| simazine          | PPI (soil active) | PSII Inhibitor/<br>Membrane disruptor | Upward soil applied (Apoplast) | Broadleaf &<br>grass | 5          |

## Effects of Growing Conditions:

When applying to forage stands, dry soil conditions at the time of weed emergence may result in reduced weed control.

## Tank Mixes:

None registered.

**Note: The above mixes are those listed on the simazine labels only.**

Adding ingredients in the correct order is critical for optimum performance. Check labels of both products to be mixed for directions.

General guidelines can be found in the introduction.

## Restrictions:

- **Rainfall:** Moderate rainfall after application enhances activity.
- **Restricted Entry Interval:** DO NOT enter treated areas for 12 hours following application.
- **Grazing Restrictions:** In forage stands, allow 30 days between application and grazing, 60 days between application and cutting for feed. **DO NOT graze or cut corn for feed prior to ear emergence.**
- **Re-cropping Interval:** Simazine is persistent and residues may persist for several years depending on soil pH, available soil moisture, number of yearly applications, and the sensitivity of the following crop. Simazine will break down in soil more slowly under conditions of high pH and/or low rainfall. Corn will tolerate soil residues of simazine and may be planted the year of application. Navy beans, onions, peas may be injured 12 month after application.
- **Aerial Application:** **DO NOT apply by air.**
- **Storage:** **DO NOT freeze Simazine 480.** Princep Nine-T may be frozen. Store in a cool, dry place.
- **Buffer Zones:** Observe buffer zones outlined in the label.

## Sprayer Cleaning:

No specific cleaning procedures are indicated on the label. Based on products with similar chemistry, 'Method B' found in the general sprayer cleaning section in the introduction or a commercial spray sprayer cleaning product, may provide adequate cleaning. Contact the manufacturer for more information.

## Hazard Rating:

**Simazine 480:** Caution – Poison

Refer to the Introduction for an explanation of the symbols.

# Simplicity

(this referring text to be removed in the 2028 edition)  
see Pyroxsulam

Herbicide Group  
2 - pyroxsulam

# Smoulder

Herbicide Group  
2 - metsulfuron  
14 - saflufenacil

## Company:

BASF Canada

## Formulations:

The *Smoulder* package contains the following components:

**Smoulder (PCP#33943):** 64.6% active ingredient saflufenacil plus metsulfuron-methyl 5.4% formulated as a water dispersible granule.

- Container size - 907 g
- plus-

**Merge (PCP#24702):** 50% surfactant/50% solvent blend adjuvant.

- Container size - 2 x 8.1 L

## Crops and Staging:

Wheat (spring, durum, winter), barley, oats, triticale and fall rye: Pre-seed, post harvest

## Weeds and Staging:

Broadleaf weeds (up to 8-leaf except where indicated):

- **Weeds controlled:**
  - Kochia (up to 15 cm in height)
  - Canada fleabane
  - Canada thistle (up to 15 cm)\*
  - Cleavers (up to 4-whorl stage)
  - Dandelion (up to 15 cm)\*
  - Flixweed\*
  - Lamb's-quarters
  - Narrow-leaved hawk's-beard
  - Redroot pigweed
  - Round-leaved mallow
  - Stinkweed
  - Volunteer canola\*\*
  - Wild buckwheat
  - Wild mustard

† Season-long top growth control.

\* When tank mixed with glyphosate will provide rapid burndown control of these weeds in addition to those weed listed under *Smoulder* applied alone.

\*\* Provides control of secondary flushes of volunteer canola (except CLEARFIELD varieties) in addition to burndown control of volunteer canola (all HT types).

## Rates:

**Smoulder:** 11.3 grams per acre

-plus-

**Merge:** 0.2 to 0.4 L per acre

Use higher rates of *Merge* is recommended for higher weed densities and when the environmental conditions at the time of herbicide application may negatively impact herbicide uptake. Maximum ONE APPLICATION per year.

## Application Information:

- **Water Volume:**
  - **Ground:** 20 to 40 L per acre
- **Nozzles and Pressure:** Use a combination of nozzles and pressure designed to deliver thorough, even coverage with **ASABE medium** droplets by ground. Low drift nozzles may require higher pressures for proper performance. DO NOT apply in periods of dead calm.
- **Screens:** Use 50 mesh or coarser screen and filter system.

## How it Works:

Refer to How Do Herbicides Work in the Weed Control Section for an explanation of the concepts used in the table below.

| Active ingredient  | Timing                                                | Target                               | Movement                                             | Spectrum                | WSSA Group |
|--------------------|-------------------------------------------------------|--------------------------------------|------------------------------------------------------|-------------------------|------------|
| saflufenacil       | POST (foliar) with slight soil activity or preharvest | PPO Inhibitor/<br>Membrane disrupter | Little movement due to rapid cell leakage (Symplast) | Non-selective broadleaf | 14         |
| metsulfuron-methyl | POST (foliar) also has soil activity                  | ALS Amino Acid Inhibitor             | Toward growth area (Symplast)                        | Broadleaf only          | 2          |

## Effects of Growing Conditions:

Limited or reduced residual control can be observed on high organic matter soils (>8 percent soil organic matter). Heavy rainfall or irrigations soon after application may result in residual crop injury of possible yield reduction. DO NOT use on variable soils that have large gravelly or sandy areas, eroded knolls or calcium deposits, or crop injury could result. Weeds hardened off by environmental stress such as cold weather, drought or excessive heat may not be adequately controlled.

## Tank Mixes:

Tank mix partners applied at all label rates and include recommended adjuvants unless otherwise noted.

**Herbicides:** *Smoulder* should be tank mixed with glyphosate at 180 to 360 g ae per acre.

**Fungicides:** None registered.

**Fertilizers:** None registered.

**Insecticides:** None registered.

Adding ingredients in the correct order is critical for optimum performance. Check labels of both products to be mixed for directions. General guidelines can be found in the introduction.

## Restrictions:

- **Rainfall:** No rainfast period is specified on the label; required interval may be up to 8 hours. Contact manufacturer for more information.
- **Restricted Entry Interval:** DO NOT enter treated areas for 12 hours following application.
- **Grazing Restrictions:** DO NOT cut as feed (hay or silage) or graze within 30 days of application.
- **Pre-harvest Interval:** 60 days when used as a pre-seed application.
- **Re-cropping Interval:** DO NOT seed treated fields to barley or wheat (spring, durum winter) within 24 hours of application. Canola (all types), faba beans, field corn, CLEARFIELD lentils, peas and soybeans may be seeded 11 months after application. Flax can be seeded 11 months after application in all regions except in the brown soil zone, where a minimum 22 month recropping interval must be observed. Oats may be seeded anytime in the following season. Fields treated in the fall with post-harvest application may be seeded in the spring to wheat (spring or durum), spring barley or oats.
- **Aerial Application:** DO NOT apply by air.
- **Storage:** Store this product away from food and feed. Store the product in original, tightly closed container, in a cool, dry, secure, well-ventilated area.
- **Buffer Zones:** Observe buffer zones outlined in the label.

## Sprayer Cleaning:

Refer to 'Method A' in the general section on sprayer cleaning in the introduction. Let solution stand for an extended period for better results. See the label for product specific cleaning details.

## Hazard Rating:

Caution – Possible Skin Irritant

Caution – Eye Irritant

Refer to the Introduction for an explanation of the symbols.

# Sortan IS

Herbicide Group  
2 - rimsulfuron

## Company:

Corteva Agriscience (PCP#32627)

## Formulation:

20% rimsulfuron formulated as a water dispersible granule.

- Container size - 1.2 kg

## Crops and Staging:

**Field corn:** pre-emergent, post-emergent up to 5 leaf (3 visible collars).

## Weeds and Staging:

Maximum 30.4 grams per acre of *Sortan IS* or 6.1 grams per acre of the active ingredient rimsulfuron PER YEAR.

**Pre-emergent surface:** 30.4 grams per acre controls the following weeds emerging from seed:

- Barnyard grass
- Foxtail (green, yellow\*)
- Lady's-thumb\*
- Proso millet
- Shepherd's-purse
- Sow-thistle (annual)\*
- Volunteer canola (NOT CLEARFIELD varieties)
- Volunteer wheat (NOT CLEARFIELD varieties)

\* **Suppression only.**

**Post-emergent:** *Sortan IS* applied alone requires the addition of a non-ionic surfactant such as *Agral 90*, *Agsurf II* or *Cittowet Plus* at 0.2 L per 100 L of spray solution.

- *The weeds listed above plus the following:*

| Weed                                        | Maximum leaf stage                     | Rate                       |                 |
|---------------------------------------------|----------------------------------------|----------------------------|-----------------|
|                                             |                                        | 15.2 g per acre            | 30.4 g per acre |
| Barnyard grass                              | 1 to 4 leaf                            |                            | ✓               |
| Foxtail (green, yellow*)                    | 1 to 4 leaf                            |                            | ✓               |
| Lamb's-quarters*                            | 2 to 4 leaf                            |                            | ✓               |
| Redroot pigweed                             | 2 to 4 leaf                            | ✓                          | ✓               |
| Shepherd's-purse                            | Cotyledon – 4 leaf                     |                            | ✓               |
| Volunteer canola (NOT CLEARFIELD varieties) | Cotyledon – 5 leaf                     | ✓                          | ✓               |
| Volunteer soybeans                          | Up to the 1 <sup>st</sup> trifoliolate | ✓*                         | ✓               |
| Volunteer wheat (NOT CLEARFIELD varieties)  | Up to 1 tiller                         | ✓                          |                 |
| Wild buckwheat                              | up to 4 leaf                           | (If mixed with glyphosate) | ✓               |
| Wild oats*                                  | 2 leaf to 1 tiller                     |                            | ✓               |
| Witchgrass                                  | 1 to 4 leaf                            |                            | ✓               |
| Quackgrass                                  | 3 to 6 leaf                            |                            | ✓               |

\* **Suppression only.**

**Post-emergent:** 22.8 grams per acre for more consistent control under heavier weed populations.

- Redroot pigweed (cotyledon to 4 leaves)
- Wild buckwheat (when tankmixed with glyphosate in *Roundup* ready corn only) cotyledon to 4 leaves

## Application Information:

- **Water Volume:** Minimum 40 to 77 L per acre. Higher water volumes may provide better performance.
- **Nozzles and Pressure:** Use 25 to 40 psi (175 to 275 kPa) if applying without drift reduction nozzles. Drift reduction nozzles may require higher pressures for proper performance. Select the nozzle and pressure combination that produces of **ASABE medium** droplets while maintaining good coverage of foliage.
- **Screens:** Use 50 mesh filter screens or larger.

## How it Works:

Refer to How Do Herbicides Work in the Weed Control Section for an explanation of the concepts used in the table below.

| Active ingredient | Timing        | Target                   | Movement                          | Spectrum          | WSSA Group |
|-------------------|---------------|--------------------------|-----------------------------------|-------------------|------------|
| rimsulfuron       | POST (foliar) | ALS Amino Acid Inhibitor | Toward areas of growth (Symplast) | Broadleaf & grass | 2          |

## Effects of Growing Conditions:

Apply ONLY when the temperature in the 24 hours before AND after application ranges between 5°C and 30°C. Temperatures outside this range increase the risk of crop injury. For optimum residual control, rainfall is required within 3 to 5 days after application for activation.

## Tank Mixes:

**Herbicides:** Glyphosate (360 g ae per acre) – pre-emergent; post-emergent (glyphosate tolerant corn only).

**Insecticides:** None Registered.

*Sortan IS* should not be applied to corn that has been treated with organophosphate insecticides. Leave 7 days between the application of *Sortan IS* and that of a foliar organophosphate insecticide.

**Note: The above mixes are those listed on the *Sortan IS* label only.**

Adding ingredients in the correct order is critical for optimum performance. Check labels of both products to be mixed for directions. General guidelines can be found in the introduction.

## Restrictions:

- **Rainfall:** Within 2 to 4 hours may reduce the efficacy of post emergent treatments. A modest rainfall after pre-emergent applications will improve control of emerging seedlings.
- **Restricted Entry Interval:** DO NOT enter treated fields for 12 hours.
- **Grazing Restrictions:** DO NOT feed (silage, grazing, greenfeed, grain) treated crop to livestock within 30 days of application.
- **Pre-harvest Interval:** DO NOT apply within 30 days of harvest for feed or grain.
- **Re-cropping Interval:** Winter wheat may be seeded 4 months after application. Corn may be seeded any time after application. Barley, canola, chickpea, corn (seed or sweet), dry beans, faba beans, field pea, flax, lentil, oats, potatoes, soybean, sunflower and wheat (spring, durum) may be grown the year after application.
- **Aerial Application:** DO NOT apply by air.
- **Storage:** Store in original containers in away from other fertilizers, food or feed. Freezing will not impair effectiveness.
- **Buffer Zones:** Observe buffer zones outlined in the label.

## Sprayer Cleaning:

Refer to 'Method A' in the general section on sprayer cleaning in the introduction.

## Hazard Rating:

Warning – Contains the Allergens Milk and Sulfites

Warning – Contains Phenol

Refer to the Introduction for an explanation of the symbols.

# Steadfast IS

Herbicide Group  
2 - rimsulfuron &  
nicosulfuron

## Company:

Corteva Agriscience (PCP#33369)

## Formulation:

12.5% rimsulfuron and 25% nicosulfuron formulated as a water dispersible granule.

- Container size - 6 x 540 g case

## Crops and Staging:

Field corn: Emergence to V4 (4 visible collars)

## Weeds and Staging:

Green foxtail, wild oats: 1 to 4 leaves (up to early tillering)

Volunteer wheat\*: 1 to 3 leaves (up to early tillering)

Volunteer canola\*: Cotyledon – 5 leaves

\* NOT Clearfield varieties.

## Rates:

Apply at 16 to 27 g per acre as a broadcast spray, with a recommended non-ionic surfactant such as *Agral 90*, *Agsurf II*, or *Citowett Plus* at 0.2 L per 100 L of spray solution. Use higher rates for dense weed populations or late weed growth stages for more consistent control. Make only one application of *Steadfast IS* or other product containing rimsulfuron or nicosulfuron per year.

*Steadfast IS* will degrade in acidic or highly alkaline water. Mix no more than can be used in one day. If spraying is interrupted, thoroughly re-agitate the spray mixture before resuming spraying.

Refer to the product label for complete mixing instructions. A general guide to mixing can be found in the introduction.

## Application Information:

- **Water Volume:**
  - **Ground:** Minimum 40 L per acre. Optimum water volume is 55 to 80 L per acre.
- **Nozzles and Pressure:** Use a spray pressure of 25 to 40 psi (175 to 275 kPa). Flat fan nozzles are recommended. Use a combination of nozzles and pressure designed to deliver thorough, even coverage with **ASABE medium** droplets by ground. Low drift nozzles may require higher pressures for proper performance.
- **Screens:** Use 50 mesh filter screens or larger.

## How it Works:

Refer to How Do Herbicides Work in the Weed Control Section for an explanation of the concepts used in the table below.

| Active ingredient            | Timing | Target                                | Movement                       | Spectrum               | WSSA Group |
|------------------------------|--------|---------------------------------------|--------------------------------|------------------------|------------|
| rimsulfuron,<br>nicosulfuron | POST   | ALS Amino Acid<br>synthesis Inhibitor | Toward growth areas (Symplast) | Broadleaf &<br>grasses | 2          |

## Effects of Growing Conditions:

Apply ONLY when the temperature in the 24 hours before AND after application ranges between 5°C and 30°C. Temperatures beyond this range increase the potential for crop injury.

**WARNING:** Crop injury, including bleaching, may result if application is made to corn that has been stressed by abnormally hot, humid or cold weather conditions, frost, low fertility, drought, water saturated soil, compacted soil, previous pesticide applications, disease or insect damage. If corn has been injured by frost, wait 48 to 72 hours before applying.

Dry conditions following application may reduce the soil residual activity. If an activating rainfall is not received before germination of susceptible weeds, weed control will be reduced. DO NOT cultivate corn within 7 days before or after an application.

## Tank Mixes:

Tank mix partners applied at all label rates and include recommended adjuvants unless otherwise noted.

**Herbicides:** Glyphosate – 360 g ae per acre when applied to **glyphosate tolerant corn only**. No surfactant required when tank mixed with glyphosate.

**Fungicides:** None registered.

**Insecticides:** None registered. DO NOT tank mix with an organophosphorus insecticide or apply an organophosphorus insecticide within 7 days before or after an application of *Steadfast IS*.

**Fertilizers:** None registered.

Adding ingredients in the correct order is critical for optimum performance. Check labels of both products to be mixed for directions. General guidelines can be found in the introduction.

## Restrictions:

- **Rainfall:** Within 2 to 4 hours may reduce control.
- **Restricted Entry Interval:** DO NOT re-enter treated fields for 12 hours.
- **Grazing Restrictions:** DO NOT graze or feed treated corn forage, silage, fodder or grain for at least 30 days after application.
- **Pre-harvest Interval:** Leave 30 days between application and harvest.
- **Re-cropping Interval:** Winter wheat may be seeded 4 months after application. Spring and durum wheat, oats, barley, soybean, canola, field pea, lentil, flax, corn, potato, dry bean\*, sunflower and alfalfa may be seeded 10 months after application.  
\* Since not all dry bean varieties have been tested for tolerance to *Steadfast IS*, first planting of each variety to previously treated field should be limited to a small area to confirm tolerance prior to general field scale.
- **Aerial Application:** DO NOT apply by air.
- **Storage:** To prevent contamination store this product away from food or feed. Not for use or storage in or around the home. Keep container closed. Keep product container away from moisture.
- **Buffer Zones:** Observe buffer zones outlined in the label.

## Sprayer Cleaning:

Refer to 'Method A' in the general section on sprayer cleaning in the introduction. Let solution stand for an extended period for better results. Flush sprayer system with water. See the label for product specific cleaning details.

## Hazard Rating:

Warning – Contains the Allergens Milk and Sulfites

Refer to the Introduction for an explanation of the symbols.

# Strim MTZ

Herbicide Group  
5 - metribuzin  
15 - metolachlor

## Company:

UPL AgroSolutions Canada (PCP#33753)

## Formulation:

405 g/L S-metolachlor/R-enantiomer and 135 g/L metribuzin formulated as an emulsifiable concentrate.

- Container size - 2 x 10.5 L, 375 L

## Crops and Staging:

### Potato:

- Pre-plant incorporated
- Pre-emergent\*

**\*DO NOT use on the varieties Belleisle, Tobique, or Superior as crop injury may result. Potato varieties may vary in their tolerance to Strim MTZ.**

## Weeds and Staging:

This product is most effective when applied prior to weed emergence and provides early season residual control.

### Weeds controlled:

- |                        |                             |                                   |                         |
|------------------------|-----------------------------|-----------------------------------|-------------------------|
| ◦ Barnyard grass       | ◦ Eastern black nightshade* | ◦ Redroot pigweed                 | ◦ Wild mustard          |
| ◦ Common chickweed     |                             | ◦ Smartweed (green, lady's thumb) | ◦ Witchgrass            |
| ◦ Common ragweed       | ◦ Foxtail (green, yellow)   |                                   | ◦ Yellow nutsedge (S)** |
| ◦ Dandelion (seedling) | ◦ Lamb's-quarters           | ◦ Velvetleaf                      |                         |

(S) Suppression only.

\* Pre-emergent gives better control than PPI.

\*\* PPI treatment only.

## Rates:

*Note: Maximum of ONE APPLICATION of this product per year.*

**Pre-plant incorporated:** 1.17 to 1.21 L per acre

**Pre-emergent:** 1.17 to 1.58 L per acre

For improved burndown of any potentially emerged, small annual weeds, the following additives may be used:

- Liquid UAN (28-0-0) or liquid ammonium phosphate (10-34-0) at 5 L per 100 L of spray solution
- Crop oil concentrate at 1 L per 100 L of spray solution
- Non-ionic surfactant at 0.1 L per 100 L of spray solution.

DO NOT use on soils that are less than 1 percent or greater than 10 percent organic matter content.

Refer to the product label for complete mixing instructions. A general guide to mixing can be found in the introduction.

## Application Information:

- **Water Volume:**
  - **Ground:** Minimum of 40 L per acre for PPI treatment; 60 to 120 L per acre for pre-emergent applications.
- **Nozzles and Pressure:** Use a combination of nozzles and pressure designed to deliver thorough, even coverage with nozzle tips no finer than 6502, 8002, or TK2. Sprayers should use between 30 to 45 psi (200 to 300 kPa).
- **Screens:** Use screens no finer than 50 mesh in nozzle and in-line strainers. A 16 mesh screen is recommended for the filter inlet side of the pump.
- **Equipment:** Sparge tube, jet or mechanical agitation is required. Return line agitation is not sufficient. A pump must be of sufficient capacity to provide adequate volume through the by-pass and/or jet agitation system to provide sufficient agitation even while the booms are operating.
- **Incorporation:** Avoid deep incorporation. Incorporate with implements which provide uniform, shallow incorporation. A single incorporation is satisfactory, however a second incorporation will generally improve herbicide soil blending and improve weed control (particularly on coarse soils).

## How it Works:

Refer to How Do Herbicides Work in the Weed Control Section for an explanation of the concepts used in the table below.

| Active ingredient | Timing                                            | Target                                | Movement                                         | Spectrum          | WSSA Group |
|-------------------|---------------------------------------------------|---------------------------------------|--------------------------------------------------|-------------------|------------|
| metribuzin        | PPI, PRE<br>(soil active)                         | PSII Inhibitor/<br>Membrane disruptor | Little foliar; upward soil<br>applied (apoplast) | Broadleaf & grass | 5          |
| S-metolachlor     | PPI, PRE (surface) with<br>residual soil activity | Long-chain<br>Fatty Acid Inhibitor    | Little movement (symplast)                       | Broadleaf & grass | 15         |

## Effects of Growing Conditions:

Rain is required within 10 days of a pre-emergent application. In areas of low rainfall, follow pre-emergence application by light irrigation of 0.3 to 0.4 inches (0.7 to 1.27 cm). Dry weather conditions as well as excessive rainfall or irrigation following application may reduce weed control. On sandy soils, heavy rainfall following an incorporated treatment may cause leaching of the herbicide.

If heavy rain occurs soon after application, plant injury may result, especially in poorly drained areas where water may stand for several days.

## Tank Mixes:

Tank mix partners applied at all label rates and include recommended adjuvants unless otherwise noted.

**Herbicides:** None registered.

**Fungicides:** None registered.

**Insecticides:** None registered.

**Fertilizers:** 28-0-0 or 10-34-0 as adjuvants as indicated above.

**Note: the above tank mixes are those listed on the *Strim MTZ* label only.**

According to the Pest Management Regulatory Agency of Health Canada's Guidance Document on Tank Mix Labelling (March 2023), unlabelled tank mixes of this product are permitted only if the label of this product and the label of the product it might be mixed with include at least general wording on their respective labels indicating they may be mixed with other pesticides. When tank mixes are permitted, apply mixes according to the most restrictive use limitations for either product.

Adding ingredients in the correct order is critical for optimum performance. Check labels of both products to be mixed for directions. General guidelines can be found in the introduction.

## Restrictions:

- **Rainfall:** A small amount of rainfall or irrigation is required following application.
- **Restricted Entry Interval:** DO NOT re-enter treated fields for 12 hours.
- **Grazing Restrictions:** DO NOT graze treated immature crops or cut for hay.
- **Pre-harvest Interval:** Leave 60 days between application and harvest.
- **Re-cropping Interval:** DO NOT plant canola the year after application. DO NOT plant fall seeded wheat, oats, or rye in the same season as application.
- **Aerial Application:** DO NOT apply by air.
- **Storage:** Store away from food or feed.
- **Buffer Zones:** Observe buffer zones outlined in the label.

## Sprayer Cleaning:

Refer to 'Method B' in the general section on sprayer cleaning in the introduction. Let solution stand for an extended period for better results. Flush sprayer system with water. See the label for product specific cleaning details.

## Hazard Rating:

Caution – Eye Irritant

Refer to the Introduction for an explanation of the symbols.

# Sulfentrazone

Herbicide Group  
14 - sulfentrazone

## Company:

FMC Corporation (*Authority 480* - PCP#29012, *Sulfentra* - PCP#35231)  
Sharda CropChem Canada (*Intensa* - PCP#35041)  
Interprovincial Cooperative Limited (*Co-op Governor* - PCP#35237, *IPCO Tactic* - PCP#35236)  
NewAgco (*Throne II* - PCP#35249)  
Viking (*Viking Sulfentrazone* - PCP#35327)  
Nufarm Agriculture Inc. (*Astir* - PCP#35356)  
Sipcam Agro USA Inc. (*Lucto* - PCP #35310)

## Formulation:

480 g/L sulfentrazone formulated as a suspension concentrate.

- Container size - 4 x 3.79 L, 2 x 7.09 L (*Astir* only), 2 x 9.4 L (*Throne II* and *Viking Sulfentrazone* only).

## Crops, Rates and Staging:

**Pre-plant surface:** Apply to the soil surface prior to seeding the crop.

**Pre-emergent:** Apply to the soil surface up to 3 days after seeding. Crops emerging or near emerging at application may be injured.

**After harvest once soil temperatures have dropped below 10°C and prior to freeze up\*:** Any registered crop can be seeded the following spring.

\* *Authority 480* and *Sulfentra* only

### At 88 mL per acre:

- Mustard †
- Wheat (spring, durum)\*

\* **DO NOT apply *Authority 480* (or any other herbicide containing sulfentrazone) to spring wheat if an application of *Focus* (or any other herbicide containing pyroxasulfone) was applied in the previous fall.**

### Up to 118 mL per acre:

- Alfalfa, dormant, established grown for seed production (Authority 480 only)†
- Chickpea\*
- Faba bean
- Field pea\*
- Flax\*
- Soybean\*
- Sunflower\*

\* *Throne II*, *Lucto* and *Viking Sulfentrazone* are only registered for these crops, NOT REGISTERED on mustard, wheat or faba bean.

† Note: Since these uses are registered under the User Requested Minor Use Label Expansion program, the manufacturer assumes no responsibility for herbicide performance. **Users of this product do so at their own risk.**

All applications require rainfall for proper activation. (See "Effects of Growing Conditions")

**Note:** The use of this chemical may result in contamination of groundwater particularly in areas where soils are permeable (e.g. sand, loamy sand or sandy loam) and/or the depth to the water table is shallow.

## Weeds, Rates and Staging:

**Controls the following weeds when applied to the soil prior to emergence:**

### At 88 mL per acre:

- Kochia
- Lamb's quarters\*
- Powell (green) pigweed\*
- Redroot pigweed\*
- Russian thistle (suppression only)\*\*\*

### At 118 mL per acre:

- Above weeds plus:
  - Cleavers (suppression)\*\*
  - Common groundsel
  - Common purslane
  - Eastern black nightshade
  - Purslane
  - Waterhemp
  - Wild buckwheat
  - Yellow woodsorrel

\* *Authority 480*, *Sulfentra*, *Co-op Governor* and *IPCO Tactic* only.

Use the higher rates within the rate range for soils with pH less than 7.0 and organic matter greater than 3 percent when crops are registered for both rates.

\*\* All products **except** *Throne II*, *Lucto*, *Astir* and *Viking Sulfentrazone*

\*\*\* *Authority 480*, *Sulfentra*, *Co-op Governor*, *IPCO Tactic* and *Astir* only

Use the higher rates with the rate range for soils with pH less than 7.0 and organic matter greater than 3 percent when crops are registered for both rates.

**DO NOT APPLY sulfentrazone to:**

- coarse-textured (sand, loamy sand, sandy loam) soils,
- fine textured soils with less than 1.5 percent organic matter,
- soils with organic matter content greater than 6 percent,
- soils with a pH of 7.8 or greater,
- fields treated with sulfentrazone per 24-month period (Including fall application).

**Application Information:**

- **Water Volume:** Minimum 40 L per acre. Use as high water volume as practical to achieve even distribution over the soil surface.
- **Nozzles and Pressure:** Maximum 30 psi (175 kPa) if using conventional nozzles. Low drift nozzles may require higher pressures for proper performance. Use nozzles and pressure designed to deliver proper coverage with **ASABE medium** droplets or larger.
- DO NOT mechanically incorporate in the fall or spring as this can destroy the herbicide barrier and allow weed escapes.
- DO NOT apply to frozen soils or existing snow cover to prevent run-off of the herbicide.

**How it Works:**

Refer to How Do Herbicides Work in the Weed Control Section for an explanation of the concepts used in the table below.

| Active ingredient | Timing                       | Target                               | Movement                   | Spectrum  | WSSA Group |
|-------------------|------------------------------|--------------------------------------|----------------------------|-----------|------------|
| sulfentrazone     | PRE (residual soil activity) | PPO Inhibitor/<br>Membrane disruptor | Little movement (Symplast) | Broadleaf | 14         |

**Effects of Growing Conditions:**

All applications require rainfall for proper activation. If weed growth begins before activation occurs, poor control may result on emerged weeds. A moderate rainfall (10 to 20 mm) or equivalent irrigation is required within 10 to 14 days to activate pre-emergent surface treatments. Dry conditions that persist after any application may reduce weed control. On sandy soils, heavy rainfall following application may cause leaching of *Authority 480* that may result in reduced weed control and increased risk of crop injury.

**DO NOT apply to fields that are covered in snow.**

**Tank Mixes:****Herbicides:**

- **Field Peas only:** Imazethapyr (28.3 mL per acre) – black and grey wooded soils only.\*
- **Wheat (spring, durum\*\*), faba bean\*, field peas and soybean only\*\*\*:** Express SG (6 grams per acre) + glyphosate.

\* all products except *Throne II*, *Lucto*, *Astir* and *Viking Sulfentrazone*.

\*\* all products except *Throne II*, *Lucto* and *Viking Sulfentrazone*.

\*\*\* See precautions on 'Tribenuron' regarding potential pulse crop injury.

According to the Pest Management Regulatory Agency of Health Canada's Guidance Document on Tank Mix Labelling (March 2023), unlabelled tank mixes of this product are permitted only if the label of this product and the label of the product it might be mixed with include at least general wording on their respective labels indicating they may be mixed with other pesticides. When tank mixes are permitted, apply mixes according to the most restrictive use limitations for either product.

**Restrictions:**

- **Rainfall:** Rainfall following application is required for adequate weed control.
- **Grazing Restrictions:** DO NOT graze stubble after a post harvest fall application.
- **Pre-harvest Interval:** Leave 60 days between application and harvest.
- **Restricted Entry Interval:** DO NOT re-enter treated area within 12 hours.
- **Re-cropping Interval:**
  - Registered crops may be planted anytime after application of *Authority 480*, *Sulfentra*, *Intensa*, *Co-op Governor*, *Lucto*, *Astir* and *IPCO Tactic* and 16 months after *Throne II* and *Viking Sulfentrazone*.
  - Winter wheat may be seeded 4 months after application of *Authority 480*, *Sulfentra*, *Intensa*, *Co-op Governor*, *Astir* and *IPCO Tactic* and 16 months after *Throne II*, *Lucto* and *Viking Sulfentrazone*.
  - Alfalfa, barley, canary grass\*, canola, field corn, oats\* and wheat (spring and durum - following use of the high rate) may be seeded 12 months after application of *Authority 480*, *Sulfentra*, *Intensa*, *Co-op Governor* and *IPCO Tactic*.
- **Except Astir and Intensa**
  - Alfalfa, barley, field corn, wheat (spring and durum) maybe be seeded 12 months after application of *Throne II*, *Lucto* and *Viking Sulfentrazone*.
  - Sweet corn, lentils and sorghum may be seeded 24 months after application of *Authority 480*, *Sulfentra*, *Intensa*, *Co-op Governor*, *Astir* and *IPCO Tactic*.
  - Sweet sorghum and canola maybe be seeded 24 months after application of *Throne II*, *Lucto* and *Viking Sulfentrazone*
  - Lentils may be seeded 36 months after application of *Throne II*, *Lucto* and *Viking Sulfentrazone*.
  - For all other crops 36 months must pass following application and a successful bioassay indicating adequate tolerance before planting.
  - **For each year of drought** experienced (especially in June, July and August), **add one year** to the intervals above and conduct a bioassay to confirm tolerance of the rotational crop. Longer re-cropping intervals should be used under dry conditions.

- **Aerial Application:** DO NOT apply by air.
- **Storage:** Store above 5°C to keep from freezing. If frozen, and solid crystals are observed, warm to above 15°C and shake or roll container periodically to dissolve solids.
- **Buffer Zones:** Observe buffer zones outlined in the label.

## Sprayer Cleaning:

Refer to 'Method A' in the general section on sprayer cleaning in the introduction. Leaving cleaning solution in the sprayer tank and plumbing for an extended period will improve cleaning effectiveness.

## Hazard Rating:

Caution – Poison

Refer to the Introduction for an explanation of the symbols.

# Talinor

Herbicide Group  
6-bromoxynil  
27-bicyclopyrone

## Company:

Syngenta Canada Inc.

## Formulation:

**Talinor (PCP#32681):** 37.5 g/L bicyclopyrone and 175 g/L bromoxynil formulated as an emulsifiable concentrate.

- Container size – 2 x 8.1 L, 129.6 L, 324L

## Crops and Staging:

Spring wheat, durum wheat and barley 2 to 6 leaf on the main stem (up to 3 tillers). Do not treat spring wheat, durum wheat and barley under-seeded to forages.

## Weeds and Staging:

405 mL per acre.

### Weeds Controlled (1 to 6 leaf unless otherwise noted):

- |                                    |                                                    |                    |
|------------------------------------|----------------------------------------------------|--------------------|
| ◦ Annual sow thistle               | ◦ Lamb's-quarters                                  | ◦ Stinkweed        |
| ◦ Cleavers (1 to 6 whorls)         | ◦ Narrow-leaved hawk's- beard (up to 15 cm height) | ◦ Wild buckwheat   |
| ◦ Common chickweed                 | ◦ Redroot pigweed                                  | ◦ Volunteer canola |
| ◦ Flixweed (up to 10 cm in height) | ◦ Scentless chamomile*                             | ◦ Wild mustard     |
| ◦ Hemp-nettle                      | ◦ Shepherd's-purse                                 |                    |
| ◦ Kochia (up to 10 cm in height)   |                                                    |                    |

### Weeds Suppressed:

- |                                                           |                                           |                                        |
|-----------------------------------------------------------|-------------------------------------------|----------------------------------------|
| ◦ Canada thistle (Up to 30cm height)                      | ◦ Horsetail (up to 15 cm in height)       | ◦ White cockle (up to 15 cm in height) |
| ◦ Dandelion (Up to 10 cm in height and 25 cm in diameter) | ◦ Round-leaved mallow                     |                                        |
|                                                           | ◦ Russian thistle (up to 10 cm in height) |                                        |

\*Spring seedlings only

For optimum results, apply actively growing weeds. An early application will maximize crop yields by reducing weed competition.

## Application Information:

- **Water Volume:**
  - Ground: Minimum 20 to 40 L per acre.
  - Aerial: Minimum 12 L per acre
- **Nozzles and Pressure:** 80° or 110° drift reducing flat fan (e.g. those with a pre-orifice or turbulence chamber) or air induction nozzles are recommended. DO NOT use flood type nozzles, controlled droplet application equipment, spray foils or hollow cone nozzles. Use pressure as recommended by the nozzle manufacturer to achieve ASAE medium sized droplets.
- **Screens:** 50 mesh nozzle screens.

## How it Works:

Refer to Do Herbicides Work in the Weed Control Section for an explanation of the concepts used in the table below.

| Active ingredient | Timing        | Target                                | Movement                                                                        | Spectrum       | WSSA Group |
|-------------------|---------------|---------------------------------------|---------------------------------------------------------------------------------|----------------|------------|
| bicyclopyrone     | POST (foliar) | HPPD Pigment Inhibitor                | Some – both foliar and root (Apoplast)<br>Somewhat systemic (has soil residues) | Broadleaf only | 27         |
| bromoxynil        | POST (Foliar) | PSII Inhibitor/<br>Membrane disruptor | Little (Apoplast)                                                               | Broadleaf only | 6          |

## Effects of Growing Conditions:

Temporary crop injury may occur with tank-mixes under extreme weather conditions or when the crop is suffering from stress due to inadequate or abnormally high moisture levels or extreme temperatures.

## Tank Mixes:

Tank mix partners applied at all label rates and include recommended adjuvants unless otherwise noted.

### Herbicides:

- *Axial* (500 mL per acre)
- *Axial Xtreme* (500 mL per acre)
- *Broadband* (263 mL per acre plus 283 mL per acre *Adigor*)
- *Traxos* (500 mL pr acre)
- *Sierra 3.0* (39 to 59 mL per acre)
- *Everest 3.0* (39 to 58 mL per acre)
- *Simplicity* (200 mL per acre)
- *Varro* (200 mL per acre)

**Fungicides:** None registered.

**Insecticides:** None registered.

**Fertilizers:** None registered.

## Restrictions:

- **Rainfall:** Avoid application when heavy rain is forecast.
- **Re-entry:** DO NOT enter or allow worker entry into treated areas for 12 hours.
- **Preharvest Interval:** 60 days after treatment for grain and straw.
- **Grazing:** DO NOT graze or feed to livestock for 30 days after treatment for forage and hay.
- **Re-cropping:** Alfalfa, canola, chickpeas, flax, mustard, potato, soybeans, barley, oats, wheat (spring and durum) and field peas\* may be grown 10 months after application. Dry beans and lentils may be grown 22 months after application.  
\* Field peas may be grown the year following *Talinor* application providing the following are met: precipitation must be equal to or above 10-year average (minimum 100 mm within 60 days of application in the year of application), organic matter must be above 2.5%, soil pH must be above 6.0.
- **Aerial Application:** May be applied by aircraft.
- **Storage:** Store this product away from food or feed. Keep in original container, tightly closed, during storage. Store in a cool, dry, well ventilated area, out of the reach of children and animals. Keep away from fire or open flame, or other sources of heat. If frozen, allow to thaw and agitate thoroughly prior to use.
- **Buffer Zones:** Observe buffer zones outlined in the label.

## Sprayer Cleaning:

Refer to 'Method B' in the general section on sprayer cleaning in the introduction. Let solution stand for an extended period for better results. Flush sprayer system with water. See the label for product specific cleaning details.

## Hazard Rating:

Danger – Poison

Warning – Skin irritant / Skin sensitizer. Contains the allergen soy.

Refer to the Introduction for an explanation of the symbols.

# Tandem

This product is the equivalent of a prepackaged tank mix of Tandem A and Tandem B (See Fluroxypyr). Information listed is restricted to Crops, Weeds, Rates and Tank mixes. For other detailed restrictions and other general information on the component products see the product pages listed above.

**Herbicide Group**  
**2 - pyroxsulam**  
**4 - fluroxypyr**

## Company:

Corteva Agriscience

## Formulation:

The Tandem package contains the following components:

**Tandem A (PCP#29985):** 30 g/L pyroxsulam formulated as an oil-dispersion.

- Container size - 8 L jug

**Tandem B (PCP#29965):** 333 g ae/L fluroxypyr formulated as an emulsifiable concentrate.

- Container size - 4.84 L jug

## Crops and Staging:

**Spring wheat (including durum):** 3 leaf stage to just prior to flag-leaf emergence.

**Winter wheat:** Apply in the spring from the 3 tiller stage to just before the flag leaf stage.

When tank-mixing always check the tank mix partner recommendations for additional staging restrictions.

## Weeds, Rates and Staging:

**Tandem A at 200 mL per acre plus Tandem B at 121 mL per acre:**

- The weeds controlled by Simplicity at the high application rate plus the following broadleaf weeds:

| Weed                                             | Maximum Application Stage |
|--------------------------------------------------|---------------------------|
| Hemp-nettle <sup>†</sup> , kochia, stork's-bill* | 8 leaves or whorls        |
| Volunteer flax                                   | 12 cm                     |

\* Suppression only.

\*\* Not CLEARFIELD varieties.

<sup>†</sup> NOTE Group 2 resistant biotypes only controlled to the 6 leaf stage.

## Tank Mixes:

Tank mix partners applied at all label rates and include recommended adjuvants unless otherwise noted.

### Herbicides:

- In spring wheat (including durum):
  - 2,4-D Ester 700 (0.24 to 0.32 L per acre)
  - Curtail M
  - MCPA ester (0.24 to 0.38 L per acre) (600 g ae/L forms)
  - Exhilarate A + MCPA ester 600 + Tandem B

**Fungicides:** None registered.

**Insecticides:** None registered.

**Fertilizers:** None registered.

**Note:** The above mixes are those listed on the Tandem label only.

According to the Pest Management Regulatory Agency of Health Canada's Guidance Document on Tank Mix Labelling (March 2023), unlabelled tank mixes of this product are permitted only if the label of this product and the label of the product it might be mixed with include at least general wording on their respective labels indicating they may be mixed with other pesticides. When tank mixes are permitted, apply mixes according to the most restrictive use limitations for either product.

Adding ingredients in the correct order is critical for optimum performance. Check labels of products to be mixed for directions. General guidelines can be found in the introduction.

## Restrictions (different from the components):

- **Aerial Application:** May be applied by air.
- **Buffer Zones:** Observe buffer zones outlined in the label.

# Telar XP

Herbicide Group  
2 - chlorsulfuron

## Company:

Envu Canada (PCP #30036)

## Formulation:

75% chlorsulfuron, presented as a water dispersible granule.

- Container size - 10 x 500 g

## Crops and Staging:

**Non-crop areas where vegetation is not desirable such as utility rights of ways, roadsides, industrial sites, railroads and storage areas. DO NOT apply to crop land.**

The use of this chemical may result in contamination of any body of water, including irrigation that may be used on crops.

## Weeds and Staging:

**For best results apply *Telar XP* post-emergence to young (less than 10 cm tall or across) annual weeds; biennial and perennial weeds.**

**Weeds should be actively growing at time of application.**

DO NOT allow spray mixture to remain in tank for more than 24 hours before spraying or the effectiveness may be reduced.

Residual control of weeds germinating after spray application is achieved when *Telar XP* Herbicide is carried into the root zone by rainfall.

For best results, sufficient rainfall to move *Telar XP* 5 to 7 cm deep into the soil is required after application, before weeds develop an established root system and grow beyond the seedling stage.

**Add Adjuvant:** non-ionic surfactant (i.e *Agral 90*, *Ag surf II*, or *Hasten NT*) at 0.1 L per 100 L of spray solution.

**Weeds controlled at 6 grams per acre + 2,4-D amine 500 at 0.32 to 0.45 L per acre or 2,4-D ester LV 700 at 0.25 to 0.32L per acre:**

- |                                             |                                                    |                       |
|---------------------------------------------|----------------------------------------------------|-----------------------|
| ◦ Annual smartweed<br>(green, lady's-thumb) | ◦ Mustard (ball, wild)                             | ◦ Russian thistle     |
| ◦ Annual sunflower                          | ◦ Narrow-leaved hawk's-beard<br>(spring seedlings) | ◦ Scentless chamomile |
| ◦ Common tansy                              | ◦ Plantain                                         | ◦ Shepherd's-purse    |
| ◦ Cow cockle                                | ◦ Prickly lettuce                                  | ◦ Stinkweed           |
| ◦ Flixweed                                  | ◦ Ragweed (common)                                 | ◦ Stork's-bill        |
| ◦ Hemp-nettle                               | ◦ Redroot pigweed                                  | ◦ Sweet clover        |
| ◦ Lambs-quarters                            | ◦ Russian Pigweed                                  | ◦ Volunteer rapeseed  |

**Weeds controlled at 12 grams per acre:**

- |                                             |                       |                      |
|---------------------------------------------|-----------------------|----------------------|
| ◦ Annual smartweed<br>(green, lady's-thumb) | ◦ Flixweed            | ◦ Shepherd's-purse   |
| ◦ Common chickweed                          | ◦ Hemp nettle         | ◦ Stinkweed          |
| ◦ Common groundsel                          | ◦ Lamb's-quarters     | ◦ Stork's-bill       |
| ◦ Corn spurry                               | ◦ Prickly lettuce     | ◦ Volunteer rapeseed |
| ◦ Cow cockle                                | ◦ Redroot pigweed     | ◦ Wild mustard       |
|                                             | ◦ Scentless chamomile |                      |

**Weeds controlled at 16 grams per acre:**

*Weeds listed above plus:*

- Wild carrot

**Weeds controlled at 28 grams per acre:**

*Weeds listed above plus:*

- |                   |                         |                    |
|-------------------|-------------------------|--------------------|
| ◦ Canada thistle* | ◦ Perennial sow-thistle | ◦ Wild rose*       |
| ◦ Dandelion*      | ◦ Russian thistle       | ◦ Wild strawberry* |
| ◦ Goldenrod*      | ◦ Sow thistle           |                    |
| ◦ Horsetail       | ◦ Sweet clover          |                    |

**Note:** Broadleaf weed control in non-crop land (where vegetation is not desirable). This rate of *Telar XP* may cause severe injury for certain grass species.

**Weeds controlled at 49 grams per acre:**

*Weeds listed above plus:*

- |                              |                  |           |
|------------------------------|------------------|-----------|
| ◦ Canada thistle             | ◦ Wild buckwheat | ◦ Willow* |
| ◦ Narrow-leaved hawk's-beard |                  |           |

\* Suppression only.

## Application Information:

- **Water Volume:**
  - **Ground:** 81 to 162 L per acre.
- **Nozzles and Pressure:** Use a combination of nozzles and pressure designed to deliver thorough, even coverage with *ASABE coarse* droplets. Sprayers without drift reduction nozzles should use between 30 to 40 psi (210 to 275 kPa). Low drift nozzles may require higher pressures for proper performance.
- **Screens:** Use a 50 mesh or coarser screen and filter system.

## How it Works:

Refer to How Do Herbicides Work in the Weed Control Section for an explanation of the concepts used in the table below.

| Active ingredient | Timing                               | Target        | Movement                           | Spectrum       | WSSA Group |
|-------------------|--------------------------------------|---------------|------------------------------------|----------------|------------|
| chlorsulfuron     | POST (foliar) also has soil activity | ALS Inhibitor | Toward areas of growth (sympplast) | Broadleaf only | 2          |

## Effects of Growing Conditions:

*Telar XP* controls susceptible annual weeds by both foliar and root uptake. Best control of emerged annual weeds is obtained when weeds are actively growing. Warm, moist growing conditions promote active weed growth and enhance activity; weeds stressed by moisture or temperature extremes may be less susceptible and incomplete weed kill may result. Residual control of weeds germinating after spray application is achieved when the product is carried into the root zone by rainfall. For best results, sufficient rainfall to move *Telar XP* 5 to 7 cm deep into the soil is required after application, before weeds develop an established root system and grow beyond the seedling stage.

## Tank Mixes:

### Herbicides:

- ***Telar XP* at 12, 16, 28 or 49 grams per acre with non-selective herbicides**
  - 2,4-D amine
  - Atrazine
  - *Hyvar X*
  - *Hyvar X-L*
  - *Karmex DF*
  - *Krovar I*
  - *Princep*
  - *Velpar*

Adding ingredients in the correct order is critical for optimum performance. Check label of both products to be mixed for directions. General guidelines can be found in the introduction.

## Restrictions:

- **Rainfall:** Avoid application when heavy rain is forecast.
- **Restricted Entry Interval:** DO NOT enter treated areas for 12 hours after application.
- **Grazing Restrictions:** DO NOT graze or cut treated areas for forage as research does not support this use.
- **Aerial Application:** DO NOT apply by air.
- **Storage:** Store in cool, dry place. Keep away from other pesticides, fertilizer, food or feed. Store in original container.
- **Buffer Zones:** Observe buffer zones outlined in the label.

## Sprayer Cleaning:

Refer to 'Method A' found in the general sprayer cleaning section in the introduction. Let solution stand for an extended period for better results. Flush sprayer system with water. See the label for product specific cleaning details. DO NOT use ammonia with chlorine bleach.

## Hazard Rating:

Caution – Poison

Warning – Contains the Allergens Milk and Sulfites

Refer to the Introduction for an explanation of the symbols.

# Thifensulfuron

Herbicide Group  
2- thifensulfuron

## Company:

FMC Corporation (*Pinnacle SG, Pinnacle Toss n Go*\*)  
Albaugh (*Volta*)

\* Note: This product is no longer manufactured but inventories still remain in distribution. This product may be removed from future editions.

## Formulation:

**Pinnacle SG (PCP#29349):** 50% thifensulfuron methyl as a water soluble granule.

- Container size - 240 g

**Pinnacle SG Toss-n-Go (PCP#30741):** 50% thifensulfuron methyl as a water soluble granule.

- Container size - 8 x 12 g water soluble pouches

**Volta (PCP#33178):** 75% thifensulfuron methyl as a water dispersible granule.

- Container size - 324 g

## Crops and Staging:

**Pinnacle SG and Pinnacle SG Toss-n-Go and Volta:**

- **Soybean:** First fully expanded trifoliate leaf to before soybeans have initiated flowering.

**Pinnacle SG and Pinnacle SG Toss-n-Go only:**

- **Camelina (Thifensulfuron tolerant varieties only):**\* After camelina is established up to 60 days prior to harvest.

**Volta only:**

- **Barley, wheat (including durum and winter), oats:** 2 leaf up to flag leaf stage. NOT for crops underseeded to a forage.

**\*NOTE:** Since these uses are registered under the User Requested Minor Use Label Expansion (URMULE) program, the manufacturer assumes no responsibility for herbicide performance. Those who apply these uses do so at their own risk.

## Weeds, Rates and Staging:

In soybeans or thifensulfuron tolerant camelina\*: Apply up to weeds 4 inches (10 cm) tall or wide.

- **Pinnacle SG, Pinnacle SG Toss-N-Go at 3.3 grams per acre or Volta at 2.2 g per acre will control:**
  - Lady's-thumb
  - Redroot pigweed
  - Wild mustard
- **Pinnacle SG, Pinnacle SG Toss-N-Go at 4.8 grams per acre or Volta at 3.2 g per acre will control the weeds above plus:**
  - Lamb's-quarters
  - Velvetleaf \*

In cereals only at **Volta** at 8 g per acre will control the weeds above plus:

- Annual smartweed (green)
- Chickweed (1 to 6 leaf)
- Corn spurry
- Cow cockle
- Hemp-nettle
- Russian thistle
- Stinkweed
- Volunteer canola (not CLEARFIELD or SU tolerant varieties)
- Wild buckwheat (1 to 3 leaf)

† **Pinnacle only.**

\* **Soybeans only:** The addition of 28-0-0 liquid fertilizer at 4 L per 100 L of spray solution or 2.4 kg of 46-0-0 dry urea fertilizer may improve control of velvetleaf. Refer to the product label for complete mixing instructions.

Thifensulfuron requires the addition of a non-ionic surfactant such as *Agral 90*, *Agsurf II*, or *Citowett* at 0.1 L per 100 L of spray solution. Oil surfactant blends such as *Assist* at 0.4 to 0.8 L per acre, or *Sure-Mix* at 0.5 L per 100 L of spray solution may be used as adjuvants (check label for use rates). A general guide to mixing can be found in the introduction.

## Application Information:

- **Water Volume:** Minimum of 45 L per acre.
- **Nozzles and Pressure:** Maximum 40 psi (275 kPa) when using conventional flat fan nozzles. Low drift nozzles may require higher pressures for proper performance. Use a combination of nozzles and pressure designed to deliver thorough, even coverage of **ASABE medium** droplets.
- **Screens:** Use a 50 mesh or coarser screen and filter system.

## How it Works:

Refer to How Do Herbicides Work in the Weed Control Section for an explanation of the concepts used in the table below.

| Active ingredient | Timing | Target                             | Movement                       | Spectrum  | WSSA Group |
|-------------------|--------|------------------------------------|--------------------------------|-----------|------------|
| thifensulfuron    | POST   | ALS Amino Acid synthesis Inhibitor | Toward growth areas (Symplast) | Broadleaf | 2          |

## Effects of Growing Conditions:

Thifensulfuron applied to crops that have been under stress before application may result in crop injury. Stress conditions within 3 days after application may also result in crop injury.

Weeds under stress conditions at the time of application may not be adequately controlled.

Stress conditions are severe weather conditions, frost, low fertility, drought, water-saturated soils, and disease or insect damage.

Injury symptoms in soybean can be crop discoloration (yellowing, purpling or reddening of leaf veins), or stunting.

## Tank Mixes:

### Herbicides:

- **In soybeans only:**
  - *Assure II* (0.2 L per acre) plus *Sure-Mix*\* adjuvant.
  - *Basagran* (0.71 or 0.91 L per acre) plus *Assist* adjuvant\*.
  - *Basagran Forté* (0.71 or 0.91 L per acre)\*.
  - *Assure II* (0.25 L per acre) plus *Basagran Forté* (0.71 or 0.91 L per acre) plus *Sure-Mix* adjuvant\*.
- **In cereals only:**
  - MCPA amine at 500 g ae per acre (0.4 L per acre of a 500 g/L formulation) plus surfactant as above.

\* Refer to appropriate labels for thifensulfuron and adjuvant rates of application.

**Fungicides:** None registered.

**Insecticides:** None registered.

According to the Pest Management Regulatory Agency of Health Canada's Guidance Document on Tank Mix Labelling (March 2023), unlabelled tank mixes of this product are permitted only if the label of this product and the label of the product it might be mixed with include at least general wording on their respective labels indicating they may be mixed with other pesticides. When tank mixes are permitted, apply mixes according to the most restrictive use limitations for either product.

Adding ingredients in the correct order is critical for optimum performance. Check labels of products to be mixed for directions. General guidelines can be found in the introduction.

## Restrictions:

- **Rainfall:** Up to 25 mm of rain beginning 1 hour or more after spraying will not reduce the effectiveness of thifensulfuron.
- **Restricted Entry Interval:** DO NOT enter treated fields for at least 12 hours.
- **Pre-harvest Interval:** Leave 60 days from application to harvest.
- **Grazing Interval:** DO NOT graze treated crops or cut for hay.
- **Re-cropping Interval:** DO NOT plant any crop other than soybean, tomatoes, thifensulfuron tolerant camelina, CLEARFIELD canola, wheat or barley for 30 days after application.
- **Aerial Application:** DO NOT apply by air.
- **Storage:** Store in closed original container in a dry area away from food or feed.
- **Buffer Zones:** Observe buffer zones outlined in the label.

## Sprayer Cleaning:

Thifensulfuron can cause severe injury to sensitive crops at very low concentrations. Sprayers used to spray thifensulfuron should be flushed out immediately after use. Refer to 'Method A' in the general section on sprayer cleaning in the introduction.

## Hazard Rating:

Warning – Contains the Allergen Milk/Sufites

# Thifensulfuron/Tribenuron + Fluroxypyr + Clopyralid

Herbicide Group  
2 - thifensulfuron,  
tribenuron  
4 - fluroxypyr,  
clopyralid

*This product is a prepackaged tank mix of Thifensulfuron/Tribenuron, Fluroxypyr and Clopyralid listed is restricted to Crops, Weeds, Rates and Tank mixes. For other detailed restrictions and other general information on the component products see the product pages listed above.*

## Company:

NewAgco (Foxy CRX)

Viking (Viking Larvik)

## Formulation:

The thifensulfuron/tribenuron + fluroxypyr + clopyralid package contains the following components:

**Viking Fluroxypyr (PCP# 34778 - Viking Larvik):** 180 g/L fluroxypyr formulated as an emulsifiable concentrate.

- Container sizes - 9.6 L, 230 L

**Foxy 333 (PCP#35375):** 333g /L fluroxypyr formulated as an emulsifiable concentrate.

- Container size - 2 x 5.1 L

-plus-

**MPOWER RX (PCP#33520 - Foxy CRX), Viking Navik (PCP# 34791 - Viking Larvik):** 50% thifensulfuron methyl + 25% tribenuron methyl formulated as a water dispersible granule.

- Container sizes - 320 g, 2 x 320 g (MPOWER RX), 24 x 320 g

-plus-

**Clobber (PCP#33114 - Foxy CRX), Viking Clopyralid (PCP# 34779 - Viking Larvik):** 360 g/L clopyralid formulated as an emulsifiable concentrate.

- Container sizes - 3.4 L, 6.8 L (Clobber only), 81 L

## Crops and Staging:

Barley, spring wheat, durum wheat only: 3 leaf to flag leaf.

## Weeds, Rates and Staging:

Weeds controlled by Foxy 333 at 0.126 L per acre and Viking Fluroxypyr (see Fluroxypyr) at 0.24 L per acre plus the weeds controlled by MPOWER RX and Viking Navik (see thifensulfuron:tribenuron (2:1) at 8 grams per acre and Clobber and Viking Clopyralid (see clopyralid) at 112 mL per acre.

If applied alone, Foxy CRX and Viking Larvik requires the addition of Icon, Agral 90, Ag-Surf or Citowett Plus adjuvant at 0.2 L per 100 L of spray solution, and which must be purchased separately.

Foxy CRX and Viking Larvik may degrade if left in the sprayer for an extended period. Apply within 24 hours of mixing.

## Tank Mixes:

None registered.

According to the Pest Management Regulatory Agency of Health Canada's Guidance Document on Tank Mix Labelling (March 2023), unlabelled tank mixes of this product are permitted only if the label of this product and the label of the product it might be mixed with include at least general wording on their respective labels indicating they may be mixed with other pesticides. When tank mixes are permitted, apply mixes according to the most restrictive use limitations for either product.

**See component products for more information on restrictions, application details and handling. Unless indicated differently above use the most limiting restrictions across all components for the mix.**

# Thifen:Triben (2:1) + Fluroxypyr + 2,4-D

This product is a prepackaged tank mix of the equivalent of thifensulfuron/tribenuron and fluroxypyr and 2,4-D. Information listed is restricted to Crops, Weeds, Rates and Tank mixes.

For other detailed information on the component products see the product pages listed above.

Herbicide Group  
2 - thifensulfuron  
& tribenuron  
4 - fluroxypyr & 2,4-D

## Company:

Loveland Products Canada (*Retain SG*)

NewAgco (*Foxy Pro RX*)

Viking (*Viking Avesta*)

## Formulations:

The *Retain SG* package contains the following components:

**Retain A (PCP#30129):** 33.35% thifensulfuron + 16.65% tribenuron formulated as a water soluble granule.

- Container size - 486 g

**Retain 333 B (PCP#32845):** 333 g/L fluroxypyr formulated as an emulsifiable concentrate.

- Container size - 2.6 L

**Loveland Products Canada 2,4-D Ester 700 (PCP#27818):** 660 g/L 2,4-D ester formulated as an emulsifiable concentrate.

- Container size - 6.8 L

-or-

The *Foxy Pro RX* package contains the following components:

**MPOWER RX (PCP#33520):** 50% thifensulfuron and 25% tribenuron formulated as a water dispersible granule.

- Container sizes - 320 g

**Foxy 333 (PCP#35375):** 333 g/L fluroxypyr formulated as an emulsifiable concentrate.

- Container sizes - 5.1 L

**2,4-D Ester 700 II (PCP#34808):** 660 g ae/L 2,4-D Ester formulated as an emulsifiable concentrate.

- Container sizes - 9.8 L

-or-

The *Viking Avesta* package contains the following components:

**Viking Navik (PCP#34791):** 50% thifensulfuron and 25% tribenuron formulated as a water dispersible granule.

- Container size - 320 g

**Viking Fluroxypyr (PCP#34778):** 180 g/L fluroxypyr formulated as an emulsifiable concentrate.

- Container size - 9.6 L

**Viking 2,4-D Ester 700 (PCP#34813):** 660 g ae/L 2,4-D Ester formulated as an emulsifiable concentrate.

- Container Size 9.8 L

## Crops and Staging:

**Wheat (spring, durum) and barley:** 4 leaf to flag leaf stage.

**Winter Wheat\*:** In spring from the 3 tiller stage until the emergence of the flag leaf.

\* *Retain SG* only.

## Weeds and Staging:

Apply from the seedling to 4 leaf or whorl stage (unless otherwise indicated) of the following weeds:

- Weeds controlled by thifensulfuron/tribenuron (2:1) plus 2,4-D ester as well as:
  - *Retain SG*: cleavers\*
  - *Foxy Pro RX*: cleavers, kochia (2 to 8 leaf), volunteer flax (up to 12 cm), stork's-bill suppression (1 to 8 leaf)

\* Not Group 2 resistant biotypes

## Rates:

**Retain SG:**

- *Retain A*: 12 grams per acre.
- *Retain 333 B*: 70 mL per acre.
- *Loveland Products Canada 2,4-D*: 0.2 L per acre.

**Foxy Pro RX:**

- *MPOWER RX*: 8 grams per acre.
- *Foxy*: 240 mL per acre.
- *2,4-D 700 ester 700 II*: 245 mL per acre.

**Viking Avesta:**

- **Viking Navik:** 8 grams per acre.
- **Viking Fluroxypyr:** 242 mL per acre.
- **Viking 2,4-D 700 ester:** 245 mL per acre

Add *Agral 90*, *Agsurf II*, or *Citowett Plus* at 0.2 L per 100 L of spray solution.

Thifensulfuron and tribenuron may degrade if left in the sprayer for an extended period. Apply within 24 hours of mixing.

**Tank Mixes:**

None registered.

According to the Pest Management Regulatory Agency of Health Canada's Guidance Document on Tank Mix Labelling (March 2023), unlabelled tank mixes of this product are permitted only if the label of this product and the label of the product it might be mixed with include at least general wording on their respective labels indicating they may be mixed with other pesticides. When tank mixes are permitted, apply mixes according to the most restrictive use limitations for either product.

Refer to the product label for complete mixing instructions. A general guide to mixing can be found in the introduction.

**See component products for more information on restrictions, application details and handling. Use the most limiting restrictions across all components for the mix.**

# Thifen / Triben (25:25) + Fluroxypyr

Herbicide Group  
2 - thifensulfuron,  
tribenuron  
4 - fluroxypyr

**Company:**

FMC Corporation (*Barricade II\**, *Barricade III*)

NewAgco (*Foxy R Extreme*, *Foxy RCK*)

*\* Note: This product is no longer manufactured but inventories still remain in distribution. This product may be removed from future editions.*

**Formulation:**

The *Barricade II/Barricade III* package contains the following components:

***Barricade SG (PCP#29544):*** 25% thifensulfuron methyl plus 25% tribenuron methyl formulated as a water soluble granule.

- Container size - 486 g (*Barricade II*), 972 g (*Barricade III*)

***Perimeter II (PCP#30094) (Barricade II), FMC Fluroxypyr 333EC (PCP#35620) (Barricade III):*** 333 g ae/L fluroxypyr formulated as an emulsifiable concentrate.

- Container size - 3.4 L (*Barricade II*), 10 L (*Barricade III*)

The *Foxy R Extreme* and *Foxy RCK* packages contain the following components:

***Rumour (PCP#33574):*** 25% thifensulfuron methyl plus 25% tribenuron methyl formulated as a water soluble granule.

- Container sizes:
  - *Foxy R Extreme* - 2 x 486 g, 48 x 486 g
  - *Foxy RCK* - 2 x 486 g, 48 x 486 g

***Foxy 333 (PCP#35375):*** 333 g ae/L fluroxypyr formulated as an emulsifiable concentrate.

- Container sizes:
  - *Foxy R Extreme* - 2 x 6.7 L, 320 L
  - *Foxy RCK* - 2 x 5.1 L, 241 L

**Crops and Staging:**

**Barley, and spring wheat (including durum) only:** 2 leaf until first node can be felt at the base of the stem.

**Oats (*Barricade II/Barricade III* + MCPA ester mix only):** 3 leaf until first node can be felt at the base of the stem.

**Winter wheat:** In the spring from the 3 tiller stage until the emergence of the flag leaf.

## Weeds and Staging:

Unless otherwise noted below, apply to young and actively growing weeds that are less than 4 inches (10 cm) in height or width.

### Weeds controlled:

- Annual smartweed (green, lady's-thumb)
- Canada thistle (less than 6 inches (15 cm) tall or across and prior to budding)\*
- Cleavers<sup>§</sup>
- Chickweed
- Cow cockle
- Flixweed\*\*
- Hemp-nettle
- Kochia (seedling to 8 leaf/10 cm\*\*\*)
- Lamb's-quarters
- Narrow-leaved hawk's-beard\*\*
- Night-flowering catchfly\*\*
- Redroot pigweed\*\*
- Round-leaved mallow (1 to 5 leaf)\*\*
- Russian thistle\*\*
- Shepherd's-purse (up to 20 cm)\*\*
- Sow-thistle (perennial)\*\*
- Stinkweed
- Stork's-bill<sup>§§\*\*\*</sup>
- Volunteer canola (not Group 2 tolerant varieties)
- Wild buckwheat (1 to 8 leaf)
- Wild mustard
- Volunteer flax (up to 12 cm)\*\*\*

\* **Suppression only.**

\*\* **Barricade II/Barricade III only.**

\*\*\* **Barricade II/Barricade III and Foxy RCK only.**

<sup>§</sup> **Cleavers from the 1 to 6 whorl stage with Barricade II, and Foxy R Extreme, 1 to 8 whorls with Foxy RCK and Barricade III.**

<sup>§§</sup> **Stork's-bill from the 1 to 6 leaf with Barricade II and Barricade III 1 to 8 leaf with Foxy RCK and Barricade III (suppression only).**

## Rate:

### For Barricade II:

- **Barricade SG:** 12 grams per acre
- **Perimeter II:** 85 mL per acre

### For Barricade III:

- **Barricade SG:** 12 grams per acre
- **FMC Fluroxypyr 333EC:** 125 mL per acre

-or-

### For Foxy R Extreme, Viking Brevik:

- **Rumour:** 12 grams per acre
- **Foxy 333:** 85 mL per acre

-or-

### For Foxy RCK:

- **Rumour:** 12 grams per acre
- **Foxy 333:** 125 mL per acre

Add Agral 90, Agsurf II, Citowett Plus, Enhance, HiActivate, Liberate or Super Spreader at 0.2 L per 100 L of spray solution.

Thifensulfuron and tribenuron may degrade if left in the sprayer for an extended period. Apply within 24 hours of mixing.

Maximum of ONE APPLICATION per year of this or other products containing thifensulfuron or fluroxypyr.

Refer to the product label for complete mixing instructions. A general guide to mixing can be found in the introduction.

## Application Information:

- **Water Volume:**
  - **Ground:** Minimum 20 L per acre.
  - **Aerial:** 10 to 20 L per acre.
- **Nozzles and Pressure:** Flat fan nozzles are recommended. Sprayers without drift reduction nozzles should use between 30 to 40 psi (210 to 275 kPa). Low drift nozzles may require higher pressures for proper performance. Use a combination of nozzles and pressure designed to deliver thorough, even coverage with **ASABE medium** droplets by ground or **ASABE coarse** droplets by air.
- **Screens:** Use a 50 mesh or coarser screen and filter system.

## How it Works:

Refer to How Do Herbicides Work in the Weed Control Section for an explanation of the concepts used in the table below.

| Active ingredient          | Timing        | Target                             | Movement                              | Spectrum       | WSSA Group |
|----------------------------|---------------|------------------------------------|---------------------------------------|----------------|------------|
| thifensulfuron, tribenuron | POST (foliar) | ALS Amino Acid synthesis Inhibitor | Toward growth areas (Symplast)        | Broadleaf only | 2          |
| fluroxypyr                 | POST (foliar) | Synthetic Auxin                    | Moves throughout the plant (Symplast) | Broadleaf only | 4          |

## Effects of Growing Conditions:

DO NOT apply to registered crops that are stressed by severe weather conditions (frost, drought or water saturated soil) as crop injury may result. Reduced activity will occur when temperatures are below 8°C or above 27°C. Frost 3 days before or after application may reduce weed control and crop tolerance. Under certain conditions (heavy rainfall, prolonged cool weather, frost conditions, and wide fluctuations in day/night temperatures), lightening in crop colour and reduction in crop height may occur.

## Tank Mixes:

### Herbicides:

Tank mix partners are applied at all their label rates and stages and include recommended adjuvants unless otherwise noted.

- **All crops:**
  - MCPA ester\* (190 mL per acre)
- **Spring wheat including Durum\*\*:**
  - Horizon NG
  - Simplicity OD
  - Simplicity OD + MCPA Ester
  - Traxos + MCPA ester\* (190 mL per acre)

\* **Rate for MCPA Ester 600.** Minimum and maximum staging for MCPA applies.

\*\* **Barricade II/Barricade III only.**

**Fertilizers:** None registered.

According to the Pest Management Regulatory Agency of Health Canada's Guidance Document on Tank Mix Labelling (March 2023), unlabelled tank mixes of this product are permitted only if the label of this product and the label of the product it might be mixed with include at least general wording on their respective labels indicating they may be mixed with other pesticides. When tank mixes are permitted, apply mixes according to the most restrictive use limitations for either product.

Adding ingredients in the correct order is critical for optimum performance. Check labels of products to be mixed for directions. General guidelines can be found in the introduction.

### Restrictions:

- **Rainfall:** Rainfall within 1 hour of application may reduce efficacy.
- **Restricted Entry Interval:** DO NOT re-enter treated fields for 12 hours.
- **Pre-harvest Interval:** Leave 60 days between application and harvest.
- **Grazing Restrictions:** MUST NOT be grazed or fed to livestock for 7 days after treatment.
- **Re-cropping Interval:** Alfalfa, barley, corn, canola, dry beans, faba bean, flax, forage grasses, lentil, mustard, oats, peas, potatoes, rye, soybeans, sugar beets, sunflowers, wheat or fields can be followed the year after treatment.
- **Aerial Application:** May be applied by aircraft.
- **Storage:** Store in a cool, dry place. Avoid freezing. If frozen, bring to room temperature and agitate before use. DO NOT store near heat or open flame.
- **Buffer Zones:** Observe buffer zones outlined in the label.

### Sprayer Cleaning:

Follow the sprayer cleaning instructions on the thifensulfuron/tribenuron page. The addition of a wetting agent (detergent) will also aid the cleaning process. Refer to the general section on sprayer cleaning in the introduction for additional information.

### Hazard Rating:

Danger – Poison

Warning – Contains the Allergens Milk and Sulfites

Refer to the Introduction for an explanation of the symbols.

# Thifensulfuron /tribenuron (2:1 ratio)

Herbicide Group  
2 - thifensulfuron,  
tribenuron

## Company:

FMC Corporation (*Refine SG*)  
NewAgco (*MPOWER RX*)  
Nufarm Agriculture (*Boost*)  
Albaugh (*Draft*)  
Viking (*Viking Navik*)

## Formulation:

**Refine SG (PCP#28285):** 33.35% thifensulfuron methyl plus 16.65% tribenuron methyl formulated as a water soluble granule.

- Container size - 486 g

**Boost (PCP#30377), Draft (PCP#31904), MPOWER RX (PCP#33520), Viking Navik (PCP#34791) = 75% WDG formulations:** 50% thifensulfuron methyl plus 25% tribenuron methyl formulated as a water dispersible granule.

- Container size - 320 g

## Crops and Staging:

Apply from 2 leaf to the flag leaf stage.

When tank mixing, always check the tank mix partner recommendations for additional staging restrictions

- **Cereals:**
  - Barley
  - Oat
  - Wheat (including durum spring and winter)
- **Sulfonylurea (SU) tolerant canola – 2 to 5 leaf and prior to bolting (*Draft* only).**
- **Seedling or established forage grasses for forage or seed production:\***
  - Bromegrass (meadow, smooth)
  - Fescue (creeping red, tall)
  - Kentucky bluegrass\*\*
  - Orchardgrass
  - Wheatgrass (crested, intermediate, northern, pubescent, slender, streambank, tall, western)

*\* NOTE: Since the use of this product on forage grasses is registered under the User Requested Minor Use registration system, the manufacturer assumes no responsibility for herbicide performance. Users of this product on forage grass do so at their own risk.*

*\*\* Established stands only.*

## Weeds and Staging:

Unless otherwise noted below, apply to young and actively growing weeds that are less than 4 inches (10 cm) in height or width.

- **Weeds controlled:**
  - Annual smartweed (green, lady's-thumb)
  - Ball mustard
  - Chickweed (1 to 6 leaf)
  - Common groundsel
  - Corn spurry
  - Cow cockle
  - Flixweed
  - Hemp-nettle
  - Lamb's-quarters
  - Narrow-leaved hawk's-beard
  - Redroot pigweed
  - Russian thistle
  - Shepherd's-purse
  - Stinkweed
  - Tartary buckwheat
  - Volunteer canola (CLEARFIELD varieties controlled with 2,4-D or MCPA mixes in cereals or grass crops only)
  - Volunteer sunflower
  - Wild buckwheat\*
  - Wild mustard
- **Weeds suppressed:**
  - Canada thistle (less than 6 inches or 15 cm tall or across)\*\*
  - Cleavers (1 to 3 whorls)
  - Round-leaved mallow (2 to 6 leaf)
  - Scentless chamomile
  - Sow-thistle (less than 6 inches or 15 cm tall or across)\*\*
  - Stork's-bill (2 to 6 leaves)
  - Toadflax (less than 6 inches or 15 cm tall)

*\* Refine SG: up to 5 leaf stage; 75% WDG formulations: up to 3 leaf stage only.*

*\*\* Prior to budding.*

## Rate:

**Refine SG:** 12 grams per acre.

**75% WDG formulations:** 8 grams per acre.

Add *Agral 90*, *AgSurf II\**, *Citowett Plus*, *HiActivate\**, *Liberate*, *Nufarm Enhance*, or *Super Spreader\** surfactants at 0.2 L per 100 L of spray solution.

*\* Refine SG only.*

Maximum of ONE APPLICATION per year of thifensulfuron/tribenuron or other products with the same active ingredients.

Thifensulfuron/tribenuron may degrade if left in the sprayer for an extended period. Apply within 24 hours of mixing. Refer to the product label for complete mixing instructions.

A general guide to mixing can be found in the introduction.

## Application Information:

- **Water Volume:**
  - **Ground:** Minimum 22 L per acre.
  - **Aerial (Refine SG only):** Minimum 10 L to maximum 20 L per acre.
- **Nozzles and Pressure:** Use 30 to 40 psi (210 to 275 kPa) when using conventional flat fan nozzles. Low drift nozzles may require higher pressures for proper performance. Use a combination of nozzles and pressure designed to deliver thorough, even coverage with **ASABE medium** droplets.
- **Screens:** Use a 50 mesh or coarser screen and filter system.

## How it Works:

Refer to How Do Herbicides Work in the Weed Control Section for an explanation of the concepts used in the table below.

| Active ingredient             | Timing        | Target                                | Movement                       | Spectrum       | WSSA Group |
|-------------------------------|---------------|---------------------------------------|--------------------------------|----------------|------------|
| thifensulfuron/<br>tribenuron | POST (foliar) | ALS Amino Acid<br>Synthesis Inhibitor | Toward growth areas (Symplast) | Broadleaf only | 2          |

## Effects of Growing Conditions:

DO NOT apply to wheat, barley or oats that are stressed by severe weather conditions (frost, drought or water saturated soil) as crop injury may result.

Under certain conditions (heavy rainfall, prolonged cool weather, frost conditions, wide fluctuations in day/night temperatures) lightening in crop colour and reduction in crop height may occur.

## Tank Mixes:

### Herbicides:

- Tank mix partners applied at all label rates. Recommended adjuvants are used unless otherwise noted.

| Tank Mix Partner                                                                        | Crops           |              |                 |                 |      |
|-----------------------------------------------------------------------------------------|-----------------|--------------|-----------------|-----------------|------|
|                                                                                         | Spring wheat    | Winter wheat | Durum           | Barley          | Oats |
| 2,4-D amine or ester (160 to 212 g ae per acre)*†                                       | ✓               | ✓            | ✓               | ✓               |      |
| <i>Curtail M</i> (0.61 L per acre) <sup>†</sup>                                         | ✓               |              |                 | ✓               |      |
| Fenoxaprop 120 EC (0.16 to 0.31 L per acre)                                             | ✓               |              | ✓               | ✓               |      |
| Fenoxaprop 120 EC (0.16 to 0.31 L per acre) plus MCPA ester (0.23* or 0.34 L per acre)* | ✓               |              | ✓               | ✓               |      |
| Fluroxypyr ( <i>Perimeter II</i> at 63 mL per acre only) <sup>†</sup>                   | ✓               |              | ✓               | ✓               |      |
| Fluroxypyr + 2,4-D ( <i>Flurox-24</i> only) <sup>†</sup>                                | ✓ <sup>ΔΔ</sup> |              | ✓ <sup>ΔΔ</sup> | ✓ <sup>ΔΔ</sup> |      |
| MCPA amine or ester (0.23* or 0.28 to 0.45 L per acre)*†                                | ✓               | ✓            | ✓               | ✓               | ✓    |
| <i>Simplicity 30 OD</i> (0.15 to 0.20 L per acre) <sup>†</sup>                          | ✓ <sup>Δ</sup>  |              | ✓ <sup>Δ</sup>  |                 |      |

† Marked tank mixes require the addition of a non-ionic surfactant. Unmarked mixes do not require additional adjuvant beyond what is provided for by the tank mix partner.

Δ *Refine SG* only.

ΔΔ *Boost* and *MPOWER R* only.

\* 500 g ai/L formulation.

♦ Tank mix with 0.23 L per acre to control CLEARFIELD canola at the 2 to 4 leaf stage.

- Check the above tank mix partner(s) respective labels for additional staging and varietal restrictions.

**Fertilizers:** None registered.

**Note: The above mixes are those listed on the Thifensulfuron/tribenuron (2:1) labels only.**

According to the Pest Management Regulatory Agency of Health Canada's Guidance Document on Tank Mix Labelling (March 2023), unlabelled tank mixes of this product are permitted only if the label of this product and the label of the product it might be mixed with include at least general wording on their respective labels indicating they may be mixed with other pesticides. When tank mixes are permitted, apply mixes according to the most restrictive use limitations for either product.

Adding ingredients in the correct order is critical for optimum performance. Check labels of products to be mixed for directions. General guidelines can be found in the introduction.

## Restrictions:

- **Rainfall:** Rainfall of 1 inch (25 mm) or more beginning within 1 hour of application of *Refine SG* or 4 hours for 75% WDG formulations may reduce control.
- **Restricted Entry Interval:** DO NOT enter treated fields for 12 hours following application.

- **Grazing Restrictions:** Must NOT be grazed or fed to livestock for 7 days after treatment.
- **Re-cropping Interval:** No restrictions the year after treatment. Canola, flax, lentil and alfalfa may be planted 2 months after application.
- **Aerial Application:** *Refine SG* may be applied by air. DO NOT apply 75% WDG formulations by air.
- **Storage:** Store in a cool, dry place. May be frozen.
- **Buffer Zones:** Observe buffer zones outlined in the label.

### Sprayer Cleaning:

Thifensulfuron/tribenuron can cause severe injury to sensitive crops at very low concentrations. Sprayers used to spray thifensulfuron/tribenuron should be drained and flushed out immediately after use.

Refer to 'Method A' in the general section on sprayer cleaning in the introduction. If mixing with another pesticide with different cleaning measures, those measures should be integrated into 'Method A' (e.g. addition of detergent).

### Hazard Rating:

75% WDG formulations:

Warning – Eye and Skin Irritant

*Refine SG:*

Warning – Contains the Allergen Milk

Refer to the Introduction for an explanation of the symbols.

## Thifensulfuron /tribenuron (2:1) + MCPA Ester

Herbicide Group  
2 - thifensulfuron  
& tribenuron  
4 - MCPA

*These products are prepackaged tank mix of Refine SG and MCPA Ester. Information listed is restricted to Crops, Weeds, Rates and Tank mixes. For other detailed information on the component products see the product pages listed above.*

### Company:

FMC Corporation (*Refine M*)

Loveland Products Canada (*BroadSide*)

### Formulation:

**Refine SG (PCP#28285):** 33.35% thifensulfuron methyl + 16.65% tribenuron methyl; formulated as a water soluble granule.

- Container size - 486 g

**Albaugh MCPA Ester 600 (PCP#32311), Broadside (PCP#27804):** 600g/L MCPA formulated as an emulsifiable concentrate.

- Container size - 1 x 7.6 L

### Crops and Staging:

**Barley, wheat (including durum and winter) and oats:** fully expanded 3<sup>rd</sup> leaf to the flag leaf stage.

When tank mixing, always check the tank mix partner recommendations for additional staging restrictions.

### Weeds and Staging:

Weeds controlled or suppressed by *Refine SG* plus 'Susceptible Weeds' controlled by MCPA Ester, plus:

- Dandelion (rosettes, less than 15 cm in diameter)
- Volunteer canola (2 to 4 leaf)

### Rates:

**Refine SG:** 12 grams per acre

**MCPA 600 Ester:** 0.19 L per acre

Refer to the product labels for complete mixing instructions.

A general guide to mixing can be found in the introduction.

### Tank Mixes:

**Herbicides:** None Registered.

According to the Pest Management Regulatory Agency of Health Canada's Guidance Document on Tank Mix Labelling (March 2023), unlabelled tank mixes of this product are permitted only if the label of this product and the label of the product it might be mixed with include at least general wording on their respective labels indicating they may be mixed with other pesticides. When tank mixes are permitted, apply mixes according to the most restrictive use limitations for either product.

**See component products for more information on restrictions, application details and handling. Unless indicated differently above use the most limiting restrictions across all components for the mix.**

# Thunderhawk

*This product is a prepackaged tank mix of Thunderhawk A (equivalent of Goldwing) and Thunderhawk B (equivalent of florasulam). Information listed is restricted to Crops, Weeds, Rates and Tank mixes. For other detailed restrictions and other general information on the component products see the product pages listed above.*

Herbicide Group  
2 - florasulam  
4 - MCPA Ester  
14 - pyraflufen-ethyl

## Company:

Nufarm Agriculture

## Formulation:

The *Thunderhawk* package contains the following components:

**Thunderhawk A (PCP#33687):** 13.5 g/L pyraflufen-ethyl and 420 g ae/L MCPA ester formulated as a emulsifiable concentrate.

- Container size - 10.7 L

-plus-

**Thunderhawk B (PCP#33717):** 50 g/L florasulam formulated as a suspension concentrate.

- Container size - 3.2 L

## Crops and Staging:

**Spring wheat (NOT including durum), barley, oats:** Apply to emerged weeds prior to seeding or just after seeding, but prior to crop emergence. Applications can be made up to a maximum of 2 days after seeding.

## Weeds and Staging:

Weeds controlled or suppressed by the component products.

## Rates:

**Thunderhawk A:** 134 mL per acre

**Thunderhawk B:** 40 mL per acre

*Note: If Thunderhawk is applied alone without glyphosate, add a non-ionic surfactant at 0.25 percent L per 100 L of spray solution.*

Refer to the product labels for complete mixing instructions. A general guide to mixing can be found in the introduction.

## Tank Mixes:

**Herbicides:** Glyphosate

**Fungicides:** None registered.

**Insecticides:** None registered.

**Fertilizers:** None registered.

*See component products for more information on restrictions, application details and handling. Unless indicated differently above use the most limiting restrictions across all components for the mix.*

# Topline

*This product is a prepackaged tank mix of Florasulam and MCPA.*

*Information listed is restricted to Crops, Weeds, Rates and Tank mixes. For other detailed restrictions and other general information on the component products see the product pages listed above.*

**Herbicide Group**  
**2 - florasulam**  
**4 - MCPA**

## Company:

ADAMA Canada (Topline)

## Formulation:

The *Topline* package contains the following components:

**Florasulam SC (PCP#30814):** 50 g/L florasulam formulated as a suspension concentrate.

**Checkmate MCPA Ester 600 (PCP#27804):** 600 g/L MCPA ester formulated as an emulsifiable concentrate.

- Container sizes -
  - **Florasulam SC:** 1.6 L
  - **Checkmate MCPA Ester:** 9.33 L

## Crops and Staging:

**Spring wheat (including durum), barley and oats:** 2 to 6 leaf stage.

When tank-mixing, always check the tank mix partner recommendations for additional staging restrictions.

## Weeds and Staging:

**Broadleaf weeds controlled at the 2 to 4 leaf stage:**

- |                |                     |                        |
|----------------|---------------------|------------------------|
| ◦ Ball mustard | ◦ Lamb's-quarters   | ◦ Smartweed            |
| ◦ Burdock**    | ◦ Prickly lettuce** | ◦ Stinkweed            |
| ◦ Chickweed    | ◦ Ragweed (common)  | ◦ Sunflower (annual)** |
| ◦ Cleavers     | ◦ Redroot pigweed†  | ◦ Volunteer canola*    |
| ◦ Flixweed**   | ◦ Russian pigweed** | ◦ Wild mustard         |
| ◦ Hemp-nettle† | ◦ Shepherd's-purse  | ◦ Wild buckwheat       |

**Broadleaf weeds suppressed:**

- |                              |                        |                            |
|------------------------------|------------------------|----------------------------|
| ◦ Canada thistle             | ◦ Plantain†            | ◦ Sow-thistle (perennial)† |
| ◦ Dandelion***†              | ◦ Stork's-bill         |                            |
| ◦ Narrow-leaved hawk's-beard | ◦ Sow-thistle (annual) |                            |

\* Including all herbicide-tolerant canola varieties.

\*\* Up to the 4 leaf stage of development.

\*\*\* Seedlings and overwintered rosettes less than 15 cm (6 inches).

† For improved control of this weed add an additional 47.5 mL per acre of MCPA LV 600.

† Top growth control.

## Rate:

**Florasulam SC:** 40 mL per acre

-plus-

**MCPA 600 ester:** 0.23 L per acre

Refer to the product label for complete mixing instructions for this product and its mixes. A general guide to mixing can be found in the introduction.

## Tank Mixes:

None registered.

According to the Pest Management Regulatory Agency of Health Canada's Guidance Document on Tank Mix Labelling (March 2023), unlabelled tank mixes of this product are permitted only if the label of this product and the label of the product it might be mixed with include general wording on their respective labels indicating they may be mixed with other pesticides. please see each manufacturer's list of supported unlabelled tank mixes for a complete list.

Adding ingredients in the correct order is critical for optimum performance. Check labels of products to be mixed for directions. General guidelines can be found in the introduction.

**See component products for more information on restrictions, application details and handling. Unless indicated differently above use the most limiting restrictions across all components for the mix.**

# Topramezone

Herbicide Group  
27 - topramezone

## Company:

AMVAC (*Impact* – PCP#28141)

BASF Canada (*Armezon* – PCP#30131)

Sharda CropChem Canada (*Topple* - PCP#35126)

## Formulation:

336 g/L topramezone formulated as a suspension.

- Container sizes:
  - *Armezon* - 0.6 L
  - *Impact* - 0.6 L

## Crops and Staging:

**Corn (field<sup>†</sup>, seed, sweet<sup>††</sup>):** From the 1 to 7 leaf stage

**Flax\* (*Armezon* only):** 2 to 4 inches (5 to 10 cm)

\* *NOTE: Since these uses are registered under the User Requested Minor Use Label Expansion (URMULE) program, the manufacturer assumes no responsibility for herbicide performance. Those who apply these uses do so at their own risk.*

<sup>†</sup> Including both conventional and herbicide tolerant varieties.

<sup>††</sup> *NOTE: Tolerance of sweet corn varieties to topramezone and its mix partners may be variable. When tolerance is unknown, check with the supplier of seed and/or apply to a small area first to assess tolerance.*

## Weeds and Staging:

The following weeds are controlled with topramezone unless otherwise indicated:

*Topramezone use in corn MUST BE applied in tank mix with one of the herbicide options indicated in "Tank Mixes:"*

- **Grass weeds below from the 1 to 4 leaf stage:**
  - Barnyard grass\*
  - Foxtail (green, yellow)\*
- **Broadleaf weeds below from the 1 to 8 leaf stage:**
  - Chickweed (common)\*
  - Nightshade (eastern black)
  - Kochia (up to 10 cm)\*\*
  - Pigweed (redroot, green)
  - Lamb's-quarters\*
  - Ragweed (common)
  - Lady's-thumb\*
  - Velvetleaf\*
  - Volunteer canola (up to 8 leaf) including glyphosate-tolerant varieties\*\*
  - Wild mustard

\* **Suppression only.**

\*\* ***Armezon* only. All types including glyphosate-resistant varieties.**

## Rates:

15 mL per acre

Must be applied with (when not mixed with glyphosate) either:

- *Merge* adjuvant (0.5 L per 100 L of spray solution)
- or-
- *Hasten NT* spray adjuvant (0.25 L per 100 L of spray solution)
- or-
- *MSO Concentrate with Leci-Tech* (1 L per 100 L of spray solution) plus liquid 28-0-0 (UAN) (1.25 L per 100 L of spray solution)
- or-
- *Destination MSO* (0.25 L per 100 L of spray solution plus UAN (1.25 L per 100 L of spray solution)
- or-
- *Assist* (or *XA Oil concentrate*) (1.25 L per 100 L of spray solution) plus UAN (1.25 L per 100 L of spray solution)

For control of secondary flushes of volunteer canola, a sequential application of *Armezon* at 15 mL per acre may be applied before the corn exceeds the 7 leaf stage. The sequential application of *Armezon* may be applied with glyphosate at 360 g ae per acre or with *Merge* at 0.5 L per 100 L of spray solution.

**Note:** MAXIMUM of 10.2 g ai per acre of topramezone per season.

## Application Information:

- **Water Volume:** Minimum 81 L per acre.
- **Nozzles and Pressure:** Use 20 to 40 psi (140 to 276 kPa) if applying without drift reduction nozzles. Drift reduction nozzles may require higher pressures for proper performance. Select the nozzle and pressure combination that produces of *ASABE medium* droplets while maintaining good coverage of foliage.

## How it Works:

Refer to How Do Herbicides Work in the Weed Control Section for an explanation of the concepts used in the table below.

| Active ingredient | Timing        | Target                 | Movement                               | Spectrum          | WSSA Group |
|-------------------|---------------|------------------------|----------------------------------------|-------------------|------------|
| topramezone       | POST (foliar) | HPPD Pigment Inhibitor | Little (Apoplast) some uptake by roots | Broadleaf & grass | 27         |

## Effects of Growing Conditions:

When weeds are stressed because of drought, flooding, hot or cool temperatures, weeds are not actively growing, control may be reduced.

## Tank Mixes:

### Herbicides:

Topramezone must be mixed with one of the following:

- **Field and sweet corn:**
  - AAtrex (0.42 L per acre) (DO NOT use *Merge* with this mix in sweet corn)
- **Field corn only:**
  - *Frontier Max* (0.3 L per acre) + AAtrex (rates above)
- **Glyphosate tolerant corn only:**
  - Glyphosate (360 g ae per acre, no adjuvant required) (see glyphosate page for details)
  - Glyphosate + AAtrex (rates above)
  - Glyphosate + AAtrex (rates above) + *Frontier Max* (rates above)

**Fungicides:** None registered.

**Fertilizers:** None registered.

**Insecticides:** None registered.

**Note:** The above mixes are those listed on the topramezone label only.

Adding ingredients in the correct order is critical for optimum performance. Check labels of both products to be mixed for directions.

General guidelines can be found in the introduction.

## Restrictions:

- **Rainfall:** DO NOT apply if heavy rain is forecast. Contact manufacturer for more information.
- **Restricted Entry Interval:** DO NOT enter treated fields for at least 12 hours.
- **Grazing Restrictions:** DO NOT graze treated fields or cut for feed within 45 days of application.
- **Pre-harvest Interval:** Leave 45 days between application and harvest.
- **Re-cropping Interval:**
  - **After two applications of Armezon (30 mL per acre total):** Field corn only may be seeded to treated areas after a crop failure. Winter wheat may be seeded four months following application. Spring wheat, canola (all types), and field corn may be seeded the following year.
  - **After one application of Armezon or Impact or Topple (15 mL per acre total):** Field corn only may be seeded to treated areas after a crop failure. Winter wheat may be seeded a minimum four months after application. Spring wheat, (all types), field corn, navy (white) bean, soybean, lentils, pea, canola, potato, flax (*Impact*, *Topple* only), sunflower (*Impact*, *Topple* only) and alfalfa may be seeded the following crop year. Check tank mix options for additional reseeding restrictions. Conduct a field bioassay (a test strip grown to maturity) the year before growing any other crop.
- **Aerial Application:** DO NOT apply by air.
- **Storage:** Store in a cool (above 5°C), dry area. If product is frozen, bring to room temperature and agitate before use.
- **Buffer Zones:**
  - Observe buffer zones outlined in the label.
  - Spray when winds are under 16 km per hour, but not dead calm.

## Sprayer Cleaning:

Refer to 'Method A' in the general section on sprayer cleaning in the introduction.

## Hazard Rating:

Warning – Contains the Allergen Soy

Refer to the Introduction for an explanation of the symbols.

# Tordon 22K

Herbicide Group  
4 - picloram

## Company:

Corteva Agriscience (PCP#9005)

## Formulation:

240 g/L picloram acid present as a potassium salt, formulated as a solution.

- Container size - 10 L

*Note: Available only through selected retail outlets.*

## Crops and Staging:

Apply at any stage of permanent grass pastures, rangeland and non-cropland.

*NOTE: It is strongly recommended that this product be applied by a licensed applicator.*

## Weeds, Rates and Staging:

For the control of biennial and deep-rooted perennial weeds listed below:

| Weed                                                                                                                                                               | Rate L per acre  | Backpack<br>(mL of Tordon 22K per 100 M <sup>2</sup> )* |
|--------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------|---------------------------------------------------------|
| Scentless chamomile                                                                                                                                                | 0.445            | 11                                                      |
| Knapweed (diffuse, spotted)                                                                                                                                        | 0.91             | 22                                                      |
| Canada thistle, pasture sage, poverty weed, Russian knapweed, perennial sow-thistle or<br><i>Low plant densities of:</i><br>Leafy spurge, field bindweed, toadflax | 1.8              | 45                                                      |
| Leafy spurge, field bindweed, toadflax                                                                                                                             | 3.6 <sup>†</sup> | 90 <sup>†</sup>                                         |

<sup>†</sup> **NOTE: This rate is only registered for spot application treating a maximum of one acre out of every two acre area at this rate.**

**\* Mix with 18 litres of water and the spray solution over 100 square metres.**

For best results, applications should be made when perennial weeds have fully developed, green leaves. Application in late summer (or periods of dry weather) when plants are not actively growing may result in unsatisfactory control.

## Application Information:

- **Water Volume:** 160 to 325 L per acre without spray running off foliage.
- **Nozzles and Pressure:** Maximum 150 to 350 kPa (20 to 50 psi) when using conventional flat fan nozzles. Low drift nozzles may require higher pressures for proper performance. Use a combination of application equipment and pressure that is designed to deliver an even coverage of coarse droplets that are not prone to drift. Non-target broadleaf plants are very sensitive to Tordon 22K drift.
- Avoid conditions that are conducive to drift. (See introduction for drift control suggestions).

## How it Works:

Refer to How Do Herbicides Work in the Weed Control Section for an explanation of the concepts used in the table below.

| Active ingredient | Timing                               | Target          | Movement                        | Spectrum       | WSSA Group |
|-------------------|--------------------------------------|-----------------|---------------------------------|----------------|------------|
| picloram          | POST (foliar) also has soil activity | Synthetic Auxin | Throughout the plant (Symplast) | Broadleaf only | 4          |

**IMPORTANT: Tordon 22K is a very persistent and water-soluble herbicide. Treated soil should NOT be moved from the treated area. DO NOT apply to soils that are permeable, have sinkholes, or lie over limestone bedrock. DO NOT apply to soils whose surfaces are composed of fractured rock or unconsolidated gravel. Application to these sites may allow the movement of herbicide to underlying water sources or aquifers. If shallow aquifers are present, DO NOT apply Tordon 22K. This product is moderately toxic to fish. DO NOT apply to any water bodies or in areas where the runoff from treated areas will reach fish-bearing waters.**

Tordon 22K must not be applied on range and pasture acres that are irrigated. DO NOT compost or mulch clippings from grass treated with Tordon 22K.

## Effects of Growing Conditions:

Avoid application when pasture and target weeds are under stress from drought, flooding, extreme heat or cold, as injury to grass or unacceptable control may result. Avoid spraying if temperatures exceed 28°C.

**Tank Mixes:**

None registered.

**Restrictions:**

- **Rainfall:** Rain within 6 hours of application may cause poor results. Heavy rainfall may dissolve and carry *Tordon 22K* away from the target area, or it may leach dissolved *Tordon 22K* out of the root zone or to undesirable locations.
- **Grazing Restrictions:** DO NOT graze lactating dairy animals within 6 weeks after treatment. There are no grazing restrictions for other livestock. DO NOT use manure from animals grazing treated forage to fertilize susceptible plants or crops.
- **Re-cropping Interval:** *Tordon 22K* may persist in the soil for up to 5 years. For this reason *Tordon 22K* may only be applied on permanent grass pastures and rangeland unless applied by an authorized pesticide applicator. Avoid the root zone of desirable trees or shrubs.
- **Aerial Application:** DO NOT apply by air.
- **Storage:** DO NOT freeze.
- **Buffer Zones:**
  - Hand-held or backpack sprayer and spot treatment DO NOT require a buffer zone from sensitive habitat.
  - Observe buffer zones outlined in the label.

**Sprayer Cleaning:**

*Tordon 22K* can cause severe injury to sensitive crops (especially pulses and other broadleaf crops) at very low concentrations. Spray equipment should be flushed out immediately after spraying *Tordon 22K*. Refer to 'Method A' in the general section on sprayer cleaning in the introduction.

**Hazard Rating:**

Caution – Poison

Danger – Eye Irritant

May Cause Skin Irritation

Refer to the Introduction for an explanation of the symbols.

# Tough EC

Herbicide Group  
6 - pyridate

**Company:**

Belchim Crop Protection Canada

**Formulation:**

**Tough EC (PCP#34647):** 600g/L pyridate formulated as an emulsifiable concentrate.

- Container size - 2 x 9.18 L

**Crops and Staging:**

**Pre-seed or pre-emergent burndown:** canola, chickpea, corn (field and sweet), and field peas.

**Post-emergent:**

| Crop                  | Staging                                                |
|-----------------------|--------------------------------------------------------|
| Corn, field and sweet | up to the 8-leaf stage                                 |
| Chickpea              | up to 9-node stage (maximum height of 20 cm or 8 inch) |

Repeat applications may be made 10 to 14 days from the first as long as the maximum yearly rate (below) is not exceeded.

**Weeds, Rates and Staging:**

**Note:** Maximum of 607 mL per acre per year.

Unless otherwise noted below, apply to young and actively growing weeds that are less than 4 to 6 inches (10 to 15 cm) in height or width.

| Weed             | Rate mL per acre |
|------------------|------------------|
| False cleavers   | 202              |
| Black nightshade | 304              |

| Weed                 | Rate mL per acre |
|----------------------|------------------|
| Redroot pigweed      | 202 to 405       |
| Lamb's-quarters      | 304 to 405       |
| Kochia, Wild mustard | 405 to 607       |
| Waterhemp*           | 607              |

\* **Suppression only.**

Refer to the product label for complete mixing instructions. A general guide to mixing can be found in the introduction.

### Application Information:

- **Water Volume:** Minimum 40 L per acre.
- **Nozzles and Pressure:** Use a combination of nozzles and pressure designed to deliver thorough, even coverage with *ASABE medium* droplets.

### How it Works:

Refer to How Do Herbicides Work in the Weed Control Section for an explanation of the concepts used in the table below.

| Active ingredient | Timing        | Target                  | Movement | Spectrum       | WSSA Group |
|-------------------|---------------|-------------------------|----------|----------------|------------|
| Pyridate          | POST (foliar) | PSII Inhibitor, Site II | Little   | Broadleaf only | 6          |

### Effects of Growing Conditions:

Weeds hardened off by cold weather or drought stress may not be adequately controlled or suppressed and re-growth may occur.

### Tank Mixes:

Tank mix partners applied at all label rates and include recommended adjuvants unless otherwise noted.

#### Herbicides:

- **In corn (field only):**
  - **Post-Emergent up to the 8-leaf stage:**
    - *Shieldex 400SC*
    - Topramezone
    - Dicamba
    - *Aatrex 480*

**Fungicides:** None registered.

**Fertilizers:** None registered.

**Insecticides:** None registered.

**Note: The above mixes are those listed on the *Tough EC* label only.**

According to the Pest Management Regulatory Agency of Health Canada's Guidance Document on Tank Mix Labelling (March 2023), unlabelled tank mixes of this product are permitted only if the label of this product and the label of the product it might be mixed with include at least general wording on their respective labels indicating they may be mixed with other pesticides. When tank mixes are permitted, apply mixes according to the most restrictive use limitations for either product.

Adding ingredients in the correct order is critical for optimum performance. Check labels of both products to be mixed for directions. General guidelines can be found in the introduction.

### Restrictions:

- **Rainfall:** Avoid application when heavy rain is forecast.
- **Restricted Entry Interval:**
  - **Corn (field and sweet) and chickpeas:** Hand set/hand line irrigation (7 days); scouting (3 days); all other activities (12 hours).
  - **Field peas and canola:** All other activities (12 hours).
- **Grazing Restrictions:** DO NOT allow animals to graze treated corn forage within 45 days of the last application. DO NOT cut treated corn stover for feed or silage within 100 days of the last application. DO NOT graze or harvest chickpeas for feed that have been treated with a foliar application of *Tough EC* as data is not available to support this use.
- **Pre-harvest Interval:** Field corn (100 days); sweet corn (45 days); chickpeas (60 days); dry peas, lentils and canola (at maturity).
- **Re-cropping Interval:** Not specified.
- **Aerial Application:** DO NOT apply by air.
- **Storage:** DO NOT freeze. Store in a cool, dry, secure and well-ventilated area.
- **Buffer Zones:** Handheld or backpack applications do not require a buffer. Observe buffer zones outlined in the label.

### Sprayer Cleaning:

Refer to 'Method B' in the general section on sprayer cleaning in the introduction. Let solution stand for an extended period for better results. See the label for product specific cleaning details.

**Hazard Rating:**

Warning – Skin and Eye Irritant

Potential Skin Sensitizer

Refer to the Introduction for an explanation of the symbols.

# Tralkoxydim

Herbicide Group  
1 - tralkoxydim**Company:**Corteva Agriscience (*Liquid Achieve* – PCP#28555 & *Carrier* adjuvant – PCP#30639)ADAMA Canada (*Bison* – PCP#29256 & *Addit* adjuvant – PCP#29263)Loveland Products Canada (*Marengo* – PCP#29289 & *Marengo* adjuvant – PCP#31670)Nufarm Agriculture (*Nufarm Tralkoxydim Liquid* – PCP#32078 & *Carrier* adjuvant – PCP#30639)**Formulation:**

400 g/L tralkoxydim formulated as a suspension concentrate.

- Container sizes:
  - *Marengo* - 8 L of tralkoxydim plus 5 L *Marengo*
  - *Bison* - 8 L of tralkoxydim plus 8 L *Addit* adjuvant
  - *Liquid Achieve* - 2 x 8 L or 96 L of tralkoxydim (adjuvant sold separately)
  - *Nufarm Tralkoxydim Liquid* - 2 x 8 L of tralkoxydim (*Carrier* adjuvant sold separately)

**Crops and Staging:**

No staging restrictions unless otherwise indicated.

**Cereals:**

- Barley
- Rye (spring, fall)
- Triticale
- Wheat (spring, durum, winter)

**Forage legumes:** May be used on wheat and barley crops undersown to the following (if not tank mixed with a broadleaf herbicide).

- Alfalfa
- Bird's-foot trefoil
- Clovers
- Sanfoin

**Forage Grasses (seed production only)\*:**

- **Under-seeded with a cereal or grown alone (seedling or established)\*:**
    - Bromegrass (meadow, smooth, hybrid\*\*)
    - Creeping red fescue
    - Wheatgrass (crested, intermediate, slender\*\*)
  - **Grown alone (seedling only)\*:**
    - Wheatgrass (northern, slender, western)
- \* *Liquid Achieve*, *Nufarm Tralkoxydim Liquid* and *Bison* only.  
 \*\* *Liquid Achieve* only.

**NOTE:** Since applications to these crops have been registered under the User Requested Minor Use program, the manufacturer assumes no responsibility for herbicide performance. An application to these crops is at the risk of the user.

When tank mixing, always check the tank mix partner recommendations for additional staging restrictions.

**Weeds and Staging:****Wild oats:** 1 to 6 leaf stage (total leaves including tillers), with a maximum of 2 tillers.**Volunteer tame oats:** 1 to 6 leaf stage.**Green and yellow foxtail:** 1 to 5 leaf stage (total leaves including tillers), with a maximum of 1 tiller.**Barnyard grass, Persian darnel:** 1 to 4 leaf stage (total leaves including tillers).

For forage grasses and perennial cereal rye, apply prior to tillering of the above weeds.

Apply at the 2 to 3 leaf stage for optimum control. Optimum weed control and yield response occurs when weeds are removed before tillering.

## Rates:

0.2 L per acre.

Add *Turbocharge*, *Carrier*, or *Addit* adjuvant at a rate of 0.5 L per 100 L of spray solution.

Maximum ONE APPLICATION of these products or other products containing tralkoxydim per season.

*Note: If water analysis shows bicarbonate levels are 400 ppm or greater, add 0.9 to 1.8 kg of active ammonium sulphate per 100 L of spray water prior to mixing to eliminate antagonism.*

Refer to the product label for complete mixing instructions. A general guide to mixing can be found in the introduction.

## Application Information:

- **Water Volume:**
  - **Ground:** 20 to 40 L per acre. Application in less than 20 L per acre water volume may result in mixing problems or unacceptable crop injury.
  - **Aerial:** 12 to 18 L per acre.
- **Nozzles and Pressure:** Use a combination of nozzles and pressure designed to deliver thorough, even coverage with *ASABE medium* droplets. See the label for detailed instructions on aerial application.

## How it Works:

Refer to How Do Herbicides Work in the Weed Control Section for an explanation of the concepts used in the table below.

| Active ingredient | Timing        | Target                            | Movement                          | Spectrum   | WSSA Group |
|-------------------|---------------|-----------------------------------|-----------------------------------|------------|------------|
| tralkoxydim       | POST (foliar) | ACCCase Lipid Synthesis Inhibitor | Toward areas of growth (Symplast) | Grass only | 1          |

## Effects of Growing Conditions:

Cereal crops that have set tillers may incur injury (yellowing and/or stunting) if applications are made within 48 hours of freezing temperatures. Cereal crops that have not set tillers may be injured if exposed to temperatures of 4°C or less up to 48 hours before or after application. Tank mixing with a broadleaf weed herbicide under adverse conditions may increase severity of crop injury. Crops under stress from foliar diseases or low fertility are more susceptible to injury from application. Temporary crop injury may occur when tralkoxydim tank mixes (particularly dichlorprop/2,4-D ester products, and bromoxynil/MCPA Ester products + additional MCPA Ester) are applied under extreme environmental conditions (dry or wet, cool or hot weather) resulting in crop stress. Control of grasses could be reduced when they are stressed due to drought, heat, lack of fertility, flooding or prolonged cool temperatures.

## Tank Mixes:

Tank mix partners applied at all label rates and include recommended adjuvants unless otherwise noted.

DO NOT tank mix tralkoxydim products with a broadleaf herbicide when applying to underseeded forage grasses or legumes.

| Tank Mix Partner                                                                | Crops        |       |                 |        |            |          |           |
|---------------------------------------------------------------------------------|--------------|-------|-----------------|--------|------------|----------|-----------|
|                                                                                 | Spring wheat | Durum | Winter wheat    | Barley | Spring rye | Fall rye | Triticale |
| 2,4-D ester (205 g ae per acre) <sup>†</sup>                                    | •            | •     | •               | •      | •          | •        |           |
| Bromoxynil <sup>†</sup>                                                         | •            | •     | •               | •      |            | •        | •         |
| Bromoxynil + 2,4-D (0.40 L per acre) <sup>†*</sup>                              | •            | •     |                 | •      |            |          |           |
| Bromoxynil/MCPA Ester <sup>†*</sup>                                             | •            | •     | •               | •      |            | •        |           |
| <i>Curtail M</i> (0.81 L per acre)                                              | •            | •     |                 | •      |            |          |           |
| Dichlorprop/2,4-D*                                                              | •            | •     | •               | •      |            |          |           |
| <i>OcTTain XL</i> <sup>††</sup>                                                 | •            | •     | •               | •      |            |          |           |
| Fluroxypyr + MCPA ( <i>Trophy</i> only)                                         | •            | •     |                 | •      |            |          |           |
| <i>Infinity</i> <sup>††</sup>                                                   | •            | •     | •               | •      |            |          |           |
| <i>Lontrel</i> (0.11 L per acre) + MCPA ester (0.38 L per acre - 600 g/L forms) | •            | •     |                 | •      |            |          |           |
| MCPA ester <sup>†</sup> (0.38 L per acre - 600 g/L forms)                       | •            | •     | •               | •      | •          | •        |           |
| <i>Prestige XC</i> <sup>††</sup>                                                | •            | •     | • <sup>††</sup> | •      |            |          |           |

<sup>†</sup> Manufacturers may support different brands of generic products with their product. Check the tralkoxydim product label for specific brands registered.

<sup>††</sup> *Liquid Achieve* and *Nufarm Tralkoxydim* only.

<sup>†††</sup> *Liquid Achieve*, *Nufarm Tralkoxydim* and *Marengo* only.

\* Tank mixes may result in some temporary initial injury under adverse environmental conditions.

\*\* Temporary crop injury can occur if applied prior to the 4 leaf stage. A reduction in wild oats control may occur with this mix.

DO NOT tank mix tralkoxydim products with herbicides or formulations of herbicides not listed above as loss of grass control may result. When applying broadleaf herbicides not listed above, in the same field, always apply tralkoxydim first. Apply the broadleaf product no sooner than seven days after application of tralkoxydim.

**Insecticides:**

- *Matador* (49 mL per acre)
- *Matador* tank mixes with *Bison* may also be combined with bromoxynil or bromoxynil/MCPA ester products.

**Fungicides:** None registered.

**Fertilizers:** None registered.

**Note:** The above mixes are those listed on the tralkoxydim labels only.

According to the Pest Management Regulatory Agency of Health Canada's Guidance Document on Tank Mix Labelling (March 2023), unlabelled tank mixes of this product are permitted only if the label of this product and the label of the product it might be mixed with include at least general wording on their respective labels indicating they may be mixed with other pesticides. When tank mixes are permitted, apply mixes according to the most restrictive use limitations for either product.

Adding ingredients in the correct order is critical for optimum performance. Check labels of products to be mixed for directions. General guidelines can be found in the introduction.

**Restrictions:**

- **Rainfall:** Within 1 hour will reduce control.
- **Restricted Entry Interval:** DO NOT enter treated field for 12 hours.
- **Grazing Restrictions:** Straw from treated grain crops may be fed to livestock. Immature cereal crops may be grazed or cut for hay 16 days after treatment. DO NOT feed or graze forage crops in year of treatment
- **Pre-harvest Interval:** Leave 60 days from application to harvest.
- **Re-cropping Interval:** DO NOT replant treated areas to tame oats or corn for at least 4 weeks after application.
- **Aerial Application:** May be applied by air to cereal crops only. DO NOT apply within 50 m of fish bearing waters and wildlife habitat.
- **Storage:** Store in a dry place. DO NOT freeze.
- **Buffer Zones:** Observe buffer zones outlined in the label.

**Sprayer Cleaning:**

Refer to 'Method A' in the general section on sprayer cleaning in the introduction.

**Hazard Rating:**

Caution – Skin and Eye Irritant

Refer to the Introduction for an explanation of the symbols.

# Travallas

Herbicide Group  
2 - metsulfuron, thifensulfuron  
4 - fluroxypyr

## Company:

FMC Corporation (PCP#31685)

## Formulation:

3 g/L metsulfuron methyl; 30 g/L thifensulfuron methyl; and 150 g/L fluroxypyr formulated as suspension concentrate liquid.

- Container size - 2 x 8 L

## Crops, Rates and Staging:

**Wheat (spring, durum) and barley:** 2 leaf to flag leaf stage (prior to head emergence).

**Winter wheat:** In the spring up to the flag leaf stage (prior to head emergence).

## Weeds and Staging:

- 0.2 L per acre to control or suppress weeds up to 10 cm tall or wide unless otherwise indicated:
  - Canada thistle (maximum 15 cm and prior to bud)\*
  - Cleavers (1 to 9 whorl)
  - Common chickweed (1 to 6 leaf)
  - Corn spurry
  - Cow cockle
  - Dandelion (fall or spring germinating rosettes up to 25 cm)
  - Flixweed
  - Hemp-nettle (1 to 8 leaf)
  - Kochia (except fluroxypyr resistant biotypes)
  - Lamb's-quarters
  - Narrow-leaved hawk's-beard
  - Night-flowering catchfly
  - Redroot pigweed
  - Russian thistle
  - Scentless chamomile (up to 10 cm)
  - Shepherd's-purse (up to 20 cm)
  - Smartweed (lady's-thumb, green)
  - Stinkweed
  - Stork's-bill
  - Volunteer canola (except CLEARFIELD varieties)
  - Volunteer flax
  - Wild buckwheat (1 to 8 leaf)
  - Wild mustard
  - White cockle

\* **Suppression only.**

Maximum ONE APPLICATION per year of *Travallas* or other products containing metsulfuron, thifensulfuron or fluroxypyr.

## Application Information:

- Water Volume:**
  - Ground:** Minimum 22 L per acre.
  - Aerial:** Apply between 10 and 20 L per acre of water
- Nozzles and Pressure:** Use 30 to 40 psi (210 to 275 kPa) if applying without drift reduction nozzles. Drift reduction nozzles may require higher pressures for proper performance. Select the nozzle and pressure combination that produces of **ASABE coarse** droplets while maintaining good coverage of foliage. Keep booms lower than 60 cm from crop canopy.
- Screens:** Use of 50 mesh screens or coarser are required.

## How it Works:

Refer to How Do Herbicides Work in the Weed Control Section for an explanation of the concepts used in the table below.

| Active ingredient           | Timing        | Target                             | Movement                              | Spectrum       | WSSA Group |
|-----------------------------|---------------|------------------------------------|---------------------------------------|----------------|------------|
| metsulfuron, thifensulfuron | POST (foliar) | ALS Amino Acid synthesis Inhibitor | Toward growth areas (Symplast)        | Broadleaf only | 2          |
| fluroxypyr                  | POST (foliar) | Synthetic Auxin                    | Moves throughout the plant (Symplast) | Broadleaf only | 4          |

## Effects of Growing Conditions:

Application to crops stressed by extreme weather conditions such as frost, hail, saturated soils or drought as well as low fertility, insect damage or disease pressure may result in crop injury and/or reduce weed control. The conditions above as well as wide fluctuations in day/night temperatures or prolonged cool weather may shorten the crop slightly.

Crop and weeds that are growing rapidly produce optimum activity. The optimum temperature range for the best activity is between 12 to 24°C. Activity will be reduced below 8°C and above 27°C.

## Tank Mixes:

Tank mix partners applied at all label rates and include recommended adjuvants unless otherwise noted.

### Herbicides:

| Tank Mix Partner                                   | Crop         |       |              |        |
|----------------------------------------------------|--------------|-------|--------------|--------|
|                                                    | Spring Wheat | Durum | Winter Wheat | Barley |
| <i>Axial 100 EC</i>                                | •            |       | •            | •      |
| <i>Axial</i> + MCPA (rates as below)               | •            |       | •            | •      |
| MCPA ester (up to 113 g ae per acre)               | •            | •     | •            | •      |
| <i>Puma Advance</i>                                | •            | •     |              | •      |
| <i>Puma Advance</i> + MCPA ester (rates as above)  | •            | •     |              | •      |
| <i>Simplicity OD</i>                               | •            | •     | •            |        |
| <i>Simplicity OD</i> + MCPA ester (rates as above) | •            | •     | •            |        |
| <i>Traxos</i>                                      | •            | •     |              |        |
| <i>Traxos</i> plus MCPA ester (rates as above)     | •            | •     |              |        |
| <i>Varro</i>                                       | •            | •     | •            |        |
| <i>Varro</i> plus MCPA ester (rates as above)      | •            | •     | •            |        |

**Insecticides:** None registered.

### Fungicides:

- *In barley and spring wheat (including durum) only:*
  - *Acapela*

**Fertilizers:** None registered.

**Note:** The above mixes are those listed on the *Travallas* label only.

According to the Pest Management Regulatory Agency of Health Canada's Guidance Document on Tank Mix Labelling (March 2023), unlabelled tank mixes of this product are permitted only if the label of this product and the label of the product it might be mixed with include at least general wording on their respective labels indicating they may be mixed with other pesticides. When tank mixes are permitted, apply mixes according to the most restrictive use limitations for either product.

Adding ingredients in the correct order is critical for optimum performance. Check labels of both products to be mixed for directions. General guidelines can be found in the introduction.

## Restrictions:

- **Rainfall:** Within 2 hours will reduce control.
- **Restricted Entry Interval:** DO NOT enter treated fields for 12 hours.
- **Grazing Restrictions:** DO NOT graze or feed treated crop to livestock within 7 days of application.
- **Pre-harvest Interval:** Leave 60 days between application and harvest.
- **Re-cropping Interval:** Canola, dry beans, faba beans, field corn, field peas, flax, lentils, oats, soybeans, and registered crops may be seeded 10 months after application.
- **Aerial Application:** May be applied by aircraft.
- **Storage:** Store in a cool, dry place in original container. Shake well before using. If frozen, warm gradually to 10°C and shake well to reconstitute component before use.
- **Buffer Zones:**
  - Observe buffer zones outlined in the label.
  - Spray when winds are under 16 km per hour, but not dead calm.

## Tank Cleaning:

Thifensulfuron/tribenuron and/or metsulfuron can cause severe injury to sensitive crops at very low concentrations. Sprayers used to spray Thifensulfuron/tribenuron and/or metsulfuron should be drained and flushed out immediately after use.

Refer to 'Method A' in the general section on sprayer cleaning in the introduction. When mixing with another pesticide with different cleaning measures, those measures should be integrated into 'Method A' (e.g. addition of detergent).

## Hazard Rating:

Caution – Skin Irritant

Potential Skin Sensitizer, Contains the Allergen Soy

Refer to the Introduction for an explanation of the symbols.

# Traxos

Herbicide Group  
1 - pinoxaden, clodinafop

## Company:

Syngenta Canada (PCP#29855)

## Formulation:

25 g/L pinoxaden and 25 g/L clodinafop propargyl formulated as an emulsifiable concentrate.

- Container sizes - 2 x 10 L, 80 L, 400 L

## Crops and Staging:

**Wheat (spring, durum, winter):** prior to the emergence of the 4<sup>th</sup> tiller.

When tank mixing, check broadleaf product description for additional restrictions.

## Weeds, Rates and Staging:

0.5 L per acre, no additional adjuvant required.

### For control of:

| Weed                                                          | Stage                            |
|---------------------------------------------------------------|----------------------------------|
| Barnyard grass, Persian darnel                                | 1 to 5 leaves prior to tillering |
| Foxtail (green, yellow)                                       | 1 to 5 leaves, maximum 2 tillers |
| Volunteer canaryseed, volunteer oats, wild oats, proso millet | 1 to 6 leaves, maximum 3 tillers |

Optimum yield response occurs when weeds are controlled in early stages.

Maximum of ONE APPLICATION per year of *Traxos* or other products containing pinoxaden.

Refer to the product label for complete mixing instructions. A general guide to mixing can be found in the introduction.

## Application Information:

- **Water Volume:**
  - **Ground:** Minimum 20 L up to 40 L per acre.
  - **Aerial:** Minimum 12 L per acre.
- **Nozzles and Pressure:** 40 to 45 psi (275 to 310 kPa) when using conventional 80° or 110° flat fan stainless steel nozzles tilted forward at an angle of 45°. Low drift nozzles may require higher pressures for proper performance. Use a combination of nozzles and pressure designed to deliver thorough, even coverage of **ASABE coarse** droplets.
- **Screens:** Use 50 mesh nozzle screens.

## How it Works:

Refer to How Do Herbicides Work in the Weed Control Section for an explanation of the concepts used in the table below.

| Active ingredient     | Timing        | Target                           | Movement                       | Spectrum     | WSSA Group |
|-----------------------|---------------|----------------------------------|--------------------------------|--------------|------------|
| pinoxaden, clodinafop | POST (foliar) | ACCase Lipid synthesis inhibitor | Toward growth areas (Symplast) | Grasses only | 1          |

## Effects of Growing Conditions:

Warm, moist growing conditions promote active weed growth and enhance activity. Weeds hardened off by environmental stress such as cold weather, drought or excessive heat may not be adequately controlled.

## Tank Mixes:

### Herbicides:

- *Buctril M\** (label rates)
- *Curtail M* (0.6 to 0.81 L per acre)
- *Infinity* (0.33 L per acre)
- MCPA 600 ester (0.28 to 0.37 L per acre)
- *Pulsar* (80 acres per case)
- *Pulsar* (80 acres per case) + MCPA 600 ester (0.23 L per acre)
- *Trophy* (20 acres per case)
  - Refer to the broadleaf herbicide label for crop staging and other information.

**Fungicides:**

- *Tilt* (0.1 L\* to 0.2 L per acre).

**Fertilizers:** None registered.

\* **Aerial application approved.**

**Note:** The above mixes are those listed on the *Traxos* label only.

According to the Pest Management Regulatory Agency of Health Canada's Guidance Document on Tank Mix Labelling (March 2023), unlabelled tank mixes of this product are permitted only if the label of this product and the label of the product it might be mixed with include at least general wording on their respective labels indicating they may be mixed with other pesticides. When tank mixes are permitted, apply mixes according to the most restrictive use limitations for either product.

Adding ingredients in the correct order is critical for optimum performance. Check labels of both products to be mixed for directions. General guidelines can be found in the introduction.

**Restrictions:**

- **Rainfall:** Within 1 hour may reduce control.
- **Restricted Entry Interval:** DO NOT enter treated fields for at least 12 hours.
- **Grazing Restrictions:** DO NOT graze or harvest treated crops for forage within 7 days of application.
- **Pre-harvest Interval:** Leave at least 60 days from application to harvest.
- **Re-cropping Interval:** No restrictions in the year following treatment.
- **Storage:** Store in a cool, dry, ventilated area away from food or feed. Avoid ignition sources. If frozen, thaw and shake well before using.
- **Aerial Application:** May be applied by air.
- **Buffer Zones:** Observe buffer zones outlined in the label.

**Sprayer Cleaning:**

Refer to 'Method A' in the general section on sprayer cleaning in the introduction.

**Hazard Rating:**

Warning – Skin Irritant

Refer to the Introduction for an explanation of the symbols.

# TraxosTwo

*This product is a prepackaged tank mix of TraxosTwo Grass (equivalent to Traxos) and TraxosTwo Broadleaf (equivalent to OcTTain). Information listed is restricted to Crops, Weeds, Rates and Tank mixes. For other detailed restrictions and general information on the component products see the product pages listed above.*

**Herbicide Group**

**1 - pinoxaden, clodinafop**

**4 - fluroxypyr, 2,4-D**

**Company:**

Syngenta Canada

**Formulation:**

The *TraxosTwo* package contains the following components:

**TraxosTwo Grass Component (PCP#31674):** 25 g/L pinoxaden and 25 g/L clodinafop-propargyl formulated as an emulsifiable concentrate.

- Container sizes - 10 L, 80 L

**TraxosTwo Broadleaf Component (PCP#31673):** 90 g/L fluroxypyr plus 360 g/L 2,4-D LV ester formulated as an emulsifiable concentrate.

- Container sizes - 9 L, 72 L

**Crops and Staging:**

Spring wheat (including durum): 4 leaf stage up to the emergence of the 4<sup>th</sup> tiller.

**Rates:**

**TraxosTwo Grass:** 0.5 L per acre

**TraxosTwo Broadleaf:** 0.45 L per acre

**Weeds and Staging:**

Weeds controlled by *Traxos* plus the weeds controlled by *OcTTain XL*.

*See component products for more information on restrictions, application details and handling. Unless indicated differently above use the most limiting restrictions across all components for the mix.*

# Traxos Xtreme

Herbicide Group  
1 - pinoxaden, clodinafop  
4 - fluroxypyr

## Company:

Syngenta Canada Inc. (PCP#35485)

## Formulation:

25.1 g/L pinoxaden; 25.1 g/L clodinafop-propargyl and 111 g/L fluroxypyr formulated as a emulsifiable concentrate.

- Container size – 10 L, 80 L, 400 L

## Crops and Staging:

**Wheat (spring, durum):** 2 leaf to stem elongation

**Winter wheat:** in the spring from 2 leaf to stem elongation

## Weeds and Staging:

| Weeds controlled                                                          | Stage                                                                                                                       |
|---------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------|
| Wild oats<br>Volunteer canary seed<br>Volunteer tame oats<br>Proso millet | 1 to 6 leaf on main stem; prior to emergence of the 4th tiller                                                              |
| Green foxtail<br>Yellow foxtail (wild millet, pigeon grass)               | 1 to 5 leaf on main stem; prior to emergence of 3rd tiller                                                                  |
| Barnyard grass<br>Persian darnel                                          | 1 to 5 leaf on main stem; prior to emergence of 3rd tiller and while barnyard grass and persian darnel are actively growing |
| Cleavers                                                                  | 1 – 4 whorls                                                                                                                |
| Kochia                                                                    | 2 – 8 leaf; including group 2 & 9 resistant biotypes                                                                        |
| Round-leaved mallow                                                       | 1 – 6 leaf                                                                                                                  |
| Volunteer flax                                                            | 1 – 12 cm                                                                                                                   |

| Weeds suppressed | Stage                                                |
|------------------|------------------------------------------------------|
| Chickweed        | Up to 8 cm; including group 2 & 9 resistant biotypes |
| Hemp nettle      | 2 – 6 leaf                                           |
| Storks-bill      | 1 – 8 leaf                                           |
| Wild buckwheat   | 1 – 4 leaf                                           |

## Rate:

*Note: Maximum of one application of this product per year.*

0.5 L per acre

Refer to the product label for complete mixing instructions. A general guide to mixing can be found in the Introduction

## Application Information:

- **Water Volume:**
  - **Ground:** Minimum 20-40 L per acre.
- **Nozzles and Pressure:** 40-45 psi (275 to 320 kPa) when using conventional 80-110 degree flat fan stainless steel nozzles tilted forward at an angle of 45 degrees. Low drift nozzles may require higher pressures for proper performance. Use a combination of nozzles and pressure designed to deliver thorough, even coverage of ASABE coarse droplets.
- **Screens:** Use 50 mesh nozzle screens.

## How it Works:

Refer to How Herbicides Work in the Weed Control Section for an explanation of the concepts used in the table below

| Active ingredient       | Timing        | Target                              | Movement                                 | Spectrum       | WSSA Group |
|-------------------------|---------------|-------------------------------------|------------------------------------------|----------------|------------|
| Pinoxaden<br>Clodinafop | POST (foliar) | ACCase Lipid<br>synthesis inhibitor | Toward growth<br>areas (Symplast)        | Grasses only   | 1          |
| Fluroxypyr              | POST (foliar) | Synthetic Auxin                     | Moves throughout<br>the plant (Symplast) | Broadleaf only | 4          |

## Effects of Growing Conditions:

Tolerance and efficacy is best when applied during warm weather when weeds are actively growing and soil moisture is adequate for rapid growth. Under prolonged stress caused by excessive cool or heat, flooding or drought, or poor fertility, control of some weeds may be reduced and or crops may be injured.

## Tank Mixes:

Tank mix partners applied at all label rates

### Herbicides:

- *Buctril M*<sup>1,3</sup> (0.4 L per acre)
- *Curtail M*<sup>1,4</sup> (0.6 to 0.81 L per acre)
- MCPA ester<sup>1</sup> (0.28 to 0.37 L per acre)
- *Infinity*<sup>3</sup> (0.33 L per acre)

<sup>1</sup> A reduction in barnyard grass control may be observed when *Traxos Xtreme* is tank mixed with these broadleaf herbicides.

<sup>2</sup> This rate is for MCPA ester 600 therefore rates must be adjusted accordingly for other concentrations.

<sup>3</sup> A reduction in green foxtail control may be observed when *Traxos Xtreme* is tank mixed with these broadleaf herbicides.

<sup>4</sup> For spring and durum wheat only.

**Fungicides:** None registered.

**Insecticides:** None registered.

**Fertilizers:** None registered.

**Note: the above Tank Mixes are those listed on the *Traxos Xtreme* label only.**

According to the Pest Management Regulatory Agency of Health Canada's Guidance Document on Tank Mix Labelling (March 2023), unlabelled tank mixes of this product are permitted only if the label of this product and the label of the product it might be mixed with include at least general wording on their respective labels indicating they may be mixed with other pesticides. When tank mixes are permitted, apply mixes according to the most restrictive use limitations for either product.

## Restrictions:

- **Rainfall:** Within 1 hour of application may reduce control.
- **Re-entry:** DO NOT re-enter treated fields for 12 hours.
- **Preharvest Interval:** Leave 30 days (hay), and 60 days (grain and straw) between application and harvest.
- **Grazing:** MUST NOT be grazed or fed to livestock for 7 days after treatment.
- **Re-cropping:** No other crop may be seeded after application until the following year. Barley, canola, flax, forage grasses, lentils, mustard, oats, peas, rye or wheat can be seeded/planted the following year, or fields can be summerfallowed.
- **Aerial Application:** DO NOT apply by aircraft.
- **Storage:** Keep in original container, tightly closed, during storage. Store in a cool, dry, well ventilated area away from feed and foodstuffs, and out of the reach of children and animals. Keep away from fire or open flame, or other sources of heat. If frozen, allow to thaw to room temperature and agitate thoroughly prior to re-immersion mixture.
- **Buffer Zones:** Observe buffer zones in the label.

## Sprayer Cleaning:

Refer to 'Method (A, B, C)' in the general section on sprayer cleaning in the introduction. Let solution stand for an extended period for better results. Flush sprayer system with water. See the label for product specific cleaning details.

## Hazard Rating:

Warning – Skin Irritant

potential skin sensitizer

For an explanation of the symbols used here see the introduction.

# Triallate

Herbicide Group  
15 (formerly Group 8) - triallate

## Company:

Gowan Canada (*Avadex Liquid EC, Avadex MicroActiv*)  
Rath Holdco Inc. (*Yieldshield Resilient Soilsorb*)

## Formulation:

**Avadex Liquid EC (PCP#16759), RHI Triallate 480 EC (PCP# 34670):** 480 g/L triallate formulated as an emulsifiable concentrate.

- Container sizes - 2 x 10 L, 115 L, 946 L

**Avadex MicroActiv (PCP#25112), Yieldshield Resilient Soilsorb, (PCP# 34574):** 10% triallate formulated as a granular.

- Container sizes:
  - 22.7 kg (*Avadex MicroActiv only*), 451.3 kg

## Crops, Rates and Application Timing:

**Avadex Liquid EC and RHI Triallate 480 EC Rates – Spring Treatment**

| Crop                                                                                    | Application Timing               | Rate (L per acre) |                        |
|-----------------------------------------------------------------------------------------|----------------------------------|-------------------|------------------------|
|                                                                                         |                                  | Organic Matter    |                        |
|                                                                                         |                                  | 4 percent or less | Greater than 4 percent |
| Spring and durum wheat                                                                  | Before seeding*                  | 1.0               | 1.2                    |
|                                                                                         | After seeding                    | 1.2               | 1.4                    |
| Barley, Canary seed***                                                                  | Before seeding and after seeding | 1.2               | 1.4                    |

### Triallate 10% granular Rates – Spring Treatment

| Crop                                                                                                            | Application Timing**                                          | Rate (kg per acre) |                        |
|-----------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------|--------------------|------------------------|
|                                                                                                                 |                                                               | Organic Matter     |                        |
|                                                                                                                 |                                                               | 4 percent or less* | Greater than 4 percent |
| Spring and durum wheat                                                                                          | Before seeding***                                             | 4.5                | 5.7                    |
|                                                                                                                 | After seeding                                                 | 5.7                | 6.9                    |
| Barley, canaryseed <sup>††</sup> , chickpea <sup>†††</sup> and lentil <sup>†††</sup>                            | Before seeding and after seeding (barley and canaryseed only) | 5.7                | 6.9                    |
| Canola, flax <sup>†</sup> , yellow and brown mustard, Oriental mustard (condiment and oilseed types), field pea | Before seeding                                                | 6.9                | 8.9                    |

\* Minimum tillage treatments must be applied to fields with at least 2 percent organic matter.

\*\* Minimum tillage treatments must be applied 10 to 14 days before seeding or incorporating. For minimum tillage treatments on spring and durum wheat, apply 5.7 kg per acre on soils with 4 percent organic matter or less and 6.9 kg per acre on soils with greater than 4 percent organic matter.

\*\*\* DO NOT apply this product before seeding wheat in soils with 4 percent or less organic matter (brown, dark brown or grey wooded soils) where discers are to be used for seeding. If an air seeder is to be used, it must be equipped with a depth control device to ensure accurate seed placement, otherwise crop injury may occur.

<sup>†</sup> Excluding Solin (low linolenic acid flax).

<sup>††</sup> Including hairless varieties for human consumption *Avadex MicroActiv* only.

<sup>†††</sup> *Avadex MicroActiv* only

#### Seedling Forage Legumes (under-seeded only):

Apply recommended rates for the companion crop.

- Alfalfa
- Bird's-foot trefoil
- Clover (alsike, red, sweet)

### Weeds and Staging:

For control of wild oats prior to their emergence (pre-emergent).

### Application Information:

- **Water/Liquid Fertilizer Volume (*Avadex Liquid EC* and *RHI Triallate 480 EC* only):** 36 L per acre.
- **Nozzles and Pressure (*Avadex Liquid EC* and *RHI Triallate 480 EC* only):** maximum 30 psi (200 kPa) when using conventional flat fan nozzles. Use a combination of nozzles and pressure designed to deliver thorough, even coverage of *ASABE medium* droplets
- **Direct Seeding Systems (minimum tillage systems)**
  - Triallate 10% granular herbicides may be applied in the fall or spring into standing stubble. If excessive crop residue exists at the time of application, a vigorous harrowing prior to application can be used to ensure that the herbicide granules make adequate contact with the soil. Under zero-till conditions it is recommended incorporation be conducted with suitable implement such as heavy harrow that allows for shallow incorporation while maintaining a uniform concentrated layer that provides adequate wild oats control.
  - Low disturbance seeding systems will not disturb the soil enough to control emerged weeds; therefore, a pre-seeding burnoff treatment using a herbicide such as glyphosate may be necessary. Ensure that cereals are seeded at least 1.25 cm (1/2 inch) below the treated layer.
  - **Fall Application:**
    - Applications of Triallate 10% granular granules should be made to standing stubble. DO NOT apply to smooth, hard packed soils that may allow granules to drift. If excessive crop residue exists at the time of application, a vigorous harrowing prior to application should be conducted to ensure the granules are in good contact with the soil. Apply after October 1 when the soil begins to cool (less than 4°C) and 3 weeks prior to soil freeze-up. Incorporation using harrow operation following application in the fall is recommended but can be performed in the spring before seeding.
  - **Spring Application:**
    - Applications of Triallate 10% granular granules should be applied and incorporated using harrow operation in spring 10 to 14 days before seeding.

- **Conventional Tillage Systems**

- **Fall Application:**

- Apply Triallate 10% granular granules to fields that are in good working condition, without excessive crop residue. Heavy crop residue or lumpy, wet fields may require tillage prior to application. Apply *Avadex MicroActiv* after September 15 until soil freeze-up. Incorporation using a harrow operation following application in the fall is recommended. Only one incorporation is required in the fall. The second incorporation may be done in the fall (before soil freeze-up) or in the spring.

- **Spring Application**

- Apply Triallate to fields that are in good working condition, without excessive crop residue. Heavy crop residue or lumpy, wet fields may require tillage prior to application. Triallate applications require two incorporations, with the second incorporation at right angles to the first. Incorporation using a harrow operation following application is recommended. Using a seeder that provides soil disturbance equivalent to a cultivator may replace one of the incorporations. The first incorporation should be completed within 48 hours of application and the second incorporation should be delayed an additional 48 hours or more.
  - The liquid formulation must be incorporated into soil that is free of lumps or crop residue. Liquid formulations should be applied to fields with 30 percent or less residue cover. Heavy crop residue or lumpy, wet fields may require tillage prior to application. The liquid formulation is recommended for spring use because soils are left in an erosion prone state if the liquid is fall-applied. The first incorporation of the liquid formulation should be completed as soon as possible after spraying, while the second incorporation may be done any time prior to crop emergence. Incorporation using a harrow operation following application is recommended.
  - Ensure that cereals are seeded at least 1.25 cm (1/2 inch) below the treated layer.

## How it Works:

Refer to How Do Herbicides Work in the Weed Control Section for an explanation of the concepts used in the table below.

| Active ingredient | Timing            | Target                                 | Movement                            | Spectrum  | WSSA Group |
|-------------------|-------------------|----------------------------------------|-------------------------------------|-----------|------------|
| triallate         | PPI (soil active) | Lipid Synthesis Inhibitor (Non-ACCase) | Little movement in plant (Apoplast) | Wild oats | 15         |

## Effects of Growing Conditions:

Reduced control may result if prolonged cool conditions or dry soil conditions prevail at the time weeds are emerging. If conditions are dry or wild oats germinate from below the treated zone, the weeds may emerge, but will usually be controlled. Thinning of wheat can occur under conditions of heavy rainfall or if cold soil conditions persist as the crop emerges.

DO NOT apply to fields where crop residue has been burned in the previous 12 months. Efficacy will be reduced.

## Tank Mixes:

**Herbicides:** *Avadex* liquid may be tank mixed with liquid formulations of trifluralin for control of wild oats, green and yellow foxtail in wheat and barley. Apply after seeding but prior to crop emergence. Consult the recommendations for trifluralin for rates in different soil types.

**Insecticides:** None registered.

**Fertilizer:** *Avadex Liquid EC* and *RHI Triallate 480 EC* alone, or tank mixed with liquid formulations of trifluralin, may be tank mixed with sprayable liquid fertilizer. Compatibility of the herbicide and sprayable liquid fertilizer should be checked. Follow the instructions on the herbicide label prior to adding the herbicide to the spray tank.

According to the Pest Management Regulatory Agency of Health Canada's Guidance Document on Tank Mix Labelling (March 2023), unlabelled tank mixes of this product are permitted only if the label of this product and the label of the product it might be mixed with include at least general wording on their respective labels indicating they may be mixed with other pesticides. When tank mixes are permitted, apply mixes according to the most restrictive use limitations for either product.

Adding ingredients in the correct order is critical for optimum performance. Check labels of products to be mixed for directions. General guidelines can be found in the introduction.

## Restrictions:

- **Rainfall:** At least 0.5 inches (1.5 cm) within 2 weeks of application in the spring is required for maximum performance of the spring treatment.
- **Restricted Entry Interval:** DO NOT enter treated fields for at least 12 hours.
- **Grazing Restrictions:** DO NOT graze the treated crop or use as hay or feed prior to crop maturity or in year of treatment.
- **Re-cropping Interval:** DO NOT seed tame oats the year after treatment.
- **Aerial Application:**
  - *Avadex Liquid EC* and *RHI Triallate 480 EC*: DO NOT apply by air
  - *Avadex MicroActiv*: Granular formulations may be applied by air with attachments designed for applying low volumes of granules.
- **Storage:** DO NOT freeze liquid formulations. Store granular formulations in a cool, dry place.
- **Buffer Zones:** Observe buffer zones outlined in the label.

## Sprayer Cleaning:

Refer to 'Method C' in the introduction for *Avadex Liquid EC* and *RHI Triallate 480 EC*.

## Hazard Rating:

 Warning – Poison (Liquid Formulation)

 Warning – Contains the Allergen Soy (Liquid and Granular), Skin and Eye Irritant (Granular Formulation)

Refer to the Introduction for an explanation of the symbols.

# Triallate + Trifluralin

Herbicide Group

3 - trifluralin

15 (formerly Group 8) - triallate

## Company:

Gowan Canada (*Fortress MicroActiv* - PCP#19521)

Rath Holdco Inc. (*Yieldshield Resiliant XP Soilsorb* - PCP#34566)

## Formulation:

10% triallate and 4% trifluralin formulated as a granular.

- Container sizes - 22.7 kg (*Fortress MicroActive* only), 454 kg

## Crops and Staging:

Prior to planting wheat (spring and durum), barley, canola, flax (not including Solin - low linolenic acid flax), mustard.

**Pre-plant incorporated:** In fall after September 15 until soil freeze-up or in the spring prior to seeding crop.

**Surface application:** Apply in the fall after October 1 and when soil temperature is less than 4°C at a depth of 2 inches (5 cm).

Incorporation using a harrow operation is recommended. Incorporation can be delayed until the following spring.

Some wheat and barley injury may be noted on eroded knolls.

DO NOT apply *Fortress MicroActiv* to fields:

- after snowfall
- with heavy crop residue.

## Weeds and Staging:

### Pre-emergent control of:

- Foxtail (green, yellow)
- Wild oats

### Suppression of:

- Kochia
- Redroot pigweed
- Wild buckwheat
- Lamb's-quarters
- Russian thistle

## Rates:

### Fall Treatment

| Crop                                | Rate (kg per acre)  |                |                |                        |
|-------------------------------------|---------------------|----------------|----------------|------------------------|
|                                     | Organic Matter      |                |                |                        |
|                                     | Less than 2 percent | 2 to 4 percent | 4 to 6 percent | Greater than 6 percent |
| Wheat                               | N.R.*               | 4.4            | 5.7            | 5.7**                  |
| Barley                              | 4.4                 | 5.7            | 5.7            | 6.9                    |
| Canola, flax <sup>†</sup> , mustard | 5.7                 | 5.7            | 5.7            | 6.9                    |
| Lentils***                          | 4.4                 | 5.7            | 6.9            | 6.9                    |
| Field peas***                       | 5.7                 | 6.9            | 8.9            | 8.9                    |

\* N.R. - Not Recommended.

\*\* For fall incorporated applications (not surface) apply 6.88 kg per acre when organic matter exceeds 8 percent.

\*\*\* *Fortress MicroActive* only.

<sup>†</sup> Excluding Solin (low linolenic acid flax).

## Spring Treatment

| Crop                                | Rate (kg per acre)  |                |                |                        |
|-------------------------------------|---------------------|----------------|----------------|------------------------|
|                                     | Organic Matter      |                |                |                        |
|                                     | Less than 2 percent | 2 to 4 percent | 4 to 6 percent | Greater than 6 percent |
| Wheat                               | N.R.*               | N.R.*          | 4.4            | 5.7                    |
| Barley                              | N.R.*               | 4.4            | 5.7            | 6.9                    |

| Field peas**                        | 6.9                 | 6.9            | 8.9            | 8.9                    |

\* N.R. - Not Recommended.

\*\* *Fortress MicroActive* only.

<sup>†</sup> Excluding Solin (low linolenic acid flax).

## Application Information:

- May be applied in the fall with or without a fall tillage operation, or in the spring as a pre-plant incorporated treatment. Before application of this product, the soil must be in good working condition. Application to a field that is wet, lumpy, rough or ridged will result in reduced weed control and promote crop thinning.
- Fall Surface Application:* Where fields are prone to water and/or wind erosion, and tillage is therefore undesirable, fall surface application should be made within 3 weeks of soil freeze-up, when the soil begins to cool (less than 4°C), which typically begins on or around October 1. Application can be made to standing stubble or to previously worked fields with incorporation delayed until spring. Incorporation using a harrow operation is recommended. For best results on heavy wild oats infestations, use the incorporated treatment.
- Fall Incorporated Application:* *Fortress MicroActiv* must be applied after September 15 and before soil freeze-up. Application prior to September 15 may result in reduced weed control. Granular *Yieldshield Resiliant XP Soilsorb* should be applied when the average soil temperature at the 5 cm depth is 4 degrees C or less and within 3 weeks of soil freeze up. Initial incorporation may be completed within 24 hours of application. Incorporation using a harrow operation is recommended. The second incorporation may be done in the fall (prior to soil freeze-up) or in the spring. Fall incorporation is not recommended on soils where a lack of crop residue cover combined with the required incorporation operation could result in soil erosion.
- Spring Application:* Can be applied before seeding but must be incorporated within 24 hours of application. The second incorporation must be delayed at least 48 hours after the first and may be performed at any time prior to crop emergence. Incorporation using a harrow operation is recommended.
- Incorporation:**
  - Applications require two incorporations, with the second incorporation at right angles to the first. Seeding with a seeder that provides soil disturbance equivalent to a cultivator may replace one incorporation. Incorporate to a maximum depth of 2 inches (5 cm) by setting disk or cultivator implements to cut a maximum of 3 inches (7.5 cm) into the soil.
  - Mixing the product to greater depths will dilute the herbicide, decrease wild oats control, and may cause injury to cereals. If the second incorporation is conducted after seeding, it should be done with harrows or other suitable tillage equipment adjusted so as not to disturb the seed. Harrowing does not provide effective in-corporation if compact soil prevents penetration of harrow teeth, if crop residue accumulates in the harrow sections, or if the harrows bounce.
- Seeding Requirements:** Accurate seeding depth control is critical. Thinning of wheat and barley has been known to occur when seeding depth has been inadequate. Ensure that cereals are seeded below the treated layer (2 to 3 inches or 5 to 7.5 cm). DO NOT seed deeper than 3 inches (7.5 cm). To ensure an even crop stand, increase the usual seeding rate of wheat or barley by 10 percent, especially if soil conditions are cold or dry. See product label for more information.

## How it Works:

Refer to How Do Herbicides Work in the Weed Control Section for an explanation of the concepts used in the table below.

| Active ingredient | Timing            | Target                                 | Movement                            | Spectrum          | WSSA Group |
|-------------------|-------------------|----------------------------------------|-------------------------------------|-------------------|------------|
| trifluralin       | PPI (Soil active) | Mitosis Inhibitor/cell division        | Little movement in plant (Apoplast) | Broadleaf & grass | 3          |
| triallate         | PPI (soil active) | Lipid Synthesis Inhibitor (Non-ACCase) | Little movement in plant (Apoplast) | Wild oats         | 8          |

## Effects of Growing Conditions:

Crop injury can occur on fields where *Fortress MicroActiv* has been applied and heavy rainfall or cold weather occur after seeding but prior to crop emergence. Seeding under warm soil conditions (greater than 10°C and generally after May 15) will ensure optimum crop germination and emergence and will reduce the risk of crop injury. Very dry conditions in spring or prolonged cool soil temperatures at time of wild oats germination will result in reduced control.

Poor results may be expected from incomplete incorporation due to wet, cloddy soil or heavy crop residues. Ridges left at seeding may disrupt the treated layer and allow weed escapes.

**Restrictions:**

- **Rainfall:** Moisture is required for activation. Rainfall of at least 0.6 inches (1.5 cm) within 2 weeks of seeding is required to ensure optimum results.
- **Restricted Entry Interval:** DO NOT enter treated fields for at least 12 hour
- **Grazing Restrictions:** DO NOT graze or cut treated crops for livestock feed prior to crop maturity.
- **Re-cropping Interval:** These products will leave a residue in the soil. Oats, canaryseed, and small seeded forage grasses may be injured if planted within 24 months of application. DO NOT apply on land to be sown to wheat if the land has been treated with trifluralin since June 1 of the previous year.
- **Aerial Application:** May be applied by airplane with attachments designed for applying low volumes of granules.

**Hazard Rating:**

Warning – Contains the Allergen Soy

May Cause Skin and Eye Irritation

Refer to the Introduction for an explanation of the symbols.

# Tribenuron

Herbicide Group  
2 - tribenuron

**Company:**

FMC Corporation (*Express SG*)  
 NewAgco (*MPOWER Extra*)  
 ADAMA Canada (*Involve 50 WDG*)  
 Albaugh (*Cleat*)  
 Sharda Cropchem (*Tribe 75 WDG*)  
 Viking (*Viking Tribenuron*)

**Formulation:**

**Express SG (PCP#28262):** 50% tribenuron methyl, formulated as a water soluble granule (WSG).

- Container size - 486 g

**Involve 50 WDG (PCP#33852):** 50% tribenuron formulated as a water dispersible granule (WDG).

- Container size - 480 g

**75% WDG formulations (MPOWER Extra – PCP#33143, Cleat – PCP#33327, Tribe 75 WDG – PCP# 34345, Viking Tribenuron (PCP#34738):**

75% tribenuron methyl, formulated as a water dispersible granule (WDG).

- Container sizes:
  - *MPOWER Extra and Viking Tribenuron* - 320 g
  - *Cleat* - 324 g
  - *Involve* - 480 g
  - *Tribe 75 WDG* - 80 g

All products are purchased alone but must be used accordingly in combination with a registered tank mix herbicide.

**Crops and Staging:**

<sup>Δ</sup> NOTE: Injury to pulse crops, forage grasses and forage legumes may occur on coarse-textured soils, low in organic matter (less than 3 percent), or in fields with variable soils, gravelly areas, sandy areas or eroded knolls. Avoid planting pulse crops in soils containing more than 50 percent sand.

\* Note: Since these uses are registered under the User Requested Minor Use Label Expansion (URMULE) program, the manufacturer assumes no responsibility for herbicide performance. Those who apply these uses do so at their own risk.

**Tribenuron + glyphosate:**

- **In the fall (post-harvest) or spring (leave a minimum of 24 hours) prior to the seeding of:**

Field Crops:

- |                                             |                          |                                                |
|---------------------------------------------|--------------------------|------------------------------------------------|
| ◦ Barley                                    | ◦ Lupin <sup>††Δ</sup>   | ◦ SU tolerant canola ( <i>Cleat</i> only)      |
| ◦ Canary seed (birdseed only) <sup>††</sup> | ◦ Oats <sup>††</sup>     | ◦ Wheat (spring, durum, winter <sup>††</sup> ) |
| ◦ Dry bean <sup>††Δ</sup>                   | ◦ Pea <sup>††Δ</sup>     |                                                |
| ◦ Faba bean <sup>††Δ</sup>                  | ◦ Soybean <sup>††Δ</sup> |                                                |

Forage Crops for Forage and Seed Production<sup>\*†Δ</sup>:

- |                                       |                                           |                       |
|---------------------------------------|-------------------------------------------|-----------------------|
| ◦ Alfalfa                             | ◦ Crested wheatgrass                      | ◦ Slender wheatgrass  |
| ◦ Alsike clover                       | ◦ Meadow fescue                           | ◦ Tall fescue         |
| ◦ Bromegrass (meadow, smooth, hybrid) | ◦ Red clover (forage and seed production) | ◦ Timothy             |
| ◦ Creeping red fescue                 | ◦ Sainfoin                                | ◦ Yellow sweet clover |

**\*Allow at least 24 hours between application and seeding.**

- **In the fall prior to the seeding of:**

◦ *The crops listed above plus:*

- |                       |                           |
|-----------------------|---------------------------|
| ◦ Canola <sup>†</sup> | ◦ Field corn <sup>†</sup> |
| ◦ Flax <sup>†</sup>   | ◦ Lentil <sup>†Δ</sup>    |

- **Fallow:**

◦ Allow 10 days between application and tillage (fallow).

**Post Emergent on Range and Pasture<sup>††</sup>:** *Express SG* or *Involve 50WDG* plus non-ionic surfactant at 0.2 L per 100 L of spray solution. Stage according to weeds.

**Tribenuron tolerant sunflower (eg. *ExpressSun SU7* variety):** *Express SG* only plus non-ionic surfactant at 0.2 L per 100 L of spray solution or *Hasten Adjuvant* at 0.5 L per 100 L of spray solution from 2 to 8 leaf stage.

**Tribenuron + 2,4-D ester:**

- **Fallow**
- **Wheat (spring and durum), barley<sup>††</sup>:** 3 leaf up to emergence of the flag leaf.

<sup>†</sup> *Express SG* only.

<sup>††</sup> *Express SG* and *Involve 50 WDG* only.

**Weeds, Rates and Staging,****Pre-seeding application and fallow mixed with glyphosate<sup>Δ</sup>:**

- **Express SG or Involve 50WDG at 6 grams per acre or 75% WDG tribenuron formulations at 4 grams per acre plus glyphosate (any brand) at 180 g ae per acre (see glyphosate pages for equivalent product rates.)**

◦ *Weeds controlled by glyphosate products at the rates above plus:*

- |                                           |                                          |                                                                             |
|-------------------------------------------|------------------------------------------|-----------------------------------------------------------------------------|
| ◦ Canada thistle (rosettes) <sup>**</sup> | ◦ Narrow-leaved hawk's-beard             | ◦ Volunteer canola (including glyphosate tolerant varieties) <sup>***</sup> |
| ◦ Cow cockle *                            | ◦ Scentless chamomile <sup>†**</sup>     |                                                                             |
| ◦ Dandelion (up to 6 inches)              | ◦ White cockle (rosettes) <sup>†**</sup> |                                                                             |

<sup>†</sup> *Express SG* only.

**Fallow<sup>Δ</sup>:**

- **Express SG or Involve 50WDG at 6 grams per acre or 75% WDG tribenuron formulations at 4 grams per acre plus 2,4-D ester 170 g (6 oz.) ae per acre (e.g. 0.24 L per acre LV 700 formulation):**

◦ *Weeds controlled by 2,4-D ester 170 g (6 oz.) ae per acre plus:*

- |                          |                           |
|--------------------------|---------------------------|
| ◦ Flixweed <sup>♦♦</sup> | ◦ Stinkweed <sup>♦♦</sup> |
|--------------------------|---------------------------|

**Post-emergent in barley and spring wheat (including durum):**

- **Involve 50WDG at 6 g per acre or MPOWER Extra only at 4 grams per acre plus 2,4-D ester 170 g (6 oz.) ae per acre (e.g. 0.24 L per acre LV 700 formulation);**

◦ *Weeds controlled by 2,4-D plus the following weeds up to 4 inches (10 cm) unless otherwise indicated:*

- |                               |                                              |
|-------------------------------|----------------------------------------------|
| ◦ Annual sunflower            | ◦ Redroot pigweed                            |
| ◦ Canada thistle (top growth) | ◦ Wild buckwheat (1 to 3 leaf) <sup>**</sup> |
| ◦ Cow cockle                  |                                              |

**Post-emergent for control of the emerged weeds below in rangeland and pasture only:**

- **Express SG or Involve 50WDG only at 6 grams per acre<sup>♦♦♦</sup> at the early bud – pre-bloom stage:**

◦ Tall buttercup

◦ Narrow-leaved hawk's-beard

- **Express SG or Involve 50WDG only at 12 grams per acre<sup>♦♦♦</sup>**

◦ *The weeds listed above plus:*

- |             |                |                |
|-------------|----------------|----------------|
| ◦ Dandelion | ◦ Common tansy | ◦ White cockle |
|-------------|----------------|----------------|

**Post-emergent in Tribenuron Tolerant Sunflowers:**

- Express SG only at 6 grams per acre plus Hasten NT adjuvant at 0.5L per 100L of spray solution or a non-ionic surfactant such as Agral 90 or AgSurf, at 0.2% v/v (2 L per 1000 L of water) will control:
  - Lamb's-quarters (up to 9 leaf)
  - Wild buckwheat\*\* (up to 6 leaf)
- \* Up to the 3 leaf stage.
- \*\* Suppression only.
- \*\*\* Up to 6 inches.
- ♦ Allow 10 days between treatment and tillage.
- ♦♦ Fall rosettes and spring seedlings.
- ♦♦♦ Addition of a non-ionic surfactant at 0.2 L per 100 L of spray solution is required.

Tribenuron may degrade if left in the sprayer for an extended period. Apply within 24 hours of mixing.

Refer to the product label for complete mixing instructions. A general guide to mixing can be found in the introduction.

**Application Information:**

- **Water Volume:** 22 to 40 L per acre.
- **Nozzles and Pressure:** Use appropriate pressure for nozzle. Low drift nozzles may require higher pressures for proper performance. Use a combination of nozzles and pressure designed to deliver thorough, even coverage of **ASABE medium** droplets or larger.
- **Screens:** Use a 50 mesh or coarser screen and filter system.

**How it Works:**

Refer to How Do Herbicides Work in the Weed Control Section for an explanation of the concepts used in the table below.

| Active ingredient | Timing        | Target                             | Movement                       | Spectrum       | WSSA Group |
|-------------------|---------------|------------------------------------|--------------------------------|----------------|------------|
| tribenuron        | POST (foliar) | ALS Amino Acid synthesis Inhibitor | Toward growth areas (Symplast) | Broadleaf only | 2          |

**Effects of Growing Conditions:**

Warm, moist growing conditions promote active weed growth and enhance the activity of tribenuron. Weeds hardened off by environmental stress such as cold weather, drought or excessive heat may not be adequately controlled.

**Tank Mixes:**

Tank mix partners applied at all label rates and include recommended adjuvants unless otherwise noted.

**Herbicides:**

- **Prior to seeding registered field crops (all products unless otherwise indicated):**
  - Must be mixed with glyphosate
- **Prior to seeding wheat (spring, durum, winter), barley, oats, dry bean, fababean, field pea, lupin and soybean:**
  - Aim + glyphosate (Express SG only)
- **Prior to seeding wheat (spring and durum) (Express SG only):**
  - Authority 480
- **Prior to seeding wheat (spring or winter, NOT durum), soybean and field pea (Express SG only):**
  - Focus + glyphosate
- **Prior to seeding faba bean, field pea, soybean (Express SG only):**
  - Authority 480 + glyphosate.
- **Fallow:** All products
  - Must be mixed with either glyphosate or 2,4-D ester
  - Aim + glyphosate (Express SG only)
- **In spring wheat (including durum) and barley (MPOWER Extra only):**
  - 2,4-D ester (170 g ae/acre)
- **Tribenuron Tolerant Sunflowers (Express SG only):**
  - Assure II plus Merge (0.5 to 1.0 L per 100 L solution) or Suremix (0.5 L per 100 L solution) adjuvants
  - Clethodim (Select, Centurion, Shadow RTM) plus Amigo (0.5 L per 100 L solution)

**Note:** The above mixes are those listed on the tribenuron labels only.

According to the Pest Management Regulatory Agency of Health Canada's Guidance Document on Tank Mix Labelling (March 2023), unlabelled tank mixes of this product are permitted only if the label of this product and the label of the product it might be mixed with include at least general wording on their respective labels indicating they may be mixed with other pesticides. When tank mixes are permitted, apply mixes according to the most restrictive use limitations for either product.

Adding ingredients in the correct order is critical for optimum performance. Check product labels for directions. General guidelines can be found in the introduction.

## Restrictions:

- **Rainfall:** Within 6 hours may reduce control. Check with product manufacturers for specific recommendations.
- **Restricted Entry Interval:** DO NOT enter treated fields for 12 hours.
- **Grazing Restrictions:**
  - **75% WDG formulations:** DO NOT graze treated crops within 30 days of application.
  - **Express SG:** Forage may be grazed immediately following application.
- **Pre-harvest Interval:**
  - **75% WDG formulations:** Leave 60 days between spraying and harvest of cereals.
  - **Express SG:** Leave 70 days between spraying and harvest of sunflower.
- **Re-cropping Interval:** There are no restrictions one year after treatment.
  - **75% WDG formulations:** Canola, flax, lentils and alfalfa may be planted 2 months after application.
  - **Express SG and Involve 50 WDG only:** All registered crop options may be seeded in the spring following a fall application. Canola, flax, and field corn may be planted 2 months after application or in the spring following a fall application (contact FMC for information on timing as it applies to tolerance on canola, lentil and field corn).
- **Aerial Application:** DO NOT apply by air.
- **Storage:** Store in a cool, dry place. May be frozen.
- **Buffer Zones:**
  - Handheld or backpack sprayers do not require a buffer zone.
  - Observe buffer zones outlined in the label.

## Sprayer Cleaning:

Tribenuron can cause severe injury to sensitive crops at very low concentrations. Sprayers used to spray tribenuron should be flushed out immediately after use. Refer to 'Method A' in the general section on sprayer cleaning in the introduction.

This ammonia rinse process should be done twice for the WDG formulations. See the labels of the various products for specific instructions. The addition of detergent may improve cleanout, especially when mixing with other products.

## Hazard Rating:

*Express SG, Involve 50WDG and Viking Tribenuron:*

Warning – Eye Irritant

Potential Skin Sensitizer

*MPOWER Extra:*

Caution – Eye and Skin Irritant

**All products:**

Warning – Contains the Allergens Milk and Sulfites

Refer to the Introduction for an explanation of the symbols.

# Tridem

Herbicide Group  
2 - pyroxsulam, florasulam  
4 - fluroxypyr

## Company:

Corteva Agriscience

## Formulation:

The *Tridem* package contains the following components:

**Tridem A (PCP#33290):** 21.5% pyroxsulam formulated as a water dispersible granule.

- Container sizes - 0.84 kg, 5.04 kg

-plus-

**Tridem B (PCP#33440):** 5 g/L florasulam and 100 g/L fluroxypyr formulated as a suspension concentrate.

- Container sizes - 2 x 8.1 L, 97.2 L

-plus-

**Bindem Utility Modifier:**

- Container sizes - 2.4 L, 2 x 7.1 L

## Crops and Staging:

**Wheat (spring, durum, winter):** 3 leaf to just prior to flag leaf emergence

## Weeds and Staging:

- Grass weeds controlled (1 to 6 leaf, prior to 4<sup>th</sup> tiller):

- Wild oats<sup>†</sup>
- Japanese brome<sup>††</sup>

- Broadleaf weeds controlled:

*The 'susceptible' broadleaf weeds controlled by 2,4-D (see 2,4-D page) plus:*

- Cleavers\*
- Chickweed
- Cow cockle
- Hemp-nettle\*
- Kochia\*
- Narrow-leaved hawk's-beard\*
- Redroot pigweed\*
- Shepherd's-purse
- Smartweed
- Sow-thistle (annual, perennial)\*
- Stinkweed
- Stork's-bill (1 to 8 leaf)
- Volunteer canola\*\*
- Volunteer flax
- Wild buckwheat

\* Suppression only.

<sup>†</sup> For low wild oats populations (less than 75 plants per square metre).

<sup>††</sup> For control of Japanese brome from the 1 leaf to 4 leaf, 2 tiller stage under good growing conditions.

\*\* Including Group 2 resistant biotypes.

\*\* Except CLEARFIELD varieties.

## Rates:

Tridem A: 21 grams per acre

Tridem B: 405 mL per acre

When tank mixed with 2,4-D 700 ester and MCPA ester at rates in the 'Tank Mix' section below, additional surfactant is NOT required; however, Bindem Utility Modifier included in the case is required at 60 mL per acre.

## Application Information:

- Water Volume:
  - **Ground only:** 20 to 40 L per acre.
- **Nozzles and Pressure:** Use appropriate pressure for nozzle. Low drift nozzles may require higher pressures for proper performance. Use a combination of nozzles and pressure designed to deliver thorough, even coverage of **ASABE coarse** droplets or larger.

## How it Works:

Refer to How Do Herbicides Work in the Weed Control Section for an explanation of the concepts used in the table below.

| Active ingredient | Timing                                  | Target                   | Movement                                | Spectrum            | WSSA Group |
|-------------------|-----------------------------------------|--------------------------|-----------------------------------------|---------------------|------------|
| pyroxsulam        | POST (foliar)                           | ALS Amino Acid Inhibitor | Toward growth areas (Symplast)          | Broadleaf and grass | 2          |
| florasulam        | POST (foliar) with little soil activity | ALS Amino Acid Inhibitor | Toward growth areas of plant (Symplast) | Broadleaf only      | 2          |
| fluroxypyr        | POST (foliar)                           | Synthetic Auxin          | Throughout the plant (Symplast)         | Broadleaf only      | 4          |

## Effects of Growing Conditions:

DO NOT apply to registered crops that are stressed by severe weather conditions (frost, drought or water saturated soil) as crop injury may result. Reduced activity will occur when temperatures are below 8°C or above 27°C. Frost 3 days before or after application may reduce weed control and crop tolerance.

## Tank Mixes:

### Herbicides:

- 2,4-D ester 700 (215 to 250 mL per acre)
- MCPA ester 600 (185 mL to 360 mL per acre)

### Fungicides:

- *Stratego 250EC*
- *Tilt 250 E*

**Fertilizers:** None registered.

**Insecticides:** None registered.

Adding ingredients in the correct order is critical for optimum performance. Check labels of products to be mixed for directions. General guidelines can be found in the introduction.

## Restrictions:

- **Rainfall:** Rainfast within 2 hours of application.
- **Preharvest Interval:** DO NOT harvest the treated crop for grain within 60 days of application.
- **Restricted Entry Interval:** DO NOT enter treated fields for at least 12 hours.
- **Grazing:** DO NOT graze for 7 days or silage/hay for 30 days following application.

- **Re-cropping Interval:** Fields previously treated with *Tridem* can be seeded the following year to wheat, barley, canola, corn, dry common beans, flax, lentils, mustard (brown, oriental and/or yellow) oats, peas, potatoes (except seed potatoes), soybeans, or sunflower.
- **Aerial Application:** DO NOT apply by air.
- **Storage:** Store in original containers in a secure, dry, well ventilated, heated storage.
- **Buffer Zones:** Observe buffer zones outlined in the label.

### Sprayer Cleaning:

Refer to the combination of 'Method A' and 'Method B' found in the general sprayer cleaning section in the introduction. Let solution stand for an extended period for better results. Flush sprayer system with water before reuse. See the label for product specific cleaning details.

### Hazard Rating:

Warning – Eye and Skin Irritant

Refer to the Introduction for an explanation of the symbols.

# Trifluralin

Herbicide Group  
3 - trifluralin

### Company:

Gowan Canada (*Treflan Liquid EC*, *Treflan MicroActiv*)

Nufarm Agriculture (*Rival*)

Loveland Products Canada (*Bonanza*)

Rath Holdco Inc. (*RHI Trifluralin 480 EC*, *Yieldshield Respectra Soilsorb*)

Sharda Cropchem Limited (*Bonita*, *Thrill*)

### Formulation:

**Bonanza 480 EC (PCP#28289):** 480 g/L trifluralin formulated as an emulsifiable concentrate.

- Container sizes - 9.45 L, 205 L

**Bonanza 10G (PCP#22744):** 10% trifluralin formulated as a granular.

- Container sizes - 22.7 kg, 500 kg

**Rival EC (PCP#18612):** 500 g/L trifluralin formulated as an emulsifiable concentrate.

- Container sizes - 2 x 9 L

**Rival 10G (PCP#18926):** 10% trifluralin formulated as a granular.

- Container sizes - 454 kg

**Treflan Liquid EC (PCP#23933):** 480 g/L trifluralin formulated as an emulsifiable concentrate.

- Container sizes - 9.45 L, 115 L

**Treflan MicroActiv (PCP#21742):** 10% trifluralin formulated as a granular.

- Container size - 454 kg

**RHI Trifluralin 480 EC (PCP# 34590):** 480 g/l trifluralin formulated as an emulsifiable concentrate

- Container size - 9.45 L

**Yieldshield Respectra Soilsorb (PCP# 34572):** 10% trifluralin formulated as a granular

- Container size - 454 kg

**Thrill (PCP#34592):** 480 g/L trifluralin formulated as an emulsifiable concentrate

- Container size

**Bonita (PCP#34924):** 10% trifluralin formulated as a granular.

- Container size - 22.7 kg

### Crops and Staging:

Certain formulations are not registered for all the crops listed here. Refer to the specific product label for details. All products are for pre-plant incorporated use only.

**Fallow use in the brown soil zone of Saskatchewan, or fall application in all soil zones (granular products only):** Spring wheat (including durum). Apply to fallow fields in May, June, or July for weed control during both years of a fallow-wheat rotation, or in the fall (September or October) or spring prior to seeding.

DO NOT apply following harvest when the previous crop was treated with another trifluralin product (*Treflan*, *Rival* or *Bonanza* products). This includes application the previous summer or fall. DO NOT apply trifluralin following harvest or to fallow when the previous year's crop was an oilseed, barley or pulse crop treated with a deep incorporated, spring or fall applied trifluralin product.

**Green and Yellow Foxtail Control in Cereals:**

- Liquids applied in spring only (after seeding but prior to crop emergence) - spring wheat (including durum), barley. Granulars applied in fall only (after September 1 but before freeze-up) - spring wheat (including semi-dwarf and durum).

**Broadleaf and Grassy Weed Control in other crops:**

- Spring applied liquid or granular formulations:**
  - Canola, pea, sunflower, safflower (liquid formulations), dry bean\*, mustard, faba bean, alfalfa, sainfoin, sweet clover, soybean, forage legumes (cicer milk-vetch, seedling alsike clover, red clover, bird's-foot trefoil).
- Fall applied granular formulations:** Canola, pea, sunflower, dry bean, mustard, faba bean, soybean, barley, lentils and flax.
- Trifluralin liquids only:** prior to planting shelterbelt transplants (elm, caragana, green ash, Scots pine).

\* RHI Trifluralin 480 EC, Thrill - black, white or kidney only

**Weeds:****Fallow use in the brown soil zone of Saskatchewan or fall application in all soil zones (granular products only):**

- Fallow Year:**
  - Barnyard grass
  - Cow cockle
  - Green foxtail
  - Lamb's-quarters
  - Persian darnel
  - Redroot pigweed
  - Russian thistle\*
  - Wild buckwheat
  - Wild oats
- Crop Year:**
  - Green foxtail
  - Lamb's-quarters
  - Wild buckwheat\*
  - Wild oats\*

\* Suppression only

**Green and Yellow Foxtail Control in Cereals:**

- Foxtail (green, yellow)

**Broadleaf and Grassy Weed Control in other crops:**

- Barnyard grass
- Brome (downy, Japanese)
- Chickweed
- Cow cockle
- Foxtail (green, yellow)
- Knotweed
- Lamb's-quarters
- Persian darnel
- Pigweed
- Purslane
- Wild buckwheat\*
- Wild oats†\*

\* Some plants may escape herbicide treatment but are not competitive with the crop.

† Suppression only with *Treflan Liquid EC* and *Bonanza 480 EC*.

**Rates and Staging:****Fallow use in the brown soil zone of Saskatchewan (granular products only):**

- DO NOT apply to sandy soils with less than 1 percent organic matter. Application to severely eroded knolls is not recommended. DO NOT apply to wet soils, soils in poor working condition, soils which contain more than 8 percent organic matter, or soils subject to prolonged periods of flooding.
- Granules may be applied to fallow fields or following harvest, provided crop residues or green growth do not interfere with cultivation (prevent soil mixing).
- Over-application caused by overlapping, improper calibration or non-uniform application may result in reduced crop stand, delayed development or reduced yields.

| Soil Organic Matter (percent) | Rate (kg per acre) |                |                |
|-------------------------------|--------------------|----------------|----------------|
|                               | 1 to 3 percent     | 4 to 8 percent | 2 to 8 percent |
| May                           | 3.85               | 4.5            |                |
| June                          | 3.25               | 3.85           |                |
| July                          | 2.65               | 3.25           |                |
| September to October          |                    |                | 2.23*          |

\* Control of green foxtail only, on soils between 2 to 8 percent organic matter.

- During the fallow year, susceptible weeds may not be fully controlled until after the second fallow operation has established a uniform layer of treated soil. Control of wild oats in the crop year may be variable depending on wild oats population as well as soil and climatic conditions. Some wild buckwheat may escape but its growth will be slowed and result in limited competition to the wheat crop.

## Pre-emergent control of green and yellow foxtail:

• **Liquids:**

| Product                                                                  | Rates (L per acre)            |                    |
|--------------------------------------------------------------------------|-------------------------------|--------------------|
|                                                                          | Light and Medium Soil Texture | Heavy Soil Texture |
| <i>Rival EC</i>                                                          | 0.49 to 0.57 L                | 0.65 L             |
| <i>Treflan Liquid EC, Bonanza 480 EC, RHI Trifluralin 480 EC, Thrill</i> | 0.49 L                        | 0.69 L             |

• **Granular products (wheat only):**

- 2.23 kg per acre in all soil textures with 2 to 8 percent organic matter.

**Broadleaf and grassy weed control in other crops:**

- For use in canola, pea, sunflower, dry bean, mustard, faba bean, seedling alfalfa (spring only), seedling sweet clover (spring only), soybean.

| Product                                                  | Soil Type                                           |              |                                                           |                      |

\* Light textured soils can be defined as sandy to sandy-loam.

\*\* Medium to heavy textured soils can be defined as loam to clay.

\*\*\* Rates vary among products. Refer to product label for specific information.

## Application:

### Liquid Formulations:

- **Water Volume:** Minimum 40 L per acre.
- **Nozzles and Pressure:** Maximum 40 psi (275 kPa) when using conventional flat fan nozzles. Low drift nozzles may require higher pressures for proper performance. Use a combination of nozzles and pressure designed to deliver thorough, even coverage of *ASABE medium* droplets or larger.

**Dry Granular Formulations:** Use equipment capable of metering granular herbicides and applying in an even layer over the surface of the soil. Close applicator lid after filling to avoid prolonged exposure to direct sunlight.

## Incorporation:

### Fallow use in the brown soil zone of Saskatchewan:

- Apply granules to the soil surface and incorporate immediately, in the same operation if possible. DO NOT delay incorporation more than 24 hours after application. Use a deep tillage cultivator, field cultivator or disc implement set to work 2 to 3 inches (5 to 8 cm) deep, and operating at 8 to 10 km per hour. Granules should not be incorporated when soil is crusted, lumpy or too wet for good mixing action.
- **May to July:** A second incorporation at the same depth and at an angle to the first should be done when weed growth requires it. Wait at least one week before making the second incorporation. After completing two fallow incorporations, additional operations with a rod weeder, shallow tillage or fall herbicide application may be required to control remaining weed growth.
- **September to October:** A second incorporation may be done in the fall a minimum of 3 days later. Alternatively, to conserve crop residues cover through the winter, the second incorporation can be completed in the spring at the same depth and at an angle to the first incorporation. When both incorporations take place in the fall, shallow spring tillage should be completed in the spring. If a discer or air seeder is used for seeding, separate spring tillage may not be necessary.
  - *NOTE: Fall application is not recommended on soils where a lack of crop residue cover combined with the required incorporation would leave the soil vulnerable to erosion.*
- **Spring (In the year of seeding):** Apply granules and incorporate immediately, in the same operation if possible. DO NOT delay the first incorporation longer than 24 hours after application. The second incorporation must be delayed a minimum of 3 days following the first incorporation. When applied to cold soils, wait 14 days before making second incorporation. The second incorporation should be done at an angle to the first incorporation, and at the same depth. If a discer or air seeder is used for seeding, the seeding operation can be used as the second incorporation.

### Green and yellow foxtail control in cereals:

- **Liquid formulations:** Apply and incorporate in spring just after seeding. Incorporate to a depth of 1 to 1.5 inches (2 to 4 cm) into a bare soil free of crop residues (80 percent black when viewed from above) using diamond or tine type harrows operated at a speed of 6 miles per hour (9 km per hour). Incorporate twice, with the second incorporation at right angles to the first. The first incorporation should be performed immediately in the same direction of application. Both incorporations should be done within 24 hours of application. When tank mixing liquid formulations with *Avadex BW*, follow the same incorporation procedure.
- **Granular formulations:** May be applied to standing or pre-worked stubble. Very heavy trash fields should be worked prior to application to allow product penetration to the soil surface. Incorporate with cultivators or disc implements only. Perform the first tillage operation within 24 hours of application. Incorporate at a working speed of 5 to 8 miles per hour (8 to 13 km per hour) and to a depth of 2 to 3 inches (5 to 8 cm). Wait a minimum of 5 days, then incorporate a second time at right angles to the first. This second incorporation may be delayed until the following spring. Subsequent working should be no deeper than 2 to 3 inches (5 to 8 cm).

### Broadleaf and grassy weed control in other crops:

- Granular formulations are recommended for use in fall or spring as a pre-plant incorporated treatment on broadleaf crops listed on the product label. The liquid formulations should be used only on soils free of lumps and relatively free of crop residues (75 percent black) and are recommended only for spring use. Granular formulations may be applied to standing or pre-worked stubble. Very heavy crop residues should be worked prior to application to allow product penetration to the soil surface. DO NOT use liquid or formulations of trifluralin as a pre-plant incorporated treatment in barley, as severe injury will result. Only the fall applications of granular formulations are registered for use as pre-plant incorporated treatments in barley. For fall application of granular formulations, work the chemical into the soil between September 1 and freeze-up. Use a discer or field cultivator (vibrating shank-type). Disc implements are preferred on stubble. Set equipment to cut at 3 to 4 inches (8 to 10 cm) depth. The initial incorporation should be done within 24 hours of application.  
The second incorporation should be done at right angles to the first. The second incorporation may be delayed until spring, except when planting barley, flax or lentils; for these crops both incorporations must be done in fall. Delay the second incorporation 5 days for better weed control. This will allow greater release of the chemical onto soil particles and assure more even distribution. Fall application of granular trifluralin on flax, lentils or barley is not recommended on soils prone to erosion, as the 2 fall incorporations necessary in these crops may leave soils vulnerable to wind or water erosion.
- For spring application of liquid and granular formulations, work the chemical into the soil prior to seeding by setting the implement at 3 to 4 inches (8 to 10 cm) cutting depth. The first incorporation must be done within 24 hours of application. The second incorporation must be done at right angles to the first. If incorporating granular trifluralin, delay the second incorporation for 3 days after the first to achieve better weed control.

### Seeding:

#### Fallow use in the brown soil zone of Saskatchewan:

- Allow soil to warm before seeding to reduce risk of injury to crop. Place seed 1.25 to 2.5 inches (3 to 6 cm) deep. If spring seedbed preparation is required, set cultivator 2 inches (5 cm) deep. To reduce the risk of wheat injury, use good quality seed and agronomic practices that will promote good growing conditions. Avoid deep seeding, loose seedbeds and seeding into cold soils. If extended dry periods were present after a fallow application, a 10 percent increase in seeding rate is recommended.

### How it Works:

Refer to How Do Herbicides Work in the Weed Control Section for an explanation of the concepts used in the table below.

| Active ingredient | Timing            | Target                              | Movement                            | Spectrum          | WSSA Group |
|-------------------|-------------------|-------------------------------------|-------------------------------------|-------------------|------------|
| trifluralin       | PPI (Soil active) | Mitosis Inhibitor/<br>cell division | Little movement in plant (Apoplast) | Broadleaf & grass | 3          |

### Effects of Growing Conditions:

Prolonged drought conditions after a May to July application to fallow may result in higher levels of trifluralin in the soil at the time of seeding.

Injury to flax, barley, wheat or lentils may occur if soil and weather conditions are not conducive to rapid crop emergence (cold or dry soils at the time of seeding and crop emergence).

To minimize crop injury, seed into a firm, moist seed bed using a seeder with good depth control and on row packing. Plant barley no deeper than 2 inches (5 cm). Plant cereals, lentils and flax no deeper than 1.5 inches (4 cm).

Less than acceptable weed control will result if dry conditions prevail at the time of weed emergence.

Rainfall has no direct effect on products' activity. Flooding (3 to 5 days) will cause rapid breakdown of the product resulting in reduced weed control. Flooding for 3 weeks or more will result in total breakdown of the product resulting in loss of weed control.

### Tank Mixes:

#### Herbicides:

- Soybeans:**
  - Sencor (Treflan Liquid EC, RHI Trifluralin 480 EC only).

**Fertilizers:** Liquid product may be applied with liquid fertilizer as a carrier. Before the herbicide is added to the tank, compatibility of the herbicide to liquid fertilizer should be tested following instructions on the herbicide container. Trifluralin liquids may be blended with dry bulk fertilizers (DO NOT mix with nitrate fertilizers). Check label for blending instructions.

**Insecticides:** None registered.

**Fungicides:** None registered.

According to the Pest Management Regulatory Agency of Health Canada's Guidance Document on Tank Mix Labelling (March 2023), unlabelled tank mixes of this product are permitted only if the label of this product and the label of the product it might be mixed with include at least general wording on their respective labels indicating they may be mixed with other pesticides. When tank mixes are permitted, apply mixes according to the most restrictive use limitations for either product.

Adding ingredients in the correct order is critical for optimum performance. Check labels of products to be mixed for directions. General guidelines can be found in the introduction.

## Restrictions:

- **Rainfall:** No restriction. Flooding may reduce weed control.
- **Restricted Entry Interval:** Wait at least 12 hours before entering treated fields.
- **Grazing Restrictions:** DO NOT graze the treated crops or cut for feed prior to crop maturity.
- **Re-cropping Interval:** Oat, canaryseed, and small-seeded grasses may be affected the year after treatment. Corn is sensitive at higher rates of application. Damage to wheat can occur if the crop is seeded into land that has been treated during the previous 21 months with trifluralin products and has received abnormally low amounts of precipitation. Damage is worse if conditions are not conducive to rapid emergence of the wheat (for example, if the crop is seeded deep or if soil conditions remain cool during emergence). Damage tends to be greater on fields treated with granular formulations.
- **Aerial Application:** DO NOT apply by air.
- **Storage:**
  - Granular formulations must be stored in a cool, dry location, out of sunlight.
  - **Rival EC:** DO NOT store below 5°C.
  - **Treflan Liquid EC, Bonanza 480 and RHI Trifluralin 480 EC:** DO NOT freeze. Crystallization of the active ingredient may occur at less than 5°C. To reconstitute, bring temperature to 15°C and shake well until no crystals are visible. This should be done before adding to the spray tank.
- **Buffer Zones:** Observe buffer zones outlined in the label.

## Sprayer Cleaning:

Refer to 'Method B' in the general section on sprayer cleaning in the introduction for liquid formulations only.

## Hazard Rating:

**Bonanza 480 EC, RHI Trifluralin 480 EC:**

Warning – Poison

Warning – Eye and Skin Irritant

**All products:** Potential Skin Sensitizer

Refer to the Introduction for an explanation of the symbols.

# Tundra

Herbicide Group

1 - fenoxaprop

6 - bromoxynil

27 - pyrasulfotole

## Company:

Bayer (PCP#29367)

## Formulation:

46 g/L of fenoxaprop-p-ethyl, 87.5 g/L of bromoxynil and 15.5 g/L of pyrasulfotole formulated as an emulsifiable concentrate.

- Container sizes - 8.1 L, 129.6 L, 405 L

## Crops and Staging:

Application beyond the maximum rates provided below may result in crop injury.

| Crop                                   | Stage                                         |
|----------------------------------------|-----------------------------------------------|
| Barley, spring wheat (including durum) | 1 to 6 leaves on the main stem plus 3 tillers |

## Weeds, Rates and Staging:

Apply at the 3 to 4 leaf stage for optimum control. Optimum weed control and yield response occurs when weeds are removed before the crop tillers.

Apply 0.81 L per acre to control:

### Grass weeds from the 1 to 6 leaf stage up to emergence of 3<sup>rd</sup> tiller:

- Barnyard grass
- Foxtail (green and yellow)
- Wild oats

### Broadleaf weeds from the 1 to 6 leaf stage unless otherwise indicated:

- Canada fleabane (up to 10 cm)\*
- Canada thistle<sup>†</sup> (up to 30 cm)
- Chickweed
- Cleavers (1 to 3 whorls)
- Cleavers (4 to 6 whorls)\*
- Dandelion<sup>†</sup> (up to 25 cm across<sup>††</sup>)
- Flixweed (up to 10 cm)
- Hemp-nettle
- Kochia (up to 10 cm)
- Narrow-leaved hawk's-beard (up to 10 cm and before bolting)
- Pale smartweed
- Ragweed (common)
- Redroot pigweed
- Round-leaved mallow<sup>†</sup>
- Russian thistle (up to 10 cm)
- Shepherd's-purse
- Sow-thistle (annual, perennial<sup>†</sup>)
- Stinkweed
- Stork's-bill (up to 8 leaf)\*\*\*
- Volunteer canola\*\*
- Wild buckwheat
- Wild mustard

<sup>†</sup> Suppression only.

<sup>††</sup> Spring seedlings and over-wintered rosettes.

\* Add 200 g of active ammonium sulfate per acre (202 grams per acre of 99 percent dry; 0.5 L per acre of 40 percent liquid; or 0.4 L per acre of 49 percent solution).

\*\* Including all herbicide tolerant varieties.

\*\*\* Only when mixed with 2,4-D ester and ammonium sulphate.

DO NOT apply *Tundra* or other products containing fenoxaprop, pyrasulfotole or bromoxynil more than once in the same year.

## Application Information:

- **Water Volume:**
  - **Ground:** 18.9 L per acre. Use higher water volumes for dense crop/weed canopies.
  - **Aerial:** 11.4 L per acre.
- **Nozzles and Pressure:** Use a combination of nozzles and pressure designed to deliver thorough, even coverage with **ASABE medium** classification droplets. Low drift nozzles may require higher pressures for proper performance.

## How it Works:

Refer to How Do Herbicides Work in the Weed Control Section for an explanation of the concepts used in the table below.

| Active ingredient | Timing        | Target                                | Movement                                                                     | Spectrum       | WSSA Group |
|-------------------|---------------|---------------------------------------|------------------------------------------------------------------------------|----------------|------------|
| fenoxaprop        | POST (foliar) | ACCCase Lipid Synthesis Inhibitor     | Toward areas of growth (Symplast)                                            | Grass only     | 1          |
| bromoxynil        | POST (foliar) | PSII Inhibitor/<br>Membrane disruptor | Little (apoplast)                                                            | Broadleaf only | 6          |
| pyrasulfotole     | POST (foliar) | HPPD Pigment Inhibitor                | Some – both foliar & root (Apoplast) – Somewhat systemic (has soil residues) | Broadleaf only | 27         |

## Effects of Growing Conditions:

Crop injury may result if applied to a crop that is stressed by severe weather conditions, frost, low fertility, drought, water-saturated soil, disease or insect damage. Weeds growing under adverse environmental conditions such as drought will be less susceptible to *Tundra*. Under stressed conditions and/or heavy crop canopy, early application will result in improved weed control.

## Tank Mixes:

### Herbicides:

- 2,4-D ester (113 g ae per acre) plus ammonium sulphate (see "Weeds, Rates and Staging:" above)

**Fungicides:** None registered.

**Insecticides:** None registered.

**Fertilizers:** DO NOT mix with fertilizers other than those indicated above.

According to the Pest Management Regulatory Agency of Health Canada's Guidance Document on Tank Mix Labelling (March 2023), unlabelled tank mixes of this product are permitted only if the label of this product and the label of the product it might be mixed with include at least general wording on their respective labels indicating they may be mixed with other pesticides. When tank mixes are permitted, apply mixes according to the most restrictive use limitations for either product.

Adding ingredients in the correct order is critical for optimum performance. Check labels of both products to be mixed for directions. General guidelines can be found in the introduction.

## Restrictions:

- **Rainfall:** Within 1 hour may reduce control.
- **Restricted Entry Interval:** DO NOT enter treated areas for 24 hours.
- **Grazing Restrictions:** DO NOT graze or cut cereal crops for hay, within 25 days of application.
- **Pre-harvest Interval:** Leave 65 days from application to harvest.
- **Re-cropping Interval:** Alfalfa, barley, canaryseed, canola, corn (Manitoba only), flax, oats, potato, soybean (Manitoba only), sunflower, tomato (Manitoba only), and wheat (spring, and durum) may be planted the season following application. Field pea may be grown the following year in all black, grey-wooded and dark brown soil zones. DO NOT plant field pea the season following *Tundra* use in the brown soil zone where soil pH is above 7.5 and precipitation was less than 125 mm from June 1st until September 1st of the year of application.
- **Aerial Application:** May be applied by air.
- **Storage:** Store in a dry controlled temperature facility. DO NOT freeze. Shake before using if stored for longer than one year.
- **Buffer Zones:** Observe buffer zones outlined in the label.

## Sprayer Cleaning:

Refer to 'Method A' in the general section on tank mixing in the introduction.

## Hazard Rating:

Caution – Poison

Danger – Corrosive to Eyes and Skin

Warning – Eye Irritant

Potential Skin Sensitizer

Refer to the Introduction for an explanation of the symbols.

# Ultra Blazer

Herbicide Group  
14 - acifluorfen

## Company:

UPL AgroSolutions Canada (PCP#32330)

## Formulation:

240 g/L acifluorfen present as a sodium salt and formulated as a solution.

- Container size - 2 x 10 L

## Crops and Staging:

**Soybean:** from the 1 to 3 trifoliolate leaf stage. DO NOT apply before the first trifoliolate leaf stage of the soybean. DO NOT apply to soybeans grown on sand or loamy sand soils.

## Weeds and Staging:

*Ultra Blazer* applied at 0.5 L per acre plus *Assist* adjuvant at 0.5 L per 100 L of spray solution will control:

| Weed            | Maximum Leaf Stage |
|-----------------|--------------------|
| Common ragweed  | 8                  |
| Redroot pigweed | 4                  |

*Ultra Blazer* applied at 1.0 L per acre\*\* will control the weeds above plus the following weeds at the maximum leaf stages listed:

| Weed                               | Maximum Stage |
|------------------------------------|---------------|
| Canada thistle*                    | Pre-bud       |
| Cocklebur                          | 4 leaf        |
| Common milkweed*                   | -             |
| Field bindweed*                    | -             |
| Hedge bindweed*                    | -             |
| Lamb's-quarters                    | 2 leaf        |
| Nightshade (eastern black)         | 6 leaf        |
| Redroot pigweed                    | 6 leaf        |
| Smartweed (including lady's-thumb) | 8 leaf        |
| Wild mustard                       | 10 leaf       |

\* Top growth control only. The plant will grow back from underground roots.

\*\* DO NOT add *Assist* adjuvant with the 1.0 L per acre rate as crop injury will result.

Refer to the product label for complete mixing instructions for this product and its mixes. A general mixing guide can be found in the introduction.

## Application Information:

- **Water Volume:** No specific water volume is provided on the label but a minimum of 81 L per acre is implied by the adjuvant rates on the label. Good coverage of weed foliage is required for proper control.
- **Nozzles and Pressure:** Use nozzles and pressure designed to deliver thorough, even coverage with *ASABE medium* droplets.

## How it Works:

Refer to How Do Herbicides Work in the Weed Control Section for an explanation of the concepts used in the table below.

| Active ingredient | Timing        | Target                               | Movement                                             | Spectrum       | WSSA Group |
|-------------------|---------------|--------------------------------------|------------------------------------------------------|----------------|------------|
| acifluorfen       | POST (foliar) | PPO Inhibitor/<br>Membrane disruptor | Little movement due to rapid cell leakage (Symplast) | Broadleaf only | 14         |

## Effects of Growing Conditions:

Soybeans may exhibit speckling, bronzing and/or leaf burn. The trifoliolate leaf emerging at the time of application may be distorted. Soybeans usually outgrow these conditions and continue to grow at a normal rate with no adverse effect on vigour, maturity, or crop yield. It is important to have good spray coverage on the weeds as *Ultra Blazer* works mainly by contact action. Failure to follow the suggested application rate and timing may result in unsatisfactory control.

## Tank Mixes:

### Herbicides:

- *Ultra Blazer* (0.5 L per acre) plus *Basagran Forté* (0.5 L per acre)
- *Ultra Blazer* (0.255 L per acre) plus *Basagran\** or *Basagran Forté* (0.71 L per acre) depending on predominant weed species present.
  - See label for details.

\* Add *Assist* adjuvant at 0.5 L per 100 L of spray solution for *Basagran* tank mix only.

**Fertilizers:** None registered. DO NOT add fertilizers to the spray mixture.

**Insecticides:** None registered.

**Fungicides:** None registered.

**Note:** The above mixes are those listed on the *Ultra Blazer* label only.

Adding ingredients in the correct order is critical for optimum performance. Check labels of products to be mixed for directions. General guidelines can be found in the introduction.

## Restrictions:

- **Rainfall:** Within 6 hours may reduce weed control.
- **Restricted Entry Interval:** DO NOT enter treated fields for 12 hours.
- **Pre-harvest Interval:** No specific preharvest interval is indicated on the label.
- **Grazing Restrictions:** DO NOT graze the treated crop or cut for hay.
- **Re-cropping Interval:** The label has no restriction on crops that may be planted the following season.
- **Aerial Application:** DO NOT apply by air.
- **Storage:** DO NOT freeze.
- **Buffer Zones:** Observe buffer zones outlined in the label.

## Sprayer Cleaning:

Refer to 'Method B' in the general section on sprayer cleaning in the introduction. Sprayers may require cleaning after several tank loads to remove any excessive oil buildup on the inside of the sprayer.

## Hazard Rating:

Caution – Poison

Danger – Corrosive to Eyes

Warning – Causes Skin Irritation

Avoid contact with skin. Harmful if inhaled.

Refer to the Introduction for an explanation of the symbols.

# Valtera Cereals

Herbicide Group  
2 - Florasulam  
14 - Flumioxazin

## Company:

Nufarm Agriculture Inc.

## Formulation:

**Valtera Cereals (PCP#35619):** 285 g/L flumioxazin plus 20 g/L florasulam formulated as a suspension concentrate

- Container size – 8L

## Crops and Staging:

**Spring wheat, durum:** Apply in the fall prior to ground freeze, or in the spring at least 7 days prior to seeding spring wheat or at least 30 days prior to seeding durum.

**Winter wheat:** Apply in the fall at least 7 days prior to seeding.

Do not apply more than once during a single growing season. Do not use florasulam in crop following a pre-seed application of *Valtera Cereals*.

## Weeds and Rate:

### Weeds Controlled at 100 mL/ac:

- Annual sow thistle
- Canada fleabane<sup>2</sup>
- Chickweed
- Cleavers
- Common ragweed<sup>2</sup>
- Cow cockle<sup>1</sup>
- Dandelion<sup>2</sup>
- Eastern black nightshade<sup>2</sup>
- Green foxtail\*<sup>2</sup>
- Green pigweed<sup>2</sup>
- Hairy nightshade<sup>2</sup>
- Hempnettle\*<sup>1</sup>
- Kochia (including group 2, 4, and 9 resistant)<sup>2</sup>
- Lamb's-quarters<sup>2</sup>
- Narrow-leaved hawk's beard\*<sup>1</sup>
- Palmer amaranth<sup>2</sup>
- Perennial sowthistle\*<sup>1</sup>
- Redroot pigweed<sup>2</sup>
- Russian thistle\*
- Shepherd's purse<sup>1</sup>
- Smartweed<sup>1</sup>
- Stinkweed<sup>1</sup>
- Volunteer canola (except Clearfield varieties)
- Waterhemp, including biotypes resistant to groups 2, 5, and 9<sup>2</sup>
- Wild buckwheat
- Wild mustard<sup>1</sup>

\*Suppression only.

<sup>1</sup>emerged weeds only (2-4 leaf)

<sup>2</sup>pre-emerge to weeds only

## Application Information:

- Water Volume:
  - Ground: Minimum 40 L per acre.
- Nozzles and Pressure: Use a combination of nozzles and pressure designed to deliver thorough, even coverage with ASABE coarse droplets.
- Screens: Use a 50 mesh or coarser screen and filter system.
- Incorporation: DO NOT incorporate. Do not disturb the soil between application and seeding.

## How it Works:

Refer to How Herbicides Work in the Weed Control Section for an explanation of the concepts used in the table below.

| Active ingredient | Timing                                    | Target                               | Movement                            | Spectrum       | WSSA Group |
|-------------------|-------------------------------------------|--------------------------------------|-------------------------------------|----------------|------------|
| Florasulam        | POST (foliar) with little soil activity   | ALS Amino Acid synthesis inhibitor   | Toward regions of growth (Symplast) | Broadleaf only | 2          |
| Flumioxazin       | PRE (surface) with residual soil activity | PPO Inhibitor/<br>Membrane disruptor | PRE: Upward in plant (Apoplast)     | Broadleaf only | 14         |

## Effects of Growing Conditions:

Dry weather following applications of *Valtera Cereals* may reduce residual weed control effectiveness as rainfall is required to activate the product in the soil. Length of residual control will decrease as temperature and precipitation increase and on soils of high organic matter and/or high clay content. For foliar weed control, *Valtera Cereals* must be applied to emerged actively growing weeds. Weeds hardened off by cold weather or drought stress may not be adequately controlled. For greatest crop safety, seed the crop 1-2 inches deep. Disturbing the soil surface after application may reduce residual herbicide efficacy. Do not perform any tillage operations after application.

## Tank Mixes:

Tank mix partners applied at all label rates and include recommended adjuvants unless otherwise noted.

**Herbicides:** *Valtera Cereals* may be mixed with glyphosate, 2,4-D, *Blackhawk*, *Blackhawk EVO*, or *Goldwing* for increased control of emerged weeds.

According to the Pest Management Regulatory Agency of Health Canada's Guidance Document on Tank Mix Labelling (March 2023), unlabelled tank mixes of this product are permitted only if the label of this product and the label of the product it might be mixed with include at least general wording on their respective labels indicating they may be mixed with other pesticides. When tank mixes are permitted, apply mixes according to the most restrictive use limitations for either product.

Adding ingredients in the correct order is critical for optimum performance. Check labels of products to be mixed for directions. General guidelines can be found in the introduction.

## Restrictions:

- **Rainfall:** Avoid application when heavy rain is forecast
- **Re-entry:** DO NOT re-enter treated fields for 12 hours.
- **Preharvest Interval:** Do not harvest the treated crop (cut hay/fodder) within 60 days after application.
- **Grazing:** Do not harvest as green feed or permit livestock to graze fields within 26 days after application
- **Re-cropping:** Spring wheat/winter wheat may be seeded 7 days after application or durum wheat 30 days after application. Barley, canola, chickpeas, field corn, field pea, dry common beans, lentils (small red and large green), soybean, and sunflower may be applied 11 months after application. All other crops not listed may be seeded 12 months after application.
- **Aerial Application:** DO NOT apply by aircraft.
- **Storage:** Do not freeze. If product is frozen, bring to room temperature and agitate before use. Do not store or transport near feed, food, drugs, clothing, or domestic water supplies.
- **Buffer Zones:** Observe buffer zones outlined in the label.

## Sprayer Cleaning:

Refer to 'Method A' in the general section on sprayer cleaning in the introduction. Let solution stand for an extended period for better results. See the label for product specific cleaning details.

# Vanquish

Herbicide Group  
4 - dicamba

## Company:

Syngenta Canada Inc. (PCP#26980)

## Formulation:

Dicamba, present as the diglycolamine salt.

- Container size – 2 x 10 L

## Crops and Staging:

Non-cropland areas such as roadsides, hydro, pipeline and railway rights-of-way, airports, military bases, wasteland and turf.

## Weeds Rates and Staging:

Weeds Controlled:

**Vanquish at 507 mL per acre controls the top growth of:**

- |                  |                         |                       |
|------------------|-------------------------|-----------------------|
| • Absinthe       | • Perennial sow-thistle | • Povertyweed         |
| • Canada thistle | • Leafy spurge          | • Scentless chamomile |

**Vanquish at 931 mL per acre controls:**

- |                         |                  |                             |
|-------------------------|------------------|-----------------------------|
| • Perennial sow-thistle | • Tansy ragwort  | • Top growth of curled dock |
| • Common ragweed        | • Canada thistle | • False ragweed             |
| • English daisy         | • Field bindweed | • Giant ragweed             |
| • Goldenrod             |                  |                             |

**Vanquish at 1.86 L per acre controls:**

- |                    |                |                       |
|--------------------|----------------|-----------------------|
| • Diffuse knapweed | • Pasture sage | • Sheep sorrel        |
| • Goat's beard     | • Povertyweed  | • Thyme-leaved spurge |
| • Ground cherry    |                |                       |

**Vanquish at 3.72 L per acre controls:**

- |                     |                              |                        |
|---------------------|------------------------------|------------------------|
| • Baby's breath     | • And top growth control of: | • Perennial cinquefoil |
| • Fringed sagebrush | • Bracken fern               | • Russian knapweed     |

**Broadleaf Weed Control:**

*Vanquish* herbicide can be used alone or in tank-mixes with 2,4-D amine or 2,4-D ester in 40 to 80 L per acre water when weeds are actively growing. For poison ivy control use 226 L per acre water.

- Poison ivy - 688 mL per acre *Vanquish* plus 890 mL per acre 2,4-D amine (500g/L)
- Wild carrot - 850 mL per acre *Vanquish*

**Brush control:**

Apply *Vanquish* tankmixes in spring or early summer to coniferous and deciduous brush species (after the leaves have fully expanded).

For best results and ease of application, cut brush or trees over 2m in height and treat regrowth when it develops.

**Stem Foliage:**

- Apply to foliage and stems to the point of runoff. Complete coverage is essential for effective control.
- Use of a tank-mix with 2,4-D ester herbicide may improve control of balsam poplar as well as other species when they are under drought stress, especially under periods of hot, dry weather.

*Vanquish* at 2.1 L per 1000 L water plus 4.0 L 2,4-D amine (500g/L formulation) or 3.3 L of 2,4-D ester (600g/L formulation):

- Alder
- Aspen poplar
- Cherry
- Wild rose
- Western snowberry
- Wolf willow

*Vanquish* at 4.0 L per 1000 L water plus 8.0 L per 1000 L water of 2,4-D amine (500g/L formulation) or 6.63 L per 1000 L water of 2,4-D ester (600g/L formulation)

- Balsam poplar
- Basswood
- Birch
- Elm
- Hickory
- Vine maple
- Black cottonwood
- Bur oak
- Red Oak
- Tamarack
- Pine
- White Cedar
- Spruce
- Balsam Fir

**Broadcast Ground Treatment:**

Apply in sufficient diluent to wet all foliage.

- Water volume of 89 to 134 L per acre.

1.7 L per acre *Vanquish* plus 3.24 L per acre of 2,4-D amine (500g/L formulation) or 2.67 L per acre of 2,4-D ester (600g/L formulation).

- White (paper) birch
- Willow
- Aspen poplar

**Roadside Vegetation Control:** *Vanquish* herbicide can be used in a tank-mix with glyphosate for annual vegetation control on 1 to 2 meter wide roadside shoulders. *Vanquish* herbicide tank-mixes with glyphosate and 2,4-D amine herbicide offer a broader spectrum of total control of roadside vegetation.

**Directions:**

Apply 0.505 to 1.01 L per acre in tank-mix with 303 mL to 405 mL per acre of glyphosate (360 g ae/L formulation).

Apply 121 mL per acre in a tank-mix with 486 mL per acre 2,4-D amine (500g/L formulation) and 303 to 405 mL per acre glyphosate (360 g ae/L formulation). Refer to the glyphosate label for the appropriate rate for specific weed control and for additional precautions and application instructions.

**Application Information:****Water Volume:**

- **Ground:** Please see rates above.
- **Aerial:** no less than 34 L per acre water.

**How it Works:**

Refer to How Do Herbicides Work in the Weed Control Section for an explanation of the concepts used in the table below.

| Active ingredient | Timing        | Target          | Movement                        | Spectrum       | WSSA Group |
|-------------------|---------------|-----------------|---------------------------------|----------------|------------|
| dicamba           | POST (foliar) | Synthetic auxin | Throughout the plant (Symplast) | Broadleaf only | 4          |

**Effects of Growing Conditions:**

Apply in the morning or late in the evening when air temperature is between 10 and 25°C for best results.

**Tank Mixes:**

**Herbicides:** as noted above

**Fungicides:** None registered.

**Insecticides:** None registered.

**Fertilizers:** None registered.

## Restrictions:

- **Rainfall:** Avoid applying this product when heavy rain is forecasted.
- **Grazing:** DO NOT permit lactating dairy animals to graze fields within 7 days after application. DO NOT harvest forage or cut hay within 30 days after application. Withdraw meat animals from treated fields at least 3 days before slaughter.
- **Aerial Application:** May be applied by aircraft for labelled uses: Aspen poplar & White (paper) birch 1.7 L per acre *Vanquish* plus 3.23 L per acre 2,4-D amine (500g/L formulation) or 2.67 L per acre 2,4-D ester (600g/L formulation)
- **Buffer Zones:** Observe buffer zones outlined in the label.

## Sprayer Cleaning:

See the label for product specific cleaning details.

## Hazard Rating:

Caution – Poison

Refer to the Introduction for an explanation of the symbols.

# Varro

Herbicide Group  
2 - thien carbazone

## Company:

Bayer (PCP#29070)

## Formulation:

10 g/L thien carbazone-methyl formulated as a suspension concentrate.

- Container size - 2 x 8 L

## Crops and Staging:

### Spring wheat (including durum):

- 1 to 6 main stem leaf stage to a maximum of 3 tillers, and before the first node can be felt in the stem. Under drought conditions, do not apply if there is >35 days between seeding and spraying, as drought hastens crop development.

### Winter wheat:

- Spring or fall application from 1 to 6 main stem leaf stage and before the first node can be felt in the stem. DO NOT apply after the presence of the first node as crop injury may occur.

## Weeds and Staging:

Grass weeds controlled from 1 to 6 main stem leaves and prior to the emergence of the 3<sup>rd</sup> tiller unless otherwise indicated:

- |                                            |                                  |                          |
|--------------------------------------------|----------------------------------|--------------------------|
| ◦ Barnyard grass                           | ◦ Japanese brome <sup>†</sup> ** | ◦ Volunteer canaryseed * |
| ◦ Foxtail (green and yellow <sup>†</sup> ) | ◦ Persian darnel <sup>†</sup>    | ◦ Wild oats              |

**Broadleaf weeds controlled at the 1 to 6 leaf stage unless otherwise indicated:**

\* Up to the emergence of the 2<sup>nd</sup> tiller.

\*\* Prior to tillering.

† Suppression only.

## Rates:

0.2 L per acre

Add ammonium sulphate on spring wheat only for improved weed control. Add 200 grams active ammonium sulphate per acre (202 grams per acre of 99 percent dry; 0.5 L per acre of 40 percent liquid or 0.4 L per acre of 49 percent solution) to the tank before adding other components.

DO NOT add ammonium sulphate to applications on durum wheat.

For improved weed control in durum wheat add either *Agral 90* or *AgSurf* at 0.25 L per 100 L.

## Application Information:

- **Water Volume:**
  - **Ground:** 20 to 40 L per acre. Use higher water volumes for dense canopies.
  - **Aerial:** Minimum 11.3 L per acre.
- **Nozzles and Pressure:**
  - **Ground:** For conventional flat fan nozzles use a pressure of 30 to 50 PSI (207 to 345 kPa). Angle nozzles forward 45 degrees for better coverage. Low drift nozzles may require higher pressures for proper performance.
  - **Aerial:** Minimum 43 PSI (300 kPa).

For either ground or aerial, use a combination of nozzles and pressure designed to deliver thorough, even coverage with *ASABE medium* droplets.

## How it Works:

Refer to How Do Herbicides Work in the Weed Control Section for an explanation of the concepts used in the table below.

| Active ingredient | Timing        | Target                             | Movement                          | Spectrum          | WSSA Group |
|-------------------|---------------|------------------------------------|-----------------------------------|-------------------|------------|
| thiencarbazone    | POST (foliar) | ALS Amino Acid Synthesis Inhibitor | Toward areas of growth (Symplast) | Broadleaf & grass | 2          |

## Effects of Growing Conditions:

DO NOT apply to crops or weeds that are stressed (frost, low fertility, drought or flooding, disease or insect damage) as crop injury or reduced weed control may result. Under drought conditions DO NOT apply to spring or durum wheat if the time from seeding to spraying exceeds 35 days or if temperatures will be 3°C or lower within 3 days of application (before or after).

## Tank Mixes:

Add ammonium sulphate to the tank first then *Varro* then the tank mix partner.

Tank mix partners applied at all label rates and include recommended adjuvants unless otherwise noted.

### Herbicides:

- **Wheat (including spring, durum, winter):**
  - *Infinity*
  - *Thumper*
- **Spring Wheat (including durum):**
  - 2,4-D ester (129 g ae per acre)
  - *Buctril M*
  - *Infinity FX*
  - MCPA ester (0.23 L per acre – 600 grams per L formulation)
- **Spring Wheat (NOT including durum):**
  - *Curtail M* (0.61 L per acre)\*
  - *Frontline XL*
  - *Refine SG*
  - *Refine SG* + 2,4-D ester (rates above)
  - *Refine SG* + MCPA ester (rates above)

**Fungicides:** None registered.

**Insecticides:** None registered.

**Fertilizers:** None registered.

**Note:** The above mixes are those listed on the *Varro* label only.

According to the Pest Management Regulatory Agency of Health Canada's Guidance Document on Tank Mix Labelling (March 2023), unlabelled tank mixes of this product are permitted only if the label of this product and the label of the product it might be mixed with include at least general wording on their respective labels indicating they may be mixed with other pesticides. When tank mixes are permitted, apply mixes according to the most restrictive use limitations for either product..

Adding ingredients in the correct order is critical for optimum performance. Check labels of products to be mixed for directions. General guidelines can be found in the introduction.

## Restrictions:

- **Rainfall:** Within 1 hour may reduce control.
- **Restricted Entry Interval:** DO NOT enter treated field for 12 hours.
- **Grazing Restrictions:** Must not be grazed within 7 days or cut for livestock feed within 30 days of treatment.
- **Pre-harvest Interval:** DO NOT harvest grain or straw within 60 days of application for spring and durum wheat or within 72 days of application to winter wheat.
- **Re-cropping Interval:** Alfalfa, barley, canaryseed, canola, chickpea, dry bean, field corn, flax, lentil, mustard, oats, pea, soybean, sunflower, timothy, and wheat (durum, spring) may be seeded the year following application.
- **Aerial Application:** May be applied by air.
- **Storage:** Store in a cool, dry place. Keep from freezing. Shake well before using.
- **Buffer Zones:** Observe buffer zones outlined in the label.

## Sprayer Cleaning:

Refer to 'Method A' in the general section on sprayer cleaning in the introduction. If mixing with other pesticides, combine this method with the method indicated for the tank mix partner.

## Hazard Rating:

Warning – Eye and Skin Irritant

Refer to the Introduction for an explanation of the symbols.

# Varro FX

Herbicide Group  
2 - thien carbazone  
4 - fluroxypyr

## Company:

Bayer

## Formulation:

Varro FX (PCP#34848): 5 g/L thien carbazone-methyl + 118 g/L fluroxypyr formulated as an emulsifiable concentrate.

## Crops and Staging:

### Spring Wheat:

1 to 6 leaves on main stem, plus 3 tillers but PRIOR to jointing (presence of first node)

### Winter Wheat:

Apply either in the fall or the spring when the majority of the plants have 1 leaf to full tillering, but PRIOR to jointing (presence of the first node)

## Weeds and Staging:

### Weeds Controlled:

- Wild oats
- Green foxtail
- Barnyard grass
- Yellow foxtail\*
- Persian dandel\*
- Volunteer canary seed
- Japanese brome\*\*
- Cleavers, 1 to 9 whorls
- Common chickweed, 1-4 leaf
- Hemp nettle
- Kochia, 2-8 leaf
- Lamb's quarters
- Pale smartweed
- Redroot pigweed
- Round-leaved mallow,\*
- Russian thistle\*, up to 10 cm tall
- Stinkweed
- Stork's-bill\*, 1-8 leaf
- Volunteer canola\*\*\*
- Wild buckwheat
- Wild mustard
- Volunteer flax\*\*\*\*, up to 12 cm

\* Suppression only

\*\* Control of spring germinated Japanese brome. Suppression of overwintered Japanese brome. Best results are obtained after a pre-seed or burndown application with glyphosate herbicide.

\*\*\* Non ALS tolerant.

\*\*\*\* Including biotypes resistant to Group 2 herbicides that inhibit the ALS enzyme.

## Rate:

0.4 L per acre

Refer to the product label for complete mixing instructions. A general guide to mixing can be found in the Introduction.

## Application Information:

- **Water Volume:**
  - **Ground:** Minimum 18.9 L per acre
  - **Aerial:** Minimum 11.3 L per acre
- **Nozzles and Pressure:**
  - **Ground:** For conventional flat fan nozzles use a pressure of 30 to 50 PSI (207 to 345 kPa). Angle nozzles forward 45 degrees for better coverage. Low drift nozzles may require higher pressures for proper performance.
  - **Aerial:** Minimum 43 PSI (300 kPa). For either ground or aerial, use a combination of nozzles and pressure designed to deliver thorough, even coverage with ASABE medium droplets.

## How it Works:

Refer to How Do Herbicides Work in the Weed Control Introduction section for an explanation of the concepts used in the table below.

| Active ingredient | Timing        | Target                             | Movement                             | Spectrum          | WSSA Group |
|-------------------|---------------|------------------------------------|--------------------------------------|-------------------|------------|
| Thien carbazone   | POST (foliar) | ALS Amino Acid Synthesis Inhibitor | Towards regions of growth (Symplast) | Broadleaf & Grass | 2          |
| Fluroxypyr        | POST (foliar) | Synthetic auxin                    | Moves through the plant (symplast)   | Broadleaf only    | 4          |

## Effects of Growing Conditions:

DO NOT apply to crops or weeds that are stressed (frost, low fertility, drought or flooding, disease or insect damage) as crop injury or reduced weed control may result. Under drought conditions DO NOT apply to spring or durum wheat if the time from seeding to spraying exceeds 35 days or if temperatures will be 3°C or lower within 3 days of application (before or after).

## Tank Mixes:

### Herbicides:

- **In spring wheat:**
  - *Curtail M\** at 0.6 to 0.8 L per acre.
- **In spring and winter wheat:**
  - *Infinity* at 0.34 L per acre.
  - *Thumper* at 0.4 L per acre.
  - *Buctril M* at 0.4L per acre.
  - MCPA ester\* at 142 to 227 grams a.e. per acre.
  - 2,4-D ester\* at 136 to 227 grams a.e. per acre.
  - *Barricade SG* at 12 grams per acre (plus one of the labelled adjuvants).
  - *Barricade SG* at 12 grams per acre + MCPA ester 500 or MCPA ester 600 at 0.23 L per acre or 0.19 L per acre.
  - *Refine SG* at 12 grams per acre (plus one of the labelled adjuvants.)
  - *Refine SG* at 12 grams per acre + MCPA ester at 113 to 227 grams a.e. per acre.
  - *Refine SG* at 12 grams per acre + 2,4-D ester at 160 to 214 grams a.e. per acre.

**\*Refer to tank mix partner for weed/rate chart**

Note: the above Tank Mixes are those listed on the *Varro FX* label only.

According to the Pest Management Regulatory Agency of Health Canada's Guidance Document on Tank Mix Labelling (March 2023), unlabelled tank mixes of this product are permitted only if the label of this product and the label of the product it might be mixed with include at least general wording on their respective labels indicating they may be mixed with other pesticides. When tank mixes are permitted, apply mixes according to the most restrictive use limitations for either product.

## Restrictions:

- **Rainfall:** 1 hour.
- **Re-entry:** DO NOT re-enter treated fields for 12 hours.
- **Pre-harvest Interval:** DO NOT harvest spring wheat for grain or straw within 60 days of application. DO NOT harvest winter wheat for grain or straw within 72 days of application.
- **Grazing:** : DO NOT graze the treated crops or cut for forage within 7 days or cut for hay within 30 days of application.
- **Re-cropping:** the following crops can be planted 10 months after application – alfalfa, barley, canola, corn, dry beans, flax, lentils, mustard, oats, field peas, soybeans, sunflowers, rye, timothy, triticale (spring and winter), wheat (spring, winter, durum)
- **Aerial Application:** May be applied by aircraft.
- **Storage:** : Store in a cool, dry place. DO NOT store at temperatures below -20°C. If frozen, allow to thaw and agitate thoroughly prior to use. Shake well before using. Store this product away from food or feed.
- **Buffer Zones:** Observe buffer zones outlined in the label.

## Sprayer Cleaning:

Refer to 'Method A' in the general section on sprayer cleaning in the Introduction. If mixing with other pesticides, combine this method with the method indicated for the tank mix partner.

## Hazard Rating:

Skin, eye, and respiratory irritant.

Refer to the Introduction for an explanation of the symbols.

# Velocity m3

Herbicide Group  
2 - thien carbazone  
6 - bromoxynil  
27 - pyrasulfotole

## Company:

Bayer (PCP#29584)

## Formulation:

5 g/L thien carbazone-methyl, 31.3 g/L pyrasulfotole and 175 g/L bromoxynil formulated as a suspension concentrate

- Container sizes - 8.1 L, 129.6 L

## Crops and Staging:

### Spring wheat (including durum):

- 1 to 6 main stem leaf stage to a maximum of 3 tillers, and before the first node can be felt in the stem. Under drought conditions, do not apply if there is >35 days between seeding and spraying, as drought hastens crop development.

### Winter wheat:

- Spring or fall from 1 to 6 leaf stage and before the first node can be felt in the stem. DO NOT apply after the first node is detectable in the stem as crop injury may occur.

## Weeds and Staging:

### Grass weeds controlled from 1 to 6 main stem leaves and prior to the emergence of the 3<sup>rd</sup> tiller:

- |                                           |                               |                               |
|-------------------------------------------|-------------------------------|-------------------------------|
| ◦ Barnyard grass                          | ◦ Canaryseed                  | ◦ Wild oats                   |
| ◦ Foxtail (green and yellow) <sup>†</sup> | ◦ Persian darnel <sup>†</sup> | ◦ Japanese brome <sup>†</sup> |

### Broadleaf weeds controlled at the 1 to 6 leaf stage unless otherwise indicated:

- |                                                 |                                                                    |                                                   |
|-------------------------------------------------|--------------------------------------------------------------------|---------------------------------------------------|
| ◦ Canada fleabane<br>(seedlings 1 to 10 cm)*    | ◦ Kochia (up to 10 cm)                                             | ◦ Shepherd's-purse                                |
| ◦ Canada thistle (up to 30 cm) <sup>†</sup>     | ◦ Lamb's-quarters                                                  | ◦ Sow-thistle (annual, perennial) <sup>†</sup>    |
| ◦ Common chickweed                              | ◦ Narrow-leaved hawk's-beard<br>(up to 10 cm and prior to bolting) | ◦ Spreading atriplex (1 to 10 leaf) <sup>†*</sup> |
| ◦ Cleavers (1 to 3 whorls)                      | ◦ Pale smartweed                                                   | ◦ Stinkweed                                       |
| ◦ Cleavers (4 to 6 whorls)*                     | ◦ Pigweed, redroot                                                 | ◦ Stork's-bill (1 to 8 leaf)**                    |
| ◦ Dandelion (up to 25 cm diameter) <sup>†</sup> | ◦ Ragweed (common, giant <sup>†*</sup> )                           | ◦ Volunteer canola (all varieties)                |
| ◦ Flixweed (up to 10 cm)                        | ◦ Round-leaved mallow                                              | ◦ Wild buckwheat                                  |
| ◦ Hemp-nettle                                   | ◦ Russian thistle (up to 10 cm)                                    | ◦ Wild mustard                                    |

<sup>†</sup> Suppression only.

\* Add ammonium sulphate as per the "Rates:" section below.

\*\* Only when mixed with 2,4-D ester + ammonium sulphate (see Tank Mixes).

## Rates:

0.405 L per acre

Add ammonium sulphate on spring wheat only for improved weed control or when tank mixing with 2,4-D or MCPA. Add 200 grams active ammonium sulphate (202 grams per acre of 99 percent dry; 0.5 L per acre of 40 percent liquid or 0.4 L per acre of 49 percent liquid). If using an ammonium sulphate product with a different concentration, adjust the rate accordingly.

DO NOT add ammonium sulphate to applications on durum wheat.

DO NOT apply *Velocity m3* or other products containing thien carbazone, pyrasulfotole or bromoxynil more than once in the same year.

## Application Information:

- **Water Volume:**
  - **Ground:** 20 to 40 L per acre. Use higher water volumes for dense canopies.
  - **Aerial:** Minimum 11.4 L per acre.
- **Nozzles and Pressure:**
  - **Ground:** For conventional flat fan nozzles use a pressure of 30 to 50 PSI (207 to 345 kPa). Angle nozzles forward 45 degrees for better coverage. Low drift nozzles may require higher pressures for proper performance.
  - **Aerial:** Minimum 43 PSI (300 kPa).

For either ground or aerial, use a combination of nozzles and pressure designed to deliver thorough, even coverage with **ASABE medium** droplets.

## How it Works:

Refer to How Do Herbicides Work in the Weed Control Section for an explanation of the concepts used in the table below.

| Active ingredient | Timing        | Target                                | Movement                                                                        | Spectrum          | WSSA Group |
|-------------------|---------------|---------------------------------------|---------------------------------------------------------------------------------|-------------------|------------|
| thiencarbazone    | POST (foliar) | ALS Amino Acid Synthesis Inhibitor    | Toward areas of growth (Symplast)                                               | Broadleaf & grass | 2          |
| bromoxynil        | POST (foliar) | PSII Inhibitor/<br>Membrane disruptor | Little (apoplast)                                                               | Broadleaf only    | 6          |
| pyrasulfotole     | POST (foliar) | HPPD Pigment Inhibitor                | Some – both foliar & root (Apoplast) –<br>Somewhat systemic (has soil residues) | Broadleaf only    | 27         |

## Effects of Growing Conditions:

DO NOT apply to crops or weeds that are stressed (frost, low fertility, drought or flooding, disease or insect damage) as crop injury or reduced weed control may result.

DO NOT apply to spring or durum wheat under conditions where the time from seeding to spraying exceeds 35 days or if temperatures will be 3°C or lower within 3 days of application (before or after).

## Tank Mixes:

### Herbicides:

- 2,4-D ester (113 g ae per acre) plus ammonium sulphate\* (see Rates).

\*add ammonium sulphate on spring wheat (NOT durum) only.

**Fungicides:** None registered.

**Insecticides:** None registered.

**Note:** The above mixes are those listed on the *Velocity m3* label only.

According to the Pest Management Regulatory Agency of Health Canada's Guidance Document on Tank Mix Labelling (March 2023), unlabelled tank mixes of this product are permitted only if the label of this product and the label of the product it might be mixed with include at least general wording on their respective labels indicating they may be mixed with other pesticides. When tank mixes are permitted, apply mixes according to the most restrictive use limitations for either product.

Adding ingredients in the correct order is critical for optimum performance. Check labels of products to be mixed for directions. General guidelines can be found in the introduction.

## Restrictions:

- **Rainfall:** Within 1 hour may reduce control.
- **Restricted Entry Interval:** DO NOT enter treated field for 24 hours.
- **Pre-harvest Interval:** DO NOT harvest grain or straw within 60 days of application to spring and durum wheat or within 72 days of application to winter wheat.
- **Grazing Restrictions:** Must not be cut for livestock feed within 30 days or grazed by livestock within 25 days of treating the crop.
- **Re-cropping Interval:** Alfalfa, barley, canaryseed, canola, field corn (Manitoba only), flax, soybean (Manitoba only), tame oats, and wheat (durum, spring) may be seeded the year following application. Field pea may be grown the following year in all black, grey-wooded and dark brown soil zones. DO NOT plant field pea the season following *Velocity m3* use in the brown soil zone where soil pH is above 7.5 and precipitation was less than 125 mm from June 1st until September 1st of the year of application.
- **Aerial Application:** May be applied by air.
- **Storage:** Store in a cool, dry place. Keep from freezing. This product is combustible. DO NOT store near heat or open flame.
- **Buffer Zones:** Observe buffer zones outlined in the label.

## Sprayer Cleaning:

Refer to 'Method A' in the general sprayer cleaning section in the introduction.

## Hazard Rating:

Warning – Poison

Danger – Corrosive to Eyes

Skin Irritant, Potential Skin Sensitizer

Refer to the Introduction for an explanation of the symbols.

# Velpar DF CU

Herbicide Group  
5 - hexazinone

## Company:

Tessenderlo Kerley Inc. (PCP#25225)

## Formulation:

75% hexazinone formulated as a water dispersible granule.

- Container size - 2 kg

## Crops and Staging:

Established alfalfa for forage and seed (established 18 months or longer). Apply in late fall prior to freeze-up when alfalfa is dormant or in early spring before alfalfa growth resumes. If burning or irrigation is to be carried out, do not apply until these operations have been completed.

Crop injury may occur in fields where alfalfa root growth has been restricted by hard pans or other physical barriers to root growth.

## Weeds, Rates and Staging:

Application stage is dictated by the crop dormancy listed above.

**Apply a minimum of 0.272 kg per acre to control:**

- Dandelion
- Sow-thistle
- Quackgrass

**Apply 0.544 kg per acre to control:**

- *The weeds above plus:*
  - Narrow-leaved hawk's-beard
  - Scentless chamomile

Use the lower rate on medium-textured soils with low organic matter.

DO NOT apply *Velpar DF CU* to:

- soil that is frozen
- Soil with less than 1 percent organic matter content
- Soil that is gravely/rocky, sandy or has exposed subsoil

## Application Information:

- **Water Volume:** 81 L per acre.
- **Nozzles and Pressure:** 30 to 40 psi (200 to 275 kPa) when using conventional flat fan nozzles. Low drift nozzles may require higher pressures for proper performance. Use a combination of nozzles and pressure designed to deliver thorough, even coverage with *ASABE coarse* droplets.

## How it Works:

Refer to How Do Herbicides Work in the Weed Control Section for an explanation of the concepts used in the table below.

| Active ingredient | Timing                       | Target                                | Movement                       | Spectrum          | WSSA Group |
|-------------------|------------------------------|---------------------------------------|--------------------------------|-------------------|------------|
| hexazinone        | PRE (surface)<br>soil active | PSII Inhibitor/<br>Membrane disruptor | Upward soil applied (Apoplast) | Broadleaf & grass | 5          |

## Effects of Growing Conditions:

Adequate soil moisture is required for activation of the product.

## Tank Mixes:

None registered.

## Restrictions:

- **Rainfall:** Rainfall is beneficial for activation of the product.
- **Restricted Entry Interval:** DO NOT re-enter treated fields for 48 hours.
- **Grazing Restrictions:** Leave 30 days between application and grazing harvesting for feed (hay or greenfeed).
- **Re-cropping Interval:** Leave 2 years of between treating alfalfa and the seeding of a crop. A field bioassay is required after 2 years to determine which crops are safe to grow.
- **Aerial Application:** DO NOT apply by air.
- **Storage:** May be frozen.
- **Buffer Zones:** Observe buffer zones outlined in the label.

## Sprayer Cleaning:

No specific cleaning procedures are indicated on the label. Based on products with similar chemistry, 'Method B' found in the general sprayer cleaning section in the introduction or a commercial spray sprayer cleaning product, may provide adequate cleaning. Contact the manufacturer for more information.

## Hazard Rating:

Danger – Corrosive to Eyes

Caution – Poison

Caution – Skin Irritant

Warning – Contains the Allergen Milk

Refer to the Introduction for an explanation of the symbols.

# Voraxor

**Herbicide Group  
14 - trifludimoxazin  
& saflufenacil**

## Company:

BASF Canada

## Formulation:

The *Voraxor* package contains the following components:

**Voraxor (PCP#33968):** 125 g/L trifludimoxazin plus 250 g/L saflufenacil formulated as a suspension concentrate.

- Container size - 1.56 L

**Merge (PCP#24702):** surfactant blend/solvent.

- Container size - 2 x 8.1 L

## Crops and Staging:

Always add *Merge* at 0.2 to 0.4 L per acre.

| Crop                                                                                   | Staging                                                   | Rate (mL per acre) |
|----------------------------------------------------------------------------------------|-----------------------------------------------------------|--------------------|
| Lentils*, canaryseed, oats, fall rye and triticale                                     | Pre-seed or pre-emergent                                  | 19.5               |
| Field corn and soybeans                                                                | Pre-seed or pre-emergent                                  | 19.5 to 40.5       |
| Wheat (durum, spring and winter), barley, peas (dried field), chickpeas and faba beans | Pre-seed or pre-emergent                                  | 19.5 to 58         |
| Chemfallow                                                                             | Apply to actively growing weeds less than 15 cm in height | 19.5 to 29         |

\* Lentils are more susceptible to injury on coarse textured (sandy or gravelly) and low organic matter soils. Lentils will typically grow out of injury symptoms, and yield will not be impacted at recommended rates under normal growing conditions.

## Weeds, Rates and Staging:

Apply at 19.5 to 29 mL per acre provides rapid burndown control of broadleaf weeds listed below (up to 8-leaf except where indicated).

### Weeds controlled:

- Canada fleabane
- Cleavers (up to 4-whorls)\*
- Hemp nettle (4 leaf)
- Kochia (up to 15 cm)\*
- Lamb's-quarters\*
- Narrow-leaved hawk's-beard (up to 8 cm)
- Redroot pigweed\*
- Round-leaved mallow
- Russian thistle (up to 15 cm)
- Shepherd's-purse
- Stinkweed\*
- Volunteer canola (all varieties)\*
- Wild buckwheat\*
- Wild mustard\*

\* *Voraxor* applied at a rate of 41.5 to 58 mL per acre will suppress of secondary flushes.

## Application Information:

- **Water Volume:**
  - **Ground:** 20 to 40 L per acre. Higher water volumes require for dense weed stands. Weed control improves with the amount of coverage.
- **Nozzles and Pressure:** Use a combination of nozzles and pressure designed to deliver thorough, even coverage with *ASABE medium* droplets by ground. Low drift nozzles may require higher pressures for proper performance. DO NOT apply in periods of dead calm.

## How it Works:

Refer to How Do Herbicides Work in the Weed Control Section for an explanation of the concepts used in the table below.

| Active ingredient | Timing                                  | Target                               | Movement                                             | Spectrum                        | WSSA Group |
|-------------------|-----------------------------------------|--------------------------------------|------------------------------------------------------|---------------------------------|------------|
| saflufenacil      | POST (foliar) with slight soil activity | PPO Inhibitor/<br>Membrane disrupter | Little movement due to rapid cell leakage (Symplast) | Non-selective broadleaf         | 14         |
| trifludimoxazin   | PRE (soil active) and POST (foliar)     | PPO Inhibitor/<br>Membrane disrupter | Little movement due to rapid cell leakage (Symplast) | Selective broadleaf and grasses | 14         |

## Effects of Growing Conditions:

Warm, moist growing conditions promote active weed growth. Weeds hardened off by environmental stress such as cold weather, drought or excessive heat may not be adequately controlled.

## Tank Mixes:

Tank mix partners applied at all label rates and include recommended adjuvants unless otherwise noted.

**Note:** crop injury may occur in lentil when saflufenacil (see Heat) is used in conjunction with certain soil applied/soil active herbicides. Consult with the manufacturer for more guidance.

### Herbicides:

- **Prior to emergence of all registered crops:**
    - Glyphosate
  - **Prior to the emergence of corn, lentils, peas, chickpeas, faba beans and soybeans:**
    - Zidua\*
    - Zidua\* plus glyphosate
- \* DO NOT apply Voraxor or Zidua SC to lentils at rates higher than 19.5 or 49 mL per acre, respectively, or crop injury may occur. Crop seeds must be planted 2.5 cm deep.

**Fungicides:** None registered.

**Insecticides:** None registered.

**Fertilizers:** None registered.

Adding ingredients in the correct order is critical for optimum performance. Check labels of products to be mixed for directions. General guidelines can be found in the introduction.

## Restrictions:

- **Rainfall:** Rainfall shortly after product application can result in slight injury to the crop.
  - **Restricted Entry Interval:** DO NOT re-enter treated fields for 12 hours.
  - **Pre-harvest Interval:** None.
  - **Grazing Restrictions:** Field corn forage and silage, soybeans, field peas and lentils for feed or grazing - 60 days. Wheat and barley forage and hay for feed or grazing - 30 days.
  - **Re-cropping Interval:** Following a spring application plant registered crops only. Plant back crops in case of crop failure\*\* - barley, dry field peas, lentils, field corn, soybean, wheat (spring, winter, durum), or when applied after August 1. After 3 months after application - winter wheat.
- \*\* Rate restrictions above apply. A second application cannot be made in the rescue crop.
- **Aerial Application:** DO NOT apply by air.
  - **Storage:** Prevent from freezing. If the product freezes, allow to thaw at room temperature for 24 hours and agitate well prior to use. Store in original container in a cool, secure and well-ventilated area separately from fertilizer, feed or food.
  - **Buffer Zones:** Observe buffer zones outlined in the label.

## Sprayer Cleaning:

Refer to 'Method B' in the general sprayer cleaning section in the introduction. Let solution stand for an extended period for better results. See the label for product specific cleaning details. Refer to the tank mix partner's product label for any additional cleaning instructions.

## Hazard Rating:

Caution – Possible Skin Irritant

Caution – Eye Irritant

Refer to the Introduction for an explanation of the symbols.

# Voraxor Complete

*This product is a prepackaged tank mix of Voraxor and Zidua SC.  
Information listed is restricted to Crops, Weeds, Rates and Tank mixes.  
For other detailed restrictions and other general information on the  
component products see the product pages listed above.*

Herbicide Group  
14 – trifludimoxazin, saflufenacil  
15 - pyroxasulfone

## Company:

BASF Canada

## Formulation:

The *Voraxor Complete* package contains three components:

**Voraxor (PCP#33968):** 125 g/L trifludimoxazin plus 250 g/L saflufenacil formulated as a suspension concentrate

- Container size - 1.56 L

**Zidua SC (PCP#32542):** 500 g/L pyroxasulfone formulated as a suspension concentrate.

- Container size - 3.89 L

-plus-

**Merge (PCP#24702):** 50% Surfactant blend plus solvent 50% formulated as a surfactant

- Container size - 2 x 8.1 L

## Crops and Staging:

Apply prior to seeding or after seeding but prior to crop emergence.

Add products to the spray tank in the following order: *Zidua SC*, *Voraxor*, glyphosate, *Merge* adjuvant. If foaming occurs, add an anti-foaming agent.

| Crop                                                      | Rates (mL per acre) |                 |              |
|-----------------------------------------------------------|---------------------|-----------------|--------------|
|                                                           | <i>Voraxor</i>      | <i>Zidua SC</i> | <i>Merge</i> |
| Field pea, field corn, soybeans, chickpeas and faba beans | 19.5 to 40.5        | 49 to 97        | 200 to 400   |
| Lentil                                                    | 19.5                | 49              | 200 to 400   |

Field corn, lentils, chickpeas, faba beans and field peas must be planted 2.5cm deep to reduce risk of injury. Soybeans must be planted at least 4 cm deep to reduce risk of injury.

## Weeds and Staging:

Broadleaf weeds controlled by *Voraxor* plus the broadleaf and grass weeds controlled by *Zidua SC* at the rates above. Foliar stages are indicated on the *Voraxor* page.

## Tank Mixes:

Tank mix partners applied at all label rates and include recommended adjuvants unless otherwise noted.

**Note:** Crop injury may occur in lentil when *Voraxor Complete* is used in conjunction with certain soil applied/soil active herbicides. Consult with the manufacturer for more guidance.

### Herbicides:

**Pre- seed, pre-emergence:** *Voraxor Complete* must be tank mixed with glyphosate 0.5 to 1 L per acre of 360 g/L equivalent. *Merge* (200 to 400 mL per acre) is **always** required.

**Fungicides:** None registered.

**Insecticides:** None registered.

**Fertilizers:** None registered.

Adding ingredients in the correct order is critical for optimum performance. Check labels of products to be mixed for directions. General guidelines can be found in the introduction.

**See component products for more information on restrictions, application details and handling. Unless indicated differently above use the most limiting restrictions across all components for the mix.**

# Zidua SC

Herbicide Group  
15 - pyroxasulfone

## Company:

BASF Canada (PCP#32542)

## Formulation:

500 g/L pyroxasulfone formulated as a suspension concentrate.

- Container size - 2 x 4.05 L

## Crops, Rates and Staging:

**Field corn:** Pre-plant (up to 30 days), pre-emergence or post-emergent up to 4 leaf.

**Herbicide-tolerant soybean:** Pre-plant, pre-emergence

|                        | Rate per acre by soil texture |                  |              |             |
|------------------------|-------------------------------|------------------|--------------|-------------|
|                        | Coarse                        | Medium-Fine soil |              | Fine        |
|                        |                               | OM ≤ 3%          | 3% < OM < 7% |             |
| Corn and soybean rates | 101 mL/acre                   | 134 mL/acre      | 169 mL/acre  | 200 mL/acre |

## Soil Textures:

| Coarse                           | Medium                    | Medium-Fine                                      | Fine                            |
|----------------------------------|---------------------------|--------------------------------------------------|---------------------------------|
| Sand<br>Loamy sand<br>Sandy loam | Loam<br>Silt loam<br>Silt | Sandy clay loam<br>Sandy clay<br>Silty clay loam | Silty clay<br>Clay loam<br>Clay |

DO NOT apply *Zidua SC* on peat or muck soils and soils with 7 per cent or more organic matter content.

**Field peas, faba beans and chickpeas:** Pre-plant, pre-emergence at 49 to 97 mL per acre, fall application 73-97 mL per acre.

**Lentils:** Pre-plant, pre-emergence at 49 to 73 mL per acre, fall application 73 to 97 mL per acre.

**Potatoes:** After planting and hilling, before crop emergence at 49 to 97 mL per acre.

**Sunflowers:** Preplant or pre-emergence at 49 to 97 mL per acre.

**Herbicide tolerant soybeans:** Early post emergence at 73 mL per acre.

## Weeds, Rates and Staging:

For corn or herbicide-tolerant soybeans for the pre-emergent control of the following weeds:

### Grasses:

- Barnyard grass
- Foxtail (green, yellow)
- Ryegrass (Italian)

### Broadleaf Weeds:

- Redroot pigweed
- Waterhemp

### Suppression of the following weeds at the lentil, field pea or potato rates above:

- Foxtail (green, yellow)
- Lamb's quarters
- Waterhemp
- Kochia
- Redroot pigweed
- Wild oats

*Maximum ONE APPLICATION per season of Zidua SC or other products containing pyroxasulfone.*

All applications require rainfall for proper activation. (See "Effects of Growing Conditions")

Refer to the product label for complete mixing instructions for this product and its mixes. A general guide to mixing can be found in the introduction.

## Application Information:

- **Water Volume:** Minimum of 40 L per acre.
- **Nozzles and Pressure:** Consult nozzle manufacturers' recommendations for spray pressure for specific nozzles.
- **Screens:** Use a 50 mesh filter screen.

## How it Works:

Refer to How Do Herbicides Work in the Weed Control Section for an explanation of the concepts used in the table below.

| Active ingredient | Timing                                    | Target                          | Movement                   | Spectrum          | WSSA Group |
|-------------------|-------------------------------------------|---------------------------------|----------------------------|-------------------|------------|
| pyroxasulfone     | PRE (surface) with residual soil activity | Long-chain Fatty Acid Inhibitor | Little movement (Symplast) | Broadleaf & grass | 15         |

## Effects of Growing Conditions:

Applications to crops under stress due to either inadequate or excess of moisture for normal crop development, cool and hot temperatures, sodic soils, poorly drained soils, hail damage, flooding, pesticide injury, mechanical injury or widely fluctuating temperatures may result in crop injury.

## Tank Mixes:

### Herbicides:

- **Field corn:**
  - *Aatrex Liquid 480* (0.85 to 1.25 L per acre)
  - Glyphosate (Pre-seed or pre-emergence only. Glyphosate present as IPA, DA or K+ salt.)
- **Soybean:**
  - Glyphosate (Pre-seed or pre-emergence only. Glyphosate present as IPA, DA or K+ salt.)
- **Potatoes:**
  - Glyphosate
  - *Sencor 480 DF*
  - Glyphosate + *Sencor 480 DF*

**Note: The above mixes are those listed on the *Zidua* label only.**

According to the Pest Management Regulatory Agency of Health Canada's Guidance Document on Tank Mix Labelling (March 2023), unlabelled tank mixes of this product are permitted only if the label of this product and the label of the product it might be mixed with include at least general wording on their respective labels indicating they may be mixed with other pesticides. When tank mixes are permitted, apply mixes according to the most restrictive use limitations for either product.

Adding ingredients in the correct order is critical for optimum performance. Check labels of both products to be mixed for directions. General guidelines can be found in the introduction.

## Restrictions:

- **Rainfall:** Moisture is necessary to activate the active ingredient pyroxasulfone in soil for weed control.
- **Restricted Entry Interval:** DO NOT enter treated fields for 12 hours.
- **Re-cropping Interval:** In the event of crop failure, only labelled crops may be planted in fields treated with *Zidua* (rate restrictions apply). Winter wheat may be planted 4 months following application. For spring applications of *Zidua*, sunflowers, field corn, soybeans, chickpea, faba beans, lentil, field peas, spring wheat (including durum), barley, oats, flax, potato, and canola can be planted the season after application. When *Zidua* is applied in the fall, fields can be planted the following season to all labelled crops, except peanuts. When total seasonal application rates exceed 97 mL per acre, corn, soybean, chickpea, lentil, field peas, flax and potato may be planted the following season.
- **Aerial Application:** DO NOT apply by air.
- **Storage:** Store in original containers in cool, dry, well-ventilated location away from food or feed.
- **Buffer Zones:** Observe buffer zones outlined in the label.

## Sprayer Cleaning:

Refer to 'Method B' in the general sprayer cleaning section in the introduction. Let solution stand for an extended period for better results. Flush sprayer system with water before reuse. See the label for product specific cleaning details.

## Hazard Rating:

Warning – Contains the Allergen Soy

Refer to the Introduction for an explanation of the symbols.

# Plant Growth Regulators

Plant growth regulators (PGRs) are chemicals that alter hormonal activity in a plant to modify plant growth and development. Depending on the compound and the plant, PGRs can modify plant growth by affecting shoot growth, branching, flowering, colour of fruit, root growth, leafing and leaf fall, as well as many other uses. PGRs are generally used to improve lodging resistance, promote fruit ripening, and to stimulate flowering in horticulture crops.

## Effect of Lodging on Cereal Crops

Yield loss due to lodging depends on cultivar susceptibility to lodging, growth stage, severity of lodging, as well as wind and rain events. The greatest yield loss occurs when lodging happens within 20 days after anthesis. Prior to anthesis, lodged plants are able to right themselves by node bending. Lodging can reduce yield by interfering with photosynthesis and carbohydrate movement in the plant, and due to difficulty harvesting and more unthreshed heads. Grain quality in lodged plants can also be reduced by lower test weight and increased sprouting.

## Types of Plant Growth Regulators

There are two main groups of PGRs used on cereal crops: ethylene releasing compounds and gibberellin inhibitors. These PGRs are intended to produce plants with shorter, thicker and stronger stems, and they may be another management tool to reduce lodging.

## How Will a Crop Respond to PGR Application?

PGRs are intended to increase crop standability and harvestability by reducing cell elongation and stem length. Plant hormones can affect other hormones, so it is possible for PGRs to have secondary or unintended effects such as increased root growth, increased resistance to environmental stress, or delayed senescence. The effects of PGRs are not well known, there have been reports of PGRs resulting in stem elongation, positively or negatively affecting yield, and increased tiller growth which could increase or decrease yield.

Response to PGRs can be crop species and cultivar specific. Wheat is known to be most responsive to chlomequat chloride, followed by barley with an intermediate response, while oats are the least responsive. Not all cultivars show similar height and lodging responses to PGR application, but more research is needed to identify which cultivars are most likely to have a positive response.

PGRs are most useful in environments where lodging risk is high and the crop has a high yield potential. Consider PGRs in high yielding environments where moisture is abundant and high levels of nitrogen have been applied.

## Application Timing

Applying PGRs as the correct time is critical. Before using a PGR, read the label to ensure that you are familiar with the correct stage of application and how to stage a crop correctly.

# Manipulator 620

Plant growth regulator

## Company:

Taminco US Inc. (PCP#31462); Distributed by Belchim Crop Protection Canada

## Formulations:

620 g/L chlormequat chloride formulated as a solution.

- Container sizes - 2 x 10 L, 859 L

## Crops, Rates and Stages:

Apply *Manipulator 620* when risk of lodging is high.

**Note:** as of January 1, 2025 [www.keepitclean.ca](http://www.keepitclean.ca) indicates that the use of this product on certain crop types may have market access concerns. Please see introduction for more information AND *consult potential grain buyers before using this product.*

| Crop*                          | Application        | Rate (L per acre)                                   | Stage                                                                                                                       |
|--------------------------------|--------------------|-----------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------|
| Barley, oats                   | Single Application | 0.93                                                | from 1 tiller to flag leaf collar visible                                                                                   |
|                                | Split Application  | 0.46                                                | first application from 1 tiller to beginning of stem elongation, second application from 1 node to flag leaf collar visible |
| Spring wheat (including durum) | Single Application | 0.7                                                 | from 1 tiller to flag leaf collar visible                                                                                   |

| Winter wheat                   | Single Application | 0.7                                                 | from 1 tiller to flag leaf collar visible                                                                                   |
|                                | Split Application  | 0.4 – First Application<br>0.3 – Second Application | from 1 tiller to beginning of stem elongation<br>from 1 node to flag leaf collar visible                                    |

\* May be applied to crops under-seeded to clover or grasses. DO NOT apply later than just before flag leaf emergence.

DO NOT exceed 0.7 L of *Manipulator 620* per acre in a single year for wheat or 0.92 L per acre for oats and barley.

## Application Information:

- **Water Volume:**
  - **Ground:** Minimum 40 L per acre.
  - **Aerial:** Minimum 20 L per acre.
- **Nozzles and Pressure:** Use a combination of nozzles and pressure designed to deliver thorough, even coverage with **ASABE medium** droplets. Boom height must be 60 cm or less above the crop.

## How it Works:

*Manipulator 620* affects the production of plant hormones responsible for cell elongation resulting in plants with shorter, thicker stems.

## Effects of Growing Conditions:

DO NOT apply *Manipulator 620* to crops under stress from drought, excess moisture or nutrient deficiency. Best results from early morning or evening application.

Applications of *Manipulator 620* may be made under normal seasonal temperatures down to 1° Celsius. DO NOT apply during frost.

## Tank Mixes:

None registered.

DO NOT use in a tank mixture with liquid nitrogen fertilizer.

## Restrictions:

- **Rainfall:** Within 2 hours may reduce effectiveness. Avoid application when heavy rain is forecast.
- **Restricted Entry Interval:** DO NOT re-enter treated fields for 12 hours.
- **Grazing Restrictions:** DO NOT graze treated crops or cut for hay.
- **Pre-harvest Interval:** DO NOT apply later than just before flag leaf emergence.
- **Re-cropping Interval:** No restrictions the year after application.
- **Aerial Application:** May be applied by air.
- **Storage:** DO NOT freeze.

• **Buffer Zones:**

| Application method  | Crops                            | Buffer Zones (metres <sup>†</sup> ) Required for the Protection of: |
|---------------------|----------------------------------|---------------------------------------------------------------------|
|                     |                                  | Terrestrial habitat                                                 |

|                     | Barley, oats                     | 15                                                                  |
| Aerial (helicopter) | Wheat (winter, spring and durum) | 10                                                                  |
|                     | Barley, oats                     | 10                                                                  |

See page 43 for an explanation of the different habitats.

<sup>†</sup> Distance measured as metres from the downwind edge of the spray boom to sensitive habitat.

## Sprayer Cleaning:

Refer to the general section on sprayer cleaning.

## Hazard Rating:

Danger – Poison

Refer to the introduction for an explanation of the symbols.

# Moddus

Plant growth regulator

## Company:

Syngenta Canada

## Formulations:

**Moddus (PCP#33930):** 11.3% trinexapac-ethyl formulated as an emulsifiable concentrate.

- Container size - 2 x 10 L

## Crops and Stages:

*Moddus* aids in the growth and lodging management of wheat, barley and oats and the growth of perennial ryegrass grown for seed.

| Crop                               | Application        | Rate (L per acre) | Stage                                                                                                                                                                                                                                                                                                          |
|------------------------------------|--------------------|-------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

|                                    | Split Application  | 0.17 to 0.21      | Make the first application at BBCH 21 to 24 (main shoot and a maximum 4 tillers).<br>Make the second application at BBCH 37 to 39 (flag leaf just visible to ligule of last leaf visible).<br>Due to risk of injury to the crop, avoid overlapping and DO NOT apply to wheat that is environmentally stressed. |
| Oats                               | Single application | 0.34              | BBCH 30 to 39 (pseudo stem erection to ligule of last leaf visible).<br>Due to risk of injury to the crop, avoid overlapping and DO NOT apply to oats that are environmentally stressed.                                                                                                                       |
|                                    | Split Application  | 0.17              | Make the first application at BBCH 21 to 24 (main shoot and a maximum 4 tillers).<br>Make the second application at BBCH 37 to 39 (flag leaf just visible to ligule of last leaf visible).<br>Due to risk of injury to the crop, avoid overlapping and DO NOT apply to oats that are environmentally stressed. |

| Crop                                               | Application        | Rate (L per acre) | Stage                                                                                                                                                                                                                                                                                                                                                                                       |
|----------------------------------------------------|--------------------|-------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Winter wheat                                       | Single Application | 0.34 to 0.42      | BBCH 30 to 39 (beginning of stem elongation to flag leaf stage).<br>Optimal application timing is at BBCH 30 to 32 (stem elongation up to 2 nodes detectable in stem).<br>Use the higher rate in varieties that are more prone to lodging and in fields that are intensively managed (i.e., high fertility, high seeding rate).<br>DO NOT apply past BBCH 39 (ligule of last leaf visible). |
| Barley                                             | Single Application | 0.42              | Optimal application timing is at BBCH 30 to 32 (stem elongation up to 2 nodes detectable in stem). DO NOT apply past BBCH 39 (ligule of last leaf visible). Due to risk of injury to barley, avoid overlapping and DO NOT apply to barley that is environmentally stressed.                                                                                                                 |
|                                                    | Split Application  | 0.21              | Make the first application at BBCH 21 to 24 (main shoot and a maximum 4 tillers).<br>Make the second application at BBCH 37 to 39 (flag leaf just visible to ligule of last leaf visible).                                                                                                                                                                                                  |
| Perennial ryegrass (turf type only) grown for seed | Single Application | 0.69 to 1.38      | Before or during stem elongation stage of development (BBCH 30 to 37). <b>NOTE:</b> Although this product is effective at any time in this growth stage the BEST timing is early, BBCH 32 (second node on the main stem is detectable). DO NOT apply to perennial ryegrass that is environmentally stressed. DO NOT apply to forage type perennial ryegrass.                                |

**Note:** Due to risk of injury to the crop, avoid overlapping and DO NOT apply to crops that are or could become stressed, such as by low fertility, high temperatures, drought, frost or diseased or insect-damaged.

Environmental conditions, crop management, and cultural practices that affect plant growth and vigour will influence the response of the crop to MODDUS Plant Growth Regulator applications.

### Application Information:

- **Water Volume:**
  - **Ground:** Minimum 40 L per acre
  - **Aerial:** Minimum 20 L per acre (wheat, oats and barley only)
- **Nozzles and Pressure:**
  - **Ground:** Use a hydraulic nozzle with 80° or 110° drift reducing flat fan (e.g. those with a pre-orifice or turbulence chamber) or air induction nozzles with up to. DO NOT use flood type nozzles, controlled droplet application equipment, spray foils or hollow cone nozzles. Use a combination of volume and pressure recommended by the nozzle manufacturer to achieve no finer than *ASAE medium* droplets.
- **Screens:** Use 50 mesh or coarser line strainers and screens or 80 mesh with air induction nozzles.

### How it Works:

*Moddus* Plant Growth Regulator aids in the growth and lodging management of wheat, barley and oats and the growth of perennial ryegrass grown for seed.

### Effects of Growing Conditions:

**NOTE:** Due to risk of injury to the crop, avoid overlapping and DO NOT apply to crops that are stressed or could become stressed following application, such as by low fertility, high temperatures, drought, frost or diseased or insect-damaged. Environmental conditions, crop management, and cultural practices that affect plant growth and vigour will influence the response of the crop to *Moddus* Plant Growth Regulator applications.

### Tank Mixes:

None registered.

It is important to check the physical compatibility of tank mixes containing *Moddus* using a jar test following the WAMLEGS mixing order with proportionate amounts of mix partners and water, before mixing in the spray tank.

In some cases, tank mixing a pest control product, such as *Moddus*, with another pest control product or a fertilizer can result in biological effects that could include, but are not limited to, reduced efficacy or increased host crop injury.

## Restrictions:

- **Rainfall:** Within 3 hours may reduce effectiveness.
- **Restricted Entry Interval:** DO NOT re-enter treated fields for 12 hours.
- **Grazing Restrictions:** Cereals – forage and hay – 30 days; cereals – grain and straw – harvest at maturity; perennial ryegrass for seed production – 50 days.
- **Pre-harvest Interval:** None indicated. Harvest at maturity.
- **Re-cropping Interval:** Wheat, barley and oats (0 days); all other feed and food crops (30 days).
- **Aerial Application:** Wheat, oats and barley may be applied by air. DO NOT apply by air to perennial ryegrass.
- **Storage:** Keep in original container, tightly closed, during storage. Store this product away from food or feed. Store in a cool, dry, well ventilated area and out of the reach of children and animals.
- **Buffer Zones:** None given. Avoid contact with non-target plants. Avoid overspraying water bodies or sensitive habitat.

## Sprayer Cleaning:

Refer to 'Method C' in the general section on sprayer cleaning.

## Hazard Rating:

Warning – Eye Irritant

Refer to the introduction for an explanation of the symbols.

# Plant Disease Control

## Integrated Plant Disease Management

### Cereal Leaf Diseases

Cereal leaf diseases affect both the yield and quality of cereals. The following management practices are recommended for effective control of leaf diseases in all cereal crops.

- **Scouting:** Scout fields prior to, during, and following flag leaf emergence to check for disease levels. Flag and upper leaves are responsible for 50 per cent or more of grain-fill.
- **Crop Rotation:** Rotate crop types [e.g. cereal (wheat)/oilseed/cereal(barley)/pulse] to reduce the build-up of disease inoculum in crop residue. If at all possible, DO NOT seed the same crop in back to back years. When a short rotation is absolutely necessary, seed in the second year a variety that is more resistant to an anticipated disease problem.
- **Resistant Varieties:** Provincial crop/seed guides provide a comprehensive listing of the performance of adapted varieties, including their resistance status to specific diseases.
- **Foliar Fungicides:** Foliar fungicides, applied at the proper time in accordance with manufacturers' Pesticide Product labels, can control cereal leaf diseases and help to attain target yields. The greatest benefit occurs when disease pressure is high or with varieties that have poor resistance.
- **Spraying Practices:** Foliar fungicides should be applied preventively, before disease is well-established in a crop and already causing crop loss. Good spray coverage with minimal drift is essential. Ideally, the best time to spray is when the wind is light, humidity is above 60 per cent and air temperature is between 10 and 25°C.

### Ergot of Cereals

Ergot is a fungal disease that affects most cereals and grasses in Canada. Ergot bodies contain toxic alkaloids; they should never be consumed by humans or fed to animals. Ergot is a particularly damaging disease of rye, and has also been observed sporadically over the years on cereals and grasses in the prairie provinces. After an ergot outbreak, crop residue and soil become contaminated with a higher load of ergot bodies, placing nearby grasses and cereal crops at greater risk of infection in the following seasons. This risk increases further when cool, moist weather conditions promote ergot spore production and/or when cereals experience an extended period of flowering or an induction of floret sterility due to any of a variety of agronomic or environmental factors. Once ergot is present, little can be done to control the disease in the field, so prevention is important. Planting seed contaminated with ergot bodies can potentially spread disease to previously clean fields and there are no seed treatments registered; therefore only clean, healthy seed should be used. During the field season, nearby grasses may be mowed to remove additional hosts. Prior to harvest, fields should be scouted to determine where ergot has developed, such as headlands, and those areas should be harvested separately. Viability of ergot bodies decreases after one to two years.

### Fusarium Head Blight of Cereals

Fusarium head blight (FHB) causes a reduction in yield as a result of floret sterility and the loss of light weight cereal kernels during combining. More important is the effect on grain quality and food safety due to production of mycotoxins, including deoxynivalenol (DON) and vomitoxins. In Manitoba, FHB occurs throughout all crop regions and will damage wheat crops whenever environmental conditions favour the disease. In Saskatchewan, FHB has been established in eastern regions for several years, but occurs across the province, particularly in wet years.

- **Field Management of FHB:** Weather is by far the greatest factor in development of FHB. The disease is most likely to develop when the plants are flowering, temperatures range from 15 to 30°C and high moisture is continuous for 48 to 60 hours. If conditions remain warm and moist, the pathogen can continue to sporulate and spread to other kernels or heads. Under these optimum conditions, crop management has little impact on FHB outbreaks. Production practices, which lead to reduced tillering and shortened flowering duration, could reduce the risk period of FHB infection.
- **Crop Rotation and Crop Selection:** A break of at least one year – preferably two years – is advised between cereal, grass and corn production. In fields of wheat on wheat stubble, the incidence of FHB was about one and a half times higher than in fields of wheat planted into pulse crop residue. Regardless of the rotation, producers should consider planting cereals that are less susceptible to FHB. Results from previous years show that durum and soft white wheat varieties are more susceptible than hard red spring wheat varieties. Barley is more resistant than wheat, and oat is more resistant than either wheat or barley. Refer to provincial seed guides for FHB disease ratings for each variety. Planting two or more varieties of wheat with differing flowering times or varying planting dates will help reduce the risk of infection. Susceptible crops should not be planted on infected corn stubble. Corn trash is slower to decompose than cereal trash, and acts as a source of inoculum for a much longer time period.

### Late Blight of Potatoes

One of the major threats to Manitoba and Saskatchewan's potato industry is the fungal disease late blight. At present, there is no fungicide registered for use on potatoes that is capable of eradicating the fungus from infected plants. As a result, producers are forced to adopt preventive management to control this disease. One of the main components of this strategy is the application of fungicides at specified spray intervals. This interval varies with the type of fungicide used. Shortening or lengthening of this interval should be based on current weather conditions and the status of the disease in the crop.

In Manitoba, potato producers can make use of a weather-based late blight risk forecasting program. The purpose of this program is to predict when environmental conditions are most conducive to disease development and issue warnings based on those parameters.

Accurate weather monitoring and scouting techniques are very important for achieving the most effective use of fungicides. Combining precise weather forecasting with spray interval scheduling may lower input costs for the farmer and lead to a more productive, higher quality crop. These weather monitoring systems monitor key environmental variables, such as relative humidity, temperature, leaf wetness and precipitation.

The following practices are recommended for effective disease management:

- **Scouting:** To effectively schedule preventative fungicide applications and eliminate unnecessary fungicide use, local weather forecasts should be used to identify conditions conducive to disease development. Scout fields regularly to identify diseases and pests that may be developing. Low areas in rolling or hilly fields and in wind-protected areas near trees lines should be specially checked.
- **Crop Varieties:** (*There are no known commercial resistant varieties currently available in Canada*). Where practical, the use of short season varieties may help reduce the period of use for fungicides.
- **Healthy Seed:** Obtain seed from sources with effective disease management practices. The use of certified seed is legislated in Manitoba and Saskatchewan. Grade seed carefully while cutting and discard suspicious looking tubers and seed pieces.
- **Cull Clean-up:** Avoid leaving tubers, including debris or slivers from seed cutting, in cull piles for any length of time. Follow a program of sanitation for storage facilities and equipment to eliminate sources of the disease. Dispose of cull piles in an approved manner so they DO NOT serve as a source of disease inoculum for future infections. Dispose by burying, using a cover, spreading out on the field over winter, or feeding to livestock.
- **Sanitation:** Follow a program of sanitation for storage facilities and equipment to eliminate sources of disease. Sanitation consists of cleaning and disinfecting all equipment, storage, and tools that contact potatoes from seeding through harvest and storage. Since most disinfectants are inactivated by soil and plant debris, it is essential that equipment and storage is thoroughly cleaned with a pressure washer or steam cleaner with detergent before disinfectant is applied. Treated surfaces should remain wet for at least 20 minutes for the disinfectant to destroy disease organisms.
- **Cultural Practices and Rotation:** Use proper cultural practices including a one in four-year potato crop rotation; proper hilling to reduce disease and greening in tubers; manage irrigation to avoid an excess or deficit of soil moisture; schedule irrigation throughout the day so it is not extending the natural dew period and prolonging leaf wetness; if late blight is discovered destroy hot spots of infected fields; control weed hosts (especially nightshades) and remove and destroy volunteer potatoes. Use appropriate weed control practices in rotational crops to control those weeds that may be hosts of diseases in potatoes.
- **Foliar Fungicides:** Preventative fungicide applications are most effective in controlling late blight. Follow product label guidelines for most efficient and safe use of products. Labels of newly registered products also provide information on resistance management. In this context – medium to high

risk of resistance fungicides (e.g. Group 7 – boscalid and Group 11 – strobilurins) should be rotated or mixed with low risk fungicides (e.g. mancozeb (M3) and chlorothalonil (M5)).

- **Farm Visits:** The following recommendations are provided to prevent the spread of potato diseases from field to field or between farms. All people serving the potato industry should use these sanitary practices.
  1. Contact the grower for permission to enter fields and other facilities on the farm.
  2. Keep your vehicle clean and whenever possible, avoid driving your vehicle into fields or potato handling areas.
  3. Carry a boot brush and a supply of disinfectant in your vehicle at all times. Quaternary ammonia (General Storage Disinfectant) is recommended as it is also registered for bacterial ring rot disinfection.
  4. Wear coveralls or other protective outerwear that can be discarded or disinfected regularly.
  5. Clean, washable, footwear is recommended and rubber boots are preferred.
  6. Clean, wash, and disinfect your boots thoroughly on arrival at each field/farm/storage shed and before leaving.
  7. Remove dirty outerwear, including boots before entering your vehicle.
  8. Any tools to be used during the farm call (potato forks, shovels, soil probes, knives, etc.) should be cleaned and disinfected before and after use.
  9. Maintain a detailed logbook of field/farm/storage shed visits.

## Canola Diseases

**Sclerotinia stem rot** has been one of the most prominent diseases affecting canola in Manitoba and Saskatchewan for the past 25 years. An important factor for disease development is environmental conditions. The disease is much more widespread and severe during wet years. Fungicide applications are an important element in controlling the development and spread of sclerotinia stem rot. Fungicide spray decisions are based on soil moisture, weather conditions, crop stage and density, and disease history. The Sclerotinia resting bodies (sclerotia) require moist soil conditions for up to 10 days for germination to occur and the spore-bearing structures (apothecia) to form. Usually these conditions DO NOT occur until the crop canopy closes. The spores released from the apothecia utilize the canola petals as a food source and fall into the canola canopy where they infect plants. Lesions form up and down the stem, wilting leaves and eventually killing the plant. Fungicide should be applied between the 20 to 50 per cent flower stages to protect the petals from being colonized by the spores.

**Blackleg** caused by *Leptosphaeria maculans* affects canola and most crucifer field and vegetable crops. After many years of low incidences, due to resistant canola varieties grown in the prairie provinces, the disease is gaining importance again. High frequency of canola in crop rotations, accompanied by changes in the pathogen populations, has led to higher incidences and severities in some fields. For an effective control, a four-year crop rotation is highly recommended.

**Clubroot** is a soil-borne disease caused by a microbe, *Plasmodiophora brassicae*. Clubroot affects the roots of cruciferous field crops such as canola, mustard, and camelina, as well as

cruciferous vegetables and weeds. Clubroot has become a significant problem for canola growers in some areas of Alberta and the pathogen has been detected in Saskatchewan and Manitoba. Clubroot is a regulated pest in Saskatchewan under *The Pest Control Act*. Currently there is no provincial legislation that regulates clubroot in Manitoba.

Invasion of the interior of the host roots alters hormone balance and leads to increased cell division and growth, resulting in clubroot galls. These deformed roots have a reduced ability to absorb water and nutrients leading to stunting, wilting, yellowing, premature ripening and shrivelling of seeds. The cause of these above-ground symptoms can be confirmed by digging up suspect plants to check roots for gall formation. Clubroot affects canola yield and quality to a similar degree as other diseases affecting water and nutrient uptake, and its impact depends on soil conditions and the growth stage of the crop when infection occurs. Spore germination, infection and disease development are favoured by warm soils, high soil moisture and low soil pH; however, the disease can still occur under conditions outside of the optimum parameters. Infected roots will eventually disintegrate, releasing resting spores into the soil, which may then be transported by wind, water erosion, animals/manure, shoes/clothing, vehicles/tires or earth tag on agricultural or industrial field equipment. Resting spore numbers will decline over time when non-host crops are grown, but a small proportion can survive in soil for up to 20 years. Clubroot is primarily a soil-borne disease; it does not infect seed but it may be found in soil attached to seed or other plant parts. There are currently no seed treatments or foliar fungicides registered for control of clubroot on canola. The following best practices are recommended for prevention and management of clubroot:

1. Plant susceptible crops, including resistant varieties, no more than once every four years. Although crop rotation will not prevent the introduction of clubroot to fields that are free of the pathogen, it will restrict clubroot development by limiting the increase of clubroot resting spores and preventing the increase of clubroot inoculum, as well as help alleviate the impact of other plant pathogens.
2. Scout crops regularly and carefully.
  - Identify suspicious above-ground symptoms including wilting, stunting, yellowing and premature ripening of canola or other susceptible crops.
  - Field entrances and approaches are likely to be contaminated with clubroot spores first. Therefore, symptoms will often appear there first.
  - Confirm cause of above ground symptoms by checking the roots for galls.
  - Send sample of symptomatic plants into a commercial lab for confirmation of diagnosis.
3. Practice good sanitation by restricting movement of potentially contaminated soil to non-contaminated regions.
  - For Saskatchewan and Manitoba producers, this means restricting entry into their fields of vehicles, field machinery or oil rig equipment with earth tag from infested regions unless it has been properly sanitized. Ask questions about where the equipment is from and what sanitation measures have been used before the equipment left the infested area, dealer or auction site.
  - Cleaning steps may include: removal of crop debris and soil, washing of equipment with a power washer using

hot water or steam and misting with disinfectant (1 to 2 per cent bleach solution), followed by an additional rinse with water.

- Other agricultural products, which could carry soil, should be carefully checked for excess soil and if possible be from clubroot free areas.

For more information on clubroot, visit [www.clubroot.ca](http://www.clubroot.ca), [www.saskatchewan.ca](http://www.saskatchewan.ca), or [www.gov.mb.ca/agriculture](http://www.gov.mb.ca/agriculture).

## Pulse Crop Diseases

There are a variety of pulse crops produced in Manitoba and Saskatchewan including field pea, field bean, lentil, chickpea and soybean. Pulse crops are adapted to different regions and will require unique agronomic and disease management practices. Some diseases will attack all pulse crops, e.g. sclerotinia (white mould) and seedling/root rots caused by *Aphanomyces euteiches*, *Pythium*, *Rhizoctonia*, *Fusarium* and *Botrytis* species. Some diseases may occur on more than one type of pulse crop, but the pathogen species infecting each is often specific to that crop. This is the case for the ascochyta blights, powdery mildews and anthracnose. It is important to source information on pulse disease control from grower organizations such as the Saskatchewan Pulse Growers ([www.saskpulse.com](http://www.saskpulse.com)), Manitoba Pulse & Soybean Growers ([www.manitobapulse.ca](http://www.manitobapulse.ca)), provincial specialists, and field diagnostic guides. Most foliar diseases are favoured by warm, moist conditions and lush crop canopies, but root rots and powdery mildew can be present in dry years as well. In general, pulse disease management will need to include the following practices:

- **Use of clean seed and seed treatments:** Plant certified seed or seed that has been tested at an accredited lab and known to have high germination and zero or acceptable levels of seed-borne disease. Seed treatments will help protect seed and seedlings from low levels of seed-borne and soil-borne pathogens.
- **Crop Rotation:** It is important to keep at least three years between the same type of pulse crop to allow for the breakdown of crop residue on which disease pathogens survive. Longer rotations may be required for *Aphanomyces euteiches*, due to long-lived resting spores in the soil. Since there are diseases that affect more than one type of pulse crop, it is still important to maintain at least two years between different pulse crops.
- **Crop Varieties with Disease Resistance:** Refer to provincial seed guides for varieties adapted to your region. When available, choose varieties with disease resistance.
- **Scouting and Foliar Fungicide Application:** Begin crop scouting at the vegetative stages for aggressive diseases such as ascochyta blight in chickpea. Scout for other foliar diseases at early bloom, e.g. ascochyta blight and anthracnose in lentil. It is too late to apply fungicide to control sclerotinia (white mould) once symptoms are observed, and/or the canopy has closed, so forecasting to determine risk is necessary.
  - Use foliar fungicides only when disease risk and potential loss are significant. Rotate fungicides or use tank mixes from different fungicide groups to prevent development of resistant pathogen populations.

## Effects of Weather

DO NOT apply foliar fungicides during periods of dead calm or when winds are gusty. Avoid application immediately after a rainfall and delay spraying if rainfall is imminent. Contact fungicides are always more sensitive to wash-off by rainfall than systemic fungicides, because their mode of action relies on drying on the leaf surface. Failure of a contact fungicide to dry on the leaf surface may result in a loss in efficacy. Systemic fungicides are less sensitive than contact fungicides, but still need sufficient drying time and be fully absorbed by plants prior to rainfall. Consult the label or product manufacturers for rainfast period for individual products.

## Pathogen Resistance (Insensitivity) Management

Any fungal pathogen population may contain strains naturally insensitive to a fungicide and other fungicides within the same Group. A gradual or total loss of disease control may occur over time if these fungicides are used repeatedly in the same fields. Other resistance mechanisms that are not linked to site of action but specific for individual chemicals, such as enhanced metabolism, may also exist.

### To delay fungicide resistance/insensitivity:

- Where possible, rotate the use of a fungicide, (and others within the same Group) with different Groups that control the same pathogens.
- Where possible, tank mix fungicides with a high risk of developing insensitivity with other fungicides from a different Group.
- DO NOT apply more than the maximum number of applications listed on the label. Avoid consecutive sprays of a fungicide, or other fungicides in the same Group, in a season.
- Fungicide use should be based on an integrated pest management (IPM) program that includes scouting and accurate recording related to pesticide use and crop rotation. An IPM program also considers cultural, biological and other chemical control practices.
- Monitor treated fungal populations for signs of fungicide insensitivity. If disease continues to progress after treatment with a product, DO NOT increase the use rate. Discontinue use of the product and switch to another fungicide with a different target site of action.
- Contact your local regional crops specialist or certified crop advisor for any additional pesticide management and/or IPM recommendations for specific crops and disease problems in your area.

## Fungicide Modes of Action

### Why are fungicides needed?

- Control of disease during crop establishment.
- Increase productivity of crop (photosynthesis) and/or reduce blemishes.
  - Maintain yield and/or market value.
- Improve storage life and quality of harvested plants / grain / produce.
  - Prevent spoilage and/or production of mycotoxins.

### How do fungicides work?

There are several ways to define 'mode of action':

- **Timing:**
  - Preventative: fungicide must be present on plant surface before the pathogen and repeated applications are required to protect new growth.
  - Curative: pathogen may already be present (post-infection, pre-symptom kick-back activity).
  - Eradicant: (post-symptomatic activity).
  - Inhibitive: prevents spore germination or sporulation.
- **Placement:**
  - Contact (AKA protectant): immobile – must come in direct contact with the pathogen.
  - Systemic (AKA penetrant): mobile – can move within plant.
- **Movement:**
  - Intra-plant Movement: within crop via vapour phase or redistribution by rain.
  - Passive Absorption – by diffusion.
  - Apoplastic Movement: xylem-mobile; move within free space and cell walls, upward through the transpiration stream (with water).
  - Symplastic Movement: phloem-mobile (common characteristic of herbicides and insecticides but very few fungicides).
- **Spectrum:**
  - General, Non-specific, or Broad Spectrum: fungicide affects pathogen in multiple ways.
  - Specific or Narrow Spectrum: fungicide targets a specific metabolic site in pathogen or against critical enzyme or protein. Genetic changes or naturally insensitive fungi have a greater chance to overcome the fungicidal effect (resistance/insensitivity).
- **Composition:**
  - Inorganic Fungicides: sulfur or metal ions such as copper.
  - Organic Fungicides: contain carbon atoms.
  - Biopesticides: suppressing pest populations using naturally occurring organisms or natural products derived from plants.
- **Biochemistry:**
  - Primary basis to classify fungicides, developed by Fungicide Resistance Action Committee (FRAC) using their general Mode of Action on fungi, and their chemistry.
    - All fungicides within a group share a common mode of action and resistance mechanism.
    - Fungicides within a group may have different chemical structures.
    - Resistance management strategies required wherever resistance is known or there is a risk of resistance development
    - See Table 1.

**Table 1. Fungicide Groups Based on Biochemical Mode of Action (FRAC)**

| Mode of Action Target                 | Chemical Group & Chemical Name     | Resistance Risk | Foliar Fungicide Products Registered in Saskatchewan/Manitoba                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | Seed Treatment Products Registered in Saskatchewan/Manitoba                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

Note: Before using any pesticide on potatoes, consult the list of Agricultural Pesticides Approved for Use, available from Simplot Canada and McCain Foods (Canada).

• Fungicide registered against the disease. Review and follow the label before application

1. Must not be used alone, only as a tank mix (consult individual labels). 2. In-furrow treatments (suppression only). 3. Suppression only (foliar application).

4. Suppression only.

Table 3. Foliar Fungicides for Disease Control in Wheat and Barley

Refer to product pages and labels for application information as well as expectations for control vs suppression.

## Foliar Fungicide Product Pages

# Acapela

Fungicide Group

11

**Company:**

Corteva Agriscience (PCP#30470)

**Formulation:**

250 g/L picoxystrobin formulated as a suspension concentrate.

- Container sizes – 115.2L drum

**Crops, Diseases, Rates and Timing:**

| Crop                          | Diseases                                                                                                                                                                                                                                         | Application Rate (per acre) | Application Timing                                                                                                                                                                                                                                                                 |
|-------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Chickpea, dry bean, faba bean | Suppression of white mould ( <i>Sclerotinia sclerotiorum</i> )<br>Control of anthracnose ( <i>Colletotrichum lindemuthianum</i> ) in dry bean                                                                                                    | 350 mL                      | Make initial application at early bloom and follow with second application 7 to 10 days later at full bloom.                                                                                                                                                                       |
| Field pea                     | Suppression of mycosphaerella blight ( <i>Mycosphaerella pinodes</i> )                                                                                                                                                                           | 240 to 350 mL               | Begin applications prior to disease development and continue on a 7 to 14 day interval. Use higher rate and shorter interval when disease pressure is high.                                                                                                                        |
|                               | Suppression of white mould ( <i>Sclerotinia sclerotiorum</i> )                                                                                                                                                                                   | 350 mL                      | Make initial application at early bloom and follow with second application 7 to 10 days later at full bloom.                                                                                                                                                                       |
| Lentil                        | Control of anthracnose ( <i>Colletotrichum truncatum</i> ), ascochyta blight ( <i>Ascochyta lentis</i> )                                                                                                                                         | 240 to 350 mL               | Begin applications prior to disease development and continue on a 7 to 14 day interval. Use higher rate and shorter interval when disease pressure is high.                                                                                                                        |
|                               | Suppression of white mould ( <i>Sclerotinia sclerotiorum</i> )                                                                                                                                                                                   | 350 mL                      | Make initial application at early bloom and follow with second application 7 to 10 days later at full bloom.                                                                                                                                                                       |
| Wheat                         | Control of leaf rust ( <i>Puccinia recondita</i> )                                                                                                                                                                                               | 120 mL                      | Begin application prior to disease development. For early application apply at Zadok's stage 12-36.                                                                                                                                                                                |
|                               | Suppression of tan spot ( <i>Pyrenophora tritici-repentis</i> ), Septoria leaf blotch ( <i>Septoria tritici</i> )                                                                                                                                |                             |                                                                                                                                                                                                                                                                                    |
|                               | Control of leaf rust ( <i>Puccinia recondita</i> ), stripe rust ( <i>Puccinia striiformis</i> ), septoria leaf blotch ( <i>Septoria tritici</i> ), powdery mildew ( <i>Erysiphe graminis</i> ), tan spot ( <i>Pyrenophora tritici-repentis</i> ) | 175 to 350 mL               | Begin applications prior to disease development and continue on a 7 to 14 day interval. Use higher rate and shorter interval when disease pressure is high. For optimizing yield and flag leaf disease control, apply <i>Acapela</i> at Zadok's stage 39-41 (flag leaf out stage). |
| Barley                        | Control of scald ( <i>Rhynchosporium secalis</i> )                                                                                                                                                                                               | 120 mL                      | Begin application prior to disease development. For early application apply at Zadok's stage 12-36.                                                                                                                                                                                |
|                               | Suppression of septoria leaf blotch ( <i>Septoria tritici</i> ), net blotch ( <i>Pyrenophora teres</i> )                                                                                                                                         |                             |                                                                                                                                                                                                                                                                                    |
|                               | Control of septoria leaf blotch ( <i>Septoria tritici</i> ), powdery mildew ( <i>Erysiphe graminis</i> ), stripe rust ( <i>Puccinia striiformis</i> ), net blotch ( <i>Pyrenophora teres</i> ), scald ( <i>Rhynchosporium secalis</i> )          | 175 to 350 mL               | Begin applications prior to disease development and continue on a 7 to 14 day interval. Use higher rate and shorter interval when disease pressure is high. For optimizing yield and flag leaf disease control, apply <i>Acapela</i> at Zadok's stage 39-41 (flag leaf out stage). |
| Oats                          | Control of powdery mildew ( <i>Erysiphe graminis</i> ), stripe rust ( <i>Puccinia striiformis</i> ), crown rust ( <i>Puccinia coronata</i> f.sp. <i>avenae</i> )                                                                                 | 175 to 350 mL               | Begin applications prior to disease development and continue on a 7 to 14 day interval. Use higher rate and shorter interval when disease pressure is high. For optimizing yield and flag leaf disease control, apply <i>Acapela</i> at Zadok's stage 39-41 (flag leaf out stage). |

Use higher rate and shorter interval when disease pressure is high.                                                                                                                        |
| Sunflower                                   | Control of Alternaria leaf spot, stem canker, black stem                                                                                                                                                                                | 240 to 350 mL                  | Begin applications prior to disease development and continue on a 7 to 10-day interval. Use higher rate and shorter interval when disease pressure is high.                                                                                                                        |
|                                             | Suppression of Sclerotinia head and stem rot                                                                                                                                                                                            | 325 to 400 mL                  |                                                                                                                                                                                                                                                                                    |
| Alfalfa                                     | Common leaf spot ( <i>Pseudopeziza medicaginis</i> ) and Stemphylium leafspot ( <i>Stemphylium botryosum</i> )                                                                                                                          | 178 to 365 mL                  | Begin applications in the spring at green-up and once 1 to 3 new leaves have grown after each cutting. Initiate applications prior to disease development and no later than 14 days prior to cutting. Use higher rate and shorter interval when disease pressure is high.          |
| Grass grown for seed                        | Yellow Rust ( <i>Puccinia striiformis</i> f. sp. <i>poae</i> )                                                                                                                                                                          | 178 to 365 mL                  | Begin applications prior to disease development and continue on a 7 to 14 day interval. Use higher rate and shorter interval when disease pressure is high.                                                                                                                        |

## Application Information:

- **Water Volume:** Use sufficient water to obtain thorough coverage of plants.
  - **Ground:** minimum 45 L per acre.
  - **Aerial:** minimum 20 L per acre.

## How it Works:

The active ingredient picoxystrobin is a broad spectrum strobilurin fungicide and is to be used as a preventative application when environmental conditions are favorable for disease development. Picoxystrobin has curative and locally systemic activity. Refer to "Fungicide Modes of Action" in the Plant Disease Control section for more information.

## Tank Mixes:

**Herbicides:** *Travallas* spring wheat (including durum) and barley.

**Insecticide:** *Delegate* on corn

According to the Pest Management Regulatory Agency of Health Canada's Guidance Document on Tank Mix Labelling (March 2023), unlabelled tank mixes of this product are permitted only if the label of this product and the label of the product it might be mixed with include at least general wording on their respective labels indicating they may be mixed with other pesticides. When tank mixes are permitted, apply mixes according to the most restrictive use limitations for either product.

## Restrictions:

- **Resistance management:** Refer to "Pathogen Resistance" in the Plant Disease Control section for more information.
- **Maximum number of applications:**
  - **Dry legumes and canola** – DO NOT exceed 1 application before switching to a fungicide with a different mode of action; maximum season use rate is 700 mL per acre.
  - **Cereal grains, soybean** – Make no more than 2 sequential applications of *Acapela* Fungicide before switching to a fungicide with a different mode of action registered for the same use.
  - **Corn** – Make no more than 2 sequential applications of *Acapela* Fungicide before switching to a fungicide with a different mode of action registered for the same use.
  - **Flax** – DO NOT exceed 1 application before switching to a fungicide with a different mode of action; maximum season use rate is 700 mL per acre.
  - **Potatoes** – DO NOT exceed 2 application before switching to a fungicide with a different mode of action; maximum season use rate is 1100 mL per acre.
  - **Sunflowers** – Make no more than 2 sequential applications of *Acapela* Fungicide before switching to a fungicide with a different mode of action registered for the same use.
  - **Alfalfa and grass grown for seed** – DO NOT exceed 2 sequential applications before switching to a fungicide with a different mode of action registered for the same use. Maximum seasonal use rate is 1100 mL per acre.
- **Grazing:**
  - **Grass grown for seed** – The harvest of forage is permitted immediately after a single application. The cutting of hay is permitted immediately following multiple applications. Maximum seasonal use rate is 1100 mL per acre.
- **Preharvest interval:**
  - **Dry legumes and soybean** – 14 days
  - **Cereal grains** – 45 days (7 days for forage, 14 days for hay)
  - **Corn** – 7 days
  - **Canola** – 28 days
  - **Flax** – 28 days
  - **Potatoes** – 3 days
  - **Sunflowers** – 7 days
  - **Alfalfa** – 14 days
  - **Grass grown for seed** – 0 days
- **Restricted Entry Interval:** DO NOT re-enter treated areas within 12 hours of application.
- **Re-cropping:** Crops that are on the product label may be replanted immediately after harvest. All other crops – 10 months following last application of picoxystrobin.
- **Storage:** Store product in original container only, away from other pesticides, fertilizer, food or feed. Not for use or storage in or around the home. Keep container closed. To prevent contamination, store this product away from food or feed.
- **Environment:** Observe prescribed buffer zones. Minimize off-target drift to reduce the effects on beneficial insects at the field boundary. DO NOT apply to areas prone to run-off and delay spraying if heavy rainfall is forecast.

## Hazard Rating:

None listed.

Refer to the Introduction for an explanation of the symbols.

# Aprovia Top

Fungicide Group  
7, 3

## Company:

Syngenta Canada (PCP#31526)

## Formulation:

78 g/L benzovindiflupyr and 117 g/L difenoconazole formulated as an emulsifiable concentrate.

- Container size – 4 x 3.78 L

## Crops, Diseases, Rates and Timing:

| Crop   | Diseases                                                                                                       | Application Rate<br>(per acre) | Application Timing                                                                                                                                                                                                                                                                                                     |
|--------|----------------------------------------------------------------------------------------------------------------|--------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Potato | Control of early blight ( <i>Alternaria solani</i> )<br>Suppression of brown spot ( <i>Alternaria solani</i> ) | 260 to 390 mL                  | Begin applications prior to disease development and continue throughout the season on a 7 to 14 day interval.<br><br>For early blight, use the high rate and short application interval under high disease pressure. Make no more than two consecutive applications before switching to a non-Group 7 and 3 fungicide. |

## Application Information:

- **Water Volume:**
  - **Ground:** Use a minimum water volume of 60 L per acre
  - **Aerial:** Use a minimum water volume of 20 L per acre

## How it Works:

The active ingredient benzovindiflupyr is a succinate dehydrogenase inhibitor (SDHI) fungicide with broad spectrum activity. The active ingredient difenoconazole is a demethylation inhibitor (DMI) fungicide. Refer to "Fungicide Modes of Action" in the Plant Disease Control section for more information..

## Tank Mixes:

None registered.

## Restrictions:

- **Resistance management:** Refer to "Pathogen Resistance" in the Plant Disease Control section for more information.
- **Maximum number of applications:** DO NOT make more than 2 applications by air or more than 4 applications by ground. If applications are made by one method (ground or air), all consecutive applications must be made by the same method. It is not acceptable to mix aerial and ground applications in the same calendar year.
- **Grazing:** No restrictions listed.
- **Preharvest interval:** 14 days.
- **Restricted Entry Interval:** DO NOT re-enter treated areas within 12 hours of application.
- **Re-cropping:** There is no plant back restriction for potatoes, tuberous and corm vegetables, fruiting vegetables, cucurbit vegetables and plants in the rapeseed sub group. A plant back restriction of 60 days is required for cereals (wheat, barley, oats, rye, triticale) and corn. A plant back restriction of 6 months (180 days) is required for all other crops intended for food and feed.
- **Storage:** Keep in original container, tightly closed, during storage. Store in a cool, dry, well-ventilated area away from feed and foodstuffs and out of the reach of children and animals. To prevent contamination, store this product away from food or feed.
- **Environment:** Toxic to aquatic organisms and non-terrestrial plants. Observe buffer zones outlined in the label.

## Hazard Rating:

Danger Poison – Eye Irritant

|                                                                                                    | Sclerotinia stem rot ( <i>Sclerotinia sclerotiorum</i> )                                                                                                                               | 280 to 400 mL               | Apply at early bloom (prior to 30% bloom). This timing will also suppress alternaria black spot. Use the higher rate if there is a history of sclerotinia infection in the area and when conditions favour development. |
|                                                                                                    | Alternaria black spot ( <i>Alternaria brassicae</i> , <i>A. raphani</i> )                                                                                                              | 200 mL                      | Apply at pod stage (90% petal fall).                                                                                                                                                                                    |
| Corn                                                                                               | Rust ( <i>Puccinia sorghi</i> )                                                                                                                                                        | 180 mL                      | Apply before disease is established and make second application 7 to 14 days later.                                                                                                                                     |
| Coriander (for seed production)** and caraway (for caraway <i>Quadris</i> and <i>Razor</i> only)** | Blossom blight ( <i>Aureobasidium</i> spp.)                                                                                                                                            | 180 to 450 mL               | Apply once prior to disease establishment. Use higher rate if a high disease pressure is present.                                                                                                                       |

| Crop   | Diseases Controlled                                                                                                             | Application Rate (per acre) | Application Timing                                                                                                                                                                                                                                                                                                 |
|--------|---------------------------------------------------------------------------------------------------------------------------------|-----------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Potato | Early blight ( <i>Alternaria solani</i> )                                                                                       | 200 to 320 mL               | Apply prior to disease development and repeat on a 7 to 14 day interval. Use the higher rate if extending treatment interval to 14 days. Apply in alternation with fungicides with a different mode of action. If late blight becomes established, discontinue use of azoxystrobin and use alternative fungicides. |
|        | Late blight ( <i>Phytophthora infestans</i> )                                                                                   | 320 mL                      |                                                                                                                                                                                                                                                                                                                    |
|        | Rhizoctonia stem rot, stolon canker, black scurf ( <i>Rhizoctonia solani</i> ), silver scurf ( <i>Helminthosporium solani</i> ) | 4 to 6 mL per 100 m of row  | Apply once as an in-furrow spray in 20 to 56 L/acre water at planting. Mount the spray nozzle so that spray is directed into the furrow as a 15 to 20 cm band just before the seed is covered. DO NOT apply by air.                                                                                                |
|        | Black dot ( <i>Colletotrichum coccodes</i> )                                                                                    | 200 to 320 mL               | Apply on a 7 to 14 day interval prior to disease development. Use the high rate and short application interval under high disease pressures.                                                                                                                                                                       |

\*Suppression of white mould in lentils for *Quadris* only

\*\*DO NOT apply by air for coriander and caraway. Follow instructions on the labels for other uses.

## Application Information:

- **Water Volume:**
  - **Ground:** Use sufficient water volume to obtain adequate coverage. Use minimum 40 L per acre. In-furrow treatment in 20 to 56 L per acre.
  - **Aerial:** Use minimum of 18 L per acre. Ensure uniform application.

## How it Works:

The active ingredient azoxystrobin is a methoxyacrylate compound (strobilurin) with broad spectrum contact and systemic activity. To be used as a preventative and curative fungicide application. Refer to "Fungicide Modes of Action" in the Plant Disease Control section for more information.

## Tank Mixes:

Follow the further instructions provided on products labels for all tank mixes indicated below prior to mixing and application.

**Insecticides:** For legumes and field corn, *Quasi*, *Quadris* and *Azoshy 250 SC* may be tank-mixed with *Matador 120EC* insecticide.

For control of potato diseases and insects, *Quasi*, *Quadris*, *Azoshy 250 SC*, *Emissarius*, *Razor 250 SC*, and *VIKING Azoxystrobin Fungicide* can be tank-mixed with *Actara 240* insecticide.

Consult each label for pests controlled, appropriate timing, precautions, and specific application instructions.

**Fungicides:** For the control of early blight of potato, *Quasi*, *Quadris*, *Azoshy 250 SC*, *Razor 250 SC* and *VIKING Azoxystrobin Fungicide* may be tank-mixed with *Bravo 500*. For control of Rhizoctonia stem, stolon canker and black scurf in potato, *Quasi*, *Quadris*, *Azoshy 250 SC*, *Emissarius*, *Razor 250 SC* and *VIKING Azoxystrobin Fungicide* can be tank-mixed with *Ridomil Gold 480EC* or *Ridomil Gold 480 SL*. Follow the instructions on the label. For control of ascochyta blight in chickpea, *Quasi*, *Quadris*, *Azoshy 250 SC*, *Razor 250 SC*, and *VIKING Azoxystrobin Fungicide* must be tank-mixed with *Bravo 500*. *Quasi*, *Quadris*, *Azoshy 250 SC*, *Emissarius*, *Razor 250 SC* and *VIKING Azoxystrobin Fungicide* may be tank-mixed with *Tilt 250E* in legumes (including soybean), wheat and barley.

- **Note:** According to the Pest Management Regulatory Agency of Health Canada's Guidance Document on Tank Mix Labelling (March 2023), unlabelled tank mixes of this product are permitted only if the label of this product and the label of the product it might be mixed with include at least general wording on their respective labels indicating they may be mixed with other pesticides. When tank mixes are permitted, apply mixes according to the most restrictive use limitations for either product.

## Restrictions:

- **Resistance management:** Refer to "Pathogen Resistance" in the Plant Disease Control section for more information.
- **Maximum number of applications:**
  - **Coriander and caraway** – DO NOT exceed 1 application of this product per season.
  - **Bean, canola, chickpea, corn, lentil, pea, soybean** – DO NOT exceed 2 applications of this product per season.
  - **Potato** – DO NOT exceed 3 applications of this product per season.
- **Grazing:** DO NOT feed dried pea vines to livestock.
- **Preharvest interval:**
  - **Canola** – 30 days
  - **Coriander and caraway** – 21 days
  - **Corn** – 7 days
  - **Legumes** – 15 days
  - **Potatoes** – 1 day

- **Restricted Entry Interval:** DO NOT re-enter treated areas until residues have dried.
- **Re-cropping:** DO NOT plant broadleaf or root crops within 30 days of application. DO NOT plant cereals within 45 days of application.
- **Storage:** Store in a cool, dry, well-ventilated area. DO NOT store below 0°C.
- **Environment:** This product is toxic to fish and aquatic organisms. Observe buffer zones outlined in the label.

## Hazard Rating:

None.

Other precautions: May irritate eyes.

Refer to the Introduction for an explanation of the symbols.

# Azoxystrobin and Prothioconazole

*Rambler Pro, Viking Kannus*

Fungicide Group  
3, 11

## Company:

NewAgco Inc. [*Rambler Pro* (Quasi – PCP #33807, *Rambler* PCP # 35048)]

VIKING Crop Production Partners Inc. “[*Viking Kannus* (*VIKING Azoxystrobin* PCP#33807, *VIKING Prothioconazole* – PCP#35109)]

## Formulation:

*Rambler Pro* is a co-pack of *Quasi* and *Rambler*. *Quasi* (250 g/L Azoxystrobin formulated as suspension), *Rambler* (480 g/L Prothioconazole formulated as suspension concentrate), container size: co-pack 13.3L of *Quasi*, 10L of *Rambler*.

*Viking Kannus* is a co-pack of *VIKING Azoxystrobin* and *VIKING Prothioconazole*. *VIKING Azoxystrobin* (250 g/L Azoxystrobin formulated as suspension), *VIKING Prothioconazole* (480 g/L Prothioconazole formulated as suspension concentrate), container size: co-pack 8.1L of *VIKING Azoxystrobin*, 5.1L of *VIKING Prothioconazole*.

## Application Information:

- **Water Volume:**
  - **Ground:** Minimum water volume 40 L/acre
  - **Air:** Minimum water volume 20 L/acre

## How it Works:

The azoxystrobin active ingredient is a methoxyacrylate compound (strobilurin) with broad spectrum contact and systemic activity used as a preventative and curative fungicide application. The Prothioconazole active ingredient is a triazole fungicide with broad-spectrum systemic activity. For more information refer to "Fungicide Modes of Action".

## Tank Mixes:

Not registered

## Restrictions:

- **Maximum number of applications:** Do not make more than a total of two applications of *Rambler Pro* or *VIKING Kannus* per season.
- **Rainfall:** Avoid application when heavy rain is in forecast.
- **Rainfast:** One hour
- **Pre-harvest Intervals:** 36 days after application for canola, 15 days for chickpea and lentil, and 20 days for soybean.
- **Re-entry:** 12 hours
- **Grazing:** No restrictions listed.
- **Re-cropping interval:** Grow all major crops the year after application.
- **Aerial Application:** Follow the label.
- **Storage:** Store this product away from food and feed. Store in a cool, dry, locked, well-ventilated area without a floor drain.
- **Environment:** This product is TOXIC to aquatic organisms. Observe spray buffer zones specified on the label. The azoxystrobin component is persistent and will carryover. It is recommended that this product is not used in areas treated with Azoxystrobin during the previous season. To reduce runoff from treated areas into aquatic habitats avoid application to areas with a moderate to steep slope, compacted soil, or clay. Avoid application when heavy rain is forecast. Do not apply directly to water or areas where surface water is present. Contamination of aquatic areas as a result of runoff may be reduced by including a vegetative strip between the treated area and the edge of the water body. This product demonstrates the properties and characteristics associated with chemicals detected in groundwater. The use of this product in areas where soils are permeable, particularly where the water table is shallow, may result in groundwater contamination.

  - **Ground:** Apply using minimum water volume of 20 to 56 L/ acre.
  - **Do not apply by air.**

## How it Works:

The active ingredient azoxystrobin is a methoxyacrylate compound (strobilurin) with broad spectrum contact and systemic activity. To be used as a preventative and curative fungicide application.

## Tank Mixes:

None registered.

According to the Pest Management Regulatory Agency of Health Canada's Guidance Document on Tank Mix Labelling (March 2023), unlabelled tank mixes of this product are permitted only if the label of this product and the label of the product it might be mixed with include at least general wording on their respective labels indicating they may be mixed with other pesticides. When tank mixes are permitted, apply mixes according to the most restrictive use limitations for either product.

## Restrictions:

- **Maximum number of applications:** Do not exceed one application of this product per season.
- **Re-entry:** 12 hours after application.
- **Storage:** Do not store below zero degrees Celsius. Store in original containers only. Keep container closed when not in use. Store in a cool, dry place, and do not expose to heat. Store this product away from food or feed.
- **Environment:** Toxic to aquatic organisms. Azoxystrobin is persistent and may carry over. It is recommended that this product not be used in areas treated with any products containing azoxystrobin during the previous season. To reduce runoff from treated areas into aquatic habitats avoid application to areas with a moderate to steep slope, compacted soil, or clay. Avoid application when heavy rain is in forecast. Contamination of aquatic areas as a result of runoff may be reduced by including a vegetative strip between the treated area and the edge of the water body. This product demonstrates the properties and characteristics associated with chemicals detected in groundwater. The use of this product in areas where soils are permeable, particularly where the water table is shallow, may result in groundwater contamination.

## Hazard Rating:

None listed.

# Boscalid

Fungicide Group

7

*Lance WDG, SHAFT Fungicide, Maxunitech Boscalid 70% WG, Terra Guard*

## Company:

BASF Canada (*Lance WDG* – PCP#27495)

Sharda CropChem (*SHAFT Fungicide* – PCP#34642)

Maxunitech North America (*Maxunitech Boscalid 70% WG* – PCP#35329)

Tide International Canada, Inc. (*Terra Guard* – PCP#35673)

## Formulation:

**SHAFT Fungicide:** 70% boscalid formulated as wettable granule.

- Container size – 2 x 2.83 kg per case

**Lance WDG:** 70% boscalid formulated as a water dispersible granular.

- Container size – 2 x 2.83 kg per case

**Maxunitech Boscalid 70% WG:** 70% boscalid formulated as wettable granules.

- Container size – 1 – 104 L

**Terra Guard:** 70% boscalid formulated as wettable granules.

- Container size – 100 g – 25 kg

## Crops, Diseases, Rates and Timing:

(Ground, Aerial, and Pivot or Sprinkler Irrigation Applications, strictly follow the label)

|--------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------|
| Alfalfa (seed production only) | Control of blossom blight ( <i>Sclerotinia sclerotiorum</i> , <i>Botrytis cinerea</i> ), common leaf spot ( <i>Pseudopeziza medicaginis</i> ), spring black stem ( <i>Phoma medicaginis</i> ), leaf spot ( <i>Leptosphaerulina briosiani</i> ) | 170 g                          | Apply at 20 to 50% flowering. Apply every 7 to 14 days if disease persists, or weather conditions are favourable for disease development. |

| Crop                                        | Diseases                                                                    | Application Rate (per acre) | Application Timing                                                                                                                                                                                                                   |
|---------------------------------------------|-----------------------------------------------------------------------------|-----------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Canola, mustard (oilseed and condiment)     | Control of sclerotinia stem rot ( <i>Sclerotinia sclerotiorum</i> )         | 140 g                       | Apply at 20 to 50% flowering. Apply a second time 7 to 14 days later up to full bloom if disease persists, or weather conditions are favourable for disease development.                                                             |
|                                             | Control of black spot ( <i>Alternaria brassicae</i> and <i>A. raphani</i> ) | 140 g                       | Apply at late flowering to early green pod.                                                                                                                                                                                          |
| Dry bean, faba bean                         | Control of white mould ( <i>Sclerotinia sclerotiorum</i> )                  | 225 to 310 g                | Apply at 20 to 50% flowering. Apply a second time 7 to 14 days later if disease persists, or weather conditions are favourable for disease development. Use the higher rate to obtain extended protection and maximum yield benefit. |
| Potato                                      | Control of early blight ( <i>Alternaria solani</i> )                        | 70 to 125 g                 | Apply prior to disease development and at 14 days intervals. DO NOT make more than 4 applications per season.                                                                                                                        |
|                                             | SHAFT Fungicide: Control of late blight ( <i>Phytophthora infestans</i> )   |                             | If late blight is on label, <i>Boscalid</i> must be tank mixed with a group M fungicide following label directions for control of late blight. Apply prior to disease development.                                                   |
| Birdsfoot trefoil grown for seed production | Suppression of crown and stem rot ( <i>Sclerotinia trifoliorum</i> )        | 170 g                       | Apply at early flowering stage to suppress crown rot/stem rot. Apply a second time 7-14 days later if disease persists, or weather conditions are favourable for disease development.                                                |

\*For use on birdsfoot trefoil, BASF Canada has not fully assessed performance (efficacy) and/or crop tolerance (phytotoxicity) under all environmental conditions or for all crop varieties when used in accordance with the label. The user should test the product on a small area first, under local conditions and using standard practices, to confirm the product is suitable for widespread application.

(Ground Application Only)

|-------------|-------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Field pea** | Control of ascochyta blight ( <i>Ascochyta</i> spp.), mycosphaerella blight ( <i>Mycosphaerella pinodes</i> ), grey mould ( <i>Botrytis cinerea</i> ) | 170 g                       | Apply at the beginning of flowering. Apply a second time 7 to 14 days later if disease persists, or weather conditions are favourable for disease development. |

\*\*DO NOT apply by air. DO NOT APPLY BY PIVOT OR SPRINKLER IRRIGATION.

(Ground and Aerial Applications)

| Crop                | Diseases                                                                                                                                      | Application Rate (per acre) | Application Timing                                                                                                                                             |
|---------------------|-----------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Chickpea***, lentil | Control of ascochyta blight ( <i>Ascochyta</i> spp.), white mould ( <i>Sclerotinia sclerotiorum</i> ), grey mould ( <i>Botrytis cinerea</i> ) | 170 g                       | Apply at the beginning of flowering. Apply a second time 7 to 14 days later if disease persists, or weather conditions are favourable for disease development. |
| Caraway             | Suppression of blossom blight ( <i>Botrytis cinerea</i> , <i>Sclerotinia sclerotiorum</i> ), ascochyta blight ( <i>Ascochyta</i> spp.)        | 170 g                       | Apply at 20 to 50% flowering. Apply a second time 7 to 14 days later if disease persists, or weather conditions are favourable for disease development.        |
| Sunflower           | Suppression of sclerotinia head rot ( <i>Sclerotinia sclerotiorum</i> ), leaf spot ( <i>Alternaria helianthi</i> )                            | 140 to 260 g                | Apply at early flower for optimal disease suppression. Use the higher rate when disease pressure is high or there is a history of high disease in the field.   |

\*\*\*Do not apply by pivot or sprinkler irrigation.

## Application Information:

- **Water Volume:**
  - **Ground:** Use a minimum water volume of 40 L per acre and ensure thorough coverage of foliage.
  - **Aerial (registered for all crops but field pea):** Use a minimum water volume of 16 L per acre and ensure thorough coverage of foliage.
  - **Pivot and Sprinkler Irrigation:** Carefully follow the label to see if pivot and sprinkler irrigation is allowed, when such applications are permitted, DO NOT exceed 0.64 cm (1/4 inch) or 25,700 L per acre. Apply only through sprinkler systems including centre pivot, lateral move, end two, side (wheel) roll, traveler, big gun, solid set, or hand move irrigation systems.

## How it Works:

The active ingredient boscalid is a carboxamide (SDHI) fungicide with systemic activity. To be used as a preventative application when environmental conditions are favourable for disease development. Refer to "Fungicide Modes of Action" in the Plant Disease Control section for more information.

## Tank Mixes:

**Insecticides:** For the control of corn borer, *Lance WDG*, *Terra Guard* and *Maxunitech Boscalid 70% WG* can be tank mixed with *Matador 120 EC* at 34 mL per acre. Apply before the larva bores into the plant stalk or pods. Follow the most restrictive application directions for each of the tank mix partner with respect to the maximum number of applications, pre-harvest interval and other label instructions.

## Restrictions:

- **Resistance management:** Refer to "Pathogen Resistance" in the Plant Disease Control section for more information.
- **Maximum number of applications:**
  - *Sunflower* – DO NOT exceed 1 application of this product per season.
  - *Canola, mustard, dry bean, chickpea, lentil, pea and birdsfoot trefoil* – DO NOT exceed 2 applications of this product per season.
  - *Alfalfa* – DO NOT exceed 3 applications of this product per season.
  - *Potato* – DO NOT exceed 4 applications of this product per season, check with other products' labels.
- **Grazing:** All crops except alfalfa and Birdsfoot trefoil (grown for seed) can be grazed or fed to livestock unless product label directs otherwise. DO NOT cut treated birdsfoot trefoil fields for hay/forage.
- **Preharvest interval:**
  - *Potato (for early blight and late blight tank-mixes)* – 30 days
  - *Beans, canola, mustard (oilseed and condiment), chickpea, lentil, pea, Caraway, sunflowers and Birdsfoot trefoil* – 21 days
  - *Alfalfa* – not applicable
- **Restricted Entry Interval:** DO NOT re-enter treated area for 12 hours after application or until dry.
- **Re-cropping:** A plant back restriction of 14 days is required for all crops not on the label.
- **Storage:** Store in a cool, dry, locked, well-ventilated area without a floor drain.
- **Environment:** TOXIC to aquatic organisms and non-target terrestrial plants. DO NOT apply to any body of water. Avoid drifting of spray onto any body of water or other non-target areas. Specified buffer zones should be observed

## Hazard Rating:

Caution Poison – Potential Skin Sensitizer

Warning – Eye Irritant

Refer to the Introduction for an explanation of the symbols.

# Cantus WDG Fungicide

Fungicide Group

7

## Company:

BASF Canada (PCP#30141)

Sharda CropChem (*Cabil Fungicide* – PCP#34638)

## Formulation:

70% boscalid formulated as a water dispersible granule.

- Container size – 4 x 2.83 kg

## Crops, Diseases, Rates and Timing:

| Crop   | Diseases                                  | Application Rate<br>(per acre) | Application Timing                                                                                               |
|--------|-------------------------------------------|--------------------------------|------------------------------------------------------------------------------------------------------------------|
| Potato | Early blight ( <i>Alternaria solani</i> ) | 70 to 130 g                    | Apply prior to disease development and at 14 day intervals if conditions continue to favour disease development. |

## Application Information:

- **Water Volume:**
  - **Ground:** Use a minimum water volume of 40 L per acre and ensure thorough coverage of foliage.
  - **Aerial:** Use a minimum water volume of 16 L per acre and ensure thorough coverage of foliage.
  - **Pivot and Sprinkler Irrigation:** DO NOT exceed 0.64 cm (1/4 inch) or 25,700 L per acre. Apply only through sprinkler systems including centre pivot, lateral move, end two, side (wheel) roll, traveler, big gun, solid set, or hand move irrigation systems. The system must contain functional valves to prevent water source contamination from backflow.

## How it Works:

The active ingredient boscalid is a carboxamide (SDHI) fungicide with systemic activity. It inhibits spore germination, mycelia growth and sporulation of the fungus on the leaf surface. To be used as a preventative application when environmental conditions are favourable for disease development. Refer to "Fungicide Modes of Action" in the Plant Disease Control section for more information.

## Tank Mixes:

None registered.

## Restrictions:

- **Resistance management:** Refer to "Pathogen Resistance" in the Plant Disease Control section for more information.
- **Maximum number of applications:** 4 applications per season on potatoes.
- **Grazing:** No restriction listed.
- **Preharvest interval:** 30 days
- **Restricted Entry Interval:** DO NOT re-enter treated area for 12 hours after application or until dry.
- **Re-cropping:** A plant back restriction of 14 days is required for all crops not on the label.
- **Storage:** Store in a cool, dry, locked, well-ventilated area without a floor drain.
- **Environment:** Toxic to aquatic organisms and non-target terrestrial plants. DO NOT apply to areas where runoff is likely to occur, or near any body of water. Avoid drifting of spray onto any body of water or other non-target areas. Specified buffer zones should be observed.

## Hazard Rating:

Caution Poison – Potential Skin Sensitizer

Warning – Eye Irritant

Refer to the Introduction for an explanation of the symbols.

|        | Suppression of fusarium head blight (FHB) ( <i>Fusarium</i> spp.)                                                                                                                                                                                                                                                                                                     | 400 mL                       | Apply prior to development of the disease when environmental conditions are favourable for disease development. Apply between full head emergence and up to 3 days after full emergence of main stem heads.                                                             |
| Oat    | Control of crown rust ( <i>Puccinia coronata</i> ), septoria leaf blotch ( <i>Septoria avenae</i> )                                                                                                                                                                                                                                                                   | 200 to 280 mL                | Apply prior to disease development or at the onset of disease.                                                                                                                                                                                                          |
|        | Suppression of fusarium head blight ( <i>Fusarium</i> spp.)                                                                                                                                                                                                                                                                                                           | 400 mL                       | Apply prior to development of the disease when environmental conditions are favourable for disease development. Apply within the time period when at least 75% of the heads on the main stem are fully emerged to when 50% of the heads on the main stem are in flower. |
| Corn*  | Suppression of fusarium ( <i>Fusarium graminearum</i> ) and gibberella ( <i>Gibberella zeae</i> ) ear rots                                                                                                                                                                                                                                                            | 400 mL                       | Apply when the crop is between silking and silk browning stage for maximum suppression. Ensure silk coverage for optimum efficacy.                                                                                                                                      |

| Crop      | Diseases Controlled                                                                                                                                                                                                                                                                                                                                                   | Application Rate (per acre)* | Application Timing                                                                                                                                                                                                                                                      |
|-----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Rye       | Control of leaf rust ( <i>Puccinia recondita</i> ), stripe rust ( <i>Puccinia striiformis</i> ), powdery mildew ( <i>Erysiphe graminis</i> )                                                                                                                                                                                                                          | 200 to 280 mL                | Apply prior to disease development or at the onset of disease.                                                                                                                                                                                                          |
|           | Suppression of fusarium head blight ( <i>Fusarium</i> spp.)                                                                                                                                                                                                                                                                                                           | 400 mL                       | Apply prior to development of the disease when environmental conditions are favourable for disease development. Apply within the time period when at least 75% of the heads on the main stem are fully emerged to when 50% of the heads on the main stem are in flower. |
| Triticale | Control of leaf rust ( <i>Puccinia recondita</i> ), stripe rust ( <i>Puccinia striiformis</i> ), stem rust ( <i>Puccinia graminis</i> ), powdery mildew ( <i>Erysiphe graminis</i> f. sp. tritici), tan spot ( <i>Pyrenophora tritici-repentis</i> ), septoria leaf blotch ( <i>Septoria tritici</i> );<br>Suppression of spot blotch ( <i>Cochliobolus sativus</i> ) | 200 to 280 mL                | Apply prior to disease development or at the onset of disease.                                                                                                                                                                                                          |

\*A case can treat 40 acres after heading (suppression of FHB) or 60 to 80 acres before heading (leaf disease). A drum can treat 320 acres after heading (suppression of FHB) or 460 to 640 acres before heading (leaf disease).

\*Corn includes field corn, sweet corn, popcorn and seed production corn.

### Application Information:

- **Water Volume:**
  - **Ground:** minimum 40 L per acre.
  - **Aerial:** minimum 20 L per acre.
  - Consult nozzle manufacturers for specific nozzle and pressure recommendations.

### How it Works:

The active ingredient, metconazole, is a broad spectrum triazole demethylation inhibitor (DMI) fungicide with systemic activity. Refer to "Fungicide Modes of Action" in the Plant Disease Control section for more information.

### Tank Mixes:

None listed.

### Restrictions:

- **Resistance management:** Refer to "Pathogen Resistance" in the Plant Disease Control section for more information.
- **Maximum number of applications:**
  - **Wheat, oat, rye, barley, corn** – DO NOT exceed 1 application of this product per season.
- **Grazing:** All crops can be grazed or fed to livestock.
- **Preharvest interval:**
  - **Wheat, barley, oat, rye** – 30 days
  - **Field corn grain** – 20 days
  - **Sweet Corn** – see label harvesting restrictions
- **Restricted Entry Interval:**
  - **Wheat, barley, oat, rye** – DO NOT re-enter treated areas within 12 hours of application.
  - **Corn** – DO NOT re-enter treated area for 12 hours or up to 3 days depending on re-entry activity (see label instructions).
- **Re-cropping:** A plant back interval of 35 days is required for all crops not listed on the label.
- **Storage:** Store in original tightly closed container. Protect from freezing.
- **Environment:** Avoid run-off from treated areas into aquatic areas. Toxic to aquatic organisms, non-target terrestrial plants and small wild animals.

### Hazard Rating:

Warning – Eye Irritant  
Check label for first-aid information.

Refer to the Introduction for an explanation of the symbols.

# Cerefit

Fungicide Group  
3, 11

## Company:

Corteva Agriscience (*Cerefit A* – PCP#33522, *Cerefit B* – PCP#33348)

## Formulations:

The *Cerefit* package contains 2 components.

*Cerefit A* – 250 g/L picoxystrobin formulated as a suspension concentrate.

- Container size – 5.3 L

*Cerefit B* – 435 g/L propiconazole formulated as an emulsifiable concentrate.

- Container size – 3.5 L

## Crops, Diseases, Rates and Timing:

| Crop   | Diseases                                                                                               | Application Rate<br>(per acre)                                              | Application Timing                                                                                                                                                                                                               |
|--------|--------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Barley | Control of leaf and stem rust, net blotch, powdery mildew, scald, septoria leaf spot, spot blotch      | 132.5 mL/acre –<br><i>Cerefit A</i> ,<br>87.5 mL/acre –<br><i>Cerefit B</i> | For early application, apply at first sign of disease, usually at the beginning of stem elongation (G.S. 12-36). For late application, apply at flag leaf (G.S. 39-41). DO NOT apply after flowering (Feekes 10.5 or Zadoks 59). |
| Oats   | Control of crown rust, septoria leaf blotch                                                            | 132.5 mL/acre –<br><i>Cerefit A</i> ,<br>87.5 mL/acre –<br><i>Cerefit B</i> | For early application, apply at first sign of disease, usually at the beginning of stem elongation (G.S. 12-36). For late application, apply at flag leaf (G.S. 39-41). DO NOT apply after flowering (Feekes 10.5 or Zadoks 59). |
| Wheat  | Control of leaf and stem rust, powdery mildew, glume blotch, septoria leaf spot, stripe rust, tan spot | 132.5 mL/acre –<br><i>Cerefit A</i> ,<br>87.5 mL/acre –<br><i>Cerefit B</i> | For early application, apply at first sign of disease, usually at the beginning of stem elongation (G.S. 12-36). For late application, apply at flag leaf (G.S. 39-41). DO NOT apply after flowering (Feekes 10.5 or Zadoks 59). |

## Application Information:

- **Water Volume:**
  - **Ground:** 40 to 80 L per acre.
  - **Aerial:** 20 L per acre.

**Application Tips:** Good coverage is essential for effective disease control. *Cerefit* should be applied as a preventative disease control measure. Established diseases are more difficult to control and may have already reduced crop vigor.

## How it Works:

The active ingredient propiconazole is a triazole fungicide with broad spectrum systemic activity. The active ingredient picoxystrobin is a broad spectrum strobilurin fungicide and is to be used as a preventative application when environmental conditions are favorable for disease development. Picoxystrobin has curative and locally systemic activity. Refer to "Fungicide Modes of Action" in the Plant Disease Control section for more information.

## Tank Mixes:

None registered.

## Restrictions:

- **Resistance management:** Refer to "Pathogen Resistance" in the Plant Disease Control section for more information.
- **Maximum number of applications:** DO NOT exceed 2 applications of this product per season.
- **Grazing:** May be grazed 7 days after application
- **Preharvest interval:**
  - **Wheat, barley and oats harvested for grain** – 45 days
  - **Forage harvest** – 7 days
  - **Greenfeed/hay** – 14 days
- **Restricted Entry Interval:** DO NOT re-enter treated areas within 12 hours of application.
- **Re-cropping:** Crops that appear on the label may be replanted immediately after harvest, all other crops may be planted 10 months after the last application of *Cerefit*.

- **Storage:** Store in original container in a secured, dry storage area. Prevent cross-contamination with other pesticides and fertilizer. Keep away from food and feed.
- **Environment:** Toxic to aquatic organisms and non-target terrestrial plants. Observe prescribed buffer zones. Minimize off-target drift to reduce the effect on beneficial insects at the field boundary. DO NOT apply to areas prone to runoff and delay application if heavy rainfall is forecast.

**Hazard Rating:**

**Cerefit A:** None listed

**Cerefit B:**

Caution – Poison

Warning – Eye and Skin Irritant, Potential Skin Sensitizer

Refer to the Introduction for an explanation of the symbols.

Cevya

Fungicide Group  
3

**Company:**

BASF (PCP#33405)

**Formulations:**

400 g/L mefentrifluconazole formulated as a suspension concentrate.

- Container size – 4 L

**Crops, Diseases, Rates and Timing:**

| Crop   | Diseases                                                                                                | Application Rate<br>(per acre) | Application Timing                                                                                                                                                                                                     |

# Chlorothalonil

Fungicide Group  
M5

Bravo Zn/Bravo ZNC/Echo NP/Echo 90WSP/Echo 720

## Company:

Syngenta Canada (Bravo Zn – PCP#28900, Bravo ZNC – PCP#33515)

Sipcam Canada (Echo 720 – PCP#29355 Echo NP – PCP#33479, Echo 90WSP – PCP#33519)

## Formulations:

Bravo Zn – 500 g/L chlorothalonil formulated as a suspension.

- Container size – 450 L

Bravo ZNC – 500 g/L chlorothalonil formulated as a suspension.

- Container size – 2 x 10 L case

Echo 90WSP – 90% chlorothalonil formulated as water dispersible granule sealed within a water-soluble bag.

- Container size – 10 kg (20 x 500 g)

Echo 720 - 720 g/L chlorothalonil formulates as a suspension

- Container size - 450 L

Echo NP – 720 g/L chlorothalonil formulated as a suspension.

- Container size – 2 x 9.46 L case

## Crops, Diseases, Rates and Timing:

| Crop     | Diseases                                                                                                                             | Application Rate (per acre)                                                           |                                                                                     |                                                                                  | Application Timing                                                                                                                                                                                                                               |

| Wheat    | Control of tan spot ( <i>Pyrenophora tritici-repentis</i> ), septoria glume blotch, septoria leaf blotch ( <i>Septoria tritici</i> ) | 600 to 1000 mL                                                                        | 405 to 690 mL                                                                       | 320 to 570 g                                                                     | Begin application at flag leaf emergence; repeat 10 to 14 days later when heads are visible. A third application when heads are fully emerged may be necessary.                                                                                  |
|          | Suppression of fusarium head blight ( <i>Fusarium</i> spp.)                                                                          | 800 to 1000 mL                                                                        | 570 to 690 mL                                                                       | 450 to 570 g                                                                     | For suppression of fusarium head blight apply at early flowering (before flowering has started in the majority of tillers) and before the beginning of weather favouring disease.                                                                |
| Pea      | Control of mycosphaerella blight ( <i>Mycosphaerella pinodes</i> )                                                                   | 800 to 1200 mL                                                                        | 570 to 850 mL                                                                       | 450 to 690 g                                                                     | Begin application at early flowering and repeat 10 days later at early pod set or mid-flowering if necessary. Make a third application 10 to 14 days after the second application at pod fill should conditions remain favourable for disease.   |
| Lentil   | Control of ascochyta blight ( <i>Ascochyta lentis</i> ), anthracnose ( <i>Colletotrichum truncatum</i> )                             | 800 to 1600 mL                                                                        | 570 to 1130 mL                                                                      | 450 to 890 g                                                                     | For one application only, apply at early flowering. For two applications: apply first before flowering when bud formation is evident; apply second at early to mid-flowering 10 to 14 days after the first application but before rows close in. |
| Chickpea | Control of ascochyta blight ( <i>Ascochyta rabiei</i> )                                                                              | 1200 to 1600 mL for first application;<br>800 to 1200 mL for subsequent applications. | 850 to 1130 mL for first application;<br>570 to 850 mL for subsequent applications. | 690 to 890 g for first application;<br>450 to 690 g for subsequent applications. | Make first application at very early flowering and remaining applications at 10 day intervals.                                                                                                                                                   |

| Crop   | Diseases Controlled                           | Application Rate* (per acre) |                 |                 |                        | Application Timing                                                                                                                                                                                                                                                    |
|--------|-----------------------------------------------|------------------------------|-----------------|-----------------|------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|        |                                               | <i>Bravo 500</i>             | <i>Bravo Zn</i> | <i>Echo 720</i> | <i>Echo 90DF/90WSP</i> |                                                                                                                                                                                                                                                                       |
| Potato | Late blight ( <i>Phytophthora infestans</i> ) | 480 to 1000 mL               | 480 to 1000 mL  | 320 to 690 mL   | 280 to 530 g           | Begin application when plants are 6 to 8 inches (15 to 20 cm) high or when disease threatens. Repeat applications at 7 to 10 day intervals or as necessary to maintain disease control.<br>*Under high disease pressure, use higher rate and shorter spray intervals. |
|        | Early blight ( <i>Alternaria solani</i> )     | 640 to 1000 mL               | 640 to 1000 mL  | 445 mL          | 370 to 530 g           |                                                                                                                                                                                                                                                                       |
|        | Botrytis vine rot ( <i>Botrytis cinerea</i> ) | 640 to 1000 mL               | 640 to 1000 mL  | 445 mL          | 370 to 530 g           |                                                                                                                                                                                                                                                                       |

### Application Information:

- **Water Volume:** Volume will vary with crop and amount of plant growth. Use sufficient water to obtain adequate coverage of foliage.
    - **Ground:** Spray volume will usually range from 90 to 640 L per acre for dilute sprays and 20 to 40 L per acre for concentrate sprays. Applicators treating potato fields must use groundboom equipment with an enclosed cab.
    - **Chickpea** – 90 L per acre. Ground application only.
    - **Aerial:** Use minimum of 12 L per acre. DO NOT apply *Bravo ZNC* using aerial application equipment.
- Note:** when using *Bravo ZNC* or *Echo NP*, mixers and loaders cannot handle more than 340 kg a.i. chlorothalonil (680 L) per person per day.

### How it Works:

The active ingredient chlorothalonil is a chloronitrile fungicide with multi-site contact activity. Refer to "Fungicide Modes of Action" in the Plant Disease Control section for more information.

### Tank Mixes:

DO NOT combine with pesticides, surfactants or fertilizers unless prior use has shown the combination is physically compatible and non-injurious under your conditions of use.

**Fungicides:** For control of early blight in potato, *Bravo 500* may be tank-mixed with 200 mL per acre *Quadris*. DO NOT apply sequential applications of this tank-mix and DO NOT exceed 3 tank-mix applications per season. DO NOT apply to potatoes later than 2 days before harvest. For control of early blight, late blight, and botrytis vine rot in potato and for suppression of storage rots, pythium leak and pink rot, in potato *Bravo Zn* may be tank mixed with 80 mL per acre *Ridomil Gold 480 EC* or *Ridomil Gold 480 SL*.

**Herbicides:** On lentils, DO NOT apply in combination with *Poast* herbicide and *Merge* surfactant or within 48 hours of the application of *Poast* and *Merge*.

### Restrictions:

- **Resistance management:** Refer to "Pathogen Resistance" in the Plant Disease Control section for more information.
- **Maximum number of applications:**
  - *Lentil* – DO NOT exceed 2 applications of this product per season.
  - *Wheat, pea, chickpea* – DO NOT exceed 2 applications of this product per season. **Note:** *Bravo ZNC* maximum 2 applications per season.
  - *Potato* (*Echo 90DF*) – DO NOT exceed 3 applications of this product per season. **Note:** *Bravo ZNC* and *Echo NP* not registered on potatoes.
- **Grazing:** DO NOT graze treated areas. DO NOT feed straw from treated crops to livestock.
- **Preharvest interval:**
  - *Potato* – 1 day
  - *Lentil* – 48 days
  - *Chickpea* – *Bravo 500* – 14 days, *Echo 720* – 48 days
  - *Wheat* – 30 days
  - *Pea* – 32 days
- **Restricted Entry Interval:** DO NOT re-enter treated area within 48 hours of application. If required, and at least 4 hours have passed since application, individuals may re-enter treated area for short-term tasks not involving hand labour. Long pants, long-sleeved shirt, and chemical resistant gloves must be worn.
- **Re-cropping:** None.
- **Storage:** DO NOT store near feed or food stuffs. Store in a cool, dry, ventilated place. Protect from excessive heat.
- **Environment:** DO NOT apply if weather conditions favour drift from area being treated. DO NOT contaminate lakes, streams or ponds. Observe a buffer zone of 100 m for aerial applications and 15 m for ground applications to protect aquatic systems.

**Hazard Rating:**

Caution – Poison

Warning – Causes Severe Eye Damage

Refer to the Introduction for an explanation of the symbols.

### Application Information:

- **Ground:** Follow the instructions on the label for each of the product. Use enough water to ensure thorough coverage. As noted on the labels, 400 L per acre (*Copper 53W* and *Copper Spray*); boom height must be 60 cm or less above the crop or ground (*Cueva*).
- **Aerial:** DO NOT apply by air

### How it Works:

The active ingredients containing copper are inorganic fungicides with contact activity. Refer to "Fungicide Modes of Action" in the Plant Disease Control section for more information.

### Restrictions:

- **Resistance management:** Refer to "Pathogen Resistance" in the Plant Disease Control section for more information.
- **Maximum number of applications:**
  - *Cueva*: DO NOT exceed 15 applications per year.
  - *Bean (Parasol WG)* – DO NOT exceed 6 applications per season.
  - *Potato (Parasol WG and Parasol FL)* – DO NOT exceed 10 applications per season.
  - *Potato (HyCop)* – DO NOT exceed 8 applications per season.
- **Grazing:** No restrictions listed.
- **Preharvest interval:** DO NOT apply within three days of harvest or as indicated on label.
- **Restricted Entry Interval:**
  - *Copper 53W, Copper Spray, HyCop, Parasol FL, and Parasol WG* – DO NOT re-enter treated areas within 48 hours of application
  - *Cueva* – 4 hours
- **Re-cropping:** No restrictions listed.
- **Storage:** Store in original container in a cool, dry, well ventilated area. To prevent contamination store this product away from food or feed. Protect from freezing. Keep away from heat, fire, and sparks. Store out of reach of children and animals.
- **Environment:** DO NOT apply or allow to drift onto streams or any body of water. To reduce runoff from treated areas into aquatic habitats avoid application to areas with a moderate to steep slope, compacted soil, or clay. Avoid application when heavy rain is forecast. Contamination of aquatic areas as a result of runoff may be reduced by including a vegetative strip between the treated area and the edge of the water body.
- **Toxicity:** Toxic to birds, small wild mammals and aquatic organisms (indicated on *Cueva* label).

**Hazard Rating:****Copper 53W, Copper Spray:** Warning – Poison**Parasol WG and Parasol FL:** Caution – Poison

Refer to the Introduction for an explanation of the symbols.

# Cotegra

**Fungicide Group  
3, 7****Company:**

BASF Canada (PCP#32530)

**Formulation:**

250 g/L boscalid and 150 g/L prothioconazole formulated as a suspension concentrate.

- Container size – 2 x 9.8 L per case

**Crops, Diseases, Rates and Timing:**

| Crop                                             | Diseases                                                                                                                                                                                                                                                                                 | Application Rate (per acre) | Application Timing                                                                                                                                                                                                                                                                                                                                                          |
|--------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Canola (including rapeseed and oriental mustard) | Control of sclerotinia stem rot ( <i>Sclerotinia sclerotiorum</i> )                                                                                                                                                                                                                      | 240 to 280 mL               | Apply <i>Cotegra</i> at 20 to 50% flowering. Select the use rate based on relative disease pressure. Use the high rate when risk for disease development is high (e.g. narrow host rotation with disease history and high potential for inoculum). Apply a second application 7 to 14 days if disease persists or weather conditions are conducive for disease development. |
| Chickpeas                                        | Suppression of white mould ( <i>Sclerotinia sclerotiorum</i> ) and Grey mold ( <i>Botrytis cinerea</i> ); Control of Ascochyta blight ( <i>Ascochyta rabiei</i> )                                                                                                                        | 280 mL                      | Apply <i>Cotegra</i> at the beginning of flowering or at the onset of disease symptoms. Apply a second application 7 to 14 days if disease persists or weather conditions are conducive for disease development.                                                                                                                                                            |
| Dry bean; faba bean                              | Suppression of white mould ( <i>Sclerotinia sclerotiorum</i> )                                                                                                                                                                                                                           | 400 mL                      | Apply <i>Cotegra</i> at 20 to 50% flowering. Apply a second application 7 to 14 days if disease persists or weather conditions are conducive for disease development.                                                                                                                                                                                                       |
| Field Peas                                       | Control of Mycosphaerella blight ( <i>Mycosphaerella pinodes</i> ) and Ascochyta blight ( <i>Ascochyta pinodes</i> ) at high rate; suppression at low rate. Suppression of white mould ( <i>Sclerotinia sclerotiorum</i> ) at high rate.                                                 | 240-280 mL                  | Apply <i>Cotegra</i> at the beginning of flowering or at the onset of disease symptoms. Apply a second application 7 to 14 days if disease persists or weather conditions are conducive for disease development.                                                                                                                                                            |
| Lentils                                          | Control of anthracnose ( <i>Colletotrichum lentis</i> ) including biotypes resistant to Group 11 fungicides at high rate; suppression at low rate. Suppression of white mould ( <i>Sclerotinia sclerotiorum</i> ) and suppression of Grey mold ( <i>Botrytis cinerea</i> ) at high rate. | 240-280 mL                  | Apply <i>Cotegra</i> at the beginning of flowering or at the onset of disease symptoms. Apply a second application 7 to 14 days if disease persists or weather conditions are conducive for disease development.                                                                                                                                                            |
| Soybean                                          | Control of frog-eye leaf spot ( <i>Cercospora sojina</i> ), pod and stem blight ( <i>Diaporthe phaseolorum</i> ) Suppression of white mould ( <i>Sclerotinia sclerotiorum</i> ), brown spot ( <i>Septoria glycines</i> )                                                                 | 280 mL                      | Apply <i>Cotegra</i> prior to disease development when conditions are favourable for disease development or at the onset of disease symptoms. Apply a second application 7 to 14 days if disease persists or weather conditions are conducive for disease development.                                                                                                      |

**Application Information:**

- **Water Volume:**
  - **Ground:** Use a minimum water volume of 40 L per acre and ensure thorough coverage of foliage.
  - **Aerial:** Use a minimum water volume of 20 L per acre and ensure thorough coverage of foliage.

## How it Works:

The active ingredient boscalid is a carboxamide (SDHI) fungicide with systemic activity. The active ingredient prothioconazole is a triazole fungicide with broad-spectrum systemic activity. To be used as a preventative application when environmental conditions are favourable for disease development. Refer to "Fungicide Modes of Action" in the Plant Disease Control section for more information.

## Tank Mixes:

None registered.

## Restrictions:

- **Resistance management:** Refer to "Pathogen Resistance" in the Plant Disease Control section for more information.
- **Maximum number of applications:**
  - *Canola, mustard, dry bean, chickpea, lentil, pea, soybean* – DO NOT exceed 2 applications of this product per season.
- **Grazing:** All crops can be grazed or fed to livestock 7 days after application.
- **Preharvest interval:**
  - *Beans, chickpea, lentil, pea, soybean* – 21 days
  - *Canola, rapeseed, and oriental mustard* – 36 days
- **Restricted Entry Interval:** DO NOT re-enter treated area for 24 hours after application.
- **Re-cropping:** A plant back restriction of 14 days is required for all crops not on the label. 30 days for all crops NOT on the label.
- **Storage:** Store the leftover product in original tightly closed container. Protect from freezing. Store in a cool, dry, locked, well-ventilated area without a floor drain.
- **Environment:** Toxic to aquatic organisms. Observe buffer zones and DO NOT apply to any body of water or where runoff is likely to occur.

## Hazard Rating:

Caution – Poison

Refer to the Introduction for an explanation of the symbols.

# Curzate

Fungicide Group  
27

## Company:

Corteva Agriscience (PCP#26284)

## Formulation:

60% cymoxanil formulated as a dry flowable.

- Container size – 1.8 kg

## Crops, Diseases Timing:

Control of late blight (*Phytophthora infestans*) in potato. Initial applications should start when local conditions indicate that late blight is imminent. Make additional applications at 5 to 7 day intervals; however, at least 20 days must pass between the second and third application.

## Rate:

Apply *Curzate* at 90 grams per acre

-plus-

*Manzate DF* or *Manzate Pro-Stick* at 540 grams to 650 grams per acre.

## Application Information:

- **Water Volume:**
  - **Ground:** Utilize sufficient water to obtain thorough coverage – 80 to 400 L per acre.
  - **Aerial:** Apply by air with a minimum water volume of 20 L per acre.

## How it Works:

The active ingredient cymoxanil is a cyanoacetamide-oxime fungicide with locally systemic activity. To be used as a preventative, curative and inhibitive (antisporeulant) fungicide application. Refer to "Fungicide Modes of Action" in the Plant Disease Control section for more information.

## Tank Mixes:

DO NOT use *Curzate* alone. Use only in a tank mix with *Dithane Rainshield*, *Manzate DF* or *Manzate Pro-Stick*.

## Restrictions:

- **Resistance management:** Refer to "Pathogen Resistance" in the Plant Disease Control section for more information.
- **Maximum number of applications:** DO NOT exceed 4 applications of this product per season.
- **Grazing:** No restrictions listed.
- **Preharvest interval:** 8 days
- **Restricted Entry Interval:** DO NOT re-enter treated areas within 24 hours of application.
- **Re-cropping:** No restrictions listed.
- **Storage:** Store product in original container in a secure, dry area away from food or feed. Protect against humid air and water. Not for use or storage in or around the home. Keep container tightly closed.
- **Environment:** A buffer zone of 50 m is required between the down-wind edge of the boom and sensitive aquatic habitats such as ponds, lakes, rivers, streams, and wetlands. DO NOT contaminate these habitats when cleaning and rinsing equipment or containers. DO NOT clean sprayer near well or water source or near desirable vegetation.

## Hazard Rating:

Danger – Poison

Caution – Eye Irritant

Refer to the Introduction for an explanation of the symbols.

# Custodia

Fungicide Group  
3, 11

## Company:

Adama Canada (PCP#33672)

## Formulation:

200 g/L of Tebuconazole and 120 g/L of Azoxystrobin formulated as a suspension concentrate.

- Container size – 10.08 L

## Crops, Diseases, Rates and Timing:

| Crop                          | Diseases                                                                                   | Application Rate (per acre) | Application Timing                                                                                                                                                                                                                               |
|-------------------------------|--------------------------------------------------------------------------------------------|-----------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Wheat (spring, winter, durum) | Leaf rust, Stem rust, Stripe rust, Septoria leaf blotch, Tan spot                          | 190-250 mL/ac               | Apply <i>Custodia</i> ® to leaf foliage at the first sign or very early stage of disease, up to the end of the flowering period. Use of the higher rate should be considered when weather conditions are conducive to heavy disease development. |
| Barley                        | Net blotch, Spot blotch, Leaf rust, Stem rust, Stripe rust, Septoria leaf blotch, Tan spot | 190-250 mL/ac               | Apply <i>Custodia</i> ® to leaf foliage at the first sign or very early stage of disease. Use of the higher rate should be considered when weather conditions are conducive to heavy disease development.                                        |
| Oats                          | Crown rust, stem rust, septoria leaf blotch                                                | 190 mL/ac                   | Apply <i>Custodia</i> ® to leaf foliage at the first sign or very early stage of disease.                                                                                                                                                        |
| Soybean                       | Frogeye leaf spot                                                                          | 190-250 mL/ac               | Apply <i>Custodia</i> ® at the very early stages of disease development. Use of the higher rate should be considered when weather conditions are conducive to heavy disease development or when heavy disease pressure is present.               |

## Application Information:

- **Water Volume:**
  - **Ground:** minimum 40 L per acre.
  - **Aerial:** minimum 20 L per acre.

## How it Works:

The active ingredient azoxystrobin is a methoxyacrylate compound (strobilurin) with broad spectrum contact and systemic activity. To be used as a preventative and curative fungicide application. The active ingredient tebuconazole is a triazole demethylation inhibitor (DMI) fungicide with systemic broad-spectrum activity. Refer to "Fungicide Modes of Action" in the Plant Disease Control section for more information.

## Tank Mixes:

None registered.

According to the Pest Management Regulatory Agency of Health Canada's Guidance Document on Tank Mix Labelling (March 2023), unlabelled tank mixes of this product are permitted only if the label of this product and the label of the product it might be mixed with include at least general wording on their respective labels indicating they may be mixed with other pesticides. When tank mixes are permitted, apply mixes according to the most restrictive use limitations for either product.

## Restrictions:

- **Resistance management:** Refer to "Pathogen Resistance" in the Plant Disease Control section for more information.
- **Maximum number of applications:** Do not apply more than once per year.
- **Grazing:** DO NOT graze or feed green forage to livestock prior to 6 days after treatment. Straw cut after harvest may be fed or used for bedding.
- **Preharvest interval:**
  - *Mature grain* – 36 days.
  - *Forage and hay* – 6 days
- **Restricted Entry Interval:** DO NOT re-enter treated areas within 12 hours of application.
- **Re-cropping:** No restrictions listed.
- **Storage:** Store above 5°C in original, tightly closed container. DO NOT ship or store near food, feed, seed and fertilizers. Store in a cool, dry, locked, well-ventilated area without a floor drain. Keep from freezing.
- **Environment:** This product is toxic to birds, small wild animals, aquatic organisms, and non-target plants. This product demonstrates the properties and characteristics associated with chemicals detected in ground water. The use of *Custodia* foliar fungicide in areas where soils are permeable, particularly where the water table is shallow, may results in ground water contamination. To reduce runoff from treated areas in to aquatic habitats avoid application to areas with a moderate to steep slope, compacted soil or clay. Avoid application when heavy rain is forecast. Contamination of aquatic areas as a results of runoff may be reduced by including a vegetative strip between the treated area and the edge of the water body.

## Hazard Rating:

Caution – Poison

Refer to the Introduction for an explanation of the symbols.

# Delaro 325 SC

Fungicide Group  
3, 11

## Company:

Bayer (PCP#31533)

## Formulation:

175 g/L of prothioconazole and 150 g/L of trifloxystrobin formulated as a suspension concentrate.

- Container size – 7.1 L

## Crops, Diseases, Rates and Timing:

| Crop                  | Diseases Controlled                                                                                                                                                                                                                                                           | Application Rate (per acre) | Application Timing                                                                                                                                                                                                                                                                                                                |

| Lentils               | White mould ( <i>Sclerotinia sclerotiorum</i> ), ascochyta blight ( <i>Ascochyta lentis</i> ), grey mould ( <i>Botrytis cinerea</i> ), anthracnose ( <i>Colletotrichum truncatum</i> )                                                                                        |                             |                                                                                                                                                                                                                                                                                                                                   |
| Soybean               | Brown spot ( <i>Septoria glycines</i> ), phomopsis stem blight ( <i>Phomopsis longicolla</i> ), white mould ( <i>Sclerotinia sclerotiorum</i> ), frog-eye leaf spot ( <i>Cercospora soja</i> )                                                                                | 230 mL                      | Apply preventatively or at the first signs of disease from early flowering (R1) to complete pod fill (R5). When disease pressure is high or when agronomic or weather conditions are conducive to disease development, make a second application 10 to 14 days later. Continue applications as needed on a 10 to 14 day interval. |

| Crop                                                      | Diseases Controlled                                                                                                                                                                                                                | Application Rate (per acre) | Application Timing                                                                                                                                                                                                                                |
|-----------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Corn                                                      | Common rust ( <i>Puccinia sorghi</i> ), eye spot ( <i>Aureobasidium zeae</i> ), Northern corn leaf blight ( <i>Setosphaeria turcica</i> ; anamorph <i>Exserohilum turcicum</i> ), grey leaf spot ( <i>Cercospora zeae-maydis</i> ) | 230 mL                      | Apply at first sign of disease. When disease pressure is high or when agronomic or weather conditions are conducive to disease development, make a second application 10 to 14 days later.                                                        |
| Alfalfa for seed production only (minor use registration) | Blossom blight ( <i>Sclerotinia sclerotiorum</i> , <i>Botrytis cinerea</i> )                                                                                                                                                       | 356 mL                      | Begin fungicide applications at the beginning of flowering or at first sign of disease. When disease pressure is high or when agronomic or weather conditions are conducive to disease development make a second application 10 to 14 days later. |

## Application Information:

- **Water Volume:**
  - **Ground:** minimum 40 L per acre.
  - **Aerial:** minimum 20 L per acre.

## How it Works:

The active ingredient prothioconazole is a triazole fungicide with broad spectrum systemic activity. The active ingredient trifloxystrobin is a strobilurin fungicide with broad spectrum preventative activity. Refer to "Fungicide Modes of Action" in the Plant Disease Control section for more information.

## Tank Mixes:

None registered.

According to the Pest Management Regulatory Agency of Health Canada's Guidance Document on Tank Mix Labelling (March 2023), unlabelled tank mixes of this product are permitted only if the label of this product and the label of the product it might be mixed with include at least general wording on their respective labels indicating they may be mixed with other pesticides. When tank mixes are permitted, apply mixes according to the most restrictive use limitations for either product.

## Restrictions:

- **Resistance management:** Refer to "Pathogen Resistance" in the Plant Disease Control section for more information.
- **Maximum number of applications:** DO NOT exceed 2 applications of *Delaro 325 SC* per season in field pea, chickpea, lentil, soybean, winter wheat and corn. DO NOT exceed 1 application of *Delaro 325 SC* per season in barley, oats, triticale, spring wheat and durum.
- **Grazing:** No restrictions listed.
- **Preharvest interval:**
  - **Wheat, barley, oats, triticale** – 45 days
  - **Field pea, chickpea, lentil** – 30 days
  - **Field corn, popcorn** – 30 days
  - **Soybean** – 20 days
  - **Sweet corn** – 14 days
  - **Flax** – 36 days
- **Restricted Entry Interval:** DO NOT re-enter treated areas within 12 hours of application.
- **Re-cropping:** Crops listed on label, corn, cereals and sugarbeet may be planted immediately following last application. DO NOT plant any other crops within 30 days of application of *Delaro 325 SC*.
- **Storage:** Store this product away from food or feed. Keep away from fire or open flame or other sources of heat. DO NOT store at temperatures below freezing. If stored for 1 year or longer, shake well before using. Store away from feed, seed, fertilizer, plant and foodstuffs. DO NOT store in or around the home. Keep in original container during storage.
- **Environment:** Toxic to aquatic organisms and non-target terrestrial plants. DO NOT contaminate irrigation or drinking water supplies or aquatic habitats by cleaning of equipment or disposal of wastes. DO NOT apply to areas where runoff is likely to occur.
- Rainfast 1 hour.

## Hazard Rating:

Caution – Eye Irritant

Potential Skin Sensitizer

Refer to the Introduction for an explanation of the symbols.

# Delaro Complete\*

Fungicide Group  
3, 7, 11

\*NOTE: As of January 1, 2025, [www.keepitclean.ca](http://www.keepitclean.ca) indicates that the use of this product on certain crop types, particularly on barley and especially on malt barley, may have market access concerns. Please see Introduction for more information AND consult potential grain buyers before using this product.

## Company:

Bayer (PCP#34095)

## Formulation:

176.2 g/L Prothioconazole, 154 g/L Trifloxystrobin, and 128 g/L Fluopyram as suspension concentrate

- Container size – 7.1 L jug (20ac/jug), 113.8 L drum (320 ac/drum)

## Crops, Diseases, Rates and Timing:

| Crop                                                                  | Diseases                                                                                                                                                                                                                                                                                                                                                                                                                                         | Application Rate (per acre) | Application Timing                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|-----------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Lentils, chickpeas, field peas, dry beans, faba bean                  | Control of white mould ( <i>Sclerotinia sclerotiorum</i> ), grey mould ( <i>Botrytis cinerea</i> ), aschochyta blight ( <i>Ascochyta</i> spp.), anthracnose in dry bean ( <i>Colletotrichum lindemuthianum</i> ), anthracnose in lentil ( <i>Colletotrichum lentis</i> ), mycosphaerella blight in field pea ( <i>Mycosphaerella pinodes</i> ), powdery mildew ( <i>Erysiphe pisi</i> ), chocolate spot in Faba bean ( <i>Botrytis cinerea</i> ) | 356mL                       | Begin fungicide applications preventatively, at the beginning of flowering or at first sign of disease. When disease pressure is high or when agronomic or weather conditions are conducive to disease development, make a second application 7 to 14 days later. Within the stated interval range, use shorter intervals for best protection. Ensure that the area to be treated is covered uniformly. Good spray coverage and canopy penetration are important for best results.                                                 |
| Soybean                                                               | Control of frogeye leaf spot ( <i>Cercospora soja</i> ), brown spot ( <i>Septoria glycines</i> ), phomopsis stem blight ( <i>Phomopsis longicolla</i> )<br>Suppression of charcoal rot ( <i>Macrophomina phaseolina</i> ), and white mould ( <i>Sclerotinia sclerotiorum</i> )                                                                                                                                                                   | 237mL                       | Begin fungicide applications preventatively or at the first signs of disease from early flowering (R1) to complete pod fill (R5). When disease pressure is high or when agronomic or weather conditions are conducive to disease development, make a second application 10 to 14 days later.                                                                                                                                                                                                                                       |
| Corn (sweet corn, field corn, popcorn, including corn grown for seed) | Control of common rust ( <i>Puccinia sorghi</i> ), southern corn rust ( <i>Puccinia polysora</i> ), eye spot ( <i>Aureobasidium zeae</i> , syn. <i>Kabatiella zeae</i> ), northern corn leaf blight ( <i>Setosphaeria turcica</i> , syn. <i>Exserohilum turcicum</i> ), grey leaf spot ( <i>Cercospora zeae-maydis</i> ), tar spot ( <i>Phyllachora maydis</i> )                                                                                 | 237mL                       | Apply DELARO COMPLETE when disease first appears and re-apply after 7-14 days if favourable conditions for disease development persist.<br>DO NOT apply DELARO COMPLETE with an adjuvant in corn. Do not apply more than 2 applications of DELARO COMPLETE per crop year. To limit the potential for development of disease resistance to these fungicide classes do not make more than 2 applications of DELARO COMPLETE or any Group 11 or Group 7 containing fungicide before rotating with a fungicide from a different Group. |

| Crop                     | Diseases                                                                                                                                                                                                                                                                                 | Application Rate (per acre) | Application Timing                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| Winter Wheat             | Control of septoria leaf blotch ( <i>Septoria tritici</i> ), powdery mildew ( <i>Erysiphe graminis</i> ), tan spot ( <i>Pyrenophora tritici-repentis</i> ), leaf rust ( <i>Puccinia triticina</i> ), stem rust ( <i>Puccinia graminis</i> ), stripe rust ( <i>Puccinia striiformis</i> ) | 189mL to 237mL              | DELARO COMPLETE should be applied as a preventative disease control measure or at the very early stages of disease development. This could occur anytime during tillering or stem elongation. Typically, one application from the tillering up to flag leaf emergence is required. A second application may be made if needed. DO NOT apply within 14 days of the first treatment. DELARO COMPLETE must be applied prior to head emergence. Timing of Application: Single application: 4-leaf stage up to flag leaf (GS 14-47). Two applications: First application: 4-leaf stage to flag leaf stage. Second application: not within 14 days of the first application and prior to head emergence. |
| Wheat (spring and durum) | Control of septoria leaf blotch ( <i>Septoria tritici</i> ), powdery mildew ( <i>Erysiphe graminis</i> ), tan spot ( <i>Pyrenophora tritici-repentis</i> ), leaf rust ( <i>Puccinia triticina</i> ), stem rust ( <i>Puccinia graminis</i> ), stripe rust ( <i>Puccinia striiformis</i> ) | 237mL                       | DELARO COMPLETE should be applied as a preventative disease control measure or at the very early stages of disease development. Typically this application will occur from tillering up to flag leaf emergence.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Barley                   | Control of net blotch ( <i>Pyrenophora teres</i> ), scald ( <i>Rhynchosporium secalis</i> ), leaf rust ( <i>Puccinia hordei</i> ), stem rust ( <i>Puccinia graminis</i> ), stripe rust ( <i>Puccinia striiformis</i> ), powdery mildew ( <i>Erysiphe graminis</i> )                      |                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Oats                     | Control of crown rust ( <i>Puccinia coronata</i> ), septoria leaf blotch ( <i>Septoria avenae</i> ), stem rust ( <i>Puccinia graminis</i> )                                                                                                                                              |                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Triticale                | Control of stem rust ( <i>Puccinia graminis</i> ), scald ( <i>Rhynchosporium secalis</i> )                                                                                                                                                                                               | 237mL                       |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

### Application Information:

- **Water Volume:**
  - **Ground:** 40 Litre/acre.
  - **Air:** 20 Litre/acre.
- For application in dry shelled pea and bean, *Delaro Complete* should be thoroughly dispersed prior to the addition of a Non-Ionic Surfactant. *Delaro Complete* may be used with a registered Non-Ionic Surfactant, such as Agral 90 or Ag-Surf, at 0.125% vol/vol.

### How it Works:

The active ingredient prothioconazole is a triazole fungicide with broad-spectrum systemic activity. Trifloxystrobin is a strobilurin fungicide with broad spectrum preventative activity. The active ingredient fluopyram is a carboxamide fungicide with systemic activity. Fluopyram is highly plant mobile and works to disrupt disease spore germination.

### Tank Mixes:

Follow the product label. When tank mixes are permitted, consult the labels of the tank-mix partners and observe the largest (most restrictive) spray buffer zone of the products involved in the tank mixture and apply using the coarsest spray (ASAE) category indicated on the labels for those tank mix partners.

## Restrictions:

- **Maximum number of applications:** maximum 2 application per season.
- **Rainfall:** Avoid application when heavy rain is in forecast.
- **Pre-harvest Intervals:** see table below.
- **Grazing:** see table below.
- **Re-entry:** 12 hours after application (see table below).

| Crop                                               | Pre Harvest Interval<br>(days) | Pre-Grazing Interval<br>(days)                                                                                                                                                       | Re-entry                                                  |

- **Re-cropping interval:** Treated areas may be replanted with any crop specified on the label as soon as practical after the last application. For all other crops, do not plant back within 30 days of last application.
- **Storage:** Store this product away from food or feed. Do not contaminate water, food, or feed by storage or disposal. Do not store below freezing. Keep away from direct sunlight. If stored for 1 year or longer, shake well before using. Store the tightly closed container away from feeds, seeds, fertilizer, plants and foodstuffs. Do not use or store in or around the home. Keep the product in the original container during storage.
- **Environment:** Toxic to birds. Toxic to aquatic organisms and non-target terrestrial plants. Observe spray buffer zones. Toxic to certain beneficial arthropods (which may include predatory and parasitic insects, spiders, and mites). Minimize spray drift to reduce harmful effects on beneficial arthropods in habitats next to the application site such as hedgerows and woodland. DO NOT contaminate irrigation or drinking water supplies or aquatic habitats by cleaning of equipment or disposal of wastes.

## Hazard Rating:

Eye irritant, Skin Sensitizer, Lung Irritant

# Diplomat 5SC Fungicide

Fungicide Group  
19

## Company:

Belchim Crop Protection Canada Inc. (PCP # 32918)

## Formulations:

Polyoxin D Zinc Salt, 5.0% as formulated as Suspension Concentrate

- Container size: 4 x 5L

## Crops, Diseases, Rates and Timing:

| Crop     | Diseases controlled                                         | Application Rate<br>(per acre) | Application Timing                                                                                                                                                         |
|----------|-------------------------------------------------------------|--------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Potatoes | Suppression of Early blight<br>( <i>Alternaria solani</i> ) | 221 – 375 mL/acre              | Begin as a preventative application when conditions favour disease development and continue on a 7-14 day interval as needed to maintain suppression. Do not apply by air. |

## Application Information:

- **Water Volume:**
  - **Ground:** Apply as a foliar spray in sufficient water to provide thorough coverage of foliage.
  - Do not apply by air.

## How it Works

Polyoxin D zinc salt stops the growth of susceptible fungal pathogens by interfering with their cell wall growth.

## Tank Mixes:

None registered.

## Restrictions:

- **Maximum number of applications:** Do not apply more than 61 g a.i./acre/season
- **Rainfall:** Avoid application when heavy rain is forecast.
- **Pre-harvest Intervals:** 0 days
- **Re-entry:** Until sprays have dried
- **Re-cropping interval:** n/a
- **Storage:** Store in the original container in a dry location away from food or feed
- **Environment:** To reduce runoff from treated areas into aquatic habitats avoid application to areas with a moderate to steep slope, compacted soil, or clay. Avoid application when heavy rain is forecast. Contamination of aquatic areas as a result of runoff may be reduced by including a vegetative strip between the treated area and the edge of the water body.

## Hazard Rating:

None listed.

Potential Skin Sensitizer

# Double Nickel LC/Double Nickel 55

Fungicide Group  
44

## Company:

Distributed by UAP (*Double Nickel LC*; *Double Nickel 55*)

## Formulations:

**Double Nickel LC (PCP#31887):**  $1 \times 10^{10}$  *Bacillus amyloliquefaciens* strain D747 spores/mL (minimum) formulated in an aqueous suspension.

- Container size – 2 x 9.46 L and 1,000 L

**Double Nickel 55 (PCP#31888):**  $5 \times 10^{10}$  *Bacillus amyloliquefaciens* strain D747 spores/g formulated in a water dispersible granule.

- Container size – 4 x 2.27 kg

| Hemp | Suppression of white mold ( <i>Sclerotinia sclerotiorum</i> ), grey mold ( <i>Botrytis cinerea</i> ) | 1 to 2 L                            | 0.2 to 0.4 kg                        | Growth stage: From planting/ transplanting until maturity and harvest. Begin applications preventatively when conditions are favorable for onset of disease. Ensure full spray coverage. White mold: Repeat application every 3 to 14 days for as long as conditions favor disease development. Grey mold: Repeat application every 3 to 11 days for as long as conditions favor disease development. Under moderate to high disease pressure, or when environmental conditions and plant stage are conducive to rapid disease development, use higher label rates (2.02 L/ac), or apply more frequently (every 3 to 7 days). Lower rates (1.01 L/ac) may be applied under low disease pressure or to smaller (e.g. newly-emerged or transplanted plants and cuttings). |

### Application Information:

- **Foliar:** Mix in sufficient volume of water to achieve thorough coverage of the crop canopy with minimal runoff.
- **For control of early blight, black scurf in potato and white mould in soybean:** Apply lower rate under low disease pressure or to smaller, newly emerged plants. Higher rates may be applied when disease pressure is moderate to high or when environmental conditions and plant stage are conducive to rapid disease development. Apply more frequently (3 to 7 days) or rotate with other fungicides for improved performance.
- **Soil application:** Apply by banded/in-furrow application. Mix the required amount of product in water and apply as banded spray (10 to 15 cm wide) or seedrow drench centered over the furrow. Apply directly over the seeds in the furrow just before seeds are covered with soil. Refer to the product labels for the table with application rates for different row spacing's.

### How it Works:

The active ingredient, *Bacillus amyloliquefaciens* strain D747, is a beneficial bacterium with broad spectrum activity. *B. amyloliquefaciens* colonizes the plant surfaces preventing establishment of disease-causing fungi and bacteria.

### Tank Mixes:

None registered.

### Restrictions:

- **Resistance management:** Refer to "Pathogen Resistance" in the Plant Disease Control section for more information.
- **Maximum number of applications:** Can be applied every 3 to 10 days as long as conditions favor disease development.
- **Grazing:** No restrictions listed.
- **Pre-harvest Interval:**
  - *Hemp* – 3 to 4 weeks
- **Restricted Entry Interval:** DO NOT re-enter treated areas within 4 hours of application.
- **Re-cropping:** No restrictions listed.
- **Storage:** Store in original container away from children and direct sunlight, at 4 to 25°C for up to two years. DO NOT contaminate feed/food.
- **Environment:** To reduce runoff into aquatic habitats, avoid application when heavy rain in forecast. Runoff can also be reduced by including a vegetative strip between the treated area and edge of water body.

### Hazard Rating:

Possible eye irritant and may cause sensitization.

# Dyax

Fungicide Group  
7, 11

## Company:

BASF Canada (PCP#32746)

## Formulation:

250 g/L of fluxapyroxad and 250 g/L of pyraclostrobin formulated as a suspension concentrate.

- Container size – 2 x 9.6 L

## Crops, Diseases, Rates and Timing:

| Alfalfa<br>for seed<br>production | Control of Common leaf spot ( <i>Pseudopeziza medicaginis</i> ; high rate only)<br>Suppression of Blossom blight ( <i>Sclerotinia sclerotiorum</i> ) | 120 to 160 mL/acre              | For optimal disease control, apply <i>Dyax</i> at the beginning of flowering (10-30% bloom) or at the onset of disease. DO NOT make more than 1 application per year |

DO NOT make sequential applications of *Dyax*. If disease persists or weather conditions are favourable for disease development, make a second application 10 to 14 days later, with a fungicide that contains a different mode of action. Use the shorter interval when disease pressure is high.

### Application Information:

- **Water Volume:**
  - **Ground:** minimum 40 L per acre.
  - **Aerial:** minimum 20 L per acre.

### How it Works:

The active ingredient fluxapyroxad is a carboxamide (SDHI) fungicide with system activity. The active ingredient pyraclostrobin is a strobilurin fungicide with broad spectrum contact and systemic activity. To be used as a preventative application when environmental conditions are favourable for disease development. Refer to "Fungicide Modes of Action" in the Plant Disease Control section for more information.

### Restrictions:

- **Resistance management:** Refer to "Pathogen Resistance" in the Plant Disease Control section for more information.
- **Maximum number of applications:** DO NOT exceed 1 sequential application of this product per season with a maximum of two total applications per season.
- **Grazing:** All crops on this label can be grazed or fed to livestock. Observe the minimum pre-harvest intervals for each crop.
- **Preharvest interval:**
  - *Field pea, lentil, chickpea, faba bean, dry bean* – 30 days
  - *Soybean* – 21 days
- **Restricted Entry Interval:** DO NOT re-enter treated areas within 12 hours of application.
- **Re-cropping:** Crops listed on label, tuberous and corm vegetables, fruiting vegetables, pome fruits and stone fruits may be planted immediately following last application. A plant-back interval of one year is required for all other crops.
- **Storage:** Store this product away from food or feed.
- **Environment:** Maintain specified buffer zones. Toxic to aquatic organisms, small mammals, and non-target terrestrial plants.

### Hazard Rating:

Danger Poison – Skin Irritant

Refer to the Introduction for an explanation of the symbols.

# Elatus

Fungicide Group  
7, 11

## Company:

Syngenta Canada

## Formulations:

The Elatus package has 2 components:

- *Elatus A Fungicide* (PCP #31973): 250 g/L azoxystrobin, formulated as a suspension
- *Elatus B Fungicide* (PCP #31977): 100 g/L benzovindiflupyr, formulated as an emulsifiable concentrate

## Crops, Diseases, Rates and Timing:

| Crop                         | Diseases                                                                                                                                                                                                                                                                                                    | Rate <i>Elatus A</i> | Rate <i>Elatus B</i> | Application Timing                                                                                                                                                                                                                                                           |

| Potato                       | Control of silver scurf ( <i>Helminthosporium solani</i> ), rhizoctonia stem canker and rhizoctonia stolon canker ( <i>Rhizoctonia</i> spp.), black scurf ( <i>Rhizoctonia solani</i> )                                                                                                                     | 4 to 6 mL/100 m row  | 200 to 300 mL/acre   | Apply once as an in furrow spray in 20 to 55 L/acre of water at planting. Mount the spray nozzle so the spray is directed into the furrow as a 15 to 20 cm band just before the seed is covered. DO NOT apply by air.                                                        |
|                              | Suppression of verticillium wilt ( <i>Verticillium dahlia</i> )                                                                                                                                                                                                                                             | -                    | 300 mL/acre          |                                                                                                                                                                                                                                                                              |
| Soybean                      | Control of cercospora leaf spot ( <i>Cercospora kikuchii</i> ), powdery mildew ( <i>Microsphaera diffusa</i> , <i>Erysiphe pisi</i> , <i>E. polygoni</i> ), septoria brown spot ( <i>Septoria glycines</i> )<br>Suppression of pod and stem blight ( <i>Diaporthe phaseolorum</i> )                         | 200 mL/acre          | 200 to 300 mL/acre   | Make first application at the R1 to R3 developmental stage or when there is a 5% disease level in the field. A second application may be made 14 days later, if conditions are conducive to disease development.                                                             |

As of January 1, 2021, [www.keepingitclean.ca](http://www.keepingitclean.ca) indicates that grain from pulse crops treated with this product may have market access concerns. Refer to "Understanding Maximum Residue Limit Statements in the Guide" in the introduction for more information AND consult potential grain buyers before using this product.

## Application Information:

- If disease pressure is high, use the highest rate and shortest application interval. For best results, use sufficient water volume to provide thorough coverage.
- **Ground:** minimum of 40 to 80 L per acre water volume is recommended.
- **Aerial:** minimum of 18 L per acre water volume is recommended.
- Use sufficient water to obtain thorough coverage of plants. DO NOT apply under periods of dead calm. Avoid application of this product when winds are gusty.

## How it Works:

The active ingredient azoxystrobin is a methoxyacrylate compound (strobilurin) broad spectrum contact and systemic activity with preventative and curative applications. The active ingredient benzovindiflupyr is a succinate dehydrogenase inhibitor (SDHI) fungicide with broad spectrum activity. Refer to "Fungicide Modes of Action" in the Plant Disease Control section for more information.

## Tank Mixes:

The Elatus package has 2 components. Add *Elatus A* (SC) and any additional SC formulation mix partners prior to adding *Elatus B* (EC) and any additional EC formulation mix partners.

It is not recommended to combine solid (WG or DF) formulations with liquid tank mix partners within a single batch. Batch mix any WG or DF formulation mix partners before *Elatus A* (SC) and any additional SC formulation mix partners. Any SN or SL formulation mix partners should be added by induction or an additional batch mix after the EC (*Elatus B*) and any additional EC formulation mix partners.

## Restrictions:

Note that Elatus contains 2 components with separate labels. Follow the most restrictive precautions, restrictions, and directions found on each of the *Elatus A* and *Elatus B* labels.

- **Resistance management:** Refer to "Pathogen Resistance" in the Plant Disease Control section for more information.
- **Maximum number of applications:** DO NOT apply consecutive applications and DO NOT apply more than 2 applications per season.
- **Grazing:** DO NOT feed dried pea vines to livestock.
- **Preharvest interval:** DO NOT apply on pulse crops within 15 days of harvest. DO NOT apply on soybean within 14 days of harvest.
- **Restricted Entry Interval:** DO NOT re-enter fields for 12 hours after application.
- **Re-cropping:** Potatoes, pulse crops (including dried pea and bean subgroup), soybean, fruiting and cucurbit vegetables, cereals (wheat, barley, oat, rye, triticale), corn, and rapeseed (including canola, mustard, flax, and borage) may be planted immediately after last application as long as they are also registered for use with azoxystrobin products. All other crops intended for food and feed may be planted 180 days after last application of *Elatus*.
- **Storage:** Store product in original container only, away from other pesticides, fertilizer, food or feed. Not for use or storage in or around the home. Keep container closed. To prevent contamination, store this product away from food or feed.
- **Environment:** DO NOT use to control aquatic pests. *Elatus A* is extremely phytotoxic to certain apple varieties. DO NOT use where spray drift may reach apple trees.

## Hazard Rating:

Warning Poison – Corrosive to Eyes and Skin

Refer to the Introduction for an explanation of the symbols.

# Elatus Era

Fungicide Group  
3, 7

## Company:

Syngenta Canada Inc. [Elatus Era – PCP # 35477 (Elatus Era A) /35474 (Elatus Era B)]

## Formulation

Elatus Era is a co- pack of Elatus Era A and Elatus Era B. Elatus Era A (100 g/L Benzovindiflupyr formulated as emulsifiable concentrate), Elatus Era B (250 g/L Prothioconazole formulated as emulsifiable concentrate), container size: Case of 10.12L Elatus Era A and 9.6L Elatus Era B.

## Application information

- **Water Volume:**
  - **Ground:** Minimum water volume 40-80 L/acre
  - **Air:** Minimum water volume 18 L/acre

## How it Works

The active ingredient benzovindiflupyr is a succinate dehydrogenase inhibitor (SDHI) fungicide with broad spectrum activity. The active ingredient prothioconazole is a triazole fungicide with broad-spectrum systemic activity. Refer to "Fungicide Modes of Action" in the Plant Disease Control section for more information.

## Tank Mixes:

According to the Pest Management Regulatory Agency of Health Canada's Guidance Document on Tank Mix Labelling (March 2023), unlabeled tank mixes of this product are permitted only if the label of this product and the label of the product it might be mixed with include at least general wording on their respective labels indicating they may be mixed with other pesticides. When tank mixes are permitted, apply mixes according to the most restrictive use limitations for either product.

## Restrictions:

- **Maximum number of applications:** Lentils, field peas, chickpeas: 2 applications, Soybeans: 1 application
- **Rainfall:** Avoid application when heavy rain is in forecast.
- **Rainfast:** 2 hours
- **Pre-harvest Intervals:** 15 days for chickpeas, field peas and Lentils. 20 days for soybeans.
- **Re-entry:** 24 hours
- **Grazing:** Please see and carefully follow the product labels for grazing precautions.

- **Re-cropping interval:** 0 days: Dried shelled pea and bean subgroup (CG 6C); 30 days: Potatoes, cereals (wheat, barley, oats, rye, triticale), Grasses grown for seed, corn, Rapeseed subgroup CG 20A.
- **Storage:** Elatus Era A: Store this product away from food or feed. Keep in original container, tightly closed, during storage. Store in a cool, dry, well-ventilated area out of the reach of children and animals. This product does not require heated storage. Elatus Era B: Store this product away from food or feed. Keep away from fire or open flame or other sources of heat. Do not store at temperatures below freezing. If stored for 1 year or longer, shake well before using. Store the tightly closed container away from feeds, seeds, plants and foodstuffs. Do not use or store in or around the home. Keep in original container during storage.
- **Environment:** TOXIC to aquatic organisms and non-target terrestrial plants. Carefully follow the labels for buffer zones. To reduce runoff from treated areas into aquatic habitats, avoid application to areas with a moderate to steep slope, compacted soil, or clay. Avoid application when heavy rain is forecast. Contamination of aquatic areas because of runoff may be reduced by including a vegetative strip between the treated area and the edge of the water body.

### Hazard Rating:

Elatus Era A: Poison, Danger: Corrosive to eyes and skin.

Elatus Era B: Caution – Poison; Potential Skin Sensitizer.

## Evito 480

Fungicide Group  
11

### Company:

UPL AgroSolutions Canada Inc. (PCP#30408)

### Formulation:

|                                                                        | Black scurf ( <i>Rhizoctonia solani</i> )                                                                                                | 1.55 to 2.33 mL product/<br>100 m row | Apply as an in-furrow application or banded application shortly after plant emergence, during herbicide application or cultivation.*                                                                                                         |
|                                                                        | Silver scurf ( <i>Helminthosporium solani</i> )                                                                                          | 2.33 mL product/<br>100 m row         | Apply as an in-furrow application or banded application shortly after plant emergence, during herbicide application or cultivation.*                                                                                                         |

\*Consult with product label before application.

## Application Information:

- **Water Volume:**
  - **Ground:** Apply in a minimum of 40 L of water per acre.
  - **Aerial:** Apply in a minimum of 20 L of water per acre.

## How it Works:

The active ingredient fluoxastrobin is a systemic fungicide that works by interfering with respiration in plant pathogenic fungi, and is a potent inhibitor of spore germination and mycelial growth. Refer to "Fungicide Modes of Action" in the Plant Disease Control section for more information.

## Tank Mixes:

**All Cereals:** propiconazole.

- **Wheat, barley and oat:** tebuconazole, *Caramba*, *Proline 480 SC*, *Prosaro 250 EC*.

**Corn:** propiconazole (field, seed, sweet), chlorothalonil (sweet corn only).

**Soybean:** propiconazole, tebuconazole

**Potatoes:** MUST be tank mixed with chlorothalonil, mancozeb.

Refer to tank mix partner labels for use in directions, restrictions and precautions.

## Restrictions:

- **Resistance management:** Refer to "Pathogen Resistance" in the Plant Disease Control section for more information.
- **Maximum number of applications:**
  - **Wheat, barley, corn, oat, rye, triticale, canola, soybean** – 2 applications per year
  - **Potatoes** – 3 applications per year
- **Grazing:** DO NOT apply within 7 days of harvest for hay and forage. If wheat forage will be harvested, make only one application.
- **Preharvest interval:**
  - **All cereals** – 40 days
  - **Canola** – 21 days
  - **Potatoes** – 7 days
  - **Corn** – 30 days (grain) or 7 days (sweet)
  - **Soybean** – DO NOT apply later than R6 (full seed)
- **Re-cropping:**
  - All crops on the *Evito 480* label (cereals, corn, canola, potato, soybean, dry bean, field pea, faba bean, chickpea, lentil) may be planted immediately following harvest.
  - Alfalfa and forage grasses may be planted following a 30 days plant back interval.
  - Sunflower may be planted following a 180 days plant back interval.
  - For all other crops, DO NOT plant back within one year of the last field application.

- **Storage:** Store in cool, dry place and in such a manner as to prevent cross contamination with other pesticides, fertilizers, food, or feed. Store in original container and out of reach of children, preferably in a locked storage area. *Evito 480* is not affected by freezing.
- **Environment:** Toxic to aquatic organisms. Observe buffer zones as specified on the label. To reduce runoff from treated areas into aquatic habitats avoid application to areas with a moderate to steep slope, compacted soil, or clay.

## Crops, Diseases, Rates and Timing:

| Crop     | Diseases                                                                                              | Application Rate (per acre) | Application Timing                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|----------|-------------------------------------------------------------------------------------------------------|-----------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Potato   | Late blight ( <i>Phytophthora infestans</i> )                                                         | 160 mL                      | Begin applications when plants are 15 to 20 cm tall or when conditions favour disease development. Repeat application at 7 to 10 day intervals.                                                                                                                                                                                                                                                                                                                                                         |
|          | Sclerotinia stem rot ( <i>Sclerotinia sclerotiorum</i> )                                              | 160 to 240 mL               | Begin applications at full bloom. Repeat application intervals of 7 to 10 days. When white mould pressure is low to moderate, use 160 mL. When conditions favour moderate to high white mould pressure, increase the rate to 240 mL.                                                                                                                                                                                                                                                                    |
| Dry bean | White mould ( <i>Sclerotinia sclerotiorum</i> ), Anthracnose ( <i>Colletotrichum lindemuthianum</i> ) | 240 to 405 mL               | For control of white mold make the first application at 10 to 30% bloom (e.g. when 10 to 30% of the plants have at least one (1) open bloom). If needed, a second application may be applied 7 to 10 days later. For control of Anthracnose make first application at 10-30% bloom (e.g. when 10 to 30% of the plants have at least (1) open bloom). If needed, a second application may be applied 10 to 14 days later. Under conditions favorable for severe disease development use the higher rate. |
| Soybean  | White mould ( <i>Sclerotinia sclerotiorum</i> )                                                       | 180 to 470 mL               | For suppression of white mould use 180 mL rate. For control of white mould use 355 to 470 mL rate. Begin application at the R1 (early bloom) to R2 (full bloom) stage of development and if needed, again 10 to 14 days later at early pod formation (R3). As a preventative spray or with conditions favoring low disease pressure, use the low rate. For conditions favoring moderate to high disease development, use high rate.                                                                     |

## Application Information:

- **Water Volume:**
  - **Ground:** 80 to 240 L per acre. Spray volumes vary with amount of plant growth; apply in sufficient water to obtain adequate coverage of foliage.
  - **Aerial:** For potatoes, soybean and dry bean minimum of 18 L per acre.

## How it Works:

The active ingredient fluazinam is a pyridinamine fungicide with contact activity. Refer to "Fungicide Modes of Action" in the Plant Disease Control section for more information.

## Tank Mixes:

According to the Pest Management Regulatory Agency of Health Canada's Guidance Document on Tank Mix Labelling (March 2023), unlabelled tank mixes of this product are permitted only if the label of this product and the label of the product it might be mixed with include at least general wording on their respective labels indicating they may be mixed with other pesticides. When tank mixes are permitted, apply mixes according to the most restrictive use limitations for either product.

## Restrictions:

- **Resistance management:** Refer to "Pathogen Resistance" in the Plant Disease Control section for more information.
- **Maximum number of applications:**
  - **Bean and soybean** – DO NOT exceed 2 applications of this product per season. DO NOT apply more than the maximum seasonal use rate of 809 mL (for bean) and 947 mL (for soybean) per acre during each growing season.
  - **Potato** – Make no more than 3 sequential applications of this product before alternating to another fungicide belonging to a different chemical family. DO NOT apply more than the maximum use rate of 1619 mL per acre during each growing season.
- **Grazing:** For soybean, DO NOT allow livestock to graze treated areas. DO NOT feed hay from treated fields to livestock.
- **Preharvest interval:** 14 days (potatoes); 30 days (dry bean). DO NOT apply after growth stage R3, early pod formation in soybean.
- **Restricted Entry Interval:** DO NOT re-enter treated areas within 24 hours of application.
- **Re-cropping:** Can be replanted with potatoes as soon as practical after the last application, 30 days for other root crops and leafy vegetables, and 70 days for all other crops. Fluazinam will carry over, DO NOT use in areas treated with this product during the previous season.
- **Storage:** Store product in a dry place separate from other pesticides, fertilizer, food, and feed.
- **Environment:** DO NOT contaminate aquatic habitats when cleaning and rinsing spray equipment or containers. DO NOT overspray non-target terrestrial or aquatic habitats.
- **Rainfall:** Avoid application when heavy rain is forecast.

# Fontelis

Fungicide Group  
7

## Company:

Corteva Agriscience (PCP#30331)

## Formulation:

200 g/L penthiopyrad formulated as a suspension.

- Container size – 2 x 9.6 L jug

## Crops, Diseases, Rates and Timing:

| Crop    | Diseases                                                    | Application Rate<br>(per acre) | Application Timing                                                                                                                                          |
|---------|-------------------------------------------------------------|--------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Alfalfa | Sclerotinia stem rot<br>( <i>Sclerotinia sclerotiorum</i> ) | 500 to 700 mL                  | Begin applications prior to disease development and continue on a 7 to 14 day interval. Use higher rate and shorter interval when disease pressure is high. |

## Application Information:

- **Water Volume:**
  - **Ground:** 45 L per acre.
  - **Aerial:** 16 L per acre.
- Use sufficient water to obtain thorough coverage of plants. DO NOT apply under periods of dead calm. Avoid application of this product when winds are gusty.

## How it Works:

The active ingredient penthiopyrad is a carboxamide fungicide with broad spectrum, locally systemic and curative properties recommended for foliar and soil borne plant diseases. Refer to "Fungicide Modes of Action" in the Plant Disease Control section for more information.

## Tank Mixes:

None registered.

## Restrictions:

- **Resistance management:** Refer to "Pathogen Resistance" in the Plant Disease Control section for more information.
- **Maximum number of applications:** DO NOT exceed two sequential applications of this product before switching to a fungicide with a different mode of action. DO NOT exceed 1.4 L per acre in one season.
- **Grazing:** No restrictions listed.
- **Preharvest interval:** 14 days
- **Restricted Entry Interval:** DO NOT re-enter treated areas until 12 hours after application.
- **Re-cropping:** Crops and crop groups on the *Fontelis* label as well as the following crops may be planted immediately after harvest: canola, cereal grains crop group, corn, cotton, legume vegetables crop subgroup, soybean, sugarbeet, tuberous and corn vegetables and leaves crop subgroup. All other crops cannot be planted until 12 months after the last application.
- **Storage:** Store product in original container only, away from other pesticides, fertilizer, food or feed. Not for use or storage in or around the home. Keep container closed.
- **Environment:** This product is toxic to aquatic organisms. When using *Fontelis*, consult the product label for buffer zones.

| Potato | Late blight<br>( <i>Phytophthora infestans</i> )  | 182 mL                      | Make the first application when disease threatens or when visible signs of disease occur in nearby fields. Apply every 5 to 7 days under high pressure or every 7 to 10 days under low pressure. A minimum interval of 5 days between applications is required. |
|        | Tuber blight<br>( <i>Phytophthora infestans</i> ) | 182 mL                      | Apply after first desiccation to target stem lesions to reduce tuber blight.                                                                                                                                                                                    |

## Application Information:

- **Water Volume:**
  - **Ground:** Use a minimum water volume of 20 L per acre.
  - **Aerial:** Use a minimum water volume of 80 L per acre.

## How it Works:

The active ingredient dimethomorph is a carboxylic acid amide fungicide with contact, systemic and antispore activity. Refer to "Fungicide Modes of Action" in the Plant Disease Control section for more information.

## Tank Mixes:

**Fungicides:** For resistance management and early blight control (*Alternaria solani*), *Forum* must be tank-mixed with one of *Dithane DG Rainshield* or *Bravo* at the product label rate.

## Restrictions:

- **Resistance management:** Refer to "Pathogen Resistance" in the Plant Disease Control section for more information.
- **Maximum number of applications:** DO NOT exceed 3 applications.
- **Preharvest interval:**
  - **Potatoes** – 4 days

- **Restricted Entry Interval:** DO NOT re-enter treated areas within 12 hours of application.
- **Re-cropping:** DO NOT plant a new crop in the treated area within 120 days of the last application.
- **Storage:** Store under cool and dry conditions in secure, well-ventilated buildings, away from foodstuffs and animal feed and out of reach of children.
- **Environment:** Toxic to aquatic organisms and mammals. Observe buffer zones outlined in the label.

## Hazard Rating:

Danger – Poison

## Formulation:

Flutriafol 125.08 g/L formulated as a suspension concentrate.

## Crops, Diseases, Rates and Timing:

| Crop    | Diseases                                                                                                                                                | Application Rate<br>(per acre) | Application Timing                                                                                                                                                                                                                                                                                                                                                         |
|---------|---------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Soybean | Cercospora blight and leaf spot ( <i>Cercospora kikuchii</i> ), brown spot ( <i>Septoria glycines</i> ), frogeye leaf spot ( <i>Cercospora sojina</i> ) | 207 to 414 mL                  | Apply as a broadcast foliar spray to soybean plants in R3 growth stage (early pod fill) or when environmental conditions are favourable for disease development. Apply second application if conditions are conducive for heavy disease development. Use the higher rate and shorter spray interval under severe sustained disease pressure. Spray Interval 14 to 21 days. |

## Application Information:

- **Water Volume:** minimum 40 L per acre.
- **ASABE medium** droplets. Boom height must be 60 cm or less above the crop.
- DO NOT apply by air

## How it Works:

Flutriafol is a demethylation inhibitor with contact and systemic activity. Refer to "Fungicide Modes of Action" in the Plant Disease Control section for more information.

## Tank Mixes:

*Fullback 125SC* may be tank mixed with *Headline EC Fungicide* at the label rates for resistance management. If compatibility is in question, use the compatibility jar test before mixing the entire tank.

## Restrictions:

- **Resistance management:** Refer to "Pathogen Resistance" in the Plant Disease Control section for more information.
- **Rainfall:** Within 2 hours may reduce effectiveness.
- **Maximum number of applications:** DO NOT apply more than 828 mL per acre per season. DO NOT apply more than 3 applications per growing season. Only one application at 414 mL per acre may be made to any one field during a single growing season. Apply only to soybean harvested for dry seed. Flutriafol is persistent and may carryover. It is recommended that any products containing flutriafol not be used in areas treated with this product during the previous season.
- **Grazing:** DO NOT feed forage or hay to animals or permit animals to graze.
- **Preharvest interval:** DO NOT apply within 21 days of harvest.
- **Restricted Entry Interval:** 12 hours.
- **Re-cropping:** Labeled crops may be planted anytime. Field corn, popcorn may be planted 150 days after application and sweet corn may be planted 200 days after application. All other unlabeled crops may be planted 365 days after application.
- **Storage:** Store unused product in original container in a cool, dry area. DO NOT contaminate water, food or feed by storage, disposal or cleaning of equipment. Shelf life of *Fullback 125 SC* is 3 years.

- **Environment:** DO NOT apply directly to water, or to areas where surface water is present or to intertidal areas below the mean high water mark. See label for more information on ground water contamination and surface water advisory. Avoid application when heavy rain is forecast. Toxic to aquatic organisms and non-target terrestrial plants. Contamination of aquatic areas as a result of runoff may be reduced by including a vegetative strip between the treated area and the edge of the water body.

### Company:

Gowan Canada (PCP#26842)

### Formulation:

66.7% mancozeb and 8.3% zoxamide formulated as a dry flowable.

- Container size – 13.6 kg

### Crops, Diseases Timing:

Control of early blight (*Alternaria solani*) and late blight (*Phytophthora infestans*) in potato. Optimum disease control is achieved when the fungicide is applied in a regularly scheduled preventative spray program. Begin applications at the first sign of disease or when blight is reported in the area. Apply at 0.90 kg per acre (2.25 kg/ha) every 7 days under high disease pressure when either disease is present or environmental conditions favour continued disease development.

Apply at 0.70 kg per acre (1.7 kg/ha) every 7 days under low disease pressure and environmental conditions unfavorable for disease development.

### Rate:

Apply at 0.70 to 0.90 kg per acre (1.7 to 2.25 kg/ha).

### Application Information:

- Thorough, uniform coverage is essential for good disease control.
- **Water Volume:**
  - **Ground:** 18 to 36 L per acre (45 to 90 L/ha). Use 36 L of water per acre under high disease pressure to provide better crop coverage.
  - **Aerial:** 18 to 36 L per acre. Use 36 L of water per acre under high disease pressure to provide better crop coverage.

### How it Works:

To be used as a preventative fungicide application. The active ingredient zoxamide is a benzamide fungicide with contact activity. The mancozeb component is a dithiocarbamate fungicide with contact activity. Refer to "Fungicide Modes of Action" in the Plant Disease Control section for more information.

### Tank Mixes:

This product may be tank mixed with a fertilizer, a supplement, or with registered pest control products, whose labels also allow tank mixing, provided the entirety of both labels, including Directions For Use, Precautions, Restrictions, Environmental Precautions, and Spray Buffer Zones are followed for each product. In cases where these requirements differ between the tank mix partner labels, the most restrictive label must be followed. Do not tank mix products containing the same active ingredient unless specifically listed on the label. In some cases, tank mixing pest control products can result in reduced pesticide efficacy or increased host crop injury. The user should contact Gowan Company at 1-800-960-4318 or information before applying any tank mix that is not specifically recommended on the label.

### Restrictions:

- **Resistance management:** Refer to "Pathogen Resistance" in the Plant Disease Control section for more information.
- **Maximum number of applications:** DO NOT exceed 6 applications of this product per season.
- **Grazing:** No restrictions listed.
- **Preharvest interval:** 3 days
- **Restricted Entry Interval:** DO NOT re-enter treated areas within 12 hours of application.
- **Re-cropping:** A 30 day plant back interval (PBI) is required for leafy vegetables and root and tuber vegetables. For all other crops not included on the label, the PBI should be 140 days.

- **Storage:** DO NOT allow product to freeze. Keep away from fire and sparks. Store in a cool, dry, well ventilated place away from feed or food.
- **Ground application:** This pesticide is toxic to aquatic organisms. A buffer zone of up to 5 m for application by ground sprayer should be established between the last spray swath and the edge of aquatic systems. Follow product label for further instructions.
- **Aerial application:** A buffer zone of up to 350 m is required between the downwind edge of the boom and the closest edge of sensitive aquatic habitats, follow product label for further instructions.

## Hazard Rating:

Caution Poison – Potential Skin Sensitizer

Warning – Eye Irritant

| Lentil     | Ascochyta blight ( <i>Ascochyta lentis</i> ), White mold ( <i>Sclerotinia sclerotiorum</i> ), <i>Mycosphaerella</i> blight ( <i>Mycosphaerella pinodes</i> ), Anthracnose ( <i>Colletotrichum</i> spp.)                            | 337 mL        | Apply at the beginning of flowering or at the first sign of disease. After the initial application, one additional application may be made 10-14 days afterwards if conditions remain favourable for increased disease development. Maximum of two applications per year.                                                                                                 |
| Field Peas | Control of Anthracnose ( <i>Colletotrichum</i> spp.) and suppression of Ascochyta blight ( <i>Ascochyta pisi</i> ), <i>Mycosphaerella</i> blight ( <i>Mycosphaerella pinodes</i> ), White mold ( <i>Sclerotinia sclerotiorum</i> ) | 337 mL        | Apply at the first sign of disease. After the initial application, one additional application may be made 10-14 days afterwards if conditions remain favourable for continued or increased disease development. Apply the higher rate when conditions favour disease development, or when growing less disease resistant varieties. Maximum of two applications per year. |

## Application information

- Water Volume:
  - Ground: Minimum water volume 40 L/acre
  - Air: Minimum water volume 60 L/acre

## How it Works

The active ingredient Prothioconazole is a triazole fungicide with broad-spectrum systemic activity. The active ingredient azoxystrobin is a methoxyacrylate compound (strobilurin) with broad spectrum contact and systemic activity with preventative and curative applications. Refer to "Fungicide Modes of Action" in the Plant Disease Control section for more information.

## Tank Mixes:

According to the Pest Management Regulatory Agency of Health Canada's Guidance Document on Tank Mix Labelling (March 2023), unlabelled tank mixes of this product are permitted only if the label of this product and the label of the product it might be mixed with include at least general wording on their respective labels indicating they may be mixed with other pesticides. When tank mixes are permitted, apply mixes according to the most restrictive use limitations for either product.

### Restrictions:

- Maximum number of applications: Two
- Rainfall: Avoid application when heavy rain is in forecast.
- Pre-harvest Intervals: Lentils: 15 days. Canola: 36 days
- Re-entry: 24 hours
- Grazing: None specific.
- Re-cropping interval: Treated areas may be replanted with any crop specified on the label as soon as practical after the last application. For crops not listed on this label, do not plant back within 30 days of last application.
- Storage: Do not store at temperatures below freezing. Shake well before using if stored for greater than 1 year.
- Environment: Gauntlet is toxic to aquatic organisms. Observe spray buffer zones specified on label. Do not contaminate irrigation or drinking water supplies or aquatic habitats by cleaning of equipment or disposal of wastes. Avoid application to areas where ground runoff is likely to occur. The use of this product may result in contamination of groundwater, particularly in areas where soils are permeable (e.g. sandy soil) and/or the depth to the water table is shallow.

400 g/L isofetamid formulated as a suspension

- Container size – 4 x 4L

## Crops, Diseases, Rates and Timing:

| Crop                                             | Diseases Controlled                                            | Application Rate (per acre) | Application Timing                                                                                                                                                                                                                                                    |
|--------------------------------------------------|----------------------------------------------------------------|-----------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Dry bean, faba bean, chickpea, lentil, field pea | Suppression of white mould ( <i>Sclerotinia sclerotiorum</i> ) | 0.51 L                      | Apply at flowering prior to disease development. Can apply a subsequent application 7 to 14 days if disease risk is high and environmental conditions are conducive for disease development. DO NOT apply more than 2 applications of <i>Kenja 400 SC</i> per season. |

## Application Information:

- Thorough, uniform coverage is essential for good disease control.
- **Water Volume:**
  - **Ground:** minimum 20 L per acre.

## How it Works:

The active ingredient isofetamid is a carboxamide (SDHI) fungicide with system activity. Refer to "Fungicide Modes of Action" in the Plant Disease Control section for more information.

## Tank Mixes:

None registered.

## Restrictions:

- **Resistance management:** Refer to "Pathogen Resistance" in the Plant Disease Control section for more information.
- **Maximum number of applications:** DO NOT exceed 2 applications of *Kenja 400 SC* per season.
- **Grazing:** No restrictions listed.
- **Preharvest interval:** 30 days
- **Restricted Entry Interval:** DO NOT re-enter treated areas within 24 hours of application.

- **Re-cropping:** No restrictions listed.
- **Storage:** Store in a dry, secure place.
- **Environment:** Toxic to birds, small wild animals and aquatic organisms. Avoid application to areas with a moderate to steep slope, compacted soil or clay to reduce runoff. Avoid application when heavy rain is forecast. Contamination of aquatic areas as a result of runoff may be reduced by including a vegetative strip between the treated area and the edge of the water body. Follow buffer zones as per the product label.

| Pre-plant – Soils where canola, sunflower, safflower, dry bean, alfalfa or soybean will be planted | White mould or sclerotinia stem rot ( <i>Sclerotinia sclerotiorum</i> ) and rots caused by <i>S. minor</i> | 400 to 800 g                | Prior to planting of spring crop; three months before the typical onset of sclerotinia stem rot or white mould.<br>In fall, prior to spring planting of susceptible crop. After application to the soil, the product should be incorporated to within 5 cm of the topsoil. Incorporation should take place as soon as possible after application (within 1 week maximum). |
|                                                                                                    |                                                                                                            | 800 to 1600 g               | If soil incorporation is to a depth greater than 5 cm, higher rate should be applied.                                                                                                                                                                                                                                                                                     |
| Postharvest – On harvest residue of susceptible crops                                              |                                                                                                            | 200 to 400 g                | Prior to the next soil treatment, the residues of the susceptible crops in rotation can be also treated to help reduce inoculum loads of sclerotia in the field.                                                                                                                                                                                                          |

### Application Information:

- Use sufficient water volumes to give thorough coverage of the soil surface and/or the crop residue (40 liters per acre of water volume).
- DO NOT allow spray mixture to stand overnight or for prolonged periods; should be used within 24 hours of being prepared.
- After incorporation, treated soils should not be disturbed to avoid bringing untreated sclerotia from lower soil depths to the topsoil layer.
- As part of an overall long-term pest management strategy, it is recommended to use other management practices along with *LALSTOP Contans WG* such as in season foliar fungicide applications and proper crop rotations.
- DO NOT apply by air.

### How it Works:

The active ingredient, *Coniothyrium minitans*, is a fungus that infects the sclerotia of *Sclerotinia sclerotiorum* and *S. minor*. Infection of sclerotial bodies prevents production of ascospores and mycelial structures that infect plants. Regular use of *LALSTOP Contans WG* in successive years within a long-term management strategy will improve disease control.

### Tank Mixes:

DO NOT tank-mix with fungicides or fertilizers. Also, DO NOT tank mix with acids, alkalines or any product that attacks organic materials. Contact UAP for more information on what products are compatible with *Contans WG*.

## Restrictions:

- **Resistance management:** Refer to "Pathogen Resistance" in the Plant Disease Control section for more information.
- **Maximum number of applications:** No restrictions listed.
- **Grazing:** No restrictions listed.
- **Preharvest interval:** Can be applied up to and including the day of harvest.
- **Restricted Entry Interval:** No restrictions listed.
- **Re-cropping:** No restrictions listed.
- **Storage:** Maximum storage period of one year at 4°C or below. Up to 6 weeks at temperatures between 4°C and 23°C. Store in a dry area inaccessible to children. Store in original container away from food or feed.
- **Environment:** DO NOT apply this product directly to freshwater habitats, estuarine/marine habitats. DO NOT contaminate irrigation or drinking water supplies or aquatic habitats by cleaning of equipment or disposal of wastes.

If diseases persists or weather conditions are favourable for disease, apply a second application 10 to 14 days later with a fungicide that contains a different mode of action.  |
| Alfalfa (for seed production only) | Control of common leaf spot ( <i>Pseudopeziza medicaginis</i> ), blossom blight ( <i>Sclerotinia sclerotiorum</i> , <i>Botrytis cinerea</i> ), spring black stem ( <i>Phoma medicaginis</i> ), leaf spot ( <i>Leptosphaerulina briosiani</i> ) | 165 mL/acre<br><i>Lance AG (B)</i> and<br>175 g/acre<br><i>Lance AG (A)</i><br>(one jug does 20 acres) | Apply at 10 to 30% bloom or at the onset of symptoms. If diseases persists or weather conditions are favourable for disease development, apply a second application 10 to 14 days later with a fungicide that contains a different mode of action. |

\*DO NOT apply by air

## Application Information:

- **Water Volume:**
  - **Ground:** Use a minimum volume of 40 L per acre and ensure thorough coverage of foliage.
  - **Aerial:** Use a minimum volume of 20 L per acre and ensure thorough coverage of foliage.

## Restrictions:

- **Resistance management:** Refer to "Pathogen Resistance" in the Plant Disease Control section for more information.
- **Maximum number of applications:**
  - **Alfalfa** – DO NOT exceed one application of this product per season.
  - **All other crops** – DO NOT exceed 2 applications per season and rotate applications with a fungicide that contains a different mode of action.
- **Grazing:** DO NOT feed alfalfa hay or forage to livestock. All other crops on this label can be grazed – follow pre-harvest interval.
- **Preharvest interval:**
  - **Field pea, lentil, chickpea, faba bean** – 30 days
  - **Canola** – 21 days
  - **Alfalfa** – Not applicable
- **Restricted Entry Interval:** DO NOT re-enter treated areas until 12 hours after application.
- **Re-cropping:** All labelled crops and the tuberous and corm vegetables, fruiting vegetables, pome fruits and stone fruits may be planned immediately following the last application. A plant back restriction of 14 days for all other crops not on label.
- **Storage:** Store in a cool, dry, locked, well-ventilated area away from food or feed.
- **Environment:** DO NOT apply to any water body. Toxic to aquatic organisms and non-target terrestrial plants. Observe buffer zones outlined in the label.

## Hazard Rating:

Caution Poison – Potential Skin Sensitizer

Warning – Eye Irritant

Refer to the Introduction for an explanation of the symbols.

# LifeGard WG

Fungicide Group  
P 06

## Company:

Certis USA, (PCP#32526)

## Formulation:

40% *Bacillus mycoides* (isolate J) formulated as a wettable granule. Guarantee –  $3 \times 10^{10}$  spores per gram.

- Container size – 20 x 0.454 kg

## Crops, Diseases, Rates and Timing:

| Crop                                                                                                     | Diseases Suppressed                                                                                          | Application Rate                                                                                                                                                                                                       | Application Timing                                                                                                                                                                                                                                                                         |
|----------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Potato                                                                                                   | Suppression of early blight ( <i>Alternaria solani</i> ), late blight ( <i>Phytophthora infestans</i> )      | Apply at a concentration of 0.33g/L of water. The amount of <i>LifeGard WG</i> applied will depend on the spray volume used to adequately cover the crop. DO NOT apply less than 28 grams of <i>LifeGard WG</i> /acre. | Repeat applications at 7 day intervals.                                                                                                                                                                                                                                                    |
|                                                                                                          | Partial suppression of sclerotinia stem rot ( <i>Sclerotinia sclerotiorum</i> )                              |                                                                                                                                                                                                                        | Apply at 7 to 14 day intervals. Use the shorter interval when high disease pressure is anticipated.                                                                                                                                                                                        |
| Hemp and Cannabis ( <i>Cannabis sativa</i> ) for commercial use on plants grown in the field and indoors | Partial suppression of white mold ( <i>Sclerotinia sclerotiorum</i> ); grey mold ( <i>Botrytis cinerea</i> ) | Apply at a concentration of 0.33 g/L of water. DO NOT apply less than 28 g of <i>LifeGard WG</i> per acre.                                                                                                             | Begin as a preventative spray. Apply at 7 to 14 day intervals when only <i>LifeGard WG</i> will be applied. Use the shorter interval when high disease pressure is anticipated. When used as part of a rotational program with fungicides labeled for this use, repeat every 7 to 21 days. |

**Note:** *LifeGard* is most beneficial when applied in alternation with other foliar fungicides that are registered for the specific use/pathogen.

## Application Information:

- **Water Volume:**
  - 20 to 100 L per acre. Use water volumes to give good canopy penetration and coverage of plant parts to be protected.

## How it Works:

*Bacillus mycoides* is a bacterium bio-fungicide that works as a host plant defence inducer. Refer to "Fungicide Modes of Action" in the Plant Disease Control section for more information.

## Tank Mixes:

None registered.

## Restrictions:

- **Resistance management:** Refer to "Pathogen Resistance" in the Plant Disease Control section for more information.
- **Maximum number of applications:** No restrictions listed.
- **Grazing:** No restrictions listed.
- **Pre-harvest interval:**
  - **Hemp** – 3 to 4 weeks
  - **Potatoes** – 0 days
- **Restricted Entry Interval:** 4 hours
- **Re-cropping:** No restrictions listed.
- **Storage:** Store in a dry area inaccessible to children in the original container. Store at or below 25°C for up to 16 months.
- **Environment:** May be toxic to bees. Bees can be exposed to direct treatment, drift or residues on flowering crops or weeds. DO NOT apply to flowering crops if bees are visiting the treatment area. Minimize spray drift to reduce harmful effects on bees in habitats close to the application site. To reduce runoff from treated areas into aquatic habitats, avoid application to areas with a moderate to steep slope, compacted soil or clay. Avoid application when heavy rain is in the forecast. Contamination of aquatic areas as a result of runoff may be reduced by including a vegetative strip between the treated area and the edge of the water body.

## Hazard Rating:

Danger – Eye Irritant, Potential Sensitizer

Refer to the Introduction for an explanation of the symbols.

# Luna Tranquility

Fungicide Group  
7, 9

## Company:

Bayer (PCP#30510)

## Formulation:

125 g/L fluopyram and 375 g/L pyrimethanil formulated as a suspension concentrate.

- Container size – 2 x 4.86 L

## Crops, Diseases, Rates and Timing:

| Crop   | Diseases                                                                                                                           | Application Rate<br>(per acre) | Application Timing                                                                         |
|--------|------------------------------------------------------------------------------------------------------------------------------------|--------------------------------|--------------------------------------------------------------------------------------------|
| Potato | Control of early blight ( <i>Alternaria solani</i> ), brown leaf spot ( <i>Alternaria alternata</i> )                              | 245 mL                         | Begin fungicide applications preventatively. Continue as needed on a 7 to 14 day interval. |
|        | Control of sclerotinia stem rot ( <i>Sclerotinia sclerotiorum</i> )<br>Suppression of black dot ( <i>Colletotrichum coccodes</i> ) | 325 mL                         | When disease pressure is severe, use the shorter intervals.                                |

## Application Information:

- **Water Volume:**
  - **Ground:** Use a minimum water volume of 80 L per acre and ensure thorough coverage of foliage.
  - **Aerial:** Use a minimum water volume of 20 L per acre and ensure thorough coverage of foliage.

## How it Works:

The active ingredient fluopyram is a carboxamide fungicide with systemic activity. The active ingredient pyrimethanil is an anilinopyrimidine fungicide with contact and systemic activity. Refer to "Fungicide Modes of Action" in the Plant Disease Control section for more information.

## Tank Mixes:

None registered.

## Restrictions:

- **Resistance management:** Refer to "Pathogen Resistance" in the Plant Disease Control section for more information.
- **Maximum number of applications:** DO NOT apply more than 1.3 L per acre of this product per season.
- **Grazing:** No restriction listed.
- **Preharvest interval:** 7 days
- **Restricted Entry Interval:** DO NOT re-enter treated areas until 12 hours after application.
- **Re-cropping:** A plant back restriction of 30 days is required for canola, cereal grains, corn, soybean, dry bean, chickpea, lentil, and alfalfa.
- **Storage:** DO NOT store below freezing. If stored for one year or longer, shake well before using. Store the tightly closed container away from feeds, seeds, fertilizer, plants and foodstuffs. Keep the product in the original container during storage.
- **Environment:** Toxic to aquatic organisms and birds. DO NOT apply directly to water, to areas where surface water is present, or to intertidal areas below the high water mark. Observe buffer zones outlined in the label.

## Hazard Rating:

None listed.

# Mancozeb

Fungicide Group  
M3

*Dithane Rainshield/Manzate Pro-Stick/Manzate Max/Penncozeb 75 DF/Penncozeb 80WP*

## Company:

UPL AgroSolutions Canada Inc. (*Manzate Pro-Stick* – PCP#28217; *Manzate Max* – PCP#33299; *Penncozeb 75 DF* – PCP#25397; *Penncozeb 80WP* – PCP#25396), *Dithane Rainshield* – PCP#20553

## Formulations:

*Dithane Rainshield* – 75% mancozeb formulated as a water dispersible granule.

- Container size – 3.5 to 544 kg

*Manzate Pro-Stick* – 75% mancozeb formulated as a dry flowable.

- Container size – 20 kg

*Manzate Max* – 480 g/L formulated as a flowable.

- Container size – 10 L, 450 L, 946 L

*Penncozeb 75 DF* – 75% mancozeb formulated as a wettable granule.

- Container size – 2.5 to 250 kg

*Penncozeb 80 WP* – 80% mancozeb formulated as a wettable powder. (*Note: Same rates as Penncozeb 75 DF.*)

- Container size – 20 kg

## Crops, Diseases, Rates and Timing:

| Crop   | Diseases Controlled                                                                      | Application Rate<br>(per acre) | Application Timing                                                                                                                                                                                                                                                                                                                                                                                                |
|--------|------------------------------------------------------------------------------------------|--------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Potato | Early blight ( <i>Alternaria solani</i> ), late blight ( <i>Phytophthora infestans</i> ) | 0.45 to 0.9 kg<br>0.7 to 1.4 L | Begin applications when plants are 10 to 15 cm high, repeat at 7 to 10-day intervals or shorter only if the label permits. Spray interval may be reduced to 5 to 6 days during periods of wet weather favouring late blight and/or vigorous crop growth. Start with the low rate if disease pressure is low, or plants are small; increase to the maximum rate as foliage develops or disease pressure increases. |

## Application Information:

- **Water Volume:** Consult with the label. Thorough uniform coverage is essential for good disease control.

## How it Works:

The active ingredient mancozeb is a dithiocarbamate fungicide with multi-site contact activity. Refer to “Fungicide Modes of Action” in the Plant Disease Control section for more information.

## Tank Mixes:

**Fungicides:** For late blight control, *Manzate Pro-stick* and *Manzate Max* can be tank-mixed with *Curzate*.

## Restrictions:

- **Resistance management:** Refer to "Pathogen Resistance" in the Plant Disease Control section for more information.
- **Maximum number of applications is 8.**
- **Grazing:** DO NOT graze or feed treated crop or straw to livestock. DO NOT graze or cut treated alfalfa for hay.
- **Preharvest interval:**
  - *Potato* – 3 days
- **Restricted Entry Interval:** DO NOT re-enter treated areas within 12 hours of application.
- **Re-cropping:** No restrictions listed.
- **Storage:** Store in cool, dry, well-ventilated place. Keep away from fire and sparks. Keep *Manzate Max* from freezing.
- **Environment:** Toxic to aquatic organisms. DO NOT contaminate any body of water by direct application, drift or by cleaning equipment.

## Hazard Rating:

Warning – Poison

Danger – Eye Irritant

Refer to the Introduction for an explanation of the symbols.

\* Including biotypes resistant to Group 11 (strobilurin) fungicides.

## Application Information:

- **Water Volume:**
  - **Ground:** Minimum 40 L/ac
  - **Air:** Minimum 20 L/ac

## How it Works:

This multi-mode fungicide works by combining two synergistic actives which includes the active ingredient azoxystrobin, a methoxyacrylate compound (strobilurin) with broad spectrum contact and systemic activity. To be used as a preventative and curative fungicide application. The other active prothioconazole is a triazole fungicide with broad-spectrum systemic activity. Refer to "Fungicide Modes of Action" in the Plant Disease Control section for more information.

## Tank Mixes:

None listed.

## Restrictions:

- **Maximum number of applications:** Do not apply more than one application per year on canola and two applications per year on peas, lentils and soybeans.
- **Rainfall:** Avoid application when heavy rain is in forecast.
- **Pre-harvest Intervals:** 36 days canola; 15 days peas, lentils; 20 days soybeans and 30 days forage and hay
- **Grazing:** Forage, hay: 30 days- Grazing or green feed: 6 days- Peas, lentils, soybeans: do not feed dried pea vines to livestock
- **Re-entry:** 24 hrs.
- **Re-cropping interval:** No restrictions.
- **Storage:** Store in the original container in a dry location away from food or feed. Do not freeze.

- **Environment:**
  - Toxic to aquatic organisms, birds, small wild mammals, and non-target terrestrial plants.
  - Azoxystrobin is persistent and will carryover. It is recommended that any products containing azoxystrobin not be used in areas treated with this product during the previous season. This product demonstrates the properties and characteristics associated with chemicals detected in ground water. The use of *Maxentis* in areas where soils are permeable, particularly where the water table is shallow, may result in ground water contamination. To reduce runoff from treated areas into aquatic habitats avoid application to areas with a moderate to steep slope, compacted soil, or clay. Avoid application when heavy rain is forecast. Contamination of aquatic areas as a result of runoff may be reduced by including a vegetative filter strip between the treated area and the edge of the water body.

**Hazard Rating:**  
Danger: corrosive to eyes and skin.

# Minuet

Fungicide Group  
BM02

**Company:**  
Bayer CropScience (PCP # 33651)

**Formulation**  
QST 713 strain of *Bacillus subtilis* – minimum of 2.7 x 10<sup>10</sup> viable spores per gram (liquid)

- Container size: 3.78 L

**Crops, Diseases, Rates and Timing:**

| Crop | Diseases Controlled                                                      | Application Rate (per acre) | Application Timing                                                                                                                                                                         |
|------|--------------------------------------------------------------------------|-----------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Corn | Suppression of Fusarium root rot, Rhizoctonia root rot, Pythium root rot | 0.2 -1.13 L/acre            | Soil surface applications, in-furrow applications, shanked-In and Injected applications, Post planting applications at any crop stage, carefully review and follow the label for each use. |

**Application information**

- **Water Volume:**
  - **Ground and in-furrow:** 20 L/ac minimum
  - **Aerial:** Do NOT apply by air
  - Carefully follow the label for preparation and application

**How it Works**

MINUET contains bacteria that, when applied to the soil, will germinate to colonize the developing root system and provide suppression of listed diseases on the label. It may be applied as a soil application by various methods either alone, or in an alternating program of applications with other registered crop protection products.

**Tank Mixes:**

This product may be tank mixed with a fertilizer, a supplement, or with registered pest control products, whose labels also allow tank mixing, provided the entirety of both labels, including Directions For Use, Precautions, Restrictions, Environmental Precautions, and Spray Buffer Zones are followed for each product. In cases where these requirements differ between the tank mix partner labels, the most restrictive label must be followed.

**Restrictions**

- **Maximum number of applications:** Not Applicable
- **Rainfall:** Not Applicable
- **Pre-harvest Intervals:** 0 days
- **Re-cropping:** There are no crop rotation or plant back restrictions
- **Re-entry:** If the product is soil-injected, soil incorporated, or applied in-furrow, workers may enter the treated area without restrictions if there will be no contact with anything that has been treated. DO NOT enter or allow worker entry into treated areas for 4 hours or until sprays have settled unless wearing long-sleeved shirt, long pants, socks with shoes and waterproof gloves. Carefully follow the label.
- **Grazing:** Not Applicable

- **Storage:** Store this product away from food or feed. Store in a dry area inaccessible to children. Store in original container only. Keep container closed when not in use. This product should be used within 3 years from the date of manufacture when stored at room temperature.
- **Environment:** To reduce runoff from treated areas into aquatic habitats avoid application to areas with a moderate to steep slope, compacted soil, or clay. Avoid application when heavy rain is forecast. Contamination of aquatic areas as a result of runoff may be reduced by including a vegetative strip between the treated area and the edge of the water body

| Wheat (spring, winter and durum) | Suppression of fusarium head blight ( <i>Fusarium</i> spp.), ergot ( <i>Claviceps purpurea</i> )                                                                                                                                                                                                                                                                    | 404 mL                      | Apply within the range of at least 75% of heads on the main stem fully emerged to when 50% of the heads on the main stem are flowering. DO NOT apply after BBCH 65. Application at the timing for fusarium head blight will control leaf diseases that occur later in the season. Application at this timing is not intended to provide curative control of established leaf diseases. |
|                                  | Control of septoria leaf spot ( <i>Septoria tritici</i> ), septoria glume blotch ( <i>Stagonospora nodorum</i> ), tan spot ( <i>Pyrenophora tritici-repentis</i> ), leaf rust ( <i>Puccinia triticina</i> ), stem rust ( <i>Puccinia graminis</i> f. sp. <i>tritici</i> ), stripe rust ( <i>Puccinia striiformis</i> ), powdery mildew ( <i>Erysiphe graminis</i> ) |                             |                                                                                                                                                                                                                                                                                                                                                                                        |

Apply *Miravis Ace* with a non-ionic surfactant at a rate of 0.125% v/v in the spray tank following label.

## Application Information:

- **Water Volume:** Thorough uniform coverage is essential for good disease control.
  - **Ground:** minimum 40 L per acre.
  - **Air:** minimum 20 L per acre.

## How it Works:

The active ingredient pydiflumetofen is a N-methoxy-(phenyl-ethyl)-pyrazole-carboxamide, unique within the carboxamide (SDHI) fungicides. The active ingredient propiconazole is a triazole fungicide with broad spectrum activity. Propiconazole is rapidly translocated acropetally through the xylem. Pydiflumetofen moves acropetally slowly through the xylem. Refer to "Fungicide Modes of Action" in the Plant Disease Control section for more information.

## Tank Mixes:

None registered.

## Restrictions:

- **Resistance management:** Refer to "Pathogen Resistance" in the Plant Disease Control section for more information.
- **Maximum number of applications:** DO NOT exceed 1 application of this product per season.
- **Preharvest interval:** Apply no later than BBCH 65 (50% of main heads in flower). 7 days for harvest of forage/hay. Grain/straw can be fed at normal harvest maturity.
- **Restricted Entry Interval:** DO NOT re-enter treated areas within 12 hours of application.

## Hazard Rating:

Caution – Eye Irritant

Refer to the Introduction for an explanation of the symbols.

- **Maximum number of applications:**
  - DO NOT exceed 3 applications of this product per season.
  - DO NOT exceed 2 consecutive applications, before switching to a non-Group 3 and non-Group 7 fungicide.
- **Preharvest interval:** DO NOT apply within 14 days of harvest.
- **Restricted Entry Interval:** DO NOT re-enter treated areas within 12 hours of application.

**Hazard Rating:**

Warning – Contains the Allergen Sulfites

Refer to the Introduction for an explanation of the symbols.

# Miravis Era

Fungicide Group  
3, 7

## Company:

Syngenta Canada (PCP # 34323 (*Miravis Era A*) and 34168 (*Miravis Era B*))

## Formulation:

*Miravis Era A*: 200 g/L pydiflumetofen formulated as suspension concentrate.

*Miravis Era B*: 250 g/L prothioconazole formulated as emulsifiable concentrate

- Container size: co-pack case 10.1 L *Miravis Era A* + 8.1 L *Miravis Era B*

## Crops, Diseases, Rates and Timing:

| Crop                          | Diseases                                                                                                                                                   | Application Rate<br>(per acre)                                         | Application Timing                                                                                                                                                                                                                                                                           |
|-------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Wheat (spring, winter, durum) | Suppression of Fusarium head blight ( <i>Fusarium graminearum</i> )                                                                                        | 253 mL/acre <i>Miravis Era A</i> +<br>202 mL/acre <i>Miravis Era B</i> | Apply within the range of at least 75% of heads on the main stem fully emerged to when 50% of the heads on the main stem are flowering.                                                                                                                                                      |
|                               | Control of leaf Rust ( <i>Puccinia recondita</i> ), Septoria leaf blotch ( <i>Septoria tritici</i> ), and tan spot ( <i>Pyrenophora tritici-repentis</i> ) |                                                                        | Application at the timing for Fusarium head blight will control leaf rust that occurs later in the season. Application at this timing is not intended to provide curative control of established leaf rust.                                                                                  |
| Barley                        | Suppression of Fusarium head blight ( <i>Fusarium</i> spp.)                                                                                                |                                                                        | Apply within the range of at least 70% of heads on the main stem fully emerged to 3 days after full head emergence.                                                                                                                                                                          |
|                               | Control of scald ( <i>Rhynchosporium secalis</i> ), spot blotch ( <i>Cochliobolus sativus</i> ), and net blotch ( <i>Pyrenophora teres</i> )               |                                                                        | Application at the timing for Fusarium head blight will control leaf diseases that occur later in the season. Application at this timing is not intended to provide curative control of established leaf diseases.                                                                           |
| Rye, Oats and Triticale       | Suppression of Fusarium head blight ( <i>Fusarium graminearum</i> )                                                                                        |                                                                        | For suppression of fusarium head blight in rye, oats, and triticale, apply within the range of at least 75% of heads on the main stem fully emerged to when 50% of the heads on the main stem are flowering. Application may only be made using ground spray equipment. DO NOT apply by air. |

## Application Information:

- **Water Volume:**
  - **Ground:** minimum 40 L per acre.
  - Apply with a non-ionic surfactant at a rate of 0.125% v/v in the spray tank
  - **Air:** minimum 20 L per acre when air application is permitted on the label

## How it Works:

The active ingredient pydiflumetofen is a N-methoxy-(phenyl-ethyl)-pyrazole-carboxamide, unique within the carboxamide (SDHI) fungicides. The active ingredient prothioconazole is a triazole fungicide with broad spectrum systemic activity. Refer to "Fungicide Modes of Action" in the Plant Disease Control section for more information..

## Tank Mixes:

Apply with a non-ionic surfactant at a rate of 0.125% v/v in the spray tank

**Restrictions:**

- **Maximum number of applications:** one application per year.
- **Rainfall:** Avoid application when heavy rain is in forecast.
- **Pre-harvest Intervals:** 30 days
- **Re-entry:** 24 hours
- **Re-cropping interval:** Follow label. 30 days for crops not on label.
- **Storage:** Keep in original container, tightly closed, during storage. Store in a cool, dry, well-ventilated area away from feed and food stuffs, and out of the reach of children and animals.
- **Environment:** Toxic to aquatic organisms and non-target terrestrial plants. Observe buffer zones and other precautions specified on label.

**Hazard Rating:**

Miravis Era A – warning, contains the allergen sulfites

Miravis Era B – caution, poison eye and skin irritant, potential skin sensitizer

# MIRAVIS Neo 300SE

**Fungicide Group**  
**7, 11, 3**

**Company:**

Syngenta Canada Inc. (PCP#33391)

**Formulation:**

75 g/L pydiflumetofen, 100 g/L azoxystrobin and 125 g/L propiconazole formulated as a suspension.

- Container size – 2 x 10.125 L, 97.2 L

**Crops, Diseases, Rates and Timing:**

| Crop      | Diseases Controlled                                                                                                                                       | Application Rate (per acre) | Application Timing                                                                                                      |

| Wheat                   | Septoria leaf blotch ( <i>Septoria tritici</i> ), spot blotch ( <i>Cochliobolus sativus</i> ), tan spot ( <i>Pyrenophora tritici-repentis</i> ), leaf rust ( <i>Puccinia triticina</i> ), stripe rust ( <i>Puccinia striiformis</i> )                                     | 303 mL                      | Make one application between end of tillering to 50% of heads on main stem emerged (BBCH 29-55).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Corn                    | Eye spot ( <i>Aureobasidium zeae</i> ), grey leaf spot ( <i>Cercospora zeae-maydis</i> ), northern corn leaf blight ( <i>Setosphaeria turcica</i> ), anthracnose leaf blight ( <i>Colletotrichum graminicola</i> )                                                        | 303 mL                      | Make the first application at the first sign of disease. A second application can be made 14 days after the first application, when disease pressure is high or when agronomic or weather conditions are conducive to disease development or movement. For season-long control of tar spot a second application may be required. For common rust, use the 404 mL/ac application rate when disease pressure is high or if susceptible hybrids are used. Apply in sufficient water volume to obtain thorough coverage; a minimum spray volume of 81 L/ac and 20 L/ac is recommended for ground and aerial application, respectively. |
|                         | Common rust ( <i>Puccinia sorghi</i> )                                                                                                                                                                                                                                    | 303 to 404 mL               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|                         | Suppression of tar spot ( <i>Phyllachora maydis</i> )                                                                                                                                                                                                                     | 405 mL                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|                         | Suppression of fusarium and gibberella ear rots ( <i>Fusarium</i> spp. and <i>Gibberella zeae</i> )                                                                                                                                                                       | 404 to 505 mL               | Apply once from developmental stage of corn between the tip of stigmata visible (silking, BBCH 63) to the stigmata drying (silk browning, BBCH 67). Apply in sufficient water volume to obtain thorough coverage; a minimum spray volume of 81 L/acre and 20 L/acre is recommended for ground and aerial application, respectively.                                                                                                                                                                                                                                                                                                |

### Application Information:

- **Water Volume:** Thorough uniform coverage is essential for good disease control.
  - **Ground:** minimum 40 L per acre, 81 L/acre for corn diseases, review the label before application.
  - **Air:** minimum 20 L per acre.

## How it Works:

The active ingredient pydiflumetofen is a N-methoxy-(phenyl-ethyl)-pyrazole-carboxamide, unique within the carboxamide (SDHI) fungicides. The active ingredient azoxystrobin is a strobilurin fungicide with broad spectrum activity. The active ingredient propiconazole is a triazole fungicide with broad spectrum activity. Propiconazole is rapidly translocated acropetally through the xylem. Both pydiflumetofen and azoxystrobin move acropetally slowly through the xylem. Refer to "Fungicide Modes of Action" in the Plant Disease Control section for more information..

## Tank Mixes:

None registered.

## Restrictions:

- **Resistance management:** Refer to "Pathogen Resistance" in the Plant Disease Control section for more information.
- **Maximum number of applications:**
  - *Corn* – DO NOT exceed 2 applications of this product per season.
  - *Field pea, chickpea, faba bean, lentil* – DO NOT exceed 1 application of this product per season.
- **Pre-harvest Interval:**
  - *Field pea, chickpea, faba bean, lentil, corn (grain and forage)* – 30 days
  - *Sweet corn* – 14 days
- **Restricted Entry Interval:** DO NOT re-enter treated areas within 12 hours of application.
- **Re-cropping:**
  - *Oats, rye* – 45 days
  - *Potatoes* – 105 days

## Hazard Rating:

Warning – Poison – Eye Irritant

Refer to the Introduction for an explanation of the symbols.

# Miravis Star

Fungicide Group  
7, 12

## Company:

Syngenta Canada Inc (PCP#34841)

## Formulation:

150 g/L Fludioxinil and 100 g/L Pydiflumetofen as Suspension Concentrate

- Container size – 8.1 litre

## Crops, Diseases, Rates and Timing:

| Crop   | Diseases Controlled  | Application Rate (per acre) | Application Timing |
|--------|----------------------|-----------------------------|--------------------|
| Canola | Sclerotinia stem rot | 404 - 485 mL                | 10-50% bloom       |

Apply with a non-ionic surfactant at a rate of 0.125% v/v in the spray tank.

## Application Information:

- **Water Volume:**
  - *Ground:* minimum 40 L/ac.
  - *Air:* minimum 20 L/ac.

## How it Works:

ADEPIDYN (pydiflumetofen) binds strongly to the plant surface and moves rapidly into the leaf surface, forming a reservoir of active ingredient in the waxy layer of the leaf tissue. Once in the plant, it moves slowly into the cells of the leaf and throughout the xylem for even distribution and protection as the plant grows. Fludioxinil is a contact fungicide from group 12 that introduces a highly effective new mode of action against sclerotinia stem rot for resistance management. It inhibits spore germination and germ tube growth thus preventing fungal development on the surface of the plant.

## Tank Mixes:

None listed.

## Restrictions:

- **Maximum number of applications:** One application per year.
- **Rainfall:** Avoid application when heavy rain is forecast.
- **Pre-harvest Intervals:** 30 days.
- **Re-entry:** 12 hours.
- **Grazing:** No grazing restrictions.
- **Re-cropping interval:** No re-cropping restrictions.
- **Storage:** Store this product away from food or feed. Keep in original container, tightly closed, during storage. Store in a cool, dry, well-ventilated area away from feed and foodstuffs, and out of the reach of children and animals. Store above 0°C, storing MIRAVIS® Star Fungicide below 0°C can negatively affect product quality.
- **Environment:** Toxic to aquatic organisms. Observe spray buffer zones specified on the label under Directions for Use.

## Hazard Rating:

Warning, contains the allergen sulfites.

# Nexicor

Fungicide Group  
7, 11, 3

## Company:

BASF Canada (PCP#32678)

## Formulation:

30 g/L fluxapyroxad, 200 g/L pyraclostrobin and 125 g/L propiconazole formulated as an emulsifiable concentrate.

- Container size – Case (2 x 8 L), 128 L shuttle

## Crops, Diseases, Rates and Timing:

| Canola                                         | Blackleg ( <i>Leptosphaeria maculans</i> )                                                                                                                                                                                                                                                        | 200 mL                      | To maximize yield in canola, it is important to protect young seedlings from blackleg infections. Apply <i>Nexicor</i> at the 2 to 6 leaf stage. Apply a maximum of one <i>Nexicor</i> application per year.                                                                                                                                                                                                                                                                                                                                                           |

## How it Works:

The active ingredient fluxapyroxad is a SDHI fungicide with systemic activity. The active ingredient pyraclostrobin is a member of the strobilurins class of chemistry used as a broad spectrum fungicide. The active ingredient propiconazole is a triazole fungicide with broad spectrum systemic activity. Best utilized as a preventative application when environmental conditions are favourable for disease development. Refer to "Fungicide Modes of Action" in the Plant Disease Control section for more information.

## Tank Mixes:

**Herbicides:** In Canola, *Nexicor* can be tank mixed with the following herbicides: *Ares* in Clearfield canola, *Liberty Herbicide* (150 SN or 200 SN) in glufosinate ammonium tolerant canola (e.g. *LibertyLink* canola) and, registered glyphosate herbicides in glyphosate tolerant canola (e.g. *Roundup Ready* canola). Review the product labels before mixing.

## Restrictions:

- **Resistance management:** Refer to "Pathogen Resistance" in the Plant Disease Control section for more information.
- **Maximum number of applications:** DO NOT exceed 1 application of this product per season.
- **Grazing:** All crops can be grazed within 3 days of application.
- **Preharvest interval:** 45 days for cereals; 30 days for canola.
- **Restricted Entry Interval:** DO NOT re-enter treated areas within 12 hours after application.
- **Re-cropping:** The following crops: barley, corn, wheat (all types), oats, triticale, rye, and bluegrasses, fescues and rye grasses (grown for seed production), soybean, canola (including rapeseed) and oilseed/condiment mustard, flax, sunflower, field pea, lentil, chickpea, fababean, dry bean, sugarbeets and alfalfa (grown for seed production), and tuberous vegetables, may be planted immediately following the last application. A plant-back interval of one year is required for all other crops.
- **Storage:** Store in original tightly closed container. Protect from freezing. Store this product away from food or feed.
- **Environment:** Observe buffer zones specified on the label. DO NOT apply on any body of water and prevent cleaning of equipment and reduce risk of runoff from treated areas into aquatic habitats by avoid application to areas with a moderate to steep slope, compacted soil. Toxic to aquatic organisms and non-target terrestrial plants.

## Hazard Rating:

Warning – Poison

Skin and Eye Irritant

Refer to the Introduction for an explanation of the symbols.

# Orondis Ultra

Fungicide Group  
40, 49

## Company:

Syngenta Canada (PCP#32805)

## Formulation:

250 g/L mandipropamid and 30 g/L oxathiapiprolin formulated as a suspension concentrate.

- Container size – 4 x 3.78 L

## Crops, Diseases, Rates and Timing:

Control of late blight (*Phytophthora infestans*) on potato. Begin applications prior to disease development. Continue applications on 7 to 14 day interval. Use higher rate and shorter interval when disease pressure is high.

## Rates:

0.16 to 0.24 L per acre.

## Application Information:

- **Water Volume:**
  - **Ground:** Use a minimum water volume of 40 L per acre.
  - **Aerial:** Use a minimum water volume of 18 L per acre.

## How it Works:

The active ingredient mandipropamid is a carboxylic acid amide (CAA) fungicide with contact and systemic activity. To be used as a preventative and inhibitive (prevents spore germination) fungicide application. The active ingredient oxathiapiprolin is an oxysterol binding protein homologue inhibitor with activity against diseases caused by oomycete fungi. Refer to "Fungicide Modes of Action" in the Plant Disease Control section for more information.

## Tank Mixes:

None registered.

## Restrictions:

- **Resistance management:** Refer to "Pathogen Resistance" in the Plant Disease Control section for more information.
- **Maximum number of applications:** DO NOT exceed 4 applications of this product per season.
  - **Maximum number of consecutive applications:** 2 applications, then switch to a non-Group 49 and 40 fungicide.
- **Grazing:** No restriction listed.
- **Preharvest interval:** 14 days
- **Restricted Entry Interval:** DO NOT re-enter treated areas until 12 hours after application.

- **Re-cropping:** There is no re-cropping restriction for all crops listed on the *Orondis Ultra* label. The re-cropping restriction is 30 days for all other crops and 180 days for legume vegetables except succulent peas.
- **Storage:** Keep in the original container, tightly closed during storage. Store in a cool, dry, well-ventilated area away from feed and foodstuffs and out of the reach of children and animals. To prevent contamination store this product away from food or feed.
- **Environment:** Toxic to aquatic organisms. To reduce runoff into aquatic habitats avoid application to areas with a moderate to steep slope, compacted soil, or clay. Runoff into aquatic habitats may be reduced by including a vegetative strip between the treated area and the edge of the water body.

### Hazard Rating:

None listed.

## OxiDate FC

Fungicide Group  
NC

### Company:

BioSafe Systems, LLC (PCP#33468)

### Formulation:

27% hydrogen peroxide and 2.5% peroxyacetic acid formulated as a liquid.

- Container sizes – 9.5, 19, 28, 113.5, 1041 L

### Crops, Diseases, Rates and Timing:

| Crop      | Diseases Controlled                                                                   | Application Rate (per acre) | Application Timing                                                                                                                                                                |
|-----------|---------------------------------------------------------------------------------------|-----------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Dry beans | Suppression of bacterial blight ( <i>Xanthomonas campestris</i> pv. <i>phaseoli</i> ) | 1.0% (v:v)                  | At the first sign of disease and/or when weather conditions are favorable for disease development. Apply diluted spray to the point of run-off to achieve full and even coverage. |
| Potato    | Suppression of botrytis tan spot ( <i>Botrytis cinerea</i> )                          | 2.5% (v:v)                  | Apply at 7 day intervals, depending upon the level of disease pressure.                                                                                                           |
|           | White mold ( <i>Sclerotinia sclerotiorum</i> )                                        |                             |                                                                                                                                                                                   |
|           | Brown leaf spot ( <i>Alternaria alternata</i> )                                       | 1.0 to 2.5% (v:v)           | Under severe disease conditions, reduce spray intervals to once every 5 days and use stronger dilution rates.                                                                     |

### Application Information:

- **Water Volume:** Thorough uniform coverage is essential for good disease control.
  - **Ground:** Apply diluted spray to the point of run-off, a minimum of 100 L per acre.
  - **Air:** DO NOT apply using aerial application equipment.

### How it Works:

The active ingredients hydrogen peroxide and peroxyacetic acid have contact activity on fungal and bacterial vegetative cells and spores. Refer to "Fungicide Modes of Action" in the Plant Disease Control section for more information.

### Tank Mixes:

None registered.

### Restrictions:

- **Resistance management:** Refer to "Pathogen Resistance" in the Plant Disease Control section for more information.
- **Maximum number of applications:** DO NOT exceed 8 application of this product per season.
- **Pre-harvest Interval:** 0 days
- **Restricted Entry Interval:** DO NOT re-enter treated areas within 4 hours of application.
- **Storage:** DO NOT allow product to become overheated in storage. The high temperature may increase the degradation of the product, which will decrease product effectiveness. Since *OxiDate FC* is a strong oxidizing agent, contact with combustibles may cause fire. Keep containers tightly closed when not in use. To prevent contamination store this product away from food or feed.
- **Storage:** TOXIC to aquatic organisms and non-target terrestrial plants. This product may be toxic to bees and other beneficial insects exposed to direct contact. Avoid application during the crop blooming period. If applications must be made during the crop blooming period, restrict applications to evening when most bees are not foraging. Contamination of aquatic areas as a result of runoff may be reduced by including a vegetative strip between the treated area and the edge of the water body. DO NOT allow effluent or runoff from greenhouses containing this product to enter lakes, streams, ponds or other waters.

**Hazard Rating:**

-  Warning – Poison
-  Danger – Corrosive to Eyes
-  Danger – Skin Irritant

Refer to the Introduction for an explanation of the symbols.

# Phosphorous acid

*Rampart/Confine Extra*

Fungicide Group  
33

**Company:**

Loveland Products Canada (*Rampart* – PCP #30654)  
WinField United Canada (*Confine Extra* – PCP #30648)

**Formulation:**

53.0% mono- and di-potassium salts of phosphoric acid.  
• Container sizes – *Confine Extra* 9.46 to 946 L; *Rampart* 9.46 L

**Crops, Diseases, Rates and Timing:**

| Crop    | Diseases Suppressed                                                                            | Application Rate (per acre) |                | Application Timing                                                                                                                                                                                                                                                                    |
|---------|------------------------------------------------------------------------------------------------|-----------------------------|----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|         |                                                                                                | <i>Confine Extra</i>        | <i>Rampart</i> |                                                                                                                                                                                                                                                                                       |
| Potato* | Late blight ( <i>Phytophthora infestans</i> ), pink rot ( <i>Phytophthora erythroseptica</i> ) | 2 to 4 L                    | 1.2 to 3.2 L   | Begin applications when conditions are favourable for disease and continue on a 7 to 14 day interval. Use the higher rate and shorter application interval when disease pressure is moderate to high. Use a maximum of 5 foliar and/or chemigation** applications per growing season. |

\*Not recommended for use on potatoes intended for seed.

\*\*Chemigation application for *Confine Extra* only.

**Application Information:**

- **Water Volume:**
  - **Ground:**
    - *Confine Extra* – minimum of 40 L per acre
    - *Rampart* – minimum 120 L per acre
  - **Aerial:**
    - *Confine Extra* – DO NOT apply by air
    - *Rampart* – minimum of 40 L per acre

**How it Works:**

The active ingredient mono- and di-potassium salts of phosphorous acid is a phosphonate fungicide with systemic activity to suppress pathogen inoculum. To be used as a preventative fungicide application on harvested tubers. Refer to "Fungicide Modes of Action" in the Plant Disease Control section for more information.

**Tank Mixes:**

None registered.

**Restrictions:**

- **Resistance management:** Refer to "Pathogen Resistance" in the Plant Disease Control section for more information.
- **Preharvest interval:** DO NOT apply within 1 day of harvest.
- **Restricted Entry Interval:** No restrictions listed.
- **Re-cropping:** No restrictions listed.
- **Storage:** DO NOT store near food or feed.
- **Environment:** DO NOT contaminate irrigation or drinking water supplies or aquatic habitats by cleaning of equipment or disposal of waste.

**Hazard Rating:**

Caution – Eye Irritant

Refer to the Introduction for an explanation of the symbols.

|           | Control of late blight ( <i>Phytophthora infestans</i> ), pink rot ( <i>Phytophthora erythroseptica</i> )<br>Suppression of silver scurf ( <i>Helminthosporium solani</i> ) | 0.42 L in 2 L water to 1 tonne tubers | Post harvest control: Apply directly to the tubers and ensure complete and even coverage.*                                                                                                                           |
| Field pea | Suppression of early season root rot ( <i>Aphanomyces euteiches</i> , <i>Pythium ultimum</i> )                                                                              | 1.2 L/acre                            | At crop emergence followed by a second application 14 days later or in-furrow at planting followed by a second application at crop emergence.                                                                        |

\*Consult with product label before application.

**Application Information:**

- **Water Volume:**
  - **Ground:**
    - *Potato*: Minimum of 12 L per acre for in-furrow treatment and minimum of 81 L per acre for foliar applications.
    - *Field pea*: Minimum of 40 L per acre.
  - **Aerial:**
    - *Potato*: Minimum of 20 L per acre

**How it Works:**

The active ingredient mono- and dibasic sodium, potassium, and ammonium phosphite is a phosphonates fungicide with systemic activity to suppress pathogen inoculum. Refer to "Fungicide Modes of Action" in the Plant Disease Control section for more information.

**Tank Mixes:**

**Pink rot:** *Ridomil Gold 480SL* (in-furrow), *Ridomil Gold MZ* and *Ridomil Gold Bravo Twin Pack* (foliar)

**Late Blight:** May be tank mixed with one of the following fungicides: *Bravo 500*, *Bravo ZN*, *Echo 720*, *Echo 90DF*, *Ridomil Gold Bravo Twin Pack*, *Dithane Rainshield*, *Manzate Pro-Stick*, *Gavel 75DF*, *Penncozeb 75DF*

## Restrictions:

- **Resistance management:** Refer to "Pathogen Resistance" in the Plant Disease Control section for more information.
- **Maximum number of applications:**
  - *Potato* – DO NOT exceed 7 applications of this product per season.
  - *Field pea* – DO NOT exceed 2 applications of this product per season.
- **Grazing:** DO NOT graze treated fields or feed treated forage to livestock.
- **Preharvest interval:**
  - *Potato* – May be applied up to the day of harvest and post harvest.
  - *Field pea* – preharvest interval is 21 days.
- **Restricted Entry Interval:** Re-entry interval after application is 12 hours.
- **Re-cropping:** No restriction listed.
- **Storage:** Store in a cool, dry, secure and well ventilated area. To prevent contamination, store this product away from food or feed. Keep pesticide in original container. Not for use in or around home. DO NOT store near open flame.
- **Environment:** Avoid run-off from treated areas into aquatic areas.
  - To reduce runoff from treated areas into aquatic habitats, avoid application to areas with a moderate to steep slope, compacted soil, or clay.
  - Avoid application when heavy rain is forecast.
  - Contamination of aquatic areas as a result of runoff may be reduced by including a vegetative strip between the treated area and the edge of the water body.
- **Toxicity:** Toxic to aquatic organisms, non-target terrestrial plants and small wild animals.

## Hazard Rating:

Caution – Skin Irritant

Refer to the Introduction for an explanation of the symbols.

# Priaxor\*

| Field pea                                                                                               | Control of powdery mildew ( <i>Erysiphe pisi</i> )                                                                                               | 120 mL                      | Apply at the beginning of flowering or at the onset of symptoms.                                                                                                                                                  |
|                                                                                                         | Control of mycosphaerella blight ( <i>Mycosphaerella pinodes</i> ); suppression of downy mildew ( <i>Peronospora viciae</i> f.sp. <i>pisi</i> )  | 120 to 180 mL               | For control of <i>Mycosphaerella</i> blight and suppression of white mould apply at the beginning of flowering. For suppression of downy mildew, apply at the beginning of flowering or at the onset of symptoms. |
|                                                                                                         | Suppression of white mould ( <i>Sclerotinia sclerotiorum</i> )                                                                                   | 180 mL                      |                                                                                                                                                                                                                   |
| Dry bean                                                                                                | Control of anthracnose ( <i>Colletotrichum lindemuthianum</i> ), powdery mildew ( <i>Erysiphe</i> spp.), rust ( <i>Uromyces appendiculatus</i> ) | 120 mL                      | Apply at the beginning of flowering.                                                                                                                                                                              |
| Soybean                                                                                                 | Control of septoria brown spot ( <i>Septoria glycines</i> ), frogeye leaf spot ( <i>Cercospora soja</i> )                                        | 97 to 120 mL                | Apply prior to disease development when conditions are favourable for disease development. Use the high rate when disease pressure is high.                                                                       |
|                                                                                                         | Suppression of white mould ( <i>Sclerotinia sclerotiorum</i> )                                                                                   | 180 mL                      |                                                                                                                                                                                                                   |
| Sunflowers                                                                                              | Suppression of leaf rust ( <i>Puccinia helianthi</i> )                                                                                           | 120 mL                      | Apply at first sign of disease.                                                                                                                                                                                   |
| Flax                                                                                                    | Control of pasmo ( <i>Septoria linicola</i> )                                                                                                    | 90 to 120 mL                | Apply at 20 to 50% flowering.                                                                                                                                                                                     |
|                                                                                                         | Suppression of sclerotinia stem rot ( <i>Sclerotinia sclerotiorum</i> )                                                                          | 180 mL                      |                                                                                                                                                                                                                   |
| Alfalfa (for seed production)                                                                           | Control of common leaf spot ( <i>Pseudopeziza medicaginis</i> )                                                                                  | 120 mL                      | Apply at the beginning of flowering (10 to 30% bloom) or at the onset of disease.                                                                                                                                 |
|                                                                                                         | Suppression of blossom blight ( <i>Sclerotinia sclerotiorum</i> )                                                                                | 180 mL                      |                                                                                                                                                                                                                   |
| Bluegrasses; fescues; rye-grasses (for seed production)                                                 | Control of leaf rust ( <i>Puccinia recondita</i> ), stem rust ( <i>P. graminis</i> ); suppression of powdery mildew ( <i>Erysiphe graminis</i> ) | 90 to 120 mL                | Apply prior to disease development when conditions are favourable for disease development. Use the high rate when disease pressure is high.                                                                       |

| Crop                                                                                                                                                       | Diseases                                             | Application Rate (per acre) | Application Timing                                                                                                                                                                                                                             |
|------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------|-----------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Non grass animal feeds including: Alfalfa, clover, Sainfoin, trefoil, vetch, crown vetch, milk vetch, and including mixed stands of forages grown for feed | Common leaf spot ( <i>Pseudopeziza medicaginis</i> ) | 120 to 180 mL               | For optimal disease control, apply at the beginning of flowering (10 to 30% bloom) or at the onset of disease.<br>Make one application per forage cutting for feed (follow preharvest intervals), with a maximum of 2 applications per season. |
|                                                                                                                                                            | Blossom blight ( <i>Sclerotinia sclerotiorum</i> )   | 180 mL                      |                                                                                                                                                                                                                                                |

DO NOT make sequential applications of *Priaxor*. If disease persists or weather conditions are favourable for disease development, make a second application 10 to 14 days later, with a fungicide that contains a different mode of action. Use the shorter interval when disease pressure is high.

### Application Information:

- **Water Volume:**
  - **Ground:** minimum 40 L per acre.
  - **Aerial:** minimum 20 L per acre.

### How it Works:

The active ingredient fluxapyroxad is a carboxamide (SDHI) fungicide with systemic activity. The active ingredient pyraclostrobin is a strobilurin fungicide with broad spectrum contact and systemic activity. To be used as a preventative application when environmental conditions are favourable for disease development. Refer to "Fungicide Modes of Action" in the Plant Disease Control section for more information.

### Tank Mixes:

**Herbicides:** In Clearfield canola and Clearfield canola quality *Brassica juncea*, *Priaxor* can be tank mixed with *Odyssey*, or *Odyssey* plus *Equinox*. BASF Canada also supports the tank mix of *Priaxor* with *Ares* in Clearfield canola. In Liberty Link canola, *Priaxor* can be tank mixed with *Liberty*. In Roundup Ready canola, *Priaxor* can be tank mixed with glyphosate herbicides.

**Fungicides:** In canola and mustard, *Priaxor* can be tank mixed with *Lance WDG Fungicide* at 140 grams per acre at 20 to 50 percent bloom to control sclerotinia stem rot and suppress alternaria black spot.

### Restrictions:

- **Resistance management:** Refer to "Pathogen Resistance" in the Plant Disease Control section for more information.
- **Maximum number of applications:** DO NOT exceed 1 sequential application of this product per season.
  - **Alfalfa, forage grasses** – DO NOT exceed 1 application of this product per season.
  - **Barley, oat, rye, wheat, triticale, corn, soybean, canola, mustard, sunflower, flax, soybean, field pea, lentil, chickpea, faba bean, dry bean** – DO NOT exceed 2 applications of this product per season.
- **Grazing:** DO NOT feed grass hay or forage to livestock. All other crops on this label can be grazed or fed to livestock.
- **Preharvest interval:**
  - **Barley, rye, wheat, oat** – apply no later than the end of flowering
  - **Field pea, lentil, chickpea, faba bean, dry bean** – 30 days
  - **Corn, soybean, canola, sunflower, flax** – 21 days
  - **Forage grasses** – 14 days
  - **Sweet corn** – 7 days
  - **Alfalfa** – not applicable
- **Restricted Entry Interval:** DO NOT re-enter treated areas within 12 hours of application.
- **Re-cropping:** Crops listed on label, tuberous and corm vegetables, fruiting vegetables, pome fruits and stone fruits may be planted immediately following last application. DO NOT plant any other crops within one year of application of *Priaxor*.
- **Storage:** Store this product away from food or feed.
- **Environment:** Maintain specified buffer zones. Toxic to aquatic organisms, small mammals, and non-target terrestrial plants.

### Hazard Rating:

Danger Poison – Skin Irritant

Refer to the Introduction for an explanation of the symbols.

# Proline GOLD\*

Fungicide Group  
3, 7

\*NOTE: As of January 1, 2025, www.keepitclean.ca indicates that the use of this product on certain crop types may have market access concerns. Please see Introduction for more information AND consult potential grain buyers before using this product.

## Company:

Bayer (PCP#30511)

## Formulation:

200 g/L of fluopyram and 200 g/L of prothioconazole formulated as a suspension concentrate.

- Container size – 10.12 L jugs

## Crops, Diseases, Rates and Timing:

| Crop                                                             | Diseases                                                                                                                                                                        | Application Rate (per acre) | Application Timing                                                                                                                                                                                                                                                         |
|------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Canola, oriental mustard (Brassica juncea) and Brassica carinata | Control of sclerotinia stem rot ( <i>Sclerotinia sclerotiorum</i> )                                                                                                             | 253 mL                      | Apply when the crop is in the 20 to 50% bloom stage. Best protection will be achieved when the fungicide is applied prior to petals beginning to fall, and it will allow for the maximum number of petals to be protected. Good spray coverage of the plants is essential. |
| Lentil, Pea, Chickpea, Dry bean, Faba bean                       | Control of white mold ( <i>Sclerotinia sclerotiorum</i> ), anthracnose in lentils ( <i>Colletotrichum lentis</i> ) including biotypes resistant to Group 11 fungicides          | 303 mL                      | Begin fungicide applications preventatively.                                                                                                                                                                                                                               |
|                                                                  | Control of ascochyta blight ( <i>Ascochyta</i> spp.), mycosphaerella blight ( <i>Mycosphaerella pinodes</i> ), anthracnose in dry bean ( <i>Colletotrichum lindemuthianum</i> ) | 202 to 303 mL               |                                                                                                                                                                                                                                                                            |
| Potato                                                           | Control of Early blight ( <i>Alternaria solani</i> ), Brown leaf spot ( <i>Alternaria alternata</i> ), White mold ( <i>Sclerotinia sclerotiorum</i> )                           | 303.5 mL                    | Begin fungicide applications preventatively. After the initial application, one additional application may be made 10-14 days afterwards if conditions remain favourable for continued or increased disease development.                                                   |
|                                                                  | Suppression of Black dot ( <i>Colletotrichum coccodes</i> )                                                                                                                     |                             |                                                                                                                                                                                                                                                                            |

## Application Information:

- **Water Volume:**
  - **Ground:** minimum 40 L per acre.
  - **Aerial:** minimum of 20 L per acre.

## How it Works:

The active ingredient fluopyram is a carboxamide fungicide with systemic activity. The active ingredient prothioconazole is a triazole fungicide with broad-spectrum systemic activity. Refer to "Fungicide Modes of Action" in the Plant Disease Control section for more information.

## Tank Mixes:

None registered.

## Restrictions:

- **Resistance management:** Refer to "Pathogen Resistance" in the Plant Disease Control section for more information.
- **Maximum number of applications:** DO NOT exceed 2 applications of this product per season.
- **Grazing:**
  - **Canola** – DO NOT allow livestock to graze treated areas, and DO NOT harvest rapeseed forage for feed.
  - **Lentils, peas, chickpeas, potato** – DO NOT allow livestock to graze treated areas and DO NOT harvest for forage and hay for 7 days after application.

- **Preharvest interval:**
  - *Canola* – 36 days
  - *Lentils, peas, chickpeas, potato* – 14 days
- **Restricted Entry Interval:** DO NOT re-enter treated areas within 24 hours of application.
- **Re-cropping:** DO NOT replant to alfalfa for 14 days after application. Crops listed on this label and other crops from crop subgroup 20A (rapeseeds), cereals, corn, soybeans, peanuts, cucurbit vegetables, crops of oilseed crop subgroup 20B (sunflowers), tuberous and corn vegetables and sugarbeets may be rotated anytime following the last application of *Proline GOLD*. All other crops may be replanted 30 days following the last application of *Proline GOLD*.
- **Storage:** Do not contaminate water, food, or feed by storage or disposal. Keep away from direct sunlight. Do not store below freezing. If stored for 1 year or longer, shake well before using. Store the tightly closed container away from feeds, seeds, fertilizer, plants and foodstuffs. Do not use or store in or around the home. Keep the product in the original container during storage. In case of fire, leaking or damaged containers, call toll free 1-800-334-7577.
- **Environment:** This product is toxic to birds, aquatic organisms and non-target terrestrial plants. Consult the product label for buffer zones.
- **Rainfast:** Avoid application when heavy rain is forecast. Rainfast in 1-2 hours.

## Hazard Rating:

None listed.

# Propiconazole

Fungicide Group  
3

*Tilt 250E/Bumper 432 EC/Pivot 418 EC/Propel\*/Propi Super 25 EC/*

## Formulations:

*Tilt 250E* – 250 g/L propiconazole formulated as an emulsifiable concentrate.

- Container size – 2 x 8 L

*Propi Super 25 EC* – 250 g/L propiconazole formulated as an emulsifiable concentrate.

- Container size – 2 x 8 L

*Bumper 432 EC* – 432 g/L propiconazole formulated as an emulsifiable concentrate.

- Container size – 4.8 L

*Pivot 418 EC* and *Fitness* – 418 g/L propiconazole formulated as an emulsifiable concentrate.

- Container size – 2 x 4.8 L

*Propel* – 250 g/L propiconazole formulated as an emulsifiable concentrate.

- Container size – 8 L

*Co-Op Pivot* – 418 g/L propiconazole formulated as an emulsifiable concentrate.

- Container size – 1 to 1,000 L

*Princeton* – 418 g/L propiconazole formulated as an emulsifiable concentrate.

- Container size – 1 to 1,050 L

*Modo* – 250 g/L propiconazole formulated as an emulsifiable concentrate.

- Container sizes – 2 X 8.1 L, 500 L

*VIKING Propiconazole Fungicide* – 250 g/L propiconazole formulated as an emulsifiable concentrate.

- Container sizes – 2 X 8.1 L, 500 L"

## Crops, Diseases, Rates and Timing:

| Timothy*† | Control of purple eyespot ( <i>Cladosporium phlei</i> ) | 200 mL                       | 120 mL                       | Apply at the first sign of disease (usually at the beginning of flowering). Can be applied up to full flowering, spray interval of 14 days. |

\*Ground application only.

† Only *TILT 250E*, *Pivot 418 EC*, *Propi Super 25 EC*, *Propel*, *VIKING Propiconazole Fungicide*, *Fitness*, and *Co-Op Pivot* are registered for use on this crop.

\* Only *TILT 250 EC*, *Propi Super 25 EC* *VIKING Propiconazole Fungicide* and *Propel* are registered for these uses

## Application Information:

- **Water Volume:**
  - **Ground:** minimum 80 L per acre.
  - **Aerial:** 16 to 20 L per acre.

## How it Works:

The active ingredient propiconazole is a triazole fungicide with broad spectrum systemic activity. Refer to "Fungicide Modes of Action" in the Plant Disease Control section for more information.

## Tank Mixes:

Review and follow the detailed instructions, restrictions and precautions on products labels before mixing.

**Herbicides:** In wheat and barley only, propiconazole may be tank-mixed with one of the following: 2, 4-D amine, MCPA amine, *Buctril-M* or *Pardner* and in wheat only, may be applied with *Horizon NG*. In wheat and barley only, *Pivot 418 EC*, *Co-Op Pivot* and *Fitness* may be tank-mixed with *Logic M* or *Brotex 240*; *Pivot 418 EC*, *Co-Op Pivot*, *Bumper 432 EC*, or *Fitness* may be tank-mixed with *Badge* or *Bromotril 240 EC*. In spring wheat and barley only, *Tilt 250E* or *Propel* may be tank-mixed with *Axial 100EC*. Refer to labels for tank-mix precautions.

**Fertilizers:** *Propiconazole* may be applied with up to 4 kg per acre (9 lb. per acre) of actual nitrogen. The appropriate amount of urea can be dissolved in water and added to the spray tank before adding the fungicide. Excessive nitrogen or application during hot weather may result in crop injury. DO NOT add nitrogen when tank-mixing *propiconazole* with a herbicide.

**Insecticides:** In field corn, *propiconazole* can be tank-mixed with one of the following: *Matador 120EC/Silencer 120EC*. In legumes, *Tilt 250E* or *Propel* can be tank-mixed with *Matador 120EC*.

In wheat and barley, *VIKING Propiconazole Fungicide* can be mixed with only one of the following: 2,4-D Amine, MCPA Amine, *Buctril M*, *Mextrol 450*, *Approve*, or *Broadband*. In corn, *VIKING Propiconazole Fungicide* can be mixed with: *Matador* Insecticide. In legume vegetables, *VIKING Propiconazole Fungicide* can be mixed with the following: *Quadris*, *Matador* Insecticide or *Warrior* Insecticide following the label directions. In some case, the tank mix should not be applied by aerial application equipment. review and follow the directions for use and precautions on all labels.

**Note:** According to the Pest Management Regulatory Agency of Health Canada's Guidance Document on Tank Mix Labelling (March 2023), unlabelled tank mixes of this product are permitted only if the label of this product and the label of the product it might be mixed with include at least general wording on their respective labels indicating they may be mixed with other pesticides. When tank mixes are permitted, apply mixes according to the most restrictive use limitations for either product.

## Restrictions:

- **Resistance management:** Refer to "Pathogen Resistance" in the Plant Disease Control section for more information.
- **Maximum number of applications:**
  - *Wheat, barley, corn, bean, legume, timothy* – DO NOT exceed 2 applications of this product per season.
- **Grazing:** DO NOT graze animals on treated green crops within 3 days of application. DO NOT feed straw treated with herbicide tank mixes to livestock. DO NOT use treated soybean seed for animal feed.
- **Preharvest interval:**
  - *Wheat, oat, barley* – 45 days
  - *Canola* – 60 days
  - *Corn* – 14 days if tank-mixed with an insecticide
  - *Soybean* – 50 days
  - *Bean* – 28 days
  - *Timothy* – 14 days
- **Restricted Entry Interval:** DO NOT allow entry into treated area until dry or for 12 hours; whichever is greater.
- **Re-cropping:** No restrictions listed.
- **Storage:** DO NOT freeze. Store products away from food or feed.
- **Environment:** Toxic to aquatic organisms. DO NOT contaminate any body of water by direct application, drift or by cleaning equipment.

## Hazard Rating:

Warning – Eye and Skin Irritant  
Potential Skin Sensitizer

**Bumper 432 EC, Pivot 418 EC, Co-Op Pivot:** Warning – Poison

**Tilt 250 EC, Propel, Propi Super 25 EC:** Caution – Poison

Refer to the Introduction for an explanation of the symbols.

# Propiconazole + Azoxystrobin

Fungicide Group  
3, 11

*Topnotch, Quasimodo*

## Company:

ADAMA Canada (*Topnotch* – PCP#31126)

NewAgco Inc. (*Quasimodo* – PCP#33807, 34213)

## Formulation:

**Topnotch:** 143 g/L of azoxystrobin and 124 g/L of propiconazole as suspension concentrate.

**Quasimodo:** 250 g/L of azoxystrobin + 250 g/L of propiconazole as emulsifiable concentrate.

| Beans, Field pea, Lentil, Soybean | Mycosphaerella blight, anthracnose, ascochyta blight (lentils only)                                                                                                                                                                                                      | 310 to 620 mL                                  | -                                               | Make the first application at the first sign of disease. Apply the high rate only under conditions of high disease pressures. A second application 14 days later may be needed if conditions persist. |
|                                   | Powdery mildew, white mold (suppression only)                                                                                                                                                                                                                            | 310 mL                                         |                                                 |                                                                                                                                                                                                       |

## Application Information:

- **Water Volume:**
  - **Ground:** minimum 40 L per acre.
  - **Aerial:** minimum 18 L per acre.
- DO NOT apply during periods of dead calm.
- DO NOT apply aerially when wind speed is greater than 16 km per hour.
- Good spray coverage and canopy penetration are important for best results.

## How it Works:

Topnotch is composed of two active ingredients; azoxystrobin and propiconazole. Both active ingredients have systemic activity and this mixture can be used for broad spectrum coverage and preventative purpose. Refer to “Fungicide Modes of Action” in the Plant Disease Control section for more information.

## Tank Mixes:

None registered.

According to the Pest Management Regulatory Agency of Health Canada's Guidance Document on Tank Mix Labelling (March 2023), unlabelled tank mixes of this product are permitted only if the label of this product and the label of the product it might be mixed with include at least general wording on their respective labels indicating they may be mixed with other pesticides. When tank mixes are permitted, apply mixes according to the most restrictive use limitations for either product.

## Restrictions:

- **Resistance management:** Refer to "Pathogen Resistance" in the Plant Disease Control section for more information.
- **Maximum number of applications:** DO NOT exceed the total number of applications of *Topnotch* per season per crop as stated in label.
- **Preharvest interval:**
  - *Cereals and straw* – 45 days
  - *Forage and hay* – 30 days
- **Restricted Entry Interval:** DO NOT re-enter treated areas within 12 hours of application.
- **Re-cropping:** A plant back interval of 105 days is required for all crops not listed in this label. Oat and rye may be planted 45 days after application.
- **Storage:** Store in original tightly closed container in a cool dry, well ventilated area away from feed and foodstuffs. DO NOT store below 0°C.
- **Environment:** Avoid run-off from treated areas into aquatic areas. Toxic to aquatic organisms, certain beneficial insects and may leach to ground water. Avoid application when heavy rain in forecast.
- **Grazing Restrictions (Topnotch):** Do not graze pea vines. 30 days for all other crops.

## Hazard Rating:

Caution Poison – Eye and Skin Irritant

Refer to the Introduction for an explanation of the symbols.

# Prosaro PRO\*

Fungicide Group  
3, 7

\*NOTE: As of January 1, 2025, [www.keepitclean.ca](http://www.keepitclean.ca) indicates that the use of this product on certain crop types, particularly on barley and especially on malt barley, may have market access concerns. Please see Introduction for more information AND consult potential grain buyers before using this product.

## Company:

Bayer (PCP#34093)

## Formulation:

200 g/L prothioconazole, 100 g/L tebuconazole and 100 g/L fluopyram formulated as a suspension concentrate.

- Container sizes – 6 L, 97 L

## Crops, Diseases, Rates and Timing:

| Crop                                                            | Diseases                                                                                                                                                                                                                                                                                                                                                                      | Application Rate (per acre)* | Application Timing                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| Oats                                                            | Control of stem rust ( <i>Puccinia graminis</i> ), stagonospora ( <i>Septoria</i> ), leaf blotch and black stem ( <i>Stagonospora avenae</i> syn. <i>Septoria avenae</i> ), crown rust ( <i>Puccinia coronata</i> )                                                                                                                                                           | 304 mL                       | Leaf and Stem Diseases: Apply as a preventive foliar spray when the earliest disease symptoms appear on the leaves and stems. Fields should be observed closely for early disease symptoms, particularly when susceptible varieties are planted and/or under prolonged conditions favorable for disease development. For suppression of fusarium head blight and ergot, apply as a preventative spray within the time period from when at least 75% of the oat panicles on the main stem are fully emerged to when 50% of the panicles on the main stem are in flower. |
|                                                                 | Suppression of Fusarium head blight ( <i>Fusarium graminearum</i> syn. <i>Gibberella zeae</i> ), ergot ( <i>Claviceps purpurea</i> )                                                                                                                                                                                                                                          |                              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Wheat (spring, winter and durum), triticale (spring and winter) | Control of rusts – leaf, stem and stripe ( <i>Puccinia tritica</i> , <i>P. graminis</i> , <i>P. striiformis</i> ), leaf and glume blotch ( <i>Septoria tritici</i> , <i>Stagonospora nodorum</i> ), tan spot ( <i>Pyrenophora tritici-repentis</i> ), powdery mildew ( <i>Blumeria graminis</i> syn. <i>Erysiphe graminis</i> ), spot blotch ( <i>Cochliobolus sativus</i> )  | 304 mL                       | For suppression of Fusarium head blight and ergot, apply as a preventative spray within the time period from when at least 75% of the wheat heads on the main stem are fully emerged to when 50% of the heads on the main stem are in flower. Optimal application timing is when first flowers emerge on the main heads. Application at this timing will also control the listed leaf diseases.                                                                                                                                                                        |
|                                                                 | Suppression of Fusarium head blight ( <i>Fusarium graminearum</i> syn. <i>Gibberella zeae</i> ), ergot ( <i>Claviceps purpurea</i> )                                                                                                                                                                                                                                          |                              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

\*A registered non-ionic surfactant must be used with this product (such as *Agral 90* or *AgSurf*) at 0.125% v/v.

## Application Information:

- Water Volume:
  - **Ground:** minimum 40 L per acre.
  - **Aerial:** minimum 20 L per acre.

## How it Works:

The active ingredients prothioconazole and tebuconazole are triazole fungicides with broad spectrum systemic activity. The active ingredient fluopyram is a carboximide (SDHI) fungicide with systemic activity. Refer to "Fungicide Modes of Action" in the Plant Disease Control section for more information.

**Tank Mixes:**

None registered.

**Restrictions:**

- **Resistance management:** Refer to "Pathogen Resistance" in the Plant Disease Control section for more information.
- **Maximum number of applications:** DO NOT apply more than once per season.
- **Preharvest interval:** DO NOT apply within 36 days of harvest.
- **Restricted Entry Interval:** DO NOT re-enter treated areas until 12 hours after application.
- **Re-cropping:** Treated areas may be replanted with any crop specified on this label and soybean as soon as practical after the last application. For all other crops, observe a 120 days re-cropping interval.
- **Storage:** Store this product away from food or feed. DO NOT contaminate water, food, or feed by storage or disposal. DO NOT store below freezing. If stored for 1 year or longer, shake well before using. Store the tightly closed container away from feeds, seeds, fertilizer, plants and foodstuffs. DO NOT use or store in or around the home. Keep the product in the original container during storage.
- **Environment:** Toxic to birds, small wild mammals, aquatic organisms, and non-target terrestrial plants. Observe spray buffer zones. See label for specific details on buffer zones. DO NOT apply directly to water or to areas where surface water is present. DO NOT contaminate irrigation or drinking water supplies or aquatic habitats by cleaning of equipment or disposal of wastes.

**Hazard Rating:**

Keep out of reach of children.

| Crop                              | Diseases                                                                                                                                                                                                                    | Application Rate for Prosaro XTR, Shalimar, StarPro, Advantage Prothio + Teb 250 EC, Fusaro, Maxunitech Prothio + Teb EC and VIKING Tromso Fungicide per acre | Application Rate for Soraduo and Duplex per acre | Application Timing                                                                                                                                                                                                                                                                        |
|-----------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Oat (only if oat is on the label) | Control of crown rust ( <i>Puccinia coronata</i> ), stem rust ( <i>Puccinia graminis</i> ), stagonospora leaf blotch ( <i>Stagonospora nodorum</i> ), black stem ( <i>Stagonospora avenae</i> syn. <i>Septoria avenae</i> ) | 325 mL                                                                                                                                                        |                                                  | Apply as a preventative foliar spray when the earliest disease symptoms appear on leaves and stems. Fields should be observed closely for early disease symptoms, particularly when susceptible varieties are planted and/or under prolonged conditions favorable for disease development |

\*Soraduo and Duplex is for suppression of fusarium head blight only.

### Application Information:

- DO NOT apply during periods of dead calm or when winds are gusty. Ensure uniform coverage.
- **Water Volume:**
  - **Ground:** minimum 40 L per acre.
  - **Aerial:** Follow detailed label recommendations for aerial application for each product.

### How it Works:

The active ingredients prothioconazole and tebuconazole are demethylation inhibitors with broad-spectrum systemic activity. To be used as a preventative fungicide application. Refer to "Fungicide Modes of Action" in the Plant Disease Control section for more information.

### Tank Mixes:

None registered.

### Restrictions:

- **Resistance management:** Refer to "Pathogen Resistance" in the Plant Disease Control section for more information.
- **Maximum number of applications:** DO NOT exceed 1 application of this product per season.
- **Grazing:** DO NOT allow livestock to graze or feed green forage to livestock prior to 6 days after treatment. Straw cut after harvest may be fed or used for bedding.
- **Preharvest interval:** 36 days
- **Restricted Entry Interval:** DO NOT re-enter treated fields until 12 hours post-application.
- **Re-cropping:** Treated areas may be replanted with any crop specified on the label and soybean as soon as practical after last application. For oat, DO NOT plant back within 30 days of application. For all other crops, DO NOT plant back until 120 days after application. Tebuconazole is persistent and will carryover. It is recommended that any products containing tebuconazole not be used in areas treated with this product during the previous season.
- **Storage:** DO NOT store in or around the home. DO NOT store at temperatures below freezing. Keep in original tightly closed container and store away from feeds, seeds, fertilizer, plants and food stuffs. Keep away from sources of heat. Shake well before using if stored for more than 1 year. DO NOT contaminate water, food, or feed by storage or disposal.
- **Environment:** Toxic to birds, small wild animals, aquatic organisms, and non-target plants. As this product is not registered for the control of pests in aquatic systems, DO NOT use to control aquatic pests. DO NOT apply to water, or to areas where surface water is present or to intertidal areas below the mean high water mark. Runoff is hazardous to aquatic organisms in neighbouring areas. To reduce runoff from treated areas into aquatic habitats, avoid application to areas with a moderate to steep slope, compacted soil, or clay. Contamination of aquatic areas as a result of runoff may be reduced by including a vegetative strip between the treated area and the edge of the water body. Follow buffer zones as per the product label.
- **Rainfast:** 1 hour

**Hazard Rating:**

Danger – Eye Irritant

Caution – Skin Irritant

Refer to the Introduction for an explanation of the symbols.

|                                                       |                                                                                                                                                                                                                                                                                                                          | 480 g/L products                                     | 250 g/L products                     |                                                                                                                                                                                                                                                                               |
| Wheat                                                 | Control of septoria leaf blotch ( <i>Septoria tritici</i> ), tan spot ( <i>Pyrenophora tritici-repentis</i> ), leaf rust ( <i>Puccinia recondita</i> )                                                                                                                                                                   | 127 mL <sup>1</sup>                                  | 240 mL <sup>3</sup>                  | Apply as a preventative foliar spray when the earliest disease symptoms appear on leaves and stems. A second application may be made after 7 days.                                                                                                                            |
|                                                       | Control of glume blotch ( <i>Stagonospora nodorum</i> )                                                                                                                                                                                                                                                                  | 127 to 170 mL <sup>1</sup>                           |                                      | Apply within the time period when at least 75% of heads on the main stem are fully emerged to when 50% of heads on the main stem are in flower. For FHB, use higher rate when disease pressure is expected to be high or to provide the highest level of mycotoxin reduction. |
|                                                       | Suppression of fusarium head blight (FHB) ( <i>Fusarium</i> spp.)                                                                                                                                                                                                                                                        | 127 to 170 mL <sup>1</sup>                           | 240 to 320 mL                        |                                                                                                                                                                                                                                                                               |
| Pearl millet, proso millet, rye, triticale, Buckwheat | Control of foliar rusts caused by <i>Puccinia</i> spp.                                                                                                                                                                                                                                                                   | 127 to 170 mL                                        | -                                    | Apply as a preventative foliar spray when disease symptoms appear.                                                                                                                                                                                                            |
|                                                       | Suppression of fusarium head blight ( <i>Fusarium</i> spp.) – except buckwheat                                                                                                                                                                                                                                           | 127 to 170 mL <sup>1</sup>                           | -                                    | Apply as a preventative spray.                                                                                                                                                                                                                                                |
| Barley                                                | Control of net blotch ( <i>Pyrenophora teres</i> ), scald ( <i>Rhynchosporium secalis</i> ), spot blotch ( <i>Cochliobolus sativus</i> )                                                                                                                                                                                 | 85 to 127 mL <sup>1</sup>                            | 240 mL <sup>3</sup>                  | Apply as a preventative foliar spray when the earliest disease symptoms appear on leaves and stems. A second application may be made after 7 days.                                                                                                                            |
|                                                       | Suppression of fusarium head blight (FHB) ( <i>Fusarium</i> spp.)                                                                                                                                                                                                                                                        | 127 to 170 mL <sup>1</sup>                           | 240 to 320 mL                        | Apply within the time period when 70 to 100% of barley heads on the main stem are fully emerged to 3 days after full head emergence. Use higher rate when disease pressure is expected to be high or to provide the highest level of mycotoxin reduction.                     |
| Oats                                                  | Control of crown rust ( <i>Puccinia coronata</i> )                                                                                                                                                                                                                                                                       | 127 mL <sup>1</sup>                                  | 240 mL <sup>3</sup>                  | Apply as a preventative foliar spray when the earliest disease symptoms appear on leaves and stems. A second application may be made after 7 days.                                                                                                                            |
| Corn                                                  | Control of Grey Leaf Spot ( <i>Cercospora zeae-maydis</i> ) and suppression of Fusarium and Gibberella ear rots ( <i>Fusarium</i> spp. and <i>Gibberella</i> spp.) and suppression of the stalk rot pathogens <i>Fusarium</i> spp., <i>Gibberella</i> spp. and <i>Colletotrichum</i> spp. which may cause stalk lodging. | 170 mL <sup>1</sup>                                  | 240 to 320 ml (follow product label) | For optimum suppression of Fusarium Ear Rot, apply from silking (tip of stigmata visible) to silk browning (stigmata drying).                                                                                                                                                 |
|                                                       | Control of Rusts ( <i>Puccinia sorghi</i> , <i>Puccinia polysora</i> ), Eyespot ( <i>Kabatiella zeae</i> or <i>Aureobasidium zeae</i> ), and Northern Blight ( <i>Setosphaeria turcica</i> )                                                                                                                             | 127 mL (170 mL for Maxunitech Prothioconazole 480SC) | -                                    | For leaf diseases, apply as a preventive foliar spray when the earliest disease symptoms appear on the leaves and stems.                                                                                                                                                      |

| Crop                                                                                                                                                          | Diseases                                                                                                                         | Application Rate (per acre) |                  | Application Timing                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

|                                                                                                                                                               |                                                                                                                                  | 480 g/L products            | 250 g/L products |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Canola, rapeseed, oriental mustard, <i>Brassica carinata</i> [if oriental mustard ( <i>Brassica juncea</i> ) and <i>Brassica carinata</i> indicated on label] | Control of sclerotinia stem rot ( <i>Sclerotinia sclerotiorum</i> )                                                              | 127 to 150 mL <sup>2</sup>  | 240 to 280 mL    | Apply at 20 to 50% bloom stage (prior to petal fall). Use high rate if history of heavy disease or if dense crop stand. For Soratel, a second application at a rate of 240 ml/acre may be applied 7-10 days later, up to full bloom, if disease persists or weather conditions are favorable for disease development. When conditions favoring disease are severe, use the shorter interval.                                                                                                                                                                                       |
| Soybean, if on label                                                                                                                                          | Control of frogeye leaf spot ( <i>Cercospora sojina</i> )                                                                        | 85 mL                       | 160 mL           | Apply when first disease symptoms are found or when the risk of infection is imminent.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Chickpea                                                                                                                                                      | Control of ascochyta blight ( <i>Ascochyta rabiei</i> )                                                                          | 127 to 170 mL <sup>2</sup>  | 240 to 320 mL    | Apply at first sign of disease. Repeat applications every 10 to 14 days. Use high rate when conditions favour disease or when growing susceptible varieties.                                                                                                                                                                                                                                                                                                                                                                                                                       |
|                                                                                                                                                               | Suppression of Grey mould ( <i>Botrytis cinerea</i> )                                                                            | 170 mL                      | -                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Lentil                                                                                                                                                        | Control of ascochyta blight ( <i>Ascochyta sp.</i> ).<br>Control of white mould ( <i>Sclerotinia sclerotiorum</i> ) if on label. | 127 to 170 mL <sup>2</sup>  | 240 to 320 mL    | Apply at the beginning of flowering or at the first sign of disease as per indicated on label. A maximum of 340 mL/acre can be applied per crop year for lentil for 480 g/L products and 647 mL/acre for 250 mL/acre products.<br><br>After the initial application, 1 additional application may be made 10 to 14 days afterwards if conditions remain favourable for continued or increased disease development. Apply the higher rate when conditions favour disease development or when growing less disease resistant varieties.<br><br>Maximum of two applications per year. |
|                                                                                                                                                               | Suppression of grey mould ( <i>Botrytis cinerea</i> ) if on label.                                                               | 170 mL                      | -                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|                                                                                                                                                               | Suppression of anthracnose ( <i>Colletotrichum lentis</i> ) if on label.                                                         | 129 to 170 mL <sup>2</sup>  | -                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Field pea (Soratel only)                                                                                                                                      | Suppression of ascochyta blight ( <i>Ascochyta sp.</i> ), control of white mould ( <i>Sclerotinia sclerotiorum</i> )             | -                           | 240 to 320 mL    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Flax (linseed), borage                                                                                                                                        | Control of sclerotinia stem rot ( <i>Sclerotinia sclerotiorum</i> )                                                              | 127 to 150 mL <sup>2</sup>  | 240 to 280 mL    | Apply at 20 to 50% bloom. Best protection will be achieved when the fungicide is applied prior to petals beginning to fall, allowing the maximum number of petals to be protected. Use high rate in fields with a history of heavy disease pressure or for dense crop stands.                                                                                                                                                                                                                                                                                                      |
| Sunflower (excluding those for export), safflower                                                                                                             | Suppression of sclerotinia head rot ( <i>Sclerotinia sclerotiorum</i> )                                                          | 170 mL <sup>1</sup>         | -                | Apply when crop is in 10 to 50% disk flower bloom stage.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|                                                                                                                                                               | If on label:<br>Sunflower rust ( <i>Puccinia helianthi</i> )<br>Safflower rust ( <i>Puccinia carthami</i> )                      | 170 mL                      | 320ml            | Apply when average rust severity reaches 1% on the upper four fully expanded leaves prior to or during bloom                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

<sup>1</sup> Apply with non-ionic surfactant, e.g. AgSurf or Agral 90 at 0.125% v/v. Consult the products labels.

<sup>2</sup> May be applied with the lowest rate of non-ionic surfactant, e.g. AgSurf or Agral 90. Consult the products labels.

<sup>3</sup> Joust: When used in wheat, barley and oat, apply with a non-ionic surfactant (AgSurf, Agral 90, Enhance, or Carrier at 0.125%). The lowest labelled rate of adjuvant (Enhance, Carrier, AgSurf or Agral 90) may be tank-mixed with Joust in canola, flax, chickpea, lentil, corn, soybean, sunflower, safflower, and sugar beet.

## Application Information:

- DO NOT apply during periods of dead calm or when winds are gusty. Ensure uniform coverage.
- **Water Volume:**
  - **Ground:** minimum 40 L per acre.
  - **Aerial:** minimum of 20 L per acre when the product is registered for aerial applications. Follow detailed label recommendations for aerial application. *Joust* is not registered for aerial applications.

## How it Works:

The active ingredient prothioconazole is a triazole fungicide with broad-spectrum systemic activity. Refer to "Fungicide Modes of Action" in the Plant Disease Control section for more information.

## Tank Mixes:

None registered.

According to the Pest Management Regulatory Agency of Health Canada's Guidance Document on Tank Mix Labelling (March 2023), unlabelled tank mixes of this product are permitted only if the label of this product and the label of the product it might be mixed with include at least general wording on their respective labels indicating they may be mixed with other pesticides. When tank mixes are permitted, apply mixes according to the most restrictive use limitations for either product.

## Restrictions:

- **Resistance management:** Refer to "Pathogen Resistance" in the Plant Disease Control section for more information.
- **Maximum number of applications:**
  - *Corn, flax, borage, sunflower, soybean, safflower* – DO NOT exceed 1 application of this product per season.
  - *Wheat, barley, oat, canola, lentil* – DO NOT exceed 2 applications of this product per season.
  - *Chickpea* – DO NOT exceed 3 applications of this product per season.
- **Grazing:** No restrictions listed.
- **Preharvest interval:**
  - *Barley, wheat, oat, rye, triticale, millet* – 30 days
  - *Canola, Rapeseed, Oriental Mustard, flax, borage* – 36 days
  - *Chickpea, lentil, field pea* – 7 days
  - *Corn* – 14 days
  - *Soybean* – 20 days
  - *Sunflower, safflower* – 45 days
- **Restricted Entry Interval:** DO NOT re-enter treated areas within 24 hours of application.
- **Re-cropping:** May be re-planted with any crop specified on the label as soon as practical. For crops not listed, wait 30 days.
- **Storage:** DO NOT store at temperatures below freezing. Keep in original tightly closed container and store away from feeds, seeds, fertilizer, plants and food stuffs. Keep away from sources of heat. Shake well before using if stored for more than 1 year. Do not use or store in or around the home.
- **Environment:** Toxic to aquatic organisms and non-target terrestrial plants. Observe spray buffer zones specified on label under DIRECTIONS FOR USE. To reduce runoff from treated areas into aquatic habitats avoid application to areas with a moderate to steep slope, compacted soil, or clay. Avoid application when heavy rain is forecast. Contamination of aquatic areas because of runoff may be reduced by including a vegetative filter strip between the treated area and the edge of the water body.
- **Rainfast:** 1 hour
- **Aerial Application:** DO NOT apply during periods of dead calm. Avoid application of this product when winds are gusty. DO NOT apply when wind speed is greater than 16 km/h at flying height at the site of application. DO NOT apply with spray droplets smaller than the American Society of Agricultural Engineers (ASAE S572.1) medium classification. Reduce drift caused by turbulent wingtip vortices. Nozzle distribution along the spray boom length MUST NOT exceed 65% of the wing or rotor-span.

## Hazard Rating:

Caution – Poison

Refer to the Introduction for an explanation of the symbols.

# Prothioconazole and Pyraclostrobin

Fungicide Group  
3, 11

Spaxor, VIKING Vaasa

## Company

NewAgco Inc. [Spaxor (Rambler – PCP # 35048, Spade – PCP #32927]

VIKING Crop Production Partners Inc. "[VIKING Vaasa (VIKING Prothioconazole – PCP#35109, VIKING Pyraclostrobin PCP#34795)]

## Formulation

Spaxor is a co- pack of Rambler and Spade. Rambler (480 g/L Prothioconazole formulated as suspension concentrate), Spade (250 g/L Pyraclostrobin formulated as emulsifiable concentrate), container size: co-pack 10L of Rambler, 13L of Spade

VIKING Vaasa is a co- pack of VIKING Prothioconazole and VIKING Pyraclostrobin. VIKING Prothioconazole (480 g/L Prothioconazole formulated as suspension concentrate), VIKING Pyraclostrobin (250 g/L Pyraclostrobin formulated as emulsifiable concentrate), container size: co-pack 10L of VIKING Prothioconazole, 13L of VIKING Pyraclostrobin

## Application information

- Water Volume:
  - **Ground:** Minimum water volume 40 L/acre
  - **Air:** Minimum water volume 20 L/acre

## How it Works

Prothioconazole: is a broad-spectrum systemic fungicide for the control or suppression of listed Ascomycetes, Basidiomycetes and Deuteromycetes diseases on the crops listed earlier. Pyraclostrobin: is a broad-spectrum foliar fungicide belonging to the strobilurin chemical class. It acts by inhibition of mitochondrial respiration. This leads to a reduction of the available ATP quantity in the fungal cell. It is used for control or suppression of fungal diseases on registered crops. For more information refer to "Fungicide Modes of Action".

## Tank Mixes:

According to the Pest Management Regulatory Agency of Health Canada's Guidance Document on Tank Mix Labelling (March 2023), unlabelled tank mixes of this product are permitted only if the label of this product and the label of the product it might be mixed with include at least general wording on their respective labels indicating they may be mixed with other pesticides. When tank mixes are permitted, apply mixes according to the most restrictive use limitations for either product.

## Restrictions:

- **Maximum number of applications:** Do not make more than one sequential application of *Spaxor* or *VIKING Vaasa*. Do not make more than a total of two applications of *Spaxor* or *VIKING Vaasa* per season.
- **Rainfall:** Avoid application when heavy rain is in forecast.
- **Rainfast:** One hour
- **Pre-harvest Intervals:** 30 days after application for barley, rye, wheat, dry beans (*Phaseolus*, *Vigna* and *Lupinus* spp.), faba beans, lentils, dry field peas, soybean and chickpeas. 7 days for succulent shelled beans and peas.
- **Re-entry:** 24 hours
- **Grazing:** None specific.
- **Re-cropping interval:** Treated areas may be replanted with any crop specified on this label as soon as practical after the last application. For crops not listed on this label, do not plant back within 30 days of last application.
- **Aerial Application:** Follow the label carefully. DO NOT apply during periods of dead calm. Avoid application of this product when winds are gusty. DO NOT apply when wind speed is greater than 16 km/h at flying height at the site of application. DO NOT apply with spray droplets smaller than the American Society of Agricultural Engineers (ASAE S572.1) medium classification. Reduce drift caused by turbulent wingtip vortices. Nozzle distribution along the spray boom length MUST NOT exceed 65% of the wing- or rotor span.
- **Storage:** Store this product away from food and feed. Keep away from direct sunlight. Keep away from fire or open flame or other sources of heat. Do not store at temperatures below freezing. If stored for 1 year or longer, shake well before using. Store the tightly closed container away from feeds, seeds, fertilizer, plants and foodstuffs. Do not use or store in or around the home. Keep in original container during storage.
- **Environment:** Toxic to aquatic organisms, non-target terrestrial plants and small wild mammals. Observe spray buffer zones specified under DIRECTIONS FOR USE. To reduce runoff from treated areas into aquatic habitats avoid application to areas with a moderate to steep slope, compacted soil, or clay. Avoid application when heavy rain is forecast. Contamination of aquatic areas as a result of runoff may be reduced by including a vegetative strip between the treated area and the edge of the water body.

## Hazard Rating:

Poison. Treat symptomatically.

# Pyraclostrobin

Headline EC\*, Spade, Raclos, Preach, VIKING Pyraclostrobin, Tide Pyraclostrobin Shield, Pyraline 250

\*NOTE: This product is no longer manufactured but product still remains in the distribution system.  
This product may be removed from future editions.

## Company:

BASF Canada (Headline EC – PCP#27322)

NewAgco Inc. (Spade – PCP#32927)

Albaugh (Raclos – PCP#34615)

Sharda Cropchem Limited (Preach – PCP#33928)

Viking Crop Production Partners Inc. (VIKING Pyraclostrobin Fungicide – PCP#34795)

Tide International Canada Inc. (Tide Pyraclostrobin Shield – PCP#35577)

Vincere Agri Solutions Ltd. (Pyraline 250 – PCP#35597)

## Formulations:

Headline EC – 250 g/L of pyraclostrobin formulated as an emulsifiable concentrate.

- Container sizes – case (2 x 6.5 L), 120 L shuttle, 400 L tote

Spade – 250 g/L of pyraclostrobin formulated as an emulsifiable concentrate.

- Container size – case (2 x 13 L)

Preach and Raclos and Pyraline 250 – 250 g/L of pyraclostrobin formulated as an emulsifiable concentrate.

- Container size – case (2 x 6.5 L)

VIKING Pyraclostrobin Fungicide – 250 g/L of pyraclostrobin formulated as an emulsifiable concentrate.

- Container size – 2 X 13 L

Tide Pyraclostrobin Shield – 250 g/L of pyraclostrobin formulated as an emulsifiable concentrate.

- Container size – 6.5-1000 L

## Crops, Diseases, Rates and Timing:

| Crop                                                                                                        | Diseases                                                                                                                                                                   | Application Rate (per acre) | Application Timing                                                                                                                                                                                                                                                                                                                                                                                  |

| Potato*       | Control of early blight ( <i>Alternaria solani</i> )                                                                                               | 182 to 271 mL               | Apply prior to row closure or when conditions become favourable for disease development. Apply on a 7 to 14 day interval.<br>Under high disease pressure, use higher rate or tank mix <i>Headline EC</i> with <i>Bravo 500</i> .<br>It is recommended that no more than 1 application of <i>Headline EC</i> or <i>Spade</i> is made before switching to a fungicide with an alternate mode of action.                                                                                                       |
|               | Control of late blight ( <i>Phytophthora infestans</i> )                                                                                           | 182 to 271 mL               | Apply prior to row closure or when conditions become favourable for disease development. Apply on a 5 to 7 day interval. Under high disease pressure, use higher rate or tank mix <i>Headline EC</i> with <i>Bravo 500</i> . If using a tank-mix, apply on a 7 to 10 day interval.<br>DO NOT make more than 1 application of <i>Headline EC</i> or <i>Spade</i> before switching to a fungicide with an alternate mode of action.                                                                           |
| Timothy hay** | Control of brown stripe ( <i>Cercosporidium graminis</i> ), leaf streak ( <i>Drechslera phlei</i> ), purple eye spot ( <i>Cladosporium phlei</i> ) | 161 to 271 mL               | Apply prior to disease development. Use higher rate when disease pressure is high. If disease persists or weather conditions are favourable for disease development, apply a second time 14 days later, with a fungicide with a different mode of action. In absence of an alternative fungicide registered for the specific diseases to be treated, for resistance management purposes, the maximum number of applications is limited to one.<br>DO NOT apply more than 162 mL/acre by aerial application. |
| Soybean       | Control of frog-eye leaf spot ( <i>Cercospora sojina</i> )                                                                                         | 161 to 242 mL               | Apply at the beginning of flowering. If disease persists or weather conditions are favourable for disease development, apply a second time 10 to 14 days later with a fungicide that contains a different mode of action.                                                                                                                                                                                                                                                                                   |

\*BASF Canada does not recommend use of *Headline EC* alone on potato due to potential for fungicide resistance.

\*\*Minor use label expansion. Follow the product label. Do not apply *VIKING Pyraclostrobin Fungicide* on Timothy hay.

## Application Information:

- **Water Volume:**
  - **Ground:** Use a minimum water volume of 40 L per acre on oilseeds, cereals, pulses, alfalfa and grasses; use 80 L per acre on potatoes. Ensure thorough coverage of foliage.
  - **Aerial:** Use a minimum water volume of 20 L per acre. Ensure thorough coverage of foliage. DO NOT apply more than 160 mL per acre by aerial application.
  - **Pivot or Sprinkler irrigation (Headline EC):** DO NOT exceed 0.64 cm (1/4 inch) (63,500 L) per hectare. DO NOT apply registered tank mixes in potato, chickpea, and canola by pivot or sprinkler irrigation. Apply only through overhead sprinkler systems including centre pivot and lateral move containing low pressure drop nozzles following label.

## How it Works:

The active ingredient pyraclostrobin is a strobilurin fungicide with broad spectrum contact and systemic activity. To be used as a preventative application when environmental conditions are favourable for disease development. Refer to "Fungicide Modes of Action" in the Plant Disease Control section for more information.

## Tank Mixes:

**Spade:** no registered tank mixes.

**VIKING Pyraclostrobin Fungicide:** no registered tank mixes.

**Herbicides:** *Headline EC* at a rate of 120 to 160 mL per acre can be tank mixed with *Ares* on Clearfield canola, *Liberty Herbicide* (150SN or 200SN) in glufosinate ammonium tolerant canola (e.g.: LibertyLink canola), and registered glyphosate herbicides in glyphosate-tolerant canola (e.g.: Roundup Ready). *Tide Pyraclostrobin Shield* can be tank mixed with the following canola herbicides at registered rates and timings: *POAST® ULTRA* Liquid Emulsifiable Herbicide in canola; registered glyphosate herbicides in glyphosate tolerant canola (e.g. Roundup® Ready).

**Fungicides:** On chickpea, *Headline EC* and *Tide Pyraclostrobin Shield* at a rate of 160 to 240 mL per acre must be applied in tank-mix with 145 to 170 grams per acre *Lance* for control of ascochyta blight. On potatoes, *Headline EC* at rates of 180 to 270 mL per acre may be applied in tank-mix with

*Bravo 500* following label rates, additional use recommendations, restrictions, and precautions for the control of late blight. On canola, *Headline EC* and *Tide Pyraclostrobin Shield* can be tank mixed with *Lance Fungicide* at 142 grams per acre at 20 to 50% flowering to control sclerotinia stem rot and suppress black spot.

## Restrictions:

- **Resistance management:** Refer to "Pathogen Resistance" in the Plant Disease Control section for more information.
- **Note:** BASF Canada does not recommend use of *Headline* alone on potato due to potential for resistance.
- **Maximum number of applications:** DO NOT exceed 1 sequential application of *Headline EC* or *Spade* per season. Any subsequent applications of this product must be in combination with a fungicide that contains a different mode of action.
  - *Alfalfa* – DO NOT exceed 1 application per season.
  - *Canola, rapeseed, canola quality Brassica juncea, mustard, flax, dry bean, faba bean, lentil, field pea, chickpea, bluegrass, fescue grass, ryegrass, corn, sunflower* – DO NOT exceed 2 applications of this product per season.
  - *Potato* – DO NOT exceed 3 applications per season.
- **Grazing:** DO NOT graze treated corn crops within 6 days of last application. DO NOT feed alfalfa hay or forage to livestock. All other crops listed can be grazed or fed to livestock.
- **Rainfast:** 1 hour after application.
- **Preharvest interval:**
  - *Barley, rye, wheat, oat* – apply no later than the end of flowering
  - *Corn* – 7 days
  - *Pulses* – 30 days
  - *Forage grasses* – 14 days
  - *Alfalfa* – not applicable
  - *Oilseeds* – 21 days
  - *Potatoes* – 3 days
  - *Soybean* – 21 days
- **Restricted Entry Interval:** DO NOT re-enter treated areas within 12 hours of application.
- **Re-cropping:** Crops listed on label may be planted immediately following last application. Wait 14 days before planting all other crops.
- **Storage:** Store in tightly closed original container in a cool, dry, locked, well-ventilated area without a floor drain. DO NOT freeze. Keep away from food, feed, and fertilizer.
- **Environment:** Highly toxic to aquatic organisms. Avoid overspray or drift to sensitive habitats. Maintain specified buffer zones. DO NOT spray non-target terrestrial or aquatic habitats. Do not contaminate water during cleaning or disposal.

## Hazard Rating:

Danger – Poison Fatal if swallowed. Severely irritating to eyes and skin. Contains aromatic petroleum distillates. Wear gloves, coveralls, and eye protection.

Refer to the Introduction for an explanation of the symbols.

# Pyraclostrobin and Tebuconazole

Fungicide Group  
3, 11

*Tornado Pro, VIKING Drobak*

## Company:

NewAgco Inc. [*Tornado Pro* (Tornado – PCP#33995, *Spade* – PCP#32927)]

VIKING Crop Production Partners Inc. "[*VIKING Drobak* (*VIKING Pyraclostrobin* – PCP#34795, *VIKING Tebuconazole* PCP#34770)]

## Formulation:

- *Tornado Pro* (Tornado – 250 g/L tebuconazole formulated as an emulsion in water, container sizes – 9.8 L and *Spade* – 250 g/L pyraclostrobin as an emulsifiable concentrate, container sizes – 7.7 L
- *VIKING Drobak* (*VIKING Tebuconazole* – 250 g/L tebuconazole formulated as an emulsion in water, container sizes – 12 L, 96 L and *VIKING Pyraclostrobin* – 250 g/L pyraclostrobin as an emulsifiable concentrate, container sizes – 9.6 L, 77 L)

| Wheat (spring, winter, durum) | Stem rust, leaf rust, stripe rust, septoria leaf blotch, tan spot                                       | <i>Tornado Pro</i><br>(150 mL <i>Tornado</i> + 120 mL <i>Spade</i> )                               | Apply immediately after flag stage or at the first sign or very early stage of disease, especially if weather conditions are conducive to disease development. |
| Barley                        | Net blotch, spot blotch, scald, stem rust, leaf rust, stripe rust, septoria leaf blotch, powdery mildew | <i>VIKING Drobak</i><br>(150 mL <i>VIKING Tebuconazole</i> + 120 mL <i>VIKING Pyraclostrobin</i> ) |                                                                                                                                                                |

## Application Information:

- **Water Volume:**
  - **Ground:** minimum of 40 L per acre.
  - **Aerial:** minimum of 20 L per acre.

## How it Works:

The active ingredient tebuconazole is a triazole demethylation inhibitor (DMI) fungicide with systemic broad-spectrum activity. The active ingredient pyraclostrobin is a strobilurin fungicide with broad spectrum contact and systemic activity. Refer to "Fungicide Modes of Action" in the Plant Disease Control section for more information.

## Tank Mixes:

None registered.

## Restrictions:

- **Resistance management:** Refer to "Pathogen Resistance" in the Plant Disease Control section for more information.
- **Maximum number of applications:** DO NOT exceed 1 application per season.
- **Preharvest interval:** DO NOT apply within 36 days of harvest.
- **Restricted Entry Interval:** DO NOT re-enter treated areas within 12 hours of application.
- **Re-cropping:** Treated areas may be replanted following harvest with any crop listed on the label. DO NOT replant treated areas for 120 days after last application for crops not listed on the label.
- **Storage:** Store in a cool, dry, locked, well ventilated area without floor drain and prevent cross contamination with other pesticides, fertilizers, food and feed.
- **Environment:** Any products containing tebuconazole should not be used in areas treated with this product during the previous season. This product is toxic to birds, small wild animals, aquatic organisms and non-target plants. Avoid overspray or drift to sensitive habitats. Maintain specified buffer zones. DO NOT spray non-target terrestrial or aquatic habitats. DO NOT contaminate irrigation or drinking water supplies or aquatic habitats by cleaning of equipment or disposal of wastes.

## Hazard Rating:

*Tornado /VIKING Tebuconazole:*

Danger Poison – Corrosive to Eyes

*Spade /VIKING Pyraclostrobin:*

Danger – Poison – Corrosive to Eyes

Danger – Eye and Skin Irritant

Refer to the Introduction for an explanation of the symbols.

# Pyrimethanil

Fungicide Group  
9

## Company:

Bayer (*Scala SC* – PCP#28011)

Sharda CropChem (*Shape SC* – PCP#34661)

## Formulation:

400 g/L pyrimethanil formulated as a suspension concentrate.

- Container size – 6.07 L

## Crops, Diseases and Timing:

Control of early blight (*Alternaria solani*) on potato. Apply when plants are 15 to 20 cm high or when disease threatens. Repeat applications at 7 to 14 day intervals or as necessary to maintain disease control. If severe disease conditions exist, use the 7 day interval. Minimum spray interval is 7 days. Ensure complete coverage.

## Rates:

Apply at 300 mL per acre as a tank mix with *Bravo ZN*.

## Application Information:

- **Water Volume:**
  - **Ground:** minimum of 120 L per acre.
  - **Aerial:** minimum of 14 L per acre.

## How it Works:

The active ingredient pyrimethanil is an anilinopyrimidine fungicide with contact and systemic activity. To be used as a preventative fungicide application. Refer to "Fungicide Modes of Action" in the Plant Disease Control section for more information.

## Tank Mixes:

**Fungicides:** To be applied ONLY as a tank mix with *Bravo ZN*. Follow mixing instructions provided on the label.

## Restrictions:

- **Resistance management:** Refer to "Pathogen Resistance" in the Plant Disease Control section for more information.
- **Maximum number of applications:** DO NOT exceed 3 applications of this product per season.
- **Grazing:** No restrictions listed.
- **Preharvest interval:** 7 days
- **Restricted Entry Interval:** DO NOT re-enter treated areas within 12 hours of application.
- **Re-cropping:** A 30 day plant-back interval is required for potatoes and wheat and 130 days for all other crops.
- **Storage:** DO NOT allow product to freeze. If stored more than 1 year, shake well before using. Store in tightly closed container away from fertilizer, seeds, feed or food.
- **Environment:** Maintain a 1 m buffer zone between areas sprayed and aquatic systems. Toxic to aquatic organisms. DO NOT apply where runoff is likely to occur.

## Hazard Rating:

Caution Poison – Skin Irritant

Refer to the Introduction for an explanation of the symbols.

# Quadris Top

Fungicide Group  
3, 11

## Company:

Syngenta Canada (PCP#30518)

## Formulation:

200 g/L azoxystrobin and 125 g/L difenoconazole formulated as a flowable suspension concentrate.

- Container size – 2 x 10.125 L

## Crops, Diseases, Rates and Timing:

| Crop                       | Diseases                                                                                                      | Application Rate<br>(per acre) | Application Timing                                                                                                                    |
|----------------------------|---------------------------------------------------------------------------------------------------------------|--------------------------------|---------------------------------------------------------------------------------------------------------------------------------------|
| Potato                     | Control of early blight<br>( <i>Alternaria solani</i> )                                                       | 229 to 405 mL                  | Apply on a 7 to 14 day interval, starting prior to disease establishment.                                                             |
| Potato<br><i>continued</i> | Suppression of brown spot<br>( <i>Alternaria alternata</i> ), black dot<br>( <i>Colletotrichum coccodes</i> ) | 229 to 405 mL                  | Apply prior to disease. Apply no more than 1 application to target these diseases. If disease pressure is high, use the highest rate. |
|                            | Suppression of sclerotinia stem rot<br>( <i>Sclerotinia sclerotiorum</i> )                                    | 405 mL                         | Apply at full bloom. Repeat applications at intervals of 7 to 10 days.                                                                |

## Application Information:

- **Water Volume:**
  - **Ground:** Use sufficient water volume to obtain adequate coverage. Use minimum 60 L per acre.
  - **Aerial:** Use sufficient water volume to obtain adequate coverage. Use minimum 60 L per acre.

## How it Works:

The active ingredient azoxystrobin belongs to a strobilurin group of fungicides and difenoconazole is a triazole fungicide. Together they provide broad spectrum preventative and systematic. To be used as a preventative and curative fungicide application. Refer to "Fungicide Modes of Action" in the Plant Disease Control section for more information.

## Tank Mixes:

None registered.

## Restrictions:

- **Resistance management:** Refer to "Pathogen Resistance" in the Plant Disease Control section for more information.
- **Maximum number of applications:** DO NOT exceed three applications per season.
- **Grazing:** No restrictions listed.
- **Preharvest interval:** 14 days
- **Restricted Entry Interval:** DO NOT re-enter treated areas until 12 hours after application.
- **Re-cropping:** DO NOT plant any other crop for a period of 60 days following application to the preceding crop unless *Quadris Top* or *Inspire* are registered for that crop.
- **Storage:** Store in cool, dry place. DO NOT store food, beverages or tobacco products in storage area.
- **Environment:** This product is toxic to aquatic organisms (or invertebrates), fish and mammals. Observe buffer zones outlined in the label.

## Hazard Rating:

Caution – Eye Irritant

Refer to the Introduction for an explanation of the symbols.

# Quash SC

Fungicide Group  
3

## Company:

Valent Canada distributed by Nufarm Agriculture Inc. (PCP#33081)

## Formulation:

480 g/L of metconazole formulated as a soluble concentrate.

- Container size – 2 x 4.8 L jugs

## Crops, Diseases, Rates and Timing:

| Crop                                           | Diseases                                                                                                                 | Application Rate (per acre) | Application Timing                                                                                                                                                                              |
|------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------|-----------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Canola                                         | Control of sclerotinia stem rot ( <i>Sclerotinia sclerotiorum</i> )                                                      | 59 to 118 mL                | 20 to 50% bloom. Under high disease pressure, use the application rate of 118 mL/acre. DO NOT make more than one application per year.                                                          |
| Dry bean,<br>Field pea,<br>Chickpea,<br>Lentil | Control of powdery mildew (field peas only)<br>Suppression of white mold, ascochyta blight (chickpeas and lentils only)  | 118 mL                      | 20 to 50% bloom stage, before disease symptoms are visible. Make a second application at full bloom a minimum 7 days after the first application. DO NOT apply more than 236 mL/acre per year.  |
| Potato                                         | Control of early blight ( <i>Alternaria solani</i> )                                                                     | 73 to 118 mL                | Apply prior to infection for preventative control. If conditions favor disease development, make additional applications at 7 to 10 day intervals. DO NOT apply more than 354 mL/acre per year. |
|                                                | Suppression of white mold ( <i>Sclerotinia sclerotiorum</i> )                                                            | 118 mL                      |                                                                                                                                                                                                 |
| Sunflower                                      | Control of rust ( <i>Puccinia helianthi</i> )<br>Suppression of sclerotinia head rot ( <i>Sclerotinia sclerotiorum</i> ) | 118 mL                      | Apply when conditions favor disease development and prior to infection. DO NOT apply more than 236 mL/acre per year.                                                                            |

## Application Information:

- **Water Volume:**
  - **Ground:** minimum 81 L per acre.
  - **Aerial:** minimum 20 L per acre.

## How it Works:

The active ingredient metconazole is a broad spectrum triazole demethylation inhibitor (DMI) fungicide with systemic activity. Refer to "Fungicide Modes of Action" in the Plant Disease Control section for more information.

## Tank Mixes:

None registered.

## Restrictions:

- **Resistance management:** Refer to "Pathogen Resistance" in the Plant Disease Control section for more information.
- **Maximum number of applications:**
  - **Canola** – DO NOT exceed more than 1 application of this product per year.
  - **Dry bean, field pea, chickpea, lentil, sunflower** – DO NOT exceed 236 mL per acre of this product per year.
  - **Potato** – DO NOT exceed 354 mL per acre of this product per year.
- **Preharvest interval:**
  - **Canola** – 45 days
  - **Dry bean, field pea, chickpea, lentil, sunflower** – 21 days
  - **Potato** – 8 days
- **Restricted Entry Interval:**
  - **Canola, potato** – DO NOT re-enter treated areas within 12 hours of application.
  - **Peas** – DO NOT re-enter treated areas within 24 hours of application.
- **Re-cropping:** DO NOT plant any other crop for a period of 30 days unless *Quash* is registered for that use.
- **Storage:** Store in a cool, dry, secure place

- **Environment:** Toxic to aquatic organisms, non-target terrestrial plants, birds, and small wild mammals. To reduce runoff from treated areas into aquatic habitats, avoid application to areas with a moderate to steep slope, compacted soil or clay.
- **Oral LD50 (Rats):** 1750 mg per kg.
- **Dermal LD50 (Rabbits):** >5000 mg per kg.

### Hazard Rating:

Warning – Eye Irritant

Refer to the Introduction for an explanation of the symbols.

|                                                            | Crown rust ( <i>Puccinia coronata</i> )                                                                                                                                          | 304 to 405 mL               |                                                                                                                                                                                                                                                                                     |
| Field, sweet, and popping corn (including seed production) | Rust ( <i>Puccinia sorghi</i> ), northern leaf blight ( <i>Setosphaeria turcicum</i> )<br>Suppression of anthracnose leaf blight ( <i>Colletotrichum graminicola</i> )           | 304 to 405 mL               | Make first application at the first sign of disease, followed by a second application 14 days after the first, if environmental conditions are favourable for disease development.                                                                                                  |
| Fescue, grown for seed production                          | Stem eyespot and leaf spot complex ( <i>Didymella festucae</i> ) and leaf spot ( <i>Pyrenophora</i> spp., <i>Drechslera</i> spp.)                                                | 405 mL                      | Begin applications when conditions are favourable for disease infection and prior to disease symptom appearance. In commercial fescue for seed production, the first application is to be made preventively prior to tiller leaves expansion; the second application 14 days later. |

\*Suppression only at rates less than 304 mL per acre.

## Application Information:

- **Water Volume:**
  - **Ground:** Apply in a minimum of 18 L of water per acre for legume vegetables and soybean. Apply in a minimum of 40 L of water per acre for other crops.
  - **Aerial:** Follow the recommendations on label for each use. Apply a minimum of 18 L of water per acre. DO NOT apply on fescue using aerial application equipment.

## How it Works:

The active ingredient azoxystrobin is a methoxyacrylate compound (strobilurin) with broad spectrum contact and systemic activity. The active ingredient propiconazole is a triazole fungicide with broad-spectrum systemic activity. To be used as a preventative and curative fungicide application. Refer to "Fungicide Modes of Action" in the Plant Disease Control section for more information.

## Tank Mixes:

**Insecticides:** *Quilt* can be tank-mixed with insecticide *Matador 120EC* for foliar disease and insect control in cereals. Consult each label for pests controlled, precautions, and specific application instructions

According to the Pest Management Regulatory Agency of Health Canada's Guidance Document on Tank Mix Labelling (March 2023), unlabelled tank mixes of this product are permitted only if the label of this product and the label of the product it might be mixed with include at least general wording on their respective labels indicating they may be mixed with other pesticides. When tank mixes are permitted, apply mixes according to the most restrictive use limitations for either product.

## Restrictions:

- **Resistance management:** Refer to "Pathogen Resistance" in the Plant Disease Control section for more information.
- **Maximum number of applications:**
  - *Canola* – DO NOT exceed 1 application of this product per season.
  - *Soybean, dry bean, faba bean, chickpea, field pea, lentil, barley, wheat, rye, triticale, oat, corn and Fescue* – DO NOT exceed 2 applications of this product per season.
- **Grazing:**
  - *Fescue* – DO NOT graze or harvest treated forage, and hay for livestock feed. Follow the instructions on label for other uses.
- **Preharvest interval:**
  - *Soybean and dry legume vegetables, canola* – 30 days
  - *Succulent podded and shelled legume vegetables* – 15 days
  - *Soybean hay and dry pea hay* – 14 days
  - *Fescue* – Make the last application at least 20 days before seed matures; seed not for human or animal consumption
  - *Wheat, barley, rye, triticale, and oat* – 45 days
  - *Field corn, sweet corn, and popcorn* – 14 days
- **Restricted Entry Interval:** DO NOT re-enter treated fields within 12 hours of application.
- **Re-cropping:** Oat and rye may be planted 45 days after *Quilt* application. DO NOT plant any other crop intended for food, grazing, or any component of animal feed or bedding within 105 days of *Quilt* application to the preceding crop unless the second crop appears on the *Quilt* label.
- **Storage:** Store in a cool, dry, well ventilated area away from feed and foodstuffs, and out of reach of children and animals. DO NOT store at temperatures below freezing. Keep in original container, tightly closed, during storage.
- **Environment:** Azoxystrobin is persistent and will carry over. *Quilt* is toxic to aquatic organisms and is extremely phytotoxic to certain apple varieties. Avoid spraying when the wind is blowing towards a nearby sensitive crop, garden, terrestrial habitat (such as shelterbelt), or aquatic habitat. DO NOT contaminate irrigation or drinking water supplies by cleaning of equipment or disposal of wastes. Avoiding spray drift is the responsibility of the applicator.

## Hazard Rating:

Caution – Poison and Skin Irritant

Refer to the Introduction for an explanation of the symbols.

# Ranman 400SC

Fungicide Group  
21

## Company:

ISK Biosciences Corporation; distributed by Belchim Crop Protection Canada (PCP#30716)

## Formulation:

400 g/L cyazofamid formulated as a suspension concentrate.

- Container sizes – 500 mL, 200 L

## Crops, Diseases and Timing:

Control of late blight (*Phytophthora infestans*) on potato. Begin applications on a 7 day schedule when warning systems forecast disease infection periods or at row closure. Use the low rate under low disease pressure and increase the rate as disease pressure and/or crop development increases, up to the maximum rate. For late blight tuber rot control, ensure that the last 2 to 3 applications prior to desiccation are made at the maximum rate following resistance management practices.

## Rates:

40 to 80 mL per acre. *Ranman 400SC* should be tank mixed with a non-ionic or organo-silicone surfactant (such as Sylgard 309 at 60 mL per acre).

## Application Information:

- DO NOT make sequential applications. After one application alternate with at least one application of fungicide with a different mode of action.
- **Water Volume:**
  - **Ground:** Apply in a minimum of 20 L of water.
  - **Aerial:** Use sufficient volume to obtain coverage of the foliage, 80 to 240 L per acre.

## How it Works:

The active ingredient cyazofamid is a cyanoimidazole fungicide with contact activity. To be used as a preventative fungicide application. Refer to "Fungicide Modes of Action" in the Plant Disease Control section for more information.

## Tank Mixes:

None registered.

## Restrictions:

- **Resistance management:** Refer to "Pathogen Resistance" in the Plant Disease Control section for more information.
- **Maximum number of applications:** DO NOT exceed 6 applications of this product per season.
- **Grazing:** No restrictions listed.
- **Preharvest interval:** 7 days
- **Restricted Entry Interval:** DO NOT re-enter treated areas within 12 hours of application.
- **Re-cropping:** A plant back interval of 30 days is required.
- **Storage:** Store product in original container in a secured dry place separate from other pesticides, fertilizer, food and feed.
- **Environment:** 20 m (fixed wing) and 15 m (helicopter) buffer zones for aerial applications in proximity of terrestrial habitats. For freshwater and marine habitats buffer zones for aerial are the same as field sprayer applications.

## Hazard Rating:

None listed.

# Reason 500SC

## Company:

Gowan Canada (PCP#27462)

## Formulation:

500 g/L fenamidone formulated as a suspension concentrate.

- Container size – 2 L

## Crops, Diseases and Timing:

Control of early blight (*Alternaria solani*) and late blight (*Phytophthora infestans*) on potato. Begin application when plants are 15 to 20 cm high or when disease threatens. Apply a fungicide with a different mode of action within 7 to 10 days after each application using the shorter interval when conditions favor disease development. Ensure even application.

## Rates:

Apply at 80 mL per acre (200 mL/ha) as a tank mix with either *Dithane DG\** at 500 grams per acre (1.25 kg/ha) or *Bravo 500* at registered rates.

\*When using other formulations of mancozeb, adjust application rates to apply 375 grams active ingredient per acre (935 g active ingredient/ha).

## Application Information:

- **Water Volume:**
  - **Aerial:** Use minimum of 14 L per acre (35 L/ha) at a pressure no less than 300 kPa.

## How it Works:

The active ingredient fenamidone is a strobilurin fungicide with contact activity. To be used as a preventative and inhibitive (spore germination and antisporeulant) fungicide application. Refer to "Fungicide Modes of Action" in the Plant Disease Control section for more information.

## Tank Mixes:

This product may be tank mixed with a fertilizer, a supplement, or with registered pest control products, whose labels also allow tank mixing, provided the entirety of both labels, including Directions For Use, Precautions, Restrictions, Environmental Precautions, and Spray Buffer Zones are followed for each product. In cases where these requirements differ between the tank mix partner labels, the most restrictive label must be followed. Do not tank mix products containing the same active ingredient unless specifically listed on the label. In some cases, tank mixing pest control products can result in reduced pesticide efficacy or increased host crop injury. The user should contact Gowan Company at 1-800-960-4318 for information before applying any tank mix that is not specifically recommended on the label.

## Restrictions:

- **Resistance management:** Refer to "Pathogen Resistance" in the Plant Disease Control section for more information.
- **Maximum number of applications:** DO NOT exceed 6 applications of this product per season.
- **Grazing:** No restrictions listed.
- **Preharvest interval:** 14 days
- **Restricted Entry Interval:** DO NOT re-enter treated areas until residues have dried.
- **Re-cropping:** A 30 day plant-back interval is required for potato and all other crops.
- **Storage:** DO NOT allow product to freeze. If stored more than 1 year, shake well before using. Keep away from fire, open flame or other sources of heat. Store in tightly closed container away from fertilizer, seeds, feed or food
- **Environment:** For ground application maintain a 1 m buffer zone between areas sprayed and aquatic systems. For aerial application allow a 5 m buffer. Toxic to fish and other aquatic organisms; DO NOT apply where runoff is likely to occur.

## Hazard Rating:

Caution Poison – Eye Irritant

Refer to the Introduction for an explanation of the symbols.

# Regalia Maxx

Fungicide Group  
Not classified, bio-fungicide

## Company:

Marrone Bio Innovations (PCP#30199)

## Formulation:

20% extract of *Reynoutria sachalinensis* formulated as a suspension concentrate.

- Container size – 4 x 5 L

## Crops, Diseases and Timing:

Partial suppression of septoria leaf blotch (*Septoria tritici*) in wheat. Apply preventatively or when disease systems first appear after initial jointing. Repeat applications in 7 to 14 day intervals depending upon crop growth and disease pressure.

## Rates:

0.25% v/v in 160 to 240 L of water per acre.

## Application Information:

- DO NOT apply by air. When environmental conditions and plant stage are conducive to rapid disease development use *Regalia Maxx* in a rotational program with other registered fungicides.
- **Water Volume:**
  - **Ground:** minimum of 160 to 240 L per acre.

## How it Works:

*Reynoutria sachalinensis* is a plant extract to induce the plants' natural defense mechanisms against certain fungal and bacterial disease. Refer to "Fungicide Modes of Action" in the Plant Disease Control section for more information.

## Tank Mixes:

None registered.

## Restrictions:

- **Resistance management:** Refer to "Pathogen Resistance" in the Plant Disease Control section for more information.
- **Maximum number of applications:** No maximum number of applications specified.
- **Grazing:** No restrictions listed.
- **Preharvest Interval:** May be applied up to the day of harvest.
- **Restricted Entry Interval:** DO NOT re-enter into treated areas until the spray is dried.
- **Re-cropping:** No restrictions listed.
- **Storage:** Store in original tightly closed container.
- **Environmental Hazards:** DO NOT contaminate irrigation or drinking water supplies or aquatic habitats by cleaning of equipment or disposal of wastes.

## Hazard Rating:

None listed.

# Revus

Fungicide Group  
40

## Company:

Syngenta Canada (PCP#29074)

## Formulation:

250 g/L mandipropamid formulated as a suspension concentrate.

- Container size – 4 x 3.78 L

## Crops, Diseases and Timing:

Control of late blight (*Phytophthora infestans*) on potato. Begin applications prior to disease development. Continue applications on 7 to 10 day intervals, following resistance management guidelines.

## Rates:

0.17 to 0.24 L per acre. The use of a non-ionic adjuvant (0.25% v/v) is recommended.

## Application Information:

- **Water Volume:**
  - **Ground:** Use a minimum water volume of 40 L per acre. In situations where dense canopy or pest pressure is high, use greater water volumes.
  - **Aerial:** Use a minimum water volume of 18 L per acre.
  - **Nozzles:** DO NOT apply using any type of ultra low volume (ULV) spray system.

## How it Works:

The active ingredient mandipropamid is a carboxylic acid amide (CAA) fungicide with contact and systemic activity. To be used as a preventative and inhibitive (prevents spore germination) fungicide application. Refer to "Fungicide Modes of Action" in the Plant Disease Control section for more information.

## Tank Mixes:

Fungicides: *Bravo ZN*

## Restrictions:

- **Resistance management:** Refer to "Pathogen Resistance" in the Plant Disease Control section for more information.
- **Maximum number of applications:**
  - DO NOT exceed 4 applications of this product per season.
  - DO NOT exceed 2 consecutive applications of this product.
- **Grazing:** No restrictions listed.
- **Preharvest interval:** 14 days
- **Restricted Entry Interval:** DO NOT re-enter treated area within 12 hours of application.
- **Re-cropping:** DO NOT plant any crop which is not registered for use with *Revus* for a period of 30 days after the last application.
- **Storage:** Store in a cool dry place away from food, beverages, and tobacco products.
- **Environment:** To reduce runoff into aquatic habitats avoid application to areas with a moderate to steep slope, compacted soil, or clay. Runoff into aquatic habitats may be reduced by including a vegetative strip between the treated area and the edge of the water body.

## Hazard Rating:

Caution – Poison

Warning – Skin Irritant  
Potential Skin Sensitizer

Refer to the Introduction for an explanation of the symbols.

# RevyPro

Fungicide Group  
3

## Company:

BASF Canada (PCP#34671)

## Formulation:

50 g/L Mefentrifluconazole and 100 g/L Prothioconazole formulated as emulsifiable concentrate

- Container size – case (2 x 8.1 L)

## Crops, Diseases, Rates and Timing:

| Crop*     | Disease**                                                                                                                                                                                                                                                                              | Application Rate (per acre) | Application Timing***                                                                                                                                                                              |

| Chickpea  | Control of ascochyta blight ( <i>Ascochyta spp.</i> ), white mould ( <i>Sclerotinia sclerotiorum</i> ), suppression of grey mould ( <i>Botrytis cinerea</i> ), suppression of powdery mildew                                                                                           | 405 mL                      | Apply RevyPro at the beginning of flowering or at the onset of symptoms. Apply a second time 10-14 days later if disease persists or if weather conditions are favourable for disease development. |
| Dry Bean  | Control of anthracnose ( <i>Colletotrichum lindemuthianum</i> ), Ascochyta blight ( <i>Ascochyta sp.</i> ) suppression of white mould ( <i>Sclerotinia sclerotiorum</i> ) suppression of grey mould ( <i>Botrytis cinerea</i> ), suppression of powdery mildew ( <i>Erysiphe sp.</i> ) | 405 mL                      | Apply RevyPro at the beginning of flowering or at the onset of symptoms. Apply a second time 10-14 days later if disease persists or if weather conditions are favourable for disease development. |
| Field pea | Control of mycosphaerella blight ( <i>Mycosphaerella pinodes</i> ), ascochyta blight ( <i>Ascochyta spp.</i> ), white mould ( <i>Sclerotinia sclerotiorum</i> ), suppression of powdery mildew ( <i>Erysiphe pisi</i> ), suppression of grey mould ( <i>Botrytis cinerea</i> )         | 405 mL                      | Apply RevyPro at the beginning of flowering or at the onset of symptoms. Apply a second time 10-14 days later if disease persists or if weather conditions are favourable for disease development. |
| Faba bean | Control of ascochyta blight ( <i>Ascochyta spp.</i> ), white mould ( <i>Sclerotinia sclerotiorum</i> ), suppression of grey mould/Chocolate spot ( <i>Botrytis cinerea</i> ), suppression of powdery mildew ( <i>Erysiphe sp.</i> )                                                    | 405 mL                      | Apply RevyPro at the beginning of flowering or at the onset of symptoms. Apply a second time 10–14 days later if disease persists or if weather conditions are favourable for disease development. |
| Lentil    | Control of ascochyta blight ( <i>Ascochyta spp.</i> ), anthracnose ( <i>Colletotrichum lentis</i> ), white mould ( <i>Sclerotinia sclerotiorum</i> ), suppression of grey mould ( <i>Botrytis cinerea</i> ), suppression of powdery mildew ( <i>Erysiphe sp.</i> )                     | 405 mL                      | Apply RevyPro at the beginning of flowering or at the onset of symptoms. Apply a second time 10–14 days later if disease persists or if weather conditions are favourable for disease development. |

\*See label for complete list of registered crops.

\*\*RevyPro is effective on Group 11 (strobilurin, QoI) fungicide-resistant isolates of *Colletotrichum lentis*, *C. lindemuthianum*, *Mycosphaerella pinodes* and *Ascochyta rabiei*.

\*\*\*Apply fungicide containing alternative mode of actions if second application is required.

## Application Information:

- Water Volume:
  - **Ground:** minimum water volume 40 L/acre.
  - **Air:** minimum water volume 20 L/acre.

## How it Works:

The active ingredients, mefentrifluconazole and prothioconazole, are broad spectrum triazole demethylation inhibitor (DMI) fungicides with systemic activity. Refer to "Fungicide Modes of Action" in the Plant Disease Control section for more information.

Tank Mixes:

Refer to the product label for tank mixing compatibility. According to the Pest Management Regulatory Agency of Health Canada's Guidance Document on Tank Mix Labelling (March 2023), unlabelled tank mixes of this product are permitted only if the label of this product and the label of the product it might be mixed with include at least general wording on their respective labels indicating they may be mixed with other pesticides. When tank mixes are permitted, apply mixes according to the most restrictive use limitations for either product..

Restrictions:

- **Maximum number of applications:** Do not make more than two (2) sequential applications of *RevyPro* before alternating to a non-Group 3 fungicide registered for the same use. Where possible, rotate the use of *RevyPro* or other Group 3 fungicides with different groups that control the same pathogens for optimal disease resistance management.
- **Rainfall:** Avoid application when heavy rain is in forecast.
- **Pre-harvest Intervals:** 21 days after application for all labelled crops.
- **Re-entry:** 12 hours.
- **Grazing:** All crops on label can be grazed or fed to livestock following a minimum of 21 days after application.
- **Re-cropping interval:** All crops on label may be planted immediately after the last application. Crops not on this label must not be planted within 1 month after the last application.
- **Storage:** Store in original container. Store this product away from food or feed. Protect from freezing.
- **Environment:** Toxic to aquatic organisms and non-target terrestrial plants. Observe spray buffer zones specified under DIRECTIONS FOR USE on label. Mefentrifluconazole is persistent and may carry over. It is recommended that any products containing mefentrifluconazole not be used in areas treated with this product during the previous season. To reduce runoff from treated areas into aquatic habitats, avoid application to areas with a moderate to steep slope, compacted soil, or clay. Contamination of aquatic areas as a result of runoff may be reduced by including a vegetative strip between the treated and the edge of the water body.

Hazard Rating:

Warning – Eye Irritant, Skin Irritant

|        | <i>Ridomil Gold 480EC, Ridomil Gold 480SL:</i><br>Suppression of pink rot ( <i>Phytophthora erythroseptica</i> ) as in-furrow treatment.                                                                                                                                                                                      | <i>Ridomil Gold 480EC, Ridomil Gold 480SL:</i><br>4 mL/100 m row, applied in-furrow at planting.                                                                                           |                                                                                                                                                                                                                                                                                                                                                      |

## Application Information:

- **Water Volume:**
  - **Ground:** use sufficient water to ensure thorough coverage of foliage. Use a water volume of 90 to 640 L per acre.
  - **In-furrow treatment:** use a minimum of 12 L per acre. For tank mixes with *Quadris* water volume should be 20 to 56 L per acre.
  - **Aerial:** use a minimum water volume of 20 L per acre.

## How it Works:

The active ingredient metalaxyl is an acylalanine fungicide with systemic activity. The active ingredient chlorothalonil is a chloronitrile fungicide with contact activity. To be used as a preventative fungicide application. Refer to "Fungicide Modes of Action" in the Plant Disease Control section for more information.

## Tank Mixes:

*Ridomil Gold/Bravo, Ridomil Gold SL/Bravo:* None registered.

*Ridomil Gold 480EC, Ridomil Gold 480SL:* May be tank mixed with *Quadris* for in-furrow treatment to control rhizoctonia stem rot, stolon canker, black scurf and suppression of pink rot.

## Restrictions:

- **Resistance management:** Refer to "Pathogen Resistance" in the Plant Disease Control section for more information.
- **Maximum number of applications:**
  - **Ground/aerial** (*Ridomil Gold/Bravo, Ridomil Gold/SL Bravo*) – DO NOT exceed 3 applications of this product per season.
  - **In-furrow** (*Ridomil Gold 480EC, Ridomil Gold 480SL*) – DO NOT exceed 1 application of this product per season.
- **Grazing:** No restrictions listed.
- **Preharvest interval:** 14 days for *Ridomil Gold SL/Bravo*
- **Restricted Entry Interval:** *Ridomil Gold 480EC, Ridomil Gold 480SL* – DO NOT re-enter treated areas within 12 hours of application.
- **Re-cropping:** A plant back interval of 30 days for root crops is required after the in-furrow application.
- **Storage:** Protect from excessive heat.
- **Environment:** DO NOT apply where runoff is likely to occur. DO NOT use on coarse textured gravelly soils, soils with less than 2% organic matter or in areas where the water table may be high. Avoid application by ground or air near or around bodies of water. DO NOT contaminate streams or ponds by spray drift, by cleaning equipment, or disposal of wastes. A buffer zone of 100 m for aerial application and 15 m for ground application should be observed to protect water bodies.

## Hazard Rating:

*Ridomil Gold/Bravo, Ridomil Gold SL/Bravo:*

Warning Poison – Eye Irritant

|                               | Suppression of septoria leaf spot and glume blotch ( <i>Septoria tritici</i> )                                                                   |                   |                                                                                                                                                                                                                                   |
|                               | Suppression of Fusarium head blight ( <i>Fusarium graminearum</i> )                                                                              | 212 mL            | Apply when at least 75% of the heads on the main stem have emerged to when 50% of the heads on the main stem are in flower.                                                                                                       |

\*Roxar can be applied with a non-ionic surfactant at 0.2-0.25% v/v. See label for further information.

## Application Information:

- **Water Volume:**
  - **Ground:** minimum water volume of 40 L per acre.
  - **Aerial:** minimum water volume of 20 L per acre.

## How it Works:

The active ingredient tetraconazole is a demethylation inhibitor with systemic and contact activity. Refer to "Fungicide Modes of Action" in the Plant Disease Control section for more information.

## Tank Mixes:

None registered.

## Restrictions:

- **Resistance management:** Refer to "Pathogen Resistance" in the Plant Disease Control section for more information.
- **Maximum number of applications:** DO NOT apply more than 270 mL per acre of *Roxar* in a single season.
- **Grazing:** No restrictions listed.
- **Preharvest interval:**
  - *Wheat and barley harvested for grain* – 40 days
- **Restricted Entry Interval:** DO NOT re-enter treated areas within 12 hours of application.
- **Re-cropping:**
  - *Wheat, barley, dried shelled pea and bean, canola, corn, sugar beet* – can be planted immediately after the last application.
  - *All other crops* – a 30 day plant interval must be observed prior to planting.
- **Storage:** Store this product away from food or feed.
- **Environmental Restrictions:** Toxic to aquatic organisms. Observe buffer zones as specified on the label. To reduce runoff from treated areas into aquatic habitats avoid application to ears with a moderate to steep slope, compacted soil, or clay. Avoid application when heavy rain is in the forecast.

## Hazard Rating:

None registered.

## Crops, Diseases, Rates and Timing:

| Crop   | Diseases Controlled                                      | Application Rate (per acre) | Application Timing                                                                                                                                           |
|--------|----------------------------------------------------------|-----------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Potato | Rhizoctonia canker ( <i>Rhizoctonia</i> spp.)            | 135 mL                      | Apply in-furrow.                                                                                                                                             |
|        | Early blight ( <i>Alternaria solani</i> )                | 68-135 mL                   | Apply to foliage prior to disease development.                                                                                                               |
|        | Sclerotinia stem rot ( <i>Sclerotinia sclerotiorum</i> ) | 135 mL                      | Apply at the beginning of flowering. Apply a second time 7 to 14 days later if disease persists or weather conditions are favorable for disease development. |

## Application Information:

- **Water Volume:**
  - **Ground:** minimum 40 L per acre.
  - **Aerial:** minimum 20 L per acre.

## How it Works:

The active ingredient fluxapyroxad is a carboxamide (SDHI) fungicide with system activity. Refer to "Fungicide Modes of Action" in the Plant Disease Control section for more information.

## Tank Mixes:

None registered.

In foliar applications always tank mix *Sercadis* with an alternate mode of action effective against the targeted disease. In foliar applications, the use of a non-ionic surfactant at 0.125 v/v is recommended. According to the Pest Management Regulatory Agency of Health Canada's Guidance Document on Tank Mix Labelling (March 2023), unlabelled tank mixes of this product are permitted only if the label of this product and the label of the product it might be mixed with include at least general wording on their respective labels indicating they may be mixed with other pesticides. When tank mixes are permitted, apply mixes according to the most restrictive use limitations for either product.

## Restrictions:

- **Resistance management:** Refer to "Pathogen Resistance" in the Plant Disease Control section for more information.
- **Maximum number of applications:** DO NOT exceed 3 applications of this product per season
- **Grazing:** No restrictions listed.
- **Preharvest Interval:** 7 days
- **Restricted Entry Interval:** Re-entry interval after application is 12 hours.
- **Re-cropping:** Tuberous and corm vegetables, sugar beets, legume vegetables, fruiting vegetables, pome fruits, stone fruits, cereal and oilseeds may be planted immediately following the last application. A plan-back interval of one year is required for all other crops.
- **Storage:** Store this product away from food or feed.
- **Environmental Hazards:** Observe buffer zones specified on label. The use of this chemical may result in contamination of ground water, particularly in areas where soils are permeable (for example sandy soils) and/or the depth of the water table is shallow.
- **Toxicity:** Toxic to aquatic organisms and small mammals

## Hazard Rating:

Warning – Contains the Allergen Soy

# Serenade OPTI

Fungicide Group

| Crop                                    | Diseases Suppressed                                                                              | Application Rate (per acre) | Application Timing                                                                                                                                                                                                                                                                       |
|-----------------------------------------|--------------------------------------------------------------------------------------------------|-----------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Dry bean, chickpea, lentil, field pea   | White mould ( <i>Sclerotinia sclerotiorum</i> ), grey mould ( <i>Botrytis cinerea</i> )          | 0.7 to 1.3 kg               | Product should be applied prior to or in the early stages of disease development; repeat applications on 7 to 10 day intervals if conditions for disease persist.                                                                                                                        |
| Soybean                                 | White mould ( <i>Sclerotinia sclerotiorum</i> )                                                  | 0.2 to 0.8 kg               | Use maximum label rates and shortened spray intervals for conditions conducive to rapid disease development. When conditions are conducive to heavy disease pressure, use in a rotational program with other registered fungicides.                                                      |
|                                         | Brown spot ( <i>Septoria glycines</i> )                                                          | 0.04 to 0.2 kg              |                                                                                                                                                                                                                                                                                          |
|                                         | Frogeye leaf spot ( <i>Cercospora sojina</i> )                                                   | 0.04 to 0.2 kg              |                                                                                                                                                                                                                                                                                          |
| Potato                                  | Sclerotinia stem rot ( <i>Sclerotinia sclerotiorum</i> )                                         | 0.4 to 1.3 kg               | Begin application soon after emergence and when conditions are conducive to disease development. Repeat as necessary on a 7 to 10 day interval.                                                                                                                                          |
|                                         | Early blight ( <i>Alternaria solani</i> )                                                        | 0.4 to 0.9 kg               |                                                                                                                                                                                                                                                                                          |
|                                         | Silver scurf ( <i>Helminthosporium solani</i> )                                                  | 7 to 14 g per tonne         | For post-harvest application to aid in the control of silver scurf. See label for details.                                                                                                                                                                                               |
| Canola, flax, borage, camelina, mustard | Sclerotinia stem rot ( <i>Sclerotinia sclerotiorum</i> )                                         | 0.1 to 0.4 kg               | Begin application at 20 to 30% bloom. A second application may be made 7 to 10 days later, at approximately 50% bloom and prior to significant petal fall, if conditions for disease development remain favourable. Use higher rates in fields with a history of heavy disease pressure. |
| Caraway, coriander, fenugreek           | Botrytis grey mould ( <i>Botrytis cinerea</i> ), white mould ( <i>Sclerotinia sclerotiorum</i> ) | 0.7 to 1.3 kg               | Begin application when environmental conditions are conducive to disease development. Repeat as necessary on a 7 to 10 day interval.                                                                                                                                                     |

## Application Information:

- **Water Volume:**
    - Use water volumes to give good canopy penetration and coverage of plant parts to be protected.
- Ground application only for all crops, except canola (ground or air).

## How it Works:

*Bacillus subtilis* is a bacterium that works as a bio-fungicide to prevent infection of labeled diseases by multi-site biochemical activity. Refer to "Fungicide Modes of Action" in the Plant Disease Control section for more information.

## Tank Mixes:

None registered.

## Restrictions:

- **Resistance management:** Refer to "Pathogen Resistance" in the Plant Disease Control section for more information.
- **Maximum number of applications:** No restrictions listed.
- **Grazing:** No restrictions listed.
- **Preharvest interval:** Can be applied up to and including the day of harvest.
- **Restricted Entry Interval:** No restrictions listed.
- **Re-cropping:** No restrictions listed.

- **Storage:** Maximum storage period of two years at room temperatures up to 25°C. Store in a dry area inaccessible to children. Store in original container.
- **Environment:** DO NOT contaminate water, food, or feed by storage and disposal.

## Hazard Rating:

None listed.

Potential Skin Sensitizer

Fungicide Group  
BM02

## Company:

BASF Canada (PCP # 30054)

## Formulation:

*Bacillus amyloliquefaciens* strain MBI 600 – not less than  $5.5 \times 10^{10}$  viable spores per gram formulated as wettable Powder.

- Container size – 2 kg jugs

## Crops, Diseases, Rates and Timing:

| Crop     | Diseases Suppressed                                                              | Application Rate (per acre) | Application Timing                                                                                                                                                                                          |
|----------|----------------------------------------------------------------------------------|-----------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Potatoes | Suppression of Early blight ( <i>Alternaria solani</i> )                         | 0.1 to 0.2 kg               | For early blight, begin applications shortly after emergence or transplanting but prior to disease development and continue on 7- to 10-day intervals if conditions are favourable for disease development. |
|          | Late blight ( <i>Phytophthora infestans</i> )                                    | 0.2 kg                      | Begin applications prior to infection and continue on 5- to 7-day intervals if conditions are favourable for disease development.                                                                           |
|          | Suppression of Rhizoctonia stem canker/black scurf ( <i>Rhizoctonia solani</i> ) | 0.1 to 0.2 kg               | Use in furrow to suppress soilborne Rhizoctonia canker or black scurf.                                                                                                                                      |

## Application Information:

- **Water Volume:**
  - **Ground and in-furrow:** 20 L/ac minimum
  - **Aerial:** Do NOT apply by air
  - Apply *Serifel* in sufficient water to ensure thorough coverage for optimum disease control. Maintain agitation of the product during the application process. The product mixture should be applied shortly after mixing. DO NOT store mixed suspensions of *Serifel* overnight.

## How it Works:

*Serifel* is an agricultural biological fungicide product formulated as a wettable powder for the suppression or partial suppression of various fungal diseases.

## Tank Mixes:

None registered.

## Restrictions:

- **Rainfall:** Avoid application when heavy rain is forecast. If heavy rainfall or irrigation occurs shortly after application, reapplication of *Serifel* may be necessary.
- **Grazing:** There are no livestock feeding restrictions for *Serifel* treated plants and produce.
- **Pre-harvest Intervals:** 0 days for all labeled crops.
- **Re-cropping:** There are no crop rotation or plant back restrictions.
- **Re-entry:** 4 hours or until sprays have dried.
- **Storage:** To prevent contamination, store this product away from food or feed. Store in a dry area for up to 3 years from Date of Manufacture .
- **Environment:** To reduce runoff from treated areas into aquatic habitats avoid application to areas with a moderate to steep slope, compacted soil, or clay. Avoid application when heavy rain is forecast. Contamination of aquatic areas as a result of runoff may be reduced by including a vegetative strip between the treated area and the edge of the water body.

**Hazard Rating:**

None listed.

**Application Information:**

- **Water Volume:**
  - **Ground:** minimum 40 L per acre.
  - **Aerial:** 12 L per acre for aerial applications targeting fusarium head blight in cereals. Use 20 L per acre for applications targeting ergot. Review and follow the product label prior to the application.

## How it Works:

The active ingredients, metconazole and prothioconazole, are broad spectrum triazole demethylation inhibitor (DMI) fungicides with systemic activity. Refer to "Fungicide Modes of Action" in the Plant Disease Control section for more information.

## Tank Mixes:

None registered.

## Restrictions:

- **Resistance management:** Refer to "Pathogen Resistance" in the Plant Disease Control section for more information.
- **Maximum number of applications:** DO NOT exceed 1 application of this product per season.
- **Grazing:** All crops can be grazed or fed to livestock.
- **Preharvest interval:** 30 days.
- **Restricted Entry Interval:** DO NOT re-enter treated areas within 24 hours of application.
- **Re-cropping:** A plant back interval of 35 days is required for all crops not listed on the label.
- **Storage:** DO NOT ship or store near food, feed, seed and fertilizers. Store in original tightly closed container. Protect from freezing.
- **Environment:** TOXIC to aquatic organisms. Observe buffer zones specified under Directions for Use.
  - To reduce runoff from treated areas into aquatic habitats avoid application to areas with a moderate to steep slope, compacted soil, or clay.
  - Avoid application when heavy rain is forecast.
  - Contamination of aquatic areas as a result of runoff may be reduced by including a vegetative strip between the treated area and the edge of the water body.
  - This product demonstrates the properties and characteristics associated with chemicals detected in groundwater. The use of this product in areas where soils are permeable, particularly where the water table is shallow, may result in groundwater contamination.

## Hazard Rating:

Warning – Skin Irritant

Refer to the Introduction for an explanation of the symbols.

# Tanos

Fungicide Group  
11, 27

## Company:

Corteva Agriscience (PCP#27435)

## Formulation:

25% famoxadone and 25% cymoxanil formulated as a dry flowable.

- Container size – 4 x 3.4 kg

## Crops, Diseases and Timing:

**Potato** – Early blight (*Alternaria solani*) and late blight (*Phytophthora infestans*). Make the first application following one or two applications of a preventative broad spectrum fungicide such as chlorothalonil or mancozeb. A minimum 12 day application interval must pass between the first and second application of *Tanos*. A minimum 24 day application interval must pass between the second and third application of *Tanos*. Fungicides other than *Tanos* may be used as necessary to protect the crop during these intervals.

## Rates:

225 to 340 grams per acre.

## Application Information:

- **Water Volume:**
  - **Ground:** Use sufficient water to obtain thorough coverage. With a conventional sprayer use no less than 100 to 120 L per acre. With an air-assisted sprayer use no less than 44 L per acre.
  - **Aerial:** minimum 20 L per acre.

## How it Works:

The active ingredient cymoxanil is a cyanoacetamide-oxime fungicide with locally systemic activity. The active ingredient famoxadone is a strobilurin fungicide with broad spectrum activity. To be used as a preventative, curative and inhibitive (against sporulation) fungicide application. Refer to "Fungicide Modes of Action" in the Plant Disease Control section for more information.

## Tank Mixes:

None registered.

Tank mix solutions containing boron may affect product solubility. When using boron containing solutions, add the correct amount of *Tanos* first and boron containing solution last. According to the Pest Management Regulatory Agency of Health Canada's Guidance Document on Tank Mix Labelling (March 2023), unlabelled tank mixes of this product are permitted only if the label of this product and the label of the product it might be mixed with include at least general wording on their respective labels indicating they may be mixed with other pesticides. When tank mixes are permitted, apply mixes according to the most restrictive use limitations for either product.

## Restrictions:

- **Resistance management:** Refer to "Pathogen Resistance" in the Plant Disease Control section for more information.
- **Maximum number of applications:** DO NOT exceed 3 applications of this product per season.
- **Grazing:** No restrictions listed.
- **Preharvest interval:** 14 days
- **Restricted Entry Interval:** DO NOT re-enter treated areas within 24 hours of application.
- **Re-cropping:** Crops that are on the product label may be planted back at any time. A 30-day plantback interval is required for cereal grains. All other crops may be planted following a 1 year interval.
- **Storage:** Store product closed in original container only. Protect against humid air and water. Avoid contact with food, drink and livestock feed material.
- **Environment:** Toxic to fish and aquatic organisms. Observe prescribed buffer zones. Toxic to birds, mammals and harmful to beneficial arthropods. Minimize off-target drift to reduce the effects on wildlife at the field boundary. DO NOT apply to areas prone to run-off.

## Hazard Rating:

Warning Poison – Eye Irritant

Refer to the Introduction for an explanation of the symbols.

| Soybean  | Control of frog-eye leaf spot ( <i>Cercospora sojina</i> )<br>Suppression of powdery mildew ( <i>Microsphaera diffusa</i> )                                                                                                                                                                                                                                           | Not registered                              | Not registered        | 152 mL to 202 mL                                                                                                  | 150 mL to 200 mL                                                                                                   | Apply when first symptoms of disease can be found or risk of infection is imminent.<br>Use the higher rate when disease pressure is severe.                                                                               |

\**Palliser*, *Hornet 432 F* and *Orius 430 SC* are recommended to be used with a registered non-ionic surfactant, such as *Agral 90* or *AgSurf*, at 1.25 L per 1000 L of spray solution.

## Application Information:

- **Water Volume:**
  - **Ground:** minimum 40 L per acre. Ensure thorough coverage of all wheat heads. Avoid excessive water volumes (maximum 80 L per acre) at flowering time because this can increase the risk of infection.
  - **Aerial:** minimum 19 L per acre (20 L per acre for *Orius 430 SC*).

## How it Works:

The active ingredient tebuconazole is a triazole demethylation inhibitor (DMI) fungicide with systemic broad-spectrum activity. Refer to "Fungicide Modes of Action" in the Plant Disease Control section for more information.

## Tank Mixes:

**VIKING Tebuconazole Fungicide:** no registered tank mixes.

**Herbicides:** In spring wheat only, *Palliser* or *Hornet 432 F* may be tank-mixed with *Buctril M* for leaf diseases and respective weeds controlled (consult labels).

**Insecticides:** None registered.

**Fungicides:** None registered.

According to the Pest Management Regulatory Agency of Health Canada's Guidance Document on Tank Mix Labelling (March 2023), unlabelled tank mixes of this product are permitted only if the label of this product and the label of the product it might be mixed with include at least general wording on their respective labels indicating they may be mixed with other pesticides. When tank mixes are permitted, apply mixes according to the most restrictive use limitations for either product.

## Restrictions:

- **Resistance management:** Refer to "Pathogen Resistance" in the Plant Disease Control section for more information.
- **Maximum number of applications:** DO NOT exceed one application of this product per season.
- **Grazing:** DO NOT allow livestock to graze or feed green forage to livestock prior to 6 days after treatment. Straw cut after harvest may be fed or used for bedding.
- **Preharvest interval:**
  - *Soybean* – 20 days
  - *Barley, oat and wheat* – 36 days; (for *Advantage Tebuconazole 250 EW* and *Tebbie* only – 20 days)
- **Restricted Entry Interval:** DO NOT re-enter treated areas within 12 hours of application.
- **Re-cropping:** Treated areas may be replanted immediately following harvest with any crop listed on the respective label. For crops not listed on these labels, DO NOT replant treated areas for 120 days after last application.
- **Storage:** Store in a cool, dry place and prevent cross contamination with other pesticides, fertilizers, food and feed.
- **Environment:** Any products containing tebuconazole should not be used in areas treated with this product during the previous season (use only in alternate years). This product is toxic to birds, small wild animals, aquatic organisms, and non-target plants.
  - DO NOT apply directly to water, or to areas where surface water is present. Maintain a buffer zone of 30 m near aquatic areas.
  - DO NOT contaminate irrigation or drinking water supplies or aquatic habitats by cleaning of equipment or disposal of wastes.

## Hazard Rating:

Danger – Skin Irritant

Caution – Eye Irritant

Refer to the Introduction for an explanation of the symbols.

# TiLMOR 240 EC

Fungicide Group  
3

## Company:

Bayer (PCP#33825)

## Formulation:

80 g/L of prothioconazole and 160 g/L of tebuconazole formulated as an emulsifiable concentrate.

- Container size – 10.12 L

## Crops, Diseases, Rates and Timing:

| Crop                                  | Diseases Suppressed                                                                                                                                                                                                                                                                                                                                               | Application Rate (per acre) | Application Timing                                                                                                                                                                   |
|---------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Wheat (spring, winter, durum)         | Control of leaf rust ( <i>Puccinia recondita</i> ), stem rust ( <i>P. graminis</i> ), stripe rust ( <i>P. striiformis</i> ), leaf and glume blotch ( <i>Zymoseptoria</i> syn. <i>Septoria tritici</i> , <i>Parastagonospora</i> syn. <i>Stagonospora nodorum</i> ), tan spot ( <i>Pyrenophora tritici-repentis</i> ), powdery mildew ( <i>Erysiphe graminis</i> ) | 253 mL/acre                 | Apply to leaf foliage at the first sign or very early stage of disease, especially if weather conditions are conducive to disease development, up to the end of the flowering stage. |
| Wheat (spring, winter, durum), cont'd | Suppression of fusarium head blight ( <i>Gibberella zeae</i> / <i>Fusarium graminearum</i> )                                                                                                                                                                                                                                                                      | 253 mL/acre                 | Apply within the time period from when at least 75% of the wheat heads on the main stem are fully emerged to when 50% of the heads on the main stem are in flower.                   |
| Barley                                | Net blotch ( <i>Pyrenophora teres</i> ), spot blotch ( <i>Cochliobolus sativus</i> ), scald ( <i>Rhynchosporium secalis</i> ), leaf blotch ( <i>Septoria passerinii</i> ), leaf rust ( <i>Puccinia hordei</i> ), stem rust ( <i>P. graminis</i> ) and stripe rust ( <i>P. striiformis</i> ), powdery mildew ( <i>Erysiphe graminis</i> )                          |                             | Apply at the very early stages of disease development.                                                                                                                               |
| Oats                                  | Crown rust ( <i>Puccinia coronata</i> ), stem rust ( <i>Puccinia graminis</i> ), stagonospora ( <i>septoria</i> ), leaf blotch and black stem ( <i>Phaeosphaeria</i> [syn. <i>Leptosphaeria</i> ], <i>avenaria</i> , f. sp. <i>avenaria</i> , asexual state <i>Stagonospora avenae</i> syn. <i>Septoria avenae</i> )                                              |                             |                                                                                                                                                                                      |

## Application Information:

- **Water Volume:**
  - **Ground:** minimum 40 L per acre.
  - **Aerial:** minimum 20 L per acre.

## How it Works:

The active ingredient tebuconazole is a triazole demethylation inhibitor (DMI) fungicide with systemic broad-spectrum activity. The active ingredient prothioconazole is a triazole fungicide with broad-spectrum systemic activity. Refer to "Fungicide Modes of Action" in the Plant Disease Control section for more information.

## Tank Mixes:

None registered.

## Restrictions:

- **Resistance management:** Refer to "Pathogen Resistance" in the Plant Disease Control section for more information.
- **Maximum number of applications:** DO NOT exceed 1 application of this product per season. *Prosaro XTR Fungicide* may be applied sequentially after an application of *TiLMOR 240 EC Fungicide*. Please refer to respective product labels for specific use directions, pertinent recommendations, restrictions and precautions.
- **Preharvest interval:**
  - *Wheat, barley and oats* – 36 days
- **Restricted Entry Interval:** DO NOT re-enter treated areas within 12 hours of application.
- **Re-cropping:** Treated areas may be replanted with any crop listed on the label as well as soybean as soon as practical after the last application. For all other crops, do not plant back within 120 days of last application.
- **Storage:** DO NOT store at temperatures below freezing. Keep in original tightly closed container and store away from feeds, seeds, fertilizer, plants and food stuffs. Keep away from sources of heat. Shake well before using if stored for more than 1 year.

- **Environment:** Toxic to birds, small wild animals, aquatic organisms and non-target terrestrial plants. Observe buffer zones specified under Spray Buffer Zones.
- **Rainfast:** 1 hour

## Hazard Rating:

Danger – Eye and Skin Irritant  
Potential Skin Sensitizer

Refer to the Introduction for an explanation of the symbols.

# Trivapro

*Trivapro is a co-pack of Trivapro A and Trivapro B. At the rates of application for Trivapro, not all diseases listed in the labels of the individual component (Trivapro A and Trivapro B) will be controlled. Please refer to the table below.*

**Fungicide Group**  
**3, 7, 11**

## Company:

Syngenta Canada (Trivapro A – PCP#32184, Trivapro B – PCP#32185)

## Formulations:

*Trivapro A:* 75 g/L azoxystrobin and 125 g/L propiconazole formulated as a suspension.

- Container sizes – 2 x 8.1 L (case), 320 L (bulk)

*Trivapro B:* 100 g/L benzovindiflupyr formulated as an emulsifiable concentrate.

- Container sizes – 2 x 2.43 L (case), 4 x 2 x 12 L (bulk)

## Crops, Diseases, Rates and Timing:

| Crop                                           | Diseases                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | Application Rate                                                                                                                 | Application Timing                                                                                                                                |

## Application Information:

- **Water Volume:**
  - **Ground:** minimum 76 L per acre.
  - **Aerial:** minimum 17.5 L per acre.
- DO NOT apply during periods of dead calm.

## How it Works:

The active ingredient azoxystrobin is a methoxyacrylate compound (strobilurin) with broad spectrum contact and systemic activity. The active ingredient propiconazole is a triazole fungicide with broad spectrum systemic activity. The active ingredient benzovindiflupyr is a succinate dehydrogenase inhibitor (SDHI) fungicide with broad spectrum activity. Refer to “Fungicide Modes of Action” in the Plant Disease Control section for more information.

## Restrictions:

- **Resistance management:** Refer to "Pathogen Resistance" in the Plant Disease Control section for more information.
- **Maximum number of applications:** DO NOT exceed 2 application per season and DO NOT exceed for than one application per season in forage and hay cereal crops.
  - Azoxystrobin is persistent and will carryover. It is recommended that this product not be used in areas treated with azoxystrobin during the previous season.
  - Benzovindiflupyr is persistent and may carryover. It is recommended that any products containing benzovindiflupyr not be used in areas treated with this product during the previous season.
- **Grazing:** DO NOT graze treated fields or feed treated forage to livestock.
- **Preharvest interval:**
  - **Corn** – 14 days for grain and sweet corn, and 30 days for forage
  - **Cereals** – 45 days for grain and straw, 30 days for forage and hay
  - **Soybean** – 30 days, 15 days for edible podded legume vegetables (Crop subgroup 6A), and 14 days for soybean hay
- **Restricted Entry Interval:** DO NOT re-enter treated area within 12 hours after application.
- **Re-cropping:** Azoxystrobin is persistent and can carryover. Oat and rye should not be planted within 40 days of application. All other crops intended for food and feed should not be planted within 105 days of application of *Trivapro*.
- **Storage:** DO NOT freeze.
- **Environment:** This product is toxic to fish and aquatic organisms. Observe buffer zones outlined in the label.

## Hazard Rating:

Poison

Warning – Eye and Skin Irritant

Danger – Corrosive to Eyes and Skin

Refer to the Introduction for an explanation of the symbols.

# Twinline

Fungicide Group  
3, 11

## Company:

BASF Canada (PCP#30337)

## Formulation:

130 g/L pyraclostrobin and 80 g/L metconazole formulated as a liquid.

- Container sizes – case (2 x 8.1L), 64 L drum, 128 L shuttle, or 400 L tote

## Crops, Diseases, Rates and Timing:

| Crop                                               | Diseases                                                                                                                                                                                                                                                                                                                                           | Application Rate<br>(per acre) | Application Timing                                                                                                                                                                                          |

| Oat                                                | Control of crown rust ( <i>Puccinia coronata</i> )                                                                                                                                                                                                                                                                                                 |                                |                                                                                                                                                                                                             |
| Rye                                                | Control of leaf rust ( <i>Puccinia recondita</i> ), powdery mildew ( <i>Erysiphe graminis</i> )                                                                                                                                                                                                                                                    |                                |                                                                                                                                                                                                             |
| Barley, rye,<br>wheat (all<br>types),<br>triticale | Suppression of fusarium head blight ( <i>Fusarium graminearum</i> ) and control of all leaf diseases controlled by lower application rates.                                                                                                                                                                                                        | 456 mL                         | When weather is warm and wet at head emergence and flowering. For wheat and rye apply at 20% flowering, for barley apply between full head emergence to up to 3 days after full emergence of the main stem. |

## Application Information:

- **Water Volume:**
  - **Ground:** minimum of 40 L per acre.
  - **Aerial:** minimum of 20 L per acre.

## How it Works:

The active ingredient metconazole is a broad spectrum triazole demethylation inhibitor (DMI) fungicide with systemic activity. The active ingredient pyraclostrobin is a strobilurin fungicide with broad spectrum contact and systemic activity. Best utilized as a preventative application when environmental conditions are favourable for disease development. Refer to "Fungicide Modes of Action" in the Plant Disease Control section for more information.

## Tank Mixes:

None registered.

## Restrictions:

- **Resistance management:** Refer to "Pathogen Resistance" in the Plant Disease Control section for more information.
- **Maximum number of applications:** DO NOT exceed 2 applications of this product per season.
- **Grazing:** No restrictions listed.
- **Preharvest interval:** Apply no later than end of flowering.
- **Restricted Entry Interval:** DO NOT re-enter treated areas within 6 days.
- **Re-cropping:** A plant back interval of 35 days is required for all crops not listed on the label.
- **Storage:** Store in original tightly closed container. Protect from freezing.
- **Environment:** Avoid run-off from treated areas into aquatic areas. Toxic to aquatic organisms, non-target terrestrial plants and small wild animals.
  - For ground application, buffer zones must be 1 m for protection of terrestrial habitats and aquatic habitats greater than 1 m deep and buffer zones must be 5 m from aquatic habitats less than 1 m deep.
  - For aerial application, buffer zones must be 10 m for protection of terrestrial habitats and aquatic habitats greater than 1 m deep and buffer zones must be 250 m from aquatic habitats less than 1 m deep.

## Hazard Rating:

Danger – Poison  
Eye and Skin Irritant

Refer to the Introduction for an explanation of the symbols.

| Crop   | Diseases                                                                                                                                                                                                                                                               | Application Rate (per acre) | Application Timing                                                                                                                                                                                                          |
|--------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Potato | Control of early blight ( <i>Alternaria solani</i> ), black dot ( <i>Colletotrichum coccodes</i> )<br>Suppression of brown spot ( <i>Alternaria alternata</i> )                                                                                                        | 202 mL                      | Begin applications prior to row closure or when conditions are favourable for disease development. Apply an additional application at an interval of 7 to 14 days if disease persists or weather conditions are favourable. |
| Corn   | Control of common rust ( <i>Puccinia sorghi</i> ), eyespot ( <i>Kabatiella zeae/Aureoasidium</i> ), gray leaf spot ( <i>Cercospora zeae-maydis</i> ), northern leaf blight ( <i>Exserohilum turcicum/Setosphaeria turcica</i> ) Tar spot ( <i>Phyllachora maydis</i> ) | 202 mL                      | Begin applications prior to disease development. Apply a second time 10 to 14 days later if disease persists.                                                                                                               |

| Crop    | Diseases                                                                                                                                                                                       | Application Rate (per acre) | Application Timing                                                                                                                               |
|---------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------|
| Soybean | Control of cercospora blight and purple seed stain ( <i>Cercospora kikuchii</i> ), septoria brown spot ( <i>Septoria glycines</i> )                                                            | 152 to 202 mL               | Apply prior to disease development when conditions are favourable. If disease persists, a second application can be applied 10 to 14 days later. |
|         | Control of frog-eye leaf spot ( <i>Cercospora sojina</i> ), pod and stem blight ( <i>Diaporthe phaseolorum</i> var. <i>sojae</i> /Phomopsis longicolla) Tar spot ( <i>Phyllachora maydis</i> ) | 202 mL                      |                                                                                                                                                  |

### Application Information:

- **Water Volume:**
  - **Ground:** minimum of 40 L per acre.
  - **Aerial:** 8 L/acre for aerial applications targeting foliar diseases. Use 20 L/acre for applications targeting Gibberella ear rots on corn. Follow the instructions on the label.

### How it Works:

The active ingredient, mefentrifluconazole, is a broad spectrum triazole demethylation inhibitor (DMI) fungicide with systemic activity. The active ingredient pyraclostrobin is a strobilurin fungicide with broad spectrum contact and systemic activity. Refer to "Fungicide Modes of Action" in the Plant Disease Control section for more information.

### Tank Mixes:

None registered.

### Restrictions:

- **Resistance management:** Refer to "Pathogen Resistance" in the Plant Disease Control section for more information.
- **Maximum number of applications:** DO NOT exceed 1 L per acre of this product per season.
- **Grazing:** No restrictions listed.
- **Preharvest interval:**
  - **Potato** – 7 days
  - **Corn, soybean** – 21 days
- **Restricted Entry Interval:** DO NOT re-enter treated areas for 12 hours.
- **Re-cropping:** A plant back interval of 35 days is required for all crops not listed on the label.
- **Storage:** Store in original container. To prevent contamination, store away from food or feed.
- **Environment:** Oral LD50 (rats) = >500 to 2000 mg/kg. Dermal LD50 (rats) = >5000 mg/kg.
  - Toxic to aquatic organisms, non-target terrestrial plants, and small wild mammals. Observe spray buffer zones specified under Directions for Use.
  - The use of this chemical may result in contamination of groundwater particularly in areas where soils are permeable (e.g. sandy soil) and/or the depth to the water table is shallow. To reduce runoff from treated areas into aquatic habitats avoid application to areas with a moderate to steep slope, compacted soil, or clay.
  - Avoid application when heavy rain is forecast.
  - Contamination of aquatic areas as a result of runoff may be reduced by including a vegetative strip between the treated area and the edge of the water body.

### Hazard Rating:

Caution Poison – Skin Irritant

Refer to the Introduction for an explanation of the symbols.

# Velum Prime

Fungicide Group  
7

## Company:

Bayer (PCP#32108)

## Formulation:

500 g/L of Fluopyram formulated as a suspension concentrate.

- Container size – 2 x 4.04 L

## Crops, Diseases, Rates and Timing:

| Crop   | Diseases                                                                                            | Application Rate*<br>(per acre)                                | Application Timing                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|--------|-----------------------------------------------------------------------------------------------------|----------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Potato | Early blight<br>( <i>Alternaria solani</i> )<br>and black dot<br>( <i>Colletotrichum coccodes</i> ) | 202 mL [4.5<br>mL/100m row<br>(based on 90 cm<br>row spacing)] | When using fungicides for late blight control throughout the season, utilize actives that also have activity on early blight.<br>Spray specified dosage in a 10-15 cm band in-furrow at planting and cover with soil. For best results direct the in-furrow spray to the seed and soil.<br>Apply in 20-61 L of water per acre.<br>For transplanted crops:<br>Post-planting drench, or hill drench.<br>Transplant water drench with mechanical planting.<br>Transplant water drench with hand planting. |

## Application Information:

- **Water Volume:**
  - **Ground:** Soil Applications using ground equipment, minimum of 20 L per acre.

## How it Works:

The active ingredient fluopyram is a carboxamide fungicide with systemic activity. Refer to "Fungicide Modes of Action" in the Plant Disease Control section for more information.

## Tank Mixes:

None registered.

## Restrictions:

- **Resistance management:** Refer to "Pathogen Resistance" in the Plant Disease Control section for more information.
- **Maximum number of applications:** DO NOT apply more than 202 g fluopyram per acre per year, regardless of formulation or method of application (soil or foliar). To limit the potential for development of disease resistance to this fungicide class do not make more than 2 sequential applications of *Velum Prime* or any other Group 7 containing fungicide.
- **Grazing:** DO NOT allow livestock to graze treated area for 7 days after application.
- **Preharvest interval:** 7 days (all crops on label).
- **Restricted Entry Interval:** DO NOT re-enter treated areas within 12 hours of application.
- **Re-cropping:** DO NOT replant to alfalfa for 14 days after application. All other crops may be replanted immediately following the last application of *Velum Prime*.
- **Storage:** Store this product away from food or feed. DO NOT store below freezing. If stored for 1 year or longer, shake well before using.
- **Environment:** Toxic to aquatic organisms and non-target terrestrial plants. Observe buffer zones specified under directions for use. Toxic to birds.

## Hazard Rating:

None listed.

# Velum Rise

Fungicide Group

7

## Company:

Bayer (PCP#34871)

## Formulation:

250 g/L Fluopyram and 106 g/L Penflufen formulated as Suspension Concentrate.

- Container size – 8.1 L jug (one jug treats 20 acres)

## Crops, Diseases, Rates and Timing:

| Crop   | Disease / Pest                                                                                                                       | Rate                                                      | Application Timing                                                        |
|--------|--------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------|---------------------------------------------------------------------------|
| Potato | Control of soil-borne black scurf, control of stem and stolon canker caused by <i>Rhizoctonia solani</i>                             | 400 mL/ac or 9mL/100 m of row (based on 90cm row spacing) | Apply as an in-furrow spray at planting following the label instructions. |
|        | Suppression of early blight, black dot, white mold ( <i>Sclerotinia sclerotiorum</i> ), root lesion and other pathogenic nematodes * |                                                           |                                                                           |

\* Black dot (*Colletotrichum coccodes*) and plant pathogenic nematodes are some of the causal agents of the potato early dying (PED disease) complex.

## Application Information:

- **Water Volume:**
  - **Ground:** Apply using minimum water volume of 16 to 60 L/acre. as an in-furrow spray at time of seeding. For best results, mount the spray nozzle to direct the spray as a 15-20 cm band onto the seed pieces in the furrow just before the seed is covered. Best control of soil-borne and seed-borne *Rhizoctonia solani* is obtained if the in-furrow treatment with *Velum Rise* is preceded by a seed piece treatment with *Emesto Silver* at registered rates.
  - **Do not apply by air.**

## How it Works:

The active ingredient fluopyram is a carboxamide fungicide with systemic activity. Refer to "Fungicide Modes of Action" in the Plant Disease Control section for more information. Penflufen is a loco-systemic carboxamide fungicide which inhibits mitochondrial respiration by inhibiting succinate dehydrogenase (SDHI), an enzyme in the electron transport system.

## Tank Mixes:

This product may be tank mixed with a fertilizer, a supplement, or with registered pest control products, whose labels also allow tank mixing, provided the entirety of both labels, including Directions For Use, Precautions, Restrictions, Environmental Precautions, and Spray Buffer Zones are followed for each product. In cases where these requirements differ between the tank mix partner labels, the most restrictive label must be followed.

## Restrictions:

- **Maximum number of applications:** To limit the potential for development of disease resistance to this fungicide class do not make more than 2 sequential applications of any Group 7 containing fungicide before rotating with a fungicide from a different Group registered for the same use. When *Velum Rise* is applied as a soil application use another mode of action for the first foliar fungicide application.
- **Fluopyram:** Do not apply more than 500 g/ha (202 g/ac.) fluopyram per year, regardless of formulation or method of application (soil or foliar).
- **Penflufen:** Do not apply more than 160 g/ha (65 g/ac.) penflufen per year, regardless of formulation or method of application (seed-piece treatment or in-furrow).
- **Re-entry:** 12 hours after application.
- **Pre-harvest Intervals:** Not Applicable
- **Grazing:** Do not allow livestock to graze treated area for 7 days after application.
- **Re-cropping interval:** Do not replant to alfalfa for 14 days after application. Potatoes and other tuberous and corm vegetables, sugarbeets, crops of crop groups 3-07 (bulb vegetables), 6 (legume vegetables, succulent or dried), 15 (cereal grains) and 20 (oilseeds) may be rotated anytime following the last application of *Velum Rise*. All other crops may be replanted 30 days following the last application of *Velum Rise*.

- **Storage:** Store this product away from food or feed. Do not store below freezing. If stored for 1 year or longer, shake well before using. Do not use or store in or around the home. Keep the product in the original container during storage.
- **Environment:** Toxic to aquatic organisms and non-target terrestrial plants. Toxic to birds. Observe buffer zones and other precautions specified under directions for use on the product label.

## Hazard Rating:

Caution, Poison

# Viatude

Fungicide Group  
3, 11

## Company:

Corteva Agriscience (PCP#34672)

## Formulation:

187.5 g/L of picoxystrobin and 62.5 g/L of prothioconazole formulated as suspension concentrate.

- Container size – 2 x 8.91 L case, 95.04 L drum

## Crops, Diseases, Rates and Timing:

| Crop    | Disease                                                                                                                                                                       | Application Rate (per acre) | Application Timing                                                                                                                                                                                         |
|---------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Canola  | Control of sclerotinia stem rot (white mould) ( <i>Sclerotinia sclerotiorum</i> )                                                                                             | 295 – 340 mL                | Begin applications before or at onset of infection to control sclerotinia. Use the higher rate when disease pressure is high. Make 2 applications per season, 14 days apart when disease pressure is high. |
| Soybean | Suppression of sclerotinia rot (white mould) ( <i>Sclerotinia sclerotiorum</i> ), brown spot ( <i>Septoria glycines</i> ), and frogeye leafspot ( <i>Cercospora sojina</i> ). | 295 – 340 mL                | Begin applications prior to or at onset of disease development. Use higher rate when disease pressure is high. Make 2 applications per season, 14 days apart under high disease pressure                   |

## Application Information:

- **Water Volume:**
  - **Ground:** Apply using a minimum water volume of 61 L/ac.
  - **Air:** Apply using a minimum water volume of 20 L/ac.

## How it Works:

The active ingredient picoxystrobin is a broad spectrum strobilurin fungicide and is to be used as a preventative application when environmental conditions are favorable for disease development. Picoxystrobin has preventative and locally systemic activity. Prothioconazole is a triazole fungicide with broad spectrum activity. Refer to "Fungicide Modes of Action" in the Plant Disease Control section for more information.

## Tank Mixes:

None registered. According to the Pest Management Regulatory Agency of Health Canada's Guidance Document on Tank Mix Labelling (March 2023), unlabelled tank mixes of this product are permitted only if the label of this product and the label of the product it might be mixed with include at least general wording on their respective labels indicating they may be mixed with other pesticides. When tank mixes are permitted, apply mixes according to the most restrictive use limitations for either product.

## Restrictions:

- **Maximum number of applications:** Canola and Soybean – maximum 2 applications of *Viatude* per season.
- **Rainfall:** Avoid application when heavy rain is forecast.
- **Pre-harvest Intervals:** Canola – 36 days, Soybean – 20 days.
- **Re-entry:** Do not re-enter treated areas within 24 hours of application.
- **Re-cropping interval:** Treated areas may be replanted immediately after harvest with any crop appearing on the label. All other crops not on the label may be planted 30 days following the last application of *Viatude*.
- **Storage:** Store product in original container away from food or feed. Do not freeze, use an appropriately heated storage.

- **Environment:** Toxic to earthworms. Toxic to certain beneficial insects. Minimize spray drift to reduce harmful effects on beneficial insects in habitats next to the application site such as hedgerows and woodland. Toxic to aquatic organisms. Observe spray buffer zones specified on the label under *Spray Buffer Zones*. To reduce runoff from treated areas into aquatic habitats avoid application to areas with a moderate to steep slope, compacted soil, or clay. Avoid application when heavy rain is forecast. Contamination of aquatic areas as a result of runoff may be reduced by including a vegetative filter strip between the treated area and the edge of the water body. DO NOT use to control aquatic pests. DO NOT contaminate irrigation or drinking water supplies or aquatic habitats by cleaning of equipment or disposal of wastes.

### Hazard Rating:

Potential Skin Sensitizer.

# Zampro

Fungicide Group  
40, 45

### Company:

BASF Canada (PCP#30321)

### Formulation:

225 g/L dimethomorph and 300 g/L ametoctradin formulated as a suspension concentrate.

- Container size – 4 x 4.14 L

### Crops, Diseases, Rates and Timing:

| Crop   | Diseases Controlled                               | Application Rate (per acre) | Application Timing                                                                                                                                                                                                                                                      |
|--------|---------------------------------------------------|-----------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Potato | Late blight<br>( <i>Phytophthora infestans</i> )  | 320 to 400 mL               | Begin applications prior to disease development and continue on a 5 to 10 day interval. Use the higher rate and shorter interval when disease pressure is high. The addition of a spreading/penetrating adjuvant is recommended to improve disease control performance. |
|        | Tuber blight<br>( <i>Phytophthora infestans</i> ) | 400 mL                      | When used in accordance to label recommendations, <i>Zampro</i> also reduces tuber blight when applied immediately prior to or after vine kill.                                                                                                                         |

### Application Information:

- **Water Volume:**
  - **Ground:** minimum 80 L per acre.
  - **Aerial:** minimum 20 L per acre.

### How it Works:

The active ingredient dimethomorph is a carboxylic acid amide fungicide with contact, systemic and antispore activity. The active ingredient ametoctradin is a quinone x inhibitor fungicide with contact and antispore activity. Refer to "Fungicide Modes of Action" in the Plant Disease Control section for more information.

### Tank Mixes:

None registered.

### Restrictions:

- **Resistance management:** Refer to "Pathogen Resistance" in the Plant Disease Control section for more information.
- **Maximum number of applications:** DO NOT exceed 3 applications of this product per season.
- **Grazing:** No restrictions listed.
- **Preharvest Interval:** 4 days
- **Restricted Entry Interval:** DO NOT re-enter treated areas within 12 hours of application.
- **Re-cropping:** A plant back interval of 30 days is required for all crops not listed on the label.
- **Storage:** Store in original tightly closed container. Protect from freezing.
- **Environmental Hazards:** Avoid run-off from treated areas into aquatic areas. DO NOT contaminate irrigation or drinking water supplies or aquatic habitats by cleaning of equipment or disposal of wastes.
- **Toxicity:** Toxic to aquatic organisms.

- Container size: 2 x 9.72 L case, 103.69 L drums

**Crops, Diseases, Rates and Timing:**

| Crop       | Disease                                                                                                                                                                                                                                                                      | Rate per acre | Crop stage and other timing information                                                                                                                                                                                                                                                                                                                                                                                                                             |
|------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Lentil     | Control of Anthracnose ( <i>Colletotrichum truncatum</i> ), Ascochyta blight ( <i>Ascochyta fabae</i> f. sp. <i>lentis</i> ), Botrytis Grey mould ( <i>Botrytis cinerea</i> ), Suppression of white mould ( <i>Sclerotinia sclerotiorum</i> )                                | 324 to 405 mL | The first application must be applied before disease is established and no later than the onset of flowering, whichever comes first. A second application with an alternate fungicide can be made 10-14 days after the first application, when disease pressure is severe or when agronomic or weather conditions are conducive to disease development or movement. Within the rate range, use the higher rate under conditions conducive to high disease pressure. |
| Chickpeas  | Control of ascochyta blight ( <i>Ascochyta rabiei</i> ), botrytis grey mould ( <i>Botrytis cinerea</i> )                                                                                                                                                                     | 324 to 405 mL | The first application must be applied before disease is established and no later than the onset of flowering, whichever comes first. A second application with an alternate fungicide can be made 10-14 days after the first application, when disease pressure is severe or when agronomic or weather conditions are conducive to disease development or movement. Within the rate range, use the higher rate under conditions conducive to high disease pressure. |
|            | Suppression of White mould ( <i>Sclerotinia sclerotiorum</i> )                                                                                                                                                                                                               | 324 to 405 mL |                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Field Peas | Control of Anthracnose ( <i>Colletotrichum truncatum</i> ), Ascochyta/Mycosphaerella blight ( <i>Mycosphaerella pinodes</i> , <i>Ascochyta pisi</i> and <i>Phoma medicaginis</i> ), Powdery mildew ( <i>Erysiphe pisi</i> ), Botrytis Grey mould ( <i>Botrytis cinerea</i> ) | 324 to 405 mL | The first application must be applied before disease is established and no later than the onset of flowering, whichever comes first. A second application with an alternate fungicide can be made 10-14 days after the first application, when disease pressure is severe or when agronomic or weather conditions are conducive to disease development or movement. Within the rate range, use the higher rate under conditions conducive to high disease pressure. |
|            | Suppression of white mould ( <i>Sclerotinia sclerotiorum</i> )                                                                                                                                                                                                               | 324 to 405 mL |                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Faba Beans | Control of Chocolate spot ( <i>Botrytis cinerea</i> )                                                                                                                                                                                                                        | 324 to 405 mL | Apply at first sign of disease or at the beginning of flowering (whichever occurs first). Within the rate range, use the higher rate under conditions conducive to high disease pressure.                                                                                                                                                                                                                                                                           |
|            | Suppression of white mould ( <i>Sclerotinia sclerotiorum</i> )                                                                                                                                                                                                               | 324 to 405 mL |                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Canola     | Control of Blackleg ( <i>Leptosphaeria maculans</i> ), Alternaria leaf spot or black spot ( <i>Alternaria brassicae</i> )                                                                                                                                                    | 324 to 405 mL | For control of blackleg, apply preventatively at the 2 to 6-leaf (rosette) stage. Within the rate range, use the higher rate under conditions conducive to high disease pressure.                                                                                                                                                                                                                                                                                   |
|            | Suppression of Sclerotinia stem rot ( <i>Sclerotinia sclerotiorum</i> )                                                                                                                                                                                                      | 324 to 405 mL | Apply prior to the onset of disease, typically around the 20 - 50% bloom stage.                                                                                                                                                                                                                                                                                                                                                                                     |

| Crop                          | Disease                                                                                                                                                                                                                                                            | Rate per acre | Crop stage and other timing information                                                                                                                                                                                                                                                                                                                                                                  |
|-------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Wheat (spring, durum, winter) | Control of stripe rust or yellow rust ( <i>Puccinia striiformis</i> )<br>Brown rust/ Leaf rust ( <i>Puccinia triticina</i> )<br>Septoria leaf spot ( <i>Septoria tritici</i> or <i>Leptosphaeria nodorum</i> )<br>Tan spot ( <i>Pyrenophora tritici-repentis</i> ) | 243 to 405 mL | At the first sign of disease, usually at the beginning of stem elongation (BBCH 29) or when conditions are favourable for disease development. To maximize yield it is important to protect the flag leaf from disease. Therefore, the optimum time to apply a single application of Zetigo PRM Fungicide is immediately after flag leaf emergence (BBCH 37-39). Do not apply after flowering (BBCH 59). |
| Barley                        | Control of net blotch ( <i>Pyrenophora teres</i> )                                                                                                                                                                                                                 | 295 to 405 mL | At the first sign of disease, usually at the beginning of stem elongation (BBCH 29) or when conditions are favourable for disease development. To maximize yield it is important to protect the flag leaf from disease. Therefore, the optimum time to apply a single application of Zetigo PRM Fungicide is immediately after flag leaf emergence (BBCH 37-39). Do not apply after flowering (BBCH 59). |
|                               | Control of Scald ( <i>Rhynchosporium commune</i> )                                                                                                                                                                                                                 | 267 to 405 mL |                                                                                                                                                                                                                                                                                                                                                                                                          |

## Application information

- **Water Volume:**
  - **Ground:** 61L/ac minimum for lentils, field peas, chickpeas, and faba beans. 40L/ac minimum for canola, wheat, and barley.
  - **Air:** 20L/ac for cereals ONLY (wheat, and barley). Do not apply *Zetigo PRM* to lentils, field peas, chickpeas, faba beans, or canola by air.

## How it Works

*Zetigo PRM* Fungicide is for use in pulses (lentils, field peas, chickpeas, faba bean), canola, wheat and barley. *Zetigo PRM* Fungicide is quickly absorbed into plant tissue and is locally systemic with translaminar movement. *Zetigo PRM* Fungicide should be included in a protective spray program and used in a rotation program with other fungicides. The active ingredient florylpicoxamid is a picolinamide fungicide with broad spectrum locally systemic activity. The active ingredient pyraclostrobin is a strobilurin fungicide with broad spectrum contact and systemic activity. To be used preventatively when environmental conditions are favorable for disease development. For more information refer to "Fungicide Modes of Action"

## Tank Mixes:

Do not tank mix with copper-based fungicides. According to the Pest Management Regulatory Agency of Health Canada's Guidance Document on Tank Mix Labelling (March 2023), unlabelled tank mixes of this product are permitted only if the label of this product and the label of the product it might be mixed with include at least general wording on their respective labels indicating they may be mixed with other pesticides. When tank mixes are permitted, apply mixes according to the most restrictive use limitations for either product.

## Restrictions:

- **Maximum number of applications:** Maximum 1 application per season, all crops (lentils, chickpeas, field peas, faba beans, canola, wheat, and barley). Alternate the use of *Zetigo PRM* Fungicide with a fungicide of a different mode of action.
- **Re-entry:** 12 hours
- **Pre-harvest Intervals:** Lentils, chickpeas, field peas, faba beans – 30 days. Canola – 21 days. Wheat and barley – 30 days.
- **Grazing:** DO NOT cut field pea vines and hay within 7 days of application. DO NOT graze or feed treated canola forage to livestock. DO NOT permit livestock to graze field or harvest forage or cut hay within 8 days of application for wheat and 12 days of application for barley.
- **Re-cropping interval:** Crops listed on the *Zetigo PRM* Fungicide label may be planted immediately following the last application (see label). All other crops can be planted 30 days after the last application.
- **Aerial Application:** Registered for aerial applications on cereals (wheat and barley) ONLY. DO NOT apply *Zetigo PRM* to lentils, field peas, chickpeas, faba beans, or canola by air.
- **Rainfall:** Avoid application when heavy rain is forecast.
- **Storage:** Store this product away from food or feed. Store in original containers in a secure, dry heated storage. Do not allow contamination of seeds, plants, fertilizers, or other pesticides. Do not contaminate food, feedstuffs, or domestic water supplies. If containers are damaged or spill occurs, use the product immediately or contain the spill with absorbent materials and dispose of waste.

- **Environment:** Toxic to aquatic organisms. Observe spray buffer zones specified under Spray Buffer Zones. This product demonstrates the properties and characteristics associated with chemicals detected in groundwater. The use of this product in areas where soils are permeable, particularly where the water table is shallow, may result in groundwater contamination. Toxic to earthworms. Toxic to certain beneficial insects. Minimize spray drift to reduce harmful effects on beneficial insects in habitats next to the application site such as hedgerows and woodland. Toxic to aquatic organisms. Observe spray buffer zones specified on the label under Spray Buffer Zones. To reduce runoff from treated areas into aquatic habitats avoid application to areas with a moderate to steep slope, compacted soil, or clay. Avoid application when heavy rain is forecast. Contamination of aquatic areas as a result of runoff may be reduced by including a vegetative filter strip between the treated area and the edge of the water body. DO NOT use to control aquatic pests. DO NOT contaminate irrigation or drinking water supplies or aquatic habitats by cleaning of equipment or disposal of wastes.

### Hazard Rating:

None listed.

Potential Skin Sensitizer

## Zolera FX\*

Fungicide Group  
3, 11

\*NOTE: As of January 1, 2025, [www.keepitclean.ca](http://www.keepitclean.ca) indicates that the use of this product on certain crop types may have market access concerns. Please see Introduction for more information AND consult potential grain buyers before using this product.

### Company:

UPL AgroSolutions Canada (PCP#33367)

### Formulation:

200 g/L fluoxastrobin and 200 g/L tetraconazole formulated as a micro emulsion.

- Container size – 2 x 5.7 L

### Crops, Diseases, Rates and Timing:

| Crop                | Diseases                                                                                                                                                | Application Rate (per acre) | Application Timing                                                                                                                                                                                                                                                     |
|---------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Field pea           | Control of powdery mildew ( <i>Erysiphe pisi</i> ), suppression of sclerotinia white mould ( <i>Sclerotinia sclerotiorum</i> )                          | 142 to 223 mL               | For optimum results, begin applications preventatively and continue as needed on a 7 to 14 day interval. Use the highest rate and the shortest interval when conditions favour high disease pressure. For management of listed Ascochyta disease use the highest rate. |
|                     | Control of Mycosphaerella blight ( <i>Mycosphaerella pinodes</i> ), suppression of Ascochyta leaf and pod spot ( <i>Ascochyta pisi</i> )                | 223 mL                      |                                                                                                                                                                                                                                                                        |
| Lentil              | Suppression of sclerotinia white mould ( <i>Sclerotinia sclerotiorum</i> ), suppression of anthracnose (include Group 11 resistant biotypes) in lentils | 142 to 223 mL               | For optimum results, begin applications preventatively and continue as needed on a 7 to 14 day interval. Use the highest rate and the shortest interval when conditions favour high disease pressure. For management of listed Ascochyta disease use the highest rate. |
|                     | Suppression of Ascochyta leaf and pod spot ( <i>Ascochyta lentis</i> )                                                                                  | 223 mL                      |                                                                                                                                                                                                                                                                        |
| Dry bean, faba bean | Suppression of anthracnose ( <i>Colletotrichum lindemuthianum</i> ), sclerotinia white mould ( <i>Sclerotinia sclerotiorum</i> )                        | 142 to 223 mL               | For management of listed Ascochyta disease use the highest rate.                                                                                                                                                                                                       |
| Chickpea            | Suppression of sclerotinia white mould ( <i>Sclerotinia sclerotiorum</i> )                                                                              | 142 to 223 mL               |                                                                                                                                                                                                                                                                        |
| Corn                | Control of common rust ( <i>Puccinia sorghi</i> ), grey leaf spot ( <i>Cercospora maydis</i> )                                                          | 202 mL                      | Apply preventatively between V4 (4 leaf collar) and dough stage (R4).                                                                                                                                                                                                  |
|                     | Suppression of northern corn leaf blight ( <i>Setosphaeria turcica</i> , anamorph: <i>Exserohilum turcicum</i> )                                        |                             |                                                                                                                                                                                                                                                                        |

### Application Information:

- **Water Volume:**
  - **Ground:** minimum 40 L per acre.
  - **Aerial (corn only):** minimum 20 L per acre.

## How it Works:

The active ingredient fluoxastrobin is a systemic fungicide that works by interfering with respiration in plant pathogenic fungi, and is a potent inhibitor of spore germination and mycelial growth. The active ingredient, tetraconazole, is a broad spectrum triazole demethylation inhibitor (DMI) fungicide with systemic activity. Refer to "Fungicide Modes of Action" in the Plant Disease Control section for more information.

## Tank Mixes:

None registered.

## Restrictions:

- **Resistance management:** Refer to "Pathogen Resistance" in the Plant Disease Control section for more information.
- **Maximum number of applications:** DO NOT exceed 2 applications per season for pulses or 1 application per season for corn.
- **Grazing:** No restrictions listed.
- **Preharvest Interval:**
  - *Pulses* – 14 days
  - *Grain corn* – 30 days
- **Restricted Entry Interval:** DO NOT re-enter treated areas within 12 hours of application.
- **Re-cropping:** All crops on the *Zolera FX* label (cereals, pulses, canola, corn) may be planted immediately following harvest. Alfalfa and forage grasses may be planted following a 30 day plant back interval. Sunflowers may be planted following a 180 day plant back interval. For all other crops, DO NOT plant back within one year of the last field application.
- **Storage:** Store this product away from food or feed.
- **Environmental Hazards:** Toxic to aquatic organisms. Observe buffer zones as specified on the label. To reduce runoff from treated areas into aquatic habitats, avoid application to ears with a moderate to steep slope, compacted soil, or clay.

## Hazard Rating:

Potential Skin Sensitizer

Refer to the Introduction for an explanation of the symbols.

Seed Treatment Tables

\* All seed treatment tables should be used only in consultation with the product labels. In case of any conflict, instructions on the label prevail.

1. Suppression only.  
2. Winter wheat only.  
3. Control of seed-borne *Aspergillus* spp. and suppression of seed-borne *Penicillium* spp.  
4. And *Alternaria* spp.  
5. And suppression of net blotch (*Pyrrenophora teres*).  
6. Refer to label for expectations for control vs suppression.
7. Refer to the label for details.  
8. Penicillium only.  
9. Control of *Rhizoctonia solani*.  
10. Control of *Rhizoctonia solani* and common bunt (*Tilletia caries*, *T. laevis*).  
11. Control of loose smut (*Ustilago tritici*, *U. avenae*) and covered smut (*Ustilago kollerii*).

Table 2. Seed Treatment Products for Buckwheat, Grasses, Millet, Rye, Sorghum, and Triticale

1. Suppression only.

2. Pythium only.

3. Fusarium and Rhizoctonia only.

4. Product does not specify causal pathogen.

5. And Alternaria spp.

6. Penicillium only.

7. For export only.

8. Product does not specify Rhizoctonia.

9. Refer to the label for details.

10. Refer to label for expectations for control vs. suppression.

11. And seed-borne Septoria nodorum.

Table 3. Seed Treatment Products for Oilseed Crops

Refer to product pages and labels for specific information on pathogens and insects listed as well as expectations for control vs suppression.

Before using any pesticide on potatoes, consult the list of Agricultural Pesticide Approved for Use from Simplot Canada and McCain Foods (Canada)

1. Not for use on potatoes. Use for disinfecting potato storages and equipment.
2. May include storage rot, tuber rot, and/or dry rot (refer to product page/label).
3. May include *Phytophthora infestans* (late blight) and/or *Phytophthora erythroseptica* (pink rot).
4. Serenade OPTI users please refer to page 596 for more information on this product as it has been removed from the Seed Treatment section of the guide.

## Seed Treatment Product Pages

# Apron Advance

Fungicide Group  
1, 4, 12

## Company:

Syngenta (PCP#30627)

**Formulation:** Apron Advance is formulated as a suspension.

| Active ingredient        |          |
|--------------------------|----------|
| Fludioxonil              | 25 g/L   |
| Metalaxyl-M and S-isomer | 20 g/L   |
| Thiabendazole            | 150 g/L- |

## Crops, Diseases and Rates:

| Crop      | Diseases Controlled                                                                                                                                                                                                                                                                                                            | Rate (per 100 kg of seed) |
|-----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------|
| Chickpea  | Seed-borne ascochyta blight ( <i>Ascochyta rabiei</i> ); seed rot/pre-emergence damping-off and post-emergence damping-off ( <i>Fusarium</i> spp., <i>Pythium</i> spp., <i>Rhizoctonia</i> spp.); seedling blight ( <i>Fusarium</i> spp., <i>Pythium</i> spp.); seed rot and seedling blight (seed-borne <i>Botrytis</i> spp.) | 100 mL                    |
| Dry bean  | Seed rot/pre-emergence damping-off, and post-emergence damping-off ( <i>Fusarium</i> spp., <i>Pythium</i> spp., <i>Rhizoctonia</i> spp.); seedling blight ( <i>Pythium</i> spp.); anthracnose ( <i>Colletotrichum</i> spp.)                                                                                                    | 100 mL                    |
| Faba bean | Seed rot/preemergence damping-off and post-emergence damping-off ( <i>Fusarium</i> spp., <i>Pythium</i> spp., <i>Rhizoctonia</i> spp.); seedling blight ( <i>Pythium</i> spp.); anthracnose ( <i>Colletotrichum</i> spp.)                                                                                                      | 100 mL                    |
| Field pea | Seed-borne ascochyta blight and foot rot ( <i>Ascochyta pinodes</i> ); seed rot/pre-emergence damping-off, post-emergence damping-off, and seedling blight ( <i>Fusarium</i> spp., <i>Pythium</i> spp., <i>Rhizoctonia</i> spp.)                                                                                               | 100 mL                    |
| Lentil    | Seed-borne ascochyta blight ( <i>Ascochyta lentis</i> ); seed rot/pre-emergence damping-off, postemergence damping-off, and seedling blight ( <i>Fusarium</i> spp., <i>Pythium</i> spp., <i>Rhizoctonia</i> spp.); seedling root rot ( <i>Fusarium</i> spp.); seed rot and seedling blight (seed-borne <i>Botrytis</i> spp.)   | 100 mL                    |

## Application Information:

Apron Advance is a seed treatment formulation for use in commercial seed treatment plants, and for on-farm treatment using auger treating only; DO NOT use in hopper box or seed drill.

## How it Works:

Fludioxonil is a phenylpyrrole fungicide with contact activity. Metalaxyl-M is an acylalanine fungicide with systemic activity against diseases caused by the Oomycetes, including *Pythium* damping-off. Thiabendazole is a benzimidazole fungicide with both contact and systemic activity.

For more information refer to "Fungicide Modes of Action" in the Plant Disease Control section.

## Tank Mixes:

None listed.

## Restrictions:

- **Labelling:** All seed treated with Apron Advance must be labelled "This seed has been treated with thiabendazole, fludioxonil and metalaxyl-M and S-isomer fungicides.
- **Re-cropping:** DO NOT plant any crop other than soybean, dry bean, chickpea, lentil or dry pea within 30 days to fields in which treated seed was planted.
- **Storage:** Store away from feeds and feedstuffs. Store between 0 and 30°C. Any spilled or exposed seeds must be incorporated into the soil or otherwise cleaned up.
- **Environmental Restrictions:** This product is toxic to fish and other aquatic organisms. DO NOT apply directly to aquatic habitats; do not contaminate water by cleaning of equipment or disposal of wastes. Any spilled or exposed seeds must be incorporated into the soil or otherwise cleaned up.

- **Compatibility with Rhizobia-based inoculants:** This product is compatible with Rhizobia-based inoculants. Check with inoculant manufacturer for details and refer to product labels prior to use. Mixing with inoculants may increase drying time while treating. Recalibrate the seed drill before planting treated seed.

### Hazard Rating:

None listed.

## Apron Maxx (Co-pack)

Fungicide Group  
4, 7, 12

Apron Maxx is only available as a co-pack of Vibrance 500FS (sedaxane fungicide) and Vibrance Maxx RTA (fludioxonil, metalaxyl-M and S-isomer).

### Company:

Syngenta Canada Inc. (Apron Maxx RTA – PCP#27577), (Vibrance 500FS – PCP#30438)

### Formulation:

| Active ingredient        |                       |                      |
|--------------------------|-----------------------|----------------------|
|                          | Apron Maxx RTA        | Vibrance 500FS       |
| Fludioxonil              | 0.73%                 |                      |
| Metalaxyl-M and S-isomer | 1.10%                 |                      |
| Sedaxane                 | -                     | 500 g/L              |
| Rates:                   | 325 mL/100 kg of seed | 10 mL/100 kg of seed |

### Crops, Diseases and Rates:

| Crop      | Diseases Controlled                                                                                                                                                                                                                                                                                                                                                                  | Rate (per 100 kg of seed) |
|-----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------|
| Chickpea  | Seed-borne ascochyta blight ( <i>Ascochyta rabiei</i> ); seed rot/pre-emergence damping-off and post-emergence damping-off ( <i>Fusarium</i> spp., <i>Pythium</i> spp., <i>Rhizoctonia</i> spp.); seedling blight ( <i>Fusarium</i> spp., <i>Pythium</i> spp.); seed rot and seedling blight (seed-borne <i>Botrytis</i> spp.)                                                       | 325 mL + 10 mL            |
| Dry bean  | Seed rot/pre-emergence damping-off, and post-emergence damping-off ( <i>Fusarium</i> spp., <i>Pythium</i> spp., <i>Rhizoctonia</i> spp.); seedling blight ( <i>Pythium</i> spp.); anthracnose ( <i>Colletotrichum</i> spp.)                                                                                                                                                          | 325 mL + 10 mL            |
| Faba bean | Seed rot/pre-emergence damping-off, post-emergence damping-off, seedling blight ( <i>Fusarium</i> spp., <i>Pythium</i> spp., <i>Rhizoctonia</i> spp.)                                                                                                                                                                                                                                | 325 mL + 10 mL            |
| Field pea | Seed-borne ascochyta blight and foot rot ( <i>Ascochyta pinodes</i> ); seed rot/pre-emergence damping-off, post-emergence damping-off, and seedling blight ( <i>Fusarium</i> spp., <i>Pythium</i> spp., <i>Rhizoctonia</i> spp.)                                                                                                                                                     | 325 mL + 10 mL            |
| Lentil    | Seed-borne ascochyta blight ( <i>Ascochyta lentis</i> ); seed rot/pre-emergence damping-off, post-emergence damping-off, and seedling blight ( <i>Fusarium</i> spp., <i>Pythium</i> spp., <i>Rhizoctonia</i> spp.); seedling root rot ( <i>Fusarium</i> spp.); seed rot and seedling blight (seed-borne <i>Botrytis</i> spp.)                                                        | 325 mL + 10 mL            |
| Soybean   | Seed rot/pre-emergence damping-off, and post-emergence damping-off ( <i>Fusarium</i> spp., <i>Pythium</i> spp., <i>Rhizoctonia</i> spp.); seedling blight ( <i>Fusarium</i> spp., <i>Pythium</i> spp.); seedling root rot ( <i>Fusarium</i> spp.); seed rot and seedling blight ( <i>Phomopsis</i> spp.); early season root rot ( <i>Phytophthora megasperma</i> var. <i>sojae</i> ) | 325 mL + 10 mL            |

### Application Information:

Apron Maxx is a ready-to-apply seed treatment formulation for use in commercial seed treatment plants and for on-farm treatment using standard gravity flow or mist type seed treatment equipment. Also used in treat-on-the-go air seeders.

This product contains a pigment which will colour the treated seed. However, users are responsible for ensuring that the treated seed, when dried and ready for bagging, storage or seeding has an unnatural colour. If the pigment contained in the formulation does not colour the seed adequately, additional colourant must be added to the mixture while treating the seed. Ensure uniform coverage of the seed, as uneven seed coverage may not give the desired level of disease control. Treatment of highly damaged seed or seed known to be of low vigour and poor quality may result in reduced germination and/or reduction of seed and seedling vigour. Allow the seed to dry before bagging, storing or seeding.

How it Works:

Fludioxonil is a phenylpyrrole fungicide with contact activity. Metalaxyl-M is an acylalanine fungicide with systemic activity against diseases caused by the Oomycetes, including Pythium damping-off. Sedaxane is a succinate dehydrogenase inhibitor fungicide with preventative and systemic activity that inhibits fungal metabolism by binding to the succinate dehydrogenase enzyme to disrupt cellular respiration and energy generation. Refer to "Fungicide Modes of Action" in the Plant Disease Control section for more information.

Tank Mixes:

None.

Restrictions:

- **Resistance management:** Refer to "Pathogen Resistance" in the Plant Disease Control section for more information. Experience has shown that strains of fungus resistant to metalaxyl-M may develop. Failure to control the disease will likely result in crop damage and/or yield losses. If disease appears in a treated field, consult the government extension specialist immediately.
- **Labelling:** All seed treated with *Apron Maxx* must be labelled "This seed has been treated with fludioxonil metalaxyl-M and sedaxane fungicides. DO NOT use for food, feed or oil purposes". DO NOT use for food, feed or oil purposes".
- **Grazing:** No restrictions listed.
- **Re-cropping:** DO NOT plant any crop other than soybean, dry bean, chickpea, lentil or dry pea within 30 days to fields in which treated seed was planted.
- **Storage:** Store away from feeds and feedstuffs. Store between 0 and 30°C. Any spilled or exposed seeds must be incorporated into the soil or otherwise cleaned up.
- **Environment:** This product is toxic to fish and other aquatic organisms. DO NOT apply directly to aquatic habitats; do not contaminate water by cleaning of equipment or disposal of wastes. Any spilled or exposed seeds must be incorporated into the soil or otherwise cleaned up.
- **Compatibility with Rhizobia-based inoculants:** These products are compatible with *Rhizobia*-based inoculants. Check with inoculant manufacturer for details and refer to product labels prior to use. Mixing with inoculants may increase drying time while treating. Recalibrate the seed drill before planting treated seed.

Hazard Rating:

None listed.

AZteroid FC

Fungicide Group  
11

Company:

Vive Crop Protection, distributed by UAP (PCP#34742)

**Formulation:** AZteroid FC is formulated as a suspension concentrate.

|                   |                |
|-------------------|----------------|
| Active ingredient |                |
| Azoxystrobin      | 390 g/L        |
| Container size:   | 4 x 3.78L case |

Crops, Diseases and Rates:

| Crop   | Diseases Controlled                      | Diseases Suppressed                                                            | Rate                            |
|--------|------------------------------------------|--------------------------------------------------------------------------------|---------------------------------|
| Potato | Silver Scurf ( <i>Helminthosporium</i> ) | Rhizoctonia stem rot, stolon canker, black scurf ( <i>Rhizoctonia solani</i> ) | 2.56 – 3.85 mL per 100 m of row |

Application Information:

Minimum water volume (ground): 20 to 56 L/acre water

How it Works:

The active ingredient azoxystrobin is a methoxyacrylate compound (strobilurin) with broad spectrum contact and systemic activity to be used as a preventative and curative fungicide application. Refer to "Fungicide Modes of Action" in the Plant Disease Control section for more information.

Tank Mixes:

Liquid Fertilizer.

**Restrictions:**

- **Labelling:** All labelled crops are registered for commercial application facilities and mobile treaters. For all labelled seeds, commercial seed treatment (facilities and mobile treaters with closed transfer, including closed mixing, loading, calibrating, and closed treatment equipment only) is permitted. All labelled crops for on-farm treatment (open transfer, including open mixing, loading, calibrating, and open treatment equipment) is permitted.
- **Maximum number of applications:** DO NOT exceed one application of this product per season.
- **Re-entry interval:** 12 hours
- **Storage:** DO NOT store below zero degrees Celsius.

**Hazard Rating:**

None listed.

# BUTEO start 480 FS Seed Treatment

Insecticide Group  
4D

**Company:**

Bayer (PCP#31451)

**Formulation:**

480 g/L flupyradifurone formulated as a suspension.

**Crops, Insects and Rates:**

| Crop              | Insects Controlled | Rate (per 100 kg of seed) |
|-------------------|--------------------|---------------------------|
| Canola*, mustard* | Flea beetles       | 625 to 1042 mL            |

\*DO NOT apply any subsequent application of a Group 4D Insecticide (for example, in-furrow, soil or foliar application) following planting of *BUTEO start 480 FS* treated seeds.

**Application Information:**

Prior to and during application, *BUTEO start 480 FS* must be thoroughly agitated to ensure uniform mixing of the product. Keep above 10°C prior to and during application. DO NOT apply direct heat to container.

**How it Works:**

Flupyradifurone is a butenolide insecticide with systemic activity. For more information refer to "Insecticide Groups Based" on Modes of Action in the Insect Control section.

**Tank Mixes:**

None listed.

**Restrictions:**

Regardless of type of application (seed treatment or foliar), DO NOT apply more than 400 g of active ingredient flupyradifurone per hectare per season.

**Hazard Rating:**

Caution – Poison

Refer to the Introduction for an explanation of the symbols.

# Clothianidin

Insecticide Group  
4A

*NipsIt INSIDE 600 Insecticide/Poncho 600 FS/Titan Poncho 600 FS is available to commercial seed treaters only. NipsIt INSIDE 600 Insecticide is available for on-farm seed treatment for wheat and potato only. Titan is available for on-farm seed treatment.*

## Company:

Valent Canada Inc. distributed by Nufarm Agriculture (*NipsIt INSIDE 600 Insecticide* – PCP#28975)  
BASF Canada (*Poncho 600 FS* – PCP#27453, *Titan* – PCP#27449)

## Formulation:

600 g per L clothianidin formulated as a suspension.

- *NipsIt INSIDE 600 Insecticide* container size - 3.78 L
- *Poncho 600 FS* container sizes - 56.8 L, 100 L, 113 L, 200 L, 1000 L
- *Titan* container sizes - 1 L, 3.8 L, 10 L, 200 L, 1000 L

|                                                              |                  | Aphid (potato, green peach, foxglove and buckthorn aphids), Colorado potato beetle, potato leafhopper, potato flea beetle (overwintered adults and suppression of second generation) | 10.4 to 20.8 mL                          |
| <i>NipsIt INSIDE 600 Insecticide</i>                         | Wheat            | Wireworms                                                                                                                                                                            | 17 to 100 mL <sup>2</sup>                |

<sup>1</sup> Increasing rates for low, moderate and severe flea beetle pressure.

<sup>2</sup> Rate of 17 mL per 100 kg of seed provides wireworm suppression only. Use higher rates of 33 to 100 mL per 100 kg of seed on wheat seed to be planted into fields known to have a history of severe wireworm infestations.

<sup>3</sup> *NipsIt INSIDE 600* insecticide and *Poncho 600FS* only.

## Application Information:

*Poncho 600 FS* is for use in commercial seed treatment facilities with closed transfer systems only. *Poncho 600 FS* DOES NOT contain a colourant. An appropriate colour must be added when this product is applied. Seed treatment must be thoroughly agitated to ensure uniform mixing of product prior to and during application. Treatment of highly mechanically scarred or damaged seed or seed known to be of low vigour and poor quality may result in reduced germination and/or reduction of seed and seedling vigour.

*Titan* is a seed piece treatment. Apply specified rate as a diluted spray onto seed pieces using a well contained, shielded spray system to prevent the loss of any liquid. Apply only in areas with adequate ventilation or in areas equipped to remove spray mist or dust. Agitate or stir spray solution as needed. For optimal insect control good coverage of seed pieces is required. DO NOT dilute with any more than 6 parts water to 1 part *Titan*. Plant seed pieces as soon as possible after cutting and treating.

In canola, rapeseed, Ethiopian mustard (*Brassica carinata*) and corn *NipsIt INSIDE 600 Insecticide* is for use with commercial seed treaters (facilities and mobile treaters) with closed transfer including closed mixing, loading, calibrating and closed treatment equipment only. No open transfer of *NipsIt INSIDE 600 Insecticide*.

In wheat, *NipsIt INSIDE 600 Insecticide* is for use in commercial seed treatment facilities (with closed transfer including closed mixing, loading, calibrating, and closed treatment equipment only) and for use on-farm (open transfer including open mixing, loading, calibrating, and open treatment equipment is allowed).

*NipsIt INSIDE 600 Insecticide* contains no colourant. An appropriate colourant must be added when this product is applied.

## How it Works:

Clothianidin is a chloronicotinyl insecticide with systemic activity. For more information refer to "Insecticide Groups Based" on Modes of Action in the Insect Control section.

## Tank Mixes:

Off-label tank mixes, as previously permitted under the Pest Management Regulatory Agency (PMRA) Off-label Tank Mix Policy memo of 2009 are no longer allowed under new guidance from PMRA. As of December 20, 2022 only products specifically indicated on product labels may be mixed, or when the labels of two or more products to be mixed include the statement quoted in the Introduction.

## Restrictions:

**NOTE:** When using a seed flow lubricant for planting corn and soybean seed treated with neonicotinoid insecticides (containing the active ingredients clothianidin, imidacloprid or thiamethoxam), use only a dust-reducing fluency agent. Talc and graphite are not permitted.

- **Resistance management:** Refer to "Pathogen Resistance" in the Plant Disease Control section for more information. DO NOT make any subsequent application of a group 4 insecticide (in-furrow or foliar application) following treatment with any of these products.
- **Labelling:** Treated seed must be labelled as follows: "This seed has been treated with clothianidin. DO NOT use for food, feed or oil processing. Store away from feeds and other foodstuffs."
- **Grazing:** None listed.
- **Re-cropping:**
  - For **Poncho 600 FS**, corn and canola may be replanted at any time.
  - For **Titan**, corn, and canola and potatoes may be replanted at any time.
  - For all products, a one year plant back interval is required for leafy, root and tuber vegetables.
  - A 30 day plant back is required for cereals, grasses, nongrass animal feeds, soybeans and dry beans.
  - For **NipsIt INSIDE 600 Insecticide** registered crops may be replanted at any time. A 30 day plant-back interval is required on cereals (except wheat), grasses, non-grass animal feeds, soybeans and dry beans.
- **Storage:** Protect products from freezing. DO NOT contaminate water, food or feed by storage, disposal or by cleaning of equipment. Store in a cool place. DO NOT store in direct sunlight. Store away from food or feed. DO NOT store treated seed above 25°C or in direct sunlight. Treated seed stored for periods in excess of 9 months should be tested for germination before planting.
- **Environment:** These products are toxic to aquatic invertebrates. DO NOT apply directly to water or to areas where surface water is present. DO NOT contaminate water when disposing of equipment wash waters. These products are toxic to birds and mammals. Any spilled or exposed seeds should be incorporated into the soil or otherwise cleaned up from the soil surface.

## Hazard Rating:

Warning – Poison

Refer to the Introduction for an explanation of the symbols.

# Cruiser 5FS

Insecticide Group  
4A

*Contains insecticide only. On-farm use for cereals and pulses up to a maximum application rate of 30 g per 100 kg seed. Higher application rates for commercial seed treaters only.*

## Company:

Syngenta Canada Inc. (PCP#27045)

## Formulation:

47.6% thiamethoxam formulated as a suspension.

- Container sizes - 23.4 L, 56.78 L

## Crops, Insects and Rates:

| Crop                      | Insects Controlled                      | Rate <sup>1</sup> (per 100 kg of seed) |

| Field pea                                  | Wireworm (suppression) <sup>1</sup> | 17 mL                                  |
|                                            | Wireworm (control) <sup>1</sup>     | 33 to 50 mL                            |
|                                            | Pea leaf weevil                     | 50 to 83 mL <sup>2</sup>               |
| Rye, millet, sorghum, triticale, buckwheat | Wireworm (suppression) <sup>1</sup> | 17 mL                                  |
|                                            | Wireworm (control) <sup>1</sup>     | 33 to 50 mL                            |

<sup>1</sup> Use lower rate for early season suppression of wireworm. For control and/or moderate to high pressure, treat crops at higher rate.

<sup>2</sup> The higher rate must be applied by commercial treaters using closed transfer

### Application Information:

For small-grain cereals (except oats) and pulse crops, *Cruiser 5FS* may be applied on-farm or by commercial seed treaters. For all other crops, application must be performed in commercial seed treatment facilities. A red colourant MUST be added when *Cruiser 5FS* is applied to grain. Allow the seed to dry before bagging or storing in bulk containers.

### How it Works:

Thiamethoxam is a seed treatment insecticide in the neonicotinoid class of chemistry that controls listed chewing and sucking insects through contact and systemic activity. Refer to "Insecticide Groups Based on Modes of Action" in the Insect Control section for more information.

### Tank Mixes:

For control of seed and soil-borne diseases, *Cruiser 5FS* can be mixed with fungicide seed treatments in a closed transfer system. Refer to label for details. Follow the label directions for each product and use the most restrictive precautions and limitations.

### Restrictions:

**NOTE:** When using a seed flow lubricant for planting corn and soybean seed treated with neonicotinoid insecticides (containing the active ingredients clothianidin, imidacloprid or thiamethoxam), use only a dust-reducing fluency agent.

Talc and graphite are not permitted.

- **Resistance management:** Refer to "Pathogen Resistance" in the Plant Disease Control section for more information.
- **Labelling:** All seed must be labelled "Seed treated with thiamethoxam insecticide. DO NOT use for food, feed or oil processing." Consult label for additional labelling requirements.
- **Grazing:** DO NOT graze or feed livestock on treated areas for 45 days after planting.
- **Re-cropping:** No restrictions listed.
- **Storage:** Store away from food and feed. Ideal storage temperature is above freezing and below 30°C. If product should freeze, bring to room temperature, then ensure the contents are mixed well prior to application.
- **Environment:** Products are toxic to aquatic invertebrates and fish. DO NOT apply directly to water or areas where surface water is present. DO NOT contaminate food, feed, domestic or irrigation water supplies, lakes, streams and ponds. If treated seed is accessible to birds or spilled outdoors, promptly clean up or bury to prevent ingestion.

### Hazard Rating:

Caution – Poison

Refer to the Introduction for an explanation of the symbols.

# Cruiser Maxx Corn

Insecticide Group  
4A

Fungicide Group  
1, 4, 11, 12

Available to commercial seed treaters only.

Cruiser Maxx Corn is a co-pack containing Maxim Quattro (thiabendazole, azoxystrobin, metalaxyl-M and S-isomer and fludioxonil fungicides) and Cruiser 5FS (thiamethoxam insecticide).

For more detailed information on component products, consult product pages listed above.

## Company:

Syngenta Canada Inc. (Maxim Quattro – PCP#29871, Cruiser 5FS – PCP#27045)

## Formulations:

*Maxim Quattro*: 26.5% thiabendazole, 3.32% fludioxonil, 2.65% metalaxyl-M and S-isomer, and 1.33% azoxystrobin formulated as a liquid suspension treatment.

- Container sizes - 5 L to bulk

*Cruiser 5FS*: 47.6% thiamethoxam formulated as a suspension.

- Container sizes - 23.4 L, 56.78 L

## Crops, Diseases, Insects and Rates:

| Crop | Diseases Controlled                                                                                                                                                                                                                                                                         | Insects Controlled        | Rate (per 100 kg of seed) |                    |

## Hazard Rating:

*Maxim Quattro*: Caution – Potential Skin Sensitizer

*Cruiser 5FS*: Caution – Poison

Refer to the Introduction for an explanation of the symbols.

# Cruiser Maxx Potato Extreme

Insecticide Group  
4A  
Fungicide Group  
3, 12

## Company:

Syngenta Canada Inc. (PCP#31024)

## Formulation:

250 g/L of thiamethoxam, 62.5 g/L of fludioxonil, and 123 g/L of difenoconazole formulated as a suspension.

- Container sizes - 2 x 9.6 L

## Crops, Diseases, Insects and Rates:

| Crop   | Diseases Controlled                                                                                                                             | Diseases Suppressed                       | Insects Controlled                                    | Rate (per 100 kg of seed) |
|--------|-------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------|-------------------------------------------------------|---------------------------|
| Potato | Stem and stolon canker ( <i>Rhizoctonia solani</i> ), fusarium dry rot ( <i>Fusarium</i> spp.), silver scurf ( <i>Helminthosporium solani</i> ) | Black scurf ( <i>Rhizoctonia solani</i> ) | Colorado potato beetle, aphids, and potato leafhopper | 20 mL                     |

## Application Information:

Apply as a water-based slurry utilizing standard slurry seed treatment equipment. Thoroughly mix the specified amount of product into the required amount of water or tank mix partner for slurry treater and dilution rate to be used. Apply only in areas with adequate ventilation or in areas that are equipped to remove mist or dust.

## How it Works:

Thiamethoxam is a systemic chloronicotinyl insecticide, fludioxonil is a phenylpyrrole fungicide with contact activity, and difenoconazole is a triazole fungicide with broad-spectrum systemic activity. Refer to "Fungicide Modes of Action" in the Plant Disease Control section for more information.

## Tank Mixes:

None listed.

## Restrictions:

- **Resistance management:** Refer to "Pathogen Resistance" in the Plant Disease Control section for more information.
- **Labelling:** No restrictions listed.
- **Grazing:** No restrictions listed.
- **Re-cropping:** Treated areas may be replanted immediately following harvest or as soon as practical following the last application with any crop listed on this label or to sorghum, wheat, barley, canola and pome fruit. Any cover crop planted for erosion control or soil improvement may be planted as soon as practical following the last application. However, the cover crop may not be grazed or harvested for food or feed. For all other crops, a 120 day plant-back interval must be observed.
- **Storage:** If soil conditions are ideal, plant potatoes immediately after application; however, if soil is predicted to be cold and wet for 3 days following application, either a) wait to cut, treat, plant until conditions are favorable or b) cut, treat and store. If cutting, treating and storing, potatoes can be treated with an inert dust to improve suberization. Store properly until conditions improve by making sure that there is adequate cool air (7 to 10°C) movement through the pile of cut seed potatoes and a relative humidity of 85 to 90 percent. Temperatures above 10°C promote soft rot in seed. Cut and treated seed should not be piled above 1.8 metres in height. Avoid storing treated potatoes for over 2 weeks. When transporting cut and treated seed make sure the seed is covered.
- **Environment:** DO NOT apply any subsequent application of thiamethoxam in-furrow or foliar application or other Group 4 insecticide following seed piece treatment with *Cruiser Maxx Potato Extreme*. DO NOT plant more than 128,700 kg of treated potato seed pieces per day. As this product is not registered for the control of pests in aquatic systems, DO NOT use to control aquatic pests. DO NOT contaminate irrigation or drinking water supplies or aquatic habitats by cleaning of equipment or disposal of wastes.

## Hazard Rating:

None listed.

# Cruiser Vibrance Quattro

Insecticide Group  
4A

Fungicide Group  
3, 4, 7, 12

## Company:

Syngenta Canada Inc. (PCP#31453)

## Formulation:

61.5 g/L thiamethoxam, 36.9 g/L difenoconazole, 15.4 g/L sedaxane, 9.2 g/L metalaxyl-M (and S-isomer), and 7.7 g/L fludioxonil formulated as a suspension.

- Container sizes - 1 to 1050 L

| Spring wheat | General seed rots ( <i>Fusarium</i> spp., <i>Pythium</i> spp., <i>Rhizoctonia</i> spp., <i>Penicillium</i> spp., <i>Aspergillus</i> spp.); seedling blight, root rot, damping-off ( <i>Fusarium</i> spp., <i>Rhizoctonia</i> spp., <i>Pythium</i> spp.); common bunt ( <i>Tilletia tritici</i> ); loose smut ( <i>Ustilago tritici</i> )                                       | Common root rot ( <i>Cochliobolus sativus</i> ); fusarium crown and foot rot ( <i>Fusarium</i> spp.); take-all ( <i>Gaeumannomyces graminis</i> ) | Wireworms          | 325 mL                    |
| Winter wheat | General seed rots ( <i>Fusarium</i> spp., <i>Pythium</i> spp., <i>Rhizoctonia</i> spp., <i>Penicillium</i> spp., <i>Aspergillus</i> spp.); seedling blight, root rot, damping-off ( <i>Fusarium</i> spp., <i>Rhizoctonia</i> spp., <i>Pythium</i> spp.); common bunt ( <i>Tilletia tritici</i> ); dwarf bunt ( <i>T. controversa</i> ); loose smut ( <i>Ustilago tritici</i> ) | Common root rot ( <i>Cochliobolus sativus</i> ); fusarium crown and foot rot ( <i>Fusarium</i> spp.); take-all ( <i>Gaeumannomyces graminis</i> ) | Wireworms          | 325 mL                    |

## Application Information:

*Cruiser Vibrance Quattro* is for use on-farm. This product can also be applied by commercial seed treaters using closed system transfer. Treat seed in a well-ventilated area. When treating seeds, all workers must wear coveralls over a long sleeved shirt, long pants, chemical-resistant gloves, work boots, sock and a NIOSH-approved dust mask.

## How it Works:

Thiamethoxam is a seed treatment insecticide in the neonicotinoid class of chemistry that controls listed chewing and sucking insects through contact and systemic activity. For more information refer to "Insecticide Groups Based" on Modes of Action in the Insect Control section. The active ingredient difenoconazole is a triazole fungicide with broad-spectrum, systemic activity. Metalaxyl-M is an acylalanine fungicide with systemic activity against diseases caused by the Oomycetes, including pythium damping-off. Sedaxane is a succinate dehydrogenase inhibitor fungicide with systemic activity that inhibits fungal metabolism by binding to the succinate dehydrogenase enzyme to disrupt cellular respiration and energy generation. Fludioxonil is phenylpyrrole fungicide with contact activity. Refer to "Fungicide Modes of Action" in the Plant Disease Control section for more information.

## Tank Mixes:

None listed.

## Restrictions:

- **Resistance management:** Pathogen "Resistance" in the Plant Disease Control section for more information.
- **Labelling:** Treated seed must be labelled (listing only the applicable active ingredients) as follows: "This seed has been treated with the insecticide, thiamethoxam and the fungicides, difenoconazole, metalaxyl-M (and S-isomer), sedaxane and fludioxonil. Wear coveralls over a long-sleeved shirt, long pants, chemical-resistant gloves, work boots, socks and NIOSH-approved dust mask when handling treated seed, and during planting (including loading, sowing, maintenance, and clean-up). When using closed-cab planting equipment, chemical-resistant gloves and NIOSH-approved dust mask are not required inside cab. DO NOT graze or feed livestock on seeded area for 45 days after planting. DO NOT use for food, feed or oil processing. Store away from food and feed. Any spilled or exposed seeds must be incorporated into the soil or otherwise cleaned-up from the soil surface." Store away from food and feed."
- **Grazing:** DO NOT graze or feed livestock on treated areas for 45 days after planting.
- **Re-cropping:** DO NOT plant any crop other than cereals, corn, soybeans, members of Crop Subgroup 6C (dried, shelled peas and beans), members of Crop Subgroup 20A (canola and rapeseed subgroup) or potatoes within 60 days to fields in which treated seed were planted.
- **Storage:** Store away from food and feed. Ideal storage temperature is above freezing and below 30°C. If product should freeze, bring to room temperature, and then ensure the contents are mixed well prior to application.
- **Environment:** Toxic to aquatic organisms. DO NOT contaminate irrigation or drinking water supplies or aquatic habitats by cleaning of equipment or disposal of wastes. Any spilled or exposed seeds must be incorporated into the soil or otherwise cleaned-up from the soil surface. Toxic to bees. Bees can be exposed to product residues in flower, leaves, pollen and/or nectar resulting from seed treatment applications.

## Hazard Rating:

Warning – Contains the Allergen Soy

| <i>Lumiderm ONIQ</i> | Canola, rapeseed, oilseed mustard                                                             | Cutworm <sup>2</sup>                | 480 to 960 mL <sup>4</sup>                          |
|                      |                                                                                               | Flea beetle                         | 960 to 1600 mL <sup>4, 5</sup>                      |

<sup>1</sup> Protection provided during early to mid-season growth and development of potatoes only.

<sup>2</sup> The *Lumiderm* application rate for cutworm will also provide some early season protection from flea beetle damage.

<sup>3</sup> Use higher rates for higher pest pressure.

<sup>4</sup> Use the higher rates in areas with high pest pressure, or where extended early season control is required.

<sup>5</sup> The application rates for flea beetles will also provide early season protection from cutworm feeding damage.

## Application Information:

For corn and registered oilseed crops *Fortenza* and *Lumiderm* must be applied in a commercial seed treatment facility using closed transfer equipment. These products contain no colourant. An appropriate seed colourant must be added when this product is applied.

*Fortenza* is designed for on-farm treating for potato seed pieces only using a closed-treatment system.

## How it Works:

The active ingredient cyantraniliprole is a systemic insecticide from the diamides chemical class. For more information refer to "Insecticide Groups Based on Modes of Action" in the Insect Control section.

## Tank Mixes:

*Lumiderm*: registered oilseed crops – *Prosper EverGol*, *Helix Vibrance*

*Lumiderm ONIQ*: registered oilseed crops – *Prosper EverGol*, *Helix Vibrance*

*Fortenza*: registered oilseed crops – *Vibrance 500 FS*; Corn – *Cruiser 5FS*, *Maxim Quattro* and/or *Vibrance 500 FS*

Follow the label directions for each product and use the most restrictive precautions and limitations.

## Restrictions:

- **Resistance management:** Refer to "Pathogen Resistance" in the Plant Disease Control section for more information. DO NOT apply any subsequent application of a Group 28 insecticide (in-furrow, soil or foliar) within 60 days of treatment with any of these products.
- **Labelling:** Seed treated with *Lumiderm* must be labeled "This seed has been treated with *Lumiderm Insecticide Seed Treatment* which contain cyantraniliprole. DO NOT use for feed, food or oil processing. Store away from feeds and other foodstuffs. Wear long-sleeved shirt, long pants and chemical-resistant gloves when handling treated seed. This product is toxic to aquatic organisms. Dispose of all excess treated seed. Left over treated seed may be double-sown around the headland or buried away from water sources in accordance with local requirements. Dispose of seed packaging in accordance with local requirements. Cover or incorporate spilled treated seeds."
  - Seed treated with *Lumiderm ONIQ* must be labeled "This seed has been treated with *Lumiderm ONIQ Insecticide Seed Treatment* which contain cyantraniliprole. DO NOT use for feed, food or oil processing. Store away from feeds and other foodstuffs. Wear long-sleeved shirt, long pants and chemical-resistant gloves when handling treated seed. This product is toxic to aquatic organisms. Dispose of all excess treated seed. Left over treated seed may be double-sown around the headland or buried away from water sources in accordance with local requirements. Dispose of seed packaging in accordance with local requirements. Cover or incorporate spilled treated seeds."
  - Seed treated with *Fortenza* must be labeled "These seeds have been treated with the insecticide cyantraniliprole. When handling and planting treated seed, workers must wear a long sleeved shirt and long pants, chemical-resistant gloves, and work boots. For good hygiene practice, it is also recommended that a NIOSH-approved dust mask be worn during all job activities. Plant treated seed only with closed cab planting equipment. DO NOT use for food, feed or oil processing. Toxic to bees. Follow best management practices to help minimize dust exposure to pollinators during planting of treated seed; refer to the complete guidance "Pollinator Protection: reducing risk of planting treated seed" on the Health Canada website."
- **Grazing:** No restrictions listed.
- **Re-cropping:** Registered crops, as well as flax, sunflower, and safflower, may be replanted at any time. For all other crops, do not plant-back within 30 days of seeding with cyantraniliprole treated seed.
- **Storage:** Store product in original container only, away from other pesticides, fertilizer, food or feed. Not for use or storage in or around the home. Keep container closed. To prevent contamination store this product away from food or feed.
  - *Fortenza*: Ideal storage temperature for the products is above freezing and below 30°C. Repeated freeze-thawing of *Fortenza* will not affect the physical integrity of the product. If the product should freeze, bring the product back to room temperature and ensure the contents are mixed well prior to application.
- **Environment:** Toxic to aquatic organisms and bees. When this product is applied and used according to label directions, risk to bees is expected to be negligible. DO NOT contaminate irrigation or drinking water supplies or aquatic habitats by cleaning of equipment or disposal of wastes. The use of this chemical may result in contamination of groundwater particularly in areas where soils are permeable and/or the depth to the water table is shallow.

## Hazard Rating:

Caution – Eye Irritant

Refer to the Introduction for an explanation of the symbols.

# Emesto Complete

Fungicide Group  
3, 7  
Insecticide Group  
4A

## Company:

Bayer Crop Science (PCP#30362, 33593)

## Formulation:

Emesto Complete is a co-pack seed-piece treatment containing Emesto Quantum and Emesto Pro, both formulated as suspensions.

## Active Ingredients:

| Product Component | Active Ingredient | Guarantee |
|-------------------|-------------------|-----------|
| Emesto Quantum    | Penflufen         | 66.5 g/L  |
|                   | Clothianidin      | 207 g/L   |
| Emesto Pro        | Prothioconazole   | 100 g/L   |

- Container sizes - 105 L to bulk

## Crops, Diseases, Insects and Rates:

| Crop   | Diseases and Insects Controlled                                                                                                                                                                                   | Application Timing and Comments                                                                                                                                                | Rate                                                                                                                       |
|--------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------|
| Potato | <i>Fusarium</i> tuber rot (including resistant strains); seed-borne <i>Rhizoctonia solani</i> (black scurf, stem and stolon canker); silver scurf; Colorado potato beetle; aphids; leafhopper; potato flea beetle | Seed-piece treatment. Apply specified dosage as a diluted spray using equipment that ensures uniform coverage of each seed piece. Treat seed pieces immediately after cutting. | <b>Emesto Pro:</b> 3.6 mL/100 kg seed pieces (1.6 mL/cwt)<br><b>Emesto Quantum:</b> 30 mL/100 kg seed pieces (13.6 mL/cwt) |

## Application Information:

Apply as a seed-piece treatment only. Apply no more than 150 mL of slurry per 100 kg of seed pieces. Maintain agitation or stirring of the slurry solution as required to ensure uniform application.

DO NOT apply by air.

## How it Works:

Emesto Complete is an all-in-one fungicide and insecticide seed-piece treatment. Penflufen and prothioconazole provide protection against key seed-borne and soil-borne diseases, including *Fusarium* and *Rhizoctonia*. Clothianidin provides early-season control of listed insect pests. The combined formulation delivers disease and insect protection in a single application.

## Tank Mixes:

Emesto Complete may be tank mixed with registered pest control products whose labels also allow tank mixing. Follow all Directions for Use, Precautions, Restrictions, Environmental Precautions, and Spray Buffer Zones for each product. Where label requirements differ, the most restrictive label must be followed.

## Restrictions:

- **Maximum number of applications:** Seed-piece treatment only.
- **Grazing:** DO NOT use treated seed pieces for food, feed or fodder.
- **Re-cropping:** Corn, canola, mustard and potatoes may be replanted at any time. A one-year plant-back interval is required for leafy, root and tuber vegetables (except potatoes). A 30-day plant-back interval is required for all other crops.
- **Storage:** Store away from food or feed. Store in a cool, dry area. DO NOT store in direct sunlight. Avoid prolonged storage at temperatures above 40°C or below –10°C.
- **Environmental Restrictions:** Treated seed is toxic to birds and small wild mammals. Any spilled or exposed treated seed must be incorporated into the soil or otherwise removed from the soil surface. This product is toxic to bees. Bees may be exposed to residues in pollen, nectar, leaves, or flowers resulting from seed treatment; when used according to label directions, minimal exposure is expected. This product is toxic to aquatic organisms. DO NOT discharge effluent containing this product into lakes, streams, ponds, estuaries, oceans, or other aquatic habitats. The use of this product may result in groundwater contamination, particularly in permeable soils or areas with shallow water tables.

**Hazard Rating:**  
Warning

# Emesto Silver Fungicide Seed Treatment

Fungicide Group  
3, 7

**Company:**  
Bayer (PCP#30361)

**Formulation:**  
100 g/L penflufen, 18 g/L prothioconazole formulated as a suspension.

- Container sizes - 1 L to 200 L

**Crops, Diseases and Rates:**

| Crop   | Diseases Controlled                                                                                                                                                          | Rate (per 100 kg of seed) |
|--------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------|
| Potato | Seed-borne black scurf and stem and stolon canker ( <i>Rhizoctonia solani</i> ), silver scurf ( <i>Helminthosporium solani</i> ), fusarium tuber rot ( <i>Fusarium</i> spp.) | 20 mL                     |

**Application Information:**

*Emesto Silver* is designed to be applied as a diluted spray using equipment that ensures uniform coverage of each seed piece. Apply no more than 150 mL of slurry per 100 kg of seed pieces. Agitate or stir the slurry solution as needed. Apply only in areas with adequate ventilation or in areas that are equipped to remove spray mist or dust. Seed pieces should be treated immediately after cutting. Plant seed-pieces as soon as possible after cutting and treating.

**How it Works:**

The active ingredient penflufen is a carboxamide (SDHI) fungicide with systemic activity. The active ingredient prothioconazole is a demethylation inhibitor with broad-spectrum systemic activity. Refer to "Fungicide Modes of Action" in the Plant Disease Control section for more information.

**Tank Mixes:**

See label for tank-mix options.

**Restrictions:**

- **Resistance management:** Refer to "Pathogen Resistance" in the Plant Disease Control section for more information.
- **Labelling:** No restrictions listed.
- **Grazing:** No restrictions listed.
- **Re-cropping:** Potatoes, corn, cereals, legumes, soybean, canola, mustard, rapeseed, borage, flax and crambe may be replanted at any time. For all other crops, DO NOT plant back within 30 days of planting with *Emesto Silver*-treated seed pieces.
- **Storage:** If cut seed needs to be stored or held for a few days, make sure that there is adequate cool air movement through the pile of cut seed potatoes at relative humidity of 85 to 90 percent. Store cut seed at or below 7°C. Temperatures above 10°C promote soft rot in seed. Cut and treated seed should be piled above 1.8 metres in height.
- **Environment:** DO NOT apply this product or treated seed pieces directly to freshwater habitats, estuaries, or marine habitats. DO NOT contaminate irrigation or drinking water supplies or aquatic habitats by cleaning of equipment or disposal of wastes.

**Hazard Rating:**  
None listed.

# EverGol Energy

## Fungicide Seed Treatment

Fungicide Group  
3, 4, 7

### Company:

Bayer (PCP#30364)

### Formulation:

38.4 g/L penflufen, 76.8 g/L prothioconazole, 61.4 g/L metalaxyl formulated as a suspension.

- Container size – 33.75 L

### Crops, Diseases and Rates:

| Crop                                                 | Diseases Controlled                                                                                                                                                                                                                                                                                                                                                                | Rate (per 100 kg of seed) |
|------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------|
| Soybean,<br>Chickpea,<br>Peas, Lentils,<br>Dry Beans | Seed rot/pre-emergence damping off ( <i>Rhizoctonia solani</i> , <i>Fusarium</i> spp., <i>Pythium</i> spp., <i>Phomopsis longicolla</i> ); post-emergence damping off ( <i>R. solani</i> , <i>Fusarium</i> spp., <i>Pythium</i> spp.); early-season root rot and seedling blight ( <i>R. solani</i> , <i>Fusarium</i> spp.); seedling blight (seed-borne <i>Botrytis cinerea</i> ) | 65 mL                     |

### Application Information:

*EverGol Energy* is designed for commercial seed treating equipment which can accurately control application rates and provide a good distribution of the chemical into the seed in the mixing chamber. Uniform application to seed is necessary to ensure optimum product performance. This product contains no dye and an appropriate seed colourant must be applied.

### How it Works:

The active ingredient penflufen is a carboxamide (SDHI) fungicide with systemic activity. The active ingredient prothioconazole is a demethylation inhibitor with broad-spectrum systemic activity. The active ingredient metalaxyl is an acylalanine fungicide with systemic activity. Refer to "Fungicide Modes of Action" in the Plant Disease Control section for more information.

### Tank Mixes:

**Insecticide Seed Treatments:** *Stress Shield 600*

**Fungicide Seed Treatment:** *Allegiance FL* for control of early-season Phytophthora in soybean.

Follow the label directions for each product and use the most restrictive precautions and limitations for either product.

### Restrictions:

- **Resistance management:** Refer to "Pathogen Resistance" in the Plant Disease Control section for more information.
- **Labelling:** Treated seed must be labeled "This seed has been treated with *EverGol Energy*, which contains penflufen, prothioconazole and metalaxyl. When handling treated seed wear a long-sleeved shirt, long pants and chemical-resistant gloves. DO NOT use for feed, food or oil processing. Store away from feeds and other foodstuffs."
- **Grazing:** No restrictions listed.
- **Re-cropping:** Registered crops for *EverGol Energy*, as well as canola, mustard, rapeseed, borage, flax, crambe and potato, may be replanted at any time. For all other crops, do not plant-back within 30 days of seeding with *EverGol Energy*-treated seed.
- **Storage:** To prevent contamination store this product away from food or feed. Store in cool, dry area. DO NOT store in direct sunlight. DO NOT allow prolonged storage in temperatures that exceed 40°C or go below -10°C.
- **Environment:** Toxic to aquatic organisms and non-target terrestrial plants. DO NOT discharge effluent containing this product into sewer systems, lakes, streams, ponds, estuaries, oceans or other water. Dispose of all excess treated seed. Left over seed may be double-sown around the headland or buried away from water sources in accordance with local requirements. DO NOT leave exposed treated seed on soil surface. Any spilled or exposed seeds must be incorporated into the soil or otherwise cleaned-up from the soil surface. The use of this chemical may result in contamination of groundwater particularly in areas where soils are permeable (e.g. sandy soil) and/or depth to the water is shallow.

### Hazard Rating:

None listed.

## Application Information:

EverGol Rise is a Semi-concentrated formulation designed for commercial or on-farm treating with conventional seed treating equipment. Uniform application to seed is necessary to ensure optimum product performance. 100 ml of water to 100 ml of EverGol RISE is recommended to use to enhance coverage of most crops. Chickpeas it is recommended to go to a high water rate

## Tank Mixes:

EverGol RISE may be combined with Stress Shield 600 for control of certain insect pests in Pea (field); Chickpea; Lentil; Bean (dry). EverGol RISE may be combined with Stress Shield 600, ALLEGIANCE® FL or ACCELERON® D-309, ACCELERON® I-425, ACCELERON® I-374 for control of certain insect pests in Soybean.

## Restrictions:

- **Labelling:** Treated seed must not be used for food, feed or oil processing. All containers or packages containing treated seed for sale or use in Canada must be labelled or tagged as follows: "This seed has been treated with EVERGOL Rise Seed Treatment Fungicide, which contains penflufen, prothioconazole, metalaxyl and trifloxystrobin. Any spilled or exposed seeds must be incorporated into the soil or otherwise cleaned up from the soil surface. Dispose of all excess treated seed.
- **Grazing:** Do not graze or feed livestock on treated areas for four weeks after planting.
- **Re-cropping:** Registered crops for EVERGOL Rise Seed Treatment Fungicide, as well as Canola, Mustard, Rapeseed, Soybean, Alfalfa, Corn and Cereal grains, may be replanted at any time. For all other crops, do not plant-back within 30 days of seeding with EVERGOL Rise Seed Treatment Fungicide treated seed.
- **Storage:** Store this product away from food or feed. Store in a cool, dry area. Do not store in direct sunlight. Do not allow prolonged storage in temperatures that exceed 40°C or go below -10°C.
- **Environmental Restrictions:** EverGol RISE is toxic to aquatic organisms. Dispose of all excess treated seed. Leftover treated seed may be double sown around the headland or buried away from water sources in accordance with local requirements.
- **Leaching:** The use of this product may result in contamination of groundwater, particularly in areas where soil is permeable (e.g., sandy soil) and/or depth to the water table is shallow.

## Hazard Rating:

Caution – Skin & Eye Irritant. Harmful if swallowed, inhaled or absorbed through the skin.

# Fortenza Advanced

Insecticide Group  
4C, 28

Available to commercial seed treaters only. Fortenza Advanced is a co-pack containing Rascendo (sulfoxaflor insecticide, available only as part of this co-pack) and Fortenza (600 g/L cyantraniliprole insecticide). For other detailed information on Fortenza see the product page listed above.

## Company:

Syngenta Canada Inc. (Fortenza – PCP#30899, Rascendo – PCP#32250)

## Formulation:

**Rascendo:** 500 g/L sulfoxaflor formulated as a suspension.

- Container size - 1 to 1050 L

**Fortenza:** 600 g/L cyantraniliprole.

- Container size - 1 to 1050 L

## Crops, Diseases and Rates:

| Crop                         | Insects Controlled          | Rate (per 100 kg of seed) |          |
|------------------------------|-----------------------------|---------------------------|----------|
|                              |                             | Fortenza                  | Rascendo |
| Canola, rapeseed and mustard | Flea beetles (early season) | -                         | 400 mL   |
|                              | Cutworm                     | 500 mL                    | -        |
|                              | Flea beetles                | 1300 mL                   | -        |

## Application Information:

For use only in commercial seed treatment facilities with closed transfer systems. This product contains no colourant. An appropriate colourant must be added when this product is applied. Regulations pertaining to the *Seeds Act* must be strictly adhered to when using this product. Seed must be conspicuously coloured at the time of treatment.

## How it Works:

Cyantraniliprole is an insecticide belonging to the chemical class of diamides. Sulfoxaflor belongs to Group 4C insecticides. For more information, please consult with the product label.

## Tank Mixes:

Please refer to the product label.

## Restrictions:

- **Resistance management:** Refer to "Pathogen Resistance" in the Plant Disease Control section for more information. DO NOT make any subsequent application of a Group 4 insecticide (e.g. in-furrow or foliar application) following treatment with *Rascendo*.
- **Labelling:** Treated seed must be labelled "This seed has been treated with sulfoxaflor and cyantraniliprole insecticides. DO NOT use for food, feed or oil purposes. Store away from feeds and foodstuffs. When handling treated seed, including planting, wear a long-sleeved shirt, long pants, chemical-resistant gloves, work boots and socks, and use closed-cab planting equipment. Chemical-resistance gloves are not required inside cab. For good hygiene practice, it is also recommended to wear a suitable dust mask during all job activities."
- **Grazing:** No restrictions listed.
- **Re-cropping:** DO NOT plant any crop other than barley, wheat or members of Crop Group 1 (root and tuber vegetables), Crop Group 5 (Brassica leafy vegetables) or Crop Subgroup 20A (canola/rapeseed subgroup) within 30 days to fields in which treated seeds were planted.
- **Storage:** Store in a well-ventilated, secure area. Avoid contamination of feed and foodstuffs. Ideal storage temperature is above freezing and below 30°C. Repeated freeze-thawing will not affect the physical integrity of the product. If the product should freeze, bring the product back to room temperature and ensure the contents are mixed well prior to application.
- **Environment:** DO NOT apply this product directly to freshwater habitats, estuaries or marine habitats. The use of this chemical may result in contamination of groundwater particularly in areas where soils are permeable and/or the depth of the water table is shallow. DO NOT contaminate irrigation or drinking water supplied or aquatic habitats by cleaning or equipment or disposal of wastes. Toxic to bees exposed to direct treatment, when used as a seed treatment according to label directions risk is not of concern. Any spilled or exposed seeds must be incorporated into the soil or otherwise cleaned-up from the soil surface.

## Hazard Rating:

**Rascendo:**

None listed.

**Fortenza:**

Caution – Eye Irritant

Refer to the introduction for an explanation of the symbols.

# General Storage Disinfectant

## Company:

Ag-Services Inc. (PCP#14957)

Distributed by JEM Holdings Inc. in Saskatchewan and by White Potato Services Ltd. in Manitoba

## Formulation:

10% n-Alkyl (40% C12, 50% C14, 10% C16) dimethyl benzyl ammonium chloride, formulated as a liquid.

- Container sizes - 4 to 200 L

## Crops:

Use for disinfecting potato storages and other storage areas and equipment. Not for direct use on potatoes.

## Diseases:

Control of bacterial ring rot in potato storage.

## Rate:

60 mL per 10 L water.

## Application Information:

Apply only when storage areas are empty. To disinfect hard non-porous walls and floors of potato storages, clean surfaces thoroughly with a broom or vacuum to remove all dirt and debris. Clean thoroughly with solution containing 60 mL in 10 L of water. Ensure surfaces and material are thoroughly saturated and remain wet for 10 minutes.

A solution of the same strength (60 mL in 10 L of water) can be used to disinfect used bags, potato planters and other machinery after all dirt has been removed. Ensure surfaces and material are thoroughly soaked and remain wet for 20 minutes.

**Equipment:** All handling and planting equipment should be cleaned and treated on a regular basis (daily when preparing seed and seed pieces). Treat equipment by mopping and brushing methods. Use 60 mL of disinfectant diluted in 10 L of water or 600 mL to 100 L drum. Ensure hard, non-porous surfaces are thoroughly saturated and remain wet for 10 minutes and all other items for 20 minutes.

**Storage walls and ceilings:** Use 600 mL of disinfectant in 100 L of water. Spray areas using a high pressure jet (up to 4250 kPa pressure) to penetrate cracks, etc. in floors. Spray A frames and other storage air ducts with a solution of 1.2 L per 100 L of water. Sub-surface air ducts, flumes and plenums should be thoroughly cleaned prior to disinfection. Use 60 mL of disinfectant diluted in 10 L of water or 600 mL to 100 L drum. Ensure hard, non-porous surfaces are thoroughly saturated and remain wet for 10 minutes and all other items for 20 minutes.

## Tank Mixes:

DO NOT mix with soaps, detergents, foaming agents or surfactants.

## Hazard Rating:

Caution – Corrosive

**Other precaution:** Corrosive, causes severe eye and skin damage. DO NOT get in eyes, on skin or on clothing. Avoid contamination of food. DO NOT breathe mist of diluted chemical created from pressure washer applications. Wear suitable protective clothing (gloves, goggles, rubber boots, wet suit, mist respirator) when using pressure washer system. Wear chemical-resistant gloves, long pants, a long-sleeved shirt and shoes when handling this concentrate.

Refer to the Introduction for an explanation of the symbols.

# Heads Up Plant Protectant

Fungicide Group  
NC

## Company:

Heads Up Plant Protectants, Inc. (PCP#29827)

## Formulation:

63.02% saponins of *Chenopodium quinoa* formulated as a soluble powder.

- Container size - 50 g pouches

## Crops and Diseases:

| Crop                         | Diseases Suppressed                                                                                                                                                                  |
|------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Potato (cut or whole tubers) | Rhizoctonia canker and black scurf ( <i>Rhizoctonia solani</i> )                                                                                                                     |
| Soybean                      | Root rot and post-emergence damping-off ( <i>Rhizoctonia solani</i> ), white mould ( <i>Sclerotinia sclerotiorum</i> ), sudden death syndrome (SDS) ( <i>Fusarium virguliforme</i> ) |
| Dry bean                     | White mould ( <i>Sclerotinia sclerotiorum</i> ), root rot and post-emergence damping-off ( <i>Rhizoctonia solani</i> )                                                               |

## Rate Information:

Mix 1 gram of product per 1 L of water. Apply 1 L of solution for every 100 to 264 kg of potato seed. For soybeans and dry beans mix 50 g package to 3 L of water. Each 37 mL of solution treats 100 kg of seed.

## Application Information:

Treat soybean or dry bean seed by dipping, spraying or dribbling the solution into a rotation auger conveyor or some other approved seed treatment device. Spray application to seeds within an enclosed spray device to ensure thorough coverage.

For seed potatoes, product must be applied to germination seed potatoes, as indicated by obvious sprouting activity coming from potato eyes. This sprouting activity can be from peeking to full sprout length, but before green leaves appear.

## How it Works:

The active ingredient saponins of *Chenopodium quinoa* is made from plant sources. Refer to "Fungicide Modes of Action" in the Plant Disease Control section for more information.

## Tank Mixes:

None listed.

## Restrictions:

- **Resistance management:** Refer to "Pathogen Resistance" in the Plant Disease Control section for more information.
- **Labelling:** No restrictions listed.
- **Grazing:** No restrictions listed.
- **Re-cropping:** No restrictions listed.
- **Storage:** Store this product away from food or feed. Store above -12°C.
- **Environment:** DO NOT contaminate irrigation or drinking water supplies or aquatic habitats. This product is toxic to aquatic organisms.

## Hazard Rating:

Caution – Poison

Refer to the Introduction for an explanation of the symbols.

# Helix Vibrance

Available to commercial seed treaters only.

Fungicide Group  
3, 4, 12, 7  
Insecticide Group  
4A

## Company:

Syngenta Canada Inc. (PCP#31454)

## Formulation:

269 g/L thiamethoxam, 16 g/L difenoconazole, 5 g/L metalaxyl-M and S isomer, 1.7 g/L fludioxonil, and 3.4 g/L sedaxane formulated as a suspension.

- Container sizes - 105 L to bulk

## Crops, Diseases, Insects and Rates:

| Crop                                                                                                  | Diseases Controlled                                                                                                                                                                                                                                       | Insects Controlled          | Rate (per 100 kg of seed) |
|-------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------|---------------------------|
| Canola, rapeseed, and mustard (both oilseed and condiment types, including <i>Brassica carinata</i> ) | Seed-borne blackleg ( <i>Leptosphaeria maculans</i> ), seed-borne Alternaria ( <i>Alternaria</i> spp.), seedling disease complex (damping-off, seedling blight, seed rot, root rot) ( <i>Pythium</i> spp., <i>Fusarium</i> spp., <i>Rhizoctonia</i> spp.) | Flea beetles (early-season) | 1500 mL                   |

## Application Information:

For use only in commercial seed treatment facilities with closed transfer systems. *Helix Vibrance* is a premix formulation that includes a pigment. However, users are responsible for ensuring that the treated seed, when dried and ready for bagging, has an unnatural colour. If the pigment contained in the formulation does not colour the seed adequately, or to optimize seed coverage, water, additional colourant and polymers can be added to facilitate application. Use standard commercial seed treatment equipment that provides uniform seed coverage to ensure desired level of insect or disease control. Maintain constant product agitation during the seed treatment process. Allow the seed to dry before bagging. Treatment of highly mechanically scarred or damaged seed, or seed known to be of low vigour and poor quality, may result in reduced germination and/or reduction of seed and seedling vigour.

## How it Works:

The active ingredient thiamethoxam is a systemic insecticide from the neonicotinoid chemical class. For more information refer to "Insecticide Groups Based" on Modes of Action in the Insect Control section. The active ingredient difenoconazole is a triazole fungicide with broad-spectrum systemic activity. The active ingredient metalaxyl-M is an acylalanine fungicide with systemic activity against diseases caused by the Oomycetes class, including *Pythium* damping off. The active ingredient fludioxonil is a phenylpyrrole chemistry and has contact activity. Refer to "Fungicide Modes of Action" in the Plant Disease Control section for more information.

## Tank Mixes:

None listed.

## Restrictions:

- **Resistance management:** Refer to Pathogen Resistance in the Plant Disease Control section for more information.. DO NOT make any subsequent application of a Group 4 insecticide (e.g. in-furrow or foliar application) following treatment with *Helix Vibrance*.
- **Labelling:** Treated seed must be labelled "This seed has been treated with *Helix Vibrance* which contains insecticide (thiamethoxam) and fungicides (difenoconazole, metalaxyl-M and S-isomer, fludioxonil, and sedaxane). Wear long- sleeve shirt, long pants, and chemical-resistant gloves when handling treated seed. DO NOT use for food, feed or oil processing. Store away from food and feed.
- **Grazing:** DO NOT graze or feed livestock on treated areas.
- **Re-cropping:** DO NOT plant any crop other than those on the *Helix Vibrance* or *Vibrance 500FS* labels within 60 days to fields in which seed treated with *Helix Vibrance* were planted.
- **Storage:** Store in a well-ventilated, secure area. Store away from food and feed. Ideal storage temperature is above freezing and below 30°C. Repeated freeze-thawing will not affect the physical integrity of the product. If the product should freeze, bring the product back to room temperature and ensure the contents are mixed well prior to application. Lab and field studies have shown that *Helix Vibrance* treated canola and mustard can be safely stored for 18 months without loss in germination or insect and disease performance. However, due to seed quality and seed storage conditions beyond the control of Syngenta Canada Inc., no claims are made to guarantee the germination of carry-over seed or propagating materials for all crop seed.

- **Environment:** TOXIC to bees, aquatic organisms, birds, and small mammals. Bees can be exposed to product residues in flowers, leaves, pollen and/or nectar resulting from seed treatment applications. Any spilled or exposed seeds must be incorporated into the soil or cleaned up. DO NOT apply directly to water, or to areas where surface water is present. In cleaning of equipment or disposing of wastes, DO NOT contaminate water used for human or animal consumption or by wildlife and aquatic life or for irrigation purposes. If treated seed is spilled outdoors, promptly clean up.

## Hazard Rating:

Caution – Poison

Refer to the Introduction for an explanation of the symbols.

# Imidacloprid

*Sombrero 600 FS/Stress Shield 600*

**Insecticide Group  
4A**

## Company:

Bayer (*Stress Shield 600 Seed Treatment* – PCP#30668)

ADAMA Canada (*Sombrero 600FS* – PCP#30505)

## Formulations:

*Sombrero 600 FS* and *Stress Shield 600*: 600 g/L imidacloprid. Contains insecticide only.

## Crops, Insects and Rates:

| Product                                                                      | Crop                                               | Insects Controlled                        | Rate                         |
|------------------------------------------------------------------------------|----------------------------------------------------|-------------------------------------------|------------------------------|
| <i>Sombrero 600 FS</i> <sup>1</sup><br><i>Stress shield 600</i> <sup>1</sup> | Wheat, barley, oat <sup>2</sup>                    | Wireworms                                 | 17 to 50 mL/100 kg of seed   |
|                                                                              | Soybean <sup>3</sup>                               | Seedcorn maggot, wireworms, soybean aphid | 104 to 208 mL/100 kg seed    |
| <i>Sombrero 600 FS</i> <sup>1</sup>                                          | Canola, mustard (condiment-type only) and rapeseed | Flea beetles                              | 667 to 1333 mL/100 kg seed   |
|                                                                              | Corn                                               | Wireworms                                 | 21.3 mL product/80,000 seeds |
| <i>Stress shield 600</i> <sup>1</sup>                                        | Dry bean                                           | Wireworms                                 | 104 mL/100 kg seed           |
|                                                                              | Field pea                                          | Wireworms                                 | 104 mL/100 kg seed           |
|                                                                              |                                                    | Pea leaf weevil                           | 104 to 208 mL/100 kg seed    |
|                                                                              | Faba bean                                          | Pea leaf weevil, wireworms                | 104 mL/100 kg seed           |
|                                                                              | Chickpea, lentil                                   | Wireworms                                 | 104 mL/100 kg seed           |

<sup>1</sup> DO NOT apply any subsequent applications of Group 4 Insecticide (e.g. in-furrow or foliar application) following treatment with *Sombrero 600 FS* or *Stress Shield 600*.

<sup>2</sup> For fields with a history of moderate to high wireworm pressure, treat crops 34 to 50 mL per 100 kg seed. Use the higher rate when infestation pressures are expected to be heavy.

<sup>3</sup> Use the higher rate for earlier seeding or when insect populations are expected to be high in soybean and peas and for extended control period for aphids in soybean.

## Application Information:

May be applied when potato pieces are being cut. Apply specified dosage as a diluted spray onto seed-pieces using a shielded spray system that is well contained and will prevent the loss of any liquid. DO NOT dilute *Sombrero 600 FS* beyond 6 percent. Agitate or stir spray solution as needed. Complete coverage of the seed piece is required for optimal insect control. As part of the seed cutting and treating process, application of a fungicide registered for potato seed treatment or an inert absorbent ingredient is recommended. Apply *Stress Shield 600* through a slurry applicator seed treater for uniform seed coverage. Allow seeds to dry before bagging or storing in bulk containers.

**NOTE:** A colourant must be added to *Sombrero 600 FS* and *Stress Shield 600* to colour seed in accordance with the *Pest Control Products Act* and the *Seeds Act Regulations*. A blue colourant must be added when this product is applied to an oilseed.

## How it Works:

Imidacloprid is a chloronicotinyl insecticide with systemic activity. Refer to "Insecticide Groups Based on Modes of Action" in the Insect Control section for more information.

## Tank Mixes:

*Stress Shield 600* is registered for tank mix with the fungicide seed treatments *Raxil PRO*, or *EverGol Energy* in cereals. *Stress Shield 600* is registered for tank mix with fungicide seed treatments *Allegiance*, *EverGol Energy*, or *Apron Maxx RTA* in pulses.

Off-label tank mixes, as previously permitted under the Pest Management Regulatory Agency (PMRA) Off-label Tank Mix Policy memo of 2009 are no longer allowed under new guidance from PMRA. As of December 20, 2022 only products specifically indicated on product labels may be mixed, or when the labels of two or more products to be mixed include the statement quoted in the Introduction.

Follow the label directions for each product and use the most restrictive precautions and limitations for either product.

## Restrictions:

**NOTE:** When using a seed flow lubricant for planting corn and soybean seed treated with neonicotinoid insecticides (containing the active ingredients clothianidin, imidacloprid or thiamethoxam), use only a dust-reducing fluency agent. Talc and graphite are not permitted.

- **Labelling:** All bags containing *Sombrero 600 FS/Stress Shield 600*-treated seed must be labeled or tagged as followed: "This seed has been treated with *Sombrero 600 FS/Stress Shield 600*, which contains imidacloprid. DO NOT use for feed, food, or oil processing. Store away from feeds and other foodstuffs."
- **Grazing:** Cover crops that are used as a rotational crop without a plant-back interval following treatment should not be grazed or harvested for food or feed. DO NOT graze or feed livestock on areas treated with *Sombrero 600 FS* and *Stress Shield 600* for four weeks after planting. Mustard greens grown or harvested from *Sombrero 600 FS*-treated seed must not be used for human consumption.
- **Re-cropping:** Use a minimum plant-back interval of 30 days for cereals, 9 months for peas and beans, and 12 months for all other food and feed crops. Green manure and other cover crops not intended for human or animal consumption do not require a plant-back interval following treatment. DO NOT graze or harvest cover crops for food or feed. It is not recommended that this product be used in fields treated with imidacloprid during the previous season.
- **Storage:** Store product in cool, dry place and in such a manner as to prevent cross contamination with other pesticides, fertilizers, food and feed. Store in original container and out of reach of children. Carry-over of *Sombrero 600 FS*-treated seed is not recommended (treated canola, rapeseed or mustard (condiment-type only) seed stored for periods in excess of 6 months may decrease at a faster rate than untreated seed). Test seed germination if stored for more than 6 months. DO NOT store *Sombrero 600 FS*-treated seed above 25°C or in direct sunlight. DO NOT store *Stress Shield 600* in direct sunlight or above 35°C.
- **Environment:** DO NOT plant treated seed pieces when rainfall is forecast for the next 48 hours. DO NOT plant treated seed pieces within 15 metres of well-head or aquatic systems, including marshes, ponds, ditches, streams, lakes, etc. This product is toxic to wildlife. Keep out of lakes, streams, ponds, or other aquatic systems. DO NOT contaminate water when disposing of equipment wash waters. Leftover treated seed should be double sown around the headland, or buried away from water sources such as lakes, streams, ponds or other aquatic systems. *Stress Shield 600* spillage and exposed treated seeds must be incorporated into the soil or otherwise cleaned-up from the soil surface.

## Hazard Rating:

Caution – Poison

Refer to the Introduction for an explanation of the symbols.

# Insure Cereal FX4

Fungicide Group  
3, 4, 7, 11

## Company:

BASF Canada (PCP#33210)

## Formulation:

16.7 g/L pyraclostrobin, 8.35 g/L fluxapyroxad, 16.7 g/L triticonazole, 10 g/L metalaxyl formulated as a liquid suspension.

- Container sizes - 2 x 9.8 L jug, 120 L drum, 450 L tote

## Crops, Diseases and Rates:

| Crop                                                       | Diseases Controlled                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | Diseases Suppressed                                                                                               | Rate per 100 kg of seed |

## Application Information:

*Insure Cereal FX4* is a ready-to-use broad spectrum fungicide seed treatment in a waterbased formulation that provides preventive seed and seedling protection. For use on farm and on closed transfer commercial seed treatment facilities. Closed transfer includes closed mixing, loading, calibrating and closed treatment equipment.

Apply *Insure Cereal FX4* using standard slurry, gravity flow or mist-type seed treatment application equipment. Agitate or shake well prior to use. Thorough seed coverage will offer the best protection of the seed from seed-, soil-borne, and seedling diseases. When used at the recommended rate of 300 mL per 100 kg seed, no additional dyes or dilutions with water are needed unless recommended by the manufacturer of the seed treatment application equipment/machines. If so, increase the use rate proportionally to the dilution rate (e.g. add 100 mL of water to 300 mL of *Insure Cereal FX4*, then apply at 400 mL per 100 kg seed). Please consult the seed treatment application equipment manufacturer in question for further directions.

## How it Works:

Pyraclostrobin is a strobilurin fungicide with systemic broad spectrum activity against seed and soil borne diseases. It inhibits fungal metabolism by blocking mitochondrial respiration. Fluxapyroxad is a carboximide fungicide that provides systemic broad-spectrum protection against seed- and soil-borne diseases. Triticonazole is a triazole based fungicide that provides systemic broad spectrum protection against seed and soil borne diseases. Metalaxyl is an acylanine fungicide with systemic activity against diseases caused by Oomycete fungi, most commonly known as *Pythium*.

## Tank Mixes:

None listed.

## Restrictions:

- **Resistance management:** Refer to "Pathogen Resistance" in the Plant Disease Control section for more information.
- **Labelling:** Treated seed must be labelled as follows "This seed has been treated with *Insure Cereal FX4* containing fungicides pyraclostrobin, fluxapyroxad, triticonazole and metalaxyl. Workers handling or planting treated seed must wear long-sleeved shirt, long pants, chemical-resistant gloves, shoes and socks. Workers handling treated seed should wear suitable dust mask. DO NOT use for food, feed or oil processing. Store away from feed and food stuff. Any spilled or exposed seeds must be incorporated into the soil or otherwise cleaned-up from the soil surface."

- **Grazing:** No restrictions listed.
- **Re-cropping:** No restrictions listed.
- **Storage:** Store in original tightly closed container and the ideal storage temperature is above freezing and below 30°C. If *Insure Cereal FX4* freezes, bring to room temperature and agitate prior to use. To prevent contamination, store this product away from food and feed. Store in cool, dry, locked, well-ventilated area without floor drain.
- **Environment:** Ensure proper soil incorporation of the seeds. DO NOT feed treated seed to, or otherwise expose, wildlife or domestic birds. If treated seed is spilled outdoors or in areas accessible to birds, promptly clean up or bury to prevent ingestion. Ensure proper disposal of any surplus treated seed not intended for later planting. DO NOT contaminate domestic or irrigation water supplies, lakes, streams, ponds or any body of water with the chemical, used containers, treated seed or bags, which have held treated seed. DO NOT contaminate water by cleaning of equipment or disposal of wastes. Unused or leftover treated seed should not be stored where there is a chance of it becoming mixed with untreated seed.

Toxic to aquatic organisms. The use of this product may result in contamination of groundwater particularly in areas where soils are permeable (e.g. sandy soil) or the water table is shallow. To reduce runoff from treated areas into aquatic habitats, consider the characteristics and conditions of the site before treatment. Site characteristics and conditions that may lead to runoff include, but are not limited to, heavy rainfall, moderate to steep slope, bare soil, poorly draining soil (e.g. compacted or fine-textured soils such as clay). Avoid application of this product when heavy rain is forecast.

### Hazard Rating:

Caution – Poison

Caution – Eye Irritant and Potential Skin Sensitizer

Warning – Contains the Allergen Soy

Refer to the Introduction for an explanation of the symbols.

# Insure Pulse

Fungicide Group  
4, 7, 11

### Company:

BASF Canada (PCP#32011)

### Formulation:

16.7 g/L pyraclostrobin, 16.7 g/L fluxapyroxad and 13.3 g/L metalaxyl formulated as a liquid flowable.

- Container sizes - 9.8 L, 120 L drum, 450 L tote

### Crops, Diseases and Rates:

| Crops                                                     | Diseases controlled                                                                                                                                                                                                                                                                         | Diseases suppressed                                                                                                                                                                             | Rates per 100 kg of seed |
|-----------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------|
| Chickpea, dry bean, faba bean, field pea, lentil, soybean | Seed rot and seedling blight (soil-borne <i>Fusarium</i> spp.); seed rot, seedling blight and root rot (soil-borne <i>Rhizoctonia solani</i> ); seed rot and seedling blight (soil-borne <i>Pythium</i> spp.); seedling blight (seed-borne <i>Ascochyta</i> spp.)                           | Anthrachnose seedling blight (seed-borne <i>Colletotrichum lindemuthianum</i> ); root rot (soil-borne <i>Fusarium</i> spp.); seed rot and seedling blight (seed-borne <i>Botrytis cinerea</i> ) | 300 mL                   |
| Flax                                                      | Seed rot, seedling blight and root rot (soil-borne <i>Fusarium</i> spp.; soil-borne <i>Rhizoctonia solani</i> )                                                                                                                                                                             | -                                                                                                                                                                                               | 300 to 600* mL           |
| Mustard                                                   | Seed rot, seedling blight and root rot (soil-borne <i>Fusarium</i> spp.; soil-borne <i>Rhizoctonia solani</i> , soil-borne <i>Leptosphaeria maculans</i> **); seed rot and seedling blight (soil-borne <i>Pythium</i> spp.); seedling blight and root rot ( <i>Alternaria brassicae</i> **) | -                                                                                                                                                                                               | 600 mL                   |

\* Use the lower rate under normal field conditions. Use the higher rate if there is a history of high disease pressures in the field OR where field conditions favour seed and soil-borne pathogens.

\*\*For control on crops that are members of the Brassicaceae family only (e.g. *Brassica* sp.).

## Application Information:

A ready-to-use seed treatment formulation for use in commercial seed treatment plants and for use in on-farm standard gravity flow or mist type treatment machines. Can also be used in "On the Go" air seeder treatment systems. When used at the recommended rate of 300 mL per 100 kg seed, no additional dyes or dilutions with water are needed unless recommended by the manufacturer of the seed treatment application equipment.

**NOTE:** If using the 600 mL per 100 kg rate (flax), it is highly recommended that the seed be treated into a bin or truck box to allow the treated seed to dry prior to placing into the seeder hopper. This will prevent clumping and bridging in the seeder.

## How it Works:

The active ingredient pyraclostrobin is a strobilurin fungicide with broad spectrum contact and systemic activity. Fluxapyroxad is a carboximide fungicide that provides systemic broad spectrum protection. Metalaxyl is an acylalanines fungicide with systemic activity. Refer to "Fungicide Modes of Action" in the Plant Disease Control section for more information.

## Tank Mixes:

None listed.

## Restrictions:

- **Resistance management:** Refer to "Pathogen Resistance" in the Plant Disease Control section for more information.
- **Labelling:** Treated seed must be labeled "This seed has been treated with *Insure Pulse* containing pyraclostrobin, fluxapyroxad and metalaxyl. DO NOT use for food, feed or oil processing."
- **Grazing:** DO NOT graze or feed livestock on treated areas for 4 weeks after planting.
- **Re-cropping:** No restrictions listed.
- **Storage:** Store treated seed in cool, dry, locked, well-ventilated area without a floor drain. Store in original tightly closed container and prevent freezing.
- **Environment:** Toxic to birds and wildlife. Ensure proper soil incorporation of the seeds. If treated seed is spilled outdoors or in areas accessible to birds, promptly clean up or bury to prevent ingestion. Ensure proper disposal of any surplus treated seed not intended for later planting. DO NOT contaminate domestic or irrigation water supplies, lakes, streams, ponds or any body of water with the chemical, used containers, treated seed or bags that have held treated seed. DO NOT contaminate water by cleaning of equipment or disposal of wastes. The use of this chemical may result in contamination of groundwater, particularly in areas where soils are permeable (e.g. sandy soil) and/or the depth to the water table is shallow.

### Application Information:

For use with closed transfer commercial seed treaters (facilities and mobile treaters). Closed transfer includes closed mixing, loading, calibrating, and closed treatment equipment. Also, for use in on-farm treatment of wheat with open or closed transfer equipment.

### Tank Mixes:

For control of wireworm, apply NipsIt INSIDE 600 Insecticide at 17-83 mL/100 kg seed.

### Restrictions:

- Labelling: Treated seed must be labeled "This seed has been treated with a product containing the active ingredient clothianidin, ethaboxam, metalaxyl, and metconazole. DO NOT use treated seed for feed, food or oil processing. Store away from feeds and other foodstuffs. Wear long-sleeved shirt, long pants and chemical-resistant gloves when handling treated seed. This product is toxic to aquatic invertebrates, oysters and shrimp. Dispose of all excess treated seed. Left over treated seed may be double-sown around the headland or buried away from water sources in accordance with local requirements. Dispose of seed packaging in accordance with local requirements. Cover or incorporate spilled treated seeds."
- Grazing: Do not graze or feed livestock on treated areas for 4 weeks after planting.
- Re-cropping: Corn, canola, rapeseed and wheat may be replanted at any time.
- Storage: Store in a cool place, out of direct sunlight. Protect from freezing temperatures.
- Environmental Restrictions: Toxic to aquatic organisms and bees.

### Application Information:

For use with closed transfer commercial seed treaters (facilities and mobile treaters). Closed transfer includes closed mixing, loading, calibrating, and closed treatment equipment. Also for use in on-farm treatment of cereal grains (except corn) and pulse crops only with open or closed transfer equipment. This product contains no colourant. An appropriate colourant must be added when the product is applied to the seed.

### How it Works:

The active ingredient ethaboxam is a benzamide fungicide with activity against diseases caused by oomycetes. Refer to "Fungicide Modes of Action" in the Plant Disease Control section for more information.

### Tank Mixes:

Off-label tank mixes, as previously permitted under the Pest Management Regulatory Agency (PMRA) Off-label Tank Mix Policy memo of 2009 are no longer allowed under new guidance from PMRA. As of December 20, 2022 only products specifically indicated on product labels may be mixed, or when the labels of two or more products to be mixed include the statement quoted in the Introduction.

### Restrictions:

- **Resistance management:** Refer to "Pathogen Resistance" in the Plant Disease Control section for more information.
- **Labelling:** Treated seed must be labeled "This seed has been treated with a product containing the active ingredient ethaboxam. DO NOT use treated seed for feed, food or oil processing. Store away from feeds and other foodstuffs. Wear long-sleeved shirt, long pants and chemical-resistant gloves when handling treated seed. This product is toxic to aquatic invertebrates, oysters and shrimp. Dispose of all excess treated seed. Left over treated seed may be double-sown around the headland or buried away from water sources in accordance with local requirements. Dispose of seed packaging in accordance with local requirements. Cover or incorporate spilled treated seeds."
- **Grazing:** DO NOT graze field pea grown from treated seeds, or feed field pea forage or hay from such fields to livestock.
- **Re-cropping:** No restrictions listed.
- **Storage:** To prevent contamination store this product away from food or feed. Store in a cool place. DO NOT store in direct sunlight. Protect from freezing temperatures.
- **Environment:** Toxic to aquatic organisms.

### Hazard Rating:

None listed.

# Interest Forte

Fungicide Group

| Spring wheat | Seed rots caused by saprophytic organisms <i>Fusarium</i> spp., <i>Pythium</i> spp. <i>Penicillium</i> spp. and <i>Aspergillus</i> spp. Common root rot, damping-off and seedling blight caused by seed- and soil-borne <i>Fusarium</i> spp. Pythium root rot, damping-off and seedling blight caused by soil-borne <i>Pythium</i> spp., septoria leaf blotch caused by seed-borne <i>Septoria tritici</i> <sup>1</sup> , common bunt caused by seed-borne <i>Tilletia</i> spp. <sup>1</sup> , loose smut ( <i>Ustilago tritici</i> )                                                                         |                                                                                                                                                                                       |                            |

<sup>1</sup> Use the 650 mL rate for control of these diseases.

<sup>2</sup> Suppression means consistent control at a level which is not optimal but is still of commercial benefit.

<sup>3</sup> Early season foliar disease control for first 4 weeks after planting. For full season control, apply a foliar fungicide according to label directions.

## Application Information:

*Interest Forte* is a ready-to-use water-based formulation for use in commercial seed treatment plants, and for on-farm treatment using standard gravity flow or mist type seed treatment equipment which accurately meters and mixes a flowable seed treatment. *Interest Forte* may also be used in a treat-on-the-go air seeder. The equipment must provide uniform coverage of *Interest Forte* on the seed.

## How it Works:

Difenoconazole is a triazole fungicide with broad-spectrum systemic activity. Metalaxyl is an acylalanine fungicide with systemic activity against diseases caused by the oomycetes, including pythium damping-off. Refer to "Fungicide Modes of Action" in the Plant Disease Control section for more information.

## Tank Mixes:

For the control of true loose smut (*Ustilago nuda*) in barley, mix *Interest Forte* with either *Charter*, *Raxil 250FL* or *Baytan 30*. Consult each product label for registered use rates and follow all label use instructions. Read the label directions for each product and follow the most restrictive label precautions and limitations.

## Restrictions:

- **Resistance management:** Refer to "Pathogen Resistance" in the Plant Disease Control section for more information.
- **Labelling:** ALL SEED TREATED WITH THIS PRODUCT MUST BE CONSPICUOUSLY COLOURED. All containers or packages containing treated seed for sale or use in Canada must be labeled or tagged as follows: "This seed has been treated with *Interest Forte* which contains the fungicides difenoconazole and metalaxyl-M and S-isomer. DO NOT use for food, feed or oil purposes. Store away from feeds and foodstuffs. Wear long-sleeve shirt, long pants, and chemical-resistant gloves when handling treated seed. DO NOT graze, feed green forage or cut for hay within 35 days of planting of cereals. DO NOT plant any crop other than cereals within 30 days to fields in which treated seeds were planted."
- **Grazing:** DO NOT graze, feed green forage or cut for hay within 35 days of planting treated cereal grain seeds.
- **Re-cropping:** 30 days
- **Storage:** Store this product away from food or feed.
- **Environment:** Toxic to aquatic organisms. Any spilled or exposed seeds must be incorporated into the soil or otherwise cleaned-up from the soil surface.

## Hazard Rating:

| Wheat     | General seed rots (including those caused by saprophytic organisms such as <i>Penicillium</i> spp. and <i>Aspergillus</i> spp.); seed rot, damping off and seedling blight ( <i>Fusarium</i> spp., <i>Rhizoctonia</i> spp., seed- and soil-borne <i>Cochliobolus sativus</i> ); seed rot, pre-emergence damping off and seedling blight ( <i>Pythium</i> spp.); loose smut ( <i>Ustilago tritici</i> ); common bunt ( <i>Tilletia tritici</i> , <i>T. laevis</i> )                         | Common root rot ( <i>Cochliobolus sativus</i> ); crown and foot rot ( <i>Fusarium</i> spp.) | 325 mL                     |
| Barley    | General seed rots (including those caused by saprophytic organisms such as <i>Penicillium</i> spp. and <i>Aspergillus</i> spp.); seed rot, damping off and seedling blight ( <i>Fusarium</i> spp., <i>Rhizoctonia</i> spp., seed- and soil-borne <i>Cochliobolus sativus</i> ); seed rot, pre-emergence damping off and seedling blight ( <i>Pythium</i> spp.); covered smut ( <i>Ustilago hordei</i> ); false loose smut ( <i>U. nigra</i> ); leaf stripe ( <i>Pyrenophora graminea</i> ) |                                                                                             | 325 to 433 mL*             |
|           | True loose smut ( <i>Ustilago nuda</i> )                                                                                                                                                                                                                                                                                                                                                                                                                                                   |                                                                                             |                            |
| Oats      | Loose smut ( <i>Ustilago avenae</i> ); covered smut ( <i>U. kollerii</i> ); seed rot and seedling blight ( <i>Fusarium</i> spp., <i>Cochliobolus sativus</i> , <i>Aspergillus</i> spp., <i>Penicillium</i> spp., <i>Rhizoctonia</i> spp.); seed rot, pre-emergence damping off and seedling blight ( <i>Pythium</i> spp.).                                                                                                                                                                 | Common root rot ( <i>Cochliobolus sativus</i> ); crown and foot rot ( <i>Fusarium</i> spp.) | 325 mL                     |
| Rye       | Seed rot and seedling blight ( <i>Fusarium</i> spp., <i>Cochliobolus sativus</i> , <i>Aspergillus</i> spp., <i>Penicillium</i> spp., <i>Rhizoctonia</i> spp.); seed rot, pre-emergence damping off and seedling blight ( <i>Pythium</i> spp.).                                                                                                                                                                                                                                             |                                                                                             |                            |
| Triticale | Seed rot and seedling blight ( <i>Pythium</i> spp.).                                                                                                                                                                                                                                                                                                                                                                                                                                       |                                                                                             |                            |

\*Use the higher rate for highly infected seed lots only.

## Application Information:

Cover 2 is for both commercial and for on farm application. Products may be applied utilizing mechanical, slurry or mist-type seed treating equipment provided that the equipment can be calibrated to accurately and uniformly apply the product to seed. Uniform application to seed is necessary to assure best disease protection and optimum performance.

Closed mix/load equipment must be used in commercial seed treatment facilities. In most cases, Cover 2 is ready to use and can be applied undiluted. However, dilution with water or container rinsate may be appropriate for some types of treaters and/or treating under dry and/or hot conditions to achieve more uniform product to seed coverage. Contact your local representative or supplier for specific recommendations.

## How it Works:

The active ingredient ipconazole is a demethylation inhibitor with systemic and contact activity and metalaxyl is an acylalane fungicide with systemic activity. Refer to "Fungicide Modes of Action" in the Plant Disease Control section for more information.

## Tank Mixes:

None listed.

## Restrictions:

- **Resistance management:** Refer to "Pathogen Resistance" in the Plant Disease Control section for more information.
- **Labelling:** All bags containing treated seed for sale or use in Canada must be labeled as follows: "This package or bag contains seed treated with ipconazole and metalaxyl. DO NOT use treated seed for food, feed or oil processing. Store away from food and feed. Handlers of treated seed must wear long sleeved coveralls over normal work clothing, chemical resistant gloves, and shoes plus socks. Treated seed is toxic to birds and small wild mammals. Any spilled or exposed seed must be incorporated into the soil or otherwise cleaned up from the soil surface."

- **Grazing:** DO NOT graze or feed livestock on treated areas for 30 days after planting.
- **Re-cropping:** No restrictions listed.
- **Storage:** Store in original container only, away from other pesticides, fertilizer, food or feed. Store in a secure place that is temperate, dry and out of direct sunlight. Avoid excess heat. DO NOT freeze.
- **Environment:** DO NOT contaminate water used for human or animal consumption or by wildlife and aquatic life or for irrigation purposes.

### Hazard Rating:

None listed.

# Lumisena

Fungicide Group  
49

### Company:

Corteva Agriscience (PCP#33001)

### Formulation:

200 g/L of oxathiapiprolin formulated as a flowable suspension.

- Container sizes - 52 L, 2 x 5.4 L

### Crops, Diseases and Rates:

| Crop      | Diseases Controlled                                                                                                     | Rate (per 100 kg of seed) |
|-----------|-------------------------------------------------------------------------------------------------------------------------|---------------------------|
| Soybean   | Control of phytophthora seed rot/pre-emergence damping off and post emergence damping off ( <i>Phytophthora sojae</i> ) | 37 mL                     |
| Sunflower | Control of systemic downy mildew ( <i>Plasmopara halstedii</i> )                                                        | 67 mL                     |

**\*Use the higher rates in areas with high disease pressure, or where extended earl season control is required.**

### Application Information:

*Lumisena* is for use in commercial seed treatment facilities only. It is not for use in on-farm treating systems such as hopper-box or slurry-box applications just prior to planting. Closed transfer includes closed mixing, loading, calibrating, and closed treatment equipment. No open transfer of *Lumisena* is permitted.

This product contains no colourant. An appropriate colourant must be added when this product is applied. Regulations pertaining to *The Seeds Act* must be strictly adhered to when using this product. Treatment of damaged seed, or seed known to be of low vigour and poor quality, may result in poor germination and/or seed and seedling vigour. In cases where seed quality is unknown, treat a small portion of the seed with *Lumisena* and confirm acceptable germination, prior to treating the entire seed lot.

**Mixing instructions:** Before transferring *Lumisena* from its container, thoroughly mix the contents to insure the product is homogenous. Dilute in a sufficient volume to obtain through, uniform coverage. Polymers, colourants, and other additives should be tested for compatibility and seed prior to use in combination with *Lumisena*.

### How it Works:

The active ingredient oxathiapiprolin is an oxysterol binding protein homologue inhibitor with activity against diseases caused by oomycete fungi including phytophthora seed rot and downy mildew.

### Tank Mixes:

None registered.

### Restrictions:

- **Resistance management:** Refer to "Pathogen Resistance" in the Plant Disease Control section for more information.
- **Labelling:** All bags containing treated seed must be labelled or tagged as follows: This seed has been treated with *Lumisena* which contains oxathiapiprolin.
- **Re-cropping:** Crops and crop groups that are on this label may be planted immediately after harvest. For all legume crops except succulent peas and soybeans, a plant back interval of 180 days is required. All other crops may be planted immediately following the planting of seed treated with *Lumisena*. Seed treated with *Lumisena* may be replanted if an emergency replanting is required due to an early season crop failure.

- **Storage:** Storage product in original container away from fertilizer, food or feed. Field and laboratory tests have demonstrated that application of *Lumisena* to soybean and sunflower will not negatively affect germination. However, due to seed quality and seed storage conditions beyond the control of Corteva Agriscience, no claims are made to guarantee the germination of carry-over seed.
- **Environment:** DO NOT contaminate irrigation or drinking water supplies or aquatic habitats by cleaning of equipment or disposal of waste. Dispose of all access treated seed. Left over treated seed may be double-sown around the headland or buried away from water sources in accordance with local requirements. Dispose of seed packaging in accordance local requirements. DO NOT contaminate water bodies when disposing of plant equipment washwaters. Cover or incorporate spilled treated seed.

**Hazard Rating:**

None listed.

Lumivia

Insecticide Group  
28

**Company:**

Corteva Agriscience (PCP#32154)

**Formulation:**

625 g/L of chlorantraniliprole formulated as a suspension.

- Container sizes - 1 L to Bulk

**Crops, Diseases and Rates:**

| Crop                     | Insects Controlled                                                                                 | Insects Suppressed | Rate                          |
|--------------------------|----------------------------------------------------------------------------------------------------|--------------------|-------------------------------|
| Corn (field, sweet, pop) | Cutworms, armyworm ( <i>Mythimna unipuncta</i> ), wireworms, larvae of May/June beetles (junebugs) | Seedcorn maggot    | 64 mL/unit (80,000 seed unit) |

**Application Information:**

*Lumivia Insecticide Seed Treatment* is an insecticide seed treatment for use in commercial seed treatment (facilities and mobile treaters) with closed transfer only. No open transfer is permitted. It is not for use in on farm treating systems such as hopper-box or slurry-box applications just prior to planting.

This product contains no colourant. An appropriate colourant must be added when this product is applied. Regulations pertaining to the *Seeds Act* must be strictly adhered to when using this product. Seed must be conspicuously coloured at the time of treatment.

Treatment of damaged seed, or seed known to be of low vigour and poor quality, may result in reduced germination and/or seed and seedling vigour. In cases where seed quality is unknown, treat a small portion of the seed with *Lumivia* and confirm acceptable germination, prior to treating the entire seed lot.

Dilute in a sufficient volume to obtain thorough, uniform coverage. Polymers, colourants, and other additives should be tested for compatibility and seed safety prior to use in combination with *Lumivia*.

Apply only in areas with adequate ventilation or in areas that are equipped to remove mist or dust.

DO NOT make a subsequent foliar application of any Group 28 insecticide for a minimum of 60 days after planting seed treated with *Lumivia*. If a foliar spray is required during this window, it must be made with an insecticide other than Group 28.

**How it Works:**

Chlorantraniliprole disrupts muscle activity in the insects, resulting in paralysis. Treated pests stop feeding quickly after initial ingestion, become lethargic and lose mobility. Refer to "Insecticide Groups Based on Modes of Action" in the Insect Control section for more information.

**Tank Mixes:**

Refer to the product label.

## Restrictions:

- **Resistance management:** Refer to "Pathogen Resistance" in the Plant Disease Control section for more information. For resistance management, please note that *Lumivia* contains a Group 28 insecticide. Any insect population may contain individuals naturally resistant to *Lumivia* and other Group 28 insecticides. The resistant individuals may dominate the insect population if this group of insecticides are used repeatedly in the same fields. Other resistance mechanisms that are not linked to site of action but are specific for individual chemicals, such as enhanced metabolism, may also exist. Appropriate resistance-management strategies should be followed.
  - **To delay insecticide resistance:** Where possible, rotate the use of *Lumivia* or other Group 28 insecticides with different groups that control the same pests in a field. Use tank mixtures with insecticides from a different group when such use is permitted. Insecticide use should be based on an IPM program that includes scouting, record keeping, and considers cultural, biological and other chemical control practices. Monitor treated pest populations for resistance development. Contact your local extension specialist or certified crop advisors for any additional pesticide resistance-management and/or IPM recommendations for the specific site and pest problems in your area. For further information or to report suspected resistance contact Production Agriscience Canada Company at 1-800-667-3852.
- **Labelling:** All bags containing treated seed must be labelled or tagged as follows: "This seed has been treated with *Lumivia Insecticide Seed Treatment* which contains chlorantraniliprole. DO NOT use for feed, food or oil processing. Store away from feeds and other foodstuffs. Wear long-sleeved shirt, long pants, chemical-resistant gloves and shoes plus socks when handling treated seed. This product is toxic to aquatic organisms. Dispose of all excess treated seed. Leftover treated seed may be double-sown around the headland or buried away from water sources in accordance with local requirements. Dispose of seed packaging in accordance with local requirements. Cover or incorporate spilled treated seeds. Toxic to birds. Any spilled or exposed seeds must be incorporated into the soil or otherwise cleaned up from the soil surface."
- **Grazing:** None listed.
- **Re-cropping:** None listed.
- **Storage:** Store product in original container only, away from other pesticides, fertilizer, food or feed. Not for use or storage in or around the home. Keep container closed. To prevent contamination, store this product away from food or feed. Field and laboratory tests have demonstrated that application of *Lumivia* to corn seed will not negatively affect germination. However, due to seed quality and seed storage conditions beyond the control of Corteva Agriscience, no claims are made to guarantee the germination of carry-over seed.
- **Environment:** This product is toxic to aquatic organisms. Residues of chlorantraniliprole are persistent and may carryover. It is recommended that any products containing chlorantraniliprole not be used in areas treated with this product during the previous season. The use of this chemical may result in contamination of groundwater particularly in areas where soils are permeable (e.g. sandy soil) and/or the depth of the water table is shallow. Dispose of all excess treated seed. Leftover treated seed may be double-sown around the headland or buried away from water sources in accordance with local requirements. Dispose of seed packaging in accordance with local requirements. Cover or incorporate spilled treated seeds. Treated seed is toxic to birds. Any spilled or exposed seeds must be incorporated into the soil or otherwise cleaned up from the soil surface. For information on disposal of unused, unwanted product, contact the manufacturer or the provincial regulatory agency. Contact the manufacturer and the provincial regulatory agency in case of a spill, and for clean-up of spills.

# Lumivia CPL

Insecticide Group  
28

## Company:

Corteva Agriscience (PCP#33335)

## Formulation:

625 g/L chlorantraniliprole formulated as a suspension.

- Container sizes - 4 x 3.5 L jugs per case.

## Crops, Insects and Rates:

| Crop                                             | Insects Controlled              | Rate per 100 kg of seed <sup>1</sup> |
|--------------------------------------------------|---------------------------------|--------------------------------------|
| Wheat, barley, oats, rye                         | Cutworm, armyworm               | 8 to 24 mL                           |
|                                                  | Wireworms                       | 24 to 40 mL                          |
|                                                  | Grasshoppers (suppression only) | 40 mL                                |
| Dry bean, chickpea, lentil, field pea, faba bean | Cutworm, armyworm               | 32 to 64 mL                          |
|                                                  | Pea leaf weevil larvae          | 64 to 96 mL                          |

<sup>1</sup> Use higher rates in areas with high pest pressure.

## Application Information:

For use in commercial and on-farm treating facilities. This product contains no colourant. An appropriate colourant must be applied when this product is applied. Polymers, colourants and other additives must be tested for compatibility and seed safety prior to use in combination with *Lumivia CPL*.

Apply only in areas with adequate ventilation or in areas that are equipped to remove mist or dust.

Dilute in a sufficient volume to obtain thorough, uniform coverage.

Treatment of damaged seed, or seed known to be of low vigor and poor quality may result in reduced germination and/or seed and seedling vigor. If seed lot quality is not known, treat a small portion of the seed with *Lumivia CPL* and confirm acceptable germination prior to treating the entire seed lot.

## How it Works:

Chlorantraniliprole disrupts muscle activity in the insects, resulting in paralysis. Treated pests stop feeding quickly after ingestion, become lethargic and lose mobility. Refer to "Insecticide Groups Based on Modes of Action" in the Insect Control section for more information.

## Tank Mixes:

*Lumivia CPL* should be applied as a tank mix with registered fungicide seed treatments containing colourant. Follow the more stringent label precautionary measures for mixing, loading and applying stated on both product labels.

When *Lumivia CPL* is applied without a fungicide seed treatment, a colourant must be added.

## Restrictions:

- **Resistance management:** Refer to "Pathogen Resistance" in the Plant Disease Control section for more information. DO NOT make any subsequent application of a Group 28 insecticide for a minimum of 60 days after planting seed treated with *Lumivia CPL*. If a foliar spray is required during this window, it must be made with an insecticide other than Group 28.
- **Labelling:** All bags containing treated seed must be labelled or tagged as follows: "This seed has been treated with *Lumivia CPL* which contains chlorantraniliprole. DO NOT use for feed, food or oil processing, Store away from feeds and other foodstuffs. Wear long-sleeved shirt, long pants, chemical resistant gloves and shoes plus socks when planting and handling treated seed. Gloves are not required when planting with a closed cab. This product is toxic to aquatic organisms. Dispose of all excess treated seed. Left over treated seed may be double-sown around the headland or buried away from water sources in accordance with local requirements. Dispose of seed packaging in accordance with the local requirements. Cover or incorporate spilled treated seeds. Toxic to birds. Any spilled or exposed seeds must be incorporated into the soil or otherwise cleaned up from the soil surface."
- **Grazing:** None listed.
- **Re-cropping:** None listed

- **Storage:** Store product in original container only, away from other pesticides, fertilizer, food or feed. Not for use or storage in and around the home. Keep container closed. To prevent contamination, store this product away from food or feed. Field and laboratory tests have demonstrated that application of *Lumivia CPL* will not negatively affect germination. However, due to seed quality and seed storage conditions beyond the control of Corteva Agriscience, no claims are made to guarantee the germination of carry-over seed.
- **Environment:** This product is toxic to aquatic organisms. Residues of chlorantraniliprole cannot be used in areas treated with this product during the previous season. Use of this chemical may result in contamination of groundwater particularly in areas where soils are permeable (e.g. sandy soils) and/or the depth to the water table is shallow. Treated seeds is toxic to birds. Any spilled or exposed seeds must be incorporated into the soil or otherwise cleaned up from the soil surface.

| Crop                     | Diseases Controlled                                                                                                                                                                                                                                                                                               | Rate (per 100 kg of seed) |
|--------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------|
| Corn (field, pop, sweet) | Seed- and soil-borne <i>Pythium</i> spp., <i>Rhizoctonia</i> spp., <i>Fusarium</i> spp. (including <i>F. graminearum</i> and <i>F. verticillioides</i> ); seed rot/pre-emergence damping-off, post-emergence damping-off, seedling blight (weakly pathogenic <i>Aspergillus</i> spp. and <i>Penicillium</i> spp.) | 67 mL                     |

## Application Information:

For use by a commercial seed treater only. Mix with water to form a slurry seed treatment. Contains no colourant; an appropriate colourant must be added to slurry before treating seed. Maintain constant agitation of slurry. Allow seed to dry before bagging. Treatment of highly mechanically damaged, poor quality or low vigour seed may result in reduced germination and/or reduced seed and seedling vigour. If seed lot quality is unknown conduct a germination test prior to treating.

## How it Works:

The active ingredient thiabendazole is a benzimidazole fungicide with contact and systemic activity. The active ingredient fludioxonil is a phenylpyrrole fungicide with contact activity. The active ingredient metalaxyl-M is an acylalanine fungicide with systemic activity against diseases caused by the Oomycetes class, including pythium damping off. The active ingredient azoxystrobin is a methoxyacrylate (strobilurin) fungicide with broad spectrum activity to be used as a preventative and curative fungicide. Refer to "Fungicide Modes of Action" in the Plant Disease Control section for more information.

## Tank Mixes:

*Maxim Quattro* may be tank-mixed with *Cruiser 5FS*.

Follow the label directions for each product and use the most restrictive precautions and limitations for either product.

## Restrictions:

- **Resistance management:** Refer to "Pathogen Resistance" in the Plant Disease Control section for more information.
- **Labelling:** Treated seed must be labelled "This seed has been treated with thiabendazole, fludioxonil, metalaxyl-M and S-isomer, and azoxystrobin. Use chemical resistant-gloves when handling treated seed. DO NOT use for food, feed or oil processing. Store away from feed and foodstuffs. DO NOT graze corn or cut for forage within 30 days of planting."
- **Grazing:** DO NOT graze or feed livestock on treated areas within 30 days of planting.
- **Re-cropping:** No restrictions listed.
- **Storage:** Store product between 0°C and 30°C. Repeated freeze-thawing of the product will not compromise its integrity. If the product should freeze, bring the product back to room temperature and ensure thorough mixing before use. Store away from food and feed. DO NOT carry over treated sweet corn to the following year.
- **Environment:** DO NOT apply directly to water, or to areas where surface water is present. In cleaning of equipment or disposing of wastes, DO NOT contaminate water used for human or animal consumption or by wildlife and aquatic life or for irrigation purposes. If treated seed is spilled outdoors, promptly clean up.

**Hazard Rating:**

Caution – Potential Skin Sensitizer

Refer to the Introduction for an explanation of the symbols.

# Mertect SC

Fungicide Group

1

**Company:**Syngenta Canada Inc. (*Mertect SC* - PCP#13975); Sharda CropChem (*Tibet 50 SC* - PCP#34386)**Formulation:**

500 g/L thiabendazole formulated as a water dispersible suspension.

- Container size - 4 x 5 L

**Crops and Diseases:**Post-harvest control of storage rots caused by *Fusarium*, *Phoma*, *Helminthosporium*, *Oospora* and *Rhizoctonia* spp. on potato.**Rate and Water Volume:**

7.5 L per 170 L of water. Spray 2 L of this suspension per 1 metric tonne of potatoes.

**Application Information:**

Post-harvest treatment. Shake well before using. DO NOT allow suspension to stand without continuous agitation. Potatoes must rotate along conveyor line to ensure complete coverage. Prior to treating potatoes destined for export, confirm with authorities that treated potatoes will be allowed to enter importing country.

**How it Works:**

The active ingredient thiabendazole is a benzimidazole fungicide with systemic activity. Refer to "Fungicide Modes of Action" in the Plant Disease Control section for more information.

**Tank Mixes:**

None listed.

**Restrictions:**

- **Resistance management:** Refer to "Pathogen Resistance" in the Plant Disease Control section for more information.
- **Labelling:** No restrictions listed.
- **Grazing:** No restrictions listed.
- **Re-cropping:** No restrictions listed.
- **Storage:** Minimum storage temperature 0°C.
- **Environment:** Toxic to aquatic organisms. DO NOT contaminate irrigation or drinking water supplies or aquatic habitats by cleaning of equipment or disposal of wastes. DO NOT discharge effluent containing this product into sewer systems, lake, streams, ponds, estuaries, oceans, and other waters.

**Hazard Rating:**

None listed.

| Wheat, barley, oats,<br>rye, triticale <sup>2</sup> | Seed rots and seedling blights ( <i>Pythium</i> spp.)                                                      | 46 to 110 mL                                           | 454 to 390 mL                                                     |
| Sorghum                                             | Seed rots and seedling blights ( <i>Pythium</i> spp.)                                                      | 93 to 110 mL                                           | 407 to 390 mL                                                     |
|                                                     | Downy mildew ( <i>Peronosclerospora sorghi</i> )                                                           | 189 mL                                                 | 311 mL                                                            |
| Bird's-foot trefoil                                 | Seed rots and seedling blights ( <i>Pythium</i> spp.)                                                      | 46 to 110 mL                                           | 454 to 390 mL                                                     |
| Low-tannin lentil                                   | Seed rots and seedling blights ( <i>Pythium</i> spp.)                                                      | 16 mL                                                  | 484 mL                                                            |

<sup>1</sup> Use the high rate if planting into cold, wet soils, if the seed is of poor quality, or if disease pressure is expected to be high.

<sup>2</sup> Triticale is a registered crop for treatment with *Belmont 2.7 FS* only and not on triticale intended for export.

## Application Information:

Mix with water to form a slurry seed treatment. Contains no colourant; an appropriate colourant must be added to slurry before treating seed. Maintain constant agitation of slurry. Allow seed to dry before bagging. Treatment of highly mechanically damaged, poor quality or low vigour seed may result in reduced germination and/or reduced seed and seedling vigour. If seed lot quality is unknown conduct a germination test prior to treating.

## How it Works:

The active ingredient metalaxyl is an acylalanine fungicide with systemic activity. Refer to "Fungicide Modes of Action" in the Plant Disease Control section for more information.

## Tank Mixes:

For control of early season root rot (*Aphanomyces euteiches*) during plant emergence and early crop establishment in pea and lentil fields with low disease pressure *Belmont* can be mixed with *Rancona Trio* at a rate of 72 mL/100 kg of seed.

## Restrictions:

- **Resistance management:** Refer to "Pathogen Resistance" in the Plant Disease Control section for more information.
- **Labelling:** Treated seed must be labelled as follows; "This seed has been treated with *Allegiance FL* or *Belmont 2.7 FS* seed protectant which contains metalaxyl. DO NOT use for feed, food or oil processing." All bags containing seed for export must be labelled "FOR EXPORT ONLY." *Belmont 2.7 FS* cannot be used on triticale intended for export.
- **Grazing:** DO NOT graze or feed livestock on treated areas for 4 weeks after planting.
- **Re-cropping:** No restrictions listed.
- **Storage:** DO NOT store above 35°C or below 0°C. Store in original container, away from pesticides, food or feed.
- **Environment:** Treated seed may be toxic to birds and other wildlife. Clean up any spilled seeds and ensure seed is properly incorporated at planting.

## Hazard Rating:

⚠ Warning – Skin and Eye Irritant

Refer to the Introduction for an explanation of the symbols.

### Tank Mixes:

This product may be tank mixed with a fertilizer, a supplement, or with registered pest control products, whose labels also allow tank mixing, provided the entirety of both labels, including Directions For Use, Precautions, Restrictions, Environmental Precautions, and Spray Buffer Zones are followed for each product. In cases where these requirements differ between the tank mix partner labels, the most restrictive label must be followed.

### Application information:

MINUET can be applied in commonly used ground application equipment. Use the appropriate spray pressure, water volume per hectare, nozzles, nozzle spacing and ground speed. Consult spray nozzle and accessory catalogues for specific information on proper equipment calibration. Accurate equipment calibration is essential prior to use.

Be sure to maintain agitation during mixing and application to assure uniform product suspension.

### Soil surface applications:

Broadcast or Band. Apply as a 15-cm band over the top of the seed row or as a broadcast spray after planting. Use higher rates for broadcast applications. Ensure incorporation into the seed zone within 24 hours of applications with rain or overhead irrigation.

Overhead irrigation. Apply with irrigation water, ensuring uniform coverage of the soil and incorporation of product into the seed zone.

Surface drip irrigation. Apply product with the first irrigation after planting. Instructions continued from above.

### Transplant drench:

Apply finished spray mixture, at a rate to thoroughly soak the growing media through the root zone or as a drench or directed spray using sufficient water to soak the root zone.

### In-Furrow Applications:

Apply as an in-furrow spray in the appropriate amount of water per hectare for the crop at planting. Mount the spray nozzle so the spray is directed in the furrow just before the seeds are covered.

### Shanked-In and Injected Applications:

Product can be shanked-in or injected into the soil prior to-, at-, or post-planting/transplanting of crops.

### Post planting applications at any crop stage:

Apply the finished spray mixture to the soil as a drench, spray, or drip irrigation, directing it towards the base of the plant to optimize efficacy. When applying as a spray (e.g., via hydraulic nozzles at low volumes), it is important to irrigate so as to move the product into the seed, root or transplant zone. Applications may be repeated at 21-28 day intervals to enhance preventive treatments. The shorter interval is recommended under moderate to high disease pressure.

After crop germination or transplanting, additional applications of MINUET may be made. Such applications may include drip irrigation (surface or subsurface), soil directed sprays or shanking in. DO NOT apply by air. DO NOT apply this product through any other type of irrigation system.

### How it works:

MINUET® contains bacteria that, when applied to the soil, will germinate to colonize the developing root system and provide suppression of listed diseases on the label. It may be applied as a soil application by various methods either alone, or in an alternating program of applications with other registered crop protection products.

### Restrictions:

- **Pre-harvest intervals:** MINUET has a 0-day PHI, and can be applied up to, and including, the day of harvest.
- **Re-entry interval:** If the product is soil-injected, soil-incorporated, or applied in-furrow, workers may enter the treated area without restrictions if there will be no contact with anything that has been treated.
- DO NOT enter or allow worker entry into treated areas for 4 hours or until sprays have settled unless wearing long-sleeved shirt, long pants, socks with shoes and waterproof gloves.

- **Environmental Precautions:**
  - To reduce runoff from treated areas into aquatic habitats avoid application to areas with a moderate to steep slope, compacted soil, or clay.
  - Avoid application when heavy rain is forecast.
  - Contamination of aquatic areas as a result of runoff may be reduced by including a vegetative filter strip between the treated area and the edge of the water body.
- **Toxicity:** Acute oral toxicity LD50 (Rat) > 5,000 mg/kg.
- **Storage:** Store this product away from food or feed. Store in a dry area inaccessible to children. Store in original container only. Keep container closed when not in use. This product should be used within 3 years from the date of manufacture when stored at room temperature.

## Modalex® 600

Insecticide Group  
4A

### Company:

BASF Agricultural Solutions Canada Inc (PCP#31357)

### Formulation:

600 g/L clothianidin formulated as a suspension.

- Container size – 984 L tote

### Crops, Diseases and Rates:

| Crop             | Insects Controlled | Rate<br>(per 100 kg of seed) |
|------------------|--------------------|------------------------------|
| Canola, rapeseed | Flea beetles       | 250 mL, 333 mL or 666 mL     |

### Application Information:

For use in commercially available equipment designed or seed treatment only.

### Tank Mixes:

Refer to product label for information on tank mix options

### Restrictions:

- **Labelling:** This seed has been treated with clothianidin. Do not use for feed, food or oil processing.
- **Grazing:** Rape greens and seed grown or harvested from Modalex 600-treated seed must not be used for feed or human consumption. Rapeseed grown and harvested from Modalex 600-treated seed is only for industrial uses and cannot be used for edible oil or any other human/feed consumption.
- **Re-cropping:** Corn, canola and rapeseed may be replanted at any time. A one-year plantback interval is required for leafy, root and tuber vegetables. A 30-day plantback interval on cereal grains, grasses, nongrass animal feeds and soybeans and dried beans is required.
- **Storage:** Store this product away from food or feed. Store in a cool place. Do not store in direct sunlight. Protect from freezing temperatures.
- **Environmental Restrictions:** Include toxicity information.
- **Toxicity Information:** No specific antidote is available. Treat the patient symptomatically. This product is toxic to aquatic invertebrates. Dispose of all excess treated seed. Left over treated seed may be double-sown around the headland or buried away from water sources in accordance with local requirements. Dispose of seed packaging in accordance with local requirements. Spilled or exposed seeds and dust must be incorporated into the soil or cleaned up from the soil surface.

### Hazard Rating:

Assessment of acute toxicity: Of moderate toxicity after single ingestion. Virtually nontoxic after a single skin contact. Virtually nontoxic by inhalation.

# NipsIt INSIDE 600 Insecticide

See clothianidin.

## Phosphorous acid

Fungicide Group

33

Confine Extra/Rampart

### Company:

WinField United Canada (*Confine Extra* – PCP#30648)

Loveland Products Canada (*Rampart* – PCP#30654)

### Formulation:

53% mono and di-potassium salts of phosphorous acid.

- Container sizes - 9.46 to 946.35 L (*Confine Extra*)
- Container size - 9.46 L (*Rampart*)

### Crops Diseases and Rates:

**Confine Extra:** Post-harvest treatment of potatoes for the suppression of late blight (*Phytophthora infestans*), pink rot (*P. erythroseptica*), and silver scurf (*Helminthosporium solani*) storage infection.

**Rampart:** Post-harvest treatment of potatoes for control of late blight (*Phytophthora infestans*) and pink rot (*P. erythroseptica*).

### Rate and Application Information:

For application prior to storage:

- Dilute *Confine Extra* at a 1 to 5.13 ratio with water (326 mL *Confine Extra* + 1674 mL water). Apply 2 L of solution as a spray to 1000 kg of potatoes.
- Dilute *Rampart* at a 1 to 5.26 ratio with water (190 mL *Rampart* + 1 L water). Apply 2 L of solution per 100 kg of harvested potatoes as a spray or rinse.

For application to stored potatoes (*Rampart* only):

- Dilute *Rampart* at a 1 to 5.26 ratio with water (190 mL *Rampart* + 1 L water). Apply 2 L of solution per 100 kg of stored potatoes into water used for post-harvest storage.

### How it Works:

The active ingredient mono- and di-potassium salts of phosphorous acid is a phosphonate fungicide with systemic activity to suppress pathogen inoculum. To be used as a preventative fungicide application on harvested tubers.

Refer to "Fungicide Modes of Action" in the Plant Disease Control section for more information.

### Tank Mixes:

None listed.

### Restrictions:

- **Resistance management:** Refer to "Pathogen Resistance" in the Plant Disease Control section for more information.
- **Labelling:** No restrictions listed.
- **Grazing:** No restrictions listed.
- **Re-cropping:** No restrictions listed.
- **Storage:** Store this product away from food or feed.
- **Environment:** DO NOT contaminate irrigation or drinking water supplies or aquatic habitats by cleaning of equipment or disposal of waste. DO NOT apply by air.

### Hazard Rating:

None listed.

# Prosper EverGol Seed Treatment

Available to commercial seed treaters only.

Fungicide Group

4, 7, 11

Insecticide Group

4A

## Company:

Bayer (PCP#30363)

## Formulation:

| Active ingredient: |                       |
|--------------------|-----------------------|
| Clothianidin       | 290 g/L               |
| Penflufen          | 10.7 g/L              |
| Trifloxystrobin    | 7.15 g/L              |
| Metalaxyl          | 7.15 g/L              |
| Container size:    | 3.8 L to 1000 L, bulk |

## Crops, Insects, Diseases and Rates:

| Product                | Crop                                              | Diseases Controlled                                                                                                                                                                                                              | Insects Controlled | Rate (per 100 kg of seed) |
|------------------------|---------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------|---------------------------|
| <i>Prosper EverGol</i> | Canola, rapeseed, mustard (oilseed and condiment) | Seed rot, damping off, seedling blight and early season root rot ( <i>Pythium</i> spp., <i>Rhizoctonia</i> spp., <i>Fusarium</i> spp., seed-borne <i>Alternaria</i> spp.); seed-borne blackleg ( <i>Leptosphaeria maculans</i> ) | Flea beetles       | 1400 mL                   |

## Application Information:

*Prosper EverGol* is for use in commercial seed treatment facilities with closed transfer systems only. Seed treatment must be thoroughly agitated to ensure uniform mixing of product prior to and during application. Treatment of highly mechanically scarred or damaged seed or seed known to be of low vigour and poor quality may result in reduced germination and/or reduction of seed and seedling vigour.

## How it Works:

Clothianidin is a chloronicotinyl insecticide with systemic activity. For more information refer to "Insecticide Groups Based" on Modes of Action in the Insect Control section. Carbothiin is a carboxamide fungicide with systemic activity; penflufen is a carboxamide (SDHI) fungicide with systemic activity; trifloxystrobin is a strobilurin fungicide with broad spectrum preventative activity; and metalaxyl is an acylalanine fungicide with systemic activity. Refer to "Fungicide Modes of Action" in the Plant Disease Control section for more information.

## Tank Mixes:

None listed.

## Restrictions:

**NOTE:** When using a seed flow lubricant for planting corn and soybean seed treated with neonicotinoid insecticides (containing the active ingredients clothianidin, imidacloprid or thiamethoxam), use only a dust-reducing fluency agent.

Talc and graphite are not permitted.

- **Resistance management:** Refer to "Pathogen Resistance" in the Plant Disease Control section for more information. DO NOT make any subsequent application of a group 4 insecticide (in-furrow or foliar application) following treatment with any of these products.
- **Labelling:** Treated seed must be labelled as follows: "This seed has been treated with clothianidin and/or carbothiin, penflufen and metalaxyl. DO NOT use for food, feed or oil processing. Store away from feeds and other foodstuffs."
- **Grazing:** No restrictions listed.
- **Re-cropping:** For *Prosper EverGol*, corn and canola may be replanted at any time. A 1 year plant back interval is required for leafy, root and tuber vegetables. A 30 day plant back is required for cereals, grasses, nongrass animal feeds, soybeans and dry beans.
- **Storage:** Protect products from freezing. DO NOT contaminate water, food or feed by storage, disposal or by cleaning of equipment. Store in a cool place. DO NOT store in direct sunlight. Store away from food or feed. DO NOT store treated seed above 25°C or in direct sunlight. Treated seed stored for periods in excess of 9 months should be tested for germination before planting.
- **Environment:** These products are toxic to aquatic invertebrates. DO NOT apply directly to water or to areas where surface water is present. DO NOT contaminate water when disposing of equipment wash waters. These products are toxic to birds and mammals. Any spilled or exposed seeds should be incorporated into the soil or otherwise cleaned up from the soil surface.

**Hazard Rating:**

Warning – Poison

Refer to the Introduction for an explanation of the symbols.

# Rancona Trio

**Fungicide Group**  
**3, 4, 7**
**Company:**

UPL AgroSolutions Canada Inc. (PCP#32668)

**Formulation:**

5.0 g/L ipconazole, 133.33 g/L carbathiin, and 13.33 g/L metalaxyl formulated as a liquid suspension seed treatment.

- Container sizes - 10L, 115L

**Crops, Diseases and Rates:**

| Crop                       | Diseases Controlled                                                                                                                                                                                                                                                                                                                                                                                                                                          | Diseases Suppressed                                                                                  | Rate (per 100 kg of seed) |

| Dry bean                   | General seed rots ( <i>Fusarium</i> spp., <i>Rhizoctonia solani</i> , <i>Penicillium</i> spp., <i>Aspergillus</i> spp.); seedling blight, damping-off ( <i>Fusarium</i> spp., <i>Rhizoctonia solani</i> )                                                                                                                                                                                                                                                    | Seedling root rot ( <i>Fusarium</i> spp.)                                                            | 500 mL                    |
| Lentil                     | General seed rots ( <i>Fusarium</i> spp., <i>Pythium</i> spp., <i>Rhizoctonia solani</i> , <i>Penicillium</i> spp., <i>Aspergillus</i> spp.); seedling blight, damping-off ( <i>Fusarium</i> spp., <i>Pythium</i> spp., <i>Rhizoctonia solani</i> ); seed-borne Ascochyta blight ( <i>Ascochyta lentis</i> )                                                                                                                                                 | Seedling root rot ( <i>Fusarium</i> spp.)                                                            | 500 mL                    |
| Chickpea                   | General seed rots ( <i>Fusarium</i> spp., <i>Pythium</i> spp., <i>Rhizoctonia solani</i> , <i>Penicillium</i> spp., <i>Aspergillus</i> spp.); seedling blight, damping-off ( <i>Fusarium</i> spp., <i>Pythium</i> spp., <i>Rhizoctonia solani</i> ); seed-borne Ascochyta blight ( <i>Ascochyta rabiei</i> )                                                                                                                                                 | Seedling root rot ( <i>Fusarium</i> spp.)                                                            | 500 mL                    |

| Crop    | Diseases Controlled                                                                                                                                                                                                                                        | Diseases Suppressed                                                                                     | Rate (per 100 kg of seed) |
|---------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------|---------------------------|
| Soybean | General seed rots ( <i>Fusarium</i> spp., <i>Rhizoctonia solani</i> , <i>Penicillium</i> spp., <i>Aspergillus</i> spp.); seedling blight, damping-off ( <i>Fusarium</i> spp., <i>Rhizoctonia solani</i> ); seedling root rot ( <i>Rhizoctonia solani</i> ) | Seedling root rot ( <i>Fusarium</i> spp.); Sudden Death Syndrome (SDS) ( <i>Fusarium virguliforme</i> ) | 500 mL                    |

### Application Information:

*Rancona Trio* is ready to use and does not need dilution prior to application. The optimum treating process and slurry composition depends on the crop, the treating process and application conditions.

### How it Works:

The active ingredient ipconazole is a demethylation inhibitor with systemic and contact activity, carbathiin is a carboximide fungicide with systemic activity, and metalaxyl is an acylalanine fungicide systemic activity. Refer to "Fungicide Modes of Action" in the Plant Disease Control section for more information.

### Tank Mixes:

In dry bean and soybean, *Rancona Trio* can be mixed with *Belmont 2.7 FS* at 24 to 89 mL per 100 kg of seed for control of seed rot/pre-emergence damping-off, post-emergence damping-off, and seedling blight caused by *Pythium* spp. In soybean, *Rancona Trio* can be mixed with *Belmont 2.7 FS* at 24 to 72 mL per 100 kg of seed for control of early season root rot caused by *Phytophthora sojae*. For control of early season root rot caused by *Aphanomyces euteiches* in fields with low disease pressure, *Rancona Trio* can be tank mixed with *Intego Solo* at 20 mL/100 kg of seed in peas and lentils or with *Belmont 2.7 FS* at 72 mL/100 kg of seed in PEAS ONLY. In wheat, barley, and oats *Rancona Trio* can be tank-mixed with 17-50 mL of *Stress Shield* per 100 kg of seed for control of wireworms. In pea, *Rancona Trio* can be mixed with 104-208 mL of *Stress Shield* per 100 kg of seed for control of pea leaf weevil. In pea, dry bean, lentil, chickpea, soybean, and faba bean *Rancona Trio* can be mixed with 104 mL of *Stress Shield* per 100 kg of seed for control of wireworms. This tank-mix will also control potato leafhopper in dry and faba beans, pea leaf weevil in faba bean, and soybean aphid, seedcorn maggot. In wheat, barley, oat, and rye *Rancona Trio* can be mixed with 8-24 mL of *Lumivia CPL* for control of cutworms and armyworms and 24-40 mL of *Lumivia CPL* for control of wireworms. In pea, dry bean, lentil, chickpea, and faba bean *Rancona Trio* can be mixed with 32-64 mL of *Lumivia CPL* for control of cutworms and armyworms and 64-96 mL of *Lumivia CPL* for control of larvae of pea leaf weevil.

### Restrictions:

- **Resistance management:** Refer to "Pathogen Resistance" in the Plant Disease Control section for more information.
- **Labelling:** Treated seed must be labelled as follows "This seed has been treated with *Rancona Trio Fungicide*, which contains ipconazole, carbathiin, and metalaxyl. DO NOT use for feed, food, or oil processing. Store away from feeds and other food stuffs. When planting or handling treated seeds, workers must wear a long-sleeved shirt, long pants, socks and shoes, and chemical-resistant gloves. Gloves are not required while driving the tractor. A closed-cab tractor is required when planting more than 2200 kg of treated seeds per day."
- **Grazing:** DO NOT graze or feed livestock on treated area for six weeks after planting barley, oats, or wheat. DO NOT graze or feed livestock on treated area for four weeks after planting all other crops.
- **Re-cropping:** No restrictions listed.
- **Storage:** Store this product away from food or feed. Store in original container only, away from other pesticides, fertilizer, food, or feed. DO NOT freeze. DO NOT store treated seed above 25°C or in direct sunlight.
- **Environment:** DO NOT contaminate ponds, lakes or streams. Treated seed is toxic to birds and small wild mammals. Any spilled or exposed seeds must be incorporated into the soil or otherwise cleaned-up from the soil surface.

### Hazard Rating:

None listed.

# Rancona V RS

Fungicide Group  
3, 7

## Company:

UPL AgroSolutions Canada Inc. (PCP#30217)

## Formulation:

9.38 g/L ipconazole and 87.5 g/L carbathiin formulated as a liquid suspension seed treatment.

- Container sizes - 10 L, 200 L

## Crops, Diseases and Rates:

| Crop                      | Diseases Controlled                                                                                                                                | Diseases Suppressed                                       | Rate (per 100 kg of seed) |
|---------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------|---------------------------|
| Canola, rapeseed, mustard | Seed rot, damping off, and seedling blight ( <i>Rhizoctonia</i> spp., <i>Fusarium</i> spp.); seed-borne blackleg ( <i>Leptosphaeria maculans</i> ) | Root rot ( <i>Rhizoctonia</i> spp., <i>Fusarium</i> spp.) | 800 mL                    |

## Application Information:

*Rancona V RS* is ready to use and may be applied to seed as purchased. However, dilution with water may help to achieve more uniform seed coverage when using some types of treaters and/or when treating under dry and/or hot conditions.

## How it Works:

The active ingredient ipconazole is a demethylation inhibitor with systemic and contact activity and carbathiin is a carboximide fungicide with systemic activity. Refer to "Fungicide Modes of Action" in the Plant Disease Control section for more information.

## Tank Mixes:

None listed.

## Restrictions:

- **Resistance management:** Refer to "Pathogen Resistance" in the Plant Disease Control section for more information.
- **Labelling:** Treated seed must be labelled as follows "This seed has been treated with carbathiin and ipconazole. DO NOT use treated seed for feed, food, or oil processing."
- **Grazing:** DO NOT graze or feed livestock on treated area for four weeks after planting.
- **Re-cropping:** No restrictions listed.
- **Storage:** Store this product away from food or feed.
- **Environment:** DO NOT contaminate ponds, lakes or streams.

## Hazard Rating:

None listed.

# Raxil PRO Seed Treatment

Fungicide Group  
3, 4

## Company and Formulation:

Bayer (PCP#30102), Sharda (Lixar PRO - PCP#34270)

FMC (Avoda PRO – PCP#35594)

## Formulation:

3.0 g/L tebuconazole, 15.4 g/L prothioconazole and 6.2 g/L metalaxyl formulated as a micro-dispersion formulation.

- Container sizes - 10 L, 58.5 L, 175.5 L, 1000 L

## Crops, Diseases and Rates:

| Crop                  | Diseases Controlled                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | Diseases Suppressed                                                                                                                                                                                                                                              | Rate (per 100 kg of seed) |

| Barley                | Seed rot/pre-emergent damping-off, seedling blight (seed- and soil-borne <i>Fusarium</i> spp., soil-borne <i>Pythium</i> spp., <i>Cochliobolus sativus</i> , seed-borne <i>Aspergillus</i> spp.); post-emergent damping-off (seed- and soil-borne <i>Fusarium</i> spp., <i>C. sativus</i> , seed-borne <i>Aspergillus</i> spp.); true loose smut ( <i>Ustilago nuda</i> ); covered smut ( <i>U. hordei</i> ); false loose smut ( <i>U. nigra</i> ); barley leaf stripe ( <i>Pyrenophora graminis</i> ) | Root rot (seed- and soil-borne <i>Fusarium</i> spp., <i>Cochliobolus sativus</i> , <i>Rhizoctonia solani</i> ); crown rot ( <i>Fusarium</i> spp.); seedling blight (seed-borne <i>Penicillium</i> spp.); seed rot, pre-emergent damping off ( <i>R. solani</i> ) | 325 mL                    |
| Oats                  | Seed rot/pre-emergent damping-off, seedling blight (seed- and soil-borne <i>Fusarium</i> spp., soil-borne <i>Pythium</i> spp., <i>Cochliobolus sativus</i> , seed-borne <i>Aspergillus</i> spp.); post-emergent damping-off (seed- and soil-borne <i>Fusarium</i> spp., <i>C. sativus</i> , seed-borne <i>Aspergillus</i> spp.); Covered smut ( <i>Ustilago kollerii</i> ); loose smut ( <i>U. avenae</i> )                                                                                            | Root rot (seed- and soil-borne <i>Fusarium</i> spp., <i>Cochliobolus sativus</i> , <i>Rhizoctonia solani</i> ); crown rot ( <i>Fusarium</i> spp.); seedling blight (seed-borne <i>Penicillium</i> spp.); seed rot, pre-emergent damping off ( <i>R. solani</i> ) | 325 mL                    |
| Wheat, rye, triticale | Seed rot/pre-emergent damping-off, seedling blight (seed- and soil-borne <i>Fusarium</i> spp., soil-borne <i>Pythium</i> spp., <i>Cochliobolus sativus</i> , seed-borne <i>Aspergillus</i> spp.); post-emergent damping-off (seed- and soil-borne <i>Fusarium</i> spp., <i>C. sativus</i> , seed-borne <i>Aspergillus</i> spp.); loose smut ( <i>Ustilago tritici</i> ); common bunt ( <i>Tilletia tritici</i> , <i>T. laevis</i> )                                                                    | Root rot (seed- and soil-borne <i>Fusarium</i> spp., <i>Cochliobolus sativus</i> , <i>Rhizoctonia solani</i> ); crown rot ( <i>Fusarium</i> spp.); seedling blight (seed-borne <i>Penicillium</i> spp.); seed rot, pre-emergent damping off ( <i>R. solani</i> ) | 325 mL                    |

## Application Information:

*Raxil PRO* is a ready-to-use treatment formulation for use in commercial seed treatment operations and for on-farm treatment with conventional seed treating which can accurately meter, mix and apply flowable seed treatment formulations.

## How it Works:

The active ingredient tebuconazole is a triazole demethylation inhibitor (DMI) fungicide with systemic activity. The active ingredient prothioconazole is a demethylation inhibitor with broad-spectrum systemic activity. The active ingredient metalaxyl is an acylalanine fungicide with systemic activity. Refer to "Fungicide Modes of Action" in the Plant Disease Control section for more information.

## Tank Mixes:

**Insecticide Seed Treatment:** May be mixed with *Stress Shield 600*.

Follow the label directions for each product and use the most restrictive precautions and limitations for either product.

## Restrictions:

- **Resistance management:** Refer to "Pathogen Resistance" in the Plant Disease Control section for more information.
- **Labelling:** Treated seed must be labeled "This seed has been treated with *Raxil PRO*, which contains tebuconazole, prothioconazole and metalaxyl. When handling treated seed wear chemical-resistant gloves. DO NOT use for feed, food or oil processing. Store away from feeds and other foodstuffs."
- **Grazing:** No restrictions listed.
- **Re-cropping:** No restrictions listed.
- **Storage:** Store product in original container only, away from other pesticides, fertilizer, food or feed. Keep container closed. Store in a cool, dry area and avoid excessive heat.
- **Environment:** Toxic to aquatic organisms. DO NOT contaminate irrigation or drinking water supplies or aquatic habitats by cleaning of equipment or disposal of wastes. Dispose of all excess treated seed. Left over seed may be double-sown around the headland or buried away from water sources. DO NOT leave exposed treated seed on soil surface. Any spilled or exposed seeds must be incorporated into the soil or otherwise cleaned-up from the soil surface. The use of this chemical may result in contamination of groundwater particularly in areas where soils are permeable and/or the depth to the water is shallow.

**Hazard Rating:**

Caution – Skin Irritant

Refer to the Introduction for an explanation of the symbols.

# Raxil PRO Shield Seed Treatment

*Raxil PRO Shield is a co-pack of Raxil PRO (tebuconazole, prothioconazole and metalaxyl fungicides) and Stress Shield 600 (imidacloprid insecticide). For other detailed information on the component products see the product pages listed above.*

**Fungicide Group**  
**3, 4**  
**Insecticide Group**  
**4A**

**Company:**

Bayer (Raxil PRO – PCP#30102, Stress Shield 600 – PCP#30668)

**Formulation:****Raxil PRO:** 3.0 g/L tebuconazole, 15.4 g/L prothioconazole and 6.2 g/L metalaxyl formulated as a suspension.**Stress Shield 600:** 600 g/L imidacloprid formulated as a suspension.

- Container sizes - 10 L Raxil PRO and 1.54 L Stress Shield 600; 175.5 L Raxil PRO and 27 L Stress Shield 600

**Crops, Diseases, Insects and Rates:**

| Crop                     | Diseases Controlled                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | Diseases Suppressed                                                                                                                                                                                                                                              | Insects Controlled | Rate (per 100 kg of seed)* |                   |

# Raxil RISE

Fungicide Group  
3, 4, 7

## Company:

Bayer (PCP# 35475)

## Formulation:

3.0g/L Tebuconazole, 15.4 g/L Prothioconazole, 15.4 g/L Metalaxyl and 6.4 g/L Penflufen formulated as a micro-dispersion.

- Container size(s) – 10L, 125L, 1000L

## Crops, Diseases, Rates and Timing:

| Crop                       | Disease Control                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | Disease Suppression                                                                                                                                                                     | Rate (per 100 kg of seed) |

## Application Information:

Raxil RISE is a ready-to-use formulation designed for commercial or on-farm treatment with conventional seed treating equipment. Uniform application to seed is necessary to ensure optimum product performance

## Tank Mixes:

Raxil RISE may be combined with Stress Shield 600 for control of certain insect pests in wheat, barley and oats.

## Restrictions:

- **Labelling:** All containers or packages containing treated wheat, barley, oat, rye or triticale seed for sale or use in Canada must be labelled with the following information: This seed has been treated with Raxil Rise, containing prothioconazole, tebuconazole, penflufen and metalaxyl. DO NOT use for food, feed and oil processing. Store away from feed and other foodstuffs. While handling and planting treated seed, wear coveralls over a long-sleeved shirt, long pants, socks, shoes and chemical-resistant gloves.
- **Grazing:** No Restrictions.
- **Re-cropping:** No Restrictions.
- **Storage:** Store product in original container only, away from food or feed. Store in a cool, dry place and avoid excessive heat. Keep container closed.
- **Environmental Restrictions:** TOXIC to non-target terrestrial plants and aquatic organisms. This product demonstrates the properties and characteristics associated with chemicals detected in groundwater. The use of this product in areas where soil is permeable, particularly where the water table is shallow, may result in groundwater contamination.

## Hazard Rating:

Caution – Skin Irritant. Harmful if swallowed, inhaled or absorbed through the skin.

# Reason 500SC

Fungicide Group  
11

## Company:

Gowan (PCP#27462)

## Formulation:

500 g/L fenamidone formulated as a suspension concentrate.

- Container size - 2 L

## Crops, Diseases and Rates:

| Crop   | Diseases Controlled                                      | Rate (per 100 kg of seed)* |
|--------|----------------------------------------------------------|----------------------------|
| Potato | Seed-borne late blight ( <i>Phytophthora infestans</i> ) | 10 mL                      |

## Application Information:

For optimal disease control, good coverage of the seed piece is required. Apply specified dosage as a diluted spray using equipment that ensures uniform coverage of each seed piece.

Agitate or stir the slurry solution as needed. Apply only in areas with adequate ventilation or in areas that are equipped to remove spray mist or dust. It is recommended to periodically clean and sanitize all surfaces which may come in contact with cut seed-pieces (i. e. cutting machines, tables, knives, planting equipment etc.). Seed pieces must be treated immediately after cutting. DO NOT use treated seed pieces for food, feed, or fodder. As part of the seed cutting and treating process, application of an absorbent ingredient is recommended to improve suberization.

## How it Works:

The active ingredient fenamidone is a strobilurin fungicide with contact activity. To be used as a preventative and inhibitive (spore germination and antisporeulant) fungicide application. Refer to "Fungicide Modes of Action" in the Plant Disease Control section for more information.

## Tank Mixes:

*Reason 500 SC* can be tank mixed with *Titan* and *Emesto Silver Titan* or *Emesto Silver* for application as a seed-piece treatment of potato when additional disease control and/or insect control is required. Refer to the registered label of each tank mix partner for application rate, precautions and directions for use associated with those products. Follow the most restrictive label precautions and limitations.

## Restrictions:

- **Resistance management:** Refer to "Pathogen Resistance" in the Plant Disease Control section for more information. If following a seed treatment application of *Revus* with foliar applications of this product, apply a fungicide belonging to a group other than Group 40 as the first foliar application of the season. DO NOT apply more than 243 g mandipropamid per acre per year.
- **Maximum number of applications:** DO NOT exceed 6 applications, or 0.48 L per acre, of this product per season.
- **Grazing:** No restrictions listed.
- **Preharvest interval:** 14 days.
- **Re-entry:** DO NOT re-enter treated areas until residues have dried.
- **Re-cropping:** A 30 day plant-back interval is required for potato and all other crops.
- **Storage:** DO NOT allow product to freeze. If stored more than 1 year, shake well before using. Keep away from fire, open flame or other sources of heat. Store in tightly closed container away from fertilizer, seeds, feed or food
- **Environment:** For ground application, maintain an 8 m buffer zone between areas sprayed and aquatic systems. For aerial application, allow a 10 m buffer. Toxic to fish and other aquatic organisms; DO NOT apply where runoff is likely to occur.

## Hazard Rating:

Caution Poison – Eye Irritant

Refer to the Introduction for an explanation of the symbols.

# Revus

Fungicide Group  
40

## Company:

Syngenta Canada Inc. (PCP#29074)

## Formulation:

250 g/L mandipropamid formulated as a suspension.

- Container size - 10 kg

## Crops, Diseases and Rates:

| Crop   | Diseases Controlled                                      | Diseases Suppressed                             | Rate (per 100 kg of seed)* |
|--------|----------------------------------------------------------|-------------------------------------------------|----------------------------|
| Potato | Seed-borne late blight ( <i>Phytophthora infestans</i> ) | Pink rot ( <i>Phytophthora erythroseptica</i> ) | 13 to 26 mL                |

\* Use the higher rate when conditions favour heavy infection pressure.

## Application Information:

Apply using standard seed treating equipment that provides uniform seed coverage. Uneven or incomplete seed coverage may not get the desired level of disease control. Add sufficient water to allow for a slurry volume that will allow for sufficient coverage. Wear coveralls over long-sleeved shirt, long pants, chemical-resistant gloves, socks and boots during mixing, loading, application, clean-up and repair. When handling or planting treated potato seed pieces, workers must wear a long-sleeved shirt, long pants, gloves, socks and boots. DO NOT use open treating equipment when treating potato seed pieces. This product must be applied using a closed treatment system.

## How it Works:

The active ingredient mandipropamid is a carboxylic acid amid (CAA) with contact and systemic activity. Refer to "Fungicide Modes of Action" in the Plant Disease Control section for more information.

## Tank Mixes:

None listed.

## Restrictions:

- **Resistance management:** Refer to "Pathogen Resistance" in the Plant Disease Control section for more information. If following a seed treatment application of *Revus* with foliar applications of this product, apply a fungicide belonging to a group other than Group 40 as the first foliar application of the season. DO NOT apply more than 243 g mandipropamid per acre per year.
- **Labelling:** No restrictions listed.
- **Grazing:** No restrictions listed.
- **Re-cropping:** No restrictions listed.
- **Storage:** Store in a cool, dry place away from food, beverages, and tobacco products. To prevent contamination store this product away from food and feed.
- **Environment:** DO NOT apply this product directly to freshwater habitats, estuarine/marine habitats. DO NOT contaminate irrigation or drinking water supplies or aquatic habitats by cleaning of equipment or disposal of wastes.

## Hazard Rating:

Warning – Poison

Caution – Skin Irritant

Potential Skin Sensitizer

Refer to the Introduction for an explanation of the symbols.

# Sharda METEB 11ST

Fungicide Group  
3, 4

## Company and Formulation:

Sharda Crop Chem distributed by UAP Canada (PCP#34038)

## Formulation:

5.0 g/L tebuconazole and 6.6 g/L metalaxyl formulated as a suspension.

- Container sizes - 10 L, 110 L drums, 200 L, 1000 L

## Crops, Diseases and Rates:

| Crop                  | Diseases Controlled                                                                                                                                                                                                                                                                                                                                      | Diseases Suppressed                                                                                                                                                                                                                                                                                                         | Rate (per 100 kg of seed) |
|-----------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------|

| Oats                  | Covered smut ( <i>Ustilago kollerii</i> ), loose smut ( <i>Ustilago avenae</i> ), seed rot and pre-emergent damping-off caused by seed- and soil-borne <i>Fusarium</i> spp., seedling blight caused by seed-borne <i>Fusarium</i> spp., damping-off caused by <i>Pythium</i> spp.                                                                        | Root and crown rot caused by seed- and soil-borne <i>Fusarium</i> species, common root rot caused by seed- and soil-borne <i>Cochliobolus sativus</i> , seed rot and pre-emergent damping-off caused by seed- and soil-borne <i>Cochliobolus sativus</i> , seedling blight caused by seed-borne <i>Cochliobolus sativus</i> |                           |
| Wheat, rye, triticale | Loose smut ( <i>Ustilago tritici</i> ), common bunt or stinking smut ( <i>Tilletia tritici</i> , <i>T. laevis</i> ), seed rot and pre-emergent damping-off caused by seed- and soil-borne <i>Fusarium</i> spp., seedling blight caused by seed-borne <i>Fusarium</i> spp., damping-off caused by <i>Pythium</i> spp., seed-borne <i>Septoria nodorum</i> | Root and crown rot caused by seed- and soil-borne <i>Fusarium</i> species, common root rot caused by seed- and soil-borne <i>Cochliobolus sativus</i> , seed rot and pre-emergent damping-off caused by seed- and soil-borne <i>Cochliobolus sativus</i> , seedling blight caused by seed-borne <i>Cochliobolus sativus</i> |                           |

## Application Information:

Commercial or on farm treating equipment that can control the application rates and provide good distribution of the chemical onto the seed in the mixing chamber. Review the product label before use for further instructions.

## How it Works:

The active ingredient tebuconazole is a triazole demethylation inhibitor (DMI) fungicide with systemic activity. The active ingredient metalaxyl is an acylalanine fungicide with systemic activity. Refer to "Fungicide Modes of Action" in the Plant Disease Control section for more information.

## Tank Mixes:

None listed.

## Restrictions:

- **Resistance management:** Refer to "Pathogen Resistance" in the Plant Disease Control section for more information.
- **Labelling:** All containers or packages containing treated seed for sale or use in Canada must be labeled or tagged as follows:  
"This seed has been treated with *Sharda METEB 11ST* fungicide containing tebuconazole and metalaxyl. Wear coveralls or a long-sleeved shirt and long pants, NIOSH-approved N95 (minimum) filtering facepiece respirator (dust mask), shoes plus socks and chemical resistant gloves when handling treated seed, stacking bags, or transferring to storage bin. DO NOT use for food, feed, or oil processing. DO NOT graze or feed livestock on treated areas for 4 weeks after planting. DO NOT contaminate feed or foodstuffs with treated seed. Do not apply this product directly to freshwater habitats (such as lakes, rivers, sloughs, ponds, prairie potholes, creeks, marshes, streams, reservoirs, ditches, and wetlands), estuaries or marine habitats. Do not contaminate irrigation or drinking water supplies or aquatic habitats by cleaning of equipment or disposal of wastes. Do not expose treated seeds on soil surface. Any spilled or exposed seed must be incorporated into the soil or otherwise cleaned-up from the soil surface. Dispose of all excess treated seed. Leftover treated seed may be double sown around the headland or buried away from water sources in accordance with local requirements. Dispose of seed packaging in accordance with local requirements. DO NOT re-use bags from treated seed to handle food or feed products."
- **Grazing:** DO NOT graze or feed livestock on treated areas for 4 weeks after planting.
- **Re-cropping:** No restrictions listed.
- **Storage:** DO NOT freeze. Store product in original container only, away from other pesticides, fertilizer, food or feed. Store in a cool, dry place and avoid excessive heat. Keep container closed. DO NOT contaminate water, food, or feed by storage, disposal, or by cleaning of equipment.
- **Environment:** DO NOT contaminate irrigation or drinking water supplies or aquatic habitats by cleaning of equipment or disposal of wastes. Any spilled or exposed seeds must be incorporated into the soil or otherwise cleaned-up from the soil surface.

## Hazard Rating:

None listed.

# Stadium

Fungicide Group  
11, 3, 12

## Company:

Syngenta Canada Inc. (PCP#31050)

## Formulation:

143 g/L azoxystrobin, 112 g/L difenoconazole and 143 g/L fludioxonil formulated as a suspension concentrate seed treatment.

## Crops and Diseases:

For use in post-harvest treatment of potatoes to control fusarium dry rot (*Fusarium* spp.) and to suppress silver scurf (*Helminthosporium solani*).

## Rate and Application Information:

*Stadium* is a suspension concentrate that must be diluted with water and applied at the rate of 32.5 mL per tonne of potatoes. Finally spray solution should deliver an application rate of 2 L (*Stadium* + water) per metric tonne of potatoes. Application is for in-line as an aqueous spray. Tubers should be rotating along a conveyor line in a single layer to ensure proper coverage. DO NOT make more than one post-harvest application to the tubers.

## How it Works:

The active ingredient azoxystrobin is a methoxyacrylate (strobilurin) fungicide with broad spectrum activity to be used as a preventative and curative fungicide, difenoconazole is a triazole fungicide with broad-spectrum systemic activity and fludioxonil is phenylpyrrole fungicide with contact activity. Refer to "Fungicide Modes of Action" in the Plant Disease Control section for more information.

## Tank Mixes:

None listed.

## Restrictions:

- **Resistance management:** Refer to "Pathogen Resistance" in the Plant Disease Control section for more information.
- **Labelling:** No restrictions listed.
- **Grazing:** No restrictions listed.
- **Re-cropping:** This product is restricted to table and processing potatoes.
- **Storage:** Store in a cool dry place. DO NOT store food, beverages or tobacco products in storage area.
- **Environment:** This product is toxic to fish and aquatic invertebrates. DO NOT apply directly to water or to areas where surface water is present. DO NOT allow contaminated waste water from the processing areas to enter lakes, streams, ponds or other waters. DO NOT contaminate irrigation or drinking water supplies or aquatic habitats by cleaning of equipment or disposal of wastes.

**Hazard Rating:**
 Warning – Poison

Refer to the Introduction for an explanation of the symbols.

# Straxan

**Fungicide Group**  
**3, 4****Company:**

Corteva Agriscience (PCP#34928)

**Formulation:** Straxan is formulated as a suspension.

| Active ingredient |                              |

### Application Information:

Straxan Fungicide Seed Treatment is a ready-to-use water-based formulation for use in commercial seed treatment plants, and for on-farm treatment using standard gravity flow or mist type seed treatment equipment which accurately meters and mixes a flowable seed treatment. Straxan Fungicide Seed Treatment may also be used in a treat-on-the-go air seeder. The equipment must provide uniform coverage of Straxan Fungicide Seed Treatment on the seed. Uneven seed coverage may not give the desired level of disease control. This product does not require the addition of water for application. Consult the manufacturer of the application equipment planned to be used for suitability for this application and for instructions on operation and calibration of the equipment. Water can be added to Straxan Fungicide Seed Treatment to create a slurry if additional seed coverage is required. Total application volume must be adjusted to reflect the additional volume so that the correct amount of Straxan Fungicide Seed Treatment is applied to each unit of seed (325 mL/100 kg).

### How it Works:

Straxan contains the active ingredients difenoconazole, metalaxyl and tebuconazole. Difenoconazole and Tebuconazole are triazole fungicides (Group 3) with broad-spectrum systemic activity. Metalaxyl is a member of the acylalanine chemical group (Group 4) and interrupts fungal nucleic acid synthesis.

Refer to "Fungicide Modes of Action" in the Plant Disease Control section for more information.

### Tank Mixes:

Lumivia CPL is a supported tank mix partner for wheat, barley oats, and rye.

### Restrictions:

- **Labelling:** Treated seed must be labeled "This seed has been treated with Straxan Fungicide Seed Treatment which contains the fungicides difenoconazole, metalaxyl and tebuconazole. Do not use treated seed for food, feed or oil processing. Store away from feeds and other foodstuffs. During handling and planting of commercially treated seeds, wear coveralls over a long-sleeved shirt, long pants, chemical-resistant gloves, socks and shoes. Use a closed-cab tractor when planting. Gloves are not required within the closed cab. Any spilled or exposed seeds and dust must be incorporated into the soil or cleaned up from the soil surface."
- **Storage:** Store product in original container only, away from other pesticides, fertilizer, food or feed. Store in a cool, dry place and avoid excessive heat. Keep container closed. DO NOT contaminate water, food, or feed by storage, disposal, or by cleaning of equipment.
- **Grazing:** Do not graze, feed green forage or cut for hay within 35 days of planting of cereals. DO NOT plant any crop other than cereals within 30 days to fields in which treated seeds were planted.
- **Environmental Restrictions:** DO NOT contaminate irrigation or drinking water supplies or aquatic habitats by cleaning of equipment or disposal of wastes. Toxic to aquatic organisms. Toxic to birds and small wild mammals. Any spilled or exposed seeds must be incorporated into the soil or otherwise cleaned-up from the soil surface. This product demonstrates the properties and characteristics associated with chemicals detected in groundwater. The use of this product in areas where soils are permeable, particularly where the water table is shallow, may result in groundwater contamination.

### Hazard Rating:

None listed.

# StorOx

Fungicide Group  
NC

## Company:

Manufactured by BioSafe Systems LLC (PCP#27432)

Distributed in Western Canada by Storcool Potato Services

## Formulation:

27% hydrogen peroxide.

- Container size - 10 to 220 L

## Crops and Diseases:

Control of fusarium tuber rot (*Fusarium* spp.), bacterial soft rot and silver scurf (*Helminthosporium solani*) in potato.

## Rate and Application Information:

Prior to storage and in storage treatment for harvested potato tubers.

As a spray treatment for newly harvested potatoes before storage: 100 mL of *StorOx* per 10 L water. Spray diluted solution on tuber to runoff to achieve full and even coverage. Use 4.15 to 8.3 L water per tonne of potatoes.

As application to potatoes in storage as a direct injection into humidification water: 100 mL *StorOx* per 10 L water. Apply diluted product for at least 20 minutes per day, based on a humidification airflow rate of 0.6 cfm.

## Tank Mixes:

May be used in conjunction with a growth inhibitor during humidification. Should not be combined or mixed with pesticides or fertilizer.

## How it Works:

Hydrogen peroxide is an inorganic compound with contact activity against fungi and bacteria. Refer to "Fungicide Modes of Action" in the Plant Disease Control section for more information.

## Restrictions:

- **Storage:** Store in cool, well ventilated area away from direct sunlight. Since *StorOx* is a strong oxidizing agent, contact with combustibles may cause fire.
- **Environmental:** DO NOT discharge effluent containing *StorOx* into lakes, streams, ponds or other bodies of water. DO NOT permit this product to enter surface or ground water.

## Hazard Rating:

 Danger – Corrosive to Eyes

 Warning – Skin Irritant

**Other Precautions:** This product is corrosive to metal surfaces; rinse all application equipment thoroughly with water after use. DO NOT enter treated storage bins until the hydrogen peroxide air concentrations are below exposure levels established by occupational health and safety authorities.

## Application Information:

Tarian MD is a ready to use formulation designed for commercial or on-farm treating with conventional seed treating equipment. Uniform application to seed is necessary to ensure optimum product performance.

## Restrictions:

- **Labelling:**
- **Grazing:** Do not graze or feed livestock on treated areas for 4 weeks after planting. Do not use for food, feed or oil processing.
- **Re-cropping:** N/A
- **Storage:** Store this product away from food or feed. Store product in original container only, away from other pesticides and fertilizer. Store in a cool, dry place and avoid excessive heat. Keep container closed.
- **Environmental Restrictions:** Toxic to aquatic organisms and non-target terrestrial plants. Any spilled or exposed seeds must be incorporated into the soil or otherwise cleaned-up from the soil surface. This product demonstrates the properties and characteristics associated with chemicals detected in groundwater. The use of this product in areas where soils are permeable, particularly where the water table is shallow, may result in groundwater contamination.

| Triticale                                                                                      | Common bunt ( <i>Tilletia tritici</i> , <i>T. laevis</i> )                                                                                                                                                                                                                                                |                                                                                                                   |                        |                           |
| Wheat, barley, oat, canaryseed, rye, triticale, annual canarygrass grown for human consumption | Seed rot, damping off, seedling blight and root rot caused by <i>Fusarium</i> spp., <i>Rhizoctonia solani</i> , and <i>Pythium</i> spp., seed rot and pre-emergent damping off caused by <i>Cochliobolus sativus</i> . Suppression of seedling blight and root rot caused by <i>Cochliobolus sativa</i> . |                                                                                                                   |                        |                           |

## Application Information:

Apply *Teraxxa F4* as a water-based mixture using standard slurry or mist-type seed treatment application equipment. The required amount of *Teraxxa F4* should then be diluted with the recommended amount of water that will provide uniform and complete coverage on the seed surface.

## How it Works:

The active ingredient broflanilide is a GABA-gated chloride channel moderator with contact activity. The active ingredient triticonazole is a triazole fungicide that provides systemic broad spectrum activity. The active ingredient metalaxyl is an acylalanine fungicide with systemic activity. Fluxapyroxad is a carboximide fungicide that provides systemic broad spectrum protection. The active ingredient pyraclostrobin is a strobilurin fungicide with broad spectrum contact and systemic activity.

## Tank Mixes:

None listed.

## Restrictions:

DO NOT use for food, feed or oil processing. This seed is treated with broflanilide, pyraclostrobin, fluxapyroxad, triticonazole and metalaxyl.

## Hazard Rating:

Warning – Contains the Allergen Soy

Caution – Skin Irritant

# Trifloxystrobin + Metalaxyl

Obex/VIKING Grimstad

Fungicide Group  
11, 4

## Company:

AgraCity Crop & Nutrition Ltd. (Obex – PCP#34858)

Viking Crop Production Partners Inc. (VIKING Grimstad – PCP#34970)

**Formulation:** Formulated as a suspension.

| Active ingredient |                              |
|-------------------|------------------------------|
| Trifloxystrobin   | 13.5 g/L                     |
| Metalaxyl         | 10.8 g/L                     |
| Container sizes:  | 2 x 10 L case and 100 L drum |

## Crops, Diseases and Rates:

## Application Information:

These Seed Treatment Fungicides are ready-to-use formulations designed for commercial or on-farm treating with conventional seed treating equipment. If diluted with water by greater than 10% by volume, ensure agitation of the mixture prior to application to seed. Compatible with *Rhizobium*-based inoculants. Please check with inoculant manufacturers for further details prior to use.

## How it Works:

Metalaxyl is a Group 4 fungicide as classified by the Fungicide Resistance Action Committee (FRAC); its mode of action is the interruption of fungal nucleic acid synthesis. Trifloxystrobin belongs to the strobilurin or Quinone Outside Inhibitors (QoI) class of fungicides (Group 11).

Refer to "Fungicide Modes of Action" in the Plant Disease Control section for more information.

## Tank Mixes:

None.

## Restrictions:

- **Grazing:** DO NOT feed or graze livestock for four weeks after planting. Treated seed must not be used for food, feed or oil processing.
- **Storage:** Store product in original container only, away from other pesticides, fertilizer, food or feed. DO NOT store below 0°C. This product cannot be frozen must be placed in a heated or adequately insulated area to avoid sub-zero temperatures. Store in a cool, dry place and avoid excessive heat. Keep container closed. Do not contaminate water, food, or feed by storage, disposal, or by cleaning of equipment

- **Environmental Restrictions:** Any spilled or exposed seeds must be incorporated into the soil or otherwise cleaned up from the soil surface. This product demonstrates the properties and characteristics associated with chemicals detected in groundwater. The use of this product in areas where soils are permeable, particularly where the water table is shallow, may result in groundwater contamination.

## Hazard Rating:

None listed.

# Trilex EverGol Fungicide Seed Treatment

Fungicide Group  
4, 7, 11

Trilex EverGol is a co-pack of Trilex Component A (penflufen and trifloxystrobin fungicides) and Trilex Component B (metalaxyl fungicide). Trilex Component A and Trilex Component B are not sold individually.

## Company:

Bayer (Trilex Component A – PCP#30644, Trilex Component B – PCP#30645)

## Formulations:

*Trilex Component A:* 154 g/L penflufen and 154 g/L trifloxystrobin formulated as a liquid based water formulation.

- Container sizes - 1.5 L or in bulk package 6.49 L

*Trilex Component B:* 317 g/L metalaxyl formulated as a suspension.

- Container sizes - 0.96 L or in bulk package 4.15 L

## Crops, Diseases and Rates:

| Crop                                                     | Diseases                                                                                                                                                                                                |                                                       | Rate (per 100 kg of seed) |                    |
|----------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------|---------------------------|--------------------|

| Chickpea<br>Dry Bean<br>Faba bean<br>Field pea<br>Lentil | Control of seed decay/pre-emergence damping-off and post-emergence damping-off ( <i>Rhizoctonia solani</i> , <i>Fusarium</i> spp., and <i>Botrytis cinerea</i> ); seedling blight ( <i>B. cinerea</i> ) | Seed rots and seedling blights ( <i>Pythium</i> spp.) | 25 mL                     | 16 mL              |
|                                                          | Suppression of seedborne <i>Ascochyta</i> blight ( <i>Ascochyta</i> spp.)                                                                                                                               | -                                                     | 25 to 32 mL               | -                  |

\*Add 7 to 1 ratio of water (25 mL of component A + 16 mL of component B + 287 mL of water for a total of 328 mL per 100 kg).

## Application Information:

*Trilex Component A* is a seed treatment formulation for use in commercial seed treatment operations, and for on-farm treating with conventional seed treating equipment which can accurately meter and apply flowable seed treatment formulations. This product is recommended to be diluted with water or another suitable liquid just prior to application to ensure uniform coverage on the seed during the application process. Uniform application to seed is necessary to ensure optimum performance. Allow seeds to dry before bagging, storing or seeding.

*Trilex Component B* should be mixed with water to form a slurry seed treatment. Mix 500 mL of slurry per 100 kg of seed to be treated. The slurry should be applied as a spray into the mixing chamber of the seed treating equipment to ensure good coverage. When preparing the slurry the following procedure should be used: 1) partially fill the mixing tank with water; 2) add the required quantity of *Trilex Component B* onto the water surface; 3) allow product to disperse and then switch on agitation; 4) top up with extra water to required volume and maintain agitation during use; and 5) add colourant last.

## How it Works:

*Trilex Component A:* The active ingredient penflufen is a carboxamide (SDHI) fungicide with systemic activity. The active ingredient trifloxystrobin is a strobilurin fungicide with broad spectrum preventative activity.

*Trilex Component B:* The active ingredient metalaxyl is an acylalanine fungicide with systemic activity. Refer to "Fungicide Modes of Action" in the Plant Disease Control section for more information.

## Tank Mixes:

**Fungicide Seed Treatments:** In addition to *Trilex Component B*, *Trilex Component A* may be mixed with *Allegiance FL*. Follow the label directions for each product and use the most restrictive precautions and limitations for either product.

Off-label tank mixes, as previously permitted under the Pest Management Regulatory Agency (PMRA) Off-label Tank Mix Policy memo of 2009 are no longer allowed under new guidance from PMRA. As of December 20, 2022 only products specifically indicated on product labels may be mixed, or when the labels of two or more products to be mixed include the statement quoted in the Introduction.

## Restrictions:

- **Resistance management:** Refer to "Pathogen Resistance" in the Plant Disease Control section for more information.
- **Labelling:** Treated seed must be labeled "This seed has been treated with *Trilex Component A* (containing penflufen and trifloxystrobin) and *Trilex Component B* (containing metalaxyl). Wear long-sleeved shirt, long pants and chemical-resistant gloves when handling treated seed. DO NOT use for feed, food or oil processing. Store away from feeds and other foodstuffs."
- **Grazing:** DO NOT graze or feed livestock on treated areas for four weeks after planting.
- **Re-cropping:** Registered crops for *Trilex Component A*, as well as canola, mustard, rapeseed, soybean, alfalfa, corn and cereal grains, may be replanted at any time. For all other crops, DO NOT plant back within 30 days of seeding with *Trilex Component A*-treated seed.
- **Storage:** Store product in original container only, away from other pesticides, fertilizer, food or feed. Keep container closed. Store in a cool, dry area. DO NOT store in direct sunlight. DO NOT store *Trilex Component A* above 40°C or below -10°C. DO NOT store *Trilex Component B* above 35°C or below 0°C.
- **Environment:** Toxic to aquatic organisms. Treated seed may be toxic to birds and other wildlife. DO NOT discharge effluent containing this product into sewer systems, lakes, streams, ponds, estuaries, oceans or other waters. Dispose of all excess treated seed. Left over seed may be double-sown around the headland or buried away from water sources. DO NOT leave exposed treated seed on soil surface. Any spilled or exposed seeds must be incorporated into the soil or otherwise cleaned-up from the soil surface. The use of this chemical may result in contamination of groundwater particularly in areas where soils are permeable and/or the depth to the water is shallow.

## Hazard Rating:

***Trilex Component B*:** Warning – Skin and Eye Irritant

Refer to the Introduction for an explanation of the symbols.

# Trilex EverGol Shield Seed Treatment

*Trilex EverGol SHIELD* is a co-pack of *Trilex Component A* (penflufen and trifloxystrobin fungicides), *Trilex Component B* (metalaxyl fungicide), and *Stress Shield 600* (imidacloprid). *Trilex Component A* and *Trilex Component B* are not sold individually. For individual component information, see the product pages listed above.

## Application Information:

For use in commercial seed treatment (facilities and mobile treaters) with closed-transfer, including closed mixing, loading, calibrating, and closed-treatment equipment only. No open transfer is permitted.

VAYANTIS Seed Treatment mixes easily with water. When mixing with products from other manufacturers, the compatibility should be tested prior to use by conducting a jar test; mixing all intended seed treatments with the appropriate amount of water in a clear glass container, mix well, and allow to sit for one hour. Remix and observe for incompatibility.

VAYANTIS Seed Treatment may be applied as a seed treatment following the guidelines specified in the Directions for Use section of the label. Ensure product is thoroughly mixed prior to application. Apply VAYANTIS Seed Treatment as a water-based slurry utilizing standard slurry seed treatment equipment that provides uniform seed coverage. Uneven or incomplete seed coverage may not give the desired level of disease control. Thoroughly mix the recommended amount of VAYANTIS Seed Treatment into the required amount of water for the slurry treater and dilution rate to be used. Follow the manufacturer's application instructions for the seed treatment equipment being used. Maintain constant agitation of the slurry during the seed treatment process. Allow the seed to dry before bagging.

Depending on planting equipment, seed treated with VAYANTIS Seed Treatment or a combination of VAYANTIS Seed Treatment and other seed treatment products may not flow through planting equipment at the same rate as untreated seed. Recalibrate the equipment before planting treated seed.

## How it Works:

Picarbutrazox is an ingredient belonging to the tetrazolyloxines chemical group of fungicides (FRAC U17). Picarbutrazox is a systemic fungicide developed to protect soybeans from key diseases like *Pythium* and *Phytophthora* caused by oomycete plant pathogens. In combination with metalaxyl-M, picarbutrazox improves the consistency of oomycete protection through overlapping effective modes of action. Sedaxane is a succinate dehydrogenase inhibitor fungicide with preventative and systemic activity that inhibits fungal metabolism by binding to the succinate dehydrogenase enzyme to disrupt cellular respiration and energy generation. Fludioxonil is a phenylpyrrole fungicide with contact activity. Refer to "Fungicide Modes of Action" in the Plant Disease Control section for more information.

## Tank Mixes:

None listed.

## Restrictions:

- **Labelling:** KEEP TREATED SEED OUT OF REACH OF CHILDREN AND ANIMALS. All containers or packages containing treated seed for sale or use in Canada must be labelled or tagged as follows: This seed has been treated with VAYANTIS Seed Treatment, which contains picarbutrazox. Do not use for feed, food or oil processing. Store this product away from food or feed. When handling and planting treated seed, wear a long-sleeved shirt, long pants, chemical-resistant gloves, socks and shoes. Gloves are not required within a closed-cab tractor. For good hygiene practice, it is also recommended to wear a NIOSH-approved N95 (minimum) filtering facepiece respirator (dust mask) that is properly fit tested during all job activities. This product is toxic to aquatic invertebrates. Dispose of all excess treated seed. Dispose of seed packaging in accordance with local requirements. Any spilled or exposed seeds must be incorporated into the soil or otherwise cleaned-up from the soil surface.
- **Grazing:** DO NOT graze or feed livestock on treated area for 45 days after planting soybeans.
- **Re-cropping:** DO NOT plant any crop other than cereals, corn, soybeans, members of Crop Subgroup 6C (Dried shelled peas and beans, chickpeas, lentils and fava beans) or members of Crop Subgroup 20A (Canola/rapeseed subgroup), within 60 days to fields in which treated seeds were planted.
- **Storage:** Store this product away from food or feed. Ideal storage temperature is above freezing and below 30 °C. Repeated freeze-thawing of VIBRANCE TRIO Seed Treatment will not affect the physical integrity of the product. If the product should freeze, bring the product back to room temperature and ensure the contents are mixed well prior to application. To prevent contamination store this product away from food or feed.
- **Environmental Restrictions:** Toxic to aquatic organisms.
  - DO NOT contaminate irrigation or drinking water supplies or aquatic habitats by cleaning of equipment or disposal of wastes. Any spilled or exposed seeds must be incorporated into the soil or otherwise cleaned-up from the soil surface.
  - This product demonstrates the properties and characteristics associated with chemicals detected in groundwater. The use of this product in areas where soils are permeable, particularly where the water table is shallow, may result in groundwater contamination.

## Hazard Rating:

Warning – contains the allergen soy

# Vibrance Maxx RFC/RTA

Fungicide Group  
4, 7, 12

Vibrance Maxx RTA is a co-pack of Apron Maxx RTA (fludioxonil and metalaxyl-M and S-isomer fungicides and Vibrance 500 FS (sedaxane fungicide). Vibrance Maxx RFC is a pre-mix formulation. For other detailed information on the component products see the product pages listed above.

## Company:

Syngenta Canada Inc. (Apron Maxx RTA – PCP#27577, Vibrance 500 FS – PCP#30438, Vibrance Maxx RFC – PCP#32272)

## Formulations:

**Apron Maxx RTA:** 0.73% fludioxonil, 1.10% metalaxyl-M and S-isomer formulated as a suspension.

**Vibrance 500 FS:** 500 g/L sedaxane formulated as a suspension.

**Vibrance Maxx RFC:** 50 g/L sedaxane, 37.5 g/L metalaxyl-M and S-isomer and 25 g/L fludioxonil.

- Container sizes - 2 x 3.075 L jugs per case, 56.78 L drum
- **Vibrance Maxx RTA** co-packs container size - 115 L Apron Maxx RTA + 3.33 L Vibrance 500 FS; 450 L Apron Maxx RTA + 4 x 3.33 L Vibrance 500 FS

Product information provided below for *Vibrance Maxx RFC* (pre-mix). For detailed information on component products of *Vibrance Maxx RTA* co-pack please consult individual product pages.

## Application Information

*Vibrance Maxx RFC* is for use in commercial seed treatment and for on-farm seed treatment using seed treatment equipment that accurately metres, mixes and applies a flowable seed treatment. Thoroughly mix the recommended amount of *Vibrance Maxx RFC* with the required amount of water for the slurry treatment and dilution rate to be used. Maintain constant agitation of the slurry during the treatment. Allow the seed to dry before bagging, storing or seeding.

## How it Works:

The active ingredient sedaxane is a succinate dehydrogenase inhibitor fungicide with preventative and systemic activity that inhibits fungal metabolism by binding to the succinate dehydro-genase enzyme to disrupt cellular respiration and energy generation. The active ingredient fludioxonil is a phenylpyrrole fungicide with contact activity. The active ingredient metalaxyl-M is an acylalanine fungicide with systemic activity against diseases caused by the Oomycetes, including *Pythium* damping-off. Refer to "Fungicide Modes of Action" in the Plant Disease Control section for more information.

## Restrictions:

- **Resistance management:** Refer to "Pathogen Resistance" in the Plant Disease Control section for more information.
- **Labelling:** All seed treated with *Vibrance Maxx RFC* must be labelled "This seed has been treated with the fungicides metalaxyl-M and S-isomer, fludioxonil and sedaxane. When handling and planting treated seed, workers must wear cotton coveralls or long-sleeved shirt and long pants, chemical-resistant gloves, and work boots. For good hygiene practice, it is also recommended to wear a NIOSH-approved N95 filtering facepiece respirator (dust mask) that is properly fit tested during all job activities. DO NOT use for food, feed or oil processing. Store away from food and feed."
- **Grazing:** DO NOT graze or feed livestock on treated areas for 45 days after planting soybeans. DO NOT graze or feed livestock on treated area for 60 days after planting chickpea, dry beans, faba beans, field peas, or lentils.
- **Re-cropping:** DO NOT plant any crop other than cereals, corn, soybeans, dry beans, chickpeas, lentils, faba beans and field peas within 60 days in which treated seeds were planted.
- **Storage:** Store away from food and feed. Ideal storage temperature is above freezing and below 30°C. If product should freeze, bring to room temperature and ensure the contents are mixed well prior to application.
- **Environment:** This product is toxic to fish and other aquatic organisms. DO NOT apply this product directly to aquatic habitats, estuaries or marine habitats. DO NOT contaminate irrigation or drinking water supplies or aquatic habitats by cleaning of equipment or disposal of wastes. Any spilled or exposed seeds must be incorporated into the soil or otherwise cleaned-up from the soil surface.
- **Compatibility with *Rhizobia*-based inoculants:** *Vibrance Maxx RFC* is compatible with *Rhizobia*-based inoculants. Please check with inoculants manufacturers for specific planting windows and methods of application prior to use.

## Hazard Rating:

***Vibrance 500 FS*:** Caution – Poison

Refer to the Introduction for an explanation of the symbols.

# Vibrance Maxx RFC with INTEGO Solo

Fungicide Group  
4, 7, 12, 22

Vibrance Maxx RFC with INTEGO Solo is a co-pack of Vibrance Maxx RFC (sedaxane, fludioxonil and metalaxyl-M and S-isomer fungicides) and INTEGO Solo Fungicide (ethaboxam fungicide). For more detailed information on the component products see the product pages listed above.

## Company:

Syngenta Canada Inc. (Vibrance Maxx RFC – PCP#32272)

Valent Canada Inc. distributed by Nufarm Agriculture (INTEGO Solo Fungicide – PCP#31324)

## Formulations:

**Vibrance Maxx RFC:** 50 g/L sedaxane, 37.5 g/L metalaxyl-M and S-isomer and 25 g/L fludioxonil.

- Container sizes - 2 x 3.075 L jugs in a case, 56.78 L drum

**INTEGO Solo Fungicide:** 383 g/L ethaboxam formulated as a suspension.

- Container sizes - 2 x 605 mL

## Crops, Diseases and Rates:

## Application Information:

Vibrance Total is a seed treatment formulation for use in commercial seed treatment (in facilities or with mobile treaters) and for on-farm treatment using seed treatment equipment that accurately meters, mixes and applies a flowable seed treatment. The equipment must provide uniform coverage of Vibrance Total on the seed. Uneven seed coverage may not give the desired level of disease control. Allow the seed to dry before bagging, storing or seeding. Thoroughly mix the recommended amount of Vibrance Total with the required amount of water for the slurry treater and dilution rate to be used. Slurry volumes will vary depending on seed size. Follow the manufacturer's application instructions for the seed treatment equipment being used. Maintain constant agitation of the slurry during the treatment.

## Seed Treatment and Inoculants

Vibrance Total is compatible with Rhizobium based inoculants. Please check with inoculant manufacturers for specific planting windows and methods of application prior to use. Consult the manufacturer of the application equipment planned to be used for suitability for this application and for instructions on operation and calibration of the equipment. Seed treated with Vibrance Total, or a combination of Vibrance Total and seed inoculants, may not flow through a seed drill at the same rate as untreated seed. Recalibrate the seed drill before planting treated seed. Mixing with inoculants may increase drying time while treating, extending the processing time.

This product contains a pigment that will colour the treated seed; however, users are responsible for ensuring that the treated seed, when dried and ready for bagging, storage or seeding has an unnatural colour. If the pigment contained in the formulation does not colour the seed adequately, additional colourant must be added to the mixture while treating the seed.

### How it Works:

Vibrance Total contains the active ingredients thiabendazole, metalaxyl, sedaxane, fludioxonil and picarbutrazox. Thiabendazole is a benzimidazole fungicide with both contact and systemic activity. Metalaxyl-M is an acylalanine fungicide with systemic activity against diseases caused by the Oomycetes, including Pythium damping-off. Sedaxane is a succinate dehydrogenase inhibitor fungicide with systemic activity that inhibits fungal metabolism by binding to the succinate dehydrogenase enzyme to disrupt cellular respiration and energy generation. Fludioxonil is phenylpyrrole fungicide with contact activity. Picarbutrazox is an ingredient belonging to the tetrazoloxines chemical group of fungicides (FRAC U17). Picarbutrazox is a systemic fungicide developed to protect against diseases caused by oomycete plant pathogens like Pythium. In combination with metalaxyl-M, picarbutrazox improves the consistency of oomycete protection through overlapping effective modes of action.

Refer to "Fungicide Modes of Action" in the Plant Disease Control section for more information.

### Tank Mixes:

This product may be tank mixed with a fertilizer, a supplement, or with registered pest control products, whose labels also allow tank mixing, provided the entirety of both labels, including Directions for Use, Precautions, Restrictions, Environmental Precautions, and Spray Buffer Zones are followed for each product. In cases where these requirements differ between the tank mix partner labels, the most restrictive label must be followed. DO NOT tank mix products containing the same active ingredient unless specifically listed on this label.

### Restrictions:

- **Labelling:** All containers or packages containing treated seed for sale or use in Canada must be labeled or tagged as follows: "This seed has been treated with the fungicides thiabendazole, sedaxane, metalaxyl-M and S-isomer, fludioxonil, and picarbutrazox. Wear chemical resistant coveralls over a long-sleeved shirt, long pants, chemical-resistant gloves, socks, and shoes during planting and handling of treated seeds and any other activities involving calibrating, clean-up, and repair. Wear a NIOSH-approved N95 (minimum) filtering facepiece respirator (dust mask) that is properly fit tested when transferring treated seed to the planter/seeder. This product is toxic to aquatic organisms. Do not use for food, feed or oil processing. Store away from food and feed. Dispose of all excess treated seed. Dispose of seed packaging in accordance with local requirements. Toxic to birds and small wild mammals. Any spilled or exposed seeds.
- **Grazing:** DO NOT graze or feed livestock on treated area for 60 days after planting dried shelled pea and bean crops, chickpeas, lentils and faba beans
- **Re-cropping:** DO NOT plant any crop other than cereals, soybeans, members of Crop Subgroup 6C (Dried shelled peas and beans, chickpeas, lentils and faba beans) or members of Crop Subgroup 20A (Canola/rapeseed subgroup), within 60 days to fields in which treated seeds were planted.
- **Storage:** Keep in original container, tightly closed, during storage. Store in a cool, dry, well-ventilated area away from other pesticides, feed and foodstuffs, and out of the reach of children and animals. To prevent contamination, store this product away from seed, food or feed. Ideal storage temperature is above freezing and below 30°C. If the product should freeze, bring the product back to room temperature and ensure the contents are mixed well prior to application.
- **Environmental Restrictions:** Toxic to aquatic organisms. Toxic to birds and small wild mammals. Any spilled or exposed seeds must be incorporated into the soil or otherwise cleaned-up from the soil surface. This product demonstrates the properties and characteristics associated with chemicals detected in groundwater. The use of this product in areas where soils are permeable, particularly where the water table is shallow, may result in groundwater contamination.

| Crops        | Diseases Controlled                                                                                                                                                                                                                                                                                                                                                                                                    | Diseases Suppressed                                                                                                                                                                        | Rate (per 100 kg of seed) |
|--------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------|
| Barley       | General seed rots ( <i>Fusarium</i> spp., <i>Pythium</i> spp., <i>Rhizoctonia</i> spp., <i>Penicillium</i> spp., <i>Aspergillus</i> spp.); seedling blight, root rot, damping-off ( <i>Fusarium</i> spp., <i>Rhizoctonia</i> spp., <i>Pythium</i> spp.); covered smut ( <i>Ustilago hordei</i> ); false loose smut ( <i>U. nigra</i> ); true loose smut ( <i>U. nuda</i> ); seed-borne <i>Alternaria alternata</i>     | Common root rot ( <i>Cochliobolus sativus</i> ); seed-borne <i>Cochliobolus sativus</i> ; fusarium crown and foot rot ( <i>Fusarium</i> spp.); take-all ( <i>Gaeumannomyces graminis</i> ) | 325 mL                    |
| Oats         | General seed rots ( <i>Fusarium</i> spp., <i>Pythium</i> spp., <i>Rhizoctonia</i> spp., <i>Penicillium</i> spp., <i>Aspergillus</i> spp.); seedling blight, root rot, damping-off ( <i>Fusarium</i> spp., <i>Rhizoctonia</i> spp., <i>Pythium</i> spp.); covered smut ( <i>Ustilago hordei</i> ); loose smut ( <i>U. avenae</i> ); seed-borne <i>Alternaria alternata</i>                                              | Common root rot ( <i>Cochliobolus sativus</i> ); seed-borne <i>Cochliobolus sativus</i>                                                                                                    | 325 mL                    |
| Rye          | General seed rots ( <i>Fusarium</i> spp., <i>Pythium</i> spp., <i>Rhizoctonia</i> spp., <i>Penicillium</i> spp., <i>Aspergillus</i> spp.); seedling blight, root rot, damping-off ( <i>Fusarium</i> spp., <i>Rhizoctonia</i> spp., <i>Pythium</i> spp.); common bunt ( <i>Tilletia tritici</i> ); dwarf bunt ( <i>T. controversa</i> ); seed-borne <i>Alternaria alternata</i>                                         | Common root rot ( <i>Cochliobolus sativus</i> ); seed-borne <i>Cochliobolus sativus</i> ; fusarium crown and foot rot ( <i>Fusarium</i> spp.); take-all ( <i>Gaeumannomyces graminis</i> ) | 325 mL                    |
| Triticale    | General seed rots ( <i>Fusarium</i> spp., <i>Pythium</i> spp., <i>Rhizoctonia</i> spp., <i>Penicillium</i> spp., <i>Aspergillus</i> spp.); seedling blight, root rot, damping-off ( <i>Fusarium</i> spp., <i>Rhizoctonia</i> spp., <i>Pythium</i> spp.); loose smut ( <i>Ustilago tritici</i> ); seed-borne <i>Alternaria alternata</i>                                                                                | Common root rot ( <i>Cochliobolus sativus</i> ); seed-borne <i>Cochliobolus sativus</i> ; fusarium crown and foot rot ( <i>Fusarium</i> spp.); take-all ( <i>Gaeumannomyces graminis</i> ) | 325 mL                    |
| Spring wheat | General seed rots ( <i>Fusarium</i> spp., <i>Pythium</i> spp., <i>Rhizoctonia</i> spp., <i>Penicillium</i> spp., <i>Aspergillus</i> spp.); seedling blight, root rot, damping-off ( <i>Fusarium</i> spp., <i>Rhizoctonia</i> spp., <i>Pythium</i> spp.); common bunt ( <i>Tilletia tritici</i> ); loose smut ( <i>Ustilago tritici</i> ); seed-borne <i>Alternaria alternata</i>                                       | Common root rot ( <i>Cochliobolus sativus</i> ); seed-borne <i>Cochliobolus sativus</i> ; fusarium crown and foot rot ( <i>Fusarium</i> spp.); take-all ( <i>Gaeumannomyces graminis</i> ) | 325 mL                    |
| Winter wheat | General seed rots ( <i>Fusarium</i> spp., <i>Pythium</i> spp., <i>Rhizoctonia</i> spp., <i>Penicillium</i> spp., <i>Aspergillus</i> spp.); seedling blight, root rot, damping-off ( <i>Fusarium</i> spp., <i>Rhizoctonia</i> spp., <i>Pythium</i> spp.); common bunt ( <i>Tilletia tritici</i> ); dwarf bunt ( <i>T. controversa</i> ); loose smut ( <i>Ustilago tritici</i> ); seed-borne <i>Alternaria alternata</i> | Common root rot ( <i>Cochliobolus sativus</i> ); seed-borne <i>Cochliobolus sativus</i> ; fusarium crown and foot rot ( <i>Fusarium</i> spp.); take-all ( <i>Gaeumannomyces graminis</i> ) | 325 mL                    |

## Application Information:

*Vibrance Quattro* is for use on-farm on barley, wheat, oats, rye and triticale. This product can also be applied by commercial seed treaters using closed system transfer. Treat seed in a well-ventilated area. When treating seeds, handling and planting treated seed, workers should wear cotton coveralls or long-sleeved shirt and long pants, chemical-resistant gloves, and work boots. Wear a suitable dust mask when transferring treated seed to a storage bin. For good hygiene practice, it is also recommended to wear a NIOSH approved dust mask during all job activities.

## How it Works:

The active ingredient difenoconazole is a triazole fungicide with broad-spectrum, systemic activity. Metalaxyl-M is an acylalanine fungicide with systemic activity against diseases caused by the Oomycetes, including *Pythium* damping-off. Sedaxane is a succinate dehydrogenase inhibitor fungicide with systemic activity that inhibits fungal metabolism by binding to the succinate dehydrogenase enzyme to disrupt cellular respiration and energy generation. Fludioxonil is phenylpyrrole fungicide with contact activity. Refer to "Fungicide Modes of Action" in the Plant Disease Control section for more information.

## Tank Mixes:

*Vibrance Quattro* may be mixed with *Cruiser 5FS* for crops common to the registered labels of both products. Refer to label for details. Consult each product and follow the most restrictive label precautions and limitations.

## Restrictions:

- **Resistance management:** Refer to "Pathogen Resistance" in the Plant Disease Control section for more information.
- **Labelling:** Treated seed must be labelled (listing only the applicable active ingredients) as follows: "This seed has been treated with difenoconazole, metalaxyl- M (and S-isomer), sedaxane and fludioxonil fungicides. When handling and planting treated seed, workers should wear cotton coveralls over a long-sleeved shirt, long pants, chemical-resistant gloves, and work boots. Wear a suitable dust mask when transferring seed to a storage bin. DO NOT graze or feed livestock on seeded area for 45 days after planting. DO NOT use for food, feed or oil processing. Store away from food and feed."
- **Grazing:** DO NOT graze or feed livestock on treated areas for 45 days after planting.
- **Re-cropping:** DO NOT plant any crop other than cereals within 60 days to fields in which treated seed were planted.
- **Storage:** Store away from food and feed. Ideal storage temperature is above freezing and below 30°C. If product should freeze, bring to room temperature, and then ensure the contents are mixed well prior to application.
- **Environment:** Toxic to aquatic organisms. DO NOT contaminate irrigation or drinking water supplies or aquatic habitats by cleaning of equipment or disposal of wastes. Any spilled or exposed seeds must be incorporated into the soil or otherwise cleaned-up from the soil surface.

## Hazard Rating:

Potential Skin Sensitizer

Refer to the Introduction for an explanation of the symbols.

# Vibrance Ultra Potato

Fungicide Group  
3, 7, 40

## Company:

Syngenta Canada Inc. (PCP#33171)

## Formulation:

77.2 g/L Sedaxane, 77.2 g/L difenoconazole, 154.3 g/L mandipropamid formulated as a suspension.

- Container sizes - 1 L to bulk

## Crops, Diseases and Rates:

| Crop   | Diseases Controlled                                                                                                                                                                                                                                                 | Diseases Suppressed                             | Rate (per 100 kg of seed) |
|--------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------|---------------------------|
| Potato | Seed-borne Silver Scurf ( <i>Helminthosporium solani</i> ), fusarium dry rot ( <i>Fusarium</i> spp.), Seed-borne black scurf, stem and stolon canker ( <i>Rhizoctonia solani</i> ) Preventative control of seed-borne late blight ( <i>Phytophthora infestans</i> ) | Pink rot ( <i>Phytophthora erythroseptica</i> ) | 32 mL                     |

## Application Information:

DO NOT use open treating equipment when treating seed-pieces, *Vibrance Ultra Potato* must be applied using a closed treatment system. Treat seed in a well ventilated area and keep treated seed-pieces away from animals.

## How it Works:

Sedaxane is a succinate dehydrogenase inhibitor fungicide with preventative and systemic activity that inhibits fungal metabolism by binding to the succinate dehydrogenase enzyme to disrupt cellular respiration and energy generation. The active ingredient difenoconazole is a triazole fungicide with broad-spectrum, systemic activity. The active ingredient mandipropamid is a carboxylic acid amide (CAA) fungicide with contact and systemic activity. To be used as a preventative and inhibitive (prevents spore germination) fungicide application. Refer to "Fungicide Modes of Action" in the Plant Disease Control section for more information.

## Tank Mixes:

For control of Colorado potato beetle, aphids and potato leafhopper, *Vibrance Ultra Potato* can be tank mixed with *Actara 240 SC* insecticide. For control of Colorado potato beetle, *Vibrance Ultra Potato* can be tank mixed with *Fortenza*. Protection is provided during early to mid-season growth and development for potatoes only. Refer to tank-mix partner labels for specific application instructions and precautions. Always use in accordance with the most restrictive label restrictions and precautions.

## Restrictions:

- **Resistance management:** Refer to "Pathogen Resistance" in the Plant Disease Control section for more information.
- **Maximum number of applications:** DO NOT apply more than 243 g mandipropamid per acre per year.
- **Labelling:** No restrictions listed.
- **Grazing:** No restrictions listed.
- **Re-cropping:** DO NOT plant any crop other than corn, cereals, canola, soybean, dry beans, dry pea, chickpea, lentil and sugar beets within 60 days to fields where seed treated with *Vibrance Ultra Potato* were planted.
- **Storage:** Store away from food or feed. Ideal storage temperature is above freezing and below 30°C. repeated freeze thawing will not affect the physical integrity of the product. If the product freezes, bring it back to room temperature and ensure the contents are well mixed prior to application.
- **Environment:** TOXIC to aquatic animals. DO NOT contaminate irrigation or drinking water supplies or aquatic habitats by cleaning of equipment or disposal of wastes. Treated seed is toxic to small wild animals. Any spilled or exposed seed must be incorporated into the soil or cleaned-up from the soil surface.

## Hazard Rating:

None listed.

# Vitaflo Brands

Fungicide Group  
7, M3

## Company:

Manufactured by UPL AgroSolutions Canada Inc. (*Vitaflo 280 Fungicide* – PCP#11423)

Manufactured by Interprovincial Cooperative Limited (*Vitaflo SP Fungicide* – PCP#30381)

Manufactured for Loveland Products by Interprovincial Cooperative Limited (*Vitaflo Fungicide* – PCP#30380)

## Formulation:

*Vitaflo 280/Vitaflo Fungicide/Vitaflo SP Fungicide*: 15.59% carbathiin and 13.25% thiram formulated as a liquid suspension.

- Container sizes - 10 L, 55 L, 100 L, 200 L, 1000 L

| Dry bean  | Early season seed rot, seedling blight, root rot ( <i>Rhizoctonia solani</i> ); seed-borne anthracnose ( <i>Colletotrichum lindemuthianum</i> ) <sup>1</sup>                                                                                                                          | –                                                                         | 260 mL                    |

| Crop                 | Diseases Controlled                                                                                                                                     | Diseases Suppressed | Rate (per 100 kg of seed) |
|----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------|---------------------------|
| Corn (field & sweet) | Seed rot and damping off ( <i>Fusarium</i> spp., <i>Pythium</i> spp., <i>Penicillium</i> spp.)                                                          | –                   | 280 mL                    |
|                      | Seed-borne head smut ( <i>Sporisorium holci-sorghii</i> )                                                                                               |                     | 560 to 748 mL             |
| Flax                 | Seed rot, root rot and seedling blight ( <i>Rhizoctonia solani</i> , <i>Fusarium</i> spp.)                                                              | –                   | 525 mL                    |
| Lentil               | Seed rot, seedling blight, and early season root rot ( <i>Botrytis cinerea</i> , <i>Rhizoctonia solani</i> , <i>Fusarium</i> spp., <i>Pythium</i> spp.) | –                   | 330 mL                    |
| Field pea            | Seed rot and seedling blight ( <i>Rhizoctonia solani</i> , <i>Fusarium</i> spp., <i>Pythium</i> spp.)                                                   | –                   | 260                       |
|                      | Seed rot and seedling blight ( <i>Ascochyta pinodes</i> )                                                                                               |                     | 330                       |
| Soybean              | Seed rot and seedling blight ( <i>Rhizoctonia solani</i> , <i>Phomopsis</i> spp., <i>Fusarium</i> spp.)                                                 | –                   | 260 mL                    |

<sup>1</sup> Will not control severe anthracnose infections

### Application Information:

Designed to be used undiluted in commercial seed treaters. Undiluted product can be used at temperatures down to -20°C. Centrifugal pumps are not recommended for pumping product. Centrifugal pumps are not recommended for pumping product. Peristaltic pumps (positive displacement) using polypropylene lines with a minimum inside diameter of 2 cm are recommended. If containers have been in storage, some settling may occur and require agitation.

### How it Works:

The active ingredient carbathiin is a carboximide fungicide with systemic activity and the active ingredient thiram is a dithiocarbamate fungicide with contact activity. Refer to "Fungicide Modes of Action" in the Plant Disease Control section for more information.

### Tank Mixes:

None listed.

### Restrictions:

- **Resistance management:** Refer to "Pathogen Resistance" in the Plant Disease Control section for more information.
- **Labelling:** Treated seed must be labelled as follows "This seed has been treated with *Vitaflo 280*, *Vitaflo Fungicide*, or *Vitaflo SP Fungicide* liquid seed protectant containing carbathiin and thiram. DO NOT use for feed, food, or oil processing."
- **Grazing:** DO NOT graze or feed livestock on treated area for four weeks after planting except for the following crops:
  - **Soybean** – DO NOT graze or feed livestock on forage and hay on treated areas.
  - **Bean** – DO NOT graze or feed on bean forage for 60 days.
  - **Barley, oat, wheat** – DO NOT graze or feed on treated area for 6 weeks.
- **Re-cropping:** No restrictions listed.
- **Storage:** DO NOT store product in direct sunlight or above 35°C. Will not freeze even at extreme temperatures. If containers have been stored for several months, shake well before using. DO NOT store dry beans, peas, lentils, or soybeans treated with any *Vitaflo* product. Wheat, barley, rye, oats, triticale and flax seed treated with *Vitaflo 280/Vitaflo Fungicide/Vitaflo SP Fungicide* can be stored up to 18 months and treated corn seed can be stored up to one year without reduction in germination.
- **Environment:** DO NOT contaminate ponds, lakes or streams.
- **Compatibility with *Rhizobia*-based inoculants:** *Vitaflo 280*, *Vitaflo Fungicide*, and *Vitaflo SP Fungicide* are compatible with *Rhizobia*. DO NOT tank mix *Vitaflo 280*, *Vitaflo Fungicide*, or *Vitaflo SP Fungicide* and *Rhizobia*. Always check with *Rhizobia* manufacturers on any restrictions that may exist with seed treatments.

### Hazard Rating:

Warning – Eye Irritant

Caution – Skin Irritant

Refer to the Introduction for an explanation of the symbols.

# Zeltera Cereals

## Seed Treatment Fungicide

Fungicide Group  
3,4,7,22

### Company:

Valent Canada, Inc. (PCP#34751)

Distributor: Nufarm Agriculture Inc.

### Active ingredients:

| Active Ingredients | Guarantee | Resistance Group |
|--------------------|-----------|------------------|
| Ethaboxam          | 15.4 g/L  | 3                |
| Metalaxyl          | 9.2 g/L   | 4                |
| Metconazole        | 4.6 g/L   | 7                |
| Inpyrfluxam        | 3.1 g/L   | 22               |

### Formulation:

Formulation type: Suspension

- Container size(s) – 10 L, 110 L

### Crops, Diseases and Rates:

| Crop                                                                                | Use pattern    | Rate (per 100 kg of seed) | Disease                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | Suppression or Control |

### Application Information:

This product is for both commercial and on-farm application. Do not apply this product in a hopper-box or planter-box at planting time. Always mix product thoroughly before use.

### Tank Mixes:

This product may be tank mixed with a supplement or with registered pest control products, whose labels also allow tank mixing. Refer to labels for information on tank mixing products. Contact Nufarm Agriculture for information on insecticide tank mix options.

### Restrictions:

- **Labelling:** All containers or packages containing treated seed for sale or use in Canada must be labeled or tagged as follows: This seed has been treated with a product containing the active ingredients ethaboxam, inpyrfluxam, metconazole, and metalaxyl. Do not use treated seed for feed, food or oil processing. Excess seed may be used for ethanol production only if (1) by-products are not used for livestock feed and (2) no measurable residues of pesticide remain in ethanol by-products that are used in agronomic practices. Store away from feeds and other foodstuffs. A closed-cab planter is required when planting treated cereal grain seeds. An open-cab planter may be used when planting teosinte seeds. Wear a long-sleeved shirt, long pants, chemical-resistant gloves, socks and shoes when handling and planting treated seeds. Gloves are not required within a closed-cab tractor. Dispose of all excess treated seed. Left over treated seed may be double-sown around the headland or buried away from water sources in accordance with local requirements. Do not contaminate water bodies when disposing of planting equipment washwaters. Dispose of seed packaging in accordance with local requirements.

- **Grazing:** No restrictions listed.
- **Re-cropping:** No restrictions listed.
- **Storage:** Keep pesticide in its original container. Store in a cool place. Do not store in direct sunlight. Protect from freezing temperatures. Store this product away from food or feed.
- **Environmental Restrictions:** Toxic to aquatic organisms. Toxic to birds and small wild mammals. Include toxicity information. Any spilled or exposed seeds must be incorporated into the soil or otherwise cleaned-up from the soil surface. KEEP TREATED SEED OUT OF REACH OF CHILDREN AND ANIMALS.

### **Hazard Rating:**

7.1 Indicate hazard rating(s): None listed.

# Insect Control

## Additional Resources

For additional information on monitoring, economic thresholds and biological control of insects in field crops, as well as information on insect management in commodities other than those covered in this guide, see the WCCP Guide to Integrated Control of Insect Pests of Crops at <https://www.westernforum.org/wccp-control-guidelines/>.

## Insect Management Decisions

Crop rotations, cultivar selections, and seeding dates can be chosen to reduce the risk of injury from some insects that may be of higher risk to a crop. Management of insects with insecticides should only be considered when numbers or damage exceed economic thresholds. To select an insecticide, verify the registered products for the insect and field crop in the following insect management charts. Consideration should then be given to the preharvest intervals, beneficial insects that may be present, how the product will be applied, restrictions, precautions and the hazard rating.

## Pre-harvest Interval

The **pre-harvest interval** is the number of days that must pass between the last application of a pesticide and harvest. Harvest is the cutting of the crop or removal of the produce from the plant. It includes direct-combining, cutting (swathing) or grazing; it does not include swath-combining or baling for hay.

## Field Scouting

Field scouting is the regular examination of fields to accurately assess the kind and the number of insects, plant pathogens and weeds present and the amount of damage being done. Scouting should be done weekly during the growing season and more frequently when infestations approach economic levels or when weather conditions favour the rapid development of specific pests.

To properly scout for insects that feed on crops or are beneficial, you must know when they occur, where they live, what they look like, and how to find and count them. The number of locations to assess in a field will depend on the field size, and any specific pests that may be of concern. Generally a minimum of 5 sites should be sampled; however, some insects may require more sites to be sampled to accurately make management decisions.

There are several possible scouting patterns that can be used when checking fields. These options are based on insect distribution and field configuration.

- **Pattern 1:** Used when insects are uniformly distributed.
  - This scouting pattern typically looks like an X, Z or W, excluding field edges. Insects that fit this pattern include aphids, bertha armyworm and diamondback moth.

- **Pattern 2:** Used when insects are generally more abundant at the edges of fields.
  - Scout by walking along field edges, fence lines or ditches. Some examples of when you would include more focused scouting along field edges are to estimate early-season populations of flea beetles, Colorado potato beetles and grasshoppers.

In each area examined, use of a sweep net, if possible, is a good way to determine what potential crop feeding and beneficial insects may be present. This should be followed by examining some plants and the soil surface. More specific counts of a particular type of insect or plant damage may be necessary if they are abundant during the more general scouting.

## Economic Thresholds

Monitoring methods, typical symptoms, and economic thresholds or nominal thresholds for the more common crop pests are described in the field scouting section for each commodity. The smallest number of insects (or level of injury) that cause damage equal to the pest management costs is called the **economic injury level**. The **economic threshold** is the density of insects (or level of injury) at which control measures should be applied to prevent an increasing population from reaching the economic injury level. Note that factors such as moisture, temperature conditions and stage of crop growth, can increase or decrease the impact of insects on crop production. In some instances, nominal thresholds are presented; these decision guidelines are based on experience rather than research quantifying the impact of the insects on the crop.

## Estimating Percent Defoliation

Many economic thresholds for insects are based on percent defoliation of the plants they are feeding on. The following figure may assist in determining the percent defoliation. Although the following photo is of sunflower leaves, this figure can be used to estimate percent defoliation for many crops.

## Hazard Ratings and Residual Times of Insecticides to Bees

The following table can be used to assist in selecting an insecticide to apply to fields where either the crop or weeds may be flowering at the time of application. Residual time indicates the length of time the residue of the product remains toxic to bees after application. **These times are to be used as general guidelines only.** Environmental conditions influence the rate at which pesticides degrade.

| INSECTICIDE                                                                | HAZARD RATING <sup>a</sup> |                | RESIDUE HAZARD (DAYS) <sup>b</sup>   |
|----------------------------------------------------------------------------|----------------------------|----------------|--------------------------------------|
|                                                                            | HONEY BEE                  | LEAFCUTTER BEE |                                      |

<sup>a</sup> HAZARD RATING 1 = Very poisonous to bees; DO NOT apply to crops or weeds in bloom unless bees are kept off for the period that residue on the crop is a hazard. 2 = Moderately poisonous to bees; avoid direct application to bees, but may be applied with minimum hazard in late evening when bees are not foraging. 3 = Not very poisonous to bees; may be applied with minimum hazard to bees.

<sup>b</sup> Residue hazard represents the average time in days that residues poisonous to honey bees will remain on foliage (may vary with formulation and weather). Unusually low temperatures following spray application may cause residues to remain toxic longer than under warmer conditions. Morning dew can also make residues more toxic to foraging bees. A more extensive list of hazard ratings of insecticides to bees and duration of toxicity can be found at the Western Committee on Crop Pests website at: <https://www.westernforum.org/WCCP%20Guidelines.html>.

## Reducing Bee Losses from Insecticides

Careless use of insecticides can kill bees and other beneficial insects such as pollinators, predatory and parasitic biological control insects. Help to reduce insecticide poisoning of bees by:

- 1. Avoid applying insecticides that are toxic to bees when crops are in bloom.** Any field with even a small amount of bloom, whether it is the main crop, cover crop, or weeds will probably have foraging bees visiting the flowers. If at all possible, apply insecticides before or after the crop has gone into bloom. Control all flowering weeds prior to insecticide application.
- 2. Apply insecticides when bees are least active.** The highest level of bee activity occurs during the day. Apply insecticides in late evening or early morning when the bees are not foraging. As a general rule, evening applications are less hazardous to bees than morning applications. DO NOT apply insecticides if unusually low temperatures or heavy dew are forecast following application, because residuals typically remain toxic to bees longer under these conditions.
- 3. Minimize insecticide drift.** To avoid insecticides drifting into non-target locations, DO NOT apply insecticides during windy conditions. Choose nozzles with a low drift rating. As a general rule, ground applications of insecticide are less prone to drift than aerial applications. When planting insecticide treated seeds, reduce the movement of dust from the seeding equipment to flowering crops, weeds and water sources that are in or adjacent to the field being seeded. If seeding equipment may potentially generate dust, controlling flowering weeds in the field prior to seeding may reduce pollinators being attracted to the field.
- 4. Contact the beekeeper before spraying.** Communication and cooperation between the insecticide applicator and the beekeeper can usually prevent bee losses. Notifying the beekeeper in advance (e.g. 48 hours) of applying insecticides will allow the beekeeper to move or protect the colonies from insecticide damage. The web-based mapping tool FieldWatch (<https://fieldwatch.com>) can be used to facilitate communication between farmers, beekeepers and pesticide applicators. FieldWatch enables beekeepers and crop producers (organic and conventional) to use a secure online registry to identify and map the locations of apiaries and crop fields that pesticide applicators should avoid.
- 5. If possible, use insecticides and/or insecticide formulations which are the least hazardous to bees.** The table "Hazard Ratings of Insecticides to Bees" will help in selecting the least hazardous insecticide. In general, dusts are more hazardous to bees than sprays. Wettable powders are more hazardous than emulsifiable concentrates (EC) or water-soluble formulations. Granular insecticides and spreadable bran bait insecticides are generally the least hazardous to bees.

## Insecticide Poisoning in Humans

Organophosphate (OP) and carbamate insecticides (identified on the Insecticide Groups chart) can pose a serious risk to unprotected persons. Poisonings can occur while mixing, loading and/or during the application of these products without the appropriate protective equipment or measures. These pesticides are readily absorbed through the skin or the lungs, and can act as nervous system toxins. Overexposure can produce symptoms such as headache, nausea, pupil dilation and excessive sweating and salivation. Higher doses may cause breathing difficulties, muscle twitching, weakness and spasms. Very high doses have caused respiratory failure and death.

Both OP and carbamate pesticides inhibit an enzyme called cholinesterase. Measurements of cholinesterase in the blood before and during the application season can indicate harmful exposures to OPs and carbamates. **Persons who intend to mix, load and/or apply these types of pesticides repeatedly during a season, need a baseline and repeat measurements. Consult your doctor before the spraying season to arrange for these measurements.**

### Degree of Risk and Hazard Rating:

(see introduction for full description on symbols and ratings)

## Resistance of Insects to Insecticides

Repeated use of the same insecticide, or insecticides with the same mode of action, against a particular insect in a given area may result in the effectiveness of the insecticide being reduced. To delay or prevent resistance of insects to insecticides:

1. Integrate different control methods (cultural, biological, chemical) into insect control programs whenever possible,
2. Use insecticides only when the economic threshold for a pest has been surpassed and natural controls fail to limit economic damage,
3. Rotate between insecticides with different modes of action, particularly if several applications are made in a season, and
4. Keep accurate records of insecticides used for each of your fields.

Insecticides can be classified according to their similarity in chemical structure (chemical group in the table below), and by mode of action (the process by which the insecticide kills the insect). The "Group" column in the following table separates insecticides based on their mode of action. By selecting products with different modes of action for an insecticide rotation program, risk of insecticide resistance can be reduced.

## Insecticide Groups Based on Modes of Action

| GROUP | CHEMICAL GROUP                                  | TRADE NAME                                                                                                                         | ACTIVE INGREDIENT                           | MODE OF ENTRY                                                                                   |

A more detailed table showing insecticides organized by mode (site) of action, and specific information on the mode (site) of action for the different groups can be found on the Insecticide Resistance Action Committee website at: <https://irac-online.org/mode-of-action/>.

\*Product contains more than one active ingredient and appears in more than one group.

## Field Scouting and Insect Management Charts

### Field Scouting in Alfalfa

#### Sap Or Fluid Feeders

- **Lygus bugs/Alfalfa plant bug**
  - **Typical Damage:** Field blooms poorly or not at all. Flower buds blasted, whitish, and dry; flowers dropping off before fully open. Collapsed seed.
  - **When and How to Monitor:** Look for plant bugs when monitoring alfalfa in June through mid-August. Make five 180° sweeps with a 15 inch (40 cm) insect net through alfalfa canopy at each sampling site. Record total number of plant and lygus bugs (both nymphs and adults) captured. Calculate average number per sweep.
  - **Economic Threshold:** Hay: Control not recommended. Seed alfalfa at bud and early bloom: 8 lygus bugs per sweep (40 in 5 sweeps); 4 alfalfa plant bugs per sweep; or 5 bugs if the plant bug population is a combination of lygus bugs and alfalfa plant bug. If insecticides are used, attempt to spray before the onset of bloom. Protecting insect pollinators in seed production fields is very important.
- **Potato Leafhopper**
  - Leafhoppers are most severe in new seedlings and in regrowth under hot dry weather.
  - **When and How to Monitor:** Take 20, 180° sweeps from 5 areas of the field. Avoid field edges. Determine the average number of potato leafhoppers per sweep.
  - **Economic Threshold:** For 9 cm stem height = 0.2 adult leafhoppers per sweep; 15 cm stem height = 0.5 adults per sweep; 25 cm stem height = 1 adult or nymph per sweep; 36 cm stem height = 2 adults or nymphs per sweep.
- **Pea Aphid**
  - **Typical Damage:** Suck juices from plants; stunt growth; cause premature drying.
  - **When and How to Monitor:** Look for when monitoring in July through August. Take 5 sweeps at each location. Monitor fields closely during periods of slow plant growth.
  - **Economic Threshold:** 100 to 200 aphids per 180° sweep when crop is moisture stressed, or until mid-August.

#### Defoliators

- **Alfalfa Weevil**
  - **Typical Damage:** Feed on developing buds and leaves. Stunt growth.
  - **When and How to Monitor:** Start scouting fields in mid-May. Look for shot holes initially, then clipping along the edges of leaves and pinhole damage. For determining if levels are at threshold in hay crops, collect 30 stems in an M-shaped pattern, place them inside a white pail and beat them against the side to knock off larvae. DO NOT include younger first and second instar larvae (3 mm or less) in the counts. Determine the average height of the crop as well.
  - **Economic Threshold:**
    - **Alfalfa Hay:** One of the best control strategies is to cut fields for hay early. If early cutting of the hay crop is not possible, treatment thresholds are based on the following measurements of plant height and levels of larvae: <30 cm to 1 larva per stem; <40 cm to 2 larvae per stem; 3 larvae per stem is generally economical to control regardless of height of crop. On regrowth for second crop, 2 or more active larvae per crown (4 to 8 larvae per square feet) will require insecticide application.
    - **Alfalfa Seed:** 20 to 30 3<sup>rd</sup> or 4<sup>th</sup> instar larvae per sweep (90° = straight sweep) or 35 to 50 percent of foliage tips showing damage. In some instances it may be practical to just treat hotspots and not entire fields.

**ALWAYS CONSULT THE INSECTICIDE LABEL BEFORE APPLYING ANY INSECTICIDE.**

<sup>1</sup> Insecticide Group: M=microbials, SB=substituted benzoylurea, B=butenolides, F=flonicamid, N=neonicotinoids, P=pyrethroids, PP=pyropenes, C=carbamates, OP=organophosphates, TT=tetronic and tetramic acid derivatives.

<sup>2</sup> LD<sub>50</sub> values represent the relative toxicity of a pesticide. They represent the dose (in milligram per kilogram body weight) that will kill 50 percent of the test animals. Thus the lower the number the greater the toxicity. Values given are for oral LD<sub>50</sub>.

## Barley – See Small Grain Cereals

### Scouting for insects in Beans (Dry Beans)

#### Belowground Feeders and Cutworm

- **Seedcorn Maggot**
  - **Typical Damage:** Seedcorn maggot attacks bean seed, preventing sprouting or weakening seedlings. The yellowish white maggot is found burrowing in the seeds or emerging stem. Seedcorn maggots are usually most severe in wet, cold seasons and on high organic matter soils.
- **Cutworm**
  - **When and How to Monitor:** To find cutworm, dig in the soil to a depth of 2.5 to 5 cm at the base of recently damaged plants.
  - **Nominal Threshold:** Treatment is warranted when one cutworm or more is found per metre of row and the larvae are still small (less than 2 cm long).

#### Sap Feeders

- **Leafhoppers**
  - **Typical Damage:** Foliage becomes dwarfed, crinkled, and curled. Small triangular brown areas appear at the tips of leaves, gradually spreading around the entire leaf margin.
  - **When and How to Monitor:** Leafhopper adults are quick and can be observed by running your hand over the top of the plants as you approach them and observing adults that fly off the plants. On the same plants, turn over each leaf to determine the number of nymphs per trifoliate.
  - **Economic Threshold:** Unifoliate stage – 0.25 leafhoppers per trifoliate; second trifoliate stage – 0.5 leafhoppers per trifoliate; fourth trifoliate stage – 1.0 leafhopper per trifoliate; first bloom – 2.0 leafhoppers per trifoliate.

#### Defoliators

- **Grasshoppers**
  - **Economic Threshold:** Substantial yield loss does not occur until up to 35 percent defoliation occurs before bloom and 15 percent after bloom.

## Scouting for insects in Canaryseed

Sap Feeders

- **Aphids**
  - **When and How to Monitor:** Start checking for aphids when monitoring during the early heading stage of canaryseed. The head should be bent and closely inspected for aphids hiding along the small stem inside the canaryseed head. Also check the stems, underside of leaves, and in the canaryseed boot.
  - **Nominal Threshold:** 10 to 20 aphids on 50 percent of the stems prior to the soft dough stage.

## Canaryseed Insect Management Chart

| Insect             | Insecticide<br>(and insecticide group <sup>1</sup> )       | Rate per Acre                                                                                             | Pre-harvest<br>interval (days) | Application<br>(A=aerial;<br>G=ground) | LD <sub>50</sub><br>(Mammalian<br>Toxicity) <sup>2</sup> |

## Field Scouting in Canola

### Scouting Calendar

**Early-season:** Flea beetles, cutworm, red turnip beetle, diamondback moth

**Mid-season:** Diamondback moth, cabbage seedpod weevil, grasshoppers

**Late season:** Bertha armyworm, diamondback moth, Lygus bugs, grasshoppers, alfalfa looper

- **Cutworm**
  - **Typical Damage:** Notched, wilted, dead, or cut-off plants (weed or crop seedlings). Plants missing from rows, bare

patches appearing in field.

- **When and How to Monitor:** Look for cutworm, and evidence of cutworm feeding, when monitoring canola in May and June. Often cutworms will be close to the cut or shriveled plants that they have just damaged. Cutworm will sometimes be most abundant in patches or a specific area of a field.
- **Nominal Threshold:** 25 to 30 percent stand reduction. Sometimes it is most economical to just treat infested patches, and not whole fields.

## Sap Or Fluid Feeders

- **Lygus bugs**
  - **Typical Damage:** Attacked buds appear shrunken and bleached white. Damaged seeds appear dark brown and shriveled.
  - **When and How to Monitor:** Monitor from when flowering is complete until seeds within the pod have become firm. Make 10 sweeps with a 38 cm diameter insect net at each of at least 5 sampling site. If while doing these samples populations appear to be of concern, take additional samples; a minimum of 15 samples is needed to accurately determine whether controls are economical. Sample canola for lygus bugs on a sunny day when the temperature is above 20°C and the crop canopy is dry.
  - **Economic Threshold:** A threshold of 20 to 30 per 10 sweeps is suitable for good growing conditions. Using the lower end of the threshold (about 20 per 10 sweeps) may be appropriate for stressed canola with less ability to compensate for feeding. When most pods become leathery and when seeds inside are firm, lygus bugs can no longer penetrate the pods or seeds with their mouthparts and are no longer an economic threat. When precipitation is greater than 100 mm from the onset of bud formation to the end of flowering, the crop may partially compensate for plant bug damage.
- **Aphids**
  - **Economic Threshold:** Control aphids in canola if densities exceed 25 aphids per 10 cm shoot tip after flowering.

## Defoliators

- **Flea beetles**
  - **Typical Damage:** Shot-holes in leaves to complete destruction of seedling plants in late May through June. Holes chewed in pods in August (occasional).
  - **When and How to Monitor:** Look for when monitoring in May through June when crop is in seedling stage. Examine 10 plants at random at each stop. Estimate overall percentage leaf loss.
  - **Economic Threshold:** When 25 percent of leaf surface is destroyed and flea beetles are present. If damage is only along the field margins and beetles are still congregated there, then control measures should be applied to the damaged areas only.
- **Cabbage Seedpod Weevil**
  - **When and How to Monitor:** Sample at 10 to 20 percent flower. Do 10 sweeps (180°) at a minimum of 4 locations; field edge, 50 metres into the field, and repeat the 2 sets at the opposite end of the field. If weevil numbers are close to the threshold the estimate may be improved by taking additional samples.
  - **Economic Threshold:** 25 to 40 weevils per 10 sweeps.
- **Diamondback moth**
  - **Typical Damage:** Flowers clipped or chewed, outer layers of stem and pods chewed, holes chewed in pods.

- **When and How to Monitor:** Look for when monitoring in late May through early September. Observing for adults and larvae while taking sweep net samples can determine the presence and relative abundance of diamondback moth in the field. If levels appear to be of concern, shake plants within a 50 cm x 50 cm area and count larvae on the ground or surface (such as a sweep net) that plants were shaken over. Another alternative is to clip or pull the plants and knock over a light colored surface (such as a sweep net, jacket, hood of a car, etc.). Multiply by 4 to get the number of larvae per square metre. Do this in at least 5 areas of the field.
- **Nominal Threshold:** 100 to 150 larvae per square metre in immature to flowering plants. 200 to 300 larvae per square metre in plants with flowers and pods.
  - Note that these threshold numbers are based on stands averaging 150 to 200 plants per square metre. In areas where stands are thinner, the economic threshold should be lowered accordingly. A nominal threshold of 25 to 33 percent defoliation with larvae still present can be applied for canola at seedling stage.

• **Bertha Armyworm**

- **Typical Damage:** Outer layers of stems and pods chewed resulting in whitish appearance, holes chewed in pods.
- **When and How to Monitor:** Look for larvae when monitoring fields in late July through early August. At each stop, shake plants in a 1/4 square metre (50 cm x 50 cm) area and carefully check soil surface for dislodged larvae. During heat of the day, larvae will often be found under leaves on soil surface.
- **Economic Threshold:** A loss of 0.058 bushels per acre for each larva per square metre can be expected. Multiplying 0.058 x average number of larvae per square metre x expected seed value (dollars per bushel) will determine the economic loss (in dollars per acre) due to the larvae. Only if control costs (insecticide plus application costs) can be applied for less than this economic loss will insecticide applications be economical. Yield loss may be greater for canola under moisture stress.
  - At an expected seed value of \$12.00 per bushel, the economic threshold will be between about 14 and 28 larvae per square metre, depending on control costs. At an expected seed value of \$16 per bushel, the economic threshold will be between about 11 and 21 larvae per square metre, depending on control costs. Tables showing specific economic thresholds at various expected seed values and control costs can be found at: <https://www.gov.mb.ca/agriculture/crops/insects/pubs/bertha-armyworm-factsheet.pdf>.

## Canola Insect Management Chart

**ALWAYS CONSULT THE INSECTICIDE LABEL BEFORE APPLYING ANY INSECTICIDE.**

<sup>1</sup> Insecticide Group: D=diamides, B=butenolides, N=neonicotinoids, S=sulfoximines, P=pyrethroids, C=carbamates, OP=organophosphates.

<sup>2</sup> LD<sub>50</sub> values represent the relative toxicity of a pesticide. They represent the dose (in milligram per kilogram body weight) that will kill 50 percent of the test animals. Thus the lower the number the greater the toxicity. Values given are for oral LD<sub>50</sub>.

<sup>3</sup> DO NOT apply any subsequent applications of a group 28 insecticide (such as *Coragen*) after planting seed treated with *Fortenza*.

<sup>4</sup> DO NOT apply any subsequent applications of a group 28 insecticide (such as *Coragen*) for a minimum of 60 days after planting seed treated with *Lumiderm*.

## Chickpea Insect Management Chart

**ALWAYS CONSULT THE INSECTICIDE LABEL BEFORE APPLYING ANY INSECTICIDE.**

<sup>1</sup> Insecticide Group: F=flonicamid, D=diamides, P=pyrethroids, N=neonicotinoids, TT= tetrionic and tetramic acid derivatives.

<sup>2</sup> LD<sub>50</sub> values represent the relative toxicity of a pesticide. They represent the dose (in milligram per kilogram body weight) that will kill 50 percent of the test animals. Thus the lower the number the greater the toxicity. Values given are for oral LD<sub>50</sub>.

<sup>3</sup> Do not make a subsequent foliar application of any group 28 insecticide for a minimum of 60 days after planting seed treated with Lumivia CPL.

## Field Scouting in Clovers

### Defoliators

- **Sweetclover Weevil**

- **Typical Damage:** Adults chew crescent-shaped and jagged notches in leaves and can completely defoliate plants.
- **When and How to Monitor:** Inspect clover seedlings for weevil damage in spring as the seedlings emerge. In midsummer and throughout August, inspect first-year clover stands for damage along crop margins. Invading

weevils move into these stands only as far as necessary to satisfy their food requirements, so an insecticide application to affected field margins is usually all that is required. Visually estimating the number of weevils per plant must be done carefully because weevils fall from plants easily and are difficult to see on the ground.

- **Economic Threshold:** 1<sup>st</sup> year stands: 1 weevil adult per 3 seedlings (1 per 5 seedlings under dry conditions). 2<sup>nd</sup> year stands: 9 to 12 weevil adults per plant.

## Clovers (sweet, red, alsike) Insect Management Chart

| Sweetclover Weevil                     | Locate new seedlings as far as possible from 2 <sup>nd</sup> year clover. Cultivating 2 <sup>nd</sup> year stands of sweet clover silage and hay as soon as possible after the crop is taken kills the new generation weevil larvae in the soil. |                                                                                                                  |                                                             |                                        |                                                          |

ALWAYS CONSULT THE INSECTICIDE LABEL BEFORE APPLYING ANY INSECTICIDE.

<sup>1</sup> Insecticide Group: D=diamides, F=flonicamid, P=pyrethroids, C=carbamates, OP=organophosphates.

<sup>2</sup> LD<sub>50</sub> values represent the relative toxicity of a pesticide. They represent the dose (in milligram per kilogram body weight) that will kill 50 percent of the test animals. Thus the lower the number the greater the toxicity. Values given are for oral LD<sub>50</sub>.

## Field Scouting in Corn (Field Corn)

### • Cutworm

- **Typical Damage:** Notched, wilted, dead, or cut-off plants (weed or crop seedlings). Plants missing from rows, bare patches appearing in field.
- **When and How to Monitor:** Look for cutworm, and evidence of cutworm feeding, when monitoring corn in May and June. Often cutworms will be close to the cut or shriveled plants that they have just damaged. Cutworm will sometimes be most abundant in patches or a specific area of a field. At each stop, examine 100 plants in a row. Calculate percentage of plants cut off or showing leaf feeding.
- **Economic Threshold:** When 2 to 4 percent of plants are cut below the ground or when 6 to 8 percent of plants are cut above the soil surface, and cutworms less than 1 inch long are present. Sometimes it is most economical to just treat infested patches, and not whole fields.

### • European corn borer

- **Typical Damage:** Shot-holes in leaves. Holes in stalk, tassels and ears. Damage may cause stalk breakage prior to harvest or cobs to fall to the ground. Nutrient flow in the plant may be restricted, resulting in smaller cobs.

**When and How to Monitor:** Begin looking for European corn borer when field scouting in early July. At 5 locations, examine 10 plants for young larvae and egg masses. Calculate percentage of plants infested. Scout every 5 to 7 days until the end of July or larvae start to tunnel into the stalks.

- **Economic Threshold:** The level of European corn borer where control becomes economical depends on the value of the crop, and cost of control. Information on determining specific economic thresholds for European corn borer in grain and silage corn can be found at <https://www.gov.mb.ca/agriculture/crops/insects/pubs/european-corn-borer-factsheet.pdf>. If the majority of larvae have bored into the stalk, DO NOT apply insecticide, as they are ineffective once the larvae have entered the stalk.

### • Armyworm

**Economic Threshold:** For corn past the 6-leaf stage, if 50 percent of the plants are showing damage and have larvae smaller than 2.5 cm (1 inch), insecticide treatment may be warranted. As long as the growing point of the plant is not damaged, the corn plant is usually able to recover from moderate feeding.

## Corn (Field Corn) Insect Management Chart

| Insect                          | Insecticide<br>(and insecticide group <sup>1</sup> )                                                                         | Rate per Acre                             | Pre-harvest<br>interval (days)                                                      | Application<br>(A=aerial;<br>G=ground) | LD <sub>50</sub><br>(Mammalian<br>Toxicity) <sup>2</sup> |

| European<br>corn borer         | Stalk Management: Stalk shredding during or after harvest can significantly reduce European corn borer overwintering. Mowing corn stalks after harvest can reduce overwintering populations up to 85 percent.<br>Resistant Cultivars: Some cultivars of Bt corn are resistant to feeding by European corn borer. A table of registered Bt corn products in Canada (as of May 2025) is available at: <a href="https://cornpest.ca/wp-content/uploads/2025/05/Canadian-Bt-Traits-Table-May-2025-English-Final.pdf">https://cornpest.ca/wp-content/uploads/2025/05/Canadian-Bt-Traits-Table-May-2025-English-Final.pdf</a> . |                                                                |                                                                                                            |                                        |                                                          |

**ALWAYS CONSULT THE INSECTICIDE LABEL BEFORE APPLYING ANY INSECTICIDE.**

<sup>1</sup> Insecticide Group: M=microbials, D=diamides, E=ecdysone receptor agonists, B=butenolides, N=neonicotinoids, P=pyrethroids, C=carbamates, OP=organophosphates, TT = tetrone and tetramic acid derivatives.

<sup>2</sup> LD<sub>50</sub> values represent the relative toxicity of a pesticide. They represent the dose (in milligram per kilogram body weight) that will kill 50 percent of the test animals. Thus the lower the number the greater the toxicity. Values given are for oral LD<sub>50</sub>.

<sup>3</sup> DO NOT make a subsequent foliar application of any group 28 insecticide (such as Coragen) for a minimum of 60 days after planting seed treated with Lumivia.

<sup>4</sup> DO NOT make any subsequent applications of a group 28 insecticide (such as Coragen) following Fortenza seed treatment.

**ALWAYS CONSULT THE INSECTICIDE LABEL BEFORE APPLYING ANY INSECTICIDE.**

<sup>1</sup> Insecticide Group: D=diamides, F=flonicamid, N=neonicotinoids, P=pyrethroids.

<sup>2</sup> LD<sub>50</sub> values represent the relative toxicity of a pesticide. They represent the dose (in milligram per kilogram body weight) that will kill 50 percent of the test animals. Thus the lower the number the greater the toxicity. Values given are for oral LD<sub>50</sub>.

<sup>3</sup> Do not make a subsequent foliar application of any group 28 insecticide for a minimum of 60 days after planting seed treated with Lumivia CPL.

## Field Scouting in Flax

### • Cutworms

- **Typical Damage:** Notched, wilted, dead, or cut-off plants (weed or crop seedlings). Plants missing from rows, bare patches appearing in field.
- **When and How to Monitor:** Look for cutworm, and evidence of cutworm feeding, when monitoring in May and June. Often cutworm will be close to the cut or shriveled plants that they have just damaged. Cutworm will sometimes be most abundant in patches or a specific area of a field. In areas of the field where cutworm damage is noticeable, check around damaged plants in a 0.25 square metres (50 cm x 50 cm) area. Use trowel or shovel to carefully search through top 5 cm of soil for cutworm larvae. Multiply the number of cutworms found by 4 to get the number per square metre. Repeat in several locations to get an accurate assessment of what cutworm levels are.
- **Economic Threshold:** 4 to 5 larvae per square metre. Sometimes it is most economical to just treat infested patches, and not whole fields.

### • Aphids

- **Typical Damage:** Extract plant fluids from the stems, leaves and developing bolls. Can cause fewer seeds to be produced.
- **When and How to Monitor:** The easiest way to detect aphids in flax is to sample the upper portions of the plant with an insect sweep net when the crop is in full bloom, or tap plants over a white tray or bucket. If aphids

are found, fields need to be more closely inspected by randomly sampling plants. To inspect plants, lightly tap the plants on a white surface, such as a tray or the canvas of a sweep net, to dislodge the insects. Plants can be severed at the base prior to tapping if desired. Inspect a minimum of 25 plants at full bloom and 20 plants at early green boll randomly in the field to provide an accurate estimate of aphid density. Record total number of aphids and calculate average per plant.

- If control is not warranted at full bloom, aphid densities should be assessed again at the green boll stage.
- **Economic Threshold:** Varies with crop value and control costs, but generally about 3 aphids per main stem at full bloom or 8 aphids per main stem at the green boll stage.
- The yield loss of flax is 0.3346 bushels per acre per aphid per plant for crops sampled at full bloom and 0.1275 bushels per acre per aphid per plant for crops sampled at the green boll stage.
- The potato aphid is highly susceptible to attack by fungi (especially in years of high rainfall and humidity in late June and July). Aphid populations sampled at full bloom that have many diseased insects should be sampled again at the early green boll stage to determine the effect of the disease on aphid densities.

### • Beet webworm

- **Nominal Threshold:** >10 larvae per square metre.

## Flax Insect Management Chart

ALWAYS CONSULT THE INSECTICIDE LABEL BEFORE APPLYING ANY INSECTICIDE.

<sup>1</sup> Insecticide Group: D=diamides, P=pyrethroids, C=carbamates, OP=organophosphates, OC=organochlorines.

<sup>2</sup> LD<sub>50</sub> values represent the relative toxicity of a pesticide. They represent the dose (in milligram per kilogram body weight) that will kill 50 percent of the test animals. Thus the lower the number the greater the toxicity. Values given are for oral LD<sub>50</sub>.

**ALWAYS CONSULT THE INSECTICIDE LABEL BEFORE APPLYING ANY INSECTICIDE.**

<sup>1</sup> Insecticide Group: M=microbials, D=diamides, P= pyrethroids, C=carbamates, OP=organophosphates.

<sup>2</sup> LD<sub>50</sub> values represent the relative toxicity of a pesticide. They represent the dose (in milligram per kilogram body weight) that will kill 50 percent of the test animals. Thus the lower the number the greater the toxicity. Values given are for oral LD<sub>50</sub>.

## Field Scouting in Lentils

### • Grasshoppers

- **When and How to Monitor:** Look for when monitoring fields from the early bud stage through pod development.
- **Economic Threshold:** 2 grasshoppers per square metre during the flowering and podding stages, especially if two-striped grasshopper is the dominant species.

### • Lygus Bugs

- **When and How to Monitor:** Look for lygus bugs when monitoring lentils during blooming and podding by using a sweep net, making 25, 180° sweeps in at least

5 randomly selected places in a field. Afternoon sampling provides more accurate estimates than morning sampling.

- **Threshold:** As a nominal threshold, insecticide treatment is recommended when 7 to 10 Lygus bugs are collected per 25 sweeps.

### • Pea aphid

- **Economic Threshold:** 20 to 66 aphids per 180° sweep of a 38 cm (15 inch) diameter insect net. This provides a 7-day lead time before aphid populations reach the economic injury level of 78 aphids per sweep.

## Lentil Insect Management Chart

| Insect                          | Insecticide<br>(and insecticide group <sup>1</sup> )                                      | Rate per Acre                                                              | Pre-harvest<br>interval (days)                                      | Application<br>(A=aerial;<br>G=ground) | LD <sub>50</sub><br>(Mammalian<br>Toxicity) <sup>2</sup> |

**ALWAYS CONSULT THE INSECTICIDE LABEL BEFORE APPLYING ANY INSECTICIDE.**

<sup>1</sup> Insecticide Group: F=flonicamid, D=diamides, N=neonicotinoids, P= pyrethroids, OP=organophosphates, TT = tetronic and tetramic acid derivatives.

<sup>2</sup> LD<sub>50</sub> values represent the relative toxicity of a pesticide. They represent the dose (in milligram per kilogram body weight) that will kill 50 percent of the test animals. Thus the lower the number the greater the toxicity. Values given are for oral LD<sub>50</sub>.

<sup>3</sup> Do not make a subsequent foliar application of any group 28 insecticide for a minimum of 60 days after planting seed treated with Lumivia CPL.

**ALWAYS CONSULT THE INSECTICIDE LABEL BEFORE APPLYING ANY INSECTICIDE.**

<sup>1</sup> Insecticide Group: D=diamides, N= neonicotinoids, P=pyrethroids, C=carbamates, OP=organophosphates.

<sup>2</sup> LD<sub>50</sub> values represent the relative toxicity of a pesticide. They represent the dose (in milligram per kilogram body weight) that will kill 50 percent of the test animals. Thus the lower the number the greater the toxicity. Values given are for oral LD<sub>50</sub>.

<sup>3</sup> DO NOT apply any subsequent applications of a group 28 insecticide (such as Coragen) for a minimum of 60 days after planting seed treated with Lumiderm.

<sup>4</sup> DO NOT apply any subsequent applications of a group 28 insecticide (such as Coragen) after planting seed treated with Fortenza.

## Oats – See small grain cereals

### Pastures and Rangelands Insect Management Chart

**Note:** Insects for biological control of weeds such as leafy spurge may be introduced and established in some pastures in Manitoba and Saskatchewan. If insect feeding to pastures gets to economic levels, consider using control strategies and insecticides that will minimize harm to these biological control agents where possible.

| Insects      | Insecticide<br>(and insecticide group <sup>1</sup> )                                                                                                                                                                                                                                                                     | Rate per Acre | Pre-harvest<br>interval (days) | Application<br>(A=aerial;<br>G=ground) | LD <sub>50</sub><br>(Mammalian<br>Toxicity) <sup>2</sup> |

| Grasshoppers | <b>Reduced Agent and Area Treatments (RAATs):</b> Grasshoppers on rangelands may be managed by applying certain insecticides in treated swaths, which alternate with untreated swaths. This can reduce the cost of control and amount of insecticide used by more than 50 percent, while resulting in effective control. |               |                                |                                        |                                                          |

**ALWAYS CONSULT THE INSECTICIDE LABEL BEFORE APPLYING ANY INSECTICIDE.**

<sup>1</sup> Insecticide Group: D=diamides, P=pyrethroids, C=carbamates, OP=organophosphates.

<sup>2</sup> LD<sub>50</sub> values represent the relative toxicity of a pesticide. They represent the dose (in milligram per kilogram body weight) that will kill 50 percent of the test animals. Thus the lower the number the greater the toxicity. Values given are for oral LD<sub>50</sub>.

## Field Scouting in Peas (Field Peas)

- Cutworm
  - **Nominal Threshold:** 2 to 3 cutworms per square metre.

### Sap Feeders

- Aphids
  - **When and How to Monitor:** Look for when monitoring field peas at the beginning of flowering. Take 180° sweeps or check 10, 8 inch (20 cm) plant tips at each stop. Record total number of aphids and calculate average per sweep or plant tip.

- **Economic Threshold:** If, at the beginning of flowering, there are 9 to 12 aphids per sweep or 2 to 3 aphids per 8 inch (20 cm) plant tip, an insecticide application when 50 percent of plants have produced some young pods will be cost-effective.

**ALWAYS CONSULT THE INSECTICIDE LABEL BEFORE APPLYING ANY INSECTICIDE.**

<sup>1</sup> Insecticide Group: F=flonicamid, D=diamides, N=neonicotinoids, P=pyrethroids, C=carbamates, OP=organophosphates, TT = tetronic and tetramic acid derivatives.

<sup>2</sup> LD<sub>50</sub> values represent the relative toxicity of a pesticide. They represent the dose (in milligram per kilogram body weight) that will kill 50 percent of the test animals. Thus the lower the number the greater the toxicity. Values given are for oral LD<sub>50</sub>.

<sup>3</sup> Do not make a subsequent foliar application of any group 28 insecticide for a minimum of 60 days after planting seed treated with Lumivia CPL.

## Scouting and Thresholds for Insects in Potatoes

### • Matador/Aphids

- **Typical damage:** Several species of aphids are sap feeders on potato leaves. At very high numbers this sap feeding may cause plants to wilt in small localized areas of the field as “aphid holes”. The greatest injury is due to transmission of viruses. Identification and control of aphids is critical in potato seed production to prevent virus spread. In commercial production tuber quality may be reduced by net necrosis of tubers.
- **When and How to Monitor:** Aphid identification and scouting should start in early July when aphids begin to be observed in fields. Sample 25 lower canopy leaves from each of 4 areas in the field (100 leaves in total). Count potato aphids and green peach aphids on each compound leaf, using a magnifying device to identify the species.
- **Economic threshold:** For seed potatoes = 3 to 10 green peach aphids per 100 leaves. For processing potatoes = 30 to 100 green peach aphids per 100 leaves. There are no economic thresholds for buckthorn and potato aphids. These thresholds relate to transmission of potato leafroll virus and are not useful in determining infectivity relative to potato virus Y. No economic thresholds have been established for aphids that relate to potato virus Y transmission.

### • Leafhoppers

- **Typical damage:** the potato leafhopper injects a toxin into the plant which results in hopper burn, a yellowing and curling of the tips and margins of the leaflets, which ultimately turn brown and brittle. Damaged plants die prematurely and yield may be reduced.
- **When and How to Monitor:** Nymphs are scouted by visual inspection; sample 100 plants from 3 to 5 areas of the

field. Count the wingless nymphs on compound leaves taken from mid canopy. Adults are sampled with a sweep net (20 sweeps per location at 5 locations for a total of 100 sweeps).

- **Economic threshold:** Nymphs – 1 nymph per 10 leaves. Adults – 1 leafhopper per sweep.

### • Colorado potato beetle

- **Typical damage:** Larvae feeding may cause extensive defoliation of leaves and is capable of transmitting spindle tuber virus and bacterial ring rot.
- **When and How to Monitor:** Start scouting for larvae 2 weeks after crop emergence. On field edges, count number of beetles on 20 separate plants. Record per cent defoliation of leaves. Repeated scouting is required since beetles have developed resistance to many insecticides and 2 generations may occur during the year.
- **Economic threshold:** Economic threshold based on beetle numbers may vary by cost of treatment, expected returns and variety. Typical thresholds are 18 larvae per 20 plants for Russet Burbank vs 6 larvae per 20 plants for Norland. Treat when defoliation exceeds 10 percent.

### • Potato flea beetle

- **Typical damage:** Beetle feeding causes “shot holes” in the leaves. Two generations may attack the foliage. **When and How to Monitor:** Estimate feeding damage on the leaf or numbers of beetles on plants.
- **Economic threshold:** Early in the season treat if greater than 10 percent defoliation. Later in the season (August) treat if greater than 25 percent defoliation or with greater than 65 beetles per plant for Norland or 300 beetles per plant for Russet Burbank.

## Grasshopper Management on Roadsides, Headlands and Summerfallow.

**Note:** Insects for biological control of weeds such as leafy spurge may be introduced and established in some areas of Manitoba and Saskatchewan. If grasshopper numbers become high, consider using control strategies and insecticides that will minimize harm to these biological control agents.

| Insecticide<br>(and insecticide group <sup>1</sup> )                                              | Rate per Acre                                                                                                                                                                                                                                          | Pre-harvest<br>interval (days)                                   | Application<br>(A=aerial;<br>G=ground)                                                              | LD <sub>50</sub><br>(Mammalian<br>Toxicity) <sup>2</sup> |

**ALWAYS CONSULT THE INSECTICIDE LABEL BEFORE APPLYING ANY INSECTICIDE.**

<sup>1</sup> Insecticide Group: P=pyrethroids, C=carbamates, OP=organophosphates.

<sup>2</sup> LD<sub>50</sub> values represent the relative toxicity of a pesticide. They represent the dose (in milligram per kilogram body weight) that will kill 50 percent of the test animals. Thus the lower the number the greater the toxicity. Values given are for oral LD<sub>50</sub>.

## Field Scouting in Rye

Information on typical damage, when and how to monitor, and economic thresholds for cutworm, aphids and armyworm in rye can be found in the section on field scouting in small grain cereals (wheat, barley, oats).

### Rye Insect Management Chart

## Field Scouting in Small Grain Cereals (wheat, barley, oats)

Belowground and Surface Feeders

- **Cutworm**

- **Typical Damage:** Notched, wilted, dead, or cut-off plants. Plants missing from rows, bare patches appearing in field.
- **When and How to Monitor:** Look for cutworm, and evidence of cutworm feeding, when monitoring in May and June. Often cutworms will be close to the cut or shriveled plants they have just damaged. Cutworm will sometimes be most abundant in patches or a specific area of a field. In areas of the field where cutworm damage is noticeable, check around damaged plants in a 0.25 square metre (50 cm x 50 cm) area. Use trowel or shovel to carefully search through top half to 1 inch of soil for cutworm larvae. Multiply the number of cutworms found by 4 to get the number per square metre. Repeat in several locations to get an accurate assessment of what the cutworm levels are.
- **Economic Threshold:** Pale western cutworm – 3 to 4 per square metre; Redbacked and army cutworm – 5 to 6 per square metre. Well established fall-seeded crops or spring seeded crops with good moisture conditions can tolerate higher numbers. Sometimes it is most economical to just treat infested patches, and not whole fields.

Sap Feeders

- **Aphids**

- **Typical Damage:** Visible wilting of plants, yellow patches in fields, plants are sticky.
- **When and How to Monitor:** Look for aphids when monitoring prior to the soft dough stage. While monitoring the field, using a sweep net or tapping plants over a white tray or bucket can alert you to the presence and relative abundance of aphids. If aphid levels appear concerning, a more thorough examination is needed. Count aphids on 20 randomly selected stems in each of 5 areas. Counts should be at least 50 paces apart, and observations should be made well into the center of the field. Too frequently farmers become alarmed after checking a few plants along the margins, especially near shelterbelts, where populations are high. Record the total number of aphids and calculate the average per plant.
- **Economic Threshold:** 12 to 15 aphids per stem prior to the soft dough stage.
- **Cereal Aphid Manager** is a mobile app that helps growers determine aphid populations by predicting what the aphid population will be in 7 days along with beneficial insect pressure on the population and suggests if insecticide application is necessary. <https://open.canada.ca/en/app/cereal-aphid-manager-mobile-app>

- **Barley Thrips**

- **When and How to Monitor:** Sampling should begin when the flag leaf is first visible and continue until the head is completely emerged from the boot. Barley thrips exhibit an edge effect; there are usually more thrips near protected field margins than other areas of the field. Most thrips can be found under the top 2 leaf sheaths. Unroll the leaf sheaths away from the stem to find the thrips.
- **Economic Threshold:** Insecticide treatments are only effective when applied before heading is complete. Treat when thrips are equal to or greater than the number calculated by: Threshold (Thrips per stem) = (Cost of Control ÷ expected \$ value per bushel)/0.4

## Defoliators

- **Grasshoppers**

- **Typical Damage:** Black strips along margins of newly emerging crops, head clipping later in season.
- **When and How to Monitor:** Look for grasshoppers when monitoring fields from late – May through to harvest. Check along edges of crop, particularly areas adjacent to hayland, pastures and roadsides. Estimate number of hoppers per square yard (m<sup>2</sup>).
- **Economic Threshold:** 8 to 13 grasshoppers per square metre. Early in the season, when grasshoppers are small, 18 grasshoppers per square metre and visible crop damage may be a more appropriate threshold.
- A rough estimate for an economic threshold for grasshoppers in crops to be used as greenfeed has been suggested at 20 grasshoppers per square metre or higher.

- **Armyworm**

- **Typical Damage:** Leaves stripped from plants, awns chewed from heads, heads clipped.
- **When and How to Monitor:** Check the soil surface for armyworm, and the plants for feeding, when monitoring in mid- June through early-August. At each stop shake plants and carefully check soil surface for dislodged larvae. During the day larvae may be under plant trash, soil clods or in soil cracks. Check the backs of armyworms for parasite eggs.
- **Economic Threshold:** Four unparasitized larvae, smaller than 2.5 cm (1 inch) per square foot. If heads are being clipped, treat when two or more armyworms per square foot are present. For migrating armyworms: treat a couple of swaths ahead of the infestation in the direction of movement to form a barrier strip.

## Seed Feeders Only

- **Wheat Midge (wheat only)**

- **When and How to Monitor:** Monitor wheat in July when crop emerges from boot stage until flowering. Check crop canopy at dusk for signs of wheat midge adult activity. At each stop, examine 10 heads. Record the number of midge adults observed on or near heads. Calculate average number of midge per head.
- Sticky traps may be used to capture adult midge activity in wheat fields.
- **Economic Threshold:** For yield only: 1 adult midge per 4 to 5 heads. At this level of infestation, wheat yields will be reduced by approximately 15 percent if the midge is not controlled. To maintain optimum grade: 1 adult midge per 8 to 10 wheat heads during the susceptible stage.

## Small Grain Cereals (wheat, barley, oats) Insect Management Chart

| Insect                                 | Insecticide<br>(and insecticide group <sup>1</sup> )             | Rate per Acre                                               | Pre-harvest<br>interval (days)                         | Application<br>(A=aerial;<br>G=ground) | LD <sub>50</sub><br>(Mammalian<br>Toxicity) <sup>2</sup> |

**ALWAYS CONSULT THE INSECTICIDE LABEL BEFORE APPLYING ANY INSECTICIDE.**

<sup>1</sup> Insecticide Group: Sp=spinosyns, D=diamides, N= neonicotinoids, P=pyrethroids, C=carbamates, OP=organophosphates.

<sup>2</sup> LD<sub>50</sub> values represent the relative toxicity of a pesticide. They represent the dose (in milligram per kilogram body weight) that will kill 50 percent of the test animals. Thus the lower the number the greater the toxicity. Values given are for oral LD<sub>50</sub>.

<sup>3</sup> DO NOT make a subsequent foliar application of any group 28 insecticide for a minimum of 60 days after planting seed treated with Lumivia CPL.

<sup>4</sup> DO NOT make any subsequent applications of a group 28 insecticide following Fortenza seed treatment.

## Scouting for insects in Soybeans

### • Cutworm

- A nominal threshold that may be used for cutworm in soybeans is 1 or more larvae per 3 feet of row and larvae are small (less than 2 cm), or 20 percent of plants cut.

### • Soybean Aphid

- **Typical Damage:** Soybean aphids suck sap from soybean plants. Infested leaves may wilt or curl when infestations are large. Other symptoms may include plant stunting, reduced pod and seed count, and yellowing of leaves.
- **When and How to Monitor:** Check 30 plants (6 plants in 5 areas) per field. Examine the entire plant and estimate populations of soybean aphids (counting exact numbers will not be possible or practical with higher populations). Once soybean aphid numbers reach 250 aphids per plant, scout the field frequently to determine if soybean aphid numbers are increasing. A population can stay at 250 to 300 aphids per plant and not cause economical yield loss. If the levels are not rising above 250 to 300 per plant, there is a good indication that field conditions are favouring natural enemies (such as

beneficial insects and fungi) that are helping control the aphids. An app called Aphid Advisor can be used to integrate common natural enemies of soybean aphids into the management decision (<http://www.aphidapp.com/>).

- **Economic Threshold:** When there are on average at least 250 aphids per plant and the population is increasing, and the plants are in the R1 (beginning bloom) to R5 (beginning seed) growth stages, treatment would be economical. This threshold gives an approximate 7 day lead time before aphid populations are expected to exceed the economic injury level (670 aphids per plant), where cost of control is equal to yield loss. When soybean aphid populations are not actively increasing above 250 aphids per plant, natural enemies are keeping up with the aphid population. DO NOT use an insecticide in this case, as it will kill the natural enemies which may enable the aphid population to increase above the economic injury level.

## Soybean Insect Management Chart

**ALWAYS CONSULT THE INSECTICIDE LABEL BEFORE APPLYING ANY INSECTICIDE.**

<sup>1</sup> Insecticide Group: D=diamides, Sp=spinosyns, N= neonicotinoids, P=pyrethroids, PP=pyropenes, OP=organophosphates, TT = tetrionic and tetramic acid derivatives.

<sup>2</sup> LD<sub>50</sub> values represent the relative toxicity of a pesticide. They represent the dose (in milligram per kilogram body weight) that will kill 50 percent of the test animals. Thus the lower the number the greater the toxicity. Values given are for oral LD<sub>50</sub>.

<sup>3</sup> DO NOT make a subsequent foliar application of any group 28 insecticide (such as Coragen) for a minimum of 60 days after planting seed treated with Lumiderm.

<sup>4</sup>DO NOT make any subsequent applications of a group 28 insecticide (such as Coragen) following Fortenza seed treatment.

## Scouting for insects in Sunflowers

Belowground and Surface Feeders

### • Cutworm

- **Typical Damage:** Notched, wilted, dead, and cut-off plants (weed or crop seedlings). Plants missing from rows, bare patches appearing in field.
- **When and How to Monitor:** Look for cutworm, and evidence of cutworm feeding, when monitoring sunflowers in May and June. Often cutworms will be close to the cut or shriveled plants that they have just damaged. Cutworm will sometimes be most abundant in patches or a specific area of a field. In areas of a field where cutworm damage is noticeable, check around damaged plants in a square foot (30 cm x 30 cm) area. Use trowel or shovel to carefully search through top half to 1 inch of soil for cutworm larvae. Repeat in several locations to get an accurate assessment of what the cutworm levels are.
- **Nominal Threshold:** 1 cutworm or more per square foot (30 by 30 cm) or if there is a 25 to 30 percent stand reduction. Sometimes it is most economical to just treat infested patches, and not whole fields.

Defoliators

### • Sunflower Beetle

- **Typical Damage:** Adults: Leaves of seedling plants chewed or completely destroyed late May through June, shot-holes or large areas of leaves chewed July through August. Larvae: Leaves of plants chewed or completely destroyed.
- **When and How to Monitor:** Adults: Look for when monitoring sunflower seedlings in May through June. Examine 10 plants at random at each stop. Larvae: Look for when monitoring sunflowers in July through mid-August. Examine 10 plants at random at each sampling site. Peel back leaves around growing tip and record total number of larvae found. Calculate average number per plant.
- **Economic Threshold:** Adults: 1 to 2 per seedling; Larvae: 10 to 15 per plant or 25 to 30 percent defoliation.

## Insects affecting the seeds

### Pests of Seed Only

#### • Red Sunflower Seed Weevil

- **Typical Damage:** Seeds partly or completely destroyed, exit hole in hull. Shriveled kernels, kernels completely destroyed.
- **When and How to Monitor:** Monitor fields when ray petals being to form and continue every 2 to 3 days until pollination is complete. When scouting, use the X pattern and begin counts at least 70 to 100 feet into the field to avoid margin effects. Examine 5 plants at each site for a total of 25 plants. For checking individual sunflower heads, brush the face of the head vigorously to bring the weevils to the surface, or use a commercial preparation of mosquito repellent containing diethyl toluamide (DEET) to spray the heads. This will cause the weevils to move out of hiding spots. Record total number of weevils and calculate average per head.
- **Economic Threshold:**
  - Confection Sunflowers: 1 to 2 weevils per plant. Control is based on a need to keep seed damage below 3 or 4 percent because of industry standards.
  - Oilseed sunflowers: 12 to 14 weevils per head.
  - The ideal plant stage to treat is when most plants in the field are at 40 percent pollen shed (R5.4).

#### • Banded Sunflower Moth

- **When and How to Monitor:** Look for banded sunflower moth adults when monitoring fields in the late bud (R-4) to early bloom (R5.1) plant growth stage. Count moths on 20 plants from 5 different sites for a total of 100 plants. Sampling in early evening or early morning when the moths are most active gives the most accurate counts.
- Sampling strategies based on scouting for adult moths during daylight hours, and counting eggs, have also been developed.
- **Economic Threshold:** 1 moth per 2 plants when monitoring in the early evening or early morning.
- If monitoring for eggs or adult moths during daylight hours, tables for determining economic thresholds can be found at: <http://www.ag.ndsu.edu/extensionentomology/field-crops-insect-pests/Documents/sunflower/e-823-banded-sunflower-moth>. If treatment is warranted, it should be applied at the R5.1 sunflower plant growth stage.

#### • Lygus bugs

- **Economic Threshold:** Confection – One adult lygus bug per 9 heads can result in economic losses through the reduction in seed quality. Lygus bug management should be initiated between when the inflorescence begins to open (R4) to early bloom (R5.1) stages if adult densities reach economic levels. No control is needed in oilseed sunflowers not used for human consumption.

## Sunflowers Insect Management Chart

# Insect Control in Stored Grain

## Prevention

**Clean in and around storage facilities.** Grain storage facilities, and the area around storage facilities, should be cleaned thoroughly prior to storing grain.

**Clean equipment used to move grain.** Grain left in equipment throughout the summer months can result in new grain that is being placed into storage becoming infested. Combines, truck beds, grain wagons, augers and other equipment used to move grain should be cleaned of grain residue. Other potential sources of grain infesting insects include livestock feeds, old seed bags, spilled grain, etc.

**Inspect grain storage facilities** for signs of deterioration, especially for leaks or holes through which insects or rodents can gain access to the stored grain. Moving and storing the grain in clean facilities will eliminate one source of infestation. However, grain stored for long periods of time still has the potential for renewed infestations.

**Treating storage facilities.** Depending on the commodity to be stored, storage facilities may additionally be sprayed or dusted, if needed, with a recommended insecticide before storing grain in the bin (e.g. malathion or diatomaceous earth – refer to product labels for details). **Note:** some commodities, such as canola, flax and sunflowers, should not be stored in facilities recently treated with malathion.

**Dry and Cool Grain.** Ideally, the grain should be dry before being put into storage, and cooled as quickly as possible. For long-term storage, producers are urged to lower the grain temperature below 15°C as soon as possible after the grain is placed in storage. At 15°C the stored product insects stop laying eggs and development stops. Aeration systems used during the night immediately after harvest should have the grain below 15°C in about 2 weeks. Grain that is not moved or aerated after harvest can remain warm enough to allow insects to survive the winter. Convection currents arising from this warm air can also promote condensation, sprouting (heating) and mould growth in unmanaged grain. These conditions are very attractive to stored product pests and support their development.

Once the grain mass is cooled to the desired temperature, fans should be sealed to prevent unwanted air migration through the mass that could result in early grain mass warm-up. Cold grain has a longer storage life than warm grain.

Note, however, that under cool grain temperatures, insect movement is reduced to the point that some insecticides may not be effective.

## Monitoring for Insects

**Bin probe and Sieves:** Stored grain insects can be monitored by taking grain samples with a bin probe, sieving the grain, and looking in the dockage for insects.

**Probe Traps:** Another means of detecting insects in stored grain is through placing probe traps (such as the WB PROBE II Trap from Trece) in the grain and monitoring them. Often the first indication of an infestation will be found near the top centre of a storage bin, and therefore, this is where traps should be placed. Monitoring

should take place once every 7 to 10 days during the onset of storage (first 60 days) and then the frequency of monitoring may be adjusted.

## Identifying insects in stored grain

Correct identification of insects found in stored grain is important in determining the most appropriate control methods. Some of the insects found in stored grain feed directly on the grain, referred to as primary pests, while others feed on grain that is damaged or going out of condition, referred to as secondary pests.

### Primary insect pests

Insects that feed directly on the grain include rusty grain beetles, red flour beetles, and sawtoothed grain beetles.

**Rusty grain beetles** are reddish brown beetles about 2 mm long. Heavy infestations of this insect cause grain to heat and spoil.

The **red flour beetle** is another common insect pest of stored grain in the prairies. Red flour beetles cannot feed on undamaged, dry seed with less than 12 percent moisture content. They prefer grain dust, broken grain and milled stocks.

**Sawtoothed grain beetles** are more common in stored oats than in stored wheat and barley.

### Secondary insect pests:

Insects that feed on fungus in the grain bin or stored grain that is damaged include the foreign grain beetle, hairy fungus beetle, psocids, and grain mites.

**Foreign grain beetles** resemble the rusty grain beetle, but can be distinguished from it by club-shaped antennae. Also, when placed in a glass jar, foreign grain beetles will climb up the sides, while rusty grain beetles cannot. While foreign grain beetle is considered a fungus feeder, they will feed on grain if the moisture content is in the high end of the acceptable range (e.g. 14.5 percent mc wheat).

**Grain mites** are whitish, about 0.2 to 0.5 mm long, and can be hard to see with the naked eye. About eight kinds of mites are common in farm granaries and elevators.

**Psocids** are soft-bodied insects, about 1 mm long, with long antennae relative to the body size.

Fungus feeding insects and mites cannot survive in dry grain. Chemical control is not necessary for fungus feeding pests in stored grain. Practices that result in the grain drying may be all that is needed to control such pests.

Information to help identify insect pests of stored grain, as well as information on control, can be found on the Canadian Grain Commission website at: <https://www.grainscanada.gc.ca/en/grain-quality/manage/>.

## Control Techniques:

*The Canada Grain Act* states that an elevator operator may reject any grain if the operator has reason to believe it is infested or contaminated. Outlined below are some control techniques and when and how these techniques can be best used.

Cold Temperatures

Rusty grain beetles are cold hardy and can survive subzero temperatures. Rusty grain beetles and other stored grain insects can be killed by reducing core grain temperatures as follows:

Time Required to Kill Insects at Various Grain Temperatures

| Grain Temperature | Time required to kill insects |
|-------------------|-------------------------------|
| -5°C              | 12 weeks                      |
| -10°C             | 8 weeks                       |
| -15°C             | 4 weeks                       |
| -20°C             | 1 week                        |

Phostoxin, Fumitoxin

**Company:** Degesch America Inc. (*Phostoxin* round tablets – PCP#15736; *Phostoxin* pellets – PCP#15735; *Fumitoxin* tablets – PCP#19227; *Fumitoxin* Pellets – PCP#19226).

**Formulation:** 55% aluminum phosphide.

| Formulation                                                                   | Primary Use                     | Container Size                                                                       |
|-------------------------------------------------------------------------------|---------------------------------|--------------------------------------------------------------------------------------|
| <i>Phostoxin</i> tablets (3 g each)<br><i>Fumitoxin</i> tablets (3g each)     | On the farm or country elevator | 333 tablets (1kg) ( <i>Phostoxin</i> )<br>500 tablets (1.5 kg) ( <i>Fumitoxin</i> )  |
| <i>Phostoxin</i> pellets (0.6 g each)<br><i>Fumitoxin</i> pellets (0.6g each) | On the farm or country elevator | 1666 pellets (1kg) ( <i>Phostoxin</i> )<br>2490 pellets (1.5kg) ( <i>Fumitoxin</i> ) |
| <i>Phostoxin</i> tablets prepac                                               | Containers                      | 1 to 4 strips of 33 tablets to a pouch                                               |

**Insects and other pests controlled:** Rusty grain beetle, red flour beetle, saw toothed grain beetle, granary weevil, yellow mealworm, lesser grain borer, spider beetles, hairy fungus beetles, Indian meal moth, Hessian fly, nematodes, mice and rodents.

**Approved for use on the following stored grains:** Barley, corn, dried peas, lentils, millet, oats, rye, soybeans, sunflower seeds, triticale, wheat, straw and hay.

**Restricted Product:** The use and sale of Aluminum Phosphide (*Phostoxin* or *Fumitoxin*) is restricted to licensed pesticide applicators possessing a valid fumigation license (Saskatchewan) or stored agricultural products license (Manitoba).

*Phostoxin* or *Fumitoxin* can only be used in conjunction with a detailed fumigation management plan.

**Rate and Minimum Exposure Period:** Refer to labels to determine rate. For grain bins a dosage of 250 to 500 tablets (or 880 to 2560 pellets) per 100 cubic metres of bin space being treated (not volume of grain) is recommended. It is important to ensure that bins are relatively secure. It is not advisable to use phosphine products in bins that are leaky or not well sealed. The following table may be used as a guide to determine the minimum length of exposure period to *Phostoxin* or *Fumitoxin* at the indicated temperatures:

| Temperature               | Exposure Period |
|---------------------------|-----------------|
| Below 5°C (40°F)          | DO NOT fumigate |
| 5°C to 12°C (40° to 53°F) | 10 days         |
| 13° to 15°C (54° to 59°F) | 5 days          |
| 16° to 20°C (60° to 68°F) | 4 days          |
| above 20°C (68°F)         | 3 days          |

Cooling the grain, through aeration or moving the grain several times during mid-winter, should provide effective control of rusty grain beetles.

Moving Grain

Moving grain using cyclone-based pneumatic conveyors (grain vacs) at about 200 bushels per hour has been shown to be an effective means of controlling insects in stored grain. However, moving too large a volume of grain at a time using a pneumatic conveyor results in the grain protecting the insects and reduces kill of stored grain insects. Loading the grain using a pneumatic grain conveyor removes insects from grain being delivered to elevators.

Aluminum phosphide cannot be used when the grain temperature is below 5°C as the tablets release the gas too slowly. Very dry grain will also slow the release of the gas from the pellets. A shortened exposure period cannot be compensated for by increased dosage. Also ensure that storage is well ventilated for at least 24 hours after the required time for fumigation.

**Environmental Hazards:** Toxic to birds and mammals. Carefully inspect the outside and inside of the structure prior to application to ensure the absence of nesting or roosting birds. Avoid application if birds are present.

Diatomaceous earth (*Protect-It*)

**Company:** Hedley Technologies Ltd. (*Protect-It* – PCP#24259)

**Formulation:** *Protect-It*: 74 percent Silicon dioxide, 10 percent Silica aerogel.

**Insects controlled:** *Beetles* – Rusty grain beetle, red flour beetle, rice weevil, granary weevil. *Moths* – Angoumois grain moth, Mediterranean flour moth, Indian meal moth.

**Approved for use on the following stored products:** Feed grains, seed, stored grains, wheat, barley, buckwheat, corn, oats, rye, flax, peas, soybeans and sorghum. Also registered for structural treatment of empty grain storage and transportation containers.

**How it works:** Diatomaceous earth damages the cuticle of the insect, reducing the insect’s ability to retain moisture. The insect eventually dies from dehydration. A 6 week period of treatment above 20°C is needed for maximum efficacy.

**Rate, for empty storage structures:** Use a dust blower or aeration fan to get diatomaceous earth into the cracks, crevices and void spaces of the structure being treated. Dust areas at a rate of 1 kg per 200 square metres (5 g per square metre).

**Rate, while grain is being placed into storage:**

- **Protect-It:** The application rate for *Protect-It* varies by crop and insect species, ranging from 100 g per tonne for control of rusty grain beetle in wheat to 1000 g per tonne for red flour beetle in corn. Refer to the label for details.

**Precautions:** The application of DE will lower the test weight measurement of the grain, but usually not to the point of downgrading. If test weight loss is excessive, the grain can be diluted with untreated grain. DE is non-toxic to humans and animals.

**Malathion Grain Protector Dust**

**Company:** Loveland Products Canada (PCP#15896)

**Formulation:** 2% malathion

**Insects controlled:** confused flour beetles, flat grain beetles, granary weevil, Indian meal moth, lesser grain borer, rusty grain beetle and sawtoothed grain beetle.

**Approved for use on the following stored grains:** Wheat, rye, barley and oats as stored grains.

Malathion Grain Dust can be applied to grain when it is in the truck or wagon prior to binning. It can also be used to control surface infestations by applying to the grain surface and raking in to

**Malathion 85E (Loveland Products Canada)**

| Insect                                                                                                                                                                                                                    | Rate                                                                    | Note                                                                         |
|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------|------------------------------------------------------------------------------|
| Rusty grain beetle, red flour beetle, sawtoothed grain beetle, confused flour beetle, grain mite, granary weevil, Indian meal moth, lesser grain borer, flat grain beetles, rice weevils (empty grain storage facilities) | Mix 490 mL in 15 L of water. Apply 5 L of mixture on 100 m <sup>2</sup> | Wait until spray has thoroughly dried before storing grain in treated areas. |

15 cm depth of the grain. Malathion controls insects by ingestion and contact and insects must be active for it to be effective.

**Rate:**

| Crop   | Rate-g/1000 kg (tonne) grain |
|--------|------------------------------|
| Wheat  | 415                          |
| Rye    | 450                          |
| Barley | 520                          |
| Oats   | 735                          |

DO NOT apply to grain within 7 days of sale.

Be aware that the Canadian Grain Commission allows only 8 ppm of malathion residues in stored grains.

**Malathion 85E**

Refer to the label for this product for insect and mite control in *empty* grain bins, grain elevators, grain box cars and flour mills.

**Note:** Some commodities, such as canola, should not be stored in facilities recently treated with malathion. Malathion residue can linger in bins for up to six months after treatment and can be transferred from the bin to canola seed. Canola found with malathion residues is unacceptable for export customers.

## Insecticide Product Pages

For rates and pre-harvest intervals for insecticides, see the insect management charts on pp. 638-677.

# Acetamiprid

Insecticide Group  
4A

### Company:

Sharda CropChem Limited (*Aceta 70 WP* – PCP#33298)

Nippon Soda Company Ltd. (*Assail 70 WP* – PCP#27128)

Distributed by Belchim Crop Protection.

### Formulations:

70% acetamiprid formulated as a wettable powder.

### Formulations, Crops, Insects, Rates:

| Product                        |                        | Aceta 70 WP                                      | Assail 70 WP   |
|--------------------------------|------------------------|--------------------------------------------------|----------------|
| Formulation and Container Size |                        | 70% acetamiprid formulated as a wettable powder. |                |
| Crop                           | Insect                 | Application rate (per acre)                      |                |
| Potato                         | Colorado potato beetle | 16.2 to 32.4 g                                   | 16.2 to 32.4 g |
|                                | Aphids                 | 22.7 to 34.8 g                                   | 22.7 to 34.8 g |
| Seed alfalfa                   | Alfalfa plant bug      | 35 to 69 g                                       | 35 to 69 g     |
|                                | Lygus bug              | 35 to 69 g                                       | 35 to 69 g     |

### Application:

- **Ground application:** Apply in a minimum finished spray volume of 200 per hectare. Use the higher rates when the majority of the Colorado Potato Beetle population is in the adult stage and for heavy pest pressure.
  - **Seed alfalfa** – Apply in a minimum finished spray volume of 100 L per hectare by ground. Apply prior to bloom up to the time when 50 percent of seed pods are ripe. Begin when adults and/or 4-5<sup>th</sup> instar nymphs have reached economic threshold levels for your area.
- **Aerial application:** Aerial use on potatoes is permitted in the provinces of Alberta, Saskatchewan and Manitoba only.

### How it Works:

*Aceta 70 WP* and *Assail 70WP* are neonicotinoid insecticides that works by contact or ingestion. They have an anti-feedant effect that can prevent pest damage to host plants prior to the death of the insect. Products rapidly degrades in the soil with no carryover effects.

### Restrictions:

- **Potato:** DO NOT make more than 2 applications per crop year. DO NOT apply more than once every 7 days. DO NOT exceed a total of 120 g active ingredient (172 g product) per hectare per season.
- **Seed alfalfa:** DO NOT make more than 3 applications per season. DO NOT apply more than once every 7 days. DO NOT exceed a total of 357 g active ingredient (510 g product) per hectare per season. DO NOT cut treated seed alfalfa fields for hay/forage.
- **Grazing:** DO NOT graze treated seed alfalfa fields.
- **Pre-harvest Interval:**
  - **Potato** – DO NOT harvest within 7 days of application.
  - **Seed Alfalfa** – DO NOT apply less than 1 day before harvest.
- **Re-Entry:** DO NOT re-enter treated areas for 12 hours after foliar application.

### Precautions

If this product is to be applied to a product destined for export to the United States, information on acceptable residue levels are available at [www.croplife.ca](http://www.croplife.ca).

**Storage:** DO NOT store in or around the home. Store unused product in a cool, ventilated, dry, locked area. DO NOT allow prolonged storage in areas where temperatures frequently exceed 46°C.

## Environmental Hazards:

**Bees:** Toxic to bees exposed to direct treatment, drift, or residues in flowering crops or weeds. DO NOT apply this product to flowering crops or weeds if bees are visiting the treatment area. Minimize spray drift to reduce harmful effects on bees in habitats close to application site.

**Aquatic Organisms:** Toxic to aquatic organisms. To reduce runoff from treated areas into aquatic habitats, avoid application to areas with a moderate to steep slope, compacted soil, or clay. Avoid application when heavy rain is forecasted.

**Others:** The lower rates allow for maximum beneficial survival and faster rebound of beneficial populations.

## Hazard Rating:

|                                |                        | Foliar Sprays         | Foliar Sprays, 44.1 mL                                               | 42.5 g                                                                |

## Application:

### Actara 240SC

- **Soil application:** Apply as an in-furrow spray during planting to allow the insecticide to be absorbed by plant roots. For 90 cm row spacing, apply 151 to 196 mL per acre. Use the higher rate for extended control. DO NOT follow a soil application with a foliar application.
- **Potato seed piece treatment:** Choose the appropriate rate from the chart on label, based on seeding rate. Apply only in areas with adequate ventilation or in areas that are equipped to remove mist or dust. Best results are obtained if potatoes are planted immediately after *Actara 240SC* is applied to seed. When transporting cut and treated seed ensure the seed is covered. DO NOT apply a subsequent treatment of in-furrow or foliar application of thiamethoxam or other Group 4 insecticide following seed piece treatment with *Actara 240SC*.
- **Foliar application:** *Actara* may be applied by ground or air. For ground application use a minimum of 40 L per acre unless otherwise indicated on label. A maximum of 2 foliar applications of *Actara* may be made per season. DO NOT exceed a total of 88 grams per acre. Allow at least 7 days between applications. DO NOT use a foliar application of *Actara* following in-furrow or soil application of *Actara*.

## How it Works:

*Actara* is a systemic (taken up into the plant foliage after application), neonicotinoid insecticide.

## Restrictions:

- **Rainfastness:** *Actara* is rainfast once spray has dried on treated plants.
- **Pre-harvest Interval:** DO NOT harvest within 7 days of application.
- **Re-Entry:** DO NOT re-enter treated areas for 12 hours after foliar application.
- **Re-cropping:** No restrictions following the harvest of sorghum, wheat, barley, canola, potatoes or cover crops. For all other crops 120 day plant-back interval is required.
- **Tank mix:** According to the Pest Management Regulatory Agency of Health Canada's Guidance Document on Tank Mix Labelling (March 2023), unlabelled tank mixes of this product are permitted only if the label of this product and the label of the product it might be mixed with include at least general wording on their respective labels indicating they may be mixed with other pesticides. When tank mixes are permitted, apply mixes according to the most restrictive use limitations for either product.
- **Buffer Zones:** Buffer zones are required for the protection of terrestrial and freshwater habitats. Refer to specific label for buffer zones required.

## Environmental Hazards:

**Bees:** *Actara* is highly toxic to bees exposed to direct treatment or residues on blooming crops or weeds. To minimize exposure to bees from foliar application, DO NOT apply this product to flowering crops or weeds if bees are visiting the treatment area.

**Aquatic Organisms:** Toxic to aquatic organisms. To reduce runoff from treated areas into aquatic habitats, avoid application to areas with a moderate to steep slope, compacted soil, or clay. Avoid application when heavy rain is forecasted.

**Others:** Toxic to certain beneficial insects.

## Hazard Rating:

*Actara 240SC:* Caution – Poison

*Actara 25WG:* Caution – Eye and Skin Irritant

Refer to the Introduction for an explanation of the symbols.

# Admire 240

Insecticide Group  
4A

## Company:

Bayer (*Admire 240* – PCP#24094)

## Formulations, Crops, Insects, Rates:

| Product                        |                                                                       | Admire 240                                                    |
|--------------------------------|-----------------------------------------------------------------------|---------------------------------------------------------------|
| Formulation and Container Size |                                                                       | 240 g/L imidacloprid formulated as a suspension concentrate.  |
| Crop                           | Insect                                                                | Application rate (per acre)                                   |
| Potato                         | Colorado potato beetle, aphids, potato leafhopper, potato flea beetle | 11.79 to 17.69 mL/100 pounds (45.36 kg) of potato seed tubers |

## Application:

### *Imidacloprid*

- **Seed piece treatment:** (*Admire 240*) Refer to Imidacloprid in the seed treatments product pages.
- **Foliar application:** (*Admire 240*) Apply only if insect populations exceed recommended economic thresholds. For optimum control, good coverage of the foliage is needed. A maximum of 2 foliar applications may be made per crop per season. Scout fields and retreat if needed. For aphids, two applications at least 7 days apart may be required to achieve control. DO NOT make a foliar application following a seed treatment of the product in the same crop. Allow at least 7 days after the last application and before harvesting the crop.

## How it Works:

*Imidacloprid* is a neonicotinoid, systemic (within the plant) insecticide that works by contact or ingestion. Control period may vary due to climate and soil conditions

## Restrictions:

- DO NOT apply by air.
- DO NOT apply following a soil, in-furrow or seed treatment application of a Group 4 Insecticide.
- **Re-cropping:** Acceptable plant-back intervals for:
  - **Cereal grains (wheat, barley, oats)** – minimum 30 days
  - **Peas and beans** – 9 months
  - **All other food and feed crops** – 12 months
  - **Green manure and other cover crops** – can be grown without plant-back intervals but cannot be grazed or harvested for food or feed.
- DO NOT apply in fields where *imidacloprid* has been used during the previous season. DO NOT apply through any irrigation system.
- DO NOT apply this product or allow it to drift to blooming crops or weeds if bees are visiting the treatment area.

## Precautions:

DO NOT re-enter treated areas for 24 hours after foliar application. Avoid application when heavy rain is forecast.

DO NOT apply product or plant treated seed pieces within 15 metres of well-heads or aquatic systems, including marshes, ponds, ditches, reservoirs, streams, lakes, etc.

DO NOT mix, load or clean spray equipment within 30 metres of well-heads or freshwater habitats.

For application with air-blast equipment, DO NOT apply within 40 metres of well-heads or aquatic systems.

The use of this chemical may result in contamination of groundwater particularly in areas where soils are permeable (e.g. sandy soil) and/or where the water table is shallow.

**Storage:** DO NOT store in or around the home. Store unused product in a cool, ventilated, dry, locked area and avoid cross-contamination with other pesticides, fertilizers, food and feed.

DO NOT use treated seed pieces for food, feed or fodder.

If this product is to be applied to a product destined for export to the United States, contact 1-866-375-4648 or [www.croplife.ca](http://www.croplife.ca).

## Environmental Hazards:

**Bees:** This product is highly toxic to bees exposed to direct treatment or residues on blooming crops or weeds.

**Aquatic Invertebrates:** This product is highly toxic to aquatic invertebrates.

**Birds:** This product is toxic to birds. Any spilled or exposed seeds must be incorporated into the soil or otherwise cleaned-up from the soil surface.

**Aquatic organisms:** Highly toxic to aquatic invertebrates.

## Hazard Rating:

Caution – Poison

Refer to the introduction for an explanation of the symbols.

# Agri-Mek SC

Insecticide Group  
6

## Company:

Syngenta Canada (PCP#31607)

## Formulations, Crops, Insects, Rates:

|                                |                                                      |                                                          |
|--------------------------------|------------------------------------------------------|----------------------------------------------------------|
| Product                        |                                                      | Agri-Mek SC                                              |
| Formulation and Container Size |                                                      | 84 g/L abamectin formulated as a suspension concentrate. |
| Crop                           | Insect                                               | Application rate (per acre)                              |
| Potato                         | Potato psyllid, Colorado potato beetle, Spider mites | 49 to 91 mL                                              |

## Application:

### Agri-Mek

- Can be applied by ground only. Colorado Potato Beetle: Make the first application after approximately 50% of the egg masses have hatched and larvae are present. Apply when potato psyllids and spider mites first appear. Make first application after approximately 50 per cent of the egg masses of Colorado potato beetle have hatched and larvae are present. If two applications are required, limit them to a single Colorado potato beetle generation per crop. Apply in sufficient solution to ensure thorough coverage of plant foliage. Avoid application when heavy rain is forecast.

## How it Works:

*Agri-Mek* interferes with neuro-transmission in insects and mites resulting in paralysis, cessation of feeding and eventually death of the pest.

## Restrictions:

- DO NOT apply by air.
- **Buffer zone:** DO NOT apply within 30 metres of freshwater habitats.
- Allow 7 days between application.
- DO NOT make more than 2 applications per growing season. DO NOT apply more than 800 mL per acre of *Agri-Mek* per season. DO NOT graze treated crop.
- DO NOT enter or allow entry into treated areas for 12 hours following application.
- **Pre-harvest interval:** 14 days
- **Storage:** Store product in original container only, away from food or feed. Keep container closed.

## Precautions:

DO NOT contaminate water, food or feed by storage or disposal.

If *Agri-Mek* is to be used on a commodity that may be exported to the United States and you require information on acceptable residue levels in the United States, visit CropLife Canada's website at [www.croplife.ca](http://www.croplife.ca) or contact Syngenta Canada Inc. at 1-877-964-3682.

## Environmental Hazards:

**Bees:** *Agri-Mek* is highly toxic to bees exposed to direct treatment or residues on flowering crops and weeds. DO NOT apply this product or allow drift to flowering crops and weeds if bees are visiting the treatment area.

**Aquatic organisms:** Toxic to aquatic organisms and wildlife. A buffer zone of 30 metres is required between the last point of direct application and the closest downwind end of sensitive freshwater habitats. Avoid application when heavy rain is forecast.

## Hazard Rating:

Warning – Poison

Refer to the introduction for an explanation of the symbols.

# Bioprotec CAF/Bioprotec PLUS

Insecticide Group  
11

## Company:

AEF Global Inc. (*Bioprotec CAF* – PCP#26854 / *Bioprotec PLUS* – PCP#32425)

## Formulation:

*Bacillus thuringiensis subspecies kurstaki*, strain EVB113-19, in a water based formulation. Potency - Bioprotec CAF: 11,400 cabbage looper units (CLU)/mg of product (equivalent to 12.7 billion CLU/L) - Bioprotec PLUS: 17,500 Cabbage Looper Units (CLU) per mg of product (equivalent to 20 billion CLU per liter).

- Container size - 10 L

## Formulations, Crops, Insects, Rates:

| Product                        |                             | Bioprotec CAF                                                                                    | Bioprotec PLUS              |
|--------------------------------|-----------------------------|--------------------------------------------------------------------------------------------------|-----------------------------|
| Formulation and Container Size |                             | Bacillus thuringiensis subspecies kurstaki, strain EVB113-19, in a water based formulation. 10 L |                             |
| Crop                           | Insect                      | Application rate (per acre)                                                                      | Application rate (per acre) |
| Quinoa                         | European corn borer         | 1.13-1.62 L                                                                                      | 0.61-1.0 L                  |

| Timothy                        | Essex skipper               | 0.22-0.28 L                                                                                      | 0.14-0.18 L                 |
| Sunflower                      | Sunflower moth              | 0.32-0.65 L                                                                                      | 0.20-0.40 L                 |
| Hemp                           | European corn borer         |                                                                                                  | 0.73-1.0 L                  |

## Application:

### *Bioprotec CAF/Biotprotec PLUS*

- Use the higher rate for heavy infestations. If egg hatch is extended or re-infestation occurs, repeat applications. Apply every 7 to 10 days.
- Apply at first signs of infestations when larvae are small. Repeat applications, according to economic threshold, as necessary to maintain control. Consult provincial recommendations and regional advisors for monitoring procedures, treatment thresholds, and timing of applications. Monitor for the pest and apply at hatching, before larvae bore into plant tissues. Apply Bioprotec CAF with a high volume sprayer in a minimum of 300 L of water per hectare.
- Apply in sufficient water volume to ensure thorough coverage. A minimum of 121.4 L per acre is recommended. Begin application at hatching before larvae bore into plant tissues. Use diluted spray mixtures within a 12-hour period.
- Bioprotec CAF/Biotprotec PLUS should be applied by aerial equipment undiluted. Dilute with minimal quantities of water only when required to improve deposit. Best results can be expected when Bioprotec CAF is applied to dry foliage with calibrated aircraft capable of obtaining droplet sizes below 300 microns and preferably in the range of 50 to 150 microns.

## How it Works:

*Bioprotec CAF/Biotprotec PLUS* is selectively toxic to some species of lepidopteran larvae. It is a stomach intoxicant only; to be effective, deposits must be ingested by susceptible larvae. Thorough coverage of target foliage where larvae are feeding is essential. In general, larvae should be treated when they are newly hatched and actively feeding. After ingestion of a sufficient dose, larvae cease feeding within a few hours and death occurs in 2 to 5 days.

## Restrictions:

- Maximum of 6 applications per year with a 5 to 10 day interval between applications.
- **Pre-harvest Interval:** 0 days
- **Storage:** *Bioprotec CAF/Biotprotec PLUS* should be stored in the original container between 4°C and 20°C. Product should be used within 18 months of the date of manufacture. Re-Entry Interval: When the product is dry.

## Precautions:

DO NOT allow the pilot to mix product to be loaded onto the aircraft. However, loading of premixed product with a closed system is permitted. Keep out of reach of children. Avoid contact with skin, eyes or clothing. Avoid breathing dust/spray mist. Wear a long-sleeved shirt, long pants, waterproof gloves, shoes plus socks, eye goggles and a NIOSH-approved respirator with any N-95, R- 95, or P-95 filter for biological products when handling, mixing/loading or applying the product and during all cleanup/repair activities

## Hazard Rating:

Caution – Eye Irritant  
Potential Sensitizer

# BioTitan WP

Insecticide Group  
UNF

## Company:

Anatis Bioprotection (PCP#33923)

## Formulations, Crops, Insects, Rates:

| Product                        |                        | BioTitan WP                                                           |
|--------------------------------|------------------------|-----------------------------------------------------------------------|
| Formulation and Container Size |                        | Beauveria bassiana strain ANT-03 as a wettable powder. 500 g to 25 kg |
| Crop                           | Insect                 | Application rate (per acre)                                           |
| Potato                         | Colorado potato beetle | 0.81-1.62 kg                                                          |

## Application:

Minimum water volume: Use spray volume sufficient to cover foliage infested with insect pests. Crop size and spray equipment will determine spray volume needed. Depending on crop treated, 500 to 1000 L of spray volume will typically be required for 1 ha.

## How it Works:

Thorough coverage of infested plant parts is necessary for effective control. BioTitan WP acts via contact and does not have systemic activity. Infection begins with the attachment of conidia to the insect cuticle, followed by germination and penetration of the fungi inside the insect body. Once inside, *B. bassiana* kills the host and if conditions are adequate, it will sporulate outside the insect's body after a few days and produce newly infective conidia.

## Effects of Weather on Performance or Safe Use

Apply only when the potential for drift to areas of human habitation or areas of human activity such as houses, cottages, schools and recreational areas is minimal. Take into consideration wind speed, wind direction, temperature inversions, application equipment and sprayer settings. Do not apply in extremely hot weather. On sunny days, apply later in the afternoon; do not apply at mid-day when temperatures are highest and the sun is most intense. For foliar applications, do not apply when heavy rain is forecast.

## Tank Mixes

Do not mix with fungicide. If a fungicide must be used, make the application of the fungicide at least 4 days before the BioTitan WP application or at least 2 days after the BioTitan WP application. According to the Pest Management Regulatory Agency of Health Canada's Guidance Document on Tank Mix Labelling (March 2023), unlabelled tank mixes of this product are permitted only if the label of this product and the label of the product it might be mixed with include at least general wording on their respective labels indicating they may be mixed with other pesticides. When tank mixes are permitted, apply mixes according to the most restrictive use limitations for either product.

## Restrictions

- **Rainfast period:** Avoid application when heavy rain is forecast.
- **Re-entry interval:** DO NOT re-enter or allow re-entry into treated areas for 4 hours or until sprays have dried, unless wearing appropriate personal protective equipment including long-sleeved shirt, long pants, waterproof gloves, socks and shoes.
- **Pre-harvest interval:** 0 days
- **Other restrictions:** To reduce runoff from treated areas into aquatic habitats avoid application to areas with a moderate to steep slope, compacted soil, or clay. Contamination of aquatic areas as a result of runoff may be reduced by including a vegetative filter strip between the treated area and the edge of the water body. Do not apply in extremely hot weather. On sunny days, apply later in the afternoon; do not apply at mid-day when temperatures are highest and the sun is most intense.
- **Buffer zones:** Apply only when the potential for drift to areas of human habitation or areas of human activity such as houses, cottages, schools, and recreational areas is minimal. Take into consideration wind speed, wind direction, temperature inversions, application equipment and sprayer settings.
- **Storage:** Store in a cool, dry place. Can be stored up to 18 months if in the refrigerator at 4°C. Can be stored up to 6 months at 21°C in an unopened package. If the package is open, this product can be stored up to 3 months at 21°C. Tightly reclose the container of unused product to prevent decrease of the efficacy. The BioTitan WP contains live spores of the naturally occurring fungus, *B. bassiana*. Spores may be damaged by storage at high temperatures (higher than 25°C) or contact with water for more than 24 hours. To prevent contamination, store this product away from food or feed.

## Environmental Hazards

*Beauveria bassiana* strain ANT-03 is considered safe for beneficial insects, although it is recommended to avoid spraying directly in areas where bees are actively foraging. If bees are contacted directly, they can bring fungal spores back to the hive and infect the susceptible brood. *Beauveria bassiana* strain ANT-03 is toxic and/or pathogenic to daphnia (aquatic invertebrate).

## Hazard Rating (Mammalian Toxicity)

Potential sensitizer.

Warning - eye irritant.

Warning - poison

# Carbine/Beleaf 50SG

|                                                                                                                         | Psyllid (suppression)                                   |                                                                        | 0.08 Kg                                                                        |

## Application:

- Thorough spray coverage of plant foliage is essential for optimum control. Apply in sufficient water volumes to ensure good coverage. Use a minimum of 38 litres per acre of water. Rates and finished spray volumes should be increased under extreme pest populations or dense plant foliage.
- For applications to control aphids, use higher rate under extreme pest populations and/or dense plant foliage.
- Scout fields and reapply if necessary.

## How it Works:

Flonicamid insecticide is a member of Insecticide Group 29 and controls target pests by contact and ingestion provoking rapid and irreversible feeding cessation. There is translaminar movement in the plant.

## Tank Mixes:

Coragen® MaX Insecticide. According to the Pest Management Regulatory Agency of Health Canada's Guidance Document on Tank Mix Labelling (March 2023), unlabelled tank mixes of this product are permitted only if the label of this product and the label of the product it might be mixed with include at least general wording on their respective labels indicating they may be mixed with other pesticides. When tank mixes are permitted, apply mixes according to the most restrictive use limitations for either product.

## Restrictions:

- DO NOT apply by air.
- DO NOT use seed or forage from alfalfa grown for seed for human or animal consumption
- Allow a minimum of 7 days from alfalfa grown for seed between applications. DO NOT make more than 3 applications per year.
- **Preharvest interval:**
  - DO NOT apply within 7 days of harvest.
- DO NOT apply more than 121 grams per acre per application. DO NOT apply more than 243 grams per acre per season.
- DO NOT use in home gardens.
- **Re-cropping:** There are no plant-back restrictions for any crop listed on the label. All other crops may be planted 30 days after the last application of *Beleaf*.

## Precautions:

Avoid overnight storage of spray mixture. Prepare only enough spray mixture required for immediate application. DO NOT use liquid fertilizer as a carrier.

*Beleaf* insecticide should not be used with spray adjuvants. Avoid application of *Beleaf* or *Carbine* Insecticide when heavy rain is forecast. DO NOT enter or allow entry into treated areas for 12 hours after application.

**Storage:** Store product in original container, in a secured, dry place separate from other pesticides, fertilizer, food or feed. Avoid the overnight storage of spray mixtures.

If this product is to be applied to a commodity destined for export, visit Crop Life Canada's website [www.croplife.ca](http://www.croplife.ca) for information on acceptable residue limits.

## Environmental Hazards:

Toxic to certain beneficial insects. Minimize spray drift to reduce harmful effects on beneficial insects in habitats next to the application site such as hedgerows and woodland. Toxic to non-target terrestrial plants. Observe spray buffer zones specified on the label. To reduce runoff from treated areas into aquatic habitats avoid application to areas with a moderate to steep slope, compacted soil, or clay.

## Hazard Rating:

Caution – Eye Irritant

Refer to the introduction for an explanation of the symbols.

|                                                        | Grasshoppers                                                                                   | 17-34 ml                    | 25-51 mL        | 51-101 mL                 | 51-101 mL    | 51-101 mL    |

| Product |                                         | Coragen MaX | Shenzi | Chlorantraniliprole 200SC | Cosayr | Vermis |
|---------|-----------------------------------------|-------------|--------|---------------------------|--------|--------|
| Quinoa  | Beet webworm, goosefoot groundling moth | 34-51 mL    |        |                           |        |        |

## Application:

### *Coragen Max/Shenzi/Chlorantraniliprole 200SC/Vermis/Cosayr*

- May be applied by air or ground equipment. Aerial applications for Shenzi, Chlorantraniliprole 200SC Vermis, and Cosayr are limited to potatoes, corn, oilseeds, legume vegetables, and cereals.
- Begin application when treatment thresholds have been reached. Thorough coverage is essential for optimal control. Use the high rate under heavy pest pressure and/or when larger larvae are present.
- **Spray Volume for Potatoes:** Apply in a minimum finished spray volume of 40 L per acre by ground. Apply in a minimum finished spray volume of 20 L per acre by air (20 L/ac by air for Chlorantraniliprole 200SC, Silencer Duo A, Cosayr, Vermis).
- **Quinoa:** Coragen MaX - Do not make more than 3 applications per year. DO NOT APPLY BY AIR. Do not apply less than 1 day before harvest. Observe a 1-day PHI.

## How it Works:

Chlorantraniliprole disrupts muscle activity in the insects, resulting in paralysis. Treated pests stop feeding quickly after ingestion, become lethargic and lose mobility. Insect death may take several days.

## Tank Mixes:

Apply mixes according to the most restrictive use limitations for either product.

- **Insecticides:** *Pounce(R) 384EC insecticide*. According to the Pest Management Regulatory Agency of Health Canada's Guidance Document on Tank Mix Labelling (March 2023), unlabelled tank mixes of this product are permitted only if the label of this product and the label of the product it might be mixed with include at least general wording on their respective labels indicating they may be mixed with other pesticides. When tank mixes are permitted, apply mixes according to the most restrictive use limitations for either product.

## Restrictions:

- DO NOT make more than 4 applications per season on bean, chickpea, lentil, pea, soybean, potatoes, corn, and forage grasses. DO NOT exceed a total of 455 mL of *Coragen* or 152 mL of *Coragen MaX* per acre per season.
- DO NOT make more than 1 application per cutting on alfalfa and sweet clover.
- **Potatoes, bean, chickpea, lentil, pea, soybean:** DO NOT apply more than once every 3 days.
- **Canola, rapeseed, mustard, flax, sunflower:** DO NOT make more than 3 applications per season. DO NOT apply more than once every 5 days.
- **Corn:** DO NOT apply more than once every 7 days. Do not apply more than once every 3 days on seed corn or sweet corn.
- **Wheat, barley, oats, buckwheat, millet:** DO NOT make more than 3 applications per season. DO NOT exceed a total of 455 mL of *Coragen* or 152 mL of *Coragen MaX* per acre per season.
- Forage (grass), fodder or hay may be fed to livestock.
- DO NOT make a foliar application of for a minimum of 60 days following an in-furrow or soil application or planting of seed or seed pieces treated with any Group 28 insecticide.
- **Restricted Entry Interval:** 12 hours
- **Storage:** Store product in original container only, away from other pesticides, fertilizer, food or feed. Not for use or storage in or around the home. Keep container closed.

## Precautions:

DO NOT contaminate irrigation or drinking water supplies or aquatic habitats by cleaning of equipment or disposal of wastes.

## Environmental Hazards:

**Aquatic organisms:** Toxic to aquatic organisms. To reduce runoff from treated areas into aquatic habitats avoid application to areas with a moderate to steep slope, compacted soil, or clay. Avoid application when heavy rain is forecast.

**Beneficial insects:** May cause harm to some generalist predators, but not harmful to some beneficial insects such as parasitic Hymenoptera.

## Hazard Rating:

Very low toxicity to mammals. Keep out of reach of children.

# Cimegra

Insecticide Group  
30

## Company:

BASF Canada Inc. (PCP#33666)

## Formulations, Crops, Insects, Rates:

| Product                        |                                   | Cimegra                                                                |
|--------------------------------|-----------------------------------|------------------------------------------------------------------------|
| Formulation and Container Size |                                   | Broflanilide formulated as a suspension concentrate (100 g/L). 2 x 3 L |
| Crop                           | Insect                            | Application rate (per acre)                                            |
| Potato                         | Colorado potato beetle, Wireworms | 51-76 mL (foliar)                                                      |
| Corn                           | Corn rootworm, Wireworms          | 101 mL; 1.9 mL/ 100 m of row (in-furrow)                               |

MRLs will be established for potatoes across North America (pending registration in the United States), and BASF has submitted for other key markets but is awaiting approvals. Discuss with your potato processor for more information.

## Application:

- For *Cimegra* insecticide to be most effective, apply in-furrow or as a T-band at planting. Apply as a dilute concentrate in sufficient water to get good coverage of the seed furrow. DO NOT apply *Cimegra* to the soil surface.
- Instructions for In-furrow Use to Control Wireworm in Potatoes:**
  - Use 250 mL per hectare of *Cimegra* insecticide in-furrow to control wireworm in potato. Apply at planting as a dilute spray in water. Apply the in-furrow spray to uniformly cover the seed pieces and surrounding soil. The spray pattern should be a 10 to 20 cm (4 to 8 inch) band that is applied to the open seed piece furrow prior to being covered with soil.
  - Dilute *Cimegra* insecticide product in a minimum of 50 L of water per hectare and apply the dilute mixture into the furrow. Use sufficient water to ensure thorough coverage of the seed piece and surrounding seed furrow.
- Instructions for In-furrow:** Use to control wireworm and corn rootworm in corn.
  - Use 250 mL per hectare of *Cimegra* insecticide in furrow to control wireworm and corn rootworm (*Diabrotica virgifera virgifera* and *Diabrotica barberi*) in corn. Apply at planting as an in-furrow or T-band spray by directing spray pattern to uniformly cover seed and surrounding soil.
    - In-furrow:** Apply through spray nozzles or microtubes into the open seed furrow, between the planter furrow openers and press wheels.
    - T-band:** Apply in a 10 to 20 cm (4 to 8 inch) band over the top of the open seed furrow, between planter furrow openers and press wheels. DO NOT T-band over the top of a closed furrow.
- Instructions for foliar application to control Colorado potato beetle in potato:**
  - Cimegra* is not systemic so recommend higher water volume to ensure thorough coverage of the plant.

## How it Works:

Broflanilide is a Group 30 insecticide that is a GABA-gated chloride channel moderator that controls listed pest species through contact and ingestion. Broflanilide binds to a specific site of action upon contact that impacts the central nervous system. Causes rapid, irreversible hyperactivity of nerves and muscles leading to convulsions, paralysis and death.

## Effects of Weather:

Avoid application when heavy rain is forecast.

## Restrictions:

- Re-entry interval:** 12 hours.
- Pre-harvest interval:** 14 days.
- Re-cropping:** Immediate plant-back is permitted for all labelled crops. A plant-back interval of 30 days is required for all crops not on the label.
- Storage:** Prevent from freezing; however, in the instance that the product freezes, allow to thaw at room temperature for 24 hours and agitate well prior to use. To prevent contamination, store this product away from food and feed. Store in original tightly closed container in a cool, dry, locked, well-ventilated area without floor drain.
- Other restrictions:** Do not apply more than 2 foliar applications per year. Do not apply more than 50g active ingredient per hectare per year (20g per acre) total. This includes all application types (infurrow, foliar, etc.)

## Precautions:

Wear a long-sleeved shirt, long pants, chemical-resistant gloves, shoes and socks during mixing, loading, application, clean-up and repair. Gloves are not required during application within a closed cab. Wash hands before eating, drinking, smoking or using the toilet. Change out of work clothes and take a bath or shower after handling or spraying the product. Launder protective clothing before re-use.

## Environmental Hazards:

**Bees:** Toxic to bees. Avoid application during crop blooming period. If applications must be made during the crop blooming period, restrict applications to evening when most bees are not foraging. However, this product is not systemic and when used according to label directions, minimal exposure or risk is expected.

**Aquatic organisms:** Toxic to aquatic organisms. To reduce runoff from treated areas into aquatic habitats avoid application to areas with a moderate to steep slope, compacted soil, or clay. Avoid application when heavy rain is forecast. Contamination of aquatic areas as a result of runoff may be reduced by including a vegetative filter strip between the treated area and the edge of the water body.

## Hazard Rating:

Warning – Contains the Allergen Soy

Refer to the introduction for an explanation of the symbols.

# Closer

Insecticide Group  
4C

## Company:

Corteva Agriscience (PCP#30826)

## Formulations, Crops, Insects, Rates:

| Product                        |        | Closer                                                               |
|--------------------------------|--------|----------------------------------------------------------------------|
| Formulation and Container Size |        | 240 g/L sulfoxaflor formulated as a suspension concentrate. 12 x 1 L |
| Crop                           | Insect | Application rate (per acre)                                          |
| Corn                           | Aphids | 30-61 mL                                                             |
| Potato                         | Aphids | 20-61 mL                                                             |
|                                | Aphids | 20-61 mL                                                             |
| Quinoa                         | Lygus  | 81 mL                                                                |

## Application:

### *Closer*

- May be applied by ground or air in corn and potatoes. Use low rates for light infestations of target pests and higher rates for moderate to heavy infestations. Apply in sufficient in sufficient solution to ensure thorough coverage of plant foliage. For ground application use a minimum spray volume of 40 L per acre. For aerial application use a minimum spray volume of 12 L per acre.

## How it Works:

*Closer* is a systemic (within the plant) insecticide that causes blockage in the insect's nervous system resulting in paralysis and eventually death, through contact or stomach action.

## Restrictions:

- DO NOT make more than 2 applications per growing season. DO NOT apply more than 121 mL per acre per growing season. The 121 mL per acre max is for potatoes and corn. Quinoa is listed at 2 applications per growing season with max of 161 mL per acre per growing season.
- DO NOT apply through an irrigation system.
- **Plant back interval:** A period of 30 days must elapse between treatment of primary crops and the planting of secondary crops not on the *Closer* label.
- **Restricted Entry Interval:** 12 hours.
- **Storage:** Store product in original container only, away from food or feed. Keep container closed.

## Precautions:

DO NOT store or ship with food, feeds, drugs or clothing.

DO NOT contaminate irrigation or drinking water supplies or aquatic habitats by cleaning of equipment or disposal of wastes.

If *Closer* is to be used on a commodity that may be exported to the United States and you require information on acceptable residue levels in the United States, visit CropLife Canada's website at [www.croplife.ca](http://www.croplife.ca).

## Environmental Hazards:

**Bees:** Toxic to bees exposed to direct treatment, drift, or residues on flowering crops or weeds. Apply early in the morning or late in the evening when bees are not active.

**Aquatic organisms:** The use of this chemical may result in contamination of groundwater, particularly in areas where soil is permeable (e.g. sandy soil) and/or the depth to the water table is shallow. Avoid application of *Closer* if heavy rain is forecast.

**Others:** Toxic to certain beneficial insects.

## Hazard Rating:

None specified

# Concept

Insecticide Group  
3A, 4A

## Company:

Bayer (PCP#29611)

## Formulations, Crops, Insects, Rates:

| Product                        |                                                                                                                              | Concept                                                                                    |
|--------------------------------|------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------|
| Formulation and Container Size |                                                                                                                              | 75 g/L imidacloprid and 10 g/L deltamethrin formulated as a suspension concentrate. 5.26 L |
| Crop                           | Insect                                                                                                                       | Application rate (per acre)                                                                |
| Potato                         | Colorado potato beetle, aphids, leafhoppers, potato flea beetle, tarnished plant bug, European corn borer (suppression only) | 142 mL                                                                                     |
| Soybean                        | Soybean aphid                                                                                                                | 132 mL                                                                                     |

## Application:

### Concept

- Ground application only.
- Apply when target pest has reached economic threshold levels. Repeat application if pest populations reach economic thresholds.
- Use sufficient water volumes for thorough coverage (e.g. minimum of 40 to 80 L of water per acre).
- For control of tarnished plant bug it is recommended to use *Concept* insecticide only when timing of application coincides with the timing for another pest on the label for potatoes.

## How it Works:

*Concept* insecticide works through contact and systemic activity. Insecticide components: Imidacloprid is a neonicotinoid, systemic (within the plant) insecticide that works by contact or ingestion. Deltamethrin is a non-systemic pyrethroid insecticide that works through contact and ingestion.

## Restrictions:

- Allow a minimum of 5 days between applications.
- DO NOT make more than 3 applications of *Concept* in a year.
- DO NOT apply *Concept* through any type of irrigation equipment.
- DO NOT apply *Concept* following a seed treatment or soil application of any Group 4 (neonicotinoid class) insecticide.
- A buffer zone of 8 metres is required between the downwind point of application and the closest edge of aquatic habitats.
- **Re-cropping:** Treated areas may be replanted with any crop specified on an imidacloprid label, or any crop for which a tolerance exists for the active ingredient, as soon as practical following the last application.
- **Acceptable plant-back intervals for:**
  - *Cereal grains (wheat, barley, oats)* – 30 days
  - *Pea and bean (including faba bean, soybean and dry common bean)* – 9 months
  - *All other food and feed crops* – 12 months
  - *Green manure and other cover crops not intended for human or animal consumption* – no plant-back interval required following treatment.
- DO NOT graze or harvest cover crops for food or feed.

## Precautions:

DO NOT enter or allow entry into treated areas for a period of 24 hours after application of *Concept*.

DO NOT apply *Concept* within 15 metres of well-heads or aquatic systems. DO NOT mix, load or clean equipment within 30 metres of well-heads or aquatic systems.

If this product is to be applied to a commodity destined for export to the United States, visit Crop Life Canada's website [www.croplife.ca](http://www.croplife.ca) for information on acceptable residue limits.

**Storage:** DO NOT use or store in or around the home. Store unused product away from feeds, seeds, fertilizer, plants and foodstuffs. *Concept* cannot be stored below freezing.

If stored for one year or longer, shake well before using.

## Environmental Hazards:

**Bees:** This product is highly toxic to bees exposed to direct treatment or residues on blooming crops or weeds. DO NOT apply this product to flowering crops or weeds if bees are visiting the treatment area.

**Aquatic organisms:** Highly toxic to fish and other aquatic organisms. DO NOT apply where runoff is likely to occur. Runoff from treated areas may be hazardous to aquatic organisms in neighbouring areas. Avoid application when heavy rain is forecast.

## Hazard Rating:

Warning – Eye Irritant

**Deltamethrin:** Danger – Poison

**Imidacloprid:** Caution – Poison

Refer to the Introduction for an explanation of the symbols.

| Potato                         | Colorado potato beetle, armyworm, cabbage looper | 178-283 mL                                                                                                                |
|                                | Aphids, European corn borer                      | 146-303 mL                                                                                                                |
| Seed alfalfa                   | Alfalfa plant bug, Lygus                         | 303-364 mL                                                                                                                |

## Application:

- Apply in a minimum finished spray volume of 200 L per hectare by ground.
- For Colorado potato beetle, DO NOT apply more than twice to a single generation and DO NOT apply to successive generations.
- For seed alfalfa, apply prior to bloom up to the time when 50 percent of seed pods are ripe. Begin when adults and/or 4<sup>th</sup> to 5<sup>th</sup> instar nymphs have reached economic threshold levels for your area.
- Minimum re-application interval of 7 days.
- Apply when insect numbers exceed economic threshold levels and use sufficient water for good coverage. Use higher rates for mature insect stages or severe infestations.

## How it Works:

Acetamiprid is a neonicotinoid insecticide that works by contact or ingestion. It has an anti-feedant effect that can prevent pest damage to host plants prior to the death of the insect. Novaluron is an insect growth regulator that must be absorbed by eggs or ingested by insect larvae to be fully effective. The primary mode of action is by disrupting cuticle formation and deposition occurring when insects change from one developmental stage to another, resulting in death at molting.

## Effects of Weather:

Drift potential is lowest between wind speeds of 3 to 16 kilometres per hour. However, many factors, including droplet size and equipment type, determine drift potential at any given speed. Application should be avoided below 2 miles per hour due to variable wind direction and high inversion potential. When making applications in low relative humidity, set up equipment to produce larger droplets to compensate for evaporation. Droplet evaporation is most severe when conditions are both hot and dry. Applications should not occur during a temperature inversion because drift potential is high. Avoid application when heavy rain is forecast.

## Restrictions:

- **Storage:** Keep in original container during storage. DO NOT contaminate or store near foodstuffs. Store in cool, dry, locked, well-ventilated area without floor drain. Keep away from fire or open flame, or other sources of heat.
- **Restricted Entry Interval:** 12 hours
- **Buffer zones:** DO NOT apply directly to water or where runoff could occur to adjacent aquatic sites.
- **Pre-harvest Interval:** 7 days

## Precautions:

Wear a long-sleeved shirt, long pants, chemical-resistant gloves, socks and shoes during mixing, loading, application, clean-up and repair. Wash the outside of gloves before removing.

## Environmental Hazards:

**Bees:** Toxic to bees exposed to direct treatment, drift, or residues in flowering crops or weeds. DO NOT apply this product to flowering crops or weeds if bees are visiting the treatment area. Minimize spray drift to reduce harmful effects on bees in habitats close to application site.

**Aquatic organisms:** Toxic to aquatic organisms and **Non-target** terrestrial plants.

## Hazard Rating:

No specific hazard rating specified.

|                                    | Variegated cutworm, cutworms                    | 115 mL                                              | 115 mL                                              |

## Application:

### Cypermethrin

- May be applied by ground application only for control of immature (up to 4<sup>th</sup> instar) grasshoppers on wheat, barley, roadsides, headlands and canola; for flea beetle control on canola and mustard; and for control of cutworm. After application for cutworm leave soil surface undisturbed for 5 days.
- May be applied by ground or air for flea beetles (aerial application for *Up-cyde* and *Ship 250 EC* only – one aerial application per year) and bertha armyworm in canola, sunflower beetle, sunflower seed weevil in sunflower, corn earworm, European corn borer in corn and Colorado potato beetle, flea beetle, leafhoppers and tarnished plant bug on potatoes.
- Apply when insect numbers exceed economic threshold levels and use sufficient water for good coverage. Use higher rates for mature insect stages (grasshoppers) or severe infestations.

## How it Works:

*UP-Cyde* and *Ship* are pyrethroid insecticides that work as a contact and stomach poison.

## Effects of Weather:

Activity of cypermethrin on grasshoppers is reduced as soil temperature increases. Application for grasshopper control should be made at temperatures below 25°C. Spraying for grasshoppers should be delayed until evening if daytime temperatures are above 25°C.

## Restrictions:

- **Grazing:** Treated crops must not be grazed or cut for hay except field corn silage derived from corn treated with *Up-Cyde* at the recommended rate and pre-harvest interval may be fed to lactating dairy cattle and beef cattle.
- **Storage:** Keep in original container during storage. DO NOT contaminate or store near foodstuffs.
- **Restricted Entry Interval:** 12 hours
- **Buffer zones:**
  - **Canola, Rapeseed, Mustard** – Cypermethrin must be applied by ground for grasshoppers.
  - DO NOT apply Cypermethrin more than once per season by air. DO NOT apply *Up-Cyde* to mustard by air.
  - **Corn** – DO NOT apply more than a maximum of 3 applications by ground. DO NOT make more than 2 aerial applications per season. Repeat as necessary with 4 to 7 day intervals between applications.
  - **Potatoes** – Ground – Apply as required with 10 to 12 day intervals up to a maximum of 3 applications per season. Air – up to 2 applications per season.
  - **Sunflower** – Ground – Apply when required with a 5 day interval between applications. A maximum of 2 applications per season. Air – 1 aerial application is permitted per season.
  - **Pre-harvest intervals:**
    - **Barley** – 45 days
    - **Canola, Rapeseed, Mustard** – 30 days
    - **Corn** – 5 days
    - **Potatoes** – 7 days
    - **Sunflower** – 70 days
    - **Wheat** – 30 days

## Precautions:

Harmful or fatal if swallowed. May be harmful if absorbed through skin. Severely irritating to eyes. Causes skin irritation and sensitization. Wear long sleeved protective clothing and gloves when handling or applying. Wear face shield or goggles when mixing.

## Environmental Hazards:

**Bees:** Very toxic to bees. Avoid spraying when bees are foraging. Spray deposit should be dry before bees commence foraging in treated crop.

**Aquatic organisms:** Very toxic to aquatic organisms and fish, and overspray or drift into sensitive areas such as sloughs, streams, rivers, dugouts and wetlands must be avoided.

## Hazard Rating:

Caution – Poison

Refer to the introduction for an explanation of the symbols.

| Potato*                        | Colorado potato beetle (time for egg hatch or small larvae) | 65-97 g                                               |
|                                | European corn borer (time to coincide with peak egg hatch)  | 65 g                                                  |
| Wheat, barley, oats, rye**     | Armyworm                                                    | 40-81 g                                               |
| Soybean                        | Armyworm                                                    | 40 to 81 g                                            |

\* Maximum 3 applications per year with a minimum retreatment interval of 7 days.

\*\* Maximum 3 applications per year with a minimum retreatment interval of 5 days.

\*\*\* Maximum of 3 applications per year, with a minimum of 5 days between applications.

## Application:

- Aerial application in potatoes and corn only. Apply in sufficient water volume to cover the entire plant using a combination of nozzles and pressure designed to deliver thorough, even coverage with **ASABE fine classification** droplets. DO NOT apply through irrigation systems.
- Spinosyns require a spray solution pH between 6 to 8. This is important for the efficacy of the product. It is recommended that growers test the pH of the spray solution prior to adding a spinosyn to the spray tank.

## How it Works:

*Delegate* is derived from the fermentation of the bacterium *Saccharopolyspora spinosa*, which is then chemically modified to create the active ingredient. Spinetoram affects the insect nervous system. It does not interact with the known binding sites of other classes of insecticides. It works through ingestion or contact with the target insects. Target insects cease feeding within a few minutes, although death may take a few days.

## Tank Mixes:

Acapela (Fungicide) is a registered tank mix on corn. According to the Pest Management Regulatory Agency of Health Canada's Guidance Document on Tank Mix Labelling (March 2023), unlabelled tank mixes of this product are permitted only if the label of this product and the label of the product it might be mixed with include at least general wording on their respective labels indicating they may be mixed with other pesticides. When tank mixes are permitted, apply mixes according to the most restrictive use limitations for either product.

## Restrictions:

- Re-entry:** DO NOT enter treated field for 12 hours.
- Pre-harvest:** DO NOT harvest within 21 days of application for wheat (spring and durum), barley, oats and rye, within 7 days for potato or within 28 days for corn or soybean.
- Forage/Grazing:** DO NOT apply within 28 days of stover harvest or with 7 days of forage harvest.
- Aerial Application:**
  - Potatoes and Corn (field, sweet, seed and popcorn):** Use a minimum spray volume of 12.1 L per acre. Recommended spray volume is 12.1 to 20.2 L per acre.
- Storage:** Store in a cool, dry place. Keep from freezing.
- Buffer Zones:** 1 m required between the point of direct application and the closest downwind edge of sensitive terrestrial habitats (such as grasslands, forested areas, shelter belts, woodlots, hedgerows, riparian areas and shrublands).

## Tank Cleaning:

Refer to Introduction.

## Environmental Hazards:

**Bees:** Toxic to bees exposed to direct treatment, drift, or residues on flowering crops or weeds. DO NOT apply this product to flowering crops or weeds if bees are visiting the treatment area.

**Aquatic organisms:** Avoid application when heavy rain is forecast to reduce runoff into aquatic habitats.

**Others:** Toxic to small wild mammals. May be toxic to certain beneficial insects.

## Hazard Rating:

No specific hazard rating specified.

## Application:

### Deltamethrin

- May be applied by air or ground equipment to all crops with the exception of alfalfa, red clover and corn, which require ground application only. Apply when insects exceed economic threshold numbers with sufficient water for good coverage. Use higher rates for severe infestations, on dense foliage or when a number of insect growth stages are present.
- Alfalfa (seed production) - Use higher rates if alfalfa weevil present.

## Tank Mixes:

When in a tank-mix the spray mixture must be constantly agitated throughout application. DO NOT allow the spray mixture to stand in the spray tank for more than 4 hours after mixing.

*Deltamethrin* may be tank mixed with the following herbicides: *Pardner*, *Buctril M*, *Banvel*, MCPA, 2,4-D, *Puma Advance*. **Tank mixes with *Puma Advance* and *Buctril M* are for use in spring and durum wheat only.**

When a tank mix is used the labels of the tank mix partners are to be consulted. According to the Pest Management Regulatory Agency of Health Canada's Guidance Document on Tank Mix Labelling (March 2023), unlabelled tank mixes of this product are permitted only if the label of this product and the label of the product it might be mixed with include at least general wording on their respective labels indicating they may be mixed with other pesticides. When tank mixes are permitted, apply mixes according to the most restrictive use limitations for either product.

## How it Works:

*Deltamethrin* is a non-systemic, synthetic pyrethroid which works by contact and ingestion.

## Effects of Weather:

DO NOT spray under a strong temperature inversion, or when temperature exceeds 25°C as this will result in a reduction in control. Best control will be achieved when deltamethrin is applied during cooler periods of the day. DO NOT apply within 1 hour of rain.

## Restrictions:

- **Alfalfa seed production** – DO NOT apply more than once per year.
- **Canola – Decis**: Maximum application of 3 applications per season with maximum seasonal load of 500 mL per hectare (202 mL per acre) or 25 g ai/ha. If 3 applications are used, only the first or second application can be at 200 mL per hectare. Allow a 7 day interval between treatments by ground application. Maximum of ONE (1) APPLICATION/YEAR via aerial application.
- **Corn (field and seed)** – DO NOT apply more than 3 times per year; ground application only.
- **Potato** – (Ground) DO NOT apply more than 3 times per year. (Aerial) DO NOT apply more than 2 times per year. May be used only once per season on high organic (muck) soils.
- **Red clover** – DO NOT apply by air. DO NOT make more than 2 applications per year. DO NOT use treated crop for feed or forage. Restricted entry interval – 12 hours
- **Wheat, barley, oats, flax, lentil** – (Ground) DO NOT apply more than 3 times per year. (Aerial) DO NOT apply more than 2 times per year.
- **Dry beans, faba beans, chickpeas, lentils, and field peas (Decis only)** – DO NOT apply more than 3 times per year (field and seed).
- **Rangeland, pastures**: Maximum 3 applications per year; only 2 of these may be by air.
- **Pre-harvest Intervals (Days)**: alfalfa (20), barley (40), canola (7), flax (40), lentils (30), mustard (7), shelled pea and beans (*Decis* only) (7), oats (31), potatoes (3), sunflower (70), wheat (40), sugar beets (100).
- **Storage**: DO NOT store below freezing. DO NOT store near feed, food, seeds or fertilizer. Keep away from heat, sparks and open flames. If stored for 1 year or longer, shake well before using. Insecticides and fungicides should be segregated from herbicides to prevent the possibility of cross-contamination.
- **Others**: DO NOT apply *deltamethrin* by air when the wind speed exceeds 8 kilometres per hour.  
In soils with high organic content (muck soils), *deltamethrin* should be applied only once during each crop year, prior to August 1.

## Precautions:

*Deltamethrin* is of high mammalian toxicity and is a severe eye and skin irritant. Avoid contacting or breathing spray mist. Wear protective clothing, including goggles and respirator, when handling or spraying. DO NOT contaminate or store near feed or foodstuffs. Wash thoroughly after using *deltamethrin*.

## Environmental Hazards:

**Bees**: Toxic to bees. Avoid spraying when bees are foraging.

**Aquatic organisms**: Toxic to fish and aquatic organisms. Avoid contamination of aquatic systems during application.

## Hazard Rating:

 Danger – Poison

## Application:

### Dimethoate

- May be applied by air or ground equipment (unless otherwise specified). If adult midges are present (1 midge / 4-5 wheat heads), sprays should be applied when 25 percent of the wheat head has fully emerged from the boot but before flowering has begun. At this stage, wheat first becomes susceptible to attack by the egg-laying females. Applications should be made in the late afternoon or evening when temperatures exceed 15°C and the wind speed is less than 10 km/h. High volume sprays will improve penetration of the crop. Proper timing of application is essential for control. Will not control midge larvae.

## How it Works:

*Dimethoate* is a broad spectrum, systemic (within the plant) and contact, organophosphate insecticide and acaricide.

## Restrictions:

- Grazing:** Remove cattle prior to spraying. Read label carefully to determine livestock re-entry period.
- Storage:** Store at temperatures between 4°C and 30°C and in areas away from feed and food.
- Others:** DO NOT treat when bees are foraging. For alfalfa, canola, safflower and clovers, DO NOT apply during the crop blooming period or during the 5 day period before the crop blooms. Wait at least 10 days before placing leafcutter bees in treated fields. DO NOT make more than 2 applications per season. *Canary seed* - Minimum application interval is 30 days. *Beans, Peas*, - Minimum application interval is 14 days (7 for *Beans* with *Lagon*). Other listed crops - Minimum application interval is 7 days.

## Precautions:

Wear a respirator, goggles, rubber gloves, rubber boots and coveralls when handling concentrate. Avoid contact with skin and eyes. DO NOT inhale spray mist.

## Environmental Hazards:

**Bees:** Toxic to bees. Avoid applications when bees are foraging in the treatment area or in groundcover containing blooming weeds. For applications on crops that are highly attractive to pollinators (alfalfa, clovers, canola, safflower, etc.) DO NOT apply during the crop blooming period or during the 5 day period before the crop blooms.

**Aquatic organisms:** Toxic to aquatic organisms. Avoid application of this product when heavy rain is forecast.

**Others:** Toxic to birds, mammals, and certain beneficial insects.

## Hazard Rating:

*Lagon, Cygon 480 AG, Diamante 4:* Warning – Poison

Refer to the introduction for an explanation of the symbols.

## Application:

### *Dipel*

- Treat when larvae are young (early instars) before the crop is damaged. A spreader sticker such as *Triton B1956* should be used to give thorough foliage coverage.

## How it Works:

*Dipel* is a biological stomach insecticide resulting in the larvae ceasing to eat in a few hours, with death usually occurring within 1 to 3 days.

## Restrictions:

- **Storage:** Store at temperatures between 0° and 25°C (cooler temperatures preferable).
- **Others:** DO NOT allow diluted spray to stand in tank for more than 12 hours. Use product within 24 months of date of manufacture if stored at cool temperatures. Final spray solution for *Dipel* should have a pH of 5-7.

## Precautions:

Harmful if swallowed, inhaled, or absorbed through the skin. Avoid breathing dust or spray mist. Avoid contact with skin, eyes, or clothing. In case of contact with eyes or skin, immediately flush eyes or skin with plenty of water.

## Environmental Hazards:

**Aquatic organisms:** DO NOT contaminate irrigation or drinking water supplies.

## Hazard Rating:

Warning – Contains the Allergen Soy

Caution – Eye Irritant, Skin Irritant, Potential Sensitizer

# Eco Bran

Insecticide Group  
1A

## Company:

Peacock Industries (PCP#25815)

## Formulations, Crops, Insects, Rates:

|---------------------------------------------------------------------------------------------------------------------|--------------|----------------------------------------------------------------------|
| Formulation and Container Size                                                                                      |              | Wheat bran infused with carbaryl insecticide. 20 kg bag, 1 kg bottle |
| Crop                                                                                                                | Insect       | Application rate (per acre)                                          |
| Beans, canola, pastures, rangelands, forage grasses, field borders, headlands, rights of-way, roadsides, wastelands | Grasshoppers | 809-1618 g                                                           |

## Application:

### *Eco Bran*

- For ground application only. DO NOT apply by air.
  - Broadcast evenly over treatment area. Use gloves and wash thoroughly following application.
- More information on application and applicators can be found at: <http://www.grasshoppercontrol.com>.

## Restrictions:

- DO NOT apply within 50 metres of sloughs, ponds, streams, dugouts or open water. Apply when winds are between 3 to 8 kilometres per hour and do not favour drift.
- May be used in pastures while beef cattle are grazing.

## Precautions:

Harmful if inhaled or swallowed. Avoid breathing dust or vapour from bait. Use only in well-ventilated areas. May cause eye irritation. Avoid contact with eyes and skin. Wash thoroughly after handling and before eating or smoking. Avoid contamination of feed and foodstuffs. Keep away from heat, sparks and open flame.

## Environmental Hazards:

**Bees:** Presence of product on flowering crops such as alfalfa and clover will not harm foraging honey or leafcutter bees.

**Aquatic Organisms:** Toxic to aquatic organisms. Avoid application when heavy rain is forecast.

# Entrust

Insecticide Group  
5

## Company:

Corteva Agriscience (PCP#30382)

## Formulations, Crops, Insects, Rates:

| Product                        |                            | Entrust                                      |
|--------------------------------|----------------------------|----------------------------------------------|
| Formulation and Container Size |                            | Spinosad 240 g/L suspension concentrate, 1 L |
| Crop                           | Insect                     | Application rate (per acre)                  |
| Potato                         | Colorado potato beetle     | 68 to 135 mL                                 |
|                                | European corn borer larvae | 101 mL                                       |

## Application:

### Entrust

- Apply as a foliar spray by ground only. Apply when scouting indicates the target pest species have reached economic threshold levels. For Colorado potato beetle larvae, target eggs at hatch or small larvae. For control of European corn borer, time the application to coincide with peak egg hatch. Use higher application rate for higher pest pressure or when extended egg hatch is anticipated. If pest populations persist, a repeat application 7 to 10 days after the initial application may be necessary.
- Spinosyns require a spray solution pH between 6 to 8. This is important for the efficacy of the product. It is recommended that growers test the pH of the spray solution prior to adding a spinosyn to the spray tank.

## How it Works:

*Entrust* is in the spinosine class of insecticides. It is a contact and stomach insecticide. It is derived from the fermentation of *Saccharopolyspora spinosa*.

## Effects of weather:

This product has the potential for run-off. DO NOT spray immediately after a rainfall or if rain is forecast within 48 hours after application.

## Restrictions:

- **Storage:** Avoid freezing. DO NOT store or ship with food, feeds, drugs or clothing.
- **Others:** DO NOT make more than 2 applications per season (maximum of 202 mL per acre).
- **Pre-harvest Interval:** DO NOT apply *Entrust Insecticide* within 7 days of potato harvest.

## Precautions:

**Buffer Zones:** A buffer zone of 2 metres (early season) or 1 metre (late season) is required between downwind edge of spray boom and sensitive aquatic habitats.

Avoid contact with eyes, skin, and clothing.

DO NOT enter or allow worker entry into treated areas for a period of 12 hours after application.

## Environmental Hazards:

**Bees:** Highly toxic to bees exposed to direct treatment, drift or residues on blooming plants. DO NOT apply this product or allow it to drift to blooming plants if bees are visiting the treatment area.

**Aquatic organisms:** This product is highly toxic to aquatic invertebrates. Avoid application of this product when heavy rain is in the forecast, or immediately after a rainfall.

**Others:** Harmful to parasitoids and predatory mites and slightly harmful to foliage-dwelling predators.

## Hazard Rating:

No specific hazard rating specified.

# Exirel

Insecticide Group  
28

## Company:

FMC of Canada (PCP#30895)

## Formulations, Crops, Insects, Rates:

| Product                        |                                         | Exirel                                                                 |
|--------------------------------|-----------------------------------------|------------------------------------------------------------------------|
| Formulation and Container Size |                                         | Cyantraniliprole 100 g/L, formulated as a suspension. 0.5, 3.79, 100 L |
| Crop                           | Insect                                  | Application rate (per acre)                                            |

|                                | Aphids                                  | 202 to 607 mL                                                          |
|                                | European corn borer, variegated cutworm | 202 to 304 mL                                                          |
|                                | Armyworm                                | 202 mL                                                                 |
|                                | Potato flea beetle                      | 202 to 405 mL                                                          |

## Application:

- Applied as a foliar spray, using ground or aerial application. *Exirel* insecticide is mixed with water for application. Time applications to the most susceptible insect pest stage, typically at egg hatch and/or newly hatched larvae or nymphs, before populations reach damaging levels. When pest populations are high, use the highest listed application rate for that pest. Use the higher rate and high spray volumes for large plants or dense foliage.

## How it Works:

*Exirel* insecticide is a member of the anthranilic diamide class of insecticides which act on insect ryanodine receptors. Although *Exirel* insecticide has contact activity, it is most effective through ingestion of treated plant material. After exposure to *Exirel* insecticide, affected insects will rapidly stop feeding, become paralyzed, and typically die within 1 to 3 days.

## Effects of Weather:

Avoid application when heavy rain is forecast.

## Restrictions:

- Storage:** Store product in original container only, away from other pesticides, fertilizer, food or feed.
- Application interval:** DO NOT apply more than once every 5 days.
  - Ground:** Apply in a minimum finished spray volume of 40 L per acre by ground. Minimum finished spray volume of 40 L per acre. DO NOT apply during periods of dead calm. Avoid application of this product when winds are gusty.
  - Air:** Apply in a minimum finished spray volume of 20 L per acre by air. Minimum finished spray volume of 20 L per acre. DO NOT apply during periods of dead calm. Avoid application of this product when winds are gusty.
- Pre-harvest interval:** 7 days.
- Others:** DO NOT make more than 4 applications per season. DO NOT exceed a total of 1.8 litres *Exirel* insecticide per ac per season. DO NOT make a foliar application of *Exirel* insecticide for a minimum of 60 days following an in-furrow or soil application or planting of seed or seed pieces treated with any Group 28 insecticide.

## Precautions:

Causes skin irritation. DO NOT get on skin.

## Environmental Hazards:

**Bees:** Toxic to bees. DO NOT apply this product to blooming crops or weeds while bees are actively visiting the treatment area. Apply early in the morning or late in the evening when bees are not active. Minimize spray drift to reduce harmful effects on bees in habitats close to the application site.

**Aquatic organisms:** This product is highly toxic to aquatic organisms. To reduce runoff from treated areas into aquatic habitats avoid application to areas with a moderate to steep slope, compacted soil, or clay. Contamination of aquatic areas as a result of runoff may be reduced by including a vegetative strip between the treated area and the edge of the water body.

**Others:** Toxic to non-target terrestrial plants. Toxic to certain beneficial insects. Minimize spray drift to reduce harmful effects on beneficial insects in habitats next to the application site such as hedgerows and woodland.

**Hazard Rating:**

Warning – Skin Irritant  
Potential Skin Sensitizer

Refer to the introduction for an explanation of the symbols.

# Harvanta 50 SL

Insecticide Group  
28

**Company:**

ISK Biosciences Corporation (PCP#32889)  
Distributed in Canada by Belchim Crop Protection Canada

**Formulations, Crops, Insects, Rates:**

|                                |                                                      |                                                   |
|--------------------------------|------------------------------------------------------|---------------------------------------------------|
| Product                        |                                                      | Harvanta 50 SL                                    |
| Formulation and Container Size |                                                      | Cyclaniliprole 50 g/L formulated as a suspension. |
| Crop                           | Insect                                               | Application rate (per acre)                       |
| Potato                         | Colorado potato beetle, potato psyllid (suppression) | 324 to 486 mL                                     |

**Application:**

- Minimum water volume:
  - **Ground:** 200 L per hectare.
- Avoid application during the crop blooming period.

**How it Works:**

*Harvanta 50 SL* is effective through contact with the insect and ingestion and has translaminar properties.

**Effects of Weather:**

Avoid application when heavy rain is forecast.

**Restrictions:**

- **Storage:** Store product in cool, dry, well ventilated place. To prevent contamination, store this product away from food or feed.
- **Restricted Entry Interval:** 12 hours
- **Pre-harvest interval:** 7 days
- **Others:** Max 3 applications per crop per year. Minimal interval between treatments is 5 days.

**Precautions:**

Avoid contact with eyes. Avoid prolonged contact with skin. Wash exposed areas of skin thoroughly with soap and warm water after handling or using. Remove contaminated clothing and wash before re-use. Wear a long-sleeved shirt, long pants, chemical-resistant gloves, socks and shoes during mixing, loading, application, clean-up and repair. In addition, wear protective eyewear (goggles or face shield) during mixing and loading. DO NOT enter or allow worker entry into treated areas during the restricted entry interval of 12 hours.

**Environmental Hazards:**

**Bees:** Toxic to bees.

**Aquatic organisms:** Very toxic to aquatic organisms. To reduce runoff from treated areas into aquatic habitats, avoid application to areas with a moderate to steep slope, compacted soil, or clay.

**Others:** Toxic to certain beneficial insects.

**Hazard Rating:**

Warning – Combustible liquid. Very toxic to aquatic life. Toxic to aquatic life with long lasting effects.

Refer to the introduction for an explanation of the symbols.

# Imidan WP Insecticide

Insecticide Group  
1B

## Company:

Gowan Canada (PCP#29064)

## Formulations, Crops, Insects, Rates:

|                                |                                                                   |                                                                       |
|--------------------------------|-------------------------------------------------------------------|-----------------------------------------------------------------------|
| Product                        |                                                                   | Imidan WP                                                             |
| Formulation and Container Size |                                                                   | 70% phosmet formulated as a wettable powder in water soluble sachets. |
| Crop                           | Insect                                                            | Application rate (per acre)                                           |
| Potato                         | "Aphids, leafhoppers, Colorado potato beetle, potato flea beetle" | 0.65 kg                                                               |

## Application:

### Imidan

- Apply by ground only.
- *Imidan* WP Insecticide is packaged in water soluble sachets that are to be dropped into the spray tank unopened. DO NOT use in low-volume, gear-type spray equipment.

## How it Works:

*Imidan* is an organophosphate insecticide.

## Restrictions:

- **Storage:** Keep sachets dry and DO NOT allow sachets to contact any moist surface prior to adding to spray tank. Keep water soluble sachets in the protective container and store in a cool, dry place. DO NOT store at temperatures below 0°C or above 40°C.
- Buffer zones required for the protection of freshwater habitat: 35 metres for depth of less than 1 metre and 10 metres for depths greater than 1 metre.
- DO NOT apply within 7 days of harvest.
- DO NOT make more than 5 applications per season.
- **Re-entry Interval (REI):** Hand set/handline irrigation related activities involving foliar contact – 33 days; roguing – 26 days; scouting – 2 days; all other activities 0.5 days.

## Precautions:

Harmful if swallowed, inhaled or absorbed through the skin. Wear protective clothing, including rubber gloves and goggles, during mixing, loading and spraying.

## Tank Mixes:

According to the Pest Management Regulatory Agency of Health Canada's Guidance Document on Tank Mix Labelling (March 2023), unlabelled tank mixes of this product are permitted only if the label of this product and the label of the product it might be mixed with include at least general wording on their respective labels indicating they may be mixed with other pesticides. When tank mixes are permitted, apply mixes according to the most restrictive use limitations for either product.

## Environmental Hazards:

**Bees:** Toxic to bees. Bees may be exposed through direct spray, spray drift, and residues on leaves, pollen and nectar in flowering crops and weeds. Minimize spray drift to reduce harmful effects on bees in habitats close to the application site. Avoid applications when bees are foraging in the treatment area in ground cover containing blooming weeds.

**Aquatic organisms:** Toxic to aquatic organisms. Avoid application when heavy rain is forecast.

**Others:** Toxic to birds and small wild mammals. Toxic to certain beneficial insects.

## Hazard Rating:

Danger – Poison

Refer to the introduction for an explanation of the symbols.

# Intrepid

Insecticide Group  
18

## Company:

Corteva Agriscience (PCP#27786)

## Formulations, Crops, Insects, Rates:

|                                     |                     |                                     |
|-------------------------------------|---------------------|-------------------------------------|
| Product                             |                     | Intrepid                            |
| Formulation and Container Size      |                     | 240 grams per litre methoxyfenozide |
| Crop                                | Insect              | Application rate (per acre)         |
| Corn (field and sweet), Beans (dry) | European corn borer | 121 to 243 mL                       |

## Application:

- **Ground application:** Thorough uniform coverage of all foliage and fruit is essential for good insect control. Apply in sufficient spray volume to ensure uniform coverage of the treated crop. A minimum of 300 L of water per hectare is generally recommended for ground application.
  - **Corn** – Apply at the first signs of feeding damage before the insect enters the fruit. Monitoring of insect populations is key to controlling this pest. Direct application at the whorl for early season (first generation) infestations. Repeat applications after 5 to 10 days if required based on population monitoring. Use the higher rate for heavy infestations, or larger crop canopies
  - **Beans** – Apply at the first signs of feeding damage before the insect enters the pods. Repeat applications after 7 to 14 days if required based on population monitoring. Use the higher rate for heavy infestations or advanced growth stages of the target pest.

## How it Works:

*Intrepid* belongs to the diacylhydrazine class of insecticides and mimics the action of the molting hormone of larval Lepidoptera. Upon ingestion, larvae undergo an incomplete and developmentally premature molt which is ultimately lethal. This process interrupts and rapidly halts their feeding. Feeding typically ceases within hours of ingestion although complete mortality of the larvae may take several days. Affected larvae often become lethargic and develop discoloured areas or bands between segments.

## Restrictions:

- DO NOT apply during periods of dead calm. Avoid application of this product when winds are gusty. DO NOT apply with spray droplets smaller than the **ASAE fine** classification. Boom height must be 60 cm or less above the crop or ground.
- **Corn:** Apply a maximum of 3 applications per year.
- **Beans:** Apply a maximum of 3 applications per year.
- **Restricted Entry Interval:** 12 hours
- **Pre-harvest interval:**
  - **Corn** – DO NOT apply within 3 days of harvest for sweet corn. DO NOT apply within 21 days of harvest for field corn and popcorn.
  - **Beans** – DO NOT apply within 7 days of harvest.
- **Storage:** Keep product in original container during storage. To prevent contamination, store this product away from food or feed.

## Precautions:

DO NOT apply using aerial application equipment. Avoid contact with eyes, skin or clothing. Avoid breathing spray mist. Apply only when the potential for drift to areas of human habitation or areas of human activity such as houses, cottages, schools and recreational areas is minimal. Take into consideration wind speeds, wind direction, temperature inversions, application equipment and sprayer settings.

## Environmental Hazards:

Avoid application when heavy rain is forecast. Methoxyfenozide is persistent and will carryover; it is recommended that *Intrepid* not be used in areas treated with this product during the previous season. The use of this chemical may result in contamination of groundwater, particularly in areas where soils are permeable (e.g., sandy soil) and/or the depth to the water table is shallow.

**Aquatic organisms:** Toxic to aquatic organisms. Observe buffer zones specified under directions for use.

**Others:** Insecticide use should be based on an IPM program that includes scouting, record keeping, and considers cultural, biological and other chemical control practices. This product is harmful to certain beneficial arthropods.

## Hazard Rating:

None listed.

# Lambda-cyhalothrin

Insecticide Group  
3A

## Company:

ADAMA Agricultural Solutions Canada (*Silencer 120 EC* – PCP#29052, *Zivata* – PCP#32427)

Sharda Cropchem Limited (*Labamba* – PCP#33576)

Syngenta Canada (*Matador* – PCP#24984)

## Application:

### *Lambda-cyhalothrin*

- **Aerial:**
  - Apply in spray volume of 10 to 40 L per hectare
  - **Canola, mustard, sunflower, flax, alfalfa** – DO NOT make more than 1 application at the 33.2 mL per acre rate per year.
  - **Corn, wheat, barley, oats, potatoes, soybean, dry edible bean, pea, chickpea, lentil, favabeen** – DO NOT make more than 2 applications at the 33.2 mL per acre rate per year.
  - **Matador and Labamba: Summerfallow** - DO NOT make more than 1 application at the 33.2 ml/acre rate per year.
- **Ground:**
  - Apply in 100 to 200 L per hectare
  - **Canola, mustard, sunflower, flax, alfalfa, summerfallow (Labamba and Matador), corn, wheat, barley, oats** – DO NOT make more than 3 applications per year at the 33.2 mL per acre rate. DO NOT cut treated fields for hay or forage; do not graze treated fields.
  - **Potatoes** – DO NOT make more than 3 applications per year at the 33.2 mL per acre rate. DO NOT make more than 2 applications per year if using the 50 mL per acre rate. DO NOT exceed 100 mL per acre of lambda-cyhalothrin per year.
  - **Beans, chickpeas, favabeans, lentils, peas, soybeans** – DO NOT make more than 3 applications per year. DO NOT graze or harvest treated forage straw or hay for livestock feed.
  - **Timothy** – For seed production only.
  - **Alfalfa** – Seed from treated crops is not to be used for production of 'alfalfa sprouts' for human consumption.

## Timing:

For potato insects, timing of application should be based on the presence of vulnerable pest developmental stages and significant populations as determined by local monitoring.

For sunflower beetles, use the high rate to control adults.

For flea beetles, to prevent migration of over-wintering adults throughout the field, spray a 15 metre strip around the field at the first sign of flea beetle feeding.

For grasshoppers, apply the low rate when grasshoppers are up to the 3<sup>rd</sup> nymphal stage (up to 1 cm in length) or when insect numbers are low. Apply the high rate when insects are larger, up to but not including, winged adults or when insect numbers are high.

For corn borer control apply before the larva bores into the plant stalk or pods.

## How it Works:

*Lambda-cyhalothrin* is a synthetic pyrethroid insecticide. It is a fast acting stomach and contact insecticide effective against a broad spectrum of foliar pests. It has no fumigant or systemic activity.

## Effects of Weather:

For best results, apply *Lambda-cyhalothrin* during the early morning before temperatures rise, and during the evening, past the heat of the day.

## Tank Mixes:

**Herbicides:** (Ground only)

- *Horizon (Matador)*
- Tralkoxydim<sup>Δ</sup> (*Matador* and *Silencer*)

**Fungicides:** (Tank mixes on legumes (bean, chickpea, lentil, pea, soybean), corn, barley, oats and wheat may be applied by ground or air).

Refer to label for other crops.

- Propiconazole<sup>Δ</sup> (*Matador* and *Silencer*)
- *Allegro* in dry bean (*Matador*)
- *Quadris* (*Matador* only)
- *Quilt* (*Labamba* and *Matador*). Refer to the, *Labamba*, *Matador* and *Quilt* labels for diseases and insects controlled as well as specific application instructions and precautions.
- *Headline* (*Silencer* and *Zivata*) on dry field pea to control insects and diseases listed on the label of each product. Read carefully and follow all use directions and use precautions on both the *Silencer 120 EC* and *Headline EC* Fungicide labels. Failure to follow the rates of use and timing of application as recommended for each product will result in unsatisfactory control of target pest.
- *Traxion* (*Matador*)

<sup>Δ</sup> **Manufacturers may only support specific mixes. Contact the manufacturer for more information.** According to the Pest Management Regulatory Agency of Health Canada's Guidance Document on Tank Mix Labelling (March 2023), unlabelled tank mixes of this product are permitted only if the label of this product and the label of the product it might be mixed with include at least general wording on their respective labels indicating they may be mixed with other pesticides. When tank mixes are permitted, apply mixes according to the most restrictive use limitations for either product.

## Restrictions:

- **DO NOT** apply to flowering crops or weeds if bees are visiting treatment area.
- **Grazing:** **DO NOT** cut treated fields for hay/forage. **DO NOT** graze treated fields. **DO NOT** feed treated crops to livestock. **DO NOT** feed seed screenings and aftermath to livestock. Corn - **DO NOT** cut treated fields for silage/forage, do not graze treated fields.
- Alfalfa seed from treated crops is not to be used for production of "alfalfa sprouts" for human consumption.
- **Storage:** Store above 0°C. Storage below 0°C will not impair the effectiveness of *Lambda-cyhalothrin*. However, following such storage, agitate well before use.
- **Others:** Allow a 7day interval between applications. **DO NOT** apply within 15 metres of productive fisheries, water or waterfowl habitat.
- **Restricted Entry Interval:** 24 hours

## Precautions:

As a result of the completed re-evaluation of lambda-cyhalothrin by the Pest Management Regulatory Agency (PMRA), effective April 29, 2023, changes will affect how all lambda-cyhalothrin-based products may be used in Canada.

*Lambda-cyhalothrin* has potential for skin and eye irritation. Avoid splashing in eyes or on skin, particularly the face. If hands are contaminated, wash with soap and water before touching other areas of skin.

## Environmental Hazards:

**Bees:** Toxic to bees when exposed to direct treatment, drift, or residues on flowering crops or weeds. **DO NOT** apply this product to flowering crops or weeds if bees are visiting the treatment area. Spray deposits should be dry before bees commence foraging in treated crop.

**Aquatic organisms:** Toxic to aquatic organisms. Avoid application when heavy rain is forecast.

Hazard Rating:

 Danger – Poison

Refer to the introduction for an explanation of the symbols.

| Beans                                                                      | Aphids, leafhoppers, spider mites                                                                                                                                                               | 297-544 mL                                                                                                                                                                              |
| Empty bin spray (grain bins, grain elevators, grain box cars, flour mills) | Confused flour beetles, flat grain beetles, granary weevils, grain mites, Indian meal moths, lesser grain borers, red flour beetle, rice weevils, rusty grain beetles, saw-toothed grain beetle | 490 mL in either 15 litres of water or 15 litres of deodorized kerosene. Spray to the point of run-off or at the rate of approximately 5 litres of spray mixture per 100 m <sup>2</sup> |

Application:

*Malathion*

- May be applied by air or ground equipment. Apply when insect numbers exceed economic threshold levels using sufficient water for good coverage. Use higher rates for heavy infestations, dense canopy or mature stages of insects.

How it Works:

*Malathion* is a non-systemic, contact, organophosphate insecticide and acaricide of brief to moderate persistence. Generally non-phytotoxic.

## Effects of Weather:

For best results apply when daytime temperatures are above 20°C.

## Restrictions:

- **Grazing:** When spraying forages and pastures, cattle should be removed and returned after spraying.
- **Storage:** DO NOT store near food or feed. Store in a cool dry place but not below -10°C. Protect from heat.
- **Others:** Maximum of 2 applications per season. DO NOT apply to any plant in bloom. Apply to crops when bees are absent from field. Avoid contact with automobile paint and wash immediately if exposure occurs.
- **Restricted Entry Interval:** 12 hours

**Note:** Some commodities, such as canola, should not be stored in facilities recently treated with malathion. *Malathion* residue can linger in bins for up to six months after treatment and can be transferred from the bin to canola seed. Canola found with malathion residues is unacceptable for export customers.

The Pest Management Regulatory Agency (PMRA) has advised that any malathion products over one year old should not be used and should be returned as part of provincial pesticide recycling programs.

## Precautions:

*Malathion* has a low acute mammalian toxicity. Wear protective clothing to reduce skin and eye exposure.

## Environmental Hazards:

**Bees:** Toxic to bees exposed to direct treatment, drift, or residues on flowering crops or weeds. DO NOT apply this product to flowering crops or weeds if bees are visiting the treatment area.

**Aquatic organisms:** Toxic to aquatic organisms. Avoid application of this product when heavy rain is forecast.

**Others:** Toxic to birds. Toxic to certain beneficial insects.

## Hazard Rating:

Warning – Poison

Refer to the introduction for an explanation of the symbols.

# Minecto Duo 40WG

Insecticide Group  
4A and 28

## Company:

| Crop                           | Insect                                                          | Application rate (per acre)                                                                  |
| Potato                         | Aphids, Colorado potato beetle, flea beetles, potato leafhopper | 178-283 g                                                                                    |

## Application:

### *Minecto Duo*

- Can be applied by ground only. Apply by closed cab groundboom only.
- Apply as an in-furrow spray at seeding depth or in a narrow surface band above the seedline during planting.
- Apply in sufficient water volume to ensure uniform application and incorporation into the soil. Add half of the required amount of water to the mix tank. With agitator running add the *Minecto Duo* to the tank. Continue agitation while adding the remaining water. Apply once the *Minecto Duo* has completely dispersed into the water mix. Maintain agitation until all the mixture has been applied.

## How it Works:

*Minecto Duo* contains two active ingredients. Thiamethoxam is a neonicotinoid insecticide and cyantraniliprole is a diamide insecticide. Both components have systemic (within the plant) properties and interfere with neuro-transmission in insects. Mode of action is through contact or ingestion.

## Restrictions:

- DO NOT apply by air.
- DO NOT use a foliar application of a product containing a Group 4 (neonicotinoid) or Group 28 (diamide) insecticide following in-furrow or soil application of *Minecto Duo*.
- **Restricted Entry Interval:** DO NOT enter or allow worker entry into treated areas for 12 hours.
- **Storage:** Store product in original container only, in a cool, dry place and away from food or feed. Keep container closed.

## Precautions:

If *Minecto Duo* is to be used on a commodity that may be exported to the United States and you require information on acceptable residue levels in the United States, visit CropLife Canada's website at [www.croplife.ca](http://www.croplife.ca).

## Environmental Hazards:

**Bees:** Toxic to bees. This product is systemic and bees can be exposed to product residues in flower, leaves, pollen and/or nectar resulting from soil applications.

**Aquatic organisms:** Toxic to aquatic organisms. Avoid application of this product when heavy rain is forecast. The use of this chemical may result in contamination of groundwater particularly in areas where soils are permeable (e.g. sandy soil) and/or the depth to the water table is shallow.

## Hazard Rating:

Warning – Poison

Refer to the introduction for an explanation of the symbols.

# Minecto Pro

Insecticide Group  
6 and 28

## Company:

Syngenta Canada Inc. (PCP#33023)

## Formulations, Crops, Insects, Rates:

| Product                        |                                                | Minecto Pro                                                                |
|--------------------------------|------------------------------------------------|----------------------------------------------------------------------------|
| Formulation and Container Size |                                                | Abamectin and cyantraniliprole formulated as a soluble concentrate. 3.78 L |
| Crop                           | Insect                                         | Application rate (per acre)                                                |
| Potato                         | European corn borer                            | 150-225 mL                                                                 |
|                                | Spider mites, potato psyllids, and flea beetle | 150-271 mL                                                                 |
|                                | Colorado potato beetle                         | 225-271 mL                                                                 |

## Application:

- **Minimum water volume:** 200 L per hectare, 80 L per acre. Apply with 0.1 to 0.5 percent v/v non-ionic surfactant (NIS).

## How it Works:

*Minecto Pro* is a non-neonicotinoid insecticide that delivers rapid activity through two complementary active ingredients – abamectin (Group 6) and cyantraniliprole (Group 28). Both active ingredients use translaminar movement within the plant to achieve excellent coverage of the crop, providing a reservoir of activity for extended residual control of targeted pests.

## Tank Mixes:

According to the Pest Management Regulatory Agency of Health Canada's Guidance Document on Tank Mix Labelling (March 2023), unlabelled tank mixes of this product are permitted only if the label of this product and the label of the product it might be mixed with include at least general wording on their respective labels indicating they may be mixed with other pesticides. When tank mixes are permitted, apply mixes according to the most restrictive use limitations for either product.

## Restrictions:

- DO NOT apply by air.
- **Rainfast period:** Once dry on leaf. Avoid application if heavy rainfall is forecast.
- **Restricted Entry Interval:** 12 hours
- **Pre-harvest interval:** 14 days
- **Storage:** Store product in original container only, in a cool, dry place and away from food or feed. Keep container closed.

- **Other Restrictions:** For European corn borer, spider mites, potato psyllids and flea beetle, DO NOT make a foliar application of *Minecto Pro* for a minimum of 60 days following an in-furrow or soil application or planting of seed pieces treated with any Group 28 insecticide. For Colorado potato beetle, DO NOT apply *Minecto Pro* for Colorado potato beetle control if any Group 28 was used at planting as an in-furrow, soil or seed-piece treatment.

### Environmental Hazards:

**Bees:** Toxic to bees exposed to direct treatment or residues on blooming crops or weeds. DO NOT apply this product or allow drift to blooming crops or weeds if bees are visiting the treatment area.

**Aquatic organisms:** Toxic to aquatic organisms. Contamination of aquatic areas as a result of runoff may be reduced by including a vegetative strip between the treated area and the edge of the water body.

### Hazard Rating:

Danger – Poison. Hazard to humans and domestic animals. Fatal or poisonous if swallowed. Harmful if inhaled. Avoid breathing spray mist.

Refer to the introduction for an explanation of the symbols.

# Movento 240 SC

Insecticide Group  
23

### Company:

Bayer (PCP#28953)

### Formulations, Crops, Insects, Rates:

| Product                                |        | Movento 240 SC                                                |
|----------------------------------------|--------|---------------------------------------------------------------|
| Formulation and Container Size         |        | 240 g/L spirotetramat formulated as a suspension concentrate. |
| Crop                                   | Insect | Application rate (per acre)                                   |
| Potato                                 | Aphids | 89-147 mL                                                     |
| Beans, chickpea, lentil, peas, soybean | Aphids | 75-111 g                                                      |

### Application:

#### Movento 240 SC

- Ground application only in potatoes and soybeans. Ground or air application for beans, chickpea, lentil and peas. Apply in adequate water for uniform coverage, a minimum of 120 L per acre. If needed repeat application with a minimum of 7 to 10 day interval. DO NOT exceed a maximum of 292 mL per acre per season.
- For best results apply when insect populations begin to build and before a damaging population becomes established. Select the appropriate rate depending on the development stage of the insect and level of infestation.

### How it Works:

*Movento* is a systemic, tetracarboxylic acid insecticide. Following application to plant foliage *Movento* moves through phloem and xylem to all plant tissues including new shoot, leaf and root growth. Mode of action is primarily by ingestion by immature insect life stages. Insect death occurs due to the inability to progress to the next development stage. Adults produce less offspring following exposure.

### Restrictions:

- DO NOT apply this product directly to freshwater habitats (such as lakes, rivers, sloughs, ponds, creeks, marshes, streams, reservoirs and wetlands). DO NOT apply during periods of dead calm. Avoid application when winds are gusty. DO NOT apply droplets smaller than *American Society of Agricultural Engineers (ASABE) fine* classification. Boom height must be 60 cm or less above ground.
- **Re-Entry:** DO NOT enter or allow worker entry into treated areas for a period of 12 hours.
- **Re-cropping:** A plant back interval of 30 days is required for all crops not on the label.

### Environmental Hazards:

**Bees:** Toxic to bee brood. Bee brood may be exposed to residues in/on pollen and nectar brought back to the hive by bees foraging on flowering crops and weeds. DO NOT apply this product during crop flowering period or when flowering weeds are present in the treatment area.

**Aquatic organisms:** Toxic to aquatic organisms. Avoid application when heavy rain is forecast.

**Others:** Toxic to certain beneficial insects.

### Hazard Rating:

Caution – Poison

Refer to the introduction for an explanation of the symbols.

# Oberon

Insecticide Group  
23

## Company:

Bayer (PCP#28905)

## Formulations, Crops, Insects, Rates:

| Product                        |                                          | Oberon                                                               |
|--------------------------------|------------------------------------------|----------------------------------------------------------------------|
| Formulation and Container Size |                                          | 240 g/L spiromesifen formulated as a suspension concentrate. 2 L jug |
| Crop                           | Insect                                   | Application rate (per acre)                                          |
| Alfalfa (seed production only) | Twospotted spider mite                   | 202-405 mL                                                           |
| Corn                           | Banks grass mite, twospotted spider mite | 161-242 mL                                                           |
| Dry beans                      | Spider mites                             | 202-242 mL                                                           |

## Application:

### *Oberon*

- May be applied by ground or air.
- Apply as soon as mite populations reach threshold levels. Repeat application if pest populations recover and reach economic thresholds. A minimum interval of 7 days between applications is required.
- Thorough coverage of all plant parts is important for optimum performance. Use sufficient water volumes for thorough coverage - e.g. minimum of 40 to 80 L of water per acre.
- Avoid application when heavy rain is forecast.

## How it Works:

Spiromesifen is in the Tetrionic acid class of insecticides and works by contact, inhibiting lipid biosynthesis in the insect. *Oberon* has strong adhesion to the leaf surface, and also some translaminar activity providing residual control through contact or ingestion. *Oberon* has activity on all mite developmental stages. Immature mite stages tend to be more susceptible to *Oberon* than adults.

## Restrictions:

- Alfalfa – DO NOT exceed 3 applications per season. Keep a minimum interval of 7 days between applications. DO NOT exceed a maximum of 1200 mL per acre of *Oberon* per season. Corn – DO NOT exceed 2 applications per season. DO NOT exceed 240 mL per acre per 14 day interval. DO NOT exceed 480 mL per acre per season.
- DO NOT enter or allow entry into treated areas for a period of 12 hours after application.
- *Oberon* is toxic to aquatic organisms and beneficial insects such as pollinators. DO NOT apply this product directly to freshwater habitats such as lakes, rivers, sloughs, ponds, creeks, marshes, streams, reservoirs, ditches and wetlands.
- DO NOT mix, load or clean equipment within 30 metres of wellheads or aquatic systems.
- **Rotational plant-back intervals for:**
  - *Field corn* – immediate plant back
  - *Wheat, barley and alfalfa* – 30 days
  - *All other crops* – 12 months

## Precautions:

**Storage:** Store in a cool, dry place in such a manner to prevent cross contamination with other pesticides, fertilizers, food and feed. DO NOT store below freezing.

## Environmental Hazards:

**Bees:** May be toxic to bee brood. Bee brood may be exposed to residues on pollen and nectar brought back to the hive by bees foraging on flowering crops and weeds. To minimize potential exposure to bees, avoid application if bees are visiting the treatment area.

**Aquatic organisms:** Toxic to aquatic organisms. Avoid application of this product when heavy rain is forecast.

**Others:** Toxic to certain beneficial insects.

## Hazard Rating:

Caution – Poison  
Eye Irritant

| Potato                                                       | Variegated cutworm, European corn borer           | 73 mL                                                                            | 73 mL                                                                        | 57 mL                                                              | 73 mL                                                                                               |
|                                                              | Leafhoppers                                       | 73 to 105 mL                                                                     | 73 to 105 mL                                                                 |                                                                    | 73 to 105 mL                                                                                        |
|                                                              | Lygus, Colorado potato beetle, potato flea beetle | 73 to 105 mL                                                                     | 73 to 105 mL                                                                 | 57 to 81 mL                                                        | 73 to 105 mL                                                                                        |

## Application:

### Permethrin

- May be applied by ground or air. Apply when insects exceed economic threshold numbers and use sufficient water for good coverage. Use higher rates for heavy infestations, adult insects and dense foliage. For cutworm control application should be made under warm, moist conditions in the evening or at night. Use high rates if larvae are near maturity or soil conditions are dry. DO NOT disturb soil surface for 5 days after treatment.

## How it Works:

*Permethrin* is a synthetic pyrethroid insecticide. It is a stomach and contact insecticide with no systemic or fumigant effects.

## Tank Mixes:

*Pounce 384EC* Insecticide is registered to tank-mix with Coragen Insecticide. Apply mixes based on the most restrictive use limitations for either label. According to the Pest Management Regulatory Agency of Health Canada's Guidance Document on Tank Mix Labelling (March 2023), unlabelled tank mixes of this product are permitted only if the label of this product and the label of the product it might be mixed with include at least general wording on their respective labels indicating they may be mixed with other pesticides. When tank mixes are permitted, apply mixes according to the most restrictive use limitations for either product.

Restrictions:

- **Grazing:** Cover crops or crops treated with *permethrin* should not be used as a green feed for animals.
- **Pre-harvest interval:**
  - *Corn* – 30 days
  - *Sweet corn* – 1 day
  - *Lentils, peas, wheat, barley, oats, rye* – 7 days
  - *Potatoes* – 1 day
- **Storage:** Store above -12°C.
- A 16 yard (15 metres) setback distance for ground and 110 yard (100 metres) setback distance by air near water bodies or other sensitive areas.

Precautions:

*Permethrin* is of low acute mammalian toxicity.

Environmental Hazards:

**Bees:** very toxic to bees; avoid spraying when bees are foraging. Spray deposit should be dry before bees commence foraging in treated crop.

**Aquatic organisms:** Highly toxic to fish and aquatic organisms. DO NOT contaminate ponds, lakes, streams or rivers during sprayer filling or rinsing operations or while spraying.

Toxic to certain beneficial insects. Minimize spray drift to reduce harmful effects on beneficial insects in habitats next to the application site such as hedgerows and woodland. *Permethrin* may impact predatory and parasitic arthropod species used in IPM programs within the treatment area. Unsprayed refugia for beneficial species of at least 1 metre from treatment area will help maintain beneficial arthropod populations.

Hazard Rating:

Refer to the introduction for an explanation of the symbols.

Plutex

Insecticide Group  
31

Company:

Andermatt Canada Inc. (PCP# 34785)

Formulations, Crops, Insects, Rates:

|                                |                  |                                                                                                                                |
|--------------------------------|------------------|--------------------------------------------------------------------------------------------------------------------------------|
| Product                        |                  | Plutex                                                                                                                         |
| Formulation and Container Size |                  | <i>Plutella xylostella</i> granulovirus (PlxyGV) isolate GV-0020. Minimum of 2.5 x 1013 occlusion bodies (OBs)/L.. 100mL-1000L |
| Crop                           | Insect           | Application rate (per acre)                                                                                                    |
| Canola                         | Diamondback moth | 20-81 mL                                                                                                                       |

Application:

- *Plutex* is for ground application only.
- Spray on plants infested with eggs or 1st instar larvae. To be effective, larvae must ingest foliage or fruits with deposits of *Plutex*.
- Apply as a full coverage spray using enough water to sufficiently cover the crop without excess run-off, minimum 200 L/ha. Re-apply every 4-8 days. Within the stated range, use the shorter re-application interval and higher application rate under high pest pressures.
- Dissolve product in the required amount in water. The pH of the solution should range between 5 and 8.5. Depending upon weather conditions and the persistence of the pest infestation, the applications may be repeated every 6-8 days. Between 2 to 5 applications may be required per generation. The use of pheromone traps is recommended to optimize application timing.

How it Works:

The active ingredient in *Plutex* is a naturally occurring virus of the diamondback moth (*Plutella xylostella*). It is a highly selective pathogen of the diamondback moth. It infects larvae by ingestion and passage through the digestive organs. Topical application has no effect

Tank Mixes:

According to the Pest Management Regulatory Agency of Health Canada's Guidance Document on Tank Mix Labelling (March 2023), unlabelled tank mixes of this product are permitted only if the label of this product and the label of the product it might be mixed with include at least general wording on their respective labels indicating they may be mixed with other pesticides. When tank mixes are permitted, apply mixes according to the most restrictive use limitations for either product.

## Restrictions:

- **Restricted Entry Interval:** 4 hours or until sprays have dried unless wearing waterproof gloves, long-sleeved shirt, long pants, socks and shoes
- **Pre-harvest interval:** Plutex can be used up to and including the day of harvest. PHI=0 days
- As this product is not registered for the control of pests in aquatic systems, DO NOT use to control aquatic pest.
- DO NOT apply in greenhouses.
- DO NOT apply this product by any type of irrigation system.
- DO NOT contaminate irrigation or drinking water supplies or aquatic habitats by cleaning of equipment or disposal of wastes.
- DO NOT apply by air.
- **Storage:** Plutex® can be stored in the refrigerator (<5°C) for two years from the date of manufacture. Store container upright and keep tightly closed when not in use. Shake vigorously to re-suspend contents immediately prior to addition in water

## Environmental Hazards:

To reduce runoff from treated areas into aquatic habitats, avoid application to areas with a moderate to steep slope, compacted soil or clay.

Avoid application when heavy rain is forecast.

Contamination of aquatic areas as a result of runoff may be reduced by including a vegetative filter strip between the treated area and the edge of the water body.

## Hazard Rating:

Not Classified; No hazardous components.

# Rimon 10 EC

Insecticide Group  
15

## Company:

UPL AgroSolutions Canada Inc. (PCP#28881)

## Formulations, Crops, Insects, Rates:

| Product                        |                                             | Rimon 10 EC                                                      |
|--------------------------------|---------------------------------------------|------------------------------------------------------------------|
| Formulation and Container Size |                                             | 10% novaluron formulated as an emulsifiable concentrate. 2 x 10L |
| Crop                           | Insect                                      | Application rate (per acre)                                      |
| Alfalfa (for seed)             | Lygus bug nymphs                            | 338 mL                                                           |
| Potato                         | Colorado potato beetle, European corn borer | 170-330 mL                                                       |

## Application:

### Rimon 10 EC

- For ground application only.
- A minimum spray volume of 40 L per acre for potatoes, a minimum spray volume of 80 L per acre for alfalfa. Higher water volumes will provide better coverage and product performance. Re-application interval of 10 to 14 days in potatoes and 7 to 10 days in alfalfa.
- Use hollow cone, disc-core hollow cone or twin jet nozzles suitable for Insecticide spraying. Drop nozzles may be required to obtain uniform coverage against certain insect pests that develop down in the canopy. Use higher application rates and spray volumes for higher insect pressure.
- Lygus bugs – application should be made when lygus bugs appear
- Colorado potato beetle – Application should be made when the majority of the population is at egg hatch to the second instar of larval development.
- European corn borer – Scout for European corn borer to monitor egg-laying and egg hatch to determine timing of application. The first application should be made just prior to egg hatch.
- Re-application on a 10 to 14 day interval will be required to protect new growth or if monitoring indicates that it is necessary to keep pest populations below economic thresholds.

## How it Works:

Rimon 10 EC is an insect growth regulator that must be absorbed by eggs or ingested by insect larvae to be fully effective. The primary mode of action is by disrupting cuticle formation and deposition occurring when insects change from one developmental stage to another, resulting in death at molting. Due to this mode of action, Rimon 10EC does not have any effect on adult stages of insects that have completed larval development.

### Restrictions:

- DO NOT make more than 2 applications per year per crop per season. DO NOT apply more than 664 mL of *Rimon 10 EC* per acre per season in potatoes. DO NOT apply more than 676 mL of *Rimon 10 EC* per acre per season in alfalfa. DO NOT apply within 14 days of harvest (Pre-harvest interval).

### Precautions:

- **Restricted Entry Interval:** DO NOT re-enter treated areas for a period of 12 hours after application.
- **Buffer Zone:** An untreated buffer zone between the last spray swath and the edge of aquatic systems (such as rivers, streams, lakes, and other water bodies) must be established. Refer to label for specific buffer zone requirements.
- **Storage:** To prevent contamination, store this product away from food or feed.

If this product is to be applied to a product destined for export to the United States, information on acceptable residue levels are available at [www.croplife.ca](http://www.croplife.ca).

### Environmental Hazards:

**Bees:** May be toxic to bee colonies exposed to direct treatment, drift, or residues on flowering crops or weeds. Avoid applying this product to flowering crops or weeds if bees are visiting the treatment area.

**Aquatic organisms:** Toxic to aquatic organisms. Avoid application of this product when heavy rain is forecast. DO NOT apply directly to water or to areas where surface water is present.

**Others:** *Rimon 10 EC* is toxic to immature insects. Minimize spray drift in habitats next to the application site (e.g. hedgerows and woodlands) to reduce harmful effects on beneficial insects.

### Hazard Rating:

Warning – May cause substantial but temporary eye injury. Harmful if absorbed through skin.  
DO NOT get on eyes or clothing.

Keep out of reach of children.

Refer to the introduction for an explanation of the symbols.

## Scorpio Ant and Insect Bait

Insecticide Group  
5

### Company:

W. Neudorff GmbH KG (PCP#33306)

Distributed in Canada by Belchim Crop Protection Canada

### Formulations, Crops, Insects, Rates:

| Product                                                      |                                                   | Scorpio Ant and Insect Bait                                           |
|--------------------------------------------------------------|---------------------------------------------------|-----------------------------------------------------------------------|
| Formulation and Container Size                               |                                                   | 0.07% spinosad formulated as an emulsifiable concentrate. 1 to 800 kg |
| Crop                                                         | Insect                                            | Application rate (per acre)                                           |
| Potato, dry bean, faba, chickpea, lentil, field pea, soybean | Black cutworm, reduces damage caused by wireworm* | 10 to 20 kg                                                           |

### Application:

- Granular Bait – Spreader. DO NOT place in piles.
- \* To reduce damage caused by wireworm: Incorporate into the soil at planting to a depth of 10 to 20 cm at a rate of 25 to 50 kg per hectare (2.5 to 5.0 g per square metre). Use the high rate when wireworm pressure is expected to be high.
- Black cutworm – Reapply after heavy rain or watering. Reapply as the bait is consumed or every 4 weeks.

### How it Works:

*Scorpio Ant and Insect Bait* in the spinosyn class of insecticides. It is a stomach insecticide.

### Effects of Weather:

Avoid application when heavy rain is forecast.

## Restrictions:

- **Pre-harvest Interval:**
  - *Potatoes* – 7 days
  - *Dry bean, faba bean, chickpea, lentil, field pea, soybean* – 28 days
- **Storage:** To prevent contamination store this product away from food and feed.
- **Other:** Maximum of 2 applications per year. DO NOT apply by air.

## Precautions:

Avoid contact with eyes, skin and clothing. DO NOT allow adults, children or pets in treatment areas during application. Wash immediately after using this product. Wear long-sleeved shirt, long pants, chemical-resistant gloves, shoes plus socks during loading, application, clean-up and repair.

## Environmental Hazards:

**Bees:** Toxic to bees.

**Aquatic organisms:** Toxic to aquatic organisms. To reduce runoff from treated areas into aquatic habitats avoid application to areas with a moderate to steep slope, compacted soil, or clay. Avoid application when heavy rain is forecast. Contamination of aquatic areas as a result of runoff may be reduced by including a vegetative strip between the treated area and the edge of the water body.

**Others:** Toxic to certain beneficial insects.

## Hazard Rating:

 Warning – May be harmful if swallowed. May be harmful in contact of skin. Causes mild skin irritation. Causes eye irritation. May be harmful if inhaled.

Refer to the introduction for an explanation of the symbols.

|                                                                                                                | Pea aphid, blue alfalfa aphid (suppression), spotted alfalfa aphid (suppression), | 81 to 162 mL                                                                |
| Grass forage, fodder, hay                                                                                      | Pea aphid, blue alfalfa aphid (suppression), spotted alfalfa aphid (suppression), | 81 to 162 mL                                                                |
|                                                                                                                | potato leafhopper (suppression)                                                   |                                                                             |
| Potato                                                                                                         | Aphids                                                                            | 81 mL                                                                       |

## Application:

### *Sefina*

- May be applied by ground or air.
- Apply *Sefina* at rates listed in the crop specific application rate tables when insect thresholds are reached. Ensure adequate water volumes are used for optimum coverage.
- **Soybean and Potato:**
  - **Ground** – Apply in a minimum of 40.5 to 81 L of water per acre.
  - **Air** – Apply in a minimum of 20.2 L of water per acre.

## How it Works:

*Sefina* is classified as an IRAC Group 9D insecticide with no known cross resistance to other chemistries. It is a contact insecticide that stops aphid feeding quickly and can provide control for up to 21 days.

## Effects of Weather:

Apply only when meteorological conditions at the treatment site allow for complete and even crop coverage. DO NOT apply during periods of dead calm. Avoid application of this product when winds are gusty. This product has the potential for run-off. Avoid application when heavy rain is forecast.

## Restrictions:

- **Restricted Entry Interval:** DO NOT enter or allow worker entry into treated areas for a period of 12 hours after application.
- Allow a minimum of 7 days between applications.
- **Storage:** Store the leftover product in original, tightly closed container. DO NOT ship or store the product near food, feed, seed and fertilizers. Store the product in cool, dry, locked, well-ventilated area without floor drain.
- **Others:**
  - DO NOT apply more than a maximum seasonal rate of 1 L per acre (potato), 0.16 L per acre (soybean), or 0.5 L per acre (alfalfa, clover, lupin, sainfoin, trefoil, vetch).
  - DO NOT apply within 7 days of harvest.
  - DO NOT feed or graze soybean hay or forage.
  - DO NOT apply less than 7 days before harvest for potato and soybean.
  - DO NOT apply more than 2 applications per year (soybean), or 4 applications per year (potato, alfalfa, clover, lupin, sainfoin, trefoil, vetch)
  - DO NOT make more than 2 sequential applications of *Sefina* insecticide before using an insecticide with a different mode of action.

## Precautions:

Wear a long-sleeved shirt, long pants, chemical-resistant gloves, socks and shoes during mixing, loading, application, clean-up and repair. Gloves are not required during application within a closed cab and/or cockpit. Wash hands before eating, drinking, smoking or using the toilet. Change out of work clothes and take a bath or shower after handling or spraying the product. Launder protective clothing before re-use.

A Vegetative Filter Strip (VFS) of at least 10 metres wide must be observed. The VFS is required between the field edge and adjacent, downhill aquatic habitats to reduce risk to aquatic organisms from run-off. The VFS is to be composed of grasses and may also include shrubs, trees, or other vegetation.

Allow a minimum of 7 days between applications.

## Environmental Hazards:

**Bees:** Application during the crop blooming period may be made only in the evening when most bees are not foraging. Minimize spray drift to reduce exposure to bees in habitats close to the application site.

**Aquatic organisms:** Toxic to aquatic organisms. Observe buffer zones and vegetative filter strips specified under directions for use.

## Hazard Rating:

Caution – Poison

Refer to the introduction for an explanation of the symbols.

|                                                                                       | Colorado potato beetle                    | 0.51 L                                                                                              |
|                                                                                       | Lygus                                     | 2.12 to 2.59 L                                                                                      |
|                                                                                       | Variegated cutworm                        | 45 mL/100 m of row                                                                                  |
|                                                                                       | European corn borer                       | 1.01 to 2.12 L                                                                                      |

## Application:

- Ground application only, except for canola.
- For grasshoppers, lower rates can be used for nymphs or sparse vegetation, and higher rates for adults and application to dense vegetation.
- In canola, applications can be made up to 4 weeks following plant emergence.

## How it Works:

*Sevin XLR* is a carbamate insecticide that works by contact and ingestion.

## Restrictions:

- **Storage:** DO NOT store in areas where temperatures frequently exceed 38°C. Store in original container in a cool dry area out of reach of children and animals and away from food and feed.
- **Restricted-Entry Intervals:**
  - **Beans** – 7 days for high contact activities such as scouting
  - **Canola** – 0.5 days
  - **Forage grasses and pastures** – 2 days
  - **Potatoes** – 0.5 to 6 days depending on the activity (see label).
- **Number of applications per year:** maximum of 2 applications per year in canola, beans, and potatoes.

## Environmental Hazards:

**Bees:** This product is highly toxic to honey bees exposed to direct treatment on blooming crops or weeds. For applications on crops that are highly attractive to pollinators DO NOT apply during the crop blooming period.

**Aquatic organisms:** Toxic to aquatic organisms. Avoid application of this product when heavy rain is forecast.

**Plants:** To avoid possible injury to tender foliage, do not apply to wet foliage or when rain or high humidity is expected during the next 2 days. *Sevin XLR* injures Boston ivy, Virginia creeper and Maidenhair fern.

**Others:** Toxic to birds and mammals.

**Hazard Rating:**

Warning – Poison

Refer to the introduction for an explanation of the symbols.

| Flax                                                | Grasshopper, armyworm, Lygus                                                                                                    | 51 ml                                                              | 34 ml                                                                          |

**Application:**

- Minimum water volume: 40 L/ac minimum
- Aerial application: 20 L/ac minimum
- Avoid application when heavy rain is forecast.

**How it Works:**

Silencer Duo insecticide works through contact and ingestion. It provides rapid knockdown and residual control of lepidopteran (e.g. moth larvae) and sucking and chewing insects. After foliar application most of the insecticide stays on the leaf surface with a small amount penetrating the leaf tissue. Initial and residual control is dependent on thorough coverage of the crop. Silencer Duo is most effective against early developmental stages of surface feeding insects and adults of pest that deposit eggs within plant parts. Insecticide components: lambda-cyhalothrin is a synthetic pyrethroid insecticide and chlorantraniliprole is a diamide insecticide.

**Restrictions:**

- **Rainfast period:** Do not apply in heavy rain is forecasted.
- **Re-entry interval:** 12 hours.
- **Canola**
  - Make only 1 application per season by either ground or air for cabbage seedpod weevil. DO NOT make more than 3 applications per season by ground application. DO NOT make more than 1 application per season by air
- **Corn (field, popcorn, seed and sweet)**
  - DO NOT make more than 2 applications per year.
- **Flax**
  - DO NOT make more than 3 applications per season by ground application. DO NOT make more than 1 application per season by air

- **Lentils, Chickpeas, Field Peas, Dry Beans and Soybeans**
  - *Ground* – DO NOT apply more than 3 times per season
  - *Air* – DO NOT apply more than once per season
- **Wheat, Barley, Oats**
  - *Ground* – DO NOT use more than 3 applications per year. Allow a 7-day interval between treatments.
  - *Air* – DO NOT make more than 2 applications by air.
- **Grazing interval:** DO NOT graze treated fields.
  - Grain/seed and meal from Canola, Cereals, Field Corn, Soybeans and Legume Vegetables (including pulses) treated with SILENCER® DUO can be fed to livestock. DO NOT feed other parts of treated crops to livestock.
  - DO NOT cut treated fields for silage/forage.
  - For grasses/non-grasses grown for seed production only, DO NOT feed seed screenings and aftermath to livestock.
- **Pre-harvest interval:**
  - *Cereals (Wheat, Barley, Oats)* – 28 days
  - *Corn (Field, Popcorn, Seed)* – 21 days
  - *Corn (Sweet)* – 1 day
  - *Pulses (Chickpeas, Lentils, Field Peas, Dry Beans, Soybeans)* – 21 days
  - *Oil Seeds Group (Canola, Flax, Mustard)* – 7 days
- **Storage:** DO NOT use or store in or around the home. Store unused product away from feeds, seeds, fertilizer, plants and foodstuffs. Silencer Duo must be stored above freezing. In pulse crops (pea, lentil, chickpea, beans and faba beans) if applied according to label rates early in the crop year at a vegetative stage or during flowering there is no need for MRL concerns. In cases of later application during pod development or seed fill to maturity (e.g. late season grasshopper control), consult with your exporter/ processor.
- DO NOT make a foliar application of Silencer Duo for a minimum of 60 days following an in-furrow or soil application or planting of seed treated with any Group 28 insecticide.
- **Buffer zones:** The buffer zones specified for this product are required between the point of direct application of Silencer Duo and the closest downwind edge of sensitive freshwater habitats (e.g. lakes, rivers, sloughs, ponds, prairie potholes, creeks, marshes, streams, reservoirs and wetlands). Spray drift buffer zones can be modified based on weather conditions and spray equipment.

## Environmental Hazards

Toxic to bees. To reduce runoff from treated areas into aquatic habitats avoid application to areas with a moderate to steep slope, compacted soil, or clay. Toxic to certain beneficial insects.

## Hazard Rating:

Danger – Poison Potential skin sensitizer.

Refer to the Introduction for an explanation of the symbols.

# Sivanto Energy

Insecticide Group  
3,4D

## Company:

Bayer (PCP#35668)

## Active Ingredient:

Flupyradifurone, Deltamethrin

## Formulations, Crops, Insects, Rates:

| Product                                                                                                                                   |              | Sivanto Energy                                                                                  |
|-------------------------------------------------------------------------------------------------------------------------------------------|--------------|-------------------------------------------------------------------------------------------------|
| Formulation and Container Size                                                                                                            |              | 75 g/L Flupyradifurone and 10 g/L Deltamethrin formulated as an emusifiable concentrate. 9.12 L |
| Crop                                                                                                                                      | Insect       | Application rate (per acre)                                                                     |
| Canola, Mustard seed (oilseed and condiment), oil radish, Brassica carinata (oilseed production only), cultivars and/or hybrids of these. | Flea Beetles | 304 ml                                                                                          |

## Application:

Minimum application volumes: 40 L/ac (Ground); 8 L/ha (Aerial).

- Do not apply after 6-leaf stage.
- Minimum application volumes: 40 L/ac (Ground); 8 L/ha (Aerial).

- Maximum Sivanto Energy allowed per crop per year: 303 mL/ac .
- Maximum flupyradifurone allowed per crop per year: 40 g a.i./ac
- Foliar Application Notes: Apply when pest pressure necessitates treatment. Apply as a directed foliar spray ensuring thorough coverage.
- DO NOT harvest or use leaves, stems, or other plant parts of Brassica carinata for food or feed.

How it Works:

Deltamethrin insecticides controls insects through contact and/or ingestion. Flupyradifurone controls insects through ingestion and o/ contact caused by listed chewing and sucking insects through contact and systemic activity

Tank Mixes

According to the Pest Management Regulatory Agency of Health Canada’s Guidance Document on Tank Mix Labelling (March 2023), unlabelled tank mixes of this product are permitted only if the label of this product and the label of the product it might be mixed with include at least general wording on their respective labels indicating they may be mixed with other pesticides. When tank mixes are permitted, apply mixes according to the most restrictive use limitations for either product.

Restrictions

- **Rainfast period:** Do not apply in heavy rain is forecasted.
- **Re-entry interval:** 12 hours.
- **Pre-harvest interval:** Do not apply after the -leaf stage of crop development. 100 days.
- **Storage:** Store this product away from food or feed. Store in cool, dry place and in such a manner as to prevent cross contamination with other pesticides, fertilizers, food, and feed. Store in original container and out of reach of children, preferably in a locked storage area.

Environmental Hazards

Toxic to small wild mammals.  
Toxic to aquatic organisms. Observe spray buffer zones specified under DIRECTIONS FOR USE.  
Toxic to certain beneficial arthropods (which may include predatory and parasitic insects, spiders, and mites). Minimize spray drift to reduce harmful effects on beneficial arthropods in habitats next to the application site such as hedgerows and woodland. Deltamethrin may impact predatory and parasitic arthropod species used in IPM programs within the treatment area. Unsprayed refugia for beneficial species of at least 1 metre from treatment area will help maintain beneficial arthropod populations.

Hazard Rating (Mammalian Toxicity)

Danger – Poison  
Refer to the introduction for an explanation of the symbols.

Sivanto Prime

Insecticide Group  
4D

Company:  
Bayer (PCP#31452)

Active Ingredient:  
Flupyradifurone

Formulations, Crops, Insects, Rates:

|                                                                                                                     |                        |                                                                        |
|---------------------------------------------------------------------------------------------------------------------|------------------------|------------------------------------------------------------------------|
| Product                                                                                                             |                        | Sivanto Prime                                                          |
| Formulation and Container Size                                                                                      |                        | 200 g Flupyradifurone per litre formulated as a liquid suspension. 2 L |
| Crop                                                                                                                | Insect                 | Application rate (per acre)                                            |
| Potato                                                                                                              | Colorado potato beetle | 304 to 405 mL                                                          |
| Corn                                                                                                                | Aphids                 | 202 to 304 mL                                                          |
| Chickpea, dry bean, faba bean, field pea, lentil, soybean, alfalfa (forage, silage and hay production only), potato | Aphids, leafhoppers    | 202 to 304 mL                                                          |

## Application:

- Apply once the target pest population has reached economic threshold according to local recommendations.
- DO NOT apply within 1 hour of rain. Avoid application when heavy rain is forecast.
- **Potato:**
  - **Application interval** – 10 days
  - **Ground** – Apply as a directed foliar spray ensuring thorough coverage. Minimum 40 L per acre.
  - **Air** – Minimum 8 L per acre. DO NOT apply during periods of dead calm. Avoid application of this product when winds are gusty.
  - **Pre-harvest interval** – 7 days
  - **Grazing interval** – DO NOT graze.
- **Corn:**
  - **Application interval** – 7 days
  - **Ground** – Apply as a directed foliar spray ensuring thorough coverage. Minimum 40 L per acre.
  - **Air** – Minimum 8 L per acre. DO NOT apply during periods of dead calm. Avoid application of this product when winds are gusty.
  - **Pre-harvest interval** – 7 days (sweet corn, forage, silage, hay cutting); 21 days (grain, stover)
  - **Grazing interval** – 7 days
- **Chickpea, dry bean, faba bean, field pea, lentil, soybean:**
  - **Application interval** – 10 days
  - **Ground** – Apply as a directed foliar spray ensuring thorough coverage. Minimum 40 L per acre.
  - **Air** – Minimum 8 L per acre. DO NOT apply during periods of dead calm. Avoid application of this product when winds are gusty.
  - **Grazing interval** – 7 days
- **Alfalfa (forage, silage and hay production only):**
  - **Application interval** – 10 days
  - **Ground** – Minimum 40 L per acre
  - **Pre-harvest interval** – 7 days, except – soybean grain 21 days
  - **Grazing interval** – 7 days

## How it Works:

*Sivanto Prime* is a broad spectrum systemic insecticide that works by contact and ingestion.

## Restrictions:

- **Storage:** Store in cool, dry place and in such a manner as to prevent cross contamination with other pesticides, fertilizers, food, and feed
- **Restricted-Entry Intervals:** 12 hours.
- **Number of applications per year:** maximum of 809 mL per acre per year.

## Tank Mixes:

DO NOT tank mix with azole fungicides during bloom. According to the Pest Management Regulatory Agency of Health Canada's Guidance Document on Tank Mix Labelling (March 2023), unlabelled tank mixes of this product are permitted only if the label of this product and the label of the product it might be mixed with include at least general wording on their respective labels indicating they may be mixed with other pesticides. When tank mixes are permitted, apply mixes according to the most restrictive use limitations for either product.

For tank mixes, consult the labels of the tank-mix partners and observe the largest (most restrictive) buffer zone of the products involved in the tank mixture and apply using the coarsest spray (ASAE) category indicated on the labels for those tank mix partners.

## Environmental Hazards:

**Bees:** Toxic to adult bees in laboratory studies via oral exposure; however, not toxic to bees through contact exposure, and field studies conducted with this product have shown no effects on honeybee colony development. Minimize spray drift to reduce exposure to bees in habitats close to the application site. Application during the crop blooming period, and when flowering weeds are present may only be made in the early morning and the evening when most bees are not foraging. Toxic to certain beneficial insects. Minimize spray drift to reduce harmful effects on beneficial insects in habitats next to the application site such as hedgerows and woodland.

**Aquatic organisms:** Toxic to aquatic organisms. The buffer zones for this product can be modified based on weather conditions and spray equipment configuration by accessing the Buffer Zone Calculator on the Pest Management Regulatory Agency website.

**Others:** *Sivanto Prime* is of low acute mammalian toxicity. Toxic to certain beneficial insects.

## Hazard Rating:

Warning – May cause an allergic skin reaction. Harmful if inhaled.

Refer to the introduction for an explanation of the symbols.

# Sluggo Professional

Molluscicide –  
no group

**Company:**  
Belchim Crop Protection (PCP#30025)

**Formulations, Crops, Insects, Rates:**

|                                |                  |                                                                                     |
|--------------------------------|------------------|-------------------------------------------------------------------------------------|
| Product                        |                  | Sluggo Professional                                                                 |
| Formulation and Container Size |                  | 0.76% ferric phosphate in a granular formulation. 5, 25 kg bags                     |
| Crop                           | Insect           | Application rate (per acre)                                                         |
| Field crops                    | Slugs and snails | Apply bait evenly at a rate of 4.9 to 20.2 kg / acre (1.2 to 5 g per square metre). |

**Application:**  
*Sluggo*

- Apply in the evening as slugs and snails travel and feed mostly at night or early morning. DO NOT place in piles. For best results the ground should be moist but with little or no standing water.
- For broadcast application, standard broadcast spreaders may be used. For row application, standard granular spreaders may be used.
- At seeding and later stages, apply the bait between rows and around the perimeter of the field. Treating around the perimeter of crop areas may intercept slugs or snails migrating from daytime refuge sites.
- Apply at the higher rate within the recommended rate range if the infestation is severe, if the area is heavily watered or after long periods of heavy rain.
- Re-apply as the bait is consumed or at least every two weeks if slugs and snails continue to be a problem.

**How it Works:**  
*Sluggo* must be consumed by the slugs or snails to be effective. After ingesting the bait, slugs and snails stop feeding providing immediate protection to plants. Affected slugs and snails die within 3 to 6 days.

**Precautions:**  
Avoid contact with eyes. May cause eye irritation.  
Wear chemical resistant gloves during mixing and loading activities and when applying by hand.

**Environmental Hazards:**  
**Aquatic organisms:** This product may be toxic to fish and other aquatic organisms. Avoid direct application to ponds, streams and lakes.

**Hazard Rating:**  
 Warning – Contains the Allergen Wheat  
Refer to the introduction for an explanation of the symbols.

# Success Insecticide

Insecticide Group  
5

## Company:

Corteva Agriscience (PCP#26835)

## Formulations, Crops, Insects, Rates:

|                                |                               |                                                                  |
|--------------------------------|-------------------------------|------------------------------------------------------------------|
| Product                        |                               | Success Insecticide                                              |
| Formulation and Container Size |                               | 480 g/L spinosad formulated as a suspension concentrate. 1 L jug |
| Crop                           | Insect                        | Application rate (per acre)                                      |
| Potato                         | Colorado potato beetle larvae | 34 to 67 mL                                                      |
|                                | European corn borer larvae    | 51 mL                                                            |

## Application:

### *Success 480 SC*

- Apply when scouting indicates the target pest species have reached economic threshold levels. For Colorado potato beetle, target eggs at hatch or small larvae. For control of European corn borer, time the application to coincide with peak egg hatch. Use higher application rate for higher pest pressure or when extended egg hatch is anticipated. If pest populations persist, a repeat application 7 to 10 days after the initial application may be necessary.
- Spinosyns require a spray solution pH between 6 to 8. This is important for the efficacy of the product. It is recommended that growers test the pH of the spray solution prior to adding a spinosyn to the spray tank.

## How it Works:

*Success 480 SC* is in the spinosyn class of insecticides. It is a contact and stomach insecticide. It is derived from the fermentation of *Saccharopolyspora spinosa*.

## Effects of Weather:

This product has the potential for run-off. DO NOT spray immediately after a rainfall or if rain is forecast within 48 hours after application.

## Restrictions:

- **Restricted Entry Interval:** DO NOT enter or allow worker entry into treated areas for a period of 12 hours after application.
- **Storage:** Avoid freezing. DO NOT store or ship with food, feeds, drugs or clothing.
- **Others:**
  - **Potatoes** – DO NOT apply more than a maximum seasonal rate of 100 mL per acre. DO NOT apply within 7 days of harvest.

## Precautions:

May cause eye and skin irritation.

**Buffer Zones:** For ground applications, a buffer zone of 2 metres (early season) or 1 metre (late season) is required between downwind edge of spray boom and sensitive aquatic habitats. Avoid contact with eyes, skin, and clothing.

## Environmental Hazards:

**Bees:** Highly toxic to bees exposed to direct treatment, drift or residues on blooming plants. DO NOT apply this product or allow it to drift to blooming plants if bees are visiting the treatment area.

**Aquatic organisms:** Highly toxic to aquatic invertebrates. DO NOT contaminate aquatic habitats, such as lakes, rivers, sloughs, ponds, coulees, prairie potholes, creeks, marshes, streams, reservoirs, and wetlands, when cleaning and rinsing spray equipment or containers.

**Others:** Harmful to parasitoids and predatory mites and slightly harmful to foliage-dwelling predators.

# Superior 70 Oil

Insecticide Group  
NA

## Company:

Loveland Products Canada Inc. (*Superior 70 Oil* – PCP#14981)

N.M. Bartlett Inc. (*Superior "70" Oil* – PCP#9542)

## Formulations, Crops, Insects, Rates:

|                                |                                                                    |                             |
|--------------------------------|--------------------------------------------------------------------|-----------------------------|
| Product                        | Superior 70 Oil                                                    |                             |
| Formulation and Container Size | Mineral Oil, 99%, emulsifiable concentrate. 10 L, 200 L and 1000 L |                             |
| Crop                           | Insect                                                             | Application rate (per acre) |
| Potato                         | Reduce the spread of Potato Virus Y (PVY) transmitted by aphids.   | 4 L                         |

## Application:

### *Superior 70 Oil*

- Maximum 10 applications when aphids first appear; Pre-harvest interval: 14 days. Ground application only. DO NOT apply by air.
- DO NOT use the spray mixture before the oil has been properly emulsified. Spray at one week intervals as soon as aphid vectors are present.
- Thorough coverage of the plants is essential. Apply at a 10 percent rate (e.g. 10 L per 1000 L water). Boom height must be 60 cm or less above ground or crop canopy.

## How it Works:

The mineral oil reduces the spread of potato virus Y (PVY) disease vectored by aphids. The mineral oil does not kill the aphids.

## Tank Mixes:

According to the Pest Management Regulatory Agency of Health Canada's Guidance Document on Tank Mix Labelling (March 2023), unlabelled tank mixes of this product are permitted only if the label of this product and the label of the product it might be mixed with include at least general wording on their respective labels indicating they may be mixed with other pesticides. When tank mixes are permitted, apply mixes according to the most restrictive use limitations for either product.

## Effects of Weather:

Avoid application when heavy rain is forecast.

DO NOT apply on drought stressed plants, in hot sun or when there is a risk of freezing temperatures.

DO NOT apply during periods of dead calm. DO NOT apply when winds are gusty or wind speed is greater than 16 km/h.

## Restrictions:

- **Maximum number of applications:** 10 per season
- **Restricted Entry Interval:** DO NOT re-enter treated areas within 12 hours of application.
- **Pre-harvest interval:** 14 days
- **Storage:** Store in original tightly closed container in a cool dry, well-ventilated area away from feed and foodstuffs. DO NOT store below 0°C.

## Precautions:

DO NOT use within 30 days before or after using Sulfur.

## Environmental Hazards:

**Aquatic organisms:** DO NOT contaminate irrigation or drinking water supplies or aquatic habitats by cleaning of equipment or disposal of wastes.

## Hazard Rating:

Danger – Poison, Eye Irritant

Refer to the introduction for an explanation of the symbols.

# Thimet 20G

Insecticide Group  
1B

## Company:

AMVAC Chemical Corporation (PCP#29000)

This product is ONLY for retail sale to and use by individuals holding an appropriate provincial pesticide applicator certificate or license.

## Formulations, Crops, Insects, Rates:

| Product                        |                              | Thimet 20G                                                                 |
|--------------------------------|------------------------------|----------------------------------------------------------------------------|
| Formulation and Container Size |                              | 20% phorate formulated as a granular. 22 kg SmartBox closed loading system |
| Crop                           | Insect                       | Application rate (per acre)                                                |
| Potato                         | Reduction of wireworm damage | 105 g/100 m in sandy or light soil 161 g/100 m in silt or heavy soils      |

## Application:

### *Thimet 20G*

- Ground application only at seeding time: This is a restricted product and can only be applied with a *SmartBox* pesticide application system properly calibrated to ensure accurate placement and rate. Distribute granules evenly in furrow at planting time only. Use low rate for sandy or light soils and high rate for silt or heavy soils. For use ONLY in potato fields where wireworm populations have been observed.

## How it Works:

Phorate is an organophosphate insecticide that works as a systemic poison, with effective initial residual activity on soil and foliar insects.

## Restrictions:

- DO NOT apply *Thimet* more than once per season.
- DO NOT apply *Thimet* to saturated soils or in wet conditions that may prevent the equipment from covering pesticide granules. DO NOT apply while precipitation is occurring and conducive to run-off from treated areas. DO NOT apply if intense or sustained precipitation is forecast to occur within 48 hours as this will favour run-off.
- Leave a 20 metre (66 feet) buffer area if used on highly erodible land adjacent to aquatic bodies. DO NOT apply within 15 metres (50 feet) of any drinking water well.
- Storage:** DO NOT store in or around the home. Store away from food or feed. All SmartBox containers must be returned per instructions provided.
- Others:** DO NOT use in muck soils. DO NOT apply later than at planting time. Will provide reduction of wireworm damage.
- DO NOT use on muck soils.
- A plant-back interval of 6 months is required for all crops except potatoes is required. There is no plant-back restriction for potatoes.
- DO NOT enter or allow workers to enter into treated areas for a period of 48 hours. DO NOT harvest potatoes before 90 days after planting time.

## Precautions:

*Thimet* is of high acute mammalian toxicity. DO NOT allow product to contact eyes and skin. Poisonous by skin contact, inhalation or swallowing. DO NOT breath dust. Repeated inhalation or skin contact with *Thimet 20G*, other organophosphorus or carbamate insecticides may, without symptoms, progressively increase susceptibility to poisoning. Wear freshly-laundered, long-sleeved work clothing daily. DO NOT handle *Thimet* with bare hands. Use rubber gloves when transferring from package to equipment. Sleeve cuffs should be worn over gloves to prevent granules from falling into the gloves. Rubber gloves should be washed with soap and water after each use. Destroy and replace gloves frequently. In case of contact, immediately remove contaminated clothing and wash skin thoroughly with soap and water.

## Environmental Hazards:

**Aquatic organisms:** Toxic to aquatic organisms. DO NOT apply while precipitation conducive to runoff is occurring or while conditions favor runoff from the treated area. DO NOT apply when forecasted precipitation event favors runoff from treated area.

**Others:** Toxic to earthworms. Toxic to birds and small wild mammals. Any spilled or exposed granules must be incorporated into the soil or otherwise cleaned-up from the soil surface. One granule is sufficient to kill a small bird or small mammal.

## Hazard Rating:

Danger – Poison

Refer to the introduction for an explanation of the symbols.

# Vayego 200 SC

Insecticide Group  
28

## Company:

Bayer (PCP#33711)

This product is ONLY for retail sale to and use by individuals holding an appropriate provincial pesticide applicator certificate or license.

## Formulations, Crops, Insects, Rates:

| Product                        |                                                                                                     | Vayego 200 SC                                                                       |
|--------------------------------|-----------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------|
| Formulation and Container Size |                                                                                                     | Tetraniliprole at 200 g/L, formulated as a suspension concentrate. 0.25 L to 1000 L |
| Crop                           | Insect                                                                                              | Application rate (per acre)                                                         |
| Potato                         | Foliar application: Colorado potato beetle, European corn borer, flea beetles, aphids (suppression) | 61 mL                                                                               |
|                                | In-furrow (at planting): Colorado potato beetle, flea beetle                                        | 6.75 mL/100 m of row                                                                |
| Corn                           | European corn borer, corn earworm, cutworms, armyworms, flea beetles, aphids (suppression)          | 61 mL                                                                               |
| Soybean                        | Cutworms, armyworms                                                                                 | 61 mL                                                                               |

## Application:

*vayego 200 SC*

- **Potato**
  - **Foliar:** Minimum application volume:
    - *Ground* – 40.5 L per acre
    - *Aerial (potatoes only)* – 20.2 L per acre
    - *Maximum foliar application of vayego 200 SC per crop season:*
      - *Potatoes, soybean* – 121.4 mL per acre (24.3 g ai/acre)
      - *Corn* – 242.8 mL per acre (48.6 g ai/acre)

## How it Works:

Tetraniliprole disrupts muscle activity in the insects, resulting in paralysis. Treated pests stop feeding quickly after ingestion, become lethargic and lose mobility.

## Restrictions:

- **Foliar application:** DO NOT apply more than twice per year in potatoes or soybean, four times per year in corn.
- **Minimum interval between applications:** 10 days for potatoes, 14 days for corn and soybeans.
- **Rainfast period:** 1 hour
- **Restricted Entry Interval:** 12 hours
- DO NOT graze after treatment.
- **Pre-harvest interval:** 14 days
- **Storage:** To prevent contamination, store this product away from food or feed. Keep in a closed container.

## Precautions:

Wear a long-sleeved shirt, long pants, chemical-resistant gloves, socks and shoes during mixing, loading, application, clean-up and repair. Gloves are not required during application within a closed cab and/or cockpit. Follow manufacturer's instructions for cleaning and maintaining PPE. If no such instructions for washables, use detergent and hot water. Keep and wash PPE separately from other laundry. Users should wash hands before eating, drinking, chewing gum, using tobacco or using the toilet. Remove clothing immediately if pesticide gets inside, then wash thoroughly and put on clean clothing. Remove PPE immediately after handling this product. Wash the outside of gloves before removing. As soon as possible, wash thoroughly and change into clean clothing.

## Environmental Hazards:

**Bees:** Toxic to bees. DO NOT apply during crop blooming.

**Aquatic organisms:** Toxic to aquatic organisms. DO NOT apply while precipitation conducive to runoff is occurring or while conditions favor runoff from the treated area. DO NOT apply when forecasted precipitation event favors runoff from treated area. Observe buffer zones specified under directions for use.

**Others:** Toxic to certain beneficial insects. Minimize spray drift to reduce harmful effects on beneficial insects in habitats next to the application site such as hedgerows and woodland.

**Hazard Rating:**

Low toxicity.

# Verimark

**Insecticide Group  
28****Company:**

FMC of Canada (PCP#30892)

**Formulations, Crops, Insects, Rates:**

| Product                        |                                            | Verimark                                                                                          |
|--------------------------------|--------------------------------------------|---------------------------------------------------------------------------------------------------|
| Formulation and Container Size |                                            | Cyantraniliprole at 200 g/L, formulated as a suspension concentrate. 4 x 2.365 L per case         |
| Crop                           | Insect                                     | Application rate (per acre)                                                                       |
| Potato                         | Colorado potato beetle, potato flea beetle | In-furrow application: 6.75 to 9 mL/100 m of row (303 to 404 mL/acre based on 90 cm row spacing). |

**Application:****Verimark**

- Apply as a narrow band in-furrow. For best results, direct spray on the seed pieces in the furrow.

**How it Works:**

The active ingredient cyantraniliprole is a systemic insecticide from the diamides chemical class. Although it has contact activity, it is most effective through ingestion of treated plant material.

**Restrictions:**

- **Foliar application:** DO NOT make more than 1 soil application per year. DO NOT exceed a total of 0.6 L of *Verimark* per acre per year. Use only a closed treatment system.
- **Minimum interval between applications:** DO NOT make a subsequent foliar application of any Group 28 insecticide for a minimum of 60 days following an in-furrow application of *Verimark* insecticide.
- **Restricted Entry Interval:** 12 hours

**Precautions:**

Wear a long-sleeved shirt, long pants, chemical resistant gloves, socks and shoes while mixing/loading, applying and during clean up and repair. Follow manufacturer's instructions for cleaning/maintaining personal protective equipment (PPE). If no such instructions for washables are available, use detergent and hot water. Keep and wash PPE separately from other laundry. Users should wash hands before eating, drinking, chewing gum, using tobacco or using the toilet. Remove clothing immediately if pesticide gets inside. Then wash thoroughly and put on clean clothing. Store product in original container only, away from other pesticides, fertilizer, food or feed. DO NOT use or store in or around the home. Keep container closed. To prevent contamination, store this product away from food or feed.

**Colorado potato beetle resistance management:** DO NOT apply any Group 28 insecticide for Colorado potato beetle control if *Verimark* insecticide was used at planting as an in-furrow treatment.

**Environmental Hazards:**

Avoid application when heavy rain is forecast. DO NOT contaminate irrigation or drinking water supplies or aquatic habitats by cleaning of equipment or disposal of wastes. To reduce runoff from treated areas into aquatic habitats, avoid application to areas with a moderate to steep slope, compacted soil, or clay. Contamination of aquatic areas as a result of runoff may be reduced by including a vegetative strip between the treated area and the edge of the water body.

**Bees:** Toxic to bees. This product is systemic, and bees can be exposed to product residues in flower, leaves, pollen and/or nectar resulting from soil applications. However, when this product is applied and used according to label directions, the risk to bees is expected to be negligible.

**Aquatic organisms:** Toxic to aquatic organisms.

**Hazard Rating:**

Low toxicity.

| Flax                                            | Bertha armyworm, grasshoppers, Lygus bugs                                                                                             | 91 mL                                                                                                             |

## Application:

### Voliam Xpress

- May be applied by ground or air.
- Timing of applications should target the pest and when populations are in a damaging life stage and at economic levels. Ensure adequate water volumes are used for optimum coverage.
- **Potatoes and Corn**
  - **Ground** – Apply in a minimum of 60 L of water per acre.
  - **Air** – Apply in a minimum of 16 L of water per acre.
- **Bean, chickpea, faba bean, lentil, pea, soybean, canola, rapeseed, mustard (oil seed), sunflower** – Apply when insect feeding is first seen on foliage. Reapply after 7 days if populations reach economic threshold levels.
  - **Ground** – Apply with a minimum of 40 – 80 L water per acre.
  - **Air** – Apply with a minimum of 16 L of water per acre.

## How it Works:

*Voliam Xpress* insecticide works through contact and ingestion. It provides rapid knockdown and residual control of Lepidopteran (e.g. moth larvae) and sucking and chewing insects. After foliar application most of the insecticide stays on the leaf surface with a small amount penetrating into the leaf tissue. Initial and residual control is dependent on thorough coverage of the crop. *Voliam Xpress* is most effective against early developmental stages of surface feeding insects and adults of pest that deposit eggs within plant parts. Insecticide components: lambda-cyhalothrin is a synthetic pyrethroid insecticide and chlorantraniliprole is a diamide insecticide.

## Restrictions:

- DO NOT make a foliar application of Voliam Xpress for a minimum of 60 days following an in-furrow or soil application or planting of seed treated with any Group 28 insecticide.
- **Bean, chickpea, lentil, pea, soybean**
  - **Ground** – DO NOT apply more than 3 times per season
  - **Air** – DO NOT apply more than once per season.
  - DO NOT graze or harvest treated forage, straw or hay for livestock feed. A 7 day interval is required between applications. ° Pre-harvest interval – 14 days except – Soybean pre-harvest interval – 21 days.
  - DO NOT exceed the following amount of product per season. This includes Voliam Xpress as well as other Group 3 and/or Group 28 insecticides. Consult the label of other products containing these active ingredients prior to treatment to ensure the annual maximum is not exceeded:
    - 90 g chlorantraniliprole per acre by ground or aerial application and; ° 30 g lambda-cyhalothrin per acre by ground application or;
    - 10 g lambda-cyhalothrin per acre by air.
- **Canola, rapeseed, mustard (seed), sunflower**
  - **Application interval** – 7 days
  - **Pre-harvest interval** – 7 days
  - Make only 1 application per season by either ground or air for cabbage seedpod weevil. DO NOT make more than 3 applications per season by ground application.
  - DO NOT make more than 1 application per season by air
- **Corn**
  - DO NOT make more than 2 applications of Voliam Xpress per year. ° Application interval – 7 days
  - **Pre-harvest interval** – 14 days if crop is harvested for silage and 21 days for field corn. DO NOT exceed – 90 g chlorantraniliprole per acre by ground or aerial application and; ° 27.6 g lambda-cyhalothrin per acre by ground application or;
  - 20 g lambda-cyhalothrin per acre by air.
- **Potato**
  - DO NOT apply Voliam Xpress Insecticide, which contains a Group 28 insecticide, following a seed piece, in-furrow, or soil application of any Group 28 insecticide.
  - DO NOT make more than 2 applications of Voliam Xpress per year.
  - **Application interval** – 7 days
  - **Pre-harvest interval** – 7 days
- **Buffer Zones:** The buffer zones specified for this product are required between the point of direct application of *Voliam Xpress* and the closest downwind edge of sensitive freshwater habitats (e.g. lakes, rivers, sloughs, ponds, prairie potholes, creeks, marshes, streams, reservoirs and wetlands). Spray drift buffer zones can be modified based on weather conditions and spray equipment.
- **Storage:** DO NOT use or store in or around the home. Store unused product away from feeds, seeds, fertilizer, plants and foodstuffs. *Voliam Xpress* must be stored above freezing. In pulse crops (pea, lentil, chickpea, beans and faba beans) if applied according to label rates early in the crop year at a vegetative stage or during flowering there is no need for MRL concerns. In cases of later application during pod development or seed fill to maturity (e.g. late season grasshopper control), consult with your exporter/processor.

## Precautions:

As a result of the completed re-evaluation of lambda-cyhalothrin by the Pest Management Regulatory Agency (PMRA), effective April 29, 2023, changes will affect how all lambda-cyhalothrin-based products may be used in Canada.

DO NOT apply during periods of dead calm or when winds are gusty.

Avoid application at temperatures above 25 degrees C. Control of insects may be reduced at higher temperatures. DO NOT enter or allow entry into treated areas for a period of 24 hours after application of *Voliam Xpress*.

If *Voliam Xpress* is to be applied to a commodity destined for export to the United States, visit Crop Life Canada's website [HYPERLINK "http://www.croplife.ca/"](http://www.croplife.ca/) **www.croplife.ca** for information on acceptable residue limits.

## Environmental Hazards:

**Bees:** Toxic to bees when exposed to direct treatment, drift, or residues on flowering crops or weeds. DO NOT apply this product to flowering crops or weeds if bees are visiting the treatment area. Spray deposits should be dry before bees commence foraging in treated crop.

**Aquatic organisms:** Toxic to aquatic organisms. Avoid application when heavy rain is forecast. The use of this product may result in contamination of groundwater, particularly in areas where soil is permeable (e.g. sandy soil) and/or the depth to the water table is shallow.

**Others:** Toxic to certain beneficial insects.

## Hazard Rating:

Danger – Poison Potential skin sensitizer.

Refer to the Introduction for an explanation of the symbols.
