MIPUG's witnesses Mr. Bowman and Mr. McLaren demonstrated that MH's OM&A forecasts generally trend higher, and have been doing so in each successive forecast since IFFO2-1, with IFFO7-01 being the latest of the series. Mr. Bowman and Mr. McLaren further observed that actual OM&A expenses have consistently been above the rising forecasts. In comparing the forecast period fiscal 2003 through 2013 with the forecasts in IFF 02-1 and IFF 07-1, Bowman and McLaren indicated a cumulative increase in OM&A of 10% as a consequence. MIPUG submitted that the Board should develop instructions and measures to better ensure MH applies effective cost control in the future.

MIPUG further suggested that the Board direct MH to provide full benchmarking information comparing its operations with other utilities, for review in a future GRA. MIPUG also suggested the Board direct MH to provide OM&A actual and forecast expenses by major function (Generation and Transmission, distinct from Distribution, Customer Service, and Administration). This request focused on the rationale that Generation and Transmission costs are not driven by the number of customers and, as such, a "cost/customer" ratio is of "no meaning".

For MIPUG, OM&A cost-per-customer ratios should be restricted to the distribution, customer service and administration functions.

In discussing the implications of the approaching adoption of IFRS, MIPUG stated there was insufficient information to make meaningful determinations on potential impacts on MH at this time. MIPUG urged the Board to direct MH to include with its next GRA filing an IFRS transition plan, including copies of reports produced for MH's consultants, and a summary of potential financial impacts.

With respect to adopting regulatory accounting to counter any negative implications of IFRS (in short, the construction of a set of financial statements prepared on a different basis than IFRS GAAP), MIPUG stated it was premature to consider whether such a step should be undertaken. MIPUG noted that regulatory accounting is an acceptable process currently being utilized by the Ontario Energy Board (OEB). MIPUG opined that there are an increasing number of issues that may lead to such an approach becoming justified in future, and in that event, the Board should not be averse to adopting the approach if needed.

As to MH making charitable donations, MIPUG opined that charitable donations, sponsorships and general economic development expenditures should not be reflected in rates, if material. However, MIPUG stated that there is no reason to exclude such costs in determining rates when such costs are not of material consequence to MH's financial results and forecasts. MIPUG opined that the current level of donations, as disclosed by MH in the GRA, should not be disallowed for reflection in rates, because the amounts involved are not material.

MKO

MKO agreed with the other interveners that MH should do more to restrain OM&A expenses, and also opined that MH's capital cost forecasts do not appear to be reasonable in light of the experience of actual costs. MKO also noted that MH's OM&A forecasts have generally trended higher in each successive forecast since IFF 02-1, with IFF 07-01 being the highest to date. MKO also demonstrated that MH's OM&A expenses have, in most cases, exceeded targets, and questioned MH's achievement of productivity gains.

MKO supported MH benchmarking costs against other utilities, and requested MH report to the Board why MH's costs deviate from the statistical average of benchmarked utilities.

MKO supported the suggestion of other Interveners that the implications of IFRS be considered in a future proceeding, at which time additional evidence would be required of MH and be tested by the Board and interested parties.

MKO recommended that MH revenues should ordinarily not be used for charitable purposes without specific direction from government. MKO suggested that MH had paid the Province $198 million in fees and capital taxes in 2007, and suggested that with provincial earmarking of such contributions for charitable purposes, the donations should be made directly by government, as that would be, in MKO's view, more appropriate.

MKO also recommended that MH and the Board clearly distinguish MH's necessary and appropriate costs (expenditures and investments related to operations, mitigation and agreement obligations) from "charitable donations". MKO suggested that endowments funded by MH's net export revenues (intended to benefit "MH Affected Communities", such as for regional economic development, community infrastructure and the enhancement of fish and wildlife) should not be "charitable donations".

5.8 Board Findings

The Board remains concerned with the growth of OM&A expenses, particularly the level and growth of these expenditures prior to deferrals, capitalization and allocations to subsidiaries.

As stated in Order 101/04:

> "The Board will expect MH to maintain vigilance over its costs, so that the additional revenues [from PUB approved rate increases] contribute as they are intended to move towards achieving the debt to equity target more quickly than suggested in MH's 2003 Integrated Financial Forecast."

Expectations from past recommendations related to OM&A expenses have not been met. The Board expects MH to control OM&A expense levels to assist in meeting its financial targets. Further control of OM&A costs is vital given the planned major capital expansion, and in light of the fact that MH will not meet its debt to equity target over the current forecast period.

And, in this Order, the Board continues to be concerned with MH's "aggressive" capitalization and deferral policies with respect to OM&A expenses. While there is an argument for the practice, the net result is that costs now being incurred are not reflected in rates until years, in fact decades, later, meaning the current generation of ratepayers leave the results for the generations that will follow to meet.

The following concern, from Order 143/04, echoes past concerns raised by the Board with respect to the capitalization policies followed by MH. The Board then stated:

> "The Board is concerned with the range and level of costs being capitalized by MH. While the Board understands that many of the projects undertaken by MH are long-term in nature, both from a benefit and cost perspective, aggressively capitalizing costs and selecting long amortization periods increases the rate risks to future generations of electric customers. If the Board questions whether aggressive capitalization policies are prudent...... The Board does not dispute that MH's accounting is based on GAAP, only that GAAP also provides for a more conservative capitalization approach."

In Order 117/06 the Board further stated:

> "The Board is concerned with MH's present capitalization and notes MH's comment that net export revenue represents a form of "windfall" which cannot be guaranteed to continue at recent levels. Even though net export revenues have been significant over the past decade, progress towards the debt:equity target of 75:25 is slow."

The Board notes MH defends its level of OM&A expenditures on the basis of 'need' and has argued that it has successfully 'controlled OM&A cost per customer account'. The Board is of the view that this premise will remain not fully substantiated, given the enormous amount and percentage of total OM&A costs that have been and are forecast to be capitalized, at least until adequate peer benchmarking has been performed and the results reviewed.

As expressed in past Orders, for two decades MH's annual net income result has been assisted/increased by its deferral and capitalization process. If non – direct construction costs (an allocation of the salary of staff in contracts not involved in actual construction but more in planning in supporting roles) had been expensed in the period incurred, rather than capitalized or deferred, annual net income would have been considerably lower, and possibly negative in many years; OM&A cost per customer account would have been much higher; rate pressure would have been considerably greater than has been demonstrated to date; and retained earnings would be much lower.

As indicated, while there is an argument for MH's current approach (to expense costs in the current period and reflect them in current rates, when the costs relate to projects not expected to provide benefits until the future, would mean charging the current generation of MH's customers for costs that could arguably be met by future generations), MH's rate structure and rates, even including the increases directed and indicated in Order 90/08, is premised on past and future OM&A cost deferrals and capitalization. If the approach was to change (a distinct possibility with the upcoming adoption of IFRS), costs now capitalized in the current period would be expensed. This would, again as previously noted, result in current and future ratepayers being billed for costs reflective not only of current costs but also cost burdens avoided by past ratepayers as a result of the current process of deferral and capitalization.

The Board does not believe OM&A should be adjusted based on the corporate strategic plan target of $640 per customer as suggested by the Coalition. The Board is not convinced the benchmark is completely relevant, given the level of expense deferrals and capitalization impacting the current result. Once more stringent capitalization requirements are put in place with IFRS such a metric may have more value and use in the establishment of rate requirements.

To arbitrarily direct, as some interveners have suggested, that a significant amount of expense not be reflected in rates, as a way of sending a message to

MH that it is spending too much on OM&A, would be irresponsible given what the Board and the recent process has revealed.

This Board must rely on the public GRA process to provide opportunities to assess OM&A, and while the Board continues to express concern, there is nothing on the record sufficiently concrete to justify not accepting the costs in rates.

IFRS

The Board notes the coming adoption of IFRS is likely to have a material impact on MH's financial reporting and results. The Board further notes that AcSB has, in advance of IFRS, established a new reporting standard with respect to accounting for intangible assets [including goodwill, deferred charges and capitalized expenditures].

These new requirements are effective for fiscal years beginning on or after October 1, 2008 and could have an impact on MH's fiscal 2009 - 2010 accounts. However, the Board is aware that MH is looking to U.S. Federal Accounting Standards Board (FASB) accounting standards in support of its continuing its present accounting practices in the short term.

The Board's primary concern is not accounting for the short-term, but the long term, particularly with MH's massive capital expenditure plans.

The Board notes in The FASB Handbook section 71.34 (in part), Accounting for the Effects of Certain Types of Regulation, reads as follows:

> "The regulator's action provides reasonable assurance of the existence of an asset (paragraph 9). Accordingly, the regulated enterprise would capitalize the cost and amortize it over the period during which it will be allowed for rate-making purposes."

The Board notes that interpretation of the above standard, which suggests continuing the current accounting practices of MH until IFRS is in place, will require the continued support of this Board.

Given MH’s reliance on a U.S. accounting standard, the question is - if the Board were to develop its own regulated retained earnings, net income and debt:equity ratio approach (ahead of mandatory IFRS adoption), one that is more “conservative” and has the effect reflecting in expenses and rates, more current period expenses, would regulatory accounting, in effect “two sets of books”, be in the public interest?

At the hearing, MH’s witness Mr. Derksen dismissed changes to rate regulated accounting at this time, noting that the CICA had deferred the matter awaiting a future conversion of Canadian GAAP to IFRS. Under US GAAP, exemptions from normal GAAP for rate regulated utilities depend upon the regulator directing the accounting treatment and are premised on the regulator effectively guaranteeing the utility future cost recovery of expenses then to be deferred through higher rates later on.

If the Board took the position that current capitalization and deferrals should not occur, perhaps reflecting its assessment of IFRS guidelines, MH would lose the ability to defer such items in its accounts, and this would affect total current expenditures, net income and, likely, rates.

The Board remains concerned with the Corporation’s ongoing aggressive deferral and capitalization accounting practices, and recommends that MH consider early adoption of IFRS standards. The Board further recommends that the Board’s prior concerns as well as its current views as expressed in this Order be brought to the attention of both MH’s external auditors and also, its independent consultant to assist the Corporation with its IFRS transition strategy.

In any case, with the reflection of IFRS in its accounts, intangible assets now on MH's books may have to be expensed. .

The Board further notes that MH has not adjusted its current forecast (IFF 07-1, which, as previously reported extends to fiscal 2017/18) to reflect the implications and impact of the new accounting standards. The Board accepts that such an adjustment, at least in a formal final sense, may be premature as the true impact and implications have not yet been resolved. Nonetheless, the Board is concerned with the impact on MH's financial statement of the transition to IFRS. The Board needs to be made aware of the implications to arise from the adoption of IFRS so as to be in a position to consider its regulatory options relative to the Board's jurisdiction.

Accordingly, the Board will direct MH to provide it a report by February 1, 2009, to be prepared by an independent professional accounting firm.

The Board will require MH to file, by January 15, 2009:

a) A report explaining and quantifying the proposed transition to IFRS.

b) A copy of MH's consultant's report indicating the projected impact of the adoption of IFRS on the Utility, specifically with respect to MH's current deferral and capitalization approaches, and as to the likely status of goodwill now recorded in its accounts.

c) An articulation of the new proposed MH accounting policies detailing how they comply with IFRS

d) An explanation of any changes to the internal operations of MH which may be planned or contemplated to offset any increased annual expenses expected as a result of the adoption of IFRS; MH's and its consultant's views of the Board's regulatory options, including a review of the pros and cons of special purpose financial reporting for utilities for rate-setting purposes.

e) Updated IFF and CEF forecasts, covering the years 2008 to 2028, reflecting the expected impact of the new standards and assumptions of related operational changes as may be planned or contemplated by MH.

MIPUG recommended that regulatory accounting be considered as an acceptable deviation from GAAP for rate-setting purposes, following IFRS being implemented and assuming the implementation will have major implications for annual expenses, net income, retained earnings and, quite possibly, future rates.

MIPUG noted that regulatory accounting is prevalent in Ontario, and is a practice followed by OEB. However, the Board further notes that the OEB regulates natural gas utilities and 80 electric distribution companies, with varied ownership structures. In the Board's view, the use of regulated accounting by the OEB may be due more to the fact of the number of electric utilities it regulates and a perceived need to account for results on a consistent basis, rather than a desire by the OEB to depart from GAAP for rate-setting purposes. There is only one electric utility in Manitoba, MH, and it is regulated by this Board.

The Board notes the importance that MH and its financial position, plans and results has in the considerations of debt-rating agencies regularly assessing the financial strength and debt rating of the Province. The financial statements of MH are currently prepared in accordance with GAAP. IFRS will be the new GAAP required by all utilities, including MH. Any deviation from GAAP for rate-setting purposes may not be viewed in a positive light by debt-rating agencies, and a negative view could have negative implications on the credit rating of the Province, potentially limiting the source of capital and increasing the cost of borrowing for both MH and the Province.

Accordingly, the Board currently does not believe that separate regulatory accounting should be considered at this time, an approach that would involve deviating from GAAP and, in a sense, establishing a second set of books for MH rate-setting purposes. The Board further believes that a change to regulatory accounting, even if a case for it is established and found valid by the Board, is premature at this time.

The potential for adopting separate regulatory accounting standards that deviate from GAAP (after the adoption of IFRS) will be considered by the Board only once the Board has more information on the potential impact of the accounting changes on MH arising from IFRS, the implications of adopting regulatory accounting, and the potential implications of staying with GAAP or moving to regulatory accounting for rate-setting for the Utility's customers.

Staffing Levels

MH's personnel complement (measured in EFTs - equivalent full-time positions - and based on hours worked as recorded by MH) has soared since 1999, the first large increase accounted for by the additional staff added to the complement following the purchase of Centra Gas, followed up in 2002 by another major influx of personnel upon the purchase of Winnipeg Hydro (WH).

Even taking into account the additional personnel associated with those purchases, and after acknowledging MH's claims of synergistic savings resulting from one employer of all staff, it remains evident that considerable additional personnel growth also occurred, and this is ahead of the actual start up of construction (other than site preparation and roads at Wuskwatim) of Wuskwatim, Pointe du Bois, etc. (an increase of a few hundred additional personnel relates to new trainee positions associated with the Wuskwatim project).

Staffing levels are projected to further increase as the capital expenditure plan develops and is implemented. That said, and some growth explained, the Board remains of the view that MH should develop enhanced analytical tools to allow for a better understanding of the reasons for staff increases over the years. It is important to understand that staff costs represent the vast majority of OM&A expenses. Such staffing analytical tools should be developed and incorporated in the benchmarking analysis which the Board will direct be undertaken in this Order.

Cost Control Measures

The Board notes that staffing levels (EFT) is an important metric, though only one among others that should be further developed. The Board further notes that while the development of performance benchmarks and metrics has long been established as a performance goal of the Corporation, due to prioritization it, regrettably, is yet to be acted on.

The Board agrees with the Coalition that MH should develop performance benchmarks just as the Corporation has indicated it has planned to do for several years in a succession of corporate strategic plans. Given OM&A expense growth in prior years and forecast for the future, MH should assist GRA proceedings by providing the Board better tools to assess the appropriate level of OM&A for rate-setting.

Accordingly, the Board will direct MH to undertake and file with the Board, by June 30, 2009, an independent benchmarking study of key performance metrics, using the most currently-available data and including:

a) Primary key drivers of OM&A in each operational division [Board preference is to allow for a comparison with a greater number of other utilities].

b) Comparable other Canadian Utility data for each of the drivers.

c) Key comparison indicators including staffing levels.

d) A comparison with and discussion of industry best practices.

e) Potential improvement areas.

The Board expects to be apprised of the scope of the study in advance of it being undertaken, and will anticipate being provided the opportunity to provide direction.

The Board is convinced that both the Province and ratepayers will benefit from the developments of appropriate metrics to assess the reasonableness of the level of current and future OM&A expenses, in advance and particularly because of, the proposed major capital expansion program.

MH's justification for the level and growth of OM&A expenditures includes an indicated need for increased maintenance and/or replacement of aging capital assets to maintain the safety and integrity of its electrical system. Recently this assertion is difficult for the Board to evaluate, as the Board lacks jurisdiction over MH's capital expenditures, yet capital expenditures are the major driver of rates.

One item that is lacking is sufficient support for the level of maintenance and upgrades to the existing capital assets of the Corporation. The Board notes Mr. Harper's suggestion that as a best practice, MH should undertake an Asset Condition Assessment, and his view that such a study will provide information on the degree of degradation of existing assets and the need for rehabilitation and/or replacement of capital assets.

Despite prior cautions from the Board, MH intends to spend, on average, $385 million a year on capital construction through to and including 2017/18, capital expenditures that are not related to major generation and transmission projects, which are accounted for separately. In an effort to better justify and demonstrate the necessity of such normal capital expenditures, the Board agrees with interveners on the need for a periodic Asset Condition Assessment Study.

The Board agrees that a study of this nature, done at reasonable intervals, will assist in evaluating MH's progress in maintaining the electrical system, and should also provide additional support for the level of OM&A being incurred and forecast. The Board believes it's appropriate that MH undertake such a study, and will so direct MH to undertake and file with the Board an Asset Condition Assessment by June 30, 2009, that defines:

a) major assets and categories of assets;

b) the estimated remaining economic life of each major asset and category of asset;

c) an indication of the implications for OM&A costs related to maintaining required and scheduled maintenance;

d) a listing of scheduled, planned or anticipated major upgrading/decommissioning of major assets and/or categories of assets;

e) forecast expenditures for planned renovations and/or replacements with respect to now-available energy supply and transmission; and

f) Dam Safety Condition Assessment and Maintenance requirements.

In advance of the commencement of the Asset Condition Assessment Study, MH is to file with the Board detailed Terms of Reference containing the scope for undertaking such a study and a definition of the resources to be employed, on or before January 15, 2009.

New Head Office

With respect to MH's head office project, which is currently expected to involve capital expenditures in the range of $280 million (approximately 1/5th of the Corporation's retained earnings), the Board remains concerned that MH's savings from operating synergies and abandoned current leases may not develop sufficient overall savings to avoid a rate impact arising from the project.

MH suggested that there would be no increase in rates to pay for the new corporate head office, and that the Corporation expects the financial benefits of productivity improvements, and lapsed lease payment requirements, to offset the approximate $20 million of annual additional costs associated with its new building.

The Board has heard MH suggest it will target headcount (EFT) reductions and lease lapses to help offset the increased costs expected to arise with the new head office (depreciation, property and capital taxes, interest, operating costs, etc.), but also heard doubts expressed as to whether such savings would fully materialize.

The Board will direct MH to file a report with the Board by June 30, 2009, detailing the final all-inclusive capital cost of the corporate head office project including such things as construction cost, furniture and equipment, telecommunications, equipment leases and the contemplated or planned operating actions to recover incremental costs related to the new head office. The Board reaffirms that no additional incremental costs are to accrue or be allocated to Centra as a result of the new MH head office.

The Board reminds MH that the Corporation has already been directed by the Board, through an Order arising out of a Centra GRA proceeding, that no additional costs are to accrue or be allocated to Centra as a result of the new head office. The head office came about as a condition of MH's purchase of WH; it had nothing to do with Centra.

6.0 Depreciation & Amortization

6.1 General

Depreciation and amortization expense was $276 million in fiscal 2003/04, rose to $314 million in fiscal 2006/07, and is forecast to further increase to $332 million for fiscal 2007/08 and $347 million for fiscal 2008/09.

MH attributed $6.5 million of the $18 million increase expected in fiscal 2007/08 (from fiscal 2006/07) to new depreciation rates, while the balance was attributed to normal amortization on increased capital assets.

MH instituted new depreciation/amortization tables as of April 1, 2007, flowing from a study that resulted in a forecast annual overall 2.2% increase in depreciation/amortization expense. The new study replaces the previous study that was undertaken in 2002; MH updates its depreciation/amortization studies every five years.

At the GRA, MH advised that it had revised the annual depreciation rate for the Pointe du Bois Generating Station from 1.94% to 11.65% to allow for the full amortization of the unamortized capital cost of the existing and old generating station over its estimated remaining life of nine years (a new generating station is planned to be constructed on the site, one with a higher capacity). As a result, the annual depreciation expense related to the existing facility increased by $1.9 million annually. MH plans on decommissioning the existing generating station effective March 31, 2015.

Depreciation and amortization is forecast to grow to $453 million by 2017/18, due to planned major increases in capital assets.

6.2 Board Findings

The Board agrees with the new depreciation rates, including the acceleration of the depreciation of Pointe du Bois to recognize that the existing asset is to be decommissioned and replaced. However, the Pointe du Bois upgrade and forecast work on the Slave Falls G.S., coming relatively shortly after the purchase of WH, raises a question as to the adequacy of present depreciation and amortization rates in use for the other generating, transmission and distribution assets acquired when WH was purchased, notwithstanding the five year review of such rates.

The Board further notes the provincial plan for curtailing Brandon Coal Plant generation [MH has estimated reducing the use of the plant to emergencies only will reduce its annual net income forecasts by $10 to $20 million dollars]. When the IFF is updated to reflect IFRS and other changes and issues raised in this Order, the decision to reduce the output of the Brandon Coal Plant should be reflected. And, if there is a decision to close the plant, this asset should be subject to an accelerated depreciation similar to that now in place for Pointe du Bois.

Accordingly, the Board will require MH to file a report by January 15, 2009 with the Board, indicating whether the current depreciation rates for the Generation, Transmission, Distribution and other assets purchased from Winnipeg Hydro, including Slave Falls, and the Brandon Coal Plant remain appropriate and the related proposed capital replacement, expansion and decommissioning costs.

The accelerated write-off of the existing Pointe du Bois facility also brings into question the price paid for Winnipeg Hydro, a price that also included a requirement to build the new head office, the cost of which is now roughly four times the original “placemarker” for the project reported by MH at the 2004 GRA.

The Board has concerns with the planned growth in capital expenditures and the related forecast increases in depreciation and finance expense, and comments further on this topic in other sections of this Order.

7.0 Payments to the Province

As a Crown Corporation, MH is not subject to corporate income tax, and it is neutral as to the federal Goods and Services Tax (GST), since GST paid for its purchases are refunded. While these exceptions are of considerable value to the Corporation, and, by extension, to its customers, MH does pay the Provincial Retail Sales Tax on its purchases, and, as well the Corporation Capital Tax, a tax that is to be deleted for private companies. The Province of Manitoba also levies a number of other fees on MH.

At the 2004 GRA, reported annual payments made to the Province from MH for fiscal 2003/04 were $175 million. The aggregate payment increased to $219 million in fiscal 2006/07 and was forecast to increase further to $230 million in 2007/08 and $223 million in 2008/09.

Total payments to the Province either made or forecast to be made from 2002/03 through 2008/09 are summarized as follows:

Payments to the Province ($millions)

	Actual					IFF 07-1	
Fiscal Year	2003	2004	2005	2006	2007	2008	2009
Corporation Capital Tax	33	35	35	36	37	38	40
Payroll Tax	6	6	7	7	8	8	8
Water Rentals	95	62	104	124	106	114	103
Debt Guarantee Fee	70	67	68	66	68	70	71
Sinking Fund Admin Fee	1	1	1	1	-	-	1
Special Payment	200	4	-	-	-	-	-
Total Payments	**405**	**175**	**215**	**234**	**219**	**230**	**223**
Retained Earnings	1135	707	845	1,265	1,386	1,650	1,774
Retained Earnings including Payments to the Province [1]	1,540	882	1,060	1,499	1,605	1,880	1,997
Total Payments as a % of Retained Earnings - Return to Shareholder[2]	28.8%	14.5%	22.1%	18.3%	14.1%	12.2%	11.2%
Total Payments as a Percentage of Gross Revenue	30.3%	13.6%	14.3%	12.8%	13.4%	13.8%	13.9%

Note 1. Approximates what retained earnings would have been at the end of the year if no payments to the Province were made.

Note 2. The Return to Shareholder is based on the payments to the Province over average Retained Earnings in each year (including the 2003 and 2004 special payments to the Province)

Overall, MH's payments to the Province have represented, excepting for 2003, a return on overall electricity sales to the shareholder in the range of 14%. While the concept of summary budgets results in the net income of MH also being recognized as income for the Province, that income is not available to the Province for its departmental spending unless paid in the form of a fee or dividend. Previously, this Board has recommended that no dividends be paid by MH to the Province until such time as MH has achieved and is expected to hold to its 75:25 debt:equity ratio target.

While MH pays Corporation Capital Tax to the Province based on its invested capital, which is a function of the level of capital employed, both debt and equity, Corporation Capital Tax is being phased out for all private corporations at the end of 2010. MH will remain subject to Capital Tax beyond 2010.

Water rentals relate to the use of provincial water resources, and the fees are paid to the Province on a monthly basis based on hydraulic generation. When, about a decade ago, MH was transferred certain northern liabilities of the Province, water rental rates were frozen to 2001.

The Provincial Debt Guarantee Fee is 1.0 % of the sum of MH bonds, provincial advances to MH and provincial short-term debt outstanding related to MH at MH's year-end. The fee was increased from 0.95% to 1.0% effective for fiscal 2006/07, and the level remains unchanged in MH's forecast for the full forecast period of IFF07-1. The Sinking Fund Service Charge is 0.075% of the amount of the sinking fund balance, and is paid to the Province for its managing of MH's sinking fund investments. MH's sinking fund is a covenant related to its bond issues.

A now expired legislative amendment to the MH Act provided for a special payment to the Province (dividend), which was made through a first instalment of

$200 million in 2002/03, followed by a remaining instalment of $4 million in 2003/04. For the purpose of comparison, dividends are regularly paid, and on an annual basis, by Hydro Quebec and B.C. Hydro to their respective provincial government owners.

The Province recently announced an intention to introduce new carbon legislation towards reducing Green House Gas emissions (GHG) in the province. MH stated that if it continued to operate the Brandon coal generating station at current production levels, the cost of the expected emissions tax on coal would be in the order of $5 to $6.5 million per year, commencing in 2011. However, it is expected that the generating station will, in the near future, be operated under very restricted conditions (for emergencies), which would reduce the emissions tax considerably. Nonetheless, the loss of the current level of average annual coal generation is forecast by MH to be $10 to $20 million annually – the operation of the plant has been profitable for the Corporation.

In addition to the payments to the Province, MH makes Grants in Lieu of Taxes (GILT) to municipalities with respect to MH buildings and structures that are located throughout the Province. In 2006/07, MH made $10 million in GILT payments, and the payments were forecast to increase to $15 million in 2008/09, the increase primarily the result of the new Corporate Head Office being added to Winnipeg's tax rolls. MH is currently negotiating with the City of Winnipeg and has estimated the annual property and business tax bill for its new head office will be in the range of $5 to $7 million dollars, the full effect to occur from 2009/10.

7.0 Payments to the Province

7.1 Interveners' Position

The Coalition noted that the special payment to the province of $204 million then-increased the debt to equity ratio by 3% and the debt component to 85% vs. 82%. By MIPUG's calculation, for 2008/09, the impact of the earlier payment remains at three percentage points.

The Coalition noted that payments to the province represent a significant benefit to the province.

7.2 Board Findings

The Board accepts that the projected payments to the Province represent a return to the Province of approximately 14% per annum of MH's overall electricity revenues. The Board understands that the Province employs these receipts to support health, education, social and other programs, for the benefit of all Manitobans.

MH is a prominent contributor to the overall economic well being of the Province, assisting in a variety of ways:

- Annual payments in excess of $200 million for water rentals debt guarantee fees, payroll taxes, capital taxes and other miscellaneous fees;
- Sales taxes, personal and corporate tax revenues with respect to staff and contractor complements and activities;
- MH's Annual net income, (projected to average $161 million per annum through 2017-18), which is included in the overall accounts of the Province;

- Mitigation payments to First Nations and Northern Communities related to the northern flood agreement and related pacts, amounting to in excess of $600 million on a cumulative basis, which has greatly assisted northern First Nations communities;
- Partnership agreement with NCN with respect to the Wuskwatim G.S. development, and potential pending relationships with other First Nations with respect to Conawapa and Keeyask;
- Targeted training and employment of northern and first nations residents;
- Grants in lieu of taxes payments to Manitoba's municipalities ;
- DSM expenditures towards the environmental objectives of the Province;
- Investment in wind generation, furthering provincial environmental objectives and rural community development;
- DSM low-income programs, to assist in sustaining low-income households;
- Planning for Bipole III to be constructed on the west side of the Province rather on the east side of Lake Winnipeg, to support the Province: object of protecting the boreal forest;
- Uniform rate design, (all communities and customers on the provincial electricity grid are subject to the same rate schedule, assisting with the economic and social development of rural and northern communities); and
- Export/import arrangements with American utilities within the MISO market and the provincial utilities of Ontario and Saskatchewan, which assist in increasing electrical reliability and the overall reduction of GHG emissions.

A further benefit to the City of Winnipeg has been the building of a new Corporate Head Office in downtown Winnipeg, a component of MH's agreement to purchase Winnipeg Hydro. The new head office will result in approximately 2,000 MH employees relocating to the new head office and contributing economically to local businesses and the further revitalization of the Winnipeg downtown.

The acquisition of Winnipeg Hydro has also provided the City of Winnipeg with an ongoing stream of revenue as a component of the sale agreement and saved the City and its ratepayers from the otherwise required massive expenditures to upgrade and maintain aging WH assets, such as Pointe du Bois G.S. Finally, with respect to the benefits provided to the City of Winnipeg, MH has expended over $13 million to upgrade the energy efficiency of the City's operations, the result to have an ongoing and substantial benefit to the City.

8.0 Financial Targets

8.1 Background

In September 1995, MH adopted the following financial targets, which were subsequently reviewed by this Board at the 2002 Status Update Hearing and, most recently, at the 2004 General Rate Application.

MH's current financial targets are as follows:

1. To achieve and maintain a minimum debt to equity ratio target of 75:25;
2. To achieve and maintain an annual gross interest coverage ratio of 1.20 annually; and
3. To fund all new capital construction requirements, except major new generation and/or major new transmission facilities (which include the new head office), from internal sources.

MH's financial targets have varied over the years, due to changing circumstances and priorities. Financial targets have been as follows:

Year	**Financial Target**
1995	75:25 debt equity ratio by 2005/06, interest coverage ratio of 1.20 to 1.35 and fund all capital expenditures, except major new generation and transmission facilities, from internally-generated funds
2001	75:25 debt equity ratio by 2005/06, minimum interest coverage ratio of 1.20 and fund all capital expenditures, except major new generation and transmission facilities, from internally-generated funds
2002	75:25 debt equity ratio by 2011/12, minimum interest coverage ratio of 1.10 and fund all capital expenditures, except major new generation and transmission facilities, from internally-generated funds
2007	75:25 debt equity ratio by 2011/12, minimum interest coverage ratio of 1.20 and fund all capital expenditures, except major new generation and transmission facilities and new head office building and DSM, from internally-generated funds

In 1995, MH moved to more aggressive financial targets to achieve a balance between fiscal responsibility, competitive positioning and customer bill affordability. MH expected that attaining the updated targets would result in lower debt, thereby reducing interest costs and ultimately assisting in rate restraint and competitiveness.

As at March 31, 2002, MH had a debt:equity ratio of 77:23, and appeared well on its way to meeting the 75:25 target. While the dividend to the Province represented an addition of 3 points to the debt element, the target was largely missed as a result of the 2003/04 drought.

The drought resulted in an approximate $600 million reduction to net export revenues relative to a normal flow period, and this, coupled with the $204 million special payment to the Province (planned and implemented before the drought), increased the debt ratio 10 percentage points in two years, severely impeding MH's progress toward its financial target.

Subsequently, the target year to reach a 75:25 debt equity ratio was changed from 2005/06 to 2011/12 to allow for a more gradual rate impact on customers. Since then, with major new capital construction in process and planned, requiring extensive new borrowings, there is no current expectation for the target to be met.

8.2 Debt to Equity

The debt to equity ratio measures the relationship of long and short-term debt (less short-term investments and sinking fund investments) to equity. The ratio is used by bond rating agencies and the Board, among others, to assess the financial risk MH represents.

Subsequent to reviewing the level of debt issued by the Corporation in relation to the amount of equity held in the form of retained earnings, there is no expectation that the Province will make equity injections into the Corporation; it is to manage its affairs such as to avoid such a requirement. MH established a debt to equity ratio target of 75:25.

MH's actual and forecast debt to equity ratios for fiscal 2003/4 to 2008/09, as compared to the forecasts of IFF03-1 presented at the last GRA, were and are as follows:

Debt to Equity Ratio Comparison Actual/IFF07-1 to IFF03-1

	Actual				Forecast	
Fiscal Year	2004	2005	2006	2007	2008	2009
Actual/IFF07-1	87:13	85:15	81:19	80:20	77:23	77:23
IFF03-1	85:15	85:15	86:14	86:14	87:13	87:13

MH has made a marked improvement in its movement towards the 75:25 debt to equity ratio target since the 2003/04 drought. The Corporation's improved financial position relates to higher than expected extra-provincial revenue in fiscal 2005/06 and 2007/08, and rate increases granted by the Board in 2004 (5%), 2005 (2.25%), 2.25% (granted on an interim basis April 1, 2007 and finalized by Order 90/08), and 5% as of July 1, 2008 (Order 90/08). The 5% increase granted July 1, 2008 (Order 90/08) should assist.

8.0 Financial Targets

At the recent hearing, MH stated that its proposed 2.9% rate increase would assist MH in pursuing its debt:equity target, while being sensitive to the impact that electricity rate increases have on customers. The Corporation advised that it did not expect to reach the target debt to equity ratio within its latest long-term forecast period, that is, through 2017/18.

Compared to other Canadian utilities, MH has a higher debt to equity ratio:

Equity Ratios Comparison to Other Utilities

	Manitoba Hydro (Mar 31)	BC Hydro (Mar 31)	SaskPower (Dec 31)	Hydro-Quebec (Dec 31)
■ 1999/00	0.17	0.26	0.44	0.26
■ 2000/01	0.20	0.30	0.43	0.26
□ 2001/02	0.23	0.28	0.40	0.27
□ 2002/03	0.20	0.28	0.43	0.26
□ 2003/04	0.13	0.30	0.44	0.30
■ 2004/05	0.15	0.30	0.42	0.33
■ 2005/06	0.19	0.30	0.39	0.34
■ 2006/07	0.20	0.30	0.39	0.36

MH's current forecast IFF07-1 does not foresee MH meeting its 75:25 debt to equity target, neither by 2011/12 nor over the remainder of the IFF07-1 forecast period to March 31, 2018. MH forecasts a debt to equity ratio of 77:23 in fiscal 2017/18, the same as forecasted for fiscal 2007/08, even with cumulative rate increases of 33% assumed over the forecast period.

MH indicated in addition to the 2.9% rate increase it was seeking at the recent GRA, that (hypothetically) consecutive increases of 6.60% in fiscal years 2010, 2011 and 2012 would be required to reach the debt to equity ratio target of 75:25 by fiscal 2011/12.

Achievement of the 75:25 debt to equity target without larger rate increases appears to be virtually impossible due to the planned major increases for capital spending initiatives on New Generation, Major Transmission and the new office building, because of the corresponding increased debt levels to fund such construction.

As well, there is an increasing statistical probability that a new drought will set the Corporation back, and the losses from a serious drought could more than eliminate the current retained earnings balance. Other risks, including currency, interest rates, accounting standards changes, increased domestic loads and higher than now-projected capital expenditures also increase MH's risk status.

As suggested, changes in GAAP to come with the move to IFRS in fiscal 2011 can be expected to further hinder MH's progress to its debt to equity target, if not place even more pressure on rates going forward. A discussion of the IFRS changes is provided in other sections of this Order. As in previous Orders, the Board questions MH's cost deferral and capitalization practices which now have the effect of increasing annual net income and retained earnings and assisting in progress towards the stated debt:equity ratio.

8.3 Interest Coverage Ratio

The Interest Coverage Ratio is calculated to measure the degree to which net income before interest exceeds finance expense. MH's interest coverage ratios, actual or projected, for 2003/04 to 2008/09 are as follows:

Interest Coverage Ratio Comparison Actual/IFF07-1 to IFF03-1

	Actual				**Forecast**	
Fiscal Year	**2004**	**2005**	**2006**	**2007**	**2008**	**2009**
Actual/IFF07-1	0.12	1.27	1.83	1.24	1.56	1.30
IFF03-1	0.29	1.08	1.05	1.05	1.03	1.04

The improved interest coverage ratio, relative to IFF03-1's actual and forecast, is due to higher than forecast net income and lower interest costs than forecast in IFF03-1. The actual ratio for fiscal 2003/04 was due to the drought and the loss incurred in that year. In the current IFF07-1, the interest coverage ratio target is achieved in all years of the forecast except for minor shortfalls from fiscal 2010 to 2014.

Again, achievement of the target in recent years has been assisted by MH's cost deferral and capitalization practices, which will change with IFRS. And, of course, there are the myriad of other risks that could lower annual net income and put the achievement of this target at risk.

8.4 Capital Coverage

The Capital Coverage, as formally stated, measures MH's ability to make "normal" non-major capital purchases without taking on additional borrowings. MH's actual or projected capital coverage ratios for 2003/04 to 2008/09 are:

	Actual				**Forecast**	
Fiscal Year	**2004**	**2005**	**2006**	**2007**	**2008**	**2009**
Actual/IFF07-1	(0.42)	1.20	2.52	1.12	1.74	1.07
IFF03-1	(0.21)	0.54	0.50	0.41	0.48	0.56

Again, the actual results for fiscal 2003/04 were due to the drought, and the improved results since to improved water flow conditions and resultant higher exports, and with the continued exception of capital spending on major projects from inclusion in calculating the ratio.

MH's current practice is to exclude major capital expenditures when determining the capital coverage ratio. When major capital expenditures are included, the resultant capital coverage ratio indicates that MH must finance its major capital expenditures with debt, as opposed to the intended internally-generated cash flows.

Comparison of MH Capital Coverage Including Major Capital:

	Actual				Forecast	
Fiscal Year	**2004**	**2005**	**2006**	**2007**	**2008**	**2009**
Actual/IFF07-1	(0.42)	1.20	2.52	1.12	1.74	1.07
Including Major Capital and Head Office	(0.35)	0.86	1.64	0.70	0.58	0.34

Comparison of MH Capital Coverage Including Major Capital IFF07-1:

Fiscal Year	**2008**	**2009**	**2010**	**2011**	**2012**	**2013**	**2014**	**2015**	**2016**	**2017**	**2018**
Actual/1FF07-1	1.74	1.07	0.69	0.76	0.84	1.13	1.03	1.1	1.22	1.21	1.40
Including Major Capital and Head Office	0.58	0.34	0.3	0.34	0.41	0.46	0.29	0.31	0.31	0.28	0.36

As previously indicated, the deterioration in the capital coverage ratio in 2003/04 was due to the drought; it led to MH's largest and a very major loss. The improvement since 2003/04, relative to the forecast in IFF03-1, is related to higher than forecast income due to excellent water conditions, providing for higher than expected export revenue, and a succession of Board-approved rate increases.

MH's capital coverage is forecast to decline in 2008/09 from that forecast for 2007/08 due to increases in capital spending. In the current IFF07-1, the target is met in all years except fiscal 2010 to 2012, those missed target years being due to increases in capital spending on new generation and major transmission projects.

Again, IFRS and the myriad of other risks faced operationally and financially by MH could reduce the net income now forecast for future years and further worsen the capital coverage ratios.

8.5 Reserves

The concept of MH establishing specifically defined reserves to meet risks associated with a drought or another calamity was suggested by MIPUG's witnesses.

The suggestion was that a reserve fund would be established out of retained earnings and future net income and, when deemed adequate, would be utilized to avoid what otherwise might be judged "excessive" rate increases, which, in the absence of adequate reserves, could be required.

With an adequate reserve in place, annual rate changes would be decided based on a judgment as to the sufficiency of the reserve funds in place to meet the risks of the Corporation, utilizing net income to build the fund during normal years and providing for a gradual recovery of a depleted reserve following a calamity that had resulted in the use of the reserve to prevent an "excessive" rate increase.

If MIPUG witnesses' advice and the intervener's recommendation was taken and such a reserve or reserves established, this approach would supplant the current reliance on retained earnings and the now-required or goal of meeting the 75:25 debt to equity target (as the means to avoid "excessive" rate increases driven by a calamity).

MH did not agree that a specific rate-protection reserve or reserves should be established, and considered the idea of segmented or restricted reserves to represent an outdated concept, and one abandoned by MH in 1992. Specific purpose reserves would, for Hydro, be inconsistent with contemporary principles of Enterprise Risk Management, in which the interdependence of risks is to be managed in a coordinated way across the Corporation.

In short, MH prefers to keep the 75:25 debt to equity ratio as its target "buffer" against <u>all</u> financial risks, and to forego the development of specific reserves to meet specific risks.

8.6 Interveners' Positions

Coalition

Mr. Harper opined that MH established a target debt to equity ratio for two primary reasons: first, to demonstrate to the financial community that MH is a financially sound Corporation (important because the perception of MH's financial integrity in the financial community affects the borrowing rate not only for MH but also for the Province of Manitoba, which guarantees the Corporation's debt), and the second, that maintaining a satisfactory level of equity provides a means of stabilizing rates under particularly adverse events such as a drought.

In meeting the financial impact of a drought (which brings losses and increased debt to equity ratios) what is important for Mr. Harper is the overall level of retained earnings and how it compares with the level of losses that might occur under various types of adverse events.

Establishing an appropriate level of reserves within this context involves more than estimating the cost of a five-year drought. Mr. Harper stated that more work needs to be done to assess MH's risks if the Board wants to establish an appropriate target reserve, even if the reserve is to continue to be expressed as retained earnings.

Mr. Harper stated that a proper determination of an appropriate level of reserves for MH would entail:

- Identification and quantification of the risks faced by MH;
- Identification of ways to manage these risks and, in particular, identification of those risks that would be managed through maintaining financial reserves as opposed to other approaches such as insurance, financial hedges and rate increases;
- A determination of the likelihood of occurrence of the various risks that are to be managed through reserves, and the extent to which individual risks are either independent or interdependent;
- A determination of the degree of a risk MH is willing to accept; and
- A quantification of the resulting reserves required.

Mr. Harper noted that the development of an appropriate reserve target should be an iterative process, as the degree of risk MH is willing to accept is dependent upon the level of reserves required and the cost of achieving such reserves, the cost being measured in the magnitude of possible rate increases.

Mr. Harper stated that forecast capital spending in 2007/08 and 2008/09 is considerably higher than historic averages, mainly due to expected higher spending on New Generation and Transmission, and noted that this spending is putting noticeable pressure on MH's debt to equity ratio. As of March 31, 2007, spending on major new generation and transmission projects was estimated to have increased the debt ratio by 2%, and by March 31, 2009, 5%.

MIPUG

MH's total capital – debt plus equity - is the denominator in the debt: equity ratio, and is expected to increase massively as the planned major new projects proceed. With domestic load expected to continue to increase, average export sales volumes can be expected to decline until new generation comes on stream. And, when new generation does come on stream, MIPUG noted that the experience has been that each new plant experiences a few years of marginal or loss years, placing pressure on annual net income levels and the debt to equity ratio during those years.

Thus, and for MIPUG, in the absence of annual and material domestic rate increases the current debt to equity target of 75:25 should not be expected to be reached in the foreseeable future, that is for more than a decade. Hence the problem, assuming the debt:equity target ratio of 75:25 is important and required to be met. If the target ratio is to be met, for MIPUG, ratepayers should expect annual rate increases, the only question being the magnitude of the increases.

To a large degree, the magnitude of the needed increases is, as MIPUG stated, necessarily related to major new capital projects and the new debt taken on to allow those plans to be realized. MIPUG thus linked future rate increases with projects to be advanced earlier than needed for domestic purposes, i.e. for export reasons, and claims that such rate increases would be contrary to "clear policy objectives" for these projects.

As such, for MIPUG, the debt:equity target (even if accepted as a valid target for assuring the Corporation's Board of Directors) is much too coarse to use as an analytical tool for the purposes of setting rate levels.

With the potential for further billions of dollars for additional capital projects in the years following the current IFF horizon, bringing debt up to, say, $20 billion by 2022, for MIPUG it is apparent that a 75:25 debt to equity ratio could only be achieved with unprecedented additions to net income by way of rate increases on top of the forecasts contained in IFF 07-1.

As to how much additional net income would be required to allow retained earnings to increase sufficiently to attain and hold to a 75:25 debt:equity ratio, MIPUG asserted up to an additional $2.5 billion in additional net income would be required, depending on the level of capital expenditures, above and beyond the net income forecast to come from annual 2.9% rate increases and net export revenues as currently forecast.

Reserves are required for the goal of protecting ratepayers from the risk of large rate increases driven by the actuality of a major risk. MIPUG's witnesses opined that MH's projected levels of retained earnings will be ineffective for this purpose, as the level of retained earnings is not directly overseen by this Board and does not provide the Board with a sufficient level of control.

MIPUG recommended that the Board should establish a reserve to cushion ratepayers from rate increases due to the risks faced by the Corporation, and discard further reliance on the debt:equity target ratio. And, per MIPUG, ahead of establishing the reserve to be required, the Board should direct that a major review of alternatives to the establishing of appropriate reserves be undertaken, as may be permitted within the appropriate legislation.

MIPUG urged the Board to consider the need for a focused debate on issues and options regarding establishing secure reserves. In such a review, consideration should, for MIPUG, extend to the determination of the appropriate levels of these reserves, alternatives for maintaining the reserves fully under the Board's jurisdiction and oversight, and, as well, measures for calculating, in any given year, the necessary level of appropriation to or withdrawal from, the reserve accounts – to affect the rate increase to follow.

8.7 Board Findings

Notwithstanding MIPUG's concerns and the hypothetical value the intervener claims for leaving the current method of determining the adequacy of MH's reserves, i.e. reliance on a debt to equity target, for specific reserves, the Board remains concerned that MH is not making sufficient progress in meeting and assuring holding to maintaining its current debt to equity target once met.

The Board is further concerned that during particular fiscal periods of the current forecast to and including fiscal 2017/18, MH does not expect to maintain either or both of its other financial stability targets, that being its interest and capital coverage ratio targets. The three measures of financial health and stability (debt to equity, interest coverage and capital coverage) are taken seriously by debt rating agencies and others, and while the ratios may not be expected to be maintained throughout the whole forecast period due to the effects of the expanded capital program, they still remain important.

Financial targets are set to be met, and to secure the future financial integrity of the Corporation MH also must, logically, take into account the upcoming adoption of IFRS, the possible future effects of continuing if not increased Canadian dollar appreciation and rising interest rates, and the rising cost of constructing new assets. The Board suggests MH consult with bond-rating agencies and government over what would represent an acceptable deviation from the existing financial stability targets during periods of considerable capital expansion, all to be financed by debt and rates.

The Board further notes that, cumulatively to March 31, 2009, and including the 5% established by Order 90/08 from July 1, 2008, approximately $400 million of additional revenue will have been generated from recent (since 2004) rate increases, following a decade of no domestic rate increases. However, despite these revenues and the on-going effect of these rate increases, with its current capital program plan and with ongoing increases in OM&A expenses, MH still does not expect to meet its debt to equity target within the current forecast period ending March 31, 2018.

The Board understands an argument can be made that current rate increases are due to capital expenses advanced for export purposes ahead of domestic load need, and that this may be considered to involve a degree of inter-generational inequity. However, the Board finds it unreasonable to expect current ratepayers to avoid any rate implications of plans now being made and implemented that contain not only opportunity but also increased risk for future generations.

The Board observes that this current generation of ratepayers may reasonably expect to gain from the economic activity associated with the Corporation's current capital plans, even ahead of those plans yielding any new export or domestic generation sales, and seeks a balance of interests.

That said, MH needs to provide the Board more assurance, through more detailed analyses and external assessments, that the risks now being taken on are reasonable and that the intended new projects will benefit not only current generations but future ones as well.

The Board notes that MH has a growing and significant level of non-revenue producing assets (intangible assets, such as deferred charges, goodwill and capitalized OM&A expenditures, the new head office building; and construction in progress, which includes large accumulations of capitalized OM&A). MH's current and forecast Retained Earnings through to 2017/18 is fully accounted for by these non-revenue producing assets, bringing into question the adequacy of a 75:25 debt:equity target with the current accounting approach - and this does not include reflection of IFRS.

The Board notes recent major export contracts being entered into since the filing of the GRA, though briefly reported on during the proceeding, are expected to require additional generation and transmission not yet included in the Corporation's capital expenditure forecast, projects that will push MH's debt closer to $20 billion by 2022 (assuming the forecast of the cost of these projects does not further increase materially).

It is the Board's view that, given the ambitious capital program and related increasing growth in debt, it is unrealistic to anticipate that MH will meet its debt to equity ratio of 75:25 even by the end of the current forecast period, 2017/18. Such a target has become seemingly impossible to attain given that the major capital expenditures contemplated are to be financed by debt, without truly significant rate increases.

The Board notes the Coalition's inference that Hydro's debt:equity ratio could be 80:20, and that such a change would be without risk as such a ratio is comparable to B.C. Hydro's new government-set target. However, BC Hydro does not have the same approach for deferral of expenditures as MH, and may not have the same OM&A capitalization policy as well. Furthermore, while BC Hydro's total long-term debt may be similar to MH's, BC Hydro has an annual revenue stream that is almost three times that of MH, providing a greater ability to service debt.

Furthermore, the degree to which B.C. government's debt ratings are dependent on B.C. Hydro is considerably less than the case with MH and Manitoba. It is the Board's understanding that rating agencies look prominently at MH's financial strength in assessing the credit rating of the Province. A weakening of the financial strength of MH would not be viewed favourably by those credit rating agencies and may have implications impacting the credit rating of the Province, making provincial borrowing more expensive. Such a development would not be in the pubic interest.

It is the Board's understanding that private utilities would have difficulty raising debt with a debt:equity ratio greater than 60:40, and that new projects would proceed only with the assumption of injections of additional capital. In MH's case, the assumption is that retained earnings represent the Utility's capital and that capital increases only by means of net income, derived from domestic rates and export profits.

If the Board were to implement, at least for rate regulation purposes, the Rate Stabilization Reserve model (RSR) proposed by MIPUG, it would be expected to deem certain earnings to contribute to the RSR while "unapproved" costs would "fall back" to MH and its sole shareholder, the Province. Under MIPUG's suggested approach, if the Province did not reimburse MH directly for such "unapproved costs", the Utility would be further at risk of missing vital financial targets.

As to MH's opposition to the RSR proposed by MIPUG, it is only partially valid. Put in the proper context, the RSR could be restricted only in the sense that it could only be used for identified operating "disaster" conditions. Under such an approach, deemed excess spending would not be reflected in rates by the Board, and would fall to the shareholder through the unrestricted retained earnings balance. However, if the Board were to adopt such an approach, a process would need to be developed to determine an appropriate level of the RSR.

What would represent an adequate RSR? Previously, the Board has requested that MH file a quantified analysis of its major risks and analysis that would put numbers to the major risks that have been identified. Not only would the risks associated with a five-year drought be quantified (MH has suggested that such a drought could result in losses of over $3 billion), but also the risks associated with the failure of major infrastructure, interest rate increases, further currency changes and, for any reason, the loss, even if temporary and for whatever reason, of the export market. In the absence of much more rigorous analysis, the Board is uncertain whether such an analysis would arrive at a RSR lower or higher than the current level of retained earnings required under a 75: 25 debt to equity target. The Board is concerned that there may be a case for establishing a higher reserve requirement, one that would further push rates.

On balance, the Board is of the view that a regulated RSR, i.e. the adoption of MIPUG's specific reserve proposal, is currently premature, at least ahead of MH identifying and properly quantifying its risks, as has been requested in past orders. Such quantification is vitally important given the increased risks that will accompany a debt level that may reach $20 billion by 2022.

Given the increase in capital spending, and recognizing MH no longer forecasts achievement (by 2012 or even 2018 for that matter); a 75:25 debt:equity ratio, it is time for MH to re-evaluate the equity target and set a new date for achievement.

Accordingly, the Board will require of MH a detailed, comprehensive and quantified Risk Review. The Board will withhold its final judgment on the development of reserves designed to meet the risks faced by MH until such a review has been placed before it and reviewed at a subsequent GRA. At least until then, the current financial targets stand.

.

9.0 Capital Expenditures

9.1 General

MH's CEF 07-1 is a projection of MH's capital expenditures for new and replacement facilities to meet the electricity requirements in Manitoba, as well as expenditures to meet firm sales commitments outside the Province.

CEF 07-1 summarizes an eleven-year program of capital expenditures totalling $11.3 Billion to fiscal 2018, ranging from $831 Million in fiscal 2008 and increasing to $1.1 billion in fiscal 2018. Spending for New Generation, Transmission (and the New Head Office) total $7.5 billion, with the balance of $3.8 billion representing an ongoing capital program of, on average, $345 million per year. This represents a ten-year increase of $930 million in anticipated new capital costs, from that previously forecast in CEF 06-1.

New Generation and Major Transmission forecast in CEF07-1 was:

New Generation & Major Transmission Capital Expenditures CEF07-1 ($ millions)

Fiscal year	Project Cost	2008	2009	2010	Culmulative to 2018
Wuskwatim Generating Station	1,274.6	147.1	287.4	293.9	1,080.4
Wuskwatim Tansmission	319.8	79.2	107.9	47.1	280.0
Keeyask Generating Station Licencii	325.3	50.5	63.4	-	113.9
Conawapa Generating Station	4,978.4	32.6	57.8	54.7	2,162.1
Kelsey Improvements/Upgrades	183.9	36.1	30.6	28.4	123.0
Point du Bois Rebuild	900.5	13.5	23.3	35.0	896.0
Bipole III Western Route	2,447.8	1.9	2.9	9.3	2,237.0
Other	305.0	7.3	13.6	46.2	253.5
Demand Side Management		40.4	43.1	34.2	338.4
Total		408.6	630.0	548.8	7,484.3

9.2 Comparison of CEF03-1 to CEF07-1

At the 2004 GRA, MH filed CEF 03-1, which reflected capital spending of $5.8 billion over the eleven-year period from 2003/04 to 2013/14. Over the same eleven-year period, MH's actual capital expenditures for 2003/04 to 2006/07 and projected expenditures for 2007/08 through 2013/14 is now forecast at $8.5 billion, $2.7 billion greater than that forecast in CEF 03-1, as illustrated in the following table:

Capital Expenditures ($millions)

	Actual				Forecast				11-Year
Fiscal Year	**2004**	**2005**	**2006**	**2007**	**2008**	**2009**	**2010**	**2011-14**	**Total**
Actual/CEF07-1	455	485	504	634	801	1,016	958	3,648	8,502
CEF03-1	481	583	622	748	748	641	598	1,405	5,826
Difference	(26)	(98)	(118)	(115)	53	375	360	2,244	2,676

The major increase since 2004 is attributable to additional new Major Generation and Transmission, the new head office and cost escalations above the rate of general inflation on capital projects, expanded DSM programs, and increased maintenance on existing infrastructure.

9.3 New Generation and Major Transmission

There has been a significant increase in the costs of new generation and Major Transmission projects since 2004. MH cited the increase is due to inflationary pressures on labour, contract services and materials, the latter representing a condition of hyper-inflation, as well as other considerations. A comparison of significant projects cost changes between CEF 04-1 and CEF07-1 follows:

New generation and Major Transmission CEF04-1 to CEF07-1

($ millions)	CEF 04	CEF 05	CEF 06	CEF 07	$Increase 04-07
Wuskwatim G.S.	846	935	1094	1,275	429
Wuskwatim Transmission	199	200	257	320	121
Wuskwatim Total Project	1,045	1,135	1,351	1,595	550
Herblet Lake Transmission	55	54	54	95	40
Bipole III(1)	388	1,879	1,879	2,248	1,860
Pointe du Bois	288	692	834	900	612
Conawapa G.S. & licensing	4,050	4,516	4,978	4,978	928

Note 1: CEF-05 assumed Bipole III would be build east of Lake Winnipeg, the current intention is a western route.

MH indicated a significant escalation in capital costs for its projects that relate to many market factors beyond its control. Utility industry construction costs have risen and are expected to remain elevated for some time, reflecting underlying trends for cost increases for steel, copper and concrete due to high global demand and, as well, increased production and transportation costs due to much higher fuel costs. Another factor is a shortage of skilled workers that has driven costs higher for utility construction services.

9.4 Wuskwatim Generating Station (Wuskwatim)

9.4.1 General

The Wuskwatim Generating Station represents Manitoba's first new hydroelectric development since the late 1980s, and the first in Manitoba structured as a partnership (MH and the First Nations Nisichawayasihk Cree Nation (NCN). In approving the project the CEC recommended that:

> "The Government of Manitoba grant The Public Utilities Board jurisdiction to review, on an ongoing basis, as part of Manitoba Hydro's future General Rate Applications, the actual revenues and costs of the projects relative to forecast, along with the impact of the Projects on Manitoba Hydro's financial stability and its domestic rates."

This application represents the Board's first review of the Wuskwatim project as it now stands.

At the CEC hearing, MH justified Wuskwatim on the basis that the new generating station would be built to serve export markets, and stated that the power from the station would not be required for domestic consumption until 2019. Now, given current firm export contracts and an increase in forecast domestic load, MH indicates the power generated from Wuskwatim will be required by 2012 to meet domestic needs and firm export contracts.

9.4.2 Capital Cost of Project

At the outset, the capital cost of the Wuskwatim project, as presented to the CEC, was estimated at $900 million. The updated cost estimate now indicates a project cost of approximately $1.6 billion, an increase of $700 million since the CEC hearing in 2004, and an increase of $550 million since CEF04-1.

MH attributed the increase to inflationary pressures on labour, contract services and materials. The estimate also increased to account for both the deferral of the in-service date, from 2010 to 2012 and to account for increases in licensing costs.

MH also reported that the Wuskwatim Project Development Agreement allocates MH's overhead costs at a rate of 21% as opposed to the "normal" 29%, this reduction allowing for the exclusion of a share of costs related to Winnipeg facilities and computer systems not expected to be utilized by the project.

9.4.3 Wuskwatim Power Limited Partnership (WPLP)

The project is to be developed by the Wuskwatim Power Limited Partnership (WPLP), an equity partnership between NCN and MH. The project is unique, and represents the first time MH has entered into an equity partnership on a generating station project. MH suggested that the experience gained through the WPLP may be used in structuring agreements for future northern Generation projects, including the now-expected development of Keeyask and Conawapa.

The two Limited Partners are to invest equity in the project by subscribing for ownership units to represent 25% of the total capital cost of the project. The WPLP agreement allows for NCN, through its wholly owned Taskinigahp Power Corporation (TPC), to subscribe for up to a 33% stake in the Equity Partnership Units. MH, through a holding company (General Partner), would have a 0.01% interest, with MH, as a Limited Partner, holding the balance of 65.99%.

The assets of the Partnership are to consist of the Wuskwatim G.S. and required working capital. MH is to lend WPLP the funds required to build the generating station. Based on the Corporation's current estimated cost of constructing

Wuskwatim, excluding the transmission component, MH projects lending the partnership $927 million to build the generating station, representing approximately 75% of the cost of the project (the remaining funding to be through the Equity Partnership Units).

MH assumes TPC will subscribe for 33% of the ownership interest, i.e. 33% of the 25% equity component. Based on the current construction cost estimate for the generating station, TPC's cost for the partnership units would be $102 million. According to the agreements, TPC will invest up to $34 million of its own capital and borrow up to $68 million from MH to fund the balance.

Revenues generated from the project are to be allocated to the partnership from MH's overall revenues, based on an agreed-to (between NCN and Hydro) formula utilizing average export prices for peak and off-peak sales. Revenues are to be adjusted as changes in export prices are experienced and realized, and are to be based on the actual output of Wuskwatim G.S., reduced by the average system line loss rate for the MH system (currently 10%). WPLP is to pay MH 3% of the partnership's gross revenues, to contribute towards the marketing and transmission costs and risks borne by the Corporation.

MH will be fully responsible for the operations of the generating station and related transmission facilities, and will charge WPLP for its incremental operating costs. MH will make no cost allocation to WPLP for system generation and transmission. Control Center costs will not be directly charged to the project but be included in the overhead charge to the project. Finance costs incurred by the Corporation, related to the loans it will take on to allow it make loans to the partnership to build the generating stations, are to be recovered, at cost, from WPLP. The financing cost related to loans to WPLP has been estimated at 7%

interest, based on MH's expected long term-cost of borrowing of 6% plus a 1% Provincial debt guarantee fee.

The proposed Development Agreement requires that WPLP maintain a 75:25 debt to equity ratio, except for the first 10 years of operations where an 85:15 debt to equity ratio will be allowed (to account for anticipated initial losses in the operation of the facilities, losses are expected for the six-year period from fiscal 2011/12 to 2016/17).

If the partnership's debt to equity ratio falls below the above parameters, there is a requirement for further cash contributions from WPLP partners based on their ownership interest in the partnership.

The agreement between Hydro and NCN also allows for advances on dividends to NCN, even during loss years and/or when the equity threshold test has not been met. MH indicated that dividend advances are to be limited to 5% of the actual cash invested by NCN, and are to be repaid by NCN out of forecast future distributions.

9.4.4 Wuskwatim Transmission

In addition to the generating station, Wuskwatim requires incremental transmission facilities. MH is to build the required transmission facilities at an estimated cost of $320 million. The cost of incremental Wuskwatim transmission is to be recovered from WPLP by way of repayment over 50 years, the payments to include principal and interest.

Repayment of the loan is to commence upon Wuskwatim's in-service date, and MH stated that the blended principal and interest payment required will be the equivalent to having the transmission asset and offsetting debt on the books of the partnership and expensing depreciation and interest. In addition, the operating costs of the transmission facilities will be charged to WPLP.

9.4.5 Project Economics

In justifying the Wuskwatim project to the CEC, MH advanced many assumptions. Based on the then-projected construction costs of the project the levelized cost of the energy was to be 6.6¢ per kW.h (costs forecasted before the CEC). Given the escalated cost of the project, the Corporation's revised estimated cost of energy has increased to 7.2¢ per kW.h.

Before the CEC, and in forecasting export prices to be realized by Wuskwatim, MH utilized a USD/CDN exchange rate of 1.35. Based on its most current forecast in 2007, the exchange rate utilized in the Corporation's forecasts as for when Wuskwatim comes in-service in 2012 was 1.14, and this appreciation of the Canadian dollar from the original projection was forecast to result in a 5% reduction in forecast export revenues.

However, if the Canadian dollar remains near par with the U.S. dollar, MH projects export prices will be 17% lower than now forecast, a result that would further negatively impact the economics of Wuskwatim.

At the CEC Hearing, and in the Corporation's justification of the project, MH calculated that the Internal Rate of Return (IRR) would be 10.3%, based on generation being sold as exports. As a result of the escalation in the cost of the project and employing the same type of financial analysis as was presented to the CEC, the IRR has reduced to 7.8 %, excluding sunk costs, and to 6.5% including sunk costs. And, even this revised IRR would be further materially reduced if the Canadian dollar remains at par.

MH cautioned that recalculating the IRR on a similar basis to that presented at the CEC hearing, as reported on above, neither reflects the decision now required nor is consistent with engineering economics. MH's rationale for this view is based on Wuskwatim being built for domestic load purposes, and a comparison of the projected cost of energy to arise from Wuskwatim with the cost expected if that amount of generation arose from with operation of a MH combined cycle natural gas turbine. On that basis, for MH, Wuskwatim is expected to result in $14 million in annual savings over the next 30 years (providing $153 million of net present value).

9.5 Bipole III

Bipole III is to be a 2,000 MW, high voltage direct current (HVDC) transmission line from Gilliam, Manitoba to The Pas, and then down the west side of the Province to Winnipeg, Manitoba. In CEF 07-1 MH budgeted for a West Side Bipole III to be in-service in 2017 with a total cost, including escalation and interest during construction, of $2.247 billion.

The new HVDC line and associated converters (at Henday and Riel) is being advanced for domestic and export transmission capacity and reliability reasons. The recently-announced power sales to Minnesota Power and Wisconsin Public Service, (again not reflected in MH's forecasts as filed at the proceeding) if finalized, will also advance the need for Keeyask and Conawapa generation. On this basis, the new Bipole III line, with its converters, will be required to meet firm export load, as well as strengthen the domestic transmission system.

Due to provincial environmental and societal considerations, MH is proceeding with a West Side of Province routing for Bipole III, rather than the originally planned shorter routing on the East Side of Lake Winnipeg. MH provided a cost-benefit comparison of a West Side Bipole III as opposed to an East Side Bipole III, and identified a $400 million capital cost differential and a line loss differential of up to a further $181 million (in favour of an East Side Bipole III).

MH identified the potential for further significant price increases for construction as a whole, and power generation and transmission in particular. And, if this concern is realized, a further significant increase in forecast Bipole III costs could result.

Evidence presented at the recent hearing suggested that a repeat of the September 1996 failure of Bipole I and II, once Bipole III is in operation, built on the west side of the Province, would have more serious consequences if the interruption occurred during peak load. While an East Side Bipole III could function in parallel with existing Bipoles I and II, and in the event of the outage of both, make use of Bipoles I and II converters as well as the new Bipole III converters to provide 3,000 MW to the south, a West Side Bipole III would be limited to using only its own converters and thus could only provide the South with 2,000 MW in such a situation. MH advised that an outage of Bipoles I and II during the summer season could result in an additional cost to the Corporation of $160 million over the cost that would be incurred if Bipole III were built down the east side, the extra costs due to a requirement for additional imports to make up for the 1,000 MW differential.

In short, during a major outage of both Bipole I and II, an East Side Bipole III could serve both domestic and firm exports, while a West Side Bipole III would require significant additional needs and presumed expensive imports to meet domestic needs and firm exports.

9.6 Other Generation

Pointe du Bois Generating Station

MH is moving forward with its approval process for construction of a new generating station to replace an aged Pointe du Bois G.S. This $900 million replacement project is viewed to be an economically superior option to upgrading the existing plant.

In the 2005/06 Power Resource Plan, MH compared the capital costs of various scenarios as follows:

Capital cost scenarios ($ millions)

Capital Expenditure	Cost Estimate	Timeframe
Decommissioning	$125	By 2014
Rehabilitation	$358	By 2021
Repowering	$562	By 2017
Redevelopment	$615	By 2013

On the basis of subsequent economic, technical, environmental and socio-economic evaluations, MH concluded that the redevelopment of the Pointe du Bois G.S. was the more attractive alternative, with an in-service date of 2015/16. The capital cost estimates based on further analysis were refined and updated to reflect current conditions.

It is not clear whether this new capital requirement was taken into account during negotiations for the acquisition of WH.

Kelsey Generating Station

MH is upgrading the Kelsey G.S., at a forecasted cost of $123 million, by re-runnering the turbines. The intent is to increase plant capacity and gain additional energy output under average flow conditions. MH advises there was no expected gain in dependable flow generation from the enhancement.

Keeyask & Conawapa Generating Stations

In January 2008 after the GRA had been filed with the Board, MH announced it had signed a term sheet for a 250 MW power sale to Minnesota Power. And, at the hearing, MH stated that it had just signed a term sheet (an intent to sell) with Wisconsin Public Service (WPS) for 500 MW, the sale to start in the year 2018 for a 15-year term, with an expected value of approximately $2 billion over the term.

Occurring after MH had filed its GRA, the WPS sale was not considered in MH's filed Power Resource Plan. The sales, Minnesota and Wisconsin, are contingent on MH developing new hydro generation. New transmission inter-tie capabilities will be required by both MH and the counter-parties to the agreements, again to meet a condition of sale.

MH will require new transmission from Riel Station, on the East Side of Winnipeg, to the U.S. border, and estimated the cost of the Manitoba portion of the new transmission inter-tie to be approximately $30 million. Costs related to the new transmission line were not included in CEF07-1, and MH also suggested that additional Alternating Current (AC) transmission could also be required to optimize the new generation projects.

MH indicated it could have to develop Keeyask (620 MW) and Conawapa (1,420 MW) generating stations in close succession, (2018 and 2021, respectively) to meet the new export sales requirements. MH forecast that the cost of Keeyask, at approximately $4 billion, also not included in CEF07-1, and Conawapa, estimated to cost approximately $5 billion, of which $2.8 billion in capital cost are forecasted to be incurred after the current CEF07-1 forecast period of 2018, were not fully included in the latest IFF or CEF. (Recently, public statements have suggested that the cost of the Conawapa capital project could reach $6 billion.)

MH further stated that it may be required to build a combined cycle natural gas fired plant, at a cost of approximately $600 million, to meet projected energy deficits that could arise as early as 2017, ahead of Keeyask and Conawapa coming on stream. The cost of a new combined cycle natural gas fired plant was not incorporated in the current capital forecast, or in the latest IFF.

In short, the impacts expected to arise from the two new power sales are not fully incorporated in MH's forecasts; and IFF07-1 and CEF07-1 are to be revised by MH, with a copy to be filed with the Board.

9.7 New Head Office

As a condition of the purchase agreement entered into when WH was acquired, MH agreed to build a new Corporate head office in downtown Winnipeg. The building was originally forecast in CEF 03-1 at a cost estimate of $75 million, the amount then cited as a 'place marker' subject to design changes and cost revisions.

The new building is to accommodate approximately 2,100 employees and to be ready for occupation by 2009, and come at a projected revised cost of $278 million. Issues related to MH's new head office were also reviewed by the Board in Order 99/07, wherein the Board noted:

> "Centra estimated that overall cost impacts of the new head office would be $21 million per annum, to be offset by lease payment savings of $5 million and annual productivity savings projected to be in the range of $20 million annually. Centra assured ratepayers there would be no increase in rates".

The Board directed in Order 99/07, that:

> "Centra confirm to the Board that no incremental costs are to accrue to Centra's customers for MH's new head office;"

MH, on behalf of Centra, provided that confirmation in this GRA.

The incremental annual cost related to the new building was estimated at $22.8 million in the first year of occupancy, with an annual cost of $18.75 million thereafter. MH expects that productivity savings will be realized by bringing staff together at one location, allowing staff to work in closer proximity and in a more efficient environment, and that this will be sufficient to result in synergy savings of between 10% and 20% of otherwise head office payroll, to offset in part the incremental costs of the new building.

MH further stated that $20 million in productivity savings, to also include lapsed leases for currently-rented facilities, will be realized and offset the increased costs from the new building.

That said, MH indicated it would be difficult to focus on the details of savings associated with the new head office at future hearings. MH recommended the Board focus on the review of costs and savings from an overall basis to ensure that costs are fair and reasonable, rather than focusing on the head office.

While the new head office is being constructed as an obligation made upon the acquisition of WH, moving to common facilities may benefit both MH and Centra in terms of more efficient operations and better customer service, to be achieved through enhanced collaboration opportunities. Given that the costs allocated to MH's electricity and Centra Gas natural gas operations are based upon the costs incurred, any productivity savings that are attributable to providing service to gas customers would flow to Centra through the normal cost allocation process.

MH opined that substantial benefits were flowing to Centra as a result of the acquisition of WH and the related move to common facilities, and recommended that continuing to allocate the actual costs of the work performed on behalf of each utility to each utility would be the best course of action. As such, for MH there should be no special allocation process implemented to ensure that the costs of the new head office flow only to electric customers.

9.8 Interveners' Positions

The Coalition

The Coalition commented that the interaction of MH and the Province has led to tremendous benefits for Manitobans, citing benefits that included rural interconnection, connection of remote communities in the north, the northwest transmission developments, and cooperation between MH and the province that has realized significant economic development and provided contributions to provincial finances. The Coalition also stated it was important to also recognize costs to the Province in terms of these developments, including mitigation expenditures related to the Churchill River diversion.

The Coalition also observed ongoing impacts on MH's revenue requirements and financial indicators that are a product of the interaction between MH and the Province. The Coalition mentioned the new head office and the west side vs. east side debate concerning Bipole III as issues with important cost consequences.

In terms of Wuskwatim, the Coalition noted that the development is placing pressure on MH's debt to equity ratio and on its revenue requirement. In addition, the Coalition noted that the intended closure of the Brandon Coal plant (that is except, for emergency use) is another important impact arising from provincial involvement in MH decision-making. The Coalition stated that MH is experiencing significant pressures on its financial results from a variety of government policy and other initiatives, though many of them have, in the past, been beneficial to Manitobans.

Mr. Harper noted that MH's capital spending for the two closest forecast years, 2007/08 and 2008/09, is to be considerably higher than historic levels, mainly due to higher spending on new generation and transmission. Mr. Harper stated the spending is in part to protect in-service dates and is being done to meet export commitments and goals, and that this spending is putting noticeable pressure on MH's debt to equity ratio.

As of fiscal 2006/07, Mr. Harper opined the impact of spending on major new generation and transmission projects has increased the debt ratio by 2 percentage points. And, by fiscal 2008/09, increased capital spending will drive up the debt ratio by 5 percentage points.

Mr. Harper submitted that in the near term, Wuskwatim will have the most impact on the change in outlook for capital spending, due both to cost increases and as a result of the advancement of the in-service date. The Coalition observed that MH's capital spending plans influence decisions about the level of net income and the level of rate increases.

As previously mentioned, Mr. Harper argued for a direction to Hydro to develop an ACA and described an ACA as a snapshot of the condition of a utility's assets, noting that it would include degree of degradation and need for rehabilitation and replacement. He suggested that ACA are usually undertaken at intervals of two to three years.

Mr. Harper claimed that an ACA helps a utility pull together, on a systematic and organized basis, an overall comprehensive assessment (for planning purposes) of work to be prioritized across its entire asset base. And, through a process of prioritizing assets by way of an ACA, MH can further prioritize work in areas of the company where there is a deficiency of a critical nature. Mr Harper stated an ACA provides a logical foundation to support OM&A and capital spending

Mr. Harper further recommended that MH undertake regular ACAs every 2 to 3 years, and that the preparation of such assessments over time will allow MH to determine whether its assets are improving or deteriorating, helping to substantiate where there is a need for increased spending.

Mr. Harper noted that MH's capital spending requirements for both base capital and new generation and transmission projects are growing, when compared with past spending levels. He indicated that while increased export revenues should benefit future customers, the capital expenditures to prepare for those exports are putting pressure on current rates and are one of the drivers for MH's requested rate increases (that now exceed inflation). For Mr. Harper, MH needs to be mindful of these pressures when developing its overall capital expenditure plans.

Mr. Harper opined that the advancement of Wuskwatim was a contributing factor to current rate pressures. In reaching this conclusion, Mr. Harper noted that a significant portion of the increases in capital spending to be experienced in the next few years relate to the development of Wuskwatim.

The Coalition stated that there were lessons to be learned from the Wuskwatim development, lessons best learned before entering the anticipated decade or more of major capital expansion. The Coalition cited submissions made by MH to the Wuskwatim CEC proceeding, that:

> "Temporary increases in MH's debt to equity ratio and decreases to the level of interest coverage which may occur in the early years of the project are judged to be manageable without impacting the Corporation's financial stability or requiring off-setting increases to domestic rates."

The Coalition further cited the CEC report which stated:

> "The Commission's support for the project is contingent on Manitoba Hydro being able to maintain its commitment that domestic ratepayers will not experience rate increases as a result of the project."

The Coalition noted that the project is now forecast to cost $ 1.6 billion, including transmission. Taking into account both inflation and the effects of the delay in-service date, the Coalition noted an increase of $418 million (in 2002 dollars) in the expected cost of construction, and that as a result, the IRR, based on the methodology employed in the submission to the CEC, has been reduced to 7.8% when sunk costs are excluded, and to 6.5% when sunk costs are included.

The Coalition submitted that the revised IRR of 6.5% is roughly equivalent to the Corporation's cost of debt, and suggested that the lesson to be learned from the deterioration of expected return is that the CEC hearing did not examine closely enough the capital expenditure forecasts of MH.

As to the new head office, the Coalition questioned whether synergies forecast by MH will be realized to offset the approximate $20 million increase in annual costs.

As MH enters into a decade of expansion, the Coalition recommended that MH employ an independent review of both its capital expenditure procedures for major projects and also for its OM&A expenditures, considering both in terms of forecasting and management best practices.

The Coalition also recommended that the Province provide the Board the legal jurisdiction to review MH's major capital expenditures.

MIPUG

MIPUG also expressed concern with the growth in MH's capital spending. Mr. Bowman and Mr. McLaren suggested that the increase in capital spending has contributed to a deterioration in MH's financial position and is one reason that MH's debt: equity targets have not been achieved. Mr. Bowman and Mr. McLaren mostly attributed the failure to meet the accepted targets to major new generation and transmission plans, including Wuskwatim.

Given that these new projects were to be pursued on MIPUG's understanding that they would not drive rates higher for domestic customers but would, over the long term, benefit domestic customers, the witnesses opined that the use of these capital projects as an implicit justification for rate increases should be of concern to the Board.

MIPUG stated that although MH had not indicated it was seeking rate increases to address the costs of bringing Wuskwatim into service, the net effect of retaining the 75:25 debt to equity ratio target requires rate increases from domestic ratepayers.

In assessing the level of MH's capital spending and its impact on the province, MIPUG suggested the Board should set rates that both reflect the cost of operating the Utility plus provide provisions or reserves for the maintenance, operation and eventual replacement of existing assets.

For MIPUG, there is no basis or regulatory convention allowing the Board to focus on the credit condition of the shareholder (the Province) in determining rate levels. For MIPUG, the Board's role is to focus on the financial condition of the Utility, solely for the benefit of its customers.

MIPUG also opined there was no basis to argue that rates should be increased for "balance sheet" reasons, i.e. to "pre-fund" the equity required for the coming phase of capital expansion (Conawapa, Bipole III, Keeyask, new cross-border transmission, Wuskwatim and Pointe du Bois).

MIPUG strongly opposed the Board taking into account concern for the Province's credit rating, and suggested that to do so would be roughly equivalent to raising rates in the 1950s to advance Grand Rapids, which came into service in the 1960s. MIPUG contended that such an approach would not have been necessary, as the Grand Rapids project, as a long-lived MH asset, has been able to cover its interest costs, repay all debt borrowed for the purposes of its construction, and provide cost-effective power for generations of ratepayers..

MIPUG cited prior Board Orders which expressed concern as to the implications of increased capital spending by the Corporation, noting from Order 143/04:

> "The Board continues to be concerned with the progress of substantial growth in capital expenditures and accompanying debt. The Board accepts that many of the capital expenditures are related to reliability and safety, and therefore are may [sic] be prudent to incur. The Board also recognizes that many of the forecast capital expenditures are related to or the equivalent of generation expansion, such as supply side enhancements, Wuskwatim, Keeyask, Conawapa, and may be justified individually when considering the each project purpose and forecast results over the long term. However, collectively these projects negatively impact MH's debt to equity ratio of and

> net income in the initial years, placing increase strain on the financial stability of the MH and adding additional risk for existing ratepayers. The Board is concerned that MH has not developed a threshold for capital expenditures and associated debt growth that considers all projects, together with the health and financial stability of the company."

MIPUG noted that MH's normal capital program has not been reduced, despite the Board's "strong" directives of Orders 7/03 and 143/04. MIPUG argued for greater regulatory scrutiny of capital spending, and urged the Board to continue to seek the necessary legislative amendments, as sought in past Orders to provide for Board oversight of MH's capital expenditures, an oversight that, for MIPUG, would be consistent with the objectives of *the Public Utilities Board Act*.

Mr. Bowman and Mr. McLaren cited CEF 07-1 as indicating that MH will be spending approximately $4.1 billion on normal capital programs to 2017/18, an average of $375 million per year. When compared to CEFO2-1, where normal capital spending was forecast to be $3.1 billion, an average of $285 million per year, the witnesses expressed concern over an increase of 30%, or 6% per year.

Mr. Bowman and Mr. McLaren noted that this level of growth, only half being consistent with expected general inflation over the period, was excessive. They opined that with capital project cost escalation occurring, it is possible that while a 6% sustained annual growth may be justifiable as reflective of premium "construction project" inflation over the period, MH has not reflected any notable cost control measures consistent with the Board's past directives.

MIPUG again recommended the Board should pursue oversight of MH's major capital projects, perhaps via a recommendation to the government for a legislative provision similar to the Certificate of Public Convenience and Necessity process that occurs in other jurisdictions.

MIPUG further stated that in the event additional Board oversight is not provided by government, nonetheless the Board clearly retained the ability to set the Utility’s rates, and could employ that ability to ensure MH is not provided upward rate adjustments to compensate the Corporation for investments the Board may not view as prudent. MIPUG stated that the Board is not bound to “adequately fund” all operating and capital decisions made by the Utility, and that the Board should reach a conclusion on the prudence of the expenditures to be reflected in rates.

MIPUG further suggested that the Board request renewal of the mandate provided the Board in 1990 (via OIC 1990-177), a mandate that provided for a detailed and comprehensive integrated review of MH’s Major Capital Projects (covering the period 1990 to 2009). Among the other benefits MIPUG suggested would arise from such a review, MIPUG suggested that the Board’s resulting report to the Lieutenant Governor-in-Council, which would arise from the review, could include a discussion of compelling policy considerations for the Government of Manitoba to address. Given the current expansion plans of MH, MIPUG held such a review would be timely.

MKO

MKO noted that MH has an aggressive capital plan that may be the most extensive in the Corporation's history, with the possible exception of the previous nearly back-to-back projects at Grand Rapids and Kettle.

MKO agreed with the position put forward by MIPUG, and suggested the Board should take on the responsibility to review major capital expenditures expected to have an impact on rates.

MKO further recommended that the Board acknowledge that MH-affected First Nations are, in essence, the original capital investors in the MH system. MKO asserted that Article 18.4 of the 1977 Northern Flood Agreement acknowledges its assertion.

Accordingly, MKO recommended the Board acknowledge that MH-affected First Nations are, at minimum, co-investors in MH's hydroelectric generating facilities, and are, in effect, "perpetual holders of Class "A" shares (in MH)", for which a return on investment should be identified and "paid" to First Nations.

RCM/TREE

RCM/TREE also noted that MH is facing significant capital costs with the major construction projects now expected and suggested that the capital costs to be incurred will take place at a time when MH has a high debt:equity ratio.

RCM/TREE suggested that even with the new construction programs, MH is forecasting energy shortages in the years 2009 to 2011, shortages to arise from accelerated domestic load growth. RCM/TREE indicated that load growth continues to exceed past projections with negative impacts on MH's finances, customers and the environment

RCM/TREE suggested that the consequence of 'suppressed electricity rates' is increases in domestic load growth that go beyond previous predictions, and that the increasing load growth threatens the export surplus, hastens the requirement to construct more costly new plants for domestic use, escalates the level of greenhouse gas emissions in North America, and has the potential for an adverse impact on Centra Gas' results and situation "if the flight from gas to electricity for water and space heating continues".

9.9 Board Findings

The Board recognizes its statutory jurisdiction does not extend to the approval of capital expenditures. Yet, it is clear MH's anticipated capital spending and associated increased debt levels is and will place upward pressure on rates. The Board has, as interveners have noted, expressed concern with MH's debt growth in previous orders. In Order 143/04, the Board noted:

> "The Board continues to be concerned with the progressive substantial growth in capital expenditures and accompanying debt. The Board accepts that many of the capital expenditures are related to reliability and safety, and therefore are may [sic] be prudent to incur. The Board also recognizes that many of the forecast capital expenditures are related to or the equivalent of generation expansion, such as supply side enhancements, Wuskwatim, Gull, Conawapa, and may be justified individually when considering each project's purposes and forecast results over the long term.
>
> However, collectively these projects negatively impact MH's debt to equity ratio and net income in the initial years, placing increased strain on the financial stability of MH and adding additional risk for existing ratepayers. The Board is concerned that MH has not developed a threshold for capital expenditures and associated debt growth that considers all projects, together with the health and financial stability of the Company."

The Board reiterates the prior concerns, and notes that with planned major capital expansion, such concerns are now graver.

In this GRA, interveners requested that the Board revisit its prior recommendations and recommend to government that the Board be provided with the statutory authority typically vested in the public utility regulators – that is, the authority to review MH's capital expenditures before such investments are committed.

In prior Orders, the Board has recommended to Government, that *The Public Utilities Board Act* be amended to make the regulation of MH equivalent to the regulation of Centra Gas by removing the exemption now provided under Section 2(5) of the Act.

In Order 143/04 the Board noted:

> ”Given the risks related to the very significant additional plant investments and associated borrowings contemplated, the Board is of the view that the Province of Manitoba should re-evaluate the existing legislation.”

The Board reiterates its past recommendation.

The Board’s concern with MH’s capital spending has previously been described, (Orders 07/03 and 143/04). With this new GRA, and with the update provided during the hearing, MH has set out planned capital expenditures that are unprecedented in the Utility’s history. The Capital Expenditure Forecast projects that from 2008/09 to 2017/18, the Corporation plans to spend $11.3 billion (of which $7.5 billion is for new major generation and transmission assets and $3.8 billion for other power supply requirements) – with further capital expenditures likely to also occur given recent export sales (i.e. Keeyask and Conawapa).

In its application, MH projected that its in-service undepreciated plant will increase by $8.6 billion to reach over $20 billion by the end of 2018, and that its debt would correspondingly increase from $7.2 billion to almost $12.7 billion by the same end date. In addition, due to recently-reported potential new long-term export contracts to Wisconsin and Minnesota, capital expenditures are expected to further increase. Assuming they are finalized, the new export contracts will require additional generation and transmission expenditures of a currently estimated cost of another $7 billion (for the planned construction of Keeyask by 2018, and Conawapa by 2022).

The additional capital expenditures are not reflected in the current capital forecast, and accordingly, the Board will, require MH to update and extend its forecasts to include the new projects. The overall level of capital spending now anticipated will result in a large increase in debt that will result in higher finance (interest), depreciation and OM&A expenses. The Corporation's debt:equity ratio, already not at the target range, will also be negatively affected.

And, based on historical experience, and consistent with MH's forecast with respect to Wuskwatim, new generating stations can be expected to operate at a loss during a large part of their first decade of operation, and this too will add pressure on the financial targets, debt levels and rates.

Limestone G.S., which came on line in 1992 at a favourable capital cost, did not achieve any positive cash flows from export sales during the first eight years of operations. However, the project recovered the initial shortfalls and now continues to contribute substantially to the Corporation's bottom line. In the absence of Limestone G.S., MH could not anticipate any significant export revenues in the IFF 07-1 forecast period.

With unexpectedly high capital costs and a somewhat flat export market, Wuskwatim G.S. may not achieve a positive cash flow for a period exceeding the projected loss estimates of the Corporation. By the time Wuskwatim can be expected to "break into the black" its output will serve domestic load only and the advancement of the project for export purposes, as originally planned, will not have proven out.

It could be reasonably expected that the advancement of Bipole III, Keeyask and Conawapa projects will face at least a decade of negative cash flow, even if transmission inter-tie capabilities are doubled. Thereafter these projects are projected to contribute to the bottom line as long as there is substantive action in the MISO region toward achieving CO_2 emission reductions.

To allow the Board to gain a further understanding of the implications of the capital expenditures now contemplated, MH is to file with the Board by January 15, 2009 an updated Capital Expenditure Forecast, and an Integrated Financial Forecast and Power Resource Plan and Load Forecast, all to extend from 2008 to 2028.

The updated Power Resource Plan should provide alternative scenarios with and without implementation of the pending new export contracts and related capital spending. It should also provide an indication of what hydro generation opportunities remain, such to be feasible opportunities, after Wuskwatim, Keeyask and Conawapa, and where the additional projects would occur and what possible quantity of energy would be expected, along with the assumed development timeline. The Load Forecast should also reconcile projected and actual DSM savings.

While MH anticipates that interest rates and inflation will continue to be low, history suggests that both factors fluctuate. Increases in either interest rates or inflation would be problematic to the costs of the proposed capital expansion program. Construction cost inflation over the past five years has been dramatic, in some years 10 times or more the rate of general inflation for some construction cost elements, particularly commodities. As to currency fluctuations, this factor is also subject to widely different possible scenarios, again outside the control of the Corporation (excepting, and to a limited degree, for longer-term “natural” hedges, and, for the short-term, financial instrument hedges).

While the Board agrees interest rates, currency fluctuations and commodity costs are affected by events outside MH’s control, the Corporation should still consider the risks of undue developments in these factors as it plans.

In the Board's view, the capital expenditure forecasts for future construction may prove to be low, thus it would be prudent to model worst case scenarios as well as those considered more likely and reasonable by the Corporation.

MH's export commitments appear to be the recent driver of the need for new major generating stations and transmission facilities. With the exception of Wuskwatim, which was reviewed by an expanded CEC hearing on the basis of export (not domestic) need, the new major capital project and export commitments have not been subject to regulatory review.

Such major capital projects and export agreements can either help or negatively affect MH's financial position, and one of the possible negative outcomes is the potential for rate increases. This was the case in 2004, when MH experienced a drought and the honouring of its export commitments came at a great cost and had a role to play in the rate decisions then made.

The consumers of MH electricity, as represented at the GRA by MIPUG, Coalition, MKO and RCM/TREE, advocate that the Board pursue oversight of MH major capital projects. MIPUG suggested a further recommendation to the Government of Manitoba, to establish legislation similar to the 'Certificate of Public Convenience and Necessity' employed by other regulators. Alternatively, Interveners want a review of MH's major capital projects through a renewal of the mandate provided to the Board in 1990 (via Order-In-Council 1990-177), when the Board was requested and did review MH's major capital plan, then covering 1990 to 2009 (a plan much modified since).

And, given the emphasis placed on exports (the source of rate subsidies for domestic customers and capital for early construction), and the risks for domestic customers if export commitments and water conditions collide, it could lead to significant financial losses.

The Board agrees with Interveners that regulatory review of the impact on consumer rates that MH's planned capital program may have is warranted, and that such a review should consider the risks faced by the Corporation and its ratepayers.

In light of the unprecedented capital expansion now under consideration, the Board will direct MH to propose to the Board on or before January 15, 2009 the terms of reference for a regulatory review of MH's planned Capital Program and its possible implications for consumer rates. The Board will also direct MH to prepare a study, for filing with the Board by January 15, 2009, a thorough and quantified Risk Analysis, including probabilities of all identified operational and business risks. This report should consider the implications of planned capital spending, taking into account revenue growth, variable interest rates, inflation experience and risk, and potential further currency fluctuation.

To provide the maximum benefit of such a risk analysis, MH will be directed to file by September 30, 2008, for Board approval, a conceptual outline for an in-depth and independent study of all the operational and business risks facing the corporation. And, as a follow-up to the risk analysis study, MH will be directed to file, by June 30, 2009, recommended risk mitigation measures and a review of possible suitable capital structures, given the capital expansion now planned or contemplated, and risks quantified.

As for Wuskwatim, it is now clear that the economic justification presented to the CEC in 2004 has changed. At the CEC hearing, MH calculated the projects IRR (Internal Rate of Return) would be 10.3%. Before this Board and incorporating changed assumptions in that original forecast, a recalculation of the IRR yielded 6.5%, a yield that approximates MH's current annual cost of debt.

With higher than expected domestic load growth, Wuskwatim is now required to meet both domestic load and firm export commitments. However, the project is now of debateable economic value, given the ongoing escalation of construction costs and the potential for under-achievement of forecast export prices.

Wuskwatim's original cost estimates, as provided to the CEC, have risen by a factor approaching 2 – with the overall cost now expected to be not $900 million but $1.6 billion. The cost increase is troubling enough, but there is also no assurance that export sale prices have increased correspondingly (if at all). The dramatic rise of the Canadian dollar has lowered revenue expectations, and there is no certainty that either a cap or trade on carbon tax is on the immediate horizon, to benefit MH's planned newest generating station.

MH does not forecast that WPLP will be profitable for the first 6 years of operations, and these forecasts may be optimistic. While MH's cost allocation approach favours the Wuskwatim project, with the Wuskwatim partnership not being allocated all costs, particularly indirect overheads, yet being assigned full export prices for all of its energy output, it is possible the project in a full economic sense may not achieve a positive cash flow.

On an overall economic basis, with construction cost estimates up 60% more and the forecast price per kW.h basically unchanged, Wuskwatim's net present value may not meet the original floor threshold assumed at the CEC hearing. MH now bases its requirement for Wuskwatim on domestic rather than export requirements. Accordingly, MH states it no longer requires Wuskwatim to meet or exceed its threshold economic return, as MH now classifies the construction as being necessary to meet future Manitoba load requirements.

That said, the Board does not agree that Wuskwatim is required for domestic purposes, particularly with its current expected in-service date. Yet, this view is of little consequence, as the Board is not required to give approval to MH's capital plans and projects. As well, Wuskwatim's plans are well past the "point of no return". Yet, it is neither the fault of MH or the government that high inflation and a much higher Canadian dollar has developed massive construction cost over-runs and problems with export receipts in Canadian dollars.

As to the arrangement with NCN, the First Nation is to receive up to 33% of ownership of the limited partnership that will construct the generating station. Yet, and until the project is finished, NCN is required to invest only $1 million, with MH borrowing what is required to complete the project. Following completion, NCN will have to make its decision whether to come in as a partner or not. Overall, and assuming NCN does take up the full ownership position it has the option to take, NCN is only required to put up $34 million of its own capital, the balance to be borrowed from MH.

The First Nation carries no direct risk with respect to the $1.6 billion project. It has an option to take up to a 33% ownership position, but it need not do so; it can evaluate the situation upon the project's completion. And, an NCN holding company will hold NCN's partnership interest in the project. With the holding company inserted between it and the partnership, and with almost all of its investment funded through a loan from MH, without any mark-up, its risks are negligible. As well, NCN will be able to receive payments from the partnership once the new generating station is in-service, even during partnership loss years. Such advance dividends will also be funded by loans from MH, as advances on future dividends.

With respect to the capital structure of the partnership, the standard formula for determining MH's debt to equity ratio has been amended, and for the Wuskwatim partnership the debt to equity ratio will exclude the expected $320 million in debt related to the necessary transmission line loan. This arrangement, having the transmission asset held “off-balance sheet”, and by MH directly, will allow for profit-sharing to occur much earlier than would be the case if the standard 75:25 ratio test was applied employing the standard debt and equity components.

MH concurred with the hypothesis that the Wuskwatim/NCN arrangement was driven by factors other than "strict economics", and that the driving factor for the arrangement is MH's operative assumption that without an agreement with NCN Wuskwatim could not proceed. The Board notes that as the generating station and related transmission lines will be located in NCN's traditional trading area, it is not surprising that the First Nation would insist on compensation for its support of the project, and that a lack of support from NCN would have made proceeding unlikely.

From the Board’s review of the WPLP Agreements, it has arrived at significant concerns with the financing arrangements, cost sharing and revenue allocation, and while there may be reasons that go beyond strict “economics” that lie behind the terms of the arrangement, the Board’s concern with the overall structure of the arrangement is such that the Board cannot, at least without being in receipt of further rationale, recommend that the agreements serve as a template for any future joint ownership opportunity.

While the WPLP is not recommended for use as an “automatic” template for further First Nations participation in Generation and Transmission projects, the experience of Wuskwatim, todate, should be used to model possible outcomes of possible future arrangements with respect to Keeyask and Conawapa.

For any future projects where joint ownership is contemplated because of the potential impact on consumer rates, the Board recommends MH seek the Board’s prior review and approval.

With respect to Bipole III, MH reported that its construction cost estimates had increased dramatically, from IFF-03's forecast of under $400 million (that estimate excluded the cost of converter stations) to $2.2 billion (which now includes the advancement by several years of the construction of converter stations, required for future generating facilities now contemplated).

The increase in forecasted spending is primarily driven by a government policy decision, supported by MH’s Board of Directors, to place the line on the west side of the Province and materially increased construction costs.

The Board notes that the new $2.2 billion forecast neither includes the present value of line losses associated with the longer distances required to go down the west side of the Province, nor any value that could be associated with the additional risks pertaining to the possible future loss of Bipole I and II transmission, which, if it occurred, would require northern transmission from the north to the south to come only from Bipole III, at a potential capacity loss of 1,000 MW.

Including the present value of the additional line losses associated with increased distance, the revised routing of Bipole III has added over a half a billion dollars of additional costs. The Board notes that export prices are set in the marketplace and are not based on MH’s generation and transmission cost. Thus, it is not the Board’s assumption or expectation that the additional costs for a ‘west side’ routing of Bipole III can be passed on to MH’s export customers. It appears that the increased cost of Bipole III, brought about by a west side route will be a cost to MH that will reduce otherwise expected future export profits.

Again, it is critical to understand that this Board is not empowered to approve MH’s capital expenditures. To similar effect, the Board is required to honour explicit government policy. Given these conditions, the Board's options are limited when it comes to the rate regulation of MH.

To "starve" MH by suppressing rates in an effort to stymie a project would be to counter government policy, a measure that the Board cannot undertake, first lacking the legislative authority and secondly, the public mandate – unlike government, this Board is not elected. In short, government and the Board of MH has, as they should, taken responsibility for the major capital expenditures and policy actions of MH. The Board has no mandate to contradict such policies. Therefore, while the Board does not find all of MH's actions justifiable on a strictly MH-centric economic rationale, it considers itself obliged to ensure MH has sufficient revenue to allow it to achieve objectives transparently established or approved by government.

Before moving to a general discussion of MH's other capital expenditure plans, the Board has some further comments to make with respect to the projected routing of Bipole III.

Currently, Manitoba Hydro's primary electricity production, from the north, is transmitted through two transmission lines from Gillam to Winnipeg through the Interlake. For a considerable period of time, it has been assumed that a third line was required, for reliability purposes, and with the continuing growth of domestic load and committed or intended export contracts, the third line has become a necessity. Upon its completion, now scheduled for 2017, Bipole III will provide backup to the existing two lines and transmit increased volumes of electricity from the planned new generating stations to southern Manitoba and further south, the primary export market.

Bipole III, to be MH's third high-voltage, direct-current transmission line, is to be constructed down the west side of Lake Manitoba, rather than taking a much shorter route through boreal forest on the east side of Lake Winnipeg. The east side of Lake Winnipeg is marked by pristine boreal forest, which the government has indicated it wants to preserve by building Bipole III down the province's west side, rather than the east.

The government, in partnership with some “east-side” First Nations, seeks what is considered to be the second-largest intact boreal forest in the world to be designated by the United Nations Educational, Scientific and Cultural Organization (UNESCO – through UNESCO’s Word Heritage Committee) as a World Heritage Site.

World Heritage sites are important, having significant positive impacts for decades to come, draw considerable world attention, and can attract significant eco-tourism. The government has indicated that an attempt to construct a major transmission line through a potential World Heritage Site would be strongly resisted by First Nations and be so opposed by environmentalists that it could result in MH’s export potential being severely damaged. In short, the Board understands that the government’s claim is not based on “economics”, particularly “relatively” short-term economics, but broader concerns extending beyond the environmental to include the cultural and the political.

There is little doubt that the proposed route down the western side of the province is both longer and will cost hundreds of millions more than if the new transmission line were to be built on the east side of Lake Winnipeg. As the precise route for the line cannot be determined until a process of environmental, design and public consultation has taken place, the certainty of the government’s final direction cannot be assured.

While opponents and/or critics of a “west-side” Bipole III include interveners at this most recent GRA proceeding, with their criticism based largely on "economics" (the undisputed understanding is that a west-side line will cost more than an east-side approach, result in increased line losses due to the longer distances involved, and, as discovered through this recent proceeding, pose an increased reliability risk in the low-probability occasion of Bipoles I and II being out of service), neither the interveners nor MH set out in detail the argument for the west-side siting of Bipole III directed by government.

The Board's mandate is to determine what is in the public interest, and has previously defined this Board's definition of what represents the public interest with respect to a public monopoly utility incorporated and operated to provide required services to Manitoba. So, while this Board does not have the statutory authority to approve or reject MH's capital expenditure plans, it certainly does have a considerable interest in what those plans are and as to what the basis for those plans are. Capital expenditures represent a major driver of rates, and this Board does have oversight and responsibility for rates.

Accordingly, the Board, in this Order, sets out herein its conclusions to date on the rationale and implications associated with building Bipole III. In setting out its perspective on the matter as it now stands, the Board concludes that it is also in the public interest to set out, as it has above, the Board's understanding of the government's, and MH's, rationale for the decision to take Bipole III down the west-side.

The gist of MH and the government's position on the matter is that taking Bipole III down the west side of the Province will better ensure the Utility's reputation and relationship with its major American export customers, and provide an opportunity to achieve, develop and enjoy a potential World Heritage Site.

In short, it is the Board's understanding that MH and the government have concluded that constructing Bipole III on the West side of Lake Manitoba is, on balance, and despite it being considerably more costly and carrying additional risks, the only truly available option at this time (assuming domestic load growth and export commitments are to be met and reliability better assured).

Finally, the Board notes a third potential option, one involving underwater cables that would carry the power through at least a portion of the distance required. The Board senses that discussion and review is likely to continue, and, until that is concluded, is content with setting out its understanding of the costs and implications of the concepts and plans provided to-date.

10.0 Load Forecasts and Power Resources

10.1 Load Forecast

MH's 2005/06 metered domestic load was 20,800 GW.h., comprised by:

Residential	6,578 GW.h	32%
GSS-ND	1,329 GW.h	6%
GOSS-D	2,038 GW.h	10%
GSM	2,949 GW.h	14%
GSL<30	1,612 GW.h	8%
GSL 30/100	988 GW.h	5%
GSL >100	5,202 GW.h	25%
ARL	96 GW.h	<1%

The segmented metered load corresponds to a load at generation of 22,899 GW.h, after taking into account distribution and transmission losses as well as weather adjustments.

MH forecasts base domestic loads at generation of:

23,318 GW.h in 2006-07	actual	
23,769 GW.h in 2007-08	451 GW.h increase	2%
24,577 GW.h in 2008-09	808 GW.h increase	3%
25,509 GW.h in 2009-10	932 GW.h increase	4%
26,069 GW.h in 2010-11	560 GW.h increase	2%
26,503 GW.h in 2011-12	434 GW.h increase	1.5%

The forecast indicates a 3,200 GW.h increase (14%) in domestic load over the five-year period, which compares to a forecast 2,350 GW.h increase forecast for the same period in the 2005/06 load forecast. (Peak load grew by 10% during that period of 750 GW.h increased usage.)

MH's 2006 Electric Load Forecast indicated that residential and commercial load growth of 1% is expected from 2006/07, and onward that industrial load growth (GSL customers) of about 2.3% annual growth should be expected from 2006/07 to 2011/12, and a further 1% per annum or less thereafter.

The chemical and petroleum transport sectors of MH's industrial customer class are expected to provide about 75% (1,300 GW.h/year) of the 1,700 GW.h total anticipated industrial load growth between 2006/07 and 2011/12. These industry sectors are energy intensive and are usually associated with relatively low levels of employment per GW.h of energy consumption. Projected load growth in the sector has not been expected to produce high levels of additional Manitoba employment. As such, the sector represents the primary target for MH's interest in a new industrial rate class that would be assessed marginal rates.

The projection of load growth does not provide for the potential arrival of new industries in Manitoba with similarly low levels of employment per GW.h. Such firms, which may be attracted by low energy rates, would reduce MH's export sales and affect general consumer rates, and, as well, possibly affect the now planned in-service dates for new generation and transmission.

This situation has led to a concern that MH may have to increasingly forego export sales (at prices from 5¢ to 7¢/kW.h) in order to service domestic industrial loads assessed at 3.5¢/kW.h or less.

Again, to counter the impact of reduced exports caused by low-employment energy intensive industry, MH sought approval for a new energy intensive rate, one more reflective of export market pricing. However, the rate proposal has been deferred to a subsequent hearing, now expected to occur later this year or early in 2009.

MH's domestic load forecast contemplates:

- Only nominal increased demand from electric space heating;
- Significant increase in demand from electric water heaters;
- Significant increase in demand from computer and internet usage;
- No increased demand relative to climate change (global warming);
- Little change in seasonal load variation due to climate change;
- A significant increase in electric load due to customer movement from natural gas to geothermal heating but no identified decease for customer movement from electric to geothermal heating;
- No customer movement from natural gas to electric heating; and
- No change in loads due to self-generation.

Given the lengthy planning process required for new generation and transmission, the accuracy of domestic load forecasts, including the categories of customers associated with specific forecasts, are critical to assessing MH's domestic load and opportunities for exports. A major risk to the present load forecast lies with the nexus of natural gas and electricity, with natural gas potentially to be a more expensive heating source than electricity.

Over half of MH's space-heating customers rely on natural gas, while the rest primarily depend on electricity. Until the May 1, 2008 Centra rate changes, electricity was the higher cost option where natural gas service was available for space heat. However, natural gas commodity prices are linked to oil prices, and oil prices have increased from the range of $15 U.S./barrel in 1999 to over $140 U.S. in recent months; while some observers suggest oil prices could reach $200 U.S./barrel within five years prices have recently moved to below $130, still basically twice last year's level.

As to natural gas, it is becoming a world-traded commodity, priced by the markets on a supply and demand basis, as is oil. The advent of LNG, liquid natural gas, and the coincident ability to transport natural gas between continents, has further increased the risk that natural gas will follow the oil price curve and out-price itself relative to electricity in Manitoba. In jurisdictions where market prices prevail, the prices for electricity produced by natural gas, coal and nuclear are rising. This increases the demand (and price of) for natural gas as a direct heating source. Consequently natural gas heating in Manitoba becomes less attractive relative to electric heating.

Assuming that full conversion of heating from natural gas to electricity may be expected to cost in the order of $3,500 (assuming the customer has 200 amp service), the payback period for conversion to electric heat would be fairly lengthy at current price differentials. However, once the change is made a customer is unlikely to reverse that decision; fuel switches are essentially permanent.

A larger risk rests with the initial selection of a space-heating source with new construction. And, as to existing customers, they need not switch entirely from natural gas to electricity to affect the domestic electricity load. At a lesser level, customers may increasingly supplement their natural gas heating by electrical sources (electric base board heating and small electric space heating units) as natural gas prices outpace electricity prices.

Recently a surge and continued volatility in and with natural gas prices has brought about suggestions of subsidies or monetary transfers from MH to Centra in order to limit the rate impact on residential natural gas heating costs. The support for such action is based on:

- Limiting the degree of fuel switching from natural gas to electricity for heating and thus avoiding the loss of favourably priced export sales which may also provide a net reduction in GHG emissions;
- Cushioning the majority of Manitoban from the full impact of soaring natural gas prices on their winter heating bills; and
- Limiting the extent of fuel switching in older residential areas that lack of adequate distribution networks to service broad scale electric heating loads.

The counterargument on cross-subsidizing natural gas vs. electric heating is as follows:

- Paying subsidies to natural gas heating in order to limit electric heating does not necessarily result in economic gains for MH from exports. Residential electricity rates are typically higher than average export prices. The net GHG reductions for displacing natural gas generation in the U.S. are only nominal; displacement of coal generation is not assured;
- Having domestic customers pay more for electricity in order to maintain current levels of natural gas consumption by Centra may keep MH whole, but implies that the electricity customer should subsidize Centra’s natural gas imports as well as MH’s electricity exports;

- Moving costs from natural gas customers to electricity customers distorts the market economics. In the absence of cost causation, the issue becomes how to limit the subsidy if natural gas prices rise to $15 U.S. /GJ or $20 U.S. /GJ the need for a subsidy becomes greater and at some point the subsidy from power becomes unmanageable.

10.2 Energy Supply

10.2.1 Hydraulic Generation

MH's hydraulic generation resources consist of:

- Lower Nelson hydraulic stations - 3,670 MW (HVDC transmission) with dependable output of 13,780 GW.h and a high flow output of 26,690 GW.h.
- Upper Nelson hydraulic station - 350 MW (AC transmission) with dependable output of 2,260 GW.h and a high flow output of 3,000 GW.h.
- Saskatchewan River hydraulic station -479 MW (AC transmission) with dependable output of 1,320 GW.h and a high flow output of 2,520 GW.h.
- Winnipeg River hydraulic station - 582 MW (AC transmission) with dependable output of 2,300 GW.h and a high flow output of 4,410 GW.h.

Overall, MH's hydraulic generation output is 19,750 GW.h under dependable flow conditions, and 36,690 GW.h under high flow conditions. Although these generation forecasts assume normal water flows are not augmented by drawing water from reservoir storage, MH does use energy-in-storage to arrive at a dependable flow output of about 21,000 GW.h (representative of 85% of base domestic load).

In median flow years (i.e., approximately 50% of the time), MH's hydraulic output is expected to be 29,500 GW.h, while in mean flow years (i.e., on the average based on 94 years of experience), hydraulic output is 29,100 GW.h. These outputs cover about 115% of base domestic load, providing the opportunity for entering into firm export commitments.

10.2.2 Augmented Flow Programs

MH employs augmented flow programs to optimize hydraulic generation output at the various plants. These programs typically involve compensation through direct payments and/or energy offsets with other jurisdictions (Saskatchewan and Ontario), or to First Nations and other to Manitoba communities.

Examples of an augmented flow program include:

- The augmented flow program on the Churchill River Diversion system allow increased additional flows by up to 5,000 cfs, annually by the approval of the Provincial Minister responsible. Deviations from the original license were offset by mitigation projects and compensation payments with respect to the communities of South Indian Lake, Nelson House, City of Thompson and town of Churchill.
- The Lake St. Joseph project, in conjunction with the Lac Seul project in northwestern Ontario, utilizes flow storage and releases that augment Winnipeg River flows by up to 9%. Under the agreement with the Lake of the Woods Control Board, MH compensates Ontario Hydro for the additional energy values.

In response to MKO interrogations, MH has provided information on a proposed water regime modification, not yet implemented, where Saskatchewan Power would be compensated for seasonally adjusted outflows from Reindeer Lake and Churchill River, controlled by the Island Falls G.S. to the benefit of MH. According to MH, Saskatchewan manages Reindeer Lake's water level to meet Saskatchewan Power's needs at its Island Falls G.S., and that potentially extra flow in the summer could be made available to MH.

MH's review to-date has not determined whether there would be any economic benefits to arise from such a flow modification. Nor has MH explored the level of compensation or mitigation that would be required from upstream or downstream affected parties.

10.2.3 Thermal Generation

To support and back-up MH's hydraulic generation, and to meet domestic load and firm exports commitments, MH relies on thermal generation:

a) Brandon Unit #5 (coal-fired), 105 MW with a maximum output of 837 GW.h.;

b) Selkirk Units #1 and #2 (natural gas), 126 MW with a maximum output of 1,060 GW.h.; and

c) Brandon SCCT, two units (natural gas), 298 MW with a maximum output of 2,400 GW.h.

The plants can provide about 4,300 GW.h/year, if fully utilized. When the Brandon coal generation is removed from full service and related to "emergency use", pursuant to a government directive related to mitigating climate change, maximum thermal output will decline to about 3,500 GW.h/year. At the present time, combining thermal and hydraulic generation provides for 100% of base domestic load.

MH rarely uses its natural gas generation plants, as such generation is uneconomic when natural gas prices are above $5 CDN/GJ. With natural gas prices currently in the range of $8-11/GJ, imports of power from the MISO market may be used instead. It is assumed that these imports come from natural gas rather than coal generation.

MH currently relies on its coal generation to provide support to hydraulic and wind generation in meeting export sale commitments. On an incremental fuel cost basis, coal generation is economically viable and contributes $10-20 million a year to MH's annual net income, in a median flow year.

The availability of the Brandon coal generation during the 2002 – 2003 drought saved MH approximately $50 million; the government has indicated that he Brandon coal plant will still be available for use in emergency conditions in the future.

The energy deficit in the MISO market caused by the Brandon coal plant closure may well be filled by additional coal generation; Sask Power or Ontario Hydro in summer and MISO region coal plants in winter. These sources if available are likely to be lower priced than natural gas generation.

10.3 Wind Generation

MH currently purchases 100 MW of wind energy from a private energy firm. The power is generated at St. Leon, Manitoba and has had a capacity factor of approximately 39%, as expected wind speed and direction are neither constant nor consistent. With forecast annual output of 320 GW.h, to be drawn on in conjunction with hydraulic generation, wind is deemed to be dependable energy.

The St. Leon wind farm has now been operational for almost three years; providing a reasonable but still limited track record for defining on-line availability of dependable energy. Though MH has cited commercial confidentiality reasons for not disclosing the operation's specific operational profile, apparently there have been some wind downtimes due to cold temperature conditions that have fallen outside the design operating range.

Another 300 MW (900 GW.h) of wind generation is to be added by 2013/14, assuming reported ongoing contract negotiations with non-utility generators lead to acceptable terms, including pricing. And, a further 600 MW is to be considered at some time in the future, although MH has expressed concern about a declining energy value of wind as related to the energy integration process of moving wind generation into the Manitoba grid.

The recent movement of MH toward new major export commitments raises the possibility that more wind generation could have positive market values. In the long-term, MH may achieve greater transmission inter-tie capabilities allowing the export of more wind and hydraulic blended energy.

As MH's anticipated 2,000 MW of new generation projects come online to meet domestic load growth and export opportunities, the limited level of then-remaining untapped hydraulic generation may have to be supplemented. More wind may well be the choice.

As the pending restriction of the Brandon coal generation plant operation by 2012 will remove 800 GW.h from MH's power resources, wind energy may now be worthy for consideration as a cost effective replacement.

10.4 New Generation and Transmission

MH is proceeding with the Wuskwatim Generating Station with a targeted in-service date of 2012/13. An Agreement has been reached with WPLP for purchase of all output, estimated to be 1,515 GW.h on average. This arrangement is expected to provide a 1,220 GW.h increase in MH's dependable power (4%).

The replacement of the Pointe du Bois G.S. on the Winnipeg River with a new plant is expect to achieve a 150 GW.h/yr increase in the dependable flow output upon the expected 2016/17in-service date for the new plant, and would add 300 GW.h/yr to average flow plant generation. The planned Kelsey rerunnering will not increase dependable flow output but will increase the average energy output of the plant by 350 GW.h/yr.

Bipole III is slated to be in-service in 2017/18, and is expected to add 442 GW.h/yr to MH's dependable generation, this by reducing transmission losses on the HVDC system. The loss reduction could be 1,000 GW.h under average flow conditions, based on the existing Upper Nelson generation plant.

MH's 2007/08 Power Resource Plan indicates that by 2017/18 total generation plant output under a dependable flow scenario will be 28,845 GW.h, equal to base domestic load. At that point, and until Conawapa and Keeyask G.S. are constructed, exports would have be supplied from domestic load reductions, through DSM and by imports or MH natural gas generation.

The Power Resource Plan calls for Conawapa G.S. to come on-stream in 2021/22, but Keeyask G.S. had then not been scheduled. And, a number of new pending export contracts were not included in the Power Resource Plan, those being:

a) 375/500 MW sale to NSP (estimated 1,600/2,000 GW.h);

b) 250 MW sale to Minnesota Power (estimated 1,000 GW.h); and

c) 500 MW sale to Wisconsin Public Service (estimated 2,000 GW.h).

Essentially, these additional export sales, if consummated, commit MH to export 5,000 GW.h/yr firm on-peak (5 x 16) power and require the development of both Keeyask and Conawapa, in close succession, and to be in place by about 2020. In the absence of Keeyask, MH's dependable domestically generated energy of, then forecast to be, about 30,000 GW.h would just cover forecast 2022/23 base domestic load. In such a case meeting the new export commitments would require further domestic load reductions through DSM savings and additional imports or MH natural gas generation.

If either space heating conversions from natural gas to electricity occurred or new large industry or large industry expansion drew power, the situation would be more problematic.

The addition of Keeyask Generating Station and Conawapa would have the following impact on the generation available from the Lower Nelson and the loads to be:

Forecast Future Lower Nelson Power Supply in 2020 GW.h				
Flow Condition	**MW**	**Dependable**	**Average**	**High**
Conawapa (2020)	1,300	4,550	7,050	9,000
Keeyask (2018	600	2,880	4,400	5,000
Total New Plants	1,900	7,430	11,450	14,000
Total Existing Plant	3,560	13,770	21,350	26,130
Total Low Nelson	5,460	21,200	32,800	40,130

MH has identified a transmission loss reduction of 442 GWH for a west-side Bipole III at current dependable energy levels. On a relative basis, the loss reduction at current average flows would be about 1,000 GWH. This level of reduction would, if moved to the export market, contribute significantly towards the annual carrying charges of the $2.2 billion investment in Bipole III and with Keeyask G.S. online the revenue contribution would be considerably larger.

Hypothetically on a relative basis for an East Bipole III that average flow scenario loss reductions would have been an additional 300 GWH. In 2022 after Keeyask and Conawapa G.S. come into service, the loss differential would be about double that amount.

With Bipole III in place and both Keeyask and Conawapa on line, MH has suggested that additional transmission may be required presumably to lower transmission losses. This could further affect capital spending plans.

10.5 Alternative Fuels and Energy Supply

Notwithstanding the recent pursuit of DSM (to reduce domestic load growth) and additional wind resources, MH has not been aggressive in pursuing other energy sources. This, in large part, relates to the relatively high cost associated with alternative sources of generation in comparison to MH’s current costs and rates.

In justifying alternative energy sources, MH has to look beyond the current demand-supply economics to additional considerations, including environmental and social issues, when considering:

- Residential and general service DSM initiatives, with the average domestic rate higher than the average export price and with residential rates higher than general service rates;
- Wind costs (prices now similar to peak export prices, (i.e. in the range of 9 cents per kW.h);
- Bio-mass costs (above peak export price);
- Solar costs (currently estimated to be well above peak export prices);
- Geothermal (lost revenues and embedded costs may exceed export revenues, particularly during off-peak);
- Non-utility Generators (lost revenues and embedded costs may exceed export revenues);
- Brandon coal generation restrictions (higher prices for replacement energy) could approach $20 million a year; and
- Bipole III - West Side (no offsetting revenue for higher capital cost, reduced savings on transmission losses) and higher risk in the expected rare case of an outage of Bipole I and II.

10.6 Greenhouse Gas Emissions

MH's GHG 2005 emissions from electricity operation were reported to be about 650 kilotonnes of CO_2 equivalent. The Brandon Coal Thermal Generation station, on average, accounted for 550 kilotonnes of the total, while generating about 500-600 GW.h/year of electricity. Closure of the plant would result in net reductions of about 300 kilotonnes of $C0_2$ if the replacement energy source is natural gas based.

Converting from coal to natural gas generation would reduce CO_2 emissions by about 60%, but the costs involved would equate to about $120/tonne of CO_2. Theoretically that leads to a strictly economic conclusion that continues to favour operation of the coal plant, though buying carbon credits could reduce its economic profitability.

Electricity exports into the MISO market in 2005/06 were 9,800 GW.h and required 2,000 GW.h of imports, to arrive at a net export of 7,800 GW.h. If this level of net exports displaced American natural gas generation, the indirect GHG savings would have been about 2,500 kilotonnes; if the exports displaced some coal generation as well as natural gas, the CO_2 reduction would have been up to 50% higher.

In 2005/06, MH reported indirect GHG reductions of 738 kilotonnes arising out of deemed DSM energy savings of 1,030 GW.h/yr. MH's estimate is consistent with an assumed 50% natural gas/50% coal generation displacement.

Because 2005/06 involved record hydraulic generation of 36,200 GW.h from exceptionally high water flows, GHG reductions in that year actually resulted from surplus hydraulic generation and not from the DSM initiatives, as there was no additional energy export from DSM possible as tie-line and other transmission constraints limited both exports and total hydraulic generation in 2005/06.

10.7 Interveners' Positions

None of the interveners challenged MH's load growth assumptions, its portrayal of the existing supply situation, or MH's identification of the consequences of increasing domestic load.

RCM/TREE is concerned about the negative consequences of continued low electricity prices, which, it holds, encourage greater domestic consumption and leads to lower exports, and hence lower GHG reductions in the U.S.

MIPUG would promote DSM activities encouraging the use of natural gas rather than electric heating, questioned the pending restrictions on the Brandon coal plant and questioned the rationale for MH’s proposed new generation and transmission facilities, being built primarily to serve exports.

MKO suggested a need for what it would consider a more accurate reflection of the risk of fuel switching in MH’s load forecast.

MKO recommended that, as one test to be applied to determine whether or not MH's costs are just and reasonable, the Board should require MH to ensure that wherever it is able to identify value from a change in its operation, for example the Augmented Flow Program, that MH be required to associate any adverse effects with justified mitigation and ensure that the projected adverse effects are fully identified, reported, accounted for and addressed. MKO suggested MH be required to provide full disclosure of augmented flow programs, and any related extra-provincial arrangements on water supply.

The basic issue of there being a financial risk associated with energy intensive industry expansion, as identified by MH, was not been challenged by the interveners. And, both the Coalition and RCM/TREE indicated strong support for MH’s intentions to implement marginal cost pricing for new industrial loads not associated with strong Manitoba economic benefits.

MIPUG didn’t dispute the premise of charging higher rates for some industrial loads, but disagreed with MH’s proposed approach and placed a higher value on large industry’s contribution to the Manitoba economy.

10.8 Board Findings

Load Forecast

Based on past experience and recent price increases and volatility related to natural gas, MH's future domestic load forecasts may prove to be low, with space heating by natural gas potentially now more expensive (leaving aside the cost of conversion) than by electricity.

With natural gas prices continuing to rise faster than electricity prices (2008-09 natural gas space heating costs may be considerably higher than was the case in 2007-08), and far more costly than was the case in 1999 when MH purchased Centra Gas Manitoba Inc., more new customers may opt for electric heat and existing natural gas customers may either convert to electric heat in greater numbers or supplement gas heating with electric baseboard or small electrical heaters.

The result would be greater domestic load and reduced opportunity for the export of electricity unless and until new generation is available.

While MH has acknowledged that there is a growing potential for customers switching from natural gas to electric space and water heating, it has not reflected the risk in its current load forecasts. MH should include an analysis of the issue and the risks with its next Load Forecast.

MH has not been attempting to influence customer fuel choice, taking the view that it is the customer's responsibility to assess the relative merits of the options. The approach taken represents an attempt by MH to remain neutral on the relative merits of electric and natural gas space heating.

However, given the financial and environmental issues at stake, MH should carry out a study to define the implications of fuel choice and take a more active role in assisting consumers in making choices, given seemingly ever-increasing energy costs, both in an absolute and as a percentage of disposable household income sense.

As MH enters into more export contracts with fewer remaining hydraulic sites apparently available, it is more likely that wind generation could have a greater prominence, and potentially-an increased market value. In light of the current wind generation project(s) developed and contemplated for development in the future, the Board requires additional information on the implication of MH's wind strategy on future consumer rates.

Accordingly the Board will direct MH to submit a report to the Board on January 15, 2009 on the 300 MW additional wind energy project(s) and a discussion of the business case, wind strategy, prospects and timelines for this project, as well as the further 600 MW moving toward the government's target of 1,000 MW of wind energy. The Board will also require access to the agreements for the existing 100 MW St. Leon wind project, and an opportunity to review the pending agreements for the 300 MW project(s).

MH's recent announcements of new power sales into the U.S. have possibly precluded further firm energy contracts, as the Utility's dependable hydraulic energy has been largely committed. This suggests that, at least in the relatively immediate future material energy sales to Ontario, Saskatchewan and even Alberta may have to be non-firm and primarily off-peak. What this says with respect to the merits and prospects for an east-west national electricity grid is a subject for conjecture.

If GHG emission reductions are seriously targeted for achievement in Canada and the U.S., MH's available energy should gain value. It is important for MH to negotiate prices providing for escalation in certain circumstances, such as further increases in oil, natural gas and coal prices, and increased attention to emission reductions (by way of cap and trade or carbon taxes).

The decision to place Bipole III on the west side of the province involves major additional costs, when construction costs, transmission losses, and reliability considerations are included. A west side of the province location for Bipole III is favoured by government, giving consideration to a hoped-for and possibly pending designation of a large sector of boreal forest East of Lake Winnipeg as a World Heritage Site. The avoidance of major development in what is deemed one of the last undeveloped large areas of boreal forest in the world has, at minimum, intrinsic value, and is consistent with recognition of the overall climate change issue and the responsibility of governments to mitigate known and expected effects.

The westerly route, while traversing similar terrain over a greater distance than the rejected eastern route, is not expected to face the same constraints that an eastern route would encounter in seeking environmental and community approval. The west side of the Province is already developed to a significant degree, and may face less opposition to the construction of a new transmission line.

As sole shareholder of MH, the Province has the right to direct the west side routing. Yet, it should be acknowledged that the additional costs will be borne by Manitoba ratepayers, either in the form of higher rates in the longer-term or a reduced export "subsidy" reflected in rates. Export contracts are price competitive and, in the absence of CO_2 taxes, coal generation costs will largely dictate future energy prices negotiated in the MISO market.

As such, the added costs for Bipole III is unlikely to be reflected in the energy sales price, although, and this is an important consideration, ”clean hydro” power may eventually command a premium price and MH’s future sales may be made “easier” by its environmentally-friendly route choice.

For MH, the development of alternative energy in its export markets may tend to reduce energy demand from MH. As well, alternative energy sources that may come into use in the future in Manitoba may well affect domestic consumption and revenues, without a corresponding reduction in the need for infrastructure and services. While MH is a significant revenue generator, its margins are low (particularly if the cost of new construction is considered), and rates are likely to be under continued upward pressure going forward.

Given that MH is incurring costs for environmental and social purposes (i.e., West Side Bipole III; Brandon Coal Plant, etc.), such costs should be separately defined and tracked to allow for subsidies and for the cost of choices made for environmental objectives to be transparent.

As noted in the findings for MH’s capital expenditures, new export agreements are driving MH’s construction of new hydraulic generating stations. The underlying economics have not been publicly disclosed or tested. Because of the potentially negative impact on domestic consumer rates, at least in the initial years, the economic justification of expansion presented on export agreements should be reviewed and approved before such export agreements are finalized.

The Board is of the view that it would be in the public interest that MH’s export contracts be filed with the Board for review, and possible approval.

There does not appear to be any clearly-defined process that MH follows in achieving augmented flow projects. Parties potentially affected by such a program might be better served if a publicly-known approval process were in place. The Board will direct MH to provide a summary of existing programs and potential future programs defining the arrangements for increased or modified (augmented) water flows within and external to Manitoba. They should include the specifics of the program and mitigation and compensation related thereto.

11.0 Demand Side Management

11.1 General

MH's Demand Side Management (DSM) initiative, "Power Smart" consists of energy conservation and load management activities designed to lower the demand for both electricity and natural gas in Manitoba. The most current plan is the 2006 Power Smart Plan.

For the electric business, the initiative is one element of the resource options available for meeting the Province's electrical needs and the initiative plays an important role in the Corporation's overall integrated resource plan. DSM initiatives are to assist customers in meeting their energy needs through energy efficient measures. For the electric business, such initiatives enable MH to serve more domestic customers with less energy. Reduced domestic load requirements allow for reduced capital expenditures and increased energy available for export. Electric DSM initiatives are evaluated utilizing the same underlying criteria and economic evaluation approach as used with alternative resource options.

11.2 Program Evaluation

To evaluate new programs a high level assessment Marginal Resource Cost Screen compares the expected benefits to the incremental capital costs. If programs pass the initial screening, a more detailed assessment is undertaken involving developing program concepts and designs and projecting costs and benefits.

MH determines the cost effectiveness of DSM programs using the Total Resource Cost and Rate Impact Measure Tests. The primary economic indicator for evaluating the effectiveness of both electricity and natural gas incentive-based programs is the Total Resource Cost (TRC) test. TRC measures the cost effectiveness of a product or program, and a TRC benefit/cost ratio greater than one (>1.0) indicates that a program is cost effective.

The secondary economic indicator for evaluating the effectiveness of programs is the Rate Impact Measure (RIM) test. RIM indicates the cost effectiveness of a program from the utility's perspective. All DSM related savings and costs incurred by the utility, including revenue loss and incentive payments, affect the RIM benefit/cost ratio. The results provide an indication of a program's expected long term impact on rates.

As a guideline, MH attempts to design electricity based DSM programs that have a RIM of 1.0 or greater. However a program with a RIM of less than 1.0 may trigger a program redesign, and may still proceed if the program design is judged to provide overall benefits.

Once Power Smart programs are in place, they are evaluated to determine the net program load savings and costs as well as the cost-effectiveness of the savings. Net savings take into consideration factors such as free riders (benefits derived that carry no specific cost), heating and cooling interactive effects, and system peak coincidence and persistence effects. Customer data and market information are used to assess the impacts of these factors on the overall savings attributable to incentive-based Power Smart programs.

In evaluating DSM programs, MH attributes no value to delayed generation in its TRC test, nor does it consider the full benefit of displacing carbon in export markets.

11.3 Program Costs and Amortization

MH plans to spend $401 million over the next 11 years on DSM expenditures. Of that amount, MH budgeted to spend $38.3 million in fiscal 2008-09, a figure later revised at the hearing to $43.1 million.

MH plants to spend a cumulative amount of $571 million on DSM expenditures through to the end of the 2017/18 fiscal year. While one purpose for spending on DSM is to delay new generation, new generation has, to date not been delayed due to DSM.

MH has defined "levelized" costs for various DSM initiatives. The following table provides insight as to the cost effectiveness of various activities and programs.

Exhibit 4.3.2.5
Electric Levelized Utility Costs
¢/KWh Saved by Incentive-Based Power Smart Program

Program		Results 2005/06
Efficiency Programs:		
1.	**Residential**	
	New Homes	7.2¢
	Home Insulation	2.8¢
	Compact Fluorescent Lighting	0.8¢
	LED Lighting	6.6¢
2.	**Commercial**	
	Commercial Construction and Renovation	1.1¢
	Internal Retrofit	1.8¢
	Commercial Lighting	1.7¢
	Agricultural Heat Pads	0.4¢
	City of Winnipeg Agreement*	7.7¢
3.	**Industrial**	
	Performance Optimization	0.3¢
4.	**Discontinued/Completed Program Costs**	N/A
	Efficiency Programs Costs Subtotal	1.0¢
	Rate/Load Management Programs:	
	Curtailable Rates**	N/A
	Overall: Program Costs	1.0¢
	Overall: Program + Support Costs***	1.1¢

* The levelized cost of the electricity savings estimate is being associated with the City of Winnipeg's Power Smart Agreement is 7.7¢/kW.h.

** Levelized cost analysis is not provided for rate/load management programs.

*** Support costs only include incremental support costs, no customer service initiatives or standard costs are included.

MH identified that its calculation of cents per kilowatt hour saved was based upon current program kilowatt hour savings, and assumed generation over a thirty (30) year planning period.

MH amortizes its DSM costs over an average 15 year period, which is longer than other comparable utilities. BC- Hydro and Quebec Hydro amortize DSM cost over a maximum 10 year period. While MH states that their policy is fully supportable. The Board has expressed reservations in past Orders and has suggested that MH could express such costs over a shorter time frame.

The unamortized balance of DSM expenditures was $17 million as of March 31, 1994, and is forecast to grow to $180 million by the end of the 2008/09 fiscal year. The amortization of DSM expenditures was $978,000 in fiscal 1993/94, to increase to $13.7 million in the fiscal year ending March 31, 2009.

MH has not yet determined the effect IFRS will have on its accounting treatment of DSM expenditures.

11.4 DSM Program Savings

By the end of 2005/06, MH opined that its Power Smart Programs would achieve an annual load reduction of 1,030 GW.h in energy, and 434 MW in winter peak demand (at generation), and that this level of “saved power” translated to a cumulative reduction of over $214 million in customer bills, and indirect greenhouse gas emission reductions of approximately 738,000 tonnes of carbon dioxide equivalent emission (the latter in 2005/06 alone).

Domestic energy reductions contribute to surplus generation capacity, which contributes to energy sales in the export market. The cumulative energy and demand reduction achieved (including savings to date) through the Corporation's DSM efforts is on target to achieve 2,695 GW.h/year of energy savings and 848 MW by 2017/18. MH also has a plan to achieve natural gas savings of 101 million cubic meters.

In total, the programs are expected to result in greenhouse gas emission reductions of 2 million tonnes by 2017/18.

The following table depicts energy and demand savings realized to fiscal 2006, and that forecast through fiscal 2018:

	89-92	92/93	93/94	94/95	95/96	96/97	97/98	98/99	99/00	00/01	01/02	02/03	03/04	04/05

Plan		12	18	75	114	101	104	110	105	136	166	183	200	296	394	414	437	463	488	507	525	538	562	578	592	607	622
Plan incl. Planned Codes & Standards						108	118	134	135	178	216	249	273	385	491	520	553	589	624	653	682	705	740	765	791	816	842

The tables suggest that MH's DSM initiatives are running at about 90% of target. Incentive-based programs, which are individually tracked, run above 95% of target, but Codes and Standards programs, which have not been specifically defined, are running at about 80% of target.

DSM has managed to offset about 20% of otherwise domestic load growth and freed-up additional energy for export. However, it does not appear to have delayed the Wuskwatim G.S. in-service date.

MH claims to have reduced GHG indirectly by 730 kilotonnes on a cumulative basis, due to reduced emissions resulting from their export of electricity.

MH acknowledged that the estimated GHG benefits have no tangible financial benefit for MH.

11.5 City of Winnipeg DSM Program

As a condition of MH's acquisition of WH, MH and the City of Winnipeg entered into a Power Smart Agreement on September 3, 2002. The objective was to capture energy efficient opportunities within the City's facilities, with a minimum target of reducing the City's energy bill by $800,000 annually. MH guaranteed the City an annual savings of $800,000 from the measures or the equivalent in the form of deemed savings plus a monetary payment by MH. MH's commitment over the ten year term this condition applied had a total value of $8 million.

A variety of energy efficient measures have been implemented for new construction and renovations in a large number of City owned or operated facilities towards meeting the objective of the program.. The energy savings forecasted to be achieved is 12.3 GW.h, a goal to be limited to a 20 year time horizon.

The estimated annual saving achieved by the City of Winnipeg related to the agreement is as follows:

Contract Year, ending August 31	**Savings ($)**
2003	607
2004	65,175
2005	144,426
2006	654,239
2007	771,905
2008 (forecast)	850,000
2009 (forecast)	900,000

To the end of 2007/08, MH has paid $2.4 million to the City, this because it could not deliver the $800,000 of annual DSM savings each year as prescribed in the agreement with the City.

So far, including the $2.4 million paid, MH has spent over $10.3 million under the agreement, exceeding the ten-year commitment of $8 million of savings and/or payments. MH states that the levelized cost of the program has been the equivalent of 7.7¢ per kW.h.

MH stated that due to the energy savings realized from the initiatives undertaken, MH is economically better off, as the energy saved has been and may be exported to the United States.

11.6 Carbon Trading

In 2002, MH became a founding member of the Chicago Climate Exchange (CCX). CCX requires participants to reduce emissions relative to historic baselines. Each participant is provided an annual allowance (of CCX units), an allowance that decreases each year from the historic baseline. If a participant's emissions exceed their allowance, the participant is required to buy additional units through the exchange. Conversely, if their emissions are below their allowance, they are able to sell the surplus units.

Through participation in this CCX, MH gains experience with the measurement, reporting and trading of admissions. Export sales, for which MH negotiates ownership of the associated emission reductions, make up a significant component of the offsets earned. While having these reductions delivers real value in complying with the voluntary commitment, surplus reductions may not yield additional value.

MH reported its intention to continue to monitor emerging market rules for opportunities to extract value from its emission reductions achieved in either Manitoba or in the Corporation's export market.

11.7 Low Income DSM Program

In its 2006 Power Smart Plan, MH included a new residential program, the "hard to reach" (HTR) program. The HTR program targets low-income residential households on an integrated basis (i.e. for both natural gas and electric consumption). The program has since been modified and now integrates funding made available by the federal government's ecoEnergy program. The current design of the low-income program was implemented December 14, 2007.

MH's Lower Income Energy Efficiency Program is designed to bring Power Smart and energy efficient measures to an estimated 4,600 lower income households over the next three and a half years ending 2010/11. The program targets lower income Manitoban homeowners and tenants.

In the case of lower income tenants, an agreement must be reached between MH and the landlord/building owner in order that a substantial portion of the benefits associated with retrofit measures funded by MH's program will be passed on to tenants. Private landlords and non-profit social housing organizations, including Manitoba Housing Authority (MHA) public housing and other non-profit subsidized housing organizations, are eligible to participate in the program.

Eligibility for households pursuant to the program was established by the Corporation at 125% of the Low Income Cut-off (LICO) established by Statistics Canada. Targeted measures to be addressed by the program include:

- low or no-cost basic energy efficiency measures, such as compact fluorescent lights;
- faucet aerators, low-flow showerhead, pipe wrap, hot water tank set back, and caulking/air-sealing;
- insulation for basement, attic and crawlspace installation; and
- High-efficiency natural gas furnaces.

Energy Efficiency Measures	Assumptions		
	Ave. electric Savings Per Home* (kw.h.)	Net to Gross Adjustments (Persistence Factor)	Participation
Insulation: including attic, basement and crawlspace	2,797	100%	Attic: 84% Basement: 58% Crawlspace: 8%
Compact Flourescent Lighting (6 CFLs per home)	138	90%	100%
Drainger	162	100%	18%
Water Measures: including tank set back, 1-Low-Flow Showerhead and 2-Faucet Aerators, pipewrap	404	Tank set back: 50% Showerheads: 90% Aerator: 90% Pipewrap: 95%	50% 100% 100% 100%
Weatherization: including air sealing and gasket covers	640	100%	100%

*- includes single detached homes, town houses, multiplexes and mobile homes

The anticipated duration of MH's Lower Income Program is tied to the Federal government's ecoEnergy program, which is currently approved to operate until March 31 2011. Contemplation of changes to the existing program will be undertaken closer to the date of the end of the Federal funding commitment.

MH intends to deliver the program through both Community Based Organizations (CBO) and individual household participation. Both approaches require pre- and post-audits, to identify energy efficiency opportunities and verify work completion.

The cumulative budget through fiscal 2017/18 for MH's Lower Income Program is $12.6 million, including rate-based, federal and Affordable Energy Fund (AEF) funding; the program's budget for 2008 was reported to be:

Program	**Budget (millions in 2008$)**
AEF Low Income - Electric Component	$3.5
AEF Low Income – Natural Gas Component	$6.1
AEF Total	**$9.6**
Power Smart Low Income – Electric	$1.1
Power Smart Low Income – Natural Gas	$1.9
Total Low Income DSM	**$12.6**

In assessing the economic benefits associated with the Lower Income Program, MH determined that the TRC for the program is 0.9, the RIM, 0.7, and the levelized cost of the program, 11.2¢ per kW.h. The results of testing indicate that the program results in some degree of cross-subsidization (of lower income customers by other residential customers).

11.8 The Affordable Energy Fund (AEF)

Following a spike in oil and natural gas prices in the summer and fall of 2005 on the heels of hurricanes Katrina and Rita, which damaged energy availability from south-east American production and distribution sites, and the Board's subsequent action as of November 1, 2005 when it deferred costs and restrained natural gas rates for Centra Gas' residential customers to recognize what the Board then-deemed to be a price bubble, the Provincial Government introduced

The Winter Heating Cost Control Act (which was subsequently passed, proclaimed and implemented in 2006).

Among other provisions, the Act established the Affordable Energy Fund [AEF], requiring MH to contribute 5.5 % of its fiscal 2006/07 gross export revenues to the AEF. This resulted in a fund of $35 million to be utilized for various energy efficiency initiatives, including if not primarily, assisting low-income electricity and natural gas customers.

MH indicated that $19 million of the AEF's $35 million was earmarked for province-wide low-income initiatives, with $8 million for community energy development, $0.25 million to expand the eligibility of Power Smart programs in Manitoba to include residential homes heated with energy other than natural gas or electricity, $0.75 million for rural and northern support and outreach, and $1 million for special projects then-yet to be defined.

MH indicated its intention that the $19 million reserved for low-income programs would mostly benefit electricity and natural gas space-heated homes, and would provide for programs that would not otherwise be funded from MH/Centra's rate-based DSM programs, including the Corporation's HTR Program.

In commenting on the establishment of the AEF at the most recent Centra GRA, in Order 99/07 the Board stated:

> "The Board notes Centra has indicated that the AEF is not slated to be credited interest on unused balances. Centra should impute interest income on AEF funds transferred to it, the proceeds to be utilized to underwrite additional or expanded low-income programs. Such an approach would also allow the funds available within the AEF to represent some measure of an endowment (the problem with the AEF is that it has been funded with a "one-time" transfer, while the work of upgrading heating efficiency and retention is likely to require more than a decade and cost more than the initial allotment of

> $19 million – which must address both electricity and natural gas low-income households)."

In Order 99/07 the Board directed:

> "Centra segregate funds transferred to it from the Affordable Energy Fund (AEF) and funds accumulated for the new Furnace Replacement Program, with such funds to earn interest at Centra's short-term borrowing rate."

MH has yet to act on the direction, responding that the AEF should not attract interest as it would result in an accumulation, before deductions for expenditures made, of more funds than were contemplated in the Act. MH stated having the fund attract no interest to be consistent with the legislation.

Recently, MH, in partnership with the Spence Neighbourhood Association initiated a pilot project. The next steps for the Corporation's province wide low-income program were reported to include continuing with the execution of private and community programs, and marketing and promoting in communities, rural areas, and other relevant venues.

11.9 Interveners' Positions

The Coalition

DSM Program Evaluation

The Coalition suggested that MH should think of DSM in a different way. Mr. Dunsky, who appeared on behalf of the Coalition, opined that the RIM Test should not be utilized to screen for justification of DSM programs, and that while the TRC should remain the primary test for DSM programs, under MH's current approach there will be proposed measures that will fail the TRC test that should still be pursued if they pass the "utility cost" test. The Utility cost test compares money invested in a program with the value of expected energy savings for the utility. For Mr. Dunsky, if MH can generate cost effective kW.hr savings, the program initiative should proceed.

Mr. Dunsky further stated that in evaluating low income programs it was extremely important to account for non-energy benefits (NEBs), noting that a growing body of evidence points to very significant NEBs arising from low-income programs. Mr. Dunsky suggested that NEBs include fewer shut-offs, reduced emissions and health and safety benefits. Mr. Dunsky recommended that the Corporation take into account NEBs in its future cost-benefit analyses of low-income programs.

The Coalition recommended NEBs be included in the screening of potential DSM programs. The Coalition further recommended that either an independent or an internal review of MH's current DSM portfolio be undertaken, and that the review consider the screening tests, portfolio of programs and NEBs.

Low-Income Programs

Mr. Dunsky observed that consumers face an array of market barriers to the adoption of cost effective energy efficiency products and practices, and suggested that the barriers are most acute for low-income customers. Mr. Dunsky cited that barriers such as information and search costs and below average language and computational skills (literacy, poor math skills, English as a second language) represent significant hurdles to both participation in DSM programs and adoption of efficiency measures.

Mr. Dunsky also cited performance uncertainty and higher than average housing mobility for low-income consumers (multiple moves within a short period of time) adds to the uncertainty regarding the economic value of long-term energy savings measures for low-income households. He also cited transaction costs: and greater difficulty experienced by low-income households in dealing with complex transactions can also lead to lower measure uptake and higher dropout rates. And, of equal importance as operating barriers to the participation of low-income households in energy efficiency measures, Mr. Dunsky noted:

a) financing difficulties – a general lack of access (or access at unreasonable cost) to capital;

b) an aversion to debt due to the payments associated with debt;

c) a diminished ability to meet upfront costs;

d) the organizational practices of many contractors, unwilling to work for low-income customers or charging a premium for the perceived risk of non-payment; and

e) the daunting issue of split incentives in rental markets, whereby landlords are unwilling to pass on savings to tenants or invest in measures that would assist in lowering utility bills but not benefit the landlord financially.

Mr. Dunsky reiterated a concern previously expressed by the Board that generally low-income customers will lack access to the capital required to make improvements to the energy efficiency of their homes. He further noted that low-income individuals are often caught in a "vicious cycle of debt", such that even if they could have access to capital, they will have an aversion for incurring debt requiring increased demands for their disposable income, and, therefore are unlikely to invest in their home (even if the investment would be in their long-term interests).

Mr. Dunsky suggested four key principles for success in administering a low-income program:

1. Keep it simple. Participation drops precipitously as complexity increases. Program implementers need to take "A-Z" ownership of the complexity involved in conducting audits, hiring contractors and overseeing work. Complexity should occur on the implementer's side, not the participant's. Similarly, proof of income and other eligibility requirements need to be flexible.

2. Keep it free. While it may be tempting and intuitive to request even symbolic participant contributions, Mr. Dunsky suggested that attempts to do so in other jurisdictions have generally met with failure.

3. Incent "sales" (outreach). For Mr. Dunsky, the difference between a good theoretical design and good performance is sales. Ideally, the utility, the contractor and other low-income stakeholders (supporters) will contribute to an active outreach effort, with only the utility and the supporting community having the capacity, tools and incentives to find potential customers and "close the sale".

4. Be comprehensive. As with any sale, the hard part is getting in the door. Mr. Dunsky suggested that once a participant is in the program, it is critical to capture all possible opportunities, recognizing that any measures not installed will likely be lost for years and/or their savings will cost significantly more to achieve at a later date. Comprehensive programs typically include education, a suite of "light" measures (CFLs, caulking/weather-stripping, low-flow aerators and showerheads, etc.), envelope measures (insulation and weatherization) and appliance and equipment replacements (especially old fridges and furnaces).

Mr. Dunsky opined there were a number of major weaknesses in MH's low-income energy efficiency program, beginning with the fact that the current program design is too complex, consisting of a number of hurdles that the low-income customer must overcome to participate. Mr. Dunsky noted that MH has not taken ownership of the delivery of its programs, passing the responsibility to low-income customers, an approach that he opined represents a serious barrier for low-income customers.

To assist in reducing low-income household resistance to implementing energy efficiency measures, Mr. Dunsky proposed that MH take full ownership of its DSM programs, including taking on all the necessary administration. He noted that in other jurisdictions where programs have been successfully implemented, full utility ownership of all approaches taken had been followed, with the benefits including the elimination of needless hurdles, the ability to negotiate better prices with contractors than can be achieved by individual low-income homeowners, and assurance of quality control.

Mr. Dunsky criticized MH's reliance on others, suggesting that relying on CBO's to identify and involve low-income customers is unlikely to secure success. Mr. Dunsky opined that another weakness in MH's program relates to the involvement of CBO's in program delivery. He recommended that MH be selective and choose only organizations with the institutional ability, reputation and capacity to deliver low-income programs effectively. He also suggested that MH invest significantly in helping CBO's develop the necessary capacities and abilities to deliver programs effectively.

Mr. Dunsky recommended that when such organizations are involved they be closely monitored and regularly assessed, particularly as to their ability to meet targets. For Mr. Dunsky, MH should measure and evaluate the time from "first contact to work completion", and both undertake quality control spot checks and utilize client satisfaction surveys.

To avoid the problems he expected to arise with involving CBOs in MH program delivery, Mr. Dunsky recommended that MH lead the projects and underwrite the costs of the measures required, dealing with the Federal government directly to recover any federal incentives that may be available.

The Coalition suggested that approximately 30% of MH's residential accounts pertain to rented homes, excluding duplex apartments, and that there are almost 98,000 apartment units. The Coalition noted renters' average household income is significantly lower than the Manitoba average, and that apartment units, where renters predominate, are currently excluded as a target group for the low-income energy efficiency program.

Mr. Dunsky stated that a major barrier faced by low-income customers is the lack of access to capital and a concurrent aversion to new debt. Mr. Dunsky also noted that the majority of low-income households are renters, and that a renter would not be willing to invest in improving the energy efficiency of a building if they were not to receive the benefit. Conversely, a renter responsible for the utility bill may find the owner of the building not willing to invest in improving the energy efficiency of the building envelope, because the landlord will not retain the benefits.

Mr. Dunsky stated that programs requiring landlord support should be made attractive for both the low-income tenant and the landlord, and that otherwise a low-income tenant will not benefit because of a lack of landlord participation. Mr. Dunsky proposed that MH offer a turnkey approaches, whereby MH would pay for all the measures undertaken and collect any external incentives. Mr. Dunsky indicated such an approach would best facilitate landlord participation.

With specific respect to natural gas furnace replacement, Mr. Dunsky indicated that MH's current program is inadequate. Mr. Dunsky suggested MH offer a zero-interest loan or, preferably, a lease. The loan/lease would involve owner payments over a maximum of 10 years.

He suggested that a leasing approach would allow repayment to remain tied to the furnace, the newer more efficient furnace to provide the energy savings benefits allowing the lease payment to be made. Mr. Dunsky also suggested that a more aggressive financing offer may overcome low-income customers' reluctance to participate, and provide an opportunity to replace inefficient furnaces (which result in high levels of emissions and bills).

Mr. Dunsky also suggested MH expand its current DSM program to include a fridge replacement program, which would target the early retirement of inefficient refrigerators. Mr. Dunsky estimated that replacing inefficient refrigerators could be expected to result in an average saving of over 900 kW.h annually for each fridge replaced.

Based primarily on its witness' testimony, the Coalition recommended, for Low-Income and Tenancy DSM:

1. MH provide turnkey service;
2. CBO capacities be evaluated prior to involvement;
3. A fridge replacement program be implemented;
4. A more aggressive approach to furnace replacement be undertaken; and
5. Expedite the rollout and implementation of low-income DSM programming, addressing costs, benefits, and sources of funding.

The Coalition did not endorse RCM/TREE's recommendation for a bill assistance program, stating that while the intervener was open to a further study of the issues involved, it had concerns with problems found in US jurisdictions, those reported to be related to low participation levels, and suggesting the potential to divide low-income customers from other customers and, as well, a concern with the income means testing that would be required.

MIPUG

DSM Programs

MIPUG suggested MH pursue all DSM opportunities where the projected costs to secure energy savings are at or below the marginal cost of new generation.

MIPUG advised MH not to screen out DSM opportunities on the basis of customer economics, but instead focus on ensuring customers have sufficient information to conduct their own evaluation of the costs and benefits of the DSM opportunity. MIPUG suggested MH's current approach may be screening out beneficial DSM measures.

DSM Program Evaluation

MIPUG expressed concern that MH's present approach is screening out economically justifiable opportunities, and opined that the TRC test excessively focuses on participant economics, and that it is possible that DSM activities that would be economically beneficial to MH and its customers are being screened out under the TRC test because the economics were not sufficiently advantageous to the participant.

Low-income programs

MIPUG opined that affordability programs to benefit low-income customers represent social policy considerations that more properly lie within the mandate of the provincial government. To base rates on a customer's ability to pay is, for MIPUG, discriminatory. Similarly, operation of a DSM program targeted solely at low-income customers is considered by MIPUG to be discriminatory, with MIPUG focused on MH's obligation to provide power to all its customers.

MIPUG opined that precedent suggests that decisions undertaken that exceed or define the bounds of discrimination should be made by explicit direction by the legislature and should not be undertaken in the absence of such direction. MIPUG's cited past legislation related to uniform rates and the establishment of the AEF, both created through government initiated legislative changes.

MIPUG further stated that if any approaches are to be undertaken to benefit low-income customers, they should be revenue neutral to non- low income customers

MKO

DSM Program Evaluation

MKO submitted that DSM programs should not be required to be revenue neutral for any particular customer class, or group of customers.

For MKO, to the extent that a provincial government elects to use MH rates as a social policy implementation tool, and provides clear direction to MH to do so, then the variance from standard rate design principles is justified.

MKO further stated for DSM programs targeted to benefit certain customers, that in the absence of a clear provincial government direction on “who should pay”, MKO submits that all MH customers should bear the costs.

Diesel Community DSM Programming

MKO submitted that energy efficiency measures are very important, especially for high-cost diesel served communities. In measuring energy savings in the diesel zone, 1 kW.h saved also reduces the cost of diesel fuel to generate the kW.h. However, since a kW.h saved in the diesel zone does not provide an extra kW.h for export sale, the more traditional approach of valuing a kW.h saved with respect to delaying new generation capacity or adding to export sales should not be used with respect to the diesel zone.

MKO noted that MH has suggested that through population growth the electricity required to serve the diesel communities may double over the next 20 years. MKO noted its understanding that INAC will pay for new generation capacity only for the diesel communities, whereas all MH customers pay for new generation capacity for the rest of the province. MKO is concerned that since MH does not have to pay for new generation capacity in the diesel communities (with the costs largely being met by INAC and rates), the Corporation has not pursued energy efficiency programs in the remote communities to the extent that it should.

MKO indicated concern with MH’s statement that its home audit program would not apply to homes in MKO communities, where, for MKO, MH perceives the benefits flow to INAC. Accordingly, MKO recommended that the Board immediately direct MH implement DSM programs for all customers in all MKO First Nation communities, whether or not MH perceives that benefits may accrue to INAC. MKO further recommended that MH personnel working with MKO First Nations customers be directed to meet with MKO First Nations to resolve misconceptions regarding the beneficiaries of DSM programs in the MKO First Nations communities.

MKO submitted that MH has been operating in violation of the spirit of Board Order 17/04, where MH was directed to implement DSM and energy efficiency programs in the diesel communities as part of the effort to reduce the financial burden on MKO customers. MKO further submitted that MH should re-evaluate its energy efficiency programs and incorporate Mr. Dunsky's recommendations to revise qualification criteria and set more realistic targets for the amounts MH will invest in energy efficiency measures in the diesel communities.

RCM/TREE

DSM Programs

RCM/TREE stated the principles of sustainability and justice should guide the Board in its determination of the public interest.

RCM/TREE noted that despite MH's internal assessment of success in its DSM program efforts, MH's standard electric residential customers continue to increase their energy consumption while Saskatchewan Power customers reduce their consumption.

While RCM/TREE supported MH in its bid to be both financially secure and socially responsible, the intervener suggested MH should further develop DSM and bill affordability programs for low-income customers.

Mr. Paul Chernick, a witness engaged by RCM/TREE, suggested that MH should double or triple its energy-efficiency spending, and energy savings, from current levels. Mr. Chernick stated that increased energy savings over the next few years would help to offset the expected and/or risk of energy shortages that may lie ahead, and that while MH asserts that “the only option available for 2009 is imported power” (to meet a possible energy shortage), accelerated DSM is clearly a lower-cost option.

For Mr. Chernick, increased energy savings over the next decade would increase MH’s flexibility, allowing it to avoid the anticipated 2020/21 energy deficit (before both Conawapa and Keeyask are expected to be on stream), without having to extend the operation of the thermal plants, while allowing the Utility to commit to larger and longer-term firm export sales.

Mr. Chernick advised that if the Board were to increase MH’s funding for DSM, low-income programs, economic development, or to strengthen MH’s balance sheet, the additional charges should come in the form of higher energy rates rather than increased demand charges, and by way of inverted higher tail-block energy charges.

DSM Program Evaluation

Mr. Chernick recommended the RIM test be discarded as a guide to the selection of DSM programs, and suggested that there are better ways to evaluate DSM programs. As to the evaluation of DSM programs, Mr. Chernick suggested the Board embed a value for carbon even though a carbon tax is currently not being received through current export prices.

Mr. Chernick recommended the Board direct MH to incorporate in its planning environmental costs for which it is not now being paid by export customers, and report back to the Board on the feasibility of including the additional benefits to Manitoba and the global environment from the reduction of carbon emissions, and how these benefits might best be incorporated in rate design and DSM evaluation.

Low-Income Programs

RCM/TREE submitted that MH should institute an affordability program, as recommended by Mr. Steven Weiss, a witness engaged by the intervener. For RCM/TREE, in addition to the social benefits that would come from a bill affordability program for the least well-off in society, such programs are also beneficial to non-participating customers because of reductions in utility collection and administration costs and reduced bad debts of low-income customers.

Mr. Weiss stated to make energy affordable, it is important for the Corporation to focus on customer energy burdens and target for benefits the most vulnerable, the benefits to be DSM and direct bill assistance. He defined energy burden as the percentage of income that non-transportation energy costs represent of household income. Mr. Weiss described a high-energy burden to represent 11% or more of household income, with a severe energy burden defined as being 15% or more of a household's income paid for energy.

Mr. Weiss recommended MH measure energy affordability, gather information on the energy burden of Manitobans, and track the effectiveness of its programs in reducing the number of customers with high and severe energy burdens. Mr. Weiss recommended MH should aim to reduce low-income residential consumers' energy burden to, at minimum, levels below the severe burden level of 15% of household income. He also suggested that over time MH should amend its goal, and seek to reduce the maximum energy burden to 11% of household income.

Mr. Weiss stated specific plans should be set to target the Low income households with the highest usage, and these residences should be provided conservation measures and bill assistance. Mr. Weiss also suggested MH should set goals and outreach targets for seniors, minorities, the disabled and families with young children.

Mr. Weiss noted that the bill assistance programs of other jurisdictions take many forms, including one-time crisis assistance payments (in the $200 - 300/year range), arranging forgiveness, rate discounts, monthly credits and assistance based on maximum percentage of household income..

Mr. Weiss indicated that programs considering the percentage of income required to be devoted to energy bills work best, when assistance levels can be set according to income level. He provided an example, whereby a customer would be charged no more than 9-10% of his/her income, being deemed a level that is "affordable." In Mr. Weiss' example, any bill amount over that level would be met through the bill assistance program.

Mr. Weiss stated that the customers of utilities offering such programs are often required to make timely payments in order to remain with the program; the goal being to provide an incentive for customers to stay current within a budget they can afford. Mr. Weiss further stated that these programs have proven to be extremely successful in reducing disconnection, arrearages and write-offs. He also recommended that such measures work best with equal payment plans.

Mr. Weiss' final recommendation was that a bill affordability program could begin as an experiment, and involve the use of a control group of low-income customers not enrolled in the program. He suggested that frequent evaluations of bill assistance programs and pilots are very useful, and that an advisory group consisting of social service agencies, low-income customers, conservation and social justice advocates, as well as utility personnel involved with the program would prove useful.

In addition, RCM/TREE expressed support for the proposals put forward by Mr. Dunsky, the witness for the Coalition who proposed recommendations to remove barriers to low- income program access.

In addressing the question of whether the Board has the jurisdiction to implement low-income programs, RCM/TREE referred to a recent decision of the Ontario Supreme Court of Justice Divisional Court (dated May 16, 2008) involving the *Advocacy Centre for Tenants* and others versus the *Ontario Energy Board* (OEB). In the Court's decision, Justices Kiteley and Cumming dealt with the issue of whether low-income programs could be viewed as being within the OEB Board's jurisdiction.

In that decision, the Court held:

> "However, in our view, the Board need not stop there. Rather, the Board, in the consideration of its statutory objectives, might consider it appropriate to use a specific method or technique in the implementation of its basic cost of service calculation to arrive at a final fixing of rates that are considered just and reasonable rates."

RCM/TREE interpreted the finding to mean the Board's jurisdiction could extend, to include the objective of energy conservation, and, as well, to the use of incentive rates or differential pricing, to further the objective of protecting the interests of consumers. RCM/TREE further interpreted the decision to suggest the Board may take into account income levels in setting utility rates, to achieve the delivery of affordable energy to low-income consumers (on the basis that this would meet the objective of protecting the interests of consumers with respect to prices).

RCM/TREE submitted the Board is engaged in rate setting within the context of the interpretation of its statute (*The Public Utilities Board Act*) in a fair, large, and liberal manner and that is not engaged in setting broad social policy; accordingly RCM/TREE urged the Board consider the approaches it recommended.

11.10 Board Findings

DSM Programs

The Board recognizes that MH has been making an increasingly significant investment in DSM programs, and has gone beyond the efforts made by the vast majority of other utilities, with spending increasing in recent years from $11.9 million in 2003/04 to a forecast in the order of $43.1 million for fiscal 2008/09.

MH's program now has a low-income component and it is a segment of MH's integrated resource plan, as energy savings allow for additional energy to either be sold on the export market or allow for the deferral of expensive new generation. Both outcomes can have the effect of improving MH's financial position and dampening the need for sizeable future rate increases.

The Board encourages MH to continue to pursue environmental objectives on an integrated natural gas-electricity basis, and in particular, to consider the position of low-income customers increasingly faced with higher energy costs and too often lacking the funds and know-how to achieve needed upgrades that would reduce their energy bills and GHG emissions.

For the Board, the Utility's DSM focus should be four-fold:

a) environmental – the reduction of wasted energy through reduced GHG emissions (here and in MH's export markets – climate change is a global challenge, the wind blows north as well as east, south and west);

b) economic – energy not consumed by Manitobans should be available for sale on the export markets, and as much of that as possible during on-peak hours at peak prices – exports are taken into account in determining domestic rates without exports current rates would be, on average, 15% higher;

c) economic – energy not consumed by Manitobans and not sold on the export market, either due to transmission capacity or price issues, can assist in the deferral of new generation and transmission, saving capital dollars and attendant interest and depreciation (construction and commodity costs have recently soared, driven in part by extraordinary expansions – of oil sands production in Alberta and the energy demand of China and India; sometimes delays can allow for projects to take place in times of more stable prices); and

d) social – increasing the energy efficiency of low-income households will allow more families to remain in their homes and to have more disposable income available for necessities other than energy (the total cost of energy – gasoline, natural gas, electricity, propane, etc., has soared for all households, but the cost increases have been particularly devastating for households in the bottom four deciles of household income levels).

With respect to the approach the Utility now takes to accounting for DSM costs, as it has in past orders the Board continues to question the appropriateness of deferring DSM costs, an approach that is now challenged not only by the Board's concern but also by the upcoming IFRS. The Board has had and remains of the view that DSM costs should either be expensed in the period incurred or amortized consistent with the much shorter periods of amortization followed by other jurisdictions.

MH defers DSM expenditures for subsequent amortization over 15 years, whereas Hydro Quebec and BC Hydro, (sister crown utilities) defer less DSM and amortize deferred DSM expenditures over a much shorter time frame. In the case of BC Hydro, DSM costs are amortized over the short term of the useful life of the program or a maximum of 10 years. Hydro Quebec also amortizes DSM expenditures over a 10-year period. With the coming introduction of IFRS, the current amortization policy will be reviewed and a more conservative approach may be an option for early adoption.

Amortization of DSM spending is forecast to grow from $9 million in fiscal 2007 to over $13.7 million in fiscal 2009, while actual spending on DSM initiatives is forecast in 2007 at $36.1 million, and to grow to over $43 million in fiscal 2009. Thus, MH now plans for deferred DSM to grow to over $180.9 million by March 31, 2009, a balance expected to continue to grow significantly through to 2018, due to increasing annual DSM spending which will eventually have to be recovered in rates – now to be achieved over a period too long for the Board.

The Board recommends MH consider changing its accounting approach to one that provides for the amortization of DSM costs over a period no longer than five years.

DSM Program Evaluation

The Board notes that MH projects that by fiscal 2017/18 (and speaking now as to electricity operations) it will have achieved 2,637 GW.h of DSM savings (1,706 GW.h through incentive-based programs and 931 GW.h of savings through changes to Codes and Standards, etc.). If achieved, this would represent a 240% increase in DSM savings over 12 years, a growth rate of almost 20% per year. (Demand savings are expected to reach 842 MW, an increase by 170% over 12 years, or almost 15% per year.).

While the projections are impressive, the Board suspects the opportunity for further reductions is great. As well, the projections are also highly subjective. MH relies on forecasts which can only be partially verified.

Despite major increases in DSM expenditures over the last four years, DSM has not had a marked effect on the deferral of planned generation and transmission projects. Since inception, DSM has, at best, offset 20% of domestic load growth. The Board notes that MH is forecasting the risk of energy shortfalls (demand, domestic and committed exports, as compared to local hydro-electric supply) through to the in-service dates of future generating stations Keeyask and Conawapa. If shortfalls do occur, and past experience and probabilities suggest a high risk of drought or below median water conditions occurring within the next five to ten years, then, as matters now stand, MH will have to rely on imported power from the MISO market. MH's MISO-market partner utilities generally use natural gas for peak demands, so the cost of imports can be a multiple of the average price of MH's exports.

In such a condition, and if a drought were to be sustained for five years (which has occurred in the past), MH has advised the Board that it could "run" a loss of over $3 billion, an amount that dwarfs the Corporation's current retained earnings balance and which would have implications for rates and the general view of the Corporation's fiscal stability going into a period of expected significant expansion.

For the Board, the risks inherent to a Corporation depending in the end on the weather suggest that there should be an even more increased focus on conservation and DSM, so as to further reduce demand to provide an increased buffer between Manitoba hydro-electric supply and likely demand in the future. Such increased DSM initiatives may also address the currently-forecast future expected shortfalls.

Energy conservation has never been of such importance to MH as it is now, as it contemplates a massive capital expenditure program, to produce power that now is expected to be required to meet rising domestic load and continuing committed export markets.

Now, as previously indicated, MH does not expect the conversion of current natural gas space heating load to electricity, nor does it expect an abandonment of natural gas as the space heating choice for new residential construction. Given the Board's understanding of current and forecast natural gas prices, and its expectation for even higher domestic load growth due to such new phenomena as "electric" and "hybrid" cars, relying on electricity rather than gasoline, the Board urges MH to focus on conservation and upgrade and develop new DSM programs, to free up hydro-electric generation to meet the risk of much higher domestic load growth than the Corporation now forecasts.

This will likely require an expansion of existing as well as additional DSM programs, along with taking more into consideration societal impacts in the evaluation of DSM programming. In short, the Board recommends that MH "step-up" its DSM plans and targets.

Indirect GHG Reductions

Interveners have suggested that increased export sales achieved by diverting price restrained domestic load growth to MISO will achieve global GHG reductions comparable to displacing coal-fired generation.

MH's evidence was that the GHG reductions are, to a greater degree, reflective of natural gas generation displacement, since the carbon footprint for natural gas generation is less than 50% of that for coal generation.

The Board sees a need for more clearly defining the relative environmental benefits of exports, and will direct MH to provide a detailed analysis and report to the Board before June 30, 2009 as to whether there are greater global environmental (GHG) and economic benefits by exporting hydraulically-generated electricity than would be achieved by fuel switching (from natural gas to electricity) and/or geothermal within Manitoba. The report should address and clearly define the relative environmental and economic benefits of exports. The assumptions should also be included in the report. Currently, Manitoba consumers and businesses transfer $1 billion to the gas producing provinces and states that supply Manitoba's natural gas, and these costs and transfers of funds to outside the province may soar even higher in the future.

Low-Income Energy Efficiency Programs

With respect to low-income programs, the Board commends MH for recently beginning to address the energy conservation needs of low-income households.

The Board is also encouraged that MH plans to enhance its low-income programs and target rental premises as well as owner-occupied residences, with MH's commitment to extend the low-income program to tenants of apartments. The Board further understands that there may be resistance for landlords to take part in the program due to split incentives and low-cost business models that some landlords may choose to operate under.

The Board also urges MH to make efforts to incent landlords to participate in the program to improve the energy efficiency of their properties, to the benefit of their tenants and the environment. The Board will expect MH to consult with stakeholders on its enhancements to its low-income programs to ensure it adequately addresses low-income needs, and to report to the Board by September 30, 2008 on the results of the consultation and subsequent development and implementation of this program.

Although MH is beginning to address the issue of energy poverty, more is required. The Board is very concerned with the slow pace of the overall effort. The Board notes that MH's current program is anticipated to address only 4,600 lower-income households over the next three and a half years, while the current low-income population is likely at least in the order of 100,000 households – and that is before taking into account recent major inflationary increases in general energy costs and risks of a slowing economy and higher unemployment.

Based on the current pace of MH's low-income DSM programs, the Corporation's spending over the next three years on low-income programs will not put a dent in the problem, and, at best, address only a very small fraction of low-income households. At the proposed pace of the program, it would take decades to obtain a significant level of participation of low-income households in MH's energy efficiency programs.

Low participation acts as a barrier to the lowering of excess energy bills and GHG emissions, and the putting in place of meaningful inverted rate program designs for residential customers. The Board agrees with the views expressed by the Coalition and RCM/TREE that more should be done in this area, to accelerate its efforts with respect to reducing the energy burden of low-income households.

The Board will direct MH to file with the Board on or before June 30, 2009 a draft plan, with projected implications, to increase the Corporation's integrated (natural gas and electricity) energy efficiency initiatives with respect to low-income households, so as to allow for reduced energy consumption for all such households within a decade.

The Board notes the evidence of Mr. Dunsky who critiqued MH's design of its low-income programs. Mr. Dunsky's suggested changes to MH's program were designed to overcome the barriers of program participation, barriers that clearly remain a significant concern of the Board. The suggested changes put forward by Mr. Dunsky have merit and should be considered by MH in its design of current and new low-income programs. The Board notes a willingness by MH to consider many of Mr. Dunsky's recommendations, and urges MH to not only consider the recommendations, but to internalize many of them, and take full ownership as to the delivery of the programs.

The Board was intrigued by the refrigerator replacement program proposed by Mr. Dunsky, and will direct MH to report back to the Board on a low-income and a general refrigerator replacement program, and provide the merits of such programs, on or before June 30, 2009. And, with respect to MH's new natural gas furnace replacement program (launched following Board direction that arose out of a Centra GRA), the Board appreciates the evaluation provided by Mr. Dunsky, and takes note of Mr. Dunsky's suggested changes to the program, including his suggestion for a lease program, with the lease payment linked to the energy benefit.

The Board notes Mr. Dunsky's critique that, as designed, the furnace replacement program will not prove an adequate incentive for the early replacement of inefficient natural gas furnaces and, at best, will likely only marginally assist the natural replacement market. The Board urges MH to seriously consider program changes to increase participation in early replacement of inefficient furnaces. Changes to the program that will better provide this opportunity are well worth the effort, and should provide energy savings for low-income customers and significant non-energy benefits to society, the Utility and the participants in the program.

The Board is aware that MH only recently launched its furnace replacement program, and suggests that design changes may be fairly easy to introduce at this time. MH has an opportunity to put this program on the “right footing” in advance of the upcoming heating season – when natural gas bills for all customers, not only low-income, may be considerably higher than they were in the previous winter.

The Board is interested in the take up of the program, and understands that it has been very low to-date, and will require MH to provide an update on the status of the current natural gas furnace replacement program (including actual and forecast take-up rates), as well as reports of possible changes to the program relative to the suggestions put forward by Mr. Dunsky, on or before September 30, 2008.

While not as aggressive, perhaps, as the Board’s recommendation that low-income customers be allowed subsidized Power Smart Loans and payment schedules involving an option requiring payment only upon the sale of the residence, Mr. Dunsky’s lease concept has merit as an option. Whether MH proceeds to adopt the Board’s recommendation for a subsidized loan program secured by the residence, or follows up and introduces a furnace lease program as suggested by Mr. Dunsky, either approach appears to be more likely of achieving success than the current approach being followed by the Corporation.

Installing high-efficiency furnaces in residences now relying on furnaces that may have efficiency ratings as low as 40% or below should assist in restraining the conversion from space heating by natural gas to electricity, that would, if it occurred, only intensify MH's supply/demand situation in the years to come.

With respect to the AEF, MH has taken the position that interest should not accrue on AEF balance, this contrary to that directed by the Board in Order 99/07. If interest was accrued on outstanding AEF balances, the AEF would have additional revenues available to fund further low-income programs. The Board recognizes that capacity issues may exist in program delivery; however, the Board believes that if more funds were made available, such programs could be expanded to meet more of the needs. If interest is not allowed to accrue to the AEF, its purchasing power will decline by at least the rate of CPI inflation; accruing interest will remove any disincentive to move quickly to put the AEF to work.

The Board does not agree with MH's perspective of the intent of the legislation that gave rise to the AEF. The Board will require MH to accrue interest on the AEF balance to ensure additional funds are available to fund expanded low-income energy efficiency programs.

The Board is also particularly concerned with the delivery of low-income programs on First Nations diesel communities. The Board notes MKO's concern that energy audits and low-income programs may not be available to diesel community households, with the perception that the benefits will be realized by INAC. The Board expects MH to meet with MKO and representatives from the diesel communities to discuss the issue of the access of those communities to MH's low-income programs, and to report to the Board on the outcome of these discussions on or before September 30, 2008.

The Board is very concerned with the burden low-income households face with higher energy costs, even more so given the rapid increases in both oil costs and natural gas pricing. The Board believes that MH has a duty to ensure a safe and reliable service to its customers. The question is whether that duty should extend to ensuring electricity is made available on an affordable basis.

Bill Assistance

The Board notes that the low-income high energy burden problem is extensive in Manitoba and that MH now relies on a voluntary program, Neighbours Helping Neighbours (Salvation Army), which allows MH customers to donate to a fund, a fund the Board finds sorely inadequate. Families and seniors who are unable to pay their natural gas or electricity bill due to personal hardship or crisis can receive support from the program, but only if sufficient funds are available.

While a voluntary program is beneficial, it cannot meet the need in the Province as it is now established. A low-income bill assistance program would assist in reducing the energy burden faced by low-income households. Significant non-energy benefits would arise, including increased comfort, reduced health costs, lower bad debt write-offs etc. .

Manitoba is a cold environment from the fall through to the spring; in this Province, adequate heat is a necessity of life. In light of this reality, the Board recommends government seek from the Federal government an exemption from GST for residential customers, as heat in Manitoba is a necessity like food; and to fund low-income and DSM programs, the Province should set aside all or a portion of provincially and or municipally sanctioned sales taxes charged to residential customers on energy used for heating purposes.

The Board notes that MH's commercial customers may recover GST paid on input costs and that health and educational institutions also receive favourable treatment with respect to the GST.

In a 2007 proceeding before the Ontario Energy Board (OEB) the Low-income Energy Network (LIEN) sought approval of a rate affordability assistance program to make natural gas distribution rates affordable to poor people. The underlying premise of LIEN's position was that low-income consumers [estimated at approximately 18% of Ontario households] should pay less for gas distribution service than other customers. The issue LIEN sought to advance were:

- Should the utility's rates include a rate affordability assistance program for low income consumers?
- If so, how should such a program be funded?
- How should eligibility criteria be determined?
- How should levels of assistance be determined?

In a split decision, the majority of the OEB panel concluded it did not have jurisdiction, pursuant to its existing legislation, to order the implementation of a low-income affordability program. The majority of the OEB concluded LIEN'S proposal amounted to an income redistribution scheme requiring one consumer rate class based on income characteristics as well as implicitly require subsidization of this new class by other rate classes.

LIEN appealed the OEB decision to the courts. Also by a split decision, the Ontario Superior Court of Justice, Divisional Court recently allowed the LIEN appeal and declared that the OEB has the jurisdiction to establish a rate affordability program for low-income consumers of the utility.

Because both the Manitoba and Ontario rate setting jurisdictions are similarly broad, this Board has previously indicated its concurrence with a dissenting position of the OEB on its ability to establish a rate affordability program for low-income utility customers, a position since upheld by the Court.

Energy affordability for low-income families is very much an issue that requires more or less immediate attention in Manitoba. The Board suspects that low-income individuals, families and seniors, unable to pay their natural gas or electricity bills due to personal hardship or crisis, could receive support from a rate reduction program without causing a major rate increase for MH's other customers.

The Board believes that in light of the recent Ontario court ruling, it (the Board) would be acting within its mandate and in the public interest if it were to direct MH to implement a bill assistance program. Accordingly, the Board sees merit in the proposition put forward by Mr. Weiss. And, therefore, the Board will direct MH to propose for Board consideration (as soon as possible for the coming heating season, but no later than September 30, 2008) a low-income bill assistance program, where such a program would occur in conjunction to and compliment an expanded low-income DSM program.

MH should address the issues of: how such a rate affordability assistance program should be funded, how eligibility criteria should be determined and how levels of assistance should be determined. Consultation with the Coalition and RCM/TREE may be of assistance to MH.

The Board understands the issues and problems raised by the Coalition relative to similar programs available in the US, where access to funds is "real", thanks to U.S. federal government funding. The Board further believes a bill assistance program (as proposed by Mr. Wiess) should be extended along with a program to improve the heat retention and the efficiency of low-income homes, and the sooner the better.

12.0 Risk Analysis

The Board has, in past Orders, requested that MH to file a quantified Risk Analysis. To date, MH has submitted limited scope and/or generic discussions of issues that would better be incorporated in a fully integrated and quantified risk analysis that provides a detailed quantification of all substantial risks and a probability analysis to assist in the testing of the appropriate level of debt:equity ratio.

Over the years and at various GRA proceedings, MH has flagged numerous business risks to its financial well being, and stressed the need for adequate retained earnings in order to make progress towards its debt/equity target of 75:25. And, consistent with these views and in response to past Board Orders, MH submitted the following reports at this year's GRA:

a) Risk Advisory Report (January 18, 2005) (2004-04 Drought Risk Management Review);

b) MH's report on Risk Strategy and Quantification (January 31, 2005); and

c) MH's analysis of Financial Loss Due to Extended Periods (July 26, 2007).

The first of these reports was narrowly focussed on MH's response to the 2003/04 drought, particularly as related to hedging and energy buy-backs. The report did not deal with MH's operational strategies going into the drought, an issue the Board has a considerable interest in (now, as an indication of possible future risks). MH's second report addressed generic issues of risk management and how the Corporation defines overall business risks. Again, it neither provided detailed assessments nor quantifications of those risks.

In the third document filed, MH quantified the financial implications associated with a repeat of the three extreme drought events in recorded history. The events were presented as individual risks and not integrated in an overall quantified business risk assessment. Also, MH, in response to interrogation, provided forecast financial impacts for a variety of business risks. However, it remained MH's position that these risks should not be aggregated and that appropriate methodology does not exist to allow the incorporation of risk probabilities to produce an overall risk quantification.

The Board observes that Manitoba Public Insurance also faces a diverse list of risks for which an aggregation would not provide a fair impression of even likely worst case scenarios yet, its actuarial advisor has assigned probability, allocated provisions for adverse deviations, and produced an overall assessment.

12.1 Drought

The following tables identify the reduction in retained earnings as of March 31, 2018 that MH projects as being associated with various unfavourable events (as identified during the hearing).

Drought Risks ($ millions)

Event in Forecast Period	Frequency	Retained Earnings Reduction	Retained Earnings, March 31, 2018
IFF 07-1	0	0	$3,349
One Year Drought (50% of 2003/04 Loss)	1 in 10	$ 490	$2,859
2003/04 Drought	1 in 15	$ 891	$2,458
Five-Year Drought (as per 1987-91)	1 in 50	$2,800	$ 549
Seven-Year Drought (as per 1936-42)	1 in 100	$3,500	($ 151)

A review of 94 years of river flow history revealed that MH has faced drought situations in 23 of the 94 years (1 year of each 4). Consecutive years of drought occurred in the periods 1929 to 1932, 1936 to 1942, 1976 to 1977, 1980 to 1981, and 1987 to 1991. MH has recognized the compounding effect on retained earnings of a multi-year drought and defined the financial consequence of a five-year drought modelled on the 1987 to 1991 experience, and, as well, the consequence of a seven-year drought modelled on the experience of 1936 to 1942.

These forecasts are presented as if these events had happened during the forecast period, to 2017/18. (The 2003-04 drought may well have been the most severe single-year drought in MH's flow history.)

The modeled multi-year droughts were projected to have retained earnings impacts of $2.8 billion for a five-year drought, and $3.5 billion for a seven-year drought. MH has never identified a "dollar based" retained earnings target, but relies on a 75:25 debt:equity target.

For a seven-year drought projected as above, and given an initial retained earning of $1.7 billion, MH forecast that an additional 4.0% annual rate increase, on top of the currently projected annual increase of 2.9%, applied over a 10-year period would not only restore the $1.7 billion projected to be lost as a result of the drought but would provide for a doubling of retained earnings to $3.5 billion by March 31, 2018.

This may suggest that $1.7 billion could be considered an adequate reserve for a seven-year drought, and that a 2% to 2.5% additional and annual rate increase for the ten years following such a drought would restore the initial reserve. However, assuming MH's current capital expenditure forecast is realized, restoring the $1.7 billion of retained earnings through annual 4.9-5.4% rate increases would not achieve a 75:25 debt:equity ratio; in fact, the retained earnings deficiency in such a situation would be quite significant.

The 2003-04 drought demonstrated that MH's generally "aggressive" approach to export energy marketing, while conducive to higher profits in median or above flow scenarios, carries the risk of increased losses during drought or low flow years. MH has acknowledged this risk, but believes its present strategy (that is, depending on median water flows) provides greater longer-term financial returns. The Board is not so certain and would prefer an independent assessment be conducted and filed.

Some of MH's exports involve three to four month advance sales of firm energy, without the certainty that the firm energy sold will be available (i.e., precipitation may not replenish water resources). Such practices lead to reasonable results in the absence of poor water conditions, but significant cost consequences when water flows fall and imports have to be purchased to fulfill contract obligations. This situation occurred in the summer of 2006/07 and, in the Board's view, contributed to MH's request for a 2.25% interim rate increase (granted initially as an interim increase and finalized by Order 90/08).

The drought scenarios represent events that could all occur over a 100-year period. However, the Board considers it reasonable that there is a very low probability that more than one multi-year drought would occur in a 50-year time period, let alone more than one during a 10-year forecast period. As such, the forecasts of multiple drought situations are not reasonably additive.

MH cannot prevent droughts from occurring, but, arguably, could do more than was done in 2003/04 to mitigate the consequences of a multi-year drought. In 2003/04, energy from water held in reserves was sold at low prices (off-peak pricing) to boost that year's annual income, only for the energy to be required to be "bought back" from the MISO market to meet MH's export commitments, and then at much higher prices than what the energy was sold for.

12.2 Other Risks

The "other risks" displayed in the following table are also circumstances that MH cannot control. However, as with droughts, the cost consequences of each can be mitigated to some degree by MH actions:

Impact of other Risks ($ millions)

Event in Forecast Period	**Frequency**	**Forecast Retained Earnings Reduction**	**Forecast Retained Earnings, March 31, 2018**
Lower Average Hydraulic Generation for 10 Years (1,000 GW.h Less)	(1)	$500	$2,849
Lower Export Revenue Prices (6¢/kW.h for 10 Years)	(1)	$800	$2,549
Exchange Rate Remains @ Unity for 10 Years	(1)	$170	$3,179
7.5% Capital Cost Price Escalation Per Year	(1)	$872	$2,477
Loss of Bipole I & II (for 4 months in 2011/12)	(1)	$200(2)	$3,149
Higher Interest Rate (up 2% on Average)	(1)	$234	$3,115

(1) Each of the above “other risks” have potentially high probabilities, ranging from 1 year in 5, to 1 year in 50

(2) Does not include costs for infrastructure repair or replacement.

The risks shown in the above table are “all inclusive”, and reflect scenarios that were raised in Board proceedings. As such, each is indicative of levels of risks that MH may be subject to at various times in the near future. From the Board’s perspective, given the importance of MH to the Province and the capital expenditure plans that are now “on the table”, a more exhaustive listing is still required, again with probabilities quantified.

The financial implications of these “other” risks may be considerably increased when MH’s recent export sales commitment announcements are confirmed in contract form. The nature of these sales and the additional capital costs associated with Conawapa and Keeyask generation and such additional transmission as may be required to meet the new commitments could substantially increase the magnitude of forecast reductions in retained earnings upon the occasion of an adverse event.

Not included in the above table are variations in domestic energy demand, medium-high domestic load scenarios as a result of extremely cold winters that can lead to energy shortages which would have to be offset by high priced imports, or conversions of energy sources to electricity from natural gas and propane. On the other hand, low-medium domestic load scenarios that arise with very mild winters can lead to energy surpluses, which in high flow years may have very limited market value.

Domestic residential and small commercial load growth comes with average revenue rates that have been above those achieved by average export rates. Domestic load growth in the large industry sector obtains the lowest rates offered by MH, other than those obtained from export sales during off-peak hours.

Overall, adverse events have variable probabilities. Two or three of these additional risks could occur in the same time period and, as such, their impacts on retained earnings could be additive. However, it appears that the total impact of the “other risks” might be of a lesser magnitude than what would be occasioned under severe drought situations.

12.3 Interveners' Positions

MIPUG, Coalition, and RCM/TREE all questioned the need for a retained earnings level based on a ratio of debt to equity, but, excepting for MIPUG's concept of specific reserves, have not made specific recommendations. A specific Board initiated review and quantification of risks has been recommended and the Coalition continues to support improved equity levels and suggests that further testing of retained earnings and reserves targets are required.

MIPUG proposes that the Board convene a special hearing to deal with risk and reserve issues, and that the Board should provide MH with prescriptive requirements and scope to define what would represent an acceptable comprehensive risk analysis and adopt an appropriate reserve mechanism for testing at future proceedings.

MKO also supports a broader role for the Board in defining business risks, including those associated with major capital programs.

12.4 Board Findings

Drought

Over the past decade or so, extra-provincial revenues have represented a significant portion of MH's actual and forecast revenues. And, as demonstrated by the $428 million loss in 2004, MH honours its obligation to meet firm export commitments by purchasing high price power in the event of a drought. The drought made clear the significant dependence that MH has on water flows; reasonable water conditions are clearly a requirement for MH to obtain favourable net export revenues and sustain domestic rates at below-cost levels.

As such, MH's energy supply resources and export commitments require constant monitoring, particularly as its assets and debts are to increase with planned massive capital expenditures.

MH has suggested that the drought of 2003/04 can be expected to re-occur once every 15 years, on average. Yet, longer droughts of greater consequence have occurred at least three times in MH's relatively short history. While MH has defined the potential impacts of various drought events, it has not provided a frequency-based in-depth analysis that is required to demonstrate the full range of economic consequence of the risk. MH will be directed to provide such an analysis.

In low water years, when MH experiences an energy shortfall, the available sources of "make-up" energy in the MISO market tend to be less efficient and very high cost natural gas generation (like the Brandon SCCT units, which recently had output costs of about 15¢/kW.h – compared to 6 cent rates for residential customers and 3.2 cents for large industry). Consequently, when MH operates gas generation to meet its export commitments, it is fulfilling export contract commitments at a substantial loss.

Unfortunately, in high flow years, MH's surplus (can be up to 7,000 GW.h greater than average) may only attract off-peak prices (and these have been under 2¢/kW.h during the summer months), as peak and shoulder-hours generation sales are limited due to transmission capacity and MISO needs. The difference between the price of a sale during peak hours and one during off-peak hours can be very significant, the former sometimes 10 times the latter, and with the latter usually being so low as to give rise to the question as to whether the sale was of strategic value.

This indicates a fairly large market risk related to MH's marketing strategies. To monitor these, the Board will be requiring MH to provide the Board with specific quarterly reports on energy supplies (including imports), domestic demand, and export sales (e.g., similar to NEB volume and price data). Alternatively, the Board could rely on annual reports, but they would enable only a form of post-mortem analyses and provide no opportunity for the Board to offer comment on more current strategies and their possible implications for consumer rates.

Infrastructure

Given the risks that abound with massive operations of high importance to not only utility customers but the Province overall, the Board will direct MH to provide regular due-diligence reports on its infrastructure, focusing on the risk aspects of the operation (e.g., Dam Safety Reports, Maintenance, and Rehabilitation Schedules, etc.), as part of expected regular updates to an Asset Evaluation Study.

Load Growth

The Board acknowledges MH's concerns about domestic load growth, particularly in the industrial sector. MH should provide a more detailed tracking of industrial load growth, along with a range of reasonable projections for the future when it re-files its application for a new industrial rate category in the fall..

The Board understands that MH's increasing DSM program is expected to offset a significant portion of domestic load growth. As such, it is essential that MH reconcile forecast DSM savings with its load forecasts and actual domestic loads. This type of analysis should be incorporated in Future Load Forecasts.

MH has yet to take a position on what might be likely climate change impacts on hydraulic generation, yet it assumes the global warming scenario in defining its export price forecasts and DSM benefits. The Board wants to explore the risks and opportunities that may lie with climate change at the next GRA, and trusts that MH is involved presently with such studies and is considering various possible scenarios, given recent new export commitments and plans for additional investments in generation and transmission facilities.

Capital Cost Escalation

The ambitious major capital program which has been undertaken to meet future export commitments and domestic load growth is expected to result in the spending of approximately $18 billion on major projects, including Bipole III, Keeyask and Conawapa. The Board notes that hyper-inflation and labour shortages was cited by MH as major reasons for the escalation in the costs to construct Wuskwatim, which is currently under development. In its evidence, MH did not indicate that the price increases experienced to date represented a short-term trend.

The Board is concerned that this higher-cost trend may continue. The Board questions and is concerned whether current forecasts of major capital programs are fully reflected in the forecast before the Board, and is concerned with the risk that an updated capital forecast more reflective of recent inflationary experience related to capital projects may show substantially-higher capital requirements, putting upward pressure on future rates.

The Board needs to examine a variety of cost and price scenarios to better assure it that the planned new capital projects will not require significant domestic rate increases over the longer term. The Board has directed MH to file an updated Power Resource Plan and provide an analysis of the rate impacts of the new planned capital projects.

Export Commitments

While the Board has not been provided with MH's specific export contract prices and terms, it is concerned because of recent average export price history. MH's forecasts assume an USD/CDN exchange rate of 1.16 and CO_2 legislation to achieve average export prices of 10¢/kW.h by 2018. If that expected price in Canadian currency does not materialize, MH could be faced with an extended period of time where average export prices will not cover incremental costs associated with Bipole III, Keeyask G.S., and Conawapa G.S, just as happened after the Limestone G.S. in-service of 1992, and as expected for several years following Wuskwatim coming into service.

With construction costs in a higher inflation mode and with interest rates at recent historic lows, it is impossible to be certain prices that have been secured on the export market will prove adequate. A relatively modest worst-case scenario could involve a 1-2¢/kW.h shortfall on export sales extending well beyond 2025. And, with Bipole III routed on the West Side of the Province, costs to be allocated under the COSS model may be 0.5¢/kW.h more than if Bipole III was to be on the East Side of the Province. A shortfall from required export pricing could have the effect of reducing future annual net income significantly after 2018, placing further pressure on domestic rates.

Other Risks

With inflation increasing and transportation costs soaring, it is difficult to imagine interest rates being sustained at current historically low levels. And, with oil at $140 a barrel and some industry observers predicting the price reaching $200, it would appear less than conservative to assume that the Canadian dollar is going to depreciate significantly from its current "near parity" level. Both an increase in interest rates and, perhaps, even a further appreciation of the Canadian dollar would have significant implications on the operations and results of MH, implications not yet quantified.

In light of the many risks discussed, the Board has directed MH to prepare a Risk Analysis to fully quantify the financial impact of the risks faced by MH.

13.0 Cost of Service

13.1 Background

Currently, MH's Cost of Service Study is a prospective study of average (embedded) historically-based costs classified, functionalized, and allocated to each customer class and sub-class on the basis of system usage. The costs reflect invested funds in Generation, Transmission, and Distribution, updated to use in forecasting costs for the next upcoming fiscal year.

Costs related to finance (interest, etc.), depreciation, and OM&A are shared by domestic customer classes and one export class on the basis of energy consumption, peak load demand, and customer numbers. Currently, surplus export revenues (above assigned and allocated costs, i.e. notional profit) are credited to the various domestic classes proportional to their share of total allocated costs.

COSS is a tool to assess the extent to which each customer class' revenues recover/compare to allocated and historic costs. The revenue to cost coverages derived from PCOSS-08 illustrate a degree of disparity in embedded cost sharing by the various classes. Yet, the results should not be viewed as being representative of a degree of unfairness, but rather as an indication of possible rate increase differentiations, if only historic costs are to be taken into account and the current method of allocating costs and revenue (including net export results) is maintained.

MH employs a Zone of Reasonableness (ZOR) from 95% to 105% to assess the need for differentiated rate increases. In this GRA, MH chose to seek an across-the-Board rate increase for all classes other than Area and Roadway Lighting (a class composed of municipal and other governments providing area roadway lighting to their communities).

MH opined that an across-the-board increase was justified, as no rate class is “paying” its full cost of service as long as MH has a retained earnings deficiency.

13.2 Amended PCOSS-06

In response to Order 117/06, which followed a comprehensive review of MH’s cost of service methodology, MH submitted a 16-page document that reflected most of the changes directed to be made by the Board in PCOSS-06 by Board Order 117/06.

Notably, the amended COS employed the following energy inputs:

Domestic Load at Generation	22,830 GW.h
Export Load at Generation	9,786 GW.h
Total Load at Generation	32,616 GW.h

For hydraulic generation cost sharing purposes, export load at generation was reduced by 9,786 GW.h, comprised of:

2,010 GW.h	(derived by imports)
587 GW.h	(derived by thermal)
1,117 GW.h	(DSM savings)
6,072 GW.h	(exports served hydraulic generation pool)

Revenues reported in the COS were:

Domestic:	$1,018.2 M (19,900 GW.h @ 5.12¢/kW.h at meter)
Export:	$547.4 M (8,800 GW.h @ 6.22¢/kW.h point of sale) - actual average export prices in 2005/06 were 5.2¢/kW.h.

MH carried out a 12-period weighting process of all hydraulic generation using the average Surplus Energy Program (SEP) pricing over an eight-year period. This approach was applied to actual domestic energy consumption and 2003/04 net export sales at generation. The use of a drought year for defining the 12-period export sales would have overstated the share of generation costs allocated to the export class (and accordingly, was not employed).

13.3 Export Costs

The COS directly assigned $123.8 million of costs and allocated a further $248.7 million of costs to the export class. These costs reflected:

	($ Millions)
Uniform Rate Adjustment	$16.7
DSM	$17.8
Trading Desk Costs	$9.1
MAPP/MISO/NEB costs; Purchased Power; and Thermal Costs	$80.2
Allocated Generation and Transmission (including Water Rentals)	$248.7

Revenue to Costs Coverage Ratios (RCC)

The revenue cost coverages for the amended COS were reported at:

Residential	94.1
GSS-ND	107.6
GSS-D	107.0
GSM	101.4
GSL<30	91.4
GSL 30/100	91.4
GSL>100	104.8
ARL	106.1

The Board did not formally respond to MH's filing of the Amended PCOSS-06, and requested the Corporation to employ the COS approach directed by Order 117/06 for the next GRA, the subject of this Order.

13.4 Embedded Cost Revenue Cost Coverages (RCCs)

In PCOSS-08, MH calculated the RCCs for the various customer classes as follows:

	After Net Export Credit	**Prior to Net Export Credit**	**MIPUG/MH I-25(b)**
Residential	96.4%	83.0%	95.9%
GSS-ND	104.3%	90.8%	103.9%
GSS-D	107.2%	93.8%	107.5%
GSM	101.1%	87.7%	101.3%
GSL <30	90.4%	76.9%	90.3%
GSL 30-100	103.7%	90.1%	104.6%
GSL >100	108.7%	94.8%	110.4%
AWR	105.8%	96.7%	105.6%

The foregoing PCOSS-08 RCC's (pre-2008 rate increase, 5% as per Order 90/08) continue to suggest a need for differentiated rate increases in the future. The results are relatively consistent with historical embedded cost RCC's, as shown in the following table:

Table: Historical RCC

	RCC PCOSS-08	RCC PCOSS-06[1]	RCC PCOSS-04	RCC PCOSS-03	RCC PCOSS-02	RCC PCOSS-01	RCC PCOSS-99	RCC PCOSS-97
Residential	96%	97%	91%	92%	97%	91%	92%	91%
GSS-ND	104%	107%	105%	107%	109%	104%	107%	107%
GSS-D	107%	105%	110%	108%	105%	105%	108%	105%
GSM	101%	101%	105%	103%	104%	109%	106%	102%
GSL 0-30 KV	90%	90%	100%	93%	97%	103%	101%	101%
GSL 30-100 KV	104%	102%	110%	109%	109%	119%	110%	108%
GSL >100 KV	109%	103%	114%	114%	100%	116%	109%	111%
A&R Lighting	106%	107%	109%	110%	102%	92%	93%	109%

1. MH's Recommended Version

The methodology used for the Cost of Service Study was changed for each of the following studies (suggesting, as was stated by the Board in Order 117/06, that COS is 'in a state of flux'):

- PCOSS-99
- PCOSS-01
- PCOSS-02
- PCOSS-04
- PCOSS-06
- PCOSS-08

13.4.1 Compliance with Board Order 117/06

Board Order 117/06 directed MH to re-file COS as presented in "PCOSS 06 - Recommended Method" on the basis of directives provided by the Board. The following identifies the Board's directives and the extent of MH's compliance.

One Export Class

MH defined a single export class encompassing both firm (dependable) energy exports and interruptible (opportunity) energy exports. Costs were either to be assigned directly or allocated on the basis of total export energy sales.

However, MH has not specifically defined the export operation as a class for regulation purposes.

Uniform Rate Adjustment

As per Order 117/06, MH credited the residential, general service small, and the area and roadway lighting classes with appropriately calculated energy-based shares of foregone revenue incurred as a result of the Uniform Rate Adjustment (URA). URA, established by provincial legislation, provides for all grid-served customers to receive the same rate, pursuant to the Board's class rate schedule.

The URA provides significant savings to rural and grid-served northern communities, compared to the previous approach which established grid rates by customer zone, with rural and northern zones being allocated higher proportional costs to serve that urban areas. Grid-rates have also been provided to residential customers served by diesel-generated power in the four northern communities still not on the grid.

The full amount of the adjustment has been deducted from the total export revenues, the assumption being that the URA has been “paid for” by export profits.

Imports and Power Purchases

As per Order 117/06, MH directly assigned all energy import and wind energy purchase costs as costs to be allocated against export revenues. Import energy costs include energy actually transmitted into the MH system and energy purchased for immediate resale (arbitrage) in the external export market. These latter energy amounts have been deducted from exports in determining the export class’ share of overall costs.

Thermal Generation

MH’s interpretation of Order 117/06 resulted in the Utility directly assigning only thermal fuel (coal and natural gas) costs at $19.3 million/year to the export class. Other generation costs, totalling $69.3 million/year for finance, depreciation, and OM&A, were not directly assigned, but placed in the generation pool for overall system cost-sharing customer classes.

However, MH elected to deduct the full amount of thermal generation (587 GW.h) from exports in determining the percentage of generation costs to be shared by exports. This interpretation by MH results in no embedded costs being allocated to the export class for the 587 GW.h thermally-generated electricity. The net effect was to reduce costs otherwise allocated to the export class by approximately $10 million.

Overall, MH’s approach reduced the unit cost assigned to exports by nearly 1¢/kW.h. MH rationalized the deviation from the Board’s instruction of Order 117/06 on the basis that while fuel costs fluctuate with export levels, the other costs do not. And, these other costs relate to fixed plant, and that the thermal plants were constructed to provide added security of reliability to domestic load demand requirements.

DSM Energy Deduction

In keeping with Order 117/06, MH charged all DSM costs directly to the export class. However, MH also deducted the DSM energy savings from exports in defining the export class share of hydraulic generation costs.

If DSM costs were allocated to exports (as per the Uniform Rate Adjustment), but energy savings were not, about $28 million of generation costs would be shifted from domestic classes to export class.

The longer-term result of MH's approach to the DSM energy savings, if accepted by the Board, would have very little (if any) generation costs being allocated to the export class; this, because DSM-derived energy savings could outstrip actual exports by 2017/18.

Energy Weighting (12 periods)

As per Order 117/06, in the cost allocation process for Generation energy supply, MH employed a 12-period price weighting rather than the four periods at initially proposed in PCOSS-06. The weighting was based on energy values during both the four seasons and the peak/shoulder/off-peak periods. The weightings in the following table reflect the average from January 1999 to December 2006, relative to a summer off-peak base value of 1.000.

The relative value of energy supply resulting were:

	Peak	Shoulder (¢ per kW.h)	Off-peak
Spring (2 months)	2.513	2.144	1.246
Summer (4 months)	3.258	2.388	1.000
Fall (2 months)	2.624	2.155	1.396
Winter (4 months)	3.406	2.262	1.796

The energy consumption values employed in the generation cost allocation process by MH reflected the domestic and export energy consumption profiles for 2003/04 in PCOSS 06 (a drought year) and for 2005/06 in PCOSS 08 (a high flow year). Consequently, the generation cost allocation to exports are quite different in the two PCOSS'.

13.5 PCOSS-08

13.5.1 Treatment of Exports Class Cost Allocations

In Board Order 117/06, MH was directed to establish a single export class, to be fully allocated costs for generation and transmission. MH opposed this direction opining that opportunity sales should only attract variable costs and not fixed costs. This view was reflected in MH's treatment of thermal costs, where MH assigned only fuel costs to the export class in contravention of the Board's directive.

13.5.2 Review of PCOSS-08

PCOSS-08 employed the following energy inputs:

Domestic Load at Generation	23,740 GW.h
Export Load at Generation	8,460 GW.h
Total Load at Generation	32,200 GW.h

Forecast Revenues in PCOSS-08

Forecast Domestic	- \$1,066 M (20,800 GW.h @ 5.13¢/kW.h at meter) (actual average export prices in 07/08 were 5.0¢/kW.h)
Forecast Export	- \$551.5 M (7,700 GW.h @ 7.16¢/kW.h at point of sale)
	(While the above were forecast, the actual average export prices in 07/08 appear to be 5.0¢/kW.h)

For hydraulic generation cost sharing purposes, export load would be reduced as follows:

	GW.h
Export Load at Generation	8,462
Less	
Served from imports and power purchase	(2,028)
Served by thermal generation	(560)
DSM savings	(1,350)
Net exports served from hydraulic generation pool	4,524

13.5.3 Treatment of Exports Class Cost Allocations

Out of a total generation and transmission cost of $1,165 million , PCOSS-08 defined export costs as follows:

Directly Assigned Costs

Uniform Rate Adjustment		$17 M
DSM Costs		$25 M
Trading Disk Costs		$13 M
MAPP/MISO/NEB Costs		$7 M
Imports and other purchased power		$134 M
Thermal Fuel Costs		$23 M
	Sub-total	**$219 M**

Allocated Costs

Generation (including water rentals)		$116 M
Transmission		$51 M
	Sub-total	**$167 M**
Total export costs		**$386 M**

Export sales accounted for 27% of system energy sales, about 20% of winter CP demand and 33% of summer CP demand.

The $386 million of defined export costs equates to approximately 5¢/kW.h at the point of sale – and were derived by MH without assigning “fixed” thermal costs to the export class as directed by the Board. While MH’s forecast export sales prices in PCOSS-08 were 7.2¢/kW.h, it now appears that the actual average export price will be closer to 5¢/kW.h

MH Position

MH contends that its current COSS model, as depicted in PCOSS-08, does not provide the most suitable basis for evaluating either class revenue requirements or establishing a rate design. MH’s fundamental issue with PCOSS-O8 relates to the magnitude of assignment (allocation) of costs to Exports.

The ultimate impact of the Board’s directives with respect to these matters was depicted in the pre-filed evidence of Patrick Bowman and Andrew McLaren, witnesses for MIPUG. In their Table 4-1, Bulk Power costs are depicted for each of the major classes, as follows:

13.0 Cost of Service

Table 4.1
Levelized RCC Ratios per kW.h PCOSS08 with DSM Correction

	Residential		GSS-ND		GSM		GSL>100kV		Exports	
	($ M)	(¢/kWh)	($ M)	(¢/kWh)	($ M)	(¢/kWh)	($ M)	(¢/kWh)	($ M)	(¢/kWh)
Costs										
1 Bulk Power Costs	$248.8	3.78	$54.8	4.12	$113.2	3.84	$171.1	3.29	$372.2	4.83
2 DSM adjustments	($4.2)	(0.06)	($3.2)	(0.24)	($4.2)	(0.14)	($6.6)	(0.13)	$24.6	0.32
3 Net Bulk Power Costs	$244.6	3.72	$51.6	3.88	$109.0	3.70	$164.5	3.16	$396.8	5.15
4 plus: Subtransmission-related	$38.5	0.59	$6.8	0.51	$11.7	0.40	$0.0	0.00	$0.0	0.00
5 plus: Distrib. and Cust. Serv.	$229.7	3.49	$42.1	3.16	$39.7	1.35	$2.0	0.04	$0.0	0.00
6 **Total Costs**	**$512.9**	**7.80**	**$100.4**	**7.56**	**$160.5**	**5.44**	**$166.4**	**3.20**	**$396.8**	**5.15**
Rates										
7 Total Sales Revenue	$417.8	6.35	$91.7	6.90	$144.2	4.89	$164.0	3.15	$490.3	6.36
8 Uniform Rate Credit	$15.4	0.23	$1.2	0.09	$0.0	0.00	$0.0	0.00	($17.2)	
9 System Merchant Sales									$61.2	
10 **Total PCOSS Revenue** (7 + 8 + 9)	**$433.1**	**6.59**	**$92.9**	**6.99**	**$144.2**	**4.89**	**$164.0**	**3.15**	**$534.3**	**6.93**
Surplus/Shortfall before Net Export Credits										
11 **Rates compared to costs** (10 - 6)	**($79.8)**	**(1.21)**	**($7.5)**	**(0.57)**	**($16.3)**	**(0.55)**	**($2.4)**	**(0.05)**	**$137.5**	**1.78**
Net Export Credits										
12 Net Export Revenues Allocation	$58.6	0.89	$11.5	0.86	$18.3	0.62	$19.7	0.38	($137.5)	(1.78)
13 **Surplus/(Shortfall) after net export revenue credits** (11 + 12)	**($21.1)**	**(0.32)**	**$3.9**	**0.30**	**$2.0**	**0.07**	**$17.3**	**0.33**		
Total Class Metered Energy (GW.h)	6,578		1,329		2,949		5,202		7,707	

The table illustrates that for transmission voltage domestic customers (General Service Large > 100kV), MH's embedded historic cost per kW.h is 3.29¢ compared to 4.83¢ for the Export Class. In fact, bulk power costs for Generation and Transmission (G&T) for all domestic classes are lower than the costs allocated to exports. MH opined that the view was counterintuitive, and that the embedded bulk power (G&T) cost of export sales should not be higher, on a unit basis, than the embedded cost to Transmission voltage domestic customers, and probably should be lower than the embedded cost of similar voltage domestic sales.

Board Order 117/06 also directed that certain other costs be specifically assigned to the Export Class, including the revenue impacts of Uniform Rates and the costs of DSM for domestic customers.

MH contends that the directed methodology of Order 117/06 assigns a much larger portion of Generation and Transmission costs against exports, and thus reduces the amount of residual export revenue available for allocation to domestic customer classes. This approach would appear to have the same effect on class RCC ratios as previous methodologies, in which the allocation of export revenues to the domestic rate classes was limited to only the Generation and Transmission functions.

With respect to DSM costs, MH interpreted Order 117/06 to mean that all DSM energy savings should be assumed to serve the export market. Accordingly, the $24.6 million in forecast DSM costs and the associated 1,350 GW.h of annual energy savings associated with all DSM carried out to-date were applied to the Export Class.

If the Board continues to direct DSM and thermal costs be assigned to exports, MH recommends that the Board confirm the treatment proposed by the Corporation for PCOSS08. However, MH reiterated that the Corporation has serious overall concern about what it perceives as an over-allocation of costs to Exports, with resulting deleterious impact on the outputs of the embedded cost study.

13.6 Marginal Cost Considerations

In Board Order 117/06, MH was directed to provide a strategy to allow for the consideration of marginal costs and environmental costs, in addition to the current embedded costs, within the COS. In the current Application, MH provided a single page marginal cost analysis without explanation or suggestion as to how the analysis would best be applied in the context of rate design.

Briefly, MH's marginal cost calculations assumed that for:

- **Generation**: All domestic customer classes should be allocated costs on the basis of annual consumption applied to forecast peak (5 x 16) export prices. (No costs were to be assigned to the export class.)
- **Transmission**: All domestic customer classes should be allocated costs on the basis of two coincidental peak (2 CP) peak load cost sharing of future additions to in-service assets, plus OM&A costs. (No costs were to be assigned to the export class.)
- **Distribution**: All domestic customer classes should be allocated costs on the basis of (NCP) peak load cost sharing of future additions to the assets in-service plus OM&A costs.

The proposed methodology was subsequently amended during the hearing; the revisions dealt with numbers employed but did not address how the RCCs calculated should be applied to rate design.

In the absence of disclosure of key assumptions (deemed commercially sensitive by MH), it is unclear to the Board as to how MH determined key inputs to the marginal cost calculations. For example, it appears that no generation or transmission investments were allocated to exports. And that no costs for water rental, imports, fuel, transmission losses, etc. were deducted from forecast export prices, employed in assigning marginal costs for generation to domestic customers. High levels of distribution investments in the distribution plant over the last ten years were not reflected in marginal cost going forward.

MH's filing on marginal cost was subsequently amended by MH, and presented marginal cost values for:

- Generation - $1.315 billion (equivalent to 20,800 GW.h @ 6.32¢/kW.h) allocated to various classes on SEP weighting basis and is essentially based on export market values;
- Transmission - $280 million (equivalent to 20,800 GW.h @ 1.35¢/kW.h) is allocated to various classes on a 2 CP basis and reflects the cost of all new transmission plant; and
- Distribution - $294 million ($133 million for distribution plant and $161 million for OM&A costs) allocated to various classes, as applicable, on a NCP basis.

There is no readily apparent definition of marginal cost, although MH's approach could be taken to represent the cost of providing each additional increment of energy, demand, or service (as these requirements grow). It could also be taken to mean the value of the last increment already supplied.

MH's approach suggests that marginal cost could be a stand-alone COSS, rather than being incremental to the existing embedded cost of service study.

Marginal cost of service methodology is complex and, to the Board's understanding, has only been employed for rate setting by a limited number of electric utilities. It could be argued that it is not readily applicable to MH's circumstances that being a vertically integrated utility with surplus energy going into a competitive export market.

13.7 Interveners' Positions

The Coalition

The Coalition cited a changing face of consumption among the various customer classes, noting that annual consumption from General Service top customers are projected to exceed residential customers by 2009/10 and are projected to be significantly higher than residential sales by 2017/18.

The Coalition further noted that average gross export rate prices for fiscal 2007/08 and fiscal 2008/09 were forecast at 5.4¢ per kW.h and 5.6¢ per kW.h respectively. This compares with an average residential rate above 6¢ per kW.h, while the average GSL greater than 100 KV rate is less than 3.5¢ per kW.h. The Coalition observed that residential rates are closer to marginal rates than those of large industrial customers. Current residential rates are 6¢ per kW.h while the long run marginal cost is 7.6¢ per kW.h, as compared to GSL greater than 30 KV with a current rate of 3.2¢ per kW.h while the long run marginal cost is approximately 6.8¢ per kW.h.

The Coalition suggested that the Board's objective is to look at the results of a marginal cost based cost allocation and use it to help inform decisions with respect to revenue allocation to customer classes. The Coalition prefers MH's approach, while considering MIPUG's approach to be better suited to a situation where one wants to incorporate marginal cost principles in an embedded COSS (as opposed to doing a marginal cost based COSS).

The Coalition noted the allocation of generation costs using the SEP prices is an example of where MH is utilizing an approach very similar to MIPUG's (i.e., determine the marginal cost for a function and use them to allocate the cost of that function). The Coalition further noted if the Board wanted to review the implications of using a marginal cost based COSS it should not look at the end results proposed by MIPUG, as MIPUG's approach distorts the results by forcing a reconciliation to the embedded cost approach on an individual function basis.

With respect to whether the differential rate increases should be based on the new cost of service study, Mr. Harper noted that the Board has directed that the zone of reasonableness (ZOR), a range of between 95% to 105%, be considered, and that some minor rebalancing might be appropriate given that three out of the eight classes are outside the range, though some only marginally.

However, Mr. Harper further stated this represents the first time that the revised cost of service study has been reviewed and that there remain some methodology issues that require resolution. Therefore, given that the RCCs are relatively close to the ZOR boundary, for Mr. Harper it would be appropriate to resolve the outstanding issues before entering into rate rebalancing.

In addition to cost of service study results, the Board has indicated that it may consider a number of other factors in assessing the revenue allocation between the classes, including the pre-export allocation as well as an allocation based on marginal environmental costs.

Mr. Harper noted that given various exhibits filed by MH and others these varying perspectives yield significantly different results, and depending upon how much weight one puts on one perspective as opposed to another can result in totally different view as to what differentiated rate increases would result to the customer classes. In addition, Mr. Harper noted that MH is seeking an increase that is higher than inflation and that differentiated rate increases would compound a negative impact for some customer classes.

The Coalition concluded that, except for Area and Roadway Lighting, there should be no differential rate increases at this time.

MIPUG

MIPUG stated the current COSS fairly reflects the embedded cost of service with the exception of the treatment of DSM. For MIPUG, MH has correctly assigned the DSM costs to the export class as directed by Board Order 117/06, however MH has also deducted 1,350 GW.h in DSM savings from the export energy used to allocate common generation pool costs.

MIPUG stated that as these same DSM Energy savings are accounted for in the domestic sales forecast, MH's treatment has erroneously double-counted the DSM Energy savings, and created an energy imbalance in PCOSS-08.

MIPUG stated MH's approach also effectively "claws back" from the common generation pool a priority allocation of generation to exports. The result being that for all intents and purposes the benefits secured from the domestic classes' participation in DSM is lost. MIPUG suggested that the Board's directive in Order 117/06 did not specify a specific treatment of DSM energy. As MH's treatment results in an energy imbalance in the PC0SS-08, MIPUG recommended the issue must be addressed.

MIPUG recommended that the Board direct MH to address the error by removing the 1,350 GW.h DSM Energy credit from the export class. MIPUG submitted the DSM costs should continue to be directly assigned to the export class but that the energy savings should remain with the domestic customer classes that undertook the measures leading to the savings.

MIPUG further stated that PCOSS-08 also failed to strictly reflect the Board's directive from Order 117/06 as to the assignment of all thermal plant costs to exports. (MH assigned only fuel to the export class, with the remainder of thermal plant costs allocated to the overall generation pool.) Yet, although the approach did not strictly conform to the Board's directive, Mr. Bowman stated MH's treatment does not appear unreasonable as thermal assets are a necessary complement to the hydraulic assets and, as a result, merit treatment as common pool generation assets. MIPUG recommended the Board approve MH's treatment of thermal costs in the COSS.

MKO

MKO concurs with the MIPUG recommendations on the 2008/09 COSS. MKO did not provide recommendations on whether embedded versus marginal costing should be utilized or whether rate increases, if granted, should be set on a differential basis.

MKO noted that it was reasonable to identify how additional environmental costs were included in PCOSS-08. In general, MKO supports greater consideration of environmental costs being given and advised it would continue to argue for a fair share of environmental benefits to accrue to MKO communities. MKO recommended that future PCOSS should quantify both environmental benefits and costs.

RCM/TREE

RCM/TREE observed that this GRA was the first to employ the new cost of service methodology, which treats export customers as a separate class and defines a revenue surplus arising from that class.

RCM/TREE noted that all domestic customer classes have a revenue shortfall relative to allocated costs, and are subsidized by export surpluses. RCM/TREE stated that this reality raises a policy question, that being how best to distribute export surplus (to the elements, activities, and classes of the utility).

RCM/TREE stated that general service large customers should be charged the embedded energy rate for usage up to a baseline, and assessed marginal cost, including environmental costs, for consumption above that level. RCM/TREE also recommended that new general service large customers should be charged the marginal energy rate. For the intervener, additional revenue raised through the implementation of the recommendations would best be used to fund economic development grants, increase DSM efforts, and to decrease demand charges.

RCM/TREE recommended that the Board direct MH to participate in a public review of marginal costs, and that those costs include environmental costs. RCM/TREE further submitted that if MH's forecast data is to be considered commercially sensitive, then publicly available information should be used to satisfy the Board's directives of Order117/06. RCM/TREE stated that MH had not satisfied the Board's directive, by including only environmental costs internalized in the market, and that those costs are only part of the full costs of full cost accounting, which should inform decision-making as prescribed by guideline one of *The Sustainable Development Act.*

Mr. Chernick stated that reducing domestic consumption would either lead to increased exports, reduced imports, or reduced MH's thermal generation, and that all of these possible outcomes would result in reduced GHG emissions. According to Mr. Chernick, currently the "costs" of greenhouse gases are not internalized in the prices charged by U.S. utilities.

Mr. Chernick submitted that the total social cost of domestic consumption of electricity is thus higher than the direct costs as calculated by MH. Mr. Chernick recommended that such additional environmental costs should be incorporated in marginal costs and reflected in the COSS, although the benefits flow to the U.S. and reduce environmental costs incurred in the U.S.

Mr. Chernick recommended that MH's rate design should be based on marginal costs, not embedded cost. and that the current COSS is based on a faulty model of cost causality, as it ignores the effects of energy use on transmission and distribution (T&D) costs.

Mr. Chernick stated that the transmission and distribution system is impacted by energy in at least three respects:

First, a large portion of MH's transmission is required to move power from remote hydro stations in the north to the load centers located in the south, and for export. Second, MH's transmission system is more expensive because it is designed to allow for large transfers of energy between neighbouring utilities. Third, MH's transmission system is designed to minimize energy losses over extended hours of high loads. Mr. Chernick submitted that were the system designed only to meet peak demand, a less costly system would suffice and, in some cases, lines or circuits now in place would not be required, voltage levels could be lower, and fewer or smaller transformers would be needed.

Mr. Chernick stated that MH's distribution costs are impacted by energy requirements, and that the sizing of transformers and underground lines are driven by the energy use on the equipment in high-load periods, in addition to maximum hourly loads. Mr. Chernick also stated that similar high load energy usage affects the service life of transformers as well as impacts the cost of other components of the transmission and distribution system.

For Mr. Chernick, high-load factors impact the sizing of underground transmission, primary, and secondary lines, and he stated that since heat builds up around hydro lines, the length of peak loads and the amount of load relief in the off-peak period affect the sizing of the underground lines.

Mr. Chernick further stated that since the number and sizing of underground lines is a function of load factor, a portion of the cost of the lines should be recovered through energy charges, even if demand charges could reasonably measure the contribution of customer loads to peak demands on distribution equipment.

Mr. Chernick concluded that there is a cost causation relationship between energy, transmission and distribution costs. Reflecting these effects by incorporating transmission and distribution costs in energy charges rather than demand charges, would, for Mr. Chernick, encourage energy efficiency. Accordingly, he recommended that a portion of the cost of transmission and distribution facilities should be allocated to customer classes based on energy.

RCM/TREE suggested that MH's reluctance to release marginal cost information goes beyond the restrictions placed by most other utilities in North America. And, while **MIPUG** supported MH's need for non-disclosure of commercially sensitive price data, RCM/TREE cautioned against excessive restrictions on the release of information, as without the information, rigorous testing cannot be achieved.

In short, **Coalition and MKO** alluded to the need for transparency and did not support the Board accepting information in confidence from the utility.

13.8 Board Findings

Embedded Cost of Service

(i) The Board will require future COSS regulatory filings to incorporate the export and diesel zone classes in the same fashion as other customer classes (i.e., separately disclosed, and including all exports in all COSS calculations and charts).

ii) The Board considers MH's interpretation of the Board's direction as to what thermal costs to assign to exports to essentially constitute a "Motion to Review and Vary Order 117/06". While MIPUG agreed with MH's interpretation, the Board reiterates its requirement that MH is to assign fixed costs as stated in Order 117/06 and allocate them to the export class, (including the $69.3 million/year for finance, depreciation and OM&A of thermal plants).

The Board understands that this will result in more costs being allocated to the export class, and that as a result unit export costs will rise above 5¢/kW.h.

The Board also accepts the risk that the stricter interpretation of the directions of Order 117/06 may result in zero or negative net export revenues in some future years. For example, in 2006 MH assigned $386 million of costs to the export class, representing a unit cost basis of approximately 5¢/ kW.h. By assigning $69.3 million of additional costs to the export class, the total cost will increase to $455 million, or approximately 6¢/kW.h.

When Brandon Coal Generation is restricted to emergency use only (in accordance with the government's direction), the allocation of costs to the export class will decrease, assuming MH doesn't replace coal with natural gas generation (e.g., combined cycle combustion turbine).

In reaching this conclusion, the Board also discards the option of directing MH not to deduct the 587 GW.h of energy from the total export energy costs and only assign fuel costs to exports. To take this route would have increased total allocated costs to the export class for generation by $10 million ($396 million as compared to $386 million). And, restriction of the Brandon plant would essentially eliminate the fuel cost and energy deductions for average year scenarios (and, the estimated $10 – 20 million of annual net income attributed to current coal-fired generation.

The Board understands that the rationale to support MH's rejected option (i.e. not charging thermal finance and depreciation charges against the export class) is that the thermal plants provide dispatchable energy, increase dependable energy for export, and enhance the reliability of domestic energy and, as such, all non-variable costs should be shared by both domestic and export classes.

However, for the Board to allow the approach favoured by MH and MIPUG would mean the Board would reject the principles of cost causation and would be avoiding a proper allocation of costs (of the thermally generated component of exports).

The Board observes that with the pending restriction on the Brandon plant, the Board's direction will have less of an effect on the average cost of export class generation; that is, unless MH moves to increased natural gas generation. At this time the Board will amend its Order 117/06 directive and assign all fuel costs and 50% of the fixed costs to the Export class. Upon the coal plant going into emergency service status, the allocation will be further reviewed.

(iii) Re: DSM: MH's approach to charging DSM costs to exports and deducting DSM energy saving from the export class results in an arithmetic imbalance in the energy generation calculation, and could ultimately result in zero generation cost allocations being made to the export class.

Because DSM-originated energy savings reduce domestic consumption, prior to determining available energy for export, DSM energy savings should be added back to the domestic loss component, to determine the percentages for generation cost-sharing.

(iv) The energy consumption values employed in the generation cost allocation process by MH reflected two distinct consumption profiles for both domestic and export energy - one for 2003/04, which was a period of drought, and the other, 2005/06, a year of high water flows.

Consequently, the generation cost allocations to the export class were quite different in the two studies. Compared to the 8-year price period, the drought year costs would be overstated, and in the high flow years, those costs would be understated. Accordingly, it would be preferable to utilize the same 8-year time period for weighting both prices and consumption.

(v) In making its closing submission, MH remained critical of Order 117/06's "considerable" cost allocations to the export class, particularly with respect to:

a) Imports (no reduction for domestic load support);

b) Thermal generation costs (fuel costs not shared by domestic load);

c) Degree of embedded costs going to both firm and opportunity exports (with MH contending that no fixed costs should be directed at opportunity sales in the export class). That argument by MH was heard and rejected by the Board at the earlier Cost of Service Review proceeding;

d) DSM (costs should only be directed to export class if energy savings are credited to export);

e) Uniform Rates Adjustment (a legislated provision); and;

f) Trading Desk/MAPP/MISO costs (no reduction for domestic load support).

The Board previously found that MH is designing and building greater generation and transmission plant capacity to achieve additional opportunity sales. Therefore, those extra costs incurred in that effort should be allocated to the export class; with the emphasis being placed on total exports, exports can no longer be viewed as “by-products” of MH’s system.

In reality, exports tend to employ the last units of generation and could arguably, and fairly, be costed (if not priced) on a marginal cost basis.

The Board decision in 117/06 appears consistent with MH’s Power Resource Plan, in which hydraulic generation capacity in excess of dependable flow is not used to supply either domestic load or firm export contracts. Typically, dependable flow from MH’s hydraulic stations represents less than 60% of installed capacity. Therefore, the balance of plant capacity can be utilized in most years to produce energy for additional opportunity export sales.

MH's position that export cost allocation should be no greater than GSL > 100 cost allocations has only limited merit. Intuitively, one could argue that generation and transmission (G & T) costs relate to common energy sources, which should be shared on an equal access basis. This suggests export load has equal status to domestic load.

Alternatively, the counter argument is that domestic load has covered the past investments in G & T, and is entitled to "Heritage rates". Hence, exports should use and carry the cost of newer assets on an incremental cost basis. Examples are:

- Imports (not usually required for domestic load);
- Thermal (not usually required for domestic load);
- Transmission (losses increase exponentially with added export loads); and
- New Generation (built to serve export contracts)

The current COSS falls between these two positions, and assigns imports and thermal fuel costs directly to exports while allowing exports to share in the overall blended costs of generation and transmission (without regard for vintage pricing). The approach does not make exports solely responsible for incremental embedded costs or marginal costs for energy.

Government and Board directives have assigned the costs of the uniform rate adjustment and the evolving DSM programs to exports. These must be considered as societal benefits, the charges for which do not vary with MH's actual energy sales on either the export or domestic fronts.

Use of Marginal Costs in COSS

MH argued that there is sufficient data on the public record to support the marginal cost values it advanced. While there may be sufficient data, the key assumptions are lacking, and are required to confirm MH's marginal cost forecasts.

MH's marginal cost for generation appears to assume an unlimited market for MH's entire energy output at 5 x 16 peak prices. Because of inter-tie transmission capacity constraints, MH can only achieve that pricing for about 7,700 GW.h of energy. In addition, firm export commitments and deliveries now fully utilize the entire tie-line capability during median flow scenarios. Consequently, new energy coming from load reduction or new plant can only earn off-peak prices.

Accordingly, the value of export energy for marginal cost purposes should be estimated to be substantially lower than the $1.315 billion suggested by MH. And the reduced amount should be further reduced by deducting appropriate costs; the Board is of the view that current export prices and market conditions do not support marginal costs of 6.3¢/kW.h for generation.

Greater inter-tie capability during the 5 x 16 period could become available when the newest export contracts go on-line, but these would likely be fully utilized by Conawapa and Keeyask. Output reductions in domestic load through DSM activities would still not be able to earn on-peak prices if that energy were exported, given transmission capacity and MISO demand limitations.

MH's marginal cost for transmission appears to reflect significant new plant requirements during the next two decades ($240 million/year of financing and depreciation costs would equate to about $3 billion of plant upgrades or expansions). The most obvious new facility, Bipole III, is being built for domestic reliability and new export loads and not for domestic load growth. The expected cost of the project was also largely allocated to the generation function in PCOSS-08. As such, most of its costs should not accrue to the domestic transmission marginal cost.

MH's marginal cost for distribution appears to be derived from a forecast of plant investment level that is considerably lower than actual capital expenditures on distribution plant over the past decade. The resulting substantially-lower marginal cost of distribution (compared to embedded costs in PCOSS-08) raises a question as to how the embedded (sunk) costs for distribution should be recovered.

The projected overall marginal cost for generation and transmission provides a perspective of what additional revenues could be extracted from domestic customers if they were to be treated as an export customer by an externally-owned utility providing only generation and transmission services. With respect to MH's current mandate, the generation and transmission marginal cost values are seriously flawed and, in the current form, should not be considered as a basis for rate adjustments.

MH has not presented any compelling arguments to support its marginal cost calculation, and reference to multi-year analysis in the SPLASH model, using undisclosed (confidential) inputs and assumptions, does not allow for any critical review or instil confidence in what would best be a transparent process.

Furthermore, MH has implied marginal cost is a separate (free standing) cost coverage process that can be compared to embedded costs. In reality, marginal cost should be treated as being only incremental to embedded costs. Historical costs still need to be recovered.

MH has suggested that available public information on actual export sales and prices is sufficient for the Board and Interveners to test the validity of the Corporation's projected marginal cost value(s). Reference was made to MH's SEP and NEB's cross-border trading data, and MISO clearing prices, etc., as useful and valid sources of information for defining marginal cost.

MH's position is only partially correct. The marginal cost identification process involves critical key assumptions (i.e., quantity of energy that has marginal cost value, transmission assets being acquired for export versus domestic load expansion, and the distribution assets which are due to load expansion). For better transparency, the Board will direct MH to file all appropriate data (e.g. SEP/ NEB/ MISO clearinghouse information and avoided cost information etc.) required for input to the marginal cost determinations for generation, transmission and distribution and to further define the key assumptions employed by MH in support of this process with the Board (on a confidential basis if necessary) on or before December 1, 2008.

Forecast Export Price Input

In MH Exhibit #68, it appears that a forecast export energy price of 7.48¢/kW.h (6.32¢/kW.h for generation and 1.16¢/kW.h for transmission) at the meter has been employed in the marginal cost calculation. This rate is difficult to rationalize given that average export prices have been about 5.0¢/kW.h for generation and transmission over the last three or four years. The Board may be compelled to direct the release and use of actual prices rather than forecast unless more transparency is displayed.

MH has suggested that historical price data has been corrected upward to reflect market conditions for electrical energy under median flow scenarios. And, this would seem reasonable given that recent years have seen above average to high flow situations which result in a greater proportion of off-peak sales, effectively driving the average export price down. However, that scenario is flawed because, in the Board's considered opinion, MH has not and cannot support its forecast of achieving an energy price of 7.5¢/kW.h based on known existing export circumstances:

Median flow scenario reflects 7,700 GW.h of export energy in 07/08, which theoretically could all be 5 x 16 peak energy, but about half would be covered by contract prices at about 5.5¢/kW.h. While the remaining peak energy might achieve 7.0¢/kW.h, it would appear that the overall average cannot reach 7.5¢/kW.h.

Dependable flow scenario reflects 4,000 GW.h of export energy, all of which could be 5 x 16 peak energy and covered by existing contracts at 5.5¢/kW.h, this well below the 7.5¢/kW.h forecast; and the high flow scenario reflects 11,700 GW.h of export energy, of which about 7,700 GW.h could be 5 x 16 peak energy including existing contracts at 5.5¢/kW.h, and 4,000 GW.h would be off-peak energy in a surplus market pricing at below 3¢/kW.h, which brings down the overall average to about 5¢/kW.h.

MH suggests export pricing will escalate in tandem with rising natural gas prices. However, this assumption is contrary to the experience over the past 4 or 5 years.

In the determination of generation marginal cost, MH applied a marginal cost, derived primarily from forecast export prices, to the entire domestic energy consumption (20,800 GW.h as metered), and arrived at a marginal cost of domestic generation of $1,315 million (or 6.3¢/kW.h at sales).

Unfortunately, MH's scenario appears unrealistic and unattainable, because:

a) the calculation suggests MH expects to export 20,800 GW.h over and above the existing export level of 7,700 GW.h, when maximum tie-line capabilities are only about 16,000 GW.h;

b) the forecast suggests it is possible to achieve peak (5 x 16) export prices above 6¢/kW.h for an additional 20,800 GW.h, although the peak period tie-line capabilities are limited to about 7,500 GW.h and are already fully committed;

c) with existing export sales contracts of 4,000 GW.h for 5 x 16 energy at current average prices of 5.5¢/kW.h, and assuming the sale of the entire remaining 3,500 GW.h of peak energy and 8,500 GW.h of off-peak at average prices of 9¢/kW.h, when MH's average price for exports has been about 5¢/kW.h for both generation and transmission, this suggests the projection is not realistic;

d) to transmit 16,000 GW.h/year of energy into the MISO market and not see average prices decline below 5¢/kW.h seems unlikely; and.

e) shifting domestic load of 8,300 GW.h (16,000 GW.h minus 7,700 GW.h median flow exports) to export would appear to yield additional revenue of about $415 million at today's average export prices. Given this could not be at 5 X 16 peak pricing, this appears to suggest a marginal cost of about 2¢/kW.h when applied to the entire 20,800 GW.h of domestic load. (This compares to the $615 million (or 3¢/kW.h) of embedded costs allocated to domestic load for generation in PCOSS-08.)

The foregoing review suggests that the marginal cost scenario for generation presented by MH is flawed and in need of revision. It also suggests that the RCCs that arise are being driven by an overstatement of generation marginal costs.

Only MIPUG, of the Intervener groups, provided comment on MH's marginal cost calculations for generation. They submitted an alternative that assigns embedded costs on an energy price (SEP-based) weighting basis.

In MH Exhibit #68, MH applied unit marginal cost for distribution to the entire load served from the distribution system. In a previous MH filing (Marginal Cost of Transmission and Generation Study of 2004), the authors suggested that the values derived were only applicable to load growth or reductions of 85 MW and should not be extrapolated further.

Accordingly, MH will be directed to revisit and re-file a better-formulated marginal cost/value, one reflecting the realities of covering embedded costs as well as future costs, and as to potential export revenues. The re-filing should include an in-depth discussion of assumptions and inputs to MH's marginal cost COS. The re-filing should also cover the marginal costs of the export class.

As for use of marginal costs and the use of RCCs in rate setting, the Board will require the additional information from MH before assessing the weighting for embedded cost RCCs and marginal cost RCCs. Presumably, the marginal cost recalculation will be equally applicable to the Energy Intensive Industry rate design.

Marginal Cost Confidentiality

MH declined to publicly present its key assumptions and specific input data that it employed with its SPLASH model in the determination of generation marginal cost. Similarly, the "avoided cost" calculations, employed in defining transmission marginal cost and distribution marginal cost, were also not made available to the proceeding.

The Board will direct MH to make all this information available (however, on a confidential basis to the Board) and will assess whether the information should be further shared with interveners. The Board will not share the information with interveners without first engaging MH in discussion ahead of a meeting to involve all parties.

During the hearing process, MH invoked a confidentiality constraint on the specifics of:

a) How forecast export prices were determined;

b) SPLASH model inputs and assumptions;

c) Transmission marginal cost assumptions and avoided cost calculations; and

d) Distribution marginal cost assumptions and avoided cost calculations.

The result is that none of the interveners were in a position to challenge the marginal cost determined by MH for generation, transmission, and distribution. While MIPUG provided an alternative to MH's calculation process, the intervener did not attempt and probably could not have challenged the unit marginal costs and/or forecast export prices.

This left the Board in the position of either accepting MH's forecast marginal cost, despite the absence of any serious testing, or directing MH to provide more detailed justification for the marginal cost calculations. The Board opts for the latter.

Forecast and Calculation of Marginal Cost

The Board suggests that MH's forecast of export prices is overstated and does not adequately recognize:

a) Current U.S. export market prices;

b) Current USD/CDN exchange rates; and

c) Current transmission inter-tie capacity to U.S. constraints.

Further, the Board has concerns about MH calculations of marginal cost for generation, specifically the total marginal cost value assigned to domestic generation. Also, as previously outlined, the Board has concerns about the lack of information (assumptions and inputs) on the transmission and distribution marginal cost provided to the proceeding.

Weighting of MC-COSS

Given this, the Board cannot establish, other than directionally, the value of the marginal cost (MC) as a COSS consideration. Much more marginal cost information and justification will be required from MH in advance of the next GRA, to allow the Board to place a weighting on the two sources of RCCs, and begin to differentially allocate future rate increases.

Therefore, the Board will not be assigning a specific weighting to the MC-RCC developed by MH, or for the amended approach proposed by MIPUG. However, after a review of the information put before it, the Board remains of the view that, in a proper form, marginal cost consideration should be given comparable weighting to that of the embedded COSS.

While previously the PCOSS was viewed to be a stand-alone tool for rate setting, it does not appear that a marginal cost determination could be other than a modifying procedure. In any event, appropriate generation and transmission costs should be allocated to the export class.

The Board therefore directs MH to provide a revamped MC-COSS analysis, one reflecting needed refinements to generation/transmission/distribution marginal costs. One scenario to be explored, among others, should involve the addition of marginal cost to embedded costs in COSS for domestic classes and the export class, prior to comparison to class revenues.

Environmental Consideration in COSS

Despite MH's contention that export pricing automatically builds in environmental considerations, it is apparent that MH, at least to date, has been unable to gain significant revenue increases of any kind related to environmental factors. Environmental or green energy considerations do not, at least at present and by no means for lack of effort on the part of MH or the Province, appear to have affected base-load coal generation prices in the MISO market region.

MH's export price forecasts assume that GHG legislation will come into play as early as 2012, and boost export prices. The Board is concerned with this degree of optimism, with $18 billion of capital expenditures lying in the future; 'best case" scenarios, while interesting and useful as goals, need to be balanced by other less positive views. The Board will direct MH to revisit its export pricing forecasts to reflect recent realities on market prices and exchange rates.

On a similar vein, MH has indicated that embedded costs incorporate substantial levels of mitigation efforts and costs. By capitalizing these costs, MH is deferring the impacts on the COSS, and on rates. The Board is mindful of the possible effects to arise out of the adoption of IFRS, and that one of those effects may well be less capitalization and more direct allocation and expensing of period costs; if this occurs, it means either less annual net income or it will require higher rate increases.

The foregoing suggests explicit consideration of environmental factors is either not necessary, or that to do so would be a form of double-counting. This issue needs further definition and development.

14.0 Rate Design

14.1 Inverted Rates

In Order 117/06, the Board reiterated its directive to MH to move towards the elimination of declining block rates. MH has, with some notable exceptions, moved toward this objective.

MH introduced, on a very limited scale, an inverted rate structure for the residential class, where the tale block rate is to be greater than the first block by a modest 1% differential. MH has suggested a continued future GRA movement in the direction of marginal cost, through future gradual increases in the to the tale block closer to the marginal cost of energy (now 7.01¢/kW.h.).

MH proposed that the first block of energy consumption be set at 900 kW.h per month, regardless of the season or the energy source for residential space heating. MH did not propose any changes to the basic monthly charge block rate.

MH acknowledged that the future evolution of the inverted residential rate should take into consideration the needs and constraints of customers who currently use electricity as a primary heating fuel, while continuing to encourage natural gas as the appropriate fuel choice in areas of the province served by natural gas. MH indicated that to address heating loads, there are essentially three approaches that could be taken to provide for meeting these needs within a lower cost first block.

The more complex mechanism would be to design a separate residential rate for electric heating loads. MH stated that this is the method preferred by Mr. Chernick, the witness for RCM/TREE, and would provide existing electricity heating customers an allowance of an additional 6,400 GW.h/ year in the initial price block during the heating season. This would result in an increase in the percentage of heating energy served at the initial rate block of roughly 54% that non-electric heating customers receive.

MH cautioned that such a specific rate targeted at electric heat customers may create an incentive for customers to report electric heat capability though staying with natural gas, and may create increased administrative burden and cost to manage/police.

MH offered two alternatives that may be simpler to administer, and which may not specifically target all electric heat customers or exclude customers using other sources of heating. MH noted the simplest method would be to differentiate the size of the first block by season, with a larger first block in winter, as is done in Ontario. The other is to provide a larger first block in winter only in areas not served by natural gas (although this may be complicated by the uniform rates legislation). MH concluded that further review of the alternatives were required.

Given the significance of residential electric heat in Manitoba (natural gas distribution is limited), as well as higher degree-days compared to Ontario, the Board would consider it appropriate to set a winter “first block size” higher than that now set in Ontario.

14.2 General Service Small and Medium Classes (GSS and GSM)

MH is moving to consolidate the GSS and GSM rate structures, supported by previous Board direction. Both classes are served from MH-owned transformation and utilize similar voltages.

The following rate table illustrates the proposed changes as initially proposed by MH (1) and the revised rates (2) as per Order 90/08 as follows:

14.0 Rate Design

	Small			**Medium**		
	March 2007	**April 2008**		**March 2007**	**April 2008**	
		1	**2**		**1**	**2**
Basic Charge Single Phase	$15.60	$16.50	N/C			
Basic Charge Three Phase	$21.75	$23.55	$22.99	$27.60	$27.60	N/C
Energy Charge:						
1st 11,000 kW.h	6.18¢	6.31¢	6.48¢	all kW.h	5.90¢	6.13¢
Next 8,500 kW.h	4.00¢	4.30¢	N/C	@	4.07¢	4.30¢
Balance kW.h	2.55¢	2.65¢	2.73¢	2.55	2.65¢	2.73¢
					no charge	
Demand Charge:						
1st 50 Kva	no charge	No charge		all KVA @		
Balance of KVa	$8.34	$8.34	N/C	$8.34	$8.34	N/C

The proposed changes are the first step of two or three transitional moves to a single rate table for GSS and GSM.

A major rate component that currently differentiates the small and medium rate classes is the application of demand ratchets, which impact the determination of monthly billing demand. The general service small class is not subject to any ratchet provisions and the class' customers are only billed on their recorded demand above 50KVa. General service medium customers are, on the other hand, currently subject to paying the higher of their recorded demand or the ratchet.

Once the classes are fully consolidated, the ratchet would not impact current general service small customers as long as they remain below 200 KVa. In MH's Application, it did not propose that the 70% winter ratchet provision be modified, but that it would continue to be applied against loads in excess of 200 KVa.

14.3 Area and Roadway Lighting (ARL)

MH has proposed a 1% increase in the ARL rate.

City of Winnipeg raised its continuing claim of the overpayment by municipal lighting customers relative to costs being allocated to the class in the embedded cost COSS. As this class has almost always been charged more than 105% of its allocated costs, MH did not dispute the City of Winnipeg's suggestion that the accumulated sum of "overpayments", relative to an RCC of unity, totals in the multi-million dollars. The City of Winnipeg did not request a refund, but rather suggested that ARL rates remain unchanged until a RCC of 1.00 is achieved.

14.4 Time of Use (TOU) Rates

Over the last eight years, the concept of Time of Use energy charges has been a subject of debate. MH has commissioned several studies to address the applicability and consequences of charging customers different seasonal and/or diurnal energy rates.

The major stumbling block has been, and continues to be, the need for more sophisticated and expensive metering and billing systems (an investment of $90 million was suggested as being required). At present, most GSL >30 customers have appropriate metering in place, however, that is not the case for GSL <30, GSM, GSM, and Residential classes.

MH has and is currently running pilot studies in Selkirk and Steinbach, to test customer response to greater awareness of actual consumption levels; the results to-date have been somewhat confusing, and have failed to give support to a massive move to TOU for residential customers.

MH acknowledged that, on balance, a TOU rate for General Service customers would likely provide increased revenues for the Corporation. MH indicated that such a TOU program could take about 12 - 18 months for start-up studies and to obtain program approval for classes with TOU meters. And that implementation could take at least four more years for the classes currently without TOU meters.

For the residential class in particular, a TOU program would involve changes to meter reading frequency. While new technologies are possible, it would appear costs could be prohibitive.

14.5 Rebalancing of Demand and Energy Charges

MH's rate structure has for many years been over-collecting on demand charges and under-collecting on energy charges relative to COSS allocations. In response to Board direction, MH has, since 2003, been assigning rate increases entirely to the energy portion of rates.

The result has been a gradual shift of the source of customer revenues, with the change viewed as being conducive to be objectives of conservation.

The following table illustrates the March 2007 imbalance situation, when comparing PCOSS-08 allocated costs to revenue at March 2007 rates.

	Demand ($/KVA)			Energy (¢/kW.h)		
	March 7/07 Rate Revenue	**117/06 Allocated Cost**	**Revenue/ Cost %**	**March 7/07 Rate Revenue**	**117/06 Allocated Cost**	**Revenue/ Cost %**
GSS	8.34	6.92	120	2.55	2.65	96%
GSM	8.34	7.09	118	2.55	2.68	96%
GSL <30	7.08	7.94	89	2.38	2.61	91%
GSL 30-100	6.06	4.26	142	2.29	2.44	94%
GSL >100	5.40	2.21	244	2.26	2.41	94%

The table suggests that MH still has a considerable way to go before revenues and costs for GSL demand and energy are in balance. Of particular note is that GSL <30 KV class revenues and rates are under-collecting for both energy and demand.

MH's March 2007 Report suggests that over a four-year period, the movement toward "full balance" has eliminated 50% of the initial discrepancy. This infers it could require another four years of rate increases applied through energy changes alone to achieve balance.

For GSS and GSM customers, the demand charge partially offset the under-funded basic monthly charge for customer service and distribution plant.

14.6 The Basic Monthly Charge

All MH customers other than GSL pay a basic monthly charge, which is intended to cover (but does not) allocated customer service and local distribution costs.

	Billing Rate	**Allocated Unit Cost (Net of Export Credit)**
Residential:		
- (<200 amp)	$6.24/month	$18.70/month
- (>200 amp)	$12.48/month	
GSS-ND	$16.50/month	$31.25/month
GSS-D	$23.55/month	$51.22/month
GSM	$27.60/month	$227.78/month

The argument for not increasing the basic monthly charge is based on the premise that the under-charge is justified by the "incentive provided" in high energy charges to reduce consumption.

14.7 Diesel Rates

At one time, in excess of thirty northern Manitoba communities were provided electricity service by means of diesel-fired generation. Over time, the number of communities served by diesel generation fell, at first to thirteen and, eventually, to the now current four.

The remote Northern Manitoba Communities of Shamattawa, Tadoule Lake, Brochet and Lac Brochet, with a total population of approximately 2,000 people having 800 separate accounts with the Corporation, are not connected to MH's transmission and distribution grid. While diesel fuel is very expensive, there are other problems with diesel generation such as winter road supply uncertainties, customer service levels and environmental issues.

Diesel generation does not provide the quality of service represented by grid service, as the four diesel class communities are limited to 60 amp service and the 800 accounts are not supposed to use electricity service for space heating.

In Manitoba, the first 2,000 kW.h of electricity consumed monthly by residential and General Service customers in the diesel zone is billed at grid comparable rates. The subsidy from full cost rates is borne by "Government Accounts" by way of surcharges or premiums. In some other Northern Canadian jurisdictions, less than 900 kW.h of diesel generated electricity is provided at grid comparable rates.

Excepting for the first 2,000 kW.h of electricity, diesel class rates are very much more expensive than grid rates. Most diesel class customers are residential, but there are also General Service, Federal and Provincial Government and First Nations accounts.

In Order 159/04, dated December 22, 2004, the Board approved interim sales rates for the diesel communities based on MH's then-Application, which reflected a tentative settlement arising out of MH's negotiations with MKO, acting on behalf of the diesel communities, and Indian and Northern Affairs Canada (INAC).

The terms of the tentative settlement were summarized in Order 159/04 to include:

1. MH would request Board approval for an allocation of net electricity export revenues to first retire the diesel zone accumulated deficit which was approximately $16.9 M as of March 31, 2004. Once the deficit had been recovered, the net export revenue would be used to reduce costs allocated to the diesel-zone customer class, thus reducing the otherwise rate requirement;

2. INAC would pay $3.2 million to MH for the surcharge billed to INAC by MH between November 2000 and May 2004;
3. INAC, on behalf of the Federal Government, would pay MH 69% of the $28.8 million of MH's diesel-related capital cost, the balance as at March 31, 2004, by July 7, 2005 without interest and by no later than January 7, 2006;
4. MH would request that other Federal and Provincial Government customers in the diesel zone (notably Health Canada, the RCMP, and the Province of Manitoba), pay MH a further 10% of MH's $28.8 million of undepreciated capital costs;
5. MH would assume the remaining 21% of undepreciated capital costs on behalf of residential and General Service customers that are neither First Nations members nor Government accounts; and
6. for major future capital expenditures in the diesel zone, MH would consult with the diesel zone's First Nations communities, and secure funding prior to making further capital expenditures.

At the time of issuing Order 159/04 the Board was advised that the signing of the Settlement Agreement was expected on or before July 7, 2005 – now three years ago. Because of various factors, the signing date has been delayed.

If the Settlement Agreement is not concluded, MH has indicated a desire to reconsider its recommendation that the class receive an allocation of net export revenue in the COSS. The delay in the finalization of the Settlement Agreement relates to the Federal Government and is beyond the control of the Board, MH, the four communities served by diesel-fired generation and the Province.

14.8 Surplus Energy Program (SEP)

MH was earlier provided with interim approval to extend the Surplus Energy Program to October 31, 2008. As part of the GRA process, MH requested that SEP be approved for five years to March 31, 2013, without any changes to the terms and conditions.

The SEP makes surplus energy available on an interruptible basis to MH's general service customers. Customers may be eligible for:

Option #1 Industrial load >1,000 KVA monthly demand (<25% of total load); or

Option #2 Space and/or water heating >200 KW per month (separately metered with full back-up); or

Option #3 Self generation displacement 200 KW to 50,000 KW with Load Factor of 25% (separately metered with full on-site back-up).

The program primarily displaces export sales, but the energy supplied to SEP customers may be supplemented from import supplies, though at much higher costs than domestically supplied energy. Energy prices (Spot Market) are forecast weekly and submitted for Board approval, for peak, shoulder, and off-peak prices.

Since December 2000, SEP has involved about 25 GSM and six GSL customers, with average (over seven years) sales of about 22 GW.h/year, average revenues of $9 million (4¢/kW.h) and average net revenues of $45,000/year (varying from a loss of $35,000 to a surplus of $210,000/year).

The customer usage of the SEP has been seasonally variable, with winter weekly high consumption being ten times summer weekly low consumption. Over the whole year, the daily usage pattern has been 24% peak, 40% shoulder, and 36%

off-peak. Demands during the summer off-peak when prices are low have been well below average.

14.9 Curtailable Rate Program (CRP)

The Curtailable Rates Program provides incentives to MH's large industrial customers; these customers curtail electrical load when called upon by MH. Incentives are provided by way of a credit to the customer's monthly energy bill.

Under the CRP, MH looks to:

- Quickly re-establish contingency reserves that are required by MAPP-GRSP;
- Maintain planning reserve obligations;
- Protect firm Manitoba load from curtailment;
- Maintain spinning and non-spinning contingency reserves; and
- Meet firm energy requirements when MH has supply shortfall.

Different CRP options provide MH with the ability to curtail demand and energy for specified time periods. Customers are provided with power price discounts on the basis of the amount of load available for curtailment. The Board approves the reference discount on an annual basis.

Savings to MH resulting from the Curtailable Rates Program are available as long as the service offering continues, whether or not actual curtailments are made at the time of system peak or at any other time. The expected availability of this load, and not the timing of its dispatch, determines the future benefits of CRP.

MH requested a change to the terms and conditions of CRP, to increase the notice period from 24 to 48 hours of anticipated plant operations shut down. This would affect the capacity reduction that could be achieved by MH.

14.10 Limited Use Billing Demand (LUBD)

The LUBD rate option was implemented July 1, 2000 and continues to be a relatively simple way for MH to address the concerns of low load factor customers and reduce demand charges they would otherwise face. Initially, the program was intended to mitigate the impact of the winter ratchet on seasonal, commercial, and light industrial winter operations. However, the program has attracted a considerable number of GS customers who are not affected by the winter ratchet. Only 5 of 123 GS customers were subject to the winter ratchet in 2004.

Currently, the customer list on LUBD is:

GSS-D -	68 (winter ratchet not applicable)
GSM -	22
GSL <30	17
GSL >100 -	1
	123

LUBD allows eligible customers to opt for higher energy rates and lower demand charges. For customers with a load factor of 18% or less, the revised rates are economically beneficial. The rate has turned out to be attractive to certain agricultural, recreational, municipal services, and wood product customers, which now account for 40% of the customers utilizing the program.

From MH's point of view, LUBD customers with their low load factor generally have lower coincident system peaks. As such, they place a lesser demand on system transmission and distribution.

MH did not propose to alter the LUBD rate structure as it applies to GSS-D and GSM, but sought to revise the eligibility requirement from 36 months to 12 months.

14.11 Winter Ratchet

The winter ratchet refers to MH's demand billing practice of charging customers the greater of:

- Actual billing demand (KVA) in each month (measured on 15 minute interval); or
- 70% of highest demand in any previous months of December, January, and February; or
- 25% of the customer's contract demand; or
- 25% of the highest measured demand in any of the previous 12 months.

The rate is applicable to GSS-Demand/GSM, and GSL classes and particularly affects seasonal customers that have high winter demand and minimal summer demand. These customers have contended that MH was charging them a demand charge related to energy that they were not using and was thus available for export by MH.

MH contends that the energy freed up is unreliable and not always of value, and recent history suggests that the energy probably has similar value to DSM freed-up energy.

The winter ratchet impacted about 700 customers in 2004, primarily in the GSM class, generating about $2 M in billing revenue. Notably, schools, hospitals, senior's residences, and similar facilities are included in this class.

The Board found that with MH's system running at near capacity throughout the year, the winter ratchet was of questionable merit and, in Board Order 07/03, directed MH to eliminate the winter ratchet effective April 1, 2004. MH sought and was granted (Board Order 15/03) a deferral to allow further study. An August 2004 report by MH argued for the retention of the winter ratchet pending further review. MH suggested that time-of-use rates may be an alternative to the winter ratchet.

Since 2004, the situation has remained essentially unchanged. MH is still considering the preparation of a time-of-use study and has not advanced a detailed analysis supporting the retention of the winter ratchet.

14.12 Interveners' Positions

The City of Winnipeg

The City of Winnipeg indicated that the rates charged the city for area and roadway lighting have been consistently above the zone of reasonableness (over the last 30 years, with the exception of one year). The City indicated that over the years MH has overcharged it approximately $49 million.

The City noted that MH proposes to address the "$620,000 excess" the City is now paying each year, or the $1 million "over collected" province wide (other municipal accounts approximate 40% of the annual bills to the class).

The City urged Board action to correct the situation.

The Coalition

Inverted Rates

The Coalition stated they are supportive of the concept of inverted rates but that for the intervener significant equity concerns exist; concerns for the impact of all-electrical customer with no competitive options; concerns for low-income persons who lack the resources to pursue DSM; and concerns for renters who may lack the ability to pursue DSM or for whom energy efficiency is uneconomic due to split incentives.

The Coalition stated that most new homes in rural areas are installing electric water and space heat, and that many of the new all-electric homes are being built in First Nation communities (many of which being low-income households). The Coalition noted that many customers with all- electric homes don't have access to competitive alternatives such as natural gas, and would not be able to adjust consumption with changes in prices and would be negatively impacted by an inverted rate scheme.

The Coalition opined that residential consumers have an inelastic demand for electricity, which means a change in consumer demand should be expected to be less responsive to a change in price. The Coalition cited a study by the Rand Corporation that dealt with electricity consumption in the US, which stated:

> "Locations where particular energy uses are very valuable, such as air conditioning in southern states or winter heating in northern states, could have price elasticity smaller in absolute magnitude because air conditioning and heating are so valuable during periods of extreme climate. The consumers are unwilling to change their use when prices change."

The Coalition underscored the importance of price signals, indicating that, in particular, commercial and industrial customers were more responsive to changes in price in adjusting their consumption.

The Coalition further suggested that there is a low-income context that needs to be addressed related to inverted rates. The Coalition suggested that MH currently has over 18,000 customers earning less than $30,000 a year that are consuming more than 18,000 kW.h per year, of which over 16,000 of those customers are all-electric customers.

The Coalition noted that this group would be negatively impacted by an inverted rates scheme, that is unless the current barriers to participation in energy efficiency DSM programs are addressed. The Coalition stated there are substantial barriers faced by low-income individuals that discourage their participation in energy savings initiatives.

Mr. Harper noted that the inverted rated proposal put forward by MH has a modest differential between the first and the second blocks, but that the modest differential does at least begin to send the correct message, i.e., that increased use is more expensive. Mr. Harper further stated the issue of bill impacts is important and should be addressed before MH makes further changes in implementing inverted rates.

Mr. Harper proposed a gradual implementation of inverted rates, and proposed that before any further changes are made MH should first ensure that its DSM programs are focused in fully supporting those low-income customers who will be most notably impacted by inverted rates, and customers who typically use more than 1,500 kilowatt hours a month (over 18,000 kW.h annually).

The Coalition stated that it would be unfair to implement inverted rates before giving vulnerable groups the tools to achieve energy efficiency. The Coalition recommended delaying inverted rates until adequate DSM programs are in place for low-income households with high consumption levels, tenants, and all-electric space heat customers that have no competitive space-heating options.

To address the inequity faced by all-electric customers, the Coalition suggested the focus should be on the differentiation between the all-electric block and the standard-use block, providing the all-electric block a larger first block during the heating season. From its perspective, the key issue is addressing the vulnerability of those customers who rely upon electric heat for their home heating.

Time of Use Rates

The Coalition expressed interest in advanced metering technology, which would be required to implement time of use rates. The Coalition urged the Board to direct MH to report on developments in terms of such metering, including the potential for the Utility controlling thermostats for peak shaving purposes.

Energy Demand Rebalancing /Basic Monthly Charge

Coalition opined there should be no increase in the BMC and suggested that the cost allocation process be changed for residential customers.

As well, the Coalition recommended the BMC recover only a percentage of customer costs, excluding customer related distribution costs, and recover only in part customer service and metering costs, with the balance of costs to be recovered through energy charges

MIPUG

Inverted Rates

MIPUG suggested that MH's inverted rate proposal for the Residential Class was inadequate, and that the small differential would not send a meaningful price signal to customers.

MIPUG suggested that MH implement inverted rate proposals for other customer classes, including the General Service large class and sub-classes. MIPUG recommended the Board direct MH to develop an inverted rate proposal for the General Service large class, in consultation with customers, and file it with the Board for consideration.

Time of Use Rates

MIPUG recommended MH be directed to develop seasonal time-of-use rates. Mr. Bowman and Mr. McLaren stated that for customers with some ability to shift their loads, a rate design that includes time-of-use components could reduce MH's costs and that these cost savings could flow, at least in part, to the load-shifting customer. For MIPUG, properly designed time-of-use rates would provide incentives to optimize the use of the generation and transmission system, resulting in cost savings and/or increased export revenues to the mutual benefit of MH and its customers.

MIPUG stated that TOU rates meet a valid regulatory objective of promoting efficiency and conservation and would provide customers the right price signal for every kilowatt hour of consumption. MIPUG stated that such an approach would be an improvement over the winter ratchet, which, for MIPUG, sends too strong a price signal for some, and none to others.

Energy Demand Rebalancing /Basic Monthly Charge

MIPUG noted that MH sought applying the Industrial rate change entirely to the energy component (and not the demand component). Given the substantial outstanding issues arising from the lack of contemporary pricing mechanisms, MH's efforts at improving the price signal were, for MIPUG, effectively irrelevant and should be rejected.

MIPUG recommended the Board reject the proposed allocation and direct MH to propose a logical process for implementing, in consultation with customers, rates that address contemporary elements of industrial rate design. In the meantime, any rate increases for industrial customers should be implemented as an equal percentage increase to the demand and energy components of the existing rate structure.

MIPUG did not take a position on whether any changes should be made to the BMC.

Winter Ratchet

MIPUG recommended the elimination of the Winter Ratchet, with it to be replaced by time of use seasonal rates.

MKO

Inverted Rates

MKO stated general support for the concept of inverted rate structures, to encourage demand and improved energy management. However, MKO shared the concerns expressed by the Coalition that inverted rates for residential customers may disadvantage consumers with electric water and space heating - customers that include MKO consumers, most of which were reported to be of low income.

MKO also noted the inelastic demand response residential customers have to electricity price changes, as noted in studies referenced by the Coalition. MKO supported the Coalition's comments on addressing the barriers to entry to DSM measures noted by Mr. Dunsky, and supported making DSM and energy efficiently programs universally available to all MH residential customers, including those in the diesel communities. MKO suggested that DSM in the diesel zone would likely have a greater impact on reducing domestic demand growth and providing for increased net export revenues than inverted rates for residential customers.

MKO proposed a more gradual inverted rate be applied to the diesel communities, and suggested such an approach may accomplish the objectives of MH without the controversy that would be inherent in trying to set and administer baselines.

MKO cautioned the Board that the inverted rate design proposed by RCM/TREE requires further testing and review to ensure that low-income and remote community MKO customers are not unduly disadvantaged.

MKO suggested the Board direct MH to propose inverted rates structures in the next GRA across all customer classes.

Basic Monthly Charge

MKO did not provide a position on changes to the BMC.

RCM/TREE

Inverted Rates

RCM/TREE recommended changes to the inverted rates program as proposed by MH, and suggested that the BMC be reduced to approximately $4.70 per month and the first block of energy be reduced from the 900 kW.h per month allowance to 600 kW.h.

RCM/TREE suggested that the rate for the initial energy block should be set at 6¢ per kW.h for 600 kilowatt hours per month for non-heating customers, and for all customers in non-winter months. In addition, to counter the impact of the inverted rates on all-electric customers, RCM/TREE proposed a 6,400 kilowatt hour annual allowance be distributed over the heating season, and be priced at the initial block rate.

RCM/TREE proposed that the rate for additional energy should be set at approximately 6.28¢ per kilowatt hour.

RCM/TREE discounted MH’s concerns about the accuracy of the Corporation’s customer database for identifying customers with electric heat capability, and suggested that exceptional cases and administrative gaps should not obstruct sound policies. RCM/TREE stated it advocates an integrated approach to affordability and efficiency.

Paul Chernick, a witness for RCM/TREE, stated inverted rates are a good and sound economic policy, and observed that while there are low-income customers that would be affected by the implementation of inverted rates that should not act as a “veto” for the program’s implementation.

Mr. Chernick stated proper steps to protect lower income individuals should be put in place. Mr. Chernick proposed the implementation of targeted low-income conservation programs and bill assistance, the latter through vouchers, as mitigation measures, enabling the Corporation to move more quickly to implement conservation measures. "There is no time for the extreme gradualism advocated by Mr. Harper", according to Mr. Chernick.

RCM/TREE stated that if MH requires time to prepare education materials and mitigation measures with respect to the introduction of inverted rates, it might be possible to begin introduction by residential rate increases under a flat rate structure, and then implement a revenue neutral inverted rate structure in the fall.

RCM/TREE did not agree with the Coalition that gradualism in the implementation of inverted rates is a good idea.

Energy Demand Rebalancing/ Basic Monthly Charge

RCM/TREE proposed the elimination of the BMC over time, and the recovering of those costs through volumetric energy charges to be applied on the tail block of inverted rates.

RCM/TREE countered concerns raised by MH that lowering the BMC for electric customers might encourage customers with small gas usage to switch to all electric appliances to avoid the recently increased gas BMC. However, RCM/TREE noted, since gas customers are also electric customers, such an incentive to switch is already built into the BMC for small users of gas. Lowering the BMC for electric customers and increasing the tail block rate provides a counter incentive for that move, according to RCM/TREE.

RCM/TREE also countered concerns raised by MH that suggested that because customer-related costs are real costs, larger consumers of energy will subsidize costs of smaller energy consumers. RCM/TREE noted that all customers are subsidized from export profits, and that credits applied to the BMC rather than energy would be a more equitable approach, and also provide a stronger price signal to conserve.

Time of Use Rates (TOU) & Demand Ratchets

RCM/TREE recommended MH should implement TOU rates, starting with the largest customers, and move revenue collection from demand charges to time-of-use energy charges. RCM/TREE acknowledged that time of use rates will require appropriate metering, but held that they should be implemented as soon as feasible. The intervener also recommended that MH eliminate demand ratchets.

Mr. Chernick noted that in jurisdictions where TOU rates have been implemented a parallel billing system was utilized, where a customer would, along with the existing bill, receive a bill as if they were on time of use rates. This allowed the customer to gauge the impact the TOU system had on their consumption and billing, and allow them time to make changes in energy use behaviour.

14.13 Board Findings

Inverted Rates

The Board encourages MH to develop plans to employ an inverted rate structure for all customer classes, initially to be designed on a revenue neutral (to MH) basis and to send a "price signal" for every kilowatt hour of energy used, to promote conservation.

MH suggested that too large an inversion would be prejudicial to all-electric customers. However, the nominal inversion of the Residential Rate approved by Order 90/08 can be expected to cost an all-electric customer approximately $45/year.

In comparison, a natural gas space-heated home, with a conventional furnace, can expect to pay hundreds of dollars more for space heating this upcoming winter as compared to a similarly adequately-insulated, electrically-heated home.

The Board agrees with the principle of inverted rates but notes, based on demand studies presented, that residential customers, in particular, do not significantly change their consumption patterns upon a price increase.

The Board shares the concerns expressed by all parties on the impact that sharply inverted rates would have on both low-income customers and all all-electric heat-load customers, who are unlikely to diminish consumption with increases in electricity prices. So, if the inversion were to be sharper, to promote conservation, this could be expected to result in a relatively high proportion of consumption being exposed to the higher second-block rate.

The Board notes that (with respect to the identified problem which electric heat customers could incur with sharply-inverted rates) there are methods to address what could be considered the inequity that could result from such sharply-inverted rates. The Board is aware of the complexities that MH will face in addressing this concern, but it warrants a fulsome analysis.

In particular, the Board is interested in MH providing additional information on seasonal variations in the size of the first electric block for electric heat-load customers. The Board agrees with MH that the size of the first rate block for Manitoba, as compared to the one utilized in Ontario, will likely have to be higher to take into consideration the greater heating load factor due to Manitoba's colder winters. The Board will direct MH to file a plan by January 15, 2009 outlining the pros and cons of the various potential inverted rate strategies under consideration, and the MH-proposed course of action to address this issue.

The Board is quite concerned with the impact that sharply-inverted rates will have on low-income customers. The Board shares the concerns raised by the Coalition that barriers exist that preclude low-income customers from taking actions to reduce electricity consumption. Given that the proposal currently under consideration only reflects a nominal differential between the first and second block, the implementation of inverted rates should not be delayed, and the Board will address the problems of higher energy costs for low-income households in a broader way.

Nonetheless, the Board will expect MH to put forward more comprehensive plans to shield low-income customers from the impacts that will result from higher electricity rates in a sharply-inverted rate scheme.

With respect to the level of the basic monthly charge, the Board will direct MH to increase the Basic Monthly Charge by 5% on July 1, 2008 and a further 5% on April 1, 2009, by way of Order 90/08. The increases will result in BMCs that will still be well below a representation of MH's actual customer-based costs.

MH is to continue with the process of the GSS and GSM customer class consolidation, and provide the Board with a proposal by June 30, 2009 for a stepped-up program and a timeframe for completion.

Time of Use (TOU) Rates should be fast-tracked for customer classes where the required meter technology is currently installed. TOU rates assist in defining marginal cost, and therefore, should be included in any new proposed energy-intensive industry rate for consideration by the Board.

The Board will direct MH to provide a planned implementation strategy outline by September 30, 2008 for TOU rates, as appropriate to the classes with required metering technology already in place. Alternate rate strategies should be included for consideration at the upcoming Energy Intensive Industry rate hearing.

Energy and demand balancing is a policy issue that speaks to the fairness of rates to individual customers within a class. The argument for reducing demand charges, and increasing energy charges, is that it does send an improved price signal and thus promotes conservation. As the change occurs, Demand and Energy Cost recoveries will be brought more into line with cost causation principles. The Board will therefore direct MH to plan to re-balance demand and energy charges on a revenue-neutral basis, and submit a 5-year transition plan for the Board's approval at the earlier of December 31, 2009 or the next GRA.

Diesel Zone: MH has indicated it will apply to the Board for finalization of the 4 interim Orders related to Diesel Rates. In such an application, the Board will also direct that MH provide reports on:

a) the fairness of the rate approach with respect to non-senior government accounts (the Board is concerned that the rates restrict the economic development prospects for the communities and drive up service and commodity costs);

b) the efficacy of the current rate schedule for non-government accounts (data on aged accounts receivable, delinquency and bad debts together with the collection policies in place for the four communities will be required);

c) the effects of the current approach to rates and consumption restrictions on the four communities, a detailed review of consumption levels and collection practice from the former Diesel communities that have been connected to the Grid which will serve as a comparison; and

d) MH to report to the Board by September 1, 2008, as to the balances and status of the diesel zone accounts; to ascertain whether existing interim rates are fully recovering operational costs.

Area and Roadway Lighting (ARL)

The Board agreed with the position advanced by the City of Winnipeg and, by Order 90/08, did not approve any rate increase for the Area and Roadway Lighting class for either July 1, 2008 or April 1, 2009.

SEP

The Board is concerned with MH's marketing practices that yield extremely low prices for off-peak exports, and suggests that retaining energy in storage may prove more beneficial in the longer term than selling power for extremely low prices. The Board acknowledges that MH may be operating the system at near optimal levels to avoid "spilling" water, but there may be a benefit to spilling when prices get too low.

MH will be directed to provide a report to the Board by January 15, 2009 evaluating the Surplus Energy Program; the report should employ monthly historical data from 2000 to 2008 to analyze and compare the benefits and costs of the actual operation of the hydraulic generating system pursuant to various less aggressive sales strategies. This report should address the relative merits of withholding surplus energy from sales at off-peak periods.

The report may show whether selling at any cost increased the financial losses in 2003/04; and may also have resulted in foregone opportunity exports in 2004/05 because of low energy in storage.

In the interim, and by Order 90/08, the Board approved the extension of the SEP until October 31, 2008, on the condition that annual reports will continue to be provided.

The Board also approved all weekly interim SEP Orders, from August 1, 2007 (Order 100/07) through and including May 21, 2008 (Order 61/08), by way of Order 90/08.

CRP

Having heard no opposition to the request, the Board approved the requested change in the Terms and Conditions for the CRP by way of Order 90/08, with annual reports to be provided as previously.

LUBD

By Order 90/08, the Board also granted final approval of the revisions to the Terms and Conditions of LUBD, reducing the eligibility requirement from 36 months to 12 months. This revision will provide customers with increased flexibility to opt out and into the LUBD option, with minimal financial impact on MH or other participating ratepayers. The Board will, however, require annual reports on this program to illustrate the economic impact on MH and customers.

Winter Ratchet

The winter ratchet should be eliminated, such that customers are billed actual demand. With MH's summer and winter demands being nearly equal, there is not a strong case for retention of the ratchet. The ratchet does not send a strong price signal and is a source of considerable customer complaint. The ratchet can be removed with only a negative $2 million a year financial impact. Unless MH provides an acceptable TOU implementation process, the ratchet is to be removed ahead of the winter of 2009/10, and the change will be confirmed in an Order to follow in due course with respect to the conditional rate increase for April 1, 2009.

As previously mentioned, MH should file an implementation program for TOU rates for GSL customers with a fast-tracking of the subclasses that have the necessary metering technology in place.

It is currently the Board's intention to direct the elimination of the winter ratchet by September 30, 2009; the matter will be addressed in the Order related to the conditional April 30, 2009 rate increases.

15.0 Class Rate Impacts

15.1 Rate Changes/Rate Impacts

MH increases as of July 1, 2008 approved in Order 90/08 were::

	2008/09	**Range of Bill Impacts**	
Class		Low	High
Residential	5.06%	3.8%	5.52%
General Service Small Non-Demand	5.08%	4.88%	5.08%
General Service Small Demand	4.83%	3.98%	6.10%
General Service Medium	5.01%	3.22%	5.53%
General Service Large <30 kW	5.16%	3.35%	6.27%
General Service Large 30-100 kV	5.04%	3.21%	5.77%
General Service Large >100 kV	5.07%	3.07%	5.33%
Area and Roadway Lighting	0.0%	-	-
Overall General Service	4.95%		

Based on the approved July 1, 2008 rates, residential customers will experience increases ranging from 3.8% to 5.5%, depending on monthly consumption. Customers using more energy will experience higher than average increases.

For example, a typical residential customer without electric space heat consumes approximately 1,000 kW.h per month on average and will note an increase in their monthly bill of $3.03 or 4.7%. A residential customer with electric space heat, using on average 2,000 kW.h per month, will note an increase of $6.36 or 5.2% per month.

General Service Small commercial customers will experience increases ranging from 3.98% to 6.10% depending on monthly consumption and/or load factor; the overall class average increase is 4.94%.

General Service medium: commercial/industrial customers will experience rate increases ranging from 3.22% to 5.53%, depending on monthly consumption and/or load factor; the overall class average increase is 5.01%.

Increases to General Service large customers vary depending on the voltage level served and the load factor of each customer. MH proposed that the demand charge applied to the General Service large classes remain the same with only the baseline energy charge to increase. This charge results in higher load factor customers receiving a higher percentage increase.

For rates effective July 1, 2008, customers served at 750 V – 30 kV will have increases in their monthly bills ranging from 3.35% to 6.27%, with the average increase being 5.16%. Customers served at 30 kV to 100 kV will experience increases ranging from 3.21% to 5.77% with the average being 5.04%. General Service large customers served at over 100 kV will note increases ranging from 3.07% to 5.33% per month, with the average being 5.07%.

15.2 Differential Rate Increases

MH did not propose any class differential rate changes in its application other than for ARL, as it was MH's position that the current COSS has not been sufficiently tested to justify relying solely on the RCC results indicated therein. Furthermore, MH noted that the Board had not given MH any indication as to how marginal cost and environmental considerations will be reflected in Rate Design.

15.3 Interveners' Positions

RCM/TREE suggested that only marginal costs be considered in Rate Design, while the Coalition took the position that while the COSS should be the primary basis for rate setting, marginal cost should also be considered.

MIPUG took the position that the COSS has been adequately vetted to allow it to be established as essentially the entire basis for rate setting. MIPUG strongly supports the concept of moving RCCs to unity over five years, and suggested that a five year migration based on a 2.9% annual rates increase would bring about annual rate increases of:

- Residential 3.78%
- GSS-ND 1.92%
- GSS-D 1.26%
- GSM 2.65%
- GSL <30 5.36%
- GSL 30/100 2.04%
- GSL >30 0.93%
- ARL 1.31%

15.4 Board Findings

The Board has accepted MH's proposal for across-the-Board increases for 2008/09 and 2009/10, in order to allow further consideration of marginal cost factors for subsequent GRA's, and, by Order 90/08, directed a 5% across-the-board increase for all customer classes except for Area and Roadway Lighting, which is to receive no increase.

Also, by Order 90/08, the Board has indicated, on a conditional basis, subject to a number of reports to be required of MH, a further 4% across-the-board increase as of April 1, 2009, except for Area and Roadway Lighting which is to receive no increase.

16.0 Energy Intensive Industry Rate (EIIR)

16.1 Background

In the public hearing that resulted in Board Order 117/06, MH raised a concern related to energy consumption by energy-intensive firms, using energy as a manufacturing input. MH foresees its revenue position and the rates of other customer classes as being threatened by new or expanding industrial loads.

MH outlined its concern by considering its energy sales to energy intensive industrial customers, typically earning the Utility approximately 3.2 cents per kW.h while energy to secure such new or expanding load may be diverted from profitable export markets, which MH forecasts to return approximately 5.39 cents per kW.h. MH's example was a new or expanded load of, say, 100 MW causing a reduction of up to $18,000,000.00 per year in MH's net income, which would, according to MH, likely necessitate a rate increase of approximately 1.8% to all domestic customers served by the Utility (to recover such a revenue deficiency).

The issue compounds in the longer term, when MH assumes the risks of advancing construction of a major new generating station to meet new industrial load at prices below marginal costs. The decision that lies ahead following MH's refiling of its application potentially has large economic consequences.

While identifying the problem is relatively straight forward, the solution(s) is/are more elusive.

Against that background, the Board notes that it provided direction in Order 117/06, including that:

- MH to consult broadly, and in particular with government and industry, prior to advancing a proposal;

- MH to develop its proposal taking into account that existing industry came, remained and expanded in Manitoba with certain assumptions as to energy prices and supply – and therefore a distinction between new and existing industry is reasonable; and
- MH to provide a report and recommendations with respect to establishing a new energy – intensive industry class, including criteria developed after broad consultations with industry and government, and rate design recommendation.

16.2 MH'S Proposal

In its GRA, and in response to Order 117/06, MH proposed a new General Service Large rate schedule that would limit the application of "heritage" energy rates (based on embedded costs) to industrial customers specific baseline energy quantities per year.

Beyond the specific baseline energy quantities, higher rates, based on the marginal value of the energy, would be applied unless the industrial customer qualifies for an exemption to raise its baseline.

In essence, MH's new energy intensive rate proposal has three interrelated components:

1. new rate based on marginal value of foregone export revenue and marginal cost of generation;
2. a baseline, which would be set as an annual quantity based on a customer's prior maximum usage; and
3. exemptions, based on economic factors which would result in an increase in that customer's baseline if the exemption criteria was satisfied.

MH initially included the proposed rates and method of calculation of the baseline within its GRA; the exemption criteria was filed subsequently.

Underpinning MH's new energy intensive industry rate proposal was the principle that the revenue from such new rates would equal the foregone revenues of the same energy if it had been sold on the export market.

In short, MH sought to make the new energy intensive rate "revenue neutral" to the Utility.

16.3 MIPUG Motion

After MH's GRA filing, and also after the filing of the exemption criteria, the MIPUG advanced a motion to the Board seeking to sever the portion of the industrial rate that deals with new and expanded loads, from the GRA proceedings.

Following oral submissions on MIPUG's motion, the Board issued Order 8/08, which severed in part consideration of the new industrial rate from the GRA proceeding. At the GRA hearing, the Board and Interveners were provided the opportunity to cross-examine MH on the Utility's full proposal.

The Board, in Order 8/08, agreed that, at a minimum, consideration of the exemption criteria would occur at a special hearing. Interveners were also advised that if they so wished, they could bring new evidence forward at a separate hearing. To that end, the Board was advised, during the GRA hearing, that at least MIPUG intends to bring new evidence forward on this issue.

16.4 MH's Revised Position

While the Board and Interveners had the opportunity to explore the strengths and weaknesses of MH's proposed rates for new or expanding industrial load, so too was MH afforded the opportunity to continue to consider the issue.

During the proceedings, MH advised the Board and all parties that MH would not seek, through the GRA hearing, approval of the proposed energy intensive industry rates. Rather, MH indicated that it wanted an opportunity to review the information provided through the GRA process and have further discussions with its large industrial customers.

And, following further consideration and discussions, MH advised that it "…… may well refile or refine [its] proposal once the new hearing date is set and the process is established".

MH further advised that its request of the Board related to this issue, flowing from the GRA, would be for the Board to endorse in principle, the end date of December 31, 2007 for the setting of any baseline that may relate to a new rate for energy intensive industry. By the Board endorsing the date of December 31, 2007, as the end date for establishing a baseline, MH wants to put customers on notice for their planning purposes.

16.5 Service Extension Policy

In June 2005, MH suspended a long standing service extension policy which provided that MH would invest up to three times the anticipated annual revenues on facilities required to strengthen or extend the common grid to service customers (not including dedicated facilities). MH did not seek Board approval of this policy suspension.

MIPUG has suggested that the suspension may not be valid, or at the least, requires Board approval. Furthermore, MIPUG requested consideration should be given to refunding the costs incurred by customers due to the suspension.

16.6 Interveners' Positions

The Coalition

New and Expanded Load

The Coalition attributed the pressure on MH's load growth to load growth related to electricity intensive industry, and noted that load growth for electricity intensive industry for the next five years was projected to amount to 57% of the total load growth.

The Coalition stated that large energy intensive industry has been attracted to Manitoba on a scale large enough to threaten the Corporation's revenue position. Coalition noted that in the short-term this would impact by loads being diverted from the export market. In the long-term, for the Coalition the impact would not only be load diverted from the export market but also the implications of advancing costs in terms of new Generation and Transmission.

Energy Intensive Industry Rate

With respect to the energy intensive industry rate base line exemption criteria, the Coalition raised concerns with the MH's proposed dispute resolution process, which would come into effect in the event that there was a dispute with the establishment of the baseline or the granting an exemption between the Corporation and an industrial customer.

The Coalition held that if exemptions are to be granted they should be brought before the Board or be testable in some public forum. The Coalition opined that transparency is important because, to the extent exemptions are granted, there will be an impact on customer bills. The Coalition suggested MH address this issue when it refilled its proposal.

MIPUG

New and Expanded Load

MIPUG rejected MH's premise that new and expanded load from industry negatively affects all other customer classes, and held that such a premise would compromise in a material way fundamental ratemaking principles.

MIPUG stated that, should MH propose this ratemaking premise in future hearings, more detailed and comprehensive analysis is required. MIPUG contended that the Board will only be in a position to rule on such an important issue if it is presented with detailed analyses of both the expected short-term and long-term implications of the measure.

MIPUG contends that in the short-term, and due to export tie-line constraints, MH's ability to export additional power at times of high export prices is limited, and, as such, industrial load expansion would result in only minor impacts on MH's revenues over the short-term. Over the long-term, and in an era of expansion, MIPUG contends that the benefits arising from developing assets sooner should be included in the analysis, to allow the Board to properly assess the impacts that increased domestic loads have on long-term rate levels.

With respect to the Service Extension Policy, MIPUG opined the Utility neither had the authority nor should have suspended the policy without Board approval. Furthermore, for MIPUG, consideration should now be given to refunding costs that were disallowed by MH's unilateral suspension of the policy.

None of the other Interveners pursued this issue.

Energy Intensive Industry Rate

MIPUG accepted that MH had withdrawn its new industrial rate proposal and planned to refile an application, and that there is, therefore, no need for the Board to comment on this issue at this time. MIPUG stated that the Board should not set a date for the Corporation to return with its application, to allow MH to "take the time it needs" to properly support its proposal.

With respect to MH's proposed date of December 31, 2007 to establish a baseline for energy intensive industry rates, MIPUG's view was that the only benefit of establishing the baseline at that date would be to prevent "gaming" (i.e. new load being "rushed into service" ahead of a new rate and class being established). MIPUG's view was that the baseline should not be based on that date as other measures can be used to prevent "gaming", if and when a new rate and rate class was ultimately adopted.

MIPUG stated that the level of consultation with affected stakeholders should be commensurate with a rate proposal of this magnitude, and that the Corporation should take the time it requires to consult with the businesses and communities that may be affected by its proposal.

MKO

New and Expanded Load

MKO submitted that charging higher rates to new energy intensive general service customers would increase MH revenues and potentially provide for lower rates for all customers and greater "dividends" to the Manitoba government.

Energy Intensive Industry Rate

With respect to the energy intensive industry rate base line exemption criteria, MKO limited its comments to its view of the rate design principles that should be considered by MH in setting an energy intensive industry rate.

Firstly, MKO submitted that the proposed energy intensive industry rate violates several fundamental rate design criteria in that having such a rate would result in the charging of different rates to similar customers, and that the implementation of such a rate should only be done after the Manitoba government has set and communicated clear policy direction that such a rate is in the best interests of Manitoba.

Secondly, MKO advised of its concern that the proposed rate design will have a fixed implementation date that could “create a price cliff and intergenerational inequities”.

Thirdly, for MKO, the proposed energy intensive industry rate will differentiate customers based on “who” should receive net export benefits and “who” should not. MKO expressed a concern that MH would be “moving away” from the fundamental principle that all MH customers, including diesel community customers, should share the net export benefits, and that such a move may be a dangerous precedent and a decision to proceed with MH proposal should not be taken lightly.

Fourthly, MKO advised of a concern that the proposed rate will only apply to the large general service customer class. MKO submits that limiting the rate to one customer class violates standard rate design principles. MKO suggested that if limiting the sale of electricity to new energy intensive industry customers is a policy objective of the Manitoba government, then a more appropriate mechanism should be used instead of altering MH’s rates.

RCM/TREE

New and Expanded Load

RCM/TREE submitted that Energy Intensive Industry load growth will have a significant impact on MH's other customers, and that MH's load growth continues to exceed past projections with negative impacts on MH's finances, customers and the environment.

RCM/TREE further opined that MH may face energy shortages in 2009 to 2011, due to accelerated load growth.

Energy Intensive Industry Rate

RCM/TREE observed MH has acted on the energy-intensive industry issue by proposing a new rate for the general service large category. RCM/TREE also noted that the complexities of the proposed rate calculation are subject to consideration by the Board in a subsequent hearing.

Mr. Chernick suggested that MH's industrial rate proposal and exemption criteria were flawed, in that:

a) the baseline consumption level proposed was too high; and
b) the proposal allowed the baseline to increase to cover large amounts of increased load, with a total growth allowance of up to 39 GW.h (to qualifying companies).

Mr. Chernick noted that under MH's proposal if the industrial customer exceeded its baseline, the baseline in future years would be increased, so that marginal cost based rates would apply only in the first year of the load growth.

With respect to the proposed exemptions and/or discounts for economic development (payroll and taxes), Mr. Chernick suggested these would be the "wrong mechanism, implemented by the wrong entity", and would not be properly designed to meet the targeted objective, in that the discounts would destroy the conservation incentives of marginal-cost pricing and the computation of the cost of additional load would fail to count the environmental costs of reducing exports, and the lost benefits of the export revenues while new loads would be eligible for exemptions, regardless of the efficiency of the equipment and process installed.

Mr. Chernick stated that the baseline proposed to be established was too high and that the base usage for which a customer would be charged embedded rates should be less than a fixed historical base usage, such as the maximum annual usage in 2005-07 as proposed by MH. For Mr. Chernick, the base usage might better be set as 95% of the historical value in 2008, falling by 2% or so each year thereafter and with no future growth allowance.

Mr. Chernick stated the growth allowance eliminates any efficiency incentive provided by MH's proposal, and that "the only qualification for the growth allowance appears to be that the customer's load is less than 78 GW.h". Mr. Chernick opined that this proposed provision appears to eliminate any efficiency incentive for any customer adding less than 39 GW.h.

Mr. Chernick did not agree that incentives for economic development (exemption from the new rate due to economic development considerations) should be included in MH's rate structure. For him, the allocation of incentives should be the responsibility of an agency of the Manitoba government, not MH.

Mr. Chernick further suggested that if the Board were to want to use some of MH's revenues to support economic development; it should designate an amount to be collected and then direct that sum to be paid to the designated economic development agency, which should then decide which development projects are desirable and economically efficient.

Mr. Chernick suggested that revenues for economic development can be collected from the higher blocks of inclining-block rate structures, and that this proposal for the collection and disbursement of economic-development incentives would retain marginal-cost pricing for industrial rates, for both new and expanded loads, while not burdening MH with an economic-development role for which it has no special expertise or mandate.

RCM/TREE stated that each GSL customer should be charged the embedded energy rate for usage up to a baseline, and that marginal cost, including environmental costs, should be charged for consumption above that level. For Mr. Chernick, new general service large customers should be charged entirely at the marginal energy rate.

RCM/TREE proposes that the Board direct MH to participate in a collaborative effort with interested parties to determine if there are areas of agreement for the design of a new industrial rate proposal, and agreed with MH's proposal to fix December 31, 2007 as the end date for determining baseline levels.

16.7 Board Findings

Energy Intensive Industry Rate

The issue of the fairness of embedded cost rates being considerably lower than marginal costs or marginal values of energy, and the potential financial impact on the Utility, is not unique to Manitoba. The Board understands that other jurisdictions have, and continue, to face this issue.

And while the issue, in its basic form, exists for each new or expanded load by any customer, the financial implications of expanded load are magnified in the case of industrial customers.

While how best to address the issue in Manitoba remains an open question, one that will be pursued at a subsequent proceeding following MH's expected refiling of an application for a new industrial rate, it is an important issue that the Board is deeply interested in.

MH proposed a calculated rate for energy consumed above a baseline level, with that rate comprised of a marginal value of generated energy based on a "normalized" forecast of export values (i.e. 5.58¢ per kW.h), together with a marginal cost of transmission based on avoided costs (i.e. 0.816¢ per kW.h).

There was neither a marginal cost nor a marginal value for distribution included in MH's proposed new energy-intensive rate, this, because general service large customers have only nominal use of MH's distribution assets. The energy rate to recover the marginal cost, as proposed by MH, was also adjusted by the current demand charge of 0.740¢ per kW.h, providing for a proposed rate for new or expanded load for GSL > 100kV customers of 5.656¢ per kW.h (5.58 + 0.816 - 0.740 = 5.656).

While the Board appreciates that MH is not asking for approval of the energy-intensive rates at this time, the Board is concerned about the use of forecast export prices (as opposed to actual export prices) in the determination of marginal costs, and encourages MH to explore and advance other options for consideration at the separate hearing into this rate matter.

To explore other options and to avoid some of the concerns with the current calculation of an energy intensive rate, MH should consider:

- Baseline and growth allowance, and whether new industry coming to Manitoba [and existing industry] should get any growth allowance at heritage rates;

- Using data that is transparent and available to all customers and is not protected by a claim of confidentiality. The Board does not accept the bid for confidentiality when the information is publicly available from other industry or regulatory sources;
- Including time-of-use alternatives and variations to reflect the different values of energy at different times;
- Keeping the overall implications for revenue requirement neutral. The Board does not consider MH's proposal revenue-neutral as presented in MH's filed Proof of Revenue and IFF; and
- Perhaps including a marginal cost component or signal in rates for all classes, not just GSL. MH has identified that over the past ten years, more than 50% of the growth in Manitoba industrial loads is attributable to expansions in the electrochemical processing industry, an industry in which 70% of the costs can be incurred for electric energy used for processing purposes. The other major energy-intensive industry load (forecast by MH to significantly increase) is the pipeline compressor load.

A question to be considered is whether these specific industries should be targeted, or whether the concern is best addressed across the entire class, or perhaps all classes, served by MH.

Therefore, for the special hearing, MH will be expected to provide options, including its preferred option. The Board notes that MH may change its preferred option from what was presented at the GRA.

Export Contracts

MH should be required to reconcile its proposed treatments of energy-intensive industries with existing and proposed export contracts. Export sales do not create any direct or indirect Manitoba employment in the sense that domestic industry does.

It can be argued that MH should be pricing energy for domestic industry at average export price minus appropriate credits for direct and indirect job creation. While this might be difficult to administer, it would reward job creation and economic values input to Manitoba.

Further to the above, it would appear that the proposed energy-intensive rate may well discourage the further growth of existing industries. For example, if an industry added work shifts it would attract substantially-higher energy prices, in addition to shift premium payroll costs, even though this growth might well be employing off-peak energy (that being of low value as an export product).

TOU rates would significantly reduce the cost to industry for such expansion, and MH could benefit by gaining more value for its off-peak energy.

Time of Use (TOU) Rates

MH has suggested TOU rates will be considered after the new intensive-energy rate is implemented. This approach avoids addressing the issue of uneconomic exports and the considerable differences in domestic customer energy usage patterns. The Board, while recognizing that the implementation process for TOU may be protracted, believes that TOU should be built into the initial concept for the new rate.

In addressing confidentiality issues, MH has suggested that there is sufficient publicly-available information for the Board and Interveners to make informed judgements on the validity of MH's marginal cost forecasts. This information (sources: SEP/NEB/etc.) should also allow MH to define time-of-use pricing on a conceptual basis for Board consideration in the new rate design.

MH has acknowledged that TOU billing could have favourable revenue results for the utility in most years. On the other hand, TOU rates should provide an opportunity to industry to optimize its energy usage and thus benefit from TOU rates.

Marginal Cost Values for Export

MH's case for increased rates to energy-intensive industry assumes that all energy used by industrial growth could alternatively be sold as peak market exports. Contract prices (generally below peak market values) apply during low flow years; only part of the exports achieve better than contract prices in average flow years, and surplus energy prices tend to fall below contract prices in high flow years. In light of the transmission tie-line constraints, the Board questions MH assumptions on the relative value of export sales and domestic load growth during the off-peak period.

Accordingly, the Board directs MH to provide an in-depth analysis of the value of peak versus off-peak energy sales into the MISO market.

MH also employs an element of avoided costs in determining the marginal cost of energy to be employed for intensive-energy usage rates. This would be appropriate if MH was actually contemplating deferral of new generation or transmission on the basis of reduced domestic load growth. In reality, MH is advancing new generation and transmission to meet new export contract sales now under negotiation.

he Board directs MH to report on the specific deferral values that could be achieved by constraining industrial load growth.

Consumption Baseline

In defining the new intensive-energy rate and by its application, MH focussed on industrial customers using more than 39 GW.h of energy per year. However, the proposed rate schedule provided marginal cost second block rates for all GSL customers.

In the Board's view, MH should have provided the impact analysis for all GSL customers, in order to justify the proposed 39 GW.h floor for new rate exemption. Accordingly, the Board directs MH to provide an analysis for all GSL customers, to justify the 39 GW.h floor for new rate exemption, and to report on the potential extension of the rate and or lowering of the threshold.

Fairness Principles

There was at least a sense of a degree of consensus from all parties that selling energy domestically at prices well below the average export market value is an issue that must be addressed. Beyond that, the Interveners were quite divided on what is a fair price level and who should pay the higher price if there is to be one.

Currently under the COSS, all domestic customer classes are allocated about 3.0 to 3.5¢/kW.h in costs for generation and transmission. Some customers pay more and others pay less than their allocated costs. No class pays the average export market value. The issue is further distorted because different classes are allocated varying amounts (zero and upward) for local distribution services. The Board will be looking to reconcile the current rate proposal with cost causation principles.

Service Extension Policy

It would appear that the policy (pre-2005) was intended to support industrial expansion in areas of the Province that did not have access to 30 kV or greater power. The scale of the investments incurred and revenues gained under this policy were not identified at this hearing. MH did not carry out a detailed feasibility test prior to suspending the policy; for the longer term, and in light of the proposed new energy-intensive rate, that policy may be reconsidered by MH.

The Board considers that the service extension policy logically falls under the Terms and Conditions that are generally believed to be integral with rate setting. Without reaching a conclusion on legal jurisdiction at this time, the Board will direct MH to file an economic feasibility test report with the Board on September 30, 2008, on the historical application of the service extension policy. In that report, MH is to define the underlying rationale for the existing policy, as it existed and explain why that rationale apparently no longer exists, together with an accounting of instances since the policy was suspended where customers paid more to have a service connection than other previous customers.

17.0 Presenters' Positions

17.1 Mr. Ciekiewicz

Mr. Ciekiewicz's view is that the March 31, 2007 interim rate increase was not justified because it was prompted by the occurrence of only a short period of low water levels in 2005/06, rather than the "long established method" of using longer periods of time to set rates.

Mr. Ciekiewicz also indicated that MH's proposed residential rate increase, and the approach the Corporation used to develop its inverted rate structure proposal penalizes home owners who are dependent on electrical heating, and/or have converted to electrical heating. He was concerned that all-electric rate-payers will face an increase greater than the rate of inflation. He argues that those who do not have the option of other fuel sources for heating should get a rebate, rather than an increased rate. As well, he predicted that inverted rates will result in heating choices by rate-payers that are not friendly to the environment.

Mr. Ciekiewicz was also concerned that it is the nature and length of the firm export contracts that constitutes the main risk affecting the financial well-being of MH, and that in years of drought the costs associated with fulfilling firm export commitments could wipe out the retained earnings.

He opined that the Board has jurisdiction over MH's export contracts, by way of section 47 of *The Public Utilities Board Act*. He recommended that the firm export contracts negotiated by MH include clauses that the contracts can be cancelled in the event of drought conditions, or that certain incentives on export prices be included in the contracts as a concession to the export customers for this cancellation clause.

Mr. Ciekiewicz also challenged the meaning of firm contracts as interpreted by MH, he based his challenge on a definition from the North American Electric

Reliability Corporation that implies that the obligation to provide power ceases when the "system reliability is threatened, or during emergency conditions".

Mr. Ciekiewicz also questioned MH assertions that the incremental costs of new office building over the efficiency savings will be cost neutral, and never affect rates. He did not accept that the $278 million price tag for the new head office will not adversely affect retained earnings, and by extension, rates.

Mr. Ciekiewicz was unclear as to whether NCN will be liable for one-third of any losses that may materialize if a future drought prevents MH from meeting its export sale commitments, and sought to have the issue clarified.

Mr. Ciekiewicz made reference to what he termed contradictory responses from MH on some Information Requests with respect to the Brandon Coal Fired Thermal Generating Station Unit 5. One apparent contradiction cited appears that MH has stated that the closure of the Unit 5 would result in firm energy deficits in 2013 to 2025 and would reduce the surplus available for export, while MH stated elsewhere in its responses to interrogatories that the thermal plants were not constructed to support export sales. Another contradiction in MH responses noted by Mr. Ciekiewicz was that MH stated in one Information Request that Unit 5 produces an average $20 million to $30 million in net income per year, while the Corporation's response to another Information Request stated that MH does not calculate the annual revenues or net income for the unit.

17.2 Mr. Forrest

Mr. Robert Forrest provided an electronic submission; he indicated opposition to MH's proposed rate increase.

Mr. Forrest stated that rates were already too high and that the current increase was not justified because MH had reported in the news a large surplus and that an increase had already been granted.

17.3 Mr. Rader

A written presentation in the form of a letter from Mr. Robert Rader, Managing Director, Koch Fertilizer Canada, Ltd., to Mr. Bob Brennan, President and Chief Executive Officer, Manitoba Hydro and to Public Utilities Board, dated February 11, 2008 was read into the record of the proceeding.

Mr. Rader made reference to the document entitled General Service Large – New or Expansion Rate Baseline Energy Consumption Level and Exemption Application Discussion Paper. He did not agree with the proposed annual growth allowance of GW.h, and recommended the growth allowance be a percentage of the base versus a fixed number.

Mr. Rader also recommended that expenditures made to reduce energy consumption should be credited at 100% rather than the 50% contemplated in the document.

Mr. Rader also stated that while his company may expand its production volume without increasing its payroll, it would still be providing secondary benefits to truck and rail companies, and that such economic benefits should be taken into account in considering exemptions from any new industrial rate.

17.4 Mr. Svidal

Mr. Kaare Svidal is the manager of the Energy Management Group of Enbridge Pipelines, and he stated that MH had made presentations across the province on the proposed new industrial rate, and that in these presentations MH had indicated that pipeline companies provide very little economic benefit to the province. He disagreed with MH on that issue, and argued that Enbridge has provided considerable value to Manitoba in the last 58 years.

He stated that Enbridge pays annual salaries of $5 million to Manitobans, and $7 million of annual property taxes in the province. He also noted that Enbridge benefits industry in Manitoba in that it delivers all the refined products to Manitoba in a reliable and economical way.

He also noted that the growing Manitoba oil producing industry, which generated $400 million in capital expenditures in 2006, relies on Enbridge to deliver their product to US markets.

He pointed out that Enbridge is a long-term financially stable A-rated base load customer of MH whose continued presence in Manitoba is required to justify the MH infrastructure in place today. He reminded the Board that his firm had switched from diesel to electrical pumping stations in 1965 at the request of the government of Manitoba, and that Enbridge was a long-term and committed customer of MH.

17.5 Mr. Turner

Mr. Bill Turner is plant manager of Canexus Chemicals at Brandon and the Chairman of MIPUG. He indicated that low-cost electricity is necessary for industry to remain competitive in Manitoba because it offsets existing geographic, climatic and other disadvantages of locating in this province, disadvantages that also include higher taxes and a growing foreign exchange problem.

Mr. Turner stated that MIPUG members pay rates that are 8% greater than the cost to MH of providing the firms the electricity they consume; MIPUG member firms were reported to consume 5,000 GW.h. annually at a cost in excess of $150 million.

Mr. Turner further advised that MIPUG members employ 4,500 Manitobans, and that the association's membership have capital assets employed in Manitoba greater than $2 billion. Mr. Turner also stated that 90% of MIPUG members' sales were exports.

Mr. Turner indicated that the new industrial rate is a new policy direction from MH with major implications for the use of energy and the development of industry within the province. He expressed frustration that the discussion meetings between MIPUG and MH on this issue were ineffectual, and that the discussions were not open and transparent. He expressed concern that the Province of Manitoba has not participating directly in the new industrial rate discussions, and stated his view that the Province may be poorly informed on the issue.

He suggested there will be far reaching impacts if the new industrial rate is adopted, in particular to the employees of affected companies and their families, and to rural and northern communities in which the firms are located.

Mr. Turner explained that with respect to his company, Canexus, 60% of the firm's manufacturing costs are for electricity ($48 million annually). He stated that 100% of his firm's product is exported, with 95% going to the US. Mr. Turner noted that the recent strengthening of the Canadian dollar had resulted in major income losses for Canexus.

He stated that his company has 6 plants in other provinces and one in Brazil, and that when the firm is not required to operate at full capacity, the firm will operate the factories with the lowest electricity cost. He also pointed out that his company is one of MH's largest DSM participants.

Mr. Turner stressed that companies such as Canexus require stability and certainty in electrical rates in order to make sound business decisions as to where they locate. He indicated that his company relocated a plant from Louisiana to Manitoba in 2004, at a cost of $55 million, because of electrical rates. He stated that further expansion plans are now being reconsidered due to the uncertainty of rates in Manitoba over the last 3 years.

He further stated that through his association with various industry groups, that business in general is concerned with the new industrial rate issue. He declared his disappointment that MH has stated that sodium chlorate companies and pipelines provide very few economic benefits in this province, and he advised of benefits being provided to the people of Brandon and the related construction trades.

18.0 IT IS THEREFORE RECOMMENDED THAT

1. MH seek independent advice as well as advice from government and its credit rating agencies as to the merits of a possible elimination of the sinking fund requirements;

2. The Board remains concerned with the Corporation's ongoing aggressive deferral and capitalization accounting practices, and recommends that MH consider an early adoption of IFRS standards. The Board further recommends that both the Board's prior concerns and current views, as expressed in this Order, be brought to the attention of both MH's external auditors and its independent consultant assisting the Corporation with its IFRS transition strategy;

3. Because of the current and future impact on rates of the unprecedented capital program and related tentative export sales contracts, the Board repeats its recommendation to government that *The Public Utilities Board Act* be amended to make the Board's regulation of MH equivalent to the Board's regulation of Centra Gas, by removing the exemption now provided under Section 2(5) of the Act;

   Or alternatively, the Board recommends that government renews the mandate provided to the Board in 1990 (via OIC 1990-177), a mandate that provided for a detailed and comprehensive integrated review of MH's Major Capital Projects in light of pending export commitments (then-covering the period 1990 to 2009). Such an updated mandate would allow for a similar review covering the period 2009 to 2028;

4. Because of the impact (and potential impact) on consumer rates, the Board recommends MH seek the Board's prior review and approval of

future agreements involving the joint ownership of Generation and Transmission assets;

5. With respect to DSM and Low-Income Energy Efficiency Programs:

   a) MH accelerate its DSM plans to achieve targets earlier than presently scheduled, and at the same time, consider changing its accounting approach to one that provides for the amortization of DSM costs over a period no longer than five years;

   b) MH to continue to pursue environmental objectives on an integrated natural gas electricity basis, and in particular, to consider the position of low-income customers increasingly faced with higher energy costs and too often lacking the funds and know-how to achieve needed upgrades that would reduce their energy bills and GHG emissions;

   c) MH undertake changes to its furnace replacement program so as to increase low-income household participation in the early replacement of inefficient natural gas furnaces. Changes to the program, as recommended by the Board by way of Order 99/07, would better provide this opportunity and should provide energy savings for low-income customers and significant non-energy benefits to society (reduced GHG emissions), the Utility (in the form of less risk of the conversion of natural gas space heating to space heating by electricity), as well as to all participants in the program;

   d) MH incent landlords to participate in the low-income DSM program, to improve the energy efficiency of their properties for the benefit of their tenants and the environment;

e) MH expand finance options for low-income customers, including subsidized Power Smart loans for the furnace replacement program, with an option either requiring repayment on the sale of the residence or, alternatively, a 10-year lease financing program as suggested by Mr. Dunsky;

6. The Board recommends government consider:

   a) Seeking from the Federal government an exemption from GST for residential customers for space heating, as heat in Manitoba in winter is a necessity like food; and

   b) Funding low-income and DSM programs, by setting aside all or a portion of provincially and or municipally-sanctioned sales taxes charged to residential customers on energy used for heating purposes.

7. The Board recommends government consider establishing a separate entity to manage the Corporation's DSM and low-income initiatives. The Board concludes that MH's full energies and focus should be placed on the effective implementation of its long-term expansion plans toward meeting the demand for electricity and natural gas to develop over the next few decades. The Board can envision MH establishing aggressive goals for the reduction of domestic energy consumption for such a new entity to meet or exceed, together with providing adequate funding to meet those goals (energy conserved is energy available for export).

19.0 IT IS THEREFORE ORDERED THAT:

1. MH file with the Board, MH's 2007/08 Annual Report, with audited financial statements, immediately after the Corporation meets its statutory filing requirement with respect to the Legislature;

2. With respect to MH's export program, MH to file a report with the Board by January 15, 2009 on the following:

   a) Overview of strategy, options, historical costs and revenues;

   b) Monthly historical export prices for the last five years, disaggregated for both peak and off-peak periods;

   c) Existing and pending export contract commitments, with annual forecast revenues both aggregated and also disaggregated (in confidence if necessary);

   d) Forecast export revenues until 2028, identifying opportunity sales distinct from firm contract sales and broken down by peak/off-peak;

   e) Detailed assumptions used in export market price forecasts (filed in confidence if necessary). MH to resubmit its export pricing forecasts to reflect recent realities of market prices and exchange rates;

   f) A testing of MH's assumptions through detailed sensitivity analyses for upper/lower quartile water flows, foreign exchange, domestic load growth and natural gas prices; and

   g) Given the crucial nature of the Corporation's export contracts and assumptions, with potential impacts on domestic rates, MH file for Board review all proposed export contracts;

3. MH to provide the Board with:

    a) Specific quarterly reports on energy supplies (including imports), domestic demand, and export sales (e.g., similar to NEB volume and price data); and

    b) Annual reports on the LUBD Program performance;

4. MH to provide the Board an independent assessment of the Corporation's relative weighting of fixed vs. floating debt, and file a report with the Board on or before June 30, 2009 ;
5. With respect to IFRS, the Board requires MH to file on or by January 15, 2009 :

    a) A report explaining and quantifying the proposed transition to IFRS;

    b) A copy of MH's consultant's report indicating the projected impact of the adoption of IFRS on the Utility, specifically with respect to MH's current deferral and capitalization approaches, and as to the likely status of goodwill now recorded in its accounts;

    c) An articulation of the new proposed MH accounting policies detailing how they comply with IFRS;

    d) An explanation of any changes to the internal operations of MH which may be planned or contemplated to offset any increased annual expenses expected as a result of the adoption of IFRS, together with MH's and its consultant's views of the Board's regulatory options, including a review of the pros and cons of special purpose financial reporting for utilities for rate setting purposes; and

e) An updated IFF and CEF (covering the years 2008 to 2028) reflecting the expected impact of the new standards and assumptions of related operational changes as may be planned or contemplated by MH;

6. MH to undertake and file with the Board, by June 30, 2009, an independent benchmarking study of key performance metrics, using the most currently-available data and including:
   a) Primary key drivers of OM&A in each operational division [Board preference is for a divisional break-down to allow for a comparison with other utilities, even if the comparison needs to be limited to specific divisions/activities],
   b) Comparable other Canadian Utility data for each of the drivers;
   c) Key comparison indicators, including staffing levels;
   d) A comparison with and discussion of industry best practices; and
   e) Potential improvement areas.

   The Board expects to be apprised of the scope of the benchmarking study in advance of it being undertaken, and will anticipate being provided a study outline on or before January 15, 2009, to allow the Board the opportunity to provide direction and/or comment.

7. MH to undertake and file with the Board an Asset Condition Assessment Report by June 30, 2009, that defines:

   a) major assets and categories of assets;

   b) the estimated remaining economic life of each major asset and category of asset;

   c) an indication of the implications for OM&A costs related to required and scheduled maintenance;

d) a listing of scheduled, planned or anticipated major upgrading/decommissioning of major assets and/or categories of assets;

e) forecast expenditures for planned renovations and/or replacements with respect to now available energy supply and transmission; and

f) Dam Safety Condition Assessment and Maintenance requirements.

In advance of the commencement of the Asset Condition Assessment Study, MH to file with the Board detailed Terms of Reference containing the scope for undertaking such a study and a definition of the resources to be employed, on or before January 15, 2009.

8. MH to file a report with the Board by June 30, 2009 detailing the final all-inclusive capital cost of the corporate head office project (including such things as construction cost, furniture and equipment, telecommunications, equipment leases, etc.), and the contemplated or planned operating actions to recover incremental costs related to the new head office. (The Board reaffirms that no additional incremental costs are to accrue or be allocated to Centra as a result of the new MH head office.)

9. MH to file a report with the Board by January 15, 2009 indicating:

a) whether the current depreciation rates for the Generation, Transmission, Distribution and other assets purchased from Winnipeg Hydro [including Slave Falls] and the Brandon Coal Plant remain appropriate; and

b) the related proposed capital replacement, expansion and decommissioning costs;

10. To gain a further understanding of the implications of the capital expenditures now contemplated, MH is to file with the Board by January 15, 2009 :

    a) An updated Capital Expenditure Forecast, and Integrated Financial Forecast covering the fiscal years 2007/08 to 2027/28;

    b) An updated Power Resource Plan covering the years 2008 to 2028. The updated Power Resource Plan should provide alternative scenarios with/without implementation of the pending new export contracts and related capital spending. The report should also indicate the remaining feasible hydro generation opportunities, following Wuskwatim, Keeyask and Conawapa, where and what possible quantity of energy would be expected, and the assumed development timeline; and

    c) An updated Load Forecast covering the fiscal years 2007/08 to 2027/28; the Load Forecast should reconcile projected and actual DSM savings;

11. The Board will direct MH to propose to the Board on or before January 15, 2009 the terms of reference for a regulatory review of MH's planned Capital Program and its impact on consumer rates;

12. MH to prepare a study, and file it with the Board by January 15, 2009, a thorough and quantified Risk Analysis, including probabilities of all identified operational and business risks. This report should consider the implications of planned capital spending and take into account revenue growth, variable interest rates, drought, inflation experience and risk, and potential currency fluctuation;

13. MH to file by September 30, 2008, for Board approval, a conceptual outline for an in-depth and independent study of all the operational and business risks facing the corporation set out in the previous directive (12);

14. MH to provide the Board, by June 30, 2009, recommended risk mitigation measures and a review of possible suitable capital structures, given the capital expansion now planned or contemplated, with risks quantified;

15. MH to provide the Board by June 30, 2009, a summary of existing programs and potential future programs defining the arrangements for increased or modified (augmented) water flows within and external to Manitoba. The summary should include the specifics of each program and mitigation and compensation related thereto;

16. MH to submit a report to the Board on January 15, 2009 on the 300 MW of additional wind energy project(s), with a discussion of the business case, general wind strategy, prospects and timelines for the project, as well as with respect to the prospect for a further 600 MW consistent with the government's identified longer-term target of 1,000 MW of wind energy. The Board will also require access to the agreements for the existing 100 MW St. Leon wind project, and an opportunity to review the pending agreements for the 300 MW project(s);

17. MH report to the Board before June 30, 2009, as to whether there are greater global environmental (GHG) and economic benefits to be achieved by exporting hydraulically-generated electricity than would be achieved by fuel switching (from natural gas to electricity) and/or

geothermal within Manitoba. The report should address and clearly define the relative environmental and economic benefits of these exports. The overall assumptions and impacts on the Load Forecast should also be included in the report;

18. With respect to low-income programs, MH to prepare and report on the following:

    a) MH to consult with stakeholders on its enhancements to its low-income programs to ensure it adequately addresses low-income needs, and to report to the Board by September 30, 2008 on the results of the consultation and subsequent development of and implementation of this program;

    b) MH to provide an update on the status of the current natural gas furnace replacement program (including actual and forecast take-up rates), as well as reports of possible changes to the program relative to the suggestions put forward by Mr. Dunsky, on or before September 30, 2008;

    c) MH to meet with MKO and representatives from the diesel communities to discuss the issue of the access of those communities to MH's low-income programs, and to report to the Board on the outcome of these discussions on or before September 30, 2008;

    d) MH to propose for Board approval (as soon as possible but no later than September 30, 2008) a low-income bill assistance program, where such a program would occur in conjunction with and complimentary to an expanded low-income DSM program;

e) MH to file with the Board on or before June 30, 2009 a draft plan, with projected implications, to increase the Corporation's integrated (natural gas and electricity) energy-efficiency initiatives with respect to low-income households, so as to allow for reduced energy consumption for all such households within a decade;

f) MH to report back to the Board on the potential for a low-income and a general refrigerator replacement program, and provide the merits of such programs, on or before June 30, 2009; and

g) MH to accrue interest on the AEF balance, to ensure additional funds are available to fund expanded low-income energy efficiency programs and to avoid the loss of "purchasing power" of the AEF due to continuing inflation;

19. MH to refile the COSS by January 15, 2009 on the following basis:

a) As defined by Order 117/06;

b) Incorporating diesel and exports in the same fashion as other domestic customer classes;

c) The assigning of 50% fixed and 100% variable thermal plant costs to the Export class;

d) Assign DSM cost directly to export class and add DSM energy savings to domestic load for Generation cost-sharing purposes;

e) Use the most recent actual [not forecast] export prices to establish export revenue in the COSS; and

f) Use actual [eight year] energy [SEP] prices and energy use profiles in Generation energy weighting process;

20. MH to provide and file with the Board by January 15, 2009 a revamped Marginal Cost (MC)-COSS analysis, one reflecting needed refinements to generation, transmission and distribution marginal costs. This should include specific demonstrations of how alternative MC adjustments could be applied to an embedded COSS. Among the scenarios to be explored, MH should consider the addition or blending of marginal costs to embedded costs prior to comparison to class revenues;

21. MH to file all appropriate data [e.g. SEP/ NEB/ MISO clearinghouse information and avoided cost information etc.] required for input to the marginal cost determinations for generation, transmission and distribution and to further define the key assumptions employed by MH in support of this process, with the Board [on a confidential basis if necessary] on or before September 30, 2008;

22. MH to provide a planned implementation strategy outline by September 30, 2008 for TOU Rates as appropriate to the classes with required metering technology already in place. Alternative rate strategies should be included for consideration at the upcoming Energy Intensive Industry rate hearing;

23. MH file a plan by January 15, 2009 outlining the pros and cons of the various potential inverted rate strategies under consideration, and the MH-proposed course of action to address this issue over the next five years;

24. MH to plan to re-balance demand and energy charges on a revenue-neutral basis, and submit a 5-year transition plan for the Board's approval at the earliest of June 30, 2009, or the next GRA;

25. MH to continue with the consolidation of process of the GSS and GSM customer class consolidation, and provide the Board with a proposal by June 30, 2009 for a stepped-up program and a timeframe for completion;

26. MH to include in its future application to finalize the four interim Orders related to Diesel Rates, reports on:

    a) the fairness of the rate approach with respect to non-senior government accounts (the Board is concerned that the rates restrict the economic development prospects for the communities and drive up service and commodity costs);

    b) the efficacy of the current rate schedule for non-government accounts (data on aged accounts receivable, delinquency and bad debts together with the collection policies in place for the four communities will be required); and

    c) the effects of the current approach to rates and consumption restrictions on the four communities, a detailed review of consumption levels and collection practice from the former Diesel communities that have been connected to the grid which will serve as a comparison; and

    d) MH to report to the Board by September 1, 2008, as to the balances and status of the diesel zone accounts; to ascertain whether existing interim rates are fully recovering operational costs;

27. MH to provide a report to the Board by January 15, 2009 evaluating the Surplus Energy Program. The report should employ monthly historical data from 2000 to 2008 to analyze and compare the benefit and costs of the actual operation of the hydraulic generating system

pursuant to various less aggressive sales strategies. This report should address the relative merits of withholding surplus energy from sales at off-peak periods;

28. MH to file an economic feasibility test report with the Board by September 30, 2008, on the historical application of the service extension policy. In that report, MH is to define the underlying rationale for the existing policy, as it existed, and explain why that rationale apparently no longer exists, together with an accounting of instances (since the policy was suspended) where customers paid more to have a service connection than other previous customers;

29. With respect to an Energy Intensive Industry rate for new and expanded load, MH is to file an updated application with the Board on or before September 30, 2008. Such an application should include:

    a) An in-depth analysis of value of on-peak versus off-peak energy sales into the MISO market;

    b) A report on the specific deferral values that could be achieved by constraining industrial load growth; and

    c) An analysis for all GSL customers, to justify the proposed 39 GW.h floor for new rate exemption, and report on the potential extension of the rate and/or lowering of the threshold;

30. MH to file before January 15, 2009, supporting information for Board review of the 4% April 1, 2009 conditional increase. In addition to the information identified above to be filed by January 15, 2009, MH is to include:

    a) first ,second and third quarter 2008/09 unaudited financial results and statements; and

b) an updated forecast of net income for 2008/09, reflecting existing water energy in storage conditions.

Order No. 59/18

FINAL ORDER WITH RESPECT TO MANITOBA HYDRO'S 2017/18 AND 2018/19 GENERAL RATE APPLICATION

May 1, 2018

BEFORE: Robert Gabor, Q.C., Chair
Marilyn Kapitany, B.Sc., (Hon), M.Sc., Vice Chair
Hugh Grant, Ph.D., Member
Shawn McCutcheon, Member
Sharon McKay, BGS, Member
Larry Ring, Q.C., Member

Table of Contents

1.0 Overview

Under Manitoba law, the Public Utilities Board ("Board") must set electricity rates for Manitoba Hydro's customers that are just and reasonable. In so doing, as confirmed by the Manitoba Court of Appeal, the Board balances two concerns: the interests of Manitoba Hydro's ratepayers and the financial health of Manitoba Hydro. Together and in the broadest interpretation these interests represent the general public interest.

1.1 The Manitoba Public Utilities Board

The Board is an administrative tribunal created by provincial legislation to act as an independent decision-maker in the regulation of public utilities in Manitoba. To carry out this mandate, the Board is empowered by legislation with many of the same powers, rights, and privileges as the Manitoba Court of Queen's Bench. As such, the Board is court-like and transparent in its processes. Those processes include the receipt of evidence under oath from utilities, interested or affected groups (also known as "Interveners"), and members of the public.

In order to make decisions on the applications before it, the Board deliberates on the evidence obtained in accordance with fair processes pursuant to principles of administrative law. For example, in the present Application before the Board, the Board received written and oral evidence from witnesses on behalf of Manitoba Hydro, expert witnesses retained by Interveners, Independent Expert Consultants, and members of the public. All of the documents filed in the proceeding, as well as transcripts of oral evidence and submissions, are available on the Board's website at www.pubmanitoba.ca.

The Board's Rate Review Mandate

The Board's mandate with respect to the regulation of Manitoba Hydro (or "the Utility") is derived from *The Public Utilities Board Act*, CCSM c P280 ("Board Act"), *The Crown Corporations Governance and Accountability Act*, CCSM c C336 ("Crown Act"), and *The Manitoba Hydro Act*, CCSM c H190 ("Hydro Act").

Pursuant to subsection 25(1) of the Crown Act, the prices charged by Manitoba Hydro with respect to the provision of power ("rates for services") are reviewed by the Board under the Board Act. No change in rates for services can be made and no new rates for services can be introduced without the approval of the Board. Manitoba Hydro is required to submit proposals regarding rates to the Board for approval.

The Board's jurisdiction over Manitoba Hydro is limited by subsection 2(5) of the Board Act, such that the Board's primary authority over Manitoba Hydro is the review and approval of rates as set out in the Crown Act. As a result, unlike all other rate-setting jurisdictions in Canada, the Board does not have statutory authority to approve Manitoba Hydro's capital project plans or expenditures; however, the Board Act provides that the Board may perform duties assigned to it by Order in Council of the Lieutenant Governor in Council.

1.2 Manitoba Hydro

Manitoba Hydro is a Crown Corporation established pursuant to provincial legislation in order to provide for the supply of power adequate for the needs of the province, and to engage in and promote economy and efficiency in the development, generation, transmission, distribution, supply and end-use of power. Further to this mandate, Manitoba Hydro provides safe and reliable electricity service to Manitobans at rates that are among the lowest in North America.

When Manitoba Hydro applies to the Board for rate increases, Manitoba Hydro bears the statutory onus of demonstrating that the increases sought are just and reasonable. While the focus of Manitoba Hydro may be on the financial risks faced by the Utility, the Board's role is broader. As noted above, to set rates in the public interest, the Board considers not only the financial health of Manitoba Hydro. Rather, the Board must balance the financial health of Manitoba Hydro with the interests of ratepayers.

In addressing these two concerns, any application by Manitoba Hydro for a rate increase cannot be divorced from the context in which Manitoba Hydro operates. As a monopoly Crown utility that generates, transmits, and distributes electricity (also known as vertically integrated), Manitoba Hydro is different from many other electric utilities operating in Canada, and in particular, from privately owned for-profit corporations. Unlike private corporations, Manitoba Hydro does not have private shareholders in the traditional sense. While owned by the Province of Manitoba for the benefit of Manitobans, Manitoba Hydro is a non-share capital corporation. This means that Manitoba Hydro does not have investors or shareholders that contribute equity to the Utility and it is not required to make payments to any equity investors. Any equity acquired by Manitoba Hydro is obtained from domestic ratepayers or export power sale customers. Rather, as a Crown utility, Manitoba Hydro has a public policy purpose.

In addition, Manitoba Hydro is a pure cost recovery utility. Unlike many other government-created utilities in Canada, Manitoba Hydro is not required to pay dividends to the provincial government. As a cost recovery utility, Manitoba Hydro is within a subset of types of utilities; it is further within a subset of cost recovery utilities because Manitoba Hydro's debt is borrowed by the Province of Manitoba. The government raises debt capital from the capital markets, and provides the funds to Manitoba Hydro with the addition of a debt guarantee fee.

1.3 The General Rate Application

In 2017, Manitoba Hydro applied to the Board for changes to its consumer rates. Specifically, Manitoba Hydro is seeking in the present General Rate Application ("GRA"), approval of three rate increases: (1) finalization of the 3.36% interim rate increase that was effective August 1, 2016, (2) finalization of the 3.36% interim rate increase that was effective August 1, 2017, and (3) a 7.9% rate increase to all components of all consumer rates, effective April 1, 2018.

While only the three rate increases listed above are before the Board for approval, the 7.9% increase sought by Manitoba Hydro for the 2018/19 fiscal year is part of a new 10-year financial plan that replaces the Utility's previous 20-year plans that were predicated on projected 3.95% annual rate increases. Under Manitoba Hydro's new 10-year financial plan, following the August 1, 2017 3.36% interim rate increase, Manitoba Hydro projects a rate path of six years of 7.9% annual rate increases, followed by a one-year rate increase of 4.54% and then two years of rate increases at 2%.

The new 10-year financial plan includes six years of rate increases at a level twice the previously requested annual rate increases and four times the rate of inflation. The new plan is designed to have Manitoba Hydro reach a 25% equity level, from the current 15%, in 10 years by 2027, while generating additional cash flow and enabling repayment of a portion of Manitoba Hydro debt. This differs from the previously projected 20-year timeframe for achieving a 25% equity level.

The Utility sees the fundamental underlying problem with its financial health as being the major capital expansion and the amount of the debt required to pay for the simultaneous construction of the $8.7 billion Keeyask Generating Station project ("Keeyask") and the $5.0 billion Bipole III Transmission Line project ("Bipole III"). Manitoba Hydro seeks a prospective level of income and cash flow that, in the Utility's view, would restore its financial strength while also being capable of enduring drought or material negative deviations from export price and interest rate forecasts without requiring emergency relief from ratepayers. While the change in risk tolerance of the Manitoba Hydro-Electric Board is a significant factor underpinning the new financial plan, Manitoba Hydro also cites lower revenue growth and increased debt as contributing factors.

The 7.9% rate increase requested for the 2018/19 fiscal year is part of Manitoba Hydro's new financial plan. While the 10-year plan is part of the circumstances before the Board in this GRA, rate increases for years beyond 2018/19 are not before the Board for approval. The Board cannot bind itself to future rate increases that are not the subject of the immediate request before the Board. Similarly, and as indicated by Manitoba Hydro, the Utility may alter its plans based on circumstances as they arise. Currently, Manitoba Hydro's Retained Earnings are at record levels and already twice the level that would be required to deal with the negative financial impacts of a five-year drought; however, should unforeseen or negative risks occur, this Board will consider the evidence of the specific circumstances and the options, including rate increases, to address such circumstances as the Board has done when warranted in the past. For example, when a drought occurred in the early 2000s, this Board approved rate increases in excess of what Manitoba Hydro requested to address the financial health of the Utility.

In its Letter of Application filed on May 5, 2017, Manitoba Hydro sought the following specific approvals in the current GRA:

1. Final approval of Order 59/16 which approved, on an interim basis, an across-the-board rate increase of 3.36% effective August 1, 2016, and final approval of any other interim rate Orders issued subsequent to the filing of the Application and prior to the conclusion of this proceeding;

2. Approval, on an interim basis, of rate schedules incorporating an across-the-board rate increase of 7.9% to all components of the rates for all customer classes to be effective August 1, 2017.

   After the Board's Order approving a 3.36% interim rate increase effective August 1, 2017, Manitoba Hydro revised its request for the 2017/18 fiscal year and sought only finalization of the 3.36% interim rate increase;

3. Approval of an across-the-board rate increase of 7.9% to all components of the rates for all customer classes to be effective April 1, 2018;

4. Final approval of the Light Emitting Diode ("LED") rates for the Area and Roadway Lighting class (Outdoor Lighting) approved on an interim basis in Order 79/14, and approval of new LED rates for the Area and Roadway Lighting class (Sentinel Lighting) as discussed in Tab 9 of Manitoba Hydro's Application;

5. Approval to remove the Area and Roadway Lighting (Festoon Lighting) and the Area & Roadway Lighting (Christmas Lighting) from Manitoba Hydro's rate schedule, as discussed in Tab 9 of its Application;

6. Endorsement of modifications to the Terms and Conditions of Option 1 of the Surplus Energy Program ("SEP") that were accepted on an interim basis in Order 43/13, as outlined in Tab 9 of its Application;

7. Final approval of all SEP interim *ex parte* rate Orders as set forth in Tab 10 of this Application, as well as any additional SEP *ex parte* Orders issued subsequent to the filing of its Application and prior to the Board's Order in this matter;

8. Final approval of Curtailable Rate Program ("CRP") *ex parte* Order 54/16 as well as any additional *ex parte* Orders in respect of the CRP issued subsequent to the filing of its Application and prior to the Board's Order in this matter;

9. Final approval of Orders 116/12 and 117/12 that approved, on an interim basis, a 6.5% rate increase to the full cost portion of the General Service and Government rates in the four remote communities serviced by diesel generation ("diesel zone") effective September 1, 2012, and final approval of diesel zone Orders 17/04, 46/04, 176/06, 1/10, 134/10, 1/11, and 148/11, subject to confirmation that Manitoba Keewatinowi Okimakanak has provided the parties to the agreement with the required affidavits from representatives of signatories to the agreement.

   In this proceeding, Manitoba Hydro's request for final approval of the diesel zone interim rates was predicated on receipt of the executed Settlement Agreement documents. In the course of the hearing, Manitoba Hydro advised that it was no longer seeking final approval of diesel zone interim rates in this proceeding as the final executed Settlement Agreement documents had not yet been provided to the Utility;

10. Endorsement of the proposed deferral and subsequent amortization of costs incurred with respect to the Conawapa Generating Station project, as discussed in Tab 4 of its Application; and

11. Endorsement of the proposed amortization period for disposition of the regulatory deferral accounts established to capture the differences between Depreciation Expense and Operating & Administrative Expense calculated for financial reporting purposes based on International Financial Reporting Standards, and Depreciation Expense and Operating & Administrative Expense calculated for rate-setting purposes reflecting Board directives in Order 73/15, as discussed in Tab 4 of its Application.

1.4 The Board's Hearing into the General Rate Application

The process for the Board's consideration of this GRA formally commenced when Manitoba Hydro filed its Letter of Application. On May 12, 2017 and May 26, 2017, respectively, Manitoba Hydro filed copies of the Revenue Requirement information with its Integrated Financial Forecast MH16 ("MH16") and the Rate Design and Cost of Service Study information in support of its GRA. On July 11, 2017, Manitoba Hydro filed an update to MH16 ("MH16 Update"), which maintained the same increases as in the new 10-year financial plan contained in MH16.

Manitoba Hydro's Application garnered significant public attention, including over 2,300 public comments on the Board's website, increased numbers of public presenters, and a greater number of applications for Intervener status than filed in prior proceedings – 12 in total, including from groups that had not previously participated in electricity regulatory matters before the Board.

Following a Pre-Hearing Conference held on June 12, 2018, the Board issued its procedural Order 70/17, in which the Board approved the following Interveners:

- Assembly of Manitoba Chiefs
- Business Council of Manitoba
- Consumers Coalition (Consumers' Association of Canada (Manitoba) / Winnipeg Harvest)
- Representatives of the General Service Small and General Service Medium Customer Classes
- Green Action Centre
- Keystone Agricultural Producers
- Manitoba Industrial Power Users Group
- Manitoba Keewatinowi Okimakanak

The Board also subsequently approved the intervention of the City of Winnipeg, as well as a request by Representatives of the General Service Small and General Service Medium Customer Classes and Keystone Agricultural Producers to combine their intervention.

An oral public hearing into Manitoba Hydro's request for a 7.9% interim rate increase effective August 1, 2017 was held on July 18 and 19, 2017, at which the Board heard oral submissions from approved Interveners and Manitoba Hydro. In Order 80/17, dated July 31, 2017, a majority of the Board denied an interim rate increase for Manitoba Hydro's general operations, and approved an interim rate increase of 3.36% effective August 1, 2017, with all revenues flowing to the previously established Bipole III Deferral Account to be utilized to pay the additional costs once Bipole III enters service.

The Board member who dissented in Order 80/17, Sharon McKay, would not have granted any interim rate increase.

After release of the Board's interim rate decision, Manitoba Hydro filed a revised financial plan, Integrated Financial Forecast "MH16 Update with Interim". MH16 Update with Interim incorporated the 3.36% interim rate granted by the Board for 2017/18 and revised Manitoba Hydro's 10-year financial plan to now forecast six consecutive years of 7.9% rate increases, through fiscal year ending 2024, followed by one year of a 4.54% increase in fiscal year ending 2025, and then two years of 2.0% increases. The revision to the financial plan maintains Manitoba Hydro's target of achieving a 75:25 debt-to-equity ratio in 10 years, rather than 20 years as the Utility projected previously. The cumulative rate increase in the MH16 Update with Interim 10-year plan is 77%.

The process for the Board's consideration of Manitoba Hydro's GRA also included a review of Manitoba Hydro's capital expenditures. This duty was assigned to the Board for the GRA filed in 2017 in Order in Council 92/2017 as a factor in setting rates for services in a manner that balances the interests of ratepayers and the financial health of Manitoba Hydro. In addition to a review of the reasonableness of current budgets and schedules for ongoing major capital projects, Order in Council 92/2017 gave rise to the Board's assessment of the economics of the Manitoba-Saskatchewan Transmission Line in this GRA proceeding. While the Order in Council expanded the Board's scope of review compared to previous GRA proceedings, the paragraph assigning the Board the duty of considering Manitoba Hydro's capital expenditures as a factor in setting rates reflects the Board's existing jurisdiction under its governing legislation. Beyond this, the Order in Council gave the Board greater procedural powers with respect to Manitoba Hydro's provision of information and documents related to capital expenditures, project justifications, and revenues and income records. The text of Order in Council 92/2017 is contained at Appendix B to this Order.

Along with the filing by Manitoba Hydro of its written pre-filed evidence in its Application and written responses to Minimum Filing Requirements from the Board, the Consumers Coalition, and the Manitoba Industrial Power Users Group, the process for this GRA included:

- a post-filing workshop,
- a technical conference on Business Operations Capital expenditures,
- a workshop on bill affordability and rate design,
- written responses by Manitoba Hydro to two rounds of Information Requests from the Board and Interveners,
- the filing of written pre-filed evidence by Intervener-retained expert witnesses,
- written responses by Intervener-retained expert witnesses to Information Requests from the Board and all parties, and
- Manitoba Hydro's written rebuttal evidence.

In addition, to assist in the Board's consideration of issues in the GRA, especially in light of the Order-in-Council, the Board retained the following Independent Expert Consultants to test commercially sensitive and voluminous information provided by Manitoba Hydro to the Board:

- MGF Project Services ("MGF") – construction management experts retained as the project lead to conduct a review Manitoba Hydro's major capital expenditures;
- Amplitude Consultants Ply Ltd - to assist MGF with the review of Manitoba Hydro's high voltage direct current transmission assets;

- Klohn Crippen Berger – to assist MGF with the review of Manitoba Hydro's hydroelectric generation projects;

- Daymark Energy Advisors - to review and provide an expert opinion on Manitoba Hydro's export price and revenue forecasts, electricity load forecasts, and to conduct an economic analysis of the Manitoba-Saskatchewan Transmission Project; and

- Dr. Adonis Yatchew - to examine the impacts of proposed electricity rate increases on the Manitoba economy.

The Independent Expert Consultants were independent of all parties and the Board, and were represented by independent counsel. The written and oral evidence of the Independent Expert Consultants was tested by all parties and the Board. The Independent Exert Consultants filed written evidentiary reports. One round of Information Requests was directed to the Independent Expert Consultants and Manitoba Hydro provided written rebuttal evidence to the written reports of the Independent Expert Consultants. All parties and the Board had the opportunity to conduct oral cross-examination of the Independent Expert Consultants.

The Board also adjudicated a number of process matters, including the aforementioned Intervener applications and related budget submissions, a procedural Motion regarding the process for the receipt of confidential information, multiple Motions by Manitoba Hydro for confidential treatment of information filed in the proceeding, and requests for extensions of time.

The oral evidentiary hearing of the GRA commenced on December 4, 2017. The Board heard 31 days of oral evidence, including four Manitoba Hydro witness panels, nine Intervener-retained expert witness panels, five Independent Expert Consultant witness panels, a ratepayer panel sponsored by the Consumers Coalition, Manitoba Hydro's oral rebuttal evidence, and three oral public presentation sessions along with three written public presentations. A summary of the evidence given by presenters in the proceeding is contained in Appendix C to this Order.

Following the conclusion of the oral evidentiary portion of the hearing, the Board heard closing submissions from Manitoba Hydro and Interveners and Reply argument from Manitoba Hydro on February 5, 7, 8, and 14, 2018.

A Glossary of Terms for technical terminology used in this Order is included as Appendix A.

2.0 Summary of the Board's Findings

By this Order, the Board denies Manitoba Hydro's request for a rate increase of 7.9% effective April 1, 2018. The Board approves a 3.6% average revenue increase to be recovered in Manitoba Hydro consumers' rates effective June 1, 2018. The recovery of these additional revenues is to be through rate increases at a different level for each customer class to address past and current under- and over-payment of costs by the customer classes.

Manitoba Hydro is to calculate the required rates to achieve the approved revenue increase of 3.6%, based on gradually adjusting the rates of all customer classes such that the revenues from each class will approximately align with the allocated costs to serve each class within a 10-year period. The Board anticipates that General Service Small Non-Demand, General Service Large 30-100 kV, and General Service Large >100 kV will experience a rate increase slightly less than the approved revenue increase of 3.6%, while other classes, including the Residential class, will experience rate increases slightly greater than 3.6%. The exception to this is First Nations on-reserve residential customers. The Board directs the creation of a First Nations On-Reserve Residential class and approves a 0% rate increase for this class for 2018/19. The customers in this class will therefore not experience any change to their rates as a result of this Order.

The Board further finalizes the previously approved interim rate increases of 3.36% effective August 1, 2016 and 3.36% effective August 1, 2017. Because these increases were previously granted and are already being collected, there will be no additional impact on ratepayers.

The Board directs Manitoba Hydro to provide a compliance filing pursuant to the directives in this Order. The compliance filing shall be provided by May 15, 2018 in order for Manitoba Hydro to receive consumer rate increases effective June 1, 2018.

Further to Order in Council 92/2017, in reaching its decision regarding rates, the Board considered capital expenditures by the Manitoba Hydro as a factor to support setting rates for services in a manner that balances the interests of ratepayers and the financial health of Manitoba Hydro.

2.1 Rate Increases for 2016/17, 2017/18, and 2018/19

Approval of August 1, 2016 and August 1, 2017 Interim Rate Increases

In this Order the Board approves, as final, the 3.36% interim rate increase effective August 1, 2016 (granted as interim in Order 59/16) and the 3.36% interim rate increase effective August 1, 2017 (granted as interim in Order 80/17). The dissenting member in Order 80/17, Sharon McKay, is in agreement with the decision to finalize the interim rate that was effective August 1, 2017 based on the review of the full record in the GRA hearing. Because these interim rates are already incorporated into existing rates, the Board's final approval now does not result in any additional bill impacts to ratepayers. While no party opposed the interim rates being finalized, the lack of testing by Interveners and lack of focus by Manitoba Hydro underscores the problems associated with interim rate processes. Interim rates are set without the benefit of a full evidentiary record, involve an abbreviated process, and are adjudicated against a less onerous legal standard than are final rates.

Interim rate processes are not to be used for purposes of convenience or as substitutes for the proper planning of GRAs. Both the ratepayers and the Utility benefit from a robust process that results in final rates that are just and reasonable. Future GRAs by Manitoba Hydro are not expected to be of this magnitude or duration as process improvements have and will continue to be implemented to focus the scope and expedite proceedings. In the absence of unforeseen or emergency circumstances, the Board will not consider future interim rate applications.

The Board appreciates Manitoba Hydro's desire to establish a regulatory timetable that does not require the use of interim rates. The Board is prepared to work with Manitoba Hydro and other parties towards the development of that regulatory timetable.

Denial of 7.9% Rate Increase Requested for 2018/19

Having considered all of the evidence in this GRA, the interests of Manitoba Hydro's ratepayers, and the financial health of Manitoba Hydro, this Board has determined that for the fiscal year April 1, 2018 to March 31, 2019 (also referred to as the "Test Year"), an average rate increase of 3.6% effective June 1, 2018 is just and reasonable. The Board further directs that rate increases are to be differentiated by customer class. To accurately quantify the expected bill impacts, for all customer classes at various consumption levels, Manitoba Hydro is directed to provide by May 15, 2018 a compliance filing containing the new rates, the bill impacts by customer class, and a proof of revenue. The results of the compliance filing will be included in the Board's Order approving the specific rates for 2018/19.

Manitoba Hydro did not provide evidence as to the economic impacts on customers in various sectors - such as residential, commercial, and industrial - or macroeconomic impacts of its proposed rate plan. However, expert witnesses retained by Interveners and the Board provided evidence that Manitoba Hydro's projected rate path may lead to short-term job losses and negative impacts for some industries that are more economically vulnerable, based on the electricity intensity of their production and the competitive nature of the markets into which they sell their products. Industry representatives similarly gave evidence that the projected rate path will make Manitoba businesses less competitive, will lead to corporate decisions to not make investments in Manitoba locations, and may lead to plant closures.

Residential ratepayers also voiced concerns about their ability to pay projected Manitoba Hydro rate increases and regarding the impact such increases would have on their standard of living.

Manitoba Hydro's Financial Plan

In reaching its decision, the Board finds that a particular equity level or pace to achieve such a target should not determine the rate increases approved in this GRA, particularly when Manitoba Hydro is undergoing record expansion in the value of its capital assets. There was no expert evidence independent of Manitoba Hydro before the Board that Manitoba Hydro's debt is leading to higher interest rates for the debt borrowings of the province. With rate increases in line with prior approved levels, Manitoba Hydro's financial metrics related to cash flow will be improved from those forecast following the NFAT for the 2018/19 Test Year. The Board also does not accept that rate increases should be higher in order to allow Manitoba Hydro to retire debt according to their new proposed debt management plan, which envisions using cash flow from the 7.9% projected rate increases to retire $3.1 billion in debt by 2027. While there are benefits to a shorter-term debt retirement plan, such a plan imposes a short-term cost on ratepayers that is not justified.

Reduction in Expenditures

In addition, while the Board appreciates that Manitoba Hydro has, in good faith, brought forward its concerns respecting financial risks and unforeseen events, the circumstances of this GRA for a 2018/19 rate increase do not require a rate increase of the magnitude proposed by the Utility. Rather, by this Order, the Board sets out its expectation that Manitoba Hydro will continue to reduce its costs, including capital and Operating & Administrative costs, and will also continue to maximize its export revenues.

For the 2018/19 Test Year, in advance of the analytical data-driven approaches to managing capital assets being developed by Manitoba Hydro, the Utility identified $160 million of Business Operations Capital expenditures that can be safely deferred. Business Operations Capital includes expenditures to renew failing assets, increase capacity to address load growth, and to connect new customers but does not include Major New Generation & Transmission capital expenditures. The Board does not accept that all Test Year Business Operations Capital investments are condition-driven and reasonably required for the safe and reliable operation of the system. The Board recommends that Manitoba Hydro defer $160 million of this capital spending, thus improving the Utility's cash flow. Manitoba Hydro should continue to find reductions in Business Operations Capital spending during the current period of record spending on major capital projects such as Keeyask and Bipole III.

Manitoba Hydro forecasts its Voluntary Departure Program will provide annual cost savings of $92 million once the one-time $53 million of restructuring costs have been incurred. Manitoba Hydro's additional reduction of operational positions and Supply Chain Management initiatives are further steps taken by the Utility in its continuous cost reduction efforts. The Board expects that Manitoba Hydro will continue to find savings as it assesses its operations following the conclusion of the Voluntary Departure Program.

Accounting Issues

There were several accounting-related issues that affect consumer rates and were the subject of evidence and adjudication during Manitoba Hydro's GRA.

- The Board directs that depreciation expense is to continue to be recorded using the Average Service Life methodology for rate setting purposes, without reversion to Equal Life Group in the financial forecast. The Board orders Manitoba Hydro to not amortize the difference between Average Service Life and Equal Life Group for rate setting.

- The Board accepts Manitoba Hydro's proposed treatment of the $380 million of past costs incurred with respect to the Conawapa Generating Station that is not proceeding. Manitoba Hydro proposes that the costs pertaining to the construction of Conawapa be recorded in a regulatory deferral account effective March 2018, with amortization of the costs to income on a straight line basis over a period of 30 years beginning on April 1, 2018. This treatment is appropriate because the decision to discontinue Conawapa construction was part of the NFAT review of the Utility's long-term system planning for long-lived assets. Further, this approach smooths out the impact of this one-time cost on consumers.

- The Board directs that the $20 million in annual ineligible overhead should continue to be deferred, consistent with the Board's direction in Order 73/15. With respect to the amortization period, the deferral account balance should be amortized over 34 years to match the average service life of the assets. This recognizes that the balance relates to a deferral of capital costs that are linked to services that will be provided by capital assets in the future.

- The Board directs that the Bipole III Deferral Account should begin to be recognized in domestic revenues once Bipole III enters service (which is expected in 2018/19) and amortized over a five-year period. This amortization will contribute $80 million annually to further smooth the rate increases necessitated with Bipole III entering service. Additionally, once Bipole III enters service, the approximately $180 million of annual revenues currently being deferred should no longer be deferred and instead accrue to Manitoba Hydro's general revenue.

Demand Side Management Spending

In addition, the Board finds that Manitoba Hydro's revenue requirement should be reduced to reflect lower demand side management spending. These expenditures should be reduced for rate-setting purposes from the level of spending currently incorporated in the Utility's Integrated Financial Forecast. The Board's approved rate increase directionally takes into consideration a reduction in demand side management spending as well as an increase in domestic load that will result from fewer demand side management programs.

Demand side management is a common utility strategy for reducing consumer demand for energy in order to defer the need for new generation assets. Manitoba Hydro seeks to pursue all cost-effective demand side management opportunities which are assessed against the Utility's marginal value of electricity. For 2018/19, Manitoba Hydro forecasts demand side management spending of $101.1 million. This amount was determined using a now-outdated marginal value of electricity. In light of the new lower levelized marginal value of electricity introduced in this hearing, and as acknowledged by the Utility, some of Manitoba Hydro's demand side management programming will no longer be cost-effective. Consumer rates should not, at this time, recover the costs of demand side management programs that are no longer economic, unless justified by a lower-income target market.

The Board also recommends that Manitoba Hydro reduce its demand side management spending, based on an assessment by Manitoba Hydro of the cost effectiveness of each of its demand side management programs. However, given the evidence adduced in this proceeding about energy poverty and bill affordability, it is reasonable for Manitoba Hydro to continue spending on lower-income demand side management programs.

In addition to continued Utility investment in lower-income demand side management programs, the Board recommends that the provincial government amend Efficiency Manitoba's mandate to explicitly include considerations of lower-income consumers and energy poverty.

Export Revenues and Load Forecasting

The Board finds that Manitoba Hydro's export revenue forecast is conservative. An export revenue forecast with a probabilistic goal of P50 (that is a 50% chance of being higher and a 50% chance of being lower) would reduce Manitoba Hydro's level of requested and projected rate increases.

In addition, the Board's finding in this Order that Manitoba Hydro's demand side management spending should be reduced for rate-setting purposes and recommendation that the Utility reduce its demand side management expenditures, along with the price elasticity impacts of the decrease in the overall rate increase, all else being equal, will result in a higher load forecast and higher domestic revenue.

Differentiated Rates

Manitoba Hydro's Cost of Service Study methodology was extensively reviewed and refined in the public hearing process that led to Order 164/16. The Cost of Service Study and the resultant Revenue to Cost Coverage ratios are tools available to be used by the Board when setting rates as the costs to serve a particular customer class can be compared to the revenues that are paid by that customer class.

Many utilities do not set rates in order to achieve class Revenue to Cost Coverage ratios of exact unity (i.e. revenues received by each customer class exactly recover the allocated cost to serve each customer class). Instead of unity, a 'zone of reasonableness' is used to target the Revenue to Cost Coverage ratios of the customer classes. Revenues that are within this range are deemed to represent full cost recovery. Since 1996, Manitoba Hydro has used a zone of reasonableness of 95-105%.

The General Service Small Non-Demand, General Service Large 30-100kV, and General Service Large >100kV customer classes have Revenue to Cost Coverage ratios in excess of 105% and thus are all overpaying their allocated costs to a significant degree. The two General Service Large customer classes have been overpaying in almost every year since 1996. The Residential customer class is currently below the zone of reasonableness, and therefore underpaying its allocated costs.

Manitoba Hydro is directed to begin to implement differentiated rates for its customer classes. The differentiated rates mean customers in the General Service Small Non-Demand, General Service Large 30-100kV, and General Service Large >100kV customer classes will experience a slightly lower rate increase than the average rate increase approved by the Board. Customers in the Residential, General Service Small Demand, General Service Medium, and Area & Roadway Lighting classes will experience a slightly higher rate increase in order for Manitoba Hydro to collect the approved revenue requirement based on the average rate increase approved by the Board. For the 2018/19 Test Year rates, Manitoba Hydro is to assume a 10-year timeframe to move all classes within the zone of reasonableness, using the alternative methodology to calculate the Revenue to Cost Coverage ratios by treating export revenues as a reduction to allocated costs. This approach to the implementation of differentiated rates is consistent with the principle of gradualism and limits the revenue recovery responsibility of the other customer classes, while maintaining overall revenue neutrality.

Manitoba Hydro is directed to include in its compliance filing for 2018/19 rates differentiated rates by customer class consistent with the Board's direction in this Order. The compliance filing is to be provided by May 15, 2018. The results of that compliance filing will be published in the Board's Order approving the specific customer class rates.

Bill Affordability

Although Manitoba Hydro's rates are among the lowest in North America, this does not mean that all Manitoba ratepayers can equally afford to pay their electricity bills. The Board has long been concerned with utility bill affordability issues. Evidence with respect to energy poverty in the province of Manitoba has been brought before the Board for at least a decade. The Board recognizes that Manitoba Hydro has, over time, developed programs to assist customers in managing their energy consumption, thereby reducing individual customer bills, and such programs include targeted support for lower-income customers. However, the Board has consistently expressed concern that measures focused on energy efficiency implemented by Manitoba Hydro to date, while commendable, have been insufficient to address the energy burden faced by lower-income customers. This is particularly the case in a time of major capital construction by the Utility, which has and is forecast to continue to put upward pressure on electricity rates at a level greater than the rate of inflation.

The Board finds that it has legal jurisdiction under its governing statutory framework to order a bill affordability program such as a lower-income rate, and to take into account affordability as a factor in setting just and reasonable rates.

The Board agrees with Manitoba Hydro's President and Chief Executive Officer that there is an important role for governments in this area. The Board recommends that the provincial government introduce a comprehensive bill affordability program run by a government department to address energy poverty issues faced by Manitobans throughout the province. The Board heard evidence that there is a long-standing need to address this issue and the provincial government is best situated to do so in a comprehensive fashion, given its social program infrastructure that is already in place.

The Board reiterates the recommendation in the NFAT Report that the provincial government should use some of the revenues it receives from Keeyask to fund a comprehensive bill affordability program.

First Nations on Reserve Residential Customer Class

A majority of the Board directs Manitoba Hydro to establish a First Nations On-Reserve Residential customer class for existing First Nations reserves and that this customer class will receive a 0% rate increase for the 2018/19 Test Year, such that the rate for this customer class will be maintained at the August 1, 2017 approved residential rate. The 0% rate increase for 2018/19 is also to apply to First Nations diesel zone residential customers. This decision by the Board to create a new customer class is not unanimous and there is a dissenting decision from Board member Larry Ring in this Order.

In this Order, the Board concurs with Manitoba Hydro's President and Chief Executive Officer that electricity rates and the resulting bills place a particularly heavy burden on First Nations communities due to inadequate housing infrastructure and the absolute levels of poverty. As noted by Manitoba Hydro's President and Chief Executive Officer, there may not be a single solution to this multifaceted bill affordability problem. While government has a role to play in addressing the issue of affordability, so too does Manitoba Hydro and rate design can assist the Utility in fulfilling its role.

The Board concludes that, under its mandate to set rates in the public interest, the Board can and should play a part in addressing bill affordability.

An appropriate starting point for bill affordability in Manitoba is a program targeted at on-reserve ratepayers, specifically through the creation of a First Nations On-Reserve Residential customer class with a differentiated rate to address energy poverty.

The creation of this new customer class is justified by the need to address energy poverty on-reserve, supported by evidence that 96% of First Nations people on-reserve live in poverty and that reserves in Manitoba have the highest rates of child poverty in Canada. In addition, the poor housing stock on reserves in Manitoba and the fact that the vast majority of on-reserve First Nations residential customers (61 out of 63 First Nations communities) have no access to the more economical option of natural gas for heating exacerbate the issue of energy poverty.

The new customer class and related affordability measure of a 0% rate increase are also consistent with the principle of reconciliation. As defined in *The Path to Reconciliation Act*, reconciliation is the ongoing process of establishing and maintaining mutually respectful relationships between Indigenous and non-Indigenous peoples in order to build trust, affirm historical agreements, address healing, and create a more equitable and inclusive society.

Manitoba Hydro is kept whole because the cost of the 0% rate increase for this new customer class has been factored into the level of the average general rate increase granted for the Test Year to all other customer classes. The Board is fully aware that there will be some obvious anomalies created where one household on-reserve will receive a lower rate than a nearby off-reserve household living in similar circumstances. This new customer class is a limited measure designed to reach a targeted group experiencing a high degree of poverty. The anomalies that result from this measure are best addressed by a more wide-reaching government bill affordability program. The Board envisions that, with the introduction of a comprehensive government bill affordability program, the new First Nations On-Reserve Residential customer class and lower rate built into the 2018/19 Test Year may no longer be required.

2.2 Payments to Government

Manitoba Hydro makes payments to the Province of Manitoba for water and land rentals, debt guarantees, and capital and other taxes. Manitoba Hydro also pays grants in lieu of taxes to municipalities. For the fiscal year that ends March 31, 2019, Manitoba Hydro forecasts that it will pay $433 million to governments, with $406 million to be paid to the Province of Manitoba. The evidence in the public hearing demonstrated that, excluding payments made to municipal governments, approximately 17 to 18 cents of each dollar of gross revenue is directed by Manitoba Hydro to the Province of Manitoba.

Manitoba Hydro's major capital expansion places upward pressure on rates, including due to the Utility's increased obligations to the provincial government. With respect to Keeyask, after it is fully in-service Manitoba Hydro will pay an approximate $140 million per year to the Province of Manitoba on account of water rentals, debt guarantee fees, and capital and other taxes. As noted by the Board in its 2014 NFAT Report:

> *While ratepayers will shoulder a significant rate burden over the next 20 years, the Province of Manitoba will reap substantial incremental revenues through capital tax and water rental payments from Manitoba Hydro as a result of the Keeyask Project. The Province should give serious consideration to using some of these incremental revenues to fund energy affordability programs targeted to vulnerable consumers, particularly lower income consumers and customers residing in northern and First Nations communities. This could involve rate relief programs as well as targeted DSM programs.*

Previously, the provincial government indicated it would consider this recommendation from the NFAT Report. The Board continues to be of the view that the provincial government should use some of the revenues that would otherwise accrue as a result of Keeyask in order to fund a comprehensive a bill affordability program.

With respect to Bipole III, the project was initially scoped, designed, and engineered by Manitoba Hydro using the most cost effective route. While the majority of Manitobans are both taxpayers and ratepayers, there is an important distinction. Domestic ratepayers are ultimately responsible for the costs of operating Manitoba Hydro's system, including recovering the costs of Manitoba Hydro's major capital projects once the assets are in service. As a result of a policy decision by the provincial government, the routing of Bipole III was changed to a western route at an additional cost of approximately $900 million. This decision created a $900 million burden for ratepayers with no apparent technical benefit for the new route. The Board considers that this was a policy decision of government that should be a cost to taxpayers, not Manitoba Hydro's ratepayers.

The Board therefore recommends that the provincial government suspend payment of the annual Bipole III debt guarantee fee and capital taxes made by Manitoba Hydro to the provincial government starting with the 2019 fiscal year. Manitoba Hydro – and ultimately the ratepayer - should be reimbursed through suspension of such payments until the $900 million burden of a policy decision made by government is satisfied, estimated at this time to be in 13 years.

Finally, the inter-relationship between Manitoba Hydro and the provincial government will be enhanced with provincial carbon pricing. In the transition to a low-carbon economy, the Province of Manitoba does and will benefit from the strength of its clean hydroelectric resources. As the provincial government will receive revenue from the planned carbon tax, the Board further recommends that the provincial government transfer a portion of the carbon tax revenues to Manitoba Hydro to strengthen Manitoba Hydro's financial health, which may allow for lower consumer rate increases.

2.3 Capital Project Review per Order in Council 92/2017

On April 5, 2017, by Order in Council 92/2017, for the GRA anticipated to be filed by Manitoba Hydro in 2017, the Board was assigned the duty of considering capital expenditures made by the Manitoba Hydro-Electric Board as a factor in the Board reaching a decision regarding setting Manitoba Hydro's rates for services in a manner that balances the interests of ratepayers and the financial health of the Utility.

The Board's review of Manitoba Hydro's capital expenditures included the following projects:

- Keeyask, with a focus on the reasonableness of Manitoba Hydro's capital cost estimates filed in support of the Utility's financial forecasts. The timeframe for the review began with the cost estimates presented at the NFAT;
- Bipole III, also focused on the reasonableness of the capital cost estimates beginning with the initial western routing control budget for Bipole III;

- The Manitoba-Minnesota Transmission Project ("MMTP") and the Great Northern Transmission Line ("GNTL"), also focused on the reasonableness of the capital cost estimates; and.
- The Manitoba-Saskatchewan Transmission Project and related SaskPower export sale, focused on whether the project is economic.

The Board's goal in its review was to gain an understanding of the reasons for past cost increases in order to better understand the forecasts of future costs. The importance of obtaining an accurate forecast of capital costs for these large projects was highlighted by evidence from Manitoba Hydro that a $1 billion increase in capital costs over its current projections would require 0.43% annual consumer rate increases for 10 years, over and above any other rate increase required for the Utility's operations, to achieve the same retained earnings level.

Major Capital Projects and Rate Setting

For rate setting purposes in this GRA, the Board accepts, as incorporated by Manitoba Hydro into its Integrated Financial Forecast, the major capital project budget amounts and construction schedules for Keeyask, Bipole III, the Manitoba-Minnesota Transmission Project, the Great Northern Transmission Line, and the Manitoba-Saskatchewan Transmission Project.

In this Order, the Board reaches several conclusions related to Manitoba Hydro's major capital projects that may assist in future capital projects.

Manitoba Hydro has been approving projects too early in the process, without sufficient development of scope, design, and engineering. The Board recognizes that, with additional scope and engineering development prior to advancing the capital project for financial and economic analysis and subsequent executive approval, there will be additional front-end costs. In the Board's view, that would be money well spent as it will allow a more informed decision by Manitoba Hydro's Executive.

The Board finds there is merit in Manitoba Hydro considering the "stage gate" approach put forward by MGF, in order to improve its past performance on cost estimating and completing projects on budget. The 'stage gate' concept is that a project does not move from one stage to the next – that is, receive approval to go to the next stage – until a set of criteria is satisfied. The Board recommends that Manitoba Hydro engage an external consultant to assist in studying this matter.

Review of Major Capital Project Planning and Construction

Keeyask

The primary reasons for the Keeyask cost increase from $6.5 billion to $8.7 billion are due to: unachievable productivity levels in the general civil contractor's bid, slow start up in the 2016 construction season when the first permanent concrete was poured, and geotechnical issues with the river bed. The Board finds the root cause for the cost overrun relates to the nature of the cost reimbursable payment structure in the Keeyask general civil contract ("GCC"), which was not sufficient to drive the general civil contractor to achieve the productivity levels contained in its original bid for the Keeyask work. Manitoba Hydro expected that tying the contractor's profit to the target price in the general civil contract would provide sufficient motivation to the contractor to meet the productivity levels in its bid, but that did not occur. It further appears that Manitoba Hydro never contemplated that the contractor's profit could erode to zero so early in the project. Once the profit eroded to zero, with no chance of re-establishing profit, the contractor had little or zero motivation to progress the project expediently. In the Board's view, this was a principal failing of the original GCC. Underpinning the reason for the profit eroding to zero so early in the project was the fact that the general civil contractor bid unachievable productivity levels. Those unachievable productivity levels formed the basis for an unrealistic target price and an unrealistic original cost estimate.

Manitoba Hydro requires a 10% improvement in productivity by the general civil contractor to meet its $8.7 billion control budget. The Independent Expert Consultants retained in this hearing evaluated Manitoba Hydro's progress to date on Keeyask and in their opinion the final cost of Keeyask will be in the range of $9.5 billion to $10.5 billion. According to the Independent Expert Consultants, unless Manitoba Hydro takes control of the Keeyask project and works with the general civil contractor to improve productivity, the final cost of Keeyask will approach $10.5 billion due in part to the cost reimbursable pricing structure in the general civil contract. The Independent Expert Consultants also made useful recommendations that Manitoba Hydro should consider implementing, and indeed, in part already has implemented. Manitoba Hydro gave evidence that the 10% improvement required is attainable and that the $8.7 billion control budget remains reasonable.

Manitoba Hydro explained that it has taken steps to mitigate schedule and productivity issues, including through retaining external consultants. The Board's expectation is that Manitoba Hydro will closely monitor and take steps to improve productivity in order to achieve the 10% improvement in productivity required to meet the $8.7 billion control budget and construction schedule. There was evidence in the GRA that Manitoba Hydro has achieved milestones in the construction of Keeyask, including that the project is on track to divert the river through the spillway in July 2018 to permit work to begin on the south dam.

For future projects, if the cost reimbursable payment structure of a contract is used, effective oversight of the contractor must be exercised. The results for Keeyask indicate there was not effective oversight under the cost reimbursable contract arrangement.

Bipole III

With respect to Bipole III, Manitoba Hydro undertook unreasonable risk when it developed its $3.28 billion Bipole III cost estimate in 2011. It appears that Manitoba Hydro had rejected its 2009 internal cost estimate of $3.95 billion, based on what was referred to as the “classic” line commutated conversion technology for the HVDC converter stations, in order to try to take advantage of new, unproven voltage source conversion technology. Manitoba Hydro compounded this risk by significantly reducing the contingency amounts.

The provincial government excluded Bipole III from the scope of the NFAT review; however, all of the development plans considered at the NFAT included Bipole III at a projected cost of $3.28 billion. The Board finds that, had a more realistic cost of Bipole III been used in the financial analyses, Manitoba Hydro’s debt under all development plans would have been higher and would be closer to the current projections of debt, as discussed in other sections of this Order.

Manitoba-Minnesota Transmission Project and the Great Northern Transmission Line

The Board accepts the forecasts of costs and construction schedules by Manitoba Hydro and Minnesota Power are acceptable for the purpose setting the approved rates for the 2018/19 Test Year.

Manitoba-Saskatchewan Transmission Line

The Board finds that the Manitoba-Saskatchewan Transmission Line project remains economic at this point in time. This transmission line from Birtle, Manitoba to the Saskatchewan border facilitates a 100 MW power sale agreement with SaskPower. The Board supports Manitoba Hydro's decision to develop firm export sales to other Canadian jurisdictions including to the west.

The Board's review of the Manitoba-Saskatchewan Transmission Line project in this proceeding is a precedent for how independent reviews can be conducted of Manitoba Hydro's capital projects. The Board continues to be of the view that in addition to its rate setting approval it should have statutory authority to approve Manitoba Hydro's capital expenditures, which is jurisdiction the Board now lacks.

3.0 Background

3.1 Previous Rate Increases

In Order 43/13, the Board established a deferral account to assist in funding Bipole III in-service costs and to assist in smoothing the rate impacts of Bipole III. The Bipole III Deferral Account is a means by which to gradually increase rates and to partially fund the depreciation, interest, and operating costs of Bipole III to avoid rate shock at the time the asset enters service. In subsequent Orders, the Board directed additional rate increases to the Deferral Account. To date, the cumulative compounded total of the rate increases directed by the Board to the Bipole III Deferral Account is 11.6%. The amounts directed to the Deferral Account have increased and have now reached approximately $180 million on an annual basis. The Bipole III Deferral Account is projected to reach approximately $400 million by the time Bipole III enters service

Payment of the costs associated with the Utility's new major capital projects (excluding Bipole III) was considered at the Board's 2014 NFAT review of Manitoba Hydro's development plans, during the 2014/15 & 2015/16 GRA, as well in the August 1, 2016 and August 1, 2017 interim rate proceedings initiated by Manitoba Hydro.

In Order 73/15, the Board finalized the interim 2.75% rate increase effective May 1, 2014 and granted a final 3.95% rate increase effective August 1, 2015. The total 3.95% rate increase was separated into a 2.15% increase for Manitoba Hydro's general operations and a 1.8% increase, the revenues from which were to be placed into the Bipole III Deferral Account.

In November of 2015, Manitoba Hydro filed an interim rate Application, seeking an interim rate increase of 3.95% effective April 1, 2016. In Order 59/16, the Board granted a 3.36% interim rate increase effective August 1, 2016 for the purpose of collecting additional revenue in the Bipole III Deferral Account. The Board found that, since Order 73/15, Manitoba Hydro's long-term financial projections had significantly improved and the Utility did not require additional revenues from a rate increase to obtain a positive net income for 2016/17. The Board concluded that the public interest would be best served if the entirety of the interim rate increase were to flow into the Bipole III Deferral Account to reduce expected rate shock when Bipole III and Keeyask enter service. The Board further directed Manitoba Hydro to file a GRA for the 2016/17 and 2017/18 years by no later than December 1, 2016, in recognition of the importance of GRAs being heard on a regular basis. The Board stated that interim rate applications ought not be the norm for Manitoba Hydro as such applications do not offer the same level of public review as a GRA.

In Order 80/17, as part of the current GRA process, the Board denied Manitoba Hydro's Application for a 7.9% interim rate increase to be effective August 1, 2017. A majority of the Board approved a 3.36% interim rate increase, with all additional revenue generated from the interim rate increase to flow into the Bipole III Deferral Account. In dissent, Board member Sharon McKay rejected any rate increase.

3.2 Manitoba Hydro's Previous Financial Plans

Manitoba Hydro's 2014 Integrated Financial Forecast MH14, which underpinned the 2014/15 & 2015/16 GRA, consisted of a 20-year rate plan of annual rate increases of 3.95% through 2031 and 2% thereafter, achieving a 25% equity level at the end of the 20-year period. The MH14 forecast projected that Manitoba Hydro would incur losses of $980 million from 2019 to 2026, the time period when Bipole III and Keeyask were forecast to enter into service. As noted above, in Order 73/15, the Board ordered a 3.95% rate increase for 2015/16, including a 2.15% increase for Manitoba Hydro's general operations and an additional 1.8% increase that was not required for operations but which the Board determined would flow into the Bipole III Deferral Account.

Similarly, the 2015 Integrated Financial Forecast MH15 also projected equal annual rate increases of 3.95% through 2029, followed by 2% annual increases thereafter, and achievement of a 25% equity level in the year 2032. The MH15 forecast reflected an improved financial position with losses incurred in only three years, totalling $58 million. As noted above, in Order 59/16, the Board concluded that Manitoba Hydro's financial projections had significantly improved and directed that the entirety of the 3.36% rate increase would flow into the Bipole III Deferral Account as it was not required for the Utility's operations.

These previous plans followed rate projections used by Manitoba Hydro in the NFAT review of equal annual rate increases of approximately 4%.

Projected rate increases and the level of Retained Earnings since the NFAT have evolved over time. The chart below sets out the Retained Earnings achieved as a result of projected rate increases over 20 years from Integrated Financial Forecasts dating back to 2012, as well as in the forecast underpinning the current GRA. The previous Integrated Financial Forecasts projected rate increases predominately at the 3.95% level, while the projections in MH16 Update with Interim include six years of annual rate increases of 7.9%, one year of a 4.54% rate increase, and 2% rate increases thereafter. The table shows the earlier achievement of a 25% equity level and increased Retained Earnings as a result of Manitoba Hydro's new financial plan as compared to previous plans.

	Integrated Financial Forecast (“IFF”) MH12		IFF MH13		IFF MH14		IFF MH15		IFF MH16 Update with Interim (20 year)	
	Equity %	Retained Earnings ($Millions)	Equity %	Retained Earnings ($Millions)	Equity %	Retained Earnings ($Millions)	Equity %	Retained Earnings ($Millions)	Equity %	Retained Earnings ($Millions)

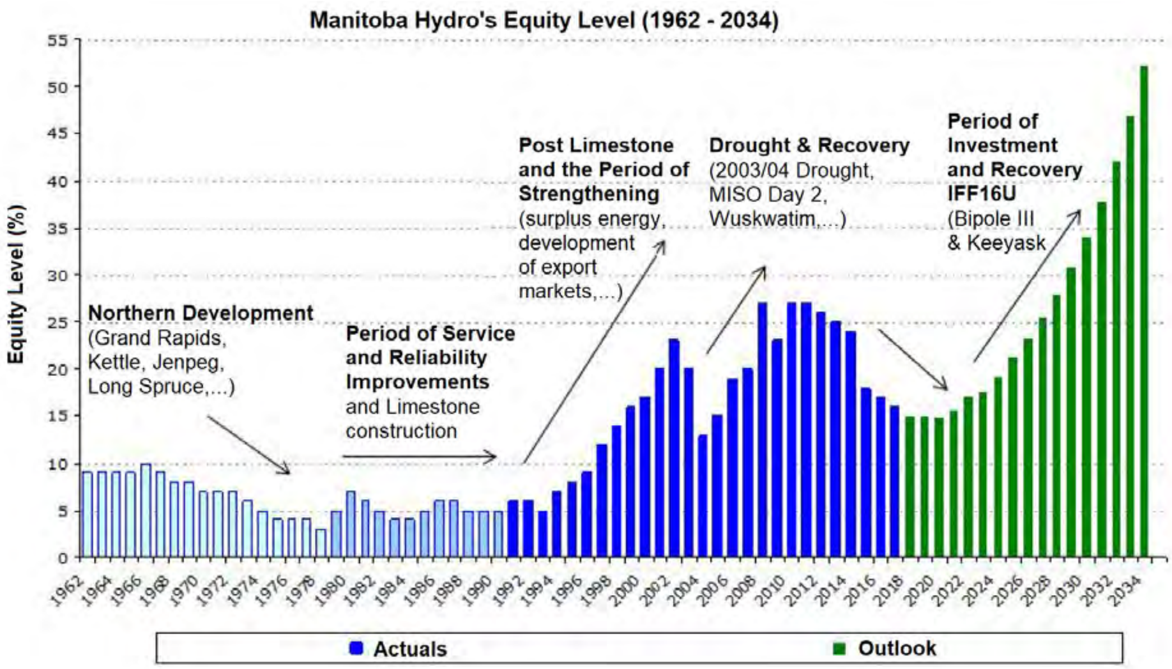
2035							35%	8,348	57%	15,259
2036									64%	16,927

Manitoba Hydro explained in this GRA that the rate strategy contained in the filed financial projections “essentially compresses the previously projected 3.95% annual rate increases which were planned until 2028/29, into the next five-year period”. As can be seen in the graph that follows, Manitoba Hydro was last at a 25% equity level in the years before construction on the $8.7 billion Keeyask and $5 billion Bipole III projects began. This is similar to the situation experienced by Manitoba Hydro at other times of major capital construction, although the equity levels have not dipped to those experienced at the time the 1350 MW Limestone Generating Station entered service in the early 1990s.

The graph below includes both the actual equity levels achieved since 1962 (shown in blue) and the projected outlook arising from Manitoba Hydro's MH16 Update with Interim projected rates (shown in green).



Source: MIPUG/MH I-2(h-i); MIPUG-26 pg 10

Since Limestone entered service, Manitoba Hydro's retained earnings (also considered as 'equity') have grown to a record level, as shown in the table below. In addition, the Utility's DBRS credit rating has improved to and been maintained at "A(high)". At the same time, Manitoba Hydro's debt financing has increased to meet the construction costs of Keeyask and Bipole III, causing the equity level to decline.

Year	Equity %	Total MH Assets ($Million)	Total MH Net Debt ($Million)	MH Retained Earnings ($Million)	DBRS Bond Rating
1992	6	6,505	4,972	183	A
1993	5	6,025	4,533	159	A

Source: MFR14 and Manitoba Hydro Annual Report

The Board learned in this proceeding that the Utility's rate requests in those previous hearings before this Board were capped at 3.95% by the Manitoba Hydro-Electric Board. In its rate increase request for the Test Year, Manitoba Hydro's new management now seeks rate increases of 7.9% for all customer classes.

4.0 Manitoba Hydro's New Financial Plan

The two concerns that must be balanced by the Board in setting just and reasonable rates are the interests of the Utility's ratepayers and the financial health of Manitoba Hydro. Regarding the latter, central to the Application and the rate requests by Manitoba Hydro in this GRA is the Utility's assertion that the "old financial plan has now failed" as it was not adequate and was far too risky. This assertion underpins the new financial plan presented by Manitoba Hydro in this GRA, which features:

- a 10-year trajectory to achieve a 25% equity level,
- achievement of $6.5 billion in retained earnings in a 10-year period to safeguard against the risks faced by Manitoba Hydro,
- improved cash flow from operations,
- higher net income, and
- a proposed debt management strategy aimed at removing approximately $4 billion of debt from the Utility's balance sheet.

The requested 7.9% rate increase for the 2018/19 Test Year is Manitoba Hydro's first step in its new financial plan.

In Manitoba Hydro's view, this new financial plan will allow for rate stability with the potential for lower rates for consumer bills in the long run (as opposed to up to 20 years of the previously projected approximately annual 4% increases). According to the Utility, its new financial plan will also avoid unfairly placing an unsustainable debt burden on future ratepayers, while managing the risk of rate shock to consumers in the event of adverse conditions such as drought and/or rising interest rates.

Manitoba Hydro acknowledged that its new financial plan and increased rates in the plan will result in a transfer of money from ratepayers to the Utility at a greater level than previous plans. Further, Morrison Park Advisors, an expert witness jointly retained by the Consumers Coalition and the Manitoba Industrial Power Users Group, gave evidence that, because Manitoba Hydro does not have shareholders to contribute equity, ratepayers are ultimately responsible for all the costs of building Manitoba Hydro's level of equity through rates. Morrison Park Advisors' view is that customer contributions – in the form of bills paid by customers - have a cost of capital for individual ratepayers, and for some customers, that cost of capital can be quite high. Morrison Park Advisors' evidence was that, from the perspective of the ratepayers who are the ultimate funders of all of the Utility's operations, equity is essentially "dead money": it earns no return, but nevertheless has been taken out of the hands of the ratepayers who could otherwise use it. Moreover, Morrison Park Advisors stated that, because Manitoba Hydro is a Crown Utility that does not have equity investors at risk for its performance, Manitoba Hydro could theoretically be 100% debt financed.

In response to Manitoba Hydro's presentation of its new financial plan in this GRA, residential ratepayers, organizations, and representatives of business and industry gave evidence that lower rate increases over a longer period of time are preferred to maintain the financial health of Manitoba Hydro while providing predictability and stability for ratepayers. As Ms. Emily Mayham testified in her oral presentation, "I would prefer the lower rate increases for a longer period of time because it's predictable. I'm able to adjust and adapt as needed." Similarly, Mr. Dan Mazier, President of Keystone Agricultural Producers, gave evidence that he does not hold much weight in the suggestion that there will be a reduction in electricity rates in 10 years, and therefore prefers a more stable approach to rate increases over a longer period of time. The Chair of the Manitoba Industrial Power Users Group testified that industrial companies "seek predictable energy rates that allow us to manage our business and plan for our future" and that Manitoba Hydro's projected 10-year rate plan will impact industrial companies' "decision-making regarding future investment in these operations and, for some, it threatens their very future."

Against this backdrop, evaluating Manitoba Hydro's assertion that a new financial plan is needed requires consideration by the Board of the issues identified by Manitoba Hydro of:

- the Utility's equity level as measured by the debt-to-equity ratio;
- the Utility's financial reserves;
- the Utility's cash flow as measured by Manitoba Hydro's new cash flow analysis as well as the traditional financial metrics of interest coverage and capital coverage;
- the Utility's debt management strategy; and
- the credit ratings of the Province of Manitoba and Manitoba Hydro.

4.1 Manitoba Hydro's Position

Manitoba Hydro's new 10-year financial plan seeks to reduce debt and increase equity through the revenues generated from six successive annual 7.9% consumer rate increases, followed by a 4.54% rate increase, followed by two years of inflationary rate increases of 2% each, in order to return Manitoba Hydro to a 25% equity level in 10 years. The Utility believes this to be the appropriate balance between addressing its financial risks and managing the impact of proposed rate increases on customers.

The new financial plan presented by Manitoba Hydro is a 10-year plan, with a 25% equity level being achieved in 2026/27. However, in response to Minimum Filing Requirements and Information Requests, Manitoba Hydro filed 20-year forecasts. The 20-year forecast included in the MH16 Update with Interim reflects an equity level exceeding 25% and achieving 64% by 2036, but Manitoba Hydro believes that limited value should be placed on forecasts that extend beyond a 10-year period. Manitoba Hydro states that it is focused on a 10-year financial plan and does not intend to achieve an equity level of that size over 20 years.

Manitoba Hydro’s position is that the rates that will be appropriate after the tenth year of its plan will be a function of events between today and 2027, but a rate reduction may be one option that could be considered among others. One forecast scenario filed by Manitoba Hydro at the request of the Board was designed to maintain 25% equity following achievement of that level in 2026/27 and includes a forecast rate decrease of 19.75% for 2027/28. An alternative scenario requested by the Board incorporated equal annual rate decreases of 5.76% in the three years from 2027/28 to 2029/30 in order to reduce forecast net income to the range of $200 million per year, while yet another scenario modeled 0% rate increases beginning in 2027/28 and every year after.

In its new financial plan, Manitoba Hydro seeks a prospective level of income and cash flow that, in the Utility’s view, would restore its financial strength while also being capable of enduring drought or material negative deviations from export price and interest forecasts without requiring emergency relief from ratepayers. Recognizing that the requested Test Year rate increases and projected future rate increases in its 10-year financial plan are materially greater than in previous GRAs, Manitoba Hydro included in its key reasons for the rate increases that:

- its current and projected financial situation, absent the proposed rate increases, represents an untenable risk to both the financial sustainability of the Utility and the overall economic health of the Province of Manitoba. The credit rating of the Province has been downgraded by both major international rating agencies and the Province has diminished capacity to absorb inclusion of Manitoba Hydro's debt in its consolidated credit profile without risking further erosion of the Province's credit standing;

- previous financial plans and requested rate increases did not adequately prepare Manitoba Hydro to absorb the significant increase in operating and borrowing costs that result from the completion of Keeyask and Bipole III. The cost overruns for Keeyask and Bipole III have increased by $2.2 billion and $400 million respectively, necessitating further increases in gross borrowing under the financial plan;

- inclusive of cash interest on reliability projects and Business Operations Capital expenditures, Manitoba Hydro has been and, without substantial rate increases, will continue to be cash flow negative on its core operations;

- since the last GRA, the financial outlook of Manitoba Hydro has deteriorated because of a reduced outlook for domestic load growth, lessening the opportunity for Manitoba Hydro to look to growth to cure its financial challenges; and

- since the last GRA, there has been continued delay in the recovery of opportunity export prices. Export price growth expectations have been tempered from past forecasts as the outlook for sustained low fossil fuel costs perpetuates.

Manitoba Hydro's financial plan involves its three self-imposed key financial targets that provide a measure of the Utility's overall financial strength. Those financial targets may also be useful to guide proposed rate increases, although consumer rates are not set to produce a target return on equity for the Crown-owned public utility. The financial ratio targets approved by the Manitoba Hydro-Electric Board are:

- A minimum debt-to-equity ratio of a 75% debt level to a 25% equity level. This ratio measures the portion of assets that are financed by internally generated funds (referred to as equity) rather than being financed by debt;

- The cash flow financial metric of an interest coverage ratio of earnings before interest, taxes, depreciation, and amortization ("EBITDA") greater than 1.80. This ratio measures the Utility's ability to meet interest payment obligations with cash flow as reported in Manitoba Hydro's cash based financial statements; and

- The cash flow financial metric of a capital coverage ratio of greater than 1.20. This ratio, which is unique to Manitoba Hydro, is a measure of the ability of cash flow from Manitoba Hydro's operations to fund Business Operations Capital expenditures, excluding consideration of spending and capitalized interest on major capital projects. Where the ratio falls below 1.0, Manitoba Hydro will have to borrow to fund Business Operations Capital spending. Manitoba Hydro notes that, as the Utility continues through a phase of unprecedented investment, the exclusion of the capitalized interest on major capital expenditures from the metric overstates the capital coverage ratio.

Debt-to-Equity Ratio

The debt-to-equity ratio is a measure of the portion of assets that are financed by Manitoba Hydro's internally generated funds, rather than debt. The measurement evaluates the relationship of debt (comprised of long-term debt, sinking fund investment, short-term debt, and short-term investments) to equity (comprised of Retained Earnings, customer contributions, Accumulated Other Comprehensive Income, and Non-Controlling Interest) through a comparison of Manitoba Hydro's net debt to total capital. The debt-to-equity ratio identifies the capital structure of the Utility.

Specifically, and as noted in the Board's 2014 NFAT Report:

> *The debt-to-equity ratio is a long-term target, which serves as a financial guideline only, not an annual requirement. In 2013 it stood at 75/25. Manitoba*

Hydro expects a significant deterioration in this ratio over the next 20 years to about 90/10 in the 2020s as debt levels increase because of Bipole III and the Preferred Development Plan.

In this GRA, Manitoba Hydro acknowledges that past applications and testimony indicated a willingness by the Utility to tolerate a relaxation to below a15% equity level during the current phase of debt-funded capital investment (primarily for Keeyask and Bipole III). In past applications, Manitoba Hydro also proposed a financial plan that would have seen an approximate 15-year to 20-year time frame for restoring a 25% equity level. According to Manitoba Hydro, conditions and outlook have changed significantly since the last GRA, including with respect to the Utility's governance with the appointments of a new President and Chief Executive Officer ("CEO") in December 2015, a new Board of Directors in early May 2016, and a new Chief Finance and Strategy Officer in September 2016.

Manitoba Hydro's evidence is that the applications previously filed by the Utility were "wrong" and that the Manitoba Hydro-Electric Board and the Utility's senior management were required to chart a new financial plan for the Utility. The Manitoba Hydro-Electric Board's tolerance for risk has changed. It is now Manitoba Hydro's view that a path back to a 25% equity level of longer than 10 years is too risky.

Financial Reserves

Manitoba Hydro's financial reserves, or Retained Earnings, are the sum of all profits received by Manitoba Hydro through customer revenues since the Utility's inception, primarily from domestic ratepayers but also from export sales. Manitoba Hydro's financial reserves are not cash and are not retained in a bank account, but rather have been reinvested back into the Utility, including through reducing the amount of new borrowing requirements. Put another way, equity and Retained Earnings are debt that is avoided. Manitoba Hydro's Retained Earnings are included in the Utility's measurement of its total equity level.

The requested and projected 7.9% annual rate increases included in Manitoba Hydro's 10-year financial plan are to provide the Utility with cash flow to ensure that it is capable of enduring drought or material negative deviations from forecast without requiring emergency rate increases from ratepayers. Under its cost of service regulatory regime, Manitoba Hydro considers its non-cash Retained Earnings as a temporary reserve to allow for cost recoveries and rates to be smoothed out over time.

In Integrated Financial Forecast MH16 Update with Interim, Manitoba Hydro's Retained Earnings are at a record-high level of $2.75 billion. By 2027, the end of Manitoba Hydro's 10-year financial plan, Retained Earnings are forecast to more than double to $6.56 billion. Under the 20-year MH16 Update with Interim forecast, following 2027 a decade of 2% rate increases results in a forecast of $16.93 billion of Retained Earnings and a 64% equity level in 2036.

Manitoba Hydro identifies that drought, rising interest rates, and export prices are the largest risk items that could negatively affect Manitoba Hydro's Retained Earnings. Manitoba Hydro estimates that the Retained Earnings impact of a five-year drought beginning in 2019/20 is approximately $1.4 billion. Due to the quantum of Manitoba Hydro's planned debt, the Utility sees rising interest rates as a greater risk than drought.

Cash Flow from Operations

Manitoba Hydro constructed a new analysis of the cash flow metric to demonstrate that, without the proposed rate increases in Manitoba Hydro's 10-year financial plan, the Utility will be unable to cover both its Business Operations Capital expenditures and its newly defined capital requirements.

According to Manitoba Hydro, capital spending to maintain normal operation and growth of the system (excluding major projects such as Keeyask and Bipole III) is in excess of what is presently being recovered annually in the depreciation expense portion of customer rates. This is because depreciation expense is based on historical costs which, given the age and long useful life of the underlying assets, is not indicative of the actual ongoing costs of maintaining and replacing the system. This situation is expected to reverse in approximately 2023 at which time depreciation expense will be greater than annual capital spending.

Manitoba Hydro argues for the first time that actual Business Operations Capital needs of the Utility have historically been understated in debt service and capital coverage financial metrics. This is because capital projects ascribed “Major New Generation & Transmission” status, due to their individual size based on dollar amounts, are excluded from the financial metrics. Manitoba Hydro now maintains that most of these Major New Generation & Transmission projects are essentially for system renewal or reliability and are not, once finished, contributing to any material increase in revenue. As such Manitoba Hydro now includes these capital expenditure requirements for the purposes of its new cash flow analysis. Major New Generation & Transmission projects continue to be excluded from Manitoba Hydro’s long-standing interest coverage and capital coverage metrics.

Additionally, Manitoba Hydro suggests that the capitalization of interest effectively delays the recognition of increased carrying costs associated with new plant as that capitalized interest is not recognized on the Income Statement for rate-setting purposes until the underlying capital asset enters service. As an example, capitalized interest on funds borrowed to finance reliability and sustainment projects like Bipole III is deferred and excluded from the determination of revenue requirement and net income until that capital asset enters service for ratepayers.

Manitoba Hydro uses a new cash flow analysis that it developed to illustrate the difference between net income under International Financial Reporting Standards (as reported in Manitoba Hydro's audited financial statements) and the Utility's new perspective on its actual cash flow requirements.

Debt Management and Borrowing Strategy

Unlike privately owned utilities, Manitoba Hydro does not have access to share capital as a source of funds and must rely on a combination of internally generated funds from operations (referred to as equity) and debt financing in order to fund its capital investment program. Manitoba Hydro is forecasting that, in the next four years, it will fund the vast majority of new major generation and transmission capital expenditures, including the sums remaining on the $8.7 billion Keeyask and $5.0 billion Bipole III projects, primarily through debt financing.

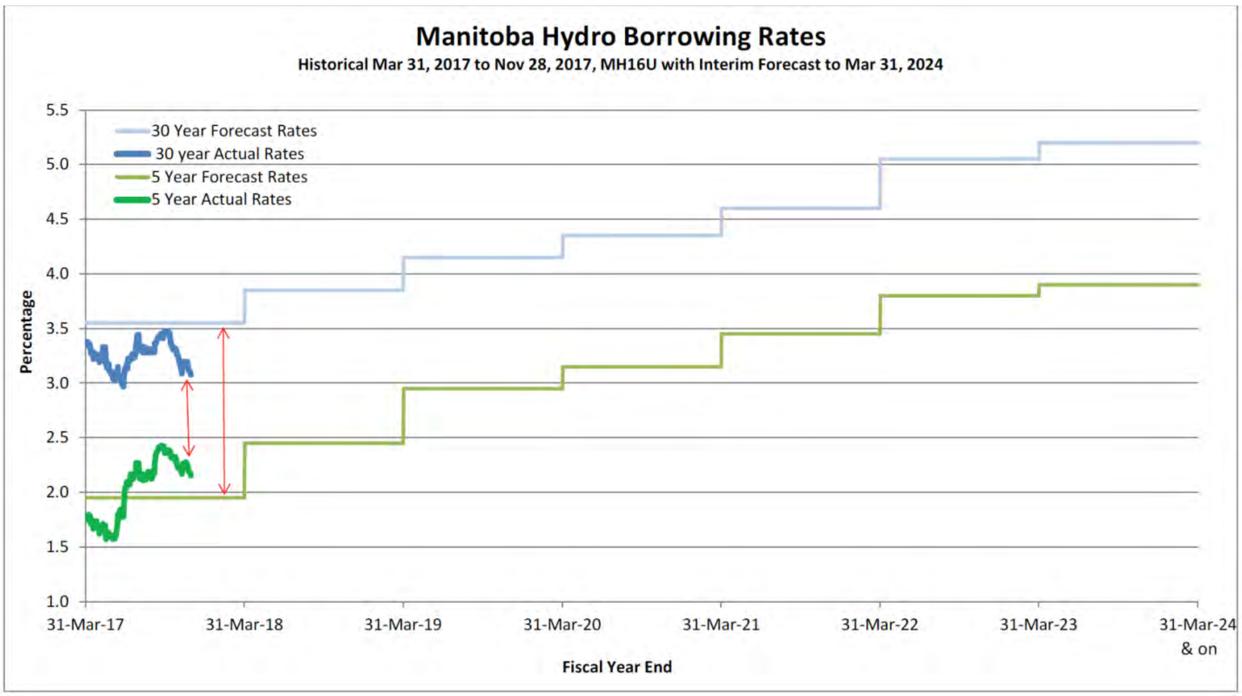
Manitoba Hydro maintains that its requested and projected rate increases in its 10-year financial plan will allow the Utility to reduce its borrowing requirements in the future, retire debt, and serve to mitigate future rate increases that may be required should interest rates rise. The risk identified by Manitoba Hydro is that interest rates will rise over and above the increases already embedded into Manitoba Hydro's Integrated Financial Forecast. Manitoba Hydro derives its long-term (10+ year) interest rate forecast from a consensus of external forecast views from the average of 10- and 30-year forecasts Canadian debt interest rate forecasts. The long-term interest rates are projected to increase over the forecast period: from 3.15% (excluding the one percent provincial debt guarantee fee) in 2017/18 to 3.90% in 2019/20 and to 4.95% in 2023/24 and thereafter.

Manitoba Hydro states that actual interest rates in the Canadian capital markets have been on a downward trajectory over the past two decades and are currently at the lowest levels in Canadian history. The implications from this record low interest rate environment are such that, should interest rates rise, and with the increasing level of debt financing required by Manitoba Hydro, the Utility is at risk of experiencing escalating debt servicing costs on its maturing and new debt issuances.

In order to reduce refinancing risk, Manitoba Hydro adopted a ‘leapfrogging’ strategy in 2008 that favoured longer-dated debt maturities that largely skipped over the future period of large borrowings for new cash requirements. This strategy enhanced debt stability by extending the debt portfolio’s weighted average term to maturity by over five years. Manitoba Hydro also took advantage of the low interest rate environment to decrease the debt portfolio’s weighted average interest rate by over 2%.

Manitoba Hydro indicates that, combined with its projected rate increase plan, the leapfrogging approach undertaken has provided the opportunity for Manitoba Hydro to now shorten the weighted average term to maturity of new debt issuance from approximately 20 to 12 years so as to retire debt permanently. The financial benefit associated with this opportunity has the potential to provide a reduction in debt servicing costs of $500 million, based on an assumed 1.6% difference between the five-year borrowing rate and 30-year borrowing rate in MH16 Update with Interim. However, Manitoba Hydro revised its estimate of the reduction of debt servicing costs during the GRA hearing down to under $250 million as a result of the recent flattening of the yield curve between shorter-term (five year) and longer-term (30 year) debt.

The forecast of 30-year and five-year interest rates and recent actual rates, including the 1% debt guarantee fee paid by Manitoba Hydro to the provincial government, is reflected in the following table and the narrowing of the differential is depicted with the arrows in the table:



Source: MH-68

Manitoba Hydro indicated that its last two debt issuances were 30-year issues and that the weighted average term to maturity of the debt portfolio is currently 18 years, not the 12-year weighted average term to maturity envisioned in Manitoba Hydro's new financial plan.

Manitoba Hydro states that, when spending on Keeyask and Bipole III is complete, and with the forecast improvement in operating cash flow stemming from the proposed rate increases and cost reductions, it sees an opportunity to use this future cash to permanently retire significant levels of debt. This debt retirement plan is a key factor in the forecast reduction in finance expense and is predicated on the successive annual 7.9% rate increases in Manitoba Hydro's 10-year financial plan. Manitoba Hydro submits that, should there be no reasonable prospect for the cash flow from its proposed rate plan, it would be unable to retire as much debt as forecast. Prudence would then dictate that the debt strategy shift to longer-dated maturities in order to protect ratepayers from interest rate refinancing risk.

Credit Ratings of Manitoba Hydro and the Province of Manitoba

Manitoba Hydro's long-term debt is provided by the Province of Manitoba. The Province raises debt capital from the capital markets, advances the funds to Manitoba Hydro, and charges Manitoba Hydro a debt guarantee fee. As a result, Manitoba Hydro's long- and short-term credit ratings are the same as the Province's credit ratings.

According to Manitoba Hydro, the Province's credit rating should be of concern to the Utility's customers as it affects the cost of borrowing that Manitoba Hydro must recover in its rates. Debt advances to Manitoba Hydro form a significant and growing portion of the total provincial debt and the Utility's financial performance is considered by credit rating agencies as a contributing factor toward the financial strength and assessment of the Province's credit rating. Manitoba Hydro maintains the proposed rate increases in its 10-year financial plan are necessary to demonstrate to the credit rating agencies that Manitoba Hydro is on a path to maintain its self-supporting financial status as it is able to support the cost of its borrowings.

Manitoba Hydro states that each credit rating agency independently evaluates Manitoba Hydro by considering the Utility's financial risk profile, including financial performance, ratios, and forecasts as well as the business risk profile in assessing whether or not

Manitoba Hydro is "self-supporting". The status of self-supporting means that Manitoba Hydro is able to adequately support its borrowing costs through its operations without seeking assistance from the province. Provided that the rating agency views Manitoba Hydro as self-supporting, the credit rating agencies do not include Manitoba Hydro's debt levels in the net tax-supported provincial debt. Should Manitoba Hydro lose its self-supporting status and the contingent liability represented by Manitoba Hydro's debt to the Province of Manitoba materializes, the implication to the Province is a heightened risk of further credit rating downgrades.

The different credit rating agencies use different methodologies and scales to measure ratings. Standard & Poor's now defines "self-supporting" as maintaining stand-alone investment grade credit metrics. Since Manitoba Hydro does not meet this standard nor intends to meet this standard, Manitoba Hydro's debt is now included by this rating agency in the tax-supported debt of the province. However, the credit rating and outlook from both the Moody's Investor Services and DBRS rating agencies have remained unchanged since 2015.

4.2 Intervener Positions

The Consumers Coalition submits the financial outlook consistent with Integrated Financial Forecasts IFF14 and IFF15 should be retained for rate setting purposes. In adopting the evidence of its expert witness, Morrison Park Advisors, the Consumers Coalition states that Manitoba Hydro's new cash flow analysis is not shared with credit rating agencies and should not be used for rate setting purposes. That the Utility has cash flows less than its annual spending on property, plant and equipment at least until 2023 is entirely consistent with Manitoba Hydro's major capital expenditure plan in the construction of the $8.7 billion Keeyask and $5 billion Bipole III projects.

The Consumers Coalition emphasizes that capital markets are not credit rating agencies and credit rating agencies are not capital markets. While both are important, they are not the same thing. This Intervener reminds the Board that, following the NFAT review, the markets did not react negatively when Keeyask was approved to be constructed with a plan of achieving a 25% equity level after approximately 20 years. Two rating agencies have long taken the position that, as long as Manitoba Hydro is paying its costs through ratepayer bills, there is no practical impact on the provincial credit rating or on the cost of the Utility's debt. In addition, the Consumers Coalition adopts the evidence of Morrison Park Advisors that Manitoba Hydro's focus on capital structure does not appear to be shared by capital markets observers, who instead are more focused on measures of cash flow sufficiency to meet debt obligations, in keeping with their primary interest of protecting their debt investments.

The Consumers Coalition maintains the 7.9% rate increase path by Manitoba Hydro is not warranted when rate increases at approximately half of that amount still allow the Utility to reach a 25% equity level by 2033/34. Rate increases at or below 3.95% are consistent with the rate path outlined in the 2014 NFAT hearing and subsequent Board rate increase decisions and ought to be the maximum rate increase allowed for 2018. In any event, as stated by Morrison Park Advisors, as Manitoba Hydro is a pure cost recovery, government-owned utility, it is not clear why "equity" should be a priority *per se*.

The Consumers Coalition submits that financial reserves should be used to manage drought risk, but not interest rate risk or export price risk, the latter two of which can be addressed through rate increase requests at future GRAs. The Consumers Coalition questions the need to have increased reserves to withstand a drought when, under Manitoba Hydro's 7.9% rate increase trajectory, Retained Earnings are growing during a drought due to excessively high consumer electricity rates. This Intervener supports the researching and developing of a probabilistic analysis to assist the Board in determining the appropriate levels of reserves for Manitoba Hydro, including through technical conferences.

The Manitoba Industrial Power Users Group advocates progressing towards a 725% equity level target over approximately twenty years (i.e. 2035/36) while maintaining rate stability and predictability. Consistent with the long life of the Keeyask and Bipole III major capital assets under construction, the recovery of the costs ought to be spread to the customers that will benefit from the assets. To proceed at the rate path projected by Manitoba Hydro would result in Retained Earnings exceeding $6.5 billion by 2026/27, while there have been no scenarios provided to suggest ratepayers face risks commensurate with this level of reserves. Additionally, it states that Manitoba Hydro has not provided a credible scenario for what happens after 10 years. Currently, the Manitoba Industrial Power Users Group sees Manitoba Hydro's approximate $3 billion of Retained Earnings as sufficient to manage a five- or seven-year drought, even without further rate increases.

Manitoba Hydro uses an uncertainty analysis to assess risk. The Manitoba Industrial Power Users Group indicates the recently developed uncertainty analysis capability of Manitoba Hydro is a significant enhancement but it is not ready to be used as a rule-based methodology in the rate-setting process. An improved uncertainty analysis will need to incorporate a rate response where rates would be expected to increase while the event (such as drought) is being experienced. An uncertainty analysis can be used as a signal to capital markets that rates are sufficient to address most future conditions without default. It can also help customers understand how rates are building reserves that yield rate stability.

In assessing the responses of capital markets and the credit rating agencies to annual 3.95% increases, the Manitoba Industrial Power Users Group indicates that there appears to be no prospect that the test used by KPMG, the Utility's external consultant, for self-supporting status (zero retained earnings combined with uncompetitive rates) would fail to be met over the near term or the long term as currently projected. Further, there is no sign that any updated information on the Utility's debt is leading to a higher cost of credit for the province. Considering that the debt guarantee is a kind of backstop or insurance, no evidence has been provided that the Province is being exposed to risks or costs that exceed the payments it has received over the period. As noted in the evidence, the Province's cost of borrowing, measured as a spread over both the federal government and the Ontario government, improved after the Standard & Poor's downgrade.

The Manitoba Industrial Power Users Group sees Manitoba Hydro's interest coverage ratio as reasonable, recognizing it will rise and fall depending on performance. For example, this target was not met under Integrated Financial Forecast MH14 for 10 years. However, there are some issues with the capital coverage ratio due to the arbitrariness of definitions of what is and is not included. According to this Intervener, the capital coverage target is met under the 3.95% rate increase trajectory in all years except 2019/20, 2025/25, and 2026/27 but the Utility's external consultant would consider the target met in each of these years as the results are within 10% of the target. This is an improvement from MH14.

The Manitoba Industrial Power Users Group maintains that, on a normal basis, rate setting for a regulated utility such as Manitoba Hydro should be performed with the primary focus being on the income statement and net income sufficiency, not capital coverage which is a cash flow test.

The 7.9% per year rate trajectory in Manitoba Hydro's new 10-year financial plan drives rates to high levels (81% above 2017's level by 2027/28), net income to record levels of $650 million per year and more, with Manitoba Hydro's financial targets (interest coverage and capital coverage) being far exceeded. The Manitoba Industrial Power Users Group maintains the analyses demonstrate that there is no overall financial deterioration compared to the NFAT or the previous GRA and there is therefore no need to deviate from the prior rate trajectory.

Representatives of General Service Small and General Service Medium Customer Classes and the Keystone Agricultural Producers adopt the Morrison Park Advisors' expert evidence, as well as the general positions as to rate increases of the Consumers Coalition and Manitoba Industrial Power Users Group.

The City of Winnipeg maintains that Manitoba Hydro's position as to financial metrics is without sufficient justification and is arbitrary. Most importantly, it states that Manitoba Hydro completely fails to take into consideration the interests of ratepayers. As such, the City of Winnipeg argues that the Utility has failed to demonstrate its proposal results in just and reasonable rates as it considered only half of the legal test the Board must apply – that test being the balancing of the interests of ratepayers and the financial health of the utility.

Simply put, the City of Winnipeg submits the Utility has not established that circumstances have so drastically changed that the conclusions of the NFAT Report are no longer are valid. On this point, this Intervener reminds the Board that Manitoba Hydro does not expect to meet all of its financial targets during periods of major capital expansion. Additionally, the uncertainty analysis from the NFAT modelling shows that rate increases of approximately 3.95% are sufficient to maintain the long-term viability of the Utility.

The Business Council of Manitoba recommends the Board deviate from the historical rate path in favour of a short-term rate path increase along the lines proposed by Manitoba Hydro. This Intervener calculates the difference between the 3.95% rate path and the MH16 Update with Interim rate path as being an incremental revenue increase of about $70 million in the next year. Interest rates going higher than forecast by 1.5% would result in $350 million in additional interest costs that would have to be borne by Manitoba Hydro in 2021 if the Utility's debt is $23.3 billion, as is currently forecasted.

The Business Council of Manitoba sees increases in interest rates and Manitoba Hydro being found to be a non-self-supporting entity as virtual certainties. This Intervener submits that, based on the current credit rating reports, the risk of a credit downgrade of Manitoba Hydro or the Province is extremely high. This Intervener concludes that the risk that any of these factors will negatively affect Manitoba Hydro and the Province in the short and long term is very high.

4.3 Board Findings

Having considered the interests of the Utility's ratepayers and the financial health of Manitoba Hydro, the Board finds that a particular equity level target and pace to achieve that target should not determine the rate increases approved in this GRA. Although the Board finds that the rate increase should not be driven by achievement of a particular equity level, the Board's assessment must include consideration of the circumstances of Manitoba Hydro's operations. Because of Manitoba Hydro's use of hydraulic resources to meet the electricity needs of the province, it has historically undertaken large investments such as generating stations and transmission lines that have initial large surpluses of capacity for the needs of Manitobans. These assets have large upfront construction costs but relatively low annual operating costs that extend through a very long expected useful life – which, in some cases, can be as much as one hundred years. With Manitoba Hydro's investments currently underway in Keeyask and Bipole III, the situation today is no different.

An important question from a rate-setting perspective is how these large investments should be funded. On the one hand, if they are to be paid for exclusively by revenues from new rates charged to domestic ratepayers, this would result in a "saw tooth" pattern of rates featuring sharp spikes when new facilities are under construction, and a return to lower rates once the desired equity portion of the project has been funded. On the other hand, if projects are funded through borrowing, rate increases may be "smoothed" over time but the cost of servicing the debt becomes an issue. The concern is to find the right balance between rate increases and the level of debt to fund large capital projects.

In making this determination, the Board is guided by two considerations. The first is: what "reserves" should Manitoba Hydro hold to manage risk and which risks should it take into account? As an example, as per the question posed in the evidence of Morrison Park Advisors, what is the level of retained earnings needed in the event of a five-year drought? The second is to place concerns about the amount of debt and retained earnings in a different perspective by also considering cash flow, using two long-standing financial metrics used by Manitoba Hydro: interest coverage ratio and the capital coverage ratio.

As detailed below, on assessment of these considerations, the Board finds that raising consumer rates by an amount equivalent to four times the rate of inflation is not required to support Manitoba Hydro's current operations. The Board recognizes the sincerity of Manitoba Hydro's concerns about potential future risks materializing. However, as the Board has demonstrated in past decisions – including in years of drought where the Board awarded rates in excess of those sought by the Utility – it will consider all of the facts and circumstances which confront Manitoba Hydro at that point in time in determining the appropriate rate relief. The Board is prepared to take regulatory action – whether through a rate rider, an interim rate increase, or a general rate increase – as required in times when emergent situations face Manitoba Hydro. At this time, however, the Board finds the circumstances confronting Manitoba Hydro, including those raised in the hearing about credit rating agencies and debt management, do not justify the 7.9% rate increase sought by Manitoba Hydro.

Any benefits of Manitoba Hydro's financial plan must be balanced against the interests of ratepayers. Funds taken out of the pockets of ratepayers through higher rate increases have a cost. In balancing this against the benefits of Manitoba Hydro's plan, the Board finds that the cost to ratepayers is not justified. The Board further notes that, while one financial scenario filed by Manitoba Hydro at the request of the Board showed rate reductions in its 20-year rate forecast, including a significant rate reduction in 2027/28, the Utility did not commit to those reductions. Instead, Manitoba Hydro acknowledged that requests for rate increases or reductions in future years will be dependent on the circumstances at the time.

Debt-to-Equity Ratio

The Board accepts Morrison Park Advisors' evidence that debt-to-equity is a questionable metric for a vertically integrated monopoly Crown utility with a debt guarantee from the provincial government. The equity level target does not have the prominence suggested by Manitoba Hydro given the context in which the Utility operates. The concern regarding the value of the equity level target is compounded when Manitoba Hydro is going through an unprecedented major investment period to more than double the value of its assets in the next four years. As noted by Manitoba Hydro's external consultant KPMG, there is a "practical recognition that this target will not be met during a period of large capital expenditures when newly constructed assets are placed in service. Accordingly, the 75/25 could remain the long-term objective." The Board supports this view. The Board agrees with the evidence that there is a cost associated with equity as equity is provided by ratepayers who could otherwise use those funds. As such, the Board is not prepared to look at the issue of pacing to achieve a particular equity level target at least until the current phase of major capital construction is completed, now projected by Manitoba Hydro to be in 2024.

The current 25% equity level target was established by the Manitoba Hydro-Electric Board in 1995 when the Utility had 8% equity and less than $300 million of Retained Earnings. Except for approximately five years during the last 20 years, immediately prior to the start of Keeyask construction, this target has not been achieved.

The 25% equity level target is "self-imposed" by Manitoba Hydro. While Manitoba Hydro may determine that the 25% target remains relevant, the Board does not accept that consumer rate increases should be granted at the level proposed by Manitoba Hydro so that the Utility can achieve its target within a 10-year time frame. As stated by the Board in the NFAT report:

> *The Panel supports a relaxation of Manitoba Hydro's 75/25 debt-to-equity ratio to smooth out rate increases and the Panel concludes that Manitoba Hydro would still be left with sufficient retained earnings if the equity level was decreased.*

Financial Reserves

The Board finds that Manitoba Hydro's forecast achievement of $6.56 billion of Retained Earnings by 2027 is too aggressive considering that the two major capital projects contributing most to the doubling of the Utility's assets are still under construction. This increase in Retained Earnings would be funded by ratepayers, with a resulting opportunity cost. In assessing this cost to ratepayers against the benefits to Manitoba Hydro, the Board finds that under the Utility's MH16 Update with Interim rate path, and as illustrated in Manitoba Hydro's sensitivity analysis and as confirmed by Manitoba Hydro in its testimony, Manitoba Hydro's Retained Earnings would continue to increase even during a five-year drought. Even though a five or seven-year drought would result in Manitoba Hydro not accumulating the same Retained Earnings as it otherwise would have, such a drought would also not result in a reduction in the Utility's Retained Earnings. The Board agrees with the evidence of Morrison Park Advisors, that this raises a question: if a primary purpose of having Retained Earnings is to withstand a drought, why does Manitoba Hydro need rates at a level that would allow it to build Retained Earnings during a drought? The Board concludes this supports the determination that a 7.9% rate increase for 2018/19 is not required.

In addition, the Board accepts the evidence of Morrison Park Advisors that Retained Earnings should be used to manage drought risk in combination with regulatory action by the Board. The Board further agrees that interest rate and export price risks over the long term should be addressed with rate increases as and when those risks materialize. Rates should not be set to increase Retained Earnings to manage those longer-term risks. As discussed elsewhere in this Order, the Board is prepared to consider regulatory action when required to address emerging risks facing Manitoba Hydro. In this context, and having considered Manitoba Hydro's new financial plan and the opportunity costs to ratepayers, the Board finds that the 7.9% requested and projected rate plan is not the appropriate balanced plan for meeting the risks and challenges that confront the Utility.

However, the Board concludes that there is merit to gaining better understanding of the financial reserves required for Manitoba Hydro under various circumstances. This would include consideration of risk tolerances, what risks should be protected by reserves, and the circumstances which would guide the need for more aggressive rate increases to continue full cost recovery for Manitoba Hydro. The Board is mindful that the financing and depreciation expenses related to these new major capital assets entering service already require additional revenues from rate increases. Consideration of the appropriate level of financial reserves, for example a minimum retained earnings test, is best done through a collaborative approach with stakeholders.

The Board directs Manitoba Hydro to participate in a technical conference hosted by Board Staff or an external consultant appointed by the Board for the consideration of the establishment of a minimum retained earnings or similar test to provide guidance in the setting of consumer rates for use in rule-based regulation. The test or rule is to be based on maintaining appropriate or minimum levels of retained earnings and meeting other financial metrics in the face of potential risks to the Utility. The Board will develop the terms of reference for the technical conference. Parties will be invited to contribute to the scope and terms of reference for this initiative.

Cash Flow from Operations

The Board finds that, in assessing whether Manitoba Hydro is meeting its ongoing financial obligations, the focus should be on the accrual accounting methodology used in the Utility's audited financial statements and the financial forecasts used for rate setting. This methodology was also previously used by Manitoba Hydro for rate setting purposes and continues to be used by Manitoba Hydro for its financial forecasting and reporting. Accrual accounting used by Manitoba Hydro includes capitalizing interest to capital projects until those new assets enter service for ratepayers. Once in service, the financing and depreciation costs are recorded on the Income Statement to be recovered in consumer rates.

Manitoba Hydro's new cash flow analysis does not appear, from the evidence, to be a typical part of financial analysis, and its value is somewhat obscure. The newly presented cash flow analysis is a "new view" created by Manitoba Hydro that the Board does not accept for rate-setting purposes. The new view treats Bipole III inconsistently, departs from the prior treatment of certain Major New Generation and Transmission projects, and deviates from accrual accounting principles. However, the Board accepts that Manitoba Hydro's payments to the City of Winnipeg and mitigation payments should be included in a cash flow analysis of the Utility's operations for rate-setting purposes. The Board notes that insufficient information was provided about the items included in Other Cash Payments in its Integrated Financial Forecast and directs Manitoba Hydro to provide that information in the next GRA filing.

With respect to the traditional financial metrics of interest coverage and capital coverage, the Board finds that the question of financial targets must be assessed in the context of a Crown Utility that is currently in the midst of a major capital expansion, doubling its asset base. With rate increases in line with prior levels, Manitoba Hydro's interest coverage and capital coverage ratios will be improved from those forecast at the time of the NFAT. These metrics therefore do not support rates at a level higher than prior rate increases. The forecast of financial measures, such as the interest coverage ratio and capital coverage ratio, even with the inclusion of City of Winnipeg and mitigation payments, do not support Manitoba Hydro's arguments that a 7.9% increase is justified solely by Bipole III entering service in 2018/19. As well, due to the Bipole III Deferral Account established by the Board and as directed by the Board in prior Orders, 11.6% is already embedded in current compounded consumer rates, despite not previously being required for the Utility’s operations, in order to smooth the rate effect of Bipole III entering service.

Debt Management and Borrowing Strategy

The Board does not accept that rate increases should be higher in order to allow Manitoba Hydro to retire debt according to their new debt management plan. The refinancing risk identified by Manitoba Hydro is linked to the Utility’s shorter-term debt retirement plan. Longer-term issuances at current low interest rates mitigate this risk as identified by Manitoba Hydro’s Treasury Department. Manitoba Hydro’s recently amended approach to the debt management plan, whereby it placed longer-term debt issues to take advantage of a flattening yield curve, demonstrates that Manitoba Hydro’s treasury function is well exercised.

While there are benefits to a shorter-term debt retirement plan, such a plan imposes a cost on ratepayers that is not justified by the evidence.

Credit Ratings of the Province of Manitoba and Manitoba Hydro

The Board finds that, while important, care must be taken to avoid placing too much weight on reports by credit rating agencies. The Board accepts that credit ratings and capital markets are related, but are not the same thing.

The Board does not accept that Manitoba Hydro’s debt is leading to a higher cost of credit for the province. Neither Manitoba Hydro nor the Business Council of Manitoba chose to call any witnesses from the credit rating agencies, financial markets, or the provincial government to testify as to the impact of Manitoba Hydro’s debt on provincial credit ratings. In so doing, the Utility and the Business Council of Manitoba appeared to take the position that it was self-evident that higher levels of debt would damage the provincial credit rating. There was no expert evidence independent of Manitoba Hydro presented to that effect. More specifically, as submitted by the Manitoba Industrial Power Users Group, there was no evidence that “even if Hydro acted prudently, yet adversely affected the province’s rating, that it would be a net short-term or long-term negative effect on the province compared to not having Hydro’s debt on the books”. The Board accepts the evidence of Morrison Park Advisors that the capital markets will be reassured by a long-term rate plan that acceptably manages Manitoba Hydro’s risks and by this Board’s regulatory action where required to address circumstances as they arise.

5.0 Major Capital Revenue Requirement

On April 5, 2017, by Order in Council 92/2017, for the GRA then-anticipated to be filed in 2017, the Board was assigned the duty of considering capital expenditures made by the Manitoba Hydro-Electric Board as a factor in reaching a decision regarding setting rates for services in a manner that balances the interests of ratepayers and the financial health of Manitoba Hydro. To facilitate the Board's review of Manitoba Hydro's capital expenditures, Order in Council 92/2017 directed the Utility to provide extensive capital expenditure, explanatory, and revenue information.

As such, this GRA proceeding included review of Manitoba Hydro's current major capital projects, specifically Keeyask, Bipole III, the United States interconnection project made up of the Manitoba-Minnesota Transmission Project ("MMTP") in Manitoba and the Great Northern Transmission Line ("GNTL") in Minnesota, and the Manitoba-Saskatchewan Transmission Project. This review included consideration of the budget estimates for these projects incorporated into the Utility's Integrated Financial Forecast, and therefore its revenue requirement.

The Board's review of Manitoba Hydro's capital expenditures included the following:

- A review of Keeyask, with a focus on the reasonableness of Manitoba Hydro's capital cost estimates filed in support of the Utility's financial forecasts. The timeframe for the review began with the cost estimates presented at the NFAT;
- A review of Bipole III, also focused on the reasonableness of the capital cost estimates beginning with the initial western routing cost estimate for Bipole III;
- A review of the MMTP and GNTL, also focused on the reasonableness of the capital cost estimates. The timeframe for the review began with the cost estimates presented at the NFAT; and

- An economic review of the Manitoba-Saskatchewan Transmission Project and related SaskPower export power sale, to determine whether the project was economic.

In order to exercise its authority and responsibility under the Order in Council in this GRA, the Board engaged the services of the following Independent Expert Consultants:

- MGF, construction management experts in the profession of Quantity Surveyors. Quantity Surveyors have construction, contract, and project management expertise. MGF was the lead Independent Expert Consultant for the review of the capital costs of Keeyask, Bipole III, MMTP, and GNTL;

- Klohn Crippen Berger ("KCB"), which has expertise in hydroelectric generating station design and engineering, including the civil, electrical, and mechanical engineering aspects. KCB assisted MGF with the review of Keeyask;

- Amplitude Consultants, which has expertise with high voltage direct current ("HVDC") transmission systems including HVDC converter stations. Amplitude Consultants assisted MGF with the review of the Bipole III converter stations;

- Stanley Consultants, which has expertise with transmission line design, engineering, and construction. Stanley Consultants assisted MGF with the review of the Bipole III, MMTP, and GNTL transmission line reviews; and

- Daymark Energy Advisors ("Daymark"), which has expertise in resource planning and utility economics. Daymark reviewed the economics of the 100 MW SaskPower power sale agreement and the Manitoba-Saskatchewan Transmission Project.

The Board developed scopes of work for each Independent Expert Consultant with input from Manitoba Hydro and Interveners in the GRA. In the case of Bipole III, the focus of the Independent Expert Consultants was on the pre-construction budget of $4.65 billion and whether the current forecast of $5.04 billion can be relied upon by the Board. The Independent Expert Consultants did not investigate the prior Bipole III cost estimates, nor did they investigate the change in routing of Bipole III from east of Lake Winnipeg to west of Lake Manitoba.

5.1 Keeyask

Keeyask is a 695 MW hydroelectric generating station located in northern Manitoba at Gull Rapids. The Keeyask project also includes infrastructure, such as the access road and accommodation camp, as well as the transmission lines to connect Keeyask to Manitoba Hydro's HVDC Bipole facilities in order that the power may be transmitted to southern Manitoba.

Keeyask is being developed through the Keeyask Hydropower Limited Partnership ("KHLP"), a partnership between Manitoba Hydro and four First Nations: Tataskweyak Cree Nation and War Lake First Nation (acting as the Cree Nation Partners), Fox Lake Cree Nation, and York Factory First Nation. The commercial terms of the arrangement are set out in the Joint Keeyask Development Agreement. The four First Nations together currently own 17.5% of the Partnership and have the right to increase their investment and own up to 25%. Manitoba Hydro will own at least 75%. The Partnership has delegated project management responsibility to Manitoba Hydro. Consequently, Manitoba Hydro is the sole entity responsible for planning, design, engineering, procurement, construction, and operation of Keeyask.

At the commencement of the NFAT review in 2014, the anticipated cost for Keeyask was $6.2 billion and the target in-service date for the first of seven generating units was November 2019.

Prior to the completion of the NFAT, the General Civil Contract ("GCC") for Keeyask was awarded to a consortium of Bechtel Canada Co., Barnard Construction of Canada Ltd., and EllisDon Civil Ltd ("BBE"). Following awarding of the GCC, the Keeyask cost estimate was updated to $6.5 billion. The GCC is the largest contract related to Keeyask and includes river management, earthworks to build the dykes, concrete structures such as the powerhouse and spillway, and electrical and mechanical work to complete Keeyask. Construction commenced in July 2014 with the building of the powerhouse cofferdam.

The pricing structure in the GCC is that of a "cost reimbursable nature with a target price" contract. The "cost reimbursable" aspect means the contractor is paid for its costs for materials and direct labour, plus profit and general administration and overheads. The "target price" aspect means that the contractor's profit erodes if the target price is exceeded and the contractor's profit increases if the actual cost is less than the target price. The target price and this so-called 'pain/gain' pricing mechanism are intended to incent the contractor to perform well.

In a cost reimbursable contract, the owner (Manitoba Hydro) is at risk for quantities, productivity, and inefficiency of the contractor. As an example, under a cost reimbursable payment structure, the contractor would be paid in full for 10 hours of work even if the contractor's successful bid was based on the contractor taking only six hours to perform the specific work task.

Other types of payment structures are 'fixed price' or 'unit price' structures. In a fixed price contract (also known as a lump sum contract), a contractor is paid a fixed price regardless of the costs it incurs or the duration of the project. In this type of payment structure, the contractor is at risk for quantities and productivity. In a unit price contract, the contractor is paid a pre-defined unit rate (or rate per quantity) multiplied by the quantity of work. For a hydroelectric project such as Keeyask, a common unit would be a cubic metre of earth excavation or a cubic metre of concrete placement. In this type of payment structure, the contractor is at risk for productivity but the owner (Manitoba Hydro) is at risk for variation in quantity from the initial estimates provided by the owner.

For Keeyask, Manitoba Hydro attempted to address and mitigate the issues and concerns that resulted in the Wuskwatim generating station exceeding its initial cost projections. At the NFAT, Manitoba Hydro identified the availability and productivity of craft labour as a major issue with Wuskwatim. To address this issue, Manitoba Hydro designed and built premier camp accommodations for Keeyask in order to attract and retain labour. Manitoba Hydro also implemented a retention bonus for craft labour which raised the remuneration under the Burntwood-Nelson Agreement to be more competitive with other remote northern construction projects. Manitoba Hydro also implemented an early contractor involvement process with the general civil contractor. Early contractor involvement is a process whereby the contractor is involved early in the project and afforded time to plan the work for its craft labour teams. One objective of early contractor involvement is to maximize productivity of the workforce.

Manitoba Hydro expected greater productivity – that is, fewer person-hours per unit of work – on Keeyask than it experienced with Wuskwatim. The productivity in the BBE bid was similar to the productivity that was achieved during construction of the Limestone generating station in the early 1990s. When evaluating the bids for the GCC, Manitoba Hydro described BBE's productivity bid as a "red flag" as it was higher than Manitoba Hydro had achieved on Wuskwatim. Manitoba Hydro further investigated BBE's bid and its productivity forecast, but Manitoba Hydro ultimately accepted the productivity rates in BBE's bid and used them to calculate the target price of the GCC and the overall Keeyask cost estimate. The optimistic productivity of the BBE bid was one reason Manitoba Hydro included a labour reserve in the Keeyask cost estimate. Manitoba Hydro characterized the amount in the labour reserve as significant, to address, in part, its concern over the productivity contained in BBE's bid. A labour reserve was not carried for Wuskwatim.

At the NFAT, the risk of cost overruns was known and the Board commented on this risk in its report:

> *The Keeyask general civil contract is a costs-reimbursable contract rather than a fixed price contract. This means that if volumes of materials increase, Manitoba Hydro is responsible for that increase. The Panel had the opportunity to consider the contract in camera as Commercially Sensitive Information, and has concluded that Manitoba Hydro bears a significant cost risk.*

And:

> *Manitoba Hydro submitted that the risk associated with the Keeyask construction is somewhat addressed given that 80% of the construction contracts have now been negotiated. However, this only partially mitigates cost risk. The Keeyask general civil contract is a cost-reimbursable contract, not a fixed price contract. This leaves the contract vulnerable to cost escalations as a result of: quantity risk, especially in areas where quantities may have been underestimated; escalation to the contractor's cost factors due to labour productivity or labour costs; escalation in the cost of supply and equipment; and challenges related to adverse weather conditions.*

The 2016 construction season was the first where significant amounts of permanent concrete were poured, beginning in May 2016. By June of 2016, BBE was falling behind on its targets for concrete placement. Manitoba Hydro requested a recovery plan from BBE in order to get the project back on schedule. The plan was implemented in June 2016, but did not achieve the desired results in terms of concrete placement or productivity. By the end of the 2016 construction season, only 65% of the earthworks target and 41% of the concrete target were met.

Manitoba Hydro investigated the root causes of the lower-than-expected concrete and earthworks productivity and completion rates. The primary root causes identified by Manitoba Hydro were: 1) unachievable productivity rates for earthworks and concrete as contained in BBE's original bid, 2) slow ramp-up by BBE to full production in the early part of 2016, and 3) geotechnical and geological challenges. These difficulties led to a potential two-year delay. Manitoba Hydro explained that the difference between the productivity bid by BBE and the actual productivity achieved is the largest driver of the cost increase from $6.5 billion to $8.7 billion. The actual number of person-hours per unit of work was much higher than the BBE bid.

Concurrently in the summer of 2016, Boston Consulting Group was retained by the Manitoba Hydro-Electric Board to investigate options related to stopping or rerouting Bipole III. Boston Consulting Group's review was expanded to include a review of Keeyask. Boston Consulting Group identified the potential cost and schedule overruns for Keeyask related to the performance under the GCC as an increase from $6.5 billion to $7.8 billion and a 32-month delay if no mitigation actions were taken. In Boston Consulting Group's opinion, mitigation measures could reduce the delay to 21 months and limit the cost overrun to $7.2 billion. Mitigation measures included extending the steel columns deeper in the powerhouse to allow concurrent construction of concrete below and steel structures above, use of auxiliary power to operate the spillway gates instead of waiting to complete the spillway ancillary building, and improving concrete and earthworks productivity.

In September 2016, Manitoba Hydro initiated development of its own recovery plan. Manitoba Hydro determined that, of the recovery options available, amending the scope of the GCC or terminating BBE were higher cost, higher risk options and that amending the existing contract with BBE was the lowest cost, lowest risk option. In January 2017, Manitoba Hydro negotiated a revision to the GCC with BBE, referred to as Amending Agreement 7.

Amending Agreement 7 also has a cost reimbursable-target price payment structure. Manitoba Hydro advises that, in order to renegotiate the contract with BBE, there were 'gives and takes' involved as well as limits to how much risk related to labour productivity, weather, geotechnical, northern logistics, and other risks that Manitoba Hydro could transfer to BBE. Amending Agreement 7 re-established the possibility for BBE to earn profit by setting a new target price based on revised productivity factors and a new schedule with the first generating unit expected to enter service in August 2021.

The schedule delay has a consequential impact on other contracts, triggering compensation related to delays on fixed price contracts as well as increased costs related to extended performance of other contracts, such as camp services. The schedule delay also increases the period over which interest charges accrue to the project. The cost increase for the GCC combined with increased interest charges due to the higher amounts borrowed and the delay result in the revised Keeyask control budget of $8.7 billion with a schedule delay of 21 months, which Manitoba Hydro made public in March 2017. A control budget is a formal project budget developed by the project team and approved by management. The revised control budget constitutes a 34% cost increase for Keeyask over the cost forecast by Manitoba Hydro in the 2014 NFAT.

The Keeyask cost estimate includes a contingency amount that is determined by probabilistic modeling of the probability and consequence of various risks. The $8.7 billion estimate with a 21-month delay incorporates a P50 contingency, such that the contingency is expected to address 50% of the risk outcomes. The Keeyask P90 cost estimate, which addresses 90% of the risk outcomes, escalates to $9.6 billion and factors in an additional eight-month delay for a total delay of 29 months from the in-service date forecasted at the NFAT.

	Pre-Construction	Revised Estimate	
	P50 Contingency	**P50 Contingency**	**P90 Contingency**
Total In-service Cost	$6.5 billion	$8.7 billion	$9.6 billion
Unit 1 In-service Date	November 2019	August 2021	April 2022
Unit 7 In-service Date	April 2020	August 2022	April 2023

Amending Agreement 7 was in place prior to the start of the main construction season in 2017. Despite revised target productivity factors (i.e. person-hours per cubic metre of concrete placed) and other changes in the GCC that were made to get the project back on budget and back on schedule, BBE still fell short of end-of-year targets for concrete placement and earthworks by 20% and 25%, respectively.

Manitoba Hydro stated that the productivity to date on Keeyask has been worse than for Wuskwatim. Manitoba Hydro explained that there are different craft labour attraction and retention issues with Keeyask than with Wuskwatim. However, the approaches put in place by Manitoba Hydro – a premier camp, retention bonuses in excess of Burntwood-Nelson Agreement wages, more favourable shift rotations – did not address the underlying labour productivity issues experienced at Wuskwatim, and the low labour productivity has been repeated at Keeyask. The actual productivity rates achieved on Wuskwatim and Keeyask to-date, as well as the productivity bid by BBE, are commercially sensitive and confidential and were heard by the Board *in camera*.

Independent Expert Consultant Evidence

MGF reviewed the Keeyask project and agreed with Manitoba Hydro that the GCC was the single largest driver of the cost increase from $6.5 billion to $8.7 billion. MGF developed its own cost estimate for Keeyask based on the productivity factors achieved by BBE in the October 2016 to October 2017 timeframe. MGF's cost estimate for Keeyask is $9.9 billion with an additional 410-day delay over the currently anticipated 21 month delay, although MGF also provided a range of likely Keeyask costs of $9.5 billion to $10.5 billion. In MGF's view, the root cause of the billions of dollars of cost overruns is that the cost reimbursable payment structure of the GCC fails to provide sufficient incentive for BBE to be responsible for productivity. According to MGF, BBE struggles to plan, manage, and execute the work. MGF further states that it has not seen Manitoba Hydro address the root causes of the poor productivity by BBE.

Similarly, KCB found that the principal reason for the cost increase in the GCC and overall Keeyask budget is the nature of the payment structure in the GCC. Specifically, BBE is being paid in full for its actual costs for labour and materials rather than for quantities of work performed against fixed or unit prices. Put another way, BBE is paid for any reasonable costs to pour a cubic metre of concrete, irrespective of the price it bid to do so. KCB also identified an unusual payment arrangement between Manitoba Hydro and BBE, whereby BBE is paid for planned work two months in advance of completing the work. KCB stated that it had never seen a contract that required such a payment condition; in KCB's experience, the way a contractor ensures its cash flow remains positive is through a mobilization payment, followed by performing the work and earning revenue based on quantities times unit prices.

KCB found that geotechnical issues were not a major driver of the GCC increase as the actual quantities of earthworks and concrete required closely aligned with the original estimates that Manitoba Hydro provided to BBE. KCB also found that the production of construction drawings by the engineering contractor has been timely, that overall design was substantially complete prior to the award of the GCC, and that design changes and extra work orders have been minimal. As such, these are not the major factors that have driven the increase in the Keeyask cost estimate.

A further serious problem MGF identified was that Manitoba Hydro, while competent at administering the payment of the construction project costs and project accounting, is not managing the GCC in a manner that is required to exert control over a contract with a cost reimbursable pricing mechanism. In MGF's view, Manitoba Hydro is managing the project and GCC as if it were a lump sum or unit rate contract.

According to MGF, Manitoba Hydro needs to take back control of the project by enforcing its rights under the GCC and holding BBE accountable for its performance, hiring experienced trades supervisors to work with and assist BBE with planning the work in a more efficient manner, understanding why planned progress is consistently not achieved, and recasting forecast at completion costs based on a realistic and achievable schedule. MGF further opines that, if Manitoba Hydro continues to stand back and watch the project unfold as if it were a lump sum contract, then the final cost will be closer to $10.5 billion, rather than $9.5 billion, which MGF views as the lowest final cost that Manitoba Hydro can achieve. Unless changes are made, MGF is of the view that BBE's poor performance will continue.

MGF also recommends that Manitoba Hydro initiate periodic contract compliance reviews. According to MGF, BBE is not complying with certain terms of the GCC. For example, BBE is consistently late in providing Manitoba Hydro with monthly progress reports. Another example is BBE's schedule has over one thousand activities with 'negative float' (i.e. activities that have not or will not meet a scheduled or specifically identified date) while the GCC requires the schedule to have no negative float.

Manitoba Hydro's Position

Manitoba Hydro states that due to the state of the competitive market across North America for major project construction work in the 2012 to 2013 timeframe, and after meeting with several contractors prior to release of the tender, it decided to tender the GCC as a cost reimbursable-target price contract instead of as a unit price or fixed price contract. There were dozens of major construction projects underway at the time across North America, including oil sands and liquefied natural gas projects. Manitoba Hydro's assessment of the marketplace was that major project general contractors would not be receptive to "hard money" contracts - that is, contracts that transferred significant risks to the contractor by requiring a firm price, either through a fixed price or unit prices. Manitoba Hydro points to its experience with the Wuskwatim generating station where it attempted to tender a unit price contract but received only one bid which was nearly double the price Manitoba Hydro expected. Manitoba Hydro further stated that the unit price bid for the Wuskwatim general civil contract was higher than the final actual costs under the cost reimbursable-target price contract.

Manitoba Hydro has a current control budget for Keeyask of $8.7 billion. Manitoba Hydro argues that it has a strong plan in place to meet this control budget, and is working cooperatively with BBE to do so.

Manitoba Hydro indicates that, to meet or be under its $8.7 billion control budget, it requires a 10% improvement in productivity in each aspect of the GCC starting in 2018, as well as for no major negative risks to materialize. Those major risks include unseasonable weather, unexpected geotechnical or geological conditions (including as the geotechnical conditions in the area of the south dam have not yet been ascertained), and work stoppages. If Manitoba Hydro does not achieve a 10% improvement in productivity starting in 2018, the final cost of Keeyask will exceed $9 billion and will approach $9.5 billion. In order to drive a 10% improvement in productivity, Manitoba Hydro states that it continues to work with BBE to develop work plans for the 2018 construction season. Manitoba Hydro has also retained former contractors to review and test the work plans developed by Manitoba Hydro and BBE, a process known as a “cold eyes” review.

Manitoba Hydro states that BBE has not performed to the original plan or the plan under Amending Agreement 7. Manitoba Hydro further states that, if it were to do the Keeyask GCC all over again with hindsight, it would take a hard look at the marketplace and decide whether a cost reimbursable-target price contract was the appropriate pricing structure for the GCC.

Amending Agreement 7 is also a cost reimbursable-target price contract, so there is the possibility that after another construction season Manitoba Hydro and BBE may be in the same position as after 2016 where there is no longer any profit for BBE. If that happens, there would be no incentive or motivation for BBE to perform under the contract, leaving Manitoba Hydro in the same position as after the 2016 construction season and contemplating whether to renegotiate the contract. Such an eventuality was contemplated by Manitoba Hydro during negotiation of Amending Agreement 7, so Manitoba Hydro attempted to narrow the possibility of this occurring. The details of how Manitoba Hydro attempted to do this are commercially sensitive and confidential and were disclosed to the Board in camera.

Intervener Positions

The control budget amounts for revenue requirement purposes were not contentious in the proceeding, although the Consumers Coalition and the Manitoba Industrial Power Users Group recommend further review of the Keeyask budget following the 2018 construction season. With respect to the Keeyask budget, the Manitoba Industrial Power Users Group argues that it is premature at this time to conclude that further cost overruns, compared to the estimates used in MH16 Update with Interim, are sufficiently likely for the purpose of inclusion in Integrated Financial Forecast projections.

Board Findings

The Board finds that the $8.7 billion control budget amount incorporated by Manitoba Hydro into MH16 Update with Interim for Keeyask is to be used for Integrated Financial Forecast modeling and rate setting in this GRA.

The control budget for Keeyask will be reviewed at the next and future GRAs in the Board's consideration of Manitoba Hydro's revenue requirement. There are four more years of construction for Keeyask and there are opportunities for unforeseen issues to arise. One potential issue is the geotechnical condition of the south channel of the Nelson River, which will not be ascertained until the river is diverted through the spillway and the south channel cofferdam is completed. To achieve the $8.7 billion control budget no major geotechnical issues can be encountered in the area of the south dam.

The Board acknowledges that Manitoba Hydro has taken steps to mitigate schedule issues and productivity, including through retaining Boston Consulting Group, KPMG, Revay, Validation Estimating, and Borden, Ladner, Gervais LLP for recommendations. There was evidence in the GRA that Manitoba Hydro has achieved milestones in the construction of Keeyask, including that the project is on track to meet the schedule for diverting the river through the spillway to permit work to be done on the south dam. The Board's expectation is that Manitoba Hydro will closely monitor and take steps to improve productivity in order to achieve the 10% improvement in productivity on all aspects of the GCC required to meet the $8.7 billion control budget. The Independent Expert Consultants, MGF and KCB, made useful recommendations that Manitoba Hydro should consider implementing, and indeed, in part already has implemented. This will help Manitoba Hydro use the four years left remaining on the Keeyask project to stay on track with the schedule and budget. Manitoba Hydro is directed to report to the Board, at the next GRA, the extent to which it has implemented these recommendations and the results.

The Board expects Manitoba Hydro to take the actions it identified in its evidence at the GRA Hearing, namely to work with BBE to plan the work in 2018 to drive productivity improvements and to bring in external expertise for a "cold eyes" review of the project to test the proposed work plans.

The Board concurs with MGF and KCB that the primary root cause of the cost overrun of the GCC, and the whole Keeyask project, relates to the nature of the cost reimbursable payment structure in the GCC. Manitoba Hydro appears to have assumed that tying the contractor's profit to the target price, with the possibility that the profit could erode to zero, would provide sufficient motivation to the contractor to meet the productivity levels in its GCC bid. It further appears that Manitoba Hydro never contemplated that the contractor's profit could erode to zero so early in the project. However, underpinning the reason for the profit eroding to zero so early in the project was the fact that BBE bid productivity levels that proved to be unachievable. While Manitoba Hydro performed an evaluation of the productivity levels bid by BBE, the Utility accepted the bid, which was ultimately unachievable and formed the basis for an unrealistic target price. Once the profit eroded to zero, with no chance of re-establishing profit, the contractor had little or zero motivation to advance the project expediently. This was a principal failing of the original GCC.

The evidence of Manitoba Hydro, MGF, and KCB was to the effect that in the planning for Keeyask and the preparation of the contract tendering documents, Manitoba Hydro was able to determine with remarkably high precision the quantities of concrete and earthworks (i.e. dams and dykes) that needed to be supplied and constructed. With hindsight, a unit price contract would have been more appropriate as it would have shifted the risk of labour productivity to the contractor while Manitoba Hydro retained the quantity risk. The Board recognizes that Manitoba Hydro had a negative experience when trying to tender the Wuskwatim GCC. Understandably, contractors are not willing to assume the risk for geological conditions and unknown quantities of excavation when bidding on construction projects.

The Board concludes that, had Manitoba Hydro exercised more effective oversight of BBE from the beginning, the current cost overruns may have been mitigated. As MGF observed, Manitoba Hydro is not a construction manager and it appears that it did not have the expertise or the awareness of how to manage a cost reimbursable contract.

5.2 Bipole III

The Bipole III Transmission Line is a reliability project that consists of:

- five 230 kV alternating current power lines, which are the outlets for the power from the northern generating stations,
- the Keewatinohk converter station, located approximately 80 km northeast of Gillam, Manitoba, which converts the alternating current into direct current,

- the Bipole III high voltage direct current ("HVDC") transmission line, a 500 kV line that is approximately 1,385 km in length,
- the Riel converter station, located east of Winnipeg, which converts the direct current power back to alternating current power for use in the domestic system or for further transmission south to be exported.

Manitoba Hydro had been considering the need for Bipole III since at least the 1980s. A wind event in September 1996 damaged 19 Bipole I and II towers and interrupted the delivery of power from its Lower Nelson River generating stations. Following that event, Manitoba Hydro began planning in earnest additional high voltage direct current transmission options to provide redundancy and increase the reliability of power supply. Initially, only a separate Bipole III transmission line was considered by Manitoba Hydro, routed down the east side of Lake Winnipeg in order to provide physical separation between the existing Bipoles I and II and the new Bipole III. As discussed elsewhere in this Order, the routing was changed to west of Lake Manitoba which necessitated the inclusion of converter stations at the northern and southern terminuses due to the longer length of the transmission line and the resulting inability of the existing HVDC converter stations to operate with the longer line. With the construction of Keeyask and any other future northern generation, additional HVDC converters are required to bring the full power of the new generation to southern Manitoba. Therefore, a transmission line-only option was no longer feasible.

Bipole III is nearing completion, with a scheduled in-service date of July 2018, at a final cost of $5.04 billion. The cost estimates for Bipole III have dramatically increased over the years since the western routing for the line was established. The following table shows the escalation of the western route Bipole III costs – including converter stations – through the years as specified in Manitoba Hydro's capital expenditures forecasts ("CEF").

Western Route Bipole III In-Service Cost Estimates - Capital Expenditure Forecast ("CEF") ($millions)					
CEF06	CEF07 to CEF10	CEF11 to CEF12	CEF13	CEF14 to CEF15	CEF16
1,880	2,248	3,280	3,341	4,653	5,042

The $1.88 billion estimate in 2006 was described in the capital project justification by Manitoba Hydro as a "placeholder". The revision to the capital project justification by Addendum 05 in CEF07 increased the cost by $368 million to $2.25 billion due to:

- an increase in the line length of 45 km in addition to the increase in line length arising from the western routing,
- increased transmission line material costs due to market price increases,
- increased transmission line construction costs as experienced by Manitoba Hydro on recent transmission line projects, such as the Wuskwatim-Birchtree line, and
- increases in interest and escalation charges.

Notably, capital expenditure forecasts CEF06 through CEF10 appear to use HVDC converter equipment estimates developed by an external consultant in 2001, meaning the largest component of the project did not have a current cost estimate. In the current control budget, the converter stations are approximately 55% of the total cost. These capital expenditure forecasts also did not include any amounts for contingency and assumed many of the converter station site development costs were included in other projects such as the Conawapa generating station and the Riel 500 kV sectionalization project.

In 2009, Manitoba Hydro prepared a revised Bipole III cost estimate of $3.95 billion, an increase of $1.71 billion. The increase was due to re-estimates of the transmission line and converter station costs, the inclusion of contingency at 15% of the base costs, the inclusion of costs previously assumed to be included in other projects, and changes in interest and escalation charges. This estimate assumed line-commutated converter ("LCC") technology, which in turn required four synchronous condensers at Riel station. This estimate, while approved by the Vice Presidents of Transmission and Power Supply, was not approved by the Manitoba Hydro Executive.

After Manitoba Hydro commissioned an estimate by an external consultant in 2010, Manitoba Hydro projected a Bipole III cost of $3.28 billion, which was reflected in CEF11 and approved by the Executive. The most significant changes were the inclusion of voltage source conversion technology instead of LCC technology and the elimination of synchronous condensers at Riel station, as well as substantial reductions in the contingency for the transmission line and converter stations. This estimate included a contingency of $205 million, representing 6% of transmission line base costs and 11% of converter station base costs, compared to the previous $525 million contingency.

The next revision to the Bipole III project cost estimate occurred in October 2014, with an increase to $4.65 billion due to:

- receipt of the HVDC converter station bids in March 2014 which provided firm, fixed pricing to refine Manitoba Hydro's internal estimates. Other contracts were finalized and incorporated into the revised estimate;
- HVDC converter station suppliers were only willing to provide LCC technology converters, necessitating the need for synchronous condensers. Manitoba Hydro had assumed that HVDC suppliers would bid the newer voltage source conversion technology which did not require synchronous condensers;
- finalization of the transmission line route according to Clean Environment Commission recommendations;

- an increase in the capacity of the HVDC converters to 2300 MW, in case additional generation is added in the future;
- a delay in the in-service date from October 2017 to July 2018;
- updated land acquisition costs;
- inclusion of the Community Development Initiative; and
- an increase to the transmission line contingency and the inclusion of a management reserve.

As explained by the Board in Order 73/15:

> *Manitoba Hydro was initially optimistic that it could utilize lower-cost voltage-source conversion (VSC) technology in the Bipole III converter stations. However, while vendors initially indicated that the use of this technology was feasible, they ultimately were not prepared to design and provide VSC technology, resulting in a requirement for line-commutated converter (LCC) technology and synchronous condensers to meet performance requirements.*
>
> *Manitoba Hydro advised that the three bids for High Voltage Direct Current (HVDC) conversion equipment closed on March 20, 2014. All bids were based on LCC technology. Manitoba Hydro completed its technical review of the proposals by June 20, 2014. The revised control budget was prepared in August of 2014 and approved by Manitoba Hydro's executive committee in August 2014. Manitoba Hydro indicated that it did not advise the Board of cost increases during the NFAT since it took several months to prepare the control budget.*

The $4.65 billion estimate was the final pre-construction estimate prepared by Manitoba Hydro. It is comprised of contracts with varying payment structures, including fixed price (HVDC converter equipment), unit price (transmission line tower foundations, towers, and conductor stringing), and cost reimbursable (camp operations) arrangements.

Of the cost increase from $4.65 billion to $5.04 billion, $106 million is due to increased HVDC converter station costs and $302 million is due to increased transmission line costs, partially offset by decreases in the Bipole III collector transmission lines and Community Development Initiative. The main reasons for these increases are as follows:

- Increased contingency to address a greater number or consequence of risks;
- Costs related to highway upgrades and the access road to the Keewatinohk converter station which were transferred from the canceled Conawapa project to Bipole III;
- Additional payments to a reserve as specified by a letter of agreement amendment to the Burntwood-Nelson Agreement;
- An increase to the HVDC converter station costs due to commodity (copper, steel, concrete) price escalation;
- Increased transmission line construction costs due to higher actual costs for anchors and foundations than anticipated, delay claims due to weather and material shortages, schedule compression using helicopters to assemble towers and string conductors, and increased costs related to biosecurity;
- Increased transmission line property acquisition costs; and
- Increased vehicle costs.

Independent Expert Consultant Evidence

Amplitude found the costs of the HVDC converter stations and the synchronous condensers to be reasonable. On a cost per megawatt basis, the Bipole III converter stations are within the range of the costs of other converter stations in Canada and internationally, although at the high end of the range. Amplitude explained that this is reasonable given the remote location of the Keewatinohk converter station, that there are two valve groups per pole compared to one for the comparison stations, and the extreme weather and environmental conditions experienced during construction. Amplitude similarly determined that the Riel synchronous condensers are within the range of other recent projects but at the high end of the range.

MGF found Manitoba Hydro's cost estimating methodologies (with respect to the $4.65 billion and $5.04 billion estimates) are consistent with industry standard and best practices. Manitoba Hydro prepared a Basis of Estimate which, in MGF's view, was extremely well done. MGF found Manitoba Hydro's approach to market, tendering of contracts, and contracting methodologies were appropriate.

MGF found the potential for a cost overrun on the HVDC converter stations to be low, due to the fact that most of the remaining work is being performed under fixed price contracts. MGF expects Manitoba Hydro will deliver the transmission line within the estimated cost.

MGF found that Manitoba Hydro has managed the project well. MGF's view is that the project is on schedule but some critical path activities are slipping, specifically work to complete tower erection and conductor stringing. Manitoba Hydro advises that it has addressed this schedule slippage by removing this scope of work from the under-performing contractor and contracting with another construction company to complete this work prior to the end of the 2017/18 winter construction season.

MGF recommends improvements for Manitoba Hydro's estimating processes on future projects, such as having the estimate team prepare the estimate with input from each department and providing supporting back-up and more detailed explanation outlining the structure and relationship between the physical scope of work and resources. MGF also suggested that a higher contingency, such as a P95 contingency, be used when evaluating the business cases of future projects.

Manitoba Hydro's Position

Manitoba Hydro submits that Bipole III is on schedule for a July 2018 in-service date and is on target to be completed within the $5.04 billion control budget.

Manitoba Hydro states that the remaining risks to Bipole III relate to schedule and not cost, as the remaining work is predominantly under fixed price or unit price contracts. As such, while the in-service date may slip from July 2018, the cost should not exceed $5.04 billion. The remaining risks include weather, transmission line contractor performance in erecting towers and stringing conductors, delays in delivery of the final synchronous condenser transformer, and commissioning of the system.

Intervener Positions

The Consumers Coalition states that Manitoba Hydro's proposed use of voltage source conversion technology for the HVDC converters, as was anticipated in the $3.28 billion cost estimate prepared in 2011, represented a high-risk decision based on new technology that had not been executed at that time. The Consumers Coalition notes that all three HVDC converter equipment vendors rejected voltage source conversion technology in their bids.

Bipole III Western Versus Eastern Routing

In 2005, Manitoba Hydro was instructed by the provincial government to consider a western routing of Bipole III. In the capital project justification prepared by Manitoba Hydro's Transmission business unit and approved by the Manitoba Hydro Executive, Manitoba Hydro identified several reasons why a western routing was inferior:

- Technically inferior solution to the eastern-routed Bipole III line with converters; less load served on average in situations for which the line is to be built.
- Less reliable solution since the west side scheme would still only provide an outlet of 2000 MW of northern generation in the event of another Bipole I & II corridor outage, while an east side Bipole III line would allow the paralleling of Bipole I & II converters on the Bipole III line providing the outlet of 3300 MW of northern generation. Also, the longer line length associated with a western route increases exposure to outages on Bipole III.
- A delayed ISD [in-service date] over an eastern routed line, placing Manitoba customers at greater risk for a longer period of time. A western line will likely take longer for conducting environmental assessment/public work consultation and will take more time to build. The earliest date for initiation of environmental work is after the October 2006 recommendation of an alternative to the east of Lake Winnipeg Bipole III line.
- Justification at a public hearing by Manitoba Hydro of the westerly routing concept vs. an easterly route concept will be problematic.
- Although 1265 km is used as a proxy minimum for the line length, it is likely the actually built line will be considerably longer with more cost and losses, due to efforts to maximize separation from the existing HVDC right of way.
- The siting of Bipole III in a western corridor would make the placement of the next north/south transmission line very problematic with the east of Lake

Winnipeg routing being blocked and the Interlake routing presenting significant risk of a common mode outage.

In 2007, the provincial government finalized its policy decision to build Bipole III with a western routing, rather than the previously planned eastern routing. In its September 20, 2007 letter to the Manitoba Hydro Electric Board, the Government explained as follows:

> *The Manitoba Government does not regard an east side Bipole III as being consistent with these commitments and initiatives. We recognize the importance of the Bipole III initiative to improving system reliability and accommodating future northern generation. We would encourage the corporation to move ahead with required consultations and planning for an alternative Bipole Ill route.*

With this letter, the provincial government eliminated the eastern route from consideration and mandated that Manitoba Hydro consider alternate routings. Manitoba Hydro had already eliminated the Interlake route because of its proximity to Bipoles I and II. Consequently, the western route was the only route considered by Manitoba Hydro to be feasible. The resulting change to the western routing gave rise to the consequent increase in capital cost associated with the longer western route, although the western routing is technically inferior and leaves Manitoba Hydro customers at greater risk of power outages.

In Order 116/08, the Board noted additional inferiorities with the western routing:

> *While an East Side Bipole III could function in parallel with existing Bipoles I and II, and in the event of the outage of both, make use of Bipoles I and II converters as well as the new Bipole III converters to provide 3,000 MW to the south, a West Side Bipole III would be limited to using only its own converters and thus could only provide the South with 2,000 MW in such a situation. MH advised that an outage of Bipoles I and II during the summer season could result in an additional cost to the Corporation of $160 million over the cost that would be incurred if*

Bipole III were built down the east side, the extra costs due to a requirement for additional imports to make up for the 1,000 MW differential.

In short, during a major outage of both Bipole I and II, an East Side Bipole III could serve both domestic and firm exports, while a West Side Bipole III would require significant additional needs and presumed expensive imports to meet domestic needs and firm exports.

Boston Consulting Group identified the increased costs of a western routing as $900 million.

Along with the existing routing of Bipoles I and II, the western and eastern routings of Bipole III are shown in the following map:

Board Findings

The Board finds that the $5.04 billion control budget amount incorporated by Manitoba Hydro into MH16 Update with Interim for Bipole III is to be used for Integrated Financial Forecast modeling and rate setting in this GRA.

The Board agrees with the Consumers Coalition that Manitoba Hydro undertook unreasonable risk when it developed its $3.28 billion Bipole III cost estimate in 2011. It appears that Manitoba Hydro had rejected its 2009 internal cost estimate of $3.95 billion, based on what was referred to as the “classic” LCC technology, in order to try to take advantage of new, unproven voltage source conversion technology. The Board finds that Manitoba Hydro compounded this risk by significantly reducing the contingency amounts. Exploring options to use new, improved technology should not be avoided. However, the Board concludes that when estimating costs for a project that includes new, unproven technology, the contingency amounts should be increased, not decreased as was done by Manitoba Hydro.

During the NFAT, Manitoba Hydro did not inform the Board that all the HVDC converter equipment vendors had bid LCC technology and had rejected the riskier voltage source conversion technology. However, as the Board concluded in Order 73/15, Manitoba Hydro at that time was in a position to know that its $3.28 billion cost estimate – which included a cost for converter stations of $1.83 billion – was not realistic and that a cost estimate approaching $4 billion was realistic.

The provincial government excluded Bipole III from the scope of the Board review at the NFAT; however, all of the development plans considered at the NFAT included Bipole III at a projected cost of $3.28 billion. The Board finds that, had a more realistic cost of Bipole III been used in the financial analyses, Manitoba Hydro’s debt under all development plans would have been higher and would be closer to the current projections of debt, as discussed in other sections of this Order.

The Board finds that the $5.04 billion estimate of the final cost of Bipole III is $900 million higher due to the western routing of the line compared to an eastern routing. The Board finds that this was a policy decision of government that should be a cost to taxpayers, not Manitoba Hydro's ratepayers. The Board's recommendation is that the payments Manitoba Hydro makes to the Government related to Bipole III be reduced until the $900 million burden is satisfied, as discussed in another section of this Order.

5.3 Manitoba-Minnesota Transmission Project and Great Northern Transmission Line

The Manitoba-Minnesota Transmission Project ("MMTP") is a single circuit, 883 MW, 500 kV alternating current transmission line starting at the existing Dorsey Converter Station northwest of Winnipeg and connecting at the Manitoba-Minnesota border to the Great Northern Transmission Line ("GNTL"), a new transmission line proposed by Minnesota Power terminating at a new station near Grand Rapids, Minnesota. Together, MMTP and GNTL form a new interconnection between Manitoba Hydro and the Midcontinent Independent System Operator market in the northern United States. MMTP and GNTL facilitate a 250 MW power sale to Minnesota Power beginning June 1, 2020 and ceasing May 31, 2035. MMTP and GNTL were reviewed at the NFAT proceeding. In its NFAT report, the Board recommended these projects proceed.

GNTL is being built in Minnesota by Minnesota Power. Manitoba Hydro, through its wholly-owned subsidiary 6690271 (Manitoba) Ltd., exercises oversight of the construction of GNTL through a Construction Management Agreement with Minnesota

Power. The Agreement grants 6690271 consultation and veto rights over construction decisions. GNTL has received all of its necessary permits for construction.

Manitoba Hydro is responsible for 100% of the construction, operating, and capital maintenance costs of the MMTP. Minnesota Power will fund 28% of the GNTL construction costs, based on the proportion of 883 MW total transmission capacity needed for the 250 MW Power Sale Agreement. Manitoba Hydro will fund the remaining 72% share. Manitoba Hydro is further responsible for 66.7% of the GNTL operating costs. Minnesota Power is responsible for 100% of the GNTL sustaining capital costs.

The new interconnection provides many benefits to Manitoba Hydro, including:

- additional import capacity of 700 MW; the additional winter import capacity allows deferral of new generation by one year,
- reduced import costs by allowing Manitoba Hydro to purchase power at the Minnesota trading hub, avoiding transmission line congestion that can push prices up at the MHEB trading node by 2% to 5% when Manitoba Hydro is importing power,
- improved energy security, emergency response, and reliability benefits in event of drought through increased access to imported power,
- additional export capacity of 883 MW, sufficient to sell the full exportable capacity of Keeyask to the Midcontinent Independent System Operator market under firm transmission,
- economic benefits in average and high flow years as Manitoba Hydro can export more power during more lucrative peak periods and spill less water when the existing interconnection would otherwise be at its maximum export limit, and

* increased prices for exported power through improved bilateral transmission access to the Wisconsin market as well as ability to sell power at the Minnesota trading hub, avoiding congestion and improving prices by 2% to 5%.

Since the NFAT in 2014, the capital cost estimates for MMTP and GNTL have increased. At the NFAT, MMTP was forecast to cost $350 million; Manitoba Hydro now estimates MMTP to cost $453 million. In 2014, GNTL was forecast to cost US$712 million in 2020 dollars. The current cost estimate is confidential and commercially sensitive and was reviewed by the Board *in camera*.

Manitoba Hydro completed the MMTP environmental permitting process before the Clean Environment Commission in 2017 and is awaiting a licence from the provincial government. In late 2017, the National Energy Board ("NEB") ruled that Manitoba Hydro must proceed with a certification process and not a permitting process, adding some additional cost. The in-service date for MMTP is June 1, 2020, coincident with the commencement of the Minnesota Power 250 MW power sale agreement. Manitoba Hydro indicated that it did not anticipate the NEB certification process would delay the in-service date, but that may be contingent upon obtaining a decision from the NEB prior to that regulator's March 2019 decision deadline.

MGF found the cost estimate for MMTP to be reasonable, although the estimated cost is low compared to a benchmark of similar transmission line projects.

MGF recommended that Manitoba Hydro prepare a Basis of Estimate to support the MMTP cost estimate. Preparation of a Basis of Estimate is an industry best practice that helps define the project scope, identifies risks and opportunities, provides a record of documents used in development of the estimate, provides a record of communications made during development of the estimate, and facilitates the review and validation of the estimate.

MGF found MMTP to be on schedule, although MGF identified some issues with the excessive complexity in some schedule areas, insufficient detail in other areas, and problems with the logic of the schedules. MGF recommended that Manitoba Hydro update the construction schedule for MMTP more frequently than every two months, which has been Manitoba Hydro's past practice, once construction commences.

MGF found the cost estimate for GNTL to be high compared to a benchmark of similar transmission line projects and high compared with MMTP. MGF recommended that an updated estimate be prepared.

MGF found that the Construction Management Agreement between Minnesota Power and Manitoba Hydro's subsidiary 6690271 Manitoba Ltd. adequately protects the interests of Manitoba Hydro.

Manitoba Hydro's Position

Manitoba Hydro advises that, although still in relatively early stages, both aspects of the United States interconnection project are on schedule and on budget, with a budget of $453 million for the Manitoba portion of the new interconnection.

Board Findings

The Board finds that the $453 million control budget amount for the Manitoba-Minnesota Transmission Project and Manitoba Hydro's currently forecast portion of the Great Northern Transmission Line project cost are to be used for Integrated Financial Forecast modeling and rate setting in this GRA. The Board expects that Manitoba Hydro will exercise effective management oversight, including with respect to schedule updates and schedule quality.

The Board recommends that, as suggested by MGF, Manitoba Hydro update the MMTP schedule more frequently than every two months once construction begins, especially considering the potential for a delay impact due to the National Energy Board licensing and certification process for MMTP. Manitoba Hydro is to consider implementing the recommendations made by MGF and report to the Board at the next GRA whether and the extent to which it has implemented these recommendations.

5.4 Manitoba-Saskatchewan Transmission Project

The Manitoba-Saskatchewan Transmission Project is a new 230 kV transmission line that runs from Birtle, Manitoba to Tantallon, Saskatchewan. The Manitoba portion of the line is approximately 44 km in length and together with associated upgrades to Manitoba Hydro's transmission system is expected to cost $57 million.

The line is being constructed to facilitate a 100 MW export power sale from Manitoba Hydro to SaskPower Corporation. The power sale agreement begins June 1, 2020 and ceases May 31, 2040. The pricing terms of the power sale agreement are confidential and commercially sensitive but were disclosed to the Board at an *in-camera* hearing. Manitoba Hydro indicates that the environmental attributes, such as carbon-free energy produced by Manitoba Hydro's hydroelectric generating stations, are transferred to SaskPower. The price paid by SaskPower includes these environmental attributes as there is no explicit pricing of environmental attributes.

In 2015 and 2016, prior to signing the contract with SaskPower, Manitoba Hydro evaluated the economics of the power sale agreement against the capital and operating costs of the new transmission line. The economic analysis showed that it was in Manitoba Hydro's interest to proceed with the power sale and construction of the transmission line. As this power sale agreement required the construction of new facilities, approval of the provincial government was sought and obtained through Order in Council.

The power sale agreement was signed in January 2016. The transmission line is currently in the design and licensing phase. Manitoba Hydro anticipates that the transmission line will require a Class 2 environmental assessment. A licence from the provincial government is expected in the second quarter of 2019. The transmission line is expected to be in service in the second quarter of 2021. This is one year after commencement of the power sale agreement. Manitoba Hydro and SaskPower have made alternative arrangements for the period prior to the transmission line entering service.

Daymark Energy Advisors found that, with updated information, the economic analysis indicates that it is still in Manitoba Hydro's interest to proceed with the project.

Board Findings

The Board finds that the $57 million control budget amount incorporated by Manitoba Hydro into MH16 Update with Interim for the Manitoba-Saskatchewan Transmission Project is to be used for Integrated Financial Forecast modeling and rate setting in this GRA.

The Board finds that the power sale agreement and transmission line project remain economic at this point in time. The Board supports Manitoba Hydro's decision to develop firm export sales to other Canadian jurisdictions including to the west.

6.0 Business Operations Capital

Manitoba Hydro prepares a projection of the capital expenditures needed annually for new and replacement equipment and facilities to meet the electricity requirements in Manitoba and firm export sale commitments outside the province. For Manitoba Hydro's fiscal years ending March 31, 2018 and March 31, 2019, total capital expenditures for its electric operations are forecast to be $3.0 billion and $2.6 billion, respectively.

Historically, and until its most current Capital Expenditure Forecast, Manitoba Hydro had three primary categories of capital projects:

1. "Major New Generation & Transmission Projects", such as Keeyask and Bipole III, which increase capacity and energy or provide increased reliability. In this context, increased reliability refers to reliability that was not previously inherent in the system. For example, replacement of an asset that restores the original or "new" reliability is not typically classified as Major New Generation & Transmission.

2. "Major Capital Projects", the category for larger expenditures, typically in excess of $50 million and with a construction period that usually extended beyond one year, which are not classified as Major New Generation & Transmission projects.

3. "Base Capital Expenditures", also previously referred to as Sustaining Capital, the category for numerous, unspecified projects below the $50 million threshold. These typically represent expenditures to renew existing assets and facilities (also referred to as "sustainment") replacements, to expand the electrical system to new customers, and to address load growth and requirements for additional capacity.

Under Manitoba Hydro's new management and the most current Capital Expenditure Forecast, capital expenditures are divided between Major New Generation & Transmission projects and Business Operations Capital projects, which combines the former categories known as Major and Base capital projects. Under the new approach, Major New Generation & Transmission projects are those that provide significant new generation and transmission capacity and include projects of a substantial cost. Business Operations Capital projects address requirements to sustain electricity service through renewal of aging or obsolete assets, to expand the electrical system to new customers, to address load growth and requirements for additional capacity, and to enhance system performance and functionality.

Of Manitoba Hydro's $3.0 billion of total annual capital expenditures in fiscal 2018, approximately $526 million is forecast to be spent on Business Operations Capital. In future years, the forecast of Business Operations Capital spending is between approximately $500 million and $650 million each year, totaling approximately $13 billion by the end of the 20-year Capital Expenditure Forecast in 2036. Under the Board Act and the Hydro Act, the Board does not have legal jurisdiction to approve Business Operations Capital projects and spending, but only to consider the revenue requirement of those projects for rate-setting purposes.

Manitoba Hydro is an asset-intensive organization that has been managing assets for generations and it has identified the need to mature its asset management practices to maximize value from scarce funding. Due to the magnitude of the past and future Business Operations Capital spending, the Board has long supported the need for Manitoba Hydro to review its spending plans and priorities by incorporating more formal, mature asset management processes.

Asset management involves the balancing of costs, opportunities, and risks against the desired performance of assets to achieve the organizational objectives. Manitoba Hydro defines asset management as the framework of processes and metrics used to make asset life cycle decisions, including operating context (duty cycle), maintenance schedules, and replacements or upgrades in accordance with corporate priorities and risk tolerances to maximize value. In its simplest terms, asset management means providing the required level of service in the most cost effective manner - the “right” work undertaken to achieve the desired performance outcomes in the most efficient and financially responsible manner. Mature and competent asset management enables the application of analytical data-driven approaches to managing assets over the different stages of their life cycle.

In prior Orders, including 116/08 and 73/15, the Board directed Manitoba Hydro to develop asset condition assessments, which are a necessary component of mature asset management processes. Asset condition assessments provide the data necessary with which to make informed asset management decisions. Manitoba Hydro has since developed asset condition assessments and health indices for many of its asset classes, however there are still many asset classes for which there are no condition assessments and the corresponding health indices are based solely on the assets’ ages.

In a comparison of Canadian Electricity Association members, Manitoba Hydro ranks in the top quartile for reliability when compared to rural Canadian utilities and in the second when compared to urban utilities. Manitoba Hydro surveys its customers four times a year for their level of satisfaction with the reliability of their electricity service as well as the price. Since 1999, customers have expressed high levels of satisfaction with reliability, while satisfaction with the price is lower. Manitoba Hydro has more limited survey data concerning customers' preferences for paying higher rates in order to reinvest in Manitoba Hydro's system and maintain the historical high levels of reliability. A 2014 survey indicated that two-thirds of the customers surveyed opposed annual rate increases of 4% to invest in modernizing Manitoba Hydro's system and add generating capacity.

6.1 Manitoba Hydro's Position

In this GRA, Manitoba Hydro identified the need to improve its asset management practices to maximize the value from limited funding. While the Utility is developing more advanced and mature asset management processes, it reports that it is at least three to five years away from being in a position to use these processes in developing its Capital Expenditure Forecast. The proposed spending in the 2016 Capital Expenditure Forecast, which is incorporated into the Integrated Financial Forecast, is based on Manitoba Hydro's long-standing capital planning processes and assumes that historical spending trends will continue into the future.

Manitoba Hydro is developing its new Asset Management Framework in three phases:

- Phase 1: assessment of current asset management practices, through a "gap assessment" performed by UMS Group Inc., an external consultant engaged by Manitoba Hydro in September of 2016;
- Phase 2: development of asset management policies and strategies. Implementation of Phase 2 has not commenced due to competing organizational priorities and the reduction of resources as a result of the Utility's Voluntary Departure Program. A timeline for initiating Phase 2 and has not been finalized although it is expected to be in 2018; and
- Phase 3: development of a detailed 'roadmap' for the implementation of a corporate asset management framework at Manitoba Hydro.

Manitoba Hydro implemented a software tool called Copperleaf C55 (“C55”) to assist with asset management, and engaged Copperleaf Technologies Inc. to help with the development of an initial Corporate Value Framework. The purpose of the Corporate Value Framework is to help Manitoba Hydro understand the value of investments and to identify the optimal set of investments across the different business units (Generation, Transmission, and Distribution) which deliver the greatest value.

According to Manitoba Hydro, all Test Year system renewal investments are condition-driven and reasonably required for the safe and reliable operation of the system. However, Manitoba Hydro also gave evidence that $160 million of capital spending proposed for the 2018/19 Test Year could be deferred. Manitoba Hydro states that a deferral of this magnitude cannot be repeated in future years.

6.2 Intervener Positions

The Consumers Coalition highlights the fact that Capital Expenditure Forecast CEF16 is based on Manitoba Hydro’s historical capital planning processes, not the asset management processes being developed. The Consumers Coalition states that the competence rating given to Manitoba Hydro in the UMS assessment applies to the asset management processes that the Utility is proposing to implement, not the processes that underpin CEF16 and the Test Year spending.

The expert witness retained by the Consumers Coalition, METSCO Energy Solutions (“METSCO”), was critical of Manitoba Hydro for implementing the C55 software prior to the development of the asset management roadmap and in advance of Manitoba Hydro understanding how the software will be used and what it will achieve.

The Consumers Coalition further submits that, while Manitoba Hydro engineers know their system and deliver good reliability results, the Utility has not demonstrated that it does so in a cost effective manner. Manitoba Hydro may not be doing the right project at the right time. The Consumers Coalition states that Manitoba Hydro does not have a consistent definition of risk that can be used across the three business units: Generation, Transmission, and Distribution. The Utility also does not have a means of planning and prioritizing capital spending across the different business units or across the different geographical areas it serves. For example, Manitoba Hydro may be spending on a Transmission project when the greater need and the greater reliability benefit may be realized with a Distribution project.

In addition, the Consumers Coalition argues that Manitoba Hydro has underspent on Business Operations Capital by 18% over the past three years compared to its planned spending, indicating that Manitoba Hydro's estimates for Test Year Business Operations Capital spending cannot be relied upon for rate setting purposes.

The Manitoba Industrial Power Users Group noted the assessment of the Boston Consulting Group that the equity ratio benefits from reduced spending on Business Operations Capital. In what was described by the Boston Consulting Group as a "Realistic 5-year Change", the deferral of low value capital projects totaling $100 million per year for five years shows a sustained benefit to the equity ratio through the year 2035 (i.e. the deferral was not depicted as a temporary change). In the view of the Manitoba Industrial Power Users Group, Manitoba Hydro has opportunities to reduce its Business Operations Capital spending, and has proven in the past that it is capable of reducing expenditures from forecast amounts.

6.3 Board Findings

The Board finds that, while in a period of major capital spending on Keeyask and Bipole III, Manitoba Hydro should find savings in Business Operations Capital.

The Board does not accept the Business Operations Capital spending forecast in Capital Expenditure Forecast CEF16. The Board does not accept that all Test Year investments are condition-driven and reasonably required for the safe and reliable operation of the system. The Board finds that Business Operations Capital spending can be safely decreased by $160 million, based on Manitoba Hydro's evidence that it can defer $160 million of spending in the Test Year. This is consistent with the Board's findings in Order 73/15 that Manitoba Hydro has not adequately evaluated the long-term pacing and prioritization requirements for Business Operations Capital spending. In that Order, the Board did not endorse Manitoba Hydro's long-term Business Operations Capital plan. The Board accepts the evidence that Manitoba Hydro can reduce the level of spending from its forecast and has shown that it has done so in the past, as with the Gillam Town Site Redevelopment project and with the lower spending in the past three years than was originally forecast.

Based on the suggestion of the Boston Consulting Group in its initial report that the spending reductions can be maintained over a longer period, this issue will be revisited at future GRAs. Reducing Business Operations Capital helps offset the expenditures on Keeyask, which are anticipated to mostly be complete by 2023. Reductions in Business Operations Capital result in a reduced need to borrow funds and will enhance Manitoba Hydro's cash flow. Furthermore, the additional reliability obtained from Bipole III and additional generating capacity from Keeyask mean Manitoba Hydro will have added system-level redundancy, reducing the need for non-critical generation investments.

In addition to the positive impact on Manitoba Hydro's cash flow, reducing Business Operations Capital also results in improvement to the debt-to-equity ratio. Manitoba Hydro's analysis also shows that a reduction of capital spending of $100 million annually increases its retained earnings by $414 million after 10 years.

The Board accepts METSCO's evidence that Manitoba Hydro cannot demonstrate the proposed spending is necessary or has been optimized to any extent. Manitoba Hydro acknowledges that it has not evaluated alternative Business Operations Capital spending scenarios or the performance and reliability impacts of different Business Operations Capital spending levels.

The Board recognizes that Order in Council 92/2017 does not give the Board authority to direct Manitoba Hydro to amend its planned Business Operations Capital spending. Rather, the Board has factored into its rate decision the reduction in Business Operations Capital of $160 million. Manitoba Hydro can decide whether to accept the Board's finding and reduce its Test Year Business Operations Capital spending, or to incur additional debt in order to maintain spending at the proposed levels in CEF16.

The reduction in spending on Business Operations Capital in no way diminishes Manitoba Hydro's responsibility and obligation to provide for an ongoing safe and reliable supply of energy to its customers in the most efficient and environmentally sensitive manner. The Board expects that Manitoba Hydro will appropriately assess, plan, and prioritize Business Operations Capital spending in order to meet its obligations in this regard.

The Board finds that Manitoba Hydro has taken initial steps towards developing asset management processes, and is to be commended for doing so in order to better ensure that the financial resources allocated to Business Operations Capital bring maximum value to the Utility's ratepayers. Further to the direction from Orders 116/08 and 73/15, Manitoba Hydro has developed asset condition assessments for some asset classes, but the health of certain asset classes is characterized solely by the age of the assets. Manitoba Hydro must continue to develop asset condition assessments for all of its major asset classes so that it has the necessary data to make prudent spending decisions within its asset management framework.

At present, Manitoba Hydro prioritizes its capital spending based on the views and experience of its subject-matter experts in Generation, Transmission, and Distribution. Manitoba Hydro has not yet developed processes and practices that would enable it to objectively compare the value of different projects across its business units, nor can Manitoba Hydro quantify in terms of increased reliability the impact of spending on a generation project compared to a transmission project compared to a distribution project. More mature asset management processes, including a more complete set of asset condition assessments, are required so that Manitoba Hydro is in a position to objectively prioritize and optimize its spending across business units based on a common definition of risk.

The Board understands that developing a modern asset management system takes time and wishes to monitor Manitoba Hydro's progress. Manitoba Hydro is directed to hire an independent consultant to assess the Utility's progress with the development of its asset management program and in addressing the recommendations made by its consultant, UMS. The consultant is to also assess progress with the development of the Corporate Value Framework. Manitoba Hydro is to file with the Board by June 29, 2018 the Terms of Reference for the consultant for the Board's review and comment. Manitoba Hydro is directed to report back to the Board on its progress and the result of the consultant's assessment at the next GRA.

The Board acknowledges the contributions from past and present Manitoba Hydro personnel in designing, constructing, and maintaining the electrical system. Clearly, with top quartile reliability, Manitoba Hydro has constructed, operated, and maintained an outstanding electrical system to the benefit of Manitobans. With this Order, the Board does not intend to diminish these contributions, but it does recognize the cost pressures that result from the capital program that includes Bipole III, Keeyask, and a new interconnection with the U.S. Those cost pressures mean that Manitoba Hydro can no longer continue to fund Business Operations Capital at its historic levels unless and until it can demonstrate through mature asset management processes that those investments are necessary.

7.0 Demand Side Management Spending

Demand side management is a common utility strategy for reducing consumer demand for energy in order to defer the need for new generation assets. Manitoba Hydro's Demand Side Management Plan, marketed under the Power Smart brand, involves various education and incentive programs aimed to reduce domestic consumption of both electricity and natural gas.

Manitoba Hydro combines the impacts of demand side management activities with the load forecast to represent the forecast net load, which is used to forecast domestic revenues in the Integrated Financial Forecast.

As noted above, *The Efficiency Manitoba Act* creates a new Crown Corporation, Efficiency Manitoba, which will have a mandate to provide demand side management programming. *The Efficiency Manitoba Act* requires annual net electricity energy savings of 1.5% of sales (compared to the previous year's weather-normal consumption) for the first 15 years of operation; however, this target can be changed by regulation. Until Efficiency Manitoba develops its long-term demand side management plan, Manitoba Hydro intends to carry forward its 2016/17 15-year Demand Side Management Plan, with one-year plans continuing to be developed.

Manitoba Hydro seeks to pursue all cost effective demand side management opportunities. The Utility assesses the cost effectiveness of demand side management programs against its marginal value of electricity. The assessment of the cost effectiveness considers the levelized resource cost of each program, taking into account, on a per kilowatt-hour basis, the combined incremental cost of the installed program plus any administrative costs associated with promoting the program. The marginal value is the value to the Utility's system of deferring an increment of load growth to Manitoba Hydro's integrated system.

Marginal value is determined based on each of the components of serving residential load: generation supply, bulk transmission capacity, and distribution capability. The transmission and distribution components are based on a one-year deferral of planned capital additions to meet ongoing capacity requirements. The generation marginal value is based on the value for each of generation capacity and generation energy. In 2017, Manitoba Hydro changed its methodology for calculating the value of generation capacity. Previously, generation capacity was valued using the potential for sales of capacity on the export market. Under the new methodology, Manitoba Hydro values generation capacity on the basis of the deferral of a new generation resource in Manitoba. Under the 2017 methodology, generation energy continues to be valued using the forecast price of energy sales on the export market.

In assessing each individual program, Manitoba Hydro considers the capacity and energy benefits over a period of time, including variations in marginal value by time of day, season, and year. As a result, a specific program may have a levelized cost that is higher or lower than the long-term average marginal value. However, in general terms, when the levelized cost of a program is below the marginal value, Manitoba Hydro considers the program cost effective. This means that, over the life of the program, there is an economic return to the Utility with respect to generation, transmission, and distribution benefits that arise from the energy savings achieved through the program.

The programs in the 2016/17 plan are measured against the 2015/16 levelized electric marginal value of 7.8 ¢/kWh. The planned levelized total resource cost of the individual electric demand side management opportunities, including both the customer's and Manitoba Hydro's investment, range from 1.1 to 13.6¢/kWh, with an average of

3.7¢/kWh for the portfolio of programs as a whole. The average levelized utility cost, or the cost of solely the Utility's investment levelized over a fixed time period, is 1.6¢/kWh for the entire electric demand side management portfolio.

During the course of the GRA proceeding, Manitoba Hydro filed updated marginal value information. The marginal value has decreased to 5.75¢/kWh for generation when serving residential customers. Although the marginal value has decreased by 28%, Manitoba Hydro does not plan to reassess the cost effectiveness of its demand side management programs under a total resource cost test because of the anticipated transfer of programming to Efficiency Manitoba.

Manitoba Hydro's 2016/17 15-year plan seeks to realize electricity savings of 1.2% of the annual average load over the next 10 years, with a Utility investment of $1.2 billion over the next 15 years. Manitoba Hydro's 2017/18 Demand Side Management one-year plan seeks to realize electricity savings of 238 MW and 310 GWh in 2017/18, with an electric utility investment of $58.7 million. Of that amount, $43.7 million was spent as of November 30, 2017. For the 2018/19 Test Year, Manitoba Hydro forecasts Power Smart electric capital and operating spending of $101.1 million for electric capital and operating spending.

The evidence is that demand side management spending exerts an upward pressure on consumer rates. Retained Earnings would be $4.2 billion greater by 2036 if no money was spent on demand side management and no energy savings achieved. While demand side management energy savings can be sold into the export market, there is currently a differential between domestic and export prices, which leads to lower overall revenues for Manitoba Hydro.

7.1 Manitoba Hydro's Position

Manitoba Hydro's position is that, while there continues to be uncertainty in how Efficiency Manitoba will pursue its mandate, it would be poor planning to arbitrarily reduce forecasted demand side management in the face of a legislative mandate that exceeds Manitoba Hydro's current plan. Manitoba Hydro argues that assuming savings on programming that is moving from Manitoba Hydro's control, but not its financial responsibility, is imprudent. Manitoba Hydro estimates that an additional $1 billion in Utility investment, over and above the currently planned $1.2 billion investment, is needed to meet *The Efficiency Manitoba Act* annual savings target of 1.5% of sales.

7.2 Intervener Positions

The Consumers Coalition raises significant concerns about the reliability of projected demand side management expenditures due to a demonstrable failure by Manitoba Hydro to undertake post-NFAT integrated resource planning. Specifically, the Consumers Coalition's position is that Manitoba Hydro has not demonstrated optimized demand side management spending, given excess load, reduced marginal cost thresholds, and the flexibility that exists under *The Efficiency Manitoba Act* to make recommendations regarding appropriate targets. With respect to the latter, the Coalition argues that the legislation supports an ongoing dialogue about the target itself and any efficiency plan that Efficiency Manitoba puts forward. This dialogue should include issues related to accessibility of demand side management programs for all ratepayers. In addition, declining marginal values may leave some demand side management uneconomic.

The Consumers Coalition submits that the Board should direct the formation of a working group on integrated resource planning, involving stakeholders, Efficiency Manitoba, and Manitoba Hydro. The Board should also recommend that funds paid by Manitoba Hydro to the Province be used to fund more extensive demand side management programs specifically targeted to lower-income and high consumption consumers.

The Green Action Centre submits that the Utility's revenue requirement should include sufficient additional funds in a dedicated account to cover rate discounts for the energy poor. As well, these funds should support more aggressive demand side management in order to meet the legislated targets and provide geothermal heating system subsidies as a rate mitigation measure for electric space heating customers.

The Manitoba Industrial Power Users Group argues that it is not apparent that Manitoba Hydro's "status quo" approach to demand side management is reasonable given that export prices and related marginal values have materially declined. The level of demand side management spending included in the financial forecast should be consistent with integrated resource planning, including a material reduction to reflect the decrease in marginal value by approximately one-third. Demand side management should be encouraged where it is proven cost-effective, including where it can benefit customers to manage electricity bills without negatively affecting other ratepayers.

7.3 Board Findings

The Board finds that Manitoba Hydro's revenue requirement should be reduced to reflect lower demand side management spending as a result of the new lower marginal value. The Board agrees with the Manitoba Industrial Power Users Group that the level of demand side management spending included in the financial forecast should be consistent with integrated resource planning, including a material reduction to reflect the decrease in marginal value by approximately one-third. As discussed below, the Board also recommends that Manitoba Hydro reduce its demand side management expenditures from the level incorporated in MH16 Update with Interim that targets 1.2% in energy savings on average in each year over the next 10 years.

The Board's approved rate increase takes into consideration a reduction in demand side management spending as well as an increase in domestic load that will result from fewer demand side management programs. This reduction in the revenue requirement is appropriate for rate-setting purposes while Manitoba Hydro remains responsible for demand side management spending and programming. Considerations other than the reasonableness of expenditures for rate-setting purposes will apply once Efficiency Manitoba has assumed demand side management programming and presents a demand side management plan to the Board for review.

While Manitoba Hydro has forecast demand side management spending to achieve energy savings over the next 10 years at a level of 0.3% below the energy savings target in *The Efficiency Manitoba Act*, the amount of spending is not justified for the Test Year. Efficiency Manitoba is not yet operational and once it is, there are legislated steps that must occur prior to the entity's implementation of an approved efficiency plan. The adverse rate impacts that arise from Manitoba Hydro's plan are not reasonable in the present context.

Reduced demand side management spending for rate-setting purposes is supported by the change in circumstances since the NFAT review in 2014. In 2014, new generation resources – such as Keeyask - were required as early as 2024 under the load forecast accepted in the NFAT Report, with additional generation resources needed by 2030. With reductions to the load forecast since 2014, including the loss of expected Top

Consumer Petro/Oil/Gas sector loads, the next new generation resource is not needed until approximately 2040, even with new export contract obligations since the NFAT. The 2017 marginal value is lower than the 2013 marginal value by approximately one-third, which affects the economics of demand side management programs. As well, as noted by Manitoba Hydro and expert witnesses in the proceeding, rate increases above inflation will themselves have a conservation impact.

The Board finds that, in light of the new, lower, levelized marginal value, some of Manitoba Hydro's demand side management programming may no longer be cost effective. This was acknowledged by Manitoba Hydro witnesses and is not contested. Consumer rates should not, at this time, recover the costs of demand side management programs that are no longer cost effective, unless justified by having a lower-income target market. Given the evidence adduced in this proceeding about energy poverty and bill affordability, it is reasonable for consumer rates to recover the costs of lower-income demand side management programs, even if not cost effective as assessed against the new lower marginal value.

In light of the above, the Board recommends that Manitoba Hydro reduce its demand side management spending. Manitoba Hydro should review its demand side management programming for cost effectiveness and cease or modify spending on programs that are no longer cost effective, except for programs targeted at lower-income and First Nations on-reserve consumers. In addition to continued Utility investment in lower-income demand side management programs, the Board recommends that the provincial government amend Efficiency Manitoba's mandate to explicitly include consideration of bill affordability. This would include targeting of lower-income consumers with demand side management programs, as well as consideration of the impact of demand side management costs being paid by non-participants.

Amendment of Efficiency Manitoba's mandate to include bill affordability is appropriate in light of the interplay between demand side management, which seeks to mitigate the impact of rate increases, and bill affordability. The Board remains concerned about bill affordability, including in the context of projected annual rate increases over the forecast period. As such, lower-income demand side management programs that are uneconomic or do not meet a cost-effectiveness assessment should continue to be pursued once the transfer to Efficiency Manitoba is complete.

Finally, the interrelationship between demand side management, the need for new generation resources, and the cost of those resources reinforces the recommendation in the NFAT Report that integrated resource planning be implemented in Manitoba.

From one perspective, Manitoba Hydro is financially worse off over the forecast period for undertaking demand side management due to the difference between domestic rates and the price for which Manitoba Hydro can sell energy saved by domestic customers into the export market. However, this analysis neglects the benefits of deferring new generation resources that may be considerably more expensive than the aggregate demand side management investments. For example, in its NFAT report, the Board concluded that:

> *…treating the DSM savings from the Supplemental 2014 Power Smart Plan as a separate, independent energy resource, yields capacity savings that amount to more than 80% of the net system capacity addition from the proposed Conawapa Project. Similarly, the annual dependable energy savings from the Power Smart Plan exceed 85% of the dependable energy output from the proposed Conawapa Project. To achieve these electricity savings, Manitoba Hydro budgets to spend $822 million, which is less than 8% of the $10.7 billion cost of building Conawapa.*

In the current proceeding, by 2031, the 2016 Demand Side Management Plan is expected to deliver capacity and energy savings of 1,232 MW and 4,506 GWh at a cost of $1.2 billion. This compares to Keeyask, which provides 630 MW of winter peak capacity and 4,400 GWh of energy in an average year, at a cost projected by Manitoba Hydro to be $8.7 billion. This is illustrative of the importance of integrated resource planning.

8.0 Export Revenue Forecast

Manitoba Hydro cites a deterioration of its anticipated export revenues as a factor in the Utility seeking higher domestic rate increases than in previous rate applications. While export prices are still forecast to increase over time, that increase is less than previously expected by Manitoba Hydro. Manitoba Hydro now tempers its export price growth as the outlook for low costs of fossil fuel continues and also because American utilities have local options for carbon-free electricity.

A higher forecast of export prices, all else equal, will require lower revenues from domestic ratepayers on a forecast basis. However, if the export price forecast is projected at a level higher than actual revenues achieved, then Manitoba Hydro will not realize the expected export revenues and, as a result, domestic ratepayers will be asked to pay higher rates to make up the shortfall.

Manitoba Hydro’s export revenue forecast is comprised of three main components:

- The volumes of energy and generation capacity that are surplus to the needs of Manitobans.
- The forecast of export prices for the surplus energy and capacity. Manitoba Hydro predominantly has two types of export sales: firm, also known as dependable, and opportunity. Firm export energy sales are made from energy which is forecasted to be available if the worst drought conditions previously experienced are repeated. Firm capacity sales are made from energy that is surplus to domestic needs based on winter or summer peak demand. Opportunity sales are from energy that is surplus to domestic requirements and firm sales.
- The revenues from firm export contracts that Manitoba Hydro has negotiated with counterparties.

The exportable volumes are determined based on Manitoba Hydro's domestic load forecast and the generating capability of the Utility's resources. Export revenues are forecast for the first year in the Integrated Financial Forecast based on the actual water inflow conditions, the most current reservoir and lake level elevations, and the expected inflows through to the end of the fiscal year. For the second forecast year, export revenues are now determined for each of the entire range of flow conditions based on expected reservoir levels. Previously, Manitoba Hydro determined the export revenue projections for the second year by using a single median flow scenario and expected reservoir levels. For the third and subsequent years of the forecast, the methodology is unchanged from previous and export revenues are determined for each of the entire expected range of flow conditions and reservoir levels. For each of these 'flow cases' for the second and subsequent years, Manitoba Hydro calculates the expected export revenues by multiplying the exported volumes by the forecasted price. Manitoba Hydro then averages the expected export revenues to arrive at a forecast of export revenues for each year of the financial forecast.

8.1 Manitoba Hydro's Position

To forecast export prices, Manitoba Hydro continues to use a consensus forecast for a 'reference case' derived from the equal weighting of four independent price forecasting consultants; however, as in the past, the Utility has made its own adjustments to the export price forecast.

In this GRA, Manitoba Hydro has removed the premium that has historically been applied to uncontracted long-term dependable energy forecast prices because utilities in the Midcontinent Independent System Operator market have other, competitive options for long-term, fixed-price, and carbon-free energy supplies. The Utility also removed the value of capacity from the pricing of potential uncommitted export sales made from surplus capacity as there is surplus capacity in the Midcontinent Independent System Operator market. The financial effect of Manitoba Hydro's revisions to the export price forecast is to value all surplus energy at opportunity prices rather than ascribe a higher value for its dependable surplus product.

Lost opportunity export revenues from the delay in the Keeyask in-service further decrease export revenues.

Manitoba Hydro assumes no new firm long term contracts will be negotiated for the substantial surplus dependable energy and capacity in the 20-year forecast. Manitoba Hydro further assumes existing long-term firm contracts will expire without negotiating extensions.

The following is the current list of Manitoba Hydro's long term contracted export sales:

Power Sale Contract	Contract Start	Contract End
Minnesota Power 50 MW System Participation	May 2015	May 2020
Minnesota Power 250 MW System Participation	Jun 2020	May 2020
Minnesota Power 50 MW ZRC System Participation	Jun 2017	May 2020
Great River Energy 200 MW Seasonal Diversity	Nov 2014	Apr 2030
Northern States Power 125 MW System Power	May 2021	Apr 2025
Northern States Power 375/325 MW System Power	May 2015	Apr 2025
Northern States Power 350 MW Seasonal Diversity	May 2015	Apr 2025
Northern States Power 75 MW Seasonal Diversity	Jun 2016	May 2020
Wisconsin Public Service 100 MW Sale	Jun 2021	May 2027
Wisconsin Public Service 108 MW System Participation	Jun 2016	May 2021
SaskPower 100 MW System Participation	Jun 2020	May 2040
SaskPower 25 MW System Participation	Nov 2015	May 2022
American Electric Power 79 MW ZRC	Jun 2016	May 2018
American Electric Power 50 MW ZRC	Jun 2018	May 2020
Basin Electric 50 MW ZRC System Participation	Jun 2018	May 2020
Basin Electric 50 MW ZRC System Participation	Jun 2020	May 2021
NextEra 30 MW ZRC Sale	Jun 2015	May 2018
NextEra 100 MW ZRC Sale	Jun 2016	May 2018

8.2 Independent Expert Consultant Evidence

Daymark Energy Advisors reviewed Manitoba Hydro's forecast of exportable volumes of energy and capacity and found those forecasts reasonable. Daymark assessed the revenues from Manitoba Hydro's firm export contracts and likewise found those revenues reasonable and were appropriately included in Manitoba Hydro's forecast of total export revenues.

In Daymark's view, Manitoba Hydro did not demonstrate that the independent price forecasts it purchased from the four external forecasting firms were "reference case" or "P50" forecasts, and therefore the resulting average of these forecasts may not be a true P50 forecast.

Daymark found that Manitoba Hydro did not use the consensus forecast for capacity prices. Daymark also found that not including a dependable energy premium or any revenue potential for capacity sales does not result in a P50 forecast, but rather a P100 forecast. Daymark found that not including the premium or capacity value may be reasonable in the short term but not in the long term, as there is evidence that the Midcontinent Independent System Operator market will be short capacity by 2022 and United States Federal and State policies may still favour Manitoba Hydro's carbon-free, firm electricity exports.

In summary, Daymark found that Manitoba Hydro's export revenue forecast is conservative or low relative to Manitoba Hydro's stated goal of having a P50 forecast of export revenues.

8.3 Intervener Positions

The Consumers Coalition argues that Manitoba Hydro's export revenue forecast is biased low as it is based on policy decisions, is not a true "P50" forecast (i.e. results being higher 50% of the time and lower 50% of the time), and does not reflect the benefits of Manitoba Hydro's new transmission interconnection with the Midcontinent Independent System Operator market in the United States. The United States Federal Energy Regulatory Commission and the United States Energy Information Administration reports support the view of Daymark that Manitoba Hydro's export forecast is conservatively low. The Consumers Coalition submits that this puts unnecessary upward pressure on the domestic rate increases.

The Manitoba Industrial Power Users Group maintains that Manitoba Hydro's Integrated Financial Forecast should include the best estimate for the prices at which the Utility can sell its surplus capacity and energy, including values for capacity, premiums, and continuing bilateral contracting arrangements. Manitoba Hydro is being pessimistic by assuming its major export contracts that expire in 2025 will not be renewed or replaced with anything that offers more than opportunity export energy value. Manitoba Hydro has assumed the worst-case scenario, and as such the Utility's approach is inconsistent with P50 forecasts in an integrated financial forecast. This Intervener argues that this should be considered by the Board in determining the appropriate rate increases to be awarded.

8.4 Board Findings

The Board finds Manitoba Hydro's forecast of export revenues to be conservative such that, on a probability basis, it will under-forecast the revenues expected to be realized from export sales. Under-forecasting export revenues results in Manitoba Hydro forecasting a need for higher domestic rates. Manitoba Hydro's failure to provide a "P50" probability export revenue forecast is a factor considered by the Board in reducing the rate increase requested by the Utility.

Accepting the evidence of Daymark Energy Advisors, the Board finds Manitoba Hydro's export revenue forecast to be conservative for the following reasons:

- Manitoba Hydro's export revenue forecast is not consistent with a financial forecast that that has a probabilistic goal of P50; and
- Manitoba Hydro's change of methodology - to remove capacity values and dependability premiums from the substantial surplus dependable energy - is reasonable in the near term, but is not reasonable in the long term as it biases the export forecast to be low and is not consistent with third party forecasters nor with the needs in the Midcontinent Independent System Operator and Minnesota markets.

Despite Manitoba Hydro purchasing capacity price forecasts from four independent price forecasters, Manitoba Hydro did not use these forecasts to develop a consensus capacity price forecast, and instead assumed zero capacity prices and revenues. With respect to the carbon price forecasts of the independent price forecasters, Manitoba Hydro argued that the goal to have an unbiased consensus forecast is achieved by accepting other experts' views of the future and not imposing its own biases by choosing forecasts to produce a predetermined result. Yet, it appears Manitoba Hydro did not do this when it ignored the consensus forecast of capacity prices and instead forecast zero capacity prices and revenues.

Additionally, the Board finds that Manitoba Hydro's export revenue forecast is low as it does not reflect the estimated 2% to 5% increase in export prices (and 2% to 5% reduction in import prices, which will increase the net export revenues) that will be achieved once the Manitoba-Minnesota Transmission Project and the Great Northern Transmission Line are in service.

9.0 Load Forecast

Manitoba Hydro's electric load forecast is used for several purposes. Short-term forecasts of sales are needed to forecast revenue for rate design and accounting purposes. Short-term forecasts of energy and peak demand are needed for system operations planning. Long-term forecasts of energy and peak demand are required for power planning to determine long-term supply requirements. Manitoba Hydro's 2017 Electric Load Forecast was created as the Utility's best estimate of Manitoba's future energy requirements on a P50 basis, meaning there is a 50% chance that the future load will exceed the forecast and a 50% chance that it will be less than the forecast.

9.1 Manitoba Hydro's Position

In this GRA, Manitoba Hydro cites a reduced forecast of domestic load growth as a contributing factor for the deterioration in the Utility's financial outlook. The reduced forecast of domestic load growth delays the Manitoba domestic need for energy from Keeyask until the mid-2030s and also, in the Utility's view, lessens the opportunity for Manitoba Hydro to look to load growth to address its financial challenges.

Manitoba Hydro expects no net load growth over the next 10 years when the impact of its current Demand Side Management Plan is included. Over the next 20 years, the net load growth is expected to average 0.7%. Manitoba Hydro identified several other factors that will further depress its load forecast that were not incorporated into the 2017 Electric Load Forecast. One factor is the cancellation of a project in the Top Consumers' Petroleum/Oil/Gas sub-sector that will reduce the load forecast by approximately 500 GWh in 2021. Another factor not included in the 2017 Electric Load Forecast is the six years of 7.9% rate increases that form part of Manitoba Hydro's current plan. The 2017 forecast is based on five years of 7.9% rate increases.

The primary driver of energy load growth in Manitoba is the population and the secondary driver is the economy. The population of Manitoba has grown from 1,185,000 people in 2006/07 to 1,323,000 people in 2016/17, averaging 1.1% growth per year. Manitoba's population is forecast to grow to 1,638,000 by 2036/37, averaging 1.1% per year. 'Real' (i.e. with inflation removed) Manitoba Gross Domestic Product ("GDP") is expected to grow 2.0% in 2017/18 and average 1.6% annually for the next 20 years.

The three main components of Manitoba's electricity use are:

- Residential Basic, with 480,365 customers, including mostly residential structures that include single-family dwellings, multi-family dwellings, and individually metered apartment suites. This residential component of the Load Forecast accounts for 32% of Manitoba Hydro's Total Consumer Sales and is projected to grow at an average rate of 1.3% per year over the next 20 years (excluding demand side management impacts). Customer growth, paralleling population growth, is growing 1.1% per year.

- General Service Mass Market, with 67,676 customers, are small to large commercial and industrial customers. The load growth for this group of customers accounts for 41% of Manitoba Hydro's Total Consumer Sales and is forecast to grow at an average of 1.5% per year (excluding demand side management impacts), which is higher than the historic growth of 1.1% per year over the past 10 years. The growth is primarily due to expected growth in residential customers and GDP.

- General Service Top Consumers, are 10 high-usage companies with 26 individually metered accounts that are forecast individually. This group of customers accounts for 26% of Manitoba Hydro's Total Consumer sales.

  The load growth for these Top Consumers customers is forecast at an average rate of 0.9% per year, which is higher than the 0.2% growth per year experienced during the past 10 years. However, it is less than the 3.2% growth per year during the period 10 to 20 years ago. The 20-year historical growth of the Top Consumers has been 1.7% per year.

9.2 Independent Expert Consultant Evidence

The Board engaged Daymark Energy Advisors as Independent Expert Consultants to assess Manitoba Hydro's load forecasting methodologies, evaluate historical performance, and assess changes between the Utility's 2014 and 2017 load forecasting methodologies. Daymark concluded that Manitoba Hydro's changes to the forecasting methodology for Potential Large Industrial Load for the Top Consumers category result in a more conservative methodology and significantly reduce the load forecast. Daymark also concluded that Manitoba Hydro has not fully considered fuel switching or the short-term impact of the proposed and projected rate increases on Top Consumers, which could reduce the load forecast and cause the forecasted loads to be lower than the actual future loads. This Independent Expert Consultant also gave evidence that Manitoba Hydro's estimated price elasticity for all sectors of customers may not be reliable. Price elasticity estimates the responsiveness of electricity demand to changes in the price of electricity.

Daymark recommended improvements to Manitoba Hydro's load forecasting methodology, as follows. According to Daymark, Manitoba Hydro should:

- incorporate scenario analysis into its load forecasts. Scenarios should be based on plausible alternative futures. Such scenarios may entail a combination of factors such as high or low growth of population, GDP, or electric vehicles, or high or low adoption of energy efficiency. Considering different scenarios allow utilities to more effectively plan and understand where and how future loads may differ from present forecasts,

- perform probabilistic assessments of the load forecast to determine the sensitivity to input variables such as population or GDP forecasts. This would help Manitoba Hydro and stakeholders understand the uncertainties in the load forecast,
- utilize more than two years of load history to determine the weather dependency of electricity consumption,
- utilize fewer than 25 years of weather data to generate the normal weather baseline, and
- test its econometric models for statistical concerns, such as multi-collinearity.

Dr. Yatchew, an Independent Expert Consultant retained by the Board to provide economic analysis, assessed the likely impacts on and responses of various customer groups to rate increases of the magnitude included in Manitoba Hydro's financial plan as well as the implications for the economy as a whole. Dr. Yatchew found offsetting forces such that electricity price increases will cause a reduction in consumer demand but, as the provincial Gross Domestic Product grows over time, the consumption of electricity to support that economic growth will increase. Factoring in Manitoba Hydro's requested and projected 7.9% rate increases in its 10-year financial plan as well as the expected provincial growth, the net result is that load in Manitoba is likely to be stagnant over the coming decade.

9.3 Intervener Positions

The Consumers Coalition accepts Manitoba Hydro's price elasticity values as being reasonable but questions the conservatism used by the Utility in forecasting long-term load as well as the significant uncertainty relating to the mobility of large industrial customers who may respond to large rate increases by relocating businesses. This Intervener recommends that Manitoba Hydro revise its methodology for estimating the load of the large industrial customers as well by providing alternative load forecast scenarios through stochastic modelling.

The Manitoba Industrial Power Users Group compared Manitoba Hydro's 2013 Electric Load Forecast, which underpinned development Plan 5 – which is akin to the plan recommended by the Board and which includes Keeyask and the new interconnection with the United States – at the NFAT proceeding, with the 2017 Electric Load Forecast. Compared to the 2013 forecast, in the year 2026/27, there is a 7.1% decrease in load. Of that decrease, approximately 5.3% arises due to customer responses to the assumed five years of 7.9% rate increases as compared to 3.95% rate increases assumed for the NFAT forecast. Absent the effect of successive 7.9% rate increases on load growth, the decline in the load forecast would only be approximately 1.8%, with some portion of this smaller decrease attributable to assumed demand side management activities. Put another way, this Intervener submits that, if approved rate increases are more in line with 3.95%, the load forecast will be higher, resulting in increased domestic rate revenue for the Utility and an improved financial situation for Manitoba Hydro.

9.4 Board Findings

The Board finds that, compared to the methodology used in 2014, the new methodology used by Manitoba Hydro in 2017 generates a lower long-term forecast of consumers' electricity consumption in Manitoba. The Board is prepared to accept the results of Manitoba Hydro's Electric Load Forecast for financial forecasting and rate setting purposes, but concludes that different considerations from those used by Manitoba Hydro support the forecast. The total load in the Test Year should be higher than that forecasted by Manitoba Hydro due to the decrease in the overall approved rate increase from 7.9% to 3.6% and the Board's recommendation in this Order that Manitoba Hydro reduce its demand side management, all else being equal. The change in the methodology to forecast the long-term Potential Large Industrial Load, while responsive to the Board's prior direction in Order 73/15, may now be an overly conservative methodology, as was found by Daymark Energy Advisors. The Board finds that the overly conservative nature of the Potential Large Industrial Load forecast is partially offset by the fact that the 2017 forecast does not factor in the cancellation of the project in the Top Consumer Petroleum/Oil/Gas sub-sector.

The Board agrees with Dr. Yatchew's assessment that the load growth will be essentially flat over the coming years. The Board finds that any long-term load forecast cannot be relied upon, due to the inherent limitations in forecasting the effects and impacts of disruptive technology, such as customers generating their own electricity with solar photovoltaic systems and storing that electricity in batteries.

The Board finds that Manitoba Hydro's price elasticity for all three of the customer sectors may not be reliable. The Board accepts the evidence in the literature cited by Dr. Yatchew, although the Board also notes that applying those elasticities results to Manitoba Hydro's load data yields results not dissimilar from Manitoba Hydro's load forecast. That literature suggests the price responsiveness of industrial customers can be greater than residential customers. In addition, as discussed in a subsequent section, the Board's recommendation that Manitoba Hydro reduce its demand side management spending will increase domestic load growth.

The Board encourages Manitoba Hydro to review and study the areas Daymark Energy Advisors and Dr. Yatchew identified for improvement and enhancement of the load forecasting methodology. Manitoba Hydro is directed to consider the areas recommended by the Independent Expert Consultants for improvement and enhancement of the load forecasting methodology and to provide details of the implementation of these recommendations, or reasons for not implementing them, at the next GRA.

10.0 Operating & Administrative Expenses

Operating and administrative expenses ("O&A") are one of Manitoba Hydro's highest expense categories in its revenue requirement. These expenses primarily consist of labour and benefits, materials, contracted services, and overhead costs associated with operating and maintaining Manitoba Hydro's facilities and providing services to customers. O&A expenses do not include capitalized salaries and benefits for employees who work on capital projects, or materials and services related to those projects. The salaries of approximately one out of three Manitoba Hydro employees are capitalized and are therefore not included in O&A expenses.

Dating back to at least Order 116/08, the Board has expressed concern regarding the level of growth in Manitoba Hydro's O&A costs.

In Order 5/12, the Board noted that, from 2005 to 2010, Manitoba Hydro's O&A expenses grew at a compound average growth rate of almost 5% annually, while inflation for the same period was under 2%. The Board concluded that a major reason for the increase of O&A expense was due to staffing levels having increased by 900 additional Equivalent Full-Time positions, or a 15% increase, in the period of 2004 to 2012. Of the additional 900 positions, 498 were in the Power Supply Business unit, which at that time managed the planned development of Keeyask and Conawapa.

In the 2014/15 & 2015/16 GRA, Manitoba Hydro expressed a commitment to reducing the growth of O&A expenses to one percent, excluding the impact of accounting changes. Since that time, Manitoba Hydro has pursued a cost containment strategy. First, over the period of 2014/15 to 2016/17, Manitoba Hydro reduced its operations by 429 positions through attrition and process efficiencies. As a result, Manitoba Hydro achieved cumulative savings of $43.2 million.

In February of 2017, Manitoba Hydro announced a plan to reduce its total workforce by 15%, or 900 positions. This plan commenced with a reduction of the executive leadership team by 30%, or three Vice-President positions, and a reduction of the senior management team by 25%. Manitoba Hydro also implemented a Voluntary Departure Program to achieve the remaining position reductions. By mid-2018, the Voluntary Departure Program will result in 817 employees leaving Manitoba Hydro (plus four employees related to Manitoba Hydro's subsidiaries), approximately 70% of which are assumed to be operational in nature. Including the position reductions resulting from the Voluntary Departure Program, the total reduction of senior management is approximately 40 positions.

10.1 Manitoba Hydro's Position

Manitoba Hydro estimates the salaries associated with the reduced positions to be $91.9 million. These savings do not include the approximately $2 million value of the salaries for those employees who did not leave the Utility through the Voluntary Departure Program but were severed.

The costs of the restructuring program include the severance and salaries paid pursuant to the terms of the Voluntary Departure Program (forecast to be $53 million). In addition, the Utility estimates reorganization costs (for retraining, information technology, and potential benefit impacts) to be $12 million in 2018/19.

Manitoba Hydro also introduced cost reductions through a Supply Chain Management initiative, intended to realize savings on goods and services purchased, reduce or avoid operating costs, reduce working capital, and reduce capital expenditures. Since these initiatives began in 2014/15, the accumulated realized savings to date total approximately $8 million. Manitoba Hydro estimates future annual cost savings between

$20 million and $50 million over the five-year period 2017/18 through 2021/22, with 30% related to operational savings and the remainder related to capital projects.

Due to the timing of the Voluntary Departure Program, Manitoba Hydro did not file detailed O&A budgets as part of the GRA and all detailed schedules embedded in the Application and filing materials for 2017/18 and 2018/19 are incomplete. In addition, Manitoba Hydro has not yet determined the impact of the Voluntary Departure Program on the Utility's pension liability. Manitoba Hydro does not expect to be in a position to forecast the pension liability until the 2018/19 fiscal year. The O&A target for 2017/18 was based on the year-end projection for 2016/17 actual results, adjusted for known wage settlements and the assumptions associated with senior management reductions and the Voluntary Departure Program. The forecast assumed savings for a partial year from a staffing reduction of 500 positions. The O&A target for 2018/19 was based on the preliminary 2017/18 forecast adjusted for known wage settlements and a partial year of operating costs for Bipole III. The forecast was then reduced by the full year impact of the assumed reduction of 500 positions. While 821 and not 500 employees left as a result of the Voluntary Departure Program, there were also differences in timing from the forecast and increased costs associated with the number of employees leaving, such that Manitoba Hydro maintained its forecast amount for 2017/18 and the Test Year.

Manitoba Hydro's position is that it has implemented effective cost reduction measures that have resulted in a growth in O&A costs at or below inflation since 2009/10. While the International Brotherhood of Electrical Workers presented evidence that O&A reductions have sacrificed the safety of Manitoba Hydro employees and customers, and have the potential to lead to decreased reliability of service, Manitoba Hydro maintains that it continues to operate safely and effectively. It submits, however, that further reductions would result in undue risk to service levels and reliability.

Manitoba Hydro cautions against making comparisons between utilities due to the myriad of factors that can influence the organizational structure, operations, and decisions of an individual utility.

10.2 Intervener Positions

The Consumers Coalition argues that, while Manitoba Hydro provides reliable service, it has failed to demonstrate that it offers economic or efficient service. This position is based on benchmarking undertaken by the Boston Consulting Group which identified that Manitoba Hydro is not generally a top quartile or second quartile performer. The Consumers Coalition indicates concern over Manitoba Hydro's suggestion that it has been able to reduce over 1,100 operational positions since 2014 while continuing to claim that it can provide reliable and quality service. The Consumers Coalition suggests that benchmarking is a useful tool for determining the appropriate level of a utility's costs, including in the context of maintaining services while reducing operational positions, and recommends that a benchmarking working group be convened for 2019/20 and 2020/21.

Representatives of the General Service Small and General Service Medium Customer Classes and Keystone Agricultural Producers submit that, prior to the next GRA, an independent Manitoba Hydro cost benchmarking and customer impact analysis should be performed. This Intervener argues that there is not presently enough detail or information to make a determination on whether Manitoba Hydro's cost control measures are sufficient. It recommends that the Board encourage Manitoba Hydro to follow through with full cost reduction measures and to file with the Board data that would allow the Board to assess the results and whether further measures are required.

The Manitoba Industrial Power Users Group argues that Manitoba Hydro should fully pursue O&A expense reductions, including reductions to staffing of 900 positions. The Manitoba Industrial Power Users Group is supportive of Manitoba Hydro responding to longstanding Board concerns over staffing levels, dating back to at least 2008.

10.3 Board Findings

The Board accepts the O&A forecast for the Test Year for financial forecasting and rate-setting purposes. The Board accepts that the level of detail needed for a full testing of the forecast is not available until the results of the Voluntary Departure Program are known. The Board directs Manitoba Hydro to file with the next GRA the details of its O&A expenditures with an explanation of the operational plan developed to continue running operations with a workforce that has been reduced by 15%, including any advice or recommendations received from external consultants retained by the Utility to assist with the restructuring and transition. This explanation should include confirmation that and details as to how Manitoba Hydro's operations are being run safely after the workforce reductions are complete. The Board further directs Manitoba Hydro to file with the next GRA details of its actual O&A expenditures dating back 10 years through to the date of the filing, along with forecast O&A expenditures by cost element and business unit, including the details of the Utility's pension liability related to the reduced staffing levels. The actual O& A expenditures are to include the compound annual growth both before and after accounting changes.

The Board acknowledges Manitoba Hydro's efforts to implement cost containment measures. While the level of cost containment has not met the 1% target on average over the five-year periods from 2009/10 through 2013/14 and from 2014/15 through 2018/19, based on the average of both actual and forecast costs, growth in O&A expenditures is at the level of inflation on average over these periods. Further, Manitoba Hydro forecasts a 3.3% reduction in O&A expense in each of 2017/18 and 2018/19, primarily due to staffing reductions. The Utility's review of its operations, at a time of restructuring and transition, presents an opportunity to find further areas to reduce O&A costs. The Board recommends that Manitoba Hydro continue these efforts, both in terms of staff reductions and Supply Chain Management, after the Voluntary Departure Program transition concludes.

The Board notes that, in Order 116/08, Manitoba Hydro was directed to undertake and file with the Board an independent benchmarking study of key performance metrics, using the most currently available data. Completion of this directive was deferred pending Manitoba Hydro's implementation of International Financial Reporting Standards ("IFRS"). While IFRS was adopted April 1, 2015, the benchmarking study directed in order 116/08 has not been filed. The Board views this as an outstanding directive and finds that independent benchmarking should be completed; however, the study should not be performed until after the transition period resulting from the Voluntary Departure Program concludes. The Board will expect an update on the status of the post-Voluntary Departure Program re-organization at the next GRA, including with respect to how the safety of employees and customers has been maintained.

11.0 Accounting Issues

The accounting treatment of Manitoba Hydro's spending has implications for the revenue requirement in the Test Year, as well as in the financial forecast. Five items were at issue in the GRA proceeding: depreciation expense, the regulatory treatment of Conawapa costs, ineligible overheads, the Bipole III Deferral Account, and the Demand Side Management Deferral Account.

11.1 Depreciation Expense

Depreciation expense is Manitoba Hydro's third highest expense category. In Integrated Financial Forecast MH16 Update with Interim, Manitoba Hydro forecasts $396 million in depreciation expense for 2017/18 and $471 million for 2018/19. Depreciation expense is projected to grow to $752 million by 2026/27 as a result of both new major generation and transmission assets and planned Business Operations Capital expenditures.

Two common methods of recording depreciation expense are Equal Life Group and Average Service Life. The Equal Life Group methodology groups assets according to their lifespan, not the type of asset. Average Service Life methodology groups assets by the type of asset and then depreciates the assets in the group according to their average service lives. The Equal Life Group methodology typically increases depreciation costs in the early years of the life of each group of assets, which increases the revenue requirement and therefore the rates that need to be recovered from consumers in those years. Most Canadian Crown-owned electric utilities use the Average Service Life methodology for rate-setting.

In the 2012/13 & 2013/14 GRA, Manitoba Hydro indicated to the Board that it planned to switch to the Equal Life Group methodology of recording depreciation for financial reporting purposes and asked the Board to consider the impact of the change for rate-setting purposes. Manitoba Hydro previously used the Average Service Life methodology.

In Directive 8 of Order 43/13, the Board ordered Manitoba Hydro to file updated depreciation rates and schedules based on an IFRS-compliant Average Service Life methodology with the next GRA. In Directive 9 of Order 43/13, Manitoba Hydro was to file, with the next GRA, a chart showing a comparison of the impact on its Integrated Financial Forecast of asset depreciation pursuant to the Average Service Life methodology (without net salvage) and the Equal Life Group methodology (without net salvage), applying both methodologies to all planned major capital additions.

In Order 73/15, the Board ordered Manitoba Hydro, for purposes of rate-setting, to continue to determine depreciation expense based on the Average Service Life methodology. The Board directed that the Average Service Life methodology be maintained until Directives 8 and 9 from Order 43/13 have been complied with and the Board has been provided with an IFRS-compliant depreciation study based on Average Service Life.

As Manitoba Hydro uses the Equal Life Group methodology for financial reporting purposes, Manitoba Hydro defers the difference between depreciation expense calculated for financial reporting and depreciation expense calculated for rate-setting purposes in a regulatory deferral account. Manitoba Hydro also makes a corresponding adjustment through the net movement in regulatory balances account such that, for rate setting purposes, the revenue requirement reflects depreciation expense based on Average Service Life depreciation rates.

In Integrated Financial Forecasts MH16, MH16 Update, and MH16 Update with Interim, Manitoba Hydro proposed ceasing the deferral of the difference between the two depreciation methodologies in 2022/23, which in effect is a reversion to Equal Life Group. Manitoba Hydro also amortizes the cost of the deferral over 20 years and charges it through net income.

Manitoba Hydro's Position

Manitoba Hydro indicates that its preference is to have a single method of depreciation for both rate setting and financial reporting purposes, so as to avoid the growth expected in the deferral account and the administrative costs associated with maintaining two sets of records for calculating depreciation balances. With respect to an IFRS-compliant Average Service Life depreciation study and the amortization of the deferral account balance for rate setting, Manitoba Hydro asks that the Board hold an alternative process, such as a technical conference, where the issues can be explored in more detail outside of a GRA process and before 2019/20.

Although Manitoba Hydro's GRA filing requested the Board's endorsement of the proposed amortization for the disposition of the regulatory deferral associated with the differences in depreciation methodology, in its closing argument, Manitoba Hydro stated that it is not seeking approval of the amortization period at this time.

Intervener Positions

The Consumers Coalition argues that there should be no amortization of the deferral account pending Manitoba Hydro's IFRS-compliant Average Service Life depreciation study and resolution of the issue of depreciation methodology.

The Manitoba Industrial Power Users Group recommends that the Board direct the implementation of depreciation rates consistent with the Average Service Life methodology, with no reversion to Equal Life Group in the financial forecast. The Manitoba Industrial Power Users Group agrees with the Consumers Coalition that there should be no amortization of the difference in rates.

Board Findings

The Board finds that depreciation is to continue to be recorded using the Average Service Life methodology for rate setting purposes, without reversion to Equal Life Group in the financial forecast. The Board orders Manitoba Hydro to not amortize the difference between Average Service Life and Equal Life Group for rate setting.

The Board finds that Manitoba Hydro has not fully complied with the Board's prior directives on depreciation methodology. In Order 73/15, the Board ordered that the Average Service Life methodology be maintained until the directives from Order 43/13 are complied with and the Board is provided with an IFRS-compliant Average Service Life depreciation study. This study has not been performed. In the absence of full compliance with the Board's past directives, the Board will not make a final disposition with respect to the appropriate long-term depreciation methodology for rate setting purposes. As was the case at the time of Order 73/15, the Board does not currently have sufficient information upon which to make a decision, especially given that a change in methodology leads to significant long-term consumer rate consequences.

By extension, the Board is not in a position to endorse any amortization of the deferral account. As noted by the Consumers Coalition witness, William Harper, the appropriate time to assess the amortization of the regulatory account balance is once Manitoba Hydro has provided the study directed by the Board, when the implications of the change in depreciation methodology will be better understood. In addition, as indicated by the Manitoba Industrial Power Users Group witness, Patrick Bowman, the principle is that the two depreciation methods will match over time as under both methods, assets are fully amortized upon retirement. This means that any difference will naturally amortize and balance over time, therefore not requiring amortization of the deferral that is intended to recognize the difference.

While Manitoba Hydro proposes that the Board hold an alternative process, the Board has previously established the process to be followed for resolution of this issue. Once Manitoba Hydro has completed and provided to the Board its IFRS-compliant Average Service Life depreciation study, the Board will make a final disposition.

11.2 Conawapa Costs

Manitoba Hydro incurred approximately $380 million in costs related to the development of the Conawapa Generating Station. Following the Board's NFAT Report recommendation, the development of Conawapa was discontinued. Manitoba Hydro expects that its auditor will view this asset as a stranded asset and will require that the asset be written off.

The issue in this hearing is whether the write-off of Conawapa should be recognized as a regulatory asset, which should then be amortized and recovered from ratepayers over a set time period. Pursuant to IFRS, regulatory assets represent the timing differences between when an expenditure must be recognized for financial reporting purposes and when an expenditure is to be recognized for rate setting purposes, as directed by an entity's regulator.

Manitoba Hydro initially advised that expenditures related to Conawapa would be maintained in the Construction Work In Progress category through to the end of fiscal 2018/19. Consistent with this, MH16 included an assumption that, for financial reporting purposes, Manitoba Hydro would be required to write off 100% of the $380 million deferred Conawapa expenditures to net income in fiscal year 2020. However, in the course of the oral GRA hearing, Manitoba Hydro indicated that, as a decision was made to discontinue any further development of the station at this time, the Utility anticipated its auditor would require that the costs would be written off in 2017/18.

In 2015/16, Manitoba Hydro capitalized $19.6 million of interest on the borrowing costs of Conawapa. In 2016/17, the capitalized interest was $15.0 million. Effective December 31, 2016, with the completion of all wind-down activities on the project, Manitoba Hydro ceased capitalizing the Conawapa interest amounts. This was done in accordance with IFRS, which does not allow the capitalization of borrowing costs for projects which are not proceeding. As interest is no longer being capitalized, but still must be paid annually on the expenses, the non-capitalized interest costs are included in finance expense in the Utility's 2017/18 financial statements and in "interest paid" under Operating Activities on the Cash Flow statement.

Manitoba Hydro's Position

Manitoba Hydro proposes that the costs pertaining to the construction of Conawapa be recorded in a regulatory deferral account effective March 2018, with amortization of the costs to income on a straight-line basis over a period of 30 years beginning on April 1, 2018. Manitoba Hydro has not forecast the inclusion of the non-capitalized interest subsequent to December 31, 2016 on Conawapa in the regulatory asset, but rather in finance expense on the financial statement.

Manitoba Hydro submits that its proposal to recognize Conawapa costs as a regulatory asset and amortize those costs over time minimizes the impact on customers. Manitoba Hydro advises that, while the non-capitalized interest on the Conawapa borrowing costs is not currently included as part of a regulatory deferral account asset in the Test Year, the inclusion of that interest is in the discretion of the Board.

Intervener Positions

The only Intervener to take a position on Conawapa costs was the Consumers Coalition, which accepts Manitoba Hydro's proposed treatment.

Board Findings

The Board accepts Manitoba Hydro's proposed treatment of the Conawapa costs. This treatment is appropriate because the decision to discontinue Conawapa construction was part of the NFAT review of the Utility's long-term system planning for long-lived assets. Further, this approach smooths out the impact of this one-time cost on consumers.

The Board finds that the non-capitalized interest related to Conawapa from January 1, 2017 on should not be included with the regulatory deferral account asset, consistent with Manitoba Hydro's forecast treatment of the interest.

11.3 Ineligible Overheads

In its transition to IFRS, Manitoba Hydro reduced the extent of overhead costs capitalized in Property, Plant and Equipment as certain annual overhead costs were deemed ineligible for capitalization under IFRS. In the 2014/15 & 2015/16 GRA, Manitoba Hydro proposed that a higher level of O&A costs than in previous proceedings be expensed due to changes made by the Utility in compliance with IFRS. In Order 73/15, the Board did not accept for rate-setting purposes the higher level of O&A costs requested and directed that the remaining administrative costs continue to be capitalized.

For rate-setting purposes, Manitoba Hydro defers $20 million annually of O&A charges in a deferral account.

Manitoba Hydro's Position

In Integrated Financial Forecast MH16, the deferral of ineligible overheads discontinues in 2023/24, when the regulatory account balance is expected to be $160 million. Manitoba Hydro proposes that the balance be amortized over a 20-year period, commencing in 2017/18.

Manitoba Hydro argues that, in Order 73/15, the Board did not provide any direction for how long the capitalization of ineligible overhead costs should be continued. It submits that an indefinite deferral is not appropriate given that the deferral and amortization is a non-cash adjustment and there is no impact to net income by the end of the amortization period. This is true regardless of the amortization period used. Manitoba Hydro supports finding an alternate process where the issue of the indefinite deferral of ineligible overhead can be discussed in more detail.

Intervener Positions

The Consumers Coalition submits that the $20 million in ineligible overhead should be continued and the deferral account balance should be amortized over 30 years.

The Manitoba Industrial Power Users Group recommends that the deferred ineligible overhead account should be amortized over 30 years as this is approximately equal to the average age of Manitoba Hydro's overall asset base. The witness for the Manitoba Industrial Power Users Group, Patrick Bowman, recommended a 34-year amortization period to match the average service life of the assets. The Manitoba Industrial Power Users Group further states that the deferral should be continued in perpetuity to mimic the continued capitalization directed by the Board in Order 73/15.

Board Findings

The Board finds that the $20 million annually in ineligible overhead should continue to be deferred. This is consistent with the Board's direction in Order 73/15 that Manitoba Hydro is to continue this practice.

With respect to the amortization period, the Board finds that, if these costs were capitalized, the costs would be amortized over the in-service lives of the assets. As supported by the expert witness for the Manitoba Industrial Power Users Group, Patrick Bowman, the deferral account balance should be amortized over 34 years to match the average service life of the assets. This recognizes that the balance relates to a deferral of capital costs that are linked to service that will be provided by capital assets in the future.

11.4 Bipole III Deferral Account

The Bipole III transmission line is being constructed to improve domestic reliability and to permit exports into the United States. However, while the construction of Bipole III is tied to revenue-generating assets such as Keeyask, the transmission line itself will achieve only limited revenue (approximately $20 million in incremental revenue) through additional export revenue from reduced line losses. As such, there are in-service revenue requirement impacts, with yearly amounts having to be recovered in domestic customers' rates.

In Order 43/13, the Board established a deferral account to assist in funding Bipole III in-service costs and to defray a portion of the rate impacts of Bipole III. Due to the significant rate increases needed at the time Bipole III comes into service, the Deferral Account is a means by which to gradually increase rates and to partially fund the depreciation, interest, and operating costs in order to avoid rate shock at the time the asset enters service. In Order 43/13, the Board directed that the revenues from a 1.5% rate increase were to flow to the Bipole III Deferral Account. Additional rate increases were directed to the Bipole III Deferral Account in subsequent Orders, as follows:

- 0.75% in Order 49/14
- 2.15% in Order 73/15
- 3.36% in Order 59/16
- 3.36% in Order 80/17

In total, Manitoba Hydro has received 11.6% compounded in consumer rates above what the Board determined was necessary for the Utility's general operations in order to assist in mitigating the rate impacts of Bipole III coming into service. At the time Bipole

III is scheduled to enter service in July of 2018, Manitoba Hydro forecasts that there will be approximately $400 million in the Deferral Account.

Manitoba Hydro's Position

As Bipole III is scheduled to enter service in 2018/19, Manitoba Hydro proposes that the Deferral Account begin to be recognized in domestic revenues following the in-service date, effective August 2018. Specifically, Manitoba Hydro proposes that the Deferral Account be amortized over a five-year period through July 2023.

Manitoba Hydro proposes the amortization of the Bipole III Deferral Account over a five-year period as it will help mitigate the initial expected increases in annual in-service costs related to Bipole III. Manitoba Hydro reasons that, after 2023, additional export revenues from Keeyask will be available to help offset those charges, so further recognition of the deferral will not be required at that time.

Intervener Positions

The expert witness for the Manitoba Industrial Power Users Group, Patrick Bowman, testified that, while he opposed the Deferral Account when the Board first introduced it, in retrospect he believes that it was a "very wise decision". No Interveners took issue with Manitoba Hydro's proposed treatment of the Deferral Account.

Board Findings

The Board finds that the Bipole III Deferral Account should begin to be recognized in domestic revenues once Bipole III enters service and amortized over a five-year period.

The Board directs that, once Bipole III enters service, the revenues currently being deferred should no longer be deferred and instead accrue to general revenue. However, the deferral is to continue until the in-service date, including any period of delay. The Board notes that a delay of the in-service date of Bipole III will have an impact on net income in the Test Year, as the compounded cumulative 11.6% in rates will continue to flow to the Deferral Account. This will increase the amount in the Deferral Account, will decrease the amount that is recognized in general revenue in the Test Year, and will correspondingly reduce net income.

11.5 Demand Side Management Deferral Account

In each Integrated Financial Forecast prepared by Manitoba Hydro, the Utility forecasts the level of demand side management spending based on its Power Smart Plan, thereby incorporating these expenditures in the revenue requirement. In response to Directive 12 in Order 43/13, to the extent that Manitoba Hydro's actual spending on demand side management falls below the level included in the Utility's revenue requirement, the amount of the underspending is accumulated as a regulatory deferral debit balance. There is a corresponding regulatory deferral credit balance. This means that, while the Demand Side Management Deferral Account had a March 31, 2017 "balance" of $48.8 million, this amount is purely notional and has no impact on the Utility's net income. The only demand side management amount that is amortized into rates is the amount of actual demand side management expenses, over a 10-year period.

In March 2017, the provincial government introduced legislation to establish a new Crown Corporation, Efficiency Manitoba, to assume responsibility for energy efficiency initiatives in the province. *The Efficiency Manitoba Act* came into force during the GRA proceedings, on January 24, 2018.

Manitoba Hydro's Position

Manitoba Hydro's position is that, until Efficiency Manitoba is fully established and delivers its initial plan, it is uncertain what the impacts will be on future domestic load and what actions are necessary to clear the Demand Side Management Deferral Account balance. Manitoba Hydro states that it therefore continues to incorporate the costs and savings reflected in its current Power Smart Plan.

Intervener Positions

No Interveners offered specific recommendations with respect to the deferred demand side management costs.

Board Findings

The Board finds that there is no cash balance related to this regulatory asset as Manitoba Hydro has established an offsetting regulatory liability. To avoid the misconception that there is a specific reserve for demand side management spending, this accounting practice should be discontinued. The Board will review Manitoba Hydro's disposition of the regulatory asset and liability at the next GRA.

12.0 Macroeconomic Impacts of Rate Increases

The economy is a complex web of interactions and a change in one sector creates ripples through the rest of the economy as households and industries adjust. Households, firms, and governments will adjust their spending patterns – spending more on electricity bills means spending less on other goods and services or inputs.

Manitoba Hydro did not provide a study on the economic impacts on the Utility's ratepayers and the provincial economy arising from Manitoba Hydro's 10-year financial plan. The Board and Interveners further examined this issue through independent expert witness reports and testimony. Expert witnesses in the proceeding filed written evidence and were cross examined on the economic impacts of electricity rate increases. All witnesses agreed that there would be significant negative economic impacts from the proposed and projected rate increases. A number of presentations were also made to the Board highlighting the negative economic impacts of the projected rate increases.

Through computer modelling, including the use of the latest Statistics Canada Input-Output tables for Manitoba, the economic impact of the requested and projected electricity rate increases is measurable. There will be initial direct effects, secondary indirect effects, as well as induced effects.

Doctors Compton and Simpson gave evidence that the electricity rate increases over seven years of Manitoba Hydro's proposed financial plan would result in the decline of Manitoba's GDP of between 2.16% and 3.63%, which is approximately equivalent to a loss of one year of growth in the Manitoba economy. They further found that, relative to electricity rate increases equal to the rate of inflation, Manitoba Hydro's planned rate increases will result in permanent job losses of between 2,480 and 4,105 jobs. Based on the 467 average monthly jobs created in the Manitoba economy over the past 10 years, Manitoba Hydro's projected rate path is estimated to cost the economy approximately five to eight months of employment growth.

Dr. Yatchew gave evidence that, as the long-term price responses are roughly three times short-term price elasticities (i.e. how much less electricity might be used on an incremental basis due to customer price response to higher rate increases), the economic impacts of the requested rate increases will not be fully realized for some time to come. According to Dr. Yatchew, steady energy price increases that are spread over a number of years do not necessarily lead to disastrous adverse effects on aggregate economic activity. One of the reasons is consumers have some opportunity to adjust and take the price effects into account in their planning for the future. In contrast, large unexpected energy price changes can have a significant disruptive effect on the economy. Large rate increases will induce a price response. This is sub-optimal in a period of energy surpluses, particularly for Manitoba Hydro as its existing surplus of energy will increase when Keeyask enters service and will continue until its energy is needed for domestic load in the mid-2030s.

The City of Winnipeg's witness, Mr. Tyler Markowsky, calculated the direct and indirect costs of electricity rate increases as planned by Manitoba Hydro as well as the increased tax revenue that would result from the City's tax on electricity for non-heating purposes over a 20-year time span. Mr. Markowsky calculated the net increase in electricity costs for the City over this 20-year time period would exceed $100 million. This would result in increases in property and business taxes and user fees, as well as reductions in services.

Dr. Yatchew explained that, while Manitoba has a diversified economy, residential ratepayers, businesses, industries, and community organizations will be negatively affected – possibly severely – by the proposed rate increases. By way of example, some companies may choose to relocate or to scale back production; some will consider very carefully whether to make major new capital investments in Manitoba. The spectre of increasing electricity rates, in the near or more distant future, may have already discouraged investment. The risk of future electricity rate increases that cumulate to 50% or more would likely be part of the decision matrix for any electricity-intensive firm in Manitoba.

The Board heard from the Chair of Manitoba Industrial Power Users Group that its member companies are among the largest electricity users in the province. Collectively, the Manitoba Industrial Power Users Group companies provide $165 million of revenue to Manitoba Hydro each year, contribute $233 million annually in taxes, have invested over $6.4 billion of capital, and directly employ 6,000 Manitobans with an additional 1,300 jobs through contract labour.

The Chair of the Manitoba Industrial Power Users Group echoed the concerns by Dr. Yatchew that Manitoba Hydro's 10-year financial plan ignores the risks of plant closures and downstream effects if the rate increases lead to job losses, out migration, or reduced household budgets. He testified that low energy costs were one of the prevailing reasons that member companies initially invested in Manitoba.

These risks were also discussed by representatives of Manitoba Industrial Power Users Group member companies and other industry representatives who gave oral presentations in this proceeding. Member companies such as Gerdau Long Steel North America ("Gerdau"), Maple Leaf Foods, and Koch Fertilizer Canada have no ability to pass through incremental costs to customers, giving rise to competitiveness concerns in a global market. A representative from Chemtrade, a sodium chlorate plant located in Brandon, gave evidence that its decisions to further invest in and grow the Brandon facility are being re-evaluated in light of Manitoba Hydro's projected rate path, particularly as many other competing jurisdictions have announced either no or modest electric rate increases for 2018. Similarly, a representative from Gerdau stated that the impact of Manitoba Hydro's rate increases may cause the company to limit investments in its Selkirk facility and to shift production to facilities in other jurisdictions. In 2007, Gerdau shut down its New Jersey location, mainly as a result of high electricity cost forecasts. Testimony from a representative of Maple Leaf Foods reflected similar concerns. In the short-term, Maple Leaf Foods stated that it estimates that electricity rate increases will lead to reductions in discretionary spending, employee headcount, capital spending, and community donations, while in the long-term, Maple Leaf Foods may scale down the work done at its Brandon facility.

Roquette, a company that produces speciality foods in locations across the world, presented evidence that it recently decided to invest in a new $400 million pea processing facility in Portage La Prairie, which in the construction phase will generate approximately 300 jobs. Manitoba's low and stable electricity costs were a factor in Roquette's decision to locate in Portage La Prairie; however, at the time of its decision to build a facility in Manitoba, Roquette was not aware of Manitoba Hydro's plans to accelerate rate increases above the 3.95% level. Manitoba Hydro's projected 7.9% rate increase path would significantly affect the operation and profitability of Roquette's Portage la Prairie facility and would cause Roquette to be less likely to make further investments in Manitoba.

A representative from the Mining Association of Manitoba echoed the concern that higher electricity rate increases will erode Manitoba's competitiveness, will jeopardize ongoing investment decisions by mining operators, and will cost the province billions of dollars in total economic activity over the forecast period.

Beyond industry, representatives from municipalities and community recreation organizations presented evidence that, in combination with a provincial government freeze on municipal operating funds, Manitoba Hydro's planned rate increases will have a negative impact on public recreation facilities and municipal operating budgets. This will result in increased user fees and reduced services. The Board heard evidence that between 20 and 50 recreation facilities in the Interlake region could close as a result of five years of electricity rate increases of 7.9%.

Presenters on a ratepayer panel sponsored by the Consumers Coalition testified that, as opposed to higher rate increases in the near-term with the possibility of rate decreases after 10 years, stable and predictable rate increases are preferred. In particular, Mr. Dan Mazier, who farms 1,000 acres in Elton, Manitoba, and is the President of Keystone Agricultural Producers, expressed concern that Manitoba Hydro's indicated rate plan includes rates that increase too quickly when compared to the expected growth of agricultural businesses, leading to Manitoba's agricultural producers being uncompetitive.

Dr. Yatchew opined that the projected rate increases in Manitoba Hydro's new financial plan are likely to have a modest net effect on aggregate Manitoba output in the long-run, though there could very well be job losses and reduced output in the short-run. The immediate main effects will be distributional, in that portions of certain sectors will be disproportionately affected. Specifically, lower-income households and remote and First Nations communities will be more strongly affected as well as others who do not have access to alternative sources of energy, in particular natural gas. In addition, lower incomes will hamper substitution of capital goods, such as improved insulation and efficient windows and doors.

In a presentation on behalf of the Business Council of Manitoba, Mr. Murray Taylor testified that a 7.9% increase in the Test Year would not make Manitoba uncompetitive with any other jurisdiction. This witness questioned where businesses could relocate in order to receive electricity rates at a low enough level that the costs of relocation would be economic.

12.1 Intervener Positions

The Consumers Coalition maintains that, compared to inflationary rate increases, the Manitoba Hydro path of sustained 7.9% rate increases would slow the economic growth of the province, the growth in labour income, and the growth in jobs.

Representatives of the General Service Small and General Service Medium and Keystone Agricultural Producers agree with all the expert witnesses who concluded there would be significant negative impacts on the Manitoba economy should Manitoba Hydro's rate plan be followed. This Intervener is also critical of Manitoba Hydro for not factoring into its consideration of the proposed rates the additional carbon tax impact on the agricultural and small and medium business sectors.

The Manitoba Industrial Power Users Group submits that, concurrent with the economic stimulus from the construction of Keeyask ending, the successive 7.9% rate increases in Manitoba Hydro's financial plan will impose material adverse impacts on the overall provincial economy. The impacts are exacerbated as the revenues from the increased rates are planned to be used for debt repayments and not injected back into the Manitoba economy.

The Assembly of Manitoba Chiefs raises concerns that the level of rate increases projected by Manitoba Hydro will substantially increase energy poverty.

The City of Winnipeg is critical of Manitoba Hydro for not undertaking an economic assessment of the impact of its proposed 7.9% rate increases considering the Utility has multiple economists on staff. According to the City of Winnipeg, Manitoba Hydro ignored half of the test of what needs to be considered when setting rates: the impact on ratepayers. The City of Winnipeg's GDP will be reduced by the Utility's proposed rate increases. As with businesses, and for the additional costs that cannot be absorbed within its operating budget, the City will need to pass on the costs of Manitoba Hydro rate increases through increased fees, reduced services, and increased taxes. The impact on residential and business customers will be magnified as a result of the trickle-down effect.

12.2 Board Findings

Manitoba Hydro did not provide evidence as to the macroeconomic impacts of its proposed rate plan, including the Test Year increase. This is a factor in the Board's conclusion that Manitoba Hydro did not meet its onus to establish that the rate increase sought by the Utility is just and reasonable.

Evidence was, however, provided by expert witnesses retained by Interveners and the Board. The Board accepts the evidence that the projected rate path may lead to short-term job losses and negative impacts for some industries that are more economically vulnerable based on the electricity intensity of their production. While the Business Council of Manitoba witness asserted that a 7.9% increase would not make Manitoba businesses uncompetitive, this was not supported by the evidence, including that provided by representatives of Manitoba industries. The Board notes the compelling evidence from the industrial and large commercial presenters in this regard. While there was evidence regarding potential job losses that could occur, the Board did not hear enough about the long-run general equilibrium effects.

The Board accepts Dr. Yatchew's evidence that the immediate main effects of the projected rate path will be distributional. In the first instance, this involves a transfer of money from ratepayers to the Utility. The Board also accepts Morrison Park Advisors' evidence that rate increases above inflation take money out of the economy and that is a factor to be considered in setting electricity rates. Secondly, rate increases affect lower-income households and remote and First Nations communities more significantly than other electricity customers.

Based on evidence presented, the Board determines that principles of rate stability and predictability are important for residential ratepayers, industry, business, and community organizations. The Board further finds that the rate increase sought by Manitoba Hydro for the Test Year departs from these principles.

13.0 Consumer Rate Increases

As noted above, Manitoba Hydro's GRA sought the Board's approvals for three separate rate increases:

- the 3.36% rate increase to all customer rates, previously approved on an interim basis effective August 1, 2016 in Orders 59/16 and 68/16. Manitoba Hydro requests this interim rate be finalized in this GRA without adjustment.
- a 7.9% interim rate increase for all rates to all customer classes to be effective August 1, 2017. As a result of the interim hearing process, the Board issued Order 80/17 approving a 3.36% average rate increase on an interim basis, effective August 1, 2017. This interim rate was to be further reviewed and considered in this GRA hearing. Manitoba Hydro now requests this interim rate be approved on a final basis with no adjustment.
- an additional 7.9% rate increase for all rates to all customer classes proposed for April 1, 2018.

13.1 Manitoba Hydro Position

While Manitoba Hydro's three rate requests are the subject of adjudication in this proceeding, the Utility also presented a new 10-year financial plan including rate increases beginning with the 2017/18 fiscal year rate increase requested in this GRA. The Utility's new 10-year projected rate plan begins with the 3.36% increase in 2017 and indicates 7.9% rate increases annually for six years followed by a 4.54% rate increase and then returning to inflationary rate increases of 2% in each year thereafter.

Manitoba Hydro acknowledges that the 7.9% rate increase request for 2018/19 and proposed for five years thereafter is an exceptional rate increase not previously sought by the Utility in recent decades. Manitoba Hydro states that "the previous plan has failed". Manitoba Hydro presented extensive evidence as to how the additional revenues from the 7.9% rate increases would enhance cash flow to facilitate payments of operating expenses, interest expense, and capital expenses while reaching a 25% equity target in a decade so as to be better financially prepared to manage risks.

Manitoba Hydro considers that a 7.9% rate increase fairly shares the burden of rate increases between current and future ratepayers. The Utility's concerns include the prospect that, without 7.9% rate increases now, future rate increases will have to be even larger.

While Manitoba Hydro has implemented cost cutting measures including staff reductions, it determined that lower load growth and lower export revenues from previous forecasts means that higher rate increases than previously forecast are now required.

With respect to the two interim rates, Manitoba Hydro's view is that these rates do not present a challenge to the Board's decision making as the Utility is not seeking to retroactively vary the interim rate increases and no Intervener gave evidence that those rates should be adjusted. Manitoba Hydro advises that it is not seeking an increase in the level of the rates awarded because it chose to focus on the 2018/19 rate increase, recognizing the compounding effect that ratepayers would face if the interim rates were finalized at a higher level at the same time as a general rate increase was implemented for 2018/19.

Manitoba Hydro indicates that it welcomes assistance from the Board in bringing to an end a regulatory cycle that includes frequent interim rate requests.

13.2 Intervener Positions

The Consumers Coalition has long been opposed to the consideration of Manitoba Hydro rate increases through interim hearing processes. Accordingly, should Manitoba Hydro seek a further rate increase for its 2019/20 fiscal year, the Consumers Coalition recommends that the Utility be directed to file its next GRA by the fall of 2018, such that it avoids the need for any interim rate hearing.

This Intervener submits that both the August 1, 2016 and August 1, 2017 3.36% interim rate increases are already built into rates and therefore are 'immunized' through the passage of time. This Intervener directed its focus to the 7.9% rate increase sought for April 1, 2018, rather than deploy resources on the historic interim rate increases.

As for the requested 7.9% rate increase for April 1, 2018, the Consumers Coalition maintains that Manitoba Hydro has not satisfied its legal onus to demonstrate that the requested rate increase is just and reasonable in achieving the needed balance as between the interests of the ratepayers and the financial health of the Utility. According to the Consumers Coalition, the GRA evidentiary record demonstrates that a 7.9% rate increase is more likely to harm Manitoba ratepayers and the Manitoba economy compared to the impacts of a smoothed rate increase at or below the 3.95% NFAT range. Smoothing rate increases at or below the 3.95% NFAT range makes sense, according to the Consumers Coalition, given the long lived and 'lumpy' nature of the Keeyask and Bipole III assets and considerations of regulatory stability, intergenerational equity, risk, and affordable access to the capital markets.

The conclusion of the Consumers Coalition is that, even assuming unbiased forecasts by Manitoba Hydro, appropriate implementation of Board Orders on accounting matters, and prudent management, Manitoba Hydro has not demonstrated a material change in its financial circumstances to justify the Utility's requested radical departure from the 3.95% NFAT range of rate increases. This Intervener submits that the rate increase for the 2018/19 Test Year could be in the range of 2.95% to 3.5%, where the higher end of the range recognizes the risks related to Keeyask costs and the lower end of the range would send a message of accountability to the Utility for its forecasting inaccuracies. Ultimately, this Intervener recommends a 2.95% rate increase for Manitoba Hydro's next fiscal year.

The Manitoba Industrial Power Users Group concludes that the evidence in the full GRA proceeding sufficiently demonstrated a need for the two 3.36% interim rate increases and that both should be approved by the Board as final without adjustment.

According to the Manitoba Industrial Power Users Group, comparing the previous GRA to this GRA:

- on a net income basis, Manitoba Hydro is now better off;
- on a comparative risk basis, the Utility is now much better off;
- on a total costs over time basis, Manitoba Hydro is approximately equal to previous forecasts;
- on a maximum debt level basis, and with the cost overruns on Keeyask and Bipole III, the Utility is now 'a bit worse off'.

The Manitoba Industrial Power Users Group suggests that, considering this mix of 'ups and downs', it would be reasonable to consider Manitoba Hydro's overall financial position as comparable to previous years.

The Manitoba Industrial Power Users Group submits any rate increase for Manitoba Hydro's 2018/19 fiscal year should fall between 3.36% and 3.57%, based on the evidence on the public record. However, this Intervener advocates this range should be lowered by the Board because of confidential information related to the understated or pessimistic export revenue forecast and load forecast that were reviewed by the Board. This Intervener also recommends the Board take into account the improvements to Manitoba Hydro's financial forecast resulting from a higher load forecast that would result from a lower rate increase.

The City of Winnipeg argues that nothing has changed from what was presented to the Board when it issued interim Order 80/17 approving a 3.36% August 1, 2017 rate increase, and as such, that rate increase should not now be altered.

As for the 2018/19 requested rate increase, this Intervener adopts the submissions by the Consumers Coalition and maintains Manitoba Hydro has not demonstrated the need for a 7.9% increase or to depart from the NFAT 3.95% rate trajectory. The City of Winnipeg maintains Manitoba Hydro has not justified the change in its financial forecast modelling, which relies on speculation and hypothetical concerns of water flows, export prices, and interest rates to promote a 10-year timeline for reaching a 25% equity level. This Intervener submits the requested 7.9% rate increase is an "exceptional rate increase", is "larger than any previous increase sought from the Public Utilities Board" by Manitoba Hydro, and has not been borne out by the evidence. The City of Winnipeg concludes such a rate increase is neither just nor reasonable nor in the public interest.

The Green Action Centre takes no position on the rate increases. This Intervener accepts the conclusions and recommendations from expert witnesses that the 7.9% proposed and projected rate increases represent a long-term problem for energy poverty in Manitoba, such that only direct rate assistance and energy efficiency plans can mitigate the impacts.

The Business Council of Manitoba encourages the Board to deviate from the historic rate path and order a 2018/19 rate increase along the lines of that requested by Manitoba Hydro. This Intervener submits the accuracy or inaccuracy of previous forecasts is irrelevant to the issues that have been raised as the focus needs to be on the issues that will occur in the near term.

Representatives of General Service Small and General Service Medium Customer Classes and the Keystone Agricultural Producers indicate that the rate increase request by Manitoba Hydro for 2018/19 cannot be considered in isolation. This Intervener maintains that the Board should consider the totality of Manitoba Hydro's 10-year financial plan and all of the 7.9% requested and projected rate increases. If 7.9% rate increase is approved for 2018/19, based on a perceived need to reach a debt-to-equity target by a certain timeframe, this would signal that 7.9% is also needed for the following years in order to achieve the date for that target. Put differently by this Intervener, the only justification for 7.9% rate increases is if the Board concludes a 25% equity level must be achieved by 2027. This Intervener submits that meeting this debt-to-equity target is not required within 10 years and that a 2018/19 rate increase of 3.95%, consistent with the prior rate paths, is appropriate.

A further recommendation by this Intervener is that the Board should schedule annual, shorter reviews of the Utility's rates.

The Assembly of Manitoba Chiefs takes no position on the appropriate rate increase for 2018/19, but submits that the 7.9% rate trajectory in Manitoba Hydro's 10-year financial plan will increase energy poverty in the province and will magnify the problems of affordability for First Nations customers.

Manitoba Keewatinowi Okimakanak adopts the submissions and positions taken by the Consumers Coalition and concludes that there has not been a material change in Manitoba Hydro's financial circumstances since that forecast at the 2014 NFAT such that the maximum rate increase for 2018/19 should be 3.9%. Manitoba Keewatinowi Okimakanak urges the Board, after determining the average electricity rate increase for 2018/19, to reduce the rate charged to First Nations customers by an amount which would serve to remove the portion that accounts for mitigation costs paid to First Nations. Manitoba Keewatinowi Okimakanak's position is that First Nations should not be paying for these costs as they are the beneficiaries of such mitigation payments.

13.3 Board Findings

The approach taken by Manitoba Hydro in this GRA is different than in prior proceedings. In this GRA, the Utility focused on reaching a particular debt-to-equity target in a 10-year time period, rather than a 20-year period as it proposed previously. In addition, Manitoba Hydro constructed a new cash flow analysis that was presented in this GRA as a "new view" of the Utility's cash flow situation. This cash flow analysis was presented to the Board, although Manitoba Hydro advises that it is not used in their audited financial statements or financial forecasts, nor is it presented to credit rating agencies. The Utility placed emphasis on this new cash flow analysis due to its view that traditional financial metrics, including the capital coverage ratio and interest coverage ratio, are deficient in certain aspects.

2016 and 2017 Interim Rate Increases

Based on an assessment of the full GRA evidentiary record, the Board approves as final each of the 3.36% interim rate increases which were effective August 1, 2016 and August 1, 2017. The dissenting member in Order 80/17, Sharon McKay, is in agreement with the decision to finalize the interim rate that was effective August 1, 2017, based on the review of the full record in the GRA hearing.

No evidence was presented as to why the 3.36% rate increases were not appropriate. However, the lack of testing by Interveners and limited focus from Manitoba Hydro underscores the Board's previous concerns about interim rate applications. The Board reiterates its conclusion in Order 59/16 that "interim rate applications ought not be the 'norm' for Manitoba Hydro. Interim rate applications do not offer the same level of public review as General Rate Applications." Interim rate processes are not to be used for purposes of convenience or as substitutes for the proper planning of GRAs. Both ratepayers and Manitoba Hydro benefit from a robust process that results in final rates that are just and reasonable. Future GRAs by Manitoba Hydro are not expected to be of this magnitude or duration as process improvements have and will continue to be implemented to focus the scope and expedite proceedings. In addition, the Board agrees with the Consumers Coalition that interim rates may create a regulatory *status quo* that is difficult to overturn, despite a lack of full regulatory review. Therefore, in the absence of unforeseen or emergency circumstances, the Board will not consider future interim rate increases.

To avoid future interim rate applications, should Manitoba Hydro request a rate increase for April 1, 2019, it must file a GRA by no later than September 1, 2018. Filing of a GRA after September 1, 2018 but before December 1, 2018 is required for consideration of a request for a revised rate in fiscal year 2019/20. For the next GRA, the Board will not consider rate increases for more than two Test Years.

The Board appreciates Manitoba Hydro's desire to establish a regulatory timetable that does not require the use of interim rates. The Board is prepared to work with Manitoba Hydro and other parties towards the development of that regulatory timetable.

Rate Increase for 2018/19

Manitoba Hydro's request for an April 1, 2018 rate increase of 7.9% is denied. The Board finds that Manitoba Hydro has not met its onus of proving that a 7.9% rate increase is just and reasonable. A 7.9% rate increase is not required for Manitoba Hydro's operations in the Test Year. In addition, the Board does not accept that achieving a 25% equity level in 10 years is an adequate reason in itself to justify a rate increase of 7.9% in 2018/19.

The Board finds that Manitoba Hydro failed to present economic impacts of the 7.9% rate increase or the impact on customers in various sectors – such as residential, commercial, and industrial. In future rate applications, the Utility is to assess the broader impacts of rate increases beyond only the financial health of Manitoba Hydro. The Board is concerned about the impact of electricity rate increases that are four times the rate of inflation in light of impending carbon taxes, both of which will affect individuals and Manitoba businesses, groups, and organizations. Representatives from industry, as well as agricultural representatives and individual ratepayers that presented evidence, stressed the need for stable and predictable rate increases. A summary of the evidence provided by presenters in the GRA proceeding is contained at Appendix C to this Order.

Based on a balancing of the interests of the ratepayers with the financial health of Manitoba Hydro, the Board approves on a final basis an overall rate increase of 3.6% effective June 1, 2018. As discussed below, the Board also approves rate increases that vary by customer class.

The Board finds an overall rate increase of 3.6% to be just and reasonable and in the public interest as it affords Manitoba Hydro sufficient revenues for financial purposes including cash flow and payments of operating expenses, interest expense, and capital expenses. With this rate increase, the Board finds that Manitoba Hydro has sufficient revenue to operate its business, manage its risks, and pay its finance expenses. From the evidence, the Board finds that the overall rate increase awarded in this Order will provide the revenues required to maintain Manitoba Hydro's cash flow and to allow the Utility to manage its debt advantageously for ratepayers. The Board's recommendations on capital expenditures and demand side management will also assist the Utility in this regard.

The Integrated Financial Forecast filed in the proceeding as Manitoba Hydro Exhibit 93 supports the Board's decision on the level of the overall rate increase. This financial scenario included: continued deferral of $20 million in ineligible overheads, amortized at a 30-year rate; Average Service Life depreciation methodology, without amortization of the difference with the Equal Life Group methodology; achievement of a 25% equity level over a longer period of time, specifically by 2035/36; and debt management based on a weighted average term to maturity of 12 years. In many respects, and as a departure from Manitoba Hydro's plan and Integrated Financial Forecast assumptions, Manitoba Hydro Exhibit 93 is therefore reflective of many of the Board's decisions in this Order.

Beginning in the Test Year, the Manitoba Hydro Exhibit 93 Integrated Financial Forecast scenario results in equal annual rate increases of 3.57%. The Board finds that with minor adjustments, this scenario is directionally consistent with the Board's decisions in this Order.

The Board finds that the 3.6% overall rate increase is to be effective June 1, 2018 in order to begin to move Manitoba Hydro back to a regulatory cycle that is consistent with the start of its fiscal year. The Board accepts that there is a benefit to both Manitoba Hydro and ratepayers in moving back to a regular regulatory cycle. If Manitoba Hydro does not adjust its planning to allow for sufficient time for the Board's review of the next GRA, any rate increase granted will not be effective April 1, regardless of the Board's intention to return the Utility to a regular regulatory cycle.

14.0 Payments to Government

Manitoba Hydro makes payments to the Province of Manitoba for water and land rentals, debt guarantees, and capital and other taxes. Manitoba Hydro also pays grants in lieu of taxes to municipalities. In Integrated Financial Forecast MH16, Manitoba Hydro forecasts that it will pay $433 million to governments in 2018/19, with $406 million to be paid to the Province for water rentals, debt guarantee fees, payroll tax, and the capital tax.

Pursuant to *The Water Power Act*, water rentals are paid to the Province for Manitoba Hydro's use of water resources for its hydroelectric generation. Land rentals are annual payments for the use of Manitoba Crown lands used for water power purposes.

The debt guarantee fee is an annual fee payable to the Province in exchange for the Government's guarantee of the Utility's debt (with the exception of Manitoba Hydro-Electric Board Bonds). The fee is calculated using a rate of 1% multiplied by the applicable outstanding debt at March 31st of the previous fiscal year. The debt guarantee fee is capitalized to the capital project to which the payment of the fee relates, and forms part of the cost of project.

The Utility pays capital tax to the Province at a rate of 0.5% which is applied to the taxable paid-up capital of Manitoba Hydro. The only corporations that pay a capital tax to the Province are Crown Corporations and financial institutions.

Manitoba Hydro pays grants in lieu of taxes on its land and buildings. The amount of grants in lieu paid is determined based on property valuations and municipal and school division mill rates, similar to the manner in which property taxes are determined for other taxpayers in Manitoba.

Payroll tax is based on a tax rate of 2.15%, which is applied to the Utility's gross payroll.

Business taxes are paid with respect to commercial space occupied by Manitoba Hydro in both leased and owned properties. The Utility pays property taxes to the landlords of leased premises as part of the required lease payments.

Manitoba Hydro also makes other municipal payments with respect to the Town of Gillam and the Frontier School Division.

As noted in the NFAT Report, the Utility's payments to the Province totaled $262 million, representing 16% of Manitoba Hydro's revenues. Since then, the ongoing construction on the $8.7 billion Keeyask and the $5.0 billion Bipole III projects, as well as other capital projects, has increased the annual amounts paid and payable to the Province. Even though Bipole III is not yet in service, in fiscal year 2018, Manitoba Hydro will pay $43 million to the Province for the debt guarantee fee and an additional $22 million to the Province for capital tax. Each of those amounts will increase when Bipole III is fully in-service in fiscal 2019. Likewise, even though Keeyask's in-service date has been delayed 21 months, in fiscal year 2018, Manitoba Hydro will pay $44 million to the Province for the debt guarantee fee and an additional $22 million for capital tax. No water rental fees for Keeyask will be paid to the Province until that generating station enters service when those water rental fees will reach $18 million per year in 2025.

When those two major capital projects are completed and beginning in 2023, Manitoba Hydro estimates it will pay approximately $490 million to the Province each year. The amount paid to the Province will decrease once Manitoba Hydro is repaying debt, thereby reducing its debt guarantee fees.

A comparison of payments to government by Manitoba Hydro and other Canadian Crown-owned electric utilities was provided in evidence and is set out in the chart reproduced below. In addition, the chart separately shows dividend payments in the jurisdictions where dividends are paid. Manitoba Hydro reiterated that there is no policy or policy discussion in Manitoba for paying dividends to the Province and the Utility's rates are not set on the basis of generating a rate of return for the Province. As illustrated in the chart below, Manitoba Hydro's total payments to Government (excluding dividend payments) as a percentage of gross revenue are higher, by a minimum of 7%, than other Canadian Crown-owned electric utilities. When dividend payments are factored in, Manitoba Hydro's total payments to Government as a percentage of gross revenue are second only to Hydro Quebec, which paid $2.146 billion in dividends to the Province of Quebec in 2016 pursuant to a dividend formula.

Payments to Governments ($ Millions)						
($ Millions)	Manitoba Hydro (Forecast 2018/19)	British Columbia Hydro (Forecast 2018/19)	Hydro-Quebec (2016 Actual, forecast not available)	Newfoundland Labrador Hydro (Forecast 2018/19)	SaskPower (Forecast 2018/19)	New Brunswick Power (Forecast 2018/19)

Source: MIPUG-30

* BC Hydro was historically mandated to pay a dividend equal to 85% of net income, subject to an 80:20 debt-to-equity cap; however, this formula was amended by Order in Council, such that beginning in fiscal year 2018, the dividends payable will be reduced by $100 million per year until zero is reached and will thereafter remain at zero until BC Hydro reaches a debt-to-equity ratio of 60:40.

** The amount of dividends paid by Hydro Quebec in 2016 was a result of the formula in that province that requires a dividend of 76% of net income be paid to the Quebec government, unless the Utility's equity ratio would fall below 26%. Hydro Quebec's high net income in 2016, which largely resulted from high run-off and favourable weather conditions, allowed the Utility to pay more than $2 billion in dividends to the Quebec government.

14.1 Intervener Positions

The Consumers Coalition requests that the Board recommend to Government that a portion of capital taxes, water rental fees and debt guarantee fees be redirected by the Province toward extensive demand side management programs for vulnerable customers, such as lower-income customers.

The Manitoba Industrial Power Users Group submits that the Board should recommend that Government implement a 10-year forgiveness of capital tax and debt guarantee fees on Keeyask and Bipole III, commencing with their respective in-service dates. The resulting financial benefits of any such relief could be split between the core objectives of permitting accelerated achievement of longer-term equity level targets and bringing average rate increases to within the range of inflation. This Intervener argues that applying these high capital tax and debt guarantee fees to major new capital projects is not appropriate so long as such charges aggravate concerns regarding equity or reserve levels and add pressures to increase domestic electricity rates above inflation. In addition, these payments have certain features that are consistent with hidden taxes. In the Manitoba Industrial Power Users Group's submission, if the Government is seeking to raise revenues, there are fairer ways than through electricity bills. This Intervener quantified the impact of its suggestion as being worth an approximate 10.6% impact on rates by 2022.

Manitoba Keewatinowi Okimakanak also submitted that the Government of Manitoba should forego some of the revenues it receives from Manitoba Hydro, as did British Columbia's government in respect of B.C. Hydro.

14.2 Board Findings

The Board finds that as a percentage of gross operations revenue, Manitoba Hydro's payments to the Province of Manitoba are high, both before and after considering the jurisdictions where dividends are paid by Crown-owned electric utilities. The evidence demonstrated that, excluding payments made to municipal governments, approximately 17 to 18 cents of each dollar of gross revenue is directed by Manitoba Hydro to the Province of Manitoba.

While the majority of Manitobans are both taxpayers and ratepayers, there is an important distinction. Consistent with the Board's responsibility for setting just and reasonable rates, ratepayers should be responsible for the economic costs associated with electrical services in Manitoba. Economic costs include both the direct costs of producing and supplying electrical power. Ratepayers are therefore billed based on their own consumption. In contrast, taxpayers should be responsible for the broader policy objectives as set by the elected members of Government. This means that the Government, on behalf of taxpayers, is custodian of the economy, owns Crown land and natural resources, and pursues social policies in the collective interest. As citizens of the province, taxpayers contribute revenues towards collective goals and collective good – such as the cost of a hospital that an individual taxpayer may never use. Nor are ratepayers and taxpayers economically identical: although most households are both, the proportion of income paid for electricity bills versus taxes varies considerably across households. As a result, any shift in the burden from taxpayers to ratepayers can have significant distributional impacts.

Consideration must be given to the appropriate allocation of revenues and costs as well as to risks and benefits as between taxpayers and ratepayers. In Manitoba, this issue is informed by the distribution of revenues and costs between the provincial government and the Crown-owned Utility. In general, the costs of Manitoba Hydro's capital projects are borne by ratepayers once the assets are in service.

The Bipole III project was initially scoped, designed, and engineered by Manitoba Hydro using the most cost effective route. However, as a result of a policy decision by the provincial government, the routing of Bipole III was changed to a western route at an additional cost of approximately $900 million. This decision created a $900 million burden for ratepayers with no apparent technical benefit for the new route. The Board finds that this was a policy decision of government that should be a cost to taxpayers, not Manitoba Hydro's ratepayers.

As such, the Board recommends that the Government suspend payment of the Bipole III debt guarantee fee and capital taxes made by Manitoba Hydro to the provincial government starting with the 2018/19 fiscal year. Manitoba Hydro – and ultimately the ratepayer – should be reimbursed through suspension of such payments for approximately 13 years until the $900 million burden of a policy decision made by government with respect to the Bipole III western route is satisfied.

With respect to Keeyask, after it is fully in-service, Manitoba Hydro will pay approximately $140 million per year to the Province of Manitoba for water rentals, debt guarantee fees, and capital and other taxes. As noted by the Board in its 2014 NFAT Report:

> *While ratepayers will shoulder a significant rate burden over the next 20 years, the Province of Manitoba will reap substantial incremental revenues through capital tax and water rental payments from Manitoba Hydro as a result of the Keeyask Project. The Province should give serious consideration to using some of these incremental revenues to fund energy affordability programs targeted to vulnerable consumers, particularly lower income consumers and customers*

residing in northern and First Nations communities. This could involve rate relief programs as well as targeted DSM programs.

In response to the Board's NFAT recommendations, the provincial government issued a letter on July 2, 2014 to both the Chair of the Manitoba Hydro-Electric Board and to the President and CEO of Manitoba Hydro stating:

> *The Manitoba Government will also consider the Panel's specific recommendation respecting Government revenues from new hydro development, as well as potential alternatives to support vulnerable consumers to reduce their bills.*

As revenues are already accruing to the Province as a result of Keeyask and in the context of projected annual electricity rate increases, the Board continues to be of the view that the Government should use some of the revenues it receives from Keeyask to fund a comprehensive bill affordability program, as discussed in detail below.

Finally, the inter-relationship between Manitoba Hydro and the provincial government will be enhanced with provincial carbon pricing. In the transition to a low-carbon economy, the Province of Manitoba does and will benefit from the strength of its clean hydroelectric resources. As the provincial government will receive revenue from the planned carbon tax, the Board further recommends that the provincial government transfer a portion of the carbon tax revenues to further strengthen Manitoba Hydro's financial health which may allow for lower consumer rate increases.

15.0 Cost of Service Study and Implementation of Order 164/16

Cost of Service is a method of allocating a utility's costs to the various customer classes it serves. Its purpose is to determine the allocation of the utility's approved costs, also referred to as the revenue requirement, among the customer classes. The Utility's Cost of Service Study determines each customer class's share of Manitoba Hydro's overall revenue requirement. A Cost of Service Study is normally filed with each GRA and, together with the proposed revenue requirement, rate design, and other pertinent information, forms the background supporting rate setting.

Through a process that began in December of 2015 and culminated in Order 164/16, the Board reviewed Manitoba Hydro's Cost of Service Study methodology. Order 164/16 provides an explanation of the concepts and terminology related to the Cost of Service Study.

In Order 164/16, the Board determined that the principle of cost causation – the idea that customers should pay for the costs they "cause" the Utility to incur - is paramount in determining the appropriate Cost of Service Study methodology. As such, ratemaking principles and goals should not be considered at the Cost of Service Study stage.

Following the Board's review, Manitoba Hydro implemented Board directives from Order 164/16 in the Prospective Cost of Service Study for Year Ending March 31, 2018 ("PCOSS18"). In scope for the current GRA hearing was the issue of whether the cost treatment of PCOSS18 follows the directions and principles of Order 164/16. Specifically, the matters raised for Board consideration are:

- the classification of wind resources, which was directed to be 100% energy in Order 164/16 on the basis that wind energy cannot be relied upon to meet peak demand and capacity needs. However, Manitoba Hydro now includes wind in its resource planning for capacity purposes, giving rise to the question of whether the classification of wind resources should be revised;

- the allocation of General Customer Services costs in the remaining general Customer Services sub-category to General Service Large 30-100kV and General Service Large >100kV customers. In PCOSS18, Customer Services activities have now been disaggregated and separated into three distinct categories: (1) Industrial and Commercial Solutions to General Service Large customers, the costs of which are allocated only to that customer class using the C23 allocator, (2) the costs of comparable services provided to smaller customers, which are allocated to all customer classes except General Service Large using the C13 allocator, and (3) the remaining general customer services, the costs of which are allocated to all customer classes on the basis of class revenues using the C10 allocator. The general customer services costs include outage calls, line locates, marketing research & development, safety watches & building moves, and rates & regulatory. These costs are allocated to all customer classes proportionately by revenue;

- the functionalization of Generation Outlet Transmission and specifically, whether there are other Generation Outlet Transmission facilities than those identified by the Board in Order 164/16 that meet the Board's criteria to be functionalized as Generation;

- whether radial transmission lines, also known as non-tariffable transmission, should be included in the allocation of export revenue as these assets are not integrated with the networked transmission system and therefore do not facilitate exports;

- the completion of the further study directed in Order 164/16 of the allocation of common costs, the service drops allocator, and the treatment of primary and secondary distribution lines; and

- how Bipole III revenues should be treated in the Cost of Service Study.

15.1 Manitoba Hydro's Position

Manitoba Hydro submits that PCOSS18 is essentially fully compliant with the methodology directed in Order 164/16. With respect to the remaining Customer Service activity costs allocated using the C10 allocator, Manitoba Hydro argues that the disaggregation of these activities into three distinct categories demonstrates that there is no overlap in the allocation of customer costs. Moreover, the activities in this sub-category are public safety-related and therefore allocable to all customers.

Manitoba Hydro acknowledges that there are two outstanding directives from Order 164/16 that remain to be addressed in the next Cost of Service Study, specifically: updating the allocator for service drops and studying the allocation of common costs. Manitoba Hydro will complete these directives in the next Cost of Service Study, but states that it does not expect that there will be a material impact on allocated costs. With respect to primary and secondary distribution lines and the Board's directive to continue with the existing methodology unless and until additional study and data are presented to justify any changes, Manitoba Hydro states that its records do not distinguish the costs of primary and secondary lines, so the data required are not available.

Manitoba Hydro submits that it annually reviews the facilities functionalized as Generation Outlet Transmission.

While Manitoba Hydro now attributes some capacity to wind generation in its resource planning, the Utility is not looking to vary the Order 164/16 Cost of Service treatment of wind costs.

With respect to the treatment of Bipole III Deferral Account revenues, Manitoba Hydro proposes returning the revenue to domestic classes on the same basis by which the revenues were accumulated in the fund (i.e. proportionally by class). Manitoba Hydro submits that this approach most fairly apportions the reserve account to each class.

15.2 Intervener Positions

The Manitoba Industrial Power Users Group submits that, while PCOSS18 largely follows Order 164/16, the evidence does not support the use of the C10 allocator to allocate the costs of contact centre – outages, marketing research and development, line locates, or building moves and safety watches to the industrial classes. Of these costs, $2.6 million are allocated to the General Service Large classes, but the costs are either driven by the distribution system, do not relate to the services received by the industrial classes, or relate to activities whose costs are already allocated to General Service Large 30-100kV and >100kV customers through the C23: Industrial & Customer Solutions sub-function allocator. The Manitoba Industrial Power Users Group recommends that C10 costs, other than education & safety and rates & regulatory not be allocated to the General Service Large 30-100kV and General Service Large >100kV classes.

15.3 Board Findings

The Board finds that, aside from the issues addressed below, Manitoba Hydro's PCOSS18 is consistent with the methodology arising from the Board's review in Order 164/16. The Board continues to find, as found in Order 164/16, the principle of cost causation is paramount in determining the appropriate Cost of Service Study methodology. As such, ratemaking principles and goals should not be considered at the Cost of Service Study stage.

Classification of Wind

The Board finds that no adjustment is needed to the classification of wind. As the Consumers Coalition expert witness testified, refinement in order to address the now-recognized capacity benefit of wind would add complexity to the Cost of Service Study methodology with minimal benefit. In addition, as a resource, wind is transacted on an energy basis through contracts with suppliers. Manitoba Hydro does not invest in wind assets in order to serve peak demand. This supports the continued classification of wind as 100% energy.

General Customer Service Costs (C10 Allocator)

The Board finds that the activities of education & safety and rates & regulatory should be allocated to all customer classes using the C10 allocator.

The Board finds that cost causality supports allocating the costs of the education & safety and rates & regulatory activities to all customer classes. Education and safety programs include safety around dams, waterways, substations, and overhead powerlines. Rates & regulatory activities relate to the work done by that department of Manitoba Hydro, including for General Rate Applications. It was not contentious in this proceeding that these costs are incurred for the benefit of all customers. As no party proposed an alternative allocator for the education & safety and rates & regulatory costs, Manitoba Hydro is to continue with the PCOSS18 methodology of allocating these costs on the basis of class total revenue.

Building moves and safety watches, contact centre – outages, line locates, and marketing research and development costs should not be allocated to the General Service Large 30-100kV and General Service Large >100kV customer classes.

Manitoba Hydro is directed to allocate the costs of these customer service activities to all classes other than General Service Large 30-100kV and General Service Large >100kV. The costs for these activities relate primarily to distribution-level assets or service to smaller customers or are already solely allocated to the General Service Large 30-100kV and General Service Large >100kV classes through the Industrial & Commercial Solutions sub-function. As detailed below, the evidence does not establish that General Service Large 30-100kV and General Service Large >100kV customers cause these costs to be incurred.

Building moves & safety watches relate primarily to distribution facilities. The safety watches activity primarily relates to on-site safety watching for residential homeowner and contractors during work in close proximity to distribution facilities, although Manitoba Hydro does not track these services by type of electric plant.

Similarly, with respect to contact centre – outages, Manitoba Hydro does not track outage reports by customer class. While Manitoba Hydro states that the contact centre is the initial point of contact for all customers, the Utility could not confirm if General Service Large customers have used the call centre. In addition, industrial customers can directly contact their key account representative, the costs of which are allocated within the C23 costs.

The costs of marketing to large customers are also specifically included in the C23 costs. Manitoba Hydro could not provide information to show that the costs in the C10 activity of marketing research & development are focused in some aspect on the General Service Large >100kV customers.

Line locates relate primarily to distribution facilities. General Service Large 30-100kV and General Service Large >100kV customers use transmission facilities, not distribution facilities. The Board understands that Manitoba Hydro does not have underground transmission lines in its system, therefore Manitoba Hydro does not incur line locating costs related to transmission lines.

Functionalization of Generation Outlet Transmission

The Board finds that Manitoba Hydro conducted a review of the functionalization of Generation Outlet Transmission and no further study is required at this time, other than reviews of the functionalization Generation Outlet Transmission that the Utility states it undertakes from time to time.

Non-Tariffable Transmission

The Board finds that non-tariffable transmission costs are not to be included in the allocation of export revenues. By definition, these lines are not used to facilitate export revenues. As such, it is consistent with the principle of cost causality to exclude the costs from the allocation of export revenues.

Matters for Further Study

Manitoba Hydro is directed to complete the study of the Service Drops Allocator and the Common Costs study that were ordered in Order 164/16 in time for its next Prospective Cost of Service Study. Manitoba Hydro has committed to completing these directives in this time frame.

The Board will not direct further study on primary and secondary lines. The necessary data are not available to conduct such a study. Moreover, Order 164/16 did not direct that this study be completed; rather, the Board directed Manitoba Hydro to continue with its existing methodology unless and until additional study and data are presented to the Board to justify any methodology changes. There is therefore no outstanding directive on the study of primary and secondary lines.

Treatment of Bipole III Revenues

The Board finds that the Bipole III Deferral Account revenues are to be returned in the Cost of Service Study to the domestic classes proportionally. No party opposed this treatment and it is consistent with the basis by which the revenues were accumulated in the fund as each class contributed to the Deferral Account proportionally. If the revenues were applied directly against the cost of the asset, classes that make relatively greater use of Generation facilities would disproportionally benefit, notwithstanding that each class has contributed 11.6% compounded in rates towards the Deferral Account. Inconsistent treatment as between the revenue collection and the recognition of the revenue for cost of service purposes is not justified.

16.0 Revenue to Cost Coverage Ratios and Differentiated Rates

As detailed by the Board in Order 164/16:

> *One of the outputs of a COSS is the calculation of total costs allocated to each customer class. The COSS output is a tool that can be used in the ratemaking process to assign target revenue for each rate class. This step includes comparisons showing scenarios of target class revenue to the cost of service-based costs allocated to the respective class. The ratio of target revenues by class to the allocated class costs results in a Revenue to Cost Coverage ratio ("RCC"). A RCC ratio less than unity (1.0) means that the revenue generated by a class is not sufficient to recover all the costs allocated and assigned to that class; conversely, a RCC ratio greater than unity (1.0) means that Manitoba Hydro is recovering more revenue from that class than its allocated and assigned costs.*

The Revenue to Cost Coverage ratios are calculated by dividing each customer class's revenue by the allocated costs for the class. In addition to revenue from domestic rates, Manitoba Hydro also receives revenues from its export business and those revenues are credited back to the domestic customer classes in the Cost of Service Study. Historically, when calculating class Revenue to Cost Coverage ratios, Manitoba Hydro added each class's share of export revenue to its domestic revenue, and then divided this total revenue number by allocated costs.

An alternative calculation methodology is to treat export revenue as a reduction to allocated class costs, such that domestic class revenue is divided by allocated costs less the class share of export revenue. If this methodology is used, classes move further from unity, particularly those that are outside of the zone of reasonableness, such that they are under- or over-contributing revenue to a greater degree.

Public Utilities Board

Régie des services publics

Many utilities do not set rates in order to achieve class Revenue to Cost Coverage ratios of exact unity. This is because, despite the appearance of arithmetic exactness, every Cost of Service Study contains a degree of imprecision due to the need to make decisions by applying judgment and limitations on the available data with respect to customer loads. Thus, instead of unity, a zone of reasonableness is used to target the Revenue to Cost Coverage ratios of the customer classes. Revenues that are within this range are deemed to represent full cost recovery. Since 1996, Manitoba Hydro has used a zone of reasonableness of 95-105%. In the current GRA, Manitoba Hydro proposes that the Board consider expanding the zone of reasonableness to a broader 90-110% range.

One use of a Cost of Service Study is to assess class Revenue to Cost Coverage ratios against the zone of reasonableness to indicate where adjustments could be made to customer class rates to address any under- or over-recovery of revenues. The means of making such adjustments is through differentiated rates. As opposed to an across-the-board rate increase, where all components of all class rates are increased by the same percentage, differentiated rates shift revenues between customer classes to bring classes outside of the zone of reasonableness within the zone. Such adjustments may be upwards – the collection of more revenue than the average rate increase – or downwards – the collection of less revenue than the average rate increase.

Revenue to Cost Coverage ratio movement may also occur naturally as new assets of significant magnitude enter service and increase the costs that are allocated to the domestic customer classes in the Cost of Service Study. Manitoba Hydro anticipates that when Bipole III enters service, there will be a degree of immediate impact to class Revenue to Cost Coverage ratios. This is because the increased annual costs associated with Bipole III will be functionalized as Generation. As a result, once Bipole

III enters service, classes with a greater proportion of allocated Generation costs relative to their total costs, such as General Service Large >100kV, will see their allocated costs increase to a greater extent than those classes that do not, such as Residential. As illustrated below, one impact is that the General Service Large 30-100kV, General Service Large >100kV, and Residential customer classes, which are currently outside of the 95-105% range, move closer to unity when Bipole III enters service.

The class Revenue to Cost Coverage ratios are as set out below, including for the Manitoba Hydro PCOSS18 calculation methodology, the alternative calculation methodology, and the estimated ratios in 2020 when Bipole III is in service:

Customer Class	PCOSS18 Revenue to Cost Coverage Ratio	Alternative Methodology Revenue to Cost Coverage Ratio	Estimated 2020 Revenue to Cost Coverage Ratio with Bipole III*
Residential	94.8%	93.5%	96.7%
General Service Small Non-Demand	112.5%	115.7%	115.3%
General Service Small Demand	101.0%	101.3%	101.3%
General Service Medium	98.3%	97.8%	97.4%
General Service Large 0-30kV	99.1%	98.7%	96.5%
General Service Large 30-100kV	109.3%	113.0%	103.5%
General Service Large >100kV	108.6%	112.3%	101.5%
Area & Roadway Lighting	100.3%	100.3%	118.2%

* Based on Manitoba Hydro's PCOSS18 methodology of calculating the Revenue to Cost Coverage ratios

16.1 Manitoba Hydro's Position

Manitoba Hydro submits that the Cost of Service Study and its resultant Revenue to Cost Coverage ratios are tools that may be used when setting rates, but the results of the study should not be used in a purely mechanistic manner. Rather, there should be a reasonable balance with the Utility's ratemaking objectives.

Manitoba Hydro argues that the Board should expand the zone of reasonableness to a broader 90% – 110% range in order to address fairness and equity matters that are no longer guiding principles of the Cost of Service Study. With this expansion of the zone of reasonableness, only the General Service Small Non-Demand class is outside of the zone.

The Utility argues further that revising the method of calculating the Revenue to Cost Coverage ratio would require an expansion to the zone of reasonableness because the alternative approach generates results with a much broader set of outcomes, suggesting a need for a more dramatic and immediate rate adjustment. As such, changing the calculation methodology should not be done in isolation, but rather in concert with acceptance of a broader zone of reasonableness. In addition, the alternative methodology would represent a significant departure from the traditional and long-standing calculation that has been used by Manitoba Hydro to report PCOSS outcomes, producing results that will not be directly comparable to those historically reported.

Manitoba Hydro submits that any evaluation of the current Revenue to Cost Coverage ratios must consider the directional changes that are expected in the next Cost of Service Study once Bipole III is in service and reflected in the revenue requirement. Manitoba Hydro states that the impacts by class of Bipole III entering service are predictable based on each class's relative usage of the bulk power system and the change in cost structure to the significant, lumpy increase in the amount of Generation-related revenue requirement included in the study. The expected change in costs is sufficient to move the Revenue to Cost Coverage ratios for the Residential and General Service Large classes into the zone of the reasonableness as soon as Bipole III enters service, without any additional rate differentiation.

Based on the foregoing, Manitoba Hydro is not proposing to shift revenues between customer classes to adjust Revenue to Cost Coverage ratios.

16.2 Intervener Positions

The Consumers Coalition notes that the most common zones of reasonableness employed by Canadian regulators are 90% to 110% and 95% to 105%, but submits that the 90% to 110% range is preferred. It argues that, even with the current zone of reasonableness of 95% to 105%, the result of Bipole III entering service will be to move the Residential class well within the zone. There is therefore no basis for a disproportionately higher rate for the Residential class. As well, Residential class rates tend to be significantly above marginal costs, so differential rates for the class are not justified from an economic efficiency perspective.

Representatives of the General Service Small and General Service Medium Customer Classes and Keystone Agricultural Producers argue that the Board should consider improvements to the Revenue to Cost Coverage ratios for certain classes, and in particular the General Service Small Non-Demand class, which is outside the zone of reasonableness at 112.5% (using the PCOSS18 calculation methodology) or 115.7% (using the alternative calculation methodology). Differential rates would therefore be consistent with the rate-making principle of fairness, which seeks to avoid a situation where any class pays an arbitrarily high rate through a contribution to costs that has the effect of subsidizing another class. There should be adjustment to the ratio for General Service Small Non-Demand in the range of a 1% lower rate increase.

The Manitoba Industrial Power Users Group submits that the calculation of Revenue to Cost Coverage ratios should be performed using the alternative methodology. It argues that the zone of reasonableness of 95% to 105% is appropriate for a large utility with a sophisticated Cost of Service Study like Manitoba Hydro. In evaluating the current Revenue to Cost Coverage ratios, the Board should set rates with positive movement towards the zone of reasonableness to reflect principles applied to utility regulation and to address longstanding overpayment of costs by the General Service Large classes. The degree of adjustment should be a rate increase 1% - 2% lower than average for the classes above 105% to reflect gradualism and to ensure that reversal will not be required in the near-term when Bipole III enters service.

16.3 Board Findings

The Board finds that the Revenue to Cost Coverage ratios are to be calculated using the alternative methodology of treating export revenues as a reduction to allocated class costs. Although this is a departure from the calculation methodology historically used by Manitoba Hydro, the goal of consistency has less weight at this time when the Cost of Service Study methodology itself has changed as a result of the Board's review in Order 164/16. Aside from the means of calculating the Revenue to Cost Coverage ratios, the results from previous Cost of Service Studies are already not directly comparable to post-Order 164/16 results given that significantly different methodologies are employed.

Further, the Board finds that the alternative methodology is consistent with cost causation. As stated by the Board in Order 164/16, "export revenues are not a 'dividend' that can be assigned or based on considerations other than cost causation". The domestic customer classes incur costs to facilitate Manitoba Hydro's export business. Treating export revenues as a reduction of allocated costs in the Revenue to Cost Coverage ratio aligns with the economic justification for major capital projects such as Keeyask, which is based on using the full quantum of export revenues to lower the cost of new generation and transmission.

As such, the Revenue to Cost Coverage ratios arising from PCOSS18 are:

Customer Class	**Revenue to Cost Coverage Ratio**
Residential	93.5%
General Service Small Non Demand	115.7%
General Service Small Demand	101.3%
General Service Medium	97.8%
General Service Large 0-30kV	98.7%
General Service Large 30-100kV	113.0%
General Service Large >100kV	112.3%
Area & Roadway Lighting	100.3%

In evaluating class Revenue to Cost Coverage ratios, the Board does not accept that the zone of reasonableness should be expanded to 90% to 110% and finds the zone of reasonableness should remain at 95% to 105%. While rate-making principles may justify accepting Revenue to Cost Coverage ratios that are outside of the zone, those principles do not support broadening the zone itself. A 95% to 105% range recognizes the sophistication of Manitoba Hydro's Cost of Service Study and departure from this range has not been justified.

The Board finds that the Revenue to Cost Coverage ratio output of the Cost of Service Study is to be used at this time to more closely align the revenues collected from each customer class with the costs of the electrical system that are caused by each class. As determined in Order 164/16, the Cost of Service Study is a tool that can be used in rate-making. With Manitoba Hydro's implementation of the methodology changes resulting from the Board's review of the Cost of Service Study in Order 164/16, the Utility now has a valid, regulator-approved cost of service result. While the cost of service should not necessarily be the overriding factor in designing rates, it is consistent with the rate-making principle of fairness to consider the output of the Cost of Service Study.

The Board directs Manitoba Hydro to begin to implement differentiated rates to collect the approved revenue requirement. General Service Small Non-Demand, General Service Large 30-100kV, and General Service Large >100kV are all overpaying costs to a significant degree outside of the zone of reasonableness, at 115.7%, 113.0%, and 112.3% respectively. The two General Service Large classes have been overpaying in almost every year since 1996, even using the previous ratio calculation methodology which tended to narrow the range of class ratios.

Manitoba Hydro is to adjust class revenue targets in order to begin to move the General Service Small Non-Demand, General Service Large 30-100kV, and General Service Large >100kV customer classes Revenue to Cost Coverage ratios into the zone of reasonableness. This will result in these customer classes receiving a level of rate increase that is slightly lower than the average rate increase.

For the 2018/19 Test Year rates, Manitoba Hydro is to assume a 10-year timeframe to move all classes within the zone of reasonableness, based on the alternative calculation methodology as directed in this Order. The rate increase impact of doing so is to be shared across all customer classes that are either below or within the zone of reasonableness: Residential, General Service Small Demand, General Service Medium, General Service Large 0-30kV, and Area & Roadway Lighting. As a result, the Residential customer class, which is currently the only class below the Zone of Reasonableness, will begin to move into the zone of reasonableness.

This approach to the implementation of differentiated rates is consistent with the principle of gradualism and limits the revenue recovery responsibility of the other customer classes, while maintaining overall revenue neutrality. This approach will also assist in limiting the prospect of over-correction of the issue at the time Bipole III enters service.

Manitoba Hydro is directed to include in its compliance filing for 2018/19 differentiated rates consistent with the Board's direction in this Order.

The Board will examine the Revenue to Cost Coverage ratios arising from the Prospective Cost of Service Study filed with the next GRA and will consider adjustment to the differentiation of rates as necessary, including to consider the impact of Bipole III entering service.

17.0 Rate Design

Manitoba Hydro designs its rates to collect the required amount of revenue from each customer class. In selecting a rate design, Manitoba Hydro considers its general rate-making objectives, which it identifies as: recovery of revenue requirement, fairness and equity, rate stability and gradualism, economic efficiency, competitiveness of rates, and simplicity and understandability.

Manitoba Hydro's existing customer class rate designs use a combination of the following charges: (1) a basic charge, which is a fixed charge that includes the direct costs of metering, portions of the distribution system, as well as billing administration, (2) a demand charge, which is a variable charge based on the maximum use of electricity within a specified time period and recovers costs that vary with peak electricity usage, and (3) an energy charge, which is a variable charge based on the electric energy consumed that recovers costs that vary with the consumption of electricity.

A simplified illustration of the existing class rate structures, based on the rates in effect as of August 1, 2017, is contained in the table below:

August 1, 2017	Basic Charge	Energy Charge (¢/kWh)	Demand Charge (/kVA)
Residential	$8.08	8.196	N/A
GSS Non-Demand (1 phase)	$21.91	8.609 * 5.976 ** 3.944	N/A
GSS Demand (3 phase)	$30.89	8.609 * 5.976 ** 3.944	$10.10
GSM	$32.61	8.609 * 5.976 ** 3.944	$10.10
GSL 0-30kV	N/A	3.709	$8.57
GSL 30-100kV	N/A	3.448	$7.34
GSL >100kV	N/A	3.342	$6.53

* First 11,000 kWh
** Next 8,500 kWh

Source: PUB 42-5-1

If a customer class's rate structure is changed, the general result will be to redistribute the collection of revenues between the customers within that class. Some customers within the class will pay more in rates than they would have under the previous rate structure, while others will pay less.

In the current GRA, Manitoba Hydro is seeking to have the requested 7.9% rate increase apply to all components of customer rates, without any change to the existing rate structures. This would increase the basic charges, energy charges, and demand charges by the approved rate increase.

In this proceeding, there were a number of proposals from Interveners and expert witnesses related to changing the rate structure, as well as an illustrative residential electric heating rate design filed by Manitoba Hydro.

First, the expert witness retained by the Green Action Centre, Paul Chernick, recommended that Manitoba Hydro be required to: 1) reduce demand charges over time while increasing energy charges and 2) eliminate the use of demand ratchets (rate provisions that charge demand-metered customers based on their maximum demand in current and previous months). Mr. Chernick gave evidence that these changes would send appropriate price signals to customers.

Second, Mr. Chernick proposed the implementation of a residential conservation rate, also referred to as an inverted block rate. This form of rate design includes a first block of consumption, set at a specified level of consumption exceeds the first block threshold – also referred to as the tail block – is priced at a higher level, based on the marginal value of energy. Because customers under this rate design pay less for consumption in the first block, and more for all kilowatt hours consumed in the tail block, there is a price signal to conserve energy.

Mr. Chernick's inverted block rate design recovers all of the requested rate increase in the tail block, with no increase to the basic charge or the energy charge for the first block of consumption.

Manitoba Hydro last used an inverted block rate structure between 2008 and 2011; however, in Order 40/11, the Board eliminated this rate design because it did not consider home heating load such that electric space heating customers were negatively affected due to their higher winter electricity consumption.

Third, Mr. Chernick proposed a rate design for residential electric space heating customers. Manitoba Hydro also filed an illustrative rate design scenario for residential electric space heating customers. The rationale for a reduced rate for electric space heating customers is that almost 20% do not have the choice of switching to natural gas space heating which is a lower-cost heating fuel. Natural gas is not available in many areas of the province and, where it is available, converting to natural gas heating may not be economically viable. As a result, rate increases place a burden on consumers who do not have the option of switching to alternative fuel sources.

Mr. Chernick's electric space heating rate design is an inverted block rate with seasonal blocks, such that the level of consumption for the first block threshold varies based on seasonality. The discount for all consumption in the first block of energy is 4¢/kWh. His objective with this rate design was to offset the cost of electric space heating, without reducing incentives to conserve energy, by targeting the reductions to usage blocks that will not be the customer's marginal usage.

Manitoba Hydro's illustrative rate design scenario is aimed at shielding electric heating customers from a portion of the proposed rate increase. Non-electric heating residential customers bear the additional revenue responsibility. This rate design scenario was not approved by the Manitoba Hydro-Electric Board and is not proposed by Manitoba Hydro for regulatory approval.

Fourth, Mr. Chernick and the expert witness retained by the Manitoba Industrial Power Users Group, Patrick Bowman, each proposed time-of-use rates for the General Service Large customer classes. A time-of-use rate recovers the Utility's costs primarily through an energy charge, which is differentiated between on-peak and off-peak hours. This creates an incentive for customers to shift consumption to off-peak times, when the energy charge is lower. Manitoba Hydro previously applied for time-of-use rates in the 2014/15 & 2015/16 GRA, but the Board determined that the issue would be addressed in the Cost of Service Study review. The Cost of Service Study proceeding ultimately excluded the review of rate-related matters from scope and deferred these to the next GRA. In this GRA, Manitoba Hydro did not submit a time-of-use rate proposal as such a rate design would shift revenue responsibility to customers who cannot make use of off-peak periods to reduce costs, exacerbating the bill impacts from the requested rate increase.

In his evidence, Mr. Chernick recommended that time-of-use energy charges be introduced to encourage reduction of usage in high-load periods. He proposed a three-period (on-peak, shoulder, and off-peak), seasonally differentiated rate with a narrow “critical peak” period. His proposal to eliminate demand charges would be a step towards the introduction of time-of-use rates.

Mr. Bowman proposed an optional time-of-use rate for industrial customers that could make use of off-peak energy at reduced rates to reduce electricity costs. Mr. Bowman’s evidence was that this would help address the issue of industrial customers having a limited number of ways to control costs without burdening customers who could not make use of the program. Mr. Bowman acknowledged that an optional time-of-use rate could result in revenue loss to Manitoba Hydro as only customers that could reduce their bills would opt for it, but suggested that the effect is likely to be a very small percentage of what the General Service Large >100kV class has been paying above costs for many years.

17.1 Manitoba Hydro’s Position

Manitoba Hydro argues that there should be no change to the rate structure at this time, as the introduction of such changes in an environment where the average customer bill is proposed to increase by 7.9% would result in some customers facing bill increases in excess of 7.9%. As such, Manitoba Hydro proposes that the rate increase of 7.9% apply to all components of the customer class rate structure.

Manitoba Hydro submits that demand charges are appropriate to provide a meaningful price signal to general service customers, without which customers may place greater demand on the system than they would otherwise. Demand charges also provide the Utility with a greater degree of revenue stability. Minimum billing demand and contract demand provisions reinforce the price signal to customers of the cost of demand that they impose on the system.

Manitoba Hydro argues that inverted block rates should not be implemented at this time due to the need to assess this rate design against the future conditions that may be experienced with Keeyask entering service, as well as with the significant change in marginal value. The tail block rate proposed by Mr. Chernick is considerably in excess of the levelized marginal value of electricity and would send an inappropriate price signal to customers.

Manitoba Hydro does not endorse the illustrative residential rate design scenario for a residential electric heating rate. With respect to Mr. Chernick's electric heating rate design, Manitoba Hydro submits that no weight can be given to the proposal as no proof of revenue was provided, making it impossible to test the design to ensure that it produces the appropriate level of revenue.

Manitoba Hydro does not accept that there should be an optional time-of-use rate, as this would result in a revenue shortfall to the Utility of approximately $1.5 million. The suggestion from the witness for the Manitoba Industrial Power Users Group that non-participating customers would not make up the revenue shortfall means that Manitoba Hydro would not be compensated for this revenue loss. This would violate the rate-making objective of full recovery of the revenue requirement.

17.2 Intervener Positions

The Consumers Coalition does not support an alternative residential rate design. At a time when any rate increase is likely to be significantly above inflation, intra-class revenue adjustments would compound consumer challenges. There is also no basis for an inverted block rate due to the differential between estimated marginal costs and the actual residential rate, based on current rates and their projected trajectory. As well, the Consumers Coalition believes that Manitoba Hydro's illustrative rate scenario is not justified by cost causation or efficiency reasons. The Revenue to Cost Coverage ratio for non-electric heating customers is already higher than that for electric heating customers, and it is likely that the marginal cost for electric heating customers is also higher.

The Green Action Centre recommends that it be a strategic priority for Manitoba Hydro and Efficiency Manitoba to address affordability for electric space heating customers through initiatives that reduce and affordably finance the capital costs of geothermal systems. The Green Action Centre also submits that the Board should accept the marginal cost calculation performed by Mr. Chernick, which indicates that current rates are below marginal costs and further supports the implementation of an alternative rate design.

The Manitoba Industrial Power Users Group argues that the Board should direct Manitoba Hydro to bring forward for the Board's review at the next GRA an optional time-of-use rate for General Service Large customers. The rate should be prepared by Manitoba Hydro in consultation with affected customers.

17.3 Board Findings

The Board finds that there will be no change to the rate design, except as may be required to achieve the class revenue targets as directed in the previous section.

First, the Board does not accept that there should be a reduction in demand charges or elimination of the demand ratchet. This change in the existing rate structure would contribute to the magnitude of bill impacts that some customers will have to absorb, including the general rate increase as well as the shift in revenue responsibility as a result of differentiated rates. In addition, the Board heard evidence in this proceeding about the potential for increased use of disruptive technology for non-utility generation, such as customer solar photovoltaic installations. This could potentially require the review of demand charges in the near future in order to ensure that class revenues are fully recovered and that the value of grid reliability is properly assessed when used by customers as a back-up power resource.

Second, the Board finds that the implementation of a residential inverted block rate is not supported on the evidence. Due to the updated marginal value, which is less than the current residential energy rate, an inverted block rate would send an inappropriate price signal and would be contrary to the rate-making principle of efficiency. However, the Board notes that the General Service classes have declining block rate structures and an explanation for this rate design was not provided in this GRA, despite the updated marginal value information. Manitoba Hydro is directed to provide in its next GRA filing the rationale for the rate design for the General Service customer classes and an evaluation of the block thresholds and charges.

Third, the Board finds that neither of Manitoba Hydro's illustrative residential rate design nor the electric space heating residential rate design proposed by Mr. Chernick are to be implemented. These rate designs are not justified on a cost of service basis, given the higher cost to serve electric space heating customers. Due to their higher cost to serve, electric space heating customers are already subsidized by non-electric heat customers. The Board also notes the lack of proof of revenue provided for Mr. Chernick's rate design proposal. However, as discussed further below, the Board is concerned about bill affordability issues for lower-income electric space heating customers and recommends that bill assistance for these customers be provided through a comprehensive Government bill affordability program.

Finally, with respect to time-of-use rates, the Board continues to be of the view that time-of-use rates should be implemented for General Service Large customers; however, due to the updated marginal values filed in this proceeding, further study is required. The Board therefore accepts the recommendation of the Manitoba Industrial Power Users Group and directs Manitoba Hydro to bring forward for the Board's review at the next GRA a time-of-use rate design proposal. The proposal is to be based on further analysis in the context of the updated marginal values. Manitoba Hydro is directed to consult with General Service Large customers before filing its proposal with the Board and to include the results of that consultation with the information provided to the Board.

18.0 Bill Affordability

The Board has long been concerned with utility bill affordability issues. Evidence with respect to energy poverty in the province of Manitoba has been brought before the Board for at least a decade. The Board recognizes that Manitoba Hydro has, over time, developed programs to assist customers in managing their energy consumption, thereby reducing individual customer bills, and such programs include targeted support for lower-income customers. However, the Board has consistently expressed concern that measures focused on energy efficiency implemented by Manitoba Hydro to date, while commendable, have been insufficient to address the energy burden faced by lower-income customers. This is particularly the case in a time of major capital construction by the Utility, which has and is forecast to continue to put upward pressure on electricity rates at a level greater than the rate of inflation. This concern is heightened with Manitoba Hydro's projected rate path that, if implemented, would increase consumer rates by 77% cumulatively over 10 years. The history of the substantial discussions on this important matter bears repeating.

Ten years ago, in Order 116/08, the Board noted that the lower-income, high energy burden problem is pervasive in Manitoba and that "a low-income bill assistance program would assist in reducing the energy burden faced by low-income households. Significant non-energy benefits would arise, including increased comfort, reduced health costs, lower bad debt write-offs etc." The Board went on to hold that "Energy affordability for low-income families is very much an issue that requires more or less immediate attention in Manitoba." The Board directed Manitoba Hydro to propose for Board consideration a lower-income bill assistance program no later than September 30, 2008. Following a Review and Vary Application by Manitoba Hydro, the Board revised its directive to remove the deadline date and to require Manitoba Hydro to provide a new date for the earliest implementation of a Lower-Income Bill Assistance Program in its update to the Board required by November 30, 2009.

Manitoba Hydro filed a report on lower-income bill assistance on March 4, 2009. In the report, Manitoba Hydro discussed possible bill assistance program expansion and indicated that it would investigate the viability of potential program expansion, citing many variables that required investigation. In Order 32/09, the Board accepted that implementation of a program would require the addressing of issues that are complex and far-reaching. The Board directed Manitoba Hydro to provide a report with respect to Manitoba Hydro's plans for a program after the Utility's planned consultation with stakeholders and subsequent recommendation to the Manitoba Hydro-Electric Board. The Board reiterated the vital importance of protection for lower-income customers, noting Manitoba Hydro's plans for a capital program predicated on consistent future rate increases and the Board's expectations that Manitoba Hydro would put forward its preferred lower-income bill assistance program.

In Order 5/12, the Board expressed its concern with the slow pace of the overall energy poverty relief effort and stated that more should be done, particularly for First Nation communities and specifically First Nation diesel communities. However, the Board found that, before it would require Manitoba Hydro to develop a definitive bill assistance program, more information was required as to existing funding made available by Government and the programs available to directly or indirectly alleviate poverty.

In the NFAT Report, the Board again expressed concern about the impact of projected rate increases on lower-income consumers, including customers living in First Nation communities. The Board noted the significant rate burden on consumers over the next 20 years and the likely substantial incremental revenues that would accrue to the Province of Manitoba as a result of Keeyask. The Board recommended that the

Government of Manitoba direct a portion of the incremental capital taxes and water rental fees from the development of Keeyask be used to mitigate the impact of rate increases on lower-income consumers.

In Order 73/15, the Board recognized that higher electricity rates – then forecast to be at the level of annual increases of 3.95% for 17 years – would have an impact on lower-income ratepayers, and particularly electric space heating ratepayers. On the recommendation of the Green Action Centre's expert witness in the proceeding, the Board directed Manitoba Hydro to initiate a collaborative process to develop a bill affordability program harmonized with Manitoba Hydro's other programs supporting lower-income ratepayers. The Board stated that, upon completion of the collaborative process, the Board would evaluate the options presented and decide on their implementation.

In response to the Board's directive in Order 73/15, Manitoba Hydro established the Bill Affordability Working Group ("Working Group"), which was comprised of a variety of stakeholders who represent, work with, or provide services to lower-income Manitoba Hydro customers. The Working Group participants were:

- Consumers' Association of Canada (MB)
- Employment & Income Assistance (Manitoba Department of Families)
- Green Action Centre
- Manitoba Housing
- Manitoba Hydro
- Manitoba Industrial Power Users Group

- Manitoba Keewatinowi Okimakanak
- Manitoba Metis Federation
- Southern Chiefs Organization
- Social Planning Council of Winnipeg
- Winnipeg Harvest

The Working Group carried out the first collaborative in-depth examination of energy affordability in Manitoba. The collaborative process took place over sixteen months and, in January of 2017, culminated in The Manitoba Hydro Bill Affordability Collaborative Process Summary Report & Recommendations ("Working Group Report"). The Working Group's primary findings included:

- A definition of energy poverty in Manitoba.

  The Working Group established the following definition of energy poverty: "Energy poverty refers to circumstances in which a household is, or would be, required to make sacrifices or trade-offs that would be considered unacceptable by most Manitobans in order to procure sufficient energy from Manitoba Hydro." For the purposes of the Working Group Report, the Working Group considered a household to be energy poor if it spends more than 6% or 10% of pre-tax income on energy and also has a level of income lower than the current Low Income Cut-Off 125 ("LICO-125"), which is 25% above the Statistics Canada lower-income measurement;

- Greater understanding and insights into energy poverty in Manitoba, including an improved understanding of which Manitobans are affected or likely to be affected by energy poverty, and why.

  Based on research conducted as part of the Working Group process, the Working Group concluded that the relationship between unpaid bills or arrears and energy poverty is relatively weak;

- Assessment of existing affordability programs for lower-income customers, including evaluation of program delivery, uptake and success in meeting stated objectives.

  Manitoba Hydro's existing programs and approaches to bill affordability reviewed by the Working Group were the Power Smart Affordable Energy Program, Neighbours Helping Neighbours, the Equal Payment Plan, deferred payment plans, arrears management, and community outreach. The Working Group also considered other assistance and options available in the province, including Employment and Income Assistance, Manitoba Housing programs, and contributions by Indigenous & Northern Affairs Canada towards the cost of Manitoba Hydro bills for customers on First Nations reserves who receive social assistance;

- Research and evaluation of bill affordability programs in other jurisdictions, to better determine if successful initiatives from elsewhere in Canada and the United States could be implemented here.

  Based on a jurisdictional scan, the Working Group concluded that Ontario appears to be the only Canadian jurisdiction to have implemented a rate assistance program. The Ontario Electricity Support Program ("OESP") was introduced in 2016 and provides fixed monthly bill credits to eligible customers. The OESP was initially ratepayer funded, but as a result of provincial legislation, is now taxpayer funded with higher fixed credit amounts;

- Potential impacts of proposed Manitoba Hydro rate increases, determined by a rate-modelling exercise to evaluate how increases would likely affect lower-income customers.

  This showed that impacts of higher energy costs are anticipated to be most pronounced for households that already spend a significant proportion of their total income on energy; and

- Rate assistance mechanisms and options that could improve affordability for lower-income customers, as well as analysis of estimated revenue losses associated with each option.

> The Working Group identified and modelled three rate assistance options: (1) basic monthly charge waiver (2) straight rate discount (3) percentage of income payment plan.

Ultimately, the Working Group concluded that its findings illustrate:

> *the deeply complex, multi-faceted nature of energy poverty. Energy poverty spans issues of income, geography, cultural identity, family size, awareness of available support programs, and more. The Working Group's findings make it clear that no single initiative or program will solve the issue of energy poverty. Rather, the Working Group's recommendations reflect the consensus view that a suite or "toolkit" of improvements is required to improve energy affordability in the province.*

The Working Group's recommendations addressed lower-income energy efficiency initiatives, electric heating, emergency assistance, landlord and tenant initiatives, extreme weather impacts, equal payment plans, bill collection, arrears management and bill forgiveness, and funding. While improvements to Manitoba Hydro's existing lower-income offerings were recommended, the Working Group did not reach consensus on any specific rate options or rate assistance program.

18.1 Jurisdiction of the Board to Order Lower-Income Rate Assistance

In Order 116/08, the Board found that it would be acting within its legislative mandate if it were to direct Manitoba Hydro to implement a bill assistance program.

In Order 73/15, the Board again considered an argument from Manitoba Hydro that the Board does not have jurisdiction to order the Utility to implement a bill affordability program. On review of the Board's constating legislation, the Board rejected Manitoba Hydro's submission and reiterated its finding from Order 116/08 that ordering a bill affordability program is within the Board's legislative powers. The Board concluded that any future proposals for bill assistance would therefore be evaluated from a comprehensive policy perspective, rather than being focused on the issue of the Board's legal jurisdiction.

Manitoba Hydro's Position

Manitoba Hydro argues that, based on the text, context, and purpose of The Crown Act, The Hydro Act, and The Board Act, the Board does not have jurisdiction to order the implementation of lower-income rates or other bill affordability programs. Although the Board has previously concluded that it does have such jurisdiction, Manitoba Hydro submits that this conclusion is inconsistent with the legislation, remains untested in the courts in Manitoba, and that the Board ought to reconsider the issue. In particular, Manitoba Hydro argues that none of the statutory factors which the Board may consider in reviewing rates explicitly permit consideration of affordability or ability to pay. Rather, the Board's rate-setting function must be interpreted as being limited to accomplishing Manitoba Hydro's mandate of providing for the supply of power adequate to meet the province's needs and to promote economy and efficiency in all matters related to the generation, transmission, distribution, and use of power. Finally, Manitoba Hydro submits that the amendments to The Hydro Act that brought in uniform residential rates were intended to create a single rate for residential electricity users. A program targeting First Nations living on reserve would necessarily classify customers based on geographic location in violation of subsection 39(2.2) of The Hydro Act.

Intervener Positions

The Assembly of Manitoba Chiefs takes the position that the Board has jurisdiction to order a bill affordability program and that this jurisdiction is affirmed by *Charter* values.

Similarly, the Consumers Coalition concludes that the Board does have jurisdiction to order implementation of a bill affordability program.

The Green Action Centre takes the position that the issue of Board jurisdiction to order a bill affordability program has long been decided and should not be revisited. It argues that the Board's constating legislation gives the Board wide latitude to take into consideration any compelling policy considerations that the Board considers relevant to setting rates, and any other factors that the Board considers relevant. This jurisdiction is similar to that of the Ontario Energy Board, which the Ontario Divisional Court concluded has the jurisdiction to consider "ability to pay" in setting rates. It argues further that, in order to achieve its mandate of supplying economic power to ratepayers at fair rates, Manitoba Hydro must deal with the issue of affordability.

Manitoba Keewatinowi Okimakanak also argues that the Board has jurisdiction with respect to bill affordability programs. It submits that the Board's mandate to set equitable rates must be governed by the direction set out in *The Path to Reconciliation Act*.

Board Findings

The Board finds that it has legal jurisdiction to order implementation of lower-income rate assistance. This issue was raised previously before the Board and addressed in Orders 116/08 and 73/15, in both of which the Board concluded that it has the legal jurisdiction. The previous position of the Board was supported by many of the parties in this hearing other than Manitoba Hydro. The Board continues to be of the view that it has jurisdiction.

The Board's jurisdiction with respect to Manitoba Hydro is derived from a suite of legislation, primarily consisting of The Board Act, The Crown Act, and The Hydro Act. While the Board's jurisdiction over Manitoba Hydro is largely limited to the review of rates, that jurisdiction is broad. As set out in paragraph 25(4)(a) of The Crown Act, in reaching a decision with respect to rates charged by Manitoba Hydro with respect to the provision of power, the Board has the discretion to take into consideration, in addition to factors relating to the revenue requirement of the Utility:

> *25(4)(a)*
>
> *viii. any compelling policy considerations that the board considers relevant to the matter, and*
>
> *ix. any other factors that the Board considers relevant to the matter.*

The considerations set out in paragraph 25(4)(a) serve as a guide to the Board in exercising its mandate under section 77 of The Board Act to fix just and reasonable rates. As the Manitoba Court of Appeal held in *Consumers' Association of Canada (Manitoba) Inc v Manitoba Hydro Electric Board*, 2005 MBCA 55, this requires the Board to balance two concerns: "the interests of the utility's ratepayers, and the financial health of the utility. Together, and in the broadest interpretation, these interests represent the general public interest." Each of these two concerns support the ability of the Board to consider the affordability of Manitoba Hydro's rates, whether broadly or within a class or sub-set of its customers. Affordability is not only relevant to the interests of the Utility's ratepayers, but also to the financial health of the Utility as rates that are in excess of what customers can afford may lead to depressed revenues through a combination of reduced energy consumption, business closures or relocation, and as acknowledged by Manitoba Hydro, potentially an increase in arrears.

The scope of the Board's discretion in reviewing Manitoba Hydro's rates is not limited to Manitoba Hydro's mandate of providing for the supply of power adequate to meet the province's needs and to promote economy and efficiency in all matters related to the generation, transmission, distribution, and use of power, as set out in section 2 of The Hydro Act. Had it been the legislature's intention to narrowly circumscribe the Board's jurisdiction in this way, it would have done so expressly using the same statutory language contained in The Hydro Act. Instead, the legislature chose to grant the Board broad discretion to consider, "any compelling policy considerations" and "any other factors" that the Board considers relevant to the matter. Affordability is a factor that the Board may consider when setting rates.

As the Board held in Order 73/15, subsection 39(1) of The Hydro Act requires that the aggregate price of power realized by Manitoba Hydro achieve full cost recovery, but this is subject to the requirement that rates must be just and reasonable. Moreover, the Board's constating legislation does not prohibit the creation of a customer class that pays less than the average cost to serve such customers.

Amendments to The Hydro Act in 2001 resulted in the elimination of regional zone rates, which had charged higher rates for customers in Northern and rural Manitoba than for those in the City of Winnipeg based on lower customer densities having higher costs to serve. Subsections 39(2.1) and 39(2.2) of The Hydro Act provide as follows:

39(2.1) The rates charged for power supplied to a class of grid customers within the province shall be the same throughout the province.

39(2.2) For the purposes of subsection (2.1),

(a) grid customers are those who obtain power from the corporation's main interconnected system for transmitting and distributing power in Manitoba; and

(b) customers shall not be classified based solely on the region of the province in which they are located or the population density of the area in which they are located.

In defining a customer class, the classification of customers cannot be based solely on the region of the province in which the customers are located or the population density of the area in which they are located. However, once a customer class has been defined in accordance with subsection 39(2.2), the requirement is only that all customers within that class be charged the same rate. The classification of customers based on other characteristics, either instead of or in addition to region or population density, is not prohibited. For example, the legislation does not prohibit the creation of a lower-income customer class as such a class would not be based solely on region or population density, subject only to the limitation that all customers within the class be charged the same rates for power.

Manitoba Hydro argues that the Board should depart from its previous findings on jurisdiction based on the decision of the Nova Scotia Court of Appeal in *Dalhousie Legal Aid Service v Nova Scotia Power*, 2006 NSCA 74. In that decision, the Court found that the Nova Scotia Utility and Review Board does not have jurisdiction to implement a rate assistance program for lower-income customers, based on subsection 67(1) of the Nova Scotia Board's governing legislation. Manitoba Hydro submits that subsection

67(1) of the Nova Scotia legislation is similar to subsection 39(2.1) of The Hydro Act, and therefore this Board should follow the guidance of the Nova Scotia Court of Appeal.

The Board does not agree. Subsection 67(1) of the Nova Scotia legislation is considerably more restricted than the statutory framework contained in The Board Act, The Crown Act, and The Hydro Act. Subsection 67(1) of the Nova Scotia legislation provides:

> *67(1) All tolls, rates and charges shall always, under substantially similar circumstances and conditions in respect of service of the same description, be charged equally to all persons and at the same rate, and the Board may by regulation declare what shall constitute substantially similar circumstances and conditions.*

Due to the requirement that customers receiving "substantially similar" service, and the Nova Scotia Board's finding that lower-income residential customers receive substantially the same level of service as all other residential customers, the Nova Scotia Court of Appeal concluded that the Board was prohibited from ordering differential rates based on the customer's income.

Unlike the Nova Scotia Board, this Board is empowered to take into account "any compelling policy considerations" and "any other factors that the Board considers relevant to the matter". In Manitoba, there is no similar restriction as in Nova Scotia that all customers receiving substantially similar service "shall always" be charged the same rate. Rather, the only limitation on the Board's broad authority under *The Crown Act* is the requirement that customers not be classified solely based on region or population density. As detailed above, this does not prohibit the creation of a lower-income customer class.

Contrary to Manitoba Hydro's submission, this Board's jurisdiction is more closely aligned with the statutory framework in Ontario. In *Advocacy Centre for Tenants-Ontario v Ontario Energy Board* (2008), 293 DLR (4th) 684, the Ontario Divisional Court distinguished the Nova Scotia decision based on the restrictive wording of subsection 67(1) of the Nova Scotia legislation. In contrast, the Court in Ontario noted that section 36 of the Ontario Energy Board's governing legislation has broad language that empowers the Ontario Board to set "just and reasonable" rates. The Ontario Court concluded that the Board could, in setting rates, take into account income levels to achieve the delivery of affordable energy to lower-income consumers as this would meet the objective of protecting consumer interests.

The Ontario legislation does differ from the legislation in Manitoba in that subsection 36(3) expressly states that the Ontario Energy Board "may adopt any method or technique that it considers appropriate" in fixing just and reasonable rates. This provision provided greater flexibility to the Ontario Energy Board than it had previously under a statutory regime that required rate-setting on a very prescriptive cost of service basis. Similarly, the Manitoba legislation grants broad authority to this Board to take into account policy considerations and other relevant factors in rate-setting. Moreover, as the Supreme Court of Canada held in *Ontario (Energy Board) v Ontario Power Generation Inc*, 2015 SCC 44, "where a statute requires only that the regulator set "just and reasonable" payments… the regulator may make use of a variety of analytical tools in assessing the justness and reasonableness of a utility's proposed payment amounts." The Manitoba Court of Appeal has similarly determined that, in Manitoba, cost of service is a tool that may or may not be used in setting rates. Thus, although in Manitoba there is no express statutory provision akin to the Ontario subsection 36(3), the Board is empowered to employ a variety of analytical tools in fixing rates. Indeed, Manitoba Hydro itself in this GRA urges the Board to be guided by considerations in rate-setting beyond pure cost to serve. Thus, the Board does not accept the argument of Manitoba Hydro that this Board's jurisdiction is more limited than the Ontario Board because of the absence of a provision similar to subsection 36(3) in Ontario.

Therefore, the Board has jurisdiction under its governing statutory framework to order a bill affordability program such as a lower-income rate, and to take into account affordability as a factor in setting just and reasonable rates.

18.2 Bill Affordability for Manitoba Hydro Customers

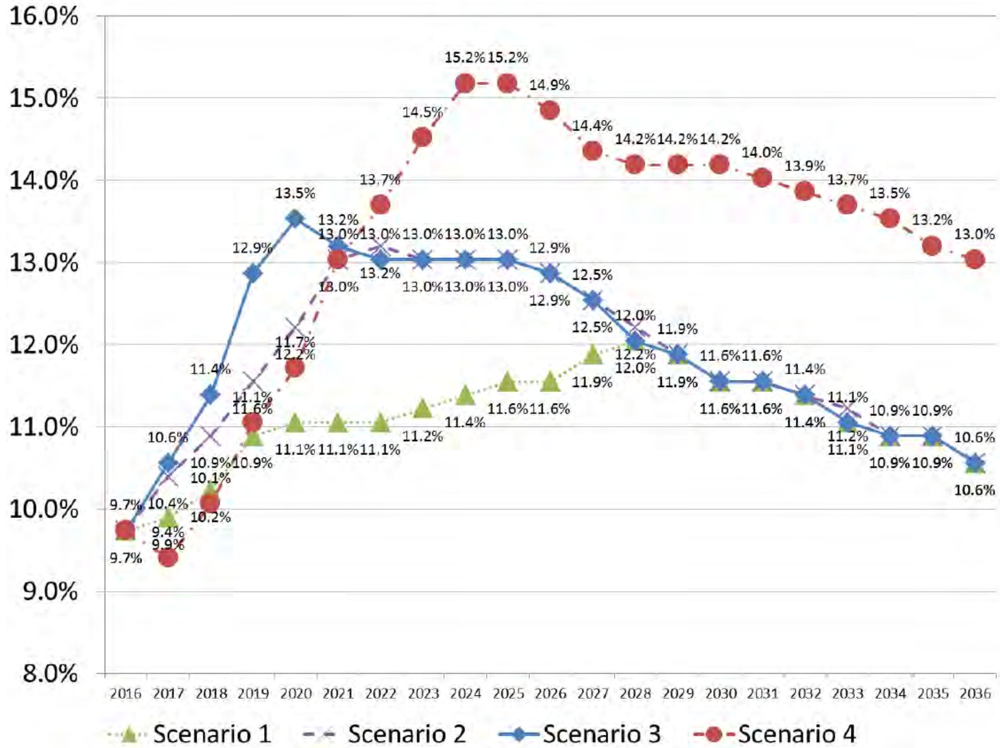
In the current GRA, which followed the completion of the Working Group Report, Manitoba Hydro did not propose an affordability rate or rate assistance program. In the GRA filing, Manitoba Hydro did provide a response to the specific recommendations of the Working Group, including actions to be taken with regards to each recommendation. However, with respect to an affordability rate or rate assistance program, Manitoba Hydro's position is that:

> *issues of poverty and distribution effects are complex and ought to be addressed through the setting of social policy which is within the purview of government. As such, Manitoba Hydro is of the view that of the provision of social assistance programs directed to low income customers is appropriately reserved for the Province of Manitoba.*

However, in testimony in the oral hearing, Manitoba Hydro's President and Chief Executive Officer stated his recognition that the matter of bill affordability will become increasingly important to resolve as Manitoba Hydro proceeds with higher rate increases and therefore, there is a need to find solutions to the issue.

The figure below depicts the impact of various Manitoba Hydro rate increases on the proportion of Manitoba Hydro's total number of residential customers (households) that are LICO-125 and above the 6% energy poverty threshold. In the figure, the plotted line for "Scenario 4" is based on the projected rate plan contained in MH16 Update with Interim. As illustrated in the figure below, the projected rate plan would result in the proportion of energy poverty increasing from 9.7% to 15.2% in 2024, and remaining at a permanently higher level through at least 2036.

Percentage of Households That Are LICO-125 and Above 6% Energy Burden Threshold



Scenario 1 - 3.95% nominal electricity rate increases for 12 years; *Scenario 2* - 5.95% nominal electricity rate increases for 6 years; *Scenario 3* - 7.95% nominal electricity rate increases for 4 years; *Scenario 4* - 3.36% nominal electricity rate increase in 2017, followed by 7.9% rate increases for 6 years and a 4.54% rate increase for 1 year

Source: AMC/MH II-23

The Board heard evidence from residential ratepayers who have to make sacrifices in their daily lives in order to be able to pay their electricity bills. As one ratepayer testified, rate increases add stress and, in the context of being on a fixed income, present difficult and limited opportunities for saving. Another ratepayer gave evidence that, if Manitoba Hydro receives the full amount of its planned rate increases, he may have to consider changing where he lives. He went on to explain that “I’m tired of working so I think it would be - - put more of a squeeze on us. I support my grandson right now. He’s out of work, lives with us - - I don’t know what else to say. It’s just getting tougher.”

A single mother of four children testified before the Board that, if Manitoba Hydro's planned rate increases are granted:

> *I will be forced to further dig in deeper into my food budget, decreasing the amount of groceries I am able to buy per month. And in terms of food, I will be looking at alternatives, cheaper, unhealthier alternatives in order to make my groceries last.*
>
> *It will reduce the amount - - it will reduce the amount that I'm able to engage in social activities with my children, social outings. It will negatively impact us … where it would not allow me to save up for the future or to have an emergency fund. It makes it more challenging for me to put money away in terms of getting a vehicle down the road and just saving - - saving money overall, it would be very challenging because I'm having a hard time with my utility bills as it is.*

In addition to the evidence of the real-life experiences of ratepayers in Manitoba, expert witnesses in the proceeding provided specific proposals for an affordability rate. In particular, the expert witness retained by the Green Action Centre, Paul Chernick, proposed inverted block rate structures both for LICO-125 ratepayers and for LICO-125 ratepayers with electric space heating.

For LICO-125 ratepayers, Mr. Chernick designed a rate based on estimates of energy consumption. His proposal is to eliminate the basic monthly charge and discount the energy charge for the first block of energy consumed by 4¢/kWh. The size of the first block for this rate design is maintained at 500 kWh in each month. Mr. Chernick recommended that the lost revenues that would result from this rate design be recovered from all non-LICO customers, including general service customers, not just non-LICO residential customers.

For LICO-125 ratepayers with electric space heating, Mr. Chernick based his rate design on the distribution of residential electric use among seasons. As with the LICO-125 rate design, the basic charge is waived and the discount for the energy charge for the first block of energy is 4¢/kWh, but the size of the first block varies by season, with the greatest discount being in the winter months. Again, Mr. Chernick recommends that the lost revenues be recovered from all non-LICO customers.

The expert witness retained by the Assembly of Manitoba Chiefs, Philip Raphals, recommended that the Board order Manitoba Hydro to present a ready-to-implement affordability rate for implementation in 2019/20, and that Manitoba Hydro do so with the assistance of a working group to develop the details of the rate. With respect to eligibility, Mr. Raphals' evidence was that coverage at this time should be limited to energy-poor customers with electric space heat, but that there should be *a priori* eligibility for First Nation residents on reserve who pay their own energy bills.

Dr. Wayne Simpson, an expert witness retained by the Consumers Coalition, recommended that, along with enhancements to affordable energy programming, Manitoba Hydro and its stakeholders continue research into energy poverty and its characteristics. Dr. Simpson recommended that Manitoba Hydro be ordered to develop an efficient rate assistance program that provides assistance to lower-income energy poor households that is not directly tied to the level of energy consumption, along the lines of fixed credit approaches taken by Colorado and Ontario.

Manitoba Hydro's Position

Manitoba Hydro's view is that the provision of lower-income social assistance programs is appropriately reserved for the Province of Manitoba. Government already administers income-based programs, has the resources, and provides these programs through a variety of existing mechanisms. While Manitoba Hydro offers programs to assist lower-income customers in lowering their energy bills through energy efficiency opportunities, it submits that the difficulties with the administration, implementation, and on-going operation of a rate assistance program pose significant challenges in identifying which customers truly require assistance. Unlike the Province of Manitoba, Manitoba Hydro does not have resources to administer a new income-based program, nor does it have access to pertinent data that would be necessary to successfully implement such a program.

Manitoba Hydro further argues that it is impossible to test Mr. Chernick's rate design proposal to ensure that it produces the appropriate level of revenue.

Intervener Positions

The Assembly of Manitoba Chiefs urges the Board to consider the goal of reconciliation, consistent with *The Path to Reconciliation Act*. The Assembly of Manitoba Chiefs states that on-reserve First Nations communities have higher rates of energy poverty, lower quality housing, lower incomes, and lower income growth than the rest of the province. Manitoba Hydro's rate increases will disproportionately affect First Nations communities. As such, the Board should order Manitoba Hydro to immediately implement bill affordability measures that offer discounts to residential customers in on-reserve First Nations communities.

Specifically, the Assembly of Manitoba Chiefs argues that Mr. Chernick's LICO-125 electric space heating rate should be ordered for implementation for on-reserve residential customers, with automatic eligibility for the first 500 kWh block of consumption, and an increased electric space heating discount that reflects the different consumption patterns on reserve. The resulting lost revenue should be recovered from all classes as the burden of the additional costs from major new generation and transmission projects which facilitate export power sales falls disproportionately on First Nations, whose Treaty rights are adversely affected. For off-reserve residents, the Board should order an engagement process for bill affordability measures and require Manitoba Hydro to report back on the chosen program within one year.

The Consumers Coalition submits that energy poverty should be addressed through a lower overall rate increase, coupled with effective provincial social benefit programs. The Consumers Coalition does not endorse a ratepayer-funded bill assistance program due to the evidence in the proceeding regarding the likelihood of unacceptably low participation rates. It also does not accept the use of an inverted block rate design for lower-income residential consumers, due to the gap between estimated marginal costs and the actual rate, nor does it support bill assistance targeted at only First Nations customers, as too many vulnerable consumers are left out. Rather, the Board should recommend that the Government establish a taxpayer-funded program to address energy poverty.

The Green Action Centre submits that, given the environment of rising rates, moving forward with implementing a bill affordability program should not be delayed by administrative concerns or differences of opinion regarding the design of the program. The Green Action Centre recommends that Mr. Chernick's LICO-125 electric space heating rate design should be selected for piloting in 2018/19, with first application to LICO-125 customers whose energy burden exceeds 6%. The program can be reviewed at the next GRA, limiting any risk associated with administration. The costs of the program should be funded by all ratepayers and Manitoba Hydro should implement a separate account to be funded at a sufficient level in addition to the revenue requirement. The Green Action Centre also suggests that there should be a single application process, amalgamated with other Manitoba Hydro assistance programs such as the Affordable Energy Program and arrears management.

Manitoba Keewatinowi Okimakanak argues that, consistent with the mandate under *The Path to Reconciliation Act*, the Board should create a separate class for First Nations residential and General Service Small and General Service Medium ratepayers – a class which can be easily identified with existing Manitoba Hydro data – and apply affordability measures to this separate class. Manitoba Keewatinowi Okimakanak suggests that lost revenues associated with the affordability measures implemented for a First Nations customer class should be allocated to all customer classes or natural gas heating customers or both. The Board should also recommend that the Government reduce the payments that Manitoba Hydro is required to make to the Government.

Board Findings

Provincial Government Bill Affordability Program

There is an important role for governments in advancing bill affordability for all Manitobans. The Board unanimously recommends that the provincial government introduce a comprehensive bill affordability program run by a government department to address energy poverty issues faced by Manitobans throughout the province. The Board heard evidence that there is a long-standing need to address this issue and the government is best situated to do so in a comprehensive fashion. The provincial government has social program infrastructure already in place.

The Working Group performed extensive research and analysis. On a consensus basis, the Working Group's Report identified three programs as options for rate assistance:

- A straight-rate discount, which would deduct a fixed percentage amount from the bills of qualifying customers. The Working Group identified three levels of discount: 25%, 35%, and 45%;
- A fixed charge waver, which would eliminate the basic monthly charge from the bills of qualifying customers; and
- A percentage of income payment plan, which would cap the energy bills of qualifying customers at a set level.

The program options identified by the Working Group provide a starting point for the provincial government's development of a bill affordability program. The Board recommends that the provincial government establish a stakeholder group to build on the research and analysis undertaken by the Working Group, as well as programs in other jurisdictions, such as the Ontario Energy Support Program.

Given Manitoba Hydro's expertise regarding its customers, billing system, and affordability issues, and the evidence of Manitoba Hydro's President and Chief Executive Officer of there being an increasing need to find solutions to the unaffordability of bills, the Utility should take initiative to work with the provincial government and other stakeholders to assist in the development of a comprehensive program.

As discussed elsewhere in this Order, the Board notes that there are new sources of revenues flowing to the provincial government and increased revenues from Manitoba Hydro – specifically as a result of the major capital projects – that can be used to fund a government bill affordability measure. This is consistent with the NFAT recommendation that the provincial government direct a portion of the incremental capital taxes and water rental fees from the development of Keeyask be used to mitigate the impact of rate increases on lower-income consumers.

First Nations On-Reserve Residential Customer Class

A majority of the Board directs Manitoba Hydro to establish a First Nations On-Reserve Residential customer class for existing First Nations reserves and that this customer class will receive a 0% rate increase for the 2018/19 Test Year, such that the rate for this customer class will be maintained at the August 1, 2017 approved Residential rate. The 0% rate increase for 2018/19 is also to apply to First Nations diesel zone residential customers. This decision is not unanimous and Board member Larry Ring provides dissenting reasons below. This section sets out the reasons of the majority on this issue.

The issue of bill affordability has been a matter of serious concern for this Board for over a decade. Yet, despite the long history of substantial evidence and discussion before the Board on bill affordability, there have been impediments that have limited the achievement of a concrete plan or program. Particularly in the context of the continuation of rising rates over the recent past, the situation must begin to be addressed.

As noted by Manitoba Hydro’s President and Chief Executive Officer, while Government has a role to play in addressing the issue of affordability, so too does Manitoba Hydro and rate design can assist the Utility in fulfilling its role. Under its mandate to set rates in the public interest, the Board can and should play a part.

The Board recognizes that there are potential administrative and program design hurdles associated with a bill affordability program, and that parties in this proceeding remain of the view that these hurdles give rise to impracticalities, inefficiencies, and cost ineffectiveness. However, the Board concludes that there are steps that must be taken today to address bill affordability.

An appropriate starting point for bill affordability in Manitoba is a program targeted at on-reserve ratepayers, specifically through the creation of a First Nations On-Reserve Residential customer class with a differentiated rate to address energy poverty on Manitoba reserves. Manitoba Hydro is kept whole because the cost of the 0% increase for this new customer class has been factored into the level of the average general rate increase granted for the Test Year to all other customer classes.

The creation of this customer class is justified by the need to address energy poverty on-reserve, supported by evidence that 96% of First Nations people on-reserve live in poverty and that reserves in Manitoba have the highest rates of child poverty in Canada. In addition, the poor housing stock on reserves in Manitoba and the fact that the vast majority of First Nations on-reserve residential customers (61 out of 63 First Nations communities) have no access to the more economical option of natural gas for heating exacerbate the issue of energy poverty. In his testimony, Manitoba Hydro's President and Chief Executive Officer described the housing conditions on First Nations reserves that he has visited as "abysmal". This results in residents on First Nations reserves having to use more energy to heat their homes. On average, First Nations on-reserve customers consume more energy than off-reserve residential customers, despite the efforts of Manitoba Hydro to use demand side management programming to improve energy efficiency for homes on reserves. Taken together, these factors lead to higher utility bills and a population of Manitobans that is disproportionately vulnerable to rate increases.

The customer class and related affordability measure of a 0% increase are also consistent with the principle of reconciliation. As defined in *The Path to Reconciliation Act*, reconciliation is the ongoing process of establishing and maintaining mutually respectful relationships between Indigenous and non-Indigenous peoples in order to build trust, affirm historical agreements, address healing, and create a more equitable and inclusive society. The creation of a separate customer class is in response to the degree of poverty on reserves. This separate customer class is to continue until otherwise ordered. Shielding the customer class from the general rate increase in the 2018/19 Test Year recognizes the particular factors that make on-reserve ratepayers uniquely situated among residential consumers in Manitoba. As argued by the Assembly of Manitoba Chiefs, rate increases should not widen the existing gap between First Nations living on reserve and other Manitobans.

The First Nations On-Reserve Residential customer class is consistent with the requirements of The Hydro Act because this customer class is not defined solely on the basis of the region of the province in which the customers are located or population density. As a creation of Canadian Aboriginal law, reserves are tracts of land that are vested in and held by the Crown for the use and benefit of the respective bands for which they were set aside through treaties or agreements with the Crown. Reserves are defined by the legal relationship between the Crown and Indigenous peoples, not by the region of the province in which they are located. Beyond this, there are 63 First Nations reserves in Manitoba, located in regions throughout the province. There is no one region that can be isolated as being the location that gives rise to the classification of these customers. For this reason, an on-reserve customer class cannot be equated with the regional zone rates that were in effect prior to the amendments to The Hydro Act.

Moreover, the Board agrees with the Assembly of Manitoba Chiefs that many more factors distinguish on-reserve residents as electricity ratepayers, such that even if this classification were based in part on the region of the province in which the customers are located, it is not solely based on region. The circumstances of on-reserve residential customers include the particular housing infrastructure, energy consumption patterns, non-availability of natural gas heating, and poverty levels. The specific conditions of electricity needs, usage, and cost on First Nations reserves justifies the creation of a separate customer class.

This step in addressing bill affordability is also administratively simple and can be effectively implemented to reach the target recipients. As Manitoba Hydro already identifies on-reserve residential ratepayers in its billing system, the members of this new customer class are readily identifiable. No application process to determine eligibility is required. The new customer class can be created immediately and the affordability measure of a 0% rate increase can be applied at the same time with minimal administration.

Due to the administrative complexity and cost concerns raised by Manitoba Hydro regarding other bill affordability program options discussed in this proceeding, the Board will not, at this time, order Manitoba Hydro to implement a broader bill affordability measure. However, the Board views the 0% rate increase for the First Nations On-Reserve Residential customer class as a modest first step in addressing bill affordability. The Board is aware that there will be some obvious anomalies created where one household on-reserve will receive a lower rate than a nearby off-reserve household living in similar circumstances; however, this is a limited measure designed to reach a targeted group experiencing a high degree of poverty. The anomalies that result from this measure are best addressed by a more wide-reaching government bill affordability program. The Board envisions that, with the introduction of a comprehensive government bill affordability program, the new First Nations On-Reserve customer class and lower rate built into the 2018/19 Test Year may no longer be required.

18.3 Dissenting Decision and Findings of Board Member Ring

I agree with the majority of Board members that Governments should develop and implement a comprehensive bill affordability program to address the needs of First Nations, remote and Northern consumers, and lower-income ratepayers. However, having read the majority reasons by my Board colleagues with respect to their decision to create a separate First Nations On-Reserve Residential customer class and order a 0% rate increase, I cannot support this decision.

Deviation from Cost of Service Regulation

In my view, the decision of the majority departs from principles of utility regulation in this province and enters a realm that is reserved for the federal and provincial governments. In particular, the context of how Manitoba Hydro operates and is regulated is not recognized in the approach taken by the majority. Manitoba Hydro is an energy utility, not a social service agency of the provincial government.

Manitoba Hydro is regulated on a cost of service basis, with rates set to recover the Utility's costs of supplying power. Board Order 164/16 set out that cost causation is paramount.

Legislated Uniform Residential Customer Class

Prior to the 2001 amendments to The Hydro Act, this regulatory principle was reflected in the use of regional zone rates, which were set to recover the higher costs to serve customers in low population density regions of Manitoba. Through legislative action by the provincial government, uniform rates were implemented and a single Residential customer class was created. Customers in low density and high cost to serve regions had their electricity rates reduced to be equivalent to the electricity rate paid by customers in the high density and lower cost to serve area of the City of Winnipeg. In effect, a policy decision of the provincial government introduced intra-class subsidization, as the cost of serving rural and Northern customers is not equivalent to the cost of serving customers in the City of Winnipeg, but the rate is nonetheless equal.

The Creation of Another Separate Residential Customer Class Should be Legislated

If there is to be another significant deviation or change to the long-standing approach to cost recovery on a cost of service basis, that change should be made by the Government as it was in 2001, and not by Manitoba Hydro or its regulator. That is particularly so with respect to the matter of energy poverty, which is a complex social policy issue that is interwoven with other issues of poverty, income adequacy, and economic development. As such, the affordability of energy bills should be resolved by elected representatives in Government, not the Utility or its regulator. In particular, the approach taken by the majority of selecting a particular sub-set of residential ratepayers to pay less than may be required to serve those customers is making social policy. Social policy should be made by the provincial government.

While I acknowledge the concerns of the majority about reconciliation, *The Path to Reconciliation Act* mandates that it is the provincial government that is to take the lead in advancing measures to promote reconciliation, through the responsible minister's development of a strategy for reconciliation.

I also cannot agree with the majority's selection of a rate increase exemption for a new customer class of First Nations On-Reserve Residential ratepayers. Beyond the issue of this being a matter outside of the role of this Board, the approach taken is significantly under-inclusive. I agree with the Consumers Coalition that bill assistance targeted only at on-reserve First Nations customers excludes too many vulnerable consumers. First Nations customers on reserve are not the only ratepayers who experience energy poverty, nor are they the only ratepayers who have no choice but to heat with higher-cost options such as electricity as opposed to natural gas.

In addition, the selection of First Nations on-reserve residential ratepayers ignores the issue of competing provincial and federal government jurisdiction on reserves. The Board heard evidence that the federal government is already involved in bill assistance for some on-reserve ratepayers. In granting a 0% increase for on-reserve customers, the Board may actually be subsidizing the costs of the federal government and not providing a form of rate relief to ratepayers.

Geographic Regions

I accept that the Board has jurisdiction to create a lower-income customer class. It does not have jurisdiction to create a discriminatory customer class based on regions of the province. A glance at most Manitoba maps will show these geographic regions.

Creating a Permanent Separate Residential Class

I am also concerned that the new customer class will become entrenched in the regulation of Manitoba Hydro rates, such that the class will be difficult to remove or revise in future proceedings. Even if the 0% rate increase is only implemented for 2018/19, it will create a rate differential with the general Residential rate that will, for all practical purposes, be permanently entrenched absent a government program that specifically eliminates the differential. Otherwise, to eliminate the differential would require the Board to approve a rate increase targeted to the First Nations On-Reserve Residential class over and above any rate increase approved for the Residential customer class.

Over time, and in the context of projected annual rate increases, the gap in residential rates will continue to grow. This would become onerous on other ratepayers that will be responsible for subsidizing through their rates the lost revenues not recovered from the First Nations on-reserve residential customer class.

19.0 Solar Generation Program Rate

Solar energy is generated by photovoltaic ("PV") generating systems that produce direct current electricity from sunlight. The direct current electricity can in turn be used to power equipment or charge batteries, generally with the use of an inverter to convert the direct current electricity to alternating current electricity for residential use.

While solar PV systems can be configured as off-grid systems, residential solar PV installations are usually tied into the local electric grid system. This allows solar PV customers to benefit from reduced grid-electricity consumption while maintaining system reliability through access to the local grid for back-up electric energy. Similarly, any excess solar PV power not consumed by the solar PV customer can be sold back to the local utility, usually through a power purchase agreement. As a result, grid-connected solar PV installations incorporate a bi-directional electricity meter that records both the amount of energy supplied by the utility as well as the excess solar PV energy flowing back into the electricity grid. Such customers are typically known as net-metered customers.

To evaluate the opportunities, challenges, and technology requirements of solar PV in the Manitoba market, Manitoba Hydro introduced its Solar Energy Program in the spring of 2016 as an energy efficiency and load displacement program. This two-year pilot program, targeted at residential and small commercial customers with less than 200 kW of electrical load, offers incentives toward the capital cost of solar PV installations. Manitoba Hydro provides an incentive of $1 per watt installed, which can represent approximately one-third of the total installed costs. The incentive is limited to the PV capacity that, at a maximum, generates less energy than that customer's annual load. In addition, Manitoba Hydro's Residential Earth Power Loan program is offered to solar PV customers to assist with the up-front capital costs of solar PV installations.

Once participating customers successfully complete the required electrical inspection, Manitoba Hydro awards the program incentives and installs a bi-directional meter that monitors power imported from the grid as well as power exported from the customer site to Manitoba Hydro's electricity grid. The meter will record the amount of energy supplied by Manitoba Hydro each month. As Manitoba Hydro explained in evidence in this proceeding, for both residential and commercial customers, the billing system will charge for this monthly consumption at the Board-approved August 1, 2017 residential energy rate. The meter will also record the amount of excess energy put on the grid by the customer's solar PV system. A billing line item reflecting the corresponding value calculated at the Board-approved residential rate is applied to the customer's monthly bill. Under Manitoba Hydro's billing system, customers with non-utility generation systems do not bank energy credits for use in later periods. Rather, energy bills are reconciled monthly using the Board-approved residential electricity rate.

Manitoba Hydro's two-year pilot Solar Energy Program will end in April 2018. At that time, the installation incentives will no longer be offered but Manitoba Hydro will continue to offer financing for solar installations through its Earth Power Loan program. Those customers who participated in the pilot program will continue to get credit for surplus energy that is within their own usage, although Manitoba Hydro is currently reviewing its policy of crediting a customer's excess electricity at the full residential rate.

As a result of the pilot Solar Energy Program, Manitoba Hydro currently has 2.6 MW of installed solar generation, which results in 3.47 GWh of energy annually displaced from the electricity grid.

19.1 Board Findings

The Board is concerned that Manitoba Hydro implemented the Solar Energy Program with a rate for excess solar energy without prior Board approval. Rate designs for net metered customers must be brought before the Board for review and rate approvals.

The Board has legal jurisdiction to review and approve the electricity rate that Manitoba Hydro applies to customers participating in the Solar Energy Program, or to customers with any on-site generation, for the return of excess energy to the grid. All rates for services, changes in rates for services, and new rates for services provided by Manitoba Hydro must be reviewed and approved by the Board. The Board's jurisdiction with respect to reviewing and approving rates is framed broadly under The Crown Act and extends to all rates, rate changes, and new rates for electricity "howsoever generated". There is no exclusion for customer-generated electricity.

The price paid by Manitoba Hydro for excess customer-generated solar power is currently unilaterally set by the Utility, which has a retail monopoly in the Manitoba market. This unilateral fee is a price charged by Manitoba Hydro, as it is an expense or cost that Manitoba Hydro sets for the supply of excess solar power. While Manitoba Hydro ultimately pays the cost for the power, this does not detract from the fact that Manitoba Hydro is setting the price for the supply of a particular form of power. Therefore, the price for customer-generated solar power is a "rate for service" subject to the Board's review and approval under The Crown Act.

The Board's conclusion with respect to jurisdiction is supported by section 38 of The Hydro Act, which provides that any person who is required by the Manitoba Hydro-Electric Board to supply power to the Utility may apply to the Board to review the price computed by Manitoba Hydro for the power. This section does not directly apply to the purchase of customer generated solar power by Manitoba Hydro as customers are not "required" to supply the power; however, as Manitoba Hydro's Solar Energy Program includes the Utility purchasing customers' excess solar electricity, section 38 should be understood broadly as demonstrating the intention of the legislature to protect all persons who are paid a unilaterally set price in a monopoly market.

Moreover, the Solar Energy Program is a demand side management program. Demand side management programs introduced by Manitoba Hydro to support customer-generated renewable power, including the Solar Energy Program, are subject to review by the Board. This includes the rates paid for customer-generated energy.

Manitoba Hydro has not yet provided evidence demonstrating the appropriate rate for crediting of customers' excess energy. For all net metering installations, the Board approves Manitoba Hydro crediting customers' excess energy put on the grid at the rate of 8.196¢/kWh for 2018/19. For any future net metered rates or changes to the 8.196¢/kWh rate, Manitoba Hydro is directed to apply to the Board for approval. For the next GRA, Manitoba Hydro is directed to provide additional details on the Solar Energy Program and other net metering installations in Manitoba.

In future, rate designs for net metered customers must be brought before the Board for review and rate approvals.

20.0 Special Rates

As noted above, in addition to the general rate increase sought by Manitoba Hydro, the Utility is also seeking approval of a number of items related to special rates:

1. Final approval of the Light Emitting Diode ("LED") rates for the Area and Roadway Lighting class (Outdoor Lighting) approved on an interim basis in Order 79/14, and approval of new LED rates for the Area and Roadway Lighting class (Sentinel Lighting) as discussed in Tab 9 of Manitoba Hydro's Application;

2. Approval to remove the Area and Roadway Lighting (Festoon Lighting) and the Area & Roadway Lighting (Christmas Lighting) rates from Manitoba Hydro's rate schedule, as discussed in Tab 9 of Manitoba Hydro's Application;

3. Endorsement of modifications to the Terms and Conditions of Option 1 of the Surplus Energy Program ("SEP") that were accepted on an interim basis in Order 43/13, as outlined in Tab 9 of Manitoba Hydro's Application;

4. Final approval of all SEP interim *ex parte* rate Orders as set forth in Tab 10 of its Application, as well as any additional SEP *ex parte* Orders issued subsequent to the filing of Manitoba Hydro's Application and prior to the Board's Order in this matter; and

5. Final approval of Curtailable Rate Program ("CRP") *ex parte* Order 54/16 as well as any additional *ex parte* Orders in respect of the CRP issued subsequent to the filing of Manitoba Hydro's Application and prior to the Board's Order in this matter.

20.1 Board Findings

The special rates were not contentious and were discussed by Manitoba Hydro during the oral hearing. The Board approves the special rates sought by the Utility, excluding finalization of the interim diesel zone rates which Manitoba Hydro is no longer seeking as part of this GRA.

Manitoba Hydro is directed to provide confirmation to the Board that the executed Settlement Agreement documents have been received by the Utility and that the documents are in proper form. With this confirmation, Manitoba Hydro is to advise the Board of its intention regarding finalization of the interim diesel zone rates.

21.0 Capital Project Review per Order in Council 92/2017

Order in Council 92/2017 assigned the Board the duty of considering Manitoba Hydro's capital expenditures as a factor in reaching a decision regarding rates for services. In the course of considering the evidence from Manitoba Hydro, Independent Expert Consultants, and Intervener Experts related to Manitoba Hydro's capital expenditures, the Board identified improvements that should be made to Manitoba Hydro's capital expenditure approval and execution processes in the future, as well as aspects that Manitoba Hydro has performed well and should therefore be continued.

21.1 Capital Project Cost Estimating

Manitoba Hydro, like all electric utilities, has significant capital assets and undertakes major capital projects in order to deliver reliable electrical service to Manitoba residents and businesses. Manitoba Hydro's initial capital cost estimates have often under-estimated the final in-service costs of these projects. The following table provides examples of changes in capital cost estimates from the original capital cost estimate to the most current estimate, and the percentage change.

Comparison of Original Cost Estimates to Current Cost Estimates for Major New Generation & Transmission Projects			
($ millions)	Original CEF* Estimate	Most Current CEF* Estimate	Percentage Change
In Progress			
Keeyask	3,700	8,726	136%
Bipole III	1,880**	5,042	168%
Manitoba-Minnesota Transmission Project	205	453	121%
Completed			
Pointe du Bois Spillway	318	576	81%
Wuskwatim (including transmission)	988	1,742	76%
Riel AC Station and Sectionalization	96	320	233%

* Manitoba Hydro's Capital Expenditure Forecast. The time between the development of the original CEF estimate and the most current CEF estimate varies for each project in this table.
** Original estimate in this table is based on the western routing with converter stations.

The above table shows the original approved cost estimate when it was first included in a Capital Expenditure Forecast. This original estimate is sometimes approved years in advance of the initiation of the project construction. As more detailed design, engineering, and project scope development are completed, the original estimates are revised – and approved – until such time as final pre-construction estimates are developed. For example, the original Keeyask estimate of $3.7 billion was approved in 2008 but construction did not commence until 2014. During that period, additional design and engineering were completed, resulting in the final pre-construction estimate for Keeyask – approved in early 2014 during the NFAT – of $6.5 billion.

METSCO, an expert for the Consumers Coalition, in an analysis of 49 generation, transmission, and distribution projects, similarly found that Manitoba Hydro significantly underestimated the capital cost of projects in comparison to the final actual costs. Compared to the original cost estimates used when the project is first approved by the Manitoba Hydro Executive, METSCO found the final actual costs to be 106% higher (when weighted by project cost). At the original cost estimating stage, Manitoba Hydro has not generally completed detailed design, engineering, and scope development.

In contrast to the original cost estimates, when compared to the final pre-construction estimates, METSCO found that the actual costs for these 49 projects were only 6% higher. In other words, the accuracy of the estimates is significantly enhanced once detailed design, engineering, and scope development are completed prior to construction.

In this GRA, MGF introduced the concept of a ‘stage gate’ approval process, specifically for MMTP but which could apply to other large projects such as Keeyask. This is a project management tool, common in the energy industry, that shepherds a project through five phases: conception, concept selection, tendering, execution, and operation, with a decision gate following each phase. The ‘stage gate’ concept is that a project does not move from one stage to the next – that is, receive approval to go to the next stage – until a set of criteria is satisfied. The criteria may be technical, financial, commercial, or other criteria. In some cases, a peer review by engineering, commercial, and project management professionals is completed to ensure that the risks associated with the project are addressed.

MGF recommends other improvements for Manitoba Hydro’s estimating processes on future projects. Those improvements include having the estimate team prepare the estimate with input from each department, providing supporting back-up, and providing a more detailed explanation outlining the structure and relationship between the physical scope of work and resources to complete the work. MGF also suggested that a higher contingency, such as a P95 contingency, be used when evaluating the business cases of future projects.

MGF explained that preparation of a Basis of Estimate document is an industry best practice. A Basis of Estimate helps define the project scope, identifies risks and opportunities, provides a record of documents used in development of the estimate, provides a record of communications made during development of the estimate, and facilitates the review and validation of the estimate. Manitoba Hydro prepared a Basis of Estimate for Bipole III which, in MGF's view, was extremely well done.

As explained earlier in this Order, MGF found Manitoba Hydro's cost estimating methodologies (with respect to the $4.65 billion and $5.04 billion Bipole III estimates) are consistent with industry standard and best practices. This finding is supported by the cost increase of 8%, which is in line with the 6% average cost increase from final pre-construction budget to actual cost as found by METSCO.

Manitoba Hydro's Position

Manitoba Hydro appears to agree with METSCO that the previous cost estimating and capital approval process that resulted in these inflated final costs is not acceptable. In response to METSCO's findings, Manitoba Hydro explained that its previous process for obtaining corporate approval required estimates of these projects to be developed and submitted for approval prior to any engineering or planning being done, and the initial estimate was completed without a clear definition of project scope. According to Manitoba Hydro, this past process has been replaced with new scope development and approval processes, which allow for the scope of the project to be developed in greater detail before the cost is estimated and the investment considered for approval to execute.

According to Manitoba Hydro, the role of the newly-created position of Director of Strategic Business Integration is to ensure that spending on Business Operations Capital is integrated into Manitoba Hydro's financial planning processes. Previously, each division – Generation, Transmission, and Marketing & Customer Service (or Distribution) – provided its list of proposed capital projects and corresponding budgets to the Executive Committee for corporate approval.

Board Findings

The Board finds that Manitoba Hydro has been approving projects too early in the process, without sufficient development of scope, design, and engineering. The Board recognizes that, with additional scope, design, and engineering development prior to advancing the capital project for financial and economic analysis and subsequent executive approval, there will be additional front-end costs. In the Board's view, these additional sunk costs would be money well spent as the additional work will allow a more informed decision by Manitoba Hydro's Executive.

The evidence shows that when Manitoba Hydro undertakes more thorough design, engineering, and project planning, the final costs of the project are closer to the estimated costs. With the sample of projects reviewed by METSCO, the final pre-construction estimate to actual cost variances were only 6%. However, the Board notes that Keeyask does not align with this sample, as Keeyask has experienced a variance between the final pre-construction estimate and the current estimate of 34%. As explained elsewhere in this Order, Keeyask has not experienced an undue number of design changes nor have the concrete or earthworks quantities driven the costs higher. As a result, Keeyask may not have benefited from additional design, engineering, and planning prior to construction the way other projects have.

Manitoba Hydro's prior capital estimating and approval process leads to the capital expenditure forecast being understated in future years, potentially resulting in inaccurate financial forecasts. It also potentially means that projects are approved without management knowing the full cost implications. It is not known how many projects would not have received approval, or that may have had their scope amended, if Manitoba Hydro's Executive had a more realistic forecast for the project costs prior to approval.

The impact of this on revenue requirements and rates is two-fold. First, for projects that are included in the capital expenditure forecast but are several years out, the underestimate of the capital cost can result in understated revenue requirements in those future years. With understated revenue requirements, Manitoba Hydro's financial ratios and metrics are more favourable and the projected rate increases beyond the Test Years may be understated. Second, and conversely, when the final actual costs are realized, the revenue requirements are higher – as will be the rates – in order for Manitoba Hydro to recover the costs of those projects and achieve its financial targets. If the final actual costs were more accurately known earlier in the process, projects may not proceed or alternatives may be considered which have a lower revenue requirement impact.

The Board notes that, with the creation of the position of Director of Strategic Business Integration, Manitoba Hydro appears to be embarking on a more robust planning, scoping, and engineering process for Business Operations Capital. The Board finds that in the area of Business Operations Capital, Manitoba Hydro has made structural changes to its organization that should improve how capital cost estimating is done. Such scrutiny should be extended to Manitoba Hydro's Major New Generation & Transmission projects. The Board recommends that Manitoba Hydro review and revise its capital project planning, scoping, and engineering processes to provide for a more certain in-service cost before such capital projects are economically and financially analyzed and presented to Manitoba Hydro's Executive for approval and, where required, subsequently to the Province of Manitoba.

There is a dilemma facing any project developer such as Manitoba Hydro, which is how much work – scope development, design, and engineering – should be completed before a decision is made whether to proceed with the project. Additional work to refine the cost estimate will result in increased costs being incurred prior to the final evaluation of the project. At the evaluation stage when the project is compared with alternatives, there is the issue of how to deal with these costs, which are also called "sunk costs".

As recommended above by the Board, more work should be done prior to making a final decision whether to proceed with a project, although this will necessarily result in greater sunk costs. However, the Board acknowledges that, as was done at the NFAT, sunk costs of any project are excluded from the economic comparison with alternative projects since these costs, having already been incurred, can no longer be avoided by choosing an alternative project. Exclusion of sunk costs from the analysis can distort the comparison of the project with alternatives. In its NFAT report, the Board recommended not only cessation of all activities and spending related to Conawapa but that existing sunk costs should not become a future justification of Conawapa.

To address the sunk cost dilemma, the Board finds there is merit in Manitoba Hydro considering the "stage gate" approach put forward by MGF, in order to improve its past performance on cost estimating and completing projects on budget. The Board recommends that Manitoba Hydro engage an external consultant to assist in studying this matter.

As explained earlier in this Order with respect to Bipole III, the Board finds that when estimating costs for a project that includes new, unproven technology, the contingency amounts should be increased, not decreased as was done by Manitoba Hydro.

Order 73/15 Directive 13 requires Manitoba Hydro to report quarterly to the Board as to the status and cost against budget in order to ensure the Board is informed of accurate and timely cost and schedule information. The Board directs that this reporting is to continue, and be amended to include not only the control budget and control schedule, but also the most current forecast at completion cost and schedule milestones based on weekly or monthly reports made by or to Manitoba Hydro. These reports are to be provided to the Board no later than 45 days following the last day of each quarter.

21.2 Potential Capital Project Approvals by the Board

The Board's review of the Manitoba-Saskatchewan Transmission Line project in this proceeding is a precedent for how independent reviews can be conducted of Manitoba Hydro's capital projects.

The Board's concern with approval of Manitoba Hydro's capital expenditures is long standing. In Order 116/08, the Board stated:

> *In prior Orders, the Board has recommended to Government, that The Public Utilities Board Act be amended to make the regulation of MH equivalent to the regulation of Centra Gas by removing the exemption now provided under Section 2(5) of the Act. In Order 143/04 the Board noted: "Given the risks related to the very significant additional plant investments and associated borrowings contemplated, the Board is of the view that the Province of Manitoba should re-evaluate the existing legislation." The Board reiterates its past recommendation.*

Also, as held in Order 73/15, in the context of Bipole III:

> *The Board has no inherent jurisdiction to review and approve the costs and economics of Bipole III. The Board agrees with the Coalition's suggested recommendation to the Province of Manitoba for a change in legislation and that the Board should have approval authority relative to Manitoba Hydro's major capital projects.*

The Board continues to be of the view that it should have legislative authority to approve Manitoba Hydro's capital expenditures. The current process whereby the Lieutenant Governor in Council approves the debt for the development of capital projects does not appear to involve a detailed review of the projects.

As discussed in the previous section, the shortcomings in Manitoba Hydro's previous capital approval process led to inaccurate financial forecasts. The original cost estimates - which generally understate the final costs - artificially depress the revenue requirement when projects are years away but then put upward pressure on the revenue requirement when the final costs - which are generally higher - are known and accounted for. As capital project costs have a substantial influence on Manitoba Hydro's revenue requirement and the resulting rates the Board approves to recover the revenue requirement from ratepayers, the Board recommends that Government grant the Board authority to review and approve Manitoba Hydro's capital projects and expenditures.

The Board envisions that, if it were granted authority to approve Manitoba Hydro's capital projects, it would require Manitoba Hydro to submit projects for the Board's review and approval that have a higher level of scope definition, design, and engineering completed. The Board expects that this will result in the final approval to proceed being based on a more accurate estimate of the final cost. As discussed above, the stage gate approval process could be used to improve the cost estimating at the approval stages while minimizing sunk costs.

21.3 Construction Contract Types and Structures

Manitoba Hydro uses contractors with specific expertise to design, engineer, procure, construct, and commission capital assets. Contracts let by Manitoba Hydro range in value from hundreds or thousands of dollars up to the largest contract for the Keeyask project, the General Civil Contract (“GCC”), which has a contract value in excess of $1 billion.

As explained earlier in this Order, there are several types of pricing structure that can be used in a contract. The pricing structure in the Keeyask GCC is a “cost reimbursable - target price” structure. In a contract with a cost reimbursable-target price payment structure, the owner (Manitoba Hydro) is at risk for quantities, productivity, and efficiency of the contractor, while the contractor is at risk for its profit. Other types of pricing structures include ‘fixed price’ or ‘unit price’ structures. In a fixed price contract (also known as a lump sum contract), the contractor is at risk for quantities and productivity. In a unit price contract, the contractor is paid a pre-defined unit rate (or rate per quantity) multiplied by the quantity of work and is at risk for productivity but not the quantities of work; the quantity risk resides with the owner.

In MGF’s view, the root cause of the billions of dollars of cost overruns for Keeyask is that the cost reimbursable payment structure of the GCC fails to provide sufficient incentive for the general civil contractor to be responsible for productivity. MGF also identified that Manitoba Hydro is managing the Keeyask GCC as if it were a lump sum or unit rate contract and not in a manner that is required to exert control over a contract with a cost reimbursable payment structure. MGF states that, to properly manage a cost reimbursable contract, the owner needs to hold the contractor accountable for its performance, hire experienced trades supervisors to assist the contractor with planning the work in a more efficient manner, understand why planned progress is not achieved, and develop realistic and achievable cost and schedule estimates.

Similarly, Klohn Crippen Berger found that the principal reason for the cost increase in the GCC and overall Keeyask budget is the nature of the payment structure in the GCC. Specifically, the general civil contractor is being paid in full for its actual costs for labour and materials rather than for quantities of work performed against fixed or unit prices.

Board Findings

As explained earlier in this Order, the Board agrees with Independent Expert Consultants MGF and Klohn Crippen Berger that the primary root cause of the cost overrun of the GCC, and the whole Keeyask project, relates to the nature of the cost reimbursable payment structure in the GCC. The reduction in profit that results from the contractor exceeding the GCC target price was not sufficient protection for Manitoba Hydro to ensure the contractor delivered the project on time and at the target price.

As explained earlier in this Order, the Board concludes that Manitoba Hydro did not exercise effective oversight of the Keeyask general civil contractor and did not manage the GCC as was required of a contract with a cost reimbursable payment structure. The Board therefore recommends that Manitoba Hydro use the services of an external construction management expert, particularly for high value projects and those with cost reimbursable payment structures, beginning with the initial study and planning through to project execution. Such a construction management expert would be able to assist Manitoba Hydro with effective project controls, enforcement of the contract terms, and identification of recourse in the event of contractor non-performance.

The Board finds nothing inherently wrong with the use of a cost reimbursable pricing structure, but the suitability of this payment structure depends on the circumstances in which it is used. If used, effective oversight of the contractor must be exercised, as explained by MGF.

The Keeyask GCC utilized a ‘cost reimbursable-target price’ payment structure for all aspects of the project work. The Board envisions a different approach be used in the future. When there are major portions of the construction project that involve below-grade construction – such as river management, removing earth and rock, and preparing the foundations for a generating station on bedrock – those below-grade aspects of the overall project cannot be known with certainty before the construction commences. Because of that uncertainty, it is more appropriate that the geological risk would be borne by Manitoba Hydro as the owner, and not the contractor in the contract. Unit price or cost reimbursable pricing structures are more appropriate for these portions of the project. Conversely, once the foundations are exposed and the remaining work is above grade, far more certainty can be obtained in the design of the project for which the contractor can and should bear more of the risk. A fixed price payment structure in the contract for this aspect of the work is therefore appropriate. There is no rule or requirement for the entire GCC to have the same payment structure.

The Board recognizes that the above approach would not solve all of Manitoba Hydro’s issues with capital cost overruns. Major construction projects throughout North America are frequently reported to be over budget. Contracts with fixed price or unit price payment structures are still susceptible to cost overruns, although these are usually related to design changes made by the owner in the case of the former and to uncertain quantities in the case of the latter. But, as identified by Klohn Crippen Berger, Keeyask did not experience significant issues with design changes or inaccurate quantities of concrete or earthworks.

21.4 What Went Well on Capital Projects

This Order identifies a number of problems, shortcomings, and issues with Manitoba Hydro's capital project estimating, planning, and execution. The evidence in this proceeding also identified a number of positives related to Manitoba Hydro's capital projects. The following is a list of the major positives:

- Issues with interfaces between contractors, as were experienced on Wuskwatim, appear to have been reduced or avoided with the inclusion of increased scopes of work under the Keeyask GCC,
- The Keeyask design and geotechnical investigations were reasonable,
- Keeyask design changes and extra work orders have not been excessive,
- Keeyask quantity estimates, in aggregate, were close to actual quantities,
- While Manitoba Hydro originally allowed over 1,000 activities in the Keeyask GCC schedule to have negative float, the Utility was able to eliminate the negative float in the most current schedule presented to the Board,
- The Bipole III transmission line was contracted with an appropriate mix of fixed price, unit price, and cost reimbursable contracts, providing cost certainty to project,
- The Bipole III transmission line project was well organized and managed,
- The Bipole III transmission line estimating team is knowledgeable and capable,
- Preparation of a Basis of Estimate is an industry best practice that helps define the project scope, identifies risks and opportunities, provides a record of

documents used in development of the estimate, provides a record of communications made during development of the estimate, and facilitates the review and validation of the estimate. Manitoba Hydro prepared a Basis of Estimate for Keeyask and for Bipole III, the latter of which MGF found to be well written and followed best practices,

- Bipole III converter stations were competitively tendered with appropriate pricing mechanisms, in particular a fixed price contract to engineer, procure, and construct the HVDC converter equipment, shifting much of the cost, schedule, and productivity risk to the contractor, and

- Together, the Bipole III converter stations and transmission line are only 8% over the final pre-construction budget.

Board Recommendations For Future Capital Projects

MGF made numerous recommendations which Manitoba Hydro could use to improve the execution of its existing projects as well which could be used in the planning, estimating, and construction of future projects. The Board recommends that Manitoba Hydro consider these recommendations, some of which are itemized below, along with other recommendations made by the Board.

- Where possible, tailor the payment structure for contracts such that risk is appropriately allocated between Manitoba Hydro and the contractor, including potentially having multiple payment structures within the same contract,

- Prepare economic evaluations of projects based on a higher probability contingency, such as at a P90 or P95 level,

- Retain external construction management expertise, particularly for high value projects and those that utilize cost reimbursable pricing mechanisms,

- Prepare a thorough Basis of Estimate document,

- Prepare a comprehensive Basis of Schedule document,
- Use estimate and schedule templates to promote consistency across groups preparing estimates and schedules,
- When developing estimates and schedules, provide supporting back-up and more detailed explanation outlining the structure and relationship between the physical scope of work and resources to complete the work,
- When developing estimates for projects that include new, unproven technology or construction methods, the contingency amounts should be increased, and
- Conduct periodic contract compliance reviews during execution of major projects to ensure the contractor is meeting its obligations.

22.0 Compliance with Board Directives

Manitoba Hydro recognizes that there is a backlog and history of not following Board directives, and that more can be and must be done by the Utility. As discussed above, directives related to depreciation, O&A benchmarking, asset condition assessment reports, and matters for further study in the Cost of Service Study have not been completed in a timely fashion.

22.1 Manitoba Hydro's Position

Manitoba Hydro's President and Chief Executive Officer advises that Manitoba Hydro takes the Orders and direction from the Board seriously, but recognizing the history of directives not being complied with, the Utility has to do a better job. In closing argument, Manitoba Hydro confirmed that, barring appeals, there will be compliance with Board directives. Manitoba Hydro states there can be no dispute that the objective of implementing a directive is to provide value to the regulatory process. Manitoba Hydro recommends that the Board contemplate follow-up or feedback mechanisms when directives are issued so that the work can proceed in a meaningful way and provide value to all parties that desire it.

22.2 Board Findings

The Board finds that the Utility has not complied with all or part of a number of past directives. If Manitoba Hydro disputes a directive issued by the Board, the Utility may choose to file a request for variance or seek leave to appeal from the Manitoba Court of Appeal. The Board has jurisdiction to impose financial penalties and stay any future applications in the event that the Utility does not comply with all or part of a Board Order.

The Board directs Manitoba Hydro to file with the Board on or before August 1, 2018 the status of compliance with all outstanding and ongoing directives. Manitoba Hydro is to provide with this filing the Utility’s comments on a process for feedback and clarification on Board directives.

23.0 Recommendations to the Provincial Government

In this Order, the Board makes the following recommendations to the provincial Government:

1. The Board should have legislative authority to approve Manitoba Hydro's capital expenditures;
2. Efficiency Manitoba's mandate should be amended to include explicit consideration of bill affordability. This would include targeting of lower-income consumers with demand side management programs, as well as consideration of the impact of demand side management costs being paid by non-participants;
3. The provincial government should introduce a comprehensive bill affordability program run by a government department to address energy poverty issues faced by Manitobans throughout the province;
4. The provincial government should establish a stakeholder group to build on the research and analysis undertaken by the Working Group, as well as programs in other jurisdictions, such as the Ontario Energy Support Program;
5. The provincial government should use some of the revenues it receives from Keeyask to fund a comprehensive bill affordability program, consistent with the NFAT report recommendations;
6. The provincial government should transfer a portion of the carbon tax revenues to Manitoba Hydro to further strengthen Manitoba Hydro's financial health, which may allow for lower consumer rate increases; and
7. The provincial government should suspend payment of the annual Bipole III debt guarantee fee and capital taxes made by Manitoba Hydro to the Province of Manitoba, starting with the 2019 fiscal year and until the $900 million burden of a

policy decision made by government is satisfied, which will occur in approximately 13 years.

24.0 Recommendations to Manitoba Hydro

In this Order, the Board recommends that Manitoba Hydro:

1. Defer $160 million of Business Operations Capital spending to a future period beyond 2018/19;
2. Continue to find reductions in Business Operations Capital spending during the current period of record spending on major capital projects such as Keeyask and Bipole III;
3. Update the Manitoba-Minnesota Transmission Project schedule more frequently than every two months once construction begins;
4. Make efforts to find further areas to reduce O&A costs, both in terms of staff reductions and Supply Chain Management, after the Voluntary Departure Program transition concludes;
5. Review and revise its capital project planning, scoping, and engineering processes to provide for a more certain in-service cost before such capital projects are economically and financially analyzed and presented to Manitoba Hydro's Executive for approval and, where required, subsequently to the Province of Manitoba;
6. Consider the "stage gate" project approval process and engage an external consultant to assist in studying the use of this process;
7. Use the services of an external construction management expert, particularly for high value projects and those with cost reimbursable payment structures, beginning with the initial study and planning through to project execution;
8. Consider the recommendations made by MGF to improve Manitoba Hydro's execution of its existing projects and in the planning, estimating, and construction of future projects; and

9. Review demand side management programming for cost effectiveness and cease or modify spending on programs that are no longer cost effective, except for programs targeted at lower-income and First Nations on-reserve consumers.

25.0 IT IS THEREFORE ORDERED THAT:

1. The rate increase of 3.36% previously approved as interim effective August 1, 2016 **BE AND IS HEREBY APPROVED AS FINAL**.

2. The rate increase of 3.36% previously approved as interim effective August 1, 2017 **BE AND IS HEREBY APPROVED AS FINAL.**

3. Manitoba Hydro's Application for a 7.9% across-the-board rate increase effective April 1, 2018 **BE AND HEREBY IS DENIED** as filed.

4. A 3.6% average revenue increase to be recovered in Manitoba Hydro consumers' rates effective June 1, 2018 **BE AND IS HEREBY APPROVED**.

5. Manitoba Hydro implement differentiated rates to collect the approved revenue requirement for 2018/19 in order to begin to move the Revenue Cost Coverage ratios of the General Service Small Non-Demand, General Service Large 30-100kV, and General Service Large >100kV customer classes into the zone of reasonableness of 95% to 105%, using the alternative calculation methodology. Manitoba Hydro is to assume a 10-year timeframe to move all classes within the zone of reasonableness, using the alternative calculation methodology. The rate increase impact of doing so is to be shared across the Residential, General Service Small Demand, General Service Medium, General Service Large 0-30kV, and Area & Roadway Lighting classes.

6. Manitoba Hydro create a First Nations On-Reserve Residential customer class. This customer class is to receive a 0% rate increase for the 2018/19 Test Year, such that the rate for this class will be maintained at the August 1, 2017

approved Residential rate. A 0% rate increase is to also apply to First Nations Residential customers in the diesel zone communities.

7. Manitoba Hydro credit net-metered customers' excess energy put on the grid at the rate of 8.196¢/kWh for 2018/19. Manitoba Hydro must apply to the Board for approval of any future net-metered rate or changes to the 8.196¢/kWh rate.

8. Manitoba Hydro recalculate and file, for Board approval, a schedule of rates reflecting the overall rate increase and differentiated rates effective June 1, 2018 for all customer classes, together with all supporting schedules including proof of revenue, customer impacts, and revenue requirement, by May 15, 2018.

9. Manitoba Hydro participate in a technical conference hosted by Board Staff or an external consultant appointed by the Board for the consideration of the establishment of a minimum retained earnings or similar test to provide guidance in the setting of consumer rates for use in rule-based regulation.

10. Manitoba Hydro provide information about the Other Cash Payments included in the Cash Flow Statement in the next GRA filing.

11. Manitoba Hydro consider the areas recommended by the Independent Expert Consultants for improvement and enhancement of the load forecasting methodology and provide details of the implementation of these recommendations, or reasons for not implementing them, at the next GRA.

12. Manitoba Hydro file with the next GRA the details of its Operating & Administrative expenditures with an explanation as to how Manitoba Hydro is carrying on its operations with reduced staffing levels, including the details of the operational plan developed to continue running operations with a workforce that

has been reduced by 15%, and any advice or recommendations received from external consultants retained to assist with the restructuring and transition.

13. Manitoba Hydro file with the next GRA details of its actual Operating & Administrative expenditures dating back 10 years through to the date of the filing, along with forecast Operative & Administrative expenditures by cost element and business unit, including the details of the Utility's pension liability related to the reduced staffing levels. The actual Operating & Administrative expenditures are to include the compound annual growth both before and after accounting changes.

14. Manitoba Hydro retain an independent consultant to assess Manitoba Hydro's development of its asset management program and its progress in addressing the recommendations made by UMS, as well as the progress of the development of the Corporate Value Framework. Manitoba Hydro is to file with the Board by June 29, 2018 the Terms of Reference for the consultant for the Board's review and comment. Manitoba Hydro is directed to report back to the Board on its progress and the result of the consultant's assessment at the next GRA.

15. Manitoba Hydro consider implementing the recommendations made by the Independent Expert Consultants with respect to Keeyask, Manitoba-Minnesota Transmission Project, and Great Northern Transmission Line, including implementing the recommendations to improve productivity to meet the control budget and schedule for Keeyask. Manitoba Hydro is to report to the Board at the next GRA whether and the extent to which it has implemented these recommendations and the projected cost savings and schedule impacts.

16. Manitoba Hydro file detailed quarterly reports for all Major New Generation and Transmission projects currently under development. These reports are to outline the proposed budget and schedule (at time of contract), budget and schedule changes and reasons for such changes, and the current forecast at completion costs and schedule based on weekly or monthly reports made by or to Manitoba Hydro. Where actual or forecast capital costs have materially increased, Manitoba Hydro is to explain how such increases will impact domestic revenue requirements and projected impacts on Manitoba Hydro's financial forecasts and targets. Specific contract costs are to be detailed for any contracts in excess of $50 million. These reports are to be provided to the Board no later than 45 days following the last day of each quarter. This Directive replaces Order 73/15 Directive 13.

17. Manitoba Hydro continue to use its existing Average Service Life methodology for calculating depreciation rates for rate-setting purposes, without reversion to Equal Life Group in the financial forecast. Manitoba Hydro shall not amortize the difference between Average Service Life and Equal Life Group for rate setting.

18. Manitoba Hydro's request to hold an alternate process for discussion of the depreciation directives as set out in Order 43/13 **BE AND IS HEREBY DENIED**.

19. Manitoba Hydro's proposed treatment of the Conawapa costs **BE AND IS HEREBY APPROVED**.

20. Manitoba Hydro's request to cease the deferral of ineligible overhead in 2023/24 and amortize the regulatory account balance over 20 years **BE AND IS HEREBY DENIED**.

21. Manitoba Hydro continue the annual deferral of $20 million in ineligible overhead. The regulatory account balance is to be amortized over 34 years.

22. Manitoba Hydro's request to begin recognizing the Bipole III Deferral Account in domestic revenues following the in-service date of Bipole III, amortized over a five-year period **BE AND IS HEREBY APPROVED**.

23. Manitoba Hydro discontinue the accounting practice of recognizing a Demand Side Management Deferral Account.

24. Manitoba Hydro exclude non-tariffable transmission costs from the allocation of export revenues in its future Prospective Cost of Service Studies.

25. Manitoba Hydro allocate the activities of building moves & safety watches, contact centre-outages, line locates, and marketing research & development costs to all customer classes other than General Service Large 30-100kV and General Service Large >100kV in future Prospective Cost of Service Studies.

26. Manitoba Hydro complete the study of the Service Drops Allocator and the Common Costs study in time for its next Prospective Cost of Service Study.

27. Manitoba Hydro calculate Revenue to Cost Coverage ratios using the alternative methodology of treating export revenues as a reduction to class costs in future Prospective Cost of Service Studies filed with the Board.

28. Manitoba Hydro provide in its next GRA filing the rationale for the declining block rate design for the General Service customer classes and an evaluation of the block thresholds and charges.

29. Manitoba Hydro file with the next GRA a time-of-use rate design proposal, including the results of consultation undertaken with General Service Large customers prior to filing the proposal with the Board.

30. Manitoba Hydro provide with the next GRA additional details on the Solar Energy Program and other net metering installations in Manitoba.

31. Manitoba Hydro's request for final approval of the Light Emitting Diode rates for the Area and Roadway Lighting class (Outdoor Lighting) approved on an interim basis in Order 79/14 **BE AND HEREBY IS APPROVED**.

32. Manitoba Hydro's requests for approval of new Light Emitting Diode rates for the Area and Roadway Lighting class (Sentinel Lighting) and for approval of the removal of the Area and Roadway Lighting (Festoon Lighting) and the Area & Roadway Lighting (Christmas Lighting) from Manitoba Hydro's rate schedule **BE AND HEREBY ARE APPROVED**.

33. Manitoba Hydro's request for endorsement of the Terms and Conditions of Option 1 of the Surplus Energy Program that were accepted on an interim basis in Order 43/13 **BE AND HEREBY IS APPROVED**.

34. Manitoba Hydro's request for final approval of all interim *ex parte* Surplus Energy Program rate Orders as set out in Tab 10 of Manitoba Hydro's Application, as well as in Appendix 17.1 of Manitoba Hydro's Written Final Argument, and issued subsequent to Manitoba Hydro's Written Final Argument and prior to the issuance of this Order **BE AND HEREBY IS APPROVED**.

35. Manitoba Hydro's request for final approval of Curtailable Rate Program *ex parte* Order 54/16 as well as any additional *ex parte* Orders in respect of the

Curtailable Rate Program issued prior to this Order **BE AND HEREBY IS APPROVED**.

36. Manitoba Hydro provide confirmation to the Board that the executed diesel zone Settlement Agreement documents have been received by the Utility and that the documents are in proper form. With this confirmation, Manitoba Hydro is to advise the Board of its intention regarding finalization of the interim diesel zone rates.

37. Manitoba Hydro file with the Board on or before August 1, 2018 the status of compliance with all outstanding and ongoing directives, along with the Utility's comments on a process for feedback and clarification on Board directives.

Board decisions may be appealed in accordance with the provisions of Section 58 of *The Public Utilities Board Act*, or reviewed in accordance with Section 36 of the Board's Rules of Practice and Procedure. The Board's Rules may be viewed on the Board's website at www.pubmanitoba.ca

Appendix A: Glossary of Terms and Acronyms

Acronyms

Acronym	Definition	Description
C10, C13, C23	N/A	The name given to a specific Prospective Cost of Service Study allocation table related to the customer cost classification. Each table will have a unique numeric code (e.g.: C10) that is then used as reference in the PCOSS calculations made by Manitoba Hydro. C10, C13, and C23 relate to general customer services costs.
CRP	Curtailable Rate Program	A program offered to Manitoba Hydro's industrial customers that gives credits on the customer bills in exchange for commitments to curtail their load during times of system emergencies.
DSM	Demand Side Management	A common utility strategy for reducing consumer demand (frequently through energy efficiency measures) for energy in order to defer the need for new generation assets. Manitoba Hydro's Demand Side Management Plan, marketed under the Power Smart brand, involves various education and incentive programs aimed to reduce domestic consumption of both electrical and natural gas.
GCC	General Civil Contract	The single largest contract with respect to the construction of the Keeyask generating station. The GCC encompasses work related to river management, earthworks to build dams and dykes, concrete structures, and electrical and mechanical work within the powerhouse and spillway structures.
GNTL	Great Northern Transmission Line	The American portion of a new 500 kV alternating current interconnection under construction between Dorsey converter station northwest of Winnipeg and a new station near Grand Rapids, Minnesota.

Acronym	Definition	Description
GRA	General Rate Application	PUB process to review Manitoba Hydro's proposed changes to electrical or gas rates and their impacts on various customer groups.
GWh	Gigawatt-Hour	An amount of electrical energy equivalent to 1,000,000 kilowatt hours (kWh), or 1,000 megawatt hours (MWh). As an example, a typical non-electrically heated home uses 10,000 kWh per year. One GWh is enough to power 100 homes for one year.
HVDC	High-Voltage Direct Current	An electric power transmission system that uses direct current for the bulk transmission of electrical power, in contrast with the more common alternating current (AC) systems. HVDC transmission is point-to-point, as opposed to the interlaced networks that are possible with AC systems. For long-distance transmission, HVDC systems may be less expensive and suffer lower electrical losses.
IFF	Integrated Financial Forecast	Provides projections of Manitoba Hydro's financial results and position over a multi-year forecast period, typically 20 years. The Integrated Financial Forecast serves as the primary forecast to determine the need for rate increases that are necessary for Manitoba Hydro to maintain a reasonable financial position and progress towards attaining and maintaining its financial targets. The most current forecast is MH16 Update with Interim.
IFRS	International Financial Reporting Standards	Accounting standards adopted by Manitoba Hydro in April 2015 which replace Canadian Generally Accepted Accounting Principles.

Acronym	Definition	Description
kV	Kilovolt	An amount of electromotive force equivalent to 1,000 volts. A volt is unit of measure for the electromotive force, and representative of the difference of potential that would drive one ampere of current against one ohm of resistance. It is roughly analogous to pressure in a water pipe.
kW	Kilowatt	An amount of electrical power equivalent to 1,000 watts. A watt is unit of measure for electrical power, corresponding to the power in an electric circuit in which the potential difference is one volt and the current is one ampere.
kWh	Kilowatt-Hour	The basic unit of electric energy equal to one kilowatt of power supplied to, or taken from, an electric circuit steadily for one hour (e.g.: ten 100 W lightbulbs left on for 1 hour would use 1 kWh, or 1000 W for one hour). A typical home without electric heat uses about 10,000 kWh each year.
LICO	Low-Income Cut-Off	A poverty measure used by Statistics Canada that represents an income threshold below which a family is likely to devote a larger share of its income on food, shelter and clothing than the average family. LICO is calculated based on total pre-tax household income, as well as family and community sizes.
LICO-125	125% of Low-Income Cut-Off	The eligibility threshold used by Manitoba Hydro for its Affordable Energy program. LICO-125 is based on 125% of Statistics Canada's Low Income Cut-Off (LICO) threshold for the large urban centre (i.e., a community with 500,000 or more inhabitants).
MH16	Manitoba Hydro Integrated Financial Forecast 2016	The original integrated financial forecast presented by Manitoba Hydro in support of its 2017/18 & 2018/19 General Rate Application.

Acronym	Definition	Description
MH16 Update	Manitoba Hydro Integrated Financial Forecast 2016	An update to Manitoba Hydro's integrated financial forecast reflecting more current forecasts of export prices, water flow conditions, domestic loads, and economic and financial indicators.
MH16 Update with Interim	Manitoba Hydro Integrated Financial Forecast 2016	An update to Manitoba Hydro's integrated financial forecast reflecting the MH16 Update forecasts of export prices and domestic loads as well as the impact of the Public Utilities Board's interim approval of rates effective August 1, 2017.
MMTP	Manitoba-Minnesota Transmission Project	The Canadian portion of a new 500 kV alternating current interconnection under construction between Dorsey converter station northwest of Winnipeg and a new station near Grand Rapids, Minnesota.
MW	Megawatt	An amount of electrical power equivalent to 1,000,000 watts, or 1,000 kilowatts (kW). Manitoba Hydro's peak generating capability from its hydroelectric generating stations is approximately 5,200 MW.
NEB	National Energy Board	Canadian federal regulator for international electricity exports and imports.
NFAT	Needs For and Alternatives To	Extensive review of Manitoba Hydro's Preferred Development Plan by the PUB with final recommendations made to the Province of Manitoba as to which development option should proceed. Last undertaken in 2014 to review Manitoba Hydro's Keeyask, Conawapa, US Intertie, and expanded DSM project investments.

Acronym	Definition	Description
P50, P90	Probability 50%, Probability 90%	A value at which the expected outcomes have a 50% probability of being higher than the value and 50% chance of being lower than the value. A P90 value is a value for which the expected outcomes have a 90% probability of being lower and a 10% probability of being higher.
PCOSS	Prospective Cost of Service Study	An embedded cost of service study in that it is based on forecast financial costs for a single test year period from the Integrated Financial Forecast. PCOSS18 refers to the PCOSS with a test year of 2017/18, which is based on IFF16 and the methodology changes directed in Order 164/16
PV	Photovoltaic	Equipment used to generate direct current electricity from solar radiation (i.e. sunlight).

Terms

Term	Description
Arrear	An amount owing, generally from unpaid bills or a portion thereof. Arrears can lead to service disconnection.
Bipole	An electrical power transmission line, within a high voltage direct current system, having two direct current conductors in opposite polarity. Manitoba Hydro implemented a high voltage direct current system in order to economically and efficiently transmit power generated by hydroelectric stations on the Lower Nelson River to southern Manitoba.
Business Operations Capital	A category within the Capital Expenditure Forecast. Capital projects in this category relate to expenditures to renew existing assets and facilities (also referred to as “sustainment”) replacements, to expand the electrical system to new customers, and to address load growth and requirements for additional capacity.
Capital Expenditure Forecast	A projection of the capital expenditures needed annually for new and replacement equipment and facilities to meet the electricity requirements in Manitoba and firm export sale commitments outside the province.
Conawapa	A potential hydroelectric generating station on the Nelson River, most recently proposed by Manitoba Hydro as part of its Preferred Development Plan in 2013 and reviewed at the NFAT in 2014. The Board recommended that Manitoba Hydro cease its development and this recommendation was accepted by the provincial government.
Conservation Rates	See Inverted Block Rates.
Control Budget	A formal budget for a capital project developed by the project team and approved by management.

Term	Description
Converter Station	A high voltage direct current (HVDC) converter station is a specialized type of substation which forms the terminal equipment for a HVDC transmission line. Converter station equipment converts alternating current to direct current, or the reverse. Manitoba Hydro currently operates, or has in construction, three northern converter stations (Henday, Radisson, and Keewatinohk) to convert from alternating current (AC) collected from nearby generating stations to direct current (DC) power for transmission. As well, Manitoba Hydro operates, or has in construction, two southern converter stations (Dorsey and Riel) to convert DC to AC for downstream customer transmission and distribution.
Corporate Value Framework	A systematic means of understanding the value of all investments in an organization. The Manitoba Hydro value framework consists of 28 value measures that span five categories: financial (including the cost of the investment), reliability, environmental, safety, and corporate citizenship. Each investment's value is assessed using these measures and the net present value is then used to determine both its independent merit and its standing among other investments competing for resources in a constrained optimization process. The value framework helps identify the optimal set of investments that deliver the greatest value to the organization while respecting funding, resource, and timing constraints.
Cost-of-Service	A process undertaken to determine the responsibilities that each customer class has for Manitoba Hydro's total revenue requirement and to assist in determining whether domestic rates are fair and reasonable.
Cost-of-Service Study	A method of allocating a utility's costs to the various classes of customers that it serves. Its purpose is to determine a fair sharing of the utility's revenue requirement among the customer classes.
Curtailable Rate Program	A program offered to Manitoba Hydro's industrial customers that gives credits on the customer bills in exchange for commitments to curtail their load during times of system emergencies.

Term	Description
Customer Class	A category of similarly situated customers. Customers are categorized into customer classes according to the characteristics of the equipment and assets that serve them as well as the characteristics of how they consume power.
"Customer" Cost Classification	A classification within the cost of service study. Utility costs that tend to vary with the number of customers. These include asset costs related to meters and service drops, as well as billing, meter reading, and customer service costs.
Customer Service	In the Cost of Service Study, customer service costs are associated with service provided to the customer after delivery of energy.
"Demand" Cost Classification	A classification within the cost of service study. Utility costs associated with consumption of electricity at peak periods and the maximum size (capacity) of facilities to serve those demands. These would generally include assets such as transmission lines and substations.
Demand Side Management	A common utility strategy for reducing consumer demand (frequently through energy efficiency measures) for energy in order to defer the need for new generation assets. Manitoba Hydro's Demand Side Management Plan, marketed under the Power Smart brand, involves various education and incentive programs aimed to reduce domestic consumption of both electrical and natural gas.
Dependable Energy	Energy that can be produced by Manitoba Hydro even during drought conditions. It is based on water levels and flows experienced in the lowest flow year on record. This includes the minimum expected generation from the hydroelectric generating stations plus continuous operation of the Selkirk and Brandon thermal generating stations, plus the minimum expected wind generation from St. Leon and St. Joseph, plus contracted imports.
Dependable Sales	Export sales made from dependable energy resources. These are also referred to as firm sales.

Term	Description
Distribution	Utility assets used to distribute lower voltage electricity to individual customers. These assets include distribution lines operating at less than 30 kV along with associated low voltage portions of substations, as well as low voltage transformers and metering.
Energy Burden	The percentage of household income that goes toward energy costs (e.g., electricity and gas).
"Energy" Cost Classification	A classification within the cost of service study. Utility costs that vary with the consumption of electricity are classified as "energy".
Energy Poverty	As defined by the Bill Affordability Working Group, energy poverty refers to circumstances in which a household is, or would be, required to make sacrifices or trade-offs that would be considered unacceptable by most Manitobans in order to procure sufficient energy from Manitoba Hydro." For the purposes of the Working Group Report, the Working Group considered a household to be energy poor if it spends more than 6% or 10% of pre-tax income on energy and also has a level of income lower than the current Low Income Cut-Off 125 ("LICO-125"), which is 25% above the Statistics Canada lower-income measurement.
Firm Sales	Export sales made from dependable energy resources.
Functionalization	The first of three main steps in a cost of service study (the others being classification and allocation) where the annual costs of a utility's assets and operations are separated according to the function performed by each asset or operation. Manitoba Hydro's cost of service study has five main functions: Generation, Transmission, Sub-Transmission, Distribution, and Customer Service.

Term	Description
Gas Available Area	Regions of Manitoba where Centra Gas Manitoba Inc. (a subsidiary of Manitoba Hydro) holds a franchise agreement with the local municipality to distribute natural gas, which is generally consumed for space and water heating. Gas available areas are generally found in the southern areas of Manitoba (mostly adjacent to the TransCanada Mainline pipeline).
General Service Large	Customer class containing predominantly industrial customers. These customers make use of customer-owned voltage transformation assets. This customer class is divided into three sub-categories, 0-30kV, 30-100kV, and >100kV, to reflect the voltage supplied to the customer by Manitoba Hydro.
General Service Medium	Customer class containing predominantly large commercial customers. These customers use Manitoba Hydro-owned transformation assets and have loads exceeding 200 kW.
General Service Small	Customer class containing predominantly small commercial customers with loads less than or equal to 200 kW. This customer class is divided into two sub-categories, Demand and Non-Demand. Demand customers pay a Demand rate based on the peak demand each month, in addition to a basic monthly charge and an energy (per kWh) charge.
Generation	Utility assets used to generate electricity. Manitoba Hydro considers all generating facilities, northern collector transmission lines, and HVDC facilities (such as Bipoles and converter stations) as generation in its cost of service studies.
Generation Outlet Transmission	Electrical conductors, and related switching and control equipment, linking electrical generators to transmission substations or converter stations.

Term	Description
Independent System Operator	An independent organization, formed at the direction or recommendation of the Federal Energy Regulatory Commission in the United States or other Canadian provincial regulator, that operates a region's electricity grid, administers the region's wholesale electricity markets, and provides reliability planning for the region's bulk electricity system.
Integrated Financial Forecast	Provides projections of Manitoba Hydro's financial results and position over a multi-year forecast period, typically 20 years. The Integrated Financial Forecast serves as the primary forecast to determine the need for rate increases that are necessary for Manitoba Hydro to maintain a reasonable financial position and progress towards attaining and maintaining its financial targets. The most current forecast is MH16 Update with Interim.
Interconnection	The physical linking of a utility's electrical network with equipment or facilities not belonging to that network. The term may refer to a connection between a utility's facilities and the equipment belonging to its customer, or to a connection between two (or more) utilities.
Inverted Block Rate	A rate design that uses a tiered pricing structure in which higher-usage customers pay an increasing marginal rate for the commodity that is consumed. The increasing pricing structure is intended to provide a price signal to customers to encourage energy efficiency. Inverted block rates are also sometimes called inverted rates or conservation rates.
Keeyask	Manitoba Hydro’s newest and fourth largest hydroelectric generating station under construction on the Nelson River. It is projected to enter service in August 2021.

Term	Description
Line Loss	While transmitting from generating stations to the end users, electricity passes through a complex transmission and distribution network, consisting of transformers, switches, and conductors. As it passes through the system, some of the energy is consumed by various system components or is dissipated due to the physical properties of the equipment. As a result, the total amount of electric energy measured at customer meters is always less than the total amount of electric energy measured at generation stations. The difference between the two is known as line loss.
Major New Generation & Transmission	Refers to capital projects that are utilized to both generate electricity and transmit this electricity to remote load centres (i.e. populated areas). Major New Generation & Transmission is a category within the Capital Expenditure Forecast that includes projects that provide significant new generation and transmission capacity and are of a substantial cost.
Marginal Value	The marginal value is the value to the Manitoba Hydro's system of deferring an increment of load growth (i.e. 1 kWh) to Manitoba Hydro's integrated system. Marginal value is determined based on each of the components of serving residential load: generation supply, bulk transmission capacity, and distribution capability.
Midcontinent Independent System Operator	A regional electricity transmission organization that assures unbiased regional grid management and open access to the transmission facilities. The Midcontinent Independent System Operator serves as a link in the safe, reliable, and cost-effective delivery of electric power across all or parts of 15 U.S. states and the Canadian province of Manitoba. It is the principal market that Manitoba Hydro exports power to.
National Energy Board	Canadian federal regulator for international electricity exports and imports.
Network Transmission	A system of interconnected electrical transmission lines that minimizes the probability of grid instability and failure. Network transmission also facilitates the exchange of electrical power amongst utilities.

Term	Description
Non-Tariffable Transmission	A sub-function in Manitoba Hydro's cost of service study that captures costs of transmission lines and substations that are not eligible to be included in the Open Access Transmission Tariff. Non-tariffable transmission includes radial transmission lines.
Off-Peak	Off-peak refers to periods when lower electricity prices are generally expected, coinciding with periods of low electricity usage. Manitoba Hydro's off-peak periods are defined as all night time hours from 11pm to 7am.
On-Peak	On-peak refers to periods when higher electricity prices are generally expected, coinciding with periods of high electricity usage. Manitoba Hydro's on-peak periods are defined as Monday to Friday (excluding Statutory Holidays) 12pm-8pm (May-October), as well 7am-11am and 4pm-8pm (November-April).
Opportunity Sales	Export sales made from surplus generation, typically hydraulic generation that is available in most water flow conditions except drought conditions.
Peak Demand	The instantaneous maximum amount of electricity required by a customer or group of customers.
Radial Transmission	Radial transmission refers to transmission lines feeding high voltage power to regions of the province using a single path without a redundant transmission line, as opposed to network transmission which provides multiple redundant paths. For example, a radial transmission line feeds the Town of Churchill.
Rate Design	The process of determining the rates charged to each customer class in order to recover the utility's revenue requirement. The cost of service study is an input to the rate design. Rates for each customer class can have basic monthly charges, demand charges, and energy rates, or a subset of these three charges.
Revenue to Cost Coverage	The ratio of class revenues and costs. Generally, the objective is to obtain a ratio close to 1 (or 100%) for each customer class.

Term	Description
Surplus Energy Program	The Surplus Energy Program is a Manitoba Hydro rate program that enables a qualifying customer to purchase surplus energy at export market prices that are determined on a weekly basis for peak, shoulder, and off-peak periods, if Manitoba Hydro has surplus energy to sell.
Test Year	The year which is the subject of the Public Utilities Board's review and approval of a rate increase. For this GRA and this Order, the Test Year is Manitoba Hydro's fiscal year beginning April 1, 2018 and concluding March 31, 2019.
Time of Use Rates	A rate design concept that varies the cost of electricity based on when it is used. The aim is to promote energy conservation and load smoothing in order to reduce overall system peak loads, thus deferring the need for new generation assets and to maximize the value of electricity exports during on-peak periods.
Transmission	Utility assets used to transmit electricity between load centres. In the cost of service study, Manitoba Hydro considers all transmission lines and high voltage portions of substations operating in excess of 100 kV as transmission. With respect to capital expenditures, transmission refers to assets operating in excess of 33 kV.
Uniform Rates	In 2001, legislation mandated uniform rates in Manitoba (also known as "postage stamp rates"). Previously, residential customers in Northern Manitoba and in rural areas paid higher rates than those in Winnipeg. Under the uniform rates legislation, the previous geographic rate zones were eliminated and the costs to serve urban customers were pooled with the costs to serve rural customers.
Water Rentals	Fees paid by Manitoba Hydro to the Provincial Government based on the amount of electricity produced from hydraulic generation.

Term	Description
Working Group	The Bill Affordability Working Group, established in response to the Board's directive in Order 73/15. The Working Group was comprised of a variety of stakeholders who represent, work with, or provide services to lower-income Manitoba Hydro customers.
Zone Of Reasonableness	An established tolerance zone around the COSS RCC target of 100% for each class. Manitoba Hydro's RCC Zone of Reasonableness currently has a range of 95 to 105 percent. A RCC ratio outside of the ZOR is one factor to be considered in the possible differentiation of rate increases.

Public Utilities Board — Régie des services publics

Appendix B: Order in Council 92/17

MANITOBA

ORDER IN COUNCIL

Finance

DATE: **April 05, 2017**

ORDER IN COUNCIL NO.: **00092 / 2017**

RECOMMENDED BY: **Minister of Finance**

ORDER

1. The Public Utilities Board (the "PUB") is assigned the duty of considering capital expenditures by The Manitoba Hydro-Electric Board ("Manitoba Hydro") as a factor in reaching a decision regarding rates for services under Part IV of *The Crown Corporations Public Review and Accountability Act* to support setting rates for services in a manner that balances the interests of ratepayers and the financial health of Manitoba Hydro.

2. For the purpose of the PUB's consideration of capital expenditures as a factor in the next review of Manitoba Hydro rates for services, Manitoba Hydro shall provide to the PUB the following information:

(a) Capital Expenditure: existing records related to planned capital expenditures, such as details on new, current committed, and proposed, planned or forecast major capital expenditures and base/sustaining capital expenditures, including copies of contracts, current and previous cost estimates, cost overrun justifications, schedule change justifications, current and future scheduled capital expenditure commitments and forecasts;

(b) Explanatory: existing records related to project justification, such as capital project justification forms, cost-benefit analyses, business case and other supporting information related to Manitoba Hydro capital expenditures identified by the PUB, including Asset Condition Assessments for previous, current and proposed major capital expenditures and base/sustaining capital expenditures;

(c) Revenue and other: existing records related to revenues and income, such as any correspondence, agreements, term sheets, export contracts, externally commissioned or internally created reports, studies or analyses, including forecasts (capital, capital structure, financial, export, import, load and power resource).

3. Manitoba Hydro may request that information it deems to be commercially sensitive be held in confidence by PUB. The PUB shall conduct the rate review in accordance with its Rules of Practice and Procedure, including determining the access of any person to information received in confidence.

4. This Order comes into effect immediately.

AUTHORITY

The Public Utilities Board Act, C.C.S.M. c. P280, states:

Power of board to perform assigned duties
107 The board may perform duties assigned to it
...
(b) by order of the Lieutenant Governor in Council; or

and Part I, in so far as it is applicable, applies to the carrying out of duties so assigned.

BACKGROUND

1. No change in rates for services shall be made and no new rates for services shall be introduced without the approval of the PUB under Part IV of *The Crown Corporations Public Review and Accountability Act*.

2. Manitoba Hydro intends to submit a general rate application to the PUB in 2017.

Appendix C: Summary of Presenter Evidence

In the GRA hearing, the Board heard evidentiary public presentations. As with other witnesses before the Board, those giving public presentations were sworn and subject to questioning by all parties and the Board. Written public presentations were provided by members of the public who registered with the Board to give an oral presentation but who were not available for the times scheduled for oral presentations during the hearing. The written public presentations were certified by the authors.

The summary of presenter evidence below is provided in the order in which presenters appeared in front of the Board.

Consumers Coalition Ratepayer Panel

Mr. Dan Mazier

Mr. Mazier resides in the rural municipality of Elton, Manitoba, on a farm property with a primary residence as well as a farm operation of 1,000 acres and a rental home. While Mr. Mazier's electricity costs for his primary residence are essentially zero due to his investments in renewable energy, he is concerned about the effect electric rate increases will have on his farm operation and on their renters in the rental home. Mr. Mazier indicated that Manitoba Hydro's projected rate plan could make Manitoba businesses uncompetitive globally. His preference is, rather than having higher rate increases in the short-term followed by lower rate increases, to have lower rate increases over a longer period of time as this is more predictable and realistic. He also stated that ratepayers do not know where the money Manitoba Hydro receives from ratepayers goes, and expressed concern that there is a lack of transparency.

Ms. Rebecca Trudeau

Ms. Trudeau is a resident of Winnipeg. Ms. Trudeau would prefer lower rate increases for a longer period of time, because this is consistent and reliable, which allows her to have an expectation of her monthly bill charges. As she lives paycheque-to-paycheque, Manitoba Hydro's proposed rate increases would affect her ability to save a portion of her income, potentially cause her to find employment that is less fulfilling but pays more, and would give rise to anxiety and stress. Her view is that Manitobans should not spend more than 5% – 6% of their annual income on energy bills, with 10% being the upper limit. She is supportive of a program to assist lower-income Manitobans in paying their electricity bills and is willing to pay a few dollars extra each month for such a program. Ms. Trudeau also noted that she finds many of Manitoba Hydro's energy efficiency programs to not be accessible for renters.

Mr. Gordon Barton

Mr. Barton is from Anola, Manitoba. He does not agree with Manitoba Hydro's proposed rate increases and feels that forecast rate decreases in 10 years cannot be relied on as Manitoba Hydro is unable to control its money today. Mr. Barton does not believe Manitoba Hydro needs the rate increases it is seeking. As well, if Manitoba Hydro receives all of the proposed rate increases, it would be a disaster for his spending and budget and he may have to consider changing where he lives. Mr. Barton's view is that rates should be increased slowly, over a longer period of time, and at a steady pace over time. Mr. Barton believes that Manitobans should not have to spend more than 3% of their income on energy bills.

Ms. Lyndie Bright

Ms. Bright lives in Winnipeg, Manitoba. She explained that she has cut back on her energy bills by lowering the heat in her apartment to 65 degrees Fahrenheit. When rates are increased, and because she is on a fixed income, Ms. Bright has to look at what in her budget she can cut back on or ways she can reduce consumption at home. This adds more stress for her. Ms. Bright advised that, if there are rate increases, she would also like there to be transparency on Manitoba Hydro's part to show what they are doing to keep rates down as much as possible. Ms. Bright's preference is for lower rate increases over a longer period of time. She would also like to see more energy efficiency programs for renters.

Ms. Emily Mayham

Ms. Mayham resides in Winnipeg, Manitoba with her four children. She finds paying her utility bills challenging at current rates. She gave evidence that, if Manitoba Hydro receives its proposed rate increases, she will have to cut her food budget by decreasing the amount of groceries she purchases and buying cheaper and generally less healthy food. She will also have to reduce the extent of her social activities with her children. In addition, Ms. Mayham explained that she would not be able to save money or have an emergency fund. Her preference is for lower rate increases over a longer period of time because it is predictable, allowing her to adjust and adapt as needed. Her view is that there should be a sliding scale based on income for utility rates. Ms. Mayham would like to see more energy efficient programs targeted to renters. Ms. Mayham also indicated that she would like to see more accountability and transparency from Manitoba Hydro as she feels consumers are being held responsible for financial irresponsibility or mismanagement by the Utility.

Oral Public Presentations

Mr. Jonathan Alward, Canadian Federation of Independent Business

Based on feedback received from its Manitoba members, the Canadian Federation of Independent Business expressed concern that the proposed 7.9% rate increases would severely affect the global competitiveness and provincial economic contributions of business and their employees, as energy costs are already among the top three cost pressures faced by Manitoba small business owners. Business owners surveyed said that the rate increases may significantly increase their electricity costs, increase prices of their products or services, delay investments in their business, or may even result in future hiring plans being put on hold and reductions in staff or staff hours. The Canadian Federation of Independent Business would like Manitoba Hydro to further its efforts to curb operating spending first instead of pursing significant rate increases.

Mr. Tim Sale

Mr. Sale identified concerns with inaccurate forecasts and cost estimates on the part of Manitoba Hydro, the difficult market for the Utility with the economics and improved technologies of wind and solar energy, and low export prices for Manitoba's hydroelectric power. He recommends that the Utility stop pursuing firm export contracts, start measures to increase electrical energy consumption in Manitoba, work with Manitoba businesses and property owners to use renewable technologies, and work with Saskatchewan to provide that province with "green" energy.

Ms. Bonnie Sheppard

Ms. Sheppard expressed her belief that Manitoba Hydro has been mismanaged for over a decade and is now asking consumers to bail out the Utility through rate increases. She suggested that Manitoba Hydro correct failures within its organization before rates are increased in order to bring an end to bad decisions, poor management, and fiscal irresponsibility, which she believes will eventually result in privatization of the Crown Corporation.

Mr. Haimana Romana

Mr. Romana spoke in opposition to a rate increase, but stated that, if an increase is approved, it should be only half of the requested amount. He questioned the need for a rate increase and suggested that ratepayers should not have to pay for the blunders of the Utility, including capital project cost overruns and increased debt, at a time when other organizations are having their budgets and funding cut. Mr. Romana expressed concern about accountability on the part of Manitoba Hydro, and questioned whether privatization is the ultimate goal.

Mayor Chris Goertzen, Association of Manitoba Municipalities

Mayor Goertzen spoke on behalf of the Association of Manitoba Municipalities to voice concerns of municipalities regarding the proposed rate increase. In particular, Mayor Goertzen raised concerns about the negative impact on the operations of public recreation facilities and municipal operating budgets due to limited means to raise funds to offset rising costs, including in the context of the provincial government's freeze on municipal operating funds. He stated that the result will be increased user fees and reduced services.

Dr. Garland Laliberte, Bipole III Coalition

Dr. Laliberte gave evidence that, in his view, the current Manitoba Hydro load forecast artificially and significantly inflates projections of future domestic revenue by approximately $2.3 billion over a future 20-year period. Dr. Laliberte recommended that the Board direct Manitoba Hydro to revise its load forecast downward to reflect recent historic experience, price elasticity impacts, and insights from other North American jurisdictions.

Dr. Laliberte estimated that the additional impact on domestic revenue as a result of the legislated demand side management target for Efficiency Manitoba is approximately $5.1 billion over a 20-year future period. In addition, Manitoba Hydro will also have to cover additional program delivery costs. Dr. Laliberte therefore concluded that the combined cumulative impact of load forecast choices and the more aggressive demand side management plan mandated by *The Efficiency Manitoba Act* is $7.4 billion over the next 20 years. Dr. Laliberte recommended that the Board direct Manitoba Hydro to conduct an analysis of the impact on its balance sheet of the Government's legislated plan for electric demand side management and report its findings at the next GRA.

Dr. Laliberte submitted that Manitoba Hydro should devote more effort to making use of its post-Keeyask energy glut, such as through advancing electric transportation and promoting a Western Canadian transmission grid.

Mr. John Greenaway

Mr. Greenaway voiced his concern with Manitoba Hydro rate increases over the years as the increases are above the cost of living and likely also above average employment wage increases. He suggested that, rather than over a three-year period, Manitoba Hydro be given a 21% rate increase over a seven-year period.

Mr. Chris Mravinec, Canadian Union Of Public Employees Local 998

Mr. Mravinec appeared on behalf of the Canadian Union of Public Employees ("CUPE"), Local 998, which represents Manitoba Hydro employees. Mr. Mravinec stated that the members of CUPE Local 998 have experienced unrealistic workloads and increased stress due to staff reductions at Manitoba Hydro. He stated that arbitrary targets for staff reductions are not feasible to operations and have a negative effect on employee well-being, safety, and customer service levels. At the same time, Manitobans are facing futures of wage increases at levels lower than inflation and rate increases at the level of 7.9% will negatively affect consumers. Mr. Mravinec recommended a balancing of interests and suggested that, rather than granting the full rate increase sought, the Board recommend that Government pursue new market opportunities within Manitoba through increased electrification, as well as in other provinces.

Mr. Allan Ciekiewicz

Mr. Ciekiewicz presented his view that ratepayers are burdened with Manitoba Hydro's capital development for the purpose of supporting Manitoba Hydro's export business. He indicated that this burden is heightened given the risk and possible repercussions of a drought. Mr. Ciekiewicz suggested that the construction of Keeyask and Bipole III should have been halted, with the savings used to finance the construction of efficient gas turbines in order to ensure a secure supply of energy for Manitobans. He also stated that rate increases above the rate of inflation are unacceptable.

Mr. Dennis Woodford, Bipole III Coalition

Mr. Woodford expressed his view that Manitoba Hydro has to be more responsive to unexpected external conditions that have and continue to occur. Mr. Woodford stated that Manitoba Hydro had ample opportunity to reassess the need for Keeyask and to stop construction, especially in light of the aggressive Demand Side Management program that it was proposing in 2016 and a soft U.S. export market. Additionally, Mr. Woodford identified that the disruptive technology of solar power may lower the domestic demand for energy produced by Keeyask. Manitoba Hydro also failed to act on opportunities to limit the project costs for Bipole III, which was not approved by the Board at the NFAT, and has also made decisions that have increased the costs.

By contrast, Mr. Woodford observed that there is a potential for a significant increase in the use of electric vehicles, which would increase domestic usage of Manitoba Hydro's surplus electricity and generate higher revenues for Manitoba Hydro than lower priced exports.

As a result, Mr. Woodford recommended that the Manitoba Hydro grid should be changed to "open access" allowing competitive marketing of electricity between consumers and producers of electricity to provide needed competition and address Manitoba Hydro's inability to adjust quickly to changing times. Furthermore, the Manitoba Hydro debt for generation and transmission should be assumed by the provincial government and not the ratepayers.

Mr. Murray Taylor, Business Council of Manitoba

Mr. Taylor, appearing on behalf of the Business Council of Manitoba, expressed his concerns regarding the current and future financial condition of Manitoba Hydro, including growing debt and the need to incur additional borrowing costs as rates are insufficient to pay for ongoing operating costs. Mr. Taylor observed that Manitoba Hydro's rates are among the lowest relative to other locations in Canada and the U.S. and questioned why rates in Manitoba are held below the costs of running the Utility. Mr. Taylor identified risks in what he sees as optimistic forecasts of Manitoba Hydro's forecast net income levels, as well as in the likelihood that interest rates will increase from the current record-low levels.

Mr. Taylor also advanced that, since the 2008 financial crisis, credit agencies have become more rigorous and continue to tighten their analysis of each entity that they examine. As a result, Mr. Taylor stated that showing leadership to increase rates substantially for the next two years will be important.

Mr. Taylor appealed to the Board to consider a path to ensuring financial stability and the lowest costs over future years collectively, and not be so focused on near-term rates at the expense of overall future costs for Manitobans. In the view of the Business Council of Manitoba, such considerations are well represented by the proposal made by Manitoba Hydro.

Ms. Andrea McLandress, Mining Association of Manitoba

Ms. McLandress presented evidence on behalf of the Mining Association of Manitoba. She testified that members of the Mining Association of Manitoba are typically the largest private employers and economic drivers in their regions. Together, Manitoba's mining operators have over 3,100 employees, largely located in the North and in rural communities, and make over $130 million in total annual purchases from Manitoba suppliers. Moreover, Manitoba's mining operators make annual electricity purchases in excess of $82 million, which for the large northern operators, represents approximately 10% to 15% of annual cash requirements.

Mining companies compete in an intense global market and are heavily affected by the cost of labour, transportation, regulations, and energy. With the exception of low electricity rates, these mining operating costs are generally higher in Manitoba than in other jurisdictions. Therefore, eroding Manitoba's only competitive advantage in mining (i.e., low electricity rates) could be disastrous for the entire mining sector of Manitoba's economy.

According to Ms. McLandress, the importance of the mining industry to the economy of Northern Manitoba makes it a vital public interest consideration when reviewing Manitoba Hydro's electric rate increase proposal. Ms. McLandress therefore advocated for a 0% rate increase as the only electric rate increase that would be acceptable to Manitoba's mining operators.

Mr. Michael Velie, International Brotherhood of Electrical Workers, Local 2034

Mr. Velie testified on behalf of the International Brotherhood of Electrical Workers, Local 2034. He gave evidence that, largely as a result of the Voluntary Departure Program and workforce reductions done numerically without planning for future operational needs, Manitoba Hydro's employees are feeling pressured to accomplish more and more work with fewer resources, resulting in shortcuts that are dangerous to both Manitoba Hydro's employees and customers. Additionally, Mr. Velie stated that Manitoba Hydro's restricted ability to employ sufficient internal resources will directly affect the reliability of the electrical service provided to Manitobans. Mr. Velie also maintained that Manitoba Hydro continues to increase its use of external contractors, which he identified as being two to three times more expensive than Utility employees.

Mr. Velie expressed support for Manitoba Hydro's 7.9% rate increase request for a period of one year to help Manitoba Hydro overcome its manpower shortage and to reduce safety risks to persons and property. However, Mr. Velie urged the Board to give Manitoba Hydro the direction it needs to curtail any further reductions in staffing levels and explore creative options for reducing the exorbitant costs of engaging contractors

Mr. Chris Hornby, Interlake Recreation Practitioners

Mr. Hornby gave evidence that there are approximately 100 recreation facilities across the Interlake and that utility costs represent about 25% to 30% of total expenses. Given the magnitude of Manitoba Hydro's planned rate increases for the next five years, the Interlake Recreation Practitioners Association is strongly against the proposed rate increase. Together with recent provincial funding cuts to community recreation and services programs, Manitoba Hydro's proposed rate increase plan will make sustaining recreation programs very difficult. Moreover, Mr. Hornby estimated that between 20 and 50 recreation facilities in the region could be expected to close as a result of Manitoba Hydro's proposed five-year rate increase plan.

Mr. Hornby also noted that Manitoba Hydro recently cut long-standing advertising at rural arenas and curling clubs. While Manitoba Hydro is still funding many local festivals, events, and non-profits, Manitoba Hydro now advertises with large private organizations such as the Winnipeg Jets.

Manitoba Industrial Power Users Group Panel Presentation

Mr. Dale Bossons, Chair of the Manitoba Industrial Power Users Group

The Manitoba Industrial Power Users Group is an association of 12 major industrial companies that belong to the three Manitoba Hydro General Service Large customer classes. On behalf of the members of the Manitoba Industrial Power Users Group, Mr. Bossons gave evidence that the difference between Manitoba Hydro's proposed 7.9% rate increase plan, compared to the previous 3.95% baseline scenario, is almost $850 million higher for the General Service Large customer classes over the next 10 years. These additional costs will affect decision-making regarding future operational investments and, for some, threaten their very future.

While the members of the Manitoba Industrial Power Users Group are not opposed to rate increases, Mr. Bossons clarified that it is important for Manitoba Hydro's revenue requirement to be based on true costs, that rates are fairly distributed across customer classes, and that options to manage electricity bills are offered and expanded. Furthermore, member companies are seeking stable and predictable energy rates that will allow them to manage their businesses and plan for their futures.

Mr. Bossons also stated that despite other operational challenges associated with Manitoba, low energy costs was the reason why member companies initially invested in this province. Additionally, there is little opportunity to pass along Manitoba Hydro's rate increases as member companies produce globally-traded commodities.

Mr. Michael St. Pierre, Chemtrade Logistics

Mr. St. Pierre explained that Chemtrade Logistics' ("Chemtrade") facility in Brandon has operated for 50 years and is the largest sodium chlorate plant in the world. For the Brandon plant, electrical power accounts for 70% of Chemtrade's variable plant manufacturing costs. Chemtrade's Brandon facility consumes approximately 5% of the province's electrical load and provides Manitoba Hydro with over $70 million in annual revenues. As a result, Chemtrade estimates that, for the coming year, Manitoba Hydro's proposed 7.9% rate increase would correspond with a $5.6 million increase in costs.

Chemtrade's decisions to further invest and grow the Brandon facility are now being re-evaluated, including due to announcements in other competing jurisdictions which will have either no or modest electric rate increases for 2018. While Chemtrade has publicly announced an additional $50 million investment in its Brandon facility, the company is finding it difficult to proceed in light of Manitoba Hydro's planned rate increases.

Mr. St. Pierre testified that Manitoba Hydro's significant and multiple rate increases will drive industry out of the province, thus decreasing baseload electricity demand and placing even more burden on those who live and work in Manitoba. Mr. St. Pierre insisted that electricity rates must be kept as low as possible to ensure a relative cost advantage for industry and to offset geographic disadvantages.

Mr. Darren MacDonald, Gerdau Long Steel North America

Mr. MacDonald gave evidence on behalf of Gerdau Long Steel North America ("Gerdau"), which currently operates 20 facilities in North America and 60 steel mills worldwide. Gerdau's facility in Selkirk makes products from recycled steel. Gerdau employs 436 people in Selkirk, with an additional 300 employees at downstream locations. Gerdau's Selkirk operations also use over 721 Manitoba vendors.

Mr. MacDonald testified that the Selkirk facility has annual electricity costs of $8 million. Gerdau has no ability to pass through incremental costs to customers as its products are traded globally. As a result of increasing electricity costs and the potential carbon tax impact, Gerdau is concerned about the Selkirk facility's competitiveness and cost structure relative to its other North American facilities. The impact of Manitoba Hydro's rate increases may cause Gerdau to limit investments made into its Selkirk facility and to shift production to other facilities. In 2007, for example, Gerdau shut down a steel mill in New Jersey, mainly as a result of high electricity cost forecasts.

Mr. MacDonald expressed support for reduced rate increases (e.g., 3.46%), reduced payments to Government, and maintaining a 20-year plan for Manitoba

Hydro to reach a 25% equity level. Manitoba Hydro should develop additional programs or rate options that would allow customers to further manage their electricity costs.

Mr. Gerald Samuel, Koch Fertilizer Canada

As Mr. Samuel explained in his presentation, the Koch Fertilizer Canada ("Koch") facility in Brandon produces anhydrous ammonia, urea, and other fertilizer products. Koch's Brandon facility provides employment for over 215 people and over 1,000 contractors, and is part of a network of five Koch fertilizer plants in North America. As electricity and natural gas are used as process feedstock, Koch has minimal opportunities to reduce its electric load. Mr. Samuel stated that Manitoba Hydro's proposed rate increase plan will cost Koch over $20 million in the next 10 years.

Mr. Samuel testified that the Brandon facility needs to remain competitive relative to the internal rate of return of Koch's other facilities. Together with the implementation of a carbon tax and federal air pollution regulations, Manitoba Hydro's proposed electric rate increases will directly affect Koch's competitiveness and will have an adverse impact on the long-term viability of the Koch Brandon plant.

Mr. Morgan Curran-Blaney, Maple Leaf Foods

Mr. Curran-Blaney testified that Maple Leaf Foods' ("Maple Leaf") operations in Manitoba employ approximately 4,000 people and represent approximately $753 million in direct economic benefits to Manitoba ($1.25 billion in indirect benefits). Its Brandon facility produces chilled pork products for the Japanese market, which is labour and energy intensive. Maple Leaf's electricity costs for the Brandon facility are approximately $4.6 million annually (or roughly 7% of its total budget overhead costs).

Mr. Curran-Blaney gave evidence that one of the few advantages of being located in Manitoba is low electricity rates. Manitoba Hydro's proposed rate increase plan will have a $4 million impact to Maple Leaf's operations in Manitoba over the next five years - a $2 million increase for the Brandon facility alone. Since Maple Leaf operates in a commodity based market, cost increases cannot be passed on to customers. Consequently, Maple Leaf estimates that in the short term, Manitoba Hydro's electric rate increases will likely lead to reductions in discretionary spending, employee headcount, capital spending, and community donations. In the long term, Maple Leaf may scale down the work done in Brandon or look at alternate sources of power generation in order to reduce grid electricity costs.

Mr. Benoit Lentz, Roquette

Mr. Lentz presented evidence that Roquette, a France-based family-owned company that produces specialty foods around the world, decided in 2017 to invest in a new $400 million pea processing facility in Portage la Prairie. As part of its investment decision, Roquette assessed its possible options using criteria that included a reliable, sustainable, and competitive electricity source. This is because, after raw input materials, electricity is, by far, Roquette's highest production cost. As a result, Manitoba's low and stable electricity costs represented an opportunity to compete against competitors located in jurisdictions with a higher carbon energy mix. In making their final investment decision, Roquette considered Manitoba Hydro's previous 3.95%

electric rate increase plan on the understanding that future rate increases would likely be between 0% and 3.95%.

Mr. Lentz stated that Manitoba Hydro's proposed 7.9% rate increase plan will significantly affect the operation and profitability of Roquette's Portage la Prairie facility. The rate increases would also undermine the Manitoba advantage of reliable and competitive electricity supply. In addition, Manitoba Hydro's rate increase plan would cause Roquette to be less likely to make further investments in Manitoba.

Dr. John Gray

Dr. Gray stated that Manitoba Hydro's proposed rate increases would have a disproportionate impact on electric heating customers. In Dr. Gray's view, Manitoba Hydro's illustrative residential electric heat rate is insufficient as it only provides minimal rate relief and pits one set of customers against another. Dr. Gray also expressed concern that Manitoba Hydro's proposed 7.9% rate increase plan will have a significant impact on the budgets of Manitobans, which are already stretched. As well, Manitoba Hydro's five-year rate plan will affect the economy in terms of job losses, reductions in consumer spending, and increased inflation.

In the short term, Dr. Gray suggested that there will be little opportunity for customers to reduce their electricity consumption but that in the long term, Manitoba Hydro's electricity sales will be significantly affected. In Dr. Gray's opinion, Manitoba Hydro under-estimates the revenue impacts of its rate increase plan.

To address Manitoba Hydro's financial situation, Dr. Gray stated that Manitoba Hydro has a huge opportunity to support electric cars, which would help increase domestic revenues, and could divest some its non-core assets such as Centra Gas.

Certified Written Public Presentations

Manitoba School Boards Association

The Manitoba School Boards Association represents Manitoba's 38 public school boards. For the 2016/17 school year, the total annual electricity costs of all 38 member school boards were $28.4 million. Manitoba Hydro's proposed rate increases over the next six years would result in additional costs of $16.4 million.

School boards are publicly funded and any additional school operation costs need to be paid by local taxpayers. As many taxpayers are also Manitoba Hydro ratepayers, Manitoba Hydro's proposed rate plan will result in a far greater personal investment from the average ratepayer. These increases would be in addition to the direct increases in the personal or business electric bills of Manitoba Hydro's ratepayers.

Given the anticipated level of impact of Manitoba Hydro's rate increase plan on school boards, and since school boards are restricted from incurring deficits or overruns, the Manitoba School Boards Association has limited options available to absorb significant increases in energy costs. As a result, reductions to the level of programs, supports, and services provided are likely.

David Sattler, Portage Regional Recreation Authority

The Portage Regional Recreation Authority is a non-profit corporation responsible for the provision of recreation and leisure facilities as well as programs for the benefit of citizens in the Portage la Prairie region. The Portage Regional Recreation Authority believes that Manitoba Hydro needs to look at other options to repair its financial position that do not involve levying a 70% increase on electricity costs over the next seven years.

Manitoba Hydro's potential annual electricity rate increases of 7.9% until 2024 are of concern to the Portage Regional Recreation Authority. There are significant electricity costs associated with the operation of recreation facilities. Manitoba Hydro's 7.9% rate increase plan will increase the Portage Regional Recreation Authority's annual electricity costs from $265,900 in 2017 to $452,760 by 2024.

To absorb Manitoba Hydro's rate increases, ignoring any other inflationary pressures or cost increases, the Portage Regional Recreation Authority would be required to increase rental fees for ice, pool, and meeting rooms. As the facility user fee increases would ultimately be combined with increases in the facility users' home utility bills, Manitoba Hydro's proposed rate plan will result in fewer individuals being financially able to participate in recreation activities that Manitobans have come to enjoy.

Josh Brandon, Social Planning Council of Winnipeg

If Manitoba Hydro's 2018/19 rate increase proposal is approved, it would mark the largest rate increase in a generation and would mean that many low-income Manitobans would be forced to choose between keeping their power on and paying for other basic necessities. Furthermore, the Manitoba Hydro Board has indicated that the 2018/19 proposed rate increase will be the first in a series of large rate increases that would raise the price of electricity by 60% by 2024. This would risk the affordable energy advantage that Manitobans have enjoyed for many years.

The Board should consider what impacts these proposed rate increases will have on the economy, on Manitoba households, and especially on low-income Manitobans. The Manitoba Government should also consider its role in protecting residents from unaffordable price increases, which would intensify energy poverty and act as a drain on the Manitoba economy. Alternative options are available that would preserve

Manitoba's affordable energy advantage and benefit all Manitobans. These options would include reducing the need for new large-scale generation, distributing the rate increases differently among the different customer classes, and the implementation of a low-income electric rate affordability program. The Social Planning Council of Winnipeg also recommends that the rate burden of any energy poverty reduction measure should be shared among all customer classes since all customers benefit from Manitoba's shared energy resources and all must therefore pay the costs required to ensure that these remain affordable for everyone.

A FINAL ORDER WITH RESPECT TO MANITOBA HYDRO'S APPLICATION FOR INCREASED 2010/11 AND 2011/12 RATES AND OTHER RELATED MATTERS

TABLE OF CONTENTS

1.0.0 EXECUTIVE SUMMARY

In this Order, the Public Utilities Board (Board or PUB) finalizes Manitoba Hydro's (MH or the Corporation or the Utility) April 1, 2010 average consumer rate increase at 1.9% and also finalizes MH's April 1, 2011 average consumer rate increase at 2.0%.

MH requested finalization of a 2.9% average consumer rate increase effective April 1, 2010 and a further 2.9% rate increase effective April 1, 2011. Since those two dates, MH has been charging Board-approved interim rates of 2.9% and 2.0% respectively.

This final Order should be read in conjunction with Order 99/11 – which, along with all Board Orders, is available through the Board's office or by viewing its website www.pub.gov.mb.ca.

As indicated by the Board in Order 99/11, MH failed to discharge its statutory and legal onus in its substantiation of its requested rate increases. The Board therefore finalizes the rate increases at a level less than applied for by MH.

Based on the evidence before the Board, for MH's fiscal 2010/11 and 2011/12 years, the finalized rate increases in this Order, which are aligned to MH's forecast rates of inflation, yield just and reasonable rates that are in the public interest. MH also put before the Board its plans for the ten-year period to 2020, a period which is described by MH as its 'decade of investment', during which MH's major capital investments – namely new generating stations and transmissions line – are forecast to total approximately $20 billion. MH's 'Business Model' includes building new generating stations in the expectation of being able to export the energy generated by these stations prior to the output being gradually required by Manitoba consumers.

The Board finds MH's business model to parallel MH's development of the Limestone Generating Station. History records Limestone G.S. as producing electricity at a cost of approximately 3¢ kWh but selling it for 1.5 - 2¢ kWh on the export market. MH lost money during the early years of Limestone's generation.

Based on MH's most recent estimates of the capital costs to construct Wuskwatim G.S. (scheduled to come into service in 2012), Keeyask G.S., and Conawapa G.S., the unit cost of electricity when these generating stations will be in service approximates 10¢ kWh. There will also be additional annual costs of approximately $150 Million per year for Wuskwatim, $500 Million per year for Keeyask and $700 Million per year for Conawapa. All of these fixed costs, along with operating expenses, will appear on MH's Operating Statement and will have to be recovered from export revenues and domestic customers. If the revenue generated is insufficient to recover the costs, higher consumer rates would be expected.

While MH has yet to file the detailed pending export agreements (the Board's request is being contested by MH in the Courts), from the record it is apparent that the export prices will not recover 100% of the costs incurred by MH to export that electricity. Therefore, it would fall to Manitoba's domestic ratepayers to subsidize the export sales commitments made by MH.

Even though MH forecasts domestic rate increases in the 'decade of investment' that are in excess of expected inflation, it appears the projected rate increases are considerably too low to support the required subsidization.

The Board is unable to approve the higher rate increases requested by MH because the Utility's business plan is incomplete, lacks required detail and has not been tested through what has been promised as a "Needs For And Alternatives To" (NFAAT) review by an independent tribunal that will have full access to the economic and financial assumptions which underpin MH's business plan.

Such a broad-scope NFAAT was last held in conjunction with MH's plans to construct Conawapa G.S. as a merchant plant. At the time, the plan was to sell the output from the plant to Ontario Hydro. Under the applicable business plan, approved by the Board in the early 1990s, MH's forecast costs to build and operate Conawapa were lower than the forecast payments expected to be received from Ontario Hydro. There was no expectation of subsidization by domestic ratepayers. Rather, there was an expectation of a net benefit to MH and its ratepayers over the entire term of the export contract with Ontario Hydro. That plan was not actualized as Ontario Hydro withdrew, leading to a negotiated settlement (Ontario Hydro compensated MH for the vast majority of its actualized development).

In addition to providing a detailed review of the economic and financial assumptions of MH's preferred development plan, an NFAAT for MH's proposed investment would also test a number of viable alternative development plans, which is necessary to ensure that electricity rates for Manitobans remain just and reasonable and in the public interest.

The Chairman and Vice Chair differ in their opinion as to whether such an NFAAT should include the planned Bipole III transmission line. The Chairman hopes that any alternative plans to be reviewed would include the use of natural gas-generated electricity to improve on reliability issues and avoid or at least delay the requirement for a Bipole III Transmission Line (Bipole III). The Vice Chair does not share this view. In the Vice Chair's view, Bipole III is required for reliability purposes in any case and its construction should not be delayed any more than necessary. This difference in opinion does not affect the Board's Directives.

The Chairman and Vice Chair agree that the seemingly ever increasing forecast in-service costs of Bipole III are likely to add approximately 3¢/kWh to every kWh transmitted from Northern Manitoba. MH seeks to assign 100% of the currently forecast (by MH) $3.2 Billion cost of Bipole III to Manitoba's domestic customers despite the fact that Bipole III will be used to meet export demand if new generation capacity is built.

It greatly concerns the Board that without having had its capital plans reviewed through an NFAAT proceeding, and without the US transmission lines required to transmit MH's electricity exports south of the border having been constructed or even been committed to, and without MH having obtained the required regulatory approvals in Canada, MH continues to spend $1-$2 Million per day on its currently favoured development plan.

A significant aspect of the scope of MH's General Rate Application was the review of MH's risks and risk management. The Board has long requested MH to provide an in-depth and independent study of MH's risks (see Order 32/09). The study was to be a thorough and quantified risk analysis that included probabilities of all identified operational and business risks. Unfortunately, and disappointingly, MH failed to provide a comprehensive quantified risk analysis. Instead, MH unilaterally changed the terms of reference to instruct an external consultant to prepare a report, and opted for a legal strategy to try and rebut the findings of a former risk consultant previously retained by MH but subsequently terminated. However, even without the expected comprehensive risk analysis, the Board was able to gain a better understanding of the Utility's risk. For this risk, MH presently reports $2.4 Billion of retained earnings.

This Order also approves and finalizes MH's Surplus Energy Program Rate Orders and Curtailable Rate Program Orders. Due to insufficient information provided by MH, the Board has denied MH's request to 'forgive' what were approved as temporary demand billing concessions to a limited number of commercial and industrial customers.

This Order also provides the Board's comments and findings with respect to other aspects of MH's GRA, as further set out below.

The Board was ably assisted in its extensive review by interveners and their witnesses.

2.0.0 PROCEDURAL HISTORY, INTERVENERS, AND PRESENTERS

2.1.0 PROCEDURAL HISTORY

When MH filed its 2010/11 and 2011/12 GRA with the PUB, its main request was Board approval of an average consumer rate increase of 2.9% effective April 1, 2010 together with a further 2.9% average consumer rate increase of 2.9% effective April 1, 2011.

In light of a lengthy prehearing scoping and discovery process, together with a lengthy oral evidentiary hearing, the Board initially addressed MH's rate increase request on an interim, but not final, basis.

In Order 18/10, the Board approved an average 2.9% interim rate increase to all customer classes (except Area and Roadway Lighting) effective April 1, 2010. In Order 40/11, the Board approved an average 2.0% rate increase to all customer classes (except Area and Roadway Lighting) effective April 1, 2011.

The Board's stated intention was to re-examine the interim rate increases prior to finalization after hearing all of the evidence and submissions in the GRA and, if the Board concluded that the underlying facts did not justify the imposition of rate increases as sought by MH – or as approved by the Board on an interim basis – the Board would adjust the rates in the final GRA Order. Any amounts collected through interim rates that were found to be in excess of the rate in the final order would then be refunded or credited back to domestic customers.

Following the oral evidentiary portion of the GRA and the closing submissions, the latter of which extended over three days (July 4, 5, and 7, 2011), the Board issued Order 99/11 on July 29, 2011, which was envisioned to be the first of two Board Orders to be issued arising out of MH's 2010/11 and 2011/12 GRA. This Order is the second of the two Board Orders issued in respect of MH's 2010/11 and 2011/12 GRA and should be read as a companion Order to and in conjunction with Order 99/11, as well as Orders 18/10, 30/10 and 40/11.

All Board Orders can be found on the Board's website www.pub.gov.mb.ca or by contacting the Board's office.

2.2.0 INTERVENERS

2.2.1 Overview

The Board received requests for intervener status from the Consumer's Association of Canada (Manitoba) Inc./Manitoba Society of Seniors (CAC/MSOS), the Manitoba Industrial Power Users Group (MIPUG), Resource Conservation Manitoba/Time To Respect Earth's Ecosystems (RCM/TREE), the City of Winnipeg, the Manitoba Keewatinowi Okimakanak (MKO), the Southern Chiefs Association (SCO), the New York Consultant (NYC), whose name Board decided not to publicize, and from Mr. Ciekiewicz.

By way of Board Order 17/10, the Board granted intervener status to CAC/MSOS, MKO, MIPUG, the City of Winnipeg, and RCM/TREE, and denied intervener status to Mr. Ciekiewicz.

By way of Board Order 30/10, the Board granted intervener status to SCO and denied intervener status to NYC.

The submissions of CAC/MSOS, MIPUG, RCM/TREE and the City of Winnipeg are set out in the respective "Intervener Positions" sections of this order.

The submissions of MKO and SCO were very limited in scope and are set out below.

2.2.2 MKO

While MKO has been a regular Intervener in MH's proceedings before the Board, MKO chose not to actively participate during MH's 2010/11 and 2012 GRA despite having been granted Intervener status.

2.2.3 SCO

SCO represents the interests of 32 Southern Manitoba First Nations and was granted Intervener status in this hearing.

SCO questioned the openness and transparency of MH's responses to information requests regarding environmental impacts associated with MH's operations.

SCO submits that the Board must not dismiss or negate claims of cumulative impacts and adverse effects on Southern Manitoba First Nation, due to MH's ongoing operations of its Integrated Power System.

SCO stated that Lake Winnipeg, Cedar Lake, South Indian Lake and other secondary sources such as Lake Manitoba, Lake Winnipegosis and Lake of the Woods are considered by MH as "energy in storage" (EIS). These EIS sites are used to calculate and regulate the main reservoirs, which in turn generate revenue for MH at the expense of SCO's First Nations' Aboriginal and Treaty rights and interests.

SCO submits that if the Board increases the rates, any increases should be set aside in a deferral account, to be used for the benefit of all Manitoba First Nations to offset any compensation required to be paid as a result of negligent operations of MH's projects and facilities.

2.3.0 PRESENTERS

The Board also heard from several presenters. Presenters did not have the right to participate in the hearing or cross-examine witnesses, but were given the opportunity to make brief submissions to the board. The submissions of the Presenters are summarized below.

2.3.1 Dr. Leonard Simpson and Mr. Blair Skinner

Dr. Simpson and Mr. Skinner presented information to the Board respecting potential development of a nuclear power generating station at the former Atomic Energy Canada Limited nuclear research site located near Pinawa, Manitoba.

Dr. Simpson stated that MH has set forth very ambitious and expensive plans for future development which are focused on our northern rivers and involve the expenditures of billions of dollars.

Dr. Simpson suggested that MH be directed to undertake a feasibility study of the potential development of a nuclear facility to determine whether it would be economic to have a major source of power close to the market. According to these Presenters, MH has not shown interest in building an infrastructure of nuclear expertise, however MH has indicated a willingness to buy and market the power if it is produced by a private vendor who would build and operate the station.

Dr. Simpson stated that the Whiteshell facility has been under nuclear license for 45 years, and because of that license, the development of a nuclear generating station on the site would require a shorter development time frame than other sites. Dr. Simpson compared the economic and employment benefits of a nuclear facility, which would result in long-term high-quality employment compared to a northern generating station which would have significant employment while being built, but with limited sustained employment once completed.

Dr. Simpson stated that the Pinawa location would be well-suited for the CANDU 6E nuclear generator which has been demonstrated in Korea, China and Argentina. A nuclear facility at the Pinawa site would have access to cooling water from the Winnipeg

River system, would be 100 km from the new converter station, close to an existing transmission corridor and could produce 700 MW of electricity.

Dr. Simpson stated a delay in Bipole III would save $4 billion and would cover more than half the capital cost of nuclear plant with the creation of 500 well-paid jobs to operate the plant with increased tax revenue and restored prosperity to the region.

MH's generation is 96 percent hydraulic, and thus susceptible to drought. According to these Presenters, the inclusion of nuclear power in MH's supply portfolio would create a more diverse generating system which would translate into greater system reliability.

2.3.2 Manitoba Chamber of Commerce – Mr. Starmer

Mr. Starmer appeared on behalf of the Manitoba Chamber of Commerce (MCC). MCC has long been a leading advocate of assisting citizens in need. It has proposed numerous changes to government to improve the lot of less fortunate citizens and is active in the poverty community, working in such areas as housing, food supply, and disabilities.

The MCC opposes the PUB being placed in a position of having to implement social policy through the setting of MH rates. The MCC is not taking a position related to whether a rate increase is justified, but if support for low-income users is included, which would impact upon the cost of electricity to other users, then MCC would oppose such an initiative.

The MCC believes that making Manitoba a better place to work and live is best achieved by keeping a number of principles in mind. Three principles advocated by MCC are:

- Representatives are elected by voters to manage the government and develop public policy.

- The basic responsibility of government is to assist those in society who are in need through social programs;

- A fundamentally accepted principle is that those in need be assisted by those who have the capacity to do so. This is the basic reason for progressive tax rates where government taxes those with the capacity to pay and give to those in need.

MCC submitted that as a public utility, MH should not be involved in social programs, nor does it have the expertise or mandate to institute public policy programs.

2.3.3 Gerdau Ameristeel – Mr. Forsyth

Mr. Forsyth appeared on behalf of Gerdau Ameristeel (Gerdau). Mr. Forsyth stated that Gerdau's steel mill in Selkirk is one of the largest manufacturers in the Province and is one of the largest shippers in the region, averaging over 150 truck loads and 25 rail cars per week. Mr. Forsyth noted the significant economic contribution Gerdau makes to the Province, which includes 770 direct jobs, spending more than $49 million with local suppliers and service companies, and generating indirect employment.

Gerdau is the largest recycler in the province, processing scrap metal collected from throughout the region, recycling approximately 400,000 tonnes of scrap each year. Mr. Forsyth stated that the processes followed by Gerdau are environmentally responsible, noting that making steel from scrap metal reduces energy use by 70% and emissions by 60% when compared to steel made from iron ore by a steel mill. The manufacturing process is energy- and capital-intensive, with electricity costs being second only to scrap steel costs as an input cost.

Energy efficiency is one of the tools that assisted Gerdau’s Manitoba facility in improving its competitiveness. Low-cost, stable, and reliable electricity is essential to Gerdau's operations in Manitoba. While energy costs in Manitoba are generally favorable, other input costs such as labor and transportation and fuel costs have countered some of the advantage offered by lower-cost electricity.

Mr. Forsyth stated that energy rates have increased substantially since 2004, increasing by over 20% since that time. With respect to the 2.9% rate increase request for 2011 and 2012, Mr. Forsyth noted that the PUB had provided interim approvals for the 2.9% increase for 2010 and the increase of 2.0% for 2011 fiscal year. Gerdau requested the Board to reconsider the contemplated increase and modify it to reflect the cost of service to the industrial customer class. Gerdau submitted that during these difficult economic times, costs must to be reduced, not increased, as they cannot be passed along to customers.

During the depths of the economic downturn in 2009, the Gerdau Manitoba facility saw production orders fall dramatically. Notwithstanding the significant economic downturn, Gerdau undertook initiatives to maintain employment by using a work share program and initiated new plans to operate the plant as efficiently as possible at the reduced operating rate. One component of costs that stood out immediately was the average price of electricity. With the reduced load at the plant, the average unit cost of electricity skyrocketed overnight by over 40% and became a major issue for continued operation. Gerdau entered into discussions with MH to rectify this unintended consequence. With the demand billing concessions provided by MH, Gerdau avoided making some relatively hard decisions with respect to the continued operation of the plant.

Mr. Forsyth recommended that the demand billing concession granted to Gerdau should be made permanent, consistent with MH's Application. He noted that the demand billing concession reacted as expected to the needs of energy consumers impacted by the economic downturn. The affected customers were able to keep people employed while ensuring that MH's revenue stream was secure.

2.3.4 The Bipole III Coalition – Mr. Derry

Mr. Derry, a retired professional engineer who spent 20 years with MH, presented on behalf of the Bipole III Coalition, which advocates for routing the transmission line down the east side of Lake Winnipeg rather than the west side.

Mr. Derry stated the east side route is preferable because of greater economic, social, technical and environmental benefits for all Manitobans. According to the Bipole III Coalition, the western route will cost at least $1 billion more for ratepayers than the more direct eastern route. The longer line will cause line losses equivalent to all wind energy generated annually in Manitoba and equivalent to the annual energy consumption of 40,000 cars.

Mr. Derry further noted that the east and west routes traverse about the same length of the boreal forest zone. However, the western route also traverses several hundred kilometers of the best agricultural soils and the most favourable agro-climatic zone in the Province. With respect to the impact on First Nations communities, 16 communities would be affected by the eastern route and 15 by the western route, i.e., essentially the same number. Neither route traverses any Aboriginal reserve land, although both traverse the traditional lands of Aboriginal people. Mr. Derry stated that First Nations Chiefs on the east side of Lake Winnipeg are expressing increased interest in the eastern route for Bipole III.

The Coalition questioned the alleged impact of the eastern route on having the region designated as a UN World Heritage site, noting that winter roads are being upgraded to all-weather roads along the east side of Lake Winnipeg and the right-of-ways will have a greater impact than a power line. Once roads have been established, a common corridor that includes the road and the Bipole III makes sense.

Mr. Derry also noted that a route on the east side of the province provides much higher reliability and protection against risk from wind and ice storms than a west side route. He stated that if Bipole I and II are damaged, the eastern route for Bipole III is twice as effective as the western route for supplying electricity to Southern Manitoba and meeting the export commitments to the United States.

Mr. Derry summarized that the HVDC Bipole III transmission line route along the west side of the province was dictated by the provincial government. Based on technical, environmental and social and economic grounds, the Coalition considers the selection process for the western route to be seriously flawed and urges the eastern route be selected as the preferred route for Bipole III.

2.3.5 Amsted Rail – Mr. Shirley

Mr. Shirley, the Chief Operating Officer of Amsted Rail, stated that as a result of the worldwide economic downturn, Griffin Wheel Company's business environment has changed dramatically. It had to idle its Winnipeg wheel plant in October 2009, and also reduce the operating schedules of its remaining three facilities. He mentioned that since the market has not yet recovered, further actions must be taken to ensure the viability of the Winnipeg operation. Amsted Rail's plan is to restart the Winnipeg facility.

Amsted Rail is asking for MH's consideration to make the demand concession a permanent concession rather than leave it as the existing temporary loan. This Presenter further asked that consideration be given to extending the concession until May of 2010 for Griffin Wheel Company and other companies in Manitoba who are still struggling with the economic recovery.

Mr. Shirley stated his company is a large user of energy, but that the peak demand charges that must be paid during periods of reduced plant operation erodes the company's ability to compete with offshore competitors. Amsted Rail is moving ahead with implementation of its plan to restart its Winnipeg plant based on the assumption that the PUB will assist with the aforementioned requests.

2.3.6 Canexus – Mr. Turner

Mr. Turner, the plant manager at Canexus in Brandon, presented on behalf of both Canexus and MIPUG, of which Canexus is a member. He requested the demand billing concessions be made permanent, as requested by MH. He also urged the Board to implement cost-based rates.

Mr. Turner noted some of the benefits that MIPUG industries bring to Manitoba. They employ in excess of 4,000 people directly in the Province, at more than twice the average industrial wage in Manitoba. They have assets with a replacement value of over $2 billion dollars. They support countless numbers of regional networks of secondary industries, retail companies and hospitality services in their communities. Most of the MIPUG industries account for a large part of the employment opportunities in rural and northern areas of the Province. Corporate taxes are estimated to be in the range of $75 to $100 million, and individual employees of MIPUG industries pay in excess of $50 million collectively to the Provincial and Federal governments in personal income taxes.

Mr. Turner stated that the purpose of MIPUG is to allow industries to work together on issues related to rates and electricity supply in Manitoba. He noted that the challenges faced by MIPUG industries, for the most part, relate to being geographically isolated from markets. The steadily appreciating Canadian dollar also makes it difficult to keep manufacturing costs low and continue to be competitive.

In order to remain competitive in external markets, Mr. Turner stated that key interests must be protected, such as access to a reliable supply of energy, as well as stable and predictable energy rates, which are critical to running production processes. MIPUG industries must estimate their product prices based on their production costs, knowing that they can rely on paying a certain amount for energy in a given year.

MIPUG has expressed an interest in keeping firm power rates relative to the cost of providing service to the specific class. Revenue-to-cost-coverage (RCC) ratios for each class should be moved within the zone of reasonableness at 95 to 105 percent. Currently, the RCC ratio is 112 percent. To keep rates predictable and stable, the Cost of Service Study (COSS) should be a reliable, verifiable method of assessing the costs for each class.

The downturn of markets all over the world in the fall of 2008 placed significant market pressures on MIPUG's members. Some members had to implement efficiency measures to remain competitive and, in another case, a plant closure was scheduled.

Canexus, as well as all other chlorate producers utilizing the electrolytic process, needs electricity to boil off water in order to produce its product, and electricity accounts for approximately 65 to 70 percent of its variable costs.

Mr. Turner stated that chlorate competitiveness is determined by three key considerations, namely power price stability and availability, salt price and availability, and transportation to markets. Power is the most important factor due to the large amount required for electrolysis. Canexus consumes about $49 million per year of MH power, and strives to utilize power efficiently. Mr. Turner noted that Canexus is continually trying to upgrade its process and was able to reduce the power brought into the plant by about 250 kilowatt hours per tonne over the years by implementing energy efficiency measures within the plant site.

2.3.7 Individual Presenters

Mr. Carriere

Mr. Carriere presented his views on what he considered MH's abusive rate increases. He mentioned there are over 136,000 people in Manitoba who rely on electric heat in the winter to heat their homes and it can be very costly for a senior on a modest pension. Mr. Carriere stated MH should look at giving people who use electric heat in the winter their own lower rate during the winter months. He suggested another option would be to offer a rebate at the end of winter on the use of electric heat.

He stated he would like to see the PUB refuse Manitoba Hydro any more increases since MH is doing well financially. If MH is having a financial problem, he suggested it should look at cuts to management and the workforce to keep the rates at a reasonable cost. In his opinion, it is time for MH to look into efficiencies in its own backyard and stop asking for increases every year.

Mr. Gray

Mr. Gray presented his comments related to the inverted rate structure of MH. Mr. Gray stated that he had converted his personal household from a gas furnace, dryer, and hot gas hot-water heating to an all-electric system. The reasoning behind this decision was that hydroelectricity provides far less environmental damage, less pollution, and much lower production of greenhouse gases. In addition, hydroelectricity, unlike natural gas, is a renewable resource, and under MH, provides stable long-term pricing.

Customers with electric heating are necessarily users of greater amounts of electricity. The introduction of the inverted rate structure has impacted disproportionately and unfairly on those customers who have chosen electric heating, as well as on many rural customers that have no access to natural gas.

Mr. Gray proposed that the PUB consider excluding the inverted rate structure step rate for those residential customers using electric heating. The same rate treatment could also be applied to residential customers with geothermal heating as an additional incentive to adopt geothermal heating, one of MH's objectives.

Mr. Gray also noted that for an increasing rate structure or peak-load pricing to be effective, customers need to know two things: what their energy consumption is on an ongoing basis, and, in addition, what to do in order to reduce their energy consumption. Residential customers would require something like an energy meter mounted adjacent to thermostats showing energy consumption and cost on a continuing basis.

Mr. Gruhn

Mr. Gruhn stated his objection to the increase being sought by MH due to the ongoing financial problems with the Corporation. Mr. Gruhn spoke of the need for a public hearing to be held in Brandon, to allow the PUB to hear from ordinary rural consumers as well as those in the city.

Mr. Jones

Mr. Jones provided comments on how he was being penalized for having installed electric heat. Special consideration should be given to those households that use electricity for heating.

Mr. Jones stated the rate structure should be set at a fair and realistic level according to the average consumption of an electrically heated house rather than an arbitrary 900kWh limit. Otherwise, electrically heated homes should have a separate rate structure. MH has a responsibility to customers they convinced to install electric heat and that responsibility should be recognized by the PUB in any planned rate adjustments.

Mr. Ciekiewicz

Mr. Ciekiewicz provided the Board with a written presentation together with his oral presentation. The presentation by Mr. Ciekiewicz covered a variety of topics – from MH's new office tower to risks, including an emphasis on inverted rates and the impacts on the MH customer using electricity for space heat.

Mr. Ciekiewicz also provided the Board with a series of recommendations that can be found starting at page 387 of the Transcript.

3.0.0 FINALIZED RATES

3.1.0 ORDER 99/11

Of particular significance and drawn from Order 99/11 is the Board's continued finding that MH failed to discharge its statutory and legal onus in the substantiation of its GRA rate increase requests:

> *"… the Corporation either refused or failed to provide the Board information that the Board considers critical to it reaching a comprehensive and final perspective on the prudency of MH's actions and plans, and the implications for domestic rates of MH's operations and plans.*
>
> *In particular, MH not only failed to provide the Board a fully updated 20-year Integrated Financial Forecast (IFF) – to include recognition of presently very low spot, opportunity and average export prices, and financial scenarios, with stated assumptions, based on capital expenditure differing from MH's "preferred development plan", but also refused to comply with a subpoena issued by the Board on July 6, 2011 that seeks the filing of MH's export contracts." (Order 99/11 – page 4)*

As a consequence, the Board denied MH's request to finalize the 2.9% interim rate increases which were implemented on April 1, 2010 and also denied MH's request to finalize the 2.0% interim rate increases which were implemented on April 1, 2011. MH's requested Board approval of a further finalized average consumer rate increase of 0.9% as of August 1, 2011, which was also denied.

On January 4, 2012, the Manitoba Court of Appeal granted MH leave to appeal the issuance of the Board's subpoena for MH's export contracts. This appeal is currently pending, and the export contracts have not been provided by MH. Therefore, the Board remains of the view that to date MH has either failed or refused, and continues to fail or refuse, to provide information that the Board considers critical to its mandate of fixing just and reasonable rates for the services provided by MH.

3.2.0 RATES AND MH'S 75:25 DEBT TO EQUITY TARGET

Beyond debate is the Board's jurisdiction and mandate to set just and reasonable rates for MH that are in the public interest. The public interest includes consideration of the fiscal health of the Utility as well as the impact of rates on consumers.

MH defends its requested rate increases of 2.9% for 2010/11 and another 2.9% for 2011/12 as maintaining the appropriate balance between customer sensitivity and fiscal responsibility. The fiscal responsibility includes taking note of MH's plans for $20 billion of major investments in new generation and transmission systems in MH's self-described "decade of investment" to the year 2020. It is during this "decade of investment" that MH foresees its debt-to-equity ratio eroding from the current 74:26 level to 80:20, even with annual rate increases in excess of the forecast rate of inflation.

Since 2004, the Board has continually approved rate increases for MH that have been in excess of inflation and also in excess of MH's own rate increase requests. These rate increases have in large measure contributed to the annual Net Income of the Utility and therefore to the Retained Earnings of MH. The rate increases further enabled MH to achieve its financial target of a 75:25 debt-to-equity ratio a full four years ahead of the target date sought by MH's Board of Directors.

The intention of reaching a debt-to-equity target of 75:25 was to afford consumers rate relief aligned to the rate of inflation once the ratio had been met – together with prudent management of MH's operating and other expenses. While the Board has had, and continues to have, serious concerns with the composition of what MH categorizes as "Equity", the overall target of 75:25 remains valid.

3.3.0 BOARD FINDINGS

3.3.1 Final Rates for 2010/11 and 2011/12

The Board is not prepared to finalize the existing interim rate increases of 2.9% effective April 1, 2010 and 2.0% effective April 1, 2011. The Board further denies the requested

0.9% average rate increase effective August 1, 2011. Rather, and based on the totality of the evidence before the Board, including MH Senior Vice President Mr. Warden's testimony that MH is now in its best financial position in the Utility's history, the Board finds that rate increases aligned to the forecast rates of inflation for 2010/11 and 2011/12 are just and reasonable and in the public interest. The Board will therefore approve, on a final basis, a 1.9% average rate increase effective April 1, 2010 and a further 2.0% average rate increase effective April 1, 2011.

The Board does not accept MH's contention that the rates proposed by MH represent a proper balance between customer sensitivity and fiscal responsibility. MH states that it is important that MH maintain an adequate level of retained earnings and that rates be raised gradually even during periods of exceptional water-flows. MH's application also seeks a higher level of retained earnings to provide funding for capital investments and reduce the need for borrowing, which MH states will in turn reduce the financing costs that ultimately must be recovered from ratepayers.

In the Board's opinion, MH's view of fiscal responsibility is skewed by blind adherence to a future major capital plan that has not been fully tested before an independent tribunal considering the "Needs For And Alternatives To" such a major capital expenditure plan (NFAAT). Such an NFAAT should include all facets of MH's capital expenditure plans, including the export contracts MH has entered into or plans to enter into to allow for the advancement of its capital expenditure plans.

The Board was reminded by CAC/MSOS to go back to first principles regarding its rate-setting jurisdiction with respect to MH. CAC/MSOS submitted that the Board's jurisdiction to fix just and reasonable rates carries with it the need to meet the general public interest made up of (1) the interests of ratepayers and (2) the financial health of the utility.

CAC/MSOS submitted that the final rate order should address both short-term test year revenue requirements and the long-term issues facing MH that are of concern to the

PUB, in particular respecting the “decade of investment.” CAC/MSOS further submitted that rate-setting at this time must also take into account the ongoing economic uncertainty and financial stresses existing in Manitoba on all consumers, including individuals, businesses and large industry.

The Board’s role, according to CAC/MSOS, must involve ensuring that MH’s forecasts are reasonably reliable, ensuring that actual and projected costs incurred are necessary and prudent, assessing the reasonable revenue needs of the Corporation in the context of the overall general health of MH, determining an appropriate allocation of costs between classes, and setting just and reasonable rates in accordance with statutory objectives.

The Board endorses these principles and the objectives as set out above that must inform it in the present circumstances when fixing rates for the test years in question. As set out in this Order, the Board is not satisfied that it has sufficient proof from MH, upon consideration of all of the evidence, to support a final approval of rate increases as sought by MH. In this GRA proceeding, MH has failed to substantiate the reasonableness of its capital plans and the expected revenues to support such a capital plan. As such, the Board cannot, and will not, endorse MH’s rate increase requests as applied for. However, the Board has determined that MH must receive inflationary increases for the test years to avoid erosion of its capital structure in the test years.

While MH has not made its case for the higher rate increases it requested, its financial position, arising from its Operating Results for the years ending March 31, 2010, 2011, and 2012 is significantly better than when MH filed its GRA in both MH’s own assessment and the assessment of the Interveners. For the fiscal year ending March 31, 2010, MH was forecasting $121 million of Net Income. Actual Net Income was $43 million greater, at $164 million. For the fiscal year ending March 31, 2011, MH was forecasting $78 million of Net Income. Actual net income was $65 million greater, at $143 million. Finally, for the fiscal year ending March 31, 2012, MH was forecasting

$87 million of Net Income. In its latest Financial Report, MH now projects Net Income at least $42 million greater, at $130 million.

The finalized rates for the 2010/11 and 2011/12 test years do not equate to the interim rate increases that were approved in Board Orders 18/10, 30/10 and 40/11. The Board is of the view that the most expeditious way to account for the differences between the interim and final rates is for MH to establish a deferral account to track, by customer class, the difference between what was collected under the interim rates and the amount that would have been collected pursuant to the rates now finalized. That difference is to accrue interest at MH's short term borrowing rate, for the benefit of MH's consumers.

Rather than requiring MH to immediately reduce its rates, the Board orders that the rate differential between what was approved on an interim basis and what has now been finalized shall be quantified by MH and remain as an interim rate, with its associated revenues being accumulated by customer class, with accrued interest, in the previously prescribed deferral account.

The reasons for not immediately requiring rate decreases and refunds extend beyond the administrative expense and potential inequities due to customer class changes. MH had indicated that the Utility would likely be seeking further rate increases, effective April 1, 2012 – subject to confirmation by the Board of Directors of Manitoba Hydro.

While the PUB is aware that no new GRA has been approved for filing as of the date of this Order, the PUB will need to know definitively of MH's intentions in that regard to enable it to further consider its approach to what will be a new interim rate and an accumulating deferral account. As always, MH and Interveners are at liberty to make submissions to assist the Board in its deliberations on this issue.

3.3.2 Final Surplus Energy Program (SEP) Rates

Included in MH's GRA Application is the Utility's request for final Board approval of all weekly SEP *ex-parte* rate orders (as listed in Appendix 10.7 in MH's GRA filing and outstanding to the date of this Order). There was no opposition to MH's request.

The SEP achieved sales of approximately 20 GWh in the November 2009 to October 2010 time period. It appears that the SEP was only modestly profitable (less than 5%) at an average revenue rate of 3¢/kWh. Historically, SEP revenue has exceeded MH's marginal cost by 10-20%, indicating that this current situation will continue to be monitored.

The Board approves as final all outstanding SEP weekly interim rate Orders from and including Order 67/08, up to and including the SEP Order issued in the week before this Order was issued.

3.3.3 Final Curtailable Rate Program (CRP) Orders

MH seeks final Board approval of CRP Orders 46/09 and 63/11, which provided interim approval of reference discount rates effective on and after April 1, 2009. No opposition to MH's request was raised during the GRA. The value MH places on CRP apparently relates primarily to winter capacity relief in years when domestic peak demand approaches system capacity.

While the Board will approve as final all interim CRP Orders (Orders 46/09 – 63/11), the Board does note that because MH normally markets its expected summer surplus capacity by the preceding February, there is a low, yet still real probability of export-related summer capacity shortfalls. Accordingly, the Board will seek additional information on this issue at the next GRA.

3.3.4 Temporary Billing Demand Concessions

MH has requested final approval of Order 126/09, which resulted from MH's Application for Temporary Billing Demand Concessions for General Service Medium (GSM) and

General Service Large (GSL) customers. The apparent impetus for this rate relief program was the economic downturn. MH sought concessions for industrial customers when the single ‘unit cost’ of their energy increased by more than 10% due to demand charges that would be incurred regardless of the energy consumed.

Unlike residential electric customers, GSM and GSL customers pay a monthly demand charge that is not directly scalable with reductions in electricity consumption. This means that even when these customers temporarily close production facilities or otherwise reduce consumption due to the global economic downturn in demand for their products, their energy bill does not decrease proportionally to the reduction in electricity consumption. MH’s rate structure for these GSL and GSM customers includes recovery of MH’s fixed costs (for property, plant and equipment) through the demand charge levied to high-volume customers.

While the Board granted temporary relief through Order 126/09, MH requested that the temporary concessions be made permanent under the program and not subject to being repaid by the GSL and GSM customers.

While under MH’s proposal, the GSL and GSM customers would not have to repay the temporary concessions, those fixed charges must still be attended to by MH. In essence, the Board concludes that other customer classes would be expected to make up the shortfall in MH’s retained earnings.

In Order 126/09 the Board indicated that for the temporary relief to be finalized, and perhaps forgiven, additional information would have to be made available to the Board. In that Order, the Board even set out a list of the types of additional information that were to be provided should MH seek finalization or forgiveness of the temporary demand billing concessions. MH either chose not to, or was unable to, obtain and provide such additional information to the Board. As such, the Board is not persuaded to grant the relief requested. Based on the evidence before the Board, and considering the submissions from parties choosing to address this issue (with Interveners on each side of this issue), the Board will not approve the forgiveness of the temporary demand billing concessions.

That portion of the qualifying customers' electricity bills that was temporarily deferred and carried at the equivalent of MH's cost of short-term borrowing as interest is now required to be repaid to MH. At the next GRA, MH is to report on the collections of the previously and temporarily deferred amounts.

4.0.0 MH'S DEVELOPMENT PLANS

4.1.0 MH'S CURRENT PREFERRED DEVELOPMENT PLAN

In defining its preferred and alternative Development Plans, MH relied on information from its various electricity planning documents, which are typically prepared annually and include:

- Integrated Financial Forecasts (IFFs);
- Capital Expenditure Forecasts (CEFs);
- Domestic load forecasts;
- External consultant panel survey on export pricing expectations;
- Power Resource Plans (PRP);
- Existing export contracts; and
- Pending export sales contracts (Term Sheets).

A key component of the PRP process involves defining "minimum dependable energy". Minimum dependable energy arises primarily from hydraulic generation but can also be sourced from non-hydraulic generation such as MH thermal, MH-purchased windpower generated in Manitoba, demand reductions resulting from efficiency improvements, demand side management (DSM), and imports from American counterparties. In MH's plans, projected domestic load (i.e., the electricity requirements of MH's Manitoba customers) is to be provided only from defined dependable energy resources. To the extent that minimum dependable energy exceeds the projected domestic load, any projected surplus becomes available for "firm" export contract sales, as opposed to opportunity exports. Firm export contracts are usually of relatively short duration relative to the life expectancy of a hydraulic generating station.

Circa 2007, MH indicated that Term Sheets had been entered into with American utilities calling for the following firm sales to export customers for various years, commencing in 2015:

- Northern States Power (NSP) - 375/325MW (2015-2025);
- Wisconsin Public Service (WPS) - 500 MW (2018-2033); and
- Minnesota Power (MP) - 250 MW (2020-2035).

To facilitate these projected export contract sales, MH's PRPs involve projected "in-service" (projected construction completion) dates for new facilities allowing for "dependable" hydraulic generation for MH's preferred and alternative development plans for various vintages of MH's PRPs.

Under the 2009/10 PRP, which was reviewed by the Board at this GRA, MH showed a proposed plan to expend capital to construct the following:

- Bipole III transmission line;
- Keeyask G.S; and
- Conawapa G.S.;

These three capital projects were to be undertaken together with other major new generation and transmission capital expenditures for:

- A 500 KV USA Interconnection;
- An expansion or upgrade of transmission facilities south of the U.S. border;
- Additional north-south AC transmission capacity in Manitoba; and
- The reconstruction of the Pointe du Bois spillway and powerhouse.

Prior to the conclusion of the GRA Hearing, MH advised of changes to its plans, most notably the recognition of a reduction in the WPS commitment from 500 MW to 100 MW, with the 15 year agreement being pushed back to 2021.

4.2.0 EVOLUTION OF MH'S DEVELOPMENT PLANS

In MH's 2004/05 PRP, MH modelled the following alternative new resource concepts, each assuming a 2024 in-service date that would follow the 200 MW Wuskwatim Generating Station's (G.S.) then-projected 2010/11 in-service date:

- Equivalent outputs from single cycle combustion turbines (SCCTs);
- A 10 turbine 1250 MW Conawapa G.S. to generate 4,500 GWh of dependable energy;
- A 5 turbine 625 MW Conawapa G.S.[1] to generate 4,500 GWh of dependable energy; and
- A 600 MW Keeyask G.S. to generate 2,900 GWh of dependable energy.

Anticipating about 3,500 GWh of firm contract commitments with its American counterparties, MH concluded that a 10 turbine Conawapa G.S. represented the most cost-effective next plant in service. There is no mention in the 2004/05 PRP as to how Combined-Cycle Combustion Turbines (CCCTs) would compare to either SCCTs or the hydraulic alternatives.

In its 2008/09 PRP, MH reconsidered the next plant in-service sequence and, based on projected higher 2008 domestic load forecasts and new export contracts beyond 2015 (500 MW to Northern States Power (NSP) / 100 MW to Minnesota Power (MP) / 500 MW to Wisconsin Public Service (WPS)), suggested the following builds:

[1] A 5 turbine Conawapa G.S. was projected as providing for sufficient capacity for full utilization of dependable river flows.

- Keeyask G.S. 630 MW 2018/19 in-service; and
- Conawapa G.S. 1,300 MW 2022/23 in-service.

This same PRP presented an alternative development plan in case the WPS and MP sales did not materialize. The alternative development plan projected:

- Additional contracted imports up to and including 2015;
- The construction of a 400 MW CCCT plant for a 2019 in-service date; and
- A 1,300 MW Conawapa G.S. for a 2021 in-service date.

In its 2009/10 PRP**,** MH projected:

- Construction of a 630 MW Keeyask G.S. for a 2018/19 in-service date;
- A 1,300 MW Conawapa G.S. for a 2022/23 in-service date;
- A 1,000 MW export inter-connection for 2018/19;
- A 750 MW import inter-connection for 2018/19; and
- Additional Manitoba north-south transmission (in support of Bipole III), to address a drought scenario similar to the one encountered in 2003/04.

This new recommended development plan was deemed necessary by MH to service its pending and/or projected Term Sheet sales of 500 MW to WPS and 250 MW to MP (which is the same scenario as was contained within MH's 2008/09 PRP). The construction of a 400 MW CCCT facility for 2018/19 was deleted, presumably reflecting a 1,000 GWh reduction in MH's domestic load forecasts.

In the absence of WPS and MP Term Sheet sales, MH's 2009/10 alternative development sequence would presumably have been:

- No Keeyask G.S.;
- Construction of a 1,300 MW Conawapa G.S. for 2021/22 in-service; and
- Deferral of the construction of a 400 MW CCCT facility to a 2033/34 in-service date.

In its 2010/11 PRP, MH deferred both Keeyask G.S. and Conawapa G.S. by one year (2019/20 and 2023/24 respectively) in its recommended plan, and Conawapa G.S. by one year (to 2022/23) in its alternative plan. The export interconnection was also set back by one year (to 2019/20). In the alternative plan, with no MP/WPS contracts and only a 375/325 MW sale to NSP, only Conawapa would be built by 2022/23, with a 460 MW CCCT plant to be added in 2033/34.

In June 2011, MH filed with the Board its 20-year financial outlook (OL 10-2), updated to reflect its most recent accepted revised capital cost estimate for Bipole III.

In July 2011, referencing a Manitoba Government press release of May 25, 2011, MH confirmed that the amount of export power for the proposed long-term sale agreement with WPS had been reduced from 500 MW to 100 MW. This reduction reduces the immediate need for a 1,000 MW export and 750 MW import intertie capacity. The reduction, if not reversed, could allow for a further deferral of the anticipated in-service date for Conawapa G.S. to a date beyond 2024/25.

4.3.0 FIRST NATION INVOLVEMENT IN THE DEVELOPMENT PLAN

4.3.1 Wuskwatim

Wuskwatim G.S. represents Manitoba's first new hydroelectric development since the late 1980s, and the first in Manitoba structured as a partnership between MH and a First Nation, namely the Nisichawayasihk Cree Nation (NCN). The project is to be developed by the Wuskwatim Power Limited Partnership (WPLP), an equity partnership between NCN and MH.

The two limited partners (MH and NCN) are to invest equity in the WPLP by subscribing for ownership units to represent 25% of the total capital cost of the project. The WPLP agreement allows for NCN, through its wholly owned Taskinigahp Power Corporation (TPC), to subscribe for up to a 33% stake in the equity partnership units.

MH, through a holding company that serves as general partner, would hold a 0.01% interest in WPLP, with MH in its capacity as limited partner holding the balance of 65.99% directly.

The assets of the WPLP are to consist of the Wuskwatim G.S. and required working capital. MH is to lend WPLP the funds required to build the generating station. Based on the Corporation's current estimated cost of constructing Wuskwatim, and excluding the transmission component, MH projects lending WPLP $927 million. The funds are to be required to build the generating station, and represent approximately 75% of the cost of the project (the remaining funding to be through WPLP's equity partnership units).

MH assumes that TPC will subscribe for the full 33% of the equity ownership interest permitted. Based on the current construction cost estimate for the generating station, TPC's cost for the partnership units would be $102 million. According to the agreements, TPC will invest up to $34 million of its own capital and can borrow up to $68 million from MH to fund the balance. MH advised that NCN has yet to commit to the full 33% ownership interest in WPLP and will not be required to make a decision on its stake in the partnership until the dam is put into service.

Revenues generated from the project are to be allocated to WPLP from MH's overall revenues, based on an agreed-to (between NCN and MH) formula utilizing average export prices for on-peak and off-peak sales. MH indicated that the determination of the average export price will include the export revenue from the new NSP agreement as well as from contracts reached with Wisconsin Public Service and Minnesota Power, along with any opportunity sales.

Revenues are to be adjusted as changes in export prices are experienced and realized, and are to be based on the actual output of Wuskwatim G.S., reduced by the average system line loss rate for the MH system (currently 10%). WPLP is to pay MH 3% of the WPLP's gross revenues, to contribute towards the marketing and transmission costs and risks borne by the Corporation.

MH will be fully responsible for the operation of the generating station and related transmission facilities, and will charge WPLP for its incremental operating costs. MH will make no cost allocation to WPLP for system generation and transmission. Control Center costs will not be directly charged to the project but be included in the overhead charge to the project.

The Wuskwatim Project Development Agreement allocates MH's overhead costs at a rate of 21% as opposed to the "normal" 29%, this reduction allowing for the exclusion of a share of costs related to MH's Winnipeg facilities and computer systems not expected to be utilized by the project.

Finance costs incurred by the Corporation related to the loans it will take on to allow it to make loans to WPLP to build the generating stations are to be recovered, at cost, from WPLP. The financing cost related to loans to WPLP has been estimated at 6% interest, based on MH's expected long-term cost of borrowing of 5% plus a 1% Provincial debt guarantee fee.

The WPLP must maintain a 75:25 debt-to-equity ratio, except for the first 10 years of operations during which an 85:15 debt-to-equity ratio will be allowed. If the partnership's debt-to-equity ratio falls below the above parameters, there is a requirement for further cash contributions from WPLP partners based on their respective ownership interest in the partnership.

The development agreement between Hydro and NCN allows for advances on dividends to NCN, even during loss years and/or when the equity threshold test has not been met. The advances are to be limited to 5% of the actual cash invested by NCN, and are to be repaid by NCN out of forecast future distributions.

In addition to the generating station, Wuskwatim requires incremental transmission facilities. MH is to build the required transmission, at an estimated cost of $320 million, the cost of which will be recovered from WPLP by way of repayment of principal and interest over a 50 year term. In addition, the operating costs of the transmission facilities will be charged to WPLP.

4.3.2 Keeyask

Like Wuskwatim (see section 4.3.1), Keeyask G.S. is to be developed through a First Nations partnership. In this case, the project will be developed and operated through the Keeyask Hydropower Limited Partnership (KHLP), a partnership between MH on the one hand and (1) the Tataskweyak Cree Nation and War Lake First Nation, acting as Cree Nation Partners, (2) the York Factory First Nation, and (3) the Fox Lake Cree Nation (collectively, the Keeyask Cree Nations or KCN) on the other hand.

The limited partners (MH and each of the four KCN) are to subscribe for equity units in the limited partnership, which is to represent 25% of the total capital cost of the Keeyask G.S. The partnership agreement allows for the KCN to collectively subscribe for up to 25% of equity units in the partnership. MH, through holding company acting as general partner, would have a 0.01%. In its capacity as a limited partner, MH would hold the remaining balance of 74.99% directly.

Each of the KCN partners can choose different ownership positions in the Limited Partnership by way of a combination of common equity and or a preferred equity share ownership. KCN partners have the option to acquire preferred equity shares amounting up to a 2.5% equity interest. MH will not provide financing for preferred equity share investments.

The minimum cash investment to be made by the KCN partners is $12.5 million, with a maximum cash requirement of $25 million. MH will lend the KCN a maximum amount equal to the difference between $25 million and the amount it takes to acquire a 17.5% common equity ownership in KHLP, financed by both KCN and MH equity loans. If KCN invests only the minimum cash investment, equity loans will be available to take an 8.75% common equity interest. The equity loans are to be at a 30-year loan rate plus 2%, payable over a 50-year term.

The assets of the Limited Partnership will consist of the Keeyask G.S and required working capital. MH is to lend KHLP the funds to build the generating station. Based on the Corporation’s current capital cost estimate of constructing Keeyask, excluding transmission investments, MH will be required to lend KHLP $4.2 billion to build the generating station, representing 75% of the cost of the project. The balance of approximately $1.4 billion is to be funded by the equity contributions of the partners.

MH will be responsible for the operation and maintenance of the Keeyask G.S. and related transmission facilities. KHLP will be assigned the costs related to management and operations of the Keeyask G.S., including all indirect costs and expenses, in a manner consistent with how Hydro allocates its indirect costs and expenses to other generating stations that are wholly owned by MH.

KHLP will attract no water rental fees, amortization or finance costs related to MH’s operations. However, KHLP will be assessed the finance costs incurred by MH related to the loans required to build the generating station. During the construction period, the loan will bear interest at the floating rate plus 2% and the debt guarantee fee. Upon completion of construction, the loan will be converted to a 30-year rate plus 2% and the debt guarantee fee. Repayment will be made be from a share of the revenue generated by the facility over a 50-year term.

MH will provide an Operating Credit Line to fund any cash calls that may occur to keep the capital structure of the Limited Partnership within established parameters of a 75:25

debt-to-equity ratio, which is allowed to rise to an 85:15 ratio during the first ten years of operations. Advances made under the Operating Credit Line would bear interest at the ten-year rate plus 2% and the debt guarantee fee.

With respect to the transmission costs that are to be paid by KHLP, the full extent of the transmission arrangements have not been fully determined, but the partnership agreement envisions that to the extent that any incremental transmission facilities are required for the Keeyask G.S. KHLP will be responsible for their capital and operating costs, including OM&A costs.

KHLP will not be responsible for any of the capital or operating costs, including OM&A costs, of Bipole III (if built), nor any costs to build or operate additional AC transmission or associated stations related to north / south transmission. KHLP will also not be allocated any costs related to interconnection between Manitoba and other jurisdictions. Such costs may be incurred to allow Keeyask-generated power to be delivered to export markets.

4.4.0 DEPENDABLE ENERGY RESOURCES

In defining its recommended development approach, MH contended that its "Dependable Energy" resource should include:

- Hydraulic Generation

  (21,100 GWh, to increase to 22,300 GWh in 2012/13 when Wuskwatim is expected to be in service);

- Thermal Generation

  (4,100 GWh, to decrease to 3,300 GWh after 2018/19, when the Brandon Coal plant is to be decommissioned);

- Wind Generation

(800 GWh, with both St. Leon and St. Joseph in-service);

- Reductions in required supply due to DSM measures

  (800 GWh in 201516, to increase to an expected 1,000 GWh by 2019/20); and

- Imports

  (2,700 GWh, this from a combination of contracted (firm) and opportunity market purchase (non-firm) imports).

MH has not specifically defined its "acceptable" levels of non-hydraulic resources that may be employed in satisfying domestic load requirements under the Utility's projected "Dependable Flow" scenario. However, from the various PRP sequences filed, it appears that a 5,000-5,500 GWh shortfall of dependable hydraulic generation relative to base domestic load would "trigger" or require new hydraulic generation to be brought into service.

When the Utility's firm energy export obligations, which are typically 2,000-3,000 GWh per year, are factored in, MH forecasts a dependable hydraulic energy shortfall of 7,000 to 8,500 GWh, which, for both economic and scheduling reasons, may require up to 8,000 GWh of imports and other power purchases in the worst-case year (i.e. in drought conditions).

In the absence of new firm export contracts, Keeyask G.S. could possibly be deferred by five or six years, the deferral to be provided for by maximizing imports. Similarly, in such a circumstance, Conawapa would only be required for domestic requirements circa 2030/31.

4.5.0 OTHER SCENARIOS

4.5.1 Overview

Circumstances have changed since MH, in its 2008/09 PRP, projected that new hydraulic generation would be required in 2018/19. Domestic consumption has declined by more than 1,500 GWh/year at a time the export market has “shrunk”. As a result, in the absence of new developments requiring large additional load, the limited deferral of new hydraulic generation may be possible without curtailing the NSP/MP/WPS sales agreements. Further, if these prospective agreements were not consummated, MH might be able to defer new generation until 2025/26 by serving domestic load only from existing domestic hydraulic/thermal/wind generation and present import arrangements.

In MH’s 2008/09 Alternate Development Scenario, MH considered the construction of a 400 MW CCCT plant in lieu of constructing Keeyask G.S. for an in-service date of 2018/19. With the then-prevailing natural gas price of $8.00/GJ, the unit operating output cost for the CCCT option was estimated at 5.50¢/kWh. However, at current natural gas prices, those being in the range of $4.00/GJ, the unit operating cost would be significantly lower, perhaps less than half the 10¢/kWh expected on-line cost of Keeyask G.S. production.

MH has included Bipole III in all of its development scenarios, and Bipole III must be in place to accommodate Conawapa G.S. output. However, it may not be required for Keeyask G.S. output, assuming average flow levels.

MH contends that Bipole III is required for domestic reliability reasons, particularly as such relate to the potential for an extended outage of both Bipoles I and II. In MH’s CEF03 and CEF04, MH contemplated building an east-side transmission facility without new HVDC converters at a cost of $0.5 billion, to deal with reliability concerns. But in its 2004/05 PRP, MH included HVDC converters, and MH’s CEF05 included a provision of $1.8 billion for Bipole III in anticipation of building Conawapa G.S. (or Keeyask G.S.) for a 2024/25 in-service date, to meet then-projected future domestic load requirements and, initially, to provide about 4,500 GWh of “surplus” firm energy for the export market.

In MH’s 2004/05 PRP, the Utility employed a SCCT thermal generation scenario as a base for comparison of its new generation alternatives. As well, Bipole III costs were excluded from the analysis. The construction of a CCCT plant was not considered, despite the typical operating costs (including fuel) of such a plant being 3-5¢/kWh lower than for a SCCT plant.

Since 2004, MH’s planning has not considered any non-hydraulic generation, such as possibly lower-cost gas plants or more wind generation to augment hydraulic capacity scenarios to meet both domestic load and reliability concerns. A wider consideration of options could include:

- Revisiting an east-side HVDC transmission line without HVDC converters as a means of improving transmission reliability for existing northern hydraulic generation;

- Examining the possible role of a 400/800/1,200 MW CCCT natural gas thermal generation plant, which, potentially, could allow for the further deferral of not only new hydraulic generation but also Bipole III, for at least a decade; and

- Firm price import contracts, focused on natural gas rather than coal- or gas-generated electricity.

The end product of the information from all these planning documents is MH’s “road map” as to future major capital projects (generating stations and transmission lines) that will be required to meet MH’s future domestic loads and firm export commitments. There is subjective decision making involved – together with numerous assumptions – that underpins any current version of MH’s Preferred Development Plan.

The significance/importance of examining and testing those assumptions and decisions cannot be overemphasized. With capital costs and financing costs in the tens of billions of dollars, the stakes are high for the domestic ratepayer who is at risk to bear the costs.

4.5.2 Keeyask G.S. without Bipole III

It is MH's position that Keeyask G.S. cannot proceed without Bipole III in place to transmit the full Keeyask plant capacity when water levels are well above dependable flow levels. MH indicates that Bipole I and II cannot operate on an extended-time basis at their full capacity of 3,854 MW, as 500 MW of Bipole capacity should be kept in reserve for maintenance and/or forced outages of valve groups. As such, the existing HVDC lines are only capable of 3,354 MW, delivering 29,400 GWh/year. This, in effect, means that the combined 4,200 MW capacity of the Keeyask/Kettle/Long Spruce/Limestone generating stations could only operate at an 80% capacity level.

It appears that other than in 2005/06 MH's output from the three existing lower Nelson River Plants has not exceeded 80% of their capacity.

Recently, MH has also suggested that an additional 208 to 838 MW of transmission capacity would be required once Keeyask is in service to match total generation capacity and provide system reserves. In MH's OL 10-2, MH's alternative to a 2,000 MW Bipole III was 2,000 MW of natural gas generation. Staggered in-service dates of individual 400 MW CCCTs to postpone the need for Bipole III do not appear to have been considered.

4.5.3 Natural Gas Generation Instead of Bipole III

In MH's 20 year financial outlook (OL10-2), MH provided a comparison of two reliability alternatives, namely Bipole III vs. a gas-only scenario. The brief analysis covered only the initial capital costs and annual fixed operating costs for SCCT plants, not a CCCT plant. It did not contemplate and model finance, depreciation and OM&A costs and revenue from a CCCT natural gas generation system, or the advantages of such additional capacity. As well, the stepped additions of 400 MW CCCT units were not considered. MH similarly did not provide a net present value analysis dealing with different service lives of the various components or the incremental revenue potential that CCCT units could achieve.

It appears that MH has not to date reviewed and considered a CCCT generation scenario that could supplement Keeyask G.S. while deferring Bipole III for at least a decade. Without the 500 MW WPS contract, the timeframe for Conawapa G.S. could conceivably be extended beyond 2029/30. Without Conawapa, the full capacity of Bipole III may not be required.

4.6.0 CARBON FOOTPRINT

4.6.1 Energy Conservation in Manitoba

Energy conservation measures by MH's customers are the most cost-effective for ratepayers when they displace thermal generation for domestic consumption. Because MH's system does not allow large seasonal or year-to-year energy transfers, conservation has a comparatively low financial value whenever MH's annual hydraulic generation is above average. In below-average flow years it can increase the availability of clean energy for export sales.

However, within the MISO marketplace, MH's hydroelectric energy has not been provided carbon premiums. MH's clean energy may well displace natural gas generation. Natural gas generation carries a lower CO_2 footprint than coal generation.

4.6.2 Demand Side Management (DSM)

DSM has generally been considered a cost-effective means of achieving energy conservation. High export prices prior to 2009/10 provided MH with a net gain on most industrial DSM measures. However, at current market prices many DSM initiatives may not be favourable to MH's bottom line. An unexpected fallout from the economic downturn sees MH unable to sell all of its surplus hydraulic energy to the limits of generation and transmission tie-line capacities even at prices that cover only water rentals and transmission charges. With 12 out of the last 15 years being relatively high-flow years, MH's acquisition of DSM energy may at times have resulted in spilling excess hydraulic capacity.

4.6.3 CO_2 Emissions

MH currently anticipates that thermal generation will be limited to 200 to 400 GWh/yr and that imports will reflect about a 50:50 split between coal and natural gas generation. Other than in drought years, this picture seems realistic. The CO_2 emissions on a combined basis (thermal and imports) are now forecast to be at least 1.3 million tonnes/year.

In drought years the CO_2 emissions could be much higher. 2003/04 saw an emission level of 9.5 million tonnes of CO_2. Most of the imports in that year apparently came from coal-fired generation, which was the lowest cost off-peak supply.

MH takes the position that responsibility for emissions rests with the generator, as MH should receive credit for the reduction of indirect emissions. As such, and on a net basis, MH's exports should result in a CO_2 reduction of about 4.5 million tonnes/year. There appears to be a counterposition that has been advanced by the Western Climate Coalition (WCC), one that would provide "ownership" of emissions credit to the utility purchasing the energy. This is consistent with the concept of ownership of clean energy credits.

4.7.0 INTERVENER POSITIONS

4.7.1 CAC/MSOS

CAC/MSOS agreed that the PUB is correct to be concerned about MH's proposed development plan, as it is yet untested. The financial impact of new generation and transmission resource development on domestic rates as illustrated in IFF09-1 is of concern to CAC/MSOS.

CAC/MSOS is uneasy about the capital cost escalations associated with the major projects envisioned in MH's "decade of investment" and is looking to achieve cost impact reductions. Ultimately, CAC/MSOS took the position that MH's development plan with respect to building for export will be subject to a full review and testing and will not proceed unless the benefits can be clearly demonstrated and substantiated in a forthcoming and promised NFAAT hearing. CAC/MSOS submitted that it is confident such a review will be held, be thorough, and will adequately address the risks involved.

4.7.2 MIPUG

In general, MIPUG was supportive of MH's Recommended Development Plan and accepting of the rate implications as forecast by MH. MIPUG submitted that the recommended development scenario advanced by MH under its PRP appears to mitigate the risks associated with the financial impacts of a drought. MIPUG viewed this conclusion, provided by KPMG, as being both credible and supportive of MH's continued planning toward its planned development sequence.

MIPUG further submitted that the degree of capital investment which is required will cause the relevance of the debt-to-equity ratio to be diminished and will have the negative effect of driving a requirement for materially higher equity levels than needed. Further, since MH's retained earnings and equity are not in the form of cash and are largely intangible, they are not available to mitigate the financial adversity of a severe drought. MIPUG submitted that in the next GRA, in light of this development, the PUB should move to investigate and implement a more developed form of financial reserve target for MH.

MIPUG's assessment of the preferred and alternative development scenarios is that they do not lead to materially different rate increase outcomes for domestic ratepayers over the long term, in accordance with MH's IFF period. MIPUG therefore submitted that PUB can be satisfied that the rates being sought in the test years are sufficient regardless of the ultimate plan selected.

MIPUG's experts Messrs. Bowman and McLaren also concluded that the PRP, with the preferred development sequence, is credible enough and would deliver enough possible benefits that MH should continue to protect the option to pursue it. In order for a final decision to be made, MIPUG supports a review and testing of the merits of all reasonable alternative development scenarios by an independent body, be it the PUB or another hearing body, as long as the process is open and transparent and permits full participation by interested parties and leads to independent conclusions.

4.7.3 RCM/TREE

While RCM/TREE offered no commentary on MH's short-term planning and supported the rate increases requested in the test period, it raised concerns over the risk report information available in the hearing process respecting long term planning and risks faced by MH.

RCM/TREE did not offer a specific perspective on the factors affecting future costs and revenues faced by MH under the development scenarios which were examined in the GRA process. They commented that these questions ought to be the subject of a proper risk review in a future hearing into the need for and alternatives to (NFAAT) the portfolio of projects, and ought to have been applied earlier in the planning process. In the view of RCM/TREE, confidentiality claims prevented a proper analysis.

Finally and as recommended by Mr. Wallach, RCM/TREE sought a much broader review of potential development scenarios, with such a review to take into account reliance on increased wind and DSM resources.

Mr. Wallach also opined that risk associated with drought is increased by virtue of MH's preferred development plan. A way to mitigate the risk, he offered, is to diversify the sources of power generation. However, RCM/TREE acknowledged KPMG's conclusion that transmission enhancement achieved via new long-term contracts reduced risk and offered that perhaps the complete dependency on hydroelectric resources and new transmission access would act as a counterbalance to greater risk.

4.8.0 BOARD FINDINGS

MH's power resource plans impact capital expenditures, which in turn impact consumer rates through finance expenses and depreciation and amortization expenses related to those capital expenditures.

The Board is not satisfied that MH has explored all reasonable power resource scenarios, including:

- Domestic customers being the focus, with limited exports;
- Domestic customers and export customers as equal embedded cost participants; and
- Exports as an independent profit centre, separate from domestic customers revenues and costs.

In particular the Board finds it troubling that MH has not explored, in any depth, a Combined Cycle Combustion Turbine (CCCT) natural gas thermal generation supply alternative to new major hydraulic generation and transmission projects.

MH chose to compare its Keeyask and Conawapa hydraulic options with a Single Cycle Combustion Turbine (SCCT) natural gas plant. Single cycle gas plants are not nearly as cost efficient as combined cycle natural gas plants (CCCT).

The failure of MH to flesh out the potential diversification of supply through the construction of a CCCT generating plant, as part of MH's future development sequence, ignores the current competitive position of CCCT generation in the MISO Market.

In light of the collapse of MISO spot market energy prices, MH should have carried out and disclosed a due-diligence assessment of its business plan. This should now be carried out, whether or not an NFAAT approval process that considers the CCCT alternative, is established by the Province.

In the Board's view, MH's apparent decision to proceed with the Keeyask G.S. to serve the 125 MW (NSP)/250 MW (MP)/100 MW (WPS) additional export sales instead of proceeding with Conawapa G.S. is a significant departure from both MH's Recommended Development Plan and MH's Alternative Development Sequence. It would appear to contemplate a power resource scenario that leaves out Conawapa G.S. if the additional 400 MW (WPS) contract is not achieved. As such, the full benefits of Bipole III would not be realized. With the considerable escalation of project costs – each successive update of MH's capital expenditure plans has shown material increases in the forecast cost of expansion - the Board is looking for MH to justify, and an independent tribunal to comprehensively review, each of the projects on a net present value basis within an NFAAT (while the Board Chairman would prefer Bipole III be included in the NFAAT review, the Vice-Chair would not).

While 100% of Keeyask G.S. capacity under maximum flow conditions requires additional transmission capacity, the Board is of the view that the Keeyask G.S. would still be able to operate at about 80% of maximum capacity even if Bipole III were delayed. A net present value analysis of natural gas (CCCT) generation for reliability purposes should explore the full range of possibilities for deferral of Bipole III.

When Drs. Kubursi and Magee suggested to the Board that MH should be focused on 'least cost scenarios' in exploring future power resource and export initiatives, it suggests that with current natural gas prices and low MISO Market prices, a natural gas (CCCT) generation scenario should be examined.

The Board is concerned about MH's inability to achieve significant (if any) premiums for clean energy in its pending export contracts When MH commits to providing substantially CO_2-free energy without a defined premium, future environmental protection costs can be expected to flow to MH's domestic customers via higher rates.

A further concern of the Board is that MH may be routinely selling hydraulic energy and purchasing mostly coal-generated energy in the same year. When MH accesses the

MISO market for the lowest-price energy, coal energy would, in off-peak periods, be the most likely source. This effectively negates the benefits of restricting the operation of the Brandon Coal Plant. The Board understands that under the WCC initiatives, the coal-fired imports would be assigned to MH. In these circumstances a natural gas CCCT could in effect, reduce, MH's GHG footprint.

Without a fully tested business case, through a detailed NFAAT proceeding, the Board will not support rate increases for recovery of future expenses related to MH's untested, and as of yet unapproved, capital plans.

5.0.0 CAPITAL EXPENDITURES

5.1.0 CONTEXT

MH's capital expenditures result in costs that must be paid through domestic consumer rates and/or export revenues. MH filed its Capital Expenditure Forecast (CEF) with the Board in support of MH's proposed rate increases. MH's major generation and transmission project capital costs stood at $16.0B in CEF-08 with essentially the same listing of specific projects as now contained in MH's proposed development plan. The budgets have now grown to an aggregate of $22.5B (and possibly to $23.5B).

The primary contributors to a $7.5B increase from CEF08 are:

- Bipole III – up $0.95B to $3.2B (40% increase / possibly 80% if Bipole III cost goes to $4.0B);
- Keeyask G.S. – up $1.94B to $5.64B (53% increase);
- Conawapa G.S. – up $2.79B to $7.77B (56% increase); and
- Pointe du Bois – up $1.1B to $2.94B (120% increase).

Bipole III with an east side alignment was proposed initially in 1990 to accommodate a 1,000 MW sale to Ontario at a cost of $1.7B. After that deal fell apart, MH explored HVDC wires only (no converters) on the east side to reduce Bipole I and II failure impacts from events such as occurred in October 1996.

However in CEF04, Conawapa G.S. resurfaced, along with a need for a Bipole III containing both wires and converters. In CEF07 a routing west of Lake Winnipeg was adopted with a budget of $2.25 billion. This budget remained unchanged for three years until March 2011, when a revised budget of $3.2 billion was issued as approved by MH.

There still remains doubt as to whether the Bipole III budget, with its current cost estimate of $3.2 billion, will prove accurate, or whether the forecast costs will again increase, to, say, $3.9 billion or $4.1 billion, or even higher.

The cost implications associated with the building and operating of Bipole III could be upwards of 3¢/kWh (maybe as high as 4.5¢/kWh) for moving 11,500 GWh of additional energy from Northern Manitoba to the south. These costs would be realized as Bipole III is constructed and would be recorded on MH's annual Operating Statement immediately upon Bipole III coming into service. In today's market conditions, it seems most probable that it would be domestic customers rather than MH's export customers that would pay for these costs. This would likely result in domestic rates for all customer classes materially increasing if or when Bipole III comes into service.

When MH was negotiating with NSP prior to 2009 to extend its contracts beyond 2015 and both MP and WPS were to sign new sales contracts extending beyond 2020, the average output cost of 4,400 GWh of new energy generated by a $3.7B Keeyask G.S. was estimated to be in the range of 7¢ to 8¢/kWh. Subsequently, in MH's latest forecasts, Keeyask G.S's projected cost increased by 25% in CEF10 and another 18% in CEF11. This constitutes an aggregate increase of 50%, which translates into a unit cost for produced energy of 10¢/kWh.

Similarly, in 2009 the average projected cost of 7,700 GWh of average new energy coming from a $5.0B Conawapa G.S. was 7¢/kWh. Subsequently, with the projected cost of building Conawapa having increased by 25% in CEF 10 and by another 25% in CEF11 (an aggregate increase of 56%), the cost of produced power from the proposed new plant has risen to about 9-10¢/kWh.

There were indications raised in the current hearing that the Term Sheet negotiations carried out in 2007/08 provided for contract prices associated with the expected NSP/WPS/MP sales that have not been increased in recent negotiations to reflect the increasing capital costs. Accordingly, those cost increases will not be recovered through higher export prices.

It appears to this Board that future project cost escalations between today's date and the in-service dates for the new facilities would similarly not be recovered by increases in average export contract prices. The Board faces the dilemma that without access to the export contracts, it has to rely on publicly available information. This information suggests that averaging the pricing of firm sales and opportunity sales will result in unit sales prices of no more than 6-7¢/kWh, reflecting both fixed prices and variable market-based prices. Such pricing would not recover the current estimated cost of producing power at either Keeyask G.S. or Conawapa G.S.

MH does not agree with the use of the initial in-service annual revenue requirement to define current rate impacts and suggests that longer term (50-100 year) levellized costs should be employed in determining the impact on domestic rates. This approach, if adopted by MH and PUB, has two implications:

- It would assign all new project costs to domestic customers; and
- It would result in the new export sale contracts enjoying the longer-term average prices despite the fact that the actual contract terms currently only extend to 10-15 years.

In short, it appears that MH prefers to consider revenue flows from export contracts linked to the construction and operation of new hydro-electric generating stations to be considered "incremental" revenue that is not subject to the full costing that usually applies to the consideration of new plants.

The Board is of the view that before proceeding with the construction of any of the new hydro-electric plants, and following an NFAAT, the Board should determine the potential rate impacts for domestic Manitoba customers with respect to these projects.

Otherwise, there is a genuine risk that domestic rates will rise sharply as the new generation and transmission assets currently planned come into service.

With respect to Bipole III, the views of the Chairman and Vice Chair differ. The Chairman is of the view that the same reasoning set out in the preceding paragraph applies to Bipole III. The Vice Chair accepts that Bipole III is required for reliability reasons at this point in time and that a delay until an NFAAT has been completed is not warranted.

5.2.0 CAPITAL FORECAST HISTORY OF MAJOR GENERATION AND TRANSMISSION PROJECTS

MH's capital estimates for major generation and transmission projects have shown significant periodic upward adjustments. This is illustrated in the following Table.

COST ADJUSTMENTS FOR MAJOR CAPITAL PROJECTS

Progression of Project Costs in $ M								
	CEF-03	CEF-04	CEF-05	CEF-06	CEF-07	CEF-08	CEF-09	CEF Mar/11
Wuskwatim G.S.		846	935	1,094	1,275	1,275	1,275	1,275
Wuskwatim Transmission		199	200	257	320	316	316	291
Wuskwatim Total Project	988	1,045	1,135	1,351	1,595	1,591	1,591	1,566
Herblet Lake Transmission	56	55	54	54	95	93	93	75
Bipole III	360(E)	388(E)	1,880	1,880	2,248	2,248	2,248	2,248[1]
Riel G.S.	96	101	103	103	105	268	268	268
Kelsey G.S.	121	121	166	166	184	190	190	302
Kettle G.S.		61	61	61	61	76	76	166
Pointe du Bois G.S.	421	288	692	834	818	818	318	398[2]
Pointe du Bois Transmission					83	86	86	86
Slave Falls G.S.				179	192	198	198	223
Conawapa G.S.		4,050	4,516	4,978	4,978	4,978	6,325	7,771
Keeyask G.S.						3,700	4,592	5,637
500 KV Dorsey U.S. Border						205	205	205
Additional N-S Transmission								313
Total						16,034	17,781	20,524

[1] MH's currently approved Bipole III estimate stands at $3.2B.

[2] MH's latest Pointe du Bois estimate includes:

Spillway	$ 398M (2015/16 in-service)
Power House	$1538M (2030/31 in-service)
Total	$1936M

In total, the estimated major generation costs have risen from $16B in CEF-08 to $20.5B in the March 2011 CEF and more recently to approximately $22.5B.

5.3.0 CAPITAL COST INCREASES FOR EXPORT-DRIVEN PROJECTS

5.3.1 Overview

MH's Business Plan seeks to achieve about 40% of foreseeable future total corporate revenues from the export market. To do this, it is deemed essential by MH that the following projects proceed within the next 10-15 years:

- Bipole III (circa 2018/19)
- Keeyask G.S. (circa 2018/19)
- Conawapa G.S. (circa 2023/24)

MH's Recommended Development Plan was first defined in the 2008/09 Power Resource Plan and in CEF-08 focused on these 3 projects. Since then the costs have been adjusted upward as follows:

	CEF-08	CEF-09	MAR/2011 CEF	LATEST
BIPOLE III	**$ 2.25B**	**$ 2.25B**	**$ 2.25B**	**$ 3.20B to $4.1B [1]**
KEEYASK G.S.	**$ 3.70B**	**$ 4.59B**	**$ 5.64B**	**$ 5.64B**
CONAWAPA G.S.	**$ 4.98B**	**$ 6.33B**	**$ 7.77B**	**$ 7.77B**
TOTAL	**$10.93B**	**$13.17B**	**$15.66B**	**$16.61B to $17.5B**

[1] Not an officially endorsed estimate, but based on internal MH calculations.

5.3.2 Bipole III

Bipole III was originally identified (circa 1990) as a component of the Conawapa G.S. project to support a 1,000 MW major energy sale to Ontario Hydro. The intended route for Bipole III at that time was down the east side of Lake Winnipeg.

The project estimate was $1.7B for transmission lines and converter stations. When in the early 1990's energy demand and energy prices fell short of earlier expectations, Ontario Hydro elected to withdraw from the sales agreement and pay compensation for costs (access roads, cofferdams, etc.) that MH had incurred relative to the generating station. No decision had been made on the specific east side alignment for Bipole III.

In September 1996 a severe wind event (tornado or wind shear) destroyed towers on both Bipoles I and II. Given a favourable low demand time of year and a quick response by MH there was no "brown-out" and the revenue consequences were relatively low. However, the event did change MH's view of the reliability of and risk with respect to Bipoles I and II. In the subsequent years MH looked to achieve additional transmission capabilities that would reduce the risk of brown-outs.

In CEF03 and CEF04 MH proposed building HVDC transmission lines without converters on the east side of Lake Winnipeg. The lines were intended to address reliability concerns about a Bipole I or II failure and to reduce HVDC line losses. Project costs were estimated at $350 to $400M.

At the time of that proposal, concerns were raised with respect to the environmental and public acceptability of an east side alignment for Bipole III. Subsequently, MH began to explore the costs and implications of a Bipole III alignment west of Lake Winnipeg. The alternative of another HVDC line through the Interlake paralleling Bipoles I and II was rejected as possibly compounding the risks to existing facilities.

CEF-05 and CEF-06 both carried a $1.88B cost estimate for an east side routing. CEF-07 raised the costs to $2.248B to reflect a longer west-side location. MH did not revise the Bipole III cost estimate in CEF-08 or CEF-09 even though MH raised the capital cost estimates for Keeyask G.S. by $0.9B and for Conawapa G.S. by $1.3B. At the time MH cited 'sticker shock' as one of the reasons for the 25% jump in costs.

A September 2009 capital cost estimate for Bipole III surfaced in Q4 of 2010/11. It indicated that costs had risen to $3.9 B. This Capital Justification Addendum (CJA) estimate was initially deemed to have no official status. It was subsequently found to have been signed by MH vice-presidents on September 10, 2009. Reportedly, the CJA was not put forward to MH's Board.

In the spring of 2011, a new summer 2010 capital cost estimate of $4.1B was leaked to the media. At this hearing, MH denied that that estimate reflected the new projected capital cost. In January 2011 MH sought an independent review of Bipole III costs by Rashwan and Associates. Mr. Rashwan had previously been an employee of MH. The summer 2010 estimate was provided to him for his review. Rashwan (et al) reviewed the design concept and costs for the converter station and collector lines but not the HVDC transmission line. They concluded that MH could reduce costs by the elimination of contingencies that were to cover synchronous converters and the usually employed escalation costs. Incorporating these changes, MH provided a revised Capital Justification Addendum with a $3.2B total cost for Bipole III. This addendum was also signed by the vice-presidents of the same division within MH.

5.3.3 Keeyask G.S.

In the 2004/05 PRP MH's cost estimate for Keeyask G.S. was $1.7B. This cost was subsequently increased twice. The first increase was from CEF-08 at $3.7B to CEF-09 at $4.59B, representing a 25% increase. The second increase was from CEF-09 at $4.59B to CEF-10 at $5.64B. This represents a further 18% increase, for a total increase over the original estimate of 47.5%.

MH cited material supply and labour shortages (sometimes referred to as "sticker shock") as the primary cause of the pre-CEF-09 cost escalation. No specific causes have been identified for the most recent increases.

5.3.4 Conawapa G.S.

When (circa 1990) MH looked to building Conawapa G.S. in order to provide electricity to Ontario Hydro, the estimated construction cost for Conawapa G.S. was $3.8B. This cost was similar to the cost of $4.0B reflected in CEF-04.

CEF-05 and CEF-06 escalated the projected cost to $4.5B and $5.0B respectively. MH did not escalate the cost further in either CEF-07 or CEF-08. However, CEF-09 saw a 25% escalation from CEF-08 to $6.3B and CEF-10 saw a further 25% increase from CEF-09 to $7.8B. This represents a total increase of 56% over the CEF-06 estimate. MH has not provided any specific details to support these large increases.

5.3.5 Wuskwatim G.S. and Transmission

The CEC hearings circa-2004 on the Wuskwatim generation and transmission project dealt with a capital cost estimate of $900M. At the planned average output of 1,500 GWh per year, the electricity cost would have been approximately 6¢/kWh after the in-service date. As the project nears completion in 2011/12, the capital cost has risen to about $1.6B. The impact of this increase is that the cost to generate electricity will have risen to approximately 9¢/kWh when the Wuskwatim facilities come in service.

5.3.6 Pointe du Bois G.S. and Transmission

After MH purchased Winnipeg Hydro in 2001, it was anticipated that the Pointe du Bois G.S. could be upgraded circa 2011 at a cost of about $400M. The upgrade would have resulted in a modest increase in capacity and energy output. In the 2010/11 PRP, MH is looking at about $2.0B for a total rebuild of the power house and spillway by 2030/31. This would provide a 50% increase in capacity and an additional 150 GWh/yr of energy output for a total average output of 800 GWh/yr, but at cost increase of 300% compared to the 2003 estimate.

Assuming the existing Pointe du Bois G.S. would otherwise be decommissioned and written off, the average initial year new plant output cost at in-service would be 20-25¢/kWh. It should be noted that the spillway-related costs of $0.5B are essentially unavoidable even if the powerhouse were to be decommissioned.

5.3.7 Other Hydraulic Generation Upgrades or Retrofits

MH has plans to undertake the following additional capital projects:

- Kelsey G.S. Rerunning, with a capital cost increase of more than 50% in CEF Mar/2011 relative to CEF08. Limited capacity and energy gains are expected.

- Slave Falls Upgrade with a capital cost increase of only 12% from CEF08. No capacity or energy gains have been identified.

5.3.8 Wind Energy Purchases

MH currently purchases the entire output from the 100 MW St. Leon and 138MW St. Joseph wind farms. The contracts call for MH to buy the entire output from both farms at undisclosed but defined prices which are significantly higher than the current average price of MH's opportunity export sales.

5.3.9 Transmission Additions

MH has identified a need for the following additional transmission projects:

- Additional north-south transmission to supplement Bipole III operations at an initially estimated $313M.

- A 500KV Dorsey to US border intertie initially estimated at $205M in CEF08, a cost that has not changed through March/2011.

5.4.0 REVENUE REQUIREMENTS TO SUPPORT EXPORT-DRIVEN PROJECTS

When a generating station (or a unit of a generating station) comes into service, MH no longer capitalizes the related costs. Rather, the costs, including financing charges, operating and maintenance costs and depreciation expenses are charged through to consumers by way of MH's Operating Statement. MH then proposes rates to recover the costs as set out in the Operating Statement.

The Board calculates the likely annual in-service costs for the new major capital projects that that will be recorded on MH's Operating Statement to be as follows:

- Keeyask - approximately $500 million – in 2018/19;
- Conawapa - approximately $700 million – in 2024/25;
- Bipole III Transmission - approximately $300 million – in 2016/19.

While MH correctly points out that their annual costs will decrease over time, such a decrease is usually very gradual.

To the extent MH's real costs with respect to these projects are not recovered from export customers, it will fall to Manitobans to bear financial responsibility through reduced annual net income of MH (and reduced overall retained earnings) and increased electricity rates for Manitobans.

The Board does not accept that "levellized costs" should be used to assess cost impacts when major capital projects come into service. The Board understands that MH uses levellized costing in its long range planning. However, the Board must have regard to how costs are paid for by consumers. Consumer rates are not based on levellized costs – they are based on actual and real costs as reflected in MH's Operating Statement.

5.5.0 INTERVENER POSITIONS

In general, the Interveners in this hearing, citing the Board's restricted jurisdiction over approval of MH's capital expenditures, did not challenge the validity of MH's estimates for the cost of major generation and transmission projects. Despite the very substantial cost projection increases since 2004/05, none of the Interveners took issue with MH's calculation of potential additional revenue requirements over the next 20 years.

5.5.1 CAC/MSOS

CAC/MSOS took issue with MH's apparent lack of foresight and unwillingness to address in a timely fashion the substantial escalation of Bipole III capital costs.

CAC/MSOS recommended that in order to assist the PUB in understanding the risks associated with MH's planned capital projects and the extent to which these risks are addressed through contingency allowances in MH's capital cost estimates, it would be useful if the PUB required, as part of MH's initial filing in a GRA, the capital project justification forms established for each project with costs in excess of $100 million dollars. This would ensure that the Board is fully informed regarding the risks associated with a particular capital project and any allowances that MH has incorporated in the project's costs to address these risks.

However, citing the Board's lack of jurisdiction, CAC/MSOS did not specifically address the increased capital cost of either Keeyask G.S. or Conawapa G.S. and the potential rate implications.

5.5.2 MIPUG

Although MIPUG did inquire into the nature of the capital cost increases, MIPUG did not specifically explore the issue of the substantial capital cost escalation and the impact of that escalation on MH's customer rates.

5.5.3 RCM/TREE

RCM/TREE did not specifically explore the issue of capital cost escalations and the potential cost implications for domestic customers. RCM/TREE continued to support maximizing export sales through expanded DSM, inverted rates and discouraging domestic electricity use for home heating.

5.6.0 BOARD FINDINGS

5.6.1 Rate Implications of the Recommended Development Plan

The Board is of the view that with the substantial capital cost escalations currently known, MH's IFF09-1 portrayal of domestic rate implications is no longer valid. Further cost escalations cannot be ruled out, and given the current state of the export market, there are no foreseeable offsetting net export revenue gains.

It would appear obvious that Bipole III costing $3.2B instead of $2.3B would require an additional rate increase in 2019, and Bipole III costing $4.0B instead of $2.3B would require an even larger rate increase in 2019.

Similarly, the Board is of the view that Keeyask costing $5.64B instead of $4.59B would require an additional rate increase in 2019, and that Conawapa costing $7.77B instead of $6.33B would require a substantial further rate increase in 2026.

5.6.2 Capital Cost Escalation

The Board views, with considerable concern, MH's lack of a defined approach to updating major project costs. Delaying the use of updated cost estimates for administrative process reasons reflects poorly on the validity of MH's recommendations for future power resource developments.

Outdated estimates can make potential export contracts look overly favourable and subsequently have the potential to lead to higher domestic rates than envisioned. Furthermore, one would not expect to see commitments entered into with respect to major projects and large export contracts when the capital budget for the underlying projects has not been changed for three or four Capital Expenditures Forecasts to reflect cost increases.

As the Board understands it, when MH initiates export sales negotiations that require new generation and transmission facilities, the price of capacity and energy is a major component of the term sheet conditions. For MH and others to suggest that the project cost and subsequent escalations are not material to export contract prices would lead to the conclusion that all cost escalations are to be paid for by Manitoba ratepayers. The public record with respect to the project cost escalations discussed in this Order shows that the rate risk to ratepayers is high when capital cost updates are deferred.

5.6.3 Capital Cost Recovery from Export Sales

The Board is unaware of any explicit MH policies or procedures to ensure adequate capital cost recovery on facilities built or advanced for export purposes. If two- or three-year old capital estimates are used as the basis for export price negotiations, there is a significant potential for revenues and costs to be misaligned.

MH and its consultants have demonstrated reluctance to the premise that MH's in-service unit output costs from new generation and transmission projects should be fully recovered from the average price of energy in any firm energy export contract. In the Board's view, a failure to achieve full recovery amounts to an acceptance of inevitable increases in domestic rates.

The Board cannot understand how a portion of capital or finance costs related to a project can reasonably be deferred to allow for lower domestic rates in the absence of export pricing sufficient to fund the capital expenditures.

MH's position that Bipole III costs should entirely be paid for by domestic customers is not consistent with the reality that the building of Conawapa G.S., for which Bipole III would be built, in the time frame contemplated is in large part to satisfy export commitments. In the Board's view, it also ignores the reliability benefits that are extended to existing and future export contracts and ongoing market sales.

Prior to the construction of the Wuskwatim Generating Station, which comes into service this year, the last major generating station constructed by MH was Limestone G.S. some twenty years ago. Limestone G.S. has, with hindsight, turned out to be an excellent investment for Manitoba. However, the "Business Model" used with regards to Limestone may be a dangerous business model to use with regards to Keeyask G.S., Conawapa G.S. and the Bipole III transmission line.

When Limestone was constructed earlier than needed for Manitoba's domestic load, the output from Limestone was to be exported on the "spot market". Unfortunately, the cost of producing electricity from Limestone G.S. when it came into service in 1992 was approximately 2 ½ to 3¢/kWh at a time when the export market was returning less than that, so MH suffered a loss in its Net Income. Limestone only became a wise investment over time, as inflationary pressures and an increasing unregulated wholesale electricity market drove up prices – MH holds that the same result can be expected with the construction of Keeyask G.S. and Conawapa G.S., although many factors have changed over the past two decades that make that assumption questionable.

From a rate setting perspective, once a generating station (or any unit of a generating station) is placed in service, all of the fixed costs can no longer be capitalized and are added to the rate base to be recovered from domestic customers or from export sales. It is by the same rate setting principles that when Wuskwatim G.S. comes into service, MH's Operating Statement will record an additional $153 million per year of costs associated with producing about 1,500 GWh of energy per year. The unit cost of energy approximates 10¢/kWh.

Because Wuskwatim's output is not immediately needed for Manitoba load, its output is to be sold on the export market. Presently there is no fixed-price export contract for Wuskwatim G.S.'s output, which means that such output will be sold on the 'spot market' – a market currently returning prices approximating 3¢/kWh during peak hours and less than half of that amount during off-peak hours.

Because the $153 million per year of costs are real, and the spot export revenues will only cover less than a third of those costs, it falls to domestic Manitoba customers to cover the financial losses flowing from the operation of Wuskwatim G.S. Those losses will result in reduced Retained Earnings, higher consumer rates, or both.

While the Board acknowledges that the in-service costs will gradually decline over the years the generating station is in service, as the financing costs will fall as the principal balance of the debt assumed declines (and the annual amortization of the initial capital cost represents non-cash expenditures), such cost decreases are very gradual.

Manitobans will be responsible for any losses incurred on the reliance of the export market until the electricity is actually needed by Manitobans.

The very same accounting and regulatory principles apply to Keeyask G.S. and Conawapa G.S. With in-service unit costs of approximately 10¢/kWh for generation and export prices returning considerably less than that, Manitobans are to bear responsibility for the losses.

As for the Bipole III transmission costs, which will approximate 3¢/kWh for every kWh of electricity transported, without having access to the export contracts the question is whether all or some of the costs will be met by net profit from export contracts or will have to be entirely paid for by Manitoba customers.

MH's Business Plan of 'building for exports' contains serious, real and significant risks and costs for domestic Manitoba customers. The current Business Plan can be contrasted with MH's pre-2000 Business Plan when it proposed and planned to construct a 'merchant plant' (i.e., a plant built to serve the export market) to export the output to a counterparty by way of a fixed-price long term contract.

Because of the near-decade of lead time required to build a large hydraulic generating station, beginning in the early 1990s MH was considering building the Conawapa G.S. as a merchant plant and selling 100% of the plant's output to Ontario Hydro. MH's Business Plan at the time incorporated provisions whereby Ontario Hydro's payments would exceed the costs incurred by MH to construct and operate Conawapa, such that there was an expected net benefit (profit) to MH over the entire term of the export contract.

While this Board's jurisdiction does not extend to the approval of MH's capital expenditures, this Board does have jurisdiction over the approval of MH's rates in which MH seeks to recover the financing, operating and amortization expenses directly attributable to MH's capital expenditures. MH has taken the position that it is important that MH maintain an adequate level of retained earnings and that rates be raised gradually even during periods of exceptional water flows. It also stated that an adequate level of retained earnings provides funding for capital investments, which in turn reduces the need for borrowing and reduces the financing costs that ultimately must be recovered from ratepayers.

Against the backdrop of different types of business plans, together with the apparently skyrocketing capital costs of Keeyask G.S., Conawapa G.S. and Bipole III, together with a depressed export market and Manitoba consumers being held financially responsible for any losses, the Board is of the view that MH's capital projects require careful and detailed scrutiny. The Chairman is of the view that this scrutiny should apply to both generation and transmission facilities. In the Vice Chair's view, while scrutiny is required for all projects whose primary current purpose is to meet export demand, Bipole III should not be delayed as it is required for reliability purposes.

Scrutiny of MH's projects has, in essence, been promised by MH when it produced confirmation from the Province of Manitoba that an NFAAT hearing similar to the one held for Conawapa G.S. in the early 1990s and Wuskwatim G.S. in the early 2000s is to occur.

Due to the hundreds of millions of dollars the Province derives from MH, the risks that will be borne by MH's domestic customers, and due to the economic and financial factors to be tested, such an NFAAT ought to be conducted by an independent tribunal with considerable expertise in the subject issues.

6.0.0 OPERATING RESULTS

6.1.0 OVERVIEW

In support of its GRA Application, MH filed its Integrated Financial Forecast (IFF) 09-1 for its electric operations, as well as its Capital Expenditure Forecast (CEF) CEF 09-1, both covering fiscal year periods 2009/10 to 2019/20. Updated forecasts (IFF 10-1, IFF 10-2 and CEF 10) were also filed over the course of the hearing. IFFs and CEFs are prepared to provide an indication of the long-term financial direction and plans of the Corporation, and are based on numerous assumptions.

MH's actual results for fiscal year 2009/10 and its updated forecast for fiscal year 2010/11 reports or forecasts that accumulated net income for the fiscal years from 2009/10 up to and including 2011/12 will be $148 million higher (pursuant to IFF 10-1) than was indicated in IFF 09-1. IFF 09-1 forms the basis of the Application before the Board.

The projected improvement in accumulated net income and retained earnings (retained earnings represent MH's "equity" or invested capital) was attributed primarily to lower than forecast depreciation, finance expenses and fuel & power purchase costs. The forecast results also represent a continuation of MH's accounting practice of capitalizing and deferring expenses incurred in current and past periods associated with the Corporation's plans to construct additional generation and transmission assets. The following table provides an overview of MH's actual and forecast revenues and expenses.

Manitoba Hydro's Revenues and Expenses, 2008-2012

Statement of Operations & Retained Earnings ($ Millions)	Actual			IFF10-1		
Fiscal Year	**2008**	**2009**	**2010**	**2011**	**2012**	**Total 2008-2012**
Revenue						
Domestic	1,006	1,014	980	1,006	1,048	
Estimated PUB Approved Increases	77	130	162	195	224	788
Export	625	623	427	444	461	
Total Revenue	1,708	1,766	1,569	1,645	1,733	
Expenses	1,371	1,478	1,409	1,496	1,612	
Non Controlling Interest					4	
Net income(loss) Actual/[IFF 10 -1]	337	288	160	149	125	
Compared to 2008 GRA Forecast						
Net income (loss) [IFF 10 -1]	264	156	105	116	114	
Net income difference	73	132	55	33	11	304
Retained earnings Actual[IFF 10 -1]	1,790	2,078	2,238	2,354	2,479	
Retained earnings [IFF07-1]	1,735	1,891	1,996	2,112	2,226	
Cumulative Retained Earnings difference						
2008 GRA vs. 2011 GRA	55	187	242	242	253	
Debt:Equity Ratio	76:24	75:25	74:26	74:26	74:26	

Note: Board-approved increases granted in prior Applications: 5% effective August 1, 2004 (a $48 million addition to annual revenue); 2.25% effective April 1, 2005 ($21.8 million of additional annual revenue); and 2.25% effective February 1, 2007 (an additional $23.0 million of annual revenue). The interim increases provided as of April 1, 2010 and 2011 represent a further addition to annual revenue of, in aggregate, approximately $62 million.

MH's financial position since the 2008 GRA is projected by MH to have improved by approximately $253 million for the fiscal years 2007/08 up to and including 2011/12. A major contribution to this improved financial position has been Board-approved rate increases which have generated over $788 million in accumulated additional revenue. Since 2004/05, over $950 million in additional revenue has been realized by MH from Board-approved domestic rate increases (this represents over one-third of MH's retained earnings).

6.2.0 FORECAST UPDATE

Two forecast updates were provided during this hearing. IFF10-1 reflected a reduction in the near term for interest rates, but the most significant change was material increases in the capital costs for both the Conawapa G.S. and Keeyask G.S. The capital cost estimate of Keeyask was increased from $4.6 billion to $5.6 billion. For Conawapa G.S., the estimated cost of construction increased from $6.3 billion to $7.7 billion. On an overall basis, the capital costs for MH's major generation and transmission projects have increased in excess of $2.6 billion dollars in IFF10-1 compared to IFF09-1.

This second update, set out in IFF10-2, reflects increases to the projected capital cost of Bipole III. The capital cost projection for Bipole III forecast in IFF09-1 and IFF10-1 was $2.2 billion. The forecast was revised to $3.2 billion over the course of this hearing, an increase of $1 billion from previous forecasts. Although other forecasts prepared internally by MH saw the cost exceeding $4 billion, MH adopted the lower estimate. The implications of this $1 billion increase capital costs were reflected in IFF 10–2. The following chart provides a comparison of the net income forecast during the outlook period in IFF09-1 with the updates provided as follows:

NET INCOME FORECAST CHANGES – IFF09-1 TO IFF10-2

Net Income- Electric ($ Millions)				
Year Ending March 31	MH09	MH10-1	MH10-2	Comparison MH10-2 vs. MH09
2010	$121	$163	$163	$42
2011	$78	$149	$149	$71
2012	$87	$125	$125	$38
2013	$72	$120	$121	$49
2014	$125	$184	$187	$62
2015	$113	$142	$145	$32
2016	$248	$217	$219	($29)
2017	$263	$267	$267	$4
2018	$235	$273	$218	($17)
2019	$244	$225	$111	($133)
2020	$276	$292	$187	($89)
2021	$299	$109	($1)	($300)
2022	$439	$351	$233	($206)
2023	$544	$443	$319	($225)
2024	$732	$512	$382	($350)
2025	$791	$631	$493	($298)
2026	$911	$597	$449	($462)
2027	$1,005	$692	$538	($467)
2028	$1,116	$796	$637	($479)
2029	$1,224	$906	$741	($483)
Total	**$8,923**	**$7,194**	**$5,683**	**($3,240)**

The successive increases in capital costs have resulted in an increase in long-term debt and related increase in finance expenses. Long-term debt was forecast in IFF09-1 to be $17.7 billion in 2029. The estimate was revised up to $21.2 billion in 2029 in IFF 10–1 and was further increased to $23.0 billion in IFF 10–2. The capital costs and the respective debt to support the increased costs result in increased operating and finance costs over the outlook period. Finance expenses in 2029 were forecast to be $980 million. Since then, they have increased to $1.2 billion in IFF10-1 and further increased to $1.4 billion in IFF10-2. Between IFF09-1 and IFF10, finance expenses in 2029 (by which time all major generation and transmission projects will have come into service) have increased by over $403 million annually.

The forecast increase in expenses from IFF09 to IFF10-2 has led to a reduction of forecast net income over the period from 2010/11 to 2028/29 by over $3.2 billion.

MH has established the export price assumptions used in its forecasts from independent forecasts provided by ICF and others. During this hearing, ICF presented information indicating a forecasted reduction in natural gas prices of 40% from previous forecasts due to abundant shale gas that can now be extracted through new technology. Shale gas is a source of natural gas that was previously uneconomic to extract. However, with new technologies, shale gas is now capable of being extracted in large quantities at low costs.

MH exports into the MISO market. Electricity generated from natural gas forms the basis of establishing marginal peaking prices in the MISO market 10% to 50% of the time. The balance of the time, MH's opportunity export prices are established by the coal generation prevalent in the MISO region.

Prior export price forecasts provided by ICF were predicated on the establishment of a U.S. carbon regulatory regime, which would increase the cost of electric coal generation. No such regime has emerged to date, and ICF has revised the timing and extent of any carbon regulatory pricing in the future downward materially.

This change in perspective on natural gas pricing and a carbon regulatory regime is not reflected in the current IFFs presented at this hearing. The issues related to export pricing are discussed further in section 5.6.0 of this Order.

6.3.0 INTERVENER POSITIONS

6.3.1 CAC/MSOS

CAC/MSOS noted that the improved actual net income for 2009/10 was $164 million. This compares to only $121 million forecast in IFF09-1, which formed the basis of MH's application. Net income in IFF10-1 for 2011/12 is now forecast to be $149 million versus $78 million in IFF09-1 and $125 million versus $87 million (IFF09-1) in 2011/12. The combined forecast improvement of $109 million more than what was forecast for those years in IFF09-1 suggests that the interim rate increases granted by the Board should be reduced.

6.3.2 MIPUG

MIPUG submitted that it does not oppose final confirmation of the two interim rate orders granted by the PUB in this proceeding. MIPUG did recommend that MH be directed to do a small rebalancing of rates, on a go-forward basis from the date on which rates are finalized, among domestic rate classes in recognition of differences in revenue to cost ratios. MIPUG's experts Mr. Bowman and Mr. McLaren opined that in general terms, rate increases in the order of inflation are understandable, so long as they are merited and defensible in terms of MH's cost structure and fairly distributed across the different rate classes.

6.3.3 RCM/TREE

RCM/TREE submitted that the interim rates should be approved as the final rates, and a further 0.9% increase from the date of the final order should be allowed. RCM/TREE further submitted that the PUB should also consider an interim rate increase for 2012/13 of 3.5% subject to a hearing for the April 1st 2013 period.

RCM/TREE also sought reintroduction of an inclined rate structure, with a change in the block size to reduce the first block. RCM/TREE further sought MH to identify electric heat customers by using a methodology suggested by this Intervener, and that MH implement a larger first block structure for these customers over the winter heating period, as proposed by Mr. Chernick.

6.4.0 BOARD FINDINGS

These findings need be read in conjunction with the Board's findings on Rates as set out in section 3.0.0 of this Order.

The Board notes the marked improvement in net income in the test years from what was forecast in IFF09, which formed the basis of the Utility's application. With the finalized rate increases approved in this Order, the fiscal health of MH in the test years (2010/11 and 2011/12) has never been stronger in MH's 60-year history.

The Board notes that MH has attained its 75:25 debt-to-equity target, a target it will "slip away from" in the next several years. The Board has grave concerns with the long-term outlook reflected in IFF 10–2.

The Board notes that over the course of two successive updates to IFF09, the increase in capital costs of Keeyask, Conawapa and Bipole III and related increased debt levels now see a 'build' price tag in excess of $20 billion, with long-term debt previously forecast to be $17 billion now over $23 billion. This higher forecast debt level and higher associated carrying cost (now to reach over $1.4 billion) has eroded the forecast profitability during the forecast period by $3.2 billion.

The Board understands that MH's forecasts are used to underpin the justification for the new major generation and transmission projects. While they reflect increased capital costs, they do not reflect the downward change in export prices that has occurred since 2008. The forecasts further do not reflect a sustained strengthening of the Canadian dollar or the lower prospects for export prices given the new realities of inexpensive and abundant shale gas, which is a common feedstock for low-cost electric generation in the markets into which MH exports. Nor does the forecast reflect the potential new reality of a low- or no-carbon regime in the export markets into which MH sells its electricity.

Abundant coal with no carbon adder and abundant natural gas will have a dampening effect on export prices in the MISO market. Given that MH is a price taker in the MISO market, lower generation costs in the export markets could have a material impact on MH and its potential export revenue. Neither of these potential realities are reflected in the forecasts presented to the Board at this GRA.

The Board requested MH to provide additional IFF scenarios, to explore the impact of such circumstances on ratepayers. They were not provided, and as noted in section 5.6.0 of this Order, MH's capital plan has not yet been tested by an NFAAT.

7.0.0 EXTRA-PROVINCIAL REVENUES

7.1.0 OVERVIEW OF SALES AND REVENUES

As can be seen from MH's IFFs, extraprovincial revenues are to constitute a significant percentage of MH's total revenues.

MH'S sales into the U.S. MISO Market and into other Canadian provinces over the last decade are summarized in the following table.

MH'S EXPORTS INTO MISO/CDN PROVINCES (GWh)

	MISO Dependable	MISO Opportunity	MISO Total	Non Merchant CDN Sales	Total Sales
2000/01	4895	4511	9406	3047	12453
2001/02	4767	5083	9850	2449	12299
2002/03	4947	2713	7660	2075	9735
2003/04	5245	507	5752	1214	6966
2004/05	5683	3218	8851	1680	10431
2005/06	4044	8879	12923	1424	14347
2006/07	3654	5877	9531	373	9904
2007/08	3921	7332	11053	682	11735
2008/09	4087	6071	10158	418	10576
2009/10	2613	6218	8831	336	9167

To supplement its own generation, MH has typically imported wind and thermally generated energy at the range of 1,500 to 3,000 GWh per year. Major exceptions were 2002/03, when the total imported was 3,800 GWh and 2003/04 when the total imported was 10,500 GWh.

With existing transmission intertie bottlenecks and constraints due to MISO capacity and hydraulic generation capacity, MH is typically limited to about 7,000 GWh/year of peak energy export sales. Except for 2008/09, the peak firm and opportunity sales have, over the last 10 years, accounted for approximately 2/3 of MH's annual exports. The remaining 1/3 were off-peak sales to the MISO market and within Canada.

During the past ten years, MH achieved average annual export prices of about 5¢/kWh. From 2004/05 to 2008/09, firm contract prices were 5 to 6¢/kWh, opportunity peak prices were 6.5 to 7.0¢/kWh and opportunity off-peak prices were 2.5 to 3.5¢/kWh. The situation changed in 2009/10, after MH's IFF09-1 was prepared. In IFF09-1 and IFF10 MH assumed average export revenue rates as follows:

COMPARISON OF AVERAGE EXPORT REVENUE RATES
IFF09-1 VS. IFF10-2

	Actual (¢/kWh)	IFF09-1 (¢/kWh)	IFF10-2 (¢/kWh)	Difference (¢/kWh)
2006/07	5.86			
2007/08	5.64			
2008/09	4.37			
2009/10	3.93			
2010/11	3.84	4.10	3.26	- 0.84
2014/15		7.40	6.63	- 0.83
2015/16		9.09	8.11	- 0.98
2019/20		10.56	10.84	+0.28
2020/21		10.66	11.12	+ 0.46
2021/22		10.94	11.13	+ 0.19
2025/26		12.25	12.20	- 0.05
2026/27		12.64	12.58	- 0.06
2028/29		13.45	13.45	Ø

IFF09-1 export price assumptions reflect the input provided to MH by a panel of external consultants in 2008. ICF, one of the consultants on the MH panel, provided evidence at this hearing that the natural gas prices employed by ICF's forecast in 2008 would currently be about 30-40% lower, and that electricity prices in the MISO market would also be lower. However, MH did not adjust these variables from IFF09-1 to IFF10-2.

7.2.0 THERMAL GENERATION COST ASSUMPTIONS

A comparison of MH's IFF assumptions on Single Cycle Combustion Turbine (SCCT) thermal generation costs leads the Board to conclude that MH did not significantly reduce the energy prices in IFF10 from IFF09-1 and may have increased that price from 2021 onward.

7.3.0 MH INFLUENCE ON EXPORT/IMPORT PRICING

MH has suggested that in the broader MISO market, a substantial decline in MH's energy surplus would not be noticed and hence no shortage pricing would develop. This does not seem consistent with the 2002/03, 2003/04 and 2006/07 drought events when prices did increase significantly. MH's argument that opportunity sale prices are depressed during extended high flow periods would also suggest the opposite, namely that less energy in the market should translate into higher prices. In recent years, MH has been regularly selling off-peak energy into the MISO market at prices as low as 0.5¢/kWh.

7.4.0 EXISTING 500 MW NSP EXPORT CONTRACT

MH's existing contract with NSP calls for MH to supply and NSP to purchase 2,086 GWh in each 12-month period. This amount equates to 5x16[2] energy on an annual basis or an average of 174 GWh per month. Payment for this power is based on both an energy charge and a demand charge.

In 2010/11 it appears that MH sold 2,960 GWh of firm energy into the MISO market at an average price of 5.14¢/kWh, including NSP sales of 1,970 GWh.

[2] Power supplied for the 5 weekdays, between 6 AM and 10 PM (16 hours)

7.5.0 OTHER REVENUES/COSTS

7.5.1 Merchant Trading

MH has in the past purchased energy in the MISO market for resale into Ontario by employing committed transmission services. The Board understands that MH has or will be discontinuing this low net revenue activity.

7.5.2 Ancillary Services

With the advent of an ancillary service market in MISO, MH is anticipating a high level of activity in providing capacity support within the MISO Market. The profitability of these services is currently uncertain. MH's IFF is apparently treating this as a break-even activity.

7.5.3 Transmission Tariffs

Under the open access transmission tariff, MH receives revenue for energy flowing through Manitoba, but MH also pays for transmission which flows through other transmission systems. Overall, this is resulting in a small net revenue gain.

7.5.4 NEB/MISO/FERC/NERC Costs

MH incurs membership costs with respect to business activities in the US. These can be related to both exports and imports, even though the level of export activity typically greatly exceeds the import activities. MH contends that an equal sharing is appropriate.

7.6.0 INTERVENER POSITIONS

7.6.1 CAC/MSOS

CAC/MSOS submitted that it is concerned with the significant variance of export revenue forecasts from actual export revenues.

7.6.2 MIPUG

There were no direct challenges by MIPUG of MH export revenue pricing. Rather, MIPUG supported MH's process of determining future export market prices and the need for secrecy with respect to firm contract pricing.

7.6.3 RCM/TREE

RCM/TREE noted that all of the risk experts appeared to be using out-of-date term sheets as the basis of MH's potential exports revenue position. It also noted that rather than adopting a skeptical review approach, the risk experts accepted the positions adopted by MH in conducting the risk analyses.

It was RCM/TREE's view that there should be a transparent correlation of MH's export pricing (contract and opportunity) to energy production costs. A rate-rider to track MH's unit export revenue in excess of costs was suggested.

7.7.0 BOARD FINDINGS

Going back to Board Order 116/08, the Board had concerns that MH's export revenue pricing forecasts, provided in the preceding 2008 GRA and in the 2008 EIIR application, were overly optimistic. Those forecasts assumed high natural gas supply prices in the future (up from $10.30/GJ in 2005) and, perhaps more significantly, an early introduction of substantial CO_2 emissions pricing.

Based on current market conditions and ICF's forecasts, it is the Board's view that the potential average export sale price may be substantially below MH's IFF09-1 and IFF10 assumptions over the next decade. Faced with continuing to make off-peak sales at under 1¢/kWh on a protracted basis, and contract prices likely below 6¢/kWh until 2015, MH's prospects for average export prices appear to be in the 3 to 4¢/kWh range.

Going forward, without any CO_2 pricing and a continuation of low shale gas prices, MH must compete with off-peak coal energy at 2-3¢/kWh (or wind at possibly even lower prices) and natural gas CCCT generation in the peak periods at prices in the 5-7¢/kWh range. Even with new contract prices of 8-9¢/kWh for peak energy volumes equal to about 1/3 of MH's exportable energy, the average export prices could be dragged down to around 5¢/kWh by low opportunity sale prices.

The IFF09-1 export revenue pricing (based on advice from an external consultant panel) prepared in 2008 did not reflect the lower natural gas prices (with shale gas availability already being experienced) or the major resistance to CO_2 emissions pricing in the US. Despite the ICF testimony at this hearing, which laid out a significantly lower future natural gas price outlook for October 2010 than in February 2009 and confirmed the suggested deferral of CO_2 emission pricing, MH did not significantly alter the IFF10 export revenue assumptions from those used in IFF09-1. This places the reliability of the IFF10 forecasts into doubt.

The Board notes that MH has, to date, declined to provide any alternative IFF scenarios based on lower natural gas prices and the absence of CO_2 emissions regulations. Overall the Board does not accept MH's export revenue forecasts to date as representing a realistic basis for determining the economic viability of the proposed new major generation and transmission facilities such as Keeyask, Conawapa and Bipole III.

The Board no longer considers IFF09-1 as providing a 'valid' picture of MH's financial position. If MH continues with its preferred development plans, the Board concludes ratepayers will undoubtedly pay higher future domestic rates than indicated in IFF09-1 or IFF10-2.

Without access to MH's export contracts, and given the current market conditions, the Board is not convinced that MH will achieve the export revenue assumed in the existing IFFs. IFF09-1 electricity export revenue forecasts were based on 2008 circumstances, presumably by using ICF's predicted natural gas prices at the time. These predated the advent of shale gas pricing, the collapse of the planned CO_2 emission charges regime and the economic downturn in the economy.

With ICF's revised natural gas prices being 30-40% lower (based on its revision made on Oct.20, 2010), the forecast electricity prices for CCCT generation could be significantly lower, as the fuel cost portion of those prices would decrease materially.

While MH has declined to provide an IFF based on PUB/MH/PREASK-4 export electricity pricing assumptions, MH has not refuted the proposed pricing scenario. About 65% of IFF09-1 pricing assumptions are relatively consistent with the implications of ICF's revised natural prices, when applied to CCCT generation variable prices.

In the Board's view the IFF09-1 and IFF10-2 export revenue assumptions are not reflective of the current and near term energy market. As such, the suggested progression of rate increases would be inadequate to cover MH's CEF09 Major Capital Expenditure Program. When the major project cost escalation is also considered, the insufficient revenue is substantially magnified. The Board would suggest that the cumulative rate increase requirements by 2025/26 would be significantly greater than the 57% forecast by MH, and quite possibly roughly double MH's forecast.

The Board acknowledges that MH could look to lesser rate increases by accepting lower annual net incomes, lower retained earnings and higher debt levels. However, such actions and results would negatively affect MH's financial ratio targets.

In the Board's view it is crucial that expert analysis and independent scrutiny of the major capital projects be undertaken before making any irreversible commitments, as MH has attested that it has been spending $1-2M per day on its "preferred development plan" even though that plan has yet to be tested.

8.0.0 FINANCE EXPENSES

8.1.0 INTEGRATED FINANCIAL FORECAST 2009 (IFF-09)

MH's borrowings result in its finance expense being the Utility's single largest expense item. Finance expenses were $401 million in 2009, representing over 29% of total operating expenses. They were forecast in IFF09-1 to be $417 million in 2010. Actual finance expenses decreased to $373 million in fiscal 2009/10. MH had forecast finance expenses to be $413 million in 2011 and increase to $468 million in fiscal 2012, representing 25% of annual operating expenses.

In IFF09-1, MH's typical practice is to base the forecast level of finance expenses on anticipated levels of borrowings exclusively based on 30-year fixed term debt. Such an approach does not recognize that a portion of the debt issued would be shorter-term floating debt with lower interest rates than 30-year debt. In the normal course of operations, MH issues both floating rate debt and long-term fixed rate financing. This reality was addressed in IFF10-1, whereby MH has now assumed that 20% of its forecast debt issues would be floating rate debt issues. MH has a target range of maintaining 15% to 25% of debt in floating rate instruments to minimize debt costs without undue interest rate exposure.

MH capitalizes interest on all capital projects during the construction phase until the project is in service. Based on IFF09-1, by 2029 Manitoba Hydro is forecasting to capitalize over $4.8 billion in interest costs.

As the major new generation and transmission projects commence construction, MH will be capitalizing a greater proportion of interest costs. Gross interest expense is forecast to be over $1 billion in 2018, of which $449 million or 43% will be capitalized. Once all major projects are completed, this high level of interest cost will need to be recovered through rates, supported by higher levels of revenue from the new generation capacity.

8.2.0 IFF10-2

MH provided an updated IFF10-2 which indicates the capital costs of the major generation and transmission projects have increased by $3.6 billion. Higher levels of debt, now to exceed $23.4 billion by 2026, will support this higher level of capital spending. This represents an increase in debt of over $5.4 billion from what was forecast in IFF09-1.

Based on IFF10-2, the updated forecast reflects reduced interest rates in the near term. Finance expense is forecast to grow by $411 million to over $1.5 billion by 2026 (up from $1.1 billion forecast in IFF09-1) when the last of the major new Generation and Transmission projects, Conawapa, is expected to be in-service.

Based on the updated cost estimates in IFF MH10-2, MH's debt is forecast to grow from $8.7 billion in 2011 to $22.9 billion in 2030, an increase of $14.2 billion. This is $5.2 billion higher than the debt level forecast in IFF09-1.

8.3.0 INTERVENER POSITIONS

CAC/MSOS noted that the level of finance expenses represents the largest component of expense in the forecast and is expected to grow. CAC/MSOS adopted the evidence of Mr. McCormick, which recommended that the Board reject the assumption used in IFF09-1 that all new debt issues would be long-term 30-year fixed rate debt and incorporate a forecast that recognizes a policy to maintain a range of short-term debt in determining interest rate forecasts. Incorporating a short-term debt component as a forecasting element would result in a significant interest rate reduction in the forecast. Mr. McCormick acknowledged that changes made in the forecasting methodology employed in IFF10 addressed this concern. However, the GRA, which is based on IFF09, does not reflect this change.

Mr. McCormick identified four elements which are required to adequately forecast financing expenses, including:

(a) reconsideration of the composition of fixed and floating debt;

(b) assumptions respecting interest rates;

(c) currency of the debt issue; and

(d) term to maturity of the underlying debt.

In MH's IFF10-2 there is reference to an enhancement to MH's longstanding forecasting approach of assuming all new debt is to be fixed for 30 years at 10 years plus rates. However, the 20% floating rate, argued CAC/MSOS, will still tend to bias the results. Mr. McCormick opined that he would much rather see consumers paying rates in the 2011/12 test year based on what we know today about the forecast rates, as they are much more current rates, as opposed to superseded rates. Further, noted Mr. McCormick, updated rates are indicative of significant excess interest costs being forecast in the revenue requirement. Mr. McCormick noted in his report that there is no "free money", and that excessive reliance on the certainty of long-term fixed debt comes at a material cost in terms of lost opportunity for lower debt costs.

CAC/MSOS recommended the establishment of an interest rate deferral mechanism as proposed by Mr. McCormick. The interest rate deferral account would capture the difference between forecast and actual finance costs, addressing forecast differences in interest costs. CAC/MSOS proposed that MH be advised that the extent of any corporate recoveries from the deferral account mechanism would be contingent on a determination that MH has been managing its financing costs prudently.

8.4.0 BOARD FINDINGS

MH plans on borrowing an additional $15 billion to support its development plan, thereby increasing MH's overall debt level to over $23 billion.

The Board notes that in IFF09-1, MH planned on increasing borrowings by $10 billion to over $17.7 billion. The revisions in IFF10-1 and IFF10-2 have increased the borrowing requirement by 50%. These borrowings come at a cost to MH in terms of carrying costs, a significant percentage of which is currently being capitalized.

The situation is exacerbated by continued cost escalation of the major generation and transmission projects. Capitalized interest may well be over $5 billion when all developments are complete. Once developed, the ratepayers will have to cover both higher interest carrying costs as well as higher amortization charges related to the developments, regardless of the income generated from the new assets.

As stated in Order 99/11, current ratepayers are being spared the increased finance expense in rates, yet decisions made currently will impact future ratepayers. These financing costs, which are currently being capitalized, will have to be supported by higher domestic rates when the projects come online and the capitalization of finance expense is no longer appropriate.

The Board remains concerned that interest rates at historical lows will likely increase when spending ramps up on the developments, resulting in higher than forecast levels of capitalized interest and finance expense.

The Board remains concerned with the impact of further capital cost escalations. As it now stands, annual carrying costs that will need to be covered from rates will top $1.5 billion in 2029, $400 million more per year than what was contemplated in IFF09-1.

As the cost of the major capital expenditures program escalates (as demonstrated in the recent updates which saw an increase of over $3.6 billion from the IFF 09-based estimate), the escalations will result in debt levels being increased by over $5.4 billion, and, ultimately, in higher finance costs which will have to be recovered from domestic ratepayers.

The forecast level of interest costs, when these projects are in service, has increased materially while the capacity to service these additional costs has not changed. MH negotiated much of the new contracts before the escalation in capital costs appeared. It is unlikely that the counterparties to the deals would be interested in paying any more than what has been negotiated due to an increase in the costs for MH to deliver the power.

There are no assurances that the current capital cost estimates will hold. Given the successive annual updates, the Board remains concerned that the economics related to these developments may be diminished. As such, it is important that MH be involved in an NFAAT process which will independently look at the economics of the proposed plans before any final development commitment are made.

The Board believes that the adoption of an interest rate deferral account is not appropriate at this time. The Board further believes that the changes in the assumed debt financing in IFF10-2 are an improvement to forecasting finance expense.

9.0.0 OPERATING AND ADMINISTRATIVE EXPENSES

9.1.0 OVERVIEW

Operating and maintenance expense (also referred to as O&A, OM&A, or operating, maintenance and administration costs) is one of MH's three largest expense categories in any given year. Over 75% of MH's O&A relate to labour costs, including employee benefits. The actual and forecast operating and administrative expenses for fiscal years 2008 to 2012 are as follows:

Operating and Administrative Costs ($Millions)

	Actual			IFF10-01	
Fiscal Year	**2008**	**2009**	**2010**	**2011**	**2012**
Labour and Benefits	$477.8	$509.9	$541.0	$556.3	$569.1
Other Expenses	$160.8	$177.30	$182.0	$183.9	$186.5
Total Costs	**$638.6**	**$687.2**	**$723.0**	**$740.2**	**$755.6**
Operating and Administration Charged to Centra	($56.3)	($59.0)	($61.0)	($63.4)	($64.0)
CICA Accounting Changes		$5.0	$9.0	$9.0	$9.0
Provision for Accounting Changes				$18.0	$13.5
	$582.3	**$633.1**	**$688.0**	**$703.8**	**$714.1**
Capital Order Activities	($192.3)	($203.1)	($224.3)	($235.0)	($239.7)
Capitalized Overhead	($67.3)	($65.7)	($69.2)	($71.0)	($72.5)
Total Capitalized	($259.6)	($268.8)	($293.5)	($306.0)	($312.2)
O&A Attributable to Electric Operations	**$322.7**	**$364.3**	**$377.6**	**$397.7**	**$401.9**

O&A, before capitalized expenditures, has increased from $582.3 million in 2008 to $688 million in 2010. O&A expenditures were forecast to grow from $703.8 million in 2011 to $714.1 in 2012.

MH capitalized $259.6 million in 2008 or over 55% of O&A costs in that year. The level of capitalized O&A increased to $293.5 million in 2010 and MH is forecast to capitalize $306 million (43%) in 2011 and $312.2 million (44%) in 2012.

From 2005 through 2010, MH's O&A expenses have grown at a compound average growth rate of almost 5% annually while inflation for that period has been under 2%.

MH had forecast O&A to be $380 million in 2011 and $403 million in 2012 based on IFF09-1, the basis for this Rate Application. MH provided an update at the hearing with IFF MH10-1, where O&A expenses are revised to $397.7 million in 2011 and $401.9 million in 2012, as reflected in the above table. MH attributed the increases in part to accounting changes since 2009 to comply with International Financial Reporting Standards (IFRS).

9.2.0 STAFFING LEVELS

A major driver in the increase in O&A expense is due to increased staffing levels which are projected to grow from 5,769 Equivalent Full Time (EFTs) in 2004 to 6,669 EFTs, an increase of 900 EFTs or over 15%. The change in MH staffing by division since 2004 is as follows:

**EQUIVALENT FULL TIME EMPLOYEES –
ANNUAL RESULTS BY BUSINESS UNIT**

Fiscal Year March 31,	**2004**	**2005**	**2006**	**2007**	**2008**	**2009**	**2010**	**2011 & 2012 Forecast**	**Change 2004 to 2012**
President & CEO	86	84	82	84	87	87	97	99	13
Corporate Relations	43	49	62	67	69	75	69	69	26

Finance & Administration	1,025	1,032	1,029	999	986	999	1042	1,043	18
Power Supply	1,287	1,344	1,366	1,405	1,470	1,576	1,757	1,785	498
Transmission	1,207	1,208	1,221	1,233	1,255	1,298	1,355	1,358	151
Customer Services & Distribution	1,565	1,605	1,647	1,617	1,640	1,671	1,708	1,711	146
Customer Care & Marketing	538	527	552	563	545	550	561	566	28
Total	**5,769**	**5,867**	**5,978**	**5,988**	**6,071**	**6,276**	**6,613**	**6,669**	**900**

This increase in staffing levels was defended by MH as due to increased work requirements. The staffing level increases are due in part to the capital expansion plans of the Corporation, as a large number of those hired were to work on capital projects.

The last time MH expanded its generation capacity was in 1993/94 with the building of Limestone G.S.. At that time, MH had an EFT complement of 4,232, including 940 construction employees. Since then, the complement has grown significantly, well beyond the increases arising out of the acquisitions of Centra and Winnipeg Hydro. As at March 31, 2011, MH had a staffing complement of 6,299, which included 1,439 construction employees. The employee level has grown by over 2,067 EFT (over 48%) since 1993, with the number of construction related positions increasing by 499 EFT (over 53%) from 1993 levels.

9.3.0 CAPITALIZATION OF OPERATING AND ADMINISTRATIVE EXPENDITURES

MH capitalizes certain operating and administrative expenditures. MH segregates costs between operating activities (which are a direct charge against the operating income for the year) and capital activities (which are charged to future periods and amortized over the future life of a respective capital project). MH indicated that employees' timecards docket their activities to specific capital projects. This amount, combined with other related costs, is charged to a capital order. In addition, MH also capitalizes overhead by applying the predetermined overhead rates to all capital projects.

MH had total operating and administrative expenses before capitalization of $543 million in 2003/04, which grew to over $688 million in 2010 and is forecast to be $703.8 million in 2010/11 and $714.1 million in 2011/12, before capitalized activities and overhead. In 2003/04 MH capitalized approximately 28% of labour and benefits. The amount of labour and benefits capitalized has increased since then, where MH now capitalizes over 32% of its labour and benefits. The increase in amounts capitalized mutes the growth in O&A expense recorded on an annual basis.

Including overhead, in total MH is forecast to capitalize $306 million of O&A expenses in 2010/11 and over $312 million in 2011/12, representing over 43% of its annual electric operating expenses in both test years.

MH also capitalizes Demand Side Management (DSM) expenditures from its Power Smart program. DSM program costs are deferred and amortized on a straight-line basis over 10 years. DSM costs are forecast at over $39 million for 2011 and $40 million for 2012. The capitalized carrying value for DSM was $168 million on March 31, 2010 and is forecast to be approximately $200 million at the end of fiscal 2012.

For fiscal 2010 MH has $591 million of deferred charges recorded as assets, including $299 million in rate-regulated assets. If MH were not subject to rate regulation, the costs would be charged to operations in the period that they were incurred.

The balances of the regulated assets at March 31, 2010 were as follows:

Regulated Assets ($ millions)	March 31, 2010
Power smart programs – electric	$168
Power smart programs – gas	32
Site restoration costs	37
Deferred taxes (CGMI)	35
Acquisition costs	23
Regulatory costs	4
Total	$299

9.4.0 MITIGATION COSTS

MH is party to an agreement dated December 16, 1977 with Canada, the Province of Manitoba and the Northern Flood Committee Inc., the latter of which represents the five First Nations communities of Cross Lake, Nelson House, Norway House, Split Lake and York Landing. This agreement, in part, provides for compensation and remedial measures necessary to ameliorate the impacts of the Churchill River Diversion and Lake Winnipeg Regulation projects. Comprehensive settlements have been reached with all communities except Cross Lake. Expenditures incurred to mitigate the impacts of the Churchill River Diversion and Lake Winnipeg Regulation projects were $26 million during fiscal 2010. As of March 31, 2010, $701 million has been spent in mitigating and compensating the project-related impacts. MH is forecasting to spend an additional $30.5 million in fiscal 2011 and $29.9 million in fiscal 2012. In recognition of the anticipated mitigation payments to be incurred, the Corporation has recorded a liability of $129 million as of March 31, 2010.

MH has also entered into agreements with the Province whereby MH has assumed obligations of the Province with respect to certain northern development projects. MH assumed obligations totalling $145 million for which water power rental charges were fixed until March 31, 2001. The remaining liability outstanding as of March 31, 2010 was $12 million. All mitigation cost obligations, including those Provincial obligations assumed by MH, are capitalized and amortized over the remaining life of the generation and transmission assets to which they pertain.

9.5.0 INTERNATIONAL FINANCIAL REPORTING STANDARDS (IFRS)

9.5.1 IFRS Transition

International Financial Reporting Standards (IFRS) will be adopted by Canadian Generally Accepted Accounting Principles (GAAP) to be implemented effective January 1, 2011. Canadian utilities have been granted an optional one-year deferral of the implementation of IFRS to years commencing on or after January 1, 2012. This allows for a transition of accounting standards that do not recognize rate-regulated assets and liabilities. MH will be required to prepare IFRS-compliant financial statements for its fiscal year 2012/13 with comparative financial information for 2011/12.

The implementation of IFRS has prompted MH to delay undertaking Board-requested studies, including an independent benchmarking study of key performance metrics comparing MH's operations with other utilities as well as an Asset Condition Assessment Report. These studies were ordered in Directive 4 and Directive 7, respectively, of Order 150/08.

9.5.2 Rate-Regulated Assets & Liabilities

IFRS does not currently recognize rate-regulated accounting. If standards remain unchanged, MH will be required to write off the accumulated balance of its rate-regulated assets against retained earnings and expense expenditures previously deferred due to rate regulation as incurred.

MH stated that its rate-regulated assets were $299 million as of March 31, 2010, of which $229 million relate to electric operations and $70 million to gas operations. A major component of rate-regulated assets is approximately $40 million in annual Power Smart DSM program costs. Currently, DSM expenditures are amortized over a 10-year period. Under IFRS, the amount would be expensed in the year incurred.

With respect to the implications of conversion to IFRS on the rate-setting process, MH believes that any changes in accounting practices can be accommodated within the rate-setting framework. Since IFRS result in changes to the timing when certain costs will be recognized in its operating accounts, MH believes that some mechanism may be required to defer certain costs for rate-setting purposes. MH stated that it would provide the Board with alternatives to consider at the appropriate time.

9.5.3 Other Accounting Impacts

Canadian GAAP converged with IFRS related to accounting for Goodwill and Intangible Assets in fiscal 2010. IFRS does not allow planning studies to be capitalized, which were previously amortized over 15 years, unless there is assurance that the facilities will be built. As a result, MH was required to write off $37 million in deferred costs including computer development, general advertising and promotion and planning studies to retained earnings, impacting MH's 2008/09 retained earnings. Included in the write off were $25.2 million in unamortized planning studies.

IFRS also has more restrictive requirements for the type of expenditures that can be capitalized. IFRS does not allow advertising and promotional activities, administrative and other general overhead expenditures, property and business taxes and interest on common assets to be capitalized. MH adjusted its overhead capitalization policy accordingly by reducing the amount of overhead capitalized to capital projects from 24% to 17% for 2010/11.

As a result of the accounting policy changes, MH reduced its total capitalized overhead by $5 million in 2008/09 and an additional $4 million in 2009/10. It also made a provision of $18 million in 2010/11 and $14 million in 2011/12, reflecting a reduction in the overhead rate.

9.6.0 O&A COST CONTROL PROCESS

MH's forecast provides for a productivity factor in the order of 0.5% to 1% annually in the setting of its business unit O&A targets. In response to the economic downturn, MH has put in place measures to constrain the increase of O&A, including a freeze on hiring of new positions (with the exception of line trades trainees), restrictions on out-of-province travel, rationalization of fleet vehicles, extension of service lives of computers and equipment and reduction of overtime costs where possible.

MH indicated that such measures were short-term and that cost containment measures would not compromise system safety and reliability. MH stated that such steps had resulted in reducing the year-over-year changes in O&A by 5% or $16 million in the first 10 months of the current fiscal year.

In Order 116/08 the Board stated:

> *"Although Hydro's operating and administrative expenses appear reasonable, the Board urges Hydro to continue to control these expenses through aggressive cost control initiatives and management of the labour force. The Board appreciates that some operating and administration expenses, particularly payments to the Province, are beyond Hydro's control. However, it remains necessary for Hydro to continue to be diligent in taking steps to control all such costs and improve efficiencies. Corporate Performance measures such as operating and administration cost per customer or per kW.h targets are of great assistance in*

assessing the performance of Hydro's cost control initiatives compared to other utilities. The Board recommends Hydro aggressively pursue meeting its operating and administration costs per customer target while finding ways to increase productivity. The Board also encourages Hydro to continue to participate in benchmarking initiatives to help identify and implement further efficiencies and enhancements of its operations as compared to other utilities."

In that Order the Board directed:

"MH to undertake and file with the Board, by June 30, 2009, an independent benchmarking study of key performance metrics, using the most current available data and including:

a) Primary key drivers of OM&A in each operational division [Board preferences to allow for a comparison with a greater number of other utilities].

b) Comparable other Canadian Utility data for each of the drivers.

c) Key comparison indicators including staffing levels.

d) A comparison with and discussion of industry best practices.

e) Potential improvement areas."

The Board expects to be apprised of the scope of the study and advancement being undertaken, and will anticipate the opportunity to provide direction.

The Board is convinced that both the Province and ratepayers will benefit from the development of appropriate metrics to assess the reasonableness of the level of current and future OM&A expenses, in advance and particularly because of, the proposed major capital expansion program.

MH has deferred undertaking the Board-directed benchmarking study until after the implementation of IFRS in fiscal 2013.

9.7.0 INTERVENER POSITIONS

9.7.1 CAC/MSOS

CAC/MSOS questioned the growth in O&A expenditures, citing internal memos from the President of Hydro in which concerns were raised about the annual increases in O&A. Such concerns were not properly externally acknowledged in the GRA, which undermines MH's argument of ongoing expenditure controls in the 2008/09 through 2010/11 being prudent and reasonable. CAC/MSOS questioned MH's cost containment efforts, noting that they were only short-term measures that cannot be relied upon to restrain the growth in O&A in the long term.

9.7.2 MIPUG

MIPUG encouraged the Board to provide MH direction to ensure a continued restraint and tight controls on O&A spending. MIPUG recommended that the Board require MH to provide detailed reports to the Board and Interveners on corporate-wide efforts to restrain O&A and that MH continue to document and report on quantitative improvements in efficiency.

MIPUG recommended that the Board require MH to provide budget scenarios and options considered for maintaining O&A spending at inflation or at zero levels, providing a transparent process to review choices.

MIPUG further commented on the growth in personnel, whereby MH had added over 600 employees during a recessionary time, contrary to what other companies would be doing related to hiring during a downturn.

9.8.0 BOARD FINDINGS

The Board notes that the Corporation has shown some interest in undertaking cost-containment measures. However, such measures are far too modest and short-lived. MH's annual operating costs top $700 million, with targeted measures expected to deliver only $13 million of savings, or 2% of the total.

Given the corporation's current development plans, MH has seen material increases in staffing levels. MH has added over 900 employees since 2004, the majority engaged in one capacity or another in implementing the utility's development plan, well ahead of an NFAAT, regulatory approvals and firm export contract commitments. If the projects do not go ahead, MH faces the likelihood of having to expense expenditures currently deferred or capitalized.

The Board, in past Orders, has recommended that MH find ways to control the growth in operating expenses. The Board continues to believe that MH should look internally to find efficiencies and control the growth in operating expenses. To do otherwise increases the risks faced by ratepayers of paying higher rates than required.

The Board notes that during the last expansion phase in 1992, MH had an employee complement that peaked at 4,232 EFTs, with fewer than 900 dedicated to capital construction. Since then, staffing has ballooned to over 6,300 EFTs, with over 1,400 EFTs dedicated to construction-related efforts.

The impact of the large staff complement is muted by MH's capitalization policies. A significant portion of MH's operating expenses (in excess of 40%) are capitalized each and every year, masking the impact of the significant staffing levels at MH. There remains a risk that if the projects do not proceed or become economically not profitable, a significant amount of capital costs, now well in excess of $400 million will have to be written off.

It is also vitally important that MH undertake a benchmarking of its operations against peers with the goal to control the growth in operating expenses and foster practices, which improve efficiencies.

10.0.0 DEPRECIATION AND AMORTIZATION

10.1.0 OVERVIEW

In the test years, depreciation and amortization is the second-largest expense category to be recovered through rates. Depreciation expenses were $358 million in fiscal 2010 and have grown to $366 million in fiscal 2011.

MH last instituted new depreciation rates on April 1, 2007. MH's last Depreciation Study by Gannett Fleming dated March 31, 2005 was filed at the 2008/09 GRA. Although a 2010 Depreciation Study was previously anticipated for this GRA, MH deferred the study pending integration of the IFRS requirements. MH at that time also deferred the Board-directed Asset Condition Assessment to circa 2013.

MH's depreciation and amortization expense is forecast to be $405 million in fiscal 2012, an increase of $47 million since fiscal 2010. MH attributed the increase to a higher level of net assets. Depreciation and amortization is now forecast to grow to over $830 million by 2030 with the new major generation and transmission projects.

10.2.0 DEPRECIABLE ASSETS

MH's IFF10-2 has 2010/11 gross electrical utility asset values of $12.6 billion which have been depreciated down to $7.8 billion.

Going forward, IFF10-2 projects the gross assets and depreciated assets to be as follows:

Net Plant In-Service ($Billions)

	Plant in Service	Accumulated Depreciation	Net Plant In Service
2015/16	17.4	6.8	10.5
2020/21	28.7	9.5	19.2
2025/26	39.9	13.0	26.8
2029/30	42.5	16.4	26.1

MH’s 2005 depreciation study apparently uses industry standards for the life expectancy of various facility components e.g.:

- Hydraulic Generation Facilities:
  - Civil Works – 100 years life with the extensive rehabilitation works required on most of the Winnipeg River plants over the last 2-3 decades. A reconsideration of the 100 year life expectancy might be acceptable.
  - Turbines and Generation - 65 years life. The significant remedial works required in the last two decades on Grand Rapids/Jenpeg generation units suggest a shorter life expectancy could be appropriate for all.
  - Accessory Equipment - 50 years life. Shorter life expectancy could also be suggested.

- Thermal Generation Facilities:
  - Steam plants - 65 years life. MH's ongoing investments in the Brandon and Selkirk plants may not support the notion of a 65 year life.
  - Natural gas combustion turbine - 25 years life. Some questions of the true economic value of these plants remain.
- Transmission Lines:
  - Towers - 75 to 85 years life. Events on Bipoles I and II in 1996 and 2011 suggest remediation of failed or damaged facilities could reduce the effective life cycles.
  - Conductors - 60 years life. Aside from the former Winnipeg Hydro transmission upgrades, MH has indicated a need for early replacements.
- HVDC Converter Stations:
  - Structures - 57 years life. No indication of problems exists.
  - Serialized equipment - 37-43 years life. Indications from prior evaluations are that the serialized equipment (synchronous condensers) may need replacement in 20 to 50 years.

10.3.0 BOARD FINDINGS

Depreciation (amortization) expense is forecast in this application based on an out-dated 2005 depreciation study. The Board is aware that a result of IFRS requirements for componentization will likely lead to an increase in depreciation expense, as components will have to be carved out and depreciated over their respective shorter service lives rather than over a longer service life of the asset as a whole. The Board understands that a new depreciation study is being prepared.

The Board remains concerned that an Asset Condition Assessment Study has been delayed and notes that several of the assets, which are being depreciated over long periods of time, may require major repairs in the interim.

There does not appear to be any explicit recognition of the physical condition and ongoing repairs associated with the individual generating stations or transmission facilities. This suggests that MH may not have an adequate history of physical plant conditions and rehabilitation needs such as would be included in an "Asset Condition Assessment". The Board will require MH to file an Asset Condition Assessment and depreciation study at the next GRA.

11.0.0 PAYMENTS TO GOVERNMENTS

As a Crown Corporation, MH does not pay income tax, provincial sales tax or the Goods and Services Tax. MH does, however, pay the Provincial Corporations Capital Tax, similar to other privately held corporations employing capital in Manitoba. The Province of Manitoba also levies a number of other fees to be paid by MH. Forecast payments to the Province were $ 240 million in 2010, $ 244 million in 2011 and $236 million in 2012.

The total payments to the Province from fiscal 2005 through 2012 are summarized as follows in the following table:

PAYMENTS TO THE PROVINCE ($MILLIONS)

	Actual					IFF09-1		
Fiscal Year	**2005**	**2006**	**2007**	**2008**	**2009**	**2010**	**2011**	**2012**
Corporations Capital Tax	35	36	37	39	44	45	47	44
Payroll Tax	7	7	8	8	9	9	9	9
Water Rentals	104	124	106	117	115	111	102	100
Debt Guarantee Fee	68	66	68	70	70	72	78	83
Sinking Fund Admin Fee	1	-	-	1	1	1	-	-
Provincial Mitigation or Settlement Obligations	13	2		2	-	2	8	-
Total Payment	**228**	**235**	**219**	**237**	**239**	**240**	**244**	**236**
Total Payments as a Percentage of MH's Gross Revenue	14%	13%	13%	14%	14%	15%	15%	13%

MH is forecasting paying $380 million to the Province in 2020, which is approximately $150 million higher than current levels. Payments to the Province will increase when the new generation and transmission projects are built.

MH pays Corporations Capital Tax to the Province based on 0.5% on its invested capital. The Corporations Capital Tax is a function of the level of debt of MH. The Corporations Capital Tax has been phased out for all corporations effective January 1, 2011 except for Crown Corporations, Banks and Trust Companies. As such, MH will remain subject to Capital Tax.

Water rentals relate to the use of provincial water resources, and are paid on a monthly basis to the Province based the greater of:

- Energy produced, at a current rate of $3.341 per MWh, or
- The installed capacity of the facility at a rate of $8.13 per installed horsepower.

The Provincial Debt Guarantee Fee is 1.0% of the sum of the balance of MH Bonds, provincial advances to MH and provincial short-term promissory notes outstanding to guarantee MH long-term debt.

The Sinking Fund Service Charge is 0.075% of the amount of the sinking fund balance, and is paid to the Province for managing MH's sinking fund balance. MH's sinking fund is a covenant related to its bond issues.

In addition to the payments to the Province, MH makes Grants in Lieu of Taxes (GILT) to municipalities on buildings and structures throughout the Province. In 2009 MH made $11 million in GILT payments. The payments are forecast to increase to $15 million in 2010, as a result of the new Corporate Head Office inclusion in the tax rolls. MH indicated the property and business tax on Corporate Head Office to be $3.8 million per year.

11.1.0 BOARD FINDINGS

The Board notes that MH makes a significant contribution to the Province and to Manitoba municipalities. The payments to the Province in particular represent 15% of the gross revenue of the utility, a significant amount. The total amount to be paid to the Province is expected to grow substantially over the next twenty years, primarily due to the now-planned new major generation and transmission investments, these through increases in borrowings, increased capital, and higher water rentals as the new generating stations are built.

The Province's financial interest in the contemplated generation and transmission investments due to potentially higher government underscores the need for an independent arm's-length review of the economics of these projects.

12.0.0 FINANCIAL TARGETS

In September 1995, MH adopted the following financial targets, which were reviewed by the Board at prior GRAs and the current hearing:

1. To achieve and maintain a minimum debt-to-equity ratio of 75:25 by no later than 2005/06;

2. To achieve and maintain an annual gross interest coverage ratio of 1:20 to 1:35 annually; and

3. To fund all new capital construction requirements except major new generation and/or major new transmission facilities, plus the new head office, from internal sources.

MH's financial targets have varied over the years due to changing circumstances and priorities. Since the original 1995 date, the targets have changed as follows:

Year	Financial Target
1995	75:25 debt equity ratio by 2005/06, interest coverage ratio of 1.20 to 1.35 and fund all capital expenditures, except major new facilities, from internally generated funds
2001	75:25 debt equity ratio by 2005/06, minimum interest coverage ratio of 1.20 and fund all capital expenditures, except major new facilities, from internally generated funds
2002	75:25 debt equity ratio by 2011/12, minimum interest coverage ratio of 1.10 and fund all capital expenditures, except major new facilities, from internally generated funds
2007	75:25 debt equity ratio by 2011/12, minimum interest coverage ratio of 1.20 and fund all capital expenditures, except major new facilities, from internally generated funds

As of March 31, 2002, MH had a debt/equity ratio of 77:23. MH stated that the largest single factor contributing to the delay in the achievement of the 75:25 debt/equity target was the 2002 to 2004 drought. The drought resulted in an approximate $600 million reduction to net export revenues relative to a normal flow period and severely impeded

MH's progress toward its financial targets. In 2002, the target year was changed from 2005/06 to 2011/12 to allow for a more gradual rate impact on customers.

12.1.0 DEBT-TO-EQUITY RATIO

The debt-to-equity ratio measures the relationship of long-term and short-term debt less short term and sinking fund investments to equity (retained earnings including AOCI and unamortized customer contributions). This ratio is used to assess the overall financial risk to MH by examining the level of debt in relation to the amount of equity held. MH has established a debt-to-equity ratio target of 75:25 by fiscal 2012.

MH attained the 75:25 debt-to-equity ratio target in 2010, an accomplishment not contemplated at the last GRA. Since the 2004 drought, the capital structure has improved from 87:13 in 2004 to 73:27 in 2010. The improved financial position relates to higher-than-expected extra-provincial revenue and rate increases granted by the Board, which on a cumulative basis have totalled 22% since 2005.

MH is now forecasting increases of 3.5% annually for the years 2013 tto 2021 (a cumulative 39% increase) but due to its planned spending on major new generation and transmission projects, MH's capital structure is forecast to weaken from the 75:25 target to a debt-to-equity ratio of 84:16 in 2021.

In support of its application, MH had filed IFF09-1 and CEF09-1. MH had anticipated capital spending of $ 13.1 billion on its three major generation and transmission projects (Keeyask G.S., Conawapa G.S and Bipole III). With the upward revised capital cost of these three projects reflected in IFF10-2, the capital cost has increased to over $16.6 billion, which is over $3.5 billion higher the cost forecast in CEF09-1.

Long-term debt was forecast to grow from $7.8 billion in 2010 to $17.7 billion in 2029. Based on the revised capital forecast, long-term debt is to balloon to over $23 billion in 2029, an increase in long-term debt of $5.0 billion from the previous forecast. The higher debt level will result in materially higher debt servicing costs, which over the forecast period has reduced the net income by $3.2 billion from the amount forecast in IFF09-1. The change in forecast net income and the debt-to-equity ratio from IFF09-1 to IFF10-2 is as follows:

	Net Income ($ Millions)			Debt : Equity Rato	
Fiscal Year Ending March 31,	**Iff09-1**	**IFF10-2**	**Difference**	**IFF09**	**IFF10-2**
2010	129	163	$34	74:26	73:27
2011	88	158	$70	75:25	74:26
2012	98	134	$36	76:24	74:26
2013	83	132	$49	76:24	77:23
2014	137	198	$61	78:22	78:22
2015	122	155	$33	79:21	79:21
2016	260	230	($30)	80:2	81:19
2017	271	278	$7	80:2	81:19
2018	246	227	($19)	80:2	82:18
2019	257	120	($137)	80:2	83:17
2020	287	198	($89)	79:21	83:17
2021	307	12	($295)	79:21	84:16
2022	450	244	($206)	78:22	83:17
2023	554	332	($222)	76:24	83:17
2024	744	392	($352)	73:27	82:18
2025	805	504	($301)	70:3	80:2
2026	922	462	($460)	66:34	79:21
2027	1019	552	($467)	61:39	77:23
2028	1127	648	($479)	56:44	74:26
2029	1237	753	($484)	51:49	72:28
Total	**9441**	**5892**	**($3 549)**		

The debt-to-equity ratio in 2029 has changed from 51:49 in IFF09-1, a particularly strong balance sheet, to 72:28 in IFF10-2, representing a materially negative financial change from one forecast to the next. Changes in GAAP with the move to IFRS in fiscal 2013 will likely further hinder MH's progress to its debt-to-equity target.

12.2.0 INTEREST COVERAGE RATIO

The Interest Coverage Ratio is calculated to measure the degree to which net income before interest exceeds finance expense. The interest coverage ratio indicates the extent to which net income is sufficient to pay gross interest on debt. An interest coverage ratio below 1 indicates that a company cannot support interest-servicing costs from operations and may require further borrowings to cover the interest charges. MH has established a target interest coverage of 1.20 in all years.

In IFF09-1 the target is not achieved, with shortfalls from fiscal 2011 to 2015. The interest coverage ratio falls within the range of 1.11 to 1.19 during that period. The interest coverage was forecast to be 2.22 in 2029.

MH filed an update based on IFF10-2, which reflected lower than forecast interest rates in the next few years. As a result of this change, MH now forecasts to meet its interest coverage ratios during each of the years 2011 through 2018. However due to the increase in capital costs of $3.6 billion and additional borrowings of over $5 billion, in the years 2019 through 2022 the interest coverage ratio will be below target. In particular, the forecast indicates that in 2021 MH will have an interest coverage ratio of 1.01.

In 2029, the interest coverage ratio has now been revised down from 2.22, based on IFF09-1, to 1.50. This is above target, but materially lower than what was indicated in IFF09-1. Further upward revisions in the capital cost of the major generation and transmission projects and any upward movement in interest rates above what is forecast could negatively impact the interest coverage ratio.

12.3.0 CAPITAL COVERAGE RATIO

The Capital Coverage Ratio measures MH's ability to make capital purchases without additional borrowings, measuring the extent to which internally generated funds are sufficient to fund capital expenditures during the year. The Capital Coverage Ratio does not include the major generation and transmission projects in its determination. If such projects were included, it would indicate that MH has a Capital Coverage Ratio well below 1.0 and that the funding for the new projects is supported primarily if not solely by new debt issues.

12.4.0 INTERVENER POSITIONS

12.4.1 CAC/MSOS

CAC/MSOS stated that in the short term the overall retained earnings and debt ratio for 2011/12 is better than originally forecast in IFF 09–1, and that the current outlooks in IFF 10–2 for 2010/11 and 2011/12 in terms of the debt ratio are both better than what was forecast in IFF 09-1. The current outlook for the test years does not support the need for rate increases greater than those already approved on an interim basis. CAC/MSOS noted that it could even be argued that the interim rate increases approved could be rolled back and would still result in a financial position at least as favourable as those originally expected in IFF 09–1.

CAC/MSOS further noted that the cost of construction of the major generation and transmission projects as they progress affects MH's balance sheet and its debt-to-equity ratio. To the extent that assets are funded through debt, it will affect the debt-to-equity ratio. Since the Board uses of the target ratio as a measure of financial soundness, this puts pressure on rates to increase to maintain the target.

CAC/MSOS adopted the evidence of Greg Matwichuk, who stated that less reliance should be placed on retained earnings and the debt-to-equity ratio for the purpose of rate-setting on a go-forward basis. Mr. Matwichuk stated that changes in MH’s debt-to-equity ratio have no apparent impact on the Province’s credit rating, noting that after the drought in 2003/04, the debt-to-equity ratio was 88:12, which resulted in no reduction to the Province’s bond-rating grade.

Mr. Matwichuk recommended that MH establish a Rate Stabilization Reserve (RSR), a regulatory mechanism to stabilize rates that may otherwise sharply increase due to the effects of unanticipated events. The RSR would provide MH ratepayers some level of protection against large rate increases that may become unavoidable due to sudden or unanticipated adverse conditions. Mr. Matwichuk noted that a similar mechanism is in place at Manitoba Public Insurance.

RSRs exist at regulated entities such as hydroelectric utilities, water utilities, local gas distribution companies and insurance companies and are typically utilized by utilities which are subject to weather- or and/or water-related factors that complicate forecasts and result in variances.

CAC/MSOS submitted that the establishment of an RSR for regulatory purposes is appropriate for MH due to significant variances in forecasting, observed volatility in export revenue, and MH's vulnerability to known contingencies with uncertain timing and impact. Mr. Matwichuk stated that an RSR would assist in managing the impact of risk to domestic ratepayers. Under his proposal, when export revenues exceed forecast export revenues, the excess would be set aside to be amortized over five years The same approach would be taken to years in which export revenues fell below the forecasted level, meaning that deficits would also be amortized over a five-year period. Under such a mechanism, the net unamortized equity or deficit arising out of export revenue differentials from forecasts would remain on the balance sheet as a form of a RSR, segregated from the general equity.

12.4.2 MIPUG

MIPUG stated that MH is in the best financial position that it has been in its history, exceeding the 75:25 debt-to-equity ratio with close to $2.5 billion in retained earnings. Based on the most current forecast, retained earnings should be increased to $4.3 billion.

With respect to the debt-to-equity target of 75:25, MIPUG stated that the true value of Hydro's assets is significantly higher than their book value. While the 75:25 debt-to-equity target is important, it is an artificial number and does not show the true strength and value of MH and its assets. MIPUG submitted that such information should provide some comfort to the Board.

Bowman & McLaren stated that the planned increase in net plant in service is a key driver in the change in the forecast debt-to-equity ratios and that the impact of a higher level of capital expenditures will have increasing cumulative impacts on the level of net income in the future. The current 75:25 debt-to-equity ratio is reflective of a retained earnings level approximately equal to the benchmark of a five-year-drought. However in the latter part of the IFF, given the capital spending proposed, the 75:25 debt-to-equity ratio target may generate retained earnings levels that may exceed the calculated cost of a five-year-drought at that time.

As the degree of capital investment increases, the relevance of the debt-to-equity target will diminish. Given the provincial debt guarantee, the debt-to-equity ratio is not as important for a public utility as opposed to what it would be for a private enterprise.

MIPUG submitted there is nothing in the evidence that indicates that MH cannot handle a five-year drought and will not have the cash flow to survive it. MH has one of the lowest electricity rates in North America, so there would be a lot of room to adjust rates, and all the forecasts show that MH would recover from a net loss without having to impose rate shock on customers.

MIPUG did not agree that water reservoir levels should be used as a rate stabilization mechanism as proposed by KM, nor did MIPUG believe that an RSR mechanism as proposed by CAC/MSOS should be implemented. The utilization of water levels as a reserve may result in suboptimal use of the resource and lead to a reduction in revenues in some cases. Adjusting lake levels by one or two feet would not be a good strategy if money ends up being lost each year because water is spilled instead of being used to sell energy on the export market.

MIPUG further submitted that the RSR mechanism as proposed by CAC/MSOS would not improve transparency and is not required because the Board's rate-setting process is effective. If the Board were to consider establishing an RSR, Bowman & McLaren noted that an orderly process as identified by the Board in Order 116/08 would have to start with the step of identifying and properly quantifying MH's risks in advance of addressing the appropriate form of reserves. This would be a matter for future consideration. Should a financial reserve target be desired in the future, the value may be derived based on targeting a long-term rate stability criterion which would include periods leading up to, during and following a benchmark drought. Such an analysis could be completed using probabilistic tools as identified in the KM report.

12.5.0 BOARD FINDINGS

Despite the concerns the Board has with respect to the "firmness", if not validity of the equity components of MH's debt-to-equity target ratio, the Board notes that MH currently has achieved its debt-to-equity target and that to maintain the 75:25 ratio it will require rate increases far higher than that currently contemplated in the IFF.

The current view of capital spending for major generation transmission, with current estimates $3.6 billion higher than in IFF 09–1, reflects an ever-increasing debt load, higher forecast carrying charges, lower income approximating $3.2 billion and a further deterioration in the capital structure of the Corporation over the next 20 years. This deterioration is predicated on increasing rates over the forecast time frame by approximately 60%.

The Board remains concerned that export revenues, which were negotiated when the capital costs of the major projects were projected to be much lower, have been locked in, yet the projected capital costs have increased unabated. These increased costs will have to be paid for somehow, and in the absence of export customers paying them, the burden will fall on domestic customers. An NFAAT process should be established to review the implications of the proposed development plans on MH's capital structure.

The Board notes that the financial capital structure of MH was to peak at 80% debt and 20% equity in 2019. Based on updated estimates, the debt portion has grown to over 84% in 2021 and is not to return to current target (and currently attained) levels at the end of the forecast period 2030. In IFF 09–1, the 75:25 debt-to-equity financial target was reached in 2024 and, optimistically, a debt-to-equity ratio of 51:49 was projected for 2029. The Board questions whether the debt-to-equity financial target of 75:25 for rate-setting purposes should be revisited, given that it is currently forecast not to be attained over the 20-year financial outlook.

Any further increase in capital costs for the major capital projects will come at the price of a further deterioration in MH's capital structure. This may require greater rate increases from domestic customers than those currently projected.

As for the interest coverage target of 1.20, the Board remains concerned that a decline in export revenues due to a structural change in the markets into which MH delivers its electricity could have grave consequences to MH's ability to meet its debt obligations. These are currently forecast to be $23 billion when the projects are completed. Interest rates, if they increase beyond forecast levels during the development and construction of the major generation and transmission projects, could further increase the debt and associated carrying costs incurred by MH. To the extent that projected revenues will not materialize, MH would still be required to meet its debt obligations.

The Board notes with concern that under the most recent forecast, the interest coverage ratio comes very close to 1.0 during one of the years of the planning horizon. This suggests that MH may come close to being unable to meet its interest obligations from its operations and will be, if the ratio falls below 1.0, in the position of having to borrow additional funds to meet its interest obligations.

Interest costs will be over $1.5 billion on an annual basis once the projects have been completed, which will have to be met by revenues from both domestic and export customers. To the extent the export revenues do not materialize as planned, the burden will fall to the domestic ratepayer. It is vitally important that the economics of the proposed generation and transmission investments be subject to a thorough review to ensure that the developments, if they proceed, will benefit and not overly burden domestic ratepayers.

The Board does not see merit in establishing an RSR based on excess or deficient export revenue. While the Board remains concerned about MH's ability to achieve its export forecasts, an RSR mechanism would not assist in smoothing out the rate implications of a shortfall.

The Board believes that the current rate-setting mechanism, including the presentation of forecasts that are tested in a rate hearing, provides an appropriate mechanism for setting rates. The Board does, however, see merit in exploring whether establishing an RSR is appropriate for other reasons.

The Board believes that having reviewed the risks faced by MH, sufficient information exists to move one step further towards assessing whether a mechanism such as an RSR would be appropriate in establishing future rate sufficiency. While the Board does not believe that an RSR mechanism should be established at this time, it should be one of the mechanisms to be considered by this Board at a future GRA.

The Board further believes that since MH's proposed capital expenditure plan is subject to material escalations, some consideration should be given to de-linking rate requirements from the debt-to-equity ratio target of 75:25. Instead, rate requirements should be more focused on an amount sufficient to meet the risks faced by the Corporation.

13.0.0 LOAD FORECASTS

13.1.0 OVERVIEW

MH's Load Forecast is used to predict when new generation and transmission assets are needed to serve MH's load. MH's 2010 GRA was premised on a May 2009 Load Forecast which only partially reflected the economic downturn. In PUB/MH II 194(a), MH confirmed a domestic load reduction of 1,000± GWh from May 2008. This did not include any plant closure impacts.

MH's Updated Domestic Load Forecasts indicate a significant downward trend in the forecasts from 2008 onward. This trend reflects the economic downturn after 2008/09 and the closure of the pulp and paper plant at Pine Falls. However, according to MH these forecasts do not include the impact of pending closures of smelter operations in Flin Flon and Thompson, which according to MH's testimony would reduce consumption by about 500 GWh after 2015/16.

13.2.0 INDUSTRIAL CUSTOMER CONSUMPTION

The table below provides an industrial energy consumption history and forecast from 2005/06 to 2009/10 and beyond. It is apparent that the total industry consumption totals are very similar to MH's total Top Consumer usage.

Industrial load growth has essentially stalled since 2005/06. Even without the pulp and paper plant shutdown, MH's industrial load would have shown little or no growth in the last 5 years. From the table below it is apparent that MH's expectations of high industrial load growth in the chemical and petroleum sectors will not be realized in the short term.

In the most recent Load Forecast, MH is looking for growth of 100 GWh per year in Top Consumer load. If correct, this would add about 700 GWh to energy consumption and offset the smelter closures by 2015. If this new load does not materialize, MH's total industrial consumption would remain near the 5,000 GWh/year level.

MH's industrial customers were targeted for higher rates during the Energy Intensive Industrial Rate (EIIR) hearing. The logic employed suggested that Manitoba industries were paying less than market value for energy consumed. Consequently, MH considered that the utility was losing money for all increases in energy sold at approved rates to GSL and GSM customers.

In Board Order 112/09, MH was directed to limit the new EIIR to new peak energy consumption. This reflected the circumstances of 2007/08, when average MISO Market prices were in excess of 4¢/kWh during peak periods but were at the 2¢/kWh range during the off-peak periods.

The market circumstances in 2009/10 and 2010/11 have shown that GSL and GSM customers are paying at least peak MISO Market prices and considerably more than off-peak MISO Market prices. MH has yet to abandon the EIIR concept, but has seen some industrial customers move to higher levels of consumption than contemplated in the EIIR hearing.

13.3.0 RATE IMPACTS ON LOAD GROWTH

It is the Board's understanding that all GSL & GSM customers are subject to the same (unchanging) demand charge per kVA and the same (progressively increasing) energy charge per kWh regardless of peak or off-peak consumption. To date, MH has declined to offer time-of-use rates to these customer classes. Apparently industrial customers are not entitled to access low cost off-peak energy on the same basis as MH's export clients.

Given the low MISO market prices, a potential problem looming for MH's industrial customers is that they may be paying significantly more for energy in the next 10 to 20 years than utility customers in the adjoining MISO states. If that ends up being the case, cheap electricity may no longer be an economic advantage of doing business in Manitoba.

13.4.0 DOMESTIC LOAD DEMANDS FOR NEW GENERATION

MH's 2008/09 Power Resource Plan contemplated a Keeyask G.S. in-service date of 2018 and a Conawapa G.S. in-service date of 2022. The 2008 Base Load Forecast along with existing NSP sales, an NSP sales extension, and the new WPS-500 MW/MP-250 MW term sheets were the apparent drivers for these in-service dates.

Domestic energy consumption, rather than peak winter demand, was viewed as the critical factor, with energy shortfalls anticipated as early as 2011/12. A need was seen for contracted imports until 2015 when the level of contract sales to NSP would be reduced.

The 2008 Base Load Forecast foresaw a domestic load of 28,100 GWh by 2015/16, reflecting 8,040 GWh of energy usage by Top Consumers.

MH's IFF10-2 lowered the 2015/16 domestic load forecast to 25,700 GWh (including 6,666 GWh of Top Consumer load, which may still be too optimistic). This differs significantly from the 27,300 GWh projection for 2015/16 set out in IFF08-1 when MH saw a need for Keeyask G.S. by 2018/19 to allow the new export sales.

13.5.0 INTERVENER POSITIONS

13.5.1 CAC/MSOS

CAC/MSOS did not take issue with MH's overall domestic load forecast. Some concerns were expressed about:

- the level of electric car growth included in general service;
- the residential load growth projections;

- the lack of growth in commercial sector load; and
- the decline in industrial sector load.

13.5.2 MIPUG

MIPUG did not offer any new insight on the recent loss of industrial load and the potential for existing customer growth and/or new industries coming to Manitoba. It appears that following another round of consultation, MIPUG now supports MH's pending EIIR initiatives.

13.5.3 RCM/TREE

RCM/TREE continues to express concern about the limited achievements with respect to energy conservation and continues to favour increased exports over higher levels of domestic load growth.

13.6.0 BOARD FINDINGS

It is the Board's view that MH's most recent domestic load forecasts for the longer term:

- do not adequately recognize the longer-term implications of the recent economic downturn;
- may well be overly optimistic given the stagnation and/or lack of growth over the last five years in the industrial sector; particularly when coupled with the actual pulp and paper plant closure and imminent smelter closures; and
- do not support the significantly advanced dates for new generation, but rather, in the absence of the new contracts, suggest a 2024/25 in-service date for domestic load only.

The Board understands that the recent MP & WPS contract announcements essentially commit MH to building Keeyask G.S. by 2020/21. This is about five years earlier than domestic need only would indicate.

While the Board appreciates that MH's domestic revenue growth from the residential and commercial sectors has largely offset the revenue decline experienced to-date in the industrial sector, it does not share MH's optimistic view of any early dramatic recovery in the latter. And, the continuing prospect of the future implementation of an EIIR could well hinder such a recovery.

The Board is still awaiting MH's re-filing of the EIIR, as directed in Board Order 112/09.

14.0.0 POWER SUPPLY

14.1.0 DC TRANSMISSION SYSTEM

14.1.1 Reliability Case for Bipole III

MH holds that Bipole III is required for domestic system reliability, and that the significant costs that would be expended on its construction, including the cost of converter stations, should not be attributed to any degree to either the planned new generation projects on the lower Nelson River (Keeyask G.S. and Conawapa G.S.) or to export customers. The coincidental outage of Bipoles I and II that occurred in the fall of 1996 has been cited as an example of the reliability risks that currently exists and needs to be addressed.

MH did not provide an analysis of any of the various events that could lead to the loss of HVDC power. Tornadoes, wind shear, forest fires and ice storms have, at various times, been identified as the most likely triggers of such an outage. All of these extreme events are more likely to occur in either the spring, summer or fall, rather than in the winter. In mid-winter, the biggest risk that has been identified is an ice storm that "takes out" some of the transmission towers.

In January 2011, a large number of Bipole I and II towers were threatened by ice formation within flooded right-of-ways. This presented a real risk. The transmission towers appear to need to be flood-proofed as soon as possible, whether or not Bipole III, or another reliability upgrade, is put in place.

It is unlikely that Bipole III, if constructed, would be built to less than a capacity of 2,000 MW. While the Board's Vice Chair accepts MH's evidence that Bipole III is required for reliability purposes, the Chairman suspects that an alternative reliability measure that could potentially replace Bipole III would be the addition of CCCT natural gas generation capacity (perhaps to be developed in "smaller steps", e.g. 400 to 500 MW at a time) to address the risk of an outage of either or both existing Bipoles.

MH compared the available aggregate Bipole I and II capacity of 3,354MW to the maximum 3,562MW generation capacity of the three existing Lower Nelson River generating stations, noting a 208MW deficiency. It is not clear what circumstance would require 100% output from these three plants to meet only domestic demand. Force majeure provisions in existing and new export contracts should allow for curtailment of export contract commitments in the event of a Bipole outage.

14.1.2 Reliability Alternatives

In June 2011, MH filed a 20-year Financial Outlook that included a comparison of the current plan for the construction of a 2,000 MW Bipole III (to be on-line in 2017/18) with a 2,000 MW natural gas generation plant to serve as an alternative. From the information provided by MH, it appears that comparison involved an SCCT plant rather than a CCCT plant, although a CCCT plant is clearly preferable due to its higher efficiency. The analysis that was provided was not detailed, and neither set out annual finance and depreciation costs nor recognized the potential revenue stream from a natural gas generation alternative.

As set out above, the Board's Vice Chair accepts MH's reasoning that Bipole III is required for reliability purposes. For the Vice-Chair, without Bipole III, the value of all lower Nelson River generation facilities (existing and planned) are jeopardized, in as much as a catastrophic failure of Bipole 1 and 2 would eliminate access to 75% of MH's hydro-electric power to southern Manitoba and export customers.

The Chairman, on the other hand, is of the view that there could be several advantages associated with a CCCT natural gas plant instead of Bipole III, which involve economics, risk management and the environment. A CCCT plant can be constructed at a fraction of the cost of Bipole III, and would provide MH with resource diversity that is currently absent. In the event of Bipole I and II being out of service, CCCT production and/or imports could be employed. MH's current diversity agreements with its American counterparties involve the receipt of coal-fired generation electricity in the winter. A

Manitoba-based CCCT plant would involve approximately half the emissions of coal-fired generation. The Chairman accordingly recommends that before Bipole III is constructed, the CCCT natural gas generation alternative should be investigated thoroughly.

In a prior Power Resource Plan, MH examined the cost of CCCT natural gas generation and concluded that a 400 MW CCGT produces about 3,100 GWh of dependable energy per year, which is slightly more than the projected dependable output of Keeyask G.S. Its capital cost was estimated at $471M and, because of its high efficiency, such a plant could produce energy at an operating cost of $55/MW or $8.40/GJ. (If, in the future, a price was put on carbon, a $30/tonne carbon cost would add less than $10/MW to the cost of operation.) Currently, natural gas is priced at $3.00 per GJ on the spot market, a mere 20% of the commodity's peak price. The reduction can be attributed partially to the slow recovery from the recession and partially to the availability of shale gas.

In its 2011 analysis, MH priced the capital cost of a 2,000 MW CCCT plant at almost $3.0B (25% higher than in 2008/09). With current natural gas costs at less than $5.00/GJ, the total on-line costs including finance, depreciation, maintenance and fuel costs would now be in the 5 to 6¢/kWh range.

14.2.0 AC TRANSMISSION SYSTEM

14.2.1 North-South Transmission

MH forecasts a need for "additional (AC) transmission from Northern Manitoba to Winnipeg" when Conawapa goes into service, now slated for 2023/24. MH's CEF-10 projection of capital costs budgeted $313 million for such a facility but did not specifically define its function or purpose.

MH has not explained its rationale for the additional AC transmission or its timing. A question that, among others, remains to be answered is whether this proposed AC addition is related to the west side siting of Bipole III and/or Bipole III capacity with or without export commitments.

14.2.2 Dorsey to U.S. 500kV AC Transmission.

CEF-10 also provides $205 million for additional Manitoba sited AC transmission to the U.S., to be in service by 2018. Presumably, this allocation was in anticipation of a 500 MW sale to WPS and a 250 MW sale to MP. With the WPS sale reduced to 100 MW, it may be that the expanded capacity could be deferred.

14.3.0 BIPOLE III FOR EXPORTS

MH notes that in the absence of the 2,000 MW Bipole III transmission line the construction of Conawapa G.S. should not occur. And, now seemingly without the 500 MW WPS sale, MH has decided to defer the construction and in-service date of Conawapa G.S., but still plans to proceed with Bipole III.

MH asserts that the planned Keeyask G.S. could not operate at maximum output in high-flow conditions without Bipole III. The assumption of a deemed requirement for 100% of Keeyask's potential generation in high flow conditions to be transmitted on Bipole III involves the prospect of opportunity export sales as well as both domestic load and firm export contracts. The availability of "dependable energy" does not require 100% of Keeyask's output.

Under the assumption that hydraulic generation is to be used to supply all firm/dependable energy in an average-flow year, MH holds that the existing Bipole I and Bipole II capacity is insufficient to convey the output from Keeyask G.S. plus the power generated from the three existing Lower Nelson River generating stations.

As set out above, the Chairman and the Board's Vice Chair are of two views with respect to MH's reliability arguments. The Chairman is of the view that MH's assumptions, which support a requirement of Bipole III if Keeyask is built, should be fully tested prior to MH making a final commitment to both Keeyask and Bipole III. The

Board's Vice Chair is of the view that Manitoba Hydro has established that Bipole III would be required for reliability purposes in any case.

14.4.0 INTERVENER POSITIONS

Recognizing that the Board was not asked or tasked to approve Bipole III, the Interveners only expressed concern with the seemingly ever-increasing costs of Bipole III and Keeyask, and with the cost revision process itself.

14.5.0 BOARD FINDINGS

The findings of the Chairman and the Board's Vice Chair differ with respect to MH's reliability case for Bipole III.

The Vice Chair is of the view that MH has established that Bipole III is required for reliability purposes even absent any additional export commitments, as the concurrent outage of Bipoles I and II presents a significant risk to MH's customers. The fact that a concurrent outage of both transmission lines is not without precedent (as it happened in 1996), and the fact that ice formations again threatened both existing Bipoles in 2011, indicates that an outage of the lines is a distinct possibility. It is also clear that the existing capacity of the three existing Lower Nelson River generating stations at 100% output already exceeds the capacity of the existing two Bipoles.

The Chairman, on the other hand, is of the view that MH has not sufficiently re-evaluated the Utility's initial view that Bipole III is required and that its construction will not "drive up" Manitoba's domestic rates, given reduced domestic demand, reduced overall exports and export pricing, and scaled down WPS export commitments.

While the Board lacks a mandate to approve MH's capital expenditures, particular capital expenditure plans predicated on export sales, the Board has to consider the economics of such expenditure plans because, in the absence of assured additional, profitable and sufficient export revenue, domestic rates could well increase materially.

To date, the Board has not been provided with any cost/benefit and domestic rate analyses supportive of the level of capital expenditure now being contemplated. In the Chairman's view, there are identified alternatives that should be thoroughly vetted before spending more funds and committing Manitoba consumers to meet any shortage of revenue that may arise with respect to meeting the projected costs of Bipole III. To that extent, MH's contention that Bipole III is being built for domestic reliability needs would best be supported by a review that includes the development of a clear definition of the various seasonal situations that could trigger the failure of Bipole I and/or Bipole II. If lower domestic rates could be expected to develop without Bipole III (or without Keeyask and/or Conawapa) within the long-term planning horizon of twenty years without any additional reliability risk, then the plans that would support such an outcome should be seriously entertained, certainly before further commitments are made to the planned capital projects.

Similarly, in the Chairman's view, if the construction of a CCCT natural gas generation plant of sufficient size can be found to provide a higher net present value than MH's current preferred development plan (Bipole III, Keeyask and Conawapa), then ratepayers should be made aware of this opportunity, as well as the projected domestic rate differential between MH's preferred plan, towards which MH has already spent and continues to expend significant funds, and a different plan, such as one that involves a CCCT natural gas generation plant in southern Manitoba.

Exports appear to be the primary driving force for the "early" (ahead of domestic need) in-service date for Keeyask G.S.. The Chairman is of the view that the export revenues expected to be generated by the new generation plant appears to also represent the impetus for an early in-service date of Bipole III. The Vice Chair does not share this view. As set out above, the Vice Chair is of the view that Bipole III is a required reliability measure even in the absence of additional export capacity.

Both the Chairman and Vice Chair believe that absent Keeyask, the construction of Bipole III can be expected to increase domestic rates. The question that remains is whether if Keeyask is built, the construction of Bipole III will still increase domestic rates. The Chairman is hopeful that both capital projects will be subjected to a full NFAAT hearing. The Chairman notes that if an economic case can be made for the deferral of Bipole III, Manitoba ratepayers would be the beneficiaries of lower electricity rates, as 100% of Bipole III's costs (not only the capital costs, but also the finance and operating costs associated with it) will, under MH's cost allocation, be borne by MH's domestic consumers. The Vice Chair does not share this view, and believes that while an NFAAT may be warranted for any new generation capacity, Bipole III should not be delayed. MH has advised, and has filed with a Board a letter from the Provincial government confirming, that an NFAAT review will be scheduled for the major capital projects.

15.0.0 ENERGY SUPPLY

15.1.0 HYDRAULIC GENERATION

15.1.1 Watershed Components

MH's hydraulic generation relies on flows originating in five large watersheds, as follows:

	Drainage Area (sq. mi.)
Lake Winnipeg Watershed	380,000
Winnipeg River	53,000
Saskatchewan River	157,000
Red River	110,000
Local Tributaries	60,000
Burntwood & Churchill (CRD) Watershed	115,000
Total Lower Nelson River Watershed (incl. Churchill River Diversion)	540,000

Since 1972, calculated and recorded inflows into Lake Winnipeg have fluctuated on an annual basis from 50% to 180% of the long term average/mean of 70,000 cfs. These represent about 70% of the total drainage system area, and about 67% of the total average annual flows on the lower Nelson River.

Because the Winnipeg River watershed contribution to total hydraulic generation output of 38% exceeds the contributions of the other watersheds, it is the most critical watershed for MH's hydraulic output.

The next largest contributor to hydraulic output is the Lake Winnipeg local drainage system, which includes Lake Manitoba/Lake Winnipegosis, with a combined surface area of 14,000 sq. mi. plus direct inflow from gauged and ungauged tributary streams. On average, this watershed accounts for another 24% of MH's hydraulic output. Seasonable run-off predictions are further complicated by the limited number of smaller stream gauging stations currently in use.

Both of the above watersheds tend to experience the same ups and downs of flows, as they typically experience the same weather systems. A drought is likely to affect both.

The Red and Saskatchewan River watersheds, respectively, account for 22% and 32% of watershed areas and 7% and 14% of MH's average annual hydraulic generation output. With 23% of the total watershed area, the Churchill River Diversion (CRD) and the Burntwood River account for 17% of MH's total average annual hydraulic generation.

While MH manages its hydraulic resources on an overall watershed basis, the foregoing suggests a more focused approach on the Winnipeg River and local Lake Winnipeg watershed have merit.

The Winnipeg River watershed is already well-monitored and controlled. This allows for reasonable spring run-off predictions. However, the local Lake Winnipeg watershed would require the resumption/expansion of tributary flow gauging stations, and a considerable effort to track net precipitation-/evaporation (as it occurs) for purposes of predicting Lake Winnipeg water levels.

15.1.2 Hydraulic Generation Output History

Since the implementation of Lake Winnipeg regulation and the construction of the Churchill River Diversion, MH has experienced cyclical variability of both river flows and hydraulic generation. There have been extended periods of low flow, as experienced from 1980/81 to 1984/85 and again from 1987/88 to 1991/1992. Most recently, an extended period of mostly high flows started in 1996/97 and continued to 2010/11 (a period that includes the drought of 2002-2004).

Since the construction of Limestone G.S., total annual watershed flows and hydraulic generation output have averaged 115,000 CFS (3,230 m^3/s) and 29,000 GWh. During that period, the minimum annual Lower Nelson River flow of 76,000 CFS (2,160 m^3/s) and the minimum annual hydraulic generation of 18,500 GWh occurred in 2003/04. The highest annual hydraulic generation of 37,200 GWh occurred in 2005/06, with an annual Lower Nelson River flow of 180,000 CFS (5100 m^3/s). It is noteworthy that flows above 150,000 CFS (4300 m^3/s) are, essentially, spilled without producing additional hydraulic output.

Over the last 19 years, MH's hydraulic output has been

- above 30,000 GWh in 11 years;
- 27,500 to 39,000 GWh in 7 years; and
- below 27,500 GWh in 1 year.

In the preceding 14 years, the hydraulic output was:

- above 30,000 GWh in 5 years;
- 27,500 to 30,000 in 1 year; and
- below 27,500 GWh in 9 years (8 years below 25,500 GWh).

While high flow years can be associated with flooding, hydraulic output above 30,000 GWh essentially ensures favourable export sales (assuming "normal" pricing – which has not been the case since the credit crisis and recession of 2008/09). The important question is: how long can above average flows be expected to continue?

Revisiting the 100 years of recorded flows into MH's overall watershed suggests that extended periods (up to 2 decades) of average and above-average flows are unprecedented. Historical experience does not preclude an extended (12 of 14 years) low flow period, as occurred from 1929/30 to 1942/43.

MH indicates that after deducting a 500 MW reserve capacity, Bipole I and Bipole II could, theoretically, transmit up to 29,400 GWh of energy per year to the common bus -

this exceeds the existing Lower Nelson River maximum achievable output of 26,100 GWh.

15.1.3 More Conservative Hydraulic Operations

In recent years, MH has been faced with high reservoir levels and the necessity of spilling water. Conserving water as energy-in-storage does not have the appeal it usually does in some years. And, provision must be made for sudden reversals in water flow conditions, such as occurred in 2002/03, 2003/04 and 2006/07.

With domestic energy requirements now exceeding dependable hydraulic generation, the risk of excessive summer demand rises. A consideration of minimum energy-in-storage levels was recommended by the independent consultants, Drs. Kubursi and Magee.

15.1.4 Supply Constraints on Lower Nelson River Generation

MH's energy supply is currently not constrained by transmission capabilities within Manitoba. The existing Lower Nelson River plants are adequately served by Bipole I and II transmission, even in high-flow years.

However, this could change if Keeyask G.S. were to proceed without or in advance of Bipole III. MH contends that without Bipole III, the full output of Keeyask and the existing Lower Nelson generations could not be transmitted to the Southern Common Bus. Bipole I and II, with an upper transmission capability of 29,400 GWh, could transmit up to 80% of the upper limit of achievable annual hydraulic generation of 32,000 GWh from a constructed Keeyask and from the three existing Lower Nelson plants. MH disagrees with the use of an energy comparison and "looks" only to the installed capacity in defining the potential shortfalls of Bipole I and II.

15.2.0 NON-HYDRAULIC RESOURCES

15.2.1 Thermal Generation

MH's present thermal (non-renewable) resources are as follows:

- Brandon coal plant – 105 MW with a maximum output of 811 GWh/year (now available to meet a drought but expected to be decommissioned in 2018/19 for environmental reasons);
- Brandon SCCTs – 298 MW with a 2,350 GWh maximum output (generally not price competitive with imports); and
- Selkirk natural gas – 132 MW with a 953 GWh maximum output (again, generally not price competitive with imports).

The thermal resources have value as a dependable energy resource, but their limited availability because of either environmental or economic reasons contributes to MH's risk when the Utility sells energy in excess of hydraulic generation. Additional imports, beyond diversity imports, are likely to be substituted for MH's thermal production in almost all years, going forward.

15.2.2 Wind Generation

Post-2010/11, MH will have 236 MW of contracted wind energy with an estimated average annual output of 700 GWh. This equates to about a 35% on-line factor (the wind does not always blow).

With current average opportunity export prices consistently being below 3¢/kWh, MH may not see a positive revenue stream from its committed wind energy purchases from the Manitoba suppliers for many years.

15.3.0 DEMAND SIDE MANAGEMENT

MH's DSM programs are intended to provide an economical energy resource, one that either reduces imports (which represents coal or gas-fired generation) or increases exports. These programs were last evaluated at various times when the marginal cost of electricity, as defined by opportunity (spot) export prices, was upwards of 5¢/kWh. Going forward, with average opportunity export prices under 3¢/kWh, some of these programs may no longer be cost-effective, although they continue to have environmental value.

15.4.0 IMPORTS

MH typically expects to import some energy from its American utility counterparties in order to maximize its export sales, not only to American utilities but also to Ontario and Saskatchewan. The imports may be linked to firm contract provisions under Export Contract Agreements, or be non-firm and sourced from the MISO market. The price of imported energy is either that established for firm imports or tied to spot MISO market prices.

Other than in apprehended or actual drought situations, MH reports that it does not depend on imports.

15.5.0 TOTAL DEPENDABLE ENERGY SUPPLY

MH's Power Resource Plans (PRP) tend to use the total of its dependable energy (from hydraulic, thermal, wind, DSM and imports) to derive an approximate limit for the Utility's firm energy obligations. The aggregate of non-hydraulic generation resources (thermal, wind, DSM and imports) over the next 6 years will be in the annual range of 8,000 to 9,000 GWh.

Were MH to actually "sell" the 8,000-9,000 GWh of non-hydraulic resources in dependable or low-flow conditions, a significant revenue shortfall would likely arise.

Even if MH relied primarily on spot-priced imports, the marginal revenue could still be negative.

15.6.0 INTERVENER POSITIONS

Interveners did not focus on hydraulic resource planning.

15.7.0 BOARD FINDINGS

In section 4.8.0 the Board has already recommended that alternative development plans be considered, including CCCT natural gas thermal generation. MH's supply system seems to lack diversity, which could mean that it is overly exposed to drought risk. With CCCT generation, domestic production could replace potentially higher priced imports in either a drought or the rare occasion that one or both of the Bipole lines were down.

16.0.0 CARBON TRADING IN MH'S MARKETS

16.1.0 RENEWABLE ENERGY MANDATES

Within the MISO region, as across North America, the previous prospects for a substantial carbon tax or a cap-and-trade system that would be beneficial to MH and its hydro-based generation appear to have, at least until the economy has fully recovered, largely evaporated. One sign of this new reality is that the Chicago Climate Exchange market has been closed.

The focus of American utilities in the MISO region is now, as it has been in the past, on providing minimum-cost and reliable energy, with environmental attributes ignored except as mandated under renewable energy targets.

Various states, including Minnesota and Wisconsin, have renewable mandates that range up to a requirement that 25% of generation must be from renewables. This has led to a rapid expansion of wind generation within the MISO region. The sudden expansion in wind resources is in large part related to the ability of utilities to typically pass through the capital recovery costs directly to ratepayers, assisted by a 1.7¢/kWh federal U.S. Government subsidy on all wind energy generated. To qualify as renewable energy for MISO purposes, hydroelectric power generated by MH must come from new "small hydro" facilities. Specifically, Wisconsin would accept power imports from MH's 200 MW Wuskwatim project, while Minnesota presently has a cap of 50 or 100 MW to define new "small hydro".

MH has advised that its new (or pending) sales contracts with American counterparties transfer any "environmental attribute" associated with renewal hydro generation to the importer.

The very competitive wind energy now in place within the MISO market (24,000 GWh in 2010, up from only 3,000 GWh in 2008) constrains the limits of MH exports. It appears that back-stopping wind (wind power is not available about 65% of the time) in peak and off-peak periods or out-bidding CCCT natural gas generation during peak periods represent MH’s most likely prospects in the export opportunity sales market.

16.2.0 CARBON CREDITS WITHIN FIRM CONTRACTS

MH’s hydraulic energy is generally acknowledged to have a very low carbon footprint. Compared to coal-fired and natural gas thermal generation, CO_2 emissions can be almost negligible for run-of-the-river hydro plants.

Within MH’s primary MISO market area, many states do not accept large hydro generation (greater than 50 to 100 MW) as qualifying for renewable energy credits. This does not preclude MISO utilities from claiming CO_2 emissions reductions for imported hydraulic energy for “public relations” purposes.

Currently, it is the Board’s understanding that MH’s MISO region customers are not willing to pay a premium for MH’s “clean” renewable power. Instead, MH is faced with offering free carbon credits for at least the bulk of its exports (non-firm as well as firm).

The “free” inclusion of carbon credits in export sales may, at times, be compounded by MH’s regular use of imports from thermal generation to either support its export sales or replace lost hydro generation in drought conditions. When MH employs lower cost off-peak imports, the probable source is coal-fired generation, which has twice the emissions than natural gas generation.

16.3.0 INTERVENER POSITIONS

Because RCM/TREE’s view is globally oriented, for RCM/TREE MH’s potential negative position with respect to giving up any environmental attributes attached to its “clean” exports to the purchaser is of no immediate concern. MH’s clean energy is beneficial globally, as it likely displaces fossil fuel-based electricity.

Other Interveners did not take a position on this issue.

16.4.0 BOARD FINDINGS

The Board notes that MISO currently does not recognize MH's clean energy as a distinct product with a higher market value than regular energy. As such, MH is currently not realizing any premium from the fact that its electricity is generated hydraulically.

17.0.0 DEMAND SIDE MANAGEMENT

11.1.0 GENERAL

MH's Demand Side Management (DSM) initiative, "Power Smart", consists of energy conservation and load management activities designed to lower the demand for both electricity and natural gas in Manitoba. The most current plan is the 2010 Power Smart Plan, which was filed during this hearing.

For electric operations, the initiative plays an important role in the Corporation's overall integrated resource plan. DSM initiatives assist customers in meeting their energy needs through energy-efficiency measures. Such initiatives enable MH to serve domestic customers with less energy. Reduced domestic load requirements allow for either reduced or deferred capital expenditures or increased energy exports.

17.1.0 PROGRAM EVALUATION

To evaluate new programs, a high level assessment (Marginal Resource Cost Screen) compares the expected benefits to the incremental capital costs. If a program passes the initial screening, a more detailed assessment is undertaken, which involves developing program concepts and designs and projecting costs and benefits.

MH determines the cost effectiveness of DSM programs using the Total Resource Cost (TRC) and Rate Impact Measure (RIM) Tests. The primary economic indicator for evaluating the effectiveness of both electricity and natural gas incentive-based programs is the TRC test. TRC measures the cost-effectiveness of a product or program, and a TRC benefit/cost ratio greater than one (>1.0) indicates that a program is cost-effective.

The secondary economic indicator for evaluating the effectiveness of programs is the RIM test. RIM indicates the cost effectiveness of a program from the Utility's perspective. All DSM-related savings and costs incurred by the Utility, including revenue loss and incentive payments, affect the RIM benefit/cost ratio. The results provide an indication of a program's expected long-term impact on rates.

As a guideline, MH attempts to design electricity-based DSM programs that have a RIM of 1.0 or greater. However, a program with a RIM of less than 1.0 may result in a program redesign, and may still proceed if the program is judged to provide overall benefits.

Established DSM programs are evaluated to determine the net program load savings and costs as well as the cost-effectiveness of the savings. Net savings take into consideration factors such as free riders (benefits derived that carry no specific cost), interactive effects of heating and cooling, as well as system peak coincidence and persistence effects. Customer data and market information are used to assess the impacts of these factors on the overall savings attributable to incentive-based Power Smart programs.

MH employs the Present Value of marginal benefits in three of their cost-effectiveness tests, namely the MRC (Marginal Resource Cost), TRC and RIM. These marginal benefits include revenues realized by MH from conserved electricity being sold in the export market, avoided cost of new infrastructure (e.g. transmission facilities) and measurable non-energy benefits (e.g. water savings). MH has yet to define the specific marginal benefits (or marginal cost savings) employed in the Utility's DSM evaluation process. At prior hearings, MH indicated that the energy value for DSM initiatives was primarily derived from the export market price. Energy value could alternatively be derived from the avoided cost of new infrastructure (generation or transmission). During the PUB's earlier EIIR hearing, MH suggested a proxy value for DSM energy savings (one related to the firm peak export energy prices of about 6¢/kWh) in lieu of defining the actual energy value (deemed to be commercially sensitive and confidential).

MH's most recent IFFs do not acknowledge that the export prices for energy have dropped substantially.

In evaluating DSM programs, MH attributes no value to delayed generation in its TRC test, nor does it consider the full benefit of displacing carbon in export markets.

17.2.0 PROGRAM COSTS AND AMORTIZATION

According to MH's 2010 Power Smart Plan, the Corporation forecasts spending $414.2 million over the next 15 years (through 2024/25) on DSM expenditures, including $23.2 million to be drawn from the Affordable Energy Fund (a fund established by legislation following the peak export price year, during which natural gas prices spiked).

Cumulative spending on electric DSM from 1989 to 2024/25 is projected to be $747.3 million. MH reported that it had budgeted to spend $37.8 million in fiscal 2011 and $38.8 million in fiscal 2012 on DSM initiatives.

MH amortizes its DSM costs over a 10-year period. This approach is similar to other Crown power utilities in BC and Québec. While the deferral of DSM costs, for subsequent amortization, is not allowed under new IFRS accounting standards, the approach can be maintained for rate-setting purposes.

MH's unamortized balance of DSM expenditures was $17 million as of March 31, 1994, and is forecast to grow to $214.2 million by 2011/12. The amortization of DSM expenditures was $978,000 in fiscal 1993/94, and is forecast to increase to $24.8 million in 2011 and $28.7 million in fiscal 2012.

The IFRS requirement will require MH to write off to retained earnings the unamortized balance of DSM expenditures in MH's 2011/12 fiscal year (the forecast balance to be written off is $214.2 million). MH has stated that the IFRS requirement to annually expense DSM expenditures rather than defer and amortize those costs will have very little rate impact.

17.3.0 DSM PROGRAM SAVINGS

According to MH's 2008-2009 Power Smart Annual Review, by the end of 2008/09 MH's Power Smart Programs would have achieved an annual load reduction of 1,510 GWh in energy, and the equivalent of a 406 MW reduction in winter peak demand. This level of "saved power" was reported by MH to represent an annual reduction of approximately $46 million in electricity customer bills (with a cumulative savings for customers of $352 million since the inception of the program).

MH reports indirect greenhouse gas emission reductions of approximately 1,019,000 tonnes of carbon dioxide equivalent emissions (plus 70,000 tonnes related to Natural Gas DSM programs).

In theory, domestic energy reductions through DSM initiatives contribute to the development of surplus generation capacity, which in turn contributes to the level of energy sales in the export market. In practice, additional export sales cannot always be made and MH has "spilled" water when the maximum capacity of its generating stations has been reached and storage cannot be increased due to lake regulation provisions. Furthermore, if export prices are below domestic rates, which has been the case since the 2008/09 credit crisis and recession, there is a negative revenue impact on MH from successful DSM initiatives. This negative revenue development does not reduce the environmental values of DSM, as DSM programs help instill a conservation mentality amongst MH's customers.

The cumulative energy and demand reduction achieved (including savings to date) through the Corporation's DSM efforts was forecast to achieve 3,048 GWh/year of energy savings and 915 MW of Winter Demand by 2023/24. These targets represent the expected impact of electricity efficiency codes and standards, customer service initiatives and incentive-based program activities. MH noted that the majority of the savings are to be realized from MH's incentive-based programs.

17.4.0 CITY OF WINNIPEG DSM PROGRAM

As a condition of MH's acquisition of Winnipeg Hydro, MH and the City of Winnipeg entered into a Power Smart Agreement on September 3, 2002. The objective was to capture energy efficient opportunities within the City's facilities, with a minimum target of reducing the City's energy bill by $800,000 annually. MH guaranteed the City an annual savings of $800,000 from the measures. If the savings were not met, MH was required to make a payment for the balance. The ten-year agreement includes a total savings commitment of $8.8 million.

MH has actually invested $10.6 million into DSM measures under the agreement. This includes $3.2 million in "commitment" payments, $6.4 million in energy efficiency project costs and $1.0 million in program administration and management fees.

MH stated that due to the energy savings realized from the initiatives undertaken, MH will be economically better off, as the energy saved is available for export.

17.5.0 CARBON TRADING

In 2002, MH became a founding member of the Chicago Climate Exchange (CCX). CCX required participants to reduce emissions relative to historic baselines. Each participant was provided an annual allowance of CCX units, which decreased each year from the historic baseline. If a participant's emissions exceeded the participant's allowance, the participant was required to buy additional units through the exchange. Conversely, if their emissions were below their allowance, they were able to sell the surplus units.

The CCX market permanently closed on December 31, 2010. An active carbon trading regime has not materialized. Without carbon legislation in the U.S. jurisdictions into which MH exports, coal-fired electricity generation remains the least-cost base load option for most American utilities.

17.6.0 LOWER INCOME DSM PROGRAM

In its 2006 Power Smart Plan, MH introduced a new residential program, the "Hard To Reach" (HTR) program. The HTR program targets lower income residential households on an integrated basis (i.e. for both natural gas and electric consumption). The program has since been modified into the Lower Income Energy Efficiency Program (LIEEP), which leverages MH's Power Smart programs, the Affordable Energy Fund (AEF), the Federal Government ecoENERGY Program, provincial government programs and existing community-based infrastructure.

The objective of LIEEP is to ensure that the financial benefits associated with implementing Power Smart energy efficiency measures will be realized by low income consumers. The program targets both lower income Manitoban homeowners and tenants. MH provided an update during the hearing, which indicated that participation of electric households in the LIEEP through 2010/11 totalled 720 households.

Rental buildings for which the landlord pays the energy bills are not eligible for participation in the LIEEP, as the landlord would be realizing the benefits of lower energy bills rather than the low income tenant. In the case of lower income tenants who do pay energy bills, an agreement must be reached between MH and the landlord or building owner to ensure that a substantial portion of the benefits associated with retrofit measures funded by MH's program will be passed on to tenants.

Non-profit social housing organizations, including the Manitoba Housing Authority (MHA) and other non-profit subsidized housing organizations, are eligible to participate in the program. An agreement has been reached between MH and MHA, whereby MHA will pay the AEF portion of the cost of the upgrades in cases where the tenant is not directly paying the energy bill.

Eligibility for households pursuant to the program was established by the Corporation at 125% of the Low Income Cut-Off (LICO) established by Statistics Canada. MH undertook a 2009 residential survey which indicated that 74,938 households meet the LICO standard and 105,784 households meet the LICO-125 criteria.

Targeted measures to be addressed by the program include:

- low or no-cost basic energy efficiency measures, such as compact fluorescent lights;
- faucet aerators, low-flow showerhead, pipe wrap, hot water tank set-back, and caulking/air-sealing;
- insulation for basement, attic and crawlspace installations; and
- high-efficiency natural gas furnaces.

MH intends to deliver the program through both Community Based Organizations (CBO) and individual household participation. Both approaches require pre- and post-completion audits to identify energy efficiency opportunities and verify that the work was completed.

17.7.0 HOME ENERGY BURDEN

Home energy burden represents energy bills as a percentage of household income.

The concept of the customers' "energy burden" is not employed in the design or assessment of MH's affordable energy programs. MH's stated position is that issues surrounding affordability are outside the scope of MH's mandate and is a matter of policy for legislators and government agencies responsible for these issues.

Since the commencement of LIEEP in 2005/06 through to 2009/10, MH has spent $1.9 million on electric LIEEP, including $0.7 million from Power Smart and $1.2 million from the AEF. MH had forecast to spend $3.8 million in 2009/10 on electric LIEEP, including $3.2 million from the AEF, but only spent $0.5 million in total including $0.4 million from the AEF. MH attributed the $3.3 million shortfall to low participation levels in the program.

17.8.0 THE AFFORDABLE ENERGY FUND (AEF)

Following a spike in oil and natural gas prices in the summer and fall of 2005 on the heels of hurricanes Katrina and Rita, which damaged energy availability from south-east American production and distribution sites, and also following the Board's action on November 1, 2005 when it deferred costs and restrained natural gas rates for Centra Gas' residential customers to recognize what the Board deemed to be a price spike, the Province of Manitoba introduced *The Winter Heating Cost Control Act*, which was subsequently passed, proclaimed and implemented in 2006. Among other provisions, the Act established the Affordable Energy Fund (AEF), requiring MH to contribute 5.5% of its fiscal 2006/07 gross export revenues to the AEF. This resulted in a fund of $35 million to be utilized for various energy efficiency initiatives which were to primarily assist low-income electricity and natural gas customers.

MH indicated that $19 million of the AEF's $36.8 million was earmarked for province-wide low-income initiatives. MH indicated its intention that the $19 million reserved for low-income programs would mostly benefit electricity and natural gas space-heated homes, and would provide for programs that would not otherwise be funded from MH/Centra's rate-based DSM programs.

A breakdown of the allocation of the AEF and the spending to 2009/10 is as follows:

Projects	**Allocated**	**Actuals to December 31, 2010**
Low – Income / Community Based Initiative	**$19.0**	**$5.1**
Geothermal Support	**$6.0**	**$1.4**
Community Energy Development	**$8.0**	**$0.8**
Oil and Propane Heated Residential Homes	**$0.25**	**$0.2**
Residential Energy Assessment Service	$0.5	$0.5

Oil and Propane Furnace Replacement	$0.2	$0.1
Residential Solar Water Heating Program	$0.3	$0.3
Power Smart Residential Loan	$1.2	$1.2
Unallocated Interest Accruals	$0.6	-
Special Projects	**$2.8**	**$2.0**
Total	**$36.8**	**$9.7**

17.9.0 FIRST NATIONS/ DIESEL COMMUNITIES

MH has employed a dedicated team and partnership approach to pursue energy efficiency opportunities in First Nations communities. The approach includes identification of ten homes in the community for which an initial home audit will be conducted. MH then trains First Nations members to undertake required retrofits, supplies the materials, and assists the First Nations in obtaining any Federal government ecoEnergy grant programs funds that may be available.

MH reported that it had completed work on 10 homes on two First Nations communities, and was shipping material to retrofit 15 homes in three other communities. It was also working with other communities, including communities served by diesel generated electricity, to see if they were interested in participating in the program.

17.10.0 DSM PROGRAM EVALUATION

MH contracted Phillipe Dunsky to undertake a Power Smart Portfolio Review. Mr. Dunsky made several recommendations to reinvigorate and expand the DSM program of MH. Some of the recommendations were to close program gaps by creating and expanding programs for:

- multifamily residential housing;
- manufactured new homes;
- consumer electronics and office equipment;

- appliance retirement;
- new commercial construction; and
- commercial custom retrofit.

MH has acted on many of the above initiatives by expanding its program offerings, including, among others, the development of a Refrigerator Recycling Program and a Commercial New Buildings Program.

Mr. Dunsky also recommended that MH:

- provide market training in the residential sector, beginning with the review of opportunities and needs for all programs;
- utilize upstream incentives in both residential and commercial/industrial sectors, beginning with the comprehensive review of the potential for upstream incentives in all programs; and
- consider options for encouraging limited third-party ideas or implementation. MH should evaluate the effectiveness of variety of options for encouraging innovation within the Province. Third-party set-asides such as those in California and Minnesota were one option to consider.

MH cited several examples where it has sought collaboration with third parties to deliver programs and where it intends to continue to pursue third-party collaboration whenever the option is assessed to be the most efficient and effective.

MH did not agree with establishing third-party set-asides as being an effective and efficient strategy for achieving the Corporation’s energy-efficiency objectives. It thought that such an approach could lead to implementing some programs in a more costly manner and simply spending the set-aside funds as opposed to undertaking initiatives in a more cost-effective manner.

Mr. Dunsky also recommended that MH establish aggressive energy savings targets such as 1 to 2% per year, in line with those of leading regions. In response to this recommendation, MH agrees with establishing aggressive energy conservation targets. However, MH believes that it is more appropriate to base the targets on identifiable economic potential for achieving energy savings rather than basing targets on arbitrary percentages. MH indicated that it is going to undertake a market potential study to identify current energy savings potential remaining in the province and will conduct a detailed comparison of MH's Power Smart Plan to BC Hydro's Power Smart plan to assess potential gaps in targeted energy savings.

Mr. Dunsky also recommended that DSM programs should be screened by the Program Administrator Cost Test (PACT), Total Resource Cost (TRC) or Societal Cost Test (SCT). Mr. Dunksy stated that the RIM test is likely leading to lost opportunities. At the last GRA, Mr. Dunsky opined that the RIM test should not be utilized to screen for justification of DSM programs. While TRC should remain the primary test for DSM programs, under MH’s current approach there will be proposed measures that will fail the TRC test that should still be pursued if they pass the “utility cost” test. The utility cost test compares money invested in a program with the value of expected energy savings for the utility. If MH can generate cost-effective kWh savings, the program initiative should proceed. In his review of the Power Smart Program, Mr. Dunsky urged MH to reconsider its screening process as a whole to ensure that it is in line with common leading practices.

MH did not agree with this recommendation. MH uses a number of cost effectiveness tests to assess energy efficiency opportunities, preferring to use the Levellized Utilities Cost test rather than PACT. MH also stated that it uses a more inclusive version of the TRC than the SCT, and also considers various qualitative factors including equity (e.g., reasonable participation by various ratepayer sectors) and overall contribution towards having a balanced energy conservation strategy and plan. MH also disagreed that the use of the RIM test was restricting its ability to pursue energy efficiency opportunities.

Lastly, Mr. Dunsky recommended that MH

- screen alternative program designs for total program cost effectiveness;
- reconsider its screening process as a whole to ensure it is in line with common and leading practices; and
- consider an expert-supported stakeholder advisory group in which stakeholders are funded supported by independent experts in a non-adversarial setting.

MH stated that stakeholder meetings to share policy and conceptual information provide some value but that such a process proves to be ineffective for establishing detailed program designs, which involve specific marketing concepts, product delivery channels, and undertaking complicated computer assessments to provide program metrics. MH further does not support the recommendation for funding external consultants for stakeholders, as this would result in a duplication of resources and be a very costly approach. MH stated that the regulatory process allows for a reasonable amount of oversight with respect to MH's DSM programs through the hiring of consultants, and that the extent of this investment is already controlled through the regulatory process.

17.11.0 INTERVENER POSITIONS

17.11.1 CAC/MSOS

DSM Program

CAC/MSOS acknowledged that MH's staff involved with DSM has a commitment to energy demand reductions and that the Corporation has a historical reputation in offering strong programming within the Canadian context. However, CAC/MSOS holds that MH attributes savings to some of its residential plans which are more optimistic than those adopted by other well-respected bodies in the area of energy efficiency (such as the Ontario Power Authority).

CAC/MSOS urged the Board to make a finding that the Power Smart residential incentive-based programs are lagging relative to the plan as a whole, with a major factor being low participation rates. CAC/MSOS noted that the low participation rate was most evident in the LIEEP and the low spending from the AEF.

CAC/MSOS recommended the Board accept the evidence of Mr. Chernick, who concluded that the 2009 and 2010 DSM plans appeared to be deficient insofar as they involve spending less and aiming lower in terms of their savings targets and spending targets compared to previous levels. For CAC/MSOS, MH's DSM program has not demonstrated a commitment to maximizing benefits for consumers.

CAC/MSOS accepted the conclusion of Mr. Dunsky that MH will need to be more ambitious with its electricity savings goals and should reconsider its current portfolio of programs and strategies to maximize energy efficiency. CAC/MSOS recommended that the Board make a finding that given the poor performance of the 2009/2010 Power Smart Plan, there is a demonstrated need to make major changes in the DSM program.

CAC/MSOS further urged the Board to determine that there is a broader need for independent third-party audit of Power Smart. MH should be required to consult with the Board and interested interveners prior to finalizing the terms of such a review.

Low Income Programs

Of particular concern to CAC/MSOS is the low participation rate in the LIEEP and the low spending of the AEF. CAC/MSOS recommended that the Board find that the challenges faced by the LIEEP suggest the need for a strategic review of the program to be provided by an independent third party who would undertake an evaluation and audit of MH's operations, to be filed with the next GRA. CAC/MSOS recommended that MH, prior to undertaking the review, consult with stakeholders as well as the Board to finalize its scope.

Dr. Tom Carter appeared on behalf of CAC/MSOS and spoke to issues related to energy poverty and low income rate affordability in Manitoba. Dr. Carter listed four approaches to energy poverty:

- the demand-side approach, where funds, loans, or grants are provided to households so they can purchase more energy efficient appliances or retrofit or weatherize their homes;
- the supply-side approach, where direct payments or subsidies are made to households to increase their income to help them cover the cost of energy;
- the bill management approach, which may involve the negotiation of late payment charges, a plan to pay down arrears, equalized payment plans, or forgiveness plans; and
- the regulatory requirements and frameworks that are set in place.

CAC/MSOS submitted that the problems of energy affordability facing low income Manitoba residents have severe social, economic, and business consequences that permeate throughout all sectors of the province. From a social perspective, unaffordable home energy not only threatens the ability of low income customers to maintain access to their utility service, but also imposes a range of adverse consequences threatening the health, housing, and general welfare of those households. Unaffordable home energy bills mean that low income Manitoba residents will go without food, medical care or other life necessities.

Dr. Carter stated that addressing the energy affordability of low income homes will generate positive social benefits. It will improve public health and safety and bolster the competitiveness of local business and industry. It will also reduce the cost of non-payment and improve the efficiency and effectiveness of utility collection efforts.

Demand and supply-side programs, according to Dr. Carter, can help reduce the cost of credit collection, bad debts, as well as termination and reconstruction costs for the utility.

In spite of the positive aspects of these programs, Dr. Carter does not think they are sufficient to make much of a difference when it comes to poverty alleviation, and states that these programs are not integrated with other programs that should help address the long-term and systemic causes of poverty.

In reviewing U.S. bill assistance programs, Dr. Carter noted particular challenges associated with the delivery of energy poverty programming, with the biggest problem being the low participation rate of many of these programs. Other challenges include difficulty in identifying the working poor, high mobility rates, the apprehension and suspicion about dealing with government, and the fact that people in poverty are so occupied with everyday existence that they cannot devote the time to avail themselves of these programs.

Dr. Carter stated that low participation rates create real problems with respect to horizontal equity. In particular, if programs are paid for through charges to the ratepayers of the utility, there is a subgroup of people that is eligible for the programs but does not avail themselves of them, yet has to help pay for the programs for the other subgroup that does use them.

In general, Dr. Carter suggested that MH was not as well-placed as some other departments in government to deliver energy affordability alleviation programs or poverty alleviation programs in general.

Dr. Carter indicated that utilities are not the best source of broad strategic poverty alleviation policies. These policies are the mandate of government, which has to build a package on the basic planks that government has in place to deal with poverty. To be effective, programs have to be integrated as part of a broad strategy that includes money for education, money for skills development, and programs to get people back in the workforce. According to Dr. Carter, the integrated approach that is currently in place fails in large degree because the levels of assistance under Social Assistance and minimum wage do not ensure that households have a level of income that will provide them with a good quality of life and opportunities to improve their potential in society. Energy poverty alleviation programs are not sufficient. Although such programs serve an important role, they should not be considered as poverty alleviation vehicles because they are not long-term, do not provide deep levels of assistance, and are not integrated with other program vehicles.

Dr. Carter stated that there are three sides to the energy poverty equation, these being price stability, energy efficiency and income stability. CAC/MSOS submitted that the best way to assist all vulnerable consumers through the regulatory process is to insist upon ongoing prudence in the operations of MH in order assist MH to achieve just and reasonable rates and invest significantly in low income energy efficiency.

CAC/MSOS endorsed recommendations made by RCM/TREE's witness Mr. Colton that MH adopt a crisis intervention and arrears management program, while rejecting Mr. Colton's recommendation for a Low Income Rate Assistance Plan. In objecting to the Low Income Rate Assistance Plan recommended by Mr. Colton, CAC/MSOS cited several concerns, including that:

- the program is unlikely to assist the poorest of the poor, as those individuals on income assistance are already receiving help with respect to their utility bills;
- the program's participation targets will not be met;
- the program runs the risk of a diverting scarce resources away from other programming such as LIEEP; and
- in light of low participation rates, they program would be horizontally inequitable.

CAC/MSOS also raised the question of the Board's jurisdiction to impose such a program given Manitoba's statutory framework.

17.11.2 MIPUG

Low-income programs

MIPUG has no issue with any bill assistance program that is funded on a voluntary basis. To do otherwise would be, in MIPUG's view, discriminatory. MIPUG noted that unless there is 100% participation in the low-income programs, the low-income customers that do not participate in the program indirectly get penalized.

With respect to the role of MH in low income programming, MIPUG cited Dr. Carter, who suggested that MH participate in an integrated strategy but not a funder of programs to alleviate poverty.

17.11.3 RCM/TREE

DSM Programs

RCM/TREE adopted the evidence of Mr. Paul Chernick. RCM/TREE acknowledged the excellent work on DSM efforts made by MH in the past. RCM/TREE approves of the recently unveiled refrigerator program and the efforts being made in the First Nation communities served by diesel generation. RCM/TREE expressed concern that MH is not planning to continue its DSM efforts as aggressively in the future.

RCM/TREE noted that Mr. Chernick had graphed MH's projected DSM savings to 2025, observing a precipitous decline in both DSM efforts and annual incremental savings. For Mr. Chernick, MH's DSM efforts are modest compared to those of many other North American jurisdictions. He noted that other jurisdictions target DSM energy savings of 1% to 2%, while MH's forecast begins at 0.6% and declines to 0.2%.

Also, when compared to other jurisdictions, for Mr. Chernick MH's spending on DSM per MWh was insufficient. Mr. Chernick concluded that MH should be able to double or triple its energy efficiency spending and savings from current levels and maintain such efforts throughout the planning period. RCM/TREE recommended that the Board benchmark its DSM programs to the programs of the three leading providers as identified by Mr. Dunsky, namely Pacific Gas and Electric (California), Efficiency Vermont and Xcel Energy Minnesota.

RCM/TREE also recommended that the Board establish DSM targets for MH to require the Corporation to increase its energy efficiency investments to reach the 90th percentile of North American jurisdictions, and that the RIM test be abandoned for program design screening.

RCM/TREE proposed that MH establish a link between DSM programs and Power Smart rates. RCM/TREE noted that rates and rate structures that fail to provide appropriate price signals undermine the performance of Power Smart DSM programs by offering contrary incentives that, in effect, subsidize higher consumption by applying embedded cost savings and export earnings volumetrically. If incremental use of electricity is underpriced, the true cost of growth imposed on other users, the utility, the province and the global environment is hidden and conservation and self-generation options become less cost-effective or suffer a longer payback period.

RCM/TREE cited past Board Orders which supported conservation incentives in rates and questioned the Board’s interim rate Order 40/11, which effectively eliminated the block differential for residential rates and provided no change to the basic charge. RCM/TREE noted that a reading of Order 40/11 illustrates a tight link between affordability goals, conservation goals and rate-setting. RCM/TREE submitted that MH's mandate to promote economy and efficiency in the end use of electricity cannot be adequately fulfilled without supportive Power Smart rate structures. RCM/TREE also stated that the energy system must mitigate the potential impacts of higher marginal rates on those customers who are least able to afford the energy. In summary, RCM/TREE submitted that MH cannot deliver on its mandate to provide its domestic customers with the benefits of electric power economically and efficiently unless it can also deliver effective measures to mitigate unaffordable energy burdens among its low income electricity customers.

RCM/TREE supports MH's initial proposal to reduce the Basic Monthly Charge by $2.00 over two years. RCM/TREE also supports Mr. Chernick's recommendation that the Board re-establish a rate inversion by making the tail-block 5% higher than the first block at the outset. In subsequent years, the first block should be reduced to no more than 600 kWh/month and the tail-block rate moved towards marginal costs. To mitigate the heating burden of existing electric heat customers, Mr. Chernick proposed offering a larger first block of lower cost energy in the winter months. The size of the first block would be set with the objective that the average heating and non-heating customers would end up paying the same blended energy rate over the two energy blocks.

RCM/TREE urged the Board to instruct MH to modify rates in the following ways over the next several years:

- increase tail block energy rates to marginal cost, including environmental costs;
- implement marginal cost-based rates for larger general service customers, using a two-part rate if necessary;
- use the increased revenues from tail block energy sales to reduce customer demand and fund enhanced energy-efficiency programs, low income customer discounts, and economic development, and improve MH's financial structure; and
- implement time-of-use energy charges, starting with the largest customers, and move revenue collection from demand charges to time-of-use energy charges.

RCM/TREE indicated that the implementation of these initiatives can take place at MH's next rate proceeding.

Low Income Programs

RCM/TREE submitted that MH should institute an affordability program as recommended by Roger Colton, who appeared on behalf of RCM/TREE. Mr. Colton stated that energy bills impose a substantial burden on low income households served by MH. Current home heating, cooling and electric bills in Manitoba have driven the home energy burdens for households living with incomes at or below 125% of LICO to crushing levels. Mr. Colton stated that the Board should be concerned when the energy burden of consumers exceeds 6% of household income. According to Mr. Colton, an affordable home energy burden is 6% of income as compared to a “severe” energy burden of 15%.

Dr. Colton proposed a four-part low income affordability program, consisting of :

1. A rate affordability component that brings the bills of low-income customers (LICO-125) within a range of affordability (6% of income) through offsetting credits. The annual credit is determined by first establishing a burden-based payment set at 6% of income. That amount is then compared to an estimate of the projected annual energy bill for the household. The credit would be based on the difference between the burden-based payment and the total projected annual energy costs. The credit would be applied to monthly energy bills and would be fixed to provide an incentive for conservation.

2. An “arrearage” management program, which retires a customer's arrears over three years in exchange for monthly contributions by the customer to his arrearage retirement. The program is designed to reduce pre-program arrears to a manageable level over an extended period of time. The customer earns credit towards the arrearage balance, so long as the customer remains on the affordable rate. The payment under the scheme is to be set at $5 per month or $60 per year to go towards the arrearage balance.

3. A crisis intervention component that addresses the income fragility of low income households. The crisis intervention component should not be based on income eligibility and should provide administering agencies with flexibility to distribute assistance on an as-needed emergency basis. The program should be limited in time and the funding should be distributed through existing crisis intervention programs.

4. An energy-efficiency component, similar to MH's LIEEP, with improved integration and other components and accelerated roll-out.

The cost of operations and administration of the first three components of the program should be recovered through meter charges and late fees. Mr. Colton estimated the cost of the proposed program to be $44.2 million, including the provision of rate discounts sufficient to reduce energy burdens to no more than 6% for LICO–125 households. Mr. Colton provided a set of scenarios with differing program energy burden thresholds between 6% and 10%, with a cost ranging from $24.9 million (10% energy burden threshold) to $44.2 million (6% energy burden threshold).

RCM/TREE stated that the Board has a responsibility to consider the special circumstances of low-income ratepayers when deciding what is considered to be just and reasonable rates. It would be inappropriate for the Board to ignore energy poverty as described by Mr. Colton in determining just and reasonable rates. It would appear to be self-evident that what is a just and reasonable rate for a person living below the poverty line is different than it would be for a family, for example, that spends less than 2% of its household income on energy.

RCM/TREE cited the case of *Advocacy Centre for Tenants - Ontario v. Ontario Energy Board* 293 D.L.R. (4th) 686 as judicial authority that the PUB has the jurisdiction to order the implementation of the low-income energy affordability program.

17.12.0 BOARD FINDINGS

17.12.1 DSM Programs

The Board recognizes that MH has been making an increasingly significant investment in DSM programs.

The Board encourages MH to continue to pursue environmental objectives on an integrated natural gas-electricity basis, and, in particular, to consider the difficult position of low-income customers that may be increasingly faced with higher energy costs while too often lacking the funds, if not the know-how, to achieve needed upgrades that would reduce their energy bills and GHG emissions.

The Board, as stated in Order 116/08, remains of the view that MH's DSM focus should be four-fold:

- Environmental: Wasted energy and greenhouse gas emissions should be reduced in Manitoba and in the export markets, as climate change is a global challenge.

- Economic: Energy not consumed by Manitobans should be available for sale on the export markets, ideally during peak hours and at peak prices.

- Economic: Energy not consumed by Manitobans and not sold on the export market, either due to transmission capacity issues or unfavourable pricing, can assist in the deferral of new generation and transmission.

- Social: Increasing the energy efficiency of low-income households will allow more families to remain in their homes and to have more disposable income available for necessities other than energy. The total cost of energy (gasoline, natural gas, electricity, propane, etc.) has soared for all households, but the cost increases have been particularly devastating for households in the bottom four deciles of household income levels.

The Board continues to question the appropriateness of MH's current approach of deferring DSM costs and amortizing them over ten years, and notes that this approach will no longer be allowed under IFRS. IFRS will require DSM expenditures to be expensed in the period in which they are incurred. Actual DSM expenditures are currently forecast to be $37.8 million in 2010/11 and $38.8 in 2011/12 while amortization of DSM spending is forecast to be $24.8 million and $28.7 million respectively. The difference will have to be expensed under the current IFRS pronouncements, thus putting further pressure on rates.

The unamortized balance of DSM costs is forecast to grow to over $214 million by 2011/12. This amount will likely not meet the criteria of an asset under IFRS and will have to be written off against retained earnings. Nonetheless, the Board believes that the manner in which program expenses are accounted for should not change the manner in which MH evaluates DSM programs.

The Board notes the evidence of Mr. Dunsky, who provided recommendations to MH to improve its DSM program. The Board is encouraged that MH has listened to many of Mr. Dunsky's recommendations and has proposed program changes. The suggested changes put forward by Mr. Dunsky, including changing the economic screening test to the PACT, has merit and should be considered by MH in its design of current and new low-income programs. The Board shares the view that the current screening process may be resulting in some opportunities being missed. The Board would like to see expanded program delivery to assist in conservation.

17.12.2 DSM Program Evaluation

The Board notes that MH projects that by fiscal 2023/24 it will have achieved 3,048 GWh of DSM savings for its electricity operations. If achieved, this would represent a 200% increase in DSM energy saving over 12 years, representing a growth rate of almost 17% per year. Power savings are expected to reach 915 MW, an increase of 230% over 12 years or almost 19% per year.

There is projected to be a drop in savings in later years of the program. The Board shares the concerns raised by Mr. Chernick of a decline in both investment and savings. The Board suspects that the opportunity for further reductions is significant. However the Board also realizes that projections extending fifteen years into the future are highly subjective.

During the EIIR hearing in 2009, MH offered a proxy value (related to the firm peak export energy prices) of about 6¢/kWh for DSM calculation purposes in lieu of defining the actual energy value, which MH deemed to be commercially sensitive and confidential. The Board suspects that MH's marginal benefit value in the cost effectiveness tests set out above also employs a similar proxy value, and it is clear that MH's most recent IFFs do not yet acknowledge that the export prices for firm peak energy have dropped substantially in recent years. The actual 2009/10 price was 2.83¢/kWh for peak opportunity export sales. There is reason to believe that prices under 3¢/kWh may still be the reality for years to come.

In the current circumstances, where MH's generation and transmission expansion plans appear to be moving forward despite an unfavourable export market, the Board is concerned about the level of economic benefits to be achieved by MH's existing and new DSM initiatives. To export DSM energy savings at prices below domestic rates does not seem totally logical from a financial perspective.

17.12.3 Lower-Income Energy Efficiency Programs

The Board commends MH for the broadening of its low-income programs and the inclusion of programs specifically targeting First Nation communities. However, the Board is concerned at the slow pace of delivery on the programs and notes that with respect to the LIEEP and AEF, MH has struggled to meet budgeted spending targets to date.

The Board understands that MH is working on a tenant-focused LIEEP but has yet to implement it. The Board understands that there may be resistance for landlords to take part in the program due to split incentives and the low-cost business models under which many landlords operate. MH should make every reasonable effort to increase participation rates by eligible landlords, as this benefits both low-income tenants and the environment. The Board further believes the LIEEP should be subject to an external review to ensure that all opportunities are being adequately met. To that extent, the Board will expect MH to provide the Board and interested stakeholders with draft terms of reference for a program review.

Although MH is beginning to address the issue of energy poverty, more is required. The Board is very concerned with the slow pace of the overall energy poverty relief effort. MH indicated that the current program is anticipated to provide relief to only 1,700 low-income households by the end of 2010/11. The current low-income population in Manitoba seems to comprise at least 105,000 households, meaning the program only targets about 1.6% of potentially eligible households annually. The Board agrees with the views expressed by CAC/MSOS and RCM/TREE that more should be done.

As for the AEF, the Board notes that $1.4 million in interest has accrued on the balance in 2009/10, thereby allowing the AEF balance to grow. This additional amount can be used to fund further low-income programs. The Board recognizes that capacity issues may exist in program delivery. However, the material budget variances which have become apparent indicate that capacity constraints may not be the only obstacle. This, too, warrants an independent external review of the program.

Overall, the Board continues to remain concerned (as expressed in previous Board Orders) with the pace of delivery of low-income programs for the First Nation diesel communities. Although MH has reported progress with respect to First Nation programs as a whole, the progress made to date does not address the full extent of energy efficiency issues on First Nation communities. In particular, more needs to be done with respect to energy efficiency measures for the First Nation diesel communities, where energy costs are significantly higher than in communities connected to the grid. The Board urges MH to work together with First Nationals and Aboriginal Affairs and

Northern Development Canada to expedite the delivery of energy efficiency measures in remote communities.

Bill Assistance

The Board notes that the low-income energy burden is high in Manitoba. This was confirmed by the 2009 residential survey which indicates that now over 105,000 Manitoba households are considered low-income, falling into Statistics Canada's LICO-125 category. The Board further notes that a substantial portion of the LICO-125 group has an energy burden in excess of 9% of household income.

Currently, MH relies solely on a voluntary program to alleviate energy burden. The program, known as Neighbours Helping Neighbours and administered by the Salvation Army, allows MH customers to donate to an energy relief fund. From a program delivery perspective, the amount of money in the fund is inadequate. While it allows families and seniors who are unable to pay their natural gas or electricity bill due to personal hardship or crisis to receive support from the program, that support is only available if there is sufficient money in the fund.

In Manitoba, adequate energy for heating is a necessity of life. As such, it should be both abundantly available and affordable. Programs that reduce the energy burden faced by low-income customers and provide significant societal benefits would likely return dividends to the Province above the cost of delivering such a program. Those benefits would include lower health care costs and other benefits such as reduced debt write-offs, improved customer service and avoided reconnection costs borne by the utility.

Before the Board is prepared to require MH to develop a definitive bill assistance program along the lines of the program proposed by RCM/TREE, the Board needs further information as to existing funding made available by government and the programs available to directly or indirectly alleviate energy poverty.

The Board is firmly of the view that MH should participate in an integrated strategy with respect to low-income programs. This could, and likely would, include a defined role in education, promotion, monitoring and perhaps delivery of such a program in conjunction with CBOs. However, until the Board has additional information as general and specific government funding available, the Board is not in a position to determine whether MH should be a “funder of programs to alleviate poverty” as suggested by RCM/TREE.

18.0.0 RISK

Similar to other large corporations, MH faces risk issues daily. All facets of MH's operations contain risk. To the extent that risk cannot be avoided, it must be managed. In order to set itself up to withstand adverse events and demonstrate the Corporation's financial strength to rating agencies and lenders, MH established its target debt-to-equity ratio of 75:25 further discussed in section 12.1.0 of this Order. MH applies this target ratio at all times except for periods when major new investments are in process that have yet to be placed "in-service" and start generating income. The Board and the Interveners have supported the target ratio. While the Board has expressed some concerns about the composition of MH's equity, as set out in section 12.1.0 of this Order, MH has met its target as of March 31, 2011 based on its own definition of equity.

To provide greater certainty as to the quantum of the equity "cushion" being sufficient to withstand the risks faced by MH, the Board has long requested MH to provide an in-depth and independent study of all operational and business risks facing the Utility. The study was to be a thorough and quantified risk analysis that included the probabilities of all identified operational and business risks. To that extent, this GRA was expressly stated to include a review of MH's risks and risk management.

Unfortunately and disappointingly, MH failed to provide the quantified risk analysis sought by this Board. In the words of one of the interveners, it was an "opportunity wasted". Rather than provide the risk analysis sought, MH incurred external costs of approximately $4 million to embark on the production of a report and the employment of a legal strategy to rebut the allegations of a risk consultant previously retained but subsequently terminated by MH.

What follows is the Board's own assessment of various risk issues based on the extensive record before it.

18.1.0 DROUGHT RISK

18.1.1 Historical Droughts

Hydraulic generation accounts for 80% of MH's average annual energy output. MH relies on river water flows and lake levels as sources of hydraulic energy. Since MH relies so heavily on water power, drought is one of the greatest risks faced by the Corporation, especially when a drought extends for several years.

Historically there have been approximately seven periods when MH would, given current domestic and export commitments, have been faced with rather substantial energy supply shortfalls. That fact suggests a theory, worthy of being tested, that total reliance on hydraulic generation may not be in the best interests of MH's ratepayers. A system dominated by hydro generation but with a significant natural gas (CCCT) thermal component would, it appears, ameliorate drought impacts and their financial consequences.

18.1.2 Drought Frequency

MH contends that it is not possible or appropriate to calculate a frequency of recurrence of various drought events. Instead, MH chose to declare and employ 1936/37 to 1942/43 hydraulic conditions as its worst-case scenario and 1987/88 to 1991/92 hydraulic conditions as a basis to determine an appropriate drought reserve target.

Attempts by various consultants to define a frequency for droughts of a five-year duration ("five-year-drought") produced a variation of opinions but no specific recurrence period. Drs. Kubursi and Magee (KM) indicated a 1.35% frequency, which suggests that a five-year-drought should be expected to occur only once in 65 years. It can be reasonably argued that the actual drought events that were recorded over the last 100 years could reoccur in the next 100 years. With hydro-electric generating stations having a potential service life of 100 years or more, it is unrealistic to assume that future years will not include substantial droughts similar to those experienced in the past century.

More recently, MH has suggested a 2% frequency for a five-year-drought. As MH's retained earnings (hopefully) increase, these retained earnings could be annually tested against each of the historical drought periods. This would provide ongoing drought event coverage ratios which could be employed in evaluating potential long-term contract commitments. MH's five-year-drought scenario could be treated as a baseline for comparison purposes.

18.1.3 Supply Commitments

When hydraulic generation in a given year exceeds committed domestic load, surplus energy is available for export sales. Over the last decade, MH has looked to long-term and annual short-term firm export contracts for the sale of surplus energy totalling approximately 6,000 GWh per year. MH's total annual commitment between domestic load and firm export sales has typically been in excess of the minimum annual dependable energy level of 21,000 GWh, with a key assumption that other non-hydraulic resources (thermal/wind/DSM/imports) could provide up to about 8,000 GWh of energy if required.

It is important to note that the non-hydraulic resources involve substantial costs due to:

- SCCT thermal generation costs being uneconomic (MH loses money operating its inefficient SCCT plants);
- Wind and DSM "tied" to MISO market prices and not readily dispatchable; and
- Imports being non-firm and, possibly, involving high market prices.

Consequently, from a financial perspective MH appears to count on each year being an average or above-average water flow year, as this would avoid the Utility having to rely on either its SCCT thermal generation or market priced imports. When MH employs imports to fulfill firm or opportunity sales, at best MH's profit margin is much smaller than when the Utility's own hydraulic generation resources are used. At worst, it is a money-losing proposition.

18.1.4 Potential Drought Costs

The actual net revenue loss associated with extended drought events is dependent on the value of:

- Foregone export sales (primarily high-value peak opportunity sales); and
- Additional fuel and power purchases.

18.1.5 Overselling

Total dependable energy, as defined by MH, consists of about 75% hydraulic generation resources (the major factor in MH's embedded cost structure) and 25% non-hydraulic generation resources.

Circa 2003/04, MH anticipated that a domestic load of 19,000 GWh and dependable export sales of about 6,000 GWh could be served from average hydraulic generation output. Unfortunately, and with a low level of energy-in-storage in April 2003, hydraulic output was only 18,500 GWh in MH's 2003/04 fiscal year. MH was faced with a 9,000 GWh shortfall that had to be met at largely very unfavourable prices. The very low April 2003 energy-in-storage level was largely the result of a high level of off-peak opportunity sales undertaken by MH in its fiscal 2002/03 year. These opportunity export sales made in the year prior to the drought, and at low sale prices, had substantial negative consequences once the drought set in.

Circa 2006/07, MH was expecting a domestic load of about 23,500 GWh and dependable export sales of 3,500 GWh, again to be served by hydraulic generation. MH's opportunity sales made early in the fiscal year, again at relatively low prices, subsequently necessitated 1,800 GWh of energy purchases at prices much higher than the Utility obtained through the earlier opportunity exports.

Overselling leads to the depletion of energy-in-storage, which can magnify a subsequent energy shortfall and drive up the negative financial impact of a drought situation.

18.1.6 Board Findings

When MH looked to calculate what it would consider to be appropriate reserves or retained earnings levels to protect against the financial consequences of drought, a five-year-drought (based on 1987/88 to 1991/92) was selected as representing what was, in essence, a financial stress test.

The Board has heard from various consultants that a five-year drought is "stressful enough" for MH, but the Board has not been convinced that the drought events extending from 1929/30 to 1942/43 (including both a five-year and a seven-year drought) would not serve as a more appropriate stress test.

With respect to MH's drought impact evaluation, and in particular the five-year and seven-year droughts, the Board finds that MH's quantitative analysis reasonably defines the energy shortages that would impact MH's energy supply. However, should MH be faced with shortage pricing such as was experienced in 2003/04, this would impact import pricing to meet any shortfalls.

The Board accepts the need for a defined drought risk reserve in establishing a retained earnings target as proposed by MH. The Board expects MH's next IFF to address the risk of, if not the reality of, a lower potential export revenue situation.

18.2.0 EXPORT MARKET RISK

18.2.1 Supply Variability

In mean (or average) flow years, and assuming no major equipment failure, MH's hydraulic generation should be adequate to meet domestic load and about 3,000-4,000 GWh/year of export sales. These export sales would typically consist of 2,000-3,000

GWh/year of firm price contract sales and a further 1,000 GWh/year of peak opportunity sales. Prior to 2005/06, these peak opportunity sales prices tended to equal or exceed the firm fixed prices. Currently, the peak opportunity sales achieve about 50% of firm prices.

In above-average flow years, MH looks to import electricity from time to time to expand peak opportunity sales to the limit of peak transmission tie line capacity and sell electricity at peak prices when available. Nonetheless, currently, under on-going high flow conditions, MH's average opportunity sales are achieving less than 3.0¢/kWh (peak and off-peak average).

In below-average flow years, MH's hydraulic generation can barely meet domestic demand. As a result, in such circumstances MH's exports mostly come from purchased energy. Consequently, net export revenues tend to be low, and can even be negative if the price of export commitments is lower than the purchase price.

Transmission constraints on exports in above-average flow years mean that MH can only export a maximum of 7,000-8,000 GWh/year during peak periods. Additional energy surpluses must be sold during the off-peak period (at prices as low as 0.5¢/kWh). The total tie line capacity limit for sales into the U.S. MISO region is 15,000 GWh/yr, including peak and off-peak sales.

18.2.2 Decreasing Export Market Demand

In the absence of low-flow and drought situations, MH can still be faced with low export revenues as a result of weak export demand. Recent MH IFF's assume that all surplus energy can be sold into the U.S. MISO market at favourable prices. This is not necessarily the case.

At the beginning of the 21st century, MH was able to readily sell 9,000 to 10,000 GWh of energy into the MISO market. These sales took place in the context of an environment that involved natural gas prices rising well above $5.30/GJ, no new coal thermal plants coming into the market due to threats of CO_2 pricing, and a "booming" U.S. economy. At that time, MH could reasonably anticipate an ever increasing demand for its surplus energy.

Circa 2004/05, the prospects for selling all of the energy output from Keeyask G.S. and Conawapa G.S. (estimated to total 12,000 GWh in average flow years) seemed certain. However, with many MISO states moving to renewable energy mandates, and with wind energy currently being eligible for a 1.7¢/kWh federal subsidy in the U.S., MH is now faced with substantial additional competition for market volume.

Prior to 2003/04, approximately 25% of MH's contracted export sales were inter-provincial Canadian sales. Since that time, MH appears to have focused almost entirely on MISO. That focus on MISO was initially successful, partly because the U.S dollar was about 1.2 times the Canadian dollar. More recently, with the economic downturn, the advent of shale gas, a Canadian dollar more or less at par and a no longer "booming" American economy, the U.S. market for MH's energy has become much less favourable.

18.2.3 Export Market Price Trends

MH's export sales into the MISO Market were initially quite profitable. This was in large part due to a very favourable foreign exchange rate (the Canadian dollar fell at one point to well below $0.65 USD) and seemingly ever-increasing natural gas prices. From the currency exchange alone, MH derived an average of $85M/year of additional revenues at the time.

This favourable situation no longer exists. However, MH's IFF09-1 still assumed a U.S. dollar equal to $1.10 CAD and to increase to $1.20 CAD. Consequently, on this factor alone, MH faces a substantial downside risk on export prices. The currency factor may, however, be partially offset by the resulting "depreciation" of that portion of MH's debt that is owed in U.S. dollars.

MH faces a combination of negative export circumstances in the current market environment. These circumstances include lower demand, subsidized wind in the U.S., reduced attention to carbon emissions, and the advent of shale gas. On the spot market, natural gas is presently selling for $3/GJ, which is only 20% of the peak price encountered in the last decade. In recent years, MH has made, and still is making on-peak and off-peak sales at an average price of less than 3¢/kWh. This represents ongoing pricing risk as a result of eroding export profitability.

The relative pricing of peak period opportunity sales and contract sales has changed since 2008/09. Day-ahead and spot prices used to be higher than fixed long-term contract prices. That is no longer the case. To the contrary, spot pricing is now up to 40% lower than contract pricing. This, too, represents an ongoing pricing risk.

18.2.4 Future Export Revenue Prospects

There continues to be significant excess energy supply in the MISO market, and expanding wind resources and new CCCT natural gas thermal generation constructed within the MISO area may maintain the excess resource situation for a considerable period ahead.

MH's new generation (from Wuskwatim and from the planned Keeyask and Conawapa generating stations) will carry fully-costed initial in-service costs in excess of 10¢/kWh. That indicated cost is almost double the current net cost of not only wind resources but also the cost of shale gas-driven CCCT generation.

With a U.S.-Canada exchange rate near parity, MH may be faced with an extended period of lower export revenues than is forecast in either MH's IFF09-1 or IFF10-2, and an extended period before a return, if it ever occurs, to the US dollar being worth $1.20 CAD (as assumed in IFF09-1).

18.2.5 Board Findings

In the Board's view, MH may be facing close to its worst-case export market scenario, particularly relative to the situation anticipated in IFF09-1, because of such factors as:

- projected major generation and transmission project costs 50% higher than initially forecast;
- natural gas generation costs having decreased by 30%-40% or more;
- the U.S./Canada exchange rate decreasing revenues by 20% (offset in part by depreciated value of MH's debt held in U.S. dollars);
- a complete lack of carbon pricing as opposed to the $20-30/tonne of CO_2 apparently once forecast by MH; and
- continued U.S. wind subsidies along with decreasing wind generation costs due to technical improvements and efficiencies.

Furthermore, the Board does not see how all of these negative market scenarios will be reversed for many years to come. The obvious risk faced by MH is that the current status quo prevails for the foreseeable future.

18.3.0 INFRASTRUCTURE FAILURES

18.3.1 Context

MH has experienced, on a periodic basis, the loss of generation and transmission system components due to both natural forces and the deterioration of parts or components. In large part, MH has been able to respond to such losses in an expeditious manner and has avoided substantial power outages to date.

The loss of various distribution system components due to natural forces, accidents and deterioration has been more frequent than the loss of generation and transmission system components. However, the extent of these failures is typically localized and blackouts have been limited to days (if not hours) rather than weeks or months.

MH's infrastructure failure risk is primarily focused on the major generation and transmission systems and the potential for broad-scale power outages. MH has frequently suggested that a failure of major generation and transmission components represents a greater financial risk than that occasioned by an extended drought period. MH looks to system redundancies to mitigate and/or preclude any inability to meet domestic load and firm export obligations.

18.3.2 Historical Events

The failure of both Bipole I and II occurred in October 1996, but the main north-south Manitoba AC lines were not affected. Subsequently, MH has progressively moved towards the implementation of a Bipole III concept, able to meet domestic loads without Bipole I and II.

A partial failure of MH's HVDC or HVAC transmission system would be more serious than a partial loss of generation capacity.

18.3.3 Dam Safety

The Board understands that like other hydro utilities, MH periodically reviews the potential for various failure modes of its hydroelectric generating stations. To date MH has not produced the Asset Condition Assessment Review requested by the Board in the 2008 GRA.

18.3.4 Consequences of Failure

A catastrophic total failure of MH's generation and/or transmission infrastructure appears to be a remote possibility. More likely is a partial failure, where the greatest cost implications will arise not from the requirement to repair or replace the failed infrastructure, but from lost revenue from exports sales or, perhaps, domestic sales that cannot be fulfilled from MH's own generation.

18.3.5 Board Findings

MH has experienced a wide array of infrastructure failures within the various components of its generation, transmission and distribution systems. Undoubtedly, similar events may be expected in the future.

With respect to the Bipole I and II tower failures, it would have been prudent for MH to conduct a comprehensive post-mortem analysis of the failures, and, as well, a cost/benefit analysis to justify the Bipole III project. The Board is of the view that to date, alternative scenarios to Bipole III have neither been adequately explored nor documented.

18.4.0 OPERATIONAL RISKS

18.4.1 MH's Forecasting Process

With upwards of 95% of MH's annual energy supply now coming from hydraulic resources, an ability to anticipate river flows and forecast hydraulic generation is essential. MH apparently relies primarily on antecedent stream flows conditions to estimate current-year and upcoming flows and hydraulic output.

A key element of MH's water supply management involves the ongoing prediction of flows and hydraulic generation for 6, 12 and 18 months in advance. This is to ensure adequate energy supply for domestic load and firm committed exports for both the current year and the upcoming year.

The Board understands that MH does not attempt to predict annual water flows via specific hydrologic parameters (such as winter precipitation, snow pack, snow melt, spring run-off and precipitation) but rather employs antecedent regression relationships to forecast annual system inflows based on actual flows. In calculating generation forecasts for the year, MH appears to assume average levels of energy-in-storage as both the starting point and end-point. This approach may not raise concerns in average or above-average flow years, when excesses or shortfalls can be managed at low cost.

However, in below-average flow years the negative cost consequences of over-prediction could be substantial.

The practical limit of MH's existing hydraulic generation capacity is about 37,000 GWh/year under high flow conditions as experienced in 2005/06 (the 2007/08 Q4 output was 9,700 GWh over a three-month period).

18.4.2 Concerns about MH's Forecasting Process

MH's reliance on actual April system inflows to define potential hydraulic generation for the upcoming year does have some merit, but only if used in conjunction with a consideration of actual April 1st energy-in-storage and a quantitative assessment of precipitation during the preceding winter months (October to March). A high April system inflow may, in some years, be the result of an early spring melt rather than an indication of high flow volumes to follow. Conversely a low April system inflow, in some years, could reflect a late spring melt. A correlation of energy-in-storage and winter precipitation with MH's existing factors should provide an additional and better indication of potential hydraulic generation surpluses.

MH's response to favourable April flows can have significant implications. Maximizing export sales in April and May can be a high-risk venture if subsequent summer flows end up being low. This applies to all opportunity sales and to bilateral summer contract sales for June-September period.

MH apparently does not carry out an annual back-testing of its hydraulic generation forecasting process and assumptions. Such a test would be extremely useful as a means of confirming the reliability of MH's current procedures and assumptions.

18.4.3 Drought Events of 2002/03 and 2003/04

Leading up to the 2003/04 drought year, MH exported about 9,900 GWh in 2002/03. 4,800 GWh of that amount was exported in the first six months of the year and 3,900 GWh in the second six months. According to the Board's calculation, these export transactions involved 7,900 GWh purely from hydraulic resources and 2,000 GWh from imports. As a result, energy-in-storage decreased from 6,300 GWh in April 2002 to 4,200 GWh in April 2003.

As a result of this decrease of energy-in-storage, in 2003/04 MH was only able to achieve 4,400 GWh of physical exports while requiring 7,000 GWh of imports. Another 2,500 GWh of firm contract exports were bought back and never delivered. About 2,600 GWh of energy imports were required to meet the domestic load shortfall.

If a similar drought were to occur in the 2011 to 2015 period, the results would likely be quite different. While the total energy obligations (both for domestic load and for firm exports) and energy shortfalls would be quite similar, the resulting costs would reflect higher energy prices and the resultant deficit would be substantially larger.

18.4.4 Board Findings

MH's Prediction Process

MH's IFF process apparently provides hydraulic generation estimates for:

- Year 1 - based on 6 month actual generation + 6 months median projected generation;
- Year 2 - based on actual April energy-in-storage adjustment + 12 month median projected generation; and
- Year 3 - based on average energy-in-storage + 12 month mean projected generation.

The Board understands that MH does not use the IFFs to make its actual operational decisions.

It appears to the Board that MH looks to April hydraulic generation (river flows) to confirm, on an antecedent basis, the hydraulic generation resource and hence energy available for export for the next 12 months. A September review based on September hydraulic generation is also used to verify the available MH energy and the need (if any) for winter imports.

Regulatory Reviews

MH's American utility customers are faced with rigorous reviews by the State Public Utility Commissions with respect to their proposed import contracts with MH (i.e., MH's export contracts). MH's export contracts, and the volumes and prices involved, are significant in determining domestic consumer rates; and, as such, need to be reviewed by the PUB even if they are filed in confidence as opposed to being placed on the public record.

2003/04 Drought

While MH contends that its management of the events leading up to and including the 2003/04 drought were totally appropriate, there has not been a detailed back-testing (post-mortem) of MH's water supply management and flow prediction system to date. The Board sees a need for MH to enhance its modeling forecast by adding a comprehensive hydrologic component.

It is apparent that MH's model employs antecedent forecasting and does not look to a hydrologic prediction in preparing annual hydraulic generation estimates. Evidence from external experts and the independent consultant indicates that the models are less accurate in replicating actual low-flow periods (such as 2003/04) than they are in replicating average or above-average flow scenarios. The Board sees this as a significant risk issue.

When MH suggests that it does not look to anticipate or predict pending drought situations, the Board can only ask why MH would not attempt to reduce energy consumption as soon as accumulated precipitation data in any year indicates that watershed runoff could be significantly below average. Reducing energy sales a month or two earlier could significantly alter the level of losses during a drought period.

The need for new hydraulic generation within MH's system is apparently determined by domestic load growth and export contract commitments. In the Board's view, MH should revisit the rationale for determining dependable energy resources and the acceptable level of non-hydraulic resources that should be used to establish firm export contract commitments.

In 2003/04, the energy shortfall resulting from a drought scenario was entirely covered by imports at unfavourable market prices. This suggests to the Board that MH does not have adequate firm resources to meet MH's firm supply obligation under droughts as historically experienced.

A renewed focus on serving domestic load first in MH's "Business Plan" could, while potentially limiting MH's export operations, ultimately benefit Manitoba consumers. The Board sees some merit in further researching and testing such an alternative focus.

18.5.0 JOINT FREQUENCY RISK CONSIDERATIONS

18.5.1 Retained Earnings Reserves

Currently MH's retained earnings reserves are expected to buffer the financial consequences of a five-year drought and shield consumers from other potentially coincident events such as:

- lower export revenues or, alternatively, shortage import prices;
- potential infrastructure failures;
- lack of domestic load or industrial growth;
- power resource planning that relies on substantial non-hydraulic resources;
- capital cost escalation;
- operational risks such as drought anticipation/overselling in spring; and

- regulatory risks.

Nonetheless, the reserves are not necessarily adequate. The quantification of the reserve will remain an issue for future GRA hearings.

18.5.2 Dedicated Reserves

MH is essentially opposed to segregating specific drought reserve requirements for particular risks. However, it could be argued that MH's overall global retained earnings reserve is subject to the independent risk of depletion due to non-drought factors such as:

- market price collapse;
- "sticker shock" capital cost escalations; and
- lack of domestic load growth.

The suggestion by the independent consultants (KM) that MH create an EIS reserve is not without merit and is worthy of further investigation. Constraints on the withdrawal of EIS could be seasonally defined, so as to reduce the likelihood or magnitude of a supply shortfall. This would not preclude MH's management of energy resources, but would ensure a minimum hydraulic resource level at all times.

18.5.3 Intervener Positions

The interveners concluded that MH's current approach of having one global retained earnings reserve was adequate.

18.5.4 Board Findings

In the Board's view, the entire issue of multiple interdependent risks has not been satisfactorily reviewed or resolved. There is a reasonable concern that the Utility's forecast retained earnings will not be realized or, if realized, maintained.

With the potential for multiple claims on a global retained earnings reserve, there exists risk that the reserve could be substantially depleted in advance of any future drought, meaning that a drought could impair MH's capital position by far more than now expected. This, in turn, could lead to higher consumer rates.

18.6.0 RISK EXPERTS

18.6.1 KPMG

The Board directed, in Order 32/09, that an independent comprehensive risk study be undertaken and filed, with the specific terms of reference for the study to be approved by the Board.

In late 2009, the Board was asked for input by MH towards establishing terms of reference for what the Board expected to be an independent comprehensive risk study, one which would address all of the risks identified by the Board in Order 32/09. The Board provided this input, and KPMG was retained by MH to carry out the study in November 2009. However, the final terms of reference were not as sought by the PUB and previously agreed to by MH.

MH advised that its Audit Committee authorized the changes to the terms of reference for the KPMG risk review and specifically approved removal of the requirements requested by the PUB for an independent and comprehensive risk study. As such, while the KPMG reports (and the cost of KPMG's representatives, who were assisted by the firm's external legal counsel at the hearing) cost MH approximately $4.0M, the work performed was not broad enough to address the Board's concerns. The terms of reference MH provided to KPMG focused on a review of the allegations of the New York Consultant (NYC) previously employed by MH rather than the identification and costing of MH's risks.

KPMG, as directed by MH, concentrated on the NYC's allegations and the development of an analysis with respect to those allegations. KPMG acknowledged in response to pre-hearing information requests and upon cross-examination during the oral hearing that it never intended to respond to any of the specific assertions of the NYC regarding MH's operations, risk management or risk governance. KPMG considered the NYC assertions, identified major issues arising from those allegations, and then analyzed those issues using the review process set out below. KPMG confirmed (on cross-examination) that the NYC had not missed identifying any of the major risk issues faced by MH.

KPMG reviewed existing risk review studies, obtained explanations of operational and planning methodologies from MH, and limited its analysis to a consideration of whether MH was operating reasonably in respect of the issues under review as defined by KPMG. KPMG did little independent verification of MH's underlying data as part of its work. For example, KPMG's Net Present Value (NPV) analysis of MH's preferred future development scenario compared to one alternative development scenario was based on MH's data, and KPMG did nothing to verify the underlying data assumptions that supported the particular stress test runs to generate the NPV outputs. Also, KPMG confirmed that with respect to its review of MH's price forecasts, it made no attempt to examine the validity of the forecasts. Rather, KPMG focused on examining the method used by MH of purchasing a number of forecasts and creating an average of the forecast values.

KPMG recognized that the original terms of reference as approved by the Board included the need for consultation with the Board and its advisors as necessary. KPMG determined that this consultation was not necessary to complete its work, even though the work was envisioned to fulfill a Board directive arising from Order 32/09.

Based on difficulties KPMG encountered with the NYC, it chose not to attempt to make contact with the NYC to obtain an explanation from the NYC as to any assertions which appeared inconsistent, unclear or ambiguous. In the circumstances that existed, which included legal action undertaken by MH against the NYC, it appears unlikely in any case that KPMG would have received any cooperation if had made such an attempt.

Following a court application by MH against the NYC on the issue of publication and use of the KPMG report, it became clear to the Board in its pre-hearing process that the KPMG report would not be tabled with the Board unless the Board served a subpoena on MH.

Accordingly, a subpoena was served on MH for production of the KPMG report on April 15 2010, the date the report was issued. MH complied with the subpoena and the KPMG report was tabled with some redactions, in compliance with the subpoena. In the course of a redactions motion before the Board, the Board approved several redactions in the KPMG report. These are set out in PUB Order 95/10. A final redacted KPMG report was then put on the record of this proceeding.

KPMG also performed an adjunct risk governance / risk management process review for MH between March and May 2010 and issued a separate report on May 2010. The KPMG risk governance / risk management process review report was tabled at the commencement of KPMG's testimony in this hearing on February 28, 2011.

The Board finds that KPMG's report is not an independent assessment of MH's material risks as was originally envisioned by the PUB. Given the somewhat narrow approach adopted by KPMG and the limited nature of KPMG's analysis, this work has limited value despite its steep price tag.

In oral testimony, KPMG's panel addressed the major topics its considered as part of its review process. KPMG's key findings were as follows (the first two conclusions were not contained in KPMG's draft report but were added to the final report after a review by MH's Audit Committee):

- There is no material risk of bankruptcy for MH as a direct consequence of MH's export power sales practices.

- There is no evidence to support an assertion of losses approaching one billion dollars in the five years preceding KPMG's review based on analysis of MH's modelling, export sales contracts and risk management practices.

- MH's strategy of entering into long term contracts and securing transmission rights in development of its system is a prudent strategy.

- MH has operated in accordance with its legislative mandate.

In two places in KPMG's draft report, KPMG made the statement that

> *"MH's core business objective is to provide its domestic customers low-cost and reliable energy service."*

On cross-examination as to why MH's Audit Committee requested that statement removed from the final version of the KPMG report (from which it was in fact removed), MH's Chief Financial Officer responded that MH never described its core business objective in this manner and that it was a truncated interpretation of MH's core business made by KPMG that MH did not agree with.

As part of its review, KPMG concluded that a legislative mandate for MH, and thus a key MH goal, was to provide low-cost power to MH's domestic customers. Given the process used by KPMG to complete its assignment, KPMG would have been informed in its interviews with MH's executive staff that this was indeed an objective of the utility. Furthermore, MH's Corporate Strategic Plan 2009-10 filed with its GRA application states that a defined target is to provide the lowest retail electricity rates in North America.

MH's testimony and submissions clearly support a long term plan which supports stable, low annual rate increases (said to be projected to remain close to inflation) for domestic customers over the 20-year time horizon shown in MH's IFFs. Indeed, MH's intention to add new generation in advance of the need of its domestic customers, as part of its decade of investment and in accordance with its preferred development scenario, is premised on export sales creating net revenues that over time will result in reduced domestic rates.

With respect to MH's risk governance structure, while KPMG generally concluded that MH's corporate risk management function is consistent with leading and prevailing practices, KPMG identified a number of risk policy areas where MH rated sub-par and made recommendations for improvement. MH subsequently reported to the PUB in the hearing process as to progress on these recommendations. Among other things, MH reported on an increased role for its Middle Office as well as increased staffing and expertise for its Middle Office. Improvements undertaken by MH include establishing a role for the Middle Office in the review of long-term export contracts. KPMG also recommended improved risk analytics technology, which appears to implemented on an ongoing basis as part of MH's improvement to its risk management infrastructure.

KPMG concluded that MH's financial risk management function is consistent with leading practises.

KPMG concluded that MH's actions, as understood by KPMG, demonstrate prudent power risk management practices as related to major export contracts and term sheets, including a conservative stress testing methodology, transaction processing controls to mitigate against human error and operational risk, compliance and risk monitoring by the Middle Office, and a comprehensive suite of reports.

KPMG also indicated that it reviewed MH's "HERMES" and "SPLASH" modelling programs. HERMES is used to plan operations of a system in the near term. SPLASH is used for long-term planning processes and to establish a business case for new generating plant additions. SPLASH also provides input for medium- to long-term financial forecasting. KPMG further concluded that MH has taken appropriate care and due diligence in developing, operating and maintaining the models. On the key issue of forecasting water flows, KPMG endorsed antecedent forecasting methods in use by MH as a useful and reliable approach to this type of forecasting.

KPMG also noted that with respect to the SPLASH model, the use of perfect foresight allows for certain conservative projections which are reasonable for the purposes for which the model is used by MH. In considering the trade-offs with respect to the perfect foresight methodology, KPMG also concluded that financial losses associated with droughts are in fact inevitable.

KPMG noted that the use by MH of the 1937-1942 drought periods is appropriate for MH's planning to determine dependable energy. KPMG acknowledged that the appropriate approach for determining dependable energy depends on the Corporation's risk tolerance. A more stringent definition of dependable energy would result in less risk of financial loss in the event of a drought, but such a strategy also has the prospect of lowering MH's revenues, on average, to the extent that it must spill water or sell on the opportunity market for less certain return.

KPMG looked at pricing in the long-term export contracts and Term Sheets as well as the structure of the long term contracts and risk capital reserves. KPMG analyzed the pricing process and concluded that MH has an appropriate methodology for arriving at the sales prices in its long-term contracts. KPMG did recommend that MH clarify the role of the premium applied to its long-term contracts, confirm the appropriate magnitude, and also that it should do a better job of documenting its pricing analysis and its future avoided cost analysis. More explicit use of the avoided cost analysis in future pricing methodology is also recommended. KPMG further recommended that in the process of reviewing export contracts and terms sheets, MH's Middle Office should have a defined role to perform a challenge function.

KPMG supported MH's long term contract strategy and found that it has the potential to mitigate market risk for MH through diversification. KPMG concluded that MH's drought risk will be mitigated because of returns (revenue) to be generated under the export contracts and the extra transmission capacity to support required imports in drought situations.

KPMG also performed a net present value (NPV) analysis to compare the Sales Scenario (being MH's preferred development sequence) to a No Sales Scenario which included an alternate expansion plan with no long-term contracts. MH redacted all of the supporting data in the KPMG report, so that there was no opportunity for the Board or Interveners to examine the NPV analysis in the report.

To perform the NPV analysis, while KPMG provided data run requests to MH, it confirmed that it performed no independent analysis of the inputs for the NPV calculation, but instead relied on MH for that information.

Based on the assumption inputs in the analysis, KPMG concluded that under all scenarios, including drought stress test cases, the NPV of MH's Sales Scenario/preferred option was greater than the No-Sales NPV. KPMG acknowledged that with the escalating costs of capital projects, a downward adjustment in the NPV of the preferred scenario would be required. Likewise, with export prices declining as projected by Mr. Rose of ICF, there would be further downward pressure on the NPV of the Sales Scenario.

KPMG also assessed net income and retained earnings over the long term with respect to the Sales and No Sales Scenarios for MH. The picture was less clear with respect to differences in net income between Sales and No Sales in the shorter term, but KPMG concluded that in the long term, net income and retained earnings were better under the Sales Scenario.

KPMG acknowledged that its NPV analysis was limited to input values for various components as available at the time of the report. Significant increases to the estimate of the capital costs of the proposed capital projects at the heart of the scenarios, being Keeyask, Conawapa and Bi-Pole III, were not available to KPMG and would materially change the analysis. KPMG confirmed that all other things being equal, higher capital costs would lead to a lower NPV in their analysis.

Given the limitations of KPMG's final terms of reference and its approach to the preparation of the report, it is useful to consider several of the risk management and risk governance issues brought forward by KPMG (and other experts before the Board) in response to the NYC's assertions. The filing of KPMG's adjunct risk governance / risk management report, the testimony of the KPMG panel, and cross-examination of the KPMG panel all added value to the engagement. KPMG's evidence suggested the following:

- The NYC identified all significant risk issues facing MH, although no specific NYC reference to quantification of MH's operational losses could be verified by KPMG. By and large, KPMG did not attempt to respond to the specific assertions of the NYC.
- The system models developed by MH for production and for long-term planning are similar to models used by other utilities, and the models are doing what they are required to do. The models are being upgraded and calibrated on a continuous basis.
- MH should proceed with its planned enhancements of the models. MH should better quantify and communicate to stakeholders, including the PUB, the impacts of the perfect foresight assumption in the calculation of drought costs. Further, MH should explicitly consider uncertainty in future water flows in the modeling process used to identify optimal production decisions. MH should consider assessing the financial impacts of drought events worse than those found on the historical record.
- MH should conduct more scenario analyses, and should do more stress testing and back-testing to evaluate risk exposure and model accuracy. MH should also formally document its in-house models, which will mitigate the risk for the time when the experienced, highly knowledgeable staff that has the knowledge about

the models leaves MH. Independent peer review of the models is also recommended.

- MH needs to continue to develop its risk management capabilities, and specifically the role of the Middle Office in risk management.

- MH must take a careful approach to future development to take advantage of the opportunities available based on Manitoba's hydrologic resources. MH must ensure that costs of the development plan "don't go way out of whack", make sure good prices are achieved in the final long-term export contracts, and make sure that the benefits flow back to Manitoba ratepayers and are not shared too widely with other parties.

- MH should create a defined risk management philosophy and create risk management objectives and a mission statement respecting risk policy. It should define its risk appetite by articulating a statement that reflects strategic growth goals and desired returns from a strategy. MH should differentiate risk appetite from risk tolerances, the latter being acceptable variations relative to the achievement of objectives. Better documentation of the risk management function through management and governance in MH are also recommended. Specific recommendations regarding monitoring and reporting of various risk issues are detailed in KPMG's May 2010 report.

- MH would benefit from completion of a final documented drought preparedness plan. Although KPMG found that MH is prudently managing its approach to drought as one of MH's biggest risks, a written plan would be an improvement as the plan would then be documented in one place, and available for the purpose of communicating it to all stakeholders and interested parties.

- MH's capital structure should continue to be formally reviewed on a regular basis. Of particular significance at this time are the major capital expansion to MH's generation and transmission system and MH's risk management improvements, which may affect MH's optimal capital structure. Better information would assist decision makers on the optimal capital structure for MH through future periods of significant change and ongoing uncertainty. The appropriate capital structure will continue to be an ongoing issue for the company, the PUB, the Province, ratepayers and lenders.

18.6.2 Dr. Kubursi and Dr. Magee

After consultations with MH and the Interveners in the pre-hearing process, and having been aware of the limited terms of reference provided to KPMG by MH, the Board determined that it would retain independent experts to perform a study of MH's material risks, in accordance with the scope of the GRA and the Terms of Reference which were attached as a Schedule to Board Order 30/10. As a result, Drs. Kubursi and Magee (KM) were retained and accepted the assignment to fulfil the assignment under the terms of reference. They retained their own counsel and proceeded with their investigation and analysis. KM also met with a number of the Interveners and, as required, provided general guidance to the Interveners and answered inquiries on risk principles.

KM worked with MH pursuant to a confidentiality agreement and spent significant time gaining knowledge of MH's operations, its models, and its risk governance and risk management processes. This knowledge was used by KM to prepare its own statistical analyses of revenue results for MH's electricity operations under various scenarios, using the same computer software which is the basis of MH's PRISM model. KM's statistical distributions were produced to assist the Board and hearing participants with a better understanding of risks faced by MH and the related implications for the financial health of the utility, its ratepayers, and the Province of Manitoba.

As a result of the limitations imposed by the confidentiality agreement, KM chose to use publicly available data, from Statistics Canada, to conduct its data analyses. Ultimately, both MH and a number of the Interveners challenged the validity of the data runs and distribution curve outputs generated by KM based on the Statistics Canada data, as well as subsequent refinements presented by KM to their initial calculations.

KM submitted that it could assist the PUB and inform the ongoing discussion of the risks faced by MH and decisions arising therefrom, in particular in the following areas:

- evaluating MH's risk governance systems and risk management strategies;
- quantification of risk;
- review of MH's operational and planning models, pricing options, investment decisions, and MH's overall business performance; and
- suggesting statistical methods for dealing with uncertainty, for example, in future water flow predictions.

While the Board is not certain that it can rely on the accuracy of the particular distribution curve graphs included in the KM report or KM's quantification of MH's drought costs, it is satisfied that the broader insights drawn by the independent experts from their data analyses are instructive as to the matters identified in the terms of reference and the MH risk review as part of the GRA.

The independent experts were qualified as experts to provide opinions in the areas of econometrics and statistics, including time series analysis, economics, production systems, risk analysis and optimization models.

In preparation for their work, KM also reviewed numerous reports and studies respecting other public utility systems and the risk assessment and risk management processes at different utilities. Dr. Kubursi in particular studied water and drought prediction models, operation research in power generation, operation and planning systems, as well as optimization systems and software.

Dr. Kubursi and his counsel Mr. Wood also met with the NYC in New York in June 2010 in an effort to understand the NYC's concerns and supporting analysis respecting those concerns. During the meeting, the NYC was prepared to identify high level issues and repeated its general assertions regarding problems in MH's risk governance and risk management areas, as well as alleged operational deficiencies and mismanagement. However, the NYC was not prepared to engage in a more detailed discussion or review of its supporting information which backs up its assertions. The NYC was not willing to share the explanation for the quantification of specific losses alleged to have occurred.

Although Dr. Kubursi concluded that the NYC displayed a strong scientific intellect and had a sound educational background along with experience in risk analysis, the NYC was reticent to share information to assist KM in their completion of their assigned tasks under the terms of reference. Further attempts to reconnect with the NYC thereafter proved fruitless.

KM generated its primary report in November 2010, which report was supplied in a redacted form based on redactions requested by MH. The redactions primarily relate to MH's long-term contract pricing and other contractual provisions, as well as certain water flow data.

KM generated a further Reply submission, which became the document used as the basis of their direct oral evidence in the hearing. KM testified before the PUB and were subject to cross examination by Board Counsel, the Interveners and MH.

The Board has identified the following findings and conclusions of KM, based upon their reports and testimony:

- There may be benefits derived by MH in integrating its operating and planning models.
- MH is a Crown Corporation, seeking to pursue maximum revenues and strong net income while serving the best interests of the Province of Manitoba and

domestic ratepayers. This is identified as a duality of interests within MH. The regulatory regime in Manitoba vests authority in the PUB, which is tasked with moderating the monopoly power which MH enjoys to ensure balance. Prices should be equal to marginal cost and only reasonable rates should be charged to Manitoba customers.

- MH is likely prone to the "principal/agent" dilemma, the principle being that there is a difference in risk tolerance between the utility and its customers. Citizens are risk-averse based on well-known and studied general principles of economic behaviour. MH as a corporate entity may be less risk-averse.

- There are naturally existing information asymmetries between MH and its stakeholders.

- Moral hazard may be an issue for MH. The Utility may be tempted to undervalue risk and to pass the cost of its risk-taking onto domestic customers.

- Risk management best practices require a continuous and systematic process. Beyond identifying and prioritizing risks, procedures must be established to estimate probability density functions and ranges in systematic, transparent, and replicable ways.

- Statistical procedures should be verified and validated by subject matter experts in the Front and Middle Offices of MH.

- Once strategies for assessing risk are in place, procedures to deal with them must be established to reduce risks to the enterprise.

- Individual responsibility and accountability for defined risk matters is required. KM confirmed on cross-examination that MH appears to have an individual responsibility/accountability system in place.

- There must be a vested defined internal authority to implement risk management processes, along with properly allocated resources, necessary expertise and appropriate oversight in the process.

- There must be a process for monitoring and tracking outcomes and learning from mistakes as part of the risk management regime at MH. The process is optimized as a continuous exercise.

- MH has shown good effort in implementing a risk governance and risk management system that is still evolving.

- As a result of the 2003/04 drought, MH recognized that it needed a comprehensive risk management plan.

- Gaps in the MH risk management system include the need for one group to undertake valuation of risk and another group, in the Middle Office, to validate the assessment.

- Qualitative analysis of MH risk can be improved. Middle office validation of quantification is necessary. Quantification should use market values, such as mark to market measures, which are preferred over other benchmark evaluations of financial risks.

- Greater expertise of statisticians and actuarial experts would assist the Middle Office and added risk analysis expertise is required.

- Risk management must take place at the highest level in the organization for MH and must continue to report to the CFO. The Middle Office must be given importance in the MH hierarchy which is necessary to allow it to function effectively with this recommended structural change.

- Risk preparedness plans are needed for all costly risks, including a written drought preparedness plan.

- One of the benefits of a drought preparedness plan is to avoid a well-established phenomenon of reaction lag time to deal with future droughts. This includes lags in recognition, diagnosis, response, action and outcome. A good plan would take into account all components and identify a set of criteria, responses and responsibilities to eliminate the lag.

- All business transactions must include a risk assessment that would be first prepared by the business unit and then reviewed by the Middle Office. Specifically, long-term contracts must fall into this review process.

- MH should introduce statistic uncertainty to its models, which are operating on deterministic structures. The current structures do not optimize assessment of risk.

- Outside peer review for the validation and audit of MH's models is important. MH should proceed to implement processes for validation and audit.

- MH's electric load forecast is reasonable, and to improve it MH should move to integrate probabilistic variables. The group responsible for the load forecast should be integrated formally into the MH model staff community. This supports greater integration of the models and is of benefit to all of the modelling staff at MH.

- MH should reconsider its use of variables for multiple forecasts in its economic outlook preparation. The practice of drawing individual variables from various forecasts may lead to incorrect outcomes.

- With respect to prediction of water flows, MH's should consider methods beyond the currently used historical simulation methods to predict droughts of greater severity than those in the historical record.

- Upon review of the NYC public document respecting high level assertions, and upon review of various related reports prepared by MH, KPMG and ICF, KM is unable to confirm any specific assertions of losses alleged by the NYC or any specific allegations of mismanagement. KM saw no evidence to support such allegations during its study.

- With respect to general issues of risk identified by NYC, areas for improvement were identified in detail in the KM report and elaborated on by KM in testimony. Included in recommendations are subject areas of model governance, model utility and relevance, model output and predicted accuracy, water flow analysis, drought risk, and risk governance and management in the MH middle office.

- Numerous benefits may accrue to MH as a result of entering into new long term contracts with its counterparties.

- High import prices are a threat in drought periods, but the long-term contracts are structured to define price limits and offer greater curtailment protection to MH under certain drought conditions.

- NYC's drought calculations are of a magnitude that is glaringly low. However, there is a need for adequate risk capital to mitigate against MH's long term contract risk exposures, which are a serious concern.

- KM has a generally positive review of MH's approach to capital planning, but there is room for improvement. KM encourages use of a comprehensive model that integrates financial, hydrological, and electric generation components, along with jointly modelling unknown future values by specifying them as random variables.

- MH will benefit from continuing to consider the merits of different rates of capital expansion as the uncertain future for the electricity export market continues to unfold. The Middle Office should play a leading role in approving the process for long term contracts. As a corollary point, KM favours a concrete valuation of a variety of expansion timelines and their implications for the long term financial health of MH.

- MH should move forward cautiously with several potential development sequences to keep its options open in the medium term and obtain the best indication of long term viability for its new capital generation system program.

- MH should complement retained earnings as a risk mitigation measure with other methods of mitigation, including but not limited to additional water storage. MH should adopt a minimum regret strategy to plan for very adverse water situations. It cannot rely only on retained earnings as protection against the severe drought event.

- PUB's role as regulator of MH is to make sure rates are justified, and that MH is not seeking increased rates for recovery of losses for mistakes, errors and inefficiencies. MH must ensure efficiencies are maximized, and that it exercises a discipline of maintaining lowest costs. A more meaningful objective for MH is to minimize costs and create the greatest efficiencies, instead of maximizing net revenues.

18.6.3 Intervener Submissions

CAC/MSOS submits that a number of important contributions have been made by KM resulting from their report and testimony before PUB, notwithstanding the fact that the data and probability distributions contained in Chapter 6 of the KM report are significantly flawed and unreliable. CAC/MSOS recommends that MH adopt the modern scientific approach to risk management outlined by KM as part of MH's risk management strategy and its justification to the PUB for resources to manage risk. CAC/MSOS identified the new risk approach as including:

- The identification of risk factors which have associated probability distributions of outcomes;
- the analysis of the probability distribution of each risk factor based on updated historical data, including the nature of any correlation between risk factors;
- the development of an integrated model of MH's operations that links the risk factors and the financial incomes of interest (net revenues); and
- the performance of Monte Carlo simulations to assess the impact of risk on MH outcomes.

As a result of the flawed analysis in Chapter 6 of the KM report, CAC/MSOS submits that no reliance can be placed on the estimates of the five-year-drought and the seven-year-drought flows produced by KM.

MIPUG identified a number of directional questions upon which it sought to engage during the hearing, related to risk. The questions defined by MIPUG included examination of MH's capabilities, internal organization, policies, procedures, oversight and governance needed to appropriately manage risk.

MIPUG submitted that upon review of all of the evidence on these subjects, MH's approach to risk, while evolving, is appropriate and prudent for a Crown utility.

The concept of risk tolerance was considered by MIPUG's experts. Messrs. Bowman and McLaren concluded that the key benchmark for MH willingness to accept risk in its operations must be the risk tolerance of its Manitoba ratepayers. MH's established risk thresholds do align its risk tolerance to ratepayers and are appropriate, they asserted. Moreover, Bowman and McLaren suggested that where MH pursues long term opportunities which are sufficiently examined and bounded, and provide the means for ratepayers to benefit from the risks of the planned endeavour, through comparatively lower and more stable rates, these actions are viewed as suitable activities underlying regulated rates and are within an acceptable tolerance.

RCM/TREE noted that all of the risk experts appeared to be using out of date Term Sheets as the basis of MH's potential exports revenue position. It also noted that rather than adopting a sceptical review approach, the risk experts accepted the positions adopted by MH in conducting the risk analyses. Particularly troubling, noted RCM/TREE, was the failure of KPMG to involve the PUB in the charting of the risk review which they were engaged to undertake. Finally, the redactions and non-disclosures in the filed material limited the ability of RCM/TREE and its expert Mr. Wallach to properly test the risk information, which limited the benefit of the process for all of the parties.

18.6.4 Board Findings

In addition to the KPMG and KM reports now reviewed, the Board also received other "risk reports". Copies of these reports are on the public record of this GRA.

In these Board findings, the Board provides its findings related to those additional risk reports, as well as its findings with respect to the KPMG and KM reports.

Risk Advisory Reports

Risk Advisory's involvement with MH through the early stages of the then pending 2003/04 drought suggest that MH was not well-prepared to modify its operations in Q3 and Q4 of the 2002/03 fiscal year. The Board notes that MH should have recognized the potential for energy supply problems in the second half of 2002/03 but did not move to deal with these until May of 2003. MH's 2002/03 annual report acknowledged the onset of drought conditions, yet "applauded" the favourable financial results despite those drought conditions.

Risk Advisory's subsequent January 2005 review of energy supply issues did not address the drought recognition aspects and MH's continuation of exports in excess of contract levels. Despite requests, MH has not filed an appropriate post-mortem of the 2003/04 drought event.

Water Stewardship – Peer Review

While the peer reviews on behalf of Manitoba Water Stewardship were generally favourable, the Board notes that the concerns and improvement suggestions are similar to those of other external experts and KM. In particular the Board notes the weak simulation of Lake Winnipeg outflows during low flow years.

Power Export Risks – Dr. N. Bhattacharyya (2007)

The 2007 report by Dr. N. Bhattacharyya flagged some serious issues with respect to the profitability of some of MH's energy trading practices. While MH has attempted to minimize the impact of the results, the Board is concerned that MH may be understating the potential for trading losses.

NYC Allegations

The process of achieving an independent review of the NYC's allegations was very convoluted. The Board looks at this exercise as being largely unsatisfactory. However, it is somewhat disconcerting to find Risk Advisory, ICF and KPMG flagging potential areas of improvement for MH that in many cases mirrored areas that the NYC was critical of, and where in some instances the NYC accused MH of mismanagement.

The contribution of the NYC to the debate on MH's Power Resource Management was significantly flawed. However, it did open a number of avenues to scrutiny. It may well be that MH's Power Sales Operations will have benefited from the public review of MH's operational structure and its business plan. The Board certainly sees that MH has been given insights to a significant number of areas that need improvement.

ICF Report and Presentation

In the Board's view there does not appear to be any direct evidence to support ICF's view that new long-term contracts and new generation and transmission will see a positive impact on domestic rates in the next decade. Publicly available information on contract pricing and conditions is not sufficient to conclude that MH's ratepayers will benefit. Furthermore, substantial capital cost escalation of new generation and transmission projects have not been factored into the process.

Given ICF's forecast of 30-40% reductions to its previous natural gas commodity price forecast, the Board can only conclude that MISO market prices for electricity in ICF's advice to MH (via the Consultant Panel Forecast Updates) will be proportionally lowered. This might confirm that MH's new contract prices are much better than MISO market prices, but increases the concern that MH's opportunity sales will not generate sufficient revenue to cover new plant costs. In an average year, opportunity sales represent more than 50% of MH's overall export sales.

On the basis of information provided, the Board does not share ICF's ready acceptance of the positive risk features associated with MH's long-term contracts. It appears that these features are somewhat favourable in the event of a "worse than the worst recorded" drought, but they do not appear to provide any substantive benefit for drought events of lesser magnitude than the maximum recorded.

ICF did not provide any analyses or evidence on the appropriate rules and volumetric limitations that should be applied to merchant and other short-term trading. The Board is uncertain as to what value can be placed on ICF's conclusions with respect to MH's acceptable management of merchant trading vs. market trading or bilateral sales. All of these activities involve MH's volumetric commitment of at times scarce energy resources without a clear understanding of the financial risks.

Without actually testing MH's modeling inputs/outputs, ICF concluded that these are adequate. This does not provide much assurance to this Board. Rather, it casts doubt on other conclusions that are based on hydrological assessment of the volumetric components of MH's energy supply.

In concluding that MH's defined five-year drought test is an adequate stress test, ICF is dismissing the possibility of other logically coincidental factors adding to drought costs. In the Board's view, more evidence would be required to support that conclusion.

In the absence of specific evidence that the impacts of the 2003/04 drought would have been reduced under the new contracts (if the Adverse Water Clause were applicable) the Board does not see much useful drought risk mitigation. Even if the Adverse Water Clause had been applicable, MH's new generation and transmission capacity may not reduce drought risks if MH continues to aggressively sell all remaining surplus energy.

KPMG Report

When the Board looks at KPMG's contribution to this hearing on risk issues, the Board concludes that the overall time, opportunity and monetary resources available to KPMG did not result in the due diligence review that the Board expected or that MH might have found useful going forward. Certainly, the Board would have expected a more in-depth analysis of MH's actual water resource utilization and the market price scenarios during 2003/04 and 2006/07.

KPMG did suggest that MH's antecedent forecasting process could be improved by adding hydrological components to the overall modeling system. However, when asked to define the specific components that should be added, KPMG indicated that it did not have the hydrological expertise necessary to provide those factors.

When revisiting MH's various development scenarios, KPMG relied totally on MH's existing models and MH's energy pricing forecast. KPMG did not see its role as challenging MH's operational decisions or MH's interpretation of the energy market.

With respect to MH's Middle Office – Front Office relationship, KPMG was concurrently retained to define the appropriate Middle Office role and structure to best augment MH's Power Sale Office operation. This supplementary report offered useful direction on Middle Office staffing and responsibilities. However, it did not provide any significant insights on the Front Office operation under drought situations such as existed in 2003/04 or on market situations such as existed in 2009/10.

In the Board's view, the value of KPMG's review was constrained by the consultant's exclusive reliance on MH's modeling assumptions and MH's export price forecasting. This degree of reliance raises concerns about the independence of KPMG's review and advice.

KPMG's acknowledgement that KPMG did not look to challenge MH's operational decisions, (presumably due to a lack of hydrological expertise) or to challenge MH's management decisions with respect to export market price forecasts does not speak well for KPMG's conclusions that "MH demonstrated prudent risk management". This also raises questions about how KPMG could dismiss most of the NYC allegations as having little or no foundation.

MH indicated that KPMG was only asked to review post-2006 operations. As such, the Board is at a loss to understand how a risk review could be accomplished without serious attention to the most significant drought in the last decade.

In a similar vein, the Board concludes KPMG did not fully address the issue of the SPLASH model's over-statement of longer term hydraulic generation as a result of perfect foresight.

KPMG has implied that MH's operations are conservative but did not look at MH's habit of typically selling up to 115% of its annual hydraulic generation and the risk of winter buy-backs relative to summer off-peak sales. The Board sees MH's actions as being somewhat aggressive rather than conservative in practice.

The Board is concerned that KPMG did not critically explore the inter-relationship of drought risks and price risks, yet concluded that MH has a "conservative" approach to power resource management and marketing.

Further, KPMG acknowledged that it did not possess the technical expertise to actually carry out:

- an independent review of hydrological issues and how these should be integrated into MH's forecasting process;
- an independent assessment and/or back-testing of MH's HERMES or SPLASH models; and
- a comparative analysis or critique of MH's market forecasts of the value of export or import energy.

In the Board's view, many of KPMG's observations and recommendations would require a high level of expertise in hydrology, water supply management modeling and energy market pricing.

Independent Consultant (KM)

The KM report provided much useful insight into MH's energy supply and power sales operations and to the NYC allegation with respect to those operations. It is the Board's view is that KM's review usefully re-defined the circumstances that were addressed by various MH consultants and provided a degree of clarity on many issues.

While KM's overall process of examining the NYC allegations was constrained by various legal challenges and the apparent need for extensive data redactions, the Board believes that useful information was gleaned from the various opinions on the validity of the allegations. There has been a strong indication that MH has or intends to strengthen the operational structure of MH's power supply and sales ventures. A stronger Middle Office with a more clearly defined Front Office interface seems to be in the making.

Various reports have identified concerns and weaknesses in MH's marketing strategies, particularly as they were enacted in 2003/04 and in 2006/07. Despite MH's current reluctance to acknowledge the potential need for operational improvement and a written Drought Preparedness Plan, KM (and other experts) were looking forward to MH's documentation of potential drought risk mitigation strategies in that plan. The Board still expects MH to file such a written plan.

Concerns raised by the NYC about the very limited number of in-house experts to run MH's key models and to direct power sales operations apparently have some merit. Most of external experts have alluded to the need for more formal documentation of these key models and the need for regular independent back-testing of operational results.

The Board sees merit in some of KM's findings on the NYC allegations, but does take issue with the narrow interpretation placed on some concerns and the reliance on other experts' opinions.

When KM (and others) suggested that MH's five-year-drought analysis represents an adequate valuation of MH's overall risk, the Board would have expected that KM (and others) would have done a detailed assessment of both the five-year- and seven-year-droughts. That apparently was not the case. KM performed various single-year-drought assessments (which conceivably would have mirrored the worst year in the five- or seven-year-droughts), but did not specifically evaluate the five-year-drought.

KM suggested that the idea of non-financial water reserves (the holding back of water against the risk of a future drought) in addition to financial reserves (adequate retained earnings) merits serious consideration, but the Board has not seen any detailed analysis of how such a reserve would beneficially function under actual historical drought scenarios.

19.0.0 COST OF SERVICE

19.1.0 OVERVIEW

The 2006 Cost of Service Review led to Board Order 117/06, which contained the Board's findings on various aspects of MH's cost allocation. MH's 2008 General Rate Application included COSS08 (prepared by MH in Aug. 2007) which only partially complied with Board Order 117/06.

As directed in Board Order 116/08, MH filed a March 2009 version of COSS08 that was in large part compliant with that Order. MH, however, continued to object to specific components of the Board Directives in Board Order 116/08. These were:

- a single export class with fully allocated embedded costs in addition to direct assignment of fuel and power purchase costs;
- direct assignment of fixed and variable thermal generation costs to exports;
- use of actual prior year export pricing instead MH's IFF forecast pricing;
- assignment of all NSB/MISO/Trading Desk costs to the export class; and
- assignment of all DSM costs to the export class.

MH has not in recent years proposed any rate increase differentials based on revenue to cost coverage (RCC) ratios for Residential and General Service Small/General Service Medium/General Service Large. Only Area and Roadway Lighting has seen rate freezes to reduce its RCC.

In the current General Rate Application MH filed COSS10 which deviated in a number of allocation aspects from Board Order 116/08.

In early 2010, MH filed COSS11 based on the 2010/11 fiscal year. However, MH recommended that both COSS11 and COSS10 be received by the Board for information only.

In light of the post-COSS11 industrial load reductions and the potential for lower export revenues, there may well be the need for a COSS12 or COSS13 to be filed before a full review of the Cost of Service is usefully undertaken.

MH has, subsequent to filing its GRA, engaged an external consulting service to "review the Cost of Service methodology for consistency with cost causation, utility economics and the range of regulatory practices in North America, and pursuant to that review, to make appropriate recommendations with respect to either maintaining or varying those methodologies."

MH did file the preliminary Terms of Reference with the Public Utilities Board in early 2010. The final terms of reference of this study have not yet been shared with the Board.

The Board expects that MH will present the "Cost Of Service Review" findings along with a detailed comparison to the March 2009 PCOSS08. Proposed changes should be accompanied by an item-by-item detailed explanation, justification, quantification and rate impact explanation. Likewise, a similar comparison should be provided for any marginal cost based cost of service study scenarios.

19.2.0 COMPARISON OF COSS08 TO COSS10 AND COSS11

The hearing record contains a line-by-line comparison of revenues and costs associated with the single export class for each of the above COSSs. That information illustrates the strong correlation between unit export revenue and the net export revenue available for customer class subsidies.

19.3.0 GENERATION AND TRANSMISSION COSTS

Generation and transmission costs (assigned and allocated) in the various COSS scenarios flow to domestic and export classes.

It is noteworthy that the two most recent versions of COSS11 show a significant increase in the domestic cost allocations compared to the PUB-approved March 2009 COSS08. Much of this increase results from the reduction in costs directly assigned to exports.

MH's COSS11 movement of all thermal costs and about 50% of NEB/MISO/Trading Desk costs to domestic classes involves a $64M shift in costs to domestic customers which is not in compliance with the Board's directives and the March 2009 COSS08.

The proportion of allocated generation and transmission costs going to exports compared to domestic remains constant at 60-70%. This disparity in allocated costs therefore seems to be largely related to the treatment of HVDC and other transmission costs.

19.4.0 DISTRIBUTION COSTS

In COSS10 and COSS11 the total allocated costs to sub-transmission/distribution plant/distribution services appears to have grown in step with sales. The cost per kWh has remained fairly constant at 2.2 to 2.3¢/kWh since 2007.

19.5.0 MARGINAL COST TREATMENT OF COSS

In Board Orders 117/06 and 116/08, MH was directed to create a Marginal Cost (MC)-based COSS and examine means to reflect environmental values within such an MC-COSS. These directives have, to date, not been adequately addressed. Initial attempts by MH to build a free-standing version of an MC-COSS were unsuccessful.

A considerable difficulty exists in defining the appropriate MC in an export market-driven utility where the actual export price-based MC could be viewed as commercially sensitive and hence confidential. This means that MC must be replaced by a proxy or some variation of embedded costs.

19.6.0 COSS TREATMENT OF NET EXPORT REVENUE

In the extended period of relatively high export prices prior to 2008/09, the impact of net export revenue credits to various domestic classes was substantial. By calculating the credit on the basis of total class costs, Residential and General Service Small receive a favourable adjustment to their Revenue Cost Coverage (RCC) ratios.

With the more recent decline in export prices, the available net export revenue (to be credited to domestic consumers) has dropped markedly. With Uniform Rates and the Affordable Energy Programs flowing largely to the Residential class, its RCC should increase relative to other classes.

Despite this treatment, Residential RCCs have remained in the 0.90 to 0.95 range compared to the GSL 30 to 100 and GSL >100 subclasses' RRCs, which are within a 1.05 to 1.10 range.

19.7.0 COSS TREATMENT OF HVDC COSTS

In recent Power Resource Plans MH indicated that new HVDC transmission costs will not be assigned or allocated to the export class. This seems to go well beyond the previous COSS process that treated a portion of the existing HVDC as a generation asset to be cost shared by export on a net export share basis. While Bipole III has reliability benefits for domestic customers, Bipole III is also needed to fulfil export commitments.

It is not clear whether COSS10 and/or COSS11 have made any adjustment to how Bipole I and II costs have been dealt with to date.

MH seems to be departing from true cost causation principles. The on-going functional usage of transmission by exports is not being considered.

19.8.0 INTERVENER POSITIONS

19.8.1 CAC/MSOS

To date CAC/MSOS has opposed the use of current COSS methodologies in rebalancing or setting differential rate increases for MH domestic customers. More robust marginal cost based analysis is suggested.

19.8.2 MIPUG

In MIPUG's view the current methodologies adequately calculate the class RCCs and should be used to assign lower differential rates to the GSL >100 class.

19.8.3 RCM/TREE

As in the past, RCM/TREE continues to support the use of an MC-based analysis in the cost allocation process and in rate-setting. With respect to low income and other social policy issues, it is RCM/TREE's position that the PUB unquestionably has jurisdiction to impose such an approach.

19.9.0 BOARD FINDINGS

MH has chosen not to seek differential class rate increases other than for Area and Roadway Lighting. MH's principles of rate design and cost allocation should be kept current. That said, the Board's position should not be interpreted to imply any support for the Cost of Service methodology changes employed by MH in PCOSS10 and PCOSS11.

In previous Board Orders, MH has been directed to treat all exports as a defined business venture obligated to share fully in the Utility's embedded costs. The Board has not accepted and does not accept the concept of any exports being a free by-product of domestic power operation.

Exports come with a cost, and that cost needs to be recognized in calculating net export revenue and in developing a business plan for new generating stations and transmission assets.

Reliability benefits associated with the HVDC system flow to export customers as well as domestic customers. Allocation of zero Bipole III costs to exports ignores these benefits and the role that Bipole III plays in facilitating exports from northern generation.

In the Board's view, MH's Export Business Model cannot transfer all operational and market risks to domestic customers. Because export contracts and opportunity sales carry greater risks than domestic sales, such export sales must provide a contribution to MH's fixed costs.

As the Board anticipates that the external Cost of Service review may not be available before mid-2012, there may be merit in a separate COSS review hearing if MH is seeking changes to the currently approved Board methodology.

Should marginal cost be a significant consideration in a future COSS, the Board's review would require MH to fully disclose its derivation of MC components. Whether any such disclosure would be on the public record will be a procedural matter to be determined.

20.0.0 RATE DESIGN

In addition to various rate matters addressed in section 3.0.0 of this Order, there are other rate and rate design issues to be addressed.

20.1.0 INVERTED RATES

Board Order No. 116/08 directed MH to file a report on Inverted Rates (in particular dealing with electric heating customer impacts) by January 15, 2009. There has been no action by MH to date with respect to that directive. MH has acknowledged that a rate accommodation will be required for electric heating customers, but has not provided any specific proposals that would mitigate a significant inverted rate strategy.

Aside from the Residential class, where prior to the Board's interim April 1, 2011 rate Order, there was only a modestly higher second block rate, the only movement toward inverted rates and toward eliminating the rate discount for higher levels of consumption appears to lie in the multi-year freeze of demand charges. However, for GSS/GSM customers energy rate adjustments are still applied on an equal percentage basis to all energy blocks in the ongoing consolidation of GSS and GSM subclasses. There has been no indication of the elimination of declining block prices for these subclasses.

20.2.0 RATE REBALANCING

MH continues to hold the demand charge at constant levels and is seeking the entire approved class rate increase via the energy charge. This process may have a limit short of fully rebalancing rates, but MH has not defined it to date.

20.3.0 CLASS CONSOLIDATION

MH continues to move the GSS and GSM subclasses toward a common rate structure. Apparently this process will be completed, within a few years, on a revenue neutral basis.

20.4.0 WINTER RATCHET ELIMINATION

The elimination of the Winter Ratchet by MH in lieu of the introduction of time-of-use may be useful in:

- consolidating GSS and GSM subclasses (only GSM had a winter ratchet);
- rate rebalancing (average demand revenues will be reduced for specific customers and subclasses and the resulting cost will be offset by higher energy charges);
- Limited Use Billing Demand (could see some reversions to normal billing); and
- Demand Concessions (lower demand charges for some GSM and GSL customers could mitigate impacts of economic downturns).

MH did not file a formal application for the elimination of the Winter Ratchet or provide a report detailing its impacts, but has proceeded with the elimination of this rate feature.

20.5.0 LIMITED USE BILLING DEMAND

The Limited Use Billing Demand (LUBD) program was initially developed for low load factor customers who were heavily impacted by the application of the winter ratchet. The LUBD in effect allowed customers with an 18% or lower load factor to opt for paying higher energy charges and reduced demand charges.

Contrary to initial expectations, LUBD attracted many seasonal customers with high summer/low winter demand. The program was not intended to be revenue neutral and now has an annual utility cost impact of $200,000 to $300,000.

20.6.0 BASIC MONTHLY CHARGE

The Board has denied MH's recently proposed reduction in the Basic Monthly Charge (BMC), citing a lack of appropriate justification. This is a cost-causation issue, because the current BMC does not nearly meet allocated customer costs.

20.7.0 TIME-OF-USE BILLING

MH has not provided any update on the status of time-of-use (TOU) rates. The elimination of the Winter Ratchet may have accomplished some time-of-use objectives. The Board's request for a September 30, 2008 planned implementing strategy report has not been answered. The Board understands that MH has been consulting MIPUG members on this issue. The content and extent of these consultations should be provided to the Board.

MIPUG's industrial customers are the most likely initial targets for TOU given the presence of appropriate metering. However, in light of current export market prices, TOU may actually have negative revenue impacts for MH. This should be considered further.

20.8.0 AREA AND ROADWAY LIGHTING

As in the previous GRA, MH's rate application did not call for ARL rate increases. The Board concurred with this in its approval of the interim and finalized rate increases.

20.9.0 ENERGY INTENSIVE INDUSTRY RATE

MH initially filed and then withdrew a revised proposal for the Energy Intensive Industry Rate (EIIR) which was being considered by MH's Board of Directors in January 2011. Beyond an indication of further consultations with industry there has been no further update on MH's intended actions.

The Board has some concerns about this issue remaining unaddressed. Until MH comes up with a revised program, the existing Board Directives on the nature of a future EIIR and a Service Extension Policy would seem to represent the current reality for MH and to new customers.

The Board notes that uncertainty with respect to the EIIR may not be attractive to potential new industrial loads.

20.10.0 SERVICE EXTENSION POLICY

Since the Board's last Order on EIIR, MH has been silent on the future of the service extension policy. The service extension policy issue is seen by the Board as independent of the EIIR. Nonetheless, the service extension policy has serious implications for industrial customers even in the absence of EIIR, especially for potential remote loads.

20.11.0 INTERVENER POSITIONS

20.11.1 CAC/MSOS

The Rate Design interests of CAC/MSOS can be succinctly indicated as being primarily focused on:

- Inverted Rates (CAC/MSOS has concerns about winter heating);
- Basic Monthly Charge (CAC/MSOS is in favour of reductions for the benefit of low-income consumers); and
- Temporary Billing Demand Concessions (CAC/MSOS is opposed to granting permanent relief as requested by MH).

20.11.2 MIPUG

The Rate Design interests of MIPUG can be succinctly indicated as being primarily focused on:

- Inverted Rates (MIPUG needs clarification before it can finalize a position);
- Rate Rebalancing (MIPUG is opposed to larger energy rate increases);
- Time-of-Use Rates (MIPUG thinks they may be of limited benefit but would want to receive a detailed study of any MH proposal);
- Energy Intensive Industry Rate (MIPUG appears satisfied with MH's consultative approach even if no proposal has been publically advanced); and
- Temporary Billing Demand Concessions (MIPUG strongly supports MH's request for "forgiveness" of the temporary deferral relief).

20.11.3 RCM/TREE

The Rate Design interests of RCM/TREE can be succinctly indicated as being primarily focused on:

- Inverted Rates (RCM/TREE want aggressive action, including higher winter thresholds for electric heating);
- Basic Monthly Charge (RCM/TREE submits that this should be eliminated as soon as possible); and
- Time-of-Use Rates (RCM/TREE is very supportive of MH advancing such rates).

20.11.4 City of Winnipeg

The ongoing rate and rate design interest for the City of Winnipeg was Area and Roadway Lighting, with an emphasis on limiting any rate increases.

20.12.0 BOARD FINDINGS

The Board notes that MH's responses on the various special rate issues remain outstanding and should receive more timely attention. The Board invites MH to provide all stakeholders (including the Board) with an overall strategy to co-ordinate the changing of rate structures for MH's various customer classes.

The Board requires MH to file preliminary reports (and status updates on):

- Inverted Rates, with a view to creating a significantly higher-priced second energy block, but providing an accommodation to electric heat customers, some of which do not have access to natural gas for heating;
- GSS and GSM Class consolidation with a view to defining the end-product and the specific timeframe for completion;
- Demand/Energy Rate Rebalancing with a view to defining the optimum balance and timeframe to achieve that balance through the allocation of Class Rate increases to the energy component;
- Time-of-Use Rates with a view to applying these in the near future to Top Consumers and industrial customers that already have the necessary metering capability;
- Limited-Use Demand billing with an update of the continued need for this rate in light of the elimination of the Winter Ratchet;
- the Energy Intensive Industry Rate, with justification for either abandoning the rate proposal or providing an alternative on-peak rate scenario as directed in Board Order 112/09; and
- the Service Extension Policy, including a proposal for the Board's review and possible acceptance in accordance with Order 112/09.

Board decisions may be appealed in accordance with the provisions of Section 58 of The Public Utilities Board Act, or reviewed in accordance with section 36 of the Board's Rules of Practice and Procedure (Rules). The Board's Rules may be viewed on the Board's website at www.pub.gov.mb.ca.

21.0.0 IT IS THEREFORE ORDERED THAT:

1. A 1.9% average consumer rate increase for all of MH's domestic customer classes (except Area and Roadway Lighting) effective April 1, 2010 **BE AND IS HEREBY APPROVED AS FINAL**;

2. A 2.0% average consumer rate increase for all of MH's domestic customer classes (except Area and Roadway Lighting) effective April 1, 2011 **BE AND IS HEREBY APPROVED AS FINAL**;

3. MH's requests to finalize a 2.9% average consumer rate increase effective April 1, 2010; a 2.0% average rate increase effective April 1, 2011; and a further 0.9% average rate increase effective August 1, 2011 **BE AND ARE HEREBY DENIED**;

4. MH recalculate and refile, for Board approval, a schedule of rates reflecting a 1.9% average increase for all customer classes (except Area & Roadway Lighting) effective April 1, 2010, together with all supporting schedules including proof of revenue and customer impacts;

5. MH recalculate and refile, for Board approval, a schedule of rates reflecting a further 2.0% average rate increase for all customer classes (except Area & Roadway Lighting) effective April 1, 2011, together with all supporting schedules including proof of revenue and customer impacts;

6. MH calculate and file, for Board approval, a new interim rate that quantifies the difference between the April 1, 2010 and April 1, 2011 interim rates and the rates

finalized in this Order, together with all supporting schedules including proof of revenue and customer impacts;

7. MH is to forthwith advise this Board and the parties to this GRA of MH's intention respecting a GRA for the 2012/13 fiscal year;

8. MH is to calculate, and file for Board approval, a deferral account that tracks the difference between revenues calculated pursuant to the interim rates (in Orders 18/10; 30/10 and 40/11) and the rates finalized in this Order, together with accrued interest at MH's short-term borrowing rate;

9. All weekly Surplus Energy Program interim *ex-parte* rate orders – from Order 67/08 up to and including all SEP Orders issued prior to this Order – **BE AND ARE HEREBY APPROVED AS FINAL**;

10. Curtailable Rate Program Orders from Order 46/09 until current – including Order 63/11 – **BE AND ARE HEREBY APPROVED AS FINAL**;

11. MH's request that the Temporary Billing Demand Concessions granted pursuant to Order 126/09, be made permanent, and forgiven, under the program **BE AND IS HEREBY DENIED**.

Manitoba Hydro

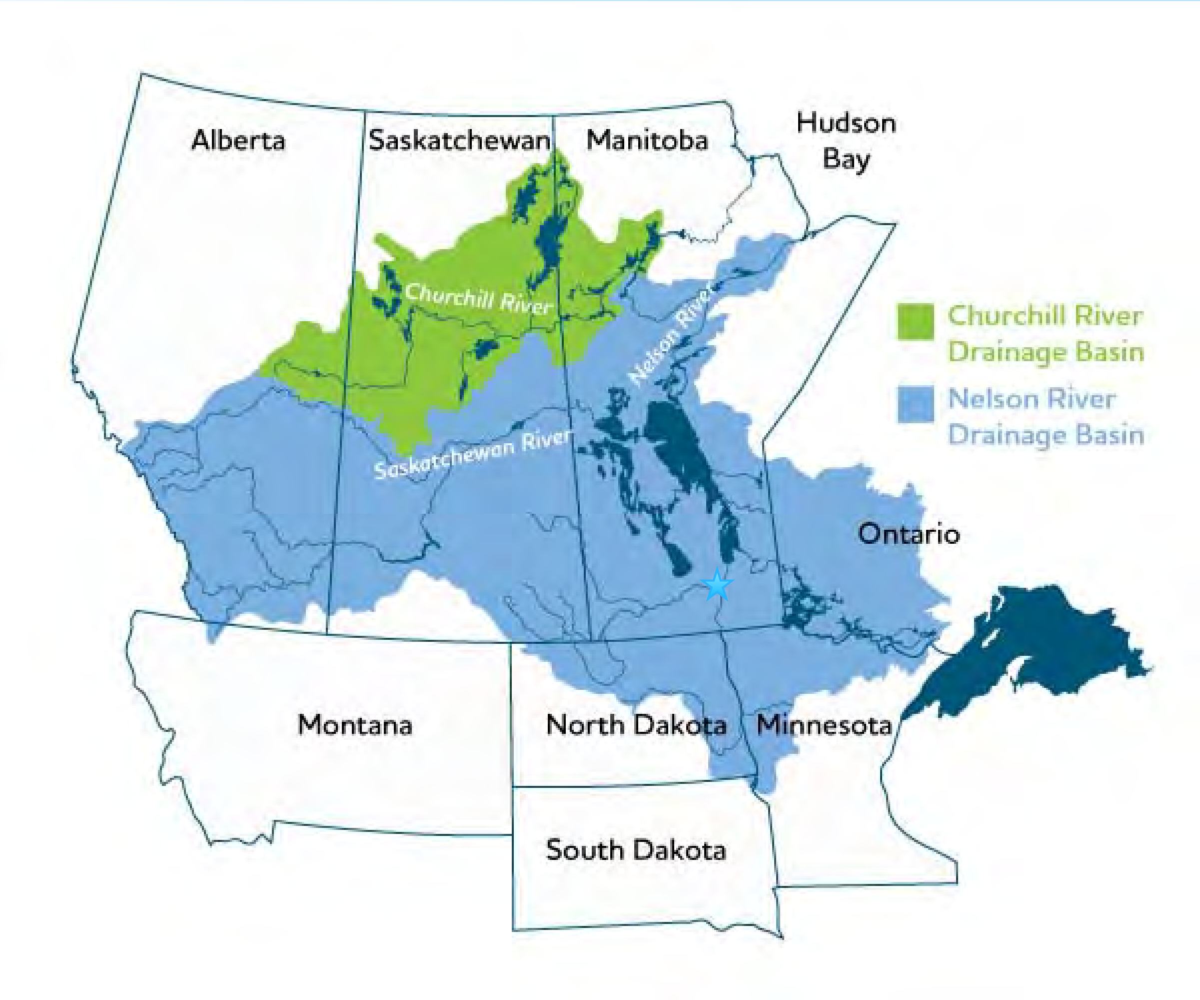
Introduction

Manitoba Hydro

Manitoba Hydro



- Crown Corporation (owned by Prov. MB) with head office at Winnipeg.
- Services for over 580,000 electricity and 280,000 gas customers.
- A total generating capacity about 5700 MW produced mainly by 15 hydroelectric stations, 2 wind plants and 2 thermal stations.

https://www.manitobahydropower.com/who-we-are/

Manitoba Hydro

1 Burntwood River -

Wuskwatim -	200 MW
First Rapids -	210 MW
Manasan -	270 MW
Early Morning -	80 MW

2 Laurie River -

Laurie River 1 -	5 MW
Laurie River 2 -	5 MW

3 Saskatchewan River -

Grand Rapids -	480 MW

4 Nelson River -

Jenpeg -	129 MW
Kelsey -	250 MW
Kettle -	1,220 MW
Long Spruce -	1,010 MW
Limestone -	1,340 MW
Keeyask -	695 MW
Conawapa -	1,485 MW
Gillam Island -	1,080 MW
Birthday -	380 MW
Redrock -	250 MW
Whitemud -	310 MW

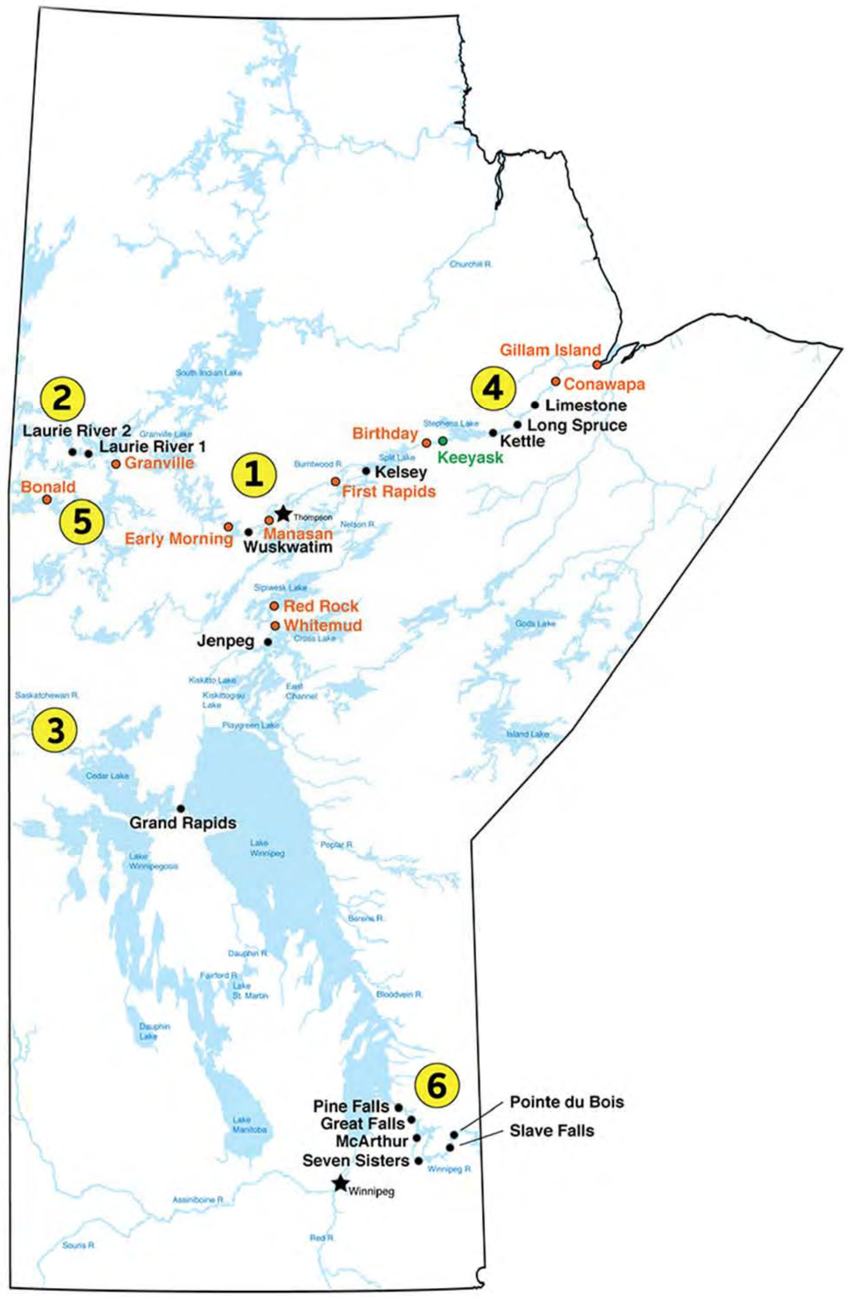
5 Upper Churchill River -

Granville -	120 MW
Bonald -	110 MW

6 Winnipeg River -

Pine Falls -	89 MW
Great Falls -	136 MW
McArthur -	55 MW
Seven Sisters -	165 MW
Pointe du Bois -	77 MW
Slave Falls -	67 MW

• Current sites-	5,228 MW
• Under development-	695 MW
• Potential sites-	4,295 MW

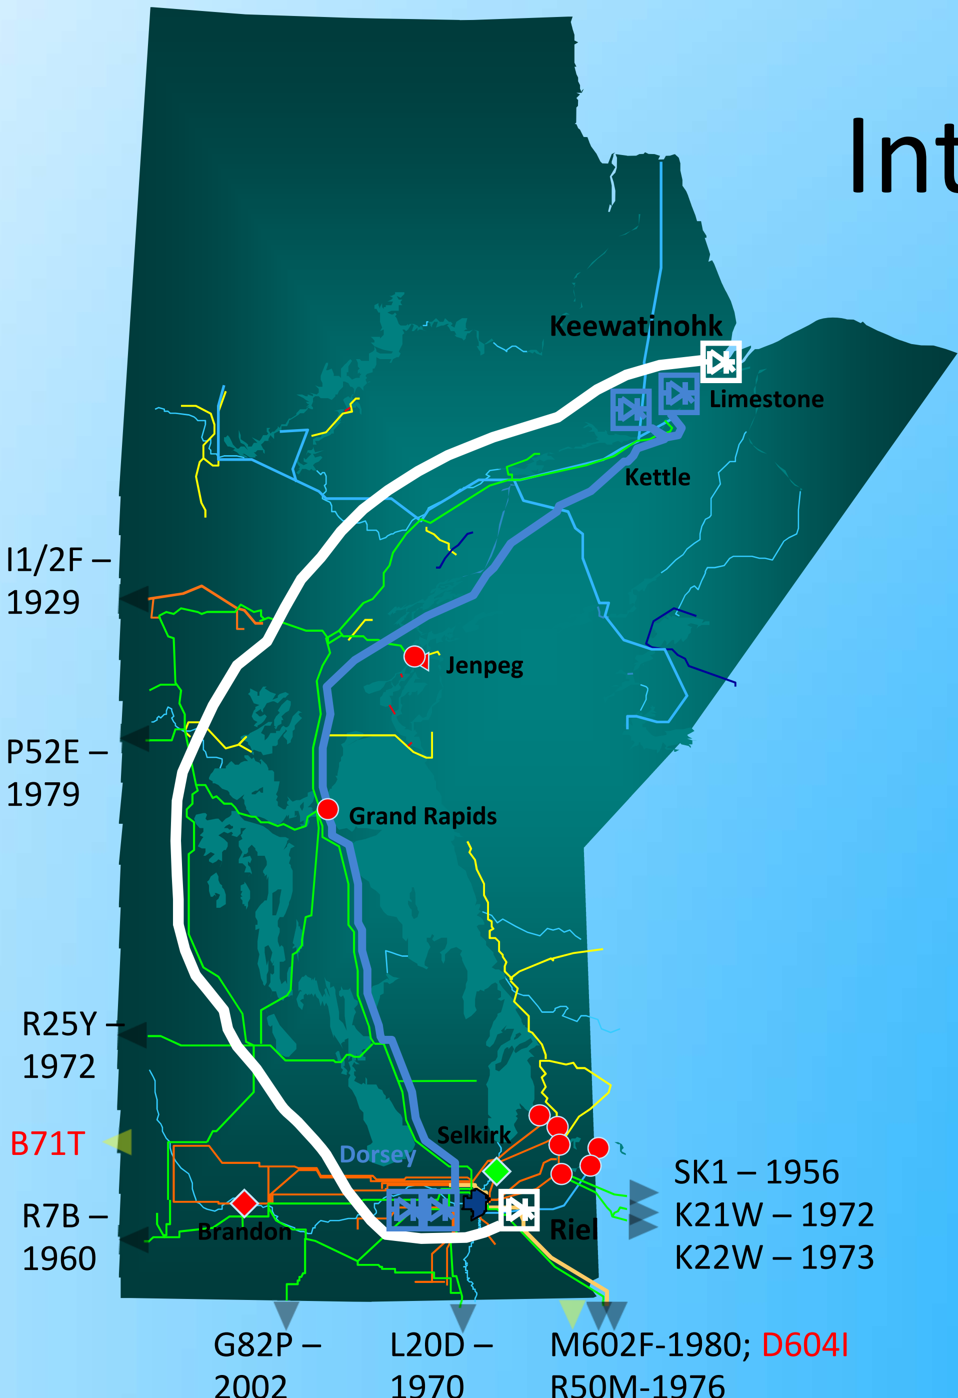


- Current Hydro sites: 5228 MW
- Under development (Keeyask) 695 MW
- Potential 4300 MW

Manitoba Hydro

Interconnections

- B71T - Birtle to Tantallon 2021
- D604I – Dorsey to Iron Range 2020 (MMTP/GNTL)



Manitoba Hydro

Firm Export/Import Capability

Ontario	200 MW	0 MW
Sask-south	150 MW 290 MW	0 MW 0 MW
Sask-north	25 MW	60 MW

*** Excludes 150 MW CRSG**

Manitoba Hydro

Early Planning Studies

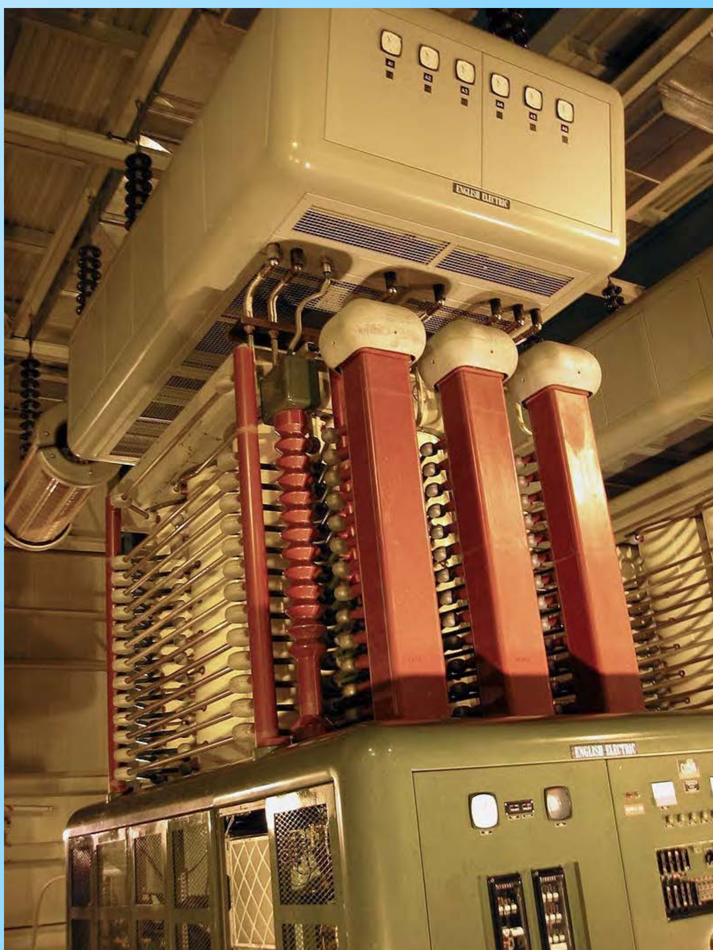
Manitoba Hydro

1960's

- 1963 – Government of Canada/Manitoba shared cost of study looking at development of the Nelson River.
- 1966 – Agreed to jointly develop Phase 1 – "Birth of HVDC in Manitoba"
- Phase 1 – 1272 MW Kettle (ISD 1974), two 900 km HVDC lines, Bipole I (ISD June 1972),

Manitoba Hydro

AC vs DC Decision

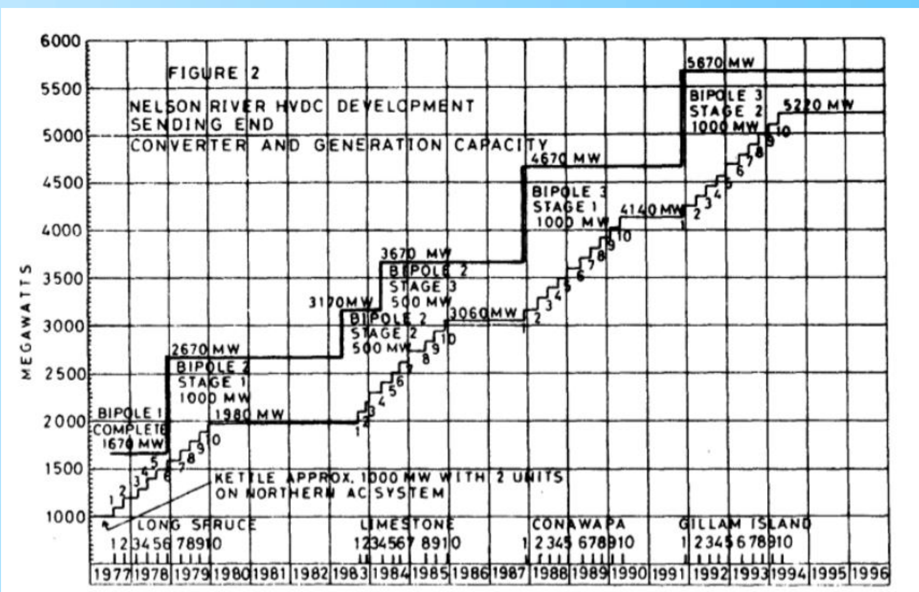


https://en.wikipedia.org/wiki/Nelson_River_DC_Transmission_System

- 500 kV AC with 70% series compensation was compared with HVDC. Series comp had about 15 years of history.
- HVDC selected – lower cost, lower losses and better performance.
- Four bids – one mercury arc only, two thyristor only and one mercury arc and thyristor. ASEA's first thyristor project (30 MW) only went into service in 1970.
- IEEE Milestone in EE – At 150 kV, they were largest mercury arc valves ever developed.

Manitoba Hydro

1970s Projections



C.V. Thio, "Nelson River HVdc Bipole-Two Part 1-System Aspects, IEEE Trans. PAS, Vol. PAS-98, No. 1, Jan/Feb 1979.

- High load growth projected need for Bipole III as early as 1988.
- A nuclear engineering department was formed in 1974.

Bipole I

Bipole II

Bipole III

Manitoba Hydro

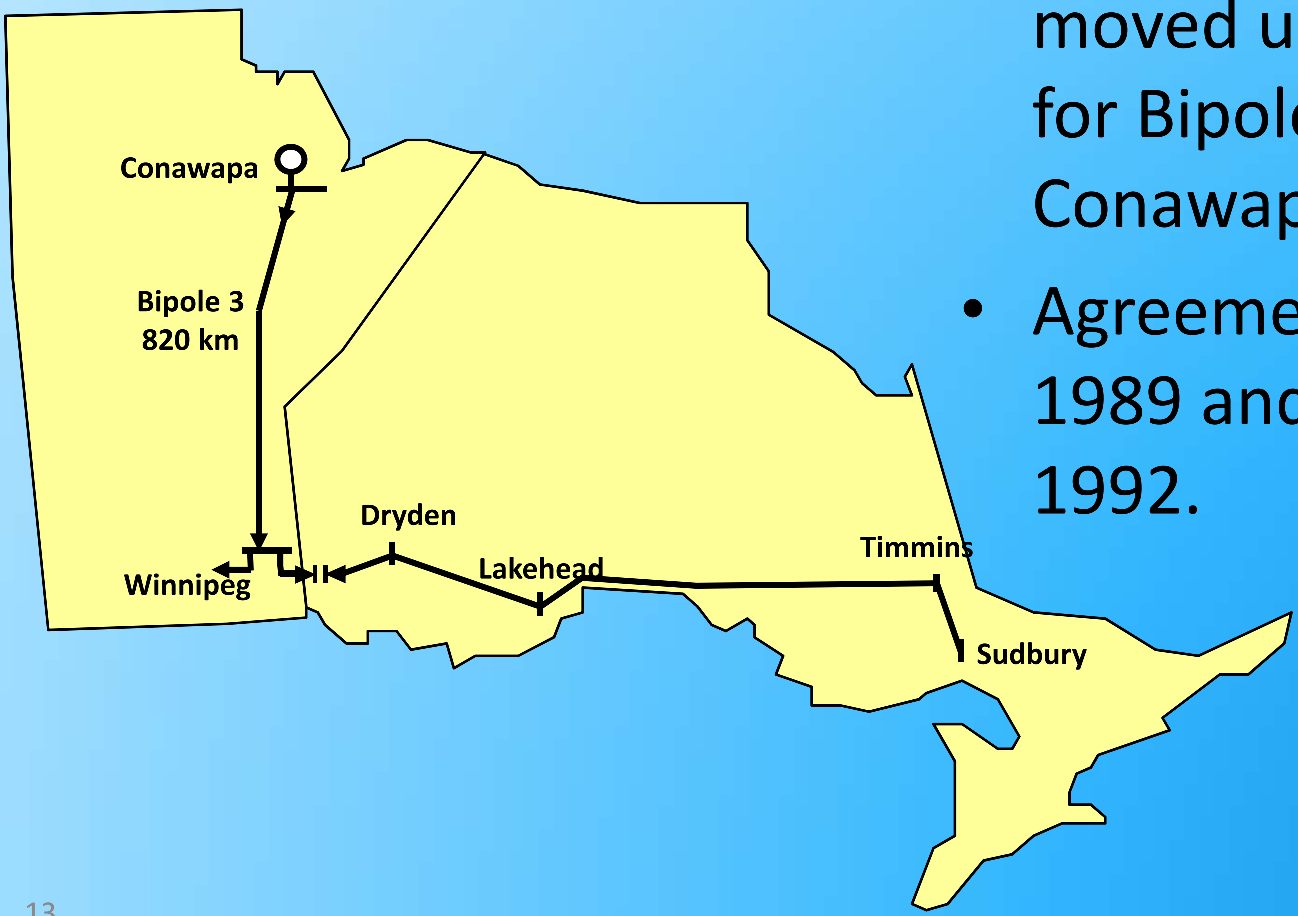
1980's

- Load growth slowed
- Completed development of Bipole II in June 1985.
- 2000 MW, 500 kV thyristor technology
- Long Spruce completed 1979.
- Limestone's original target year was 1983 – deferred to 1990.

https://en.wikipedia.org/wiki/Nelson_River_DC_Transmission_System

Manitoba Hydro

Early 1990s



- Potential for a 1000 MW to sale to Ontario moved up the schedule for Bipole III and Conawapa.
- Agreement signed in 1989 and cancelled in 1992.

Manitoba Hydro

Features of the Bipole I and II System

- Link to 70% of the Province's generating capacity
- Bipole I and II HVdc lines constructed on the same Right-of-way
- 900km overhead lines, difficult terrain and access in the north
- Terminated at a common station – Dorsey (inverter)
- Highest percentage of power concentrated in a single facility - "Too many eggs in one basket"

Manitoba Hydro

External Asynchronous Resource (EAR)

- Bipoles I and II allows for hydro to look like a battery. Allows for hydro-wind synergy. Very fast ramping capability.
- EAR is a market-designated resource separated from the main MISO market by a DC tie.
- EAR is very flexible and can provide energy, spinning, supplemental regulating reserves, regulation, ramp products, capacity.
- Currently, EAR is bidirectional and limited to 375 MW. Available since ~2010.

Manitoba Hydro

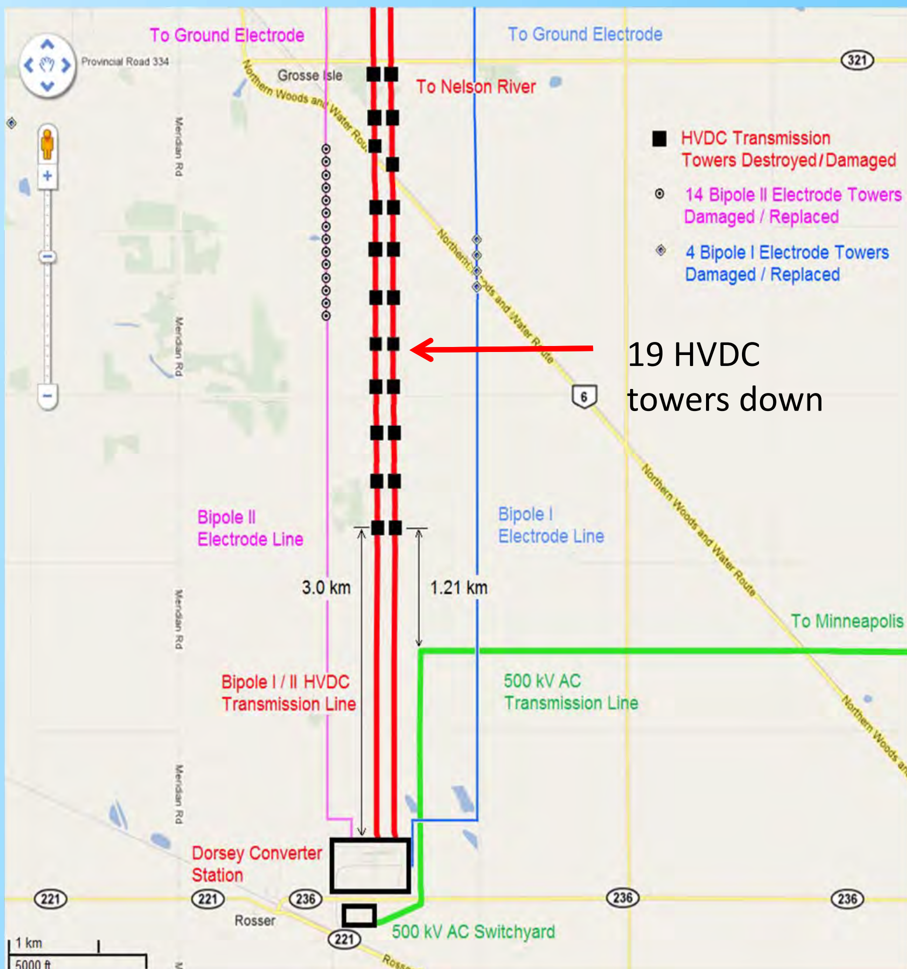
Bipole III Need

Why is Bipole III required now?

- Bipole III is required for reliability
  - Bipole I & II DC transmission line corridor loss
  - Only one southern converter station (Dorsey)
  - Long restoration times
- We’ve experienced loss of corridor before and near misses (downbursts, ice, forest fires and etc.).
  - *Real risks, not theoretical*

Manitoba Hydro

Reliability Risk – Sept. 5th 1996 Wind Event
1.5 miles away from Dorsey Converter Station



- Public appeal for power reduction
- All generation units on maintenance returned to service
- Rotating blackout planned

Manitoba Hydro

Reliability Risk – Dorsey Converter Station

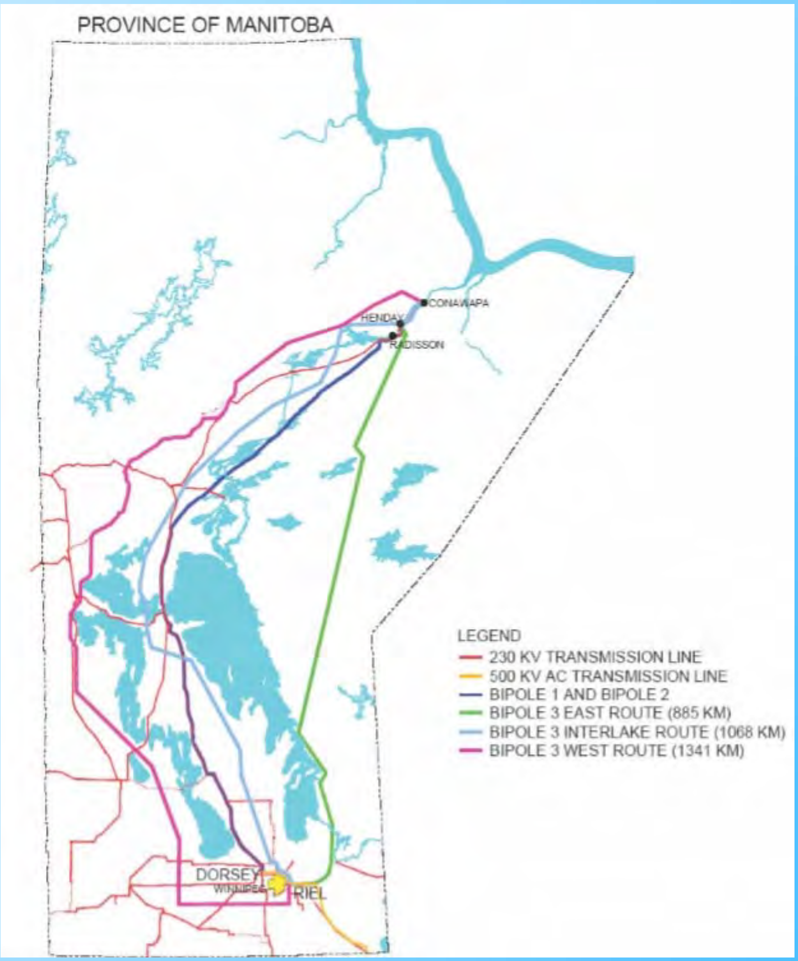
Elie F5 Tornado

Storm hits portions of Dorsey, Aug. 10, 2007;
Lost BPI followed by D602F 60 seconds later

- Dorsey is a single terminus point for HVDC system
- Significant weather events (tornados, etc.) in the vicinity of Dorsey in the past
- A complete loss at Dorsey could mean loss of connection to northern generation for up to 3 years.

Manitoba Hydro

Probabilistic Analysis – Weather Hazards

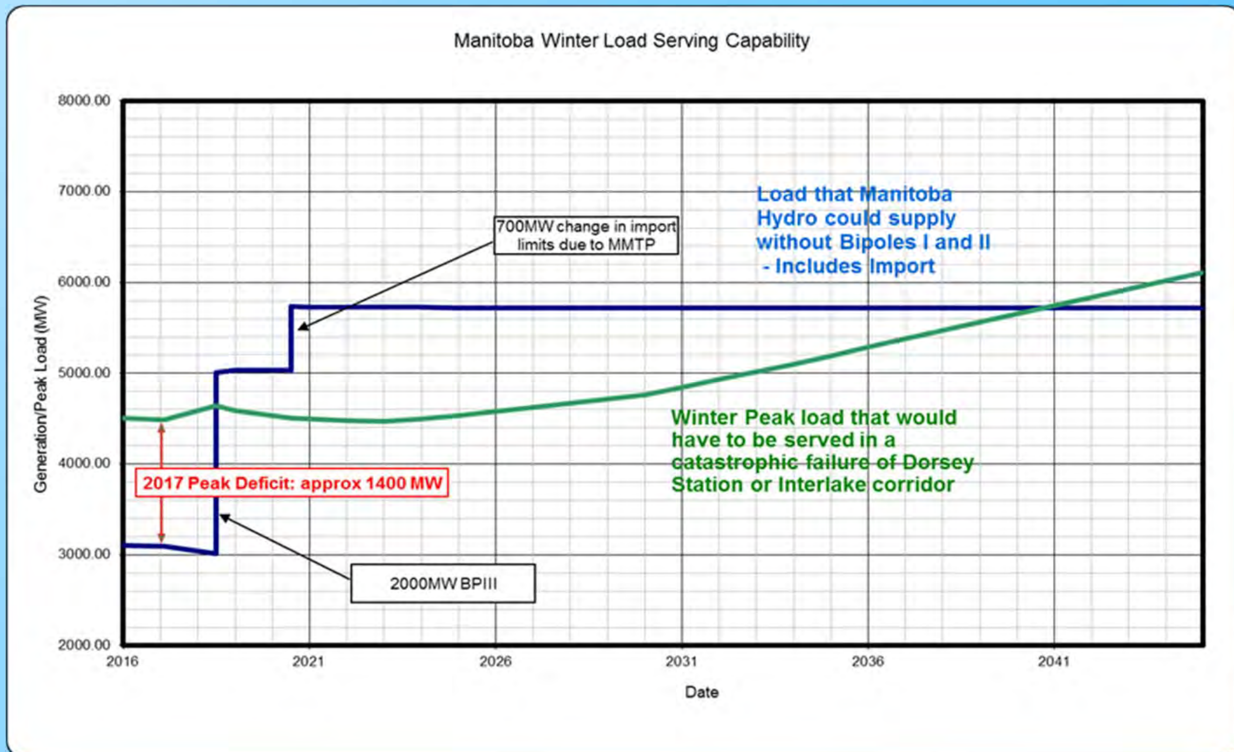


Manitoba Hydro has worked closely with field experts/consultants to evaluate weather hazards (Tornados, wide front wind, ice) and other risks of losing the HVDC system after the 1996 event.

Events	Return Period of Failure (years)	
	Pre-Bipole III	Post-Bipole III
Tornados	17	3700
Synoptic Wind (wide front)	90	560
Combined Wind and Ice	20	200+

Manitoba Hydro

Deterministic Analysis – Supply Deficit

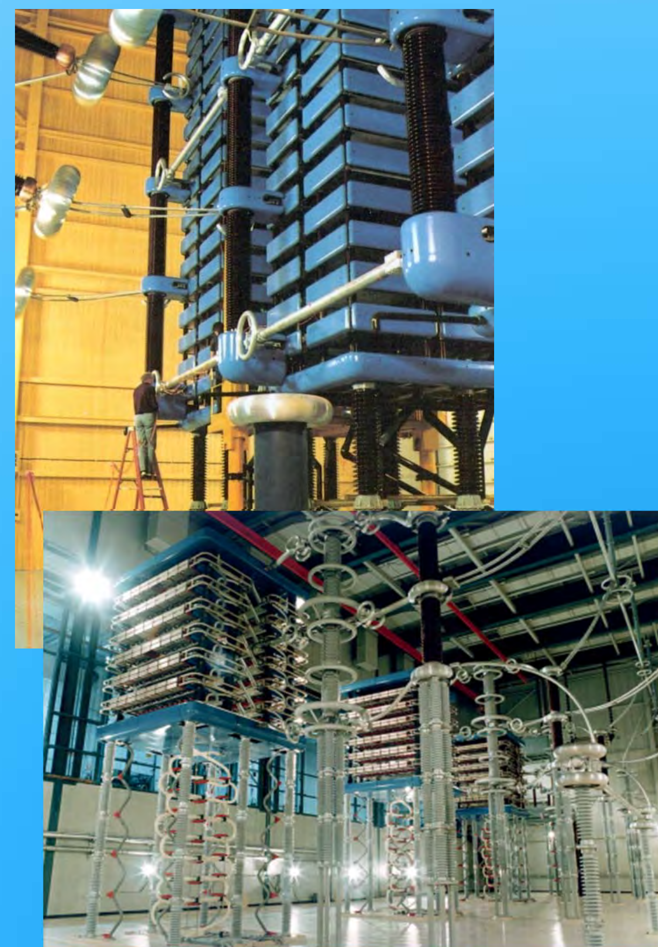


- Manitoba Hydro assesses the reliability risk of low-probability high-impact events according to NERC Standard TPL-001
- Supply deficit of about 1400MW for the loss of existing Bipole I/II system in the winter of 2017 (pre-Bipole III).

Manitoba Hydro

Additional Benefits of BPIII

- Aging BP I and BPII converters (>30 years in service) require life extension upgrades: $1B.
- BPIII offers adequate DC transmission spare to facilitate & optimize BPI/II refurbishment and save outage costs.
- Reduce HVDC transmission loss: about 80MW
- Provide HVdc capacity for future renewable energy development

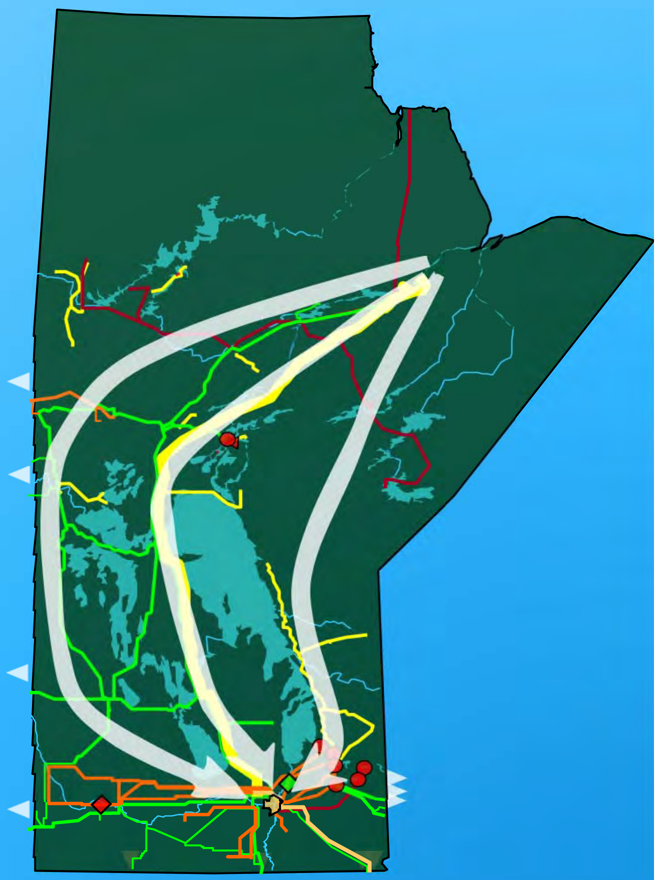


Pole1 refurbished with thyristor valves -1992

Manitoba Hydro

2000's

- 2001: Internal report recommends:
  - Building 800 km East side HVdc line by 2010
  - Sectionalization of D602F at Riel in 2008.
  - Bipole I and II lines would be paralleled on BP I. Bipole III line would terminate at Dorsey on BP II.
- In 2005, East side becomes unavailable as an application to designate area as a UNESCO world heritage site in progress.
- Decision made in 2007 to proceed with Western route. New DC converters added to scope as impedance of 1388 km route expected to be difficult for Bipole II analog controls.



Manitoba Hydro

Bipole III Project Scope

Manitoba Hydro

Bipole III Planning Studies

- Power flow studies
- Fault studies
- Stability studies
- Ac and DC harmonic studies
- Small signal stability assessment
- Feasibility studies of VSC technology

Manitoba Hydro

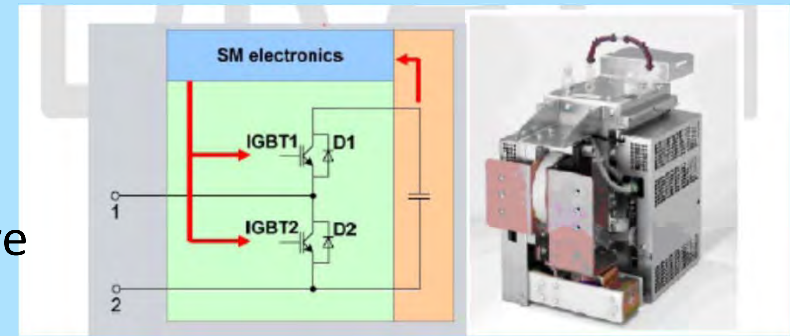
Outcome of Bipole III Planning Studies

- Determine BPIII size and operation modes
- Ac system reinforcement for integration of BPIII (new lines/stations, location, upgrades, etc.)
- Static/dynamic reactive power requirements
- Determine equipment rating (breakers, switches, grounding and etc.)
- Estimation of ESCR and MIESCR for dc performance and determine mitigation
- Determine impact on the nearby systems (ac and dc in multi-infeed schemes)
- Determine special requirements (supplementary damping /fast dc reductions)

Manitoba Hydro

Feasibility Study - VSC Option

- No synchronous condensers
  - Cost savings : Capital /O&M
  - Reduce system fault levels
  - VSCs can provide voltage and reactive power support, but not inertia that synchronous condensers do



- No commutation failure

  - Large infeed of HVdc schemes in proximity: If all LCC links fail commutation at the same time, it can lead to potential (although very short) loss of significant power to southern system.

  - VSC improves this situation by not failing commutation and ability to maintain power flow.

Manitoba Hydro

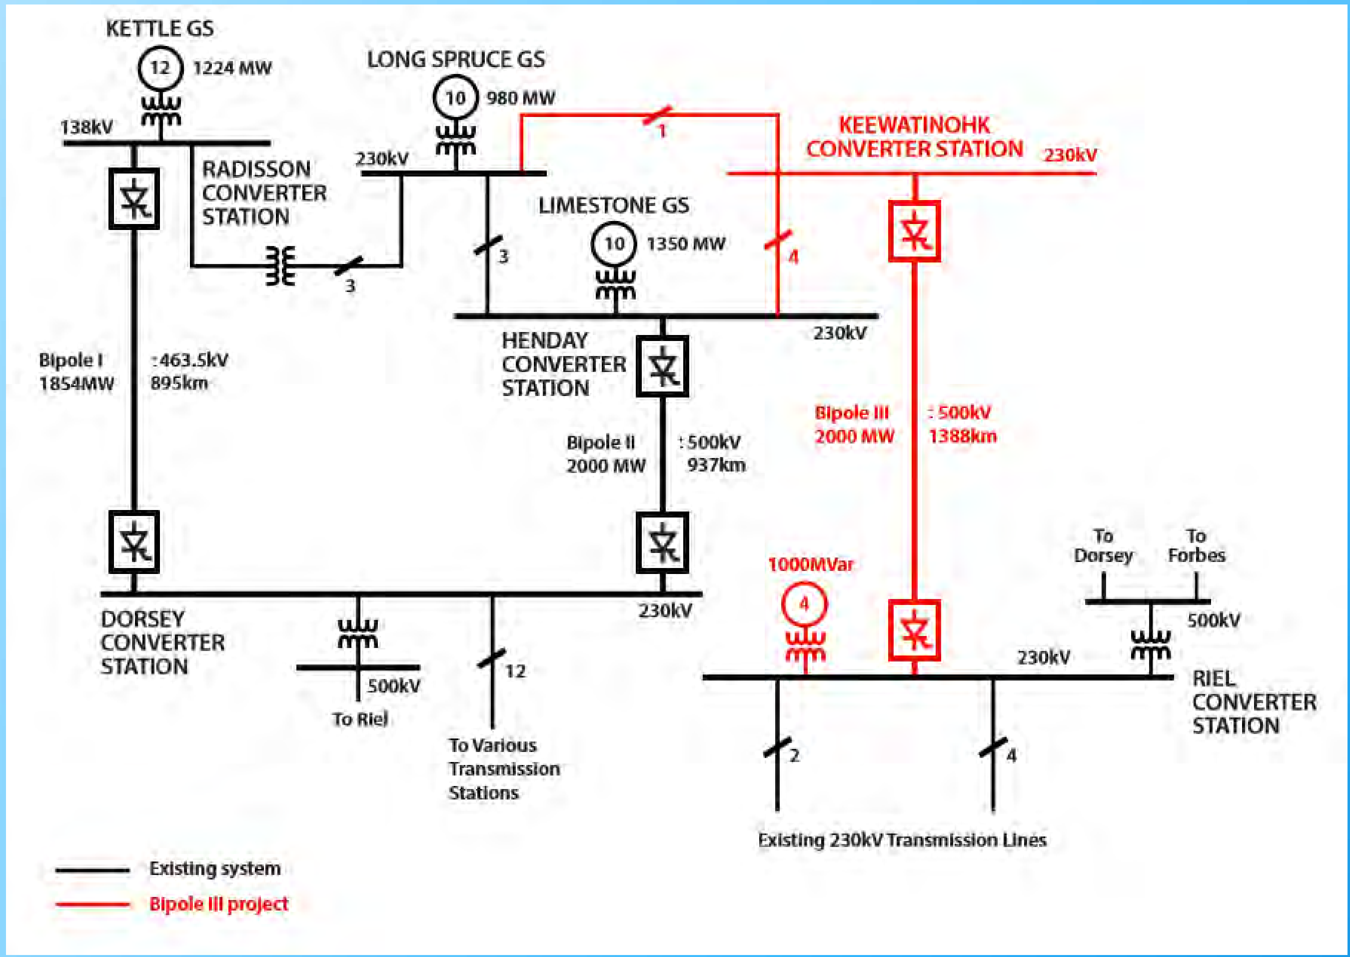
Feasibility Study - VSC Option

- Disadvantages
  - Not implemented at 500 kV and 2300 MW; Skagarak 4 planned for 2014
  - Limited number of vendors
  - Dc fault clearing requires ac breakers (half bridge technology)
  - Converter losses slightly 1% vs 0.7%

- Decision
  - Permit VSC bids as an option
  - Included price break as 4x250 MVAr synchronous condensers not required.
  - Required dc faults to be cleared on dc side (full bridge or dc breaker needed).

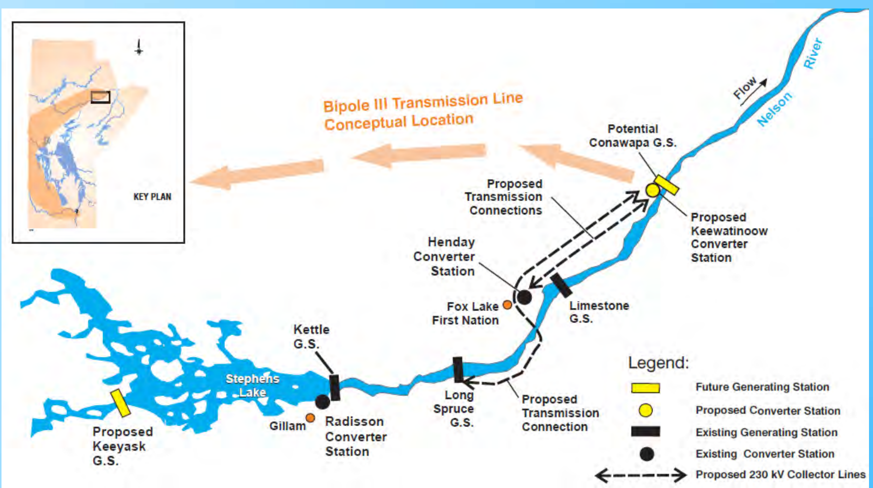
Manitoba Hydro

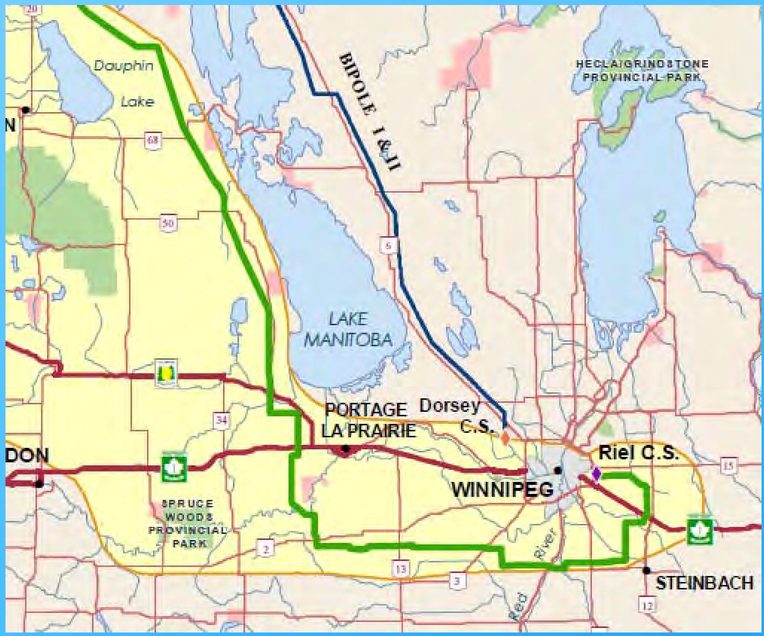
Bipole III Project Scope - ISD 2018
LCC, ±500 kV, 2000 MW



Manitoba Hydro

Locations of BPIII Converters





- Rectifier KCS: The location is physically separated from existing Bipole I and II converter facilities at Radisson and Henday stations
- Inverter RCS: about 40km away from Dorsey Station
- Considerations of separation to eliminate the common mode failure

Manitoba Hydro

Bipole III Project Implementation

Turnkey Contracts:

- Keewatinohk and Riel converter stations & HVDC equipment (> $800M)
- Keewatinohk ac switchyard (~ $112M)
- 4x250MVar, Riel Synchronous Condensers (>$200M)

Managed by MH:

- 1388 km transmission line
- AC system upgrades (north/south)
- Other interface components

Manitoba Hydro

Project Scope - Converter Stations

- LCC technology with Direct-light Triggered Thyristor (LTT)
- High levels of availability & reliability
  - Two series connected 12-pulse valve groups (VG) per pole
  - physical separation of valve group & pole controls on a per-pole basis
- -50C to +40C outdoor equipment design

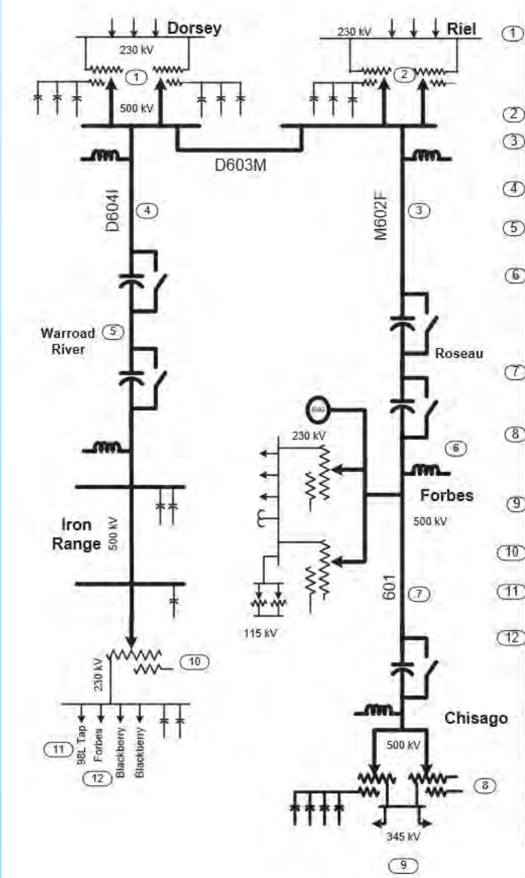
Manitoba Hydro

Project Scope - Converter Stations

- Nominal power transfer capacity of 2000 MW with 115% continuous overload
- Transient overload capability of 1.27pu for damping purposes
- Reduced (0.8 pu) dc voltage operation for forest fires conditions.
- De-icing operation : 2 poles transmit power in opposite directions (P6 in forward & P5 in reverse) to allow high DC current flow for melting ice on the HVdc line
- Paralleling with BPII – control capability tested
- Up to 80Hz frequency excursions at the rectifier – permits HVDC reduction

Manitoba Hydro

DC reduction



HVDC REDUCTION SCHEME

	TRIGGER	AMOUNT	Pmin (MW)
	(% of M602F MW unless otherwise specified)		
1	a) Loss of both Dorsey 500/230 kV transformers	60%	M602F > 1200
	b) Overload of one Dorsey 500/230 kV transformer	40%	M602F > 1200
2	Overload of one Riel XFMR	20%	M602F > 30
3	M602F 3-ph trip		
	a)	100%	M602F > 900
	b)	100%**	M602F > 1300
4	D604I 3-ph trip	100%*	D604I > 500
5	Bypass both Warroad River Series Cap.	30%*	D604I > 900
6	a) ~~Forbes SVC trip or failure of TSC 3 (236 Mvar)~~	~~20%~~	~~M602F > 750~~
	b) ~~Forbes SVC unable to control (overload > 10 sec) or (undervoltage > 10 sec)~~	~~60%~~	~~N.A.~~
7	601 3-ph trip		
	a)	60%	601 >1200
	b)	50%	601 > 900
8	Loss of both Chisago 500/345 kV transformers		
	a)	60%	601 > 1200
	b)	50%	601 > 900
9	Loss of both Chisago 345 kV lines	50%	601 > 900
10	Loss of Iron Range XFMR	100%*	D604I > 500
11	Loss of Iron Range to 98L 230 kV line	50%*	D604I > 800
12	Loss of Iron Range to Forbes 230 kV line	50%*	D604I > 800

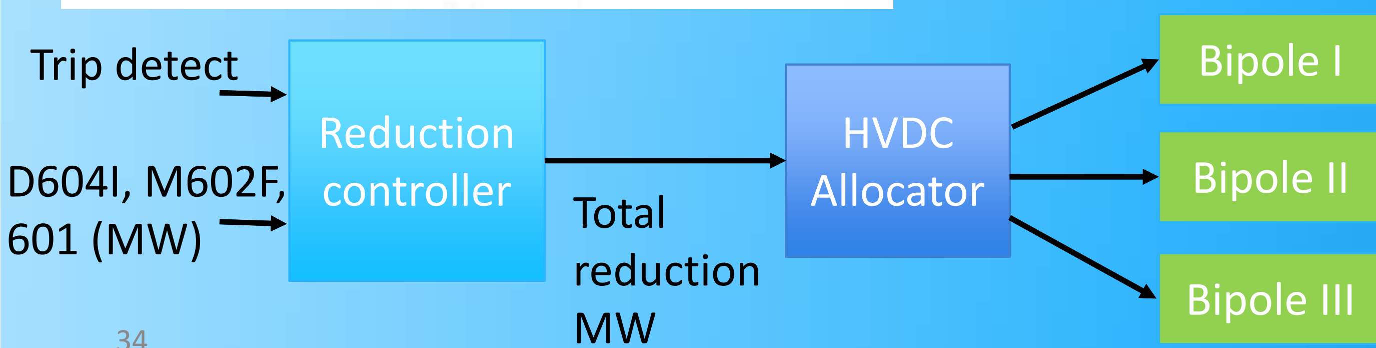
Note:

The above amount is the required reduction at inverters.

The reduction amount with a "*" is based on D604I flow.

The reduction with a "**" will also bypass both series cap at Warroad.

- Monitors status of key components of 500 kV tie lines
- Monitors pre-contingency MW flow at key locations
- Calculates dc reduction required
- Changes power order at rectifier of each Bipole
- Total time delay around 50-100 ms. Modelled as 200 ms



Manitoba Hydro

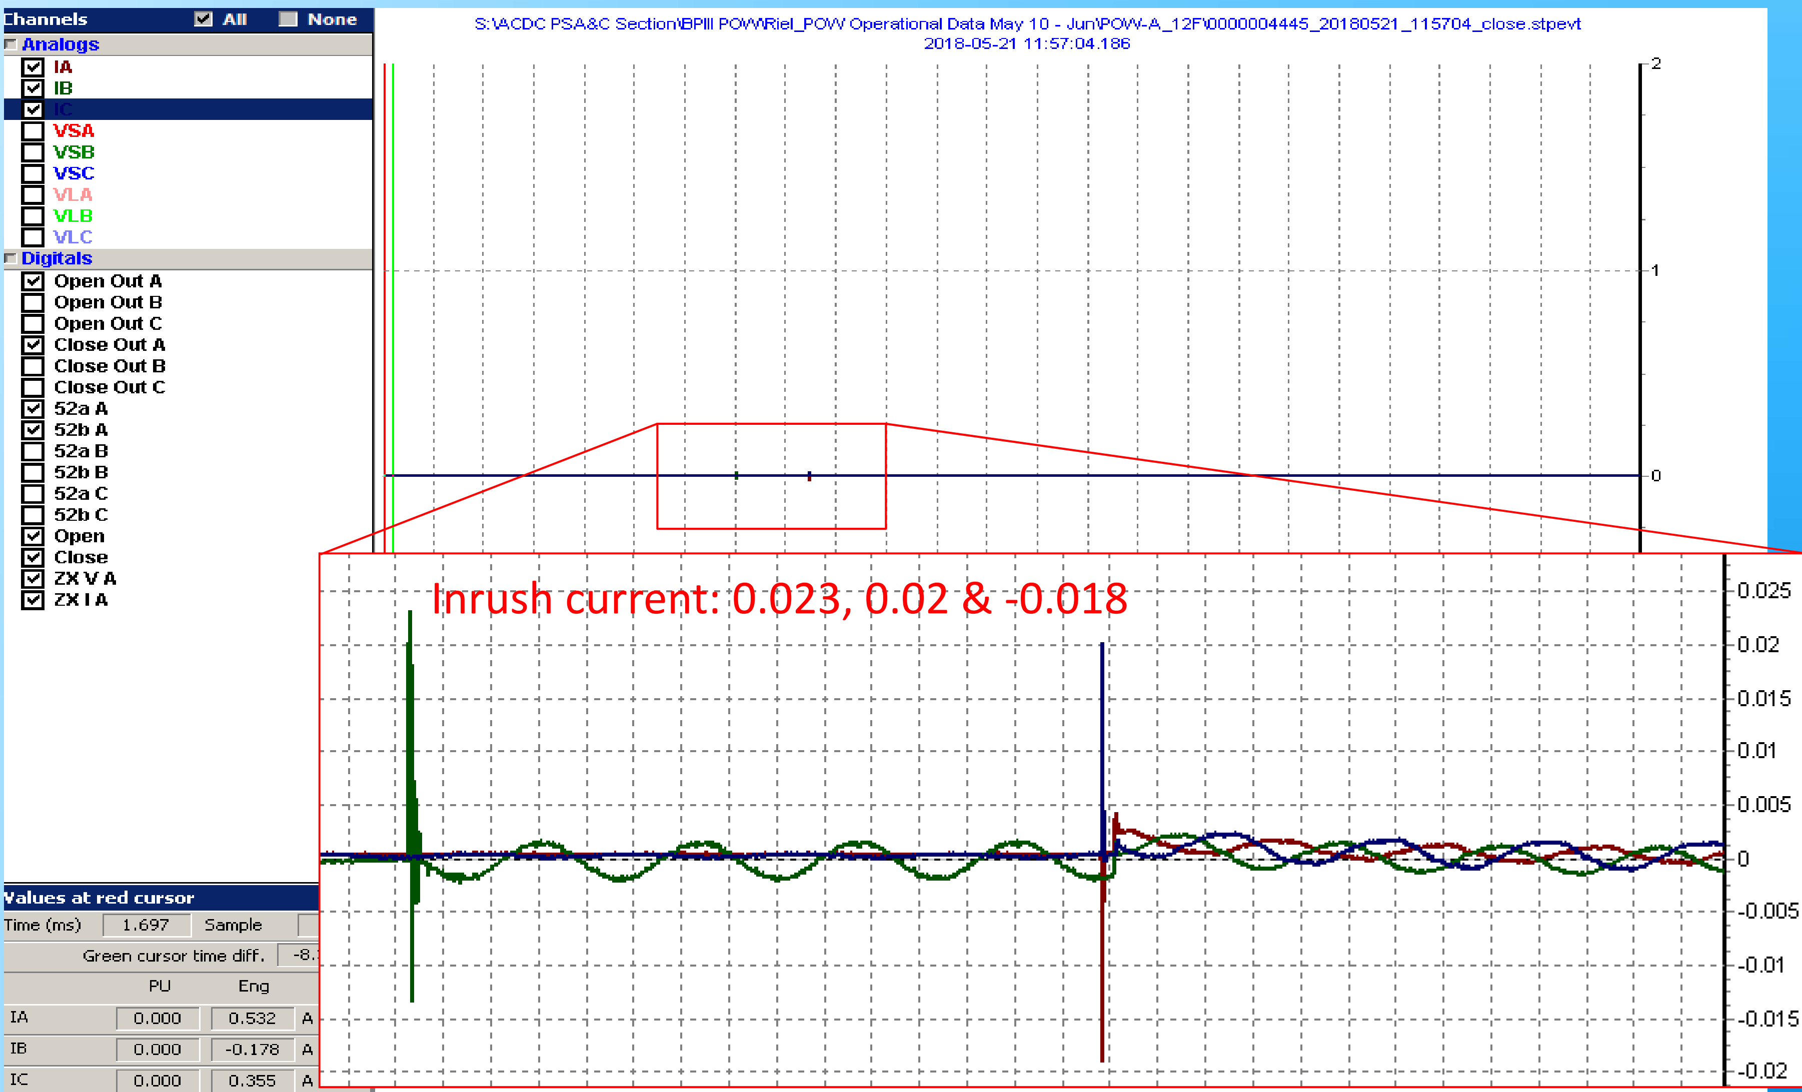
Project Scope - Converter Stations

- Total of 20 converter transformers including spare units
- Controlled switching for energizing two parallel converter transformers (3-phase 5-limb): Pre-insertion resistors at Rectifier and Point-on-Wave (POW) controllers at Inverter (world first!).
- Both POW and PIR can meet the requirements of mitigating transient inrush (typically less than 0.1pu, 1.5 kA base)
- Controlled switching reduced inrush current such that they could be released for operation in 2 minutes rather than 10 minutes.

Manitoba Hydro

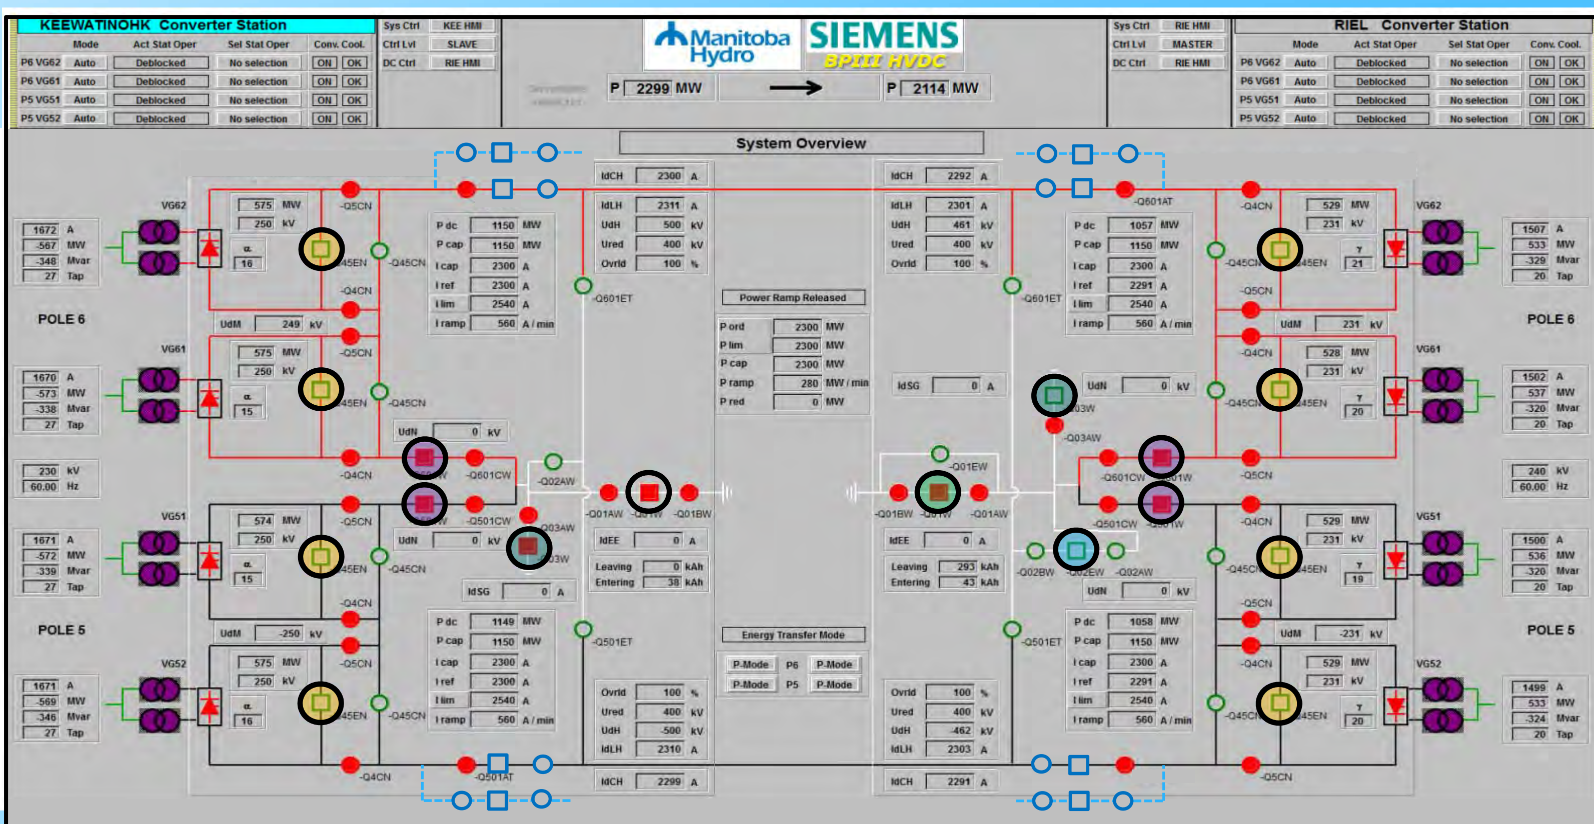
Field Commissioning & Results

Riel CS Operation: Optimal Scenario



Project Scope - Converter Stations

- Highly flexible operation modes (bipolar, monopolar ground return, monopolar metallic return, combinations of different VGs) achieved with dc yard design



- MRTB (1)
- GRTB (1)
- NBGS (2)
- NBS (4)
- ELTS (1)
- BPS (8)

Manitoba Hydro

Project Scope - Converter Stations

- DC switchyard
- DC filter banks (multi-turned, N-1)
- Smoothing reactors (two individual units for redundancy)

Manitoba Hydro

Project Scope - Converter Stations

- 230 kV Air Insulated Switchyard (AIS)
- New 230 kV bays & apparatus at KCS
- Expansion of 230kV yard at RCS
- Four AC filter banks at each station (with controlled switching)

Manitoba Hydro

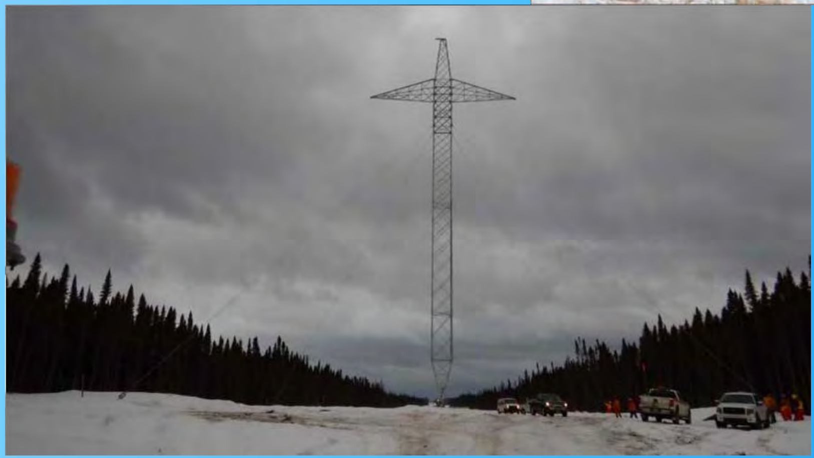
Project Scope - Riel Synchronous Condensers

- Four +250/-125 MVAr synchronous condensers; hydrogen cooled.
- Each synchronous condenser requires a unit transformer
- Provide voltage , reactive support and system inertia: critical for HVDC operation in Manitoba southern weak ac system
- Minimum MIESCR of 2.5 at Riel
- Multi-infeed Effective Short Circuit Ratio (MIESCR) – considers the closeness of converters via an impact factor. If the inverters are on the same bus, the factor is 1; if they are infinitely far away the factor is 0.

Manitoba Hydro

Project Scope – HVdc Line

- 1388km, 500KV overhead
- Self-supporting and guyed towers
- Base reliability level of 150 year return period for weather loads and increased to 500 year return design at some sections
- Anti-cascading towers (every 5-10 km)



Manitoba Hydro

Project Scope – HVdc Line

- 3-bundle Configuration vs. 2-bundle of existing Bipole I&II lines
- Conductor surface gradient less than 23kV/cm.
    - Bipole II is 28 kV/cm. Reduced noise, corona loss and hopefully reduced risk of anomalous (pseudo-random fair weather on negative pole) flashovers.
- OPGW for Lightning protection and communication; 4 repeater stations

Manitoba Hydro

Project Scope – AC System Upgrades

- Five new 230kV ac lines (north) and sectionalization of one 230kV ac line in the south
- Upgrades of two existing ac stations for line terminations
- Breaker upgrades at various stations due to fault level increases

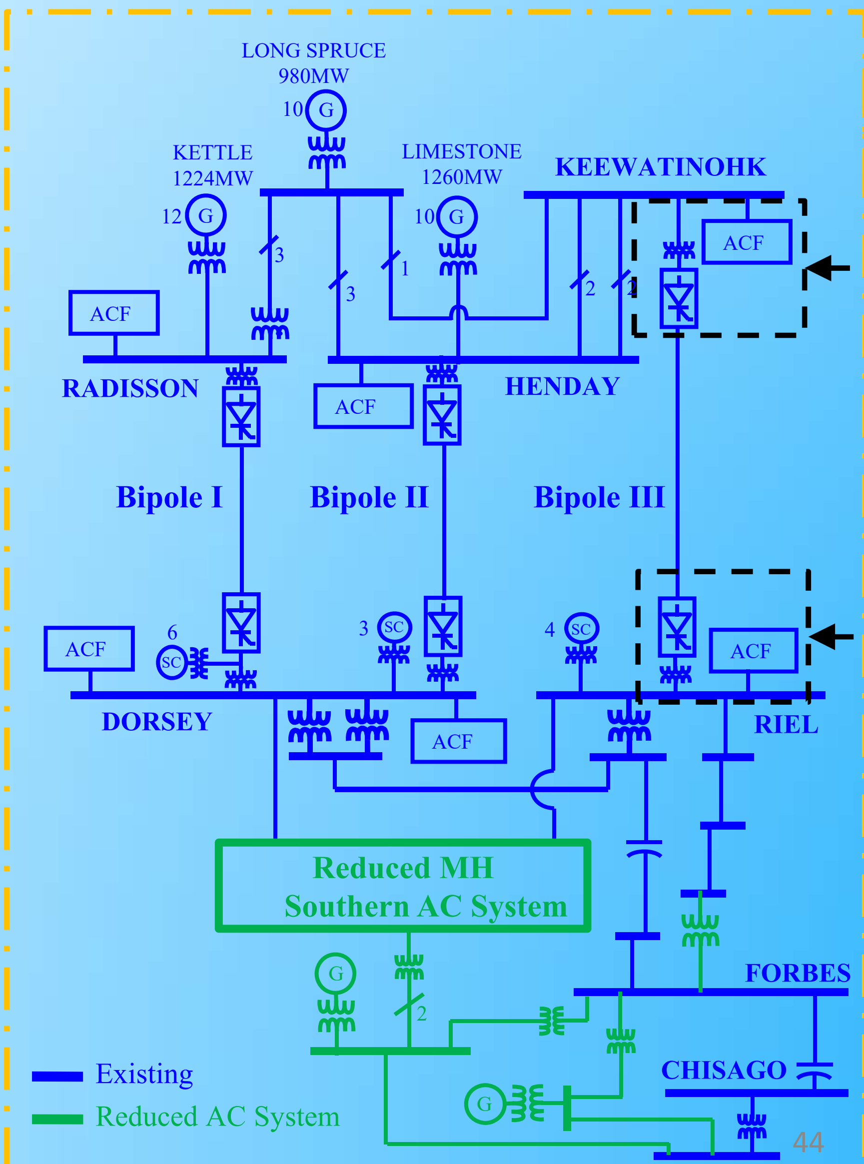
BPIII Replica C&P HIL Testing



real-time
simulation

RTDS (PB5)

Bipole III C & P Replica

Model Improvements
- o In-house Bipole I&II model
- o Freq-Dependent TLine
- o Transformer saturation & OLTC
- o 55 µs time-step; 6 racks

MH SPS & supplementary controls
- o HVDC reduction allocator, 500 kV SPTR
- o Custom SC exciter & JVC

MH & US ac dynamic equivalent

Manitoba Hydro

Bipole III Project Timeline

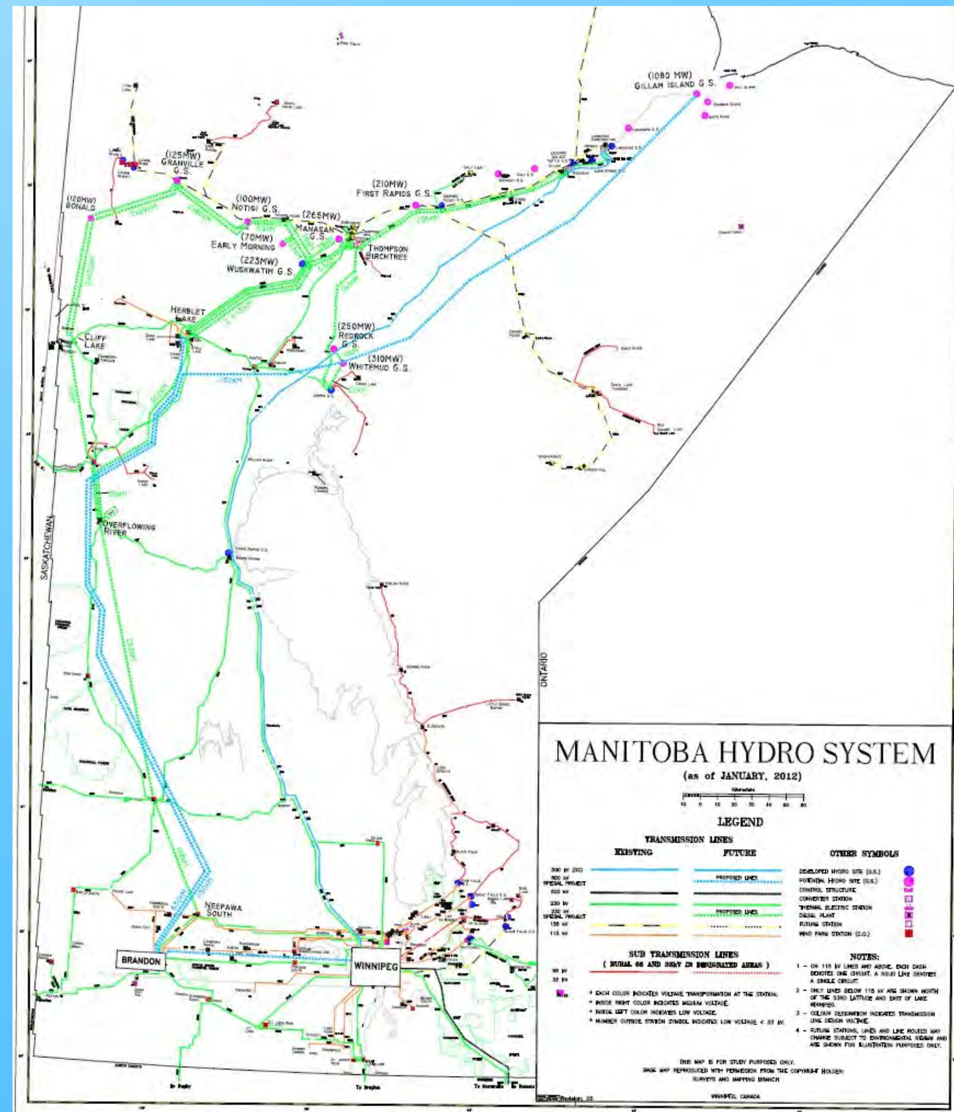
- EIS was filed in 2011 for western route and Environmental License was received in August 2013.
- Various RFP packages were released after 2013.
- Line construction started in 2013.
- Converter contract was released and awarded in 2014 . Both VSC and LCC were considered in the HVDC converter station tendering process – only LCC bids received.
- System commissioning tests in 2018 (4 months, ~250 tests, ~400 transformer energizations, 5 staged faults with drone/pendulum)
- ISD of July 2018

Manitoba Hydro

Bipole III Future

Business as Usual

- Conawapa will utilize Bipole I-III. Full 2300 MW rating of Bipole III will be utilized (6x250 MVAr syncs). Maintain a minimum valve group spare above generation.
- Statcom with or without energy storage will be considered instead of syncs.
- After Conawapa, northern generation will be integrated using new north south 230 kV and 500 kV ac.
- Bipole IV (LCC or half-bridge VSC) not permitted.



Manitoba Hydro

With BPIII VSC taps (full bridge)

- Stage 1 – Integrate 680 MW Burntwood River; 700 MW VSC near Thompson plus new collector system (370 km)
- Stage 2 – Integrate 500 MW of Upper Nelson generation; 500 MW parallel VSC tap at Thompson and 500 MW tap at Brandon

Manitoba Hydro

With BPIII VSC taps

- Stage 3 – Integrate 1130 MW Conawapa plant; 700 MW parallel VSC tap at Brandon; Conawapa connects to Riel via east side Bipole. Salvage and relocate DC lines. End up with a 1200 VSC point to point link to Brandon and a 2000 MW LCC link between NCS and Winnipeg, which creates three north-south corridors.

Manitoba Hydro

Summary

- Bipole III has a long history!
- Bipole III is a large investment ($B) by Manitoba Hydro to address the lack of redundancy in the HVdc system and load serving deficiency under catastrophic HVdc contingencies
- The in-service of Bipole III reliability project significantly enhances our system reliability and resilience.
- BP3 offers adequate HVdc transmission spare to facilitate & optimize BPI/II refurbishment .
- Provides additional HVdc capacity for future renewable energy development in northern Manitoba.
