Dam-nation: Why Man. plan is too costly

By Graham Lane

Reading Time: 3 minutes

Published: June 28, 2013
Opinion

Many Manitoba residents are aware of the provincial government's planned massive expansion of Manitoba Hydro's northern hydroelectric generation and transmission facilities, but few understand the negative implications for their own pocketbooks.

The government's plans for Hydro were developed before 2008, when the economic environment was different. At that time, premier Gary Doer said: "Hydroelectricity is Manitoba's oil".

Hydro and government expected:

- Natural gas prices would stay high and increase. Not $4 per gigajoule but $10 or more.
- There would be a price on carbon, providing for a premium price for hydro power.
- Rather than industrial closures, new and expanded industry would develop to drive demand growth.
- Higher spot and fixed export prices would develop, rather than the less than three cents for spot sales of recent years.
- Construction costs to increase with inflation. The initial forecasts are now recognized as being far too low.
- An eastern route for BiPole III would save $1 billion and reduce troublesome engineering concerns.
- A lower Canadian dollar.
- A much higher rate would be in place for new or expanded energy intensive industry.

The global credit crisis and recession has since led to an industrial slow down, with the Americans focusing on their economy rather than on climate change.

As well, Americans began using more renewable energy by subsidizing wind and solar power, while new technology reduced the cost of wind and solar power. Americans also moved to generate jobs in the United States.

New production technology un-locked a torrent of shale gas, which drove natural gas prices much lower, providing increased use of gas turbine generating stations.

The Canadian dollar is at or near par, construction costs have skyrocketed, the model first dam, Wuskwatim, has proved an economic disaster, and the government forces a western BiPole III route while ignoring opportunities to diversify supply.

The strategy that is unfolding involves spending a considerable amount of money ahead of final approval of the projects, which will force up rates to keep Hydro's bo om line in the black.…

BiPole III will require either new net revenue or a 30 percent rate hike when it comes into service.

So, regardless of the weakness of Hydro's new revenue forecast, it counts on more export revenue to justify the building of the Keeyask and Conawapa dams while also planning to rebuild Pointe de Bois, "doubling down" the bet.

To assist these plans, the government has allowed Hydro to withhold critical information from the Public Utilities Board as the costs and risks of its development plan grows.

In essence, the strategy appears to be one hiding the real rate cost to consumers by gradually increasing rates.

We are already seeing the plan unfold: rates are climbing and forecasts of further rate increases are gradually being accepted while costs incurred are being deferred, allowing for the "feathering in" of the rate increases to consumers.

Who backstops the risk for Hydro blunders? Only ratepayers. Who protects ratepayers? Not Hydro, not the Public Utilities Board, not the auditor general and certainly not the provincial government.…

The development bus needs to slow down. The party that is truly at risk is required to be brought to a full understanding of the merits and risks of the present plans.

Reviews and audits need to be undertaken, options need to be examined and risks need to be adequately addressed.

Proceeding without a truly adequate dialogue represents an unnecessary and foolhardy process, one that could well bring economic and social pain to a province that lacks the financial base to gamble.

This article is excerpted from a Frontier Public Policy paper entitled DamNation: Rolling the Dice on Manitoba's Future by Graham Lane. Selinger: 'Hydro Power is Manitoba's Oil'

September 29, 2011 11:28 AM | News

Manitoba Votes 2011

NDP leader **Greg Selinger** spoke to a business crowd Thursday morning, where he outlined the importance Manitoba Hydro plays to the province's economy.

"Hydro power is Manitoba's oil," Selinger told the Manitoba Chambers of Commerce. "The main economic question in this election is do we build Hydro or not? The differences between myself and Mr. McFadyen on this are clear as day."

Greg Selinger (CHRISD.CA FILE)

Selinger went on to outline Hydro's contribution of $500 million to the economy each year through export sales, and noted it's poised to invest as much as $15 billion in new dams and transmission lines.

Selinger again went on to criticize his main opponent, Progressive Conservative Party leader **Hugh McFadyen**, saying the PCs would be "reckless" with their plans for Bipole III, a controversial high-voltage Manitoba Hydro transmission line taking power to northern Manitoba via the west side of the province. McFadyen has continually said his government would reroute the line on the east side of Lake Winnipeg — making for a shorter, more cost-effective alternative.

"The Liberals want to put the Bipole under water," Selinger added. "Different parties, different positions, but both would lead to the same sorry results: letting jobs and opportunities die on the vine."

The Green Party has gone on record to say the project wouldn't be necessary at all.

ENVIRONMENT

MARCH 24, 2013 / 6:10 AM / UPDATED 8 YEARS AGO

Analysis: Obama's climate agenda may face setbacks in federal court

By Valerie Volcovici

WASHINGTON (Reuters) - President Barack Obama's plan to use federal agencies, and the Environmental Protection Agency in particular, to drive his second-term climate change agenda might be in peril if he cannot fill vacant seats on the federal court that has jurisdiction over major national regulations, legal experts say.

U.S. President Barack Obama waves as he boards Air Force One at the airport in Amman March 23, 2013. REUTERS/Majed Jaber

Obama is the first full-term president in more than a half century not to have appointed a single judge to the powerful U.S. Court of Appeals for the District of Columbia Circuit.

The court, considered the second most important in the nation, decides cases challenging agency regulations such as those involving the EPA's Clean Air Act and often serves as a feeder to the Supreme Court.

New York attorney Caitlin Halligan, Obama's first nominee to fill one of four vacant seats on the 11-judge bench, announced her withdrawal on Friday after Republicans twice blocked her nomination over concerns about a 2001 case in which she represented New York state and argued that gun manufacturers had created a "public nuisance" under state law.

Obama said in a statement on Friday that he was "deeply disappointed" that a minority of senators continued to block an up-or-down vote on her nomination after two and a half years.

Meanwhile, Obama's second pick, former corporate lawyer Sri Srinivasan, will have a Senate Judiciary Committee hearing in the next few weeks after being delayed in 2012 by Republican requests for more information about his role in the settlement of a housing act case as a U.S. deputy solicitor general.

While some fault Republicans for slow-walking the appointment of judges that would shift the balance of the court to Democrat-appointed judges, others fault Obama for not taking advantage of the now-four open seats and making judicial appointments a political priority. Two of the four vacant seats have been open since Obama came into office in January 2009. The seat Halligan was nominated for has been vacant since 2005.

Some legal experts warn that under the status quo - four Republican appointees and three Democratic appointees among active judges - Obama's plan to bypass a deeply partisan Congress to address climate change using existing authorities will not be easy.

"There is really no moving forward with regulation without going to the DC Circuit and the decision of the court could really have major consequences," said Michael Livermore, executive director of the Institute for Policy Integrity at New York University's law school.

The court hears all challenges to government agency regulations.

And regardless of the political balance, some warn the short-staffed court will have a hard time handling a growing case load of challenges to increasingly complex EPA regulations.

"There is a reason why there are 11 judges on that court of appeals," said John Cruden, director of the Environmental Law Institute. "They (cases) will take longer to resolve than they are right now because they are more complicated and they require and demand a lot of attention."

A former D.C. circuit judge on the court from 1979 to 1999 last month termed the ongoing vacancies a cause of "extreme concern" because the court lacks the manpower to carry out its "weighty mandate," which includes cases ranging from environmental protection to civil rights to national security.

Patricia Wald, who was an appointee of Democratic President Jimmy Carter, wrote in a February 28 op-ed in the Washington Post that the number of pending cases per judge has grown to 188 today from 119 in 2005.

Although the court's six senior status judges can hear cases, they cannot participate in re-hearings. Five of those six judges are Republican appointees.

AUTOMATIC CHALLENGE

Obama said in his February State of the Union address that he would direct his cabinet to take steps to curb carbon emissions if lawmakers fail to enact legislation - a likely outcome in the deeply divided Congress.

The EPA is expected to be at the center of Obama's climate efforts. It is due this year to finalize emissions standards for new power plants and industrial facilities. After that, it will set a standard for the country's power plants and industrial sources that account for nearly 40 percent of domestic emissions.

The proposed regulations will almost certainly be challenged by industry, including electric utility companies and manufacturers, who argue the agency is wrongly interpreting the Clean Air Act to write its standards.

“He (Obama) can lean as heavily as he wants on the EPA and its all for nothing if he gets the wrong panel reviewing what they do,” said Tom McGarity, a law professor at the University of Texas law school in Austin, who specializes in environmental and administrative law.

Three-judge panels are assigned randomly to resolve cases brought to the court. With just seven active judges, many of the same judges will deliberate similar EPA challenges.

Some analysts say the court has become more polarized on these issues, making the outcome largely dependent on the panel that gets selected - a roll of the dice.

Some also expect delays or revisions to the EPA’s proposed standard for new power plants beyond an April 13 deadline as the agency anticipates inevitable challenges in the DC circuit and uncertainty about how the judges will rule.

“It’s certainly possible that the EPA has recognized that it needs to be a little less aggressive in its interpretation and implementation of its authority,” said Jonathan Adler, a law professor at Case Western Reserve University.

Recent setbacks in the DC circuit might have reminded EPA that its technical and legal analysis needs to be bullet proof.

One such loss was the court’s 2-1 decision in August to strike down an EPA rule to curb sulfur dioxide and nitrogen oxide emissions from power plants that cause acid rain and smog across state lines. The decision called on the agency to rewrite the rules, a process that could take years.

Two of the three judges ruling on the case said the EPA exceeded its “jurisdictional limits” in interpreting the Clean Air Act. The EPA asked for a full-court hearing in January but it was denied.

The court ruled more favorably for the EPA in June, though, when it upheld agency rules on greenhouse gas emissions, including the scientific justification to regulate them because they endanger public health.

But new standards for power plants, mercury and hazardous materials, ozone rules and other controversial regulations will face uncertain fates in the court if the status quo continues.

NYU’s Livermore said that, while recent decisions on the EPA’s interpretation of the Clean Air Act have been mixed, the court has clearly demonstrated it is not afraid to strike down rules and send the agency back to the drawing board.

“This is not a court that is afraid to act and use its powers. There is no getting around these guys. It is small, so one or two judges can make a big difference in the ultimate decision,” he said.

Observers say Obama needs to make more nominations for the court or broker a deal with Republicans to get at least some of his judicial picks confirmed, or he will risk missing out on a chance to leave his mark on the court.

“If we continue on the current path of invalidating critically important rules, the DC circuit will be the graveyard for all programs, initiatives that are being pushed by the Obama administration and will affect all of us,” said Nan Aron, president of the judicial rights group Alliance for Justice.

“The DC circuit has that much power.”

Supreme Court Deals Blow to Obama’s Efforts to Regulate Coal Emissions

By Adam Liptak and Coral Davenport

Feb. 9, 2016

WASHINGTON — In a major setback for President Obama’s climate change agenda, the Supreme Court on Tuesday temporarily blocked the administration’s effort to combat global warming by regulating emissions from coal-fired power plants.

The brief order was not the last word on the case, which is most likely to return to the Supreme Court after an appeals court considers an expedited challenge from 29 states and dozens of corporations and industry groups.

But the Supreme Court’s willingness to issue a stay while the case proceeds was an early hint that the program could face a skeptical reception from the justices.

The 5-to-4 vote, with the court’s four liberal members dissenting, was unprecedented — the Supreme Court had never before granted a request to halt a regulation before review by a federal appeals court.

“It’s a stunning development,” Jody Freeman, a Harvard law professor and former environmental legal counsel to the Obama administration, said in an email. She added that “the order certainly indicates a high degree of initial judicial skepticism from five justices on the court,” and that the ruling would raise serious questions from nations that signed on to the landmark Paris climate change pact in December.

In negotiating that deal, which requires every country to enact policies to lower emissions, Mr. Obama pointed to the power plant rule as evidence that the United States would take ambitious action, and that other countries should follow.

The White House said in a statement that it disagreed with the court’s decision and remained confident that it would ultimately prevail. “The administration will continue to take aggressive steps to make forward progress to reduce carbon emissions,” it said.

Opponents of Mr. Obama’s climate policy called the court’s action historic.

“We are thrilled that the Supreme Court realized the rule’s immediate impact and froze its implementation, protecting workers and saving countless dollars as our fight against its legality continues,” said Patrick Morrisey, the attorney general of West Virginia, which has led the 29-state legal challenge.

"There's a lot of people who are celebrating," said Jeff Holmstead, a lawyer with Bracewell & Giuliani, a firm representing energy companies, which are party to the lawsuit. "It sends a pretty strong signal that ultimately it's pretty likely to be invalidated."

The challenged regulation, which was issued last summer by the Environmental Protection Agency, requires states to make major cuts to greenhouse gas pollution created by electric power plants, the nation's largest source of such emissions. The plan could transform the nation's electricity system, cutting emissions from existing power plants by a third by 2030, from a 2005 baseline, by closing hundreds of heavily polluting coal-fired plants and increasing production of wind and solar power.

"Climate change is the most significant environmental challenge of our day, and it is already affecting national public health, welfare and the environment," Solicitor General Donald B. Verrilli Jr. wrote in a brief urging the Supreme Court to reject a request for a stay while the case moves forward.

The regulation calls for states to submit compliance plans by September, though they may seek a two-year extension. The first deadline for power plants to reduce their emissions is in 2022, with full compliance not required until 2030.

The states challenging the regulation, led mostly by Republicans and many with economies that rely on coal mining or coal-fired power, sued to stop what they called "the most far-reaching and burdensome rule the E.P.A. has ever forced onto the states."

A three-judge panel of the United States Court of Appeals for the District of Columbia Circuit in January unanimously refused to grant a stay.

The court did expedite the case and will hear arguments on June 2, which is fast by the standards of complex litigation.

The states urged the Supreme Court to take immediate action to block what they called a "power grab" under which "the federal environmental regulator seeks to reorganize the energy grids in nearly every state in the nation." Though the first emission reduction obligations do not take effect until 2022, the states said they had already started to spend money and shift resources.

Eighteen states, mostly led by Democrats, opposed the request for a stay, saying they were "continuing to experience climate-change harms firsthand — including increased flooding, more severe storms, wildfires and droughts." Those harms are "lasting and irreversible," they said, and "any stay that results in further delay in emissions reductions would compound the harms."

In a second filing seeking a stay, coal companies and trade associations represented by Laurence H. Tribe, a law professor at Harvard, said the court should act to stop a "targeted attack on the coal industry" that will "artificially eliminate buyers of coal, forcing the coal industry to curtail production, idle operations, lay off workers and close mines."

The E.P.A., represented by Mr. Verrilli, called the requests for a stay "extraordinary and unprecedented." The states challenging the administration's plan, he said, could point to no case in which the Supreme Court had "granted a stay of a generally applicable regulation pending initial judicial review in the court of appeals." In a later brief, the states conceded that point.

Mr. Verrilli said judicial review of the plan, including by the Supreme Court, will be complete before the first deadline for emissions reductions in 2022.

"There is no reason to suppose that states' duties under the rule will be especially onerous," Mr. Verrilli wrote. "A state can elect not to prepare a plan at all, but instead may allow E.P.A. to develop and implement a federal plan for sources in that state."

The two sides differed about whether current declines in coal mining and coal-fired power generation are attributable to the administration's plan. "Some of the nation's largest coal companies have declared bankruptcy, due in no small part to the rule," a group of utilities told the justices.

A coalition of environmental groups and companies that produce and rely on wind and solar power said other factors were to blame for coal's decline.

"These changes include the abundant supply of relatively inexpensive natural gas, the increasing cost-competitiveness of electricity from renewable generation sources such as solar and wind power, the deployment of low-cost energy efficiency and other demand-side measures, and increasing consumer demand for advanced energy," they wrote.

LEGISLATIVE ASSEMBLY OF MANITOBA

Tuesday, April 25, 2006

The House met at 1:30 p.m.

PRAYER

Speaker's Statement

Mr. Speaker: I have some information for the House.

The Honourable Jobie Nutarak was a wonderful and very caring man. He was the Speaker of Nunavut Territory, and I am sad to announce that he passed away on the weekend due to a hunting accident. I am informing the House that I passed along sympathies and condolences to his family on behalf of all members, and also on behalf of everyone that is associated with the Manitoba Legislative Assembly.

ROUTINE PROCEEDINGS

PETITIONS

Funding for New Cancer Drugs

Mr. Kelvin Goertzen (Steinbach): Mr. Speaker, thank you for that message, and our condolences to your colleague.

I wish to present the following petition to the Legislative Assembly of Manitoba.

These are the reasons for this petition:

Cancer is one of the leading causes of death of Manitobans.

Families are often forced to watch their loved ones suffer the devastating consequences of this disease for long periods of time.

New drugs such as Erbitux, Avastin, Zevalin, Rituxan, Herceptin and Eloxatin have been found to work well and offer new hope to those suffering from various forms of cancer.

Unfortunately, these innovative new treatments are often costly and remain unfunded under Manitoba's provincial health care system.

Consequently, patients and their families are often forced to make the difficult choice between paying for the treatment themselves or going without.

CancerCare Manitoba has asked for an additional $12 million for its budget to help provide these leading-edge treatments and drugs for all Manitobans.

Several other provinces have already approved these drugs and are providing them to their residents at the present time.

We petition the Legislative Assembly of Manitoba as follows:

To request the Premier (Mr. Doer) of Manitoba and the Minister of Health (Mr. Sale) to consider providing CancerCare Manitoba with the appropriate funding necessary so they may provide leading-edge care for patients in the same manner as other provinces.

To request the Premier of Manitoba and the Minister of Health to consider accelerating the process by which new cancer treatment drugs are approved so that more Manitobans are able to be treated in the most effective manner possible.

This petition is signed by S. Holden, D. Jeanson, G. Peck and many, many others.

Mr. Speaker: In accordance with our Rule 132(6), when petitions are read they are deemed to be received by the House.

***** (13:35)

Point of Order

Mr. Leonard Derkach (Official Opposition House Leader): On a point of order, Mr. Speaker.

Mr. Speaker: The honourable Member for Russell, on a point of order.

Mr. Derkach: Well, Mr. Speaker, for the last two weeks in this House, we have been reading petitions, and, basically, the petitions urge the Premier (Mr. Doer) and the government.

Mr. Speaker, the Premier has said quite out loud in this Chamber that petitions are a waste of time. I am wondering whether we could encourage that the reading of petitions should not begin until the Premier is present since they are, in fact, directed at him and his government.

Mr. Speaker: The honourable Minister of Energy, Science and Technology, on the same point of order?

Hon. Dave Chomiak (Minister of Energy, Science and Technology): Yes, thank you, Mr. Speaker. I just want to make two points to the House. Firstly, we changed the order of petitions in order to allow petitions to be read in this Chamber. So the order was changed by agreement of all parties of which I think the member opposite signed on.

Secondly, Mr. Speaker, I think the member misappropriated what the Premier said. He said the bell ringing was a waste of time.

And, thirdly, Mr. Speaker, the Premier was just returning on behalf of the Province of Manitoba– *[interjection]*

Mr. Speaker: Order.

Mr. Chomiak: The Premier was just returning from speaking on behalf of the Province of Manitoba at the Holocaust Memorial ceremony that just took place, Mr. Speaker. *[interjection]*

Mr. Speaker: On the point of order raised by the Official Opposition House Leader, all members are aware that mentioning the presence or absences of members is not allowed in our rules. The honourable member does not have a point of order.

*** * ***

Mr. Speaker: But we will continue on with petitions.

Mr. Cliff Cullen (Turtle Mountain): Mr. Speaker, I ask for leave to present the petition on behalf of the Member for Tuxedo (Mrs. Stefanson).

Mr. Speaker: Does the honourable member have leave? *[Agreed]*

Mr. Cullen: Mr. Speaker, I wish to present the following petition to the Legislative Assembly of Manitoba.

These are the reasons for this petition:

Cancer is one of the leading causes of death of Manitobans.

Families are often forced to watch their loved ones suffer the devastating consequences of this disease for long periods of time.

New drugs such as Erbitux, Avastin, Zevalin, Rituxan, Herceptin and Eloxatin have been found to work very well and offer new hope to those suffering from various forms of cancer.

Unfortunately, these innovative new treatments are often costly and remain unfunded under Manitoba's provincial health care system.

Consequently, patients and their families are often forced to make the difficult choice between paying for the treatment themselves or going without.

CancerCare Manitoba has asked for an additional $12 million for its budget to help provide these leading-edge treatments and drugs for Manitobans.

Several other provinces have already approved these drugs and are providing them to their residents at present time.

We petition the Legislative Assembly of Manitoba as follows:

To request the Premier (Mr. Doer) of Manitoba and the Minister of Health (Mr. Sale) to consider providing CancerCare Manitoba with the appropriate funding necessary so they may provide leading-edge care for patients in the same manner as other provinces.

To request the Premier of Manitoba and the Minister of Health to consider accelerating the process by which new cancer treatment drugs are approved so that more Manitobans are able to be treated in the most effective manner possible.

This petition is signed by Graham Hnatiuk, Leanne Peixob, Kristjana Wood and many, many others.

***** (13:40)

Grandparents' Access to Grandchildren

Mr. Ralph Eichler (Lakeside): Mr. Speaker, I wish to present the following petition.

These are the reasons for this petition:

It is important to recognize and respect the special relationship that exists between grandparents and grandchildren.

Maintaining an existing, healthy relationship between a grandparent and a grandchild is in the best interest of the child. Grandparents play a critical role in the social and emotional development of their grandchildren. This relationship is vital to promote the intergenerational exchange of culture and heritage, fostering a well-rounded self-identity for the child.

In the event of divorce, death of a parent or other life-changing incident, a relationship can be severed without consent of the grandparent or the grandchild. It should be a priority of the provincial government to provide grandparents with the means to obtain reasonable access to their grandchildren.

We petition the Manitoba Legislative Assembly as follows:

To urge the Minister of Family Services and Housing (Ms. Melnick) and the Premier (Mr. Doer) to consider amending legislation to improve the process by which grandparents can obtain reasonable access to their grandchildren.

Submitted on behalf of A.C. Anderson, Liz Anderson, Chris Mazur and many, many others.

Crocus Investment Fund

Mr. Denis Rocan (Carman): I wish to present the following petition to the Legislative Assembly of Manitoba.

These are the reasons for this petition:

The Auditor General's *Examination of the Crocus Investment Fund* indicated that as early as 2001, the government was made aware of red flags at the Crocus Investment Fund.

In 2001, Industry, Economic Development and Mines officials stated long-term plans at the Crocus Investment Fund requiring policy changes by the government were cleared by someone in "higher authority," indicating political interference at the highest level.

In 2002, an official from the Department of Finance suggested that Crocus Investment Fund's continuing requests for legislative amendments may be a sign of management issues and that an independent review of Crocus Investment Fund's operations may be in order.

Industry, Economic Development and Mines officials indicated that several requests had been made for a copy of Crocus Investment Fund's business plan, but that Crocus Investment Fund never complied with the requests.

Manitoba's Auditor General stated, "We believe the department was aware of red flags at Crocus and failed to follow up on those in a timely way."

As a direct result of the government ignoring the red flags, more than 33,000 Crocus investors have lost more than $60 million.

The relationship between some union leaders, the Premier (Mr. Doer) and the NDP seems to be the primary reason as for why the government ignored the red flags.

The people of Manitoba want to know what occurred within the NDP government regarding Crocus, who is responsible and what needs to be done so this does not happen again.

We petition the Legislative Assembly of Manitoba as follows:

To strongly urge the Premier to consider calling an independent public inquiry into the Crocus Investment Fund scandal.

Signed Jeff MacDonald, Bob Gass, Craig MacDonald and there are many, many others.

Mr. Larry Maguire (Arthur-Virden): Mr. Speaker, I wish to present the following petition to the Legislative Assembly of Manitoba.

These are the reasons for this petition:

The Auditor General's *Examination of the Crocus Investment Fund* indicated that as early as 2001, the government was made aware of red flags at the Crocus Investment Fund.

In 2001, Industry, Economic Development and Mines officials stated long-term plans at the Crocus Investment Fund requiring policy changes by the government were cleared by someone in "higher authority," indicating political interference at the highest level.

In 2002, an official from the Department of Finance suggested that Crocus Investment Fund's continuing requests for legislative amendments may be a sign of management issues and that an independent review of Crocus Investment Fund's operations may be in order.

Industry, Economic Development and Mines officials indicated that several requests had been made for a copy of Crocus Investment Fund's business plan, but that Crocus Investment Fund never complied with the requests.

Manitoba's Auditor General stated, "We believe the department was aware of red flags at Crocus and failed to follow up on those in a timely way."

As a direct result of the government ignoring the red flags, more than 33,000 Crocus investors have lost more than $60 million.

The relationship between some union leaders, the Premier (Mr. Doer) and the NDP seems to be the primary reason as for why the government ignored the red flags.

The people of Manitoba want to know what occurred within the NDP government regarding Crocus, who is responsible and what needs to be done so this does not happen again.

We petition the Legislative Assembly of Manitoba as follows:

To strongly urge the Premier to consider calling an independent public inquiry into the Crocus Investment Fund scandal.

This petition is signed by Eric Dickson, Brad Rowat, Marion Kostuik and many, many others.

***** (13:45)

Civil Service Employees–Neepawa

Mr. Glen Cummings (Ste. Rose): Mr. Speaker, I wish to present the following petition to the Legislative Assembly.

These are the reasons for this petition:

Eleven immediate positions with Manitoba Conservation Lands Branch, the Crown Lands and Property Special Operating Agency, are now being moved out of Neepawa.

Removal of these positions will severely impact the local economy with potentially 33 adults and children leaving the community.

Removal of these positions will be detrimental to revitalizing the rural and surrounding communities of Neepawa.

We petition the Legislative Assembly of Manitoba as follows:

To request the provincial government to consider stopping the removal of these positions from our community and to consider utilizing current technology, as Land Management Services existing satellite sub-office in Dauphin does, in order to maintain these positions in their existing location.

Signed by Jim Beaumont, David Beaumont and Barnie Provost.

Crocus Investment Fund

Mr. Kevin Lamoureux (Inkster): Mr. Speaker, I wish to present the following petition to the Legislative Assembly of Manitoba.

The background to this petition is as follows:

The Manitoba government was made aware of serious problems involving the Crocus Fund back in 2001.

Manitoba's provincial auditor stated "We believe the department was aware of red flags at Crocus and failed to follow up on those in a timely way."

As a direct result of the government not acting on what it knew, over 33,000 Crocus investors have lost tens of millions of dollars.

The relationship between some union leaders, the Premier (Mr. Doer) and the NDP seems to be the primary reason as for why the government ignored the red flags.

We petition the Legislative Assembly of Manitoba as follows:

To request the Legislative Assembly of Manitoba to consider the need to seek clarification on why the government did not act on fixing the Crocus Fund back in 2001.

To urge the Premier and his government to co-operate in making public what really happened.

Signed by M. Singh, J. Rapose, E. Rapose and many, many others.

MINISTERIAL STATEMENTS

Holocaust Memorial Day

Hon. Nancy Allan (Minister responsible for Multiculturalism): Yes, Mr. Speaker, I have a ministerial statement for the House.

On May 1, 2000, Manitoba's Legislative Assembly voted unanimously to pass Bill 19, an act to proclaim Holocaust Memorial Day or Yom Hashoah in Manitoba.

On this day, we in Canada and all over the world stand in solidarity with our Jewish brothers and sisters to remember the atrocities committed by the Nazi regime towards the Jewish community in Europe, which culminated in the death of 6 million Jewish men, women, children and others. Today we must remember that the Holocaust was not only a tragedy for the Jewish people but also a human tragedy. We owe nothing less than awe to the strength and determination of the survivors. In these people we see the power of the human spirit, the triumph of hope over loss and the victory of courage over fear.

This morning I was honoured to participate in the "unto every person there is a name" ceremony here at the Legislature. I was joined by many of my colleagues as well as the Maples Collegiate Unity Group who were awarded the International Peace Medal in 2003, as well as the Manitoba Human Rights Award in 2005 for their efforts to promote human rights, anti-racism and social justice issues. I congratulate the Maples Collegiate Unity Group for their efforts to combat racism and promote human rights, as well as a better understanding and respect for cultural diversity.

The attitudes and values of young people will shape Canadian society, and the future will depend on their involvement and engagement. Today we not only look to our youth for hope, but also look to our leaders for inspiration.

Earlier today, as I recited the names of the Holocaust victims who are inscribed on the Holocaust monument on the Legislative grounds, I was reminded that it is important for all of us to stand together in unity and say: Never again. Let us remember that, while the tragedies of history cannot be undone, we must envision the future with courage and determination, and never let the errors of the past be repeated.

Mr. Speaker, after my colleagues have spoken, I would ask that all members observe a moment of silence as we reflect on those whose silence we will remember forever.

***** (13:50)

Mr. Stuart Murray (Leader of the Official Opposition): Mr. Speaker, I wish to join the minister on her reflection and on the reflection of all members in this Chamber for what was, I believe, a very important bill that was passed unanimously to proclaim Holocaust Memorial Day or Yom Hashoah in Manitoba.

I know that those of us who had the opportunity to participate in "unto every person there is a name" this morning, it just sends an incredible, powerful message to all of us that we stand before people to recite names of family members' loved ones that were so taken away for something that to this day, I do not think anybody can understand why it happened.

I know that my wife and I were joined with a number of Manitobans on a solidarity mission. I know the Premier (Mr. Doer) and the Minister of Energy, Science and Technology (Mr. Chomiak) have also been over to Israel, along with others, to understand and try to get a sense of why it is that we are in a situation that we have to deal with issues such as remembering the Holocaust. Anybody who has a chance to travel to Israel will see a people who were put onto a desert, and unto their determination and spirit they have created a society that, I think, we all can stand back and learn from.

So, today, Mr. Speaker, I say to all members of the Legislature and to all Manitobans, we join the minister in citing that we all must, in our own way, every single day of our lives, ensure that atrocities, as happened to the Jewish people who suffered in the Holocaust, and all of those people who were affected, that all of us ensure that it will never, ever happen again. That is something that we, as this side of the House, that side of the House, all members of this Legislature, I think, stand united. We always must take time to never forget. Thank you very much.

Hon. Jon Gerrard (River Heights): I ask leave to speak to the minister's statement.

Mr. Speaker: Does the honourable member have leave? *[Agreed]*

Mr. Gerrard: Mr. Speaker, I would like to join my colleagues today, Holocaust Memorial Day, in remembering the tragedy of the Holocaust, the 6 million people who died, the 1.5 million children, and in joining others in the resolve to do everything in our power here and elsewhere to prevent such tragedies in the future.

This Holocaust Memorial Day has a special meaning to me this year because I was in Jerusalem in February and had a chance to visit the Holocaust Museum. What an incredible experience going through and seeing the many stories.

After I read at the memorial, "unto every person there is a name," after I had read some of the names this morning, I had a chance to talk with one of the survivors who has lived here in Winnipeg now for many years. It was very moving, both on the one hand to hear her speak of the pain that is there every day for her even now, so many years later from the many people whom she knew and she lost in the terrible tragedy that was the Holocaust. But, Mr. Speaker, in spite of that pain being there every day, she has contributed in Manitoba in many, many ways, including working with children at the Children's Hospital for many years.

***** (13:55)

I think it is an important opportunity to salute those who have come through this terrible experience and, yet, have been able to contribute in one way or another so much here in Manitoba and others, of course, around the world.

This is a real opportunity to remember and to recommit ourselves to preventing this sort of thing from ever happening again. Thank you.

Mr. Speaker: Do members wish to rise for a moment of silence? *[Agreed]* We will rise for a moment of silence.

A moment of silence was observed.

Introduction of Guests

Mr. Speaker: Prior to Oral Questions, I would like to draw the attention of honourable members to the public gallery where we have with us from Isaac Brock School 10 Grade 9 students under the direction of Mr. Larry Beaudoin and Mr. Paul Doerksen. This school is located in the constituency of the honourable Member for Minto (Mr. Swan).

On behalf of all honourable members, I welcome you here today.

ORAL QUESTIONS

Manitoba Hydro
East Side Transmission Line

Mr. Stuart Murray (Leader of the Official Opposition): Mr. Speaker, currently, 70 percent of the power from northern Manitoba comes down two high voltage transmission lines, Bipole I and Bipole II. Both lines are located on the west side of Lake Winnipeg.

Manitoba Hydro will eventually need Bipole III, a third high voltage line to bring down power from the North. A route going down the west side of Lake Winnipeg will be $400 million to $550 million more expensive than a line going down the east side of Lake Winnipeg. A west side route will also be 400 kilometres longer and result in additional line losses of some 70 megawatts.

Mr. Speaker, to put this into perspective, the proposed $1.2 billion Wuskwatim Dam is a 200-megawatt project, meaning a west side line will result in the losses of more than a third of the output of the Wuskwatim Dam. This NDP government has vetoed an east side route.

I ask the Premier: Why is his NDP government choosing an alternative that is more expensive and results in greater line loss than an east side route?

Hon. Gary Doer (Premier): Mr. Speaker, there are a number of options that Hydro is looking at. Part of those options that are being discussed is the cost not only of the direct transmission line, which the member reports, but also the cost of potential settlements and the cost of delay. So the members opposite do not cite the costs of communities that may be in favour of it, and many other communities on the east side are not in favour of it. That is different than a straight-line engineering calculation, and, of course, Hydro has to consider making decisions not only of the straight-line transmission costs but the costs of not being able to build the line and the cost of not being able to have appropriate agreements with people who actually live in the area.

I am pleased that members opposite, the mothball party of Manitoba, have a new interest in hydro development, but I would point out that it was the NDP government who built the direct current line which is one of the most efficient in all of the world, Mr. Speaker. I would point out that Manitoba's profit last year was $400 million after we built Limestone, and it is going to be comparable this year.

* (14:00)

Mr. Murray: Well, I do not want to get into the millions and millions and millions of dollars that they raided out of Hydro, but I digress, Mr. Speaker.

Mr. Speaker, events such as the Québec ice storm of 1998 and the northeastern brownout of 2003 remind us of how vulnerable we are to power interruptions. It is important that we prepare ourselves for a power outage, particularly during Manitoba's minus 40 degree Celsius temperatures. A winter power outage would threaten Manitobans who heat their homes with electricity and natural gas users whose furnace fans are powered by electricity. Instead of building a transmission line down the east side of Lake Winnipeg and increasing the reliability of power to Manitobans, this government is proposing to not build a second but a third transmission line down the western corridor. An east side route would help to protect the province from natural disasters and terrorist attacks.

Nowhere else do we see the arrogance that this government exhibits. We are a province, Mr. Speaker, with an opportunity to increase the reliability of our electricity supply. Instead of embracing these opportunities, this NDP government is squandering the opportunity. An east side transmission line would provide greater reliability for all Manitobans.

I would like to ask the Premier: Why has his NDP government vetoed the possibility of a route that would provide increased reliability for Manitobans?

Mr. Doer: Mr. Speaker, I do not know whether the member opposite has been on the east side meeting with people in the community, but we have had over 30 community meetings on the east side. We actually respect when people live in an area, there may be a diverse few, but if people are opposed to it those are not even factored into Hydro calculations, and if the line is never built the delay and the cost of delay is also not factored in.

I would point out, Mr. Speaker, everybody is talking about east and west. We may be talking because we are not just dealing with reliability. This government is not only looking at reliability, it is also looking at increased sales. Those increased sales may go to the east across the north and may go to the west across the north. So there is more than one option on the table.

They are the mothball party that cancelled Limestone. They cancelled Conawapa. The NDP will build Hydro for the future, Mr. Speaker.

Mr. Murray: Mr. Speaker, this is a very important issue for the future of Hydro and the future of all Manitobans, clearly.

Mr. Speaker, what we see from the member opposite, the Premier, is that the NDP government apparently is prepared to take their advice from Bobby Kennedy, Jr. We believe all Manitobans should be involved in this discussion. Every Manitoban can gain from this, not just Bobby Kennedy, Jr. We think that Manitoba officials from Hydro believe that a Bipole III line is necessary. We believe that discussions should take place, including all Manitobans, to ensure what is right for the province of Manitoba. What we do not want is a veto.

Mr. Speaker, this government is to veto the option of building a transmission line down the east side of Lake Winnipeg and is ignoring the needs of residents along the east side. Many of the east side residents see this development of an east side corridor as an opportunity to construct an all-season road that would provide them with access to goods, access to services year-round, including–

Some Honourable Members: Oh, oh.

Mr. Speaker: Order.

Mr. Murray: Well, thank you, Mr. Speaker. An all-year access road would provide them with goods and services year-round and improve their quality of life. Each year, a winter road is constructed to provide access to the east side residents and to transport goods into the community. Weather permitting, the winter road is open for a small window each year. During the rest of the year, east side residents are isolated from the markets and from critical services such as health care.

Mr. Speaker, I would like to ask this Premier: How long does he expect the east side residents of Lake Winnipeg to live as second-class citizens?

Mr. Doer: Mr. Speaker, as one who was in the Cabinet that extended the transmission line into the Island Lake area and had consultations beforehand with the people in the communities, we respect and we respect greatly the people in the communities and their views. The people in the communities have a right to have a say and, they do have a say, not somebody else. I think it is Robert Kennedy, Jr. you are talking about, unfortunately, a different person the member was mentioning.

Mr. Speaker, secondly, the issue of the road, the road costs between $350 million and $400 million. We do believe in more access. We are working on plans to extend the road up the east side and extend the road, like we did with the winter road from Norway House into the Island Lake area which we did this year, to get goods and services there.

But to say Hydro, on the one hand, should not be raided and, on the other hand, if you build the transmission line for the road, getting $400 million from Hydro is just creating a false choice, it is not true. People should not say it and journalists should not say it because it is just not true.

When we have meetings with Aboriginal people, we tell the truth. We do not say you are going to get a free road if a transmission line comes in. Part of the debate should be truth, Mr. Speaker.

Finally, Mr. Speaker, the only raid that has taken place in this province is the Tories selling one Manitoba Telephone System against the consent of the people of this province.

Lake Winnipeg
Eastern Access Road

Mr. Larry Maguire (Arthur-Virden): Well, Mr. Speaker, Manitobans are not interested in ancient history. There are–

Some Honourable Members: Oh, oh.

Mr. Speaker: Order. The honourable Member for Arthur-Virden has the floor.

Mr. Maguire: Mr. Speaker, there are tens of thousands of stranded Manitobans on the east side of Lake Winnipeg. Winter roads are becoming less reliable and more costly. Air lifting is extremely expensive. Fuel costs continue to skyrocket.

Can the Minister of Transportation and Government Services tell Manitobans why he has not promoted the development of an east side access route in conjunction with a proposed new transmission line needed to deliver more electric power for Manitobans or for export?

Hon. Ron Lemieux (Minister of Transportation and Government Services): Mr. Speaker, how hypocritical. You have the member opposite who criticizes us for putting money into winter roads; we have doubled the winter roads' budget. He criticizes that, criticizes any initiative we have; $29 million more into the current budget. He criticizes that, yet will not have the courage to debate the budget on these monies to be forwarded to Manitobans.

I can tell you we are committed to northern Manitobans, eastern Manitobans, western Manitobans, members from all over Manitoba. They know we are committed to transportation, that we put in many dollars over the last number of years to Manitobans.

Mr. Maguire: Mr. Speaker, the only thing we are criticizing here is the minister's responsibility in acting in this regard in a responsible manner. These tens of thousands of isolated Manitobans need road access for many reasons; better health care facilities, economic development, access to family members and friends in neighbouring communities and access to more competitively priced food products, to name a few.

Can the minister tell Manitobans, particularly those isolated on the east side of Lake Winnipeg, what discussions his government has had with Manitoba Hydro regarding the construction of an eastern access road?

Hon. Gary Doer (Premier): Mr. Speaker, let the record show that nobody is perfect, but you put more money in 11 years into the road to Oak Hammock Marsh than you put in all northern Manitoba. How dare you raise these questions today.

Mr. Maguire: Well, Mr. Speaker, I am sure that that is no solace to the people on the east side of Lake Manitoba who remain isolated. The minister talks of having good roads as an economic driver in our economy, yet his government had to add over 400 kilometres to this winter roads system to deliver basic essentials so these eastern citizens have access to what other Manitobans take for granted.

Can the minister explain why he continues to isolate the tens of thousands of eastern Manitobans by denying health care access, competitive food products and better economic opportunities that an eastern access road would provide?

***** (14:10)

Mr. Lemieux: We put millions of dollars into repairing airports in northern communities providing access. We have also provided millions of dollars with regard to winter roads. Also, we have taken many, many kilometres off of the ice and off of the river system in order to provide safety for northern Manitobans.

Mr. Speaker, members opposite continually criticize us every time we talk about putting money into northern Manitoba. Here on this side they are trying to provide a wedge between northern Manitobans and southern Manitobans, but we as a government care for all Manitobans in transportation throughout this province.

Crocus Investment Fund
Co-investment Risk Analysis

Mr. Glen Cummings (Ste. Rose): Mr. Speaker, the state of the roads in this province, I would not be bragging about it if I was–

Some Honourable Members: Oh, oh.

Mr. Speaker: Order.

Mr. Cummings: Yesterday, Mr. Speaker, the Minister of Finance refused to answer whether he had received any information about Crocus Investment Fund status while receiving reports from Treasury Board analysis or any other risk and exposure the government might have had. Again he proved that he must have something to hide or he would be willing to answer some questions.

Mr. Speaker, I will give him a chance again today to answer the question. As head of Treasury Board, who should be the most knowledgeable minister on that side of the House regarding financial affairs, did he receive information about the Crocus Fund in 2001, about his performance through Treasury Board or any other risk assessment?

Hon. Greg Selinger (Minister of Finance): Mr. Speaker, yesterday I read into the record how the fund was set up by the former government, and it was very clear at the time that the members opposite wanted it to be a community-driven institution, driven by the private sector, driven by business leaders and independent from government. No private organization reports to Treasury Board. The member sat on Treasury Board, he should know that.

Mr. Cummings: Mr. Speaker, again this minister has proven why we need an inquiry into what happened at Crocus. There is no limit to his evasive answers it would appear. I remind him that at some point he is going to have to swear under oath and provide answers that are truthful in public.

Did he or his officials meet with Sherman Kreiner?

Mr. Selinger: All the relevant events, in terms of meetings, are reported in the Auditor General's report. The member has full access to it in terms of all the meetings that occurred. He simply has to take the time to read the report. If he really wants to go fishing, Mr. Speaker, I suggest he go fishing in some of the excellent lakes we have in Manitoba where he might catch something.

Public Inquiry

Mr. Glen Cummings (Ste. Rose): If that was my seven-year-old son, I would assume that the answer was yes, from that type of an answer, but they expect better from the Minister of Finance.

If he has nothing to hide, why will he not answer the simplest of questions? He is right and, in fact, I was on Treasury Board for a number of years. I believe that this minister would have or should have received reports that would have had implications with information about co-investments where there was risk associated with Crocus. If he did not know, he was asleep at the switch, Mr. Speaker.

Will he now join this side of the House in agreeing that we need a public inquiry into what happened at Crocus?

Hon. Greg Selinger (Minister of Finance): Well, Mr. Speaker, just because the member opposite mistreats his seven-year-old son does not mean he can mistreat the people of Manitoba.

The evidence of all the meetings is in the Auditor General's report. The member should take the time to read it. When he came to Public Accounts, ministers were ready to answer his questions. When he was confronted with the evidence, he folded his tent, went home and cancelled the meeting.

Now the member, in addition, has asked about MIOP loans. They are all reported in the Public Accounts. All he has to do is read the Public Accounts and he will see that all the loans that went bad were loans that the members opposite made when they were in government. They lost money. If they really want to know the facts, all they have to do is read all the information disclosed on the public record instead of going fishing in the Legislature, instead of fishing in the excellent lakes that we have in Manitoba.

Teachers' Retirement Allowance Fund Board Member Removal

Mrs. Myrna Driedger (Charleswood): Mr. Speaker, Jon Singleton, the Auditor General, has criticized the Minister of Education for his inaction on Tom Ulrich's letter.

On page 13 of Tom Ulrich's letter to the Minister of Education, he stated that, and I quote, "I was surprised to discover that the citizen representative, Bob Malazdrewich, had been replaced. I contacted him to express my surprise and thank him for his service and support and he informed me that it was not his choice to leave. Never in the history of TRAF had a citizen representative been removed from the TRAF board except by resignation."

I would like to ask this Minister of Education: Why was Bob Malazdrewich, who had been appointed by Order-in-Council, removed from the board?

Hon. Peter Bjornson (Minister of Education, Citizenship and Youth): Mr. Speaker, with respect to the TRAF board, I should point out for the member opposite, who has been asking about the chair, that currently we are, as I said yesterday, in the process of dealing with the chair and appointment of the chair.

Mr. Speaker, I would also like to point out with regard to the allegations that had been received from Mr. Ulrich, when we received those allegations we immediately followed up with the TRAF board. I also contacted the office of the Auditor General, because the letter had been copied to the office of the Auditor General and the Auditor General's office is the office that does the audit on TRAF. So we had followed up with the allegations.

Mrs. Driedger: Well, Mr. Speaker, he certainly totally avoided answering that question. It is interesting the letter that Mr. Ulrich wrote and the concerns he wrote were sent back to the people he was raising concerns about. Mr. Ulrich also went on to say, and I quote, "It led me to wonder whether Bob's outspoken support of me and his questioning the advisability of some local investment proposals had affected his reappointment."

So I would like to ask the Minister of Education: Did he remove Bob Malazdrewich from the teachers' fund board because he spoke out against the $10-million pension money investment into the Manitoba Property Fund?

Mr. Bjornson: No, I did not.

Investment Practices

Mrs. Myrna Driedger (Charleswood): Bob Malazdrewich was replaced on the board by Lea Baturin, who was also on the Crocus board. As Crocus was pushing the Manitoba Property Fund, the NDP board appointee, Alfred Black, on TRAF, was pushing the Manitoba Property Fund on TRAF.

I would like to ask the Minister of Education: Was Lea Baturin put on the teachers' pension board to help Mr. Alfred Black push the Manitoba Property Fund on TRAF?

***** (14:20)

Hon. Peter Bjornson (Minister of Education, Citizenship and Youth): Mr. Speaker, that is not the case, and with respect to the Property Fund that the member has been talking about–

Some Honourable Members: Oh, oh.

Mr. Speaker: Order.

Mr. Bjornson: With respect to the Property Fund that the member is talking about, I have repeatedly told the member that this Property Fund has performed at or above the industry benchmarks for the rate of return. The member is also inaccurate in talking about the figure of $10 million, Mr. Speaker. TRAF has not invested $10 million in the Property Fund as the member has repeatedly put on the record.

I wish the member would do some research. There are three letters, Mr. Speaker–

Some Honourable Members: Oh, oh.

Mr. Speaker: Order.

Mr. Bjornson: Thank you, Mr. Speaker. I have provided the member opposite with three letters that I have tabled in this House from the stakeholders in TRAF that have said if the member has some concerns to contact the CEO, and she will get accurate information with regard to her concerns.

Child Welfare System
Case Reviews

Mrs. Mavis Taillieu (Morris): Mr. Speaker, the four authorities who deliver child welfare on their own initiative are conducting face-to-face interviews with all the children in care and those whose files were closed within 30 days.

Now, at the halfway mark of the review, can the Minister of Family Services say how many children are still to be accounted for, how many have had face-to-face meetings and how many children are not accounted for because their whereabouts are not known?

Hon. Christine Melnick (Minister of Family Services and Housing): Mr. Speaker, we worked with the four authorities to put together a plan for them to make sure that they were having face-to-face meetings with the children, that the front-line workers were meeting with the children. I think it is important to note that these people are professionals and that they know that it is very important to have these independent meetings.

I also think it is important for the House to know that in 1999-2000, there were some 440 front-line workers, social workers; in 2006-07, there are 553. Mr. Speaker, that is an increase of 112 front-line social workers, an increase of over 25 percent.

Mrs. Taillieu: Mr. Speaker, I am afraid that was not an answer to the question.

We have been told by front-line social workers that in past they have been directed to close files when they could not physically locate the child. Manitobans want to be assured that no more children slip through the cracks and die like Phoenix Sinclair, whose file was closed three months before she died.

Is the minister satisfied all children whose files were closed are not at risk? What directive has the minister given to account for children whose files were closed because they could not find the child?

Ms. Melnick: Again, Mr. Speaker, we are working with the four authorities. They have put together a work plan with their front-line workers. They have brought in extra staff to make sure that the deadlines can be met. They are meeting with children. They are working with families. They are professionals who are working on the front lines in some very difficult situations. I think it is important that this House support the work of the four authorities, that they support the work of the front-line workers and that we all work together in the best interests of the children of Manitoba.

Mrs. Taillieu: Well, Mr. Speaker, we certainly recognize the good work that social workers do, but we also recognize the minister places impossible time limits on social workers and this continues to put children at risk. The minister does not give answers to my questions either because she has no good news, has something to hide, or she just has not bothered to find out how many children are not accounted for.

What information has the minister received from the authorities to date? Will she make it public today, and will she promise to make public the authorities' findings once the 30-day review is finished on May 5?

Ms. Melnick: Mr. Speaker, the 30-day review was not something that was imposed. It is something that was agreed upon with the consensus of all four authorities. It was something that was agreed upon by myself with the four authorities. These people are working on the front lines. They are working with the children. They are working with the families.

Again, it is very important, rather than fearmonger and place doubt in the minds of all Manitobans around a very important service for very vulnerable families and children in this province, that we support the work of the front-line workers, that we support the work of the authorities and that, mostly, we support the work to take care of the vulnerable children of Manitoba.

Devils Lake Outlet
Filtration System–Negotiations

Mr. Stuart Murray (Leader of the Official Opposition): Mr. Speaker, yesterday, I challenged the Premier to describe what efforts he made to address the concerns related to the opening of the Devils Lake outlet. Although he indicated he had, indeed, spoken with the U.S. Council on Environmental Quality, the Premier refused to elaborate on what was discussed or whether an agreement would be reached in time. We are now six days away from the scheduled opening of the Devils Lake outlet, and the clock continues to run down.

We have heard today in the *Winnipeg Free Press*, Mr. Speaker, that the federal government, and I quote, has come to a meeting of the minds, end quote, on this issue.

Mr. Speaker, will the Premier please describe to this House whether his mind was at that meeting and what the outcome of the latest rounds of negotiations was?

Hon. Gary Doer (Premier): Well, Mr. Speaker, I will be speaking later with a federal minister who was at the meeting. Today, the CEQ secretary that reports to President Bush committed United States to the design which they have already completed and which they are consulting with Canada on and the filter construction which we think is a positive step. I will be discussing today with the federal minister the latest developments, and I provide to the House what I can in terms of what is available to be made public.

But what I said yesterday is very consistent. What I said last week was what was announced this morning. There still remain difficulties for Manitoba, as I have said before.

Mr. Murray: Well, thank you, Mr. Speaker. The Premier has so far refused to verify whether an actual risk to Lake Winnipeg exists from the release of water from Devils Lake. As we get closer and closer to the opening of the outlet, there remains a continuing lack of scientific data.

The Premier has claimed repeatedly that there were species in Devils Lake that were a threat to Lake Winnipeg. He has argued that there is scientific evidence to support this claim.

To quote directly from an interview that the Premier gave to the CBC, on August 8, 2005, and I quote the Premier: Twenty biologists have been on the lake for the last three weeks, and we have a lot of test results. However, these results, Mr. Speaker, have yet to have been tabled in the House.

Mr. Speaker, the only scientific information that was made available is a very limited survey of Devils Lake that was not the work of 20 biologists over three weeks. Nevertheless, the Premier maintained that the evidence was clear that there was a risk to Lake Winnipeg from Devils Lake.

Mr. Speaker, the limited study released by the government last fall called for further study on Devils Lake.

I ask the Premier: Has there been any further study conducted, and can he provide information in light of recent negotiations at the federal level?

Mr. Doer: Mr. Speaker, we just had the U.S. government confirm that they have designed and are going to construct a multimillion dollar filter. They are not doing it because they do not believe that there are any issues for Manitoba's water. They are doing it because we know from the tests–the good news was that 13–*[interjection]*

Mr. Speaker: Order.

Mr. Doer: I have read the report.

Some Honourable Members: Oh, oh.

Mr. Speaker: Order.

***** (14:30)

Mr. Doer: The fear we had about the unknowns on Devils Lake, because it was an isolated lake for 1,000 years, it had been stocked artificially by North Dakota from outside sources. The fear we had is alien species from the Missouri River may have gotten into Devils Lake. Those tests have concluded that 13 of the species that were most at risk for Lake Manitoba, invasive species which we are also concerned about with NAWS, why we went to court, and with the North Dakota state water act, those species do not exist in Devils Lake. What does exist there are parasites and some algae that are not specific to Lake Winnipeg.

Mr. Speaker, we feel, therefore, that a filter should be built; designed, which it has been; built, which has been committed to and implemented before the water flows.

Mr. Murray: Mr. Speaker, in light of what the Premier has just said, I would very simply ask him, because he knows that through all of the political rhetoric he has spun in Manitoba, with less than a week to go, that water scheduled to flow, and it will flow in thousands of cubic feet per second through the Devils Lake outlet. I would just ask this Premier: Can he stand today and ensure all Manitobans that no water will flow through the Devils Lake outlet on May 1 unless a filter is put in place? Will he ensure that not one drop of water will flow on May 1 unless a filter is put in place?

Mr. Doer: Mr. Speaker, the thousands of cfs, I really would caution the member opposite. I will get the exact number from last year's projections, but it is quite a bit less. Having said that–*[interjection]* No, it is just important to get the facts right.

Some Honourable Members: Oh, oh.

Mr. Speaker: Order.

Mr. Doer: Well, Mr. Speaker, I hear members talking about it. You know, when Governor Schafer was going to build an inlet from the Missouri River to Devils Lake, there was no agreement not to build that. Now, in Manitoba, for the first time ever, we have an agreement that there will be no inlet from the Missouri River to Devils Lake, something members opposite sat on for three years, including the member who was in Cabinet at the time.

Now having said that, Mr. Speaker, we believe the filter is very simple. We are glad the United States has agreed to design the filter, which they have done. We are glad they have agreed to pay for it, which they have done. We are glad they agreed to construct it, which they are going to do. We believe the construction and implementation of the filter should take place before the water flows. That is the position of the Prime Minister, that is the position of the Foreign Affairs Minister and that is the position of the Government of Manitoba.

Why can we not get the opposition on side? I know the Member for Emerson (Mr. Penner) does not believe that there is any risk in Devils Lake. He gave me a lot of flack for going to court on Devils Lake. He said that is the reason why the border was closing for cattle. Let us get some straight answers in this House, Mr. Speaker.

Clean Environment Commission Hog Production Sustainability Study

Hon. Jon Gerrard (River Heights): Mr. Speaker, my question is to the Premier. Yesterday, in response to my question, the Premier emphasized the integrity of the Clean Environment Commission in relationship to the Maple Leaf Foods review. The review the Premier referred to recommended that Manitoba Conservation oversee a study to examine the sustainability of hog production with a full report due by December 2005. It is now May 2006.

Why has this report not been completed? Indeed, has the study even been started?

Hon. Gary Doer (Premier): Well, there were a number of conditions that the Clean Environment Commission placed on the licensing of a second shift at Maple Leaf. One was a review of the Assiniboine River Watershed, not the whole province, just in terms of that recommendation. Secondly was a recommendation that the nutrient levels coming out of Maple Leaf would have to be of greater quality for water quality before a licence was granted.

The work on the Assiniboine River Watershed is completed. The Department of Conservation is releasing it, even though Maple Leaf is not proceeding with a second shift because, Mr. Speaker, the conditions of the licence for the increased improvement on water quality is not in place in the water treatment plant that was approved by members opposite. As a condition precedent of the second shift going forward, both the study and the nutrient levels have to be met. The study has been completed. The nutrient levels, the water treatment plant, is not in place. Therefore the licence, second shift is not approved by this government.

Mr. Gerrard: Mr. Speaker, we have not seen the report. We did not know that there were public hearings that we could present to. What kind of a behind-the-scenes effort was this?

My supplementary to the Premier: The issue here is the integrity of the Premier's government. The issue here is the commitment of the government to follow through on the Clean Environment Commission recommendations. The Clean Environment Commission said 2005. It did not say 2006. It did not say 2007. It did not say 2008. Where is this report? Why was it not ready in 2005? Why did the Premier fail to meet the commitment? Why did the Premier not act with integrity in following through with the Clean Environment Commission recommendations?

Mr. Doer: Well, Mr. Speaker, I need no lectures from the member opposite on integrity. We know he sat around the Cabinet table when the sponsorship scandal was developed in 1996 and '97.

Some Honourable Members: Oh, oh.

Mr. Speaker: Order.

Point of Order

Mr. Speaker: The honourable Member for River Heights, on a point of order?

Mr. Gerrard: Mr. Speaker, the issue here is the study on hogs in the province of Manitoba and the Assiniboine basin. It is not some thing that is going on in Ottawa some time ago. What is the matter with the Premier? Does he not understand what hogs are and the Assiniboine basin? Where is this study? Why is it not tabled?

Some Honourable Members: Oh, oh.

Mr. Speaker: Order. The honourable First Minister, on the same point of order?

Mr. Doer: Yes. Mr. Speaker, I would caution members to be holier than thou. When they are, they should be prepared for the rebuttal.

Some Honourable Members: Oh, oh.

Mr. Speaker: Order. The honourable Official Opposition House Leader, on the same point of order?

Mr. Leonard Derkach (Official Opposition House Leader): Well, on the same point of order, Mr. Speaker, the Member for River Heights did raise an issue. It is a serious issue. The issue has to do with a situation in Manitoba, and he is correct about that. He was seeking information from the Premier. Now, for the Premier to treat it so lightly and to give his flippant responses, even on a point of order, is not within the character of the First Minister of our province. I think he should be cautioned to answer a question that has been posed seriously.

Mr. Speaker: On the point of order raised by the honourable Member for River Heights, we do allow leaders' latitude, and the First Minister still has the floor.

* * *

Mr. Doer: Mr. Speaker, we have never in government, never, overturned a recommendation of the Clean Environment Commission. The second shift for Maple Leaf has not proceeded with even though, obviously, the economics of that, of a plant that is already built, are good for the government. But what we are not going to do is sacrifice the water quality recommendations of the Clean Environment Commission. We have stood on that recommendation for two years. The member opposite talks about public hearings. There were public hearings into the Maple Leaf licensing process. He should have been there.

***** (14:40)

Crocus Investment Fund Conflict of Interest

Mr. Kevin Lamoureux (Inkster): Mr. Speaker, when the wheels fell off the Crocus Fund back in December of 2004, within two weeks MLAs were sent a letter, and I will table a copy of that letter, suggesting how we really need to come together and support the Crocus Fund. Some would even suggest strong-armed. Who was the author of that letter? Well, no one else but the Premier's good buddies and friends, Mr. Alfred Black and Peter Olfert.

Here we have that special relationship that goes beyond just having a special relationship. We are also talking about–

Some Honourable Members: Oh, oh.

Mr. Speaker: Order.

Mr. Lamoureux: Mr. Speaker, we are not only talking about a special relationship to the Premier; these are individuals who contribute to the New Democratic Party.

I believe that this is a conflict of interest and my question to the Premier is: Can the Premier indicate how many of those board members and other people closely tied to the Crocus fiasco have donated to his political party, and what is the total amount–we know it is into the thousands, Mr. Speaker–in 2004? Will the Premier tell this House?

Hon. Gary Doer (Premier): Well, Mr. Speaker, I would point out that one of the individuals mentioned was appointed to the board of directors of Crocus by the previous government, not by our government. Secondly,–*[interjection]*

If I could please–

Some Honourable Members: Oh, oh.

Mr. Speaker: Order. The honourable First Minister has the floor.

Mr. Doer: We passed legislation, Mr. Speaker, that Mr. Harper is now passing, Prime Minister Harper, to allow the Auditor General to follow the money no matter where it goes. We passed that in 2001. I am glad Parliament, to clean up the Liberal mess, is passing similar legislation in 2006. I hope our federal party supports it.

Finally, Mr. Speaker, when the Auditor General was being potentially stopped by the same individuals mentioned by the member opposite, we backed up the Auditor General to follow the money wherever it was, including with the individuals mentioned by the members opposite.

Mr. Speaker: Order. Time for Oral Questions has expired.

Speaker's Ruling

Mr. Speaker: I have a ruling for the House.

Following Members' Statements on April 11, 2006, the honourable Official Opposition House Leader (Mr. Derkach) raised a point of order regarding the Standing Committee on Agriculture and Food and noted that the committee had not been called to transact business since May 9, 2001. He concluded his advice to the Chair by recommending that the Government House Leader (Mr. Mackintosh) be instructed to call a committee for the purpose of undertaking a review on the state of agriculture in the province, hear witnesses and travel throughout the province and report back to the House by December 1, 2006. The honourable Government House Leader, the honourable Member for Inkster (Mr. Lamoureux) and the honourable Member for Lakeside (Mr. Eichler) also offered advice to the Chair on the point of order. I took the matter under advisement in order to consult the procedural authorities.

I would note for the House that there is no requirement in our rules which dictates how often committees meet and that, by practice, the Government House Leader schedules meetings of standing committees often in consultation with other members such as House leaders or critics. Also, Speaker Rocan ruled in 1989, 1993 and 1994 that the opinion of the Speaker cannot be sought in the House about matters arising in committee and that it is not competent for the Speaker to exercise procedural control over committees.

After considering the submissions of members and also considering the advice of procedural authorities, I would rule that there is no point of order. What has been raised is an issue of negotiation and scheduling between the House leaders, which should not be raised as a point of order in the House. I would encourage the House leaders to discuss the issue, and if they so wish, take the appropriate steps after their negotiations.

MEMBERS' STATEMENTS

Pembina Trails Voices

Mrs. Myrna Driedger (Charleswood): Mr. Speaker, I rise today to pay tribute to the Pembina

Trails Voices, an internationally acclaimed choir from the Pembina Trails School Division.

Pembina Trails Voices returned recently from the Young Prague International Festival of Choirs. This international musical festival has made it its aim to help promising young artists who are starting their career in classical music, such as instrumentalists, choirs, conductors, as well as composers.

The festival this year was under the patronage of Ms. Anna Curdova, the Member of Parliament of the Czech Republic. The festival, now in its 12th year, brought talented young musicians and singers to the Czech capital from around the world from March 23 to 26.

Prague is a magical city, one of music, theatre, dance and opera. Many countries were represented at this spectacular event. There was a high level of competition, a parade through the city centre and joint performances of all festival musicians and singers on the beautiful Old Town Square.

The Pembina Trails Voices returned with gold and silver medals: the girls' choir directed by Ruth Wiwchar won a silver medal; the boys' choir directed by Michael Proudfoot won a gold medal; the mixed choir directed by Ruth Wiwchar won a silver medal; the best conductor performance was Ruth Wiwchar in the mixed choir category.

This was the experience of a lifetime for these young singers, and I would like to extend congratulations to the performers, conductors and volunteers of Pembina Trails Voices who worked so hard to make their participation in this event possible. Thank you, Mr. Speaker.

Holocaust Remembrance Day

Mr. Doug Martindale (Burrows): Mr. Speaker, April 25 is Yom Hashoah or Holocaust Remembrance Day. On this day, Manitobans join people all over the world to pause and remember the six million Jews who were put to death by Nazi Germany.

From their ascension to their dying days, Hitler's Nazis persecuted, murdered and attempted to annihilate Europe's Jews with an incomprehensible zeal and fervour. Over six million Jews lost their lives in the Holocaust. This day of remembrance marks this terrible event, an indelible stain on human history.

But it is also important on this day, Mr. Speaker, that we remember all the victims of fascism: Gypsies and Poles, Catholics and Communists, Slavs and the disabled, gays and lesbians, partisans and pacifists. These millions all died by the Nazis' hands. All had their lives cut brutally short.

The enormity of these numbers, their sheer size, must not blind us, however, to the individuals who all died their own death. By remembering the names of the millions and bearing witness to their constant humanity, each and every one of them can continue to live in us and through us still.

Today, there was a ceremony on the legislative grounds at the Holocaust monument marking the Day of Remembrance for Manitobans. This ceremony allows all Manitobans to join together in grieving the Jewish community's loss. It also serves as a reminder of the ever-present dangers of religious discrimination and racism and a call to staunchly confront these insidious elements wherever they lurk.

Devils Lake Outlet

Mr. Ralph Eichler (Lakeside): Mr. Speaker, this NDP government has indicated time and time again that there were serious environmental concerns with water flowing from Devils Lake. They have touted themselves as Manitoba's protectors, but now the Premier (Mr. Doer) is saying that it is the responsibility of the federal government. This NDP government has passed the buck to Ottawa and Washington.

Where is this Premier's conviction and his promises to fight for Manitoba now? Where is the update through scientific evidence to back up his claims? If Manitoba's waterways, including Lake Winnipeg, are truly under threat, then this Premier should have ensured that an effective filtration was in place.

The Premier has admitted that this so-called signed agreement did not exist. With the May 1 deadline fast approaching to open the Devils Lake outlet, why has this NDP government not reached out to the state of North Dakota to build a partnership to find real and timely solutions?

Instead of working for a solution, this NDP government exposed our province to lawsuits. Mr. Speaker, the Premier's mistrust, accusation and misleading ways are serious injustices against our province. The Premier should apologize to Manitobans for misleading them as to the existence of a signed agreement potentially exposing an already flooded southern Manitoba to more water.

Wanda Koop

Mr. Rob Altemeyer (Wolseley): Mr. Speaker, I am pleased to announce that Wanda Koop, famous artist and long-time resident of the Wolseley constituency, was recently awarded the Order of Canada.

***** (14:50)

Wanda Koop is a very deserving recipient of our nation's highest honour for lifetime achievement. She is an internationally renowned artist whose work spans three decades. She is a visual artist who works primarily in paint and video, and her art often depicts scenes of urbanization, industrialization and war. Her work challenges us to reflect upon powerful ubiquitous cultural images that confront us daily through broadcast media. Her work has been featured in over 50 solo showings in locations around the world.

Mr. Speaker, Wanda Koop is also a very deserving recipient of this honour for the work she has done in the West Broadway area. She is the founder of Art City, a storefront art centre on Broadway that provides inner city youth with a safe environment to have fun and express themselves creatively.

Art City has had a tremendously positive impact on the community. It has beautified buildings through murals and turned empty storefront windows into colourful displays and art installations. Art City also now has two annual events which are at the heart of West Broadway during the summer parade and also during their annual Halloween Howl and Haunted House. Art City has changed the lives of many neighbourhood youth who have developed new skills and confidence there, and we have Wanda, above all else, to thank for it.

Mr. Speaker, on behalf of all members, I congratulate Wanda Koop on an outstanding career as an artist and a citizen. I look forward to seeing her receive this deserved honour from Governor General Michaëlle Jean at a ceremony later this year. Thank you very much.

Devils Lake Outlet

Mr. Jack Penner (Emerson): Mr. Speaker, the Premier (Mr. Doer) has stated repeatedly that there was a signed agreement between Canada and the United States to have a filter installed to protect Manitoba waterways from biota in water from Devils Lake. We now know that there is no such signed agreement.

The Premier has stated that there were 20 scientists on, in and under the lake for 20 days, 24 hours a day, studying the water for harmful organisms, biota and fish species. We now know that there were only two Manitoba people on one boat for the better part of three days in North Dakota on Devils Lake.

Findings in the report from the Department of Water Stewardship state that, and I quote: "None of the targeted 12 known species of concern were found in this survey of Devils Lake." Despite this, the Premier has repeatedly stated that Manitoba waters and fisheries would be threatened by the water from Devils Lake.

Mr. Speaker, it would appear that there have been mixed messages and misdirection coming from the Premier about Devils Lake. I would suggest that the Premier is so convinced that the water from Devils Lake would cause severe harm to lakes and fisheries in Manitoba, he should go to North Dakota, sit down with the governor and offer to build a filter immediately and determine who would pay for it later to ensure our lakes and waterways would be protected from Devils Lake water flows into Manitoba again.

We are serious about protecting the fish, the fishery in Lake Manitoba. We are serious about protecting the waterways in Manitoba, and if what the Premier has been telling Manitobans is true, then, Mr. Speaker, it is imperative that the Premier go to North Dakota now and enter into an agreement to build a filter.

MATTER OF URGENT PUBLIC IMPORTANCE

Mr. Stuart Murray (Leader of the Official Opposition): Mr. Speaker, in accordance with Rule 36(1), I move, seconded by the Member for Emerson (Mr. Penner), that the regular scheduled business of the House be set aside to discuss a matter of urgent public importance, namely the issue of the Devils Lake outlet, set to open on May 1, 2006, and this Premier's ongoing fearmongering over the presumed risk that the water from Devils Lake possesses to Lake Winnipeg ecosystems and the Province's multimillion-dollar fishery, and his assertion that an agreement existed at the federal level to construct an advanced filtration system, an agreement that has been proven fictitious, additionally the Premier's comments of yesterday when he indicated that the United States government was working with the

Canadian federal government on a proposal to install a permanent filter at Devils Lake.

Mr. Speaker: Order. Before recognizing the honourable Leader of the Official Opposition, I believe I should remind all members that under Rule 36(2), the mover of a motion on a matter of urgent public importance and one member from the other parties in the House are allowed not more than 10 minutes to explain the urgency of debating the matter immediately.

As stated in *Beauchesne's* Citation 390, "urgency" in this context means the urgency of immediate debate, not of the subject matter of the motion. In their remarks members should focus exclusively on whether or not there is urgency of debate and whether or not the ordinary opportunities for debate will enable the House to consider the matter early enough to ensure that the public interests will not suffer.

Mr. Murray: Mr. Speaker, I thank you for reminding me of those requirements because this is a very important issue facing all of Manitobans.

Mr. Speaker, there are two conditions that must be satisfied for this matter to proceed. The first requirement was to file this motion with the Speaker's office at least 90 minutes prior to Routine Proceedings. I believe that that requirement has been made. The second condition is that the matter is an urgent nature.

Mr. Speaker, the Devils Lake outlet is set to begin releasing thousands of cubic feet per second of water that will then make its way into the Red River and Lake Winnipeg. The outlet will be opened on May 1, 2006, which is six days from now. To date there has been no effort to construct an advanced filtration system to protect Lake Winnipeg from potentially invasive species entering Manitoba's waterways, jeopardizing the health of the lake's indigenous species. Limited scientific study of Devils Lake has proven inconclusive in establishing whether there is actual risk to Lake Winnipeg that exists in terms of foreign biota.

However, the Premier (Mr. Doer) and his ministers continue to maintain that there is a risk. To quote the Premier directly from a March 24, 2000, news release, Manitoba's water resources, and I quote: "could be jeopardized if foreign life forms and other harmful substances that we know are in Devils Lake are transferred" to the Red River system.

Mr. Speaker, how can the Premier be so certain that there is a risk to Lake Winnipeg's ecosystem, when in-depth research into the biota of Devils Lake has not taken place? The Premier has argued for months now that, unless a filtration system is installed in the Devils Lake outlet, the water should not flow. Well, the outlet is scheduled to open in six days, regardless of what this Premier's assertions are. He has long argued that it was the federal government's responsibility to ensure the filter was put in place and that his government was not to blame for the fact that the outlet would be opened with or without a filter.

On April 18, 2006, the Premier stood up in this very House and stated that, and I quote the Premier: The document that was signed was signed between Canada and the United States last summer. That is August 2005.

Prior to that on April 13, 2006, the Premier assured this House that he would "get a copy of the agreement," and that "it was released to the public."

Well, Mr. Speaker, the Premier did not provide a copy of that agreement, because the only physical documentation that exists regarding this agreement was a press release, a press release that was issued by the federal government signifying its willingness to work with the United States on determining the need for a filter, and that they would be interested in co-operating on its construction.

Mr. Speaker, after generating public fear and anxiety over the supposed existence of harmful organisms in Devils Lake, the Premier pinned all of his hopes and all of Manitoba's hopes on a federal agreement to build a filter to protect this province. Well, that agreement has proven to be nothing more than the actual press release, unsigned, and not legally binding.

***** (15:00)

When I spoke with the U.S. Consul to Manitoba, Mr. Todd Schwartz, about the existence of this so-called alleged agreement that this Premier talked about, the U.S. Consul specifically stated that there was no signed agreement that he was aware of. The Premier had no choice but to acknowledge this fact.

Mr. Speaker, to recap, we now have claims by this NDP government that there are potentially invasive species that pose a risk to the health of Lake Winnipeg based only on an extremely limited scientific study. Nevertheless, they have argued that the only way to protect our lake is with the construction of a filtration system in the Devils Lake outlet.

Rather than negotiate its construction, this NDP government has chosen to rely on a non-existent federal government agreement to build. With six days left, until this outlet is set to open, there is yet no filter and Manitobans are left to wait and to worry. In the eleventh hour of this situation, the Premier is still looking to assure all Manitobans that he is continuing lobbying for a resolution to this issue.

When pressed for details in this House, the Premier continues to defer to the U.S. Council on Environmental Quality, the American organization in charge of dealing with the Devils Lake outlet. To date, the CEQ has offered nothing to reassure Manitobans that the Devils Lake water is safe.

Mr. Speaker, time is running out. It is crucial that the concerns of Manitobans be addressed on this issue. The Premier has indicated that Manitoba should stand by as negotiations continue. However, they need to know what the Premier is doing to address the concerns he himself has generated. We need to know that and we need to know that today. We, the people of Manitoba, are not content to rely on NDP press releases stating the government's level of concern. We must have results.

If the water starts to flow on May 1, then it is too late to do the proper work to be done in resolving this matter. I, therefore, argue in favour of proceeding with this MUPI today so that the duly elected representatives of the people of Manitoba, all of us in this Chamber who have serious concerns about what is going to happen on May 1, may be fully established on what course of action is to be taken on this very urgent matter. Thank you, Mr. Speaker.

Hon. Steve Ashton (Minister of Water Stewardship): Mr. Speaker, well, let us start with one very clear and evident fact. Members opposite, if they are so concerned about Devils Lake, if they are so concerned with the fact that we have right now the fifth greatest flood of the century, the fifth most significant, if they are concerned about any of the important issues of the day, they can debate them in about 10 minutes or so by allowing us to get into Orders of the Day and discuss the budget, in which case each and every member of the Legislature will get an opportunity to speak, not for 10 minutes but for 30 minutes. That is the first point I want to make.

The second point I want to make, Mr. Speaker, is this opposition has shown the lowest level of petty partisanship you could ever imagine on as significant an issue as Devils Lake. Let us not only go from the comments made by the Member for Emerson (Mr. Penner), who, at various different times, has said there is no problem with the water, that the filtration is not needed or that there is a problem and we do need the filtration but Manitoba should build it, or that we should build it and collect it back from the various different levels of government. Well, I do not know from day to day whose side the Member for Emerson is on, but it sure is not Manitoba's.

I want to go one step further because– *[interjection]*

An Honourable Member: Mr. Speaker, on a point of order.

Mr. Speaker: Order.

Point of Order

Mr. Speaker: The honourable Member for Emerson, on a point of order?

Mr. Jack Penner (Emerson): Mr. Speaker, on a point of order. The minister just put on the record that I had indicated I was in favour of allowing Devils Lake waters to flow to the Sheyenne River and to the Red River, and, in other words, Lake Winnipeg, without it being treated. I have never said that. What I have said is, constantly, that if we can believe what the Premier (Mr. Doer) has been telling the people of Manitoba that there was a signed agreement and that there was danger of that water to our waters, then we wanted this government to take action and build a filter. That is what I have said.

Mr. Speaker: Order. I remind members that points of order are supposed to be raised to point out to the Speaker a breach of the rule of the House. Points of order should never be used for means of debate.

The honourable Member for Emerson does not have a point of order. It is a dispute over the facts.

* * *

Mr. Speaker: The honourable Minister of Water Stewardship has the floor.

Mr. Ashton: Thank you, Mr. Speaker. You know, all throughout this and shown again today by the Leader of the Opposition (Mr. Murray), there is a clear indication of just how little members opposite are concerned about any issues related to the environment. I know that the Member for Emerson has stated on the public record that water in Manitoba is in better shape today than it was 30 years ago. He is about the only person in the province that believes that, a charter member I am sure of the Flat Earth Society, which, I am sure, has membership in all the members opposite.

But, Mr. Speaker, what I think is appalling is the degree to which this member and the Leader of the Opposition understand nothing about issues related to foreign biota. I tell you, Joe Belford is a person I respect. He is from Devils Lake in North Dakota. I expect him to be making the kind of arguments that I have heard him make over the last number of years. But I expect better from the Leader of the Opposition and the Water Stewardship critic who do not understand that the No. 1 issue with foreign biota is that if there is any chance of a transfer of foreign biota, you have to be concerned. What you do is you have a proper environmental assessment and you have mitigation. That is why we went and argued that it should be referred to the IJC. I point out the members opposite, at that time, claimed to support going to the IJC.

Mr. Speaker: Order. I remind members that this is the point in time where trying to convince the Speaker of their urgency of dealing with this matter. This is not the time to be getting into debate.

Mr. Ashton: Mr. Speaker, what they do, take for example the survey work that was done last year, and they belittled it. It came out of an agreement of about 20 scientists from all the jurisdictions, and it was put on the record. It was released as public information, a report. It was tabled in this House. It has been on the Web site since October. There are four algae species and three fish parasites that are not known to be in Lake Winnipeg, a number of which had not been previously identified. The basic principle when it comes to foreign biota is that you err on the side of protection.

I would expect the members opposite, if they cared about Manitoba, not to be undercutting the evidence that is clearly there, accepted by this province, the State of Minnesota, the Government of Canada and the CEQ.

You know, Mr. Speaker, what a bunch. I realize they have a leadership convention up this weekend. I am surprised they have anybody willing to lead that group over there. Their latest is to attack the CEQ. They call it an organization. It is the Commission on Environmental Quality. It is the White House. It is George W. Bush. It is the federal U.S. government that is committing to the filtration for Devils Lake.

Mr. Speaker: Order.

Point of Order

Mr. Speaker: The honourable Official Opposition House Leader, on a point of order?

Mr. Leonard Derkach (Official Opposition House Leader): Yes, thank you, Mr. Speaker, on a point of order.

Mr. Speaker, the Leader of the Opposition (Mr. Murray) rose in his place today and argued for a matter of urgent public importance to be debated in the House. In doing that, there is going to be a response from the government. I would expect that they would want to argue either in favour of the matter of urgent public importance to proceed or argue why it should not be proceeded with.

***** (15:10)

The Minister of Water Stewardship has embroiled himself in the debate. Now, I am assuming that the debate must be going ahead because the Minister of Water Stewardship is now into the body of a debate.

So, Mr. Speaker, if that is the case, then I say let us proceed, and the speaking order then should be one party to another. But, if we have agreed already and we are proceeding with the debate on this matter, I am encouraged by it.

Mr. Speaker: On the point of order raised by the honourable Official Opposition House Leader, he does have a point of order because our rules are very clear at this point in time. I do allow a certain amount of leeway, but our rules are very clear that this is the time to convince the Speaker that there is an urgency to debate this matter immediately.

So the honourable member does have a point of order.

* * *

Mr. Ashton: Indeed, I apologize, Mr. Speaker, if I was responding to the Leader of the Opposition.

But I do want to make the point that on a day in which the CEQ has made a clear commitment, Mr. Speaker, the head of the CEQ in a press conference with Rona Ambrose, Minister of the Environment– who, by the way, commended not only the Prime Minister and the President of the U.S. but also the Premier of Manitoba for the efforts to get to the point of having the filtration–I would expect the Leader of the Opposition, the Water Stewardship critic, all members on that side of the House to be saying let us have a united stand. Instead, they want to move and suggest we have a debate, to what? To divide this province more.

I say no, Mr. Speaker. If they want to debate this issue, they can do this on the budget. But I would suggest one thing, and I should maybe be generous to the Leader of the Opposition who will soon be retired from the most difficult job in Manitoba. It is not actually being the Leader of the Opposition; it is being Leader of the Conservative Party.

You know, Mr. Speaker, after I see what has happened on issues like Devils Lake, I can understand why the Leader of the Opposition is smiling, because, quite frankly, you are faced with issues like this and you have a caucus and a party that is out of touch with the year 2006, that does not get that when you have had a commitment from the U.S. federal government, you do not belittle that; you say that it is good.

But let us get that filtration in place before the water flows. Let us have a united front. If I could, I want to suggest, Mr. Speaker, you have two choices. You play the kind of petty politics we are seeing again on this proposed matter of urgent public importance, or you stand up for Manitoba. The NDP, in fact, 99 percent of Manitobans are prepared to stand up for Manitoba. Which side are the Tories on?

Mr. Speaker: The honourable Member for River Heights, if he is up to speak to this matter of urgent public importance, would require leave.

Hon. Jon Gerrard (River Heights): I would ask for leave to speak to this matter of urgent public importance.

Mr. Speaker: Does the honourable member have leave?

Some Honourable Members: Leave.

Mr. Speaker: Yes, leave has been granted.

Mr. Gerrard: Thank you, Mr. Speaker. We have had a debate back and forth, it would appear, over whether our waters are cleaner now than they were 30 years ago or not. Although the Member for Emerson (Mr. Penner) may be right that there are a few streams or lakes that may be cleaner, most of them have, in fact, had more problems. That is particularly true of Lake Winnipeg where the levels of phosphorus are higher. The problems with algae are higher. The problems at our beaches are worse in terms of people going out and swimming because of the E. coli levels.

The fact of the matter is that it is worse now than it was 30 years ago which is a reflection of the fact that the Conservative and NDP governments which have been in power over the last 30 years have not done their job properly.

What we need to be debating is the situation with Devils Lake. That is my understanding of what the Leader of the Opposition (Mr. Murray) was putting forward. It was emphasizing the need to have a debate on Devils Lake.

Clearly, Mr. Speaker, this is timely because the deadline is May 1, as we understand it now, for the water to flow. From what I hear we are in agreement in this House that the water should not flow until the filter is there. So it would be important that we have this discussion. I would suggest that since there seems to be unanimity here among all parties of the importance of not having the water flow until the filter is there that there is an opportunity to build consensus and go forward with the debate which will emphasize what is critically needed. That is that the water should not flow until the filter is in place and has been tested and shown to be working. That is what we need.

We can talk about all the problems, all the way along the way from where we are now. I know that a number of years ago there was an opportunity to have this go to the IJC which the government turned down. But we are now where we are and we have to deal with this situation. There is an opportunity to get everybody here in the Legislature on the same page, and that same page being that the water should not flow out of Devils Lake until the filter is in place and has been properly tested to know that it is working.

That is our position on the Liberal Party. That is the position that we would like to advance together with the other members of the Legislature as part of this effort. So that, Mr. Speaker, is why we need this debate today. Thank you.

Mr. Speaker: Order. I thank the honourable members for their advice to the Chair on whether the motion proposed by the honourable Leader of the Official Opposition should be debated today. The notice required by Rule 36(1) was provided under our rules and practices. The subject matter requiring urgent consideration must be so pressing that the public interest will suffer if the matter is not given immediate attention. There must also be no other reasonable opportunities to raise the matter.

I do not doubt that this matter is one that is of serious concern to members as water is an essential resource, and clean and safe water is important to all of us. I have listened very carefully to the arguments put forward. However, I was not persuaded that the ordinary business of the House should be set aside to deal with this issue today.

Additionally, I would like to note that there are other avenues for members to raise this issue including questions in Question Period, raising the item under Members' Statements, and raising the issue during budget debate.

Therefore, with the greatest of respect, I rule the motion out of order as a matter of urgent public importance.

Mr. Derkach: Mr. Speaker, with the greatest of respect, I am disagreeing with you. But you are telling me I cannot challenge the ruling, is that correct?

Mr. Speaker: Order. Our Manitoba rules state that matters of urgent public importance, the decision of the Speaker is final. There is no challenge to the rulings.

Point of Order

Mr. Speaker: The honourable Official Opposition House Leader, on a point of order or a matter of privilege?

Mr. Derkach: On a point of order, Mr. Speaker.

Mr. Speaker: On a point of order.

Mr. Derkach: Mr. Speaker, it is a sad day because we are six days from the water flowing from Devils Lake into Manitoba. It is sad that the government does not want to allow debate on this very important matter.

***** (15:20)

But, Mr. Speaker, I have another point of order. This point of order has to do with a very simple matter, but one that is fairly serious. When the House rose on December 8, the Hansard number was 27A and B. When the House returned on March 6, the Hansard number was 32. The issue for me is how did that happen. *[interjection]* Well, the Minister of Energy, Science and Technology (Mr. Chomiak) says it was the Julian calendar.

Maybe it was, but, Mr. Speaker, I just simply do not have an answer for it, and so therefore I raise this issue as a point of order because I would like to know whether we have lost five days or whether in fact I misunderstand the way that Hansard is numbered.

I raise this as a point of order, so perhaps you, as Mr. Speaker, may want to take this under advisement and come back with a clarification for my purposes, or perhaps we can get to the bottom of it in some way, shape or form. I thank you for that.

Mr. Speaker: For the explanation for the honourable member, the reason that you have noticed a difference in days is because there were some intersessional committee meetings, and the agreement of the House at that time was that the intersessional committee meetings would be included as sitting days of the House. That was agreed to by all parties, and that is why you noticed the difference of that day to when you came back.

Mr. Derkach: I thank the Speaker for that information, and I just wanted to confirm that there were in fact five sitting days of intersessional committees between December 8 and March 6. If that is the case, I accept that as an explanation.

Mr. Speaker, I have another point of order. *[interjection]* Yes, that is not a problem. I do not want to belabour it.

Mr. Speaker: If the honourable official opposition would not mind, I can get those dates for you and bring the information back to the House, so that way we can move ahead.

*** * ***

You had indicated you had a new point of order?

An Honourable Member: Yes, I did.

Mr. Speaker: The honourable Official Opposition House Leader, on a new point of order.

Mr. Derkach: Mr. Speaker, I appreciate the fact that this information will be forthcoming and there is no rush for it at all, but before I start on my point of order, I do want to make a comment regarding your announcement today with respect to the Speaker of Nunavut if I may take a minute.

Mr. Speaker, on behalf of our party, I do extend our heartfelt sympathies to the people of Nunavut in losing the Speaker of their Legislature. I met Jobie Nutarak when I was with you in Nunavut, and I also met him on one previous occasion when we were still in government at a time when we visited Nunavut just at the time Nunavut received its own government.

What struck me about Jobie was that he was a very kind and gentle-hearted person and, Mr. Speaker, after speaking to him for a little while, his very calm nature and his very kind demeanour left one with a very positive and a very warm impression of this individual. I know that the people of Nunavut will miss this individual because he indeed was one who attracted people to himself because of his nature.

Mr. Speaker, if I just could conclude, not only from myself personally but indeed from members of this side of the House, we extend our heartfelt sympathies to his family and to the government of Nunavut and all of the people in the territory of Nunavut.

Mr. Speaker: I thank the honourable member very much for that comment, and I will ensure that the comment will appear in Hansard. I will send it up to the Legislature so they can share it with the people of the territory.

Point of Order

Mr. Speaker: The honourable Official Opposition House Leader, on a point of order.

Mr. Derkach: Yes, Mr. Speaker, I am on a point of order now with regard to comments made by the Government House Leader (Mr. Mackintosh) in Saturday's *Winnipeg Free Press* column. The Government House Leader said, and I quote: "There is a sessional order . . . that is now in peril."

Mr. Speaker, this is a serious question because what is happening now is the House Leader went on to say: "There is now a serious question as to what the Speaker will do on June 13" with regard to the budget votes.

Well, Mr. Speaker, the reason this is a serious issue is because it now is reflecting upon the Speaker. If we go to *Beauchesne*, 6th Edition, section 71(1), where it states very clearly, and I will quote from *Beauchesne*, that "the Speaker should be protected against reflections on his or her actions." Secondly–this is on page 21, Citation 71(1): "The Speaker should be protected against reflections on his or her actions."

Mr. Speaker, our rules, Rule 41 states: "Questions not to be revived or anticipated. No member shall revive a debate already concluded during the session or anticipate a matter appointed for consideration of which notice has been given."

Mr. Speaker, the House made a decision concerning the proceedings of the session on June 9, 2005, as found on pages 373 to 375 of *Journals*. The Government House Leader is now indicating that somehow the House order is in peril, or is anticipating that you will be taking some action concerning this matter. If that is the case, we on this side of the House would like to know what the government has in mind concerning the House order. If the Government House Leader is so willing to speak to the media about this, and others outside of the House, he should have the courage to rise in his place to speak on the matter or have the courage to call me, as the Opposition House Leader, to see who we would like to see as leading the commission of inquiry related to Crocus so then we can get on with the business of the House.

So he has some choices to make, Mr. Speaker. But he has chosen not to do this. Instead, he is trying or attempting to reflect on your responsibilities as they relate to an order that was passed in this House. Now, the order, as it was passed in this House, was very clear. The order stated that, regardless of what happens with regard to debate, if the criteria that were set out in the order are proceeded with, then the Speaker has no choice but to call for a vote on the budgetary bills, and they are listed in the order. The Speaker will, it says on June 12 and 13, deal with these matters in an appropriate way, which means he will call a vote on them. It is spelled out in the order.

In my view, Mr. Speaker, the Government House Leader has erred in his comments in the paper. He has again, like his leader, like the Premier (Mr. Doer), misled Manitobans to believing that somehow the budget will not pass on the 13th of June, which is not the case. Our hands are tied, whether we are in opposition or in government, with regard to what happens on June 12 and 13, because the order spells it out very clearly. Unless the government chooses not to vote for its own budget, I can see no other action but that the budget will pass because you, as Mr. Speaker, have no choice but to call those supply motions, those motions that have been identified through the order on the 12th and 13th of June.

Now, Mr. Speaker, with regard to the legislation, there are some deadlines that have to be met. We have passed one of those deadlines. We are approaching another deadline. Then there is as yet a third deadline that has to be met prior to June 12 and 13.

***** (15:30)

It is up to the government to conduct the business of the House. They can do it in several ways. The opposition have drawn a line in the sand. The opposition in this House have said that the Premier has to call a public inquiry because, otherwise, we will continue not to debate the budget. If you listen to the media, the media have called upon the government to call a public inquiry. They have not relented from that position, Mr. Speaker. Just this morning, Mr. Speaker, on CJOB, it was very clear that we are on the right track, that the government needs to call a public inquiry.

Mr. Speaker, if we look at the *Free Press* editorial of just a day or two ago, it was very clear that the government has a responsibility to be accountable to Manitobans and call a public inquiry. That is what we are demanding of the government. Let there be no mistake; let there be no mistake. It is a public inquiry that we and the Liberal Party are calling for. It is very clear, unmistakable.

Mr. Speaker, if the government calls the public inquiry, we will get on with the business of the people, the business of the House. The government can then start the process of going into Estimates, calling bills, and the normal processes of this House can take place. But, without calling the public inquiry, I am afraid the government finds itself in a pickle, and that pickle is this: the deadlines are approaching; there are some pieces of legislations that could be in peril. It is at the hands now of the opposition, I think, that we will–

An Honourable Member: Wear it.

Mr. Derkach: Yes, we will wear it, Mr. Speaker. As a matter of fact, we will trumpet it. What we will trumpet is the fact that this government has not got the courage to call a public inquiry because it is culpable, because it has implicated itself in the whole scandal. This, to Manitoba, is like Gomery is to Canada. On a per capita basis, it is probably even worse.

Now, Mr. Speaker, Manitobans, whether they live in Thompson, in Russell, in Binscarth, in Winnipeg, in Brandon, in Winkler, wherever, are calling for a public inquiry. How long will the government resist?

Now, I say, Mr. Speaker, the Government House Leader (Mr. Mackintosh) erred. He said that the order is in peril. I think he needs to retract that statement or he needs to correct it, because the order is not in peril. The order of the House stands, simple as that. It was passed. Unless the Government House Leader needs to have an explanation given to him about what he signed, I see no other way, unless there is unanimous consent in the House, that the order will be proceeded with.

Now, I look at my colleagues in the Liberal Party, and I do not think they are about to try to renege on the order. Certainly, the opposition is not about to renege on the order. Now, I do not know whether the government wants to renege. By the looks of it, they would like to renege on the order. Then, of course, by virtue of reneging on the order, they would simply blame the opposition for not being able to do anything in the House. Oh my goodness. Have you ever seen a situation where a government has a majority of 15 members–

Mr. Speaker: Order. We are getting into debate here. I would like to remind the honourable member that when up on a point of order, it is to advise the Chair of a breach of a rule or a departure of Manitoba practice.

Mr. Derkach: Thank you, Mr. Speaker, and this is a breach of a rule that is quite clearly stated in *Beauchesne's*, Edition No. 6, Citation 71(1), where in fact it states that "the Speaker should be protected against reflections on his or her actions."

Well, the action here,–and I apologize for taking a little bit of latitude there, but I thought I was allowed some, given the speech we had from the Minister of Water Stewardship (Mr. Ashton). But, nevertheless, on this citation it says the Speaker should be protected against reflections, and clearly, the Government House Leader's comments were a reflection of a ruling, an action of the House, and you as Mr. Speaker, because the House Leader said, and I quote: "There is a sessional order . . . that is now in peril." Now how could that be, Mr. Speaker? How could that be? Is the government somehow going to use its majority to try and persuade you as Mr. Speaker and us as a Legislature, that we should change the order. Well, it can do that, but I do not see how the order itself is now in peril. It is not in peril. The order will be proceeded with.

Mr. Speaker, we have talked to the media about the order as well. It is clear. So, when the House Leader of the government says that the order is in peril, he is clearly mistaken. So I think that the House Leader needs to correct the record, needs to apologize for misleading Manitobans and misleading this Chamber, and, more importantly, he has an obligation to apologize to you for reflecting on you as the Speaker of this Chamber who has taken an action on behalf of the Chamber and accepted the order that was agreed to by the government and by the opposition, along with the Liberal Party. That is an order, in my view, that is solid and cannot be tampered with. Thank you.

Hon. Dave Chomiak (Minister of Energy, Science and Technology): Mr. Speaker, as has been a pattern in this House ever since the opposition began its campaign of stalling the Legislature and failing to deal with the day-to-day business, either because of a leadership convention, because of internal issues or whatever issues are on the table of members opposite, they are failing to deal with the day-to-day business of the Legislature.

Because an article appeared in one of the newspapers being critical of the opposition for wasting the time of the Legislature and costing the people of Manitoba resources and because the House Leader made a comment outside of the House in reflection to questions regarding the obstinacy of the members opposite, the fact that members opposite are coming here every day raising points of order, challenging every one of your rulings, Mr. Speaker, every one of your rulings on a daily basis, because members opposite are in that kind of a situation, they are now seeing that they have to try to wiggle their way out, wiggle their way out of the jam that they have gotten themselves into by virtue of raising frivolous points of order that are not even (a) points of order, (b) on the record.

Mr. Speaker, we have before this House a budget that sets the spending of the Province of Manitoba over the next year, and members opposite are either afraid or unwilling to debate the budget. Day after day they ring the bells rather than have the courage to debate the budget. Now, I know that members opposite are involved in events perhaps somewhat removed from activities in the day-to-day Chamber. Maybe there are various campaigns going on. Maybe people are out visiting various groups and individuals. That is possible. I do not know, but I know what happens in here every day. We come in here wanting to pass the budget and pass legislation that is important to the people of Manitoba, and members opposite ring the bells consistently, raise points of order, rebut every single one of your rulings.

There have been more actions with respect to not just appealing the ruling of the Chair but the order that deals with personal–*[interjection]* Matters of privilege. There have been more matters of privilege in this session than I recall during my entire career in opposition. That is from 1990 to 1999. There have been more privileges by members opposite in this session than we raised during those entire nine years. What does that tell you, Mr. Speaker? That tells you there is a little bit of difficulty with members opposite. They are afraid or unwilling to debate the budget and all of the bills that are on the Order Paper, that we have put on the Order Paper for the benefit of Manitobans, which include matters dealing with crystal meth, which include matters dealing with health, which include matters dealing with natural resources.

Mr. Speaker, it is very simple for members opposite. They need a way out. We are offering them a way out. The way out is to debate the budget, debate the bills, get on to doing what the people of Manitoba have sent us here to do, not ring the bell hour after hour after hour in an attempt to–in contravention of what we are elected to do, and that is to make the laws of the Province of Manitoba, debate the laws of the Province of Manitoba, and, most importantly, let the public have a say in the bills that are before this Chamber.

***** (15:40)

Their actions disallow the public from having an opportunity to have a say in what we are debating in this Legislature, and the record will show, and history will show, the consequences of the actions taken by members opposite, just as history has shown that the consequences of members opposite in ramming through the MTS bill have rained upon them and have ramifications upon them to this very day in terms of their credibility amongst the general public of Manitoba.

The public remembers, Mr. Speaker. The public knows what is going on. They know what members opposite are doing, and I suggest to members opposite that we get on with debating the budget and the bills that are important for the people of Manitoba.

Mr. Speaker: Is the honourable Member for Inkster (Mr. Lamoureux) rising to give the Speaker some procedural advice on this point of order?

Mr. Kevin Lamoureux (Inkster): Yes, Mr. Speaker, in addition to that to respond–

Mr. Speaker: Okay, the honourable Member for Inkster.

Mr. Lamoureux: Yes, Mr. Speaker. But, of course, and I listened very patiently, as you did, as the government representative tried to give us a lesson on a number of things. One of the things that I thought was most interesting is he was talking about a way out, and there is a way out of this situation that we currently have. You have had both oppositions in a very strong way encourage the government to use that way. You have had independent media outlets encourage this government to do what is right. You have had Crocus shareholders, individual Manitobans, even former NDP Premier Ed Schreyer tell this government to do, or show them the way out, and the way out, of course, is to call for a public inquiry regarding the Crocus fiasco.

Mr. Speaker, if we look at *Beauchesne's* as the Opposition House Leader (Mr. Derkach) has so eloquently pointed out, *Beauchesne's* 71, I think that there is merit for us to deal with what the government–and it is the Government House Leader (Mr. Mackintosh) that we are talking about, who is putting not only, I would argue, you, but he is also reflecting on all members inside this Chamber, and I am concerned that there is indeed a serious attempt by this government to put a political spin around this whole budget and possibly some legislation in terms of not being able to pass.

Mr. Speaker, the Member for Russell (Mr. Derkach) points out about an agreement, and the government is fully aware of that agreement. Yes, there are some decisions that do need to be made, but I would like to read in particular one portion of that agreement where it states, and I do this so that the Member for Kildonan (Mr. Chomiak) and other government members would be familiar with what that agreement actually states, and it is item 7:

"By the usual adjournment hour on Monday, June 12, 2006, the business of supply for the 2006-07 fiscal year must be concluded as follows: (a) by 4:00 p.m. on that day (i) the consideration of departmental estimates in the Committee of Supply must be concluded, and (ii) both the concurrence motion in the Committee of Supply and the concurrence motion in the House must be put; and (b) by the usual adjournment hour on that day, all stages for the passage (including all related motions and all three readings) of the following bills must be completed: The Appropriation Act, 2006, The Loan Act, 2006, The Budget Implementation and Tax Statues Amendment Act, 2006.

"If the Committee of Supply, the Committee of the Whole, or the House has not concluded any item or stage described above by the required hour, the Committee Chairperson or the Speaker, as the case may be, must interrupt the proceedings at the usual adjournment hour on that day and, without seeing the clock, put all questions necessary to dispose of the required items without further debate or recorded vote."

Mr. Speaker, so the Member for Russell is right on when he talks about what it is that the Government House Leader (Mr. Mackintosh) has done in making statements. Ultimately, he might have compromised the very chair in which you sit in and, in fact, all members of this Legislature. I do not believe the Premier (Mr. Doer) is, nor is the Government House Leader, doing a service to Manitobans by trying to give the impression that the budget will not pass, and you know what? It is possible in one way. It is possible in one way, and that is if not enough government members support the budget, then, yes, the budget will not pass, but I can appreciate that there might be some members, whether it is Transcona, Radisson, Fort Whyte–or Fort Garry, I should say–that might be a little nervous about that.

Mr. Speaker: Order. We are getting into debate. A point of order is to point out to the Speaker a breach of a rule, not to be used for means of debate.

Mr. Lamoureux: In short, in listening to what the Member for Russell has brought to our attention, Mr. Speaker, I do believe that we need to look at the consequences of those statements, because indeed it is a reflection on something that has taken place where there was full agreement, and that full agreement was from everyone inside this Chamber. I believe it was June 9 of 2005 when that agreement was put into place, and, as the Speaker of this Legislature, you have the responsibility to ensure that that agreement is adhered to.

Now, Mr. Speaker, I can appreciate the government, particularly the Premier, might have some concerns, as Manitobans do have some concerns. They like to see proper and due course given and attention and debate and public meetings and discussions in committees, in fact, addressing all the wide variety of things that we have to deal with, whether it is a budget or legislation that is before this

Chamber. But this is something which the Premier is going to have to sleep on, and the Premier is going to have to realize what his ways are in order to be able to address both the need for a public inquiry regarding the Crocus fiasco and the legislative and budget agenda of this government.

It is not appropriate for the Government House Leader (Mr. Mackintosh) to be reflecting to the degree in which he has as to what you are going to be facing come June 12, unless it is an attempt by the government to apply pressure on your Chair, and I hope that that is not the case. I trust that the government is going to be more careful with the way that they are reflecting on what is taking place and be more transparent with Manitobans on this issue.

As the Minister of Energy, Science and Technology (Mr. Chomiak) has pointed out, Mr. Speaker, there is a need for a way out, and the one who has the responsibility to get that way out is going to be the Premier of the province and the Government House Leader. I would suggest that they start looking at that way, and the way to start it off would be to call a public inquiry regarding the Crocus fiasco.

Mr. Speaker: Well, that is one of the longest points of order that I have heard previously, because points of order are usually dealt with in a few comments and then a rule is pointed out and we vote on it. We have spent over 20-some minutes on this, so I will hear the honourable Member for River East, briefly.

Mrs. Bonnie Mitchelson (River East): Thank you very much, Mr. Speaker, and I will be very brief, but as my colleague did point out in *Beauchesne* Citation 71(1) on page 21, it is very clear that the Government House Leader (Mr. Mackintosh) has gone beyond what he should be saying publicly and has put into question your ability to make the right decisions based on the rules that have been set out and, I think, have been fairly clearly articulated here in the Legislature this afternoon.

***** (15:50)

I listened very carefully to the Member for Kildonan (Mr. Chomiak), the Minister of Energy, Science and Technology, when he spoke and talked about how the opposition now, somehow, was trying to wiggle their way out of some circumstance that we have gotten into in the House. Well, I would submit that the only people who are trying to wiggle their way out of an uncomfortable situation is the government who refuse to call a public inquiry into the Crocus scandal.

You know, I also heard the minister, in his response to this point of order, indicate that we do not have the courage to debate the budget. Well, I would submit to you, Mr. Speaker, that the only people that do not have courage in this Legislature are the government members who do not have the courage to call a public inquiry.

Mr. Speaker, what are they hiding? I would venture to guess that if, in fact, they could tie the whole Crocus scandal to the former government, they would have called an inquiry the very first opportunity they had. But they did not, and why are they not calling a public inquiry? Are they afraid to put their hands on the Bible and swear that they are not tied directly to the scandal through their union brothers and sisters that have controlled and manipulated the Crocus Fund to a point where nothing that this government says in the House can now be believed?

Mr. Speaker, we would ask and submit that the way we could end this dispute in the Legislature and move on with the business of the House would be to have the government call the inquiry, agree to put their hands on the Bible and to swear and tell the truth because we are not getting the answers that we should be getting to very serious questions in this Legislature.

Mr. Speaker, then their reflecting on your office and your ability to manage the affairs of the House, as set out in the rules, is extremely serious and is very misleading to the general public out there. I think you should take this issue and this point of order very seriously and, possibly, censure the Government House Leader (Mr. Mackintosh) for his comments that he made publicly to try to deflect away from their inability to tell the truth and the inability of Manitobans to get to the bottom of the issue, the Crocus scandal, that is facing our province and will, very definitely, leave a black mark for years to come. So I would hope that you would take this point of order very seriously and rule that the Government House Leader stepped beyond his authority by making those comments publicly and has done a disservice to the working of this Legislature. Thank you.

Mr. Speaker: On the point of order raised by the honourable Official Opposition House Leader (Mr. Derkach), I am going to take this matter under advisement so I can check all resources available to me, and I will be consulting with the procedural authorities. I will be returning to the House with the ruling.

* * *

Mr. Speaker: But I have some further information for the first point of order that was raised by the honourable Official Opposition House Leader. Due to recent rule changes respecting intersessional standing or special committees, the volume numbering for the daily Hansard has been adjusted to reflect this change.

The sitting dates that were sitting intersessionally were Friday, December 9, 2005, at 9:30 a.m., and it was dealing with Public Accounts, and the second day was January 26, 2006, at 1 p.m. dealing with the Committee on Justice. The other, third day, was February 2, 2006, dealing with Public Accounts at 9:30 a.m., and Wednesday, March 1, 2006, at 6 p.m., dealing with the Justice Committee.

I hope that is the information that the member was seeking. So that would account for the days that the member thought were missing from one Hansard to the next Hansard. If you need further information, I welcome you to go on to the Internet. The information is all there on the Internet.

* * *

Mr. Speaker: The honourable Official Opposition House Leader, on a new point of order or a matter of privilege?

Mr. Derkach: Mr. Speaker, I move that the House do now adjourn.

Mr. Speaker: Order. A motion cannot be moved until we get to Orders of the Day, and we have not reached that stage yet, so the motion is totally out of order.

The honourable Official Opposition House Leader, on either a point of order or a matter of privilege.

Mr. Derkach: Mr. Speaker, with the greatest of respect, I challenge your ruling.

Mr. Speaker: The ruling of the Chair has been challenged.

Voice Vote

Mr. Speaker: All those in favour of sustaining the ruling of the Chair, say yea.

Some Honourable Members: Yea.

Mr. Speaker: All those opposed to sustaining the ruling of the Chair, say nay.

Some Honourable Members: Nay.

Mr. Speaker: In my opinion, the Yeas have it.

Formal Vote

Mr. Derkach: A recorded vote, Mr. Speaker.

Mr. Speaker: A recorded vote having been requested, call in the members.

Order. Sixty minutes have expired. Please turn the bells off.

The question before the House is shall the ruling of the Chair be sustained.

Division

***A RECORDED VOTE** was taken, the result being as follows:*

Yeas

Allan, Altemeyer, Ashton, Bjornson, Brick, Caldwell, Chomiak, Dewar, Doer, Irvin-Ross, Jennissen, Jha, Korzeniowski, Lathlin, Lemieux, Mackintosh, Maloway, Martindale, McGifford, Melnick, Nevakshonoff, Oswald, Reid, Robinson, Rondeau, Sale, Santos, Schellenberg, Selinger, Smith, Struthers, Swan, Wowchuk.

Nays

Cullen, Cummings, Derkach, Driedger, Dyck, Eichler, Faurschou, Goertzen, Hawranik, Lamoureux, Maguire, Mitchelson, Reimer, Taillieu.

Madam Clerk (Patricia Chaychuk): Yeas 33, Nays 14.

Mr. Speaker: The ruling of the Chair has been sustained.

* * *

Mr. Derkach: Mr. Speaker, I see it is about a minute to five. Do we want to call it five o'clock?

Mr. Speaker: Is it the will of the House to call it five o'clock?

Some Honourable Members: No.

Mr. Speaker: No? Okay.

Point of Order

Mr. Speaker: The honourable Official Opposition House Leader, on a point of order or a matter of privilege?

Mr. Derkach: Well, Mr. Speaker–

Mr. Speaker: On a point of order or a matter of privilege?

Mr. Derkach: On a point of order, Mr. Speaker.

Mr. Speaker: Okay, the honourable Official Opposition House Leader, on a point of order.

Mr. Derkach: Mr. Speaker, on a point of order, earlier today in Question Period the Minister of Education (Mr. Bjornson) was asked some fairly serious questions by the Member for Charleswood (Mrs. Driedger). Instead of dealing with the matter raised, the minister decided to bring in some extraneous areas which made no sense whatsoever, misleading the House, misleading Manitobans and not dealing with the matter raised.

***** (17:00)

Now, Mr. Speaker, *Beauchesne* 417 is very clear and, although we do not use it during Question Period because we allow the latitude for a minister to be able to respond to preamble that a member puts forward, or a questioner to respond in her preamble to the question to what the minister may want to put on record, the issue is that 417–

Mr. Speaker: Order.

The hour being 5 p.m., we will adjourn and this point of order will continue as first order of business tomorrow.

The hour being 5 p.m., this House is adjourned and stands adjourned until 1:30 p.m. tomorrow (Wednesday).

LEGISLATIVE ASSEMBLY OF MANITOBA

Wednesday, September 26, 2007

The House met at 1:30 p.m.

PRAYER

ROUTINE PROCEEDINGS

INTRODUCTION OF BILLS

Bill 18–The Forest Health Protection Act

Hon. Stan Struthers (Minister of Conservation): I move, seconded by the Minister of Health (Ms. Oswald), that Bill 18, The Forest Health Protection Act; Loi sur la protection de la santé des forêts, be now read a first time.

Motion presented.

Mr. Struthers: Mr. Speaker, The Forest Health Protection Act will give us the tools to protect the health of all trees and forests in Manitoba by enabling the Province to monitor and respond quickly with effective preventative measures to control forest pests in the event of an outbreak. Thank you.

Mr. Speaker: Is it the pleasure of the House to adopt the motion? *[Agreed]*

Bill 19–The Fair Registration Practices in Regulated Professions Act

Hon. Nancy Allan (Minister of Labour and Immigration): Mr. Speaker, I move, also seconded by the Minister of Health (Ms. Oswald), that Bill 19, The Fair Registration Practices in Regulated Professions Act; Loi sur les pratiques d'inscription équitables dans les professions réglementées, be now read a first time.

Motion presented.

Ms. Allan: Mr. Speaker, this bill will provide that regulated professions and individuals applying for registration in Manitoba are governed by registration practices that are transparent, objective, impartial and fair.

In particular, fair registration practices will assist in breaking down the qualifications recognition barriers for internationally educated or out-of-town or out-of province individuals seeking work in their fields of expertise.

Thank you.

Mr. Speaker: Is it the pleasure of the House to adopt the motion? *[Agreed]*

PETITIONS

Provincial Trunk Highway 2–Glenboro

Mr. Cliff Cullen (Turtle Mountain): Mr. Speaker, I wish to present the following petition to the Legislative Assembly.

These are the reasons for this petition:

As a result of high traffic volumes in the region, there have been numerous accidents and near misses along Provincial Trunk Highway 2 near the village of Glenboro, leading to serious safety concerns for motorists.

The provincial government has refused to construct turning lanes off Provincial Trunk Highway 2 into the village of Glenboro and onto Golf Course Drive, despite the fact that a number of businesses along Provincial Trunk Highway 2 have increased greatly in recent years.

We petition the Manitoba Legislative Assembly as follows:

To urge the Minister of Infrastructure and Transportation (Mr. Lemieux) to consider implementing a speed zone on Provincial Trunk Highway 2 adjacent to the village of Glenboro.

This petition is signed by Jill Nowazek, Henry Thornborough, Ron Book and many, many others.

Mr. Speaker: In accordance with our rule 132(6), when petitions are read they are deemed to be received by the House.

Provincial Trunk Highway 10–Brandon Hills Estates

Mrs. Leanne Rowat (Minnedosa): I wish to present the following petition to the Legislative Assembly of Manitoba.

These are the reasons for this petition:

Provincial Trunk Highway 10 serves as a route for an ever-increasing volume of traffic including heavy trucks, farm vehicles, working commuters, tour buses, campers and the transport of dangerous goods.

Provincial Highway 10 access travelling south to Brandon Hills Estates is not only unsafe for school students who must cross the busy highway, but also for the turning vehicles who must cross a solid line to enter the park community.

Traffic levels are expected to escalate further due to projected industrial expansions.

Highway upgrades of Provincial Highway 10 are occurring within a short distance of this site. Priority should be given to this community, based on the dangerous access to highways for residents.

We petition the Legislative Assembly of Manitoba as follows:

To urge the Minister of Infrastructure and Transportation (Mr. Lemieux) to act on the situation by considering construction of turning lanes that would reduce the danger posed in traffic access to Brandon Hills Estates, which is home to 85 residents.

This petition signed by Judy Stuckel, Larry Stuckel, Hazel Asham and many, many others.

Cree Nation Child and Family Caring Agency

Mrs. Mavis Taillieu (Morris): I wish to present the following petition to the Legislative Assembly of Manitoba.

These are the reasons for this petition.

Cree Nation Child and Family Caring Agency is a provincially mandated First Nation child protection and welfare agency. Operated under authority of the Provincial Ministry of Family Services and Housing, the mission is to keep children, families and communities safe and secure, and promote healthy citizen development and well-being.

Lynn Lake is located 321 kilometres northwest of Thompson, Manitoba on PR #391. There is no social worker living and working in the community. The goals of the ministry are implemented from a distance and supplemented with infrequent and short visits from a social worker located in Thompson.

The Lynn Lake Friendship Centre is a designated safe house and receiving home providing accommodations, services and care to children and families experiencing difficulties in a safe environment. The designated safe house and receiving home are forced closed at this time due to outstanding accounts payable due from Cree Nation Child and Family Caring Agency.

Failure to have a social worker based in Lynn Lake providing immediate and sustained services and forcing the receiving home and designated safe house to close, children and families experiencing difficulties in Lynn Lake and area have their health and safety placed in great jeopardy.

We petition the Legislative Assembly of Manitoba as follows:

To request the Minister of Family Services and Housing (Mr. Mackintosh) to consider re-staffing the social worker position in Lynn Lake in order to provide needed services to northwestern Manitoba in a timely manner.

To request the Minister of Family Services and Housing to consider mediating outstanding accounts payable due to Lynn Lake Friendship Centre and Cree Nation Child and Family Caring Agency in order to allow the designated safe house and receiving home to resume regular operations and services and continued utilization of these operations and services.

This is signed by Minnie Carberry, Mary Bighetty, Tom McCann, and many more concerned Manitobans.

***** (13:40)

Provincial Slogan

Mr. Kevin Lamoureux (Inkster): Mr. Speaker, I wish to present today the following petition to the Legislative Assembly of Manitoba.

The background to this petition is as follows:

That the NDP have authorized the spending of hundreds of thousands of tax dollars to promote the new slogan, Spirited Energy.

That Friendly Manitoba is a better description of our province.

We petition the Legislative Assembly of Manitoba as follows:

To request the Legislative Assembly of Manitoba to consider supporting the slogan, Friendly Manitoba over Spirited Energy.

To urge the Premier and his NDP caucus to make public the total cost in creating and promoting the new slogan, Spirited Energy.

Signed by Eric Miranda, Nellie Miranda, Jeric Miranda, and many, many other fine Manitobans.

TABLING OF REPORTS

Mr. Speaker: I am pleased to table in the House the Reports of Members' Expenses for the year ended March 31, 2007, in compliance with section 4 of the Indemnities, Allowances, and Retirement Benefits regulations.

Hon. Greg Selinger (Minister of Finance): I would like to table the following, the *Manitoba Finance, Supplementary Information for Legislative Review: 2007-2008 Departmental Expenditure Estimates*.

Hon. Diane McGifford (Minister of Advanced Education and Literacy): I'm pleased to table the 2007-2008 Departmental Estimates for Advanced Education and Literacy.

Hon. Oscar Lathlin (Minister of Aboriginal and Northern Affairs): I'm pleased to table the 2007-2008 Departmental Estimates for Aboriginal and Northern Affairs and the *Annual Report of the Communities Economic Development Fund*.

MINISTERIAL STATEMENTS

National Forest Week

Hon. Stan Struthers (Minister of Conservation): I have a statement for the House.

This white spruce tree seedling is presented to you in celebration of National Forest Week, September 23-29, 2007, by Manitoba Conservation and the Manitoba Forestry Association (MFA). The white spruce is, of course, Manitoba's provincial tree, and these seedlings are locally grown at Pineland Forest Nursery in Hadashville.

In Manitoba, the Manitoba Forestry Association, or MFA, has marked this annual occasion by providing white spruce seedlings to my honourable colleagues. I commend the MFA for their ongoing efforts to celebrate and create awareness of our valuable forest resources and to provide forestry education to Manitobans of all ages.

Mr. Speaker, sustaining Manitoba's forests for environmental, social, and economic benefits is a priority for Manitoba Conservation. Thank you.

Mrs. Heather Stefanson (Tuxedo): I thank the minister for his statement today. On behalf of members of this side of the House, Mr. Speaker, we want to say how happy we are to celebrate this week, National Forest Week.

It should also be noted that today is Maple Leaf Day, a day when Canadians are asked to reflect on the link between our lives, our Canadian heritage, and our symbol, which is historical and economic environmental link between these and the trees, Mr. Speaker.

I want to just take this moment, this opportunity, to quote a former colleague of mine, which I'm sure is familiar to many members in this House, one Harry Enns, the former member for Lakeside, who made a comment each year when he got up to thank members opposite for the trees. He said, and I quote: The trees seem to get smaller each year, Mr. Speaker. Obviously this government is truly conserving.

Mr. Speaker, I think, and I do have to say that at this time–

Mr. Speaker: Order. Just for information of the House, responses to Ministerial Statements should not take longer than the response of the ministers unless–

Some Honourable Members: Oh, oh.

Mr. Speaker: Order. If a person wanted to put more on record, they would have to have unanimous consent of the House by leave. That's just information for the House.

Hon. Jon Gerrard (River Heights): I ask for leave to speak to the minister's statement.

Mr. Speaker: Does the honourable Member for River Heights have leave? *[Agreed]*

Mr. Gerrard: Mr. Speaker, I rise to salute the importance of the forest industry and to speak out on behalf of trees and forests in Manitoba because of what they contribute, not only to Manitoba. Forests have often been called the lungs of the planet because they contribute so much to the well-being of our environment. Certainly from a perspective of global warming, forests can play a very important role and we need to acknowledge that. So I join with other colleagues in paying attention to trees and forests and make sure that we continue to do so. Thank you.

Introduction of Guests

Mr. Speaker: Prior to Oral Questions, I'd like to draw the attention of honourable members to the public gallery where we have with us today 47 retired teachers.

On behalf of all honourable members, I welcome you here today.

ORAL QUESTIONS

Bipole Power Line West Side of Manitoba

Mr. Hugh McFadyen (Leader of the Official Opposition): Mr. Speaker, I would like to just pick up on what the Member for Tuxedo (Mrs. Stefanson) was saying. I want to just say that on this side of the House, all trees are equal. We don't discriminate between east-side trees and west-side trees. They all deserve equal treatment when it comes to their future.

Some Honourable Members: Oh, oh.

Mr. Speaker: Order.

Mr. McFadyen: Mr. Speaker, yesterday we witnessed a situation, a shameful situation, where perhaps the most significant policy decision to be made by this government in the term of this mandate or any other mandate was made by the CEO of a Crown corporation under the cover of another government announcement relating to a public statutory holiday.

Now, this decision to build the next bipole power line down the west side of the province of Manitoba, Mr. Speaker, is going to cost future generations of Manitobans upwards of $500 million, a legacy of debt of half a billion dollars for future generations of Manitobans. That's not to mention the lost potential for sales arising from the line loss arising from an extra 230 kilometres of line that's going to be required, much of it through forest in the northern and western part of Manitoba.

Mr. Speaker, the Premier has admitted that no environmental study has been done to justify the environmental arguments that have been made. The CEO of Hydro says it's going to cost between $300 million and $400 million for the line alone, plus lost sales, plus other lost opportunities for Manitobans.

Now I know the Premier is concerned about symbolism. He's concerned about political legacies. He said yesterday in Estimates, he doesn't want to be accused of flip-flopping.

I'd like to ask the Premier today if he would set aside the short-term, personal political considerations and do what's right for the future of Manitobans. Don't leave them a legacy of debt, environmental destruction and despair for the residents of the east side of Lake Winnipeg.

***** (13:50)

Hon. Gary Doer (Premier): Unlike members opposite, we do believe that all people are equal and that's why, Mr. Speaker, I thought it was passing strange in the questions and points the members opposite were making in my Estimates that they did not deal with the starting point of First Nations people that reside and live and have lived for generations, in fact thousands of years on the east side of Lake Winnipeg.

In speaking in terms of trees are equal, Mr. Speaker, there is, I believe, some 800 kilometres of trees on the east side. There is much less than that on the west side. I believe the number is about 550 kilometres. Thirdly, it is clear that the east side is less developed than the west side in terms of other right-of-way areas for Hydro and, of course, other rights-of-way that have developed in mining, hydro-electricity, other developments on the west side.

Mr. Speaker, we made our feelings and preference known during the election campaign. When members talk about the timing of an announcement, the timing–

Some Honourable Members: Oh, oh.

Mr. Speaker: Order. The honourable First Minister has the floor.

Mr. Doer: The timing of the specific announcement was that of Hydro. The issue of the debate on the Tory vision, Mr. Speaker, which has been before their Cabinet in the early '90s and not proceeded with, our vision was well debated in the election campaign. We fully admitted that the cost of doing the west side transmission line was higher from a straight, straight-line basis. It's obviously cheaper to build a straight line than it is to have a more circuitous route. We admitted that during the campaign. And if you go to that logic, you would proceed with the line down the Interlake route because it is an absolute straighter line with already the right-of-way fully obtained. But that is not the most reliable route.

So there are issues of reliability, cost, ecology, First Nations, sustainability. I would also point out that there is the issue of long-term markets for the sale of hydro-electric power, and that's why we stated our preference in the election campaign. The member opposite stated his preference, and that was fully debated in the election campaign. The member opposite put his position out in the campaign. It was debated in every constituency, at least where we were contesting the election. We were proud to put our position forward because it is the long-term visionary position for Manitoba, Mr. Speaker.

Mr. McFadyen: The Premier is wrong on so many counts in that answer, Mr. Speaker. I'm going to have to take full advantage of leader's latitude to go through it because he is absolutely wrong on every count, and he talks about debates and political campaigns. He was the one who was ducking live debates because he didn't want to have to justify his positions, and he didn't want to have to defend himself and respond to questions related to this very misguided decision which is going to have a long-term impact on generations to come of Manitobans.

We know there is no environmental study. The Premier talks about the equality of all people in Manitoba. There's been no consultation with people on the west side. He talks about consultation on the east side. He hasn't consulted with people on the west side who are going to be impacted by the development on that side of the province.

We have a quote, this morning in the media, from Elijah Harper representing people, Aboriginal people, First Nations people who have lived for thousands of years on the east side of Lake Winnipeg and he says, and I quote: We were devastated by today's announcement.

This is Elijah Harper. A movie has been made about Elijah Harper. He is a legend. He is a person who is trusted by First Nations throughout our province. He calls this decision devastating for his people. So the environmental case has not been made. The people who are concerned are speaking up and saying that it's wrong. They've done so much damage to Hydro in the past through their raids on its reserve, Mr. Speaker, that this decision makes the MTX fiasco of the Howard Pawley years look like child play. There's absolutely no comparison when you look at the comparison. He turns up the volume and shouts but if you look up the responses, they just don't stand up.

Bob Brennan, the CEO of Hydro, yesterday said that there was a case to be made in terms of reliability whether you went down the east side of the lake or on the route that has been selected. The reliability argument doesn't stand up, and he's contradicted by his own Hydro CEO, Bob Brennan, whose word I will take 10 times out of 10 when it's put up against the words of the member opposite.

So, Mr. Speaker, we've got a situation now where by Hydro's estimates there will be 78 megawatts of line loss running through the Interlake. That line loss will be increased by more than 78. It'll be more than 78 megawatts. We've got 99 megawatts of power coming from wind power. It'll wipe out in one move, wipe out the entire capacity of wind power in Manitoba, completely undo everything that's been done in wind power in Manitoba today.

Will the Premier admit he has made a mistake, back away from this terrible decision before it's too late and send a clear message that he's prepared to show leadership, admit a mistake, end the political hoax and do what is right for future generations of Manitobans?

Mr. Doer: Mr. Speaker, the member opposite did not listen to my answer. I said the most direct route was the Interlake route between the two lakes. That's the Interlake route. The east side is the east side of Lake Winnipeg. The west side is west of Lake Winnipegosis. The Interlake route is between Lake Manitoba and Lake Winnipeg.

So when I said that the issue of reliability–the line was shorter in the existing and the right-of-ways were better on the Interlake route. That was the issue of reliability. So the argument you're making is on the wrong route. I already answered that. Secondly–

Some Honourable Members: Oh. Oh.

Mr. Speaker: Order.

Mr. Doer: Mr. Speaker, that presumes that there will be no sale of hydro-electric power to Saskatchewan and Alberta, and I can assure the House that we are in negotiations with different provinces on the west side. We've just received a number of reports about the absolute demand on the west side, and it also presumes that the east-side line can be built.

There are serious licensing issues on the east side. The reviews of the east-side option raise serious image and market potential and liabilities in markets that we already export, i.e., places like Minnesota where there will be huge international opposition to the destruction or tampering with parts of the boreal forest.

I would also point out that we do know that on the east side there are two heritage rivers affected. On the west side there is one heritage river affected. Again, that's part of the analysis that's taken place.

But certainly Hydro has done a review. We've done our review. We've stated our preference, and we absolutely believe that the reliability issues dictate that the west side is the preferred option. That will go to public hearings with the licensing by the Clean Environment Commission. There will be lots of debate. Hydro will be required to scope the route that has been chosen by the Hydro board. It's certainly consistent with our view and we believe that the–*[interjection]*

The member who dropped his paper yesterday is now chattering at the back of the room, Mr. Speaker.

Some Honourable Members: Oh. Oh.

Mr. Speaker: Order.

***** (14:00)

Mr. Doer: Mr. Speaker, there is significant opposition to the east side. There is significant opposition not just in Manitoba but in places where we sell power. We always have to work on securing any power sale we have in international markets. So, we would argue that if you can't build the line on the east side, if you're denied a licence on the east side for all the reasons I've indicated, or if the east side becomes an issue for external and international markets or other markets in western Canada or eastern Canada, then the economics have to be adjusted accordingly.

This is a serious challenge for Manitoba to be dealing with international markets in Minnesota with the opposition that would be outlined by those people. They are able to put commercial pressure on Manitoba Hydro. The commercial pressure can exert different decisions with different agencies in United States, and those factors also have to be considered when looking at the two routes. I personally believe, Mr. Speaker, that the former government had a recommendation to proceed on the east side in 1992-1993. They didn't go ahead. Why?

Mr. McFadyen: The fact is that the Premier hasn't even made the effort to make the case to potential buyers based on facts rather than spin, in order to deal with the issues and opposition that might exist. He hasn't even attempted to take that proposal through the licensing process, Mr. Speaker, because, for reasons that are not entirely clear–presumably because of some political whim–he has landed on a decision that he now can't back out of and has decided to proceed full speed ahead against the evidence, contrary to the facts, and with the outcome that future generations of Manitobans will be left with hundreds of millions of dollars in debt, added environmental degradation, and a loss of hope for people on the east side.

Mr. Speaker, I have confidence that potential buyers, such as Minnesota Power and others, will look at the facts. They won't be taken in by rhetoric when it comes to any proposal that's made by Manitoba. As an example, if the Premier was making the argument to Minnesota, he might want to point out that running the line down the east side, rather than the proposal that he's adopted for all the wrong reasons, would save, could save, in the range of 100 megawatts of line loss. That's half the capacity of the Taconite Harbor Energy Center coal-fired plant in Minnesota. He could shut down half the capacity of a coal-fired plant in Minnesota if he made the right decision. He doesn't care about coal-fired plants operating in Minnesota and the chance to displace that power. He doesn't care about the fact that with the added 200-plus kilometres of line, the trees are going to have to be cut. It's all about spin; it's all about rhetoric; it's all about a political hoax; and the result is that he is going to leave a triple-D legacy: a legacy of debt, despair, and environmental destruction.

I would call on the Premier at this point to take a step back, put this decision on hold, look at the facts, and make the right decision for future generations of Manitobans.

Mr. Doer: Mr. Speaker, the debt-for-debt ratios have gone down under our administration. The 86 percent we inherited from the Conservatives has been reduced consistently.

Some Honourable Members: Oh, oh.

Mr. Speaker: Order.

Mr. Doer: Thank you, Mr. Speaker.

The issue of the coal-fired plant. I would point out that we closed down the coal plant in Selkirk that was operating with one of the highest emission records anywhere in Manitoba. Members opposite were belching out smoke into their own constituents' backyards. We had the courage to close it down and we're proud we did.

We are also proceeding on a strategy to close down the plant in Brandon with redeployment of employees from that area and, Mr. Speaker, we have developed over 300 megawatts of renewable energy in Manitoba. A lot more than just a hundred megawatts of wind power. Over 300 megawatts have been developed by our government by going from ninth place under the Conservatives in energy renewability to first place in Canada.

Mr. Speaker, there is an extremely active lobby in the state of Minnesota against hydro-electric development and sales. It is an important lobby to pay attention to. It is very important that we proceed in the most environmentally sound way with the majority of First Nations people on our side to develop export sales.

Members opposite have no experience in developing export sales. The only thing they developed was mothballing projects that we had brought forward. They're the mothball party of Manitoba. We are the only ones capable of developing export sales to take advantage of the transmission line that we are going to build on the west side of Manitoba, but we will do so in full awareness of the proximity to the west side, to Saskatchewan and Alberta where the demand for energy and renewable energy is going up every day. We will also do so with an eye to the south of Manitoba where environmental stewardship, the protection of the Boreal Forest and relationships with First Nations people will be paramount for the regulatory bodies to approve future hydro development sales. That's why we'll get it done, Mr. Speaker.

Child Welfare System
Government's Response to Problems

Mr. Stuart Briese (Ste. Rose): Mr. Speaker, the child welfare system in Manitoba is in chaos. Children have been lost in the system, social workers are in very short supply and priorities have been misguided and misplaced. Children are being put at risk. The proof is in the growing list of children who have died tragically while in the care of a system that was supposed to protect them. In short, the minister has grossly mismanaged child and family services.

Mr. Speaker, will the minister take responsibility for his role in creating the chaos and confusion within the child welfare system?

Hon. Gord Mackintosh (Minister of Family Services and Housing): First, Mr. Speaker, I congratulate the member for his first question. I still remember my first question. I also reflect we were able in previous capacities to work together to solve issues for rural Manitobans, and I anticipate that we will look for opportunities to work together to better serve the needs of Manitoba families in our current capacities.

Mr. Speaker, Manitoba, not unlike other jurisdictions, has for too long suffered serious shortcomings in the child welfare system. We know that, not just from too many tragedies, but also from the independent eyes of what has been an historical analysis by both the Advocate and the Ombudsman. The recommendations that were made challenges Manitoba to become a leader in child welfare. To meet that challenge we've introduced changes for children. It was introduced in October initially with a $42-million investment.

Mr. Briese: Mr. Speaker, Gage Guimond, aged two, died while in the care of Child and Family Services. He died after CFS decided he should be removed from a loving foster home and placed with relatives. His best interests were not protected.

Mr. Speaker, the minister has failed to establish clear priorities for our child welfare system. Children are paying the price of this government's mismanagement. Will the minister take action today and issue a written directive to all child welfare authorities that in every instance a child's safety and well-being outweigh all other considerations?

Mr. Mackintosh: Mr. Speaker, I remind members that Manitoba has launched the most significant aggressive overhaul, if not transformation, of the child welfare system as a result of the Changes for Children initiative that began in October. We are not yet one-third of the way into this overhaul, but it holds out great promise for significant strengthening of the child welfare system.

The loss of Gage Guimond has weighed heavily on the hearts of, not only myself certainly, all Manitobans, I trust. When we have a loss like this, a tragic loss, it's important that we learn what went wrong and that we make changes accordingly. That, Mr. Speaker, we are committed to doing.

***** (14:10)

Mr. Briese: Mr. Speaker, the minister refuses to acknowledge that in practice the child's best interests are always being put first. He refuses to acknowledge that under his watch, other priorities are put first.

His mismanagement of the child welfare system is failing Manitoba children. I will ask the minister again: Will he do whatever it takes today to make it clear to all Child and Family Services staff that the child's safety and well-being comes before everything else?

Mr. Mackintosh: Mr. Speaker, the Changes for Children initiative devolution is built on the essential component of the child protection system of Manitoba, which is child safety. That is the foundation of the child protection system. It is found throughout the legislation, and indeed, when the authorities legislation was introduced into this House and agreed to unanimously, it began with the important WHEREAS that the safety, security and well-being of children and families is of paramount concern of the people of Manitoba.

Mr. Speaker, when members opposite introduced changes to the legislation to recognize that aboriginal children be placed with family and extended family, even then there was no trumping of safety. Safety is job one, always has been, always will be.

Addiction Treatment
Availability of Programs

Mr. Kelvin Goertzen (Steinbach): Mr. Speaker, in July the *Canadian Journal of Psychiatry* released a study indicating that 13.5 percent of Manitobans were dealing with substance abuse issues. Not only is this higher than the Canadian average, but it's twice that of the rate of Toronto. Workers with the Addictions Foundation of Manitoba are saying that the NDP government is cutting funding, closing treatment programs during the summer and reducing workers to treat addiction.

Mr. Speaker, why is it that when the province's addiction problem is getting worse, this government is doing less?

Hon. Kerri Irvin-Ross (Minister of Healthy Living): Mr. Speaker, our government has been committed to supporting individuals with addictions since being elected in 1999. Our support has increased over the years. The Addictions Foundation of Manitoba in 1999 when we took office received $9 million. This year it is now $14 million.

We've also continued to support the whole network, ensuring that Manitobans have a whole spectrum of services that are available for them from the point of prevention and awareness to recovery services.

Mr. Goertzen: Mr. Speaker, the minister's comments defy not what I'm saying but what the Addictions Foundation of Manitoba is saying. In fact, Barry Rudd, a prevention and education consultant with the very same Addictions Foundation of Manitoba, said that while more youth are indicating that they are taking illegal drugs, treatment programs in Manitoba often have limited availability.

In fact, his comments are bang on: two months wait for a female to access the River House treatment programs; three and a half months wait to get into the impaired driving programs; a month wait for drug treatment at Gimli. It's a month wait for drug treatment in the community of Steinbach.

Mr. Speaker, a day is a lifetime for a drug addict. A month or two can mean death for those who are dealing with addiction. Why is it that this minister hasn't made this a priority for her government and those that are dealing with addiction in our province?

Ms. Irvin-Ross: Mr. Speaker, I'm proud to say that this has been a priority for our government. We continue to provide the services that are necessary. We have provided in-patient services as well as day program services to all Manitobans to ensure that they have the services that they need. The amount of money–$17 million has been invested in the last two years for addiction services across the province of Manitoba to ensure that we are providing a continuum of services for all Manitobans.

Mr. Goertzen: Mr. Speaker, the minister refuses to adhere to what the experts are saying, the Addictions Foundation of Manitoba, when they say that there are long waiting times backed up by the fact that her own department provides. The City of Winnipeg recently said–the police department–that 80 percent of crimes somehow relates back to drugs or drug addiction, yet this government is not making it a priority to ensure that there's addiction treatment in our communities, on the streets or even in our prisons.

Mr. Speaker, when addicts finally open their minds to getting treatment, they shouldn't have to find a closed door at the treatment centre. When an addict shows up at that door, they should find help and not be given a number and told to wait their turn for a month or two. Why won't this government finally make it a priority and commit to when they show up at the door, they'll get the treatment they need.

Ms. Irvin-Ross: Mr. Speaker, the resources are being provided to all Manitobans. We've increased the budget by 50 percent. We continue to ensure that there is a whole spectrum of services for people that have addictions. People that are needing addiction services need to have in-patient programs as well as day programs, as well as recovery programs. We make sure that that spectrum of service is available to all Manitobans. We take this very seriously, and we will continue to work with all of our community partners to ensure that services are available for everyone. Thank you.

Hollow Water First Nation Cottage Barricade

Mr. Gerald Hawranik (Lac du Bonnet): Mr. Speaker, last week the Premier (Mr. Doer) and the Justice Minister trotted off to Ottawa to ask the federal government to add more criminal laws. Also last week Hollow Water First Nation unlawfully set up a barricade on a public road to protest this government's mismanagement of the cottage lot draw system. It's now 12 days since that public road was blocked. No action from the NDP, no consequences for that unlawful act.

So I ask the Minister of Justice: Why would he ask for more criminal laws at the time when he isn't prepared to enforce the laws that he already has?

Hon. Dave Chomiak (Minister of Justice and Attorney General): Mr. Speaker, I want to remind the member that I was very proud to be part of a delegation that included the leader of his own party, the leader of the third party in the Legislature, the police chief of Winnipeg and Brandon, the mayor of Winnipeg and Brandon, and Chief Dennis Meeches of Sioux Valley, and a victim, who all unanimously agreed with the position that we have taken in Manitoba. The Minister of Justice, the Canadian Minister of Justice said how pleased he was that we could come together in Manitoba to work together to deal with crime and that he would carry our message forward to Parliament, which is responsible for making the laws that we are involved with enforcing.

Mr. Hawranik: Mr. Speaker, he's asking for more laws and at the same time he isn't even enforcing the laws he already has.

A week ago RCMP Sergeant Doug Ashton stated that blocking a roadway is illegal according to The Highway Traffic Act, and yesterday on CJOB the Minister of Conservation (Mr. Struthers) stated that the barricades are illegal and he wasn't going to stand on a barricade that shouldn't be there. Those were his words.

So I ask the Minister of Justice: Since the barricades are illegal and shouldn't be there, why has he failed to enforce the law?

Mr. Chomiak: I think that one of the most moving speeches that I've ever heard last week was said by Chief Meeches before the parliamentarians that youth have choices now: The gangs or the clan? I think that was the most moving moment that we all had in terms of the opportunities that we must provide young people.

Mr. Speaker, I do not direct the police. The police undertake these matters, and I rely on the police to determine their course of action in these matters. I suspect that there's no Solicitor General nor a Justice Minister in the country who would want to be in the position of say–

Some Honourable Members: Oh, oh.

Mr. Speaker: Order.

Mr. Hawranik: Mr. Speaker, the RCMP and the Minister of Conservation (Mr. Struthers) are clearly on the record stating that the barricades are illegal. However, the Minister of Culture, Heritage and Tourism (Mr. Robinson) is on the record this week as well, indicating that Hollow Water should be respected for their attempts to protect their traditional land. In effect, what he's saying is that Manitobans should respect an illegal barricade on a public road.

So I ask the Minister of Justice: Is he prepared to respect an illegal act or will he do his duty as Minister of Justice in this province and enforce that law?

Some Honourable Members: Oh, oh.

Mr. Speaker: Order.

***** (14:20)

Mr. Chomiak: Mr. Speaker, the function and role of the police, I think members indicated yesterday in their speeches that the role and function of police– and now I understand why members voted against our increases to police. Now I understand why they voted against the Prosecutions' increase. They want us to step into the position of police officers. They want us to step into the position of prosecutors and do their jobs.

Our job, Mr. Speaker, is to provide them with the resources and the direction; their job is to do their work. I would not want to be in the position of the former Premier of Ontario–

Mr. Speaker: Order.

Mr. Chomiak: I don't want to be in the position of the former Conservative Premier of Ontario, Mr. Speaker, who put on his police hat and went running out–that is not the position. In fact, if I were to cross that boundary, I would be in dereliction of my duty.

School Review Process
School Board's Authority

Mr. Ron Schuler (Springfield): Mr. Speaker, yesterday evening, parents attended a public meeting where the process was outlined that would be followed in the viability review of Westview School, a process put in place by the provincial government that should apply equally to all schools.

I ask the Minister of Education whether his department school review policy is still, in fact, a 20-month process and whether school boards still have the authority to decide the viability of the school?

Hon. Peter Bjornson (Minister of Education, Citizenship and Youth): Certainly when school divisions are faced with issues such as declining enrolments, they do have difficult decisions to make with respect to the viability of the facilities, and we are currently reviewing the school closure policies and guidelines, Mr. Speaker.

It's rather interesting that members opposite would be raising this when you consider their election promise where they didn't see it necessary to increase any funding to the Education budget because of declining enrolment, Mr. Speaker. But we continue to support schools. We have small school grants; we have declining-enrolment grants. We know how important they are to the community, and school divisions have difficult decisions to make when it comes to school closures.

Mr. Schuler: What's funny, Mr. Speaker, is the Premier (Mr. Doer) said he would live up to the COLA for retired teachers. He never did, and they are sitting in the gallery right now.

Mr. Speaker, what's problematic about this issue is a senior member of this NDP government, the legislative assistant to the Premier, rose yesterday at the public meeting and said to the parents and members of the community that, and I quote: 2009 doesn't have to be *Apocalypse Now*. If we need more time, let us have more time. In other words, the process can be changed, assuming by him.

I would like to ask this Minister of Education whether the Member for Radisson's (Mr. Jha) comments reflect a change in policy, and has he neglected to inform parents and elected trustees of this change?

Mr. Bjornson: Mr. Speaker, we have committed to review the closure policies based on a request by the Manitoba Association of School Trustees and we're certainly going to do that. As I said, the viability of schools is an issue that many school divisions wrestle with because of declining enrolment. There is declining enrolment. We have committed to review the policies. We will review the policies. But we continue to fund education at unprecedented levels, and that's what allows schools to remain viable in the communities and remain an important focal part of that community.

Mr. Schuler: Mr. Speaker, the problem is that the process of a school viability review needs stability. The Member for Radisson stands up and grandstands, saying the 20-month minimum is no *Apocalypse Now*, or, in other words, it can be changed. The Minister of Education must send a clear message to students, parents and the community on his school review policy, and while he's at it, will he please admonish the Member for Radisson on the irresponsible comments made last night at the community meeting.

Mr. Bjornson: Mr. Speaker, as I said, we continue to increase funding to support programming, to support the viability of schools. Talk about grandstanding, I've heard the member refer to the teachers' pension where they continue to masquerade as advocates on behalf of teachers. They did nothing to the pension during the 1990s. They cut 252 teachers because of a lack of funding in 1995. How did that impact the pension? They made a promise during the election to fund two-thirds COLA, and the numbers that they have thrown out are absolutely false with respect to how they could achieve that.

The member opposite should not lecture me about grandstanding, Mr. Speaker. We're the government that supports education. We support teachers; we support small schools in the province.

Spirited Energy Campaign
Involvement of Former NDP Staff Member

Mrs. Leanne Rowat (Minnedosa): Mr. Speaker, yesterday the Premier (Mr. Doer) confirmed that Pat Britton, whose name is on a majority of the Spirited Energy invoices, is the same Pat Britton who was the former executive director for the NDP. I would like to table a sampling of these invoices, Mr. Speaker.

It seems pretty hypocritical for the government to say Spirited Energy isn't simply a partisan paint job when their former executive director is holding the purse strings.

Mr. Speaker, I would like to ask the Minister of Competitiveness (Mr. Rondeau): Why was the former executive director of the NDP so closely involved with the Spirited Energy campaign?

Hon. Gary Doer (Premier): Mr. Speaker, the individual in question did have another position in between the time she was working for government. *[interjection]* I just want to be factual.

I'll pass on her gratuitous comments about the Spirited Energy campaign that were made yesterday in the House and again today in the House. I'll pass that on to all the volunteer business people that have been involved. I'll pass it on to the Chamber of Commerce. I'll pass it on to Mr. Silver that is also spearheading this move. I'll pass it on to Mr. Starmer. I'll pass it on to the mayor of Brandon that endorsed the Spirited Energy campaign. I've got a whole list of business people that I'll pass it on to. I don't think they'll appreciate her gratuitous advice. If we have to take advice on a campaign, we'll take it from people like Bob Silver, not from the member opposite, Mr. Speaker.

Expense Claims

Mrs. Leanne Rowat (Minnedosa): Mr. Speaker, yesterday in this House I asked the minister about beer and wine that was approved as a taxpayer expense for the Spirited Energy campaign. In light of the confirmation of Pat Britton's role in the campaign, I would like to know, and I'd like to ask the minister if the former NDP executive director's decision was to approve the expenses of taxpayer dollars for the beer and wine consumed for the development of the Spirited Energy campaign.

Hon. Jim Rondeau (Minister of Competitive Training and Trade): I'm pleased to provide some information on the Spirited Energy campaign which is led by the business community. May I remind the people that it is not a partisan committee. The PEAC organization is led by Bob Silver, the president of Western Glove Works. We have Jim August who's the CEO of the North Portage, and all these people have provided their expertise, their guidance. Dave Angus. We have Irene Merie. We have all these people, a whole page of people who work on this campaign, and they do it because they want to promote Manitoba in a non-partisan, positive way.

And when we talk about the expense on beer and wine, we're talking about $68. A lot of times we have people who are spending lots of time volunteering, they're spending their own time, efforts–

Mr. Speaker: Order.

Time for Oral Questions has expired.

Some Honourable Members: Oh, oh.

Point of Order

Mr. Speaker: Order. The honourable Member for River Heights, on a point of order?

Hon. Jon Gerrard (River Heights): Mr. Speaker, on a point of order. I am asking for leave to ask my question and two supplementaries which I should be able to do in this Chamber when it's operating fairly.

Mr. Speaker: The honourable member has requested the unanimous consent of the House to pose his question and two supplementary questions. Is there leave of the House? *[Agreed]*

I will now recognize the honourable Member for River Heights to pose his question.

Power Line Development Agreement with Ontario

Hon. Jon Gerrard (River Heights): Mr. Speaker, I remember before and during the election that when the Premier (Mr. Doer) was asked about power transmission lines, he said: I like the option of a power transmission line going straight from Conawapa to Ontario, Sudbury or somewhere like that. I presume that line was predicated on agreement with Ontario, power sales to Ontario, support from the national government.

What happened, Mr. Premier, to the option of a line through Ontario, to the agreements with Ontario, to the national support?

***** (14:30)

Hon. Gary Doer (Premier): Mr. Speaker, there are two issues here. One is the issue of export sales and future export sales, and the other issue is an ongoing issue that would include both sales and reliability. The issue of reliability has been before the previous government from 1992 on. There is a view and advice that reliability must be enhanced. We are attempting to do that with enhancing sales at the same time. Future developments in northern Manitoba, there's a potential of a number of dams on the Nelson River. Over time, if there was a sale to Ontario, it could necessitate or allow for that route.

So it's not an either/or. There's one potential for reliability, which is, as I say, been before governments since 1992. Obviously, Hydro has reviewed the three options north and south, but there was other potential east and west. Certainly that's a site that is not being approved by the board of Hydro last week.

Mr. Gerrard: It seems to me, Mr. Speaker, that the Premier is essentially saying that the line to Ontario is essentially dead because Ontario is not a very reliable partner, Ontario is not coming to the table by buying sales, that there wasn't a reliable national government who was ready to support a trans-Canada transition line.

What is the problem with reliability here of a third line going to Ontario as an alternative to a line in western Manitoba?

Mr. Doer: Well, I don't want to be involved in partisan politics in Ontario, but just to talk about the federal government. I would mention that the Ontario latest energy report and the one before that and the one before that, and I'm sure the members opposite have read it, have referred to Manitoba and the potential of Manitoba. We are attempting to sell power south, which we believe is extremely positive and an extremely sensitive market. We are selling power to Ontario now, and we plan to sell more power to them if it's the right price. We are in discussions with Saskatchewan and the western provinces have already agreed to a grid.

In terms of funding for a grid, Mr. Speaker, there is more money from the existing federal government for partial funding of east-west connections than there was with the previous government. So I don't want to get involved in the back and forth between the Liberals and the Conservatives. I just want to state the facts.

Placement in Manitoba

Hon. Jon Gerrard (River Heights): My question to the Premier: I know that Manitoba Hydro is planning an alternative to the Dorsey substation, which is a Riel substation east of Winnipeg. I would ask: If the Premier is so confident that there may be sales to Saskatchewan or Alberta, why is he not putting that substation in western Manitoba where it would be much more convenient for serving people west instead of east?

Hon. Gary Doer (Premier): Well, Mr. Speaker, the Hydro is recommending–the chief executive officer is recommending, over time, two of them for reliability. That, of course, makes up almost half of the issue of transmission.

I would point out in the election campaign we had clear positions. Our position was to support the option of the west side, with the additional costs and being up front because we thought that was the only viable option. The members opposite had a position for the east side, which was the position recommended to them back in 1992. The Liberals had no position. They were on the one hand and on the other hand. They liked to protect the boreal forests and they want the cheaper line. What's your position, sir?

Mr. Speaker: Order. That will now conclude oral questions and we'll move on to members' statements.

MEMBERS' STATEMENTS

Anola Centennial

Mr. Ron Schuler (Springfield): Mr. Speaker, it gives me great pleasure to congratulate the village of Anola on celebrating its centennial in 2007. Anola is located in the rural municipality of Springfield at the highway intersection known locally as "Twelve and Fifteen."

One-time and well-known residents of Anola include a baseball player, Corey Koskie, and entertainer, Al Simmons. The friendly and welcoming nature of all residents of this community has always impressed me. I was pleased to receive a copy of *Anola Past and Present*, a book written to celebrate and document the village's history. I would like to recognize the efforts of everyone involved in this project and centennial celebrations throughout the year.

The village was originally named Free Port by American businessmen from Freeport, Illinois, in 1912. The name was changed to Anola. Agriculture has been an economic and cultural mainstay in Anola, supported by the many family farms in the area.

Close-knit and hardworking families have benefited from local businesses, recreational sports and social clubs over the last century. Fond memories were formed at businesses like the small, one-room Bugyik's store started in 1915 to the more recent Anola Village Inn. Generations have shared many laughs and countless cups of coffee together. A popular social club is the still active Anola and District Over 50 Club. Anola has been blessed with dedicated congregations that still gather to serve in worship at beautiful churches.

Anola is also home to the Selo Ukrainian Dancers and Mohutnity Ukrainian Dance Ensemble. These dance troupes have provided breathtaking entertainment for many and demonstrate how proud residents are of their cultural heritage.

The Anola and District Museum has done a tremendous job honouring Anola's history. Officially opened in 1975, it has continued to preserve the area's heritage with the dedicated assistance of volunteers. The museum features a pioneer house, chapel, school, blacksmith shop, and the RM of Springfield's first fire truck.

In closing, I would like to congratulate all past and present residents of Anola as they celebrate their historic centennial. Thank you, Mr. Speaker.

Cranberry Portage Community Events

Mr. Gerard Jennissen (Flin Flon): Mr. Speaker, apart from the large urban centre known as the city of Flin Flon, there are many unique, smaller communities in what constitutes the huge Flin Flon constituency. Cranberry Portage is one of those unique communities which, in 1928, mushroomed out of the northern soil almost overnight. This August, Cranberry Portage was able to showcase its talents and skills as the village hosted the sixth Annual National Aboriginal Arts Administrators and Funders gathering in conjunction with the second Annual Summer Arts Festival. Various colourful events were held in the park in front of beautiful Lake Athapapuskow. The big attraction was the world's largest canvas teepee.

I am pleased to announce that the former teepee height record was shattered. The world's largest canvas teepee now stands a proud 22.6 metres high and has a diameter of 21.6 metres. The opening ceremony was able to accommodate not only the delegates but numerous visitors, dignitaries, and the media.

Although the main teepee was the centrepiece of the gathering, there were 20 other smaller teepees, including my own. Each teepee was painted by a creative northern Manitoba artist. The event was an excellent way to have northern artists network and share ideas about how to increase their exposure and access to vital grants.

This gathering was also a wonderful way for the whole community to get involved. The artists offered sessions and teachings in their craft. For example, residents participated in painting classes, sweat lodges, elders' teepee, and learned the use of natural products in art creation, among many other offerings.

Cam McLean showcased his beautifully restored Bombardiers. After all, Mr. Speaker, Cranberry Portage unofficially is the Bombardier capital of Canada.

The delicious community feast involved 538 people and was another great way for residents, delegates, and artists alike to share their experiences. In fact, some delegates commented that the town's hospitality made them feel regal. Northern hospitality is indeed special. Mr. Speaker, the event was so well received and organized that every artist in attendance has registered for the third annual arts festival next year.

Congratulations to the main organizers Lisa Gamblin and Irvin Head, the Cranberry Aboriginal Arts Committee, and the many volunteers that made this event a great success. They have shown that the people of Cranberry Portage, when they work together, can accomplish wonderful things. I call on all honourable members to join me in congratulating the whole community of Cranberry Portage. By hosting this important national conference, they've put a small village on the map with the world's largest canvas teepee.

Stubble Burning Ban

Mrs. Mavis Taillieu (Morris): Mr. Speaker, in late August, an inadvertent stubble fire caused dark smoke to drift across the highway just east of Elie in my constituency and, unfortunately, an accident ensued.

The knee-jerk reaction of this government was to slap a ban on burning instead of investigating and determining that this was an isolated incident. A week later, they lifted the ban, and what happened? Pent-up need for burning resulted in many burns, more smoke and, unfortunately, another accident.

I blame the mismanagement of the NDP government for this mess. If they'd investigated the first fire, found it to be an isolated incident, no ban would have been necessary, and the producers could have continued with the controlled regime adhered to in years past.

Burning of stubble is controversial, but we need to balance the need of those whose health is aggravated by the smoke and those who need to do it for their livelihood, Mr. Speaker. Producers have done a good job of managing their fields, which has resulted in less and less burning over the years. Permits to burn issued on certain days have also been successful.

Mr. Speaker, this government's knee-jerk reaction to this situation is just another example of the mismanagement, lack of vision and leadership that they constantly exhibit. Thank you.

***** (14:40)

Bishop Grandin Greenway

Ms. Erin Selby (Southdale): Mr. Speaker, the residents of south Winnipeg are able to breathe a little easier thanks to the Bishop Grandin Greenway. This greenway stretches from Royalwood to the Red River. The path encourages people to exercise and travel in an environmentally friendly way, and also provides a natural prairie habitat for Manitoba wildlife.

A dedicated group of volunteers have been working to enhance, maintain and connect the greenway to other trails. What better way to combat climate change, Mr. Speaker, than to encourage people to leave their cars at home. Over a thousand trees have been planted on this path alone, with more to come next year. There are plans for a community garden that will be home to Manitoba butterfly species and this path is an exciting addition to our community.

With support from Community Places, this dream was realized, and this initiative is an excellent example of how our government helps communities reach their goals. It is truly a pleasure to see the excitement this greenway has created with residents in the neighbourhood, as well as cycling and outdoors enthusiasts from all over Winnipeg. But the celebration is not yet over. There are plans to expand the path to Fort Whyte Alive and to Lagimodiere Boulevard, and I look forward to working with the volunteers to bring this next phase of their plan to life.

I would ask that all honourable members join me in congratulating the forward-thinking organizers and hardworking volunteers of the Bishop Grandin Greenway for their outstanding efforts in making this greenway a reality. Thank you, Mr. Speaker.

Hecla Island Causeway

Hon. Jon Gerrard (River Heights): Mr. Speaker, I want to acknowledge the efforts of Halli Jonasson, of Riverton, in bringing forward his long-time concerns about the major impacts of the causeway to Hecla Island. The causeway was constructed in about 1970 and blocked much of the flow through the Grassy Narrows, the channel between Hecla Island and the mainland on the west side of Lake Winnipeg.

Halli Jonasson has lived, trapped and fished in the Grassy Narrows area for many, many years and he's very knowledgeable of the situation, both before the causeway was constructed and since. Al Kristofferson, who is the managing director of the Lake Winnipeg Research Consortium, has said of Halli Jonasson: "I think (Jonasson) has his head screwed on straight and has a lot of good information."

Mr. Jonasson has observed dramatic declines in the numbers of muskrats, minks, ducks, geese and jackfish in the marshes in the Grassy Narrows channel. Before the causeway was constructed, Jonasson observed that the marshes served to trap and filter out significant quantities of algal blooms. Today, because of the causeway and changes to the adjacent marsh, this is not happening. Mr. Jonasson has furthermore observed that the water flow both north and south in Lake Winnipeg has been significantly altered as a result of the Hecla Island causeway and this may have had an impact on the erosion along the shores of Lake Winnipeg.

Clearly, scientific work by the Lake Winnipeg consortium, and perhaps by others, is needed to investigate the impact of the Hecla Island causeway before further action is taken. But I think it's important to report today that, at a meeting last Saturday in Riverton, I found considerable support for the ideas that Halli Jonasson is putting forward. I understand that the MLA for Gimli (Mr. Bjornson) has been approached on this issue starting some time ago, several years ago but has declined so far to show any real interest. I would hope that the MLA for Gimli and his government would start paying more attention to the needs of Lake Winnipeg.

ORDERS OF THE DAY

GOVERNMENT BUSINESS

House Business

Hon. Dave Chomiak (Government House Leader): Mr. Speaker, I wonder if I might have leave of the House to change the hours for the Estimates committees in all three locations for Wednesday and Thursday. I wonder if I might have leave of the House to change those hours to extend from 5 p.m. until 6:30 p.m. in all three sites today and Thursday.

Mr. Speaker: Is there leave for the Estimates to continue between 5 p.m. to 6:30 p.m. in all three committee rooms for the Estimates? Is there leave? Is there agreement? *[Agreed]*

Mr. Chomiak: Mr. Speaker, I wonder, also, if I might have leave of the House, with respect to these hours, to have the Friday rules apply to those sittings between 5 p.m. and 6:30 p.m. on Thursday and Friday and, presumably, the House will adjourn at 6:30 on Thursday.

Mr. Speaker: Is there agreement of the House for Wednesday and Thursday, between 5 p.m. and 6:30 p.m. to apply the Friday rules to those two days, which is no quorum and no votes. Agreed? *[Agreed]*

Mr. Chomiak: I wonder if I might have leave to change the order of the Estimates on the Estimate order sheet that was tabled in the Chamber yesterday, that I might have leave to move Education, Citizenship and Youth in the Chamber to be after Labour and Immigration but before Science, Technology and Energy, and that only for today, in Room 255, at 5 p.m. Conservation will take the place of Agriculture, Food and Rural Initiatives from 5 to 6:30, and tomorrow in Room 255, Agriculture, Food and Rural Initiatives will continue in Room 255 as per the schedule.

Mr. Speaker: For clarification for the House, the honourable Government House Leader, when you were proposing the sittings extend from 5 to 6:30 on Wednesday and Thursday, did you also include no sitting on Friday? Okay.

So for clarification of the House, there will be no Estimates sitting for this Friday. We ask for a clarification of the House.

Okay, for the information of the House, today from 5 to 6:30 p.m., there will be a change in the Estimates from Agriculture and Food to Conservation for today only. Also, to change permanently on the Estimates order, that Education, Citizenship and Youth will now follow Labour and Immigration, and that's a permanent change. Okay?

Mr. Chomiak: Mr. Speaker, I thank all members of the House for their co-operation and the Clerks and yourself for working a way through this.

I wonder if the Chamber might dissolve into Committee of Supply or resolve itself into Committee of Supply or dissipate into Committee of Supply. Thank you, Mr. Speaker.

Mr. Speaker: The House will now resolve into Committee of Supply.

Deputy Speaker and the Chairs, please proceed to the respective rooms that you will be chairing.

COMMITTEE OF SUPPLY (Concurrent Sections)

INFRASTRUCTURE AND TRANSPORTATION

***** (15:00)

Madam Chairperson (Marilyn Brick): Will the Committee of Supply please come to order. This section of the Committee of Supply will now resume consideration of the Estimates for the Department of Infrastructure and Transportation. As had been previously agreed, questioning for this department will proceed in a global manner.

The floor is now open for questions.

Mr. Larry Maguire (Arthur-Virden): I want to welcome others that have come in for the day on water resources and water services–

Madam Chairperson: I'm sorry to interrupt you. I think all the individuals who were at the table are still the same.

Is there someone additional? Okay.

Just prior to that then, what I will ask is if the minister, just for a review of the members who are here from yesterday an introduction of any new members who have joined us at the table. That would be excellent. Thank you.

Hon. Ron Lemieux (Minister of Infrastructure and Transportation): We have the general manager of Water Services, if I am using the correct title, and that's Mr. Dick Menon.

Floor Comment: An engineer?

Mr. Maguire: I would like to welcome Mr. Menon as well.

Before we get to some of the questions, there was one that I got in just before the bell yesterday in regard to an upgrade or an update, I guess if you would, from the minister on, I believe it was the No. 10 bridge, No. 10 highway, bridge work that was done in the summer. I just wondered if he could indicate to us what was done, the final results, when it was opened again. I know it is open, I was over it the other day. Just an update on it.

Mr. Lemieux: Two things: One, I'll comment on the bridge shortly, on No. 10 south of Brandon, but there was an outstanding question related to staff and the amount of people that the department has hired in '06-07. We hired 388 people in '06-07, and to date in '07-08, the department has hired 161 people.

With regard to the bridge, we replaced two sections of failed concrete on the bridge. The Member for Arthur-Virden is correct. It is now open and being used.

Mr. Maguire: Just for a little more clarification, when the concrete block fails like that, can the minister elaborate on just whether that's in the rebar that's in the bridge or just what structural defect becomes obvious or becomes aware or how do they become aware of those kinds of defects? Can he elaborate a little more on what they mean by failed concrete?

Mr. Lemieux: A point of clarification. Is that the bridge we're talking about on No. 10 or this just any bridge in the province?

Mr. Maguire: Mainly on this particular bridge. I suppose it's the same–well, actually, it's probably different in each case, but if you could give me an indication on this one.

Mr. Lemieux: In the case of this particular bridge, a hole was punched through the deck and the concrete piece or section failed and that piece had to be replaced. This is not always the case, but in aging bridges and other structures, this happens from time to time. That was spotted, and of course action was taken as soon as possible to rectify it.

Mr. Maguire: I was just wondered if the minister could comment on rebar failure or that sort of thing. Sometimes the concrete falls off with these issues, off the surfaces. Were there rebar failures?

Mr. Lemieux: Well, I've been advised that this was a case of just the concrete itself punching through. I can clarify that with staff, but there are various reasons why bridges are repaired. I'm sure the member appreciates this. I'm not in engineering with regard to the specifics or the technicalities related to bridge failures or deck failures, but I will enquire with staff to find out in this particular case was it more than just concrete or was it also rebar? I've been advised it was just concrete that was punched through, but I'll clarify it while the member is asking his follow-up question.

Mr. Maguire: Yes, I'd just like to take a moment to let the minister get the answer. I would just say that, as I said earlier, there are likely differences in the reasons that there are failures in bridges every time something like this comes up, and if he could just confirm that for me. I would assume this is different than some of the other bridges that have failed around the province.

Mr. Lemieux: Well, I thank the member for the question. I've consulted with staff and they've said in this particular case it wasn't a matter of traditional rebar corroding, for example, the traditional rebar that's been used in our bridges, whereas the rebar and the concrete punched through as a result of a truck or another vehicle going over this particular section. In this particular case, I've been advised that it is the concrete that was just punched through.

Just to add to bridges, I'm not sure if the member is aware that today we made an announcement over the next four years of adding $125 million that would be added to the Infrastructure funding. That $125 million is added to bridges to improve inspections, to improve bridges, whether it's rehab or other work that needs to take place. I know he has an appreciation for bridges by virtue of raising this as one of his first questions today and how important he feels bridges are.

The major focus of our restructuring of the Department of Infrastructure and Transportation is renewal. Renewal is what we feel is very, very important to our system, and I know that the priority is evident in today's announcement that allocates funds specifically to maintain and support Manitoba's bridges. This will lead, of course, to more inspections and more regular maintenance and more repairs overall as needed.

This is a huge amount of money because we're talking about, not only the $400 million, $2 billion, five-year plan, we're talking about an additional approximately $30 million being added per year, so it's approximately $430 million per year now that will be part of Infrastructure and Transportation's budget.

It's a large announcement. We feel that it's a proactive way to address our structures in the province of Manitoba. Again, with today's announcement, it'll mark a first in Manitoba's history, a total investment average of about

$430 million per year. During this time, we will see that average of $30 million invested in preserving, maintaining, and inspecting our bridges, but it's a 40-percent increase over current levels. Investment in Manitoba's bridges is possible because of an aggressive $4-billion multi-year highway plan that we put forward.

I know that all key stakeholders, including the Heavy Construction Association, Association of Manitoba Municipalities, and others are all working together just based on the 2002, 2020 Vision consultation process. We've moved forward since then, not as a result of recent incidents that have taken place in the province but as a result of consultations that took place in 2002. We realize that we have an aging infrastructure as do the other provinces in Canada, as does the states in the United States, with regard to not only bridges but our highways. So, with that answer, I look forward to the member's question.

Mr. Maguire: I absolutely knew that sometime this afternoon the minister would have a chance of remaking his announcement. I appreciate that announcement, and I think all Manitobans will in regard to the kinds of dollars that are being made available. I may have a few more questions in that area later.

But yesterday I had indicated that I wanted to have a few questions and some time on the Water Services Board, and so, with the minister's indulgence, I would try to go to some of those questions just a little bit on that department.

I appreciate Mr. Menon taking time to be here today as well as the lead staffperson in that area. I note with interest in this department that there are a great many projects. There're always more requests for projects than there are funds to go around on these issues, and as our aging infrastructure continues to age, there will be more need for, I believe, the kinds of waterfication that we're seeing in some areas of Manitoba and the kinds of sewer and water needs that we have, never mind the over a billion dollars that we need in the city of Winnipeg alone to take care of some of the needs there.

As I've stated publicly a number of times, we can have the best roads in the world leading to all of our communities, including Winnipeg, but if we don't have good water and sewer facilities in those communities, then it's very unlikely you're going to attract new citizens, retirees, or businesses to those regions. So I think it's doubly important that we have, I guess, a sound plan on how to develop and proceed with the development of water and sewer needs that we have throughout the province of Manitoba. I know that those are some of the major projects that this area of the minister's department deals with.

First of all, I wondered if the minister could just provide me with the number of projects that perhaps Water Services is presently dealing with across the province of Manitoba.

***** (15:10)

Mr. Lemieux: Well, let me just say first of all, before I answer the member's question, I just want to thank him very much for allowing us to ask Mr. Menon to come in from Brandon, and that's important, but even though we're willing to go global, you know, to give us a heads-up as to who we would need some assistance from to help us with the answers. That was important because Mr. Menon would be able to plan his day and so on. So I thank the Member for Arthur-Virden (Mr. Maguire) for that heads-up as I am sure Mr. Menon does.

There are a lot of projects, a huge amount of projects, and as a provincial government, I would agree in total with the comments made about how important water is and sewerage issues are and water treatment is to the province of Manitoba. We've taken many initiatives, whether we're dealing with phosphorus or nitrogen into our great lakes or whether or not we're talking about sewer and water projects in each community. We know that if we're asking people to retire and stay in their communities–whether it's in rural Manitoba, northern Manitoba or indeed, Winnipeg–we would, and they expect to, receive services dealing with water and water treatment and sewage treatment.

Just to directly mention some of the projects, and when I say they're almost too numerous to go through all of them, I will try to go through some and maybe highlight some.

The sewer and water projects again, these are currently being worked on: the one in Gimli we're talking about, waste water treatment, the phase 2 completion as well as waste water treatment phase 3 start-up; and we're also talking about Grandview, Manitoba, a new waste water treatment plant; also looking at Lansdowne and Arden, a water and sewer system. Also, we're looking at MacGregor, a regional water supply; Melita, which the member will be familiar with in the corner of the province that he is, resides, new waste water treatment plant and reservoir as well. Also, we're looking at the park in San Clara, a lagoon; the city of Portage, a waste treatment plant upgrading; also, in the R.M. of Portage la Prairie, water and sewer system at Peony Farm; St. François Xavier, water and sewerage system extension.

Also, we're looking at Springfield and Anola, which is, I understand, the community celebrating an anniversary. This is related specifically to a boil-water order that took place in that particular community and that's being addressed. Also, Springfield regional waste water treatment system and the community of Whitemouth is also receiving a water supply booster station, and there are water development issues related to regional water lines and this is very, very important in Westbourne and Wallace and Stanley and Portage and Grey, Yellowhead region as well. There are other miscellaneous water development and regional water line supplies as well.

New projects, Gimli phase 4 we're currently looking at, Minnedosa as well as Flin Flon, and the projects that I've just mentioned are very important to these communities. We take a look at the community of Roblin, for example, a water treatment plant upgrade; Shoal Lake, Manitoba; The Pas; Plum Coulee; Lac du Bonnet; Franklin; Dominion City. A lot of these projects are truly important to these communities, and we know that the communities, generally the ones that need more work, this program is oversubscribed. It always is, no different than community places grants or other programs that we have in place in government.

We talk about aging bridges, aging infra-structure, overall aging transportation networks, but we also have a system that's aging, that many people do not see and that could be sewer lines under the ground. People don't see that. They might see a bridge that is having some difficulty and is in stress, but you don't see the sewer lines and water lines that are running under the ground that have corroded over years of time and of use. It's something that's very important to us as a government and we know that a program like this is oversubscribed. Yet I know that Mr. Menon and people in Water Services branch as well as the Water Services Board are trying to make long-range capital plans as well as taking a look at the short-term issues they need to address. They need to be thanked, and I'll publicly thank them now for all the hard work they've done with managing a budget that is often oversubscribed by many, many times the amount they have.

Water has become an important issue. I would argue not just recently but over the last numbers of years, and we as a government are not only interested in taking care of the roads and highways and bridges in our province, but also feel that water lines and sewer lines and treatment are also equally as important to the citizens of its province. They expect us to be investing. I use the word investment because it's not cost; it's an investment that we place in the future of our province and with young people in our province. Thank you.

Mr. Maguire: Madam Chairperson, I know I didn't expect the minister to go through a plethora of the listing of them, but I would ask him if he could provide me with a list of the present projects that might be on the go in Manitoba from his department. That would be helpful to help follow as well.

Mr. Lemieux: I would just like to make sure I give the member an updated list, and we'll try to get that to you in the next number of days just to make sure the list is updated and everything is correct.

Mr. Maguire: I know there are particular projects that I and some of my colleagues may want to ask a few questions on this afternoon. I wonder if we could do that for both the waterfication projects that are on the go in Manitoba as well as some of the sewer projects and lagoon work that's being done as well.

Mr. Lemieux: Certainly, Madam Chairperson, anything that's part of the public record. I'll be pleased to do so.

Mr. Maguire: Which raises some concern by the minister stating that it's anything that would be available to me from a public perspective, does that mean that there are–could he just qualify that? I mean I'm assuming that there are projects on the go that they're in negotiations with. Is that what he means, that those aren't available?

Mr. Lemieux: Well, there are communities that have come forward. I've mentioned the program, as he has, that it's oversubscribed. There are many communities that are coming forward all the time, you know, raising issues related to water or sewer, or sewage treatment that are really in a state of discussions. I mean there is no–you know, I mean they've either applied and have not been approved or indeed they may be actually looking for a bump-up in infrastructure because costs have gone up, whether it's dealing with steel or concrete or asphalt. All costs have gone up and these costs have also–you know, people have been challenged with these costs of their projects going up.

So there are a lot of discussions going on. That's all I meant by that. I mean, we're going to provide the member with everything that we have.

Mr. Maguire: Can the minister indicate to me whether there's a set sharing program that he has with municipalities and the federal government on the costs of these projects in regard to the sharing of the cost of the projects? Is there a formula that's used in the sharing of those? Are they all a third, a third, a third with rural municipalities and the federal government, or are they negotiated.

Mr. Lemieux: Well I understand the sharing is on rural pipelines, for example. There is that kind of sharing. That's my understanding, the one-third, one-third, one-third.

***** (15:20)

Mr. Maguire: I just wanted to clarify that, Madam Chairperson, as well.

Can the minister indicate to me with all of the projects that are coming forward what sort of mechanism he or his department uses in regards to which ones would go forward, which ones would wait? Is it a first come, first served on the list, or is there a–I know there will be emergencies and priorities that might come into that sort of thing, and so can he just indicate to me the pecking order, I guess, that's used in regards to how you determine which ones will be done first?

Mr. Lemieux: Well, thank you for the question. I think it's good for the citizens of Manitoba to know that there is a point system that's used. How the point system really works is that there are issues related to public health, environmental issues. For example: documented problems and water shortages; boil water; septic breakouts; septic breakouts, as I mentioned, in different emergencies. Also, there are first-time services for some, potential concerns and problems to meet legal requirements. There are also economic benefits; there's also a point system related to applications; benefit to the province, for example; benefit to the municipality; water conservation measures; innovation wetlands and effluent irrigation. That's another area.

There's another category which talks about meeting certain standards. Also, water and sewer maintenance extensions are part of it, water and sewer main renewals. Once the point system is looked at, it goes to the Water Services Board, and the Water Services Board makes the decision. Now, it's not an easy decision, obviously, because if it's over-subscribed, you're taking a look at some issues related to the point system that address the challenges these communities have. But the board also needs some flexibility, because there might even be emerging issues that they have to deal with in an expedited way, so there is some flexibility built into it. But the point system has worked well. I would say that most municipalities really appreciate the work that Dick Menon and his staff do on a day-to-day basis. I can't stress the fact that not only he personally needs to be thanked, but they do a tireless job trying to work on behalf of our communities.

Mr. Peter Dyck (Pembina): Just the comment you made regarding the sharing of the water and rural municipalities, I'm thinking specifically of the R.M. of Stanley which–now, the other side of it is they were designated as the fastest growing rural municipality in all of Canada last year. But, anyway, regarding the waterfication of the rural municipality, my understanding from the local council is that the federal government has their money there. They have their money ready to go, but it's the Province who is not prepared to continue with the water bringing it to the rural residents. Now, is that accurate or is that not accurate, or where are you at with that one?

Mr. Lemieux: Well, I thank the MLA for the question. I know that his federal cousins appreciate the question, but, quite frankly, the federal money is not there, PFRA money for this particular project. Parts of it have been done, as I understand it, but the federal portion of the dollars currently are not there.

Mr. Dyck: Okay, just to clarify then, the provincial money is there, and they would be able to, if they could access the federal money, then they could move ahead. Am I understanding this correctly?

Mr. Lemieux: Today's dollars and the dollars we have have already been prescribed. But, you know, if they do come up with the money or if their money is there, they certainly would go through the processes that they would have to go through. It's not a slam dunk. It's not just automatic just because someone has the money, just saying, yeah we've got the money now, let's get it done. Thank you.

Mr. Dyck: The other question I would have is regarding the Pembina Valley Water Co-Op and the need for water in order to be able to service the residents along that–there are all the communities, and that's anywhere from Emerson through to Altona and Morden and Winkler. I think even Carman's a part of that whole loop.

But, anyway, could you tell me where they are? I know that at one point in time they were looking at drawing from the Sandilands, I believe it is. Can the minister tell us where that is at right now, please?

Mr. Lemieux: Thank you very much for the question. Just wanting to clarify this issue, they have not come to PFRA or to the federal government agency or to the province with regard to this project. There are groups that are pursuing this, but, as I understand, there's a lot of discussion going on, but they have not come officially to the Province or to the federal government with regard to this project.

Mr. Dyck: Just one more question then. So would you suggest that they come to your department and pursue this? Because I know that in discussions with the city of Winkler and the Town of Morden, and you know the growth that's taken place there that this is really one of the concerns that they have. So, if we need to look at another ministry as to where it's been at, we'll do that, but, just was asking for a suggestion.

Mr. Lemieux: Well, as a provincial government, we're open to having dialogue and discussions and consultations with all communities in Manitoba. If they have challenges around water or sewage treatment or effluent reduction, I mean, we're open to having those conversations. I know the people from PFRA and the federal government are as well. But we don’t have a crystal ball and we can't–you know, we're not able to read into that what they want or what their needs are. So we'd be pleased to talk to people about it.

As the member knows, on these issues related to Water Services branch or the Water Services Board many, many projects are oversubscribed and have been for a while. Yet we know how important water is to communities all over the world, quite frankly, not just in Manitoba. It has become and will become a more important issue in days and years to come.

Mr. Maguire: I just wanted to follow up on that. The federal government makes the dollars available through the PFRA and I know that there's an oversubscription of those funds.

In regard to that, when the prioritization of projects takes place because there are federal dollars involved through PFRA, does PFRA or the federal government become involved in much of a say in regard to the prioritization process that the minister was pointing out to me earlier?

***** (15:30)

Mr. Lemieux: Well, before I deal with that question directly, I'll state this: that agreement is coming to an end. I believe it's March 31 '08. So anything the rural MLAs can do–and I know the Member for Arthur-Virden was a strong advocate dealing with issues of agriculture in days before he became an elected provincial politician. He knows how important these issues are. Yet this program, I believe it's called the National Water Supply Expansion Program. I know the member opposite knows how important this is as well as his other rural MLAs, as I am, and this program really needs to continue. Anything he can do or his colleagues can do to speak to his political cousins in Ottawa to stress the importance of this, or even to members of Parliament of the governing party in Manitoba, would really be appreciated because we've tried to stress from our side how we want this program to continue.

No different, actually, quite frankly, than Prairie Grain Roads. I know he has an appreciation for that as well. The Prairie Grain Roads Program expired. Now you've got this Water Supply Expansion Program expiring. So we see a lot of these programs going by the wayside, and I'm just wondering how the member opposite feels about this program overall, or what he knows of it, or what does he think, whether it's worthwhile pursuing.

Mr. Maguire: I guess my comments would only be that in order to support our rural waterifications as well as those in the north and in the city of Winnipeg, all of our urban regions as well, it's more important that we look at the province as a whole in those areas.

But the federal dollars that the minister gets, albeit if this program ends in May, have they been able to obtain the dollars from the federal government for the projects and the work that's been done so far? Has it come in as the work is done or does it come in at the beginning of the project to be used by the Province at that time?

Mr. Lemieux: We get the money essentially up front from the federal government, which we're very much appreciative of. Then we match projects up against that.

There is a working committee, a working group, I'm not sure of the proper name, but Manitoba puts two people on this management committee, and the federal government puts two people on the management committee, and then they are able to approach the dollars and projects in that manner. We do appreciate–don't mistake what I'm saying, but we do appreciate the money that the federal government is allocating to this program. I wouldn't want to leave the impression that we're not. But in my travels throughout the province of Manitoba, whether it would be north or rural Manitoba, I hear how important this is to the Association of Manitoba Municipalities, as well as to rural Manitoba, northern Manitoba. They really feel this program has served us well.

We, I believe, have taken advantage more than other provinces. That's why it's more specifically important maybe to us than other provinces with regard to these dollars. That's why I think it's imperative that we as elected officials, no matter what political stripe, really push for the extension of this program, not just an extension but the revitalization of this program. I think it's really important that we pursue it.

Mr. Maguire: I'm looking on page 117 in the Estimates book in regard to the sub-appropriation 15-5, just in regard to the minister's comments. It says: "Less: Recoverable from Rural Economic Development." There's $2.9 million; to be exact, $2,984,000 there.

Can the minister indicate if any portion of those $2.9-million recoverable comes from any of those particular programs that he just alluded to?

Mr. Lemieux: On that page 117, the money we're talking about is Manitoba money. There is no federal money within this package. Last year there was approximately $5 million that we had received from the federal government.

Mr. Maguire: Can the minister just indicate where the 2.984 then–I know it comes from rural economic development, I'm assuming. Can he just outline the nature of those funds?

Mr. Lemieux: These dollars come from MAFRI. These are MAFRI dollars. They come from Agriculture and rural economic development. These are dollars that go toward the water and all the issues related to water that we're talking about on this page 117.

Mr. Maguire: Yes, as these dollars come from the Manitoba agrifood and rural initiatives, then would they be–I'm assuming, they would all go into sewer-water projects as opposed to drainage or that sort of thing.

Mr. Lemieux: Yes.

Mr. Maguire: The comments in regard to PFRA, the federal dollars that would go in there, those would be national dollars that would go into the Prairie Farm Rehabilitation Administration assistance across Canada. How does the minister negotiate with the federal government in regard to how many dollars Manitoba's share would be of those dollars? Is it based on population, need, miles of line or can he indicate to me what the prioritization mechanism would be?

Mr. Lemieux: The dollars were part of the Ag Policy Framework agreement, and it was a five-year plan. There were so many dollars allocated into it. We were allocated, essentially, I would think, because of our rural needs and the high needs we had in rural Manitoba. That's how we were able to access these dollars through this five-year Ag Policy Framework agreement. It was initially about $15 million we received out of a larger pot. The agreement stated that if other people aren't using the money, you could try to tap into other dollars if you can. But we do have a large need in Manitoba and that's how we accessed it, through this five-year agreement.

***** (15:40)

Mr. Maguire: I appreciate that. It gives the minister about $3 million a year then, the $15 million received through Manitoba, roughly to work with. I know that if that's the federal third and we match that as a province and the municipalities work on it as well, it gets a small portion, every year, done of the kind of work that we need. But it is certainly, I'm assuming, a help to get those projects on the go.

The minister has indicated to me a little bit about prioritization. I know that there is a need for more funds to continue with this type of project, and I know as much as the minister's just earlier elaborated on his announcement of $125 million for infrastructure for these kinds of projects on bridges and not on water and sewer albeit, another type of announcement, I believe it was from the federal Minister of Environment, yesterday talking about $30 billion in regard to some environmental uses for those funds. I'm assuming that from that there will be funds coming forward, not from Manitoba, not all obviously, and if it's based on the similar kinds of need, there'll be, hopefully, large dollars available there for the city of Winnipeg and all of rural Manitoba as well because of the huge need that's there.

I think they named Montreal, Victoria and one other city, I believe, in today's news about dumping raw sewage still right into the rivers, into the main waterways, and the number of those areas. I think we could include Winnipeg in that, as it happens from time to time with heavy rainfalls and one thing and another in the province here as well.

So my question is just how the minister will be following up on trying to attain some of those dollars, and how can we use those in water services to the best of our ability?

Mr. Lemieux: Just to clarify what Minister Baird was talking about, that $33 billion is a national infrastructure program overall. It's not just to deal with environment. That's the large pot of money dealing with all kinds of issues and all kinds of challenges that we have in Canada. So, obviously, Manitoba wants to receive its fair share.

We talk about in Manitoba, for example, on the Transportation side where we've allocated gas tax or motive fuel tax dollars back to Transportation infrastructure. It's been talked about now almost two years. It will be two years this January, I think, that the last federal election was held, and now-Prime Minister Harper then was Leader of the Opposition, mentioned that provinces would be getting dollars very similar to what was announced by the Martin government to municipalities in that these dollars would be used for various infrastructure programs. Now what Minister Baird was talking about is tapping into that large pot of money that the Prime Minister and their government have made the previous announcement on.

Mr. Maguire: Yes, in regard to specific projects, my colleague from Carman, I'm going to defer to him to just ask on a specific project in his area.

Mr. Blaine Pedersen (Carman): Madam Chair, specific programs, our project is the Lavenham community, southwest of Portage. They have a community well in place which services approximately 20 families. They've been told that under the Water Services branch, they will not be able to use a community well unless it is treated properly and monitored. They are willing to treat it. However, the cost of having someone certified to do the testing and travel costs are always a significant cost. They have been in touch with the R.M. of South Norfolk in terms of testing the water.

I should also add that there is a rural water line coming from Rossendale, but it'll cost each individual household about $10,000 to hook up which is very significant when they have an excellent source of water right now. So can you give me an update as to what's happening for Lavenham?

Mr. Lemieux: Madam Chairperson, first of all, let me just say, before I answer the question, I just want to thank the MLA for Carman (Mr. Pedersen) for the question. This is the first time in Estimates that he's had the opportunity. I will just make a quick, brief comment prior to getting involved in the politics of his own party, but I can tell you that the MLA for Carman before was a strong advocate for the area, raised all kinds of issues with regard to transportation and infrastructure issues. I just want to say, having talked to him briefly, I know that the current MLA will work just as diligently and as hard for his constituents. So let me just make that–without getting into the politics of all this, I just want to put that on the record.

Dealing with the community of Lavenham, we're certainly in discussions with them, with the R.M. of South Norfolk, which they're part of, and to extend water from the Yellowhead regional water supply. So discussions are ongoing and, as the member can appreciate, there are discussions going on on a daily basis with many, many R.M.s about their water quality.

Now, as I understand it, in a lot of cases it's not dealing with E. coli or the kind of contaminants that are in the water. Sometimes the water is just not a good quality of water. I guess I would ask the representative for Carman to maybe pose the question to the Minister of Water Stewardship (Ms. Melnick) because this is an area that the drinking water people I believe are involved in this particular area and this discussion. So it may be a question more appropriate to the Minister of Water Stewardship to address it.

Mr. Maguire: Well, Madam Chairperson, I just wondered if, from the minister's perspective, this wouldn't fall under water services. I don't know whether the Member for Carman can correct me, but, in regard to many water projects across the province of Manitoba that are being done on waterfication right now, they are dealing with drinking water as well. Wouldn't they, under the Water Services Board be certainly dealing with drinking water in some cases, if not all?

Mr. Lemieux: Just a point of clarification, if nothing else, is that the Department of Water Stewardship deals with the regulatory part of the water, but the capital infrastructure piece of doing the capital side, the infrastructure side is related to my department.

Mr. Pedersen: Madam Chairperson, in this particular case, it's not a question of water quality. The water quality is deemed to be safe; however, there are regulations about multiple use on a community well. I believe that falls under Water Services branch. The water quality is not an issue.

Mr. Lemieux: The issues around drinking water are truly important, and The Drinking Water Safety Act is under Water Stewardship. They're the ones to determine whether or not the quality of the water or the water itself reaches is at that acceptable level. That's Water Stewardship that determines that. We deal with the capital side of either transporting water or dealing with that capital infrastructure piece, but it's Water Stewardship that's responsible for The Drinking Water Safety Act. As the member pointed out, there's plenty of water. The quality of water is at issue, and it's Water Stewardship that is responsible for The Drinking Water Safety Act.

***** (15:50)

Mr. Maguire: Just to follow up, I believe the Member for Carman indicated that it wasn't a water quality issue. It's delivery of the product and that sort of thing, so it looks forward to the future development of it.

I wanted to just, while I have a few comments in regard to the prioritization that we talked about earlier, and I know that we've got to be fair around the province in regard to the minimal dollars. Regardless of however many dollars they are, they're a minimal amount of dollars because there's never enough to go around in these projects as has been pointed out.

In regard to waterfication programs in rural Manitoba, in a lot of cases, industry may develop lines that would go straight to an industry in an urban or a rural community area. But in regard to human need, the water will go on to, perhaps if I could use the example of farm yards as well as industries, the water all goes down the same lines in rural areas because, of course, that has to be how it's put in from a cost perspective. Can the minister indicate to me just if there's much of a difference in how urban lines or projects are chosen over rural?

Mr. Lemieux: Just on clarification, there are two pieces to this. The one that's dealing with rural, PFRA plays a role and has a pot of money that can be tapped into; dealing with urban, it's provincial monies only, and it still goes through the management committee and then goes on to the board which will make decisions. My understanding, anyway, is that we primarily looked at existing homes and existing development, not at new development, for example, new developments that may be coming up and need water supplies and so on, so it's always been geared to current or existing development.

Mr. Maguire: I guess, when you're looking at things, it's simplistic to look at just the population base. You've got a rural municipality with not a huge population, and some of them are pretty thin, in regard to a community that might have a thousand, 2,000, 5,000 people living in it which would sort of get a priority because you can hit more people with better water and that sort of thing. Of course, that would be an ultimate objective as well.

But I know in some cases most of the water that would go through some of the rural lines will end up in livestock or some of the smaller processing facilities as opposed to being used for human consumption. That's where I was going in regard to that. I would hope that we don't look at the number of people, I suppose, that may need the water in those areas as opposed to on a population basis as determining priorities in those areas because that's how we need to sustain the rural areas is to provides these kinds of infrastructure needs in their communities.

As I said earlier, you can have all the good roads you want leading to a community or a rural area or the city of Winnipeg for that matter, but without good water and good sewer facilities you're not going to attract the people or the business.

I know my colleague from Minnedosa has just a question in regard to a facility in her region. I would just turn it over to her to ask that question.

Mrs. Leanne Rowat (Minnedosa): Madam Chair, my question is brief, but I wanted just to get the minister's comments on record so that I know how to proceed with this issue.

I met with the R.M. of Whitehead on September 10. It's general practice for me before I go into session that I meet with my municipalities. In our discussion on issues, the water infrastructure project in Alexander or in the R.M. of Whitehead had been raised and there seems to be a grey area. There seems to be now an item that could be very costly, and the community is really concerned about how they fit in the costing of a plastic liner that has to be put in a lagoon.

So I'm wanting to know if the minister has had some discussions with staff on this and if he can provide me with some background on where the province is going in discussions with the community on this because I don't believe that, based on what I'm hearing, they really should be looking at an additional cost for the project based on decisions that were made outside of their control.

Another point with regard to the community is the fire hydrants. They really were of the understanding that they were going to be and wanted to have a town grade 1 and that would have definitely had an impact on their insurance costs. Apparently, when that part of the project was complete, they remain a town grade 3. So their underwriter standards were not met and obviously the ratepayers within that area will not see the benefits of an increased or an improved system of fire safety.

Those are the two points that I'd like just a comment from the minister on, if he can, in consultation with his staff.

Ms. Sharon Blady, Acting Chairperson, in the Chair

Mr. Lemieux: Madam Acting Chairperson, allow me to say that it's a pleasure to have you as an MLA for Kirkfield Park. This is your first occasion to be dealing with Estimates so just wanting to say congratulations to you personally.

Just a clarification about the community of Alexander and Whitehead, it's done. You mentioned about the lagoon and waste water, it's finished.

***** (16:00)

Mrs. Rowat: The community is asking–there seems to be an issue of the liner cost that was outstanding on September 10. Has that been resolved? The community has not received any correspondence and are concerned that there might be additional costs associated to their project.

Mr. Lemieux: Well, there could be some discrepancy with regard to payment and so on, but we'll follow it up and see what's happening because, my understanding–I've been advised that everything has been taken care of.

Mrs. Rowat: Could the minister elaborate on discrepancy with payment? Is there an issue with the costing of the liner and the responsibilities of the municipality or the province on that?

Mr. Lemieux: We'll follow this up and see what's happening with regard to this issue because, as far as we understand, everything's been resolved and that's where it stands.

Mrs. Rowat: I will follow up with the municipality as well, but this definitely was their No. 1 point of issues when I met with them the other week. So I just wanted to determine, since we have the staff here and the minister really wanting to check on the status of this. But if he's saying that things have been resolved, then there seems to be a communication issue and I'll go back to the municipality on that.

Mr. Maguire: Madam Acting Chair, I, too, would like to welcome you to the Estimates process, as well as we did yesterday, with the Member for Fort Rouge (Ms. Howard) as well, I believe it was.

So I want to just go back to the minister in regards to some of the issues around prioritization of the various projects and, of course, I would put a comment in that, you know, people want extremely healthy food today. It's becoming a bigger issue in all areas all the time, and so in regards to waterfication projects, I'll put my two cents' worth in for some of the rural water projects that are going on today because it probably–not probably–it has on environmental programs that I've looked at in the past, helped out in regards to healthier livestock and a number of other areas in certain cases, and so I would encourage the minister to continue to look at as many of those projects as he possibly can.

I know he does continue to work with the ministry and his department on making sure that we maximize as much as we can on those and also dealing with the dollars from the federal counterparts. I know that, at the present time, where he is indicating that there is about $3 million a year coming from the federal department which gives him about $9-million worth of projects. If I am correct on that, can he just expand on whether that's accurate or not?

Mr. Lemieux: Well, at the end of March, the program's over, and that's why I would ask the Member for Carman (Mr. Pedersen), Member for Ste. Rose (Mr. Briese), Member for Arthur-Virden

(Mr. Maguire) and many of the MLAs who are from rural Manitoba, to talk to the members of Parliament and to stress to them how important they feel a program like this is, because the program ends and it's done.

Mr. Maguire: I appreciate the minister's concern, but the question is to do with the $3 million would be roughly $9-million worth of projects this year and in the past?

Mr. Lemieux: I thank the Member for Arthur-Virden for the question. Last year, in fact, we spent more than what was the norm, probably almost I guess $15 million or five times the three. But I can tell you that, as I mentioned about being oversubscribed, the importance of this program shows there's about $200 million to $300 million out there that there's a request for. That's the kind of need that's there on the waterfication of Manitoba and so, again, I just want to reiterate. I'm sure I know he does know how important this is and that's why we need, quite frankly, all-party support to ensure that this program continues, very similar to Prairie Grain Roads. And it worked well.

I know that we have the MLA for Ste. Rose here at the table, that he knows from wearing a previous political hat on how important Prairie Grain Roads was and how that worked well with the input from Association of Manitoba Municipalities and others. So we look forward to all parties pushing, quite frankly, for the resumption of this program.

Mr. Maguire: I know that some of the projects that are on the go, and I just wanted to refer to one in my area and that is; well, there's two, and the minister alluded to one of them earlier. That is the community of Melita getting water coming into Melita from the R.M. of Albert, a good project. I know the town appreciates it and the work that's going on there. It looks like they may be at least looking at starting to get some of the infrastructure in place this fall before freeze up if they can and that's, I believe, ongoing.

There's also, of course, a major project in the R.M. of Wallace that's been undertaken and moving forward very well from their perspective, I think, at this point. There're always concerns about trying to link up with others to look at projects like that. I wonder if the minister can give me an update on both of those projects in regard to where they stand at this time.

Mr. Lemieux: Well, the member mentioned the R.M. of Wallace, and not to put a fine point on it, but there's about $8 million that has been spent with regard to the R.M. and there's an additional $73 million we're looking at, and so this is a huge project for that particular R.M. I know the member raises the point that how important it is that these projects are for rural Manitoba. I just wanted to reiterate that these projects are taking place all over the province, not in one particular area, but all over rural Manitoba.

***** (16:10)

Mr. Maguire: Yes, I understand that. I guess the question that I was looking at was can he provide me with, just with a little bit more detail on where each project is at? I know that there've been dollars spent on each of them, but I believe–actually I should clarify that, on the Melita project just to know where it's at in regard to how much work will be done this fall.

Mr. Lemieux: As of about the middle of September, about 75 percent of the Wallace project is complete. But I think an important point to make as well is that when you're looking at Wallace and the completion of Wallace, there are many R.M.s that have been looking at regional water systems and that includes Pipestone and rural water for Pipestone. So there are many opportunities. Once these lines are completed, you start looking at regional water supplies, which more and more R.M.s now are looking at. Of course, R.M.s are also looking at sewage treatment on a regional basis, which, for many R.M.s would make good financial sense to look at water treatment or sewage treatment, effluent treatment on a regional basis.

So I trust that answers the question with regard to what the Member for Arthur-Virden asked. So Wallace is about 75 percent complete.

Madam Chairperson in the Chair

Mr. Maguire: I appreciate the comments of the minister. I know that sustainable development is of huge importance. It's on everyone's mind these days, and I appreciate the initiative taken by the R.M. of Wallace and the people in that region and the co-operation so far from both levels of government on that. Certainly, I know that the Water Services Board has done an admirable job in regard to trying to accommodate the needs of this group of persons putting this project forward. But sustainable development–the more people you get hooked onto the lines and that sort of thing, the sooner we can make them, I guess, more self-sufficient, if you will, Madam Chair, from that end of it.

The minister has alluded to the R.M. of Pipestone, and I know from speaking with Reeve Tycoles there that they have, I think, proposals forward that they'd like to work with as well. My assumption is that, from what I'm told, they would get their source of water from Pipestone as it comes through the R.M. of Wallace. I wonder if the minister can just give me an update on where that proposal would be at.

Mr. Lemieux: The project that the MLA for Arthur-Virden is talking about is about an $8 million to $10 million, probably closer to $10-million project. Right now that PFRA program is coming to an end. It was always anticipated that there would be cost-sharing involved in a lot of these projects so the projects are in the mix. The dilemma is there's a huge question mark right over top of where the dollars are coming from. Mr. Tweed is the member of Parliament, I believe, for the area, and I would strongly recommend that the R.M. of Wallace and the R.M. of Pipestone talk to their member of Parliament about PFRA dollars and what's going to be happening to the program. I just asked that and I know that the member is a rural MLA as I am, and we're all concerned with a program like this because it truly benefits directly primarily rural Manitoba.

Mr. Maguire: I thank the minister for that. I know it's been kind of talked about here that we would take a bit of a break, I think, in 15 or 20 minutes. I know the Chair and I have chatted about this just as a situation with staffing for five or 10 minutes only, briefly. I'm just raising that now instead of doing it at 4:30 roughly, see if the minister has agreement in regard to a short break at that time, just five or 10 minutes.

Mr. Lemieux: Well, I don't know about the Member for Arthur-Virden, but I drank my quantity of water over the last little while, so I know I would have an appreciation for taking a short break, as possibly others would. But since we're dealing with water issues, I'm not sure what time that would be. Maybe we could just get some clarification from the Chair as to what time that would be.

Madam Chairperson: If it's the agreement of all members, we will take a 10-minute break at 4:30, from 4:30 to 4:40, just to allow members to have a short recess in light of the fact that we are going later this evening. Is that agreed?

Mr. Maguire: That's agreeable, Madam Chair. We may have a few questions of Water Services after that, but I think we'll move forward. Not being one to want to relieve the pressure off the minister here, I want to keep the pressure on him, but I appreciate the answers that he's been giving us as well.

We've spent quite a bit of the afternoon talking about water and the need for good water, so all humour aside, let's move forward.

The Member for Minnedosa would also like to ask a question on waterfication issues in her region. I'll turn it over to her.

Mrs. Rowat: My question for the minister is in relation to the R.M. of Saskatchewan. As I had indicated earlier, I've been meeting with my communities, and, as I'm flipping through my folders, I'm coming across the issues that relate to your area.

They're looking at establishing a rural water pipeline and did a survey within their community and asked the community to get back to the council by September 1. They've indicated to me, and I've been aware that they've been working with Water Services Board and PFRA for a number of years on this. I believe that water is obviously something that is very important for any community. I would like to know if the minister can provide me with some feedback or the status of this initiative for my municipality. Then I would take whatever he has back to my municipality and work with them to make sure that this project does become a reality for them.

Mr. Lemieux: I thank the Member for Minnedosa for the question. There are large issues in rural Manitoba in this particular case with trying to do joint projects and trying to tap into different water sources, whether it's R.M. of Saskatchewan trying to get water from Minnedosa or whether or not they have to come from Oak River or a different direction. I know the Water Services branch has been working and meeting with the R.M. of Saskatchewan trying to get this nailed down.

We're talking about a $5-million project, which is huge money, but there are so many communities in Manitoba that all have their $5-million, $3-million, $2-million projects. Certainly, Water Services branch and Mr. Menon and others are trying to address this. But they're certainly working with the communities trying to find out which is the best source, where that water should come from, and then, once that process has taken place, to look at where the dollars are going to come from.

There is a process that I talked earlier about and a prioritization system that we use. When I say we, I mean Water Services branch and Water Services Board. How do they determine the projects and where they fit. I won't go through the criteria or the point system, it will be on Hansard and people can look at that. I went through the whole list of how projects are determined and how they're selected. Just to capsulize it, it's the water source. Where is it going to come from for the R.M. of Saskatchewan? Is it going to come from Minnedosa or does it have to come the other way from Oak River? That's where the discussions are right now.

***** (16:20)

Mrs. Rowat: Madam Chair, I appreciate the comments. I will reflect back on *Hansard* to the previous question that was placed, and I will work with my municipalities to make sure that due process is followed in that regard.

Yes, I do understand and appreciate that there are different ways, there are different sources of access for those communities for water. But, again, I know that there are a number of communities that are looking for high-end infrastructure. But these are my communities, and it's my prerogative to fight for them. So, I do appreciate that.

Mr. Maguire: I just wanted to return to the questioning that I was doing in regard to that R.M. of Wallace project, in Pipestone.

I know, like the Member for Pembina (Mr. Dyck) where he was looking at the type of project that was coming forward there for sustainability, the projects here–I guess I would ask the minister that–you know, I get the picture that he's talking about, with the PFRA wants everybody to lobby the federal government on that effort, and I have no problem doing that.

I guess the question there is, though, municipalities need to know that if they're lobbying the federal government hard as well–and I'm sure they would do that through the minister as well; he's probably been in touch with them to do that–where would the province be in regard to moving that forward? I know that certainly priority No. 1, I believe, would be to see the Wallace project finished. It's 75 percent complete now, and having that completed, making that project more sustainable, would be, of course, a benefit from having Pipestone on-stream, as–literally–I guess, from my perspective, that's how I would see it at least anyway. I wonder if he could just comment on being able to move forward with those.

Mr. Lemieux: Just on the point about dollars and pockets of dollars: you don't like to start a project and leave it half finished or three-quarters completed and not totally finished. There is a challenge, though, around the dollars, the PFRA dollars specifically, is that not knowing what's going to happen with that, because as the program's coming to an end has created a huge challenge for us–and I'm sure he can appreciate that; I know he has stated that this program is valued, and I believe all his colleagues in rural Manitoba would say the same. As we've gone through a number of questions from different R.M.s, so I can tell you that we have made–municipalities are aware of this issue, quite frankly, and they're very concerned with it.

AMM is also aware of this issue. I'm not sure where they've gone with it, whether or not they've officially written or verbally contacted the federal ministers to make their case, or federal members of Parliament, but I know that AMM certainly is aware of it. They're very concerned about the issue that the PFRA's program is going to be finished and completed as of March of '08. The municipalities are as well, because they can see how many projects are out there and they realize that there is a priority system, there's a good due diligence process laid out, but a big question mark over the dollars from PFRA.

Mr. Maguire: Just for clarification: these are not funds coming out of the Manitoba-Canada Infrastructure Program through the PFRA?

And can the minister give me some indication of his responsibilities in regard to whether he can use those funds in the areas of water and sewer as well?

Mr. Lemieux: I appreciate the question that the member is asking. Certainly, PFRA was one avenue, but it was the Agricultural Policy Framework agreement that was covering a lot of the water extension, the water projects we have been talking about.

Dealing with the Canada-Manitoba Infrastructure dollars, certainly, it's always possible, but there's a huge list of projects that we're talking about when we're talking about the Canada-Manitoba Infrastructure Program. There need to be some criteria, I guess, developed around that. But I understand where the member is coming from, that he's looking at where is there another pocket of money for this, and currently there is a huge demand, of course, on the Canada-Manitoba Infrastructure grants themselves as well.

There's a secretariat. There's a secretariat very similar to the working group we talked about that goes to the Water Services Board and then presents what they have found and their recommendations. Also, there's a secretariat, a Canada-Manitoba secretariat, that also looks at Canada-Manitoba Infrastructure monies as well.

Mr. Maguire: I guess I'll come back to that later, but I just have another question from the Member for Minnedosa.

Mrs. Rowat: I'm not sure if this falls under your area. If it does, I hope you have a good response for me. It was another community, the R.M. of Minto, and there have been a couple of issues. One of them is integrated water management plans. Does that fall under your jurisdiction? I guess that's the question and then I'll proceed.

Mr. Lemieux: It's actually the Department of Water Stewardship that the question is better directed to on this particular issue.

Mrs. Rowat: I'll still put on the record, though, the concern that they've faced. Obviously, these development plans are highly technical. There are a lot of issues or a lot of things that need to be dealt with, water flows, et cetera, and I guess what their concern is is that there seems to be a breakdown in resource supports. There seem to be challenges every time they need to get references or supports in a different area, staff change.

I want to put on the record that this is a serious issue when communities are trying to move forward and trying to meet the plans the that government has set out, and there seems to be some challenges in supports available to them.

Mr. Lemieux: I thank the Member for Minnedosa for the question. I'll pass this on to the Minister of Water Stewardship (Ms. Melnick), just in case she doesn't have the opportunity to raise the question. I'll certainly mention it and pass it on to the minister, that she's raised a concern about it. I'll definitely take it upon myself to pass that on to the Minister of Water Stewardship.

Mr. Maguire: We have another question from our Member for Emerson (Mr. Graydon) as well, if we could go to him, please.

Mr. Cliff Graydon (Emerson): A question for the minister: We all realize that the limiting factor to development in any area is water and more especially in the Red River Valley. We depend a lot on the Red River, but we know that the Red River can get quite low and may not be able to supply the water that we need. Droughts we find are a lot more devastating than what floods are.

So, Mr. Minister, as an alternative, I understand that the Red River Valley co-op or corporation, Pembina water corporation applied for a licence to pipe water from the eastern side of their constituency to the valley. Could you tell me where the status of that application is?

Madam Chairperson: The time being 4:30 p.m., as previously agreed unanimously by the committee, we will take a brief recess until 4:40 p.m.

As announced in the House, the committee will be sitting until 6:30 p.m. As a reminder to all members, the time from 5 until 6:30 p.m. we will be operating under Friday rules, meaning there will be no votes and no quorum. Thank you.

The committee recessed at 4:30 p.m.

The committee resumed at 4:40 p.m.

Madam Chairperson: Will the Committee of Supply please come to order. The floor is now open for questions, and the honourable Member for Emerson had asked a question prior to our recess. You can restate it if you wish or I can just turn it over to the minister.

Mr. Lemieux: Thank you very much and thank you very much for the short break. I think a lot of us appreciated it, including staff and others, and thank everyone for their co-operation.

A quick answer to this is that the Pembina Valley Water Cooperative, PVWC, handles water for–some people around the table are not familiar with the area, primarily west of the Red River, but there's a portion that's in the south just on the east of the Red.

They applied for an environmental licence from the Minister of Conservation a while back, and it was referred to the Clean Environment Commission. The problem with the water, as I understand it, is that when you pump, you're going to draw up a lot of saline water. I guess there's and intrusion into the good water so what's happened is the PVWC has pulled their application for the accessing that aquifer. Basically, that's as much as I know of it, and I'm not sure if the MLA for Emerson has more to add on it, but I understand that because it was referred to the Clean Environment Commission and the problem was with the saline water intrusion and when you do the pumping, and there was a whole issue related to that. Now they've pulled the application with regard to accessing that aquifer.

Mr. Graydon: Mr. Minister, does that mean that the Clean Environment Commission would not issue the licence because I'm not aware of it being pulled?

Mr. Lemieux: Well, I've been advised and I understand that it was referred to the Clean Environment Commission and that it never–I don't think it ever got there. I think that the PVWC pulled their, you know, they essentially pulled their application and then–well, the point I should make is that this is probably a better question that should go to the Minister of Conservation (Mr. Struthers), quite frankly, because he has more details for the MLA for Emerson (Mr. Graydon), but because of that saline, the saline getting into the good water, to the good aquifer, because of the pumping that would be necessary and the kind of water that they need to draw, that created, you know–once people were understanding of this, they had to re-evaluate. Where do they go with this? The MLA for Emerson may want to ask the Minister of Conservation because I don't have any further details and nor does my department on where this is at or the process itself.

Mr. Graydon: I thank the minister for that. I am sure that if that pumping was going to pollute that aquifer, I would agree that it should be pulled. However, having recognized that fact or learned that fact today, the fact remains that the valley is in desperate need of a stable water supply for any future development. They are basically nearing a crisis situation, and the dependency of the Red River is, as you know, not a stable source of water.

Has the minister's department looked at any other alternatives, and I'm going to suggest that they may have, and if they have, what would those alternatives be for that valley?

Mr. Lemieux: Well, there are many Manitobans, unlike some of us around the table here, who live and are close to the Red River and constituencies border on the Red River. They would be surprised by the fact we're talking of lack of water. They're too familiar with hearing in the media and sources that say, like '97 and other years, that there is an overabundance of water, even just this past spring. People are more familiar with that side of it than realizing, you've got the Pembina Valley and you have other communities that have been there, because we know that it's cyclical, the water cycles, and the Red River may not always be full. In fact, it does get fairly low and people who draw off of it, as well as use the water in the region, know that there are challenges about this.

So your point and your question is right on. We know it, but there are many that would not, you know, have this understanding because they're not familiar with the concerns of the area. But my constituency of La Verendrye does border on the Red, and I do have an appreciation for that, and yet we're talking about further south. I know that–I believe it's called the PVWC–is looking at possibly Morris as another alternative, I understand, for a water source.

Now, to the best of my knowledge, we haven't been asked. No one has approached Water Services Board or staff about, you know, what's another alternative? Where do we go then? Again, I've been advised that that saline, the pumping they needed to do, would–I don't want to use the word contaminate–but would alter the kind of water that they would be getting, but again, its Conservation that would have more answers with regard to this, to that application and process.

Mr. Graydon: I'm getting there. Thank you.

Would it be appropriate, Mr. Minister, to look at some alternatives and one of them being the Pembina River through the Pembina Valley? It seems that it is a flooding issue. If I understand right, there has been a study done on this particular river at one time. Is that an alternative to the valley?

***** (16:50)

Mr. Lemieux: I have to tell you, as a minister of the Crown, and one of my first years in this building–which, it's a privilege to be here and I want to congratulate the Member for Emerson (Mr. Graydon) on your election–but I just want to say that Harry Enns, and you probably are familiar with Harry Enns, the Member for Lakeside. So Harry Enns, one of the first opportunities I had of discussion with Harry Enns, was to talk about putting up a dam across the Pembina River or possibly putting a dam structure on the Assiniboine and diverting water to the south, dealing with water retention and talking about those issues.

So I recall this well, because he, and yet he's not from the region but has a huge interest in trying to, well, raising the issue, highlighting the issue about water retention, as opposed to–we're always talking about expanding the floodway, dealing with floods. We often don't talk about the other side of the coin which deals with water retention. I firmly believe, in years to come, if the scientists are correct–maybe we won't be here in that time; some of these young MLAs may be around at the time–but we will, I think, have a challenge about water, you know, the water retention issue about holding water back, keeping water for days and years that are dry and how do we manage that.

So PFRA is not involved, of course, in dam building or putting up dams across the Pembina River and looking at that kind of an alternative. The reason why I mention that is because the Pembina River and the Pembina River Valley is very important, but PFRA is also important on how we work with water issues to the Water Services branch and board.

So I think everyone is looking at alternatives but I just reflect, I digress slightly, but just wanting to raise this issue that Harry Enns approached me one of the first days in this building and he raised this as something that possibly a new government may want to look at, and may want to consider years down the road. So here we are eight years later and there are still people raising this issue about water retention and possibly building dams, diverting water, those kind of things.

So I do appreciate your question, and government is looking at alternatives and taking it seriously as to what do you do about water retention.

Mr. Graydon: In regard to your comment on Harry Enns, he did come from that area. He was more familiar with the Red River probably than you are because he grew up against it.

However, on a point of water retention, I can only agree with you. The Pembina Valley has had a study done one time before and I would ask the minister and his department if they would be interested in sitting down with myself and some of the people in the Emerson constituency to go over that type of a proposal and see if it has merit today. It would involve working with our American neighbours as well. I know that sometimes you don't look forward to that; however, the water does flow north.

The Pembina River does cause a great deal of flooding from time to time and that water causes a great deal of problems in our province. So I think there's a dual benefit that could come from this type of a development. One of those would be recreation. The other would be water retention for the valley, and the other one would be for flooding and could also be used for irrigation.

So there're a number of possibilities that could arise from this type of a discussion, Mr. Minister. Would you be prepared to meet and to discuss that with you and your department?

Mr. Lemieux: Well, we've always, as a government, prided ourselves in consultation. Not only the consultation process, I know the MLA for Transcona (Mr. Reid) is here and he participated in our 2020 Vision consultation process on transportation and transportation infrastructure, and came forward with a great recommendation that we have used as a blueprint and a guide for where we've gone right now.

So consultation is not foreign to us. I don't want to burden staff or overburden them with extra meetings and so on, but I'll certainly consult and talk to them about, you know, is there an opportunity to open discussions. But if you're talking about a study, I would see the federal government having a huge role to play in this whole issue.

I just want to clarify something. I don't mean to be rude to the MLA for Emerson, but I have a lot of good friends in the United States, as we all do. We consider them friends and have a great friendship with the United States, whether it's North Dakota, South Dakota, Montana, Wisconsin, Missouri, and so on, so I don't mean to miss out any states. But I have to tell you that we do have a lot of friends, and we look forward to working with our neighbours to the south. Without having clear dialogue and open dialogue, which we have had on a number of issues, I mean this is not to discuss the issues about the lake that currently often makes the press, but all of us have an appreciation for our neighbours to the south and have a lot of friends there.

So I just want to make that clear, that we do have conversations and open dialogue with our neighbours to the south of us. They have their water challenges, so do we. But, without federal involvement of any kind dealing with international waters, dealing with–I mean the Souris River dips in and out of the United States, comes back in, so we have a common tie, quite frankly, with our neighbours to the south, and that is water. We continue to have dialogue with them, but that's a role that the federal government, I believe, does play, an important role with regard to participating in something like this.

I didn't know Harry Enns, by the way, was from the area. And you're right; Harry Enns will know and knows a lot more than I will ever probably know about the Red River, so I grant the member that.

Mr. Graydon: I didn't mean to leave the impression, Honourable Minister, that you didn't have friends in the United States. I also have friends there, and I'm married to one. So I'm actually handicapped in what I can say at times because I can't cook. But thank you for your candor.

Mr. Maguire: Yes, I would defer, Madam Chair, to the Member for–where is he?–Turtle Mountain.

Mr. Cliff Cullen (Turtle Mountain): Well, Madam Chair, I just want to add some words to what the Member for Emerson (Mr. Graydon) has said. I have the Pembina Valley. The Pembina River flows through my area, too, and a number of communities are looking at some opportunities that we think going forward could be very positive for the area. We've endeavoured to have the Minister of Water, two ministers of Water Stewardship in the last few years, come out to that area and tour the area, particularly Pelican Lake and Rock Lake. We haven't been successful in getting them out there, so we would certainly entertain members of your department if they'd like to come out and look at the options that we think could be beneficial to the area.

In regard to your comment about our American neighbours, it seems that when we talk about water issues south of the border, the Province of Manitoba, at this point in time, seems to be more interested in lawsuits than actually any negotiations which we think could be positive. Clearly, we talk about water retention. We know there are areas in the province that are going to require water, and I think it would be very, very useful to enter into some serious and, hopefully, positive dialogue with our neighbours on how we're going to use that water.

In terms of the Water Services Board, I see the budget is about $10 million. I'd just like to get a bit of a feel for what kind of money or applications come forward from jurisdictions across the province on an annual basis.

***** (17:00)

Mr. Lemieux: Well, the budget is about over $12 million, I believe, just over $12 million or around $12 million, I believe, but I stand to be corrected by a few dollars here or there. So the programs are overprescribed. We talked about contributions coming from elsewhere, but the totals are about $30 million for water services and Water Services branch, but the provincial contribution is around $12 million, as I understand it.

A program like this, not unlike a Community Places grant, where you have many, many more multi-millions of dollars worth of programs or applications that come in for all kinds of–you know, it's not a case of saying that they're not worthy. All these projects have some true benefit for rural Manitoba, and not just for rural Manitoba, any community that is applying. But the criteria, which I won't go through, I did this for the Member for Arthur-Virden (Mr. Maguire). You'll be able to see it in *Hansard*. I tried to go through that and lay out the criteria that are there.

So the Water Services Board and the Water Services branch have a tough–it's a very difficult situation, quite frankly, because you have so many projects that are worthy and yet you have to priorize them somehow. You have to be able to put good projects forward. That also comes from the application process from the communities.

To your point about not wanting to work with people, I don't mean to misquote you, but the Province of Manitoba has always worked with our neighbours to the south and always has had open dialogue. Sometimes that's not always what you read or what you hear on the radio or see on TV, but there are always discussions happening with our good friends from North Dakota and other states of the United States.

With regard to the comment that the MLA for Emerson made, congratulations on your marriage and hopefully everything goes well.

Mr. Cullen: Well, thank you very much, Mr. Minister. The municipalities and towns and communities around Manitoba are facing a lot of pressure with the drinking water regulations that have come forward and I guess the fact that a lot of their waste water treatment facilities and lagoons are quite dated. So we have the Department of

Conservation on one hand regulating them and telling them what they have to do and then saying, okay, here's what you have to do. Go to the other section here, go to the other department and ask for money to get it done. Quite frankly, as you said, we don't have the money to cover what's needed there on an annual basis. So it's very frustrating for those jurisdictions going forward.

Having said that, are you looking at increasing the money that's going to be available for those particular facilities that need upgrading? I guess the second part to that question: I'm assuming that you're having some kind of dialogue with our federal counterparts as well, our federal government as well.

Mr. Lemieux: Well, first of all, even though different responsibilities lie with different departments, I can tell you that the ministers work very, very closely together and so do departmental officials. I don't like to use the word "bureaucrats" but people within the bureaucracy work closely with each other to ensure that they're not duplicating what each other is doing but also working hand in hand to ensure that they work closely with each other.

The question you ask is a budgetary question in the sense that, you know, where are we going with regard to finances in the future. That's something that there's ongoing dialogue with regard to water and also sewage treatment and effluent treatment and looking at phosphorus and nitrogen and all the impacts on our water system overall.

So, to answer your question, the third piece, is there dialogue with the federal government, we have had dialogue, certainly as I understand it. I know we talk about these issues related to PFRA. Agriculture, because there's an agriculture agreement, they are ones who are certainly looking at issues related to PFRA and extension of water lines and so on. So we would want to make sure that dialogue is continuing.

Infrastructure overall, absolutely, we've told the federal government. AMM have told the federal government, I think even going back certainly to when your MLA for Ste. Rose was involved with the AMM. Everyone was telling the federal national government we need some vision here on infrastructure and I believe the vision is there. I think we all are on the same page. We just need to have some cash flowing.

The Department of Conservation, as you rightly point out, is involved, and also Water Stewardship, too, when you're talking about water sources and different regulations involved with water.

But we do work closely together. With regard to the budgetary item, we're certainly reviewing on an ongoing basis as to whether or not there's more dollars needed and how do we approach this whole issue.

Mr. Cullen: Madam Chairperson, seeing that we have the Water Services Board people here, just a couple of updates in my constituency, if you would. The first one is in regard to the Yellowhead project there. I know that MacGregor-Austin is currently being hooked up, but if you could kind of give me a little status of where that project's at just briefly. I guess the second part of that, too, is potential expansion up into that Gladstone district, I believe is in the works. So, if you could, kind of, give me just a brief synopsis of where that project is headed and when you might see that being finalized.

Mr. Lemieux: Just to deal with the Yellowhead regional water supply, I can let the member know that the water supply pipeline, MacGregor to Austin, is under construction and 85 percent complete. The booster station, Yellowhead to Bagot, is under construction at 60 percent complete. The water supply pipeline from Gladstone to Ogilvie is certainly on stream and it's about 98 percent complete; there's just some clean-up to do. Also, the water distribution pipelines 2007 Norfolk has been awarded. It's at the tender stage.

The other comment I'd like to make is dealing with the kind of dollars that have been spent totally right now with Yellowhead. About $15 million have been spent kind of to date. This connects Gladstone, MacGregor, Austin, but there are future plans to extend to the R.M. of South Norfolk and also to the R.M. of Lansdowne. So, people in the department and water services have been working diligently on this, trying to make sure there is a good plan in place to try to connect a lot of these R.M.s. I know the MLA for Arthur-Virden (Mr. Maguire) has mentioned it a couple of times, but the PFRA piece is very important here, and I would hope that all MLAs in the opposition would support making sure the PFRA dollars are flowing because they play an important role in a lot of these projects for rural Manitoba and, specifically, ones that are in the backyard of the MLA for Turtle Mountain, as well.

Mr. Cullen: Madam Chair, I know you said it was in the works in terms of the expansion going toward Gladstone, I believe. I just kind of get a bit of a time frame on that and, in addition then, all that water that will be going north and also into South Norfolk, maybe you can just give a bit of an idea where you're thinking that's going to go. Is that just a farm area? Then all that water, I'm assuming, will be taken out of the Assiniboine River at Portage for that entire project.

***** (17:10)

Mr. Lemieux: Just a point of clarification that the water does come from the Assiniboine but through the city of Portage la Prairie. But all funding in future projects is also tied to PFRA or federal monies, and that's why the urgency about the PFRA program through the ag agreement expiring in March of '08 shines a huge spotlight on the importance of what we've been discussing, quite frankly, for a couple of hours now.

Mr. Cullen: Just on another project then, it's a lagoon project. It's going to be a shared lagoon, I believe, between the R.M. of Riverside and the R.M. of Strathcona. There were some land issues related to the existing lagoon, and they were going to build a lagoon just adjacent to their old one. I'm just wondering if your staff are familiar with that particular project, and if we cleared those legal hurdles to move that project forward.

Mr. Lemieux: I thank the member for the question. The lagoon project, the Riverside-Strathcona one at, I guess, Ninette, is what the reference is being made. There are some land issues but the Canada-Manitoba Infrastructure monies are involved in that particular project.

Just to talk about Pelican Lake, I know that he may have invited people. I don't know if they went there for formal meetings, but many MLAs have visited the Pelican Lake area and know how beautiful it is. I'm not sure what ministers have or have not gone there for official meetings, but I know we've all seen Pelican Lake and know how beautiful it is and what a great tourism attraction it is for our province.

But, to make my answer short and brief, the Canada-Manitoba Infrastructure money is involved with that Riverside-Strathcona project, as I understand it, and also land issues are a huge concern. *[interjection]*

They have been settled? I have been advised that the land issues have been settled.

Mr. Cullen: I appreciate the information and the update on those projects, and certainly, as the MLA representing Pelican Lake and Rock Lake, I would invite you out any time at all. We're certainly working on restocking that lake with fish so that's maybe another issue we can bring up with the Water Stewardship department, but if you could pass that information along to the powers that be, that we'd be certainly grateful. So thank you very much for your time.

Mr. Maguire: I just had a couple of questions in regard to–I know we wanted to get as many of the questions in regard to Manitoba Water Services as we could today, and I appreciate Mr. Menon being here.

I just wanted to go back to a question that my colleague from Turtle Mountain asked. I know the minister, right from the text here, it’s the sewer and water projects for about $12 million. Just for clarification, that would be the $12 million that the Province of Manitoba would make available, so it gives you a much greater–by the time these projects are partnershipped, you could end up with three times that in actual project value?

Mr. Lemieux: Yes, the Member for Arthur-Virden's correct. It expands it a fair bit from 12 to approximately 30.

Mr. Maguire: As these are projects that are to be done this year, can the minister share or provide me with a list of the projects that are already up and running? We're doing these estimates a little bit later in the year than we normally might have, and you know, the year's half over. I'm assuming that there are roughly–and I didn't use that as a means to say that half the money should be spent by now. I'm just saying: Could the minister provide me with a list of the sewer and water projects and their dollar value around each one of them that he has to date, that have been agreed upon to date, at least?

Mr. Lemieux: Yes.

Mr. Maguire: I wonder if I could get a similar list for the 2006-07 year, for the whole year because those projects will be completely completed by now or not completely completed, but the funds will have gone toward all of those for the past few years. I wonder if I could get a list of those for '06-07.

Mr. Lemieux: Well, we believe in open government. It's on our Web site, but I will provide a hard copy. I think we can do that.

Mr. Maguire: I'm going to make a note to myself. Thank you, I appreciate it. Just for the record, the minister is a member of the Treasury Board?

Mr. Lemieux: He is.

Mr. Maguire: I just wanted to touch base. I know that there are a host of projects, as I said. One of the key areas that the Province is concerned about, and I know that the minister is concerned about it as well because some of them have taken place in his jurisdiction, and that is just the–and I know it falls into his jurisdiction at some point because all of the infrastructure projects do come in there. It's sort of around what my colleague alluded to earlier today in regard to the Lansdowne project, I think it was, that he had commented on. That is around the issues of boil-water orders. There are some 60-plus in the province of Manitoba today.

I wonder if the minister can confirm that for me, and what his dealings are with the boil-water order processes.

Mr. Lemieux: No, I certainly can't confirm it. I cannot confirm it. I mean, that's probably a question for Water Stewardship or another minister. You're asking about the boil-water orders. I can't confirm that.

Mr. Maguire: Can the minister indicate then what kind of interaction there would be between Water Stewardship and themselves in regard to–I know Water Stewardship was responsible for the boil-water orders, I assume, from that end of it. I'm just trying to piece the different water pieces under different ministries. The minister's indicated earlier that he's responsible for sort of the projects that go, all the infrastructure.

So how often does he commiserate with his colleagues in regard to the issues of boil-water orders and their infrastructure needs, if I could add that?

Mr. Lemieux: The staff meet on a regular basis, as I certainly do with all my colleagues, all my ministerial colleagues. So we have dialogue often. I wouldn't use the word commiserate. I would just say we share a lot of information back and forth about the issues. But, just with regard to the boil-water orders, at least what we're looking at is possibly three or four municipal systems under boil-water orders. The numbers that the MLA for Arthur-Virden's thrown out, you know I'm not sure where these numbers come from or, you know, what it's based on, but that's news to me.

***** (17:20)

Mr. Maguire: It comes from the open government that the minister referred to earlier, I believe. I haven't done it in the last few weeks, but, earlier, it was on a Web site. I was just looking at it under Water Stewardship. I've been told that there's in that neighbourhood. I do know of one that has been outstanding since 2000, and that's the community of Medora. That's in the village of Medora. That is probably one of the oldest on record now. I know that's in my constituency. I keep bringing it up in regard to the requirement and need for that area. I know there was a water project ongoing, as the member here earlier indicated. Financial outlay of each individual in regard to the project ended up being somewhat higher than the local persons, I believe, were willing to go with, but it became a much bigger project as well. So Melita, of course, it wasn't part of that particular Medora project, but I am happy to see that the community of Melita is going forward with the project that they are, in regard to the waterfication of their community, bringing in the source and treating it in the community as well. I look forward to that being finished next year, I believe it is, and await as a response to their needs. I'm sure it will help them in regard to not only the individual homes, but the maintenance of their hospital in the future and other community businesses that are located in that fine community.

It is a growing community at this point. We've had some situations in the past, flooding in '99, where some issues of concern were raised by town council and others in that area. They have done a tremendous job of coming back on their feet, I believe, in regard to travel and asking the government for future encouragement in regard to roads and bridges in that area.

I just wanted to make the comment that there are a very minimal amount of homes for sale in the community of Melita now. I'll let you know that the oil industry has been a benefit in that area, and young people are moving into that region, you know, to some extent, and it's certainly been a plus for that community. So the water going into that community is going to be a valuable asset for that community in their whole future.

I guess I want to move forward in regard to any particular grants that Water Services might have on industry and development of industries anywhere in Manitoba, if the minister can inform me of what might be available there through his department, the Water Services, I know, in regard to finding of water, quality as Water Stewardship issues we've talked about earlier, but in regard to infrastructure grants to develop some of those projects. I wonder if he could elaborate on that for me.

Mr. Lemieux: The dollars that come for different industries or different businesses, they are not provided by grants through Water Services Board or Water Services branch or Infrastructure and Transportation. They come from other departments. It could be from Agriculture, Food and Rural Initiatives or from different departmental grants that may be available. But the department, through Water Services branch, manages a lot of these projects for these communities or in consultation with the communities whatever the projects are. So the dollars come from different departments as far as grants that may be provided to the different companies or organizations that are looking for assistance. But we just project manage often, but don't supply. At least I've been advised we don't supply dollars directly to companies or corporations or agencies looking for monies to assist them in developing.

Mr. Maguire: I know that there was a situation in the Oak Lake community in regard to a sewer and water project, I think the R.M. of Sifton and the town of Oak Lake, and also some concerns in the futures with some of the cottage lots, not just at Oak Lake, but around the province of Manitoba. I wonder if the minister can respond as to any information that he can provide me on the particular project with the R.M. of Sifton around water, and I believe that they've been contacted on that, and some progress has been made?

Mr. Lemieux: Just to, I guess, maybe a point of clarification on the Water Services Board that the dollars don't necessarily go to recreation lots or cottage lots, they go to residential property. So that has been a policy that I have been advised that has been used. Since we're talking about Oak Lake, or Oak Lake Lagoon, this, again, would be the policy that we've adhered to consistently.

Mr. Maguire: Can the minister indicate to me just the position of that lagoon at this time, at the Oak Lake Lagoon?

Mr. Lemieux: In consultation with staff, we'll have to get back to the MLA for Arthur-Virden just to give you kind of an update where it sits or where it's at. I'm not familiar with that at the moment, but definitely we'll get back to you and let you know. I've asked staff to make sure they do that just to follow it up.

Mr. Maguire: I thank the minister for that, Madam Chair. I know Reeve Harrison and Mayor Sigurdson have had discussions on that issue with the department. I appreciate that update.

I want to, at this time–there may be more questions that come up in regard to Water Services and the board and that sort of thing over the time that we'll have left in Estimates, maybe not today, but tomorrow as well, as we cannot vote on this later today–but I want to particularly thank Mr. Menon and his department, Mr. Menon for coming in today, personally, and taking the time to be here and answer these questions for myself and my colleagues this afternoon.

There might be a colleague that just walked in that might have a question on water in some of those areas, and before I turn it over to him–I don't know if he has or not; I could go there myself–but I want to thank Mr. Menon for coming in, for being here, for providing the minister with support in regard to the questions we've asked today, and my colleagues. And also to take back to his staff and department our sincere thanks for the work that you do throughout the year in regard to providing all of Manitoba with a better environment and better water and safer sewers and lagoons. It's a big job to keep it all straight, to try to appease everyone's needs. I think it's only right that, I, as the critic in opposition, thank you as well, as the minister has, for that level of dedication that you've provided.

I know that the Member for Brandon West (Mr. Borotsik) has come in, as I was referring to him earlier, not earlier, just since he came in, but we've talked about some of the major projects that are on. It reminded me of the project between Maple Leaf and the City of Brandon, and the Province's involvement in that. Is there anything that we can get from the minister before we end that discussion on that particular project and where it's at?

Mr. Lemieux: Well, I thank the member for the question. Maple Leaf, as the member knows, there are discussions ongoing. There is a huge price tag associated with that particular project. I would only be guessing with regard to the kind of dollars that are involved, but you're talking about–I don't know if this is an exaggerated or inflated number–but you're talking about anywhere from $75 to $100 million, which is a huge amount of money. So I just know that it's ongoing dialogue, ongoing discussions going on.

Mr. Daryl Reid, Acting Chairperson, in the Chair

***** (17:30)

Mr. Rick Borotsik (Brandon West): I appreciate the opportunity, Mr. Minister. Certainly, I'll echo Mr. Maguire's comments about Mr. Menon. He and I go an awful long way back. We appreciate the fact that he resides in Brandon and that he has provided a reasonable service to the department over the past number of years.

Two questions, actually. I don't know if Mr. Menon is the one who's prepared to answer this one or not. I don't know if it's even been questioned at this point in time, but one of the major concerns of the environment, certainly at the present time, and it's been mentioned on numerous occasions, is the combined sewer system in the city of Winnipeg. Has that been brought to this table at this point?

We recognize that there are several environmental problems with respect to Lake Winnipeg and, I don't know, is Dick prepared to answer some of these? Or to the Chair?

Mr. Lemieux: Well, let me just say, first of all, congratulations to the MLA for Brandon West.

Mr. Borotsik: Thank you.

Mr. Lemieux: Welcome. I know he is an experienced politician and has had opportunities at the federal level and municipal level, and I just welcome him here.

With regard to issues around the city of Winnipeg, Water Services just deals with issues outside the perimeter; maybe that's the best way to describe it, rural and north, so that's all that we can answer with regard to that. Of course, there are other departments like Conservation and Water Stewardship that also have a role to play with regard to water issues, so it's a–sometimes the questions have been overlapping, and we've had to say, well, ask the Minister of Water Stewardship (Ms. Melnick) when you get a change or the Minister of Conservation (Mr. Struthers) whenever they get into their Estimates, so that's kind of where it stands.

Mr. Borotsik: Thank you, Mr. Minister, for that explanation. I do know that Mr. Menon is responsible for the rural water services, which brings me to another issue. I don't know whether Mr. Maguire, and I do apologize for coming in late, but I was listening to the discussions between the Premier (Mr. Doer) and my leader, which were probably more interesting than Mr. Maguire and the minister.

An Honourable Member: No, no.

Mr. Borotsik: That would be your opinion. Certainly, I was enthralled. The issue with rural lagoons, and, again, I apologize if this has already been dealt with, but there have been a number of rural lagoons in southwestern Manitoba, particularly that have had some of their standards changed and capacity limits changed on those particular lagoons. This has caused some difficulty, some grave difficulty in some of those smaller communities not having the capacity that they once had. Now, that doesn't mean that the hydraulic capacity's not there; it's just simply the capacity that has changed with standards of effluent.

Is the government prepared to look at these particular lagoons where they've changed the standards and help those municipalities fund to a greater degree than the normal infrastructure of funding that has been put forward previously? Is the government prepared to fund a greater portion of those lagoons to assist some of the smaller rural municipalities and, certainly, some of the smaller communities who don't have the financial wherewithal with respect to the taxation to help fund those infrastructure requirements?

Mr. Lemieux: Well, first of all, let me say that I'm not privy to the discussion that took place between Her Majesty's Royal Opposition, the Leader of the Royal Opposition or the Premier, but the issues we're discussing here with water have been highly engaging and very important. So, just to clarify that the discussion around water and sewage may not be very sexy to some people, but, as a rural MLA, I'm sure the Member for Brandon West as well as the other members know how important they are. So I will have to look at *Hansard*, I'm sorry, to take a look at what conversation has taken place in a different room between the Premier and the Leader of the Opposition (Mr. McFadyen), but the discussion here has been a good one.

Just to talk a little bit about the point that the MLA for Brandon West made. This program is hugely oversubscribed, you know, a huge need, and the PFRA program that we tap into is coming to an end in March, March of '08, sorry. And I've been asking MLAs around the table of all political stripes to talk to their members of parliament, whether it's Mr. Tweed or others to ask them to take a serious look at keeping that program in place, because that has a huge impact on what we can do and what more we can do, quite frankly.

The comment that staff made was that we work with rural municipalities and towns and villages to bring to using today's standards, quite frankly. They're funded at a 50-percent level from Manitoba Water Services Board. The point I want to make, though, is that, because they are so oversubscribed and the communities are small, some of them, we are looking at issues around funding, looking at issues–not only did I mention PFRA but our own internal funding as to the need that's out there. And infrastructure, not only roads and bridges are aging but the sewer lines under the–you don't see them and the water lines under the ground, you don't see them, but time has taken a toll on them as well, as well as on lagoons, whether it's population moving in, you know, needing expanded lagoons because of populations that have grown in some communities, other communities just by virtue of age of some of the lagoons.

So it's a huge challenge and we're trying to head it and meet it straight on and trying to deal with it, and now more communities are looking at a regional approach whether it's dealing with lagoons or with water systems now. We've talked about this over the last four hours or so, I believe, about how they've got many communities trying to tap into water pipelines to make it work for each community. It takes a lot of co-operation between towns and villages, and it takes a lot of patience to work and time to work and money actually to work through this.

I'm sorry for the long-winded answer but I just wanted to kind of lay out what we've been talking about over the last little while and just to let the MLA from Brandon West know that.

Mr. Borotsik: Thank you for that explanation. In fairness it may not be sexy, Mr. Minister, but I can assure you that if you've tried to flush your toilet and it doesn't go anywhere, the requirement definitely is one that's necessary.

I appreciate the fact that it does take co-operation within municipalities. I guess the point I was trying to make–and I'd just like to reiterate it right now and get a comment–is we recognize that PFRA had a program. We recognize that it's oversubscribed. We recognize that the feds have only thrown so much money at it. What I was trying to get at is sometimes or on occasion it's the province that controls and regulates the lagoons of the municipalities. It's the province that then will set the standards of those lagoons. It's the province that will then dictate to the municipality as to what capacity they can have and to what requirements there are for change to those lagoons.

The point I was trying to make, if in fact there is no money from the PFRA or if it's oversubscribed, and we know that there are certain programs across Canada that the PFRA funds and Manitoba only gets a certain portion of it, my question to you was, and I appreciate the fact that you did indicate that there is a review of funding. My concern is, with a lot of the municipalities that I've talked to, is that when restrictions are placed on those municipalities, they do not have the financial wherewithal to achieve their contribution, that the province, because they're making the changes to the lagoons themselves in capacity, should it not be a provincial requirement or could it not well be a provincial policy that would fund those infrastructure improvements to a greater degree from the province, granted there should be contribution from the municipalities themselves. I don't think there's any question about that and I don't think there's a municipality that I've ever talked to that wouldn't agree to having their requirement there for their own capital improvements, but should the province not be, because the province is making the requirements for change, should the province not come to the table with more funding to the municipalities?

***** (17:40)

Mr. Lemieux: We do work actually very, very closely with rural municipalities and also the communities within those municipalities. To a certain degree it's based on their financial wherewithal. You know, we don't impose certain funding challenges to them when we know that their ability to raise, or their tax base is not as large as the next community a few municipalities over, and so on. So there is some flexibility that Water Services Board uses with that regard, and we work closely on finding solutions too. Sometimes it's not just replacing someone's lagoon and the big brand-new, you know, kind of spanking brand-new lagoon. It's tying in, trying to have a regional approach as to what can you do with your neighbours.

So there is that approach and we try to work with the communities and I think that it's not only, when we talk about infrastructure, lagoons, water, those issues are often forgotten, and roads and bridges get a lot of the public attention and have a lot of the public attention, and yet the others do not. These are budgetary items that we discuss about what do you do about dollars, and we review that on an ongoing basis, and we take a serious look at that and whether or not we can increase the amounts of dollars because there are many different programs. There's not just Water Services Board; there are all kinds of different programs, whether it's agriculture or industry or other departments that also help contribute to some different challenges they have. So we do take a look at it on an ongoing basis, and we review it with staff and also the input we have from AMM and other people.

Mr. Borotsik: One final question; I'll become a little bit more parochial on this one. It's to do with the city of Brandon. I do appreciate, Mr. Minister, that there are substantial infrastructure projects that are out there. Not only are the lagoons and the water services oversubscribed, but I can assure you that I know and others know that the infrastructure requirements out there are oversubscribed at the same time.

However, in saying that, the city of Brandon–and I do appreciate the fact that you're putting substantial infrastructure in there with respect to bridges at the present time and some roadway work that's going on. But there are two major projects that have been identified. One of them is the eastern bypass, the extension that is to be completed, and I know it's a priority. The second priority in Brandon–and I know you've been there on numbers of occasions–doesn't particularly have a prime entrance. It doesn't have a double-lane highway coming from No. 1 into the community. Eighteenth Street and First Street are both major entrances but they are not of the same calibre that I would like to see for a community of our size. In saying that, we do know that the eastern access is a priority, and I know that your department has been working very hard to complete that project, although it's been on the go for quite a number of years now.

I guess my question is, I've seen the drawings for the 18th Street access from Highway 1. I'm told that those drawings are basically placed in a potential of a 30 to 40-year timeline. Thirty or forty years, Mr. Minister–I don't think you or I will ever sit at this table–but I would love to drive on that road. I would love to drive on that road, and I don't think I have the 30 or 40 years left in me to be able to accomplish that. I would ask you at this time if, in fact, any consideration from your department has been given to accelerate that timeline with respect to 18th Street access up to the No. 1 highway. I do know that there are some land requirements. In looking at the drawings, I do know that there's some dedication or some land acquisition that's required, but again, my simple question is, do you consider accelerating that particular project within the community of Brandon?

Mr. Lemieux: I thank the member for the question. I just want to say that first of all, we're very, very proud of the fact that, as a government, we're putting in the new bridges in Brandon. It's necessary; it's a growing community. The region, it's a regional community, and the bridge is very, very important. Now, the documents the MLA for Brandon West is talking about are planning documents–the documents that the department will use when a decision or if a decision is made to improve the stretch of road.

I can tell you that the land was purchased for the northeast Perimeter in the 1960s, before, actually, our government decided to complete the Perimeter around the northeast side or the east side of the city of Winnipeg. So these documents are planning documents, and they're documents that are used to look ahead into the future as to what we want to do.

To answer your question specifically, we are considering what to do certainly with Highway No. 10 or that entrance into Brandon. The new bridge is going to be going in there. So, we are looking at it in a serious way. No decisions have been made as yet, and I try to be forthright about that, but Brandon is a growing community and will continue to grow. So those challenges will always be there.

Mr. Maguire: Just a last question to the minister while Mr. Menon is still here.

The Member for Russell (Mr. Derkach) has asked me to–he is at another set of Estimates right now–has asked me to ask a question in regards to the Decker Hutterite Colony in regards to the water supply to that particular location.

It's going to need the waterline coming in and I think the choice is either Miniota or Hamiota or somewhere in those areas. I just wonder if the minister is familiar with it, and if he can give us any kind of project report or commitment as to what's required there.

Mr. Lemieux: Just wanting to talk about the Decker Colony project. It's something that they approached the department 10 years ago and wanted to look at alternatives. And actually, there was a solution given, but they turned it down. Now they've re-engaged dialogue with Water Services to see what kind of solutions are there. So, I understand that meetings have been arranged and discussions are going to take place as to what possible solutions are there.

Back to the MLA for Russell, you're certainly, you know, you can pass this on back to him, that there are conversations going to be taking place in the very near future as to looking at solutions. What those are and costs–I am sure you have an appreciation that costs have gone up substantially in 10 years. It may look like quite a deal compared to what 10 years ago would have been, but I will just conclude my remark at that. That is, that they will be talking.

Mr. Maguire: Thank you, for that answer.

Mr. Acting Chair, I thank the minister for his answer. Apparently now that there is a greater need, and I don't know if the water is contaminated in that particular location right now, they are hauling drinking water as I understand it, and they have the facilities to treat water that will come in, from my understanding, and so I'll leave it at that.

I want to turn it over to my colleague from Springfield (Mr. Schuler) in regard to any, some particular questions on that and I'll close by thanking Mr. Menon again for being here. We would, I believe as I said, be able to answer if there's any other questions on water, we'll just have to ask and have the minister get back to us. But I thank you again for your time here today and for coming all the way in from Brandon. Thanks.

Mr. Lemieux: Well, again, I just also want to thank Mr. Menon. He's been a very loyal civil servant, very well respected by municipalities and citizens of Manitoba and I think we all would want to pass that on to him. So, I appreciate the Member for Arthur-Virden's comments and we know his role and his job is very, very important to the citizens.

I just want to ask my critic whether or not we are going to proceed with transportation issues at this point, or where my colleague would like to go with regard to questions.

Mr. Maguire: Yes, I believe I'll just proceed with transportation issues, and my colleague from Springfield will be next.

Mr. Ron Schuler (Springfield): Minister, I have four questions, and I understand that these do involve some technical answers and I would be fine if they were taken as notice and the department could afterward send a letter. I don't know if you want me to give them one at a time. I would just love to have a response at some point in time; it doesn't necessarily have to be tonight.

The first one is PTH 15, the bridge over the floodway. That's the Dugald bridge over the floodway. What kind of a retrofit is the department looking at? Like, what will that involve? One of the questions that we would clearly want to know is what kind of traffic interruption there would be? I believe PTH 15 is one of the most travelled, single-lane, feeder routes into the city. It carries an enormous amount of traffic. So it's not something that need be answered right now, just at some point in time, if I could get that information.

***** (17:50)

Mr. Lemieux: Well, I certainly can answer part of this. We're taking a look at the options with regard to, certainly, the bridge crossing the floodway at this time, also the intersection with regard to the Perimeter and Highway 15. There are a lot of challenges with regard to traffic, of course. The Rosser Road, for example, has more traffic than Highway 15 or Dugald Road does. It might be a moot point, but there is a lot of traffic anyway on Highway 15 as we all know, and I use it as well.

We are very pleased, of course, that the work we've done in the northeast Perimeter is coming along very well. There have been some weather-related issues. I know the Member for Springfield has put out a couple of mailers saying that it's a great thing that the northeast Perimeter is being done, and I thank him for that. We're also pleased to do it, and we look forward to when it's going to be completed. But there are some challenges with regard to the bridge that crosses the floodway at Highway 15, and our department continues to work on some solutions for that.

Mr. Schuler: If the minister could, at some point in time or the department could let me know what kind of a retrofit they're looking at, we don't have to take any more time from the committee.

Great segue, minister, into my next question, that's the Highway 59-Perimeter intersection. When is that bridge, that intersection, that interchange going to proceed?

Mr. Lemieux: Just a clarification, that's Highway 59 where it meets the northeast Perimeter. That's going to be a multi-year project because not only is it going to be costly, but it's going to take a number of years.

The intention right now, the department is looking at starting on that project, hopefully, in the next couple of years, hopefully sooner, but that's something that we're looking at. We know that, again, there's a need there in the northeast Perimeter and the amount of traffic that goes around the city now that the number of different lanes have been twinned. So, we do appreciate the question, and I can tell the MLA for Springfield that we are proceeding internally at looking at design and looking at those kinds of things that need to be done. Again, it's a very costly project, but we're certainly committed to it, and we've said that all along.

Madam Chairperson in the Chair

Mr. Schuler: Yes, and on that one, obviously, a lot of trucks are tipping trying to get from one section of the Perimeter to another because it's a very sharp corner, but the minister, I'm sure, knows that.

On to my third question. Back to Highway 15, east of Anola fire hall to Eastdale Road, the road is in really rough shape, and I was wondering if the department has had the opportunity to have a look at it, and is there any plan to do some resurfacing work there?

Mr. Lemieux: The department is aware of it, and staff from Steinbach in the regional office, they monitor our highways on an ongoing basis, all the highways in their jurisdiction. They're continually looking at the kind of needs that are out there and trying to balance that off with greater needs, I guess if I could put it that way, because they have to prioritize, and it has to be a balance. But they are certainly looking at it, and they're aware of the situation of not only the traffic, for example, on Highway 15, but certainly aware of the shape that the roads are in.

I have to point out, too, that the department also is wanting to ensure that roads are safe; they always do that. That's paramount with regard to any of their planning and any suggestions that they pass on to the deputy minister's office or through the deputy minister to me. So there's ongoing monitoring of all of our roads around the province. So just to let the MLA for Springfield know that they are very much aware of it and are certainly monitoring that particular stretch of road as well as they monitor 15 on an ongoing basis.

Mr. Schuler: My last question is: Highway 15, I take it there are no plans for twinning of Highway 15. The department a while back had looked at the Oakbank corridor. Is that still something that is an active file, or what has happened with the Oakbank corridor?

Mr. Lemieux: A point of clarification. Is the MLA asking about Garven Road and those kinds of connections or is this a new, like a different route as opposed to Oakbank?

Mr. Schuler: No, the Oakbank corridor is a mile road past Oakbank. It is actually Cedar Lake Road, which then would cross the floodway. It crosses the Perimeter and clips into Gunn, and then afterwards it meanders Gunn and then meanders over to Springfield and would come out at 59. The reason why it doesn't take Springfield is because then it would cross right at the railroad tracks because Springfield sort of shaves into the railroad track. That's why it was always Cedar Lake Road. The department did an open house on this. It was agreed that it would be Cedar Lake Road and then it sort of meanders over eventually to Springfield. Then it just sort of quieted down in the late '90s. Is there any discussion in the department on the Oakbank corridor?

Mr. Lemieux: No, there is no serious consideration being given for it right now.

Mr. Gerald Hawranik (Lac du Bonnet): Yes, I have a question with regard to a small bridge that is on PTH No. 12 south, specifically as it intersects with Oakwood Road in the Rural Municipality of Springfield. While it isn't in Lac du Bonnet constituency, many of my constituents are affected by it. I notice that this spring I've had a number of complaints about it because it was restricted to a greater level and extent than the road itself. As a result, and because it's on a provincial trunk highway, I'm wondering what plans the minister has either to replace it and when that will be done or perhaps maybe even be replaced with culverts because it's not a large bridge on PTH 12.

Mr. Lemieux: I thank the member for the question. I'm not sure if they call it Oakwood bridge or what the term is, but I'll certainly ask the department to look into this to find out what the status of that is, or what condition it is. I mean, we're running regular highway weights on No. 12. I'm not sure where the dilemma is because the regular highway weights are being run on over the bridge. I don't know if someone has raised this and said there were flags there or something, but regular weights have been run over the bridge and run on that road.

Mr. Hawranik: That's fair enough. If you could check into that in any event because I've had a number of complaints from truck drivers, particularly saying that it's restricted even more than the road itself. I think, in fact, the signs went up, haven't been there over the last couple of weeks over that particular portion, but the signs went up apparently in May restricting that bridge just after the election, in fact, a couple of days afterwards. So it was toward the end of May, beginning of June, somewhere in that neighbourhood.

Secondly, there's a concern in our area about Provincial Road 302 and, of course, the restricted portion from the CPR railway tracks going north, pretty much to Pescitelli Road as it enters Beausejour. That particular stretch of highway is in poorer shape than the rest of Provincial Road 302. I note that the Rural Municipality of Brokenhead has, in fact, approved a rezoning for a Robert Small Agri-Tel industries along that particular stretch for a biodiesel plant, which means that there's going to be heavier trucks likely going along that stretch of highway.

I've also had had conversations with the reeve of the Rural Municipality of Brokenhead, who's indicated that because that particular stretch of road–it's about four or five miles of roadway–has greater restrictions than the rest of Provincial Road 302 that they're using the gravel roads of the Rural Municipality of Brokenhead to get around that stretch of road. He told me he's considering, in fact, restricting the municipal roads, and that poses a real problem for some of the truck drivers in that area, particularly since LSL Sand is just north of that stretch and so on. So it can create a major problem. I'm wondering what plans the minister has, if any, to upgrade that particular portion of 302.

***** (18:00)

Mr. Lemieux: Knowing that the request is for RTAC and carrying heavier weights, there is no consideration being given to that at this time, but we're certainly looking at doing some repairs on that road, whether it's seal coating and so on, but we're not looking at making it RTAC currently.

The R.M. of Brokenhead has raised this. I've met with them on a number of occasions and I know they've raised it. It is a concern for them, and they're, of course, concerned with rural economic development and how highways tie into that. It's been something that's been raised to us.

Can I just, if I could follow up, actually, just with a question on clarification of the Oakwood bridge. Where is that located, just trying to get a better idea where that's located on No. 12?

Mr. Hawranik: It would be approximately four to five miles north of Anola on PTH 12 at the intersection of Oakwood Road. In fact, all the roads in the Rural Municipality of Springfield are named so I believe it's at the intersection of Oakwood Road and PTH 12.

Mr. Lemieux: We've not known it as that name of a bridge, but we know the location now and we'll certainly look into it. Thank you.

Mr. Stuart Briese (Ste. Rose): Madam Chair, I want to refer to several roads in the north end of my constituency that I would like to know if there's anything planned on them. One is a PR and the other two are market roads. It's my understanding that in the former LGDs, there's a cost sharing with the municipalities on market roads of 50-50. I believe that's the way it works with the province and the former LGDs. These are in the R.M. of Alonsa, one being the Birdinia Road between Highway 50 and Highway 68; that's one of the market roads, another one being east of Rorketon from Rorketon to PR 481, and the third one being PR 481 between Highway 68 and PR 276.

These are all roads that are in terrible shape most of the time, and in the spring of the year almost impassable. It's an area where there are very few roads of any sort and they're not all that well maintained. There's a safety factor, certainly, there. One of those roads goes to the Crane River First Nation and the Crane River Northern Association of Community Councils. I'm told by people who live up there that they have to replace tires on the car twice a year. That's just a kind of a standard because the roads are in such rough shape. I would like to know if there's any plan to do any work on those particular roads.

Mr. Lemieux: Maybe the dilemma that we all face, quite frankly, as rural Manitobans, as Manitobans, is no clearer depicted than questions around transportation, around roads. Each MLA will have a series of roads that are important to them, and it's very difficult to say that the MLA for Ste. Rose's (Mr. Briese) roads are more important than the MLA for Morris (Mrs. Taillieu) or the MLA for Steinbach (Mr. Goertzen), yet, clearly, there has to be a balancing act, even though we have a $4-billion 10-year plan of $400 million a year. Actually, with regard to that, just that we've added on additional today, made an announcement, and an additional $125 million adding to that particular budget.

Even with that expansion, there are some huge challenges around infrastructure and transportation in the province. We are adding, around Highway 68 in the MLA for Ste. Rose's area, about $7-million worth of work just on that Highway 68 in that one stretch. To be frank and forthright with the MLA and, again, this is the first time I have an opportunity to talk to him across this table dealing with Estimates, so welcome and congratulations.

The challenge is still great. There's ongoing maintenance. I'll be frank with you. Ongoing maintenance will take place with regard to those roads, but I'm not sure if the MLA's asking to make sure all of them are paved up to a higher standard or just need more basic tender loving care with regard to these roads. So I'm not sure what the MLA's asking.

Mr. Briese: There are areas on at least one of those roads where the water ran over this year till the end of June. It's below grade level. I believe it's the Birdinia Road at the north end.

You referred to Highway 68 and the amount of money spent on it. Most of that was, I think, spent on the east side of the Narrows, was it not, under the Prairie Grain Roads programs. I believe that's what it was because I was involved in it. I know there was some spent on the west side, but, anyhow, I think the people up there would be happy with just a higher level of maintenance. They're very upset about the quality of those roads. Thank you.

Mr. Lemieux: The $7 million I'm talking about is really, I'm trying to think of Ebb and Flow or the corner that it's at. There's a stretch of 68 that's actually fairly close to Ste. Rose. It's about $7 million. That's a huge amount of money, but 68, again, has been designated as an important route for trade and so on. But the point is well taken from the MLA about roads and the quality of them.

With having 19,000 kilometres of roads in Manitoba to be responsible for, I'm sure he has an appreciation, being involved with the AMM. What we used to call it was the hot seat or the bull pit, the sessions that happened at AMM, and numerous roads are always being discussed. There's a huge oversubscription with regard to ask as to what to do with different roads in the province.

Not unlike other provinces–other provinces across Canada are facing the same dilemma. Our infrastructure is aging, our bridges are aging, infrastructure with regard to sewer and water and so on. We have a huge balancing act as a government, but I believe we're heading in the right direction with this $4-billion 10-year plan. I believe this initiative will take us a long way to addressing our infrastructure challenges that we've got.

***** (18:10)

Mr. Kelvin Goertzen (Steinbach): Irrespective of the fact that I know that the minister has many miles of roads to take care of, I'm still elected to lobby for my miles of roads. So that's what I'll do. With the one question that I have, I'm going to lump in two roads.

The minister knows, being a neighbouring constituency of mine, the growth that we have in the Steinbach region with traffic. He might want to suggest that's as a result of good government; I might say it's good local representation. Probably the truth is that neither of us have anything to do with it, but the fact is it's there. There's lots of vehicle traffic and it's growing as a result of the immigration. I know that he's had many meetings regarding Highway 12 north in the Steinbach area. I believe that highway is actually part of a different report, which designated the intersection of either 12 north and Park or 12 north and Clearspring the most dangerous intersection of its classification in the province, so the need is obviously there in a higher key of other needs.

While there have been some changes to that road as a result of the Superstore being built and Safeway being built–we're running out of grocery stores. I don't know how many other grocery stores are going to put money into redeveloping Highway 12 north, but I would ask the minister, as part of my first question or the first part of my one question, whether or not the council meetings that he had with the City of Steinbach, previous councils, just to see where No. 12 north is on the radar of expenditures.

The other issue that I'll raise and I ask him to address simultaneously is the issue of Highway 311 between Blumenort and Highway 59. The restrictions on there, I believe are at 65 percent. It's caused significant problems for businesses like Bothwell Cheese, for example, who have a difficulty getting their product in and out of the business.

I understand also that more recently the Manitoba Pork Council, it was announced they'll be doing assembly of hogs along 311, so that's going to be causing issues of restrictions. Also, the R.M. of Hanover passed a resolution regarding those restrictions because both the Manitoba Pork Council, who wants to do the assembly of the hogs along that highway through one of the businesses, and Bothwell Cheese–now there are a few others that are in some ways getting a road restricted out of business.

So those two questions: Where Highway 12 north of Steinbach fits onto the minister's radar, and also the restrictions on 311. I want him to be aware of it because the resolution from council has come forward, and there will be a meeting, I understand, with local highway department officials on that issue.

Mr. Lemieux: I thank the MLA for Steinbach for the question.

Steinbach has grown tremendously over the last number of years. I've lived in the region for over 30 years and I know that the MLA, of course, knows it very well equally, certainly, and possibly even better than I. But it has grown and will continue to grow.

Sometimes, and this is not to dodge the question, but sometimes we take announcements of what government does in certain areas in an isolated way. If you take a look at what we've been able to do as a government with regard to Bethesda Personal Care Home, CT scan and so on, the point I'm trying to make here is that often we take what a government does for communities or working with communities in an isolated manner. The point I'm trying to make is that Steinbach is not forgotten by this government.

We have, on the highways side, looked at fixing Clearspring. I believe there's about $2 million budgeted for doing something about that particular stretch, met with recent council, and will continue to meet with council in Steinbach, the newly elected mayor, Chris Goertzen, and others wanting to look at the challenges we have along No. 12.

The reality about the challenges of No. 12 is that businesses have continued to build along No. 12, and they want access to No. 12. So as you start to look at whether it is Penner International, Penner trucking, now they're looking for a new space. Where are they going to put that? They would like to plop it right next to No. 12 highway where you have a lot of traffic going north-south on it on 12 north of Steinbach.

So there are a lot of challenges around the growth, but we're working with the community. We've made a commitment, a budgetary commitment, within our five-year capital plan to address some of them. That's not to say that all of them are going to be addressed, but we're certainly working with council and also wanting to work with the R.M.'s in the area. Hopefully, the R.M.s as well as the City of Steinbach will be able to work in a co-operative manner on a number of different issues, but this particular one is important to the community of Steinbach. We are dedicating dollars from our budget, our five-year capital plan, toward making some changes for the better with regard to safety issues and so on.

With regard to 311 from Blumenort to 59, I've had occasion to speak to some people and people with the R.M. of Hanover. The road is restricted. I'm not sure if it's at 65 or 90. I can clarify that. I think it's 65. Yes, I've been advised that it is 65 percent. Yet it's not that the road is unsafe, but because they're wanting to haul more product with regard to the hog industry related to that road and wanting to get onto Highway 59 they have asked that we consider doing more upgrades. Now I've asked the person who's our regional head to meet with some of the industry to have the discussion as to is it at certain periods of the year that's really hurting them or is it all year round or trying to work around some solution. So just to let the MLA know that there is dialogue going on. We recognize that there are some challenges there with regard to the industry and being able to use larger trucks on those roads.

I understand that Pansy is still on the map, the Manitoba map; it's been put there, just on a lighter note. It was removed accidentally. Now I know that the MLA for Steinbach (Mr. Goertzen) has roots there, so we want to make sure that that community is taking its rightful place on the province of Manitoba map.

Mr. Kevin Lamoureux (Inkster): I wonder if the minister can give indication on when Manitobans can anticipate that the Inkster Boulevard and the construction of Inkster Boulevard would commence.

Mr. Lemieux: Just on that particular project on Inkster, we are very pleased, of course, to be doing a lot of work with regard to that road. We've talked about that particular project on a number of occasions. It's a multi-year project; there's not going to be any hard construction. The design of the project is going to be taking place over the next while.

There's not going to be any construction taking place next year, as I've been advised. But the design is one aspect that has to take place first and the functional design and so on. So just to let the MLA for Inkster know that's really where it stands right now.

Mr. Lamoureux: So we can actually anticipate construction beginning of–you know, in the spring of 2009 roughly?

Mr. Lemieux: There are always challenges around new roads. The challenge, of course, is utilities, land acquisition, those kinds of things. But it's a project that we're doing–and I have to say–in co-operation with the federal government. On occasion I've wanted to hold the federal government's feet to the fire, but in this particular occasion we work very, very closely with the lead minister of the province of Manitoba, the Honourable Vic Toews, as well as Minister Cannon, to ensure that some Asia-Pacific dollars and other monies would come to Manitoba. That particular project was one that we had put out as being very important. I have to take this opportunity to thank the federal government for putting monies into the province of Manitoba on that project. That's not always the case; I won't always be thanking the federal government. But I'll tell you that when it's deserved they will certainly get it from me because I really want to use this opportunity to say so. So we are tied in with them.

The reason why I want to mention to the MLA for Inkster why we're tied in, why this is important and why I raised the Asia-Pacific, because there are some time lines there with regard to spending of monies. So, to make my answer as succinct as possible, we look to start in '09. We're looking to get going as long as the land issues and the issues related to utilities–and once that can be clarified, we'd like to get, and I know the federal government would like to get, moving on this as soon as we can.

***** (18:20)

Mr. Lamoureux: I ask in part because I know not only Manitobans but a number of MLAs are directly affected because of where it's located. To be able to say that at this stage we're looking at engineers and drafters getting together, sometime by the end of 2008 that should be complete, and we're hopeful that in 2009 it will be under construction, that's just to give out kind of like a ballpark explanation to people that might be asking.

What about the portion between Route 90 and Keewatin? I know the City of Winnipeg had talked about it, and there are some trucking companies that are actually in that portion. Is the department aware of what it is the City is doing with that portion?

Mr. Lemieux: To address the question specifically, that portion belongs to the City of Winnipeg that we're referring to. We included that piece within our proposal for the Asia-Pacific monies that the feds would contribute. That was not considered, just the stretch that was provincial road was. To this date, I'm not sure, and the department has advised they're not clear on what the City is going to do with that piece. You're right. It's not a huge stretch, but it is an important stretch, and I know they're considering it.

Mr. Lamoureux: Then I would look to see maybe through the department if they could do all of us a favour and get some sort of a formal response from the City because what we're talking about is right from Main Street, Inkster is virtually doubled. There's just that little section between Keewatin and Route 90. I think that it would be beneficial for all of us, all interested stakeholders, just to understand where the City is at in regard to it. If I could be cc'd a copy of the correspondence, I would appreciate it, in particular if the City responds. This way, it's not the department approaching the City and me approaching the City. I know that they would be very receptive and responsive to what the department requests.

Mr. Lemieux: Well, certainly, the MLA for Inkster can contact the City himself. We are in dialogue with the City on a number of different issues, but there is nothing restricting the MLA for Inkster from contacting the City and saying: Look, what are you going to do about this piece? In fact, it would hold, I am sure, a great deal of weight with the City and the local city councillor to know that the MLA for Inkster is very interested in ensuring that, for safety reasons and other reasons, this piece is addressed.

Mr. Lamoureux: I'll do just that, and I'll cc it to the minister so that he is aware that it has been done, but I do believe it is important that the department should be aware of what is actually being done in that section of Inkster Boulevard, because it would be nice to see that it was done in some form of a co-ordinated effect to minimize traffic problems when construction does get under way. So there should be some sort of co-ordination. That is the reason why I suggested the department needs to also communicate with the City on that point.

The other quick question that I had is in regard to the taxi industry. Recently, I was approached by a cab driver indicating that, you know, they have the cameras inside the taxis. He had indicated that there was a report that was done on one particular incident, and they said, well, because the incident occurred in the front seat, the clarity of the picture isn't as good as it would have been if the incident would have occurred from the back seat. I would have thought that the camera would have had a better reception or more clarity in the front because it is actually on the front windshield. To what degree would the department be aware? Does the minister have staff? I can appreciate he might not have the staff here to answer that question. If that is the case, maybe, again, the minister could get some sort of written response to me.

Mr. Lemieux: Well, I thank the MLA for this. This is something that hasn't been raised to me as an issue or even raised as a point of comment about the clarity of cameras and so on, but I will endeavour to get back to the MLA for Inkster on this. It's the Taxicab Board that, of course, is that regulatory body that works with the cab industry, taxi industry, but I'll certainly look at talking to the chair. There isn't anyone here today to assist me in the answer or to provide me with some clarity, but I will check into it, and I will certainly get back to the MLA for Inkster about it.

Mrs. Mavis Taillieu (Morris): A couple of questions. I, first of all, just want to acknowledge the work on Highway 75, which was necessary, and, I'm sure, will be ongoing. Looking forward to seeing it completed right from the city of Winnipeg down to the border.

Having said that, I wanted to ask a question in regard to the shoofly on Highway No. 1 just west of Headingley. This looks like it is, say, a diversion to allow for a culvert that is going under the highway. If the minister's not familiar with the term "shoofly," it's just a bypass. But I want to question about that because, as we saw the work proceed on Highway 75, the traffic, of course, and it's a larger area, of course, but the traffic was diverted to the opposite side of the highway for quite some time. In this case, it looks like another road or a diversion, a detour is being built specifically to divert the traffic. It also appears that the culvert will be have to be done on the other side of the divided highway as well. I know that there could be issues around turning radius and this kind of thing. But I'd like to ask the minister: What is the cost of this project in the short on the one side of the highway, and then, again, will it be done on the other side of the highway, and how much will that cost?

Mr. Lemieux: Well, thank you to the MLA for Morris for the question. If the MLA doesn't ask these questions, who else is going to? But I just wanted to respond by saying that there are a couple of culvert jobs that need to be done, not on both sides necessarily. I've been advised that we're not looking at doing both sides. The culvert has taken stress more on one side than the other, so it looks like we may be just doing one side. So it won't be necessary to do both sides.

But we haven't tendered the jobs out yet, so I'm hesitant to talk about the kind of monies that are involved in the big project to do both. We're actually doing two culverts at different sections of No. 1. But it's in the millions of dollars to do both of these, and a substantial amount of money is being spent.

I know the MLA didn't purposely leave out all the work that's been done around the community of Headingley and the stretch between the Perimeter and Headingley and the weigh scales. But maybe I can use the opportunity of just mentioning how much work has been done and the tremendous amount of work that's been done on No. 1 west and near the Flying J. We appreciate the co-operation we receive from Flying J as well as others to fix that intersection up, as well as the reeve for the R.M. of Headingley. It's always a pleasure to work with him. We know that there are a lot of other projects we have to work on, but Highway 75 will continue. We made a commitment to ensure Highway 75 would be improved. So I know the MLA for Morris will be pleased to hear that.

Mrs. Taillieu: I do recognize the hard work of the Rural Municipality of Headingley in getting and procuring a Flying J restaurant to that stretch of highway, and the work that has ensued to upgrade the road there.

Just in regard to this particular shoofly on the highway, it's a small detour, but would it not have made sense–and I'm just simply asking the question–to divert the traffic down the other side of the highway? I know there are a number of mile roads that could have happened. I also do recognize, of course, that the turning radius for larger trucks could have been a problem, but it just seems to me that there may have been another alternative.

Mr. Lemieux: I thank the member, the MLA. I know neither one of us are engineers, and we leave it up to the professionals to make those decisions. So we trust their decision is the right one on behalf of the taxpayer and all of us.

Madam Chairperson: The time being 6:30 p.m., committee rise.

AGRICULTURE, FOOD AND RURAL INITIATIVES

***** (15:00)

Mr. Chairperson (Rob Altemeyer): Good afternoon. Will the Committee of Supply please come to order.

This section of the Committee of Supply will now resume consideration of the Estimates for the Department of Agriculture, Food and Rural Initiatives. As had been previously agreed, questioning for this department will proceed in a general manner with the resolutions to be passed once all questioning is completed, with the exception of resolution 3.2, which will be passed once questioning on that section of the department is completed.

Now I'd also like to remind everyone, as agreed to in the Chamber just now, that we will be discussing Estimates for this department until 5 o'clock and then from 5 to 6:30 we will switch to deliberation on Conservation Estimates.

I also understand the minister has a comment to make at the beginning, so we allow that to proceed.

Hon. Rosann Wowchuk (Minister of Agriculture, Food and Rural Initiatives): Mr. Chairman, I would like to provide some information to a question that was asked yesterday, if I could.

The Member for Lakeside (Mr. Eichler) asked a question about how many untendered contracts over $25,000 did MAFRI enter into, in '06-07. During the fiscal year '06-07, MAFRI entered into one untendered contract over $25,000. That contract was with a University of Manitoba Ph.D. student who has extensive expertise in the type of information we were requesting, and that is science-based risk assessment for bovine tuberculosis. We have used this individual in the past, and he provides excellent information.

There was also a sole-source contract in 2006-07 over $25,000, and that was for the rental of all the audio-visual equipment used at Rural Forum in Brandon. This is a sole-source supplier contract with a local business in Brandon. There is another sole-source untendered contract for survey maps, and there is only one supplier for those maps.

Mr. Ralph Eichler (Lakeside): I thank the minister for her information, and her staff. Just for the record, the Ph.D. student for the science-based study, who was that individual, Madam Minister?

Ms. Wowchuk: The student is Ryan Brook.

Mr. Eichler: Thank you, Madam Minister.

Mr. Chair, my colleague from Russell, the critic for Rural Development, has a funeral tomorrow, and we've asked the minister earlier if it would be okay to leave the MASC for now and come back to it tomorrow. The rest of the afternoon will be dedicated to Rural Economic Development Initiatives by the Member for Russell, and I'm sure I'll probably have some questions as well. So, if it's okay, we'd like to proceed on that basis with the minister.

Ms. Wowchuk: Mr. Chairperson, certainly that's okay. I would like to introduce Dori Gingera-Beauchemin, who is the Assistant Deputy Minister of the Agri-Food and Rural Development division, who has now joined us at the table, as well as my deputy, Marvin Richter.

Mr. Chairperson: Very good. The floor is now open for questions.

Mr. Leonard Derkach (Russell): Let me, I guess, begin in a general sense by stating somewhat of a disappointment in terms of how the Rural Development side of this department has been, I guess, responding to the issues that are in rural Manitoba, although I note that this is not a reflection on staff because certainly staff of the department have done everything they possibly can, given the constraints that government has put on them.

This is a direct comment on the policies of the government by diminishing the importance of rural economic development in Manitoba and folding it in with the Department of Agriculture and also stripping a lot of the department budget that was formally in the Department of Rural Development to a point where it has become an ineffective tool, if I might add, in terms of addressing many of the needs of rural Manitobans.

I want to ask the minister first of all whether she can separate and identify for us the global budget for rural economic development in Manitoba.

Ms. Wowchuk: Mr. Chairperson, under the Rural Economic Development Initiatives, the budget is $21.108 million, but that does not include the 11 business development specialists that are outside this amount. They are included in the Go Team alliance. So that's the amount that we have budgeted here.

Mr. Derkach: So a department that used to have a budget of $50 million has now been diminished to a $21-million department. Is that correct?

Ms. Wowchuk: Mr. Chairman, when the reorganization was done, the time that the member refers to was a time when there were other responsibilities under Rural Development, responsibilities such as conservation districts, Water Services Board. We have made some changes and the responsibilities, the Rural Economic Development Initiative is under this department, so it would be inaccurate to say that it has diminished from over $50 million to $21 million. Some of the responsibilities are in other departments and the dollars went with them.

Mr. Derkach: Mr. Chairman, if that is an inaccurate number, can the minister tell me what the accurate number is in terms of how the department has diminished over the course of the last eight years?

Ms. Wowchuk: Mr. Chairman, if you look back to 1998-99, the Rural Economic Development Initiatives had a budget of about $21 million. It was $21 million in 1999-2000. When it came to our department in 2002-2003, that budget was at $16.225 million, and since that time it has come up and it is $21.305 million. So the member is referring to a time when they were in government, 1999, it was at $21,000–$21 million, I should say–and it is at $21.3 million now. So the Rural Economic Development Initiatives are at about the same level that they were in 1998-99.

Mr. Derkach: Well except that the minister forgets that some of the programming that was eliminated also eliminated the dollars with it.

First of all, I'd like to ask the minister where the dollars that were identified for and designated for Grow Bonds, where did that money go to?

There was, I believe, $40 million in total for Grow Bonds at the time. My numbers might be a little dated, but nevertheless that was money that was set aside to guarantee the Grow Bonds program. The government eliminated the Grow Bonds program. The money that was in that file came from video lottery terminals. There was a promise by the former administration, of course, that money generated from VLTs in rural Manitoba and Winnipeg would be split 50-50 and the money that was used from VLTs for rural Manitoba would be used for economic development initiatives.

I'd like to ask the minister where the money from VLTs that was designated for the Grow Bonds program was redesignated for.

***** (15:10)

Ms. Wowchuk: Mr. Chairman, when the member talks about $40 million being available for Grow Bonds, that was the provision for capital authority. That was not the actual amount that was there; that was provincial guarantees, but that would not have been the amount that was budgeted every year. There would have been a budgeted amount, but the whole $40 million would not have been the amount that was budgeted.

So we have gone from a grow bond to a CED tax credit that supports investments in communities and there are some good results with that. I could say to the member that there are still some outstanding provincial guarantees under the Grow Bonds, so there is still money provided there. But we have moved to a system of CED tax credits, Mr. Chairman, and we feel that this is a tax credit that encourages local private investment in Manitoba-based opportunities by providing community-based enterprise development projects with the means to raise the necessary equity capital. That's the purpose of it and it is working.

So there is economic development money available, but it is in a different form than under the previous administration when they were offering the Grow Bonds program. There are also the Community Works Loan Program and the Communities Economic Development Fund that are also available through the funds in this program.

Mr. Derkach: We are getting into the same realm that we were last evening when we adjourned here. Is the minister telling me that the tax credit program is now somehow utilizing VLT dollars? So are we now saying that VLT dollars are being used to shore up a tax credit program for businesses in rural Manitoba? Is that what I'm hearing from the minister?

Ms. Wowchuk: Mr. Chairman, just as the Grow Bonds program uses tax dollars to make grants to raise money for CED, a tax credit encourages local private investments in Manitoba-based opportunities by providing community-based enterprise development projects with a means to raise the necessary equity capital. Just as they raise capital under the grow bonds by selling shares, they raise money under–they use the tax credit as a vehicle as well.

Mr. Derkach: Well, this is getting more interesting as the minister answers the questions. The minister is telling me that we use the Grow Bonds program as a tax credit program. We never did. Nobody ever did. The Grow Bonds program was one where local capital was guaranteed by a Grow Bond, by the VLT money that was set aside for that purpose. Nowhere in that program was there ever a tax credit program given to businesses utilizing VLT money. But the minister here is telling me is that there's somehow, now, a tax credit program developed for economic development in rural Manitoba utilizing VLT money as tax credit dollars. Is that what she's telling us in the House or in this Chamber?

Ms. Wowchuk: Mr. Chairperson, under the previous administration, Grow Bonds or VLT money, as the member opposite talks about, VLT money was used to raise local capital and then VLT money was used to pay off the losses from the Grow Bonds projects that weren't successful. That's what the money was used for.

In this case, it is just a different vehicle that we have chosen, and the CED tax credit encourages local private investment in Manitoba-based opportunities to provide community-based enterprise development projects with a means to raise the necessary equity capital. It's the same used under your administration. You were using VLT money to guarantee Grow Bonds and pay off the losses if there were any. In this case, we are using it to encourage people to invest in their community.

Mr. Derkach: Well, there is a very distinct departure here, Mr. Chair. I'm not an economics major, but I can tell you there's a very, very big difference between using money from Grow Bonds, from the VLTs, to use those monies as a guarantee for money that is invested by local investors into an enterprise and using money from VLTs as a tax credit shore-up for businesses that are starting up.

Can the minister tell me, if I am a business, today, starting up, and I enter the CED tax credit program, I get a tax credit for starting up the business? How is that shortfall made up to government? Is that where the VLT money is used?

Ms. Wowchuk: Mr. Chairperson, the business does not get the tax credit. It is the individual who makes the investment in the local venture and they have to get approval before they can move forward with their tax credit. But, yes, the individual who makes the investment earns a tax credit that they collect on their income tax. Just as under the previous administration, if there was a loss, money was used to pay off the loans.

Mr. Derkach: Excuse me for my lack of understanding as to how the process works. I'm going to ask the minister to explain it once again. As I understand it, the individual who invests in an enterprise gets a tax credit. If that tax credit is $5,000, that individual gets a receipt from the Department of Finance that would give them a tax credit on their income tax of $5,000. Where does the VLT money come in then? How is the VLT money used then? Is the VLT money then used to pay that $5,000 to the government for the tax credit that they give to the individual?

***** (15:20)

Ms. Wowchuk: Yes, this money is targeted for projects in rural Manitoba. So that is why the appropriation is under the rural economic development system. It is a tax credit system and the money flows through the tax system, but, just to say in this case, they get a tax credit. Under the Grow Bonds, if there was a loss, it was a direct payment to the individual for the losses that they might have had on the Grow Bond. It is a different mechanism, but in each case the money is used to encourage rural economic development.

Mr. Derkach: Mr. Chair, let me just try to put this in perspective.

Under the Grow Bonds program a local investor invested in a project. He invested in the project at a particular interest rate. The business that he was investing in had to pay him back the principal and whatever interest rate was determined in the agreement. If the business failed, the province through the Grow Bonds program, through the VLT money, guaranteed that the investor would not lose his or her principal. The interest would be lost but not the principal. That's it. Not every single person who invested in projects got money. They earned their money from investing in the enterprise.

What the minister under this program is telling us is that now individuals can invest in local businesses, and that individual then gets a tax credit on his personal income tax when he files it. That tax credit that that individual gets now, apparently, is shored up to the government, to the tax department, to the provincial treasury, by VLT money. Is that what is really happening under this program?

Ms. Wowchuk: The member surely knows that one of the challenges that people in rural Manitoba face when it comes to starting up a business is to raise equity. That's why, Mr. Chairman, under this program it is just a matter of flowing the, of advancing the money to the individuals sooner rather than later because they make the investment, they get their tax credit up front and then they have the ability to raise more money. The member talks as if some money, paying off somebody's debt if a bad investment is made is different than giving an advance up front. The member may think that that's different, that's fine, but I can tell him that there have been projects that have looked at the CED tax credit and have been able, because of this tax credit, to make viable business ventures in rural Manitoba. This is about looking at ways that we can help people raise money.

I look at Pilot Mound co-op committee. They were able to take advantage of this. Bowsman community store, a grocery store, where there would only have been one if it wasn't for–but they were able to use this tax credit and raise their money. Clearwater Development Corporation used it. Biodiesels were able to use this vehicle to raise the money that they needed. There are many groups that are looking at this as a way to raise the equity that they need in order to build viable projects and viable businesses in rural Manitoba.

The member may not agree with this approach, and he seems to be saying that we are using this money to offset taxes. In reality we are using this money to start businesses, and of the $15.2 million that have been approved, the program–

The member talks about how Grow Bonds didn't pay out as much or this might be paying out money up front. I'm not sure what his concern is, but of $15.29 million approved under the Grow Bonds they paid out $6.689 million in net guarantees. There was money paid out under Grow Bonds, and under this program there is money that is being paid out through a tax credit system to encourage investment in rural Manitoba, and the investment is taking place.

Mr. Derkach: I should illustrate this for the minister if I might. Under the Grow Bonds program, if I use her numbers of $50 million–

An Honourable Member: Fifteen. Fifteen.

Mr. Derkach: There was over 50 invested, I know that. But okay, out of 15, $6 million dollars she said was paid out in loans. Under her program, if that were the budget, $15 million would be paid out, not 6, because under the tax credit program you would have to pay that out.

I want to ask the minister: What rate of interest or what tax credit rate is used when an investor invests? What rate of tax credit do they get? Is it at 10 percent, 15 percent, 30 percent? What is it?

Ms. Wowchuk: A Manitoban who invests in an eligible local enterprise will earn a 30 percent income tax credit on a maximum annual investment of $30,000 or get $9,000 in tax credits, and no individual can acquire more than 10 percent of any issue.

Mr. Derkach: Mr. Chair, the individual who invests gets a 30 percent tax credit and on top of that tax credit that individual then takes a share in the company and would receive a dividend from the company as well. The principal of that individual who invests in a business whether it's $30,000 or $10,000, is there any guarantee on the principal that is invested in that company?

Ms. Wowchuk: No, Mr. Chairman, there is no guarantee under investment, but they can get a 30 percent personal income tax maximum amount.

Mr. Derkach: Does the individual who takes a share in that company, does that individual then get eligibility for dividends from the company, or then is that individual also allowed to share in the profits of the company?

Ms. Wowchuk: If the company is successful then they would be able to share it. I don't think you could get people to invest if they thought that they weren't also going to share in the profits if those profits become a reality.

***** (15:30)

Mr. Derkach: So what the minister is telling us is that the individual gets a 30 percent tax credit, is able to capitalize on the project if in fact the project is a successful one, can earn dividends from the project as well, and can share in the profit if the business is sold.

Ms. Wowchuk: Mr. Chairman, that's what investing is about. That's what all investors expect. They invest because they think a project is going to be successful. They don't invest because they think they're going to get a tax credit. They invest because they want the business to succeed, but they have no guarantee that it will be successful, and that is the risk that they're taking, but ultimately they and we want these projects to succeed.

Mr. Derkach: Mr. Chairman, can I ask the minister how much money has been set aside from the VLT program for this tax credit program.

Ms. Wowchuk: $300,000 in this budget, Mr. Chairman.

Mr. Derkach: So, Mr. Chair, is that what the annual budget is for this program, $300,000 a year of VLT money?

Ms. Wowchuk: That's the amount that is budgeted this year. We could make an adjustment when we're doing the next budget, but that's what it is this year.

Mr. Derkach: So can the minister tell me where all of the VLT money that had been designated for the guarantees now flows?

Ms. Wowchuk: Mr. Chairman, as I indicated, the Rural Economic Development Initiative is at $21.305 million and in that line there is also sufficient provision that has been made for the Grow Bonds that are still outstanding should there be need to pay out that money. It is in there as well.

Oh, I'm sorry. There is also a provision, but it's not within the 21. That's been put aside in previous years.

Mr. Derkach: Well, Mr. Chair, I did not get an answer to my question. It appears that the minister is somewhat confused here, but we need to move on, and I'm going to ask the minister how much VLT money went to the provincial treasury this year. Was it the $300,000, or was that what was set aside from the VLT program to compensate for the tax credit program that was invested in by individuals in Manitoba?

Ms. Wowchuk: I will try to answer the member's question and I hope I'm getting it right, but $300,000 has been set aside out of the budget that I referred to for the tax credit. If I'm not getting the question right, I would ask the member to repeat it.

Mr. Derkach: In simple terms, can the minister tell me how much of the $300,000 was spent?

Ms. Wowchuk: In the last fiscal year we spent $310,510 on the tax credit. This year we have budgeted $300,000.

Mr. Derkach: Surely this can't be for all of rural Manitoba. That number is just too small. Can the minister review that number and tell me whether this meagre amount is for all of the businesses that have started up under this program in rural Manitoba for one year?

Ms. Wowchuk: Mr. Chairperson, last year was the first year of that program. There were three successful applications for the program and that is the amount of the tax credit. We anticipate and in fact there are more applications this year for the program, but we budgeted according to what we had last year. We anticipate that we will probably be over budget because there is an increased number of applications this year, but in the first year that we had the program there were three applications.

Mr. Derkach: A province as large as Manitoba, I don't know how many rural communities, and we have three projects in the province for one year. Is that what the minister's telling me?

Ms. Wowchuk: There were three projects that were approved for a tax credit. There were many other projects of economic development that have taken place in this province. What I'm telling the member is three projects were successful in getting a CED tax credit program and that resulted in a tax credit of $310,500.

Mr. Derkach: Can the minister tell me the disclosed businesses that received part of the program– whatever it was, $310,000, who the businesses were and where they're located?

Ms. Wowchuk: There was a Clearwater Development Corporation in Clearwater, Bifrost Bio-Blends in Arborg, and Intermountain Forage Limited in Dauphin.

An Honourable Member: What is it?

Ms. Wowchuk: Intermountain Forage in Dauphin. Those were the three that were successful in the first year of the program's existence.

Mr. Derkach: I'd like to move to another area because my time is limited, Mr. Chair, and although we could spend hours debating this, I want to ask just one more question on this. The tax credit that is provided, is that a one-time tax credit?

Ms. Wowchuk: Yes, Mr. Chairman.

Mr. Derkach: I'd like to move to another area and that is the area of the cattle slaughter facility in Dauphin, again another failed attempt by this government to do anything constructive in the whole area of product processing in this province. I want to ask the minister if she can explain how it is that that project failed so miserably.

***** (15:40)

Ms. Wowchuk: Mr. Chairman, the cattle slaughter facility in Dauphin grew out of the whole BSE crisis. There was a real recognition that there was need for slaughter capacity in this province and a group of producers got together. This government was very supportive of the project, made a significant amount of money available, took the steps to be sure that the investment in infrastructure was there. But I guess the members opposite could also, I would remind the members opposite that their critics were saying that we didn't need slaughter capacity in this province. They didn't do anything to encourage producers to participate.

At the end of the day, despite the significant support that was put in place, the Ranchers Choice group had been doing fundraising and were not able to raise adequate money to meet the producer's share. I would remind the member that when this got started, the producers told us clearly that they did not want the province to be building a slaughter facility. They wanted support from government. We were there to support them. Unfortunately, they were not able to raise enough of the producer equity that was required, and I guess, I would say, I feel very saddened that this didn't become a reality.

But the slaughter industry is a very tough industry, and there have been others who have attempted to build slaughter processing facilities since the time of BSE and others still look to do it. We will continue to work with the producers of Manitoba or the processors of Manitoba as others look at opportunities to increase slaughter capacity in this province.

Mr. Derkach: Well, Mr. Chair, I don't have to recite history for the minister because this whole project went from bad to worse under her watch.

First of all, it wasn't just the capital that needed to be raised by local producers because I believe that if the government had had the climate correctly, there would have been the investment in the project. You can't create questions in the minds of investors and expect them to invest.

When the Securities Commission pointed out to the government and the project that they had erred horribly in–yes, you were part of that, Madam Minister, and the error that was made with regard to the registration of the project, and the collection of money, and the purchase of equipment before the Securities Commission had actually given the green light; this caused a big question in the minds of people who were wanting to invest. Then, when you had to re-structure the entire project, once again, that raised questions in the minds of people.

Today, government's money is lying in a pile of rubble in equipment that can't be used, and I'd like to ask the minister how much provincial money was wasted on this project to date.

Ms. Wowchuk: I have to correct the member because the issues at the Securities Commission were not our issues. The decisions were made by the board. With their legal counsel they made the decision on how they should apply to the Securities Commission. There was an error made. They had to reapply and work through it. So that's what happened with the Securities Commission. The member, of course, can spin it anyway he wants that this government is responsible for that, but the members opposite are also responsible for a lot of language that they put into the media about no need for slaughter capacity in this province. Issues like that did not help with investments.

With regard to this facility, the member asked about how much money was wasted. Well, you know, it's just like some Grow Bond projects that the member opposite was part of when they thought something could work. It didn't work and money had to be paid out. I think there was a significant investment in Elie that did not work and there was a huge write-off on Grow Bonds. That was a decision made by the previous government. The member asks specifically. I would say that we are in the range of about $4.8 million that was invested in this project. When it is all finalized, the equipment will revert back to the province, and I'm still hopeful that there are others who will be interested in this project.

I can say to you, just last weekend, I met with an individual who was asking about the equipment and whether there is a possibility of him acquiring it. So there are still people that are interested in slaughter capacity in this province, but it was a significant investment and I regret that it did not come to fruition.

Mr. Derkach: I think we all regret that it didn't happen, Mr. Chairperson. But there were other projects on the table that the Province refused to look at. One of them was the proposal by Natural Valley to build a slaughter facility in Neepawa.

When we asked questions of the minister in the House, she refused to even acknowledge that this was a project that they were anywhere interested in and continued to refer to the Dauphin project. Not that the Dauphin project was a negative one, but there was also a desire by people who were investing in Natural Valley to see their infrastructure needs in Neepawa enhanced so that they could proceed with their project. That never happened also.

In addition to that, I understand that when it came to the Dauphin infrastructure issue, both the federal government and the City of Dauphin had made commitments to the infrastructure, whereas this government did not.

Can the minister tell me whether or not their commitment was on the table and how much it was for the infrastructure and the upgrading of the effluent and water treatment plant in Dauphin?

Ms. Wowchuk: I hate to tell the member this, but he is wrong on both counts. On the Dauphin infrastructure, the federal and provincial governments made the announcement at the same time. It was a $10-million project. It was a three-way split between the federal government, the provincial government, the city and the R.M. Our money was on the table.

***** (15:50)

With regard to Natural Valley Beef, I would support Natural Valley Beef. We've told them time and again to come forward with a business plan: Tell us what you're going to do. They have not come forward with a business plan to this point on building a slaughter facility. They are working on another business plan at the present time, but they never came forward with a plan on building this facility. They talked about it, but when you came down to the nitty-gritty they were not able to provide us with the plan and the member would know, from his time in government, before you invest in a facility you have to know what their business plan is and work through it with them as well.

Mr. Derkach: I thank the minister for her response and I stand corrected. She is right about the $10-million announcement that was made. I just forgot, but I know that the Province was dragged into it kicking and screaming in a way. But let me ask a question about the hemp plant in Dauphin now.

Can the minister tell me why it is, here's a plant that was also, I guess designated for the area, significant dollars were invested by producers and now this project has, once again, for about the third time, fallen down and mothballed because, as has been reported in the papers, had the government come in early, the speculation is that we would've helped to attract the balance of money. The delay–that was a comment made by Don Dewar as a matter of fact, and he is a community member of Dauphin. I don't know. Maybe the minister has a cynical view of him, but indeed he is a significant contributor to the community and an investor in the project and so I have to take his word at its face value. I ask the minister why it is that once again we have another failed project under her watch.

Ms. Wowchuk: First of all, I would like to say that we're now joined at the table by Allan Preston, who is Assistant Deputy Minister for Agri-Industry Development and Innovation division. Welcome to the table.

When groups try to raise money and when they run into difficulties, there are some that will say, well, if the government had been at the table we could have raised money. When this group went out to the market, they had a plan to raise money. They didn't say to the producers, well, we are getting this much money from government. When they couldn't raise their money, they looked for additional money, but, had we funded that amount that they wanted, we would have been well over 50 percent of the project and that was just, you know, a significant amount of money.

However, it was the producers that made the decision that they would close their share-offering and return the money. That was a producer's decision, and we are still working with them, looking for a way to redesign the project so that it can fit in with what they are able to raise. So there is a certain point that you can go to and there is a certain amount of money that government can contribute. I could say to the member that we made every effort to get the project scaled down to size, but if you're going to go start scaling down the project, then with their share offering they would be having to refund anyway so rather than–because you're changing the project. They made the decision that they would close their share offering, and we are still working with them to redesign that project.

Mr. Derkach: Mr. Chair, in an article, Mr. Dewar indicates that they were looking for the Province to take an equity position in this hemp processing plant similar to the position that the government had enunciated for Ranchers Choice. Was the province prepared to take the same position with this hemp processing plant as they were with Ranchers Choice?

Ms. Wowchuk: Mr. Chairman, every project has to be dealt with in an individual way because every project is different. When the individuals first came to us, they came to us for a MIOP loan, and the MIOP loan was supposed to help them secure their investors. We made the commitment of the MIOP loan and they went out to the investors. When they weren't able to raise as much money as they thought they were able to, we made a commitment to assist with equipment, with purchasing some of the equipment. That would reduce their capital plan.

So we looked at every way that we could help them, and we met what they had asked for, a MIOP loan and then an investment in equipment, but even with those investments, they could not raise enough local capital so that they could then do the borrowing that they had to do.

Mr. Derkach: Can the minister tell me whether the investors in this project were given the same opportunities as investors in the CED tax rebate program, whether investors in the hemp plant were eligible for a tax rebate program?

Ms. Wowchuk: Mr. Chairman, the group did not apply for a CED tax credit, and I think part of it is they didn't want to make their application complicated, but the other issue is that some of the investment by producers is straw. So that's how they were building up some of their investments and that wouldn't have qualified but, basically, they did not apply for a CED tax credit.

***** (16:00)

Mr. Derkach: I just want to make sure I heard the minister correctly. Did the Province offer the tax credit system to the investors? Now, this is not offering it to the project; you're offering it to the investors in the project because, as the minister said, this is an individual tax credit on an investment in a business.

There is no particular size, as I understand from the minister, in terms of the business, but worthy individual producers or the individual investors, whether it's straw or money, were they offered a tax credit program to try to entice and attract investment into the hemp project, and is that still available to them if they were able to apply for a tax credit for the money that they have invested thus far in the project?

Ms. Wowchuk: The program was discussed with the producers, and if they were going to take advantage of the program, the project would have to make an application through their local economic development board. Yes, there is a cap on the amount that could be used for this. They were aware, but they did not make application.

Mr. Derkach: So the minister is telling me that the project could not attract enough investment, yet there is a 30 percent tax credit program available to people who invest in businesses of this nature. She is telling me that the people who are on the board of the hemp plant chose not to apply for the tax credit program, yet they were seeking investment from investors without offering them a program designed by the government to give them a 30 percent tax credit. Is that what the minister is telling me?

Ms. Wowchuk: Mr. Chairman, this program is targeted at smaller projects. It's targeted. I said to the member opposite they were made aware of the program and they could have applied but there is a cap to the amount. The eligible investment right now is to a maximum amount of $500,000.

So this project would have been greater than that, so if they would have been able to raise it–*[interjection]* So they could have applied for up to that amount of money, but they chose not to.

Mr. Derkach: Can I ask the minister whether or not people who are investing in Ranchers Choice were made aware and given the opportunity to take advantage of the tax credit program?

Ms. Wowchuk: On the hemp project, I can say to the member, this project isn't over. They have talked to us and they have said they want to return their share offering but we continue to work with them. There are further plans to work with them that I'm not at liberty to talk about. But they are working at trying to bring this project to reality.

With regard to Ranchers Choice, this program was available at the time, but I think we have to remember that when they first started Ranchers Choice they were talking of commitment of cattle. They weren't talking about dollars. They were looking for producers; they were signing up cattle. Some of the amounts were very small amounts that were being put in. I guess I can't tell you. They didn't apply. They could have applied, and they were working with people who were aware of the program, but, no, they did not apply for the program.

Mr. Derkach: Again, the minister points the finger at everybody else but herself.

I was approached to be an investor in Ranchers Choice. Our family was. It wasn't cattle that we were initially investing. It was money.

Had the project come to me or to any investor and said, if you invest a thousand dollars you can get a 30 percent tax credit on your money because this is a program that the government has in place, I don't think there would have been a great difficulty to collect the money. The government either completely hid the opportunity for people to get the tax credit who were investing in these enterprises, or somehow misled the enterprises themselves, because I can't see why an enterprise that wants to attract capital would reject the opportunity for people to have a 30 percent tax credit when they invest some money in it. That just doesn't make any sense.

I would like the minister to explain why Ranchers Choice or the hemp plant would reject a 30 percent investment credit program for people who invest in their projects. Can she explain that?

Ms. Wowchuk: Mr. Chairman, it's very difficult for me to answer for a board as to why they didn't apply. There is a producer board. They were given legal advice, and I cannot tell the member why they didn't apply for the tax credit. The program was just getting started at the time. It had been brought in December of '04. That was just about the time that they were starting to raise their money. It may have been the structure. It may have been that they were, I cannot answer the question as to why that board made a decision not to take advantage of the tax credit.

***** (16:10)

Mr. Derkach: I don't want to dwell on this too much more, but I think what is on *Hansard* is important.

Mr. Chair, I just want to ask the minister whether or not this program was offered by the government. The minister knew that there was difficulty in raising capital, both at the hemp plant and at Ranchers Choice. Did she direct her staff to offer the tax credit program to people who were investing in either Ranchers Choice or the hemp plant?

Ms. Wowchuk: Mr. Chairman, when investors come to the government to talk about projects, our staff make them aware of all of the programs that are there. They're made aware of them and then it's up to the individuals to decide which programs they want to take advantage of. Some will come and look for a MIOP loan. Some will come looking to the government to take an equity position. But everything is made available to them, and this program was made available to them as well. They were aware of all the programs we have to offer.

Mr. Derkach: I'm happy that the minister has answered that question because, indeed, this is something that I will pursue because in all my discussions, I had never ever been aware. Even though I was approached as a potential investor, no one had ever offered a program or made me aware that there was an availability of a tax credit program on a personal income tax basis if I were to invest in a project.

Ms. Wowchuk: Remember, that isn't available to an individual. There has to be a sponsorship of the project by the local community development corporation. So maybe they went to the local community development corporation and it wasn't endorsed. I'm not sure whether they went there or not. But they could not come to an individual and say there is a tax credit available if they do not get the endorsement of the project.

Mr. Derkach: Well, Mr. Chair, this is all a question of awareness, because I'm sure that I could go to people whom I know who have invested in the project and ask them whether they were even made aware of the tax credit program availability. I'm sure that in 99 percent of the cases, I will get the answer that they were not aware of the fact that there could be. So how could they even go and lobby their corporation, their community development corporation, if they weren't aware that this project could qualify for a 30 percent tax rebate program?

I can't see, Mr. Chair, how it is that anybody would reject investing in a project that they wanted to see in their community, knowing that they could get a 30 percent tax rebate if they were offered that opportunity. I know that investors around the Dauphin area, if they knew that they could have had a 30 percent tax credit had they got the approval of their local community economic development office, will go to that community economic development office today and ask them why that project was not approved by that community development office, because that's what the minister is saying.

Ms. Wowchuk: That's not what I said. What I said is, when there's a project, it is up to the proponents of the project to take it to the community economic development committee and seek approval. I do not seek endorsement for the project. I do not know what steps they took, whether they went to the economic development–but the individuals would not know about it unless it was approved, endorsed by, and then an application was made for approval.

Mr. Derkach: Well, this is a truly bizarre issue, Mr. Chair, because here we have struggling enterprises who are trying to raise capital from individuals, who are approaching individuals to invest, and yet here is a program that was supposed to have been designed for these very types of economic development initiatives in rural Manitoba that people don't know about. I think it's the minister's responsibility to ensure that, for example, Ranchers Choice had every available tool at their disposal to be able to attract as much capital as they could to the project to make the project viable and successful.

So I regret that that issue is one that wasn't taken advantage of, and I know that in the future I'm going to ensure that Manitobans know that these types of programs are available and they need to be applying through their community economic development office to take advantage of these programs. This is not the end of the world, but certainly it does indicate a management issue on the part of the minister here.

Ms. Wowchuk: Mr. Chairman, when people come to us with projects, our economic development officers, our staff make them aware of every available tool that is there. They were, I'm sure, made aware of this, but there are limitations to this program, and their program, they may have looked at it and the size of their project may have been beyond what was available through this program. But I can assure the member that all of the programs that we have available through government, the proponents were made aware of them, our staff worked very closely with them and indeed spent countless hours as they worked on this project.

Mr. Derkach: Mr. Chair, I don't doubt anything that the minister says in terms of the staff commitment to it.

I want to go to another project, and I'm sorry that we're–*[interjection]*

Mr. Chair, I would like to ask whether or not there has been any discussion with Pizzey Milling regarding the sale of the technology to an Irish firm.

Ms. Wowchuk: This is a sale between Pizzey's and the Irish company. It's a private sale, they have not approached us and we have not had any discussion with them to this point.

Mr. Derkach: Mr. Chair, I'm just interested, and it's only for information. I'm seeking information whether or not any of the departmental staff have had an opportunity to discuss with the Pizzeys in the last six months how it is that we could perhaps retain the intelligence, the knowledge and the development of the products that the Pizzeys have developed over the course of time where the growth and benefit of Manitoba industries rather than this technology now escaping the country for that matter and going to an Irish firm. Or whether or not there's an opportunity for the Irish firm to indeed continue to develop the technologies with regard to flax products here in Canada. I know one of the hurdles is going to be the tax credits that are provided for research and for the development of new products.

I think this is such an important initiative in Manitoba that it would do us all good if we could perhaps enter into some discussions, either with the new company or with Pizzey's, regarding the future of the enterprise for Manitoba and for Canada and also the retention of that plant within this province.

***** (16:20)

Mr. Chairperson: Order.

Ms. Wowchuk: Thank you, Mr. Chairperson. The member raises a very important and interesting issue and the sale has just recently taken place. I can tell the member that we haven't talked directly to Pizzey's or the new company since the sale took place but we have had very close working relationships with Pizzey's.

Our staff had a meeting with them where they did a presentation on rural entrepreneurship. There is a group, a project called Flax 2015 that engages the federal-provincial government and the industry in looking at how you can further move the flax industry along, and Mr. Pizzey is on that board so our staff has regular discussions with him.

We were driving out to Souris the other day and we were having this discussion about how we have to make contact with the new company and see what steps we can take because surely if there's anything we can do to keep the jobs here and advance the technology here in Manitoba, it's what we would want to do.

Mr. Derkach: I thank the minister for that, and I think that's an important initiative for us to undertake on behalf of Manitobans because the innovation that has taken place in that particular industry is important, I think, to us in this province. And I know that we can't interfere in a private deal between two private companies, but if there is something that we can do to retain the technology, to retain the processing here in Manitoba I encourage the minister and her department to undertake to do what they can in that regard.

I certainly don't have the answers, but I am somewhat anxious about the fact that this sale could in fact over time spell the, sort of the closure of that plant here in the province, because there are some real issues facing the location of that particular plant, in that access is the one thing that I think has been enunciated. They have to get their product to market on time and when they face the kind of restrictions that they are facing in terms of bringing their product in and taking it out because of road restrictions, it just is not very business-friendly to a company that has some time-sensitive issues in terms of delivery of product and that sort of thing.

So all I can say to the minister is, I encourage her to continue to do what she can in that regard.

I indicated to the minister in my opening remarks that over the course of the next few weeks there are some exciting projects happening out in my end of the country that I need to talk about. One of them is an ethanol–the potential, I would say right now; I wouldn't say it's a fait accompli, but certainly the potential of–an ethanol plant being located in the area.

In talking to the proponents, there's some frustration with our provincial government in terms of commitments to the capital that is going to be required for infrastructure. I don't think the company is asking for investment by the province into the project itself except that there is a need for the expansion of rail and road work and also the–as I understand it, the hydro is there but the expansion of the gas line is something that is required and that is where the company expects that a province will contribute.

I want to ask the minister if she can update us as to what the status is since this company is quite anxious to get started on the project as soon as possible. It's a commitment I think that I heard the Premier (Mr. Doer) make in terms of expanding the biofuel industry in this province.

Manitoba lags desperately behind other jurisdictions in the development of this industry, and I'm wondering whether or not the minister can give me an update on the commitments that have been made with regard to this particular project.

Ms. Wowchuk: Mr. Chairman, I want to let the member know that, in fact, I, along with staff, have met with the Russell group and representatives of the group from Florida. We talked about their plan. We asked them for a copy of their business plan. I believe some staff are working with them but we have not received the business plan from them yet. The specifics we have not, but we're quite willing to work with them and the ball is really in their court right now. There is outstanding information that they have to provide us with so that we can continue to work with them. *[interjection]*

The staff may have received the business plan but they haven't worked on it to the point where it has come to me or to anyone in government for a decision yet. So they could have got it at the staff level. I have not seen it and we are, as I understand–there's still some outstanding information that we're looking for.

But I can get back to you on this and find out exactly at what stage we are at and whether, in fact, we have received the information that we have been looking for.

Mr. Derkach: I would just encourage the minister to perhaps do some follow-up on this because it appears that I'm getting two messages here, one from the development side and one from the department here. We should try to put this together so that the project can move ahead. There's some, I guess, desire on the part of the company to move ahead with at least some of the earth work as soon as possible–or the proponent or the developer.

So, therefore, I think it's an emergency, and I don't want to see the same thing happen here as has happened in other projects where there's a lot of finger-pointing at the end of the day and it's difficult to sort out where the issues really are.

So I'm just encouraging the minister to do some follow-up on this. I know staff in the department will, but certainly this is an important project I think to the province.

Ms. Wowchuk: I will certainly endeavour to follow up and I can over the next couple of days let the member know what it is we've found and what we're waiting for. But my understanding is that there was a sod-turning planned and that's been postponed. So we'll do some work and I'll get back to you.

***** (16:30)

Mr. Derkach: I'd like to turn to food commercialization, if I might, Mr. Chair. I want to ask the minister, with regard to food commercialization, whether or not the minister has in place a strategic program to assist those producers and processors of functional foods and nutraceuticals to give them some prioritization in terms of having their projects looked at by this province so that they can proceed. I'm speaking specifically of projects that have been in the development phase now for about three years. Because of delays in Manitoba, proponents are moving outside of the province to have their products tested, to have their products commercialized, and to have their products examined for the various components that those products may contain.

So I ask the minister whether or not her department has put any priority on ensuring that these types of projects are given the fastest time possible to do research on their projects and to get back to the proponents, because we've seen some fairly significant delays in Manitoba whereas outside of the province, those results are coming back within a matter of a week or two.

Ms. Wowchuk: The straight answer is, yes, we do put a priority on these kind of products and have made significant investments in development and commercialization so that these products can move forward. Sometimes individuals come to our facility and if we haven't got the equipment, we direct them to another facility that may have a higher or a different level of equipment, and there is a sharing of knowledge across the country. In the case, I believe, the member is talking about, we in fact did direct him to go outside the province because there was better equipment somewhere else, and in fact he is back now, I believe. He is running into difficulty and having his product tested, developed in Alberta, and now he is coming back to work here.

Mr. Derkach: I'm not talking about a specific project. Just to tell the minister, I've heard that our nutraceutical centre in Manitoba is vastly underutilized in terms of what they're capable of doing and in terms of what they are doing. So I want to know from the minister whether or not there is a direct link between our Food Commercialization unit with the department and our nutraceutical centre at the University of Manitoba and at Portage la Prairie to ensure that those entities are used to the maximum possible capacity for the enhancement of products in Manitoba.

Ms. Wowchuk: The member is right. There is a lot of capacity at the nutraceutical functional food centre. It's a new facility. They've come here with a wonderful team of scientists and they are just getting started; hopefully, we will see more activity there.

The Manitoba agrifood health network has been established. This is established to link the three facilities together, the nutraceutical functional food centre, the St. Boniface Research Centre, better known as "R camp", and the Food Development Centre. They have just been established. There are two people working there; they're located in our urban GO team, our urban GO Centre, but we have been–I believe very much that we have to do this kind of joint marketing.

We have a unique cluster here in this province, one where you can develop a product, test a product, and take it to commercialization. As we move forward, I think that this will be an opportunity to attract many projects here. But you are right when you say that it is underutilized because right now, they are just getting started. But I can also say that, under our ARDI program, nutraceuticals are our top area of funding.

Mr. Derkach: Mr. Chair, I note that in total the grants and transfer payments to facilities for food development are in the range of $2.2 million per year.

Has the minister got any intentions to invest more money into this area since it is–since she says it is–a priority area? Two million dollars to me is not a lot of money invested in something that is as important as nutraceuticals. Are there monies in other places that need to be identified?

Ms. Wowchuk: Mr. Chairman, when you look at the $2.2 million per year, that's just the operating money of the Food Development Centre. We made an investment of $13 million into equipment and we're working on that one. So there is a lot more that's in there. So that's for the Food Development Centre. But there is money for the Richardson Centre and the St. Boniface Centre coming from the ARDI side of it from the federal-provincial agreements and that's where the money comes, from those.

***** (16:40)

When the Richardson Centre was being built, we made a significant investment into it as a province.

The St. Boniface Research Centre had just last year got an investment of around $17 million from the federal government. On top of those things we have–since we reorganized the department, we created the Food Commercialization and Marketing Branch of the department. So it's created in Portage la Prairie. There's additional staff that will be working in that department to work on food commercialization and move it along. So, to say that we're only spending 2.2, that is just for the operation of the Food Development Centre.

Mr. Derkach: I think I recognize that, but I'm still not clear on how much money is being invested by the Province into the Richardson Centre for operating on an annual basis. ARDI provides money and that's a provincial-federal program, but how much operating money goes from the province to the nutraceutical centre at the University of Manitoba?

Ms. Wowchuk: When the business plan was put forward for the Richardson Centre there was a request or a commitment of $1.5 million in operating money for five years. The goal is to get them to the point where they're operating without supports. So we give them $250,000 a year per year for five years. As well, we have $2.5 million in ARDI and about 21 percent of that goes into projects there–but that's projects driven–but the operating is $250,000 per year for five years. That was the agreement.

Mr. Derkach: Where is that found in the Estimates book? Because I don't find the line in here for that.

Ms. Wowchuk: You won't see a direct line because that's coming out of ARDI money. That's coming out of ARDI money, but there is a portion of annual grants that cover the lab operating costs for the Richardson Centre, for functional foods and nutraceutical, for the operation of other facilities. But those come through the university budget; it won't show up here. That's where that fund will be identified.

Mr. Derkach: That's exactly my point. I was wondering what the department itself, the department responsible for commercialization of food products rural economic development, is investing in the Richardson Centre to enhance, whether it's small business who want to be processing or large businesses that want to develop production.

I know there are grants that go to the university; there's a partnership in ARDI. I'm talking about specific monies flowing from this department to the Richardson Centre for operating and ensuring that we enhance the ability of people who want to develop products to use the Richardson Centre.

Ms. Wowchuk: When we talk about food commercialization, that does not happen at the Richardson Centre. Food commercialization happens at the Food Development Centre. That's their role. Richardson Centre is research on functional foods and nutraceuticals. So we provide funds to the university, and from the university they make a decision where those funds will go.

For example, we provide a grant of $868,300 to the university and that is used for research in different projects. When this facility was built, what they came to us and asked us for was a specific amount for operating, and that's what we committed to, operating dollars. But we also have created the Department of Science, Technology and innovation, and most grants are allocated out of that department.

So there is what we provide here, but there are many more research grants and supports that come from another department. It is the way we have organized our government, and by creating this new department, that is where additional money would come from.

But certainly Commercialization is Food Development Centre, but this department does not provide direct funding for the universities. That comes from the Department of Advanced Education as well, and there would be funds for research coming from STEM. We provide the amount, as I said, of $868,000 for programming.

Mr. Derkach: I'm running out of time, Mr. Chair, and I have to move on to other little areas that I want to touch on.

One of the areas is the local economic development corporations. We have had significant concerns expressed by the local community economic development officers and the community development corporations that, in fact, their funding is not increasing, it's decreasing, and they're having difficulty in operating.

I want to ask the minister if she can identify for me the area where we can find the grants that are provided to community economic development boards for the enhancement of economic development in the communities.

***** (16:50)

Ms. Wowchuk: Mr. Chairman, the information that the member is looking for is on page 125. It is under

Grants and Transfer Payments, where there is $957,000. It's included in there, and the amount for development corporations is $544,986, and the amount has not gone down. It's the same amount that it was.

Mr. Derkach: So can the minister tell me how much, or what the formula is for economic development officers and development corporations for funding for their particular areas?

Ms. Wowchuk: These grants are following the same model that was established about 10 years ago. It hasn't changed. They were negotiated with the RDCs and no specific formula is followed. It was what was negotiated and it is the same model that's being used now as then. There has been some–*[interjection]*–no, there hasn't. I'm looking at the wrong line. So the amount has basically stayed the same.

Mr. Derkach: So is the minister telling me that over the course of the last eight years the monies afforded to the RDCs has not changed at all?

Ms. Wowchuk: That's right.

Mr. Derkach: The minister's department is getting increases on an annual basis to run her affairs and her offices and her department. How is the minister expecting these RDCs to continue to operate on the same monies that they were given eight years ago?

Ms. Wowchuk: These are municipal entities and they don't only get money from the Province. They have the ability to get money from other sources. There are municipal contributions that go to help them operate and we have not reviewed them; we have not put additional resources in, but we are not their sole funder.

Mr. Derkach: I know that the Province is not the sole funder. I mean it's never been thus, but my issue here is that we have development corporations that are trying to enhance the opportunities in their communities through the hiring of an economic development officer, yet the Province's formula has not changed in eight years. Now this isn't any different than any other entity. If there are increased expenditures because of inflation, because of cost increases, certainly, that has to be reflected in the grants that are given to these organizations.

I want to ask the minister why money hasn't changed over the course of eight years. That's a long time. I can see something staying stagnant for a year or two. We're talking about eight years here, Mr. Chair.

Ms. Wowchuk: The member knows that when we reorganized the department we put additional economic development staff into each of the offices; we hired additional people. These people work very closely with the development corporations. When you have these kinds of corporations and you put in development officers in each region of the province then you have to do some review. I can say to the member that we are doing some review of the corporations, of how do we get them to work more closely with the staff that we have, and they are working more closely. We are doing a review of all the different levels of economic development support that's out there and looking at how we might work more closely together.

Mr. Derkach: Well, Mr. Chair, unfortunately, that doesn't answer the question.

I'm supportive of the concept that was developed regarding the GO centres and the way that they have been operating. I think it's a reasonable concept, one that hasn't diminished the services in the communities. I will put on record that I congratulate the department and the minister for taking that initiative and developing those centres, because I do believe just from watching the operations thus far that they are continuing to work with local community ag offices and economic development offices. I think we need to have a higher level of expertise in these GO centres in the areas of rural development. I believe that we should be utilizing graduates from the Brandon University master's program in rural economic development for those programs, and also utilizing more frequently the expertise of local developers. I think there can be some enhancements there, but I think that will come over time. I do believe that the GO centres are entities that can enhance the ability of rural Manitoba to grow.

I want to end by asking the minister whether she has any commitment to increase the youth program that used to be called the green program, specifically for rural communities and rural Manitoba. The only way that rural Manitoba is going to retain its youth is by ensuring that the employment opportunities are there for them. The Green Team program and the youth program were ones that were, I think, quite readily endorsed by local communities, and we need to enhance that part of the rural development program, and also the round tables that were established to look at the strengths and the weaknesses of communities. I'm just going to give the minister a quick minute for a response.

***** (17:00)

Ms. Wowchuk: I thank the member for raising some important issues. The Green Team is a very important program. I believe that we have about $1.8 million budgeted for that program, and there has been an increase in that program.

On the round tables, I believe that we're moving to the next round of them where we're doing community vitality indicators. There are four communities that we're working with, trying to develop a new model of how we might be able to work and have round tables, but we're piloting it in four communities.

Mr. Chairperson: Order, please. The hour now being 5 o'clock, as previously agreed in the House, this section of the Committee of Supply will now move on to consider the Estimates of the Department of Conservation.

Shall we briefly recess to allow the minister and critics the opportunity to prepare for the commencement of the next department? *[Agreed]*

Five minutes? We will recommence at seven minutes after 5 o'clock.

The committee recessed at 5:00 p.m.

The committee resumed at 5:09 p.m.

Mr. Andrew Swan, Acting Chairperson, in the Chair

CONSERVATION

The Acting Chairperson (Mr. Andrew Swan): Will the Committee of Supply please come to order. We will now be considering the Estimates of the Department of Conservation. I would remind members that, also, as agreed in the House, we are now operating under the Friday rules regarding no quorum requirements and no votes. This means that any vote today which is not unanimous will be deferred until the next sitting of Supply.

Moving on to Conservation, does the honourable minister have an opening statement?

Hon. Stan Struthers (Minister of Conservation): He sure does, Mr. Acting Chairperson, thank you very much.

I want to say that I'm very pleased to embark on a discussion of the Estimates for the Department of Conservation, and I'm very happy that we can put forward such a progressive conservation agenda on behalf of the people of the province of Manitoba.

***** (17:10)

Mr. Chairperson in the Chair

I want to begin by acknowledging the hard work of staff in the department. I don't think we can say enough for the kind of work that the civil servants across government, but, I may be a little biased in saying this, specifically the folks that work in Conservation, from my deputy minister right through to all of those who are in the front lines day to day conversing with the people of Manitoba, protecting the resources of the province of Manitoba. I can think of no other department, from Antler, Manitoba to Churchill to Middlebrow in the southeast that are out on the rivers and the creeks and in the forests and in the communities dealing with issues, issues that are far-reaching and important to Manitobans.

In a few minutes I'll be introducing some of the staff that will be assisting me today. One person that I want to pay some tribute to was a person who won't be joining us here today, who is retired since our get-together on Estimates last year; that was Dave Wotton. Dave was our assistant deputy minister. Dave put a lot of years in with the department and I really enjoyed working with Dave. In particular, one time at Whitehorse, when Dave led up the cause on behalf of all of the ministers in terms of humane trapping and dealing with the federal government on a specific issue that I thought Dave really did well, so I want to wish him a happy retirement.

I want to be really clear that this summer was extraordinary. A number of extraordinary events that were dealt with by extraordinary people in our department, in other departments, right across Manitoba. I toured through the southern part of our province just after the tornadoes–a system of tornadoes, really–went through that area, the one that hit Elie and other areas. I stood in the middle of a farm south of Baldur, a farm that was in that family's name for 126–it was a century farm. After being in the family for 126 it got smashed within 30 seconds. That farm, a number of farms throughout the south–I toured with the EMO officials from Baldur right through to pretty much the Saskatchewan border. I came across emergency officials, municipal officials, Conservation officials, folks from Manitoba Hydro, all going above and beyond the call of duty in making things as good as they could for the people that we all represent.

That same storm went through our Whiteshell Park. It blew down a whole pile of trees. I toured that area and from the air it looked like a combine had gone through and laid over one poplar tree after another. Huge amount of damage to our park. We were lucky that nobody was hurt. But we had fire crews and other officials from the eastern region and around the province step up to the plate and really do a yeoman's job in getting that park up and running again for that July long weekend. That was after the blowdown and after a huge amount of rain that also complicated the work that they were doing there.

We had some very good work done to repair damage and replant trees at the International Peace Gardens, the Peace Gardens, which mean so much to our province and to the state of North Dakota, and we moved very quickly to make sure that we helped out there.

This year I think another very successful, very significant step was in terms of contaminated sites where we set aside $39 million to begin that kind of very important work and I'm very proud of the MOU that we've signed at Grosse Isle with the R.M. of Rosser and their reeve, Alice Bourgouin, and we got some movement on that.

We helped out in others and not just our own jurisdiction, but our officials were called upon to help out fighting fires in Québec. We had a couple of requests that we came through with, and sent 40-some firefighters, forest firefighters, to the States to help with some fires–I believe it was in Montana. That was something that I was very proud of as a Manitoban, seeing Manitobans helping not only each other out, but helping out people in other parts of the country and the continent.

It was a year of success for our parks reservation system. When we inherited the old system, we knew we could do better than that and boy, did we ever. I'm glad that the Member for Lakeside (Mr. Eichler) is right with me on that. We increased by 36 percent the number of reservations that Manitobans and people visiting our province booked. For the first time ever, we exceeded the number 50,000. We're well over the 50,000 mark. But most importantly, we have a system that is built by Manitobans, run by Manitobans, staffed by Manitobans. Manitobans can make decisions from one year to the next, make decisions like multiple reservations, which was a question actually at this table last year in Estimates, and we heard the request and responded in such a way that Manitobans could make multiple reservations.

In the area of protected areas, there are two things I want to just very quickly touch on. One that I'm really proud of is the protection of Little Limestone Lake. Nowhere on the face of this earth is there a better example of a marl lake, a lake that changes colour as the temperature of the day increases. I've been there a couple of times; its absolutely spectacular. It's a stone's throw off of No. 6 highway, about 40 minutes north of Grand Rapids. We're working with the Mosakahiken Cree Nation and with the folks at Grand Rapids to protect that lake, and I think that is something that is very worthwhile doing.

We also have a Memorandum of Understanding that we signed with the City of Winnipeg. I was really pleased to get together with Mayor Katz and make sure that we were able to take a look at some of the very significant green spaces within the city limits, some parts of our capital city that deserve protection, and we're going to work with the city to make sure that that happens.

The other part of our Estimates, of course as well, is an analysis of the Sustainable Development Innovations Fund, and I look forward to talking about some of the good programs that that fund contributes to in every part of our province.

I think the last thing that I'd like to do is welcome the new critic, the Member for Tuxedo (Mrs. Stefanson). Welcome to the wonderful world of Conservation. I think you'll find that the people that are involved in it are great and that the issues we deal with are varied. I know that you know that these are important issues to Manitobans.

If I myself or our staff can be of assistance to any issues, whether they be the kind that grab headlines or the kind that simply need to be worked on, just contact me. The Member for Tuxedo knows where I hang out here at the Leg.

So, with those few words, I look forward to a discussion on my Estimates, Mr. Chairperson.

Mr. Chairperson: We thank the minister for those comments.

Does the official opposition critic, the Member for Tuxedo, have any opening comments?

***** (17:20)

Mrs. Heather Stefanson (Tuxedo): Thank you very much, Mr. Chair, and I thank the minister for his kind words about my recent appointment as the critic responsible for the environment, actually, which, of course, the Department of Conservation falls under the purview of that.

I have had the opportunity already to meet with a number of stakeholders in various communities across our wonderful province, and a number of issues have arisen as a result of those. Certainly, I understand that throughout the course of this Estimates process various colleagues of mine will be coming forward to ask many of those questions as well, because there are a number of issues in our various communities that we would very much like an answer to.

Having said that, I just want to also thank our leader, the Member for Fort Whyte (Mr. McFadyen), for giving me this opportunity. I have found all of the portfolios that I have had the honour of being the critic for challenging and I'm very much looking forward to the challenges within this portfolio as well. I look forward to the days and months and maybe years ahead of questioning and essentially holding the government's feet to the fire and this Minister of Conservation's (Mr. Struthers) feet to the fire when it comes to issues that preserve our environment, that preserve our forests, our wildlife and our lakes and just make us a better province and make us, hopefully, working towards achieving having a much cleaner environment within our province.

So I very much look forward to the challenges that lie ahead. The minister did have a statement earlier with respect to this being National Forest Week, and, unfortunately, in the House I didn't get the opportunity at the time to finish my response to his ministerial statement. I think our leader actually got into some issues after, which I think are of concern certainly to members on our side of the House, but indeed to a number of communities across Manitoba.

I find it somewhat passing strange and a little bit alarming that the Minister charged with the administration of The Manitoba Hydro Act (Mr. Selinger) would come out in the same week with an announcement of their decision to extend the lines down the west side of Lake Winnipeg at a time where it's National Forest Week. There's a number of forests that will be affected as a result of that announcement, and I do have a number. I just think the timing of that announcement is unfortunate. Obviously, a priority is not necessarily placed on our forests and wanting to preserve those but we're looking at making an announcement which makes no sense from an environmental perspective and from a fiscal perspective. Certainly, I think that there are going to be a number of questions surrounding that in the days ahead, that we will have the opportunity to be questioning this minister.

So, having said that, I know that time is limited when it comes to our Estimates process. We have a number of issues that we would like to jump into and question the minister on with respect to various communities across this wonderful province of ours.

I thank the minister again for his kind words on my appointment. Having said those few brief words, I'm looking forward to getting into the Estimates process.

Mr. Chairperson: We thank the critic for those opening remarks.

Under Manitoba practice, debate on the Minister's Salary is the last item considered for a department in a Committee of Supply. Accordingly, we shall now defer consideration of line item 12.1(a) and proceed with consideration of the remaining items referenced in resolution 12.1.

At this time we invite the minister's staff to join us at the table, and I would ask the minister to please introduce them once they've arrived.

Mr. Struthers: Thank you, Mr. Chairperson.

I'm joined by my deputy minister, Don Cook. I'm also joined by four assistant deputy ministers: Bruce Bremner, Regional Operations; Bruce Gray, Finance–we share Bruce with Water Stewardship; Fred Meier, with Programs; and Environmental Stewardship, Serge Scrafield, at your service.

Mr. Chairperson: Does the committee wish to proceed through the Estimates of this department chronologically or to have a global discussion?

Mrs. Stefanson: We would prefer, and I know the minister and I had a brief discussion about this before, and I think he was amenable as well to have a global discussion if possible.

Mr. Struthers: Discuss globally, act locally. I'm agreeable with it.

Mr. Chairperson: All right. Second that.

Just to be clear, we're going to do a global discussion. Thank you.

My faithful assistant here who keeps me on track as Chair has also pointed out that this now means that all resolutions will be passed once all the questioning has been completed. Understood.

Mrs. Mavis Taillieu (Morris): I want to thank the minister for the opportunity to have some questions here, and thank the new critic, the Member for Tuxedo, and certainly congratulate her on her new critic responsibilities. Also, I want to say hello to the staff here and thank them for the job that they do.

I do have a couple of questions from my constituency. In regard to contamination sites, I'm informed that there is a site in St. Malo termed Parc Esso in which there was a service station on the site. It's very close to the water source for the town. I'm informed by the local council there that they have been questioning about this and the removal of this site and have been told, in fact, and I will ask the question because I'm told that this one of the five worst contamination sites in the province but that it's going to take at least three years before they get to cleaning this one.

I'd like to ask the minister in regard to the Parc Esso site in St. Malo if it is in fact one of the five worst contaminated sites in the province, and what is the time line for cleaning up this site?

Mr. Struthers: We have booked $39 million to deal with the contaminated sites that are found around the province. Our specific mandate here, mostly it is to deal with those abandoned gas sites that may have a tank and may be polluting into the environment. The basic premise that we've accepted is that the polluter needs to pay for the mess that they've left behind, and one of the first things we do when we deal with a site is we try to make a determination as to who is responsible to pay for that clean-up.

***** (17:30)

That's where this particular site at St. Malo is. We're trying to assess responsibility for this. I want the site to be cleaned up. I don't want the people of Manitoba to subsidize, in this case, Esso, for the mess that they've made. If we determine that we can't trace that to Esso, we can't in any way pin that responsibility, that liability, onto them, then we as a Province have stated that we would pay for that. We don't want to leave it out there leaking into the water table, and that sort of thing.

So we're at the stage with this right now where we're trying to make that determination at the site. My instruction is that we do that as thoroughly but as quickly as we can, because I don't want the people of Manitoba to unnecessarily have to clean up for a company who has a responsibility to do that. So that's where that one is.

Mrs. Taillieu: Mr. Chair, can the minister confirm then, that it is in the top five contaminated sites in the province?

Mr. Struthers: No, Mr. Chairperson, at this stage, given the work that we've done there, we can't make that determination as to a ranking. It is booked as one of the ones that we need to be moving on. For example, we've got an MOU in Grosse Isle, where we know, where we've done that work, where it's kind of like the No. 1 that we're moving on and there's others that we're doing that and we need to prioritize these. But this one's still at the point where we're figuring out the liability and then making sure that if we can't do that then it does become something that we would pay for a cleanup.

Mrs. Taillieu: Mr. Chairperson, it sounds to me then, that you've prioritized the one in Grosse Isle as the worst one, so you're dealing with that one right now. Is there any way, then, to determine where in the ranking this one is going to fall and how long? Like what time frame is the community looking at here?

Mr. Struthers: In relation to the one at Grosse Isle, when we look at prioritizing, there are a whole number of factors that come into play: the kind of damage, the kind of impact on human health. In that particular case, there are people that have got these–I've seen them, I've been there–these big ugly looking filters that's in the community hall there. It's in some residences. Part of our analysis is the impact on human health: is there a direct line between the contamination and people living in the area? Those sorts of things.

The other part of this is–and part of my job is–to make sure that we've got the resources in place to do these kinds of analysis. We have added five resource staff particularly to do these kinds of evaluations at each of these sites. One site may be smaller than another, but it might have a bigger impact on human health. If there's a school that's over top of a site, that's different than if there's a–oh, I don't know–if there's a golf course over the site. Or whether there's a pasture over the site. Those kind of determinations need to be made on a case-by-case basis. So it really depends–the ranking of this one that my colleague from Morris is interested in–depends on that work that we do in the beginning to analyze the site and its human health impact. That is the assessment that we're doing.

We're looking at about 239, I believe that we've got booked for assessments. So that's going to take some time to go through that, but I understand that some of that work is beginning at this site already.

Mrs. Taillieu: Mr. Chair, the site I'm referring to, the site of the former Parc Esso in St. Malo, I'm told it's very, very close, within a few blocks of the school there. I know that it's very close to the source of the town's drinking water.

I know that the government is concerned about clean drinking water, but, you know, we see a lot of boil-water advisories around the province. We certainly don't want to see any further contamination into any water supplies for the town, for the surrounding area, and, certainly, if there's anything leeching into the soil, it's going to be close to where children are playing. I think that's an issue that needs to be dealt with fairly quickly. I think the rural council of DeSalaberry has written to the minister, so I know he's familiar with this particular site, and I've written as well. I do not think that I have received a reply yet, but I will look forward to that.

I would like to move on to another question and this relates to the strawboard plant at Elie, recognizing that that plant has had many difficulties over its lifespan. However, something was brought to my mind very suddenly just in the last month when we saw an issue of stubble burning that was very close to where those bales are. So I'm thinking, what would happen should those bales catch on fire, because if you think you saw smoke across the highway from a fire in a ditch, you can imagine the fire and the smoke that would arise when there's 160,000 rotten bales sitting there. It would not be a clean burn. It would be an ugly black smoke that would probably blanket the city and blanket the province for a long, long time.

Now, I recognize, of course, that this is a privately owned enterprise at the time, and Dow Chemical has committed to doing something with these bales. However, we do know that they are not operating the plant, so they're not decreasing the number of bales that are stored there. There has been some attempt to decompose those bales and to use them for other purposes, but the fact is there are so many of them that it's going to be a hazard and it is a fire hazard. Not only is it a fire hazard, it's a health hazard.

I guess what I'm saying is that should Dow Chemical or any future owner of that property, should it just revert to the Municipality of Cartier, it is going to be something that I believe the Province will have to deal with as an environmental issue because should there be a fire or anything related to those bales, it will become an issue for the Province and not just for the town of Elie or the Municipality of Cartier.

I'm wondering what kind of emergency plans or has the minister looked at the possibility or the repercussions of any disaster that would result from these bales catching fire.

Mr. Struthers: I think my colleague from Morris has her finger on a very–it's a complicated issue but it's one that she's exactly right, could end up really becoming a problem for a lot of people in that area and throughout the southern part of our province.

The role that we have in this is working with Dow in terms of a decommissioning plan that they had to have in place when they assumed ownership of the site. We've been working with them in implementing that decommissioning plan.

***** (17:40)

The other part of this is that there's not just the bales we're dealing with, with Dow, but there's a private individual with some of those bales on his land as well. I think the Member for Morris (Mrs. Taillieu) is aware of that. So we have to try to not only work with Dow, but we also have to work with that private individual. They've been working at taking apart some of those bales and trying to work it into the land, but that's a lot of bales to work into land. That's going to be part of the solution that they come up with.

Our responsibility is to make sure that Dow Chemical and the private individual follow the decommissioning plan through to the end so that we don't end up with that kind of a smoky hazard that none of us around this table want to see happen. That's the role that Conservation plays in this.

On a bigger picture, I'm hopeful that some day we can find a more innovative process to deal with straw bales, whether it's a 160,000 or 190,000, whatever the total number of bales is. Not to just take care of the bales that are there which are of varying degrees of quality, but also that we can put some people in rural Manitoba to work adding value, not just taking care of a stubble-burning, hay-burning kind of an issue, but also adding value to something that many of our constituents produce, i.e., straw. I think, from a bigger picture, that's where we have to go on this.

But specifically, we work with Dow in terms of their decommissioning plan. The other part of this, too, of the decommissioning plan, is to work with Dow in terms of rodent control. One thing I notice when I drive by there, back and forth to home to Dauphin on the weekends, is a huge number of hawks and other birds of prey licking their beaks as they sit on top of a great big round bale, or a pile of round bales, as they watch for mice and rats and whatever else is down there that they are interested in turning into lunch. Part of our decommissioning plan has to be a rodent control plan to go along with a disbursement of those bales angle to the plan.

Mrs. Taillieu: I do recognize that there has been some work done to try and decompose some of those bales. Of course, the issue is not so much with the straw as with the twine that's holding the bales together. It doesn't decompose and it gets caught up in any kind of machinery that tries to take the bales apart.

I know that there's been some use of those bales for erosion control, for example, in the floodway. Certainly, they've tried to turn them into pellets, I think, that would be used in burning in stoves. I'm not too familiar that, but I've been told about it.

I think, though, that the issue may become one that the bales are going to be left there. You can always fight over about who's responsible for them, but in the end if they should catch on fire, there needs to be a contingency plan to deal with the issue should that arise.

I know that I spoke with the minister in the House a while ago now. It was probably just after the Dow Chemical plant was closing or decommissioning or beginning that process about alternate uses for that plant because it is a plant that's sitting on the Trans-Canada Highway. It's in a good location: rail, highway, energy sources. It's close to the city of Winnipeg as well. There have been a number of proposals, I think, for looking at what can be done in that plant.

This is just some of the things that people have been talking about, but one of them is the use of these kinds of bales as cellulosic material in the production of ethanol, straw bales that can be used in ethanol production. I'm just wondering if the minister has had any conversations with interested parties, or if there's any will on the part of the Department of Conservation to look at doing something in this plant.

Mr. Struthers: Our prime focus in this is as the regulator and overseer of the environment licence and decommissioning plan. From a department's point of view, that is by far our main focus. The Dow reports do us on a quarterly basis. They update us on what they've been doing in a number of angles, I guess, on this, and they do keep us informed of the negotiations they're having with other companies. Maybe another company that might come in, they could have a better use for those bales than having them sit there and be a fire hazard or a house for rodents. So I know that the company itself has been active. I know that they've been in conversations with some of my colleagues in other departments in order to try to facilitate a sale to somebody else or better use for those bales, but our focus really needs to be as a regulator. That's our department's No. 1 job in this and making sure that a decommissioning plan is unfolding as it should.

Mrs. Taillieu: Well, thank you very much for that, Mr. Minister.

Just another question on a different topic again, and this will not come as a surprise, but I need to talk about the deer population. I am speaking both for myself and for the Member for Charleswood (Mrs. Driedger). I know there is an increasing population of deer in that area, and when she speaks about moving the deer out of that area, you know, that moves into my area, and when we move them out they just, you know–they need to go farther away from populated areas because there are a huge number of them. They are causing a number of accidents on roadways, I think, which is a major, major concern. With the number of accidents, car collisions with animal life, particularly deer on the roads, I think that MPI premiums probably are going to see a rise because there have been so many deer accidents.

So I guess my question is: What can be done? What is the Department of Conservation looking at doing to curtail the deer population or move them?

Mr. Struthers: Yes, I kind of thought the Member for Morris might bring this to the Estimates procedure and I've got to say, if I were in her shoes, I'd do the same. I'm not saying this in a way to discourage her from bringing it forward or to excuse the number of deer that she's dealing with, but every single region of our province is experiencing tons of deer. We became aware of many problems in terms of the deer, so much so that we actually did a deer survey in the Capital Region.

An Honourable Member: How many responded?

***** (17:50)

Mr. Struthers: Well, we mailed them all letters and we're taking the response that if they don't respond to us, then there's no problem, and then the Member for Morris doesn't really have a concern. But we're counting the deer, let's put it that way. We divided the city up into grids just like you would do over the Duck Mountain to count moose or elk or deer or bear or whatever you're doing, and I don't know if that's ever been done over the city of Winnipeg before, but just the volume of calls that we were getting about deer indicated to us that we had to do something like that, No. 1, so that we could share that information with agencies like MPI, the City of Winnipeg and others, so that we could all sit together and talk about some things that we have to do.

One of the things that was very clear that we need to do is that we needed to get, fairly quickly, into the hands of people living where the deer numbers are high, some very practical advice to people about what they should and shouldn't do. There were some people who, well, they like the fact that maybe a deer wandered through their lawn; they put a little food out for the deer and next thing you know, they got 30 in their backyard. So we've had to get some very practical tips to people on what to do and what not to do.

So we did get a pamphlet out. We did get a pamphlet, a brochure, into mailboxes here in the city of Winnipeg and we–I guess what maybe one of my worries over the long haul is that, with what we see projected in terms of climate change, every winter seems to be getting milder and the one person that can do the most to help us in this is Mother Nature. We haven't had a cold winter and we haven't had the kind of losses in deer that we've seen in a while and that's part of the natural cycle. What we end up with is, I think, an unnatural cycle where you end up with too many deer and not enough controlling factors that are just natural controlling factors.

So part of my worry is that this is a problem that's going to be with us for a while and we've got to work out ways in which us and the City of Winnipeg and other municipal leaders in the R.M.s that form the Capital Region can work together on to try to minimize the damage that these deer do.

Mrs. Stefanson: I know the Member for Morris (Mrs. Taillieu) was asking these questions on behalf of her constituents and the constituents of Charleswood and my constituency in Tuxedo. About a third of the constituency is actually in Charleswood and I think there is no question about the fact that there is a problem with the deer population there. I know the minister has sort of talked about, you know, how they're sort of trying to come to realize that there is a problem, but there's lots of these sort of studies and round table discussions and all of these sorts of things. We already know that there's a problem and I guess, the question is, what are you going to do about it?

Mr. Struthers: Part of what the member refers to as studies and discussions is centred around what other communities have done that have been successful. Between us and the City of Winnipeg and others who we've been working with on this, we've been looking at other communities to see what they have tried. The first lesson that has come out of that is to get information out to people as quickly as you can. Useful information. The city of Philadelphia tried some sort of a euthanization/sterilization scheme that landed everybody in hot water who had anything to do with it, and didn't really prove to be all that effective.

So our approach is to draw from other jurisdictions who have been into this some useful information that we can then get into the hands of people who are living in the city with a lot of deer. I think that's the most useful thing that we can do to help residents who are putting up with deer in their lawns and in their gardens. I think that's the best approach.

Mrs. Leanne Rowat (Minnedosa): I have a couple of just quick housekeeping issues from my communities and then I have a couple of issues that reflect my critic area.

The first issue is with regard to the provincial park in the Chimo Beach area in the R.M. of Daly. I understand that there's some development happening in that area. I'm curious to know what type of consultation that has taken place with the municipality and the town of Rivers and the development of some of the lots in that area.

Mr. Struthers: Could my colleague from Minnedosa clarify? Is it a consultation that we are doing in terms of more campsites or is it cottages? And this is at Rivers Park?

Mrs. Rowat: Sorry, it's near the dam up toward Chimo Beach, so it's on the highway heading west. No, sorry, east. Out of town.

Mr. Struthers: We're very much in the planning stages in terms of electrifying some campsites that are in there. We're at a very early stage, and at the appropriate time we'll be including the R.M. and the town. That's standard practice that we do in an area. It's part of our camping initiative.

What we've found is that we have many campsites that are unserviced go unused, and we have people being turned away because there's not enough electrified sites. So this is one of the parks where we want to provide more accessibility for Manitobans, for her constituents. But as per normal course, we would be talking to the local people that she has talked about.

Mrs. Rowat: Mr. Chairperson, I have met with the R.M. of Daly and the Town of Rivers prior to coming to session, and this was an issue that was raised by those municipalities just wanting to know what was going on. They didn't seem to feel that they were being included in, you know. They don't own that property or that area, but they do definitely have an interest in what's going on in their district. So I would encourage the next opportunity, that staff can take some time and meet with the municipalities and just give them an update. They're very curious and they're very supportive of any initiative that would increase or enhance the quality of campsites within their community. They appreciate the park there and they would really like to be a part of "the know" of what's going on.

On another point, provincial park signs: The community has indicated that that is an issue and they would strongly recommend that the minister consult with staff and determine whether that is a viable option. They feel that there's not enough signage indicating there's a provincial park just on their doorstep. So they would like to see your involvement and your support in providing better signage for that park especially along No. 10 highway where people may just want to scoot off No. 10 and come down the highway and enjoy the park.

Just wanting to know what the status is of any discussions that have occurred there and whether a decision has been made, and if there has been a decision made, is there an appeal process if the decision has been negative?

***** (18:00)

Mr. Struthers: Well, first of all, just to add to what the Member for Minnedosa said about the approach to provincial parks. We find that quite often when we sit down with the neighbouring R.M. or the neighbouring town, we get some good ideas on what we do. We've improved our park system a number of times by talking with local First Nations, local R.M.s, and have been able to offer something that's much more in tune with what the local area believes would be successful. So that's good advice.

We have been dealing with the signage, not just at this park but at others. I think we've got some great parks and I want more people in them. I don't want people driving past them on the highway, not knowing where to turn off. We've initiated that in terms of this park and others. We worked with the department of Transportation who, I understand, ultimately sticks the sign in the ground. Our instructions have been clear that we want people to know where our parks are and we work with Transportation to make sure that that happens.

Mrs. Rowat: I would like to know what the status then is of the Town of Rivers and the R.M. of Daly's request to have signage. Can you give me a time line?

Mr. Struthers: I think I should undertake to get back to the Member for Minnedosa on that. My view is the sooner the better on that one and others. It is a regulation that falls within the Department of Transportation so we have to work with them on that. They know that our wishes are to make sure there are signs showing where are parks are, but if there's any more detail on it, I can get back to the member.

Mrs. Rowat: Thank you. I'll hold the minister to that and I'll be tracking you down on that issue. I appreciate that.

Highway 1 bridge near the Grand Valley Road: This has been on my radar screen now for two years. There's debris that was in under the bridge. We've asked staff to remove the debris. They've removed it out of the water and they've put it on the side of the bank. I don't know if this is your area or not, but I'm raising it.

That debris is now on the side of the bank. As soon as the water levels increase this coming spring, that debris will just go back right into the river. It's a continuing issue. I've had several people call me on it. The debris is on the side of the bank under the bridge. It needs to be removed. It's a hazard. It's an eyesore. So I don't know if this is your area, but I would strongly recommend somebody move the wood.

Mr. Struthers: I'm trying to understand just where it is, under a bridge on the highway over a river. If we could get some more details, I'd like to get our guys out there to lead the clean-up of that. But, again, it's almost like what we were talking before with the polluter pay. I know R.M.s, I've had people come to me, a farmer who's bulldozed a bunch of trees into the ditch and then refuses to clean it up. Then the R.M. will send him a bill. They very consistently follow the polluter pay.

I'd like to know exactly where it is but also who's responsible for cleaning that mess up. I don't want it to end up back in the river. That's not good, but I don't want somebody just tossing out debris into the river and letting the provincial government come to clean it up.

Mrs. Rowat: I agree, and there have been carcasses found in some of that debris so there is a major issue with, you know, health issues as well with that. This has been ongoing for two years. I can send you the e-mails. I probably have a good dozen from, you know, at least two individuals that have continually e-mailed me and saying, I'm driving down No. 1 highway, I'm crossing the bridge, that debris is still there. I will gather up my e-mails, and I will get them to the minister. Hopefully, we can get rid of the debris and rid of the health concerns regarding carcasses and move on. So I will get that to you and hopefully get that debris moved out of the river bank.

The next question is regarding health inspectors. I know that at one point, about a year ago or so, there were vacancies which were fairly alarming in the area of health inspectors. I just wanted to know what the present number of health inspectors are in the province and if there are any vacancies and where they are, and we'll go from there.

Mr. Struthers: In my opening remarks, I was talking about some of the successes that we've had over the course of the year. This is one of those that we can put in the area of a success, not because we transferred it over to Health but because, before we transferred it over to Health, we offered an incentive package and some salary improvements that encouraged some people to apply for some PHI positions, and we filled those vacancies.

What has happened is that those health inspectors have been returned to the Department of Health where they came from in about 1973, I think, '72-73, and that's now under the purview of the Minister of Health (Ms. Oswald). It was felt that that was a better fit, that there were a lot more advantages to being in Health with some of their other colleagues that they could have some synergies with, such as the Medical Officer of Health, for example, out in the regions. So that has taken place. I don't want people to think that it's successful because we transferred it. It's a success because we did have some people step up and fill those positions.

Mrs. Rowat: Mr. Chair, my understanding is there were 30 positions, 30 public health inspector positions, under your watch or within your department. Did you transfer 30 staffing years to the Department of Health?

***** (18:10)

Mr. Struthers: When PHIs are part of our department, they work closely with the environment officers. Between the public health inspectors and the environment officers, there were 62. There was an overlap and a co-ordination of jobs between the two.

What was felt was necessary to transfer over to Health was 27 FTEs on the public health side. The thinking was that on the Health side, there was already staff there that would complement the 27 PHIs. I believe that their belief was that they came out ahead on this because of that. We still have within our purview the environment officers. The work that they do is more suited to the mandate of our department and public health inspectors were more suited to the mandate of Health.

Mrs. Rowat: So, just to clarify, there are 27 positions that moved into the Department of Health. My question would be which area in Health did they get transferred to and have their roles remained the same, if you have that information. Also, are these full-time positions that have transferred over?

You've also indicated that–Oh, I'll leave it at that, and I've got one more question regarding the number of environment.

Mr. Struthers: Yes, first off, they are full-time. They're full-time; they are FTEs, so that they're full-time. The advantage that they saw in being part of Health is that they are now able to concentrate on, to do the jobs that they were intended to do, the jobs that they were trained for as opposed to an overlap with environment officers. Now they could do their job 100 percent of the time. So, that was a real advantage to them. But, yes, they are full-time.

Mrs. Rowat: Thank you. You've indicated there were 62 in total between the two areas, the health inspector positions as well as the environment positions. How many positions now would be considered in the environment role of the leftover?

Mr. Struthers: Yes, if the Member for Minnedosa would permit me, I could get back to her with that information. Part of the problem is the environment officers are spread out throughout the regions, over four divisions. There are livestock people; there are people who work on Environment Act licences. These are all environment officers: on-site waste water management, disposal grounds, petroleum, the contaminated sites that we had worked on before. We've got people working on emergency response and the dangerous goods and handling transportation stuff, plus the ones in the regions. I don't have a total number available to me right now, but I can commit to come back with that.

Mrs. Rowat: Thank you, I will follow up on that. I am very curious to see where these positions have moved around to and the roles that they play and what type of responsibilities these individuals have. So, thank you.

Mr. Cliff Graydon (Emerson): Mr. Minister, in your preamble, you spoke of a tornado that did extreme amount of damage throughout the province recently. The question I would pose: has there been any payment to individuals or municipalities for the damage that was caused by that terrific windstorm?

Mr. Struthers: I hate to sound like I'm going to pass the buck, but I'm going to pass the buck. The minister responsible for disaster financial assistance, the Minister of Intergovernmental Affairs (Mr. Ashton) is responsible for those. The R.M.s that I met with and the towns that I met with, I encouraged all of them to get their resolutions to the Minister of Intergovernmental Affairs. I saw a list of those who did and it was a fairly–I think all of the ones that I'd heard about had put their resolutions forward. Then the minister responsible for that would then be following up with those R.M.s. I hope I didn't sound too much like I was passing the buck, but that is another department.

Mr. Graydon: In the situation of the blowdown in the Big Whiteshell, is there a salvage project underway for the timber that's there?

Mr. Struthers: Yes, that was a massive blowdown. Our worry is, first of all, when those trees dry out, they become prime area for a fire to start and to move in an area that is surrounded by cottages and recreational facilities and lodges and a whole lot of infrastructure that's important to us all.

The other thing we're worried about, of course, is that that's prime area for disease. We do not want to give any opportunity for pests to be getting a foothold and causing damage as well. I was really proud of my staff who worked really hard to do the clean-up out in that area, and also worked with the southeast quota holders to give them an opportunity to make use of that wood rather than just letting it hang around as a fire hazard.

Yes, we've actually estimated a half a million cubic meters of a blowdown. That's a pretty sizable annual allowable cut for any quota holder. There are multiple quota holders that we're working with to provide them with some economic opportunity, but also provide us with some of the safeguards against fire and disease.

The other thing we've done is we've had an open house in the area, so the people in the area could understand exactly what we're doing with that blowdown. I think it's important to assure people that we are acting promptly with that so that we minimize any kind of danger that exists.

***** (18:20)

Mr. Graydon: In regard to that particular blowdown in regard to the quota system that you made available or the quota that you made available to the logging outfits in the southeast, is it my understanding that the roads leading out of there will only carry a half load and become an economic deterrent to doing any logging in that area?

Mr. Struthers: Yes, the member has got his finger on a challenge that we face in this. We actually faced it in his riding in the Sandilands, I believe the year before last, where there was a blowdown there as well. On these kind of issues, we work very closely with the Department of Transportation.

The roads, and it's not just the roads, it's the bridges as well that we need to be creative with. We want to get that wood out of there for all the reasons we stated earlier, but we don't want to beat the daylights out of the roads and the bridges and cause even more of a problem on the way out.

I've really been pleased with the approach that our people and Transportation have had. I think they're trying to be creative in getting that wood out of there. My understanding is in the winter it'll be a different story with the road conditions, but we want to get that wood out of there as quickly as we can. So Transportation and us have been working on ways in which we can do that without causing irreparable damage to our bridges and roads.

Mr. Graydon: Thank you for that, Mr. Minister. The reference that you made to the Sandilands brings to my attention that on Friday there will be a tree planting with Manitoba Forestry and Qualico Group of Companies who will be doing a tree planting there.

I would like to also bring to the minister's attention that although there has been a certain amount of logging done in that area, there was a lot of the timber that was not logable or not usable, and I would question his department for not cleaning that up. It still remains to be a fire hazard. The trails through the Sandilands are not usable at this time for either snowmobiles or ATVs and the question would be: When would the minister see that that problem and fire hazard is rectified?

Mr. Struthers: Yes, I said some kind words today about the Manitoba Forestry Association and handed out the seedlings. We're aware of the tree planting that's taking place.

At the time of the storm at Sandilands, I was really very proud of how quickly our department got in there, quicker than any other agency involved in that particular event. We also went in there quickly with the southeast quota holders again, and what we did was we looked at the trees that were closest to the community that represented the biggest threat to the community and worked. I was pretty impressed with the kind of planning that went into it, starting at a small circle closest to the community, getting rid of the trees that were down, and then working our way out to a bigger radius around the community.

If there are other areas there that need to have that attention, then I'll see to it that that happens. But we prioritized in terms of the trees that were of the most danger. They had to be out first, and we did really do a good job of that, but I'll follow-up with the suggestion that the Member for Emerson has made.

Mrs. Stefanson: Just to jump into the cottage lot draw process which is obviously being affected by the blockade set up by the Hollow Water First Nation. Originally, as I understand, according to the government's Web site, the lot selection meetings were to be held in the order of eastern Manitoba, western, northwestern, Interlake, et cetera, et cetera. Now this being the eastern area which was scheduled for Sunday, September 23, I gather it's been postponed until further notice. The next one is scheduled in the western area for this Saturday, September 29.

What is happening with respect to the meeting that was scheduled for September 23? Will that meeting be held prior to the meeting that will be held in the western area on September 29?

Mr. Struthers: Because of the events that we've been reading about in the paper and the member has put her finger on, we decided it was prudent to take any of the lots that were associated in this draw with the eastern region, to take them off, to postpone that for now. So we're moving forward with the west, the Interlake, Lake Manitoba area, and some of the north. In the west, we've got, I believe we have about 120 lots in the western region, with about 200 or more people interested in them.

The other thing that I want to note is that for this draw we've made a change, I think, that will help people move these lots, and that is they can put their names in for lots in a number of these different regions, and we will draw until those lots have all been claimed. We thought it would be prudent, given the timing, to postpone the lots that are involved in the eastern region.

Mrs. Stefanson: Well, as I understand that in the cottage lot process, various applicants will choose first choice, second choice lots. If people have chosen lots in the eastern area as their first choice and maybe the western area or another area as the second choice, they're obviously placed in a very serious predicament. Obviously, the entire process is sort of turned upside down. I think that it's obviously going to be very unfair for those people who fall into this kind of a category.

I'm wondering if the minister could answer. Obviously, we need to resolve this–

Mr. Chairperson: The hour being 6:30, and as previously agreed in the House, committee rise.

EXECUTIVE COUNCIL

***** (15:00)

Madam Chairperson (Bonnie Korzeniowski): This section of the Committee of Supply has been dealing with the Estimates of Executive Council.

Would the First Minister's staff please enter the Chamber.

We are on page 31 of the Estimates book.

Hon. Gary Doer (Premier): Yes, there were a number of issues I took as notice yesterday.

Did the budget reflect the decrease in positions from 44 to 36? Yes, the transfer is reflected in the '05-06 budget. The budget was $3.4 million in the '03-04 and $2.6 in '05-06. This reflects a transfer of eight FTEs from the Executive Council.

There is a discrepancy, the question of a discrepancy would be Public Accounts and the printed vote. Public Accounts adds $950,000 to Executive Council as essentially the flow through, as I indicated yesterday, from the international MCIC grants of $950,000, so the matter is reconciled, I think.

Which political staff, quote-unquote–because they're all working for the public, of course, in the political office–Alison DuBois, Mark Veerkamp and Jackie Friesen are three political staff appointed in the last 12 months that are presently working in Executive Council.

Pay increments on Mr. Balagus: No, there are no bonuses, standard pay increments. The salary was $131,000, not $135,000. The increases reflect, as previous practice in the Premier's office, the payment in lieu of pension; the vehicle allowance, which is attributed to and accounted to in the Public Accounts; and the increments in regular pay increases, one of which was retroactive, so there's been no extra increment or similar provision.

The Hydro, I was correct, paid for the charter flight to Nelson House for that announcement that I was on. It was with the Executive's Hydro. I believe the CEO of the corporation and at least one of the vice-presidents, if not two, were on that flight. I think the other people came from Thompson who were there for the announcement.

If there were any positions in Executive Council being reclassified: No.

What is the Goldin contract? We talked about that. Actually this is a Canadian firm. There was some controversy in the past about the pins we hand out. The pins typically cost about 25 cents apiece, tremendous demand from Legions, sport teams and other community groups.

The projects under Hydro, I don't think I took that as notice, but it was Kettle project. It was the first one in '66-67, and there were further ones negotiated in the seventies. That would be under, I presume, Ed Schreyer, Jenpeg and Long Spruce, so the Kettle and Jenpeg were separated by different governments.

Mr. Hugh McFadyen (Leader of the Official Opposition): Thanks to the Premier for those clarifications. There are a couple which remain outstanding from yesterday, and I just wonder if in addition to the, quote-unquote, political staff that joined Executive Council in the past 12 months, if he could indicate the names of those who left Executive Council, and just indicate where those individuals are employed currently?

Mr. Doer: I made a mistake. Alison DuBois left, and she is gone to take her Ph.D., and Jackie Friesen was appointed to Executive Council. Mark Veerkamp was transferred from Executive Council to CEDC. And in terms of the list that you've got, Andrea Coulling worked in government before, in January '07, and she has departed for the private sector.

Mr. McFadyen: The transfer, it was Mark Veerkamp, I think the name was, to CEDC. Is that a transfer into a permanent civil service position as contrasted with an Order-in-Council serving at the pleasure position?

Mr. Doer: I'll have to take that as notice. I'll report back tomorrow on that. I don't know the how-to. *[interjection]* Pardon? *[interjection]* Is it a yes? Okay. Well, I'll double-check. I always like to double-check.

Mr. McFadyen: The beauty of double-checking with Estimates is eventually you get to the last day and then there's 12 months before we get to follow up again. But I'll leave that as an aside. *[interjection]* It does fly, actually, when you're having fun.

I didn't quite understand: the Premier said something to the effect that Jackie Friesen had been transferred within Executive Council, or was an employee of Executive Council but left. It wasn't clear to me where she went to.

Mr. Doer: Jackie was doing her part for population increase in Manitoba. She left government and was reappointed to government in a position she held most effectively in Cabinet Communications.

Mr. McFadyen: Well, in that case, I want to extend my congratulations to her.

Madam Chair, I just want to come back. There was one other response the Premier provided as a follow-up to questions that were asked yesterday, and I would just note before I get to that question that he indicates salary was $131,000 for Mr. Balagus, not $135,000. The $135,000 reflected other benefits that were non-salary benefits, which I understand, which means that there was an increase of roughly $26,000 over three years from a base of about $101,000, which still sounds like something in the range of 8 percent. The Premier says those are related to standard merit increments.

It sounds high to me, an 8 percent increase from one year to the next, average of eight years, when you consider what's going on with cost of living in other sectors. I just wonder if he could just provide some additional explanation.

Mr. Doer: In essence, there are close to four wage increases because one is retroactive. We apply the public service settlement to all excluded people in the public service after the contract is negotiated and ratified.

I'm just recalling, but in '03, the contract was not negotiated before the election, and it certainly wasn't negotiated quickly after the election. There was a certain lag time, so there would have been that retroactively and, of course, we didn't start Mr. Balagus at the top of his range. We started him in a position where he got increments, a very comparable practice to when the Leader of the Opposition was in the former premier's office. The increments flowed to the staff, and then you could sometimes get increases. Obviously, the increment and the general wage increase can produce results that are higher for a short period of time until the increments are over.

I can get even a further delineation, but that's the explanation of it, and, again, it was exactly as Mr. Sokolyk had received in the sense that he'd been there three or four years, I believe, and got increments and general wage increases. There was no adjustment. I would require an Order-in-Council to adjust the salary from 2003 to add an increment. I would require an Order-in-Council, and if I did that, it would be fully divulged to the opposition because they're public documents. I don't recall, and I've asked people to double check, whether there was any increase beyond the regular increases that do not require statutory approval, and there just wasn't an extra payment.

But there was an extra situation with the salary increase that did come in retroactively, so he would have had, in a very short period of time, the increase. I think almost every civil servant in 2004 got a 2003 retroactive increase. If I recall correctly, the MGEU filed for arbitration. Then there was a subsequent settlement, so that delayed, during the period of time that we may or may not have gone to arbitration, there was a definite gap of time which would result in the increase being–you'd have to go back to '03 because it was higher because of the retroactivity.

I did not sign an Order-in-Council. I got the nod. I'm pretty sure I would remember that. Actually, I'm pretty sure somebody would ask a question about it the second–before the ink dried, as you would expect.

***** (15:10)

Mr. McFadyen: I assume when the Premier talks about somebody wanting to ask a question before the ink dried, he's referring to members of his Cabinet. I leave that as an aside, Madam Chair. I know that members of senior staff are not always popular with other members of Cabinet, so that's why I make that comment, not that I ever had conflict with members of Cabinet in the day. *[interjection]* Well, that's what I saw on the ad. I did see that in an ad.

Back to the Premier again, just coming back to the staffing numbers within Executive Council. He indicated, and this name is reflected on a chart that we were provided that's dated September '07, Andrea Coulling as a member of staff. He indicated one member of staff who left and then returned and then two others who departed.

I wonder, is there a vacancy created by virtue of that? You've got one new staff and two departing staff over the last 12 months or was that vacancy filled? Is there another new member, I guess is the question, from the past 12 months?

Mr. Doer: On September 28 when Andrea leaves, we will have a vacancy, both in person and in spirit.

Mr. McFadyen: Thank you for that clarification. I thought that you had said that she had joined within the past 12 months. *[interjection]* She did and she's departing. Okay, all right, it's a revolving door.

Madam Chair, I just want to ask the Premier, just to come back on one other question. I asked yesterday whether there were any other departments or Crown corporations or provincial government agencies that covered the Premier's travel expenses. He was good enough to confirm that Hydro had paid for the expenses, which makes sense to me, for the flight to Nelson House in connection, I presume, with the Wuskwatim announcement.

I just want to ask the Premier whether there were any other departments, Crown corporations or provincial government agencies that covered any other travel expenses in the course of the past 12 months.

Mr. Doer: I mentioned Intergovernmental Affairs. I'll double-check the other departments. The total will be provided consistent with FIPPAs. The quantum will be provided. The source, I can also get to the member. It's primarily Intergovernmental Affairs, but it may have been other departments from time to time, giving speeches, et cetera. But I'll get the exact–I'm just thinking of the internal trade discussions that Bernard Lord and I led. Sometimes the budget came out of the Trade department. But the quantum, the total, would be obviously disclosed, including any memberships in Davos.

Mr. McFadyen: I wonder if, just to go back over the period of time since our last Estimates which were in May of last year, May of 2006, which in some respects seems like a lifetime ago but really wasn't all that long ago, if the Premier can just give an overview of the–before I get to the question, I just want to premise it by repeating what I said yesterday, that travel is an important part of the Premier's job. Representing Manitoba is a critical component of the Premier's responsibilities, so there's no issue at all with respect to the need to travel from time to time on important trips.

But I do want to just ask if the Premier can provide a summary of his travel from last year's Estimates, May of 2006, until the present, his official travel. We don't need to hear about Lac Lu.

Mr. Doer: Well, I can provide that. I'll get that. I think it's going to be available. I actually like to read it sometimes. I've noticed the odd time there's been a double-counting of something, not by anybody. I sometimes want a reality check to make sure it's accurate.

We also are subject to FIPPA obviously on the travel and I believe we're looking at having a regular disclosure of that information similar to members' allowances and expenses.

Mr. McFadyen: Madam Chairperson, I wonder if, when he returns with that information, the Premier can just outline the purpose of the trip, the destination, and who accompanied the Premier on those trips in terms of the delegation.

I just want to ask the Premier, going back beyond the previous 14 months, if he, in any official capacity, has travelled with a Mr. Costas Ataliotis.

Mr. Doer: No. I don't even have to check that.

Mr. McFadyen: Madam Chairperson, I want to ask the Premier whether he's travelled, going back to 2000, with either the chair of Crocus, Mr. Rob Hilliard, Sherman Kreiner, and/or James Umlah over that time period.

Mr. Doer: No.

Mr. McFadyen: Thank you. Just coming back on the issue of Crocus. This is the first time we've had Estimates since the Cabinet document was made public. That was the November 2000 Cabinet document that contained within it two fairly startling statements: one that Crocus was headed towards a liquidity crisis, and, secondly, that it was operating outside of its prospectus.

I want to ask the Premier if he could explain what direction he gave to his Minister of Finance (Mr. Selinger) when that paper came forward to Cabinet, given the very startling and serious nature of the statements in that document that were signed off by his then and current Minister of Finance.

Mr. Doer: Well, it's also the first time since the member opposite argued that the government withheld those documents from the Auditor General and the Auditor General's office confirmed that it made up the Auditor General's report. It was considered by the Auditor General. I still haven't got an apology from the Leader of the Opposition to the Minister of Finance.

I'm also quite concerned that the member opposite has had correspondence with the legal team suing the Government of Manitoba. Of course, our concern is for the taxpayers of Manitoba. The lawsuit goes back prior to our administration in government. It's not just the Province of Manitoba. I know that that's a fact conveniently overlooked, but I'm going to be very careful on any comments I make here because we're fully accountable in any lawsuit and we'll be judged accordingly.

We also have the Auditor General's report which, contrary to allegations made, did have the document, did consider the document. So I'll be dealing with issues in a lawsuit before the whole provincial government back to 1992 and I'll be very careful.

Mr. McFadyen: Thank you. I agree on the need to be careful, which is why it's important to get the chronology right in terms of the Cabinet document that the Premier is referring to, that there was a rushed letter issued by the new Auditor General who was not a part of the Crocus audit, the contents of which were leaked to the media by the Minister of Finance (Mr. Selinger) before the letter was released the next day.

At the next Public Accounts meeting, the gentleman, whose name I will double-check, who actually oversaw the audit issued a document which backed away from what the new Auditor General had said about that document. In fact, the individual within the Auditor's office who issued the statement indicated that the document had not been provided to the Auditor's office by the Premier (Mr. Doer) or the Minister of Finance (Mr. Selinger), which is exactly what I and the leader of the third party had said.

***** (15:20)

In fact, what had happened was that the Auditor's office stumbled upon the document in the course of reviewing monitoring files within the Department of Industry and, when confronted with that document, chose to not make reference to it in the Auditor's report. It was background knowledge that was possessed by the Auditor's office, but it was not referred to in the report.

The problem that the Auditor's office was confronted with when coming across the document was that in 2001 the Premier and Minister of Finance had amended the Auditors act to prevent the Auditor General from having access to Cabinet documents without the prior permission of Cabinet. That permission was never sought, and the document was therefore not specifically referenced in the Auditor's report.

Anybody who has read the Auditor's report in its entirety will know that the specifics of that document were not referenced in that report. So it is important, as the Premier says, to get the record right and be factual about what actually happened, which is why I would suggest that if anybody owes anybody else an apology, the Premier may want to apologize for not proactively giving the Auditor access to the Cabinet document and for not proactively granting permission to the Auditor's office to make use of that document in the course of their audit.

So, coming back to the question, because that's a long diversion but I think important to correct the record. Coming back to the question, I wonder if the Premier can indicate why he didn't direct his Minister of Finance to warn Crocus investors of what they were aware of along with a public plan for getting the fund back up on its feet and heading off its liquidity problems and instead chose to keep it secret.

Mr. Doer: I would point out that the former Auditor General said, and I quote, in the *Winnipeg Sun* that the documents would not have made any difference to the findings in the audit. The Auditor General did comment on issues of pacing, and we did take responsibility for that when the Auditor General reported.

I would point out that we're aware that the member opposite has had–his office has had communication with the defence lawyers or the lawyers from the group that is suing the government. It is our responsibility to protect taxpayers. It is the primary responsibility to protect taxpayers and we have the Auditor General's report.

We have a civil suit that is proceeding or before the court. It goes back to 1992-93 when the legislation was passed. The Province of Manitoba is defending the lawsuit that goes back to the previous Premier and the Auditor General report stands. I certainly support the findings of the Auditor General, accept responsibility for them and accept the fact that we took a proactive approach when Crocus was balking at the documents being released. We wrote a letter to Crocus, said that the new legislation we brought in allows for the Auditor General to go into private companies, i.e., Crocus. The Auditor General has the authority to do that, and we will back up the Auditor General in court. So we did take a proactive approach.

The law provides access to every document, every file in every department dealing with any audit. That's just plain and simple, and the Auditor General, of course, has access, power, subpoena and anything else so it's completely open, but the Auditor General report stands. It's a document for this Legislature and the member opposite may want to join the legal team of the plaintiffs. That's his right, but I'm not here to try the court case in Estimates of the Premier.

Mr. McFadyen: We certainly share the frustration of all Manitobans, which includes the 34,000 Manitobans who lost money in Crocus who are the plaintiffs in a lawsuit, at their inability to get at the facts and the truth and to shed some light on exactly what happened in the lead-up to the fund's collapse and for that reason make no apology for communicating with advocates for those 34,000 plaintiffs, with a view commonly to get at all the facts so that we can establish what happened and allow Manitobans to know what happened and ultimately arrive at a fair settlement for those who have been impacted–fair both to taxpayers who are funding the defence of this lawsuit, the protracted, expensive "Russian winter" defence that the government is mounting to the lawsuit, which is at the expense of taxpayers. We think that full disclosure of the facts to the people of the province of Manitoba is in the interest of both taxpayers and Crocus shareholders and make no apology for working with others who may have information that is relevant.

We certainly contrast that with the witness tampering that went on by his former Minister of Health and Minister of Family Services in the 1990s which was the subject of some comment, and we certainly are not in the business of trying to influence the testimony of witnesses. We are simply interested in gathering information as it becomes available, Madam Chair.

So the Premier (Mr. Doer) hasn't responded to the question. They've launched a cover-up strategy for more than four years after they became aware of the problem. Shortly after the Cabinet discussion in November of 2000, in fact, the first opportunity after that discussion, they introduced amendments to the Auditor's act which did two things: one is open up labour-sponsored funds to scrutiny; secondly, to close off access to Cabinet documents. So, certainly, the government was prepared to allow the funds to be held accountable and to be scrutinized but wasn't prepared to be scrutinized itself. So, when the Premier says that all documents are available to the Auditor, the fact is that the Auditor is not in a position to make use of Cabinet documents without Cabinet's permission. That sets up a barrier to the Auditor. It slows down the audit and creates a vacuum in terms of the information that's available to the public.

I just want to ask the Premier because it would have seemed–the Premier is known for being a smart political operator–it would've seemed to me that it would have been politically prudent at the time of that Cabinet discussion to have made disclosure of the problems, and I certainly would have expected they would have made every attempt to blame the problems that were coming to the surface on the previous government. That does happen sometimes after governments change and then embark on a program of attempting to correct the problems. I don't understand why they wouldn't have taken that course of public disclosure, outlining what the problems were, providing some explanation as to what might have caused them, and embark in a public process of working out the problems in full view of those who were to invest in the fund. I wonder if the Premier can just explain why the choice was made to take a cover-up strategy as opposed to an open and transparent strategy.

Mr. Doer: Well, we have full accountability with the Auditor General's review; we'll have full accountability with the lawsuit. I'm surprised that the member opposite is working in concert with people that are trying to sue the previous government and this government when he confirmed that he is working with the advocates for the plaintiff. I think that there is a–I guess our concern is the taxpayers. The member opposite, a year ago, said he would settle the lawsuit after he urged me not to settle it in the House. We are defending the position and we're actually defending the former government. Part of the allegations in the lawsuit deal with the existing legislation that was passed as far back as '92-93.

So, my job here is–and the member opposite is working in concert with the plaintiffs' lawyers, you know. I'm working in co-operation with defending both our government and the previous government on the lawsuit. We believe that taxpayers are our responsibility, and we're fully accountable and we will continue to be accountable.

The member opposite used the White Russian metaphor, the "Russian winter." I hope he's not Napoleon in this regard and I think he might be.

***** (15:30)

Mr. McFadyen: Without getting bogged down in the confusing historical reference, I want to just come back to some of the things the Premier said which are just dead wrong. This defence is about protecting the Premier, members of his Cabinet and his friends at Crocus. It's got nothing to do with protecting Manitoba taxpayers because if he was interested in protecting Manitoba taxpayers, he would have been prepared to get to the bottom of what had happened and then work out something that's fair instead of this protracted defence which is now being undertaken. The lawyers representing the government are very good lawyers. They bill accordingly.

I just want to ask the Premier if he can indicate what the cost of the defence to taxpayers is to date.

Mr. Doer: I'm sure you could have your critic ask in the Department of Competitiveness. I'll double-check who the actual authority is for the expenditure of money. The member opposite indicated that he was willing to settle. That in itself is expensive. That's his position. Our position is to defend, not only our government but the previous government. The case goes back to '92-93. It goes back to the original legislation. It goes back to the directors appointed. The original directors were appointed under the legislation. The original team of directors goes right back to an initial document signed off by one Eric Stefanson. It includes our time and the previous government's time.

We certainly know that the cost was $12 million for an inquiry. We asked that question, which is also expensive. I've called inquiries before when I thought that some of the other checks and balances were not adequate. Driskell is one, Sophonow is two, and I promised to have an inquiry on the unfortunate death of Phoenix Sinclair after the alleged murder charges have been dealt with. But I'm conscious of the costs and the benefits of any inquiry. Obviously, I will be accountable in court, as we said before, and we will provide our answers under cross examination with no fear of providing those answers. I'm certainly knowing that the member opposite has confirmed that he's working with the plaintiff's lawyers. Just to say that this court case is before the courts and it goes back to the previous government and our government, and we'll defend our actions.

Mr. McFadyen: Thank you, and I know that his lawyers are in communication with the plaintiff's lawyers, and I've said that we are interested in gathering facts wherever we can so that the people of the province know what happened, and we can get past the cover-up.

The Premier has made some incorrect statements in his response. He indicated–or misleading statements, I guess may be a better way of describing them–that the lawsuit goes back to the former government. If you read the statement of claim, which I know he has, he knows that the allegations of negligence and abuse of public office and the serious allegations arise from 2000 forward under his government. Certainly, the statement of claim lays out facts in order to provide some contextual background that goes back to the 1990s in terms of the start-up of the fund, the legislative framework and other things. But the allegations relating to negligence and other serious abuses of public trust, all are directed at his NDP government. I think that's important to have that on the record.

It's not surprising, when we consider what we know to this date, which is that the warnings were coming forward through 2000 in terms of the looming liquidity problems at the fund and the fact that the government was aware that the fund was operating outside of its prospectus and not disclosing that to the public. Clearly, it doesn't take a lot of common sense to view that as outrageous behaviour when it comes to protecting the public interest, and now, as a result of that, Manitoba taxpayers are faced with a $200-million claim, with legal costs mounting and interest running on that claim as well.

So my advice and my position is that we should get to the facts as quickly as we can, stop paying the lawyers, cut off the interest payments, and, on the basis of the facts that are available, cut taxpayers' losses. What the Premier's decided is to put himself and his friends at Crocus first, allowing the interest to climb, allowing the legal bills to mount, so that Manitobans are left in the dark, and I think that's unfortunate. But, clearly, the Premier's not in any mood to make any admissions, and so it will go on and on and on, I would assume, Madam Chair.

I just want to come back to a statement the Premier made with respect to the motion the government had brought to strike the claim, and the Premier made a statement in the media that he could pretty much guarantee the government was going to win that motion and have the claims struck out. As we now know, Justice Hanssen rejected the government's motion, did not strike out the claim, believed there was enough merit to the claim that the lawsuit should continue, so I wonder if the Premier wants to apologize now for wrongly predicting and trying to suggest that the government had an easy case on this motion to dismiss.

Mr. Doer: Yes, in fact, the member opposite, when he first took the position, he said that we should move to the motion to dismiss, and then he took a different position four weeks later that we should settle. So it's a very convenient legal position on the one hand and on the other hand. So we've been consistent in terms of defence. The issues will be resolved in the court. There are appeals, potentially, Wellington West and Pricewaterhouse, the Securities Commission, a number of individuals. I would point out the seven, quote, so-called "insiders" to Crocus that were named in the lawsuit were all under the–six out of the seven were under the Conservative regime. I know the member opposite only focussed in on one in his questions and the media accordingly did the same.

The lawsuit's statement of claim goes back to March 21, 1992. It covers seven and a half years of the previous government and four years of our government and, as I say, six out of the seven, quote, "insiders" were obviously appointed by the previous government. The legislation that arises, the first allegation is dealing with the legislation, the Auditor General already raised that issue. So we'll be accountable in court and we accept that.

Mr. McFadyen: Well, the Premier conveniently, in giving the chronology, again fails to make the point that the allegations of negligence and abuse of public trust and other issues all arise from the period 2000 forward. Certainly, there's contextual background going back a number of years, but certainly none of the serious allegations relate to anything that happened under the previous government. I know that, if they had evidence to support that position, they would have produced it by now and they haven't. So I would suggest that–he's cast aspersions on Mr. Stefanson and other members of the former government routinely in his defence on this case–rather than doing that without any evidence to support it, the Premier might want to be cautious and careful in terms of how he tries to spin the chronology that's laid out in the lawsuit.

But, moving on to a related question, I want to ask the Premier whether he had discussions with GrowthWorks and was privy to any of the discussions or played a role in connection with the GrowthWorks takeover of the management of ENSIS that was recently announced.

Mr. Doer: I didn't have discussions with GrowthWorks. I mean, GrowthWorks was in the public domain in terms of even Crocus back in–a few years ago, I guess, '05.

***** (15:40)

Just in terms of chronology, the lawsuit's statement of claim goes back to March 21, 1992. That's not something that's spinning; that's the fact of the case. Secondly, on aspersions, I just stated the fact–and I'll table in the House tomorrow–the Memorandum of Agreement between the Manitoba Federation of Labour and the provincial government at the time that was signed off as the basis for the genesis of the legislation, and that is a factual statement. It was in and around the time of March 21; I know it was 1992. I'll provide it to the member. I'm not casting aspersions. I'm just stating the chronological facts when a case begins.

The case is against the Province of Manitoba. The Province of Manitoba is cited from March 21, 1992 until its seven and a half years under the Conservative government, four years under our government, and it's still the Province of Manitoba. We've had other cases before where lawsuits emanate from different administrations and carry on from one administration to the other. The initial allegation is dealing with the initial legislation that has already been commented on in the Auditor General's report.

Mr. McFadyen: Again, not to continuously go over the same ground, but the allegations of negligence and other serious misconduct related to the period from 2000 until 2004.

I want to just come to statements that the Premier made in the House in response to questions prior to that Cabinet document coming to light. He made a statement in this House that all representations to us were that Crocus was strong. Given the Cabinet document that he had seen six years earlier that said it wasn't strong, I wonder if the Premier wants to take the opportunity to apologize and correct the record.

Mr. Doer: Well, you're taking my comments out of context as usual. I know they do that in moot court at the university. But if you read the whole statement you'll find that I was talking about my dialogue with Mr. Chipman. I was dealing with him on the development of the proposed MTS Centre, which was opposed by the Conservatives. I was also discussing with him–informally he mentioned the great success of National Leasing. But if you go back in *Hansard* there's a context. If you want to keep taking things out of context, don't expect me to answer out-of-context questions.

Mr. McFadyen: The Premier, I will acknowledge, is very good at parsing and picking the part of the question that he wants to respond to and giving half-answers. So that's why we have to sometimes keep coming back on these issues. That's a common tactic of people who don't want to be candid. He'll provide a narrow response to a question but is certainly not prepared to be candid on the issue of what they were told. *[interjection]*

Well, there was an exchange that went back and forth over what he knew about Crocus, and the statement was deliberately narrow. In any event, we now know that he didn't think Crocus was strong and that he had had representations from his own Minister of Finance (Mr. Selinger) that it wasn't. Presumably he takes the advice of his Minister of Finance seriously and doesn't completely disregard it. There are times when probably he should, but presumably he takes it seriously, and it's interesting that he would choose to leave that out of his response when we're talking about his knowledge of what was going on.

Just moving forward on this issue to recent events. The Premier indicated he didn't have any communications with anybody at GrowthWorks with respect to their takeover of ENSIS. I just wonder if he can indicate whether any members of his staff or any government staff had such communications who may have then reported those to him.

Mr. Doer: I'll check to see if anybody had. I heard the media reports on it.

I think GrowthWorks was something I was aware of in the media with the different options that the former board of Crocus was looking at. There was an issue there of liability and the government. We did not proceed to protect the board members with liability. We did proceed to have the tax reduction extended. But I'll double check on GrowthWorks. I'm trying to–I saw Bill Watchorn a couple times socially, I don't think he–I'm trying to recall our conversations–it was a golfing fundraising event. I'll check with my staff, but I certainly knew the announcement when it was made, and it was a private deal.

Mr. McFadyen: I just want to ask the Premier whether he shares the concern that we have expressed that the takeover of the management of ENSIS by a Vancouver-based firm in effect shifts head office decision-making responsibilities out of Manitoba.

I know in the short run, other than Mr. Watchorn who's joining the board of GrowthWorks, the officers and staff at ENSIS are, at least in the short run, protected, but the decision-making power, broadly, has been shifted out of Manitoba consistent with a trend that we've seen over the last number of years in the number of head office jobs declining in Manitoba.

I want to ask the Premier whether he is concerned about the fact that the transfer of head office responsibility to ENSIS has left Manitoba.

Mr. Doer: Well, if the member opposite will recall, I was concerned that the pension decision on teachers back in the '90s, prior to my election, was transferred to the head office and management of that fund. So I think it's Greystone, or I'll try to get the right name. I'm just trying to remember. The company was transferred to Regina out of Winnipeg.

To be consistent I would prefer the management and ownership in Winnipeg. Having said that, I listened to Mr. Watchorn's explanation in the media about the need to get bigger funds to survive. I don't know whether it's, quote, a red flag, but I was aware in the media that there were financial statements about ENSIS, before Crocus, dealing with some companies that were losing money. After Crocus it certainly accelerated in terms of the participation rate.

Mr. Watchorn also talked about the performance or lack of performance of other labour-sponsored funds, but I believe that there have been some positive developments with funds in Manitoba, the Canterbury fund that was established by a number of prominent Winnipeggers in Manitoba. Mr. Weinberg, of course, has been involved in that fund initially.

I also know that the Richardson fund has established again a venture fund here in Manitoba, an investment fund rather, in Manitoba and there is more head office capital here now with the creation of that new fund in Manitoba over the last four years. I think those are positive developments.

Obviously Crocus and ENSIS, Crocus is a very negative development, and ENSIS, I would have preferred it to be managed here in Manitoba. But I did listen to Mr. Watchorn's reasons for making that decision, and his view was, as the manager of the fund responsible for private-sector criteria, that this was in the best interest of the shareholders. He therefore made that decision as he saw fit, and I assume it was ratified by a body that is responsible for the ratification of those decisions, not by government.

Mr. McFadyen: I would just note the Premier's acknowledgment that the Crocus fiasco played a role in the problems that ENSIS faced and contributed to a need on the part of ENSIS to find a manager or a partner that had national reach in terms of marketing.

I certainly want to acknowledge the success of Marty Weinberg's fund as well as the Richardson fund. They've done a good job of raising capital, important to note, of course, that they're not restricted to investing here in Manitoba, although my understanding is that they're either looking at or have invested in Manitoba companies. But much of it is invested outside the province. Notwithstanding that, it is a strength of our province that we've got people with the capability to manage funds of that size.

***** (15:50)

Danny Bubis is another individual in our city who has taken on significant responsibilities in managing mutual funds, very significant ones. So certainly we have some talent. It is disheartening, however, when the focus is outside the province in terms of the investment targets for those funds.

Just back to the topic of head office jobs, I wonder if the Premier can indicate, and if he would be prepared to table the log of, any communications he had with Mr. Schmidt, the CEO of the former Sask Wheat Pool, now CEO of the new merged company with Agricore, about head office jobs here in Manitoba.

Mr. Doer: Well, they are private correspondences, but I have met with Mr. Schmidt on the Agricore-Sask Pool decision. Obviously, they're keeping all their operations here including the malt plant in Portage la Prairie, the oats plant rather. The head office jobs, some of them have remained in Manitoba. We've met with Mr. Schmidt. We know that some of the jobs were purchased by Richardsons to deal with competitive issues. Other jobs were purchased by a second company, and we certainly are worried that he's made it very clear publicly in Regina and in Winnipeg that the merger would reduce head office staff. He's been clear about that.

He's also made it very clear that there would be a process of reviewing all operations in both places over the next 12 months to determine the staffing and the location. Obviously, if we were quite worried when a Regina-based company purchased a Winnipeg-based company, we were quite worried about that. We see mergers the other way, though, you know, all the time. When Great-West Life buys another company and merges it and reduces its staffing, or Investors buys another company–and I was just meeting with the principals of those two companies this summer as well–it is a net gain. In fact, in the financial services sector, there's a considerable amount of gain in jobs and employment over the last number of years with the successful mergers that have taken place.

But this one, the head office right now is in Regina, of the company. If it was a bidding contest between the Richardsons and Sask Pool, obviously we're working with the successful bidder because they won, but, you know, when there're two companies bidding, one located in Regina and one located in Winnipeg, we start from the belief that–and I'm not talking about this situation because I don't want to offend Mr. Schmidt in my discussions with him–but my general principle, not with this case, of course, it doesn't apply to this case, but the general principle is we prefer Manitoba companies to be the buyer not the buyee.

Mr. McFadyen: The numbers that we see on a net basis on head office jobs in Manitoba are disconcerting in that there's been a steady decline in the number of head office jobs, an increase in the number of actual head offices, but the number of jobs declining. It's the job number that's the relevant one when a person is looking at where they want to have their future. Whether they're a graduate of engineering or commerce or any other faculty or a graduate of a community college, they're looking at their opportunities to progress up through the ranks of companies. As head office jobs move to other places, it's certainly discouraging for people who are trying to make decisions about where to go.

I'm not suggesting that as of today we are in, by any means, a crisis, but we have a concern with the direction things are moving in, relative to other places and, in particular, the recent decision by James Richardson International to locate their Canola crushing operation in Saskatchewan rather than Manitoba.

The movement of jobs by the successful bidder in the wheat pool bidding contest of head office jobs from Manitoba to Saskatchewan and so many other indicators of growth in Saskatchewan in that economy and relatively poor growth in Manitoba, and in the case of head office job numbers, negative growth, decline in terms of head office job numbers.

I wonder if the Premier can indicate what, if anything, he has in mind as a strategy to reverse this trend.

Mr. Doer: The member opposite mentions a couple of examples.

I would point out that the Canola crushing plant in Yorkton has not proceeded. I would point out that the regime of attraction in Brandon, from the community of Brandon and from ourselves, was as attractive, if not more attractive. But the whole issue of transportation costs with the number of Canola producers has put the cost benefit closer to the majority of Canola producers–or the number of Canola producers–in Saskatchewan. We didn't agree with the decision, but we certainly believe that–and we've had, from Mr. Richardson, confirmed that the bids were positive.

We've had a couple of other value-added jobs in plants announced in Brandon just recently in the food processing industry, particularly related to the health food industry. Just a few years ago, we were competing, with the Simplot operation, against Saskatchewan, Alberta and Idaho for potatoes, which went ahead. We've been competing on value-added jobs in hemp. We've been competing on value-added jobs in the hog industry; Maple Leaf has announced and then shelved their plans to expand dramatically, even with considerable public money, the Mitchell plant in Saskatoon and has proceeded with their own amount of money in the expansion of the second shift in Brandon. I talked about Great-West Life with its takeovers of other companies and the additional jobs, considerable jobs, in this community. Investors, with its takeover of the Mackenzie Financial services, and the movement of jobs to Winnipeg. I'll have to look at the financial services jobs numbers.

The overall job creation situation is extremely positive in Manitoba. The GDP is predicted to be positive. The earning rates are positive. There's still a lot more work to do. Every possible opportunity comes available. There are some that argue that the government should not put any, quote, money, in. I notice that some of these investments, like Motor Coach, with a small investment in the composite location, has ended up producing hundreds of jobs, some at Boeing, 300 extra jobs at Boeing. I was just talking to Minister Prentice about it last week when we were in Ottawa, besides the other issues that the member and I worked on together. We talked about the composite potential for the C17 repair and what it could mean. So that has been a very positive investment in manufacturing. But I'll check the actual jobs in the financial services sector.

Obviously, we are getting growth in a number of very, very major companies that are producing very significant careers. Just recently, as I said, I met with the principals, with the Power Corporation people in terms of their long-term planning, their long-term success and their great belief in Manitoba.

In terms of strategy, we believe education and training is the No. 1 priority for any government. I note that the Member for Brandon West (Mr. Borotsik) was just recently at an announcement where we further announced developments in the ACC college, the movement to the mental health site with expanded courses. We also are providing investments, seven percent to universities, to try to continue to invest in the future from where we were in the past, where cuts were the order of the day.

Ms. Erna Braun, Acting Chairperson, in the Chair

***** (16:00)

Of course, the member opposite pretty well duplicated the tax reductions we made to the corporate sector, the corporate tax reduction that we brought in. We had the highest corporate tax rate in Canada at 17 percent in 2000. It's now moving down to 12, and it's still more work to do. We had no change in the corporate capital tax. We've had no change in the manufacturing tax; we've reduced that. We've had no change on the machinery depreciation which we have matched the federal government's budget of February 2007, which to some degree has been helpful with the dollar and its rise of 15 percent in just less than a year and, of course, we pledge to eliminate the small business tax in Manitoba. We have the lowest small business tax in Canada, and we have pledged to eliminate that tax over the term of this mandate.

So we continue to chip away at the taxes on the corporate side, the education side, and on the personal side. You know, we've started from a pretty high base, and we continue to try to lower them on the corporate side but we don't believe in just the policies on taxes. We also believe in policies dealing with regulations. I think we've been evaluated to have the third best, but not the best in regulations. We're trying to continue to move in that area, behind B.C. and Alberta. We think we should do better. We believe in internal trade agreement in Canada, and we also believe in education and training as a key part of an economic strategy.

Mr. McFadyen: Well, the Premier likes to cite examples of companies and I know he likes to, any chance he gets, assign blame to previous governments for things that have gone wrong, but I note the list of companies that he indicated that are performing well in Manitoba are companies that were established here well before his government was elected. To be sure, the insurance companies controlled by Power Corp, Great-West Life, Investors Group and others–I find it surprising that you would be trying to take credit for the success of those organizations given how long-established they have been in Manitoba. I don't think that it would be entirely honest to say that it's as a result of any great initiative by his government that they have managed to be successful in this environment.

I also note the credit for the Maple Leaf expansion in Brandon and the reason for that is that Maple Leaf has the most modern plant in the country in Brandon. That was a plant that was built under the previous government, and so the rationale for Maple Leaf consolidating in Manitoba is because the previous government took steps–many of them opposed by him when he was in opposition–to create a good environment for those investments. Certainly, we're seeing the fruits of that today. In the case of Maple Leaf we see, in so many of the other examples he cited, companies that were established well before the life of this government.

So he talks about jobs. I would only note that we've gone from having the lowest unemployment rate in the country, now we've dropped four notches on that front, we now have the fourth lowest. We have discouraging numbers according to Stats Canada on the head office job front on a net basis. You can single out examples where there's been growth, but you have to subtract from those where we've lost jobs such as in the case of Agricore and in other cases where there's been a shift in head office responsibility.

So I wonder if rather than going over existing companies that are performing well in Manitoba, performing well because of the growth in the North American economy, not because of anything happening here, if the Premier can just outline what significant private-sector investment has taken place in Manitoba over the past 24 months.

Mr. Doer: First of all, I want to make it clear that there were two–there were about three or four questions posed by the member opposite in his previous question and one was "what are we doing" and the other question is "what is the status."

On the status side, I mentioned the issue of some of the companies that I've been meeting with this summer, and I want to give credit to the management, to the ownership and to the employees of those companies that continue to grow, and I would certainly want to ensure that that is the obvious case. There are issues on a go-forward basis when people are locating employees and manufacturers are interested in the manufacturing policy, which includes energy costs, which includes issues such as costs to compete in terms of education and training and other tax policies related to manufacturing, and they do make decisions every day about where to locate future work as does the financial sector.

On the financial side, I think one of the areas in our budget that we did announce two years ago and we implemented in the current budget, which the member opposite has basically adopted in his election campaign, was to eliminate the non-banking capital tax. That is an extremely important issue for companies going forward because there's no such thing, even though companies that have been established in Manitoba they make decisions on an ongoing basis of where to locate, and it's not just in Canada. It's at minimum, you know, a North American market, at minimum.

I'm not saying that that is the reason. I want to make it very clear. I think one of the areas that really is good for Manitoba has nothing to do with politics or government, and that is the whole issue of getting a well-trained person that is very loyal to the company that they work in. You hear this over and over and over and over again in Manitoba. This is a culture of loyalty and hard work that goes back to our parents and grandparents. I want to give credit long before this generation of political figures, and I want to make that very clear. If I said anything to do the opposite it's certainly my belief any time I'm dealing with a competitive issue that it starts with the hard work and skilled work of people, whether it's in the financial sector, the manufacturing sector. When I go on a shop floor at Motor Coach or when I go on a shop floor at Boeing or I go on a shop floor at Flyer or I go on a shop floor in a company in northern Manitoba, and I go to a fair amount over the year to keep in touch, it's always what comes back to me from management, and it includes managements moved in from the United States, is the creativity of people and the work ethic in this province. We debate about, you know, the cup being half full and the cup being half empty or full or empty, and the credit goes to a lot of really smart people that are working around Manitoba.

From time to time we do have competition. I mention the Simplot potato plant that was predicted to never proceed in Manitoba. I acknowledge that the former government proceeded with the Maple Leaf processing plant. We supported it in opposition, and we have worked with Mr. McCain to improve both the employment levels at the plant, but also the water protection, the new water protection that the Maple Leaf company has put in place. Another possibility to combine it with other companies in the area, adjacent to the area, is a market improvement from where it was in 1997-98 when the licence was improved, and I think that the Assiniboine River and the watershed will be better off for it because Maple Leaf has gone to the new nutrient and phosphorus levels. I applaud them for that and I think it's obviously the right decision, and the initial investment in that expansion was made entirely by them. They want to have a more co-operative proposal with the city of Brandon and other companies adjacent to it. But I do want to acknowledge the hard work of people, and I just wanted to make that very clear.

On the specific question of the financial sector, I said I would get those numbers. I would point out that the unemployment rate fluctuates with the labour force numbers on a monthly basis. The latest numbers are different than fourth in Canada. Just on average, we're averaging close to 7,000 jobs a year on average in the last number of years. We were averaging 3,000 a year in the '90s so we're moving in the right direction, and the public knows this. We can sit here and talk stats all day long. People know whether their economic situation is better today than it was before. They actually know that. No amount of statistics between politicians is going to change the reality of people's lives, whether it's better or worse.

***** (16:10)

On the issue of private-sector investment, between 55 percent and 60 percent of the new jobs this year, in 2007, are I believe in the private sector. I'll double-check that number, but I think it's close to that in terms of private-sector employment

Mr. McFadyen: I'm pleased the Premier is acknowledging the energy and ingenuity of business leaders in our province, many of whom have had success over significant periods of time and continue to adapt and excel in what they do. We do have a conversation in this Chamber about the environment within which they operate, the political environment which includes tax policy and a variety of things, and there are very often companies that will succeed in spite of a negative environment, and from time to time you'll have companies that fail in a good environment.

The debate is really around our assessment of the environment in Manitoba in comparison to other places which is really the most important consideration because people have so much freedom and this is a good thing, that they have so much freedom now to make decisions about where they want to invest and live and do business, that we are in a competitive world. I know the Premier will certainly acknowledge that in comments, but sometimes we note that it doesn't seem to be backed up by action and policies, and that's where we have concerns.

I know that lots of Manitobans today feel reasonably comfortable, but we also know that some of the early indicators of problems can arise and are very often flagged by people who are in leadership roles in different companies and organizations. I know, and I think the Premier can probably candidly say that he is hearing from people more often now, particularly in the last short while, concerns about where things are going in Manitoba but also how things are going more broadly. But the concern focusses to a large extent around Manitoba's position to weather difficult times.

Our Finance critic has certainly had the opportunity to touch on the point in Question Period, but it bears some further discussion here because it is so significant, every aspect of what goes on in the province if the economy turns down and we don't have the money for health care and education and universities and Family Services and all these other areas, roads, all these things that are important to us.

So I would say and I think would have a hard time finding anybody to disagree with me that having an economic strategy with the foresight to prepare for these negative developments has got to be a very, very high priority because of the fact that the economy underpins everything else, including funding Family Services and other areas.

So I asked the Premier the question whether he could list significant private-sector investments made in Manitoba in the past 24 months. He took the question as notice. Normally, when there's a major private-sector investment in a province, it doesn't take very much recall, especially for a skillful politician like the Premier, to recall those success stories and happily trumpet them at every opportunity.

So I want to ask him again if he could just, without taking the question as notice, list off new significant private-sector investments that have been made in Manitoba over the past 24 months.

Mr. Doer: Well, there was just one a couple of weeks ago in Brandon dealing with omega-3 products.

Madam Chairperson in the Chair

There's potential new development on hemp in Dauphin. I mentioned the Maple Leaf investment. I think they put $11 million into the existing plant. There's considerable amount of conversations on other major developments. There's of course OlyWest, an operation the member opposite is aware of, that was proposed and is still proposed in Manitoba.

Those are just a couple of examples. I can get a full list for the member. But we get advice about operations that are contemplating new investments all the time. Sometimes that's confidential and I respect that. But those are just a couple of examples.

Mr. McFadyen: I appreciate the requirement for confidentiality on things that are not yet announced, but the four examples, again Maple Leaf consolidating, because they've got a modern plant in Brandon built under the previous government. I was in Dauphin recently. There is frustration at the slow rate of progress on the hemp investment in Dauphin and a sense that there isn't a lot happening in terms of government attention and support in moving that investment forward. There was a reference to a Brandon investment which I'd be curious to know more about.

Then OlyWest, which is taking the position that they'll invest in Manitoba notwithstanding the negative environment that's been created by the moratorium, but because Manitoba, geographically, is well positioned for such a plant, and to take advantage of other developments in places like Québec, Saskatchewan and other places where they're going through downsizing and restructuring. Given our centrally positioned geography, there's logic in developing in Manitoba. We're glad to see that development. We think that OlyWest are very good corporate citizens and have served Manitoba well, and we look forward to that investment happening. I want to, in the spirit of non-partisanship, assure the Premier that we'll certainly applaud that investment when it is announced and confirmed.

But the four examples are not very compelling. Not very many of them have anything to do with action taken by government. This brings us back to our concern about a lack of focus and energy going into developing and encouraging private investment in Manitoba. We look at the jobs being created. A lot of them are spin-offs from major public investments: the floodway, the Hydro tower, highway construction. All things that are public sector investments, which obviously contribute to stimulating the economy in the short run, but don't form the basis for any new wealth-creation in the province which will sustain us going forward.

Obviously, our increasing dependence on transfer payments from Ottawa is a signal that Manitoba's capacity to support itself through its own source revenue is not as good as it could or should be. So I would just ask the Premier and suggest and put on the record our concern about the fact that there seems to be a lack of focus on economic development and a lack of strategy. Certainly, it shows up when we have such tepid reports of interest in investors here in Manitoba in major private-sector investments.

Now we see the dollar on par. The Premier talks about Motor Coach. We see the layoffs at General Motors in Ontario. We see a downturn in the U.S. housing market which, obviously, creates issues for companies in Manitoba like the strand board, Louisiana-Pacific at Swan River, and all of those companies engaged in manufacturing and exporting to the United States.

So I wonder if the Premier can indicate whether his thinking in terms of current economic policies, the incrementalist approach to dealing with taxes; the lack of energy going into attracting private investment; and the environment here, which is a difficult one with respect to labour laws–and in particular when you see situations like Mayfair Farms–whether he wants to revise his thinking and adopt a more pro-investment approach, and more energetically position Manitoba to be successful, because, certainly, we fear that these developments in the United States and the upward movement of the Canadian dollar will, down the road, start resulting in job losses and insecurity here in Manitoba. Even if people don't feel it today, our concern is that if the action isn't taken today, that they are going to feel it tomorrow and down the road.

I wonder if the Premier is prepared to, for example, take a more aggressive approach to dealing with property taxes in Manitoba, to dealing with the payroll tax, and in dealing with income taxes in the province of Manitoba, in addition to those other taxes as one part of that strategy, but also to be more aggressive in outreach and attracting potential private-sector investors.

***** (16:20)

Mr. Doer: I expect you do and are aware of the Husky plant that's now been multiplied by 10 times their ethanol plant. It's not open yet. It's open soon, but it's gone from 10 million litres to 125 million litres in Minnedosa. The company I was thinking of is Shape Foods in Brandon.

I want to come back to Boeing because they now have 75 engineers working on the 787 aircraft, and, again, this is work that you don't get automatically just because you did the previous aircraft. And the composite centre that we invested in here in Manitoba is being utilized by Motor Coach and other manufacturers, which was an idea that we developed in the early 2000s. We'd been told directly that that co-investment between the private sector and the public sector has made a considerable difference, the 300 employees on the shop floor in Boeing, and there is more work coming to that plant in Manitoba.

So there's an example where it's private sector driven, private-sector creativity, but the training facility at the airport, the college credit course, and the example that I raised with the composite centre has been very, very important. Light manufacturing is important for a more energy-efficient transportation product, whether it's a bus or an airplane, and it's going to continue to be very, very important.

The private capital investment in Manitoba will rise 6.5 percent this year. It's the second best in Canada and three times the national average. So when you talk about private capital investment, it's considerably higher than in previous decades and certainly it's doing quite well. The manufacturing capital investment in Manitoba will grow by close to 30 percent in 2007, the third best in Canada and again considerably higher than the national average of 5.3.

We've had record numbers of building permits in Manitoba, and we continue to believe that this is extremely important. So, you know, you could talk about these issues but I know that business feels, yes, worried about the rising Canadian dollar, but feels that things are doing quite well in Manitoba. The economy's doing quite well, and the numbers–well, again, the stats are not as relevant as people's opinions about their place in the economy.

On the issue of the dollar, we met with the manufacturers when the dollar was at 65 cents, and it looked to us like it was going to rise. We were told by the manufacturers of Manitoba that they could sustain up to an 80 cent dollar with the exports to United States. They were quite concerned and remain concerned when the dollar goes up so high, particularly when small short-term interest rates are higher in Canada than United States. They were in the past when the fiscal policy, the financial policy was to raise the short-term interest rates and really increase the rapidity of the rise of the dollar, and many companies lost their accounts receivables in a very short period of time. They may have shipped something 60 days to pay their bills and then lose the money in that period of time.

We agreed with Jerry Gray when he chaired a committee on the manufacturing sector. We joined with him in a proposal called Lean Manufacturing which dealt with labour costs, dealt with energy costs; it dealt with the manufacturer's tax credit which we've accelerated in three budgets. It dealt with the depreciation of equipment in a more rapid state.

I was just talking to Jim–Minister Flaherty–and I mentioned to him that we matched that when he brought in his budget last year or this current year, current fiscal year. We are concerned about where the dollar's going to go. One of the advantages we have is energy costs. One of the advantages we have is labour productivity in terms of the work ethic of employees. One of the advantages we have is education and training. More of the recent reports indicate that Winnipeg was the third most competitive community in Canada. Many companies that are small business companies that feed the manufacturing sector is where the biggest growth is taking place. And that's why we've gone from the highest small business tax to the lowest small business tax in Canada. The rate is now below Alberta. When we came in we were double that of Alberta, and we think that that is stimulating not those high-profile, ribbon-cutting kinds of announcements, but every day making a difference in terms of the economy because small business is extremely important to the Manitoba economy. We have had discussions on the dollar at par, you know, the U.S. financial policies. I'm sure members opposite followed Mr. Greenspan in his discussions. I haven't read his book yet.

An Honourable Member: You're still reading Mulroney's.

Mr. Doer: What was that?

An Honourable Member: You're still reading Mulroney's.

Mr. Doer: Still reading Mulroney's? Well I've read portions of Mulroney. I haven't read the whole thing yet. I've cherry-picked the CF-18 discussion and some of the ones that are more topical to Manitoba, a little bit of the Meech Lake. I haven't read the appendix yet, but I understand it's interesting. Everybody's got a book on it, Mrs. Carstairs and now Mr. Mulroney. I'm sure there's more coming over time. So I've read part of that, but I want to read Mr. Greenspan's book. I think it would be enlightening. I saw his interview with Mr. Russert this weekend and it was an interesting interview.

I mean, I've always been worried about the U.S. economy. I could say, well, I've always worried when conservatives are in charge of an economy, but I won't say that. But I've always worried when there's a combination of–you don't have to be a Ph.D.–I always worry when I hear that, I mean, the elements of a lack of medicare sustainability. Again, if you listen to Mr. Russert's interview with Mr. Greenspan, he says the social security gap is not as great as what people purport it to be. It could be managed with a small percentage of GDP over the medium term. But he indicates that there's a huge and growing problem in the United States on health care and the health care gap, both in terms of the sustainability of the existing system and the coverage of that system, which by the way when we meet with companies from different countries that are looking at either Canada or the United States, the issue of a medicare plan is a competitive advantage for Canada relative to the United States.

Another issue of competitive advantage is less lawyers in Canada. I want to say that, and I don't mean anything personally to the member opposite, but this is not a litigious society, as litigious a society as United States. So those are two of the competitive advantages we have.

The U.S. dollar is depreciated against the Euro, against the Australian currency, against many other currencies, and to some degree the Canadian dollar rise is to do with, according to Mr. Flaherty, all governments running surpluses and investing in productivity. But one could argue the other side of that. It's also to do with the fact that the United States has a situation where they're running a huge deficit. They're decreasing taxes–and you know my opinion about decreasing taxes and running a deficit–and also trying to finance a very expensive war and those are just the current economic realities of United States. You've got the sub issues and the sub prime issue and how it affects capital in the markets and the availability of capital in the markets. You've just got some retail numbers yesterday from companies that should concern all of us. It concerns me even though the stock market went up because the energy prices went down. I think the whole issue of the currency parody is going to remain with us because of the challenges on a go-forward basis with the U.S. fiscal situation.

***** (16:30)

So I think that we have to live with the dollar and that's why we adapted and adopted the lean manufacturing strategy in Manitoba with the manufacturers. We didn't sit in an office; we went with them a number of times and came up with a number of recommendations that they gave to us. We're going to continue to work with them because we recognize that it's extremely tough for them, and it's been extremely tough to compete. As I say many of them have exceeded what they thought they could do when the dollar was–they said to us they could live till 80 cents, 85 cents, but now it's going up and it went up 15 percent just in less than 12 months in Canada. So we're quite worried about it, but we're going to continue to work with these sectors that are established. What may be not a real problem for one sector, like the financial sector, may be a real problem for another sector.

Mr. McFadyen: I'll withdraw the point of order, Madam Chair. I was going to rise on the length of the response. It was getting dangerously close to the length of the clerk's Ph.D. thesis. I haven't read it, but I assume it's a weighty document.

In any event, I just want to come back that everything the Premier said is acknowledgment of the fact that we have economic problems in the U.S. which could have a negative impact on Manitoba. Our concern, when you look at the private investment story in Manitoba over the past 24 months, is that it hasn't been a great story. We could talk about an increase projected for this year. Projections don't always come out in reality, but when you're starting from a relatively low base compared to other provinces it is sometimes possible to have misleadingly high numbers in percentage terms when you start from a lower base. I would just leave that as a comment on the record.

I would also just indicate that representatives of small business, as an example, within small business, the restaurant and food service industry indicating disappointment at the sluggish situation within that industry, the lack of growth. We get new restaurants that come up from time to time but others are closing. These are businesses that have very narrow margins, and many of them are run by people who are not wealthy people, or people who are real entrepreneurs and who put up capital at their own risk. Sometimes they borrow money against their mortgages on their homes. In many cases, they're new Canadians who have come here and are going into business and taking risks to support themselves and their family and to provide a service to their community.

What I hear from people in that industry is concern about the fact that, while there's been tremendous growth in other provinces, there hasn't been such great growth here. There's a sense of stagnation. That's one industry that's highly sensitive to people's after-tax incomes. It's one of the first things you cut out, if your income is stagnant or goes down, is restaurant eating, and it's a good bellwether. I would just say to the Premier for the record that, when you hear those sorts of reports coming from people in that industry, it is time to be more alarmed and more concerned and to consider it a red flag that calls for more energetic and more significant action from the government to head off what may be a downturn in the Manitoba economy.

The Premier talks about this being academic in nature. I don't know if he used the word "academic," but something that people don't relate to at present because they think about their own circumstances. But the fact is that, when you see warning signs on the horizon, this could very well and very quickly move from being an academic discussion to being a discussion about people's lives and jobs and mortgages and homes and ability to get by, with an impact on health care and education and family services and these other areas.

We've certainly made the point, I've made the point, about the urgency. We think the government should be doing more, should be more pro-business, should be pursuing lower taxes and a better regulatory environment. We're on the record saying that, and I guess we shall see what transpires in the months and the years ahead.

Just coming back on a specific issue that came up last spring, there was some media around the fact that Ainsworth was looking at investing in Manitoba. I wonder if the Premier can just update us on the status of that proposed investment.

Mr. Doer: I just want to deal with a couple of issues. One, in the election campaign–I assume that's still your platform–the member opposite did not promise dramatic decreases in business taxes in Manitoba. He actually made a statement. After we had promised to eliminate the small business tax in this term, he basically said that the tax reductions on the corporate side, the small business side, the capital tax, would all be honoured by his "government." He then made a further adjustment uncosted, or not costed, on the payroll tax deduction being moved up moderately. So, really, where he blew his money, his income was a potential revenue issue. He spent $200 million on a proposal to lower the sales tax by one point.

Now, I'm not giving the member advice for the next election campaign, but if you wanted to get a bigger bang for your business buck and consumer buck, I would argue strongly that that was a very uneconomic proposal. I could think of four or five other proposals that business trying to compete with other provinces would prefer more than that.

So you have $200 million out the window in the first couple of days of the campaign, out the window in terms of ongoing revenue. Then you had other promises that were interesting to say the least. You never did cost the marina in Point Douglas. You know we didn't know how many houses you were going to bulldoze there and how many boats you were going to park there and all kinds of other things, but I would suggest that you, sir, have copied–can't use Xerox, that's an old term–but have taken off the electronic press, release of our business announcements and budgets and virtually brought them forward as your own.

We're flattered. I know that you had to work fast because we made the small business tax reduction in Brandon at the Chamber of Commerce luncheon, the independent Chamber of Commerce luncheon that we attended at that meeting. We certainly were happy that the member ran quickly to catch up but, you know, I would like to have some of those taxes lower. I wish we would have started on the corporate tax side. It's at 14 percent and now we'd be equal to Alberta. We started at 17 and we've lowered it every year since 2001, every year.

We've lowered the small business tax every year, every year. I wish we didn't start at eight percent. My brother's an accountant, and he tells me that we had the highest business taxes in Canada when we came into office.

An Honourable Member: They were during your time.

Mr. Doer: Well, you had no change in the corporate tax since the second World War. No change, so I take responsibility. I guess Premier Bracken was in, but it was 17 percent, including under NDP governments from 1945 to 2002. We started lowering it in 2002. We had it in the 2001 budget. Maybe we lowered it in 2001, but we lowered it down each year, and we have to do more. We have to do more, I acknowledge that.

An Honourable Member: Ainsworth.

Mr. Doer: Yes. I'm going to get to that, but you go on in a five-minute statement. You make statements and I have to have–this is a debate. This is not moot law school at Robson Hall. This is actually a two-way conversation, and I get to respond to some of your issues as opposed to–I know the member opposite loves that profession and someday he might go back to it, but here we have a discussion and, if you make a statement, I have the responsibility to deal with statements made. So I would point out that the–

Madam Chairperson: Order, please.

I'd just like to take a moment to remind all members to speak through the Chair and there'll be less temptation to respond.

Mr. Doer: Yes, Ainsworth is still interested in investing. They are still consulting with First Nations. They are slowing down all of their North American investments with the market the way it is, but they're still consulting with First Nations.

***** (16:40)

Mr. McFadyen: The Premier has completely left out in his response several points of importance. One is that it was he that raised the sales tax from six to seven points on June 1, 1987, when he was in Cabinet, and it was his government, NDP government, that set taxes at the record-high levels they were at. Certainly, with deficits and cutbacks in transfer payments through the 1990s, a recession in the early 1990s, there was limited room for tax reductions, and the Premier, I think, has said already that he doesn't think we should reduce taxes if it's going to create a deficit. So that's why he voted for the Filmon budget in 1999 and why he supported all of the Conservative economic policies when he ran successfully in 1999. He had to run as a conservative in 1999 to win the election. So I hope he'll at least be honest enough to acknowledge that.

We've also said that property taxes, education property taxes, should be reduced in Manitoba. This is a huge driver of property values which has an influence on one's ability to borrow against that value to invest in new businesses and create jobs. It was the Saskatchewan NDP that cut their sales tax by two points. Prime Minister Harper, whom the Premier has praised many times, is a Prime Minister who's cut the sale tax at that level. I think, every now and then, that regular people deserve a tax break, and that's why we think that sales taxes are worth going after.

But not alone by any means, Madam Chairperson, we think the payroll tax should be reduced. Over a longer term, the government should look at eliminating it completely. We're one of three provinces that still has one. It's a major issue with anybody we speak to in the business community that is investing in growing, particularly as you hit the threshold and the tax is applied retroactively to the full payroll. It's a significant blow, and it's a significant disincentive to invest. The proof is in the record. That's why the Premier can't name a significant new, private-sector investment in the past 24 months, and why he doesn't seem to be able to offer us any sense of optimism but what might be in the pipeline in terms of new investment in Manitoba. Even Ainsworth, which was rolled out in the middle of the damage control campaign last May, when the Crocus lawsuit was filed, appears not to be moving forward. The Premier blames North American conditions, but, again, we're discouraged by the fact that we don't see very much good news on the horizon, in the pipeline, and lots of reasons to be concerned. We see a poor record of private-sector investment and a lack of commitment going forward.

I want to just come to the issue of the Spirited Energy campaign, which, I think, was meant to be the government's substitute for an economic development strategy. I want to ask the Premier whether he continues to believe that the Spirited Energy brand is the right way to go. Is it creating the sense of excitement in the province that he said it would, and does he feel good about the millions of dollars in taxpayers' money that have been spent on that campaign to date? So I'll stop there with those questions, and we'll ask more when we hear the response.

Mr. Doer: Well, I mentioned a number of private-sector investments. You talk about pipeline; the Tundra Oil and Gas company has quadrupled their investments in Manitoba. We changed a number of tax policies on oil and recyclable materials in the extraction of oil. We're now working with Tundra on carbon sequestering. When you talk about pipelines, it's another development in southwest Manitoba.

I would point out that in 1999 I did vote for the budget. In fact, one columnist accused me of being co-opted by the former premier. In fact, the premier didn't just drive away with me, or he didn't just co-opt me; he put me in the back of a Jimmy and drove off with me. But I won't cite who that author was because you never want to admit you read any of it. So it's very important that you never admit you read anything because never let them see you sweat.

An Honourable Member: You do read his articles.

Mr. Doer: Oh, it was a lot easier to read them in opposition.

I did make a certain set of promises in 1999. We voted for two budgets, and I don't have any apologies for that. I actually think from time to time, if you agree with the majority of what's in a budget and if it's mostly what you've been saying in Question Period, you should vote for it. I didn't have any problem voting for, I believe, it was the 1999 budget or '98 budget, and the member opposite I know he–

Some Honourable Members: '88, '89 and '99.

Mr. Doer: No, we didn't vote for the '88 one. We voted for two budgets of the Conservatives, and I'll check the dates when they were introduced.

I don't have any difficulty with that. I recall one Liberal member who's no longer in this Chamber saying, why are we voting against this budget? Basically, it was some tax reductions that I certainly supported. It was for middle income families, lower income families. It actually was sensible in a minority government. We voted for it.

I remember some of the members saying, oh, why aren't we voting against it, or why are we voting for it? Some of the Liberals were huddling around the NDP, and I know that the member opposite was one of the gurus of Madam Carstairs' team, part of the small elite group that advised her, but I remember some of the people that said, why are we voting against this? I said we're voting for it; I don't know why you're voting against it. You know, they were out of this Legislature, the majority of them, after following that advice when they collectively poured gasoline on their head and lit the match. They were out of this Legislature months later, but they were able to go around, we voted against the budget we're great. You know, in this House, I want to tell people, the public is smarter than all of us, and never lose track of them.

On the '99 issue, we did change some things that I didn't agree with in the past. It had been implemented. One was actually the flat tax. We got rid of that flat tax in the income tax rates, and we didn't campaign on this, but we started to reduce business tax. It became obvious to all of us within the first year of office that we really were being in a negative situation with small business tax, corporate tax, and eventually we got around to the capital tax.

On the education property tax, the record is clear. You can find these numbers out. The taxes went up on average 68 percent in the '90s on education tax for home-owners, and it is now, CBC argues, up until the last budget it was 9 percent. We think it's 10 percent. We believe this latest budget advanced it further, and we're going to continue to lower the education taxes for home-owners in Manitoba. We're going to continue to do that. We've also promised to eliminate, or not eliminate, but to go to 80 percent reduction of education tax on farmland. You know, members opposite raised the farmland portioning. We lowered it. We think those are very good developments.

On Spirited Energy, we had a recommendation from the business community to allow them to run a campaign. We knew there would be low-hanging political fruit from members opposite if we allowed the business community to come forward with a campaign. We also felt that other provinces and cities were spending a lot more money, and we, basically, said to the business community that we're volunteering that we would fund a campaign. They said they would go out and get gifts in kind, and some gifts in contribution, and when it became an issue that it was perceived to be part of a pre-election campaign, even though the second stage was to be out of province, we put it on hold, and we put it on hold until after the Auditor General will report. We supported the idea of sending it to the Auditor General, and we don't think we did it perfectly, but we think that many other municipalities have signed on to the campaign. I know that there's controversy any time anybody agrees to a campaign. I also knew that it would be, as I say, low-hanging opposition political fruit, and it has been. You know, we're just prepared to take the advice of the Auditor General and some of the allegations that were made and take the advice of the business community. I have great faith in the people that are driving this. I have great faith in them.

***** (16:50)

It's not inconsistent with how we've operated in tourism. The former government used to have the Tourism portfolio close to their chest, or vest rather, and have a situation where they would have decisions on advertising made close to the government. We don't make decisions on advertising for any of the tourism campaigns. We have a group of business people in a committee volunteering their time to try to decide what is the best market and what is the best way of advertising that market. We created a council of people chaired by Mr. Robson, who used to be the ADM of Tourism. It is made up of prominent people in the business community in the tourism sector. We took the issue and decision, which is usually perceived as a partisan decision, you know, whoever advertises for you during a campaign gets the advertising contract of tourism, and that's gone back over a number of years. We took it outside of government and we moved it to–well, the money is from government, but the decision making is removed from government. So that's what we did with the tourism business.

We did the same thing with Spirited Energy, and I'll await the Auditor General's report. But I just want to pay tribute to the business people who have been involved in it and have supported it through thick and thin. We all knew–I said that it would be really easy to criticize this and it's going to be attacked from different quarters all over the place because it's easy to do. They wanted to do it. They felt it's in the best interests of Manitoba, and they recommended it to us. They recommended the two stages. We put the second stage on hold and we'll await the Auditor General's report.

Mr. McFadyen: The business community certainly has an interest in seeing our province prosper and succeed and be well positioned to outsiders. I certainly know that, when people volunteer time, they do so in good faith; I have no doubt about that. They are naturally inclined to take things at face value. I don't begrudge them that one bit. But, when we dig beneath the surface and look at the facts as to who's driving this campaign, who's paying for it, who's driving it, who's administering it, it is very much a political NDP operation. It's not disrespect to the individuals, but they're all political NDP operators that are running the day-to-day operations. We certainly have volunteers from different sectors come in for meetings from time to time, and I respect them for doing that, but the facts are that we've got millions of tax dollars that have gone into the campaign. We have a former communications director to the Premier overseeing it. We have a former executive director of the NDP administering the invoices and the payments with respect to taxpayers' dollars, and I don't blame Manitobans for being as cynical that this is really all about politics and not very much about what's best for the province and getting value for tax dollars.

So the Premier talks about the wisdom of the people and that they are smarter than us. I agree with that statement. So that's why I would ask the Premier why he ignored the advice of the real people who attended the focus groups who said that they didn't like Spirited Energy. It left them cold. They thought it was weird. Those were some of the comments. When the idea was tested with real Manitobans, it didn't achieve the objective that you would want to achieve with a branding campaign.

I know the Premier knows something about market research and focus groups, that you sometimes come forward with ideas and sometimes they test well, sometimes they don't. This one didn't test well. So why did they go ahead and spend millions of dollars in taxpayers' money on a campaign that real people were telling them wasn't going to work?

Mr. Doer: Well, here we have three examples of where we have given responsibility in terms of decision making to an outside body, in this case, Mr. Silver, Mr. Angus, Mr. Starmer, I believe, Mr. Modha.

Yes, there has been staff support, but the people that–I'm shocked to hear the list of people that have been involved in the committee and making the decisions, Mr. Ziegler, were, quote, "NDP hacks." That is just quite a dismissive term.

It came out of a recommendation, including where the existing mayor recommended, said that Winnipeg and Manitoba's absolute image has got to be modernized. They came out with a number of recommendations, some on small business taxes, some on education and training, some on using Hydro, an Aboriginal employment summit. They came out with at least 10 good recommendations, and one of the agreements I had with them is that we weren't going to have them operate as business people, have a meeting, pat them on the head and ignore their advice. So they cited cases after and examples of where documents are prepared, they work hard on it, they go out and have sector meetings, they get all this work done, and then reports gathered dust. They cited that to me. So I promised them at the outset that we would look at and we would try to make sure that this is a body that had not only the leadership from the business community and labour and universities, but also have not only the leadership responsibility but the authority to do so.

I used the same model that we used in tourism. We took tourism experts and allowed them to cancel the old patronage practice of putting out advertising and having focus groups and whatever else. I don't read the focus groups on tourism. I mean, we use business people to do it, and we also used, in the case just recently of Louis Riel, where we said that the students would have a set of meetings and discussions and come out with names. We didn't say that we were going to overrule them, and we didn't.

With the case of Spirited Energy, we supported the idea of the business community, who said, "We don't want government to run this thing. We want to run it and develop it ourselves." So I didn't micro-manage it; I didn't read the focus groups, didn't attend the focus groups, and they asked for and got the authority.

Madam Chair, I have to take a one-minute break.

Madam Chairperson: Is it the will of the committee to recess? *[Agreed]*

We are accordingly recessed.

The committee recessed at 4:57 p.m.

The committee resumed at 5:01 p.m.

Madam Chairperson: Committee of Supply will continue.

Mr. McFadyen: Back on Spirited Energy, I wonder if the Premier (Mr. Doer) would provide some clarification. One of the pieces of information that was released when the government finally, after months of asking and weeks and months of stonewalling, when it finally released the documents related to the Spirited Energy campaign, it showed that there had been retainer payments made on a monthly basis to the advertising firm, which is a good firm, but what would appear to be unusually high monthly retainer payments to the firm. I can't recall the exact number, but I think it was something in the range of $30,000 to $35,000 per month.

I wonder if the Premier would be prepared to inquire as to whether any of those payments were then used to pay subcontractors who may have worked underneath the advertising firm, and who those subcontractors were and what amounts they received, because it's common that firms, as he will know, will use subcontractors on these sorts of projects. I think in the interests of full public disclosure, would he be prepared to ask for disclosure, who the subcontractors were and how much they received under those payments?

Mr. Doer: Well, thank you. I'll inquire whether the Auditor General has that information. I'm not aware of any timing issues, but I'll ask the question as well. The contract was tendered, that's all I know.

Madam Chairperson: The honourable Leader of the Official Opp–

An Honourable Member: I'll be just a few minutes.

An Honourable Member: Brandon West.

Madam Chairperson: The honourable Member for Brandon West.

Mr. Rick Borotsik (Brandon West): Thank you very much. Thank you for the opportunity to speak, first of all, to the Premier. I do appreciate that, and thank you for acknowledging me as the Leader of the Official Opposition, which isn't, in fact, the case–which is not the case, I can assure you of that.

It is a pleasure, certainly, to be able to question the Premier. I do know that the Premier does have his heart in the province of Manitoba. I recognize that, and I certainly accept that. During the last election, he did spend an awful lot of time in Brandon, and I appreciated that as well.

As he was spending the time, the Premier had an opportunity to make a number of promises, election promises to my constituents in my constituency, and I appreciate that. I do know that the Premier is a man of his word. One of those election promises was very important. It was a redevelopment of a sports field at Vincent Massey High School. In fact, it was well publicized. It was a very good photo opportunity for the Premier at the time, and everyone, including the school board and the school trustees, was certainly very appreciative of that.

I do know that the Premier did put some financial terms on it. However, I found out now that it seems that it's not quite what it was going to be. It seems that now the school board has been requested to submit an application under Community Places grants, which was not the vehicle by which the school board was originally believing it to be. There are two issues here: No. 1 is, did the Premier at that time believe that it should be Community Places grants, or was there going to be another opportunity to fund this from another funding pool? If, in fact, that isn't the case that it was Community Places grants, does he not believe that the community of Brandon itself would be affected by having other projects that would be looking at those funds under Community Places not then having their projects approved?

Mr. Doer: I went through the list of commitments in August and I was told that that was on track, so if the interpretation of on track is different than what I intended it to be, I'll check that.

I made a promise to Mr. Grindey and the football team and I intend on keeping it, so I will raise it with my staff tomorrow morning and follow it up. I intend on keeping that commitment. It's interesting that not only has Israel Idonije come out of that program, but also I notice the receiver from Hamilton was a prominent member of that football team and I think his name is–they've obviously got a good football team. I think it's safe to say we don't want kids playing on fields that injure their ankles before they even start tackling.

Mr. Borotsik: Thank you, Mr. Premier. I do appreciate you taking that under advisement. This did come to my attention just recently from the school board themselves, and I should say that having Community Places as being part of the criteria was certainly not what their intention was, it certainly was the impression during that announcement.

Second thing is, and again, it's a very exciting project for the city of Brandon. I see the Member for Brandon East (Mr. Caldwell) here as well who was very involved in the project with respect to the relocation of Assiniboine Community College from its current site to the Brandon Health Centre, and certainly there's been a lot on this. As a matter of fact, the Premier's alluded to that on a number of occasions, even in the debate with my leader.

It's very positive. We all recognize that a post-secondary education is extremely important for Manitoba, for, certainly, the people who are coming through the high school system. They require post-secondary education and, certainly, the community college in Brandon is a very positive step for them as well as Brandon University.

In saying that, I have some concerns, I suppose, and perhaps the Premier could speak to those, is the lack of a plan. We do know that there've been an awful lot of announcements, and I appreciate that, but politically there's going to be a lot of sod-turnings and a lot of announcements and a lot of photo ops, but there doesn't seem to be any really well thought-out long-term plan as to how the facility will be relocated to the BMHC.

One of my concerns, and the Premier can hopefully deal with it, is that at some point in time the government may well say that the funding is not available for the complete relocation of ACC at the BMHC, which certainly is not what the original plan was intending. When I say there's no plan it seems to be only one building or one function at a time, and it should lay out a complete schematic as to the time line, as to when the full facility will be relocated to the new site. Thank you.

Mr. Doer: Well, there is a plan. It has been amended to include an increase in the number of trades and apprenticeship positions or spots which we announced an overall increase in the province, and we did announce a plan. We said that that would go for two reasons: One, we have a shortage and a waiting list in Brandon and across Manitoba; and two, there's a real gap for purposes of businesses at the ACC site and across Manitoba in terms of skilled workers. So for those two reasons we moved up the apprenticeship building and trades building.

We also were originally going to co-locate it in the Parkland Building, but there is more work necessary on the Parkland Building. These are historic–well, the nurses' residence is historic and it's come in on time, on budget; the Parkland Building was originally going to have the trades centre moved to it, but because we have to expand it and because of the inadequacies of part of the Parkland Building we have to alter that. So, rather than Parkland Building being phase 2, it's now phase 3, but the real gap is phase 2, the trades and apprenticeship program for which I announced the time lines in Brandon.

***** (17:10)

We're still awaiting the final number on the renovation on the Parkland Building, but, certainly, we intend on moving courses and students to that phase 3. That should complete the transfer from Assiniboine College. One of the great advantages of colleges is that they're more agile, perhaps, than universities. If there is something else like the trade shortage that we see, it may alter or amend parts of the phases.

But the phases are phase 1, the nursing residence. Well, I guess, phase 1 was making the decision, and that was not easy because the original numbers would not have supported it. I want to congratulate the mayor because the original decision, if we didn't have the operating costs down like we do at Red River College here, it would be the added cost of an historic building, environmental-lead technology and the student costs; it would have been too prohibitive to do it. But all things came together with the discussions and the costs.

The third phase will be the Parkland Building, and it will be after the trades building, which we are working as quickly as we can to get it going because right now there is a line-up. I think it is very unproductive to have youth interested in a trade or an apprenticeship, businesses needing them and a gap because we don't have the space to do it. That's why we're expanding the space in Brandon and in Winnipeg and in the University College of the North.

Mr. Borotsik: As I mentioned in the preamble from the last question, we all agree, I'm sure, everyone in this Chamber that education is extremely important, not only for the province of Manitoba, but for the children that we have coming up through the high school system. As part of that opportunity, the post-secondary education is Brandon University. Brandon University as well as two universities here in Winnipeg are certainly well suited to accept the students coming out of the high school system.

However, when dealing with the administration of universities, all universities in Manitoba, the one thing that continually comes up, obviously, are the shortcomings of funding from the Province backfilling the funding requirements that are there because of the tuition freeze that has been put into place. Of the administrators that I've talked to in the universities, this is one area that they certainly would like to see rethought, retooled. Tuition freezes, currently, are affecting the students, the classes, the ability to acquire capital for the programs, for the labs. Certainly, the tuition freeze is having an impact on the ability for the universities to provide the education that they should provide for their students.

I wonder if the Premier would like to share with us now, in fact, from a policy perspective, he and his government would look seriously, over the not-too-distant future, perhaps as early as the next budget, with respect to the lifting of that particular freeze so universities can get on with the business that they were intended to do, and that was to educate our children.

Mr. Doer: Well, thank you very much for the question. Is it the advice from the Member for Brandon West to lift the tuition freeze?

Mr. Borotsik: The question was posed to the Premier as to what his policy changes may well be with his government in the next budget with respect to the tuition freeze.

Mr. Doer: Well, I'm curious to know whether the member opposite has a different position than his leader who campaigned on a tuition freeze. So, if he talks about the weakness of that position, he is talking about the weakness of the Tory platform, by definition.

The other part of his question was dealing with the budget. The budget will be presented in due time. All things will be revealed to the member opposite at that time.

Mr. Borotsik: I would like to, certainly, for the record state that I have not said one way or the other. All I said is I've talked to–

An Honourable Member: You're a Liberal now.

Mr. Borotsik: I have talked to the administrators. The Liberals left. That's not even a good heckle at this point in time. The Liberals have gone.

The fact is I've talked to administrators. I've talked to the administrators. I've talked to the president of Brandon University. I do know the position of the University of Manitoba. I do know what their position is, and the question simply was placed to the Premier: Is he prepared to look at the policy that is currently in place, by himself and his government, with respect to the tuition freeze? I do know and I can bring data and information from my own president at Brandon University and what his views and his thoughts are with respect to the tuition freeze. I'm sure that he has imparted those views to the Premier himself, personally, and, on behalf of my president of my university in Brandon, I would like to know whether in fact the Premier certainly is prepared to stay with this policy, or if he's prepared to look at any changes to that policy.

Mr. Doer: I've had a consistent policy over the years. I'm curious to know–I actually thought the one thing we'd get from the Member for Brandon West was a kind of a frank, open, you know, kind of being-his-own-person kind of approach to politics, and I see he's a wishy-washy Liberal in his second day in the Chamber.

What are you recommending to me, sir? I'm listening, I always listen to everybody here in the Chamber. Are you recommending that we lift the tuition freeze, or do you want us to maintain the tuition freeze?

Mr. Borotsik: I could give you the recommendations that have been forwarded to myself. I have also talked to the president of Brandon University, who has, in his own words, suggested that–not only suggested, has demanded that the tuition freeze be lifted.

I can tell you of the position of my president at Brandon University who has suggested in strong terms that the tuition freeze be lifted. I've talked to administration in the University of Manitoba who have suggested quite strongly that the tuition freeze be lifted, so I can impart that information to this particular individual, the Premier.

As for wishy-washy, I suspect that the answer coming back to my question is probably equally if not more wishy-washy than the question that the Premier suggests is put to him.

Mr. Doer: Well, I already campaigned on a tuition freeze and that's pretty clear. We campaigned–in our budget, we brought in a tuition freeze again.

I would point out to the member, I'm glad he's the surrogate for one part of the stakeholders in Brandon. There are students. What are the opinions of students there? What about families in the Brandon community? I think that, when people went to the doorstep in Brandon, they liked affordable education and training.

In fact, the idea for a tuition freeze actually came out of a visit I had to a Brandon high school. A few of the kids were going to go to British Columbia because the tuition fees at that time were lower than Manitoba and they had also at that time a tuition freeze. So I'm curious to know, representing your constituents, what is the advice to me? We will make the decision in the budget, but you have a chance now to influence the budget. Do you want the freeze lifted or do you want the freeze to stay the same?

Mr. Borotsik: I guess I can't put it any more plainly. My advice to you is, and by the way if you're talking about the students, yes, I have had discussions with the president of the student union. It doesn't get any better than that. I believe he represents the students in Brandon University. The president of the student union has told me that in fact they would like the tuition freeze lifted.

The president of Brandon University has told us that his position would be that the tuition freeze be lifted. I can't be anymore plain than that. The people I represent, the stakeholders I represent, have asked me to pass on that information to the government of the day, which in fact is the Premier sitting before me, so I pass on that information for what it's worth. If you wish to have that reflected in the budget, then certainly those stakeholders would love to see it happen. Is the Premier prepared to look at that?

Mr. Doer: We obviously prepare a budget and we'll prepare accordingly, and I'll pass on the advice of the Member for Brandon West (Mr. Borotsik) who wants us to lift the tuition freeze. He cites the president of the Brandon student union and the president of the university.

***** (17:20)

Mrs. Bonnie Mitchelson (River East): Madam Chairperson, I'm pleased to have the opportunity to have a little bit of dialogue, discussion and maybe ask a few questions of the Premier.

First of all, we both represent the same area of the city of Winnipeg, the northeast quadrant of the city of Winnipeg, and I know we've both worked together on many projects that have enhanced that community, both being in government and in opposition, one of them, of course, being the Chief Peguis Trail. I know we're both very supportive of the extension of the Chief Peguis Trail and the twinning of the Perimeter Highway in the northeast quadrant. I know it's shaved about 15 minutes off my trip to the lake, and I'm sure the Premier has probably noticed a significant difference in his travel time too.

One of the areas that I have a bit of concern about is Henderson Highway as it goes out to East St. Paul. I know that Henderson Highway within the city of Winnipeg is a city responsibility, but it's a Capital Region issue also. We have significant growth outside of the Perimeter in East St. Paul; and, as we see some new development on Henderson Highway–namely, I see sort of right in our local community the new liquor store that's going in at the corner of Henderson and Bonner–I sense that there will be significant additional traffic and maybe some backlog. The area of Henderson Highway from Gilmore out past the Perimeter is a dangerous area where we have a lot of stop signs, very few traffic lights and a lot of heavy traffic. It's very hard to get across Henderson Highway.

I know a lot of other routes that go outside of the city of Winnipeg right around the province have significantly better roads and access. They have medians and turning lanes and lots of opportunity for people to get partway across a very busy thoroughfare. I'm just wondering, I'd like to ask the Premier whether he's had any discussions. I am extremely supportive of getting improvements made to Henderson Highway.

Also, with the new condominium development that is on the west side of Henderson Highway, it's made it very dangerous to get across, very dangerous for pedestrians and also dangerous for cars that are driving and trying to turn across a very busy road.

I'm extremely supportive of improvements, and I'm just wondering if the Premier has had any discussion with the City of Winnipeg, or if he might consider making it a priority, or one priority, when we're looking at Capital Region. Is there any sense that the province might be involved in any way in trying to work with the City to enhance the traffic flow on Henderson Highway?

Mr. Doer: Well, it's certainly a road I travel on to various sporting events with my two daughters, so I'm very aware of it. I'm aware of three challenges in the northeast quadrant of the city. One is the completion of the Perimeter Highway, in which I believe we're on time and on budget for on that quadrant. Certainly, that will be an improvement. Secondly, the interchange at Lagimodiere and the Perimeter Highway, which also is important; and, three, the Chief Peguis Trail. When we increased our funding for the city of Winnipeg, some of it was for infrastructure and some of it was for new capital. This certainly allows the City to move this up.

I believe that the issue of Henderson Highway–I'll have to get a determination. We have built some infrastructure out in the northeast quadrant; outside of the Capital Region, I think there were some investments in highways, on Highway 59. There's a lot of work on Highway 59 now up until the turnoff on the road, I forget the name of the road that goes to Elmhurst and Pine Ridge. I'll try to see the traffic flows. I think that there are some issues of traffic.

One of the concerns we had when the zoning was agreed to in some of the development in northeast Winnipeg was the lack of any highway impact, water impact, and a school impact. We said that in opposition. Sometimes we get pressure for a high school now. I think the enrolment now has reached a bubble. We get pressure on roads now, and we think that part of that should have been managed in the development and supported by some of the development decisions, which would have been quite lucrative in the area just northeast of Winnipeg. But there are some situations, and I'll raise it with our highways people because the jurisdiction of the road ends at the bus loop, I think. One is the responsibility of East St. Paul and the Province, and the other is the responsibility of the city, but I'll definitely look at it.

The priority is the completion of the Perimeter, the interchange and the Chief Peguis Trail, and two of those projects are completely within the purview of the Province and responsibility of the Province. One is the responsibility of the city, but we have quadrupled the money for maintenance and construction of roads and bicycle paths.

Mr. Leonard Derkach (Russell): A question to the Premier regarding an issue that I keep going at from time to time, every session I guess, regarding a commitment that was made back in 2003 and reiterated by the Premier in a question that I asked just prior to the election, and that is the staffing and the ensuring of the opening of the emergency part of the Erickson hospital. This hospital serves an area that is equivalent to the population of Brandon just to the north, and has been bypassed because there are no emergency services available in the hospital and, also, the doctors have not been recruited for that area. The community has recruited a doctor on a part-time basis to act in the area during the summer months, but that doesn't really allow for full emergency services in that area. Currently, I don't know if the Premier is aware that we do have an ambulance stationed in Onanole or in Clear Lake during the summer months, but that is hardly adequate service in this day and age for medical emergencies that arise, especially in an area that is a fairly significant tourism area in our province.

I want to ask the Premier whether he's committed to following up on the commitment he made and ensuring that the people in that area receive the kind of medical services that should be available to all Manitobans.

Mr. Doer: I'll have to check with the Department of Health on the existing status of it. I feel there're some compelling reasons for emergency services in Erickson. We did talk about that. I remember raising it before I went out and called the election, not because we thought necessarily that it was going to be an election issue, but because I knew at the last minute that the election would be potentially around the long weekend date. I didn't know it would be exactly a day after, I have to confess, but I certainly knew it would be in and around the four-year mark. People were getting too predictable. So you have to be always unpredictable. So keep your running shoes on at all times. I want to say that.

***** (17:30)

So I'll check on the status of what happened this summer. We have increased the support for emergency staff and support for support staff, but I want to take a good look at it. I did say it. I did like the idea about Clear Lake, and I did talk about that in 2003. My preference is to have it, but I don't always get my preference and so I am going to do some work but, because doctors are actually not civil servants, or they can't be moved around like chess pieces necessarily, not that any of us can be, there is a certain freedom that they have to practise, and we haven't been successful. I'll check what happened this summer. You would know better than I, but I do agree. I have friends that go to Clear Lake every weekend. The winter recreation is increasing as it is all along the west side, by the way, as you know. I'll find out what's going on on it and what the status is. I will get back to you. I don't know what happened all week and all summer at Clear Lake, but I know you would know, and just an ambulance, I think, for some of those weekends is not ideal.

Some Honourable Members: Oh, oh.

Madam Chairperson: Order, please.

Mr. David Faurschou (Portage la Prairie): The Premier is aware of the significant undertaking by the City of Portage la Prairie and the Rural Municipality of Portage la Prairie in a commitment to provide to the Central Region a new multiplex sporting facility. During the election, the Premier attended to Portage la Prairie and pledged his support and his government's support to the new multiplex sporting facility.

I would like to ask the minister at this time, the commitment being made, there was a very exciting press conference last Thursday where the Portage Industrial Exhibition Association came on board for this project and are lending their site on Island Park to the new sporting-plex. I would like to ask the Premier at this time the process to which he would suggest that the now three very significant entities, the R.M. of Portage la Prairie, City of Portage la Prairie and the Portage Industrial Exhibition proceed with this. Is there a point person in regard to the government's commitment to support this project? I believe it was in the amount of about $5 million.

Mr. Doer: Well, our desire when we made the announcement was to have the gap–first of all, I want to give credit to the people of Portage and the leadership. They've done a magnificent job of bringing together a lot of resources and a lot of co-ordination to get this project a lot of funding and a lot of support. It's a good proposal, and they've done a lot of good work. There's a gap there that I said the Province would participate in. We are raising with the federal government in terms of both of us doing it like we did at Dauphin and Thompson and, obviously, MTS Centre and, in a different kind of context, the Keystone Centre. We think that it's an item that I think–I do think–I don't want to speak for the honourable minister. Maybe I better wait a week. I don't want to get collateral damage from the member of Parliament statements. Notwithstanding that–I know Kelvin will pass that on to his good friend–the Member for Steinbach, I mean–I think it's a lot of a proposal. I know that a local member of Parliament is supporting it, and I'm sure the member is aware of that. So there is the political will and leadership in the community, and there is the political will on our part. It didn't evaporate just because the results weren't what we would have preferred in the riding. I want to congratulate the member, but we thought it was a good announcement at the time.

Also, we pledged to support a number of projects with the money we announced in the election campaign for community recreation. We think there are more kids and people participating in sports, not just kids, seniors and a lot of other people. More people are active. They want to be more active. They need more facilities. People are travelling way too many miles. Just this last week we did the University of Manitoba proposal, and I didn't kick a soccer ball with a pair of shorts on, but I still thought it was a good proposal. I have legs like iron, but I didn't put shorts on. It was in the middle of the day. We think it's a good proposal, and so it's a matter of just closing the gap with the feds and ourselves, and I think it's definitely doable.

The point person is the person dealing with federal-provincial relations, and I'll make sure that that person or a person in her office gets hold of you, but also gets hold of the organizing committee. I did raise it at one of the staff meetings a couple weeks ago, just where is this, along with the Brandon football field. I'll follow it up again.

Mr. Kelvin Goertzen (Steinbach): Madam Chairperson, I wish I could provide the Premier (Mr. Doer) with a shocking question, one that he doesn't expect. I doubt that this would be one of those.

Prior to the election, the Premier made comments that his election timing call had a lot to do with landing planes and making sure that they got down on the ground and off the radar. One of the planes that didn't land before the election was the proposed and hopeful expansion of the Bethesda Hospital emergency room along with the operating rooms. I do know that during the campaign in the context of an announcement made in Ste. Anne for the expansion of their operating capacity, and, you know, I'm not specifically speaking of that, but there was a commitment made to deal with the needs of the Bethesda Hospital. Specifically, the Premier won't be shocked to know, I'm sure he's had the statistics. I provided him information prior to the last session or the sitting in June and in providing him information from doctors, he agreed to look at that and personally review it, and I trust that he did that. I know he said that he did that in a letter back to me. I appreciated that.

More specifically, the Steinbach emergency room was built to handle about 10,000 people a year. They are now getting 24,000 visits a year. So it's twice the number of visits annually that it was built for when it was constructed, so he knows that there're pressures on. I talked to the doctors who said that there're regularly four or five people in the hallways of the emergency room waiting to get a room to just be examined in, in the ER. I've been told by the doctors that there are many fire codes that are being broken as a result of the over-crowding at Bethesda Hospital and also in relation to the operating rooms that were built in the 1960s and haven't had improvement since then. There are other issues, obviously, related to the growth of the region and what it's doing to the work of the Bethesda Hospital, and I have already provided information to the Premier on that.

What I am asking now today, both as a reminder and a request, to determine where on this now post-election radar the Bethesda Hospital falls because I know that he'll want to fulfill the commitment to the people of the region to ensure that the health-care needs of the Bethesda Hospital are being met. So I look forward to the Premier indicating when he expects to fulfil that election promise.

Mr. Doer: Well, we made both announcements together as the member pointed out on the Ste. Anne and Bethesda Hospital. First of all, I want to thank the staff at both hospitals. Some of the investments we've made in the operating capacity and staffing decisions at Bethesda to try to take pressure off of lineups both locally and further afield in the area. Even here in Winnipeg from time to time people go there. It's been really positive; so the evaluation has been extremely positive.

***** (17:40)

We have a capital cap in government each year. We're working that through our capital cap, but we're working it together. We're not going to say bye, bye to the Member for Steinbach because we think the patient needs are real. I say that because my first question I got on the community college from a number of volunteers in Steinbach, they said, oh, oh, we've elected this NDP government; what have we done and what's it going to mean to the college. I met with them and said, listen, if you can raise the money in the field and everything else, it's got nothing to do with the fact that we got four votes in Steinbach; it's got everything to do with the merit of the proposal. So they were shocked to hear that, and they just said that what we want is a yes or a no. The committee said, we're business people, we just want to know. Is it yes or is it no? And I said, well, we think there's a need for training in that area. We'll go back and look at it.

So I will be able to report soon. I expect no later than this session, as short as it's alleged to be, and we are working it through our capital cap. We will not make an announcement, I don't believe. It will be my goal to make the announcement of Ste. Anne's and Bethesda together or, you know, make the decision certainly together because we think they're related in terms of patient need in the area. That's why it was in the press release, not because I thought we were peaking too early in Steinbach in the election campaign.

Mr. McFadyen: I did have a brief moment of concern when I saw Steinbach announcement, but the tracking established that it was a very genuine and non-partisan announcement. I'm pleased to hear the Premier's response.

We're on the theme of local issues, so I just want to take the opportunity to raise a question of local interest to my constituents. Then we'll come back to some of the other broader themes that we'd been on earlier.

My question relates to the need for a public high school in the Fort Whyte constituency. I know it's an issue the Premier's familiar with. I know he met at one point with various parties involved from the school board, representatives of the community involved, and the high school lobby group. I believe there may have been involvement, either at that meeting or the later meeting, among staff from federal and civic governments when they're looking at a potential proposal that might involve some recreation facilities in combination with a potential high school.

The consistent response that's come back from both the Premier and the minister has been that it's not a matter of if but when in terms of the construction of a high school. I'm aware that Pembina Trails school board has put forward to the Public Schools Finance Board within its capital plan requests that it submits to the PSFB annually over several years a request that the high school be considered within the department's capital plans. I'm recently advised that the PSFB has undertaken a review, is doing a study to establish the case, we assume, for building the high school to help inform the capital planning process and the decision around the high school. I'm advised that there's a meeting taking place between officials from PSFB and the school board in October to present that report and discuss it.

I wonder if the Premier could indicate whether it's still a commitment of him and his government to proceed with the high school, whether he's able to provide any more detail in terms of the timing of that announcement and of the work and whether he would be prepared to allow the school board and/or PSFB to release that report to members of the community who have an intense interest–people with young children who are looking to the future, wanting them to be able to go to high school in the local community, looking at the reality of Waverley West coming on and the other developments in that corner of the city and just planning for the future–whether he'd be prepared to allow that report to be released publicly after that discussion has taken place.

I know there are several questions embedded there. I'm hoping you might be able to respond to each of them. Thank you.

Mr. Doer: I was just wondering whether it was several questions embedded in the report that I hadn't read yet that the member opposite might have, but I'm not paranoid. I'll get briefed on this.

Certainly, we believe that over the medium term there will be demand for the school. We said that before. You can't, in our view, make a decision on the expansion of housing and not have in the plan a consideration of schools. We were encouraged by the previous government's local concern about–I actually liked the idea that former Minister Alcock had proposed that we should look at recreation, community recreation and school recreation and leisure together. I thought that was a smart way to go. I don't know where that is with the demise of his Treasury Board career. I'm not sure where he will be on–I guess he's not a candidate in the next election, I don't know. I don't keep track of all those things– *[interjection]* I beg your pardon. *[interjection]* Oh, okay. I'm just chattering. I'm sorry. I apologize, Madam Chairperson. That's my fault. Loewen, he's back. Well, it will be interesting. *[interjection]* You know, the–

Madam Chairperson: Order, please.

Mr. Doer: I'll keep answering the question, but I always said to him he should have waited one year and he could have run in Lloyd Axworthy's seat. However, I digress.

I will find out about the report. I don't know what's in it. I'll get a copy of it. I normally believe that that kind of report should be available, but we should get more definition. I'm going to get the advice of what they're saying to us. It is a non-politically appointed body now. I know the member opposite is not being political in his question at all, and I'm not being political in my answer, but I'll find out their advice and whether we have to ask questions about that. Then we will also ask the second question: At what point is it a public document that can be released to the public?

I'm not aware of how this works exactly, but I'll inquire on all the points you raised. I take them seriously because I do believe over time we will need the school. I just don't know when.

Mr. McFadyen: I think I heard the Premier suggesting that deputy ministers aren't subject to political influence, but let's leave that for another discussion. We're going to have a debate about the public service and politics. Let's not do that right now though. Let's get on to other things. *[interjection]*

Madam Chairperson: Honourable First Minister.

Mr. McFadyen: Sorry, no, that was just a digression on my part. So I do have a question here, and I want to come back just with a loose end on Spirited Energy, with apologies to staff for–

Madam Chairperson: I still have to recognize you. The honourable Leader of the Official Opposition.

Mr. McFadyen: Was any of what I just said on the record, or was I not recognized when I was making all those comments?

Madam Chairperson: No. Then I recognized the First Minister when he was interjecting, and now I'm just putting you back.

Mr. McFadyen: Oh. Okay. So, in any event, what I was saying was that there were some loose ends on Spirited Energy I just want to come back to, with apologies to staff who are going to be going through *Hansard* and trying to figure out the flow of all these questions. But, in any event, the question relates back to the focus groups that were undertaken by the Premier's Economic Advisory Council.

He indicated that he didn't sit in on those groups. I wonder if he could advise or come back with information as to who did sit in on those focus groups and, in particular, were Mr. Flanagan and Ms. Britton part of that, and whether or not they were, if you could just indicate who did sit in on that focus group process. The reason that's important, of course, is that we know the focus groups didn't go well, and so, clearly, there are questions around how that information was communicated back to the decision makers, and why it was that the advice of regular Manitobans who were in those focus groups was ignored.

***** (17:50)

Mr. Doer: Well, as I say, I'll find out who was there, but, secondly, as I understood it, we released the report and the report was given to the principals that were making the decision. So I'll take the question as notice, but I do understand that there was a report written, which I never read either because I basically established that we'd set up this Spirited Energy similar to what we did in tourism. I'll inquire on that. But there was a report written and the people have received the report, the marketing people. They are experienced in marketing. They're not people that are, they're not politicians. They're business people and they receive marketing reports, I assume, all the time because they're in the markets a lot more than politicians on selling this or selling that or identifying this market or that market. I'm not aware but, usually, you find focus groups on the one hand or on the other hand. I could just say the odd one I've read in the election campaign, or got briefed on in the election campaign. They're people's opinions and they range. There's advice, but at the end of the day you still have to go with your own mind about what's best.

Mr. McFadyen: I guess, at the end of the day then whose mind was it that decided to go ahead with the campaign after the focus groups?

Mr. Doer: Well, the committee made up of the business representatives. You know, they asked for the authority. There's a report recommended that the business community have a budget and authority and responsibility to engage in an implementation of a recommendation dealing with the image of Manitoba. These are people who are experienced in dealing with this kind of marketing. They recommended that. I had to either accept it or reject it, and I accepted it.

I had another model to go by because we had established a similar arm's-length body from the issue of tourism. Now, people sometimes get advice from focus groups and don't follow the advice. I could ask the member opposite, did you follow the advice of focus groups on the, I promise to bring back the Jets? It's a legitimate question in terms of how people make decisions after they get information. Curious, very curious, but I did not substitute my judgment for the business people that were leading the exercise.

Mr. McFadyen: I'm debating whether or not to take the bait, Madam Chair.

I want to maybe ask the Premier if a focus group advised him to say that the chances of NHL hockey coming back to Winnipeg are about as good as him ending winter. I think that's what he said during the campaign, only to be contradicted by Gary Bettman a couple of weeks later. That's not my question, that's just an editorial comment for the record, which he'll probably choose to respond to.

Madam Chair, I just want to come back to one of the frustrations that we, and I know the media and members of the public, experience with this government–it's not just this government, it's other governments as well–it's access to information. Certainly, FIPPA provides a framework of rules and laws that require government to provide information in certain circumstances and subject to some exceptions. There are deadlines put in place and procedures that people have to follow and fees and all those things.

Sid Green has made the point that a spirit of openness within government and transparency is far preferable to a series of laws that require government to do things in certain ways because we know that laws can sometimes allow government the excuse to comply only with the letter of the law and use exceptions and other ways of getting around providing transparency to the people that they serve, the people of the province who elect them and pay taxes and deserve openness and accountability. So we certainly have frustrations with delays. Spirited Energy was a good example of that, delays in getting information to us. Media made the comment that the delays were unwarranted and frustrating. It certainly is a concern shared by us.

More specifically on the topic of information and privacy, the Premier has a longstanding commitment to establish an information and privacy commissioner in Manitoba to bring us in line with what's happening in other provinces. I wonder if he can indicate whether he intends to follow through, and if so when.

Mr. Doer: First of all, I want to thank the Ombudsman on the issue of Spirited Energy because there were issues related to the private sector and the public sector. Not only did the Ombudsman perform a very, very important role in identifying the material that could be released, there was also work that she performed on behalf of the public to identify what couldn't be released, that would be confidential with the private company. I wanted to make sure that, certainly, I respect her advice and her office's advice in this regard. I'll have to see the status of that recommendation on the privacy commissioner. We're certainly consulting with the Ombudsman's office in that regard, and I'll report back on the timing and the content.

Mr. McFadyen: I would make a comment that, in looking at the invoices that were released under Spirited Energy, you see decisions made to black out certain pieces of information. It's disclosed that they had wine and beer at a meeting, and a Mediterranean buffet, but they black out the quantities of glasses of wine and bottles of beer but leave in place the amount charged. There seems to be some absurdity built into the process. Common-sense people would look at that and wonder what it was that the government was trying to hide when you see these things blacked out.

So I think if your objective is to try to reduce public cynicism in the sense the government is hiding things from people, that you might want to, and we might want to as Legislators, look at the act and consider whether either the way those provisions are being applied or the provisions themselves need to be addressed and changed so that people look at information coming out with these, what would seem to be fairly arbitrary decisions about what to block out, and it leaves them feeling as though they're having the wool pulled over their eyes. It doesn't seem to do anything to advance the cause of protecting third-party confidentiality which, of course, is important.

But I would make the suggestion that most people who deal with government as suppliers or contractors or advisors or people who are in partnerships with government of one kind or another would do so with some expectation that there's going to be some public disclosure of the transactions and how the money flows, how the money is used and a degree of accountability. It's an issue that's been debated all over the democratic world when you've got more and more private-public partnerships and arm's-length bodies, et cetera. But it is an issue that should be revisited. I wonder if the Premier, in the spirit of openness and accountability, would agree to undertaking a review to see whether either they waive that those provisions are being applied, or the provisions themselves need to be changed in order to provide more accountability for these sorts of transactions and dealings.

Mr. Doer: The whole issue of disclosure, in my view, is that, in general terms, it's always better to have the disclosure. I would concur with the principle on the private-sector entity. The Auditor General now has the authority to audit books in the private sector that have relationships with the government, because there are lots of things we would have liked to have looked at. I know in opposition some land deals, and I won't go any further than that, but I have my list.

***** (18:00)

Thirdly, the complicating part for this, as I understand it, and I'll look forward to the advice of the Ombudsman because I think we can get a more inclusive strategy rather than just having these as one-off decisions that take too long to release. Sometimes you have issues, not of disclosure, but you have, perhaps, national companies that provided some benefit to Manitoba through a campaign who worry about whether then all the other jurisdictions will demand the same gift in kind, if you will. So that's where there is some sensitivity. Not to the idea that if we just lived in Manitoba this would be fine, but are they going to get requests that are equal and proportionate to a population even greater for a company that does business outside of Manitoba.

So that was one of the issues that I heard raised by representatives of the private sector, but I didn't hear it specific; I heard it specific to the campaign itself. So I'm sure that that was part of the consideration, but I hope out of this we can improve because I don't think this is the ideal way to go. I hope we can improve out of this, and I certainly concur that there has to be improvements, particularly when the people are getting legal opinions about what can or can't get released when usually releasing things is better rather than not.

Mr. McFadyen: Certainly, the feedback that we get from regular citizens and from members of the media is that it is more difficult than ever to get information out of government, that every rule and regulation is applied in such a way to allow for the lowest possible amount of disclosure to take place in any given situation. I don't think anybody thinks that's healthy for our democracy and does anything to enhance public confidence in government.

I want to just move, but before I move from that, I don't know if I got an answer to the question about the privacy and information commissioner. I wonder if the Premier can indicate whether he intends to follow through on that commitment.

Mr. Doer: There are some discussions going on with the existing Ombudsman now and I'll report. I haven't got anything this moment, but I'll catch up on that issue.

Mr. McFadyen: Just coming back to a point that my colleague, the Member for Brandon West (Mr. Borotsik) raised when I was out of the Chamber, and it's to do with the tuition freeze on the universities. I wish I was here for that exchange because I probably could have added something to the record which might have, hopefully, provided a clearer picture of what's been said to date on the issue. The government has now had that freeze in place, this would be, I believe, the seventh year going into this academic year. The institutions that are affected by it are reporting serious strain; apparently there are ongoing issues with retention of staff, people who are highly qualified and highly educated and highly mobile, and this is having a significantly detrimental impact on the universities, particularly when the freeze is coupled with a policy of not funding universities to the level that they need to be funded at in order to be competitive. So it’s the double policy of leaving the tuition freeze in place at the same time as not increasing grant funding from the government to the university that’s having this impact.

I understand UMFA, the faculty association union, took a strike vote, I believe, either yesterday or the day before and there're serious strains in terms of both the capital and maintenance side of what's going on in the universities, but just, if not more importantly, the ability of the universities to retain highly qualified staff. The Premier knows, because we've had this discussion, that I had commented that the freeze shouldn't be lifted until the government can address two issues: one is fairness to students; the other is adequate financial arrangements for the university, and that was reported on some time ago. In the course of the campaign, I said that we took the position that it should be reviewed by people who are knowledgeable about such things, who will undertake a consultation with students who are going to be impacted by policy changes, but also with leaders in the university.

I note from the Premier's public comments, I believe it was on CJOB a couple of weeks ago, that he hasn't committed to extending the freeze beyond this year. So what we are suggesting and proposing is that the government look at some kind of shift in policy that takes into account the need for kids from lower-income families to be able to access universities, so that the smartest kid from the poorest family in the province is able to go through university without finances being a barrier to university education access or college education access.

So I want to ask the Premier what his current thinking is on the policy and whether he is open to lifting the freeze in some reasonable way and adopting policies that will ensure access is there for kids who may need some financial help. By way of example, the Premier will know this initiative well, Dr. Axworthy has embarked on a project with the support of an outstanding young person named Kevin Chief, who's there in an administrative capacity in the support of others to provide credits to young people from economically disadvantaged backgrounds as they work their way through school, financial credits along the way as they achieve certain milestones that would be banked, effectively, and used by them against tuition costs when they get to university. It's an interesting idea. It's got longer term implications. There are lots of good ideas out there.

I'm wondering what the Premier's current thinking is and whether he is prepared to undertake a review and signal that he is prepared to move away from the current policy, which combined with inadequate funding is having a detrimental impact on our institutions and the quality of the degrees and the reputation of the degrees for students who are graduating and looking to the future.

Mr. Doer: Well, I don't know whether to start with your history as the board of governor's representative from the former government or as your key Cabinet role that one had–*[interjection]*

Obviously, the enrolment has gone up over 30 percent since we've been elected. We're pleased about that. We've increased dramatically bursaries, and it doesn't get a lot of media coverage. It is really important for lower income families. We don't see tuition fees, itself, as the key point for the lowest of income people. We see bursaries being the most important ingredient for that potential student population. We're looking at other bursary proposals, which we think are important.

We're looking at the other end of the equation. We made an announcement last year on tax reductions with students after they've completed education to their staying here in Manitoba and making that more affordable for student debt to have a reduction.

On the issue of tuition freeze, I would point out that we did fund the reduction to begin with. We did increase the operating expenses to deal with the 10 percent tuition reduction when we first came into office, and maintained that in the operating budget ever since.

We also increased the capital budgets in the universities dramatically. With the University of Manitoba, we've pledged $50 million. We have up to $200 million in private pledges, and we also gave the university the ability to proceed earlier so they can combine projects like eliminating asbestos with new capital so it wouldn't be inefficient for proceeding. It's one of the issues that is a notional debt on the books. So, when the member raises that, it's one of the issues of capital that is important.

The other issue that we deal with is the operating amount for the university. We've supported universities in two ways. One is the tax reduction. We've eliminated the education property tax on universities, and two, the operating grant to universities. This year, the operating grant to universities is 7 percent. Even if you had a 5 percent operating grant, the 2 percent would more than equal a considerable tuition increase of 4 or 5 percent, I believe. A 2 percent operating grant to the whole university is worth equivalent of 5 percent tuition increase. So the 7 percent makes up a lot of the room. I don't know many other entities in government that have got a 7 percent increase.

***** (18:10)

So I know things are tough, but we're slowly and surely making a difference. The capital plan of the University of Manitoba is in a lot better shape than it was seven years ago. We are investing in new innovations at the university with the Richardson nutraceutical and bio-food centre. We're also looking at other capital, the new engineering and computer science building. So there are other developments that are taking place there, but the issue of the tuition freeze will be determined in our deliberations going into the budget.

We'll take into consideration the member opposite's views. We'll take into consideration the views of the Member for Brandon West (Mr. Borotsik), who wants an immediate removal of the freeze, and we will take into consideration the views of administrators at universities, students, faculty and families that really want their kids to have the chance to go to school. So all of that will be factored in going into the budget in 2008.

Mr. McFadyen: I thank the Premier for that response. We would again repeat our commitment to be supportive of changes. Obviously, we reserve the right to comment on details in terms of how they're enacted, but we are certainly supportive of the principle of making some changes in that area in accordance with the principles that we've set out around protecting students and families, as well as funding our universities at adequate levels.

When I asked the Premier just about the coming over to a major capital project under way right now at the City of Winnipeg as part of the effort to clean up the rivers and lakes of the province, we know the tremendous movement backward in terms of Lake Winnipeg over the last several years. It's been an evolutionary process. It's not a purely political comment, but anybody that's been to the lake knows and has seen the deterioration over the last number of years. So we support the objective of dealing with the nutrients that ultimately make their way into Lake Winnipeg, but focussing specifically on the major expenditure being undertaken by the City of Winnipeg pursuant to the direction provided by the provincial government through the environment department, Conservation Department, which project is now estimated to be in excess of a billion dollars.

The scientific advice that we have received from several people knowledgeable about water and water quality issues is that the most prudent way to proceed would be to remove phosphorus first. There's a certain process that's used at wastewater plants to remove phosphorus from the affluent before it flows into the river. The advice is that the removal of phosphorus will quite probably have the desired effect in terms of reducing blue-green algae blooms, and then to consider nitrogen at a later date. Nitrogen requires a separate process, which is a highly expensive process. So I wonder if the Premier has taken account of that scientific advice as the City of Winnipeg embarks on a very expensive project, which is largely going to be funded by City of Winnipeg ratepayers. There is a very nominal contribution being made by the provincial government with, obviously, ultimately funded by provincial tax payers. But, in the scheme of the overall project, it's a relatively small contribution. City of Winnipeg sewer and water ratepayers are paying the lion's share of the bill, and the City is looking at significant rate increases in order to fund the reserve that's required for this project.

So I wonder if the Premier has considered the scientific evidence and whether he is prepared to consider the advice which has been provided, which is to proceed first with phosphorus removal before going ahead and requiring the removal of nitrogen.

Mr. Doer: Well, the Clean Environment Commission received a lot of advice, a lot of technical advice. The advice they received from outside experts and most of the inside experts in government recommended both phosphorus and nutrients. Nutrients is another word for another more graphic term, the member knows, and it would be consistent with water that flows to Winnipeg from places like Calgary, from places like Regina. Brandon is moving in that direction with even the second shift at Maple Leaf. Portage la Prairie is looking at similar investments again with the Province.

It is unfortunate that in 1988 when the environmental licence exemption was removed from the City of Winnipeg, which was always a source of contention for people living outside of Winnipeg, you know, here we had an environmental law, but a bubble of exemption. Since that time, well over $600 million or $700 million of unallocated money has gone from the Province to the City. So, if they would have had a bit of the will to move on with this, which has been recommended for years, obviously, the city–this is the old inner city–with the raw sewage and then, of course, the phosphorus. There are proper allocations. The Schreyer government took action for all new suburbs to have retention ponds which would affect the level of water, I might add, in Bunn's Creek, but the retention ponds to allow for the adequate treatment of water in the new suburban areas, but unfortunately the old city of Winnipeg has not had the appropriate investments in old single-sewer system and the combined system.

We're trying to implement the Clean Environment Commission's decision, and I would say it was their decision, and it's a licensing decision in the most prudent way as possible for the City of Winnipeg. One area that we're still working on is discussions with the national government on what the allocation will be for Manitoba. We're still working with them on this file. We think we're close, and then we can sit down with the City and say this is how much it's going to be to what we consider to be the number one priority of infrastructure in Winnipeg.

I might point out that in our last investment, a decision with Winnipeg, the former MP insisted on the underpass, the former mayor insisted upon rapid transit, and we insisted on sewage treatment, and we got as part of that agreement 50 percent. I think the member opposite is chief of staff, and the city would know that 50 percent of it was allocated thankfully to the treatment plants. We're getting some completion on one of the three plants that have to be done on some of the projects. The whole issue of the spreading of raw sewage has been documented in the Clean Environment report. The issue of the pipes is a huge expenditure and then, of course, the treatment plant is not the whole billion dollars. The treatment plant to remove phosphorus and nutrients is less than that, and it constitutes a real important development for water quality in Lake Winnipeg. I know people use the term "nutrients" and a lot of the public don't know what it means, but if you say to the people what it means they don't like it so much, and that's why people use "nutrients" and not the real term that is much more graphic in their minds and in their view.

I've got to have a further discussion with the City of Winnipeg because we've got to nail down this federal amount so we can give the city some predictability into their budget process. It's starting in earnest right now. It's really important, I think, and it's a legitimate question. How much is coming from other levels of government? We were able to increase the road amount and the infrastructure amount, but this is still an important priority for us and for them. I would point out there is an allocated amount about $45 million a year in the City budget from the Province of Manitoba. It could be used at any time for sewage treatment as well.

***** (18:20)

Mr. McFadyen: I'm certainly aware of the amount that's been committed to date by the provincial and federal governments, and the Premier knows that against the backdrop of a project which is now in the range of a billion dollars plus that a commitment in the range of $60 million represents only 6 percent of the total project costs, so the lion's share of the cost and, of course, the lion's share of the credit rests with the mayor and City Council and the citizens of Winnipeg who are going to be funding this, but I certainly appreciate and we'll look forward to hearing more in terms of contributions from senior levels of government to the project.

I would only note that there is a theme which we sometimes see with this government that they'll take positions on issues and will act as the champion on the issue and then leave it to others to pay the actual cost of achieving whatever the goal is. It certainly is happening with the City of Winnipeg and City of Winnipeg ratepayers. It doesn't mean the objective is wrong and, in fact, the objective is right, but sometimes it can rub people the wrong way when you see people taking credit for things that other people are paying for.

That theme, as it applies to the City of Winnipeg applies equally as well to private landowners in rural Manitoba who are working very hard every single day to run agricultural operations which have been buffeted over many years by different factors, sometimes created by government policy, sometimes created by international markets or weather and climate.

People are working hard to make a living in agriculture who were alarmed and concerned when the government came out with its approach to regulating private land use that there was an insensitivity to the reality of agriculture and a lack of concern for the fact that for many people who are struggling, and when an operation is marginal, every regulation that comes along that tells you that there's something you can't do on your land diminishes the value of that land, makes the enterprise more difficult. We, certainly, heard loud and clear, and I raised concerns about the way in which the regulations were being proceeded with and the lack of sensitivity to what was going on in rural communities.

I want to ask the Premier, because they've made some noises about working in a spirit of co-operation, I wonder if he can commit at the same time as he's working with senior levels of government to secure funding for the City of Winnipeg project, will he commit similarly to seeking funding and providing support to private landowners who are being asked to make significant changes. Many of them have made changes voluntarily as it is.

I always say, and I believe firmly that farmers are the best stewards of the land. Their livelihood depends on sound, long term thinking when it comes to what they do with their land, so lots of changes have been made. They deserve credit for that, but to the extent the government has required them to go further, eliminating some land from use which may be appropriate from an environmental perspective, but are they taking into account the negative impact on those landowners? Are they prepared to show a greater level of co-operation and partnership and move toward incentives and partnership as opposed to confrontation and a dictatorial approach which many people feel has been taken today?

Mr. Doer: Well, the Water Stewardship plan that was released last year and now is before the Clean Environment Commission did include incentives, did include some transition, did include timing, did include consultations on some of the issues of standards that were recommended by KAP and others did include set aside timing, issues of set aside for manure on water. So it didn't happen right away. There are people who are very critical of that being too long from now. There are other people that say it's too quick. All those issues have been submitted to the Clean Environment Commission.

I'm sure that there are issues that any individual would wrestle with if they had to be an arbiter over these decisions. For example, did we wait too long on livestock adjacent to rivers, you know, and waterways? That'll be raised I'm sure in the hearings. We get criticized from both sides. Sometimes when you take the balanced approach you are criticized from both directions, and I accept that.

Moving ahead on water stewardship with all sectors, and I include agriculture, but also homeowners that have phosphorus in their fertilizer and phosphorus in their dishwater detergent. We would prefer to have a national policy to lower the prices of those consumer products. I noticed in la belle province they just made a point of saying that there's more to this than just farmers. Jean Charest said that yesterday, and we agree with him.

On the issue of a dictatorship, I have never been accused of being a dictator by anybody I know, except my most immediate friends.

Mr. McFadyen: Part of what generated the negative reaction through rural Manitoba, and I attended one of the meetings that was held by the Conservation Department–Mr. Williamson came on behalf of the government–was the noted absence of a minister to provide political leadership and feedback at these meetings and discussions. There was even a meeting that had been scheduled with the then-Water Stewardship Minister, who is the former Water Stewardship Minister, that was organized and then cancelled at the last minute. People came out because they thought they were going to have a chance to hear directly from the minister, and were disappointed when he cancelled. I don't know what the circumstances were, but the message that it sends when you send an official out, as capable as they are, the message at the political level is that there's not a real political interest in what's going on. So much of the negative reaction was a sense that new rules were coming from government issued from Broadway, and that there wasn't a genuine dialogue going on with producers as to how best to implement the new measures.

I understand the give-and-take and the push-and-pull on these issues. People have cottages at wonderful places like Rock Lake in the Pembina Valley, who have concerns about water quality there, and they see from time to time livestock grazing in waterways and would see that as a contributor to the problem. You can also see the perspective of the producer who is trying to make a living on marginal land with grazing. So I think what you need to do in those circumstances to make progress is to have dialogue as to how you bring about those changes in a co-operative way. I would only say that there was a genuine sense through much of the province that that was not taking place under the former minister.

I know there were main concerns over details. I would just say in the spirit of not being overly partisan I sense that there's a feeling that progress is being made on them. I would simply ask the Premier to ensure that the direction continues to be that there's a genuine dialogue, and that we're not expecting producers to bear the brunt of the load when it comes to achieving this objective, and that there's a real commitment to fairness, both in terms of what actually happens and the way it's perceived by people. I think that's important and would ask the Premier to commit that that spirit of partnership be the way this proceeds and not one of confrontation or, if not confrontation, simply lack of interest on the part of ministers in his government until the present.

Mr. Doer: I may not know about the specific meeting, but I have heard sometimes criticism of the minister that misses a meeting and they're at a funeral. I understand why people would be very upset. So, if you're expected to be there, you better have a good reason. If you've confirmed to be at a place, we all know this rule: You better have a good reason for not being there and sending a very qualified person in your place.

Secondly, we just talked about the city of Winnipeg and all the pressure now to deal with phosphorus and nutrients, and then we talked about agriculture, I think the fact that the questions followed each other indicates that there are many sources for the challenges of water and water quality and water degradation. Therefore, there are many sources that we have to look at.

As we get gavelled down–

Madam Chairperson: As previously agreed, the hour being 6:30 p.m., committee rise.

Call in the Speaker.

IN SESSION

Madam Deputy Speaker: Being after 6:30 p.m., as previously agreed, this House is adjourned and stands adjourned until 10 a.m. tomorrow (Thursday).

CORRIGENDUM

Vol. LIX No. 9B – 1:30 p.m., Tuesday, September 25, 2007, page 319, the first column second paragraph should read:

I know that the Member for Lac du Bonnet, the Opposition House Leader (Mr. Hawranik), along with the Government House Leader (Mr. Chomiak) and others travelled to Saskatchewan recently to have a discussion with people in that jurisdiction about the way Public Accounts works in Saskatchewan and, I think, came back impressed with some of the things that have been happening there.

LEGISLATIVE ASSEMBLY OF MANITOBA

Monday, December 3, 2012

The House met at 1:30 p.m.

Mr. Speaker: O Eternal and Almighty God, from Whom all power and wisdom come, we are assembled here before Thee to frame such laws as may tend to the welfare and prosperity of our province. Grant, O merciful God, we pray Thee, that we may desire only that which is in accordance with Thy will, that we may seek it with wisdom and know it with certainty and accomplish it perfectly for the glory and honour of Thy name and for the welfare of all our people. Amen.

Good afternoon, everyone. Please be seated.

ROUTINE PROCEEDINGS

INTRODUCTION OF BILLS

Bill 15–The Employment Standards Code Amendment Act (Minimum Wage Protection for Employees with Disabilities)

Hon. Jennifer Howard (Minister of Family Services and Labour): I move, seconded by the Minister of Justice (Mr. Swan), that Bill 15, The Employment Standards Code Amendment Act (Minimum Wage Protection for Employees with Disabilities); Loi modifiant le Code des normes d'emploi (protection du salaire minimum pour les employés ayant des incapacités), be now read a first time.

Motion presented.

Ms. Howard: I want to start by noting that today is the United Nations day of people with disabilities, and we're joined by many people in the gallery who were out marking that day this morning at a forum held at the convention centre that I was honoured to be able to speak at. And many people in the gallery today have fought very hard for the bill that we are introducing, and it is a bill that will eliminate the ability for employers to apply to Employment Standards to pay less than minimum wage to someone simply because they have a disability.

This is a recommendation from the Labour Management Review Committee. It's a consensus of the employer and employee reps on that committee. Currently there are fewer than 20 such permits issued. This bill will allow for those remaining permits to be in effect as a result of discussions that have been had with those individuals and their families. It will allow the director to make changes to those permits in order to ensure employees are protected.

As I said, I want to thank the people who are with us in the gallery today who have fought hard not only for this change but so many changes that make Manitoba more inclusive and a more accessible province for all of us. Thank you.

Mr. Speaker: Is it the pleasure of the House to adopt the motion? *[Agreed]*

Bill 17–The Consumer Protection Amendment and Business Practices Amendment Act (Motor Vehicle Advertising and Information Disclosure and Other Amendments)

Hon. Jim Rondeau (Minister of Healthy Living, Seniors and Consumer Affairs): I move, seconded by the Minister of Family Services and Labour, that Bill 17, The Consumer Protection Amendment and Business Practices Amendment Act (Motor Vehicle Advertising and Information Disclosure and Other Amendments); Loi modifiant la Loi sur la protection du consommateur et la Loi sur les pratiques commerciales (publicité et communication de renseignements visant les véhicules automobiles et autres modifications), be now read a first time.

Motion presented.

Mr. Rondeau: I apologize for the cold for the Minister of Healthy Living.

Anyhow, Mr. Speaker, this bill adds to The Consumer Protection Act dealing with motor vehicle advertising and information disclosure. Prohibition against false advertising and providing false information about a motor vehicle are included. Advertisements must include the price of a vehicle. The advertised must be the total price, including all fees charged as levies and taxes except GST and PST, and it must indicate whether the vehicle is new or used. And requirements for disclosure about the vehicle are moved from The Business Practices Act to The Consumer Protection Act, and consumer compliance orders can be issued and publicized by the director. It also makes other changes that will be involved in the legislation. Thank you very much.

Mr. Speaker: Is it the pleasure of the House to adopt the motion? *[Agreed]*

Any further introduction of bills? Seeing none–

PETITIONS

Provincial Trunk Highway 1

Mr. Larry Maguire (Arthur-Virden): I wish to present the following petition.

And the background of this petition is as follows:

(1) The provincial government presently maintains a freeway system for PTH 1 through the province of Manitoba.

(2) By definition this would lead to the elimination of all traffic lights on PTH 1 by building overpasses at every major intersection along the highway.

(3) The Town of Virden and the local planning district have never adopted a 1997 Manitoba Infrastructure and Transportation overpass plan for the community at the junctions of PTH 1 and King Street, 83 Highway and PTH 257.

(4) This freeway system overpass plan is impeding business development in Virden. Presently, a Virden businessman is virtually prohibited from relocating his business to his own land because it sits on the footprint of the planned overpass, even though his relocated business would generate $700,000 in provincial sales tax annually for Manitoba.

(5) Manitoba's infrastructure deficit has reached a record high. This deficit, paired with the number of existing projects still awaiting completion throughout Manitoba, will render the proposed overpass project financially unfeasible for decades to come.

We petition the Legislative Assembly as follows:

To request the Minister of Infrastructure and Transportation consider abandoning the Manitoba freeway proposal for the junction of PTH 1 and Virden's three intersections, particularly the King Street junction.

This petition is signed by L. Flett, J. Barkley, K. Gabrielle and many, many others, Mr. Speaker.

Mr. Speaker: In keeping with our rule 132(6), when petitions are read they are deemed to have been received by the House.

St. Ambroise Beach Provincial Park

Mr. Ian Wishart (Portage la Prairie): I wish to present the following petition to the Legislative Assembly.

And the reasons for these–for this petition are as follows:

The St. Ambroise provincial park was hard hit by the 2011 flood, resulting in the park's ongoing closure and the loss of local access to Lake Manitoba, as well as untold harm to the ecosystem and wildlife in the region.

The park's closure is having a negative impact in many areas, including disruptions to local tourism, hunting and 'fissing'–fishing operations, diminished economic and employment opportunities and the potential loss of the local store and decrease in property values.

Local residents and visitors alike want St. Ambroise provincial park to be reopened as soon as possible.

We petition the Legislative Assembly of Manitoba as follows:

To request the appropriate ministers of the provincial government consider repairing St. Ambroise provincial park and its access points to their preflood conditions so the park can be reopened for 2013 season or earlier if possible.

This petition's signed by K. Lipke, A. Lachappelle and M. Taylor, many, many more fine Manitobans.

***** (13:40)

Vita & District Health Centre

Mr. Dennis Smook (La Verendrye): I wish to present the following petition to the Legislative Assembly.

The reasons for this petition are as follows:

The Vita & District Health Centre services a wide area of southeastern Manitoba and is relied on to provide emergency services.

On October 17th, 2012, the emergency room at the Vita & District Health Centre closed with no timeline for it to reopen.

This emergency room deals with approximately 1,700 cases a year, which includes patients in the hospital, the attached personal care home and members of the community and surrounding area.

Manitobans should expect a high quality of health care close to home and should not be expected to travel great distances for health services.

We petition the Legislative Assembly of Manitoba as follows:

To request the Minister of Health consider reopening the emergency room in Vita as soon as possible and commit to providing adequate medical support for residents of southeastern Manitoba for many years to come.

This petition is signed by J. Hryciuk, P. Thiessen–P. Friesen and H. Mark and many more fine Manitobans. Thank you.

Provincial Road 520

Mr. Wayne Ewasko (Lac du Bonnet): I wish to present the following petition to the Legislative Assembly.

The background to this petition is as follows:

The rural municipalities of Lac du Bonnet and Alexander are experiencing record growth due especially to an increasing number of Manitobans retiring in cottage country.

The population in the RM of Lac du Bonnet grows exponentially in the summer months due to increased cottage use.

Due to population growth, Provincial Road 520 experiences heavy traffic, especially during the summer months.

PR 520 connects cottage country to the Pinawa Hospital and as such is frequently used by emergency medical services to transport patients.

PR 520 is in such poor condition that there are serious concerns about its safety.

We petition the Legislative Assembly as follows:

To urge the Minister of Infrastructure and Transportation to recognize the serious safety concerns of Provincial Road 520 and to address its poor condition by prioritizing its renewal.

This petition is signed by T.J. Johnson, B. Summerfield, B. Buck and hundreds of other fine Manitobans.

Provincial Trunk Highways 16 and 5 North–Traffic Signals

Mr. Stuart Briese (Agassiz): Mr. Speaker, I wish to present the following petition to the Legislative Assembly of Manitoba.

These are the reasons for this petition:

The junction of PTH 16 and PTH 5 north is an increasingly busy intersection which is used by motorists and pedestrians alike.

The Town of Neepawa has raised concerns with the Highway Traffic Board about safety levels at this intersection.

The Town of Neepawa has also passed a resolution requesting that Manitoba Infrastructure and Transportation install traffic lights at this intersection in order to increase safety.

We petition the Legislative Assembly of Manitoba as follows:

To request the Minister of Infrastructure and Transportation to consider making the installation of traffic lights at this intersection–at the intersection of PTH 16, PTH 5 north–a priority project in order to help protect the safety of the motorists and pedestrians who use it.

This petition is signed by E. Waldner, K. Dalglish, M. Pearson and many, many other fine Manitobans.

Personal Care Homes and Long-Term Care–Steinbach

Mr. Kelvin Goertzen (Steinbach): Yes, good afternoon, Mr. Speaker. I wish to present the following petition.

These are the reasons for this petition:

The city of Steinbach is one of the fastest growing communities in Manitoba and one of the largest cities in the province.

This growth has resulted in pressure on a number of important services, including personal care homes and long-term care space in the city.

Many long-time residents of the city of Steinbach have been forced to live out their final years outside of Steinbach because of the shortage of personal care homes and long-term care facilities.

Individuals who have lived in, worked in and contributed to the city of Steinbach their entire lives should not be forced to spend their final years in a place far from friends and from family.

We petition the Legislative Assembly of Manitoba as follows:

To request the Minister of Health ensure additional personal care homes and long-term care spaces are made available in the city of Steinbach on a priority basis.

Mr. Speaker, this petition is signed by D. Rempel, J. Funk, B. Bartel and hundreds of other fine Manitobans.

TABLING OF REPORTS

Hon. Ron Lemieux (Acting Minister charged with the administration of The Manitoba Lotteries Corporation Act): I'd like to table Manitoba Lotteries' second-quarter report for the six months ending September 30th, 2012.

Introduction of Guests

Mr. Speaker: Prior to oral questions, I'd like to draw the attention of honourable members to the public gallery where we have with us today from Selkirk Junior Parliament 36 grades 7 to 9 students from East Selkirk Middle School, Walter Whyte School, Lockport School and École Selkirk Junior High under the direction of Deanna Cameron, Kelly Murray, Jennifer Magnusson and Scott Andrews. These folks are the guests of the honourable member for Selkirk (Mr. Dewar) and also the Minister of Entrepreneurship, Training and Trade (Mr. Bjornson). On behalf of all honourable members, we welcome you here this afternoon.

And also in the public gallery, we have with us today Kirstie Grimmer from the Chancellor School Advisory Council, who is a guest of the honourable member for St. Norbert (Mr. Gaudreau). On behalf of honourable members, we welcome you here today.

ORAL QUESTIONS

Manitoba Hydro
Export Market Concerns

Mr. Brian Pallister (Leader of the Official Opposition): The top priority for investments by Manitoba Hydro has always been Manitobans' best interests in the domestic market, not foreign exports of hydro. And yet the government has it upside down. It seems like they're saying that the reason for going ahead with this supersizing of Manitoba Hydro is–well, the quote the Premier's known for is: It's about power exports to the US, he says. They're willing to pay premium international prices.

Interestingly, those prices are leading to increases in rates for Manitobans, Mr. Speaker, up to 40 per cent or more over the next decade, 6 per cent in the last three months.

So my question, I guess, is this: Why? Why double the size of Manitoba Hydro? Why speculate in the risky US energy market? Why place the interests of American power buyers ahead of Manitobans who really own Manitoba Hydro, not the NDP?

Hon. Greg Selinger (Premier): Mr. Speaker, the experience of the opposition never changes when it comes to Manitoba Hydro. They always are looking for a reason to not build it, to mothball it. And as a result of that, we lost a decade in the '90s.

They criticized Limestone as a project that was uneconomic. It was built and it paid itself back within 10 years, and then that power was available, having been paid off by export revenues available to Manitobans. The capital was paid off by the export revenues to Manitobans.

The Leader of the Official Opposition needs to understand that export revenues keep rates lower in Manitoba than they would be if we did not have export revenues. The absence of export revenues would make prices rise higher in Manitoba, as we're seeing in other jurisdictions across the country.

Mr. Pallister: The Premier's degree from London School of Economics obviously isn't in economics.

The fact is that export prices have declined to half the level of five years ago while he's caught in the headlights. The reality is today's price per kilowatt hour is 3 and a half cents. The reality is the cost of production is 13 cents. The reality is that we're going to be losing money if we follow the NDP's bullheaded plan.

The NDP business plan calls for the largest megaproject investment in the history of our province, Mr. Speaker, and it is concocted. It's on false urgency. It's based on skyrocketing supply, but they're ignoring the skyrocketing supply, and they're ignoring the sinking markets.

Now, previous premiers, including Edward Schreyer, had the wisdom to listen to his advisers and put the brakes on projects when it was appropriate. Why is this Premier acting like a deer caught in the headlights?

Mr. Selinger: Mr. Speaker, the member clearly has his head stuck in the sand; that's his problem when it comes to understanding the future of Hydro. The spot sales have shown a decline in prices. Firm sales remain very strong. Firm sale prices are the kind of prices that reduce the cost of building new hydro in Manitoba. Those export revenues–over $20 billion of export revenues over the next 20 years–will generate benefits that pay down the capital of new hydro installations and make those installations available to the Manitoba economy, which is a growing economy, an economy that's growing with people.

It's growing with clean energy; it's growing with new people investing in Manitoba; and as this economy grows, there will be a demand for clean, green energy.

When we build it now and export it, the price that comes back from those exports keeps the cost lower in Manitoba and allows us to get ahead of the curve on clean, green energy in the province of Manitoba.

***** (13:50)

Mr. Pallister: Manitobans deserve more than jolly Pollyanna for Premier here, Mr. Speaker.

The reality is that the Premier is telling everybody in the province to hurry up and get in the car; let's go for a 50-year US vacation, and they'll all–they'll pay for the freight. But the fact is he spends a lot of his time looking in the rear-view mirror; he can't see what's coming. The reality is he hasn't got any headlights on the car and he can't see the problems right in front of him. The reality is he hasn't got any brakes on the car either and once we start the car rolling, Mr. Speaker, there's no stopping. The reality is that he is telling everybody to listen to him that we're going to stay free down in the States on this vacation. And they're saying, we're booked; there's no room right now and there won't be any room for 50 years.

So, former and present NDP experts, former and present hydro experts, they're all saying the same thing: sober second thought, take a look at this, what's the rush? Len Evans, Len Bateman–smart men, smart people–are saying, bad idea.

So why get in the Premier's car when he doesn't have a map and, like many men, he doesn't have the brains to ask for directions either?

Mr. Speaker: I want to caution the honourable Leader of the Official Opposition–in fact, all members of the House–I very much, as your Speaker, want this to be a respectful workplace. So I'm asking for the co-operation of all honourable members to ensure that that happens. And I caution the honourable Leader of the Official Opposition, please, sir, pick and choose your words very carefully.

The honourable First Minister, to respond to the question.

Mr. Selinger: Yes, Mr. Speaker, I appreciate the question, without the editorial comments, but the question allows me to put on the record the following.

We have signed contracts in the United States for additional power sales. This is something the member seems to skip over.

We listened very courteously when the member put his very rude question, Mr. Speaker. Perhaps he could do the favour of listening to us when we give him the answer. Or is that beyond his capacity at this early stage in his career as Leader of the Opposition? Clearly seems to be.

We have signed contracts for over $7 billion of noon sales–new sales. We have ongoing contracts where we provide up to 10 per cent of the hydroelectricity to the great state of Minnesota. We have people looking for clean, green power in the United States that's reliable power, power that could be provided by Manitoba Hydro.

And just like the Limestone project, which they criticized and denigrated every step of the way, that–those power sales paid themselves back in 10 years and then made that capital investment in new dams available to all Manitobans, which allowed us to grow our economy and keep the lowest rates in North America. The lowest rates in North America is what we have right now here in Manitoba in spite of the mothballing of the members of the opposition.

Manitoba Hydro
Export Market Concerns

Mr. Ron Schuler (St. Paul): Mr. Speaker, hydro rates are expected to go up by 45 per cent by 2021 as a direct result of NDP mismanagement. Manitobans will be forced to pay for export-driven projects that the PUB says are not likely to break even, let alone make money, in the coming decade.

Why is the NDP forcing these plans ahead without the proper integrated economic reviews?

Hon. Dave Chomiak (Minister charged with the administration of The Manitoba Hydro Act): Mr. Speaker, I think the member is reading the wrong briefing note. Power rates are going up in the next year 41.4 per cent in BC. They're going up 23.9 per cent in Saskatchewan, and they're going up 42 per cent in Nova Scotia.

Mr. Speaker, in Winnipeg the monthly cost of residential power is $76.25. In Regina, it's $125.48. In St. John's, it's $125.48. In Halifax, it's $150.06. In Calgary–Calgary, the energy capital of the country–it's $117.41, almost double what it is in Manitoba.

I will take those rates, the lowest in the country, in front of the rhetoric the member is trying to inaccurately put on the record any time.

Manitoba Hydro–Bipole III Needs For and Alternatives To Review

Mr. Ron Schuler (St. Paul): Mr. Speaker, the minister is a little defensive on this one.

The minister has ordered a needs for and alternatives to, or NFAT, for Keeyask and Conawapa to ensure that they are economically sound, but not Bipole III. The Conservation Minister also cut a proposal to have the NFAT review done at the environmental hearings.

Is the minister afraid to send bipole through–III through an NFAT because it would fail?

Hon. Dave Chomiak (Minister charged with the administration of The Manitoba Hydro Act): As the member probably is aware, we've already announced an NFAT for Conawapa and for Keeyask.

Mr. Speaker, just let me repeat. The monthly rate for an average Manitoban, of a thousand kilowatts an hour, is $76.25 for the average Manitoban. For the average person in Halifax, it's $150, which is more than double. For the average person in BC–in BC, which has hydro–it's $87.77. For the average person in Regina next door, it's about $50 a month more. That equates to $600 a year per person. We have the lowest rates in the country. We're going to keep it that way.

If we had done what the Tories had asked us to do before, Mr. Speaker, we'd have the highest rates. They want market rates. They want to go back to coal. They want to use natural gas. They want to use systems that are foregone. Why don't we go to coal?

Mr. Speaker: Order, please. Order, please. The minister's time has expired.

Mr. Schuler: Mr. Speaker, this is a minister in a government that promised no tax increases and then increased them, said they would balance the budget by 2014–got those numbers wrong. There's nothing this minister can put on the record that we believe at this point in time. But thank you very much for that.

Export sales to the US can't be fully judged without evaluating the cost of getting it there. Bipole III is estimated to cost 3 cents per kilowatt hour to transmit power, which has a big impact on both export sales and domestic use.

Will the minister put bipole through–III through NFAT at the same time as Keeyask and Conawapa so we can get a clear picture of the integrated economics of this $18-billion project?

Mr. Chomiak: First off, Mr. Speaker, bipole doesn't cost $18 billion. The cost of transmission for reliability for bipole is almost not calculable in terms of what would happen if those two lines that are nearby each other were to go out. It's for reliability.

It's one of the reasons why we have signed contracts with the United States. It's one of the reasons why we're negotiating with Saskatchewan. We're negotiating with the province next to us to provide power to them.

It's one of the reasons why companies come to Manitoba every single day, because of our rates, and want to relocate to Manitoba. And you know what?

An Honourable Member: Name them.

Mr. Chomiak: Name them? Just you wait, Mr. Speaker. Just you wait.

Phoenix Sinclair Inquiry Responsibility for Missing Documentation

Mrs. Leanne Rowat (Riding Mountain): For those following the tragic replay of Phoenix Sinclair's life as the inquiry unfolds, there remain a lot of unanswered questions. It seems that someone does not want these questions answered, as notes on the child welfare file have gone missing. The minister has recently admitted the notes did exist, are missing and were perhaps destroyed.

Mr. Speaker, I ask the minister: When did she become aware that the notes were missing, and what has she done to investigate this very serious situation?

Hon. Jennifer Howard (Minister of Family Services and Labour): Thank you very much, Mr. Speaker, for the question. I think, as I've said before, watching the inquiry unfold, hearing the stories that are being told of the tragic life and even more tragic death of Phoenix Sinclair is a painful experience for all of us.

I find the fact that there's missing documentation extremely distressing. It would be my wish that all the documentation was available, because the reason why we called the inquiry was to get the full story so that we can make the changes that are necessary to be made. I am–I understand that there has been an extensive search for that documentation and–many times by many people involved in the system.

I look forward to the inquiry's conclusion. I look forward to the recommendations that they bring forth, and I look forward to continuing to making changes–

Mr. Speaker: Order, please. Minister's time has expired.

Mrs. Rowat: Based on her comments, I believe–and I believe Manitobans believe–that she didn't do what needed to be done to protect those files.

Mr. Speaker, several reviews were done at the time Phoenix Sinclair was murdered. Over 300 recommendations were made.

If the minister–is the minister not concerned that these notes may have been deliberately removed to impair the work of the inquiry? Mr. Speaker, will the minister today indicate whether the fire–files were available when all these reviews were done?

Ms. Howard: Well, Mr. Speaker, I want us all to be clear in this Chamber. I don't want us to–any of us to put forward allegations for which there is no evidence, and there is no evidence that any notes were deliberately removed–no evidence that I'm aware of.

If the member opposite has that evidence, I would ask her to share it with me, because that would be very, very serious. That would be very, very serious if there is–if there are those allegations and she has evidence to support those allegations.

***** (14:00)

As I've said, I think that the missing information is troubling. It's something that we wish was available because it would give us a full picture. Documentation has been an issue and was identified in several of the reviews of this case. That's why we've made moves to increase training, to increase standards to ensure the documentation is made in a timely way.

Mr. Speaker: Order, please.

Mrs. Rowat: Mr. Speaker, the Phoenix Sinclair inquiry was called over six years ago. Why wasn't this minister being proactive or this government being proactive in ensuring that those documents were secure? The inquiry has been stalled and delayed and now key documents are missing.

Given the seriousness of this situation, why were the documents not protected, kept in a safe place so that full disclosure would have been made available to the public during the inquiry? This government failed to give instruction that all files be kept safe, Mr. Speaker. It's obvious; they're missing.

Why did she fail to have these documents sealed and protected?

Ms. Howard: I think, clearly, there are standards in place when it comes to documentation. There are standards in place when it comes to the security of information. We have made moves to strengthen those standards, to increase the training available, to make sure that there's resources in place to help people make sure that the data is entered correctly and we'll continue to make those moves.

And we will take the recommendations from this inquiry very, very seriously, and if there are further moves that we need to make to ensure the documentation is done appropriately and done well, then we will make those changes, Mr. Speaker. That's why we called the inquiry, because we want to get the full story of what happened and information on how we can improve the system as much as anybody. Thank you.

Phoenix Sinclair Inquiry
Responsibility for Missing Documentation

Mrs. Bonnie Mitchelson (River East): That answer isn't good enough. It was this government that called the inquiry six years ago. Mr. Speaker, it was up to this government to ensure the integrity of the files that were available so the inquiry and the commissioner could do his work.

Why did this government fail to ensure that those documents were in a secure place and protected so that the commissioner could do his work?

Hon. Jennifer Howard (Minister of Family Services and Labour): We called this inquiry because we wanted the whole story, the full story, to become available. We wanted people to hear–and I think what's unfolding in the inquiry is an unprecedented look at how the child welfare system works and how it doesn't work. And I think that doing that, while it is very painful for the people involved, I think it is necessary and it will be necessary so that we can take a look at what happened in this case, so that we can make more changes. Many changes have been made, but so that we can make more changes into the future to ensure that the system is in a place where it can protect children and help families.

Mrs. Mitchelson: Under law, the Minister of Family Services has the ultimate responsibility to ensure that children are protected. When Phoenix Sinclair fell through the cracks and was murdered, Mr. Speaker, this government called an inquiry. That inquiry should have been full and the commissioner should have had all of the information for him to do his job and it was up to the minister and the government responsible to ensure that those files were there.

Why did they fail to protect the documents?

Ms. Howard: Well, I think, Mr. Speaker, as I've stated, there has been an exhaustive search for those documents. Everybody wants to make sure that that–those documents, all the information that the commissioner needs, is turned over to the commissioner and they have full access. There has been extremely good co-operation, I think, between the government and the commission in making information available.

I don't know what allegations the members opposite have evidence to support. I'm open to hear that evidence if they have some allegations and we'll take that very seriously.

The things that we have done to make sure that children are protected in the wake of the tragic death of Phoenix Sinclair is invest in front-line social workers to the tune of over 200 more people in the system, make sure that standards are brought up to date that are in place, standards that include things like having every child seen every time. And there's much more to do, Mr. Speaker, and we will hear those recommendations and we'll take them seriously.

Mr. Speaker: Order, please.

Mrs. Mitchelson: The evidence that we do have is that this government failed to protect the files and ensure that they were secure so that the commissioner and the inquiry could do their job.

Mr. Speaker, they have failed Phoenix Sinclair through their lack of accountability and their incompetence. Why wasn't a directive sent to ensure that those documents were in a safe place so that Manitobans–excuse me–could have all of the information and all of the facts as the inquiry unfolded?

Ms. Howard: Well, Mr. Speaker, the truth is that there are standards in place to make sure that all information in the child welfare system is kept secure and is kept confidential. People take that very, very seriously. In this situation, as I've said before, there has been extensive searches for these documents. They haven't been found. I wish that they were available because I think that they would be useful to the commissioner.

We have worked to co-operate with the commission. We called the commission of inquiry because we wanted there to be a full disclosure of what happened in this case and because we wanted to be able to learn how to strengthen the system, and that commission will continue and that inquiry will continue and we will take our lessons from the commissioner.

Taxation
Possible Increases

Mrs. Myrna Driedger (Charleswood): Mr. Speaker, for two weeks now this NDP government has refused to say if they will raise taxes again to pay for the spending mess that they've created. It is troubling that this Minister of Finance babbles on about all kinds of things, but he refuses to answer the question.

So I'd like to ask him again: Will the NDP raise taxes again in their next budget to pay for their spending addiction?

Hon. Stan Struthers (Minister of Finance): You know, Mr. Speaker, it's quite rich that the member opposite would complain when we come forward, not only just complain but vote against a measure in terms of reducing RHAs in this province to contain costs and have those costs transferred to the front lines that Manitobans care about.

She talks about babbling on. Well, last week I guess I babbled on about a–$1.2 billion in tax savings for individuals, property and business. Now, I have fairly thick skin, I can handle her calling–

saying I babble on, but those were real tax savings for Manitobans. I don't know if they think I was babbling on or not.

Mrs. Driedger: Well, Mr. Speaker, in the last election we saw this government raise taxes by $184 million. He's neglecting to talk about that.

Mr. Speaker, the federal government has said that they will not raise taxes in their next budget, but for some reason this NDP government here won't give Manitoba taxpayers the same straight answer.

And it's a very simple question: Will the NDP guarantee, like the federal government has, that they won't raise taxes in their next budget?

Mr. Struthers: Well, Mr. Speaker, in the last election–the member across the way is incorrect. In the last election we talked about protecting services that Manitobans value more than others. We talked about protecting health care. We talked about protecting education. We talked about protecting services that protect kids. We talked about very strategic investments in our economy to grow that economy.

We have taken on seriously reductions in spending, a streamlining of government, offering our services to Manitobans in a different way that's more efficient and more effective, and they do not support that. They work against–

Mr. Speaker: Order, please. The minister's time has expired. Order, please.

Balanced Budget
Government Timeline

Mrs. Myrna Driedger (Charleswood): Mr. Speaker, the federal government has also said they are going to balance their books by 2015, yet this NDP government refuses to say whether they will balance their budget here in Manitoba.

Mr. Speaker, the lack of responses by this NDP government on both those issues of raising taxes and balancing the budget is becoming shocking. They're not giving a clear answer to Manitoba taxpayers.

So I'd ask him today for a very clear answer: When will the NDP government in Manitoba balance the budget?

***** (14:10)

Hon. Stan Struthers (Minister of Finance): Well, Mr. Speaker, the federal government has also had five different dates over the last 20 months as to when they're going to come back into balance. The federal government has also laid off Manitobans and left unprotected some of the services that matter most to Manitobans.

Our commitment has been very clear, Mr. Speaker. We're going to take on decisions that reduce the spending that we do have. We're not going to do it in such a way that we lay people off, and we're not going to do it in such a way that we hurt health care, that we hurt education, that we hurt our ability to protect kids in this province.

We're not going to take your advice–Mr. Speaker, we're not going to take their advice and go into these with deep cuts that put our–that would risk putting our economy–

Mr. Speaker: Order, please. Order, please. Minister's time has expired.

Balanced Budget
Government Timeline

Mrs. Heather Stefanson (Tuxedo): During the last election, the Premier (Mr. Selinger) promised that he would balance the budget in Manitoba by 2014, and he said that he would do so without raising taxes, Mr. Speaker.

Well, Manitobans have two questions for him: No. 1, when will he balance the budget, Mr. Speaker? And, No. 2, will he do so without raising taxes?

Hon. Stan Struthers (Minister of Finance): Mr. Speaker, we've employed a very balanced approach to our economy. The balance includes both revenue and expenditure decisions. Members opposite will see that kind of a balanced approach come forward.

What we will not be doing, Mr. Speaker–what we will not be doing–is taking advice from members opposite who for some reason think it's a good–a good way to do this would be very draconian cuts to services, very deep, heartless cuts, if I may say so, deep cuts that would (a) leave our–Manitobans without the services that they desire and (b) would run the risk of putting our economy further into an economic downturn.

Mr. Speaker: Order, please. The minister's time has expired.

Mrs. Stefanson: And these are not trick questions that we are asking the Minister of Finance. In fact, Mr. Speaker, we have asked these questions several times, in fact, every day in question period in the last few–couple of weeks.

My question for the Minister of Finance is quite simple: Is it his intention to balance the budget at all, Mr. Speaker? Yes or no.

Mr. Struthers: Mr. Speaker, this is the same group of people who came into this Legislature with a resolution–with a resolution that would have cut deeply into the services that Manitobans really want us to protect.

They came in and they put that resolution on the table. They all stood and they voted for it. Those were deep cuts that would've kicked our economy into recession.

Then the election comes along, and what do they do? Eleventh hour, just before the election, the night before the election, they decide we're not coming back into balance 'til 2018. The people with credibility problems on this issue are sitting to your left, Mr. Speaker.

Mrs. Stefanson: Mr. Speaker, the Minister of Finance can't even answer a simple yes-or-no question. That's–it's concerning for Manitobans. They want to know whether or not this Minister of Finance has any intention at all of ever balancing the budget.

Will he answer that question, Mr. Speaker? Will he–does he have the intention of balancing this budget ever?

Mr. Struthers: Well, Mr. Speaker, when we talk about these issues, I think it's very important to remember what the debt-to-GDP ratio is today as compared to what it was a number of years ago. If we want to really measure the effectiveness of government actions, that is a very good way to do it.

Mr. Speaker, 33 per cent represents the number in 1999, back in the days when the member of–the Leader of the Opposition thought that they were blessed with having that government, back in the days when the–that was a intelligent way of governing. Thirty-three per cent, more than a third of our debt to GDP existed at that time.

Today, we've worked that down to 27 per cent, Mr. Speaker, because we have–

Mr. Speaker: Order, please. Minister's time has expired.

**Phoenix Sinclair Inquiry
Responsibility for Missing Documentation**

Hon. Jon Gerrard (River Heights): Mr. Speaker, with regard to the missing supervisor's notes at the Phoenix Sinclair inquiry, the minister insists that there were standards in place. Presumably, these were standards for storing records, for accessing records and for records security. She also says it's unknown why these files were missing. But one supervisor, Andy Orobko, took his notes home, had them there for several years and then destroyed them.

I ask the minister: Will the minister tell us which standard this follows, and will the minister today table the standards that she's so–referring to earlier on?

Hon. Jennifer Howard (Minister of Family Services and Labour): Well, clearly, the destruction of notes does not follow a standard; that is clear. I don't think anybody would purport to say that it does follow any standard of good recordkeeping.

I'd be pleased to share with the member opposite the standards that are in place when it comes to documentation. I don't have them with me today, but I'd be pleased to make that information available to him.

Mr. Gerrard: Mr. Speaker, I look forward to the minister tabling those as soon as possible.

Mr. Speaker, in Saturday's Winnipeg Free Press, Lindor Reynolds wrote of the missing CFS supervisory notes on the Phoenix Sinclair file. She said: The notes may become the inquiry's version of the infamous 18 and a half missing minutes of taped conversation between US President Richard Nixon and his chief of staff used to determine the President's role in covering up the Watergate scandal.

I ask the Minister of Family Services: What action did senior CFS management make to make sure the CFS supervisory notes for Phoenix Sinclair were not lost, and can the minister completely tell us what action had been taken to try and retrieve these lost notes?

Ms. Howard: I think it's worth noting, again, for members opposite, that it was this government that called the inquiry. We called the inquiry because we wanted to have a full airing, and it has provided, really, an unprecedented look at the child welfare system. We have had people testify who worked on the case. We've had people testify who were supervisors of that case, and as that inquiry unfolds, we will also hear what has happened since the death of Phoenix Sinclair, and then we will also move into a discussion of some of the issues that we all confront in our society that leads to the neglect and abuse of children. So the inquiry is going to teach us much about how we can improve the system, and we'll look forward to those recommendations.

As I've said before, the standards that are in place speak to the security and confidentiality of records–

Mr. Speaker: Order, please. Minister's time has expired.

Mr. Gerrard: Mr. Speaker, the processes and procedures to ensure that CFS notes do not get lost, misplaced, or destroyed are the responsibility of the Minister of Family Services and of other senior CFS officials like, for example, Darlene MacDonald was at the time. While the decisions related to what was said then on what happens to an individual child and family may depend a lot on the front-line worker, the procedures and processes which are vital to the integrity of the system are those of the minister and the senior management.

And I ask the minister: Why has the revolving door of NDP CFS ministers allowed the CFS department to be run in such a way that critical notes of CFS supervisors have gone missing and the media is now comparing NDP governments to Watergate?

Mr. Speaker: Order, please. Order, please.

Ms. Howard: You know, I'm not going to engage in the cynicism of the member opposite on this file. We come to work here every day because all of us want to do better for our communities, and I come into my office every day with the heavy responsibility but the welcome responsibility for making sure that children and families are cared for and protected, and I take that responsibility extremely seriously. And I am not going to give up on that responsibility, and I'm not going to give up in the face of the kind of cynicism that the member opposite brings into this Chamber, Mr. Speaker.

We are paying very close attention to this inquiry. I believe this inquiry will come out with a report that will transform the way children and family services are delivered in this province, and I welcome the opportunity to put that into effect.

***** (14:20)

Seasons of Tuxedo Geothermal System

Mr. James Allum (Fort Garry-Riverview): Winnipeggers and Manitobans are excited about the new retail development boom that is happening in our great city, which creates economic growth and creates jobs. What they may not know is that one of these developments, the Seasons of Tuxedo, is one of the greenest in the world.

Could the Minister for Innovation, Energy and Mines please inform the House about the–how the Province helped support this energy efficient development with green tax incentives and geothermal grants?

Hon. Dave Chomiak (Minister of Innovation, Energy and Mines): I was honoured to be able to be present at the 275,000-square-foot retail development, the largest retail development with a geothermal system of its kind probably in the world, Mr. Speaker, which was–which has provided green and clean energy with a payback to both the tenants and the owners of eight years, and which was assisted by the Green Energy Equipment Tax Credit as well as the district geothermal grant.

We were able to help these come to Manitoba, keep the Manitoba economy expanding and keep it expanding in a green, sustainable way, with sustainable, green jobs going into the future. That's what Manitobans want to have dealt by their government.

Manitoba Public Insurance Corporation Collection Agency Garnishee Order

Mr. Cliff Graydon (Emerson): Bill Turner received a speeding ticket driving home one evening. He's never disputed that he was in the wrong and should have to pay it. He tried to pay the ticket online where he was told that there was no record of the ticket; it didn't exist. The ticket was issued to the wrong address. He had recently moved and had registered this with MPI. The ticket, however, was mailed to the wrong address. Because of this error, a $354.75 ticket became a ticket in excess of $400, with late fees, garnishment fees and court costs, plus an additional $1,340 to renew his licence and registration.

Mr. Speaker, I want to ask the Minister of Justice: Why must Mr. Turner pay for MPI's mistakes and mismanagement?

Hon. Andrew Swan (Minister charged with the administration of The Manitoba Public Insurance Corporation Act): Although I can't discuss the specific case, it is clear the member does not have all the information.

There is some advice I can give the member, and indeed, all Manitobans: No. 1, don't speed on our highways; No. 2, make sure that you give MPI your current address because it is very important if they need to get a hold of you; No. 3, if you speed and you're caught and you're handed a ticket by the RCMP or by a police officer, you should pay it in accordance with the terms written on ticket. If you want to oppose it, you should do so in accordance with the terms printed on the ticket. If you don't pay it in accordance with those terms or oppose it, it is not surprising there is then collection action that can be taken for the outstanding amount of the ticket. And when you go to renew your driver's licence or your vehicle registration, you may find there's a hold that's been placed against it. Now, even–

Mr. Speaker: Order, please. Order, please. The minister's time has expired.

Mr. Graydon: Due to the mismanagement of MPI, the collection agency and the justice system received inaccurate information. The minister responsible for MPI and the Minister for Justice are one and the same. When his office was contacted, they acknowledged it was some confusion on what was owed and sent Mr. Turner the wrong phone number to call and rectify the situation.

Mr. Speaker, the minister still has an opportunity to do the right thing and commit to refund the extra fees to his–through his department's failures.

Mr. Swan: Good–some more information I can provide to the member opposite and all Manitobans is that if you do get a ticket, when you do pay the ticket, you still have to pay for your vehicle registration and the cost of your driver's licence, which, unfortunately, was incorrect in the information put forward by the member opposite and the Tory press releases. They continue, Mr. Speaker, to aim lower.

But, you know, this morning I stood shoulder to shoulder with the RCMP out at Headingley as they again announced their annual Check Stop program. We support the RCMP. We support their efforts to make our roads safer, to keep them safe from impaired drivers, to make sure that individuals are wearing their seatbelts, not distracted, and one of the most important issues is to make sure individuals are not speeding on our highways. We stand shoulder to shoulder with the RCMP to reduce the deaths in our province caused by people speeding on our highways. We take it very seriously. I know the police take it very seriously–

Mr. Speaker: Order, please. The minister's time has expired.

Mr. Graydon: *[inaudible]* cannot renew his insurance on his vehicle in a monthly or quarterly installments as he has done previously. He will be unable to renew his driver's licence without undue hardships. For a man that commutes to work every day from Gretna to Winkler, this is a tall order.

When my office notified the minister, they continued on their reckless path and sent a collection agency after him, and Mr. Turner has had enough.

Mr. Speaker, can the minister commit to meeting with Mr. Turner and resolve all the issues involved in a ticket, including Mr. Turner's reputation and his credit rating?

Mr. Swan: My first response–I did explain some of the challenges, and it's some of the things that all Manitobans need to do, and it is true, if you receive a park–if you receive a speeding ticket and you're either convicted or you say you'll pay it and you don't, if you don't pay that fine, there may be action taken. And Manitoba Justice does pursue individuals with outstanding fines. We believe it's important.

I thought the member for Brandon West (Mr. Helwer) thought that was important, but that was a different week. And then he did and he didn't, but that's another point.

But we believe that drivers who break the law, who break The Highway Traffic Act, actually should have to pay when they receive tickets.

And, again, I would point out to all Manitobans, it's very important that they continue to advise Manitoba Public Insurance of their correct address because that's the only place MPI–

Mr. Speaker: Order, please. Order, please. The minister's time has expired.

There are a few seconds left.

Phoenix Sinclair Inquiry
Responsibility for Missing Documentation

Mrs. Bonnie Mitchelson (River East): Mr. Speaker, I think the answers from the Minister of

Family Services today left a lot of unanswered questions.

Very simple question to the minister: Why did the government not ensure that the files and the documents that should have been available to the commissioner from the Phoenix Sinclair murder, why did she, Mr. Speaker, why did her government not ensure that those files were in a secure, safe place so that Manitobans would have all of the answers and the commissioner would be able to do his work?

Hon. Jennifer Howard (Minister of Family Services and Labour): Mr. Speaker, well, as I've said before, there were and there are standards in place that speak to the confidentiality and the security of information, and that is our expectation when it comes to recordkeeping with regards to all child welfare cases.

We called this inquiry because there are unanswered questions, and we called this inquiry because we want to hear the answers to those questions. We want Manitobans to hear the answers to those questions, but more importantly than any of that, Mr. Speaker, we want to hear how we can go about improving not only the system designed to protect children but improving all of our province so that children aren't in need of that kind of protection. That's what we await to hear from the inquiry. Those are the recommendations that I think will be very important to transforming the future of Child and Family Services, and we'll take those recommendation as they come.

Mr. Speaker: The time for oral questions has expired.

MEMBERS' STATEMENTS

Charleswood Historical Society Centennial Committee

Mrs. Myrna Driedger (Charleswood): Charleswood turns 100 next year. The Charleswood Historical Society is busy planning this centennial, and I would like to congratulate them on their dedication and energy to fulfill their motto, Celebrating our Past; Embracing our Future.

The centennial committee has identified a wide range of ideas and events to celebrate the centennial next year. Once again, the people of Charleswood are stepping up to volunteer their time and energy to help with these celebrations. They have already published a calendar with wonderful photos of old Charleswood, and these calendars are now available for sale through the Charleswood Historical Society.

Dan Furlan is the chair of the centennial committee, and plans are well underway for many exciting events. The Charleswood 100 logo was designed by local resident Doug Coates and will be used to brand all of the centennial activities.

The volunteer committee has big plans and hopes for the year. Some of the plans under consideration includes improvement and recognition of the historical sites of The Passage and Kelly's Landing, recognition of 100-year families and veterans and a canoe dock at Caron House. Research is also being done into the Red River buffalo hunt and the significance of the Buffalo Pound Hunting Site. Also proposed are the establishment of two trails off the Harte Trail: First Nations tribute trail and Old Pembina trail habitat preservations trail to save habitat and preserve our Red River cart trail history.

The Charleswood Legion plans to have a wall of pictures of Charleswood residents. A committee plans to go into schools to do presentations about local history. Other ideas include a children's fair, a lecture series, Doors Open Winnipeg at Caron House, fireworks, business improvement beautification, fashion show and car show and probably many, many others. The ideas are endless, and it should be a year of lots of celebration. We invite people outside of Charleswood to join with us in celebrating our 100th birthday. It is definitely time to celebrate.

Mr. Speaker, I wish to congratulate and thank all of the wonderful volunteers in Charleswood who are so enthusiastic about planning and carrying out this year-long event. Good luck to them with all of the events and activities, and they are indeed an inspiring group to work with. And I look forward to participating with them.

Thank you.

***** (14:30)

Chancellor School Advisory Council

Mr. Dave Gaudreau (St. Norbert): As a society, one of the greatest things we can do for our children is to ensure their education and socialization. Schools play a key role in achieving this goal and it takes many people to create a positive learning environment. While staff members are irreplaceable and vital to all educational institutions, advisory council volunteers are also important to the growth and prosperity of every school. The Chancellor School Advisory Council or CSAC in St. Norbert is one such wonderful example.

CSAC is a group of parents and guardians that support students and staff at Chancellor elementary school. It's actively involved in the school by means of classroom volunteering, field-trip supervision, helping with reading and special lunch-day assistance. Outside of school hours, this dedicated council organizes fun events for the students and their family including movie nights, a Peak of the Market fundraiser, a holiday concert auction. While some of these events act as a fundraiser for the school, they, most importantly, all bring the community together. Notably, the fundraisers are chosen carefully to reflect the council's values: social justice, nutrition, literacy and development.

Successful fundraising efforts have allowed CSAC to support Chancellor School in various ways. Recent council initiatives have included a $2,000 subsidy towards the purchase of agenda books, kindergarten welcome bags, classroom grants, student leadership rewards, post-immunization snacks and an end-of-the-year grade 6 farewell celebration. Last year, the council focused on improving the school's play structure making it more accessible, adding more pieces and improving drainage. Every project the council has pursued has been prioritized in response to the needs of the students, their families and staff.

Mr. Speaker, the dedication of the Chancellor School Advisory Council to bettering the education experience of children is tremendous. Having attended the school functions, I have witnessed the phenomenal council teamwork and can assert that the students at Chancellor School are certainly fortunate. Thank you to the many council members who volunteer their time to improving their school's community. The council's positive impact on the community is, in fact, immeasurable and deserving recognition.

Thank you, Mr. Speaker.

Les Kletke

Mr. Cliff Graydon (Emerson): I rise today to recognize an outstanding writer and public speaker from my constituency.

Les Kletke from Altona has spent more than 25 years in the communication industry working as a book coach, freelance writer and a highly regarded speaker on numerous issues. Throughout those 25 years, he has published six books as well as writing for many newspapers and magazines, winning numerous awards in the process.

Les studied economics and agriculture at the University of Manitoba, which led him to studying as a Nuffield scholar, allowing him to gain new agriculture experience in Britain. His work in the agricultural sector also allowed him to travel to Russia, the United States, Korea, Brazil, New Zealand, Mongolia and China. Les is also trained as an auctioneer, and is involved in many charity auctions for worthwhile causes.

Mr. Speaker, all of these skills have led Les to being named Canada's representative to the global farmers roundtable, world food symposium, in Des Moines, Iowa. The event invited 20 producers from all over the world to discuss trade and technology in the agricultural sector, and to better understand and address the challenges of filling an increased food and nutritional security gap.

The second part of Les's trip is to attend the World Food Prize event in which many, many more farmers and those employed in the agricultural industry will debate and discuss other issues in the industry, like food security, conservation solutions and emergency technologies in agriculture.

Mr. Speaker, Les is a respected voice in the agricultural industry and is well respected in publishing industry as well. His work helps many understand complex issues, and is a great educator in both fields.

I would ask all members of this House to join me in congratulating Les on all of his successes and wish him the best of luck in his future work.

Thank you, Mr. Speaker.

Guru Nanak

Mr. Mohinder Saran (The Maples): Mr. Speaker, on December 2nd, 2012, our honoured Premier (Mr. Selinger) and I were honoured to attend the Sikh Society of Manitoba's celebration of the birthday of Sri Guru Nanak Dev Ji, the founder of the Sikh religion.

While this celebration was held this past weekend, Guru Nanak was born on November 28, a month of great significance to Sikhs. It is a month of pride but also one of sadness.

Political instability and philosophical friction within the Indian state led to the 1984 genocide of Sikh people in New Delhi and many parts of India outside of Sikhs' homeland. People were tortured and set on fire, and women were raped and made to wander the streets naked.

This state failed to protect them. After 28 years nobody is convicted. The democracies of the world appeared to sympathize with the victims.

The month of November brings sorrow to the Sikh community, but also great pride, pride because they did not take revenge upon the innocent, though many innocent Sikhs were slaughtered, but chose instead to donate blood to save lives as well as to commemorate the memory of the victims of the 1984 genocide. The campaign of blood donation in North America began in November 1999 and has saved since then thousands of precious lives.

Mr. Speaker, I would like to take the time for us to stop here today and honour these many people, the Sikh people, for their sacrifice, and remember the religious freedom we enjoy in Canada and in the world today because of people like Sri Guru Nanak Dev Ji and Sri Guru Teg Bahadur Ji, gurus of Sikhism who taught us lessons of integrity and sacrifice.

Thank you.

Magnus Eliason Recreation Centre

Mr. Rob Altemeyer (Wolseley): Mr. Speaker, the Magnus Eliason Recreation Centre, known as the MERC, is located on Langside Street in the heart of the Spence neighbourhood. Led by the Spence Neighbourhood Association and the Youth Agencies Alliance, the MERC provides local youth with a safe place to play sports and take part in after school drop-in programs.

In October, our provincial government and Manitoba Lotteries partnered with the Spence Neighbourhood Association and none other than the National Basketball Association to unveil the newly renovated gymnasium at the MERC.

The new features include everything from a refurbished gym floor to new wall pads, new backboards, several dozen new NBA basketballs, new scoreboard, shot clock, timer, and many other features.

I was really pleased to join our Premier (Mr. Selinger) at the grand opening for this amazing celebration where kids from the local neighbourhood had a chance to meet NBA legend and hall of famer Clyde the Glide Drexler. Members of the Minnesota Timberwolves and the Harlem Globetrotters were also on hand to help kids with their locals–help local kids with their skills and show off some off some of their professional moves.

Mr. Speaker, our government has really fought to promote the benefits of giving kids an opportunity to play sports in all parts of our province. I know from my own experience as a youth athlete, youth are able to grow as individuals and learn to work together as a team and, in turn, sport helps foster healthy neighbourhoods and communities where citizens can learn and work together and trust each other. The MERC is an essential part of this process in the Spence neighbourhood and the gymnasium's revitalization is an essential part in the amazing accomplishments that this community is achieving.

Today in the gallery we have with us: Jamil Mahmood, the executive director of the Spence Neighbourhood Association; Chino Argueta, the recreation and sports coordinator for the Youth Agencies Alliance; and Adam Wedlake, the executive director of Basketball Manitoba. These community organizations were essential in creating this lasting legacy in Spence neighbourhood, and I'd ask all of my MLA colleagues here in the House to join me in thanking them for their tireless efforts on behalf of today's youth.

Thank you.

Mr. Speaker: Grievances. Seeing no grievances–

ORDERS OF THE DAY

GOVERNMENT BUSINESS

House Business

Hon. Jennifer Howard (Government House Leader): Mr. Speaker, could we proceed with second reading of Bill 3, followed by Bill 12, 9, 14 and–yes, and 14.

Mr. Speaker: We'll now proceed with second readings of bills in the following sequence: Bill 3, Bill 12, Bill 9, and then Bill 14.

SECOND READINGS

Mr. Speaker: So we'll now call Bill 3, The Employment Standards Code Amendment Act (Leave Related to the Critical Illness, Death or Disappearance of a Child).

Bill 3–The Employment Standards Code Amendment Act (Leave Related to the Critical Illness, Death or Disappearance of a Child)

Hon. Jennifer Howard (Minister of Family Services and Labour): I move, seconded by the Minister of Finance (Mr. Struthers), that Bill 3, The Employment Standards Code Amendment Act (Leave Related to the Critical Illness, Death or Disappearance of a Child); Loi modifiant le Code des normes d'emploi (congés en cas de maladie grave, de décès ou de disparition d'enfants), be now read a second time and be referred to a committee of this House.

Motion presented.

***** (14:40)

Ms. Howard: I'm proud to be able to introduce this bill and speak a little–to sec–move this bill to second reading, speak a little bit about it today.

This bill, of course, provides for new leaves for parents of critically ill children or parents of children who have disappeared or died as a result of a crime. The Employment Standards Code will be amended to provide job protection up to 37 weeks for parents of a critically ill child, up to 104 weeks for parents of children who have been murdered, and for parents of a child gone missing as a result of a crime, up to 52 weeks.

Consistent with other leaves under the code, an employee who has been employed by the same employer for at least 30 days would qualify for the leave, although, of course, I think it always bears saying that employers and employees can make their own arrangements as long as it doesn’t provide for less than what's provided for in the code.

For an employee to be eligible for the critically ill leave, a physician has to issue a certificate stating that the child is critically ill as a result of a life-threatening illness or injury and requires the care or support of the employee.

In the case of a murdered or missing child, the leave would be available where it is probable in the circumstances that they child died or disappeared as a result of a crime.

And, of course, these definitions are patterned after the federal bill that will provide for income support for parents who take advantage of these leaves. The leave, under the code, will enable parents to access newly announced federal benefits. The federal government has indicated that it will provide a federal income support for parents of murdered and missing children as of January 1st, 2013. That's why we're hopeful that we'll have co-operation of the House in order to move this bill through to third reading and proclamation before the House rises.

In addition, a new employment insurance benefit will provide up to 35 weeks of benefits to eligible parents who take leave from work to care for a critically ill or injured child. This income supplement is expected to be available in June, 2013.

I can't imagine the kind of trauma that parents who find themselves in these situations face. Certainly, my–one of the questions that was asked of me, when we brought in this bill, by the media, was how many parents would use this leave. And my answer was, I hope none. It's not a number that any of us, I think, can forecast.

In many cases, we know that parents whose children go missing, whose children may have been murdered–they face great uncertainty for a long period of time about how to put their life back together, if they ever can. They're involved with the police and the courts–processes that can be difficult to navigate and take time to resolve. In many cases, they may face attending in court for many, many months.

The uncertainty also exists for parents tending to a child with life-threatening illness. Parents who take leave from their job to care for a critically ill child or to deal with the aftermath of the murder or disappearance of a child often worry about their job–often worry that their job may disappear while they're away from work and they're focused on their child. And we know that the ability to get some income support benefits is important so that people can take the time that they need.

Dealing with these situations can require a significant period of time for parents to heal and attempt to overcome the tragedy. These parents require time to grieve, to address the severe psychological effect that they may be faced with and to deal with the stresses they face. And we believe that no parent should have to, on top of that, face the worry or fear that they may not have a job to go back to. That's why we've brought in Bill 3, to implement the consensus recommendations of the Manitoba Labour Management Review Committee, which will provide job protection for parents who take these leaves.

I also just want to let the House know that we will be bringing forward an amendment at committee just for extra clarity, that in the event that a parent would be convicted of a crime that led to the death or disappearance of the child, of course, that parent wouldn't be eligible for that leave. It did seem to be practically assured in the federal bill they aren't eligible for the benefits, but we want to make very sure that they wouldn't be eligible for the job leave also. And I want to thank the members of the opposition for putting forward some constructive suggestions when it came to that.

So thank you very much, Mr. Speaker, for the opportunity to speak to this bill. We have had an opportunity to brief the opposition and, as I say, I look forward to the ability to pass this bill before the House rises at the end of this week. Thank you.

Hon. Jon Gerrard (River Heights): Mr. Speaker, I rise to speak to Bill 3, The Employment Standards Code Amendment Act, dealing with leaves related to the critical illness, death or disappearance of a child. I welcome this legislation because I think it's helpful, useful and can be important in terms of helping parents adjust when there is a child who is critically ill, or on the death or disappearance of a child which is related to a crime.

I think that there are some areas which this legislation may need some clarification. Certainly, from my point of view, I want to speak from my experience as a physician looking after children with cancer, having dealt with many children who have been critically ill with cancer and be able to talk in that context on terms of how this might work and some of the flexibility that should be needed to be sure that is there in order for this bill to work optimally.

I think that the–it will be very important, as well, once this bill passes, that there be information on how this time is used that's very clear for parents, that's on the web or on information brochures but certainly readily accessible. At the time of–a child is critically ill, it's not a time when parents have lots of time to be figuring out things so that the–needs to be very easy and accessible and straightforward, so that people can use these measures and use these measures easily and readily.

One of the aspects that I think is pretty important is when one is–for instance, has a child who has a form of cancer. Very often there is some intensive treatment, during which time the child may be in a hospital or certainly often fairly sick for a period and need absolute day-to-day attention. But, then, over the next–and it may go on for a year or two or three sometimes, depending on the treatment, there will be intermittent times when a child is very sick. It could be as a result of the cancer; it could be as a result of the chemotherapy and the treatment; could be as the result of an infection that occurs.

And it would be very important, in my view I offer to the minister, that this be flexible, so that a parent might be able to take a month at the start of a very severe illness, but might be able to take the other weeks at intervals of their choosing at later times, that the 37 weeks shouldn't have to be a continuous 37 weeks and that this be very clear in the legislation, in the regulations around the legislation. You know, if you–again, an example where a child may need–or parents may need to be there, you know, all the time for the first month but, then, after that it may be at 'intervittent' periods. And it may be, in fact, a year or two or sometimes even longer down the road that the child–the cancer comes back, and sad as though that may be, it may be another period of very intensive care and attention that is needed by parents.

But I think that it is important not only that there be that flexibility for parents to use that time which, when it works for them, but that they're–parents know this right at the beginning, and so that the parents can then plan and use the time optimally. Because the last thing you want, for example, is for a parent to use up the 37 weeks and, then, on the 38– week, the cancer in a child comes back and you have another very intensive period that you need to have a significant amount of flexibility.

* (14:50)

And I would suggest that, if this is not adequately covered in this legislation, that there be an amendment. And if it can be covered in regulations, that you have some consultation with professionals who are in this area so that you can, in fact, make sure that it is optimum for parents of children who may be very seriously ill. That the–and it's not just with cancer. It may be with other illnesses that–they can be very serious, and the treatment may work for a while or there may be–not only a relapse, but a child, for example–I can give you a child who's now grown up and is a woman: when she was very young and she had a condition which left her in a very disabled state and that she had during her early years several bouts when she was very, very severely ill and could, in fact, have died, but these were not all in one 37-week period. They were at this time, you know, and then maybe a couple of years later and then maybe three or four years later.

But there needs to be a level of flexibility, I believe, if this is going to work well. And that level of flexibility needs to be very clear in the rules, but it also needs to be made very clear to the parents when the child first gets sick so that they can plan adequately and know how best to use this type of a leave. It's not like a maternity leave where you have–a child is born and then you have a certain period of time, but this can be a, certainly, very on-again, off-again process, and the legislation and the regulations, I believe, need to recognize that very well.

I think that the situation with the death of a child–now, I've certainly got a lot more familiarity with the death of a child from cancer than from a child who has died after murder, but what I would say to you is this: that the parents may go through periods when they are, you know, just really consumed by what has happened to their child. And I think what is good is to have the longer period in this circumstance. But again, it may well be that this can be a–somewhat intermittent when the parent has these periods when they are totally consumed by what's happened to their child and they're really unable to work. And so I think, again, there should be some level of flexibility in these circumstances as well, and I think it would be important that that would be there.

The second aspect which I think may need a little bit of clarity, the–in sections 59.8(2) and later on in 59.9(1), where we have the definition of the employee who is entitled to leave under the section, part (a) says, a parent of the child. Now, I'm presuming, but I may be wrong, that this is a biological parent of a child that the minister is referring to, and if that's the case, maybe that should be there.

If that's not the case, it seems to me that the (b), (c), (d) and (e) spell out most of the tie–instances where we're dealing with non-biological parents, but there would be some special interest–incidences, certainly, I would suggest, and perhaps refer this to the minister. For example, where you have a surrogate mother who would be a biological parent in certain circumstances, and where does this precisely fit in and who has the lead? And what–and with these sorts of things need to be thought through ahead of time because of the variety of families that we have now. And I think that it needs to be clear and that there shouldn't be, you know, uncertainty here in these definitions.

So I suggest to the minister that whether it is in the bill itself or is in regulations that there needs to be a little bit of additional clarity in terms of ensuring that you have the parents covered or the other people who we're looking at in terms of the guardian or foster parent, the person with whom the child has been placed for the 'pursopses' of adoption, et cetera. And one presumes, but–you know, that this applies to all who may be parents or involved in this circumstance. So that in–or for an individual child, there could be in some circumstances where you've got parents, presumably biological parents, the spouse of–where the parents are divorced, you may have two spouses of parents, you could have–where a child has been–has biological parents and there's been a divorce and there's two spouses and two biological parents and then the child has been adopted, you could have a fairly–a fair number of people who might be eligible to apply for leaves under the circumstances.

I don't have a quarrel with making sure we're inclusive, but I just want to make sure that the intent is clear in terms of what I presume is the minister providing that each and every one of these people in a particular circumstance would be able to have such leave.

I am fully supportive of this legislation. I think it's an excellent and worthwhile idea. I know that it's complementary to legislation which is coming at the federal level. And I'm certainly willing to work with the minister and others to get this passed as soon as possible. But I look forward to people who may come and present tomorrow. I believe it's going to be at committee stage, presuming we pass this, and I look forward to the ongoing discussion in having this in law as soon as possible.

Thank you, Mr. Speaker.

Mr. Kelvin Goertzen (Official Opposition House Leader): Mr. Speaker, our critic will have more comments to put on the record on third reading on this bill, but at this point we're prepared to move this committee–to committee in an expeditious fashion.

Hon. Nancy Allan (Minister of Education): Oh, sorry. Sorry.

Mr. Speaker: Is the House ready for the question?

An Honourable Member: Question.

Mr. Speaker: The question before the House is Bill 3, The Employment Standards Code Amendment Act (Leave Related to the Critical Illness, Death or Disappearance of a Child).

Is it the pleasure of the House to adopt the motion? *[Agreed]*

House Business

Hon. Jennifer Howard (Government House Leader): Mr. Speaker, on House business.

Mr. Speaker: On House business.

Ms. Howard: Would you please canvass the House to see if there's leave for the Standing Committee on Human Resources to meet concurrently with the House starting at 11 a.m. on Tuesday, December 4th, 2012?

Mr. Speaker: Is there leave of the House for the Standing Committee on Human Resources to meet concurrently with the House starting at 11 a.m. on Tuesday–tomorrow, December the 4th, 2012? *[Agreed]*

The honourable Government House Leader, on House business.

Ms. Howard: On House business, I would like to announce that the Standing Committee on Human Resources will meet on Tuesday, December 4th, 2012, at 11 a.m., to consider Bill 3, The Employment Standards Code Amendment Act (Leave Related to the Critical Illness, Death or Disappearance of a Child).

Mr. Speaker: It has been announced that the Standing Committee on Human Resources will meet tomorrow, Tuesday, December the 4th, 2012, at 11 a.m., to consider Bill 3, The Employment Standards Code Amendment Act (Leave Related to the Critical Illness, Death or Disappearance of a Child).

*** * ***

Mr. Speaker: We'll now proceed with Bill 12, The Community Schools Act.

***** (15:00)

Bill 12–The Community Schools Act

Hon. Nancy Allan (Minister of Education): I move, seconded by the Minister of Family Services and Labour (Ms. Howard), that Bill 12, The Community Schools Act; Loi sur les écoles communautaires, be now read a second time and referred to a committee of this House.

His Honour the Administrator has been advised of the bill, and I table the message.

Mr. Speaker: It has been moved by the honourable Minister of Education, seconded by the honourable Minister of Family Services and Labour, that Bill 12, The Community Schools Act, be now read for a second time and be referred to a committee of this House.

His Honour the Administrator has been advised of the bill, and the message has been tabled.

Ms. Allan: The transformative power of education in schools is well recognized and documented. This power works best when students and families are positioned to take full advantage of investments in our public education system and the rich learning opportunities that it offers to all students.

Some students and families, however, are unable to take–make maximum advantage of these educational investments and opportunities due to a variety of personal, family and community circumstances, sometimes related to health, mental health, food and nutrition, and poverty. These circumstances can impede attendance, learning and high school graduation. They can also create challenges beyond what schools can be expected to handle alone.

The community school philosophy and way of practice provides an integrated response to address these challenges. With this approach schools serve as hubs of educational, social, recreational and cultural activities and interagency outreach services, deploying community, government and corporate resources to help students and families overcome barriers to learning so they can achieve success and participate in our economy.

Since 2005 the government of Manitoba has supported the expansion of schools adopting the community school philosophy and model in urban, rural and northern sites throughout the province. To date, there are 29 schools in 14 school divisions who have reported a variety of positive responses about the impact of this strategy on students and their families. This act will further strengthen community schools programming throughout the province by establishing an operational infrastructure. It will better assist schools in forging partnerships, mobilizing and leveraging resources and accessing training, thereby giving every student the best possible chance to succeed.

Bill 12 outlines the key features of a community school philosophy and model practice, including the various types of supports that may be required to overcome impediments to learning and assist students' success in school. While this approach is an asset for any community, the most significant value and impact occurs in vulnerable neighbourhoods with very diverse and sometimes vulnerable populations.

Consequently, Bill 12 calls for the establishment of the community schools program that will be comprised of schools serving socio-economically disadvantaged communities. As part of the legislation, schools participating in the program will be required to an–assign an employee to act as a community liaison at the school. This role helps to fulfill the essential function of developing and co-ordinating partnerships and mobilizing resources that align with the needs of students and families and the school's core 'instructural' programing.

This bill also calls for the establishment of the community schools unit and lays out the unit's responsibilities related to the provision of support to participating community schools.

I'm also pleased to add that this bill will establish a community schools network. The network will provide any public school interested in exploring the community school model and philosophy of practice with access to planning information, tools, study sites and a range of professional learning and training events and opportunities. The community schools unit will co-ordinate and maintain the community schools network.

The bill will establish a deputy minister's committee on community schools to provide overall direction to the program. Working collaboratively around a common agenda, the committee will help to provide timely responses to emerging issues, more effective policy and program alignment, efficient use of resources and stability for the long-term partnership development. A community schools advisory committee, also set out in the bill, will further strengthen the work of the community schools unit and the deputy minister's committee by providing guidance around program planning and the identification and provision of community assets and resources.

The Community Schools Act will help schools to better support students' educational success, break–build stronger families and improve communities all across our province.

Thank very much, Mr. Speaker, and I encourage all members to support the passage of Bill 12.

Ms. Melanie Wight (Burrows): Mr. Speaker, I am honoured to be here today speaking on Bill 12, The Community Schools Act, and I'm proud to be part of a government that has the vision to have come up with this originally and looking at schools as a community centre almost.

And it's just–I have one in my area, and it's called the Elwick village Community School, and the principal there is a woman by the name of Verland Force–and that, Mr. Speaker, is a fabulous name for her because she is completely a force in that community and a force for good along with all the people that work with her. And that school is the perfect description of a hub. It is just always full of activity and fabulous things going on in the community, and it has become a place of real trust for the community and it's a very diverse community.

So building trust within the community groups and all the different combinations of people that happen to live there hasn't been an easy thing, and I think that that–making that school a community–of a community school has really worked towards that goal of having everyone in the community working together for the betterment of the kids in their area, and it's pretty impressive.

We have, I think, spent about $841 million in public schools, in capital in schools, and so I think it's so important that we really be making use of those assets, Mr. Speaker, to their fullest. And that is a piece of what this act is about. It helps our schools really reach out to the communities. This one's going to include having a liaison worker assigned who's going to be working to do that, to really be reaching out and making sure that those assets that Manitobans have invested in are being fully used.

They're not just being used from 8 o'clock in the morning 'til 4 o'clock in the afternoon. They're going to be used in the evenings and on the weekends, and I just can't think of a better way to make use of those buildings to be reaching out to our kids in that way.

And it's going to be for so many different things Mr. Speaker. It's not only, you know, reaching out in the area of sports, but it also is adult literacy programs, and I know we have those happening in schools in my community in The Maples. They have them in their school and other different areas where we have adult education going on. We have health and mental health services happening in there, early childhood education programs. Well, of course, you're aware that all the new schools that are built in this province now include early childhood education programs, and we can't stress the importance of that.

And I'm really proud to see that we are a Province that has not been cutting our education. I was just at a meeting last week with one of the school divisions and they were sharing some of the information of what the other provinces are doing. And they have made some significant cuts to education in various provinces throughout Canada. I'm very pleased to see we're not doing that. One of them was they cut kindergarten completely out of the program, and in a time when we are learning more and more and more how important early childhood education is to the future of our children, I'm certainly pleased to say that I'm in a province where I don't think that will ever happen as long as we're in government. And it's just so important to me and to Manitobans.

***** (15:10)

I'd also like to mention just some of the things that we've done, in addition to this, that show our commitment to the children of our province. And one of my favourites is the K-to-3 classroom sizes because that is one where we know the effects of that added attention and how important it is to the future success of our children. And so, I think it's an investment where we're going to see returns well beyond anything that we can imagine as we start doing those kinds of things in education.

I love the legislation to keep kids in school until they're 18, Mr. Speaker. I think it's just tremendously important, again, to the future of our youth and really helps people find creative ways to work with kids and find what their area is that they're going to really excel in, and I think keeping them those extra years is really, really 'verly' valuable.

So, I would just like to again state how excited we are about this act, and pray it will go forward.

Thank you, Mr. Speaker.

Hon. Kevin Chief (Minister of Children and Youth Opportunities): Just like to say it's an honour to put a few words on the record on The Community Schools Act. There's a–there's, of course, many things I could talk about of the importance of the–of a community schools, but there's a–three, in particular, that I'd like to highlight and share. We, of course, are seeing how incredibly diverse classrooms are becoming, how incredibly important schools are becoming, particularly for young people that come that have, maybe, socioeconomic barriers, who maybe are–who are new to our country, new to our province. And, you know, schools have become a real hub of activity and a place where, you know, families really feel a strong sense of belonging.

And as we look at the importance of schools in our community, teachers and educators and people that work in our communities talk about the importance of young people being able to connect in–with a enriched curriculum, Mr. Speaker, and how important school projects become. So, you know, point 1 is when we have community schools that reach out to the community and bring people in. I think a really good example of that would be the emphasis that we put on the Aboriginal Academic Achievement Grant, where performers can come in, where storytellers can come in.

You know, we can find ways in which to enrich the curriculum. Another good example of that would be in a local school that is a community school working really closely with the University of Winnipeg on a program called the Eco-U on campus, where grades 4, grades 5, grade 6 students actually go on campus and learn science by tenured 'facuty' professors, Mr. Speaker. A lot of them first time being on campus, and they're learning science by professors. This is a really great example of how schools can do outreach with, you know, local and post-secondary institutions. In fact, they–we–we're able to coin a phrase called, a tap on the shoulder, which basically says that all young people, regardless of their background, regardless of they come from, that they should get a tap on the shoulder to say post-secondary is for you. We're not waiting 'til, you know, grade 9, 10, 11, 12 to give young people a tap on the shoulder; we're starting that at grade 4, starting that at grade 5, starting that at grade 6, so that teachers and educators can work in partnership with non-profit organizations in partnerships with our post-secondary. So we're able to enrich the curriculum, highlight some of the very unique things going around and–with school projects on highlighting diversity.

Number 2, the other thing that community schools really puts a lot of emphasis on is this idea for unique programs. Someone like myself, Mr. Speaker, when I was in school, I had a natural draw to sport, and so I was able to, you know, join the cross-country team, the volleyball team, the basketball team. And so there was a natural structure there for me to participate in because of my love for sport. But for a lot of young people that may have low self-confidence, low self-esteem, that might not've had the enrichment opportunity because their mom and dad might not've been able to afford to put them in, they need some unique programs to build their self-confidence and self-esteem. And we're seeing how much work that we're seeing around, you know, cultural programs, recreation programs, leadership programs and a lot of that exists in the community. Now, often what can happen is we want to make sure that young people that are in school can connect to those programs, and school and these partnerships, the community schools, can start connecting these programs with schools, Mr. Speaker.

You know, I was just very proudly able to announce our After School Leaders program. It's a great example how–of how Community Schools Act is going to be very supportive. You have a private sector, the Winnipeg Jets True North Foundation, working in partnership with the Winnipeg School Division, in essence to start five local high schools puts an emphasis on mentorship, leadership, you know, employment opportunities. There is a big impact on that work in the classroom because it's a partnership with the schools, Mr. Speaker, and the big thing is is that we're starting to connect these things. We understand that young people that are involved in positive things outside the 'clashroom' has a direct impact on what happens to them inside the 'clashroom.'

The community schools are saying that it's a great hub of activity to take a non-profit organization, a private sector organization, and match it up with what's going on in the schools. When you have administrators, principals, vice-principals, you know, promoting the idea of schools, the idea of community to teachers, teachers promoting that to their students and then students promoting that to their families what you do is you do get academic achievement, you do increase the ability for young people to learn, develop and grow. And so, when we're able to provide these unique programs what ends up happening, Mr. Speaker, is young people, through their communities, start develop a level of self-confidence and of self-esteem that they start to try out for school sports teams, they get more involved in leadership, they get more involved in cultural programs connected to their school community. So being able to bridge that gap is going to support some of the young people who may be, at times, struggling to have that self-confidence to try out for mainstream school activities.

And No. 3, Mr. Speaker, it puts a lot of emphasis on the idea of parents, caregivers, people who really care about their children or care about children doing well in school. We understand how important it is to make sure that, you know, parents are going out to parent-child–parent-teacher interviews, they're involved in their child's educational career. And sometimes there needs to be some additional outreach. Sometimes there needs to be some additional support. Sometimes barriers need to be removed to help with that. Some of our parents, some of our grandparents don't always have the best experiences at school when they were young. And so, the idea of community schools is going to help parents and caregivers and older brothers and sisters and aunties and uncles get a sense of belonging within the school community.

You know, some of the other pieces why this becomes so important, Mr. Speaker, is that we want to make sure that young people in our province that we're able to develop their talents, develop their gifts. A great example of this is is I always share the story of I Love to Read. And, you know, I Love to Read is one of these things that we do together in the country where we get role models to come out and read to children, and the idea is that you can read to kids and you inspire them to want to read and the idea of a role model is anyone who can create and influence change–that's what a role model is. And so, one of the things we do in public ed every year in February is we get people to come out and do I Love to Read. I'm a former basketball player, and so I always used to get asked to do this as a basketball player. Now, being in politics, of course, and being someone who worked in the community, I always get asked to go and read to kids and tell them how important that is.

Well, every year, Mr. Speaker, I always bring a young person with me. This past year, I brought a young girl–she was 14 years old. Her name is Jessica. She runs–she looks after young people as part of summer employment. And I got to read to some students, and I got to read a book and I brought Jessica to read a book. And we both read to these kids.

The great thing is about when you read to children, grade 1s, grade 2s, grade 3s, they all sit down and you read to them and you ask them do you have any questions after you're done reading. All their hands go up. They all have questions for you. Often, they don't ask you questions anything to do with what you read to them, but they got a lot of questions for you. So I read the book because I was invited as the role 'moder'–role model, and I brought Jessica with me, who's 14, so we asked all the kids: You have any questions? All the hands go up. Eight out of 10 questions, they don't ask me; they ask Jessica. And they ask Jessica because she's younger, because they see Jessica as someone they can relate to. Now, if a role model is anyone who can create, influence change, well then who's the more effective role model, me or Jessica? Well, clearly these kids are asking her because they look up to her. That's how you create and influence change.

***** (15:20)

Community schools, what it does is it gives Jessica the structure to be able to inspire children to read, to inspire young people to do good things, to do positive things. What it does is it removes barriers for Jessica so she can actually go out in the community and develop her skills and develop her talents. It also is going to allow young people like her, through a variety of activities and initiatives, to give back to her community. And I've said here many times that we should be defining generosity by not how much money you have, but your ability to give up something that means a lot to you: your ability to give up time. And there are thousands of young people in our province, Mr. Speaker, who may not have a lot of money, but they're always willing to give up their time. They're always willing to volunteer. They're always willing to do things to make their community better. This–The Community Schools Act will allow young people to be able to do that.

What it does is it not only builds a strong structure for people to do that, Mr. Speaker, but it puts in good supervision. It puts in that type of mentorship we need. You know, teachers are some of our most powerful role models. So the supervision is there. It also is going to build skills of young people. That's the importance of mentorship and leadership and those types of things.

Mr. Speaker, so I'm very proud of the commitment of our government on The Community Schools Act. I know that it's going to continue to build a lot of partnerships. It's going to maximize the services and resources within our neighbourhoods and our communities. It's going to support young people who may have barriers, particularly young people who come from backgrounds of, you know, low socio-economics. And so very proud of this bill that I'm proud to be able to stand and put a few words on the record.

Thank you, Mr. Speaker.

Mr. Matt Wiebe (Concordia): I'm thrilled to stand to speak to Bill 12 and to this exciting piece of legislation that we're moving forward with. So I'm also very proud to be following the Minister of Children and Youth Opportunities, and I think some of the points that he made with regards to the work that he's doing in his department and the initiatives that they're taking and how that fits in with this particular piece of legislation, I think, is exciting work. And I think there's a lot of opportunities there that we need to explore.

I don't think you'll get much debate on the idea of education being an integral part of our success in this province and an integral part of how we see our future going forward, but it is interesting to note that we're putting in the investments necessary to see those things through. And there certainly was a time when that was a very different story here in Manitoba, but I digress and I won't get too far down that road.

But I do want to, in particular, speak to this bill, because it's something that I do have knowledge about and some experience with, the community schools model, and it's a model that I've seen in action and I've seen how it can affect families and how it can affect the students and really change how a community sees itself and how it can see itself moving forward and how it can see itself building it–going into the future.

In my community I have a community school, and it's a place where we have some of the best educators. We have some of the best programming, and with the community schools framework around it are able to connect those resources to, frankly, the kids in my neighbourhood that do need it the most and the families that need it the most. It's really building a hub and it's building an access point for families and for students that, you know, frankly we sometimes think that the programming that we do, you know, it fits a certain need or it fits a certain segment of the population. But sometimes they have trouble accessing that and I think that's what the community schools–this is where it's been unique and successful in that it brings those programs down to the level of the folks in the community.

So, you know, the students are already spending their time in the classroom and in the school setting, and by offering those programs to the students and through the students to their parents makes all the difference for how the folks in the community can then see that programming.

And, again, you know, I talk a lot about the idea that we sometimes as legislators are at 30,000 feet, you know, and we're looking at the community and saying, well, this is a good program; this fits this need and this will address this particular problem. But unless that actually connects with families and that actually connects with the people that need it, we're not going to be successful.

Mr. Mohinder Saran, Acting Speaker, in the Chair

So I think that's what's the key in this particular legislation and how it will be successful going forward. You know, we talk about how the programming–how the–we want to connect folks to the programming, and it's not just, you know, what's happening in the classroom and it's not just what's happening even before and after school, although those are very particularly important programs. But it also connects people with adult skills training. It connects people with the financial literacy training that's so important, to nurse practitioners and to the health of the community, and it really gets them to the level where they can start seeing how they can help their own community and they can feel strong and they can feel a sense of identity.

One of the most successful programs in particular in my neighbourhood has been–it has an Aboriginal focus and it's been connecting the parents and the students with teachers around that–around their Aboriginal heritage, and it brings them together, allows them to discuss issues in that context. It allows them to feel community and build community based on that common thread, and it helps them develop what our programming will look like going forward. So we're getting feedback from what's happening on the grassroots level and it's coming back up into the programming, and we know that this is stuff that's working and it's working to make the lives of families better.

But, you know, I think really what the purpose of this legislation is, is to say that this is just the beginning, that we've seen how it can work but that there's so much more potential, and so I'm so proud to see that we're putting the resources in that will make that difference, that we see that it will go to the next level, that we will have dedicated folks within the schools to see this programming connected, and also an oversight–a general oversight to get this programming, continue it and to make it–keep it going forward.

So, with those few comments, Mr. Speaker, I appreciate the opportunity to speak to this legislation, and I commend the Minister of Education (Ms. Allan) on her initiative in bringing this forward and on continuing to move Manitoba forward in this regard.

Thank you, Mr. Speaker.

Mr. Kelvin Goertzen (Steinbach): I move, seconded by the member for River East (Mrs. Mitchelson), that debate now be adjourned.

Motion agreed to.

The Acting Speaker (Mohinder Saran): Now we are going to move the Bill 9, the Teachers' Society amendment, second reading.

Bill 9–The Teachers' Society Amendment Act

Hon. Nancy Allan (Minister of Education): I move, seconded by the Minister of Entrepreneurship, Training and Trade (Mr. Bjornson), that Bill 9, The Teachers' Society Amendment Act; Loi modifiant la Loi sur l'Association des enseignants du Manitoba, be now read a second time and be referred to a committee of this House.

Motion presented.

***** (15:30)

Ms. Allan: The Manitoba Teachers' Society has requested of government that certain amendments be made to The Teachers' Society Act. This request came to government following the society's most recent annual general meeting where proposed changes to the legislation were discussed and endorsed by their membership.

Mr. Speaker in the Chair

While it is important to note that the changes in the bill do not impact the department's responsibility for the certification of teachers–in other words, the authority to set the requirements necessary to grant a licence to teach as well as to remove that licence in appropriate circumstances–they do enhance the capacity of the society to perform its critical function of establishing, maintaining and enforcing standards of professional conduct and a code of conduct for its members. The changes to the legislation expand the range of penalties for members who, following an investigation and hearing, are found to have engaged in unprofessional conduct or conduct unbecoming to a teacher. In addition to the current provisions enabling the review committee to admonish or censure a member or recommend to the minister that the member's teaching certificate be suspended or revoked, it can also direct that a teacher be suspended or terminated as a member of the society or impose such other penalty as the bylaws of the society may prescribe. Importantly, the bill also sets out that the society, again, through its bylaws establish a process whereby a teacher whose membership has been terminated may be reinstated.

To this point, the cost of an investigation and hearing on an allegation of unprofessional conduct have been borne entirely by the society. The society has expressed the view, supported by its membership, that if a teacher is proven to have engaged in unprofessional conduct, it is reasonable for that teacher to bear some portion of the costs if so ordered by the review committee. Therefore, the bill enables the review committee to order the payment of costs up to a maximum of $5,000. Further, if it becomes necessary to do so, the bill allows the society to file an order for payment of those costs in the Court of Queen's Bench, which then allows for enforcement of that order.

I support the society's request and believe the changes are reasonable and sensible. Parents, students and community members and, of course, teachers themselves believe that high professional standards are critical in the vocation of teaching. This bill enhances the capacity of the society to address issues of unprofessional conduct in a more comprehensive way. The government supports this endeavour and commends the Manitoba Teachers' Society for taking these important steps to ensure the highest professional standards. I recommend to the House that Bill 9 be supported and passed.

Thank you very much, Mr. Speaker–Deputy Speaker.

Mr. Kelvin Goertzen (Steinbach): I move, seconded by the member for Midland (Mr. Pedersen), that debate now be adjourned.

Motion agreed to.

Mr. Speaker: We'll now call Bill 14, The Education Administration Amendment and Public Schools Amendment Act (Parent Groups for Schools).

Bill 14–The Education Administration Amendment and Public Schools Amendment Act (Parent Groups for Schools)

Hon. Nancy Allan (Minister of Education): Mr. Speaker, I move, seconded by the Minister of Finance (Mr. Struthers), that Bill 14, The Education Administration Amendment and Public Schools Amendment Act (Parent Groups for Schools); Loi modifiant la Loi sur l'administration scolaire et la Loi sur les écoles publiques (groupes de parents œuvrant en milieu scolaire), be now read a second time and be referred to a committee of this House.

Motion presented.

Ms. Allan: Education is critical to the future success of our children and our province, and we all collectively play a part in it. No one, Mr. Speaker, plays a more important role than that, of course, of parents. Parents act as first teacher and because of the bond which they share with their children are intimately invested in their educational well-being. Studies have shown that children perform better academically when their parents are active and supportive in their children's school and in their learning. Support for the classroom teacher and school administration, advocacy as appropriate, and participation in school-based decisions through parent groups are all ways in which parents shape and improve the learning experience of their children.

Bill 14 addresses the formal role parents can and do play in schools. To begin, the bill recognizes the Manitoba Association of Parent Councils, MAPC, as the representative organization for school-based parent groups for school divisions other than the Division scolaire franco-manitobaine, the DSFM. The Fédération des parents du Manitoba, the FPM, is the organization representing the interest of parents in the francophone community. I am very pleased to make reference in legislation to MAPC, as this organization has, through the dedicated efforts of its executive and administrative staff, expanded its number of member schools, provided helpful resources to parents, given constructive advice to parents through its advocacy project and been an important resource to me in helping inform my perspectives and decisions related to the K-to-12 public education system.

I'd like to express my thanks to the president of MAPC, Judith Cameron, her executive and the executive director, Naomi Krause, for the ongoing good work of the organization. This bill will set out the requirement of the minister to meet with MAPC at least annually, something which I enjoy doing every year.

I must also say how appreciative I am of the contributions that MAPC makes at the provincial oversight committee. Along with all of our other education stakeholders, MAPC's perspective has been so helpful in our deliberations regarding the new provincial report card that has been just sent out to all of our schools for the first time in the history of this province. And I have to tell you, the feedback that we are getting back on the provincial report card is wonderful at best. At–they are also sitting on our committee now to help us in our deliberations around the kindergarten to grade 3 class-size initiative, and I know they will make a huge contribution as we move forward with the–our class-size initiative.

Bill 14 also formalizes at the school level the role of the parent council in the development of the annual school plan. Where a council exists the principal of the school will consult with that group on the plan's preparation. The bill so–also sets out the role of the principal in providing to parents information on the role and function of parent groups, the manner in which one may be established and the right of parents to become a member of such a group. I am gratified by the knowledge that this already happens in many of our schools, with principals taking a proactive approach in providing information to parents and encouraging their participation and support.

Mr. Speaker, children do better in school and our education system is strong when parents are actively engaged as partners in education. This bill recognizes the good work of MAPC in supporting parents at the school level and encourages greater parental involvement. And I am pleased we are debating this bill on the very day that my colleague the MLA for St. Norbert did a member statement recognizing the Chancellor School Advisory Council for their contribution to the enhancement of the education experience. When parents are involved in their schools, everyone does better.

I support wholeheartedly the amendment sent out in Bill 14 and recommend their passage to this House. Thank you.

***** (15:40)

Mr. Dave Gaudreau (St. Norbert): Well, Mr. Speaker, it's a great pleasure to rise today in support of this and to talk a little about parent advisory councils.

Earlier on today, I had a member from my parent advisory council from Chancellor School here in the gallery and was able to present her with a nice plaque on the words that I spoke about, how important the parent advisory councils are in our area.

Last year, parent advisory council at Chancellor, they raised money to create an accessible playground for some of the children in the area who are bound to wheelchairs. So that council has taken on roles in the community of looking at what is good for everyone and they're teaching social responsibility to their children who go there. And they involve–not only did they involve the school administration, they involved all the children in the school in this project, too. So the children are learning that there's great things that can be accomplished when we all work together.

I also want to recognize that Bonnycastle School, which is in my area, has another fantastic parent advisory council. And through the work that I've been doing with them and they've been doing with the school division and the school, we had a great announcement a few weeks back with the Education Minister and the Premier (Mr. Selinger), so we're going to be doing a eight-classroom expansion, which is a part of our commitment towards lower classroom sizes on the K-to-3 initiative. And we're also adding into that, we're adding a daycare facility–74-seat daycare facility in the area, which is a fantastic announcement for the area and for the school.

And all of that is made possible through partnerships with these advisory councils letting me know and letting the trustees know what's needed for the area. So these councils are very important for all of us.

I have another great council in the area at Parc La Salle School, and this weekend I had the honour of working their breakfast with Santa. I worked the door and sold tickets to everybody as they came in and had breakfast with Santa. And all of the kids of the area come and get to sit on Santa's lap and get to tell him what their wishes are for Christmas. And that advisory council is so active in their community and they raise money every year for great projects like a gardening project that they're going to be doing this next summer. That council is one of the fun ones that I get to work with in the area.

Also La Barriere Crossings, their advisory council there, the principal there meets with everybody once a month and asks the parents what they'd like to hear on topics that are related to the school. And every month she presents them with things that are going on in the school. Great information for the parents and for myself to hear, in the school and in the community.

So these kinds of groups are really important, and I'm confident that the opposition is going to come forward and support this because they had that speech about how great volunteers are and how, you know, they were pointing out all the volunteer organizations in our communities and how much money they've raised and how fantastic it is that we have all these organizations and all these volunteers. So these parent advisory councils are just another step–they're another part of all these volunteers that do great work in our community.

Now, it's interesting because today in the paper we reported that they're having–themselves, having trouble finding volunteers for any of their stuff. It doesn't seem to be that way in the Pembina Trails School Division; we have fantastic volunteers that come out and all of the school division volunteer groups are fully–every seat is fully filled and they're a fantastic group of people. So, maybe I'll work together with the opposition and see if some of those members can come out and work with them to do some of the literature jobs that they're desperately needing.

But, you know, I just think it's very important that we recognize that these people are absolutely the cornerstone of our schools, and working with them and the parent advisory council and the principals, and all of the vice principals and all of the teachers in the school, we can make the–great things happen.

I mean, if you look at what our policy has been over the last 12 years, we've been growing schools. We're–actually had a great announcement where a school is going to be built in the Leader of the Opposition's riding. It's too bad he didn't attend, but I was there, because, you know what, it's important for Manitobans; it's important for everybody. So, you know, I decided to attend even though that he decided not to be there. We're going to be putting $28 million into a school in the opposition leader's–of the opposition's riding. I think that just shows what caring and great education system we have.

We're also going to be building a new school at some point in the future in Bridgwater–point–sorry, Pointe West area. And–you know, and I'm committed to working with the community on that.

And we're going to move along and keep building towards new schools and education, as opposed to in the '90s when we saw rollbacks of 6.6 per cent, Mr. Speaker–6.6 per cent rollbacks. Schools were, you know, being closed, education was not important. So, you know, if we want to do a contrast, I'm sure that the Leader of the Opposition will stand up and support this bill, even though he didn't stand up and come out for his community on the day that the announcement was made for a record investment in his community of $28 million in a brand new school. Which, Mr. Speaker, I might add, also includes another 74 daycare spots, which is a total of 148 new daycare spaces in our area, partnered with education. *[interjection]* Thank you. This is fantastic news for the south area of the city, and, you know, if the member for the opposition, if the leader, doesn't know about these things, I'm glad to inform him because I go to those meetings. I can totally tell him anytime something like this comes up. Glad to work with him, you know. *[interjection]* Yes, it's fantastic, Mr. Speaker.

We're not–you know, we're not cutting things. We're actually building our province. We're growing on education. We're growing the capacity to teach our kids. We've got great things going on, and these parent advisory councils are just one other aspect of how we can all work together to make our communities better. And every one of these councils in my area is fantastic to work with. They are all have such a commitment to the school and to the education of their children. You know what? Some of the students as they move along to other schools their parents still sit on those councils because they believe so much in what is going on in the community. So we have to give them absolute credit for being there all the time even once their children have moved along to other schools.

So it's with great pleasure that I stand up here to support this parent advisory council bill. And I think that, you know, one of the greatest things that we do in our society is educate our children, and it's towards the future of everything that our province is building for. If you look at all of our jobs that are coming up, all of the economic growth and development, all of this stems back from the fantastic education system that we have and how we're going to train those workers for tomorrow. So, with that, Mr. Speaker, I support this motion and I thank you very much.

Mr. James Allum (Fort Garry-Riverview): It's always an honour to get up and speak in the House, and it's always an honour especially to get up and speak in support of bills aimed at education in our province. And I'm honoured to work with the Minister of Education (Ms. Allan). She is a change agent for a progressive education system in the 21st century here in Manitoba, and Bill 14 is just one example of many examples that we will bring forward–certainly, talk about–myself, in the next few minutes, about our government's contribution to education in Manitoba.

Now, I think I've told the House about all they really want to know–all they want to know–about my own educational background. I did end up spending a lot of my teenage years and then my adult life in academic institutions–was lucky enough to get a Ph.D. and also lucky enough to do that when I was raising my own three kids. I come from a school of teachers–a family of teachers, Mr. Speaker. My oldest sister, who's almost 14 years older than me, was teaching grade 1 when I was in grade 1 and so that was always useful; I actually brought her home information that she could use in her own classes that I'd learned that day myself. Also, my older brother taught English in southern Ontario for nearly 30 years and is a fantastic teacher. And then I'm also proud to say that my own oldest daughter, who's now 25–I can hardly believe it, is a teacher, and she's teaching in Kuwait right now, but she's got both languages. She has French immersion; she learned that here in Manitoba's great education system. So I'm always proud to get up and speak to matters that relate to public education in Manitoba.

And when I look back at our record on education since we've been in government in 1999, I'm just blown away at the things that we've been able to achieve. We believe in a balanced approach, and I think everyone knows that. I–certain that the members opposite are becoming more and more aware of that particular phrase. They operate in an imbalanced kind of way. But funding for schools has increased at or above the rate of economic growth for the last 13 years. That's a pretty remarkable statistic considering the uncertain economic times that we live in. So that increase is all–actually over 53 per cent, or more than $411 million has been added to the public school education budget since 1999. I think that's really remarkable. And then on top of that is another $841 million has been invested in public school capital projects since 1999, as the member for St. Norbert (Mr. Gaudreau) just indicated. We continue to build educational institutions. We continue to make sure that they have child-care centres associated with them. What we want to make–do is make sure the children of all Manitobans have an opportunity to get the full value of their education.

***** (15:50)

Our grad–as a result of this investment, Mr. Speaker, our graduation rates have increased to 83.5 per cent, as of 2011, from 71 per cent in 2012, which, to help with math on that side of the House, that's a 17 per cent improvement since 2002.

But, then, if you look at those are just the statistical financial issues, then you look at sort of the quality control that also goes on in schools: commitment to reduce K-to-3 class sizes to 20 students by 2017–fantastic commitment on our part; legislation to keep kids in school until they're 18–another fantastic piece of legislation on our part, to show them that education matters and that they need to stay in school; a new parent-friendly plain language report card. And I know that when I was a parent and my kids were coming home with their report cards, and they were all doing fantastic, I'm sure, I often didn't understand what they said, so a plain-speaking, plain-language report card can only enhance parents' participation in the education of their own children.

We've come up with common in-service days within school divisions to help families co-ordinate their busy schedules; God knows with three kids, and I think others would understand that as well, we'd come home after a day of trying to organize how their life went and then we'd find out that there was teachers' day the next day and have to organize all that. So we've done practical, simple things that make–improve the quality of education on the one hand, but make life better for families on the other. And that's the whole objective.

Now, education is a–partly about making sure that we have sustainable economic growth in the future. Education is also about expanding the knowledge base among our–among Manitobans. But, more than that, education is about building citizenship, participation in the community. We're more than just taxpayers here in this province. We are citizens of a greater community, and education teaches us quite a bit about what we can do from a citizenship point of view.

So Bill 14 is in that vein. It tries to encourage a more parental participation that is already going on in schools to this day, and last week I had the opportunity to go to a Winnipeg School Division No. 1 meeting that brought parent councils together with school trustees and, frankly, MLAs from this side of the House. I don't see anybody from the other side of the House at the meeting; perhaps they were there. I know my friend from Burrows was there. It was very educational. And from–

An Honourable Member: Tyndall.

Mr. Allum: From Tyndall Park, of course, my friend was also there. We sat together with parent councils, with administrators, with teachers, with principals, and we talked just about what we should be doing to advance public education here in Manitoba.

It was a fantastic meeting and quite valuable, and I was proud to be there with my colleagues as well as members from parent advisories–councils in my constituency. And I've had the pleasure, Mr. Speaker, of going to all the parent advisory councils at the schools–I think there's 8 or maybe 9 schools in my constituency–and I'd met with these folks and I'm just in awe of the work that they do. They not only do the school lunch programs, which are fantastic from a nutrition point of view, make sure every kid's got a full belly to go on learning during the day, they do fundraising activities to support school trips and other enhancements at the school, and then in addition to that, they're all involved in school transformation, school playground transformation projects that just blow you away because it's no longer just thinking of that asphalt pad outside the school where kids are supposed to go for recess. Now we think of those as actual schoolrooms, as places to learn and to grow and develop.

And so, when I see the work of parent advisory councils and the work that they do throughout the full school day and on behalf of schools, I'm just blown away by their contribution to the welfare of our communities.

And so Bill 14 tries to enhance what's already going on. It recognizes the Manitoba Association of Parent Councils, or what we call MAPC, as a representative organization for school-based parent groups for all English-speaking school divisions, and I think that's fantastic.

In addition, it also–Bill 14 formalizes the role of the parent council in the development of the annual school plan. And so where a council exists at a certain school, the principal of the school will consult with that group on the plan's preparation, and what I really like about that is that it gets parents involved, not just in fundraising activities which are absolutely incre–important, but in terms of their participation in the annual school plan. And I think that that's just something that makes all the difference in the world. Parents feel like they're part of the school. Kids feel, obviously–are part of the school, but they feel like their parents are engaged, and it makes a real difference in the attitude that the student has each day to be willing learners.

So Bill 14–and in giving more roles to the parent advisory groups, certainly recognizes the role and function of parent groups, the manner in which they'll be established and the right of parents to become a member of such a group. And if I could make any suggestion at all, it's to make sure that more parents become part of parents advisory groups, to take full advantage of that opportunity to be an important player in what the school's doing and also to send a clear signal to your son or daughter that education matters.

Education certainly matters in this–to this government. We've been leaders, not only in Manitoba but across the country, in public education. I'm pleased today, Mr. Speaker, to stand and support Bill 14.

Thank you.

Mr. Kelvin Goertzen (Steinbach): Mr. Speaker, I move, seconded by the member for Spruce Woods (Mr. Cullen), that debate now be adjourned.

Motion agreed to.

Hon. Jennifer Howard (Government House Leader): Mr. Speaker, will you please call second readings on Bill 8 and Bill 10.

Mr. Speaker: We'll now call second reading on Bill 8, The Provincial Court Amendment Act.

Bill 8–The Provincial Court Amendment Act

Hon. Andrew Swan (Minister of Justice and Attorney General): I move, seconded by the Minister of Advanced Education and Literacy (Ms. Selby), that Bill 8, The Provincial Court Amendment Act; Loi modifiant la Loi sur la Cour provinciale, be now read a second time and be referred to a committee of this House.

Motion presented.

Mr. Swan: This bill will provide for the use of electronic documents in the Provincial Court. The Criminal Code of Canada, the federal law which governs criminal matters, allows the use of electronic documents in relation to matters under that statute, provided their use is in accordance with either the rules of the Provincial Court or an act of the Legislature. This bill will enable their use for Criminal Code matters as well as matters related to other provincial or federal enactments. This bill will support ongoing work to develop and implement an electronic system in court and eliminate most of the paper processes currently used by the Provincial Court.

Mr. Speaker, the Provincial Court is a very busy court. It handles the vast majority of charges–in fact, 97 per cent of charges moving through the criminal justice system. Currently, almost the entire process is paper-based. Moving to allow the acceptance of electronic documents in the court system will increase the efficiency of our courts, our police and other law 'enforshment'–enforcement officials and other partners in the justice system, and will continue to modernize and streamline the justice system. Eliminating paper will streamline the criminal justice system and significantly reduce its paperwork.

This amendment specifies that electronic documents may be filed with and created by the Provincial Court. The amendment also specifies that if a document is filed and is required to be signed, an electronic signature–a secure electronic signature as specified in the regulations–will be considered valid. Scanned documents can also be received and used to process matters in Provincial Court.

This is one of the many measures we're taking, Mr. Speaker, to innovate and streamline our justice system. We've worked with many partners across the system. We've assisted our police through investments in things like the police cadet program, through the helicopter, through amendments to amend Manitoba Public Insurance legislation to free up officers from having to take reports which would only be duplicated at MPI sometime later.

We've also worked within the court systems to make sure that we're getting the most we can out of the individuals who work very hard within that system. As many will know, we have a new director of innovation who's been working very hard with our partners to find different ways that we can streamline things and move things more swiftly through our justice system.

When we do things, Mr. Speaker, we intend to do them right, and we're moving ahead on this measure to reduce the amount of paper flowing into our court system, make sure that matters aren't delayed or that documents aren't misplaced. And I can advise this House, there will be many other advancements on the justice front to come, as we continue to build a better, stronger and swifter justice system.

So, Mr. Speaker, I do look forward to the support of this House in having this bill passed.

Mr. Reg Helwer (Brandon West): I move, seconded by the member for Spruce Woods (Mr. Cullen), that debate be adjourned.

Motion agreed to.

* (16:00)

Mr. Speaker: We'll now call Bill 10, The Correctional Services Amendment Act.

Bill 10–The Correctional Services Amendment Act

Hon. Andrew Swan (Minister of Justice and Attorney General): I move, seconded by the Minister of Entrepreneurship, Training and Trade (Mr. Bjornson), that Bill 10, The Correctional Services Amendment Act; Loi modifiant la Loi sur les services correctionnels, be now read a second time and be referred to a committee of this House.

Motion presented.

Mr. Swan: This bill seeks to clarify the authority to intercept, monitor and restrict inmate communications in provincial correctional facilities. This will enhance the security of those facilities while at the same time enhance public safety. Now, I know we will have the opportunity to discuss the bill in more detail at the committee stage, but there are some important points that I'd like to bring to the attention of honourable members.

Mr. Speaker, the control of inmate communications is a vital aspect of institutional security and public safety. It is necessary and desirable for incarcerated individuals to be able to maintain communications with people in the community, be they friends, family members or legal counsel.

However, it is also necessary to ensure that inmates do not use the available communications systems in our correctional centres to plan or commit illegal acts or to carry out criminal enterprises while incarcerated. Such acts, of course, could affect the security of the correctional facility, including attempts to introduce illicit drugs or other contraband into facilities, or they may be directed at members of the public, such as attempts to threaten or intimidate domestic partners, witnesses and victims. They may also attempt to contact individuals, including former domestic partners, in violation of court orders made against them, and because of this it's essential that correctional authorities have clear authority to control inmate communication.

Mr. Speaker, this bill provides corrections officials with the clear authority to intercept all inmate communications, and where reasonable grounds exist to do so to monitor and restrict those communications. The bill also describes clearly what constitutes these reasonable grounds as well as protecting privileged communications such as communications between inmates and their legal counsel from interception or monitoring.

In addition, Mr. Speaker, this bill includes provisions for more detailed regulations with respect to the control of inmate communications including the handling, retention and disposal of inmate communications as well as the various procedures respecting the interception, monitoring and restriction of inmate communications. The control of inmate communications has proven to be an effective and essential means of protecting institutional and public safety, and this bill will enhance the ability to do so.

I do want to take a minute to thank the individuals who work on our correctional system. It is not an easy job that they do. We know that there are certain challenges, and I know that our correctional officers continue to meet those challenges to a high degree of–in a very professional way.

So, Mr. Speaker, I look forward to the support of this House in having this bill passed.

Thank you.

Mr. Reg Helwer (Brandon West): I moved– *[interjection]* no, sorry. Oh–

Mr. Speaker: All right, I'm sorry, the honourable member for St. James.

Ms. Deanne Crothers (St. James): Thank you, Mr. Speaker. My apologies.

I'm happy to stand and speak in support of Bill 10, correctional services amendment. As the minister stated, this bill is designed to create greater protection for the public by preventing incarcerated criminals from continuing to harass the public from jail. As some of their behaviour has led to being convicted of a criminal offence while free, it is reasonable that we would not allow that same type of behaviour to continue while serving their time.

If there is a belief that an inmate is using a call for criminal activity or harassing partners, victims, witnesses or the general public and reasonable grounds for this have been established, corrections officials can monitor or listen in to the call. Inmates are notified that telephone calls may be monitored, however, some calls considered privileged communication won't be, such as a call between a lawyer and client. This amendment still respects the need and right for privacy, but not at the expense of a victim of a crime or abuse. And speaking of expenses, the cost associated with amendment is cost neutral.

What I find particularly satisfying about seeing this bill in the House, is that it complements our provincial domestic violence strategy so well. The work that we have done to decrease domestic violence will be enhanced by this amendment. That strategy was developed with input from province-wide public consultations. With the public's guidance and input, we have created the strategy which Bill 10 supports.

Women who are caught in a cycle of abuse with a partner, who have found the courage to press charges, may find that their abuser can continue to harass and intimidate even after they have been arrested and placed in jail. It is difficult to prove that someone is harassing you under these circumstances, and I suspect many women or victims of a crime who have found themselves in this type of situation would likely feel unable to prove definitively that this is taking place. Likely, they have simply tried to cope with it. It seems exceptionally unfair to anyone who has had the courage to stand up to an abuser or someone who has committed a crime against them, only to find themselves still burdened by their dark intentions even if they have been physically removed.

The amendment will allow provincial facilities to have a way to prove that a criminal indeed acting in a way that harms a member of the public and will allow them to stop it by being able to record and listen in on conversations. Where the criminal is co-ordinating with others to act on their demands, we create an opportunity to prove their actions and no longer allow them to continue. It will allow victims of abuse or victims of crime and the public at large to know that justice continues to function as it should for criminals even after they have been incarcerated. Those who most need the protection of the law after being a part of the process as a victim will continue to have the assurance that the person responsible for their abuse or for causing them to be a victim will not be able to continue influencing their lives.

I feel very good about being a member of a party that recognizes and acts on the needs of the public, with the public.

I hope that all members of the Legislature will support this bill. I appreciate having an opportunity to speak in support of Bill 10 and would like to thank the Minister of Justice (Mr. Swan) for bringing this valuable piece of legislation forward.

Thank you, Mr. Speaker.

Ms. Sharon Blady (Kirkfield Park): It is a privilege to put a few words on the record about Bill 10. As someone that has had the privilege and opportunity of working in the larger domestic violence prevention strategy and in the interpersonal violence and technology network, this bill is very significant in what it does for victims. And it balances the need for the privileged communication for those who are incarcerated for what–their rights, but at the same time it provides a protection from ongoing harassment and from the possibility of someone misusing the access that they have to communications to either engage in ongoing illegal activities and/or to continue to victimize members of–whether it's their own family, whether it's a variety of people that can be victimized.

And this legislation is very significant as part of the larger provincial domestic violence strategy. And as part of a multi-year strategy that has been developed with input from province-wide public consultations, research and strategy review committees, this particular piece is one more crucial piece into–in providing peace of mind for victims and giving them a layer of prevention by denying access to them. And then also, at the same time, provides a layer for justice to be able to locate and prosecute those that do engage in that kind of behaviour once they have already been incarcerated and don't necessarily realize the full consequences of their actions and feel that they are at liberty to continue engaging in such negative and destructive behaviour.

So I would just like to thank the Minister of Justice for the work that he continues to do with the Minister responsible for the Status of Women, and the entire team that has been working both in Corrections, in Victims Services, and to the many community partner organizations and shelters, because this is one more piece that helps protect women and other victims of domestic violence.

Thank you very much for your time, speak–Mr. Speaker.

Mr. Reg Helwer (Brandon West): I move, seconded by the member for Lac du Bonnet (Mr. Ewasko), that this bill referred to the committee of this House–*[interjection]*–oh–sorry–sorry, the debate be adjourned. Yes, we're corrected, Mr. Speaker–

Mr. Speaker: It's been moved–

Mr. Helwer: Sorry.

Mr. Speaker: It's okay. It's been moved by the honourable member for Brandon West, seconded by the honourable member for Lac du Bonnet, that debate be adjourned. Is that agreed? *[Agreed]*

Mr. Speaker: We will now move on with Bill 10, I believe. *[interjection]* No, that was Bill 10.

Hon. Jennifer Howard (Government House Leader): Could we move ahead with second readings on Bill 4 and then move to Bill 6 and then Bill 7.

Mr. Speaker: Okay. We'll call bills in the following order: Bill 4, followed by Bill 6, and then Bill 7, starting with Bill 4, The Personal Health Information Amendment Act.

***** (16:10)

Bill 4–The Personal Health Information Amendment Act

Hon. Theresa Oswald (Minister of Health): I move, seconded by the Minister of Justice (Mr. Swan), that Bill 4, The Personal Health Information Amendment Act; Loi modifiant la Loi sur les renseignements médicaux personnels, be now read a second time and referred to a committee of the House.

His Honour the Lieutenant Governor has been advised of the bill, and I table the message.

Mr. Speaker, I need to retract what I just said and start again. I made a mistake.

I move, seconded by the Minister of Justice (Mr. Swan), that Bill 4, The Personal Health Information Act; Loi modifiant la Loi sur les renseignements médicaux personnels, be now read a second time and be referred to a committee of this House.

Motion presented.

Ms. Oswald: When we discuss details about our own health and health care with our doctor or nurse practitioner or any other provider we have a right to know that the information will be kept confidential. Bill 4 will further strengthen The Personal Health Information Act to provide improved protection of patients' private and confidential health information. The Personal Health Information Act, or PHIA as it has come to be known, already provides strong protections for patient privacy.

Under the current legislation, Mr. Speaker, an employee can be charged with an offence and subject to a fine for wilfully disclosing personal health information without authorization. However, if they wilfully access or otherwise use personal health information appropriately but do not disclose it, no such penalties currently apply under the act. We would commonly refer to this as snooping, and, indeed, it is unacceptable.

These amendments that we're putting forward represent a response to recommendations, but made by Manitoba's Ombudsman. The Ombudsman looked at an issue because, indeed, this very situation happened: an employee at one of our organizations, our health-care organizations, accessed the personal health information of a patient when, indeed, they had no business to do so. It was a clear violation of a patient's privacy and it was unacceptable.

Once the amendments are in force, Mr. Speaker, employees will have to ensure that they have proper authorization before accessing someone's personal health information, better protecting people across the province.

In addition, Mr. Speaker, we're also making it a finable offence to knowingly falsify personal health information. This particular notion has been implemented in a few other jurisdictions and we will add this to our legislation as well, feeling that it is prudent to provide even better protection for patients.

Instituting penalties for snooping and falsifying information sends a strong message throughout the health-care system that such actions will not be tolerated. Under the amended act individuals will face a fine of up to $50,000 if convicted.

Mr. Speaker, we must, however, recognize that there are many, many instances where it does, indeed, benefit a patient for someone else to know certain details of their medical situation. Obviously front-line health-care professionals having access to information that directly affects their patient's individualized care and treatment plan is very important and we would not want to stand in the way of that kind of authorized access.

There are also a number of circumstances, Mr. Speaker, where family can and should have access to the health information of their loved ones. We know, in a modern society, that families' loved ones can be very important partners in the care of their loved one. They have critical information to provide to caregivers and in turn, can react to information when it is provided to them about the care of their loved one. We know that when The Personal Health Information Act first came into being, there was something that came to be known as PHIAnoia that developed, and that the system in some respects seized up and was very reticent to share information, even when the sharing of that information was very appropriate and would have resulted in better care for a patient.

We did a lot of work with patient safety advocates, Mr. Speaker, and amended The Personal Health Information Act some years ago to clarify and address what I believe was always intended with the original legislation, thus making it sure that information was protected but indeed that family members and other appropriate individuals would have access to information when it could enhance the care of an individual.

So, certainly, I agree wholeheartedly with what the Ombudsman has suggested to us, which is why we're bringing forward these amendments today, to protect against snooping and against falsifying information, but we want to make sure that we also send an equally strong message, that we need to be partners and we need to share in the responsibility of caring for our loved ones, and that in no way will these amendments cause us to retreat to a time when information was not shared when appropriate.

So with those few words, Mr. Speaker, I recognize the need for protecting that which is most sacred to us, our most private, intimate and personal health information and the details therein, while at the same time ensuring that patients in our facilities get the best possible care from a united, cohesive, collaborative and co-operative discussion about that person's care. Thank you very much.

Mr. Speaker: Any further debate on the legislation? The House ready for the question?

Some Honourable Members: Question.

Mr. Cameron Friesen (Morden-Winkler): Mr. Speaker, I move, seconded by the member for Brandon West (Mr. Helwer), that debate be adjourned.

Motion agreed to.

Mr. Speaker: We'll now move on with Bill 6, The Highway Traffic Amendment Act (Flexible Short-Term Regulation of Vehicle Weights and Dimensions).

Bill 6–The Highway Traffic Amendment Act (Flexible Short-Term Regulation of Vehicle Weights and Dimensions)

Hon. Steve Ashton (Minister of Infrastructure and Transportation): Mr. Speaker, I move, seconded by the Minister of Local Government (Mr. Lemieux), that Bill 6, The Highway Traffic Amendment Act (Flexible Short-Term Regulation of Vehicle Weights and Dimensions); Loi modifiant le Code de la route (réglementation provisoire des poids et des dimensions des véhicules) be now read a second time and be referred to a committee of this House.

Motion presented.

Mr. Ashton: Mr. Speaker, this bill provides more flexible process for short-term variations in terms of permissible vehicle weights on our highways. I think, as members will be aware, this is a challenge at various times of the year, particularly in the spring, and what this is aimed at doing is addressing a number of types of scenarios.

When road conditions permit higher weights, such as early winter conditions, when highway upgrades are completed and emergency situations where detours are necessary due to events such as floods or landslides, and, of course, we've had a significant experience with that, just the last number of years.

Currently, highway classifications and permissible weights on highways are prescribed by Lieutenant Governor-in-Council under the vehicle weights and dimensions and classes of highways regulations; long-term classifications of permissible vehicle weights on highways will continue to be set by these regulations. However, the regulatory process can be somewhat lengthy, in terms of the implementation of increased permissible vehicle weights.

***** (16:20)

These amendments will allow the minister and his or her delegate to issue orders for temporary short-term variations to the permissible vehicle weights on highways or to highway classification. Ministerial orders can be implemented much more quickly than regulatory amendments, reducing any potential delay in the implementation increase permissible vehicle weight. The proposed ministerial order-making powers will be limited to a maximum of a two-year period. Decisions regarding the ability of a highway or a roadway to carry heavier weights will continue to be based on acceptable engineering standards and, of course, road and weather conditions.

Proposed new provisions clarify the ability for the minister and his or her designate to impose spring road restrictions by order and enable seasonal RTAC routes to be established by order, rather than by regulation.

Sessional RTAC routes or highways are currently only classified in the vehicle weights and dimensions, and classes of highways regulations, as RTAC routes from December 1st to the last day in February of every year, after which point, they go back to lower highway classification. This will give greater ministerial order powers and greater flexibility in setting the dates for seasonal RTAC routes.

I do want to note that the Keystone Agriculture Producers have praised this proposed move to a weather-based approach rather than a rigid calendar schedule.

And I know I got the attention of members opposite. I'm sure they'll want to join with us with our continuing partnership with the agricultural community and, in fact, now approaching 13 years of listening to our agriculture community, because I can indicate that this has been a significant concern with our ag producers. They asked for it and we are delivering, Mr. Speaker.

And I want to indicate that this is also reflective of climate change. We're certainly seeing a significant shift, and when these kind of restrictions need to be put in place, we're seeing, for example, in some parts of the province, you know, quite a significant shift to when winter begins and when spring comes. I think everybody in this province, over the last weekend, is certainly aware that winter is with us. And I think that it's important to note that we're anticipating this kind of flexibility will be needed on a greater basis in upcoming years with climate change.

And I do want to indicate that there are amendments that deal with signage, affected periods, et cetera, and there are a couple of minor amendments as well.

But I do want to just conclude by saying, Mr. Speaker, I do want to thank our trucking industry. We work very closely with our trucking industry in this province.

And I invite members to check out the new highways map, which is just one more symbol of the degree of which–*[interjection]* Yes, I was going to say, the member for Lakeside (Mr. Eichler) just may–maybe put his own picture on the back. He doesn't like the picture on the back. I know that's been a practice of some MLAs. That's fine, Mr. Speaker.

But the Manitoba Trucking Association has long argued for this. And also I want to indicate, Mr. Speaker, this is continuing with the kind of work we're doing with Saskatchewan, where we've got greater synchronization with the province of Saskatchewan when it comes to RTAC weights, both the total weight now and also our seasonal restrictions. And so I think it's something that the Manitoba Trucking Association is very supportive of. It's something Keystone Agriculture Producers played a lead role in asking for. We're bringing it in. I know *[inaudible]* will be onside.

And I look to members opposite: we might be able to make this unanimous and perhaps move it through quickly. I think it would be very useful if we could get this in place prior to next spring, particularly with a potential for early spring conditions. So I look forward to members opposite joining with us, joining with the trucking association–Manitoba Trucking Association–joining with farmers as represented by the Keystone Agriculture Producers, and perhaps, getting on board with this excellent piece of legislation, which, I think, will make a real difference for everyone in the trucking industry, many people in the farm sector, and many of the businesses that are part of our growing economy here in Manitoba.

So the time is now, Mr. Speaker, and I hope members opposite will support this.

Mrs. Mavis Taillieu (Morris): Mr. Speaker, I move, seconded by the member for Lakeside (Mr. Eichler), that debate now be adjourned.

Motion agreed to.

Mr. Speaker: We'll now call Bill 7, The Planning Amendment and City of Winnipeg Charter Amendment Act.

Bill 7–The Planning Amendment and City of Winnipeg Charter Amendment Act (Affordable Housing)

Hon. Ron Lemieux (Minister of Local Government): I move, seconded by the Minister of Housing and Community Development (Ms. Irvin-Ross), that Bill 7, The Planning Amendment and City of Winnipeg Charter Amendment Act (Affordable Housing); Loi modifiant la Loi sur l'aménagement du territoire et la Charte de la ville de Winnipeg (logement abordable), be now read a second time and be referred to a committee of the House.

Motion presented.

Mr. Lemieux: Mr. Speaker, as communities grow in many of our cities and towns across Manitoba, community leaders are concerned about the availability of affordable housing.

We have seen great population growth in Manitoba over the recent years, particularly in the Winnipeg region and other areas of Manitoba, including Brandon. Manitoba's population reached 1.2 million in 2011, an increase of 5.2 per cent or almost 60,000 people from 2006. Growth rates in these areas are expected to continue to rise as Manitobans move–sorry, as Manitoba moves forward with our successful strategy to bring more immigrants to work in our province. This rate of growth, which has not been seen in generations, will increase the need for a range of housings housing families across a variety of income levels. Having a place to live is still a key component to the Manitoba success story. This is true for new Manitobans and established ones as well.

Community leaders have asked for more tools to increase the amount of affordable housing available in their community. I am proud to introduce this legislation that will give municipalities throughout Manitoba another mechanism to ensure Manitobans have access to affordable housing. This authority, which is commonly known as inclusionary housing–

or inclusionary zoning refers to two–sorry–refers to bylaw provisions that either require or encourage developers of market residential projects to include units for low- and moderate-income households.

It's fundamental objective is to ensure affordable housing is available on a permanent basis to a wider mix of incomes in all new residential developments. Over time, this means that a wider range of housing options are available to all income groups across the entire community.

We know mixed income developments enrich local culture and support diversity that reflects the community overall. It also ensures greater access to improved services and a range of neighbourhood amenities for all Manitobans. Thus, inclusionary housing is presented as an outcome in comparison to exclusionary housing. It's a way–excuse me–to see our communities.

The legislations–the legislation being presented holds new provisions that are enabling to municipalities. It will be entirely up to the members of a municipal council or planning district board whether they use this tool, and if they do, whether they seek voluntary developer involvement through incentives or take a mandatory approach. Local authorities will decide to use this tool based on their local needs and conditions.

In addition, as well, with all zoning bylaws, the municipality will be required to hold a public hearing on an inclusionary housing bylaw before it can be officially adopted. This way, we ensure the public is engaged in the process as well.

As we were bringing forward this legislation, we made sure to consult with key stakeholders. Consultations were held with the Department of Housing and Community Development, the Association of Manitoba Municipalities, the cities of Winnipeg and Brandon, and we have heard from the community-based non-profit and affordable housing groups that indicated general support for the concept of bylaws to require or enable affordable housing. We've also had conversations with the Urban Development Institute.

The amendments to The Planning Act and the City of Winnipeg Charter clearly empower all municipalities to pass bylaws to require or encourage affordable housing when warranted by community conditions.

The legislation incorporates the following provisions: enabling authority for a planning district board or municipal council to pass a zoning bylaw to require a specified percentage of the residential units within a development be affordable to low- and moderate-income households; (2) is to–enabling authority to relax some provisions in the zoning bylaw, including density. If a developer provides a public benefit in return, increased density is a very important tool to achieve affordable housing. Smaller lot or unit sizes can lower per-unit housing costs and provide for more effective use of infrastructure. Existing legislation in British Columbia and Ontario use similar provisions, called density bonusing, as a way to achieve the construction of affordable housing by developers; No. 3, a condition that a zoning bylaw for a new residential development requiring affordable housing may be imposed only if a definition of affordable housing is specified in the bylaw. Municipalities will define affordable housing based on local context and needs, which can defer greatly from community to community. However, resources like those provided by the Canadian Mortgage and Housing Corporation can guide municipalities as they seek to properly defining affordability for their community, provisions for development agreements between a municipality and developer to specify the required number, type and extent of affordable housing units and the necessary measures to protect the ongoing affordability of the affordable housing units.

***** (16:30)

This legislation will complement HOMEWorks!, Manitoba Housing and Community Development's long-term housing strategy and policy framework, to promote quality and affordable housing markets and encouraging more housing options for Manitobans.

I look forward to debate on Bill 7 from all members, as we surely all see that Manitoba is growing and we must provide the right tools to municipal leaders as we are seeing many new communities develop in all corners of this beautiful province.

Thank you, Mr. Speaker.

Mr. Blaine Pedersen (Midland): Mr. Speaker, I move, seconded by the member for Spruce Woods (Mr. Cullen), that debate now be adjourned.

Motion agreed to.

Hon. Jennifer Howard (Government House Leader): Would you please call Bill 11 and Bill 13.

Mr. Speaker: We'll now proceed to call Bill 11, followed by Bill 13. Starting with Bill 11 first.

Bill 11–The Proceedings Against the Crown Amendment Act

Hon. Peter Bjornson (Minister of Entrepreneurship, Training and Trade): I move, seconded by the Attorney General (Mr. Swan), that Bill 11, The Proceedings Against the Crown Amendment Act; Loi modifiant la Loi sur les procédures contre la Couronne, be now read a second time and be referred to a committee of this House.

Motion presented.

Mr. Bjornson: I'm very pleased to stand in the House today to speak to the amendments to The Proceedings Against the Crown Act. Right now all provincial, territorial and federal signatories to the Agreement on Internal Trade are taking steps to ensure that awards under the agreement of internal trade are enforceable in the same manner as orders against the Crown.

In particular, the current amendment is needed by all parties to the agreement in the event that a compliance panel in a person-to-government dispute under the AIT awards a monetary penalty against a party for failure to implement a panel ruling. The amendments we are making to The Proceedings Against the Crown Amendment Act fulfills Manitoba's commitment to fully honour its obligations required to implement the recently revised dispute resolution chapter of the Agreement on Internal Trade. Upon ratification and entry into the force of the 14th protocol of Agreement on Internal Trade, the revised dispute resolution chapter will include monetary penalties for failure to comply with the dispute panel recommendation for persons-to-government disputes. As of November 2012, four jurisdictions have ratified and signed the 14th protocol of amendment, being Manitoba, Alberta, Canada and Québec.

So, to put this in context, Mr. Speaker, Manitoba previously amended the proceedings to the Crown act in 2009 to incorporate specific articles in the agreement relating to potential monetary penalties awarded in government-to-government disputes. Specifically, the 2009 dispute resolution chapter of the agreement includes monetary penalties for failure to comply with the dispute panel recommendation for government-to-government disputes as determined by a compliance panel. The maximum potential penalties range from 2,000–$250,000–pardon me–to $5 million, depending on the size of the jurisdiction. In the unlikely event of a penalty against Manitoba, the highest the penalty could be is $1.5 million.

Now, with the recent agreement to extend such awards to person-to-government disputes, we can now simplify this provision by making a more general reference. We can do this by removing references to specific articles in the AIT, and this means that no further Crown act amendments would be needed, even if future editing changes were required, such as the renumbering of articles in this chapter of the Agreement on Internal Trade.

The alternative, Mr. Speaker, would be to list at least 12 specific articles from the agreement in total, and further amendments to the Crown act would be required at a future date as and when article numbers are amended.

As background, the Agreement on Internal Trade is an agreement that governs trade in key areas between the jurisdictions within Canada. Effective in 1995, the federal government, all provinces and two territories at the time signed the agreement. Its purpose is to reduce and eliminate barriers to internal trade.

As a co-lead with New Brunswick on the Council of Federation's initiatives on internal trade, Manitoba has consistently taken the leadership role in both the negotiations and implementations of this agreement. We've worked diligently to improve the effectiveness of the agreement, eliminate trade barriers, enhance the competitiveness in businesses and address the common concerns of individuals, businesses and governments.

This amendment is necessary to provide that the order for a monetary penalty or cost order issued by a panel under the Agreement on Internal Trade may be filed with the Court of Queen's Bench in Manitoba and would be enforceable as an order for the payment of money made by the court against the Crown. As noted earlier, cost orders can be issued by a panel under both government-to-government and person-to-person dispute processes. The first changes under the government-to-government procedures were made to ensure dispute resolution procedures were more enforceable, effective and fair, and, namely, an appeal process was added with respect to panel decisions. A compliance review was implemented which could lead to monetary penalties against parties that were found to have an inconsistent measure but had not rectified it. A summary review was also implemented allowing parties to obtain and expedite a compliance review for existing disputes during a transition period, and a potential suspension of dispute resolution privileges provided further incentive to ensure the implementation of panel rulings.

These revisions addressed concerns that the record of implementing panel decisions was very disappointing despite sound panel decisions. The implementation of panel rulings was further improved by establishing provisions allowing for possible monetary penalties of up to $5 million in the event that a government fails to implement a panel ruling. Individual penalties reflect both the seriousness of the violation and the impact on the market. A tiered approach to monetary awards also took into account the size of the population of the jurisdiction, and, as I've mentioned before, in Manitoba's case the maximum potential penalty would be $1.5 million.

This early work was followed by revisions to the person-to-government dispute process in June 2012. These revisions essentially mirror the previous improvements and provide for the same additional reviews and effective procedures. This means that if a private individual or business can successfully prove that an–to an AIT panel that a measure has been contravened, the AIT–they may be awarded a cost order to recover reasonable costs incurred to bring compliance. In the event that a jurisdiction does not bring its measure into compliance with the AIT, the compliance panel may award a monetary penalty. All monies from the monetary penalty over and above the cost of the awards will be provided to a research or educational project in support of international trade, and these projects will be under the direction of the committee on internal trade. This approach ensures that jurisdictions have an incentive to be compliant with the AIT and at the same time that individuals do not have an incentive to reap windfall gains. This current change to the dispute resolution chapter fulfills the commitment made by the premiers and the ministers to internal trade to enhance the dispute resolution procedures under the agreement.

We can attest to the effectiveness of the changes to the dispute measures. Manitoba has successfully used the revised government-to-government dispute mechanisms to ensure that the rights of Manitobans under the AIT are respected. Manitoba successfully led a 2011-2012 dispute against Ontario, and once again the western provinces worked together as Saskatchewan, Alberta and BC joined the compliant–joined this complaint, pardon me, as interveners. Ontario has since revised its legislation that it be compliant with the agreement, and Ontario will now allow certificate-to-certificate recognition of the certified general accountants practising public accounting from Manitoba without any further training required. While we won on behalf of Manitobans, accountants from any province or territory in Canada also benefited from this panel ruling.

It is also useful to point out that, in keeping with our commitment to honour our obligations under the agreement, not a single Manitoba measure has been subject to a dispute panel. I am pleased to say that we are doing our part as a Canadian jurisdiction to ensure the compliance with our obligations, and we expect all other parties to do the same–all other parties to the AIT.

***** (16:40)

Thus, in conclusion, Manitoba has consistently–*[interjection]* Well, I know the members opposite would like to hear more. I know they'd like to hear more but, in conclusion, Manitoba has consistently advocated a national approach to improving internal trade. Let me emphasize national approach to improving internal trade. And the participation of all parties to the agreement helps us achieve our objective of a single market within all of Canada.

So, with the introduction of this bill, Mr. Speaker, Manitoba demonstrates a further–its further leadership on internal trade by being one of the first jurisdictions in Canada to act on these obligations under the AIT.

I thank you very much, Mr. Speaker.

Mr. Cliff Graydon (Emerson): I move, seconded by the member for La Verendrye (Mr. Smook), that the debate be adjourned.

Motion agreed to.

Mr. Speaker: We'll now proceed with Bill 13, the Fish and Wildlife Enhancement Fund Act.

Bill 13–The Fish and Wildlife Enhancement Fund Act

Hon. Gord Mackintosh (Minister of Conservation and Water Stewardship): I move, seconded by the Minister of Local Government (Mr. Lemieux), that Bill 13, The Fish and Wildlife Enhancement Fund

Act, be now read a second time and be referred to a committee of this House.

His Honour the Administrator has been advised of the bill, and I table the message.

Mr. Speaker: It's been moved by the honourable Minister of Conservation and Water Stewardship, seconded by the honourable Minister of Local Government, that Bill 13, The Fish and Wildlife Enhancement Fund Act, be now read for a second time and be referred to a committee of the House.

His Honour the Administrator has been advised of the bill, and the message has been tabled.

Mr. Mackintosh: Mr. Speaker, this bill would set in place in law, for the first time in Manitoba, a dedicated support for fish and wildlife projects in this province. I want to, at the outset, thank the member for the Interlake (Mr. Nevakshonoff) for bringing this idea forward to my office and, as well, giving support to the Manitoba Wildlife Federation's interest in having legislation like this put into place when it comes to wildlife protections.

The member for the Interlake did a tremendous job dealing with stakeholders and consulting to determine if there was an interest in proceeding at this time with legislation and, as well, provided a lot of important recommendations in terms of how the legislation could be designed.

The bill, first and foremost, establishes the Fish and Wildlife Enhancement Fund. Under this enhancement fund, monies will fund fish enhancement initiatives as well as wildlife enhancement initiatives. It, of course, builds on the efforts, the experience of the fish enhancement fund that is in place in Manitoba, the work in large part of David Carrick and many others that are stakeholders on that fund.

What is particularly different here, of course, and what is, I'm confident, attractive for those who have been involved in fish enhancement initiatives is that this now entrenches in law the fund and, as well, for the first time, requires it to be a dedicated fund.

The fish and wildlife enhancement initiatives include, of course, projects that can serve fish and wildlife populations. It includes projects or programs to promote, manage and restore the habitats that species rely on. Initiatives under the bill include studies on fish and wildlife populations, hunting, trapping and angling education programs, as well as the acquisition of property by purchase or lease to protect critical habitat that the species may need to survive.

I might add that I certainly have heard time and again an interest by–particularly hunting stakeholders of the need to expand aerial surveying and making sure that we understand populations and trends and, of course, top of mind comes–top of mind is the interest in ensuring a healthy moose population in Manitoba.

Payments into the fund include fees placed on fishing, hunting and trapping licences. We want, of course, these licences to remain affordable so the fees will necessarily have to be nominal, and we will discuss with the stakeholders what the fee structure should be and listen to the interests of others as well to make sure that we meet the objectives of both the enhancement fund and affordability.

The monies generated from fish-related fees will be directed to the fish enhancement account. Monies from the hunting and trapping-related fees will be directed to the wildlife enhancement account.

The bill also provides the ability to prescribe certain fees on other types of licences, permits, certificates and other authorizations respecting fish and wildlife. Gifts or grants or bequests, donations and other contributions can also be placed into the fund.

I might add we are also looking at the experiences in other jurisdictions. Many of the other provinces on both sides of us have approaches that are similar to this.

To ensure ministerial government accountability, of course, the minister is responsible for the management of the fund overall and may make or authorize payments from the fund to support fish and wildlife enhancement initiatives and also the operation of government fish hatcheries. The cost to administer the act in relation to these initiatives will also be covered by the fund.

The bill establishes the fish and wildlife enhancement committee. The committee consists of a chair, members of the fish enhancement subcommittee and members of the wildlife enhancement subcommittee, all of whom are appointed by the minister. The majority of the members of the fish enhancement subcommittee can be nominated by organizations that represent anglers. We, of course, want to ensure continuity with the existing fish enhancement fund, and we will want to see that membership continue as a majority on the new committee. Organizations that represent hunters and trappers can also nominate the majority of members to the wildlife enhancement subcommittee.

The fish enhancement subcommittee must review all proposals submitted for funding related to fish enhancement initiatives, and the wildlife enhancement subcommittee must review all proposals submitted for funding related to wildlife enhancement initiatives. The subcommittees must then provide to the minister each subcommittee's funding recommendations respecting enhancement initiative proposals. The minister must take the recommendations into account in determining which initiatives receive funding, and, as I recall, there was a time restriction placed on the timeliness of the ministerial decision. The bill also allows regulation-making powers, of course, for the minister to create prescribed fees as well as prescribe the types of permits, licences, certificates and other authorizations under regulation.

So Manitoba now has the ability to dedicate funding for fish and wildlife management in this province if this bill proceeds to passage. The creation of the fund, through the act, is widely supported by anglers, hunters and trappers of Manitoba. I would like to commend this bill to the House, and I look forward to any insights from members and from the public and further insights from stakeholders.

I would particularly like to thank the Manitoba Wildlife Federation for their vision here that we are following up on now, and it's been a pleasure to work with the Wildlife Federation. We'll continue to do that as we design the terms of reference and other regulations including the fees, and, as well, I want to recognize the ongoing advice of David Carrick and the fisheries groups, the Manitoba Lodges and Outfitters Association as well as the Manitoba Trappers Association, which has expressed their support, and it'll be important, of course, to engage trappers as well because we shouldn't forget that it's not just about hunting and fishing but trapping as well that will benefit from this.

In short, I think what this fund offers is a greater opportunity for a greater fishing and hunting and trapping experience for Manitobans and for those who visit our province. It will help ensure going forward that, when you go out for that deer, you're going to have a better story to tell, and when you're going out fishing, oh well, you know, the stories were told anyway. Yes. But, no, we really hope that, and expect that, this fund will ensure the ongoing and healthy stocking of our lakes and, as well, the healthy–healthier populations when it comes to hunting and trapping as well.

So, with those remarks, I again, just ask the House to recognize the role of the member for the Interlake (Mr. Nevakshonoff), given his passion for this fund, and I look forward to the debates and the proceedings in the committee. Thank you, Mr. Speaker.

***** (16:50)

Mr. Tom Nevakshonoff (Interlake): It is my honour and a distinct pleasure to arise to speak on Bill 13 this afternoon, and I want to thank the Minister of Conservation and Water Stewardship for his kind words just now and for the leadership and enthusiasm that he has expressed in regard to this most important act. It's–kind of follows up a little bit on an act that was passed through the Legislature here just a short time ago with joint co-operation of both sides of the House, The Hunting, Fishing and Trapping Heritage Act. Members opposite, I'm sure, recall that; had a lot to do with the genesis of that act; and I acknowledge their good works in that regard and hope that they will speak favourably in regard to this latest endeavour on behalf of wildlife and our fish populations and our hunters and fishers across this beautiful land of ours.

Now, I've had some experience in this field. My family owned a fishing lodge up in northern Manitoba–my brother currently owns it–so I was raised on the lake. I was guiding Americans when I was 10 years old, as a matter of fact, so it's been–it had nothing to do with my Uncle Cubby, I may add. This was strictly an endeavour that my father, Mike Nevakshonoff, got started in–back in 1966 or '67, I think. *[interjection]* Well, members opposite seem to have some interest in this and I'm very glad that they're expressing this interest.

Most important, I think, to put on the record that this was a major component of TomorrowNow-Manitoba's Green Plan that was announced by the Premier (Mr. Selinger) in June. So this is just one of the many ways that our government is expressing this. Just goes to show that we have truly the interests of rural Manitoba at heart. And that goes right into the very heart of the bush, I might add.

In addition to being a fisher, of course, I'm an active hunter, and we'll put on the record: I did get my deer this year. I still have to send the forms in and–so that we can do proper recordkeeping which is fundamental to the maintenance of our wildlife stocks. If we don't spend the money to do the counts–the wildlife counts–so that we actually know what we have out there, then it's difficult, as a government, to make the decisions as regards hunting licences, either the length of them, or whether you're harvesting one deer or two, or what have you. So all of these factors, this particular bill will give us the enhanced ability to monitor our fish stocks, our wildlife stocks, and not just to monitor them, but to make fundamental investments in the habitat itself, which is not just to be taken for granted.

A number of very good people, I might add, have worked on this project throughout the course of its coming to pass. I do want to acknowledge some of them on the record today, Mr. Speaker.

First and foremost would be a former director of wildlife, then moved on and spent the end of his career as the regional director for the Interlake region. His name was Brian Gillespie, a very good friend of mine. I've known him since I was first elected in 1999. Him and I are cut from the same bolt of cloth, but I do recall our meeting, I'd have to say. I'd phoned one of his staff people and–to talk about whatever, drainage or elk depredation on hay. Very quickly, the director phoned me back and said that I should be talking to him, so I arranged for a meeting and the two of them met across his desk and kind of glared at each other a little bit, but we very soon came to realize that we both had the same things near and dear to us, the preservation of wildlife and good water management, and became fast friends. And he was very instrumental in advising me through the course of this bill. He was heavily involved in the expansion of the wildlife management areas back in the 1970s and was instrumental in the reintroduction of the Manitobensis species of–subspecies of elk back into the Interlake–very successful program that is evident today. Truly, one of the crown jewels of our province is the elk herd in the Interlake. So I acknowledge Brian Gillespie's good works in that regard.

Also, Barry Verbiwski, who currently works for us–very often, we tend to overlook our staff, how hard they work behind the scenes. Barry Verbiwski, as we went back and forth on this bill–and it went back and forth quite bit, I have to say, Barry was the guy that carried that heavy load. He was the one that did all the writing and all the revisions, so I really want to acknowledge his good works as well as other people like Dr. Brian Parker, who is the Fisheries director now. Brian joined Jim Duncan, our current wildlife director, and Blaire Barta as well, who was working on the draft, as well as many others. This is–was a combined effort that I take my hat off to all of our staff, past and present, for the good works that they do on behalf of the people of Manitoba, and help us to do a hard job as elected officials as well.

You know, part of our mandate, the expansion of, you know, of protected areas in our province, whether it's parks, wildlife management areas, what have you, and I don't have to look very far outside of my constituency. In fact, within my constituency, just in the last year or so, we did create a brand-new park, the Fisher Bay Park, which is more a water park, which is unique in itself, and there again acknowledge the good works of the chief of the Fisher River Cree Nation, Dave Crate, who lobbied very hard, very long, and very effectively in that regard.

So I see that time is almost up. I would like to speak so much more about some of the other people who have contributed toward this, about some of our plans to include First Nations people as a part of this process, very important, but time is of the essence and the clock is ticking and my time has pretty much run out, so I just hope that members opposite are fully in support of this worthy endeavour.

Thank you very much, Mr. Speaker.

Mr. Kelvin Goertzen (Steinbach): Mr. Speaker, I move, seconded by the member for Tuxedo (Mrs. Stefanson), that debate now be adjourned.

Motion agreed to.

Hon. Jennifer Howard (Government House Leader): Mr. Speaker, would you please call Bill 5.

Mr. Speaker: We will now proceed to call Bill 5, The New Home Warranty Act.

Bill 5–The New Home Warranty Act

Hon. Jim Rondeau (Minister of Healthy Living, Seniors and Consumer Affairs): This bill established mandatory minimum warranty protection for the–oh, I move, seconded by the Minister of Housing (Ms. Irvin-Ross), that Bill 5, The New Home Warranty Act; Loi sur la garantie des maisons neuves, be now read a first–a second time and be referred to a committee of this House.

His Honour the Administrator has been advised of the bill, and I table the message.

Mr. Speaker: It has been moved by the honourable Minister of Healthy Living and Seniors, seconded by the honourable Minister of Housing and Community Development, that Bill 5, The New Home Warranty Act, be now read for a second time and be referred to a committee of the House.

His Honour the Administrator has been advised of the contents of this bill, and the message was tabled.

Mr. Rondeau: Good day, Mr. Speaker. This bill will establish mandatory minimum warranty protection for new homes built in this province. It ensures new homes built for sale are covered by a warranty against defects and materials, labours, design and structural defects.

Mr. Speaker, this bill's on the let's make a better deal commitment where we want to continue to expand protection for consumers. The purchase of a new home is one of the largest purchases that most consumers and families can make. Most consumers don't buy many homes in their lifetime.

The complexity of a new home or a construction of condominiums–it can make it difficult to understand all the systems, components and structural elements that go into building of a new home. Many people may not be aware of the potential defects and consumer-related problems that might appear after they move in, and it's a very tough system.

And so, Mr. Speaker, only three provinces have mandatory new home warranty legislation: Ontario, Québec, British Columbia, and the most recent of these existing programs was developed in BC as a response for the leaky condo crisis. That happened in the 1990s. It worked well and others have joined us.

Manitoba's not alone in moving forward–

Mr. Speaker: Order, please. Order, please.

When this matter's again before the House, the honourable Minister of Healthy Living and Seniors–will remain standing in the name of the honourable Minister of Healthy Living and Seniors.

The hour being 5 p.m., this House is adjourned and stands adjourned until 10 a.m. tomorrow morning.

CORRIGENDA

On November 29, 2012, page 275, first column, seventh paragraph, should have read:

The NDP government tries to use its Crown corporations as cover for their own mismanagement. They tried to raid MPI before and they're doing it again, Mr. Speaker. They've done it with Hydro as well.

On November 29, 2012, page 302, second column, sixth paragraph, should have read:

This year we announced the province's biggest population gains since modern-day recordkeeping began in 1971. Mr. Speaker, 16,045 people came to Manitoba between April of 2011 and April of 2012. That's a record. We want Manitoba to be a destination choice for people from around the world.

Dams and development:
A new framework for decision-making

Overview of the report by the World Commission on Dams

December 2001

The present paper is a summary of the final report produced by the World Commission on Dams, which was published in November 2000. A full copy of the report titled *Dams and Development: A New Framework for Decision-Making*, can be obtained from bookshops or Earthscan Publications Ltd, 120 Pentonville road, London N1 9JN, UK. Email: earthinfo@earthscan.co.uk and http://www.earthscan.co.uk. The report is also downloadable at http://www.dams.org/report/.

CONTENTS

SUMMARY

What are the real costs of dams? Who pays for them? And who benefits from them? The construction of large dams is now one of the most hotly contested issues in sustainable development. Supporters talk up the social and economic benefits of irrigation, electricity, flood control and water supply; while opponents highlight their negative impacts, such as cost overruns and debt burden, the displacement and impoverishment of people, the destruction of important ecosystems and fishery resources, and the inequitable distribution of costs and benefits.

The rivers, watersheds and aquatic ecosystems harnessed and affected by dams provide the basis for life and livelihoods. The considerable benefits that dams can provide must therefore be weighed against the negative consequences of introducing structures that transform the surrounding landscape, impacting on every species living within it. The World Commission on Dams (WCD) was set up to undertake the huge task of assessing the past performance and future role of large dams.

Dams and Development: A New framework for Decision-Making is the product of over two years of intense study, dialogue and reflection by the WCD, the WCD Stakeholders' Forum and hundreds of individual experts on all aspects of dams. Providing a comprehensive, global review of their performance and contribution to development, the WCD report is relevant to everyone working with or concerned by dams, from governments and international organisations, the private sector and civil society groups, to the communities most intimately affected by dams. This paper presents a brief overview of the issues addressed by the report, summarising its main recommendations and proposals.

Building on an analysis of how and why dams succeed or fail to meet development objectives, the report addresses key issues at the heart of the debate on dams, and recommends fundamental changes in the manner in which water development options are assessed and project cycles planned, implemented, monitored and evaluated. Working on the premise that dams are but one means of improving human welfare on a sustainable basis, the Commission proposes that they should be judged accordingly, supported if they offer the best way of achieving this goal, and avoided should other, better options be available.

Such judgement requires a new, more inclusive approach to dams as a development option: an approach that begins by identifying the broad range of stakeholders potentially affected by new initiatives, recognises their rights and the risks attendant upon a proposed programme, and ensures their informed participation in the decision-making processes that shape the development of water and energy resources. To support this new framework for decision-making, the Commission outlines seven strategic priorities, with criteria and guidelines that should enable stakeholders at all levels to seek and attain the most appropriate means of exploiting and protecting water and energy resources. Vital reading on the future of dams and the changing development context, *Dams and Development* leaves no doubt that business as usual is simply no longer an option.

INTRODUCTION: A BRIEF OVERVIEW OF DAMS AND DEVELOPMENT

There is nothing new about dams: for thousands of years people have been building them to manage flood waters and supply water for drinking, irrigation and, more recently, industry. By the 1950s, as national economies and populations expanded, dams were increasingly viewed as a means of meeting water and energy needs, and since then, at least 45 000 large dams have been constructed. Nearly half of the rivers in the world now house at least one large dam, and hydropower produces over 50% of the electricity in a third of countries across the world, with large dams generating 19% of electricity overall. Half of the world's large dams were built exclusively or primarily for irrigation, and some 30-40% of the 271 million hectares irrigated worldwide rely on these constructions.

Dams have been promoted as an important means of meeting water and energy needs, and as a long-term, strategic investment with the ability to deliver multiple benefits, some of which are typical of all large infrastructure projects, while others are unique to dams and specific to particular projects. Regional development, job creation and fostering an industrial base with export capability are often cited as additional considerations when building large dams, while other goals include the generation of income from export earnings, either through direct sales of electricity or by selling cash crops or processed products from electricity-intensive industries.

However, such benefits need to be weighed up against the social and environmental impacts of large dams, which have become increasingly obvious over the last fifty years. Rivers have been fragmented and transformed, and worldwide, an estimated 40-80 million people have been displaced by reservoirs. The enormous investment required to build large dams, and their huge social, environmental and economic impact, have fuelled opposition to them. As decision-making processes in many countries have become more open and transparent, the future of large dams is increasingly being called into question.

Changing context

A number of global reports have documented the dramatic impact of withdrawing water from the world's lakes, rivers and underground aquifers, as withdrawals doubled over the second half of the last century to an estimated 3800 cubic kilometres per year. Sustainable management of water resources has been pushed to the top of the global development agenda by the need to supply growing populations and economies with water, while groundwater sources are depleted, water quality is declining and increasingly severe limits have been imposed on surface water extraction.

Over the past few decades, water has ceased to be seen as a free commodity, and is now valued as a limited natural resource, an economic good and a human right. As such, it should be allocated in an equitable manner, but in 1990, over a billion people were estimated to have less than the 50 litres per person per day recommended as sufficient for basic human requirements, while households in industrial countries and wealthy city-dwellers in developing countries were consuming four to fourteen times this amount.

Leading analysts predict that competition for water to meet the demands of industry, agriculture and human consumption will increase, forecasting that by 2025, there will be a total of 3.5 billion people living in water-stressed countries. Empirical evidence suggests that limited water supplies, current agricultural practices and population growth will make it increasingly difficult for various countries to achieve food self-sufficiency, which will intensify the focus on food security and the protection of other environmental resources. Clearly, action is required to address both current and future needs, and dams are at the heart of the debate about how this might be achieved. While there are many threats implicit in this pressure on water, it could also act as a catalyst for positive change in water-related policies, creating new opportunities for development initiatives.

Cure or curse? The debate on dams

Between the 1930s and the 1970s, when the construction of large dams peaked, they were viewed by many as synonymous with development and economic progress. Hydropower, irrigation, water supply and flood control services were widely seen as sufficient justification for the huge investments required; while other benefits, such as the economic prosperity brought to a region by multiple cropping, the installation of electricity in rural areas, and the expansion of physical and social infrastructures, such as roads and schools, were used to justify dams as the most economically and financially competitive option.

However, a growing body of knowledge and experience about the performance and consequences of dams has raised questions about the reported returns on the investments required, and the level and distribution of benefits actually delivered. Initially focusing on specific sites, opposition has now evolved into a global debate about dams: their impact on neighbouring communities, livelihoods and ecosystems, and whether they represent the best investment of public funds and resources.

The debate ranges from the gap between the promised benefits of a dam and the actual outcomes, to the challenges of developing water and energy in terms of 'nation building' and resource allocation. Proponents maintain that dams have generally performed well as an integral part of water and energy development strategies in over 140 nations, for the most part providing an indispensable range of water and energy services. Opponents claim that better, cheaper options for meeting water and energy needs, from small-scale, decentralised water supply and electricity options to large-scale end-use efficiency and demand-side management options, have often been ignored, despite the fact that they may offer more sustainable and equitable development benefits.

While protagonists may agree on the need to take the environmental and social costs of dams more seriously, and systematically to consult with the people affected by their construction, there are still deep divisions over issues such as:

- the extent to which alternatives to dams are viable for achieving various development goals, and whether alternatives are complementary or mutually exclusive;

- the extent to which adverse environmental and social impacts are acceptable;
- the degree to which adverse environmental and social impacts can be avoided or mitigated;
- the extent to which local consent should govern development decisions in the future.

Today, the decision to build a large dam is rarely only a local or national one. The debate has been transformed from a local process of assessing costs and benefits to one in which dams in general are the focus of global concern about development strategies and choices.

THE WORLD COMMISSION ON DAMS

It was against this background that a meeting to discuss issues relating to large dams was convened in Gland, Switzerland, in April 1997. Supported by the World Bank and the IUCN – World Conservation Union, the meeting was attended by thirty-nine participants from governments, the private sector, international financial institutions, civil society organisations and people affected by dams. It resulted in a proposal to establish the World Commission on Dams (WCD), with a mandate to:

- Review the effectiveness of large dams as a development option, and assess alternatives for developing water resources and energy;
- Develop internationally acceptable criteria, guidelines and standards, where appropriate, for the planning, design, appraisal, construction, operation, monitoring and decommissioning of dams.

Members of the Commission were selected to reflect regional diversity, expertise and stakeholder perspectives; and to act in an individual capacity, rather than representing institutions or countries. In May 1998, the WCD started work on the first independent global review of the performance and impact of large dams and the options available for water and energy development. This involved preparing eight detailed case studies of large dams, country reviews for India and China, and a briefing paper on Russia and the Newly Independent States. Surveys were conducted on one hundred and twenty-five large dams; seventeen thematic reviews written on social, environmental and economic issues, alternatives to dams and governance and institutional processes; and nine hundred and forty-seven submissions and presentations made at four regional consultations. These inputs formed the

core of the WCD Knowledge Base, which served to inform the Commission on the main issues surrounding dams and their alternatives.
With the focus as much on the process as on the product, public consultation and access to the Commission were key components of the review, which was conducted in consultation with the WCD forum, a sixty-eight-member group representing a cross-section of interests, views and institutions. Taking care to involve all interest groups in the debate, the WCD also pioneered a new funding model, and fifty-three public, private and civil society organisations pledged funds to the WCD process.

The main components and findings of the WCD Global Review

The review was structured around three main components:

1. An assessment of the technical, financial and economic performance of dams, their impact on ecosystems and people, and the distribution of project gains and losses;
2. An assessment of the alternatives to dams, and the opportunities and obstacles relating to them;
3. An analysis of the planning, decision-making and compliance issues underpinning the selection, design, construction, operation and decommissioning of dams.

Evaluation of performance was based on the targets set for large dams by their proponents – the criteria providing the basis for government approval and financing. While recognising the substantial benefits derived from dams, the review also focuses on why, how and where they failed to achieve the results intended, or produced unanticipated outcomes. An integral part of the research involved documenting the good practices developed to address the shortcomings and difficulties experienced in the past. These practices suggest that there is cause for optimism about improving the benefits, increasing the beneficiaries and reducing or mitigating the negative impacts and conflicts caused by dams.

The principal findings of the review, which form the basis for the new approach developed within the report, are summarised below:

- Dams have made a significant contribution to human development, and considerable benefits have been derived from them;
- An unacceptable and often unnecessary price has been paid to secure those benefits, especially in social and environmental terms, by

displaced people, communities downstream from the dam, taxpayers and the environment;
- Compared with other alternatives, the value of dams in meeting water and energy development needs is questionable, particularly in view of the lack of equity and uneven distribution of benefits;
- By bringing to the table all those whose rights are involved, and who bear the risks associated with different options for developing water and energy resources, it should be possible to address competing interests and resolve conflicts in a positive manner;
- Negotiation can be used as a tool to increase the effectiveness of water and energy development projects, by eliminating inappropriate projects at an early stage and offering only those options that key stakeholders agree are the best for meeting the needs in question.

A new approach to improving the outcomes of dams and water development projects

Like any development project, dams and their alternatives must respond to a wide range of needs, expectations, objectives and constraints. This can only be achieved by transforming the development process, so that it includes all relevant stakeholders and is based on negotiation and consensual decision-making. For this radically different approach to work, participants need to have a clear understanding of and agreement about the shared objectives and goals of development, which should be underpinned by five core values identified by the Commission:

- Equity
- Efficiency
- Participatory decision-making
- Sustainability
- Accountability

The endorsement of these values is a key theme of the report and its recommendations, and there is significant support for rights, particularly human rights, to be considered as a fundamental reference point in any debate on dams.

In view of the importance of rights-related issues, and the nature and magnitude of the potential risks for all protagonists, the Commission proposes that an approach based on the recognition of rights and assessment of risks (particularly the rights at risk) be developed as a tool for guiding future planning and decision-making. This will also provide a more effective framework for integrating the economic, social and environmental issues at stake when assessing development options and implementing projects.

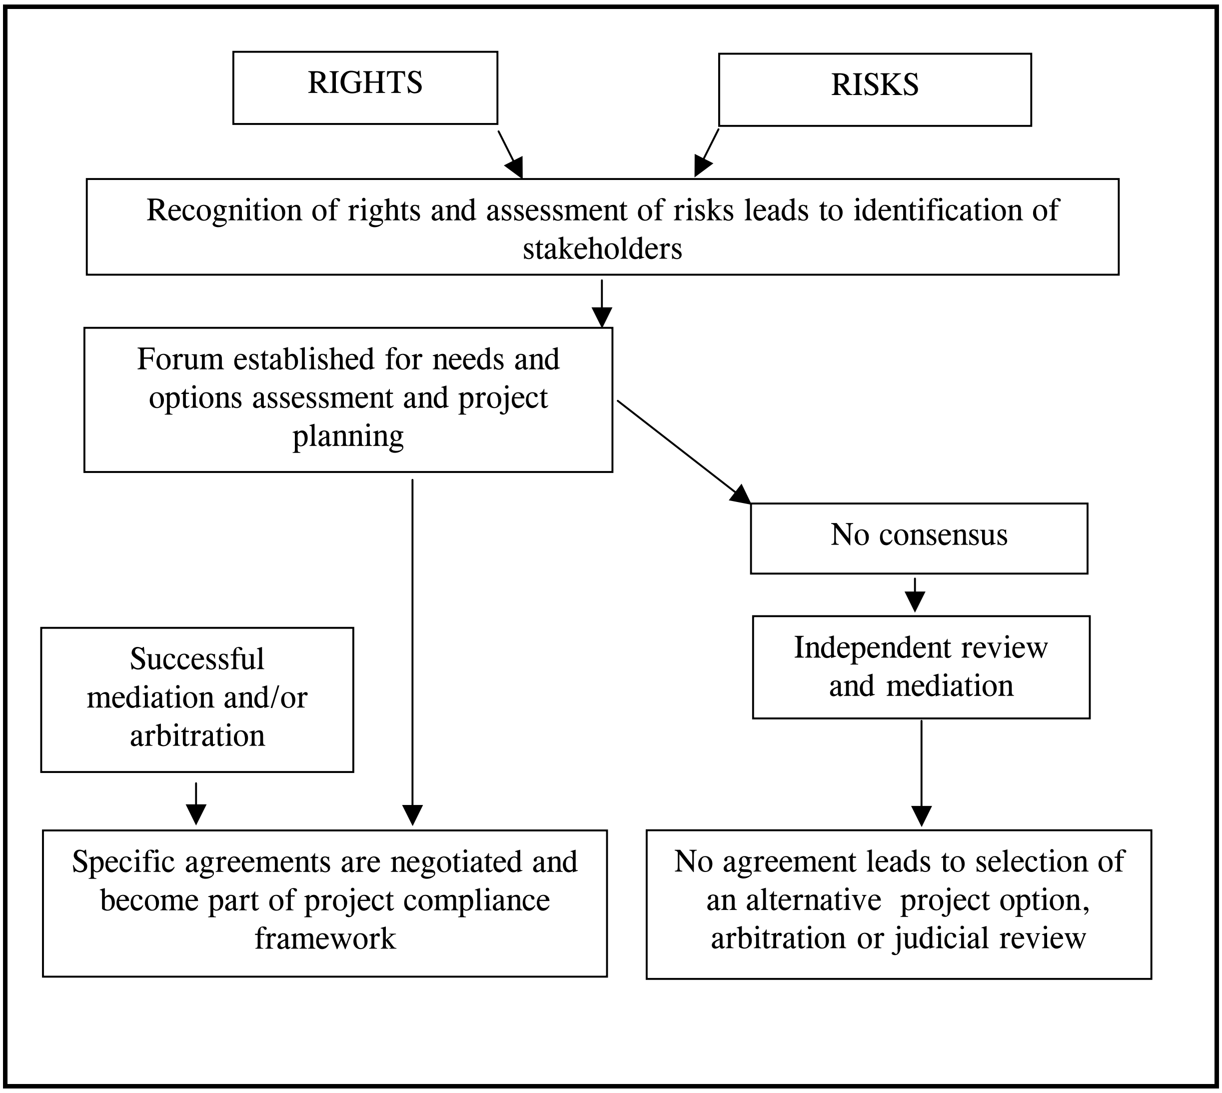
In order to identify the legitimate claims and entitlements potentially affected by a proposed project or its alternatives, it is essential to clarify the rights at stake, as a pre-requisite to identifying all the groups entitled to a formal role in the consultative process. These stakeholders should be actively involved from the start, and party to negotiating project-specific agreements on issues such as benefit sharing, resettlement or compensation.

The notion of risk adds an important dimension to understanding how, and to what extent, a project may have an impact on such rights. Traditionally, the definition of risk was limited to the capital invested and returns expected by developers or corporate investors. These voluntary risk-takers can determine the level and type of risk they wish to take, and explicitly define its boundaries and acceptability. As the Global Review shows, water development projects have often created a far larger group of involuntary risk-takers, who find that their livelihoods, quality of life and very survival are at stake, and that the risks imposed upon them are managed by others. Typically, these involuntary risk-bearers have little or no say in overall water and energy policy, the choice of specific projects, or project design and implementation.

Like rights and entitlements, these risks must be identified, articulated and addressed. This will involve formal recognition of the fact that governments or developers are not the only parties at risk, and that the communities affected by a project, as well as the environment, also have much to lose.

A rights-and-risks approach to assessing options and implementation will provide an effective framework for determining who has a legitimate place at the negotiating table, and which issues need to be on the agenda (see Figure 1 below). Although this approach may be more demanding in the early stages of options assessment and project design, inclusive and transparent decision-making processes aimed at negotiated outcomes should legitimise subsequent stages of the project, thereby helping to resolve the many and complex issues surrounding water, dams and development.

Figure 1: From rights and risks to negotiated agreements: a framework for options assessment and project planning



Having taken the five core values outlined above as the basis for developing a rights-and-risks approach to the development process, the Commission then uses the broad framework of existing and emerging policy at local, national and international levels to identify seven strategic priorities and corresponding policy principles:

- Gaining public acceptance
- Comprehensive option assessment
- Managing existing dams
- Sustaining rivers and livelihoods
- Recognising entitlements and sharing benefits
- Ensuring compliance
- Sharing rivers for peace, development and security.

These priorities provide the basis for an innovative and constructive framework for decision-making, moving away from the traditional, top-down, technology-oriented approach towards a much more inclusive method of assessing options, managing existing dams, gaining public acceptance and negotiating and sharing benefits. Presented as outcomes to be achieved, the seven strategic priorities are supported by a practical set of principles and guidelines designed to be adopted and adapted by everyone involved in the debate about dams.

1. Gaining public acceptance

In order to develop water and energy resources in an equitable and sustainable manner, it is essential that there is public acceptance of such initiatives. This entails recognising the rights, addressing the risks and safeguarding the entitlements of all interested groups, by ensuring that they are informed about the issues at stake, able effectively to participate in decision-making processes, and that there is demonstrable acceptance of key decisions. Particular care should be taken to include the most vulnerable parties, such as women, the poor and certain indigenous groups, and that decision-making processes are guided by their free, informed and prior consent.

2. Comprehensive options assessment

The most appropriate development initiatives for a particular area can only be identified by assessing food, water and energy needs and clearly defining programme objectives. The full range of policy, institutional and technical options, which may well include alternatives to dams, should then be comprehensively assessed in a participatory process that accords the same significance to social and environmental considerations as to economic and financial factors. This process of assessment should continue throughout the planning, development and implementation of the project.

3. Managing existing dams

Dams and the context in which they operate are not static over time. Their benefits and impacts may be transformed by changes in priorities for water use, physical and land use changes in the river basin, technological developments, and changes in public policy expressed in environmental, safety, economic and technical regulations. Management and operational practices should be continuously assessed and adapted to changing circumstances, in order to optimise the benefits, address social issues and improve measures to limit and restore damage to the environment. This process should extend beyond the life of the project, so that the performance, benefits and impacts of all existing large dams can be monitored and evaluated on a long-term basis, and appropriate action taken to improve all aspects of their service delivery.

4. Sustaining rivers and livelihoods

Dams transform the landscapes they inhabit, with potentially irreversible effect. It is essential to understand, protect and restore ecosystems at river basin level, in order to minimise their negative impact, limit and mitigate harm to the health and integrity of the river system and those dependent upon it, and promote equitable human development and the welfare of all species. These are key issues when selecting sites and designing projects. Governments should develop national policies for maintaining in their natural state selected rivers with high ecosystem functions and values, and look for alternative sites on tributaries when assessing proposals for dams on undeveloped rivers.

5. Recognising entitlements and sharing benefits

Rather than benefiting from them, many of those affected by dams are aware only of their negative impacts. To redress the balance, a process of joint negotiation with such groups is required, based on recognition of rights and assessment of risks. The aim of these negotiations is to agree on legally enforceable mitigation and development provisions, which recognise entitlements that improve livelihoods and quality of life. States and developers are responsible for resettling and compensating all affected people, and satisfying them that their livelihoods will be improved by moving from their current situation. Legal means, such as contracts and accessible recourse at national and international levels, should be used to ensure that responsible parties fulfil their commitments to agreed mitigation, resettlement and development provisions.

6. Ensuring compliance

In order to win and maintain public trust and confidence, governments, developers, regulators and operators must meet their commitments for planning, implementing and operating dams. Compliance with applicable regulations, criteria and guidelines, and project-specific negotiated agreements should be ensured at all critical stages of project planning and implementation. A set of regulatory and non-regulatory mechanisms, incorporating incentives and sanctions, and flexible enough to accommodate changing circumstances, is needed to enforce social, environmental and technical measures. A clear, consistent and common set of criteria and guidelines to ensure compliance should be adopted by sponsoring, contracting and financing institutions, and compliance subjected to independent and transparent review. Legislation, voluntary integrity pacts, debarments and other instruments should be used to eliminate corrupt practices.

7. **Sharing rivers for peace, development and security**

The storage and diversion of water on transboundary rivers can cause considerable tension within and between countries. As specific interventions for diverting water, dams require constructive co-operation, and states or political units within countries need to agree on the use of resources in order to promote regional co-operation and peaceful collaboration.

Rather than focusing on allocating water as a finite resource, states need to work on sharing rivers and their associated benefits. This will involve negotiating a wide range of issues, and making provision in national water policies for basin agreements in shared river basins. These agreements should be based on the principles of equitable and reasonable use, no significant harm, prior information and the Commission's strategic priorities.

If an objection by a riparian state to a proposal for a new dam on a shared river is upheld by an independent panel, construction should not be carried out. Furthermore, where a government agency plans the construction of a dam on a shared river in contravention of the principle of good faith negotiations between riparians, external financing bodies should withdraw their support for projects and programmes promoted by that agency.

A NEW FOCUS FOR PLANNING AND DECISION-MAKING

In order to act on the strategic priorities recommended by the Commission, a new focus is required for planning and management in the water and energy sectors. This can best be achieved by focusing on the key stages in the decision-making process that influence final outcomes, and where compliance with regulatory requirements can be verified. The Commission identified five critical decision points for water and energy options. The first two relate to planning, and lead to decisions on a preferred development plan:

1. Needs assessment – validating needs for water and energy services;
2. Selecting alternatives – identifying the preferred development plan from among the full range of options.

When a dam is selected as a preferred development option, there are three further critical decision points:

3. Project preparation – verifying that agreements are in place before the construction contract is put to tender;
4. Project implementation – confirming compliance before commissioning;
5. Project operation – adapting to changing contexts.

The decision made at each of these points represents a commitment to action that will govern the course of future conduct and the allocation of resources. It is at these points that ministries and government agencies need to test compliance with preceding processes, before giving the green light to go on to the next stage. They are not exhaustive, and within each stage many other decisions have to be taken and agreements reached. The five stages and associated decision points need to be interpreted within the overall planning contexts of individual countries; and the Commission also noted that even when these decision points have been passed, there are certain steps that should be taken to improve outcomes (see Box 1 below).

Box 1 Dams in the pipeline

It is never too late to try and improve the outcomes of projects, even the many dam projects currently at various stages of planning and development. *Dams and Development* calls for an open and participatory review of all ongoing and planned projects, to see whether changes are needed to bring them into line with the WCD strategic priorities and policy principles. In general, regulators, developers and, where appropriate, financing agencies, should ensure that such a review:

- Uses stakeholder analysis based on the recognition of rights and assessment of risks to identify a stakeholder forum that is consulted on all relevant issues;
- Enables vulnerable and disadvantaged groups of stakeholders to participate in an informed manner;
- Includes a distribution analysis to see who bears the costs and who enjoys the benefits of the project;
- Develops agreed mitigation and resettlement measures to promote development opportunities and benefit displaced and adversely affected people;
- Avoids, through modified design, any severe and irreversible impacts on the ecosystem;
- Provides for an environmental flow requirement, and mitigates or compensates any unavoidable impacts on the ecosystem;
- Designs and implements recourse and compliance mechanisms.

The process of review implies added investigations or commitments, the renegotiation of contracts and the incorporation of a Compliance Plan. However, additional financial costs will be recouped in lower overall costs to operators, governments and society in general, as a consequence of avoiding negative outcomes and conflicts.

In the past, decision-making processes have taken little account of social, environmental, governance and compliance issues. The Commission therefore developed a set of criteria and twenty-six guidelines to complement the body of knowledge on good practices, and add value to current national and international guidelines, including those on the technical, economic and financial aspects of development. Used in conjunction with existing decision-making tools, these criteria and guidelines provide a new direction for appropriate and sustainable development. Bringing about this change will require concerted action from a number of quarters:

- Planners need to identify stakeholders through a process that recognises rights and assesses risks;
- States should invest more at an earlier stage of the process, to screen out inappropriate projects and facilitate integration across different sectors within the context of the river basin;
- Consultants and agencies have to ensure that outcomes from feasibility studies are socially and environmentally acceptable;
- All players should promote open and meaningful participation during planning and implementation, to achieve negotiated outcomes;
- Developers should take contractual responsibility for effectively mitigating social and environmental impacts;
- Independent reviewers need to improve compliance;
- Dam owners must apply the lessons learned from regularly monitoring past experiences and by adapting to changing needs and contexts.

WHAT NEXT?

The findings presented in *Dams and Development* are aimed at everyone involved in dams, from governments and the private sector, developers and owners, to civil society groups, international organisations and affected communities. The challenge now is to use the insights and proposals made in the report to reassess established procedures and involve all stakeholders - from the most powerful international players to the smallest communities - in making and implementing decisions about fundamental water and energy development choices.

The Commission proposes a number of entry points to help organisations start to act on the report, by:

- Carefully reviewing and actively disseminating the report;
- Issuing public statements of support for the approach taken;
- Using WCD criteria and guidelines to review dams currently being developed;
- Supporting investment in building capacity, particularly in developing countries, for options assessment and improved decision-making.

Specific proposals are included for national governments and line ministries, civil society groups, the private sector, bilateral aid agencies, multilateral development banks, export credit agencies, international organisations and academic and research bodies. These actions, outlined in Box 2 below, would facilitate permanent change and advance the principles of a more inclusive and equitable approach to development.

Box 2 Selected recommendations for key stakeholders in the debate on dams

National governments:

- Review existing procedures and regulations relating to large dam projects;
- Use time-bound licences for both public and privately owned dams;
- Establish an independent, multi-stakeholder committee to address unresolved issues caused by dams.

Civil society groups:

- Monitor compliance with agreements and assist any aggrieved party in resolving outstanding disagreements or seeking recourse;
- Actively assist in identifying stakeholders potentially affected by dam projects, using the rights-and-risks approach.

Organisations representing communities affected by dams:

- Identify unresolved social and environmental impacts and convince the relevant authorities to take effective steps to address them;
- Develop support networks and partnerships to strengthen the technical and legal capacity for needs and options assessment.

Professional associations:

- Develop processes for certifying compliance with WCD guidelines;
- Extend national and international databases, such as the ICCOLD World Register of Dams, to include social and environmental parameters.

Private sector:

- Develop and adopt voluntary codes of conduct, management systems and certification procedures for best ensuring and demonstrating compliance with the Commission's guidelines, including, for example, through the ISO 14001 management system standard;
- Abide by the provisions of the anti-bribery convention of the OECD;
- Adopt integrity pacts for all contracts and procurement.

Bilateral aid agencies and multilateral development banks:

- Ensure that any dam options for which financing is approved have been selected from an agreed system of ranking, and respect WCD guidelines;
- Accelerate the shift from project- to sector-based finance, by increasing financial and technical support for effective, transparent and participatory needs and options assessment, and by financing non-structural alternatives;
- Review the portfolio of projects to identify any that may have under-performed in the past or still present unresolved issues.

A considerable element of trust between all players will be needed to move forward with these proposals. This will require early and resolute action to address various unresolved issues, and assurances to countries in the early stages of economic development that, within certain parameters, dams may still be a viable water and energy development option.

While the debate over dams will continue for many years, the Commission has shown that it is possible to find common ground without compromising individual values or losing a sense of purpose. The framework for a new approach to dams as a development option has been established, but its strength and effectiveness will depend on all parties pursuing the process in good faith and signing up to fundamental changes in priorities and practices. The report leaves no doubt about the challenges ahead, ending with an explicit call to action:

> "*We have conducted the first comprehensive and global review of the performance of dams and their contribution to development. We have done this through an inclusive process that has brought all significant players into the debate. And we believe that we have shifted the centre of gravity in the dams debate to one focused on options assessment and participatory decision-making. The rights-and-risks approach we propose will raise the importance of the social and environmental dimensions of dams to a level once reserved for the economic dimension. We have told our story. What happens next is up to you.*"

MANITOBA
ORDER IN COUNCIL

DATE: **August 17, 2011**

ORDER IN COUNCIL NO.: **00304 / 2011**

RECOMMENDED BY: **Minister**

ORDER

1. Manitoba Hydro is authorized to enter into an agreement with Minnesota Power, an operating division of ALLETE, Inc. dated May 19, 2011 for the sale by Manitoba Hydro and the purchase by Minnesota Power, an operating division of ALLETE, Inc. of 250 megawatts of electrical generating capacity and associated energy.

2. Manitoba Hydro is authorized to enter into an agreement with Wisconsin Public Service Corporation dated May 19, 2011 for the sale by Manitoba Hydro and the purchase by Wisconsin Public Service Corporation of 100 megawatts of electrical generating capacity and associated energy.

3. Manitoba Hydro is authorized to enter into such agreements and do all things proper or necessary for the due exercise of the above.

AUTHORITY

The Manitoba Hydro Act, C.C.S.M. c. H 190, states:

Powers of corporation with approval of L. G. in C.
16(1) With the approval of the Lieutenant Governor in Council the corporation may

(h) supply power generated in Manitoba to any other province or state of the United States, or to any person in that other province or state;

(j) enter into agreements and do all things proper or necessary for the due exercise of the powers mentioned in this section.

BACKGROUND

1. Manitoba Hydro, Minnesota Power and Wisconsin Public Service have signed the subject agreements, subject to the approval of the Lieutenant Governor in Council.

2. The construction of new power generation and transmission facilities in the Province of Manitoba will be necessary in order to Manitoba Hydro to fulfil its commitments pursuant to the agreement.

What You Should Know About Megaprojects, and Why: An Overview

By
Bent Flyvbjerg
Professor and Founding Chair of Major Programme Management
Said Business School
Oxford University

Draft 9.2

Full reference: Bent Flyvbjerg, 2014, "What You Should Know about Megaprojects and Why: An Overview," *Project Management Journal*, vol. 45, no. 2, April-May, pp. 6-19, DOI: 10.1002/pmj.21409

Abstract

This paper takes stock of megaproject management, an emerging and hugely costly field of study. First, it answers the question of how large megaprojects are by measuring them in the units mega, giga, and tera, concluding we are presently entering a new "tera era" of trillion-dollar projects. Second, total global megaproject spending is assessed, at USD 6-9 trillion annually, or 8 percent of total global GDP, which denotes the biggest investment boom in human history. Third, four "sublimes" – political, technological, economic, and aesthetic – are identified to explain the increased size and frequency of megaprojects. Fourth, the "iron law of megaprojects" is laid out and documented: Over budget, over time, over and over again. Moreover, the "break-fix model" of megaproject management is introduced as an explanation of the iron law. Fifth, Albert O. Hirschman's theory of the Hiding Hand is revisited and critiqued as unfounded and corrupting for megaproject thinking in both the academy and policy. Sixth, it is shown how megaprojects are systematically subject to "survival of the unfittest," explaining why the worst projects get built instead of the best. Finally, it is argued that the conventional way of managing megaprojects has reached a "tension point," where tradition is challenged and reform is emerging.

Keywords: Megaproject management; Scale; Four sublimes; Iron law of megaprojects; Break-fix model of megaprojects; Hirschman's Principle of the Hiding Hand; Survival of the unfittest; Tension points

Mega, Giga, Tera: How Big Are Megaprojects?

Megaprojects are large-scale, complex ventures that typically cost a billion dollars or more, take many years to develop and build, involve multiple public and private stakeholders, are transformational, and impact millions of people.[1] Hirschman (1995: vii, xi) calls such projects "privileged particles of the development process" and points out that often they are "trait making," that is, they are designed to ambitiously change the structure of society, as opposed to smaller and more conventional projects that are "trait taking," i.e., they fit into pre-existing structures and do not attempt to modify these. Megaprojects, therefore, are not just magnified versions of smaller projects. Megaprojects are a completely different breed of project in terms of their level of aspiration, lead times, complexity, and stakeholder involvement. Consequently, they are also a very different type of project to manage. A colleague likes to say that if managers of conventional projects need the equivalent of a driver's license to do what they do then managers of megaprojects need a pilot's jumbo jet license.[2] And just like you would not want someone with only a driver's license to fly a jumbo, you don't want conventional project managers to manage megaprojects.

Megaprojects are increasingly used as the preferred delivery model for goods and services across a range of businesses and sectors, like infrastructure, water and energy, information technology, industrial processing plants, mining, supply chains, enterprise systems, strategic corporate initiatives and change programs, mergers and acquisitions, government administrative systems, banking, defense, intelligence, air and space exploration, big science, urban regeneration, and major events. Examples of megaprojects are high-speed rail lines, airports, seaports, motorways, hospitals, national health or pension ICT systems, national broadband, the Olympics, large-scale signature architecture, dams, wind farms, offshore oil and gas extraction, aluminum smelters, the development of new aircrafts, the largest container and cruise ships, high-energy particle accelerators, and the logistics systems used to run large supply-chain-based companies like Amazon and Maersk. Below we will see just how big megaprojects and the megaprojects business are. We will also understand what drives scale.

To illustrate just how big megaprojects are, consider one of the largest dollar figures from public economic debate in recent years, the size of US debt to China. This debt is around one trillion US dollars and is considered so large it may destabilize the world economy if the debt is not managed prudently. With this supersize measuring rod, now consider the fact that the combined cost of just two of the world's largest megaprojects – the Joint Strike Fighter aircraft program and China's high-speed rail project – is more than half of this figure, at 700 billion dollars (see Figure 1). The cost of a mere handful of the largest megaprojects in the world will dwarf almost any other economic figure, and certainly any investment figure.

[Figure 1 app. here]

However, not only are megaprojects large, they are constantly growing ever larger in a long historical trend with no end in sight. When New York's Chrysler Building opened in 1930 at 319 meters it was the tallest building in the world. The record has since been surpassed seven times and from 1998 the tallest building has significantly been located in emerging economies with Dubai's Burj Khalifa presently holding the record at 828 meters. That is a 160 percent increase in building height over 80 years. Similarly, the longest bridge span has grown even faster, by 260 percent over approximately the same period. Measured by value, the size of infrastructure projects has grown by 1.5 to 2.5 percent annually in real terms over the past century, which is equivalent to a doubling in project size two to three times per century (author's megaprojects database). The size of ICT projects, the new kid on the block, has grown much faster, as illustrated by a 16-fold increase from 1993 to 2009 in lines of code in Microsoft Windows, from five to 80 million lines. Other types of megaprojects, from the Olympics to industrial projects, have seen similar developments. Coping with increased scale is therefore a constant and pressing issue in megaproject management.

"Mega" comes from the Greek word "megas" and means great, large, vast, big, high, tall, mighty, and important. As a scientific and technical unit of measurement "mega" specifically means a million. If we were to use this unit of measurement in economic terms, then strictly speaking megaprojects would be million-dollar (or euro, pound, etc.) projects, and for more than a hundred years the largest projects in the world were indeed measured mostly in the millions. This changed with the Second World War, Cold War, and Space Race. Project costs now escalated to the billions, led by the Manhattan Project (1939-46), a research and development program that produced the first atomic bomb, and later the Apollo program (1961-72), which landed the first humans on the moon (Morris, 1994; Flyvbjerg, 2014). According to Merriam-Webster, the first known use of the term "megaproject" was in 1976, but before that, from 1968, "mega" was used in "megacity" and later, from 1982, as a standalone adjective to indicate "very large."

Thus the term "megaproject" caught on just as the largest projects technically were megaprojects no more, but, to be accurate, "gigaprojects" – "giga" being the unit of measurement meaning a billion. However, the term "gigaproject" never really caught on. A Google search reveals that the word "megaproject" is used 27 times more frequently on the web than the term "gigaproject". For the largest of this type of project, costs of 50-100 billion dollars are now common, as for the California and UK high-speed rail projects, and costs above 100 billion dollars not uncommon, as for the International

Space Station and the Joint Strike Fighter. If they were nations, projects of this size would rank among the world's top 100 countries measured by gross domestic product, larger than the economies of, for example, Kenya or Guatemala. When projects of this size go wrong, whole companies and national economies suffer.

"Tera" is the next unit up, as the measurement for a trillion (a thousand billion). Recent developments in the size of the very largest projects and programs indicate we may presently be entering the "tera era" of large-scale project management. If we consider as projects the stimulus packages that were launched by the United States, Europe, and China to mitigate the effects of the 2008 financial and economic crises, then we may speak of trillion-dollar projects and thus of "teraprojects." Similarly, if the major acquisition program portfolio of the United States Department of Defense – which was valued at 1.6 trillion dollars in 2013 – is considered a large-scale project, then this, again, would be a teraproject (United States Government Accountability Office, 2013: 2). Projects of this size compare with the GDP of the world's top 20 nations, similar in size to the national economies of for example Australia or Canada. There is no indication that the relentless drive to scale is abating in megaproject development. Quite the opposite; scale seems to be accelerating.

How Big Is the Megaprojects Business?

But megaprojects are not only large and growing constantly larger, they are also being built in ever greater numbers at ever greater value. The McKinsey Global Institute (2013) estimates global infrastructure spending at USD 3.4 trillion per year 2013-2030, or approximately four percent of total global gross domestic product, mainly delivered as large-scale projects. *The Economist* (June 7, 2008: 80) similarly estimated infrastructure spending in emerging economies at USD 2.2 trillion annually for the period 2009-2018.

To illustrate the accelerated pace at which spending is taking place, consider that in the five years from 2004 to 2008, China spent more on infrastructure in real terms than in the whole of the 20th Century. That is an increase in spending rate of a factor twenty. Similarly, from 2005 to 2008, China built as many kilometers of high-speed rail as Europe did in two decades, and Europe was extraordinarily busy building this type of infrastructure during this period. Not at any time in the history of mankind has infrastructure spending been this high measured as a share of world GDP, according to *The Economist*, who calls it "the biggest investment boom in history." And that's just infrastructure.

If we include the many other fields where megaprojects are a main delivery model – oil and gas, mining, aerospace, defense, ICT, supply chains, mega events, etc. – then a conservative estimate for the global megaproject market is USD 6-9 trillion per year, or approximately eight percent of total global gross domestic product. For perspective, consider this is equivalent to spending five to eight times the accumulated US debt to China, *every year*. That's big business by any definition of the term.

Moreover, megaprojects have proved remarkably recession proof. In fact, the downturn from 2008 helped the megaprojects business grow further by showering stimulus spending on everything from transportation infrastructure to ICT. From being a fringe activity – albeit a spectacular one – mainly reserved for rich, developed nations, megaprojects have recently transformed into a global multi-trillion-dollar business that affects all aspects of our lives, from our electricity bill to how we shop and what we do on the Internet to how we commute.

With so many resources tied up in ever-larger and ever-more megaprojects, at no time has the management of such projects been more important. The potential benefits of building the right projects in the right manner are enormous and are only matched by the potential waste from building the wrong projects, or building projects wrongly. Never has it been more important to choose the most fitting projects and get their economic, social, and environmental impacts right (Flyvbjerg el al., 2003). Never has systematic and valid knowledge about megaprojects therefore been more important to inform policy, practice, and public debate in this highly costly area of business and government.

The Four Sublimes

What drives the megaproject boom described above? Why are megaprojects so attractive to decision makers? The answer may be found in the so-called "four sublimes" of megaproject management (see Table 1). The first of these, the "technological sublime," is a term variously attributed to Miller (1965) and Marx (1967) to describe the positive historical reception of technology in American culture during the nineteenth and early twentieth centuries. Frick (2008) introduced the term to the study of megaprojects and here describes the technological sublime as the rapture engineers and technologists get from building large and innovative projects with their rich opportunities for pushing the boundaries for what technology can do, like building the tallest building, the longest bridge, the fastest aircraft, the largest wind turbine, or the first of anything. Frick applied the concept in a case study of the multi-billion-dollar New San Francisco-Oakland Bay Bridge, concluding "the technological sublime dramatically influenced bridge design, project outcomes, public debate, and the lack of accountability for its [the bridge's] excessive cost overruns" (239).

Flyvbjerg (2012, 2014) proposed three additional sublimes, beginning with the "political sublime," which here is understood as the rapture politicians get from building monuments to themselves and their causes. Megaprojects are manifest, garner attention, and lend an air of proactiveness to their promoters. Moreover, they are media magnets, which appeals to politicians who seem to enjoy few things better than the visibility they get from starting megaprojects. Except maybe cutting the ribbon of one in the company of royals or presidents, who are likely to be present lured by the unique monumentality and historical import of many megaprojects. This is the type of public exposure that helps get politicians re-elected. They therefore actively seek it out.

Next there is the "economic sublime," which is the delight business people and trade unions get from making lots of money and jobs off megaprojects. Given the enormous budgets for megaprojects there are ample funds to go around for all, including contractors, engineers, architects, consultants, construction and transportation workers, bankers, investors, landowners, lawyers, and developers. Finally, the "aesthetic sublime" is the pleasure designers and people who appreciate good design get from building, using, and looking at something very large that is also iconically beautiful, like San Francisco's Golden Gate bridge or Sydney's Opera House.

All four sublimes are important drivers of the scale and frequency of megaprojects described above. Taken together they ensure that strong coalitions exist of stakeholders who benefit from megaprojects and who will therefore work for more such projects.

[Table 1 app. here]

For policy makers, investment in infrastructure megaprojects seems particularly coveted, because, if done right, such investment:

- Creates and sustains employment.
- Contains a large element of domestic inputs relative to imports.
- Improves productivity and competitiveness by lowering producer costs.
- Benefits consumers through higher-quality services.
- Improves the environment when infrastructures that are environmentally sound replace infrastructures that are not (Helm, 2008: 1).

But there is a big "if" here, as in "if done right." Only if this is disregarded – as it often is by promoters and decision makers for megaprojects – can megaprojects be seen as an effective way to deliver infrastructure. In fact, conventional megaproject delivery – infrastructure and other – is highly problematic with a dismal performance record in terms of actual costs and benefits, as we will see below. The following characteristics of megaprojects are typically overlooked or glossed over when the four sublimes are at play and the megaproject format is chosen for delivery of large-scale ventures:

1. Megaprojects are inherently risky due to long planning horizons and complex interfaces (Flyvbjerg, 2006).
2. Often projects are led by planners and managers without deep domain experience who keep changing throughout the long project cycles that apply to megaprojects, leaving leadership weak.
3. Decision-making, planning, and management are typically multi-actor processes involving multiple stakeholders, public and private, with conflicting interests (Aaltonen and Kujala, 2010).
4. Technology and designs are often non-standard, leading to "uniqueness bias" amongst planners and managers, who tend to see their projects as singular, which impedes learning from other projects.[3]
5. Frequently there is overcommitment to a certain project concept at an early stage, resulting in “lock-in” or “capture,” leaving alternatives analysis weak or absent, and leading to escalated commitment in later stages. "Fail fast" does not apply; "fail slow" does (Cantarelli et al., 2010; Ross and Staw, 1993; Drummond, 1998).
6. Due to the large sums of money involved, principal-agent problems and rent-seeking behavior are common, as is optimism bias (Eisenhardt, 1989; Stiglitz, 1989; Flyvbjerg el al., 2009).
7. The project scope or ambition level will typically change significantly over time.
8. Delivery is a high-risk, stochastic activity, with overexposure to so-called "black swans," i.e., extreme events with massively negative outcomes (Taleb, 2010). Managers tend to ignore this, treating projects as if they exist largely in a deterministic Newtonian world of cause, effect, and control.
9. Statistical evidence shows that such complexity and unplanned events are often unaccounted for, leaving budget and time contingencies inadequate.
10. As a consequence, misinformation about costs, schedules, benefits, and risks is the norm throughout project development and decision-making. The result is cost overruns, delays, and benefit shortfalls that undermine project viability during project implementation and operations.

In the next section, we will see just how big and frequent such cost overruns, delays, and benefit shortfalls are.

The Iron Law of Megaprojects

Performance data for megaprojects speak their own language. Nine out of ten such projects have cost overruns. Overruns of up to 50 percent in real terms are common, over 50 percent not uncommon. Cost overrun for the Channel tunnel, the longest underwater rail tunnel in Europe, connecting the UK and France, was 80 percent in real terms. For Denver International Airport, 200 percent. Boston's Big Dig, 220 percent. The UK National Health Service IT system, 400-700 percent. The Sydney Opera House, 1,400 percent (see more examples in Table 2). Overrun is a problem in private as well as public sector projects, and things are not improving; overruns have stayed high and constant for the 70-year period for which comparable data exist. Geography also does not seem to matter; all countries and continents for which data are available suffer from overrun. Similarly, benefit shortfalls of up to 50 percent are also common, and above 50 percent not uncommon, again with no signs of improvements over time and geography (Flyvbjerg et al., 2002, 2005).

[Table 2 app. here]

Combine the large cost overruns and benefit shortfalls with the fact that business cases, cost-benefit analyses, and social and environmental impact assessments are typically at the core of planning and decision-making for megaprojects and we see that such analyses can generally not be trusted. For instance, for rail projects an average cost overrun of 44.7 percent combines with an average demand shortfall of 51.4 percent, and for roads, an average cost overrun of 20.4 percent combines with a fifty–fifty risk that demand is also wrong by more than 20 percent. With errors and biases of such magnitude in the forecasts that form basis for business cases, cost–benefit analyses, and social and environmental impact assessments, such analyses will also, with a high degree of certainty, be strongly misleading. "Garbage in, garbage out," as the saying goes (Flyvbjerg, 2009).

As a case in point, consider the Channel tunnel in more detail. This project was originally promoted as highly beneficial both economically and financially. At the initial public offering, Eurotunnel, the private owner of the tunnel, tempted investors by telling them that 10 percent "would be a reasonable allowance for the possible impact of unforeseen circumstances on construction costs."[4] In fact, costs went 80 percent over budget for construction, as mentioned above, and 140 percent for financing.

Revenues have been half of those forecasted. As a consequence the project has proved non-viable, with an internal rate of return on the investment that is negative, at minus 14.5 percent with a total loss to the British economy of 17.8 billion US dollars. Thus the Channel tunnel detracts from the economy instead of adding to it. This is difficult to believe when you use the service, which is fast, convenient, and competitive with alternative modes of travel. But in fact each passenger is heavily subsidized. Not by the taxpayer this time, but by the many private investors who lost their money when Eurotunnel went insolvent and was financially restructured. This drives home an important point: A megaproject may well be a technological success, but a financial failure, and many are. An economic and financial ex post evaluation of the Channel tunnel, which systematically compared actual with forecasted costs and benefits, concluded that "the British Economy would have been better off had the Tunnel never been constructed" (Anguera, 2006: 291). Other examples of non-viable megaprojects are Sydney's Lane Cove tunnel, the high-speed rail connections at Stockholm and Oslo airports, the Copenhagen metro, and Denmark's Great Belt tunnel, the second-longest under-water rail tunnel in Europe, after the Channel tunnel.

Large-scale ICT projects are even more risky. One in six such projects become a statistical outlier in terms of cost overrun with an average overrun for outliers of 200 percent in real terms. This is a 2,000 percent overincidence of outliers compared to normal and a 200 percent overincidence compared to large construction projects, which are also plagued by cost outliers (Flyvbjerg and Budzier, 2011). Total project waste from failed and underperforming ICT projects for the United States alone has been estimated at 55 billion dollars annually by the Standish Group (2009).

Delays are a separate problem for megaprojects and delays cause both cost overruns and benefit shortfalls. For instance, preliminary results from a study undertaken at Oxford University, based on the largest database of its kind, suggest that delays on dams are 45 percent on average. Thus if a dam was planned to take 10 years to execute, from the decision to build until the dam became operational, then it actually took 14.5 years on average. Flyvbjerg et al. (2004) modeled the relationship between cost overrun and length of implementation phase based on a large data set for major construction projects. They found that on average a one-year delay or other extension of the implementation phase correlates with an increase in percentage cost overrun of 4.64 percent.

To illustrate, for a project the size of London's 26 billion dollars Crossrail project, a one-year delay would cost 1.2 billion dollars extra, or 3.3 million dollars per day. The key lesson here is that in order to keep costs down, implementation phases should be kept short and delays small. This should not be seen as an excuse for fast-tracking projects, i.e., rushing them through decision making for early construction start. Front-end planning needs to be thorough before deciding whether to give the green light to a project or stopping it (Williams and Samset, 2010). But often the situation is the exact opposite. Front-end planning is scant, bad projects are not stopped, implementation phases and delays are long, costs soar, and benefits and revenue realization recedes into the future. For debt-financed projects this is a recipe for disaster, because project debt grows while there is no revenue stream to service interest payments, which are then added to the debt, etc. As a result, many projects end up in the so-called "debt trap" where a combination of escalating construction costs, delays, and increasing interest payments makes it impossible for income from a project to cover costs, rendering the project non-viable. That is what happened to the Channel tunnel and Sydney's Lane Cove tunnel, among other projects.

This is not to say projects do not exist that were built on budget and time and delivered the promised benefits. The Guggenheim Museum Bilbao is an example of that rare breed of project. Similarly, recent metro extensions in Madrid were built on time and to budget (Flyvbjerg, 2005) as were a number of industrial projects (Merrow, 2011). It is particularly important to study such projects to understand the causes of success and test whether success may be replicated elsewhere. It is far easier, however, to produce long lists of projects that have failed in terms of cost overruns and benefit shortfalls than it is to produce lists of projects that have succeeded. To illustrate, as part of ongoing research on success in megaproject management the present author and his associates are trying to establish a sample of successful projects large enough to allow statistically valid answers. But so far they have failed. Why? Because success is so rare in megaproject management that at present it can be studied only as small-sample research, whereas failure may be studied with large samples of projects.

Success in megaproject management is typically defined as projects being delivered on budget, time, and benefits. If, as the evidence indicates, approximately one out of ten megaprojects is on budget, one out of ten is on schedule, and one out of ten is on benefits, then approximately one in a thousand projects is a success, defined as on target for all three. Even if the numbers were wrong by a factor two – so that two, instead of one, out of ten projects were on target for cost, schedule, and benefits, respectively – the success rate would still be dismal, now eight in a thousand. This serves to illustrate what may be called the "iron law of megaprojects": *Over budget, over time, over and over again* (Flyvbjerg, 2011).[5] Best practice is an outlier, average practice a disaster in this interesting and very costly area of management.

The "Break-Fix Model" of Megaproject Management

The above analysis leaves us with a genuine paradox, the so-called "megaprojects paradox," first identified by Flyvbjerg et al. (2003: 1-10). On one side of the paradox, megaprojects as a delivery model for public and private ventures have never been more in demand, and the size and frequency of megaprojects have never been larger. On the other side, performance in megaproject management is strikingly poor and has not improved for the 70-year period for which comparable data are available, at least not when measured in terms of cost overruns, schedule delays, and benefit shortfalls.

Today, megaproject planners and managers are stuck in this paradox because their main delivery method is what has been called the "break-fix model" for megaproject management.[6] Generally, megaproject planners and managers – and their organizations – do not know how to deliver successful megaprojects, or do not have the incentives to do so, and therefore such projects tend to "break" sooner or later, for instance when reality catches up with optimistic, or manipulated, estimates of schedule, costs, or benefits; and delays, cost overruns, etc. follow. Projects are then often paused and reorganized – sometimes also refinanced – in an attempt to "fix" problems and deliver some version of the initially planned project with a semblance of success. Typically lock-in and escalation make it impossible to drop projects altogether, which is why megaprojects have been called the "Vietnams" of policy and management: "easy to begin and difficult and expensive to stop" (White, 2012; also Cantarelli el al., 2010; Ross and Staw, 1993, Drummond, 1998). The "fix" often takes place at great and unexpected cost to those stakeholders who were not in the know of what was going on and were unable to or lacked the foresight to pull out before the break.

The break-fix model is wasteful and leads to misallocation of resources, in both organizations and society, for the simple reason that under this model decisions to go ahead with projects are based on misinformation more than on information. The degree of misinformation varies significantly from project to project, as documented by the large standard deviations that apply to cost overruns and benefit shortfalls (Flyvbjerg et al., 2002, 2005). We may therefore *not* assume, as is often done, that on average all projects are misrepresented by approximately the same degree and, therefore, we are still building the best projects, even if they are not as good as they appear on paper. The truth is, we don't know, and often projects turn out to bring a net loss to the economy, instead of a gain. The cure to the break-fix model is to get projects right from the outset so they don't break, through proper front-end management.

Hirschman's Hiding Hand, Revisited

One may argue, of course, as famously done by Hirschman (1967a: 12-13), that if people knew in advance the real costs and challenges involved in delivering a large project, "they probably would never have touched it" and nothing would ever get built. So it is better not to know, because ignorance helps get projects started, according to this argument. The following is a recent and particularly candid articulation of the nothing-would-ever-get-built argument, by former California State Assembly speaker and mayor of San Francisco, Willie Brown, discussing a large cost overrun on the San Francisco Transbay Terminal megaproject in his *San Francisco Chronicle* column (July 28, 2013, emphasis added):

> "News that the Transbay Terminal is something like $300 million over budget should not come as a shock to anyone. We always knew the initial estimate was way under the real cost. Just like we never had a real cost for the [San Francisco] Central Subway or the [San Francisco-Oakland] Bay Bridge or any other massive construction project. So get off it. In the world of civic projects, the first budget is really just a down payment. *If people knew the real cost from the start, nothing would ever be approved*. The idea is to get going. Start digging a hole and make it so big, there's no alternative to coming up with the money to fill it in."

Rarely has the tactical use by project advocates of cost underestimation, sunk costs, and lock-in to get projects started been expressed by an insider more plainly, if somewhat cynically. It is easy to obtain such statements off the record, but few are willing to officially lend their name to them, for legal and ethical reasons to which we will return. Nevertheless, the nothing-would-ever-get-built argument has been influential with both practitioners and academics in megaproject management. The argument is deeply flawed, however, and thus deserves a degree of attention and critique. Hirschman's text contains the classic formulation of the argument and has served widely as its theoretical justification, as has Sawyer (1952), who directly inspired and influenced Hirschman.[7] A recent celebration of Hirschman's thinking on this point may be found in Gladwell (2013).

Hirschman (1967a: 13-14) observed that humans are "tricked" into doing big projects by their own ignorance. He saw this as positive because just as humans underestimate the difficulties in doing large-scale projects they also underestimate their own creativity in dealing with the difficulties, he believed, and "the only way in which we can bring our creative sources fully into play is by misjudging the nature of the task, by presenting it to ourselves as more routine, simple, undemanding of genuine creativity than it will turn out to be." Hirschman called this the "principle of the Hiding Hand" and it consists of "some sort of invisible or hidden hand that beneficially hides difficulties for us," where the error of underestimating difficulties is offset by a "roughly similar" error in underestimating our ability to overcome the difficulties thus helping "accelerate the rate at which 'mankind' engages successfully in problem-solving."

Sawyer (1952: 199, 203) – in a study of early industrial infrastructure projects that he called a work "in praise of folly" – similarly identified what he called "creative error" in project development as, first, "miscalculation or sheer ignorance" of the true costs and benefits of projects and, second, such miscalculation being "crucial to getting an enterprise launched at all." Sawyer argued that such "creative error" was key to building a number of large and historically important projects like the Welland Canal between Lake Erie and Lake Ontario, the Panama Canal, the Middlesex Canal, the Troy and Greenfield Railroad, and early Ohio roads. For these and other projects, Sawyer found that "the error in estimating costs was at least offset by a corresponding error in the estimation of demand" (p. 200). Hirschman (1967a: 16) explicitly mentioned Sawyer as an inspiration and his "creative error" as a close "approximation" to the Hiding Hand principle.

It is easy to understand why Hirschman's and Sawyer's theories have become popular, especially with people who benefit from megaprojects. The theories encourage promoters and decision makers, like Willie Brown above, to just go ahead with projects and not worry too much about the costs or other problems, because the Hiding Hand will take care of them, eventually. And, in any case, who wants to be the killjoy stopping large projects from going ahead by an overdose of truth? Hirschman (1967b) was an immediate hit with practitioners, from Washington's policy establishment to the United Nations to the World Bank. The head of the bank's Economics Department told Hirschman, "You've helped in part to remove the unease that I have had in reflecting on the fact that if our modern project techniques had been used, much of the existing development in the world would never have been undertaken" (Adelman, 2013: 405). Hirschman's thinking also eventually penetrated academia. Teitz and Skaburskis (2003) follow the Hiding Hand logic when they ask of the huge cost overrun on the Sydney Opera House, “Did people really think that the Sydney Opera House would come in on budget? Or did we all agree to accept the deception and engage in wishful thinking in order to make something that we really wanted happen? ... [D]o Australians really regret those dramatic sails in the harbour? Or would they have regretted more the decision [not to build] that would most reasonably have been based on a fair prediction of costs?”

The logic is seductive, yet precarious. In retrospect, of course Australians do not regret the Sydney Opera House, given what it has done for Australia – though at first the building was not called "dramatic sails in the harbour," but “copulating white turtles” and “something that is crawling out of the ocean with nothing good in mind” designed by an architect with “lousy taste” (Reichold and Graf, 2004: 168). Non-Australians may feel regret, however, for instance the architect of the Opera House, what's his name? Does anybody know? Only few do, which seems surprising given we are talking about the architect of arguably the most iconic building of the 20th century. And if anybody knows the architect is the Dane Jørn Utzon, how come they can hardly ever mention another building designed by him? Because the overrun on the Opera House and the following controversy destroyed Utzon's career and kept him from building more masterpieces. He became that most tragic figure in architecture, the one-building-architect. This is the real regret – and real cost – of the Sydney Opera House. Not premier Joe Cahill's deliberate deception about the cost – to get approval in Parliament – and the consequential huge cost overrun (Flyvbjerg, 2005).

In a meeting held in support of Utzon at Sydney Town Hall in March 1966 – six weeks before the controversy made Utzon leave Australia and the Opera House, in the middle of construction and never to return – the Vienneseborn Australian architect Harry Seidler said, “If Mr. Utzon leaves, a crime will have been committed against future generations of Australians” (Murray, 2004: 105). Seidler was more right than he could have imagined, except the crime would not be limited to Australians, it became a crime against lovers of great architecture everywhere. After winning the Pritzker Prize – the Nobel of architecture – in 2003, Utzon again became widely acclaimed, even in Australia, where the Sydney Opera tour guides for years had been forbidden to even mention his name. But it was too late. Utzon was now 85 and he had not built anything major for decades. So instead of having a whole oeuvre to enjoy, as we have for other architects of his caliber, we have just the one main building. Utzon was 38 when he won the competition for the Opera House – how would the work of the mature master have enriched our lives? We will never know.

As a thought experiment, consider the collected works of architect Frank Gehry, who is in the same league as Utzon; then consider which building you would choose, could you choose only one, and the rest would have to go. So if you chose, say, the Guggenheim Museum Bilbao, then Los Angeles' Disney Concert Hall, Chicago's Jay Pritzker Pavilion, Prague's Dancing House, Seattle's Experience Music Project Museum, etc. would be eliminated. This illustrates the high price the government of New South Wales has imposed on the world by mismanaging the planning of the Sydney Opera House and deliberately playing the game of creative error and Hiding Hand. Even if the Opera House may be an extreme case, Sydney drives home an important point: managing by creative error is risky and disruptive, sometimes in drastic and unexpected ways, and the Hiding Hand isn't big enough to hide all, or even most, errors.

Hirschman's and Sawyer's theories are also flawed at a more basic level, that of validity. A close look reveals the theories to be based on small samples and biased data. Hirschman studied only 11 projects, or a few more if we count subprojects, Sawyer ten to 15. This important fact is typically ignored when the Hiding Hand principle is discussed. Hirschman (1967a: 7, 14) seemed aware of the weak foundations and limited applicability of the principle when he called it "speculative" and useful only "[u]p to a point." To a colleague he admitted at the time of publication that his book was "an exploration, an experiment;" to another he said he had deliberately biased his analysis "to emphasize unexpected successes" (Adelman, 2013: 404-5). Even so, Hirschman went on to call the Hiding Hand a "general principle of action" and brazenly used a name for it with clear connotations to Adam Smith's famous Invisible (Hidden) Hand. Evidently, the temptation to formulate an "economic law" was too strong, despite the weak and biased data. Sawyer (1952: 204) warned the reader up front that his study must be considered a "marginal and distinctly limited note." He admitted the study considers only a "quite special kind of case" and neglects projects that were "failures" in order to focus on projects that were "successful" in the sense that "an original gross miscalculation as to costs ... was happily offset by at least a corresponding underestimation of demand." Sawyer's results thus do not describe a general characteristic of large projects, but a characteristic of his biased sample that includes only projects lucky enough to have had large underestimates of costs compensated by similarly large or larger underestimates of demand. Some would call this data fishing and the only redeeming factor is that Sawyer was disarmingly honest and tongue-in-cheek humoristic about it. He appears to not have expected to be taken wholly seriously, which unfortunately he was by some, including Hirschman.

Today we have much better data and theories on megaproject performance than at the time of Hirschman and Sawyer. We now know that, while there may be elements of truth in these authors' theories for certain types of projects and contexts, their samples and conclusions are not representative of the project population. In particular, their odd asymmetrical assumption that optimism would apply to cost estimates but pessimism to estimates of benefits has been solidly disproved by Kahneman and Tversky (1979a, b) and behavioral economists building on their work. They found that optimism bias applies to estimates of costs and benefits, both. An optimistic cost estimate is low and leads to cost overrun, whereas an optimistic benefit estimate is high and results in benefit shortfalls. Thus errors of estimation do not cancel each other out, as Hirschman would have it; the exact opposite happens, errors generally reinforce each other.

Megaproject planners and managers would therefore be ill advised to count on Hiding Hands, creative errors, or any other general principle according to which underestimates of costs would be balanced by similar underestimates of benefits. We also now know it would be equally foolhardy to assume that downstream human creativity may be generally counted on to solve problems that planners and managers overlook or underestimate when the decision is made to go ahead with a project. The data show that for too many projects with front-end problems such creativity never materializes and projects end up seriously impaired or non-viable. Initial problems, if not dealt with up front, tend not to go away. The iron law of megaprojects, described above, trumps Hirschman's Hiding Hand at a high level of statistical significance, and we know why. The Hiding Hand is itself an example of optimism and does therefore not capture the reality of megaproject management. For such capture, and true explanatory power, we must turn to theories of optimism bias, the planning fallacy, strategic misrepresentation, and principal-agent behavior.

Survival of the Unfittest

In sum, one does megaprojects – and megaproject management – a disservice if one claims they can only be done through the Hiding Hand, creative error, or downright deception. It is, undoubtedly, quite common for project promoters and their planners and managers to believe their projects will benefit society and that, therefore, they are justified in "cooking" costs and benefits to get projects built (Wachs, 1990; Pickrell, 1992). Such reasoning is faulty, however. Underestimating costs and overestimating benefits for a given project – which is the common pattern, as described above – leads to a falsely high benefit-cost ratio for that project, which in turn leads to two problems. First, the project may be started despite the fact it is not financially and economically viable. Or, second, it may be started instead of another project that would have shown itself to yield higher returns than the project started, had the real costs and benefits of both projects been known. Both cases result in Pareto inefficiency, that is, the misallocation of resources and, for public projects, waste of taxpayers' money. Thus for reasons of economic efficiency alone the argument must be rejected that cost underestimation and benefit overestimation are justified to get projects started.

But the argument must also be rejected for legal and ethical reasons. In most democracies, for project promoters, planners, and managers to deliberately misinform legislators, administrators, bankers, the public, and the media about costs and benefits would not only be considered unethical but in some instances also unlawful, for instance where civil servants would intentionally misinform cabinet members, or cabinet members would intentionally misinform parliament. In private corporations, Sarbanes-Oxley-like legislation similarly makes deliberate misrepresentation a crime under many circumstances, which in the US is punishable with prison up to 20 years.[8] There is a formal "obligation to truth" built into most democratic constitutions – and now also in legislation for corporate governance – as a means for enforcing accountability. This obligation would be violated by deliberate misrepresentation of costs and benefits, whatever the reasons for such misrepresentation may be. Not only economic efficiency would suffer but also democracy, good governance, and accountability.

A first answer to the skeptics' question of whether enough megaprojects would be undertaken if some form of misrepresentation of costs and benefits was not involved is, therefore, that even if misrepresentation was necessary in order to get projects started, such misrepresentation would typically not be defensible in liberal democracies – and especially not if it was deliberate – for economic, legal, and ethical reasons.

A second answer is that misrepresentation is not necessary to undertake projects, because many projects exist with sufficiently high benefits and low enough costs to justify building them. Even in the field of innovative and complex architecture, which is often singled out as particularly difficult, there is the Basque Abandoibarra urban regeneration project, including the Guggenheim Museum Bilbao, which is as complex, innovative, and iconic as any signature architecture, and was built on time and budget. Complex rail projects, too, like the Paris-Lyon high-speed rail line and the London Docklands light railway extension have been built to budget. The problem is not that projects worth undertaking do not exist or cannot be built on time and budget. The problem is that the dubious and widespread practices of underestimating costs and overestimating benefits used by many megaproject promoters, planners, and managers to promote *their* pet project create a distorted hall-of-mirrors in which it is extremely difficult to decide which projects deserve undertaking and which not.

In fact the situation is even worse than that. The common practice of depending on the Hiding Hand or creative error in estimating costs and benefits – thus "showing the project at its best" as an interviewee put it in a previous study – results in an inverted Darwinism, i.e., the "survival of the unfittest" (Flyvbjerg, 2009: 352). It is not the best projects that get implemented in this manner, but the projects that look best on paper. And the projects that look best on paper are the projects with the largest cost underestimates and benefit overestimates, other things being equal. But the larger the cost underestimate on paper, the greater the cost overrun in practice. And the larger the overestimate of benefits, the greater the benefit shortfall. Therefore the projects that have been made to look best on paper become the worst, or unfittest, projects in reality, in the sense that they are the very projects that will encounter most problems during construction and operations in terms of the largest cost overruns, benefit shortfalls, and risks of non-viability. They have been designed like that, as disasters waiting to happen.

The result is, as even the industry’s own organ, the Major Projects Association, has said, that “too many projects proceed that should not have done” (Morris and Hough, 1987: 214). One might add that projects also exist that do not proceed but should have, had they not lost out, not to better projects but to projects with “better” creative error, that is "better" manipulated estimates of costs and benefits.

Light at the End of the Tunnel?

Fortunately, signs of improvement in megaproject management have recently appeared. The tacit consensus that misrepresentation is an acceptable business model for project development is under attack. Shortly after taking office, President Obama openly identified “the costly overruns, the fraud and abuse, the endless excuses” in public procurement for major projects as key policy problems (White House, 2009). The *Washington Post* rightly called this “a dramatic new form of discourse” (Froomkin, 2009). Other countries are seeing similar developments. Before Obama it was not common in government or business to talk openly about overruns, fraud, and abuse in relation to megaprojects, although they were widespread then as now. The few who did so were ostracized. However, as emphasized by Wittgenstein (2009), we cannot solve problems we cannot talk about. So talking is the first step.

A more material driver of improvement is the fact that the largest projects are now so big and consequential in relation to individual businesses and agencies that cost overruns, benefit shortfalls, and risks from even a single project may bring down executives and whole corporations. This happened with the Airbus A380 superjumbo, when delays, cost overruns, and revenue shortfalls cost the CEO and other top managers their jobs. The CEO of BP was similarly forced to step down and the company lost more than half its value when the Deepwater Horizon offshore oil drilling rig caught fire and caused the world's largest oil spill in the Gulf of Mexico in 2010. At Kmart, a large US retailer, the entire company went bankrupt when a new multi-billion-dollar ICT enterprise system, which was supposed to make Kmart competitive with Walmart and Target, went off the rails (Flyvbjerg and Budzier, 2011). In China, corruption and related safety issues on the country's 300 billion dollar high-speed rail program have caused massive reputational damage, and cost the railway minister his political life in 2011. Today, if you are a CEO, minister, permanent secretary, or other top manager and want to be sure to keep your job, you will want to manage your megaprojects properly. Episodes like these have triggered leaders to begin looking for better megaproject delivery.

Even the wealth of whole cities and nations may be affected by a single megaproject failure. In Hong Kong, months of hiccups at the opening of a new international airport made traffic go elsewhere resulting in a fall in GNP for the entire city state. For Greece, a contributing factor to the country's 2011 debt default was the 2004 Athens Olympics, where cost overruns and incurred debt were so large they negatively affected the credit rating of the whole nation, substantially weakening the economy in the years before the 2008 international financial crisis. This resulted in a double dip, and disaster, for Greece, when other nations had only a single dip. Likewise, in Japan 2011, the nuclear tragedy at Fukushima significantly and negatively impacted the national economy as a whole. It is becoming increasingly clear that when megaprojects go wrong they are like the proverbial bull in the china shop: it takes just one to smash up the entire store. It is becoming similarly clear to many involved that something needs to be done about his.

In the UK at the beginning of the century, cost underestimation and overrun was rampant in so many projects in so many ministries that the reliability of national budgets suffered, leading the chancellor to order a Green Book on the problem and how to solve it (HM Treasury, 2003). This move inspired other countries to follow suit. Lawmakers and governments have begun to see that national fiscal distress and unreliable national budgets are too high a price to pay for the conventional way of managing megaprojects. In 2011, the UK Cabinet Office and HM Treasury joined forces to establish a Major Projects Authority with an enforceable mandate directly from the Prime Minister to oversee and direct the effective management of all large-scale projects that are funded and delivered by central government. In 2012, the Authority established, in collaboration with Oxford University, a Major Projects Leadership Academy – the first of its kind in the world – to train and authorize all UK civil servants in charge of central government major projects.[9]

Outside of government, private finance in megaprojects has been on the rise over the past twenty years. This means that capital funds, pension funds, and banks are increasingly gaining a say in management. Private capital is no panacea for the ills in megaproject management, to be sure; in some cases private capital may even make things worse (Hodge and Greve, 2009). But private investors place their own funds at risk. Funds and banks can therefore be observed to not automatically accept at face value the cost and revenue forecasts of project managers and promoters. Banks typically bring in their own advisers to do independent forecasts, due diligence, and risk assessments, which is an important step in the right direction (Flyvbjerg, 2013). The false assumption that one forecast or one business case may contain the whole truth about a project is problematized. Instead project managers and promoters are getting used to the healthy fact that different stakeholders hold different forecasts and that forecasts are not only products of data and mathematical modeling but also of power and negotiation. Why is this more healthy? Because it undermines trust in the misleading forecasts often produced by project promoters.

Moreover, democratic governance is generally getting stronger around the world. Corporate scandals, from Enron and onwards, have triggered new legislation and a war on corporate deception that is spilling over into government with the same objective: to curb waste and promote good governance. Although progress is slow, good governance is gaining a foothold even in megaproject management. The main drivers of reform come from outside the agencies and industries conventionally involved in megaprojects, which is good because it increases the likelihood of success. For example, the UK Treasury now requires that all ministries develop and implement procedures for megaprojects that will curb so-called "optimism bias" (Flyvbjerg, 2006). Funding will be unavailable for projects that do not take into account such bias, and methods have been developed for doing this (UK Department for Transport, 2006). Switzerland and Denmark have followed the lead of the UK (Swiss Association of Road and Transportation Experts, 2006; Danish Ministry for Transport and Energy, 2006, 2008). In Australia, the Parliament of Victoria has conducted an inquiry into how government may arrive at more successful delivery of significant infrastructure projects (Parliament of Victoria, 2012). Similarly, in the Netherlands the Parliamentary Committee on Infrastructure Projects did extensive public hearings to identify measures that will limit the misinformation about large infrastructure projects presented to the Parliament, public, and media (Dutch Commission on Infrastructure Projects, 2004). In Boston, the government has sued to recoup funds from contractor overcharges for the Big Dig related to cost overruns. More countries and cities are likely to follow the lead of the UK, Australia, Switzerland, Denmark, the Netherlands, and Boston in coming years.

Finally, research on how to reform megaproject management – examples of which has been referenced above – is beginning to positively impact practice. Such research has recently made great strides in better understanding what causes the many failures in megaproject delivery, and how to avoid them. For instance, we now understand that optimism bias and strategic misrepresentation are significantly better explanations of megaproject outcomes than previous explanations, including Hirschman's Hiding Hand and Sawyers creative error discussed above. And with a better understanding of causes has followed a better grasp of cures, from front-end management (Williams and Samset, 2010) to reference class forecasting (Kahneman, 2011: 243-254; Flyvbjerg, 2006) to institutional design for better accountability (Scott, 2012; Bruzelius et al., 1998). Moreover, research is beginning to help us understand success and how to replicate it. Perhaps most importantly, researchers have begun to take seriously the task of feeding their research results into the public sphere so they may effectively form part of public deliberation, policy, and practice (Flyvbjerg, 2012; Flyvbjerg et al., 2012).

With these developments things are moving in the right direction for megaproject management. It is too early to tell whether the reform measures being implemented will ultimately be successful. It seems unlikely, however, that the forces that have triggered the measures will be reversed, and it is those forces that reform-minded individuals and groups need to support and work with in order to improve megaproject management. This is the "tension point" where convention meets reform, power balances change, and new things are happening. In short, it is the place to be as a megaproject planner, manager, scholar, student, owner, or interested citizen.[10]

Figure 1: Size of selected megaprojects, measured against one of the largest dollar-figures in the world, accumulated US debt to China.

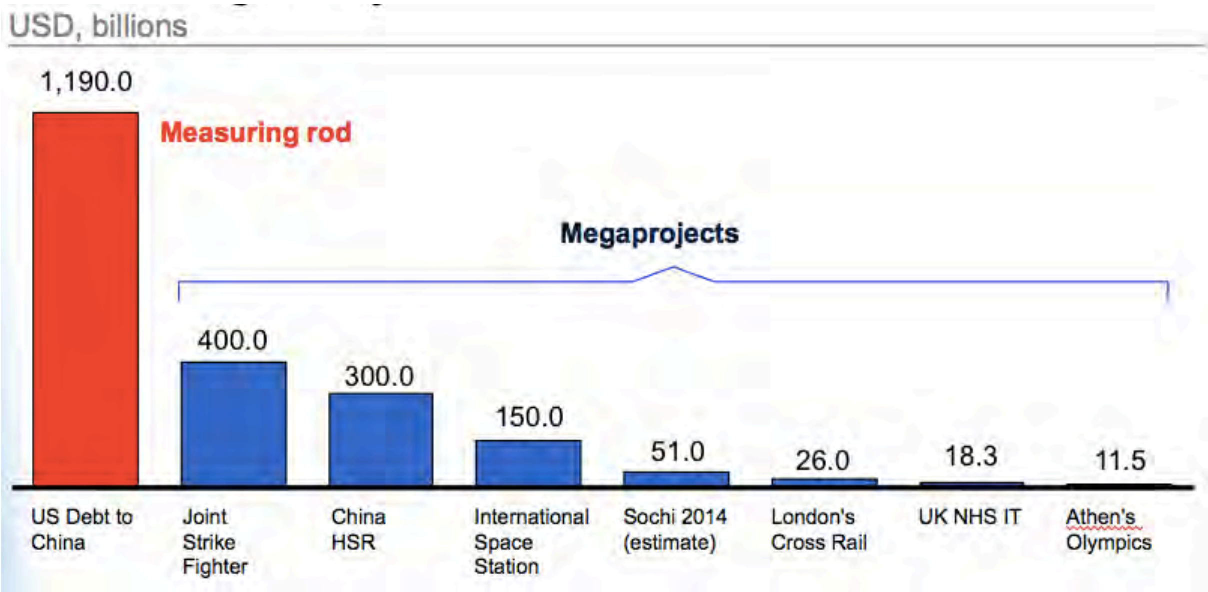

Table 1: The "Four Sublimes" that drive megaproject development.

Type of Sublime	Characteristic
Political	The rapture politicians get from building monuments to themselves and their causes, and from the visibility this generates with the public and media
Technological	The excitement engineers and technologists get in pushing the envelope for what is possible in "longest-tallest-fastest" type of projects
Economic	The delight business people and trade unions get from making lots of money and jobs off megaprojects, including for contractors, workers in construction and transportation, consultants, bankers, investors, landowners, lawyers, and developers
Aesthetic	The pleasure designers and people who love good design get from building and using something very large that is also iconic and beautiful, like the Golden Gate bridge

Table 2: Large-scale projects have a calamitous history of cost overrun.

Project	Cost Overrun (%)
Suez Canal, Egypt	1,900
Scottish Parliament Building, Scotland	1,600
Sydney Opera House, Australia	1,400
Montreal Summer Olympics, Canada	1,300
Concorde supersonic aeroplane, UK, France	1,100
Troy and Greenfield railroad, USA	900
Excalibur Smart Projectile, USA, Sweden	650
Canadian Firearms Registry, Canada	590
Lake Placid Winter Olympics, USA	560
Medicare transaction system, USA	560
National Health Service IT system, UK	550
Bank of Norway headquarters, Norway	440
Furka base tunnel, Switzerland	300
Verrazano Narrow bridge, USA	280
Boston's Big Dig artery/tunnel project, USA	220
Denver international airport, USA	200
Panama canal, Panama	200
Minneapolis Hiawatha light rail line, USA	190
Humber bridge, UK	180
Dublin Port tunnel, Ireland	160
Montreal metro Laval extension, Canada	160
Copenhagen metro, Denmark	150
Boston-New York-Washington railway, USA	130
Great Belt rail tunnel, Denmark	120
London Limehouse road tunnel, UK	110
Brooklyn bridge, USA	100
Shinkansen Joetsu high-speed rail line, Japan	100
Channel tunnel, UK, France	80
Karlsruhe-Bretten light rail, Germany	80
London Jubilee Line extension, UK	80
Bangkok metro, Thailand	70
Mexico City metroline, Mexico	60
High-speed Rail Line South, The Netherlands	60
Great Belt east bridge, Denmark	50

Notes

[1] As a general rule of thumb, "megaprojects" are measured in billions of dollars, "major projects" in hundreds of millions, and "projects" in millions and tens of millions. Megaprojects are sometimes also called "major programs."

[2] The colleague is Dr. Patrick O'Connell, Practitioner Director of Major Program Management at Oxford University's Saïd Business School.

[3] "Uniqueness bias" is here defined as the tendency of planners and managers to see their projects as singular. This particular bias stems from the fact that new projects often use non-standard technologies and designs, leading managers to think their project is more different from other projects than it actually is. Uniqueness bias impedes managers' learning, because they think they have nothing to learn from other projects as their own project is unique. This lack of learning may explain why managers who see their projects as unique perform significantly worse than other managers (Budzier and Flyvbjerg 2013). Project managers who think their project is unique are therefore a liability for their project and organization. For megaprojects this would be a mega-liability.

[4] Quoted from "Under Water Over Budget," *The Economist*, 7 October 1989, 37–8.

[5] *The Economist* (March 10, 2012: 55) describes the near-certainty of large cost overruns and delays in transportation infrastructure projects as "the iron law of infrastructure projects." Our data show the iron law is not limited to infrastructure; it applies to megaprojects in general and covers benefit shortfalls in addition to cost overruns and delays.

[6] The author owes the term "break-fix model" to Dr. Patrick O'Connell, Practitioner Director of Oxford University's BT Centre for Major Programme Management.

[7] Two versions of Hirschman's text exist (1967a, 1967b). The version of the text referenced here is the one published in *Development Projects Observed* (Hirschman 1967a), which is the original text. The differences between the two texts are minor and are mainly due to the editing of Irving Kristol, editor of *The Public Interest* at the time of publication (Adelman 2013: 405).

[8] The Sarbanes-Oxley Act of 2002 pioneered this area in the US, but many other countries have since followed suit with similar legislation. Section 802[a] (18 U.S.C. § 1519) of the original act states that whoever knowingly alters, destroys, mutilates, conceals, covers up, falsifies, or makes a false entry in any record, document, or tangible object with the intent to impede, obstruct, or influence the investigation or proper administration of any matter within the jurisdiction of any department or agency of the United States or any case filed under title 11, or in relation to or contemplation of any such matter or case, shall be fined, imprisoned not more than 20 years, or both.

[9] For full disclosure: The author was involved in the planning, start up, and delivery of the UK Major Projects Leadership Academy.

[10] See Flyvbjerg et al. (2012) regarding the use of tension points for triggering change in policy and practice, including for megaprojects.

RISK.1027

Estimate Accuracy: Dealing with Reality

John K. Hollmann, PE CCE CEP

ABSTRACT—This paper reviews over 50 years of empirical cost estimate accuracy research and compares this reality to common but unrealistic management expectations. The empirically-based accuracy research of John Hackney, Edward Merrow, Bent Flyvbjerg and others on large projects in the process industries is summarized. The paper then highlights risk analysis methods documented in recent AACE Recommended Practices that yield outputs based upon and comparable to empirical reality. Tragically, many cost engineers are facilitating management's collective and sometimes willful biases regarding accuracy by using flawed, unreliable risk analysis methods; those who use empirically valid practices face the fate of Cassandra. The paper is intended as a fundamental reference on the topic of accuracy as well as a call for our profession to use reliable practices and speak the truth to management. Attendees will gain an understanding of estimate accuracy reality, the risks that drive it, management's biases about it, and methods that analyze risks and address the biases in a way that results in more realistic accuracy forecasts, better contingency estimates and more profitable investments.

Introduction

Accuracy is a measure of how a cost estimate will differ from the final actual outcome. It is also a measure of cost uncertainty or risk (these terms are essentially synonymous in TCM). Empirical estimate accuracy data has been researched for over 50 years [30]. In addition, reasonably reliable practices for quantifying project cost uncertainty have been recommended by AACE and others. However, the level of industry understanding of the reality of accuracy and how well risk analysis methods forecast it is generally poor. Investment decision makers seem particularly unaware of our research and recommended practices. Sometimes they are aware but seem to ignore them. Worse, many cost engineers facilitate management ignorance by standardizing their wishful thinking (i.e., tunneling or neglecting sources of uncertainty) as exemplified by bias towards 10% contingency and +10/-10% range [42]. Poor investment decisions may result from using risk analysis methods that are known to be a "disaster" when systemic risks are present [27].

One researcher said this behavior verges on "criminal" [19]. Cost disasters and criminality are economic in nature, but deadly serious to owners, investors and tax-payers; one must ultimately take responsibility for our role in their economic well-being. To help improve on the situation, this paper surveys the research facts (reality), exposes flawed practices and highlights better practices.

The paper summarizes data from well referenced studies by others; however, the data confirms the author's experience. The author's data and observations are added as well as observations by others. While fact and opinion are mixed, it is hoped that readers will draw the same conclusions as the paper and work to improve the situation.

Studies of Overall Estimate Accuracy

How accurate have cost estimates been for owners? To answer this, references providing empirical data on estimate accuracy and cost uncertainty were sought. This paper focuses on engineering and construction projects in the process (e.g., oil, gas, chemicals, mining, metals, utilities, etc.) and infrastructure (often associated with process plant projects) industries. These are generally characterized by complexity, unique work scopes, design change and sometimes new technology. The chosen references represent academic, research, consulting and industry practitioner sources. Empirical research on defense, aerospace and IT projects was found but excluded; their experience is analogous but more extreme [13,16, and 20].

Estimate accuracy and cost uncertainty data from 12 empirical studies are summarized in Table 1. These include over 1,000 projects with samples ranging from about 20 to 250 projects each. The projects were typically large enough to affect enterprise success (i.e., typically one million US dollars up to megaprojects). The costs studied are the costs to the owners. Study purposes varied; however, the typical the questions were: "*what is the accuracy of our estimates and why*?" in reaction to a perceived preponderance of cost overruns.

Table 1—Empirical Estimate Accuracy Studies (Typically From the Funding Estimate)

In summary, the approximate range of ranges for accuracy or uncertainty around the reference amounts are as follows:

- P10: -32% to +8% (average about -9%)
- P50 or mean: 0% to +88% (average about 21%)
- P90: +34% to 190% (average about 70%)

The "accuracy" shown is the percentage variation of the final actual cost from the reference estimate. The reference estimate was usually the basis for an actual or *defacto* investment decision by the owner. Estimate names are industry specific; for example, "feasibility" is the funding estimate for mining projects, but not for projects in other industries. The reference estimates usually include contingency; therefore, the accuracies are understated in respect to base estimates without contingency. From the author's experience, the contingency applied at sanction is usually between 5 and 15 percent.

The statistics provided ranged from mean and standard deviations alone to distribution charts or tables or values at various confidence levels. For comparison, the accuracies in table 1 are summarized at *approximate* p10/p50/p90 confidence levels where the "p" value indicates the percentage that underran. If a mean was provided (μ), it is shown as such. If p-values were not provided, they were approximated from the mean and standard deviation assuming a normal distribution; i.e., p90 equals the mean plus 1.28 times standard deviation (the ~ symbol indicates an approximation.) This approximation underestimates the high range when actual/estimate accuracy data is skewed to the high side (i.e., actual data is not normally distributed).

The project samples were not scientifically random, but were not selected specifically because their estimates were inaccurate; the authors generally considered the projects in their samples to be reasonably representative. Studies done in reaction to overruns may be biased toward that experience; however, the number of studies and the variety of industries, regions and project types covered indicate that cost overruns are prevalent for large process industry projects.

The quality of the datasets varied, but in general the authors lament the poor state of historical project records. For many studies, the only reliable data was the cost at the time of project funding approval (i.e., sanction or investment decision) and the cost at completion. However, some studies were corrected for major scope changes and escalation which many practitioners would not expect an estimate to cover.

The key observation is that <u>in no case was the nominal p90 value ever less than +34% of the funding estimate</u> (i.e., about +40 to +50% of the base estimate). Also, the average mean or median overrun is about 21%. This is the best picture we have of reality for large process industry projects with all their imperfections and risks (unfortunately, causal data is lacking).

Arguably, the most notable studies are by John Hackney and Edward Merrow because these are the foundation for process industry phase-gate project systems [22, 35]. However, the studies by Dr. Bent Flyvbjerg are perhaps best known in the popular press [19]. Dr. Flyvbjerg has made the following statements regarding industry estimating practices: "*We conclude that the cost estimates used in public debates, media coverage, and decision making for transportation infrastructure* *development are highly, systematically, and significantly deceptive." "(those) who value honest numbers should not trust the cost estimates presented by infrastructure promoters and forecasters."* He adds, "*institutional checks and balances—including financial, professional, or even criminal penalties for consistent or foreseeable estimation errors—should be developed to ensure the production of less deceptive cost estimates* [19]."

Merrow disagrees with Flyvbjerg in the following: *"There is widely held belief that large public sector projects tend to overrun because the estimates are deliberately low-balled. Our (IPA's) analysis of large private sector projects suggests that no Machiavellian explanation is required. Large projects have a dismal track record because we have not adjusted our practices to fit the difficulty that the projects present* [33]."

Regardless of motives and causes, large process and infrastructure projects (and defense, aerospace and IT) are frequently overrunning our funding estimates and by very large margins. The search found no research that showed otherwise. Further, as "forecasters" (as one is referred to by Flyvbjerg) we are failing to reliably predict the proper point of funding including contingency, but the *range* of project cost uncertainty.

Studies of Estimate Accuracy Progression Versus Level of Scope Definition
It is generally agreed that the less well defined the project scope is, the wider the estimate accuracy range will be. This is a premise of phase-gate project systems. Table 2 summarizes accuracy studies from among they paper's sample that also addressed accuracy and uncertainty at various levels of scope definition *approximated* to AACE classifications (Class 5 to 1).

	Conf. Level	Class 5	Class 4	Class 3	Class 2	Class 1
		Actual % Difference from Estimate (or as stated)				
Hackney [22] -Conventional process plant -Range around the **Base Estimate** -Adjusted for scope and time	P10	+36	+34	+9	+2	-1
	P50	+60	+41	+15	+6	+4
	P90	+80	+45	+21	+12	+11
RAND [35] -Process plant; newer technology -Range around the **Funded Amount** -Adjusted for scope and time	P10	+39	+18	+9	+5	-1
	P50	+100	+60	+28	+20	+7
	P90	+260	+150	+58	+41	+18
Harbuck [23] -Avg. of 3 Transport Study Averages -Range around the **Construction Estimate** (<u>not the final actual costs</u>) -No adjustment for scope & time	Mean	+49	+37	+18	study base	n/a

Table 2 - Empirical Estimate Accuracy Studies (Progression by Level of Scope Definition)

Complicating the comparison, each study has different data attributes and uses different scope definition rating schemes (i.e., AACE classification ratings were not used). However, the author's experience is that process industry funding decisions are being made based on scope definition somewhat better than AACE Class 4, but worse than Class 3. Research indicates that the design development necessary to thoroughly mitigate definitional risk includes *issued-for-design,* signed-off process and instrumentation diagrams (P&IDs) for all process and utility units; the author rarely sees this level of definition at the time of funds authorization [4].

The key observation from Table 2 is that even projects funded on better scope definition (AACE Class 3) tend to be overrun; there is a huge potential for overruns if the scope is more poorly defined than Class 3. Note that the Hackney and RAND models based on this data are available in working Excel tools found at the AACE website (www.aacei.org [11]).

What Our Estimates Say and What Owners Want Are the Same (i.e., Wishful Thinking)
The next question is "are the overrunning projects within the cost range of our risk analyses?" Unfortunately, they usually are not. The author has reviewed many industry risk analyses by owner companies and their EPC contractors and their p90 forecast is rarely great than 30% over the base estimate excluding contingency. Table 3 provides an indicative sample of risk analysis outcomes.

Project Type	Estimate Class	Preparer	P10	P50	P90	Method	Notes
Mega, Expansion, Refining	Class 4	Owner	<15>%	+13%	+45%	Ranging w/M-C (validated)	Exceeded P90 at next estimate
Large, New, Mining	Class 4	EPC	+7%	+13%	+19%	Ranging w/M-C	Remote, developing country
Small, Revamp, Refining	Class 3	Owner	<3>%	+5%	+13%	Ranging w/M-C	Plant-based project
Mega, New, Metals	Class 4	EPC	+0%	+5%	+13%	Ranging w/M-C	Low wage country
Mega, Expansion, Refining	Class 4	EPC	+2%	+10%	+18%	Ranging w/M-C	Largest in region, low wage country
Mega, Upgrader	Class 4	EPC	<3>%	+12%	+28%	Ranging w/M-C	Remote, severe winter

Table 3 - Reported Accuracy Ranges from Owner and EPC Contractor Risk Analyses

The first project risk analysis shown in Table 3 had a p90 value of +45%; however, the risks on this project were extreme and while the team captured some of them, the range was overrun by the next phase estimate. P50 values are often as little as 5% even for highly risky projects. The author's experience is that despite extensive risk registers and brainstorming sessions, most risk *quantification* is dominated by an estimator's bias in which the team consciously or unconsciously perceives uncertainty in terms of estimate and takeoff assumptions and math (i.e., "estimator's risks"). A high (p90) range of about +30% reflects the perceived worst case uncertainty around quantities, rates, pricing and productivity while unrealistically assuming the scope is fixed, the execution strategy and plan is never changed, no risk events occur and if they do, risk responses are always effective. The result is a range that seems to be what the owner wants to hear.

So the next question is "what does the owner want to hear?" Table 4 provides an indicative sample from different industry segments of owner accuracy range expectations as stated in their phase-gate project scope development processes.

	CLASS 5	**CLASS 4**	**CLASS 3**
	AACE 18R-97 RANGE of RANGES		
	-20/50% to +30/100%	-15/30% to +20/50%	-10/20% to +10/30%
COMPANY	**OWNER "TARGETS"** • *Most misquote AACE (AACE has not quoted target ranges for 15 years)* • *NONE state what the confidence interval statistically represents*		
Oil Sands	-30 to +50%	-20 to +30%	+/- 10%
Power	-30 to +50%	-15 to +30%	-5 to +15%
NOC Oil	-/+50%	-/+30%	-/+15%
Mining	-/+50%	-/+25%	-/+10%
Integrated Oil	-15 to +50%	-10 to +30%	-10 to +25%

Table 4 - Owner Phase-Gate Target Accuracy Ranges Vs. AACE Classes and Empirical Studies

The table compares the owner targets to the range-of-ranges in the **AACE Recommended Practice 18R-97** [4]. Is it coincidence that the owner p90 targets in table 4 are about the same as the p90 values estimated in table 3?

By quoting specific accuracy range targets in their processes, owners display a dangerous misunderstanding of risk and estimating. Once a project plan reaches the target level of scope definition (e.g., Class 3), the residual risk and its potential impact is a project scope attribute and no estimator can appreciably improve the accuracy range by doing a "better estimate." For a project with substantial risks (most large projects), the company accuracy ranges in table 4 have <u>no relevance.</u> Unfortunately, targets tend to pre-determine risk analysis outcomes; i.e., they drive the risk analysis outcomes seen in table 3 (owners get what they ask for). Targets are *prima facie* evidence of risk ignorance (tunneling) driven by the inflated expectations that phase-gate processes alone will manage risks.

Further, the communication of targets by many owners is statistically meaningless. First, many misquote AACE Recommended Practices by stating that the targets are "per AACE" when no AACE document includes specific targets [4]. Also, few state the confidence interval represented or the reference value that the range is around (the base or the funded amount?).

To wrap up the target/as-estimated versus actual accuracy discussion, figure 1 shows the averages of table 1 (Reality) and table 3 (As Estimated) as log-normal curves with p10/50/90 values comparable to the table 1 and 3 averages for those confidence levels.

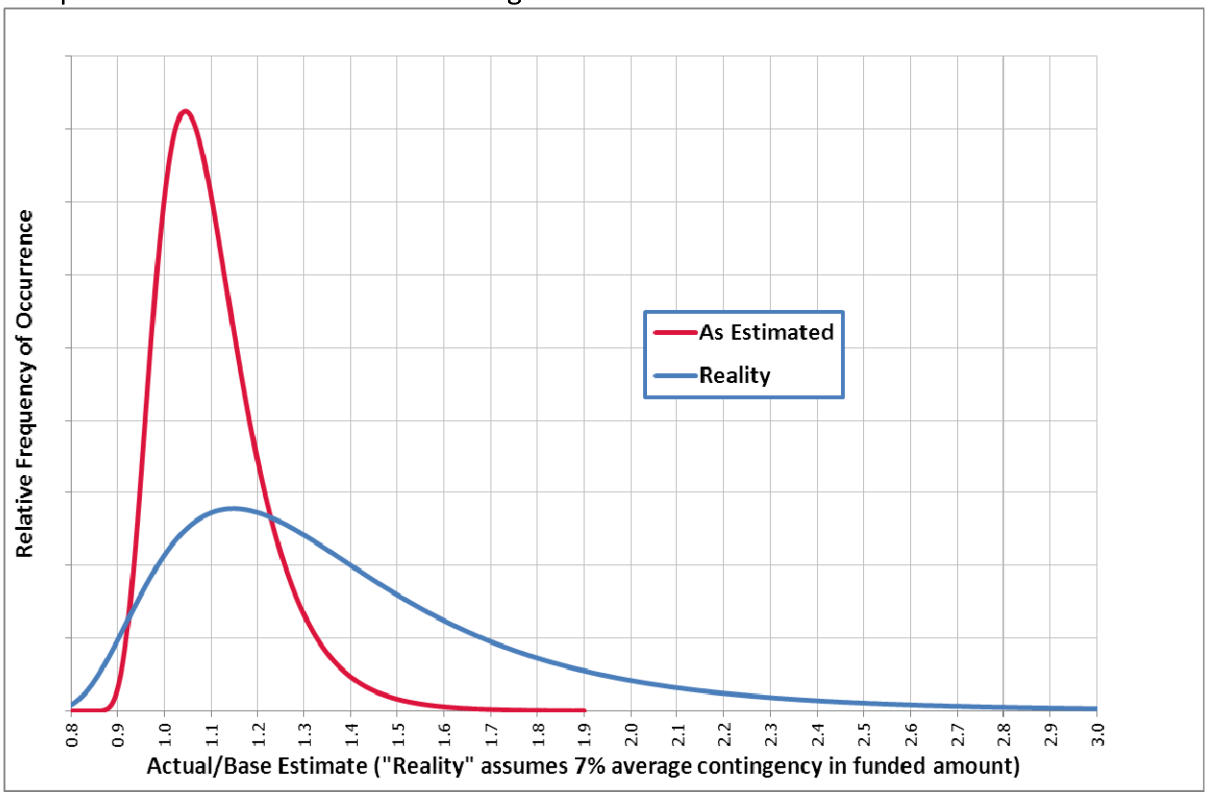

Figure 1 - As Estimated (and Target) Accuracy Vs. Empirical Accuracy at Funding

Several of the studies and the author's experience suggest that the lognormal distribution of actual/estimate data is representative [14,35]. Teams are assuming a p10/p90 accuracy range around the base estimate of about -10/+30% with a p50 value of about 10%, while the reality is closer to -20/+120% with a p50 of about 20%. Arguably, a 20% or even 30% overrun will not render most projects unprofitable; however, a 120% overrun at p90 would.

Challenging the Data : Nowhere to Hide

The following are likely challenges to this paper's findings along with the author's responses:

<u>1) The actual data includes the impact of major scope changes and escalation.</u>

Major scope change and escalation are by definition excluded from contingency [3]. In table 1, 7 of the 12 studies corrected for price changes over time and 3 corrected for major scope changes (i.e., changes to basic project premises such as plant location, product specifications or capacity). Studies show wide accuracy ranges with or without correction. In the author's benchmarking experience, major owner scope change (as opposed to design changes which owner costs must cover) is uncommon (this may be less true for public projects).

2) We cannot forecast volatility and/or black swan events (i.e., unknown unknowns).

While any *one* black swan event is improbable, the probability of *any* black swan or an equivalent confluence or compounding of lesser risks occurring during the extended duration of large projects is likely. The accuracy findings appear to hold for all time periods and regions, in both hot and cold economies. For example, Ernst & Young found that mining projects estimated during hot markets (when market risks were known) were still overrunning during the post-2008 recession; "*Of the companies that reported project overruns publically (between Oct 2010 and March 2011), the average overrun was about 71% of the original project cost estimate*"[37]. Another mining article referenced a series of studies which indicate that overruns have been the norm in every time period since 1965 [38]:

- "A study of 18 mining projects covering the period 1965 to 1981 showed an average cost overrun of 33 per cent compared to feasibility study estimates.
- A study of 60 mining projects covering the period from 1980 to 2001 showed average cost overruns of 22 per cent with almost half of the projects reporting overruns of more than 20 percent.
- A review of 16 mining projects carried out in the 1990s showed an average cost overrun of 25 percent".

Historical experience alone is enough to quantify the probability and impact "unknown-unknowns" as a class. We may not know the risk's name, but we know about what it will cost (i.e., Table 1.)

3) Some systemic risks are difficult to measure and/or politically sensitive.

The tools for rating scope development as well as competency and project system discipline (e.g., weak change management) are well established [4,21,22,35,and 45]. While including "incompetent management" in a risk register is problematic, it is necessary to identify and quantify such risks. The risk analyst must have sufficient independence to do so.

4) Estimating "all" project cost risk is not part of the job (not in my work scope).

If one declared in the *Basis of Estimate* reports that "most significant risks were excluded" and/or "past experience with similar projects was ignored,' this challenge might have some validity. However, in the author's experience, such statements (or confessions) are rarely made. Unfortunately, breaking risk down (e.g., operational, project, strategic, enterprise, contextual, global, background, etc. [42]) and disseminating responsibility for its analysis and quantification is a potential recipe for forecasting failure. Risks interact and often compound and cannot readily be parsed for quantification like elements in a work breakdown.

In summary, it is the author's experience that these "challenges" are usually just reasons for our failings; they do not excuse them. One knows better and the data is clear; with empirical insight added to other methods, risk is always quantifiable albeit imperfectly.

Flawed Practices and Lost Credibility

Flawed practices such as a bias toward estimator's risk, misguided targets, tunneling and parsing risk quantification have been mentioned. The 1990s also brought reengineering and downsizing to the industry with the loss of empirical data and analytical skills. Concurrently, Monte Carlo simulation (MCS) for spreadsheets was introduced which made risk analysis seem simple and doable regardless of skill level. Unfortunately, MCS was applied in "line-item ranging" (as opposed to range estimating) in which the team assigns cost ranges to line-items in their estimate (i.e., contributing to estimator's bias) based on brainstorming, and then runs the MCS, usually without considering line-item dependency [24]. The risks listed in the register (which tend to exclude systemic risks) are not explicitly included in these models. This is the method that research has shown to be a "disaster" for projects with systemic risks [27]. "Line-item ranging" (or activity duration ranging for schedule) fails in part because of faulty application (i.e., no dependencies) but also because brainstorming is unable to elicit the impacts of systemic risks on individual estimate line items or activities, and finally, the impact of risk register events are difficult to ascribe to individual estimate line items in aggregate. This method is not an AACE Recommended Practice.

It is easy to conclude from the research and observations that <u>our risk analyses and contingency estimates are not credible</u> for large process industry projects. Decision analysis expert John Schulyer defines a *credible analysis* as "one that gets used [44]." The following statements by industry executives indicate that our analyses are not useful (self-criticism by owner executives is understandably more difficult to find):

- Schlumberger CEO Andrew Gould stated: *"...while not wishing to embarrass any of my customers, I would add that many greenfield (upstream oil) projects suffer significant cost overruns. Indeed, as a general rule 30 percent of such projects experience budget overruns of 50 percent* [41]."
- Financier Jasper Bertisen of Resource Capital Funds (RCF) had this observation: "*the vast majority of mining projects have been coming in way over budget for the past couple of decades. As a result, RCF now automatically factors in an average cost overrun of 25% when it considers the cost of mining projects* [28]."

The prevailing use of flawed analyses has damaged our collective credibility. This will be difficult to remedy because poor practices have become institutionalized. For example, in the mining industry, the author commonly finds companies funding projects at a p80 level of confidence. This has evolved because (as indicated by prior quotation) managers intuitively understand that the p50 values we provide in our estimates are too low (i.e., often <10% contingency on even the riskiest projects) and they feel that the p80 level of about 15 to 20% contingency is more realistic. However, it is "more realistic" because in fact <u>this forecast p80 is the p50 of the "reality" that we fail to predict</u>! Cost engineers who do use realistic risk quantification practices are treated like Cassandra; management will not believe the truth after being fed unreality for decades. The *real* p80 or p90 is likely to be unprofitable; as shown in studies, the *least* p90 capital cost growth is >40 to 50%. If management faced this reality, no project would ever be authorized without stellar scope definition and optimization, top-notch planning, team building, risk management and all of the other best practices we know of. Isn't that the point? Why would anyone facilitate anything less? Why would one let them assume that poor practices are a safe bet when they are courting *disaster*!

The lesson from the empirical history (table 1) and the practice history (table 2) is that one needs to address the entire scope of risks (project-specific, systemic, and escalation) and the empirical "reality" of uncertainty on large process industry projects. Research by others points in the same direction [16,17,18,19,22,27,32,33,42]. AACE is currently developing a Decision and Risk Management Professional (DRMP) Certification that will focus on risk identification and quantification competencies, including AACE Recommended Practices that document reliable methods.

The Project Size Dichotomy

There is less empirical research of small project estimate accuracy because these projects are individually less of a threat to overall profitability and shareholder's perceptions. However, we know that the realities of small and large projects differ; small projects are biased to overestimating and underruns. As stated by one researcher, "*when a project team sets a soft (cost) target, about half of the unneeded funds are usually spent…about 70% of small projects underrun*" [29]. This research also indicated that in small project systems, overruns tend to be punished. To avoid punishment (in less disciplined cultures) teams avoid overruns by including "fat" (i.e., above-the-line contingency) in the base estimate because high visibility contingency is often poorly received by management for any project size. This can bias a company's perception of risk and partly explain their misguided targets.

Few researchers study small projects because not only is record keeping lax, but underruns are rewarded and are not seen as a problem despite being associated with wasteful capital spending. Figure 2 shows a representative distribution of actual/estimate values observed by the author for small project portfolios; often, no projects overrun by more than 10%. In this "cresting wave" pattern, most projects spend all their funds, while some return all or some of the excess; for this outcome, management and/or teams are rewarded. The more that funds are wasted, the sharper the peak between 0.9 and 1.1. Perversely, the more "accurate" the outcome, the less desirable (though best rewarded) it is; underruns and tight accuracy often indicate overfunding and wasted capital rather than excellent project control discipline

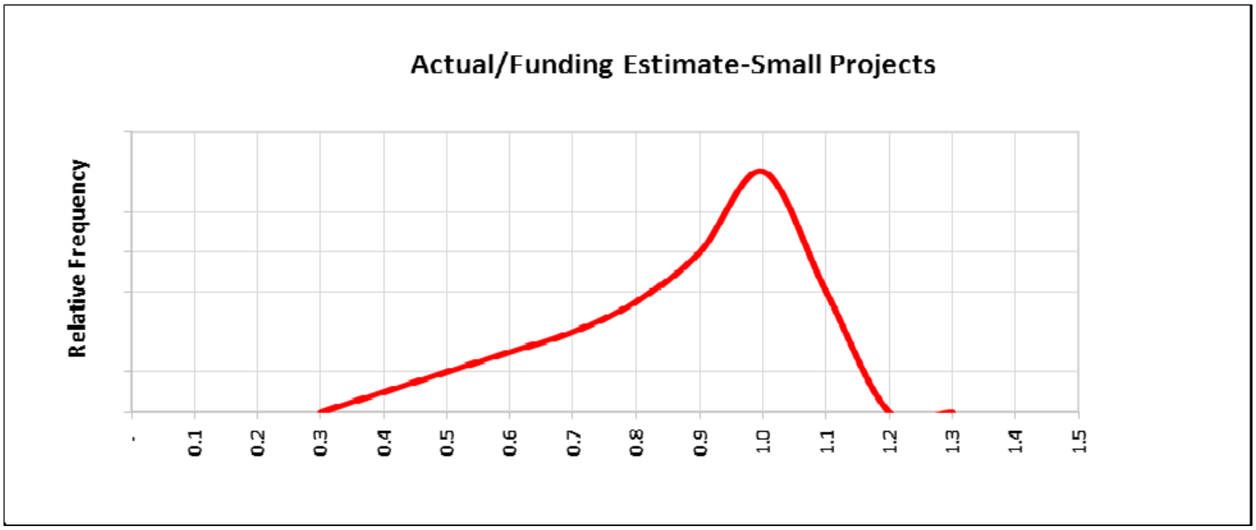

Figure 2 - Actual Cost/Appropriation Estimate For Small Projects

The small vs. large project overrun dichotomy can induce a kind of corporate schizophrenia. Many owner companies have “major project” organizations that are separate from small or plant-based organizations. A newly formed major project group will often inherit the small project system trait of risk-ignorance (expectation of underruns.) They do not appreciate that EPC contractors for major projects prepare base estimates with less fat because reviews expose fat and there is sometimes a bias to keep estimates low to see the project get funded. The combination of small project target-reinforced tunneling and risk-free base estimates is a recipe for overruns on large projects.

Looking at an entire company project portfolio, the combined distribution of accuracy data for small and large projects can look serenely “normal.” Benchmarking data observed by the author indicates that in a population of all project sizes, the P10/P90 range is about +/-20% around the funding estimate as illustrated in figure 3. Given just one distribution, management will be unaware that there are two conflicting realities.

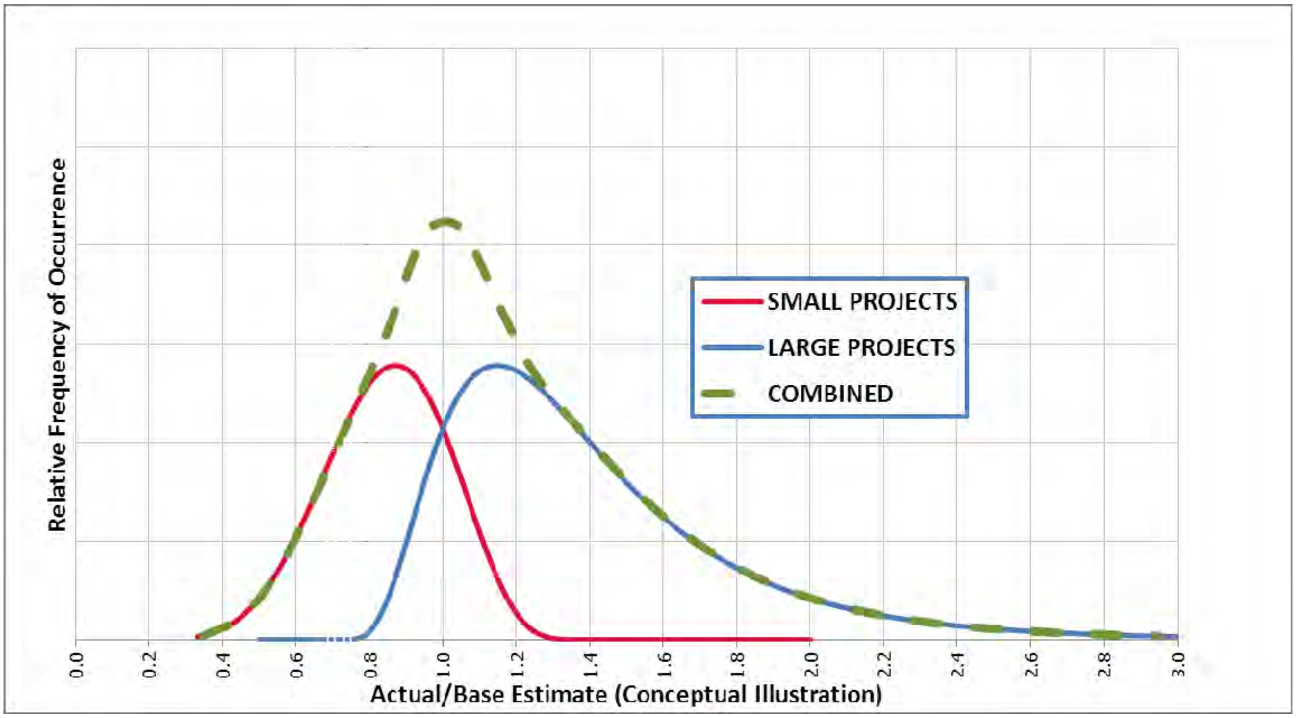

Figure 3 - Balancing Of Over and Underruns When All Project Sizes Are Studied Together

The Measurement Dilemma

Unfortunately, accuracy (i.e., actual/estimated cost) is often misused as a measure of *estimate "quality"* (as in "*a high quality estimate is an accurate estimate*") or estimating performance. This is inappropriate because, as discussed, the only way for an estimator to deliver a targeted accuracy for a given scope is to over-estimate the cost; risk and project performance are not in the estimator's control. Faced with overruns, estimators and the team tend to hide behind the excuses discussed previously. Accuracy should be used to measure the performance of the *risk management process* (not the estimating process) in conjunction with project historical data including causal information so we can improve our risk identification, analysis and quantification, and treatment. Tight accuracy may indicate wasted capital funds; accuracy measures must always be accompanied by measures of project control process discipline and project cost competitiveness (lower absolute costs) or cost bias.

AACE Recommended Practices (RPs)

There is an AACE RP that guides the selection and development of risk quantification and contingency estimating methods [2]. This RP provides "principles" that any method should align with including;

- start with identifying risk drivers;
- link risk drivers and cost/schedule outcomes; and
- employ empiricism.

Note that the previously discussed "line-item ranging" method is not explicitly in accordance with any of above principles.

Risks differ in how they impact project costs and therefore methods vary in how the risks are quantified. To cover the whole scope of risks, AACE has defined a risk breakdown [24] in respect to quantification methods that includes:

- **Project-Specific Risk**: risk affecting the specific project and plan;
- **Systemic Risk**: artifacts or inherent attributes of the system, enterprise or strategy; and,
- **Escalation Risk**: driven by economics (which regionally may involve politics).

Analogies for these risks suggested by others include: operational (project), strategic (enterprise), and contextual (global) risks respectively [42]. Methods that address these risk types can be integrated to generate a "universal" cost risk profile to support decision making. AACE also recommends that cost and schedule risk analysis be integrated.

For each risk type, there are AACE RPs for risk analysis methods that apply as follows ("how-to" descriptions for these methods are covered in the references):

- **Project-Specific Risk**:
  - 41R-08: Risk Analysis and Contingency Determination Using Range Estimating [12].
  - 44R-08: Risk Analysis and Contingency Determination Using Expected Value [9].
  - 57R-09: Integrated Cost and Schedule Risk Analysis Using Monte Carlo Simulation of a CPM Model [8].
  - 65R-11: Integrated Cost and Schedule Risk Analysis and Contingency Determination Using Expected Value [7].
- **Systemic Risk**:
  - 42R-08: Risk Analysis and Contingency Determination Using Parametric Estimating [10].
  - 43R-08: Risk Analysis and Contingency Determination Using Parametric Estimating – Example Models as Applied for the Process Industries [11].
- **Escalation Risk**:
  - 58R-10: Escalation Principles and Methods Using Indices [6].
  - 68R-11: Escalation Estimating Using Indices and Monte Carlo Simulation [5].

Regardless of the risk analysis methods used, the findings of this paper suggest that, at a minimum, you always test your p90 outcomes (the "high" scenario given to the business organization to test the robustness of their decision) against the empirical reality. If no other historical data is available, this paper provides actual examples to consider. If your p90 is 25% or less over the base estimate, ask why NO study ever showed less than about 40% for p90; what risks are you missing? what impacts have you underestimated? Finally, and most important, ask "how can one improve project practices and scope in consideration of the risk reality?"

Conclusion

As a student of cost engineering and the editor/lead author of AACE's Total Cost Management Framework process [26], one is dismayed by the extreme disconnect between our practices and the long-known reality as shown in Figure 1. There is an ongoing failure to effectively address the reality of project cost uncertainty and there is a lack of good historical data with causal information. This has led to a credibility crisis. It also raises an ethical question (if not a criminal one per Flyvbjerg); what does it mean if we understand reality but continue to use failed methods known to be contrary to experience to the potential detriment of our employers and clients? The AACE Canon of Ethics (item 2g) states: "*When, as a result of their studies, members believe a project(s) might not be successful…they should so advise their employer or client*" [1]. In respect to large process industry projects, readers of this paper can consider themselves so advised.

There are of course practitioners who do address the entire scope of cost risks (in AACE terms; systemic, project-specific and escalation), capture data and consider the empirical record [16,17,18,21,42, and 43]. However, in the author's experience, the application of robust practices is uncommon. At a minimum, teams should at least test their worst case analysis outcomes against the empirical reality. They should study this paper's references and their own enterprise's historical experience (watching out for the small versus large project behavioral dichotomy). And, they should then seek to improve their practices to improve on past outcomes. The author does not agree with Dr. Flyvbjerg's approach to using empiricism (i.e., "reference class forecasting" [19]) which implies that biases are so intractable that we are doomed to repeat the past.

The paper also points out that companies should not use accuracy as a cost estimating quality measure; it is a risk management and project control process quality measure. Tight accuracy is often an indicator of wasted capital; measures of project control process discipline and project cost competitiveness must accompany accuracy measures.

In summary, this paper references and summarizes over 50 years of empirical cost estimate accuracy research on large projects in the process industries. It shows how this reality compares (or does not compare) to what we say and do. Recommended risk analysis methods have been highlighted. Failed methods are exposed. It is hoped that the facts, observations and opinions brought together here will serve as a valuable reference on the topic of cost accuracy and uncertainty so that we can better speak the truth among ourselves and with management. The path to more realistic uncertainty forecasts, better contingency estimates and more profitable investments is clear and documented by AACE International.

M A N I T O B A

O R D E R I N C O U N C I L

DATE: **October 10, 2018**
ORDER IN COUNCIL NO.: **301/2018**
RECOMMENDED BY: **Minister of Crown Services**

ORDER

1. Gordon Campbell is appointed as commissioner to inquire into Manitoba Hydro's development of the Keeyask Generating Station and the Bipole III transmission line and converter station project.

2. The inquiry is to be conducted in accordance with the attached Terms of Reference.

3. Nothing in paragraph 2 limits the commissioner's right to request the Lieutenant Governor in Council to expand the terms of reference to cover any matter that the commissioner considers necessary as a result of information that comes to his attention during the course of the inquiry.

4. The commissioner must complete the inquiry and deliver a final report containing the commissioner's findings and recommendations to the Minister of Crown Services (the "minister") by December 31, 2019. The commissioner may give the minister any interim reports that the commissioner considers appropriate to address urgent matters. All reports must be in a form appropriate for public release, but release is subject to *The Freedom of Information and Protection of Privacy Act* and other relevant laws.

5. To avoid duplication of effort, the commissioner may rely on the record of proceedings before, and the findings, reports and orders of, The Public Utilities Board and the Clean Environment Commission, and other regulatory bodies, concerning Manitoba Hydro.

6. Government departments and agencies and other bodies established under the authority of the Manitoba Legislature must assist the commissioner to the fullest extent permitted by law.

7. The commissioner may hold proceedings in public or private as he considers advisable in the course of the inquiry.

8. Except as required to be summarized for context in a report, the commissioner must ensure that any information reviewed by the commissioner that is subject to subsection 19(1) (Cabinet confidences) of *The Freedom of Information and Protection of Privacy Act* remains confidential and is not further disclosed to any other person. The commissioner must also ensure that information the disclosure of which may reasonably be expected to cause undue financial loss to, or significantly harm the competitive position of, Manitoba Hydro or its customers, or parties with whom it has contracted, is adequately protected.

9. The commissioner may grant any individual whom the commissioner is satisfied has a substantial and direct interest in the subject matter of the inquiry an opportunity during the inquiry to give evidence and to examine or cross-examine witnesses personally or by counsel on evidence relevant to that individual's interest. The commissioner may approve funding, at reasonable rates approved by the minister, in respect of the costs incurred for that purpose by the person.

10. The commissioner must perform his duties without expressing any conclusion or recommendation about the civil or criminal liability of any person or organization.

11. The budget for the conduct of the inquiry is $2.5 million. The minister may, in consultation with the commissioner, revise the budget to accommodate any change in circumstances.

12. The Minister of Finance may pay the following amounts from the Consolidated Fund, at the request of the minister:

    (a) fees and salaries of any technical advisors or other experts and assistants employed or retained for the purpose of the inquiry;

(b) travelling and other incidental expenses that the commissioner incurs in conducting the inquiry;

(c) any other operational expenditures necessary to support the inquiry.

13. This Order is effective immediately.

AUTHORITY

Subsection 83(1) and section 96 of *The Manitoba Evidence Act*, C.C.S.M. c. E150, state in part:

Appointment of commission
83(1) Where the Lieutenant Governor in Council deems it expedient to cause inquiry to be made into and concerning any matter within the jurisdiction of the Legislature and connected with or affecting

(a) the good government of the province or the conduct of any part of the public business thereof;

(b) the conduct of any provincial institution or of any institution within the province receiving provincial aid;

...

(f) any matter which, in his opinion, is of sufficient public importance to justify an inquiry;

he may, if the inquiry is not otherwise regulated, appoint one or more commissioners to make the inquiry and to report thereon.

…

Power to make rules
96 The Lieutenant Governor in Council may make provision, either generally in regard to all commissions issued and inquiries held under this Part, or specially in regard to any such commission and inquiry, for

(a) the remuneration of commissioners and persons employed or engaged to assist in the inquiry, including witnesses;

(b) the payment of incidental and necessary expenses; and

(c) all such acts, matters, and things, as are necessary to enable complete effect to be given to every provision of this Part.

TERMS OF REFERENCE

Manitoba Hydro proceeded with developing the Keeyask Generating Station project ("Keeyask") and the Bipole III transmission line and converter station project ("Bipole III") during a time when the market price for energy was declining. Continuing with these projects has required Manitobans to deal with the costs, and the billions in related cost overruns, through increases in electricity rates that far exceed the expected rate of inflation.

As a result, the commissioner is to

(a) inquire into the following matters:

1 With reference to the actual or proposed in-service dates of Keeyask and Bipole III, to what extent did Manitoba Hydro pursue these two projects when they were not necessary, or not necessary at the time, to meet the province's then-anticipated electrical needs in a timely and cost-effective manner?

2 With reference to Keeyask and Bipole III, to what extent did the directions that the government gave to Manitoba Hydro

(i) promote economy and efficiency in the generation, transmission, distribution and supply of power in the province; and

(ii) result in Manitoba Hydro having to address matters beyond its statutory mandate?

3 To what extent were the estimated net benefits projected at the planning stage for Keeyask and Bipole III

(i) determined in accordance with best practices then applicable for such projects;

(ii) demonstrably superior to the estimated net benefits of proceeding with other options then available for addressing the province's then-anticipated electrical needs in a timely and cost-effective manner; and

(iii) based on sound export market forecasts?

4 To what extent did the Keeyask and Bipole III planning and approval processes of Manitoba Hydro and the government, and any other applicable approval or review processes, appropriately

(i) evaluate the commercial risk associated with each project and the risks of the two projects proceeding concurrently;

(ii) assess the allocation of the risks among those involved in the construction of the projects; and

(iii) consider the immediate and long-term fiscal implications of the projects for the province and Manitoba taxpayers and Manitoba Hydro and its ratepayers?

5 Given the magnitude of Keeyask and Bipole III and the time lines necessary to complete them, to what extent did the oversight process that was followed after these projects were approved

(i) reflect best practices then applicable for such projects; and

(ii) mitigate the associated commercial risk and accommodate changing circumstances as they occurred?

(b) make recommendations about the following matters:

1 How should Manitoba Hydro's and the government's oversight of any similar project proposed in the future, including the planning, approval, procurement and construction processes for the project, be strengthened to ensure that

(i) there is appropriate transparency and accountability for decisions;

(ii) the commercial risk associated with the project is appropriately evaluated and allocated, both on an individual project and on a systemic basis; and

(iii) the financial and fiscal implications of the project for Manitoba Hydro and the province are assessed in an appropriate and timely manner?

2 Should Manitoba Hydro's statutory mandate be clarified to ensure that decisions concerning any such future project are in the best interests of Manitobans?

3 Should the planning and approval processes for such a future project include additional regulatory approvals or an external review? If so, what form and manner should the regulatory approvals or external review take?

4 If such a future project is approved to proceed, how should the project oversight process be improved so that

(i) changes in circumstances are accommodated in a timely and cost-effective manner; and

(ii) verification is carried out at appropriate junctures to ensure that the project continues to be in the best interests of Manitobans?

5 Are there prudent steps for the government and its Crown corporation Manitoba Hydro to take to restore the corporation's financial health, given the government's ongoing obligation to ensure that provincial finances are managed responsibly and that Manitoba has an attractive investment environment?

The Joint Keeyask Development Agreement is not within the scope of these terms of reference.

EXECUTIVE SUMMARY

Manitoba Hydro's (MH) 2017/18 and 2018/19 General Rate Application (GRA) seeks approval from the Public Utilities Board (PUB) for an increase in its rates. MH has developed the rates proposal with a goal of restoring its Equity Ratio to 25 percent within 10 years, 5 years earlier than the previous plan. The need for rate increases on sales to its domestic customers is driven, in part, by a decline in MH's expectations for revenues. MH's integrated financial forecast includes a long-term forecast (20 years) of export revenues as a key input.

The PUB retained a team of Daymark employees as Independent Expert Consultants (Daymark IEC Team) to conduct an Export Pricing and Revenues Review. The objective of the review was to determine the accuracy and reasonableness of the export revenues forecast and assumptions included in MH's request for rate increases and its long-term financial forecasts. This report contains our analysis and findings resulting from that review.

We conclude that MH's export revenue forecast is conservative/low relative to a value that is consistent with MH's stated goal that it will have a 50 percent chance of achieving the equity ratio target within 10 years. The key issues we identify here are:

- The reference case energy market price forecast and the resultant energy revenues are susceptible to be biased low.
- MH assumes that no revenue will be received for capacity or any other premium values from the substantial surplus dependable energy in the forecast.
- The uncertainty analysis that MH has conducted demonstrates the asymmetrical nature of the risk, with energy price risk skewed toward higher values, where the expected value of the forecast will be higher than the reference case value.

The components of the export revenue forecast that we reviewed and found to be reasonable include the forecast of surplus dependable energy and opportunity sale energy and MH's forecast of revenues to be derived from existing firm contracts.

The vast majority of MH's export sales are made to U.S. entities operating in the markets administered by the Midcontinent Independent System Operator (MISO). Our review of the characteristics of the MISO marketplace found the following.

- The 61 GW of coal generation in the MISO market is likely to decline significantly over the next decade with the age of the fleet and the economic pressure of low natural gas prices being primary drivers. About 88 percent of the existing coal capacity is over 50 years old today. A number of planned coal retirements have been announced in MISO plans or in utility resource plans.
- MISO needs assessments indicate that the current system surplus capacity is expected to erode within 5 years based on current assumptions and information on existing, committed, and planned changes in capacity resources, with the need for new resources of about 24 GW occurring by 2031. This need is driven primarily by expected retirements of aging coal generation. The replacement resources will be determined by the generating companies in the region, with natural gas generation and renewable generation featured as prominent options considered in the resource plans we reviewed.
- State polices have significant influence on resource choices. In Minnesota, policies governing utility resource planning are placing increased importance on greenhouse gas emission reductions and renewable resources. As examples, Northern States Power and Minnesota Power each show coal retirements and increasing natural gas and renewables in their plans for the coming decade. Wisconsin state policy shows some similarities to Minnesota, while North Dakota requires planning to consider least cost.

Our report contains our review and findings on the components of our scope of work:

1. A discussion of factors influencing the MISO market
2. A review of MH's electricity export price forecasts
3. A review of MH's forecast of exportable surplus energy
4. A review of changes in MH's methodology regarding premiums
5. A review of MH's forecast of revenues from existing contracts
6. A review of MH's 20-year forecast of net extraprovincial revenue

I. INTRODUCTION

A. Scope of the Report

Daymark Energy Advisors (Daymark)[1] offers this independent expert report to describe our export pricing and revenues review and provide our expert opinion regarding the treatment of those topics by Manitoba Hydro (MH) in its 2017/18 & 2018/19 General Rate Application (GRA).

On August 21, 2017, the Manitoba Public Utilities Board (PUB) retained a team of Daymark employees as Independent Expert Consultants (Daymark IEC Team)[2] to conduct an Export Pricing and Revenues Review and a Load Forecast Review. This Export Pricing and Revenues Report (Export Report), and the companion Load Forecast Report, are now provided to present the results of the work requested by the PUB.[3] The full text of the scope of work for the Export Report is included in Appendix A, which includes:

1. A review of MH's electricity export price forecasts;
2. A review of MH's forecast of exportable surplus energy;
3. A review of MH's 20-year forecast of net extraprovincial revenues;
4. A review of changes in MH's methodology regarding premiums; and
5. A discussion of factors influencing the MISO market.

The objective of this scope of work is to determine the accuracy and reasonableness of the export revenues assumptions included in MH's request for rate increases for consideration by the PUB. MH's export revenues projections rely on information that is highly sensitive and confidential and rely on MH's proprietary models and third party forecast information, including confidential information shared directly with the Daymark IEC team. For this reason, the Daymark IEC Team is charged with preparing a

[1] Daymark Energy Advisors is the new name of the firm formerly known as La Capra Associates.The name change occurred on November 9, 2015.

[2] The Daymark IEC Team includes specific individuals within Daymark Energy Advisors. A separate set of Daymark employees have been retained by the PUB as Advisors. The Daymark IEC Team conducted its work and maintained documents separate from all other Daymark employees in accordance with the terms of a non-disclosure agreement executed with Manitoba Hydro.

[3] On October 25, the PUB added a third task to the Daymark IEC Team scope of work. That task will be a review of the economic case for the Manitoba-Saskatchewan Transmission Line and export sale to Saskatchewan Power. A report on that review will be submitted separately on or before December 15, 2017.

full, confidential report on our findings to the PUB, and providing a report suitable for the public record that does not disclose any confidential information.

B. Daymark Approach

The Daymark IEC Team conducted the scope of work considering:

- MH's GRA filing, minimum filing requirements, and interrogatory responses;
- Certain information on export revenue projections from prior rate proceedings and the NFAT proceeding;
- Information provided directly and confidentially to the Daymark IEC Team by MH resulting from direct discussion with the MH subject matter experts (SMEs); and
- Publicly available documents obtained by the Daymark IEC Team from research on the export markets.

MH provided direct access to its SMEs for the Daymark IEC Team to conduct our review, including:

- Meetings in MH's offices in Winnipeg with the MH SMEs and staff on September 13 and 14, 2017;
- Weekly coordination calls with the SMEs;
- Frequent conference calls with certain SME's on each of the sub-topics included in the reviews; and
- Transfer of documents identified over the course of these meetings.

In working with MH's SMEs, the Daymark IEC Team solicited certain documentation necessary to complete our scope of work and reviewed those materials with the SMEs that developed them to understand how each analysis was conducted. MH established a secure file transfer mechanism to provide electronic copies of documents identified in this process to the Daymark IEC Team, with those documents held in a secure file server location with access limited to the members of the Daymark IEC Team.

Throughout this report we footnote all materials sourced from a specific document. At the end of this report, Appendix B provides a full annotated listing of all documents relied upon by Daymark in the production of this report.

This report is structured to provide a clear discussion of the work performed by the Daymark IEC Team and to clearly identify the inputs used to reach the expert opinions related to each scope item. We have modified the order of the scope items discussed in this report to better sequence the information, such that the initial sections provide foundation for the later sections. The following report sections correspond to the scope of work as follows.

Table 1: Mapping of Report Sections to Scope Items

REPORT CHAPTER	SCOPE ITEM
Section II: Factors Influencing the MISO Market	5
Section III: Export Prices	1
Section IV: Export Energy and Capacity	2
Section V: Changes in Forecasting Methodology	4
Section VI: Firm Contracts	3
Section VII: Revenue Forecast	3

II. FACTORS INFLUENCING THE MISO MARKET

A. Overview

The most significant wholesale market neighboring the MH system is the Midcontinent Independent System Operator (MISO). MISO and the utilities in MISO's footprint provide a significant opportunity to buy and sell energy, including in firm bilateral deals, shorter-term opportunity sales, and direct participation in the MISO day-ahead energy market. In a typical year, MH exports close to 25 percent of its production to the US through MISO.[4] Over 90 percent of all energy exports included in MH's export revenue forecast are through MISO.[5]

MISO is one of the largest Independent System Operators (ISOs) in North America with primary functions that include the operation of the transmission grid, administration of the wholesale markets, coordination of regional planning activities, and the enforcement of regional and federal reliability standards.

In this section of our report, we discuss the market fundamentals in the MISO region and how they may influence MH's participation in the various MISO markets.

The material presented in this section provides background and context for the subsequent sections of our report regarding MH's export revenue forecast.

B. Scope of Investigation

This section of the report discusses the factors influencing the MISO market and trends that are affecting market prices. This section also serves to provide background information supporting other elements of our work. MH's export sales include several longer-term contracts and the GRA filing includes a longer-term forecast of export sales and revenues. Accordingly, several elements of the scope of work call for information regarding longer-term trends and forecasts, as well as information on near-term market conditions. The information we provide here relies principally on publicly available information on near-term conditions and longer-term trends. Our scope of work does not include preparation of an independent forecast or consideration of confidential forecast information available to MH.

[4] Manitoba Hydropower's website, accessed November 2017, available at: http://www.manitobahydropower.com/who-we-are.shtml

[5] Derived from confidential SPLASH results

We have modified the order of the topics discussed in this section to better sequence the information, such that the initial sections provide foundation for the later sections. The following report sections correspond to the scope of work as follows.

Table 2: Mapping of Report Subsections to Scope Item #5

SUBSECTIONS		SCOPE ITEM
II. C.1	Existing Generation Mix	5 (b)
II. C.2	Forecasted Retirements for the Next 20 Years	5 (d)
II. C.3	Expected New Generation to be Installed in the Next 20 Years	5 (c)
II. C.4	Supply and Demand Balance in the Northern MISO Region	5 (e)
II. C.5	State and Federal Policies on Electricity Generation and Emissions	5 (a)
II. C.6	Factors that may Affect Manitoba Hydro's Ability to Export Energy and Capacity into the MISO Market	5 (f)

To perform this scope of work, Daymark reviewed publicly available documents including reports from MISO, for the North American Electric Reliability Corporation (NERC), and data from SNL Financial, an entity that provides electric industry-specific market data obtained from public and private companies worldwide.[6] A specific list of these documents is provided in Appendix B.

C. Analysis

MISO administers the U.S. wholesale market neighboring the MH system. MISO coordinates the movement of electricity across all or parts of 15 U.S. states, largely in the corridor between Minnesota and Louisiana. MISO operates its wholesale markets only within its market footprint and coordinates reliability under a larger reliability footprint.

MH's relationship with MISO differs from other entities that serve load and/or own generation within the MISO market footprint. MH's load is not served under the MISO's Open Access Transmission, Energy and Operating Reserve Markets Tariff, and its generation is not directly dispatched by MISO. Under MH's governing legislation, the delegation of authority of MH's assets to a third party is not authorized except only to limited instances and subject to Lieutenant-Governor in Council approval. As a result, MH participates as a coordinating member in the MISO market via three agreements.

[6] http://www.snl.com/

Two of the agreements pertain to transmission coordination between MISO and MH and the third is a MISO market participation agreement required by MISO for all market participants.[7]

The table below provides a brief overview of the MISO's characteristics.[8]

Table 3: MISO at a Glance

Generating Capacity	174,724 MW
Peak Demand	127,125 MW (Summer) 109,336 MW (Winter)
Transmission Lines	65,800
Annual Billings	$25.3 Billion
States Served	15
Generator Units	6,567

The figure below depicts MH's transmission interface limits to three neighboring regions including the U.S. MH is connected via one 500-kV transmission line and one 230-kV transmission line with Minnesota and two 230-kV transmission lines with North Dakota. The figure also provides the transfer capability of the three different interconnections under the best-case scenario.[9]

[9] http://www.manitobahydropower.com/who-we-are.shtml

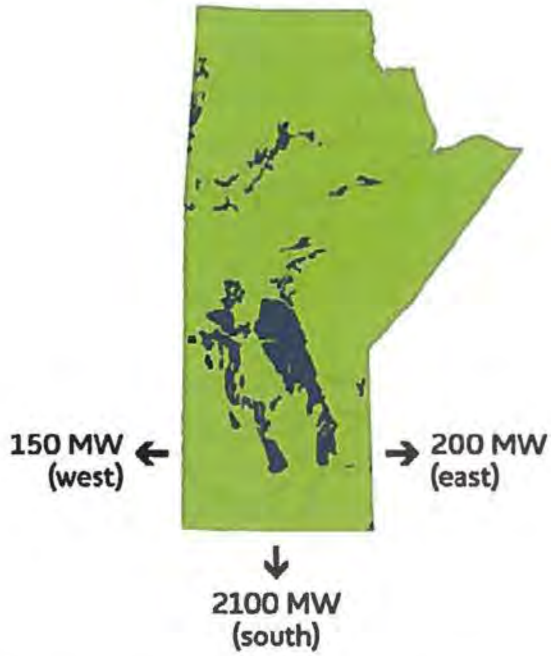

Figure 1: MH's Transmission Interconnections to Neighboring Regions

1. Existing Generation Mix

The MISO system is comprised of a variety of generating resources such as coal, natural gas, nuclear, renewables, and others. Natural gas and coal resources are the predominant sources of capacity, each providing approximately one-third of the total, with a mix of other sources providing the remainder as depicted in the table below[10]:

Table 4: Percentage of Total MISO Capacity by Fuel Type

Fuel Type	2017 Market Capacity Share	2017 Market Capacity (MW)
Gas	41%	71,637
Coal	35%	61,153
Nuclear	8%	13,978
Renewables	13%	22,714
Other	3%	5,242
Total	**100%**	**174,724**

[10] MISO website, accessed in November 2017, available at : https://www.misoenergy.org/AboutUs/Pages/FactSheet.aspx

As recently as 2012, the MISO region was one of the most coal-dependent regions in the U.S. with close to 66 GW of coal-fired generating capacity. Over 5 GW of coal generators have retired since 2012, reducing the amount of available coal resource capacity to 61 GW.[11] According to the 2016 MISO Transmission Expansion Planning (MTEP), MTEP16, 4,847 MW of generation capacity retired in 2016 with an additional 67 MW slated to retire in 2017. The report indicated that the data suggested that the majority of retirements in 2016 were related to compliance with the Mercury and Air Toxics Standards.[12]

These economic factors and tighter environmental regulations, described in the *State and Federal Policies on Electricity Generation and Emissions* section below, have stimulated several unit retirements in the MISO region. The retirement of resources has been slower than other regions[13] due to smaller amounts of economic natural gas resources compared with other regions. However, based on the MTEP16 report retirements have accelerated over the past year.[14]

[11] SNL Financial

[12] MTEP16 Full report – page 75

[13] Electric System Reliability and EPA's Clean Power Plan: The Case of MISO Page 12 and figure 4, Analysis Group

[14] MTEP Full report – page 76

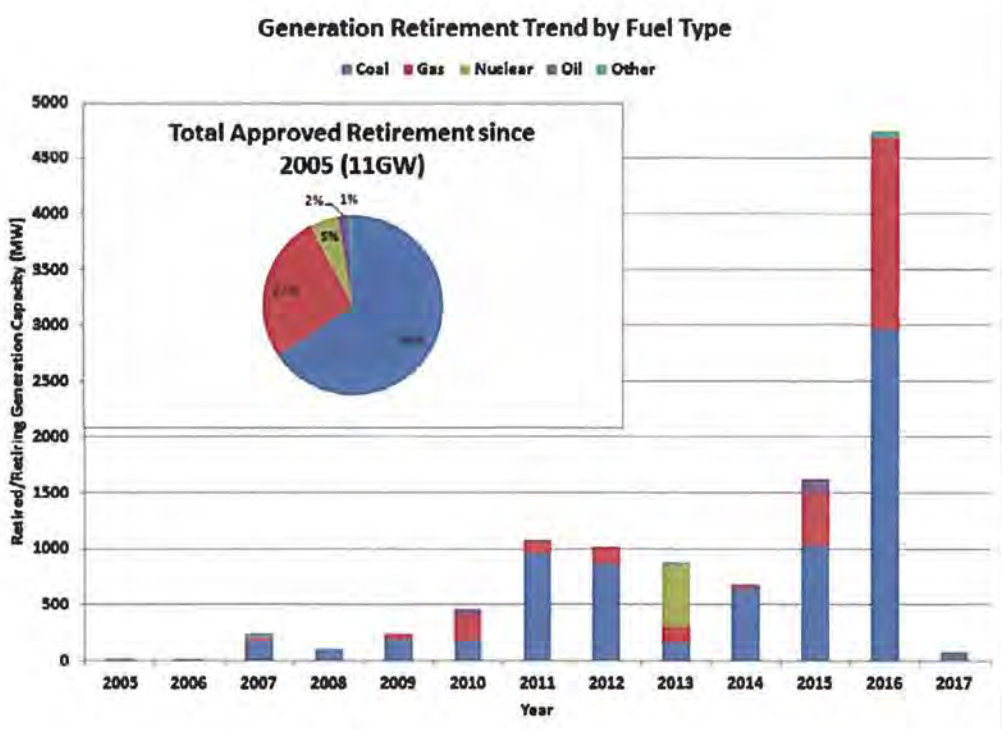

Figure 2: Generation Retirement Trend by Fuel Type, 2005-2017

The reduction in available coal capacity and the less advantageous economics for the coal resources reduced the amount of energy production from coal as depicted below.[15] The shale gas revolution and the resulting lower natural gas prices influenced all Regional Transmission Organizations (RTOs) and ISOs, including MISO's generation, and stimulated a transition to a fuel mix with increasing dependence on natural gas-fired generation compared to coal.

The overall MISO generation mix became larger and more diverse with the integration of Entergy's utilities into MISO in 2013, having considerably more natural gas-fired capacity than the rest of the MISO zones. The graph below indicates the magnitude of the gas resources added to the MISO system by the integration of MISO South, as compared to the rest of MISO, described as MISO North/Central.[16]

[15] SNL Financial

[16] Today's Trends, Tomorrow's Energy Needs - Wisconsin Public Utility Institute – slide 13 – 2016 YTD is depicted as of March 2016

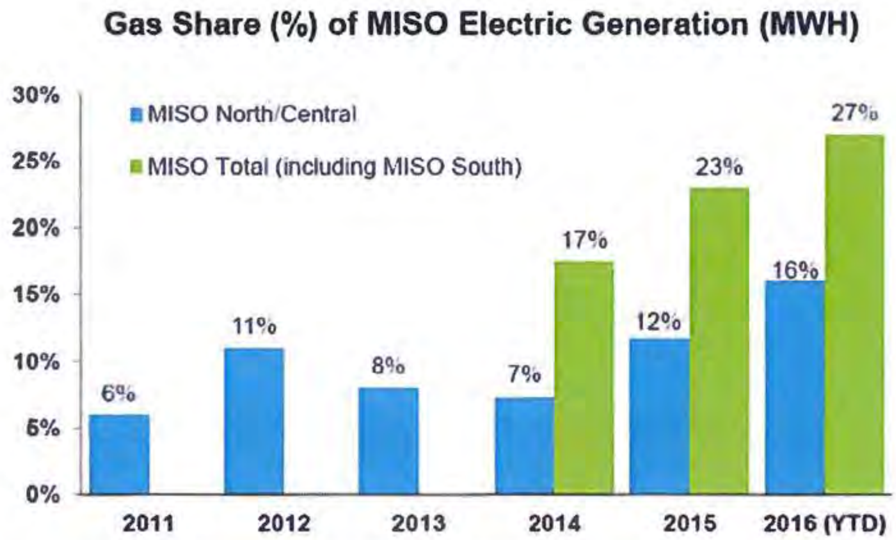

Figure 3: Gas Share (%) of MISO Electric Generation (MWh)

Despite the increase in gas share, the MISO real-time energy market is frequently priced based on coal. Natural gas resources set prices approximately 40 percent of the time, compared to approximately 10 percent of the time in 2012.[17] The 2016 State of the Market Report presents the following graph of monthly price setting by fuel.[18]

[17] 2012 STATE OF THE MARKET REPORT FOR THE MISO ELECTRICITY MARKETS, page A-7

[18] 2016 State of the Market Report for the MISO Electricity Market, Analytic Appendix – Figure A1, page 2.

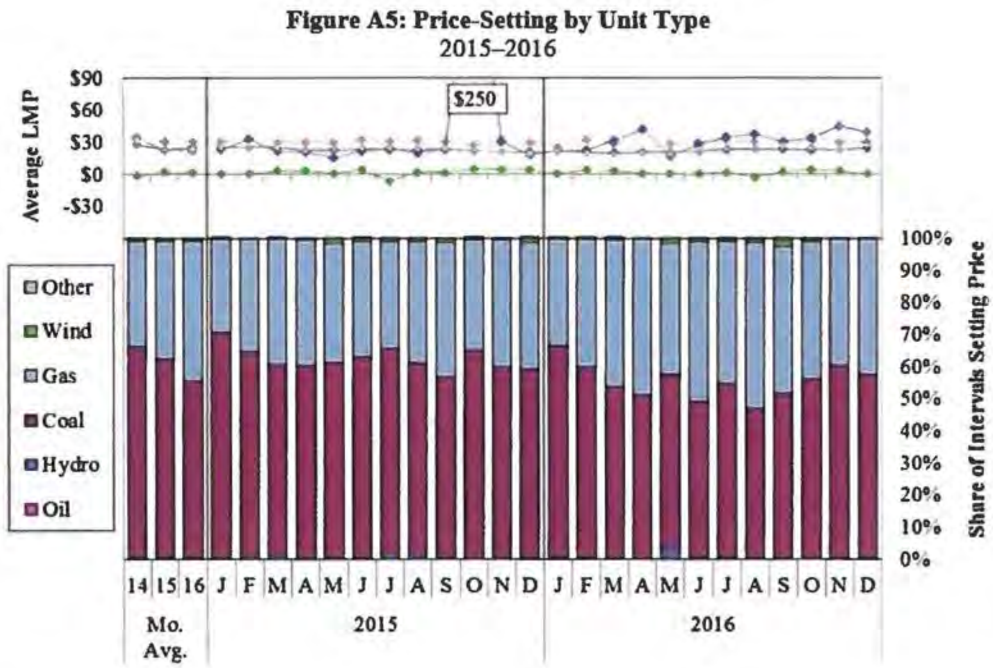

Figure 4: Price Setting by Unit Type, 2015-2016

2. Forecasted Retirements for the Next 20 Years

Even with the recent retirements of coal plants in the MISO markets, coal generation remains a significant part of the MISO mix. Looking forward, there will continue to be pressures that will bear on future coal plant retirements, including the aging of existing units, environmental regulations, and the cost of alternatives.

With respect to alternatives, the shale gas revolution and significant investment in pipelines throughout North America have made low-priced natural gas available and have eliminated the price separation between the regions that had persisted for decades. The U.S. Energy Information Administration (EIA) graph below presents the estimated natural gas production potential in the U.S., indicating a continued expansion of the availability of natural gas over the next 20 years and beyond.[19] High availability of natural gas for the longer term provides a basis for natural gas generation to be a competitive alternative to coal in the MISO market in the longer term.

[19] https://www.eia.gov/outlooks/archive/aeo16/MT_naturalgas.cfm#natgasprod_exp

Figure MT-46. U.S. dry natural gas production by source in the Reference case, 1990–2040

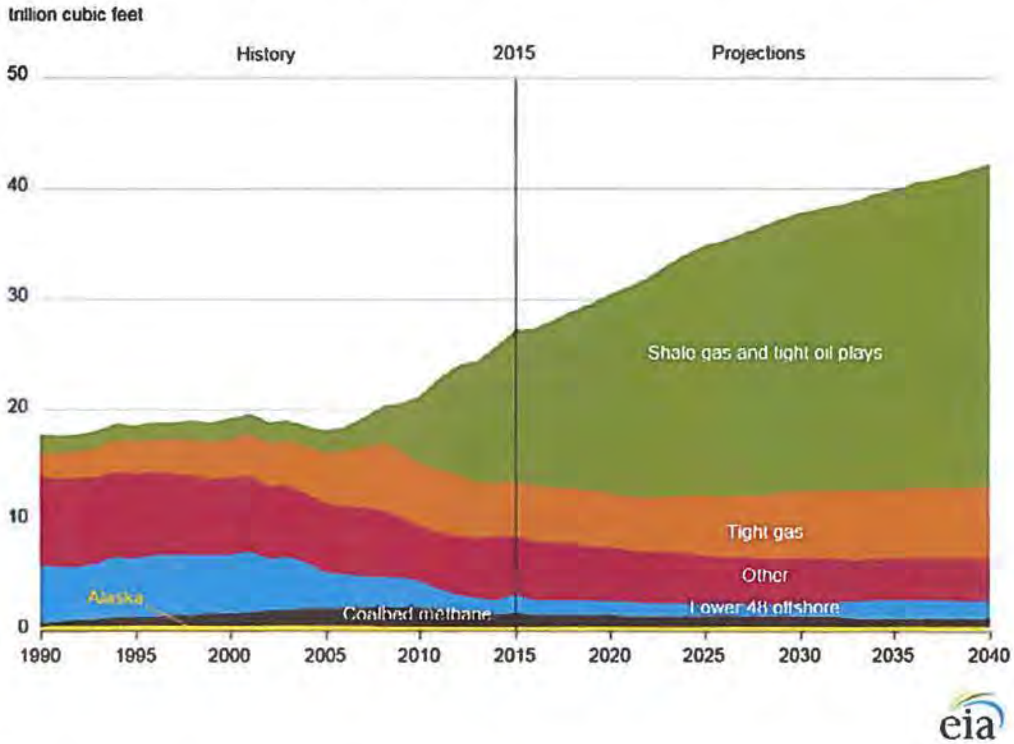

Figure 5: U.S. Dry Natural Gas Production, 1990-2040 (Trillion Cubic Feet)

Another critical factor of the existing MISO fleet that may stimulate retirement is plant age. Nearly 88 percent (55 GW) of the MISO's coal capacity is at least 50 years old and 52 percent (~30 GW) is at least 60 years old, as shown in Figure 6.[20] Coal generating units have traditionally been built with an assumed design and economic life span of about 30 years, with the implicit assumption that the generator engine and critical components would be replaced after that period. Therefore, it is common for coal resources to remain in service much longer than 30 years after critical components are replaced, extending their life span to 50-60 years. As they age, generators face substantial reliability, efficiency, and performance problems, which in turn increase operating costs.

[20] MISO Fleet Changes – slide 9

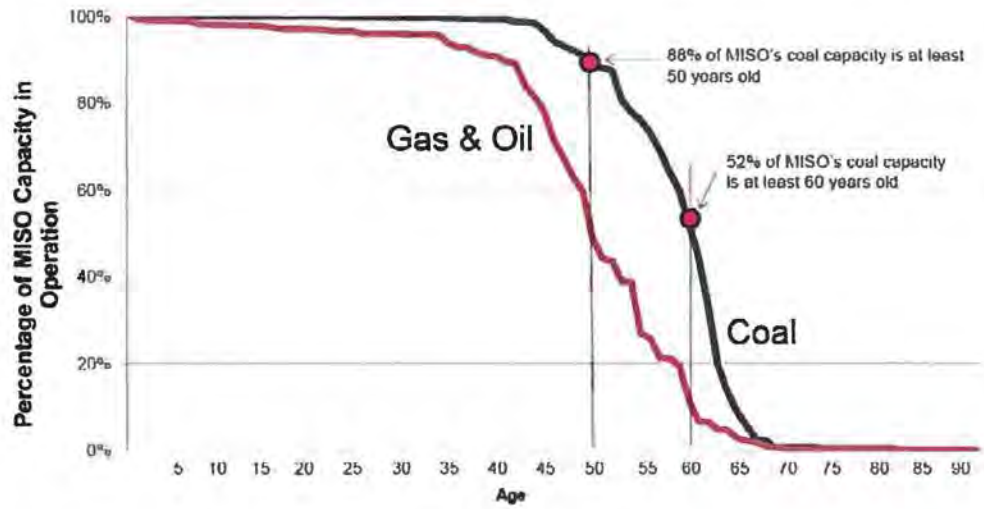

Figure 6: Age Distribution of Operating Coal Capacity and Gas & Oil Capacity in MISO

MISO has determined that 91 percent of the MISO coal capacity that has retired, retired prior to its assumed 65-year useful life and 48 percent retired by age 60. If this trend persists, then close to 50 percent (30 GW) of the coal fleet is at risk for retirement in the next decade and more over the next 20 years.

These changing market conditions and the potential for accelerated retirements have been reflected in various reports from MISO and the NERC. In its 2016 Long-Term Reliability Assessment (LTRA), NERC identified a resource adequacy need by unconfirmed resource retirements over the next few years. The graph below describes the impact of these retirements on the reserve margin in the region.[21]

[21] Reliability Assessments DL_2016 Long-Term Reliability Assessment, p 8

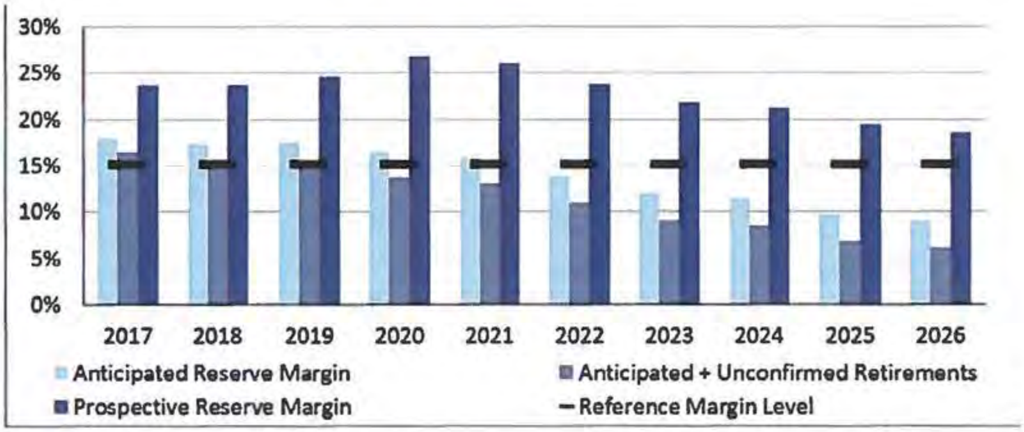

Figure 7: Impact of Retirements on Reserve Margin, MISO

Furthermore, in the draft MTEP17, MISO projects a range of approximately 8 to 24 GW of coal retirements between now and 2031, with 1.7 to 4.8 GW of that amount in MISO zones 1 and 2 (zones neighboring Manitoba). These values are shown in Figure 8.[22]

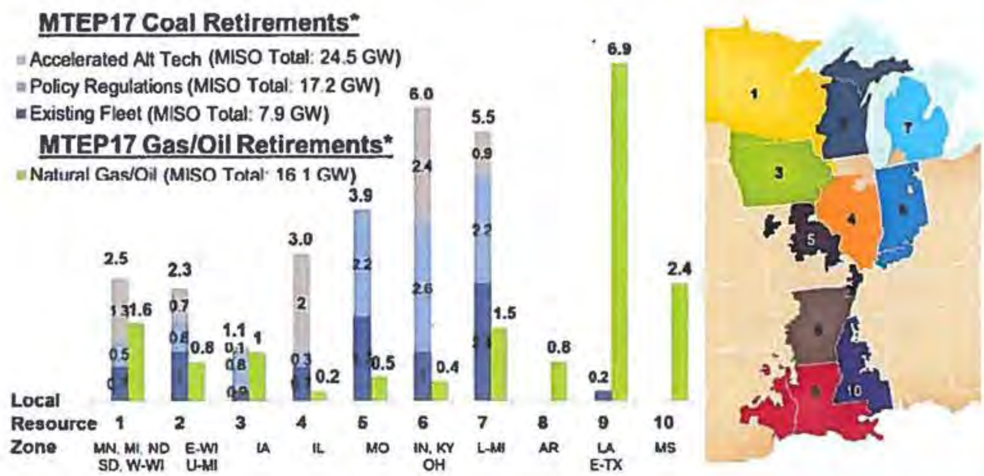

Figure 8: MTEP17 Retirement Assumptions by Zone by 2031

Unit age is the main driver of retirements in MTEP17. The Mercury and Air Toxics Standards (MATS) compliance deadline ended in April 2016 and the MTEP17 assumes no further unit retirements due to environmental compliance assumptions (retirements, retrofits or coal-to-gas conversions).

[22] MTEP 2017 draft, Appendix E2, pp 17

MTEP17 also provides information on the location of most of the older units that are located within the MISO region and what is considered to retire based on age or environmental policy. Figure 9 is a visual depiction of the locational distribution of the retirements assumed in MTEP17.

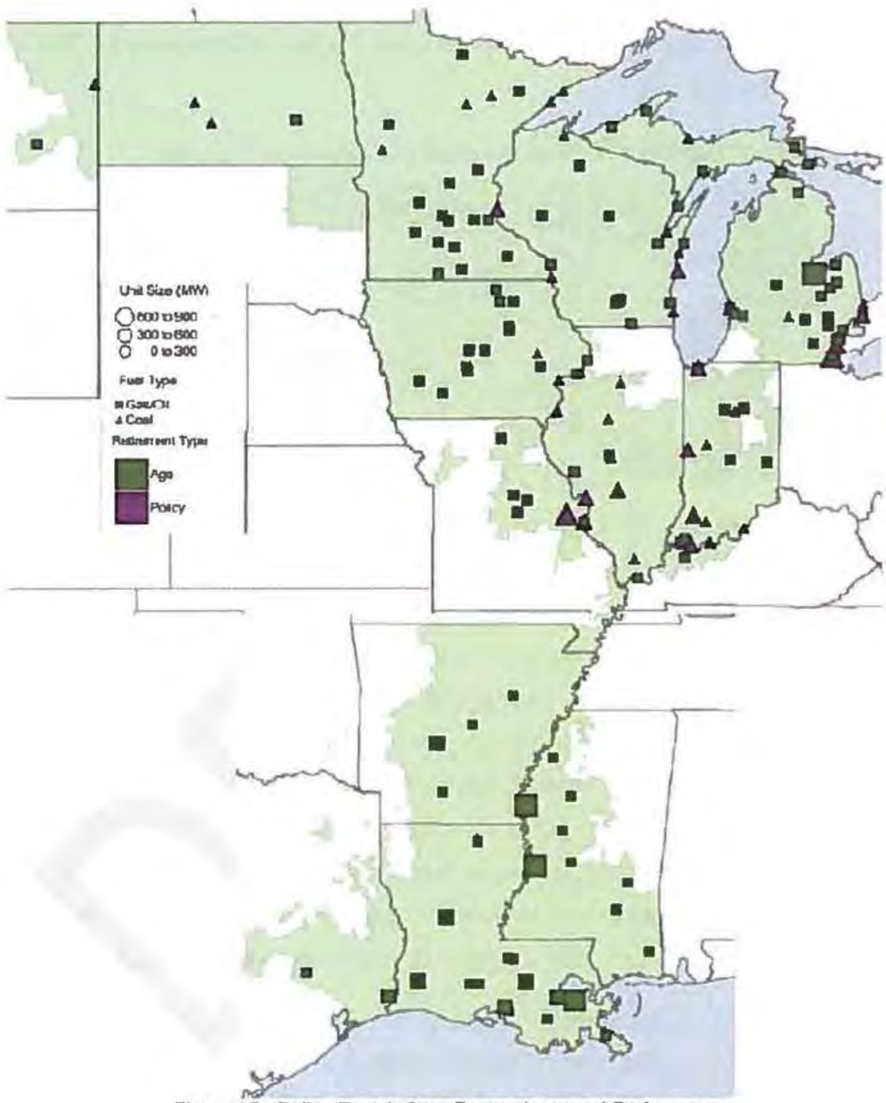

Figure 15 : Policy Regulations Future Assumed Retirements

Figure 9: Assumed Retirements in MTEP17

3. Expected New Generation Over the Next 20 Years

The potential significant amount of generation retiring over the next few years will create a need for new resources in the region. In its draft MTEP17, MISO indicates that in order to maintain resource adequacy within its footprint, close to 4.5 GW of new resources are projected to enter the market as described in the Table 5, below.[23] The table's resource projections are based on the latest Organization of MISO States-MISO survey results.[24]

Table 5: Expected New Generation over the next 10 Years

In GW (ICAP)	PY 2018/19	PY 2019/20	PY 2020/21	PY 2021/22	PY 2022/23	PY 2023/24	PY 2024/25	PY 2025/26	PY 2026/27	PY 2027/28

PRMR Surplus / Shortfall	2.7	3.9	3.2	2.6	0.6	-1.4	-2.4	-2.5	-2.5	-2.5
Reserve Margin Percent (%)	17.9%	18.9%	18.3%	17.9%	18.3%	14.7%	14.0%	13.9%	13.8%	13.8%

With respect to the expected new generation over the next 20 years, there is significant need for new capacity resources in years 6 to 20 for which the MISO participants have not yet identified the resources to be developed to meet the need. The MISO MTEP17 analysis indicates that the current system surplus capacity is expected to erode within 5 years based on current assumptions and information on existing, committed, and planned changes in capacity resources. This assessment assumes no reduction in imported capacity through 2028. Longer term (year 2024 and later), absent any action to add new capacity resources to the system, the MISO market would be short of the capacity needed to meet reserve margin requirements. For example, in MISO's MTEP16 report, it included an assessment that 24 GW of new resources would be needed by 2031 to meet the need in that year (this analysis was not updated in the MTEP17 draft).

The region can accomplish the procurement of needed, but as yet unidentified, resources via established processes both at the state and regional level. Each state's Integrated Resource Planning (IRP) process and the MISO's capacity market ensure that

[23] MTEP17 draft – Table 6.2-1 MISO anticipated PRMR details

[24] PMMR is the Planning Reserve Margin Requirement. Low certainty resources are resources that may be available to serve MISO load but do not have firm commitments to do so. The 2016 OMS- MISO results can be found here: https://www.misoenergy.org/Library/Repository/Meeting%20Material/Stakeholder/Workshops%20and%20Special%20Meetings/2016/OMS-MISO%20Survey/2016OMS-MISOSurveyResults.pdf

this need will be met in the most cost-efficient way to the consumers. The IRP process is described in more detail in the *State and Federal Policies on Electricity Generation and Emissions* section of this report. In this section, we will provide information related to MISO's capacity market. Under the IRP construct, a utility may forecast a supply adequacy need and propose to build a new plant to fill the need. Utilities that need capacity will weigh the cost of developing new resources relative to the cost and availability of bilaterally-sourced existing supplies from neighboring systems. For instance, it may be more cost-effective to procure excess capacity from neighboring utilities or uncontracted IPPs rather than build new resources. The MISO capacity market provides a measure of the cost and availability of existing surplus capacity as an option to meet the utility's capacity needs.

4. Supply and Demand Balance in the Northern MISO Region

For the purposes of this report, Daymark defines the Northern MISO Region to be comprised of Minnesota, Iowa, Wisconsin and parts of North Dakota, South Dakota, and Montana – the states that are most proximate to MH. MISO defined nine Load Resource Zones (LRZ) in its system, defined by major internal transmission interfaces where transfers may be limited between LRZs. MH connects to MISO LRZ 1, which includes most of Minnesota, North Dakota, and portions of Montana and Wisconsin (see map in Figure 10).

The MISO Northern Zones are currently transfer limited, meaning capacity is surplus in those zones with the surplus capacity exceeding the ability of the transmission system to allow that surplus to be transferred to and used by zones with short supply to the south. Currently, LRZ 1 has an export limit of 600 MW and has surplus capacity in excess of this limit. Figure 10 is an illustration of this current surplus condition in LRZ 1.

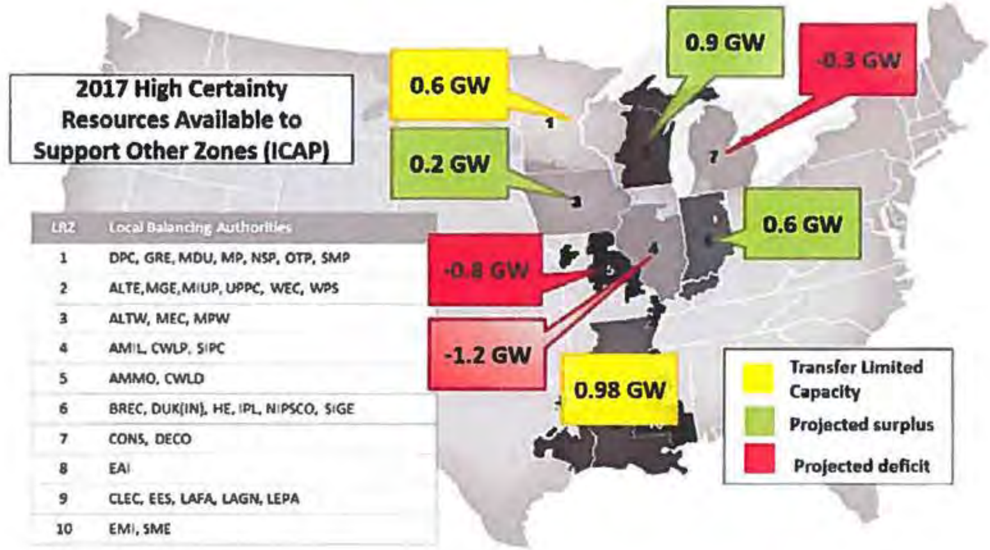

Figure 10: MISO Capacity Zones: Capacity Surplus/Deficit[25]

Table 5, above, included an amount of capacity that is transfer-limited, and therefore unavailable to meet MISO requirements in the 2018-2023 period. That analysis indicates that the system is not expected to be transfer-limited thereafter.

The retirement of capacity in the northern zones, as shown in the figure, eliminate that export-constrained situation by 2023. Figure 9 shows a significant number of retirements in the northern MISO zones.

MISO North's load growth on average is below 1 percent, with LRZ 1, 2, and 3 having slightly higher load growth than most of the other zones.[26]

5. State and Federal Policies on Electricity Generation and Emissions

State and federal policies regarding environmental performance of electric systems – particularly with respect to requirements for renewable and clean energy content and with respect to reliability and operational requirements in power markets – can lead to opportunities for premium pricing for MH contract offerings.

Environmental policy associated with U.S. electric systems has shifted to a more state-centric approach. The Obama Administration was actively advancing policies to reduce greenhouse gas emissions in the electric sector, most notably in the form of the Clean Power Plan rules pursued by the Environmental Protection Agency. Following the election, the Trump Administration has acted to withdraw from the Paris Climate

Agreement and has suspended the Clean Power Plan. While the Clean Air Act requirements will remain important to planning for the future of the electric system, the policy initiatives for renewable and clean energy are most active at the state level, with several states recently placing more emphasis on renewables and greenhouse gas emission reduction policies.

In this section, we discuss policy issues in Minnesota, Wisconsin and North Dakota as examples that are most relevant to Manitoba. We also discuss the development of capacity markets in the MISO market, driven by federal policy to ensure resource adequacy (sufficient generation reserves).

State Policy Drivers

Since most new capacity at MISO is procured through IRPs, state policies have a significant impact on what capacity is procured. With respect to MH's potential counterparties, key states to review are:

- Minnesota;
- Wisconsin; and
- North Dakota.

Minnesota

Minnesota is a state with aggressive renewable energy and carbon reduction policies. The state has a renewable portfolio standard (RPS) requiring 25-30 percent renewable energy by 2025 or 2020, depending on the utility.[27] The Minnesota Public Utilities Commission (MPUC) recently acted to increase the range of CO_2 pricing in resource planning assessments.[28]

One of the key counterparties for MH – Minnesota Power – is even more aggressively pursuing renewable power. Minnesota Power recently announced a new plan with a goal of 44 percent of the company's energy supply coming from renewable resources in the near term (2025) and a long-term goal of reducing coal to one-third of its energy mix, with two-thirds being renewable energy and natural gas.[29]

[27] http://programs.dsireusa.org/system/program/detail/2401

[28] *Minnesota agency raises state's CO2 values, rejects federal cost of carbon*, July 28, 2017, S&P Global Market Intelligence.

[29] https://minnesotapower.blob.core.windows.net/content/Content/Documents/Company/PressReleases/2017/201767_NewsRelease.pdf

Northern States Power (NSP), an Xcel Company, is another MH counterparty that serves load in Minnesota as well as in North and South Dakota. According to "*Application for Consideration of a Resource Treatment Framework to Address Jurisdictional Cost Allocation Issues*," pages 14-15,[30] the latest IRP for NSP identified the following "energy resources" as scheduled to retire in the 2020s:

- 2023: Blue Lake Units 1-4 (natural gas combustion turbines (CTs)) cease operation (153 MW);
- 2023: Sherco Unit 2 (682 MW coal) retirement;
- 2025: Manitoba Hydro contracts expire (850 MW);
- 2026: Cottage Grove Combined Cycle Energy Center contract expires (262 MW);
- 2026: Sherco Unit 1 (680 MW coal) retirement; and
- 2027: Mankato Energy Center Combined Cycle (MEC I) contract expires (375MW).

The MPUC has approved NSP's plan. The document states that new baseload will not be needed until 2026 in NSP's service territory, but NSP does indicate that aging of its coal and nuclear facilities will require planning to address the loss of 75 percent of the energy-producing resources on the NSP system in its next IRP.[31]

In addition to the above, Minnesota has been a leader in developing value of solar methodology that assigns externality value to solar.[32]

Finally, Minnesota has the Next Generation Energy Act, which sets goals of reducing carbon emissions by 80% of 2005 levels by 2050, with interim goals.[33]

Wisconsin

The Public Service Commission of Wisconsin produces a Strategic Energy Assessment[34] every 2 years. The purpose of that document is to evaluate, "*the adequacy and reliability of Wisconsin's current and future electrical capacity and supply*." The latest version of that assessment predicts that there will be about 520 MW of retirements in the state by 2020. This includes one 320 MW coal facility. The remainder are natural gas units.

[33] https://www.pca.state.mn.us/air/greenhouse-gas-emissions-minnesota-0

[34] https://psc.wi.gov/Documents/SEA2022.pdf

Additionally,_Wisconsin has an RPS that requires LSEs to increase their renewable supply percentages by 2 percent by 2010 and 6 percent by 2015. The Strategic Energy Assessment projects a surplus of renewable energy, as shown in Figure 11.

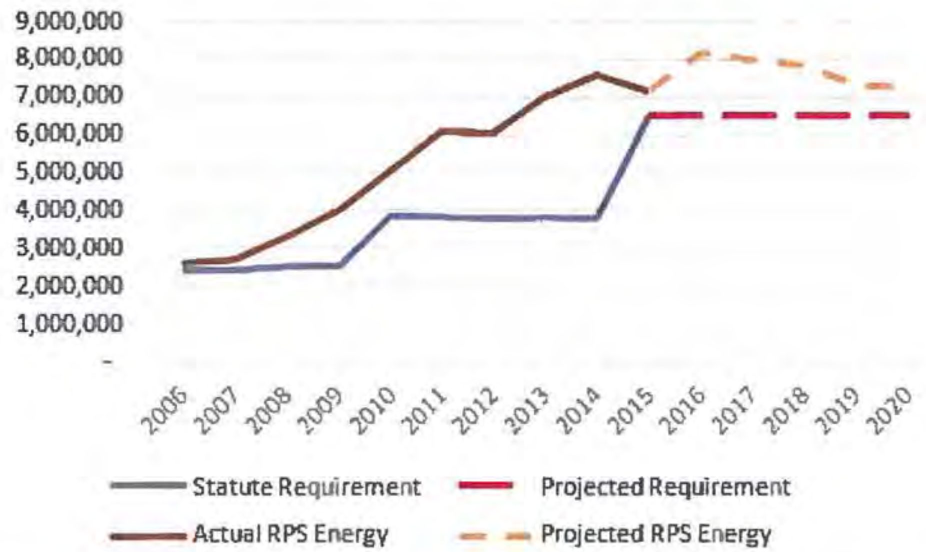

Figure 11: Statewide RPS Renewable Retail Sales (Actual vs. Required, 2006-2020)[35]

[35] Projection out to 2020 based on 0 percent energy growth. Source: Commission Staff 2015 RPS Compliance Memorandum (PSC REF#: 285744).

North Dakota

North Dakota's policy environment differs from Minnesota and Wisconsin. By law, utilities cannot consider environmental externalities in their resource planning decisions. This difference is punctuated by a recent Northern States Power filing with the MPUC and the North Dakota Public Service Commission, seeking a process to separate the IRP processes in those states due to the differences in policy.[36] From a policy perspective, utilities in North Dakota would not apply any premium on renewable or clean energy attributes.

With respect to the need for power in North Dakota, the discussion of system needs in the NSP system would apply in North Dakota, as well, because NSP's system planning is currently completed for its multi-state service territory.

MISO Resource Adequacy

MISO has established a uniform resource adequacy standard that requires an aggregate quantity of installed capacity to meet peak demand plus a determined minimum reserve margin. The capacity requirement is estimated at a level expected to produce a loss-of-load event no more than once every ten years. Each utility or load serving entity in the region is obligated to procure enough capacity resources to meet their own coincident peak plus a reserve margin. The aggregate requirement is comprised of all the LSE and utility requirements. The resource adequacy process includes a location-specific aspect to account for transmission limitations on moving capacity between specific areas of the system. The figure below depicts the current planning resource zones at MISO.[37]

[36] Application for Consideration of a Resource Treatment Framework to Address Jurisdictional Cost Allocation Issues, Northern States Power, December 31, 2016. MPUC Docket No. E-002/M-16-223 and NDPSC Case Nos. PU-12-813, et. al.

[37] https://www.misoenergy.org/Library/Repository/Report/Resource%20Adequacy/Planning%20Year%2017-18/2017-2018%20Planning%20Resource%20Adequacy%20Results.pdf, slide 6.

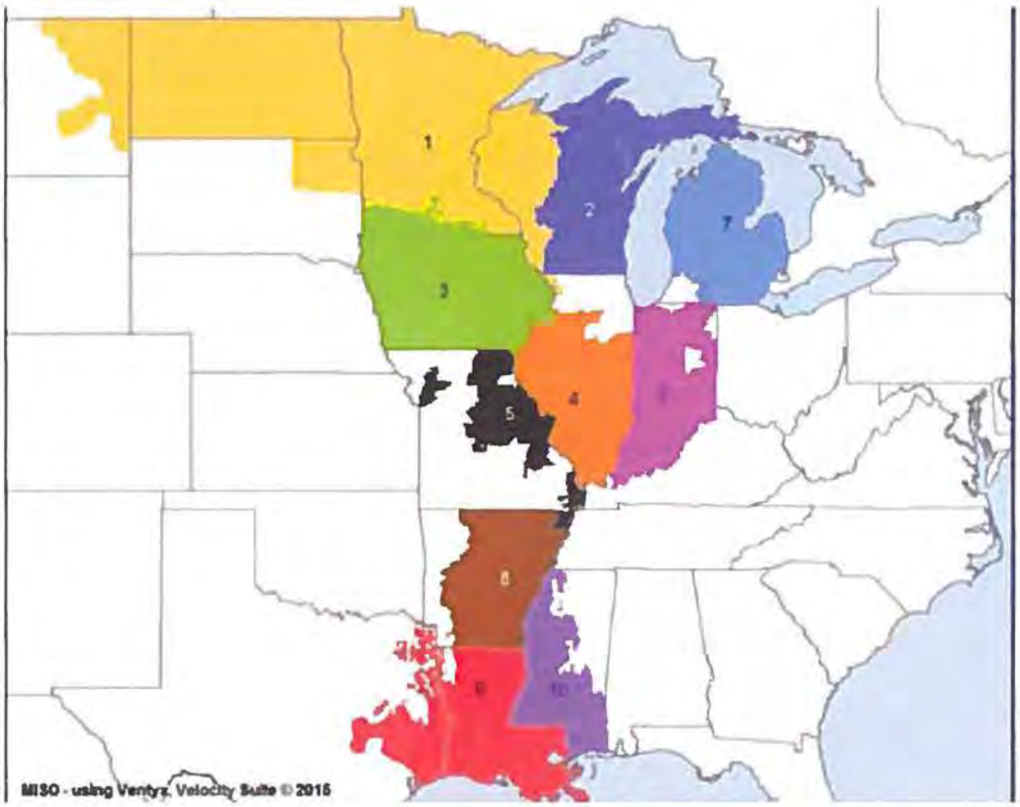

Figure 12: MISO Planning Resource Zones

Each LSE or utility can meet their requirement using a combination of self-supply, bilateral contracts, and procurements through MISO's Planning Resource Auction (PRA). MISO's hybrid model is necessary because most of the LSEs are regulated utilities with resource commitments selected within integrated resource plans well in advance of the delivery year. MISO's capacity maket can be considered as the last opportunity for LSEs to fill any deficiency in their capacity obligations. This auction is the only opportunity for market participants and the MISO to view the aggregate impacts of locational supply and demand balance and to ensure that local obligations are met.

An LSE seeking to pre-plan for its resource adequacy requirement can obtain resources by either self-scheduling resources or by submitting a Fixed Resource Adequacy Plan (FRAP). In the MISO PRA auctions, the majority of the capacity that clears is either self-supply or FRAP. In the 2017/2018 Planning Auction Resource Results report[38], out of

[38] https://www.misoenergy.org/Library/Repository/Report/Resource%20Adequacy/Planning%20Year%2017-18/2017-2018%20Planning%20Resource%20Adequacy%20Results.pdf

134,753 MW of total committed capacity, 129,017 MW of it was either FRAP (49,463 MW) or self-scheduled (79,554 MW). Thus, 96 percent of the cleared capacity was identified by LSEs prior to the balancing auction. This indicates the critical part that IRPs and bilateral transactions play in meeting MISO's resource adequacy needs.

The capacity market at MISO has produced low prices since its inception, mainly due to the significant amount of surplus capacity. The recent retirements of various resources have reduced the amount of surplus, changing the market dynamics and potentially resulting in higher prices to incentivize new investment. The table below indicates how prices in the region have fared over the last few periods and the MISO's estimate on the amount of resources exiting and entering the market. Historically, the entities MH has transacted with are in zones 1 and 2.

Table 7: Capacity Market Prices, by Zone, 2014/15-2017/18

	$/MW-day			
Zone	2014/15	2015/16	2016/17	2017/18
LRZ 1	$ 3.29	$ 3.48	$ 19.72	$ 1.50
LRZ 2	$ 16.75	$ 3.48	$ 72.00	$ 1.50
LRZ 3	$ 16.75	$ 3.48	$ 72.00	$ 1.50
LRZ 4	$ 16.75	$ 150.00	$ 72.00	$ 1.50
LRZ 5	$ 16.75	$ 3.48	$ 72.00	$ 1.50
LRZ 6	$ 16.75	$ 3.48	$ 72.00	$ 1.50
LRZ 7	$ 16.75	$ 3.48	$ 72.00	$ 1.50
LRZ 8	$ 16.44	$ 3.29	$ 2.99	$ 1.50
LRZ 9	$ 16.44	$ 3.29	$ 2.99	$ 1.50
LRZ 10			$ 2.99	$ 1.50

For a resource to enter the market, it will have to be economically feasible. In theory, merchant generation will not enter unless average future prices are expected to be at least the Net Cost of New Entry (Net CONE), which is the gross cost of new entry, less the variable profit the resource is expected to earn from energy, ancillary service, and other market services. While most capacity does not enter the market through this mechanism, it is still an important indicator of the total revenue requirement of new capacity.

MISO calculates the CONE[39] and for the 2016/2017 planning year has produced the following expectations.

Table 8: Cost of New Entry, by Zone, Planning Year 2017/17

Zone	PY 2016/17 CONE ($/MW-yr)	Zone	PY 2016/17 CONE ($/MW-yr)
LRZ 1	$94,170	LRZ 6	$94,340
LRZ 2	$95,110	LRZ 7	$94,830
LRZ 3	$93,130	LRZ 8	$90,360
LRZ 4	$94,630	LRZ 9	$91,690
LRZ 5	$96,430	LRZ10	$89,810

Even though most new capacity at MISO is procured through the established IRP processes, the MISO capacity market provides an indication of the value of capacity in the region. Utilities that seek to build new resources to meet their resource adequacy requirement assess – among other things – the capacity market environment at the time and whether it is sensible to procure the required capacity through the market, build it on their own, or enter into a bilateral contract. Failure to procure enough capacity to meet capacity requirement results in deficiency charges.[40]

The expectations that MISO will be moving from the current capacity surplus position to one of potential shortages and need for capacity and energy additions will increase the importance of the capacity market structure in MISO. Other regions have seen material changes in capacity market design to better align the market to the need for resources.

6. Factors That May Affect Manitoba Hydro's Ability to Export Energy and Capacity into the MISO Market

MH interconnects with MISO via multiple transmission lines. This interconnection provides reliability and economic benefits to both Manitoba and MISO. In a study conducted in 2013, MISO evaluated the benefits from MH's large and flexible system in terms of its ability to reliably and economically integrate wind.[41]

[39] MISO does not calculate net CONE

[40] An LSE that is capacity deficient will be assessed a Capacity Deficiency Charge in accordance with Section 69A.10 of the MISO Tariff – Module E

[41] https://www.misoenergy.org/Library/Repository/Meeting%20Material/Stakeholder/Planning%20Materials/Manitoba%20Hydro%20Wind%20Synergy%20TRG/Manitoba%20Hydro%20Wind%20Synergy%20Study%20Final%20Report.pdf

In brief, the study identified that there are significant benefits derived from integrating an incremental amount of MH resources, which are realized as:

- **Production cost savings** after less-economic resources are displaced by inexpensive MH resources;
- **Load cost savings** after the region experiences lower energy prices;
- **Reserve cost savings**, due to an added ability to share reserves, enabled by the increased transmission capacity between the two regions; and,
- **Wind curtailment reduction**, since MH resources are easily dispatchable and able to mitigate wind intermittency over the long term.

As the region continues to invest in wind resources, the benefits articulated in the MISO wind-hydro synergy study should continue to provide strong incentive for MH and their U.S. counterparties to continue to derive benefits from bilateral contracts for power and capacity.

D. Daymark Findings

Based on our analysis, we make the following observations:

- MISO's existing generation mix is becoming more diversified. Over 5 GW of coal retirements and increases in natural gas and renewable production in recent years leaves coal as the leading energy source in the MISO market, but with natural gas and renewables having increasing market shares. Natural gas is the fuel setting market prices about 40 percent of the year.
- The 61 GW of coal generation in the MISO market is likely to decline significantly over the next decade with the age of the fleet and the economic pressure of low natural gas prices being primary drivers. About 88 percent of the existing coal capacity is over 50 years old today. A number of planned coal retirements have been announced in MISO plans or in utility resource plans.
- MISO needs assessments indicate that the current system surplus capacity is expected to erode within 5 years based on current assumptions and information on existing, committed, and planned changes in capacity resources, with the need for new resources of about 24 GW by 2031. This need is driven primarily by expected retirements of aging coal generation. The replacement resources will be determined by the generating companies in the region, with natural gas generation and renewables being prominent options under consideration in resource plans we reviewed.

- State polices have significant influence on resource choices. In Minnesota, policies governing utility resource planning are placing increase importance on greenhouse gas emission reductions and renewable resources. As examples, Northern States Power and Minnesota Power each show coal retirements and increasing natural gas and renewables in their plans for the coming decade. Wisconsin state policy show some similarities to Minnesota's priorities, while North Dakota requires that utility planning primarily consider least-cost resource options.
- Federal policies that will be important in the coming decade will likely center on market mechanisms. With MISO expecting an end to its historical capacity surplus conditions by 2025, the MISO capacity market will become increasingly important. FERC has been very active in capacity market design policy across the U.S. and in MISO.
- The continuous and rapid integration of renewables will add significant value to the energy and capacity provided by MH due to its reliability and dispatchability characteristics. The MISO wind-hydro synergy report identified several market and reliability benefits. We expect these to increase over time upon the potential creation of new ramping and/or other market products.

III. EXPORT PRICES

A. Overview

The Export Prices section of this report provides a more detailed assessment of MH's electricity export price forecast with an emphasis on the primary export market in the U.S., which is administered by MISO.

MISO administers a complex competitive wholesale market for energy, reserves, and capacity. The energy markets are day-ahead and real-time exchanges that establish market clearing prices by location on 5-minute intervals (Locational Market Prices or LMPs). The capacity market is a voluntary auction process allowing entities with load serving obligations to buy or sell capacity entitlements for the coming year, a market that is locational by zone across the MISO system.

Market participants can buy or sell energy and capacity directly into the organized MISO markets or they can enter into bilateral contracts directly with other market participants. In either case, market participants will consider historical market prices and estimates of future market prices when making decisions about energy and capacity transactions. It is common practice for market participants to develop or obtain a forecast of market prices to forecast costs and revenues from transactions in the markets as well as to provide a price benchmark in evaluating bilateral transactions.

In this section, we describe our review of MH's market price forecasts used as inputs to the export revenues forecast included it its GRA application. We describe, (i) the scope of our investigation, (ii) the analysis we conducted, including detailed findings, and (iii) a summary of our findings.

B. Scope of Investigation

Daymark has prepared this section of the report to address the first part of the Scope of Work and support other elements of our work that rely on the materials in this section. The specific section of the Daymark Scope of Work addressed in this section is:

> *"Review Manitoba Hydro's electricity export price forecast and third party consultant forecasts, including the low and high case forecasts, in the context of current MISO market conditions and factors influencing future MISO prices. The third party consultant forecasts are to be taken as a "given" and are to be assumed to be reasonable and accurate with respect to the other tasks in this*

Scope of Work. Notwithstanding that the third party consultant forecasts are to be accepted for the purposes of this review, if the IEC identifies significant issues or inconsistencies with the third party consultant forecasts in the course of its general review, those issues or inconsistencies are to be identified in the IEC's reports."

To perform this scope of work, Daymark interviewed MH personnel responsible for the MISO energy forecasts and reviewed public and confidential MH documents, including the actual third-party forecasts and the contracts between MH and the third-party vendors. A specific list of these documents is provided in Appendix B.

C. Analysis

The Daymark IEC Team investigated both the reasonableness of the process used by MH in obtaining and vetting the price forecasts received from the third-party consultants and the reasonableness of the price forecast derived by MH based on those forecasts. We also reviewed MH's development of the price inputs used in its various processes and planning applications used to develop the export revenue forecast.

1. Background

Fundamentally, there are four services or commodities that MH may export:

1. **Energy:** Actual electrical energy generated, as measured in MWhs.
2. **Capacity:** Ability of generation units to generate energy, as measured in MWs.
3. **Ancillary Services:** Services necessary to support the transmission of capacity and energy from generation resources to consumers while maintaining reliable power grid operation. These services include Regulation, Operating Reserve, and Black Start services.
4. **Environmental Attributes:** Additional value of energy from certain types of generators, generally either renewable or low-emission, as defined by environmental policies and regulations.

These components of power can be sold either in a direct contractual arrangement with another utility, often referred to as a bilateral transaction, or be sold in an organized market where multiple sellers can offer these components to multiple buyers through a competitive market structure. The primary export market for Manitoba is the MISO market to the south of the province.

One can view the price forecast in two horizons that align with energy resource decisions: (i) the short-term or operating horizon and (ii) the long-term planning horizon.

2. Short-Term Forecast

The short-term forecast (months to a year out) relies on one independently-produced forecast. [redacted] is the company that provides a monthly price forecast for the upcoming 3a
months. Like the long-term forecast, the prices reflect the consulting firm's view of the market based on factors that, in their opinion, will influence the MISO markets over the forecasting period.

The short-term price forecast is provided to the MH staff on a monthly basis and is reviewed internally before it is used as an input to various planning applications. One of the critical components of this review is the MH staff's adjustment to the [redacted]-produced 3a
prices. According to MH staff, this adjustment is necessary to account for historical deviations between forecast and actuals. The graph below depicts a 12-month average on-peak price variance between the actual forecast and [redacted] short-term forecast.[42] 3a

[redacted] 3a

Figure 13: 12-Monthly Average On-Peak Price Variance

[42] 2[redacted] Performance Review - CHARTS CONF 3a

Based on the information provided by MH, these adjustments:

- Were selected by evaluating differences between [redacted] and other market providers[43], and considering the past 12-month historical values; and,
- Were based on approximate comparisons to other forecasts, forward prices, and historic prices for same time of year. 3a

MH applied their judgement to [redacted] forecasted energy prices in [redacted] months and [redacted] months to reflect what they saw as a systematic [redacted].

The two graphs below depict the on- and off-peak [redacted] forecast, the adjustment, the actual forecast used in the planning applications, and the average of the 3 independent consultants and ICE forwards. 3a

[redacted] 3a

Figure 14: On-Peak Forecast Comparisons ([redacted], Adjustment, Actual, Average) 3a

[43] Manitoba Hydro uses short term forecasts from 3 independent consultants and ICE forwards to benchmark [redacted] forecast 3a

[redacted] 3a

Figure 15: Off-Peak Forecast Comparisons [redacted], Adjustment, Actual, Average) 3a

For the 2016 forecasts, MH staff incorporated [redacted] 3b

This practice was also used in 2017. We have reviewed the data and the methodology for this use of historical data and we find it reasonable.

3. Long-Term Forecast

MH uses the long-term forecast to develop price inputs to its long-term planning model called SPLASH. In this context, the long-term period begins in the second future year in the planning period and extends to the end of the planning period.

Under the long-term forecast process, MH acquires four independent market price forecasts from various consulting firms that have established expertise in North American energy markets. Each consulting firm uses an electricity price forecast model. While the contracts between MH and the vendors do not specify what tools will be used to produce the forecasts, these vendors are well known consulting firms in the industry who typically use production cost models capable of simulating the operation of the power system over a specific period. Each consultant considers their models and market price models to be confidential and proprietary.

While differing in the specifics, the products purchased from the independent consultants all provide MISO-specific outputs and some level of information on the factors that affect pricing outcomes within its region. More specifically, the models used to produce the prices are based on key inputs such as:

- Load characteristics and estimated load growth rate;
- Existing generator characteristics like generator size, fuel, and heat rate;
- Retirements and additions to the generator fleet;
- Thermal fuel forecasts; and,
- Potential changes in the regulatory environment regarding emissions and RPS requirements.

MH received electronic information from each vendor, which represented the entirety of the information available for reviewing and characterizing the forecast received. For all four vendors that information was provided via one or more spreadsheets. All four vendors provided annual energy and capacity prices. Some provided monthly energy prices as well. MH used a consensus approach, taking the average of the annual energy and capacity prices to create a single forecast, which MH called their reference energy price forecast.

The reports provided to MH staff for the 2017 reference energy price forecast are described below.[44]

[redacted]

[redacted]

[redacted] 2b

Key Inputs

To review the reasonableness of the consensus methodology and the resulting energy price forecast, Daymark reviewed the key inputs: natural gas prices, carbon prices and capacity retirements. Natural gas forecasts varied across the four vendors. Figure 16 provides an MH graph comparing the four natural gas forecasts and the resulting 2017 Reference natural gas forecast based on the MH consensus methodology.

[redacted] 2b

Figure 16: Comparison of Natural Gas Price Forecasts, by Independent Consultant

To test the reasonableness of the results, Daymark compared the consensus natural gas forecast to the 2017 Annual Energy Outlook (2017 AEO) from the U.S. EIA. The 2017 AEO is a good benchmark because it is publicly available and contains descriptions of the underlying fundamentals that drive their forecast. Figure 17 shows that comparison with the consensus view being somewhat lower in the short term and close to the AEO in the longer term.

[redacted] 2b

Figure 17: Comparison of MH Consensus Natural Gas Price Forecast to EIA 2017 AEO

In addition to natural gas prices, carbon pricing assumptions are an important assumption used in many energy price forecasts. Figure 18 provides a MH graph comparing the four carbon forecasts and the resulting 2017 Reference Carbon forecast based on the MH consensus methodology.

[redacted] 2b

Figure 18: Comparison of CO_2 Price Forecasts, by Independent Consultant

Range of Results

The following charts provide the price at the MHEB energy pricing node and the range of the independent consultant forecasts for on-peak energy, off-peak energy, and capacity.[49] Since the independent consultants provide only 20-year forecasts, MH extrapolated prices for all additional years at a constant real rate. Figures 19 through 21 provide the 2017 reference case prices as a result of the consensus methodology, accompanied by the range of the independent forecasts prices.

Figure 20: Off-Peak Energy Price Forecast at Pricing Node MHEB

[redacted] 2b

Figure 21: Capacity Price Forecast at Minnesota

Forecast Variance

As discussed in the section results above, the energy and capacity price forecasts show significant variance between the four independent consultants. Given that one of the forecasts was three months older than the others, Daymark investigated the impact of the oldest forecast to understand the impact of its inclusion.

Market price forecasts rely on information that is knowable about future market conditions at the time the forecast is prepared. Forecasts prepared at different points in time will vary, even from the same forecaster, if new information becomes available (e.g., updated forecasts of fuel prices, retirements, or market designs). We reviewed the vintage of the four forecasts to assess whether they were reasonably contemporaneous and, if not, if any change in market conditions were evident in the differences in the forecasts.

MH's On Peak Consultant Comparison graph provides an example of the range of forecasts. [redacted] 2b

[redacted] 2b

Figure 22: Comparison of On-Peak Energy Price Forecasts, by Consultant

50 [redacted] 2b

A look at the capacity price forecast graph from MH shows another view of the difference in the [redacted] forecast (See Figure 32). 3a

[redacted] 2b

Figure 23: Comparison of Capacity Price Forecasts, by Independent Consultant

[redacted] 2b

Lack of Detailed Input Review

The issue of report variance is exacerbated by the lack of detailed review that was done with regards to the forecasts themselves. As was discussed above, the four forecasts provided different levels of insight into what input assumptions were used. The documentation provided by the vendors did not provide the level of information a price forecaster would need to be able to assess the forecasts to determine if they each represented their company's reference forecast. Nor do the documents define how MH should view these forecasts within a range of possible outcomes. Only one of the four, [redacted] even uses the term "reference" when referring to the product being provided to MH. 2b

Furthermore, there is no evidence that MH attempted to perform a deeper review of the forecasts, or assess the possibility that one or all of the forecasts might not qualify as "reference". The four forecasts provided price strips for energy and capacity and, after performing some basic due diligence on the natural gas and carbon prices, MH used the average of the four forecasts.

Neither the information available in the contractual arrangements with each vendor, nor the forecast materials provided by each vender contain any information on the vendors' views on the probability that prices will be higher or lower than the forecast provided. In each case, a single forecast was provided; there were no high or low alternative cases delivered that might serve to provide some context on their view of how the delivered forecast fits within the range of uncertainties.

As a result, we found no means to determine if the four forecasts are prepared on a consistent basis or if they were prepared with a specific objective to be a "50/50 reference forecast".

Apparent Inconsistencies between MH and Third-Party Forecasts

After looking in more detail at the data provided by the independent consultants we identified inconsistencies between MH's market view and the consultants' views. More specifically, one of the primary reasons for MH to remove the capacity premium from a subset of modeled products in its planning applications (See Section VII) was that the capacity prices will remain low "as coal closures have been delayed under the Trump administration, increasing capacity supply."[51] [redacted] 2b

[redacted]

[51] PUB MFR 79 Updated - CONFIDENTIAL

Adjustments for Congestion and Losses
The consulting firms provide a forecast for MISO's Minnesota Hub (MINN HUB), which is an aggregation of generation and load pricing nodes in the Minneapolis area. Since MH delivers its power at the border between Manitoba and the U.S. represented by a pricing node called MHEB or Manitoba interface, MH calculated an adjustment and applied it to account for the historical transmission congestion and marginal transmission line losses. [redacted] 3b

4. High and Low Cases Methodology

Following reduced interest by its stakeholders and to minimize cost, MH began in 2017 to produce the high- and low-price cases in-house. MH considered a variety of methodologies with the goal of producing a forecast that used publicly available information, had scientific accuracy, and provided a reasonable deviation from the reference case.

The methodology chosen included information provided by the U.S. EIA on an annual basis via its AEO process. The AEO outlook includes projections of energy production, consumption, fuel oil prices, and other prices through 2050. The data is provided in a reference case that describes the EIA's view of the future[52] and seven sensitivities around the base case that capture fundamental economic drivers such as growth, oil prices, resource and technology changes, and others. In brief, the seven sensitivities capture the industry changes as mentioned above based on variances in oil and natural gas prices, technology differences, and economic growth.

[52] "The Reference case projection assumes trend improvement in known technologies, along with a view of economic and demographic trends reflecting the current central views of leading economic forecasters and demographers. It also assumes current laws and regulations will remain unchanged" Annual Energy Outlook 2017 with projections to 2050.

As an example, the total energy production is represented in Figure 24.

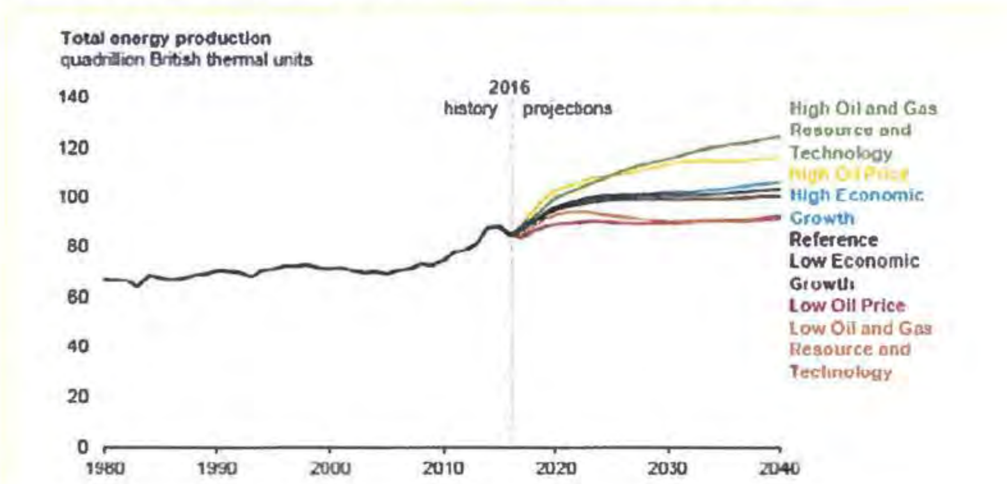

Figure 24: Total Energy Production, Annual Energy Outlook

MH chose two of the seven sensitivities to represent the high and low cases[redacted] A natural gas price deviation was then calculated between the reference AEO case and the two chosen boundary cases.[redacted] 3b

After estimating the prices, MH staff used the following formula to derive a heat rate:

Heat Rate = Power Price ÷ Natural Gas Price

Finally, the high- and low-price cases were developed by changing the natural gas price in the above calculation and keeping the heat rate consistent.[53] The resulting high and low cases for 2017 – for both on-peak energy and off-peak energy[54] - are presented in Figure 25 and Figure 26, respectively.

MH also eliminated the production of the high and low capacity forecasts, since they were not used by the stakeholders.[55]

[redacted] 3b

[55] PUB MFR 79U-CONF

[redacted] 3b

Figure 25: On-Peak Energy Price Forecasts (Reference, High, Low) at MHEB

[redacted] 3b

Figure 26: Off-Peak Energy Price Forecasts (Reference, High, Low) at MHEB

D. Summary of Findings

We offer the following observations regarding the third party consultant forecasts and MH's reference case forecast:

- MH's purchased off-the-shelf energy and capacity price forecasts from four third-party consultants that offer these services to the industry broadly on a subscription basis.
- In each case, MH purchased a single case or scenario and did not purchase high or low case alternatives. The single case forecasts and associated documents did not include any characterization of the design objectives of the case with respect to the likelihood that values could be higher or lower than the case presented.
- MH used the average of the four forecasts as its reference case.
- MH's resultant reference case forecast has the following characteristics:
  - [redacted]
  - [redacted] 3b
  - [redacted]

We offer the following observations regarding the low and high case forecasts:

- MH elected to develop high and low case forecasts in-house, rather than purchase such forecasts from third-party consultants as it had done in prior years.
- MH defined those cases by calibrating its reference case to its high and low cases using EIA AEO low, reference, and high cases.
- [redacted] 3b
- MH did not provide a low or high capacity price forecast.
- [redacted] 3b

As we discuss further in Section VII, we understand that "reasonableness" in this context is whether the forecast is a balanced, with the values being used representing assumptions that fall in the middle of the range of plausible values (i.e., a P50 value). In that context, our observations on the reasonableness of the market price forecasts are:

- Assuming the four third-party forecasts reflect each vendors' view of a P50 forecast, MH's reference case method of weighting the four equally is a reasonable basis for a forecast.
- [redacted]
  - [redacted]
  - [redacted] 3b
  - [redacted]
- [redacted]

IV. EXPORT ENERGY AND CAPACITY

A. Overview

This section describes the work undertaken to understand the forecasting methodology used by MH to determine the exportable energy and capacity, considering the flow and inflow conditions, reservoir levels, as well as other hydrologic inputs that are applied to the Emma/Splash modeling. Additionally, we discuss changes in forecasting methodology between the NFAT and today.

B. Scope of Investigation

The MH16-Update projections were classified as short-term (2017/18 and 2018/19) and long-term (2019/20 to 2051/52). Our analysis in this section is sub-divided into *Short-Term Hydrology* and *Long-Term Hydrology.* Due to the differences in calculation of water inflows between Year 1 (2017/18) and Year 2 (2018/19), the *Short-Term Hydrology* subsection is further organized into *Year 1 Inflow Calculations* and *Year 2 Inflow Calculations*, before combining the outputs of the two into the short-term forecasting model, as explained below.

For this assessment, Daymark used all confidential documents in relation to hydrology provided by MH, as well as publicly available sources of information on historical hydrologic trends. Documents relied upon in the performance of this work are listed in Appendix B.

C. Analysis

The assessment by Daymark showed that the methodology used by MH for both the short-term and the long-term periods appeared to be reasonable. The short-term hydrology methodology has changed from previous years and it is dependent on initial storage condition assumptions that result from that change. However, the change in methodology and the resulting energy and capacity values appear reasonable. The long-term hydrology methodology is consistent with the approach used in previous rate filings and Daymark did not identify any concerns with respect to the hydrologic calculations.

Details of the work performed are organized into the following subsections:

- Short-Term Hydrology Analysis
- Long-Term Hydrology Analysis

1. Short-Term Hydrology Analysis

Based on information provided by MH, the hydraulic generation values and net export revenues are dependent on the following two important factors:

- Inflow conditions; and
- Starting reservoir/lake storage level elevations.

From IFF16, Tab 3.1,[56] the short-term forecast methods used in IFF16 and MH16-Update can be summarized as follows:

- For Year 1 (2017/18):
  - Actual inflow conditions until May 2017
  - 'Expected' inflow conditions[57] determined through statistical (regression) analysis for June 2017 through March 2018
  - Actual reservoir and lake level elevations
- For Year 2 (2018/19):
  - Inflow conditions calculated based on an average of 104 water flow cases[58] – referred to as the 'multiflow' method
  - Expected starting reservoir and lake level elevations assumed to be carried forward from Year 1

Year 1 – 2017/18 Inflow Calculation Overview

The Year 1 methodology and calculations were reviewed in detail. Year 1 hydrology is based on the state of actual hydrology as of the date the analysis is done plus an expected rest-of-year hydrology using regression analysis designed to predict balance-of-year hydrology from the previous month's results.

No issues were found with the Year 1 methodology or results.

Year 2 – 2018/19 Inflow Calculation Overview and Inputs

MH used the 'multiflow' technique for the Year 2 forecast of inflow conditions in preparation for the MH16-Update. This methodology differs conceptually with the previously-used 'median flow year method'. Daymark analyzed the two methods, including the rationale for the change and the supporting documents articulating the results.

[56] GRA Submission, Appendix 3.1, pp. 16.

[57] PUB-MH II-37a-b, pp. 2.

[58] Correction from 102 flow cases to 104 flow cases by the Company as indicated in MH PUB 1.19a, pp. 1.

Multiflow Method

For Year 2 (2018/19)[59], using MH's operational modeling capability, the average of 104 river flow cases (1912/13 to 2015/16) was considered for inflow conditions. The resulting hydrology for the IFF was the average of all flow cases.

Median Water Flow Year Method

From the documentation provided by MH[60], the 'median water flow year' method can be summarized as a calculation technique for inflow conditions based on a single flow year, where the single flow year would be the median water flow year among 80 years.

Comparison between the Two Methods using Starting Storage Conditions

An important factor to understand is the asymmetrical relationship between water flow conditions and hydro generation. The river flow conditions might not directly depict an impact on the hydro generation due to the limitations in storage conditions. If the median water flow year is determined to be a high-flow year, this could result in more water than the capability of hydro generating units, resulting in capped generation. This could consequentially result in lesser downstream energy production.

Given the uncertainty surrounding future hydrology, an average of all flow years is more likely to capture the asymmetry than a single flow case, even the median one. Based on that, Daymark determined that the analysis using the 'Multiflow Method' in MH16-Update was reasonable.

2. Long-Term Hydrology Analysis

From IFF16, Tab3.1[61], the long-term forecast method used in IFF16 and MH16-Update can be summarized as follows:

- It applies to years 3 and beyond (2019/20 and beyond); and
- The forecast is determined by averaging revenues across inflow conditions for the past 102 years.

This approach is consistent with methods used in the NFAT and previous GRAs. The principle tool used in this approach continues to be Simulation Program for Long-term

[59] PUB-MH I-19d, pp. 1-2.

[60] COALITION-MH I-62a-e, pp. 2., PUB-MH I-19d, pp. 1-2.

[61] GRA Submission, Appendix 3.1, pp. 16.

Analysis of System Hydraulics (SPLASH). SPLASH has been thoroughly tested over many years and remains a reasonable tool for modeling the specific MH system.[62]

Dependable Energy Results

One of the key outputs of the modeling efforts is the available dependable energy. Figure 27 shows the opportunity sales, firm (contract) sales and available dependable energy, all in GWh.[63]

[redacted]

5b, 5c

Figure 27: Annual Firm and Opportunity Exports and Dependable Surplus

Long-term Hydrology Observations

The methodology used in determining the hydrology for the long-term period appears to be reasonable and consistent with the previously-reviewed and approved methodology. Furthermore, the post-processing calculations of the SPLASH output data have been appropriately represented to be the average of 102 flow cases for each load year and are properly being used in the export revenue forecast. To the extent that proper price and firm energy assumptions are assumed, the results are reasonable.

[62] Manitoba Hydro, "Peer Review of Manitoba Hydro's Splash Model", May, 2005, https://www.hydro.mb.ca/regulatory_affairs/electric/gra_2010_2012/Appendix_74-Attachment_2.pdf.

[63] The dependable energy numbers are from Appendix 7.3, pp 22 and 23. Because 7.3 assumed Keeyask in service in 2019/20, the dependable energy values for 2020/21 and 2021/22 were adjusted to estimate the impact of the delay of Keeyask. Firm and Opportunity Sales come from confidential SPLASH documents provided to Daymark via MH's SharePoint site.

D. Summary of Findings

Daymark concludes that the hydrology used by MH for the MH16-Update appears reasonable and consistent with previously-used methodology. Calculations of dependable and total energy are reasonable.

V. CHANGES IN FORECASTING METHODOLOGY

A. Overview

MH regularly conducts forecasts of export revenues for its annual financial planning for resource planning studies. The export revenues are generated from the sale of surplus energy including sale of surplus dependable energy via existing long-term contracts (as discussed in Section VI) and through the sale of additional surplus energy. The additional surplus energy can include surplus dependable energy (surplus energy in dry year conditions) and additional surplus opportunity sales (additional energy available in average year conditions). In this GRA, MH's methodology and assumptions for forecasting the revenues from the surplus energy that is not committed via long term contracts – surplus dependable and surplus opportunity –differs from those used by MH in the NFAT proceedings and prior financial projections.

B. Scope of Investigation

Scope item #4 requires Daymark to "*assess the reasonableness of changes in MH's forecasting methodology that eliminates the assumed premiums for surplus dependable energy and capacity sales.*"

Our approach to this work centers on MH's response to PUB MFR 79 (Updated), in which MH offers it explanations of the changes in methodology, along with the 2016 Electricity Export Price Forecast (2016 EEPF).[64] We discussed the response and the methodology changes with MH SMEs and reviewed associated analysis of export revenue sales. We also rely on our work on presented in Sections II, III, and IV of this report to assess the reasonableness of the methodology.

C. Analysis

MH included a Long Term Dependable Product forecast in its EEFP in 2013, 2014 and 2015, as well as in the analysis MH provided in the NFAT proceeding. MH removed the assumption of a premium for that product in its 2016 EEFP and has continued the assumption of no premium in the export revenue projections provided in the GRA proceeding. In more recent analyses, MH made additional changes to its method of forecasting prices for that product.[65] In this Section V, we discuss the change in the assumption regarding the premium, which is the subject of our

[64] The 2016 EEPF is an internal MH document, dated August 9, 2016 provide as a confidential document to the Daymark IEC Team via SharePoint. The 2016 EEFP is identified in the response to PUB MFR 79 (Updated).

Scope Item #4. In Section VII, we discuss the full set of changes to the forecasting methods that have been implemented in the current export revenues forecast.

In the NFAT proceeding, and in the 2013 to 2015 EEPFs, the long-term forecast was used for both spot/opportunity sales and non-committed firm sales. The non-committed sales – an important component of MH's Preferred Development Plan during the NFAT – were defined as firm sales not yet under contract that were priced at premium prices.

In this period, MH defined a Long Term Dependable Product to be On-Peak Energy (5x16) and associated capacity sold in a long-term contract of 5 years or more. The price premium [redacted] was used to represent the additional amount that buyers would pay for price and volume certainty over the long term and for the environmental advantages of hydropower.[66] The value of the premium was [redacted] 7b 7b

Figure 28 illustrated the forecast results of the reference case for the Long Term Dependable product, broken out by component, at MHEB in 2015 US$/MWh.[67]

[65] PUB MFR 79U, page 1.
[66] 2015 EEPF, page 14.
[67] 2015 EEPF, page 15.

[redacted] 3b, 3c

Figure 28: Reference Case Forecast, Long Term Dependable Product, by component

In MH's 2016 EEPF, the [redacted] premium for the Long Term Dependable Product was removed due to MH's assessment of then-current market conditions. MH removed the premium based on the following concerns:[68] 3b, 7b

- [redacted]
- [redacted] 3a
- [redacted]
- [redacted]
- [redacted]

With respect to the 2017 Energy Price Forecast (2017 EPF), MH's observation on the current market conditions [redacted] 3a The premium was not used in the 2017 EPF.

The primary question we have been asked to address is the reasonableness of the assumptions regarding the premium for the surplus dependable energy and capacity.

[68] 2016 EEPF, pages 12-13.
[69] PUB MFR-79U-CONF, page 4.

We have been asked to consider the 20-year forecast of export revenues and consider the entirety of that term in this assessment. As we discuss further in Section VII, we understand that "reasonableness" in this context is whether the forecast is a balanced view, with the values being used representing assumptions that fall in the middle of the range of plausible values (i.e., a P50 value).

We also observe that the forecast of surplus available energy is significant for most of the 20-year forecast period. The values are shown in Figure 27 in Section IV, with roughly 2,000 GWh/yr in the near term and over 4,000 GWh/yr for a ten-year period and remaining above the 2,000 GWh/yr level thereafter. These values make the longer term pricing assumptions important to the reasonableness of the forecast.

Upon review of the reasons for first instituting a premium and then removing the premium, we believe the elimination of the premium in its entirety for the 20-year forecast is not well supported and not consistent with the information available to MH from the independent market consultants (see Section III) or the information from MISO, NERC and utility IRPs (see Section II). With that said, we agree with MH's assessment of the softening of the market for exports in the near-term over the past several years. The explanations of the market conditions associated with this issue from the 2017 EPF are very focused on the current and near term market conditions. We do not see any consideration of the potential for materially different circumstances to be prevailing beyond the near term.

Based on our review of the information on the longer-term trends in MISO (as documented in Sections II and III), the near-term market conditions that are adversely affecting the ability to sell firm power at a premium are not expected to persist for more than a few years. Our observation that the 20-year plus long-term outlook prepared by MH, assuming no premium at any point in time, is inconsistent with the rationale for instituting the premium in the first instance for years 6 to 20 of the forecast.

D. Summary of Findings

Based on our analysis, we make the following observations:

- The changes to the forecast methodology over the testing period indicate a more conservative approach than was previously used.
- The primary reason for the premium is to reflect the added value to buyers, beyond the commodity energy and capacity value, for attributes such as long term price certainty and stability and the environmental attributes of hydropower.

- The primary reason for the change in methodology is a view that lower natural gas and capacity market prices, along with surplus capacity conditions have made the market soft in recent years.
- The elimination of the premium appears reasonable for the near term.
- The elimination of the premium in the longer term is not consistent with the longer-term outlook for energy, capacity and clean energy requirements in the Northern MISO region. Based on Daymark's MISO market assessment provided in Section II and the independent consultants view on capacity needs in the near future, an opportunity for premiums in long-term contracts is a distinct possibility, as was observed by MH when it initiated the premium in 2013.

VI. FIRM CONTRACTS

A. Overview

Firm energy and/or capacity export contracts represent a significant portion of MH's forecasted revenues. The Daymark IEC Team reviewed the accuracy and reasonableness of the revenue forecasts associated with these firm export contracts.[70]

MH currently has a substantial portfolio of contracts exporting firm energy and/or capacity to extraprovincial counterparties. The volumes of committed energy and capacity over time from existing executed contracts are summarized in Figures 29 and 30.

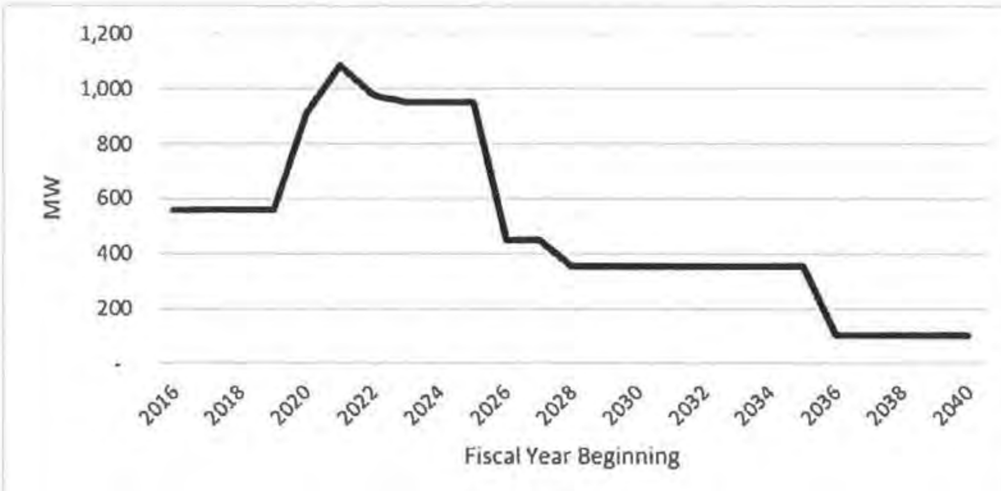

Figure 29: Firm Export Capacity under Contract[71]

[70] Unless otherwise specified, all references to calculations of contract revenues refers to calculations done for the updated MH16 analysis that is part of the presentation in Tab 3.6

[71] Compiled from export contracts provided by MH. Note that the value for each FY includes the sum of maximum monthly value for each contract for that FY. For example, if a contract exporting 100 MW expires midway through FYB 2020, the total will include 100 MW from that contract.

[73] Ibid.

B. Scope of Investigation

This section covers the work done to complete the review of revenues sourced from contracted energy and capacity sales, as contemplated in Scope Item #3. The review of the remainder of the components of the 20-year forecast of export revenues, as contemplated in Scope Item #3, is addressed in Section VII below.

Our investigation of firm contracts included both those contracts that were executed prior to the NFAT filing (referred to here as "carryover contracts") as well as new contracts that were executed since the completion of the NFAT proceeding.

The scope of our investigation varied slightly for carryover and new contracts. For carryover contracts, the revenue forecasts were reviewed in detail during the NFAT proceeding. The Daymark IEC Team was asked to take as a given that the forecasts of the carryover contracts are correct, so long as MH's revenue forecast aligned with the evaluation conducted for the NFAT proceeding, subject to changes in escalation and exchange rates.

For new contracts, the Daymark IEC Team reviewed the contract terms to create an independent forecast of firm energy and capacity revenues, and compared this analysis to MH's forecast.

The documents used in this evaluation are listed in Appendix B.

C. Analysis and Detailed Findings

The Daymark IEC Team conducted analysis on each of the contracts included in the revenue forecasts for both the NFAT and GRA analyses. As discussed above, there are two primary categories of export contracts: carryover contracts consisting of those predating the NFAT proceeding, and new contracts that have been executed since the NFAT proceeding concluded. There are four contracts that were listed in MH-CSI #36[74] that were not included in the GRA analysis; these contracts are considered "excluded" because they are not included in MH's forecast of firm extraprovincial export revenues in the current analysis. The table below lists the carryover, excluded, and new contracts, and identifies the products transacted in each contract.

[74] "LCA-CSI-34-Supp Att-LCA Comparison to MH CSI 36.xlsx", tab "MH CSI 36". This document contains the analysis of extraprovincial energy and capacity export contract revenue from the NFAT proceeding. This document was provided by MH and was used by the Daymark IEC Team to assess forecast consistency.

Carryover Contracts

The Daymark IEC Team evaluated the carryover contracts to confirm that the revenues included in MH's forecast are reasonable given the contract terms and the analysis was structured to confirm that the methods used by MH to forecast the energy and capacity revenues are consistent with the methods used during the NFAT proceeding. The terms of individual contracts vary, so the specific analysis conducted was structured specifically for the contract. For example [redacted] 1d, 3a, 7b

The Daymark IEC Team reviewed the revenue forecasts that were evaluated and approved during the NFAT proceeding and updated the key assumptions to those forecasts that impact pricing terms – [redacted] 1d, 3a, 7b [redacted] The Daymark IEC Team compared these updated forecasts to the export contract revenue assumptions used by MH in the GRA, provided in MFR 84.[75] 1d, 3a, 7b

Through the review of documentation provided by MH, discussions with MH staff, and independent analysis of the contracts, the Daymark IEC Team has concluded that the revenue forecasts assumed by MH for carryover contracts are reasonable.

The Daymark IEC Team also found that there were four contracts listed in the MH-CSI #36 documents that were not listed as firm contracts in the GRA materials.[76] These excluded carryover contracts are addressed below.

Excluded Carryover Contracts

Four contracts were included in the MH-CSI #36 accounting of firm energy and capacity revenue that were excluded from MFR 84. The Daymark IEC Team investigated these contracts by reviewing documentation provided and through conversations with MH.

The MPEE contract is an energy exchange contract with Minnesota Power [redacted] 1d, 3a Through discussions with MH, the Daymark IEC Team determined that while it is not listed in MFR 84, the MPEE contract is included in the Company's financial forecasts. The accounting associated with the MPEE contract is consistent with the treatment in the NFAT proceeding, despite the difference in categorization.

NSP 350 Div Exch and GRE Div Exch are diversity exchange agreements with Northern States Power and Great River Energy, respectively. Diversity exchange agreements allow MH to essentially trade energy with these counterparties across seasons. As a winter-peaking system, MH would receive energy in the winter and deliver energy in the summer. The contracts are structured such that MH has a specified amount of energy it must offer into the counterparty's market during specified hours. [redacted] 1d, 3a but that the revenue is still accounted for in the financial forecasts used in the

[75] MFR 84 contains the Company's forecast of extraprovincial energy and capacity export contract volumes and revenue.

[76] MFR #84

GRA. Despite the difference in labeling and classification, the forecast of revenue from the sale of the diversity exchange energy is calculated in the same manner as it was in the NFAT forecasts.

The WPS 308 contract was an agreement with Wisconsin Public Service that was contingent on the approval and construction of the Conawapa project. The MH-CSI #36 forecast included energy and capacity revenue from that contract beginning in 2026. As that project is no longer proceeding as anticipated in the NFAT filing, the WPS 308 contract is no longer included in MH's revenue forecast.

Based on the review of documentation and conversations with MH, the Daymark IEC Team has determined that the exclusion of these contracts from the firm energy and capacity revenue forecast is reasonable.

New Contracts

To evaluate MH's forecasts of energy and capacity revenue from new contracts executed since the NFAT proceeding, the Daymark IEC Team reviewed the executed contracts, as provided by MH, and calculated an independent forecast of revenues based on contract terms. These independent forecasts were compared to the contract-by-contract forecasts developed by MH.[77]

The eight new contracts are categorized into two groups. Six of the contracts are capacity-only contracts, [redacted] 1d, 3a

The remaining two contracts (SP 2020-2040 and SP 25) are firm energy and capacity contracts, with specified quantities of annual energy and capacity that remain constant throughout the term [redacted] 1d, 3a

For the capacity-only contracts, the calculations performed by the Daymark IEC Team matched the revenue forecasts provided by MH in MFR 84.

In comparing annual forecasts for energy and capacity under the SP 2020-2040 and the SP 25 contracts, there were some very slight discrepancies in MH's forecast and the calculations conducted by the Daymark IEC Team. In total, these discrepancies amounted to less than 0.5 percent of total revenue forecasted from these contracts.

[77] MFR #84

Based on the evaluation of the energy and capacity contracts, as well as the capacity-only contracts, the Daymark IEC Team concluded that MH's forecasted revenue for new contracts is reasonable.

D. Summary of Findings

Based on our review of the export contract revenue forecasts for capacity and energy provided by MH, the Daymark IEC Team makes the following findings:

- With some exceptions (detailed next), MH's treatment of carryover contracts included in both the NFAT and the GRA is consistent. The energy and capacity revenue forecasts used in the GRA analysis reflects a reasonable estimate of firm extraprovincial revenues from these contracts.
- The exception to this conclusion on carryover contracts relates to four specific contracts that were included in the summary of NFAT contracts (MH-CSI #36), but were not included in the GRA summary (MFR 84). The Daymark IEC Team investigated the discrepancy and concludes that for three of the contracts, the actual treatment of these contracts by MH and the method of forecasting revenue from these contracts has not changed, only the classification of the contracts has changed. The final contract was removed due to MH's failure to gain approval for the Conawapa project. The Daymark IEC Team does not recommend any adjustment be made for these contracts.
- The new export contracts executed since the NFAT proceeding were treated in a manner consistent with the carryover contracts. The forecast of energy and capacity revenue included in the Company's extraprovincial revenue forecast reflects reasonable treatment of these contracts, and the Daymark IEC Team has no concerns with these forecasts.

Based on the foregoing findings, the Daymark IEC Team has verified the reasonableness of the extraprovincial revenue forecast.

VII. REVENUE FORECAST

A. Overview

MH's forecast for export revenues and fuel and power purchases (net export revenues) for the next 20 years is a key input to its determination of the need for revenues from domestic ratepayers within the GRA rate period and its longer-term assessment of the attainment of a 25 percent equity ratio target within ten years. MH's forecast of net export revenues for the first 20 years is provided in Figure 32 below.

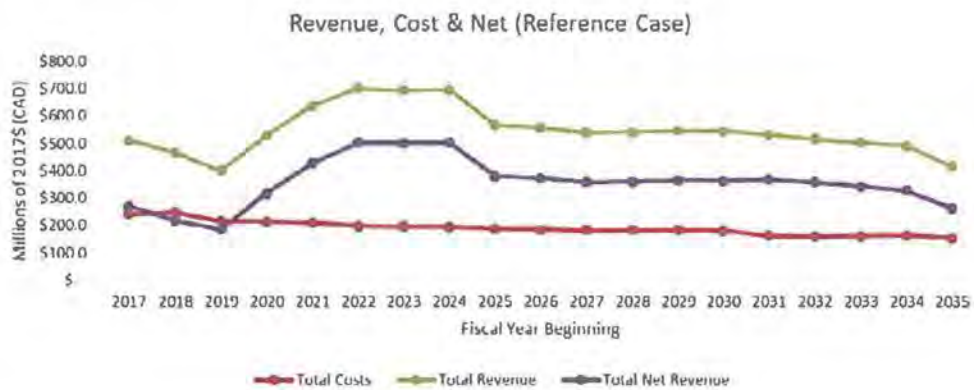

Figure 32: Forecast of Net Export Revenues, 2017-2035

B. Scope of Investigation

This section presents our assessment of the reasonableness of MH's net export revenue forecast, the primary objective included in Scope Item #3. This section builds on the work from Sections II through VI, which contain assessments of key inputs to the forecast: the market context, market prices, forecast of surplus energy and capacity, and revenues from existing export contracts. Our reasonableness review focuses on MH's forecast of overall export revenues used to define its requested rate increase proposal, which we refer to as the Reference Case export revenue forecast. We also include a discussion of the implications of the uncertainty analysis MH provided in Tab 4 to provide information on the uncertainty and risk inherent in the forecast.

Our review tests the reasonableness of the forecast in two ways.

First, we review each of the key inputs and the analysis used to assemble the forecast to verify the soundness of the methodologies and the accuracy of the results.

Second, we consider whether the forecast is a reasonable balance of risk between MH and its domestic ratepayers. In Tab 4, MH observes that *"By the end of the 10-year forecast period, there is a 50% chance that Manitoba Hydro will achieve the minimum 25% equity ratio target."*[78] Figure 4-10 from Tab 4 of MH's filing (See Figure 33 below) provides the context for MH's presentation of the uncertain impact those revenues would have on the company's financial performance.

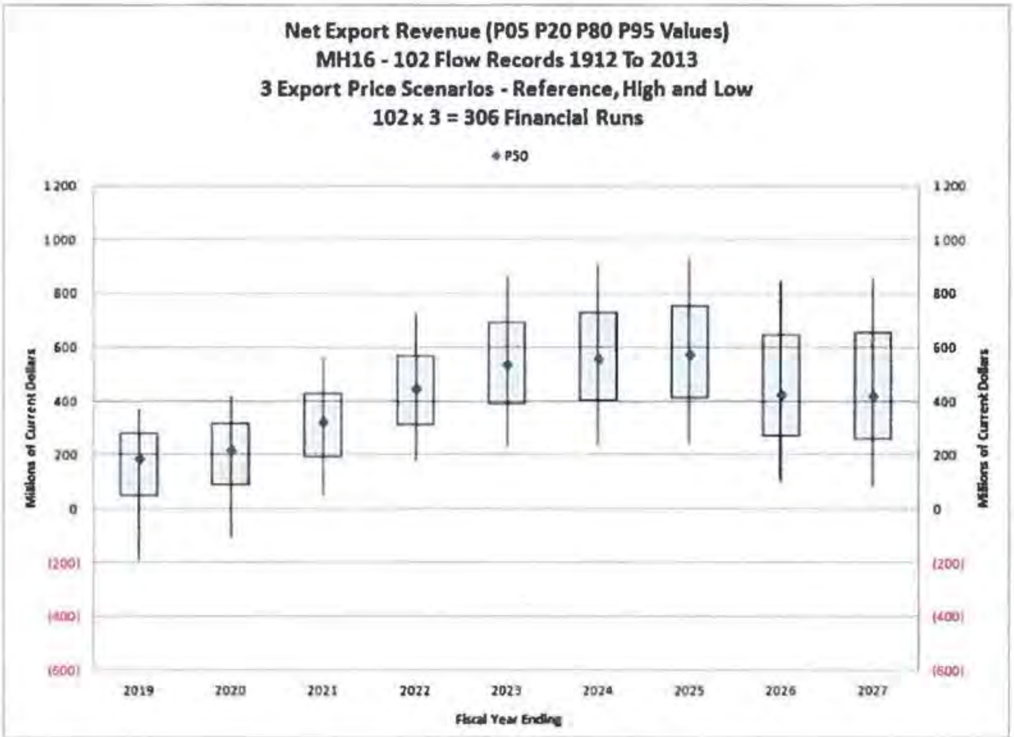

Figure 33: Net Export Revenues, and Impacts of Uncertainty

We understand from this statement, and from our discussions with MH SMEs, that MH intends for the Reference Case forecast to be a "P50" case – a reference case where there is equal chance that the results are higher or lower than forecasted.

[78] GRA Submission, Tab 4, pp. 24.

C. Reference Case Observations

There are a few areas where we believe that the assumptions or methods of producing the current export revenue forecast are not in keeping with a P50 reference forecast. These items are:

- The methodology for forecasting the export energy and capacity prices;
- The assumption that no firm energy sales will be made from the forecasted surplus dependable energy;
- The assumption that no extension of sales will occur with existing buyers when current firm contracts expire; and,
- The assumption that MH will not receive any capacity revenue associated with surplus dependable energy or opportunity sale energy over the study period.

This subsection discusses these items and the ramifications of these omissions on the reasonableness of the export revenue results.

Export Price Forecast Methodology and Result

Daymark identified several concerns with the methodology and results of the price forecasts themselves, as discussed in Section III. These concerns, when taken together, suggest that the market price forecast may be conservative relative to a P50 forecast of energy and capacity prices.

The most significant concern is that the limited of documentation of the third-party vendors forecast does not provide sufficient information to determine whether any of the vendors consider the forecast provided a P50 forecast. Consequently, the MH price forecast cannot be shown to be a P50 forecast since it is a simple average of the four forecasts. Understanding the nature of the forecasts and the assumptions underpinning them is necessary to ensure that they are being used appropriately in MH's efforts to produce a P50 forecast.

No Forecasted Capacity Revenue

MH's export revenue forecast assumes that there will be no capacity revenues derived from the uncommitted surplus dependable energy or opportunity sale energy. While it may be reasonable to assume MH cannot make additional capacity sales in the short run due to market and policy factors, those factors are short-term drivers of market dynamics. As is the case with the removal of the premium for surplus dependable (discussed in Section IV), this is a change from the assumptions used in the 2013-2015 EEPF. The capacity revenue component included at that time is depicted in Figure 28.

As discussed in Section II, there are many sources -- utility IRPs, MISO reports, state and federal processes, and others – that indicate that it is likely that MISO will be short capacity within the next ten years, possibly as soon as 2025. Further, NSP and Minnesota Power each discuss significant need for new capacity and energy in that same timeframe in their most recent IRPs. State environmental policies, particularly in Minnesota, will result in some percentage of that required capacity to be sourced from low- or zero-carbon emitting resources.

As with the discussion of the premium in Section V, we believe the elimination of capacity revenues for surplus dependable energy and opportunity sales in its entirety for the 20-year forecast is not well supported and not consistent with the information available to MH from the independent market consultants (see Section III) or the information from MISO, NERC and utility IRPs (See Section II). With that said, we agree with MH assessment of the softening of the market for exports in the near term over the past several years. The explanations of the market conditions associated with this issue from the 2017 EPF (discussed in Section V) are very focused on the current and near-term market conditions. We do not see any consideration of the potential for materially different circumstances to be prevailing beyond the near term, as is evident in the third-party forecasts and MISO planning.

Given that, a reasonable P50 forecast should include capacity revenues from the considerable dependable energy surplus (see Figure 27). Eliminating all forecasted capacity revenues associated with surplus dependable energy represents a very conservative assumption, as it is the lowest conceivable revenue outcome for the capacity value that the surplus energy can provide.

No Firm Energy Sales

As was discussed in Section V, during the NFAT, MH projected future firm sales from surplus dependable energy. In the GRA, all available energy (after meeting provincial load and existing contracts) was presumed to be sold in the MISO energy market as opportunity sales throughout the study period.

This is a conservative assumption, as it presumes that all surplus energy, including surplus dependable energy, will only receive energy revenues and will not receive any revenues for capacity or any other attributes (e.g., long term firm pricing, storage flexibility, clean energy, or price hedging). With respect to the energy sales, the value is based on MH's market energy price forecast. For all other attributes, the assumption of no value is clearly the lowest possible value.

As has been discussed in Section II, the MISO market is widely understood to be moving from a period of surplus to a period where considerable new capacity is needed. This is reflected in the capacity market price forecasts that MH received from each of its independent market price consultants. We believe there is clearly a range of plausible market values for capacity that MH does not consider in its Reference Case, particularly for MISO planning years 2023/24 and later. Similarly, Section II describes areas where state policy in Minnesota is increasingly valuing resources with low greenhouse gas emissions. This means that none of the uncertainty surrounding MHs ability to make firm sales or obtain added value for other attributes of its power are included in this forecast.

No Assumed Replacements for Expiring Firm Sales

In the current forecast, as fixed contracts that MH currently has in place begin to expire (see Figure 31 in Section VI), there is no assumption that these contracts will be replaced. This means that all capacity under contract receives no revenue after the contract ends and all energy is only priced as non-firm. Given that the counterparties will need to replace those products it is extremely conservative to presume, as MH has, that no amount of the energy can be resold above the spot energy price and that the capacity will have a value of zero after the contracts expire.

Available Dependable Energy

The conservative nature of the previous assumptions is further highlighted by a review of MH's filing. In the "*2016/17 Resource Planning Assumptions & Analysis*" document (Tab 7.3), MH indicates that "*the need for new resources is driven by a sustained dependable energy shortfall beginning in 2038/39*."[79] Table 1 of that same Appendix shows surplus dependable energy of roughly 1,000 GWh or more through 2036/37.

[79] GRA Submission, Appendix 7.3, pp. 12.

Figure 34 shows the forecast of exports split between opportunity sales and firm energy sales. [redacted] 5b, 5c Furthermore, since there is already a large volume of opportunity sales in those hours, the SPLASH opportunity pricing blocks that have the best prices will be utilized in most SPLASH runs. This means that, in addition to only pricing the energy at spot market prices, it will largely be priced below the forecasted monthly prices.

[redacted] 5b, 5c

Figure 34: Annual Export derived from SPLASH Output

D. Uncertainty Analysis Observations

MH included an uncertainty analysis to illustrate MH's view on risk by analyzing three key drivers of uncertainty: water supply variability, interest rates, and export prices.[80] Daymark reviewed this analysis at a high level to understand the context that MH provided around the reference case results.

[80] GRA Submission, Tab 4, pp. 8.

Expected Value and Risk Assignment

Uncertainty analysis is generally designed to understand what the "expected value" outcome is. Expected Value is a predicted value of a variable, calculated as the sum of all possible values, each multiplied by the probability of its occurrence. As MH stated in their filing, "*The uncertainty analysis is a sophisticated analytical tool which evaluates the impacts of the variation of multiple planning variables in order to determine a range of possible financial outcomes for the utility. The uncertainty analysis presented below combines multiple risk factors which reveals a more extensive picture of the risks facing the Corporation*."[81] This analysis is intended to show the risk that MH faces relative to meeting its 25 percent goal as well as the risks that will be borne by customers if rates are increased.

This idea that uncertainty analysis shows risks for either the Company or the customer is an important one, because while some of the risks identified are completely exogenous, whether viewed from the perspective of MH or the customer, other risks are of the type that MH has some ability to control. In particular, as was discussed in Section VII.A., the risk associated with export pricing is not completely out of the control of MH with respect to the marketing of the surplus dependable energy to obtain capacity and other premium values. This has implications for determining an equitable assignment of risk to both parties.

Asymmetrical Risk

When reviewing the export revenue forecast, Daymark noted two risk components that are more likely to lead to higher revenues than to lower revenues.

First, with natural gas prices at historically low levels and without a formal market process for pricing carbon, there are more factors that could exert upward pressure on energy prices than downward. Second, with the assumption that there will be no future firm energy or capacity sales, there is no risk of a lower forecast for those values and some unexplored possibility of increased revenues.

This asymmetrical risk profile means that there is a greater weighting on forecasts above the reference case than on those below. This then leads to an expected value above the reference case. So even if the reference case was a true P50, there would be strong argument for a higher export revenue forecast as more appropriately sharing risk between the company and its customers.

---

[81] Ibid.

Impact on Financial Results

In addition to the question of risk profile, the potential impact of a high or low scenario on the financial results is not necessarily symmetrical. Daymark requested that MH run their uncertainty analysis step by step to show the impact of each key variable on the range of results. Figure 35 below shows the results of their analysis for the step involving Export Revenues[82]:

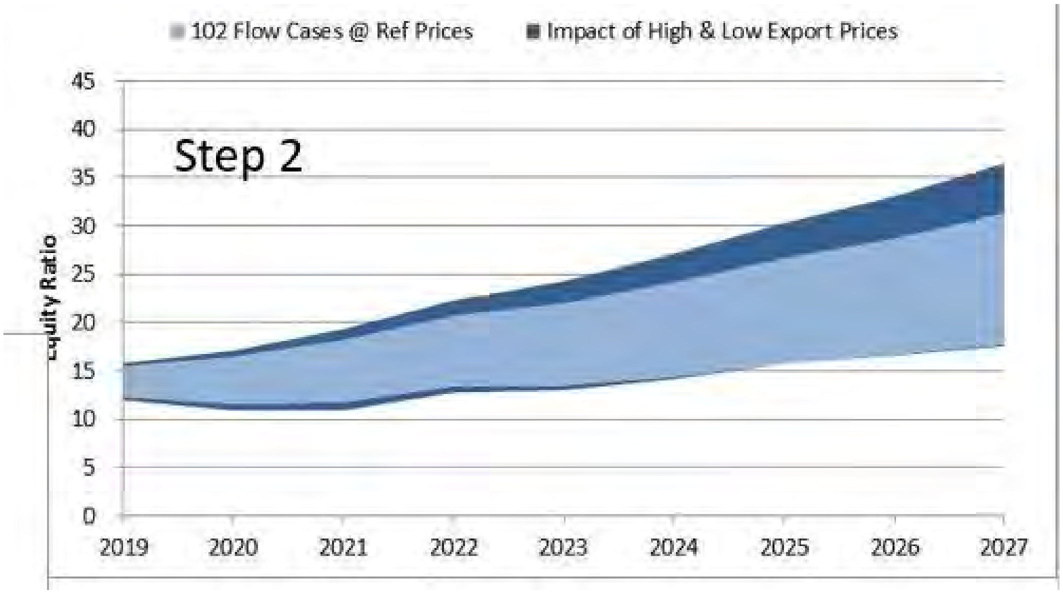

Figure 35: Isolated Impact on Equity Ratio for Hydrology & Export Revenues

In this graph, the light blue area represents the range of uncertainty around the forecast of hydrology. This was produced by accumulating the results of the 102 hydrology runs against the reference export price forecast and the reference interest rate. The dark blue color represents the additional uncertainty range produced by adding the high and low export price forecasts into the analysis, creating 306 total runs (102 hydrology runs against all 3 export price runs, all still with the reference interest rate). The results show that higher export prices have significantly more impact on the financial results than lower export prices.

[82] MH prepared confidential analysis, *Isolating impacts each comp uncertainty analysis - Tab 4*, provided via the MH confidential SharePoint site.

E. Summary of Findings

Based on our review of the export revenue forecasts for capacity and energy provided by MH, the Daymark IEC Team makes the following findings.

We have identified the follow components of the export revenue forecast that cause the forecast to be conservative/low relative to a value that is a P50 value:

- MH assumes that no revenue will be received for capacity or any other premium values from the substantial surplus dependable energy in the forecast.
- The energy market price forecast and the resultant energy revenues energy forecast is susceptible to be biased low.
- The uncertainty analysis that MH has conducted demonstrate the asymmetrical nature of the risk, with energy price risked skewed toward higher values, where the expected value of the forecast will be higher than the reference case value.

The components of the export revenue forecast that we reviewed and found to be reasonable include the forecast of surplus dependable energy and opportunity sale energy and MH forecast of revenues to be derived from existing firm contracts.

APPENDIX A

Daymark Energy Advisors

Scope of Work

DAYMARK ENERGY ADVISORS

Scope of Work

Export Pricing and Revenues Review

1. Review Manitoba Hydro's electricity export price forecast and third party consultant forecasts, including the low and high case forecasts, in the context of current MISO market conditions and factors influencing future MISO prices. The third party consultant forecasts are to be taken as a "given" and are to be assumed to be reasonable and accurate with respect to the other tasks in this Scope of Work. Notwithstanding that the third party consultant forecasts are to be accepted for the purposes of this review, if the IEC identifies significant issues or inconsistencies with the third party consultant forecasts in the course of its general review, those issues or inconsistencies are to be identified in the IEC's reports.

2. Review and assess Manitoba Hydro's forecast of exportable surplus energy and capacity by on-peak and off-peak period, taking into account expected inflow conditions, reservoir levels, and tie line capacities.

3. Review Manitoba Hydro's forecast for export revenues and fuel & power purchases for the next twenty years and assess whether the forecast of net extraprovincial revenue is reasonable. As an independent review of the extraprovincial revenues arising from contracted energy and capacity sales was undertaken at the 2014 NFAT (Exhibit LCA-5 in response to CSI Undertaking UT-34), a review of Manitoba Hydro's export contracts and estimation by the IEC of firm energy revenues and capacity revenues is not required for any contracts that were contemplated and assessed at the NFAT. Manitoba Hydro's updated export revenues, volumes, and unit prices by contract and by year will be provided as part of PUB MFR-84. The firm energy and capacity revenues in PUB MFR-84, for those contracts evaluated by the IEC at the NFAT, are to be taken as "given", so long as the firm energy and capacity revenues are aligned with the independent analysis from the NFAT after adjusting for changes in forecast exchange rates and escalation.

4. Assess the reasonableness of changes in Manitoba Hydro's forecasting methodology that eliminates the assumed premiums for surplus dependable energy and capacity sales.

5. Provide comments on the factors influencing the MISO market and trends that are affecting market prices, including but not limited to:

(a) state and federal policies on electricity generation and emissions;

(b) existing generation mix;

(c) expected new generation to be installed in the next 20 years;

(d) forecasted generation retirements in the next 20 years;

(e) supply and demand balance in the northern MISO region; and

(f) factors that may affect Manitoba Hydro's ability to export energy and capacity into the MISO market.

6. Provide a report to be placed on the public record that provides the Consultant's findings, opinions, and non-commercially sensitive supporting information.

7. Provide a non-public report to the PUB that provides commercially sensitive information and additional calculations supporting the findings.

Public and Commercially Sensitive Load Forecast Review

8. Review Manitoba Hydro's 2017 Load Forecast and assess the changes with respect to the 2014 Load Forecast.

9. Assess Manitoba Hydro's load forecasting methods for Residential, Mass Market, and Top Consumers segments and compare to industry best practices with respect to:

(a) the econometric and end-use forecasting methodology;

(b) the elasticity methodology used to evaluate how Manitoba Hydro evaluates the implications of rate increases and new technology on electricity demand.

(c) Manitoba Hydro's economic assumptions including population growth, GDP growth, and price elasticity;

(d) the reliability of the short and long-term domestic load forecast modelling;

(c) the extent to which Manitoba Hydro has used appropriate scenario planning to examine the potential impact of changes in the industry, the Manitoba and Canadian economies, available technology (generation and loads) and energy efficiency measures (costs and cost effectiveness);

(f) the appropriate use of probability analysis of projected load forecasts;

(g) the extent to which retrospective load analysis provides confidence in the load forecast;

(h) the reasonableness of peak demand and energy trends including seasonal variations in load forecasting; and

(i) impacts on load forecasts resulting from potential fuel switching, particularly in light of rocent trends in the cost of natural gas and potential carbon taxes.

10. Assess other aspects of the load forecasting methodology including transmission and distribution losses.

11. Evaluate the historical performance of Manitoba Hydro's load forecasting methodologies for Residential, Mass Market, and Top Consumers segments.

12. Review the commercially sensitive load forecast for Top Consumers and assess the reasonableness of the forecasting methods and forecast.

13. Coordinate with other IECs who are reviewing price elasticity impacts on electricity demand in order to minimize duplication of analysis.

14. Provide a report to be placed on the public record that provides the Consultant's findings, opinions, and non-commercially sensitive supporting information.

15. Provide a non-public report to the PUB that provides commercially sensitive information and additional calculations supporting the findings.

APPENDIX B

Daymark Energy Advisors

Documents Relied Upon

Consistent with the agreement between Daymark Energy Advisors and the Manitoba Public Utilities Board, the following appendix provides a reference to the documents that were relied upon to develop this Independent Expert Consultant Report.

This appendix is organized into two sections. The first is a list of the documents relied upon that are already part of the record in this docket. The second is an annotated bibliography of additional documents relied upon that are not already part of the record in this docket.

Documents in the Record

AN INTERIM ORDER WITH RESPECT TO MANITOBA HYDRO'S APPLICATION FOR INCREASED 2010/11 AND 2011/12 RATES AND OTHER RELATED MATTERS

Table of Contents

Contents

Executive Summary

Among other requests, Manitoba Hydro (MH or the Corporation) applied to the Public Utilities Board (Board) for across-the-board 2.9% rate increases to take effect both on April 1, 2010 and April 1, 2011, and for a further 0.9% rate increase to take effect August 1, 2011. As is always the case with applications made to the Board, the onus is on the applicant, in this case MH, to fully and adequately support requests made. In this case, MH failed to discharge that onus.

In past Board orders arising out of public proceedings concerning MH, the Board has raised concerns with the scale of capital expenditures and new debt MH plans to undertake, plans premised in large part on the expectation of "profitable" net export sales. In those past orders, the Board has suggested there was a risk that if the Corporation's plans were implemented MH may not be able to both meet its domestic and export commitments and achieve its financial targets without having to (with the Board's approval) increase domestic rates not only beyond the levels now projected by MH, but above a level consistent with both public expectations and the general public interest.

Accordingly, within the proceeding just concluded, which not only considered MH's requests but, also, other related matters, the Board undertook an in-depth review of MH's operational business risks and its risk management practices. This review included consideration of the probabilities of occurrence, and possible cost consequences of occurrence, of all identified operational and business risks – this in the context of the Corporation's planned capital spending and concurrent pursuit of export contracts with American utilities.

Unfortunately, in the public hearing that concluded on July 4, 5 and 7 of 2011 (with the closing statements of both interveners and MH), the Corporation either refused or failed to provide the Board information that the Board considers critical to it reaching a comprehensive and final perspective on the prudency of MH's actions and plans, and the implications for domestic rates of MH's operations and plans.

In particular, MH not only failed to provide the Board a fully updated 20-year Integrated Financial Forecast (IFF) – to include recognition of presently very low spot, opportunity and average export prices, and financial scenarios, with stated assumptions, based on capital expenditure plans differing from MH's "preferred development plan", but also refused to comply with a subpoena issued by the Board on July 6, 2011 that seeks the filing of MH's export contracts.

MH intends to seek leave to appeal to the Manitoba Court of Appeal towards its objective of quashing the Board's subpoena. This Board will oppose the granting of leave to appeal and, if granted, plans to oppose MH's effort to quash the Board's subpoena. (The position of the Board with respect to its access to the export contracts is set out in Board Order 95/11, issued July 22, 2011, available on the Board's website: www.pub.gov.mb.ca.)

With respect to alternate capital development scenarios (models providing forecasts of financial results out twenty years) not provided by MH, one scenario among others that the Board wants to be modelled involves the deferral (potentially partial, and potentially to represent a "staggering" of elements of MH's current capital development plan) of the Corporation's current major capital development plan along with the modelling of the expected consequences of the construction of a combined cycle natural gas generation plant in southern Manitoba.

In this Order, and based on the evidence available to it, the Board establishes its concerns with MH's preferred capital expenditure development plan. That plan would have MH construct two new hydro-electric generating stations (a third new plant, Wuskwatim

Generation Station, is nearing completion) and Bipole III, and the Corporation entering into new export contracts towards meeting the costs of advancing the construction of the planned new generation stations well ahead of expected domestic electricity load requirements.

Since MH's plans were conceived "much has changed" – the expected costs of constructing MH's planned new generation and transmission assets has soared by approximately $3.5 billion (to-date); the price MH receives from its American utility counterparties for spot and opportunity export sales – which are anticipated to represent at least 50% of the Corporation's export sales - has fallen dramatically. (MH generally expects "firm" export sales, sales made at prices set in long term contracts, to represent no more than 50% of its total export sales, with the remaining sales being spot or opportunity sales at then-market prices.)

For an extended period of time, and since the fall 2008 when the global credit crisis and recession began to the present time, MH's off-peak spot and opportunity export sales have realized prices as low as 0.5¢/kWh, reducing the average price received for its exports, including its "firm" and peak sales, to below 3.5¢/kWh.

The presently low export prices are generally understood to be attributable to:

a) the employment of new natural gas extraction methods, allowing for the production of natural gas from seemingly abundant shale deposits in North America, and, as well;
b) a reduction in industrial demand, in both Manitoba and in its export market, from previous levels.

The reduction in industrial demand, and reduced projections of future industrial load growth, are due in part to the slow recovery, particularly in the United States, from the recession, and, also, here in Manitoba with the recent closure of a pulp and paper plant and an announcement of an impending closure of an existing Manitoba smelter and refinery operation in Thompson (which follows the closure of another industrial smelter in Flin Flon).

From the evidence currently available to the Board (and in advance of receipt of the export contracts for which the Board has issued a subpoena), the Board is concerned that if MH proceeds with its "preferred development plan" the consequences for Manitoba ratepayers, as to be evidenced in rate increases, may be much higher than MH currently projects.

Ahead of regulatory approvals in both Canada and the United States, MH has already expended hundreds of millions of dollars (and it continues to spend to "protect" the planned in-service dates of its planned new generation and transmission), on its capital development plan, a plan outlined in more depth within the body of this Order.

The Board believes a thorough 'Needs For and Alternative To' (NFAAT) process should be held to consider MH's planned major capital expenditure plans and related new export contracts far in advance of MH making final commitments to enter into its proposed export contracts and undertaking massive new investments.

While MH currently projects that the implementation of its capital expenditure and export contract plans will result in domestic rate increases cumulating over twenty years at approximately 70%, the Board fears that MH has both understated the costs of its preferred development plan and overstated future export sale revenue, with the result potentially being a compound overall increase in domestic rates over the twenty year period twice that forecast by MH.

MH's primary objectives include serving domestic load reliably, and at rate levels consistent with Manitoban expectations. The Board indicates within this Order its concern that if MH proceeds with its development plan "as is" the inadvertent result could be domestic ratepayers subsidizing export sales to the United States. The Board is not at all confident that the risk tolerance exhibited by MH is shared by the majority of its ratepayers.

Thus, despite the lengthiest, most complex and certainly most expensive public proceeding ever held by the Board, a hearing that has involved several interveners and numerous expert witnesses, the Board concludes that, on an interim basis, it must deny not only MH's requests for the finalization of interim rate increases but also approval of a further rate increase at this time.

This is the first of two Board Orders to be issued arising out of the recent public hearing, and, as suggested above, it is focused on MH's rate requests, risks and risk management. The second Order will follow in due course, and will not only address in more depth matters dealt with herein, but also provide the Board's findings on other matters considered in the recent hearing (including ex parte interim rate orders outstanding with respect to MH's Surplus Energy Program, SEP, and MH's Curtailable Rate Program; MH's application for the Temporary Billing Demand Concessions for General Service Medium and Large customers provided in Board Order 126/09 being made permanent; the "firmness" of MH's equity components; the prudency of MH's expenditures; and, the approach to be taken with respect to lower income customers and other rate design matters, including Cost of Service issues).

The second Order will also provide commentary and findings with respect to the participation in the proceeding of interveners and expert witnesses, and address the recommendations made by the interveners and their expert witnesses.

1.0 Application

In November 2009 and pursuant to *The Public Utilities Board Act* and *The Crown Corporation Public Review* and *Accountability Act*, MH applied to the Board for the following:

a) *Approval of rate schedules incorporating an across-the-board 2.9% average increase in General Consumer's rates effective April 1, 2010 (with the exception of Area & Roadway Lighting Class;*

b) *Approval of rate schedules that incorporate a further across-the-board 2.9% average increase in General Consumers' rates effective April 1, 2011;*

c) *Final approval of all Surplus Energy Program ("SEP") ex parte rate orders outstanding;*

d) *Final approval of Curtailable Rate Program ex parte Orders /09 and 63/11; and*

e) *Final approval of Order 126/09, which resulted from MH's application for Temporary Billing Demand Concessions for General Service Medium and Large customers related to the impacts of the economic downturn. MH requests that the Temporary Billing Demand Concessions be made permanent under the program.*

2.0 Background

MH's preceding General Rate Application (GRA) was held in 2008, and was the subject of Board Orders 90/08, 91/08 and 116/08, all of which are available on the Board's website (www.pub.gov.mb.ca).

In Order 90/08, as in prior Orders going back to 2004, the Board raised many concerns about the risks faced by MH. In particular, and more recently, the Board has raised concerns with the scale of capital expenditures and new debt MH plans to incur over the next 15 years. The Board also suggested that there is a risk that the Corporation may not be able to meet its domestic and export commitments without having to resort to high-priced imported power and/or Manitoba thermal generation (also at a high cost), and both with environmental implications during years of lower than median water conditions.

The Board, in Order 90/08, granted a 5% rate increase effective August 1, 2008. In granting the increase, the Board stated:

> *"Despite the Board's limited mandate with respect to capital costs, the Board expresses concern, not to be confused with opposition, with the unprecedented capital expenditure levels, and questions whether the export revenue stream from new generation and transmission projects will be sufficient to cover the financial obligations related to these works, given the inherent risks that are present and lie ahead.*
>
> *The Board will seek further assurances from MH that new contracts are priced at or above forecast average export prices."*

The Board also directed MH to file information in support of a 4% conditional rate increase, which was to be effective April 1, 2009. MH filed additional information that included updated financial forecast information (IFF 08-1). Upon a review of the information, the Board, in Order 32/09, revised the 4% conditional rate increase to 2.9%, and noted recent improvements in MH's published financial position to be balanced with the Board's ongoing concerns related to the Corporation's multiple and major risks.

In that Order, Board Directive 4 required:

> *"MH to file by September 30, 2009 for Board approval, a conceptual line for an in-depth and independent study of all of the operational business risks facing the Corporation. The study to be a thorough and quantified Risk Analysis, including probabilities of all identified operational and business risks. This report should consider the implications of planned capital spending taking into account export revenue growth, variable interest rates, drought, inflation experience and risk, and potential currency fluctuation."*

On December 1, 2009, MH filed a General Rate Application (GRA) seeking across-the-board 2.9% average rate increase in General Consumer rates effective both April 1, 2010 and, also, April 1, 2011.

In accordance with previous directives issued by the Board, MH filed (in confidence with the Board) documents related to its risk management assessment and practices. Through a review of the information, the Board determined that a special hearing process was required to consider how best to address the confidential information that would allow for an appropriate review of MH's risk management.

Accordingly, on December 10, 2009 and December 22, 2009 the Board held Pre-Hearing Conferences, the first considered whether and how to incorporate a review of MH's risks and risk management into the GRA process; the latter dealt with which Interveners should be approved for participation in the GRA public process and the establishment of a timetable for the orderly exchange of evidence (to lead up to public hearings, then-planned to commence in 2010).

Among the issues canvassed was whether the Board should retain an independent risk consultant. Subsequently, the Board issued Order 17/10 (dated February 9, 2010) which concluded that a detailed risk and risk management review would be addressed in the GRA.

Order 17/10 also approved the following parties as Interveners to the GRA:

i) Consumers' Association of Canada (Manitoba) Inc., Manitoba Society of Seniors (CAC/MSOS);
ii) Manitoba Keewatinook Ininew Okimowin, (MKO)
iii) Manitoba Industrial Power Users Group (MIPUG);
iv) City of Winnipeg (City); and
v) Resource Conservation Manitoba (now Green Action Centre) and Time to Respect Earth's Ecosystems (RCM/TREE).

The Board then issued Order 30/10 (dated March 26, 2010), and, in Schedule C of that Order, the Board provided the terms of reference for the engagement of independent experts by the Board to undertake an independent risk and risk management review. Additionally, Southern Chiefs Organization (SCO) was added as an Intervener.

Matters related to the risk review and other procedural matters led to a lengthy delay in the commencement of the GRA, which was held over 41 hearing days (commencing January 5, 2011 through and including June 9, 2011). Closing submissions by Interveners were heard by the Board on July 4 and 5th of 2011, followed by MH's closing submission provided on July 7, 2011.

Due to the delay in the commencement of the hearing, the Board heard submissions from MH and Interveners on January 19, 2010 to consider whether an interim rate increase should be granted effective April 1, 2010. The Board (in Orders 18/10 and 33/10) provided an interim approval of a 2.9% across-the-board rate increase (except for the Area and Roadway Lighting Class, for which no rate increase was approved). Subsequently in 2011, the Board received submissions from Interveners and MH as to whether an additional interim 2.9% rate increase (as applied for by MH) should be granted effective April 1, 2011. Following receipt and consideration of submissions, the Board issued Order 40/11, which approved an interim 2% across-the-board rate increase for all classes (again except for the Area and Roadway Lighting Class, for which no rate increase was approved).

In MH's closing submission of July 7, 2011, MH requested the two interim rate Orders be finalized and an additional 0.9% rate increase be granted (the latter to take effect August 1, 2011).

To respond to MH's request for the finalization of the two interim rate Orders and approve an additional 0.9% rate increase to be effective August 1, 2011, the Board issues this interim Order, it being the first of two planned Orders to address all issues raised in MH's GRA. Findings and information in this first Order are to be expanded upon in the second Order, which is to follow in due course. The positions of MH, Interveners and experts on various issues will be detailed in the second Order, which may also include additional Board findings and directives.

3.0 Key Information

3.1 Operating Results

In support of its Application, MH filed an Integrated Financial Forecast (IFF), MH IFF 09-1 for its electric operations, as well as a Capital Expenditure Forecast (CEF) CEF 09-1, both forecasts extended from MH's fiscal year 2009/10 to fiscal year 2019/20. Updated forecasts (IFF MH 10-1 and CEF 10-1) were filed later in the hearing. IFFs and CEFs are prepared to provide an indication of the long-term financial direction, plans and expectations of the Corporation, and are based on numerous assumptions.

MH's actual results for fiscal year 2009/10 and its forecasts for fiscal years 2010/11 and 2011/12 (the annual report of MH, to include its audited financial statements for 2010/11 has yet to be released) projected accumulated net income for fiscal years 2009/10 to and including 2011/12 will be $148 million higher (pursuant to IFF 10-1) than was indicated in IFF 09-1 (IFF 09-1, the IFF which was filed in the Application).

The projected improvement in accumulated net income and period ending retained earnings (retained earnings represent MH's "equity" or capital) was primarily attributed to lower than forecast depreciation, finance expense and fuel & power purchase costs. As well, the forecast represented a continuation of MH's accounting practice of capitalizing and deferring expenses incurred in current and past periods associated with the Corporation's plans to construct additional generation and transmission assets.

MH's IFF 09-1 indicates MH achieved its 75:25 debt to equity ratio financial target. While the 75:25 debt to equity ratio target has generally been accepted as being representative of an adequate capital structure, this Board has questioned the "firmness" of components of the equity factor (which include contributions in aid of construction, Accumulated Other Comprehensive Income, and intangible and deferred costs – all "illiquid"), and has raised doubts as to whether the present target ratio of 75:25 will remain adequate if MH's proceeds to expend (largely based on additional borrowings) approximately $20 billion on new major generation and transmission assets over the next ten or so years).

MH's IFF 10-1, a partially updated forecast still largely based on assumptions that underlie IFF 09-01, supports in part the Board's interim rate approvals of 2.9% and 2% effective April 1, 2010 and April 1, 2011, respectively.

MH's actual and currently forecast operating results compared to forecasts of the preceding 2008 GRA are as follows:

Table 1

Pro Forma Statement of Operations & Retained Earnings

($ Millions)	**Actual**			**IFFIO-1**		
Fiscal Year	**2008**	**2009**	**2010**	**2011**	**2012**	**Total 2008-2012**
Revenue

Retained earnings IFF07-1	1,735	1,891	1,996	2,112	2,226	
Cumulative Retained Earnings difference						
2008 GRA vs 2011 GRA	55	187	242	242	253	

Note: Board approved increases granted in prior Applications: 5% effective August 1, 2004 (a $48 million addition to annual revenue); 2.25% effective April 1, 2005 ($21.8 million of additional annual revenue); and, 2.25% effective February 1, 2007 (an additional $23.0 million of annual revenue). The interim increases provided as of April 1, 2010 and 2011 represent a further addition to annual revenue of, in aggregate, approximately $48 million.

Overall, and on the "face of it" (setting aside the Board's ongoing concern with respect to MH's practice of deferring and/or capitalizing a significant amount of its annual OM&A expenditures), MH's financial position since the 2008 GRA is projected by MH to improve by approximately $253 million over the period 2007/08 through to and including 2011/12.

It is important to note that since 2008, this Board has approved rate increases that are expected to provide MH over $788 million in accumulated additional revenue through to and including fiscal 2011/12.

In the decade prior to 2004/05, in essence domestic rates remained "frozen" and MH relied on net export revenues to meet its increased reported annual expenditures and pursue its financial targets (debt to equity ratio, interest coverage and capital expenditure coverage).

3.2 Financial Targets

MH's most recent financial targets (as established by MH's Board of Directors and generally accepted by this Board – with reservations given the components of equity and the plans for massive borrowing - and Interveners to MH GRA proceedings, to-date) are as follows:

1. Achieve and maintain a minimum debt to equity ratio target of 75:25 by no later than 2011/12;
2. Achieve and maintain an annual gross interest coverage ratio of 1.20 annually; and

3. Fund all new capital construction requirements (except major new generation and/or major new transmission facilities, plus the new head office), from internal sources (net income and non-cash expenditures).

Debt to Equity

The debt to equity ratio has been the focus of attention at this and prior hearings and this ratio has been employed as one means of assessing the capital adequacy of MH – i.e. its "financial strength", by comparing MH's debt to its equity.

While MH's debt is secured for its lenders by the guarantee of the Province (which annually charges MH a 1% debt guarantee fee), lenders and credit rating agencies relied on by lenders, given the significant percentage of overall Provincial Government debt that is comprised of MH borrowings, pay attention to the reported capital adequacy of MH when considering the interest rates the Province itself will have to bear when it issues debt.

At the 2008 GRA, MH's filed IFF 07-1 did not project MH reaching its debt to equity target of 75:25 during the then-forecast ten year period through fiscal 2017/18. However actual events and the latest forecast suggest a changing "landscape".

MH's actual and forecast debt to equity ratios for its fiscal years 2007/08 to and including 2017/18, from IFF 10, as compared to IFF 07-1 as it was filed at the preceding GRA, are as follows:

Table 2

Debt to Equity Ratio Comparison

	Actual			Forecast		
Fiscal Year	2008	2009	2010	2011	2012	2018
Actual/IFF10	73:27	77:23	73:27	74:26	74:26	82:18
IFF07-1	77:23	77:23	77:23	78:22	78:22	78:22

Based on MH's IFF 10-2, again a partially updated version of IFF 09-1, MH will continue to meet the 75:25 debt to equity ratio target as of March 31, 2011, continue to meet the target through to the end of fiscal 2011/12, then, as a result of planned capital expenditures, fall below the equity target.

Since the 2003/04 drought, where a loss of $436 million was reported driving up the debt component of the debt to equity ratio, MH's capital structure (as reported by MH) has improved.

MH's "reportedly" improved financial position relates to three major factors:

a) higher than expected extra provincial revenue (net export revenue) in fiscal 2006 – this driven in large part by a spike in natural gas prices following hurricanes Katrina and Rita that "drove up" opportunity export sales prices at a time of high water flow conditions;
b) rate increases granted by this Board in 2004 (5%), 2005 (2.25%), 2007 (2.25%), 2009 (5%), and interim increases granted as part of the current proceeding in 2010 (2.9%) and 2011 (2.0%); and,
c) a decrease in borrowing rates, particularly short-term rates, this largely the result of government actions following the global credit crisis and recession (the former commencing in the fall of 2008 and both concluding in 2009/10).

On an overall basis, domestic electricity rates have increased, on a compounded basis, by over 22% since 2004 – an increase that exceeds the general rate of inflation through the period.

MH having attained the debt:equity target (again, this Board has reservations with respect to how MH's calculates the equity component of the ratio), and despite the Corporation's forecasts of annual rate increases of 3.5% for the years 2013 through 2021, a rate of increase much higher than the expected rate of inflation, MH does not anticipate maintaining its target debt:equity ratio. MH projects that its debt to equity ratio will "slip" (deteriorate) due to MH's planned major capital program.

MH currently forecasts, (forecasts having only been partly updated) that its debt to equity ratio will decline to 82:18 as of March 31, 2018, a ratio worse than that MH contemplated in its IFF 07-1 (filed in the 2008 GRA). MH's capital structure is forecast to weaken even further after 2018, before the Corporation's anticipated in-service dates of both Keeyask and Conawapa generation stations, with the debt to equity ratio now projected by the Corporation to reach 84:16 as of March 31, 2021.

In support of its most recent Application, and as previously indicated, MH filed IFF MH 09-1 and CEF 09-1. MH then-anticipated capital spending of $13.1 billion on three major Generation and Transmission projects (Keeyask Generating Station, Conawapa Generating Station and the Bipole III Transmission line). MH concurrently forecast that its long term debt would increase from $7.8 billion (as of March 31, 2010) to $17.7 billion as of March 31, 2029, a projected increase of $9.9 billion.

However, MH has since revised its capital cost projections for the three major projects. As reflected in MH's IFF 10-2, MH now projects the capital cost of the three major projects to be in the range of \$16.6 billion – approximately \$3.5 billion higher than MH forecast in CEF 09-1, only one year earlier. Concurrently, MH also increased its forecast of required additional debt, now projected by the Corporation to increase by over \$15 billion, and to reach \$23 billion as of March 31, 2029, an increase in projected long term debt in excess of \$5 billion from the Corporation's previous forecast.

As a result of the increased capital expenditure forecast, MH has now projected that its debt to equity ratio as of March 31, 2029 will change from the 51:49 projected in its IFF 09 forecast (that forecast represented an expectation that significant annual net income results would result in what the Corporation denoted as its "decade of return", which was projected to follow MH's "decade of investment") to 72:28 (that ratio drawn from MH's partially updated IFF 10). It is important to note that MH's revised debt to equity ratio projection of 72:28 still does not take into account the current low prices being received for spot, opportunity and average export sales.

The change in MH's forecast of its debt to equity ratio as of March 31, 2029, a date at which MH currently plans to be operating Keeyask, Conawapa (relying on Bipole III), and exporting significantly increased volumes of power to the United States, represents a material negative financial change – one that appears to acknowledge the new and higher capital cost forecast and the impact of higher capital expenditures on forecast annual amortization and finance expense.

Changes to Generally Accepted Accounting Practices (GAAP), with the move to International Financial Reporting Standards (IFRS) expected to occur in MH's fiscal year 2012/13, raise the potential for an expensing (write-off to retained earnings) of Rate Regulated Assets of over \$300 million (OM&A expenditures that were deferred, not included as a period expense in the year of incurring, and now classified as an "asset" in MH's balance sheet). If this occurs, MH's debt to equity ratio will be negatively affected.

3.3 Operating, Maintenance and Administrative Expenses (OM&A)

3.3.1 Capitalization of Operating and Administrative Expenditures

While MH's rates are largely driven by its capital assets (generation, transmission and distribution), they also reflect the Corporation's Operating, Maintenance and Administrative (OM&A) expenditures. In setting rates, the Board's goal is that those rates are not only just and reasonable, but also reflect prudent expenditures (the concept of prudency extends not only to capital expenditures, but also to OM&A costs).

A particular difficulty in setting what is to be "just and reasonable rates" reflective of prudent actions by the Corporation is that the Board does not have jurisdiction with respect to MH's capital expenditures. Since the Corporation is wholly owned by the Province, i.e. it is a Crown Corporation, the practice of disallowing expenditures, whether capital or OM&A, considered not to be prudent is more problematic than in the case of privately owned utilities, where disallowance affects private not public interests. To disallow an expense of a Crown Corporation would, in effect, send a "message", but as to who is to "pay the cost", it would simply "move" the disallowed cost from the utility's ratepayers to the taxpayers of the Province.

As previously indicated, MH defers and/or capitalizes certain of its operating, maintenance and administrative expenditures. A significant percentage of MH's annual OM&A expenditures incurred in its fiscal years have been or are to be capitalized or deferred (and then categorized as "assets" and not expensed), to be amortized over a period of years (with the amortization period for certain of those capitalized expenses to begin only after the "in service" date of a new Generating Station or transmission line).

The outcome of "capitalization" is, in essence, the transfer of a cost incurred in one particular fiscal year to other years, as the initial cost could be amortized over the expected service life of the "asset" it is associated with. With capitalization of OM&A, the rates of current ratepayers are restrained, with responsibility, in the form of impact on rates, transferred to future generations of ratepayers.

Private corporations, which pay income taxes, tend to "write-off" period expenses rather than capitalize or defer them, the effect of doing so reduces the income tax liabilities of the corporations while relieving future annual statements and, potentially, customers, of costs that would, if capitalized, fallen in future years.

MH segregates its costs between operating activities, which are a direct charge against the operating income for the year the expenditure occurs, and "capital" activities, which are deferred or capitalized in the year of incurrence and charged to future periods and amortized over the future life of the respective capital project. In addition, MH also capitalizes a significant component of its annual administrative overhead by applying predetermined overhead rates to all capital projects.

Over 75% of operating and administration costs (OM&A) relate to labour costs, including employee benefits. Manitoba Hydro had total (OM&A costs before capitalization or deferral of $543 million in 2003/04, an annual amount that increased to over $688 million in 2010, and was recently forecast to increase further to $704 million in fiscal 2010/11 and $714 million in 2011/2, before capitalization and/or deferral.

In 2003/04, MH capitalized or deferred a significant portion of its period costs, including approximately 28% of labour and benefits costs.

Actual and forecast operating and administrative expenses, before and after capitalization, for the fiscal years 2007/08 to and including 2011/12 are as follows:

Table 3

Operating and Administrative Costs ($000's)

	Actual			**IFF10-01**	
Fiscal Year	**2008**	**2009**	**2010**	**2011**	**2012**
Labour					
Wages, Salaries	$359.3	$380.0	$408.0	$415.2	$424.8
Overtime	$41.8	$45.9	$50.3	$48.1	$49.2
Employee Benefits	$76.8	$83.7	$82.7	$93.0	$95.2
Labour and Benefits	$477.8	$509.9	$541.0	$556.3	$569.1
Employee Safety & Training	$3.7	$4.2	$4.6	$4.8	$4.9
Travel	$28.3	$31.8	$32.4	$33.0	$33.7
Motor Vehicle	$22.4	$24.1	$24.3	$23.1	$23.7
Materials & Tools	$27.8	$29.4	$26.9	$26.2	$26.8
Consulting & Professional Fees	$7.5	$9.7	$14.8	$10.9	$11.2
Construction & Maintenance Services	$15.9	$18.4	$20.1	$21.8	$22.3
Building & Property Services	$25.7	$29.0	$22.9	$20.7	$21.2
Equipment Maintenance & Rentals	$11.7	$13.0	$14.4	$13.9	$14.2
Consumer Services	$4.7	$5.3	$5.8	$5.7	$5.8
Computer Services	$1.1	$0.9	$1.0	$0.7	$0.7
Collection Costs	$5.3	$5.0	$4.6	$4.5	$4.7
Customer & Public Relations	$6.7	$6.9	$8.2	$6.0	$6.2
Sponsored Memberships	$1.2	$1.5	$1.3	$1.3	$1.3
Office & Administration	$14.4	$14.7	$15.3	$15.7	$15.9
Communication Systems	$1.4	$1.5	$1.8	$1.6	$1.6
Research & Development Costs	$3.0	$3.1	$4.0	$4.1	$4.2

	Actual			IFF10-01	
Fiscal Year	**2008**	**2009**	**2010**	**2011**	**2012**
Contingency Planning				$5.4	$3.9
Operating Expense Recovery	($23.3)	($21.5)	($21.6)	($16.5)	($16.7)
Total Costs	**$638.6**	**$687.2**	**$723.0**	**$740.2**	**$755.6**
Operating and Administration Charged to Centra	($56.3)	($59.0)	($61.0)	($63.4)	($64.0)
CICA Accounting Changes*		$5.0	$9.0	$9.0	$9.0
Provision for Accounting Changes				$18.0	$13.5
	$582.3	**$633.1**	**$688.0**	**$703.8**	**$714.1**
Capital Order Activities	($192.3)	($203.1)	($224.3)	($235.0)	($239.7)
Capitalized Overhead	($67.3)	($65.7)	($69.2)	($71.0)	($72.5)
O&A Attributable to Electric Operations	**$322.7**	**$364.3**	**$377.6**	**$397.7**	**$401.9**

The amount of annual labour and benefits being capitalized has increased to the point where MH now capitalizes over 32% of its annual labour and benefit costs. The increase in amounts capitalized mutes, or masks, the growth in OM&A expense recorded on an annual basis.

If MH were to expense, i.e. charge against annual revenue/net income, labour and benefit costs that it now capitalizes, MH would, in the absence of larger rate increases than those now projected for future years, report net losses in many of its forecast future operating years, rather than forecasting annual net income for every one of its projected future years as it currently does.

Including overheads, in total MH forecast the capitalization of $306 million ($235 million with respect to in capital asset construction activities and $71 million of administrative overhead) of OM&A expenses in fiscal 2010/11, and over $312 million ($240 million in capital order activities and $72 million in overhead) in fiscal 2011/12, representing over 43% of its annual electric operating expenses in those two years.

A further analysis and discussion of the cost deferral and capitalization practices of MH will be provided in the subsequent second Order of the Board to arise out of the recent hearing.

3.3.2 Growth in OM&A

Operating and Administration Expenses, as recorded in MH's audited financial statements – after capitalization, have increased from $323 million in fiscal 2007/08 to $364 million in fiscal 2008/09; the two "test years" from the 2008 GRA (and representing an increase in one year of 13%). OM&A expenses, as recorded as an expense in MH's accounts, further increased to $378 million in 2010, an additional $13 million or 3.6% change from the prior year.

From fiscal 2004/05 through fiscal 2009/10, MH's OM&A expenses have grown at a compound average growth rate of almost 5% annually, while inflation for that period has been under 2% per year. MH forecast OM&A expense to be $380 million in fiscal 2010/11 and $403 million in fiscal 2011/12. And, MH provided an update at the hearing with its IFF 10-1, wherein the OM&A expense projection was revised, to $398 million for fiscal 2010/11 and $402 million for fiscal 2011/12 (as reflected in the above table).

MH attributed the increases in part to accounting changes (to conform with changes to GAAP, as GAAP transitions to comply with International Financial Reporting Standards, IFRS). Canada is in the process of converging its accounting practices with international accounting standards, which will, when the transition is complete, become the new Canadian GAAP.

OM&A increased in 2009/10 by $11 million, and MH recently forecast further increases in the order of $31 million for fiscal 2010/11 and $27 million for fiscal 2011/12 (incorporating provisions for expected IFRS mandated accounting changes to impact OM&A by $18 million and $14 million, for the respective years).

OM&A are direct expenses within the control of MH (some of these direct expenses have a "fixed" aspect – required annual expenses such as insurance premiums and building operation costs, while others are more of a variable nature, such as external legal and consulting fees, more susceptible to reduction).

MH indicated in the recent proceeding that it plans to "control" and restrain OM&A spending by implementing a number of measures, including a "general" hiring freeze (which provides for exceptions), restricting travel to only "out of Province" trips deemed very essential, and extending the service life of computer equipment (which lowers annual amortization expense, while extending the number of years amortization expenses occur related to those assets).

These actions, together with other measures related to targeted initiatives, were forecast by MH to save between $11 million to $13 million in expenses in the current year, fiscal 2010/11. MH also considered freezing management and executive salaries, an action that would have been consistent with the freezing of civil service salaries undertaken by the Province, but did not do so, asserting that to do so could risk the loss of key personnel to other utilities in other provinces. (MH testified that it had lost five employees to Saskatchewan Power over the last year, this out of a total complement of approximately 6,700).

A further discussion and analysis of MH's OM&A expenditures and the Board's perspective on the prudency of MH's OM&A expenses and its recent cost constraint measures will be provided in the subsequent Order of the Board.

3.3.3 Staffing Levels

A major driver of increases in OM&A expense (both before and after capitalization of OM&A) is increased staffing levels, which, despite MH's assertion that it seeks to restrain hiring, have been projected to increase from 5,769 Equivalent Full Time (EFTs) in 2004 to 6,669 EFTs, an increase of 900 EFT's (over 15%).

The increase in staffing levels and related labour costs was attributed by MH to be largely due to increased work requirements, with the largest additions to staffing levels taking place in three of its operating divisions: Power Supply (an increase of 498 EFT), Transmission & Distribution (an increase of 151 EFT), and Customer Service & Distribution (an increase of 146 EFT).

MH indicated that a large percentage of those recently hired were engaged to work on current and planned capital projects.

3.3.4 International Financial Reporting Standards (IFRS) Transition

Canadian accounting standards for financial accounting and reporting by publicly accountable private businesses and government business entities (the latter includes MH) are established by the Accounting Standards Board (of Canada, AcSB). AcSB's decisions represent Generally Accepted Accounting Principles (GAAP) in Canada. The International Accounting Standards Board (IASB) – which assumed the responsibilities, in 2001, of the previous International Accounting Standards Committee - establishes accounting standards meant for universal global adoption.

Standards adopted by IASB are denoted as International Financial Reporting Standards (IFRS), and AcSB has adopted IFRS as the new GAAP for Canadian enterprises, and is transitioning to that end.

The opinions of auditors of publicly accountable enterprises on the financial statements of those enterprises are based on compliance with GAAP, and those opinions, and the associated financial statements, are carefully considered not only by the general readership of such statements, but also investors in, lenders to (also the credit rating agencies relied upon by lenders) and regulators of those enterprises.

While the general accounting principles of what was Canadian GAAP are similar to those of IFRS, there are differences, and those differences, as IFRS has prevailed, have already affected and, particularly in the case of rate regulated utilities, will continue to affect financial reporting in Canada. IFRS provides a principle-based approach that values substance over form, relies more on fair (market) value, and seeks to achieve enhanced transparency. "Fair value" accounting, as compared to previous GAAP, has and will require adjustments to enterprise balance sheets and income statements.

IFRS was adopted as Canadian GAAP effective January 1, 2011. However, Canadian utilities were granted an optional one year deferment of implementing of IFRS, this to allow for an orderly transition from current Canadian GAAP accounting standards that recognize "rate regulated" assets and liabilities to those that do not.

Rate regulated assets represent expenditures currently allowed under Canadian GAAP to be capitalized or deferred, and not recorded as period expenses (for later amortization, over periods of time extending as much as 60 years), but which will be required to be recorded as period expenses under IFRS for fiscal years commencing on or after January 1, 2012.

MH has advised that it will be required to prepare IFRS compliant financial statements for its fiscal 2012/13 year, with comparative financial information for 2011/12.

MH has advised that its pending implementation of IFRS has prompted it to delay undertaking certain long outstanding Board-requested studies, including: a) an Independent Benchmarking Study of Key Performance Metrics, to compare MH's operational costs against those of other utilities; and, b) an Asset Condition Assessment Report, to assess the present condition of MH's assets and provide for possible future action such as asset upgrades and/or replacements.

These studies, which remain outstanding, were ordered to be developed and filed with the Board by way of Directives 4 and 7, respectively, of Order 150/08.

Pursuant to IFRS, and as previously indicated, MH reported that it may be required to write-off "rate regulated" assets, and that doing so would be expected to reduce its retained earnings by over $300 million (which would negatively affect MH's present and future debt to equity ratio).

MH has indicated that it will propose to the Board an approach that would allow for the continuation of "rate regulated" assets for rate setting purposes, although no details of such an approach has been provided. The Board would have to accept amendments to MH's audited accounts for rate setting purposes (i.e. "two sets of books"), if it were to agree to the approach being considered by MH.

A further discussion of IFRS and related accounting matters will be provided in the subsequent Order of the Board.

3.4 Power Resource Planning

The Wuskwatim Clean Environment Commission (CEC) hearing of 2003 (two members of the Public Utilities Board sat on that panel with members of the Commission) reviewed MH's then-plans to construct Wuskwatim Generating Station and related Transmission (at a cost then projected to be of approximately $900 million. CEC is an advisory body, not a quasi judicial administrative tribunal such as the Public Utilities Board.

While the CEC's review considered MH's Wuskwatim proposal, then based on an expected cost of $900 million, as being advanced for export sales and not domestic purposes, the latest estimate is $1.6 billion, approximately 75% higher, while MH first adjusted its view of the project, suggesting that it was required for domestic load requirements; it has reverted to its initial expectation that Wuskwatim will be employed for export sales.

Projects advanced for export purposes are expected to produce annual profits representing an acceptable rate of return on investment, whereas projects required for domestic load do not. With Wuskwatim now expected to be in-service in fiscal 2011/12, its generation understood to be sold, at least until new export sales contracts "kick-in", at spot or opportunity export sales prices, which, currently, are only one-third of Wuskwatim's expected per unit in-service costs.

The experience of Wuskwatim suggests that MH's planning for future investments in generation and transmission require significant testing ahead of approval, yet MH has put forward a very limited range of development scenarios with respect to meeting future domestic load growth.

Since 2004/05, MH's Power Resource plans have contemplated new major generation to meet projected future increases in domestic load requirements. The following table provides a snapshot of the progression of MH's expectations with respect to "dependable" hydraulic generation output:

Table 4

Dependable Hydraulic Growth

POWER RESOURCE PLAN YEAR	POST-WUSKWATIM DEPENDABLE HYDRO GWh	RECOMMENDED POWER RESOURCE PLAN GENERATION GWh/Additions	ALTERNATIVE POWER RESOURCE PLAN ADDITIONAL GWh/Additions
2004/05	22,500	26,900 – Conawapa (2024/25)	25,400 – Keeyask (2024/25)
2008/09	22,500	25,400 – Keeyask (2018/19) 29,800 – Conawapa (2022/23)	28,900 – 400 MW CCCT (2018/19) 30,400 – Conawapa (2020/21)
2009/10	22,500	25,400 – Keeyask (2018/19) 29,800 – Conawapa (2022/23)	26,900 – Conawapa (2021/22) 30,400 – 40 MW CCCT (2023/24)
2011 Outlook	22,500	25,400 – Keeyask (2020/21) 29,800 – Conawapa (2023/24)	Not Identified

For MH's recommended major development plan (the construction of Wuskwatim, nearing completion, plus Keeyask and Conawapa Generation Stations and Bipole III), the Corporation's dependable hydraulic power resources can be compared to domestic load requirements (and hydraulic shortfalls) as follows:

Table 5

Power Resources, Domestic Load and Dependable Hydraulic Shortfalls

Forecast Year	Projected 2020/21 Domestic Load (GWh)	Shortfalls (GWh)	2025/26 Projected Domestic Load (GWh)	Hydraulic Shortfalls[1] (GWh)
2004/05 Forecast	26,600	4,100	27,900	1,000
2008/09 Forecast	29,700	4,600	31,200	1,400
2009/10 Forecast	28,800	3,400	30,600	800
2011 Outlook	27,000	4,500 Pre-Keeyask 1,600 Post-Keeyask	28,900	900

It should be noted that each of these forecasts rely on about 4,000 GWh/year of non-hydraulic dependable resources in MH's fiscal year 2020/21. However, in MH's Outlook IFF 10-2 that level of shortfall of dependable hydraulic energy requirement is, pre-Keeyask, the same as it was in MH's 2004/05 forecast.

MH's preferred Power Resource Plan remains essentially unchanged since 2008/09, a time when domestic load forecasts were about 2,500 GWh/year higher than MH's most recent forecasts. In the absence of the recently announced additional export sales to Minnesota Power, Wisconsin Public Service and Northern States Power, it would appear MH could defer Keeyask G.S. (G.S., generation station) by about six years, rather than the one year deferral modelled in MH's IFF 10-2.

During the proceeding, MH modelled only two alternatives: a) build (MH's preferred approach - the construction of Wuskwatim, Keeyask, Conawapa and Bipole III, a plan that requires new export contract commitments); and, b) "no build", i.e. the development of Wuskwatim, Conawapa and Bipole III, to service domestic load when required and sell excess generation through opportunity export sales).

MH's witness, ICF, provided an estimated present value of MH's preferred approach which indicated that the approach, compared to the "no build" scenario (which omits Keeyask), the only other scenario seriously modelled by MH, could be expected to be moderately beneficial for domestic customers.

However, that estimate was made prior to ICF's awareness of the recent increases to MH's capital cost projections and the steep "fall off" of average export prices. As well, there has been a substantial "run-up" of the Canadian dollar (export sales to American counterparties are prices in USD), and a change in the outlook for carbon pricing has occurred. MH has reported that in its new export contracts with American counterparties, all "environmental" attributes or benefits associated with "clean" power is to go to the counterparties, and not to MH.

When ICF was cross-examined at the hearing, the witness acknowledged that the now expected $3.5 billion increase in the capital cost of MH's development scenario invalidated the consultant's earlier estimate.

MH also advised that it had, earlier, considered an alternative approach beyond that of the "no build" option, one relying on the construction and use of Combined Cycle Combustion Turbine (CCCT) thermal generation (refer to MH's 2008/09 and 2009/10 Alternative Development Sequences), MH did not, in the end, consider employing CCCT generation as a means to defer new hydro generation, and possibly transmission, as is now proposed for in its capital development plan.

The deferral of new hydro-electric generation in favour of the diversification of supply through the construction of CCCT generation would represent an approach that may not require additional firm export contracts.

MH asserted that Keeyask G.S. cannot proceed without Bipole III being in place. While the primary rationale for Bipole III has been to enhance reliability, MH asserts Bipole III is also required if Keeyask or Keeyask and Conawapa are to be built.

While there is no doubt Bipole III is required to transmit Conawapa generation, based on the capacity of the current system, existing Bipole I and II transmission appear capable of handling perhaps 80% of the maximum capacity of Keeyask/Kettle/Long Spruce/Limestone Generating Stations. This approach would have been adequate to transmit the entire output of those generating stations in 29 of the last 30 years, and without Bipole III.

Further discussion and analysis of these matters not only follow later in this Order but will also occur in the subsequent Order, and, presumably, would be one of the matters to be considered in a NFAAT proceeding.

3.5 Capital Expenditures

MH's capital estimates for major generation and transmission projects have been subject to significant periodic and dramatic upward cost adjustments.

In total, the estimated cost of MH's planned major generation and transmission expenditures has risen from $16 billion (from MH's CEF-08) to $20.5 billion (March 2011's CEF), and, more recently, to at least $23 billion (this estimate includes $1.9 billion now apparently required to upgrade Point du Bois, circa 2031).

As the volume of additional power that would be generated from Wuskwatim, Keeyask and Conawapa exceeds expected domestic requirements for decades, MH's "business plan", or strategy, seeks to sell the generated power that is expected to be in excess of domestic requirements to export customers, those primarily being American utilities. In fact, MH expects to obtain approximately 40% of its foreseeable future total electricity revenues from the export market.

In short, export sales would not be a “by product” of MH generation directed to fulfill domestic needs, but a significant market component in itself, one undertaken with the “hope” that domestic ratepayers would not be negatively impacted. To accomplish such a high level of overall revenue coming from export sales, MH plans to advance, well ahead of projected Manitoba demand, new major generation and transmission projects.

MH’s recommended and preferred development plan was first outlined in its 2008/09 Power Resource Plan, and, as well, in MH’s CEF-08. The focus of the plan is the construction of three major projects – Keeyask, Conawapa and Bipole III. The purpose for Wuskwatim, originally conceived as a generation source for export sales, was revised by MH in this proceeding as being required for domestic purposes, although domestic load is not expected to require additional generation until 2019.

Generation and transmission to meet domestic requirements are not subject to an economic evaluation, whereas plants constructed for export purposes do. The increase in the capital cost of Wuskwatim (which was first forecast at $900 million and is now forecast at $1.6 billion), in conjunction with the currently low average export sales prices and reduced domestic load growth, is unlikely to allow for a positive “economic” evaluation at this time.

The Board acknowledges that events post-2008, which have “dimmed” future immediate year net income prospects for the generation to flow from Wuskwatim, could not have been anticipated at the time of the CEC hearing.

Since MH's 2008/09 Power Resource Plan, the estimated construction costs for the three major projects have been adjusted upward, as follows:

Table 6

Major Generation and Transmission Projects Capital Cost ($billions)

	CEF-08	CEF-09	MAR/2011 CEF	LATEST
Bipole III	$ 2.25	$ 2.25	$ 2.25	$ 3.20 to $4.1 [1]
Keeyask G.S.	$ 3.70	$ 4.59	$ 5.64	$ 5.64
Conawapa G.S.	$ 4.98	$ 6.33	$ 7.77	$ 7.77
TOTAL	$10.93	$13.17	$15.66	$16.61 to $17.5

[1] The higher estimate has not been endorsed by MH.

3.5.1 Keeyask & Conawapa

Keeyask G.S.

In MH's 2004/05 Power Resource Plan, MH's cost estimate for Keeyask G.S. was $1.7 billion. This has subsequently been increased as follows:

CEF-08	$3.70 B	
CEF-09	$4.59 B	(25% increase)
CEF-10	$5.64 B	(18% increase, accumulated increase 52.4%))

MH cited material supply and labour shortages (which MH claimed resulted in "sticker shock") as the primary cause of cost forecast escalation when it submitted CEF-09; no specific cause was identified for the most recent increase.

Conawapa G.S.

When (circa 1990) MH looked to building Conawapa G.S. (then in order to service an expected Ontario export sale), the estimated construction cost was $3.8 billion for the Generating Station - this similar to the estimated cost of $4.0 billion reflected in CEF-04 for the project.

MH's CEF-05 and CEF-06 reported escalations in the projected cost of Conawapa, first to $4.5 billion and then to $5.0 billion. MH did not further increase its cost estimate for Conawapa in either its CEF-07 or CEF-08 reports. However, MH's CEF-09 indicated a further 25% increase in the estimated cost for Conawapa, to $6.3 billion, and, with MH's CEF-10, the cost estimate was increased by a further 25% to $7.8 billion (73% over the CEF-05 and CEF-06 estimates).

MH has not provided any specific details to support these large increases.

3.5.2 Bipole III

Bipole III, then with an "east side" of the Province alignment, was proposed initially in 1990 to accommodate a then-expected 1,000 MW sale to Ontario, at a cost of $1.7 billion for the transmission line and converters. The building of this line, as well as Conawapa G.S., was cancelled when the Government of Ontario repudiated its power purchase agreement with MH (Ontario compensated MH for most of the costs expended by MH on the project, MH advised that a "relatively" low charge against retained earnings took place).

With the vast majority of Manitoba's population being in southern Manitoba and with the majority of MH's power generation located in northern Manitoba, the reliability of MH's transmission from the north is of the highest importance. In October 1996, a severe wind event destroyed towers on both Bipoles I and II, and the event, understandably, changed MH's view of the adequacy of Bipole I and II's reliability. Subsequently, MH has planned on constructing additional transmission to reduce the risk of "brown-outs" in southern Manitoba (a distinct possibility given an event such as 1996's wind storm).

In both MH's CEF-03 and CEF-04 forecasts, MH proposed building additional HVDC transmission on the east side of Lake Winnipeg. The new transmission was intended to address reliability concerns (the evident risk of a failure of either Bipole I or II, or both), and was also expected to reduce HVDC line losses. However, at that time, the proposed HVDC project cost was estimated to be only $350 to $400 million.

MH's CEF-05 and CEF-06 forecasts both included a $1.88 billion cost estimate for an east side of Lake Winnipeg routing, now including converting resources, while MH's CEF-07 increased the projected costs of Bipole III to reflect a western route, preferred by the Province. The cost estimate then rose to $2.248 billion, the additional cost reflecting the longer distance inherent with a "western" rather the "eastern" routing.

The switching to a western route from the initial plan for an eastern route came about as the result of concerns related to environmental matters, and general public, First Nation and American acceptability of an east side alignment for Bipole III. (The potential for another HVDC line through the Interlake, paralleling Bipole I and II, was rejected, being viewed as compounding existing risks).

The Board's understanding is that a reliability concern with respect to a substantial outage of Bipole I and II similar to the 1996 event could be met by several means. Two of these (applied to a forecast 2018/19 situation) being:

1. An outage of Bipole I and II up to 2018/19 (one that occurred during the summer peak season) could, it appears, be adequately served by the addition of 600 MW (plus reserve capacity) of CCCT thermal generation, or, alternatively by the in-service of Bipole III. Such an outage could be triggered by any of forest fires, wind storms and/or right of way flooding during the summer. Outage impacts are anticipated to be less in the spring and fall.

2. An outage of Bipole I and II (up to 2018/19) that occurring during the winter peak season could be met by the addition of 1,800 MW (plus reserve capacity) of CCCT thermal generation, or by Bipole III. Such an outage could result from winter blizzards and/or extreme cold temperatures. Ice storms are also a possibility, but less likely in mid-winter.

It seems that an outage shortfall would more probably be in the 800 to 1,500 MW range, which could be met either by new CCCT generation or Bipole III. (The Board understands that employing CCCT generation to meet the shortfall would disqualify the output from being certified as "green power" by Minnesota and Wisconsin.)

Failure of the existing Bipole (Bipole I and II) presents the greatest risk to Manitobans in the winter when domestic demand is generally at its highest. Peak winter domestic demands in 2018/19 are estimated in the order of 5000 MW. Loss of the existing Bipole would then require that domestic loads be served by AC connections (that are not dependant on the Bipole), existing thermal resources and emergency imports. Manitoba Hydro has approximately 1600 MW of hydro generation capacity not connected to Bipole, 370 MW of thermal resources and an emergency import capability of approximately 1500 MW. Therefore, to completely meet Manitoba's peak domestic loads in the winter, if Bipole III were not available Manitoba would need a gas plant having a capacity of approximately 1500 MW. This represents a worse-case scenario should a

Bipole failure coincide at the moment in time of the peak winter demand. In the summer, the situation is not as difficult as peak domestic summer demands are in the order of 3900 MW. In the absence of Bipole III failure of the Bipole lines in the summer would require a gas plant in the order of 400-500 MW.

A Question of Credibility and Process

While MH did not revise its new Bipole III (with converting station costs) estimate of $2.248 billion in either its CEF-08, CEF-09 or CEF-10 forecasts, even though MH then-raised its capital cost estimates for both Keeyask G.S. (by $0.9 billion) and Conawapa G.S. (by $1.3 billion), MH did cite 'sticker shock' as one of the reasons for the 25% jump in the estimated costs of the generating stations.

Subsequently, a September 2009 capital cost estimate for Bipole III surfaced in the fourth quarter of MH's 2010/11 fiscal year, suggesting that the projected cost had increased to $3.9 billion. This Capital Project Justification Addendum (CPJ, a form employed by MH to record and, potentially, "approve" project cost estimates) was rejected by MH's senior management, although it was signed on September 10, 2009 by two MH division vice-presidents. MH advised that while the estimate was discussed by senior management it was not brought forward to MH's Board of Directors.

Ahead of that discovery, the matter of the cost estimate for Bipole III was reviewed by Board Counsel in discussion with Mr. Warden, MH's Senior Vice-President and Chief Financial Officer. What follows are excerpts from the record of the hearing:

MH Senior Vice-President and Chief Financial Officer testified that an internal process exists with respect to changing construction cost estimates. Apparently, the division or divisions with responsibility for the proposed project "bring forward proposals for approval of (MH's) executive committee which, if approved, gets incorporated in the integrated financial forecast (IFF) …" and that "… in the case of Bipole 3, there was no revision approved".

So, from the time when CEF-07 was developed, and although four years had passed, during which the cost forecasts for Wuskwatim, Keeyask and Conawapa had substantially increased, MH "stayed with" with its forecast of $2.248 billion for Bipole III.

With respect to the CPJ signed by two MH vice-presidents which projected Bipole III at $3.9 billion, MH's Senior Vice-President and Chief Financial Officer initially testified, in response to a question from Board Counsel ("… with respect to Bipole 3, did the line divisions bring up changes in the capital forecast cost for Bipole 3 through the internal channels up to its vice-president?"), his response was "I don't know whether it made its way to the vice-president or not. It never made its way to executive committee though".

Following a follow-up question by Board Counsel: "Does the Board understand your previous evidence to be that the document (the CPJ that identified a forecast cost of $3.9 billion for Bipole 3, signed by two vice-presidents)) … never made its way to Manitoba Hydro's executive committee?", and, Mr. Warden testified "Yes, that's right", and, subsequently, "… it's the first time I've seen this document, it's never, been presented to the executive committee … it has no signatures. It's not signed by the … vice-president of transmission and power supply … until those signatures are affixed, this document is just a preliminary estimate which is subject to change…".

And, in response to Board Counsel's follow-up question "… you're suggesting that Hydro was not aware that on August 18th (2009) that … Hydro's transmission planning and design division was recommending a revision to the capital expenditure budget for

Bipole 3?", Mr. Warden responded "...it's the first time I've seen this document, it's never been presented to the executive committee, you'll note … it has no signatures … it's not signed by the vice-president of transmission and power supply … until those signatures are affixed, this document is just a preliminary estimate which is subject to changes".

Board Counsel then asked two more questions of Mr. Warden with respect to the above references CPJ: "… you're saying that until I showed (the CPJ, an unsigned version) to you this morning, you've never seen the document before?", and "… (would you) have expected to see this document in your capacity as a member of the executive committee if it had come up through the line divisions through the vice-presidents?".

And, Mr. Warden responded: "That's right", and "… I note that the division has not signed off. The process would be for the division to forward it to the respective vice-president to allow him the opportunity to challenge the document and – when he's satisfied – he or she, in this case he, but when he's satisfied with the document then it's brought forward for a review by the executive committee. That hasn't happened."

Board Counsel also asked Mr. Warden "What you're telling the Board … is that in 2007 and 2008 Manitoba Hydro saw no need to check to see whether the cost of Bipole 3 was escalating even though the costs for Conawapa and Keeyask were?" Mr. Warden responded "The process is to come up with an in-service cost for all projects and unless there's a reason to revise that estimate, there's no addendum (CPJ) brought forward. So it's not unusual to have a project that is estimated and unchanged" and "I'm telling you that we have an approved estimate of $2.2 billion for Bipole 3, and until it's officially revised that is the approved estimate … this is no different from any other capital estimate at MH in that respect. Until we have a number that we are satisfied with … a number that we can have confidence in we don't revise that number …".

Board Counsel concluded his cross-examination of Mr. Warden on this topic with the request "Mr. Warden, can you tell the Board whether (MH's) Audit Committee was provided a copy of the … revised Bipole (3) calculation?" Mr. Warden responded "No, they were not … the Audit Committee would not typical receive these documents … they receive a very consolidated summary of all capital expenditure forecasts for … the twenty year financial document".

Two days following this series of exchanges between Board Counsel and MH's Senior Vice-President and Chief Financial Officer, MH tabled the CPJ referenced above in the dialogue between Board Counsel and Mr. Warden. The CPJ was signed by two vice-presidents, as Mr. Warden then stated:

"Mr. Tymofichuk, the Vice-President of Transmission, did in fact sign this document on September 10th of 2009 … and the Vice-President of Power Supply signed the document on the very same day … the CPJ would have been forwarded to Finance and Administration (the division for which Mr. Warden is responsible) for the preparation of an (executive committee) recommendation, which was done and was, in fact, forwarded to my office… I did not recall having seen the document, however I would have … been aware of the amount at that point in time … I would have consulted with Mr. Brennan as to how we would deal with it… of course, we were both concerned about the increase … and, therefore, did not move forward."

Further, Mr. Warden reported: "I consulted again with Mr. Brennan just to make sure my memory and his memory was somewhat aligned, and following September of 2009, there would have been a lot of internal discussion about the amount of the capital cost estimate, or the revision to that estimate and it took approximately twelve months before we referred that to an outside consulting firm to resolve this issue for us, or at least to come up with an estimate that … we would have more comfort with”.

Thus, MH, accepting that estimated cost of Bipole III may be subject to a dramatic revision higher, in January 2011, MH sought an independent review of Bipole III costs by Rashwan (and Associates), the principal being a former MH employee.

While Rashwan & Associates reviewed the design concept and costs for the converter station and collector lines, the firm did not review the cost estimates for the HVDC transmission line. The firm concluded that MH could reduce Bipole III costs by eliminating a provision (included in the $3.9 billion estimate rejected by senior management) of a contingency reserve in case synchronous converters were required and, also, eliminate the escalation cost provisions usually employed by MH. Incorporating the changes suggested by the consultant, MH provided a revised CPJ with a $3.2 billion overall total costs for Bipole III, which was “accepted” by MH’s Board of Directors.

3.5.3 Project Economics

When prior to 2009, MH was negotiating with Northern States Power (NSP) on an extension of export sales contracts beyond MH’s fiscal year 2014/15, and with Minnesota Power (MP) and Wisconsin Public Service (WPS) for new sales contracts beyond 2020, the average value of new energy projected to be realized from MH’s planned new Keeyask G.S. was in the range of 6 to 7¢/kW.h. However, subsequent to negotiations that resulted in term sheets being entered into in 2007 and 2008, ahead of the global credit crisis and recession and the recognition of a substantial increase in the projected cost of Bipole III, the capital cost estimate for the construction of Keeyask increased (first by 25% as identified in CEF-10, and, later by another 18% in CEF-11, together representing an aggregate compounded increase of 50%).

Similarly, the expected average value of new energy arising from the planned construction and operation of Conawapa G.S. was in the range of 7¢/KWh in 2009. However, the estimated construction cost for the Conawapa generation station has since increased (by 25% in CEF-10 and by a further 25% in CEF-11, an aggregate increase of 56%).

Indications from publicly available documents from American regulatory hearings suggest that the term sheet negotiations carried out in 2007 and 2008 resulted in contract prices with NSP/WPS/MP that, at best, have not been increased in the NSP Agreement.

The evidence of the recent proceeding suggests that the subsequent and major project cost escalations for MH's preferred development plan will not be "covered" (met) by increases in export revenues. In short, it would appear that any profitability that may have appeared present with respect to these sales when the initial term sheets were entered into in 2007 and 2008, before the global recession and lower natural gas prices and industrial load, shale deposits, have been, at minimun, significantly reduced if not totally offset as the result of the capital cost increases (which were also not projected at the time of the signing of the term sheets).

3.5.4 Development Partnership Agreements

Manitoba Hydro has entered into agreements with First Nations with respect to the almost completed Wuskwatim Generation Station and the planned Keeyask Generation Station. The agreements provided the First Nations with the opportunity to participate in the equity ownership of the new generating stations, and represented a “new way” of approaching developments on lands occupied by First Nations, a way which involved negotiations ahead of construction, a way that allowed for First Nation approval and cooperation.

In both cases, taking into account the increases in construction costs from the original estimates, Wuskwatim – which is expected to be in operation in this fiscal year - and Keeyask, which is planned, are expected to produce power at or about 10¢/kWh.

According to MH’s projected initial “Operating Statement”, which was prepared by MH from the perspective of the partnership rather than MH’s overall operation, Wuskwatim’s probable initial years’ revenue stream will be based on opportunity export prices.

MH’s projected initial “Operating Statement” for the partnership, as reflected in IFF 09-1, projects revenues based on average opportunity export sales prices of about 7¢/KWh. Unfortunately, the export sale estimate is significantly higher than the current average MH is receiving for export opportunity sales to American counterparties, which appear to have been in the range of 2 to 3¢/kWh (2009/10 and 2010/11).

Accordingly, in the case of Wuskwatim and, if the Keeyask project is undertaken and completed, Keeyask’s, revenue stream as well, at least initially, if based on current opportunity export prices or, in the case of Keeyask, an average of firm and opportunity export sales prices, may prove insufficient to fully meet costs.

Also, from the evidence available, it appears the allocation of expenditures to be incurred by MH favour the new partnerships, resulting in an even lower overall "economic" value of the new generation stations to MH overall (details discussed below under Board Findings).

3.6 Finance Expense

Finance expenses, as reported in MH's audited accounts, were $401 million in 2009, representing over 29% of total operating expenses, and were forecast (MH's IFF 09-1) to be $417 million in fiscal 2009/10. Actual finance expenses decreased to $373 million in fiscal 2009/10.

For the fiscal years 2007/08 through to and including 2009/10, actual finance expenses were approximately $76 million lower than that forecast in IFF 07-1, this the result of declining and relatively low interest rates during the period (largely the result of the global credit crisis and recession, and the slow recovery from the event), the rates particularly low for short term debt. MH forecast its overall finance expense at $413 million for fiscal 2010/11 and to increase to $468 million for fiscal 2011/12, representing approximately 25% of its annual operating expense.

The variation between actual and forecast is attributable to two factors, a growth in debt levels, more than offset by lower interest rates.

As it does with respect to certain OM&A expenses, MH capitalizes interest on all capital projects during construction, and only begins to record the costs as expenses once the project is complete and in service.

MH's finance expense for electric operation before capitalized interest is forecast to be \$509 million for fiscal 2009/10, \$417 million on a net basis after adjusting for capitalized interest of \$92 million. MH forecasts net finance expense of \$413 million in fiscal 2010/11 and \$468 million in fiscal 2011/12, after capitalizing \$131 million and \$137 million, respectively.

As the major new generation and transmission projects commence construction, MH expects to capitalize a greater proportion of its finance costs, with \$449 million or 43% of net interest expense being capitalized in its 2017/18 fiscal year.

MH's gross finance expense is forecasted to grow from \$605 million in fiscal 2011/12 to \$1,104 million by fiscal 2018/19; or, \$674 million on a net basis after adjusting for capitalized interest of \$430 million. Finance expense and capitalized interest for fiscal years 2009/10 through to fiscal 2018/19 are as follows:

Table 7

Finance Interest & Capitalized Interest

Finance Expense ($ millions)	IFF MH09-1									
For the years ended March 28/29	**2010**	**2011**	**2012**	**2013**	**2014**	**2015**	**2016**	**2017**	**2018**	**2019**
Gross Finance Expense	$509	$544	$605	$635	$671	$752	$835	$953	$1,036	$1,104
(Less) Capitalized Interest	(92)	(131)	(137)	(110)	(144)	(208)	(306)	(408)	(449)	(430)
Total Finance Expense	$417	$413	$468	$525	$527	$544	$529	$545	$587	$674
% Capitalized	18%	24%	23%	17%	21%	28%	37%	43%	43%	39%

Based on MH's IFF 09-1, by its fiscal year 2028/29, MH forecasts to have capitalized, in aggregate, over $4.8 billion in interest costs to the in-service dates of the planned two new generation stations. When considering the estimated cost of MH's capital expenditure plans, it is important to consider financing costs, which are a significant element in capital intensive operations such as hydro-electric based utilities.

IFF 10-1 Update

MH provided a partially updated IFF MH 10-2 during the hearing, which reflects recently adopted increases in the capital costs of the Major Generation and Transmission projects in the order of $3.6 billion. In total, MH now projects an increase in its long-term debt from current levels by over $15 billion, to $23 billion, by 2029 ($5.3 billion higher than that forecast in IFF 09-1).

Given updated capital costs, capitalized finance expense will exceed $5 billion by 2029 (capitalized finance expense would be amortized over the expected service life of the assets).

Based on IFF 10-2, MH's forecast for finance expense was updated from $413 million to $393 million for fiscal 2010/11 and from $468 million to $411 million for fiscal 2011/12. The updated forecast reflects expected reduced interest rates in the near term, as rates have remained relatively low due to the slowness of the North American economic recovery. Finance expense is forecast to grow from an annual $411 million to over $1.5 billion by fiscal 2025/26, when the last of MH's planned major new Generation and Transmission projects, Conawapa, is expected to be in-service.

Based on the updated cost estimates in IFF 10-2, MH's debt is forecasted to grow from $8.7 billion as of March 31, 2011 to $22.9 billion as of March 31, 2030, an increase of $14.2 billion. The debt to equity ratio for 2029 has also changed, and, as indicated previously, MH now forecasts that implementation of its development plan (which includes the construction of new generation and transmission assets, from the 51:49 ratio projected in MH's IFF 09 forecast to 72:28 in its partially updated IFF–10 forecast, representing a material financial change from one forecast to the next. (The latest forecast includes the assumption of a series of 3.5% annual rate increases for a decade, to be followed by annual 2% rate increases.)

In MH's current forecast, the overall finance interest rate is projected to increase to 6.6% (excluding the 1% Provincial Debt Guarantee Fee) by fiscal 2016/17, and from then projected to remain constant at that rate through fiscal 2029/30. MH has not forecast any increase in long term interest rates beyond 2029/30.

4.0 Risk

4.1 Financial Forecasts

MH's initial Application, as indicated based on MH's IFF 09-1 forecast, is supported in part by 2008 export pricing forecasts, now at question, and capital expenditure estimates for Bipole III/Keeyask G.S./Conawapa G.S. totalling $13.1billion (CEF-09), those since updated to a current construction cost projection of $16.6 billion (IFF 10-2).

There has been a major increase in expected capital costs, which will be exacerbated by finance costs on the additional debt. Finance costs over the full term of the debt, can be expected to exceed the initial construction cost by a wide margin by the time the debt is fully repaid. MH's net export revenue assumptions have, essentially, remained unchanged from its IFF 09-1 forecast, this notwithstanding a 30-40% reduction in natural gas price forecasts that has developed since IFF 09-1 and MH's plans were established (reduced natural gas prices are a primary driver of lower spot prices on in the American electricity market, MISO, that MH operates in).

The now-forecast decrease in natural gas forecasts, which, if realized, would reduce CCCT natural gas generation costs by, say 25%, and affect, lower, at least spot and opportunity export sales prices, are not reflected in the financial forecasts placed by MH before the Board.

Again, the implication of the major reduction in actual and projected natural gas and spot and opportunity electricity prices in the MISO market is the suggestion of a significant pending drop from MH's currently forecast net export revenues. MH plans for firm export volumes to represent no more than 50% of overall export volumes, the other 50% to be represented by opportunity export sales - much of that at off-peak hours where pricing has been as low as 0.5 kWh over the last year and more.

While net income reduction scenarios are intended to illustrate the sensitivity of net income to changes in export and import pricing assumptions, MH declined to test, as requested by the Board, its export revenue forecast against assumptions of low opportunity export sales prices (related in part to lower natural gas prices, the current lack of indication of a price being placed on carbon and reduced industrial demand in the United States), both in response to Information Requests/Pre-Asked Questions from the Board or in MH's latest (IFF 10-2) financial forecasts (and despite ICF, a MH's expert witness, testimony on natural gas price decline and recent trends in the export market sales).

While MH's financial position as reflected in the partially updated IFF 10 reflects a marked decline from MH's projections of IFF 09-1 (covering a 20 year period), due to increased costs of Keeyask G.S., Conawapa G.S. and Bipole III, MH's current projection of its future financial position does not include the potential for lower overall export revenues.

As it is, MH's net income and retained earnings forecast as of fiscal 2028/29 – while subject to question and likely further adjustments, has changed, as follows:

Table 8
Changes in Net Income, Retained Earnings & Long Term Debt

	Net Income	**Retained Earnings**	**Long Term Debt**
IFF 09-1	$1,224M	$11.0B	$17.7B
IFF 10	$ 906M	$ 9.2B	$21.2B
OL 10-2	$ 741M	$ 7.7B	$23.0B

The changes that have been made by MH reflects revised and increased capital costs of over $2.3 billion for Keeyask G.S. and Conawapa G.S. (reflected in IFF 10-1) and an additional $0.9 billion increase in the capital cost of Bipole III (reflected in IFF 10-2). On a cumulative basis, the "accepted" increase in the capital cost of MH's capital expenditure plans amount to $3.5 billion and results in a $3.3 billion reduction in MH's IFF 10-2 projected retained earnings, and an increase in MH's projected long term debt of over $5.3 billion compared to IFF 09-1.

Again, the accepted "decline" in MH's forecast financial results does not take into account any implications that may be related to potential lower than forecast export prices.

4.2 Domestic Load Forecast

In MH's IFF 09-1, the Corporation identified a projected decline from its 2008 GRA forecast of domestic demand of about 800-1,000 GWh. in its 10-year forecast of total domestic base load. Subsequently, and taking into account the slow recovery of industry (in the United States in particular), the closure of a Manitoba pulp and paper plant and the announced future closure of a smelter and refinery in Thompson, it could be argued that MH's domestic load forecast should, or at least could, have been further reduced by 1,400-1,800 GWh./year.

As it is, MH's latest forecast suggests total domestic loads of 25,700 GWh. in fiscal 2015/16 (down 1,400 GWh from IFF 09-1), and 27,000 GWh. in fiscal 2025/26 (down 1,700 GWh from IFF 09-1).

Almost the entire projected decline in domestic load forecasts rests with the industrial sector (or "Top Consumers" category), for which MH has forecast loads being down by

1,300 GWh./year from MH's IFF 09-1 forecast for fiscal 2015/16 through fiscal 2025/26. The major pulp and paper plant closure and "Primary Metal" industrial "cutbacks" could account for about 600 GWh/per year of the above decline. That noted, relying on notices issued by existing industrial companies concerning operational closures could add another 500 GWh/year of industrial demand loss after fiscal 2014/15.

Overall, and based on the evidence of the proceeding, growth prospects for the industrial sector, which currently account for about 1/3rd of annual domestic demand, appear to be very limited. MH testified that it was unaware of any new industrial customer planning to come on line over the current projection period, i.e. to fiscal 2028/29, not to say that either a new large industrial operation could choose to locate in Manitoba or an existing industrial concern expand.

Overall, MH's IFF 10 forecast does not forecast any reduction in total domestic revenue from the projections of IFF 09-1; MH's assumption being that load growth from residential or other classes will "make up" load losses as a result of industrial slow-downs or cut-backs. (The Board notes the potential that may lie with "electric" cars, though there are technological and economic issues to resolve (battery and "cold weather" among them).

MISO Market Impacts

MH's current actual export revenues (since the onset of the economic downturn in the fall of 2008 and the advent of enhanced forecasts of shale gas production and natural gas price declines) have reflected steep opportunity export price declines, from in excess of a 5¢/kWh range, that of the pre-economic slowdown period, to the 2 to 3¢/kWh. range.

Despite high river flows and excellent hydraulic generation potential, MH's overall export revenues remain depressed (due to not only low prices but also less volume that had been anticipated).

Going forward, export prices, taking into account low opportunity sales prices, may remain lower, perhaps considerably lower, than what is currently forecast by MH. The advent of commercially extractable shale gas and the absence in the near term and delay in the evolution of CO_2 emission pricing is reflected in ICF's revised long-term natural prices being 30% to 40% lower than the firm forecast in 2008.

Because MH exports "compete" with CCCT natural gas generation in the peak and shoulder period, and MH's exports "compete" with incremental coal and wind generation in off-peak periods, the lower natural gas prices could, hypothetically, result in a substantial reduction from what MH currently forecasts as its expected future net export revenues.

With MH declining to provide additional lower export price scenarios, for which MH was asked, the Board can only impute what domestic revenue requirements could be in the next 20 years. Shortfalls from expected net export revenue will be reflected in domestic rates, if MH's financial targets (particularly debt to equity) remain as is.

4.3 Export Revenue Pricing Assumptions

MH sales into the U.S. MISO Market over the last decade can be summarized as follows:

Table 9

MH's Exports into MISO & Canadian Markets (GW.h)

Year	Dependable	Opportunity	Total	CDN Sales[1]	Total
2000/01	4,895	4,511	9,406	3,047	12,153
2001/02	4,767	5,083	9,850	2,449	12,299
2002/03	4,947	2,713	7,660	2,075	9,735
2003/04	5,245	507	5,752	1,214	6,966
2004/05	5,683	3,218	8,851	1,680	10,431
2005/06	4,044	8,879	12,923	1,424	14,347
2006/07	3,654	5,877	9,531	373	9,904
2008/09	3,921	7,332	11,053	682	11,735
2009/10	4,087	6,071	10,158	418	10,576
2010/11	2,613	6,218	8,831	336	9,167

[1]Non-merchant sales from MH's own resources.

Typically, MH has purchased wind and thermally generated energy to support its hydraulic generation in the range of 1,500 to 3,000 GWh: drought period exceptions occurred in fiscal 2002/03, at 3,800 GWh, and in 2003/04, at 10,500 GWh.

With only the existing transmission tie-lines to rely upon, MH is generally limited to, assuming adequate water levels, about 7,000 GWh./yr of peak energy sales. Except for fiscal 2008/09, peak firm and opportunity sales over the last 10 years have accounted for 2/3^{rds} of MH's export; meaning the other 1/3rd of total export sales serve off-peak markets (in both MISO and Canada).

During that period, MH achieved average annual export prices of about 5¢/kWh. From 2004/05 to 2008/09 firm contract prices were 5 to 6¢/kWh, opportunity peak prices were 6.5 to 7.0¢/kWh, and opportunity off-peak export sales came at prices in the range of 2.5 to 3.5¢/KWh.

Unfortunately, this situation changed in 2009/10 after MH's IFF 09-1 had been filed. In IFF 09-1 and IFF 10 MH assumed average export revenue rates as follows:

Table 10

Forecasted Average Expert Revenue Rates

Fiscal Year	IFF 09-1	IFF 10
	(¢/kWh)	(¢/kWh)
2010/11	4.10	3.26
2014/15	7.41	6.63
2015/16	9.09	8.11
2019/20	10.56	10.84
2020/21	10.66	11.12
2021/22	10.94	11.13
2025/26	12.25	12.20
2026/27	12.64	12.58
2028/29	13.45	13.45

MH's IFF 09-1 forecast of export prices reflect the input (which occurred in or before 2008) of a panel of external consultants engaged by MH. ICF, one member of the panel, provided evidence in this proceeding that the natural gas prices employed by ICF's forecast in 2008 are 30-40% higher than ICF's current forecasts, and that, as a result, MH's previously forecast spot and opportunity electricity prices for the MISO market could be lower.

A comparison of MH's IFF assumptions to more current data as to Single Cycle Combustion Turbine (SCCT) thermal generation costs confirms that MH did not alter its export energy price forecasts in its IFF 10 projection from those of its IFF 09-1 forecast.

The chart which follows largely results from the expected change in natural gas prices and provides a comparison of four various export price scenarios, namely:

- Scenario #1 – MH's IFF 09-1 Export Revenue Prices
- Scenario #2 – MH's IFF 10 Export Revenue Prices
- Scenario #3 – 0.75 x MH's IFF 09-1 Export Prices
- Scenario #4 – PUB/MH Pre-Ask #4 Export Price Scenario

The first two scenarios are extracted from MH's filed export revenue price assumptions for IFF 09-1 and IFF 10. Scenario #3 at 75% of IFF 09-1 prices is intended to reflect the 35 to 40% reduction in ICF's natural gas price forecasts as of 2008 and 2010. Scenario #4 is drawn from PUB/MH – Pre-ask #4 (which MH declined to respond to).

The export revenue rates illustrated for the 20 years of forecast show very little change between IFF 09-1 and IFF 10, particularly from 2019/20 on-ward. As expected a 25% revenue rate reduction in Scenario #3 would see 8 to 10¢kWh export electricity prices after 2019/20 to 2029/30. This could be considered a conservative position, relative to Scenario #4 which at about 65% of IFF 09-1 prices is more pessimistic.

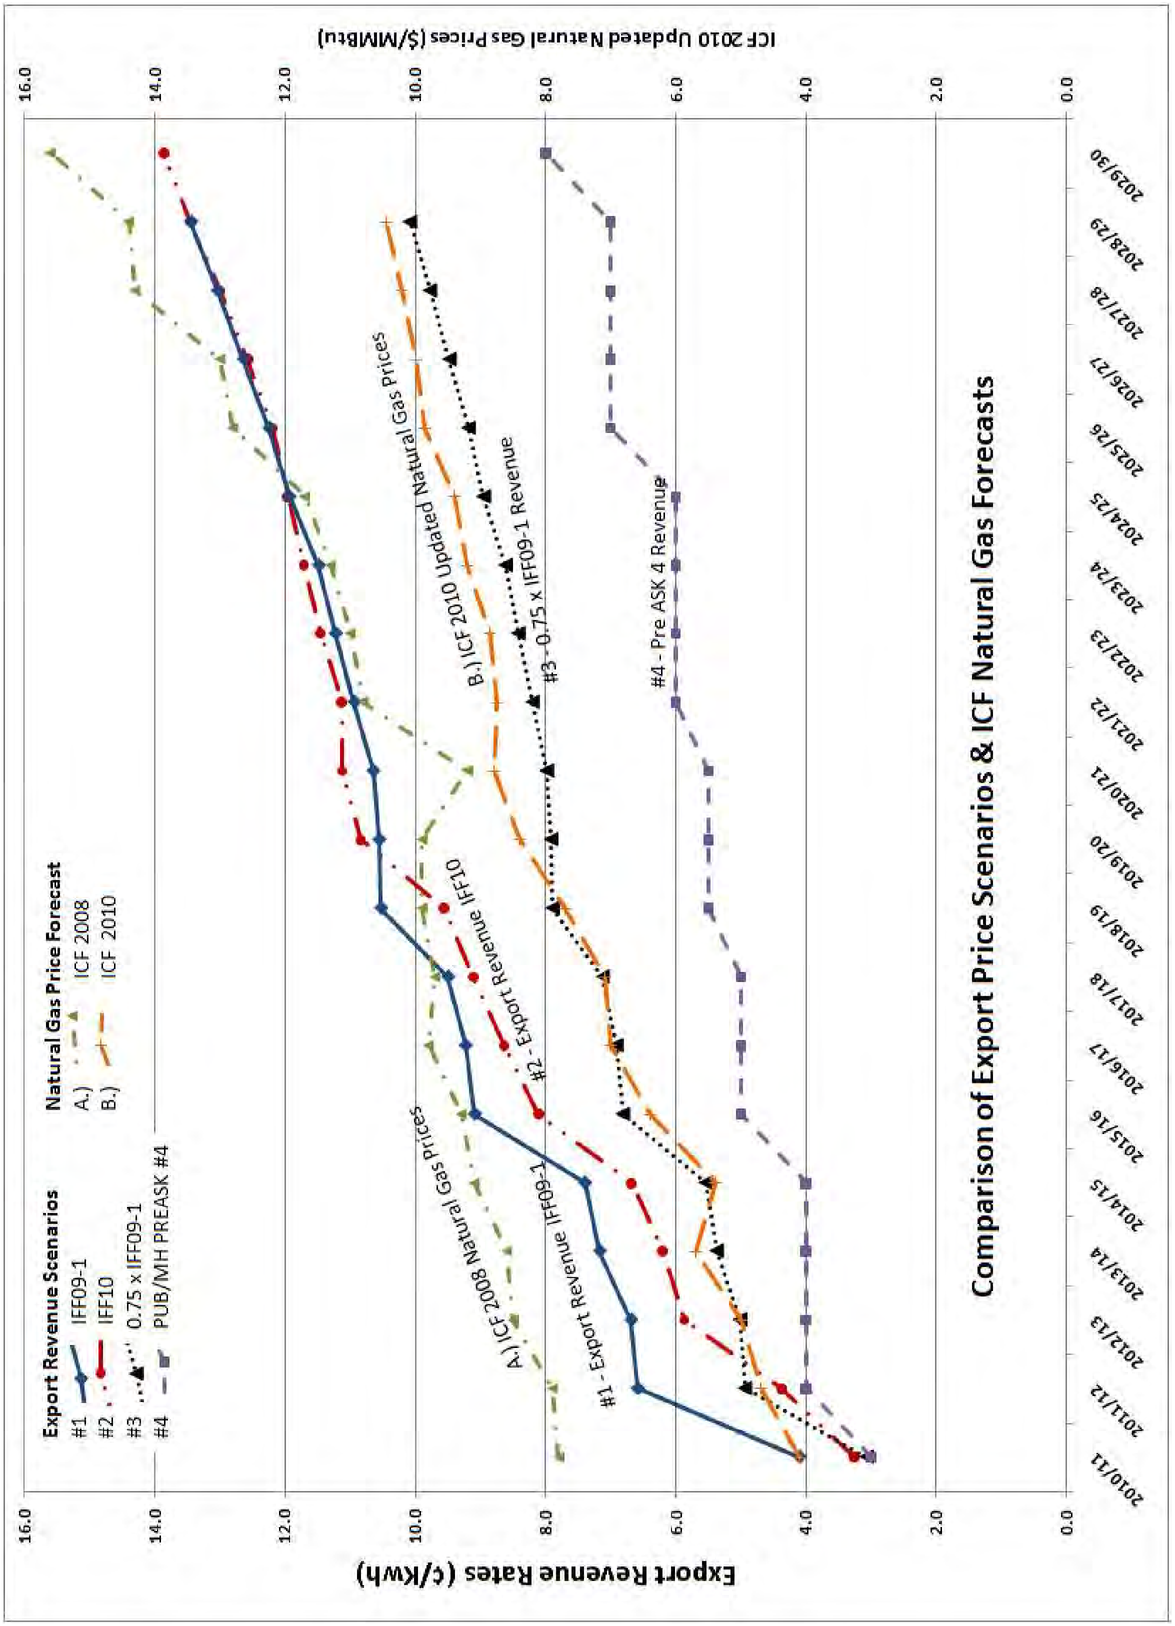
Also indicated as Scenarios A and B on the chart are the natural gas price forecast for 2008 and 2010 drawn from ICF presentations and subsequent exhibits.

ICF now expects natural gas prices to remain below $6/MMBtu until fiscal 2014/15, then remain below $8/MMBtu until 2018/19, and not achieve $10/MMBtu before 2026/27. (As a comparison, in the last decade natural gas prices have exceeded $10/MMBtu on at least two occasions – following hurricanes Katrina and Rita in 2005, natural gas prices soared to in excess of $15/MMBtu – these events precede the advent of shale gas production.)

In 2008, when MH developed its export price forecast for IFF 09-1, natural gas prices were upwards of $7/MMBtu, and were expected to progressively rise, achieving about $10/MMBtu (as CO_2 emissions factors kicked in circa 2015), and rising further to $15/MMBtu by 2028/29. CCCT thermal generation was then generally expected to dominate the peak period electricity generation market, and to a lesser extent compete for base load with coal generation. Other new energy resources for MISO, such as MH exports and northern states' wind farms would presumably be constrained price-wise by now expected lower CCCT operating costs.

Chart 1

Comparison of Export Price Scenarios & ICF Natural Gas Forecasts



According to the public record, MH expects to achieve on average at least 8.7¢/kWh for peak "firm" sales from its new export contracts, from 2015/16 onward. Even allowing for some escalation (MH advised of a formula within its new contracts that allow for price escalation related to a partial recognition of general inflation), this "expected" average price is at least 10% lower than MH's IFF 09-1 and IFF 10 assumptions for average export sales prices.

Intuitively this suggests that MH's spot and opportunity export sales (the average of peak and off-peak) may have to average about 1-2¢/kWh higher than the "firm" peak prices encapsulated in its contracts to meet the revenue forecasts made by MH. The historical record provides no evidence of such a past situation.

4.4 Export Contracts

4.4.1 Current Export Contracts

Currently, MH has firm long term obligations under Northern States Power (NSP) contract that extends from 2005-2015 and involves 500 MW. The contract requires MH to provide 500 MW to NSP or an annual supply of 2,100 GWh of "5x16" energy (five days a week, sixteen hours each day). The contract extends to 2015 with fixed pricing. Although this obligation could, theoretically and presumably, be reduced under drought conditions more severe than the worst case on record, the Board has not been in a position to review the contract.

Yet, according to NSP's public documents, as filed in the United States, MH has not, at least to the date of the filing of those documents, curtailed supply under this contract, and NSP has indicated to its regulator that it does not expect MH to ever curtail supply.

During the 2003/04 drought, MH continued to supply "firm" power to its American counterparties, despite the Board's understanding that the Corporation had the right to curtail supply in the event of a drought, but that it chose not to curtail to preserve the business arrangement and MH's reputation as a reliable supplier. In any case, if there was misunderstanding, that contention was corrected by MH in this proceeding, wherein MH indicated that the contract did not allow for the Corporation to curtail due to the drought, and that it had an obligation to supply that it could not set aside.

Additionally MH has entered into diversity agreements out to 2015 with NSP (and others) for about 350 MW of capacity. The arrangement, as reported, provides for a summer-winter exchange of capacity availability (variable energy as/when required to be supplied and billed at market prices). When MH imports power from the United States that power arises largely from thermal (coal primarily) generation, while MH exports hydro-electric power to the United States.

MH also annually enters into bilateral agreements with various parties in the MISO region to supply summer (5x16) firm energy. Typically these arrangements involve about 1,000 GWh./year of energy at prices that are annually adjusted.

As well, MH engages in day-ahead and real-time opportunity sales into the MISO market. These forays have, in above average flow years (since 2003/04), been in the 3,000 to 7,000 GWh/year range. Prices for such sales have dropped sharply since the fall of 2008, and now average about 3¢/KWh. (average includes both peak and off-peak sales).

4.4.2 Future Export Contracts

MH has recently announced that it has entered into new export contracts (subject to regulatory approval in both the United States and Canada and dependent on MH proceeding with its preferred capital development plan, pertaining to periods beyond 2015.

These include:

(i) Northern States Power (NSP)

NSP [2015 to 2025] - 375/325MW summer (5x16) winter (5x12) – fixed price/firm

- 350MW Diversity Exchange Agreement – market price based
- 125MW summer (5x16) winter (5x12) – fixed price/firm

(Defined energy obligation: 2100 GWh)

(ii) Minnesota Power (MP)

MP [2020 to 2035] - 250MW summer/winter (5x16) - fixed price/firm

- 250MW summer/winter weekend (2x16) - market price based

(Defined energy obligation: 1,400 GWh.)

(iii) Wisconsin Public Service (WPS)

WPS [2020 to 2035] – 100MW summer/winter (5x16) - fixed price/firm

- 100MW summer/winter weekend (2x16) – market price based

(Defined energy obligation: 600 GWh)

While individual contract specifics on pricing have been deemed confidential by MH, and have yet to be shared with the Board, ICF, an expert retained by MH, presented information at the proceeding suggesting MH's combined capacity and energy prices were in the range of about 8.7¢/kWh, on average, for firm (peak) energy.

When price escalation is factored in, the price suggested appears to represent about 90% of MH's IFF 09-1 export price assumptions. Consequently, if MH's forecast export prices for its IFF 09-1 are "reasonable", the required assumption appears to be that the average price of spot and opportunity export sales was expected to be higher than the contract values.

Without access to the unredacted contracts, it is not possible for the Board to either agree or disagree with either MH's views on pricing or that of its various consultants' on the adequacy of any curtailment or 'adverse water' clauses that may reside within the contracts.

However, and significantly, the evidence suggests that MH cannot reduce summer sales to its American counterparty under the 'adverse water' clause cited by MH at the proceeding. It is unclear at this time, and without present access to the contracts, as to what extent contract provisions mitigate against the likely or possible cost consequences associated with drought conditions.

From the evidence provided, MH's exports to NSP after 2015 come with environmental attributes included in the negotiated price – i.e. environmental attributes of power supplied by MH to its American counterparties are to be attributed to the American counterparties (the exact conditions of the Clean Energy Clause were redacted from the information placed on the record of the hearing).

What does appear clear is that there are no defined Clean Energy premiums to be paid MH by NSP. Rather, any future CO_2 premium costs would increase MH's import and thermal generation costs.

4.5 Drought

One of the major risks faced by MH is drought. Lack of available water during a drought severely limits MH's power supply.

Despite commitments made by MH to provide the Board, by April 1, 2011, a formal "written" Drought Preparedness Plan, nothing has been filed. Nonetheless, MH asserts that drought planning is a constant activity within the Corporation and is incorporated in its business processes. Both ICF and the Independent Experts recommended a formal written plan be prepared.

In 2003/04, MH experienced drought conditions that resulted in a net loss of $436 million. Despite the evident cost consequences of drought conditions for a utility relying on hydro-electric generation and involved in significant power exchanges with American utilities, with commitments and/or understandings with respect to supply involved, MH has suggested that a written Drought Preparations Plan would be redundant given MH's current practices, which were reported to have been employed in 2003/04.

Despite the Board having directed MH to engage an independent risk expert to conduct a post-audit of MH's actions through the drought, no such report was filed. And, no evidence was presented either at a prior or recent hearing indicating that MH undertook a detailed assessment of its water resource management and decisions employed in 2003/04.

MH's past planning position is that preparing for a five-year drought (as defined by the specific historical period from 1987/88 to 1991/93) provides an adequate drought risk stress test. It remains unclear as to what degree of shortage pricing, such as experienced in 2003/04, should be anticipated.

MH has projected that the financial consequences of a five-year drought to be in the range of $2.0 billion in reduced retained earnings ($2.4 billion when increased finance costs are considered). MH indicated that if shortage/ high import price situation coincided with a drought period this could increase the cost of a five year drought from $2.0 billion to $2.5 billion (with finance costs included, an even larger overall shortfall).

The Independent Experts also projected the cost of a five-year drought, and arrived at an estimate of $1.6 billion, with a $2.0 billion cost anticipated in the case of a seven-year drought. However, when an assumption of high import prices are incorporated and coincide, and are modelled as being sustained throughout the drought periods, the estimated cost of a drought may, in the view of the Board, be significantly higher.

The Independent Experts also recommended that MH not solely rely on retained earnings as the only buffer against a drought, but to also incorporate a reservoir storage buffer as a mitigation measure.

Evidence was presented at the hearing modelling varying duration of droughts, including efforts to ascertain the implications of droughts with durations longer than five years. During the period of 1928 to 1941, MH experienced low water flow conditions in 12 of the 14 years (this reflective of an extreme drought condition). While no estimate was provided as to the impact on MH if such a prolonged drought now occurred, it seems obvious that a repeat of such difficult conditions would have a significant financial impact on MH.

A similar situation occurred during the 1980/81 to 1991/92 period, with ten out of 12-years of drought, but the financial consequences at that time were much lower than would now be expected, particularly if the new export contracts were consummated. During that period, MH's exports to the United States were not a major factor.

On the issue of drought frequency, it may not be essential to define the return period of a 5-year or 7-year drought (by "return period", the concept is how many fiscal periods would be expected to have to occur before the losses were recovered). However, it is appropriate that MH's business strategies be tested against the entire historical drought experience, an experience that includes the 1928-1941 period, when 12 of 14 years were drought conditions.

Even after establishing the volumetric drought risk, the question that remains is what import prices should be expected in the case of an extended period of low hydraulic generation. The concept of shortage pricing is broadly acknowledged (when a shortage develops and the supplier seeks to meet demand through alternate sources, the price of obtaining the supply may be far higher than the normal cost of production for the supplier), but differences exist on whether volumetric shortfalls and shortage pricing are mutually exclusive and independently variable, or whether the two events are closely linked.

It could be postulated that for MH's export business shortage pricing is unlikely to occur and only be an issue in the absence of adverse or low water supply situations. In negotiating long term contracts, again yet to be shared with the Board, MH has advised that it has obtained 'price cap' clauses applying to the purchase costs of energy or buy-back costs that might be occasioned under 'adverse water' conditions. This suggests that shortage pricing could be a serious issue, otherwise why would MH simply not rely solely on the MISO market for imports as well as exports?

Droughts are expected to result in negative financial implications when MH's long term contracts are reliant only on hydraulic generation (and do not involve thermal and wind generation). In addition to being less profitable, dependable energy sales, and also peak opportunity sales, in volumes in excess of hydraulic generation can involve comparably priced energy purchases under the best of circumstances (while they can result in significantly greater financial losses for MH under adverse – low water flow - water conditions).

4.6 Financial Risks

Among the many and diverse high consequence risks faced by the Corporation (risks which include drought, the loss of export markets, and infrastructure – transmission or generation - failure), MH has also identified financial risks associated with interest rates and exchange rate volatility.

MH has indicated that a 1% upward change in interest rates can be expected to have a $170 million negative impact on its net income over an eleven year period. The analysis arriving at that forecast was based on using MH's IFF 07-1 as the base case and applying a 1% increase in interest rates to derive the interest rate risk scenario. MH compared the effect to its IFF 07-1 net income forecast for the fiscal period 2007/08 to 2017/18 (that being the base case employed to test the resultant total net income impact of a 1% upward and sustained movement in interest rates).

MH also provided an updated risk analysis for 2010, with an updated cost consequence related to a change in interest rates. The financial exposure risk was updated to approximately $430 million negative for a 1% increase in interest rates over a ten-year period, this up substantially from the previous estimate of $170 million.

The current higher estimate was likely based on MH's IFF 09–1 and, accordingly, has not reflected the more recent projection of higher capital costs for MH's planned major generation and transmission projects (the increase in projected capital costs being in the order of $3.5 billion).

Accordingly, the negative financial consequence of an increase in interest rates of 1% is likely to be even higher than the current estimate of $430 million over a 10-year period, and would have further negative financial implications over a 20-year term through to and including fiscal 2029/30.

Currently, MH has in excess of $7 billion in long term debt, the majority of which is locked in for terms as long as 30 years. As previously indicated, MH is planning, and acting currently on those plans – expending significant sums ahead of regulatory approvals, to undertake an ambitious capital expansion program requiring additional borrowings of $15 billion or so over the next fifteen years.)

With current interest rates, particularly short-term rates, being quite low, MH is forecasting long term interest rates to be 6.6% (excluding the provincial debt guarantee fee of 1%) by fiscal 2016/17, with that rate to remain constant to and including fiscal 2029/30.

MH is also at risk to economic losses due to unfavourable foreign exchange movements with respect to the Canadian dollar (CDN) vis a vis the United States dollar (USD).

Export sales to U.S. counterparties are denominated in USD, as is a component of MH's long term debt. MH's risk exposure to USD/CDN changes primarily arise through the sale and purchase of electricity and fuel into and from U.S. firms.

MH attempts to "manage"/offset the exchange risk through a long-term "natural hedge" involving USD cash inflows from export revenues and USD cash outflows for long-term debt interest and principal payments. MH's Exposure Management Program (EMP) is designed to match cash outflows for USD debt [principal and interest] with cash inflows from net exports sales (export sales net of U.S. fuel and power purchases).

To bridge the timing differences between the inflows and outflows of USD requirements, MH may utilize various financial instruments, including derivative foreign exchange contracts, debt, investments, swaps etc. Nonetheless, MH has estimated the potential negative financial impact of a reduction in the value of USD compared to CDN to be approximately $125 million over a ten-year period.

While presently CDN is valued above par with USD, MH is forecasting the US-CAD exchange rate to rise to 1.04 by 2012/13, 1.09 by 2014/15, and to 1.11 by 2015/16, with the 1.11 ratio to continue through to the end of MH's 20-year forecast. (In other words, MH's currency forecast has the Canadian dollar below par with the USD throughout the twenty year period.)

Currently, MH's accounts include within its equity component Accumulated Other Comprehensive Income (AOCI), that balance largely represented by "unrealized" gains on foreign exchange. MH borrowed funds in USD in the past at exchange rates much different than is currently the case, and the "current market value" ascribed to those debts is much lower expressed in CDN that it was when the debt was incurred. This situation also is assisting MH when it pays interest on American debt, converted to CDN the cost is less than the "coupon rate" of the debt.

As present unrealized gains on foreign exchange are realized through annual payments of principal and interest, the "gains" are expected to offset by the countervailing effect of exports to American counterparties being priced in USD. In short, it would appear that AOCI is but a temporary "credit" component of equity as its value will diminish and eventual be extinguished through lower values of export sales that would have been the case if the CDN/USD ratio had not changed.

And, going forward, while export sales to American counterparties will continue to be priced in USD, or so it appears, there is no guarantee that further downward movements in the USD ratio to the CDN to offset the loss of revenue will occur. As well, there is no guarantee that MH will continue to borrow in USD at the same rate as it has in the past.

A more detailed discussion and analysis of the financial risks, interest rates and currency, faced by MH will be provided in the second Order.

4.7 Power Resource Modelling

MH employs a fairly extensive array of models to define energy, energy demand and net revenue streams. MH models were the focus of much study and commentary ever since the 2003/04 drought event, and particularly in the recent proceeding.

There appears to be a reasonable consensus (among the various experts that testified in the hearing) that MH's models are more effective in defining and considering the effects of high flow circumstances than defining and considering the effects of low flow circumstances. Except for MH's 2003/04 fiscal year, the available data essentially reflects above average water flow situations. Prior to 2005/06, market price information did not readily provide peak and off-peak volume and price data, inhibiting the back-testing of drought events such as the drought of 2003/04.

A common theme in the various reviews was that the models lacked hydrologic predictive components and instead relied on antecedent forecasting. Lack of consistency in model assumptions was also a concern.

The use of the assumption of "perfect foresight" in MH's SPLASH modeling allows reservoirs to be drawn down to zero storage; a situation that would not be acceptable in MH's HERMES model. The result is that SPLASH-based IFF revenue projections may be overstated.

Unlike SPLASH, HERMES employs only "limited foresight": that is, hydrologic run-off predictions based on previous precipitation levels is not a direct factor in MH's forecasting of hydrologic generation. Evaporation losses are not actually determined on an ongoing basis, rather average conditions apparently are assumed for this and ungauged local stream flows.

It was noted by the Independent Experts that MH's various models (SPLASH/HERMES/PRISM, etc.) lack an integrated platform. The Independent Experts suggested that the lack of a common/integrated platform left uncertainty as to the consistency of the assumptions employed in the various models.

All of MH's recent external reviews (particularly KPMG, Independent Consultants and NYC) focused on the need for MH managing a more transparent operation, particularly as it relates to having an effective "middle office" function. The middle office is intended to operate as a check to the sales operation, to ensure that sale and purchase decisions from external counterparties are in MH's best interests. A strong middle office, with a defined mandate and a broader expertise in staffing, was seen as an essential step to assure appropriate MH Power Resource Management, Drought Mitigation and the derivation of other risk element evaluations.

Again, in the second Order more will be said on this topic.

4.8 Interveners and Positions on Rates

CAC/MSOS submitted that the Board eliminate the 2% interim rate increase for 2011/12, or at least cut the increase in half. CAC/MSOS asserts that the evidence does not support the increase.

MIPUG submitted that the Board should given final approval to the 2010 – 2.9% and 2011- 2.0% interim increases as granted, but with proposed rate adjustments between customer classes incorporated to reflect MIPUG's position respecting required rebalancing based on differences in revenue to cost coverage ratios.

RCM/TREE submitted that the Board should give final approval to the 2010 – 2.9% and 2011 – 2% interim increases as granted, and requested by MH, and the Board should add a further 0.9 of 1% from the date of the Board's order for a rate increase of 2.9% forward for the balance of the 2011/12 year. RCM/TREE also proposed rate structure changes for the residential class.

The City of Winnipeg submitted, in agreement with the position of MH, that no increase in rates be applied to its rate category of Area and Roadway Lighting; the City took no position on the general issue of rate increases.

SCO submitted that if the Board approves the interim rate increases for 2010/11 and 2011/12, those revenues arising from the increases should be set aside and earmarked for all Manitoba First Nations, to be used as a compensation fund. MKO made no submissions.

It is fair to say that, in general, all participants await the outcome of MH's pending Cost of Service Study (COSS), and all interveners see the need to have further input on rate design/rate class issues. MH seeks across the board increases at this time (as noted), excluding Area and Roadway Lighting, given that the COSS is not complete.

5.0 Board Findings

Two Rate Orders

As previously indicated, on December 1, 2009, MH filed its 2010/11 and 2011/12 GRA.

The proceeding that followed included a detailed review of MH's risks and risk management as practised by MH, and spanned a period of 19 months and involved 41 hearing dates (not including pre-hearing conferences and three days of closing statements) and the filing of 27 binders of information (including over 5,300 filed interrogatory responses, over 200 exhibits, and testimony from several expert witnesses), all providing an extensive record of the proceeding for the Board to evaluate.

While the record of the hearing is extensive, it is, unfortunately, not complete. MH has failed to provide export contracts, financial projections, alternative development scenarios and other information requested by the Board, despite the Board's need for the information to allow for a finalization of various interim decisions, and the Board's commitment to maintain commercially sensitive information confidential.

During the course of the proceeding, and particularly concerned with the risks faced by the Corporation in difficult and uncertain economic conditions, the Board granted MH interim rate increases of 2.9% effective April 1, 2010 and 2% (rather than the 2.9% applied for) effective April 1, 2011, both of which Orders MH now requests be finalized.

In addition, MH has requested a further 0.9% rate increase; in seeking the additional 0.9% MH requested that the additional rate increase be approved effective August 1, 2011.

To respond to MH's requests, the Board will issue two Rate Orders. This first Order addresses issues on certain rate and risk related issues, with the second Order to provide a much more detailed and comprehensive review of the issues before the Board (the issuance date and comprehensiveness of the second Order cannot be assured at this time, dependent in part on whether the Board receives information it deems necessary and within its jurisdiction to receive).

Rates

Particularly since the 2003/04 drought, the Board, MH, along with certain Interveners, have recognized the importance of MH having an adequate and stable financial structure.

While the Board retains serious concerns with how MH calculates the equity component of its debt and equity ratio, the attainment of MH's target ratio of 75:25 (debt to equity) was not, at the 2008 GRA proceeding, envisioned to occur within the then 10-year planning horizon. And, at that time, the anticipated result of achieving the 75:25 target was the expectation of modest annual rate increases to follow, to reflect general inflationary pressures, no more.

While, with the filing of this GRA, MH asserts the achievement of the 75:25 debt-to-equity target, this coming four years in advance of the most previous target date, rather than annual "inflation level" rate increases to follow, MH is now seeking rate increases of 2.9% in both 2010/11 and 2011/12, and projects further rate increases of 3.5% per year for each year of the following decade, to be followed by annual rate increases of 2%, the 2% level coinciding with the target of the Bank of Canada for inflation.

The years of 2.9% and 3.5% projected annual rate increases coincide with the decade that MH would have marked by the construction of major new generation and transmission investments, advanced ahead of Manitoba demand requirements to meet expected and presumably profitable U.S. export contracts.

MH acknowledges that its operations involve risk in virtually every aspect of the Corporation's operations. As one and a major component of a plan to mitigate risks, the assumption has been to achieve the 75:25 debt to equity ratio and hold it there through inflation level annual increases thereafter.

However, as indicated above, MH's planned "decade of investment" (to involve major capital construction at a cost of $20 billion or more), despite larger annual rate increases than previously thought required, once the 75:25 debt to equity ratio was reached, is now projected by MH to deteriorate to 83:17, before fully recovering following several years after the in-service dates of the planned major construction.

In determining whether or not, particularly in the circumstances now in "play", MH's capital structure and rate proposals mitigate the various and serious risks faced by the Corporation, the Board reviewed MH's risks and risk management in this proceeding.

It has become very clear that a major risk is associated with MH's planned "decade of investment" (to be supported by sought-after long-term energy sales to American counterparties). The capital costs of the new generating stations, to be built well ahead of domestic load requirements, and transmission are very high, and while the planned new export contracts bring significant obligations they, perhaps, do not produce enough assured revenue to avoid higher domestic rate increases than may be acceptable.

Manitoba Hydro's historical record of having domestic rates that are the lowest or among the lowest in North America has been described as the *Manitoba Advantage*. And, despite these low rates, Manitoba's cold weather and the lack of province-wide availability of natural gas mean that some customers, particularly lower income households, receive electricity bills that they have difficulty paying (some 80,000 or so accounts are apparently delinquent following any billing date – being delinquent does not mean the account ends up written-down or off, but it does infer late payment fees).

In addition, large industrial consumers, represented by presenters at MH GRA hearings, have often cited the importance of Manitoba retaining low electricity rates to their operations remaining and expanding in the Province.

Rate increases above the rate of inflation are regularly opposed by consumer advocates, including an Intervener to this hearing. And, MH currently projects just that through its planned "decade of investment". It is far from clear whether the risk tolerance level of MH matches that of its customers, particularly its household and industrial customers.

It is also far from clear for the Board, which has yet to receive (in confidence) MH's export contracts, whether MH's proposed new export arrangements can be expected, if not assured, to generate enough additional revenue to fully meet the cost of advancing new generation ahead of domestic need, or whether, in the end, domestic customers will end up subsidizing exports to the U.S.

And, with respect to Bipole III, while the Board readily identifies with the vulnerability of southern Manitoba, in particular, to outages caused by the failure of Bipole I or II or both, and understands the Corporation's focus on reliability, the Board is, despite the hearing, still not assured that the costs of the new transmission will be met by net export profits and not have to be absorbed by domestic customers through rate increases higher than those now projected.

The Board notes that MH's plan (major construction and new export sales) preceded the negative economic events of the summer and fall of 2008, which involved a credit crisis and the beginning of a global recession that still "lingers". It also preceded changes in the American political landscape, where the focus has moved from "climate change" and efforts to reduce green house gas (GHG) emissions to pressing economic and budgetary challenges.

This said, the Board observes that American politics is a volatile environment and a resurgence of support for measures to reduce GHG emissions could reappear in the future. Currently, America is locked in a critical debate centered around its federal budget and an ongoing slow recovery from the recession.

However, it is the Board's understanding that MH's recent export contracts, conditional upon regulatory approval and the construction of new generation and transmission by MH and the construction of new transmission by the American utility counterparties, provide for the exporting of power for a considerable length of time with any “clean energy” credit that could develop to accrue to the benefit of the American counterparties, not MH.

To further complicate the situation, since MH entered into term sheets in 2007 and 2008 with American counterparties, new engineering methodology has allowed for the affordable extraction of natural gas from North American shale deposits, further depressing the price of natural gas (already depressed by the slow recovery from the recession), which affects the marginal cost of production of electricity within the American component of the MISO market.

(The Board notes that the production of shale gas from shale deposits has been associated with negative environmental consequences primarily associated with the use of water and the condition of such water after its employment in gas production. Accordingly, the Board cannot be “sure” that the shale gas “revolution”, described as a “game changer” by academics, producers and others, will be realized as now anticipated.)

Yet, despite all of the changes that have occurred since MH developed and put into action its preferred development plan, which counts on new export contracts, changes which also extend to the rise of the Canadian dollar to above par with the respect to the American dollar, and hyper-inflation with respect to major construction projects, MH has not changed its “game plan”.

The main question before this Board is whether MH’s “game plan” will require higher domestic rates than MH projects. At this point, and with the information that MH has provided the Board, while the “jury is still out” the Board has serious concerns.

Through this proceeding, the Board gained the understanding that the approximate cost of creating and supplying the energy to service the planned export contracts from major new generation projects is estimated to be in excess of $0.10/kW.h. However, the record of the proceeding also indicates that the expected export prices, which include not only firm energy obligations and opportunity export sales, may not, in aggregate, be sufficient to cover the cost of advancing the projects ahead of domestic demand, leaving a financial shortfall to be reflected in the rates of domestic ratepayers (that being in addition to the rate increases currently forecast by MH).

In order to appropriately assess the risks faced by domestic Manitoba customers. The Board first requested and later subpoenaed copies of MH's new export contracts, this to allow the Board to assess whether the prices and the terms in the contracts either mitigate or increase risks for domestic ratepayers. The obtaining of the export contracts is currently subject to procedural motions; to-date, the Board has not yet been provided with the specific information requested.

The appropriateness of the current 75:25 debt-to-equity target is predicated on the Board's understanding of MH's risk profile, and, as well, the Board's acceptance of MH's calculation of its equity. As to the terms of the new export contracts and the implications for the risks assumed and rates to be assessed domestic ratepayers, these have not been fully assessed by the Board, given the withholding of the subpoenaed contracts and the failure of MH to provide a fully updated IFF and additional development scenarios.

Thus, the Board is currently unable to determine whether the interim and the requested additional rates are just and reasonable.

Therefore the rate increases granted on an interim basis in this proceeding will remain interim, subject to finalization, amendment or further continuation as interim until such time as the Board has sufficient information to reach a further decision. As well, and for the same reason, the additional rate increase sought of 0.9% across all rate classes will not be granted at this time.

The capital expenditures and planned capital expenditures and the related export contracts have a direct financial bearing on domestic rates and speak to whether MH's projected rate increases through to fiscal 2028/29 are likely to be sufficient to meet the growing capital and other associated costs of the new generation and transmission projects required to service the export contracts.

MH has expended hundreds of millions already on its "preferred development plan", a plan yet to receive regulatory approval on either side of the Canadian-U.S. border. MH continues to spend to "protect" the in-service dates required to meet the obligations of its new export sales contracts.

Regardless of the "good faith" and "good intentions" likely attached to this pre-spending, expending massive funds ahead of final regulatory approval appears to represent speculation, and, given the hundreds of millions that have been spent and the ongoing spending, a degree of speculation rarely found with private utilities, let alone Crown Corporations.

If the plans do not work out, then the pre-spending may well have to be "written off", with implications for rates and the current generation of ratepayers.

These interim findings may be continued or otherwise varied in the Board's next Order.

Operating Results

The Board notes that MH has projected an improved financial position from that it reflected in its IFF 09–1, and accepts that, on the surface of the evidence before the Board, MH has reached its long-sought 75:25 debt to equity ratio. Assuming Board acceptance of the methodology employed by MH to derive its projected debt to equity ratio, a methodology the Board currently continues to question, the Board would have to question the need for any further rate increases other than that required to sustain the capital structure.

The planned major Generation and Transmission projects required to support the announced new export contracts reflect seemingly ever-escalating capital costs, which, pursuant to the filings made by MH, are expected to result in the debt to equity ratio forecast deteriorating from the current asserted 75:25 to 84:16 for fiscal 2020/21.

And that "weakened" projected capital structure is predicated on the Board providing consecutive annual rate increases that compound to reflect an overall increase of over 40% by 2021, and to almost 60% by fiscal 2027/28, required, according to MH's projections, just to return to the 75:25 ratio now claimed to have been achieved.

All considered, MH's business case is predicated on stepping up domestic rates by 60% from current levels to support the development of generation and transmission projects, the projects to be advanced for export ahead of domestic requirements, projects yet to receive regulatory approval.

Given the changing circumstances within the North American and MISO market, it is not clear whether the export contracts negotiated can be expected to provide sufficient revenue to avoid domestic ratepayers subsidizing export sales. A significant portion of the energy to be delivered under the export contracts will be based on spot and opportunity sale market rates, which may be depressed for some time due to reduced natural gas prices, that the result of seemingly abundant shale deposits which have and are expected to depress natural gas prices.

This in turn has and is presently expected to lower the incremental cost of generated electricity by American utilities in the MISO market, which may, as it has since 2008, depress the export prices MH realizes and may realize in the future. The Board has a serious concern as to current and potentially longer term MISO market conditions, which are outside the control of MH, and which may well have negative implications for domestic ratepayer rates.

If export revenues do not meet MH's currently forecast targets, and MH's currently planned major capital expenditures take place, MH will need to look towards domestic ratepayers to support much of the debt to be entered into to build the generation and transmission assets. Until, if possible, the risk of unacceptable future domestic rate increases can be reduced or eliminated (addressed to the Board's satisfaction), it seems quite possible that future rate increases, now forecast at 3.5% annually for ten years to be followed by 2% annually, may prove quite insufficient.

OM&A Expense

MH's forecast of its OM&A expenses assumes a productivity factor in the order of 0.5% to 1% annually (i.e. that costs will be lower by 1% in each future year due to ongoing productivity improvements – in the absence of achieving the annual productivity target, OM&A costs would, presumably, be 1% higher than MH's present forecast) in the setting of its business unit OM&A targets.

In Order 07/03, the Board stated:

> *"Corporate performance measures such as the operating and administration costs per customer or per kW.h targets are of great assistance in assessing the performance of Hydro's cost control initiatives compared to other utilities. The Board recommends Hydro aggressively pursue meeting its operating and administration costs per customer target while finding ways to increase productivity. The Board also encourages Hydro to continue to participate in benchmarking initiatives to help identify and implement further efficiencies and enhancements in its operations as compared to other utilities."*

In Order 116/08 the Board stated:

> *"Although Hydro's operating and administrative expenses appear reasonable, the Board urges Hydro to continue to control these expenses through aggressive cost control initiatives and management of the labour force. The Board appreciates of some operating and administration expenses, particularly payments to the Province, are beyond Hydro's control. However, it remains necessary for Hydro to continue to be diligent in taking steps to control all such costs and improve efficiencies. Corporate Performance measures such as operating and administration cost per customer or per kW.h targets are of great assistance in assessing the performance of Hydro's cost control initiatives compared to other utilities. The Board recommends Hydro aggressively pursue meeting its operating and administration costs per customer target while finding ways to increase productivity. The Board also encourages Hydro to continue to participate in benchmarking initiatives to help identify and implement further efficiencies and enhancements of its operations as compared to other utilities."*

In that Order the Board directed:

> *"MH to undertake and file with the Board, by June 30, 2009, an independent benchmarking study of key performance metrics, using the most current available data and including:*

a) *Primary key drivers of OM&A in each operational division [Board preferences to allow for a comparison with a greater number of other utilities].*
b) *Comparable other Canadian Utility data for each of the drivers.*
c) *Key comparison indicators including staffing levels.*
d) *A comparison with and discussion of industry best practices.*
e) *Potential improvement areas."*

The Board expects to be apprised of the scope of the expected study, and its advancement (in advance of receipt and review of the study, it is difficult to complete an assessment of the prudency of MH's OM&A expenditures), and anticipates being provided the opportunity to provide direction.

The Board is convinced that domestic ratepayers will benefit from the developments of appropriate metrics to assess the reasonableness of the level of current and future OM&A expenses, in advance of, if not particularly because of, the proposed major capital expansion program (that program "driving" OM&A expenses).

To-date, the Board's past and present concerns on the ongoing annual escalation of MH's OM&A expenses have not been addressed. MH has not undertaken Board-directed benchmarking studies and has deferred such studies until 2013 (when IFRS is expected to be fully implemented).

In the meantime, OM&A expenses, particularly before the capitalization and deferral of a significant percentage of such expenses, have escalated well above inflation, in part due to MH's Preferred Development Plan. The Board remains concerned with the escalation of operating expense, of which a large portion is being deferred (to be borne by future ratepayers). Such deferral has muted the OM&A increases reflected in MH's annual accounts, its GRA rate requests and domestic rates.

OM&A costs have increased in part due to MH engaging hundreds of new employees involved, in one capacity or another, in implementing – ahead of regulatory approval - the Utility's development plans. OM&A period costs are being accumulated and that accumulated amount, which grows by the day, faces the risk that it may have to be "written off" if the development plans now proposed by MH are either significantly amended or rejected.

The Board questions the sincerity of MH's commitment to rein in costs, without action rate increases above inflation remain a probable outcome. As previously indicated, MH continues to capitalize and defer a significant portion of its annual operating costs.

While this practice has been accepted by MH's external auditor and, accordingly, may be considered to be within the guidelines of what now represents GAAP, Canadian accounting standards, and leaving aside that those guidelines and GAAP are in flux as the transition to IFRS continues, the practice allows MH to report higher annual net income results than it otherwise could (if more of the now deferred and capitalized expenses were treated as period costs and charged directly, in the year of incurrence, against the net income of that year).

Though these capitalized and/or deferred costs are presently not charged against net income in the year of incurrence and do not affect either MH's retained earnings and debt to equity ratio, they do not "go away", but are simply "transferred" to future years, where the costs will be charged by way of gradual amortization against the net income of those future years, affecting the revenue requirement and rates of those years.

These issues will be discussed further in the Board's subsequent Order.

Partnerships and Wind Purchases

The contracts entered into by MH with respect to partnerships with First Nations (the partnership with respect to Wuskwatim Generation Station signed off on and with the generating station well on the way to completion; the partnership with respect to Keeyask Generation Station, being conditional on Keeyask proceeding and that requiring regulatory approvals on both sides of the border) and wind generators are based on factors that go beyond the economic.

There is an "accounting" and "business" aspect to these completed and/or pending arrangements that need to be understood. While MH "treats" the generation and direct payments to the wind farm owners as "purchased power" and intends to amalgamate the power to be generated from Wuskwatim and Keeyask within its consolidated accounts as if Wuskwatim and Keeyask were just another MH hydro-electric generation station, and will record any payments due the First Nations from future partnership net income as deductions from consolidated net income denoted as "minority interest", the accounting fails to identify nuances of some importance.

MH will incur costs that while associated with the First Nations-MH partnerships and the wind farms will neither be charged against the partnerships nor be allocated to its Manitoba wind generation purchases; those costs will simply "fall" to overall operations and so affect domestic rates. These "ignored" costs (ignored only as to recognition in respect to partnership and wind generation costs) include, at least, capital tax (which will be assessed on MH with respect to loan balances attributable to the partnerships and wind farms) and general operating and administration costs that could, fairly, be allocated to the partnerships and the wind purchases.

Power Resource Planning

The Board is not satisfied that MH has explored all reasonable power resource scenarios based on the following assumptions:

- Domestic customers and their rates are the priority;
- Domestic customers and exports share in both fixed and incremental costs; and
- Exports are an independent profit centre, separate from domestic customer classes.

In particular, the Board finds it troubling that MH has not explored in any depth natural gas (CCCT) thermal generation supply alternatives to the new major hydraulic generation and transmission projects now planned for by MH. Yet, MH chose to compare the Keeyask and Conawapa hydraulic generation options to a natural gas (SCCT) thermal generation base case scenario in 2004/05 (a time when natural gas prices were much higher than current prices).

MH's current reluctance or failure to consider CCCT thermal generation as a potentially viable option to its current development plans ignores the presently very competitive position of CCCT generation in the MISO market.

As well, to further "cloud" the present situation, MH's apparent decision to proceed with the Keeyask G.S. to serve the "announced" 125 MW (NSP)/250 MW (MP)/100 MW (WPS) export sales instead of proceeding first with the Conawapa G.S. is a significant departure from both MH's previously devised recommended development plan and, as well, the possible merits of an alternative development sequence.

MH's current plans, backed by expenditures in excess of $400 million on pre-construction Keeyask costs, appear to contemplate a power resource scenario without

Conawapa G.S. if the 400 MW (WPS) contract is not achieved. If this approach was actually taken, it seems the full benefits of Bipole III would not be realized.

With the considerable escalation of project costs for Keeyask G.S., Conawapa G.S. and Bipole III, the Board would prefer MH justify (on a Net Present Value basis) the need for and alternatives to each of these three projects.

Accordingly, the Board strongly believes a thorough 'Needs For and Alternative To' (NFAAT) process, presided over by a quasi judicial panel with independent adjudicative authority and evidence based process should address these issues far in advance of MH making final commitments to enter into its proposed export contracts, and as soon as possible to avoid further massive new investments in MH's preferred development plan ahead of a thorough NFAAT proceeding.

That proceeding should examine not only MH's preferred development plans, but also consider alternative development scenarios including the potential construction of a combined cycle natural gas generation plant, that to diversify supply, reduce drought risk and, potentially defer Keeyask, if not Bipole III.

As to the alternative of proceeding with Conawapa ahead of Keeyask, it also needs a thorough hearing.

Such a proceeding needs to have access to all needed information, including export contracts, and, as well, MH's IFF 20-year forecast needs to be fully updated, to take into account the reality of current and expected market prices in the MISO market.

The Independent Experts suggested to the Board that MH should be focused on 'least cost scenarios' in exploring future power resource and export initiatives. By this recommendation, the Board understands that the Independent Experts, as does the Board, place domestic ratepayers, reliable domestic service, and the rates domestic ratepayers are to pay in future years as the number one priority.

The Board is also concerned about MH's inability to achieve significant (if any) premiums for "clean energy" in its pending export contracts. When MH commits to providing substantially CO_2-free energy without a defined premium, it seems that there is a risk that future environment costs of importing thermally generated electricity could be expected to flow to MH's domestic customers and result in higher domestic rates.

Capital

The Board views with concern MH's infrequent updating of not only its capital cost estimates for major new generation and transmission assets but also its forecasts of spot and opportunity sales export prices. It seems inappropriate to make commitments on major projects and large export contracts when the capital expenditure forecast remains unchanged through three or four years of CEF submissions, and when issued financial forecasts do not reflect changing export market conditions.

There has been a material increase in the capital costs of MH's Major Generation and Transmission Projects, and this has implications, which include increased debt requirements and the related carrying costs (amortization of assets – the cost of which include pre-construction costs - and finance costs on assumed debt) when the projects are placed into service. These projects are being advanced to meet recently entered into export commitments.

Export contract negotiations that appear to use outdated costs of generation and transmission as a point of reference could, in the Board's opinion, seriously undervalue the total energy being sold. Belated capital cost updates will not, it appears, achieve any cost recovery from exports with respect to the additional capital costs.

The Board is unaware of any MH explicit policy or process for ensuring adequate capital investment recovery on facilities built or advanced for export purposes.

Finance Expense/ Financial Risks

Ultimately the total finance expense associated with MH's planned new major capital construction of generation and transmission will need to be recovered from future revenue as the major projects come on line and capitalization of interest ceases.

As it is, a significant percentage of MH's annual finance expense is currently being capitalized, and MH has forecast that over $5 billion will have been capitalized when all developments are complete. The Board remains concerned with the significant escalations in the capital cost for these major projects, which appear to be resulting in seemingly ever increasing borrowing requirements. Such capitalized amounts will form part of the capital base and will be need to be recovered from future revenue.

Once the major projects have been completed, the capitalization of finance expense will cease and will need to be recovered from revenue. If net export revenues are insufficient to meet all of the period costs that will begin to be recorded in MH's accounts following the in-service dates of the new assets, then domestic rate payers will be required to subsidize the investments through rates (if the debt to equity ratio target is to be maintained).

As the cost of the major programs escalate there will be, as demonstrated in the recent increase of over $3.6 billion from prior IFF 09-based estimates, both increased debt levels and ultimately higher finance costs (which may well have to be recovered solely from domestic ratepayers as the export sales prices were developed prior to the construction cost escalation).

There remains a real risk that interest rates may rise from what has been forecast by MH. Given the increases in Long Term Debt from the ever escalating cost of the Major Generation and Transmission projects, such a higher interest rate environment with the increased borrowing requirements, will further erode MH's financial strength to the detriment of domestic ratepayers. To the extent that export revenues do not materialize, interest costs do not disappear and will have to be met by domestic ratepayers.

As for foreign exchange rate risk, the Board notes that the Canadian dollar is currently above par with its USD counterpart, yet MH continues to project a weakening Canadian dollar relative to USD within MH's forecast period. In the Board's view, there is a real risk that the current exchange paradigm (with the Canadian dollar at or above par with its US dollar counterpart) may be sustained for a long period of time.

While the Board is not certain on how such an eventuality would impact MH's financial position, it is concerned that MH's current forecast of future export revenues may be overstated. As MH has experienced in the past couple years, a Canadian dollar at or above parity with its USD counterpart has resulted in lower realized export revenues.

MH's preferred Development Plan is predicated on export revenues derived from the new export contracts with US counterparties to support the costs incurred to build the Major Generation and Transmission Assets required to service them. A weakening USD would place further pressure on MH, which may then have to seek to recover any shortfall from domestic ratepayers.

The Board will require MH to provide a full analysis of the implications of a Canadian dollar at or above parity on its long-term Preferred Development Plan.

Domestic Load Forecast

With MH's forecast of domestic load being down by 1,400 to 1,800 GWh, the unit revenue (rate per kWh) would have to increase to retain MH's forecast of future annual electricity revenue. However, MH has not made any significant adjustment to its projection of domestic rates and MH's forecast of total residential and commercial load was identical in IFF 10 and IFF 09-1. MH has yet to explain how this is possible.

The Board is unable to reconcile MH's domestic load forecasts with domestic revenues and is concerned that MH's forecast domestic revenues may be overstated.

In MH's Recommended Development Plan, (IFF 09-1 assumptions) Keeyask G.S. had an in-service date of 2019/20; in the Board's view domestic load, only, would have required a 2021/22 in-service date, and now with the reduced domestic load forecasts a 2025/26 in-service date could be more appropriate.

It is the Board's view that MH's most recent domestic load forecasts for the longer term:

- Do not adequately recognize the longer term implications of the recent economic downturn;
- Are overly optimistic, given the stagnation (lack of growth) over the last five years in the load of the industrial sector - particularly when coupled with an actual major pulp and paper plant closure and imminent announced smelter and refinery closures; and

- Do not support the significantly advanced dates for new generation, but rather, in the absence the new export contracts, suggest a 2025/26 in-service date is required to meet domestic load.

The Board understands that the recent MP and WPS announced contracts essentially commit MH to building Keeyask G.S. by 2020/21. This is about five years earlier than domestic load requires.

Export Contracts

Without access to MH's new export contracts, the Board continues to see these ventures as potentially unfavourable risk issues. There is no certainty that the revenue streams from those announced contracts will cover the incremental revenue requirements of new generation and transmission.

The Board does not see that the volumetric drought risks are being reduced with the new export contracts. Cost consequences of a drought may well be greater with the contracts in place. As of now, the question is open for debate, as there are experts that say the consequences of a drought with the new export contracts should be lower.

However, these experts have all seen the export contracts and are, presumably, relying on MH's, and perhaps their own, interpretation of the Adverse Water clauses. Because the Board has not seen the contract to verify the salient terms, the Board advises that it may change its view after it receives and has reviewed the contracts.

Export Revenue Pricing

It is the Board's understanding that MH's IFF 09-1 forecast (particularly for electricity export revenues) was based on 2008 circumstances, and, presumably, employed ICF predicted natural gas prices. The forecast predated the advent of shale gas and lower natural gas prices, the collapse of CO_2 emissions charges and the severe economic downturn that has transpired in the U.S. economy.

With ICF's revised (October 20, 2010) natural gas prices being 30-40% lower than its 2008 forecast, projected electricity prices with respect to the fuel cost portion of CCCT generation may well be lower by a comparable amount. (If fixed costs were included in the IFF assumptions, the forecast electricity price would be about 25% lower, rather than 30-40% as projected by ICF).

While MH has declined to provide an IFF using the export electricity pricing assumptions advanced by the Board (PUB/MH/PREASK-4), MH has not refuted the proposed pricing scenario, which, at about 65% of IFF 09-1 pricing assumptions, are in the Board's view relatively consistent with ICF's revised natural price forecast when applied to CCCT generation fixed and variable prices.

In the absence of any significant MH downward revisions of export market electricity prices to reflect the drastic shift in the forecast cost of CCCT thermal generation, the Board has elected to address this issue by postulating two alternative electricity export pricing scenarios. These are not the only, or necessarily correct, views of MH's export market over the next 15 years.

And, at 75% and 65% of MH's IFF net export revenues assumptions, the Board's price forecast could be viewed as somewhat pessimistic if not very pessimistic as to a recovery of past and higher MISO Market electricity prices.

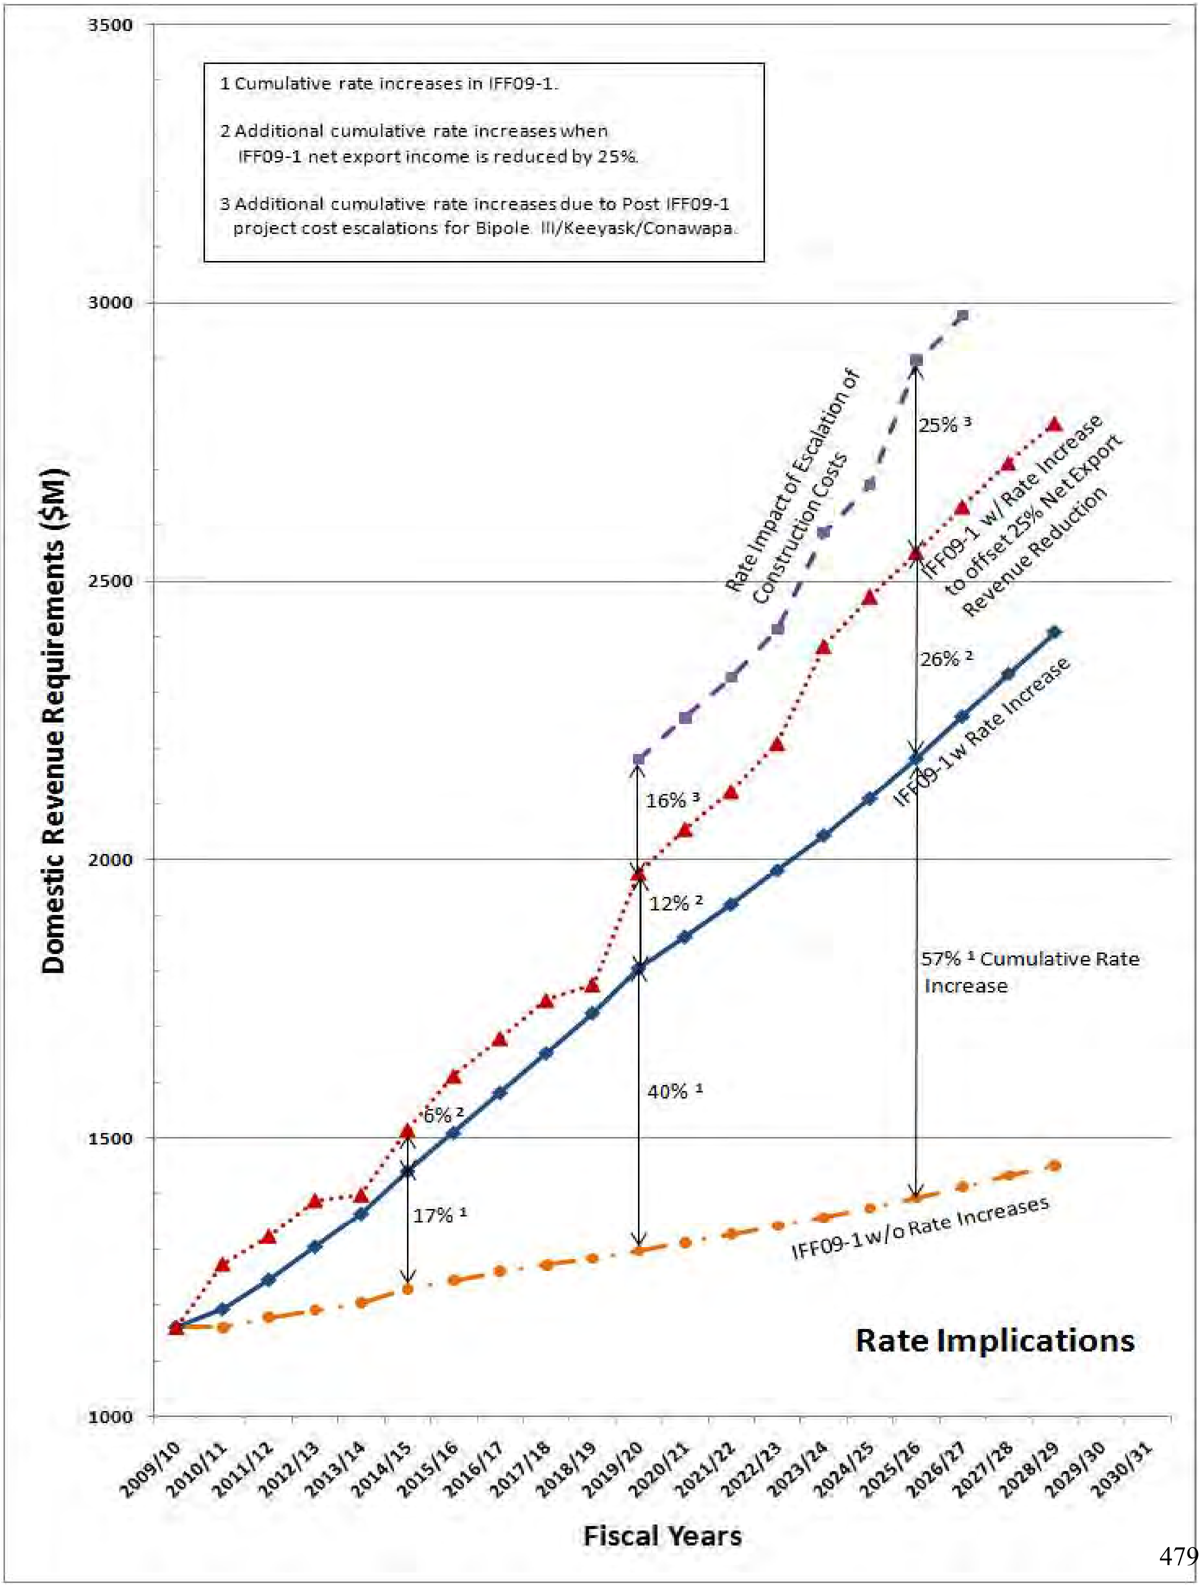
In Chart 2, which follows below, the lower line (red-dashed) projects MH's domestic revenue in the absence of any domestic rate increases over the next 20 years. The next line up (blue-solid) illustrates MH's IFF 09-1 based domestic revenues with MH's projected rate increases (2.9% to 3.5%/year, annually). In 2025/26, such an eventuality would be expected to result in overall domestic revenue of about $2.2 billion (57% of which would arise from rate increases).

If, as a result of ICF's projected lower natural gas price forecasts, MH's export revenue projections of IFF 09-01 were reduced by 25%, this would negatively affect IFF 09-1 projections for net income, retained earnings and MH's debt:equity ratio. Accordingly to meet MH's targets of its IFF 09-01, domestic revenue would have to be increased as shown in the 3rd line from the bottom (red–dotted). In 2025/26, such a scenario suggests that domestic revenue of about $2.25 billion would be required (which would represent another 26% increase from the 57% projected by MH in IFF 09-1).

This upper line (blue-dashed) models the required addition of domestic revenue that appears to arise from the major project price escalation that has developed since MH's IFF 09-1 forecast. In 2025/26, recognition of this factor suggests that the domestic revenue requirement would be approximately $2.85 billion (up a further 25% from that projected by MH).

Chart 2

Domestic Revenue Requirements and Rate Implications (75% of IFF 09 Export Revenue Rates)



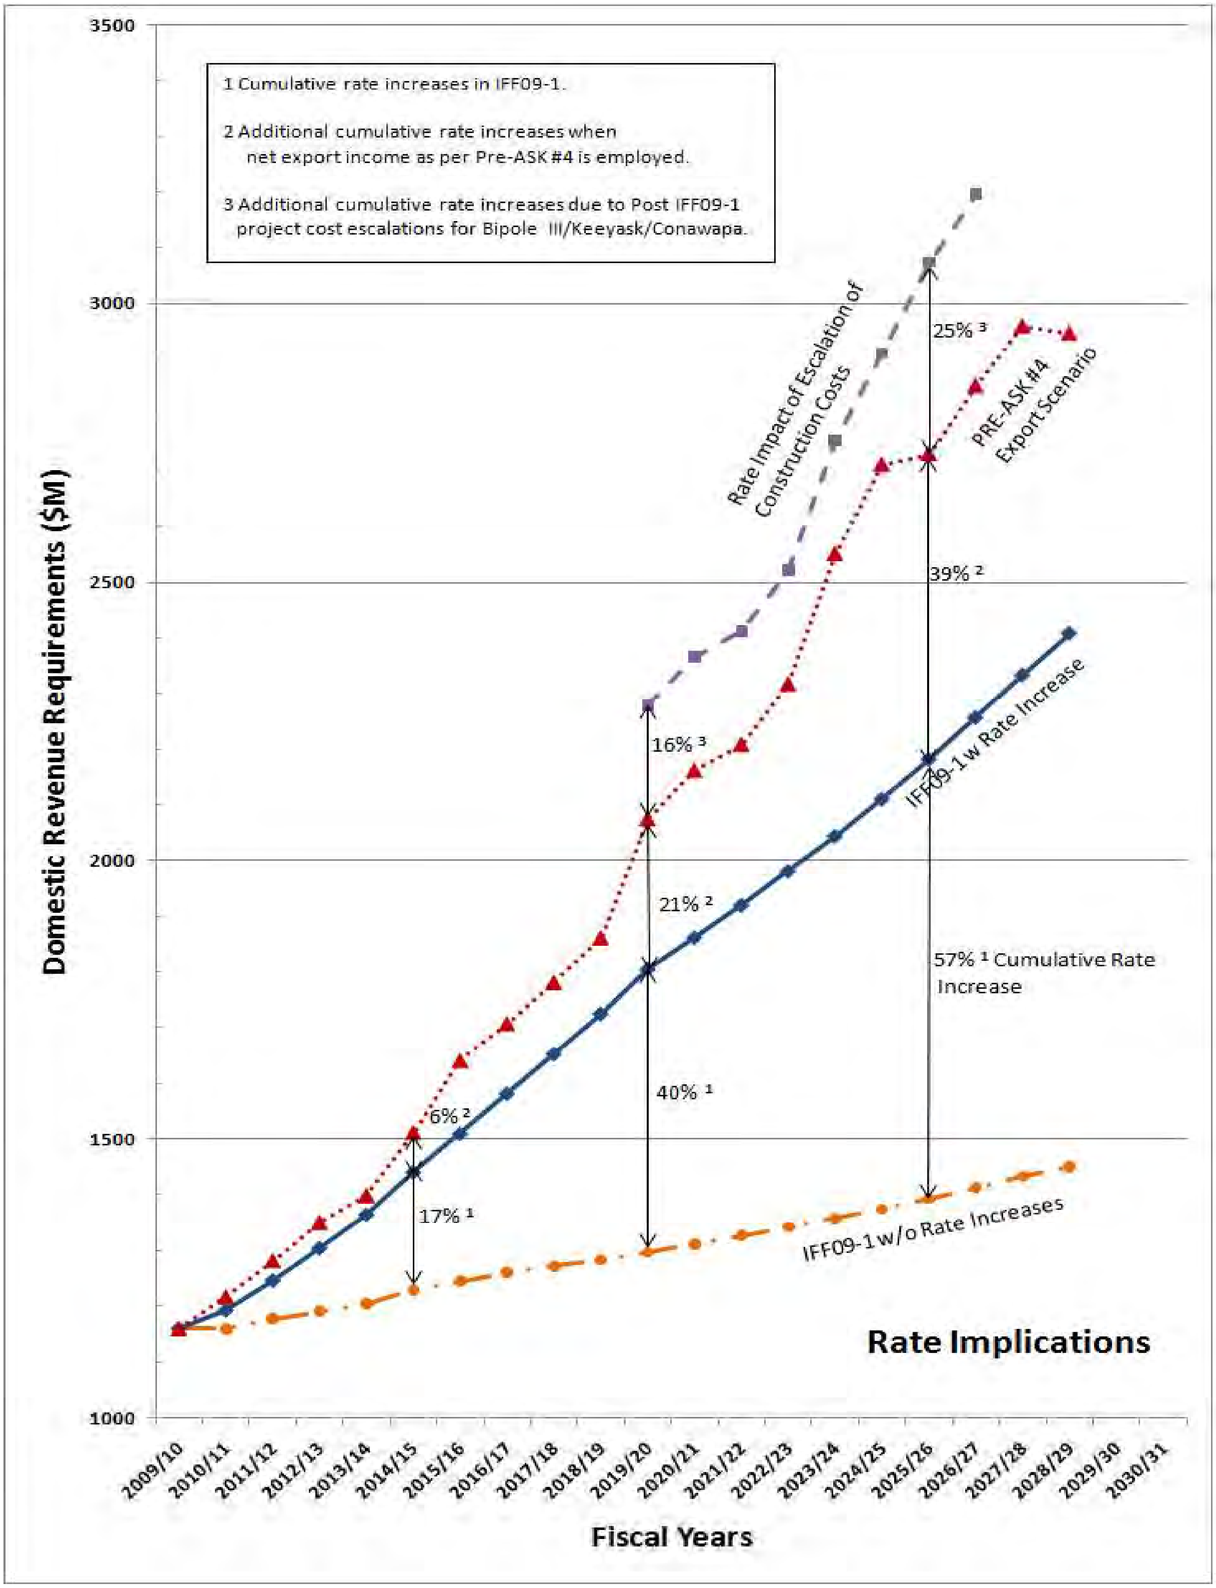
In Chart 3, which follows, the lower line (red-dashed) projects MH's domestic revenue in the absence of any rate increase over the next 20 years. The next line up (blue-solid) illustrates MH's IFF 09-1 projected domestic revenues with MH's projected rate increases (2.9% to 3.5%/year). In 2025/26, MH's assumptions project domestic revenue of about $2.2 billion (57% of which would come from rate increases).

The third line (red-dotted) on the chart illustrates the domestic revenue requirement if export revenues were consistent with the export/import price scenarios PUB requested MH provide in PUB/MH-Pre-ask #4, and if MH's IFF 09-1 targets for net income, retained earnings and debt-equity were to remain unchanged. In 2025/26, this assumption requires domestic revenue of $2.7 billion (up another 39% increase from the 57% projected by MH in its IFF 09-1).

The upper line (blue-dashed) indicates the additional domestic revenue requirement that would presumably result from meeting the major project cost escalation that has occurred since IFF 09-1 was developed by MH. In 2025/26, recognizing this development would require domestic revenue of about $3.1 billion (up a further 25% from the 57% modelled by MH's IFF 09-1 and the 39% projected by the presumed response to PUB/MH-Pre-ask #4).

Chart 3

Domestic Revenue Requirements and Rate Implications (PUB/MH Pre-Ask #4 Export Revenue Rates)



These charts suggest that MH's IFF 09-1's rate increase assumptions may prove significantly too low if ICF's lower natural gas prices "prevail" and MH's latest capital estimates are realistic. It is possible that actual domestic rates could be more than doubled over the next two decades if the Board's modelled assumptions were realized.

In the Board's view, MH's IFF 09-1 and IFF 10-2 export price assumptions are not reflective of the current and likely near-term energy market. As such, the suggested progression of rate increases for domestic customers may well not be adequate to cover, even after taking into account projected additional export revenues, the costs of MH's CEF 09 Major Capital Expenditure Program. And, when the latest major project cost escalation is considered, the potential revenue insufficiency appears to be substantially magnified.

Export Revenue Pricing

In Board Order 116/08, it was the Board's opinion that MH's export revenue pricing forecasts provided in the preceding 2008 GRA, and in MH's 2008 Energy Intensive Industry Rate (EIIR) application, were overly optimistic. Prior to 2008/09, MH's forecasts counted on future high natural gas supply prices (forecast to continue to rise and anticipated an early introduction of substantial CO_2 emissions pricing. These are no longer realistic expectations.

IFF 09-1 export revenue pricing (based on advice to MH from an external consultant panel, which, as previously indicated, included ICF) was prepared in 2008 and neither reflected the lower natural gas prices with shale gas availability now being experienced nor the evident major resistance to CO_2 emissions pricing in the U.S.

ICF testimony at this hearing provided a much lower future natural gas price outlook and suggested that a substantial deferral of CO_2 emission pricing would take place. Despite this, MH did not significantly alter its IFF 10 Export Revenue Assumptions from those MH employed in IFF 09-1. Notably both ICF and KPMG indicated that, pursuant to their terms of reference, which were provided by MH, they did not challenge MH's views on market energy prices. Apparently, neither ICF nor KPMG nor the Independent Experts had access to MH's IFF market price derivations.

The Board also notes that MH declined to provide any alternative IFF scenarios based on the now obviously lower natural gas prices and absence of CO_2 emissions regulations.

Overall, the Board does not accept MH's export revenue forecasts to-date as representing a realistic basis for determining the economic viability of MH's proposed new major generation and transmission facilities, to be supported by export sales in advance of domestic load requirements.

Implications for the Domestic Revenue Requirement

Based on the evidence in this proceeding, the Board suggests that the cumulated rate increase required of domestic customers would, by fiscal 2025/26, be significantly greater than the approximately 60% (57%) forecast in IFF 09-1, and, more probably, the cumulated rate increase in 2025/26 could be in the 100% to 120% range (roughly double MH's forecast).

In the next MH rate application, the Board will require MH to file a revised 20-year electric IFF, reflecting as of December 31, 2012:

- Updates to construction costs;

- Projected extra-provincial gross and net revenues;
- Projected domestic and export loads;
- Projected net income;
- Debt equity ratios;
- Projected retained earnings; and
- Projected future domestic rate increases (2012/13 to 2032/32).

Further to the above, the Board will also require MH to analyze and file the implications associated with limiting annual domestic rate increases to 2%, using a 7% discount rate net present value analysis of MH's Development Plan.

This should indicate the adjusted:

- Projected net income;
- Debt/equity ratios; and
- Projected retained earnings.

Drought

Without going into a detailed litany of the various critiques of MH's drought risk processes issued by various parties since 2003/04, the Board is convinced that there are many areas of MH's Drought Risk Management processes that could be improved upon.

These include a more open and transparent management of volumetric risks and price risks. As well, annual post-mortems (back-testing of decisions) should be normal practice. (The Board, in its 2004 GRA Order directed MH to provide such a post-mortem of its actions through the drought of 2003/04, that report was never filed.)

In the Board's view, and in the Board's present predicament of not being privy to MH's export contracts, MH's export business model does not appear to be the assured profit generator that it may have been in past decades. Specific concerns relate to what appears to be MH's misconception that export sales are always profitable when they exceed water rentals and transmission losses; subsequent repurchase costs and the need for export contributions to embedded costs seem to be ignored.

The Board cannot be sure that MH's drought management actions in the period 2002/03 to and including 2004/05 were optimal, when a $436 million net loss required a rate increase aggregating 9.5% to restore MH to its financial targets. That result cannot, in the absence of detailed post-mortem review, be considered ideal. MH should be looking to do better in the future than it did in 2003/04.

In a response to an interrogatory submitted by the Board, MH responded that it would file a written Drought Preparedness Plan by April 1, 2011; MH did not. In cross-examination, MH suggested that a written plan was not needed as MH reacts "everyday" on the basis that a drought could be starting, and it would be difficult to reduce all of MH's experiences into a written plan, when MH has to plan given an infinite number of variables. However, another MH executive appear to over-rule the other executive by indicating "…(it) would be a good idea to have a written drought preparedness plan… "

MH was disingenuous in its response to the Board's interrogatory and it remains to be seen if the Corporation will follow through on its written evidence and oral testimony by a Vice-President.

The Board recommends MH act to meet the urgent need for such a document.

There appears to have been a prodigious amount of study and analysis since 2003/04 (KMG, ICF, Independent Experts, 2008 and 2010 GRA) on MH's risk practices and management. Further work is still warranted. The severe consequences that can attend a drought or less than optimal decisions on major capital projects and export contracts require the attention now apparently being given to the risks.

Power Resource Modelling

The Board accepts that there have been valuable insights gained from the rather extensive number of experts involved on the broader risk issues since the 2003/04 drought event. Significant contributions were made by the following:

- Risk Advisory (engaged by MH);
- Manitoba Water Stewardship Expert Panel (Wuskwatim Hearings);
- NYC (initially engaged by MH);
- Dr. Bhattacharyya (engaged by MH);
- ICF and KPMG (engaged by MH); and
- Independent Experts (engaged by the Board).

The Board has been given to understand that MH has and will be acting on many of the recommendations made in these various reports. The Board sees a need to verify the status of those changes and to seek assurance as to further improvements to MH's modeling process.

Despite an extensive and protracted process that involved numerous experts, there is still no clear indication of the appropriate level of retained earnings required as a drought reserve. While MH does not formally target a specific level of retained earnings, or provide for a specific drought reserve, achieving and maintaining a debt-equity ratio of

75:25, debt to equity, is viewed by MH as the best way to financially position itself for a severe drought, such as has been experienced within the historical record.

The Board has heard recommendations and commentary about:

- Dedicated drought reserve;
- Greater energy-in-storage;
- Export contract value-at-risk reserves; and
- Domestic rate-riders to track export price volatility.

In the Board's view, none of these absolutely preclude the diversion to other purposes of reserves intended for drought recovery. However, the Board favours measures that may reduce the volumetric domestic and export load shortfalls and thus limit the cost impact of drought events. Such measures could include:

- More clearly defined curtailment opportunities within the long term export contracts;
- Stricter volume limits on summer bilateral agreements;
- Redefinition of dependable energy to reduce the non-hydraulic generation components that go to defining dependable surplus energy;
- Adding CCCT thermal generation units to MH's power sources to beef-up dependable generation (generation diversification, as practised by most North American electricity utilities);
- A minimum energy-in-storage policy, in effect a water reserve that cannot be tapped into except in below average flow years;
- Hydrologic predictions of potential spring runoff and potential summer evaporation losses; and

- Disclosure of annual back-testing of supply system operations and net export revenues achieved.

The Board is aware that ICF/KPMG/Independent Experts reports alluded to the ability to gain domestic rate increases (if approved by the Board) as a risk mitigation factor. This is not inconsistent with what happened after both 2003/04 drought and the 2006/07 mini-drought, where rate increases were provided to MH; increases that have provided ongoing revenues that, as a present value, has provided well in excess of the specific revenue shortfalls experienced. Ratepayers have not seen any subsequent rate relief.

Concluding Note

On a positive note, and recognizing that the in-depth risk assessment explored in this hearing (limited by MH's refusal to provide its export contracts, fully updated 20-year financial forecasts and alternative development scenarios, as requested by the Board) was partially stimulated by the dire predictions of bankruptcy and blackouts by NYC, the Board is satisfied by the unanimous evidence of all the experts heard from that such dire predictions are without merit.

Board decisions may be appealed in accordance with the provisions of Section 58 of *The Public Utilities Board Act*, or reviewed in accordance with Section 36 of the Board's Rules of Practice and Procedure (Rules). The Board's Rules may be viewed on the Board's website at www.pub.gov.mb.ca.

6.0 IT IS THEREFORE ORDERED THAT:

1. Manitoba Hydro's requests to finalize existing interim rates and for an additional 0.9% rate increase for all customer classes, effective August 1, 2011, BE AND IS HEREBY DENIED;

2. Existing interim rates and MH's request for a further 0.9% rate increase will be further considered and may be adjusted on a final basis in a subsequent Order of the Board;

3. This Order shall remain interim until a further Order of the Board.

The Public Utilities Board

Report on the **N**eeds **F**or and **A**lternatives **T**o **(NFAT)**

Review of Manitoba Hydro's Preferred Development Plan

June 2014

[THIS PAGE INTENTIONALLY LEFT BLANK]

MESSAGE FROM THE PANEL

Manitobans have benefited from many decades of inexpensive electricity, in large part because of earlier decisions to develop the province's rich hydraulic resources. Manitobans will continue to be highly reliant on these resources for their power generation, and this Report addresses incremental additions to a hydro-dominant system.

At the same time, Manitoba's energy future is uncertain. Wind, solar and energy efficiency technologies, flattening load growth, volatile natural gas prices, climate change and the resulting impacts on water flows, and regulatory changes including the potential for carbon taxes are all creating upheaval in North American energy markets.

Faced with these uncertainties, and in light of the short time frame for the Panel to conduct the review, it would have been tempting to recommend deferring decisions. The Panel took a different route. This Report frames a new energy future for Manitoba.

The Panel expresses its appreciation and gratitude to all participants in the NFAT Review, especially the Public Utilities Board's Staff and Advisors. Any errors and omissions in this Report are solely the responsibility of the Panel.

Respectfully submitted, Winnipeg, June 20, 2014

Executive Summary

A. Mandate

By way of an Order in Council, on April 17, 2013, the Government of Manitoba asked a Panel of the Public Utilities Board of Manitoba (PUB) to conduct a review into the Needs For and Alternatives To (NFAT Review) Manitoba Hydro's Preferred Development Plan, and issue a Report to the Minister responsible for the administration of *The Public Utilities Board Act* by June 20, 2014. The Terms of Reference issued for the NFAT Review require the Panel's report to address the needs for Manitoba Hydro's Preferred Development Plan and to provide an overall assessment as to whether or not the Plan is in the best long-term interest of the Province of Manitoba when compared to other options and alternatives.

Manitoba Hydro's Preferred Development Plan consists of the following components:

- The 695 megawatt (MW) Keeyask Project ($6.5 billion), with a planned in-service date of 2019;
- The 1,485 MW Conawapa Project ($10.7 billion), with a planned in-service date of 2026;
- The North-South Transmission Upgrade Project (approximately $500 million), with an in-service date to coincide with the installation of the last turbine unit of Conawapa; and
- The 750 MW U.S. Transmission Interconnection Project terminating near Duluth, Minnesota (approximately $1 billion).

B. Key Panel Recommendations

As a result of its review, the Panel rejects Manitoba Hydro's Preferred Development Plan, as well as Manitoba Hydro's suggestion to consider pathways that map out a 78-year future, as the Panel sees Manitoba Hydro's long-term future projections as highly speculative and too uncertain.

The Panel recommends to the Government of Manitoba that:

- Spending on the Conawapa Project and the North-South Transmission Upgrade Project be discontinued immediately and the projects terminated;
- The Keeyask Project proceed with an in-service date of 2019;
- The 750 MW U.S. Transmission Interconnection Project proceed;

- Manitoba Hydro be divested of Demand Side Management (DSM) responsibilities and the Government of Manitoba establish an independent arm's length entity to deliver government-mandated DSM targets; and
- The Government of Manitoba not approve any further generation and transmission projects, or approve the commencement of spending on such projects, unless such projects have been examined through a comprehensive and regularly occurring integrated resource planning process.

In reaching its recommendation with respect to the Keeyask Project, the Panel concluded that natural gas generation does not present an acceptable alternative, as it is less economic than hydroelectric generation and relies on burning fossil fuel. Furthermore, any short-term capital cost advantages are offset by significant ongoing operating cost risk, primarily fuel costs. Similarly, wind generation does not currently represent a preferred alternative to Keeyask based on economics.

The Panel's full conclusions and recommendations are set out in Chapter 14 and described at the end of this Executive Summary.

C. The NFAT Review Process

The NFAT Review was governed by the NFAT Terms of Reference as well as the PUB's Rules of Practice and Procedure. As permitted by the Rules of Practice and Procedure, the Panel granted Intervener status to five organizations, namely the Consumers' Association of Canada (Manitoba) Inc. (CAC), the Green Action Centre (GAC), the Manitoba Industrial Power Users Group (MIPUG), the Manitoba Métis Federation (MMF) and Manitoba Keewatinowi Okimakanak Inc. (MKO).

The NFAT Terms of Reference also permitted the Panel to appoint Independent Expert Consultants (IECs) in different subject areas to examine the Preferred Development Plan, file expert reports on the record, and testify in the NFAT Review. The Panel appointed eight IECs to provide evidence at the hearing.

Manitoba Hydro filed its written NFAT Business Case on August 16, 2013 and was subject to two rounds of written Information Requests, which were in part answered through direct discussion between the NFAT Review participants and Manitoba Hydro. Evidence from Interveners and IECs was subject to one round of Information Requests.

The oral evidentiary portion of the NFAT Review started on March 3, 2014, and ended with Manitoba Hydro's closing submissions on May 26, 2014. Overall, the Panel heard 43 days of evidence.

In addition to hearing evidence, the Panel also heard from numerous Presenters, both in Winnipeg and in Thompson, Manitoba. Their Presentations are summarized in Appendix 6.

D. The Need for New Resources

The need for new electricity resources in Manitoba is determined by three things: the level of demand growth in the province projected through load forecasting, existing contractual export obligations, and any reductions in this anticipated demand that can be achieved through DSM initiatives.

Electrical demand is made up of two components: energy, which is the amount of electricity used over a period of time measured in gigawatt-hours (GWh); and capacity, which is the demand for energy at any given point in time measured in megawatts (MW).

Because Manitoba Hydro relies primarily on hydroelectricity, it is subject to water flow variations, which translate into variations in the amount of energy that can be produced in any given year. To meet Manitoba demand and firm export obligations, Manitoba Hydro relies only on dependable energy. Dependable energy is the amount of energy that can be produced during a year that mirrors the lowest-flow year in the last 100 years.

The year of need for new resources is the year in which Manitoba Hydro is first expected to experience a shortage of either dependable energy or capacity.

On its own accord and at the request of the Panel and Interveners, Manitoba Hydro analyzed the year of need based on several uncertainties:

- Whether a demand for 1,700 GWh as a result of oil and gas pipeline customers (pipeline load) would materialize;
- The magnitude of DSM initiatives and corresponding energy and capacity reductions; and
- The ability to serve export contracts, including the new Minnesota Power and Wisconsin Public Service contracts even if the Keeyask Project were deferred beyond 2019.

Based on these factors, the Panel concludes that new generation will likely be required no later than 2024. However, there are compelling economic, financial and commercial reasons to advance the Keeyask Project to 2019.

E. Manitoba Hydro's Load Forecast

Manitoba Hydro prepares a 20-year Load Forecast on an annual basis that projects demand in several customer classes, including Residential, General Service Commercial, General Service Industrial, and Top Consumers, the latter being the largest industrial consumers of electricity in the province. In its 2013 Load Forecast, Manitoba Hydro projects total demand for both energy and capacity to grow by 1.5% per year over the next 20 years. This represents a reduction from earlier planning assumptions.

Several parties criticized the methodologies used by Manitoba Hydro, but the Panel is satisfied that the load forecasting methodology is reasonable in the short term. The biggest short-term uncertainty is whether or not 1,700 GWh of new pipeline load will materialize in Manitoba. This could change the need date for new resources by a full seven years. There is sufficient evidence to assume that the pipeline load will materialize. Accordingly, it is prudent to plan for a need date on that basis.

The Panel has less confidence in Manitoba Hydro's Load Forecast over the long term, as the Load Forecast is unable to anticipate fundamental structural change that could greatly increase or decrease demand. An example of a structural change that could increase demand would be the widespread adoption of electric cars. An example of a structural change that could decrease demand would be alternative renewable technologies, such as domestic solar photovoltaic cells, which are rapidly becoming cost-competitive with traditional generation technologies. This concept is known as "grid parity."

Another long-term uncertainty is the effect of Demand Side Management (DSM), which has the potential to reduce the overall demand for electricity.

F. Demand Side Management (DSM)

DSM is the reduction of energy consumption through targeted energy efficiency and demand initiatives. DSM may also include the adoption of an alternative energy resource or technologies that may result in energy reductions (such as fuel switching to natural gas, domestic solar photovoltaic or heat pump technology). DSM is a powerful tool, as it can defer the need for new generation, and has the potential to be as economic, if not more economic, than new generation.

For consumers, DSM is attractive as it can lower their total consumption of energy, which mitigates the impact of higher rates. Consumers who fully avail themselves of DSM measures have the potential to lower their total energy bill even as rates increase.

Manitoba Hydro prepares a 3-year DSM plan, called Power Smart Plan, on an annual basis in consultation with the Province of Manitoba as required by *The Energy Savings Act*. Through DSM, Manitoba Hydro expects to offset 86% of the anticipated load growth to 2017.

In 2014, Manitoba Hydro also prepared a 15-year supplementary plan. In that plan, Manitoba Hydro expects to offset 66% of anticipated load growth to 2028/29, saving 1,136 MW of capacity and 3,978 GWh of dependable energy annually.

To place this into perspective, the capacity savings in the supplementary plan amount to more than 80% of the net system capacity addition from the proposed Conawapa Project. Similarly, the annual dependable energy savings from the Power Smart Plan exceed 85% of the dependable energy output from the proposed Conawapa Project. To achieve these electricity savings, Manitoba Hydro budgets $822 million, which is less than 8% of the $10.7 billion cost of building Conawapa.

While *The Energy Savings Act* requires consultation with respect to Manitoba Hydro, the Province of Manitoba does not currently set mandatory DSM targets.

Manitoba Hydro treats DSM as a reduction in load forecast demand, rather than as an alternative resource to meet demand projections. This approach was criticized by an independent expert and several Interveners. In their view, DSM should have the same status as generation sources, and be evaluated as such for planning purposes. The Panel shares that view.

Manitoba Hydro dramatically increased its projected DSM savings in the course of the NFAT Review. The Panel is uncertain that these projections can be achieved by Manitoba Hydro. However, this risk is mitigated by the Panel's recommendation to proceed with a 2019 in-service date for the Keeyask Project, which will provide sufficient energy and capacity to meet needs if projected savings do not fully materialize.

Manitoba Hydro's DSM targets appear to be overly aggressive in the short term, and overly conservative in the long term. While incremental DSM savings are projected to be significant in the first few years of the plan, they ultimately tail off. Other jurisdictions have reported that achieving sustainable annual incremental targets of 1.2-1.5% of forecast load is possible.

Manitoba Hydro, formerly a leader in DSM initiatives, has been surpassed by a number of other jurisdictions. Jurisdictions that are DSM leaders have separate DSM delivery entities with clear targets and accountability measures to achieve such targets. The Panel concludes that there is an inherent conflict in Manitoba Hydro being both a seller of electricity and a purveyor of energy efficiency measures. A separate externally regulated entity is required to develop and implement energy efficiency measures and monitor their effectiveness. Such an entity should be subject to regular external audits to confirm DSM savings. Examples of similar arrangements exist in other North American jurisdictions.

The electricity savings delivered through an independent arm's-length entity would constitute an additional resource available to Manitoba Hydro to meet energy needs.

G. Defining Manitoba Hydro's Preferred Development Plan

Manitoba Hydro's Preferred Development Plan consists of the following:

- The 695 MW Keeyask Project ($6.5 billion), with a planned in-service date of 2019;
- The 1,485 Conawapa Project ($10.7 billion), with a planned in-service date of 2026;
- The North-South Transmission Upgrade Project (approximately $500 million), with an in-service date to coincide with the installation of the last turbine unit of Conawapa; and
- The 750 MW U.S. Transmission Interconnection Project terminating near Duluth, Minnesota (approximately $1 billion).

Manitoba Hydro predicated its Preferred Development Plan on a series of executed new power purchase agreements with U.S. counterparties, specifically:

- A 125 MW system power sale agreement with Northern States Power to run from 2021-2025;
- A 100 MW system power sale agreement with Wisconsin Public Service to run from 2021-2027;
- A 250 MW system power sale agreement with Minnesota Power to run from 2020-2035; and
- A 308 MW system power sale agreement with Wisconsin Public Service to run from 2027-2036.

The 308 MW Wisconsin Public Service contract is premised on the construction of the Conawapa Project. Although the export commitments under the contract can be fulfilled with Keeyask alone, this would require a waiver by both parties of the contractual requirement that Conawapa be built for the sale contract to proceed. There is reason to believe that the contract will proceed if Manitoba Hydro can establish that sufficient firm energy will be available without Conawapa.

In addition to exports under contract, Manitoba Hydro also currently exports, and plans to continue to export, electricity into the Midcontinent Independent System Operator (MISO) market at prevailing spot market prices that vary on a day-ahead, real-time basis. Approximately 60% of Manitoba Hydro's projected export revenues are based on these opportunity sales. Manitoba Hydro's total energy exports into MISO represent less than two percent of the total energy in MISO, making Manitoba Hydro a price taker in that market.

Manitoba Hydro argued that a confluence of factors led by significant interest of U.S. counterparties in new imports from Manitoba Hydro and a strengthened interconnection created an opportunity to proceed with the Preferred Development Plan now. The Panel agrees with that argument as it relates to the Keeyask Project and the 750 MW Transmission Interconnection, but not as it relates to the Conawapa Project and the North-South Transmission Upgrade Project.

H. Pathways vs. Projects

In the course of the NFAT Review, Manitoba Hydro recognized that the economic prospects of the Conawapa Project in the near term were uncertain and encouraged the Panel to consider a "pathway" approach. This approach focuses on decisions that must be made in 2014 and acknowledges that there are other decisions that do not have to be made until a later date. Manitoba Hydro suggested that the two decisions that must be reached in 2014 are (1) whether to proceed with the Keeyask Project, and specifically, its planned 2019 in-service date, and (2) whether to proceed with the 750 MW interconnection.

Given the significant uncertainty involved in planning over a 78-year time frame, it is not feasible to approve a pathway with numerous future decision options.

I. Alternatives Evaluated

The Table below shows the 15 alternative development plans presented by Manitoba Hydro for analysis, listed in increasing order of required capital investment.

In the course of the NFAT, Manitoba Hydro took the position that several plans were no longer viable. Specifically, Manitoba Hydro indicated that any plans with a 250 MW interconnection are "hypothetical" as Minnesota Power has sought regulatory approval for a 750 MW line. This eliminates Plans 4, 11, and 13. Furthermore, Plans 5 and 14 were updated to reflect Wisconsin Public Service's unwillingness to invest in the U.S. segment of the transmission line.

Plans were analyzed through an initial economic screening. Manitoba Hydro conducted a full economic analysis on only 12 of the plans, and narrowed this down further to eight plans in its financial and rate impact analysis. In the course of the hearing, as updated assumptions became available, the list of plans was further narrowed.

Description of Manitoba Hydro's Development Plans

Plan	Short Name	Description
1	All Gas	Natural Gas-Fired Generation starting in 2022/23
2	K22/Gas	Keeyask 2022/23, Natural Gas-Fired Generation starting in 2029/30
3	Wind/Gas	Wind Generation starting in 2022/23 supported by Natural Gas-Fired Generation starting in 2025/26
4	K19/Gas24/250MW*	Keeyask 2019/20, Natural Gas-Fired Generation starting in 2024/25, 250 MW Export/50 MW Import U.S. Interconnection 2020/21, 250 MW MP Sale
5	K19/Gas25/750MW(WPS Sale & Inv)**	Keeyask 2019/20, Natural Gas-Fired Generation starting in 2025/26, 750 MW Import/Export U.S. Interconnection 2020/21, 250 MW MP Sale, Proposed 300 MW WPS Sale
6	K19/Gas31/750MW	Keeyask 2019/20, Imports, Natural Gas-Fired Generation starting in 2031/32, 750 MW Import/Export U.S. Interconnection 2020/21, 250 MW MP Sale
7	SCGT/C26	Simple Cycle Gas Turbine in 2022/23, Conawapa 2026/27, Natural Gas-Fired Generation starting in 2038/39
8	CCGT/C26	Combined Cycle Gas Turbine in 2022/23, Conawapa 2026/27, Natural Gas-Fired Generation starting in 2039/40

*Described as hypothetical due to Minnesota Power seeking regulatory approval for a 750 MW interconnection

**Adjusted to remove Wisconsin Public Service investment in the Great Northern Transmission Line

J. Economic Comparison of Alternatives

Manitoba Hydro has consistently taken the position that a "do nothing" approach is not an option, as new generation is eventually required to meet Manitoba demand for electricity. Accordingly, rather than analyze the 15 plans against a do-nothing scenario, Manitoba Hydro used the All Gas Plan as a baseline against which all other plans were evaluated.

Plans were subjected to different methods of economic analysis and compared to the All Gas Plan. The methods used included a determination of Net Present Value (NPV), internal rate of return and break-even year.

Over the course of the NFAT, Manitoba Hydro substantially and materially revised its assumptions, which caused the economics of the Preferred Development Plan to deteriorate. Whereas the NFAT Submission showed an incremental Net Present Value for the Preferred Development Plan of $1.7 billion compared to the All Gas Plan, the revised assumptions reduced this amount to only $45 million over 78 years. This was caused primarily by changes to the assumed capital cost of Keeyask and Conawapa as well as the assumed discount rate and increased DSM.

In contrast, a plan that involves the construction of Keeyask for a 2019 in-service date, the construction of the 750 MW interconnection, and a gas turbine in the later years of the plan, fared better. This plan compares favourably to both the All Gas Plan and the Preferred Development Plan. Deferring Keeyask to 2024 (the need for new supply in Manitoba) is less economic than to advance its in-service date to 2019. Furthermore, even if the 750 MW U.S. transmission interconnection should not receive regulatory approval in the United States, a plan that involves only Keeyask fares no worse than the All Gas Plan. As such, there is sufficient justification to proceed with a 2019 in-service date for the Keeyask Project.

There are realities of the Keeyask Project over which the Panel had no influence. Approximately $1.2 billion has already been spent on the Keeyask Project. The $3.2 billion Bipole III transmission line, which was not subject to the NFAT Review, has already received regulatory approval and will be constructed to carry northern electricity to southern Manitoba. Both of these were treated by Manitoba Hydro as "sunk costs", and therefore excluded from the economic analysis.

Conawapa's economic benefits have not been demonstrated. Furthermore, Manitoba Hydro has not put forward a business case that supports protecting Conawapa's 2026 in-service date.

Gas generation is not a preferred alternative to Keeyask, as it is at least $339 million less economic than the plan recommended by the Panel. While short-term capital costs may be lower, ongoing operating costs are higher, and the lifetime of gas turbines is only approximately one-third of that of a hydroelectric facility. This means a gas turbine of comparable size would have to be replaced twice during the lifetime of the Keeyask Project. The operating costs of a gas facility include the price of natural gas, which is volatile and forecast to increase from current decade-low prices. The burning of fossil fuels also creates significant greenhouse gas emissions, contradicting the Province's Clean Energy Strategy. Furthermore, the pursuit of the All Gas plan would not support the Minnesota Power export contract, which could lead to a loss of the 750 MW U.S. interconnection.

There are significant benefits associated with the 750 MW interconnection that go beyond the pure economics of the underlying export contract. Currently, Manitoba is interconnected with the MISO market through 1,950 MW of transmission capacity. An additional 750 MW interconnection provides increased electric reliability to Manitoba through additional capacity for imports in times of drought or infrastructure outages. The increased transmission capacity also opens new potential markets in the United States to Manitoba Hydro.

Similarly, wind power is not currently a preferred alternative to Keeyask. On its own, wind power is variable and requires backup capacity, either through a gas plant or hydraulic storage. While Manitoba Hydro's future cost projections for wind power are excessively conservative, wind power is currently less economic than other alternatives.

K. Financial Evaluation and Rate Impacts

All plans analyzed by Manitoba Hydro will require significant rate increases for a period of at least 20 years. Given the need to construct new generation by no later than 2024 and to repair or replace existing infrastructure, an approximate doubling of rates by 2032 is seen by Manitoba Hydro as inevitable. By 2032, Manitoba Hydro's projected increase in rates varies from 82% to 125% for different plans. This means that an average electricity bill in 2013 could double by 2032.

Manitoba Hydro's financial targets determine how rates are set. Targets include a self-imposed 75/25 debt-to-equity ratio. Manitoba Hydro's financial forecasts are premised on rates being increased sufficiently to allow the debt-to-equity ratio to recover to the target level over a 20-year time period, followed by lesser rate increases thereafter. During the NFAT Review, Manitoba Hydro also provided alternate suggested rate methodologies that would increase rates more gradually, with the result of pushing back the date at which financial targets will fully recover.

A doubling of rates will have a significant effect on all ratepayers. This includes not just residential customers, but also commercial and industrial ratepayers, the latter of which are sensitive to price increases as it can affect their competitive position. The Panel supports a relaxation of Manitoba Hydro's 75/25 debt-to-equity ratio to smooth out rate increases and the Panel concludes that Manitoba Hydro would still be left with sufficient retained earnings if the equity level was decreased.

While some ratepayers have the option of switching to gas heat if electricity gets too expensive, this option is not available to many other Manitobans to whom gas is not available. These customers will be especially affected by rising rates, as they are dependent on electricity to meet their heating needs.

The Panel is particularly concerned about the impact the projected rate increases will have on lower income consumers, as it heard a substantial amount of evidence about the impact of electricity rates on the lower income segment of the population. This includes customers living in First Nation communities. Manitoba Keewatinowi Okimakanak (MKO) advised that in its First Nations 86% of accounts are currently in arrears, which signals significant affordability issues. However, to a large extent, cost increases can be mitigated by aggressive DSM, which can lead to overall savings.

While ratepayers will shoulder a significant rate burden over the next 20 years, the Province of Manitoba will reap substantial incremental revenues through capital tax and water rental payments from Manitoba Hydro as a result of the Keeyask Project. The Province should give serious consideration to using some of these incremental revenues to fund energy affordability programs targeted to vulnerable consumers, particularly lower income consumers and customers residing in northern and First Nation communities. This could involve rate relief programs as well as targeted DSM programs.

L. Economic Risk Factors

i. Capital Cost Uncertainty

Manitoba Hydro prepares Capital Expenditure Forecasts (CEFs) on an annual basis. Since CEF08, prepared in 2008, the capital cost projections for the Keeyask Project and Conawapa Project have increased in successive annual forecasts. At the start of the NFAT, Manitoba Hydro's capital cost projection was $6.2 billion for the Keeyask Project and $10.2 billion for the Conawapa project. Manitoba Hydro's NFAT Business case was prepared based on these estimates.

The most recent capital cost estimates for the Keeyask Project and Conawapa Project are $6.5 billion and $10.7 billion respectively. This means that since Manitoba Hydro's NFAT evaluations were initially prepared, the projected cost for the Keeyask project has increased by $300 million and the projected cost for the Conawapa Project has increased by $500 million.

Manitoba Hydro executed the Keeyask general civil contract in early 2014. With that contract, approximately 80% of the Keeyask project has now been contracted. Manitoba Hydro assumes that this reduces cost uncertainty, but noted that the Wuskwatim hydroelectric project increased in cost by 10% from a similar project development stage as the Keeyask Project.

Manitoba Hydro's $6.5 billion cost estimate is based on a "P50" estimate, meaning there is a 50/50 chance of costs being either lower or higher. This creates a higher risk of cost overruns than a more conservative P80 estimate. The Panel is also concerned that Manitoba Hydro's assumed escalation rate for construction materials and labour may be too conservative.

The Keeyask general civil contract is a costs-reimbursable contract rather than a fixed-price contract. This means that if volumes of materials increase, Manitoba Hydro is responsible for that increase. The Panel had the opportunity to consider the contract *in camera* as Commercially Sensitive Information, and has concluded that Manitoba Hydro bears a significant cost risk. There is a realistic possibility that the capital cost for the Keeyask Project may reach Manitoba Hydro's "high" cost scenario of $7.2 billion, with a smaller possibility of total costs increasing beyond that amount.

With respect to Conawapa, which has a projected in-service date of 2026, there is significantly more cost uncertainty than for Keeyask, and the Panel has little confidence in the capital cost estimate for the Conawapa Project.

ii. Export Revenue Projections

Over the past decade, Manitoba Hydro has exported between 10,000-12,000 GWh of electricity annually. Its Preferred Development Plan is predicated on exports, and Manitoba Hydro currently predicts a cumulative $6.9 billion of contracted firm energy revenues between 2015 and 2036. In addition, Manitoba Hydro projects approximately $10.1 billion of opportunity sales into the spot market, for which prices fluctuate on a real-time basis. With respect to firm energy, the primary risk is that Manitoba Hydro will not be able to obtain new contracts in the future on equally favourable terms, or at all. With respect to opportunity sales, the primary risk is that energy prices will be lower than projected.

Opportunity sales projections rely on a carbon price eventually developing in the United States, making them highly speculative. There is currently no clear consensus among different commercial export price forecasters regarding the timing and magnitude of carbon pricing. The MISO market is undergoing a period of significant transition, which could have the effect of negating Manitoba Hydro's competitive advantages. This includes the replacement of coal with other, cleaner, technology, which would decrease the environmental premium U.S. utilities will be willing to pay. Furthermore, to the extent any contractual counterparties are currently paying an implicit "carbon premium" on the expectation that carbon pricing will materialize, the failure of a carbon regime to develop could reduce firm export prices in future contracts. Lastly, if load growth in MISO ends up being less than projected, as a result of the reduced demand for electricity, opportunity prices may not be as high as assumed by Manitoba Hydro.

While the Panel has confidence in Manitoba Hydro's projection of $6.9 billion of contract revenue, opportunity sale projections are optimistic, particularly if a carbon pricing regime does not materialize. In that case, domestic ratepayers are exposed to risk as they would have to make up any revenue shortfall.

M. Socio-Economic Evaluation

Manitoba Hydro conducted a Multiple Account Benefit/Cost Analysis for several plans, including the Preferred Development Plan. This analysis determines the net social benefits of each plan and how these benefits are distributed among Manitoba Hydro, ratepayers, the Government of Manitoba and provincial residents in general. Several non-monetary accounts are also considered. Two aspects of this analysis are noteworthy: the socio-economic benefits associated with each plan; and the implications for the Government of Manitoba's revenues.

In Manitoba Hydro's analysis, the Preferred Development Plan has the highest net social benefits. This is primarily due to the economic spin-offs associated with the construction phase of the Keeyask and Conawapa Projects. There would be significant leakages of spending out of the province, as only 45% of construction jobs are expected to be filled by Manitobans and major components such as turbines, cement and steel must be sourced from outside the province; nonetheless, the Preferred Development Plan has a larger impact on employment and income than the other plans.

The socio-economic benefits of the Keeyask Project are more tangible than those of the Conawapa Project. According to Manitoba Hydro's economic analysis, the Keeyask Project will create Manitoba labour income of over $500 million, and almost 7,000 person-years of employment. The project will be developed through a partnership between Manitoba Hydro and four First Nations. These are Tataskweyak, War Lake, Fox Lake and York Factory, collectively known as the Keeyask Cree Nations (KCNs). Pursuant to the partnership agreement, significant benefits will flow to the four First Nations through preferred dividend distributions, directly negotiated contracts, and an aboriginal training and employment initiative. To reap the long-term benefits of such training and employment, ongoing professional development opportunities are likely required after Keeyask is completed.

At the NFAT Review, the KCNs spoke in support of the project and indicated that if Keeyask were to be delayed, it would not be easy to regain the momentum and start over. While the NFAT Panel heard dissenting views from some members of the KCN communities, such views represent a minority opinion, as referenda were held in each community.

With respect to the Government of Manitoba, substantial government revenues accrue from hydroelectric development, primarily through water rental fees and capital taxes paid by Manitoba Hydro. At a 3.0% discount rate, the 78-year Net Present Value of water rentals and capital taxes is $6.1 billion for a plan that involves Keeyask and the 750 MW interconnection. This constitutes an additional benefit to the Province that is not captured in the results of Manitoba Hydro's economic evaluation, and dwarfs the incremental benefits flowing to Manitoba Hydro and its ratepayers.

N. Macro Environmental Evaluation

The Panel was asked to conduct a macro environmental evaluation of the Preferred Development Plan. The Panel interpreted and defined the term in accordance with the direction of the Province not to duplicate efforts undertaken by the Manitoba Clean Environment Commission, which, together with the federal Canadian Environmental Assessment Agency, has conducted an environmental assessment review of the Keeyask Project. No similar review has taken place for the Conawapa Project to date. The Clean Environment Commission recommended that a licence be issued for the Keeyask Project, with certain mitigation and monitoring conditions, including stocking of lake sturgeon for 50 years.

The Preferred Development Plan has significant Greenhouse Gas (GHG) benefits compared to alternatives, both in terms of avoided emissions and in terms of GHG displacement in the MISO market, which is still heavily reliant on coal. The Panel's recommended plan has lower total emissions than all other technologies except wind and nuclear energy.

Nonetheless, both the Keeyask Project and the Conawapa Project will have adverse impacts, with the impacts of the Keeyask Project better known due to the environmental assessment review having already been completed. The most significant adverse effect of the Keeyask Project is its impact on lake sturgeon due to the disappearance of Gull Rapids and a risk of turbine mortality for adult lake sturgeon. Other adverse effects include impact on caribou, flooding, and temporarily increased methyl mercury levels as a result of leaching from flooded soil. To the extent such effects have not been mitigated, Manitoba Hydro has agreed to compensate affected First Nations through Adverse Effects Agreements.

Manitoba Hydro's hydroelectric plans have the lowest overall macro environmental impact when GHG savings are taken into consideration, with wind power being competitive with hydroelectricity from a macro environmental perspective. Nonetheless, the Panel heard from several affected First Nations communities about the effects of past hydropower developments, and one Intervener strongly suggested the need for a regional Cumulative Effects Assessment to be completed.

While the Preferred Development Plan has the greatest GHG displacement potential, the Panel notes that if Keeyask proceeds and Manitoba Hydro renews its emphasis on DSM, Conawapa is not required. The Panel further notes that in the future, other renewable technologies are likely to become commercially feasible.

The Panel's recommendations are aligned with Manitoba's Clean Energy Strategy, *The Climate Change and Emissions Reductions Act*, and the Principles of Sustainable Development as outlined in *The Sustainable Development Act*, and as such are consistent with the Province's goals for a clean energy future.

O. Integrated Resource Planning

The Terms of Reference required the Panel to consider "if preferred and alternative resource and conservation evaluations are complete, accurate, thorough, reasonable and sound."

By failing to offer an analysis of conservation measures as a stand-alone energy resource competitive with other generation resources, Manitoba Hydro presented an analysis of conservation measures that was neither complete, accurate, thorough, reasonable nor sound.

Integrated resource planning is a regular practice in many jurisdictions. An integrated resource plan determines what supply side and demand side resource mix is in the best interest of electricity customers. The Panel heard evidence that the best practices for integrated resource planning involve placing every resource option on an equal footing and a public consultative planning process. In contrast, Manitoba Hydro prepares an annual Power Resource Plan that is not developed through a public integrated resource planning process.

The NFAT Review demonstrated that DSM measures were not equally weighted with other energy options as they would have been if Manitoba Hydro had used an integrated resource planning process framework.

The effectiveness of integrated resource planning in determining least-cost combinations of resources cannot be overestimated.

To satisfy anticipated load growth to 2028/29, the Preferred Development Plan delivers 2,025 MW of additional capacity at an estimated cost of $18.7 billion. If the supplementary 2014 Power Smart Plan DSM measures were treated as a stand-alone and equally weighted resource and added to the capacity from the Keeyask Project, the total capacity addition would be 1,766 MW at a projected cost, including transmission, of $8.3 billion. This is more than 85% of the net system capacity addition of the Preferred Development Plan.

It was only in the course of the NFAT hearing that it became clear that significantly higher levels of DSM than originally proposed by Manitoba Hydro were both achievable and economic. Proper integrated resource planning could have reached that determination years earlier.

P. Panel Conclusions and Recommendations

Manitoba Hydro has not justified the need for its Preferred Development Plan and has not shown it to be superior to alternatives.

There are good reasons to proceed with the Keeyask Project at this time in light of the need for new resources, construction expenditures undertaken to date, the socio-economic and environmental benefits of the project, and the important commercial relations that Manitoba Hydro has established both with First Nations and through its export contracts. Moreover, there are associated reliability benefits with the 750 MW Transmission Interconnection Project.

In contrast, Manitoba Hydro's business case did not demonstrate the need for Conawapa and the associated North-South Transmission Upgrade. The risks associated with the Conawapa Project are unacceptable. It is too speculative in light of rapidly changing conditions in North American electricity markets.

Manitoba's energy future no longer lies exclusively with hydroelectricity. In a time of rapid technological innovation in both the demand and supply side, openness to alternative resources and new technologies will be required. This may involve new methods of saving electricity as well as new methods of generating it, such as wind and solar power. Integrated resource planning provides the analytical framework to evaluate such options and, as such, should be required before any further generating facilities beyond the Keeyask Project are constructed.

The Panel recommends the following:

Manitoba Hydro's Preferred Development Plan

1. The Panel recommends that the Government of Manitoba not approve Manitoba Hydro's proposed Preferred Development Plan.

Keeyask Project

2. The Panel recommends that the Government of Manitoba authorize Manitoba Hydro to proceed with the construction of the Keeyask Project to achieve a 2019 in-service date.

750 MW U.S. Transmission Interconnection Project

3. The Panel recommends that the Government of Manitoba authorize Manitoba Hydro to proceed with the 750 MW U.S. Transmission Interconnection Project for a 2020 in-service date.

Conawapa Project

4. The Panel recommends that the Government of Manitoba not approve the construction of the Conawapa Project and the North-South Transmission Upgrade Project.

5. The Panel recommends that the Government of Manitoba direct Manitoba Hydro to immediately cease any and all expenditures associated with the design, implementation, and future development of the Conawapa Project.

Creating New Demand Side Management Opportunities

6. The Panel recommends that the Government of Manitoba divest Manitoba Hydro of its responsibilities for Demand Side Management.

7. The Panel recommends that the Government of Manitoba mandate incremental annual Demand Side Management targets in the order of 1.5% of forecast domestic load (including codes and standards) over the long term.

8. The Panel recommends that the Government of Manitoba establish a regulated, independent arm's-length entity that would be responsible for developing and implementing a plan to meet the mandated Demand Side Management targets.

9. The Panel recommends that the Demand Side Management savings reported by the independent arm's-length entity be independently audited on an annual basis.

10. The Panel recommends that until the independent arm's-length entity is established, Manitoba Hydro continue to address the barriers to lower income customer participation in its Demand Side Management programs.

11. The Panel recommends that until the independent arm's-length entity is established, Manitoba Hydro proceed with its fuel switching and heating fuel choice initiatives to encourage customers to use natural gas for space and water heating.

Rates and Ratepayer Impacts

12. The Panel recommends that the Government of Manitoba direct a portion of the incremental capital taxes and water rental fees from the development of the Keeyask Project to be used to mitigate the impact of rate increases on lower income consumers, northern and aboriginal communities.

13. The Panel recommends that Manitoba Hydro relax its 75/25 debt-to-equity ratio policy to moderate its proposed electricity rate increases.

14. The Panel recommends that Manitoba Hydro implement cost containment measures to moderate its proposed electricity rate increases.

Actions in Support of a Clean Energy Future

15. The Panel recommends that integrated resource planning become a cornerstone of a new clean energy strategy for the Province of Manitoba.

16. The Panel recommends that the Government of Manitoba not approve the construction of any generating facilities, nor approve the beginning of the

required infrastructure work for any generation facility, beyond the Keeyask Project, unless such facilities are justified through an integrated resource planning process. The integrated resource planning process must include public consultation.

1.0.0 The Needs For and Alternatives To Review

1.1.0 Background

Manitoba Hydro has identified a need for new electricity resources based on its forecasts of future electricity demand in Manitoba and electricity export sale commitments. To meet this need, Manitoba Hydro examined a number of resource options and identified a Preferred Development Plan, which it believes will provide significant benefits to Manitobans and is the best option when compared to alternatives. This Plan, which consists of building the Keeyask and Conawapa generating stations, as well as associated transmission facilities, and a 750 MW transmission interconnection to the United States, has been approved by the Manitoba Hydro Electric Board and submitted to the Government of Manitoba for approval.

Under *The Manitoba Hydro Act*, Manitoba Hydro must have the Lieutenant Governor in Council's approval to develop new power generation stations and to supply power to other jurisdictions. Before it makes a decision, the Government of Manitoba may have Manitoba Hydro's development plans undergo a public review.

On January 13, 2011, the Government of Manitoba advised Manitoba Hydro that it intended to have an independent body conduct a Needs For and Alternatives To (NFAT) review of the proposed Keeyask and Conawapa generation projects and related transmission facilities. This notification was followed in late 2012 by an announcement from the then Minister of Innovation, Energy and Mines that the Government had asked the Public Utilities Board (PUB) to conduct the NFAT Review.

1.2.0 The Nature and Role of the Public Utilities Board

The Public Utilities Board is an arm's length, provincial, quasi-judicial body established under *The Public Utilities Board Act*. The Lieutenant Governor in Council appoints the Board's members. One of the PUB's main functions is to set "just and reasonable rates" that utilities such as Manitoba Hydro may collect from ratepayers for electricity and natural gas services. In addition to its general jurisdiction, the Board may, from time to time, perform additional duties assigned to it, such as those assigned by order of the Lieutenant Governor in Council under clause 107(b) of *The Public Utilities Board Act*.

1.3.0 Formation of the Needs For and Alternatives To (NFAT) Review

1.3.1. Order in Council and Terms of Reference

The NFAT Review was officially constituted on April 17, 2013 by Order in Council 128/13, whereby the Lieutenant Governor in Council assigned to the PUB, the conduct of a Needs For and Alternatives To Review (NFAT Review) of Manitoba Hydro's proposed Preferred Development Plan, which includes the Keeyask and Conawapa Generating Stations, their associated domestic alternating current transmission facilities, and a new international transmission interconnection.

The Order in Council sets out detailed Terms of Reference for the conduct of the NFAT Review (see Appendix 1). The Terms of Reference establish the subject matter and scope of the NFAT Review. The first component of the Review is a "needs for" analysis. In this regard, the Terms of Reference direct the PUB to assess whether the needs for Manitoba Hydro's Preferred Development Plan are "thoroughly justified and sound, its timing is warranted, and the factors that Hydro is relying upon to prove its needs are complete, reasonable and accurate."[1] The second element of the Terms of Reference directs the PUB to examine the "alternatives to" the Preferred Development Plan and "whether the Plan is justified as superior to potential alternatives that could fulfill the need."[2] The factors that must be considered in relation to both of these elements are outlined in the Terms of Reference.

1.3.2. Matters Not Within the Scope of the Review

There are a number of matters that the Government has decided to exclude from the scope of the NFAT Review. These matters are set out in the Terms of Reference and are listed below:

- The Bipole III transmission line and converter station project;
- The Pointe Du Bois project;
- Commercial arrangements between Hydro and its aboriginal partners for the development of the proposed hydro-electric generating stations (Keeyask and Conawapa);
- The environmental reviews of the proposed projects that are part of the Preferred Development Plan, including Environmental Impact Statements (subject to individual processes by the Manitoba Clean Environment Commission);

[1] Exhibit PUB-2, p. 2.
[2] Exhibit PUB-2, p. 2.

- Aboriginal consultation pursuant to section 35 of the *Constitution Act* (conducted as a separate Crown-Aboriginal consultation process);
- Past Manitoba Hydro development proposals or government assessments of past development proposals, including past NFATs; and
- Historic environmental costs.

1.3.3. Conduct of the NFAT Review

The Terms of Reference direct the Panel to conduct the NFAT Review in accordance with *The Public Utilities Board Act* and the Terms of Reference, and through "a transparent and public process." The public was encouraged to provide input and comment on the Preferred Development Plan. In an effort to provide the public with access to the public information filed in the course of the Review, the PUB maintained a dedicated NFAT Review portal within the PUB's website. All of the non-Commercially Sensitive Information, including documents, reports, filings, exhibits and testimony provided in the NFAT Review can be downloaded from the website of the Public Utilities Board at the following address: *http://www.pub.gov.mb.ca/nfat/index.html.*

1.3.4. Report to Government

The Order in Council directs the PUB to prepare a report on the matters outlined in the Terms of Reference and to present that report to the Minister responsible for the administration of *The Public Utilities Board Act* by June 20, 2014. The Report is to include recommendations to the Government of Manitoba on the needs for Manitoba Hydro's Preferred Development Plan and an overall assessment as to whether or not the Plan is in the best long-term interest of the province of Manitoba when compared to other options and alternatives.[3]

1.4.0 Review Parties and Participants

1.4.1. The PUB NFAT Review Panel

Under the Terms of Reference, the Chair of the PUB is to designate an NFAT Panel from PUB members to carry out the NFAT Review. The Panel formed to conduct the Review consisted of Régis Gosselin, (Chair of the Panel and of The Public Utilities Board), and Board members Richard Bel, Dr. Hugh Grant, Marilyn Kapitany, and Larry Soldier. Mr. Bel and Dr. Grant were appointed as members of the Public Utilities Board for the purpose of participating in the NFAT Review by Order in Council 472/2013 on December 18, 2013.

[3] Exhibit PUB-2, pp. 2-3.

1.4.2. Manitoba Hydro

As the proponent for the Preferred Development Plan, Manitoba Hydro had "applicant" status for the NFAT Review. It was Manitoba Hydro's business case that was analyzed by the Panel. Throughout this Report, the business case is referred to as Manitoba Hydro's NFAT Submission.

1.4.3. Interveners

Interveners are parties, usually umbrella organizations, which represent the perspectives of affected stakeholders. There is no right to Intervener status, but the Public Utilities Board has the discretion to permit Interveners. The function of Interveners is to assist the Board in a role akin to a "friend of the court." Interveners have the right to adduce their own evidence and test the evidence of other parties.
The Board granted Intervener status to the following five organizations: [4]

- Consumers' Association of Canada (Manitoba) Inc. (CAC)
- Green Action Centre (GAC)
- Manitoba Industrial Power Users Group (MIPUG)
- Manitoba Keewatinowi Okimakanak Inc. (MKO)
- Manitoba Métis Federation (MMF).

The Consumers' Association of Canada (Manitoba) Inc. is an independent, non-profit, volunteer-based organization dedicated to educating and informing consumers and to representing the interests of consumers to all levels of government and sectors of society. CAC notionally represents Manitoba Hydro's 456,130 residential customers. CAC has intervened in all rate applications before the PUB for electricity, natural gas, and auto insurance rates.

The Green Action Centre (formerly Resource Conservation Manitoba) is a non-profit, non-governmental organization, based in Winnipeg and serving Manitoba. GAC promotes greener living through environmental education and encourages practical green solutions for homeowners, workplaces, schools, and communities. Its primary areas of work are green commuting, composting and waste, sustainable living, resource conservation, and energy and climate change policy.

The Manitoba Industrial Power Users Group is an association of major industrial customers operating in Manitoba. Its members are: Amsted Rail - Griffin Wheel

[4] Exhibit PUB-6.

Company (Winnipeg); Canexus (Brandon); Enbridge Pipelines Inc. (Southern Manitoba); ERCO Worldwide (Virden); Gerdau Long Steel North America – Manitoba Mill (Selkirk); HudBay Minerals Inc. (Flin Flon); Koch Fertilizer Canada ULC (Brandon); Tolko Industries Ltd. (The Pas); TransCanada Keystone Pipeline (Southern Manitoba); and Vale (Thompson). These customers work together on issues of common concern related to electricity supply and rates in Manitoba. Members' concerns are reflective of the size of their investments in Manitoba, the long-term view essential for such investments, and the requirement for continued large-scale purchases from Manitoba Hydro. Members' concerns also reflect competitive market pressures from selling Manitoba industrial products to external markets, and the need to secure the lowest reasonable costs for power and other production inputs to offset disadvantages from operating in Manitoba, such as transportation.

Manitoba Keewatinowi Okimakanak Inc. represents more than 65,000 treaty First Nation citizens in northern Manitoba. MKO has been in existence for over 32 years, and is a non-profit advocacy organization governed by the elected Chiefs of the 30 First Nations in northern Manitoba.

The Manitoba Métis Federation represents over 100,000 Manitoba Métis citizens at the local, regional, and provincial levels. The history and early beginnings of trade and industrial development in Manitoba are interwoven with the history of the Manitoba Métis community as founders of Manitoba. The MMF supports development in Manitoba as long as the development is handled in a manner that promotes sustainability and economic prosperity for the Manitoba Métis community and for all Manitobans.

The PUB approved Intervener funding for all five Interveners as provided for in its Rules of Practice and Procedure. Interveners were represented by legal counsel and were approved by the PUB to engage experts to undertake research, prepare reports and assist them in participating in the NFAT Review. Please see Appendix 4 of this Report for a listing of the Interveners and the issues they considered in relation to the Terms of Reference.

1.4.4. Independent Expert Consultants

The Terms of Reference also provide for the Panel to engage independent expert consultants (IECs) to assist it in the NFAT Review. The Terms of Reference outline a number of subjects that the IECs are to examine.

The Panel used a Request for Qualifications (RFQ) process to engage the IECs. A detailed Request For Qualifications document was finalized in June 2013 and approved by the Panel. Fifteen firms responded to the RFQ and eight were chosen as IECs, along with another firm who was approved as a subcontractor to one of the chosen IECs. Detailed scopes of work were developed for each IEC in specific subject and issue areas. Independent legal counsel was also appointed for the IECs.

The following subject areas were addressed by IECs. Their detailed scopes of work can be found on the PUB website.

Table 1 List of Independent Expert Consultants

Independent Expert Consultant	Scope of Work (High-Level Description)
Elenchus Research Associates Inc.	Load forecasting, DSM, energy efficiency
La Capra Associates, Inc.	Power resource planning, economic evaluation, business case and risk analysis, transmission economics, export contracts, financial modelling
EnerNex (as a subcontractor to La Capra Associates, Inc.)	Wind matters
Knight Piésold Ltd.	Construction management, capital costs
MNP LLP	Macro-environmental issues
MPA Morrison Park Advisors Inc.	Commercial evaluation of Preferred Development Plan
Potomac Economics, Inc.	Midcontinent Independent System Operator (MISO), export markets, export prices and revenues
Power Engineers, Inc	Transmission line construction and management
TyPlan Consulting Ltd.	Socio-economic impacts and benefits

The IECs were engaged as independent arm's-length experts to provide an impartial, independent review of the matters assigned to them in their respective scopes of work and by the Terms of Reference. With a view to preserving that impartiality and independence, the PUB required all parties to the Review to follow a comprehensive communications protocol in relation to the IECs.[5] The communications protocol established parameters for IEC interaction with the NFAT Review Panel and other members of the PUB NFAT Review team, including PUB staff, legal counsel, technical advisors, and the NFAT project manager. The protocol ensured that the IECs did not receive direct instruction from the NFAT Review Panel, aside from additions to their scopes of work. Inquiries between the PUB team and the IECs, other than those of a purely administrative nature, were routed through the IECs' independent legal counsel.

Parameters were also established in relation to the preparation and filing of the IECs' reports. IECs were not to share draft reports with the PUB team and their final reports were to be filed in evidence in the NFAT proceeding on the public record even if the NFAT Review Panel disagreed with their findings and conclusions. As required by the

[5] Exhibit PUB-20, Appendix A, pp. 16-18.

Terms of Reference, the IECs' reports were to contain their analysis of the submissions filed by Hydro and were not to draw conclusions about the needs for or alternatives to the Preferred Development Plan; this being the remit of the Panel.[6]

1.4.5. Presenters

The Panel also heard from Presenters. Presenters are organizations or individuals who are not intervening in the proceedings, but who nevertheless wish to make their views known to the Panel. Presenters were able to provide their views in writing to the Panel or could appear before the Panel at the NFAT public hearings. Presenters made their presentations throughout the hearing process, as well as at designated presenter days in Winnipeg and Thompson, Manitoba. Summaries of the Presenters' reports and presentations are found in Appendix 6.

1.5.0 Review Process and Hearing

1.5.1. The Hearing

Following the issuance of the NFAT Terms of Reference on April 17, 2013, the Panel issued a public Notice of Pre-Hearing Conference in major newspapers across Manitoba and required Manitoba Hydro to serve past Interveners before the Public Utilities Board and the Clean Environment Commission. A pre-hearing conference to hear submissions with respect to process as well as applications for Intervener status took place on May 16, 2013. A further pre-hearing conference to deal with procedural matters took place on September 4, 2013.

Prior to the filing of Manitoba Hydro's NFAT Submission on August 16, 2013, Manitoba Hydro held a two-day technical conference for the Panel, IECs and approved Interveners to provide an overview of how the NFAT Submission business case would be organized and what information it would contain. A second technical conference was held in September 2013.

The hearings began on February 27, 2014 with non-evidentiary presentations received from registered Presenters. Presentations were also heard throughout the proceedings in Winnipeg and on May 14, 2014 in Thompson, Manitoba. The evidentiary portion of the hearing commenced on March 3, 2014 and ended on May 14, 2015. Closing submissions from Interveners were held on May 20 and May 21, 2014. Closing submissions from Manitoba Hydro were received on May 26, 2014. With the exception

[6] Exhibit PUB-2, p. 4.

of the one-day session for Presenters in Thompson, Manitoba, all hearings were held in Winnipeg.

1.5.2. Filings and Records of the Hearing

Information Requests

The Board's Rules of Practice and Procedure allow the parties to make Information Requests of other parties. Following the filing of Manitoba Hydro's NFAT Submission on August 16, 2013, Interveners, IECs, and PUB Advisors submitted two rounds of written Information Requests. Manitoba Hydro challenged a number of Information Requests and questioned the volume of them. The Panel held a motions day on these issues on September 30, 2013, as a result of which it decided that certain Information Requests did not have to be answered. The Panel also encouraged all parties to obtain answers to Information Requests through informal discussion with Manitoba Hydro to the extent possible, thus reducing the number of formal written Information Requests to be answered.

The process also allowed for one round of Information Requests to IECs and Intervener experts, which was utilized by most parties to the hearing.

Filing of Evidence

Consistent with PUB practice, all documents relevant to the Review and within the scope of the Terms of Reference, except for Commercially Sensitive Information, were filed on the public record. These public documents were made available to the public on the PUB website. Commercially Sensitive Information was not publicly filed or made available on the website. In addition to the filing of Manitoba Hydro's NFAT Submission and responses to Information Requests, answers to undertakings and pre-asks were filed periodically throughout the oral evidentiary portion of the hearing.

1.5.3. Commercially Sensitive Information

The Panel obtained access to and considered Commercially Sensitive Information (CSI) to ensure that it was fully informed in reaching its conclusions and recommendations. CSI is described in the Terms of Reference as *"any information that may reasonably be expected to cause undue financial loss to Manitoba Hydro … or any of its contractual counterparties or to harm significantly Hydro's or its contractual counterparties' or domestic customers' competitive position"….* [7] This information included Manitoba Hydro's export contracts and term sheets for the purchase and sale of power and

[7] Exhibit PUB-2, p. 6.

energy entered into between Manitoba Hydro and its U.S. customers, export price forecasts, Manitoba Hydro's yearly internal, non-public load forecasts, construction contracts, and Manitoba Hydro's existing and future Power Resource Plans.

The Panel was aware of the importance of conducting a transparent and public process, but also of its obligation to respect the commercially sensitive nature of some of Manitoba Hydro's information. Throughout the hearings, the Panel, in discussions with Manitoba Hydro and legal counsel, endeavored to find ways to make as much information publicly available as possible. As a result of these discussions, some of the information initially redacted as CSI was made publicly available with Manitoba Hydro's consent.

The IECs had access to CSI in preparing their reports. However, CSI was redacted from public versions of IECs' reports. The Panel held *in camera* proceedings to consider evidence based on Commercially Sensitive Information.

While this report does not contain or make direct reference to specific Commercially Sensitive Information, the Panel's conclusions and recommendations are informed by CSI evidence adduced during the *in camera* portions of the hearing.

1.5.4. Weighing of Evidence

In Appendix 7 the Panel has listed the names of the witnesses, and others, who have appeared at the NFAT Review.

It was the Panel's intention to record the names of all who have contributed to the Panel's better understanding of the myriad of complex issues, and the Panel regrets any omissions that may have occurred.

As the list discloses, the Panel heard evidence from over 75 witnesses. Even if the witness' name is not cited in the body of the Report, each and every witness assisted the Panel in its understanding of the issues and in reaching its decisions and recommendations.

As can be expected in a hearing of this magnitude, different witnesses provided different and sometimes opposing evidence on the same issue. In such cases, the Panel carefully weighed the evidence from the competing perspectives before arriving at its conclusions and recommendations.

The Panel again thanks all witnesses and parties for their dedication and professionalism in the NFAT Review.

2.0.0 Manitoba Hydro's Preferred Development Plan

2.1.0 Preferred Development Plan Components

Manitoba Hydro's Preferred Development Plan involves a major investment in new generation, transmission, and export contracts. At its core, the Preferred Development Plan involves the following components:

- The 695 megawatt (MW) Keeyask Project ($6.5 billion), with a planned in-service date of 2019;
- The 1,485 MW Conawapa Project ($10.7 billion), with a planned in-service date of 2026;
- The North-South Transmission Upgrade Project (approximately $500 million), with an in-service date to coincide with the installation of the last turbine unit of Conawapa; and
- The 750 MW U.S. Transmission Interconnection Project terminating near Duluth, Minnesota (approximately $1 billion).

2.1.1. The Keeyask Project

The Keeyask Project includes the construction of a 695 MW hydropower generating station located in northern Manitoba at Gull Rapids, as well as the development of ancillary transmission facilities.

The Keeyask Project is expected to take seven years to construct at a total estimated in-service cost of $6.2 billion as of the time of Manitoba Hydro's NFAT Submission. This estimate has since been revised to $6.5 billion.[8] Construction of the preparatory support infrastructure began in 2012. Manitoba Hydro anticipates that construction of the generating station and transmission components will commence during the summer in 2014, after all necessary regulatory approvals have been received. Initial power production is anticipated for 2019, with all generating units in production by 2020. When fully operational, Keeyask is expected to produce an average of 4,400 gigawatt-hours (GWh) of electrical energy annually. Annual dependable energy production (the amount of energy that could be produced in the lowest-flow year on record) is projected to be 3,003 GWh.

[8] Exhibit MH-113.

The generating facility is being developed through the Keeyask Hydropower Limited Partnership (KHLP), a partnership between Manitoba Hydro and four First Nations, namely the Tataskweyak Cree Nation, War Lake First Nation, Fox Lake Cree Nation and York Factory First Nation. The commercial terms of the arrangement are set out in the Joint Keeyask Development Agreement (JKDA). A review of these terms was excluded from the scope of the NFAT Review.

The Partnership will contract the planning, construction, and operation of the generation and infrastructure projects to Manitoba Hydro. Manitoba Hydro will then subcontract most of the services and supplies required to build the project. In addition, Manitoba Hydro will be contracted to provide the required debt financing for the projects. KHLP will sell all the power produced at the generating station to Manitoba Hydro.

Manitoba Hydro will own and operate the transmission infrastructure required for the Keeyask generating station.

2.1.2. The Conawapa Project

The Conawapa Project includes the construction of a 1,485 MW hydroelectric generating station downstream of the Limestone generating station, as well as the development of ancillary transmission facilities.

The Conawapa Project is expected to take over 10 years to construct at a total estimated in-service cost of $10.2 billion as of the time of the filing of Manitoba Hydro's NFAT Submission. This estimate has since been revised to $10.7 billion.[9] In its August 2013 submission, Manitoba Hydro anticipates that construction of the generating station will commence in 2017. Initial power production is projected for May 2026; with all generation units in production by October 2027. Final decommissioning of temporary infrastructure and site rehabilitation is slated for completion in 2028. When fully operational, Conawapa is expected to produce an average of 7,000 gigawatt-hours (GWh) of electrical energy annually.

2.1.3. North-South Transmission System Upgrade Project

Manitoba Hydro's high-voltage direct current (HVDC) transmission system, which will include Bipole III, will be used to transmit the power to be produced at the Conawapa Generating Station. However, certain upgrades to the exiting northern alternating current and high-voltage direct current system are required to transmit the remaining power. These upgrades are described in Manitoba Hydro's NFAT Submission as the

[9] Exhibit MH-113.

North-South Transmission System Upgrade Project. The Upgrade Project consists of two main elements:

- Upgrades to the existing northern 230 kV alternating current (AC) transmission system; and
- Upgrades to the existing HVDC transmission system within or in the immediate vicinity of the Radisson Converter Station and Kettle Generating Station in the north and the Riel Converter Station in the south.

The proposed in-service date for the Project is to coincide with the in-service date of the last Conawapa generating units. The initial, estimated capital cost for the North-South Transmission System Upgrade Project is $340 million (in $2012).[10]

2.1.4. Manitoba-Minnesota Transmission Project

The proposed Manitoba-Minnesota Transmission Project is a single circuit 750 MW, 500 kV alternating current (AC) transmission line starting at the existing Dorsey Converter Station south of Winnipeg, and connecting at the Manitoba-Minnesota border to the Great Northern Transmission Line, a new transmission line proposed by Minnesota Power. The projected in-service cost for the Manitoba portion of the project is $350 million.

2.1.5. Great Northern Transmission Line

The Great Northern Transmission Line is a new 750 MW, 500 kV AC transmission line proposed by Minnesota Power, one of Manitoba Hydro's contractual counterparties, in Minnesota. In the north, it would join with the Manitoba-Minnesota Transmission Project described above. In the south, it would terminate in the Iron Range near Duluth, Minnesota.

While the Great Northern Transmission Line is proposed and being developed by Minnesota Power, Manitoba Hydro plans to have a 49% ownership stake in the line, effectively funding a portion of construction and operating expenses. Manitoba Hydro intends to fund 67% of the line, but has expressed hope that it will eventually be able to sell its ownership stake. The total projected construction cost is in the vicinity of US$700 million. Construction is anticipated to begin in 2016, for an in-service date of 2020.

[10] Exhibit MH-95, p. 85.

2.2.0 The Preferred Development Plan and its Alternatives

In its NFAT Submission, Manitoba Hydro presented 14 alternative plans in addition to the Preferred Development Plan. These alternatives had been prepared to help test the Preferred Plan, as well as illustrate other resource options. These alternatives are presented in the Table below.

The plans fall into three main categories:

- four plans with a 750 MW U.S. interconnection;
- three plans with a 250 MW U.S. interconnection; and
- seven plans that, starting in 2022/23, meet Manitoba Hydro's domestic load and existing firm export commitments with no new U.S. interconnection.

2.2.1. Pathways

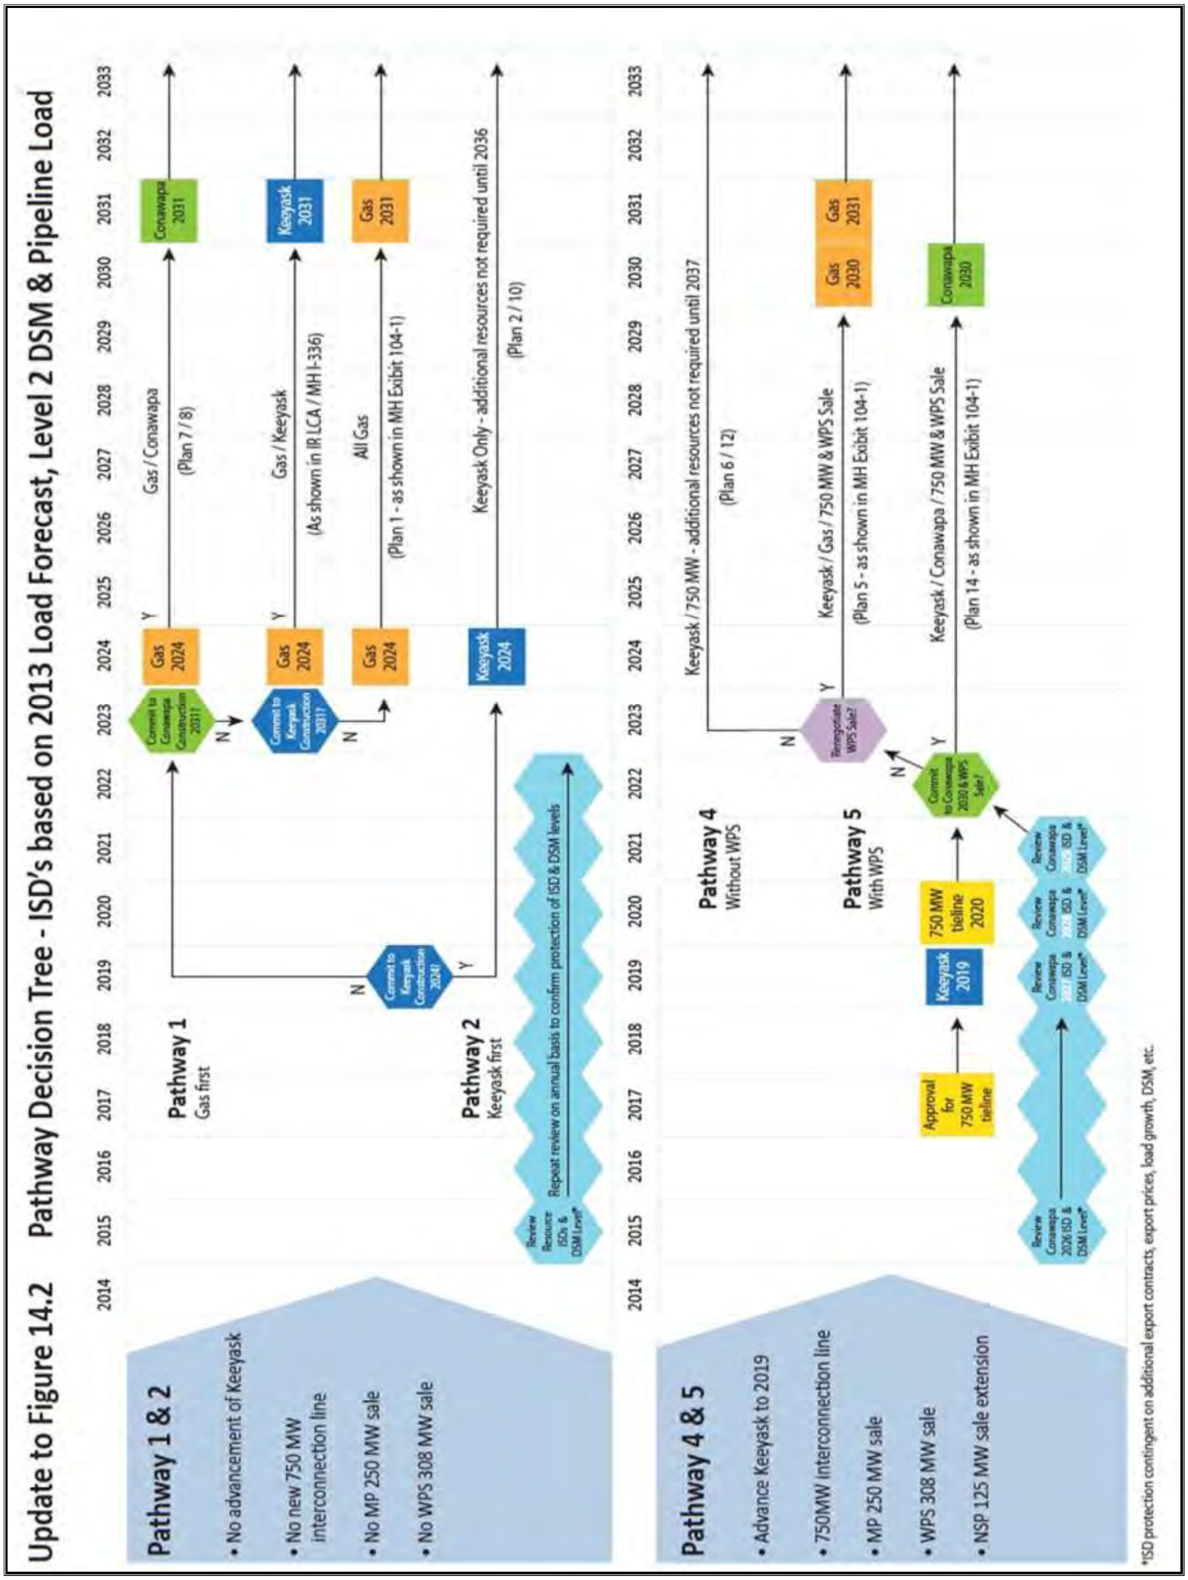
As a part of its planning, Manitoba Hydro prepared a number of pathways that would guide decisions on both the introduction of new generation, and their logical timing and order.[11] The Figure at the end of this chapter[12] presents the final version of the pathways that include the proposed actions associated with all of the new generation options and facilities: the construction of the Keeyask and Conawapa Projects, the construction of the transmission line, and the introduction of Demand Side Management (DSM) Level 2 initiatives.

[11] Manitoba Hydro NFAT Submission, Chapter 14, pp. 5-6.
[12] Exhibit MH-192 p.1.

Table 2 Description of Manitoba Hydro's Development Plans

Plan	Short Name	Description
1	All Gas	Natural Gas-Fired Generation starting in 2022/23
2	K22/Gas	Keeyask 2022/23, Natural Gas-Fired Generation starting in 2029/30
3	Wind/Gas	Wind Generation starting in 2022/23 supported by Natural Gas-Fired Generation starting in 2025/26
4	K19/Gas24/250MW	Keeyask 2019/20, Natural Gas-Fired Generation starting in 2024/25, 250 MW Export/50 MW Import U.S. Interconnection 2020/21, 250 MW MP Sale
5	K19/Gas25/750MW(WPS Sale & Inv)	Keeyask 2019/20, Natural Gas-Fired Generation starting in 2025/26, 750 MW Import/Export U.S. Interconnection 2020/21, 250 MW MP Sale, Proposed 300 MW WPS Sale
6	K19/Gas31/750MW	Keeyask 2019/20, Imports, Natural Gas-Fired Generation starting in 2031/32, 750 MW Import/Export U.S. Interconnection 2020/21, 250 MW MP Sale
7	SCGT/C26	Simple Cycle Gas Turbine in 2022/23, Conawapa 2026/27, Natural Gas-Fired Generation starting in 2038/39
8	CCGT/C26	Combined Cycle Gas Turbine in 2022/23, Conawapa 2026/27, Natural Gas-Fired Generation starting in 2039/40
9	Wind/C26	Wind in 2022/23, Conawapa 2026/27, Natural Gas-Fired Generation starting in 2036/37
10	K22/C29	Keeyask 2022/23, Conawapa 2029/30, Natural Gas-Fired Generation starting in 2040/41
11	K19/C31/250MW	Keeyask 2019/20, Natural Gas-Fired Generation starting in 2024/25, Conawapa 2031/32, 250 MW Export/50 MW Import U.S. Interconnection 2020/21, 250 MW MP Sale
12	K19/C31/750MW	Keeyask 2019/20, Imports, Conawapa 2031/32, Natural Gas-Fired Generation starting in 2041/42, 750 MW Import/Export U.S. Interconnection 2020/21, 250 MW MP Sale
13	K19/C25/250MW	Keeyask 2019/20, Conawapa 2025/26, Natural Gas-Fired Generation starting in 2040/41, 250 MW Export/50 MW Import U.S. Interconnection 2020/21, 250 MW MP Sale
14	K19/C25/750MW (WPS Sale & Inv) Preferred Development Plan	Keeyask 2019/20, Conawapa 2025/26, Natural Gas-Fired Generation starting in 2041/42, 750 MW Import/Export U.S. Interconnection 2020/21, 250 MW MP Sale, Proposed 300 MW WPS Sale
15	K19/C25/750MW	Keeyask 2019/20, Conawapa 2025/26, Natural Gas-Fired Generation starting in 2041/42, 750 MW Import/Export U.S. Interconnection 2020/21, 250 MW MP Sale

Figure 1 Pathways Identified by Manitoba Hydro



2.2.2. Developments During the NFAT Review

Manitoba Hydro made a number of changes that affected the economics of the Preferred Development Plan during the course of the NFAT hearing. On March 10, 2014, Manitoba Hydro updated its capital costs estimates for both Keeyask and Conawapa.[13] The update showed increases in the construction cost estimate for Keeyask from $6.2 billion to $6.5 billion and for Conawapa from $10.2 billion to $10.7 billion. Manitoba Hydro also explained that Wisconsin Public Service would not be investing in the proposed 750 MW transmission interconnection while still committing to purchase 308 MW of power from Manitoba Hydro. "

At that same time, Manitoba Hydro also provided information on the impact of increased Demand Side Management efforts and the potential for future pipeline industry load.[14] Its new Power Smart Plan envisions its customers switching from electricity to gas, where available, for space and water heating, conservation rates for domestic customers and self-generation by industrial customers.[15] The increased Demand Side Management will have the potential to delay the domestic need for new generation beyond 2022, which was the year Manitoba Hydro forecasted that new generation would be needed in its NFAT Submission.

[13] Exhibit MH- 95.
[14] Exhibit MH- 95.
[15] Exhibit MH-153.

3.0.0 Alignment with Applicable Legislative and Policy Documents

3.1.0 Introduction

In its Terms of Reference, the Panel was asked to consider the alignment of the Preferred Development Plan and its proposed alternatives to a number of acts and strategies. These were *The Manitoba Hydro Act*, the *Manitoba Clean Energy Strategy*, *The Change and Emissions Reductions Act*, and the sustainable development principles, as outlined in *The Sustainable Development Act*.

3.2.0 The Manitoba Hydro Act

The Terms of Reference specifically direct the Panel to consider the alignment of the proposed Preferred Development Plan with Manitoba Hydro's mandate as stated in section 2 of *The Manitoba Hydro Act.* That section states the following*:*

> ***Purposes and Objects of Act***
>
> *2. The purposes and objects of this Act are to provide for the continuance of a supply of power adequate for the needs of the province, and to engage in and to promote economy and efficiency in the development, generation, transmission, distribution, supply and end-use of power and, in addition, are*
>
> > *(a) to provide and market products, services and expertise related to the development, generation, transmission, distribution, supply and end-use of power, within and outside the province; and*
> >
> > *(b) to market and supply power to persons outside the province on terms and conditions acceptable to the board.*

In the Panel's interpretation, Manitoba Hydro's foremost purpose under section 2 of the *Act* is to ensure that Manitobans have adequate access to electrical power at all times. All plan alternatives presented by Manitoba Hydro are focused on meeting domestic load growth, providing reliable power, and anticipating load growth challenges.

The *Act* also directs Manitoba Hydro to seek economies and efficiencies in its development, generation, transmission, distribution, supply, and end-use of power. In the Panel's interpretation, this involves several things. First, while the *Act* does not mandate Manitoba Hydro to choose the lowest-cost generation source, it requires a careful analysis of the economic and financial impacts of alternative choices. Second, it involves an obligation on Manitoba Hydro to act efficiently and avoid unnecessary costs. Third, it requires a focus on energy efficiency and Demand Side Management, with a legitimate focus on end-use of power. In the Panel's view, while all alternative plans involving a significant focus on Demand Side Management are broadly aligned with these requirements, the focus on economics and efficiency mandated by the *Act* underlines the Panel's conclusions about new investments in generation.

The Manitoba Hydro Act further provides for the marketing of products, services and expertise, as well as direct export sales to external customers in Canadian provinces beyond Manitoba and in the United States. In the Panel's view, this section is permissive, that is, while it allows Manitoba Hydro to engage in these activities, it does not mandate the utility to do so. As such, Manitoba Hydro should only pursue them if it is in the economic interest of Manitoba ratepayers to do so.

In its Preferred Development Plan and corporate plans and documents, Manitoba Hydro points to the value and importance of export sales as a means of supporting new generation costs and moderating domestic rates. As was indicated in its Preferred Development Plan, Manitoba Hydro looks to "surplus by design" to take advantage of export sales opportunities. In fact, Manitoba Hydro sees a limited "window of opportunity" available to capitalize on the need of external customers to seek out renewable energy sources.

3.3.0 Manitoba's Clean Energy Strategy

Released in December 2012, the Manitoba Clean Energy Strategy outlines proposed goals and actions in five areas: (1) building a new Manitoba Hydro; (2) leading Canada in energy efficiency; (3) keeping rates low; (4) growing renewable alternatives; and (5) freedom from fossil fuels.

The Clean Energy Strategy suggests that "by advancing the construction of new hydro plants ahead of domestic needs, Manitoba can both earn additional export revenues and expand valuable interconnection transmission, while also building the plants it will need to meet its own future requirements."[16]

In addition, the Strategy envisages a new Manitoba Hydro having a clean energy portfolio which would add wind and other emerging, renewable energies, as well as energy efficiency initiatives, improved transmission, and the rehabilitation of older

[16] Exhibit PUB 58-5, p.337.

projects.[17] Notably, the Strategy does not require Manitoba Hydro to proceed with construction, but only requires the proposed new generating stations to proceed through environmental and economic review.[18]

The Strategy also describes Manitoba's energy efficiency efforts and achievements. It notes the Province's ability within a few years of becoming a leader in Canada. The Strategy proceeds to outline a number of priority actions for the future, including new programs and funding for residential energy efficiency improvements.[19]

The Clean Energy Strategy celebrates the fact that the cost of electricity in Manitoba has been among the lowest in Canada. It endeavours to maintain a "low utility rate advantage"[20] through predictable, modest rates increases for Manitoba Hydro over the coming years.[21]

The Strategy observes that there has been a growth in the range of renewable energy technologies, such as wind, heat pumps, and electric vehicles. It outlines efforts in a number of areas where new priorities will be given to new initiatives. These areas include wind, solar, geothermal heat pumps, and electric vehicles. In particular, the Strategy talks about the opportunities, advantages, and goals associated with wind power. It describes the expected economic benefits to come from the St. Leon and St. Joseph wind farms. The Strategy sets out the goal of an additional 1,000 MWs of economically developed new wind.[22]

Manitoba Hydro has taken the position that it is more economic to import wind energy from the United States. It has a wind exchange agreement beginning in 2020 with Minnesota Power pursuant to which U.S. wind power is stored in Manitoba Hydro's reservoirs. However, several Interveners criticized Manitoba Hydro's assumptions with respect to the cost of wind energy. The Panel is of the view that a decision to proceed with Keeyask will likely delay the development of any additional wind power in Manitoba, as Keeyask adds a significant amount of dependable energy to Manitoba Hydro's system, negating the need for new generation for at least a decade.

The Strategy concludes with a commitment to move away from fossil fuels as an energy source for Manitoba. In addition to highlighting a number of specific initiatives, the Strategy notes Manitoba Hydro's own action in this regard. The Panel would note that

[17] Exhibit PUB 58-5, p.341.
[18] Exhibit PUB 58-5, p.330.
[19] Exhibit PUB 58-5, pp.346-354.
[20] Exhibit PUB 58-5, p.354.
[21] Exhibit PUB 58-5, p.355.
[22] Exhibit PUB 58-5, p.375.

the Preferred Development Plan and many of its alternatives support this goal of the Clean Energy Strategy. Some alternatives do involve gas thermal generation, but in supporting roles to hydropower. However, one should not forget that during periods of off-peak imports, Manitoba Hydro is likely importing coal-generated energy from the United States.

3.4.0 The Climate Change and Emissions Reductions Act

The Climate Change and Emissions Reductions Act stipulates that Manitoba Hydro must not use coal to generate power, with the exception of emergencies.[23] The Panel notes that the Preferred Development Plan and its alternatives do not propose to use or develop coal to generate power. As such, all proposed plans are aligned with this statute.

3.5.0 Principles of Sustainable Development (as outlined in The Sustainable Development Act)

In 1998, the Province of Manitoba enacted *The Sustainable Development Act* to "create a framework through which sustainable development will be implemented in the provincial public sector and promoted in private industry and in society generally" (Government of Manitoba 1998). The principles and guidelines of sustainable development are appended to the statute. These principles are: integration of environmental and economic decisions, stewardship, shared responsibility and understanding, prevention, conservation and enhancement, rehabilitation, and global responsibility.

Manitoba Hydro provided the Panel with evidence as to how its plans and actions are aligned with these principles.[24] For example, Manitoba Hydro has integrated environmental factors into its economic decisions. Stewardship and defined, shared responsibilities are evident in its agreements with the Keeyask Cree Nations. Manitoba Hydro's environmental mitigation and adverse effects agreements address prevention and conservation considerations.

It is readily apparent to the Panel that both the Preferred Development Plan and the plan recommended by the Panel will yield some residual effects. This includes the environmental impact of flooding, erosion, and the destruction of sturgeon habitat, as well as long-term rate impacts on consumers.

[23] Exhibit PUB - 62, pp. 1-2.
[24] Manitoba Hydro NFAT Submission, Appendix 14.1, pp. 1-12.

3.6.0 Conclusions of the Panel

It is the Panel's view that the Preferred Development Plan and the proposed Alternative Plans are aligned with *The Manitoba Hydro Act*, the Manitoba Clean Energy Strategy, *The Climate Change and Emissions Reductions Act*, and the sustainable development principles outlined in *The Sustainable Development Act.*

The Panel finds that all alternative plans are broadly aligned with section 2 of *The Manitoba Hydro Act*, so long as the economic and financial repercussions of each plan are sound.

In particular, the Panel notes that the 2012 Clean Energy Strategy provides a basis for the Panel's thinking about what is needed to achieve a new energy future. The Panel shares the Strategy's conclusions as to the importance of Demand Side Management initiatives, the need for a greater portfolio of renewable resource options, and the need to keep rates low. In particular, the Panel agrees with the goal of making Manitoba a leader in energy efficiency initiatives.

4.0.0 Domestic Need and Load Forecast

4.1.0 Introduction

Manitoba Hydro's mandate under section 2 of *The Manitoba Hydro Act* includes "providing for the continuance of a supply of power adequate for the needs of the province." To ensure there is an adequate, reliable supply of power to meet demand, Manitoba Hydro must plan ahead by looking at current energy demand, future energy requirements, and the ability of existing power resources to meet those requirements. In carrying out its mandate, Manitoba Hydro annually forecasts the expected future electricity needs of Manitoba residences, commercial businesses, industries, and institutions as part of its power resource planning process.

The Terms of Reference direct the Panel to examine the "*reasonableness, thoroughness and soundness of all critical inputs and assumptions Hydro relied on to justify the needs. This should include Hydro's planning load forecast and future load scenarios, its demand and supply analysis, export expectations and commitments and demand side management and conservation forecasts*."[25]

4.2.0 The Components of Manitoba's Electricity Demand

4.2.1. Energy and Capacity Demands

There are two components to Manitoba's electricity demand, namely energy and capacity. Energy, measured in kilowatt-hours (kWh) or gigawatt-hours (GWh), is the total quantity of power consumed over a certain timeframe. Capacity, measured in megawatts (MW), is the amount of electricity consumed at a point in time. Manitoba Hydro must be able to supply sufficient energy to meet its customers' needs over a period of time, such as a season or year, as well as sufficient generating capacity to meet the peak demands of its customers. Manitoba Hydro's 2013 Electric Load Forecast provides a forecast for Manitoba's Gross Firm Energy requirements in GWh and Gross Total Peak demand in MW assuming normal weather.

Gross Firm Energy is the total annual energy required for Manitoba Hydro's domestic customers on the integrated electricity grid. Gross Total Peak is the maximum amount of power needed to serve Manitoba Hydro's grid-based customers at any given time. Because Manitoba is a winter-peaking jurisdiction, peak domestic load occurs in winter, typically on a very cold weekday. For generation planning purposes, Manitoba Hydro reduces the Gross Firm Energy and Gross Peak Demand by forecasted DSM savings.

[25] Exhibit PUB-2, p. 2, Item 1.

The forecast of Gross Firm Energy is derived from the energy forecasts for the individual sectors that make up total domestic load. These sectors are comprised of major customer groups — Residential Basic, General Service - Mass Market, and General Service - Top Consumers — and other components such as Losses (losses associated with the transmission and distribution of electricity over power lines) and Station Service (energy used by power plants to generate power and service their own load), and miscellaneous customers such as seasonal customers, flat rate water heating customers, and area and roadway lighting.

Manitoba Hydro's analysis filed in its NFAT Submission was based largely on its 2012 Electric Load Forecast, which covers the 20-year period to 2031/32. Manitoba Hydro also included further analysis based on updated information from the 2013 Electric Load Forecast (2013 Load Forecast). The 2013 Load Forecast estimates Manitoba's energy needs and peak demand requirements for the 20-year period from 2012/13 to 2032/33. In the 2013 Load Forecast, Manitoba Hydro forecasts Gross Firm Energy to grow at the rate of 1.5% (413 GWh) per year over the next 20 years to 32,667 GWh by 2032/33. Gross Total Peak is expected to grow by 76 MW (1.5%) per year to reach 5,959 MW by 2032/33. Manitoba Hydro has not specifically provided load growth beyond 2033, but it can it be calculated as being 1.1% (with DSM Level 2 as explained in Chapter 5) out to 2049.[26]

Compared to the 2012 Load Forecast, the 2013 Load Forecast shows a 1,159 GWh (3.5%) reduction in Gross Firm Energy by 2031/32, which is equivalent to almost three years of annual load growth. Forecast Gross Total Peak in the 2013 Load Forecast shows a decline of 146 MW (2.4%) by 2031/32, amounting to a reduction of almost two years of load growth. Lower forecasted population growth and delays in the plans of two industrial power customers were largely responsible for the reductions in forecasted demand between the 2012 and 2013 Load Forecasts.

Manitoba Hydro stated that its 2014 Electric Load Forecast will not be ready in time for the Panel to consider it during the NFAT Review. However, Manitoba Hydro identified the following potential adjustments to its upcoming 2014 Load Forecast.[27]

[26] Exhibit MH-104-3, p.6.
[27] Exhibit MH-87, p. 12.

Table 3 Load Forecast Adjustments to Manitoba Hydro's 2014 Load Forecast

Change Item	Impact – GW.h	Date
Pipeline Sector	1700 GW.h*	2019/20
Codes and Standards	(300) GW.h	2027/28
Price Elasticity	(500-600) GW.h	2027/28
Fuel Choice	(100) GW.h	2027/28

4.2.2. Main Customer Components

The three main customer groups (Residential Basic, General Service – Mass Market, General Service – Top Consumers) are the most significant components of Manitoba Hydro's load and contribute most of Manitoba Hydro's revenue. Manitoba Hydro uses a different methodology for forecasting the energy requirements of each customer group and has made a number of changes to its forecasting methodologies over time. Manitoba Hydro is forecasting growth in consumption across all customer groups, resulting in overall load growth that is slightly higher than the Canadian average, and slightly lower than the U.S. average.[28]

Residential Basic

The Residential Basic sector consists mainly of single detached dwellings, multi-attached dwellings, and individually metered apartments. In 2012/13, there were 456,130 Residential Basic customers comprising 33.6% of domestic sales.

The primary drivers of growth in this sector are population increases (largely attributable to immigration) and greater reliance on electricity for space and water heating. Manitoba Hydro is forecasting increased use of electricity for space and water heating. Projections in the 2013 Load Forecast indicate that by 2032/33, approximately 40% of Residential Basic customers will be using electricity as a heating source, an increase of 3% from 2013 levels. The number of residential customers using electric water heating is expected to climb to nearly two-thirds by 2032/33. However, in its 2014 Power Smart Plan, Manitoba Hydro expects to achieve significant electricity savings through a fuel switching program and conservation rates, both of which could encourage electric space and water heat customers to switch to gas. If implemented, such measures may reverse this trend. Fuel switching is discussed in greater detail in Chapter 5.

[28] Exhibit MH-87, p. 8.

General Service - Mass Market

The General Service - Mass Market sector is comprised of commercial and industrial customers such as offices, retail and wholesale businesses, schools, hospitals, agriculture, apartment complexes, manufacturing, and industrial customers that do not fall within the Top Consumers sector. In 2012/13, there were 65,974 General Service - Mass Market customers accounting for approximately 39.3% of electricity sales. The main drivers for growth in the General Service – Mass Market sector are growth in the number of Residential Basic customers and the forecast Gross Domestic Product (GDP) for Manitoba, which Manitoba Hydro currently estimates will grow by 2% over the long term.[29]

General Service – Top Consumers

The General Service – Top Consumers category is comprised of 31 customers made up of 17 companies in sectors such as primary metals, chemicals, petrol/oil/natural gas, pulp/paper, food/beverage, and colleges/universities. This sector accounts for approximately 22.8% of load.

Energy consumption by Top Consumers grew by 91 GWh (2.0%) per year over the past 20 years. Growth over the past 10 years, however, was down considerably, at only 28 GWh per year (0.5%). The economic downturn from 2008 to 2011 and the loss of one major customer in this sector significantly reduced the 10-year growth rate. Manitoba Hydro is forecasting energy consumption to increase by 1.6% or 103 GWh per year over the next 20 years, similar to growth over the past 20 years despite the pending closure of the Vale smelter and refinery in Thompson circa 2016/17.

Manitoba Hydro uses a two-pronged approach to forecasting load in this sector comprised of shorter-term (3-5 years) individual forecasts for each member of the sector and a longer-term potential load calculation, "Potential Large Industrial Loads" or "PLIL." PLIL is used to represent the sector's overall growth, including major expansions, as well as the addition and loss of customers. Starting in 2016/17, 100 GWh a year is forecast for PLIL to account for unforeseen expansion, contraction, and growth.

In addition to PLIL, Manitoba Hydro also considers it likely that 1,700 GWh of additional load will arise by 2019/20[30] from upgrades to pipeline pumping stations within Manitoba. Enbridge's Alberta Clipper pipeline, Enbridge's planned upgrades to its Line 3 pipeline, and TransCanada Pipeline's Energy East pipeline project, which involves the conversion of a portion of TransCanada's Mainline gas pipeline to oil, will result in

[29] Manitoba Hydro NFAT Submission, Appendix G, p. 6.
[30] Exhibit MH-87, p.12.

1700 GWh of additional load. The Line 3 upgrade and the Energy East project are currently before the National Energy Board, while the remaining pipeline expansions, with their resulting electric load, have already received National Energy Board approval.[31] Four hundred GWh of that pipeline load are incorporated in Manitoba Hydro's 2013 Load Forecast as PLIL projections.[32]

4.3.0 Load Forecasts

4.3.1. Load Forecasting Methodology

Because the customer sector forecasts play such an important role in Manitoba Hydro's load forecast, there was a considerable amount of discussion before the Panel about the methodologies that Manitoba Hydro employs to develop these forecasts.

Manitoba Hydro employs an end-use model to forecast energy demand in the Residential Basic sector. The model determines electricity use based on assumptions about the numbers of customers, dwelling type, location within Manitoba, appliance age and saturation, and the number of customers who use electricity for space and water heating. These assumptions rely on information from Manitoba Hydro's 2009 Residential Survey.

With respect to the Residential Basic forecast, Elenchus identified a number of concerns, ranging from problems with the method of forecasting the residential customers' market share of electric heat and failing to account for potential changes in population growth, to reliance on a static person-per-household ratio and dated (2009) survey data that may not reflect current conditions.

Economic and Population Demand Scenarios

Experts testifying on behalf of CAC raised the issue of testing the effect of different economic and population scenarios on demand. The Residential Basic and General Service – Mass Market sectors' forecasts are heavily influenced by population and economic growth.[33] The Panel learned that the projected growth in Manitoba's population could be lower than the future growth projected in the 2013 Load Forecast, based on three of the five updated population forecasts relied upon by Manitoba Hydro.[34] Even with these concerns, Elenchus noted that there have not been significant errors in recent Residential Basic forecasts when compared to actual consumption.

[31] Transcript, pp. 1137-1140.
[32] Exhibit MH-104-3, pp. 59,83.
[33] Exhibit CAC-25, p. 8.
[34] Exhibit MH-93.

However, over the longer-term 20-year forecast period, the concerns identified could "cause more significant deviations."[35]

The Top Consumers sector was singled out as the source of the highest forecasting error. Elenchus pointed to consistent over-forecasting in recent years, as well as previous periods of both under-forecasting and over-forecasting. Elenchus maintained that the PLIL projection is particularly sensitive to economic conditions, as was evidenced by the economic downturn in the last decade, and would benefit from sensitivity testing against high, medium and low economic conditions.[36] Similarly, Patrick Bowman, an expert witness for the Manitoba Industrial Power Users Group (MIPUG) noted that "*the most significant weakness for the industrial load forecast, from the perspective of a long-term NFAT review, is the failure to explicitly consider scenarios that result in much higher or quicker developing future industrial load."*[37]

Manitoba Hydro acknowledges that it is more difficult to forecast load growth in the Top Consumers sector than it is in the Residential Basic or General Service - Mass Market sectors, where load typically increases (or decreases) gradually. Load growth (or contraction) in the Top Consumers sector, on the other hand, tends not to be gradual or linear because the addition of new customers or customer expansions can add large blocks of load and contractions or plant closings can reduce load significantly. Manitoba Hydro maintains that the PLIL calculation is a reasonable proxy for longer-term load growth forecasts based on average load growth over the past 20 years with the expectation of future periods of economic downturn and economic growth.[38]

Forecasting Methods

Manitoba Hydro uses a hybrid approach to forecasting load, employing different methodologies for the different sectors. CAC expert, Dr. Gotham, provided the Panel with a high-level description of load forecasting methodologies that MISO considers acceptable in some circumstances and unacceptable in other circumstances. He noted that econometric modelling would be useful in a number of sectors.[39] Dr. Gotham identified concerns with some of the methodologies employed by Manitoba Hydro. According to Dr. Gotham, load forecasts prepared in support of generation planning for MISO participants may not utilize certain approaches, such as trend analysis or survey-based forecasting techniques. Manitoba Hydro uses both in certain elements of its load

[35] Exhibit ERA-5, p. 16.

[37] Exhibit MIPUG-9, pp. 3-11.
[38] Exhibit MH-85, p.18.
[39] Transcript, pp. 8292-8293.

forecasting.[40] PLIL is an example of trend analysis, as is the use of a fixed ratio of population to households, which is used in the Residential Basic forecast. The Residential Basic forecast also makes use of survey-based techniques to forecast the market share of electric heat. As the General Service – Mass Market forecast relies on the Residential Basic customer forecast, it too relies on trend analysis forecasting techniques, according to Dr. Gotham.[41] Manitoba Hydro acknowledged that the PLIL calculation is a form of trend analysis, but argued that it has very little overall influence on the load forecast.[42]

Electricity Demand/Price Elasticity

Manitoba Hydro's load forecast does not factor in the effects of increasing electricity prices on electricity demand, a concept known as price elasticity. Drs. Simpson and Gotham described its absence as "the most disturbing omission from Manitoba Hydro's forecasting methodology" because it implies an upward bias into the forecast, leading to "inflated load forecasts and requirements for new system capacity.[43]

In a similar vein, Elenchus maintains that it is inconsistent with experience in other jurisdictions to assume there will be no impact on demand from rising electricity rates.[44] Given projected long-term annual rate increases associated with the Preferred Development Plan in the order of 2% more than expected annual increases in the Consumer Price Index, Dr. Simpson suggested that, with a long-run elasticity factor of -0.5 in the residential sector, loads could decline despite future population growth.[45] The reduced load growth could defer the need for new resources by one year and possibly up to three or four years if the General Service - Mass Market and Top Consumers sectors similarly responded to increasing electricity prices.[46]

Manitoba Hydro pointed out that electricity prices in Manitoba have increased slowly, at or close to the rate of inflation and, consequently, the effect of price changes on customers' use of electricity would not have demonstrated a measurable price elasticity.[47] Manitoba Hydro provided preliminary projections of price elasticity-related load reductions in the order of 500-600 GWh by 2027/28, which are expected to be incorporated into the 2014 Load Forecast.[48] Manitoba Hydro's calculation assumes an

elasticity value of -0.05, which Dr. Gotham described as being on the low end of values used in other jurisdictions.[49]

Accuracy of Forecasts

Elenchus examined the accuracy of Manitoba Hydro's forecasts by looking at historical 5-year ahead, 10-year ahead and 15-year ahead forecast performance for both energy and peak demand. Elenchus' analysis revealed periods of under- and over-forecasting, much of which is attributable to forecasts in the Top Consumers sector,[50] while the 20-year ahead forecast accuracy levels compared favourably with some other longer-term forecasts in other jurisdictions prepared for system expansion purposes.[51]

As for the probability approach adopted by Manitoba Hydro, Elenchus argues that it: *"is less transparent and provides less insight than the multiple scenarios approach used in 2009."*[52] Furthermore, according to Elenchus, it is important to test "*the sensitivity of the forecast to changes in the economic and demographic assumptions used to derive it."*

MIPUG's expert witness, Mr. Bowman, cautioned that in the context of the NFAT analysis it is less important to achieve a high degree of accuracy in a single load forecast than it is to test a series of scenarios.[53]

Despite the concerns raised with respect to various aspects of Manitoba Hydro's load forecasting methodologies and assumptions, overall, Elenchus and MIPUG's expert found Manitoba Hydro's methodology appropriate for short-term forecasting and the load forecast reasonable.

4.4.0 Need for New Resources

The need for new generation resources arises when Manitoba Hydro expects to have a shortfall in energy or capacity. Manitoba Hydro's generation planning involves comparing the existing and proposed generating resources along with contracted and proposed imports against the firm domestic load and export obligations. The planning criteria for hydraulically generated energy are based on dependable generation, which means the generation available from the lowest water flow year recorded. The year when new resources, such as Keeyask or a gas turbine plant, are required is called the "need date", and it could be driven by either a shortfall in energy or capacity.

[49] Exhibit GAC-65, p. 34.
[50] Exhibit ERA-3, pp. 34-38.
[51] Exhibit ERA-3, p. 40.
[52] Transcript, p. 4841.
[53] Exhibit ERA-3; Exhibit MIPUG-9, p. 3.11.

The need date considers only the forecasted domestic load and existing export contracts. The need date does not include any future export obligations, such as the Minnesota Power 250 MW contract, except those that are already being served.

Manitoba Hydro presented several load growth scenarios to determine the domestic need date based on various levels of DSM and whether or not the pipeline load materializes.

Table 4 Need for New Resources Under Different Planning Assumptions

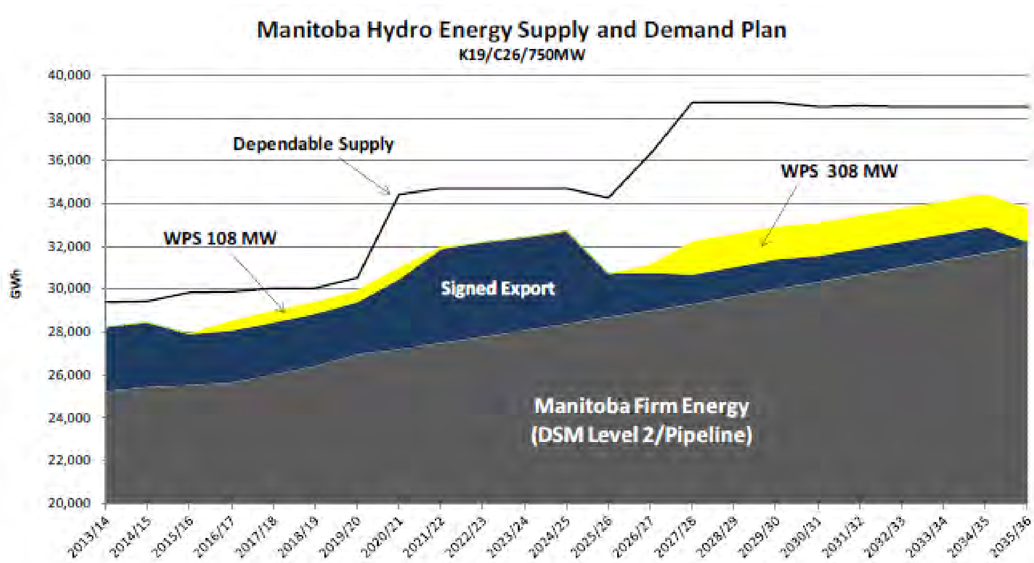
Estimated Need for New Resources		
Planning Assumptions	**Need for Dependable Energy**	**Need for Capacity**
2012 Planning Assumption	2022/23	2025/26
2013 Planning Assumption	2023/24	2026/27
NFAT DSM 1	2028/29	2030/31
NFAT DSM 2	2031/32	2031/32
NFAT DSM 2 + increased pipeline load	2024/25	2030/31
NFAT DSM 3	2033/34	2033/34
NFAT DSM 3 + increased pipeline load	2029/30	2030/31

The most plausible scenario draws on their 2013 Load Forecast, includes the pipeline load and DSM Level 2 initiatives, and assumes no new exports. Initially, Manitoba Hydro stated the domestic need date was 2027, neglecting a small (39 GWh) energy deficit in 2024 because of larger energy surpluses in 2025 and 2026. Later in the NFAT proceeding, Manitoba Hydro determined the domestic need date should be driven by the small deficit in 2024, and confirmed 2024 as the domestic need date.

In all cases with additional future export obligations, such as the Minnesota Power 250 MW contract, it is assumed that Keeyask is constructed for an in-service date of 2019. However, a scenario not considered by Manitoba Hydro but investigated by the Panel is the potential to defer Keeyask while still serving the Minnesota Power and other new export contracts. This potential to defer Keeyask arose with the additional DSM savings proposed by Manitoba Hydro, resulting in sufficient surplus power to serve the new export contracts with Manitoba Hydro's existing generating resources. With DSM Level 2, or with the DSM savings from the 2014 Power Smart Plan, Keeyask may not be needed until the mid- to late 2020s.

The exact date when Keeyask is needed depends on whether the pipeline load materializes, whether Manitoba Hydro extends its diversity exchange contract with Northern States Power, or whether other measures that increase capacity are included, such as the Curtailable Rate Program. The following Figure shows Manitoba Hydro's energy supply and demand, as well as surplus dependable energy.

Figure 2 Manitoba Hydro Energy Supply and Demand (K19/C26/750MW – Pipeline Load)



4.5.0 Transformative Change in Load Demand

4.5.1. Structural Changes to Forecast Fundamentals

The Panel heard evidence on two factors that over the longer term may have a significant impact on electricity demand: change in the fundamental factors underlying electricity demand, and distributed generation technologies achieving cost parity with grid-supplied electricity, otherwise known as "grid parity."

Elenchus contends that Manitoba Hydro's load forecasting methodology tacitly assumes that there will be no significant structural changes in the fundamentals underpinning the forecasts. Given that the analyses on which Manitoba Hydro's NFAT Submission is based extend out over a 78-year timeframe, Elenchus maintains *"that it is more reasonable to expect that there will be significant structural changes that will result in dramatically different domestic demand (and presumably export prices) in the coming decades than it is to assume that the past provides a realistic window on the future."*[54]

Elenchus offered two examples of transformative changes to illustrate the possible impacts. Improved battery storage for electric vehicles, which, combined with carbon pricing of transportation fuels, could transform the transportation market and increase

[54] Exhibit ERA-5, p. 41.

load dramatically. On the other hand, significant penetration of alternative distributed generation technologies, such as solar photovoltaic, could transform the market and reduce load as the cost of electricity from these technologies approaches parity with grid-supplied power.

4.5.2. Impact of Grid Parity

The Panel heard evidence from witnesses about the impact of grid parity on demand for grid-supplied electricity. Grid parity is the term used to describe the point at which the cost of producing electricity with a new technology, such as solar photovoltaic or distributed generation, equals the cost of electricity from traditional generating technologies used to provide grid-based power.

Dunsky Energy Consulting's pre-filed expert evidence on behalf of CAC and GAC, noted that the cost to produce electricity from solar panels, on a ¢/kWh basis, is now the same or cheaper than electricity rates in some U.S. states and could reach parity with Manitoba Hydro's domestic rates before the end of the current load forecast period. Furthermore, the cost of utility-scale solar photovoltaic applications is declining to the point where it will become competitive with the cost of other generating technologies.[55]

Grid parity has the potential to affect Manitoba Hydro in two ways: by reducing domestic demand for electricity; and by decreasing demand and suppressing prices in Manitoba Hydro's export markets. Manitoba Hydro advised that it has not carried out any modelling of the longer-term impact of grid parity or disruptive technologies on domestic load or analysed when parity will be reached in Manitoba, although it has done a high-level examination of solar photovoltaic technology as a DSM savings.[56]

If grid parity materializes in the export markets, it could depress load growth and put downward pressure on prices. Manitoba Hydro may not be able to realize the export revenues it is forecasting if this were to occur.

Elenchus noted that with grid parity, distributed generation will compete directly with grid-supplied power and constrain the prices Manitoba Hydro can charge. In this scenario, Manitoba Hydro will always be able to sell the full output of its dams, but not necessarily at a sufficiently high price to recover the cost to build them: "*Once built, high-capital-cost, low-operating-cost technologies such as large-scale hydro generation which the associated extensive transmission and distribution networks may always be*

[55] Exhibit CAC-62, p. 37.
[56] Transcript, p. 604.

able to under-price the alternatives, but that ability to compete does not ensure full recovery of sunk costs."[57]

Manitoba Hydro submitted that there is a great deal of uncertainty about the timeframe when grid parity may be reached, although it does not expect sufficient penetration of distributed generation, and specifically solar photovoltaic generation, to result in any significant demand savings until after 2020.[58] Manitoba Hydro anticipates than even after grid parity is achieved, there would be a gradual reduction in domestic load over a number of years rather than a step change in load because the adoption of new technology will be slow at first and build momentum over time.[59]

4.6.0 Reliability and Security of Manitoba's Electricity Supply

One of Manitoba Hydro's key responsibilities is to provide and maintain a reliable power system. Given this responsibility, Manitoba Hydro identified a need for new resources to meet persistent shortfalls in system capacity and energy and identified different development plans to meet that need. When considering reliability, the focus is on the ability of the power system to meet peak load. Manitoba Hydro designed the Preferred Development Plan and alternative plans evaluated for the purpose of its NFAT Submission to provide the required system reliability and to ensure that there are sufficient resources to meet peak and annual load.

Manitoba Hydro explained to the Panel that the degree of system reliability is typically measured by "loss of load expectation" – the average number of days per year that the load could not be fully met. A common industry standard is an inability to meet system load one day every 10 years. The lower the loss of load expectation, the greater is the system's reliability. This can equivalently be expressed in terms of the system's load-carrying capability. With greater reliability, the system can reliably carry or meet a greater amount of peak load.

Although all of the development plans that Manitoba Hydro considered ensure system reliability, some plans were found to offer more reliability than others. Plans with a 750 MW interconnection provide greater reliability because of the ability to import power from the U.S. For example, plans with a 750 MW transmission interconnection offer 500 to 1,000 MW of additional transmission capacity to carry domestic load from 2020 to 2040 than plans with no interconnection, and the Preferred Development Plan, with its

[57] ERA-3 p. 42.
[58] Transcript, p. 606.
[59] Transcript, p. 607.

two generating stations and the 750 MW transmission interconnection, offers the most reliability benefits of the plans with a 750 MW interconnection.[60]

Building Keeyask would add more capacity than is required for a considerable period of time and Conawapa would add even more. This additional capacity is far more than reliability-planning metrics suggest is needed. However, there are reliability benefits associated with these additions in terms of avoiding shorter- and longer-term power outages and supply constraints.

Manitoba Hydro's analysis indicates that development plans with a 750 MW interconnection are much more secure under extreme drought conditions than other plans because of the import room they provide – some 3,000 to 4,500 GWh/year more emergency energy for Manitoba domestic load from 2020 to 2040.[61] Although the Preferred Development Plan adds additional hydraulic generation that can be affected by drought, it will still add to Manitoba's energy security because Manitoba Hydro can curtail delivery of exports in order to satisfy Manitoba load.

4.7.0 Conclusions of the Panel

The Panel is satisfied that Manitoba Hydro's load forecast is reasonable for the short term. It is prudent to assume that the planned pipeline load will materialize, especially in light of the long lead time to construct Keeyask and Manitoba Hydro's obligation to serve domestic load. The Panel accepts the need date determined by Manitoba Hydro to be 2024, based on the 2013 Load Forecast, DSM Level 2, and the pipeline load.

Nonetheless, the methodological concerns raised by parties to the NFAT Review highlight the need for more robust forecasting. In future General Rate Applications, the Panel will expect Manitoba Hydro to provide a more robust forecast to better understand the factors that influence short-term load fluctuations.

That said, the Panel encourages Manitoba Hydro to consider the improvements to the load forecasting methodology recommended by Drs. Gotham and Simpson, as they could provide benefits to the forecasts considered at future rate proceedings.

The Panel has less confidence in Manitoba Hydro's forecast in the long term as it does not address the effects of potential structural change from new technologies or grid parity. The Panel recognizes that such factors are difficult to predict in both their magnitude and direction. While some structural change, such as the widespread adoption of electric vehicles, could significantly increase demand, other structural

[60] Exhibit MH-204, p.182
[61] Exhibit MH-95, p. 140.

change, such as grid parity for solar photovoltaic technology, could substantially decrease it. It is the Panel's view that Manitoba Hydro should, in the coming years, avail itself of external expertise to be a leader in the implementation of these technologies and prepare future integrated resource plans on that basis.

In light of the significant rate increases projected over the next 20 years, the Panel further concludes that Manitoba Hydro should more carefully scrutinize the potential for price elasticity impacts.

The Panel notes that Demand Side Management initiatives in the future will likely have a profound impact on Manitoba Hydro's load forecast. This issue is further discussed in Chapter 5. Manitoba Hydro did not consider the ability for DSM to increase Manitoba Hydro's exportable surplus, such that Keeyask may not be needed to serve the new export contracts until the mid- to late 2020s. The Panel views this as a weakness in the analysis. Despite this shortcoming, the Panel accepts that there are tangible reasons to proceed with the construction of Keeyask at this time, rather than to delay construction for five years and require a renegotiation of the general civil contract to construct the project and the numerous First Nation agreements already executed.

Should Manitoba Hydro's load forecast turn out to be too low, construction of the 750 MW U.S. transmission interconnection provides concrete reliability benefits, as it facilitates additional imports.

5.0.0 Demand Side Management (DSM)

5.1.0 Introduction

The Terms of Reference direct the Panel to consider the role of Manitoba Hydro's Demand Side Management (DSM) and conservation forecasts in Manitoba Hydro's Preferred Development Plan. This involves consideration of whether the DSM programs were adequately integrated into Manitoba Hydro's resource planning, and assessing the extent to which DSM could affect decisions on the timing of and need for new resources. For the purposes of this chapter, DSM includes energy efficiency and capacity savings.

The Panel heard of the importance of DSM in the course of the NFAT Review hearings. DSM can be a valuable and versatile asset in resource planning. It can help meet energy, as well as capacity needs. It can be targeted to specific end-users or technologies and solutions, and designed to meet the challenges and circumstances of each jurisdiction. DSM can be designed to offset or delay the need for new generation investments. Philippe Dunsky, an expert witness appearing on behalf of CAC, put forward the business case for DSM as a resource option, noting that at 2¢ to 4¢ per kWh, DSM costs two to eight times less than new power plant investments, produces from two to ten times more jobs per million dollars invested, reduces greenhouse gas (GHG) emissions, has economic benefits, and produces high levels of customer satisfaction.[62]

During the hearings, a significant change in DSM planning and strategy occurred. In early March 2014, Manitoba Hydro introduced the possibility of including a new set of DSM programs and measures in the Preferred Development Plan and the alternative development plans. Their effect would be to potentially delay the need for new generation resources and deal with increasing domestic need. Up to this point, Independent Expert Consultants and Interveners had been critical of the Preferred Development Plan and the absence of new DSM plans or efforts. This changed with Manitoba Hydro's new DSM plan, which promised an impact on the need for new resources and the nature of the required resource portfolio.

In its NFAT Submission in August 2013, Manitoba Hydro provided a DSM potential study prepared by EnerNOC, a U.S. consulting firm that identified the DSM potential that could be achieved. Manitoba Hydro retained EnerNOC in 2011.[63] Relying on EnerNOC's work, Manitoba Hydro developed three different levels of DSM savings,

[62] Exhibit CAC-62, p.9.
[63] Transcript, p.395.

identified as Level 1, Level 2, and Level 3, and concluded that DSM Level 2 was achievable and economic. Manitoba Hydro first provided this information in late February 2014. Manitoba Hydro then provided a number of economic analyses based on the assumption that DSM Level 2 would be implemented.

This Chapter focuses on the nature and impact of these new DSM Level 2 initiatives, their associated energy and capacity savings, their impact on the Preferred Development Plan and alternative development plans, and the requirements to ensure the successful implementation and long-term realization of DSM goals.

5.2.0 Manitoba Hydro's Power Smart Programs and DSM Proposal

5.2.1. Manitoba Hydro's Power Smart Programs

Manitoba Hydro engages in DSM initiatives to reduce electricity demand. Manitoba Hydro's DSM programs are outlined in its Power Smart Plans, and consist of energy conservation and load management activities designed to lower the demand for both electricity and natural gas in Manitoba. Program measures include:

- Education initiatives and financial incentives to encourage energy savings;
- Supporting energy savings through the adoption of federal and provincial codes and standards;
- Load reduction by participating customers; and
- Encouraging customers to install load-displacement generation systems.

Manitoba Hydro views DSM programs as a way to reduce energy consumption and demand, and thus defer the need for new generating resources. Manitoba Hydro used to be a leader in DSM. In recent years, Manitoba Hydro's DSM spending has decreased. The energy savings reported by Manitoba Hydro on an annual basis as a percentage of total demand have declined to approximately 0.4%, well below the 1.5% to 2% levels achieved in many other jurisdictions.

Manitoba Hydro's 2013-2016 Power Smart Plan outlined a series of measures that Manitoba Hydro expected would produce energy savings of 570 GWh and demand reductions in the order of 280 MW over the Plan's three-year horizon. The three-year plan was prepared in consultation with the Government of Manitoba, as required under *The Energy Savings Act.* [64] Manitoba Hydro was forecasting that the DSM efforts in its

[64] Transcript, p. 9856.

2013-2016 Power Smart Plan would reduce annual load growth to 1.4% per year over the 20-year load forecast period.

Manitoba Hydro's new 2014-2017 Power Smart Plan, which became available in April 2014 during the NFAT Review hearings, outlines substantially increased spending on DSM and proposes a doubling of targeted electricity savings to be achieved over the next three years (2014/15-2016/17) relative to the 2013-2016 Power Smart Plan. These savings are projected to be 1064 GWh and 411 MW, or 4% of the estimated load forecast by 2016/17, thus offsetting 86% of projected load growth during this three-year period.[65] Manitoba Hydro prepared its 15-year Supplemental Report for integrated resource planning purposes.

5.2.2. Revised Manitoba Hydro DSM Proposals (March 2014)

Before the NFAT Review hearings began in early March, Manitoba Hydro filed new evidence on its DSM activities and projections, which Manitoba Hydro described as DSM Levels 1 through 3. Each level contains higher levels of DSM programming, as described below, and produces progressively higher levels of energy savings beyond the existing DSM portfolio used in the NFAT Submission.[66]

- DSM Level 1 is comprised of energy efficiency initiatives, which include extending some existing programs, technologies such as LED lights for applications in roadway, residential and commercial lighting, and modifying some existing programs with a more aggressive design and approach.
- DSM Level 2 includes the Level 1 initiatives plus measures such as conservation rates, load displacement measures, and fuel switching.
- DSM Level 3 encompasses all of the DSM Level 2 initiatives and modifies the energy efficiency programs to achieve greater energy savings, but at a higher cost. These higher cost programs would be considered uneconomic relative to the Level 2 programs when evaluated against the marginal costs but were included to test more fully the viability of a higher level of DSM.[67]

The three new programs Manitoba Hydro highlighted as part of DSM Level 2 were conservation rates, fuel switching, and load displacement. Conservation rates are electricity rates that are tailored to encourage conservation through pricing mechanisms and may involve inclining blocks where electricity consumed beyond a certain threshold costs more than the initial block. These rates would require approval by the Public

[65] Exhibit MH-153, p. 1.
[66] Exhibit MH-85, pp. 28-29.
[67] Exhibit MH- 85, p. 28.

Utilities Board. Fuel switching encourages customers to use natural gas instead of electricity for space and water heating. Load displacement programs encourage industrial customers to self-generate electricity.

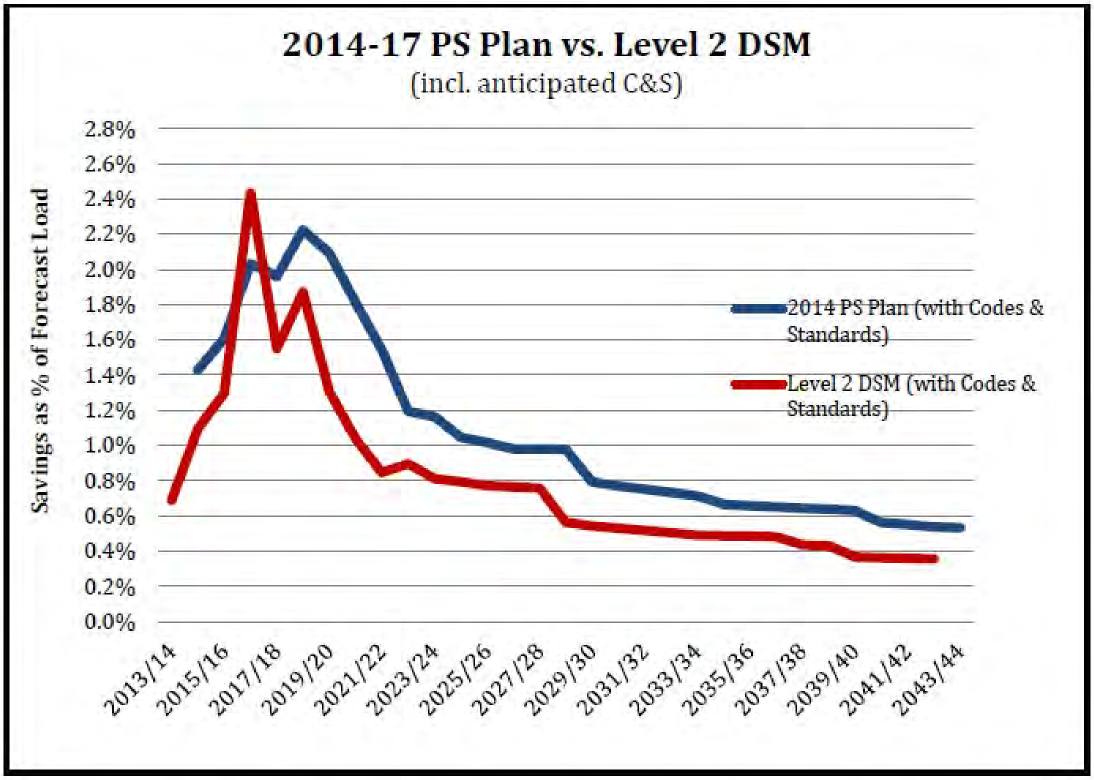
These increased levels of DSM represent substantial increases over the DSM program outlined in the 2013 Power Smart Plan; ranging from 2.2 to 4.6 times the program savings outlined in the 2013 Plan.[68] Manitoba Hydro considered the DSM Level 2 initiatives to be economic, but Level 3 to be uneconomic.

Manitoba Hydro confirmed that the DSM savings projected in the 2014-17 Power Smart Plan were similar to the savings projected for DSM Level 2. The Power Smart Plan program savings are slightly lower than the DSM Level 2 savings. However, the savings from codes and standards projected in the Power Smart Plan are higher, making the overall Power Smart Plan savings greater than DSM Level 2.

In assessing DSM savings, a distinction must be drawn between cumulative savings and incremental savings. Once a DSM measure is implemented, it usually provides cumulative savings. Incremental savings, on the other hand, are those savings achieved through new measures layered on top of existing measures. The Figure below illustrates the anticipated differences between the 2014-2017 Power Smart Plan and DSM Level 2 in terms of incremental DSM savings, expressed as a percentage of forecasted load, including codes and standards savings. [69]

[68] Exhibit MH-204, p. 20.
[69] Exhibit MH-202.

Figure 3 Manitoba Hydro 2014 Power Smart Plan vs. DSM Level 2 Savings



5.3.0 The Impact of New DSM on Load Growth

A number of witnesses talked about the impact of Manitoba Hydro's DSM Level 2 proposals on the forecasted load growth. All agreed that increased DSM could reduce load growth. Most suggested tht with successful implementation, Manitoba Hydro could achieve DSM savings greater than Manitoba Hydro's plans, which they characterized as conservative in the long term.

Several witnesses questioned the proposed incremental savings scenario for DSM Level 2, particularly the sudden increase followed by a tailing-off of incremental savings. As illustrated in the above Figure, Manitoba Hydro's scenario suggests a rapid increase in incremental savings to 2.4% in 2017/18, followed by an equally steep decline to 0.8% in 2021/22, and then a downward trend to 0.4% by 2043/44. Mr. Chernick, who testified on behalf of the Green Action Centre, suggested that it was unusual for a power utility to commit to an early DSM increase and then indicate that there were few achievable DSM savings afterwards.[70] He stated:

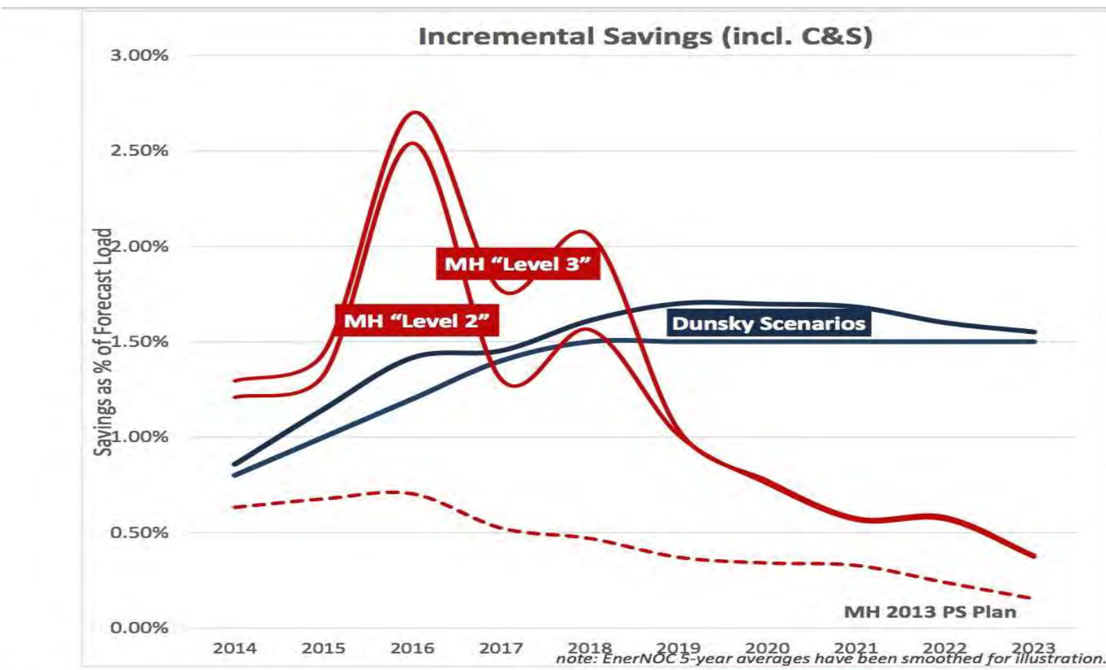
[70] Transcript, p. 9838.

> *I can't really think of another example that – that's quite so vivid in terms of a utility saying over and over again, we can do a lot in the next few years, but then nothing after that. And it – it looks like the Utility is – is willing and interested in doing some energy efficiency in the near term, but is reluctant to interfere with long-term construction plans by committing to a long-term energy efficiency program, so the numbers go down.*[71]

Mr. Dunsky submitted that Manitoba Hydro's DSM Level 2 plans represented a static view of the future: while they signified a dramatic and commendable change in DSM planning and target setting over the short term, they then reverted to previous assumptions, such that by 2023 and after, DSM savings would be 90% below the Level 2 peak.[72]

Mr. Dunsky provided the Panel with an alternative view for a DSM scenario that presents a more gradual growth to 1.5% incremental savings in 2016, followed by a stable DSM savings of 1.5% around 2019, as depicted in the Figure below. [73]

Figure 4 Incremental Savings - Manitoba Hydro DSM Levels 2 & 3 vs. Dunsky Scenarios

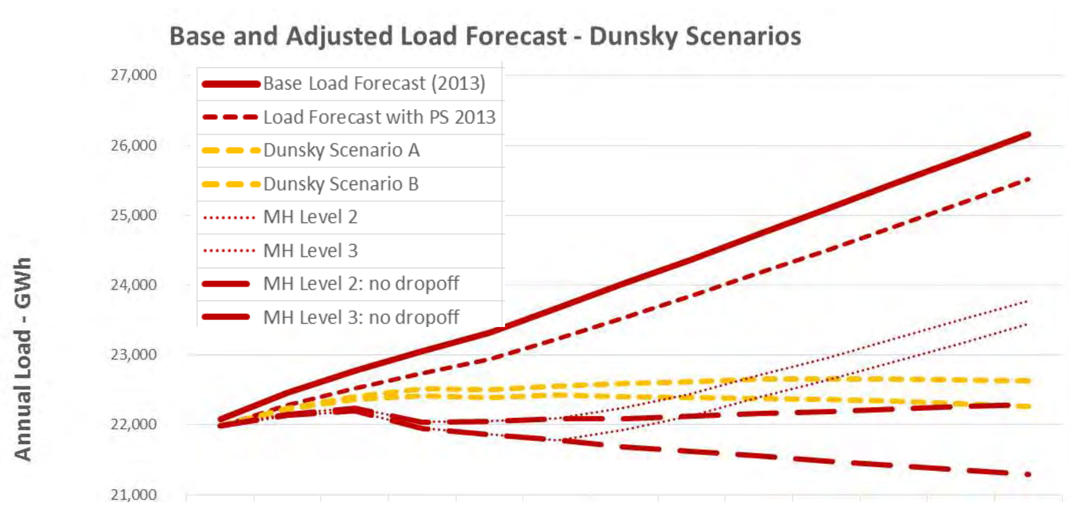


Mr. Dunsky felt that Manitoba Hydro could achieve annual average energy savings at a cost well below the cost of new generation or the price of power exports, and achieve

[71] Transcript, p. 9838.
[72] Exhibit CAC-62, p.15.
[73] Exhibit CAC-62, p.14.

annual average energy savings for the next 10 years (2014-2023) of 1.1% from utility programs (1.3% including codes and standards) under a "cautious" DSM scenario and 1.3% (1.5% including codes and standards) under a more aggressive approach to DSM.[74] These increased DSM levels, he maintained, could translate into cumulative savings over that 10-year period of 2,634 GWh/year (3,220 GWh/year including codes and standards) under the cautious scenario and 3,013 GWh/year (3,534 GWh/year including codes and standards) for the aggressive portfolio, the net effect of which is to virtually flatten domestic load growth, as shown by the dashed yellow lines in the following Figure.[75]

Figure 5 DSM Scenarios' Impact on Manitoba Hydro Load Forecast



Mr. Chernick also suggested that Manitoba Hydro could increase DSM savings from the current 0.4% of retail sales to 1.5% of sales annually through a combination of measures to discourage the use of electricity for heating, as well as codes and standards, and regulations.[76]

A number of witnesses were of the view that it was possible to flatten load growth with DSM. Dr. Gotham, an expert witness on behalf of the CAC, felt that DSM could not realistically achieve negative net load growth, because incentives change when load is shrinking there is no longer the benefit of avoided cost of new generation.[77] Mr. Dunsky argued that load growth could be flattened and new generation deferred until at least

[74] Exhibit, CAC-62, p.13.

[76] Exhibit GAC-22, p. 25.
[77] Transcript, pp 8602-8603.

the mid-2020s.[78] Mr. Chernick and another CAC expert, Dr. Higgin, also agreed that flat load growth could be attained through DSM efforts.[79]

The original versions of Manitoba Hydro's proposed development plans provided in August 2013 assumed the 2012 load forecast projections, and a "base" level of DSM. The 2014 versions of the development plans assume the newer 2013 load forecast projections and substantially higher DSM spending to achieve DSM Level 2. This change in forecasted DSM savings caused dramatic changes in both the need date for new generation resources to meet Manitoba demand and in the economics of the development plans that Manitoba Hydro analyzed.

DSM Level 2 affected the Net Present Value of all development plans. The Net Present Value of the Preferred Development Plan relative to the All Gas Plan decreased by $329 million such that it is only $45 million better than the All Gas Plan. Plans with Keeyask but not Conawapa were not significantly affected by DSM Level 2 relative to All Gas, and, in fact, improved their Net Present Value.[80]

Chapter 8 of this Report discusses Manitoba Hydro's economic evaluation of the Preferred Development Plan and alternatives.

5.4.0 The Value Proposition of DSM

During the NFAT Review hearings, the Panel heard from a number of witnesses about the importance of DSM in Manitoba's energy future. Witnesses spoke to the Panel about successful DSM programs in other jurisdictions and the framework required to achieve stable long-term DSM savings. The Panel saw that DSM can have a profound impact on the date when new energy resources are needed. The Panel learned that DSM is a powerful resource that can bring value to resource planners, ratepayers, the economy, and the environment. The Panel, therefore, considered how DSM can bring that value. It looked at the role of DSM in resource planning.

The Panel found that treating the DSM savings from the Supplemental 2014 Power Smart Plan as a separate, independent energy resource, yields capacity savings that amount to more than 80% of the net system capacity addition from the proposed Conawapa Project. Similarly, the annual dependable energy savings from the Power Smart Plan exceed 85% of the dependable energy output from the proposed Conawapa

[78] Transcript, p.8182; Exhibit CAC-62, p. 57.
[79] Transcript, p.9536; Transcript, pp. 9661-2.
[80] Exhibit MH 104-15, p. 2.

Project. To achieve these electricity savings, Manitoba Hydro budgets to spend $822 million, which is less than 8% of the $10.7 billion cost of building Conawapa.[81]

5.4.1. Role of DSM in Resource Planning

A number of witnesses discussed how DSM savings should be treated for resource planning purposes.

Manitoba Hydro provided evidence on how its DSM initiatives fit into its power resource planning process. Referring to the interface as a "combined DSM integrated resource planning process", it begins with resource planning staff indicating a value that represents the value of energy to Manitoba Hydro (currently approximately 7.5 ¢/kWh). This marginal value represents the value of energy that is saved and then exported combined with the avoided cost of new transmission and distribution infrastructure. This value is used to update Manitoba Hydro's Power Smart Plan in relation to economic DSM opportunities based on a total resource cost metric. The revised plan is then provided back to Manitoba Hydro's resource planners for input into the resource planning process.[82]

Elenchus and Mr. Dunsky emphasized that Manitoba Hydro should treat DSM as a resource option from the outset, assessing it in the same manner as investments in traditional resource options such as hydro dams or investments in transmission and distribution. Both suggested that Manitoba Hydro pursue an Integrated Resource Planning (IRP) approach to evaluate supply- and demand-side resources on an equal footing.[83]

Mr. Dunsky further stated that an integrated process helps to ensure that least cost options are fully considered. He maintained that by not treating DSM as a resource option through an IRP approach in its analysis of the possible resource options to meet domestic power needs, Manitoba Hydro has *"de facto excluded the single lowest-cost and lowest-risk resource option available"*[84] and "*risks locking itself into a path of new supply that, as a result, will lock out the much less expensive option of more efficient demand.*"[85]

Manitoba Hydro maintains that it is undertaking integrated resource planning that combines supply and demand options, and that its Power Smart Plan is an integral

[81] Exhibit MH-180, p. 31.
[82] Transcript, pp. 431-434.

[85] Exhibit CAC-19, p. 16.

component of its resource plans. It asserted that the analysis of DSM options and supply options provided to the Panel after the hearing began was an integrated evaluation.[86]

There was also discussion about innovations that can sustain DSM savings over the long term. Mr. Dunsky stressed that DSM opportunities are constantly being renewed through innovation.[87] He further suggested that Manitoba Hydro was presenting an unrealistic view of the emerging opportunities for energy efficiencies, such as emerging innovations in efficiency standards, LED lighting, heat pumps, data-driven analytics, and solar photovoltaics.[88] In his view, "*New DSM opportunities abound – including several "game changers" that have already landed in market, with many more to come."*[89] He further stated that: *"Not accounting for these game changing future opportunities really exposes long-term investment plans to significant risk. And that's not to say it's not a risk worth taking, but there's a very real risk that needs to be accounted for, especially in long-term forecasts.*"[90]

Mr. Dunsky indicated that resource planners in a number of jurisdictions are now assuming that DSM opportunities will continue to improve and replenish themselves as opposed to reaching depletion. Those same system planners also consider DSM to be a dependable, low-risk resource.[91]

Manitoba Hydro has traditionally focused on DSM measures and opportunities that are known, commercially available, or very near commercialization.[92] On the issue of innovation and the focus of its DSM measures and opportunities, Manitoba Hydro stated the following:

> *"While it may only be a question of timing as to when the next innovation or evolution of energy efficient technology will become available and commercially viable, for the purposes of resource planning and meeting customers' energy needs, timing does matter. The Corporation must balance risks and the timing of technology evolution, and its adoption can have a significant impact on the Corporation's obligation to meet customers' energy requirements."*[93]

[93] Exhibit MH-204, p. 26.

The certainty of DSM savings was the subject of some discussion. While Manitoba Hydro includes DSM in its supply-demand analysis and considers DSM to be 100% dependable, it would appear to have some reservations about the certainty of DSM as a resource. In its NFAT Submission, Manitoba Hydro notes the following:

> *"… Without regulation or legislation, achieving energy reduction targets is strongly dependent upon market acceptance and voluntary action. Also, in addition to market availability and adoption forecasts, the savings potential is estimated based on a variety of assumptions that include natural technological development, anticipated customer energy usage/savings and market cost projections. As a result, expected energy savings from DSM do not have the same future certainty of supply as would the development of a physical resource."*[94]

Elenchus maintained that future DSM savings were not certain and suggested that DSM should be treated as a non-dispatchable resource subject to explicit dependability factors.[95] Mr. Dunsky, on the other hand, was of the opinion that all forecasted DSM savings could be counted on for planning purposes.[96] This view was supported by Mr. Chernick.[97]

5.4.2. Value of DSM to Ratepayers: Savings Potential

DSM program spending and benefits have different impacts on customers as some customers participate to varying degrees in the DSM programs while other customers do not participate at all. In particular, specific barriers to participating in DSM programs have been identified with respect to lower income customers.

DSM programs typically result in higher rates because total demand is reduced; the fixed costs of Manitoba Hydro's system, including DSM spending, do not fall with demand and have to be recovered over lower sales volumes. The result is that bills may go down for participating customers even as the electricity rates may go up. Customers who access DSM programs and choose to participate can benefit from reduced energy consumption and thus reduce their annual energy bills. Customers who do not participate in DSM programs and therefore do not reduce their energy consumption will potentially pay more for their electricity.[98]

[94] Manitoba Hydro NFAT Submission, Chapter 7, p. 13.

[96] Transcript, p. 8074.
[97] Transcript, p. 9822.
[98] Exhibit MPA–3-1, pp. 6-7.

In jurisdictions that export surplus energy and capacity, DSM savings may mitigate the rate increases associated with the cost of DSM measures. This mitigating effect comes from the ability of DSM measures to free up more energy and capacity for export, and thus increase revenues from export sales. If export prices are equal to or greater than the utility's costs of the DSM measures, these costs could be recovered from export revenues and ratepayers might not see a rate increase at all.

Residential customers can realize significant savings on their energy bills if they fully utilize the available DSM measures. Manitoba Hydro provided three example scenarios to illustrate such savings based on an average single detached home of approximately 1,300 square feet.[99] These examples show annual energy savings ranging from 7% to 42% depending on the measures employed.

- Example 1: For the customer heating both their home and their water with electricity, if they were to install energy efficient lighting, the free Water & Energy Saver kit, upgrade their attic insulation from R20 to R50 and their basement insulation from R0 to R24, and retire their second refrigerator, they could save approximately 42% on their annual electricity bill.
- Example 2: For the customer heating their home with natural gas and their water with electricity, if they were to install energy efficient lighting, the free Water & Energy Saver kit and retire their second refrigerator, they could save approximately 16% on their electricity costs or 7% on their overall energy bill (natural gas and electricity).
- Example 3: For the customer heating their home and their water with natural gas, if they were to install energy efficient lighting and retire their second refrigerator, they could save approximately 15% on their annual electricity costs or 5% on their overall energy bill (natural gas and electricity).

DSM programs are a direct way for residential, commercial, and industrial ratepayers to participate in their energy savings and contribute to their energy future. Since their implementation in 1989, Manitoba Hydro programs will have saved participating customers over $1 billion.[100]

Certain industrial customers have the greatest potential to benefit from DSM program energy savings as they are large consumers of electricity. The Manitoba Industrial Power Users Group (MIPUG) indicated that industry has been one of the largest and most committed participants in Manitoba Hydro's DSM programming.[101] However, as

[99] Exhibit MH-164.
[100] Exhibit MH-154, p.5.
[101] MIPUG-28, p. 91.

further set out below, MIPUG was critical of the perceived lack of availability of some DSM measures to industry, particularly the Curtailable Rate Program (CRP).[102]

In its updated analysis of ratepayer costs for the Panel, Morrison Park found that DSM Level 2 had a "powerful effect" on ratepayer costs in that it brought ratepayer costs down. They noted that DSM can not only help to reduce the electricity bills of ratepayers who take advantage of the programs, but also reduce Manitoba domestic load, and free up more capacity for export.[103]

5.4.3. Value to Lower Income Customers

Throughout the hearing, the Panel heard about how lower income customers would be negatively affected by the rate increases projected in Manitoba Hydro's development plans. The Panel also learned that lower income customers face barriers to participating in energy efficiency programs. CAC identified a number of barriers to lower income customer participation in Power Smart programs, including lack of access to financing, housing conditions that preclude energy efficiency improvements, and electricity bills being in arrears.[104] Witnesses noted the common problem of DSM programs in reaching lower income and vulnerable customers. In some cases, the challenge is getting information, services, and incentives to rural and remote communities.

Dr. Higgin stressed the importance of DSM programs reaching vulnerable customers. He concluded that bills, not rates were important.[105] Dr. Higgin was of the view that the impacts on ratepayer bills in the short term proposed for the Preferred Development Plan were not acceptable, particularly for vulnerable consumers,[106] whom he defines as customers whose household income is less than 125% of Statistics Canada's Lower Income Cut-Off measure.[107]

The ability of customers who are in arrears to participate in Power Smart Programs was identified as a particular concern. Manitoba Hydro does not permit these customers to participate in its Power Smart programs unless they have made payment arrangements designed to eliminate the arrears. The Panel was told that the exclusion of customers in arrears from Power Smart programs has a significant impact on many aboriginal communities where many residents are in arrears.[108] MKO submitted in its closing

[108] Exhibit MKO-11. p. 8.

argument that 86% of MKO First Nations accounts are currently in arrears and are therefore ineligible to participate in DSM measures.[109]

The Interveners agreed that specific actions should be taken to assist lower income and vulnerable customers. CAC suggested that bill support be considered.[110] MKO stressed the importance of Manitoba Hydro undertaking efforts to reduce electricity bills by ensuring the availability of DSM programs, particularly to lower income, fixed income, and remote residential customers, and to general service customers in First Nations communities. MKO also maintained that future rate increases should be conditional on Manitoba Hydro's DSM programs being universally available and practically accessible to First Nations customers. To achieve accessibility, MKO recommended that Manitoba Hydro act on Mr. Dunsky's ideas of providing DSM programs on a turn-key basis to First Nations customers. MKO also recommended that Manitoba Hydro measure and report on the availability and penetration of lower income DSM programs for First Nations customers, particularly to lower income First Nations customers, and on the success of DSM programs in reducing the bills of lower income First Nations customers.[111]

5.4.4. The Curtailable Rate Program (CRP)

Manitoba Hydro has had a Curtailable Rate Program in place for industrial customers since 1998. Customers who participate in the Curtailable Rate Program can have their power curtailed on short notice. This program is used to maintain operating and contingency reserves in order to minimize disruption to Manitoba Hydro's firm customers in the event of loss of generation or transmission. Curtailable load is particularly valuable to Manitoba Hydro in system emergencies. However, its greatest value is during times of peak power use.

Mr. Dunsky explained that there is considerable opportunity for Manitoba Hydro to achieve capacity savings through a combination of new demand response initiatives, energy-focused DSM initiatives, and Manitoba Hydro's current industrial Curtailable Rate Program (CRP).[112] The Panel learned that Manitoba Hydro has capped the CRP and is no longer accepting new entrants. MIPUG members appeared before the Panel and expressed an appetite for continued participation in the program, as well as for enhanced and new opportunities to participate in other demand response initiatives and customer self-generation measures. MIPUG offered the view that Manitoba Hydro had not captured the benefits of the CRP. In its view, the CRP provides capacity and helps

[109] Exhibit MKO-11, p. 8.
[110] Exhibit CAC – 91, p, 50.
[111] Exhibit MKO-11, pp. 6-7.
[112] Exhibit CAC-19, pp. 41-42.

with reliability. As such, participation in the CRP should not be capped and there should be options to allow for new participants.[113]

In response, Manitoba Hydro noted that only 16 industrial customers have made use of the CRP since its formation, and only three businesses currently use it. Accordingly, while Manitoba intends to ensure that existing CRP participants continue to receive its benefits, Manitoba Hydro indicated that to remove the cap would invite uneconomic DSM.[114]

5.4.5. DSM and Fuel Switching

GAC's expert witness, Mr. Chernick, raised a concern with the ongoing switching of Manitoba Hydro customers from gas-fired space and water heating to electric heat. In GAC's view, space and water heating with natural gas is preferable by every measure. Gas heating is a more efficient use of gas than to generate power (greater than 90% efficient for space heating versus 25 to 50% efficient in a power plant), saves customers money, is better for the environment because of reduced global emissions, and provides cash flow to Manitoba Hydro through additional exports. Since the electricity savings generated by relying on gas allow Manitoba Hydro to export more electricity into the heavily coal-based MISO market, relying on gas heat instead of electric heat actually reduces global greenhouse gas emissions. In light of these factors, GAC called the ongoing switch to electric space and water heat a "*serious market failure*."[115]

Manitoba Hydro's 2012 Fuel Switching Report provided findings similar to Mr. Chernick's analysis. The Report states that: "*From the customer, utility and provincial leakage perspectives, there are substantive benefits when customers use natural gas rather than electricity for space heating purposes... Using electricity for space heating in Manitoba as opposed to natural gas will reduce GHG emissions in Manitoba; however the global GHG emissions will be higher due to reduced electricity exports from Manitoba.*"[116]

Manitoba Hydro owns Centra Gas, the Province's only natural gas distributor. Because of this, Manitoba Hydro is in the position of being able to encourage its customers' fuel choices one way or the other. Rather than aggressively advocating one fuel over the other, Manitoba Hydro has developed a "Fuel Switching Initiative" consisting of an education and information campaign directed to homeowners, heating contractors, homebuilders, and land developers. The aim of the initiative is to increase awareness of

[113] Exhibit MIPUG-28, p. 68.
[114] Exhibit MH–204, p. 35.
[115] Exhibit GAC-27, pp. 12-13.
[116] Manitoba Hydro NFAT Submission, Appendix 15.4.

the lifetime costs of installing and operating electricity, natural gas, and geothermal heating systems in order to provide customers with information to make informed choices.

Mr. Chernick disagrees with this passive approach and suggests that the trend toward electric heat could be reversed through the vigorous promotion of gas heat by a combination of better information, appropriate incentives, Power Smart programs, and offering low-cost, on-bill, transferable financing.[117] Furthermore, Mr. Chernick suggested that Manitoba Hydro could do more to discourage electric heat by increasing the cost to land developers for electricity line extensions and reducing the cost of gas connections.[118] Elenchus further noted that because Manitoba Hydro controls both the distribution and sale of electricity and natural gas, and Manitoba Hydro's focus as a Crown corporation is on serving the customer as cost effectively as possible, it should help customers choose the least expensive fuel.[119]

The Manitoba Métis Federation noted its concern about the failure of Manitoba Hydro to consider biomass, such as wood, as a fuel switching or load displacement option. They observed that many northern and aboriginal communities have access to this fuel source and that considerable new technologies now exist to use biomass as a fuel.[120]

5.4.6. DSM Employment Potential

Manitoba Hydro indicated that it did not prepare a study of the employment impacts associated with DSM for the NFAT Review, in part, because fewer opportunities for DSM-related training and employment would exist in northern Manitoba. However, Mr. Dunsky suggested that DSM could create significant employment in comparison to new generation options. He noted that studies of the economic benefits of DSM show that for every million dollars spent on DSM, 15 to 35 person-years of employment were created, which is 2 to 10 times more than for new power plant construction. The high level of job creation associated with DSM was confirmed in a study Mr. Dunsky conducted in four Canadian provinces, and will, he suggests, be further supported by a national DSM study that has yet to be publicly released. Mr. Dunsky stated the DSM employment values for Manitoba will be toward the higher end of the range, based on the study's macroeconomic modelling.[121]

117 Exhibit GAC–12, pp. 2-13.

119 Transcript, p. 5183.
120 Exhibit MMF-36, p. 6.
121 Transcript, pp. 8184-8186. Exhibit CAC-62 p.9.

One of the presentations to the Panel provided information on the job creation potential of DSM, indicating that the cost to create a Demand Side Management job could be about $80,000 per direct/indirect full-time equivalent (FTE) position.[122] The cost to create a hydropower development job could, in this Presenter's view, be several hundreds of thousands of dollars. He emphasized there were many advantages associated with DSM employment opportunities, such as more permanent jobs, additional transferable skills, and more local employment, as well as a better geographic distribution of jobs, including northern and aboriginal communities.[123]

5.4.7. Environmental Benefits of DSM

Reducing energy consumption has obvious environment benefits. Manitoba Hydro is projecting greenhouse gas (GHG) emission reductions of 780,000 tonnes as a result of its gas and electric DSM programs over the three-year period, 2014-2017.[124] Including GHG reductions achieved to date, Manitoba Hydro is forecasting GHG reductions in the order of 4.6 million tonnes by 2028/29.[125]

A long-time advocate of using natural gas as a heating fuel because it frees up electricity for export, GAC emphasized the importance of distinguishing between the GHG impacts of natural gas used for heating and natural gas used to generate electric power. Because of the difference in their efficiencies, (greater than 90% for a gas furnace versus 20-50% for gas turbine or coal power generation), heating with electricity causes significantly more GHGs to be produced by the North American energy system than heating with a high-efficiency gas furnace. GAC argues that converting to electric heat to achieve fossil fuel freedom increases the net environmental impacts associated with the heating choice.[126]

5.4.8. Implementing a Successful DSM Program

An inherent conflict of interest may exist when a utility that derives income from the power it sells also has the responsibility of promoting the use of less electricity through energy efficiency programs. If a utility can make more money from selling electricity than it can if electricity is saved, there can be a disincentive to encouraging customers to reduce their energy consumption. Reduced consumption means less income, unless the energy can be sold on the export market at prices that are higher than domestic electricity rates.

[125] Exhibit MH-180, p. 40.
[126] GAC-27, p. 32.

Witnesses outlined to the Panel their views on how best to achieve a successful DSM program. Based on their observations and experiences with other jurisdictions in Canada and the United States, they identified the following requirements:[127]

- The creation of DSM targets. Targets are mandated, clear, and measurable. While it is important to have a long-term perspective on desired outcomes, DSM programs need measurable targets to guide program design.
- Aggressive pursuit of DSM targets. The entity charged with delivering DSM programs must be committed to achieving the targets.
- Monitoring and reporting of performance relative to targets. Performance against goals is assessed through independent (third party) audits and evaluations, which is reported publicly.
- An effective body to track performance. Often times this body is the regulator, but it could also be another entity.

In his testimony, Mr. Dunsky explained:

> *"I've worked with organizations that have put DSM out there and hope that people will come. And often times they find that they don't, and then declare failure. Those organizations tend not to have the motivation to deliver, to sell. They tend not to have a solid reporting framework, where they have to actually report their results in a specific way. Those organizations that operate under a clear oversight framework with clear reporting requirements, and ideally performance requirements, they deliver and they systematically deliver."*[128]

Manitoba Hydro submitted that such a framework already exists in Manitoba by virtue of *The Energy Savings Act,* which requires Manitoba Hydro to consult with the Province of Manitoba in developing its DSM plans.[129]

In their Closing Submissions, both CAC and MIPUG supported efforts to implement and pursue enhanced DSM programs.[130]

MKO recommended in its closing submission that an entity independent of Manitoba Hydro be established with a mandate to deliver DSM programs in Manitoba.[131] Residential, business, and especially lower income customers often need to be "sold"

[127] Transcript, pp. 8143-8149; pp. 9420-25.

[131] Exhibit MKO-11, p. 9.

on DSM. Programs and information need to be provided in a manner that speaks to them directly, and in a clear and convincing manner.

5.5.0 Conclusions of the Panel

In the course of the NFAT Review, the Panel heard much about the importance of DSM. Energy and capacity savings achieved through DSM measures provide a low-cost, reliable, dependable resource that has the added benefit of reducing customer energy bills. Furthermore, DSM measures can provide a hedge for the consumer against increasing energy costs and for the utility against grid parity. In the Panel's view, there are ample reasons for placing DSM measures on an equal footing with supply-side resource options.

Integrated Resource Planning

Integrated resource planning is a regular practice in many jurisdictions. The purpose of an integrated resource plan is to determine analytically what resource is in the best interest of consumers by examining a full spectrum of possible supply-side and demand-side options and measuring them against a collective set of objectives and criteria. This contrasts with traditional methods of utility resource planning, which emphasize supply-side options such as building new generation, transmission, and distribution facilities. Integrated resource planning also tends to be more transparent than traditional resource planning.

The Panel heard evidence that the best practices for integrated resource planning involve placing every conceivable resource option on an equal footing. Manitoba Hydro prepares an annual Power Resource Plan. However, this plan is not tested through an integrated resource planning process.

The Terms of Reference required the Panel to consider "if preferred and alternative resource and conservation evaluations are complete, accurate, thorough, reasonable and sound."

By failing to offer an analysis of conservation measures as a stand-alone energy resource competitive with other generation resources, Manitoba Hydro presented an analysis of conservation measures that was neither complete, accurate, thorough, reasonable, nor sound.

The NFAT Review demonstrated that DSM measures were not equally weighted with other energy options. It was only in the course of the NFAT hearing that it became clear that significantly higher levels of DSM than originally proposed by Manitoba Hydro were both achievable and economic. The Panel agrees with the Consumers' Association of Canada (Manitoba) that Manitoba Hydro did not treat DSM as a stand-alone resource option competitive with other generation options in its resource planning and analyses.

In its resource planning, Manitoba Hydro added DSM to each alternative plan it examined. By doing this, Manitoba Hydro effectively screened out DSM as an independent resource to be evaluated against other generation resources.

Had Manitoba Hydro undertaken a best-practices integrated resource planning effort, DSM would have been incorporated in the NFAT analysis from the beginning.

Thus, to satisfy anticipated load growth to 2028/29, the Preferred Development Plan delivers 2,025 MW of additional capacity at an estimated cost of $18.7 billion. Had the Supplemental 2014 Power Smart Plan DSM measures been treated as a stand-alone and equally weighted resource, and added to the capacity from the Keeyask Project, the total capacity addition would be 1,766 MW at a projected cost, including transmission, of $8.3 billion. This is more than 85% of the net system capacity of the Preferred Development Plan, at a considerably lower cost.

It is clear: DSM must be evaluated as a stand-alone resource in an integrated resource planning process by Manitoba Hydro.

In a time of rapid technological innovation on both the demand and supply side, openness to alternative resources and new technologies will be required. This may involve new methods of saving electricity as well as new methods of generating it, such as wind and solar power. Integrated resource planning provides the analytical framework to evaluate all such energy resource options – hydropower, wind, solar, gas, DSM, or other technologies – on an equal footing. As such, it should be adopted by Manitoba Hydro before any further generating facilities beyond the Keeyask Project are constructed in the future.

DSM Targets

Annual average incremental energy savings in the order of 1.5% (including codes and standards) are achievable and economic. This target contrasts with Manitoba Hydro's 2014-17 Power Smart Plan which forecasts declining future DSM savings. In the Panel's view, it is prudent to assume that DSM savings will continue to be attained and technological advances will present new savings opportunities.

While reliance on on-going incremental DSM savings present a risk that the savings will not be realized, several other North American jurisdictions have successfully achieved ongoing annual savings at targeted levels. Mitigating this risk, the Panel's recommendation to proceed with a 2019 in-service date for Keeyask will provide sufficient capacity and dependable energy to create a safety margin in case DSM targets cannot be fully achieved in the short term.

While Manitoba Hydro currently consults with the Province of Manitoba as required under *The Energy Savings Act*, there are no clear DSM targets established by the Government. The Panel is of the view that clear, measurable DSM goals and targets are a key component of Manitoba's energy future.

Implementing DSM Programs

There is an inherent conflict of interest when a utility acts as both a seller of electricity and a purveyor of energy efficiency measures. Therefore, the Panel concludes that the planning and provision of DSM services should be divested from Manitoba Hydro.

Jurisdictions such as Vermont that have established independent arm's-length entities to deliver DSM programs have had considerable success in reducing energy consumption and maintaining program performance. The Panel notes that Manitoba Hydro has a long and for the most part successful history with DSM, but in recent years has seen DSM initiatives scaled back and spending reduced. While Manitoba Hydro is to be commended for the new DSM initiatives in its latest Power Smart program, the Panel believes from the evidence before it that the energy savings will not be sustained at levels it considers achievable over the long term. The Panel is also concerned that the utility's renewed focus on DSM may not be continued into the future, in the face of cost constraints and other corporate priorities.

Therefore, in addition to supporting the creation of long-term DSM targets, the Panel also sees great value in establishing an entity independent of Manitoba Hydro to implement DSM programs. The independent arm's-length model has been operating and proven successful in other jurisdictions; the Panel sees no reason why it could not be successfully implemented in Manitoba. The power savings delivered through an independent arm's-length entity would constitute an additional resource available to Manitoba Hydro to meet energy needs.

Monitoring DSM Performance

Monitoring performance against DSM targets was stressed by a number of witnesses as a hallmark of a successful DSM program. The Panel concurs with that view and strongly believes there should be accountability and performance measurement in terms of achieving DSM goals. The Panel also sees the importance of ensuring that performance evaluation is carried out by someone independent of the DSM provider. For these reasons, DSM savings should be independently audited on an annual basis.

Lower Income and Vulnerable Customers

A significant concern of the Panel is the impact of Manitoba Hydro's projected rate increases over the next 20 years on lower income and vulnerable customers, as discussed in Chapter 9. The Panel notes that DSM measures can help customers mitigate the impact of expected rate increases on their bills. The Panel is of the view that until a new independent arm's-length entity is established to implement DSM programs, Manitoba Hydro should continue to address barriers to lower income customer participation in Power Smart programs. The Panel suggests that a stakeholder consultation process that involves business, residents, and organizations may be able to provide assistance in reaching lower income and vulnerable customers.

Furthermore, the exclusion of customers in arrears from Power Smart programs precludes those that are most in need of these programs from receiving their benefits. Given the projected rate increases that customers will face in the decades ahead, the exclusion of these customers from participating in Power Smart programs needs to be addressed immediately.

The Curtailable Rate Program (CRP)

The Curtailable Rate Program has the potential to result in additional capacity savings. As such, the program merits further review.

Fuel Switching

The Panel supports efforts to reduce the number of customers switching from natural gas to electric heating, and to encourage natural gas use for space and water heating in new construction. Therefore, until a new independent arm's-length entity is established to implement DSM programs, Manitoba Hydro should continue to proceed with its fuel switching and heating fuel choice initiatives to encourage customers to use natural gas for space and water heating. If warranted, fuel switching initiatives should include the provision of a fuel-switching option to biomass in areas where natural gas service is not available.

DSM Employment Potential

Long-term DSM provides enhanced long-term employment, which should be considered an additional socio-economic benefit of DSM programs.

6.0.0 Exports Markets and Contracts

6.1.0 Introduction

Since 1970, Manitoba Hydro has sought out customers and exported its electricity to markets in other Canadian provinces and into the United States. What has been a growing endeavour with increasing revenue is now an essential element of Manitoba Hydro's future plans and strategies.

Manitoba Hydro sees export sales as an opportunity to offset a portion of the costs of its proposed new resource needs, mitigate risks for ratepayers, and meet its commitment to sustain low electricity costs. As Manitoba Hydro has stated in its filing, under the title of Surplus by Design "Exports and transmission access to export markets have been and will continue to be critical for the effective and efficient operation of Manitoba Hydro's system and the development of Manitoba's hydropower resources."[132]

The Panel's Terms of Reference directed it to consider a number of issues related to exports and Manitoba Hydro's export contracts. In particular, the Panel was asked to examine the reasonableness, thoroughness, and soundness of Manitoba Hydro's export market forecast and its revenue projections.

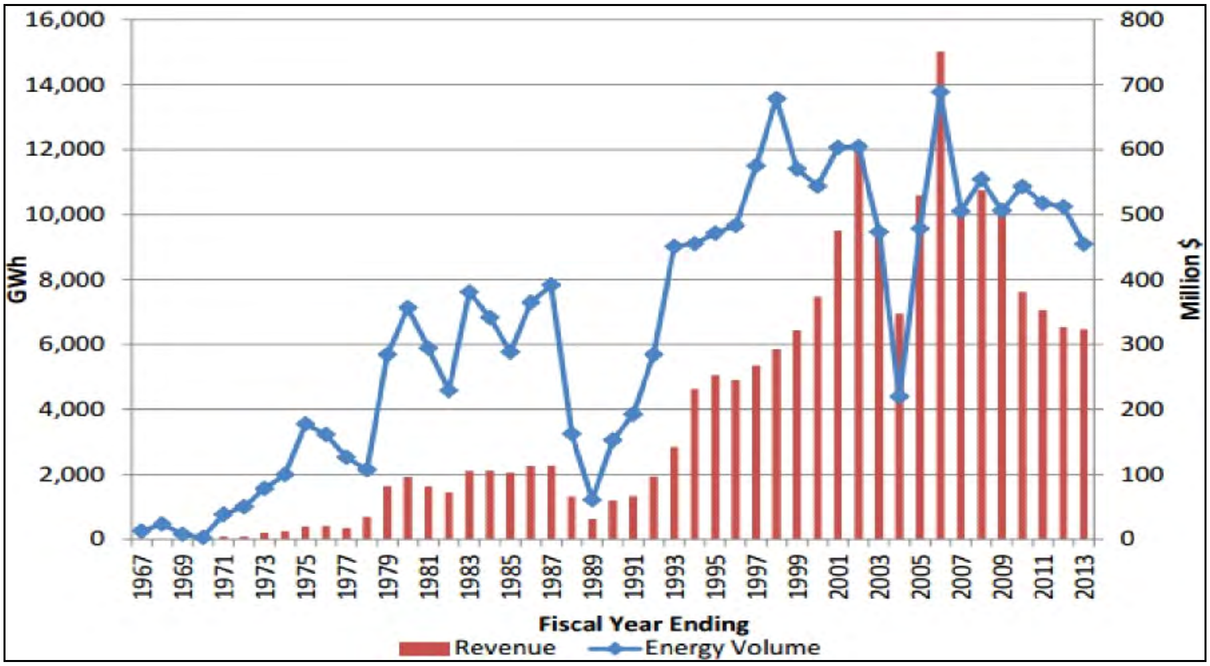
6.2.0 Background and Context

6.2.1. History of Manitoba Hydro's Exports

The annual history of Manitoba Hydro's energy exports (GWh) and gross revenues from those exports are presented in the Figure below:[133]

[132] Manitoba Hydro NFAT Submission, Chapter 5, p. 31.
[133] Manitoba Hydro NFAT Submission, Chapter 5, Figure 6.3, p. 20.

Figure 6 Manitoba Hydro's Gross Export Revenues and Volumes (1967-2013)



Over the past decade, Manitoba Hydro's exports have generally been between 10,000 and 12,000 GWh/year. Over the period of 2002/03 to 2011/12, about one-third of Manitoba Hydro's total electricity gross revenue has come from exports.[134]

6.2.2. Export Sales, Services and Products

Manitoba Hydro exports four services or commodities: electrical energy generated as measured in GWh, capacity as measured in MW, ancillary services, and environmental attributes. Environmental attributes provide additional value for energy from certain types of generation such as renewable or low-emission generation. These products can be sold in a direct contractual arrangement with another utility. This is often referred to as a bilateral transaction. Alternatively, they can be sold in an organized market where multiple sellers can offer these components to multiple buyers through a competitive market structure.

Manitoba Hydro sells its exports in durations of long-term firm products, medium-term products, and spot-market products. With regard to long-term firm sales, Manitoba Hydro determines its dependable surplus power availability and then seeks to make surplus firm energy available for sale under agreements with terms greater than one year. These sales are done on a bilateral basis directly with counterparties. These long-term sales include both system participation power sales and diversity exchange sales,

[134] Exhibit LCA-9, p. 6-4.

and are usually of 10- to 15-year durations with utility companies in the U.S. Medium-term arrangements are sales with terms longer than one day but less than one year. Spot market sales are defined as sales with timeframes of one day or less. They are done on a bilateral basis or through structured markets, and administered by regional transmission organizations, such as the Midcontinent Independent System Operator, Inc. (MISO).[135]

6.2.3. Surplus By Design

Manitoba Hydro's focus on exports and transmission access to export markets is a continuation of past practices. In its Preferred Development Plan and in many of the alternatives, exporting energy is an underpinning strategy and goal of Manitoba Hydro. Continued and increased exports are seen as the means to contribute to the financing of its new generation needs. By design, in all flow conditions other than the lowest flow period of the past 99 years, there will be hydro-generation capacity surplus to domestic load and committed firm export requirements. Furthermore, hydro developments result in large additions of capacity that produce surpluses of energy compared to what is needed for domestic load, especially in the early years of a new hydro development.[136]

During the hearings, this strategy was presented as the "opportunity" side of the ledger, or the "opportunity pathway." As Manitoba Hydro CEO Scott Thomson indicated on the first day of the hearings:

> *"… Our statutory mandate contemplates exports on appropriate terms. As I'll discuss later, exports have been a major reason why Manitoba Hydro's rates remain so low relative to many other jurisdictions. Revenues from exports help to offset costs for domestic customers."*[137]

Others had differing views as to this approach and its implications. In its closing submission, the Consumers' Association of Canada (Manitoba) Inc. (CAC) made note of the "merchant plant" concept (that is, building a generating station for the export market) underlying Manitoba Hydro's export plans and pathways. In CAC's view, this approach exposes ratepayers to substantial risks.[138]

This notion of the "merchant plant" and its implications was best articulated in the report and testimony of Morrison Park:

135 Exhibit LCA-9, p. 5-8.
136 Manitoba Hydro NFAT Submission, Chapter 5, pp. 31-32.
137 Transcript, p. 79.
138 Exhibit CAC-91, pp. 8-9.

> *"Considered more broadly, Manitoba is simply a price taker in the MISO market, whether it is taking prices in short-term markets, or in a longer-term market for bilateral arrangements with specific counterparties…. As a result, the longer-term firm contracts are not mitigating market risk or exposure for Manitoba Hydro, but merely apportioning the market risk accepted in pursuing the Preferred Development Plan.*
>
> *In this respect, Manitoba Hydro is acting as a "merchant" investor, taking substantial market risk based on expectations, or bets, about the future. While "probabilities" have been placed on different potential futures through the scenario modeling process, fundamental market risks are necessarily imbedded in some Resource Plans to a far greater extent than in others.*
>
> *Prices will either turn out to be high, and ratepayers will benefit, or they will turn out to be low, and ratepayers will have to shoulder more of the burden of Manitoba Hydro's costs. Either way, ratepayers can have no certainty in advance, and no choice in the matter."*[139]

6.3.0 Export Markets

6.3.1. Canadian Export Markets

In its planning, Manitoba Hydro examined the long-term potential and value of both its current markets and potential markets in Ontario and Saskatchewan. Manitoba Hydro currently has a relatively small, 200 MW, export capability into Northwestern Ontario. There is already ample generation and a relatively small load within Northwestern Ontario. The Ontario interconnection through east-west transmission lines is insufficient for a major new sale into southern Ontario. In the view of Manitoba Hydro, this makes the likelihood of increased future power sales to Ontario unrealistic.[140]

Manitoba and Saskatchewan have had ongoing discussions about future power sales. Over the last decade, SaskPower appears to have focused on natural gas-fired generation of electricity, with Saskatchewan being Canada's third-largest producer of natural gas. Recently Manitoba Hydro and SaskPower entered into a Memorandum of Understanding (MOU) dated October 7, 2011 regarding SaskPower's potential

[139] Exhibit MPA-3, pp. 68-69.
[140] Manitoba Hydro NFAT Submission, Chapter 5, pp. 49-51.

purchase of 25 MW from Manitoba Hydro, commencing in approximately 2015. That MOU was converted to a non-binding Term Sheet, dated September 13, 2013.[141]

6.3.2. United States/MISO

Manitoba Hydro has long sold power to public utilities in the MISO territory comprising 15 of the United States. Manitoba Hydro pursues U.S. exports through bilateral contract negotiations with MISO members, especially utilities in Minnesota. The primary reason for Manitoba Hydro's focus on U.S. exports and interconnections with the MISO market is the Minneapolis–Saint Paul metropolitan area of Minnesota, which represents the closest and largest population centre and electricity market to southern Manitoba. Minnesota is a significant net importer of electricity, providing a market for Manitoba Hydro's surplus power.[142] Given the existing U.S. interconnections and size of the Midwestern U.S. market, over 85% of Manitoba Hydro's exports have been sold into the MISO market in recent years. Manitoba Hydro continues to rely on the MISO energy market for the majority of its exports.

6.4.0 Export Market Forecast

6.4.1. Introduction

During the course of the NFAT Review, the Panel heard testimony about the transformation of the electricity marketplace. As a result of innovation, technology advances, concerns about climate change and impending regulations, power utilities are facing an uncertain world which makes planning and forecasting challenging. These factors include:

- The flattening of load growth throughout the U.S.;
- The cost of fuels, especially natural gas;
- The impact and timing of climate policies and regulations, especially as they pertain to carbon pricing;
- The retirement and other restrictions on power sources, such as coal-fired and nuclear generation;
- Public acceptance of new power options, especially shale gas hydraulic fracturing;

[141] Manitoba Hydro NFAT Submission, Related Documents, Export Contracts, Saskatchewan Power Corporation and Manitoba Hydro Term Sheet, September, 13, 2013.
[142] Manitoba Hydro NFAT Submission, Chapter 5, p. 38.

- The rate and adoption of new energy technologies, such as wind, solar photovoltaic, and ground source heating; and
- Changes in the generation sources that might come with grid parity (that is, distributed generating resources that achieve cost parity with grid supplied power).

The potential impacts of distributed generation achieving grid parity are discussed in Chapter 4. Proliferation of grid parity technologies in Manitoba Hydro's export markets could dramatically limit load growth in those markets and compete on price with grid power, effectively capping export prices.

6.4.2. The Nature of the MISO Market: Influences and Determinants

Overview of the Market Drivers

Electricity demand in both Canada and the U.S. is assumed by Manitoba Hydro to continue to increase over its 35-year planning horizon. The Energy Information Administration's (EIA) Annual Energy Outlook 2013 reference case projects overall U.S. load growth of 28% between 2011 and 2040 (0.9% per year).[143]

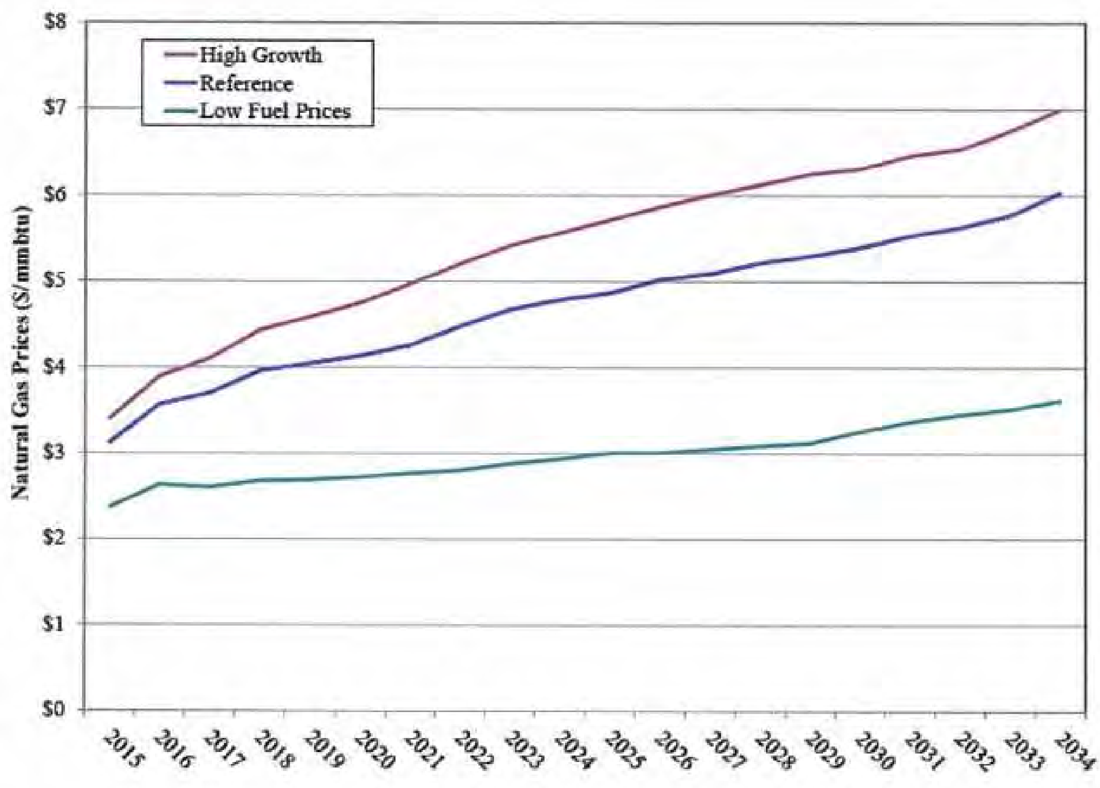
The electricity market is driven not just by the cost of generation but by environmental considerations and policies. For the foreseeable future, environmental considerations, including the anticipated effects of electric industry regulations on greenhouse gas emissions, will continue to influence the generation choices of utilities in MISO and the U.S. as a whole. Many market participants and observers, including Manitoba Hydro, anticipate legislation or regulation that will put a price on electricity generated with carbon-emitting resources such as coal and natural gas. Such policies, often referred to as "carbon taxes", ultimately favour non-greenhouse gas (GHG) emitting generation sources such as hydroelectricity generated by Manitoba Hydro.

Countering the purely environmental considerations of electricity generation are the recent developments in natural gas extraction that have increased natural gas supplies and reduced the cost of production. The combination of horizontal directional drilling and hydraulic fracturing of shale rock has resulted in abundant new supplies of natural gas. Since the highs of 2008, natural gas prices have declined. While future prices are, as always, the subject of prognostication and speculation, the expectation from industry analysts is that natural gas prices will moderately increase over the next decade.[144]

[143] Manitoba Hydro NFAT Submission, Chapter 3, p.1. See also, Manitoba Hydro NFAT Submission, Appendix 6.3.
[144] Manitoba Hydro NFAT Submission, Chapter 3, p.31.

While the Independent Expert Consultant, Potomac Economics, did not produce their own natural gas price forecast, they did provide the EIA's forecast, depicted in the following Figure: [145]

Figure 7 Energy Information Agency Natural Gas Price Forecasts (2013 Energy Outlook, real US$/mmBtu at Henry Hub)



Future MISO Generation Mix

Several factors are driving expected change in the electricity generation mix in MISO. Environmental policies are growing in importance for electricity generators and will increase the cost of refurbishing coal plants and accelerate the pace of coal plant retirements.

Investment decisions in new generation for MISO market participants will be driven by capital costs, fuel costs, financing costs, and regulatory considerations. Manitoba Hydro expects that constraints on new coal generation in the U.S. along with continued low natural gas prices will drive the choice toward new natural gas generation.[146] At the

[145] Exhibit POT-2-1, Appendix A-1 p.47.
[146] Manitoba Hydro NFAT Submission, Chapter 3, pp. 1-3.

same time, new renewable portfolio standards and lower capital costs could move investment towards wind and solar power.

As a part of the NFAT Review, the Independent Expert Consultant MNP reviewed the MISO generation mix. MNP concluded that by 2020 a number of factors will converge: coal plants grappling with compliance with carbon policy; new mercury policy; new water use regulations; and more stringent air pollutant regulations. These will all have the effect of retiring coal power plants. Although the rate at which it will occur is open to debate, MNP expects between 10 and 20 GW of coal generation to retire by 2025, representing a possible reduction in coal generation of at least 17%. Potomac Economics, on the other hand, expects only 6 GW of coal plant retirements in the MISO market based on the EIA's view of the expected retirements.[147]

MNP believes that new energy requirements will be met with a combination of natural gas combined cycle generators and wind investments over the period of 2015 to 2037. This may dampen the amount of coal that currently sets marginal prices in the MISO market, and move more gas to the marginal fuel.[148] MNP suggested the forecast changes might have the effect of supporting hydroelectricity development.[149]

Potomac Economics' view of the future MISO generation mix likewise foresees new combined cycle gas turbines and wind generation. Potomac agrees with the EIA's forecast of 6 GW of coal plant retirements which differs from the MISO Transmission Expansion Planning forecast of 12 GW of retirements.[150]

Impact of U.S. Renewable Portfolio Standards

A Renewable Portfolio Standard (RPS) is a U.S. regulation that requires the increased production of energy from renewable energy sources, such as wind, solar, biomass, and geothermal. Hydro power is not always included in a particular state's RPS; hydro generating plants with a capacity less than 100 MW may be included in Minnesota's RPS, while any new hydro plant built after 2010 is eligible for Wisconsin's RPS.[151] The RPS mechanism generally places an obligation on load serving utilities to procure a specified fraction of their electricity from renewable energy sources.

[147] Exhibit POT-1, MH/POT-022a.
[148] Exhibit MNP-5, p.30.
[149] Exhibit MNP-5, p. 30.
[150] Exhibit POT-1, MH/POT-022a.
[151] Manitoba Hydro NFAT Submission, Chapter 5, p.54.

Independent Expert Consultant La Capra Associates concluded that neither Minnesota nor Wisconsin would be short of renewable supply under current policies.[152] This could reduce Manitoba Hydro's prospects for future 'clean' hydro electricity sales.

Impact of Carbon Pricing

Carbon pricing has the potential to greatly influence the market price for electricity. As a carbon price is implemented, the cost of fossil fuel-fired generation goes up in proportion to the level of carbon emissions associated with each individual resource. For example, the carbon price component for electricity generated from coal is approximately two times the carbon price component of electricity generated from a combined cycle gas turbine plant. Given that the MISO market is heavily coal-dominant and despite anticipated coal plant retirements, Manitoba Hydro's primary market will be highly susceptible to the presence or absence of carbon pricing. Manitoba Hydro noted that carbon pricing will be a major driver of future power prices.

The Panel also heard from a number of expert witnesses on this matter. MNP prepared a low, reference (or base), and high carbon price forecast. The low case assumed no cap-and-trade legislation until 2030 and a $10/tonne floor price. MNP's reference or base case assumed legislation in 2021 and a $13.14/tonne of carbon floor price. MNP's high case foresaw cap-and-trade legislation in effect in 2020 and a floor price of $15.80/tonne of carbon.[153]

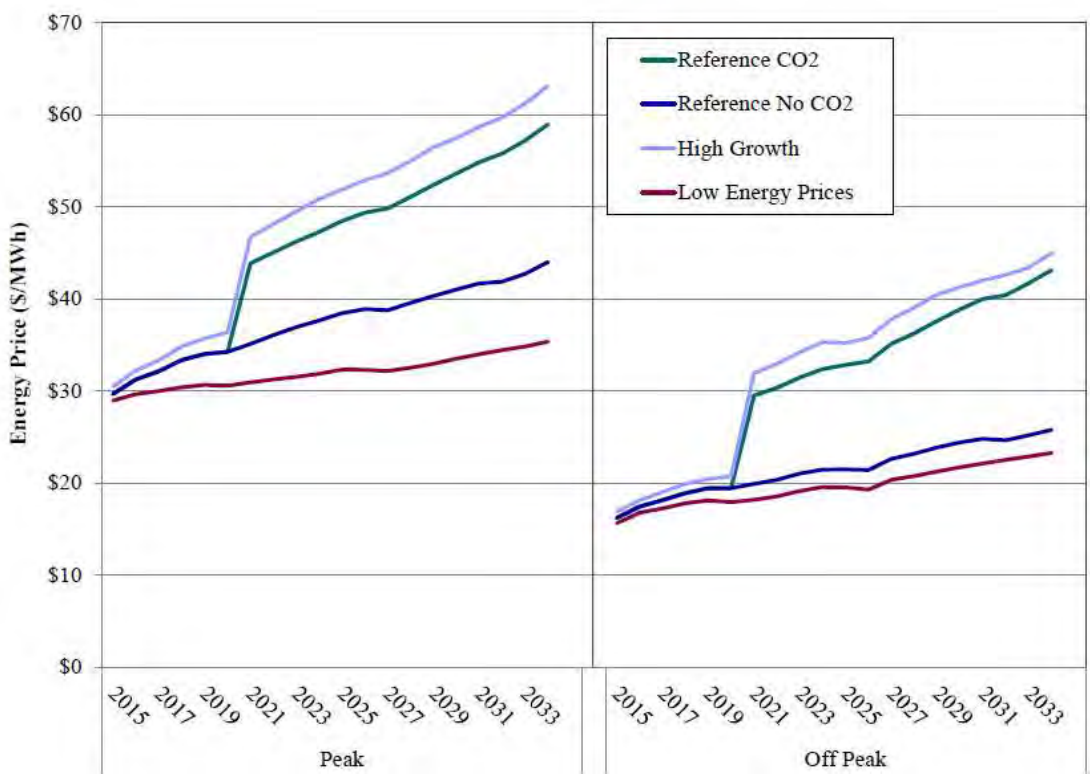
In his review of the carbon costs, Dr. Gotham indicated that there was considerable uncertainty with the use of carbon costs in the export price forecasts. He also concluded that the imposition of carbon restrictions could have a significant impact on projected export revenues. Referencing the public forecasts of the Brattle Group, moderate carbon costs could result in an increase of $13-14/MWh in the market price, while the absence of carbon costs could see Manitoba Hydro's export prices and revenues 20-25% lower, or a shortfall of $1.8 to $2.3 billion based on the expected present value of Manitoba Hydro's export revenues.[154]

Potomac viewed an equal probability of there being, or not being, a future carbon price. Potomac prepared price forecasts reflecting both scenarios, as shown in the graph below. The Reference and High Growth scenarios both anticipate a carbon price beginning at $13.14/tonne in 2021 as suggested by MNP, while the Reference No Carbon and High Resource cases assume no carbon price.[155] According to Potomac's

[152] Exhibit LCA 7-1, p. 4-18.
[153] Exhibit MNP-5, p. 31.
[154] Exhibit CAC 26-1, p. 7.
[155] Exhibit POT-4 p.27 and Exhibit POT-3 pp. 25-28.

graph, on-peak electricity export prices are increased by 25-30% by carbon pricing; off-peak export prices are increased by 50-65%.

Figure 8 Potomac Economics Export Price Forecasts



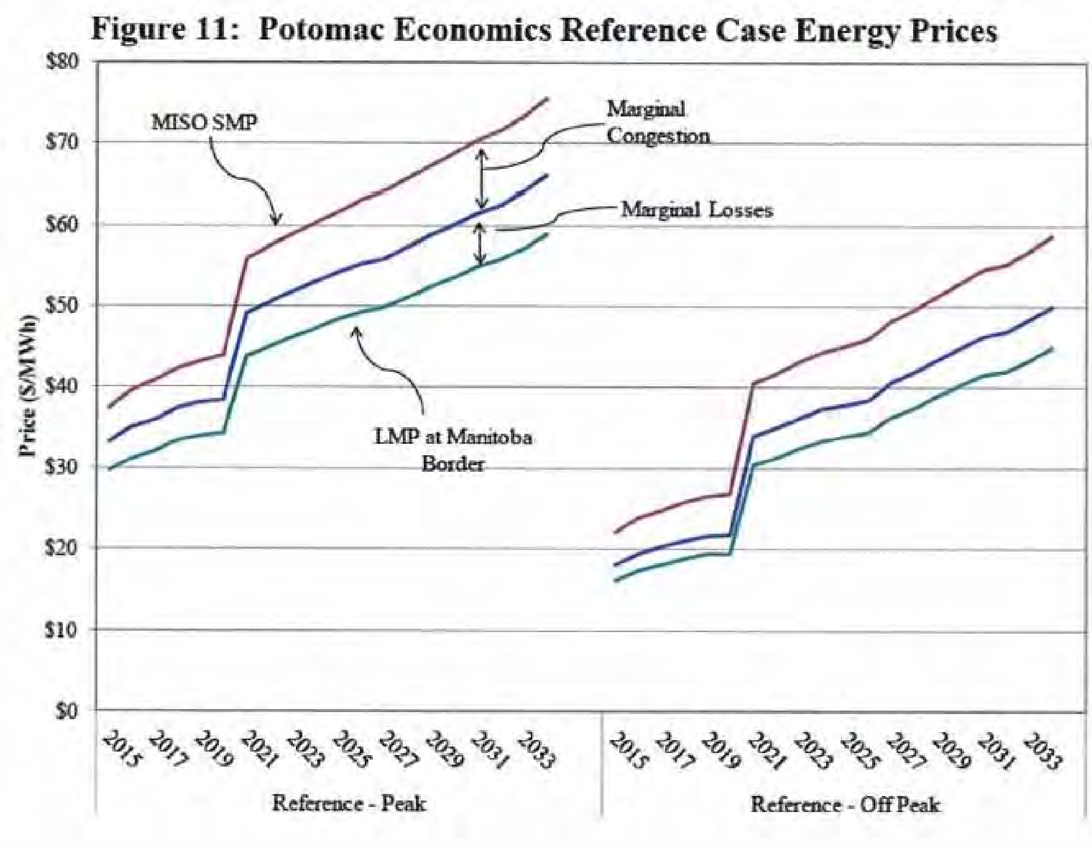
Transmission Congestion

Transmission congestion occurs on electric transmission grids when actual or scheduled flows of electricity over a line or piece of equipment are constrained below desired levels. Transmission congestion shrinks the size of the export market since it excludes participants from outside the congested area. In his analysis, Dr. Gotham concludes that transmission congestion will have an impact on export prices, and could reduce annual average prices by 3-12% at the Minnesota Hub, which is one of several price clearing locations within MISO.[156] In Dr. Gotham's view, there is substantial congestion between Minnesota and Wisconsin and the rest of the MISO market which serves to reduce the market prices in these locations, which in turn, will reduce Manitoba Hydro's export revenues.[157]

[156] Exhibit CAC 26-1, pp. 4-6.
[157] Exhibit CAC 26-1, p.9.

Potomac Economics also examined transmission congestion. They developed an econometric model to estimate how key factors that contribute to congestion, such as system marginal prices, market generation, ramp requirements and wind share of generation, affect market prices. Potomac Economics incorporated these congestion effects into its forecast of market prices. The graph below shows how congestion depresses the System Marginal Price, which in conjunction with transmission losses, results in a lower Locational Marginal Price at the Manitoba-Minnesota border where the prices for Manitoba Hydro's exports are settled.[158]

Figure 9 Potomac Economics Reference Case Energy Prices



6.4.3. Energy Price Forecasts

MISO market electricity prices consist of the market price for energy, which includes the variable cost of generation including fuel, and the price of capacity, which reflects the capital, financing, and fixed costs of investing in new generation. Energy and capacity prices incorporate the effects of supply and demand, economic conditions, commodity prices, and the impact of existing or potential energy and environmental policy. Based

[158] Exhibit POT 2-1, pp. 29-34.

on these factors, electricity prices are expected to increase in real terms. For purposes of its planning and the development of its alternatives, Manitoba Hydro used an export price forecast that is an average of six forecasts provided by independent consultants. With one exception (the Brattle Group), these forecasts were not available on the public record due to their proprietary and commercially sensitive nature. These forecasts were available to the Panel *in-camera*.

Potomac Economics is the Independent Market Monitor of MISO, a role that requires Potomac to closely monitor prices, investments, market structure, and market outcomes. Potomac formulated and developed their own MISO market price forecasts using publicly available information, which they compared to Manitoba Hydro's independent consultants' forecasts. Potomac created a forecast based on MISO supply and demand characteristics and recent market outcomes, along with input assumptions from the EIA. Potomac's models relied on lower natural gas price forecasts, lower rates of demand growth, and lower quantities of coal plant retirements than most of the six consultants.[159]

Each of Manitoba Hydro's consultants' forecasts was evaluated by Potomac, although Potomac was not provided access to the underlying assumptions behind the consultants' forecasts. Potomac forecasts lower prices than the Brattle Group, and generally lower prices than the other consultants. Potomac noted that the Brattle Group assumes carbon pricing beginning in 2020 at $15/tonne and increasing to $24/tonne by 2034. Potomac believes Brattle overstates the emissions and fuel costs of gas-fired and coal-fired generators and thus overstates forecast energy prices, while at the same time understating capacity prices. Potomac was not able to disentangle these conflicting effects and thus does not recommend the NFAT Panel use Brattle's forecast. For various reasons, contained in commercially sensitive information reviewed *in-camera*, Potomac was not able to recommend the use of any of the other Manitoba Hydro consultants' forecasts. Potomac recommended their own forecast be used by the NFAT Panel to evaluate Manitoba Hydro's Preferred Development Plan business case because Potomac does not find the Manitoba Hydro consultants' forecasts to be credible.[160]

Dr. Gotham commented that if carbon prices do not materialize, MISO market prices will be lower by 20-25%. Dr. Gotham quoted La Capra's finding that the impact of carbon prices on the Preferred Development Plan are significant, as the absence of a carbon

[159] Exhibit POT-2 p.5.
[160] Exhibit POT-2 p.41.

price lowers the NPV advantage of the Preferred Development Plan over the All Gas Plan by approximately $340 million.[161]

Dr. Gotham prepared and presented a review of export price forecasts using MISO's Transmission Expansion Plan, Brattle Group and Potomac Economics cases with the lowest carbon price assumptions.[162]

Table 5 Export Price Forecast Comparison: No Carbon/Low Carbon (US$/MWh)

	MTEP	Brattle	Potomac
2017	29.65	30.00	26.00
2022	32.54	33.00	29.00
2027	37.78	37.00	31.00

In Dr. Gotham's view: "*If the electricity price projections from The Brattle Group are indicative of Manitoba Hydro's forecast from the average of the vendor forecasts, it is reasonable. If the Manitoba Hydro forecast is higher than the Brattle forecast, there is cause for concern.*"[163]

6.4.4. "Window of Opportunity"

In support of its Preferred Development Plan, Manitoba Hydro argues that there is a window of opportunity to develop new hydroelectric generating resources. According to Manitoba Hydro, along with new transmission interconnections, new hydroelectric generating stations can take advantage of marketplace opportunities, if decisions are made now and proposed construction begins as planned. Manitoba Hydro identified the following factors as favoring new hydro development: expectations of MISO load growth; retirements of older, smaller coal plants in MISO; and additional carbon related costs and environmental restrictions for fossil-fired generation. Furthermore, Manitoba Hydro has negotiated transmission project agreements and Minnesota Power has undertaken to champion them to the U.S. regulatory authorities. Manitoba Hydro is concerned that it might miss out on improved transmission opportunities if it does not proceed with the U.S. interconnection.[164] Manitoba Hydro indicated that a number of the already negotiated, but conditional export contracts are linked to the power generated by Keeyask and/or Conawapa.[165]

[161] Transcript, p.8438.
[162] Exhibit CAC-26-1, pp. 7-9.
[163] Exhibit CAC-26, p. 9.
[164] Manitoba Hydro NFAT Submission, Chapter 6, p. 6.
[165] Manitoba Hydro NFAT Submission, Chapter 6, p. 28. Exhibit MH-99, See also Appendix 6.1.

As part of its analysis, La Capra examined Manitoba Hydro's reasoning for a "window of opportunity." La Capra noted that one of Manitoba Hydro's rationales for this window was the ability to respond to Renewable Portfolio Standards requirements. However, current U.S. RPS requirements are primarily focused on increasing U.S. wind generation capacity, not Canadian hydro capacity.[166]

When Manitoba Hydro agreed to a Term Sheet with WPS in 2008, Manitoba Hydro also placed firm transmission reservations in order to have the transmission capacity to export power from Minnesota to Wisconsin. These reservations placed Manitoba Hydro at the front of the queue for access to new transmission facilities from Minnesota to Wisconsin. When available, this transmission access opens up new markets for Manitoba Hydro's exports, in essence doubling its market size by being able to export beyond Minnesota into Wisconsin. In Manitoba Hydro's view, failure to take advantage of the window of opportunity by building the 750 MW interconnection and completing the WPS sale would result in the firm transmission reservations being lost. According to Manitoba Hydro, the 750 MW Great Northern Transmission Line is a once in a lifetime opportunity.[167]

6.4.5. Export Volume Assumptions

Manitoba Hydro assumes that all surplus electricity can be sold either as long-term firm energy or as on-peak and off-peak opportunity sales. Potomac Economics concludes that because Manitoba Hydro's exports are a small percentage (less than 2%) of the total MISO market volumes, Manitoba Hydro will be able to sell all of its surplus power into MISO, and Potomac's price forecasts account for these additional volumes.

Potomac disagreed with Manitoba Hydro's assumption that it can sell 100% of its dependable energy under long-term firm contracts at the premium prices that Manitoba Hydro assumes for those long-term firm contracts. Potomac Economics reviewed this assumption and suggested that Manitoba Hydro could export 91% of its surplus dependable energy under long-term firm contracts.[168] However, it has not been conclusively demonstrated that all of this surplus dependable energy will achieve capacity revenues in addition to energy revenues.

6.5.0 Export Prices, Revenues Forecast and Contracts

6.5.1. Existing and Future Export Contracts

The following is a listing of the current and future signed export contracts:[169]

Table 6 List of Current and Future Manitoba Hydro Export Contracts

Customer	Contract Type	Term
Northern States Power	150 MW Seasonal Diversity (Summer)	May 1991 to April 2015
Northern States Power	200 MW Seasonal Diversity (Summer)	November 1996 to April 2015
Northern States Power	500 MW System Participation	May 2005 to April 2015
Minnesota Power	50 MW System Participation	May 2009 to April 2015
Minnesota Power	50 MW System Participation	May 2015 to May 2020
Minnesota Power	250 MW System Participation	June 2020 to May 2035
Minnesota Power	Energy Exchange	June 2020 to May 2035
Great River Energy	150 MW Seasonal Diversity	May 1995 to October 2014
Great River Energy	200 MW Seasonal Diversity	November 2014 to April 2030
Northern States Power	125 MW System Participation	May 2021 to April 2025
Northern States Power	375/325 MW System Participation	May 2015 to April 2025
Northern States Power	350 MW Seasonal Diversity	May 2015 to April 2025
Wisconsin Public Service (100 Product A)	100 MW System Participation	June 2021 to May 2025
Wisconsin Public Service (100 Product B)	Surplus Energy	June 2025 to May 2029
Wisconsin Public Service	308 MW System Participation	January 2027 to May 2036
Wisconsin Public Service	108 MW System Participation*	June 2016 to May 2021
Note: The Wisconsin Public Service contracts (Product A and B) will terminate if the 308-system power sale begins before May 31, 2029.		

[169] Exhibit PUB/MH 1-280R and Exhibit MH-99.

6.5.2. Impact of Exports on Selected Plans

Morrison Park examined the relationship of energy prices with ratepayer impacts. Their conclusion was that high energy prices would lead to lower Manitoba ratepayer costs in the Plans based on the Keeyask and Conawapa projects. In their recent work, Morrison Park compared the role of exports in the 2013 versions of the Plans with the role of exports in the 2014 updated versions (calculated from the 6% NPV figures):[170]

Table 7 Exports as % of Total Revenues : 2013 vs. Updated Plans

	Plan 1: All Gas	Plan 2: K22/Gas	Plan 4: K19/Gas 24/250	Plan 5: K19/Gas 25/750	Plan 6: K19/Gas 31/750	Plan 14 (PDP)
2013 Version	8.6%		14.2%		13.8%	17.3%
2014 Version	13.9%	16.1%	20.2%	21.4%	21.1%	27.5%
Change	+5.3%		+6.0%		+7.3%	+10.2%

The significant increases in revenues, from exports, for Manitoba Hydro across all of the updated Plans result from the much lower domestic demand in Manitoba due to increased DSM programs. The percentage of revenues from exports for the updated 2014 All Gas Plan 1 is similar to the percentage of revenues from exports for the 2013 versions of Plans 4 and 6. The updated versions of Plans 4 and 6 are now almost 50% more export oriented, and in fact are projected to generate a greater percentage of revenue from exports than the 2013 version of the Preferred Development Plan.

6.5.3. Assessing the Contract Terms and Conditions

Minnesota Power Contracts

In its NFAT Submission and during the hearings, Manitoba Hydro indicated that several of its signed export contracts were contingent on the construction of Keeyask and/or Conawapa. For the Minnesota Power 250 MW sale, it was noted that a condition precedent (in favour of Manitoba Hydro and which Manitoba Hydro could waive) existed related to Keeyask construction commencing by June 2016. A two-year delay for regulatory purposes is permitted. While the construction of Keeyask is a condition precedent, which Manitoba Hydro could choose to waive, Manitoba Hydro stated that it had always represented to Minnesota Power that Keeyask would be built to serve the MP 250 MW contract. In Manitoba Hydro's view, the Minnesota Power sale is uncertain without the start of Keeyask construction by June 2016.

[170] Exhibit MPA 3-1, pp. 22-23.

Manitoba Hydro expressed further concern that Minnesota Power may back away from its application to build the 750 MW Great Northern Transmission Line if Keeyask was not also built. Manitoba Hydro stated that Minnesota Power was counting on the wind storage benefits from new hydraulic generation, implying that Minnesota Power was counting on Keeyask. Manitoba Hydro had previously stated that Keeyask does not provide wind storage benefits because of the relatively small size of its forebay. However, significant wind storage exits in Manitoba Hydro's overall system.

Manitoba Hydro can control the level of Stephens Lake to increase or decrease flow through Kettle, Long Spruce, Limestone, and Conawapa, which makes the lake act as a storage battery for wind energy. Conawapa enhances the effective energy storage capacity of Stephens Lake by approximately 25%.[171]

Manitoba Hydro and Minnesota Power also have an agreement to exchange wind energy. Minnesota Power has the option of storing 250 GWh, or up to 383 GWh, of wind energy in Manitoba Hydro's water reservoirs. If Manitoba Hydro accepts the wind energy, it then has the obligation to return energy when requested by Minnesota Power.[172]

Wisconsin Public Service Contracts

According to Manitoba Hydro, the WPS 100 MW sale is contingent on Keeyask being in service.[173] However, construction and commissioning of Keeyask are not conditions precedent in favour of WPS in this contract. Manitoba Hydro's conditions precedent for this contract are considered trade secrets and thus commercially sensitive.[174] However even if construction or commissioning of Keeyask was a condition precedent in favour of Manitoba Hydro, Manitoba Hydro could waive the condition and serve the WPS 100 MW contract from its existing resources.

The WPS 308 MW contract has conditions precedent in favour of Manitoba Hydro that allow the contract to be canceled if either Keeyask or Conawapa do not enter service. WPS has no condition precedent requiring Keeyask and Conawapa to be built, however there is a termination clause that allows WPS to cancel the contract if the 4th unit of Conawapa does not enter service by June 2031. There was no evidence provided in the hearing that WPS would exercise this termination clause if Conawapa was not built.[175]

[171] Transcript, pp.1671-1672, 1683-1684.
[172] 250 MW Energy Exchange Agreement - MHEB and MP, May 19, 2011.
[173] Exhibit MH-99.
[174] Exhibit MH-31-3, p. 73.
[175] 308 MW System Power Agreement between MHEB and WPS, February 26, 2014. p. 114 to 120, 123

In their testimony, Morrison Park made mention of this situation, when contracts and commercial agreements must be terminated by one party. In Morrison Park's view, commercial transactions are ended all the time; there are consequences in terms of financial losses as well as lost reputation and commercial trust. These are difficult to measure, but are nevertheless real.[176]

6.5.4. Export Revenue Forecasts

Manitoba Hydro's Export Contract Revenues

Manitoba Hydro began the hearings by indicating that export sales revenues would be a significant aspect of their Preferred Development Plan. While initially, Manitoba Hydro estimated export revenues from firm contracts at $9 billion, this amount was subsequently revised to $6.9 billion.[177]

Table 8 Manitoba Hydro's Gross Export Revenues

Gross Export Revenues and Sales 2015-2037	$ Billions
Dependable Capacity and Energy[178]	5.88
Contracted Surplus Energy[179]	1.05
Total Contracted Sales (sub-total)	6.93
Opportunity Sales (non-contracted peak and off-peak)	10.08
Total Gross Extra-Provincial Revenues[180]	17.01

In addition to the contracted energy and capacity, Manitoba Hydro also forecasts that between 2015 and 2037, it will sell an additional $3.416 billion worth of 'Non-Contracted Surplus Energy Sales', which amounts are included in the Opportunity Sales in the above Table. Manitoba Hydro seeks to achieve firm (long term and short term) bilateral sales to its existing counterparties, for its presently 'non-contracted surplus'. Any of this surplus that is not contracted would then be sold as opportunity sales into the MISO market.

Based on La Capra's review of Manitoba Hydro's bilateral firm contracts, the Panel accepts the quantification of Manitoba Hydro's contracted dependable capacity and energy revenues as well as the contracted surplus energy revenues. However, the

[179] Exhibit MH-100.
[180] Exhibit MH-104-12-7.

Panel notes that diversity revenues are not guaranteed revenues as the counterparty has no obligation to purchase any diversity energy.

Diversity Exchange Agreements[181] augment Manitoba Hydro's winter capacity by 350 MW with Northern States Power, and by an additional 200 MW with Great River Energy. In summer, Manitoba Hydro is obligated to dedicate 550 MW of capacity to Northern States Power and Great River Energy for all hours of the summer months. While there is no obligation for Northern States Power or Great River Energy to buy any energy from the dedicated capacity, Manitoba Hydro is prohibited from selling the dedicated capacity during the summer months under long-term or short-term contracts.[182] Furthermore, although diversity exchanges are served from Manitoba Hydro's dependable resources, the energy prices are transacted at market prices, not fixed contract prices.

Relationship of Export Contract Revenues to In-Service Costs

From an accounting and rate setting perspective, when a generating station or transmission line comes into service, Manitoba Hydro no longer capitalizes the related costs. Rather the accumulated costs, including the financing charges, depreciation expense and operating and maintenance expenses are charged through to domestic ratepayers by way of Manitoba Hydro's Operating Statement. Manitoba Hydro then proposes rates, at regular General Rate Applications before the Public Utilities Board, to recover the costs included in the Operating Statement. Manitoba Hydro contends that while some of the in-service costs of new capital assets are directly attributable to a particular asset, the benefits are not.[183] Manitoba Hydro submits that the appropriate approach to the evaluation of capital assets such as Keeyask and new transmission lines is through development plan comparisons.

In addition to development plan comparisons, the NFAT Terms of Reference direct the Panel to examine "[T]he impact on domestic electricity rates over time with and without the Plan and with alternatives."[184]

Manitoba Hydro provided an indication of the in-service costs for various capital projects that are included and/or required in its Preferred Development Plan. Bipole III will enhance reliability for domestic customers and will be used for transmission of Keeyask energy. In 2025, the annual in-service costs for Keeyask are $486 million; the costs for

[181] Exhibits MH-99, pp. 2-3 and MH-100, pp. 1-5.
[182] 350 MW Diversity Sale Agreement with NSP dated May 27, 2010 and 200 MW Diversity Exchange Agreement with GRE dated July 26, 2013.
[183] Exhibit MH-210 and MH-211.
[184] NFAT Terms of Reference, p. 3 of 8.

the 750 MW interconnection are $86 million and the costs of Bipole III are $259 million - totaling $831 million for that year.[185]

To partially offset those $831 million of 2025 in-service costs, Manitoba Hydro forecasts net export revenues (net of fuel and power purchases and incremental water rentals) of approximately $600 million.[186]

The resulting shortfall of $231 million is to be recovered from domestic ratepayers. Additionally, the costs of, and the resulting domestic revenue reductions due to enhanced DSM programs will become the responsibility of the domestic ratepayers.

On a cumulative basis from 2016 to 2037, (the years Manitoba Hydro has firm export contracts) the gross export revenues of $17.0 billion are reduced to $10.5 billion by the costs of exports (fuel and power purchases and incremental water rental fees). The cumulative costs of Keeyask, the 750 MW interconnection and Bipole III over the same period are approximately $14.4 billion. The resulting shortfall of $3.9 billion, together with costs for enhanced DSM and the related reduction in domestic revenues, will be added to ratepayer obligations.[187]

Morrison Park noted the relationship between Manitoba Hydro's capital and operating costs, and its export prices and revenues. They stated that the long-term fixed contract prices are not related to Manitoba Hydro's cost of production, but rather to what the counterparty's alternative cost of energy might be, which is typically gas or coal-fired generation. According to Morrison Park, Manitoba Hydro is producing a fundamentally different product with different risks than the gas-fired generation developers in MISO, but is obtaining prices that are structured to reimburse a gas-fired developer for the risks it is taking.[188]

6.6.0 Conclusions of the Panel

Long-Term Export Sales

Long-term export sales at premium prices underpin the business case of Manitoba Hydro's Preferred Development Plan and many of its alternatives. "Surplus by design" as a business strategy requires the assurance that Manitoba Hydro has access to markets and can sell its surplus capacity at favourable prices, for decades to come.

[185] Exhibit MH-211.
[186] Exhibit MH-104-12-7.
[187] Exhibit MH-211 and Exhibit MH-104-12-7.
[188] Transcript pp. 7379-81.

Manitoba Hydro's primary export market lies in MISO, particularly in Minnesota and Wisconsin. There does not appear to be a substantial Canadian market for Manitoba Hydro's exports. The reality is that Manitoba Hydro is reliant on a single market and dependent on the circumstances of that market, in which it is a price taker.

Based on the Panel's and La Capra's review of Manitoba Hydro's bilateral firm contracts, the Panel accepts the quantification of Manitoba Hydro's contracted dependable capacity and energy revenues as well as the contracted surplus energy revenues as $6.9 billion. However, the Panel notes that diversity revenues are not guaranteed revenues as the counterparty has no obligation to purchase any diversity energy.

The Panel is concerned that Manitoba Hydro only has export contracts with terms of 10 to 15 years, and no contracts extend past 2036. This is less of a concern if only Keeyask is built, since domestic load and the existing signed contracts are expected to consume Keeyask' s dependable output prior to 2036. The Panel is concerned with the risk that future export contracts may not attract the premium pricing that Manitoba Hydro assumes. These premium prices are also assumed in the economic and financial analyses of the Conawapa Project.

Export Price Forecasts

Manitoba Hydro's electricity export price forecast is optimistic. Manitoba Hydro bases its forecast of opportunity sales and future long-term firm contracted sales on its electricity price forecast. If the export price forecast is too high, then Manitoba Hydro will not realize the anticipated export revenues and domestic ratepayers will be required to pay higher rates to make up the shortfall.

Carbon pricing may have a significant impact on the North American energy sector including MISO market prices. To the extent Manitoba Hydro's export price forecast includes a 'carbon premium', those export revenue forecasts will be overly optimistic if such a carbon premium does not materialize when forecasted. If a more robust carbon regime materializes, the results would be more favourable to Manitoba Hydro. The uncertainty as to carbon pricing adds to the risk facing Manitoba Hydro and its ratepayers.

Dependable vs. Opportunity Sales

The Panel does not share Manitoba Hydro's view that it can sell all of its surplus dependable energy and capacity as long-term firm contracted sales at premium prices. In the absence of long-term firm U.S. MISO bi-lateral sales, Manitoba Hydro will have to rely on opportunity sales, at market prices. Accordingly, the Panel considers Manitoba Hydro's forecast of future firm export revenues to be optimistic.

New Generation and Transmission

The Panel evaluated the in-service costs (financing, depreciation, operating and maintenance) of Keeyask, Conawapa, Bipole III and the 750 MW interconnection. The Panel concludes that the firm and opportunity revenues from Keeyask are not sufficient to pay all of the in-service costs of Keeyask, the 750 MW interconnection, and Bipole III. As a result, domestic customers are required to make up the shortfall through rates. Keeyask is required by domestic customers after 2024. Until then, the export revenues will continue to defray some of the in-service costs and mitigate some of the risk associated with the project.

The Panel considered the new export contract with Minnesota Power. The Panel notes that there is no contractual obligation on the part of Manitoba Hydro to construct Keeyask in order to serve the Minnesota Power 250 MW contract. Furthermore, with its enhanced DSM measures, Manitoba Hydro may not need the power from Keeyask to serve this contract until the mid- to late-2020s. However, as the Panel concludes in the Economic Evaluation Chapter, it is still more economic to construct Keeyask for a 2019 in-service date than to defer construction.

Manitoba Hydro stated that Minnesota Power is justifying the 750 MW interconnection to its regulator by highlighting the benefits of the additional wind storage that will result from new hydraulic generation being constructed by Manitoba Hydro. The Panel sees little risk in Minnesota Power backing away from the 750 MW interconnection because the Energy Exchange Agreement provides significant wind storage benefits in Manitoba Hydro's system. While the Panel does not expect Minnesota Power to back away from its application to build the 750 MW transmission line, the Panel notes there is risk that the Minnesota Public Utilities Commission may not approve the project. This risk is discussed in Chapter 10.

Manitoba Hydro asserted that the other significant export contract, the WPS 308 MW sale, is "tied to Conawapa." There is a termination clause that allows WPS and/or Manitoba Hydro to cancel the contract if the 4th unit of Conawapa is not commissioned by 2031. With Manitoba Hydro's enhanced DSM measures, the WPS contract could be served from Keeyask and existing hydraulic resources. While the Panel recognizes that WPS could terminate the 308 MW sale contract if Conawapa is not constructed, it also expects WPS would want to avail itself of Manitoba Hydro's exported energy, regardless of whether it is generated by Conawapa or Manitoba Hydro's other hydroelectric stations.

Summary Observations

The Panel observes that:

- MISO market price forecasts may be too high;
- Carbon prices may not materialize, lowering the forecast market price by 20-25%. Alternatively, if the carbon market exceeds forecasts, the value of Manitoba Hydro's exports may be enhanced;
- With decreased MISO market prices, both opportunity and future firm contract prices and revenue will be lower;
- Manitoba Hydro is unlikely to be able to sell 100% of its dependable energy under long-term firm contracts at premium pricing; and
- Other technology risks such as distributed generation achieving grid parity could result in dramatic decreases in market prices.

If export revenues are less than Manitoba Hydro forecasts, domestic customers will be expected to make up the shortfall. While Manitoba Hydro forecasts rate increases for the next twenty years, export revenues short of those expectations may force the rate increases to be greater. Since more of the output of Keeyask is sold under firm contract, including the WPS 308 MW contract, the Panel sees less risk of disappointing export revenues from Keeyask compared to Conawapa.

Considering the uncertainty of future export revenues, specifically those that flow from Conawapa, all of these factors add up to heightened and unacceptable risk associated with the Preferred Development Plan.

The Panel considers it critical that Manitoba Hydro achieve firm bilateral sales, at premium prices, for its non-contracted surplus energy. Failure to do so exposes the domestic ratepayer to additional rate increases.

7.0.0 Cost of New Generation and Transmission

7.1.0 Introduction

The need to develop and construct new generation resources underpins all of Manitoba Hydro's plans and strategies. To meet that need, Manitoba Hydro considered a range of alternative resource options, including hydroelectric generating stations, natural gas-fired generation stations and wind farms. All alternatives rely on new transmission infrastructure. The hydroelectric alternatives rely on the northern HVDC corridor and interconnection to the United States.

The alternatives differ in the magnitude of their capital costs, and expected useful life. The magnitude of the required capital investments creates risks of a nature and extent that will have a significant impact on Manitoba Hydro, Manitoba ratepayers, and the Government of Manitoba.

Given the importance associated with the costs and risks in constructing new generation, the Terms of Reference directed the Panel to consider a number of specific questions. In particular, the Panel was asked to assess the reasonableness of construction costs. This chapter examines Manitoba Hydro's construction cost projections and management.

This chapter begins with a consideration of the construction requirements and costs associated with the Keeyask and Conawapa Projects. It examines the estimated costs, the contracting procedures and the construction management requirements and risks. The chapter then proceeds to look at the transmission elements to the Preferred Development Plan. Finally, the chapter considers the construction costs and roles of gas, wind and solar generation in Manitoba Hydro's future.

7.2.0 Alternative Plans and New Generation Requirements

Each of the proposed alternative plans has different combinations of generation supply components, including hydropower, thermal gas-fired generation (both simple cycle gas turbines and combined cycle gas turbines), and wind power. In addition, different plans have different transmission requirements and components. These requirements and options are summarized in the Table below. They include the 15 plans as originally filed by Manitoba Hydro, along with two additional plans prepared and presented by La Capra Associates.[189]

[189] Manitoba Hydro NFAT Submission, Chapter 9, p. 12. Exhibit LCA-45, pp. 29-39.

7.3.0 Hydropower Projects: Keeyask and Conawapa

Manitoba Hydro's Preferred Development Plan and its alternatives include two hydropower projects (Keeyask and Conawapa), a new 750 MW U.S. transmission interconnection, and upgrades to Manitoba Hydro's northern alternating current (AC) transmission system. Each consists of a number of components, which are further described below.

7.3.1. Overview of the Keeyask and Conawapa Projects

The Keeyask Project has three components: the 695 MW generation station, the related Keeyask infrastructure project, which is currently nearing completion, and the Keeyask transmission project. Collectively, the Keeyask Project is expected to take 8 years to construct. The infrastructure work began in 2012 and the generation stations and transmission element are scheduled to begin in July 2014 depending on decisions and approvals by the Government of Manitoba and the Government of Canada.

The first generation units are planned to be in-service in 2019, and all units in operation in 2020. Keeyask will add 3,000 GWh of dependable energy to Manitoba Hydro's system.

The Conawapa Project consists of two elements: the 1,495 MW generation station and related Conawapa transmission outlet project. Additionally, Manitoba Hydro will undertake a north-south transmission system upgrade to the existing northern 230 kV alternating current (AC) system and the existing HVDC transmission system. This upgrade is only required if Conawapa is developed.

The generation component is expected to take 9 years to complete from a planned start in 2019. In the NFAT Submission, Manitoba Hydro indicated a 2026/27 in-service goal with the first of 10 generating units for service in 2026 and the remaining units in production in 2027.

The north-south transmission upgrades will be completed coinciding with the in-service date of the last Conawapa units. Conawapa will add 4,650 GWh of dependable energy to Manitoba Hydro's system.

7.3.2. Construction Costs of Keeyask and Conawapa Projects

In the course of the hearing, Manitoba Hydro advised the NFAT Panel of capital cost estimate updates for Keeyask and Conawapa. As illustrated below, the capital cost estimates were increased on March 10, 2014 to $6.5 billion from $6.2 billion for the Keeyask Project and to $10.7 billion from $10.2 billion for the Conawapa Project.[190]

[190] Exhibit MH-95, pp. 101, 103. See also 2009 Estimate: CEF09-1, November 2009.

Table 10 Keeyask and Conawapa Construction Budget Updates, 2009-2014

Project	Capital Cost Updates	Base Costs (includes sunk costs)	Interest + Escalation	Total Costs
Keeyask	**2009 Estimate (2019 ISD)**	n/a	n/a	3.7
	NFAT Submission (2019 ISD)	4.63	1.59	6.2
	March 2014 Update (2019 ISD)	4.84	1.65	6.5
Conawapa	**2009 Estimate (2022 ISD)**	n/a	n/a	4.9
	NFAT Submission (2025 ISD)	6.39	3.90	10.2
	NFAT Submission Update (2026 ISD)	6.39	4.05	10.4
	March 10, 2014 Update (2026 ISD)	6.44	4.22	10.7

Since 2009, the capital costs of Keeyask and Conawapa have increased materially, with the Keeyask capital cost projection having increased by 75% and the Conawapa capital cost projection by over 100%.

Manitoba Hydro's current "high" capital cost estimate is $7.2 billion for the Keeyask Project (15% above its current cost estimate) and $12.5 billion for the Conawapa project (17% above its current cost estimate).[191] The Panel notes that, in March 2014, Manitoba Hydro estimated sunk costs by June 2014 for the Keeyask Project of $1.2 billion and $.4 billion for Conawapa. However, Manitoba Hydro's witness Dr. Borison cautioned against assuming that past increases were a predictor of future cost increases. In response to concerns that Keeyask may experience similar cost increases as Wuskwatim, Manitoba Hydro noted that Wuskwatim costs only increased by 10% from the point in time where Wuskwatim had reached a similar stage of development, project definition, and contracting as Keeyask.[192]

In their review of similar dam construction projects, Knight Piésold found that large hydropower plants such as Keeyask and Conawapa typically range from $2 Million/MW installed to $10 Million/MW installed. The proposed installed costs of the Keeyask Project is $9.9 Million MW, which is at the upper level of project norms.

7.3.3. Construction Contingencies and Reserves

Manitoba Hydro's "reference" capital cost estimates are based on a P50 contingency level, meaning there is an equal probability of costs being lower or higher. Manitoba Hydro's "high" capital cost estimates are determined by adding a Management Reserve to the contingency. The Management Reserve consists of a labour reserve, which is

[191] Exhibit MH-161, pp. 2-3.
[192] Exhibit MH-204, p. 69.

designed to account for labour productivity problems, as well as an escalation reserve, which is designed to account for annual escalation costs being higher than the 2.5% budgeted by Manitoba Hydro.[193]

Knight Piésold reviewed Manitoba Hydro's approach to contracting and risk management. It found that Manitoba Hydro was following best practices. However, Knight Piésold also suggested that a more risk-averse decision maker would use a P80 cost estimate, rather than a P50 cost estimate[194], as well as apply a composite hydropower escalation rate of 3.1% to 3.4% rather than the 2.5% applied by Manitoba Hydro.[195] A P80 cost estimate means that there is only a 20% chance of the project being over budget and, according to Manitoba Hydro's estimate, would increase the required contingency for Keeyask by $321 million.[196]

Based on their knowledge of similar projects, Knight Piésold expressed concerns about the risks associated with labour shortages, construction delays given terrain and northern climate, and concrete work productivity. As a result, Knight Piésold concluded that the "amount of contingency carried for the two generation projects (Keeyask and Conawapa) could be considered insufficient depending on the use made of the capital cost estimates."[197] A worst-case capital cost scenario might see costs higher than the $7.2 billion for Keeyask currently forecast by Manitoba Hydro for its "high" scenario.

7.3.4. Keeyask Construction Contract

In its scope of work, Knight Piésold was asked to review the cost estimates, contracting practices, and the contract provisions. They undertook to determine the extent practices were appropriate, costs were reasonable, and measures were in effect to address changes or increases in construction costs. The Panel focused on Keeyask-related contracting given the immediate nature of decisions on whether to proceed with construction in July 2014, and the fact that Conawapa construction contracts had not yet been entered into.

Knight Piésold assessed Manitoba Hydro's costs estimates and contracts. They discussed questions about documentation and procedures with Manitoba Hydro staff. They then used their experience and past work to assess these practices against industry best practices and similar hydropower construction projects. Knight Piésold reported to the Panel that many of Manitoba Hydro's practices and procedures were

193 Manitoba Hydro NFAT Submission, Chapter 15, p. 39.

197 Exhibit KP 3-1, p. i.

reasonable and appropriate, relative to industry best practice. Knight Piésold supported Manitoba Hydro using an Early Contractor Involvement process to obtain input from the chosen contractor in order to refine the design, construction techniques, schedule, and risk sharing.[198] Knight Piésold told the Panel that Manitoba Hydro had made the appropriate choices in the various Keeyask Project contracting efforts. The contracting choices were designed to secure the most cost effective contracts.[199]

Manitoba Hydro submitted that the risk associated with the Keeyask construction is somewhat addressed given that 80% of the construction contracts have now been negotiated. However, this only partially mitigates cost risk. The Keeyask general civil contract is a cost-reimbursable contract, not a fixed price contract. This leaves the contract vulnerable to cost escalations as a result of: quantity risk, especially in areas where quantities may have been underestimated; escalation to the contractor's cost factors due to labour productivity or labour costs; escalation in the cost of supply and equipment; and challenges related to adverse weather conditions.

No similar contracts exist with respect to the Conawapa Project.

7.4.0 Transmission

7.4.1. Overview of Transmission Components

Manitoba Hydro's transmission system consists of numerous transmission lines that assist in delivering power to its Manitoba customers, as well as supporting both exports and imports to and from neighbouring power systems in Saskatchewan, Ontario and the United States.

The system has two major components: the Alternating Current ("AC") transmission system and the High Voltage Direct Current ("HVDC") system. The existing HVDC system consists of Bipoles I and II and connects to the Northern Collector System, which consists of several short transmission lines connected to the northern hydro dams.

The AC transmission system forms the bulk of the length of the transmission lines in Manitoba, consisting of 7,200 km of lines. This system brings power from generating stations to dozens of electrical stations around the province.

With regard to other provinces and the United States, Manitoba Hydro currently has five cross-border transmission interconnections with Saskatchewan, three interconnections

[198] Exhibit KP-4 p.14.
[199] Exhibit KP-4 p. 14.

with Ontario and four interconnections with the U.S. The current interconnection capacity is:[200]

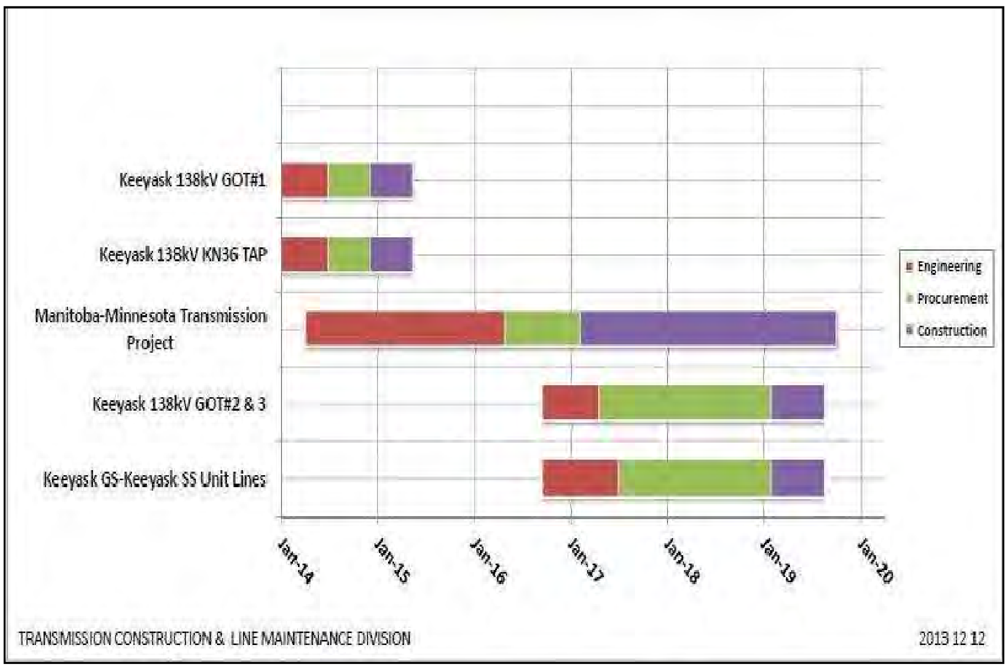
Table 11 Manitoba Hydro Interconnection Limit and Capacities

Interconnections	Firm Export Schedule Limit	Firm Import Transfer Capacity
United States	1,950 MW	700 MW
Ontario	200 MW	0 MW
Saskatchewan	150 MW	0 MW
Total	2,300 MW	700 MW

7.4.2. Proposed Transmission Connections

In its Preferred Development Plan, Manitoba Hydro identified the following transmission components: Keeyask Transmission Project; Conawapa Transmission Project; North-South Transmission System Upgrade Project; and the Manitoba-Minnesota Transmission Project. These are to be constructed in accordance with the following Manitoba Hydro timetable:[201]

Figure 10 Transmission Engineering, Procurement and Construction Timetable, 2014-2020



200 Manitoba Hydro NFAT Submission, Chapter 5, p.16.
201 Exhibit KP-3-1, p. 79.

The Conawapa Transmission Project and North-South Transmission System Upgrade Project are scheduled to be completed by 2027.

Keeyask Transmission Project

The Keeyask Transmission Project will connect the Keeyask Generating Station to the existing Radisson Converter Station, and involves the construction of a new switching station as well as approximately 39 km of transmission line. The total cost estimate, in 2012 dollars, is projected at $156.7 million.[202] With escalation and interest, the in-service cost is estimated at $203 million.[203] Power Engineers examined the cost estimate and found it to be reasonable in light of several construction difficulties identified for the line.

Conawapa Transmission Outlet Project

The Conawapa Transmission Outlet Project will connect the Conawapa Generating Station to the newly constructed Keewatinow Converter Station by means of a 7 km transmission line. The total cost estimate, in 2012 dollars, is projected at $10 million.[204] With escalation and interest, the in-service cost is estimated at $14 million.[205]

North-South Transmission System Upgrade

Although all of Conawapa's power can be transmitted from northern Manitoba to southern customers on Manitoba Hydro's high-voltage direct-current (HVDC) transmission system (including Bipole III, which is expected to be constructed by the time Conawapa enters service), Manitoba Hydro has identified reliability issues with respect to such an arrangement. To improve reliability, Manitoba Hydro proposes to upgrade the existing northern 230 kV alternating current (AC) system and existing HVDC transmission system, including a split of the northern Bipole system and placing one or more units of the Kettle Generating Station from the HVDC system onto the AC system. This will see the overall system usage rebalanced.

Together, these upgrades are referred to as the North-South Transmission System Upgrade Project. The project would have an in-service date coinciding with that of the last Conawapa unit. It would only be constructed if Conawapa proceeds. The total cost, in 2012 dollars, is estimated at $340 million. With escalation, the total in-service cost is estimated at $498 million.[206] Power Engineers examined the cost estimate and found it to be reasonable. However, Power Engineers also identified a possible additional cost

[202] Exhibit MH-95, p. 78.
[203] Exhibit PE-3, p.3.
[204] Exhibit MH-95, p.84.
[205] Exhibit PE-3, p.5.
[206] Exhibit PE-3, p.6.

of $39 million to enhance Bipole III converters to increase Bipole III capacity by 300 MW.[207]

Manitoba-Minnesota Transmission Project

The proposed U.S. interconnection consists of a new single-circuit 500 kV AC transmission line originating from Dorsey Station, northwest of Winnipeg, running south around Winnipeg, connecting to the Riel Converter Station, and then continuing in a southeast direction toward the international border. The U.S. portion of this interconnection, called the Great Northern Transmission Line, will terminate at a new 500 kV substation adjacent to the existing Blackberry substation in Minnesota, located approximately 100 km northwest of Duluth, Minnesota. The approximate total length of the 500 kV transmission line between the Dorsey and Blackberry substations is 600 km. The Manitoba-Minnesota portion of the Transmission Project in-service cost is estimated to be $350 million.[208]

Great Northern Transmission Route

The Manitoba-Minnesota Transmission Line will connect at the U.S. border with Minnesota Power's proposed Great Northern Transmission Line with an in-service date of 2020. The total cost in 2013 U.S. dollars is estimated at $507 million.[209] Manitoba Hydro will be responsible for some portion of the capital and ongoing operating costs associated with the U.S. portion of the transmission line. During the hearings, Manitoba Hydro updated the Panel on the costs and cost sharing arrangements.

Minnesota Power will have funding responsibility (33%) for the transmission needed for the 250 MW Power Sale Agreement. Manitoba Hydro will fund the remaining 67% share for its 49% ownership position plus 18% scheduling fee. This is paid to Minnesota Power to cover increased revenue requirements associated with the additional 133 MW of capacity that it will own above the 250 MW Sales Agreement. Manitoba Hydro is in discussions to sell a portion of their 49% share.[210]

7.4.3. The Role and Value of Transmission Export and Import Capacity

In the course of the hearings, the Panel learned of the importance of new transmission to the United States with regard to enhancing system reliability and providing greater opportunities for both exporting and importing electricity.

[207] Exhibit PE-3, p.6.
[208] Manitoba Hydro NFAT Submission, Chapter 2, p. 59.
[209] Exhibit MH-95, p. 81.
[210] Exhibit MH-204, pp. 103-104.

In its Preferred Development Plan, Manitoba Hydro outlined the potential benefits realized by the addition of the new hydro resources and the new U.S. interconnection. In its view, the interconnections provide significant reliability benefits in terms of sharing of generation contingency reserves, sharing of capacity resources due to load diversity, importation of energy during drought conditions or extreme supply loss in Manitoba, and the ability to supply cross-border load when this load is isolated from its system.

Transmission has economic value. It provides the means to export surplus hydropower. There are times during the peak winter demand period when it may be economically beneficial to import lower-cost resources from outside of Manitoba rather than use Manitoba Hydro's own thermal resources.

Several individuals testified that the development of new transmission connections with the United States will be a strategic asset. They noted that transmission to facilitate imports could have the effect of changing the development plan options and pathways. Greater imports could defer the need for new resource development, especially hydropower facilities. For several interveners, such as the Green Action Centre, the construction of the 750 MW transmission line has demonstrated value.[211]

In its report on transmission, La Capra Associates identified that the addition of Keeyask in 2019, the new interconnection line in 2020, and Conawapa in 2026 all affect the total energy exported by Manitoba Hydro. They concluded that there is a 3.2% increase in total exports when Keeyask is placed in service and a 38% increase when the new line is completed. Lastly, there could be a 30% increase in total exports in 2026 when Conawapa enters operation.[212]

The new interconnection will, therefore, help in optimizing the new capacity from Keeyask and perhaps Conawapa in future years. The majority of the benefits will appear after the construction of Conawapa where the total exports will be around 14,000 GWh, almost 50% higher than the average over the 2009-2012 period. Still, the addition of the new interconnection results in a significant increase in total firm sales in 2020. The increase in firm sales is mostly associated with the initiation of the new Minnesota Power Sales Agreement and the Wisconsin Public Service Agreement.

7.5.0 Manitoba Hydro's Proposed Generation Alternatives

In its NFAT Submission, Manitoba Hydro outlined a number of generation options and opportunities. Some are described as long-term opportunities for future consideration.

[211] Exhibit GAC-27, p. 23.
[212] Exhibit LCA-11, pp. 65-66.

Others were assessed as being not effective or relevant to Manitoba's power requirements. Still others, such as the Keeyask Project, are presented in detail and require immediate decision-making, leading to impending development and construction. The following Table summarizes the capital and per unit energy costs as identified by Manitoba Hydro:[213]

Table 12 Comparison of Installed Capital Cost and Per Unit Costs Based on Utility Scale Generation in Manitoba

Technology	Installed Costs $/kW	Energy Cost $/MWh	Cost Trend
Energy Storage	300 – 11,000	10 – 360	**Decreasing**
Solar Photovoltaic	3,700 – 5,000	190 – 200	
Wind	1,600 – 7,600	60 – 210	
Biomass	2,000 – 5,800	100 – 150	**Stable**
Solar Thermal	3,500 – 7,500	140 – 190	
Enhanced Geothermal	25,000 – 37,500	290 – 440	**Increasing**
Hydroelectric	3,800 – 21,000	60 – 290	
Hydrokinetic	7,00 – 9,500	160 – 620	
Nuclear	3,500 – 7,000	90 – 120	

During the hearings, the Panel heard a great deal from its Independent Expert Consultants and the Interveners about the relative merits of gas turbines as a resource option, and the emerging importance of solar and wind power generation.

7.5.1. Thermal Gas Generation

Thermal gas generation options play a prominent role in Manitoba Hydro's planning options. An All Gas option was used as the reference case. All of the 15 Alternative Plans entail the construction on one type or other of gas turbines at some point in the future.[214] Manitoba Hydro examined both Simple Cycle Gas Turbines (SCGT) and Combined Cycle Gas Turbines (CCGT). While SCGTs are lower capital cost, they are less efficient than CCGTs, more at risk to fuel price changes, and emit more greenhouse gases. CCGTs are more efficient, use less fuel, emit fewer greenhouse gases, and are better suited to either intermediate or baseload service because of their higher capital cost.[215]

[213] Manitoba Hydro NFAT Submission, Appendix 7.1, p. 17.
[214] Manitoba Hydro NFAT Submission, Chapter 9, Table 9.3.
[215] Manitoba Hydro NFAT Submission, Appendix 7.2, pp. 26-30.

Knight Piésold examined the capital costs of gas turbines: SCGTs cost $0.77 million per MW of installed capacity and CCGT turbines cost $1.30 million per MW.[216] The various Plans required differing numbers of types of turbines over the 78-year period. The All Gas Plan requires eight SCGTs and CCGTs.[217]

La Capra Associates provided the Panel with two additional alternative plans, including one with an all-gas scenario. It involved only CCGTs rather than mix of CCGT and SCGTs. This additional option was seen to be similar to Manitoba Hydro's All Gas reference case. The No New Generation Plan included the 750 MW interconnection with the U.S., enhanced DSM, increased imports from the U.S., and new gas turbines as required once DSM and imports could no longer address domestic load growth. The No New Generation plan compared favourably to the All Gas Plan on economics, and had better expected values than the Preferred Development Plan.[218]

There are also socio-economic and environmental considerations of gas as a resource option. Gas generation might offer more distributed socio-economic benefits throughout Manitoba, and employment advantages might eventually equal those of northern hydropower projects. However, the benefits to northern and aboriginal communities associated with hydropower options would be lost. Moreover, there are serious environmental impacts: the Clean Environment Commission estimated that a comparably sized natural gas plant would produce as much greenhouse gas in 177 days as the Keeyask Generation Project will produce in 100 years.[219]

7.5.2. Solar Power Generation

Solar photovoltaic power, or solar PV, was once an expensive option, and unthinkable from a resource planning perspective. However, a combination of technological advances and economies of scale have dramatically altered the outlook for solar PV. Solar power is currently being supplied by some electrical utilities using large "solar farms," as well as through roof-top panels by individual residential and commercial users.

During the hearings, the Panel heard from several parties about the new promise of solar power, given its forecasted cost decline and its implications for grid parity. Grid parity is that point at which, from homeowner or business perspectives, the installed cost of rooftop solar PV becomes less expensive, on an annualized basis, than the cost of electricity supplied by the grid. In the view of Mr. Dunsky, solar PV costs have been

[216] Exhibit KP 3-1, p. 51.
[217] Manitoba Hydro NFAT Submission, Chapter 8, pp. 19-22.
[218] Exhibit LCA- 45, p. 24.
[219] Exhibit PUB-69, p. 61.

declining sharply (10% per year on average since 2006) and are expected to continue to do so in the near future. Because of these declines, solar PV has begun to achieve grid parity in several U.S. states. Various forecasts now expect grid parity to be reached for a large share of worldwide electricity demand by 2020.[220]

In its NFAT Submission, Manitoba Hydro identified the declining costs of solar PV through 2020 for residential and utility systems. Manitoba Hydro anticipates residential system costs declining to $1.12/watt by 2020.[221] Given Manitoba's annual sunshine (global solar radiation in Winnipeg based on Natural Resources Canada data), Mr. Dunsky estimates residential rooftop solar PV costing approximately 8¢/kWh by 2020.[222] According to Mr. Dunsky, if this cost forecast is correct, then given Manitoba Hydro's own projected rate increases, residential grid parity could be reached in Manitoba well before the end of the current planning period. Moreover, Mr. Dunsky states that Manitoba Hydro's own projections for utility-scale PV costs are even more dramatic and are forecast to cost $0.65/watt by 2020. If this is accurate, the cost of utility-scale solar in Manitoba would drop to approximately 5¢/kWh by 2020, well below the projected levelized cost of Conawapa.[223]

Knight Piésold also noted that capital costs for solar PV have reduced by a factor of 10 over the last three decades and have experienced a 22% reduction in the last three years. Manitoba Hydro will have to factor these price decreases into its future integrated resource plans.[224]

7.5.3. Wind Power

Manitoba Hydro currently purchases all of the output of the privately owned St. Leon and St. Joseph wind farms, which have a combined maximum hourly generation capacity of 258 MW[225]. Wind power generation was also part of two of Manitoba Hydro's alternative development plans. Under the Wind/Gas Plan, new wind capacity would come into service in 2022/23, supported by new gas capacity but no new hydro capacity. This Plan would encompass generic 65 MW wind farms: two built per year from 2022 through 2024, and one per year from 2027 through 2047 for a total of 1,755 MW. Under the Wind/C26 plan, new wind capacity would be installed in 2022/23, along with Conawapa coming into service in 2026/27. This Plan would involve a nominal wind capacity of 390 MW.[226]

[220] Exhibit CAC-19, pp. 35-39.
[221] Manitoba Hydro NFAT Submission, Appendix 7.1, pp. 43-44.
[222] Exhibit CAC-19, p. 39.
[223] Exhibit CAC-19, p. 39.
[224] Exhibit KP-3-1, p.57.
[225] Manitoba Hydro NFAT Submission, Chapter 5, p. 6.
[226] Manitoba Hydro NFAT Submission, Chapter 8, p. 19.

However, for purposes of its resource planning, Manitoba Hydro considers wind as an intermittent resource that is only available when the wind is blowing. Manitoba Hydro also assumed that wind power has a reliable winter peak capacity of zero, given its intermittent nature and the inability of wind generators to reliably function in temperatures below -30^{o}C.[227] Manitoba Hydro calculated that the Levelized Cost of Electricity[228] (LCOE) of wind was $82/MWh (2014$) as compared to $60/MWh for Keeyask and $67/MWh for Conawapa.[229]

Manitoba Hydro concluded that wind generation was significantly more expensive than its Preferred Development Plan. As a result, Manitoba Hydro stated that "wind generation as a major generation supply in Manitoba was determined to be un-economic at this time."[230] A number of the Independent Expert Consultants and the Interveners disagreed with Manitoba Hydro's conclusions based on the following three factors.

Wind Power Capital Costs and Trends

In its NFAT Submission, Manitoba Hydro identified a reference case capital cost of $2,100/kW for the wind turbines, with an additional $300/kW for transmission upgrades.[231] This assumption was also addressed by Knight Piésold, which suggested a base cost of $1,800/kW (excluding transmission).[232] La Capra Associates concluded that average capital costs were about $1,750/kW in 2012 including transmission interconnection costs.[233] In its assessment, Power Advisory recommended $1,940/kW as a reasonable estimate of wind capital costs in 2012 including transmission.[234]

Manitoba Hydro assumed that wind capital costs would neither increase nor decrease in real terms. To the contrary, Knight Piésold, La Capra Associates, and Power Advisory all reported that wind capital costs are expected to decline.

Construction Period and Operating Life

Manitoba Hydro's LCOE calculations suggest a three-year construction period, which Power Advisory's research suggested was reasonable. However, Manitoba Hydro assumed that 97% of the wind project construction costs will have been incurred by the second year. Power Advisory disagreed, suggesting that 5% of total costs are incurred

---

233 Exhibit LCA-45, p. 35.
234 Transcript, p.9668, 9829.

in the first year and 35% in the second year.[235] Manitoba Hydro's assumption increases the LCOE for wind because the costs are being evaluated on a net present value basis.

In its NFAT Submission, Manitoba Hydro assumed that new wind projects would have a useful life of 20 years.[236] La Capra Associates identified 25 years and Power Advisory found in discussions with wind power developers that 25 years is a common operating life for wind turbines.[237] Power Advisory noted that the St. Leon wind project has a contract term with Manitoba Hydro for 25 years, while the St. Joseph wind project has a 27 year contract term. Power Advisory also noted that new wind turbines have 25 year warranties. The shorter project life assumed by Manitoba Hydro negatively impacts the economics of wind projects.

Wind Capacity Factor

Manitoba Hydro assumed a wind capacity factor of 40%, "consistent with recent experience for wind generation resources in Manitoba having 80 metre hub heights."[238] La Capra Associates questioned this assumption. It noted recent projects in the region with an average capacity factor of 42% and assumed a 43% capacity factor in its sensitivity analysis.[239] Power Advisory agreed with Manitoba Hydro's assumption of a 40% capacity factor, while pointing out a higher capacity factor may be appropriate for new projects with larger towers.[240] Manitoba Hydro states that it assumes a Fixed O&M cost of $39.55/kW-year in 2012 dollars.[241] Power Associates reported that this was consistent with its experience, but also noted that Manitoba Hydro used a higher cost of $46/kW-year in its calculation of LCOE.[242]

7.6.0 Conclusions of the Panel

The actual construction cost of Keeyask will increase beyond Manitoba Hydro's currently projected capital cost of $6.5 billion. Budgeting at least for Manitoba Hydro's "high" estimate of $7.2 billion would be prudent.

This conclusion is not reached as a result of the history of past capital cost increases. The Panel accepts Manitoba Hydro's argument that the past is not necessarily a predictor of the future. Rather, the Panel bases its conclusion on its review of the Keeyask general civil contract, which is a cost-reimbursable contract that leaves a

---

[235] Stevens, May 1, 2014 Transcript p.9669.
[236] Exhibit GAC/MH, 1-010a.
[237] Exhibit GAC-13, pp. 4-7.
[238] Exhibit GAC/MH 1-004a.
[239] Exhibit LCA-5-1, p.10.

[242] Exhibit GAC-13, pp.4-9.

significant portion of cost risk with Manitoba Hydro. It would be a fallacy to assume that the contract provides anywhere near the same level of cost certainty as a fixed-price contract, which would be more expensive.

This is not a criticism of the Keeyask general civil contract or Manitoba Hydro's approach to contracting. The Panel is satisfied that Manitoba Hydro's approach to developing and negotiating the contract, as well as its approach to managing risk, has been appropriate to date. Rather, it reflects the general nature of a large infrastructure project with inherent risks that can be mitigated, but not avoided.

Since no similar contract exists for the Conawapa Project to date, and Conawapa's proposed in-service date is a full 12 years away, the Panel has little confidence in Manitoba Hydro's current control budget. While the Panel is satisfied that Manitoba Hydro followed proper cost estimating procedures, in the Panel's view the significant uncertainties associated with Conawapa make any current estimate a rough guess at best and a high risk at most.

The history of capital cost increases over numerous successive forecasts is of concern to the Panel. It therefore sees a need for greater cost accountability in the form of an annual accounting of construction costs to the Province of Manitoba, which would explain the reason for such increases, rather than simply filing a new Capital Expenditure Forecast.

With respect to Manitoba Hydro's construction cost estimates for transmission facilities, the Panel concludes that such estimates are reasonable and recommends that Manitoba Hydro be given approval to proceed with the construction of a 750 MW transmission interconnection to the United States for a 2020 in-service date.

This interconnection provides increased firm transmission access extending into Minnesota, provides important, increased reliability, and supports import and export of electricity. However, the Panel encourages Manitoba Hydro to sell a portion of its 49% stake in the Great Northern Transmission Line.

Given the Panel's recommendation to discontinue spending on Conawapa, the North-South Transmission System Upgrade will not be required.

The Panel does not believe that thermal gas generation provides a reasonable alternative, especially when considered against the future potential of solar and wind power. The Panel is very concerned about the environmental implications of gas generation as a baseload resource, especially with respect to Simple Cycle Gas Turbines that do not achieve the same efficiency as Combined Cycle Gas Turbines.

While future integrated resource planning will have to consider all resource options, the adverse environmental effects of gas generation will have to be thoroughly considered.

With respect to alternative generation technologies, the Panel concludes that Manitoba Hydro's cost estimates for wind are likely overstated. Given the rapid changes in pricing with respect to alternative generation technologies, especially wind and solar PV, Manitoba Hydro should include greater consideration of such technologies in its integrated resource planning. This analysis and planning must include consideration of potential future grid parity with respect to solar technology, and the likely impacts of such a scenario on load forecasts and expected revenues.

8.0.0 Economic Evaluation

8.1.0 Introduction

8.1.1. Types of Evaluations

Manitoba Hydro's NFAT Submission provides an economic and a financial evaluation of the Preferred Development Plan and the alternative development plans that Manitoba Hydro considered as future resource options. Both types of evaluations are ways to compare the different plans and provide information to aid decision making in choosing a plan. The economic evaluation compares the benefits and costs of the different plans from Manitoba Hydro's perspective in order to determine which plan provides the greatest economic benefit to the utility. The financial evaluation compares the costs and revenues associated with each plan to determine the impact on future customer rates and Manitoba Hydro's exposure to financial risk. In Manitoba Hydro's Multiple Account Benefit-Cost Analysis (MA-BCA) discussed in Chapter 11, the total social benefits and costs, as well as their distribution, are considered.

The Terms of Reference task the Panel with assessing "whether the Preferred Development Plan is justified as superior to potential alternatives that could fulfill the need." In doing so, the Panel is to consider "the reasonableness of the scope and evaluation of risks and benefits proposed to arise from the development" and the "economic risks of the Plan … and alternative development strategies." The Terms of Reference further state that the Independent Expert Consultants engaged by the Panel must "critically examine whether the high level summaries filed by Hydro of Net Present Values and Internal Rates of Return which are derived from Commercially Sensitive Information reflect sound assumptions and calculations."[243]

This chapter examines Manitoba Hydro's economic evaluation of the Preferred Development Plan and alternatives. It also presents other economic evaluation metrics that the Independent Expert Consultants have used in their respective economic analyses.

8.1.2. Metrics

This chapter makes reference to different metrics in relation to the economic analysis: Net Present Value (NPV), Cumulative Present Value (CPV), Break Even/Payback, Internal Rate of Return (IRR), Ref-Ref-Ref, and Expected Value. Each of these metrics has a different meaning and provides a different view of the various development plans.

[243] Exhibit PUB-2, pp. 2-4.

In its analysis, Manitoba Hydro compares the net benefits of alternative development plans to Plan 1 (the All Gas Plan).

Net Present Value (NPV) is a standard economic analysis tool representing the present value of the future stream of annual revenues and costs. Because people tend to place a higher value on income today compared to income in the future, the stream of net benefits over time must be "discounted" at an appropriate rate to reflect this time preference. Net Present Value thus allows for alternatives with different costs and revenues that occur at different times to be compared on an equivalent basis at a single point in time.[244]

Cumulative Present Value (CPV) examines how beneficial a plan is compared to a base case from the start of a study period to a certain point in time during the period. The Cumulative Present Value is the Net Present Value at a given time (and thus ignores the incremental value of a plan over future dates). The final year's Cumulative Present Value matches the 78-year Net Present Value metric used by Manitoba Hydro.

A Cumulative Present Value Analysis is useful because it provides an understanding of the path towards reaching the Net Present Value and the year when a plan breaks even on a present value basis when compared to the base case and other plans being evaluated, or the **Break Even/Payback**. It complements a Net Present Value analysis by providing information on how quickly an upfront investment pays off as it is discounted over time.[245]

Manitoba Hydro did not calculate the Cumulative Present Value for the various development plans. La Capra Associates, Inc. provided these calculations in its analysis for the Panel.

Internal Rate of Return (IRR) is another metric typically used to evaluate investments or development plans. The Internal Rate of Return of a plan is the interest rate at which the Net Present Value of the costs associated with a development plan equals the net present value of the plan's benefits. It calculates the average annual return earned over the length of the study period. Another way of describing the Internal Rate of Return is the discount rate that brings the Net Present Value to zero. In relation to the evaluation of the development plans, if a plan has a positive incremental Net Present Value compared to the base case, then the Internal Rate of Return will be greater than the discount rate that Manitoba Hydro used in the economic evaluation. Manitoba Hydro provided Internal Rates of Return in response to an Information request from the

[244] NFAT Review, Manitoba Hydro Application, Chapter 9 p.3
[245] Exhibit LCA-12, p. 9A-36.

Panel[246], but did not perform an Internal Rate of Return analysis in the main NFAT Submission. La Capra developed the Internal Rates of Return for the alternative development plans by using the annual cash flows incremental to the All Gas Plan. The annual cash flows are the annual values that resulted from Manitoba Hydro's modeling results.

In Manitoba Hydro's economic analysis, Ref-Ref-Ref refers to reference, or most likely, conditions. Manitoba Hydro also provided analyses for varying conditions for high and low export and natural gas prices, capital costs, and interest or discount rates. The weighted average of all of the ranges of those factors is known as the Expected Value (EV). Expected Value is an alternative metric to the Ref-Ref-Ref metric.

8.2.0 Manitoba Hydro's Economic Evaluation

8.2.1. Economic Evaluation Parameters

In Chapter 9 of the NFAT submission, Manitoba Hydro conducted an economic evaluation of the Preferred Development Plan and its 14 alternative plans using the following parameters:

- A 78-year study period. The study period used in Manitoba Hydro's NPV analysis is 78 years in order to include the end of the service life of the longest-lived asset, the Keeyask and Conawapa generating stations., The first 35 years of analysis are based on a detailed evaluation of each plan while, for some plans, the results are extrapolated over the remaining 43 years.
- Revenue sources used to calculate each incremental NPV include revenues from electricity export sales contracts and forecast revenues from surplus power exports. Costs were comprised of capital cost estimates; fuel costs, consisting of the water rental rate under *The Water Power Act* and Manitoba Hydro's natural gas price forecast; estimated operating and maintenance costs, including capital maintenance; estimated cost of electricity imports; capital tax; Manitoba's carbon tax on coal; and the forecast of future carbon costs for Manitoba-based generation.
- The discount rate applied to convert the cash flow streams to a net present value. The discount rate was based on Manitoba Hydro's real weighted average cost of capital (WACC). The WACC is calculated using Manitoba Hydro's target debt-to-equity ratio of 75/25, its forecast cost of borrowing of 3.65% plus the 1% debt guarantee fee Manitoba Hydro pays to the Government of Manitoba, and an

[246] NFAT Review, PUB/MH1-079(c).

added premium of 3% to set the return for the equity component.[247] The initial real discount rate used was 5.05%. [248]This was updated for 2013 to 5.40%.[249]

- Manitoba Hydro used the All Gas Plan with the lowest capital costs as a proxy for the do-nothing option against which the other development plans were compared.
- The various development plans were evaluated relative to the All Gas Plan for their benefits to Manitoba Hydro.
- A "reference case" known as "Ref-Ref-Ref" was used for each alternative development plan. The reference case is based on what Manitoba Hydro considered to be the "most likely" costs and benefits.
- All costs to be incurred prior to June 2014 related to preserving the in-service dates of Keeyask and Conawapa (estimated at $1.6 billion) were considered to be "sunk costs" and common to all plans and were excluded from the economic analysis.

8.2.2. Manitoba Hydro's Initial Evaluation Results

The results of the economic evaluation for each Plan's Reference Case based on Manitoba Hydro's 2012 planning assumptions are provided below. (Note that the value for the All Gas Plan is zero, as it is the base case.)[250]

[247] NFAT Review, NFAT Application Chapter 9 pp. 6-7.

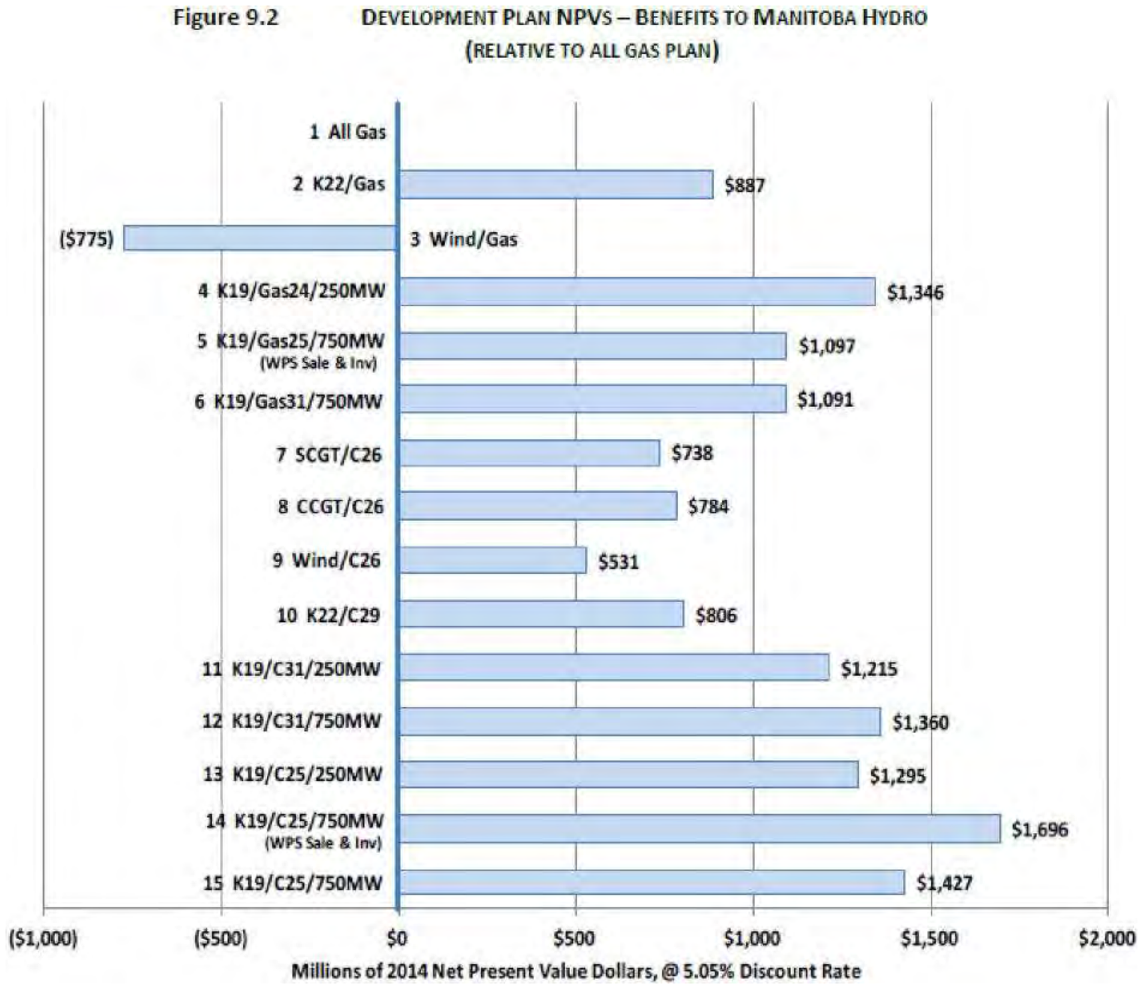
[250] Manitoba Hydro NFAT Submission, Chapter 9, p. 15.

Figure 11 Results of Manitoba Hydro's Initial Incremental NPV Evaluation



The initial economic evaluation showed that Plan 14 (Preferred Development Plan) provides significantly better economic benefits ($1.7billion) compared to Plan 1 (All Gas) and the other development plans. Plans with a 750 MW transmission interconnection and gas generation (rather than Conawapa) following Keeyask (Plans 5 and 6) were virtually identical in overall benefits, but substantially below Plan 14. Manitoba Hydro indicated that given the levels of costs and revenues involved, differences of more than $100 million would be required to determine conclusively that one Plan was more attractive than another.[251] The results of the NPV analysis materially changed when Manitoba Hydro updated its plan on March 10, 2014.

[251] LCA/MH 1-349.

8.2.3. Updated Evaluation During NFAT Review Hearing

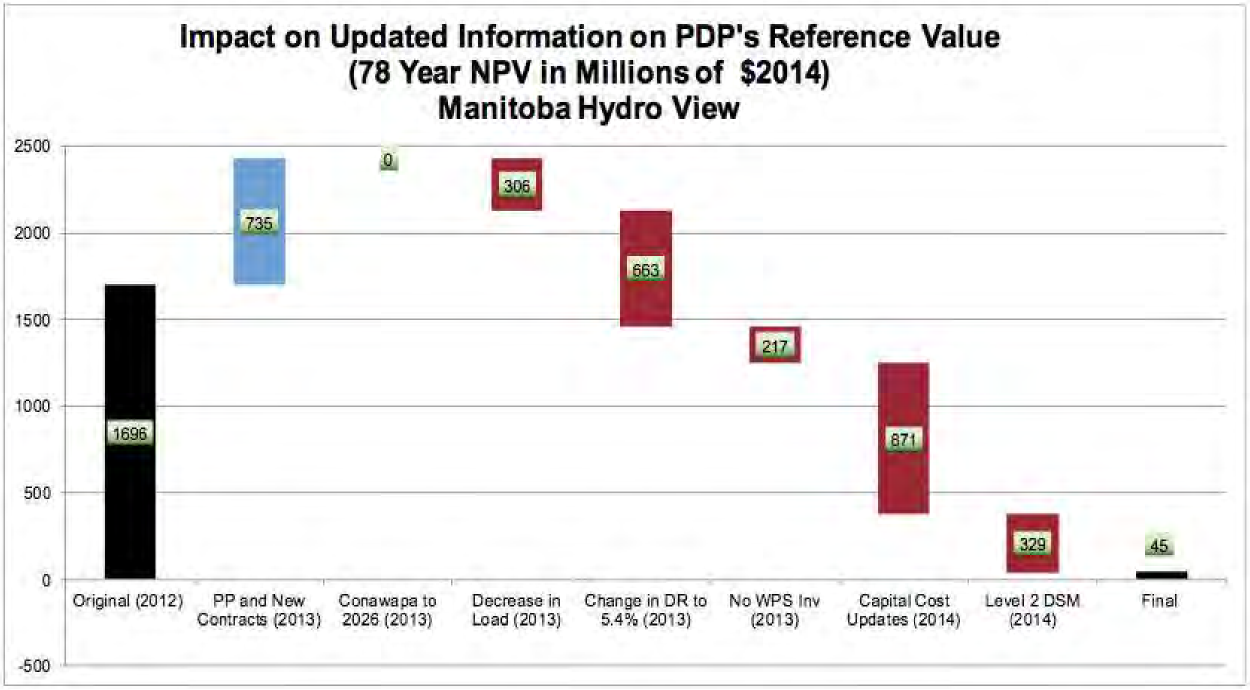
On March 10, 2014, Manitoba Hydro provided the Panel with new information that had a material impact on the economics of various development plans:

- the capital cost estimates for Keeyask increased by approximately $300 million and Conawapa increased by about $500 million between Capital Expenditure Forecast CEF12 and the March 2014 update;[252]
- Wisconsin Public Service (WPS) would not be investing in the 750 MW transmission interconnection, thus changing the costs of Plans that included a WPS investment, including the Preferred Development Plan;
- New Demand Side Management scenarios (DSM Levels 1 – 3), of which initiatives approximating DSM Level 2 will be pursued through the Power Smart program; and
- the possibility of increased domestic load associated with the expansion of the pipeline transportation sector.[253]

As a result of the updates, the incremental Net Present Value of the Preferred Development Plan was reduced from $1.7 billion to $45 million. La Capra depicted the decline in the Net Present Value of the Preferred Development Plan relative to All Gas in the waterfall diagram below.[254]

[252] NFAT Review, Exhibit MH-95, pp. 123-124.
[253] Exhibit MH-95 pp. 103,128.
[254] Exhibit LCA-53.

Figure 12 La Capra Associates "Waterfall" Chart Showing Impact of Updated Information on the Economics of the Preferred Development Plan



The largest contributor to the deterioration in the economics of the Preferred Development Plan was the increase in capital costs for Keeyask and Conawapa, which lowered the Net Present Value by $871 million, while an increase in the discount rate of 35 basis points reduced the Net Present Value by $663 million. Other factors such as DSM Level 2 and the absence of WPS investment in the 750 MW transmission interconnection also played a material role in reducing the Net Present Value.

Under the updated assumptions, plans that include Keeyask, Gas and the 750 MW transmission line such as Plan 5 provide significantly more economic benefits than the Preferred Development Plan, and Plan 4 (Keeyask19/Gas/250 MW) has the best ranking overall. Manitoba Hydro, however, advised that it no longer considers Plan 4 a viable option because Minnesota Power has applied for regulatory approval to construct to a 750 MW transmission line. These changes are outlined in the Table below.[255]

At the request of the Panel, Manitoba Hydro analyzed two alternate scenarios under which the Keeyask Project would be deferred to 2026. Both are based on DSM Level 2 and the pipeline load materializing.

[255] Exhibit MH-104-15 (Revision 3).

The first Keeyask deferral scenario is based on 2013 planning assumptions and 2014 capital costs. It assumes that Keeyask is deferred to 2026, the Northern States Power 125 MW Sale does not proceed, the coal-fired Brandon Unit 5 is kept operational for drought emergencies until December 2025, the 750 MW U.S. interconnection is built for a 2019/20 in-service date, and the existing Great River Energy 200 MW and NSP 350 MW diversity agreements are extended to 2035. The in-service date for a post-Keeyask gas-fired generation facility does not change. The incremental NPV of such a scenario is $259 million. This is $80 million less than the incremental NPV of Plan 5, which has a Keeyask in-service date of 2019.[256]

Manitoba Hydro's second Keeyask deferral scenario is based on the same set of assumptions as the one above, with the exception that the in-service date of a post-Keeyask gas turbine is deferred based on the extension of the diversity sales. This pushes the assumed in-service date for new gas-fired generation back from 2031 to 2035 and beyond. Manitoba Hydro's analysis indicated that this scenario is marginally more economic than Plan 5, at $345 million compared to $339 million for Plan 5. However, this amounts to only a $6 million difference over 78 years.[257] Given the inherent imprecision in this type of analysis, that difference is not material.

Overall, these two deferral scenarios indicate that deferring Keeyask does not improve the economics of a Keeyask-based plan.

Manitoba Hydro also analyzed a scenario in which the Keeyask Project proceeds with a 2019 in-service date, but the 750 MW U.S. transmission interconnection does not get built. This scenario approximates a situation in which Minnesota Power cannot obtain regulatory approval for the Great Northern Transmission Line. The plan, denoted as "Plan 2 Modified" on the Table below, shows that without the interconnection, a Keeyask-based plan has essentially the same 78-year Net Present Value as the All Gas Plan, at an incremental NPV of $1 million.[258]

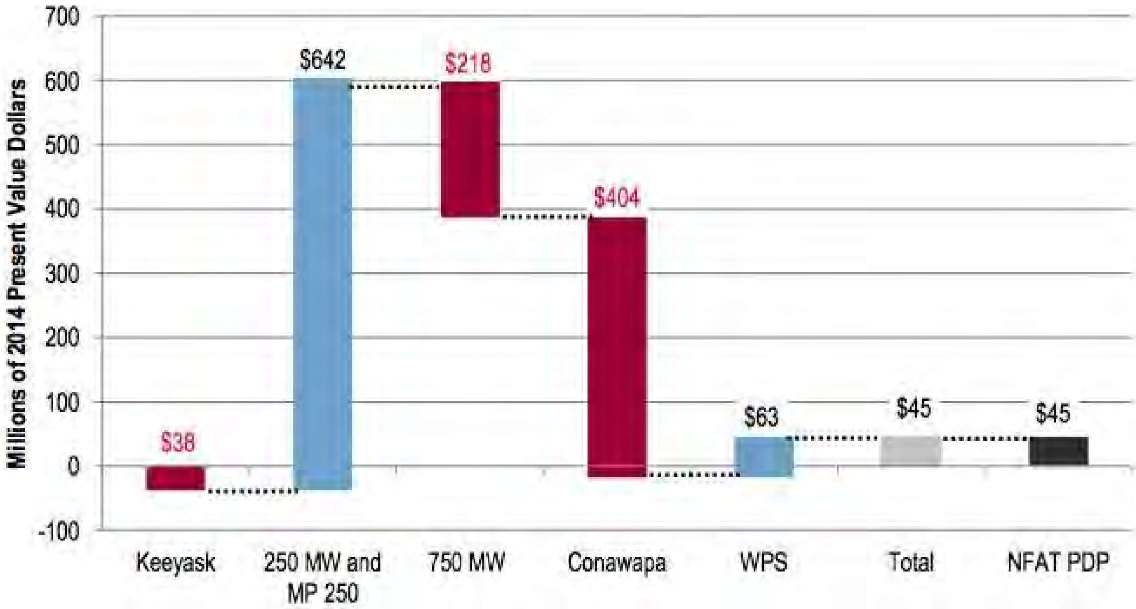
Table 13 Incremental Net Present Values of Alternative Plans Compared to All Gas Plan under Ref-Ref-Ref Assumptions, With In-Service Dates for Subsequent New Generation

	Incremental Net Present Value, (Millions of $(2014)) Relative to All Gas at Specified Level of DSM			
	Base DSM	**DSM Level 1**	**DSM Level 2**	**DSM Level 3**
Plan 2 (K23/Gas)	164 Gas 2029		-38 K 2031	
Plan 2 Modified (K19/Gas)			1 Gas 40	
Plan 4 – Hypothetical (K19/Gas/250MW)			604 Gas 2040	
Plan 5 (K19/Gas/750MW)	377 Gas 2026	339 Gas 2030	410 Gas 2031	373 Gas 2033
Plan 5 (K19/Gas/750MW) – With Pipeline			339 Gas 2030	361 Gas 2030
Plan 5 Keeyask Deferral Scenario 1 (K26/Gas/750MW19) – With Pipeline			259 Gas 2030	
Plan 5 Keeyask Deferral Scenario 2 (K26/Gas/750MW19) – With Pipeline			345 Gas 2030	
Plan 6 (K19/Gas/750MW)			386 Gas 2040	
Plan 12 (K19/C40/750MW)			-18 Conawapa 2040	
Plan 14 (K19/C/750MW) – With Pipeline	374 Conawapa 2026	124 Conawapa 2030	45 Conawapa 2031	-7 Conawapa 2033

The waterfall diagram below from La Capra's analysis depicts the incremental Net Present Value of each of the components of the Preferred Development Plan. This depiction shows that adding Keeyask would increase the costs by $38 million relative to the All Gas Plan over the 78-year period based on which NPV is calculated. The value of adding the 250 MW transmission interconnection and the Minnesota Power sale is $642 million. Moving from a 250 MW to a 750 MW interconnection and adding Conawapa increase the costs by $218 million and $404 million, respectively, while the addition of the Wisconsin Public Service sale provides a benefit of $63 million. As this figure indicates, the Net Present Value reduction associated with Conawapa virtually negates the value of the transmission interconnection. The WPS contract, on the other hand, improves the NPV by $63 million.[259]

[259] Exhibit LCA-3-3, p. 9S-6, Figure 9-99S.

Figure 13 La Capra Associates Chart Showing the 78-Year Incremental NPV of Preferred Development Plan Components



La Capra stated that alternative metrics, such as Internal Rate of Return and Break-Even Year, do not show the Preferred Development Plan to be the lowest cost development plan.

Another way of looking at the economics of the various plans is to determine the Cumulative Present Value relative to the All Gas Plan (Plan 1) at various points over the 78-year timeframe. Cumulative Present Value provides an understanding of the timing of the costs and benefits over a study period. The Table below shows that Plan 14 (Preferred Development Plan) does not achieve a positive Cumulative Present Value relative to the All Gas Plan until 2089. Plan 5, on the other hand, moves into positive range by 2062, twenty-seven years before the Preferred Development Plan. Plan 4, with the 250 MW line, ranks best overall, but Manitoba Hydro now considers this plan to be hypothetical because of its commercial arrangements with Minnesota Power.

All of the breakeven years for development plans that include Keeyask or Keeyask and Conawapa are beyond the detailed analysis period of 35 years and therefore rely on the extrapolation of assumptions to determine the benefits. Plans with Keeyask and excluding Conawapa break even at 40-50 years compared to All Gas and are therefore less reliant on forecast extrapolation than Conawapa-related plans.[260]

[260] Exhibit, LCA-3-3, p. 9S-8, Figure 9-21S.

Table 14 Summary – CPVs as compared to All Gas Plan at the End of Various Periods, Break-Even Year, 78 year IRR and 78 Year CPV of Total Capital ($millions in 2014 Present Value Dollars)

Plans	78 Year CPV of Total Capital	78 NPV	50 CPV	35 CPV	20 CPV	78 Year IRR	Break Even Year (All Gas) Base Case
1 All Gas	$2,764	$0	$0	$0	$0	N/A	N/A
2 K31/Gas29	$4,429	($38)	($349)	($798)	($1,781)	5.28%	N/A
4 K19/Gas40/250MW	$5,774	$604	$239	($284)	($1,541)	6.26%	2055
5 K19/Gas31/750MW (WPS	$6,215	$410	$10	($523)	($1,899)	5.92%	2062
6 K19/Gas40/750MW	$6,175	$386	($5)	($555)	($1,876)	5.90%	2063
12 K19/C40/750MW	$8,421	($18)	($954)	($2,261)	($2,395)	5.36%	N/A
14 K19/C31/750 (WPS)	$9,528	$45	($863)	($2,173)	($5,298)	5.42%	2089

The Preferred Development Plan (Plan 14) economics have eroded to essentially break-even with the All Gas Plan, even over the 78-year study period.

Several resource development plans (Plans 4, 5 and 6) that do not include Conawapa have economic benefits over a 78-year Net Present Value basis of about $400 to $600 million as compared to the Preferred Development Plan.

The Table above also shows that the net gain on the Net Present Value of the Preferred Development Plan is a miniscule percentage of the incremental investment costs of the plan. For example, the 78-year Net Present Value of the Preferred Development Plan is $45 million. To carry out the Plan, the incremental investment on a present value basis is over $9.5 billion. Plans 5 and 6 perform better than the Preferred Development Plan on this metric at just over $6 billion for $400 million in benefits. The All Gas Plan represents the lowest investment at $2.7 billion.

As for the Internal Rate of Return metric, over 78 years the IRR of the Preferred Development Plan is slightly higher than the 5.40% hurdle discount rate; Plans 5 and 6 posted better IRR values, at 5.92% and 5.90% respectively.

8.3.0 La Capra's Alternative Plans

In addition to the various development plans presented in Manitoba Hydro's NFAT Submission, La Capra provided two additional alternative plans – an All Gas plan involving only combined cycle gas turbines (CCGT) rather than mix of CCGT and simple cycle gas turbines (SCGT) relied on by Manitoba Hydro, and a No New Generation Plan relying on increased imports. The economic evaluation of La Capra's CCGT Plan and No New Generation Plan revealed that the CCGT Plan was similar to Manitoba Hydro's All Gas reference case. The No New Generation Plan compared favorably to the All Gas Plan and had better Expected Values than the Preferred Development Plan.

The No New Generation Plan is considered by La Capra to be a hypothetical plan, the results of which point to the potential for added elements such as DSM, import limit capabilities which may have promise either by themselves or in some combination. [261]

Manitoba Hydro suggested that a new transmission line in the U.S. to provide imports to rather than exports from Manitoba is unrealistic.[262] Manitoba Hydro saw no value in the hypothetical No New Generation plan, as it is of the view that it has captured the benefits of various elements of the No New Generation Plan through incorporating higher DSM levels, and the 750 MW Manitoba-Minnesota transmission interconnection.[263]

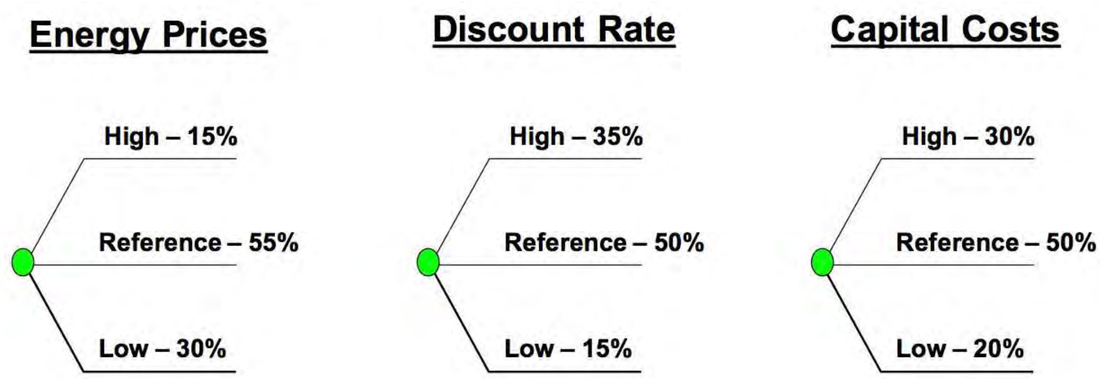
8.4.0 Uncertainty Analysis

Manitoba Hydro's economic evaluation also provided an economic uncertainty analysis. This branch of the analysis included a probabilistic analysis, which examined the range of uncertainty around energy prices, the discount rate and capital costs, three factors that Manitoba Hydro asserts have the greatest impact on the economic and financial outcomes of the development plans. Each of those factors is a grouping of several underlying factors. For example energy prices are influenced by export prices, carbon prices and natural gas prices. The discount rate includes the nominal interest rate, inflation and exchange rates. Capital costs include the capital costs of hydro, wind and natural gas generation, transmission costs and certain escalation.

A range consisting of low, reference and high was developed for each of the three factors. Based on its own judgment, Manitoba Hydro determined probability weightings for the high impact factors as follows: [264]

[261] Transcript p. 5826.
[262] Exhibit MH-204, p. 168.
[263] Exhibit MH-204, p. 169.
[264] Manitoba Hydro NFAT Submission, Chapter 10 –p.8, Figure 10.4.

Figure 14 Probability Weightings for Energy Prices, Discount Rate and Capital Cost



The combination of these three groupings and three sets of assumptions in each grouping combined to produce 27 scenarios that were modeled in the initial analysis for 12 of the 15 development plans.

Manitoba Hydro determined both a reference Net Present Value and the Expected Net Present Value which reflected the probability distribution of all outcomes. The use of the Expected Value methodology was recommended by Dr. Borison of Navigant Consulting,[265] which assisted Manitoba Hydro in undertaking the uncertainty analysis. Navigant opined that in uncertainty analyses, the single most important output is typically the Expected Value or mean. The Expected Value is the sum of each scenario Net Present Value by the probability of its occurrence. Accordingly, Manitoba Hydro determined the Expected Value of each of the development plans by taking the sum of the Net Present Values multiplied by the appropriate scenario probabilities listed in the column on the far right on the following Table, known as a Probabilistic Analysis Quilt:[266]

[265] Exhibit MH-95 pp. 60-61.
[266] Manitoba Hydro NFAT Submission, Chapter 10, Table 10.5, p. 17.

Colour Legend: < -3000 | 0 | > 3000

The above Probabilistic Analysis Quilt is based on the incremental difference of the Net Present Value against the least capital cost option, which is the All Gas Plan (Plan 1). Green cells indicate an incremental positive Net Present Value relative to the Net Present Value of the All Gas Plan, while red cells indicate a negative incremental Net Present Value.

Manitoba Hydro determined a single un-weighted scenario (representing the reference value for the three risk factors) with the resulting incremental Net Present Value of $1.7 billion for Plan 14 (Preferred Development Plan) as compared to the All Gas Plan. Based on the Expected Value economics, the relative Expected Value NPV was $1.085 billion based on the original NFAT Submission.[267]

267 Manitoba Hydro NFAT Submission, Chapter 10, Table 10.6, p. 17.

This analysis showed that the incremental Expected Value for the Preferred Development Plan was higher than the Expected Value for all other development plans.

On March 10, 2014, Manitoba Hydro updated the capital cost estimates for Keeyask and Conawapa, and adjusted for Wisconsin Public Service's decision not to invest in the 750 MW U.S. Great Northern Transmission Line. Manitoba Hydro also updated for 2013 planning assumptions, which included enhanced levels of DSM and potential new pipeline load. With that information, Manitoba Hydro also updated the probability weightings as follows:[268]

Figure 15 March 10, 2014 Updated Probability Weightings for Energy Prices, Discount Rate, and Capital Costs

Based on this updated information, the incremental Net Present Value on a reference case basis for the Preferred Development Plan declined to $45 million relative to All Gas Plan from the $1.7 billion in the original business case. On the basis of reference case comparisons, the Preferred Development Plan was no longer the most economic plan, where other alternatives such as Plan 5, which excludes Conawapa, had materially higher economic value on an incremental NPV basis.

On March 27, 2014, Manitoba Hydro provided an incomplete update of Expected Values of eight plans based on the updated capital cost assumptions, as well as the removal of the originally anticipated investment of Wisconsin Public Service in the Great Northern Transmission Line. This update was still based on 2012 planning assumptions, without enhanced DSM and without the anticipated new pipeline load. In this update, Manitoba Hydro also lowered the probability weightings for 'high' capital costs from 30% to 20% based on Manitoba Hydro's view that there would be increased cost certainty from the recently received Keeyask general civil contract.

[268] Exhibit MH-104-8.

The update was provided for 7 of the 12 plans originally analyzed, as well as for Plan 8, as reflected in the following Table.[269]

Table 17 March 10, 2014 Updated Expected Values

Most significantly, the update reduced the Expected Value for the incremental Net Present Value of the Preferred Development Plan to $120 million. This is over $900 million less than the $1.085 billion Expected Value forecast in the original business case. Furthermore, the revised analysis indicates that those plans that exclude Conawapa have higher Expected Values than those that include it. The updated analysis reveals that Plan 4 has the highest Expected Value (Manitoba Hydro now considers Plan 4 to be hypothetical). Excluding Plan 4, Plan 6 (K19/Gas32/750 MW) has the highest Expected Value ($386 million) followed by Plan 5 at $268 million. Plan 14 has the most downside risk:[270]

The uncertainty analysis also reveals that the upside potential for Plans that include Conawapa comes with scenarios that include high export prices, low capital costs and/or low interest rates. These scenarios are uncertain at best.

The above quilt reflects a reference Net Present Value for the Preferred Development Plan of $614 million. This led to an Expected Value of $120 million. The above quilt does not fully reflect the updated economic information, which indicates that the Preferred Development Plan has a Reference Net Present Value of $45 million. Accordingly, it is possible that the Expected Value remains overstated at $120 million. Manitoba Hydro did not provide any further updates to the Expected Value analysis, nor a probability quilt on the Preferred Development Plan or alternatives based on 2013 planning assumptions with enhanced DSM and potential Pipeline load due to timing restrictions to run the full analysis.

Many witnesses described the Expected Value as a key risk output and more informative than the Ref-Ref-Ref value. The Panel was not in a position to comment on how the Preferred Development Plan would have performed relative to other plans based on the risk-adjusted basis.

La Capra also performed an uncertainty analysis, but instead of referencing every Net Present Value to the All Gas Plan Ref-Ref-Ref scenario, it provides a comparative analysis across plans using consistent assumptions of uncertain parameters based on the same probabilities used by Manitoba Hydro. For example, the Preferred Development Plan's Hi-Low-Ref scenario was compared to the All Gas Hi-Low-Ref scenario. What La Capra determined was that when interim period economic analysis results are used to develop metrics for 20, 35, and 50 year study periods, the Preferred Development Plan does not appear to be the lowest-cost resource plan alternative even when a probabilistic scenario analysis covering 27 scenarios is included. Plans with Keeyask but without Conawapa have more favorable economic uncertainty profiles than the Preferred Development Plan.[271]

La Capra also conducted a sensitivity analysis of changing the discount rates, capital costs and export prices and their impact on the Preferred Development Plan. La Capra concluded the following:[272]

- A modest increase in discount rates or the elimination from consideration of the low discount rate scenarios postulated by Manitoba Hydro would make the Preferred Development Plan have the same present values of costs over 78 years as the All Gas Plan on an Expected Value basis.
- Several Plans have lower costs than the Preferred Development Plan, even over 78 years, when higher discount rates are assumed.
- Modest increases in capital cost assumptions for the Keeyask and Conawapa projects would also result in other development plans having lower costs than the Preferred Development Plan, even over 78 years.
- A slightly lower view of export market prices substantially erodes Manitoba Hydro's expected economic benefits of the Preferred Development Plan.

CAC's expert, Dr. Wayne Simpson, plotted the risk against expected return to determine that Plan 4 was the superior plan, followed by Plan 6, Plan 5, and then Plan 2. Dr. Simpson was of the view that Manitoba Hydro's evaluation was not robust to changing costs and other updates.[273] Another CAC expert, Mr. Harper, also provided a probabilistic analysis and determined that the Preferred Development Plan was not preferred from an economic perspective.[274]

[271] Exhibit LCA-12 p. 80.
[272] Exhibit LCA-12. p.129.
[273] Exhibit CAC-69, pp. 14-15.
[274] Exhibit CAC-68 pp. 47-48.

La Capra's view was supported following the updates to the Keeyask and Conawapa capital costs that showed plans with Keeyask and the interconnection as being superior to plans containing both Keeyask and Conawapa.

The Panel received comments from several witnesses about the limitations of Manitoba Hydro's updated analysis, particularly the fact that it was not updated to reflect new DSM levels. Many felt that their analysis was hampered by the absence of revised Expected Values that would factor in the new levels of DSM. The rapidly changing economic analysis constituted a significant problem to both the Panel and Interveners in analyzing the Preferred Development Plan and alternatives.

8.5.0 Specific Risk factors

Manitoba Hydro also evaluated the sensitivity of selected development plans to factors such as drought, long-term climate change, Manitoba load growth and Demand Side Management. These risk factors are discussed in Chapter 10.

8.6.0 Selected Issues Relating to Manitoba Hydro's Analytical Approach

8.6.1. Treatment of Cash Transfers to the Province

Manitoba Hydro's economic analysis (not its MA-BCA analysis) includes payments to government as a benefit, which is discounted at the same rate as benefits to Manitoba Hydro. CAC's expert witness, Mr. Harper, raised two concerns with this approach. First, the inclusion of cash transfers to the Government clouds the perspective of the economic analysis in that it no longer represents only Manitoba Hydro's perspective. Second, this inclusion does not adequately portray the broader societal perspective because the discount rate applied is the same discount rate used to determine the NPVs from Manitoba Hydro's perspective.

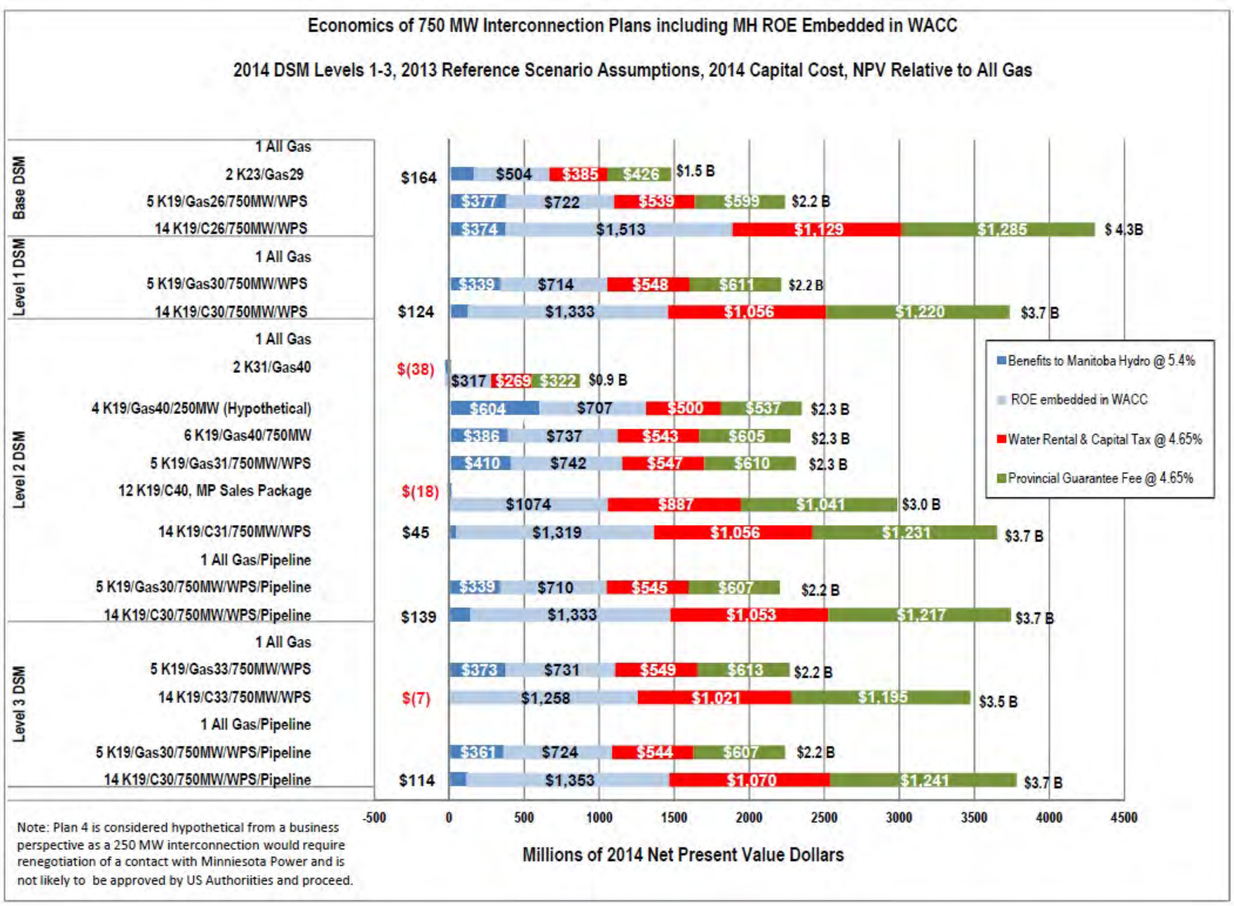
Mr. Harper pointed out that in the MA-BCA analysis (see Chapter 11), Manitoba Hydro used a 6% discount rate for government benefits, which is intended to reflect the social opportunity cost of capital from the taxpayers' point of view. Furthermore, Mr. Harper is of the view that the MA-BCA analysis properly recognizes that the debt guarantee fee payable by Manitoba Hydro to the Province of Manitoba is a cost associated with compensating the province for the increased risk the province assumes for guaranteeing Manitoba Hydro's debt.[275]

[275] Exhibit CAC-30, pp. 25-26.

8.6.2. Embedded Return on Equity

In concert with its March 10, 2014 update, Manitoba Hydro introduced into its economic evaluation the concept of the Return on Equity embedded in its Weighted Average Cost of Capital (WACC). Based on this change in methodology, Manitoba Hydro continues to include transfers to the Government, including the debt guarantee fee, in its updated Net Present Value analysis, but now uses a lower discount rate of 4.65%, rather than the 5.40% WACC used to calculate the benefits to Manitoba Hydro. The net effect of this was to nullify the application of a WACC to the analysis of provincial benefits and return to an analysis based on Manitoba Hydro's cost of borrowing plus the 1.0% debt guarantee fee. The impact of lowering the discount rate in this manner was to increase the indicated level of benefits to be derived by the Province. The diagram below depicts this approach:[276]

Figure 16 Manitoba Hydro Embedded Return on Equity



[276] Exhibit MH-171 (Revision 4).

Based on this new approach, the total NPV of provincial benefits calculated by Manitoba Hydro is $3.7 billion for the Preferred Development Plan for DSM Level 2 including the derived $1.3 billion in embedded equity. The analysis was provided for illustrative purposes and was not suggested to replace the WACC being used for corporate economic purposes[277].

Morrison Park questioned the significance of the calculation, noting that it was not directly relevant to ratepayers or the government, but simply represented Manitoba Hydro's view.[278] MIPUG's expert witness indicated that it could be informative, but should not be the primary consideration.[279]

In its final argument, MIPUG noted that one of the main concerns with the embedded return on equity methodology is that it is calculating the Net Present Value by looking only at the need to finance the underlying debt. MIPUG stated:

> *Conceptually, we know that larger plans require other levels of returns – whether that is for First Nation benefit sharing, setting aside reserves, or helping build to a debt:equity target. All of those other considerations cannot be achieved with a plan that is solely (barely) able to repay its debt over its life, which is what a 4.65% discount rate effectively represents.*[280]

CAC's witness, Mr. Harper, questioned whether embedded equity could be viewed as a benefit. The Preferred Development Plan involves more capital and that requires additional equity in order to sustain Manitoba Hydro's financial integrity.[281]

The following Table shows the comparable economics excluding the embedded return on equity:[282]

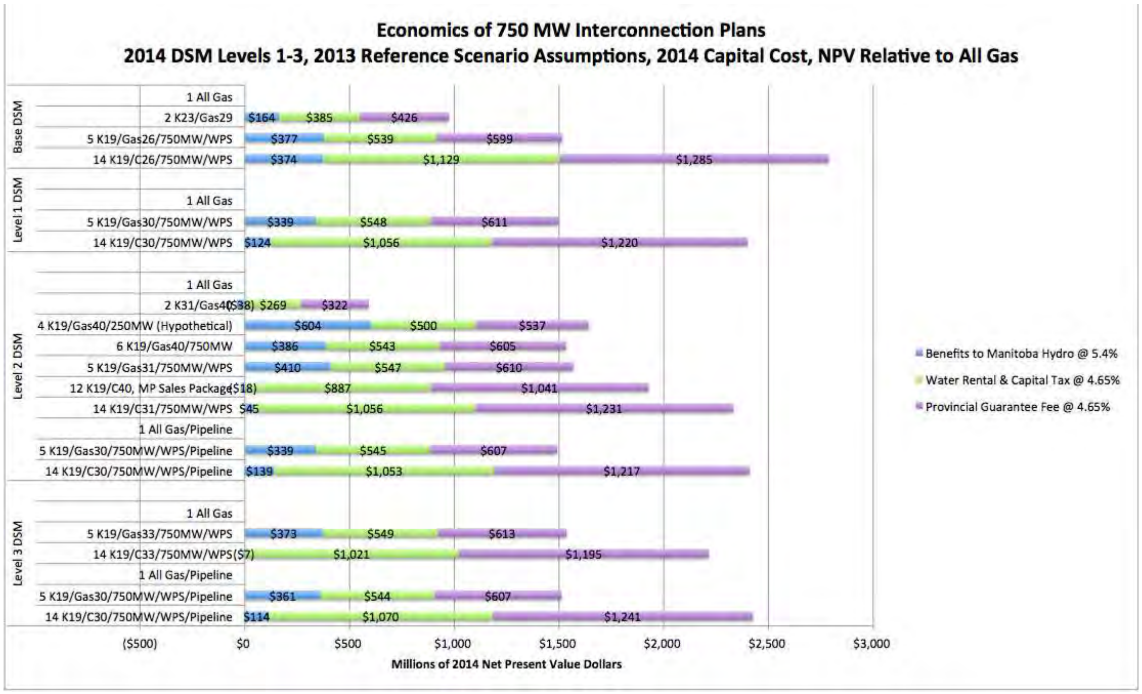
[281] Transcript, p. 8542.
[282] Derived from Exhibit MH-171, excluding embedded equity.

Figure 17 Manitoba Hydro Exhibit #171 Excluding Embedded Equity



8.6.3. How Determinative is the NPV Analysis?

Manitoba Hydro maintains that Net Present Value is the best metric for economic analysis when comparing mutually exclusive plans, while Internal Rate of Return (IRR) is useful when analyzing incremental cash flows.[283] Dr. Borison, Manitoba Hydro's expert, indicated that the Net Present Value metric is the primary decision making tool used to evaluate such major capital investments."[284]

La Capra stressed that the Net Present Value metric, while important, did not reveal everything that one might need to know about the economic benefits of a plan. Manitoba Hydro's singular focus on the 78-year Net Present Value metric as the basis for comparing alternative development plans is too limited in scope for a decision of this magnitude. Manitoba Hydro does not offer any comparative metrics that capture important differences in the plans through the study period that bear on the timing of costs and benefits and the associated risks.[285] For example, the Internal Rate of Return demonstrates how large an investment is needed to obtain the benefit shown. Similarly, Cumulative Present Value provides a snapshot of the economics at a particular time

[283] Transcript, p. 1686, p.1878.
[284] Transcript, p. 1686.
[285] Exhibit LCA-12 p. 9A-151.

and will provide important information on the time required for proposed investments to provide benefits and on assessing implications of forecast risk.[286]

Morrison Park stated that for a typical investor, the discount rate could either represent the investor's hurdle rate, or the total cost of capital for the project if calculating Internal Rate of Return rather than total return. However, Morrison Park noted that neither of these uses appears to be appropriate in the current case. Since minimizing cost to ratepayers is a priority, use of the discount rate seems better focused on the comparison of ratepayer costs over time.[287]

8.6.4. Timeframe of the Analysis

As mentioned earlier in this chapter, Manitoba Hydro used a 78-year time period in its economic evaluation, comprised of a 35-year detailed evaluation and an extension of the 35-year period by 43 years to the end of the service life of the longest-lived asset, a hydro-electric generating station. The values for the 43-year period are an extrapolation of those used in the detailed analysis representing a residual value of a long-lived project. Some witnesses were of the view that the study period was too long and exposed the economic evaluation to too much uncertainty. Manitoba Hydro maintains that for the purpose of an economic analysis, it is appropriate for the timeframe to extend to the end of the life of the longest-lived asset.

The MMF's expert witness, Whitfield Russell Associates, indicated that the 78-year period exceeds Manitoba Hydro's 20-year financial forecast and its 35-year Power Resource Plan period. It was noted that there could be many changes over that period which could affect how revenues and costs were treated.[288]

Both Morrison Park and La Capra cautioned that there was much uncertainty and unpredictability associated with a long timeframe used in Manitoba Hydro's analysis.

Morrison Park indicated that there is a significant danger in assuming that a view of the future from the perspective of today will be very accurate. For example, technological advances could render the underlying assumptions obsolete even in relatively short periods of time.[289] The technology development of hydraulic fracturing in the natural gas industry over the past decade is only a recent example of expectations about future market conditions being totally undermined: widespread expectations a decade ago

[286] Exhibit LCA -3, p. LCA-9.
[287] PUB/MPA 32(a)
[288] Exhibit MMF-31, pp. 5-6; Transcript, p. 10591.
[289] Exhibit MPA-3, p. 16.

were that North America would by now be supply-constrained and increasingly reliant on expensive imports of natural gas.

La Capra expressed concern that a 78-year study period is unusual in evaluating utility investments and indicated there are risks inherent in forecasting over such a long period of time, and the estimates of benefits over that period of time are subject to much uncertainty.[290]

La Capra further states that it is common for decision makers to place much less weight on long-term forecasts of long-term benefits in conjunction with plans with high front-end costs. This means it is valuable to consider intertemporal issues, payback, Internal Rate of Return and other metrics that better articulate the temporal relationship between investments and the associated benefits expected from those investments.[291]

By contrast MIPUG considered the 78-year evaluation appropriate for purposes of considering which plans should be pursued, but stated that to analyze ratepayer impacts, time horizons from the very short-term to the full forecast period is required.[292]

8.6.5. Treatment of Sunk Costs

The treatment of the $1.6 billion in sunk costs was also raised as an issue. In the Net Present Value analysis, the expenditures to preserve the in-service dates of Keeyask ($1.2 billion) and Conawapa ($400 million) were treated as common costs to all plans, rather than as costs applied to the Preferred Development Plan or to plans that include Keeyask or Conawapa. Some witnesses maintained that this treatment biases the analysis in favour of the Preferred Development Plan.

Whitfield Russell identified the treatment of costs associated with Bipole III as a particular concern. This witness was of the view that the costs of Bipole III were not sunk costs because the facility is yet to be built. Whitfield Russell further suggested that including Bipole III's costs as a common cost biases the economic analysis in favour of the hydro-based plans. In this witness's opinion, Bipole III should not be treated as a neutral factor in assessing all of the development plans because not all of the plans require its construction. Consequently, Bipole III's costs should be considered as a cost attributable to the hydro-based plans rather than to the system as a whole.[293]

[290] Exhibit LCA-12, p. 9A-24.
[291] Exhibit LCA-12, p. 9A-24.
[292] Exhibit MIPUG-28, p. 28.
[293] Exhibit MMF-31, pp. 23-24.

8.6.6. Discount Rate

Selection of the appropriate discount rate to apply over a 78-year time period is open to debate. Justification of a high discount rate can be based on the social cost of capital; an intermediate rate based on the current cost of borrowing; and a low rate based on views of inter-generational equity such as has arisen in treatments of the future impacts of climate change. The issue is magnified in the case of the Preferred Development Plan, which entails large expenditures in the near future with the expected net benefit accruing many years in the future.

The discount rate that Manitoba Hydro used in the economic evaluation accordingly drew comment. The discount rate in the economic evaluation context is designed to reflect the return that markets require from the type of investment in question.

CAC's expert Mr. William Harper was of the view that Manitoba Hydro understated the cost of equity, resulting in a lower discount rate than what should be applied in the analysis. Mr. Harper indicated that the allowed return on equity was higher in other jurisdictions than the amount assumed by Manitoba Hydro, which was notionally based on 300 basis points over the cost of debt, including the debt guarantee fee. Calculating the Net Present Value at the rate that Mr. Harper felt was appropriate (5.2%,[294] subsequently updated to 5.55%[295]) results in in lower NPV values for all plans.

Furthermore, CAC and MIPUG's experts argued that it was not appropriate to include the discount rate as an uncertainty because it challenges the ability to compare the alternatives and makes the discount rates and interest rates difficult to separate. Manitoba Hydro's expert acknowledged that the explicit treatment of the discount rate as an uncertainty is challenging, but stated that it is an accepted practice.

8.7.0 Conclusions of the Panel

The Panel accepts that Net Present Value (NPV) is an appropriate metric and a useful guide to decision-making. However, other metrics such as the Internal Rate of Return (IRR) and Cumulative Present Value (CPV) complement the Net Present Value analysis and have been considered by the Panel in assessing the economics of the plans.

Based on the March 27, 2014 updated information (which reflects only increases in the capital costs of Keeyask and Conawapa based on 2012 assumptions and the lack of Wisconsin Public Service investment, but does not reflect enhanced DSM or the new pipeline load), plans with Conawapa have a lower expected Net Present Value than

[294] Exhibit CAC-30 pp. 20-21.
[295] Exhibit CAC-69, p. 26.

plans without Conawapa. This means that on a risk-adjusted basis, it is not economic to pursue Conawapa.

Furthermore, the comparative economic benefits of the Preferred Development Plan at reference conditions have deteriorated significantly since Manitoba Hydro's NFAT Submission was filed in August 2013. In August 2013, Manitoba Hydro suggested that the Preferred Development Plan would have an incremental Net Present Value of $1.7 billion compared to the All Gas Plan. Since then, based on changed assumptions this advantage has disappeared virtually completely. The incremental Net Present Value is now only $45 million. Accordingly, it is clear that the economic analysis does not support proceeding with the Preferred Development Plan. Given the current economics, the plan does not break even until 2089, which is at the end of the 78-year planning horizon.

The Panel further agrees with Manitoba Hydro's expert witness, Dr. Borison, that Expected Values are one of the most important risk analysis outputs in comparing the economics of plans. Manitoba Hydro was not able to provide the Panel with fully updated Expected Value calculations before the completion of the hearings. Manitoba Hydro only provided non-risk-adjusted "reference" Net Present Value based on complete updated 2013 assumptions. This is unfortunate, as it left the Panel without one of the important decision-making tools at its disposal. The Panel has no choice but to extrapolate. In the last full economic analysis, which had a non-risk-adjusted reference Net Present Value of $614 million, the relative Expected Value was only $120 million. Since the non-risk-adjusted Net Present Value has now further deteriorated from $614 million to $45 million, the Expected Value compared to the All Gas Plan is now likely negative.

The plans that include Keeyask and the 750 MW transmission interconnection, on the other hand, break even compared to the All Gas Plan after approximately 50 years. While they are still a long-term proposition, they fare significantly better than the Preferred Development Plan.

The Panel notes that the economic analysis supports the building of a 750 MW transmission interconnection to the United States. There are measurable economic benefits associated with the transmission line relative to the All Gas Plan without an interconnection. Leaving the economics aside, there are also tangible reliability benefits associated with the transmission intertie, including the ability to import additional power in times of drought and during emergencies.

Manitoba Hydro was not able to provide the Panel with fully updated Expected Value calculations before the completion of the hearings. Manitoba Hydro only provided non-risk-adjusted "reference" Net Present Value based on complete updated 2013 assumptions. This is unfortunate, as it left the Panel without one of the important decision-making tools at its disposal. However, the Panel is prepared to extrapolate. In the last full economic analysis, the Preferred Development Plan had a non-risk-adjusted reference Net Present Value of $614 million, and the relative Expected Value was only $120 million. Since the non-risk-adjusted Net Present Value has now further deteriorated from $614 million to $45 million, it stands to reason that the Expected Value compared to the All-Gas Plan is now likely negative.

The various iterations of economic analysis from the August 2013 NFAT Submission until the end of the NFAT Review hearing have shown a narrowing of the gap between the various development plans and the All Gas Plan. But plans with Keeyask and a transmission interconnection to the U.S. have all outperformed the All Gas Plan by margins that are materially better. On the basis of the results of the economic analysis, the Panel can see no reason to support the All Gas Plan.

The Panel does not consider the Embedded Return on Equity to be a particularly useful metric in reaching its conclusions.

9.0.0 The Rate Impacts of the Preferred and Alternative Development Plans

9.1.0 Introduction

Proceeding with any of the development plans that Manitoba Hydro considered to meet electricity demand will have an impact on the rates that customers pay for electricity, as well as an impact on Manitoba Hydro's overall financial position. All plans require Manitoba Hydro to make significant expenditures, although the nature and timing of the expenditures vary. Some plans, particularly those that include hydroelectric generating stations, require large up-front capital expenditures and involve comparatively low operating expenses, while others, such as those that rely on gas-fired generators as the principal generating option, have relatively lower up-front capital costs and higher operating and maintenance costs over time. Customer rates will increase materially under all plans.

Rate increases above the rate of inflation will also be required over the coming decade even if Manitoba Hydro were not to proceed with developing new generation resources. Manitoba Hydro informed the Panel that the need to refurbish aging infrastructure and pay for Bipole III would be significant drivers of these increases.

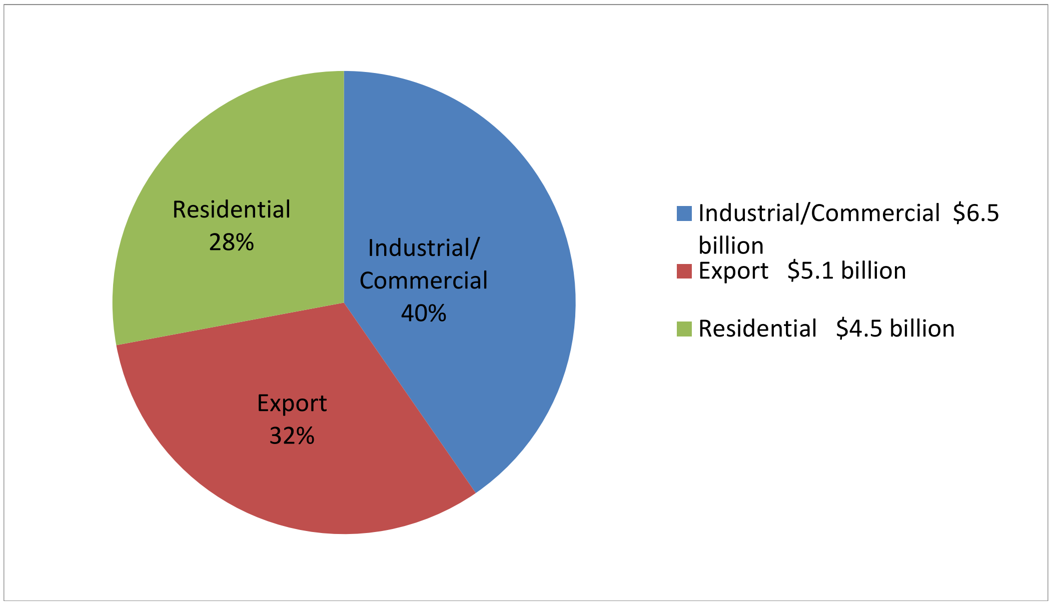
As Manitoba Hydro is obliged to recover its costs from its domestic customers, ratepayers are ultimately responsible for paying for the Preferred Development Plan or any other power resource option that may be pursued. The Terms of Reference address the issue of rates by requiring the Panel to consider the impact on domestic electricity rates over time with and without the Plan and with alternatives.

9.2.0 Manitoba Hydro's Current Revenue Base

Manitoba Hydro's revenue base from electric operations is derived from domestic rates and export revenues. Domestic electricity revenues accounted for just over two-thirds of Manitoba Hydro's revenue in the past 10 years. This share has been increasing as domestic consumption and rates have risen and export revenues and volumes have declined, largely due to lower opportunity export prices and the drop in U.S. consumption associated with a continued downturn in economic activity in Manitoba Hydro's U.S. export markets.

Manitoba Hydro is regulated on a cost of service basis and recovers its costs from domestic customers through PUB-approved rates. Ratepayers are divided into different customer classes; for example, residential, and general service, small, medium and large. Each class has a different rate structure. The Figure below depicts Manitoba Hydro's electricity revenues by customer type over the period 2003/04 – 2012/13.[296]

Figure 18 Electricity Revenue Sources, 2003/04 to 2012/13



Over the past decade, Manitoba Hydro has generally exported between 10,000 to 12,000 GWh of energy annually, which approximates 40% to 50% of the energy sold to domestic customers during the period.[297] Exports have contributed about 32% of Manitoba Hydro's revenue[298] and aided in keeping Manitoba Hydro's domestic electricity rates among the lowest in Canada and North America. Export revenues have declined in recent years from 2009 levels of over $600 million to about $350 million to $400 million annually because of the weakening in wholesale market prices resulting from the recession and lower natural gas prices.

Generally, export revenues come from two different sources: opportunity export sales and longer-term sales under export contracts. Opportunity sales are classified as on-peak and off-peak and may be priced above or at market prices at the time of the sale, Sales under export contracts are at the price agreed to in the contract, which is typically higher than the opportunity price. The types of export products Manitoba Hydro sells and the expected revenues are discussed in Chapter 6. For the purpose of the financial analysis, Manitoba Hydro assumes that all surplus dependable energy (dependable

---

[296] Exhibit MH-111, p. 8.
[297] Exhibit LCA-9, p. 6-2.
[298] Over the past 10-years, export revenues totaling some $5.6 billion have accounted for nearly one-third of Manitoba Hydro's revenues for electricity sales. See https://www.hydro.mb.ca/corporate/electricity_exports.shtml, accessed May 17, 2014.

energy that is not currently subject to long-term contracts) can be sold at long-term firm prices.[299]

9.3.0 Manitoba Hydro's Financial Targets

Manitoba Hydro has three self-imposed key financial targets:

1. A minimum debt-to-equity ratio of 75/25;
2. An interest coverage ratio of greater than 1.20; and
3. A capital coverage ratio of greater than 1.20.

These targets are important because they provide a way to measure Manitoba Hydro's overall financial strength and guide proposed rate increases. The targets are imposed by Manitoba Hydro's Board of Directors and are monitored by credit rating agencies.

Manitoba Hydro's plan to construct new generating facilities and make capital expenditures to renew the existing infrastructure, as well as the costs involved with reliability improvements such as Bipole III, will put pressure on meeting these financial ratios over the next decade.

9.3.1. Debt-to-Equity Ratio

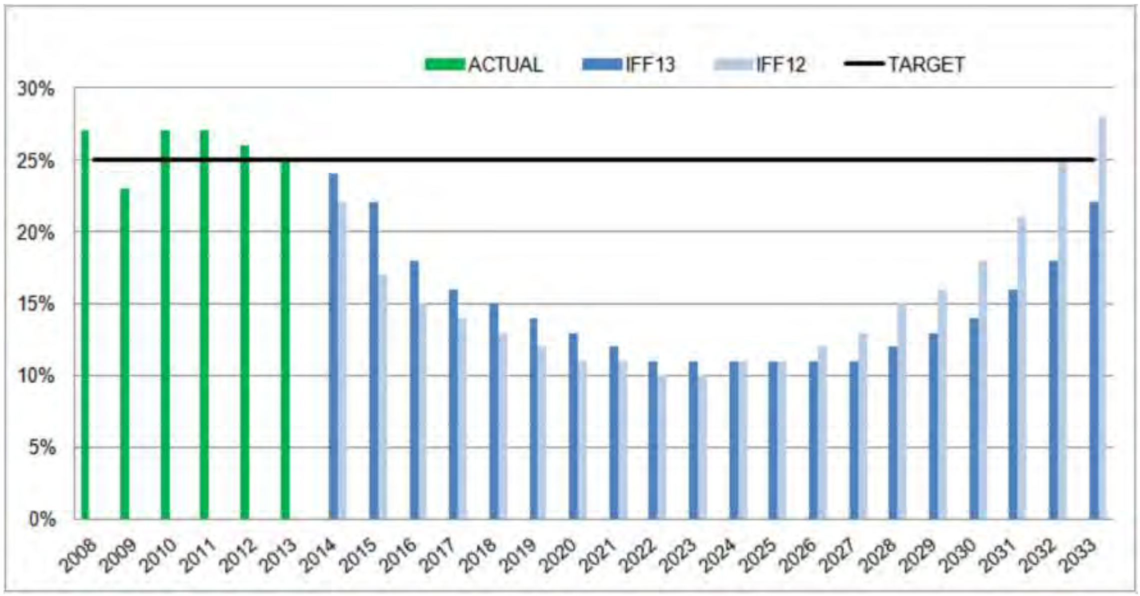
The debt-to-equity ratio indicates the portion of Manitoba Hydro's assets that are financed through long-term and short-term debt, and through funds from operations from customer rates and export revenues. This ratio is a measure of the overall financial risk to Manitoba Hydro. Attaining a debt-to-equity ratio of 75/25 means that 25% of Manitoba Hydro's assets would be financed through internally generated funds (domestic rates and export revenues) rather than through debt.

The debt-to-equity ratio is a long-term target, which serves as a financial guideline only, not an annual requirement. In 2013 it stood at 75/25.[300] Manitoba Hydro expects a significant deterioration in this ratio over the next 20 years to about 90/10 in the 2020s as debt levels increase because of Bipole III and the Preferred Development Plan. The Figure below depicts Manitoba Hydro's forecasted debt-to-equity ratio to 2033 (assuming development of the Preferred Development Plan) as compared between Integrated Financial Forecast IFF13 and with Integrated Financial Forecast IFF12.[301]

[299] 5x16 peak sales are sales that take place five days per week (Monday to Friday) when market load is typically higher. Off-peak periods are hours during the week when load is normally lower; for example overnight and over certain hours on the weekends.
[300] Exhibit MPA-3, p. 18.
[301] Exhibit MH-111, p. 6.

The 2014 updated Keeyask and Conawapa capital costs are not reflected in the debt-to-equity ratios shown in the following Figure.

Figure 19 Manitoba Hydro's Debt-to-Equity Ratio, 2008 to 2033



9.3.2. Interest Coverage Ratio

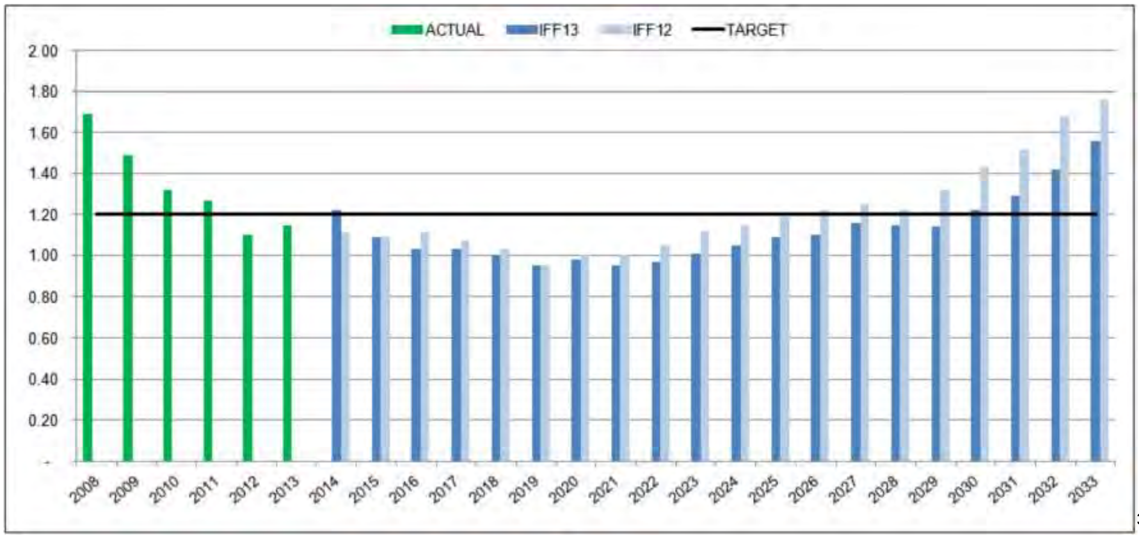
The Interest Coverage Ratio signals Manitoba Hydro's ability to meet its interest payment obligations from its net income. Manitoba Hydro seeks to maintain an interest coverage ratio of greater than 1.20, which gives it a 20% cushion of annual cash available over expected interest costs. An interest coverage ratio below 1.0 indicates that Manitoba Hydro may need to borrow to meet its interest obligations. Manitoba Hydro has indicated that it can maintain its interest payment obligations if the interest coverage ratio is greater than 0.8.[302]

In 2013, the interest coverage ratio stood at 1.15. Manitoba Hydro is projecting the Interest Coverage Ratio to fall below the target level for a period of 15 years because of higher debt levels and related borrowings associated with Bipole III and the Preferred Development Plan.

The Figure below depicts Manitoba Hydro's Interest Coverage Ratio forecast to 2033 (assuming the development of the Preferred Development Plan) as compared between 2013 and 2012 Integrated Financial Forecasts.[303]

[302] Transcript p. 2915.
[303] Exhibit MH-111, p.17.

Figure 20 Interest Coverage Ratio, 2008 to 2033



[304]

9.3.3. Capital Coverage Ratio

The Capital Coverage Ratio measures Manitoba Hydro's ability to fund sustaining base capital expenditures, excluding major new generation projects and transmission facilities, out of current cash flow from operations. Base capital expenditures are capital investment required to renew Manitoba Hydro's existing assets. Manitoba Hydro's target Capital Coverage Ratio is greater than 1.20. A capital coverage ratio of less than 1.0 indicates that Manitoba Hydro must borrow to fund its annual base capital requirements.

Manitoba Hydro expects its Capital Coverage Ratio to dip below the 1.20 target from 2014 to 2021, and even below 1.0 for much of that period. The Figure below depicts Manitoba Hydro's 2013 forecast for the Capital Coverage Ratio (assuming the development of the Preferred Development Plan) to 2033 as compared to its 2012 forecast.[305]

[306]

9.4.0 Manitoba Hydro's NFAT Financial Evaluation

Manitoba Hydro provided a financial evaluation of eight of the 15 different development plans it had considered in the economic evaluation. The financial evaluation compared the impact of each development plan on electricity rates and Manitoba Hydro's financial position.

The financial evaluation featured the same uncertainty analysis framework that was applied to the economic analysis, namely three values (reference, high, and low) for three variables (energy prices, economic indicators, and capital costs). A distinct difference was that $1.4 billion in sunk costs that were excluded from the economic analysis were included in the financial analysis for alternatives that did not include either or both Keeyask or Conawapa, as they represent real costs that will have to be recovered through rates.

The following eight plans were the subject of the financial analysis based on 2012 planning assumptions:[307]

[306] Exhibit MH-111, p. 18.
[307] Manitoba Hydro NFAT Submission, Chapter 11, p. 3.

Table 19 Evaluated Plans: Financial Analysis Based on 2012 Planning Assumptions

Interconnection	Plan #	Development Plan
No New Interconnection	1	All Gas
	2	K22/Gas
	7	Gas/C26
250 MW Interconnection	4	K19/Gas/250 MW
	13	K19/C25/250 MW
750 MW Interconnection	12	K19/C31/750 MW
	6	K19/Gas/750 MW
	14	K19/C25/750 MW (Preferred Development Plan)

Of the eight plans evaluated, the Plan 1 (All Gas) and Plan 14 (Preferred Development Plan) presented the most significant contrasts in overall resource strategy, as they have two different resource components (gas vs. electric) and two distinct orientations (domestic need vs. export). Manitoba Hydro did not provide a financial analysis of a Wind/Gas scenario, as it was screened out due to its economic performance against other plans.

Manitoba Hydro prepares a 20-year financial forecast annually. The NFAT financial analysis was based on a 50-year forecast of electric operations to 2062. Manitoba Hydro selected a 50-year study period "in order to be consistent with the long-term nature of hydro-electricity assets and to provide a sufficient time frame to analyze the benefits and costs of each development plan."[308] The financial analysis used a 35-year time period (coinciding with the period for which Manitoba Hydro's SPLASH[309] computer model simulates system operations) with additional extrapolation to extend the analysis to 50 years. All the financial analysis was performed in nominal dollars, which contrasts with the economic evaluation results that were provided in real dollars, excluding the impact of general inflation.

During the NFAT Review hearings, Manitoba Hydro filed an updated financial analysis for Plan 1 (All Gas) and Plan 14 (Preferred Development Plan), as well as a new financial analysis for Plan 5 (K19/Gas/750 MW).[310] Following this initial tranche of evaluations, financial evaluations were provided for Plans 2, 4, 6 and 12, and then for Plans 1, 5, and 14 with DSM Level 2 and the pipeline load.[311]

[308] Manitoba Hydro NFAT Submission, Chapter 11. p. 3.
[309] SPLASH is the acronym for Manitoba Hydro's computer model, Simulation Program for Long-term Analysis of System Hydraulics.
[310] Exhibits MH-104-12-1 to 104-12-4.
[311] Exhibits MH-104-12-5 to 104-12-7.

The plans were updated as follows:

- Plan 1 (All Gas), Plan 5 (K19/Gas/750 MW) and Plan 14 (Preferred Development Plan, K/19/C26-33/750 MW) were updated for Base and DSM Levels 1 – 3, 2014 updated reference Keeyask and Conawapa capital costs, and the 2013 Electric Load Forecast and discount rate, as well as for DSM Level 2 and the pipeline load.
- Plans 5 and 14 were updated for the various DSM levels, the 2013 Electric Load Forecast and discount rate, and the 2014 updated high capital cost scenario for Keeyask and Conawapa.
- Plan 2, (K31/Gas), Plan 4 (K19/Gas/ 250 MW), Plan 6 (K19/Gas/750 MW) and Plan 12 (K19/C40/750 MW) were updated for DSM Level 2, 2014 updated reference capital costs for Keeyask and Conawapa, and the 2013 Electric Load Forecast and discount rate.[312]

The updates were made to the IFF12 forecast model used for the NFAT Submission evaluation, as the IFF13 forecast was not extended to 50 years. Consequently, the base capital expenditures are based on IFF12 assumptions.[313]

Manitoba Hydro conducted its financial evaluation of the development plans on the basis of applying even annual rate increases over an 18-year period to achieve a debt-to-equity ratio of 75/25 by 2031/32. For years beyond 2031/32, Manitoba Hydro set annual rates to maintain a 1.20 interest coverage ratio to the end of the 50-year study period.

The financial modeling provides comparative metrics in order to assess the proposed development plans rather than a definite rate path. Manitoba Hydro told the Panel that it has a longstanding strategy of smoothing rates over a period of time in developing its rate proposals. This essentially involves pre-funding of major generation and transmission projects. Accordingly, actual rate increases may be higher or lower than projected. The Public Utilities Board must approve Manitoba Hydro's electricity rates. Proposed rate increases will depend on Manitoba Hydro's future revenue requirements and will be the subject matter of General Rate Applications before the Public Utilities Board.

[312] Exhibit MH-104-12-5.
[313] Exhibit MH-204, p. 188.

9.5.0 Impact of Development Plans on Electricity Rates

Manitoba Hydro's initial evaluation showed that the Preferred Development Plan would result in equal annual rate increases of 3.95% through 2031/32. Other development Plans ranged from 3.43% for Plan 1 (All Gas) to 3.86% for Plan 7 (Gas/Conawapa 26). The magnitude of rate increases under all options was significantly higher than the forecast level of inflation. Over a 78-year time frame, the Preferred Development Plan had the lowest overall cumulative nominal annual rate increases compared to other plans at 106% versus 176% for Plan 1 and 134% for Plan 7.[314]

The financial evaluations based on Manitoba Hydro's March 10, 2014 update project higher even annual rate increases to 2031/32 for plans that include Keeyask and/or Conawapa. The new analyses, which assumed implementation of DSM Level 2, Manitoba Hydro's new higher reference capital costs for Keeyask and Conawapa, and the 2013 Electric Load Forecast scenario, projected even annual rate increases from 2015/16 through 2031/32 as shown in the Table below.[315]

The financial evaluation reveals significant rate increases for all plans. Over the entire 50-year evaluation period to 2061/62, the hydro-based plans (with no gas) have the lowest rate increases, but over the medium term (through 2031/32), plans that include gas have the advantage over hydro-based plans.

Starting in 2015/16 and continuing to 2031/32, the Preferred Development Plan would see projected even annual increases of 4.38% (with DSM Level 2 with reference assumptions and reference costs and pipeline load), rather than 3.95%, as Manitoba Hydro first projected. This increase stems largely from higher capital costs estimates for Keeyask and Conawapa, lower forecast domestic load and Wisconsin Public Service (WPS) declining to invest in the U.S. transmission line. As reflected in the Table below, if capital costs increase to Manitoba Hydro's new high capital cost scenario upper limit, annual rate increases associated with the Preferred Development Plan are projected to be 4.63% over the period to 2031/32.

[314] PUB/MH I-0149a, Revised, p. 7.
[315] Exhibit MH-104-12-6, p. 1.

Table 20 Projected Even Annual and Cumulative Rate Increases by Development Plan, 2013 Assumptions/DSM 2/Reference & High Capital Costs (Main Submission Rate Methodology)

Plan #	Even Rate Increases 2015/16 to 2031/32	Even Rate Increases 2015/16 to 2061/62	Cumulative Nominal Rate Increases at 2031/32	Cumulative Nominal Rate Increases at 2061/62
Plan 1 (All Gas)	3.36%	2.02%	82%	161%
Plan 1 (All Gas) (Pipeline Load)	3.52%	2.05%	87%	165%
Plan 2 (K31/Gas)	3.55%	1.85%	88%	141%
Plan 5 (K19/Gas25/750MW)	3.74%	1.72%	94%	126%
Plan 5 (K19/Gas/750MW) (MP & WPS Sales) (High capital costs)	3.99%	1.72%	102%	127%
Plan 5 (K19/Gas/750MW) (MP & WPS Sales) (Pipeline Load)	3.86%	1.79%	98%	135%
Plan 6 (K19/Gas/750MW) (MP Sale)	3.75%	1.70%	95%	125%
Plan 12 (K19/C40/750MW) (MP Sale)	3.76%	1.55%	95%	109%
Plan 14 Preferred Development Plan (K/19/C31/750MW) (MP & WPS Sales)	4.27%	1.30%	112%	86%
Plan 14 Preferred Development Plan (K/19/C26/750MW) (MP & WPS Sales) (Pipeline Load)	4.38%	1.37%	115%	92%
Plan 14 Preferred Development Plan (K/19/C26/750MW) (MP & WPS Sales) (High capital costs)	4.63%	1.35%	125%	91%

9.6.0 Impact of Demand Side Management Programs on Rates

Manitoba Hydro's DSM programs and plans were discussed earlier in this report.

In preparing its financial evaluation updates, Manitoba Hydro assumes that it will be implementing higher levels of DSM, and determined that DSM Level 2 adds the most value to Manitoba Hydro and customers who take advantage of the DSM programs.

Manitoba Hydro is forecasting expenditures totaling $822 million from 2014/15 to 2028/29 for Electric Power Smart programs and initiatives.[316] Annual expenditures on DSM programs are amortized over ten years and included in rates. Furthermore, the reduction in domestic load from DSM programs will create an increasing revenue shortfall that must be offset by increased rates, unless the energy saved can be sold on the export market at prices that fully offset the loss of domestic revenues from DSM.

While all customers bear the impact of the costs of DSM programs, customers who take advantage of available programs have an opportunity to mitigate the rate impacts by reducing their energy consumption and lowering their energy bills, as further discussed below.

9.7.0 Impact of Sunk Costs on the Projected Rate Increases

The rate impact of the sunk costs of the Keeyask and Conawapa projects was identified as an important issue in relation to the financial evaluation of the projects. Sunk costs, which are currently estimated at $1.6 billion,[317] are the estimated expenditures that will have been incurred by June 2014 to protect the respective in-service dates for Keeyask and Conawapa.

Manitoba Hydro's financial evaluation assumes that these sunk costs need to be included in the revenue requirement for the purpose of rates. For plans that include Keeyask or Conawapa, sunk costs form part of the asset costs and are amortized over the life of the asset. For plans that exclude Keeyask or Conawapa, Manitoba Hydro has chosen to amortize the sunk costs over an 18-year period to 2031/32,[318] which would require approximately $90 million in annual revenue requirements associated with those plans over 18 years.[319]

[316] Exhibit MH-180, p. 31.
[317] Transcript, p. 2883. See also, Exhibit MH -111, p. 38.
[318] Manitoba Hydro NFAT Submission, Chapter 11, p. 5.
[319] MIPUG/MH I-003c.

The Panel was told that one of the reasons there is less of a distinction in the rate implications of the various plans than one might otherwise expect is that the sunk costs of the Keeyask and Conawapa projects will be applied to plans that do not include those assets because of the need to recover those costs.

Morrison Park noted before the Panel that sunk costs represent money spent that will have to be accounted for in some way.

> *"However, the reality is if you don't go forward with the Keeyask project, you still have to pay the $1.4 billion. So that $1.4 billion loss, if you will, in certain circumstances has to be addressed and taken into account. So is that in some sense unfair to other options? Well, I suppose. If an alternative option only costs $4 1/2 billion and Keeyask all-in costs 5 1/2, once you add the sunk costs of Keeyask onto the other option, suddenly it doesn't look so attractive. Fair or not, that's reality. … And that's how you have to address the attractiveness of the different options, because it's what ratepayers have to pay."*[320]

La Capra Associates provided the Panel with an analysis of the impact of sunk costs on various development plans. The Table below, based on 2012 assumptions, illustrates these impacts. It is clear from this analysis that Plan 1 (All Gas) bears the brunt of sunk costs, followed by Plan 7 (Gas/C26). Plans that include Keeyask but not Conawapa are less affected by sunk costs because the expenditures associated with Conawapa ($400 million to date) are less than the money spent to date on Keeyask ($1.2 billion). [321]

Table 21 Rate Increases by Development Plan under Reference Conditions With and Without Sunk Costs

Plan #	Plan Short Name	Even-Annual Rate Increases (2012/13 to 2031/32)		Cumulative Nominal Rate Increases at 2031/32	
		With Sunk Costs	Without Sunk Costs	With Sunk Costs	Without Sunk Costs
1	**All Gas**	3.43%	3.05%	90%	78%
7	**Gas/C26**	3.86%	3.58%	105%	95%
2	**K22/Gas**	3.49%	3.40%	92%	89%
4	**K19/Gas/250**	3.42%	3.33%	90%	87%
6	**K19/Gas/750**	3.50%	3.41%	92%	89%

Evidence was provided that the sunk costs may not have to be recovered through rates in the early years if either Keeyask or Conawapa remain in Manitoba Hydro's planning

[320] Transcript, p. 7283.
[321] Exhibit LCA-13, p.10A-31.

horizon.[322] Furthermore, the Panel was told that even if the sunk costs are written off, a one-time charge could be taken or the amount of costs found to not have a future value could be written off over different time frames. Any rate proposal related to a write-off of sunk costs would have to be approved by the PUB.

9.8.0 Impact of Bipole III on Rates

The Panel also heard evidence about the rate implications of the Bipole III transmission project, currently projected to cost $3.3 billion dollars. The last capital cost update for Bipole III was in 2010. In addition to Bipole III, the Riel Converter Station is required to deliver the power from Bipole III. When the project is completed and in service by 2017/18, Manitoba Hydro has determined approximately $280 million will have to be recovered annually through rates.[323] This would require a one-time rate increase of about 20%.

9.9.0 Export Revenue Forecasts

Manitoba Hydro indicated to the Panel that export revenues would continue to be an important source of revenue to help offset the costs of the Preferred Development Plan. To this end, Manitoba Hydro has negotiated a number of contracts with other parties as part of the development of the Preferred Development Plan, the most notable being the contracts with Minnesota Power (MP) and Wisconsin Public Service (WPS). These contracts, which all expire by 2036, take up a portion of the dependable output of Manitoba Hydro's system, leaving some room for Manitoba Hydro to negotiate more firm dependable contracts and sell a substantial amount of other surplus power in the opportunity export market. The terms of all of Manitoba Hydro's export contracts are relatively short (10 to 15 years) compared to the expected 100-year life of the proposed new generating stations. Consequently, Manitoba Hydro will be looking to renew contracts with existing counterparties or find new contract purchasers to sustain its export revenue stream.

The indicative rate increases associated with the various development plans are based on projections of operating results to meet a 75/25 debt-to-equity ratio by 2031/32. A key factor influencing the operating results is how much revenue Manitoba Hydro will be able to realize from export sales as opposed to domestic rates.

The level of export revenue is affected by the assumptions underlying export sales, including the volume of future exports and future export prices. Export prices, in turn are

[322] Transcript, pp. 2883-2884.
[323] Exhibit MH-211.

affected by the prices of natural gas and other fuels used to generate power in the export markets, mainly the U.S. MISO market. The implementation of a carbon tax premium is a crucial factor in Manitoba Hydro meeting its forecast export revenue assumptions. Manitoba Hydro's export sales assumptions and revenues are discussed more fully in Chapter 6 of this Report.

The following Table shows Manitoba Hydro's projected revenues from domestic and extra-provincial sources for selected years from 2015 to 2033.[324]

Table 22 Projected Domestic and Extra-Province Revenues, DSM Level 2 + Pipeline Load $ million

Plan 14 (Preferred Development Plan)	2015	2019	2022	2026	2029	2033
Domestic Customers	1,456	1,798	2,124	2,624	3,075	3,610
Gross Export Revenue	383	460	871	835	858	1,351
Plan 5 (K19/Gas/750 MW)	**2015**	**2019**	**2022**	**2026**	**2029**	**2033**
Domestic Revenue		1,762	2,052	2,485	2,869	3,319
Gross Export Revenue		460	871	836	873	906

By 2033, Manitoba Hydro is projecting that domestic revenue will more than double and export revenues will more than triple from current levels. These domestic revenue assumptions are based on even annual rate increases of 4.38% until 2032. The DSM Level 2 scenario assumes Conawapa coming into service in 2031. If Plan 5 (No Conawapa) were implemented, even annual rate increases to 2032 would be 3.86%, or over 0.53% (53 basis points) lower.

To the extent that export revenues fall short of Manitoba Hydro's forecasts, additional rate increases will be required to cover Manitoba Hydro's costs. Conversely, if export revenues exceed forecasted levels, ratepayers will benefit.

Morrison Park provided an updated analysis of the role of exports in the 2013 versions of the plans, as noted in the Table below.[325]

[324] Exhibit MH-104-12-7, p. 25, 31.
[325] Exhibit MPA 3-1, p. 22.

Table 23 Exports as % of Total Revenues: 2013 vs. Updated Plans

	Plan 1 All Gas	Plan 2 K22/Gas	Plan 4 K19/Gas/250MW	Plan 5 K19/Gas/750MW	Plan 6 K19/Gas/750MW	Plan 14 (Preferred Development Plan)
2013 Version	8.6%		14.2%		13.8%	17.3%
2014 Version	13.9%	16.1%	20.2%	21.4%	21.1%	27.5%
Change	+ 5.3%		+ 6.0%		+ 7.3%	+ 10.2%

Morrison Park concluded that the increases in revenues from exports for Manitoba Hydro across all of the updated plans result from lower domestic demand because of DSM Level 2 programs. The updated All Gas Plan is now as reliant on exports as the 2013 versions of Plans 4 and 6 were, while the updated versions of Plans 4 and 6 are now almost 50% more export-oriented, and projected to generate more revenue from exports than the 2013 version of the Preferred Development Plan. This indicates that ratepayer costs in all of the updated plans are inversely proportional to energy prices, and likely quite strongly inversely proportional.[326]

Commenting on the relationship between export risk and ratepayers, Morrison Park noted that "*structuring the Preferred Development Plan to be exposed to export price risks and export volume risks is not a traditional or typical way of constructing the economic relationship of a ratepayer to a monopoly utility provider*."[327]

9.10.0 Other Metrics for Examining Rates and Revenues

9.10.1. Net Present Value Analysis

La Capra Associates reviewed the financial evaluation presented in Manitoba Hydro's 2013 NFAT Submission and calculated the Net Present Value of the projected annual rate increases, assuming a 7.05% nominal discount rate. The Net Present Value calculation provides a comparison of future rate increases to present rate increases. Manitoba Hydro did not provide this calculation in its financial analysis.

La Capra's Net Present Value analysis indicated that the Preferred Development Plan was not a clear winner in terms of having the lowest rate increases over the entire 50-year study period. Plan 4 (K19/Gas/250 MW) had lower rate increases and Plan 6 (K19/Gas/750 MW) showed lower rate increases over 35- and 40-year time periods. It was not until year 50 that the Preferred Development Plan moved into second place

[326] Exhibit MPA 3-1, p. 22.
[327] Transcript, p. 7392.

behind Plan 4. La Capra's findings were also consistent with another metric it calculated, namely the levelized cost of energy supplied.[328]

9.10.2. Impact of Rate Increases on Ratepayers

Manitoba Hydro's rate projections call for sustained even annual rate increases for at least 20 years. In its evidence before the Panel, Manitoba Hydro emphasized the intergenerational considerations associated with these increases. Manitoba Hydro's argument is essentially a "pay-it-forward" approach: today's generation of ratepayers enjoy low electricity rates and benefit from the investments of past generations in the hydro-electric system; therefore, it is now this generation's turn to pay higher rates so that future generations will reap the benefits of lower electricity rates.

The Preferred Development Plan and the All Gas Plan provide a good example of the intergenerational differences among the plans: with the Preferred Development Plan, today's ratepayers would pay higher rates, while the next generation would presumably benefit from lower rates; with the All Gas Plan, today's ratepayers would face rate increases that are less prolonged and severe than those of the Preferred Development Plan, but the next generation of ratepayers would face higher rates.

It is Manitoba Hydro's view that even with the proposed doubling of electricity rates over the next 20 years, Manitobans will still experience lower rates than many other Canadian jurisdictions, as electricity rates in those jurisdictions are increasing as well.[329]

Manitoba Hydro also told the Panel that rate increases in the order of 3.95% annually for the next seven to ten years would be required even if no new generation options were undertaken. The need to refurbish existing infrastructure and pay for Bipole III will drive these increases.[330]

9.10.3. Present Value of Customers' Revenues

The Panel was told that two critical elements for ratepayers are: (1) what the rates are expected to be over time; and (2) the expected total rate revenue that will be generated over time from domestic customers. Under Manitoba Hydro's current rate proposals, rates will more than double from current values.

Morrison Park constructed a financial model of Manitoba Hydro's electrical operations to assess the overall costs, benefits, and risks to ratepayers and other stakeholders in

[328] Exhibit LCA-13, p. 10A-60.
[329] Transcript, pp. 246-248.
[330] Transcript, p. 3031.

relation to Plan 1 (All Gas), Plan 4 (K19/Gas24/250 MW), Plan 6 (K19/Gas25/750 MW, WPS investment in transmission), Plan 12 (K19/C31/750 MW) and Plan 14 (Preferred Development Plan). Morrison Park's financial model calculates the annual payment that Manitoba ratepayers are presumed to make in the future under various assumptions and hydrological patterns using two different discount rates (6% and 10%) in order to compare streams of cash flow that fluctuate over time. Morrison Park applied Manitoba Hydro's probability weightings to each set of future conditions and blended the results based on these weightings to provide a calculation of average probability-weighted present value of domestic revenue.

With respect to the present value of ratepayer costs, the model demonstrated the sensitivity of the various plans to changes in the discount rate. The All Gas Plan and the Preferred Development Plan represent different rate patterns, with the All Gas Plan showing rate increases for the "first generation" of ratepayers that are less prolonged and not as high as those projected for the Preferred Development Plan. For the "second generation" of ratepayers the pattern reverses. According to Morrison Park, this is where the discount rate and the time value of money become apparent: if ratepayers would prefer to save now and pay later, they would have a high discount rate such as 10% or more and choose Plan 1 (All Gas). Conversely, if they were to focus on long-term benefits, they would have a low discount rate of 6% or less and choose the Plan 14 (Preferred Development Plan). Plans 4 and 6 fall in between Plan 1 and Plan 14.[331]

Overall, Morrison Park concluded, among other things, that Plans 4 and 6, which include Keeyask, a transmission interconnection, and natural gas plants, appear to rank better than the other plans, while Plans 14 and 12, which include Conawapa, are more costly to ratepayers than Plans 4 and 6, which include Keeyask but not Conawapa. Furthermore, Plan 4, with a 250 MW interconnection, outranks Plan 6, with a 750 MW interconnection. However, there is never more than a 1% variation between them.

Morrison Park updated its Net Present Value (ratepayer costs) analysis for the Panel. Ratepayers costs associated with various development plans were calculated at 6% and 10% discount rates over 20-, 30-, and 48-year periods. This analysis showed that the Preferred Development Plan had the highest ratepayer costs for all periods, although the gap narrowed significantly over time.

Morrison Park provided the total cost to ratepayers based on each 2013-updated plan, assuming annual rate increases of 3.8%. The Net Present Value total cost to ratepayers by plan is as follows[332]:

---

[331] Exhibit MPA-3, p. 46.

Standard Deviation	$4,568	$4,059	$4,278	$4,212	$4,449	$4,950

Morrison Park made the following observations from the above analysis:[333]

- The results for Plans 4, 5, and 6 (all of which include Keeyask and exclude Conawapa) are within 1% of each other across all cases (based on 6%, 10% discount rates and nominal dollars and also across maximum, minimum, and average values).
- Plan 2, which includes Keeyask but no transmission interconnection, and is therefore a domestically focused Plan, is slightly inferior to Plans 4, 5, and 6 at a discount rate of both 6% and 10%. In nominal dollar terms, however, it is significantly inferior, which indicates that its costs to ratepayers are higher farther out in the future.
- The All Gas Plan is competitive with Plans 4, 5, and 6 at a discount rate of 6%, but slightly superior (by approximately 1%) when the discount rate is 10%. But in nominal dollar terms, the All Gas Plan has the highest ratepayer cost of all Plans modeled, which indicates that its costs to ratepayers are significantly higher farther out in the future.

[333] Exhibit MPA 3-1, pp.11-12.

- The Preferred Development Plan is approximately 5% inferior to Plans 4, 5, and 6 across all cases. It is the worst performing plan in terms of Net Present Value calculated at both 6% and 10%, but is superior to the All Gas Plan and Plan 2 in nominal dollar terms.
- The Preferred Development Plan also has the highest standard deviation, which suggests that it is the most sensitive to hydrology. Notably, there is no discount rate at which the Preferred Development Plan is superior to Plans 4, 5, and 6: they are superior to the Preferred Development Plan regardless of discount rate assumptions (note that nominal dollars are equivalent to a discount rate of 0%).

Morrison Park also provided a comparison between 2013 and 2014 ratepayer costs based on the updated 2013 information on a reference case basis. Morrison Park noted a significant change in the original 2013 analysis resulting in noteworthy changes in the costs to ratepayers.[334]

Morrison Park noted that across all Plans, projected total costs for Manitoba ratepayers have declined. It was notable that the decline occurred despite the fact that expected interest rates have increased, capital costs for projects have increased, and inflation rates have increased slightly. According to Morrison Park, the declines in the total ratepayer costs "*speak to the powerful impact of dramatically expanded DSM programs (4x the spending contemplated in the 2013 Business Case), which are expected to*

[334] Exhibit MPA 3-1, p.14.

dramatically reduce Manitoba domestic load, and free up more capacity for export."[335] Furthermore, the plans now contemplate a reduced level of capital spending on generation projects (and generally later in time), although spending on enhanced DSM programs will begin almost immediately.

As for the specific plans, the gap between All Gas and the Keeyask-based plans has lessened. The All Gas Plan is now marginally superior to Plans 4, 5 and 6 at a 10% discount rate, and essentially identical at a 6% discount rate. Based on the 2013 Plans, Plans 4 and 6 were superior to All Gas at 6%, and Plan 4 was also superior at 10%. When it comes to the Preferred Development Plan, however, that gap between that Plan and the other Plans increased.[336]

9.10.4. Plan 5 (K19/Gas/750 MW) Rate Pathway vs. Plan 14 (Preferred Development Plan)

Morrison Park mapped the rate increases based on 99 hydrological conditions and determined that based on an annual 3.8% or 4.0% maximum allowable rate increase scenario, Plan 5 (K19/Gas/750 MW) rate requirements are radically different from Plan 14 (Preferred Development Plan). Rate increases under Plan 5 peak in early 2030s then fall for approximately 10 years while under the Preferred Development Plan the rate increases do not peak until between 2038 and 2040.[337]

9.10.5. Intergenerational Impacts

Morrison Park's analysis also considered the intergenerational impacts of the projected rate increases. Morrison Park noted that irrespective of the plan chosen, ratepayers would face the maximum allowable rate increases for the next 15 years under all plans. After approximately 2030, however, the plans separate fairly dramatically and continue to do so for many decades. Morrison Park calculated ratepayer impacts at different timeframes, as shown in the Figure below.[338]

[335] Exhibit MPA 3-1, p.14.
[336] Exhibit MPA 3-1, p.14.
[337] Exhibit MPA 3-1, pp.16-17.
[338] Exhibit MPA 3-1, p. 23.

Table 26 Morrison Park's Calculation of Ratepayer Costs for Alternative Periods

Present Value of Domestic Revenue
Reference Economics, Energy and Capital
20 year, 30 year and 48 year periods
($ in millions)

	All Gas	Plan 2	Plan 4	Plan 5	Plan 6	PDP
Present Value						
NPV @ 6.00%						
2015 - 34	$24,244	$24,094	$24,911	$24,965	$24,993	$25,212
2015 - 44	$31,014	$31,728	$32,111	$32,314	$32,407	$34,694
2015 - 62	$39,659	$40,284	$39,440	$39,636	$39,696	$41,999
NPV @ 10.00%						
2015 - 34	$17,224	$17,133	$17,572	$17,599	$17,612	$17,721
2015 - 44	$19,900	$20,149	$20,440	$20,526	$20,566	$21,488
2015 - 62	$21,999	$22,248	$22,225	$22,312	$22,345	$23,322

Morrison Park's analysis indicates that in the first 20-year period, Plan 2 (Keeyask/Gas) is the least costly for ratepayers, likely because it does not require Keeyask's sunk costs to be written off (as the All Gas Plan does), while new spending on Keeyask occurs relatively late in the period. When the examined period is 48 years, Plans 4 (K19/Gas/250 MW), 5 (K19/Gas/750MW, with WPS sale), and 6 (K19/Gas/750MW) have caught up to or surpassed the All Gas Plan, which suggests that ratepayers in that final 18-year period are dramatically better off under Keeyask-based plans.[339]

The Preferred Development Plan has the highest ratepayer costs in all periods, but the gap narrows considerably over time. Morrison Park noted that if its model were to progress beyond 48 years, the ranking of the Preferred Development Plan likely would continue to improve in nominal dollar terms. However, depending on the discount rate selected, the Preferred Development Plan might never catch up to Plans 4, 5, and 6, as higher discount rates dramatically reduce the present value effect of results so far in the future.[340]

When considering ratepayer costs from an intergenerational perspective, Morrison Park concluded that the choice of plans is essentially immaterial to anyone who is likely to be a ratepayer only for the next 15 years. This would include older ratepayers or businesses that do not foresee a long-term future in the province as rates will increase under all plans. Past that point, however, the choice of plans can have a very significant impact, as ratepayer costs diverge.[341] Morrison Park's analysis reveals that "*the*

[339] Exhibit MPA 3-1, p.24.
[340] Exhibit MPA 3-1, p.24.
[341] Exhibit MPA 3-1, p.24.

generational burdens, and the likely competitiveness of Manitoba electricity rates, will be very different depending on the choices made."[342]

In its Final Argument, Manitoba Hydro commented on Morrison Park's model, noting that while there may be some benefit in using third party models for indicative long-term planning purposes, the models were not sufficiently robust to be considered reliable for short-term decision-making or rate-setting purposes. Manitoba Hydro was of the view that Morrison Park's model was sophisticated but had shortcomings that would limit its use.[343]

9.11.0 Bill Impacts

The Panel heard that customers' electricity bills matter more than rates. Each month, customers are focused on how much they have to pay rather than their electricity rate. The following Table provided by La Capra Associates shows the projected monthly bills for a residential customer using 750kWh of electricity at the estimated rate increases for the different plans. [344]

[342] Exhibit MPA 3-1, p.24.
[343] Exhibit MH-204, p. 197.
[344] Exhibit LCA-3-3, p. 9S-10.

Table 27 La Capra Associates - Projected Monthly Residential Electricity Bill (Non-Electric Heat, 750 kWh/month)

	2013	2032	2042	2052	2062	NPV 2013-2062
Plan 1 (All Gas) – Original 2013 Analysis	$60.96	$115.72	$119.21	$143.32	$168.50	$1,218
Plan 7 (Gas/C26) – Original 2013 Analysis	$60.96	$124.69	$109.96	$128.65	$142.89	$1,222
Plan 2 (K22/Gas) – Original 2013 Analysis	$60.96	$117.05	$115.46	$134.58	$146.44	$1,209
Plan 4 (K19/Gas/250MW) – Original 2013 Analysis	$60.96	$115.58	$112.42	$131.55	$148.33	$1,196
Plan 13 (K19/C25/250MW) – Original 2013 Analysis	$60.96	$127.28	$106.89	$120.03	$128.65	$1,217
Plan 12 (K19/C31/750MW) – Original 2013 Analysis	$60.96	$123.43	$110.55	$121.69	$128.94	$1,214
Plan 6 (K19/Gas/750MW) – Original 2013 Analysis	$60.96	$117.16	$112.24	$131.86	$148.10	$1,202
Plan 14 (PDP – K19/C25/750) – Original 2013 Analysis	$60.96	$126.65	$104.92	$118.28	$125.59	$1,208
Plan 14 – 2014 Update - With DSM Level 2 – Main Rate Submission	$60.96	$129.00	$104.93	$110.16	$113.28	$1,196
Plan 5 – 2014 Update - With DSM Level 2 – Main Rate Submission	$60.96	$118.31	$104.61	$123.35	$137.80	$1,168
Plan 1 – 2014 Update - With DSM Level 2 – Main Rate Submission	$60.96	$111.11	$110.78	$137.97	$158.89	$1,171
Plan 14 – 2014 Update - With DSM Level 2 and High Capital Cost – Main Rate Submission	$60.96	$136.88	$111.89	$114.52	$116.21	$1,237

The above Table shows that by 2032, the various development plans all significantly impact customer bills.

9.11.1. Impact on Lower Income and Vulnerable Consumers

Many witnesses and presenters expressed concern about the proposed rate increases. Dr. Higgin, an expert witness on behalf of CAC, noted that there was considerable "intergenerational inequity" associated with the proposed increases since ratepayers would have to wait a long time to benefit from more modest rate increases while paying much higher electricity bills in the short term (2015 to 2025). He described the short-term impact on ratepayers' bills as "not acceptable", particularly for lower income and vulnerable consumers.[345] Dr. Higgin determined that vulnerable consumers[346] who use electricity to heat their dwellings would see a 46.5% increase in their electricity bills over 10 years (2013 to 2023) under the Preferred Development Plan compared to 39.9% under the All Gas plan, as depicted in the following Table.[347] Dr. Higgin defines

[345] Exhibit CAC-76, p. 10.
[346] Exhibit CAC-27, p. 55.
[347] Exhibit, CAC-27, p. 55.

vulnerable consumers as families (1-7 persons) with an income that meets the Statistics Canada After Tax LICO (2011 data).[348]

Table 28 Dr. Higgin (CAC) Calculation - Bill Increases for Electric Heat, 2013 to 2023

Plan	2013 Base yr.	2013	2013 – 2023 Increase
K19ExpC25 750 MW	$1831	$2683	46.5% ($852)
All Gas	$1831	$2561	39.9% ($730)

In their analysis of the impact of rate increases on low and non-low income households in Manitoba, two other CAC experts, Harvey Stevens and Dr. Wayne Simpson, concluded that rate increases of the scale proposed by Manitoba Hydro over the 2015 to 2032 period worsen the deficit already experienced by low income households and could move many near low income households into a deficit position.[349] Dr. Simpson noted that government transfers are one way to address the affordability of electricity rates.[350]

One witness from the joint CAC/MMF ratepayer panel told that Panel that electricity currently comprises 12% to 15% of her family's annual income.[351] CAC argued that the proposed rate increases would only further erode the already scarce dollars of lower income consumers and force them to cut back on other basic necessities.

9.11.2. Impact on Northern and Aboriginal Customers

Another concern brought to the Panel's attention was the large electricity bills paid by northern and aboriginal customers.

At one time, electricity customers paid different rates depending on where they lived in Manitoba. Northern customers were charged higher electricity rates than residents in the larger population centres such as Winnipeg and Brandon. This rate structure was abandoned several years ago when *The Manitoba Hydro Act* was amended to ensure that all customers in a specific rate class, including residential customers on the interconnected grid, paid the same electricity rates regardless of where they live in the province.[352]

---

[348] The Low income cut-off (LICO) represents a household income threshold where a family is likely to spend 20% or more of its income on food, shelter and clothing than the average family, leaving less income available for other expenses such as health, education, transportation and recreation. LICOs are calculated for families and communities of different sizes
[349] Exhibit CAC- 31, p. 3.
[350] Transcript, pp. 7865, 7867.
[351] Transcript, p. 7646.
[352] *The Manitoba Hydro Act*, C.C.S.M., c. H190. ss. 39(2.1), 39(2.2).

The Panel heard that residents of northern Manitoba face higher electricity bills because of the particularly harsh climate and their reliance on electricity as a heating source. It was pointed out to the Panel that customers in northern Manitoba do not have the range of heating fuels available to them that many customers in southern Manitoba do. Natural gas is not available in the north, leaving electricity or wood as the primary heating fuel options.

One northern resident described the sense of inequity felt upon seeing the homes of Manitoba Hydro employees in Gillam equipped with two electricity meters, one for heat and one for regular electricity use, and knowing that these employees do not have the same costs for electric heat. Some northern residents believe that Manitoba Hydro's northern employees receive free heat.[353] While these employees do not receive free electric heat, the Panel learned that they do pay a much-reduced charge for this service. Manitoba Hydro confirmed that corporate homes for employees are fitted with two meters in order to separately meter electricity used for home heating. Employees pay a flat rate for heat based on the lowest average heating costs in Winnipeg, adjusted annually, and regular rates for electricity used for non-heating purposes.[354] The Panel recognizes that this is an irritant for northern ratepayers, but Manitoba Hydro reported that this is a taxable benefit for its employees.

The Panel learned that affordability of electricity was a major concern for residential and general service customers in MKO First Nation communities. Most citizens of MKO First Nation communities fall into the low-income category and, like other lower income Manitobans, spend a greater percentage of their income on electricity than customers in higher-income categories. The Panel was told that rate increases would only exacerbate the lack of affordability demonstrated by the high levels of delinquent accounts in First Nations communities. Furthermore, these communities have no evidence that the federal government will raise its level of support to offset the projected rate increases.

In its presentation in Thompson on May 14, 2014, MKO indicated that 86% of MKO First Nation electricity accounts are currently in arrears. MKO called for greater access to DSM programs to help MKO customers to reduce their electricity bills and for the impact of future rate increases to be mitigated to the fullest extent possible. Of particular concern was the potential ineligibility of customers in arrears for Power Smart DSM programs.

[353] Transcript, p. 8244.
[354] Exhibit MH-181, p. 1.

MKO told the Panel that a significant number of customers in MKO First Nations continue to be affected by the projects and operations of Manitoba Hydro in the north. Manitoba Hydro makes mitigation payments to certain First Nations customers to compensate for these effects. The Panel heard that because Manitoba Hydro must recover the costs of mitigation payments through rates, the recipients of these payments are, in effect, paying for a portion of the mitigation payments they receive. To address this issue, MKO suggested that mitigation costs be removed from the rates that hydro-affected customers pay.

9.11.3. Impact on Commercial and Industrial Customers

Industrial and commercial (general service) customers provide 56% of Manitoba Hydro's domestic revenue from rates. The 17 largest industrial customers contribute some 22% of total domestic electricity revenue.[355] Overall, industry pays up to 10% more in rates than it costs Manitoba Hydro to provide them with power.[356]

MIPUG presenters identified their main concerns with respect to electricity costs as stability of rates, ongoing transparent regulation of Manitoba Hydro's rates and major capital spending, and ensuring that rates for all customer classes reflect the cost of serving the class. One MIPUG presenter underlined that industry could expect to pay some $400 million more over the next 20 years for the Preferred Development Plan compared to other viable alternatives. MIPUG also noted that rate increases of the magnitude and length proposed under Manitoba Hydro's Preferred Development Plan will be important considerations in future investment decisions, especially in deciding whether to expand and where expansions will take place, given competitive power rates in other jurisdictions.

The Panel was told that industrial customers have more flexibility than residential customers in their ability to respond to rate increases since, ultimately, they can take their business to jurisdictions with more competitive rates. The result would be a loss of these businesses in Manitoba.

9.12.0 Manitoba Hydro's Alternative Rate Methodologies

Manitoba Hydro's rate methodology for the NFAT analysis proposes even annual rate increases on the basis of reaching the 75/25 debt-to-equity target by 2031/32. After the debt-to-equity target is reached, the 1.20 interest coverage ratio would become the relevant target and rates increases would decline significantly.

[355] Manitoba Hydro, Annual Report for the year ended March 31, 2013, pp. 48-49.
[356] Exhibit MIPUG -28, p. 13.

Manitoba Hydro filed two alternative rate-setting methodologies with the Panel that would moderate the projected rate increases. According to Manitoba Hydro, these methodologies were provided as information for the Panel and do not indicate a policy change or yielding on its financial targets, but rather are a means of providing additional flexibility[357] in relation to the amount of rate increases and the timing of reaching the financial targets.[358]

The alternative rate methodologies, which propose rate increases based on the interest coverage ratio, are described below:

Alternative Methodology One would maintain annual 3.95% rate increases for each development plan until the 1.20 interest coverage ratio was achieved followed by subsequent rates increases to maintain the 1.20 ratio. This alternative yields significantly on the debt-to-equity target, and only achieves debt-to-equity ratios in the order of 82% for the All Gas Plan (1) and 88% for the Preferred Development Plan (14) by 2031/32.[359]

Alternative Methodology Two is similar to Alternative Methodology One, with rate increases adjusted from 2016 to 2022 to minimize losses, followed by 3.95% annual rate increases until the 1.20 interest coverage ratio was achieved, and subsequently by rate increases to maintain the 1.20 ratio. Similar to Alternative One, Alternative Methodology Two represents financial scenarios that materially miss Manitoba Hydro's debt-to-equity target, and only achieve ratios in the order of 78% for the All Gas Plan and 86% for the Preferred Development Plan by 2031/32.[360]

The following Table shows the cumulative rate increases using Alternative Methodologies One and Two.[361]

[357] Exhibit MH-204, p. 188.
[358] Exhibit MH-204, p. 188.
[359] Exhibit MH-104-12-6, p. 2.
[360] Exhibit MH-104-12-6, p. 3.
[361] Exhibit MH-104-12-6, pp. 1-3.\\MH-104-12

Table 29 Cumulative Rate Increases at DSM Level 2, Using Alternative Methodologies and Reference Capital Cost

Manitoba Hydro Plans	2031/32		
	Base Methodology	Alternative Methodology One	Alternative Methodology Two
ALL GAS (1)	82%	54%	51%
K31/GAS (2)	88%	56%	53%
K19/GAS/750 MW (5)	94%	56%	53%
K19/GAS/750 MW (6)	95%	57%	53%
K19/C40/750 MW (12)	95%	57%	54%
Preferred Development Plan (14)	115%	70%	69%
Preferred Development Plan (14) (Pipeline Load)	115%	78%	76%

Under Alternative Methodology Two, in the medium term, most of the plans have cumulative rate increases in the range of 51%-54%, as compared to the Preferred Development Plan's 69%. This is significantly lower than the expected cumulative rate increases under Manitoba Hydro's base methodology.

9.13.0 Mitigating the Impact of Rate Increases

About 15% of Manitoba Hydro's annual gross revenue is paid to the Government of Manitoba for water rentals, debt guarantee fees, and capital tax. These direct payments are currently in the order of $250 million annually and will double to over $500 million for the Preferred Development Plan.[362] In addition, the Panel estimates that Bipole III in-service will result in incremental government revenue of over $40 million annually. On an incremental Net Present Value basis, the total benefits to the Province are almost $2.3 billion for the Preferred Plan compared to the All Gas Plan.[363]

Several witnesses commented on the scale of the relatively risk-free government benefits in relation to the rate increases and risks that ratepayers will face with export-oriented development plans. The Panel was told that the provincial government would see significant increases in payments from Manitoba Hydro under export-oriented development plans compared to plans designed to serve domestic need at a time when customers face the burden of rate increases and added risk.

[362] PUB/MH I-073a
[363] Exhibit MH-171, p. 1.

A number of Interveners suggested ways for Manitoba Hydro or the Government of Manitoba to mitigate the impact of higher rates and the associated risks. MIPUG suggested that if Keeyask and the 750 MW transmission interconnection were to be pursued, Manitoba Hydro could adopt, for rate-setting purposes, lower debt-to-equity and interest coverage targets rather than adhering to a 75/25 debt to equity ratio target for at least the next two decades in order to bring rates for plans involving new hydro generation closer to the rate increases expected from the All Gas plan. MIPUG also called for the Government of Manitoba to reduce the impact on ratepayers by foregoing incremental government charges on the new projects for 15 years after their in-service dates.

MIPUG's expert witness provided an illustrative example of foregone government benefits that would make the Preferred Development Plan more beneficial for ratepayers than the All Gas Plan based on the 2012 estimates provided in the original NFAT Submission. In MIPUG's example, the present value of the foregone government benefits over the period to 2040 is $1.398 billion (with no relief after that date), which amounts to approximately 60% of the benefit from water rentals, capital taxes and debt guarantee fees under Plan 14 (not including the other government benefits from higher taxes from the construction and other economic development arising from construction and operation.)[364]

Morrison Park provided the Panel with a recent example of risk sharing where the Government of Newfoundland and Labrador is absorbing a portion of the risk associated with the development of the Muskrat Falls generating station, which is being proposed to serve domestic and export markets.[365]

CAC recommended that the government create a Green Energy Benefit to mitigate the costs and risks associated with the export-oriented plants.

MKO suggested that the Government of Manitoba should consider broadening its current water rental sharing arrangements to include other MKO First Nations. It also suggested that additional consideration should be given to exempting hydro affected First Nations from water rental fees and mitigation costs. MKO also proposed a sharing of export revenues with affected communities.

[364] Exhibit MIPUG-127, pp.1-3.

9.14.0 Conclusions of the Panel

There is a requirement for Manitoba Hydro to provide safe and reliable electricity service, and that this includes investments in new generation, as well as replacement of aging infrastructure. As a result, all proposed development plans would require increases in electricity rates above the rate of inflation. In that regard, Manitoba is no different than other Canadian jurisdictions, which project substantial rate increases in the imminent future.

All development plans presented could lead to higher-than-projected rate increases under several scenarios, including (1) capital costs higher than forecast, (2) interest rates rising above forecast levels, (3) export prices being lower than what is forecast, or (4) drought conditions which limit export quantities. All other things being equal, any single one of these risk factors would result in higher rate increases than projected. Ratepayers are shouldering each of these risks. In comparison, the capital tax and water rental fees realized by the Government of Manitoba are relatively risk-free.

It would be reasonable for the Government of Manitoba to give serious consideration to a reduction of increment provincial benefits from the Keeyask Project. This should involve the Government directing a portion of its incremental capital taxes and water rental fees to be used to mitigate the impact of rate increases on lower-income customers, as well as northern and aboriginal communities.

Manitoba Hydro can contribute to the impact of rate increases in two ways. It can relax is 75/25 debt-to-equity ratio policy to moderate its proposed electricity rate increases. Manitoba Hydro should also mitigate rate increases by seeking to reduce its own expenditures through operational savings.

The development of the Conawapa Project would result in even higher ratepayer commitments to 50 years, after which the rate increases are not as great as other options. Based on current circumstances, the risks related to Conawapa's development far exceed any rewards to ratepayers over the next 50 years. It would not be prudent to continue spending money on Conawapa. The Panel also notes the importance of sunk costs and their impact on rates, particularly when those costs have to be written off.

10.0.0 Risk and Uncertainty

10.1.0 Introduction

Manitoba Hydro identified a number of risks inherent in the Preferred Development Plan and alternative plans. In estimating the expected Net Present Value of different plans, it is necessary to make assumptions about the likely future values of critical economic variables (the reference case) and then conduct a sensitivity analysis in order to test the vulnerability of the reference case outcomes to different risk factors. For example, Manitoba Hydro's load forecast is based on a number of assumptions about population and economic growth in the province. If this forecast growth is not realized, new generation assets will be oversized for actual load. Similarly, if energy prices are lower than forecast by Manitoba Hydro, then electricity export revenues will be less than expected and will result in higher domestic rates to make up for the shortfall.

There are a number of risk factors facing Manitoba Hydro and its ratepayers:

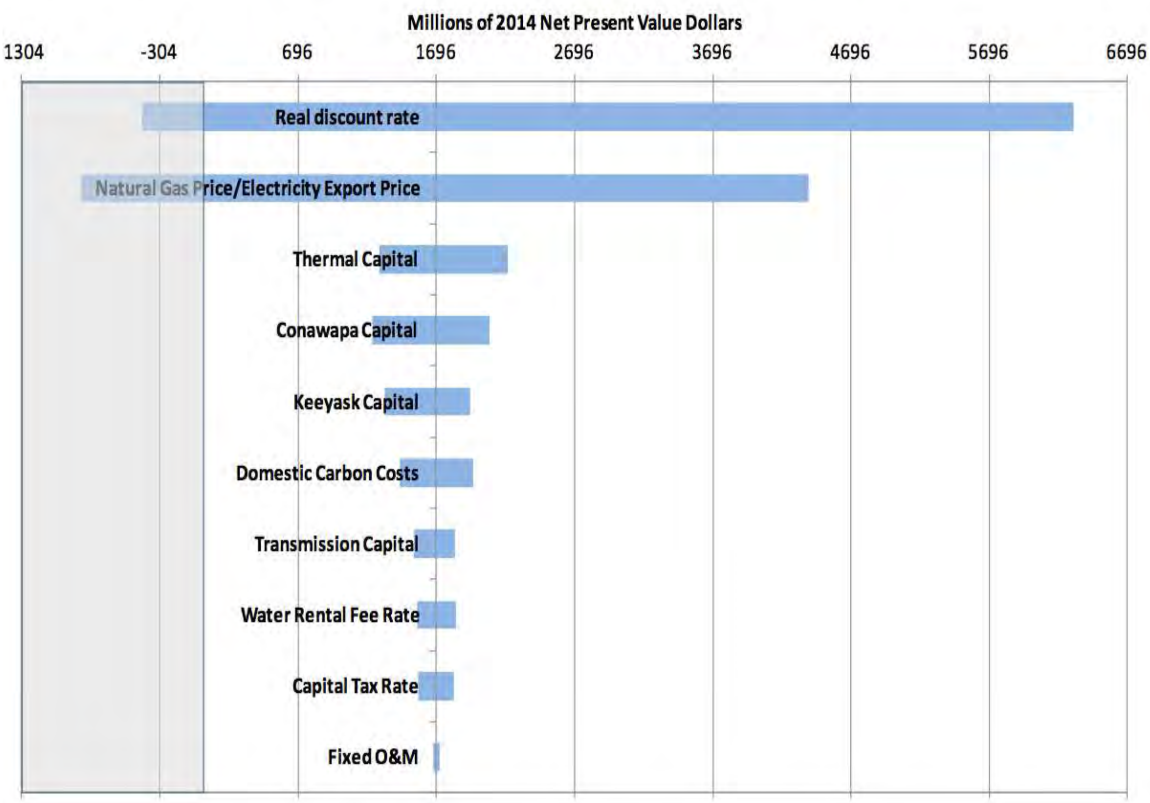
- Energy prices;
- Assumptions for a recovery of U.S. demand to pre-2008 levels;
- The future price of natural gas;
- The development of a carbon price regime in the U.S.;
- Assumptions regarding coal retirements;
- Discount rate and interest rates;
- Load forecast and Demand Side Management;
- Construction costs;
- Climate change and drought;
- Drought impacts and mitigation;
- U.S. transmission interconnection approval;
- Financial impact to the Province of Manitoba; and
- Risk impact on ratepayers compared to risk impacts on the Province.

Any planning process must consider the risk that the assumptions regarding key economic variables may not be accurate. This problem is magnified by the lengthy planning horizon over which Manitoba Hydro conducted its economic analysis and financial analysis (78 years and 50 years, respectively). As the time period lengthens, forecasting future trends in such factors as load growth, energy prices, interest rates and capital costs becomes more difficult and the results more uncertain. As a result, the Preferred Development Plan and alternative plans are subject to a significant level of risk and uncertainty in meeting their expected economic and financial outcomes.

10.2.0 Identification and Ranking of Risk Factors

With respect to the Preferred Development Plan, Manitoba Hydro identified the ten risk factors and their range of uncertainty from low to high. For the purpose of its uncertainty analysis, Manitoba Hydro grouped the high impact factors into three categories: (1) economic indicators (primarily the discount rate), (2) energy prices (both electricity export and natural gas prices), and (3) capital costs. The following Tornado diagram lists the factors from highest to lowest impacts.[366]

Figure 22 Tornado Diagram Showing Sensitivity of the Preferred Development Plan to Different Risk Factors



Source: Manitoba Hydro NFAT Submission, Chapter 10, Figure 10.1, p, 4

[366] Manitoba Hydro NFAT Submission, Chapter 10, p, 4.

Other factors were identified, but not separately analyzed, as they did not appear to have a material impact on the relative benefits of evaluated alternative plans. Manitoba Hydro determined that certain plans were affected differently by the three identified factors.

In addressing risk, Manitoba Hydro performed an assessment to determine which risk factors had the highest impact on the economic and financial outcomes. After identifying the most critical risk factors, Manitoba Hydro undertook an uncertainty analysis, defined by "reference" values as well as "low" and "high" values for these factors. They were then formulated into 27 different scenarios, each of which was analyzed for its probability.

For the All Gas Plan, the discount rate was the foremost factor affecting its Net Present Value. At a low discount rate, there is a significant negative impact on its incremental Net Present Value, while a high discount rate would give it a comparative advantage over more capital-intensive plans. The All Gas plan is also exposed to future gas prices, as the commodity cost of gas is an input into the generation cost.

For the Preferred Development Plan, the opposite effect is the case. It is a capital-intensive hydro project with a large upfront capital cost and attendant revenue requirement to recover these costs over the long-term. The Preferred Development Plan is, therefore, affected more negatively by higher discount rates, which would dilute the long-term benefits from the Plan that occur fairly late in the 78-year study period. Conversely, a lower discount rate improves the benefits associated with the Plan.

Manitoba Hydro indicated that overall, the Preferred Development Plan is most affected by energy prices, but has significant exposure to both discount rate and capital cost escalations. In plans with a mix of new gas and hydro resources, such as Plan 5, the impact of the three factors is moderated. The diversity provided by the mix of hydroelectric and natural gas-fired resources balances the effect of the factors and limits the significance of their effect on incremental Net Present Value.[367]

10.2.1. Energy Prices

Manitoba Hydro's Preferred Development Plan relies on exports of power surplus to domestic needs through firm long-term contracts, shorter-term firm sales, and opportunity sales of surplus energy on the spot market. The primary market for Manitoba Hydro's exports is the MISO market. The greatest uncertainty in modeling export markets is the level of forecasted export market prices. These prices are subject

[367] Manitoba Hydro NFAT Submission, Chapter 10, p. 7.

to a number of different factors, including U.S. demand for electricity, the prices of competing generation sources, and whether or not a carbon tax will materialize in the U.S. Potomac Economics performed an analysis of the Midcontinent Independent System Operator (MISO) market and a review of Manitoba Hydro's export market price projections, which is discussed in further detail in Chapter 6.

Manitoba Hydro has included capacity pricing premiums in its export price forecast. Independent Expert Consultant, Potomac Economics, has suggested that this represents a substantial risk to Manitoba Hydro and that its capacity revenues may be much lower than expected. When there are capacity surpluses in the MISO region, the capacity market pricing may be much lower than expected.

In modelling the uncertainty around energy prices, Manitoba Hydro utilized six independent commercially available forecasts for electricity, natural gas, and carbon prices. Natural gas prices and carbon prices were assumed to be independently uncertain. Electricity prices were assumed to be deterministically dependent on the natural gas and carbon prices.

Export prices in the U.S. MISO market are influenced by the least costly generation alternative. Currently, electricity prices in MISO are set by the cost of coal-fired generation over 90% of the time and during virtually all of the off-peak hours. The rest of the time, the MISO market price is set by a combination of the cost of Combined Cycle Gas Turbine (CCGT) and Simple Cycle Gas Turbine (SCGT) natural gas-fired generation.[368]

Overall, Manitoba Hydro's energy price assumptions are directly influenced by four factors: (1) a recovery in the export market demand to pre-2008 levels (before the financial crisis); (2) trends in the future price of natural gas, especially shale gas; (3) the near-term development of a carbon price regime in the U.S.; and (4) retirements of coal-fired generating stations in the MISO area.

10.2.2. Assumptions for a Recovery of U.S. Demand to Pre-2008 Levels

The 2008 financial crisis in the U.S. resulted in electricity demand being significantly depressed, compared to pre-2008 levels. While the economy has since recovered, an issue that was raised repeatedly before the Panel was whether there has been a structural shift that has permanently altered the nature of the relationship between economic growth and load growth in the U.S. economy. CAC's witness, Dr. Gotham,

[368] Manitoba Hydro NFAT Submission, Chapter 5, pp. 45-46.

noted that there was significant unresolved uncertainty regarding this issue.[369] Notably, despite the recovery in the U.S. economy, Manitoba Hydro has experienced five years of average export prices in the MISO region in the 3¢/kWh to 3.5¢/kWh range, with no apparent upward trend in market prices.[370]

Elenchus noted the potential for structural change to the electricity market as a result of new technology, suggesting that forecasting, by its very nature, does not assume or account for such structural change. Potential issues of concern would be the widespread adoption of electric vehicles, which would increase demand, or alternatively grid parity of alternative generation sources such as solar power that would lower demand. In Elenchus' view, the uncertainty is not whether such change will happen, but when.[371] If (or when) the cost of distributed and/or micro-generation and storage declines to the point of grid parity, there could be a tipping point where industrial, commercial, and even residential customers switch en masse from grid power to self-generation.[372] This would allow consumers to price-competitively generate a portion or all of their electricity and reduce their reliance on the grid.[373]

Morrison Park and other witnesses also noted that while the timing and impact of changes would likely be gradual, long-lived assets, such as those included in the Preferred Development Plan, may become locked in. This means the utility would forego the possibility of adopting new, more inexpensive technology.[374] CAC further quoted Mr. Campbell, the CEO of Ontario's Independent Electricity System Operator, who spoke to the potential for fundamental change across the electricity sector, stating that:

> *Take these four points together: cheaper solar power, cheaper energy storage, more internet-connected devices, and low voltage DC power-networks offering alternative ways to distribute your home-grown energy sources to devices in your home. Somehow this is all starting to feel like very fundamental change across our sector.*[375]

For Manitoba Hydro, the risk of structural change is two-fold. First, it could reduce demand in Manitoba, resulting in decreased revenues from Manitoba customers. Second, it could depress export prices or complicate the renewal of export contracts,

375 Exhibit CAC-91, p.19.

thus reducing export revenues. In the Panel's view, the worst-case scenario could lead to so-called stranded assets for which Manitoba Hydro cannot recover all of its costs through domestic and export revenues.

10.2.3. The Future Price of Natural Gas

Less than 10 years ago, natural gas prices were at all-time highs. Since then, prices have dropped by approximately 50% due to the advent of shale gas economically produced through hydraulic fracturing, or "fracking" technology. CAC noted the transformative effects of shale gas upon the U.S. marketplace and called it a "game changer."[376]

Natural gas prices are a significant cost input into gas-fired generation that sets the price point in MISO during on-peak periods. Continuation of low gas prices has the potential to significantly lower Manitoba Hydro's export revenues. Continued low gas prices may also affect domestic electricity demand for space-heating purposes if customers realize they can drastically reduce their heating bills by switching to gas furnaces and water heaters. This could reduce domestic demand for electricity.

10.2.4. The Development of a Carbon Price Regime in the U.S.

Hydroelectric energy does not result in any significant carbon dioxide (CO_2) emissions. Conversely, coal-fired generation and, to a lesser extent, gas-fired generation, results in significant emissions. According to the U.S. Environmental Protection Agency, average CO_2 emissions for coal are 1.02 tonnes/MWh, while emissions for gas are around 0.5 tonnes/MWh.

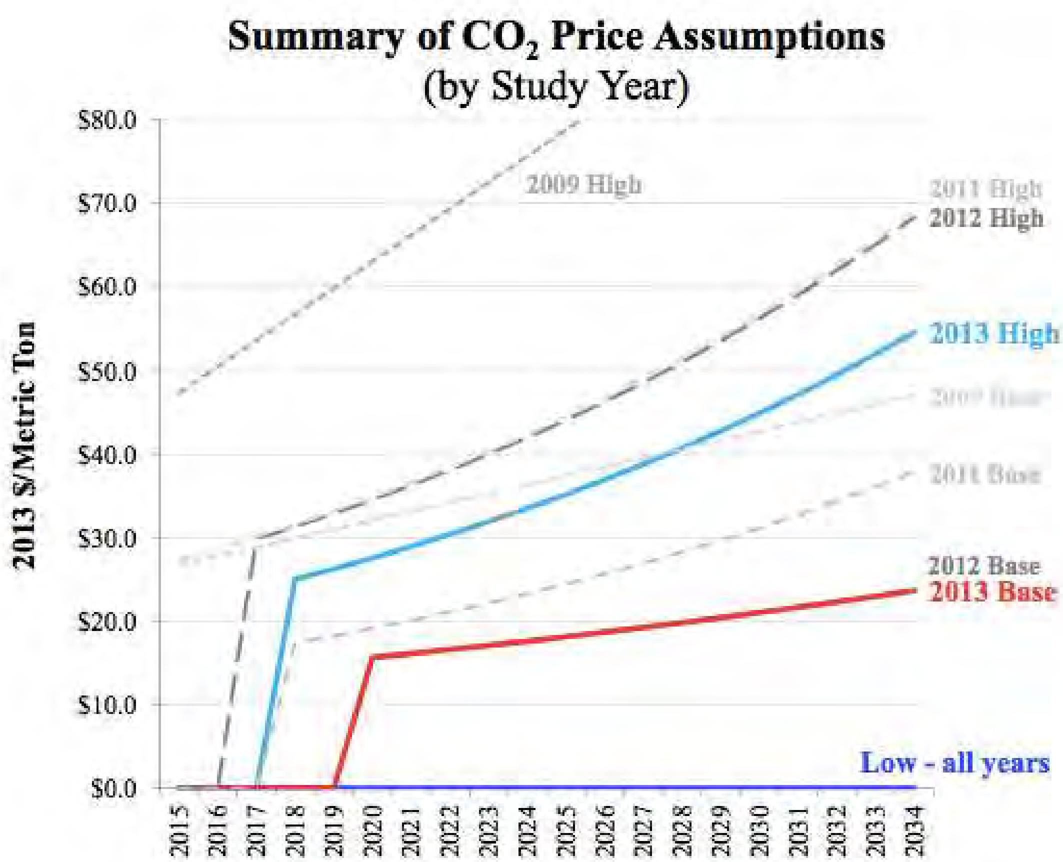
To date, the U.S. does not have a carbon tax or cap-and-trade mechanism. However, there is a widespread expectation that the U.S. will eventually implement legislation, although both the timing and magnitude of any tax or emissions restrictions is uncertain. Should such a regime be eventually introduced, the economic competitiveness of low-emission hydroelectricity will increase vis-à-vis coal- and gas-generated electricity, as the latter two would become more expensive due to the cost of emissions.

Dr. Murphy of the Brattle Group indicated that while less than a decade ago there was an expectation for a carbon regime in the relatively near term, the global recession "knocked that train off the rails."[377]

[376] Exhibit CAC-91, p. 11.
[377] Transcript, p. 2247.

Manitoba Hydro filed on the public record the Brattle Group's forecast, which assumes carbon prices starting at $15/ton (U.S.) in 2020, growing to $21/ton in 2030, and reaching $24/ton by 2034.[378] The Brattle Group also observed that over the past several years, carbon price assumptions have both pushed back the expected implementation date and reduced the expected carbon price. This is illustrated in the following diagram by the Brattle Group, which highlights the importance of both the level and timing of carbon pricing to export price forecasts:

Figure 23 Brattle Group Summary of Current and Historic Carbon Price Assumptions



In an in-camera session, the Panel had the opportunity to examine the various carbon price assumptions made by Manitoba Hydro's commercial forecasters. In addition, MNP provided evidence regarding its own pricing assumptions. Overall, it became clear that there is significant uncertainty about the development and nature of a carbon regime. In the Panel's view, there is no clear consensus on what level (if any) of carbon pricing should be employed.

[378] Exhibit POT-2-1, p. 10.

MNP assigned a 50/50 probability that a carbon tax regime would develop. Potomac Economics provided a reference forecast with a carbon tax commencing in 2021 and one reference forecast without a carbon tax regime. Potomac indicated both outcomes are equally as likely but will ultimately depend on the direction of future policy in the U.S.[379] CAC's witness, Dr. Gotham, stated that the development of a carbon regime is a binary proposition and essentially a "yes" or "no" question, with a significant difference in electricity market pricing between the two.[380]

Since Manitoba Hydro's export revenue forecast is premised on the development of a U.S. carbon regime, the failure of such a regime to develop could, in the Panel's view, significantly lower actual export revenues realized by Manitoba Hydro, and as such represents a significant risk in its assumptions. The uncertainty surrounding this forecast is significant, as La Capra Associates indicated that a slightly lower view of export market prices substantially erodes the economic benefits of the Preferred Development Plan.[381]

10.2.5. Assumptions Regarding Coal Retirements

As set out above, coal-fired generation sets the MISO market price, especially during off-peak hours. A retirement of coal-fired generating stations would likely lead to the replacement with higher-cost sources, such as natural gas generation. This could result in rising MISO electricity prices, and hence increased revenues achieved by Manitoba Hydro.

The Brattle Group forecasts from 11 to 16 GW of MISO coal plant retirements in the coming years. This level of MISO coal plant retirements is substantially above the level assumed by Potomac Economics in its reference case. Potomac assumes 6 GW of coal plant retirements in the MISO region. Potomac opined that the emissions and fuel cost assumptions along with the high level of coal plant retirements assumed by the Brattle Group overstate energy prices.[382]

10.2.6. Discount Rate & Interest Rates

The discount rate in the economic evaluation context is designed to reflect the return that markets require on the type of investment in question. Discount rates and interest rates are linked, as interest rates influence Manitoba Hydro's cost of borrowing. To the extent that interest rates increase the future the cost of borrowing, it will be reflected in a

[379] Exhibit POT-2-1, p. 45.
[380] Transcript, p. 8562.
[381] Exhibit LCA-3, p. LCA-27.
[382] Exhibit POT-2-1, p.11.

higher discount rate. Such circumstances would increase both the cost of borrowing incurred by Manitoba Hydro, as well as the discount rate used to evaluate the development plans. Higher discount rates have a negative impact on the finances and economics of capital-intensive plans with high up-front costs such as the Preferred Development Plan, because the long-term benefits are highly discounted.

Manitoba Hydro used a "weighted average cost of capital" (WACC) approach. This approach is premised on Manitoba Hydro's target 75/25 debt-to-equity ratio. The debt portion is based on Manitoba Hydro's cost of borrowing, including the debt guarantee fee it pays to the Province of Manitoba. For the equity component, which constitutes 25%, Manitoba Hydro added a 3.00% return on equity. In its original filing Manitoba Hydro's WACC discount rate was 5.05%. In its 2013 update, the WACC discount rate increased to 5.40% as a result of increased borrowing costs.

Manitoba Hydro assumed long-term interest rates of 4.50% for 2014, rising to 6.75% for 2019 onwards. Changing these interest rate assumptions will raise or lower the projected interest costs to be incurred by Manitoba Hydro, and will have a strong impact on its finances.

Morrison Park conducted an interest rate sensitivity analysis of the impact on the total costs to Manitoba ratepayers.[383]They indicated that interest rates have some clear impacts on total cost to Manitoba ratepayers. For Plan 5, a 1% increase in interest rates causes the Net Present Value (at a 6% discount rate) of Manitoba ratepayer costs to rise by approximately 6.5%. For the All Gas Plan, this sensitivity is only 4.5%, while for the Preferred Development Plan the sensitivity is 9.5%.

Changes in interest rates have the greatest impact on the Preferred Development Plan, which employs the greatest amount of debt. Conversely, interest rates have the least impact on the All Gas Plan, which employs the least amount of debt.[384]

La Capra Associates also measured the impact on the economics of the Preferred Development Plan of the increase from Manitoba Hydro's 2012-assumed WACC of 5.05% to the 2013-assumed WACC of 5.40%. According to La Capra, the change in discount rate reduced the $1.7 billion Net Present Value of the Preferred Development Plan by $663 million.[385] Given that this was a relatively minor change in the assumed discount rate, it is clear that the Preferred Development Plan is highly sensitive to

[383] Exhibit MPA 3-1, p. 20.
[384] Exhibit MPA 3-1, p. 19.
[385] Exhibit LCA-45, p.16.

discount rates. Plans involving only the Keeyask Project are still affected, but are less susceptible to discount rate risk due to less capital being committed.

10.2.7. Load Forecast and Demand Side Management

The Panel heard evidence of potential new industrial load in the pipeline sector, which can add approximately 1,300 GW of incremental energy load that is currently not included in the 2013 base load forecast. If the pipeline load materializes, this will increase pressure on Manitoba Hydro to achieve its Demand Side Management targets, as it will reduce the available generation surplus. However, advancing the construction of the Keeyask Project to 2019 mitigates this risk by providing additional surplus capacity.

Manitoba Hydro's latest load forecast assumes that enhanced DSM based on the 2014 Power Smart Plan will achieve over 3,900 GWh of energy savings, as well as over 1,100 MW in capacity savings.[386] This level of DSM is greater than the dependable energy output of the Keeyask Project. If the savings are not realized, this will have financial implications for Manitoba Hydro and will affect the timing requirement for other new generation.

In the long term, Manitoba Hydro's load forecast is significantly more uncertain, as it does not account for the development of new technologies that could either significantly increase or decrease electricity consumption. This could include the development of grid parity with respect to technologies such as solar photovoltaic cells or the proliferation of electric vehicles.

10.2.8. Construction Costs

Higher construction costs for Keeyask and Conawapa are a major risk facing the Preferred Development Plan. La Capra Associates stated that modest increases in capital cost assumptions for these projects would result in other development plans having lower costs than the Preferred Development Plan even over the 78-year evaluation period.[387] This was highlighted by the effect of a relatively modest capital cost increase noted in 2014. During the NFAT Review, Manitoba Hydro filed updated costs for Keeyask and Conawapa that increased the cost of Keeyask by close to $300 million and the cost of Conawapa by nearly $500 million from 2012 levels.[388] La Capra Associates determined a reduction in incremental Net Present Value of the Preferred

[386] Exhibit MH-180, pp.55-56.
[387] Exhibit LCA-3, p. LCA-27.
[388] Exhibit MH-113.

Development Plan by $871 million or over 50% of its benefit compared to the All Gas Plan.[389]

Morrison Park prepared a domestic revenue sensitivity analysis showing the Net Present Value (2015-2062) impact on ratepayers of a $1 billion increase in the capital cost of each of Keeyask and Conawapa. Morrison Park noted that the results of a $1 billion increase in capital costs were very similar to the impact of higher interest rates. Adding $1 billion to the construction costs of Keeyask causes Plan 5's Net Present Value (at 6%) of ratepayer costs to rise by slightly less than 3%. At this level, the All Gas Plan is approximately 2% superior to Plan 5 (or the other plans including Keeyask in 2019). Morrison Park also indicated that the analysis showed that the Preferred Development Plan was inferior, requiring higher domestic revenues compared to all other plans if both Keeyask and Conawapa construction costs are increased.[390]

10.2.9. Climate Change and Drought

Manitoba Hydro's primarily hydraulic generating facilities rely on adequate water flows being available. Plans that rely on either Keeyask or Conawapa are therefore subject to a greater risk of climate change and droughts.

Manitoba Hydro conducted an economic sensitivity analysis to see how various potential hydrological changes due to the effects of climate change would affect the economic analysis of some representative portfolios. However, Manitoba Hydro did not indicate any directional impacts of climate change.

La Capra Associates and MNP were critical of Manitoba Hydro's climate modeling and Manitoba Hydro's failure to quantify the impact of climate change on the severity of droughts.[391] According to La Capra Associates, Manitoba Hydro's Global Climate Model only models long-term average stream flows rather than dealing with specific annual flows. As a result, in a severe drought the long-term flows are "hardwired" into this analysis without being adjusted.[392] In La Capra Associates' view, this means that the impact of climate change is essential "assumed away" in the analysis.

Manitoba Hydro engaged the Ouranos Consortium on Regional Climatology and Adaption to Climate Change (Ouranos)[393] to assist with modeling the impact of climate

[389] Exhibit LCA-45, p. 16
[390] Exhibit MPA-3-1, p. 21.
[391] Exhibit LCA-7, p. 4-11.
[392] Exhibit LCA-7, p. 4-12.
[393] Ouranos was created in 2001 as a joint initiative of the Quebec Government, Hydro-Quebec and Environment Canada. The consortium brings together 450 scientists and professionals that have considerable experience in climate change impacts and adaptation including a focus on energy supply and water resources.

change on the Manitoba hydrology. Dr. Roy of Ouranos testified that he did not agree with the concerns raised by the Independent Expert Consultants. He indicated the state of knowledge on climate change and drought remains inconclusive, since there is no consensus in the scientific community with respect to quantitative impacts of climate change on droughts. Dr. Roy further noted that given the current state, Manitoba Hydro's consideration of the worst drought in its historical record was the best approach to be used at this time.[394]

However, Manitoba Hydro did not utilize the worst drought on record, choosing instead to use the 5-year historical drought from 1987/88 to 1991/92. Manitoba Hydro indicated that this was an appropriate drought to be utilized, as it is representative of a post-Lake Winnipeg Regulation scenario. Lake Winnipeg Regulation, which came into effect in the 1970s, requires Manitoba Hydro to keep the level of Lake Winnipeg between a certain minimum and maximum, subject to conditions.

Manitoba Hydro has experienced at least four multi-year drought situations in the last 99 years, namely:

Table 30 Historical Droughts Experienced in Manitoba

Historical Period	Duration of Drought
1929 -1933	5 Years
1935 - 1942	7 Years
1981 - 1985	5 Years
1988 - 1992	5 Years

Morrison Park illustrated that a prolonged drought such as the worst on record, which occurred from 1929 to 1942, when Manitoba Hydro experienced an extended period of below-average flows for 12 of 14 years, would have a large impact on retained earnings, and require a lengthy recovery period.[395] The recovery period would be much greater for the Preferred Development Plan versus the All Gas Plan.

Morrison Park did an analysis of the 1929 to 1942 period, superimposed on lower water flows based on 90% of the long-term average flows. While the long-term implications of a drought were similar for the Preferred Development Plan and the alternative plans, over the term of the drought, the Preferred Development Plan would require larger rate increases.

[394] Transcript, pp.1907-1908.
[395] PUB/MPA 027(a)-(c).

10.2.10. Drought Impacts and Mitigation

The biggest risk with respect to a prolonged drought is not that Manitoba's electrical demand cannot be met, but that Manitoba Hydro could suffer significant, adverse financial consequences in meeting both domestic and export contract obligations. Manitoba Hydro measured its drought risk based on the impact of a 5-year drought. The timing of a potential drought could directly affect Manitoba Hydro's retained earnings. For the Preferred Development Plan, a 5-year drought commencing in 2014/15 would reduce retained earnings by $1.2 billion. For a drought commencing in 2021/22 (when Keeyask is in service) the impact increases to $2.1 billion, and for one commencing in 2027/28 (when both Keeyask and Conawapa would be in-service), the impact would increase to $2.3 billion. The magnitude of the impact of droughts is similar for alternative plans including the All Gas Plan or one without Conawapa because Manitoba Hydro's system is predominantly hydro based.[396]

According to Morrison Park, in a prolonged 20-year period of low water flows similar to the 20-year period of high water flows Manitoba Hydro has just experienced, there is a risk that a portion of Manitoba Hydro's debt could become "stranded." This means that Manitoba Hydro would no longer be able to make full debt payments.[397] Since Manitoba's electricity system is virtually completely hydro-based, this risk exists regardless of whether the Keeyask Project or a gas facility is chosen.[398] If the Province of Manitoba had to start servicing this debt pursuant to its guarantee, this could be seen as a government subsidy of Manitoba Hydro.[399] However, because the Conawapa Project would increase Manitoba Hydro's debt by an additional $10 billion, it would increase the sensitivity to a prolonged drought.[400] In Morrison Park's assessment, the upper boundary of potentially stranded debt would be approximately $10 billion, and having the Province of Manitoba service such debt could be seen as a tax-supported subsidy of Manitoba Hydro.[401]

Manitoba Hydro took issue with Morrison Park's financial model used to determine financial distress. Manitoba Hydro suggested that Morrison Park's calculations would tend to overstate gross interest expense, understate net income, and understate the gross interest coverage ratio in some years. That would overstate the amount of stranded debt in some years.[402]

[402] Exhibit MH-204, p. 198.

Aside from the possibility of rate increases greater than currently budgeted for by Manitoba Hydro, there are other drought mitigation options. Morrison Park suggested that the establishment of a drought contingency fund of sufficient size to offset all water rental fees and capital taxes for three years in the event of a severe drought would provide insurance against a significant level of financial distress.[403]

As experienced by Manitoba Hydro in 2004, droughts can lead to significant year-over-year rate increases both during and immediately following the drought. These rate increases become imbedded in Manitoba Hydro's future revenues.

10.2.11. U.S. Transmission Interconnection Approval

The Great Northern Transmission Line, in which Manitoba Hydro has an ownership and a financial stake, is a project being advanced by Minnesota Power. In order to proceed, this project requires a Certificate of Need from the Minnesota Public Utilities Commission (MPUC). If the transmission line is not approved by the MPUC and Manitoba Hydro has committed to the construction of Keeyask for an in-service date of 2019, Manitoba Hydro would have to rely on existing transmission to deliver Keeyask generated power to market. If the line receives permitting and is built, it will allow for expanded exports and have the added benefit of reducing drought risk by increasing import capabilities.

10.2.12. Financial Impact to the Province of Manitoba

The preceding risk issues all have the potential for reducing Manitoba Hydro's net income in the post-Keeyask construction time frame. A combination of downside risks, which involve higher capital cost, coupled with lower export prices and below average flow years, could result in consecutive annual net losses for Manitoba Hydro. Because the Province must show Manitoba Hydro's losses on its financial statements, and will experience lower water rental revenues during a drought, it is likely that Manitoba Hydro would seek higher rate increases to ensure positive net income.

10.2.13. Risk Impact on Ratepayers Compared to Risk Impacts to the Province

Depending on the direction of the risks set out above, ratepayers can either lose or benefit, since Manitoba Hydro's rates are set on a cost-of-service basis. To the extent that Manitoba Hydro's costs cannot be recovered from export revenues, they must be recovered through domestic rates. Ratepayers accordingly would face the risk of higher-

[403] PUB/MPA 27(c), p. 26.

than-expected rate increases under certain conditions, such as higher capital costs, higher interest rates or lower exports revenues.

It is important to note that the risks borne by ratepayers differ significantly from risks borne by the Province. The Province receives relatively steady revenue flows from Manitoba Hydro by virtue primarily of the capital tax, water rentals, and the debt guarantee fee. As a result, the Province is not exposed to the downside risk faced by ratepayers.

MIPUG compared and contrasted the respective upside and downside faced by ratepayers and the Province of Manitoba under a P10 scenario (approximating the worst case) and a P90 scenario (approximating the best case), as compared to the reference scenario of the All Gas Plan:[404]

Table 31 Incremental Benefit to Ratepayers and Government After 30 Years (Net Present Value Basis - $ millions)

	Plan 1 (All Gas)		**Plan 2 (K22/Gas)**		**Plan 6 (K19/Gas/750MW)**		**Plan 14 (K19/C26/750MW)**	
	Ratepayer Benefit	Government Benefit	Ratepayer Benefit	Government Benefit	Ratepayer Benefit	Government Benefit	Ratepayer Benefit	Government Benefit
Max (P90)	+593	+344	+1,083	+1,996	+1,204	+1,989	+1,074	+4,089
Reference	**0**	**0**	**-164**	**+1,666**	**-138**	**+1,572**	**-1,031**	**+3,598**
Min (P10)	-586	-384	-1,376	+1,300	-1,524	+ 1,100	-3,277	+3,093

The Table shows that for all plans, after 30 years, ratepayers will receive a negative incremental benefit compared to the All Gas Plan at a reference scenario, while the Province of Manitoba will realize a positive benefit. Furthermore, at a P10 probability level, which approximates a worst-case scenario, incremental ratepayer benefits will be significantly negative, while the Province of Manitoba has no negative downside risk whatsoever. In MIPUG's view, there should be a rebalancing of the benefits realized by the Province from the new developments to offset the large increases in rates being sought from ratepayers and the exposure to risks borne by ratepayers.

10.3.0 Conclusions

All plans have risks that will have to be ultimately borne by ratepayers. The Preferred Development Plan has both the highest upside potential and greatest downside potential of all of the plans evaluated. However, the rate implications of the downside risks are material to ratepayers. The downside risk of Plan 6, which excludes

[404] Exhibit MIPUG-9, p. C-46.

Conawapa, is half that of Plan 14, which includes Conawapa. In light of this risk, adding Conawapa to Manitoba Hydro's generation fleet is not justified. Further spending on Conawapa should be terminated immediately.

The Panel recognizes that there is uncertainty associated with Manitoba Hydro achieving its forecast electricity export prices, owing to uncertainty with respect to the development of a carbon tax regime and projected demand in the MISO market. Manitoba Hydro's export pricing forecasts include a carbon premium at a future date, which is dependent on pending U.S. Federal and State mandates on clean energy. Whether these mandates will materialize remains uncertain.

Manitoba Hydro is currently experiencing historically low interest rates. However, there is a risk that higher, future interest rates when Keeyask and Conawapa come into service will result in higher annual debt servicing costs. These costs will ultimately have to be borne by ratepayers.

Manitoba Hydro's load forecast is subject to several short-term uncertainties, primarily whether the expected pipeline load will materialize. In the long term, the load forecast is subject to the risk of new technologies developing that will either significantly increase or decrease the demand for electricity. Manitoba Hydro has yet to address the potential risk and impacts of competing technologies and the implications of grid parity on its load forecast. There is further risk related to Manitoba Hydro's Demand Side Management efforts. Manitoba Hydro's Power Smart Plan target is new and untested. The Plan has yet to be formalized and executed. If Manitoba Hydro does not meet its targets, then capacity implications may arise with the arrival of new pipeline load requirements. However, advancing the Keeyask Project to 2019 mitigates this risk by providing additional surplus capacity in advance of domestic need.

Manitoba Hydro's capital cost estimates for its major generation and transmission projects could experience further increases, which could challenge Manitoba Hydro's financial well-being. It is the Panel's view that there remains a high degree of uncertainty as to whether the capital cost estimates for Keeyask and, in particular, Conawapa will escalate further. Should costs escalate to even higher levels, the economics of Manitoba Hydro's Preferred Development Plan would further deteriorate.

Manitoba Hydro continues to be subject to drought risk, specifically in the face of prolonged low water flows. The primary risk is not that Manitoba Hydro could not meet domestic demand, but rather that its financial situation would erode. This could require rate increases beyond what is currently budgeted. In the absence of such rate increases, there is a risk that the Province of Manitoba might have to step in to assume a portion of Manitoba Hydro's debt. From a reliability perspective, the 750 MW U.S. transmission interconnection would mitigate drought risk by providing enhanced import capacity.

However, the Panel recognizes that ratepayers will face significant rate increases in the early years as a result of these projects even without any downside risk materializing, while the Province of Manitoba will stand to benefit.

11.0.0 Socio-Economic Impacts

11.1.0 Introduction and Background

The Economic Evaluation, outlined in Chapter 8, considers only the net economic benefits of various development plans, and does so only from the perspective of Manitoba Hydro. The Panel's Terms of Reference also directed it to consider a broader range of social and economic effects and to determine whether the Preferred Development Plan provides the highest level of overall socio-economic benefit to Manitobans.

Recognizing the broad nature of socio-economic impacts and benefits, the Panel first sought to define the scope of its inquiry. In consultation with Manitoba Hydro and the Interveners, the following definition was developed:

> *"A critical analysis of the socio-economic impacts and benefits of Manitoba Hydro's Preferred Development Plan and alternative plans. Specifically, a high level summary of potential effects to people in Manitoba, especially Northern and Aboriginal communities, including such things as employment, training and business opportunities; infrastructure and services; personal, family and community life; and resource use."*[405]

Manitoba Hydro's examination of these issues was limited in scope, largely restricted to four considerations:

- A qualitative assessment of the environmental and socio-economic benefits of a limited set of different resource technology options, including hydro, wind, Demand Side Management (DSM) and natural gas;
- An economic impact analysis of the Preferred Development Plan;
- A more detailed analysis of expected socio-economic benefits of the Keeyask Project; and
- A Multiple Account Benefit Cost Analysis (MA-BCA) to determine the net benefits accruing to various stakeholders (accounts), including Manitoba Hydro, the Government of Manitoba, ratepayers, aboriginal communities and the Manitoba economy in general.[406] The MA-BCA analysis was limited to a comparison of the Preferred Development Plan to three other plans: Plan 1/All Gas; Plan2/K22/Gas; and Plan 4/K19/Gas24/250MW.

[405] Exhibit PUB-10, p.14.
[406] Manitoba Hydro NFAT Submission, Chapter 13, p. 2.

This chapter reviews each of these four components of Manitoba Hydro's socio-economic evaluation and the limitations of the analysis presented during the NFAT Review. The Panel heard concerns that Manitoba Hydro's approach and the small number of plans that it considered did not provide a thorough socio-economic evaluation. Specifically, while there is an in-depth analysis of the Keeyask Project and its impact on aboriginal and northern communities, there is much less assessment of the benefits and impacts of other alternatives or other generation sources.[407]

11.2.0 Qualitative Assessment of Resource Technology Options

11.2.1. Manitoba Hydro's Screening of Resource Technology Options

In developing the Preferred Development Plan and alternative plans, Manitoba Hydro began by considering 16 utility-scale resource technology options to meet anticipated load growth. These included DSM, hydro, natural gas, coal, nuclear, wind, solar, geothermal, biomass, and imports. The viability of different resource options were then assessed according to: a) technical characteristics, including the intermittency and seasonality of supply; b) environmental characteristics, such as greenhouse gas emissions and other potential environmental harm; c) social and policy characteristics, such as regulatory constraints and "social acceptability"; and d) economic characteristics.

On this basis, Manitoba Hydro ruled out geothermal, biomass, nuclear, and solar as viable resource options and limited its consideration to resource plans that included DSM, hydro, wind, natural gas, and imports.

For the purposes of its socio-economic analysis, Manitoba Hydro prepared the following overview of a specific set of socioeconomic considerations associated with six resource options: DSM, the Keeyask Project, the Conawapa Project, on-shore wind, simple cycle gas turbines, and combined cycle gas turbines.[408]

[407] Exhibit MMF-26, pp. 7-8.
[408] Manitoba Hydro NFAT Submission, Chapter 7, p. 39.

Table 32 Socioeconomic Screening of Generation Technologies

	DSM	Keeyask	Conawapa	Wind	Heavy Duty CCGT	Heavy Duty SCGT
Health Concerns	-	Very Low	Very Low	Low	Low	Low
Safety Concerns	-	Medium	Medium	Very Low	High	High
MB Business Opportunities (% of capital spent in MB)	100%	53%	46%	18%	30%	17%
Employment Direct Construction	Program Dependent	4480 Person-Years	6650 Person-Years	35 to 80 Person-Years	329 Person-Years	116 Person-Years
At Northern Work Sites	Program Dependent	94%	94%	0%	0%	0%
Permanent O&M	Minimal	58 FTE	61 FTE	4 to 8 FTE	94 FTE (for 1 to 2 plants at site)	52 FTE (for 1 to 4 plants at site)
At Northern Work Sites	0%	100%	100%	0%	0%	0%
Royalties / Taxes (2014$) Water Rentals	-	$9.0 M/year	$12.8 M/year	-	-	-
Capital Taxes	Program Dependent	$17.3 M/year	$28.6 M/year	$0.8 M/year	$2.0 M/year	$0.8 M/year
Guarantee Fees	Program Dependent	$27.7 M/year	$45.8 M/year	Potential for $1.3 M/year	$3.2 M/year	$1.3 M/year

Aside from this very general qualitative overview, no aspects of the socio-economic impacts and benefits of DSM or wind options received further attention. Instead, Manitoba Hydro's analysis focussed on the socio-economic impacts on the Preferred Development Plan and a MA-BCA analysis restricted to four development plans that included only hydro and gas resource options.

11.2.2. Considering the Employment Benefits of Other Options: Wind and Demand Side Management

There was limited analysis of the employment opportunities and benefits associated with components of the Preferred Development Plan. This includes options that might involve generation located in central and southern Manitoba. In particular, there was little assessment of the employment impacts associated with wind generation and increased Demand Side Management programs.

Manitoba Hydro indicated that Demand Side Management had not been assessed because, in part, fewer opportunities for Demand Side Management-related training and employment would exist in northern Manitoba. However, Intervener witnesses suggested that Demand Side Management create significant employment in comparison to other capital projects. Mr. Dunsky who appeared on behalf of CAC, told the Panel in his presentation that Demand Side Management can result in two to ten times more jobs per $ million investment.[409]

Mr. Klassen provided information on the job creation potential of Demand Side Management. He indicated that the cost to create a Demand Side Management job could be about $80,000 per direct/indirect full-time equivalent (FTE) position.[410] The cost to create a hydropower development job could be several hundreds of thousands of dollars. In addition, Demand Side Management jobs provide ongoing employment for a wide range of skills and individuals associated with efficiency programs and trades throughout Manitoba, including northern and aboriginal communities.

In his analysis of wind power generation options, Mr. Hendriks, a witness for MMF, provided the Panel with additional information on employment benefits, especially for communities located in southern and central Manitoba. In its filing, Manitoba Hydro attributed 35 to 80 person-years to the direct construction of wind generation resources (4-8 FTEs); and a combined 120 to 240 person years, including O&M positions.[411] Using data from British Columbia wind energy construction and operations employment, Mr. Hendriks suggested that actual employment could be significantly higher.[412]

11.3.0 The Socio-Economic Impacts of the Preferred Development Plan

Manitoba Hydro estimated the economic impacts of the Preferred Development Plan that would accrue to Manitoba and the Rest-of-Canada (ROC). The Manitoba Bureau of Statistics' input-output model was used to estimate the direct, indirect and induced effects associated with project spending and the jurisdiction in which the effects accrue.

The impacts considered include a wide range of components, including the direct effects on employment and the production of goods or services delivered to Manitoba construction sites (such as cement), taxes and other indirect effects, (such as the spending on fuel and vehicle repair services associated with vehicles used on construction sites) and induced effects (where the employment income on construction sites can lead to spending on food, housing, entertainment, transportation).

For the Preferred Development Plan as a whole, which includes Keeyask, Conawapa, the North-South transmission upgrades, and the 750 MW interconnection, total

409 Exhibit CAC-62, p. 9.
410 Transcript, p. 7930.
411 Manitoba Hydro NFAT Submission, Chapter 7, p. 39.
412 Exhibit MMF-13-1, p. 31.

expected impacts would be significant. According to Manitoba Hydro's estimates, the total economic impact of the Preferred Development Plan would be significant. For the Manitoba economy, there would be over 17,000 person-years of employment created; roughly $1.4 billion in labour income; and just under $1 billion on government tax revenue. The distribution of impacts between Manitoba and the rest of Canada attributable to each component of the Preferred Development Plan are provided in the following Table:[413]

[413] Manitoba Hydro NFAT Submission, Appendix 2.3, p. 4.

11.3.1. Manitoba Economic Impacts

Manitoba Hydro's Preferred Development Plan and the alternative plans affect the Manitoba economy in terms of employment, needs and opportunities for new skills and training and demands for goods and services. In particular, the demand for labour has the greatest potential for economic impacts. The following Table provides the estimated Manitoba-specific economic impacts related to developing Keeyask and the 750 MW transmission line.[414]

Table 34 Manitoba Economic Impacts of the Keeyask Project and 750 MW Transmission Interconnection

	Construction			O&M			Total Impact on Manitoba		
	Keeyask	750 MW Transmission	Total	Keeyask	750 MW Transmission	Total	Keeyask	750 MW Transmission	Total
Employment (person years)									
Project Direct	2,436	119	2,555	39	1	40	2,475	120	2,595
Other Direct	2,175	124	2,299	2	-	2	2,177	124	2,301
Indirect and Induced	3,736	255	3,991	29	1	30	3,765	256	4,021

Provincial	204,340	16,069	220,409	831	22	853	205,171	16,091	221,262
Local	40,915	2,478	43,393	162	5	167	41,077	2,483	43,560
Federal	161,059	10,714	171,773	988	23	1,011	162,047	10,737	172,784
Total Tax Revenue ($millions)	406,314	29,261	435,575	1,981	50	2,031	408,295	21,463	437,606

One of the challenges with the economic impact analysis is to determine to what extent economic benefits accrue in Manitoba as opposed to elsewhere. If direct jobs are filled by non-Manitoba residents or if the procurement of materials is sourced outside of the province, there is a leakage of benefits to other parts of Canada or to other countries. Manitoba Hydro estimates that approximately 60% of labour income and 55% of GDP impact will be incurred in Manitoba.

TyPlan, an Independent Expert Consultant, largely confirmed the magnitude of the total economic impacts, but estimated that a greater proportion of the employment and income created would be captured within Manitoba.[415]

In comparison, Plan 1/All Gas has the least amount of capital spending in the first part of the planning period, with only small amounts invested for thermal power plants starting in the 2020s.[416] Because of the smaller scale of the construction involved, the

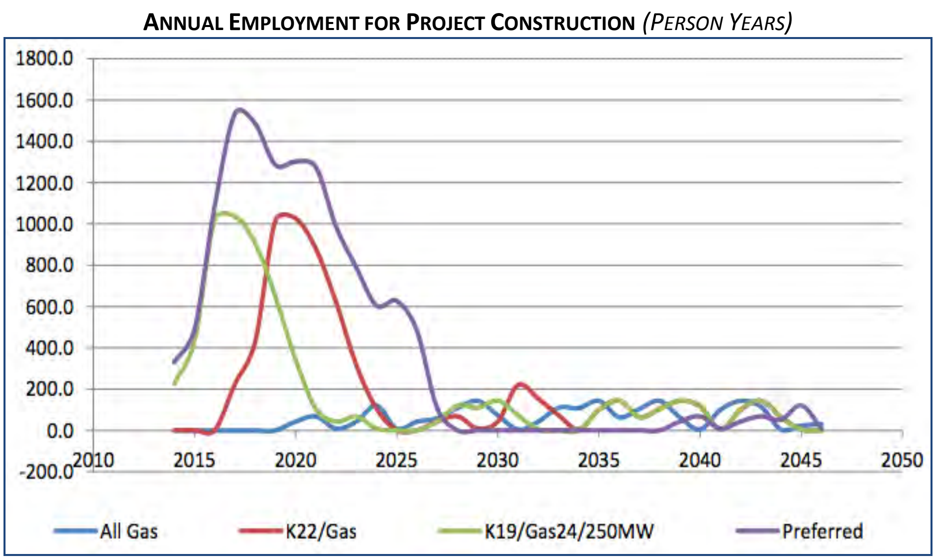
[414] Manitoba Hydro NFAT Submission, Appendix 2.3, p. 4.
[415] Exhibit TyP-1, p. 26.
[416] Manitoba Hydro NFAT Submission, Chapter 13, p. 34.

economic impacts are fewer. Employment would occur in primarily southern Manitoba construction, development and operation with more ongoing operational job requirements. In contrast, plans associated with the Keeyask and Conawapa dam construction have primarily northern Manitoba impacts.

11.3.2. Employment Benefits

These differences in capital spending carry over into the demand for labour. The total annual employment directly required for the construction of the generating and transmission projects varies between different plans. As noted in the chart below, the Preferred Development Plan, again followed by the two plans that include Keeyask, is expected to generate the largest amount of construction employment.[417]

Figure 24 Annual Employment Estimate for Project Construction



The following Table shows estimated and predicated present value of the gross wages generated by the direct employment in project construction and O&M in the preferred and alternative plans. The wages are shown separately for the employment that takes place in northern versus southern Manitoba.[418]

[417] Manitoba Hydro NFAT Submission, Chapter 13, p. 35.
[418] Manitoba Hydro NFAT Submission, Chapter 13, p. 37.

Difference from Preferred Development Plan	0.0	(756.7)	(894.9)	(1,414.5)

NFAT REFERENCE SCENARIO ASSUMPTIONS (2014 PRESENT VALUE IN MILLIONS 2014$)

In terms of net benefits, Manitoba Hydro assumed that 15% of the gross wages would be paid to Manitobans. However, the net benefit for northern aboriginal employment, supported by training, recruitment and retention policies and programs is estimated to be in the order of 50% of the gross wages paid.

At the time of the NFAT Submission, Manitoba Hydro assumed that Manitobans would fill 70% of construction jobs. In February 2014, Manitoba Hydro revised this estimate downwards to 40-45%, suggesting a significant employment leakage. Of these Manitobans, 50% would be northern aboriginal people.[419] With respect to the southern construction jobs, Manitoba Hydro indicated that Manitobans would fill just over 50% of the gas plant related employment and almost all of the tie-line and head office related employment.[420]

The net benefits derived from the employment on Manitoba Hydro's projects are not measured by the gross wage impact, but rather by the incremental income or other benefits Manitobans would realize. The incremental wage benefits during construction and ongoing operations of various plans were estimated as follows:[421]

[419] Manitoba Hydro NFAT Submission, Chapter 13, p. 38.
[420] Manitoba Hydro NFAT Submission, Chapter 13, p. 40.
[421] Manitoba Hydro NFAT Submission, Chapter 13, p. 41

Difference from Preferred Development Plan	**0**	**[123.7]**	**(150.0)**	**[260.3]**

NFAT REFERENCE SCENARIO ASSUMPTIONS (2014 PRESENT VALUE IN MILLIONS 2014$)

Manitoba Hydro assumes that Manitobans will fill all Operations & Maintenance (O&M) jobs. Manitoba Hydro has also assumed that at least 45% of northern O&M jobs would be filled by northern aboriginal people based on current shares of northern operations employment and targeted measures expected with the Keeyask Project.

Manitoba Hydro estimated the net benefits of construction employment in the North would equal 12.2 to 12.4% of the total gross wages paid. The net benefits of O&M employment in the north would be 30.8% of the total gross wages paid; for O&M employment in the South net benefits would be 15% of total gross wages paid.[422]

11.4.0 The Keeyask Project and Northern Aboriginal Communities

11.4.1. Joint Keeyask Development Partnership

Following years of discussion and negotiation, Manitoba Hydro and four Manitoba First Nations (Tataskweyak and War Lake acting as the Cree Nation Partners, York Factory, and Fox Lake) established the Keeyask Hydropower Limited Partnership (KHLP) and negotiated the Joint Keeyask Development Agreement with Manitoba Hydro. The agreement sets out how the Keeyask Project will be developed and identifies potential income opportunities, training, employment, business opportunities, and other related matters. In addition, individual Adverse Effects Agreements were signed to identify

[422] Manitoba Hydro NFAT Submission, Chapter 13, p. 39.

potential negative impacts of the Keeyask Project, and outline measures to prevent or reduce these effects.[423]

An important feature of the Agreement is the ability of the four Keeyask Cree Nations (KCNs) to purchase equity ownership shares. The KCNs have two investment options: a common equity option, which allows the community to obtain a proportionate share of cash distributions from the Project based on the Partnership financial performance, and a preferred equity option, which involves a guaranteed return of approximately $5 million per year.[424] At the time of this report, the choice of option has not been made, and Manitoba Hydro advised that its partners would have until 2019 to exercise the option.[425]

In the hearings, the Panel heard differing and often passionate views about the importance of the Partnership and the construction of the Keeyask Project. Some questioned the consultations leading to the Partnership Agreement.

Members of the KCNs told the Panel that they had been actively involved in negotiations and development of the Keeyask Project. They saw many positive advantages that had come from their involvement from the beginnings of the project development, the extensive community consultations and the respect shown to their Aboriginal Traditional Knowledge. These views and advantages were summarized during Manitoba Hydro's closing submission in remarks made by the Keeyask partner First Nations.[426]

The Panel notes that the commercial arrangements between the partners are outside the scope of the NFAT Terms of Reference. Accordingly, the Panel will not comment on the merit of these submissions.

11.4.2. Employment and Training

Manitoba Hydro has assumed that northern aboriginal people will fill approximately half of the construction positions filled by Manitobans. To the end of March 2013, there already had been 1,118 aboriginal hires for the Keeyask Project, representing 61% of total hires to date.[427] The Project will create jobs in three categories: designated trades, non-designated trades and support occupations. More specifically, Manitoba Hydro identified the following distribution of estimated employment:[428]

---

Table 37 Keeyask Project Summary of Socio-Economic Benefits for Northern Manitobans

Direct Employment	Keeyask Cree Nations	Northern Aboriginal Residents
Construction	Infrastructure: up to 110 person years; Generation: 235 to 600 person years Other: 35-40 person years	Infrastructure: up to 138 person years, including KCNs Generation: 550-1700 person years (315-1100 persons excluding KCNs)
Operations	45% of 50 estimated positions to be aboriginal Minimum 182 positions	45% of 50 estimated positions to be aboriginal

Dr. Buckland and Dr. O'Gorman provided an estimate of the income associated with the 182 ongoing operational jobs. Each job was assumed to have an annual salary of $60,000 and inflated 2% annually. The high estimate of 182 jobs would result in total earnings of $13.408 Million and a low estimate of 91 jobs would equate to $7.204 Million.[429] As was noted in the hearings, all employment is conditional on applicants having the required qualifications.

The Panel also heard about the importance of addressing the need for qualifications through adequate, long-term training and skills development programs. Several presenters noted the outcomes of the Wuskwatim Training and Employment Initiative and the Hydro Northern Training and Employment Initiative (HNTEI). The Clean Environment Commission (CEC) report on the Keeyask Project expressed its concern about HNTEI's inability to train an aboriginal workforce of a size and skill set able to successfully compete for Manitoba Hydro jobs. The CEC recommended that the Keeyask Partnership support ongoing education and training initiatives.[430]

11.4.3. Business and Economic Impacts

The construction of the Keeyask project is estimated to bring business, investment and employment opportunities to the KCNs through the Partnership Agreement and Direct Negotiated Contract (DNC) provisions. To the end of March 2014, $393.6 million in purchase orders have been directly negotiated with the KCNs. These include construction camp services, worksite development, access road construction, and emergency services.[431]

As set out above, the KCNs also have investment options arising from the Keeyask project. The first option involves holding their investment in the form of Common Units.

[429] Exhibit, CAC-83, p. 1.
[430] Exhibit PUB-69, p. 104.
[431] Exhibit MH-137, p. 1.

The second option is the Preferred Unit option. The return on KCN investment for this option will be the higher of the Preferred Minimum Distribution and the Preferred Participating Distribution. In response to questions during the testimony, these estimates were updated to the following for high and low estimates of benefit:[432]

Table 38 Estimated Benefits to the Keeyask Cree Nations

Period	Total/Per Capita	Annual Estimated Range of Benefits	
		Low Estimate	High Estimate
Construction	**Total ($ million)**	$10.26	$20.67
	Per capita ($)	$1,616	$3,255
Post Construction	**Total Benefits ($ million)**	$9.58	$19.92
@ 1.9% equity ownership/6 years post construction	**Per capita ($)**	$1,509	$3,137
Post Construction	**Total Benefits ($ million)**	$9.58	$21.36
@ 2.5% equity ownership/6 years post construction	**Per capita ($)**	$1,509	$3,363

Under the Agreement, investment income can be used for such measures as support for the viability of resource harvesting, cultural and social development, business and employment development, construction, infrastructure, and housing.[433]

In addition, with this employment growth and these business opportunities, Keeyask Cree Nations members should have incomes to spend on goods and services. Construction workers will increase demand for all goods and services in the Keeyask Cree Nations. This may lead to further employment and spending, which could drive business growth.

The Panel learned that these effects would also see economic benefits for northern Manitoba communities, especially Gillam and Thompson. Other economic benefits would come from increased housing construction, local roads, or water infrastructure, especially in the Keeyask Cree Nation communities.

In closing arguments, the Panel heard of the efforts underway to create joint ventures as the communities prepare to capitalize on these economic and business opportunities. Counsel for the partners argued forcefully that these cannot be delayed or

[432] Exhibit CAC-85-1, p. 2.
[433] Exhibit PUB-69, p.100.

postponed with the expectation that they can be easily restarted later should there be a delay in developing Keeyask.[434]

11.4.4. Impacts on Communities, Culture, and Health

It is the nature of large hydropower projects to fundamentally alter the social and economic landscape of the local region. An initial period of construction, involving employment and other economic opportunities, may be followed by decades of adverse community, cultural, social, and health consequences.

Habitat Health Impact Consulting examined the health issues faced by northern Manitoba communities. Population health outcomes in the Burntwood Regional Health Authority (where over two-thirds of the residents are aboriginal), rank poorly when compared to Manitoba averages: pre-term births are greater; life expectancy is lower; mortality is higher; the rates of asthma, arthritis, diabetes, obesity, and heart disease are all higher; injuries are more common; and mental health issues are found in greater numbers.

These problems are likely to grow given the boom-and-bust nature of the hydroelectric investment projects. The period of construction creates social, economic, and cultural stress through the rapid influx of outside workers, rising living costs, and housing pressures. After the construction ends, problems of adjustment may continue for years as incomes are lost, and traditional diets and ways-of-life have been altered. These pressures imposed on communities occur in a region with an already inadequate and challenged health care system.[435]

In its filing, Manitoba Hydro recognized the potential for a wide range of community impacts, from pressures on housing, health services, and social programs to adverse impacts on traditional hunting, trapping, and fishing ways of life. For these reasons, it has worked with the KCNs to develop plans, strategies, and programs to address public safety and worker interactions, heritage resources, traditional ways-of-life, and community health.

In its Preferred Development Plan, Manitoba Hydro has undertaken to put into place a community impact and risk mitigation strategy. Under Adverse Effect Agreements, each KCN is responsible for managing, implementing and operating adverse effects programs. The Agreements include funding and compensation measures. The Adverse Effects Agreements include offsetting programs that encompass a wide range of

[434] Exhibit MH-204, p. 3-4.
[435] Exhibit CAC- 47, pp. 3-4.

projects and initiatives, such as transportation to access off-system lakes and rivers to fish; cultural sustainability efforts to support learning of the Cree language and culture; an alternative justice program; funding for a crisis centre and wellness counseling program; and support for a traditional lifestyle experience, and traditional knowledge learning programs.[436] Interveners in the NFAT hearings supported these efforts so long as there was effective monitoring and support for their implementation and success.

Several parties to the hearing were critical about benefits flowing only to the KCNs, leaving out other aboriginal groups. It was noted that the KCNs only make up 20% of northern affected aboriginal people. The Manitoba Métis Federation noted that there is no benefit sharing with the Métis.[437] Dr. Buckland and Dr. O'Gorman urged the Panel to support efforts to extend the benefit sharing to others.[438]

11.5.0 Multiple Account Benefit-Cost Analysis

Manitoba Hydro undertook a Multiple Account Benefit Cost Analysis (MA-BCA) to determine the net benefits accruing to different stakeholders (accounts), including Manitoba Hydro, the Government of Manitoba, ratepayers, aboriginal communities and the Manitoba economy in general.[439] In addition, the net environmental effects were considered. Where such costs and benefits could be expressed in monetary terms, the sum of each individual account provides the net benefits from a total or societal perspective.

The MA-BCA analysis was limited to a comparison of the Preferred Development Plan to three other plans: Plan 1/All Gas; Plan 2/K22/Gas; and Plan 4/K19/Gas24/250MW. It is summarized in the following Table.[440]

436 Exhibit MH-145. See also Transcript, p. 3892.

Table 39 Manitoba Hydro Multiple Account Benefit-Cost Analysis Summary

	Preferred Development Plan	K19/G24/250MW	K22/Gas	All Gas
Market Valuation Net revenues (cost) to MH and partners	--	17.0	(270.5)	(654.1)
Customer Account Cumulative rate increase	Preferred Development Plan has highest rate increases in first 20 years (cumulatively 16 to 18 percentage points more than the alternative plans) but has lowest rate increases over long term (cumulatively by year 50 approximately 34 to 37 percentage points less than the two alternatives with Keeyask G.S. and 70 percentage points less than the all gas plan).			
Reliability	Preferred Development Plan and to lesser extent the alternative with the smaller interconnection provides greater load carrying capability, lower expected loss of unserved energy and greater ability to manage extreme drought			
Government Incremental revenues net of costs/risk	--	(353.5)	(395.9)	(674.2)
Manitoba Economy Employment net benefits	--	(100.7)	(120.1)	(192.7)
Environment Manitoba GHG external cost	--	(208.6)	(174.3)	(320.3)
Global GHG impact	Preferred Development Plan and to lesser extent the two plans with Keeyask G.S. would contribute to a reduction in global emissions by displacing thermal generation in US.			
Manitoba CAC damage cost	--	(8.6)	(7.1)	(13.3)
Residual biophysical	Aquatic and terrestrial impacts with hydro projects in Preferred Development Plan and plans with Keeyask G.S.; subject to detailed environmental hearings, residual effects and local external cost expected to be relatively small with initial design, extensive mitigation, monitoring, compensation and benefit-sharing arrangements.			
Social Partner net return	Significant net returns from up to 25% interest in Keeyask G.S. and income benefits from Conawapa G.S. in Preferred Development Plan; significant benefits from up to 25% interest in two alternatives with Keeyask G.S., greater with new sales and interconnection.			
Community impacts	Wide range of potential impacts on local employment and business; population, infrastructure and service; social and community well-being; owners of land needed for rights of way and easements; major commitments and plans to minimize adverse residual effects with extensive mitigation, monitoring, compensation and partnership arrangements.			
Other Manitoba	Potentially significant bequest value from the hydro assets remaining at end of planning period; greatest with Preferred Development Plan and to a lesser extent in the alternatives with Keeyask G.S.			
Overall Monetized Net Benefit (Cost)	--	(654.4)	(967.5)	(1,854.6)

NFAT REFERENCE SCENARIO ASSUMPTIONS (2014 PRESENT VALUE IN MILLIONS OF 2014$)

11.6.0 Government of Manitoba Benefits

Manitoba Hydro in the course of its operations pays to the Government of Manitoba fees and taxes, which currently total $262 million annually representing 16% of Manitoba Hydro's revenues. Payments to the Province are forecast to double to $516 million by 2032. These charges include water rental fees, payroll and capital taxes, a provincial debt guarantee fee of 1% on Manitoba Hydro's outstanding debt as well as a sinking fund administration fee. Manitoba Hydro also makes Municipal Grants in Lieu of Taxes (GILTs), which total $22 million and are forecast to grow to $35 million by 2032.[441]

Morrison Park estimated the Net Present Value of future payments to the Province for different plans based on 2013 planning assumptions. The estimates were provided at a 6% discount rate, a 3% discount rate (which approximates the provincial government's own cost of borrowing), and in nominal dollars.[442]

Table 40 Morrison Park – Average Present Value of Revenue to the Province of Manitoba

[441] PUB/MH 1-073a.
[442] Exhibit MPA-3-1, p. 38.

Manitoba Hydro, La Capra and Morrison Park identified that not all of these payments constitute net benefits or incremental revenues to the Government of Manitoba. While the debt guarantee fees are substantial, the amount of debt that government would be guaranteeing is also significant. Given that the provincial debt guarantee fee is provided in exchange for this guarantee, it could be considered a fee for service rather than a net benefit to the Manitoba government.

According to Morrison Park's analysis above, the incremental Net Present Value of water rentals and capital taxes to the Province of Plan 5 (K19/750MW) compared the All Gas Plan is approximately $876 million. Morrison Park also noted that the Preferred Development Plan provides the Province of Manitoba with the most revenue under all scenarios: across each revenue source individually, in total, and regardless of the discount rate calculation. This should be expected since the Preferred Development Plan uses the most water, the most capital, and the most debt of all the Plans.[443]

The benefits of additional revenue from Manitoba Hydro must be balanced against the higher costs to ratepayers that result from the Preferred Development Plan. It must also be balanced against the potential economic drag that may result from those higher rates (higher costs for a staple such as electricity is roughly the equivalent of a reduction in disposable income for individuals and businesses, which could result in lower tax revenue to the Government from sources other than Manitoba Hydro).[444] MIPUG, in its closing submission, agreed with this analysis.[445]

The nature and extent of benefits to the Government of Manitoba drew the attention of MIPUG. In MIPUG's view, the benefits from the Preferred Development Plan and other opportunity-based, export focused plans were "extraordinary." Mr. Turner, who provided a presentation on behalf of MIPUG, indicated that Industry would be paying $400 million more in rates over the next 20 years for the Preferred Development Plan compared to viable alternatives. He stated that this amount would not be available for Manitoba companies to invest in expansion, employees, community support, and other actions that would help the companies' competitiveness.[446]

11.7.0 Conclusions of the Panel

The Preferred Development Plan provides significant socio-economic benefits to the province, though not as high as originally stated. Manitoba Hydro initially assumed that Manitobans would fill 70% of construction jobs; however, in February 2014, Manitoba

[443] Exhibit MPA 3-1, pp. 28-29.
[444] Exhibit MPA 3-1, p. 28.
[445] Exhibit MIPUG-28, p. 5. See also Transcript, pp. 7529-7530.
[446] Transcript, p. 7208.

Hydro revised this figure down to 45%. The limited analysis undertaken by Manitoba Hydro of other Development Plans supports the view that the socio-economic benefits of hydro-based plans compare favourably with those based primarily on natural-gas thermal generation, largely due to the scale of the construction expenditures involved.

At this point in time, the Keeyask Project is associated with tangible socio-economic benefits that have been assured through the Joint Keeyask Development Agreement, already executed directly negotiated contracts, and a significant training effort that has been undertaken to date. While there will be some adverse effects in the communities, the Adverse Effects Agreements negotiated between each Keeyask Cree Nation and Manitoba Hydro largely address such effects. The Panel concludes that plans involving the Keeyask Project have higher benefits than plans in which Keeyask is not included. In contrast, Conawapa benefits are primarily speculative, as no agreements have been negotiated.

From an employment perspective, there is a legitimate concern that employment is subject to the cyclical nature of construction work. Compared to fossil-fueled generation, hydroelectric dams require fewer operating personnel. However, the overall benefits associated with the Keeyask Project significantly exceed the benefits of an All Gas Plan, and are to a large extent directed to northern Manitoba, in particular to affected First Nations communities. This is clear from the fact that despite dissenting voices in the community, the Keeyask Cree Nations have unequivocally stated that they support Keeyask being built.

The Panel is concerned that the full value of the socio-economic benefits of construction of Keeyask will not be realized without due attention to long-term training and further skills development for local workers, especially First Nations. Manitoba Hydro, together with the Keeyask Cree Nations, should facilitate ongoing professional development opportunities even after Keeyask construction has been completed.

The Panel is also of the view that Demand Side Management has the potential to provide significant employment benefits, which were not analyzed in the course of the NFAT Review. Chapter 5 notes the employment potential of DSM. DSM can and will play an important role in the creation of jobs in the future.

The Panel notes that under all scenarios, the Province of Manitoba will realize significant benefits from the development of the Keeyask Project through water rental fees and capital tax payments as further discussed in Chapter 8. The Government of Manitoba could use a portion of the incremental capital tax and water rental fees from the development of the Keeyask Project to mitigate the impact of rate increases on lower income, northern and aboriginal communities.

12.0.0 Macro Environmental Considerations

12.1.0 Introduction

The Panel examined the risks and benefits associated with the Preferred Development Plan and its alternatives from a "macro environmental perspective."[447] While this term was not defined, the Panel assessed the Plan from a broad comparative perspective, including Greenhouse Gas (GHG) and the impact on select valued ecosystem components (VECs). Since the Panel was specifically directed not to duplicate the environmental impact assessment for Keeyask recently completed by the Clean Environment Commission (CEC), the NFAT environmental review took place at a higher level than would be expected for an environmental review. The Panel was further directed not to consider historic environmental costs.[448]

12.2.0 Background and Context

12.2.1. Defining the Term "Macro Environmental"

The Panel consulted with Manitoba Hydro and the Interveners, and decided on the following definition to guide its work:

> *"A critical analysis of the macro environmental impacts and benefits of Manitoba Hydro's Preferred Development Plan and alternative Plans. Specifically this refers to the collective macro-economic consequences of changes to air, land, water, flora, and fauna, including the potential significance of these changes, and their equitable distribution within and between present and future generations."*[449]

12.2.2. The Environmental Regulatory Process

It is important to understand the overall regulatory process given that there have been two reviews of the Keeyask Project: the recently completed environmental assessment hearing by the Manitoba Clean Environment Commission (CEC) and the comprehensive study by the Canadian Environmental Assessment Agency (CEAA). The Panel expects that both of the agencies heard significantly more detailed evidence on the environmental effects of Keeyask than the Panel did, and thus defers to the findings of these agencies on several environmental issues.

[447] Exhibit PUB-2, p. 3.
[448] Exhibit PUB-2, pp. 7-8.
[449] Exhibit PUB-10, p. 12.

Since no environmental assessment process has taken place with respect to Conawapa to date, the Panel's evidence as to the macro environmental effects of Conawapa is limited. While the greenhouse gas (GHG) implications of Conawapa were well developed in the evidence, impacts on valued environmental components (as described below) were not.

Canadian Environmental Assessment Agency Report on the Keeyask Project

The Canadian Environmental Assessment Agency completed its work and issued its report with respect to the Keeyask Project in April 2013.[450] The Agency concluded the Keeyask Project is not likely to cause significant adverse environmental effects when its proposed mitigation measures were put into place.[451] It recommended a follow-up program should be established to verify the accuracy of the environmental assessment and to determine the effectiveness of the proposed mitigation measures. This follow-up program will focus on country foods and human health, fresh-water fish and fish habitat, water resources, birds and wildlife, wetlands, rare plants, and archaeological and heritage resources.

Manitoba Clean Environment Commission Report on the Keeyask Project

The Manitoba Clean Environment Commission has recently completed its public hearings and issued its report on the Keeyask Project.[452] After considering its evidence, the Commission recommended that the Keeyask Project be approved for a license with certain conditions.[453] These conditions included finding specific ways of mitigating impacts on the environment, including reducing the level of disturbance or replacing habitat. Other recommendations focused on the need for additional monitoring so that adverse effects can be identified and environmental management measures developed. The Commission's report has the status of an advisory document to the provincial government. Accordingly, discretion will lie with the provincial government as to whether to incorporate these suggestions if it decides to issue an environmental permit with respect to Keeyask.

In its report, the Commission has also made several non-licensing recommendations to the Province of Manitoba, including that the Province provide guidelines for cumulative effects assessment best practices and include specific direction for proponents in

[450] Exhibit PUB-70.
[451] Exhibit PUB- 70, pp. iii-iv.
[452] Exhibit PUB-69.
[453] Exhibit PUB-69, pp. 165-167.

project guidelines. The Commission also noted that a regional cumulative effects assessment is currently being prepared and is expected to be released in 2015.

12.3.0 Manitoba Hydro's Environmental Assessment Approach

In lieu of providing an actual environmental impact assessment in the NFAT process, Manitoba Hydro provided a comparative overview of environmental effects through a Multiple Accounts – Benefits/Cost Analysis (MA-BCA), as well as a matrix comparison between different technologies.

12.3.1. Environment Account of Multiple Account Benefit/Cost Analysis

Manitoba Hydro evaluated its planning options using a multiple account benefit cost analysis (MA-BCA). In their filing, Manitoba Hydro addressed the consequences of the different plans though an "environment account." This account attempted to provide a monetized social benefit of avoided greenhouse gas emissions, along with air contaminant and biophysical effects associated with the construction and operation of the projects in the different plans.[454] Manitoba Hydro concluded that the Preferred Development Plan has the lowest overall social cost of GHG emissions at $150.2 million, compared to $470.5 million for the All Gas Plan and $358.8 million for a plan involving Keeyask and a 250 MW interconnection.[455] Manitoba Hydro did not provide a separate analysis for a plan involving only Keeyask and a 750 MW interconnection.

12.3.2. Matrix Comparison of Different Technologies

In addition to being analyzed as one of the accounts in the MA-BCA framework, Manitoba Hydro provided a matrix analysis focused on specific Valued Ecosystem Components (VECs) and compared these VECs across different technologies.[456] The concept of a VEC forms part of the federal environmental assessment regime and was also applied in the environmental impact statement that formed the basis of the CEC's hearing into Keeyask.

The NFAT Panel heard evidence with respect to certain key VECs, which are described in greater detail below.

[454] Manitoba Hydro NFAT Submission, Chapter 13 (Revised), p. 47.
[455] Exhibit MH-185 p. 2.
[456] CAC/MH 231(a).

12.4.0 Climate Change: Greenhouse Gases and Air Pollutants

12.4.1. Introduction

Manitoba Hydro's status as an exporter of hydroelectricity means that Manitoba Hydro's hydro-electric generation has GHG implications not only in Manitoba, but also in the United States. The MISO market into which Manitoba Hydro exports relies, to a large extent, on coal and gas generation, which means that exports from Manitoba have the potential to displace GHG emissions in MISO.[457] Conversely, night-time imports from MISO can increase GHG emissions.

12.4.2. Assessment by Resource Option

To compare the relative GHG emissions of the Keeyask and Conawapa Projects, six comparison generation technologies were researched: supercritical pulverized coal combustion, coal with carbon capture and storage, natural gas-fired combined cycle, natural gas-fired simple cycle combustion turbines, wind and nuclear.[458]

Keeyask and Conawapa Project Life Cycle GHG Results

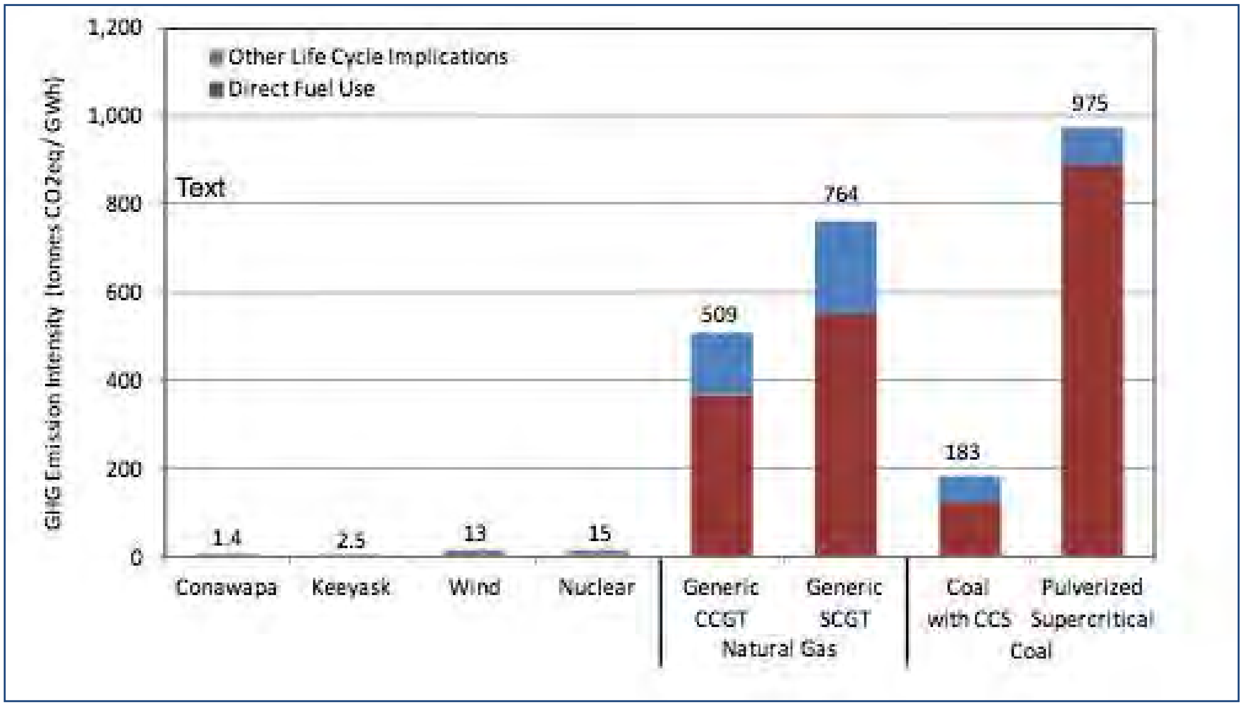
Over a 100-year life, the Keeyask Project is estimated to produce approximately 980,000 tonnes of CO_2 equivalent. Of this amount, GHG emissions associated with the construction phase of the project account for approximately 46% of life-cycle GHG emissions.[459] The Conawapa Project is estimated to produce approximately 900,000 tonnes of CO_2 equivalent with 86% of that amount related to construction.[460]

Comparison with Other Power Generation Technologies

As shown in the Figure below, lifetime GHG emissions for the two proposed hydro projects are significantly lower than for alternative technologies:[461]

[457] Manitoba Hydro NFAT Submission, Chapter 13 (Revised), p. 67.
[458] Manitoba Hydro NFAT Submission, Chapter 13 (Revised), p. 4.
[459] Manitoba Hydro NFAT Submission, Appendix 7.3, pp. 7-8.
[460] Manitoba Hydro NFAT Submission, Appendix 7.3, p. 9.
[461] Manitoba Hydro NFAT Submission, Appendix 7.3, p.12.

Figure 25 Comparison of Life Cycle Greenhouse Gas Emissions for Different Sources of Electricity



This is further borne out by an examination of the intensity-based GHG emissions for different technologies. The All Gas Plan would create 28.4 tonnes of CO_2e/GWh, compared to 13.1 tonnes of CO_2 equivalent/GWh for the Keeyask/Gas/750 plan and 5.5 tonnes of CO_2e/GWh for the Preferred Development Plan.[462] In terms of generating technologies, only wind and nuclear technology are competitive with hydroelectricity.

Unfortunately, no separate GHG emissions analysis was provided for Demand Side Management (DSM). However, it stands to reason that avoided generation would be at least as favourable as hydroelectric generation.

Greenhouse Gas Displacement

The energy produced by Keeyask and Conawapa Projects (less transmission losses) will displace a variety of fossil-fuelled generation in the interconnected U.S. export markets. Manitoba Hydro's analysis of the electricity market estimates the avoided GHG emissions due to energy being injected into the regional energy markets from Manitoba. Conventional coal generation is typically in the order of 900 to 1,100 tonnes CO_2 e/GWh, while natural gas can range from about 300 to 800 tonnes CO_2e/GWh

[462] Exhibit MH-148, p. 2.

depending on the specific technology and its efficiency.[463] Combined-cycle gas turbines (CCGT) tend to be significantly more efficient than simple cycle gas turbines (SCGT).[464]

Manitoba Hydro currently assumes that its net exports displace 750 tonnes CO_2 equivalent/GWh.[465] This reflects a marginal generation mix of various fossil fuels and technologies. Given that the current marginal generation, other than in peak periods, remains primarily coal; the 750 tonnes of CO_2 equivalent/GWh factor used by Manitoba Hydro is considered to underestimate the emissions displaced by exports. The net positive effect of the Keeyask and Conawapa Projects on climate change reflects the small life cycle GHG emissions of the proposed projects versus the much more significant emission reductions that will result from the displacement of high GHG intensity sources of generation.[466] MNP determined the following displacement potential:[467]

Table 41 Cumulative Greenhouse Gas Emissions and Cumulative Greenhouse Gas Displacement Potential of Alternative Development Plans

MNP LLP

Selected Plans' Air Impacts

Air Impacts*	Preferred Plan #14: K19/C25/ 750MW (WPS Sale & Investment)	Plan #1: All Gas	Plan #4: K19/Gas24/ 250MW	Plan #5: K19/Gas25/ 750MW (WPS Sale & Investment)	Plan #7: SGCT/C26
Cumulative GHG Operating Emissions	7.5 Mt CO2e	33.2 Mt CO2e	25.4 Mt CO2e	16.3 Mt CO2e	13.0 Mt CO2e
Cumulative Regional GHG Displacement Potential	191.6 Mt CO2e	22.5 Mt CO2e	107.7 Mt CO2e	94.4 Mt CO2e	102.1 Mt CO2e

12.5.0 Comparing Environmental Effects for Competing Technologies

12.5.1. Introduction

As part of its review, the Panel received evidence regarding the high-level impacts to be expected from different technologies. These are summarized in this section.

12.5.2. Hydropower Generation

While large hydropower projects can have significant global GHG benefits, they can also have a profound environmental impact on the land and water. Localized impacts include flooding, shoreline erosion and water quality impacts. In the context of a heavily developed river system like the Lower Nelson, the cumulative impacts must be considered together with the incremental impacts of a new dam.

Keeyask Project

The Keeyask Project will require about 125 km^2 of land in the boreal forest, of which 50 km^2 will be land that is flooded for the reservoir and dam.[468] This ecosystem and its water regime have already been altered considerably by previous hydroelectric developments and are therefore vulnerable to further change.[469]

According to Manitoba Hydro's NFAT Submission, the water regime changes include flooding and increased water levels at Keeyask downstream of Lake Winnipeg on the Upper Nelson River. The reservoir will stretch from the generating station approximately 93 km^2 in area and it will extend 42 km upstream to the outlet of Clark Lake. The reservoir will consist of approximately 48 km^2 of existing waterways, 45 km^2 of newly submerged lands and 264 km of shoreline.[470] Water quality in the newly flooded areas with be affected during the initial 10 to 15 years, but impacts are expected to diminish thereafter.[471]

In their report, MNP noted the following impacts: complete loss of Gull Rapids; slower, deeper water through Gull Lake, Birthday Rapids, and as far upstream as the outlet of Clark Lake; changes in erosion patterns and water quality downstream of Keeyask, but not upstream in Split Lake; and flooding of several Caribou calving islands in Gull Lake.[472]

[470] Exhibit MNP-6, p. 37.
[471] CAC/MH I-232(a), p 10.
[472] Exhibit MNP-6, pp. 39-40.

Conawapa Project

Preliminary information exists on the water impacts associated with the Conawapa Project. It will require over 20 km^2 of land, of which 10 km^2 is needed for construction and only 5 km^2 will be flooded for reservoir requirements.[473] Since no environmental impact statement has been prepared for Conawapa to date, the environmental impacts of Conawapa are significantly less well known than those of Keeyask. Similarly, any potential changes to the overall water flow regime and regulation of Lake Winnipeg to maximize exports have not been examined in detail.

Hydropower Mitigation Strategies

Manitoba Hydro plans to mitigate, manage and monitor environmental effects, primarily for the Keeyask Project. This includes environmental protection, management and monitoring plans. The program will cover erosion control from the shoreline, roads, stream crossings, earth dams and dykes, and will guide compliance with relevant legislation.[474]

In their review, MNP advised the Panel that these measures are "commensurate with expectations of a project this size. There is always risk that mitigation features are not as effective as expected, but we do not believe that Manitoba Hydro is missing any important elements in their mitigation strategies."[475] MNP's report was filed prior to the CEC releasing its report.

12.5.3. Natural Gas Thermal Generation

While GHG emissions from gas-fired power plants are less than emissions from coal-fired power plants, they are still significant, and the CEC noted that a comparably sized natural gas plant would produce as much greenhouse gas in 177 days as the Keeyask Generation Project will produce in 100 years.[476] Concerns over the impact of hydraulic fracturing and the considerable risks it poses to potable water supplies and human health as well as its significant contribution to global warming, must also be considered.[477]

[475] Exhibit MNP-6, p. 47.
[476] Exhibit PUB-69, p. 61.
[477] Exhibit CAC-29, p.22.

12.5.4. Wind Power

According to CAC's expert witness Dr. Gunn, much of the research on the environmental impacts of wind energy production has focused on the potential adverse effects of multiple rotor blades on birds and landscapes. Other studies suggest that no serious unusual interference with wildlife is associated with wind energy development. Aside from those associated with equipment production, wind energy CO_2 emissions are extremely low. Human health impacts include visual disturbance and shadow flicker.[478]

12.5.5. Solar Photovoltaic Power

There are two types of solar photovoltaic generation technologies – roof-based and ground-based. While GHG-emissions are created upon production, emissions are extremely low during the operating phase. However, while roof-based systems require little landmass, ground-based solar farms can have significant land requirements.[479]

12.5.6. Demand Side Management

Reducing energy consumption has obvious environment benefits, relative to new generation construction and development. The concept of Demand Side Management is not new and has been applied for decades not only to energy supplies but also to other public utilities such as water and gas. By reducing the need for new generation, Demand Side Management has the potential to avoid the adverse effects of other technologies. However, the environmental impact of DSM is dependent on the specific measure used.[480]

12.6.0 Valued Ecosystem Components (VECs)

12.6.1. Introduction and Scope

The Canadian Environmental Assessment Agency defines Valued Ecosystem Components (VECs) as environmental elements of the ecosystem that are identified as having unique, scientific, social, cultural economic and aesthetic importance. In the environmental impact statement filed before the CEC, a total of 38 VECs were discussed.[481]

Aside from GHGs, which are discussed above, the analysis before the NFAT Panel focused on three key VECs, namely lake sturgeon, caribou, and public health and

[478] Exhibit CAC-29, pp. 26-27.
[479] Exhibit CAC-29, pp.31-32.
[480] Exhibit CAC-29, pp. 34-36.
[481] Exhibit PUB-69, p. xv.

community safety. The Panel notes that virtually all of the evidence it heard with respect to specific VECs related to the Keeyask Project, with little information being provided as to the environmental effects of the Conawapa Project, other than high-level evidence with respect to GHG and flooding impacts.

12.6.2. Lake Sturgeon

Lake sturgeon are a culturally and spiritually important species to the Cree. Lake sturgeon are a Manitoba heritage species and have been designed as endangered by the Committee on the Status of Endangered Wildlife in Canada (COSEWIC).[482] The federal government is also currently considering whether to list lake sturgeon as an endangered species under the *Species at Risk Act* (SARA).[483] In addition, lake sturgeon are particularly vulnerable due to a number of unique characteristics: they have a late sexual maturity, infrequent spawning patterns, slow to maturity growth rates, and 60-year plus longevity.[484] Manitoba Hydro identified lake sturgeon as the number one regulatory risk with respect to the Keeyask Project.[485]

In its filing, Manitoba Hydro notes that the Keeyask Project will affect sturgeon spawning habitat. In assessing the potential impacts, MNP determined that a number of the anticipated impacts have the potential for significant, adverse effects. Construction will impede fish migration and affect spawning. Sturgeon require a large turbulent rapids habitat. Construction will result in the permanent loss of Gull Rapids. Fish movement will be altered as a result of the presence of the generating station and increased access might encourage more fishing and overharvesting.[486]

To mitigate these effects, Manitoba Hydro indicated that the Keeyask Partnership will develop new sturgeon habitat; undertake an experimental, up-stream fish passage study; install turbines that enable a large percentage of fish to successfully pass downstream; and implement a regional sturgeon stocking program.[487] The Panel heard concerns that stocking programs have not been proven effective at hydroelectric projects; habitat required to fulfill life cycles may not be available; and large sturgeon may not be able to move past the generating station.[488]

MNP examined plans to install a temporary, experimental catch and transport system and conduct studies of fish habitat and behavior. While they concluded that this was a

[488] CAC/MH I-231(a), p. 14.

"sensible approach," there is equally the cost to build and operate it.[489] Other testimony and the findings of the Clean Environment Commission questioned this approach. The CEC and CEAA environmental reports into the Keeyask Project both concluded that a permanent fish passage was not necessary. The Panel notes that, the Clean Environment Commission expressed its concerns about the mitigation strategies, and recommended that the Keeyask Partnership stock lake sturgeon for at least 50 years.[490]

The Panel notes that there remains a risk to lake sturgeon, and that the CEC recommendations will impose ongoing operational costs if imposed, as a term of Manitoba Hydro's environmental licence for Keeyask.

12.6.3. Caribou

Caribou are important to the northern ecology and to northern aboriginal people. Boreal woodland caribou are protected under the federal *Species at Risk Act (SARA)* and *The Endangered Species Act* (Manitoba). Some local Cree identify woodland caribou in the Keeyask region, but federal and provincial regulators have not determined that the caribou resident in the area are protected boreal woodland caribou.[491]

In their filing, Manitoba Hydro has identified a number of potential impacts on caribou. They include the habitat losses and fragmentation, increased predator access, and sensory disturbances from heavy machinery and construction activities. Among strategies identified to mitigate these potential effects, Manitoba Hydro and Keeyask Partnership have listed adjusted roads, borrow areas and excavated placement areas to avoid sensitive caribou habitat; limits of some construction activities such as blasting to the extent practicable during the calving season; and blocking access trails once they are no longer required (i.e., post-construction). New calving habitat is also expected to be created on new islands in the new reservoir.[492]

In their analysis, MNP determined that these impacts had a medium to low consequence: construction will not lead to a reduction of food sources; increased predator and hunters' access will be a concern; there will be minimal loss of habitat for calving; and caribou are shown not to abandon habitat.[493]

In their report, the Clean Environment Commission came to the conclusion that additional research was required given insufficient data on woodland caribou

populations and recommended that a three- to five-year telemetry study be put into place.[494]

12.6.4. Mercury

Methyl mercury exposure and contamination of fish can be caused by mineral bank erosion and peat land disintegration.[495] Since mercury bio-accumulates in fish, this can cause a health risk from eating fish caught in the Nelson River. Predictions are that the maximum mean mercury concentrations for lake whitefish, northern pike, and walleye from the Keeyask reservoir and Stephens Lake could be reached within three to seven years post-construction, and return to pre-project levels at least 30 years post-impoundment.[496]

In its report, the Clean Environment Commission noted that this is an understandable concern, but concluded that methyl mercury would be a temporary effect that would occur over two to three decades. The Commission recommended continued monitoring.[497]

12.7.0 Adverse Effects Agreements

To compensate for any residual effects not addressed through mitigation, Manitoba Hydro negotiated adverse effects agreements with each of the Keeyask Cree Nations. Pursuant to these agreements, Manitoba Hydro provides a series of "offsetting programs" in each of the communities, as well as a residual monetary payment. The offsetting programs are primarily cultural in nature, such as the provision of gathering centres and counselling programs, but also include a healthy food fish program in each community, which facilitates access to fish not affected by increased mercury levels in the Nelson River.[498] The residual monetary payments provide ongoing payments for the duration of the Keeyask project in the case of three of the communities, and payments until 2025 for the fourth.[499]

12.8.0 Need for Regional Cumulative Environmental Assessment

In the course of conducting the NFAT Review, the Panel heard from several affected communities who commented on the effect of past hydroelectric developments on their lives. In addition, Dr. Gunn, who appeared on behalf of CAC, testified that a macro

[494] Exhibit PUB-69, p. 96.
[495] Exhibit MNP-6, p. 69.
[496] Exhibit MNP 6, pp. 69-70.
[497] Exhibit PUB-69, pp. 112-113.
[498] Exhibit MH-145.
[499] Exhibit PUB-58-5, Tab 9.

environmental review should be cumulative in nature. This means that it should consider not merely the incremental effect of one project, but the collective effect of the project when added to impacts that have already happened.[500]

The Panel notes that the CEC recommended a regional cumulative effects assessment for the area in its report into the Bipole III project, and commented in its report on the Keeyask Project that it expected such an assessment to be available by 2015, yet did not recommend withholding a licence for the Keeyask Project pending the availability of the document. The NFAT Panel supports the preparation of a regional Cumulative Effects Assessment and is heartened by the fact that on May 27, 2014, the Province and Manitoba Hydro agreed to Terms of Reference for a regional Cumulative Effects Assessment of hydro-electric developments that includes the Nelson, Burntwood, and Churchill River systems.

12.9.0 Conclusions of the Panel

In the Panel's view, all plans presented by Manitoba Hydro will have an impact on the local, regional and global environment. To some extent, such effects can be avoided through a focus on demand reduction through DSM efforts that avoid the need for new generation sources being constructed. However, if one accepts that new generation will be required in Manitoba within the next decade, DSM does not represent a freestanding solution.

Hydroelectricity emits minimal greenhouse gases and does not rely on fossil fuels. While wind and solar power are environmentally friendly technologies with similarly low GHG emissions, they are intermittent power sources that do not provide capacity and as such must be backed by either hydroelectricity or gas-fired generation.

These alternative generation options should be analyzed further as part of any future integrated resource plan, to assess their economics and study how they could be integrated into Manitoba Hydro's system. Manitoba Hydro expended substantial efforts to mitigate adverse environmental effects from Keeyask. The Panel received little substantive evidence on efforts to mitigate the impact of Conawapa, which has yet to be subject to environmental proceedings.

Overall, the Panel is of the view that while a plan involving Keeyask is environmentally favourable from an avoided GHG emissions basis, Keeyask creates an ongoing risk to lake sturgeon and will have a significant effect on its sustainability on the Nelson River. Nonetheless, the effects have been mitigated to the extent possible and have been

[500] Exhibit CAC-29, p. 12.

found to be acceptable by the Clean Environment Commission and the most affected First Nations.

To that extent, the Panel concurs with the Clean Environment Commission that a regional cumulative effects assessment for the area is required to determine the cumulative effects of hydroelectric developments to date. To date, insufficient information has been collected and better assessment methods are needed.

In addition, the Panel support the actions now needed as a result of the Clean Environment Commission recommendations. In particular, it notes the importance of the CEC's findings with regard to caribou and lake sturgeon.

13.0.0 The Commercial Perspective

13.1.0 Introduction

The Preferred Development Plan and suggested alternative development plans bring together all of the costs, risks and benefits that affect stakeholders such as ratepayers, the Government of Manitoba, Manitoba taxpayers, First Nations commercial partners and others. The Panel considered Manitoba Hydro's Plans from a number of perspectives, including financial, socio-economic and environmental. It assessed the costs of construction and the realities of expenditures and anticipated revenues.

In this chapter, the Panel considers the Preferred Development Plan and the alternatives from a commercial perspective. The Panel treats the Plan and alternatives as investments, and ratepayers as shareholders. In fact and as Morrison Park told the Panel, Manitoba ratepayers are in a disadvantaged position. They have no certainty in advance. They cannot choose another supplier of electricity, and they must shoulder the risk burden.[501]

13.2.0 The "Positional View"

In their analysis of Manitoba Hydro's plans, Morrison Park briefed the Panel on the realities of its "positional view." In many regards, the Panel and the NFAT Review was caught between decisions and actions already taken and the uncertainty of a long-term planning horizon. Uncertainties underlay many of the projections and forecasts, and they extend out not only years, but also many decades.

In this regard, the analytical tools and planning methods can be a limiting factor. The search for precision can disguise the reality that such tools are often based on assumptions that fail to consider future possibilities. In this context, the Panel was persuaded by the guidance provided by Morrison Park when they stated:

> *There is a significant danger in assuming that a view of the future from the perspective of today will be very accurate. All such assumptions should be approached with humility, and treated with respect as the best available basis for decision-making, but without claiming them to be more than what they are. Decisions cannot be made without taking a view of the future, but the future may prove unwilling to agree with the forecasts made of it.*

[501] Exhibit MPA-3, p. 69.

> *It is commonplace that commercial transactions are analyzed using mathematical models, often providing a degree of precision measured in decimal points, which sometimes gives the illusion of accuracy or predictive power. . . . However, these models are only as accurate as the assumptions about the future that underlie them. Since those assumptions must be given a broad range because of the difficulty inherent in predicting the future, especially over decades, the models should and do result in outputs with an equally broad range. This means that mathematical models sometimes may be capable of excluding certain decision options from the realm of reasonable commercial choice, but cannot always point to a single preferred outcome among several. In these cases, decisions still must be made, but they must be rendered on the basis of judgement. Commercial decisions are ultimately about judgement, and judgement is extremely difficult to quantify.*[502]

Useful forecasts are typically based on assuming incremental changes to the practices of the past. Over extended time horizons, the practices and assumptions of the past have less value as a forecasting tool. Incremental change can be pushed aside by transformative events. As Morrison Park stated, "*what may appear to be reasonable today may at some point in the future – with the benefit of hindsight – look like a terrible mistake, or a massive stroke of luck*."[503]

The NFAT Panel had to consider this positional view. The NFAT Review took place in the midst of actions already taken, immediate decisions to be taken, and long-term uncertainties. Manitoba Hydro chose which plans to present and analyze, without input from the NFAT Panel or Interveners. Significant costs associated with Keeyask have been expended, and export contracts signed.

Commercial decisions, especially long-term decisions, are ultimately about judgment. As this report has already indicated, the economic and financial analyses have been useful tools to determine whether the Preferred Development Plan is in the best interests of Manitoba, and superior to others. However, the Panel is called on to consider a wide range of factors, including socio-economic and environmental factors, risks associated with droughts, and ratepayer risks. In the final analysis, the Panel has been asked to consider all the evidence and use its judgement to balance risk and opportunity, cost and benefit.

[502] Exhibit MPA-3, p. 16.
[503] Exhibit MPA-3, p. 16.

13.3.0 The Situation Today

Analyzing the reasonableness of Manitoba Hydro's Preferred Development Plan and alternatives from a commercial perspective involves looking at the options from the position that one is in today. Because of the circumstances and the timing of the NFAT Review, the Panel was not provided with a blank canvas.

The information before the Panel with respect to the Keeyask Project and the 750 MW transmission interconnection provides evidence of a tangible set of initiatives. The following bullets describe key aspects of the current commercial realities the Panel weighed in coming to its conclusions:

- Approximately $1.4 billion will have been spent on Keeyask by end of June 2014. If the project proceeds, these expenditures will be part of the project costs to be recovered when in-service. If the project does not proceed, these sunk costs will have to be absorbed into rates and paid by ratepayers over a much shorter period.
- Manitoba Hydro has signed the general civil contract for the Keeyask Project and authorized the general civil contractor to commence marshalling resources. Manitoba Hydro wishes to begin construction of the Keeyask project during summer 2014 in order for the first of the generating turbines to be in service in 2019.
- The Manitoba Clean Environment Commission has recommended that an environmental licence be issued for Keeyask.
- The federal environmental licensing process for the Keeyask Project is complete.
- Bipole III will be available to transmit Keeyask's power to the south.
- New export contracts have been negotiated and signed with counterparties in the United States to purchase hydro-electric power. Part of the output of Keeyask has been sold under firm export contracts. Manitoba Hydro continues to actively market Keeyask power to potential extra-provincial customers.
- A 750 MW transmission interconnection between Manitoba and Minnesota is being pursued for a projected in-service date of 2020. Minnesota Power has a 51% ownership stake in and is championing the interconnection before the Minnesota Public Utilities Commission.
- Manitoba Hydro will own the Manitoba portion of the interconnection and is taking a 49% ownership stake in the U.S. portion. Manitoba Hydro has agreed to pay 67% of the costs of the construction and operations of the new line. Manitoba

Hydro told the Panel it is seeking to divest its ownership position in the U.S. intertie and is actively negotiating to do so.

- The 750 MW transmission interconnection will enable Manitoba Hydro to deliver power under export agreements with Minnesota Power and Wisconsin Public Service, and may open up new market opportunities to sell Keeyask energy to other potential customers.
- Four First Nations communities have partnered with Manitoba Hydro to develop the Keeyask generation project. Agreements detailing the commercial arrangements among the parties have been negotiated and signed.

With respect to the Conawapa Project, Manitoba Hydro has spent $400 million to date, and wishes to spend an additional $323 million to preserve its in-service date.[504] However, despite the sunk costs, Manitoba Hydro has not made a viable business case for the Conawapa Project:

- Manitoba Hydro's own projections for DSM savings set out in the 2014 15-year Power Smart Plan supplant more than 85% of the net capacity addition that Conawapa was to provide by its in-service date.
- The Conawapa Project has yet to proceed to final design.
- No environmental assessment hearings have taken place to date.
- One export contract with Wisconsin Public Service is considered to be conditional upon Conawapa being in service by 2031. If Conawapa does not proceed, the contract would have to be amended to remove that condition. There are no guarantees such amendment negotiations would be successful, without Conawapa. Manitoba Hydro has the capacity to fulfill the power requirements called for in the contract from existing system resources, including Keeyask.
- Unless firm export contracts are negotiated for Conawapa's power, the output would have to be sold at the market prices of the day.

13.4.0 The Parameters of the Commercial Perspective

Morrison Park was of the view given that Keeyask and the 750 MW transmission interconnection are "immediate, real and actionable projects"[505] there would have to be a very persuasive case to terminate, change course, or choose another alternative.

Mr. Pelino Colaiacovo from Morrison Park put it this way:

[504] PUB/MH-1-238(c).
[505] Exhibit MPA 3-1, p. 43.

> *... our point was that given all of the money that's been spent on Keeyask, given the commercial arrangements that have been made for Keeyask, a decision to not proceed … could only occur if there was very, very strong evidence that not proceeding would be advantageous to the ratepayer and to other stakeholders. That it's not sufficient to say that financial modeling, or economic modeling suggests that All Gas is preferable to -- to going ahead with Keeyask on some narrow basis.*
>
> *That the burden of proof, frankly, lies on people who question the decision to go forward with Keeyask, to demonstrate that other options are conclusively better. If they can't demonstrate that … their other options are conclusively better, then Keeyask is the real option that -- that is before the Government of Manitoba, is before the NFAT process. There has been some new information. The cost of Keeyask has gone up. It's legitimate to recalculate numbers to ensure that … new information doesn't change all of the analysis that's happened so far to date.*[506]

The view with respect to Conawapa was quite different. Morrison Park described Conawapa as a "development opportunity", competing with other potentially superior alternatives; hence continued expenditures to develop Conawapa should have to be justified from that perspective.[507]

13.5.0 Conclusions of the Panel

It is clear to the Panel that from a commercial perspective much more is at stake with Keeyask and the 750 MW transmission line than there is with Conawapa. Cancelling the Keeyask Project now would result in material consequences for ratepayers, because Manitoba Hydro would have to recover the $1.4 billion spent on the Project to date. The arrangements with First Nations would have to be terminated and significant economic opportunities lost. Manitoba Hydro's commercial reputation may suffer. The Keeyask general civil contract would have to be renegotiated and cancellation fees may be payable.

Even changing the timing of the Keeyask development could present challenges and commercial consequences. Agreements and understandings either embedded or underlying export contracts would be affected. This could lead to future negotiation consequences. Commercial reputation concerns, reliability benefits and the possibility of future export opportunities are all tied to the 750 MW transmission interconnection.

[506] Transcript, p. 7614.
[507] Exhibit MPA-4, p. 6.

The Panel finds persuasive Morrison Park's arguments with respect to the high burden required to demonstrate other alternatives as being preferable to Keeyask and the 750 MW transmission interconnection. Keeyask and the 750 MW transmission line represent a tangible commercial opportunity. Therefore, it would be prudent to proceed with the development of Keeyask and the 750 MW transmission line.

The Panel concurs with Morrison Park's view that Conawapa is simply a development opportunity. It was therefore incumbent on Manitoba Hydro to justify why Conawapa is superior to other alternatives, either those that might exist now or be present in the future. Manitoba Hydro has not established that justification.

Conawapa's economic benefits have not been demonstrated. The risks to and burden on ratepayers are too high. Nor has Manitoba Hydro put forward a business case that supports protecting Conawapa's 2026 in-service date. Should the need for new generation resources of the magnitude of Conawapa arise in the future, consideration of Conawapa as a generating option must be justified through a full and thorough integrated resource planning process. Continuing to spend money on Conawapa would unduly advantage Conawapa in any future analysis and disadvantage other contending alternatives. The Panel strongly believes that, within a proper integrated resource planning process, there must be a level playing field with respect to the consideration of future alternatives.

14.0.0 Recommendations

In accordance with the Terms of Reference and based on the evidence presented by Manitoba Hydro, Interveners and the Independent Expert Consultants, the Panel makes the following recommendations.

Manitoba Hydro's Preferred Development Plan

The Panel was requested to assess whether the needs for Manitoba Hydro's Preferred Development Plan are thoroughly justified and sound, its timing is warranted and the factors that Manitoba Hydro relied on to prove its needs are complete, reasonable and accurate. The Terms of Reference also asked the Panel to assess whether the Preferred Development Plan is justified as superior to potential alternatives and is in the best long-term interest of the province of Manitoba. The factors that the Panel considered in reaching its conclusions and recommendations were defined by the Terms of Reference and have been discussed throughout this Report.

The Panel concludes that new generation resources will likely be required no later than 2024. However, Manitoba Hydro has not established that the Preferred Development Plan is the best alternative to meet this need, or has been justified as being in the best long-term interest of the province of Manitoba.

1. ***The Panel recommends that the Government of Manitoba not approve Manitoba Hydro's proposed Preferred Development Plan.***

However, the Panel recommends alternative actions that are better justified in terms of meeting the need for new resources and export opportunities, while addressing the risks to ratepayers and the requirement for a new approach in planning future generation resources. These actions are presented in the recommendations below.

Keeyask Project

The Panel concludes that the Keeyask Project is justified in terms of resource needs for domestic and export requirements. The Panel considered the impending domestic load requirements, and determined that even with the successful implementation of Demand Side Management programs, Manitoba requires new, long-term energy supply based on the hydropower from the Keeyask Project. The Panel was persuaded by the commercial realities of the Keeyask Project, including some $1.2 billion already spent on the Project, as well as the supporting export contracts and the socio-economic benefits from partnership agreements with First Nations.

The Panel considered the question of the in-service date and, in light of the potential impacts of Demand Side Management initiatives, whether to recommend deferral of the start of Keeyask's construction. The Panel notes the need for new capacity as a result of load demands associated with expected new pipeline construction. Agreements also have been signed with the Keeyask Cree Nations that could be adversely affected by delay. As a result, the Panel found no convincing reason to delay the in-service date of 2019 for the Keeyask Project.

2. The Panel recommends that the Government of Manitoba authorize Manitoba Hydro to proceed with the construction of the Keeyask Project to achieve a 2019 in-service date.

750 MW Transmission Interconnection Project

Manitoba Hydro has demonstrated the value of constructing the proposed 750 MW Transmission Interconnection to the United States. Financial and economic analysis indicates that this Transmission Interconnection adds value to Manitoba Hydro's future plans. The Transmission Interconnection is equally justified in terms of its contribution to system reliability, and to address export and import needs during periods of drought or system emergencies.

3. The Panel recommends that the Government of Manitoba authorize Manitoba Hydro to proceed with the 750 MW U.S. Transmission Interconnection Project for a 2020 in-service date.

Conawapa Project

The Panel concludes that Manitoba Hydro has not justified the construction of the Conawapa Project as part of the Preferred Development Plan, or any future plan. In light of the Panel's recommendations on Keeyask, the 750 MW Transmission Interconnection and expected impacts of future Demand Side Management efforts, Conawapa is not needed for either domestic or export needs. It makes no positive contribution to the financial value of the Preferred Development Plan or any alternative resource plans.

4. *The Panel recommends that the Government of Manitoba not approve the construction of the Conawapa Project and the North-South Transmission Upgrade Project*.

Given the Panel's view that the Conawapa Project has no place in future plans or strategies, there is no need to continue any activity to protect a future in-service date. Nor should existing sunk costs become a future justification for Conawapa.

5. ***The Panel recommends that the Government of Manitoba direct Manitoba Hydro to immediately cease any and all expenditures associated with the design, implementation, and future development of the Conawapa Project.***

Demand Side Management Plans and Programs

During the NFAT Review hearings, the Panel heard that Demand Side Management initiatives were "game changers." The Panel learned that Demand Side Management can have a profound impact on the need for, and timing of, new energy resources. According to its 2014 Supplementary Power Smart Plan, Manitoba Hydro can achieve 1,136 MW and 3,978 GWh of electricity savings by 2028/29. This would amount to more than 80% of the net system capacity addition from the proposed Conawapa Project.

Successful Demand Side Management initiatives are based on ambitious and achievable targets. In recent years and on an annual basis as a percentage of total demand, Manitoba Hydro's DSM savings have declined to approximately 0.4%, well below the 1.5% to 2% levels seen in many other jurisdictions. Demand Side Management savings in the order of 1.5% (including codes and standards) are achievable and economic.

Manitoba Hydro was formerly recognized as a leader in DSM but has since been surpassed by a number of jurisdictions. The Panel is concerned that the full potential for Demand Side Management will not be realized if the responsibility for Demand Side Management remains within Manitoba Hydro. Commitment, independent action and external monitoring of performance are the demonstrated and proven ingredients of successful DSM programs. Interveners encouraged the Panel to take these steps.

6. ***The Panel recommends that the Government of Manitoba divest Manitoba Hydro of its responsibilities for Demand Side Management.***

7. ***The Panel recommends that the Government of Manitoba mandate incremental annual Demand Side Management targets in the order of 1.5% of forecast domestic load (including codes and standards) over the long term.***

8. ***The Panel recommends that the Government of Manitoba establish a regulated, independent arm's-length entity that would be responsible for developing and implementing a plan to meet the mandated Demand Side Management targets.***

9. ***The Panel recommends that the Demand Side Management savings reported by the independent arm's-length entity be independently audited on an annual basis.***

10. The Panel recommends that until the independent arm's-length entity is established, Manitoba Hydro continue to address the barriers to lower income customer participation in its Demand Side Management programs.

11. The Panel recommends that until the independent arm's-length entity is established, Manitoba Hydro proceed with its fuel switching and heating fuel choice initiatives to encourage customers to use natural gas for space and water heating.

Rates and Ratepayer Impacts

Manitoba Hydro will have to invest in replacing aging infrastructure and in building Bipole III. This will result in increasing electricity rates over the coming decade. The construction of new generation and associated transmission facilities will add to and prolong these rate increases. Furthermore, construction costs will most likely grow and revenue projections may not be achieved. This gap between rising costs and unrealized revenues will be borne by ratepayers.

Given the length of time projected for these rate increases and their magnitude, especially in the early years, the Panel is concerned about intergenerational fairness and the impact on vulnerable residents and communities. Lower income consumers, particularly those in northern and aboriginal communities where energy choices are limited or non-existent, will especially feel this impact.

The Government of Manitoba will receive significant revenues from incremental capital taxes and water rental fees from the development of the Keeyask Project. It would be reasonable for the Government of Manitoba to use some or all of the incremental revenue it will realize from the Keeyask Project to mitigate adverse rate impacts on vulnerable consumers. Furthermore, Manitoba Hydro should take internal actions to moderate rate increases.

12. The Panel recommends that the Government of Manitoba direct a portion of the incremental capital taxes and water rental fees from the development of the Keeyask Project to be used to mitigate the impact of rate increases on lower income consumers, northern and aboriginal communities.

13. The Panel recommends that Manitoba Hydro relax its 75/25 debt-to-equity ratio policy to moderate its proposed electricity rate increases.

14. The Panel recommends that Manitoba Hydro implement cost containment measures to moderate its proposed electricity rate increases.

Actions in Support of a Clean Energy Future

As a result of the NFAT Review, the Panel concludes that Manitoba requires a new commitment to a clean energy future. The recommendation to proceed with the Keeyask Project and the 750 MW Transmission Interconnection augments Manitoba's hydropower foundation. It is now time to determine and build a more diversified resource portfolio. To achieve this future, Manitoba must invest in new planning tools. Integrated resource planning is a best practice in many jurisdictions. The Panel concludes that an integrated resource planning process is required to determine what supply and demand side resource mix is in the best interests of Manitobans.

15. The Panel recommends that integrated resource planning become a cornerstone of a new clean energy strategy for the Province of Manitoba.

16. The Panel recommends that the Government of Manitoba not approve the construction of any generating facilities, nor approve the beginning of the required infrastructure work for any generation facility, beyond the Keeyask Project, unless such facilities are justified through an integrated resource planning process. The integrated resource planning process must include public consultation.

APPENDIX 1 Order in Council and Terms of Reference

No. 128/2013

ORDER IN COUNCIL

Healthy Living, Seniors and Consumer Affairs
Initiating Department/Agency

BILINGUAL: ☐ Yes ☒ No

ORDER

1. The Public Utilities Board (the "PUB") is assigned the conduct of a Needs For and Alternatives To review (an "NFAT review") of Manitoba Hydro's proposed preferred development plan, which includes the Keeyask and Conawapa Generating Stations, their associated domestic alternative current ("AC") transmission facilities, and a new Canada-United States of America ("USA") transmission interconnection.
2. Arthur Mauro and Mel Lazareck are appointed as members of the PUB, for the purpose of participating in the NFAT review, with terms to expire on such date as the PUB has fully completed its assigned duties in respect of the NFAT review, unless their appointments are revoked before that date by the Lieutenant Governor in Council.
3. The NFAT review will be conducted in accordance with the attached Terms of Reference.
4. This Order is effective on the date it is made.

AUTHORITY

The Public Utilities Board Act, C.C.S.M. c. P280, states:

Membership of board
4 The board shall be composed of such number of members, not less than three, as the Lieutenant Governor in Council may determine.

Appointment of members
7 The members shall be appointed by the Lieutenant Governor in Council, and shall be paid such remunerations as determined by the Lieutenant Governor in Council.

Term of office
9 Each member shall hold office during pleasure of the Lieutenant Governor in Council.

Power of board to perform assigned duties
107 The board may perform duties assigned to it

...

(b) by order of the Lieutenant Governor in Council; or

...

and Part I, in so far as it is applicable, applies to the carrying out of duties so assigned.

BACKGROUND

1. The Government of Manitoba wishes to have the PUB conduct an NFAT review of Manitoba Hydro's proposed preferred development plan for meeting a growing provincial demand for electricity and for taking advantage of export opportunities, which includes the Keeyask and Conawapa Generating Stations, their associated AC transmission facilities, and a new Canada-USA transmission interconnection, in accordance with the attached Terms of Reference.
2. Arthur Mauro and Mel Lazareck are being appointed to provide the PUB with the necessary capacity and expertise for the NFAT review. Manitoba has requested the chair of PUB to designate these new members, under subsection 15(6) of *The Public Utilities Board Act*, as the members who will conduct the NFAT review, together with any other members of PUB as he deems necessary for purposes of the review.

ORDER

1. Hugh Grant and Richard Bell, both of Winnipeg, are appointed as members of The Public Utilities Board (the "PUB"), for the purpose of participating in The Needs For and Alternatives To review of Manitoba Hydro's proposed preferred development plan, which includes the Keeyask and Conawapa Generating Stations, their associated domestic alternative current ("AC") transmission facilities, and a new Canada-United States of America ("USA") transmission interconnection, assigned to the PUB by Order in Council 128/2013 (the "NFAT Review").
2. The terms of office of Hugh Grant and Richard Bell expire on the date the PUB has fully completed the duties assigned to the PUB in respect of the NFAT Review in accordance with Order in Council 128/2013, unless their appointments are revoked before that date by the Lieutenant Governor in Council.
3. The remuneration to be paid to members of the Board is $146.00 per meeting or $255.00 per day, plus out-of-pocket expenses.
4. The appointments of Arthur Mauro and Mel Lazareck as members of the PUB for the purposes of the NFAT Review are revoked.
5. This Order comes into effect on the date it is made.

AUTHORITY

The Public Utilities Board Act, C.C.S.M. c. P280 states:

Membership of board
4 The board shall be composed of such number of members, not less than three, as the Lieutenant Governor in Council may determine.

Appointment of members
7 The members shall be appointed by the Lieutenant Governor in Council, and shall be paid such remunerations as determined by the Lieutenant Governor in Council.

Term of office
9 Each member shall hold office during pleasure of the Lieutenant Governor in Council.

Power of board to perform assigned duties
107 The board may perform duties assigned to it

...

(b) by order of the Lieutenant Governor in Council; ....

...

and Part I, in so far as it is applicable, applies to the carrying out of duties so assigned.

BACKGROUND

1. Under clause 107(b) of *The Public Utilities Board Act*, the Lieutenant Governor in Council, by Order in Council 128/2013, assigned to the PUB the conduct of the NFAT review.
2. Arthur Mauro and Mel Lazareck were appointed as members of the PUB for the purpose of participating in the NFAT review by Order in Council 128/2013, and they have resigned.
3. Hugh Grant and Richard Bell are being appointed to the PUB to provide it with the necessary capacity and expertise for the NFAT review. Manitoba has requested the chair of the PUB to designate Hugh Grant and Richard Bell, under subsection 15(6) of *The Public Utilities Board Act*, as the members of the PUB who will conduct the NFAT review, together with any other members of PUB the chair considers necessary for purposes of the NFAT review.

Terms of Reference - Needs For and Alternatives To (NFAT) Review

NFAT review for Manitoba Hydro's proposed preferred development plan for the Keeyask and Conawapa Generating Stations, their associated domestic AC transmission facilities and a new Canada-USA transmission interconnection

INTRODUCTION

On January 13, 2011, the Government of Manitoba notified Manitoba Hydro (Hydro) of its intention to carry out a public Needs For and Alternatives To (NFAT) review and assessment of the corporation's proposed preferred development plan (Plan) for major new hydro-electric generation and Canada-USA interconnection facilities using an independent body.

On November 15, 2012 the Minister of Innovation, Energy and Mines announced that the Government of Manitoba had asked the Manitoba Public Utilities Board (PUB) to conduct the NFAT for the Keeyask and Conawapa Generating Stations and their associated transmission facilities. This document, including Appendix A, outlines the Terms of Reference for the NFAT.

THE PLAN

Hydro's Plan is intended to meet a growing provincial demand for electricity and take advantage of opportunities to export power to US customer utilities. The Plan includes the Keeyask and Conawapa Generating Stations, their associated domestic AC transmission facilities and a new Canada-USA transmission interconnection. Hydro has stated that its Plan is being brought forward now to take advantage of the proposed Canada-USA interconnection and long-term firm export sale opportunities that occur rather infrequently. Hydro's Plan is dependent upon developing a new transmission interconnection into the USA and entering into long-term firm export sales with US-based electric utilities Minnesota Power and Wisconsin Public Service.

Hydro asserts that the Plan will provide significant benefits to Manitobans. Hydro also asserts that the value proposition of its Plan is justified on a very broad basis, taking into consideration inherent uncertainties that exist over a reasonable range of future possible critical inputs into its business case, and that it is the best development option when compared to alternatives.

MANDATE

The NFAT will be conducted under the authority of section 107 of *The Public Utilities Board Act* ("The PUB Act"). PUB members designated by the Chair to conduct the NFAT under section 15(6) of The PUB Act will constitute the NFAT Panel (the "Panel"). Panel members will exercise their duty to conduct the assigned NFAT in accordance with The PUB Act and these Terms of Reference.

For greater certainty, in conducting the NFAT, the Panel members who are designated by the Chair to conduct the review:

(a) may hear evidence *in camera* for the purpose of protecting Commercially Sensitive Information as defined in Appendix A, which forms a part of these Terms of Reference;

(b) may exercise discretion over the access of any person to Commercially Sensitive Information; and

(c) shall follow the Rules of Practice and Procedure of the PUB, as amended from time to time, if not otherwise dealt with under these Terms of Reference.

At the completion of its review, the Panel will provide a report to the Minister responsible for the administration of *The Public Utilities Board Act* (currently the Minister of Healthy Living, Seniors and Consumer Affairs) no later than June 20, 2014. The report will include recommendations to the Government of Manitoba on the needs for Hydro's preferred development Plan and an overall assessment as to whether or not the Plan is in the best long-term interest of the province of Manitoba when compared to other options and alternatives.

PUBLIC PARTICIPATION

The public will be encouraged to provide input and comment on the Plan as part of the NFAT.

SCOPE OF THE NFAT REVIEW

The Panel will review and assess the needs for and alternatives to Hydro's Plan. Its assessment will be based upon the evidence submitted by Hydro, intervenors and independent expert consultants used by PUB to assist in the NFAT. The Panel's report to the Minister will address the following items:

1. An assessment as to whether the needs for Hydro's Plan are thoroughly justified, and sound, its timing is warranted, and the factors that Hydro is relying upon to prove its needs are complete, reasonable and accurate. The assessment will take the following factors into consideration:

   (a) The alignment of the Plan to Hydro's mandate, as set out in Section 2 of *The Manitoba Hydro Act*.

   (b) The alignment of the Plan to Manitoba's Clean Energy Strategy and the Principles of Sustainable Development as outlined in *The Sustainable Development Act*.

   (c) The extent to which the Plan is needed to address reliability and security requirements of Manitoba's electricity supply.

   (d) The reasonableness, thoroughness and soundness of all critical inputs and assumptions Hydro relied upon for its justification of its needs. This should include Hydro's planning load forecast and future load scenarios, its demand and supply analysis, export expectations and commitments, and demand side management and conservation forecasts.

2. An assessment as to whether the Plan is justified as superior to potential alternatives that could fulfill the need. The assessment will take the following factors into consideration:

   (a) If preferred and alternative resource and conservation evaluations are complete, accurate, thorough, reasonable and sound;

   (b) The alignment of the Plan and alternatives to Manitoba's Clean Energy Strategy, *The Climate Change and Emissions Reductions Act* and the Principles of Sustainable Development as outlined in *The Sustainable Development Act*;

   (c) The accuracy and reasonableness of the modeling of export contract sale prices, terms, conditions, scheduling provisions, export transmission costs, and the reasonableness of projected revenues;

   (d) The reasonableness of forecasted critical inputs including construction costs, opportunity export revenues, future fuel prices, electricity market price forecasts, the determinants of those values, and export volumes;

(e) The reasonableness of the scope and evaluation of risks and the benefits proposed to arise from the development and the reasonableness and the reliability of Hydro's interpretation of the most likely future outcomes as a result of climate changes, interest rate fluctuations, export market prices, domestic load fluctuations, droughts, competing technologies, fuel prices, carbon pricing, technology developments, economic conditions, Hydro's transmission positions and other relevant factors;

(f) The impact on domestic electricity rates over time with and without the Plan and with alternatives;

(g) The financial and economic risks of the Plan and export contracts and export opportunity revenues in relation to alternative development strategies;

(h) The socio-economic impacts and benefits of the Plan and alternatives to northern and aboriginal communities;

(i) The macro environmental impact of the Plan compared to alternatives;

(j) If the Plan has been justified to provide the highest level of overall socio-economic benefit to Manitobans, and is justified to be the preferable long-term electricity development option for Manitoba when compared to alternatives.

Independent Expert Consultants

The Panel shall establish a process for the thorough review of any information that the Panel determines to be relevant to the conduct of the NFAT, including relevant Commercially Sensitive Information, as defined in Appendix A, subject to these Terms of Reference.

The Panel may use one or more independent expert consultant(s) for the purpose of the NFAT. In addition to such other questions and issues as the Panel may determine they should examine, the independent expert consultant(s) shall be expected to critically examine the following:

(a) the high level forecasts of export revenues that are filed by Hydro and whether the forecasts appropriately and accurately reflect the export contracts, including Commercially Sensitive Information.

(b) the accuracy and reasonableness of Hydro's approach to producing an assessment of financial risks (including drought), the assessment of which is derived using Commercially Sensitive Information;

(c) the appropriateness and correct application of methodologies that cannot be publicly disclosed by Manitoba Hydro because they contain Commercially Sensitive Information, such as whether Hydro's approach to comparing generation sequences follows sound industry practice;

(d) whether high level summaries filed by Hydro of Net Present Values and Internal Rates of Return which are derived from Commercially Sensitive Information reflect sound assumptions and calculations; and

(e) the accuracy and soundness of Hydro's calculation of a consensus forecast of future market prices for electricity and fuels which is derived from Commercially Sensitive Information.

The PUB shall hire the independent expert consultant(s).

The independent expert consultant(s) shall provide a report(s) to be filed in evidence on the public record, which shall contain their analysis of the submissions filed by Hydro, with sufficient information to satisfy the Panel that the review was conducted with due diligence. The report(s) shall not draw conclusions as to the needs for or alternatives to the Plan, which is the role of the Panel.

The independent expert consultant(s) shall be available for cross-examination at the public hearing, and shall be available as a resource to legal counsel for registered intervenors as deemed necessary by the PUB to prepare for the cross-examination of Hydro witnesses on Commercially Sensitive Information.

The independent expert consultant(s) may also provide such advice to the Panel, and file such report(s) with the Panel *in camera*, that contain, reference, or analyse Commercially Sensitive Information in sufficient detail to satisfy the Panel. Cross-examination of the independent expert consultant(s) on such issues shall be permitted *in camera.*

The independent expert consultant(s) shall not quote in their publicly filed report(s) Commercially Sensitive Information or information that would enable a third party to reverse-engineer Commercially Sensitive Information ("reverse-engineer" means to discover, synthesize or otherwise recreate the Commercially Sensitive Information following a detailed examination). No public cross-examination of the independent expert consultant(s) shall take place with respect to Commercially Sensitive Information. The independent expert consultant(s) will be required to execute a non-disclosure agreement satisfactory to Hydro and the Panel.

NOT IN SCOPE

The following items are not in the scope of the NFAT:

- The Bipole III transmission line and converter station project;
- The Pointe Du Bois project;
- The commercial arrangements between Hydro and its aboriginal partners for the development of the proposed hydro-electric generating facilities (the impacts of these are included in the cost of the projects that are part of the Plan);
- The environmental reviews of the proposed projects that are part of the Plan, including Environmental Impact Statements (these will be conducted through individual processes by the Manitoba Clean Environment Commission ("CEC"), and where possible the impacts of the matters to be considered by the CEC are included in the costs of the projects that are part of the Plan);
- Aboriginal consultation pursuant to Section 35 of the *Constitution Act* (this is conducted as a separate Crown-Aboriginal consultation process);
- Any past Hydro development proposals or government assessments of past development proposals, including past NFATs;
- Historic environmental costs.

APPENDIX A
PROVISIONS FOR THE PROTECTION OF COMMERCIALLY SENSITIVE INFORMATION:

Transparency

The Panel is directed to conduct the NFAT in a transparent and public process. However, in conducting the NFAT, the Panel is to ensure adequate protection of any information the disclosure of which may reasonably be expected to cause undue financial loss to Manitoba Hydro ("Hydro") or any of its contractual counterparties or to harm significantly Hydro's or its contractual counterparties' or domestic customers' competitive position, including, but not limited to, any sections of the following documents containing such information (collectively, "Commercially Sensitive Information"):

(a) any and all export contracts and term sheets now or hereafter in existence for the purchase and sale of power and energy entered into between Hydro and its customers in the United States of America, including but not limited to the export contracts and term sheets commonly described as follows: Minnesota Power 250 MW Energy Exchange Agreement; Minnesota Power 250 MW Power Sale Agreement; Wisconsin Public Service 100 MW Power Sale Agreement; Wisconsin Public Service 108 MW Energy Sale Agreement; Wisconsin Public Service Term Sheet, Northern States Power 375/325 MW System Power Sale Agreement; Northern States Power 125 MW System Power Sale Agreement, and Northern States Power 350 MW Seasonal Diversity Agreement (collectively, "Export Contracts");

(b) the internal, non-public load forecast prepared by Hydro on an annual basis (collectively, "Load Forecast"); and

(c) the Hydro document dated September 24, 2010 titled "THE 2010/11 POWER RESOURCE PLAN, Report PPD #10-07" and any further existing or future power resource plans hereinafter developed by Hydro (collectively, "Power Resource Plan")

Document Filings and Evidence

In conducting the NFAT, the Panel shall be able to require the production, from Hydro, of any documents and other such evidence as the Panel determines to be relevant to the conduct of the NFAT within the scope of the Terms of Reference from the Province of Manitoba. The procedures for filings and evidence shall be as set out below:

(a) Public Filings

Any documents that do not contain Commercially Sensitive Information are to be filed on the public record. As part of its NFAT submission Hydro shall file on the public record copies of its Export Contracts, Load Forecast and Power Resource Plan, with details considered by Hydro to be Commercially Sensitive Information redacted.

To the extent that information necessary for the conduct of the NFAT cannot be made public due to the presence of Commercially Sensitive Information, Hydro shall file on the public record high level summaries and reports that incorporate the relevant information, at a level of summary and aggregation which will not disclose Commercially Sensitive Information.

Any evidence before the Panel shall be public, other than evidence with respect to Commercially Sensitive Information, which testimony shall be received in camera as further described in (b) below. To the extent that it deems practical, the Panel shall limit the scope of *in camera* proceedings so that the major issues in the NFAT review can be canvassed and discussed in public.

(b) Confidential Filings

Any documents that the Panel determines to be relevant but that contain Commercially Sensitive Information are to be filed with the Panel in confidence in unredacted form, including unredacted copies of the Export Contracts, Load Forecast and Power Resource Plan.

On an *in camera* basis, the Panel may:

(i) ireview the complete, unredacted versions of Hydro documents that contain Commercially Sensitive Information; and

(ii) permit evidence with respect to Commercially Sensitive Information.

Access to *In Camera* Evidence

Based on the *in camera* review, the Panel may choose to publish findings and conclusions about export revenues, forecast market prices and the like, to inform the public discussion and serve as inputs to further analysis and review by participants at the public hearing, or it may choose to reserve comment until the conclusion of the hearing.

The documents filed and evidence adduced *in camera* shall not be made public, other than through the high-level summaries as described above, and shall only be disclosed to or shared with the following persons, on the terms and conditions as noted below:

1. Members of the Panel, the Board's Executive Director and Board staff may review Commercially Sensitive Information and participate in the *in camera* process for the purpose of carrying out their specific duties with respect to the NFAT without having to sign an undertaking or a non-disclosure agreement.

2. Legal counsel of record of the Board and counsel for registered interveners may review Commercially Sensitive Information and participate in the *in camera* process upon execution of an undertaking to the Panel in a form agreeable to the Panel and Hydro.

3. Any independent consultant(s) appointed by the Panel and any non-staff Panel advisors with a need to know, as determined by the Chair, may review Commercially Sensitive Information and participate in the *in camera* process upon execution of a non-disclosure agreement in a form agreeable to the Panel and Hydro.

Subject to the following dispute resolution provision, the Panel will not publish Commercially Sensitive Information in Orders or other public documents or include information that would enable a third party to reverse engineer Commercially Sensitive Information. The Panel will establish procedures to protect the documents and evidence from inadvertent disclosure and will instruct each individual who receives access to do the same. If the Panel so chooses, it may solicit Hydro's comments on particular documents that are in the process of being prepared in the interests of avoiding inadvertent disclosures.

Dispute Resolution Regarding Commercially Sensitive Information

If, during the in camera review, the Panel identifies any Commercially Sensitive Information, other than third party proprietary price forecasts, which the Panel considers would be beneficial to place on the public record at the NFAT, the Panel may refer those matters in dispute to a neutral third party to be agreed upon between the Panel and Hydro. The third party will receive written submissions and make a decision thereon, on an expedited basis, which decision will be given effect to in the proceedings before the Panel. In arriving at any such decision, the neutral third party shall specifically take into account the general undesirability of making disclosure of any Commercially Sensitive Information that may have been furnished to Hydro by third parties, in reliance upon contractual commitments by Hydro to maintain confidentiality, and the importance of maintaining such confidences.

APPENDIX 2 NFAT Panel Member Biographies

Régis Gosselin, B ès Arts, MBA, CGA, Chair

Appointed to Public Utilities Board April 2012

Former Director of Corporate Services for the Canadian Grain Commission, this member has worked for the Fédération des Caisses Populaires and also Entreprise Saint-Boniface, a community economic development organization. He is a past Chair of the Société d'assurances dépôts des caisses populaires du Manitoba, Caisse populaire de Saint-Boniface and Centre Youville.

Richard Bel, B.A., M.A. , M.Sc.

Appointed to Public Utilities Board December 2013

Co-owner and managing partner of the Fort Garry Hotel since 1994, this member is also the current Chair of the Forks North Portage Partnership. In addition to being a former owner of various Winnipeg restaurants, he was an Assistant Professor of Economics at Kobe University (Kobe, Japan) and the University of Manitoba. He has been appointed a member to examine Manitoba Hydro's Preferred Development Plan.

Hugh Grant, Ph.D. (Economics)

Appointed to Public Utilities Board December 2013

Professor of Economics at the University of Winnipeg, he teaches on indigenous economic development in the University's Masters of Development Practice program. He also currently serves as the President of the University of Winnipeg Faculty Association. He obtained his Ph.D. in Economics from the University of Toronto. In addition to his academic research on labour economics, health economics and Canadian economic development, he has engaged in policy work with a range of organizations including Industry Canada, the Law Commission of Canada, Manitoba Family Services and Consumer Affairs, the Public Interest Law Centre and the Canadian Royal Commission on Aboriginal Peoples. He also has previous experience as a consultant to aboriginal associations on comprehensive land claims. He was appointed a member to review Manitoba Hydro's Preferred Development Plan.

Marilyn Kapitany, BSc. Honours, MSc.

Appointed to Public Utilities Board July 2012

A former senior Federal Government executive responsible for Western Economic Diversification Canada. Former Regional Director General of Indian and Northern Affairs Canada (Manitoba) as well as Director of Industry Services at the Canadian Grain Commission.

Past Chair of the National Board of YM-YWCA of Canada and appointed as Canada's International Representative in 2014. Marilyn is a member of the Riverview Health Centre Board. Former Chair of the YM-YWCA of Winnipeg Board, and past member of Assiniboine Park Conservancy Board and Association of Professional Executives.

Larry Soldier

Appointed to Public Utilities Board July 2012

Former Chief of the Swan Lake First Nation.

Serves on the Board of Directors for Youville Centre. Former Vice-Chairman of the Dakota Ojibway Tribal Council and Dakota Ojibway Child and Family Services. Served on numerous committees which includes former Chairperson of the Small Business Management and Dev. Committee of Keewatin Community College and past member of Chiefs Committee on Treaties and Self-Determination. Former Chairman of the Regional Advisory Board, Alcoholism Foundation of Manitoba. Served as City Councillor for the City of Thompson. Proprietor since 2006.

APPENDIX 3 Chronology of Events

January 13, 2011 – The Government of Manitoba notifies the Manitoba Hydro-Electric Board (Manitoba Hydro) of its intention to carry out a public Needs For and Alternatives To (NFAT) Review and assessment of the Manitoba Hydro's proposed Preferred Development Plan (PDP) for major new hydro-electric generation and Canada-USA interconnection facilities using an independent body.

November 16, 2012 – The Minister of Innovation, Energy and Mines announces that the Government of Manitoba has asked the Manitoba Public Utilities Board (PUB) to conduct the NFAT Review for the Keeyask and Conawapa Generating Stations and their associated transmission facilities.

April 17, 2013 – By Order in Council 128/2013, the Government of Manitoba assigns to the PUB the conduct of a Needs For and Alternatives To (NFAT) Review Manitoba Hydro's Preferred Development Plan, which includes constructing the Keeyask and Conawapa Generating Stations, their associated domestic alternating current transmission facilities and a new Canada-United States transmission interconnection. The NFAT Review is to be conducted in accordance with the Terms of Reference for attached to the Order.

April 25, 2013 – The Government of Manitoba issues a news release respecting the NFAT Review.

May 16, 2013 – The NFAT Panel of the Public Utilities Board holds first Pre-Hearing Conference to determine Interveners for NFAT Review.

June 11, 2013 – The Panel issues Order 67/13 granting Intervener Status with respect to the NFAT Review to the following five applicants:

- Consumers' Association of Canada (Manitoba) Inc. (CAC);
- Green Action Centre (GAC);
- Manitoba Industrial Power Users Group (MIPUG);
- Manitoba Keewatinowi Okimakanak Inc. (MKO); and
- Manitoba Metis Federation (MMF).

The following four applicants were denied Intervener Status:

- Peguis First Nation;

- The Pimicikamak at Cross Lake;
- Kaweechiwasik Inninuwuk; and
- Manitoba Public Interest Research Group.

July 15, 17, 2013 – Manitoba Hydro holds first NFAT Technical Conference.

August 9, 2013 – The Panel issues Order 91/13 dismissing applications by Pimicikamak and the Manitoba Public Interest Research Group to review and vary Order 67/13, which dismissed applications by the respective applicants to obtain Intervener status in NFAT Review.

August 9, 2013 – The Panel issues Order 92/13, which addresses a number of procedural issues arising out of Order 67/13. The Order provides preliminary approval of Interveners' consultants and expert witnesses, and draft budgets.

This order also defines the terms ''macro environmental" and "'socio-economic" for the purposes of the Review.

> Macro environmental impact assessment is defined as*: A critical analysis of the macro environmental impacts and benefits of Manitoba Hydro's Preferred Development Plan and alternative Plans. Specifically this refers to the collective macro-economic consequences of changes to air, and, water, flora and fauna, including the potential significance of these changes, their equitable distribution within and between present and future generations.*
>
> Socio-economic impact and benefits is defined as*: A critical analysis of the socio-economic impacts and benefits of Manitoba Hydro's Preferred Development Plan and alternative Plans. Specifically, a high level summary of potential effects to people in Manitoba, especially Northern and Aboriginal communities, including such things as employment, training and business opportunities; infrastructure and services; personal family and community life; and resource use.*

August 16, 2013 – Manitoba Hydro files its NFAT Business Case Submission with the PUB.

August 2013 – The Panel engages Independent Expert Consultants to assist the Panel in the NFAT Review.

September 4, 2013 – The Panel holds second Pre-Hearing Conference.

September 5-6, 2013 – Manitoba Hydro holds second Technical Conference.

September 2013 – The Scopes of Work for the Independent Expert Consultants are established.

September 30, 2013 – The Panel holds a "motion day" hearing to deal with a motion made by Manitoba Hydro with respect to First Round Information Requests and issues raised by counsel for the independent expert consultants.

October 4, 2013 – The Panel issues procedural Order 119/13 in respect of matters raised at the September 30, 2013 "motion day" hearing. The Order establishes a process to deal with Information Requests directed to Manitoba Hydro and issues raised by the Independent Expert Consultants.

October 21, 2013 – The Panel issues Order 126/13, an Erratum order in respect of Order 119/13.

October 21, 2013 – The Panel issues Order 127/13, which relates to procedural matters arising from the September 4, 2013 Pre-Hearing Conference, including establishing a communications protocol for the Independent Expert Consultants.

December 18, 2013 – By Order in Council 472/2013, the Government of Manitoba appoints Dr. Hugh Grant and Mr. Richard Bel to the Public Utilities Board for the purpose of participating in the NFAT Review.

February 27, 2014 – The Panel holds a Presenters day in Winnipeg to hear a number of organizations and individuals who wished to make their views on the Preferred Development Plan known to the Panel.

March 3, 2014 – The oral evidentiary phase of the NFAT Review hearings begins.

March 4, 2014 – The Panel issues Order 22/14, which partially grants Manitoba Hydro's motion to strike portions of the evidence of Whitfield Russell Associates provided on behalf of the Manitoba Métis Federation (MMF) on that grounds that the evidence is outside scope of the Terms of Reference for the NFAT Review.

April 9, 2014 – The Panel issues Order 35/14 granting the MMF's motion to review and vary Order 22/14 and accepting the revised redactions proposed by MMF to the evidence of Whitfield Russell Associates.

May 13, 2014 – The evidentiary portion of the NFAT Review hearings concludes.

May 14, 2014 - The Panel holds a Presenters day in Thompson, Manitoba to hear from a number of organizations and individuals who wished to make their views on the Preferred Development Plan known to the Panel.

May 20-26, 2014 – The Panel hears closing submissions from Interveners and Manitoba Hydro.

June 20, 2014 – The NFAT Review report is submitted to the Minister responsible for the administration of *The Public Utilities Board Act,* as required by the Terms of Reference*.*

APPENDIX 4 Independent Expert Consultant Scope of Work

Independent Expert Consultant	Scope of Work (High-Level Description)
Elenchus Research Associates Inc.	Load forecasting; Demand side management (DSM); energy efficiency
La Capra Associates, Inc.	Power resource planning, economic evaluation, business case and risk analysis, transmission economics, export contracts, financial modelling
EnerNex (as a subcontractor to La Capra Associates, Inc.)	Wind matters
Knight Piésold Ltd.	Construction management, capital costs
MNP LLP	Macro-environmental issues
MPA Morrison Park Advisors Inc.	Commercial evaluation of Preferred Development Plan
Potomac Economics, Inc.	Midcontinent Independent System Operator (MISO); export markets, prices and revenues
Power Engineers, Inc.	Transmission line construction and management
TyPlan Consulting Ltd.	Socio-economic impacts and benefits

SCOPES OF WORK: The detailed Scopes of Work for the Independent Expert Consultants can be found on the PUB website.

http://www.pub.gov.mb.ca/nfat/index.html

REPORTS: The reports prepared by the Independent Expert Consultants can be found on the PUB website.

http://www.pub.gov.mb.ca/nfat/index.html

APPENDIX 5 Interveners

By Order 67/13, the Public Utilities Board granted Intervener status to the Intervener Applicants named below. Each Intervener was approved with respect to the issues listed for the respective Intervener.

Consumers' Association of Canada (Manitoba) Inc. (CAC)

- Reliability of Manitoba Hydro's forecast relating to load, capital costs, export revenues, and enhanced transmission capacity
- Risk Assessments as detailed in CAC's written Application for Intervener Status
- Analytical consideration of alternatives to Manitoba Hydro's Preferred Development Plan (PDP) including risk diversification, energy efficiency and non-hydroelectric options such as natural gas and wind
- Sustainability of Manitoba Hydro's PDP and comparison to alternatives
- Rate impacts on Manitoba Hydro's domestic ratepayers – including those on fixed and low incomes
- Macro-Environmental Impacts of the PDP and alternatives
- Socio-Economic impacts and benefits of Manitoba Hydro's PDP – compared to alternatives – in regard to northern and aboriginal communities as well as all Manitobans

Green Action Centre (GAC)

- Forecasts and risks associated with domestic load, export commitments and export pricing
- Use of Demand Side Management and alternative energy initiatives
- Marginal costs of Manitoba Hydro's Preferred Development Plan ("PDP") and alternatives including DSM
- Alternatives to Manitoba Hydro's PDP together with integration into a diversified portfolio and consideration of such contributions to Risk Management.

Manitoba Industrial Power Users Group (MIPUG)

- Impact on domestic rates, including long term impacts
- Risks to domestic customers through Manitoba Hydro's investment in subsidiaries, export ventures and new Programs

- Alternatives to Manitoba Hydro's Preferred Development Plan including demand side management programs
- Risks including long-term financial and economic risks and the financial liability of Manitoba Hydro

Manitoba Keewatinowi Okimakanak Inc. (MKO)

- The socio-economic impacts and benefits of Manitoba Hydro's Preferred Development Plan ("PDP") and alternatives in respect of the MKO First Nations
- The impact of domestic electricity rates over time, with and without the PDP and with alternatives

Manitoba Métis Federation (MMF)

- The impact on domestic rates
- Financial and economic risks
- Socio-economic impacts and benefits of Manitoba Hydro's Preferred Development Plan ("PDP") and alternatives to Northern and Aboriginal communities
- Macro-environmental Impacts of the PDP compared to alternatives
- Whether the PDP is the highest level of overall socio-economic benefit to Manitoba

REPORTS: The reports prepared by Intervener experts can be found on the PUB website.

http://www.pub.gov.mb.ca/nfat/index.html

APPENDIX 6 Summary of Intervener Closing Submissions

For the completeness of the record, this Appendix provides a summary of the closing submissions of each Intervener. The Panel regrets any errors or omissions that may have occurred in summarizing Intervener submissions. The full submissions can be accessed at http://www.pub.gov.mb.ca/nfat.

Consumers' Association of Canada (Manitoba) Inc. (CAC)

The Consumers' Association of Canada (Manitoba) Inc. (CAC) submitted that the Preferred Development Plan has suffered painful evidentiary blows, and that the most recent economics make it untenable. In CAC's view, the business case was premised on certain expected capital costs, a robust U.S. economy, and carbon prices developing in the United States. However, export price projections are now significantly lower than they used to be, while the capital cost of the Preferred Development Plan has gone up. CAC called the availability of shale gas a "game changer." In addition, CAC stated that carbon pricing is still uncertain, the U.S. economy has experienced a paradigm shift, grid parity is a risk during the planning horizon, and both wind and solar energy have become more feasible. CAC submitted that Manitoba Hydro is a price taker in the U.S., and thus is exposed to the cost of alternative technologies and market rates, being unable to obtain pricing based on its own cost structure. According to CAC, this confluence of factors eviscerated the "decade of returns" previously envisioned by Manitoba Hydro.

CAC was critical of the presence of sunk costs in Manitoba Hydro's analyses, which make non-hydro alternatives less competitive than they would otherwise be. CAC further stated that the inclusion of Bipole III costs and the Gillam expansion, both of which form part of Manitoba Hydro's northern strategy, further harm such alternative plans.

CAC further noted that the changes to a number of factors in Manitoba Hydro's analysis, including changed capital costs and economics, the revelation that the most economically competitive plan, which would have had a 250 MW interconnection, was not viable, and the exclusion of certain updates from new analyses all led to "resource planning on the fly."

CAC concluded that Manitoba Hydro's analysis did not constitute good integrated resource planning. According to CAC, Manitoba Hydro's plan suffers from an overstatement of demand, and the failure to include demand side management (DSM) as an integral element of resource planning constitutes a fatal flaw in Manitoba Hydro's business case. CAC noted that the rate of electricity demand growth in North America has been decreasing over the past decade and that there is the possibility of a zero-growth future. All of this creates risk when investing in a "merchant plant", i.e., a plant designed primarily for export.

CAC recommended that DSM Level 2 savings should be anticipated to extend beyond 2018, and that multi-year DSM targets should be imposed on Manitoba Hydro and reviewed by the Public Utilities Board on an annual basis.

CAC considered the impact of the Preferred Development Plan on ratepayers to be unacceptable, and states that electricity is an essential service and basic necessity for lower income consumers, who would have to pay an increasingly large percentage of their budget for electricity under the proposed rate increases. This issue is amplified for northern and aboriginal ratepayers who pay disproportionally large hydro bills. CAC stated that lower income customers face significant barriers in accessing DSM programs that could improve affordability, which means such programs should be straightforward for lower income ratepayers and, ideally, not involve a cost to the ratepayers. CAC recommended that a stakeholder consultation process be initiated to remove barriers, and Manitoba Hydro report on the issue in six months to one year.

CAC submitted that the Preferred Development Plan was not justified, and that no further funds should be spent on protecting a Conawapa in-service date without express authority of the Public Utilities Board following an updated consideration of the business case based on modern integrated resource practice. Otherwise, CAC submitted there were three feasible options:

1. Proceed with economic DSM; no build until domestic need date;

2. Proceed with economic DSM and have Manitoba Hydro return with updated information related to integrated resource planning, export opportunities, and a regional cumulative effects assessment; or

3. Proceed with economic DSM, Keeyask, and the 750 MW intertie with conditions.

Despite the fact that two of its expert witnesses spoke in favour of developing Keeyask, CAC submitted that the best option would be Option 2, which should be followed by a further review process. However, if the Panel approves Option 3, CAC recommended a phased approach, in which Manitoba Hydro, until 2018, would be required to expand its DSM program, provide annual cost reporting, and provide a rate impact mitigation strategy. In addition, CAC would like to see the regional cumulative effects assessment reviewed by the Clean Environment Commission. In Phase II, after the construction of Keeyask, CAC would like to see Manitoba Hydro file an updated business case for any further generation based on a comprehensive integrated resource planning framework.

If Keeyask proceeds, CAC further suggested the implementation of a Green Energy Benefit to compensate ratepayers for the disproportionate share of risk borne by them. This benefit could either be directed to persons of modest means or made available to a broader spectrum of ratepayers.

Green Action Centre (GAC)

The Green Action Centre (GAC) supported the target set out in *TomorrowNow: Manitoba's Green Plan* to make Manitoba one of the most sustainable places to live on earth. GAC noted that rate impacts are just one consideration among many others for the NFAT Panel to take into account. Specifically, GAC submitted that the NFAT Panel ought to consider broader societal issues such as jobs and economic benefits, revenue flows to the Province from water rentals, taxes and the debt guarantee fee, and the impact of the Preferred Development Plan on greenhouse gas emissions both within and outside Manitoba.

GAC submitted that Manitoba Hydro's evidence was deficient in failing to treat Demand Side Management (DSM) as an alternative to new generation and wind as an alternative to northern dams. GAC stated that the evidence of La Capra Associates, Mr. Chernick, Mr. Dunsky and Mr. Harper suggests that Manitoba Hydro can offset all currently projected load growth with DSM measures. According to GAC, DSM reduces line losses and emissions, creates jobs, and has proved to be a dependable resource for other utilities.

Of particular concern to GAC was fuel choice. GAC stated that Manitoba Hydro has insufficiently addressed this matter. GAC pointed to what it calls market failures with respect to the installation of electric space and water heat for the convenience of builders and contractors rather than homeowners. In GAC's view, the issue of fuel choice extends to the projected new pipeline load. GAC stated that if the pipeline companies had to pay export market rates for electricity, there would be little benefit for them in choosing electric pumping stations.

GAC is critical of Manitoba Hydro's DSM Level 2 program, stating that other utilities manage to achieve sustained savings of 1.3% per year. In contrast, Manitoba Hydro's proposed program ramps up to 2.1% in the short term, but then decreases gradually to only 0.2% by 2028/29, even including conservation rates and customer generation, neither of which are usually counted in DSM savings. According to GAC, Manitoba

Hydro's 41% probability of new supply being required in 2023 could be significantly reduced with increased DSM and fuel switching. GAC further stated that additional load will not appear overnight, and if growth turns out higher than expected, Manitoba Hydro could add wind resources within two years at a lower cost and at less risk than Keeyask.

According to GAC, the levelized cost of energy (LCOE) of wind would be lower than the LCOE for Keeyask and Conawapa. GAC suggested that for purposes of estimating the capital cost of wind, Manitoba Hydro should use the U.S. Department of Energy's market report as a starting point and determine cost differences specifically between average costs and those expected in Manitoba. Manitoba Hydro should further consult with wind developers as to expected project life and take into account technological and costing trends. GAC further suggested developing several wind sites to a preliminary level so that in the case of supply shortfalls, wind projects could be brought into commercial operation in approximately two years.

GAC recommended that Manitoba Hydro should pursue aggressive DSM, including conservation rates and fuel switching, but acknowledged that vulnerable persons with a high energy burden will require bill mitigation through targeted retrofit and efficiency programs, special rate design and, in some, cases, discounted bills. On the issue of rate design, GAC stated that stakeholder consultation could provide a valuable benefit.

GAC supported the approval of Keeyask and 750 MW intertie, noting that the intertie is the most important asset in Manitoba Hydro's plan and provides economic imports as well as firming capability for wind and solar power. GAC submitted that no case has been made to approve Conawapa, and argued forcefully against new gas generation, especially for baseload. GAC stated that while using gas for space and water heating leads to greenhouse gas reductions, the opposite is true if gas is used to generate electricity.

GAC further submitted that Manitoba Hydro should implement integrated resource planning, including an evaluation of wind integrated and the identification of trigger events to revive Conawapa.

Manitoba Industrial Power Users Group (MIPUG)

The Manitoba Industrial Power Users Group (MIPUG) noted that under Manitoba Hydro's initial numbers, industry could pay an additional $400 million in rates over the next 20 years compared to viable alternatives. MIPUG expressed frustration that the NFAT Review was made difficult by four factors, namely (1) the presence of over $1.4 billion of sunk costs which would have to be written off with all non-Keeyask plans, (2) the fact that the 250 MW transmission line option has effectively been dropped, (3) the absence of a broad resource planning review before the current project-specific review, and (4) the high rate impacts ratepayers are already bearing for Bipole III, a project without associated revenue benefits.

In MIPUG's view, plans that are focused on meeting domestic need rather than export opportunities remain credible, since with economic DSM the required in-service date for new generation could be pushed back to at least 2024. To that extent, MIPUG suggested a possible scenario in which a gas unit would be built before Keeyask, pushing Keeyask back to 2031 or later. MIPUG noted that all plans must consider that electric load forecasts may be reasonable over the short term, but significantly differ from the future reality over the medium to long term. It further observed that Manitoba Hydro's goal of a maximum 10% error over 10 years equates to approximately 3,000 GWh, which is similar to the output from Keeyask.

Nonetheless, MIPUG submitted that a K19/750 MW plan had significant benefits, among them cross-border transmission, the value of which had not been fully captured in the Manitoba Hydro's analysis. It suggested that K19/750 MW could in fact be the preferred plan, but only if mitigation measures were instituted. Specifically, MIPUG suggested that Manitoba Hydro should relax its financial standards such that it does not have to return to 75%/25% debt-to-equity and a 1.20 interest coverage ratio within the next 20 years. MIPUG pointed to several rate-design alternatives filed by Manitoba Hydro that would result in decreased retained earnings at the end of 20 years which, in MIPUG's view, would keep rate increases similar to the increases expected for an all-gas alternative, but would still allow Manitoba Hydro to absorb drought risk, which MIPUG noted does not exceed $3.568 billion even under a high-export price scenario. MIPUG also suggests that transfers to the provincial government through capital taxes and water rental fees should be reduced during the period in which customers face upward pressure on rates. MIPUG stated that under the current scenario, the risk for the K19/750 MW plan is borne by ratepayers, while the Province of Manitoba would reap significant benefits without any negative downside risk.

MIPUG was supportive of DSM Level 2if it is realistic and can be achieved without adverse rate impacts. In MIPUG's view, this would involve a focus on the Program Cost Administrator Test (PACT) and the Rate Impact Measure (RIM) test, and less reliance on the Total Resource Cost (TRC) test currently applied by Manitoba Hydro. The DSM program should also provide sufficient support for self-generation by industrial customers, as well as an encouragement of curtailable load to derive capacity benefits. MIPUG specifically took issue with Manitoba Hydro's cap on the Curtailable Service Program (CSP) and its closure to new entrants.

While MIPUG did not support a plan that involves Conawapa at this time, noting that it brings no benefits and substantial risks, MIPUG was supportive of "minimal" spending of $100-$150 million to protect a 2026 or 2031 Conawapa in-service date. MIPUG submitted that if Manitoba Hydro were to consider that the proposed U.S. 750 MW interconnection can be expanded to 1,100 MW in the future, the value of Conawapa energy could increase. Furthermore, Conawapa could provide a basis for Manitoba Hydro to be able to sell its stake in the 750 MW interconnection in the future.

MIPUG did not support a revision to Manitoba Hydro's import criteria without a detailed and thorough consideration of the risks from such a revision.

MMF

The Manitoba Métis Federation (MMF) submitted that while Manitoba Hydro consulted with Aboriginal communities and shared benefits with the Keeyask Cree Nations, Manitoba Hydro did not apply its proactive approach to partnership to the Métis community. For example, Manitoba Hydro's advisory group on employment only contained Aboriginal representation from the Keeyask Cree Nations despite Métis constituting a significant part of Manitoba Hydro's workforce. The MMF also criticized the fact that there are no adverse effects agreements with respect to transmission impacts, despite over $200 million having been paid for adverse transmission impacts associated with Wuskwatim. In that context, the MMF stated that the assumption in Manitoba Hydro's Multiple-Account Benefits-Cost Analysis that residual impacts would be minimized through mitigation and compensation does not apply to the Métis community, since no compensation was provided to the Métis and mitigation of transmission impacts was not included. The MMF also stated that the cost of Section 35 consultation should have been included in costs, even if such consultation was outside the scope of the NFAT Terms of Reference.

With respect to environmental issues, the MMF cautioned that findings from the Clean Environment Commission and the Canadian Environmental Assessment Agency apply only to Keeyask, but not to Conawapa or other alternatives, and that a regional cumulative effects assessment had not yet been provided. The MMF further stated that information provided by Manitoba Hydro in the course of the NFAT Review did not deal with the collective impact of the Preferred Development Plan.

With respect to rate impacts, the MMF submitted that Manitoba Hydro should diversify its DSM and fuel switching strategy and expand education programs targeted to northern and aboriginal communities. For example, in the MMF's view, not enough attention was paid to fuel switching to biomass, despite woodstoves being a viable source of heat for many aboriginal communities.

With respect to financial and economic risk, the MMF stated that the 78-year study period was too long and tends to favour high-risk hydro-centric plans requiring a large capital investment. The MMF submitted that lower rates in the long term at the cost of significant near-term rate increases would result in intergenerational inequity. In the MMF's view, the Preferred Development Plan was further dependent on the magnitude of future exports and future export prices, the latter of which have been declining over successive forecasts since 2009. The MMF also submitted that if the cost of Bipole III were to be added to the Preferred Development Plan, it would increase the in-service cost of Keeyask from approximately 10¢/kWh to 13¢/kWh, which would not recover the cost of Bipole III and Keeyask until the mid-2040s. The MMF further submitted that treating Bipole III as a sunk cost to be included in all development plans had the effect of biasing the analysis in favour of the Preferred Development Plan.

On the issue of transmission risk, the MMF stated that the deterministic standard applied by Manitoba Hydro to transmission risk could have been met by strengthening interconnections to the United States, and that any reliability benefits from Bipole III would drop with the addition of Keeyask and disappear completely with the addition of Conawapa. The MMF concluded that Manitoba Hydro is placing "too many eggs in one basket" by relying on the northern generation corridor and that greater emphasis should be placed on the need to improve import capability.

The MMF suggested that La Capra's No New Generation "Plan 17" remains an economic option, and that a U.S. 500 kV transmission line without further hydroelectric capacity would improve reliability and increase both the ability to export and import power. The MMF moreover argued that further consideration should be given to this plan, including pursuing additional diversity exchange agreements.

The MMF also submitted that wind could form part of an optimized plan to delay new hydro generation until 2030, which would delay the construction of any new hydro until after the completion of a regional cumulative effects assessment. In the MMF's view, wind as a resource not only provides for greater flexibility, but would allow communities to participate in small-scale renewable projects.

As a procedural recommendation, the MMF submitted that the NFAT Panel should recommend an amendment to existing legislation requiring Manitoba Hydro to undergo an NFAT before any major capital expenditure as a precondition to recovering its costs in rates.

Manitoba Keewatinowi Okimakanak Inc. (MKO)

Manitoba Keewatinowi Okimakanak Inc. (MKO) intervened on issues relating to the socio-economic impact of the Preferred Development Plan and alternatives on the MKO First Nations and the impact of domestic electricity rates over time. MKO's primary focus was the impact of rate increases on citizens of the MKO First Nations. MKO identified its member citizens as being Residential ratepayers and the First Nation governments to be General Service ratepayers, including the four communities receiving diesel-generated power.

In MKO's view, the planned rate increases tied to the Preferred Development Plan will have a disproportionate impact on the Residential and General Service ratepayers in the First Nations areas, as most citizens there are lower income customers and spend a higher proportion of their budget on electricity. Furthermore, for many, income to pay for electricity bills comes from the federal government. MKO noted that Aboriginal Affairs and Northern Development Canada (AANDC) funds electrical costs based on a cost reference manual and not based on actual costs. Of particular concern to MKO is the statistic that currently 86.3% of all Residential and General Service accounts in the MKO First Nations are in arrears, suggesting a significant existing issue with the ability of the MKO First Nations customers to pay the current electric rates. MKO cited several presenters who indicated in a presentation to the NFAT Panel that Manitoba Hydro will not deliver Power Smart programs to customers in arrears.

The MKO suggested that measures are required to mitigate the impact of rate increases on northern First Nations, including the establishment of objectives to make DSM programs available all First Nations customers. In that regard, the MKO sought a recommendation from the NFAT Panel that Manitoba Hydro be directed to regularly measure and report on the actual availability and penetration of Manitoba Hydro's lower income DSM programs to First Nation customers. No rate increase greater than the rate of inflation should apply to ratepayers in the MKO First Nations unless and until Manitoba Hydro or an independent DSM entity makes DSM and Power Smart universally accessible to all customers in the MKO First Nations, and universal penetration of these programs in the MKO First Nations can be confirmed.

The MKO also argued for several rate mitigation measures for MKO First Nations customers, submitting that while they currently pay the same level of rates as other customers, they do not share in the same level of provincial benefits as other ratepayers, with many of them having their income level determined by the Government of Canada. Furthermore, many of them could be classified as "Hydro Affected

Customers" since they reside in an area with significant existing hydro projects. MKO suggested six specific rate mitigation measures:

1. The removal of environmental mitigation costs from rates paid by Hydro Affected Customers, since these customers are directly affected by the environmental effects of the project;

2. An allocation of a greater share of net export revenue based on the recognition that a fundamental change in understanding has occurred since the time First Nations first entered into treaties and signed mitigation agreements, and the recognition that the generating stations located in the area are being used to create export revenue;

3. The creation of an "equivalent to gas" rate for the heat portion of the electricity bill, similarly to what is currently being provided to Manitoba Hydro employees working in the area, who pay a rate equivalent to the lowest average heating cost in Winnipeg. The MKO noted that natural gas service is not available to any of the MKO First Nations;

4. An allocation of net export revenue to reduce the cost of service in the four remaining Diesel communities that are not connected to the electric grid;

5. A removal of water rental fees from the bills of Hydro Affected Customers. In MKO's view, these represent an indirect provincial taxation from which First Nations should be exempt; and

6. The creation of a First Nation customer class, of which Hydro Affected Customers could be a sub-class.

Lastly, MKO noted that there is no reason why First Nations that have been affected by northern dams before the current benefit sharing model with the KCN was developed should not receive a portion of the benefits from past or current projects as well.

APPENDIX 7 Summary of Public Presentations

For the completeness of the record, this Appendix provides a summary public Presentations received by the Panel. The Panel regrets any errors or omissions that may have occurred in summarizing these Presentations. The full Presentations can be accessed at http://www.pub.gov.mb.ca/nfat.

Winnipeg Harvest

Donald Benham spoke to Winnipeg Harvest's perception on how Manitoba Hydro's plans are likely to affect lower income Manitobans. Mr. Benham noted Manitoba Hydro's current policy does not distinguish rates on ability to pay. It was also noted that the policy of cross-subsidization is already well-established in relation to urban-rural ratepayers. Based on this policy, rates are set to increase uniformly and lower income ratepayers are not able to absorb the increases. This results in more people taking money out of food budgets and greater reliance on food assistance from Winnipeg Harvest and its associated agencies.

Winnipeg Harvest then issued a proposal. The proposal recommends that the PUB raises rates by no more than one percent per year for lower income ratepayers. Ratepayers would apply to be designated as lower income ratepayers. Income levels for determining eligibility would be based on the 2012 Acceptable Living Level report. The Acceptable Living report produced by Winnipeg Harvest and the Social Planning Council of Winnipeg measures how much money is needed to buy basic necessities in Winnipeg.

It is also the position of Winnipeg Harvest that flooding and dams negatively affect the fishing, hunting and gathering of indigenous peoples in rural communities and their ability to provide their own food.

Bipole III Coalition

Dr. Garland Laliberte's presentation questioned Manitoba Hydro's load forecast upon which its preferred development plan relies. He stated that recent trends in both energy and peak load reveal a flattening of growth in Manitoba load that began in 2005/06, well before the 2008 recession. He further stated that this points to a similar flattening of demand in the region into which Manitoba seeks to export electricity and beyond. He proposed replacing Manitoba Hydro's load forecast with a moderate forecast that is more reflective of the trends outlined. The risk of proceeding with the preferred development is rates that escalate even more rapidly than projected. He raised the possibility of Manitoba Hydro becoming insolvent. He advocated a pause in the implementation of any plan, a pause which would allow the utility to take advantage of the extended timeline that a more moderate load forecast would permit. Further, domestic load should be continually monitored, and there should be further reviews based on more credible load forecasts.

Manitoba Industrial Power Users Group

Mr. Bill Turner stated that the recent change in available lower-cost natural-gas-produced power in the U.S. is making it more difficult for some major Manitoba companies to be competitive in the export of finished goods. Given the relative importance of electricity to industry, both the actual price and the predictability of electrical costs are extremely important. The Manitoba Industrial Power Users Group asked the Board to take a long-term view and allow them to retain a competitive position in Manitoba and in North America. The Manitoba Industrial Power Users Group indicated the importance of its associated businesses to the Manitoba economy.

Mr. Turner stated that although the Manitoba Industrial Power Users Group is supportive of continuing hydro development, it has concerns with the current preferred development plan. Mr. Turner indicated that industrial users are eager participants in Demand Side Managements programs. The Manitoba Industrial Power Users Group supports expansion and exports to other markets by Manitoba Hydro, but not at the sake of loss of domestic power loads.

Mr. David Forsythe relayed further concerns industrial users have with the Preferred Development Plan, specifically with the risk borne by ratepayers. He indicated that if the assumptions of Manitoba Hydro are incorrect, ratepayers will face rapidly increasing costs, contrary to the interests of industrial users.

Interchurch Council on Hydropower

Mr. Will Braun provided the Board with concerns relating to the Preferred Development Plan. He indicated that the faltering of Wuskwatim is a key indicator of issues with the overall plan. Wuskwatim highlights the risk and unpredictability of Manitoba Hydro's forecasts. He further stated that the resulting rate increase cannot be afforded by residents of northern Manitoba. He also outlined a number of environmental issues associated with the project, including the macro environmental impacts of the Preferred Development Plan fuel source in relation to the Churchill River Diversion. In his opinion, Manitoba Hydro failed to properly consider Demand Side Management as an alternative to the Preferred Development Plan. He argued that this planning error is so fundamental it should stop the process.

Canadian Wind Energy Association

Mr. Tom Levy provided a letter that presented CanWEA's belief that wind energy will continue to make a valuable contribution to Manitoba's future electricity needs. Further, he stated that wind energy is increasingly cost-competitive, provides important economic benefits to rural communities and can serve as a valuable complement to hydroelectricity.

Elton Energy Co-operative

Mr. Dan Mazier submitted a letter highlighting considerations for future energy production. It stated that the cost per kWh of non-hydro renewable energy continues to be economically competitive compared to non-renewables and non-hydro renewable energy can serve as a valuable complement to hydroelectricity.

The Lake on the Pembina Committee

Mr. David Melvin appeared on behalf of The Lake on the Pembina Committee, which represents five rural municipal governments and numerous village and town councils in the Pembina valley area of southern Manitoba that is not currently served by natural gas. He suggested that there would be significant benefits to expand gas service to the area, as with the phase-out of coal, businesses and industry would have to switch to expensive hydroelectricity, while in southwestern Manitoba, gas is being flared off. He further suggested that southeastern Manitoba would be an excellent location for a gas generating plant, since existing transmission already exists in the area due to the St. Leon windfarm.

GEOptimize

Mr. Ed Lohrenz stated that the use of geothermal energy is a more cost-effective alternative to hydroelectricity. He further stated that geothermal energy is established and proven in Manitoba, and less expensive to implement than the proposed projects as well as better for the environment. In this analysis, he compared the energy projections associated with the Preferred Development Plan to possible production from increased geothermal development. He presented information showing the increasing use of geothermal energy in Canada and the United States, citing increased accessibility and improved installment training that reduce risk in implementation.

50 by 30

Mr. Daniel Lepp Friesen spoke to 50 by 30's proposed goal to increase Manitoba's renewable energy use from 30% to 50% by the year 2030. In implementing this plan, he suggested utilizing renewable energy sources in combination with demand reduction programs. 50 by 30 would like to Panel to evaluate Manitoba Hydro's plan in the context of an overall energy policy in Manitoba, and suggests long-term, comprehensive planning prioritizing renewable energy sources.

Buller Center for Business

Mr. Bruce Duggan presented his concerns about Manitoba Hydro's Preferred Development Plan, in particular the capital expenditure forecast. He expressed concern with the debt financing approach the project would require and the fiscal stability of Manitoba Hydro and the province. He suggested delaying the project until Manitoba Hydro provides evidence that it has fully utilized Demand Side Management. He also suggested delaying the project until after Bipole III expenditures have peaked to reduce the pressure on Manitoba Hydro to raise debt.

Tim Sale

Mr. Sale expressed concern with Manitoba Hydro's Preferred Development Plan, and is of the opinion that the plan exposes Manitobans to unacceptable risks and major rate increases. He questioned Manitoba Hydro's past record of capital cost estimates. In his assessment he also considered the low cost of natural gas, the decreasing cost curve of alternative energy production methods, and unstable future interest rates. He advocated an assessment based on risk management. Mr. Sale believes Manitoba Hydro should prioritize its mandate to provide cost-effective power to Manitobans.

Prof. David G. Barber

Professor Barber of the Center for Earth Observation Science presented on climate change, including recent assessment reports, increasing global land-ocean temperatures, and reduction of sea ice caused by society's addiction to fossil fuels. He indicated that these changes could impact Manitoba infrastructure and agricultural crops and are already affecting the global economy through natural disasters. Professor Barber stated that climate change is a present issue that requires responsive planning.

Jackie Girardin

Ms. Girardin is concerned about electricity rate hikes proposed by Manitoba Hydro. She indicated that individuals who live in rural Manitoba only have the option of using electricity to heat their homes. She characterized the proposed rate increases as "outrageous" and states that increased electricity costs of this magnitude will put a significant financial strain on her and individuals in similar circumstances.

Ken Klassen

Mr. Klassen has over 30 years of experience focused on improving the energy and environmental performance of new and existing buildings and communities. He stated that the employment projections and comparisons of the Preferred Development Plan as compared to Demand Side Management are problematic. Mr. Klassen questioned the projected employment creation and the low number of permanent jobs created by the Preferred Plan. He indicated there were numerous employment advantages to using Demand Side Management.

Mr. Klassen indicated other benefits of using Demand Side Management. He stated energy efficiency was the lowest cost source of increased available electricity, and he believes that there has been a lack of consultation with local energy efficiency experts. He indicated there are a numerous energy efficiency measures that remain options.

Allan Ciekiewicz

Mr. Ciekiewicz presented his concerns with Manitoba Hydro's Preferred Development Plan, citing inaccuracies with its underlying predictions, projections and forecasts. He questioned the burden the Plan places on ratepayers for the purpose of supporting export markets. He questioned Manitoba Hydro's transparency. He argued that current production capabilities combined with Demand Side Management are sufficient to meet energy demands. He also addressed the possible risks associated with the Preferred Development Plan, specifically the possible repercussions of a severe drought. In addition, he questioned the planned rate increases in light of what he perceived to be Manitoba Hydro's excessive capital expenditures.

Dr. Peter Kulchyski

Dr. Kulchyski presented on hidden costs associated with the Keeyask and Conawapa projects. These hidden costs relate to potential aboriginal title and rights liabilities, and costs associated with continuing detrimental social impacts of these developments on local indigenous communities. He stated that outstanding or unfulfilled Treaty rights or claims can be considered contingent liabilities that have not been properly accounted for by Manitoba Hydro.

Dr. Kulchyski gave three examples of the liabilities potentially affecting the projects. They are a) the lack of signatures on Treaty 5 by Tataskweyak representatives; b) the non-surrender of water rights in Treaty 5; and c) the lack of constitutional amendments supporting the so-called implementation agreements associated with liabilities arising from obligations made in the Northern Flood Agreement. Dr. Kulchyski further stated that problems associated with these agreements could lead to substantial claims by indigenous communities, the notion of which is reinforced by the Supreme Court's strong position on protecting Aboriginal and Treaty rights. He argued that Manitoba Hydro's development plans will only benefit the small professional class, and will not alleviate poverty in those communities but create further disparity.

Solange Garson, Carol Kobliski & Janie Duncan

Ms. Garson, Ms. Kobliski and Ms. Duncan all expressed concerns with the transparency and accountability of Manitoba Hydro's expenditures and relations with First Nations communities. They feel that Manitoba Hydro has not utilized funds appropriately, causing unnecessary expenses to be passed on to ratepayers and communities affected by hydro development. There was particular concern with expenses relating to legal and consulting costs spent in planning and negotiations. They are concerned that business entities meant to accumulate economic benefits for first nations communities have failed to do so. Ms. Duncan argued that the Preferred Development Plan should not go forward.

Lorna Kopelaw

Ms. Kopelaw advocated for the communities along routes 201, 202, 203 and 204. Ms. Kopelaw argued that Manitoba Hydro's plan was severely flawed. She stated the plan will damage the heritage of these communities, have negative financial impacts, damage the ecosystem, and threaten the health of these communities. In her opinion, the plan unfairly exploits these communities.

Pimicikamak Okimawin

Mr. David Muswaggon expressed his community's concerns regarding the development plan. Mr. Muswaggon expressed his people were not in support of Manitoba Hydro's project, both due to the escalating costs of hydroelectricity for consumers and the destruction of their homeland and heritage. He expressed the opinion that the current infrastructure is sufficient to support Manitoba's energy needs. He expressed concerns that the ecological and cultural costs have not been adequately addressed in energy development and planning. He encourages an assessment of the legality and fairness of the projects that reflects indigenous peoples as a sovereign indigenous nation with their own values and legal systems.

Mr. Darwin Paupanekis presented a historical background of the Pimicikamak people, including specifics about their historical lifestyle and connection to the land. Further, Mr. Paupanekis described the impact he believed continued development by Manitoba

Hydro would have on the land and lifestyles previously stated. His people do not believe Manitoba Hydro has properly considered the needs of northern Manitobans, and has failed to properly mitigate ongoing environmental concerns. In addition, he stated that the Province of Manitoba and Manitoba Hydro have failed to meet their obligations related to the Northern Flood Agreement and other Treaties.

Ms. Flora Jane Ross spoke to the difficulties faced in their community. She discussed problems with basic amenities, sickness, and education. To address these problems, she stated that it is important to be able to access and utilize their land for traditional purposes.

Mr. Mervin Garrick expressed his concern with the Province's history of compliance with the Northern Flood Agreement. He believes the spirit of the agreement has not been fulfilled. He cites issues relating to continued poverty, unemployment and environmental damage in his community.

Mr. Tommy Monias expressed his belief that Manitoba Hydro has utilized an imbalance in bargaining power in its relations with aboriginal people. He encouraged alternatives to hydroelectricity, such as biomass and wind.

Mr. George Ross expressed concern regarding the relationship between Pimicikamak and the Province. He highlighted differences observed between pre- and post-development of hydroelectric dams proximate to their community. He further expressed concern about high electricity rates.

Mr. Jeremy Ross presented his objection to development of new dams. In his opinion, the current electricity production is sufficient, and any further development is not worth the resulting difficulties faced by surrounding communities. He also objected to any increased rates for people in his community due to the increased financial strain that would result.

Mr. Darrell Settee expressed disapproval with Manitoba Hydro's projects in their entire form. He is concerned with the environmental and ecological impacts of the projects. He questions the value of the projects. He is also concerned with the loss of land with important cultural, traditional and spiritual significance.

Ms. Shelly Paupanekis spoke against any further hydro developments in the area, due the negative impacts they have on the land, waters, resources and recreation for those living in Cross Lake.

Mr. Jack Osborne objected to any further hydro developments at this point in time. He requests further consultation with First Nations people before further developments take place.

York Factory First Nation – Gordon Wastesicoot

Mr. Wastesicoot presented the views of York Factory First Nation in support of the Keeyask Project. The community heavily analyzed the benefits and costs of the project and decided in its favour. He further stated that the financial and employment benefits from the project would not otherwise be available, and he expressed hope that the project will improve the socio-economic conditions of the community. The community is optimistic that it can navigate any obstacles faced to reach a mutually satisfying result. Mr. Wastesicoot expressed concern with increasing rates and the financial strain faced by his community.

Gerhard Randel

Mr. Randel presented an alternative to bury Manitoba Hydro's overhead high voltage transmission lines. He suggested that burying the lines will have the benefit of reducing lost electricity in transmission due to electromagnetic fields. By failing to pursue this alternative, Mr. Randel argued that Manitoba Hydro has failed to follow its mandate to produce electricity in a cost-efficient way. He further stated that burying the transmission lines also reduces health, environmental and economic costs. He cited studies showing increased incidents of cancer resulting from living close to transmission lines. He also explored risks associated with maintaining overhead transmission lines.

Jason Cook

Mr. Cook presented his experience on the effects hydro development has had on traditional aboriginal lifestyles. He described the destruction of his homeland and the environment. He indicated that navigational waterways are no longer safe to travel. He requested that future plans include a full socio-economic analysis that includes the costs previously stated. He also requested that that resource development should be planned and implemented in a transparent, accountable and equitable manner.

Leona Massan

Ms. Massan expressed concern with the cost of hydroelectricity in Gillam, Manitoba, and its effect on the strained financial budget of its residents. She questioned the underutilization of northern residents in project employment. She also cited examples of environmental and ecological damages caused by hydroelectrically development in her community.

Manitoba Keewatinowi Okimakanak

Elder Flora Beardy expressed thoughts and concerns of the community of York Landing. She indicated that the proposed rate increases would result in hardship for many residents. She indicated the nature of how residents of northern communities address budgetary concerns to attempt to address their basic needs. She requested that Manitoba Hydro come to the community to inform and advise residents on Power Smart and low income programs to help reduce electricity bills.

Mr. Roger Ross spoke on behalf of the Manto Sipi Cree Nation, which is concerned about the potential impacts of proposed rate increases at approximately double the rate of inflation. He calls on Manitoba Hydro to do everything possible to reduce electricity bills paid by First Nations people. He further recommended that the qualification requirements for the Home Insulation Program should not exclude individuals in arrears on their electricity bills. He does not want increased electricity costs to result in a reduction in the level of community programs and services in northern Manitoba.

Mr. Michael Anderson reiterated the difficulty faced by the community in affording hydro bills. He also addressed the problem previously addressed in the qualifications for the Power Smart program. He argued that the inability of these individual to access the Power Smart program inhibits them from reducing or paying off those debts. He also argued that First Nations people affected by hydro developments should be provided a portion of the revenue generated by such developments, and articulates a number of related options. The recommendations by Mr. Anderson in the presentation session mirrored the closing submissions of MKO.

Fox Lake Cree Nation

Mr. Ralph Beardy presented the impacts of the Preferred Development Plan in Fox Lake from the perspective of a business owner. One major issue with local hydroelectric development in the town of Gillam is a greater demand for land, contrary to Fox Lake's plans, historical claims, treaty and aboriginal rights. He referenced Fox Lake's support of the Keeyask project. Fox Lake is hoping to reach a mutually beneficial agreement with Manitoba Hydro regarding Conawapa. He suggested that a future goal for the community should be to work with Manitoba Hydro and the provincial government to create opportunities in Fox Lake.

Mr. Conway Arthurson spoke to the need for Fox Lake's First Nations community to be allotted more reserve land in Gillam. The Fox Lake First Nation requested the support of Manitoba Hydro as a third party interest holder in attempting to obtain more reserve land.

Fawn Morales

Ms. Morales suggested the possibility of creating a lock port on the Nelson River to allow safer navigation by boat. She discussed the negative impacts the dam had on marine life on which her people have relied. She expressed concern with the reduction of boreal forests and the destruction of ecosystems due to hydro development.

Alberteen Spence

Ms. Spence stated that she did not support the Keeyask dam with the current management and projections. She is not in favour of the major risk the project places on Manitobans, in particular First Nations people in northern Manitoba. She supports further analysis on alternative forms of energy.

Tataskweyak First Nation

Elder Eunice Beardy expressed concerns about the damages related to dam development. In her opinion although Manitoba has consulted with first nations people on certain issues, they have failed to show commitment to those groups in the implementation stages. She is concerned the land and environment will deteriorate further in future generations.

Ms. Charlotte Wastesicoot stated her belief that Manitoba Hydro should focus on stakeholders within its mandate, mainly provide sufficient power for the people of Manitoba.

South Indian Lake

Ms. Shirley Ducharme presented on the socio-economic impacts of past hydroelectric developments on their community. She indicated that the biggest impact has been on the fishing and trapping industry. There have been few employment opportunities provided to individuals in impacted communities. Due to hydro development the community have been unable to pursue traditional activities. The compensation for these losses has not been sufficient.

Ms. Hilda Dysart and Leslie Dysart spoke to the environmental impact of hydro development and the resulting impact on traditional aboriginal lifestyles. The cost to First Nations communities in surrounding areas is not worth the addition of the new dams.

Nisichawayasihk Cree Nation

Mr. Marcel Moody disputed information brought forward by previous presenters regarding the implementation of the Northern Flood Agreement. He stated that the Northern Flood Agreement has had success in spurring economic development in his community. He further stated that certain critiques of the agreement and Manitoba Hydro were uninformed and inaccurate on the actual compensatory measures being implemented. In his opinion, the partnership between Manitoba Hydro and his community has been working.

Elders Jimmy Hunter-Spence and Joe Moose reiterated the working relationship the community has with Manitoba Hydro. They stated that the two parties have worked together to form a relationship established on mutual respect and trust.

APPENDIX 8 Appearances

Manitoba Hydro Witnesses

Scott Thomson, President & CEO, Manitoba Hydro

Load Forecasting Panel

Ed Wojczynski, Division Manager, Portfolio Projects Management, Manitoba Hydro
Lloyd Kuczek, Vice President, Customer Care & Energy Conservation, Manitoba Hydro
Lois Morrison, Division Manager, Consumer Marketing and Sales, Manitoba Hydro
Dale Friesen, Division Manager, Industrial & Commercial Solutions, Manitoba Hydro
Ian Page, Division Manager, Corporate Planning & Strategic Review, Manitoba Hydro
Ingrid Rohmund, Director, Energy Analysis and Planning, EnerNOC Inc.

Needs and Alternatives Panel

Joanne Flynn, Division Manager, Power Planning, Manitoba Hydro
Terry Miles, Manager, Resource Planning & Market Analysis Department, Manitoba Hydro
Bill Hamlin, Manager, Energy Policy & Analysis Department, Manitoba Hydro
David Cormie, Division Manager, Power Sales and Operations, Manitoba Hydro
Dave Bowen, Manager, Project Services Department, New Generation and Construction Division, Manitoba Hydro
David Jacobsen, Section Head, Interconnections & Grid Supply, Manitoba Hydro
Adam Borison, Director, Navigant Consulting Inc.
Dean Murphy, Principal, Brattle Group
Eric Swanson, Attorney, Winthrop & Weinstine, P.A.
Rene Roy, Director, Scientific Programme, Ouranos Consortium
Kristina Koenig, Hydrologic Studies Section Head, Water Resources Engineering Department, Manitoba Hydro

Finance Panel

Darren Rainkie, Vice President, Finance & Regulatory, Manitoba Hydro
Manfred Schulz, Corporate Treasurer, Manitoba Hydro
Liz Carriere, Manager, Financial Planning Department, Manitoba Hydro
Greg Barnlund, Division Manager, Rates & Regulatory Affairs, Manitoba Hydro

Socio-Economic Panel

Shawna Pachal, Division Manager, Power Projects Development Division, Manitoba Hydro
Jane Kidd-Hantscher, Partnership Implementation Supervisor, Manitoba Hydro
Marvin Shaffer, Consultant, Marvin Shaffer & Associates Ltd.
Karen Anderson, Director of Operations, Fox Lake Cree Nation Negotiations Office
Ted Bland, Senior Negotiator, York Factory Future Development
Norman Brandson, Consultant, N2B Environmental, Resource & Governance Consultancy and EarthWise Environmental Governance
Martina Saunders, Negotiator, York Factory Future Development
Victor Spence, Manager of Future Development, Tataskweyak Cree Nation

Independent Expert Consultants

Robert Sinclair, Vice President, Potomac Economics, Ltd.
David Patton, President, Potomac Economics, Ltd.
John Todd, President, Elenchus Research Associates
Russ Houldin, Associate, Elenchus Research Associates
Craig Sabine, Senior Manager, Energy and Utilities, MNP
Sarah Keyes, Consultant, Energy and Utilities, MNP
Dan Peaco, President, La Capra Associates
John Athas, Principal Consultant and Treasurer, La Capra Associates
Mary Neal, Consultant, La Capra Associates
Glenn Davidson, Senior Project Manager, Power Engineers
Brian Furumasu, Senior Project Manager, Power Engineers
Paul Arnold, Senior Project Manager, Power Engineers
Michael Robertson, Specialist Engineer and Project Manager, Knight Piésold
Boris Fichot, Senior Engineer, Knight Piésold
Russell Tyson, President, TyPlan
Pelino Colaiacovo, Managing Director, Morrison Park Advisors
Benjamin Kinder, Vice President, Morrison Park Advisors

Intervener Panels

Affordability Panel

Gio Robson, Certified Energy Advisor and President, prairieHOUSE Performance Inc.
Gloria Hartley
Dave Mouland
Albertine Mason

Jacqueline Salamisan
Darrell Settee
Richard Genaille

Elders and Traditional Land Users

Noah Massan
Robert Spence
Flora Beardy
Ila Disbrowe
Christine Massan
Jack Massan
Ivan Moose

Intervener Experts

Phillipe Dunsky, President, Dunsky Consulting Inc.
William Harper, Associate, Econalysis Consulting Services
Douglas Gotham, Director, State Utility Forecasting Group, Purdue University
Wayne Simpson, Head, Department of Economics, University of Manitoba
Harvey Stevens, Consultant
Melanie O'Gorman, Associate Professor, Department of Economics, University of Winnipeg
Jerry Buckland, Professor of International Development Studies and Dean, Menno Simons College
Marla Orenstein, Senior Partner, Habitat Health Impact Consulting
Kyrke Gaudreau, Sustainability Manager, University of Northern British Columbia
Robert Gibson, Professor and Associate Chair, Department of Environment and Resource Studies, University of Waterloo
Jill Gunn, Assistant Professor, Department of Geography and Planning, University of Saskatchewan
Roger Higgin, Principal, Sustainable Planning Associates Inc.
Paul Chernick, President, Resource Insight, Inc.
Wesley Stevens, Senior Associate, Power Advisory LLC
Patrick Bowman, Principal and Consultant, InterGroup Consultants, Ltd.
Rick Hendricks, Director, Camerado Energy Consulting Inc.
Whitfield Russell, President and Partner, Whitfield Russell Associates
Geneva Looker, Senior Associate, Whitfield Russell Associates

Legal Counsel and Representatives

Patti Ramage, Counsel, Manitoba Hydro
Marla Boyd, Counsel, Manitoba Hydro
Doug Bedford, Counsel, Manitoba Hydro
Helga Van Iderstine, Counsel, Manitoba Hydro
Jennifer Moroz, Counsel, Manitoba Hydro
Odette Fernandes, Counsel, Manitoba Hydro
Janet Mayor, Counsel, Manitoba Hydro
Jack London, Counsel, Keeyask Cree Nations Partners
Brad Regehr, Counsel, Keeyask Cree Nations Partners
Byron Williams, Counsel, CAC
Meghan Menzies, Counsel, CAC
Aimée Craft, Counsel, CAC
Joëlle Pastora Sala, CAC
William Gange, Counsel, GAC
Peter Miller, Advisor, GAC
Antoine Hacault, Counsel, MIPUG
George Orle, Counsel, MKO
Michael Anderson, Advisor, MKO
Jessica Saunders, Counsel, MMF
Corey Shefman, Counsel, MMF
Tony Marques, Counsel, MMF
Christian Monnin, Counsel, Independent Expert Consultants
Michael Weinstein, Counsel, Independent Expert Consultants
Bob Peters, Public Utilities Board Counsel, Fillmore Riley LLP
Sven Hombach, Public Utilities Board Counsel, Fillmore Riley LLP

Public Utilities Board Staff and Advisors

Hollis Singh, Executive Director, Public Utilities Board
Kurt Simonsen, Associate Secretary, Public Utilities Board
Josée Lemoine, Project Manager, NFAT Review, Public Utilities Board
Margaret Smith, Public Utilities Board Advisor
Bill Smith, Public Utilities Board Advisor
Brenda Bresch, Office Manager, Public Utilities Board
Nancy-Ann Cribbs, Administrative Assistant to the Public Utilities Board
Diana Villegas, Administrative Assistant to the Public Utilities Board
Larry Buhr, Public Utilities Board Advisor
Roger Cathcart, Public Utilities Board Advisor
Brady Ryall, Public Utilities Board Advisor

APPENDIX 9 Glossary of Terms

2x16 Power: Power delivered two days a week (during weekends) for 16 hours per day, from 6:00am to 11:00pm.

5x16 Power: Power delivered five days a week (during weekdays) for 16 hours per day, from 6:00am to 11:00pm.

Alternating current (AC): Electric current that reverses its direction of flow at regular intervals. This occurs 60 times each second and is referred to as a frequency of 60 cycle (Hertz). All utilities in North America use 60 Hertz.

Average Energy: The energy Manitoba Hydro can produce in any given year based on average water flows.

Base Load: The basic demand for electricity that is expected during all times.

Bilateral Contract: A contractual agreement between two market participants for the purchase or sale of capacity and/or energy.

Board Counsel: Legal counsel to the Public Utilities Board, who acted as counsel to the NFAT Panel.

Canadian Environmental Assessment Agency: The federal Canadian environmental assessment body.

Capacity: The amount of power that a piece of equipment, or a group of pieces of equipment acting together, can generate or transmit. For example, a transmission line may have a transfer capacity of 750 megawatts or a generating station may have a capacity to produce 1200 megawatts.

Carbon Price: A tax or surcharge levied by the government on electricity generated from sources that emit carbon dioxide (CO2). The carbon price is specified in dollars per tonne of CO2. Different generating stations produce different amounts of carbon dioxide per MWh of electricity output, with coal producing the greatest amount of CO2 and combined cycle gas turbines producing about half of the emissions of coal per MWh.

Clean Environment Commission (CEC): Manitoba's environmental regulatory tribunal.

Combined Cycle Gas Turbine (CCGT): The combination of a gas turbine and a steam turbine in an electric generating plant. The waste heat from the gas turbine provides the heat energy for the steam turbine.

Conawapa Generating Station: A proposed new hydroelectric generating station with a capacity of 1,485 MW, producing 4,650 GWh of dependable energy per year and an average of 7,000 GWh per year.

Consumers' Association of Canada (Manitoba) Inc. (CAC): One of the five Interveners in the NFAT Review.

Congestion: Congestion occurs when there is inadequate transmission to deliver all of the lowest-cost power to the load.

Contingency or Operating Reserves: Available spare generation that must be kept available in the event of sudden generation or transmission outages.

Curtailable Load: A DSM load reduction program in which customers agree to a partial or complete power shut off for a limited period of time in exchange for lower electricity rates.

Demand Side Management (DSM): A targeted reduction in the demand for electricity through energy efficiency measures and updated codes and standards. DSM can reduce the requirement for new electricity generation and serve as a source of meeting demand in the same manner as new generation. Manitoba Hydro administers DSM through its Power Smart plan.

Dependable Energy: The energy that a generation station or electric system can produce under the lowest water flow conditions. Manitoba Hydro's total dependable energy is comprised of dependable energy from hydro generation, thermal generation, wind generation, and imports.

Discount Rate: A percentage rate by which a future revenue flow is discounted to derive the Net Present Value (NPV) of that flow of money.

Distributed Generation: Electricity generation located throughout the electrical distribution system, usually closer to load centres or downstream of the customer's meter. Distributed generation is usually comprised of smaller-scale generating facilities.

Diversity Agreements or Diversity Exchanges: Agreements that provide for the seasonal exchange of power between utilities during their respective peak load periods. When utilities have opposite peak load seasons, they can enter into diversity agreements to exchange power. For example, Manitoba's peak power load is in the winter, while Minnesota's peak power load is in the summer.

Energy: A quantity of power consumed over a period of time. Energy is expressed in kilowatt-hours (kWh), megawatt-hours (MWh) or gigawatt-hours (GWh). A 100-watt incandescent light bulb burning for 10 hours consumes one kWh (0.1 kW x 10 hrs).

Energy Information Agency (EIA): Part of the U.S. Department of Energy, the EIA creates forecasts for electricity and natural gas consumption, market prices, and supplies that are used by the electricity industry.

Expected Value: The probability-weighted NPV of the development plans calculated from the low, reference, and high estimates of energy prices, capital costs, and economic indicators/discount rates. Expected value is used in the economic analysis.

Firm Export: The guaranteed sale of a contracted amount of energy and/or capacity to utilities or customers located outside of Manitoba.

Firm Power: Capacity and energy that must be supplied to meet domestic demand or under certain export contracts. Firm power is guaranteed to be available when specified and can only be interrupted in emergencies or when the reliability of the power system is threatened.

Firm Transmission Service: Full path transmission service that has the highest priority and cannot be interrupted unless all lower priority levels of service have been interrupted.

Fracking or Hydraulic Fracturing: A technique for drilling and completing natural gas wells that, combined with horizontal drilling, produces greater amounts of gas from an individual well. Fracking has significantly increased the North American supply of natural gas.

Fuel Switching: The switch from one heating fuel source to another (e.g., gas to electricity or electricity to gas).

GHG: See Greenhouse Gas.

Gigawatt-Hour (GWh): A unit of electrical energy. A GWh is the amount of electrical energy produced by one gigawatt of power applied over one hour of time, or 1000 MW over one hour.

Green Action Centre (GAC): One of the five Interveners in the NFAT Review.

Greenhouse Gases (GHG): Gases that contribute to climate change because of they contribute to the greenhouse effect of the Earth's atmosphere by trapping thermal radiation from the sun. For electricity generation, the most common greenhouse gas - and the one of greatest concern - is carbon dioxide, which is a product of the combustion of fossil fuels such as coal and natural gas.

Grid Parity: The point where distributed generation technologies such as solar photovoltaics can generate electricity for the same cost as buying electricity from the utility using its distribution grid.

Gross Firm Energy: The total annual non-curtailable demand for energy in Manitoba.

Gross Total Peak: The highest demand for power to be expected in Manitoba in any specific year, measured at generation as opposed to at the meter. It typically occurs during the coldest winter day.

Hydraulic Fracturing: See Fracking.

Independent Export Consultant (IEC): Independent third-party experts retained by the NFAT Panel for purposes of the NFAT Review. IECs were represented by independent legal counsel and subject to cross-examination of their reports and testimony.

Integrated Financial Forecast (IFF): A 10- or 20-year financial forecast prepared by Manitoba Hydro on an annual basis that details expected revenues, expenses, financial ratios and rate increases.

Intervener: An organization with interest in the NFAT Review that was granted legal standing to appear and adduce evidence, cross-examine witnesses, and make closing submissions. The NFAT Panel granted Intervener status to five parties pursuant to the Public Utilities Board's Rules of Practice and Procedure.

Interconnections: Power lines that interconnect one electrical utility's power system with another. Interconnections facilitate the export and import of power.

Interruptible Energy: A supply of energy, which is subject to short- or long-term interruption with or without notice.

Keeyask General Civil Contract: The contract Manitoba Hydro awarded to construct the majority of the Keeyask generating station, including the rock excavation and concrete works.

Keeyask Generating Station: A proposed new hydroelectric generating station with a capacity of 695 MW, producing annual dependable energy of 3,000 GWh and average annual energy of 4,400 GWh. Manitoba Hydro plans to have Keeyask constructed for a 2019 in-service date.

Kilowatt (kW): The unit of electrical power equivalent to 1000 watts (W).

Kilowatt-Hour (kWh): A unit by which electrical energy is measured. A kilowatt-hour is a unit of energy equivalent to one kilowatt (1000 watts) of power applied over one hour of time. For example, 10, 100 W light bulbs switched on for one hour would use one kilowatt-hour (1000 W one hour). The electrical energy used in homes and small businesses is usually measured in kilowatt-hours.

LCOE: See Levelized Cost of Energy.

Levelized Cost of Energy (LCOE): The cost of constructing and operating a generating resource over its life, including capital cost, fuel cost, and operations and maintenance cost.

Load: The total amount of demand electricity.

Load Serving Utility: an electric utility that supplies electricity to end use customers. Manitoba Hydro, Minnesota Power, and Wisconsin Public Service are all load serving utilities.

Locational Marginal Price (LMP): The MISO market price for energy at a certain location, taking into account transmission losses and congestion effects that depress the price from the System Marginal Price.

Long-Term Firm Exports: The sale of electricity to parties outside Manitoba where the quantity and price of the electricity are fixed over a long-term period.

Manitoba Industrial Power Users Group (MIPUG): One of the five Interveners in the NFAT Review.

Manitoba Keewatinowi Okimakanak Inc. (MKO): One of the five Interveners in the NFAT Review.

Manitoba Métis Federation (MMF): One of the five Interveners in the NFAT Review.

Megawatt (MW): The unit of electrical power equivalent to 1,000,000 watts (W).

Megawatt -Hour (MWh): A unit by which electrical energy is measured. One MWh is a unit of energy equivalent to one million watts of power applied over one hour of time.

Midcontinent Independent System Operator, Inc. (MISO): MISO is a U.S.-based independent, not-for-profit regional transmission organization responsible for maintaining reliable transmission of power in 15 U.S. states and the Canadian province of Manitoba.

Minnesota Public Utilities Commission (MPUC): A regulatory body responsible for the regulation of natural gas and electric utilities in the state of Minnesota. MPUC has oversight over and approves the construction of natural gas and electricity facilities such as electric power plants, transmission lines, wind power generation plants, and large natural gas and petroleum pipelines. Manitoba Hydro's interconnection with the U.S. requires MPUC approval.

MISO: See Midcontinent Independent System Operator, Inc.

MPUC: See Minnesota Public Utilities Commission.

Net Present Value (NPV): The present value of a future revenue and cost stream. NPV is calculated by taking an assumed revenue in each future year and applying a discount rate to account for the time value of money (e.g., $100 ten years from now do not have the same value as $100 today). The applicable discount rate is a matter of judgment and was a subject of debate in the NFAT. Frequently in the NFAT the NPV of development plans is referenced to the NPV of the All Gas plan (i.e. the All Gas plan NPV is set to zero and the NPVs of the other plans are adjusted accordingly)

Nominal Dollars: Future year dollars that include the effect of inflation (CPI increases) as opposed to real dollars which have the effects of inflation removed.

Off-Peak Period: The overnight and weekend hours in a week during which load is usually lower that the average weekly load. Overnight the hours are 5 weekdays x 8 hours/day plus weekends which are 2 days x 24 hours/day.

On-Peak Period: The weekday daytime hours during which load is usually highest: from 6:00 am to 11:00 pm, otherwise known as "5x16."

Opportunity Energy: Available surplus energy that Manitoba Hydro sells into the MISO market at the prevailing spot market price, and for which it has not negotiated firm pricing arrangements through a bi-lateral contract.

Peak Load: Instantaneous maximum amount of electricity used. On an annual basis, peak load in MISO occurs during the summer air conditioning season, while peak load in Manitoba occurs during the winter heating season. On a daily basis, peak load varies with the business cycle.

Person-Year: A person-year of employment is the equivalent of one full time job for one year. The number of hours assigned to a person-year very. In the Keeyask environmental impact assessment, one person-year of employment is defined as 3,000 hours of work.508

Power: The flow of electricity at any given time. Power is expressed in watts (W), kilowatts (kW – 1,000 watts) or megawatts (MW – one million watts).

Real Dollars: Future year dollars that have the effects of inflation removed, as opposed to nominal dollars which include inflation effects.

Simple Cycle Gas Turbine (SCGT): A turbine powered by natural gas or fuel oil in an electric generation plant. The waste heat from the gas turbine is exhausted and not utilized.

Solar Photovoltaic Generation: The conversion of sunlight directly into electricity by incidence of sunlight on a semiconductor surface, also known as a solar panel. The amount of electricity generated is proportional to the size of the solar panel, and can range from roof-top units that generate electricity for a residential home to utility-scale arrays of solar panels that produce megawatts of electricity.

Surplus Energy: Energy not needed to meet Manitoba demand and which Manitoba Hydro is not contractually required to export.

System Marginal Price (SMP): The system-wide MISO market price for energy. SMPs do not take into losses or congestion that can depress the market prices at specific locations.

System Participation Sale: In the context of Manitoba Hydro, a contract through which Manitoba Hydro sells a defined amount of energy, from a defined portion of its installed generating capacity, to a named contractual counterparty. System Participation Sales do not include any generation reserve as required by counterparty's operating authority.

Terms of Reference: The terms of the Panel's mandate to conduct the NFAT Review, including definitions of items that are and are not in scope. The Terms of Reference were approved by Order in Council 128/2013 on April 17, 2013.

---

[508] Transcript, p. 3898.

Voltage: The electric potential between two points in an electric connection, expressed in volts (V) or kilovolts (kV). A North American electrical outlet operates at 120 volts. High-voltage transmission usually operates at either 230 kV or 500 kV.

Water Flow: The flow of water through Manitoba Hydro's hydraulic basins and generating stations. It is expressed in cubic metres per second (m3/s).

Watt (W): The unit of measurement of electrical power.

Tab 16

NFAT Manitoba Hydro's Development Plan

A Review of Manitoba Hydro's Load Forecast

John Todd
Elenchus Research Associates
April 2, 2014

Overview

1. Purpose of Elenchus Load Forecast Evidence
2. Setting the Stage
3. Rebuttal Evidence of Manitoba Hydro
4. Key Messages: Concluding Remarks
5. Scope of Work (SOW) Responses

Purpose of evidence

- To address the issues in the MPUB Scope of Work (SOW) on Load Forecasting
- Within the context of the Terms of Reference

elenchus 3

Setting the Stage (1)

Load forecasting in the context of a GRA

vs.

Load forecasting for assessing a development plan

In the long run, structural change is a risk that is a "known unknown".
Relevant for NFAT; not for GRA.

elenchus 4

Setting the Stage (2)

Manitoba Hydro's load forecasting methodology:

- Incorporates known knowns reasonably well
- But ignores known unknowns (i.e., price elasticity and structural change)

At its core the NFAT is an analysis of the long term risks associated with the Preferred Development as compared to the alternatives.

elenchus

5

Setting the Stage (3)

Two missing "worst case" structural change scenarios:

1. **High demand** that result in supply inadequacy
2. **Low demand** that creates stranded assets

How tolerable are the extreme high-impact, low-probability (HILP) events?

elenchus

6

Setting the Stage (4)

1. The **high demand** structural change scenario:

- Perhaps, a "tipping point" for electric vehicles

Can MH respond to a worst case increase in demand?

elenchus

7

Setting the Stage (5)

2. The **low demand** structural change scenario:

- Disruptive innovation (e.g., grid parity/competitive options)
  - Declining cost of renewables + storage
  - Fuel cell technology
  - Result: low marginal cost and market price for power

The known unknown:
The market price for grid power in the long run (2+ decades).
Is stranded costs acceptable?

elenchus

8

Rebuttal Evidence of Manitoba Hydro

- Sect. 2.1, Overview of Forecast Growth
- Sect. 2.4, Price Elasticity
- Sect. 2.5, Adjusting for Weather
- Sect. 2.6, Forecast Variability and Accuracy
- Sect. 2.7, Scenarios and Probability
- Sect. 3.6, Solar and Grid Parity

elenchus 9

Key Messages: Concluding Remark #1

1. At the current time, the load forecast does not provide any alternative economic or population scenarios to test the sensitivity of the load forecast to changes in these assumptions. Elenchus believes that as an input for effective long-term resource planning, Manitoba Hydro should provide alternative economic and population growth scenarios and their associated effects. While Manitoba Hydro provides a simplified probabilistic confidence interval analysis, this does not test the sensitivity of load forecast parameters to changes in input assumptions on economic and population growth.

elenchus 10

Concluding Remark #2

2. Consideration should be given to the financial risks related to potential market transformation, such as grid parity, that could result in a disconnect between Manitoba Hydro's projection of (total domestic) demand and the future demand for grid power.

elenchus

11

Concluding Remark #3

3. Additional transparency about the choice of model and model accuracy needs to be provided. For example, methodological changes in the specification of econometric models have been made from one year to another without adequate explanation about why the changes were made and the effect of the changes. Model performance including within sample error and alternatives considered and rejected would also help increase transparency.

elenchus

12

Concluding Remark #4

4. An updated Residential Survey to reflect current conditions within the Residential market should be undertaken and integrated into the load forecast to verify assumptions about electric heat market share and the end-use model parameters.

Concluding Remark #5

5. Alternate models for projecting the number of Residential customers should be explored and reported on. Alternate population scenarios and the effect on the Residential and GS Mass Market forecasts should to be included.

Concluding Remark #6

6. Manitoba Hydro should explain the alternative models considered for the GS Mass market forecast.

elenchus

15

Concluding Remark #7

7. Alternative economic growth scenarios and additional transparency and analysis on the Top Consumers forecast would improve transparency.

elenchus

16

Concluding Remark #8

8. Elenchus believes the weather adjustment process applied by Manitoba Hydro should be treated with caution and may result in potentially spurious outcomes. Manitoba Hydro should investigate using time series longer than 2 years to estimate the weather sensitivity of its weather sensitive consumption sectors. A more thorough explanation of the weather adjustment process needs to be developed to allow stakeholders to understand the process more clearly.

elenchus

Scope of Work, #1

From an energy demand perspective, comment on the extent to which Manitoba's Preferred Development Plan addresses the reliability and security requirements of Manitoba's electricity supply.

- The Preferred Development Plan (and all alternatives) is designed to address the reliability and security requirements of Manitoba's electricity supply. While actual demand could exceed the forecast, the adequacy of supply would only be compromised in the most extreme circumstances.

SOW 1; Elenchus Load Forecast Report sections 3.1 and 3.2

elenchus

Scope of Work, #2

Review Manitoba Hydro's Load Forecast factors and comment on whether they are complete, reasonable and accurate.

- The load forecasting methodology is reasonable assuming there are no significant structural changes to the demand drivers that underpin the forecasting methodology. However, given the time frame of the NFAT analysis, it can be expected that there may be significant structural changes that could result in dramatically different domestic demand in the coming decades.

SOW 2; Elenchus Load Forecast Report sections 2.1

elenchus

19

Scope of Work, #3

Comment on the use of an econometric and end-use forecasting methodology.

- The methodology is generally reasonable although some refinements are suggested.

SOW 3; Elenchus Load Forecast Report sections 2.1.1 and 2.1.2

elenchus

20

Scope of Work, #4

Assess the reliability of Manitoba Hydro's short- and long-term domestic Load Forecast modelling.

- Manitoba Hydro's methodology is generally appropriate for short term forecasting (no structural changes). There is limited consideration of factors that could dramatically impact on demand in the long run (over the next decade and beyond).

SOW 4; Elenchus Load Forecast Report sections 3.1 and 3.2

elenchus

21

Scope of Work, #5

Review the extent to which Manitoba Hydro has used appropriate scenario planning to examine the potential impact of changes in the industry, the Manitoba and Canadian economies, available technology (generation and loads) and energy efficiency measures (costs and cost effectiveness).

- Rather than a specific point forecast associated only with a reference forecast, Elenchus believes an approach with a range of outcomes based on Low, Medium-Low, Reference, Medium-High and High economic scenarios should be paired with load forecast outcomes. Manitoba Hydro used this approach until 2009.

SOW 5; Elenchus Load Forecast Report sections 3.2

elenchus

22

Scope of Work, #6

Comment on the appropriate use of probability analysis in projected Load Forecasts.

- The probability approach used by Manitoba Hydro is less transparent and provides less insight than the multiple scenario approach used until 2009. See item 5 above.

SOW 6; Elenchus Load Forecast Report sections 2.1.1 and 2.1.2

elenchus

23

Scope of Work, #7

Comment on the extent to which retrospective load analysis provides confidence in the Load Forecast.

- Retrospective load analysis indicates that confidence in the load forecast is justified except for the Top Users. Top User loads can change significantly in unanticipated ways since their demands are driven by many idiosyncratic factors that cannot be known to Manitoba Hydro.

SOW 7; Elenchus Load Forecast Report sections 2.1 and 3.2

elenchus

24

Scope of Work, #8

Review Manitoba Hydro's 2012 in 2013 load forecasts.

- The review is captured by the other SOW items.

SOW 8; Elenchus Load Forecast Report section 2

elenchus

Scope of Work, #9 a)

Compare Manitoba Hydro's 2012 and 2013 Load Forecasts with Manitoba Hydro's historical load forecasts back to 2008 with specific reference to:

a) Population growth (birthrates/immigration)

Historical trends in population growth are reflected in the load forecast. Possible future changes in the historic trends are not specifically considered. See item 5 above.

SOW 9 a); Elenchus Load Forecast Report section 2.1.1

elenchus

Scope of Work, #9 b)

Compare Manitoba Hydro's 2012 and 2013 Load Forecasts with Manitoba Hydro's historical load forecasts back to 2008 with specific reference to:

b) Changes in number, size and occupancy of residential dwellings

Historical trends are reflected in the load forecast. Possible future changes in the historic trends are not specifically considered. See item 5 above.

SOW 9 b); Elenchus Load Forecast Report section 2.1.1

elenchus

27

Scope of Work, #9 c)

Compare Manitoba Hydro's 2012 and 2013 Load Forecasts with Manitoba Hydro's historical load forecasts back to 2008 with specific reference to:

c) A comparison of the Load Forecast with similar markets (i.e., are Manitoba Hydro's assumptions consistent with neighbouring jurisdictions)

- Manitoba Hydro's load forecasting methodology and accuracy are broadly consistent with load forecasting in other jurisdictions. For long term planning, however, increasing consideration is being given to the possibility of "game changers".

SOW 9 c); Elenchus Load Forecast Report section 3.2

elenchus

28

Scope of Work, #9 d)

Compare Manitoba Hydro's 2012 and 2013 Load Forecasts with Manitoba Hydro's historical load forecasts back to 2008 with specific reference to:

d) Peak demand and energy trends including seasonal variations in load forecasting

- Manitoba Hydro's methodology is based on the questionable assumption that past trends will continue for the full planning period.
- The load forecast does not address seasonal variations.

SOW 9 d); Elenchus Load Forecast Report section 3.1

elenchus

29

Scope of Work, #10

Review Manitoba Hydro's weather adjustment methodology, with specific reference to:

a) Non-heating load

b) Electric heating loads

c) Commercial or mass-market consumption

d) Distribution Losses

e) Transmission Losses

- Manitoba Hydro gives explicit and appropriate consideration to each factor identified in its weather adjustment methodology, subject to caveats noted elsewhere.

SOW 10; Elenchus Load Forecast Report section 2.1.4

elenchus

30

Scope of Work, #11

Assess the consistency of transmission and distribution losses under various loads and weather occurrences and the assignment of such losses to customer classes.

- The load forecast does not include this level of detail.

SOW 11; Elenchus Load Forecast Report – n.a.

elenchus 31

Scope of Work, #12

Assess the impacts on Load Forecasts resulting from potential fuel switching, particularly in light of recent trends in the cost of natural gas.

- Potential fuel switching is treated for load forecasting purposes as an independent customer decision. Since Manitoba Hydro controls both the electric and natural gas utilities, its decisions and marketing policies are likely to have significant influence on both the decisions made by developers for new buildings and fuel switching decisions (driven in part by the availability of natural gas as a result of system expansions). Over the longer term, the market penetration of natural gas for space heating could be significantly influenced by Manitoba Hydro.

SOW 12; Elenchus Load Forecast Report section 2.1.1

elenchus 32

Scope of Work, #13

Comment on the price elasticity and the impact of electricity rate changes in demand.

- Manitoba Hydro has not been able to quantify the price elasticity of demand for electricity empirically and it consequently excludes price elasticity from its load forecasting methodology. This result may be a reflection of the historically low price of electricity in Manitoba. It is not consistent with the experience of other jurisdictions to assume there will be no price response in the event of more significant electricity rate increases in the future.

SOW 13; Elenchus Load Forecast Report section 2.1.3

elenchus

33

Scope of Work, #14

Review and comment on Manitoba Hydro's historical and forecast growth in electric heating relative to natural gas heating in the context of electricity and natural gas pricing.

- See Slide 31 (SOW #12) above.

SOW 14; Elenchus Load Forecast Report section 2.1.1

elenchus

34

Scope of Work, #15

Review and comment on the extent to which Demand-Side Management and energy efficiency measures have been relied on as an alternative to generation.

- Manitoba Hydro has not utilized integrated resource planning as a basis for establishing the cost effective level of DSM in Manitoba. It has conducted sensitivity analysis with respect to the currently planned level of DSM.

SOW 15; Elenchus Load Forecast Report – n.a., See the Elenchus DSM Report

elenchus

35

Scope of Work, #16

Review and comment on the appropriateness of and uncertainty related to the timelines for future generation assets to meet domestic load requirements and export commitments.

- From a load forecasting perspective, the timelines appear adequate for meeting domestic load requirements and export commitments. The greatest risk relates to the ability to adjust to lower growth in demand in the event of market transformations such as grid parity in Manitoba and/or export jurisdictions.

SOW 16; Elenchus Load Forecast Report section 4

elenchus

36

Scope of Work, #17

Comment on the impact of global warming on the Load Forecast.

- The impact of climate change on the climate in specific areas is proving very difficult to predict. The primary impact appears to be increased uncertainty and more frequent extreme weather conditions. It is therefore difficult to build the impact of climate change into the Manitoba Hydro load forecast. The primary consideration is that longer term trends are more uncertain than ever, which suggests that flexibility in development plans may be of increased importance.

SOW 17; Elenchus Load Forecast Report section 3.2

elenchus

37

Scope of Work, #18

Comment on the Load Forecast for industrial and commercial consumers.

- The forecast for Top Consumers is the only component of the load forecast that has shown large variances. In recent years, there has been a tendency to over-forecast Top Consumer demand.
- There is a risk that Top Consumers could opt for self-generation in the future resulting in declining rather than decreasing demand. There is also a risk that closure in the coming decades could have a significant impact on Top Consumer demand given the small number of customers in this class.

SOW 18; Elenchus Load Forecast Report section 2.1.3

elenchus

38

Scope of Work, #19

Upon prior approval by the NFAT Panel, address any other issues that may be identified in reviewing Manitoba Hydro's evidence or are requested by the NFAT Panel.

- Not applicable.

Manitoba Hydro
2017/18 & 2018/19
Electric General Rate Application

December 4, 2017

Kelvin Shepherd, P.Eng
President & Chief Executive Officer
Jamie McCallum
Chief Finance & Strategy Officer

Agenda

I. Overview of Manitoba Hydro
II. Highlights of Manitoba Hydro's Financial Plan
III. Manitoba Hydro Faces Large Risks
IV. Facts of this Rate Case
V. How Did We Get Here?
VI. Addressing Key Concerns
VII. Summary

Manitoba Hydro

Today's Presenters

- Kelvin Shepherd, P. Eng.
  - Appointed President and CEO December 2015
  - 36 years of progressive technical and management experience in large telecommunications companies
  - 9 years as President of MTS
  - Prior to that was Chief Operating Officer and Chief Technology Officer
  - Bachelor of Science, Electrical Engineering, University of Saskatchewan (1981)
- Jamie McCallum
  - Appointed Chief Finance and Strategy Officer February 2017
  - 22 years of experience in strategic and financial planning, corporate stewardship, capital management and capital markets
  - 2004 to 2016: Managing Director of Richardson Capital Limited
  - 1995 to 2004: Investment Banker at several leading global firms
  - Bachelor of Commerce (Hons), University of Manitoba (1995)
  - Former director of six corporations

A New Financial Plan for Hydro

- Old plans were not adequate and far too risky
- MH business outlook has deteriorated significantly
- MH will soon have an unsustainable level of debt
  - Not supportable with rate increases of old plan
- Current rates are not funding the ongoing costs of the current system
- Old financial plan has now **failed**

A New Financial Plan for Hydro

- A new plan is required to continue to keep providing safe, reliable and competitively priced power to Manitobans
  - MH has taken action to increase and accelerate internal cost reductions
  - Streamlined organization, reduced senior management and targeted 15% staff reduction
  - Rates need to be increased more in near term to help mitigate increase in debt levels
  - 10-year plan provides capacity to manage operational/business risks and keep rates lower over long term
- Appreciate the challenges associated with higher rates
  - But it will be worse not to act

I. Overview of Manitoba Hydro

Corporate Profile

Electric Residential Customers **503,000**	Electric Commercial /Industrial Customers **70,000**	Consolidated Assets(1) **$23.7 Billion**	Consolidated Debt(1) **$17.9 Billion**
2016/17 Consolidated Revenue **$2.3 Billion**	2016/17 Electric Segment Domestic Revenue **$1.4 Billion**	2016/17 Electric Export Revenue **$0.5 Billion**	2016/17 Natural Gas Revenue **$0.3 Billion**
2016/17 Consolidated Net Income(2) **$51 Million**	2016/17 Electric Segment Net Income(2) **$33 Million**	Leader in Indigenous Employment **≈1 in 5 Employees**	Equivalent Full Time Employees(3) **5,990**

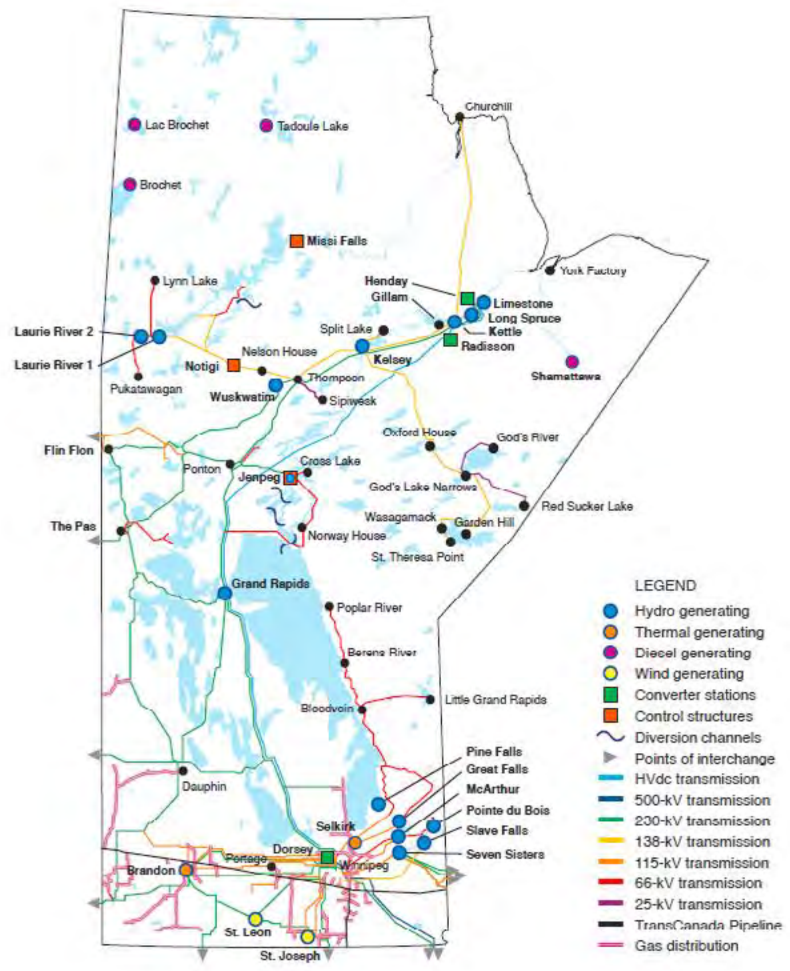
(1) As of September 30, 2017
(2) Excludes $20 million non-recurring gain
(3) As of October 2017 excluding subsidiaries

System Overview

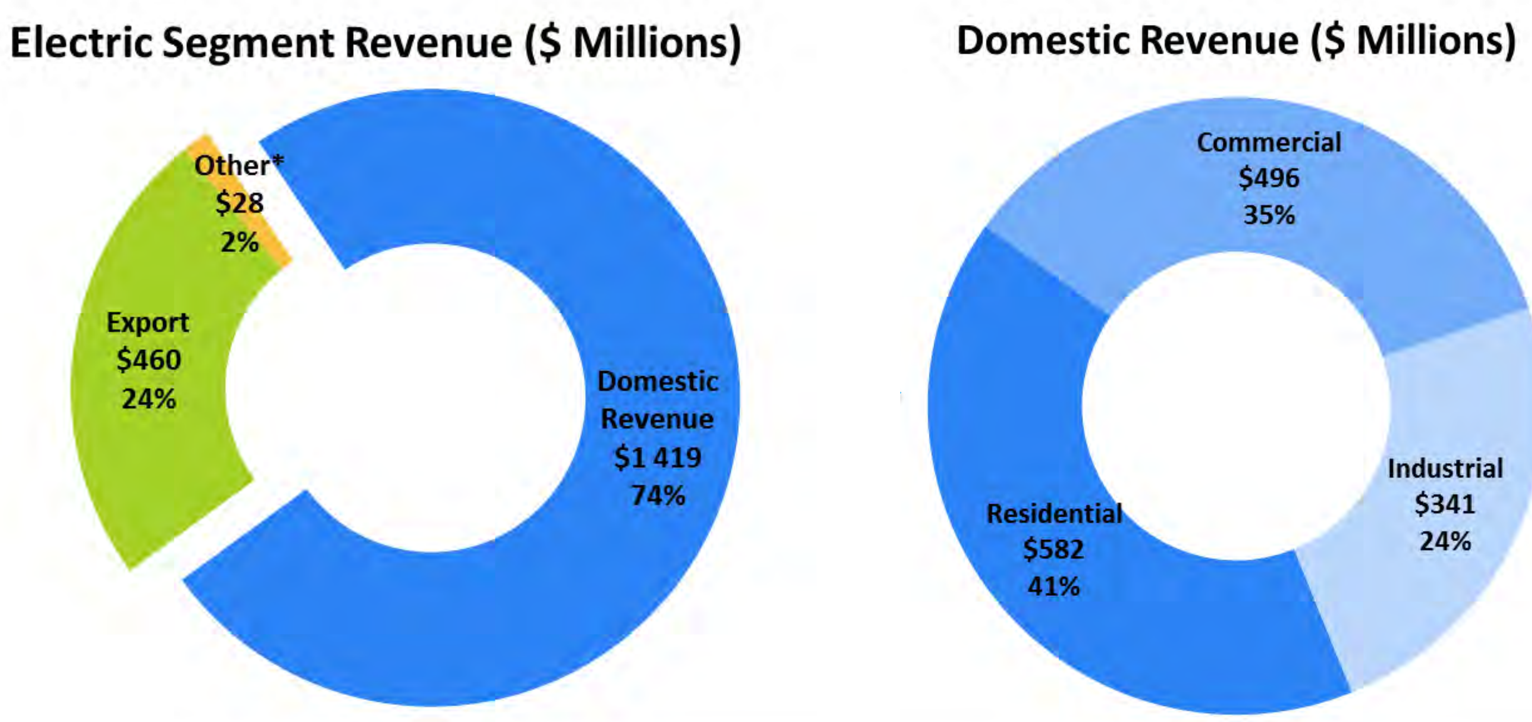
Total Customers	Hydro Generating Stations
573,000	**15**

Electricity Generating Capability	Distribution Lines
5,679 MW	**68,100 KM**

Transmission Lines	2016/17 Total Energy Supplied
18,500 KM	**36.4 TWh**



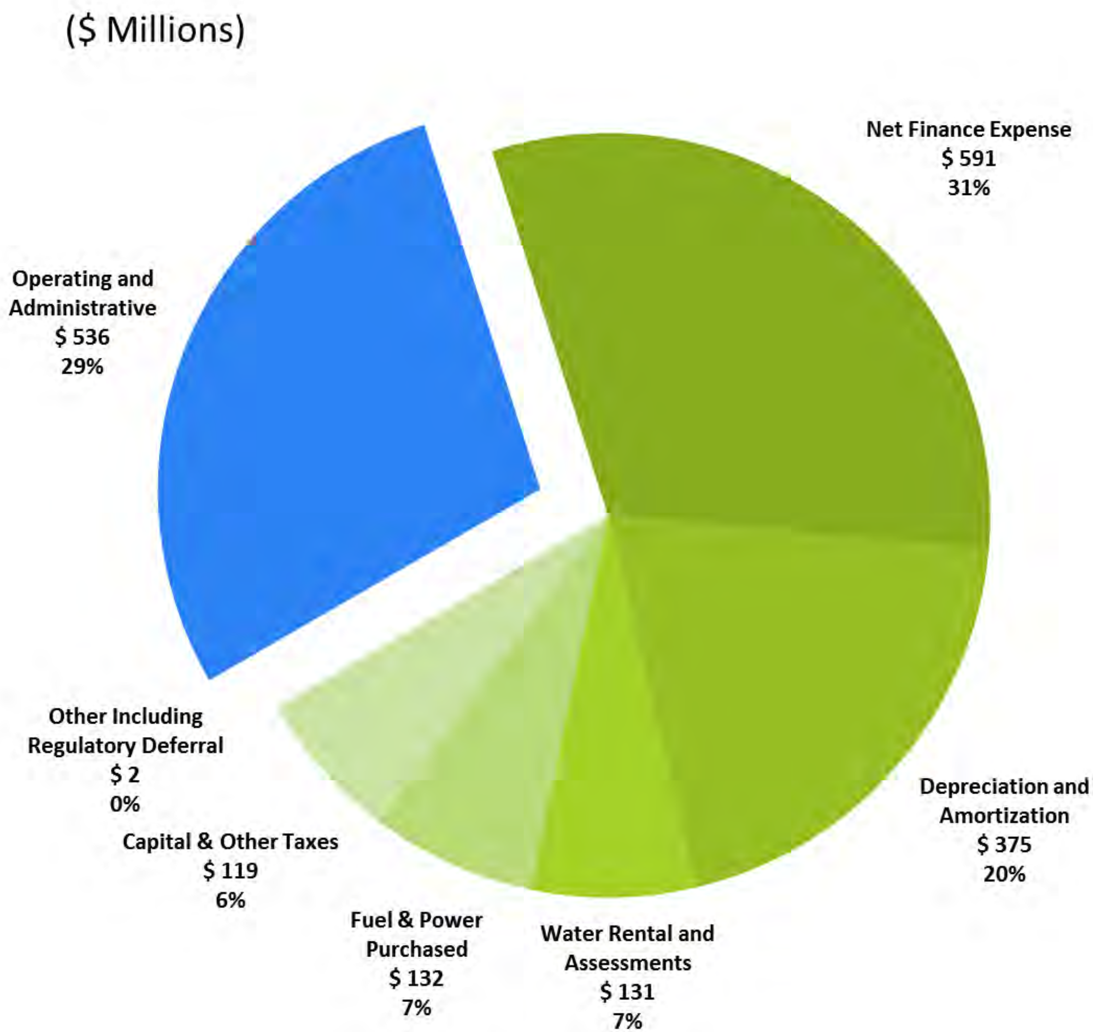
Revenue - Electric



*Excludes $20 million non-recurring gain

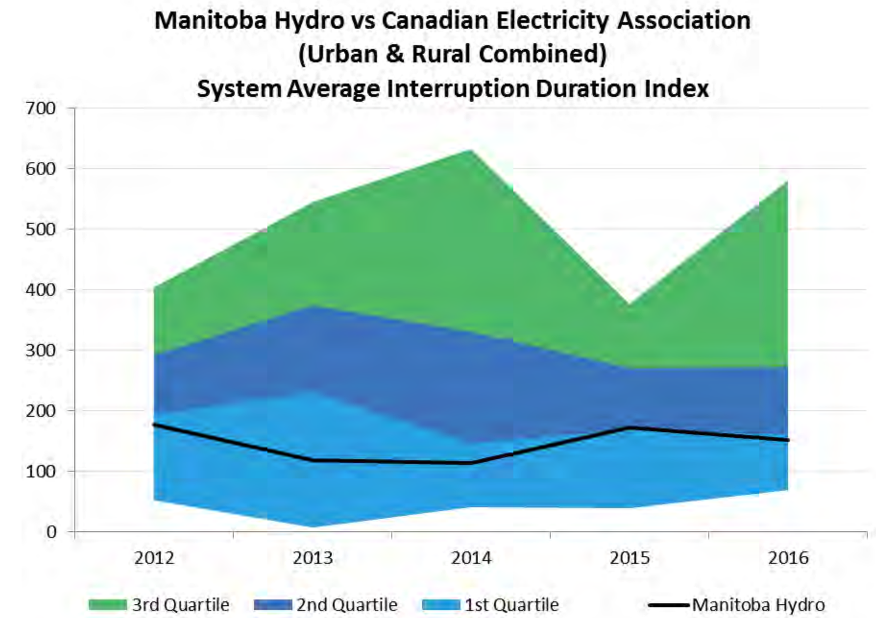
832

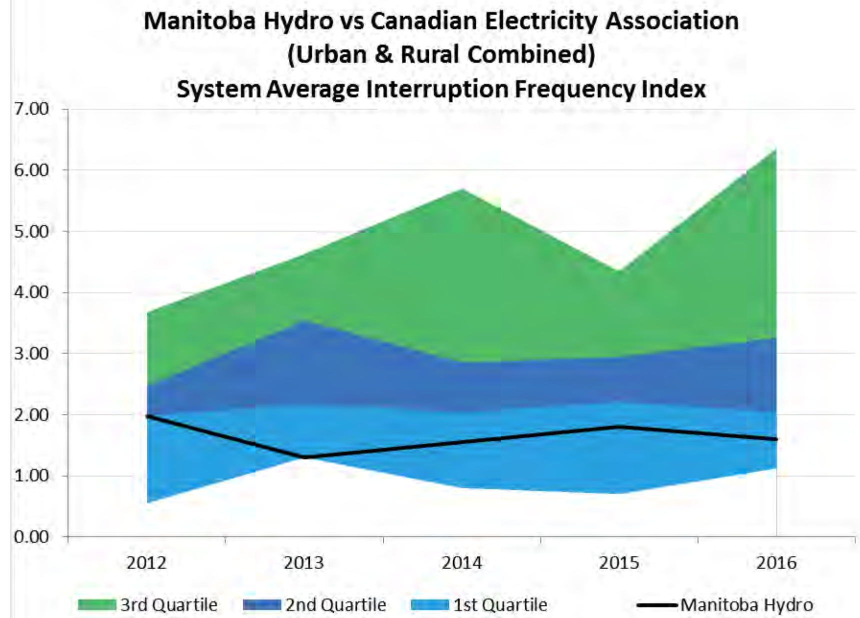
Cost Structure – Electric (2016/17)



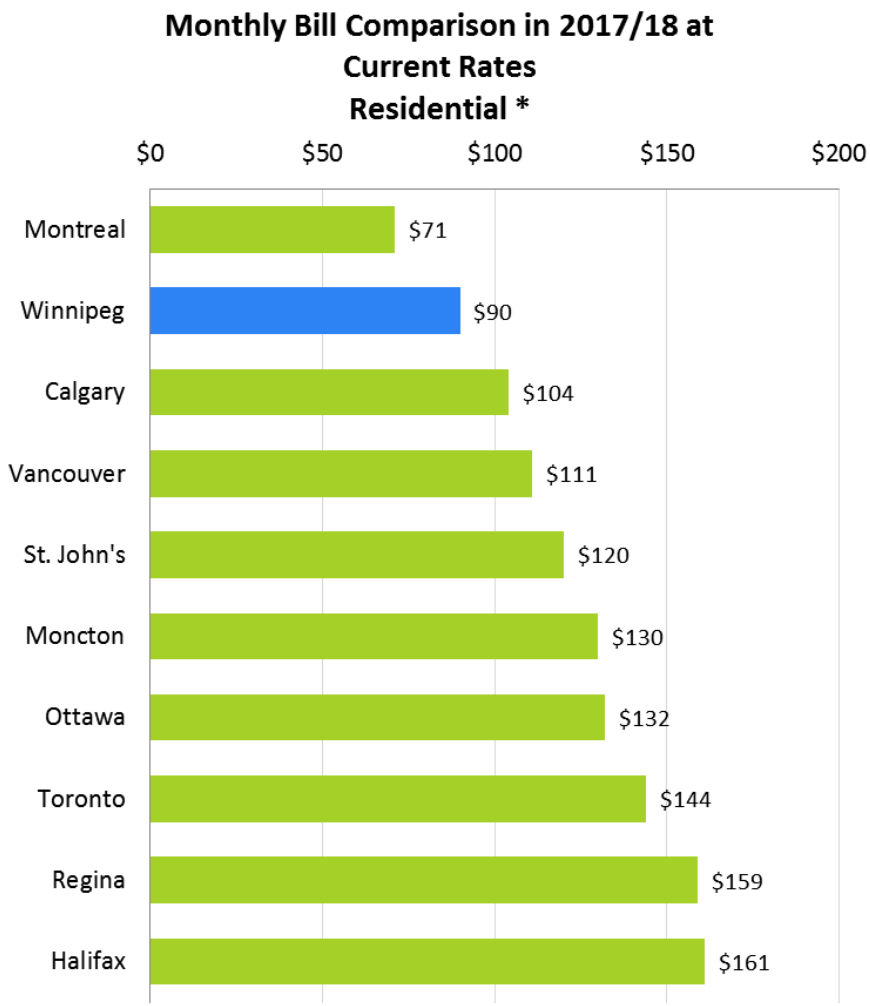
Reliability

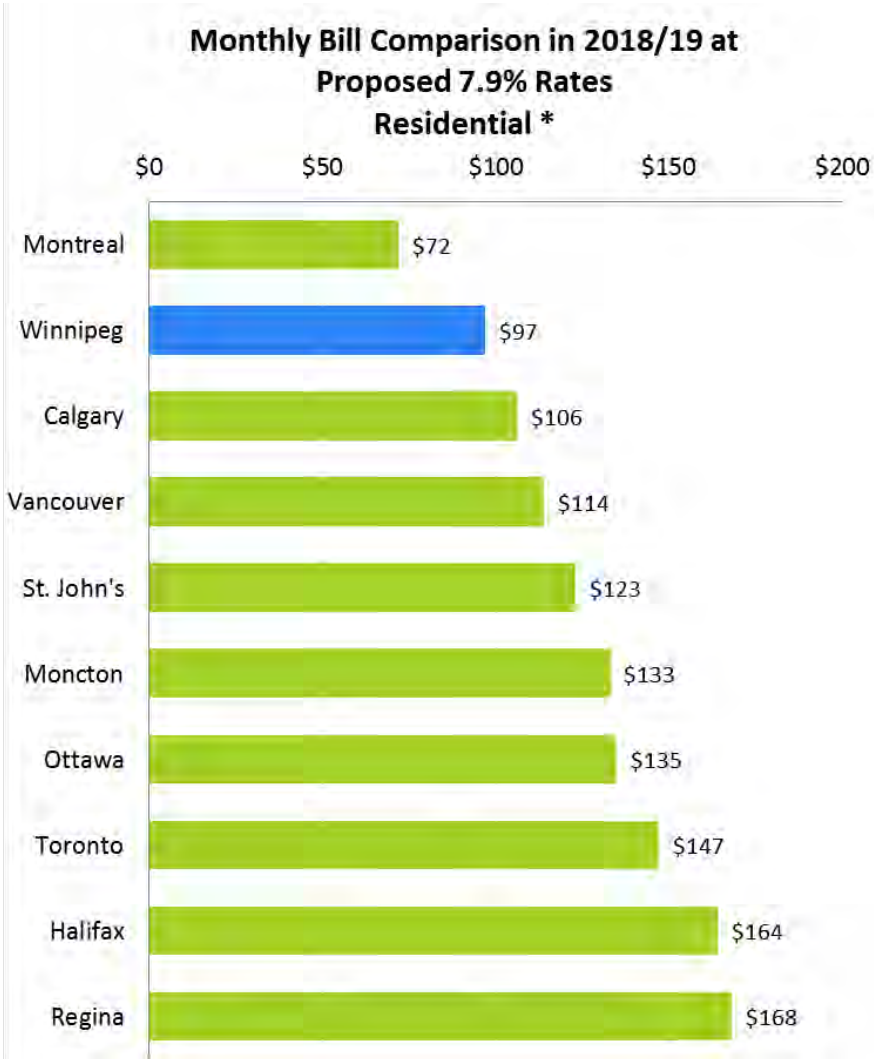
- Manitoba Hydro strives to maintain its reliability performance and looks to the performance of its peer group as one measure of its success





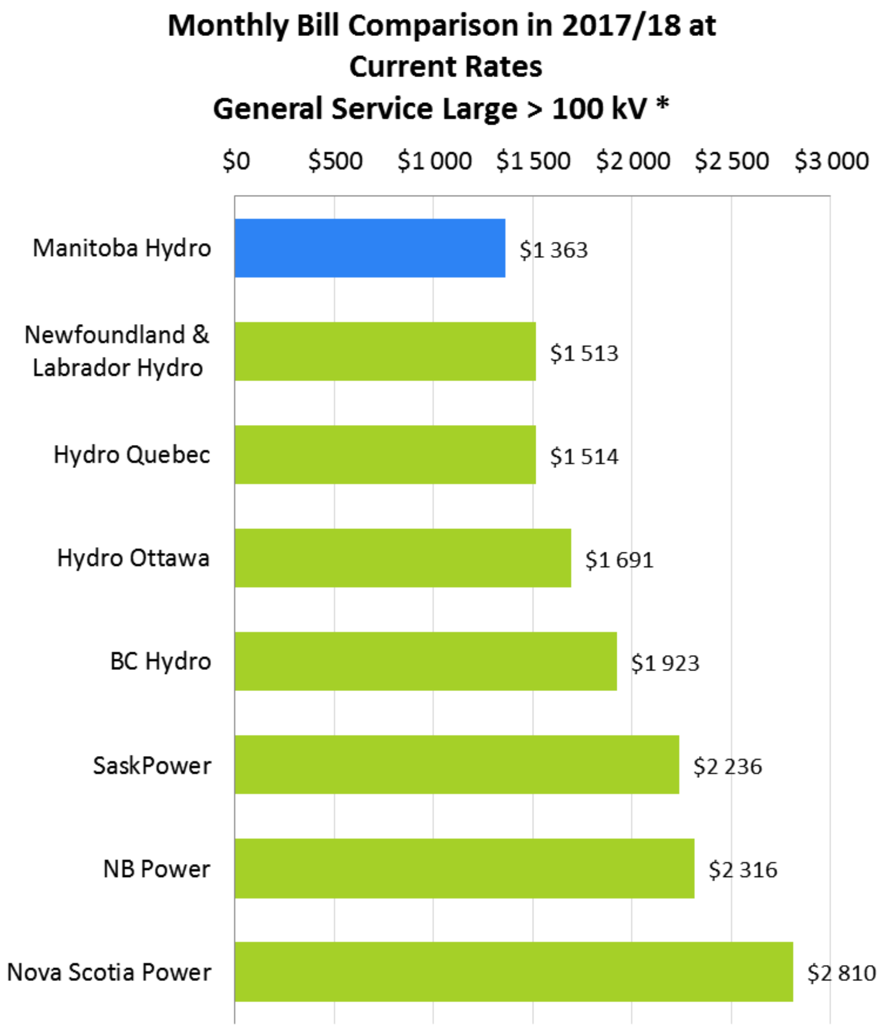
Rate Comparisons - Residential

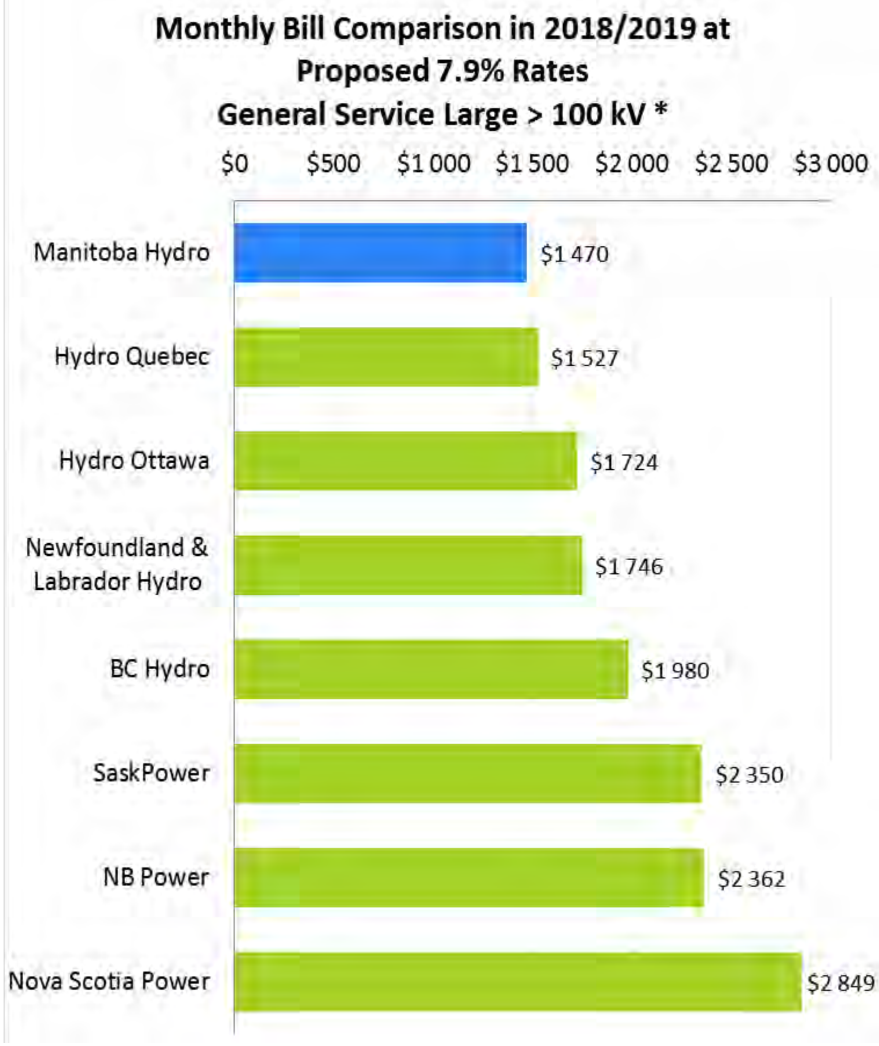




***Consumption: 1,000 kWh/Month**

Rate Comparisons - Industrial





Consumption: 31,000 MWh and 50 MW/Month; $ in 000's

Strategic Imperatives

Manitoba Hydro

OUR MISSION

We create value for Manitobans by meeting our customers' expectations for the delivery of safe, reliable energy services at a fair price

STRATEGIC PRIORITIES

Restore Financial Sustainability	Deliver an Excellent Customer Experience	Engage Employees in our Transformation	Respect & Support Indigenous Peoples in all Aspects of our Business

FOUNDATIONAL PRINCIPLES

Safety	Environmental Leadership
Respectful Engagement with Communities and Stakeholders	Respect for Each Other

II. Manitoba Hydro's New Financial Plan

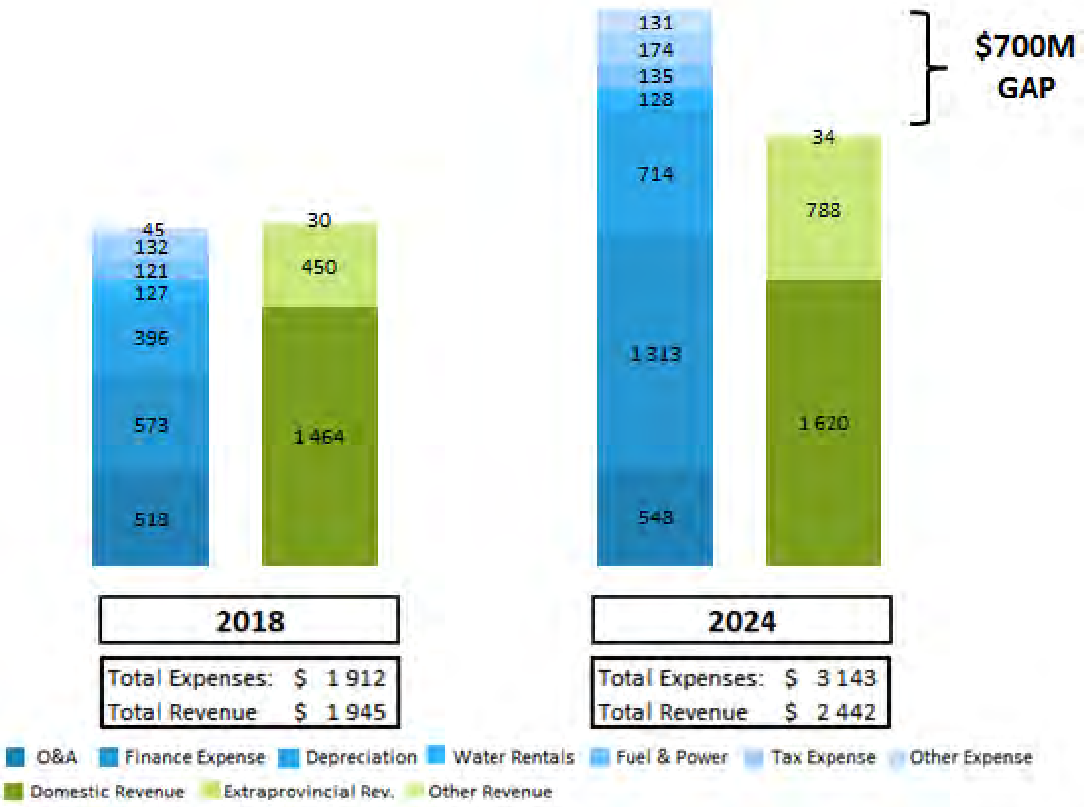
What Our Plan Had to Address

- Substantial deterioration in business outlook and growth expectations since last GRA/NFAT
- Current and future rate insufficiency
  - Negative net income: no cushion for scale of business and inherent risks
  - Borrowing money to fund core, continuing operations
- Growth in debt not sustainable
  - Not supported by 3.95% rate plan
- Risk of unpredictable and higher long term rate increases
- Inadequate financial strength for Manitoba Hydro to continue to meet its mandate
  - Need to invest in aging infrastructure
  - Potential industry and technology change threatening traditional utility model

Near-Term Income Shortfall

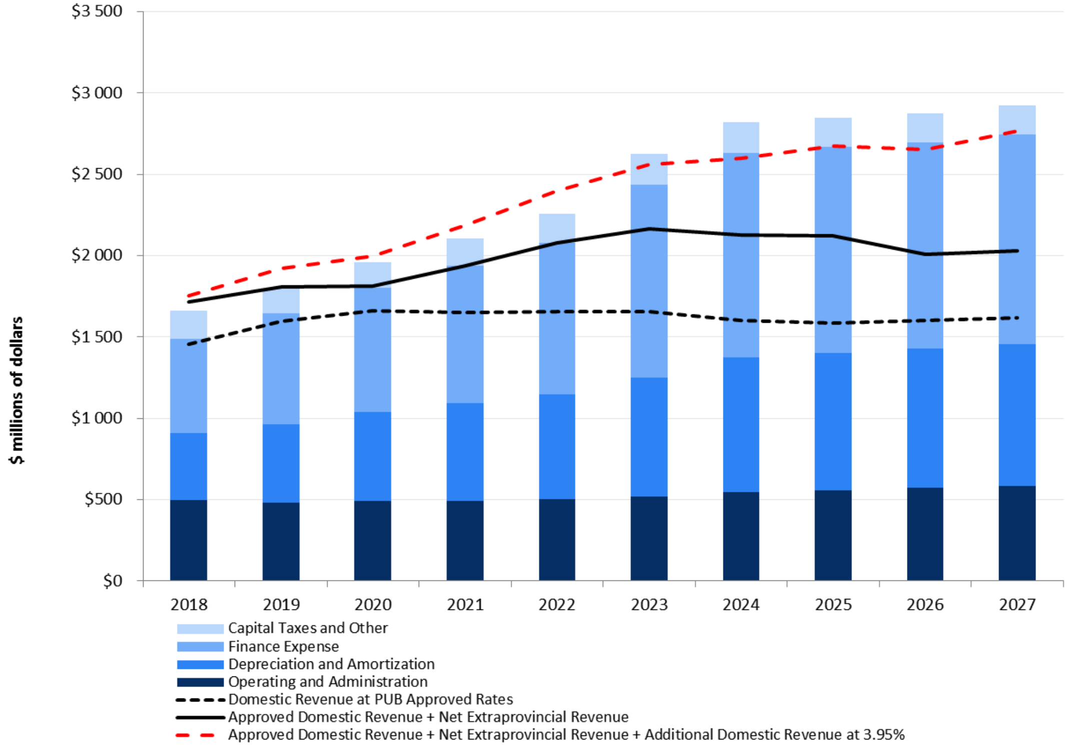
- Without rate increases, Manitoba Hydro will have a $700 million per year revenue shortfall in the first year Keeyask is fully in service
  - $700 million gap represents a 43% increase over 2017/18 domestic revenues
  - 3.95% rate increase would only address $480 million leaving a $220 million gap

- Breakeven income on $30 billion in assets cannot be the goal in any event



Old Financial Plan Does Not Work

- MH15 rate path (3.95% until 2029) fails to generate sufficient revenue to address inescapable growth in carrying costs
  - Cumulative net loss until 2031/32 (15 years); Debt >$25 billion



841

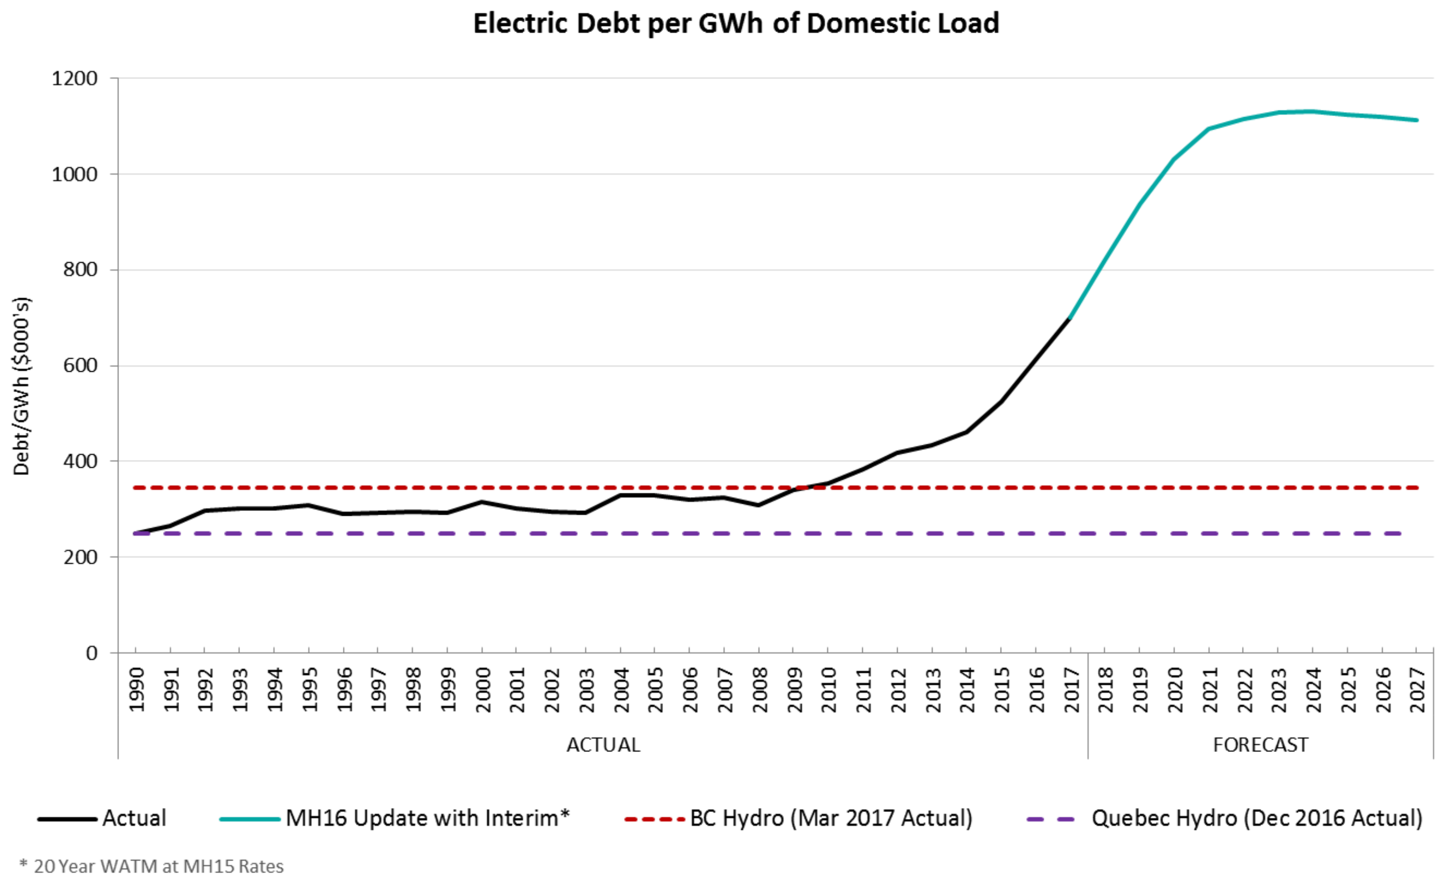
Cash Deficit on Current Operations

(In Millions of Dollars)	2015/16 Actual	2016/17 Actual	2017/18 Forecast (1)
Receipts from Customers	1 907	1 997	2 152
Payments to Suppliers and Employees	(736)	(933)	(892)
Interest Paid (2)	(575)	(580)	(550)
Business Operations Capital Expenditures	(616)	(578)	(586)
Demand Side Management	(54)	(50)	(55)
Mitigation and Other Deferred Expenditures	(22)	(5)	(27)
Ineligible Overhead	(20)	(20)	(20)
Cash From Operations Less Capex (2)	**(116)**	**(169)**	**22**
Mitigation, Major Development & Other Liability Payments	(26)	(13)	(59)
City of Winnipeg Payments	(16)	(16)	(16)
Adjusted Cash Deficit	**(158)**	**(198)**	**(53)**
Interest on Bipole III Reliability Project (2)	(52)	(98)	(174)
Contribution from Water Conditions (3)	(62)	(87)	(91)
Cash Flow (Deficiency)/Surplus	**(272)**	**(383)**	**(318)**
Shortfall vs. Domestic Revenue (Gross of BPIII Deferral)	**19%**	**25%**	**20%**

(1) MH16 Update with Interim not adjusted downward for revised outlook for 2017/18 per the MHEB Quarterly Report ended September 30, 2017
(2) For presentation purposes above, MH has separated out interest paid and capitalized to the Bipole III for further clarity
(3) From Figure 15 of Supplement to Tab 3

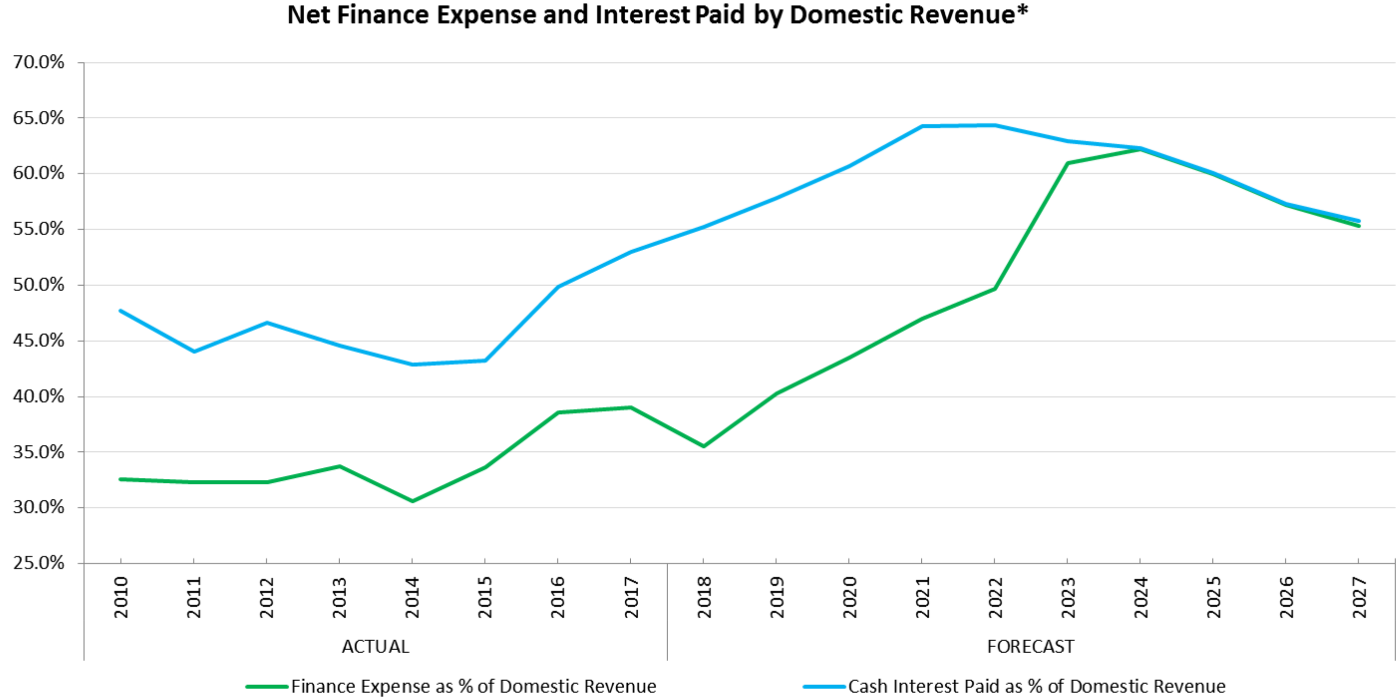
The Debt Problem

- Rates are insufficient – while debt is growing out of all historical proportion



The Debt Problem

- Without stronger rate action, interest costs will consume an ever larger share of domestic revenue
  - Fewer dollars left over to manage interest rate (or any other) volatility – which is entirely on the shoulders of domestic ratepayer



*20 Year WATM at MH15 Rates
Interest Paid is presented gross of capitalized interest

MH16 – A New Plan

- A 10-year plan to restore Manitoba Hydro to a minimum level of financial health
- Substantially accelerated operating cost reductions
- Acceleration of rate increases
  - Enabling lower and more stable rates in the long run vs. 3.95% plan
- Positive cash flow after Keeyask comes into service
  - Enabling more aggressive debt management strategy
  - Save interest costs and mitigate rate increases

Cost Reductions

- **$0.8 billion improvement in Operating & Administrative costs in 2017/18 - 2026/27 period as compared to MH15**
- New financial plan includes 900 person headcount reduction (15%)
  - On top of 429 operational position reduction from 2013/14 to 2016/17
  - 30% reduction in executive and 25% reduction in management
  - Voluntary Departure Program has identified 821 individuals to leave with the majority by February 1, 2018
  - Approximate savings of $90 million annually inclusive of salaries and benefits
    - It is estimated $70 million will come from O&A
- New initiatives expected to yield Supply Chain / Purchasing efficiencies of approximately $50 million per year by 2020/21
  - Approximately 30% of savings come from O&A

Rate Increase Profile

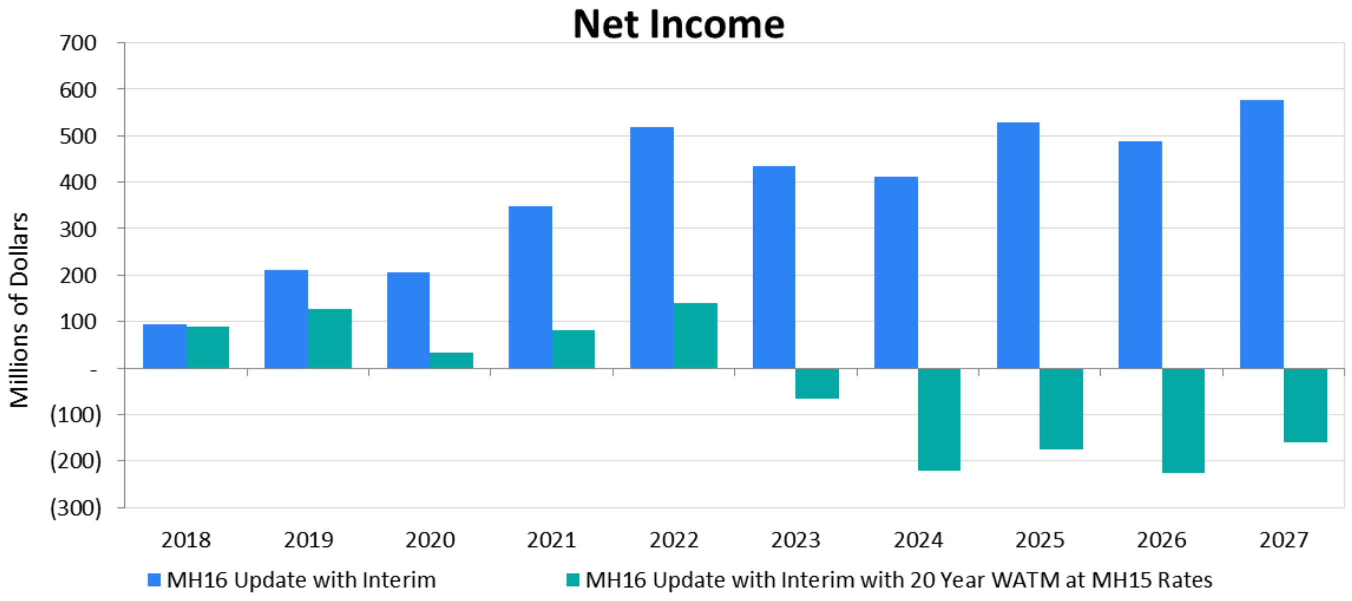
Year	Effective Date	"Old" Plans (3.95% Rate Increases)	MH16 (As Filed)	MH16 Update with Interim
2016/17	August 1, 2016	**3.36%**	**3.36%**	**3.36%**
2017/18	August 1, 2017	**3.36%**	**7.90%**	**3.36%**
2018/19	April 1, 2018	**3.95%**	**7.90%**	**7.90%**
2019/20	April 1, 2019	3.95%	7.90%	7.90%
2020/21	April 1, 2020	3.95%	7.90%	7.90%
2021/22	April 1, 2021	3.95%	7.90%	7.90%
2022/23	April 1, 2022	3.95%	2.00%	7.90%
2023/24	April 1, 2023	3.95%	2.00%	7.90%
2024/25	April 1, 2024	3.95%	2.00%	4.54%
2025/26	April 1, 2025	3.95%	2.00%	2.00%
2026/27	April 1, 2026	3.95%	2.00%	2.00%
	After 2027	3.95% for 9 more years to reach 25% equity by 2035/36	TBD	TBD

Debt Terming Strategy

- $500 million **potential** savings opportunity over 10 years is a benefit enabled by taking necessary rate action to address unsustainable debt
- Without expectation of any free cash flow – which is only possible through enhanced rate action – Manitoba Hydro’s customers would be exacerbating near-term refinancing risk
- **Not a “no risk” strategy** – insofar as cash flows don’t materialize for whatever reason, refinancing risk remains
- Even under past practice, MH will have substantial ($6 billion) refinancing risk in the 2022/23 - 2026/27 time period

Net Income Comparison

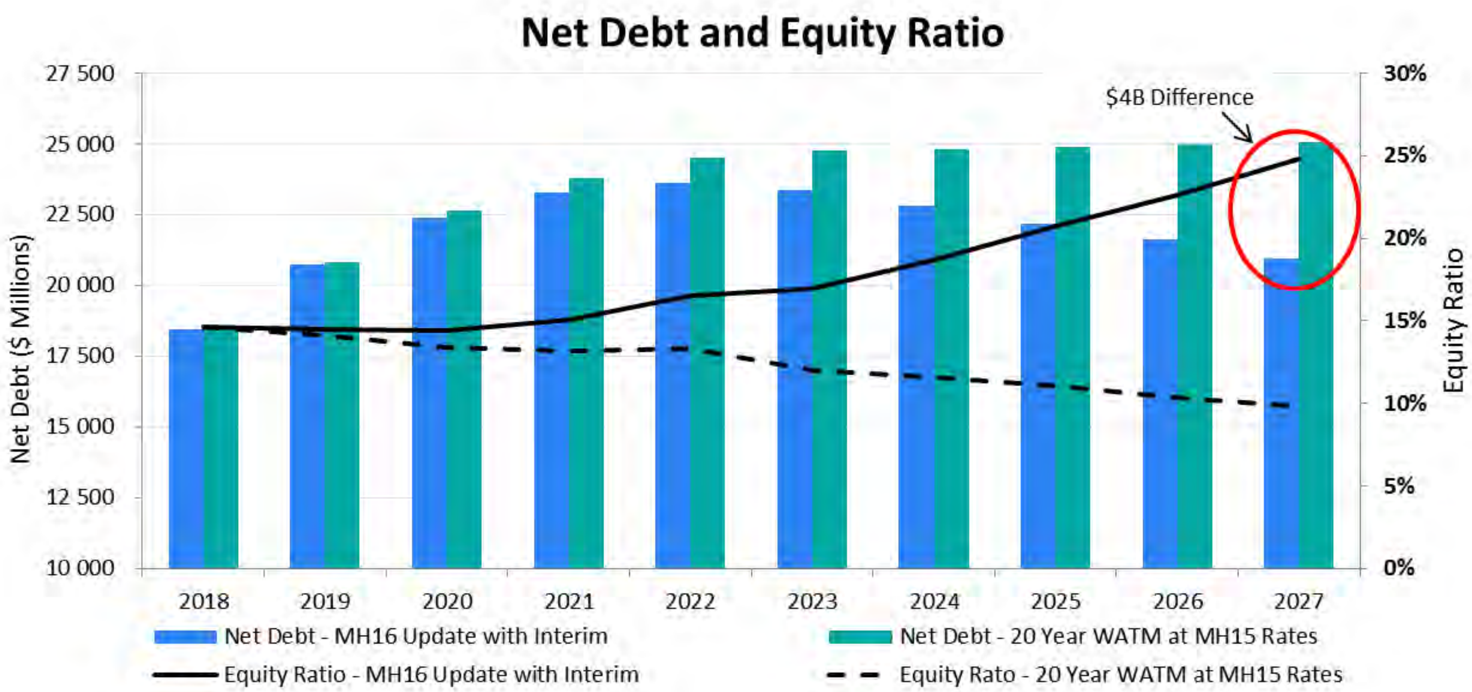
- 3.95% rate strategy leads to $850 million of net losses over the next 10 years to 2026/27
- Net income levels under the MH Plan are essential:
  - "Shock absorber" in **plan** to absorb forecast variability and adverse events
  - Creates cash flow needed to bring debt down to sustainable level



Manitoba Hydro

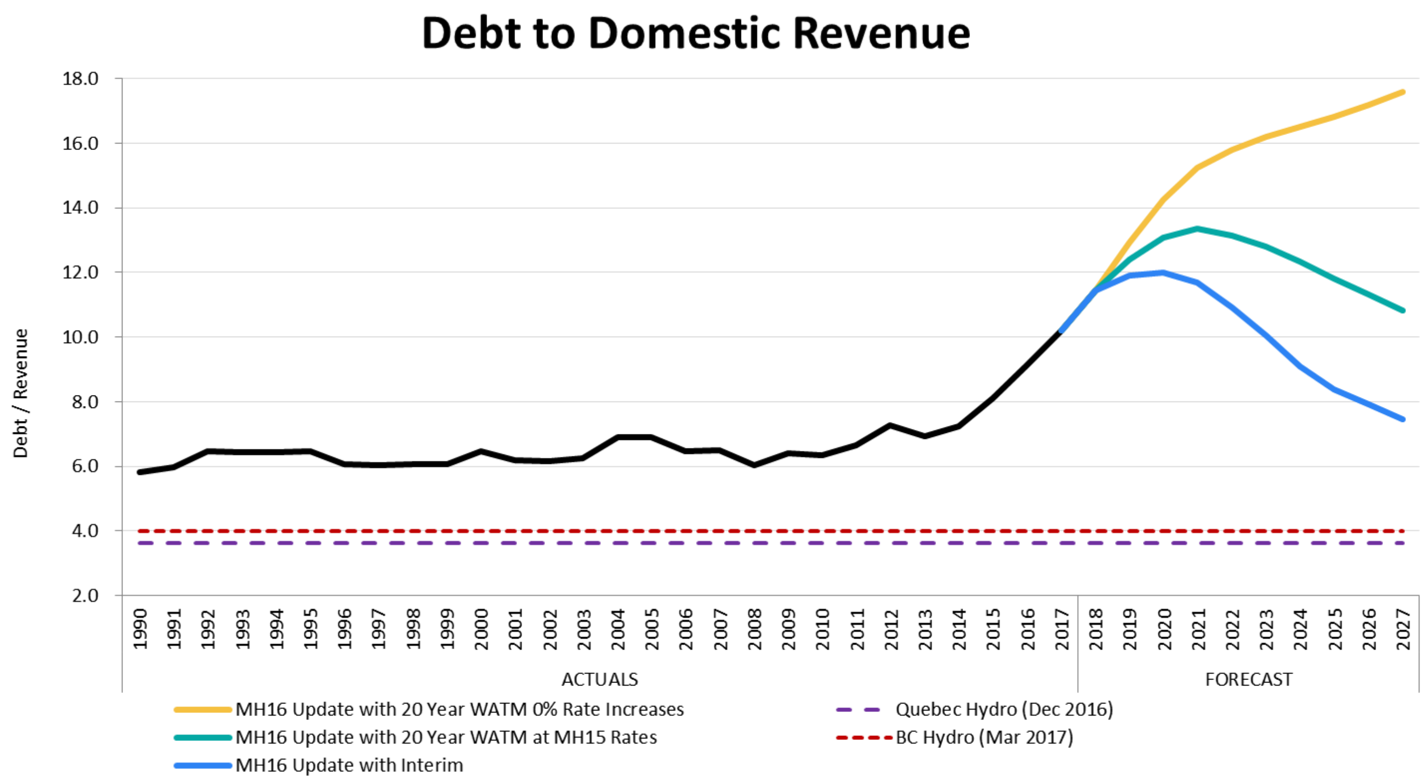
Debt Levels and Equity Ratios

- Higher net income is essential to creating cash flow
  - In short term rate increases are necessary just to ensure ratepayers are funding full current and future cost of operating the business
  - Important to maintain income at sufficient level to bring debt down to a sustainable level to achieve rate impact benefits for long term



Bringing Debt Partly Back to Scale

- The rate increases proposed reduce Manitoba Hydro to historical debt still 30% above relative levels before the major projects began
- And still well in excess of peers



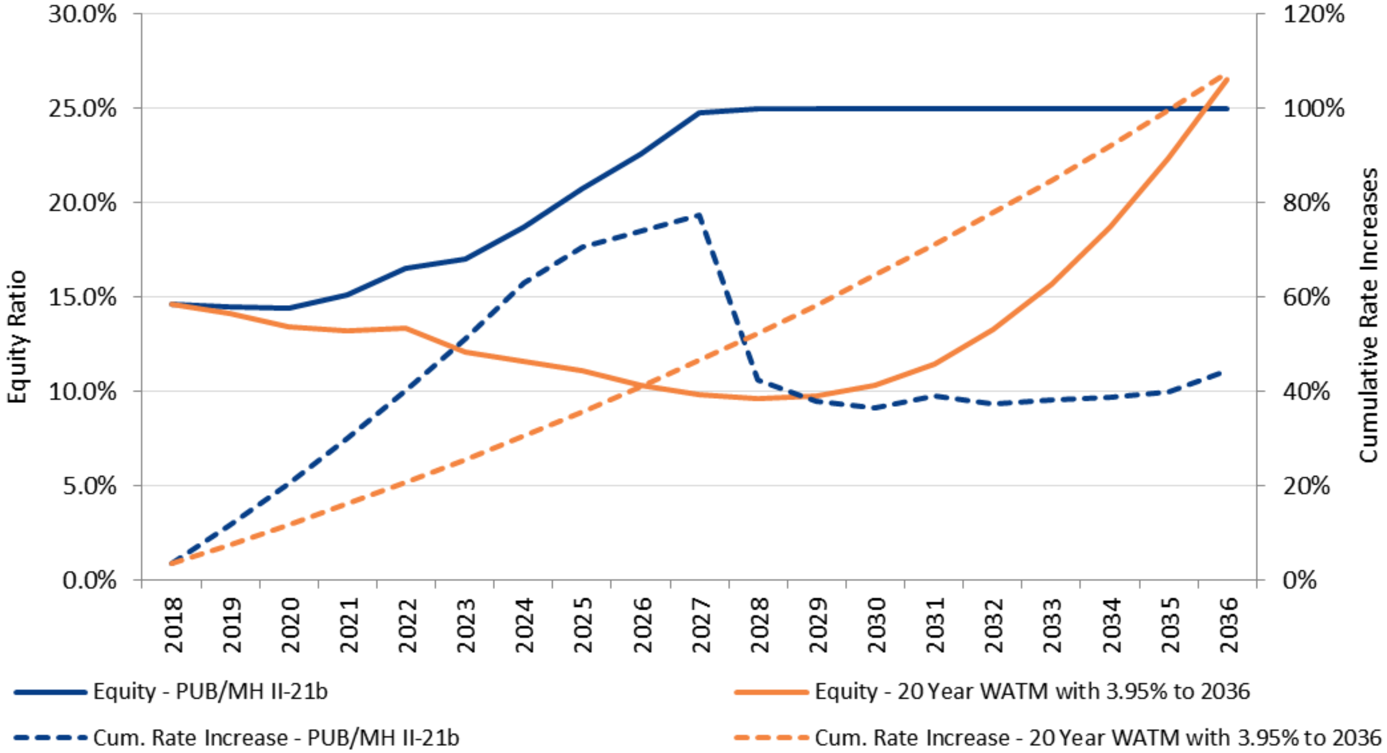
Note: excludes non-cash amortization of Bipole III Reserve Account

What Does MH16 Achieve?

- Proactive action to bring debt, while **still very high vs. relative historical levels**, to more sustainable levels
- Path of rate changes beyond 2026/27 can not be easily forecast today
- What is assured?
  - Interest rate exposure (and therefore rate volatility) lessened by removing $4 billion of debt
  - Regardless of future conditions, addressing debt problem enables lower cumulative rate increases over long term
- Near term potential economic impacts far outweighed by longer term benefit of lower cumulative rate increases and sharply reduced likelihood of contagion impacts on Province of Manitoba

Why Are We Doing This?

- Ensuring service, reliability, preparedness
- Managing risk
- Rate stability with potential for lower rates and bills in the long run



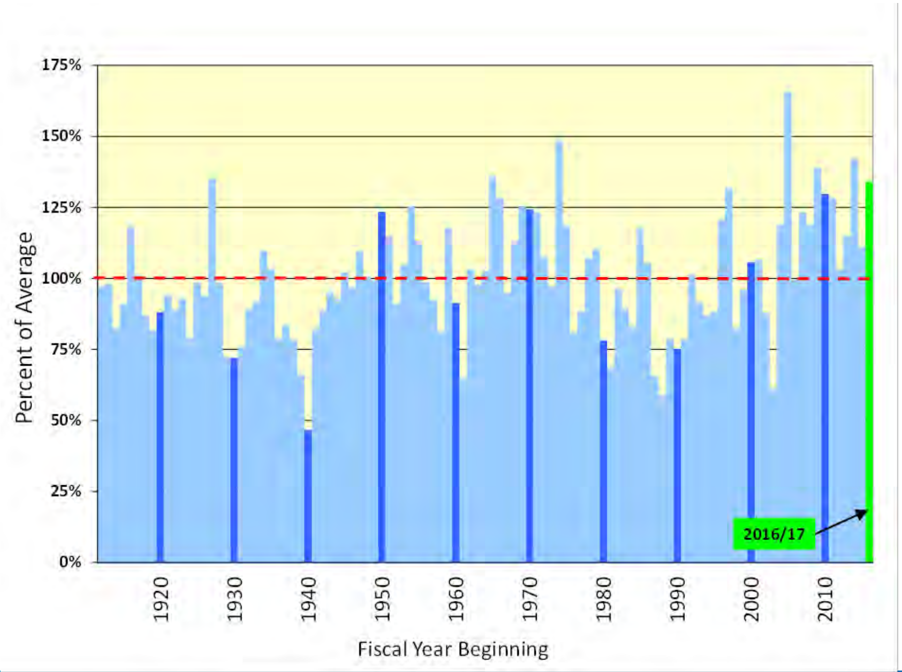
III. Manitoba Hydro Faces Large Risks

Manitoba Hydro Risks

- Manitoba Hydro presents a unique set of risks that together reinforce importance of adequate reserves:
  - **Hydrology** – no hydro-based utility has the volatility in water conditions and relative small reservoir size Manitoba Hydro must manage
  - **Debt** – Manitoba Hydro debt is, and will continue to be, more leveraged relative to the size of its operations than it has ever been creating far more exposure to interest rate volatility
  - **Export Revenue** – export sales represent a much larger share of total revenue (particularly after Keeyask) than peers creating more exposure to fluctuating export prices
  - **Major Projects** – each $500 million increase in capital costs is a $30 to $35 million annual addition to revenue requirement

Hydrologic Risk

- Manitoba Hydro's water conditions are subject to a great deal of volatility
- **Manitoba Hydro has enjoyed 14 consecutive years of greater than average system inflows**
  - Previous "wet" record was 5 years
  - Above average water has contributed $215 million to equity (or approximately 8%) since NFAT (2014/15 - 2016/17) representing virtually all of retained earnings growth in that time frame



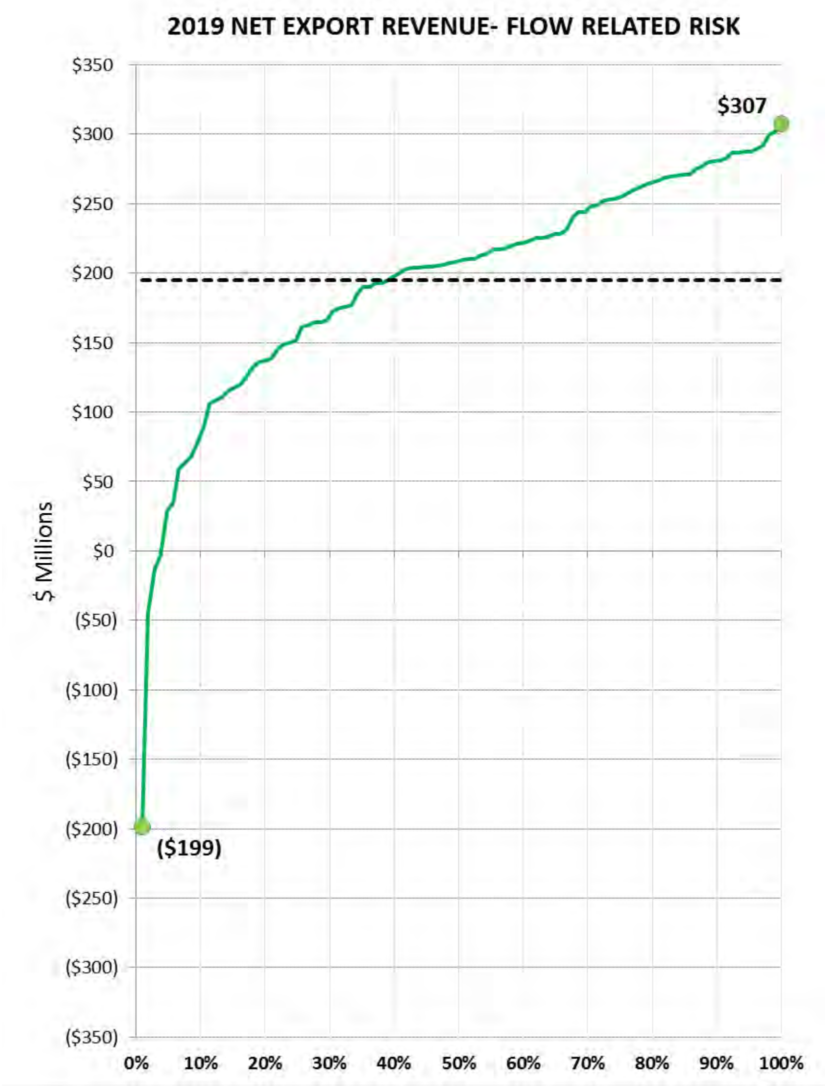
856

Hydrologic & Export Risk

- $58 million or 22% drop in net export revenue in 2017/18 between MH16 Update (prepared in May/June) and outlook in September
  - 68% decrease to 2017/18 forecast net income
- $20 million decrease to 2018/19 outlook
- Charts to follow highlight the potential variability in net export revenue due to water conditions for 2018/19 (which begins in four months)

Hydrologic & Export Risk

- While drought can impair next year's net income by up to $400 million, even below average (1 in 5 to 10 year) water conditions can compromise $60 to $120 million of earnings
- While tempered from past export price forecasts, Manitoba Hydro is still projecting appreciating opportunity export prices over the next 10 years
  - Opportunity price appreciation is contributing $45 million to 2022/23 net income and $90 million to 2026/27 net income
  - Combined with hydrologic risk, net export revenue is subject to **significant and asymmetrical** volatility in potential outcomes each year



No Room for Interest Rate Increases

- Manitoba Hydro's forecast assumes rates stay near all-time lows
  - Historical experience shows rates can often move up or down +/- 5% in a decade
- A comparison of borrowing requirements:

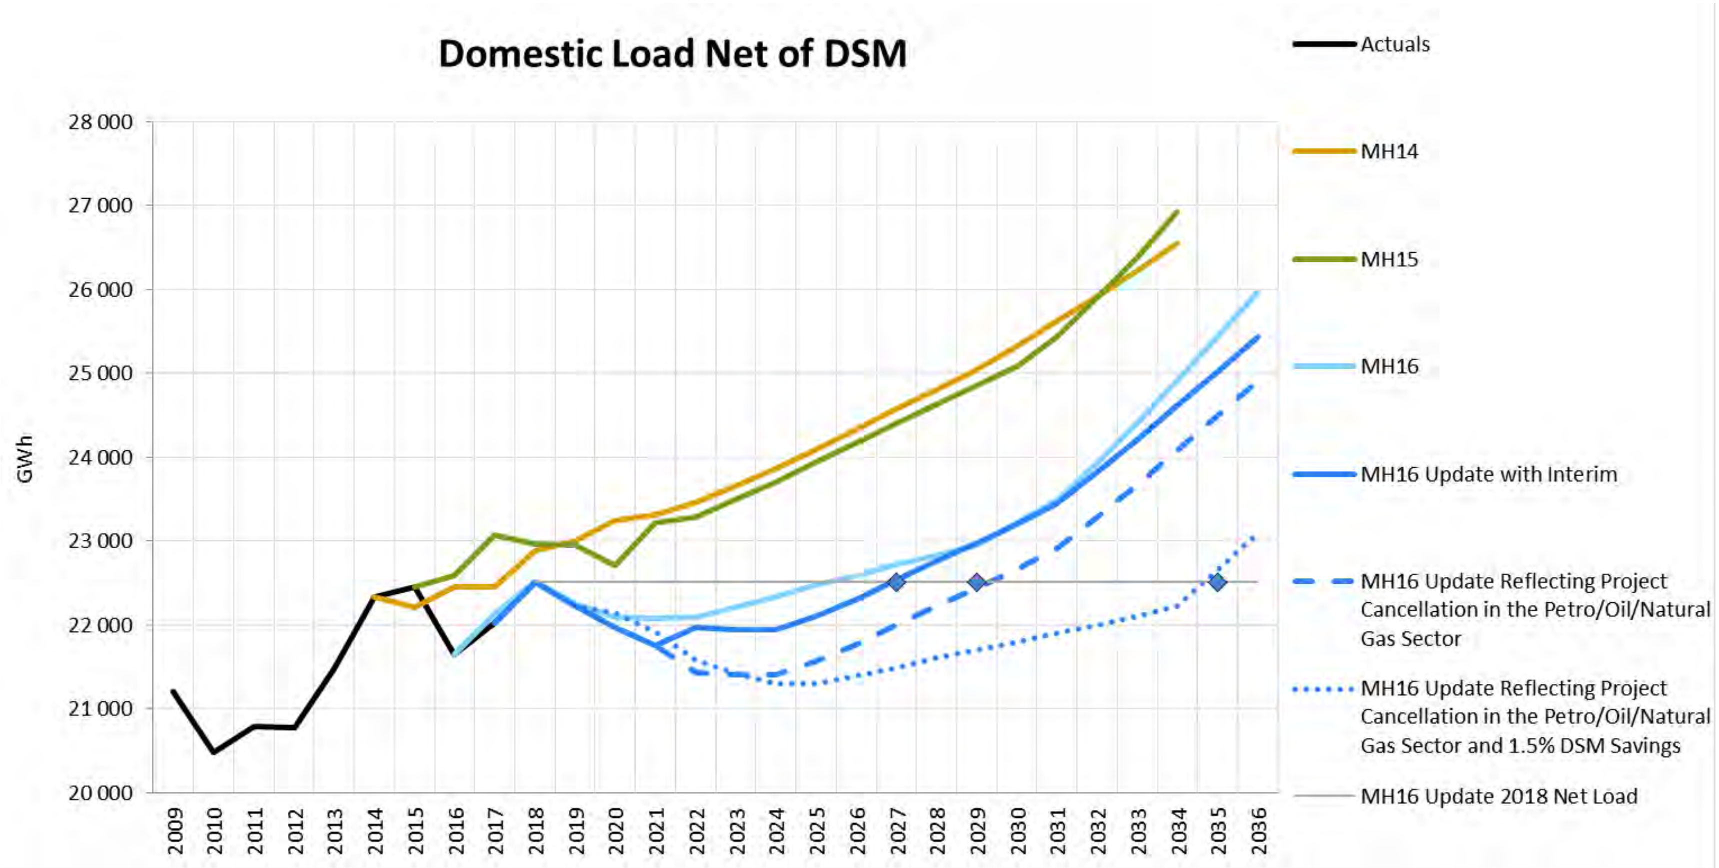
In Billions of Dollars	MH Plan	3.95% / 12 Year WATM
2017/18 - 2021/22 Borrowing	$13.5	$14.1
2022/23 - 2026/27 Borrowing	$8.8	$9.7
2022/23 - 2026/27 Cash Flow	($3.1)	($0.4)
Total 10-Year Borrowing	$19.2	$23.4

- Each 1% move upward in interest rates, depending on timing, could cost Manitoba Hydro upwards of $200 million **per year** by the end of the forecast period

IV. Key Facts of This Rate Case

MH Outlook Has Deteriorated

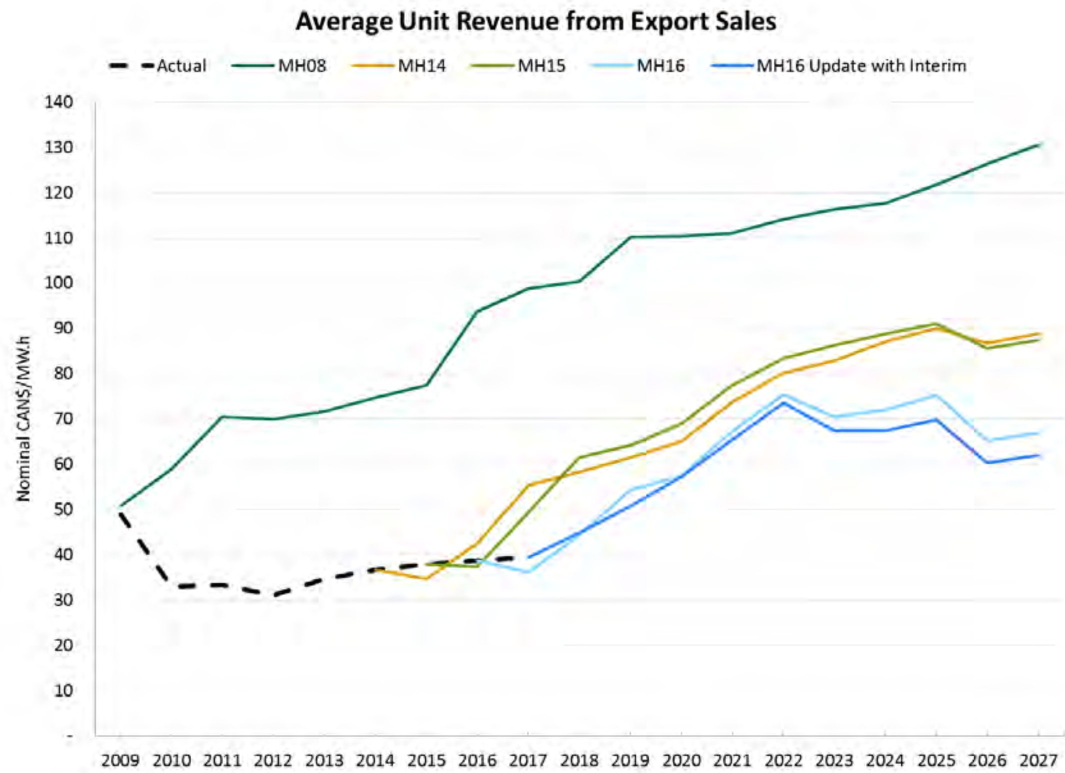
- Now facing 10 years or more of **no net load growth**
- Loss of unit volume amplifies the rate increase needed to maintain the same revenue dollars – the 3.95% plan assumed far more load



861

MH Outlook Has Deteriorated

- Export price outlook continues downward trend – decline in outlook for spot prices since MH15 impacting post-Keeyask revenue by ~$170 million
- Approximately $90 million/year in opportunity revenues at risk by 2026/27 if prices do not rebound



862

MH Outlook Has Deteriorated

- Keeyask Generating Station “P50” control budget has increased $2.2 billion to $8.7 billion and in-service date has been delayed 21 months to August 2021

MH Outlook Has Deteriorated

- Bipole III Reliability Project control budget has increased $0.4 billion to $5.0 billion

MH Outlook Has Deteriorated

- Revenue down $3 billion
- Net income down $1 billion
- Debt increased $3.2 billion

	2017-2027		
	Increase/(Decrease) In Millions of Dollars		
NET INCOME	**MH16 Update***	**MH15**	**Variance**
Domestic Revenues (at MH15 Rate Increases)	20 865	22 265	(1 400)
Extraprovincial & Other	7 193	8 746	(1 554)
Total Revenues	**28 058**	**31 011**	**(2 954)**
Total Expenses including Net Movement	**28 378**	**30 407**	**(2 028)**
Non-Recurring Gain	20	-	20
Net Revenue Lost due to Current Water Flow Projections	(78)	-	(78)
Net Income	**(379)**	**604**	**(983)**
Net Income (at MH15 Rate Increases) Attributable to:			
Manitoba Hydro	**(403)**	**607**	**(1 010)**
Non-controlling Interest	25	(2)	27
	(379)	**604**	**(983)**
Equity Ratio in 2027	**10%**	**14%**	
Net Debt in 2027	**25 060**	**21 838**	**3 221**

*MH16 Update with Interim with 20 Year WATM at MH15 Rates

MH Outlook Has Deteriorated

- Comparison understates the forecast erosion
  - Keeyask 21 month delay **adds** $750 million to MH16 Update with Interim net income in form of net cost avoidance
  - 2016/17 under MH16 includes $87 million of additional net income from high water conditions
  - MH16 Update with Interim overstates current expectations by $78 million in test years due to dry 2017 summer and persistently low opportunity export prices
- **There is no basis whatsoever for intervener evidence of no deterioration**
- Very limited ability for interest rate reductions and O&A cuts to offset foregone revenue outlook
- **Manitoba Hydro is not going to grow its way into managing its debt – debt load needs to be reduced**

Net Income Is Not Full Picture

- On a normalized basis, Manitoba Hydro has had *minimal to negative* net income for each of the last three years and is forecast to again in 2017/18

(In Millions of Dollars)	2014/15	2015/16	2016/17	2017/18
Net Income Attributable to MH	111	37	53	93*

Adjusted Net Income/(Loss)	**33**	**(40)**	**(82)**	**(9)**

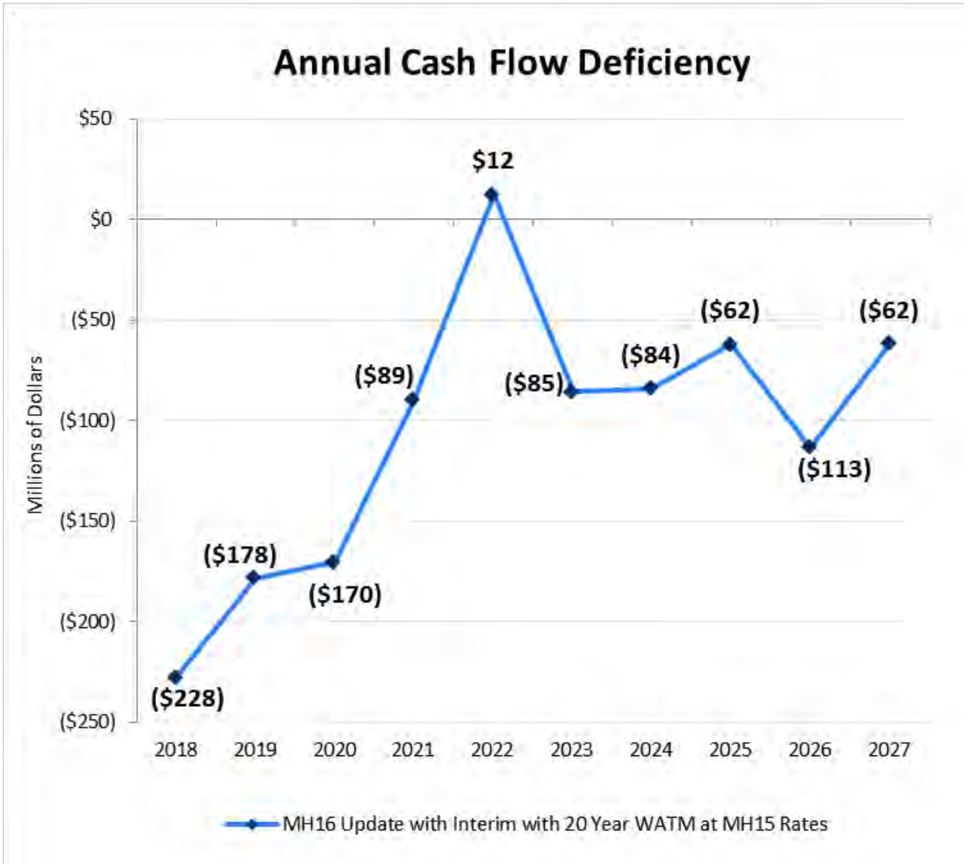
*MH16 Update with Interim

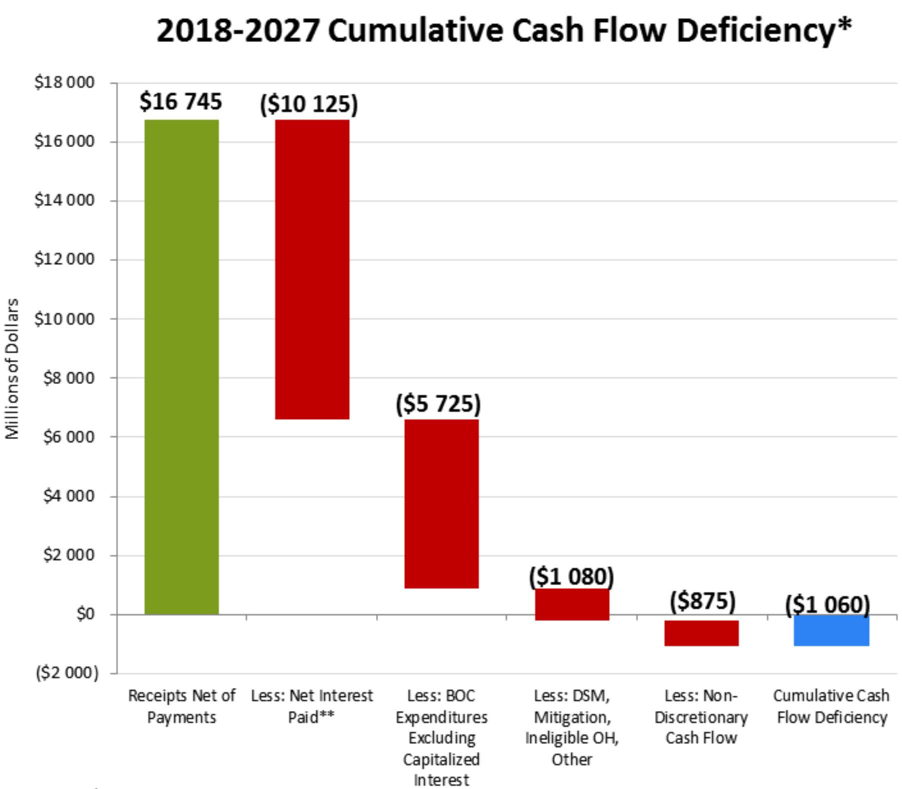
Net Income Is Not Full Picture

- Net income, even if positive, gives an incomplete picture of financial health
- Depreciation determines revenue requirement but is based on **historical cost**
  - Large part of the system was built more than 25-30 years ago
  - Costing significantly more to sustain
  - Business Operations Capital is $150-200 million more than amount being recovered through depreciation
- MH has significant other ongoing cash expenditures which only minimally impact revenue requirement / net income
  - Annual payments to City of Winnipeg
  - Payment commitments on mitigation and past development liabilities
  - Demand Side Management
- Must now take into account the current cash burden and imminent expense burden from Bipole III

MH Has a Cash Flow Problem

- The 3.95% rate path generates an annual cash flow deficiency in all years but one (2021/22) and a $1 billion cumulative deficit by 2026/27





*20 Year WATM at MH15 Rates

**Interest Paid net of Interest Received and gross of capitalized interest excluding Keeyask, MMTP & GNTL

Equity Ratio Is Important

- Equity ratio is the best of Manitoba Hydro's traditional financial targets
- Capital Coverage and Interest Coverage are incomplete
  - Do not capture all of the recurring, non-discretionary cash demands on Manitoba Hydro
  - Therefore provide no picture of whether MH is increasing or decreasing reserves and/or debt
- Equity ratio should also be thought of in inverse: Debt Ratio
  - **Equity is not a cash reserve – on its own, and without income, does nothing for MH when adverse events occur**
  - For MH, equity represents **debt avoided**
  - Focus of MH16 Financial Plan is to curb unsustainable growth in debt

Equity Ratio Is Important

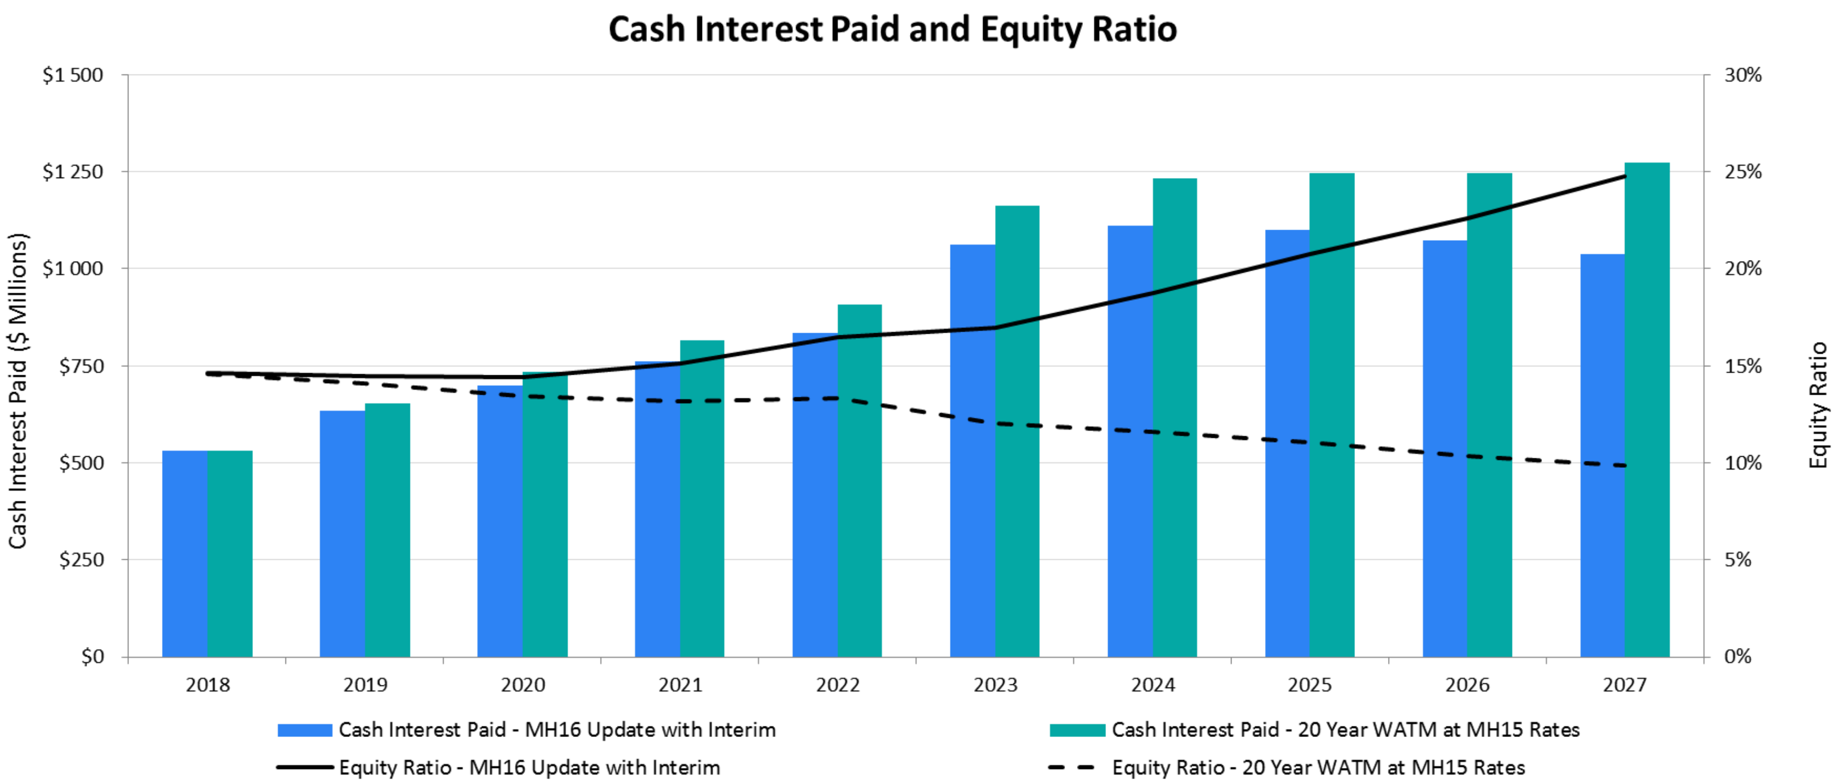
- Debt level is inextricably linked to the cash flow of any business
- For MH, interest expense will be, by far, the largest cost/cash flow burden on revenues
- Targeting equity can and does achieve **forecast** income and cash flow adequacy that leads to:
  - Reserves or “cushion” against the unforeseen **and forecast variability**
  - Debt reduction
  - Predictable rates which are lower in long run
- Achievement of equity ratio is perfectly aligned with meeting minimum cash flow based metrics advocated by intervener experts

Equity Ratio Is Important

- Numerous rating agency reports on Province of Manitoba cite rising debt levels at MH as a significant concern
- Debt:Equity is a proxy for overall debt levels which debt markets care about very much
- Regardless of the capital markets or credit rating agencies, Manitoba Hydro, its customers and the PUB should focus on and be concerned with debt levels
- Credit ratios are inextricably linked: Debt determines interest payments; interest payments determine cash flow and therefore cash flow adequacy

Equity Ratio is Important

- Interest will be **by far** the largest cash burden on Manitoba Hydro
- Therefore amount of debt is the most significant driver of the cash flow and financial condition of the Corporation



Other Ratios Have Shortcomings

- **Capital Coverage Ratio** has important weaknesses
- Numerator (Cash from Operations) **omits all capitalized interest** which can understate the current and pending burden on the company for **non-revenue generating** in flight projects (e.g. Bipole III)
- Denominator (Business Operations Capital) has numerous weaknesses which understate the annual cash burdens on Manitoba Hydro:
  - Business Operations Capital arbitrarily excludes large sustainment projects
  - DSM, City of Winnipeg, Mitigation and Past Development liability payments are entirely excluded **but are real costs**

Other Ratios Have Shortcomings

- **Interest Coverage** (EBITDA to Interest) Ratio provides no indication of whether cash flow is sufficient to meet interest obligations **and** the ongoing reinvestment and other commitments of the utility
  – For a utility, ongoing capital expenditures are, generally, not discretionary – investments are required to maintain system, meet mandate **and enable the revenue which the EBITDA forecast assumes**
  – Other payments (Mitigation, Winnipeg Hydro) represent contractual commitments

Other Ratios Have Shortcomings

- 3.95% rate path does not come close to meeting targets in any event

Financial Ratios:	2017/18	2018/19	2019/20	2020/21	2021/22	2022/23	2023/24	2024/25	2025/26	2026/27

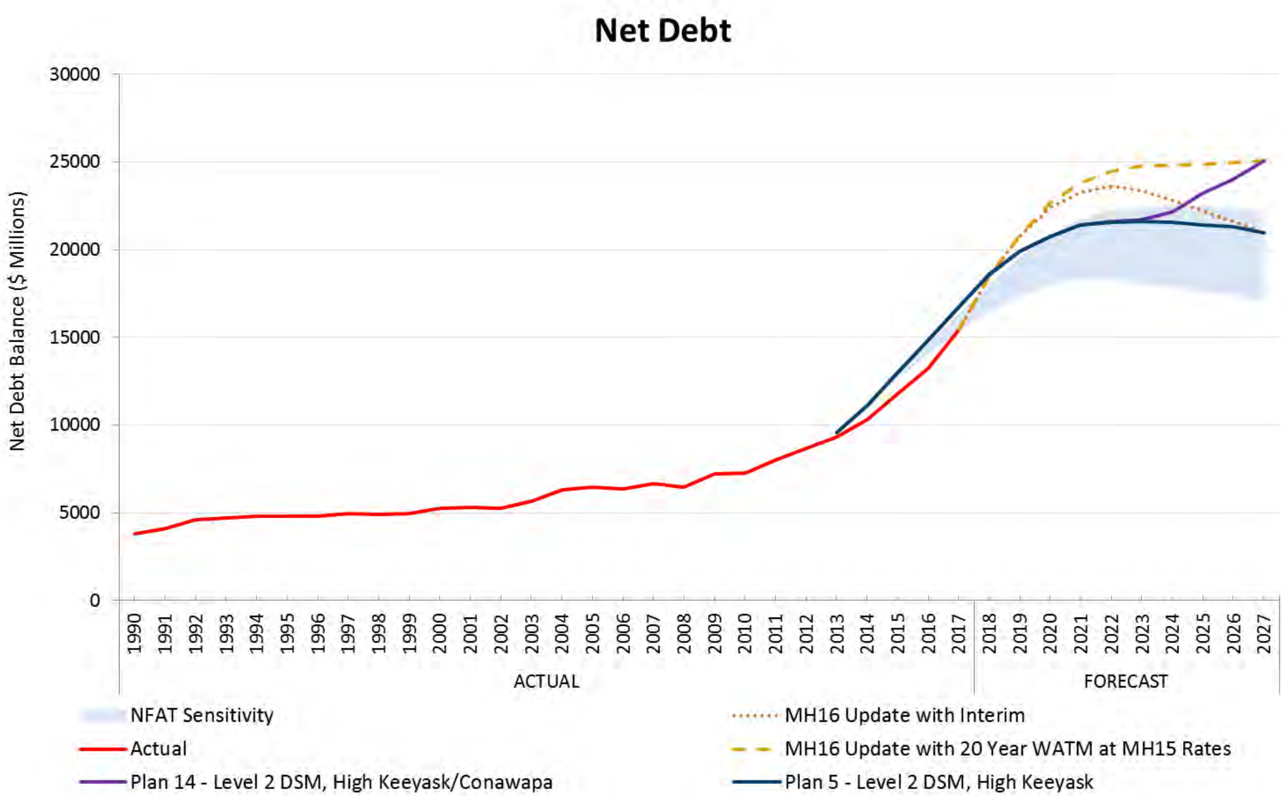
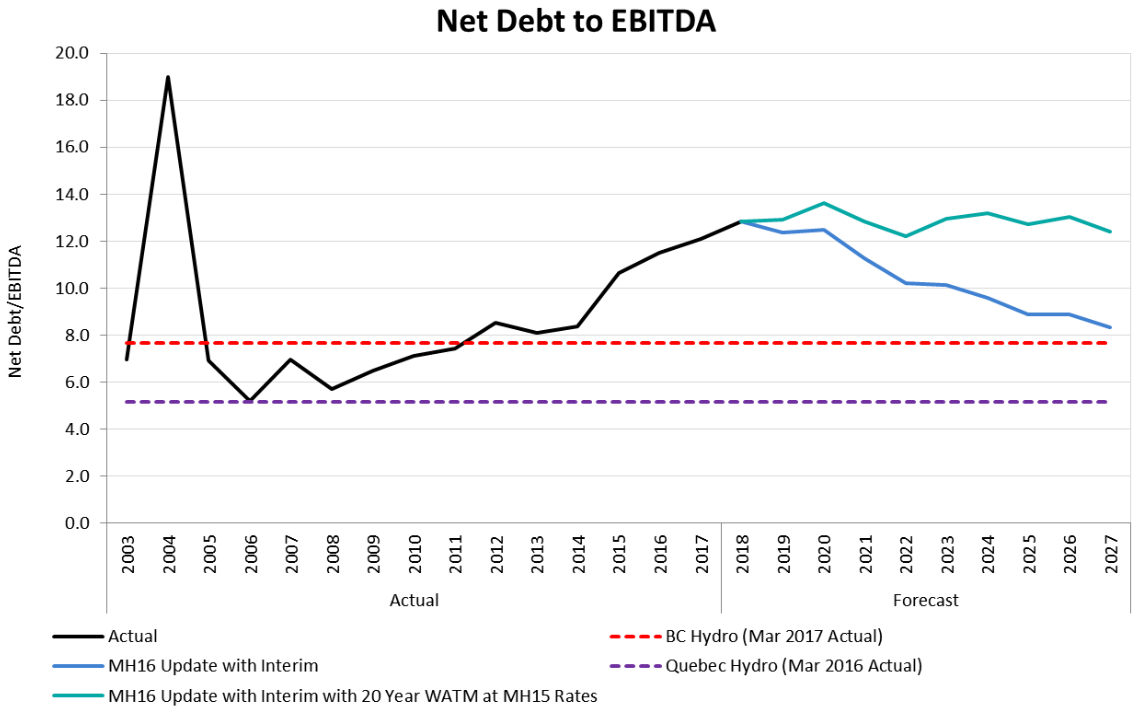
Debt Continues to Escalate

- Figure 5-3 from Mr. Bowman's evidence shows forecast net debt levels now substantially **exceed** high end of sensitivity range of NFAT
  - On a smaller than anticipated domestic business due to lower load growth outlook
  - Notwithstanding high water contributions of 2014/15, 2015/16, 2016/17, 2017/18 and 2018/19…
  - …and in spite of now lower interest rate forecast



EBITDA and Leverage

- Debt / EBITDA is a common measure of relative debt level
- Manitoba Hydro's leverage ratio has steadily increased
  - Forecast to peak at nearly 14x and, without more aggressive rate action, not abate
  - Comparable leverage level to 2003/04 drought when MH lost >$400 million



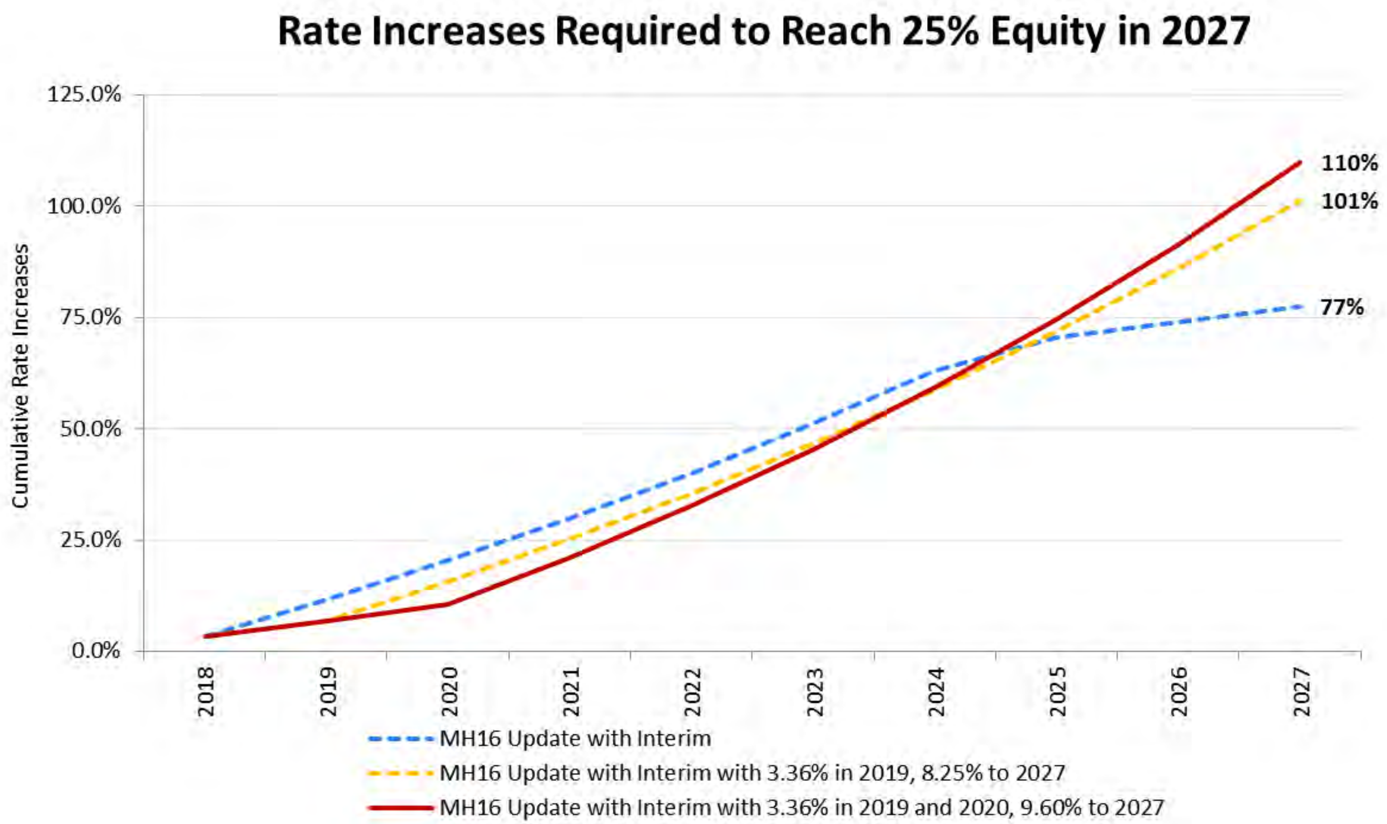
879

Province of MB is a Stakeholder

- Manitoba Hydro customers bear the **full cost** of operating the system
- MH should not be permitted to threaten or impair the credit standing of the Province of Manitoba
- Manitoba Hydro customers also have vested interest – Provincial borrowing cost is passed on to MH
- Not appropriate to inflate debt until **inevitable** corrective rate action is too politically or economically infeasible therefore forcing taxpayers to fund relief
- Provincial Guarantee Fee is **not** compensation for increasing Province's borrowing costs

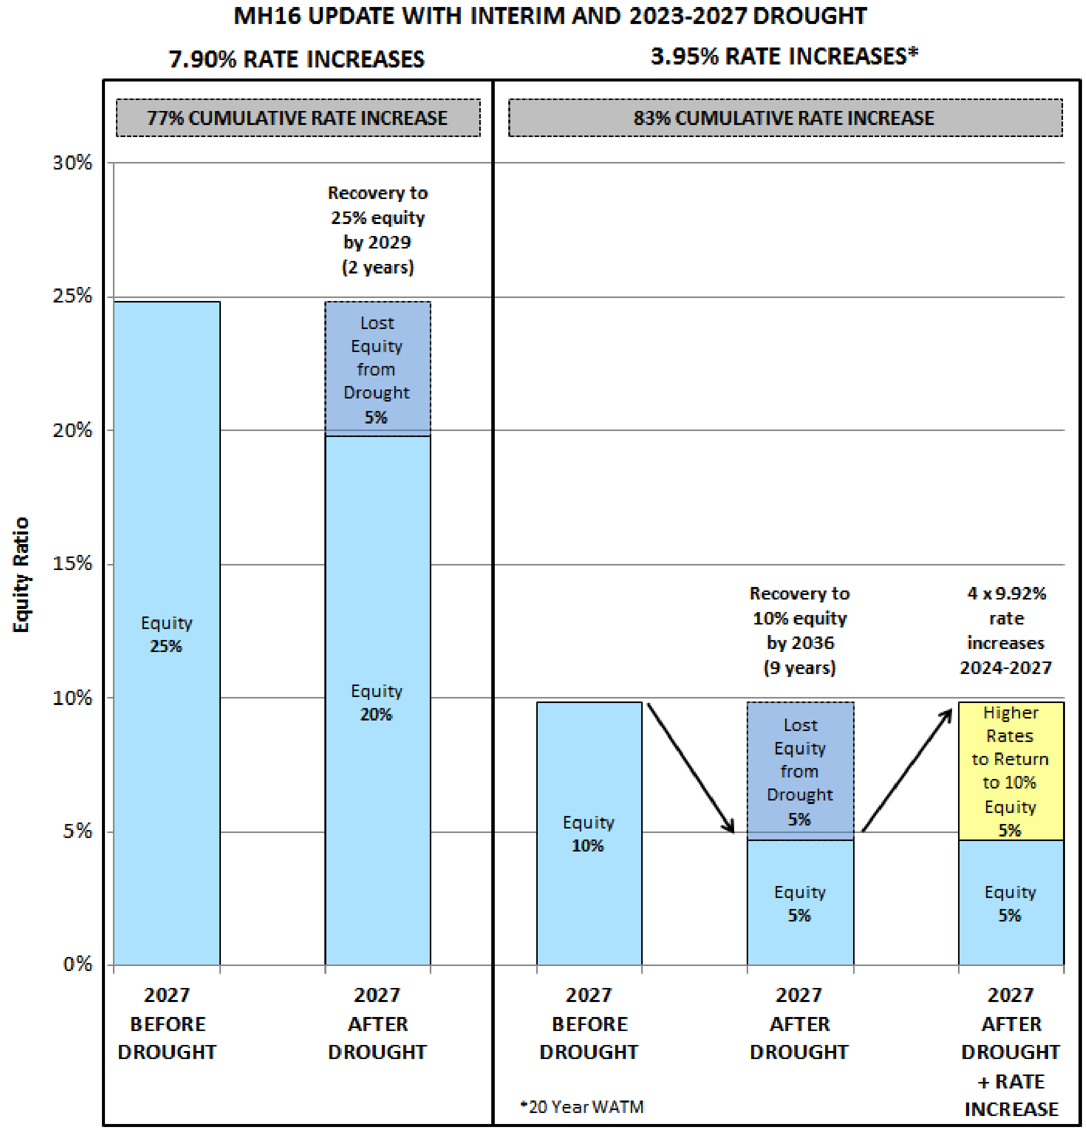
Important to Act Now

- Multi-year and compounding impacts of first year(s) rate increases are essential
- Must get on right trajectory - very difficult to “catch up”



Important to Act Now

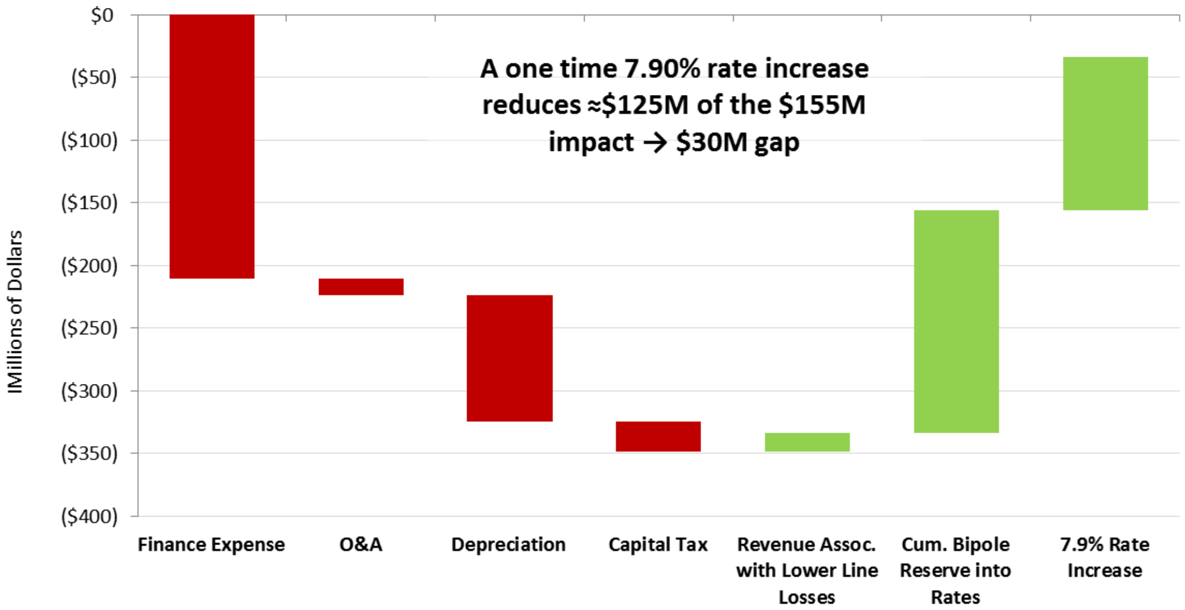
- In the event of a five-year drought from 2022/23 - 2026/27:
  - Under the proposed plan, no significant rate action is required. Attainment of the 25% equity ratio is delayed by ***two years***
  - Under 3.95% rate increases, recovery to pre-drought equity of **only** 10% is delayed by ***nine years to 2035/36***
    - Or requires four 9.92% rate increases just to maintain **10% equity**
    - Which would leave rates in 2027 6% **higher** than under MH plan



882

Important to Act Now

- April 1, 2018 (proposed) is the last rate increase before Bipole III comes in service in **less than 9 months**
- Current rates are not adequate
  - Already not funding full costs of operating the business
  - Bipole III is significantly underfunded through rates



April 1, 2018 Rate

- Rate request is 7.9% for April 1, 2018
- Comfortably supported by:
  - Will address only 60% of 2019 cash flow deficiency
  - Current rates too low by up to 20%
  - Still insufficient to address imminent revenue requirement of Bipole III
- Essential and necessary first step in proactively addressing
  - Lack of contribution to reserves in current rates
  - Debt continuing to grow to unsustainable levels
  - Need to ensure Manitoba Hydro is financially positioned to address aging infrastructure and a changing utility model

Reserves are Essential

- Equity – in and of itself – does not create the buffer that cushions rate impacts when things go wrong
  - It is not a cash “rainy day fund”
  - Accumulated net profit of years ago is of no use during adverse events with no current income / cash flow
- Instead, for Manitoba Hydro, equity (or reserves) represents **debt not borrowed**
- Only path available to MH to create useful reserves is to build a financial plan and rate strategy that has positive net income and positive cash flow
  - 3.95% does not come close to achieving

Reserves Must Be Funded In Rates

- Positive net income and cash flow represents a **planned** contribution to reserves each year through rates
- Value is the ability to manage and absorb **foreseeable** risks (e.g. below average water conditions, rising interest rates), without necessitating immediate rate action
- Insofar as risks don't present, income and cash flow will build reserves through the reduction of debt
  - Contribute to returning Manitoba Hydro debt to a sustainable level for the size of its operation
  - Increase probability of lower, more stable rates

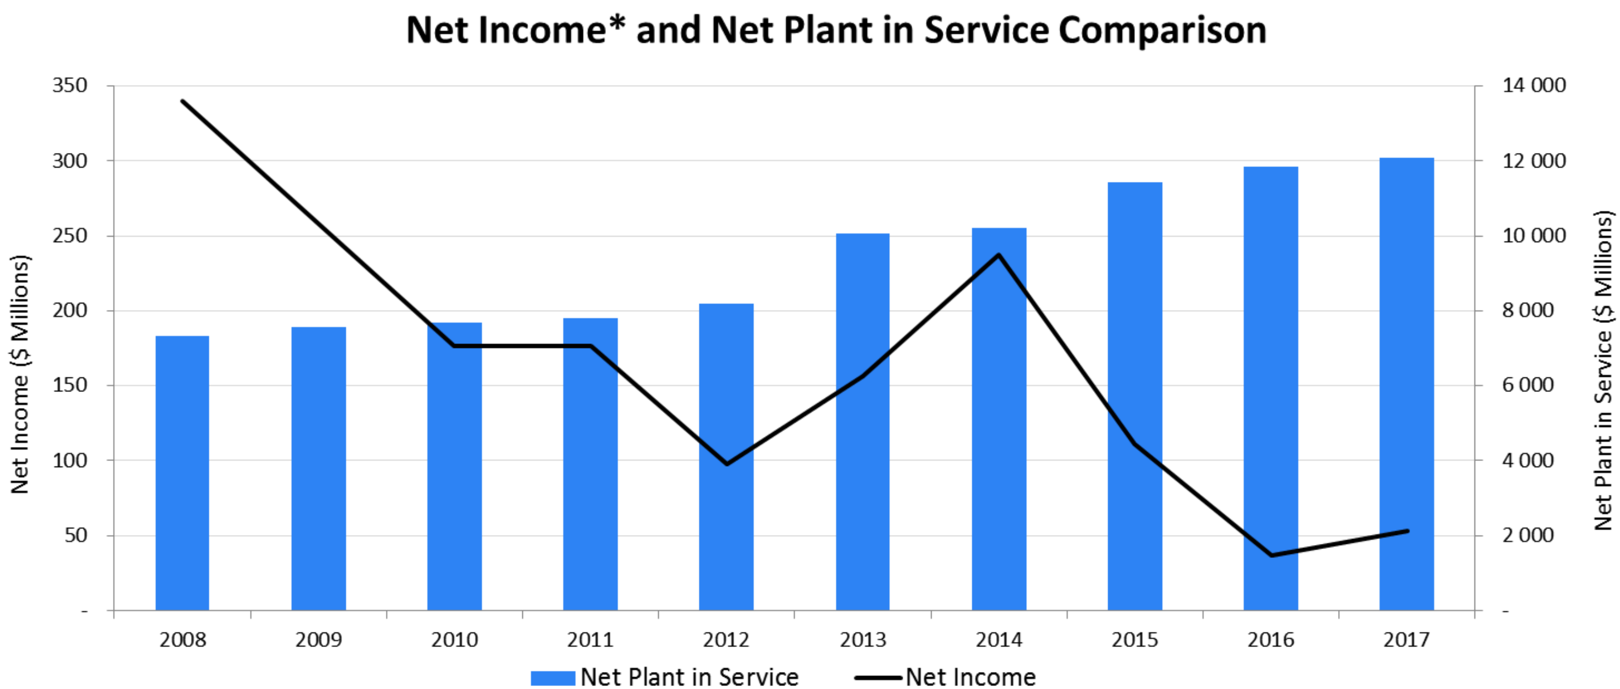
V. How Did We Get Here?

What Happened?

- Export prices collapsed, without domestic rates compensating
- Domestic load growth has slowed – substantially
- Costs of being in the electricity business have been rising faster than inflation
- Did not take advantage of high water conditions by making contributions to reserves – in fact, the opposite
- Keeyask business case has eroded
- Bipole III, while necessary, compounded the challenges
- Undertook what has become almost $14 billion of capital projects with too risky a plan to pay for them

Rates Are Too Low

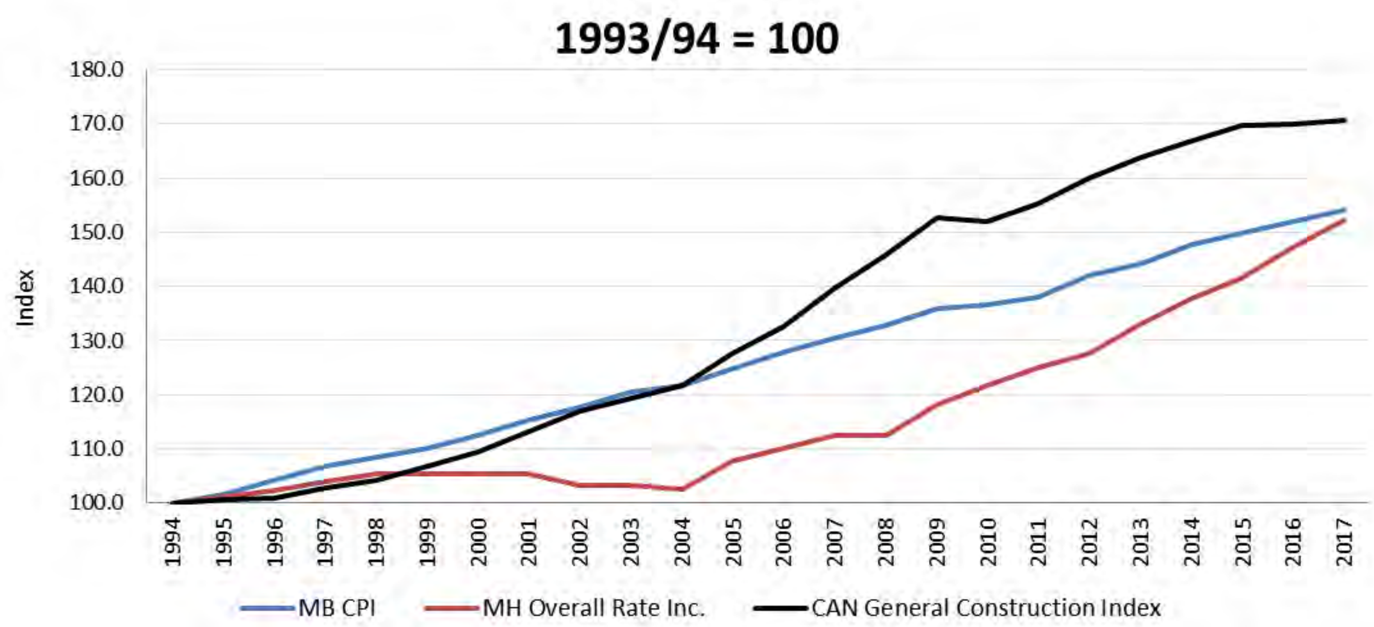
- Manitoba Hydro has not been asking for the right rates
  - As the business has grown, net income has been systemically falling
  - In spite of 14 years of above average water conditions
  - In spite of declining to multi-generational low interest rates
  - Inadequate or no contribution to reserves being made for size of this business



*2010-2014 net income adjusted to add back accounting changes from Figure 2.3 of Rebuttal Evidence

Rates vs. Inflation

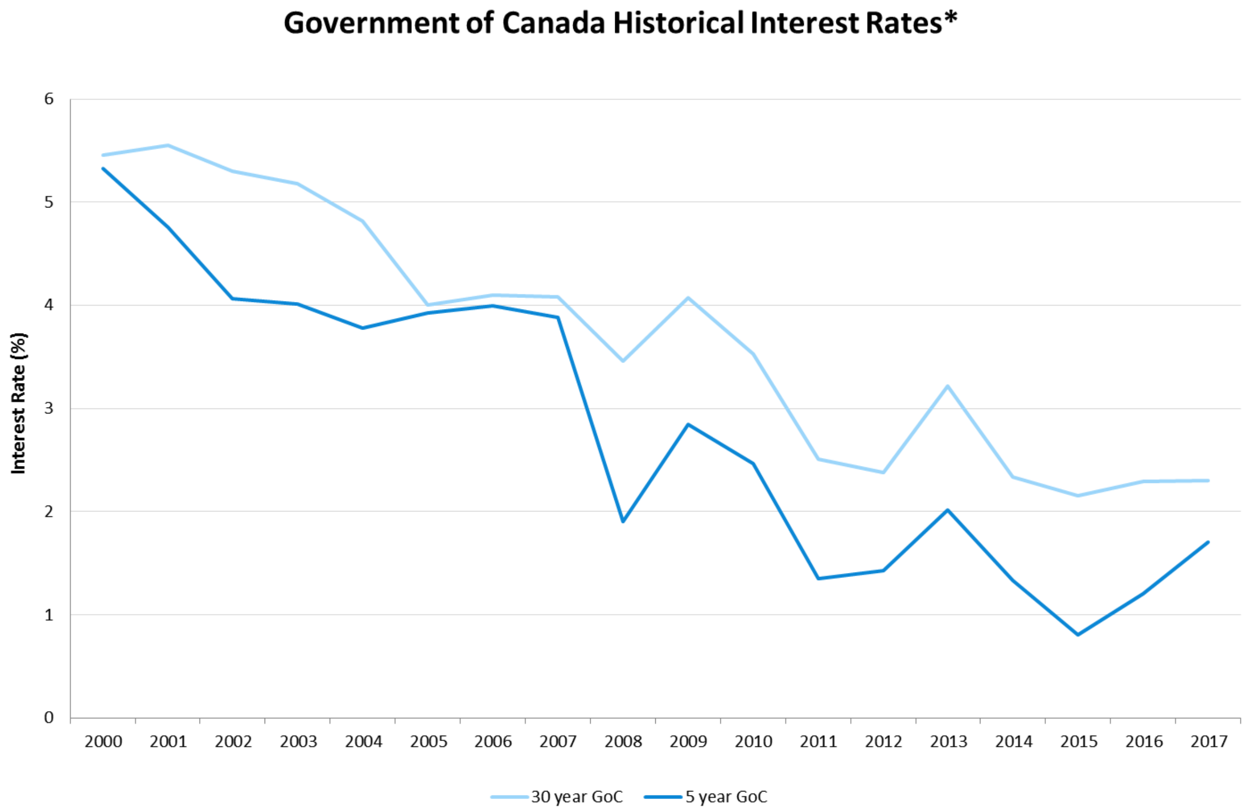
- Until recently, rate increases have stayed well beneath inflation on a cumulative basis
- Meanwhile, construction costs – an important factor for Manitoba Hydro – have significantly outpaced inflation



890

Interest Rates Have Cooperated

- Without declining interest rates this would have been a financial / rate catastrophe



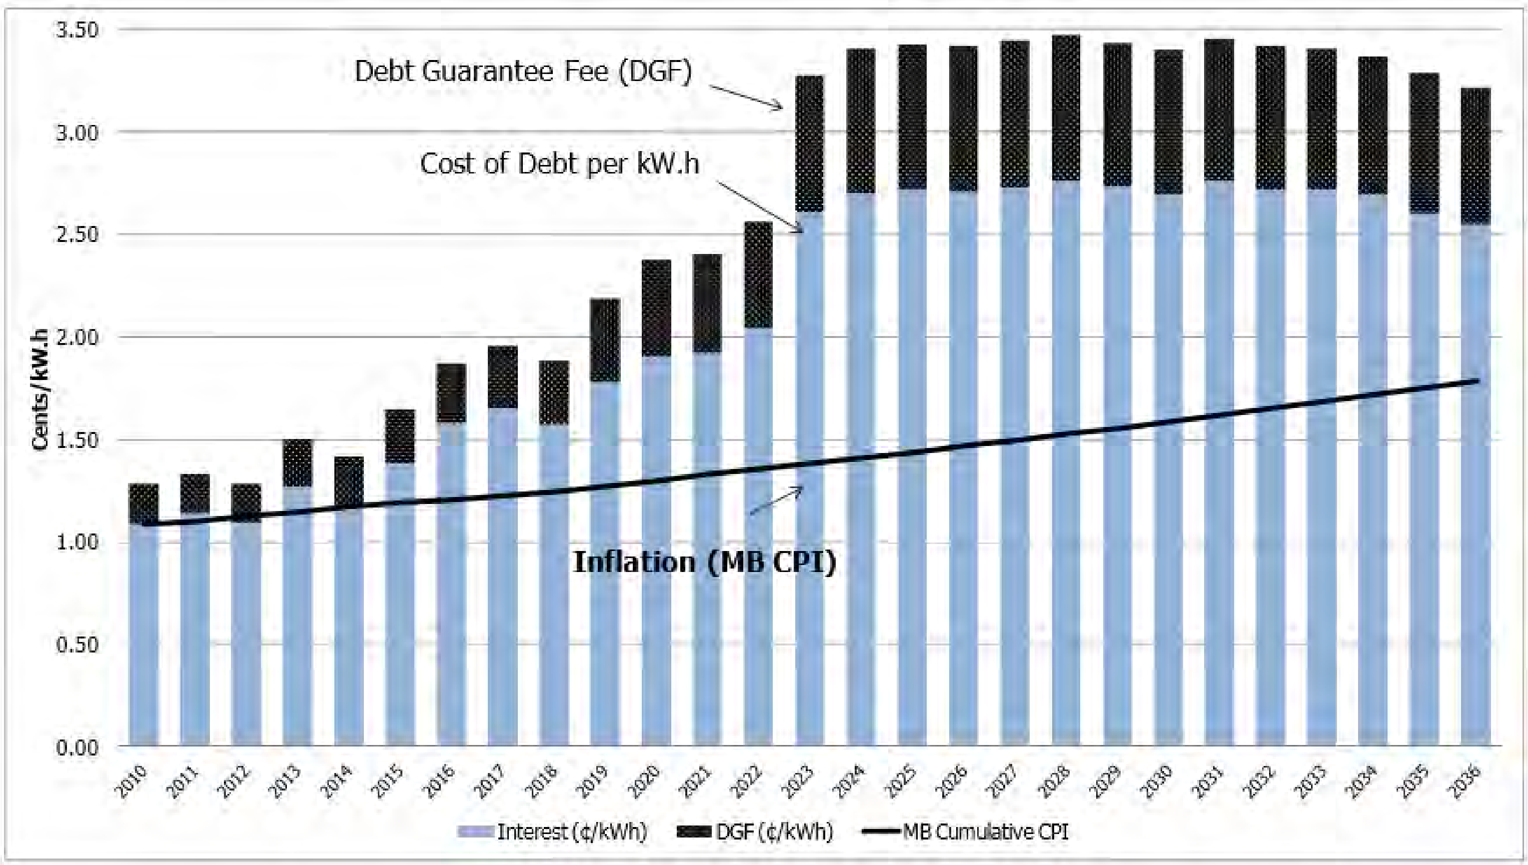
* Reflects data at calendar year end

891

Manitoba Hydro

But Interest Burden Growing Rapidly

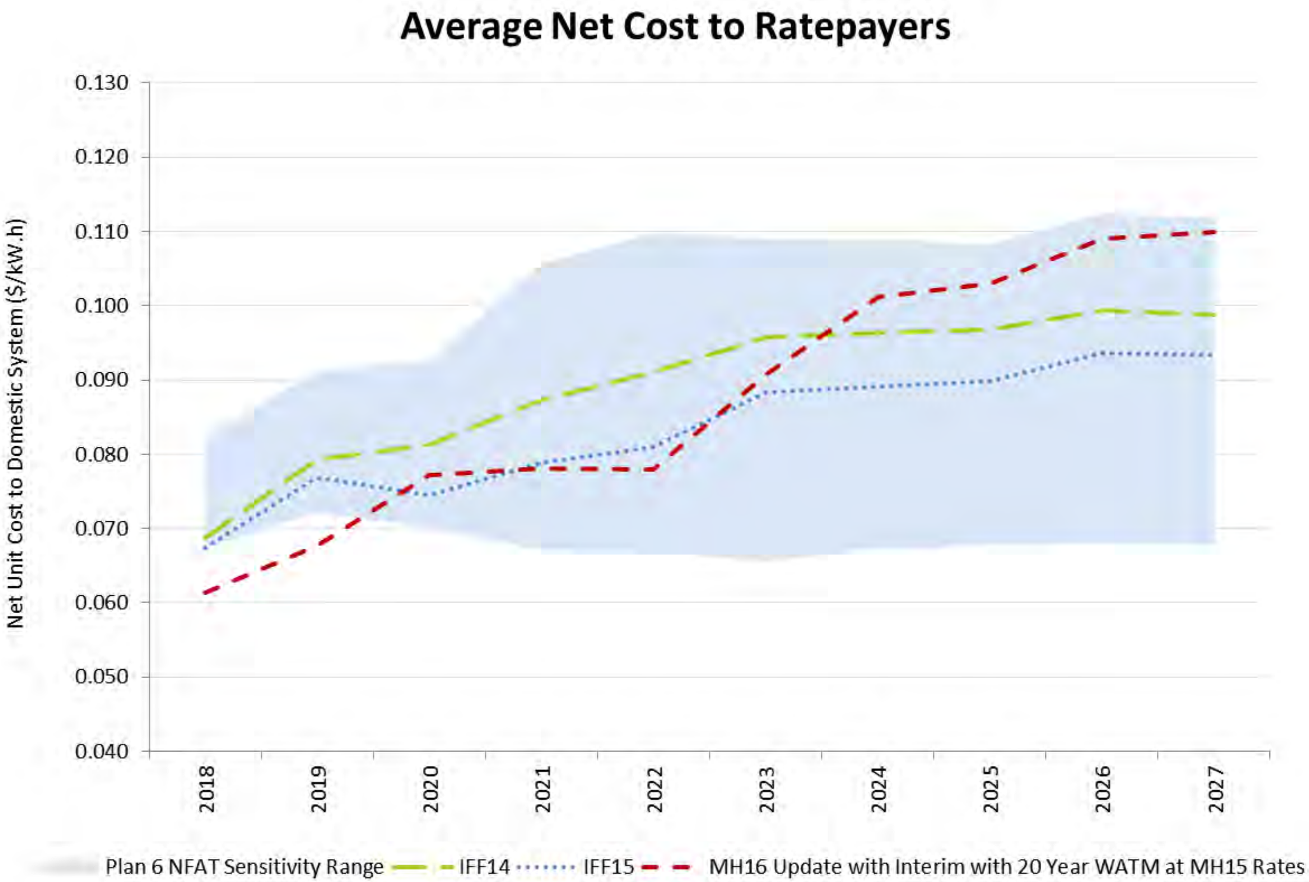
- Per MH-MIPUG (Bowman)-23, Figure 2*:



*based on MH16 Update with Interim at MH15 Rates from PUB/MH I-34 (Updated Appendix 3.4)

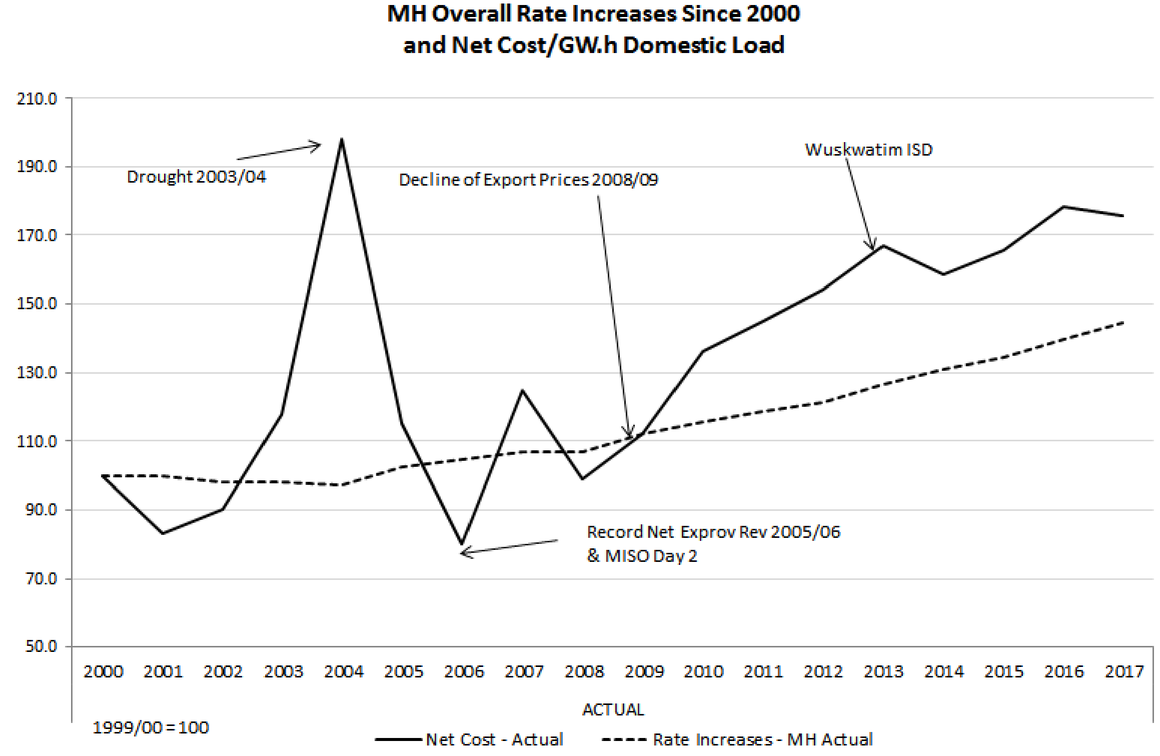
Net Costs vs. NFAT

- Net costs are now forecast to be at the high end of the NFAT sensitivity range (in spite of lower interest rates)



Net Costs vs. Rates

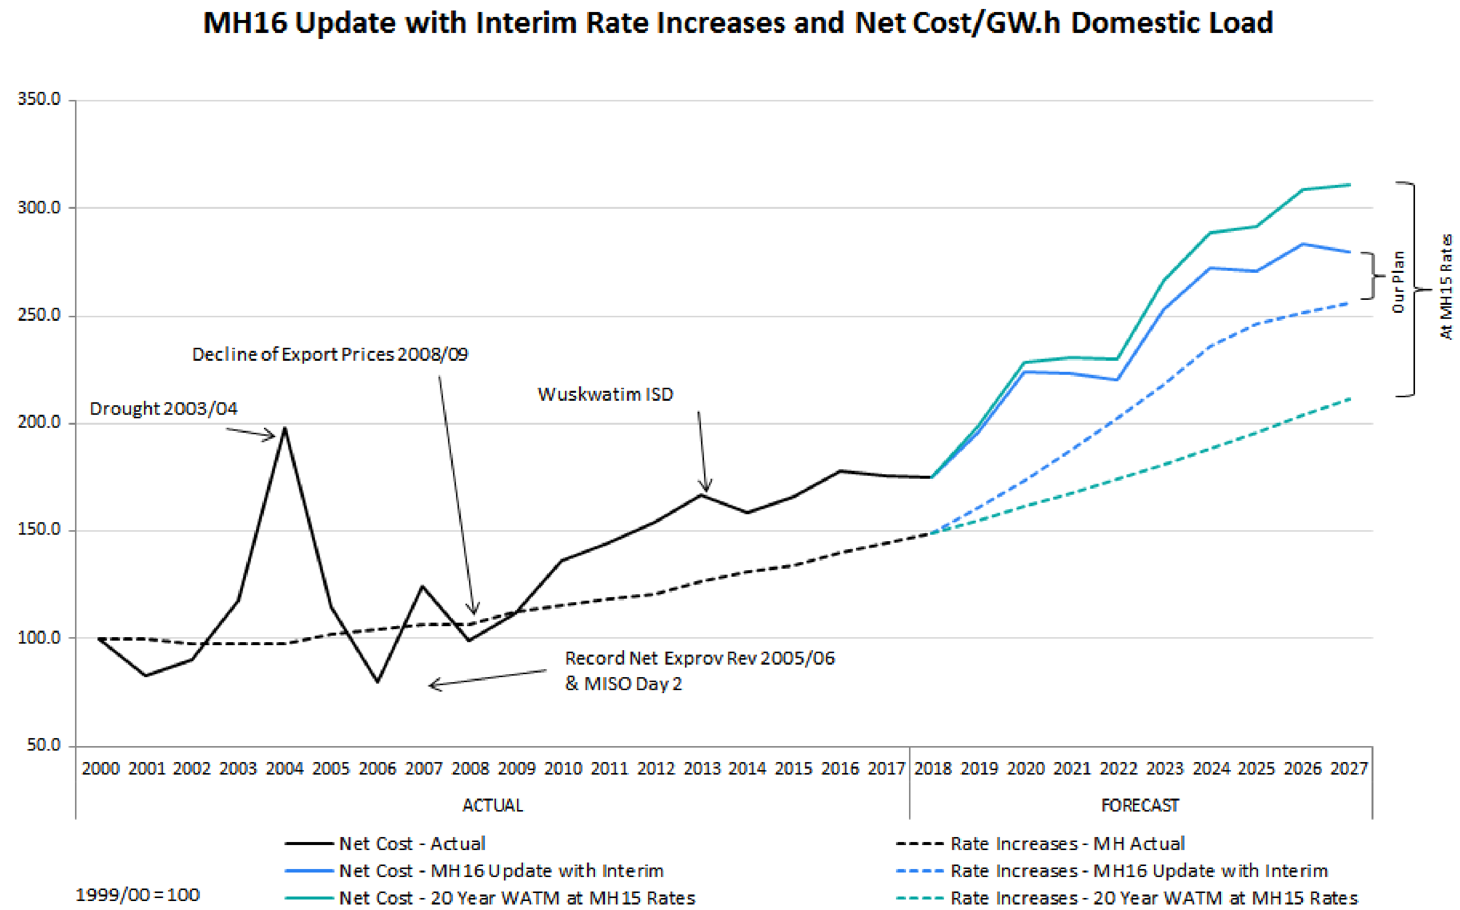
- After 2008, opportunity export prices collapsed
- Coupled with escalating costs and below CPI rate increases have led to net costs increasing substantially faster than rates



894

3.95% Path Does Not Work

- A 65% increase in net cost per unit between now and 2023/24 cannot be met with a 30% increase in rates



VI. Addressing Key Concerns

What You May Hear

Argument	Reality
MH has net income – things are fine	• Net income and cash flow are different and we are in a cash deficit • Today’s rate levels aren’t sufficient to absorb Bipole III and then Keeyask • $30 million of net income (with exceptional water conditions) is not adequate
These rate increases will damage the economy / industrial customers will leave	• 3.95% plan amounts to a doubling of rates over 18 years • Unplanned “rate shock” is worse • In longer term, competitiveness is enhanced through lower, more stable rates having lowered our debt
Stop Bipole III and Keeyask	• Far more damaging to customer rates – upwards of $450 million of annual interest cost without a functioning asset or any revenue to show for it

What You May Hear

Argument	Reality
Hydro should just cut more costs instead of raising rates	• O&A is <20% of costs post Keeyask; issue cannot be addressed without rate action • To plug gap in 2018/19 revenues from Order 80/17 (3.36%) vs. 7.9% would require reduction of ≈700 operational employees excluding restructuring costs beyond the 700 underway
Spread the rate increases over 20 years	• First 10+ years remain highly susceptible to risk • Greater potential for long term rate escalation…even if our forecasts are right and interest rates stay low • Continuing to build debt vs. make contributions to reserves for 6 years after Keeyask is in service
Low income customers can't afford this	• Important issue that MH does not have the tools/mandate to address • Relates directly to customers' ability to pay; issue requires many parties/organizations working together

What You May Hear

Argument	Reality
Change the Projections to Justify Lower Rate Increases	• Hope is not a plan • Depreciation and regulatory accounting policies make no material difference • Less risky to adjust rates later for good news
Markets are unperturbed and there is no threat to the Province of Manitoba credit rating or MH's borrowing costs	• Taking pressure off the Manitoba credit rating is a collateral benefit • The issue is that Manitoba Hydro has an unsustainable level of debt and therefore too much vulnerability to overall interest rate increases regardless of cause
Cut maintenance capital expenditures	• Short-term perspective; aging infrastructure needs to be addressed • Makes negligible difference to revenue needs in any event
Punish Manitoba Hydro by Withholding Rate Increases	• To what end? • Will only exacerbate the issue for our customers

What You May Hear

Argument	Reality
Take on shorter term debt to save on interest costs and keep rates lower	• Enormous risk to rate stability in next 10 years • Would leave almost the entirety of Hydro's projected peak debt subject to interest rate risk between now and 2026/27
Our forecasts are too conservative and overstate need for rate increases	• Load forecast is already looking too optimistic • Efficiency Manitoba is a wildcard • Export prices thus far in 2017 tracking well below projections • Short-term interest rates already ≥ 2018 forecast • Hope is not a plan – rates can be adjusted if things go better; much harder the other way
Not Fair to Current Ratepayers	• Rates have not kept up with costs of the system and are too low today • Rates have not made a contribution to reserves in almost 10 years • Not fair to park unsustainable debt burden on the next generation

VII. Summary

Key Messages

- Manitoba Hydro's business outlook has deteriorated significantly since the last GRA
- Financial condition is not sustainable
  - Debt levels are far too high and are growing massively out of proportion to the scale of MH business
  - Cash flow negative
- 3.95% rate plan is grossly insufficient and puts MH and its customers at far too much risk
- Taking strong action now is essential
  - April 1/18 rate request does not fully address Bipole III and current cash deficiency
  - Enables much higher likelihood of stable and overall lower rates in the long run

Tab 18

MANITOBA PUBLIC UTILITIES BOARD

IN THE MATTER OF *Order in Council 128/2013 and attached Terms of Reference Needs For and Alternatives (NFAT) Review*

AND IN THE MATTER OF *Manitoba Hydro's Filing with Respect to the Need For and Alternatives to Manitoba Hydro's Preferred Development Plan*

FINAL ARGUMENT

OF MANITOBA HYDRO

May 26, 2014

Manitoba Hydro

TABLE OF CONTENTS

1.0 INTRODUCTION

The NFAT Terms of Reference provided by the Provincial Government to the PUB specify that the PUB's report is to "include recommendations to the Government of Manitoba on the needs for Hydro's Preferred Development Plan and an overall assessment as to whether or not the Plan is in the best long-term interest of the province of Manitoba when compared to other options and alternatives."

As delineated in the Submission (e.g. Executive Summary Pages 1:2), the Preferred Development Plan contains two key components that require immediate commitment:

- Start construction immediately in 2014 of the Keeyask Generating Station (G.S) for a 2019 in-service date (ISD)
- Proceed with a 750 MW US transmission interconnection for a 2020 ISD

The Preferred Development plan also includes the 1485 MW Conawapa Generating Station, with an In Service Date not earlier than 2026. A decision regarding construction of Conawapa is not required immediately, however in order to protect an In Service Date for Conawapa as early as 2026 certain actions and investments are required in the near term, recognizing that conditions will be continually monitored to determine if such continued investments are warranted and, ultimately, to determine if Conawapa should be constructed and for what ISD. A final decision on construction of Conawapa for an ISD of 2026 must be made by 2018.

The resources in the Preferred Development Plan are supported by a number of export agreements, notably the 250MW sale to Minnesota Power, the 100 MW sale to Wisconsin Public Service (WPS) and the 308 MW sale to WPS. The Government of Manitoba authorized Manitoba Hydro to enter into both the Minnesota Power 250 MW and Wisconsin Public Service 100 MW sales agreements in Order In Council 304/2011 which issued August 17, 2011. Order In Council 308/2011 notes that the construction of new power generation facilities in the Province of Manitoba are necessary to fulfill these contracts. These agreements do not require further confirmation from the Government of Manitoba. However, if these agreements are to proceed, the generation and transmission facilities upon which they are contingent, that is the Keeyask Generating Station and the 750 MW transmission interconnection, require immediate approval.

The Preferred Development Plan includes continued substantial investment in DSM/Power Smart and efficiency improvements to existing generation. During the course of the NFAT process, MH filed new analysis which indicated that it would be economic to quadruple its DSM plan to target 3978 GWh and 1136 MW (including savings from codes and standards) by 2028/2029. DSM plans will also be continually monitored and updated.

The Preferred Development Plan is not a rigid plan with fixed ISDs and resource selection for the next 20 years. Mr. Thomson indicated on March 3rd (Tr. p. 76-77), "And I do want to underscore that the Preferred Development Plan is not without flexibility. While construction on the Keeyask generating station and other aspects of the Preferred Plan must begin shortly, Manitoba Hydro will always maintain the flexibility to respond to future circumstances when it comes to future resources identified as part of the path. Conawapa, for instance, will only get built if the business case remains sound."

The Preferred Development Plan has the necessary flexibility and optionality to permit Manitoba Hydro to respond to changing circumstances over the next number of years. The NFAT process outcome is not a long term plan with future decisions pre-established but a pathway. The pathway involves a combination of immediate decisions and commitments followed by longer term components which are responsive and adapt as the future unfolds. Future decisions on the longer term components will be influenced by a wide range of evolving factors such as load growth, natural gas prices, GHG emission restrictions, export prices, future export contract negotiations, capital cost forecasts, technological innovation, inflation and interest rates. Mr. Bowman strongly supports the concept of pathways and the importance of considering the optionality benefits associated with these pathways (Tr. p. 10040-10050). The Preferred Development Plan pathway involves front end decisions and commitments which provide early and immediate benefit while also providing options and flexibility in the long term to reduce risks and maximize benefits as opportunities arise.

While there are a number of fundamental possibilities for PUB to consider, the NFAT process has evolved such that the primary PUB recommendation to be considered is: Should Keeyask be constructed and advanced to have an ISD of 2019 in order to provide for both a range of possible need dates for domestic load and to take advantage of the Minnesota Power (MP) 250 MW export sale contract with the associated commitment by MP to develop a 500 kV interconnection? Recommending for or against this pathway will facilitate or put to an end a number of other critical options that will affect electricity supply in Manitoba for decades to come.

MH Exhibit #192 presented by Mr. Wojczynski on May 1 (Tr. p. 9848-9853) depicts the choice to be made concerning the long term electrical energy future of Manitoba. Advancing Keeyask to 2019 is integral to Pathway 4 & 5. This allows the MP 250 MW sale to proceed and the 750 MW interconnection be developed in concert with Manitoba Hydro's US partners. The WPS 100MW sale and the NSP 125 MW export extension would also proceed.

Proceeding with Keeyask and the interconnection in 2019/20 also provides for the opportunity in the future to take advantage of the WPS 308 MW export sale and to develop Conawapa, should circumstances be favorable. This would also facilitate pursuing other export contracts with counterparties such as with Great River Energy (GRE), SaskPower, NSP 500 MW and others. However, no decision is required for a number of years whether and when to construct Conawapa.

The other choice depicted in MH Exhibit #192 is to pursue Pathways 1 & 2. If these pathways are adopted, Keeyask will not be advanced to an early In Service Date, nor will the MP 250 MW, WPS 100 MW or WPS 308 MW export sales proceed and no new interconnection will be developed in the foreseeable future. At some later date a choice is made to proceed with Keeyask (Pathway 1) or with natural gas generation (Pathway 2).

In both sets of Pathways (1 & 2 and 4 & 5), there is an annual review of resource choices and timing (e.g. continuing commitment to DSM based on achievements and newly identified opportunities, potential new generation ISDs and options).

In deciding whether to recommend Pathway 1 & 2 or 4 & 5, there are a number of associated considerations which will help to illuminate the main recommendation:

- Is development of the 750 MW interconnection advantageous for Manitobans?
- Is it advantageous to advance Keeyask to 2019 from a date when it is needed strictly for domestic needs?
- Is the overall package of developing Keeyask in 2019 and proceeding with the MP 250 MW sale and 750 MW interconnection a preferred option for Manitoba compared to plans based on development of natural gas or other options?

The NFAT Terms of Reference specify the perspectives which were used to evaluate and compare the plans and pathways to demonstrate that the Preferred Plan and its associated pathway are in the best long term interest of the Province of Manitoba and Manitobans.

These perspectives are listed in Table 1 which is drawn from slides 7 and 8 from Manitoba Hydro Exhibit #86 and which were presented on the first day of the hearing.

These perspectives are addressed in the remainder of the MH Final Argument.

Table 1: NFAT Multiple Perspectives

Market Valuation Economics

- NPV net benefit to MH (domestic customers & project partners)

MH Domestic customer

- Reliability (minimum required by planning criteria & amount above criteria)
- Energy security (minimum required by planning criteria & amount above criteria)
- Rate increases (annual & cumulative)
- Financial targets (debt/equity, interest coverage, capital coverage)
- Retained earnings, fixed asset & debt levels

Socio-economic

- Manitoba Economy – employment & income
- Training & business opportunities
- Infrastructure, services, personal & family & community life, resource use, heritage resources
- Special focus on Northern & Aboriginal communities

Macro-environmental impacts & benefits

- Air, land, water, flora, fauna
- Greenhouse gases & key environmental functions
-

Manitoba Government

- Financial transfers to provincial government
- Capital tax, water rentals, debt guarantee fee
- Alignment to Manitoba Hydro Act, Sustainable Development Act, Climate Change Act, Clean Energy Strategy

Risk

- Deal with uncertainties, mitigation, flexibility

2.0 LOAD FORECAST

2.1 Manitoba Hydro's Position: the Forecast Is Reasonable for NFAT purposes

Manitoba Hydro's Load Forecast is updated annually to include current information about Manitoba Hydro customer groups in order that the best estimate of future load can be produced. The base forecast is intended to predict what would happen in an average growth case, where there is an equally likely (50:50) chance of the actual load being higher than the forecast as there is of it being lower than the forecast. If the future brings faster than expected population or economic growth, then the actual loads will exceed the forecast. If the future brings slower than expected population or economic growth, then the actual loads will be less than the forecast.

This position is supported by other experts. The conclusion of Mr. Todd (Elenchus) is that the forecast is reasonable, except for possible structural change.[1] However, as Mr. Todd also testified, structural change cannot be predicted or built into the forecast.[2]

The Elenchus report stated: "Elenchus is of the opinion that the 2012 and 2013 Electric Load Forecasts prepared by Manitoba Hydro are reasonable projections of future domestic electricity demand assuming there are no significant structural changes to the demand drivers that underpin the forecasting methodology." [Elenchus Review of Manitoba Hydro's Load Forecast, page i]

> "Unfortunately, it is not possible to build structural changes in the market into a load forecast. The most important potential changes are inherently unpredictable. We cannot even predict with confidence whether future structural changes will dramatically escalate demand or cause demand and sustainable prices to collapse." [Elenchus Review of Manitoba Hydro's Load Forecast, page 41]

This difficultly in determining the impact of structural change is further emphasized by Mr. Todd in his testimony at Transcript Page 5125, lines 14-17:

> "It would be harder to predict what the long-term structural impact would be in Manitoba than it would be for Canada as a whole. And economists –

[1] Transcript page 4788, line 7.
[2] Transcript page 4795, line 3.

analysts are still trying to figure that out and are guessing in both directions for Canada as a whole."

Manitoba Hydro's load forecast was also endorsed by MIPUG, wherein the pre-filed testimony of Mr. Bowman of InterGroup Consulting, states: "The load forecast used for Hydro's NFAT filing was tested for reasonableness (Appendix D), and found to be reasonable for the purposes of long-term planning. The P10 and P90 bounds provide a wide range of conditions that are appropriate for scenario analysis." [Pre-filed Testimony of P. Bowman for NFAT, page 1-10].

2.2 Handling Structural Change - Scenarios versus Probability

In 2009, Manitoba Hydro moved from scenario analysis to the use of a probabilistic approach for projecting potential variations to the load forecast. As part of Manitoba Hydro's Electric 2010/11 & 2011/12 General Rate Application, the Public Utilities Board issued Order No. 30/10 on March 26, 2010 appointing Drs. Kubursi and Magee to provide an independent assessment of Manitoba Hydro risks. The Load Forecast was part of this review, and Drs. Kubursi and Magee supported the probabilistic approach for risk assessment for long term planning.

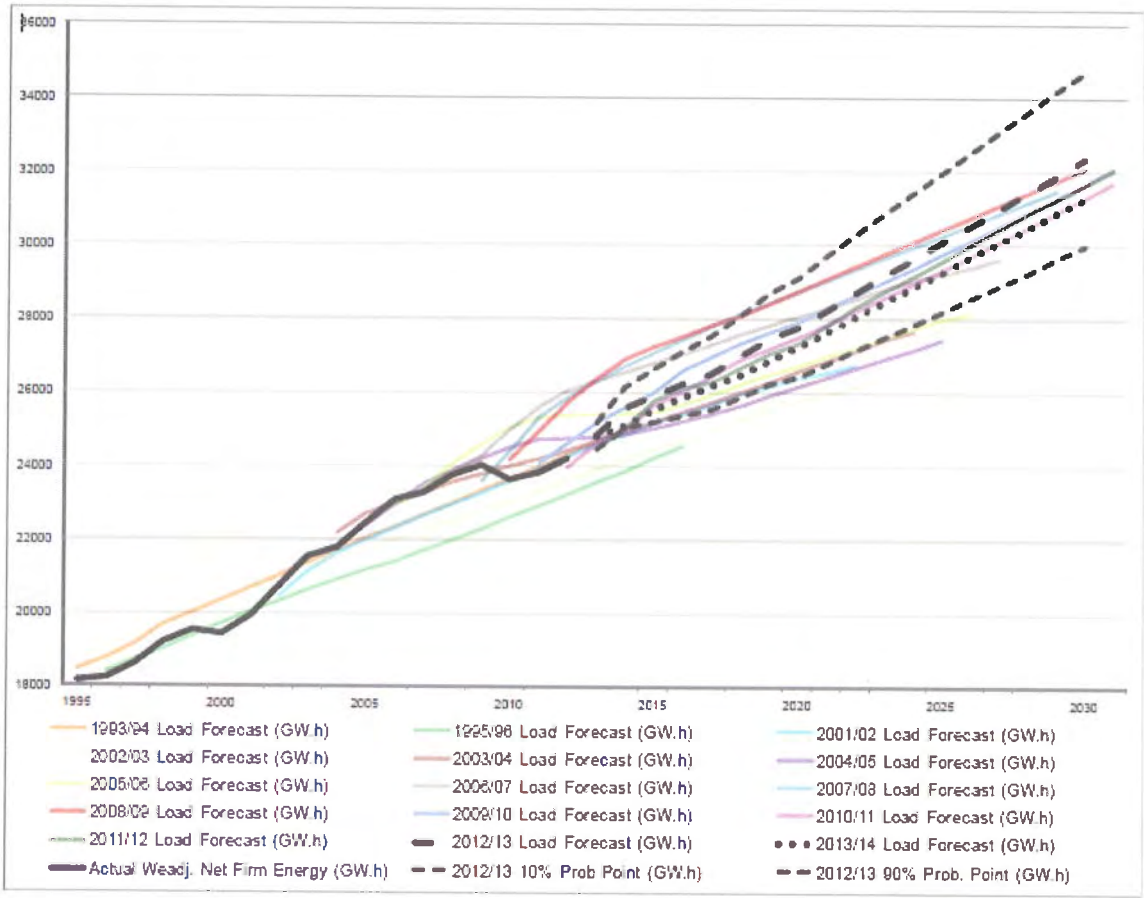
Scenario analysis requires the development of inputs for various cases or scenarios that are analyzed to establish their impact on future load growth. This process involves changing population forecasts, and/or economic input variables, and/or the inclusion of specific assumptions. This requires subjective decisions as to how to forecast each of the inputs. Even after the arbitrary decision is made as to what a scenario consists of, especially one of structural change, estimates must be based on relationships that occurred in the past. These relationships are often assumed to continue into the future. Otherwise, another set of assumptions are required in order to model future relationships. The selection of any scenario requires judgment and the possible combinations are limitless.

Probability analysis provides an analytical solution that avoids the problems of scenario analysis. Instead of attempting to manufacture a scenario, the distribution of load variation from the past is used to develop a probability distribution for future load variation, and statistics is used to produce probability bands. For specific purposes, a set of probability points can be selected to represent high and low scenarios.

Scenarios do not in and of themselves indicate the likelihood of the scenario occurring. In contrast, probability analysis provides a likelihood of what the load will be. Using probability points, any desired level of risk can be analyzed and assessed. The net benefit or cost of this level of risk can be determined and the results can be combined as a full risk analysis.

For the purposes of the NFAT analyses, Manitoba Hydro examined 90% and 10% confidence intervals of the load forecast. As Mr. Wojczynski testified, in setting up these sensitivities for analysis, Manitoba Hydro sought values which were not exceedingly extreme, but which had a medium level of occurrence (Tr. p. 1135, lines 14-18). In his pre-filed testimony, Mr. Bowman agreed that the use of this probability analysis can provide good bounds and presented the following figure:

Figure 6: Manitoba Hydro Historical and Forecast Net Firm Energy (GW.h) 10th and 90th Percentile Forecasts (2012/13 Load Forecast)[12]



"Figure 6 above shows the addition of Manitoba Hydro's sensitivity load forecasts. This includes the 10th and 90th percentiles. This figure serves to illustrate the wide range of sensitivities that arise when these load cases are tested against the NFAT Plans and why they provide what is generally a reasonable outer band of expected experience." (MIPUG Exhibit #9, Appendix D, p. D-9)

This is not to say that an assessment of individual possible events is not useful. Such analysis provides information as to the potential implications of specific events and their relative impacts. This type of information is provided in the Possible Events section of Manitoba Hydro's Load Forecast (Appendix D page 50).

Elenchus prefers the use of scenario analyses. Elenchus is of the opinion that Manitoba Hydro did not address structural change to future energy demand in its NFAT analyses, presenting grid parity as an example of a structural change that could cause a major reduction in the load forecast, and electric vehicles as a structural change that could cause a major increase in future load requirements.

As part of these proceedings, Manitoba Hydro did address structural changes that could cause a major reduction in load growth. Additional analyses were undertaken examining a "no new load growth" case (Manitoba Hydro Exhibit #156) and enhanced levels of DSM (MH Exhibit #95, page 129). In these analyses, Manitoba Hydro determined that if no load growth is assumed beyond 2022/23 and surplus energy is valued using the 2013 long-term price forecast, building Keeyask and a new interconnection results in an incremental net present value of $395M (at real WACC of 5.4%) relative to building no new generation, and that pursuing enhanced DSM up to Level 2 is beneficial under the All Gas, K19/Gas/750 MW and K19/C/750MW plans with incremental net present values ranging from $737 million to $887 million.

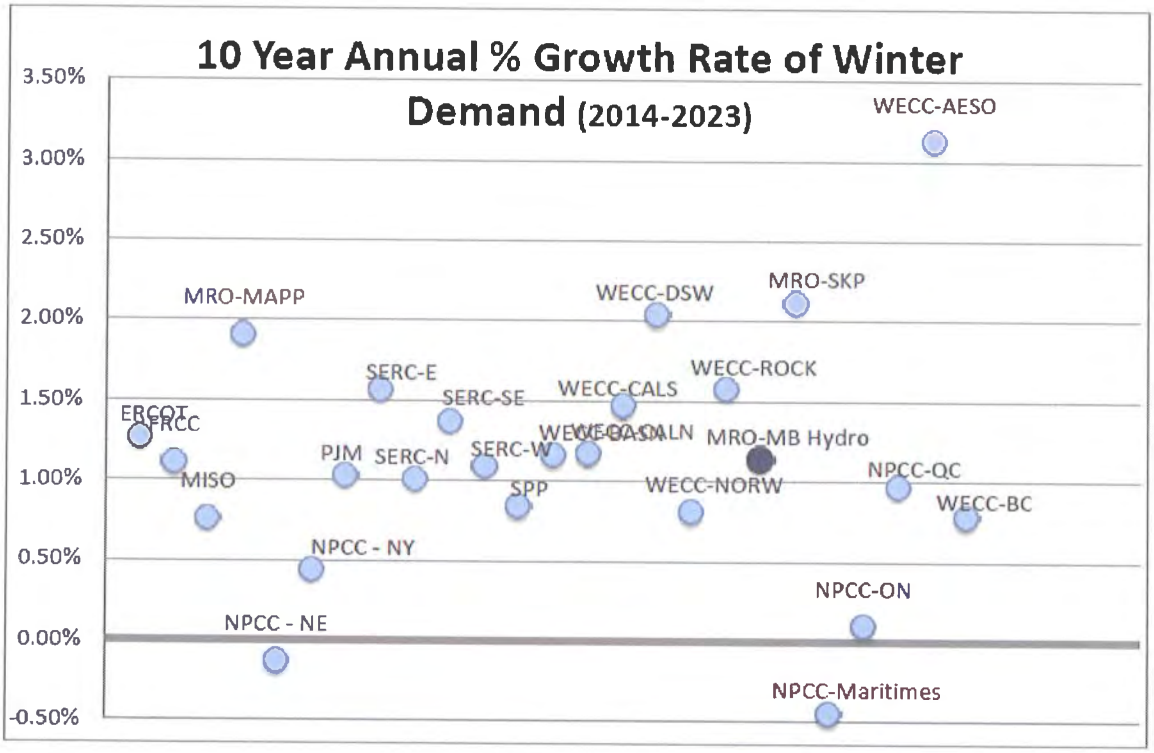
2.3 The Historical Accuracy is Within Reasonable Bounds.

The historical accuracy of the forecast is limited by the year to year variability in the actual growth. The base forecast assumes normal growth. Short term economic conditions may cause the short term load to be higher or lower than forecast, but in the long term, these conditions generally average out.

MIPUG's evidence noted that "Within the reasonable bounds of long-term forecast expectations, Manitoba Hydro's load forecasts appear to have generally tracked trends in power usage well. Each individual forecast can be off by a certain degree, but the forecasting process has been largely self-correcting over a series of years." [Pre-filed Testimony of P. Bowman for NFAT, page D-3]

2.4 Neither Over-Forecast nor Under-Forecast

Manitoba Hydro notes that in comparing its forecast load growth to other jurisdictions, on an equivalent basis, Manitoba's forecast rate of load growth is in line with other jurisdictions. Manitoba Hydro cautions that such comparisons between jurisdictions must be undertaken with care. Jurisdictions do not define their load the same way and comparisons must be done on an equivalent basis. In its Rebuttal Evidence, Manitoba Hydro presented the data assembled from utilities by the North American Electric Reliability Corporation (NERC) as an appropriate comparator [MH Exhibit #85, page 5]. NERC reports Summer and Winter peak demand excluding Station Service and including DSM programs and specific system improvements. This information was updated in MH Exhibit #94 (Transcript Page #810) and continues to demonstrate that Manitoba's forecast rate of load growth remains in line with other jurisdictions.



Manitoba Hydro also notes the evidence on behalf of MIPUG that "Over the past few decades, there has been substantial criticism of Canadian Crown utilities producing overly optimistic load forecasts supporting construction of new baseload plants. While it is important to test whether Manitoba Hydro has exhibited a tendency to over-forecast growth, the evidence in this Appendix suggests this is not the case." [Pre-filed Testimony of P. Bowman for NFAT, Appendix D-1]

Given this comparison, Manitoba Hydro submits that its forecast growth is not overstated, is reasonable and is in line with the majority of regions.

2.5 The Forecast Methodology is Reasonable

Manitoba Hydro's Load Forecast is updated annually to include the latest information about customer groups so that the best estimate of future load can be produced. The methods used for forecasting are reasonable, with Manitoba Hydro's position being supported by others.

> "Hydro's load forecast reflects relative consistency with past practice, and a reasonable approach to analysis. The Hydro load forecast also reflects a reasonable approach to assessing the NFAT Plans." [Pre-filed Testimony of P. Bowman for NFAT, page 3-11].

Manitoba Hydro uses econometric and end-use forecasting for its Residential and General Service Mass Market sectors. In reviewing Manitoba Hydro's use of econometric and end-use forecasting methodology, John Todd of Elenchus noted: "In our view the methodology is generally reasonable, although, some refinements are suggested. Again, we're talking about tweaking, judgment of experts." (Tr. p. 4839).

Manitoba Hydro submits that the refinements suggested by Mr. Todd do not impact the reliability of the load forecast for the purposes of considering the issues before this Board. Mr. Todd also admitted this when he testified: "…as a load forecast it's very difficult to criticize it and say there's a different set of numbers that's better… what we did not do from the beginning was to say, We're going to develop our own load forecast with a different set of numbers. If we did that, we wouldn't come up with anything much different." (Tr. p. 4855).

As such, using a different methodology than what Manitoba Hydro used would not produce a substantially different forecast.

2.6 Top Consumers and Potential Large Industrial Loads (PLIL)

Manitoba Hydro's Top Consumer segment is comprised of a limited number of customers spread across a broad grouping of differing industry sectors. The number of customers within each of those sectors is relatively small with no one sector having an overwhelmingly larger concentration of customers than other sectors. Variables related to facility age and technologies employed within industrial facilities located in Manitoba reflect different levels of competitiveness within a global industrial landscape. They contribute to an industrial landscape where the competitiveness and applicable market influence for a particular customer does not necessarily align with forecasting techniques that are based on high level sector-based trends[3]. The fortune of a few companies and their desire to situate in Manitoba, or need to expand or contract their Manitoba operations, as well as the nature of their specific industry that may force them to expand or reduce operations or close shop entirely is inherently unpredictable. Patrick Bowman testified that "Industrial Load Forecasting in particular is notoriously difficult when there are a limited number of customers." [Pre-filed Testimony of P. Bowman for NFAT, page 3-11]

In these circumstances, Econometric and End Use forecasts do not work well because they must rely on the generalized forecasts of the industries and levels of production expected which are at least as difficult to predict, if not more so, and may not be representative of the companies in Manitoba given their small number and specific circumstances. Manitoba Hydro also believes the use of available "Manitoba specific" GDP forecasts is not suitable as there is not a demonstrated strong relationship as noted in the response to PUB/MH II-457(a). Mr. Todd acknowledged these difficulties in his direct evidence, which includes the statement that "Top User loads can change significantly in unanticipated ways since their demands are driven by many idiosyncratic factors that cannot be known to Manitoba Hydro." [Elenchus presentation ERA Exhibit #5, slide 24] In addition, after review of the performance of Indiana's econometric-based load forecast for industrial customers, Dr. Gotham agreed that some events cannot be predicted with any methodology. (Tr. p. 8628)

Recognizing the limitations associated with econometric and end use forecasts for Top Consumers in Manitoba, Manitoba Hydro undertakes forecasting of short-term energy use for Top Consumers on a per-company basis in order to include their respective committed plans in its forecast. Manitoba Hydro has established a good working relationship with these customers, and is able to gain first-hand information regarding customers' short term energy requirements based on their knowledge of their operations, markets and opportunities. To

[3] Transcript page 8642, lines 10-22.

estimate the longer-term growth for the Top Consumer sector, the sector is forecast as a whole based upon average growth over a period of 20 years. Given the high degree of year over year variability in industrial growth (i.e. load is added or removed in large blocks), industrial growth and decline should be examined on a longer-term basis. This 20 year period includes periods of growth and recession, including the recent loss of one Top Consumer. This approach is endorsed by MIPUG in the response to Information Request MH/MIPUG I-4 which states: "It is reasonable to portray the ongoing load growth using an equal annual PLIL approach over the long-term with an acknowledgement that the intent is not to precisely predict the load in any given year, but simply the range of reasonable longer-term trends." [MH/MIPUG I-4, Page 4] MIPUG concludes by stating "Elenchus' conclusion that Hydro industrial load forecasts are overstated, and that 'the Top Consumer sales forecast appears to be a major source of forecast error' is not borne out over the periods relevant for the analysis of resource planning." [MH/MIPUG I-4, Page 5]

Manitoba Hydro is confident its approach to forecasting for the Top Consumers sector is reasonable and appropriate for long term forecasting purposes.

We cannot leave the discussion of Top Consumers without speaking to the pipeline sector. There has been significant discussion during this proceeding regarding projected growth in the pipeline sector. Mr. Friesen spoke at length about the projects driving growth in this sector (Tr. p. 1136 – 1142). He noted that the projects included upgrades in pumping capacity or enhancements to existing pipelines to increase flows; National Energy Board (NEB) approvals have been received for these projects with some components awaiting provincial approvals. In addition, TransCanada Pipeline Inc has filed the Energy East Pipeline proposal with the National Energy Board. Mr. Gange expressed in closing argument for GAC that the anticipated new pipeline load may not choose electricity over natural gas for compression and pumping (GAC Exhibit #27, page 13). To assist the Board and the stakeholders of this proceeding, we would remind the Board of Mr. Friesen's evidence that due to the viscosity and incompressibility of oil, it is difficult to provide the pumping force required through natural gas compression and therefore all discussions have been regarding electrically driven pumps (CSI Tr. p. 29 – 30, PUB/MH II-358b). Mr. Friesen also explained that for this sector it is not a matter of Manitoba actively attracting these customers to the region, but that Manitoba is simply "in the path" as they seek to serve customers in other locations (Tr. p. 587 – 588). Given the market indications, Manitoba Hydro is of the opinion that these projects will proceed.

2.7 Price Elasticity in Manitoba

Consideration of the impact of price elasticity in Manitoba has been an issue of interest in this proceeding. Manitoba Hydro agrees with the observation of Dr. Gotham that "having a -- a history of low, stable electricity prices makes determining a -- from a mathematical standpoint, determining a price elasticity from the historical data difficult, if not impossible". (Tr. p. 8643). Manitoba Hydro expects that higher real prices of electricity will lead to reductions in electricity use; however the analysis of the magnitude of this price effect is not a simple task.

The regression equations that determine price effect must not be so simplistic that all coincidental change in load is assigned to the price variable, or the price elasticity will be greatly over-estimated. This would result in a much larger price effect than would be realized and lower the forecast more than appropriate, risking Manitoba Hydro's ability to effectively meet future need.

Studies from other jurisdictions are not necessarily applicable to Manitoba, and it is not prudent to adopt a price elasticity found on the internet [Simpson/Gotham report, CAC Exhibit #65, page 9] without understanding the conditions and drivers underpinning that value. Differences between Manitoba and the other jurisdictions in factors such as starting price, rate structure, average versus marginal pricing and cross price effect with other fuels must be considered. All non-price effects must be accounted for to minimize the potential for double counting of effects, such as the effects of an economic downturn, codes and standards, conservation rate programs and DSM programming.

In contrast to the information from US jurisdictions referenced by Dr. Simpson in support of his suggestion of a -0.5 factor, BC Hydro in 2008 adopted an own price elasticity of -0.05 , one-tenth of that recommended by Dr. Simpson, for their load forecast which has been reviewed and accepted by the BC Utilities Commission. BC Hydro accounted for DSM programs, influence of codes & standards, and assumed a lower elasticity to compute the conservation effect of a rate level change under a flat rate design (-0.05) compared to that under an inclining rate design (-0.10). [CAC Exhibit #45-01, Subject: Load Forecast & DSM, Pages 144 to 145]

Manitoba Hydro intends to reflect the price effect in future forecasts. However, Manitoba Hydro seeks to ensure the price elasticity used appropriately represents Manitoba's situation with regards to rate structure, existing low prices, effects of DSM programs along with Codes and Standards. (Tr. p. 882 – 883).

3.0 FUEL SWITCHING

3.1 Manitoba Hydro's Heating Fuel Choice Initiative continues to evolve and will be effective in reducing electric heat market share
