In week 1 there were 202 cases of influenza A and 6 cases of influenza B. A total of 689 cases of influenza A and 15 cases of influenza B have been reported since the start of the current influenza season. The volume of tests was similar to the one in week 53.

Since the beginning of this season, 158 hospitalizations, 24 ICU admissions, and 16 deaths associated with a laboratory-confirmed diagnosis of influenza have been reported. *Numbers are subject to change as more data become available.* *The reason for the reported hospitalizations, ICU admissions, and deaths does not have to be attributable to the influenza diagnosis.*

The proportion of patients visiting sentinel physicians for influenza-like illness was 6.87% (12.94% in week 53).

Manitoba’s influenza activity, as estimated by Google Flu was Intense. There were 49 Calls to Health Links - Info Santé (54 calls in week 53).

In week 1, 299 units of oseltamivir were dispensed from community retail pharmacies. Since October 1, 2014, 1065 units have been dispensed.

Since September 1, 2014, 66 lab-confirmed outbreaks of influenza A have been reported.

Since September 1, 2014, no isolates have tested positive for resistance to either oseltamivir or zanamivir.

As of January 2, 2015, 16.8% of Manitobans had received the seasonal influenza vaccine. *This provisional estimate is subject to change.*
In Summary

- There were 202 laboratory-confirmed cases of influenza A and 6 cases of influenza B reported in week 1, lower than in the previous week.

Surveillance Measures

1. Laboratory Surveillance

Reports of influenza nucleic acid detection, culture isolation, and enzyme immunoassay (EIA) detections are received from Cadham Provincial Laboratory (CPL) and occasionally other laboratories. These reports are forwarded to the Surveillance Information Systems (SIS) within 24 hours of confirmation.

CPL performs testing for other respiratory viruses including parainfluenza, RSV, adenovirus, rhinovirus, coronavirus, enterovirus, and bocavirus. The total number of other respiratory viruses detected is reported to SIS on a weekly basis.

In week 1, there were:
- 202 cases of influenza A reported;
- 6 cases of influenza B reported.

Since the beginning of this season, there have been:
- 689 cases of influenza A reported;
- 15 case of influenza B reported.

Figure 1. Number of laboratory-confirmed influenza A cases by week
Week 1: Jan 4–Jan 10, 2015

Figure 2. Cases of influenza A and B by age group, Manitoba, 2014/15

2. Outpatient Influenza-Like-Illness (ILI) – Sentinel Physicians

The proportion of patients seen for ILI in Week 1: 6.87%

The proportion was similar to the total observed around the same time last season.

Manitoba Health participates in the National FluWatch Program coordinated by Public Health Agency of Canada (PHAC). In addition to laboratory-confirmation of influenza, this program relies on weekly reports of ILI as reported by 27 current Manitoban sentinel physicians in all five Regional Health Authorities (RHAs) including Northern, Southern, Prairie Mountain, Interlake-Eastern, and Winnipeg.

Manitoba Health, Healthy Living and Seniors (MHHLS) receives weekly reports from PHAC presenting the provincial ILI rate and the specific data for each of the participating sentinel physicians. The graph below depicts the proportion of total patients who were seen for an ILI. **These numbers should be interpreted with caution as the number of sentinel physicians reporting to FluWatch varies from week to week and may not be representative of ILI activity across the province.**
Health Links – Info Santé (HL-IS)
HL-IS is a 24-hour, 7-days a week telephone information service staffed by registered nurses with the knowledge to provide answers over the phone to health care questions and guidance to appropriate care. When a caller phones HL-IS and selects the Influenza Service, they are given an option to select information on (1) the groups of individuals who are at an increased risk of serious illness, (2) how to arrange a flu shot, (3) the annual influenza immunization campaign, or (4) the management of flu and its potential complications.

There were 49 calls to HL-IS in week 1. This weekly total was lower than the total observed around the same time last season.

Figure 4. Number of calls to HL-IS in the 2013/14 and 2014/15 influenza seasons, Manitoba

Severity (Clinically Severe Cases)
This season, PHAC is requesting provinces and territories to report the number of hospitalizations, ICU admissions, and deaths associated with a lab-confirmed report of influenza. The reason for hospitalization, ICU admission, or death does not have to be attributable to the influenza diagnosis in order to be included in this count. These data are collected in order to continue with the surveillance system implemented during the 2009 H1N1 pandemic to help monitor the severity/burden of illness during the influenza season.

In week 1 there were:
- 63 hospitalizations, of which
- 9 resulted in an ICU admission; and
- 7 deaths¹

Since the beginning of the season, there have been:
- 158 hospitalizations, of which
- 24 resulted in an ICU admission; and
- 16 deaths¹
  (1 in week 51, 1 in week 52 and 7 in week 53)

*Hospitalized cases are reported based on laboratory report date.
*Numbers are subject to change. Missed events in current weekly report due to a delay of submission to MHHLS and will be reported in the following weekly reports when data become available.

¹ The reason for hospitalization, ICU admission, or death does not have to be attributable to the influenza diagnosis in order to be included in this count.
Institutional Outbreaks

Outbreaks of influenza must be accompanied by a positive influenza lab report to be counted. The outbreak-related cases reflected on tables and figures within this report are lab-confirmed. However, note that most outbreak-related cases will not be lab-confirmed.

In week 1 there were:
- **17** outbreaks of influenza A;
- **0** outbreaks of influenza B.

Since the beginning of the season, there have been:
- **66** outbreaks of influenza A;
- **0** outbreaks of influenza B.

* Numbers are subject to change. Missed events in current weekly report due to a delay of submission to MHLS will be reported in the following weekly reports when data become available.

Syndromic Surveillance

Google Flu Trends uses certain influenza-related search terms as indicators of influenza activity. These aggregated search data are used to estimate influenza activity. Google Flu Trends compares current estimates against a historic baseline of influenza activity for the relevant area or region. Depending on whether the current estimate is higher or lower than the baseline, the general activity is classified as Minimal, Low, Moderate, High, or Intense. As of January 15, 2015 Manitoba’s influenza activity level was **Intense** but has decreased from week 53.
Sub-Typing, Strain Characterization, and Antiviral Resistance

_Sub-Typing:_
Sub-typing of influenza A specimens as reported by CPL, 2014/2015 flu season, Manitoba

<table>
<thead>
<tr>
<th></th>
<th>A/H1</th>
<th>A/H3</th>
<th>A Unsubtyped</th>
<th>A Total</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>0</td>
<td>251</td>
<td>366</td>
<td>617</td>
</tr>
</tbody>
</table>

_Strain Characterization:_
Since September 1, 2014, National Microbiology Laboratory (NML) has antigenically characterized 89 influenza viruses (55 H3N2, 2 H1N1, and 32 B viruses) that were received from Canadian laboratories including CPL with the following results:

<table>
<thead>
<tr>
<th>Strain</th>
<th>Number of viruses</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Canada</strong></td>
<td><strong>Manitoba</strong></td>
</tr>
<tr>
<td>A/Switzerland/9715293/2013-like$^1$</td>
<td>49</td>
</tr>
<tr>
<td>A/Texas/50/2012 (H3N2)-like$^2$</td>
<td>6</td>
</tr>
<tr>
<td>A/California/07/09 (H1N1)-like$^3$</td>
<td>2</td>
</tr>
<tr>
<td>B/Massachusetts/02/12-like (B Yamagata lineage)$^4$</td>
<td>32</td>
</tr>
</tbody>
</table>

_Antiviral Resistance:_
Since September 1, 2014, NML has performed drug susceptibility testing on influenza isolates received from Canadian laboratories with the following results:

<table>
<thead>
<tr>
<th>Antiviral resistance by influenza virus type and subtype, Canada, 2014/2015</th>
</tr>
</thead>
<tbody>
<tr>
<td>Virus type/subtype</td>
</tr>
<tr>

</tr>
<tr>
<td>B</td>
</tr>
</tbody>
</table>

---

$^1$ A/Switzerland/9715293/2013 is the H3N2 virus selected for the 2015 Southern Hemisphere influenza vaccine. It is related to, but antigenically and genetically distinguishable from the A/Texas/50/2012 vaccine virus.

$^2$ A/Texas/50/2012 is the recommended H3N2 component for the 2014-2015 influenza vaccine.

$^3$ A/California/07/09 is the recommended H1N1 component for the 2014-2015 Northern hemisphere influenza vaccine.

$^4$ B/Massachusetts/02/12-like virus, which belongs to the B Yamagata lineage, is the recommended influenza B component for the 2014-2015 Northern hemisphere influenza vaccine.
Abbreviations

ACF = acute care facility
CPL = Cadham Provincial Laboratory
HL-IS = Health Links – Info Santé
PHAC = Public Health Agency of Canada
ICU = intensive care unit
ILI = influenza-like-illness
LTCF = long term care facility
NML = National Microbiology Laboratory
PHS = Public Health Surveillance
RHA = Regional Health Authority
WRHA = Winnipeg Regional Health Authority

Explanatory Notes and Definitions

Cumulative data:
Cumulative data includes updates to previous weeks; due to reporting delays or amendments, the sum of weekly report totals may not add up to cumulative totals.

Data extraction date:
Manitoba-specific information contained within this update is based on data confirmed in Manitoba’s PHS Unit databases on or before January 16, 2015, the date of data extraction.

ILI in the general population:
Acute onset of respiratory illness with fever and cough and with one or more of the following – sore throat, arthralgia, myalgia, or prostration, which is likely due to influenza. In children under 5, gastrointestinal symptoms may also be present. In patients under 5 or 65 and older, fever may not be prominent.

ILI outbreaks:
Schools: Greater than 10% absenteeism (or absenteeism that is higher (e.g. >5-10%) than expected level as determined by school or public health authority) which is likely due to ILI.
Hospitals and residential institutions: Two or more cases of ILI within a seven-day period, including at least one laboratory confirmed case.
Other settings: Two or more cases of ILI within a seven-day period, including at least one laboratory confirmed case; i.e. workplace, closed communities.

Specimen collection date:
The date the laboratory specimen is taken is used to assign cases to the appropriate week in this report. However, hospitalized/ICU cases are reported based on laboratory report date.
