COMPLEX: WINNIPEG RIVER RIVERBANK PROTECTION PROGRAM

Proposal

Placement of rock protection and construction of slope stabilization to reduce erosion of riverbank along the Winnipeg River. The work includes inspection, design, mapping, land acquisition and remedial construction at Pine Falls and McArthur Falls.

JUSTIFICATION: ☐ Load ☐ Service ☐ Safety ☐ Efficiency ☐ Reliability ☒ Other

Explanation

Provision of riverbank protection and stabilization work along the Winnipeg River and tributaries between Seven Sisters forebay and Manitou Rapids from erosion partially due to hydraulic operations.

COMPLEX STATUS: [X] Planned [ ] In progress

Complex no. 246

REVISION STATUS: [ ] New complex [X] In service change [ ] Concept change [ ] Estimate change only

COMPLEX: KETTLE G.S. STATOR REWIND

Proposal
Rewind generator stators on units 1 - 12.

JUSTIFICATION: [ ] Load [ ] Service [ ] Safety [ ] Efficiency [X] Reliability [ ] Other

Explanation
The stator windings at Kettle are a polyester bonded mica which is prone to internal degredation as a result of thermal and electrical stresses. There has been a much higher failure rate for stator coils at Kettle than in any of our other generators installed since 1960. Analysis of the internal conditions of the insulation system is ongoing. Rewedging units at Kettle is an opportunity to repair isolated cases of severe slot discharge, necessary to avoid deterioration. Replacing stators as well is under investigation to include a single turn roebel bar winding with class 'f' insulation.

Title
KETTLE G. S.- GENERATOR STATOR REWIND - UNITS 1-12

Budget reference number
01-20-7046

Originating division	Coordinating division	Constructing division	Project Order Group (Range):
Generation - North	Generation - South	Generation - South	60165

SCRIPTION:
wind generator stators on Units 1 - 12.

JUSTIFICATION:
The stator windings at Kettle are a polyster bonded mica which is prone to internal degradation as a result of thermal and electrical stresses. There has been a much higher failure rate for stator coils at Kettle than in any of our other generators installed since 1960. Analysis of the internal conditions of the insulation system is ongoing. Rewedging units at Kettle is an opportunity to repair isolated cases of severe slot discharge. This measure is necessary to avoid deterioration. Year 2002 is the target for the first rewind.

Replacing the stator as well as the winding is under investigation. This will confirm the installation of a single turn roebel bar winding with class 'f' insulation instead of the existing multi-turn coil winding.

REVISION:
Work start date changed from 1997 08 to 2000 04. This item should be studied in conjunction with plans to rerunner these units.

COMPLEX STATUS: [X] Planned [ ] In progress

Complex no. 252

REVISION STATUS: [X] New complex [ ] In service change [ ] Concept change [ ] Estimate change only

COMPLEX: KELSEY GS GATE REHABILITATION

Proposal

Replacement of rollers, installation of cathodic protection, touch up painting, seal replacement, and replacement of the hoist cables if required for units 1-5.

JUSTIFICATION: [X] Load [ ] Service [X] Safety [ ] Efficiency [X] Reliability [ ] Other

Explanation

The unit 2 gate inspection in 1997 established that the above mentioned work is required to ensure that the intake gates function as designed. If they do not function as designed, there is the possibility of a run away unit.

Title
KELSEY GATE REHABILITATION

Budget reference number
01-07-8084

Originating division	Coordinating division	Constructing division	Project Order Group (Range):
Generation - North	Generation - North	Generation - North	61693:61697

DESCRIPTION:
KELSEY GENERATING STATION, UNITS ONE TO FIVE, INTAKE GATE REHABILITATION. THE WORK WILL INCLUDE THE REPLACEMENT OF ROLLERS, INSTALLATION OF CATHODIC PROTECTION, TOUCH UP PAINTING, SEAL REPLACEMENT AND REPLACEMENT OF THE HOIST CABLES IF REQUIRED.

JUSTIFICATION:
THE UNIT 2 GATE INSPECTION IN 1997 ESTABLISHED THAT THE ABOVE MENTIONED WORK IS REQUIRED TO ENSURE THAT THE INTAKE GATES FUNCTION AS DESIGNED. IF THE INTAKE GATES DO NOT FUNCTION AS DESIGNED, THERE IS THE POSSIBILITY OF A RUN AWAY UNIT.

REFERENCE:
KELSEY GENERATING STATION, UNIT TWO, INTAKE GATE INSPECTION AND CATHODIC INSTALLATION, 1997 REPORT NO: GN98-01, FILE NO: 000111-76300, DATE: 98 03 06.

REVISION:
DELAYED ONE YEAR TO FACILITATE THE REHABILITATION WORK TO BE COMPLETED ON UNITS 6 & 7.

CAPITAL EXPENDITURE FORECAST COMPLEX

(IN THOUSANDS OF DOLLARS)

COMPLEX STATUS: [X] Planned [ ] In progress

Complex no. 256

REVISION STATUS: [X] New complex [ ] In service change [ ] Concept change [ ] Estimate change only

COMPLEX: KETTLE CENTRAL ANNUNCIATION SYSTEM UPGRADES

Proposal

A new system consisting of GE Fanuc PLCs and a Windows NT based human-machine interface (HMI) should be installed to replace the existing Central Annunciation System (CAS) at Kettle GS.

JUSTIFICATION

[X] Load [ ] Service
[ ] Safety [ ] Efficiency
[X] Reliability [ ] Other

Explanation

A condition assessment of the existing Central Annunciation System (CAS) has revealed that,due to deterioration, lack of spare parts and manufacturer support, the system is at the end of its life. Replacement of the CAS with a new system similar to systems installed at other generating stations has the best net present value of possible options.

(IN THOUSANDS OF DOLLARS)

COMPLEX STATUS: ☐ Planned ☒ In progress

Complex no. 38

REVISION STATUS: ☐ New complex ☒ In service change ☒ Concept change ☐ Estimate change only

COMPLEX: THERMAL G.S. ASSURANCE

Proposal

Refurbish the thermal generating units at Brandon and Selkirk Generating Stations as follows;

Brandon - Refurbish Units 1-5. Install electrostatic precipitators and a cooling tower for Unit 5, meet environmental licence requirements, upgrade coal handling facilities, and perform unit 5 mechanical upgrades (1998/99).

Selkirk - Refurbish Units 1 and 2, install ash lagoon and effluent management systems, and modify coal handling facilities.

JUSTIFICATION

☐ Load ☐ Service
☐ Safety ☐ Efficiency
☒ Reliability ☐ Other

Explanation

Based on WP London's report, Brandon and Selkirk Generating Stations require refurbishment of equipment, installation of environmental protection equipment, and modification of the fuel handling system in order to assure; service life to planned retirement, operation under more stringent environmental standards and a continuing supply of fuel.

CAPITAL EXPENDITURE FORECAST COMPLEX

(IN THOUSANDS OF DOLLARS)

COMPLEX STATUS: [X] Planned [ ] In progress

Complex no. 226

REVISION STATUS: [ ] New complex [ ] In service change [ ] Concept change [X] Estimate change only

COMPLEX: BRANDON G.S. LICENCE RENEWAL

Proposal

Refurbish unit #5, extending the useful life of the plant to 2019. Life extension requires: procurement of a new environmental licence for the period 2006 - 2019, replacement of last two rows of L.P. turbine blading, retube condenser, upgrade electrical services, install nitrous oxides control & continuous emission monitoring. Build new ash lagoon.

JUSTIFICATION: [X] Load [ ] Service [ ] Safety [ ] Efficiency [X] Reliability [ ] Other

Explanation

The 1998 power resource plan report recommends Brandon #5 life extension as an option to meet future load requirements and increase system reliability.

Originating division	Coordinating division	Constructing division	Project Order Group (Range):
Power Planning & Operations	Power Planning & Operations	Generation - South	61506:81980

DESCRIPTION:
REFURBISH UNIT #5, EXTENDING THE USEFUL LIFE OF THE PLANT TO 2019. LIFE EXTENSION REQUIRES: PROCUREMENT OF A NEW ENVIRONMENTAL LICENCE FOR THE PERIOD BETWEEN 2006 AND 2019, REPLACEMENT OF LAST TWO ROWS OF L.P. TURBINE BLADING, RETUBE CONDENSER, UPGRADE ELETRICAL SERVICES, INSTALL NITROUS OXIDES CONTROL AND CONTINUOUS EMISSION MONITORING. BUILD NEW ASH LAGOON.

JUSTIFICATION:
THE 1998 POWER RESOURCE PLAN REPORT RECOMMENDS BRANDON #5 LIFE EXTENSION AS NEXT PLANT TO MEET FUTURE LOAD REQUIRMENTS AND INCREASE SYSTEM RELIABILITY.
BASED ON CONSULTANT W.P. LONDON'S PRELIMINARY REPORT, UNIT #5 REQUIRES REFURBISHMENT OF EQUIPMENT, INSTALLATION OF ENVIRONMENTAL PROTECTION EQUIPMENT AND CONSTRUCTION OF A NEW ASH LAGOON IN ORDER TO ASSURE EXTENSION OF OPERATING LIFE TO 2019 AND COMPLIANCE WITH MORE STRINGENT ENVIRONMENTAL STANDARDS.

NOTE: ESTIMATE INCLUDES AN UNAMORTIZED BALANCE OF PRELIMINARY PLANNING STUDIES ESTIMATED AT $.917 MILLION.

REVISION:
CONTINGENCY AMOUNT: $2,637,000 (1997$)

COMPLEX STATUS: ☐ Planned ☒ In progress

Complex no. 220

REVISION STATUS: ☐ New complex ☐ In service change ☒ Concept change ☒ Estimate change only

COMPLEX: BRANDON G.S. SWITCHYARD JETAIRE BREAKER REPL

Proposal
Replacement of all thirteen 115kV Jetaire circuit breakers at Brandon G.S.

JUSTIFICATION
☐ Load ☐ Service
☐ Safety ☒ Efficiency
☒ Reliability ☐ Other

Explanation
These breakers have been in service for 40 years and have reached the end of their useful life. Obsolescence (interim system upgrades and their age have decreased their capability), high fault levels, decreasing reliability, and high maintenance costs (8.4 times higher than similar breakers at Bdn with parts very expensive or unavailable) indicate these breakers should be replaced with existing surplus breakers, after their refurbishment.

BRANDON G.S. SWITCHYARD JETAIRE BREAKER REPLACEMENT

Budget reference number
01-05-7012

Originating division	Coordinating division	Constructing division	Project Order Group (Range):
Generation - South	Design	Construction	60158

DESCRIPTION:
REPLACEMENT OF ALL THIRTEEN 115 KV JETAIRE CIRCUIT BREAKERS AT BRANDON GENERATING STATION.

JUSTIFICATION:
THE THIRTEEN 115 KV JETAIRE CIRCUIT BREAKERS AT THE BRANDON GENERATING STATION WERE INSTALLED IN 1957 AND ARE THE ONLY ONES REMAINING ON THE MANITOBA HYDRO SYSTEM. THEIR FAULT INTERRUPTING RATING IS LOW AND SYSTEM PROCEDURES HAVE BEEN PUT INTO PLACE TO REDUCE SYSTEM FAULT LEVELS DURING CERTAIN BREAKER OPERATIONS.

REFERENCE:
REPORT NO. 95-HGE-018.109 (PS96-08)

REVISION:
CASH FLOW ADJUSTED TO REFLECT MORE WORK DONE IN 1998/99 THAN PREVIOUSLY FORECASTED.

REVISION STATUS: ☐ New complex ☒ In service change ☐ Concept change ☒ Estimate change only

COMPLEX	200MW ONTARIO HYDRO SALE

Proposal

Make necessary adjustments to units 1 to 6 at Seven Sisters G.S. to allow conversion of units to synchronous condenser operation.

JUSTIFICATION

☒ Load ☐ Service ☐ Safety ☒ Efficiency ☒ Reliability ☐ Other

Explanation

During low Winnipeg River generation and single contingency outage conditions, additional voltage support is required in Whiteshell area to maintain 200MW sale to Ontario. This item provides for capability to convert Seven Sisters generating units to synchronous condenser operation to provide required voltage support.

SEVEN SISTERS GENERATOR 1-6 SYNCHRONOUS CONDENSER CONVERSION			01-02-5933
Originating division	Coordinating division	Constructing division	Project Order Group (Range):
Planning & Control	Generation - South	Generation - South	60090

DESCRIPTION:
MAKE NECESSARY ADJUSTMENTS TO UNITS 1 TO 6 AT SEVEN SISTERS GENERATING STATION TO ALLOW CONVERSION OF UNITS TO SYNCHRONOUS CONDENSER OPERATION.

JUSTIFICATION:
DURING LOW WINNIPEG RIVER GENERATION AND SINGLE CONTINGENCY OUTAGE CONDITIONS, ADDITIONAL VOLTAGE SUPPORT IS REQUIRED IN WHITESHELL AREA TO MAINTAIN 200 MW SALE TO ONTARIO. THIS ITEM PROVIDES FOR CAPABILITY TO CONVERT SEVEN SISTERS GENERATING UNITS TO SYNCHRONOUS CONDENSER OPERATION TO PROVIDE REQUIRED VOLTAGE SUPPORT.

REFERENCE:
REPORT PSPD 94-1, SYSTEM IMPROVEMENTS TO SUPPORT 200 MW SALE TO ONTARIO HYDRO IN 1998.

REVISION:
WORK SCHEDULED FOR 1999/00 IS COMPLETION OF OUTSTANDING DEFICIENCIES.

Title
Seven Sisters 115 kV Breaker and Wall Bushing Upgrade

Budget reference number
01-02-8071

Originating division	Coordinating division	Constructing division	Project Order Group (Range):
Generation - South	Generation - South	Construction	61365:61367

DESCRIPTION:
Upgrade the short circuit rating of the 16 - 115 kV AT breakers (includes 1 spare) at Seven Sisters G.S. from 3500 MVA to 5000 MVA by reinstalling their pre-insertion resistor switching mechanism. Replace the oil-leaking 115 kV line wall bushings with new spare units.

JUSTIFICATION:
The fault levels at Seven Sisters Generating Station exceed the current interrupting rating of the 115 kV AT breakers. Upgraded breakers will withstand the worst case existing and horizon year's station fault currents. Replacement of the deteriorated 115 kV line wall bushings enhances transmission reliability of the 200 MW sale to Ontario Hydro.

REFERENCE:
Memo: Walter Zurba to Clarence Thio, 1997 07 04 - 'Upgrading the 115 kV system at Seven Sisters G.S.'
Memo: Walter Pawlikewich to John Clouston, 1997 08 28 - 'Seven Sisters G.S. - 115 kV Wall Bushings'

REVISION:
Wall bushing upgrade and pre-insertion resistors completed in 1998/99. Scope of work in 1999/00 is to install one refurbished breaker and to refurbish and re-install a second breaker. In following seven years, refurbish and re-install two breakers per year.

COMPLEX STATUS: [X] Planned [ ] In progress

Complex no. 227

REVISION STATUS: [ ] New complex [ ] In service change [ ] Concept change [X] Estimate change only

COMPLEX: SITE REMEDIATION - CONTAMINATED CORPORATE FACILITIES

Proposal

Conduct geotechnical investigation of the various contaminated Corporate facilities to deliniate the extent of any contamination on/around the site and prepare a report each with recommendations for cleanup. Remediate contaminated areas to environmentally acceptable limits and issue a final report confirming the site remediated in accordance with applicable environmental regulations.

JUSTIFICATION: [ ] Load [ ] Service [X] Safety [ ] Efficiency [ ] Reliability [X] Other

Explanation

Environmental concerns and/or regulations require that Corporate facilities be investigated and remediated as required to restore them to a level which permits unrestricted use of the site.

Complex no. 225

REVISION STATUS: ☐ New complex ☒ In service change ☐ Concept change ☐ Estimate change only

COMPLEX	OIL CONTAINMENT - POWER SUPPLY

Proposal

Modifications and/or additions are required to prevent and contain oil spills:

1) southern and northern hydraulic generating stations, install oil/water separators, modify drainage systems, and upgrade sump, fuel storage facilities and dyking systems.

2) converter stations, install an oil containment system to collect and recover any oil spilled within the station.

JUSTIFICATION

☐ Load ☐ Service
☒ Safety ☐ Efficiency
☐ Reliability ☒ Other

Explanation

Previous experience with oil spills requires the Corporation to demonstrate "due diligence" with respect to containing and minimizing the potential for any further occurances. In addition, any plant outage as a result of a spill represents a minimum loss of $5000/hr.

TOTAL	8,334	15,858	16,175	14,321	-1,854	-11

FORECAST HISTORY (IN THOUSANDS OF DOLLARS):

APPROVED yyyy | mm	TOTAL AMOUNT	AMENDMENT
96 10	19,730	New complex (previously part of 81) which covers Power Supply portion of oil containment & two new spill response equipment purchase items, base year 1996.
9710	18,504	Increased for 7 mo deferral of Great Falls, Jenpeg, and Grand Rapids, cost of approved Generation South spill response equipment and decreased for favourable contract prices for
9810	17,494	Reflects 97/98 underexpenditure 0.5M, reduced scope + contract prices at Long Spruce and Limestone, addition of risk analysis by consultant at 3 sites and deferred in-service dates.
1999 10	15,582	Reflects tailrace & splash shield, and 'Oil Spill Containment Working Group' scope reductions, favourable actual costs, and costs to completion.

GENERATION SOUTH GENERATING STATIONS - OIL SPILL CONTAINMENT	01-01-6969

Originating division	Coordinating division	Constructing division	Project Order Group (Range):
Generation - South	Generation - South	Generation - South	60094:60098

DESCRIPTION:
MODIFICATIONS ARE REQUIRED AT THE GENERATION SOUTH HYDRAULIC GENERATING STATIONS TO PREVENT OIL SPILLS. MAJOR ITEMS IDENTIFIED AT EACH STATION ARE AS FOLLOWS: PINE FALLS - INSTALLATION OF OIL/WATER SEPARATOR, MODIFICATIONS TO DRAINAGE SYSTEM, DYKING IN 115KV SWITCHYARD. START 95 11 ISD 97 03. GREAT FALLS - OIL CONTAINMENT IN TURBINE PITS, SECOND OIL/WATER SEPARATOR. START 96 11 ISD 98 03 MCARTHUR FALLS - CONVERSION OF EXISTING SUMP TO OIL/WATER SEPARATOR, OIL SKIMMERS, MODIFICATIONS TO STATION DRAINAGE SYSTEM. START 95 11 ISD 97 03. JENPEG - UPGRADE OIL SKIMMER EQUIPMENT, IMPROVE OIL INTERCEPTER, FUEL STORAGE FACILITY UPGRADE. START 96 11 ISD 98 03. GRAND RAPIDS - TRANSFORMER OIL PIT DRAINAGE SYSTEM, MODIFICATIONS TO EXISTING PIPE TRENCH TO FUNCTION AS OIL/WATER SEPARATOR, NEW OIL STORAGE BUILDING, GOVERNOR OIL LEVEL MONITORING, AND TRANSFORMER DECK SPRAY SHIELDS. START 95 11 ISD 97 03.

JUSTIFICATION:
MANITOBA HYDRO HAS HAD TWO OIL SPILLS IN THE LAST FIVE YEARS FROM ITS HYDRAULIC PLANTS. ANY FURTHER SPILLS WILL PROBABLY RESULT IN CHARGES BY MANITOBA ENVIRONMENT AND THE FEDERAL GOVERNMENT AS MANITOBA HYDRO WILL BE CONSIDERED A REPEAT OFFENDER. THE WORK ITEMS HAVE BEEN IDENTIFIED IN VARIOUS ENGINEERING REPORTS. BY COMPLETING THIS WORK, MANITOBA HYDRO WILL HAVE DEMONSTRATED DUE DILIGENCE IN ITS APPROACH TO OIL SPILL CONTAINMENT.

REFERENCE:
MECHANICAL DEPT. REPORT 95-M5 OIL SPILL CONTAINMENT IN CORPORATE FACILITIES REPORT NO. 95-M4 OIL SPILL CONTAINMENT REQUIREMENTS FOR PRODUCTION DIVISION SOUTH - HYDRO AND THERMAL GENERATING STATIONS REPORT 95-M2 MCARTHUR FALLS G.S. - OIL SPILL CONTAINMENT, PREPARED BY K. HUNTER. GRAND RAPIDS G.S.- OIL SPILL PREVENTION AND CONTAINMENT STUDY, FEB/95 PREPARED BY ACRES ENGINEERING.

REVISION:
IN SERVICE DATES FOR GREAT FALLS, AND GRAND RAPIDS PHASE 'B' SCHEDLUED FOR 1999/12 AND 2000/11. ESTIMATE AT GRAND RAPIDS REDUCED TO REFLECT REVISED SCOPE OF WORK (NOT DOING TAILRACE SPLASH SHIELDS).
CONTINGENCY AMOUNT: $100 000

Title			Budget reference number
GENERATION NORTH GENERATING STATIONS OIL SPILL CONTAINMENT			01-20-5940
Originating division	Coordinating division	Constructing division	Project Order Group (Range):
Generation - North	Generation - South	Generation - South	60064:60073

DESCRIPTION:
IN ORDER TO PREVENT OIL SPILLS, MODIFICATIONS AND ADDITIONS TO THE EXISTING FACILITIES ARE REQUIRED AT GENERATION - NORTH HYDRAULIC GENERATING STATIONS AND CONTROL STRUCTURES. THIS WILL INCLUDE: INSTALLATION OF OIL SEPARATORS; MODIFICATION OF THE EXISTING STATION SUMP(S); INSTALLATION OF NEW SUMP PUMPS; CONVERSION OF TAILRACE DECKS TO OIL CONTAINMENT CAPABILITY; INSTALLATION OF PIPING TO DRAIN TAILRACE DECK, TRANSFORMER PITS AND EXISTING SUMP(S) TO OIL SEPARATORS: CONTAINMENT OF HYDRAULIC SYSTEMS FOR HEADGATES; MINOR TRENCH AND STRUCTURE MODIFICATIONS FOR SPILL CONTAINMENT; UPGRADING OF THE EXISTING FUEL STORAGE FACILITIES IN ORDER TO BRING THEM UP TO MEET THE REQUIREMENTS OF THE CURRENT LEGISLATION. SOME OR ALL OF THESE CHANGES ARE REQUIRED AT EACH PLANT.

JUSTIFICATION:
MANITOBA HYDRO HAS HAD TWO OIL SPILLS IN THE LAST FIVE YEARS FROM ITS HYDRAULIC PLANTS. ANY FURTHER SPILLS WILL PROBABLY RESULT IN CHARGES BY MANITOBA ENVIRONMENT AND THE FEDERAL GOVERNMENT AS MANITOBA HYDRO WILL BE CONSIDERED A REPEAT OFFENDER. THE MAJORITY OF MANITOBA HYDRO'S PRODUCTION COMES FROM GENERATION-NORTH. IN THE PAST, PLANT OUTAGE HAS BEEN THE INITIAL RESPONSE TO AN OIL SPILL. THE MINIMUM COST OF A PLANT OUTAGE AT ONE OF THE THREE LARGE PLANTS IS $5000 PER HOUR. THE GENERATION-NORTH PLANTS PRESENT A CHALLENGE WHEN ATTEMPTING TO MINIMIZE THE EFFECT OF AN OIL SPILL BECAUSE: THE HIGH WATER FLOWS THROUGH THE NELSON RIVER WILL HAMPER THE USE OF BOOMS AND WATER CRAFT TO RECLAIM OIL; REMOTE LOCATIONS OF PLANTS AND LOW STAFFING LEVELS INCREASE RESPONSE TIME; IT WILL TAKE APPROXIMATELY 2 DAYS TO GET ASSISTANCE FROM OTHER AGENCIES SUCH AS GENERATION-SOUTH OR THE COAST GUARD; AND THE CLIMATE, IN PARTICULAR THE VERY LOW TEMPERATURES, WILL CHALLENGE OUR ABILITY TO SAFELY WORK OUTSIDE AND ON THE WATER.

REFERENCE:
CH2M HILL ENGINEERING LTD. REPORT DATED OCT/94 AND MECH. DEPT. JULY/95 REPORT 95-M5 'OIL SPILL CONTAINMENT IN CORP. FACILITIES.'

REVISION:
REDUCED ESTIMATE REFLECTS ACTUAL COST AT LIMESTONE AND LONG SPRUCE BEING LESS THAN ESTIMATED. CASHFLOW FOR 1999/00 REFLECTS COMPLETION OF DEFICIENCIES AT KETTLE G.S.

Title	Budget reference number
GENERATION NORTH SPILL RESPONSE EQUIPMENT	09-00-7805

Originating division	Coordinating division	Constructing division	Project Order Group (Range):
Generation - North	Generation - North	Generation - North	61652

DESCRIPTION:
PURCHASE SPILL RESPONSE EQUIPMENT FOR THE GENERATION NORTH DIVISION IN ORDER TO MEET CORPORATE SPILL RESPONSE OBJECTIVES.

JUSTIFICATION:
THE CORPORATE OIL SPILL CONTAINMENT WORKING GROUP'S TERMS OF REFERENCE INCLUDED THE DEVELOPMENT OF EMERGENCY RESPONSE PROCEDURES AND EQUIPMENT PROCUREMENT, STAFFING AND TRAINING. THERE IS PRESENTLY NO CORPORATE INITIATIVE IN PLACE TO EVALUATE THE OVERALL FINANCIAL REQUIREMENTS AND NECESSITY FOR SPILL RESPONSE EQUIPMENT AT VARIOUS FACILITIES. THIS ISSUE WAS THEREFORE ADDRESSED BY THE OSCWG.

REFERENCE:
OIL SPILL CONTAINMENT WORKING GROUP REPORT 95-M5 DATED 1996 01 30. OSC PROGRAM 6(C) SUB-COMIMITTEE DRAFT REPORT DATED 1996 05 16.

REVISION:
REFLECTS ACTUALS TO COMPLETION.

CAPITAL EXPENDITURE FORECAST COMPLEX

(IN THOUSANDS OF DOLLARS)

COMPLEX STATUS: ☐ Planned ☒ In progress

Complex no. 228

REVISION STATUS: ☐ New complex ☒ In service change ☐ Concept change ☒ Estimate change only

COMPLEX: FIRE PROTECTION PROJECTS - POWER SUPPLY

Proposal

Design and install passive and/or active fire prevention and protection systems at all generating stations, and key transmission terminating stations as outlined by The Fire Prevention and Protection Committee and defined in the Fire Manual Part II.

Locations covered by this capital item complex are;
Pine Falls, McArthur, Kelsey, Limestone, Kettle, and Long Spruce Generating Stations, and Dorsey, Radisson, and Henday Stations.

JUSTIFICATION

☐ Load ☐ Service
☒ Safety ☐ Efficiency
☒ Reliability ☐ Other

Explanation

In accordance with the rules and guidelines established by The Fire Prevention and Protection Committee, implementation of this program will reduce the risk of fire to an acceptable level and mitigate the effects of any such occurance.

Estimate Level	COMPLEX START (yyyy mm)

Title: KETTLE G.S. - FIRE ALARM SYSTEM

Budget reference number: 01-20-7009

Originating division	Coordinating division	Constructing division	Project Order Group (Range):
Generation - North	Generation - South	Generation - South	60154

DESCRIPTION:
MODIFICATIONS TO THE EXISTING SYSTEMS WILL INCLUDE: EXTENDING THE EXISTING DELUGE PIPING TO ENSURE DIRECT WATER SPRAY ON THE BASE OF THE GENERATOR STEP-UP TRANSFORMER BUSHINGS;ADDITION OF SPRINKLERS ON THE DOWNSTREAM POWERHOUSE WALL AND CONSTRUCTION OF A FIRE BARRIER BLAST WALL BETWEEN UNIT #1 TRANSFORMER AND THE CONTROL ROOM/OFFICE AREA.

JUSTIFICATION:
RECENT FIRES AT KETTLE GENERATING STATION IN STEP-UP TRANSFORMER T9 INDICATED A NEED TOIMPROVE THE EXISTING SYSTEMS TO PREVENT OR LIMIT THE SPREAD OF A FIRE AND TO MEET CURRENT FIRE PROTECTION STANDARDS. IT IS FELT THAT THESE MODIFICATIONS WILL REDUCE THE EXISTING FIRE RISK, THE POSSIBILITY OF EXTENSIVE FIRELOSSES, INTERUPTION OF POWER SUPPLY AND IMPROVE THE OVERALL OPERATING SYSTEM SECURITY

REFERENCE:
MECHANICAL DEPARTMENT REPORT 95-M8

REVISION:
PROJECT COMPLETE. REFLECTS ACTUAL COST TO COMPLETION.

Title: JENPEG FIRE PREVENTION & PROTECTION

Budget reference number: 01-23-8108

Originating division	Coordinating division	Constructing division	Project Order Group (Range):
Generation - South	Engineering Services-P.S.	Construction	61412

DESCRIPTION:
TO UPGRADE THE FIRE WATER MAIN SUPPLY TO PROVIDE ADEQUATE FLOWS AND PRESSURES IN ORDER TO PROTECT THE STAFFHOUSE AT JENPEG GENERATING STATION IN THE EVENT OF FIRE.

JUSTIFICATION:
IMPLEMENTATION OF THE RECOMMENDED FIRE PREVENTION AND PROTECTION MEASURES WILL REDUCE THE EXISTING FIRE RISK AT JENPEG POWERHOUSE AND THE STAFFHOUSE TO AN ACCEPTABLE LEVEL AND WILL ALSO REDUCE THE POSSIBILITY OF EXTENSIVE FINANCIAL LOSSES.

Title
SEVEN SISTERS G.S. - FIRE PREVENTION/PROTECTION SYSTEM

Budget reference number
01-02-8117

Originating division	Coordinating division	Constructing division	Project Order Group (Range):
Generation - South	Generation - South	Generation - South	61421

DESCRIPTION:
Installation of Addressable Fire Alarm System at Seven Sisters Generating Station.

JUSTIFICATION:
The fire alarm systems installed in the four Winnipeg River plants require modifications to eliminate false alarms, to provide visual warnings where auditory alarms cannot be heard, and to update drawings enabling staff to properly trace and repair faults. Consistent false and trouble alarms in a fire protection system results in staff becoming complacent resulting in response delays to fire conditions.

REFERENCE:
Memo W.L. Pawlikewich to M.J. Townsley dated 1998 03 16

Title			Budget reference number
DORSEY BP 1 & 2 ADDRESSABLE FIRE ALARM SYSTEM			03-00-4809
Originating division	Coordinating division	Constructing division	Project Order Group (Range):
HVDC	HVDC	Construction	60104

DESCRIPTION:
REPLACE THE EXISTING ZONE TYPE FIRE ALARM SYSTEM WITH AN ADDRESSABLE TYPE. THE MAIN FIRE PANELS IN THE CONTROL ROOM AND ALL THE DETECTOR HEADS THROUGHOUT THE STATION WILL BE REPLACED EXCEPT WHERE A REMOTE FIRE PANEL EXISTS. THESE ARE THE VALVE HALLS, HALON SYSTEMS, CONVERTER TRANSFORMERS, AND SMOOTHING REACTORS.

JUSTIFICATION:
THE EXISTING ZONE TYPE FIRE ALARM SYSTEMS ARE 17 TO 22 YEARS OLD. THEY ARE REACHING THE END OF THEIR USEABLE LIFE, BECOMING UNRELIABLE AND DIFFICULT TO MAINTAIN DUE TO UNAVAILABILITY OF PARTS. THE NEW ADDRESSABLE TYPE FIRE ALARM SYSTEM IS VIRTUALLY MAINTENANCE FREE AND VERY RELIABLE. THUS IT WILL PROVIDE SUBSTANTIAL MAINTENANCE COST SAVINGS, IMPROVED RELIABILITY, AND IMPROVED RESPONSE TIME TO FIRES.

REFERENCE:
REPORT NO. PS94-06 BIPOLES 1 & 2 FIRE ALARM SYSTEM REPLACEMENT.

REVISION:
ESTIMATE DECREASED TO REFLECT ACTUALS.
PROJECT COMPLETE.
CONTINGENCY AMOUNT: $11 200.

This BRN contains Deleted, Blocked, or Closed Orders.

Title: HENDAY STATION ADDRESSABLE FIRE ALARM SYSTEM (HENDME5)

Budget reference number: 03-00-5926

Originating division	Coordinating division	Constructing division	Project Order Group (Range):
HVDC	HVDC	Construction	60106

DESCRIPTION:
REPLACE THE EXISTING ZONE TYPE FIRE ALARM SYSTEM WITH AN ADDRESSABLE TYPE. THE MAIN FIRE PANELS IN THE CONTROL ROOM AND ALL THE DETECTOR HEADS THROUGHOUT THE STATION WILL BE REPLACED EXCEPT WHERE A REMOTE FIRE PANEL EXISTS. THESE ARE THE VALVE HALLS, HALON SYSTEMS, CONVERTER TRANSFORMERS, AND SMOOTHING REACTORS.

JUSTIFICATION:
THE EXISTING ZONE TYPE FIRE ALARM SYSTEMS ARE 17 TO 22 YEARS OLD. THEY ARE REACHING THE END OF THEIR USEABLE LIFE, BECOMING UNRELIABLE AND DIFFICULT TO MAINTAIN DUE TO UNAVAILABILITY OF PARTS. THE NEW ADDRESSABLE TYPE FIRE ALARM SYSTEM IS VIRTUALLY MAINTENANCE FREE AND VERY RELIABLE. THUS IT WILL PROVIDE SUBSTANTIAL MAINTENANCE COST SAVINGS, IMPROVED RELIABILITY, AND IMPROVED RESPONSE TIME TO FIRES.

REFERENCE:
REPORT NO. PS94-06 BIPOLES 1 & 2 FIRE ALARM SYSTEM REPLACEMENT.

REVISION:
UPDATED ESCALATION AND INTEREST.
CONTINGENCY AMOUNT: $30 000.

Title
DORSEY BP1 THYRISTOR VALVES FIRE PROTECTION UPGRADE

Budget reference number
03-00-7221

Originating division	Coordinating division	Constructing division	Project Order Group (Range):
HVDC	HVDC	Construction	61005

DESCRIPTION:
DESIGN AND RETROFIT FIRE PROTECTION DEVICES TO IMPROVE THE FIRE RESISTANCE ON THYRISTOR VALVE TOWERS IN VALVE GROUPS 11, 12, AND 13.

JUSTIFICATION:
VALVE HALLS FIRE RISK IS A MAJOR CONCERN. THE ORIGINAL DESIGN PROVIDED BY GEC-A SATISFIED THE REQUIREMENTS OF M.H. SPECIFICATIONS. THERE HAS BEEN A HISTORY OF MAJOR VALVE FIRES SUCH AS ITAIPU, RIHAND, AND SYLMAR SUBSEQUENT TO THE ISSUE OF OUR BP1 VALVE REPLACEMENT SPECIFICATION. ON OUR REQUEST, GEC-A SUBMITTED A PROPOSAL TO IMPROVE THE FIRE RESISTANCE OF THYRISTOR VALVE TOWERS IN POLE 1 OF BIPOLE 1. THIS CER COVERS THE COST OF IMPLEMENTING 'LEVEL ONE' PROTECTION OF THE REPORT.

REFERENCE:
REPORT HVDC 96-10 ON BIPOLE 1, THYRISTOR VALVES FIRE PROTECTION UPGRADE AND MEMO FROM I.H. McKAY TO A.M. SNYDER DATED 1998 09 03.

REVISION:
SLIGHT DECREASE IN ESTIMATE DUE TO ACTIVITY RATE CHANGE.

CAPITAL EXPENDITURE FORECAST COMPLEX

(IN THOUSANDS OF DOLLARS)

COMPLEX STATUS: ☐ Planned ☒ In progress

Complex no. 13

REVISION STATUS: ☐ New complex ☒ In service change ☒ Concept change ☐ Estimate change only

COMPLEX: BUILDINGS - POWER SUPPLY

Proposal

1. Construct a 23500sq.ft. service building for admin, maintenance, and stores for Wpg R. gen. stations. (1998/99-1999/00)
2. Construct 32 permanent housing units, and a 6 point infrastructure renewal (5 yr plans) at Gillam. (1995/96-2000-01)
3. Build 18 new single family homes in Gillam to replace temporary modular units that cannot be rehabilitated. (1993/94-1994/95)
4. Construct a staffhouse at Grand Rapids containing 12 single and 4 suites, kitchen, dining, rec. and lounge. (1996/97-1997/98)

JUSTIFICATION

☐ Load ☒ Service
☐ Safety ☐ Efficiency
☐ Reliability ☒ Other

Explanation

To consolidate staff currently leasing space or conducting activities from substandard facilities, the corporation has a sequenced program of major building additions staged at one per year. In addition, the corporation is continuing to provide accommodations at remote or northern locations where acceptable alternatives or conditions are unavailable. Gillam housing requirements are: Production North (26), Construction (4), and Northern Region (2). Gillam infrastructure evaluation lists substandard: water quality, sewage treatment, fire hydrants, rec facility, and trailer park insulation.

WINNIPEG RIVER OPERATING CENTRE

Budget reference number
01-01-5943

Originating division	Coordinating division	Constructing division	Project Order Group (Range):
Generation - South	Generation - South	Generation - South	60086

DESCRIPTION:
CONSTRUCTION OF A 23,500 SQ. FT. SERVICE BUILDING TO ACCOMODATE ADMINISTRATION, MAINTENANCE, AND STORES FUNCTIONS FOR THE WINNIPEG RIVER GENERATING STATIONS.

JUSTIFICATION:
THE PRESENT GREAT FALLS ADMINISTRATION, MAINTENANCE, AND STORES FACILITY COMPRISES A TOTAL OF 19 BUILDINGS. MANY ARE OF THE SAME VINTAGE AS THE GENERATING STATION. MOST OF THE BUILDINGS WERE NOT DESIGNED FOR THE PURPOSES THAT THEY ARE BEING USED FOR TODAY. DUE TO THEIR AGE THE BUILDINGS ARE NOT ENERGY EFFICIENT, AND LACK PROPER HEATING, LIGHTING, AND VENTILATION. MOST DO NOT MEET TODAY'S FIRE REGULATIONS. DUE TO THE PRESENT BUILDINGS BEING SCATTERED OVER A WIDE AREA FACILITIES SUCH AS LUNCH ROOMS AND WASHROOMS ARE DUPLICATED IN MANY AREAS. THE TOTAL AREA OF THE PRESENT FACILITIES IS 29,500 SQ. FT.

REFERENCE:
REPORT PD 92-02 DATED 1992 02 07. MEMO FROM D.W.ANDREY TO R.CAMPBELL DATED 1992 01 31. MEMO FROM M.J.MINOR TO L.P.JONASSEN DATED 1992 03 23. MEMO FROM D.W.ANDREY TO R.E.HLADY DATED 1993 06 15.

REVISION:
INCREASE REFLECTS ADDITION OF MEZZANINE IN STORES AREA, ADDITIONAL COST FOR FURNITURE AND ADDITIONAL COST FOR ARCHITECHUAL SERVICES.

Title: GILLAM INFRASTRUCTURE UPGRADE

Budget reference number: 01-20-6970

Originating division	Coordinating division	Constructing division	Project Order Group (Range):
Generation - North	Generation - North	Generation - North	61627:61689

DESCRIPTION:
A FIVE YEAR PLAN FOR INFRASTRUCTURE RENEWAL AT THE GILLAM TOWNSITE IS IDENTIFIED AND DIVIDED INTO SIX COMPONENTS:
(1) WATER TREATMENT PLANT
(2) SEWAGE TREATMENT PLANT
(3) WATER & SEWER LINE REHABILITATION
(4) ASPHALT REPAIRS
(5) RECREATION CENTRE REFURBISHMENT
(6) TRAILER PARK IMPROVEMENTS

JUSTIFICATION:
A SITE EVALUATION BY REID CROWTHER & PARTNERS STATES THAT THE QUALITY OF DRINKING WATER DOES NOT MEET CURRENT CANADIAN DRINKING WATER GUIDELINES. THE SEWAGE TREATMENT PLANT DESIGNED TO TREAT 250,000 IPGD IS UNABLE TO TREAT THE 400,000 IPGD DAILY INFLOWS. THE LGD OF GILLAM DOESN'T HAVE SUFFICIENT HYDRANTS OR WATERLINE VALVE SPACING TO MEET MINIMUM FIRE PROTECTION COVERAGE. REPAIRS WOULD REQUIRE EXCAVATIONS THROUGH EXISTING ASPHALT ROADWAYS. THE RECREATIONAL FACILITY HAS REACHED AN AGE OF PHYSICAL AND PROGRAMMATIC WEARINESS. THE FAULTS ARE NOT SERIOUS AND THERE IS STRONG POTENTIAL TO REGENERATE THE CENTRE. THE TRAILER PARK ORIGINALLY ESTABLISHED AS TEMPORARY HOUSING DOES NOT HAVE FROST PROTECTION FOR THE WATER AND SEWER RESULTING IN FREEZING AND RUPTURES OF SERVICE LINES.

REFERENCE:
REID CROWTHER & PARTNERS LTD. REPORTS MARCH 1993, APRIL 1994, APRIL 1995, AND MAY 1995. MEMO G.A. MAHER TO H.J. CLOUSTON 1995 07 07. MEMO G.A. MAHER TO H.J. CLOUSTON DATED 1996 05 28; MEMO H.J. CLOUSTON TO A.M. SNYDER 1997 03 03.

REVISION:
CHANGE IN SEWAGE TREATMENT PLANT CASH FLOW, WORK TO BE DONE IN 1999/00 RATHER THAN 1998/99 AND 1999/00. PHASES 2 AND 3 OF WATER AND SEWER LINE REHABILITATION DEFERRED ONE YEAR. RECREATION CENTRE CASH FLOWED OVER TWO YEARS INSTEAD OF THREE. TRAILER PARK IMPROVEMENTS PHASE 2 DEFERRED ONE YEAR TO 2001/02. DECREASED ESTIMATE DUE TO LOWER THAN FORECAST COSTS FOR THE WATER TREATMENT.

Title			Budget reference number
Grand Rapids Infra Structure Upgrades			01-08-8091
Originating division	Coordinating division	Constructing division	Project Order Group (Range):
Generation - South	Generation - South	Generation - South	61389

DESCRIPTION:
Upgrade the Grand Rapids Infra Structure, and have the powerhouse untreated sewage effluent piped to the townsite lagoon.

JUSTIFICATION:
1) The townsite sewer system is overtaxed during periods of heavy rainfall and high ground water resulting in house basement flooding.
2) The townsite domestic water quality is below standards as a result of a deteriorating softening system, inconsistent concentrations of chlorine and corroding water lines and storage tank. Many residents have stopped drinking the water and now haul in water for drinking and food preparation.
3) The townsite water system reliability is compromised by a single well pump and a limited chlorinated fire water supply.
4)The powerhouse aging septic sewage system should be proactively upgraded to reduce environmental pollution risks and to reduce maintenance costs.

REFERENCE:
UMA's report dated November 1997.
PP&O Report 97/6

REVISION:
Construction deferred to 2000/2001 to allow for full scoping of work to be done.

Contingency Amount: $328 000.

Title
GILLAM PERMANENT HOUSING

Budget reference number
08-00-6581

Originating division	Coordinating division	Constructing division	Project Order Group (Range):
Generation - North	Generation - North	Generation - North	61626:61692

DESCRIPTION:
THE GILLAM HOUSING ALLOCATION COMMITTEE HAS BEEN REVIEWING THE PERMANENT HOUSING NEEDS FOR GILLAM. THE COMMITTEE ASSESSED THE CURRENT AND FUTURE HOUSING REQUIREMENTS FOR (A) PRODUCTION DIVISION - NORTH (B) CONSTRUCTION DIVISION (C) NORTHERN REGION THEIR STUDY INDICATES THAT AN ADDITIONAL 32 HOUSING UNITS WILL BE REQUIRED TO SATISFY THE PRESENT HOUSING REQUIREMENTS.

AS PER A MEMO DATED 1996 12 11 FROM H.J. CLOUSTON TO A.M. SNYDER, THE EXISTING STAFFHOUSE IS BEING CONVERTED INTO CONDOMINIUM APARTMENT UNITS. THIS CONVERSION WILL REPLACE 8 OF THE 32 HOUSING UNITS.

JUSTIFICATION:
CURRENTLY THERE ARE 32 EMPLOYEES ON CONVENTIONAL HOUSING LISTS. DUE TO VACANCY RATES AND HOURLY STAFFING LEVELS, 26 UNITS WILL BE REQUIRED AND WILL NOT DECREASE IN THE FUTURE. THE CONSTRUCTION DIVISION REQUIRES 4 UNITS AND 2 ADDITIONAL UNITS ARE REQUIRED FOR NORTHERN REGION'S REQUIREMENTS.

REFERENCE:
MEMO DATED 1995 07 13 FROM H.J. CLOUSTON TO R.O. LAMBERT - GILLAM HOUSING REQUIREMENTS; MEMO DATED 1996 12 11 FROM H.J. CLOUSTON TO A.M. SNYDER - GILLAM STAFFHOUSE CONVERSION PROJECT.

REVISION:
FUTURE HOUSING RE-ESTIMATED AND DEFERRED ONE YEAR. INCREASED COSTS ON THE APARTMENT BUILDING GARAGES DUE TO PERFORMING THE WORK IN-HOUSE, PROVIDING ON-THE-JOB TRAINING AND BECAUSE THE LATENESS IN THE START OF THE WORK INCREASED THE COSTS OF THE CONCRETE.

Title
GRAND RAPIDS G.S. - STAFFHOUSE REPLACEMENT

Budget reference number
08-00-8029

Originating division	Coordinating division	Constructing division	Project Order Group (Range):
neration - South	Generation - South	Construction	60153

DESCRIPTION:
CONSTRUCTION OF A NEW STAFFHOUSE FACILITY TO REPLACE THE EXISTING BUILDING WHICH WAS ORIGINALLY DESIGNED AS A HOSPITAL IN 1960 AND DOES NOT PROVIDE THE REQUIRED FACILITIES OF A MODERN STAFFHOUSE. THE NEW STAFFHOUSE WILL CONTAIN 12 SINGLE ROOMS AND 4 SUITES AS WELL AS KITCHEN, DINING ROOM, RECREATION AND LOUNGE FACILITIES. CONSTRUCT 2 VEHICLE GARAGES IN CONJUNCTION WITH THE STAFFHOUSE, EACH GARAGE HAVING SPACE FOR 4 CARS.

JUSTIFICATION:
THE EXISTING STAFFHOUSE WAS BUILT AS A HOSPITAL DURING THE CONSTRUCTION OF THE GRAND RAPIDS GENERATING STATION AND WAS CONVERTED TO A STAFFHOUSE FOR OPERATING STAFF. MOST OF THE EXISTING ROOMS ARE SMALL AND DO NOT CONTAIN ANY BATHROOM OR STORAGE SPACE. THE KITCHEN AND DINING ROOM FACILITIES ARE OUTDATED AND TOO SMALL. THE NEW STAFFHOUSE WILL CONTAIN SUFFICIENT SINGLE ROOMS TO REPLACE A SIX ROOM TEMPORARY DORMITORY THAT IS PRESENTLY IN USE. A NEW STAFFHOUSE IS RECOMMENDED AS REHABILITATION OF THE EXISTING BUILDING WOULD RESULT IN EFFECTIVELY SALVAGING LITTLE MORE THAN THE STRUCTURAL FRAME OF THIS BUILDING AND WOULD NOT PROVIDE FOR THE DESIGN OF A MODERN STAFFHOUSE.

REFERENCE:
REPORT PD 86-15 TITLED GRAND RAPIDS STAFF ACCOMMODATION REPORT PD 88-01 TITLED PRODUCTION DIVISION STAFF ACCOMMODATIONS.

REVISION:
REFLECTS TOTAL COST ON JOB COMPLETION.

CAPITAL EXPENDITURE FORECAST COMPLEX

(IN THOUSANDS OF DOLLARS)

COMPLEX STATUS: ☐ Planned ☒ In progress

Complex no. 990

REVISION STATUS: ☐ New complex ☒ In service change ☒ Concept change ☐ Estimate change only

COMPLEX: PRELIMINARY PLANNING STUDIES

Proposal

Carry out assessments, conceptual designs and planning studies of potential supply options, and associated transmission. Areas of study include establishment of design parameters, structure layouts, support facilities, hydraulic model testing, exploration, data collection, environmental assessments and public input, schedules and cost estimates.

JUSTIFICATION

☐ Load ☐ Service
☐ Safety ☐ Efficiency
☐ Reliability ☒ Other

Explanation

In order to plan the development of the Province's resource potential and related projects, office studies, environmental assessments and field exploration have to be carried out. The results and technical designs are required to support the planning process.

Originating division	Coordinating division	Constructing division	Project Order Group (Range):
Power Planning & Operations	Power Planning & Operations	Power Planning & Operations	61507:80002

DESCRIPTION:
CARRY OUT ASSESSMENTS, CONCEPTUAL DESIGNS AND PLANNING STUDIES OF POTENTIAL SUPPLY OPTIONS AND ASSOCIATED TRANSMISSION. AREAS OF STUDY INCLUDE ESTABLISHMENT OF DESIGN PARAMETERS, STRUCTURE LAYOUTS, SUPPORT FACILITIES, HYDRAULIC MODEL TESTING, EXPLORATION, DATA COLLECTION, ENVIRONMENTAL ASSESSMENTS AND PUBLIC INPUT, SCHEDULES AND COST ESTIMATES.

JUSTIFICATION:
IN ORDER TO PLAN THE DEVELOPMENT OF THE PROVINCE'S RESOURCE POTENTIAL AND RELATED PROJECTS, OFFICE STUDIES, ENVIRONMENTAL ASSESSMENTS AND FIELD EXPLORATION HAVE TO BE CARRIED OUT. THE RESULTS AND TECHNICAL DESIGNS ARE REQUIRED TO SUPPORT THE PLANNING PROCESS.

REVISION:
REFLECTS REQUIREMENT OF THE 1999 POWER RESOURCE PLAN.

(IN THOUSANDS OF DOLLARS)

COMPLEX STATUS	Complex no.	REVISION STATUS
☐ Planned ☒ In progress	121 - 129	☐ New complex ☐ In service change ☐ Concept change ☒ Estimate change only

COMPLEX	DOMESTIC ITEM - POWER SUPPLY

Proposal

This complex consists of several hundred projects which are not identified as Major Items and whose individual cost is of a relatively small amount. The majority of projects are required to provide safe reliable and efficient power supply and HVDC facilities, and to replace plant facilities whose useful life has been exceeded.

JUSTIFICATION	Explanation
☒ Load ☒ Service ☒ Safety ☒ Efficiency ☒ Reliability ☒ Other	Enhancements or rehabilitation to the power supply facilities will ensure a safe reliable and efficient source of energy.

Estimate Level	COMPLEX START (yyyy mm)

COMPLEX	DEMAND SIDE MANAGEMENT COSTS - 221

Proposal

To promote conservation of electricity when it can be acheived more economically than supply and to conduct all corporate activities to minimize adverse environmental impacts.

JUSTIFICATION

☐ Load ☐ Service ☐ Safety ☒ Efficiency ☐ Reliability ☐ Other

Explanation

Energy conservation can be economically efficient and environmentally beneficial. Manitoba Hydro is committed to promoting conservation of electricity when it can be acheived more economically than supply. The strategic objective is a reduction in Manitoba Hydro's peak load of 316 MW and firm annual energy requirement of 1249 GW.h by the year 2011/12.

CAPITAL EXPENDITURE FORECAST COMPLEX

(IN THOUSANDS OF DOLLARS)

Advance or deferral impact

Delays in the DSM implementation schedule could influence future generation sequence timing.

Factors affecting timing or viability

Avoided utility cost of supplying customers; Economic tests used to measure cost effectiveness; technological change; Customer needs and expectations; Government Legislation - Codes.

AUTOMATIC METER READING IMPLEMENTATION			05-00-3016
Originating division	Coordinating division	Constructing division	Project Order Group (Range):
Finance & Admin - Customer Serv	Finance & Admin - Customer Serv	Finance & Admin - Customer Serv	82041

DESCRIPTION:
PURCHASE AND INSTALLATION OF AN AUTOMATIC METER READING (AMR) COMMUNICATION NETWORK TO REMOTELY READ AND ELECTRONICALLY DISSEMINATE METER READINGS AND OTHER RELEVANT CUSTOMER INFORMATION TO THE APPROPRIATE DEPARTMENT OR DIVISION.

JUSTIFICATION:
THIS AMR SYSTEM WOULD SATISFY THE ONGOING NEED FOR ROUTINE METER READINGS FOR CUSTOMER BILLING AS WELL AS PROVIDE 'ON DEMAND' READINGS TO ANSWER CUSTOMER INQUIRIES. OTHER BENEFICAL FEATURES OF THE AMR SYSTEM INCLUDE:

- CUSTOMER AND SYSTEM POWER OUTAGE ALARMS
- DEFECTIVE METER AND THEFT OF SERVICE DETECTION
- MORE FLEXIBILITY IN THE TIMING AND CONSOLIDATION OF BILLINGS.

THE COMMUNICATION NETWORK WOULD ALSO SUPPORT A NUMBER OF POTENTIAL USES OF CURRENT INTEREST INCLUDING:

- DEMAND SIDE MANAGEMENT DATA
- LOAD RESEARCH DATA FOR RATE PLANNING
- TIME OF USE BILLING
- DISTRIBUTION AUTOMATION
- TRANSFORMER LOAD MANAGEMENT

REVISION:
CASHFLOW ADJUSTED FOR REVISED SCHEDULE.
BASE YEAR REVISED TO 1996.

CAPITAL EXPENDITURE FORECAST COMPLEX

(IN THOUSANDS OF DOLLARS)

COMPLEX STATUS: ☐ Planned ☒ In progress

Complex no. 141 - 149

REVISION STATUS: ☐ New complex ☐ In service change ☒ Concept change ☐ Estimate change only

COMPLEX: DOMESTIC ITEM - CUSTOMER SERVICE

Proposal

This complex consists of minor projects which are not identified as Major Items and whose individual cost is of a relatively small amount. The majority of projects are required to supply service to residential, farm, commercial and industrial customers and to replace plant facilities whose useful life has been exceeded.

JUSTIFICATION: ☒ Load ☒ Service ☒ Safety ☒ Efficiency ☒ Reliability ☒ Other

Explanation

The Corporation has incurred consistant expenditures in the past to meet customer service requirements. The residential, farm, commercial and industrial loads are expected to grow at an 20 year average rate of 1.5% per annum and will require a program of additions and replacements at the customer service point to accommodate these anticipated changes.

COMPLEX	FIRE PROTECTION PROJECTS - CORPORATE GROUP

Proposal

Design and install passive and/or active fire prevention and protection systems at all generating stations, key transmission terminating stations and strategic buildings (Head Office/ Operating Centre) as outlined by The Fire Prevention and Protection Committee and defined in the Fire Manual Part II.

Locations covered by this capital item complex are; Head Office and Waverley SC.

JUSTIFICATION

☐ Load ☐ Service
☒ Safety ☐ Efficiency
☐ Reliability ☐ Other

Explanation

In accordance with the rules and guidelines established by The Fire Prevention and Protection Committee, implementation of this program will reduce the risk of fire to an acceptable level and mitigate the effects of any such occurance.

THIS ITEM IS INTENDED TO PROVIDE FINANCIAL COVERAGE FOR FIRE PREVENTION AND PROTECTION AT WAVERLEY SERVICE CENTRE.

JUSTIFICATION:
ADDITIONS AND IMPROVEMENTS TO FIRE PREVENTION AND PROTECTION AS RECOMMENDED IN REPORTS 88-M1, 88-M2 AND 88-M3.

REFERENCE:
INTEROFFICE MEMO FROM F.K. WONNICK, DIVISION MANAGER SERVICES TO D.L. RIEHL, VICE-PRESIDENT PERSONNEL & SERVICES, DATED 1994 07 07.

REVISION:
1999 SUBMISSION.

COMPLEX STATUS: ☐ Planned ☒ In progress

Complex no. 231

REVISION STATUS: ☐ New complex ☒ In service change ☐ Concept change ☒ Estimate change only

COMPLEX: BUILDINGS - CORPORATE GROUP

Proposal

Refurbish existing 205000sq.ft. Head Office (HO) mech/elec, HVAC, fire protection and curtain walls. (2003/04-2004/05)

JUSTIFICATION: ☐ Load ☐ Service ☒ Safety ☒ Efficiency ☐ Reliability ☐ Other

Explanation

Refurbishing HO will provide improved security & fire protection, modern communication, power & HVAC control systems and reduced energy consumption.

Title
INTEGRATED TRADES TRAINING CENTRE PROPERTY AND BUILDING

Budget reference number
08-00-5568

Originating division	Coordinating division	Constructing division	Project Order Group (Range):
Human Resources	Generation - South	Construction	80033

DESCRIPTION:
ACQUIRE 160 ACRES OF LAND IN 1994/95, PERFORM ENGINEERING AND ARCHITECTURAL DESIGN FOR SITE IMPROVEMENTS, COMMUNICATION AND 3 PHASE POWER SUPPLY TO BE PROVIDED IN 1995/96. IN 1995/96 & 1996/97 PERFORM SITE IMPROVEMENTS, CONSTRUCT POWER SUPPLY AND COMMUNICATION SYSTEM, AND CONTRACT FOR CONSTRUCTION OF A 25 000 SQUARE FOOT BUILDING TO ACCOMMODATE TRADES AND TRANSMISSION LINE MAINTENANCE TRAINING.

JUSTIFICATION:
LINE DEPARTMENT AND TASK FORCE REVIEWS HAVE CONFIRMED THAT PROPERLY SEQUENCED PERFORMANCE BASED TRAINING, DELIVERED BY TRAINED INSTRUCTORS IN A FACILITY HAVING PROPER FORMAL AND PRACTICAL TRAINING AREAS, AND REAL WORLD SIMULATION OF TRANSMISSION AND DISTRIBUTION SYSTEMS AND EQUIPMENT, IS ESSENTIAL TO ENSURE CONSISTENCY AND QUALITY IN THE TRAINING PROVIDED TO CORPORATE TRADES STAFF. THIS ITEM REFLECTS THE RECOMMENDATIONS OF THE TASK FORCE AND DIRECTION FROM EXECUTIVE MANAGEMENT. DEFINES FUNDS TO PURCHASE A SITE (YET TO BE DEFINED) IN FISCAL YEAR 1994/95 AND CONSTRUCT A 25,000 SQUARE FOOT PORTION OF THE TRAIN ING CENTRE IN 1995/96 & 1996/97.

REVISION:
REMAINING FUNDS REQUIRED TO COMPLETE MINOR DEFICIENCIES.

Title
REFURBISH 820 TAYLOR AVE BUILDING

Budget reference number
08-00-7058

Originating division	Coordinating division	Constructing division	Project Order Group (Range):
Human Resources	Design	Construction	80045

DESCRIPTION:
THE HEAD OFFICE BUILDING WAS CONSTRUCTED IN 1956, WITH MAJOR ADDITIONS IN 1962 AND 1967. ONCE STAFF CAN BE RELOCATED TO NEW SPACE PROPOSED TO BE IN SERVICE IN 2001, IT IS PROPOSED TO REFURBISH THE MECHANICAL SYSTEMS, PARTICULARLY THE HEATING, VENTILATING AND AIR CONDITIONING (HVAC) COMPONENTS (REPLACE WITH ENERGY CONSERVING SYSTEMS) PLUS THE ELECTRICAL DISTRIBUTION, THE NORTH AND EAST PERIMETER CURTAIN WALL AND INSTALL FIRE SPRINKLER AND SMOKE CONTROL SYSTEMS AS REQUIRED TO SATISFY CURRENT STANDARDS AND DESIGN PRACTICES.

JUSTIFICATION:
TECHNOLOGICAL DEVELOPMENTS SINCE THE 1960'S HAVE PROVIDED ENERGY EFFICIENT THERMAL INSULATING CURTAIN WALL SYSTEMS AND SYSTEMS TO RECLAIM INTERNALLY GENERATED BUILDING CORE HEAT FOR USE IN PERIMETER HEATING. IMPROVED TEMPERATURE CONTROL AND SIMULATANEOUS HEATING AND COOLING FOR DIFFERENT PARTS OF A BUILDING ARE NOW THE NORM. REFURBISHING WILL PROVIDE IMPROVED SECURITY AND FIRE PROTECTION, MODERN COMMUNICATION, POWER AND HVAC CONTROL SYSTEMS, AS WELL AS REDUCED ENERGY CONSUMPTION.

REVISION:
1997 SUBMISSION. BASE YEAR REVISED FROM 1996 TO 1997.

(IN THOUSANDS OF DOLLARS)

COMPLEX STATUS	Complex no.	REVISION STATUS
☐ Planned ☒ In progress	244	☐ New complex ☒ In service change ☒ Concept change ☐ Estimate change only

COMPLEX	YEAR 2000 CONVERSION

Proposal

Convert existing computer application programs (ie Customer Service System, Human Resources System, Plant Maintenance System, CADD and computational) NETWORK and PC HARDWARE / SOFTWARE systems to year 2000 compatability. To provide replacements, repair,consulting, or contracting for the year 2000 embedded system failures or performance issues for power system equipment in all business units.

JUSTIFICATION

☐ Load ☒ Service
☐ Safety ☒ Efficiency
☒ Reliability ☐ Other

Explanation

Current software / hardware systems have not been programmed to recognize the year 2000. This will result in all systems failing to operate as programmed. In addition funding is required to replace or repair candidatres for year 2000 failures or loss of performance such as power system equip used in energy mgmt,process control, monitoring, metering , data acquisition, communication, and protection equipment.

Title
CUSTOMER SERVICE SYSTEM

Budget reference number
09-00-8821

Originating division	Coordinating division	Constructing division	Project Order Group (Range):
Corporate Controller	Corporate Controller	Corporate Controller	82050

DESCRIPTION:
To replace the existing mainframe Customer Service System, Meter Records System, Miscellaneous Billing System, and Street Light System with an improved customer system.

JUSTIFICATION:
The present Customer Service System (CSS) has been in service for approximately 13 years, however the underlying technology is approaching 17 years of age. The CSS has limited capabilities in, or would require extensive reworking to provide:
-billing of services other than electricity
-billing on alternative industrial/commercial rate structures
-integration of operational requirements (eg. interface with MAPINFO and TVD for outage location and associated customer contact), user programming capabilities, online updates, and consistency with other software
-offering of 'choice' items such as French Language, consolidated billing, and bill detail

Replacement of the CSS would allow the integration of other systems (Meter Records, Miscellaneous Billing, Street Light Systems) and provide flexibility and capacity for improved customer service and marketing initiatives necessary to fulfil our mandate.

REVISION:
Deferred spending until 2000/01.

Addendum to Item
Meeting No. 78

MINISTER RESPONSIBLE
FOR MANITOBA HYDRO

Legislative Building
Winnipeg, Manitoba, CANADA
R3C 0V8

SEP 2 0 2007

Mr. Vic Schroeder
Chairman
The Manitoba Hydro-Electric Board
820 Taylor Avenue
Winnipeg Manitoba R3C 2P4

Dear Mr. Schroeder:

Please accept the following as further clarification on the Government of Manitoba's view respecting Manitoba Hydro's plans to build a third Bipole transmission line, and the ongoing planning and other community development activities on the east side of Lake Winnipeg.

As you are aware, in August 2000, our government announced our intention to initiate Broad Area Planning on the east side of Lake Winnipeg. This followed shortly after our government's acceptance of the Consultation on Sustainable Development Implementation (COSDI) Report, which recommended, among other things, the creation of Broad Area Plans.

The east side of Lake Winnipeg was chosen for broad area planning for many reasons, including:

- the area is a unique and environmentally spectacular area, containing a vast expanse of undeveloped, contiguous, boreal forest (one of the largest in North America);
- the east side is home to a population that is 96% First Nation;
- the east side provides one of the largest habitats for the threatened woodland caribou and is home to the Bloodvein River (a Canadian Heritage River), as well as the Manigotagan River – both renowned for their marvelous natural and recreational significance;
- access to transportation networks and many economic opportunities are more limited than in other parts of the province; and
- the east side, like other remote areas, has already begun to feel the effects of climate change in reducing the viability of winter roads that bring in vital supplies, and applying pressure on the boreal forest.

More recently, the east side has been identified as a prime candidate for United Nations World Heritage Site designation, on the basis of both cultural and natural significance – one of only very few sites throughout the world to be nominated for both criteria.

significance – one of only very few sites throughout the world to be nominated for both criteria.

The objective of the original East Side Planning Initiative (ESPI), now known as Wabanong Nakaygum Okimawin (WNO), was to bring together local communities, First Nations, industry and environmental organizations to develop a vision for land and resource use in the area that respects both the value of the boreal forest and the needs of local communities.

As part of the planning initiative, Ministers and the Premier participated in community meetings throughout the region – in total, 80 separate east side community meetings were held. Through this process, we learned a great deal about the views of east side residents, their plans, their hopes, their concerns and their dreams about the future of their families, their communities, their traditional economies, their environment and their sacred and natural areas.

It was clear through this process that there was no consensus view on building a new HVDC Bipole transmission line through the east side. This lack of consensus was subsequently reflected in *"Promises to Keep...": Towards a Broad Area Plan for the East Side of Lake Winnipeg*, which was received on November 14, 2004, and represents a framework for a broad area plan. As a result, we have been working with Manitoba Hydro to find a routing option that respects First Nations planning.

As documented in the ESPI final report, the planning process found very strong support for traditional land use planning, for clear processes for First Nations involvement in decision-making, and for sustainable community and economic development initiatives.

Among other initiatives, our government has been active with the Government of Ontario and the four First Nations of Poplar River, Little Grand Rapids, Paunigassi and Pikangikum in pursuing UNESCO World Heritage designation for lands on the east side of Lake Winnipeg in Manitoba and Northwestern Ontario. The proposed World Heritage Site is 4.3 million hectares and encompasses the traditional territories of the four First Nation communities, Atikaki Provincial Wilderness Park in Manitoba and Woodland Provincial Park in Ontario.

Pimachiowan-Aki non-profit corporation has been established to lead next steps in the designation process. It is our strong hope that the east side will be appropriately recognized alongside other legendary UNESCO sites, such as Machu Picchu in Peru, the Great Barrier Reef in Australia, Acropolis in Greece, the Taj Mahal in India and the Grand Canyon in Arizona.

Through strong First Nation leadership, gaining international recognition for this globally significant area will raise awareness and interest in the east side well beyond our borders, creating opportunities for education about the region and its people, community capacity building, conservation activities, tourism, related training and marketing of local products and services.

The Government of Manitoba and WNO First Nations also recently signed (April 3, 2007) an historic agreement, the *WNO Accord*, confirming a government-to-government relationship between its parties. The WNO Accord reinforces the foundation for

comprehensive traditional land-use planning and confirms a commitment to develop a shared vision for the east side of Lake Winnipeg.

It is now the goal of the WNO to develop a broad area plan for the east side, with the next critical step being traditional land-use planning. To this end, the Province has committed $2.5 million, which First Nations on the east side will use for traditional land-use planning. The WNO Accord outlines guidelines for working together and ensuring that First Nation governments are involved in decisions that will affect their communities and traditional territories.

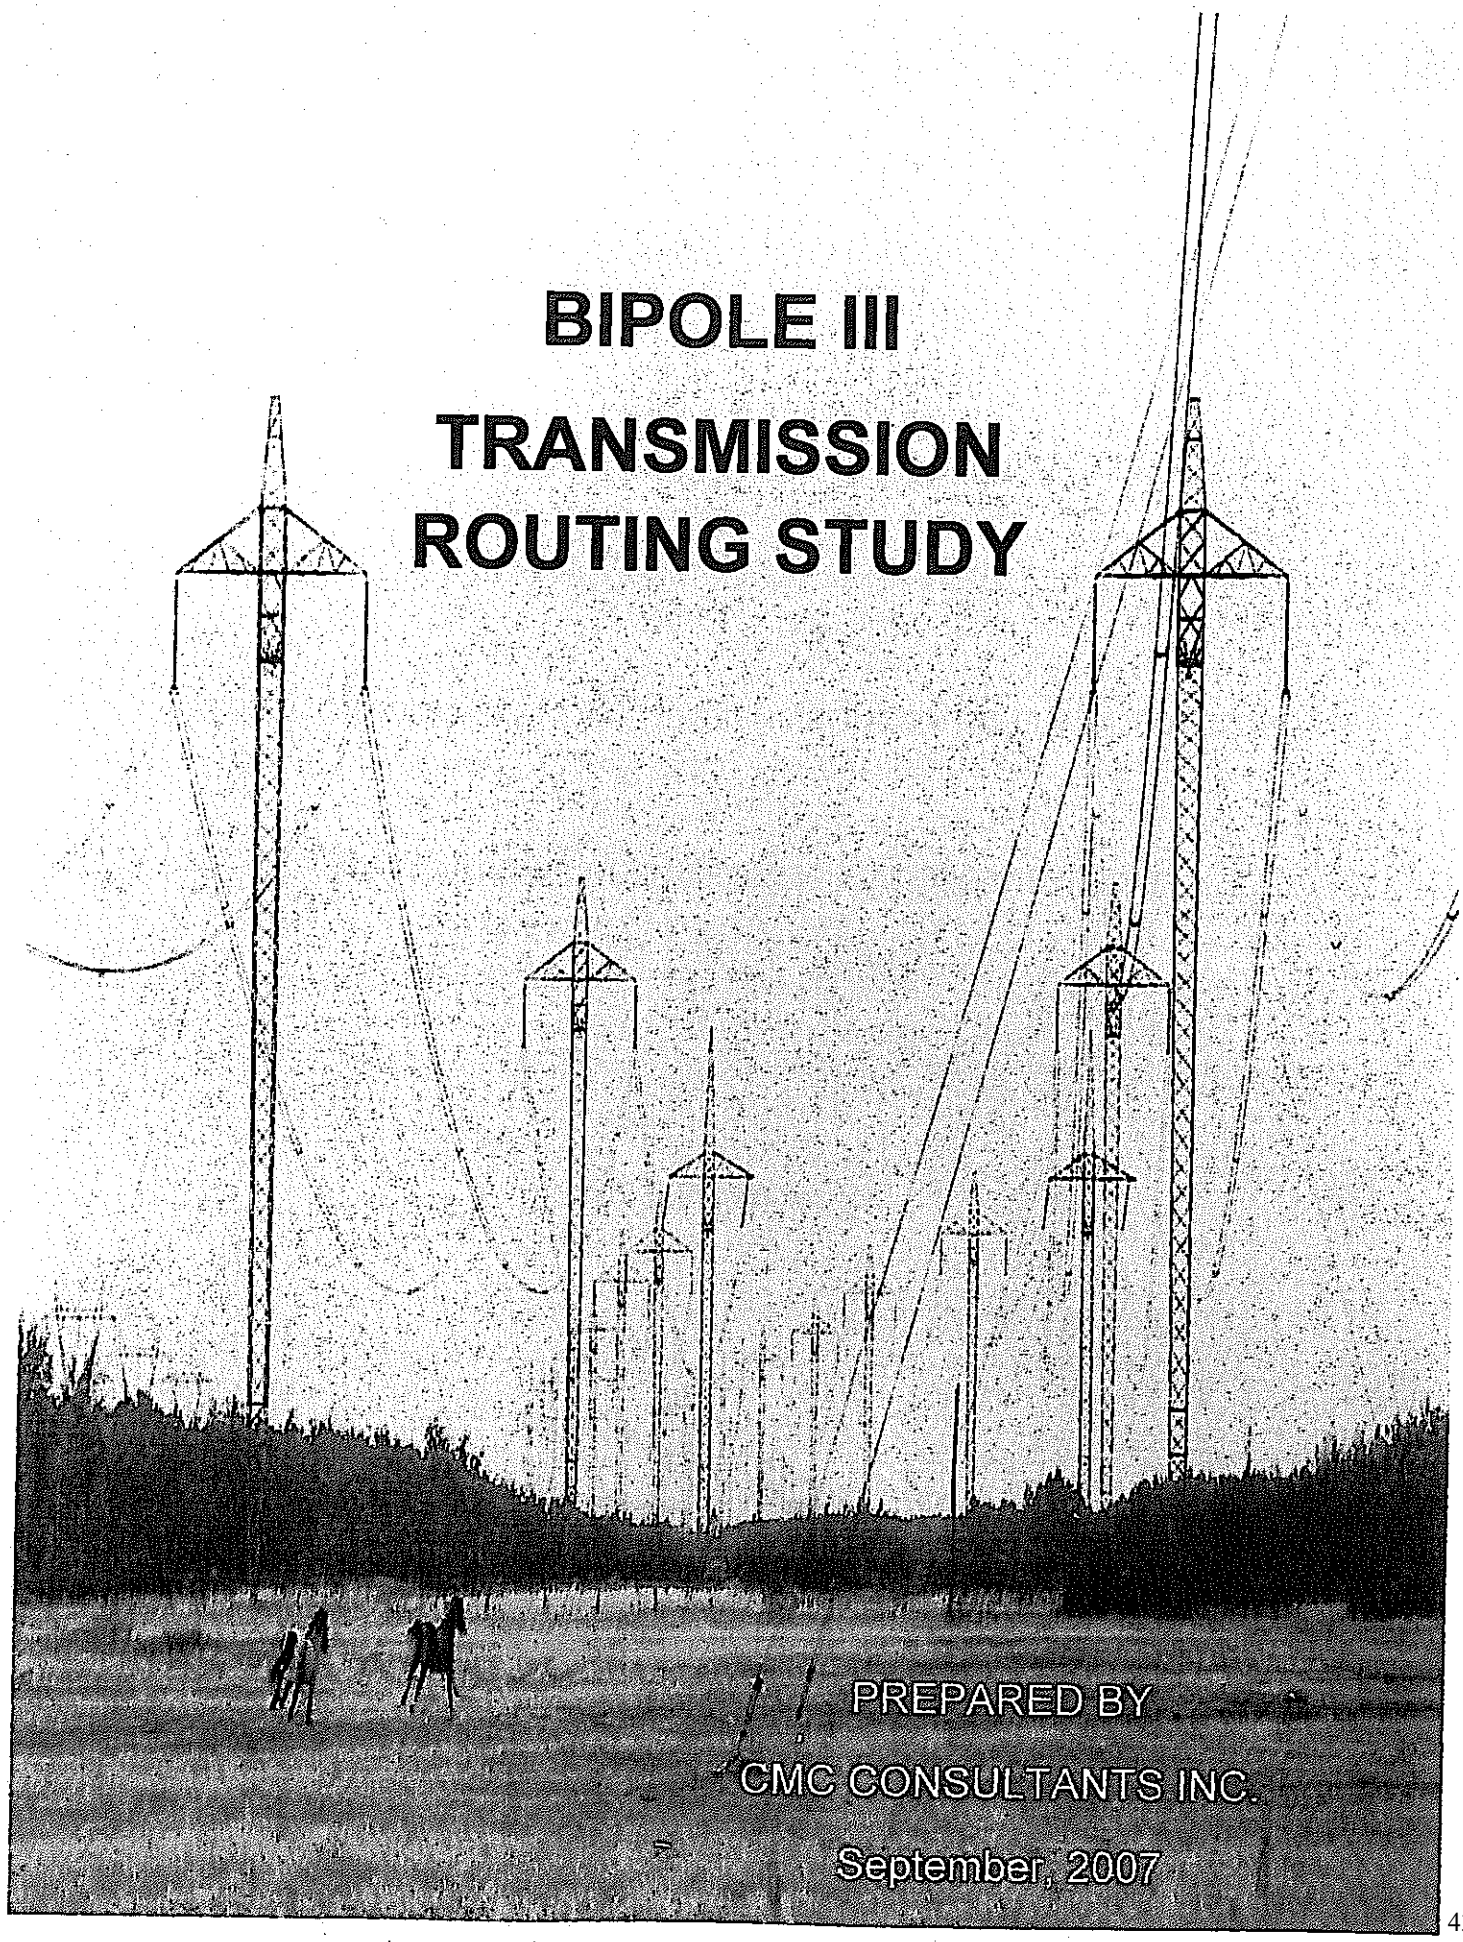
Planning on the east side will be done in a manner consistent with the principles of the WNO Accord. We anticipate that it will take a number of years to complete planning activities contemplated in the Accord with First Nations on the east side in a spirit of mutual recognition, respect and reconciliation, as we have committed to do.

As announced during the recent provincial election, our government has also made a commitment to protect the east side by introducing new legislation, to be drafted in consultation with First Nations. The intent of the new legislation will be to enable First Nations to develop land use plans to guide development on the east side and to create new protected area designations, which will ensure the area is protected in a way that is consistent with the establishment of a UNESCO World Heritage Site.

We are also moving forward with our commitment to build the first leg of an all-weather road on the east side, which will serve a critical infrastructure need in the region, improving access to food and other needed supplies, and opening the way for other sustainable community economic development.

With respect to Bipole III, I understand that your Board directed the corporation to explore alternatives to the east side in 2004; and more recently, contracted with CMC Consultants Inc. (Mr. Dave Farlinger) to carryout an external review of routing options. The CMC Consultants Inc. study reaffirms that there are routing options other than the east side that can provide desired system reliability enhancements, and will also serve to accommodate future new generation. The study also highlights that an east side routing for Bipole III would be problematic in several respects, including:

- An east side route would dissect boreal forest that is significantly in-tact and of high ecological integrity;
- An east side route has strong potential to undermine First Nations-led efforts to achieve UNESCO World Heritage designation;
- An east side route would be a sub-optimal choice in terms of habitat for the threaten woodland caribou;
- There is already significant demonstrated opposition to an east side route, which has the potential to translate into a long and divisive licencing process, with unbudgeted costs and delays;
- An east side route would present significant threats to corporate image, including in export markets; and
- Pursuing an east side route for Bipole III would require that detailed routing work be carried out in advance or concurrently with First Nations land-use planning. This is clearly at odds with Manitoba's commitment to an approach of careful up-front planning first.



It is the policy of the Manitoba Government to make its government decisions about development on the east side in a manner consistent with the above-noted commitments and initiatives. The Manitoba Government does not regard an east side Bipole III as being consistent with these commitments and initiatives. We recognize the importance of the Bipole III initiative to improving system reliability and accommodating future northern generation. We would encourage the corporation to move ahead with required consultations and planning for an alternative Bipole III route.

Yours truly,

Greg Selinger
Minister

APPENDIX I		33
APPENDIX II		34

1. Introduction

There is an immediate need to increase the reliability of Manitoba Hydro's HVdc transmission system. This system transmits over 70% of the peak power requirements of the province along a single corridor through the Interlake. By North American standards this poses an unacceptable risk to the utility's customers. To improve the security of the HVdc system, Manitoba Hydro is proposing to build a new transmission line – the Bipole III Line.

The two primary routing alternatives for the Bipole III Line are the east side of Lake Winnipeg or west of Lake Winnipegosis and Lake Manitoba. From an increased security and economic perspective, the preferred route would be located on the east side of Lake Winnipeg. However, there are other considerations, which are addressed in this report, that make the choice of a preferred route difficult.

This report provides an overview of major issues related to the alternatives of routing the Bipole III Line on either the east or west side of the province. It is not intended to be a scaled down site selection and environmental impact study. The report considers issues on a highly generalized and comparative basis. It draws upon existing reports and narrowly based interviews, and was completed within a very short timeframe. There are no conclusions presented in this report. The report simply lays out the issues for Manitoba Hydro and the Province of Manitoba to consider.

Other than technical and economic considerations, there are few absolutes in the east vs. west debate. There are uncertainties associated with most aspects of the project, including:

- *Will the line impact a bid for a World Heritage Site?* The answer is possibly, but not necessarily.

- *Is there support from the First Nations on the east side of Lake Winnipeg?* Government meetings in 2004 concluded that there was none. However, recent statements made by First Nations to the media and east side planning documents suggest that there is now some support.

- *Will there be international opposition from environmental groups to an east side route even if there were First Nations agreement to proceed?* Very likely, but the tenor of the debate may change, as environmental groups could no longer point to a lack of First Nations support for the east side route as part of their opposition, and it could potentially place them in conflict with First Nations communities, with whom they have previously partnered.

- *Could continued or further conflict with individual First Nations impact power sales to Minnesota in the future?* Potentially yes.

- Manitoba has a business relationship with First Nations more or less from Conawapa to Snow Lake. West and south of Snow Lake the position of First Nations on the west side is unknown.

- Environmental opposition to a route on the west side of the province is likely much less than opposition to an east side route. However, it is still uncertain and unpredictable.

- Issues of ecological integrity and Protected Areas are better-studied and advanced on the east side. There is significantly less clarity and knowledge as well as profile regarding these issues on the west side.

- For woodland caribou, a west side routing would be a better option, but would not be without potential impacts.

- In built up areas there are preliminary indications from municipalities that they equate a transmission line with development and prosperity, and feel some responsibility to facilitate route location. However, there will be site-specific opposition from property owners. There will likely be strong opposition where the line circumnavigates the south and east sides of Winnipeg.

- The public has not understood the need for the Bipole III Line, nor the complexity of the trade-offs required for a routing decision. Recent licensing processes have become increasingly acrimonious and lengthy, which has further impeded communication and knowledgeable debate.

- Routing on the west side will be neither easy nor guaranteed.

The issues are rife with contradictions, such as:

- Hydro provides grid service to east side communities yet the Corporation is regarded with apprehension and distrust in some circles, even where the only involvement with Manitoba Hydro has provided benefits.

- In some communities, an all-weather road is acceptable on the east side (and even desirable) but a Bipole III Line is not.

The terms of reference provided for this assignment are attached as Appendix I.

2.0 Need for Bipole III Line

2.1 Present Situation

There is an immediate need to increase the security of Manitoba's HVdc transmission system that presently transmits 70% of the peak power requirements of the province over two ± 500kV HVdc transmission lines (Bipole I and Bipole II Lines). These two lines run along a single right of way (ROW) through the Interlake area from large generator stations on the Nelson River system in northern Manitoba to the major load centres in the southern part of the province.

The original transmission system design provided for the output of both Bipole I and Bipole II converters to be temporarily connected together in parallel on either of the two ± 500kV HVdc lines. In the event of the loss of one of the lines, this enabled most of the output of the northern converters to be transmitted to the south, albeit with increased line losses, on the remaining transmission line.

The southern Manitoba load centre, however, remains vulnerable to the simultaneous loss of both lines. This would leave southern Manitoba dependent on power from Winnipeg River generation, northern generation connected to the southern ac system, and available import from adjacent interties. In addition, the southern Manitoba electrical system is vulnerable to the loss of Dorsey Converter station through which all the HVdc transmitted from the north passes and where it is converted from direct current to alternating current for use on the southern distribution system. Dorsey station is also the Manitoba termination of the 500kVac interconnection with the United States.

The vulnerability of the existing system to a single destructive event was starkly demonstrated when 19 towers of the two existing HVdc lines on the same row were simultaneously toppled due to a wind shear downburst event on September 5, 1996. Fortunately, this did not cause widespread supply problems, as it occurred during the night at a time of low demand, with little requirement for heating or air conditioning. Had it occurred at a time of peak demand, it could have had a much more severe effect.

The severity of the effect of the complete loss of access to northern generation in the future, at or near peak load times, could lead to southern Manitoba experiencing a severe disruption to commercial and domestic activity, a strain on emergency services, and a risk to the health and safety of the population in general.

2.2 Options to Improve Security of the Present System.

Recently, several studies have been undertaken to assess alternative options to improve the security of the existing HVdc transmission system. All of the alternatives involve building an additional ± 500kV HVdc north/south transmission line (Bipole III Line). To minimize the risk of the loss of all three ±500kV HVdc lines (the two existing lines on the same ROW and the proposed additional Bipole III Line), it was recognized that the new line must be located on a ROW corridor remote from the existing lines.

The geography of Manitoba, includes some significantly large lakes that lead to a natural separation of possible transmission line routes into the following three north/south corridors:

- The "East" corridor, between Lake Winnipeg to the west and the Ontario border to the east.
- The "Interlake" corridor, between Lake Manitoba, Lake Winnipegosis and Cedar Lake to the west, and Lake Winnipeg to the east.
- The "Far West" corridor, between the Saskatchewan border to the west, and Lake Manitoba, Lake Winnipegosis and Cedar Lake to the east.

Studies of these corridors have been undertaken by Manitoba Hydro to determine the best technical and economic option for the location of the Bipole III Line.

2.2.1 The "East" Corridor

Routing the Bipole III Line along the East Corridor offers the most attractive technical solution for improvement to the security of the existing HVdc north/south transmission system. It is the shortest route, consequently minimizing exposure to line failure and making it the most economical to build.

The operation of the transmission system with the completed Bipole III Line along the eastern route, as well as providing the required additional system security, would enable the cost of building and operating the Bipole III Line to be recovered through the increase of export sales due to the savings through the decrease in line losses.

It is intended that the new Bipole III Line from Henday would terminate at the planned Riel Station, which is to be located close to the east side of the Red River Floodway, next to the existing Deacon Reservoir.

A paralleling line would connect the Riel Station to the Dorsey Converter station to enable the existing Bipole II converters at Dorsey and at Henday to be connected to the Bipole III Line. The two existing lines (Bipole I & Bipole II Lines) would then be connected in parallel to the Bipole I converters at Dorsey and at Radisson.

This configuration would provide for the needed emergency parallel connection of existing converters, enabling transmission of almost all of the output from existing converters in the event of the complete loss of transmission on any one of the corridors.

Consideration should also be given to advancing the installation of converters on the east route to provide for significant HVdc transmission in the event of a catastrophic loss of Dorsey station.

2.2.2 The "Interlake" Corridor

Presently, all of the HVdc power from northern generation is transmitted along the existing Bipole I and Bipole II Lines, which are sited on the same ROW along the Interlake corridor. To provide for a new ROW along this corridor while maintaining an adequate separation distance to prevent a single event affecting both ROWs has proved to be challenging.

Previous studies have determined that a separation distance between ROWs should be at least 40km to reduce the chance of a single event affecting all three lines, with a return period in excess of 800 years. The only option for a marginally suitable ROW would involve building artificial islands that allow island hopping of the transmission line across Cedar Lake.

The consensus is that an additional route through the Interlake would not provide adequate security for the total north/south HVdc transmission system, but it may be considered for future north/south transmission once the security issue is resolved.

2.2.3 The "West" Corridor

Routing the Bipole III Line along the West Corridor would provide the greatest separation between the existing lines and the proposed new line, but it would also be the longest, most expensive and least useful for emergency operation in the event of the loss of one of the transmission corridors.

Unfortunately, due its long length, its characteristics make it unsuitable to operate with either of the existing Bipole I or Bipole II converters, requiring it to have its own converters designed to operate with the longer line. The Bipole III Line and converters would not be able to operate connected in parallel with the existing Bipole I and Bipole II converters.

If the Bipole III Line (West) were lost, the existing Bipole I and Bipole II lines would be able to carry the full existing output from northern converters. However, if the Bipole I and II Lines (Interlake) were lost, the new Bipole III (West) would only be able to carry its rated load (about 50% of the available output). Together with imports from tielines, this may be sufficient to meet current peak load requirements for southern Manitoba but would require the advancement of a fourth HVdc Line and converters (Bipole IV) to meet load growth expectations.

2.3 Intermediate Future Development

Intermediate future system development calls for the building of further northern generation, which would require the provision of additional north/south transmission capacity.

If the Bipole III Line were built along the East Corridor, additional capacity could be provided by installing the Bipole III converters. (If Bipole III converters were installed

earlier, to provide security in the event of a catastrophic loss of Dorsey, no new converter capacity would be required.) This would provide for at least two-thirds of northern capacity to be transmitted south in the event of loss of either corridor.

If the Bipole III Line, together with converters, is built along the West Corridor, only about one-third of northern capacity could be transmitted to the south in the event of total loss of transmission on the Interlake corridor. If the transmission on the west were lost, the Interlake corridor would be able to carry about two-thirds of northern capacity.

2.4 Ultimate Development

In the event that full development of northern generation were to occur, it would approach 90% of the province's total generation capacity. This would require the construction of Bipole IV and Bipole V. For reliability purposes this would require a third corridor.

The ultimate requirement for Bipoles IV and V should not be construed as lessening the technical arguments for an east side location for Bipole III.

3.0 The Environmental Landscape of Alternative Routes

Either option for routing of the Bipole III Line will traverse both forested and rural areas of Manitoba. In very broad terms, a west side routing will traverse very roughly 580 km of forest from Henday to approximately The Pas, then approximately 760 km of rural landscape from The Pas to Riel. An eastern routing would traverse 800 km of forest from Henday to about the Winnipeg River and 85 km from there to Riel. The forested areas of the west route are much more intensively developed than on the east side, with roads, rail lines, geotechnical survey lines, and transmission lines, as well as forestry and mining operations. Both east and west side routings contain traditional land use areas and Treaty Land Entitlement areas of various First Nations, as well as Resource Management Areas. A larger, wide-spread population is affected by a west side routing, which also impacts more of the densely populated region in proximity to Winnipeg.

3.1 Differences among Potential Biophysical Impacts

Generally, different types and magnitudes of potential biophysical impacts could occur in the two landscapes of forested and rural areas. Potential impacts are associated with the construction phase and the presence of and maintenance of the transmission line and ROW, and will vary with line length and specific sites. In the boreal forest areas of northern Manitoba, key potential impacts are:

- Loss of ecological integrity
- Changes to ecologically sensitive and protected areas
- Declines in populations of rare, threatened and endangered wildlife, habitats and flora
- Disturbance to fur-bearing and other wildlife populations important to local communities, as well as alteration to habitat and changes in ease of human access
- Stream crossings that could alter water quality, aquatic habitats and fish species

In the more southern rural and rural residential areas, biophysical impacts tend to be more site-specific and could include some of the same issues, but often to a lesser degree. Ecological integrity is generally not of concern in this landscape, which tends to already have significant existing infrastructure, such as roads and other transmission lines.

Opinions on the significance of residual biophysical impacts after mitigation range from minimal to unacceptable impact. However, in the past decade, several significant transmission line projects have undergone provincial and federal environmental assessment and licensing. Consequently, Manitoba Hydro has developed extensive experience in mitigating transmission line biophysical impacts through:

- Extensive consultation processes to understand local concerns and gain information to assist in routing and mitigation
- Routing selection studies to avoid sensitive areas, and to reduce aesthetic and other impacts

- Environmental protection plans that are monitored by several regulatory agencies and include stream crossing guidelines and improved vegetation management practices

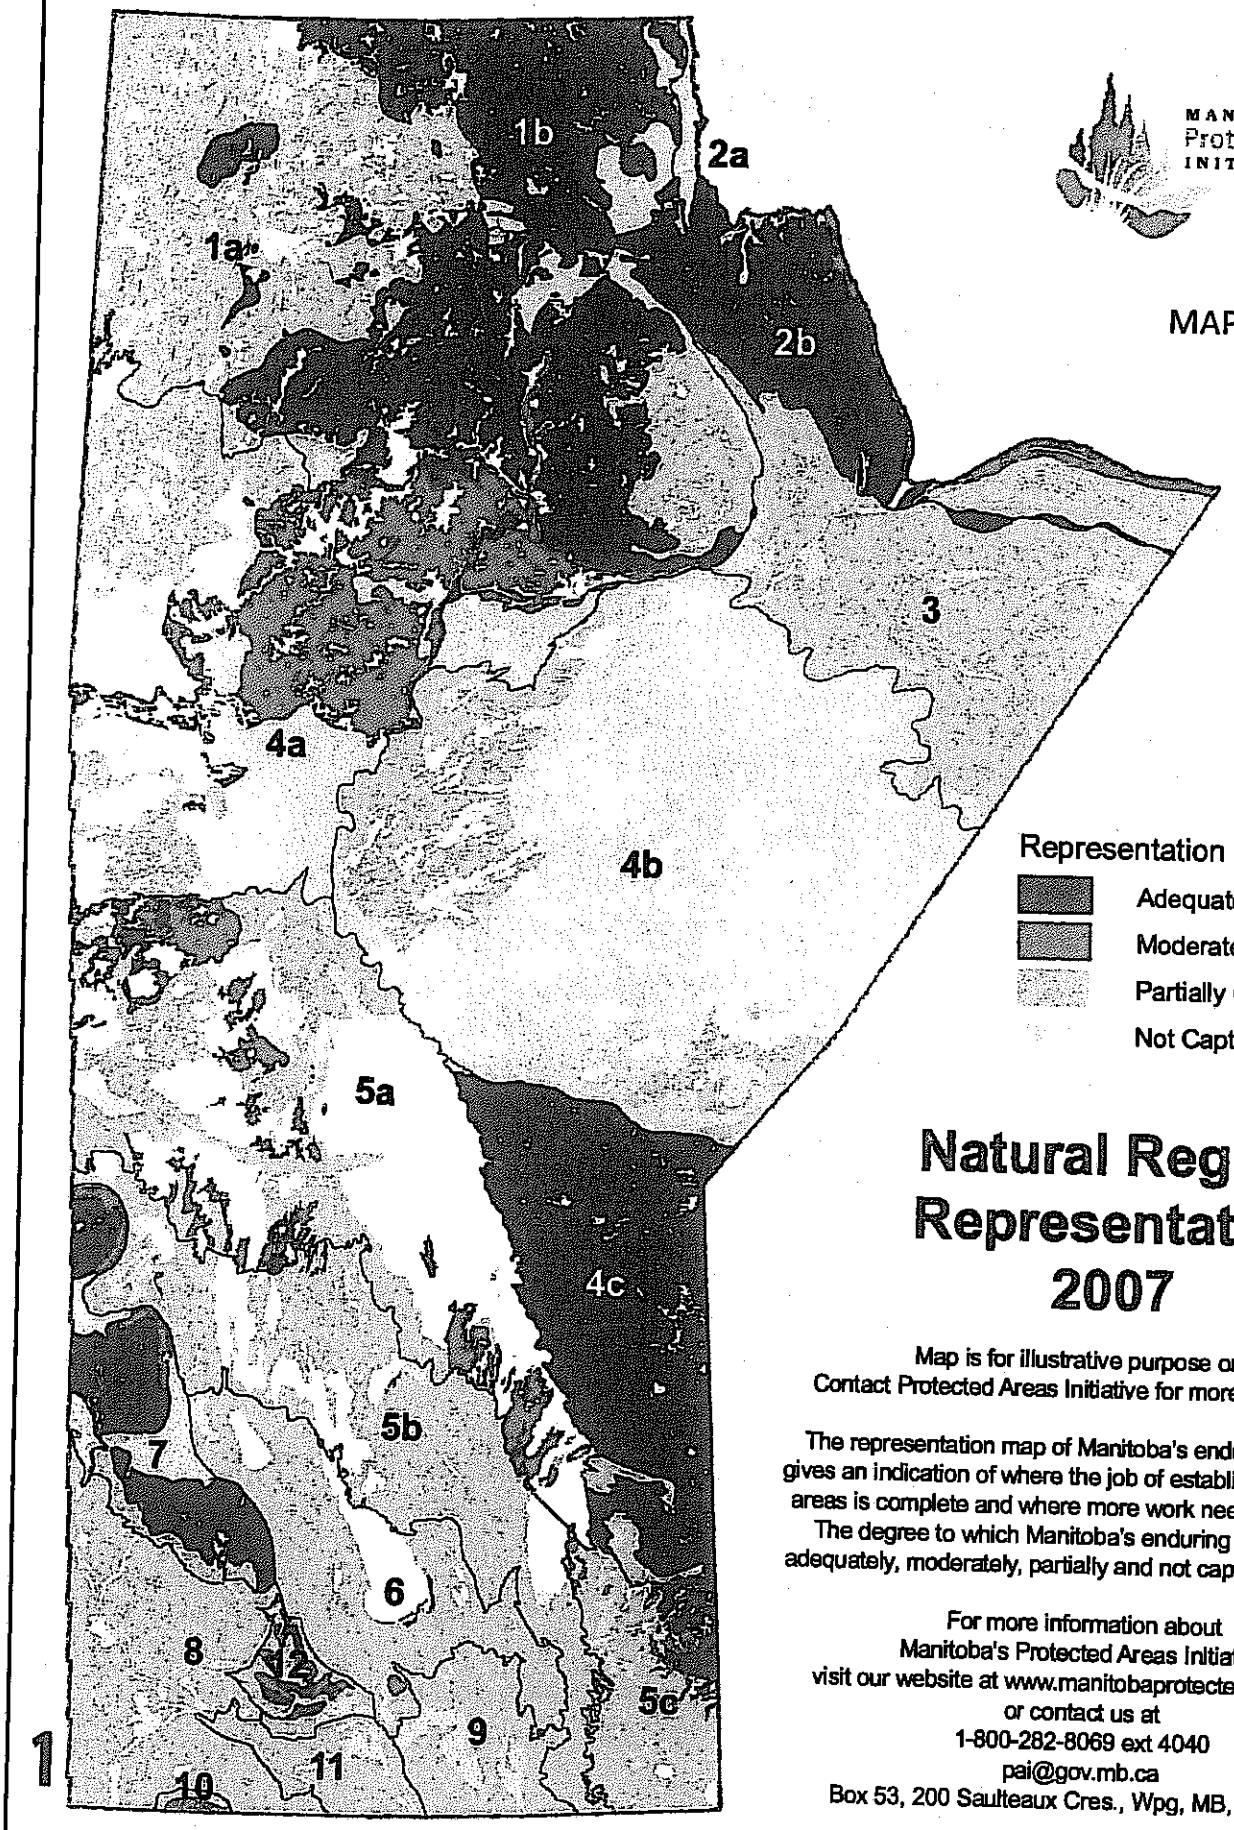
The following sections provide a high-level overview of an eastern vs. western routing for each of the key biophysical issues and has not benefited from information from local communities.

3.1.1 Ecological Integrity

Ecological integrity is a broad term often used by environmental groups, the scientific community and federal government, yet it is not necessarily consistently defined. To date, it has not figured significantly, if at all, in Manitoba Hydro reports; the focus is usually on habitat, sustainable development and cumulative impacts. The Clean Environment Commission recommended that periodic reports on ecological integrity (as well as enduring features, biodiversity and sustainability) be part of the Environmental Protection Plan for the Wuskwatim Project. Ecological integrity is sporadically but increasingly cited as the reason to "save the boreal forest," which is discussed in more detail below. A high level review of ecological integrity issues indicates that this is a complex subject. Neither the east nor the west side would be particularly favoured.

Ecological integrity seems to often mean "intactness," ensuring continuity of systems and processes, unfragmented and distant from human infrastructure. Global Forest Watch Canada defines intact forest as 50,000 ha (500 sq. km) and at least 10 km wide, while the World Resources Institute defines intact forest as areas of 200 sq. km or more that is mostly undivided by roads or other access routes, although they recognize that smaller tracts of forest may still contain high conservation values.

Clearly, the east side has greater existing ecological integrity than the west side. The west side has a 90 year history of mining, forestry, hydroelectric development and associated infrastructure of roads, rail lines and cut lines for geophysical exploration. The Flin Flon/ Snow Lake greenstone belt and the Thompson Nickel belt are two of the most prolific mining districts in the world. Forestry operations extend throughout most of the northern area to be traversed by a western corridor save for the Split Lake Resource Management Area. While the east side is also traversed to some extent by transmission lines (for example, north to Poplar River, east to Little Grand Rapids, and in the North-Central Project region) and by winter roads, with plans for all weather road development to Bloodvein and potentially further north it is of a different scope and intensity. The existence of extensive development in the west however, does not mean that biophysical impacts in that region would be less nor that it would necessarily be easier to find a route. Several other observations relevant to this debate include:



- The section of boreal forest between Poplar River and Oxford House, representing roughly 25% of an east side route, is largely free of linear infrastructure. It is also free from forestry resource allocation – a key criterion in preserving ecological integrity. This is the area where the greatest impact on ecological integrity would occur, particularly if the

Poplar/Nanowin Rivers Park Reserve is to be avoided through a more easterly routing. From Berens River south, a routing close to Lake Winnipeg and adjacent to the existing transmission line ROW would have minimal impacts on ecological integrity.

- The east side is virtually entirely in the boreal shield ecozone. Given that this forest does not recognize provincial boundaries, even with an east side Bipole III Line, tracts of intact boreal shield forest greater than the definitions above would remain in this region of Manitoba and Ontario.
- A west side routing will cross not only boreal shield but also boreal plains ecozones (from roughly Ponton to Red Deer Lake). This latter ecozone is considered to be highly impacted and at greater risk – according to Global Forest Watch, less than 15% remains in large, intact areas. This includes the same ecozone that was identified for protection as part of the proposed Manitoba Lowlands National Park. Although there are potential routing options through this ecozone that could parallel existing developments, an argument could be made that this region has greater urgency for protection of ecological integrity than the vaster boreal shield forest of the east side. However, this forest does not have the same profile and emotional appeal as the east side.
- A July 2007 map prepared by Manitoba's Protected Areas Initiative illustrates at a high level where the Province considers that adequate protection exists for the Natural Regions (or ecoregions) of Manitoba (Map 1). Both an east and a west side routing would pass through ecoregions that are not considered to have the enduring features adequately captured, including ecoregions where no protection yet exists. This is most significant for the east side, where the large Natural Region 4b Hayes River Upland would have to be traversed, but a west side routing may pass through several natural regions that do not have enduring features captured. However, the map also indicates that an east side routing would pass through a significant area that is considered adequately represented – Natural Region 4c Lac Seul Upland.
- A more detailed discussion of the potential UNESCO World Heritage Site is provided below, but some references suggest that if 50% or more of a region's land is given protected status, then integrity is protected. As noted above, the Province already considers this natural region to be adequately represented in terms of enduring features. This means that, provided that the Bipole III Line does not alter the potential UNESCO status, a routing scenario for the east side could be developed if it were coupled with real, and perhaps additional, protected status.

3.1.2 Ecologically Sensitive Areas and Protected Areas

Manitoba's Protected Areas Initiative is in the process of assembling a network of lands that protect representative samples of the province's 18 natural regions. This has been identified as a priority for the provincial government. Candidate sites move through a hierarchy of designation, beginning with Area of Special Interest (ASI) to Protected Area

July 2007

Manitoba

Proposal to Park Reserve to Protected Area. Once established, a Protected Area would likely not be able to be traversed by a new transmission line.

Existing and potential Protected Areas exist along both the east and the west sides of the province, rendering this topic largely neutral in terms of deciding on an east vs. a west preference. Potential impacts on ecologically sensitive areas and protected areas can largely be avoided through routing selection that avoids them – recognizing that avoidance adds to costs through longer line length and the need for more expensive angle towers. Other factors to consider:

- On the east side, the existing or potential Protected Areas are large, but generally better identified and further along in the designation process. There are several ASIs between Poplar/Nanowin Rivers Park Reserve and Henday area, but they are large blocks and routing may be possible through them. In other words, there is more knowledge and certainty in dealing appropriately with Protected Areas on the east side.

- There is less knowledge and certainty regarding potential and existing Protected Areas on the west side. The greatest challenge will be finding a route through the area known as the Saskatchewan River Forest Reserve and south, roughly from Cormorant and down to Swan River. Although lacking the profile of the east side, sites such as the Saskatchewan River Delta may be important. Large swaths of this area are covered by ASIs. In most cases, ASI boundaries are flexible and can be changed to respond to new information. However, single or restricted occurrence enduring features have limited flexibility for boundary changes. Significantly, during the Wuskwatim Transmission Line Project, essentially only one alternative route could be identified for evaluation in the section from Herblet Lake to Rall's Island Station near The Pas. The timing to gather appropriate information and work through consultative processes on potential protected areas on the west side would be significant.

- An east side routing will cross two Canadian Heritage Rivers, the Hayes and the Bloodvein, both of which are already crossed by either 66 kV or 138 kV transmission lines. A west side routing will cross one Canadian Heritage River, the Red, which is presently crossed by a 500 kVac line north of Winnipeg. Although CHRS status does not preclude additional transmission lines, there will be an aesthetic impact on the recreational experience and an impact on the values for which the rivers were nominated, particularly for the two northern rivers.

3.1.3 Rare, Threatened and Endangered Wildlife, Habitats and Flora

In the absence of routing studies for either the east or west side, it is impossible to know the extent and magnitude of rare, threatened and endangered wildlife, habitat and flora. Detailed route selection typically identifies such sites for avoidance. The major exception

is woodland caribou, and the following section compares the two potential routings in terms of potential impact on this iconic species.

Woodland Caribou

Of all the wildlife in the boreal forest the woodland caribou is often singled out special attention. Canadian coins feature the queen on one side and symbols of our identity on the other. On the quarter it's a caribou. A prominent symbol of wilderness values.

All boreal populations of woodland caribou are listed as Threatened both provincially and nationally. There is a provincial conservation and recovery strategy in place in Manitoba and a draft national recovery strategy nearing completion federally. Both strategies recognize the primary objectives in caribou conservation as retaining existing populations and maintaining the integrity of their ranges. The common history of woodland caribou decline is for individual populations to have their ranges disturbed by human activity, which (i) isolates populations, (ii) removes habitat, (iii) upsets the natural balance between caribou and other species, and (iv) provides opportunity for increased kill by human hunters. Caribou commonly occur in small herds (tens to perhaps a few hundred animals) and have a low reproductive rate compared to moose and white-tailed deer. Consequently, caribou populations lack the ability to recover from even a few additional deaths each year. Disturbed populations typically dwindle and then disappear. The disappearance can take as long as a few decades, but the end is predictable. Over the past century, numerous boreal woodland caribou populations have disappeared across Canada and there is no record of any population ever re-establishing itself after it has become locally extinct.

There are several points of general consensus in the wildlife research and management communities regarding boreal woodland caribou:

(1) The critical aspects of habitat are that it occurs in a very large range (hundreds or thousands of square kilometres), and that it be mature coniferous forest (including bogs and fens if present);
(2) Caribou populations will decline if they are sharing their range with moose or white-tailed deer and their parasites or predators;
(3) Caribou populations will decline with even small increases in the number of individuals killed by humans; and
(4) The negative effects of range disturbance may not become evident for 20 years or more owing to a time lag before changes in wildlife and human uses of a range occur.

Potential impacts to caribou from transmission lines may occur from the noise and activity during transmission line construction, which could displace any caribou in its vicinity, likely by several kilometres. Effects of construction activities are unlikely to yield long-term consequences to caribou populations if the disturbance is of short duration and it is planned to avoid key seasons.

In isolation, the direct effects of a transmission line ROW, once operating, are not likely to disrupt an established population and should not put caribou populations at risk – it is

the access facilitated by a transmission line ROW that leads to greater risk. Specifically, human access for hunting and access by other forms of wildlife, which presents risk of disease transmission from moose and white-tailed deer as well as changes in predator populations. Accordingly, the ability to isolate a transmission line ROW from other activities will dictate its impact upon caribou.

In comparing the east side to the west side from a transmission line planning point of view, all caribou ranges encountered are High Risk, regardless of an eastern or western routing.

East Side: Any transmission line constructed on the east side of Lake Winnipeg would intersect the range of the Atikaki-Berens population, one of three populations already in the High Risk category. The Manitoba Conservation and Recovery Strategy shows a blank space north of the Atikaki-Berens range. It is known that this area contains one or more caribou populations but there is not sufficient information to determine the extent of their range(s). It would be prudent to consider the area between the Atikaki-Berens range and Oxford House as being occupied by caribou. Lake Winnipeg is a natural barrier to woodland caribou populations. Should a transmission line be constructed on the east side of Lake Winnipeg, placing the corridor close to the lake would, at worst, remove the westernmost margin of population ranges and cause minimal loss of caribou range.

West side: The western corridor options provide opportunities to follow existing transmission lines, rail lines or highways for most of its length. The Wabowden population's range is already bisected by both roads and rail lines. From the Wabowden area, a route north of Moose Lake then south past the Pas and Swan River appears able to avoid introducing any new linear features into caribou ranges.

Eastern vs. western routing: Considering the points of consensus on boreal woodland caribou noted above and the knowledge of woodland caribou in Manitoba, the west side presents the best options for woodland caribou in Manitoba. It would not need to fragment additional caribou ranges and would leave a large contiguous block of caribou habitat on the east side of Lake Winnipeg. Widening an existing transmission line corridor would reduce impacts relative to creating a new corridor. As noted above, the direct effects of a transmission line are much less than the effects related to associated access. Parallel transmission lines in the same corridor would provide a minimal increase in access compared with the establishment of a transmission line in a new area. Potential mitigation measures could be applied regardless of the selected routing, although their effectiveness are speculative. Route selection is the most important consideration; within any selected route, mitigation measures should focus on access along the ROW. It is also important to note that though the ranges and dynamics of all woodland caribou populations in Manitoba are not known and might benefit from study, funding additional research will not provide new information for many years and is unlikely to be able to inform the planning process.

3.1.4 Disturbance to Fur-bearing and Other Wildlife Populations

While important, especially for Aboriginal communities, at this high level of comparison, no significant difference between an eastern vs. western routing is identifiable, with the exception that an east side routing passes through a greater length of boreal forest, while the west side routing passes through more ecozones and potentially a greater diversity of wildlife populations.

3.1.5 Aquatic Habitats and Stream Crossings

While important, at this high level of comparison, no significant difference between an eastern vs. western routing is identifiable. Both routing options would cross major rivers and a myriad of smaller rivers and streams, as well as a variety of wetlands. The longer western route might cross more water bodies, but this is speculation. Existing mitigation measures would reduce potential impacts regardless of the routing choice.

3.1.6 Impacts on Carbon Stocks

The Wuskwatim Transmission Line Project includes an assessment of potential impacts on carbon stocks. Global warming is of increasing concern and attention. Right now it is difficult to make any meaningful comparison for an east vs. west Bipole III Line. Very generally, it appears that potential release of carbon would be greatest in forested areas, meaning that the east side may have a higher impact without mitigation or offsets. This issue cannot be used in making routing decisions at present due to insufficient information, but Manitoba Hydro will be increasingly cognizant of this topic.

3.2 Differences among Potential Socio-economic Impacts

In general, as with biophysical impacts, routing selection processes plus environmental assessment and mitigation measures result in few residual socio-economic impacts with new transmission lines. However, the mitigation required may be difficult, expensive and sometimes extremely disruptive and upsetting for the individuals involved. Public perception, especially near Winnipeg and other built-up areas, will view the construction and presence of the Bipole III Line negatively (see Section 4.1).

The west side option is significantly longer through rural and built-up areas and will require more avoidance routing and mitigation to minimize impacts on:

- Farming operations
- Visual impacts
- Noise
- Heritage resources
- Health concerns, especially linked to EMF (regardless of current scientific literature or Manitoba Hydro's position)
- Negative impact on property values

It will be virtually impossible to avoid homes in routing the Bipole III Line. The risk for the associated significant dislocation is greater with the longer western option, particularly in the vicinity of Winnipeg.

Socio-economic impacts will require avoidance routing and mitigation in the northern sections for either an eastern or western potential routing including: communities, Registered Trap Lines, access by non-members into traditional land use or Resource Management Areas of First Nations, etc. Neither routing would be more or less challenging in this regard. However, the west side has a long history of mining, forestry, hydroelectric development, settlements and related infrastructures that are not found in the core parts of the east side. While at times this may provide opportunity to parallel existing infrastructure and reduce impacts, intense human development conversely presents more obstacles.

4.0 Considerations Associated with Different Routing Options

This section raises a number of considerations that are linked to biophysical and socio-economic impacts, but deal with specific issues. For example, one consideration is the nature of opposition in built-up areas and why a western route might be perceived as benign while an eastern route is troubling. And while the issues raised here are eclectic, they are useful considerations associated with different route options and important from a general planning perspective. One notable feature in all of these topics is the degree of uncertainty, as each involves a degree of speculation and ultimately requires substantial judgment.

4.1 Opposition in Built-Up Areas

A west side routing would pass through significantly greater rural areas and pass in proximity to more built-up areas, particularly near Winnipeg.

Limited discussion with elected municipal officials in rural municipalities and planning districts suggest a surprising absence of strong views that would preclude a new HVdc line in built-up areas. Opinions have been expressed to the effect that:

- The municipal relationship with Manitoba Hydro has always been positive. There will be no outright opposition to a line by municipal governments. The municipal position might be cautious but certainly open to discussion and a willingness to find solutions.
- There were offers from Planning Boards to facilitate discussion and meetings
- There is a notion that transmission lines are necessary for the public good. Civic duty requires cooperation in building this infrastructure.
- Some people associate transmission lines with economic development and prosperity and see them in a positive light
- Financial incentives to landowners have created a very positive relationship with the Corporation. Municipal concerns would relate to use of municipal lands and impacts to future development opportunities.

There will be site-specific opposition to new transmission in built-up areas of the province. It is inconceivable that new transmission could be built without coming close to some rural or ex-urban residences. Based on Hydro's experience to date, opposition from individuals affected by the line can be expected to be ardent, vociferous and litigious. Depending on the magnitude of opposition, elected officials may become less accepting of the HVdc line. In addition to the cost of acquiring easements and rights-of-way, Hydro should expect to be faced with expropriations, buyouts, and settlements for damage to property values.

To terminate at Riel, a west side routing will need to circumnavigate Winnipeg to a significantly greater degree than an east side routing. Ex-urban development has increased the extent and density of houses and developments outside the city's perimeter since the previous Bipoles were built and since the 500 kv line was built in and out of Riel. Opposition will be more vocal and organized in these areas, and mitigation

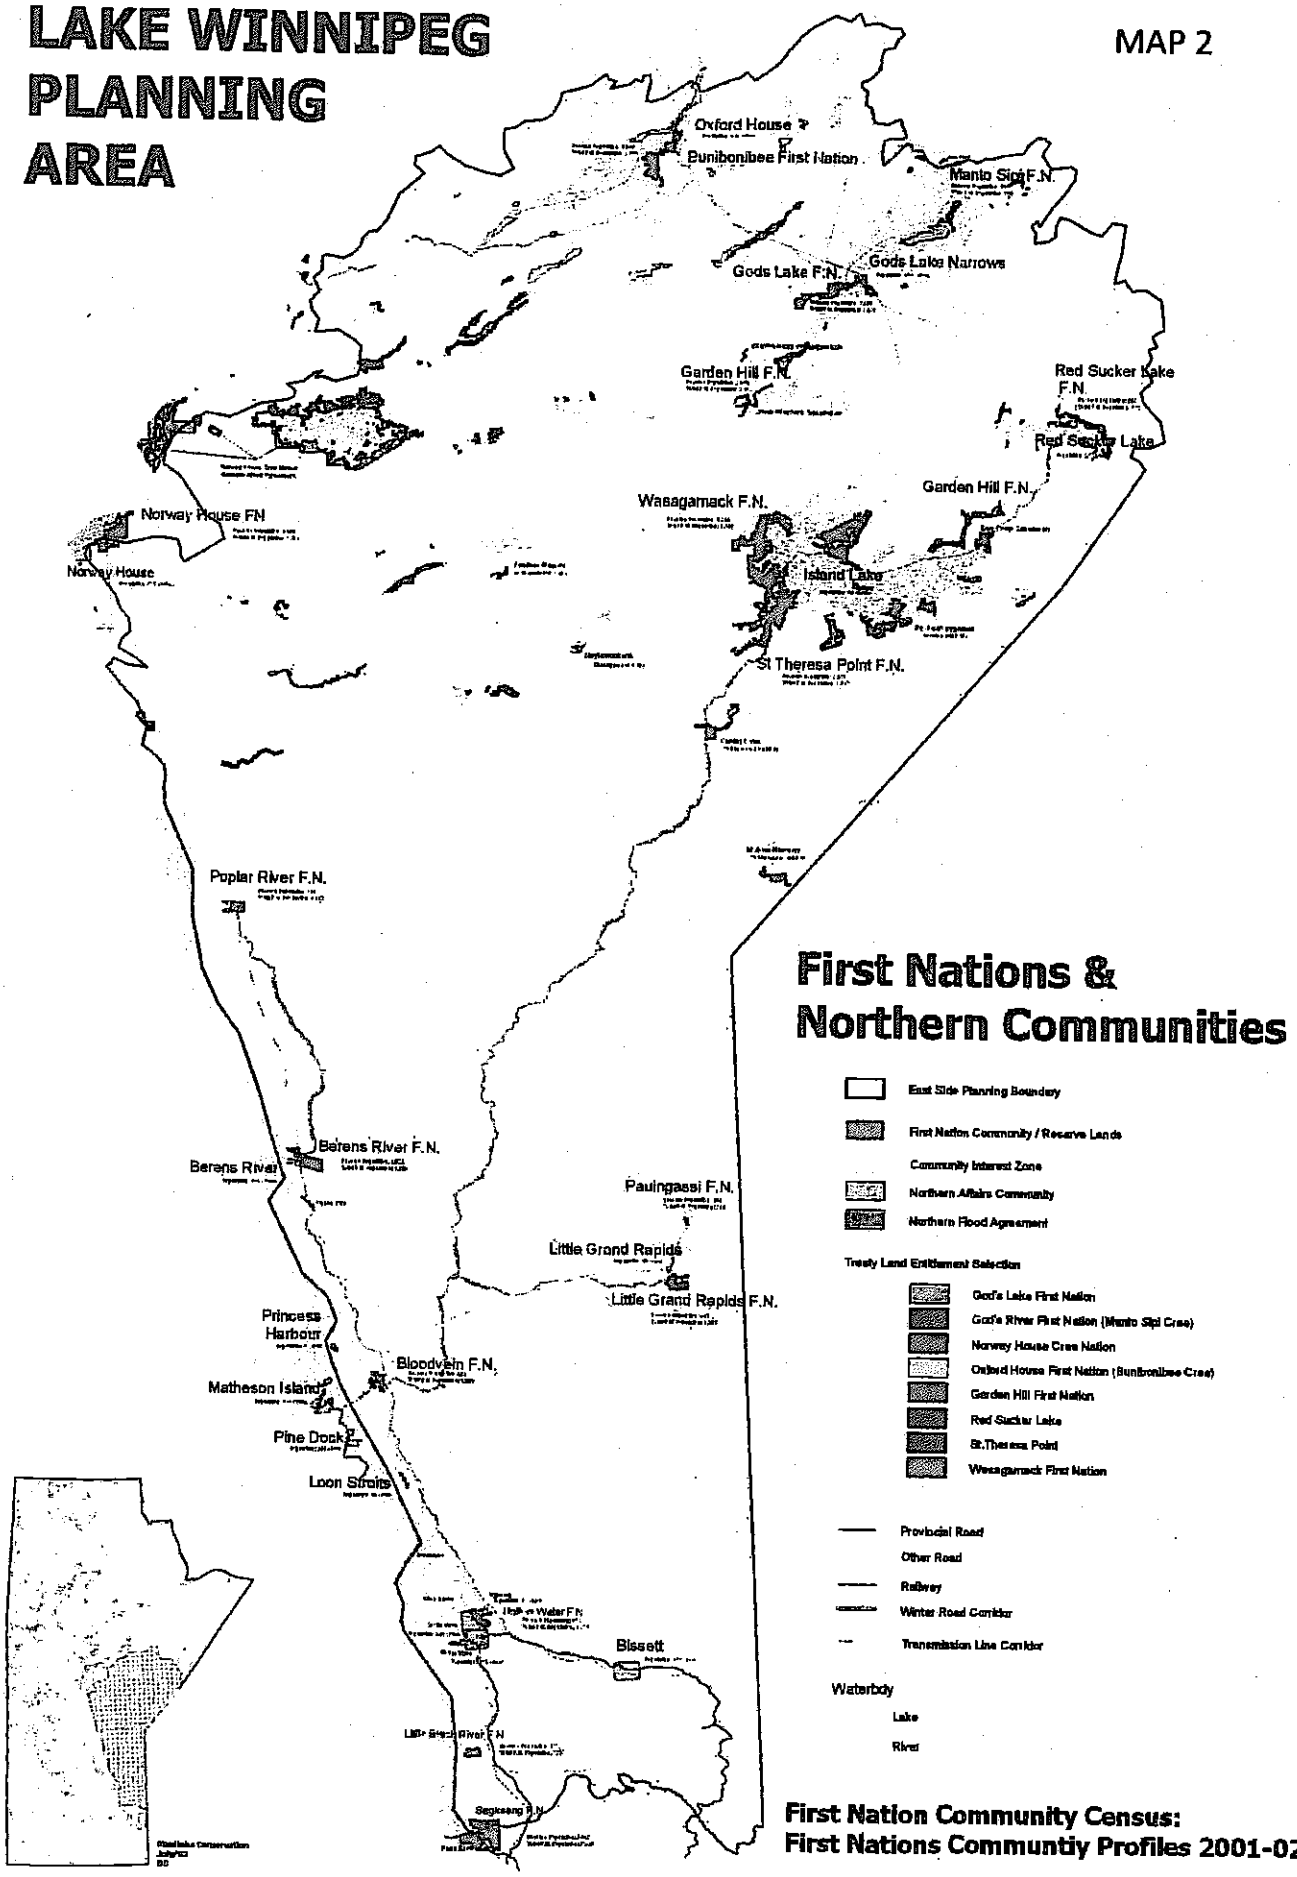
measures such as financial incentives to landowners will be less appealing and successful than in rural farmland. No one will want the HVdc line in their back yard.

4.2 The Evolving Nature of Resources Management Areas

In northern Manitoba, the provincial government is party to the development of Resource Management Areas (RMA) and the recognition of Traditional Use Areas. RMAs exist or are in development on both the east and west sides of the province. These initiatives are in collaboration with First Nations and recognize that Aboriginal rights extend beyond reserve boundaries into unoccupied Crown lands. They have proven to be an effective forum to facilitate discussion and to coordinate planning. The whole notion of co-management has been evolving, in part due to Supreme Court rulings, and in part simply due to an interest in better community relations.

However, the evolution of Traditional Areas and Resource Management Areas is beginning to show there are limits at which they can become counterproductive. While a Resource Management Area should provide a forum for consultation and improved decision-making, if the RMA begins to take on attributes of real property, it can become an impediment to development and cause conflict among First Nations by allowing one party to effectively veto projects of interest to the majority of Aboriginal people in any one region. Rather than reducing conflict, these arrangements can create tensions whereby the government states that the relationship is one of consultation but in effect grants a right of consent to each First Nation in a region prior to any resource allocation.

These areas are a direct provincial responsibility, however, Manitoba Hydro is often drawn into these discussions because of First Nation concerns about mitigating or offsetting impacts of transmission lines. First Nations on both the east and west side have clearly indicated a desire to be consulted regarding future hydro-electric development, including transmission lines, and the RMA agreements will be a factor in these discussions.



4.3 Current Partnerships

Manitoba Hydro has two major business partnerships with First Nations related to the development of new generation:

- There is an agreement with Nisichawayasihk Cree Nation (NCN) to jointly develop the Wuskwatim Generating Station. This is a 200 MW plant estimated to cost some 1 billion dollars. Associated transmission will see a new corridor from Thompson to the Wuskwatim site and to The Pas.
- In October 2000, Manitoba Hydro and Tataskweyak Cree First Nation (TCN) entered into an agreement in principle to explore the business opportunity to develop the Keeyask Generating Station. This is a 620 MW site that will cost upwards of 3 billion dollars. While transmission has not been discussed, TCN has understood that it will have to facilitate a transmission corridor as well as agreement to an infringement of Aboriginal rights at the site of the station. However, discussions about a Bipole III Line to date has been in the context of a

north/south orientation away from the TCN Resource Management Area. The notion of an east/west line would be something new and would potentially traverse a significantly longer section of the RMA.

The TCN Resource Management Area covers as much as 7% of the province. It stretches from the proposed Conawapa converter site to the LGD of Mystery Lake (Thompson) and is contiguous with the NCN RMA.

These relationships suggest there is a reasonable opportunity to achieve agreement with both TCN and NCN on a west side transmission corridor. This report has not involved any technical studies but a map review of the integrated transmission system at least suggests the opportunity to widen existing and proposed transmission corridors through these Resource Management Areas to The Pas.

4.4 The East Side "Address"

Regardless of potential impacts and opposition to a west side routing, the east side has gained an upscale "address". It has garnered international attention and has become symbolic of efforts to "save the boreal forest". The east side has been formally recognized by Parks Canada as a place of "***outstanding universal value***" when it added this area to Canada's Tentative List of World Heritage Sites. Details regarding this initiative and the profile of the east side among environmental groups are discussed in later sections.

A Manitoba news release of February 2007 notes "The project has already ***generated considerable international interest*** since the site would fill an identified gap in the World Heritage Site system of protected areas, and because it proposes an innovative approach to land management that combines natural and cultural features. It has exceptional ecological values with extensive undisturbed forests, lakes and wetlands that reflect unique geological processes and represent critical habitat for several threatened or endangered species including woodland caribou, bald eagles and wolverines. The site also represents an outstanding example of traditional Aboriginal life based on a close and enduring relationship to the land"

It is notable that similar claims are not made for the west side of the province, even though there are ecological units on the west route that are arguably of equal value to anything to be found on the east.

This notion of an east side address is important in understanding why an east side route would likely attract fire while a west side route may move through the environmental licensing process somewhat easier.

4.5 The East Side Planning Initiative/ WNO

The East Side Planning Initiative or Wabanong Nakaygum Okimawin (WNO) virtually encompasses the entire area required for an east side Bipole III corridor save for the extreme northern end (Map 2). Launched in 2000, WNO has a mandate to develop

"traditional land-use plans and a broad area plan for the east side." There are 16 First Nations in the planning area with Norway House/Gods Lake and the Island Lake communities on the northern boundary and Sagkeeng on the south.

The EPI/WNO has gone through several evolutions. Most recently, on April 3, 2007, the Province of Manitoba and the Signatory First Nations signed the Wabanong Nakaygum Okimawin (WNO) Council of Chiefs Accord. The Accord "confirms the government to government relationship between WNO First Nation Governments and the Government of Manitoba ...reinforcing the most comprehensive traditional land use planning in this country."

Clause 3.10 states that until the "First Nations land use plans are developed and adopted or resource management agreements are in place, the Province, before deciding on a proposal for an allocation or disposition of Manitoba Crown land or resources for an activity in the Planning area, will consult meaningfully with any First Nation Government whose aboriginal or treaty rights may be adversely affected by the proposal." Late drafts of the Accord went beyond consultation to grant the right of consent over resources dispositions on the east side. References to consent have all been removed from the final document.

4.6 WNO and the Transmission Line

The "Promises to Keep..."[1] document states: "The vision of the East Side Planning Initiative is based on the fundamental principal that the land is and must continue to be protected and. Further, it is a vision which:

- Equates the importance of human development with the requirement for a wise and sustainable stewardship of the land."

The document goes on to say that this vision includes opportunities for economic development of local resources. It is intended to balance economic, social and environmental issues. It is not prescriptive of excluding any type of development and is not prescriptive of excluding a transmission line.

There is a disconnect between the Province's and WNO's position on the Bipole III Line. The "Promises to Keep..." document notes that in its own community consultations the "reaction to the corporation and the proposed transmission line corridor on the east side of Lake Winnipeg was either uniformly negative, or contained significant overtones of mistrust and suspicion" (section 6.6). However, the report did not recommend that the line not be built. The report actually included 10 recommendations providing guidance on major issues that would have to be dealt with through negotiation, consultation and planning. Further, there is a perception that some east side communities are willing to discuss an east side route in the context of economic opportunities. A recent example was found in the printed media ("East side is the right side", Letter to the Editor, *Winnipeg Free Press*, July 28, 2007).

[1] Promises to keep - towards a Broad Area Plan for the East Side of Lake Winnipeg, East side Planning Initiative, September 2004

This issue is complicated by statements from the provincial government ruling out an east side location, in part, because of opposition from First Nations. In a ministerial tour of east side communities in 2004, First Nation communities voiced consistent and uniform opposition to an east side route. In early 2007, statements were made by government ministers to the effect that an east side location was being protected from Hydro development.

WNO may be a potential forum to continue discussion of an east side location. As an organization with a mandate to develop a plan for the east side, the Province would be looking to the WNO for advice. However, while the Secretariat is managing the planning process through the WNO Council of Chiefs structure, the WNO does not have a mandate to make significant decisions on behalf of participating First Nations.

There is uncertainty and risk regarding support or opposition by First Nations for potential routings on either side, although the debate has been more specific and longer term on the east side. It is clear that there is some First Nation support for an east side route but that the support is not unanimous. Also, the support that exists is conditional on financial incentives/opportunities that are beyond what Hydro has proposed for its transmission development fund. For a west side routing, there is opportunity from existing partnerships with NCN and TCN, and recent transmission lines have been successfully routed, but this does not guarantee that opposition will not occur and nor be significant and demand the same financial incentives/opportunities. First Nations have not been directly contacted for this report.

4.7 The Government Role in Planning

Planning for a new transmission line includes elements that are beyond Manitoba Hydro's mandate. Amongst those interviewed there is a common opinion that the Province should take a lead role in the initial planning and decision-making. The rationale for this includes:

- The expense involved. The cost for the Bipole III Line down either corridor will run into the hundreds of millions of dollars, with a west side routing costing significantly more. The choice of east vs. west will affect the provincial debt and the ability of Manitoba Hydro to pay a future dividend.
- The reputation of the Crown is at stake.
- The Crown has a duty to consult. Over time, Supreme Court decisions have refined and provided guidance about the Crown's duty to consult with respect to Aboriginal and treaty rights. The Crown has an obligation to respect and honour the Aboriginal and treaty rights of communities and communities have a right to be appropriately consulted and accommodated if activities adversely affect their rights. Some aspects of this duty to consult may be delegated to Manitoba Hydro but ultimately the Crown has the responsibility to meet this obligation.

There is a wide range of interests that are also the mandate of the Province of Manitoba. These include:

- The impact of land-use decisions and shared decision making on non-First Nation communities and industry, and the potential conflicts with other public policy objectives;
- Public well-being in terms of health and safety linked to reliability;
- Commitment to address climate change and protect and improve the environment;
- Potentially competing values; and
- Community and economic development responsibilities.

5.0 Impact on Other Initiatives in the Area

There is forestry and mineral exploration on the east side of Lake Winnipeg. There are also plans to start extending all weather roads into the region. None of these initiatives would be impacted by or benefit from an east side transmission corridor.

The sole issue that has received attention in this respect is the potential for a large part of the east side to be inscribed as an UNESCO World Heritage Site. Most of this section deals with UNESCO issues.

5.1 UNESCO World Heritage Site

UNESCO (The United Nations Educational, Scientific and Cultural Organization) through its **World Heritage Committee** has inscribed 851 properties worldwide to its **World Heritage List**. These properties are recognized by the World Heritage Committee as having **Outstanding Universal Value.** The properties may be listed as cultural, natural or mixed locations. Inscription of sites on the World Heritage List serves as a catalyst for heritage preservation and provides access to the World Heritage Fund. Sites inscribed on the World Heritage List benefit from the development and implementation of a comprehensive management plan that sets out preservation measures and monitoring mechanisms. Inscription of a site can bring an increase in tourist activities at the site. This can bring funding to the site and local economy provided that the tourism activities are well planned and within sustainable tourism principles.

Just as projects may be inscribed, they may also be removed from the World Heritage List if they do not maintain their cultural and/or natural values. A number of sites are listed as being in danger of removal. These include a site in China where UNESCO has serious concern over a controversial proposal to build dams and water power infrastructure near the site. China has been asked to provide a report within the next year on the environmental consequences of the project.

Parks Canada is the lead federal agency for the implementation of the World Heritage Convention in Canada. Sites considered for nomination by a State Party are placed on a **Tentative List**. Canada last updated its Tentative List in 2005. At that time, over 150 sites were identified as potential candidates with 10 being placed on the list. One of these was a large site located in the boreal forest of eastern Manitoba and northwestern Ontario known as Pimachiowin Aki, which was advanced as a combined natural and cultural site.

The proponents of Pimachiowin Aki are:

- Pikangikum First Nation (Ontario)
- Poplar River First Nation
- Pauingassi First Nation
- Little Grand Rapids
- Governments of Manitoba and Ontario

The east side generally and Pimachiowin Aki specifically has received significant provincial, national and international attention and support.

Nomination of a site requires a wide range of management plans and documents cataloguing the "cultural and natural" heritage values. Pimachiowin Aki will take four to six years before the nomination is ready to be put forward to UNESCO for consideration. The Bipole III Line routing and assessment studies could conceivably be occurring in advance of or concurrent with this process, which may generate greater opposition unless Manitoba Hydro is seen as actively and meaningfully supporting the UNESCO process, as well as working on a routing that avoids the study area completely.

The precise boundaries of the site are not known and will not be known for some time. But while the boundaries of the site are not well defined, Parks Canada believes there is a high potential for conflict with a transmission line. Furthermore, First Nations territories extend all the way to Lake Winnipeg, meaning there is no place where the line can be built without impacting to some degree the cultural values of the Aboriginal population.

The impact of the Bipole III Line on any future UNESCO application is uncertain. In large part it depends on the level of cooperation between Manitoba Hydro and all of the UNESCO proponents. There are numerous World Heritage Sites that have fully developed modern infrastructure systems. Most of these were in place before inscription. A transmission line within the site would certainly weaken the case for inscription based on "natural values".

The worst case scenario would be constructing the Bipole III Line in the face of First Nation opposition. Under the UNESCO convention, the proponents and especially the State Party are obligated to protect an area of **"outstanding universal value"**. This includes protection for both natural and cultural values. Building a line within the site in the face of opposition would be taken as a lack of commitment to UNESCO values and poor stewardship. It is not clear how the UNESCO process would deal with conflicting First Nation support and opposition to a transmission line.

The best case scenario would:

- Achieve full cooperation with First Nations and other proponents
- Develop agreements between Manitoba Hydro and First Nations that go beyond a simple financial relationship to demonstrate mutual respect, recognizes stewardship for the land and honours First Nations cultural ties to the land. This could be shown through meaningful support of Pimachiowin Aki.
- Clarify and align the Province's and Manitoba Hydro's positions and priorities. The Bipole III Line project will only move forward if the two entities share a common vision and objectives on both transmission and UNESCO issues.

If First Nations are on-side, the Bipole III Line routing studies could commence and begin to consider the broad and site-specific biophysical and socio-economic impacts. If all or some First Nations oppose the line, it could become a serious complication involving the Province's honour with respect to previous commitments, its reputation and its commitment to "stewardship". Regardless, it will be a long and difficult process.

5.2 Roads and Other Initiatives

The Province has committed to a road up to Bloodvein First Nation by rebuilding the Rice River Road and bridging the Bloodvein River. This is a five-year program with an annual commitment of $8 million and a total project cost of $41 million. This has been discussed as the first step in establishing all-weather road access further north into Berens River.

Manitoba Infrastructure and Transportation is about to commission a "System Planning Study" that would consider the options for more northern communities. This will likely involve an east/west route from the Island Lake communities to Norway House.

First Nation support for roads but opposition to the Bipole III Line is not necessarily inconsistent when viewed from a community context. While the roads have been identified by the communities as something they need and want, the need for the Bipole III Line is external and potentially of no community benefit. In Aboriginal communities, Manitoba Hydro developments come with an image of environmental degradation and an atmosphere of distrust.

The proposed roads will avoid the proposed UNESCO site. Persons involved with the UNESCO process seem willing to take the application forward with notions of a road but are apprehensive about the Bipole III Line unless there is clear First Nation acceptance. For those who see transmission lines as benign, this position might be difficult to accept. It should be noted, however, that the current road proposal for the northern part of the region does not involve a north/south link. That alignment apparently, at least in part, reflects a concern to maintain the wilderness values of the region. This road would traverse the area (Natural Region 4b Hayes River Upland) with the greatest need and opportunity to preserve ecological integrity on the east side.

5.3 Manitoba Model Forest

The east side is home to Manitoba's only Model Forest, a non-profit organization dedicated to finding new and innovative approaches to sustainable forestry practices in the boreal forest. An east side routing for the Bipole III Line would traverse the Manitoba Model Forest research area but would not affect their designation as a model forest.

5.4 Minnesota Legislation

During the 2007 Minnesota Legislative session an Omnibus and Energy Policy Bill was passed requesting Manitoba Hydro to provide information annually with regard to First Nations that are a signatory to the Northern Flood Agreement.

The Bill reads as follows:

> Sec. 9. Minnesota Statutes 2006, section 216C.052, is amended by adding a subdivision to read:
>
> Subd. 8a. **Manitoba Hydro Information.** By January 1. 2008 and each year thereafter, the task force shall request the Manitoba Hydro-Electric Board to

provide the following information for each community that is a signatory to the Northern Flood Agreement, including South Indian Lake:

(1) median household income and number of residents employed full-time and part-time
(2) the number of outstanding claims filed against Manitoba Hydro by individuals and communities, and the number of claims settled by Manitoba Hydro; and
(3) the amount of shoreline damaged by flooding and erosion, and the amount of shoreline restored and cleaned.

For purposes of this subdivision, "Northern Flood agreement" means the agreement entered into by the Northern flood Committee, Incorporated, the Manitoba Hydro-Electric Board, the province of Manitoba and the government of Canada on December 16, 1977.

This legislation was a result of lobbying by Fresh Energy and Minnesotans for Energy Efficient Economy (ME3). ME3 initiated the Just Energy campaign in December 2001, which focuses on educating consumers about the impacts Manitoba Hydro's large dams are allegedly having on people and the environment.

Fresh Energy claims that Manitoba Hydro is able to sell power to Excel Energy at a low rate because the external environmental and socio-economic costs are not included. This, they claim, hurts Minnesota's own renewable energy development.

Their purpose is to block future sales to Minnesota in order to develop the market for wind energy in that state. They support the development of energy that is locally generated and appear to be using the claims of a Manitoba First Nation to further their interests.

Fresh Energy and ME3 appear to have a strong presence in Minnesota, and will continue to attempt to negatively influence purchases of Manitoba hydro-electric power. A lengthy dispute with First Nations over the selection of a route for the Bipole III Line will likely add 'fuel to the fire' regarding opposition to the purchase of power from Manitoba.

6.0 Scope of Interest of Environmental Organizations

This section considers a number of factors involving local, national and international environmental organisations. Like other aspects of the routing options (other than technical considerations) there is uncertainty.

There is no credible **Theory of Action** to guide decision-making in this area. While having unanimous support from First Nations along either routing option is clearly beneficial, it is far from certain that any course of action will produce a predictable overall result and change the magnitude and nature of potential opposition by environmental organizations to either an eastern or western route. A firm decision and pushing ahead without consensus could produce a range of results. For example:

- It could be found, after the fact, that some of the concerns and issues raised by either side prove to be bogeymen.
- Alternatively, environmental groups could coalesce around this issue and make it into an international *cause celebre*, damaging the reputation of the Crown, causing a local political crisis and threatening energy exports to the United States.
- Since the outcome is unpredictable, it argues for taking extraordinary measures for achieving consensus before moving ahead. At some point, however, the economic price of avoiding conflict might simply be too great and the Corporation and the Province will have to risk a conflict situation. There are significant economic concerns that have to be balanced against uncertain outcomes in the environmental arena.

6.1 Nature of the Debate

The debate can be characterized as being one of technical/economic/public good arguments vs. less quantifiable environmental concepts, concerns and a different public good, as well as impacts on Aboriginal culture and interests. To some First Nation and environmental groups, the transmission line is a symbol of environmental destruction and specifically the loss of something unusual and of great value. While the arguments may not always be completely logical and the "facts" put forward may be inaccurate at times, the opposition is very real and should not be underestimated.

To a certain extent the debate has been sloganized: "Save the Boreal Forest"/protect "Pristine Wilderness Values". These slogans make a strong appeal to emotion, but what does saving the boreal forest mean in practical terms?

There are perceptions that we need at least one place preserved from development – protection for our one last wild place. These are very deeply held opinions. Increasingly, the scientific community is weighing in on the debate, raising ecological integrity as a more measurable and definable objective. More data is becoming available about the boreal forest in terms of its role as the "lungs of the planet" and as a carbon sink, as well as the 'free' services it provides, such as purifying water sources. Nonetheless, the debate will be one of values – caribou vs. economics. This argument cannot be won on the basis of duelling environmental impact reports. Hints from both sides of the debate that disaster will happen if their side does not prevail do not assist in arriving at the best decision. The

debate has to be engaged at the community as well as the provincial and international level.

To date, the debate has largely focused on the east side, and the implications of a west side routing have not been fully discussed. There is much that is unknown about this potential routing, including potential opposition environmental groups.

6.2 Commitments

Commitments have been made to the public, First Nations, local environmental groups and international environmental groups that there will not be a transmission line on the east side of Lake Winnipeg. Specifically, a minister of the provincial government apparently had a meeting with the Natural Resources Defense Council (NRDC) and made a commitment to the NRDC that there would not be a transmission line down the east side of Lake Winnipeg.

The context of these commitments is important, i.e. they were made in the context of apparent unanimous opposition to the line by First Nation communities on the east side. If that position has now changed there may be good reason to re-evaluate government decision-making (e.g. a letter to the editor published in the *Winnipeg Free Press* on July 28, 2007 by the Chief of Berens River indicated a desire for an east side routing).

The discussion has been complicated by public statements committing the government to protection for the east side, a debate in the media, and advocacy for creation of a UNESCO World Heritage Site. The proposed Pimachiowin Aki World Heritage Site has the potential of being used by opponents of the transmission line as a powerful weapon in the debate, regardless of whether actual boundaries of the site would exclude an HVdc transmission line next to the existing 66 kV line. As a proponent of the site, the Province is required to demonstrate stewardship and to offer protection for the natural and cultural characteristics of the site, which the government has promoted as being of "outstanding value to humanity". An east side routing creates the opportunity to attack the Province's commitment to stewardship with the argument being that the government's actions are contrary to the UNESCO Convention and would endanger the potential for inscription.

6.3 The Risk of Creating a Cause Celebre

An east side transmission corridor could develop into a "cause celebre". How would that happen and what is the significance? Does it matter? How can the risks of these events be balanced against the direct cost of the longer and technically inferior west side Bipole III Line?

If an east side route location develops into a confrontation – First Nations and environmental groups vs. Hydro – it will draw in national and likely international environmental groups. This creates a risk to the Province's reputation. Decision-making and licensing processes will become more onerous and lengthy. A cause celebre also potentially creates an economic risk related to export energy markets.

The risk of creating a cause celebre derives in part from the fact that the east side has achieved national and international recognition. This was reinforced by the UNESCO

proposal by way of which Parks Canada has recognized the east side as a place of "outstanding universal value." Being added to Canada's Tentative List for World Heritage Sites is a "prestigious place to be."

The east side has a prominent place on the web sites of major national and international environmental associations and a prestigious environment award was recently made to Sophia Rabliauskas of Poplar River First Nation:

> "Working on behalf of the Poplar River First Nation, Rabliauskas succeeded in securing interim protection for the boreal forest of Manitoba, effectively preventing destructive logging and hydro-power development while the government and international agencies deliberate on the future of the region. The Goldman Prize **amplifies the voices of these grassroots leaders** [emphasis added] and provides them with: **international recognition** [emphasis added] that enhances their credibility and **worldwide visibility** [emphasis added] for the issues they champion."[2]

NRDC has also identified the east side of Manitoba through its BioGems campaign, which prominently features the east side boreal forest.

> "The Natural Resources Defense Council (NRDC) is an environmental action group supported by 1.2 million members and activists. Our mission is to safeguard the earth: its people, its plants and animals, and the natural systems on which all life depends. By fighting in court, working through Congress, and mobilizing millions of people worldwide, NRDC has stopped powerful corporate interests from destroying our clean air and water, public lands and wildlife habitats."[3]

The NRDC has aligned itself with high profile individuals that attract media attention. In the case of the boreal forest, Robert F. Kennedy Jr. has taken an active role in protecting the boreal forests of eastern Manitoba.

The NRDC has been cited in the media as one of the United States most powerful and effective environmental groups. The NRDC web site offers specific commentary on the Manitoba commitment to protect the east side:

> "Until recently the wildest stretch of the forest along the border of Manitoba and Ontario was in danger of losing these nesting grounds to new hydropower development. *But in May 2005, the Manitoba government announced that it will seek alternative routes for proposed hydro transmission lines that would have cut through the forest* [emphasis added]."

If the east side became a high profile issue, it is expected that other international groups will also participate.

---

[2] Web Site (www.goldmanprize.org): The Goldman Environmental Prize
[3] NRDC Web Site: www.savebiogems.org

How would Manitobans react to this? While many Manitobans wish to be perceived as environmentally sensitive, there may be a public backlash against international interveners, particularly Americans, weighing in on what is seen as a local issue.

Could a cause celebre involve more than public tension? Is there a risk to energy exports to the United States? Potentially this could come by way of legislation in U.S. markets where the wind energy and/or coal lobby coupled with environmental groups could manage to successfully block energy imports from Manitoba. The U.S. has a reputation for protective trade actions and recent legislation in Minnesota already obliges the state to consider the environmental effects of electrical generation in Manitoba. The notion of impaired energy exports is highly speculative but is part of the overall consideration in balancing a much more expensive western route against a potential confrontation on the east side.

The potential cause celebre is strengthened by the collaboration of environmental groups with First Nations, and a linking of their joint concerns. Conversely, if all or some First Nations begin to support the Bipole III Line, environmental groups could no longer point to a lack of First Nations support for the east side route as part of their opposition, and it could potentially place them in conflict with First Nations communities, with whom they have often previously partnered.

6.4 Environmental Organizations

A detailed but not exhaustive list of environmental organizations that may have an interest in participating in the debate about routing Bipole III can be found in Appendix II. It is drawn from interveners in the Wuskwatim licensing process and organizations that have identified interest in the boreal forest and/or specifically the east side on their websites. Since the debate to date has focused on the east side, it is not known which, if any, local groups may oppose a west side routing.

6.4.1 Local Environmental Groups

Local environmental groups will actively participate in the licensing process of major projects such as Bipole III Line. They are familiar with the Manitoba environment and can provide useful input by identifying environmental impacts that may have been underestimated or overlooked and suggesting mitigation measures.

Local environmental organizations are generally small and under funded. As such, they have limited ability to influence public policy. Their primary strength is their strong connection to national and international organizations, and their ability to draw these organizations into the debate.

6.4.2 National Environmental Groups

National environmental organizations are much larger than local groups and have substantially more funding. Thus, they have some ability to retain experts and to proactively place advertisements outlining their position in the media.

6.4.3 International Environmental Groups

International environmental organizations tend to be very large, well financed and influential. They operate by stopping projects they consider destructive to the environment. Local and national environmental organizations rely extensively on the media to carry the issue into the public forum as a matter of public interest. The defining distinction between these organization and international organizations is the financial ability of the international organizations to pay for media messaging, to lobby and to litigate. With the resources and experience to involve the courts in a meaningful way, international organizations do not need to rely on political pressure generated by free media coverage to force favourable decisions.

The following table compares local, national and international environmental organizations and outlines their relative strengths.

TABLE 1: LOCAL, NATIONAL, INTERNATIONAL ENVIRONMENTAL ORGANIZATIONS

	Local	**National**	**International**
Structure	Volunteer Small or informal memberships	Local chapters National membership/ less than 25 000 Some paid staff but mostly volunteer at the chapter level Focus on programs	High paid technical staff including in-house legal counsel Well organised fund raising structure Membership ^ 500 000
Financial Resources	none to modest	< $5 M annual budget	> $50 M annual budget
Capabilities	Local newspaper articles/ letter writing Contacts to national and international environmental organizations Present at environmental hearings	Media stories Organize local demonstrations	Litigation High level lobbying Paid media messaging Media savvy with extensive media contacts National member and public mobilization Celebrity spokesperson
Potential Impact	Raise local concern about government/ Hydro environmental policies	National attention Impact guidelines for the environmental licensing process	Legal injunctions Adverse legal judgments International trade threats/ action

The Way Forward

Elements of a go-forward strategy:

- A connection has to be made between the proposed transmission line and the public good. Without public support a decision will never be made for either corridor.
    - This report assumes that a new bipole is essential to improving the reliability of the integrated transmission system and that the public is at significant risk from energy outages due to potential failure of the existing HVdc lines. Contradictory messages in the public forum include the notions of new generation "merchant plants" and economic opportunities associated with the "Manitoba Advantage". Clarity is required as to the rationale for this project.
- An east side route requires near unanimous First Nation approval. There is little public will to act contrary to firm First Nation opposition.
    - Testing First Nation reaction to renewed discussions on an east side corridor will require that tacit approval of the province. This is a sensitive area that will require the province to acknowledge that it is prepared to re-evaluate its position on an east side route on the basis of new information.
- There is an opportunity to turn this project from one where there is reluctant approval to proceed with any corridor to pride in having developed a "best in class" facility.
    - Manitoba Hydro has become arguably a leader in innovation when it comes to community relations and environmental commitments. Rather than proceeding on the basis that a new HVdc line is something really awful that has to be done in spite of effects, the project should be presented as an opportunity to highlight Manitoba skills and commitment to environmental issues.
    - There is a win-win solution that needs to be explored. This holds true for either an east or west side corridor.
    - The focus on innovation, commitment to minimizing biophysical and socio-economic impacts and enhancing aboriginal culture will not likely win over people with deeply held environmental convictions but it will take energy out of a "stop the line" campaign.
- The way forward, for either corridor, must include a strategy to protect the cultural identity of First Nations as well as offering economic development opportunities for them. It's got to be both and cannot be simply a financial pay-off.
    - Protection of culture should be addressed firstly;

- The notion of economic opportunities should come second. It is as complex, however, as protecting and enhancing aboriginal culture:
    - There are few direct community benefits available in either the construction or operation of the line
    - There are rising expectations about the magnitude of cash benefits that will be available through funding arrangements that might come with the line. These expectations will be difficult to meet.

- In either the eastern case or the western case the province should be directly involved in corridor selection. There are provincial interests and responsibilities that are beyond Hydro's mandate.

Appendix I

Terms of Reference
Bipole III Transmission Route Study

Review of Socio-Economic and Environmental Considerations and Potential Roles and Impacts of Environmental Organizations

Manitoba Hydro is in need of a major north-south transmission line in order to enhance the reliability of the existing power system to deliver power generated in northern Manitoba to the southern load centres.

Numerous technical reviews have been undertaken of routing options, including East of Lake Winnipeg, the Interlake and West of Lake Manitoba. These studies have determined technical benefits associated with an East Side routing.

Manitoba Hydro is interested in obtaining additional information with respect to the environmental and community considerations of different routing options. As well as regarding the potential roles and impacts of environmental organizations that play an active role vis a vis hydroelectric transmission in Manitoba.

Accordingly, Manitoba Hydro are interested in contracting consulting services to evaluate:

- The environmental landscape of alternative routes, including an assessment of environmental significance;
- Considerations associated with different routing options, including community preferences, potential community partnerships;
- Considerations associated with the impact of a transmission line on other initiatives, in the area, in particular, the potential UNESCO World Heritage Site designation and related community partnerships;
- The scope of interest of environmental organizations in Manitoba transmission routing, including membership, local interest and support and potential influence;
- Relative risks from an environmental perspective

Appendix II

The following is a list of local, national and international organizations that may be expected to participate in a Bipole III Line licensing process.

Local Organizations

Boreal Forest Network
The Boreal Forest Network identifies itself as an environmental justice organization of environmentalists, indigenous peoples and scientists concerned with the protection and sustainable use of the boreal forest, one of the three great forest systems of the world. Their website states that the boreal is also home to almost a million indigenous people, many of whom retain a strong connection with their cultures and traditions and value their traditional economies.

The Boreal Forest Network is strongly opposed to the eastern route and has published papers expressing a preference for the western route. It is expected that they will be very active in any licensing process for Bipole III Line.

Centre for Indigenous Environmental Resources (CIER)
CIER is a national, First Nation-directed environmental non-profit organization with charitable status and is based in Winnipeg, Manitoba. CIER was founded in 1994 by a small group of First Nation leaders from across Canada who recognized the need for Aboriginal peoples to have the capacity to solve environmental problems affecting their lands and resources. CIER received federal non-profit corporate status in 1995 and became a registered charity in 2000. CIER develops and implements sustainable solutions to proactively address environmental issues affecting First Nations lands and resources.

CIER appeared at the Wuskwatim hearings and can be expected to participate in a Bipole III Line licensing process.

Consumers Association of Canada – MB Chapter/Manitoba Society of Seniors
The Consumers' Association of Canada describes itself as an independent, non-profit, volunteer organization dedicated to educating and informing consumers and to representing the best interests of consumers to all levels of government and to all sectors of society. The Manitoba Society of Seniors represents Manitobans 50 plus by promoting their needs and concerns.

These two organizations are usually represented by common legal counsel and usually provide a common presentation at hearings such as the Wuskwatim licensing process and rate applications before the Public Utilities Board. They focus on both environmental and economic issues.

Manitoba Industrial Power Users Group (MIPUG)
MIPUG represents the large industrial power users in the Province. They have the financial capability to hire experts in various areas of expertise as deemed advisable. While not an environmental organization, MIPUG appeared at the Wuskwatim hearing and can be expected to appear at a Bipole III Line hearing focusing on security of supply and economics. The greater cost of a western route will be of concern to them.

Manitoba Wildlands
Manitoba Wildlands identifies itself as a Manitoba based non-profit environmental organization that continues the protected areas work of WWF Canada and Nature Canada in the province. According to its website, it works with Manitoba communities, industry sectors and other environmental organizations. Fulfillment of public policy to establish protected areas, which represent our lands and waters, is the focus of Manitoba Wildlands. The organization also provides international, national and regional information about climate change, water, energy, species, biodiversity, and forests.

Manitoba Wildlands participated in the Wuskwatim hearing process and can be expected to be participate at future hearings regarding Manitoba Hydro facilities. They currently are working for and providing advice to the Poplar River First Nation.

Provincial Council of Women of Manitoba
The mission of the Provincial Council of Women of Manitoba is to empower women to improve the quality of life for themselves, their families and society. PCWM acts as an advocacy body at the provincial level on behalf of various women's groups and organizations concerning a wide range of issues relating generally to the improvement of social conditions for the community and family.

It is possible that the PCWM could appear at a hearing regarding Bipole III Line approval focusing primarily on social issues.

Resource Conservation Manitoba (RCM)
RCM is a non-profit, non-governmental organization directed by an elected community board. RCM's mission is to promote ecological sustainability through environmental education and to develop alternatives to current practices. Their programs focus on sustainable transportation, waste reduction, climate change, and sustainable living. In addition, RCM's elected community board makes formal presentations on issues such as utility rates, extended producer responsibility, ecological fiscal reform, and urban planning.

RCM promotes applied, ecological sustainability through environmental education and the development of alternatives to current unsustainable practices.

RCM did not participate in the Wuskwatim hearings and may or may not become involved in a Bipole III licencing process.

Time To Respect Earth's Ecosystems (TREE)
TREE describes itself as committed to the advancement of a more sustainable society in which the planet's natural endowments of living and nonliving systems and resources are valued, respected and conserved. Recognizing that this natural legacy is finite and subject to degradation and depletion, TREE promotes eco-efficiency, improving the ratio of social benefits to environmental harms as essential pillars of a sustainable society.

TREE participated in the Wuskwatim hearing and can be expected to participate in future hearings focusing primarily on issues of sustainability, particularly energy conservation, alternatives to northern generation, and the socio-economic consequences of alternatives.

National Organizations

Canadian Boreal Initiative
The Canadian Boreal Initiative (CBI) describes itself as "working with a wide range of conservation organizations, First Nations, industry and other interested parties to link science, policy and conservation activities in Canada's boreal forest." Located in Ottawa, CBI also partners with non-governmental organizations, First Nations and others across the country in on-the-ground boreal conservation work. The Canadian Boreal Initiative is supported financially by the Pew Charitable Trusts.

While CBI is unlikely to participate directly in the Bipole III licensing process, they will be involved through their partners doing on-the-ground conservation work.

Canadian Parks and Wilderness Society (CPAWS)
CPAWS is a national organization with 13 chapters across the country, including a Manitoba chapter. It has a membership of 20,000 and a staff of 50 with an annual budget of almost $5,000,000. One of the organization's primary objectives is protection of the boreal forest. As a signatory to the Boreal Forest Conservation Framework released by the Canadian Boreal Initiative, the goal of CPAWS is to protect at least 50% of Canada's boreal forest in areas off-limits to development.

CPAWS has issued a public warning regarding the proposed transmission of power between Manitoba and Ontario, which would bisect Ontario's northern boreal region. CPAWS urges governments to proceed with caution subject to the following conditions:

- The project must demonstrate that it is better than alternatives
- Routes for the project should proceed through already fragmented landscapes before intact areas are disturbed
- If fragmenting the intact landscape is necessary, then it should proceed only after conservation-based land use planning determines how to protect the region's ecological integrity
- Carbon implications must be fully accounted for
- Aboriginal peoples have constitutionally protected rights that require governments to fully consult and accommodate these rights

CPAWS holds the position that for hydro-electric facilities to be truly "green," they must be located close to the end user to eliminate the impacts of long transmission lines.

Given their focus on the boreal forest at both the national and Manitoba chapter level, CPAWS is likely to choose to participate in the Bipole III Line licensing process.

David Suzuki Foundation
The David Suzuki Foundation is a large environmental foundation funded largely by individual donations and with substantial media presence and experience. Global conservation is one of the Foundation's primary objectives. That prominently includes protecting the boreal forest. They could well participate in the Bipole III Line licensing process.

Nature Canada (formerly Canadian Nature Federation)
Nature Canada is a member-based, non-profit conservation organization. Their network includes 40,000 supporters and more than 350 naturalist organizations across Canada.

Their mission is to protect nature, its diversity, and the processes that sustain it. The focus of Nature Canada is on effecting change on issues of national significance, including bird conservation, wilderness protection, endangered species and national parks.

Nature Canada may well participate in the Bipole III Line licensing process, as it would involve routing through the boreal forest, the nesting grounds of many species of migratory birds.

Sierra Club of Canada
The mission of the Sierra Club of Canada is to develop a diverse, well-trained grassroots network working to protect the integrity of our global ecosystems. The Sierra Club of Canada's mission focuses on five overriding threats:

- loss of animal and plant species;
- deterioration of the planet's oceans and atmosphere;
- the ever-growing presence of toxic chemicals in all living things;
- destruction of our remaining wilderness; and
- spiralling population growth and over consumption.

While not participating in the Wuskwatim process, given their dedication to maintaining the ecological integrity of the remaining wilderness, the Sierra Club could choose to participate in the Bipole III licencing process.

International Organizations

Natural Resources Defense Council
NRDC is a large, vocal and influential organization with 1.2 million members and has partnered previously with Canadian and Manitoban environmental organizations. Their

mission is to safeguard the earth – its people, plants and animals – and the natural systems on which all life depends. The NRDC often aligns itself with high profile individuals that attract media attention. In the case of the boreal forest, Robert F. Kennedy Jr. has taken an active role in protecting the forest of eastern Manitoba.

The New York Times and The Wall Street Journal, among others, have identified NRDC as one of America's most powerful and effective environmental groups. By fighting in court, working through Government, and mobilizing millions of people worldwide, NRDC has stopped powerful corporate interests from implementing projects that the NRDC believed threatened air and water quality, public lands and wildlife habitats.

The NRDC BioGems campaign [which prominently includes the east side boreal forest] empowers citizens to take effective online action in defence of our planet's most endangered wild places"[4]

The NRDC website offers specific commentary on the Manitoba commitment to protect the east side as follows:

> "Until recently the wildest stretch of the forest along the border of Manitoba and Ontario was in danger of losing these nesting grounds to new hydropower development. **But in May 2005, the Manitoba government announced that it will seek alternative routes for proposed hydro transmission lines that would have cut through the forest** [emphasis added]. Yet until the government grants permanent protection to the region, the threat of transmission lines, roads, mining and logging remains. Indeed, Manitoba Hydro's president has said that the recent decision concerning transmission lines does not mean that the company is ruling out development in the region, only that it is looking at other options."

The NRDC is a vocal supporter of the proposed United Nations World Heritage Site and is working with the Poplar River First Nation to assist them in achieving their goals.

NRDC is almost certain to participate in the licensing of Bipole III Line, particularly if an east side route is selected. Given their history and resources available to them that participation could include both intervention at a hearing and legal action in an attempt to prevent or delayconstruction. It is unknown, but possible that they could oppose a west side routing as well.

In addition to NRDC, there may be other American or European organizations that national and local environmental groups could align themselves with, if they feel international intervention would assist them in achieving their objectives.

What We Heard

Berens River First Nation - NACC, MMF

- We would like to see the agendas of the advisory groups and East Round Table meetings of upcoming events and presentations, especially with respect to the areas of concern. We want to be notified and informed. We want the minutes of the meetings to be circulated to the community.

- Protected areas need to be revisited. The Poplar River Protected Area includes some lands, which are part of Berens River traditional territory. Because Berens River was never consulted on this, its territory should be removed from the protected area.

- We as a community are concerned with Lake Winnipeg water quality. The algae, smell and water levels are all concerns for us.

- River quality is threatened by activities that are still occurring in Ontario. What happens in Ontario will ultimately affect the Watershed here in Manitoba. We need to know what is happening in Ontario.

- We need to know what Manitoba Hydro has in store for us. We cannot create an effective community plan without knowing where the hydro-line is going to be placed.

- Hydro maintains its transmission lines by using chemicals to kill plants. Imagine what that will do to our trees and animals. We would like to know what type of chemical they will be using and have any existing studies forwarded to us.

- Hydro lines and roads will destroy our traditional way of life. How are the young people going to survive?

- Are they going to put the lines in the north, but distribute the electricity to the south?

- The cost of hydro in the north shows we are not getting our share of the resources sold.

- We will not be able to tap into the hydro lines.

- Are there any studies of the effects of transmission lines on humans and the environment? If so, we would like to see them.

- The literature provided does not address how this process might affect treaty rights. Should speak

- more about constitutional treaty rights, protected areas.

- How will this plan affect outstanding Treaty Land Entitlements? What has been happening with respect to the TLE process? How much Crown Land should we be granted?

- We do not condemn the ESPI process; we just do not have a position in place as yet.

- There is no protocol to consult with First Nations.

- Are there any studies being done on the effects of dams and the associated lake quality and lake level changes? These factors affect our livelihoods. What about studies on the rivers, river levels and river water quality? Also we need to know the effects of control structures on our water systems. Our water has gone down 4 feet and it is affecting our fishermen.

- Hydro should consult if they have a plan in place.

- Do you come out and help us with an action plan to stop it development if we do not want a hydro line here?

- If the Trappers Association make a presentation, will you hear it?

- Trapline boundaries should be the boundaries for planning.

- An all-weather road would effect Treaty #5. Right now there is no money coming this way for road development and maintenance of existing network. Available dollars are not reaching into the northern areas.

- If a road goes through we need to get our lands back for ecotourism. We are not getting our share.

- We have 3rd world roads here.

- We need economic development; government is stalling development.

- Safety on Lake Winnipeg is an issue as people have died crossing the lake.

- Do not want more consultations – takes too long.

- Need to make recommendations immediately - be preventive.

- Berens River recommended the ESRT advise the government that it would like to see Rupertsland Constituency cut in half.

- Our children's education service is below provincial teaching standards.

- Our business is presently going to Pine Dock, then Gimli and Selkirk. They value our business.

Bissett – NACC

- Include all East Side communities in one meeting.

- Caribou habitat protection important.

- Economic development and environmental protection processes need to work together in a balanced way.

- Wanipigow River Protected Area has allowed mature trees to fall into River and is destroying the river quality. If trees are allowed to be cut, the economic gain is met and the river is managed. Protectionism measures applied by Parks Manitoba may do more harm than good to the river and river areas.

- Land allocation methods for specific purposes by the province are not an acceptable practice.

- Why should we be interested in mining activity when the broad area plan is going to prevent such?

- Land regulations contravene Mining Act.

- Bissett is a mining town and residents believe there is mining potential for the area.

- Mining is the lifeblood of Bissett. Exploration needs to continue.

- Government bureaucracy is causing problems with respect to mining activity. To keep a claim valid, one has to show some kind of development or be in violation of the Mining Act and loose the claim. In many cases, people have been refused permits to travel forestry roads to their claim.

- Government must allow claims in the area. The government supports the community, however not in the way the community wants them to.

- Nopiming and Atikaki Parks restrict mining development.

- First Nation Communities are getting all the traplines and pulp potential. They have a federal voice, larger than ours.

- It appears that the message that Manitoba is not open for business is getting outside to the industry. American mining investors are going elsewhere when they learn the Hayes River will be set aside as a heritage river. How will this affect future mining exploration activity?

- Residents want to benefit from mining and want to stop restrictions imposed by park regulations and legislation.

- Nopiming Park was originally a multi-use park. Now you cannot consider it a multipurpose park due to restrictions. Recreation activities and development are causing problems.

- The province should sell Crown lands for development by local land developers. I am specifically referring to a piece of land, which is not pristine, but on which other activities used to take place but no longer do. All that remains now is a bunch of run down buildings. To allow local residents to make use of such lands is sustainable development in my opinion.

- Trust issues are non-existent with government initiatives (i.e. lodges and cabin development). Government did not follow the recommendations of the community in the past, why should we trust them now?

- Access to existing education and training programs needed to help secure future for the community.

- Tourism does not benefit Bissett. The road through Nopiming bypasses Bissett.

- Government has negatively impacted Caribou when they developed the road through Nopiming. Road development has affected the Owl Lake Caribou herd (Black Lake calving grounds).

- A Canadian Heritage River designation impedes mining exploration.

- Who is going to replace the vacated mining representative position on the ESRT.

- The Prospectors and Developers Association should be represented on the East Side Advisory Committee.

- Pave road from Manigotagan and finish straightening road to Bissett.

- What is happening with the Cat Lake to Red Lake Road?
- Jobs are needed in Bissett. Some have to leave by spring for work.

Bloodvein First Nation

- Safety is a concern.
- Can we access information on the Internet?
- We have to fight for our land. I see that in process for East Side area.
- Community is all for economic development.
- The planning process should be with First Nation's people directly because it impacts First Nations directly.
- We need to know who the stakeholders are and what their plans are in all of this.
- We need to do more as a community to protect treaty lands.
- We need to develop our own plan.
- Elders and youth must be involved to voice concerns in our community.
- We need protected area for our traditional lands.
- We want total control of the management of forestry and mining here.
- We do not think the people on the ESRT represent us. I strongly recommend considering one of the communities like Poplar River or Hollow Water to represent us. They live on the East Side.
- What are the hidden agendas on economic development?
- If we tell you what we want, what guarantees are there that we will get what we want?
- We are working on several proposals that involve our traditional land and we are asking for total control.

- Does the area that Tembec is planning to cut involve Bloodvein, or is it part of the planning area? We want to do the cutting ourselves, not Tembec. We are in a process of looking at deals like the one Pikangikum has with their Whitefeather Initiative and co-management model.

- Are they going to hurt the rivers if the road comes?

- How much space will the Native people have?

- We are preparing for the all weather road by training our people how to use the heavy equipment needed too build.

- We are not a stand-still community; we are looking forward to young people gaining employment.

- Most often people out there come here to tell us what's best for us, but we live here, not them. They come in and take over and say it is in our best interest. They have not walked in our moccasins so to speak. The time frame is too long, it take too much time and in the mean time the government have their way to control it till they get what they want.

Bunibonibee Cree Nation

- We need to do something for our young people. We need to look in the long term.

- We need to plan what we are doing in an orderly fashion.

- Concerned that corporations come in and ruin a First Nation community and the First Nation doesn't get anything from it. For example, First Nations currently do not benefit from harvest of timber resources. Communities must benefit if there is development, not the individual but the whole community.

- An all-weather road would cut through many traplines and trappers would not get anything from it.

- Must plan right with traditional knowledge. Must carefully consider how development takes place. Have to consider how we are part of the land.

- Trapline regulations pretty strict - size of a cabin etc, cost of permits to build etc. Regulations quite an issue here. Too many regulations and why are there regulations on our land?

- Not happy with 100-foot set back from water bodies.

- A 200' x 200' area for trapper's cabins is not realistic. There should be more flexibility for types of traps to be used.

- Government regulations prohibit using trapline/cabins for rental purposes. Regulations should support trappers.

- One of the questions I have, one thing promised to us, First Nations have access to live off the land so how come there are regulations e.g. hunting? After all is done what is going to become of the process and plan?

- Trapping is an issue of sharing resources again. This should be part of the issue for the Round Table – so we can maintain our lifestyle. Trapping and its regulations need to be addressed in the plan

- Gain must be distributed to the community as a whole, not to individuals.

- Teach youth how to grow trees and about renewing the forest and fishery resource. Learn how to develop and operate businesses to create a good living for residents.

- Happy to see things moving ahead through the process.

- Must share resources and FN must benefit from them.

- Thankful that people are focusing on our concerns. Often people call on us for work and we do most of the hard work. In the end however, we are thrown aside. It is good to have people who are concerned about us.

- Why can someone own our traditional land? I worked for long time in fisheries and for 5 months could make a living fishing. Prices of fish not viable now. We need a subsidy program for fishing.

- Concerns were expressed about a burial ground threatened by development. There are 3 graves and it should be marked on a map.

- People who come up here like mining companies, need to bring more money into the community and share the wealth.

- Land use is very important.

- Timber is the most important resource to retain for the community. Mining activity is expensive to pursue.

- Trapping regulations not meeting our needs and don’t make sense.

- More meetings are needed.

- Were there studies done for resource assessments, land analysis, community development, economic development and traditional history?

- Hydro promised money ($8000.00 per trapper) to trappers who were hit by the development but they did not follow through. I get the same impression about the round table.

- Concerns about hunting. When an area becomes developed there is a boundary placed around it and you can't hunt there. Can we go hunting and hunt where we want? The plan has to allow us to be able to go in and hunt where we want, even if the area is developed.

- Concerns about third parties coming in and using our traditional areas and then we have a problem negotiating with them on land use. Negotiating can take a very long time.

- We are encouraged by the chief and council having this evening.

- Interesting idea – teaching our young people to grow trees so they can re-grow what is taken out, same with fish – need to target the young people.

- An all-weather road has all sorts of advantages including training for heavy equipment operators.

- Oxford Lake was closed for fishing due to high transportation costs to market. We were throwing away our catch because there was no transportation to market. It is a waste of time, energy and fish. Pickerel is the only viable species now and it is three times the work. Need to build a road to transport fish out. Advantage of road – transportation the fish, shopping trip, etc, - all weather road is the answer. On the other side more influences coming in and not all good influences. We need to be aware of that.

- Important that FN gets the first chance to get employment.

- There was mention of stakeholders. Northern Stores, MTS, MB Hydro are stakeholders. Are they trying to maximize benefits for the communities – what are they doing for the communities?

- If a trapper looses a cabin in a fire is there a way that he can be reimbursed for it?

- This information should go to the schools for study and response.

- Need to look at funding for informing the community of the process.

- It is important to get a community person hired soon because election is coming in November.

Garden Hill First Nation – MMF

- Youth are not aware of the Treaties, their cultural traditions, the old way of life and survival on the land. Government should provide funding to train youth to learn about Aboriginal tradition and culture.

- Loss of traditional way of life and children being taught to follow dominant way of life.

- Fish are being depleted from the lakes and information is not being shared on fish management strategies, if any are planned or exist.

- Health is a major issue, particularly diabetes. Government should work more closely with northern communities in the area to address health concerns.

- High price of goods and services makes it difficult if not impossible to purchase healthy foods such as fresh fruit and vegetables.

- Government needs to respect hunting and other rights, if parks, which include traditional hunting areas, are deemed to be set aside as protected areas.

- In the past, the province did not consult with trappers regarding government actions impacting on traditional trapping/hunting grounds.

- Concern raised because of the lack of community members at the meeting. Another community meeting recommended allowing for more involvement from the rest of the community.

- Do not talk about a hydro line before a commitment to an all-weather road as the community cannot continue to be at an economic disadvantage due to an absence of all-weather road access.

- We see the pros and cons of roads to communities. The social impact has to be addressed when we see a road coming into Garden Hill. A lot of elders have expressed they do not want a road because of the destruction of life from alcohol and drugs.

- It is critical to understand and be aware of the many sites of historical and cultural significance before proceeding with roads or hydro.

- We have heard from Hydro before. They came to us, but did not give us enough time to respond. You have to give us more time. There is a lack of information provided by Hydro for the community to adequately respond or participate. We do not want a poor consultation process. We do not want this to be like the Hydro process.

- Development has to be shared with the people of Garden Hill.

- There is a need for more information on the ESPI process.

- Concern about mining at Twin Lake and if the community could get government to involve them in meaningful consultation before permitting mining in their traditional territory.

- Possibility of constructing a larger airport on a cost shared basis.

- Government can promise anything but not deliver because in the end government will do what they want.

- There is a lack of trust between communities and government.

- There is concern about a proposed road which can be built from North of God's Narrows connecting Northern Ontario.

- Pros' and cons of an all weather road discussed - would lower the price of goods and transportation.

- Communities will need an analysis on what impacts an all-weather road will have on them. Elders have expressed some negative thoughts a road would bring to the community, such as alcohol, drugs and gang related problems. Government in the end will go the cheapest route.

- Manitoba Hydro held a consultation process on its hydro Bipole lll transmission line but shared only what they wanted and expected the community to learn everything on that day. Time will be needed for the community to absorb the information and get it out to all the members in order to fully participate in this process.

- A suggestion was made to include all East Side communities in one meeting.

- Maps don't show territorial lines due to lack of funding and shortage of technical people. Need for technical people to assist the community in this process.

- Lack of telephone lines is a real problem. People are not able to use the phone between 5:00 pm to midnight. This causes further problems regarding emergencies.

- If the community does not become involved in the process, they will be losing an excellent opportunity to participate in planning and development activities.

- Community is concerned of the short timeline.

- Where is the funding coming from.

- What are the next steps to this process?

- Economic development and environmental protection processes need to work together in a balanced way.

- We are not fully aware of the Treaty anymore. The younger generations have not been educated about the Treaty and the significance of our Treaty at the time it was signed.

- Years ago the white man put up a sawmill here and took all the best trees, we did not care for sustaining them then. Then he came for the fish. There are still trees and fish, but the best are now gone.

- The younger generation is not learning the traditional ways. Our youth only correspond with what they learn from a white dominant society. Our sickness is worse today (diabetes) because we have lost some of our traditional ways. If we dropped a young person off in the bush today he would not know how to survive, to make a fire, to make a bed. We need funding to retain our traditional ways and livelihood. We have to retain our traditional ways to heal ourselves.

- Prices are too high to afford the goods that we once could afford.

- Years ago the Island Lake Tribal Council talked about co-management of resources.

- You must be aware that there is a park being proposed in the area of the Wasagamack First Nation. The local trappers do not want this. There also is mining at Twin Lake. The trappers at Red Sucker Lake did not agree to this. They also are planning a road. Can the people at Red Sucker stop this legally. The people there have not been consulted. Is this the way it should be? Does the province have a responsibility to consult?

- There was a process with Treaty land selections where we identified our traditional lands, and sacred and cultural spots. The round table does not

have this information. This must be integrated, but we never had the money like you have to record all of this and create fancy maps. We need money to identify and map where the important sites and lands are. We are short of technical skills. Your community coordinators cannot do this alone.

- The community must have a general Board meeting to discuss this East Side plan.

- In 1972 a report by the community on all-weather roads was sent to the government.

- The people of Garden Hill need to hear from other communities. Why not get a few people from the 16 communities to get together to see if there are shared values. We need to understand one another. Recommend two or three from each community.

- In the past, government projects (i.e. MTS) have not included extra funding to First Nations. You have a few people, but need more people involved in the planning process. You have to understand another reality. There is no money here, there are no jobs. Up north we have vast resources, but the money and the jobs benefit the south (Winnipeg).

- Do you know how hard it is to get a telephone line between Garden Hill and Winnipeg from 5-11 at night because all the lines are jammed (internet users). Think about this from a medical perspective. There are ten thousand people up here.

- There are two TV stations here. You have to broadcast on both to touch all the people. It was only broadcast on one so you have missed many of our people.

- We want an all-weather road because we see things will be cheaper for us to but, but we are also concerned for our youth because this road will make it easier to bring in booze and drugs.

God's Lake First Nation - NACC

- The East Side Planning Initiative is entirely new to us and more information is needed. Who are the 22 people on the round table? Where are they from? How were they appointed? Is there a timeline for this process?

- Our rights are treaty driven. How can the process affirm treat rights when the Natural Resources Transfer Agreement is a contradiction to them? We have to educate mainstream society about our treaties.

- Government has a hidden agenda. When we ask the province to address our needs they say that they are not responsible. First Nation people should not be considered a federal responsibility.

- We have to consider the human factor in this process. Our regional needs have to be considered; health and education. For example, we need a regional hospital that is central to communities such as in God's Lake narrows.

- We have concerns about the environment and have been fighting with the province about cleaning up the old transmission line to an old mine on Elk Island. There is about 50 miles of wire just left on site. The government tells me they have no funds so how can they make this process work if they can't even undertake one little mine clean-up project. I don't know who else to talk to.

- When traditional areas are referred to by governments they think it is a trapline. Our ancestors come from Ontario and our traditional area is also in Ontario. It is not only ours but belongs to other First Nations.

- We are not opposed to an all-weather road as it would help alleviate the high cost-of-living for First Nation people. We would like to see road access to communities before hydro lines go through. What are other communities saying about this?

- Governments don't want to listen and probably won't listen to this plan either. For example, cottagers – governments would soon listen to them.

- We would like our road and human issues dealt with before Hydro.

- I can't see that there is anything wrong with an all-weather road. We would have benefits such as forestry and tourism.

- The community would want an east-west road connection. Use the winter road alignment so as not to disturb any more landscape.

- The timber company in The Pas has a license for cutting in our area.

- Governments do not consult with us about mining and claims until after the fact.

- We have to have training for our youth to prepare them for future opportunities such as resource development that may result from the East Side plan.

- Community contact positions should be full-time.

- Provincial government is holding up our treaty land entitlement – they should move a little faster.

Hollow Water First Nation

- Does the government or industry consult with the people or just Chief & Council?

- Do the Chief and Council have to be present for there to be consultation?

- What would happen if the recommendations conflict with the community plans?

- Does anyone in the round table membership oppose development?

- Who makes the final decision on the recommendations?

- What is community participation?

- There is a need to have something in place besides just community forum and working group. There is a need to go house to house.

- Is this consultation or an information session?

- Information should be provided beforehand to facilitate preparation and discussion. Provide information by all available means.

- Is there already a plan?

- Development already exists. What is left to be decided?

- We need a map to indicate traditional uses at Hollow Water and include Black Island.

- Hollow Water could provide a land use plan to round table.

- How can the province come in and provide permits on the Hollow Water River for cottages?

- Is Black Island included in the planning area?

- When did this process start? Was there nothing before that? Shouldn't the community have been involved in 1999? Why did it take so long to get to the communities? This should have begun with the communities.

- What about traditional territories beyond treaty (reserve) lands?

- Traditional lands are being taken away. All this is predetermined. There is a lot of skepticism about this process.

- What type of agreements can the community get from this process?

- Will government put community interests before Hydro?

- Will there be funding and technical support for community participation at the same level as the RT?

- Will there be a set amount of funding?

- What is the completion date?

- A presentation was made on the need to create a local advisory board. It was emphasized that this is an opportunity that the community must seize now because if it does nothing it would lose an opportunity. We want to be involved in benefits, partner and training for anything happening in our region. We will block any developments done without consultation.

- Traditional areas need to be extended and users need to have a say on what happens there. It all comes down to the land you control. Give us the control to see how serious you are.

- When will round table be back?

- There should be regular contact between the Community and the Round Table.

Island Lake – NACC

- How long after the deadline will the plan actually take place?

- Once the recommendations have been made, when will they be given to government?

- Who is pushing for the all weather road? Government or communities?

- Government needs to hear from communities other than Island Lake in regards to an all weather road.

- Local people need to be hired if an all-weather road is to be built.

- Forestry is not offering much employment because of changing modern technology.

- Is there any one community that can stop the process? There may not be consensus at the end of this process because different groups have different interests and views.

- Will there be a possibility to meet as a community to discuss this process to include all members.

Little Black River First Nation

- Timber is being cut within our trap lines without our input.

- The ESPI ties in with some of our community initiatives.

- The maps on the wall need to be blank so that we can identify what we want to protect as ours.

- Economic benefit and jobs are not going back to local communities.

- Expansion at Nopiming will mean that pollution will come down through our river system.

- The chief and council should be here, as we need to have direction and input from our leadership.

- Any additional travel going north will create additional opportunities for us such as a gas bar for example. A gas bar location on highway #304 might be accomplished through Little Black River reserve land being “swapped”.

- Let’s put our minds together to make our reserve a better place. We have people come to our community, let’s work together with them to plan for our community.

- We will be working to develop ideas and plans and will invite the Round Table back then.

- We need economic development, tourist development; there are lots of alcohol problems.

- We have visions of ecotourism and general tourism development.

- We need to create employment and learn how to use resources. The Round Table is here to help us, we have a small reserve and there have been too many changes of leadership. Let's work together.

- Relations must improve, not just with government but people in general. We do not want to be in a position where we have to beg for our own future. Give us our resources back.

- Billions have been spent on gun control. Money could have been better spent on assistance.

- Our infrastructure needs to be upgraded. We have a beach but lack the funding to improve the road to it. We need gravel and crushed rock for the road.

- If there is forestry development we want to do it. We disagree with the Forest Management License.

- One time wild rice was open for use by anyone but harvesting was taken away from us. Today we need a permit to harvest. We want it back and be able to share with everyone. We want to get back to that way of life. We were here before the boundaries.

- Cottage developments and expansions are occurring. Water treatment plants etc. are issues that are happening on our traditional lands and we are not being informed. We need to be made aware of these developments and our concerns listened too.

- We are scared of partnerships that are formed without the First Nations Council.

- Lets do the planning so we can help our community develop and prosper.

- We are a small community with a lack of support. Changes in leadership lead to minimal positive activity/development. We need to develop our plan to aid our community. We need to get as much from our resources as we can.

- Our land use will supercede any other plans.

- Our trapline is smaller than others in the area and should be made larger. Our population has grown.

- We have concerns with hydro and Bipole III.

- We have concerns with sustainable development. What happened to our buffalo?

- We are hindered in what we can do in our territory because of our circumstances.

- I am glad that governments seek knowledge from our scientists (Elders). Does the government already have a plan? Everything we need is contained in Treaty # 5. Why do you have to come back for reaffirmation?

- Why are there no muskrats and fish anymore? Is it because of hydro?

- Non-Aboriginal people have to work with us; relations between us have to improve.

- Maybe we don't need your help; we just need the resources you took from us.

- When is the road into the community of Loon Straits going to be improved?

- Little Black River is very interested in cottage development in the area and we should have exclusive rights to such.

Little Grand Rapids First Nation

- How do we ensure outsiders don't come in and over exploit the resources?

- How can the community stop lodges from taking in hundreds of fish?

- Commercial fishing is being opposed by local lodge owners and therefore sport fishing is the only game in the area.

- Water quality is becoming an issue as the water color is changing and affecting fish quality.

- There was mention of the world heritage site being proposed by three First Nations in the area. What will happen to the committee formed for an accord with Pikangikum, Pauingassi, Poplar and Bloodvein to address the issue of sustaining the environment? Will it be disbanded because of the round table and this process? It is recommended that the committee be included in this process.

- There has been vandalism of trap lines. There is no compensation with respect to loss of revenue by local trappers.

- The First Nation needs employment and has identified employment opportunities with Manitoba Conservation as a part solution to local unemployment issues.

- Need to improve relations and communications with Manitoba Conservation, particularly with the NRO's.

- It is a historical moment that the government is sharing information with First Nations people.

- First Nation identified future resource sharing as a means of financing resource management.

- Government hasn't shared much so what is being planned?

- Is government stopping all development on the east side? Will the winter road be built this year?

- There are no recycling opportunities in the community and as a result, landfill sites are pressured to take recyclable materials thereby using necessary space.

- Atikaki Park closed all doors and no economic development opportunities.

- Cottage and lodge developments are a concern. It appears only white outsiders are approved for lodge and other licenses.

- Trappers indicate that wildlife is moving away from traditional spawning and calving areas.

- The community would like co-management opportunities.

- There is a need for their own conservation officers to police their own community.

- Non-Aboriginals will force us out of our own lands.

- People want to maintain traditional lifestyles.

- Lodge owners are using airplanes to hunt.

- Hunting only for sport.

- Community would like another set of maps.

Little Grand Rapids NACC

- If the forests are not cut and used it will burn and no one will benefit.
- Winter roads are built too late in the season. There is a need to ensure the winter road is built earlier by the band. There is lack of capacity and experience for neighboring communities to do the job they need to do.
- Have more RCMP/policing for the surrounding communities.
- There are child welfare issues in the communities.
- What is government's strategy to deal with alcoholism and rampant drug abuse by adults and youth? This is the future of the communities and more priority should be given on these life and death issues.

Manigotagan – NACC, MMF

- There are trust issues between community members and government in general. The community finds it difficult to trust the objectives of the initiative and whether or not their suggestions/comments will be taken into consideration when it is time to make decisions.
- An elder from each community should sit on the round table to represent communities and present traditional knowledge on resources and medicines. Elders should attend all meetings.
- Everything should be recorded at these meetings.
- A community radio station could broadcast these meetings.
- Decisions will be difficult given all the competing issues.
- Money should be spent on existing roads before a new one is planned for the east side.
- Local people must benefit from resource use activities.
- The community requires jobs and road improvement projects could provide them.

- Whenever industry moves into the area, people from outside the community benefit more than local people.

- There is a lot of mistrust due to past actions of government. For example, at Wanipigow, cottage owners erected a water control structure drastically reducing the flow of water downstream. This is the source of drinking water for the Hollow Water First Nation.

- It is unrealistic to expect communities to develop positions by June 2004. This date makes the process seem like it is being fast-tracked. Communities need time and resources (money, facilitators, etc.) to identify issues and formulate positions on them.

- The Manigotagan River Park Reserve is being pushed on the people. The community of Manigotagan is planning to expand their boundary up the Manigotagan River to the second falls. Because our community is situated on the river, we would like to continue our community on the river. The park reserve is willing to start at the second falls but once the BI-Pole lll line comes down, will they take the land back from the community for this line? This is something that the community does not want to see happen.

- A person can get an outfitter license but no moose or deer tags. The resource allocation process needs to be reviewed.

- How can the City of Winnipeg dump raw sewage that affects Lake Winnipeg and not be held responsible? Fisheries are affected by water quality in the lake. Algae blooms are increasing and affecting fishers' livelihood.

- Manigotagan will share its community plan with the round table when it is ready.

- Manigotagan want more training and education opportunities in the community.

- Manigotagan does not want the Manitoba Hydro BI- Pole line running trough their community.

Manto Sipi Cree Nation

- A concern was raised that cyanide from a mine on Elk Island was polluting a river that runs into God's Lake, and whether or not it could be stopped before it was too late. The water quality should be checked.

- An all-weather road is important; it would be good for groceries. Concerns raised around all-weather access to the community included a negative impact on the lodge, on young people (access to drugs) and possible abuse of traditional areas. Highway would have to be kept clean by R.C.M.P. It is not going to be easy.

- Any routing of an all-weather road should connect God's River with Thompson.

- Manto Sipi Cree Nation needs early fire notification and professional fire fighters.

Matheson Island – Loon Straits, Princess Harbour – NACC

- At what stage is Manitoba Hydro at in getting their line in?

- Can the north-south hydro line be done in collaboration with the winter roads, ie. make 1 instead of 2 corridors?

- Why not put the roads and lines together so they do not have to use so much forest?

- Is there an issue with stopping the road in the East Side?

- I can feel the effects of the damage that Hydro has done, the water levels are low.

- It would be a blessing to have a road for those communities.

- Who is to tell us how to make these decisions and who will help us develop a plan?

- There will be anglers, hunters and trappers up here and they will use up the lands too quickly.

- Loon Straits is forgotten people here, in what way can we benefit from outsiders?

- Jobs and economic development are important.

- What advantages does the west side have when the East Side opens up?

- What are other communities saying about their issues? They might have said things we won't think about and vice-versa.

- Why does Manitoba Hydro get to say “no” to the road?
- They should take the road if they want their line to go through it?
- Make them pay for the road too, instead of a fee.
- There has been destruction from Hydro in the past with little compensation.
- Is there compensation for impacting trapline areas of First Nations if hydro lines go through?

Norway House Cree Nation

- Only a small part of original Manitoba left; it is fearful what is happening.
- How can we make our living here in a deteriorating environment?
- How can we protect our mother earth because this land is all ripped up?
- Norway House was a happy place but not anymore.
- We are beginning to return to traditional medicine.
- Fish movement in and out of the land is important
- What are the government’s plans regarding the development of the East Side?
- The Norway House Cree Nation is not accountable to the Government of Manitoba and an MOU should be in place before we participate in any planning process dealing with resource management.
- The local trappers association wants to know what will happen to the trap lines when development occurs.
- There is high unemployment in our communities, because when any development opportunities arise, proponents bring their own people to work on local projects. We have a lot of traditional people here that are qualified to work.
- We want government to consult trappers about their plans because we want to keep the land in its original state.

- Norway House considers itself a sovereign nation and the fact that the province established a First Nation Council does not mean it represents Norway House First Nation. We consider this a provincial entity.

- Land planning is important to the trappers. The trappers believe they are losing access to traditional trapping areas.

- Fur market prices are low and trapping operations are more expensive today than in the past.

- The Norway House First Nation members have a hard time locating maps for use in trapping.

- There is mining activity in the Red Sucker Lake vicinity, however, we believe this to be Norway House traditional territory.

- Since the construction of the highways, the three types of Caribou who used to be here, no longer inhabit this area.

Norway House NACC

- Information that was to be provided to communities is not being received.

- Information is not going to the community in a timely fashion.

- What is the plan? Government must have a plan in place already.

- Are any communities suggesting leaving some areas as they are?

- Is this process a spin off from the Manitoba round table? No this process is the East Side Planning Initiative and separate from the Manitoba round table.

- Does this process overlap the other round table? Yes everything overlaps.

- Request for a list of the round table and First Nations Council membership list.

- How many people attended the Norway House Cree Nation community visit?

- Concern about mining.

- Should be able to revisit the plan and have a renewal within 5 years and have the ability to revisit because changes will continue to change in the area.

- Treaty Rights must be honoured and accessibility to the lands be available for First Nations.

- Change in the water, it's dirtier with more algae.

- Swampland has an ecological process and function and is not to be viewed as wasteland.

- Aware that progress can't be stopped, it will happen.

- Each new venture should be step by step and ensure to plan stage by stage and not everything coming at once.

- Norway House NACC is currently in the process of creating a community plan. Northern Affairs has been dealing with Northern Flood issues and this has pushed their planning back.

- Concern that once the road is built people will follow with their developments. Outside influences coming into the community could be a concern.

- Community involvement needs to be done before any decisions can be made.

- Current road into the community is in terrible condition and needs repair.

- Tourism would be a plus for the community.

- Is there any info that shows possible routes for an all weather road?

- Individual councilors are building cottages and are pushing for a road.

- Cost of food and supplies higher in some communities.

- Government won't build a road unless it is for there own needs. It won't be built because the community wants it. It will be built because of the resources the government wants and needs.

- Economic development over the next 10-15 years is a major priority for the community.

- Development of a fish processing planting is currently being discussed. Fish is currently being sent to Freshwater Fish Marketing Board.

- Need to develop eco-tourism.

- Fishing Lake, cabins and opportunities not available to everyone in the community.

- Community is not made aware of activities from the resource board. They have recently been provided a spot on the board.

- Growing cranberries could be a viable opportunity for the area.

- Each community has to be consulted and they decide what should be done along the east side.

- Have to ensure it is a process that is revisited and changed as needed.

- Radio stations can be used as a means of getting the information out to the community.

- Trappers and elders communicate in Cree so there is a need to make the information available in Cree.

- Hydro development along the east side is a concern for the community.

Pauingassi First Nation

- When people are given permits to trap in the Pauingassi traditional area, the First Nation wants to be consulted so that the First Nation members can be apprised of who has been given permits and develop working relations with permitees.

- Wild rice harvesting is an opportunity the First Nation can develop and maintain.

- The construction and maintenance of a local airport would bring much-needed jobs in the area as well as bring the costs of goods and services down to acceptable levels. Currently, the price of a four-litre milk is $13.99 in Pauingassi, which is four times the price of milk in the south. Alcohol, however, is the same price.

- The construction of a local airport would also improve medi-vac programs for those individuals who require medical emergency assistance.

- The First Nation has indicated our priorities should be reviewed to accommodate our young people who require milk to develop their minds and bodies.

- Hydro rates are a serious concern to local residents. The current rate for an average sized bungalow is approximately $200.00 per month while rates in the south for a similar size home is approximately $75.00.

- While Manitoba Hydro has introduced an insulation program to help defray hydro costs, communication between Hydro and the First Nation administration has not been the best. The First Nation wants to see rates lowered through any means.

- Unemployment rates range in the 80-90 percent. A commercial fishery in the area would improve job creation, however, transporting fish would remain a high cost to the industry.

- There is opposition to outpost hunting in the area. This opportunity is done without any consultation with the local people.

- The First Nation wants to work closer with the Natural Resource Officers who frequent the area. They want their people hired to work alongside the NRO's.

- The province has sided with local lodge owners and favour these owners when developing pollicies on lodges in the north. People who live in the north should be given priority when policies are developed.

- The First Nation requested a land status report on their existing reserve lands. They indicated a misunderstanding exists between the parent First Nation and Pauingassi.

- The First Nation will advise the ESPI if they require a community meeting.

Pine Dock

- Why is Pine Dock included in the discussions of the East Side Planning exercise?

- A proposed road on the East Side of Lake Winnipeg would impact inhabitants, wildlife, eco-system, etc.

- The community wants to be consulted on land transactions and allocations in the area.

- The cost-efficiency or feasibility to build an all-weather road up the east side of Lake Winnipeg is questionable.

- The community expressed concerns about not being notified well about East Side meetings and requested that information be sent to them in a timely manner so that they would be ale to comment effectively.

Powerview and Local MMF

- Have additional timber leases been increased?
- How will the Hydro projects on the East Side impact the ESPI Process?
- Is the extension of 304-highway north talked about in connection with hydro development?
- Are we here to talk about the development on the east side?
- Send future information to Powerview Metis Local through the Manitoba Model Forest
- Is there objection to the development and construction of an all-weather road?
- There should no more Federal and provincial parks established without consent of the community.
- All communities in the southern portion of the study area have been developed around logging. We need logging and mining on the east side. Logging is much more environmentally sensitive today.
- We are concerned about the environment. Hunting, fishing and trapping are an important part of our life.
- These meetings are important.
- People in the community are educated and must be listened to.
- Parks would be OK if the tourists didn't make such a mess.
- The only thing allowed on the Bloodvein River is a canoeing and people are making decisions about the area without knowing anything about it.
- There is support for the construction of an all-weather road, to reduce freight and hauling costs and to create employment, but not more Parks.
- Costs in the north are directly related to the freight costs.

- An all-weather road would not only be helpful to the community, but also to taxpayers.

- Health problems are greater in the north; a road would help alleviate much of the problem.

- You cannot find nurses to go north because they have to fly.

- Education in health and diet, as well as nursing, ambulance and police services, would all improve with a new road.

- If a road goes into a remote area, concerns about culture are what that area makes of it. People from remote areas must leave their community on medical trips and have no one to escort them, visit them, or aid in their recovery, because others can't get to and from the hospital by road.

- There are a lot of untapped Federal dollars that could be put to training programs for local people to develop an all-weather road. This would create local employment.

- People are in favor of development but we also care about the environment. We live here and do not want to see the environment destroyed. The mill at Pine falls is very environmentally concerned and responsible. We helped reforest areas while Abitibi was here. That was never done down East.

- What ill effects will an all weather road do or have? Has the road through the Interlake affected the environment?

- If our First Nations brothers want a road we should support them.

- Environmental impact studies must take place.

- It is startling on how the wealthy all over the world try to tell us what to do we are being watched by the world. There was a person from Germany in Hollow Water begging the people of Hollow Water to stop this process (ESPI).

- Influential environmental groups are negatively impacting local communities.

- How much time is being spent in schools? It is their future and they need to be involved. We must get information to the schools, to teach the children to protect the environment but still have progress and development

- You don't need to protect the trees to the degree that a protected area demands. There are enough protected areas.

- We in the community have to have a say in what is going on. We need to have a strong understanding of what has to be done not some millionaire in Florida.

- Will there be no forestry licence expansions until the ESPI is complete?

- It is not easy to reforest a mature forest; it is much easier to reforest an area after has been cut.

- Communities must be advised of the park issues, so that they understand the impact.

- Tourist come from the city to our area and leave so much garbage behind that it costs our communities to clean up the mess. They also bring their own food and drink with them so what will they be doing for communities up the east side when they don't spend money here?

- Is it odd that chronic wasting disease is rampant in Manitoba's major national park, Riding Mountain, where logging and hunting are prohibited?

- The environmental people should come to talk to our community so that we can tell them how we feel.

Red Sucker Lake First Nation – NACC, MMF

- There is a need to find a way to get community members more informed about the East Side Planning Initiative. Radio and TV could be used and information is required in the local dialect.

- The community needs someone to point out the potential for development and how to develop resources.

- There is a need for more discussions between government and the community.

- There is a need to be involved in the designation of protected areas. A community member had received a map from Energy & Mines that showed an area south of Red Sucker Lake that he was told was protected. If that were true, mining in the area would not be available to the community, nor would jobs. There is also good timber around Red Sucker Lake and there was a concern that a protected areas designation would prevent one individual from developing a sawmill to replace a number of tents with buildings.

- For this reason as well, the community must also be consulted about mining activity. Community members have observed the comings-and-goings of mining equipment, personnel, etc., all of which, it knows nothing about.

- One trapper raised a concern about people coming onto his trapline and staking a claim and then him being asked to leave his trapline.

- There is a need to have more Elders involved in this process.

- Youth must have a role in this process as they are excluded most times.

- Everyone needs to work together in this process.

- Several people noted the hardship in living up north. Gas is $1.99 per litre. The cost of a helicopter to go there (33 miles) is $4,000.00 for a one-way trip. Everything is expensive. The round table is needed.

- Jobs are needed.

- A concern was raised about mining companies abandoning mines and just leaving the environment destroyed. An example was noted in which 197,000 gallons of diesel fuel were left in tanks within one trapline after a mine closed. The site is in Ontario, 30 miles from Red Sucker Lake. The tanks are now leaking.

- One Elder noted that boundaries were set up and regulations passed that interfered with the peoples' livelihood.

- There is a need for a community map focussing on activities that might affect the planning.

- The East Side Planning Initiative requires more time to discuss issues focussing on aboriginal interests.

Sagkeeng First Nation (North Shore)

- There should be more Elders and youth involved in the process.

- There should be an office established for our students to discuss this and other issues.

- We are happy that the province is finally listening to us

- If an all-weather road is built, funds should not be deducted from our INAC funds.

- What is meant by annual allowable timber cut?

- A concern was expressed about opening up the north to mining and its ecological impacts. How does mining development fit I with sustainable development?

- What is happening with the impacts on the environment as a result of abandoned mines, ie tailings, heavy metal pollution, etc.?

- Why wasn't Manitoba Tourism in the video? We should be looking at the potential of this sector instead of forestry ad mining.

- There needs to be environmental impact studies done before development takes place.

- If we take fish and timber away - we take away lives.

- Give dollars for road development to communities to lower their costs for consumption.

- An all-weather road must not impact our treaty rights.

- Lumber companies erect fences and gates on roads after they clear-cut and claim that area. We have no access anymore. In one company area, we went hunting by going through an unlocked gate, however, conservation charged our people with trespassing and hunting and seized our guns. By doing this, our treaties rights and land entitlement are taken away.

- Who is studying and monitoring water and air pollution?

- There needs to be more support from Tourism Canada, not just from the Province of Manitoba.

- The video should show Elders, woman and children expressing their view.

- We should earn some money from this initiative.

- What damage does the pulp mill do to our water?

- We have to phone the mill for permission to hunt. If we do not hunt within those times, we are charged.

- What benefits will First Nations get out of an all-weather road and will we be compensated for its impact?

- While the province talks about shared resources, we haven't had anything shared with us through treaty rights or land entitlement.

- If the First Nations claimed the beaches on the east side of Lake Winnipeg, they could get millions of dollars in return.

- Our rights have been trampled on for many years and the pulp mill took our traditional livelihood away.

- Development on the East Side has to do with resource harvesters, not First Nation's people. Forestry harvesters and cottage developers will benefit from development.

- What benefits do we get from Forest development? We were promised jobs by past forest operations, it did not happen.

- How are court case decisions concerning Treaty Rights, such as the Supreme Court decision concerning Sparrow, going to be looked at by the round table?

- Treaties need to be interpreted to know what they imply before land use decisions for the east side can be made.

- Protected areas are being established without consultation with affected First Nations.

- The maps you have arrived with have no Anishnabe input.

- How do you protect the environment if a road goes through?

- Treaty Rights have not been defined by Anishnabe people within our communities. We need to understand some of these things before we get involve with east side planning. Our land has been taken over, we are now beggars in our own land.

- When I was young, we lived off the land and didn't need help. We had an abundance of resources. Then change came in a form of a document called The Indian Act. In 1942 a person pushed for the Indian Act, from British Columbia. Our chief went against it, he knew enfranchisement was coming. In 1948, chiefs were called in to revise the Indian Act. It was rejected but passed through in 1951. Our Chief John Thompson was disregarded, and the Federal government declared elections. Sagkeeng had been in a downward spiral ever since. We were self-sufficient until 1951; money wasn't needed, goods were traded.

- If we put resources to use in communities today, we would teach people to be like before 1951

- The province had a lot of gall to ask Anishinabe to support changes to the Fisheries Act.

- Let Anishinabe map out their protected areas and territory areas on the maps.

- Lumber companies are clear cutting in parks.

- Mining is bad for environment.

- Roads construction will affect plants and animals and therefore how can treaty rights to hunt not be impacted?

- Why is Tembec involved in this process and what percentage of the east side will they be allowed in the future?

- We should be developing promotional materials for our culture? We could do this through tourism.

- Ecotourism should be seen as an alternative to forestry and mining. Bring in German tourists who want to learn about our culture.

- The Royal Proclamation state rights will be protected. How will this road impact these rights?

- First Nations are not allowed to hunt in parks yet lumber companies can go in and harvest. This is an infringement on Treaty Rights.

- Many of us have criminal records and cannot use firearms, we might as well go back to bow and arrows.

- The mill has caused great damage to the community, nobody wants to takes responsibility for this.

- Lumber companies and hydro do not care about damage. They care about profit.

- Understanding Treaty Rights is also responsibility of Manitoba government and not just First Nations.

- Promote students in each First Nation. Students have role to play and need to work closely with your office. Set up a sub-office in Sagkeeng to help students gather information and advocate on behalf of their First Nation.

- Can you guarantee our treaty rights to be honored when new road is built?
- What are other communities saying about an all-weather road?
- Visiting communities only once is not fair as it does not solicit all the issues and concerns of the communities.

Sagkeeng First Nation (South Shore)

- There seem to be two entities: the province and Tembec. How do we separate them?
- 75 years ago we promised them and they promised us. Today, they have not delivered. We had a deal with one company and we are still waiting.
- There is no information on economics.
- We are interested in your opinion, but you do not live in the community. How can you suggest change?
- How can 20 people digest all this information, for example, things I hear about mining?
- We may say something but it is going to happen anyway.
- Why wasn't there more information on the video about ecotourism?
- How is sharing information going to help me?
- There should be no mining in the planning area at all. There is too much poison from the mining industry.
- We are concerned about changes in government and direction jeopardizing the plan.
- Treaties were signed and recognized as nothing but promissory notes
- We are here to share information and the powers that be will use that information to do their projects
- Is this initiative related to an all-weather road?
- Should we put a dollar figure to life?

- A road will open up the drug trade and communities will lose their language. Look at Cross Lake and hydro and the negative consequences it caused.

- We will become the 51st state of the U.S. the way things are going.

- We are losing our rights now, ie dental.

- Used to see large trees but as a result of forestry, they do not exist anymore. Logging companies are hauling toothpicks. They over cut and don't reforest. I see positive change in selective cutting and applying traditional knowledge.

- What kinds of life will our children will have? Youth look forward to being 18 to receive welfare.

- There is nothing left in our traditional area because of mining, forestry, etc. All the game and furbeares are gone. There is nowhere to trap.

- Tembec and First Nations have to work together to develop a committee to define Traditional Ecological Knowledge projects and surveys. Is Tembec committed to funding TEK mapping?

- Want to see more emphasis on watershed management. Look at how many mills, cottages, towns, etc. are dumping into the river as far away as Thunder Bay.

- Concerned about water pollution and its impact on the health of our people and children. Monitor our water intake - not like Waterton. We need money to get our domestic water supply treated. Our Elders are telling us that there is something wrong with our water.

- Mining raises red flag; companies create pollution. They provide jobs, but what about safety?

- Should have First Nation people looking after natural resources.

- Mines declare bankruptcy and the clean up is left to others.

- Three different metals were found in the water of Lake Winnipeg.

- Treaties were signed with the Federal government. Where does Province fit in?

- Communities have to be educated on the all-weather road and its impact.

- Who will benefit from tourism?

- Should have woman and men working on the development?

- This initiative is important and our leadership should be sitting here.

- Tried for years to get water testing but the paper company says the water is safe to drink. Doctors say do not swim in it because it's contaminated.

- They talk about mining and forest in the video. These activities can cause great damage.

- There is nothing in our trapping area now and our medicine is being destroyed. We hope that you are in a position to help.

- Doctors say that if you drink chlorine over time you get cancer and diabetes.

Seymourville/Aghaming – NACC

- A concern was raised regarding the composition of the Round Table: how many Aboriginal people were on it and how many lived in the planning area.

- Tourism must be made more accessible in the area. One person had a proposal to purchase additional land to expand his tourism facility refused due to competing interest of protected areas and Tembec's right of first refusal in the area. Operations like Pelican Harbour however, got land development privileges and were supposed to provide jobs in return, which they did not.

- Concerns were raised on the impacts of opening up the East Side on traditional lifestyle of hunting, trapping and fishing.

- Metis and NACC communities need to have an equal say with First Nations.

- There needs to be profit-sharing between large corporations and communities.

- Concerns were expressed about how NACC communities would receive fair representation and what they could do to ensure their recommendations are honoured.

- A concern was expressed that a proposed sawmill partnership excluded Seymourville.

- Seymourville needs to develop its own plan as well as look at a larger geographical area and work with surrounding communities. It will need funds to accomplish this.

- A question was asked where BI-Pole lll was going to be erected and how close it will come to the community.

- Internal road conditions pose health and safety concerns that have to deal with on a constant basis. Can the round table help the community lobby for better roads?

- How often does the Round Table and First Nation Council meet?

- The deadline to complete the plan by June 2004 is unrealistic. It is unrealistic to expect communities to develop positions before then.

- The community of Manigotagan is planning to expand their boundary up the Manigotagan River to the second falls. Because the community is situated on the river, they wish to continue growth along the river. While the Manigotagan River Park Reserve is willing to start at the second falls, there is a concern that once the BI-Pole II comes down, the Province will take the land back from the community for this line. This is something that the community does not want to see happen.

St. Theresa Point First Nation

- I heard someone welcomed the shift in government policy to include First Nation people in planning processes. He indicated government has been exploiting resources since 1933 and deliberately excluded First Nations in resource management.

- He suggested negotiations between First Nations and the province include resource ownership, resource management and revenue sharing schemes.

- Traditional territory belongs to community members.

- Depletion of resources, medicinal plants, fish and animals are being destroyed by outsiders.

- An elder expressed concerns regarding the ability of wildlife populations to sustain them.

- He asked what the province is doing regarding the protection of drinking water on Lake Winnipeg and fisheries.

- Local artifacts belong to First Nation people in the area and should be returned.

- Terms and conditions of treaty should be resolved first before commencing with planning activities on the East Side.

- First nation education should be a requirement of the public school systems including universities.

- Trappers and fishers should be treated the same as farmers down south.

- Road access into traditional lands would impact on wildlife and traplines.

- Development would upset natural process. Any development should be properly planned and proceed with caution.

- Environment is changing and land ruined and disrespected by non-Aboriginal people.

- Trespassers should be charged for trespassing and destruction on traditional land and affecting the livelihood of local trappers.

- Planting and harvesting of wild rice on traditional land by non-Aboriginal people is affecting livelihood of local people.

- There has been building of damns to irrigate water for wild rice, without asking for permission to build them. The province should also do something about the waste material along our shorelines.

- Need to consult with community before any activity happens in the planning area.

- Secretariat provided information about the role of the recently established Aboriginal Relations Branch within the department.

- Secretariat to follow up with Aboriginal Relations Branch regarding trespassers harvesting wild rice without permission from the community.

- Activities from Hydro, logging, mining adversely affect the community and the land.

- What plans exist regarding the construction an airport and a road from St. Theresa Point to Wasagamack First Nation?

- The province should negotiate ownership since development would be on their land.

- There are concerns respecting the proposed Manitoba Hydro BI-Pole lll transmission line and how it will impact employment opportunities for the communities.

- Revenue sharing between the province and the communities should include Hydro, mining, pulp, logging, forestry and commercial fishing.

- Health conditions and lack of proper nutrition is an issue because of restrictions on hunting rights that are an infringement on Treaty and inherent rights.

- All resource issues need to be looked at to preserve First Nation culture and way of life.

- Need to conserve and preserve all resources for future generations.

- The general public and public school systems need to include Aboriginal history life styles and way of life in order that we eliminate cultural differences.

- Media needs to be kept in check and lines of communication need to be clear.

- Local trappers and fishermen need to be represented on the round table.

- There is a need for funding for community cleanup to help attract and develop tourism opportunities for the communities.

- Development of resources needs to be clear and transparent.

- Conduct clear and open surveys.

- Communities require traditional territory maps.

- There is a rapidly growing population in the communities and financial resources cannot keep up with demand.

- Natural law of nature is being altered and changed.

- Hudwin Lake is recognized as a traditional area.

- Is Hudwin Lake a protected area and do they have the right to hunt or trap or will restrictions be implemented? Can a community member go into the area and build on it as his inherent right?

- Natural Resources Transfer Agreement should be reviewed to ensure all people understand it.

- Province should negotiate with all First Nations and not just one.

- The province needs to ensure the information flows into the communities.

- The traditional territory is where the older people were born. It is only recently that people have lived in communities like St. Theresa Point. He notices that the environment has changed, the land has been spoiled by white people. The fish and animals are not the same.

- How can I charge a trespasser on my land? The issue is a wild rice harvester who also put a dam up to raise water levels and impacted his livelihood.

- First Nation people are keepers of the land. The new activities like hydro, forestry and mining are an exploitation of our resources.

- The North-West Hydro project that brought power to seven local communities was funded 75% by INAC, 15% by Manitoba and 10% by Hydro. Now Hydro owns an infrastructure that was paid for by Treaty (INAC) dollars. The First Nations should have ended up owning the lines and hired Hydro to manage them. The First Nations should also own the roads and airports that will be built on reserve land in this area. Bi-Pole III is a moneymaking scheme for Manitoba. The revenues should be shared with us. The same can be said for mining, forestry and commercial fishing.

- Our rights to hunt and fish are being restricted. We should not require any permits (gun registration, fishing permits) as this is an infringement on our rights. The legislation has to be looked at.

- We need to keep the land clean – we depend on the land for food and medicine. The land is what keeps us alive. Any kind of development must preserve and conserve. I hear Lake Winnipeg is polluted. If they (Whites) are going to come are they going to do the same with their technology.

- We do not want secret surveys of our resources. We hear of helicopters flying people around to look at the land. Developers must come to the community first.

- There should also be a trapper representative and a fishing representative on your round table.

- Farmers get compensated for loss of income. So do East Coast fishermen. Trappers have lost income because of markets. Trappers should be treated the same as farmers with respect to loss of income.

- We need a road to promote tourism

- There should be dollars for community clean up.

- There should be a process for 10-year reviews of development in the north.

- People in the south need to be educated about our ways in the north – they get a slanted view of our ways. The South has no understanding of the hardships here.

- The Province, not only the Federal Government, must respect the treaties.

- I have expressed my concerns many times. The creator gave us the resources – all the things on Earth. These are what define us as First Nations. My concerns over government are decisions that affect our identity. As an example, First Nations had their own way of child rearing. We believe that it is important to discipline a child. Now there are laws against this and it results in delinquency. Also, the government has wanted to assimilate us and change us to white people.

- It is my wish to leave our resources as they once were. The way this should be – the goose knows when to go south. This is how nature works. We cannot disrupt this. Our climate changing is upsetting the natural process. This is what so-called development has done to our country.

- Is Hudwin Lake a true protected area? If you do your research you should find past agreements on this area. Can First Nations hunt, fish and trap in these protected areas. My son wants to put a cabin up at Hudwin Lake. This has been a traditional area since 1953. Some elders used to live there.

- You must deal with the northern bands seven collectively as well as individually.

Wasagamack First Nation

- Wasagamack First Nation has begun to explore and research the development of a forest management plan, a resource management plan, a community development plan and a long-term sustainable development plan.

- There is a concern regarding the future of the young people in the area. This process must enable their ability to practice traditions and culture in order that they can survive on the land.

- A concern was expressed about outsiders coming into the community, collecting and recording data, leaving and not returning any information or results.

- The community must benefit from the ESPI process.

- Intruders onto existing trap line areas affect wildlife populations due to poor mining practices and lack of environmental and wildlife considerations. These same people also trap in the community's traditional trapping area which results in declining revenues for trappers and less wildlife for sustenance use by local people.

- Due to the language barrier and infrequency of communication between the two cultures, it is difficult to communicate and resolve local issues and concerns. There is a need to work closer together and translate all literature to Oji-Cree for elders and other community members to understand and participate fully in this process.

- Traditional hunting grounds are being invaded and communities have been told there is nothing community members can do about it. There is a need to respect and protect wildlife and hunting grounds. Sport hunting should not be allowed. We have video footage of hunters killing for sport.

- The community is thankful for the opportunity for Elders to speak and share their knowledge.

- There is a need for the community to be given time to absorb the information provided and return views and comments at a later date.

- There is a need for maps to show burial sites so they are not desecrated in any future land developments.

- It is preferable to have a united voice representing the Island Lake First Nations. For that reason, the round table members need to sit down with the Island Lake Tribal Council to discuss concerns, ideas and views about their communities and development in the area.

- Fish caught locally do not taste the same and now we have to go to traditional fishing areas to be able to eat fish.

- Once the report is completed will the committees be consulted and will Hydro work only with the round table?

- Compensation concerns from Manitoba Hydro to the First Nation were raised.

- There was a time you could drink water straight from the lake. Due to water quality concerns, the community must now rely on the water treatment plant for its water.

- We hear of (southern) people flying around in helicopters to shoot moose. We do not appreciate these sport hunters who only take the antlers. This is disrespect. We have to use every part of the animals we hunt. We also find intruders on our trap lines. This happened as far back as 1933 when I came upon a driller while out shooting for rabbits. My mother told me there was a lot of exploration and mining in the early days.

- There are times today when you hear that outsiders are invading our hunting territories. A man has been told that he cannot hunt or fish in his area for the area is set aside for sport fishing now. The (Canadian) government said they would take care of the Indian People and allow us to hunt in our traditional ways. They are taking this away slowly, just look at the gun registration. This East Side plan must protect hunting, fishing and trapping rights and respect the traditional hunting grounds.

- Outfitters planted wild rice in my trap line. Over time we have noticed the fish disappearing from this area. I met this person and told him he should not have done this in the first place. No one talked to us about this development.

- There was talk some years ago about planning for the land in our area. The Island Lake Tribal Council has begun to look at how the land should be cared for.

- The community needs to define traditional boundaries. We need to map traditional sites, summer camps and burial grounds. This will take a lot of resources, but these things have to be respected. We need this information before Bi-Pole III and roads come through.

- You need to change a few things with this new process. People often come from the outside to speak and get our input, but they never come back. Very few people get involved this way. You need to come back to Wasagamack.

- Your brochures should be translated into syllabics for some people can not read English.

- The people of Wasagamack need to work together with the southerners. We have to focus on what is going to happen in our lands. We also need to capitalize on our fishing and hunting skills.

- A representative of MKO spoke about areas that the Community needs opportunity to explore. These are a (1) community development plan; (2) forest management plan; (3) resource management plan; and (4) sustainable development plan.

- There was a story from an elder who witnessed his father becoming the first chief for Wasagamack. At this time an Indian agent signed an agreement and wrapped the chief in a Canadian flag as a symbol that Canada would protect our people and protect the land. This was a show of respect for Indian leaders. Now the chiefs do not get respect. Today all we have is broken promises on Treaty. There was a tree beside the Band Office that symbolized our first chief. This is where he went when it was time for him to pass on. Today there is a monument outside the Band Office that symbolizes our first chief.

- As First Nation people we have a lot of disadvantages in these communities. I fished and trapped when I was 14. This was the education provided by my parents. Your time here is too short for me to tell my tale. What I will tell you is that the four communities of Island Lake are close knit. As individual First Nations we are not strong enough to deal with the issues. The four must stand together.

- If we knew before hand that the government was coming we could have come better prepared. For some reasons we take it for granted that our council will give us the information. This does not happen. You see only a few people here – it embarrasses me. Because of such short notice we can not put our ideas in writing. We have to follow-up though. It is important to maintain contact.

- People down south do not know what it is like around here. They do not know our youth enjoy the forest and to go hunting. We are not in the bush enough though. The decline of traditional knowledge (i.e. curing of trees for medicine) has resulted in a decline in our health (i.e. diabetes). We have to obtain knowledge of our environment again and how to use the forest wisely. The Elders are passing on and the knowledge is being lost. The school system has to recognize this. There has to be a balance to allow people to go on the land.

- The next time you come up should be in the winter when the roads are in. Then you can have a meeting with all four communities together.

- We have to keep government honest with respect to Treaty rights. The government wants to amend various acts to get out of its commitments. An example is federal changes to the Indian Act. It says it has consulted us - via the Internet. This is not adequate consultation.

Appendix 8.11

Community Reports: "What We Heard" By Issue

East Side Planning Initiative Community Visits

September 2003 to January 2004

What We Heard

Final Report By Issue

Response to East Side Planning Initiative Community Visits

September 2003 to January 2004

What We Heard

Groups invited to participate:

FN – First Nations
MMF – Manitoba Metis Federation
NACC – Northern Association of Community Councils
ESPI – East Side Planning Initiative
ESRT or Round Table – East Side Round Table

Communities Visited:

Berens River FN, NACC, MMF
Bissett NACC
Bloodvein FN
Bunibonibee Cree Nation
Garden Hill FN, MMF
God's Lake FN, NACC
Hollow Water FN
Island Lake NACC
Little Black River FN
Little Grand Rapids FN
Little Grand Rapids NACC
Manigotagan NACC, MMF
Manto Sipi Cree Nation
Matheson Island / Loon Straits / Princess Harbour NACC
Norway House Cree Nation
Norway House NACC
Pauingassi FN
Pine Dock NACC
Powerview and local MMF
Red Sucker Lake FN, NACC, MMF
Sagkeeng FN (North Shore)
Sagkeeng FN (South Shore)
Seymourville / Aghaming NACC
St. Theresa Point FN
Wasagamack FN

What We Heard regarding:

Treaty Rights and Tradition..... 1
Environment, Protected Areas..... 9
Economic Development, Forestry, Mining..... 14
Roads..... 25
Hydro..... 29
Other Issues and Concerns..... 31

Note:

Some of the messages heard are presented as one concern shared by more than two people. Some are phrased as general topics of concern. Others are individual concerns paraphrased in short form.

Treaty Rights and Tradition

- People down south do not know what it is like around here. They do not know our youth enjoy the forest and to go hunting. We are not in the bush enough though. The decline of traditional knowledge (i.e. curing of trees for medicine) has resulted in a decline in our health (i.e. diabetes). We have to obtain knowledge of our environment again and how to use the forest wisely. The Elders are passing on and the knowledge is being lost. The school system has to recognize this. There has to be a balance to allow people to go on the land.

- We have to keep government honest with respect to Treaty rights. The government wants to amend various acts to get out of its commitments. An example is federal changes to the Indian Act. It says it has consulted us - via the Internet. This is not adequate consultation.

- Concerned that corporations come in and ruin a First Nation community and the First Nation doesn't get anything from it. For example, First Nations currently do not benefit from harvest of timber resources. Communities must benefit if there is development, not the individual but the whole community.

- Government regulations prohibit using trapline/cabins for rental purposes. Regulations should support trappers.

- One of the questions I have, one thing promised to us, First Nations have access to live off the land so how come there are regulations e.g. hunting? After all is done what is going to become of the process and plan?

- Trapping is an issue of sharing resources again. This should be part of the issue for the Round Table – so we can maintain our lifestyle. Trapping and its regulations need to be addressed in the plan

- Concerns were expressed about a burial ground threatened by development. There are 3 graves and it should be marked on a map.

- Trapping regulations not meeting our needs and don't make sense.

- The literature provided does not address how this process might affect treaty rights. Should speak

- We need to know more about constitutional treaty rights, protected areas.

- How will this plan affect outstanding Treaty Land Entitlements? What has been happening with respect to the TLE process? How much Crown Land should we be granted?

- There is no protocol to consult with First Nations.
- If the Trappers Association make a presentation, will you hear it?
- Trapline boundaries should be the boundaries for planning.
- First Nation Communities are getting all the traplines and pulp potential. They have a federal voice, larger than ours.
- The planning process should be with First Nation's people directly because it impacts First Nations directly.
- We need to do more as a community to protect treaty lands.
- Elders and youth must be involved to voice concerns in our community.
- We need protected area for our traditional lands.
- We want total control of the management of forestry and mining here.
- How much space will the Native people have?
- Concerns about hunting. When an area becomes developed there is a boundary placed around it and you can't hunt there. Can we go hunting and hunt where we want? The plan has to allow us to be able to go in and hunt where we want, even if the area is developed.
- Concerns about third parties coming in and using our traditional areas and then we have a problem negotiating with them on land use. Negotiating can take a very long time.
- Youth are not aware of the Treaties, their cultural traditions, the old way of life and survival on the land. Government should provide funding to train youth to learn about Aboriginal tradition and culture.
- Loss of traditional way of life and children being taught to follow dominant way of life.
- Health is a major issue, particularly diabetes. Government should work more closely with northern communities in the area to address health concerns.
- Government needs to respect hunting and other rights, if parks, which include traditional hunting areas, are deemed to be set aside as protected areas.
- In the past, the province did not consult with trappers regarding government actions impacting on traditional trapping/hunting grounds.

- We are not fully aware of the Treaty anymore. The younger generations have not been educated about the Treaty and the significance of our Treaty at the time it was signed.

- The younger generation is not learning the traditional ways. Our youth only correspond with what they learn from a white dominant society. Our sickness is worse today (diabetes) because we have lost some of our traditional ways. If we dropped a young person off in the bush today he would not know how to survive, to make a fire, to make a bed. We need funding to retain our traditional ways and livelihood. We have to retain our traditional ways to heal ourselves.

- We are not fully aware of the Treaty anymore. The younger generations have not been educated about the Treaty and the significance of our Treaty at the time it was signed.

- The younger generation is not learning the traditional ways. Our youth only correspond with what they learn from a white dominant society. Our sickness is worse today (diabetes) because we have lost some of our traditional ways. If we dropped a young person off in the bush today he would not know how to survive, to make a fire, to make a bed. We need funding to retain our traditional ways and livelihood. We have to retain our traditional ways to heal ourselves.

- You must be aware that there is a park being proposed in the area of the Wasagamack First Nation. The local trappers do not want this. There also is mining at Twin Lake. The trappers at Red Sucker Lake did not agree to this. They also are planning a road. Can the people at Red Sucker stop this legally. The people there have not been consulted. Is this the way it should be? Does the province have a responsibility to consult?

- There was a process with Treaty land selections where we identified our traditional lands, and sacred and cultural spots. The round table does not have this information. This must be integrated, but we never had the money like you have to record all of this and create fancy maps. We need money to identify and map where the important sites and lands are. We are short of technical skills. Your community coordinators cannot do this alone.

- Our rights are treaty driven. How can the process affirm treat rights when the Natural Resources Transfer Agreement is a contradiction to them? We have to educate mainstream society about our treaties.

- Government has a hidden agenda. When we ask the province to address our needs they say that they are not responsible. First Nation people should not be considered a federal responsibility.

- When traditional areas are referred to by governments they think it is a trapline. Our ancestors come from Ontario and our traditional area is also in Ontario. It is not only ours but belongs to other First Nations.

- Provincial government is holding up our treaty land entitlement – they should move a little faster.

- The chief and council should be here, as we need to have direction and input from our leadership

- Let's put our minds together to make our reserve a better place. We have people come to our community, let's work together with them to plan for our community.

- Relations must improve, not just with government but people in general. We do not want to be in a position where we have to beg for our own future. Give us our resources back.

- We are scared of partnerships that are formed without the First Nations Council.

- I am glad that governments seek knowledge from our scientists (Elders). Does the government already have a plan? Everything we need is contained in Treaty # 5. Why do you have to come back for reaffirmation?

- Maybe we don't need your help; we just need the resources you took from us.

- There are trust issues between community members and government in general. The community finds it difficult to trust the objectives of the initiative and whether or not their suggestions/comments will be taken into consideration when it is time to make decisions.

- An elder from each community should sit on the round table to represent communities and present traditional knowledge on resources and medicines. Elders should attend all meetings.

- We are beginning to return to traditional medicine.

- The Norway House Cree Nation is not accountable to the Government of Manitoba and an MOU should be in place before we participate in any planning process dealing with resource management

- Norway House considers itself a sovereign nation and the fact that the province established a First Nation Council does not mean it represents Norway House First Nation. We consider this a provincial entity.

- Land planning is important to the trappers. The trappers believe they are losing access to traditional trapping areas.

- One Elder noted that boundaries were set up and regulations passed that interfered with the peoples' livelihood.

- Concerns were raised on the impacts of opening up the East Side on traditional lifestyle of hunting, trapping and fishing.

- Metis and NACC communities need to have an equal say with First Nations.

- I heard someone welcomed the shift in government policy to include First Nation people in planning processes. He indicated government has been exploiting resources since 1933 and deliberately excluded First Nations in resource management

- Traditional territory belongs to community members.

- Terms and conditions of treaty should be resolved first before commencing with planning activities on the East Side.

- Trappers and fishers should be treated the same as farmers down south.

- Health conditions and lack of proper nutrition is an issue because of restrictions on hunting rights that are an infringement on Treaty and inherent rights.

- All resource issues need to be looked at to preserve First Nation culture and way of life.

- The general public and public school systems need to include Aboriginal history life styles and way of life in order that we eliminate cultural differences.

- Hudwin Lake is recognized as a traditional area.

- Is Hudwin Lake a protected area and do they have the right to hunt or trap or will restrictions be implemented? Can a community member go into the area and build on it as his inherent right?

- Our rights to hunt and fish are being restricted. We should not require any permits (gun registration, fishing permits) as this is an infringement on our rights. The legislation has to be looked at.

- The Province, not only the Federal Government, must respect the treaties.

- It is my wish to leave our resources as they once were. The way this should be – the goose knows when to go south. This is how nature works. We

cannot disrupt this. Our climate changing is upsetting the natural process. This is what so-called development has done to our country.

- There is a concern regarding the future of the young people in the area. This process must enable their ability to practice traditions and culture in order that they can survive on the land.

- Traditional hunting grounds are being invaded and communities have been told there is nothing community members can do about it. There is a need to respect and protect wildlife and hunting grounds. Sport hunting should not be allowed. We have video footage of hunters killing for sport.

- The community is thankful for the opportunity for Elders to speak and share their knowledge.

- There are times today when you hear that outsiders are invading our hunting territories. A man has been told that he cannot hunt or fish in his area for the area is set aside for sport fishing now. The (Canadian) government said they would take care of the Indian People and allow us to hunt in our traditional ways. They are taking this away slowly, just look at the gun registration. This East Side plan must protect hunting, fishing and trapping rights and respect the traditional hunting grounds.

- The community needs to define traditional boundaries. We need to map traditional sites, summer camps and burial grounds. This will take a lot of resources, but these things have to be respected. We need this information before Bi-Pole III and roads come through.

- There was a story from an elder who witnessed his father becoming the first chief for Wasagamack. At this time an Indian agent signed an agreement and wrapped the chief in a Canadian flag as a symbol that Canada would protect our people and protect the land. This was a show of respect for Indian leaders. Now the chiefs do not get respect. Today all we have is broken promises on Treaty. There was a tree beside the Band Office that symbolized our first chief. This is where he went when it was time for him to pass on. Today there is a monument outside the Band Office that symbolizes our first chief.

- As First Nation people we have a lot of disadvantages in these communities. I fished and trapped when I was 14. This was the education provided by my parents. Your time here is too short for me to tell my tale. What I will tell you is that the four communities of Island Lake are close knit. As individual First Nations we are not strong enough to deal with the issues. The four must stand together.

- If we knew before hand that the government was coming we could have come better prepared. For some reasons we take it for granted that our council will

give us the information. This does not happen. You see only a few people here – it embarrasses me. Because of such short notice we can not put our ideas in writing. We have to follow-up though. It is important to maintain contact.

- Does the government or industry consult with the people or just Chief & Council?
- Do the Chief and Council have to be present for there to be consultation?
- What would happen if the recommendations conflict with the community plans?
- Is this consultation or an information session?
- We need a map to indicate traditional uses at Hollow Water and include Black Island.
- Hollow Water could provide a land use plan to RT.
- How can the province come in and provide permits on the Hollow Water river for cottages?
- Is Black Island included in the planning area?
- What about traditional territories beyond treaty (reserve) lands?
- Traditional lands are being taken away. All this is predetermined. There is a lot of skepticism about this process.
- There has been experience with vandalism of trap lines. There is no compensation with respect to loss of revenue by local trappers.
- What type of agreements can the community get from this process?
- We want to be involved in benefits, partner and training for anything happening in our region.
- Traditional areas need to be extended and users need to have a say on what happens there. It all comes down to the land you control. Give us the control to see how serious you are.
- How do we ensure outsiders don't come in and over exploit the resources.
- Cottage and lodge developments are a concern. It appears only white outsiders are approved for lodge and other licenses.

- Non-Aboriginals will force us out of our own lands.

- The Norway House Cree Nation is not accountable to the Government of Manitoba and an MOU should be in place before we participate in any planning process dealing with resource management.

- Land planning is important to the trappers. The trappers believe they are losing access to traditional trapping areas.

- Treaty Rights must be honoured and accessibility to the lands be available for First Nations.

- When people are given permits to trap in the Pauingassi traditional area, the First Nation wants to be consulted so that the First Nation members can be apprised of who has been given permits and develop working relations with permitees.

- The First Nation remains opposed to Outpost hunting in the area. This was done without consultation with the local people.

- The First Nation requested a land status report on their existing reserve lands.

- Tembec erects fences and gates on roads after they clear-cut and claim that area. We have no access anymore. In one Tembec area, we went hunting by going through an unlocked gate, however, conservation charged our people with trespassing and hunting and seized our guns. By doing this, our treaties rights and land entitlement are taken away.

- While the province talks about shared resources, we haven't had anything shared with us through treaty rights or land entitlement.

- If the First Nations claimed the beaches on the east side of Lake Winnipeg, they could get millions of dollars in return.

- How are court case decisions concerning Treaty Rights, such as the Supreme Court decision concerning Sparrow, going to be looked at by the Round Table?

- Treaties need to be interpreted to know what they imply before land use decisions for the east side can be made.

- Treaty Rights have not been defined by Anishnabe people within our communities. We need to understand some of these things before we get involve with East Side Planning. Our land has been taken over, we are now beggars in our own land.

- Roads construction will affect plants and animals and therefore how can treaty rights to hunt not be impacted?

- First Nations are not allowed to hunt in parks yet Tembec can go in and harvest. This is an infringement on Treaty Rights.

- Understanding Treaty Rights is also responsibility of Manitoba Government and not just First Nations.

- Treaties were signed and recognized as nothing but promissory notes.

- There is nothing left in our traditional area because of mining, forestry, etc. All the game and furbeares are gone. There is nowhere to trap.

- Treaties were signed with the Federal government. Where does Province fit in?

- There is nothing in our trapping area now and our medicine is being destroyed. We hope that you are in a position to help

Environment, Protected Areas

- We have concerns about the environment and have been fighting with the province about cleaning up the old transmission line to an old mine on Elk Island. There is about 50 miles of wire just left on site. The government tells me they have no funds so how can they make this process work if they can't even undertake one little mine clean-up project. I don't know who else to talk to.

- Fish are being depleted from the lakes and information is not being shared on fish management strategies, if any are planned or exist.

- Is Hudwin Lake a true protected area? If you do your research you should find past agreements on this area. Can First Nations hunt, fish and trap in these protected areas. My son wants to put a cabin up at Hudwin Lake. This has been a traditional area since 1953. Some elders used to live there.

- The traditional territory is where the older people were born. It is only recently that people have lived in communities like St. Theresa Point. The environment has changed, the land has been spoiled by white people. The fish and animals are not the same.

- How can the City of Winnipeg dump raw sewage that affects Lake Winnipeg and not be held responsible? Fisheries are affected by water quality in the lake. Algae blooms are increasing and affecting fishers' livelihood.

- Protected areas need to be revisited. The Poplar River Protected Area includes some lands, which are part of Berens River traditional territory. Because Berens River was never consulted on this, its territory should be removed from the protected areas.

- Wanipigow River Protected Area has allowed mature trees to fall into River and is destroying the river quality. If trees are allowed to be cut, the economic gain is met and the river is managed. Protectionism measures applied by Parks Manitoba may do more harm than good to the river and river areas.

- Land allocation methods for specific purposes by the province are not an acceptable practice.

- Nopiming Park was originally a multi-use park. Now you cannot consider it a multipurpose park due to restrictions. Recreation activities and development are causing problems.
- We as a community are concerned with Lake Winnipeg water quality. The algae, smell and water levels are all concerns for us.

- River quality is threatened by activities that are still occurring in Ontario. What happens in Ontario will ultimately affect the Watershed here in Manitoba. We need to know what is happening in Ontario.

- Caribou habitat protection important.

- Economic development and environmental protection processes need to work together in a balanced way.

- What are the hidden agendas on economic development?

- Not happy with 100-foot set back from water bodies.

- A 200' x 200' area for trapper's cabins is not realistic. There should be more flexibility for types of traps to be used.

- Expansion at Nopiming will mean that pollution will come down through our river system.
- A concern was raised that cyanide from a mine on Elk Island was polluting a river that runs into God's Lake, and whether or not it could be stopped before it was too late. The water quality should be checked.

- How can we make our living here in a deteriorating environment?

- How can we protect our mother earth because this land is all ripped up?

- A concern was raised about mining companies abandoning mines and just leaving the environment destroyed. An example was noted in which 197,000 gallons of diesel fuel were left in tanks within one trapline after a mine closed. The site is in Ontario, 30 miles from Red Sucker Lake. The tanks are now leaking.

- Depletion of resources, medicinal plants, fish and animals are being destroyed by outsiders.

- An elder expressed concerns regarding the ability of wildlife populations to sustain them. He asked what the province is doing regarding the protection of drinking water on Lake Winnipeg and fisheries.

- Environment is changing and land ruined and disrespected by non-Aboriginal people.

- Natural law of nature is being altered and changed.

- We need to keep the land clean – we depend on the land for food and medicine. The land is what keeps us alive. Any kind of development must preserve and conserve. I hear Lake Winnipeg is polluted. If they (Whites) are going to come are they going to do the same with their technology.

- Fish caught locally do not taste the same and now we have to go to traditional fishing areas to be able to eat fish.

- There was a time you could drink water straight from the lake. Due to water quality concerns, the community must now rely on the water treatment plant for its water.

- How do we ensure outsiders don't come in and over exploit the resources.

- Concern of lodges taking in hundreds of fish, how can the community stop this from happening. Commercial fishing is being opposed by local lodge owners and therefore sport fishing is the only game in the area. Water quality is becoming an issue as the water color is changing and affecting fish quality.

- There was mention of the World Heritage site being proposed by three First Nations in the area. What will happen to the committee formed for Accord with Pikangikum, Pauingassi, Poplar, and Bloodvein to address the issue of sustaining the environment. Will it be disbanded because of the Round Table and this process?

- No recycling opportunities in the community as a result landfill sites are pressured to take recyclable materials thereby using necessary space.

- Traditional areas indicate that wildlife is moving away from traditional spawning and calving areas.

- Trappers notice change in animals moving away from spawning areas.

- Lodge owners are using airplanes to hunt.

- Only a small part of original Manitoba left; it is fearful what is happening. How can we make our living here in a deteriorating environment? How can we protect our mother earth because this land is all ripped up? -

- Change in the water, it's dirtier with more algae. Swampland has an ecological process and function and is not to be viewed as wasteland.

- The First Nation is part of an alliance with three other First Nations to identify and request a world heritage site be establish identifying their traditional territories.

- There should no more Federal and Provincial parks established without consent of the community.

- We are concerned about the environment. Hunting, fishing and trapping are an important part of our life.

- Parks would be OK if the tourists didn't make such a mess.

- The only thing allowed on the Bloodvein River is a canoeing and people are making decisions about the area without knowing anything about it.

- There is support for the construction of an and all-weather road, but not more Parks.

- People are in favor of development but we also care about the environment. We live here and do not want to see the environment destroyed. The mill at Pine falls is very environmentally concerned and responsible. We helped reforest areas while Abitibi was here. That was never done down East.

- Environmental impact studies must take place.

- You don't need to protect the trees to the degree that a protected area demands. There are enough protected areas.

- Tourist come from the city to our area and leave so much garbage behind that it costs our communities to clean up the mess. They also bring their own food and drinks with them so what will they be doing for communities up the east side when they don't spend money here?

- A concern was expressed about opening up the north to mining and its ecological impacts. How does mining development fit I with sustainable development?

- What is happening with the impacts on the environment as a result of abandoned mines, ie tailings, heavy metal pollution, etc.?

- There needs to be environmental impact studies done before development takes place.

- Who is studying and monitoring water and air pollution?

- What damage does the pulp mill do to our water?

- Protected areas are being established without consultation with affected First Nations.

- How do you protect the environment if a road goes through?

- Ecotourism should be seen as an alternative to forestry and mining. Bring in German tourists who want to learn about our culture.

- There is too much poison from the mining industry.

- There is nothing left in our traditional area because of mining, forestry, etc. All the game and furbeares are gone. There is nowhere to trap and our medicines are being destroyed..

- Tembec and First Nations have to work together to develop a committee to define Traditional Ecological Knowledge projects and surveys. Is TEMBEC committed to funding TEK mapping?

- Want to see more emphasis on watershed management. Look at how many mills, cottages, towns, etc. are dumping into the river as far away as Thunder bay.

- Concerned about water pollution and its impact on the health of our people and children. Monitor our water intake - not like Waterton. We need money to get our domestic water supply treated. Our Elders are telling us that there is something wrong with our water.

- Mines declare bankruptcy and the clean-up is left to others.

Economic Development, Forestry and Mining

- We need to do something for our young people. We need to look in the long term.

- Must plan right with traditional knowledge. Must carefully consider how development takes place. Have to consider how we are part of the land.

- Trapline regulations pretty strict - size of a cabin etc, cost of permits to build etc. Regulations quite an issue here. Too many regulations and why are there regulations on our land?

- Teach youth how to grow trees and about renewing the forest and fishery resource. Learn how to develop and operate businesses to create a good living for residents

- Thankful that people are focusing on our concerns. Often people call on us for work and we do most of the hard work. In the end however, we are thrown aside. It is good to have people who are concerned about us.

- Why can someone own our traditional land? I worked for long time in fisheries and for 5 months could make a living fishing. Prices of fish not viable now. We need a subsidy program for fishing.

- People who come up here like mining companies, need to bring more money into the community and share the wealth.

- Were there studies done for resource assessments, land analysis, community development, economic development and traditional history?

- Interesting idea – teaching our young people to grow trees so they can re-grow what is taken out, same with fish – need to target the young people.

- Important that First Nations gets the first chance to get employment.

- There was mention of stakeholders. Northern Stores, MTS, MB Hydro are stakeholders. Are they trying to maximize benefits for the communities – what are they doing for the communities?

- High price of goods and services makes it difficult if not impossible to purchase healthy foods such as fresh fruit and vegetables

- Concern about mining at Twin Lake and if the community could get government to involve them in meaningful consultation before permitting mining in their traditional territory.

- Possibility of constructing a larger airport on a cost shared basis.

- Lack of telephone lines is a real problem. People are not able to use the phone between 5:00 pm to midnight. This causes further problems regarding emergencies.

- Economic development and environmental protection processes need to work together in a balanced way.

- Years ago the white man put up a sawmill here and took all the best trees. Then he came for the fish. There are still trees and fish, but the best are now gone

- Prices are too high to afford the goods that we once could afford.

- Years ago the Island Lake Tribal Council talked about co-management of resources.

- In the past, government projects (i.e. MTS) have not included extra funding to First Nations. You have a few people, but need more people involved in the planning process. You have to understand another reality. There is no money here, there are no jobs. Up north we have vast resources, but the money and the jobs benefit the south (Winnipeg).

- Do you know how hard it is to get a telephone line between Garden Hill and Winnipeg from 5-11 at night because all the lines are jammed (internet users). Think about this from a medical perspective. There are ten thousand people up here.

- We have to consider the human factor in this process. Our regional needs have to be considered; health and education. For example, we need a regional hospital that is central to communities such as in God's Lake narrows.

- Governments don't want to listen and probably won't listen to this plan either. For example, cottagers – governments would soon listen to them.
- The timber company in The Pas has a license for cutting in our area.

- Governments do not consult with us about mining and claims until after the fact.

- We have to have training for our youth to prepare them for future opportunities such as resource development that may result from the East Side plan.

- Timber is being cut within our trap lines without our input.

- Economic benefit and jobs are not going back to local communities

- Any additional travel going north will create additional opportunities for us such as a gas bar for example. A gas bar location on highway #304 might be accomplished through Little Black River reserve land being “swapped”.

- We need economic development, tourist development; there are lots of alcohol problems.

- We have visions of ecotourism and general tourism development.

- We need to create employment and learn how to use resources. The Round Table is here to help us, we have a small reserve and there have been too many changes of leadership. Let’s work together.

- Our infrastructure needs to be upgraded. We have a beach but lack the funding to improve the road to it. We need gravel and crushed rock for the road.

- If there is forestry development we want to do it. We disagree with the Forest Management License.

- One time wild rice was open for use by anyone but harvesting was taken away from us. Today we need a permit to harvest. We want it back and be able to share with everyone. We want to get back to that way of life. We were here before the boundaries.

- Cottage developments and expansions are occurring. Water treatment plants etc. are issues that are happening on our traditional lands and we are not being informed. We need to be made aware of these developments and our concerns listened too.

- Lets do the planning so we can help our community develop and prosper.

- We are a small community with a lack of support. Changes in leadership lead to minimal positive activity/development. We need to develop our plan to aid our community. We need to get as much from our resources as we can.

- We have concerns with sustainable development. What happened to our buffalo?

- We are hindered in what we can do in our territory because of our circumstances

- Little Black River is very interested in cottage development in the area and we should have exclusive rights to such

- Local people must benefit from resource use activities.

- The community requires jobs and road improvement projects could provide them.

- Whenever industry moves into the area, people from outside the community benefit more than local people.

- There is a lot of mistrust due to past actions of government. For example, at Wanipigow, cottage owners erected a water control structure drastically reducing the flow of water downstream. This is the source of drinking water for the Hollow Water First Nation.

- The Manigotagan River Park Reserve is being pushed on the people. The community of Manigotagan is planning to expand their boundary up the Manigotagan River to the second falls. Because our community is situated on the river, we would like to continue our community on the river. The park reserve is willing to start at the second falls but once the BI-Pole lll line comes down, will they take the land back from the community for this line? This is something that the community does not want to see happen.

- Manigotagan will share its community plan with the round table when it is ready.

- Jobs and economic development are important.

- Fish movement in and out of the land is important

- The local trappers association wants to know what will happen to the trap lines when development occurs.

- There is high unemployment in our communities, because when any development opportunities arise, proponents bring their own people to work on local projects. We have a lot of traditional people here that are qualified to work.

- We want government to consult trappers about their plans because we want to keep the land in its original state.

- There is mining activity in the Red Sucker Lake vicinity, however, we believe this to be Norway House traditional territory.

- The community needs someone to point out the potential for development and how to develop resources.

- There is a need to be involved in the designation of protected areas. A community member had received a map from Energy & Mines that showed an area south of Red Sucker Lake that he was told was protected. If that were true, mining in the area would not be available to the community, nor would jobs. There is also good timber around Red Sucker Lake and there was a concern that a protected areas designation would prevent one individual from developing a sawmill to replace a number of tents with buildings.

- For this reason as well, the community must also be consulted about mining activity. Community members have observed the comings-and-goings of mining equipment, personnel, etc., all of which, it knows nothing about.

- One trapper raised a concern about people coming onto his trapline and staking a claim and then him being asked to leave his trapline.

- Several people noted the hardship in living up north. Gas is $1.99 per litre. The cost of a helicopter to go there (33 miles) is $4,000.00 for a one-way trip. Everything is expensive. The round table is needed.

- Tourism must be made more accessible in the area. One person had a proposal to purchase additional land to expand his tourism facility refused due to competing interest of protected areas and Tembec's right of first refusal in the area. Operations like Pelican Harbour however, got land development privileges and were supposed to provide jobs in return, which they did not.

- There needs to be profit-sharing between large corporations and communities.

- A concern was expressed that a proposed sawmill partnership excluded Seymourville.

- Seymourville needs to develop its own plan as well as look at a larger geographical area and work with surrounding communities. It will need funds to accomplish this.

- It has been suggested negotiations between First Nations and the province include resource ownership, resource management and revenue sharing.

- First nation education should be a requirement of the public school systems including universities schemes.

- Development would upset natural process. Any development should be properly planned and proceed with caution.

- Trespassers should be charged for trespassing and destruction on traditional land and affecting the livelihood of local trappers.

- Planting and harvesting of wild rice on traditional land by non-Aboriginal people is affecting livelihood of local people.

- Need to consult with community before any activity happens in the planning area.

- Activities from Hydro, logging, mining adversely affect the community and the land.

- What plans exist regarding the construction an airport and a road from St. Theresa Point to Wasagamack First Nation?

- The province should negotiate ownership since development would be on their land.

- There are concerns respecting the proposed Manitoba Hydro BI-Pole lll transmission line and how it will impact employment opportunities for the communities.

- Need to conserve and preserve all resources for future generations.

- There is a need for funding for community cleanup to help attract and develop tourism opportunities for the communities.

- Development of resources needs to be clear and transparent.

- Conduct clear and open surveys.

- How can I charge a trespasser on my land? The issue is a wild rice harvester who also put a dam up to raise water levels and impacted his livelihood.

- First Nation people are keepers of the land. The new activities like hydro, forestry and mining are an exploitation of our resources.

- The North-West Hydro project that brought power to seven local communities was funded 75% by INAC, 15% by Manitoba and 10% by Hydro. Now Hydro owns an infrastructure that was paid for by Treaty (INAC) dollars. The First Nations should have ended up owning the lines and hired Hydro to manage them. The First Nations should also own the roads and airports that will be built on reserve land in this area. Bi-Pole III is a moneymaking scheme for

Manitoba. The revenues should be shared with us. The same can be said for mining, forestry and commercial fishing.

- We do not want secret surveys of our resources. We hear of helicopters flying people around to look at the land. Developers must come to the community first.

- There should be a process for 10-year reviews of development in the north.

- Wasagamack First Nation has begun to explore and research the development of a forest management plan, a resource management plan, a community development plan and a long-term sustainable development plan. There should be a process for 10-year reviews of development in the north.

- A concern was expressed about outsiders coming into the community, collecting and recording data, leaving and not returning any information or results.

- Intruders onto existing trap line areas affect wildlife populations due to poor mining practices and lack of environmental and wildlife considerations. These same people also trap in the community's traditional trapping area which results in declining revenues for trappers and less wildlife for sustenance use by local people.

- There is a need for maps to show burial sites so they are not desecrated in any future land developments

- We hear of (southern) people flying around in helicopters to shoot moose. We do not appreciate these sport hunters who only take the antlers. This is disrespect. We have to use every part of the animals we hunt. We also find intruders on our trap lines. This happened as far back as 1933 when I came upon a driller while out shooting for rabbits. My mother told me there was a lot of exploration and mining in the early days.

- Outfitters planted wild rice in my trap line. Over time we have noticed the fish disappearing from this area. I met this person and told him he should not have done this in the first place. No one talked to us about this development.

- There was talk some years ago about planning for the land in our area. The Island Lake Tribal Council has begun to look at how the land should be cared for.

- The people of Wasagamack need to work together with the southerners. We have to focus on what is going to happen in our lands. We also need to capitalize on our fishing and hunting skills.

- A representative of MKO spoke about areas that the Community needs opportunity to explore. These are a (1) community development plan; (2) forest management plan; (3) resource management plan; and (4) sustainable development plan.

- Forestry is not offering much employment because of changing modern technology.

- We need economic development; government is stalling development.

- Our children's education service is below provincial teaching standards.

- Our business is presently going to Pine Dock, then Gimli and Selkirk. They value our business

- The province should sell Crown lands for development by local land developers. I am specifically referring to a piece of land, which is not pristine, but on which other activities used to take place but no longer do. All that remains now is a bunch of run down buildings. To allow local residents to make use of such lands is sustainable development in my opinion.

- Trust issues are non-existent with government initiatives (i.e. lodges and cabin development). Government did not follow the recommendations of the community in the past, why should we trust them now?

- The Prospectors and Developers Association should be represented on the East Side Advisory Committee.

- Community is all for economic development.

- We need to develop our own plan.

- If we tell you what we want, what guarantees are there that we will get what we want?

- We are working on several proposals that involve our traditional land and we are asking for total control.

- Does the area that Tembec is planning to cut involve Bloodvein, or is it part of the planning area? We want to do the cutting ourselves, not Tembec. We are in a process of looking at deals like the one Pikangikum has with their Whitefeather Initiative and co-management model.

- We are not a stand-still community; we are looking forward to young people gaining employment.

- Why should we be interested in mining activity when the broad area plan is going to prevent such?

- Land regulations contravene Mining Act.

- Bissett is a mining town and residents believe there is mining potential for the area.

- Mining is the lifeblood of Bissett. Exploration needs to continue.

- Government bureaucracy is causing problems with respect to mining activity. To keep a claim valid, one has to show some kind of development or be in violation of the Mining Act and loose the claim. In many cases, people have been refused permits to travel forestry roads to their claim.

- Government must allow claims in the area. The government supports the community, however not in the way the community wants them to.

- Nopiming and Atikaki Parks restrict mining development.

- It appears that the message that Manitoba is not open for business is getting outside to the industry. American mining investors are going elsewhere when they learn the Hayes River will be set aside as a heritage river. How will this affect future mining exploration activity?

- Residents want to benefit from mining and want to stop restrictions imposed by park regulations and legislation.

- A Canadian Heritage River designation impedes mining exploration.

- Who is going to replace the vacated mining representative position on the ESRT.

- There is a need to create a local advisory board. This initiative is an opportunity that the community must seize now because if it does nothing it would lose an opportunity. We want to be involved in benefits, partner and training for anything happening in our region. We will block any developments done without consultation.

- The First Nation needs employment and has identified employment opportunities with Manitoba Conservation as a part solution to local unemployment issues.

- First Nation identified future resource sharing as a means of financing resource management.

- Atikaki Park closed all doors and no economic development opportunities.

- Members expressed the concern that if the forests are not cut and used it will burn and no-one will benefit.

- There is high unemployment in our communities, because when there are any development opportunities arise, proponents bring their own people to work on local projects. We have a lot of traditional people here that are qualified to work.

- Tourism would be a plus for the community.

- Economic development over the next 10-1 5 years is a major priority for the community.

- Development of a fish processing plant is currently being discussed. Fish is currently being sent to Freshwater Fish Marketing Board.

- Need to develop eco-tourism.

- Growing cranberries could be a viable opportunity for the area.

- First Nation identified wild rice harvesting as an opportunity they can develop and maintain.

- The construction and maintenance of a local airport would bring much needed jobs in the area as well as bring the costs of goods and services down to acceptable levels.

- The construction of a local airport would improve medi-vac programs for those individuals who require medical emergency assistance.

- Job creation is a major concern for the First Nation. Current unemployment rates range in the 80-90 percent. The council indicated commercial fisheries in the area would improve job creation, however, transporting fish would remain a high cost to the industry.

- The First Nation remains opposed to Outpost hunting in the area. This was done without consultation with the local people. The First Nation wants to work closer with the Natural Resource Officers who frequent the area. They want their people hired to work alongside the NRO's and believe the province has sided with local lodge owners and favour these owners when developing policy on lodges in the north. People who live in these areas (north) should be given priority when policies are developed.

- All communities in the southern portion of the study area have been developed around logging. We need logging and mining on the east side. Logging is much more environmentally sensitive today.

- It is not easy to reforest a mature forest; it is much easier to reforest an area after has been cut.

- Why wasn't Manitoba Tourism in the video? We should be looking at the potential of this sector instead of forestry and mining.

- There needs to be more support from Tourism Canada, not just from the Province of Manitoba.

- If the First Nations claimed the beaches on the east side of Lake Winnipeg, they could get millions of dollars in return.

- Development on the East Side has to do with resource harvesters, not First Nation's people. Forestry harvesters and cottage developers will benefit from development.

- What benefits do we get from Forest development? We were promised jobs by past forest operations, it did not happen.

- Ecotourism should be seen as an alternative to forestry and mining. Bring in German tourists who want to learn about our culture.

- Mining raises red flag; companies create pollution. They provide jobs, but what about safety?

- Should have First Nation people looking after natural resources.

Roads

- An all-weather road would cut through many traplines and trappers would not get anything from it.

- An all-weather road has all sorts of advantages including training for heavy equipment operators.

- Oxford Lake was closed for fishing due to high transportation costs to market. We were throwing away our catch because there was no transportation to market. It is a waste of time, energy and fish. Pickerel is the only viable species now and it is three times the work. Need to build a road to transport fish out. Advantage of road – transportation the fish, shopping trip, etc, - all weather road is the answer. On the other side more influences coming in and not all good influences. We need to be aware of that.

- Do not talk about a hydro line before a commitment to an all-weather road as the community cannot continue to be at an economic disadvantage due to an absence of all-weather road access.

- We see the pros and cons of roads to communities. The social impact has to be addressed when we see a road coming into Garden Hill. A lot of elders have expressed they do not want a road because of the destruction of life from alcohol and drugs.

- There is concern about a proposed road which can be built from North of God's Narrows connecting Northern Ontario.

- An all-weather road would effect Treaty #5. Right now there is no money coming this way for road development and maintenance of existing network. Available dollars are not reaching into the northern areas.

- If a road goes through we need to get our lands back for ecotourism. We are not getting our share.

- We have 3rd world roads here.

- Tourism does not benefit Bissett. The road through Nopiming bypasses Bissett.

- Government has negatively impacted Caribou when they developed the road through Nopiming. Road development has affected the Owl Lake Caribou herd (Black Lake calving grounds).

- Pave road from Manigotagan and finish straightening road to Bissett.

- What is happening with the Cat Lake to Red Lake Road?

- Jobs are needed in Bissett. Some have to leave by spring for work.

- Are they going to hurt the rivers if the road comes?

- A proposed road on the East Side of Lake Winnipeg would impact inhabitants, wildlife, eco-system, etc.

- We are preparing for the all weather road by training our people how to use the heavy equipment needed too build.

- Pros' and cons of an all weather road discussed - would lower the price of goods and transportation.

- Communities will need an analysis on what impacts an all-weather road will have on them. Elders have expressed some negative thoughts a road would

bring to the community, such as alcohol, drugs and gang related problems. Government in the end will go the cheapest route.

- The cost-efficiency or feasibility to build an all-weather road up the east side of Lake Winnipeg is questionable.

- We want an all-weather road because we see things will be cheaper for us to but, but we are also concerned for our youth because this road will make it easier to bring in booze and drugs.

- We are not opposed to an all-weather road as it would help alleviate the high cost-of-living for First Nation people. We would like to see road access to communities before hydro lines go through. What are other communities saying about this?

- We would like our road and human issues dealt with before Hydro.

- I can't see that there is anything wrong with an all-weather road. We would have benefits such as forestry and tourism.

- The community would want an east-west road connection. Use the winter road alignment so as not to disturb any more landscape.

- Who is pushing for the all weather road? Government or communities?

- Government needs to hear from communities other than Island Lake in regards to an all weather road.

- Local people need to be hired if an all-weather road is to be built.

- Money should be spent on existing roads before a new one is planned for the east side.

- An all-weather road is important; it would be good for groceries. Concerns raised around all-weather access to the community included a negative impact on the lodge, on young people (access to drugs) and possible abuse of traditional areas. Highway would have to be kept clean by R.C.M.P. It is not going to be easy.

- Any routing of an all-weather road should connect God's River with Thompson.

- Is there an issue with stopping the road in the East Side?

- It would be a blessing to have a road for those communities.

- Why does Manitoba Hydro get to say "no" to the road?

- Since the construction of the highways, the three types of Caribou who used to be here, no longer inhabit this area.

- Internal road conditions pose health and safety concerns that have to deal with on a constant basis. Can the round table help the community lobby for better roads?

- Road access into traditional lands would impact on wildlife and traplines.

- The annual practice of building winter roads is that they are built too late in the season. There is a need to ensure the winter road is built earlier by the band. There is lack of capacity and experience for neighboring communities to do the job they need to do.

- Since the construction of the highways, the three types of Caribou who used to herd here, no longer inhabit this area.

- Concern that once the road is built people will follow with their developments. Outside influences coming into the community could be a concern.

- Current road into the community is in terrible condition and needs repair.

- Government won't build a road unless it is for there own needs. It won't be built because the community wants it. It will be built because of the resources the government wants and needs.

- There is support for the construction of an and all-weather road, but not more Parks.

- Costs in the north are directly related to the freight costs.

- An all-weather road would not only be helpful to the community, but also to taxpayers.

- Health problems are greater in the north; a road would help alleviate much of the problem.

- You cannot find nurses to go north because they have to fly.

- Education in health and diet, as well as nursing, ambulance and police services, would all improve with a new road.

- If a road goes into a remote area, concerns about culture are what that area makes of it. People from remote areas must leave their community on medical trips and have no one to escort them, visit them, or aid in their recovery, because others can't get to and from the hospital by road.

- There are a lot of untapped Federal dollars that could be put to training programs for local people to develop an all-weather road. This would create local employment.

- What ill effects will an all weather road do or have? Has the road through the Interlake affected the environment?

- If our First Nations brothers want a road we should support them.

- If an all-weather road is built, funds should not be deducted from our INAC funds.

- Give dollars for road development to communities to lower their costs for consumption.

- What benefits will First Nations get out of an all-weather road and will we be compensated for its impact?

- How do you protect the environment if a road goes through?

- Roads construction will affect plants and animals and therefore how can treaty rights to hunt not be impacted?

- What are other communities saying about an all-weather road?

- A road will open up the drug trade and communities will lose their language. Look at Cross Lake and Hydro and the negative consequences it caused.

- Communities have to be educated on the all-weather road and its impact.

Hydro

- Hydro promised money ($8000.00 per trapper) to trappers who were hit by the development but they did not follow through. I get the same impression about the round table.

- It is critical to understand and be aware of the many sites of historical and cultural significance before proceeding with roads or hydro.

- We have heard from Hydro before. They came to us, but did not give us enough time to respond. You have to give us more time. There is a lack of information provided by Hydro for the community to adequately respond or participate. We do not want a poor consultation process. We do not want this to be like the Hydro process.

- Manitoba Hydro held a consultation process on its hydro Bipole lll transmission line but shared only what they wanted and expected the community to learn everything on that day. Time will be needed for the community to absorb the information and get it out to all the members in order to fully participate in this process.

- We have concerns with hydro and Bipole III.

- Why are there no muskrats and fish anymore? Is it because of hydro?

- Manigotagan does not want the Manitoba Hydro BI- Pole line running trough their community.

- At what stage is Manitoba Hydro at in getting their line in?

- Can the north-south hydro line be done in collaboration with the winter roads, ie. make 1 instead of 2 corridors?

- Why not put the roads and lines together so they do not have to use so much forest?

- I can feel the effects of the damage that Hydro has done, the water levels are low.

- There has been destruction from Hydro in the past with little compensation.

- Is there compensation for impacting trapline areas of First Nations if hydro lines go through?

- A question was asked where BI-Pole lll was going to be erected and how close it will come to the community.

- The community of Manigotagan is planning to expand their boundary up the Manigotagan River to the second falls. Because the community is situated on the river, they wish to continue growth along the river. While the Manigotagan River Park Reserve is willing to start at the second falls, there is a concern that once the BI-Pole II comes down, the Province will take the land back from the community for this line. This is something that the community does not want to see happen.

- There are concerns respecting the proposed Manitoba Hydro BI-Pole lll transmission line and how it will impact employment opportunities for the communities.

- Once the report is completed will the committees be consulted and will Hydro work only with the round table?

- Compensation concerns from Manitoba Hydro to the First Nation were raised.

- We need to know what Manitoba Hydro has in store for us. We cannot create an effective community plan without knowing where the hydro-line is going to be placed.

- Hydro maintains its transmission lines by using chemicals to kill plants. Imagine what that will do to our trees and animals. We would like to know what type of chemical they will be using and have any existing studies forwarded to us.

- Hydro lines and roads will destroy our traditional way of life. How are the young people going to survive?

- Are they going to put the lines in the north, but distribute the electricity to the south?

- The cost of hydro in the north shows we are not getting our share of the resources sold.

- We will not be able to tap into the hydro lines.

- Are there any studies of the effects of transmission lines on humans and the environment? If so, we would like to see them.

- Are there any studies being done on the effects of dams and the associated lake quality and lake level changes? These factors affect our livelihoods. What about studies on the rivers, river levels and river water quality? Also we need to know the effects of control structures on our water systems. Our water has gone down 4 feet and it is affecting our fishermen.

- Hydro should consult if they have a plan in place.

- Do you come out and help us with an action plan to stop it development if we do not want a hydro line here?

- Hydro development along the east side is a concern for the community.

- Hydro rates are a serious concern to local residents. They provide examples of current rates for an average sized bungalow is approximately $200.00 while rates in the south for similar size home is approximately $75.00 per month. Manitoba Hydro has introduced an insulation program to help defray hydro costs, however, liaison and communication between Hydro and the

First Nation administration has not been the best. The First Nation wants to see rates lowered through any means.

- How will the Hydro projects on the East Side impact the ESPI Process?
- Is the extension of 304 highway north talked about in connection with hydro development?
- Tembec and hydro do not care about damage, they care about profit.

Other Issues and Concerns

- We need to plan what we are doing in an orderly fashion.
- Gain must be distributed to the community as a whole, not to individuals.
- More meetings are needed.
- If a trapper looses a cabin in a fire is there a way that he can be reimbursed for it?
- This information should go to the schools for study and response.
- Need to look at funding for informing the community of the process.
- Concern raised because of the lack of community members at the meeting. Another community meeting recommended allowing for more involvement from the rest of the community.
- There is a need for more information on the ESPI process.
- Government can promise anything but not deliver because in the end government will do what they want.
- There is a lack of trust between communities and government.
- A suggestion was made to include all East Side communities in one meeting.
- Maps don't show territorial lines due to lack of funding and shortage of technical people. Need for technical people to assist the community in this process.
- If the community does not become involved in the process, they will be losing an excellent opportunity to participate in planning and development activities.

- Community is concerned of the short timeline.

- Where is the funding coming from.

- What are the next steps to this process?

- The people of Garden Hill need to hear from other communities. Why not get a few people from the 16 communities to get together to see if there are shared values. We need to understand one another. Recommend two or three from each community.

- The East Side Planning Initiative is entirely new to us and more information is needed. Who are the 22 people on the round table? Where are they from? How were they appointed? Is there a timeline for this process?

- Once the recommendations have been made, when will they be given to government?

- Is there any one community that can stop the process? There may not be consensus at the end of this process because different groups have different interests and views.

- Will there be a possibility to meet as a community to discuss this process to include all members.

- Is there any one community that can stop the process? There may not be consensus at the end of this process because different groups have different interests and views.

- Will there be a possibility to meet as a community to discuss this process to include all members.

- The ESPI ties in with some of our community initiatives.

- The maps on the wall need to be blank so that we can identify what we want to protect as ours

- We are hindered in what we can do in our territory because of our circumstances.

- Non-Aboriginal people have to work with us; relations between us have to improve.

- Decisions will be difficult given all the competing issues.

- It is unrealistic to expect communities to develop positions by June 2004. This date makes the process seem like it is being fast-tracked. Communities need time and resources (money, facilitators, etc.) to identify issues and formulate positions on them.

- Manigotagan will share its community plan with the round table when it is ready.

- Who is to tell us how to make these decisions and who will help us develop a plan?

- What advantages does the west side have when the East Side opens up?

- What are other communities saying about their issues? They might have said things we won't think about and vice-versa.

- Only a small part of original Manitoba left; it is fearful what is happening.

- What are the government's plans regarding the development of the East Side?

- There is a need to find a way to get community members more informed about the East Side Planning Initiative. Radio and TV could be used and information is required in the local dialect.

- There is a need for more discussions between government and the community.

- There is a need to have more Elders involved in this process.

- Youth must have a role in this process as they are excluded most times.

- Everyone needs to work together in this process.

- The East Side Planning Initiative requires more time to discuss issues focussing on aboriginal interests.

- A concern was raised regarding the composition of the Round Table: how many Aboriginal people were on it and how many lived in the planning area.

- Concerns were expressed about how NACC communities would receive fair representation and what they could do to ensure their recommendations are honoured.

- The deadline to complete the plan by June 2004 is unrealistic. It is unrealistic to expect communities to develop positions before then.

- Media needs to be kept in check and lines of communication need to be clear.

- Local trappers and fishermen need to be represented on the round table.

- There should also be a trapper representative and a fishing representative on your round table.

- Farmers get compensated for loss of income. So do East Coast fishermen. Trappers have lost income because of markets. Trappers should be treated the same as farmers with respect to loss of income.

- People in the south need to be educated about our ways in the north – they get a slanted view of our ways. The South has no understanding of the hardships here.

- I have expressed my concerns many times. The creator gave us the resources – all the things on Earth. These are what define us as First Nations. My concerns over government are decisions that affect our identity. As an example, First Nations had their own way of child rearing. We believe that it is important to discipline a child. Now there are laws against this and it results in delinquency. Also, the government has wanted to assimilate us and change us to white people.

- Due to the language barrier and infrequency of communication between the two cultures, it is difficult to communicate and resolve local issues and concerns. There is a need to work closer together and translate all literature to Oji-Cree for elders and other community members to understand and participate fully in this process.

- It is preferable to have a united voice representing the Island Lake First Nations. For that reason, the round table members need to sit down with the Island Lake Tribal Council to discuss concerns, ideas and views about their communities and development in the area.

- There is a need for the community to be given time to absorb the information provided and return views and comments at a later date.

- You need to change a few things with this new process. People often come from the outside to speak and get our input, but they never come back. Very few people get involved this way. You need to come back to Wasagamack.

- The next time you come up should be in the winter when the roads are in. Then you can have a meeting with all four communities together.

- Most often people out there come here to tell us what's best for us, but we live here, not them. They come in and take over and say it is in our best interest. They have not walked in our moccasins so to speak. The time

frame is too long, it take too much time and in the mean time the government have their way to control it till they get what they want.

- Safety on Lake Winnipeg is an issue as people have died crossing the lake.

- Need to make recommendations immediately - be preventive.

- Berens River recommended the ESRT advise the government that it would like to see Rupertsland Constituency cut in half.

- We do not condemn the ESPI process; we just do not have a position in place as yet

- We do not think the people on the ESRT represent us. I strongly recommend considering one of the communities like Poplar River or Hollow Water to represent us. They live on the East Side.

- There is a need to have something in place besides just a community forum and working group. There is a need to go house to house.

- Information should be provided beforehand to facilitate preparation and discussion. Provide information by all available means.

- When did this process start? Was there nothing before that? Shouldn't the community have been involved in 1999? Why did it take so long to get to the communities? This should have begun with the communities.

- Need to improve relations and communications with Manitoba conservation, particularly with the NRO'S.

- Chair discussed the INAC funding and use of it for this process. Historical moment for government to open the doors to share information with First Nations people.

- Need for their own conservation officers to police their own community.

- Have more RCMP/policing for the surrounding communities.

- Concern was raised regarding child welfare issues in the communities. What is government's strategy to deal with alcoholism and rampant drug abuse by adults and youth? This is the future of the communities and more priority should be given on these life and death issues.

- We are beginning to return to traditional medicine.

- Should be able to revisit the plan and have a renewal within 5 years and have the ability to revisit because changes will continue to change in the area.

- Norway House NACC is currently in the process of creating a community plan. Northern Affairs has been dealing with Northern Flood issues and this has pushed their planning back.

- Current road into the community is in terrible condition and needs repair.

- Trappers and elders communicate in Cree so there is a need to make the information available in Cree.

- Tembec open houses are being held for the public. Tembec is not a proponent on the all-weather road.

- Is the extension of 304 highway north talked about in connection with hydro development?

- Send future information to Powerview Metis Local through the Manitoba Model Forest.

- People in the community are educated and must be listened to.

- What ill effects will an all weather road do or have? Has the road through the Interlake affected the environment?

- It is startling on how the wealthy all over the world try to tell us what to do we are being watched by the world. There was a person from Germany in Hollow Water begging the people of Hollow Water to stop this process (ESPI).

- How much time is being spent in schools? It is their future and they need to be involved. We must get information to the schools, to teach the children to protect the environment but still have progress and development

- We in the community have to have a say in what is going on. We need to have a strong understanding of what has to be done, not some millionaire in Florida.

- The community of Pine Dock expressed concerns about not being notified well about East Side meetings and requested that information be sent to them in a timely manner so that they would be ale to comment effectively.

- Communities must be advised of the park issues, so that they understand the impact.

- Is it odd that chronic wasting disease is rampant in Manitoba's major National Park, Riding Mountain, where logging and hunting are prohibited?

- The environmental people should come to talk to our community so that we can tell them how we feel.

- There should be more Elders and youth involved in the process.

- Promote students in each First Nation. Students have role to play and need to work closely with your office. Set up a sub-office in Sagkeeng to help students gather information and advocate on behalf of their First Nation.

- Pine Dock wants to be consulted on land transactions and allocations in the area.

- The maps you have arrived with have no Anishinabe input.

- When I was young, we lived off the land and didn't need help. We had an abundance of resources. Then change came in a form of a document called The Indian Act. In 1942 a person pushed for the Indian Act, from British Columbia. Our chief went against it, he knew enfranchisement was coming. In 1948, chiefs were called in to revised the Indian Act. It was rejected but passed through in 1951. Our Chief John Thompson was disregarded, and the Federal government declared elections. Sagkeeng had been in a downward spiral ever since. We were self-sufficient until 1951; money wasn't needed, goods were traded.

- If we put resources too use in comminutes today, we would teach people to be like before 1951.

- Tembec and First Nations have to work together to develop a committee to define Traditional Ecological Knowledge projects and surveys. Is TEMBEC committed to funding TEK mapping?

Legal Impact of the Status Report

The contents of this Status Report – the narrative, analysis, observations, and recommendations are presented to the Government of Manitoba in the spirit of good will and good faith. The Government of Manitoba is committed to improve the relationship between the people of the province and First Nation/Aboriginal peoples based on principles of mutual recognition, mutual respect, and mutual responsibility. Nothing in this Status Report shall be construed to restrict, compromise or fetter the ability of First Nations and Aboriginal communities and their members to fully enjoy the Aboriginal and Treaty Rights recognized and affirmed by the Canadian Constitution and the evolution of Canadian case law. The Government of Manitoba, in creating the East Side Planning Initiative, has affirmed that the content of this Status Report shall not be construed to alter, replace, or fetter the legal responsibility and obligation of the provincial government to engage in meaningful consultation and accommodation with respect to any and all issues identified in this report.

"Promises to Keep[1]..."

Towards a Broad Area Plan *for the East Side of Lake Winnipeg*

Dedicated to:

The future of the people
of the east side of Lake Winnipeg
and to the land which will continue to sustain them.

[1] The title of the status report is taken from the final stanza of the Robert Frost poem ***Stopping By Woods On A Snowy Evening***

> The woods are lovely, dark and deep.
> But I have promises to keep,
> And miles to go before I sleep,
> And miles to go before I sleep.

September 2004

The Honourable Stan Struthers
Minister of Conservation
Government of Manitoba
Room 330 Legislative Building
450 Broadway
Winnipeg, MB R3C 0V8

Dear Minister Struthers:

On behalf of the East Side Round Table and the First Nations Council, it gives us great pleasure to submit to you our status report on the development of a Broad Area Plan for the east side of Lake Winnipeg entitled *Promises to Keep*. For your convenience and reference, as well as for broader distribution, we are also pleased to provide you with a separate executive summary of the status report.

In presenting this report to you and your government, we wish to assure you that we have laboured long and hard to both gain the confidence and understand the preferences of the residents of the east side of Lake Winnipeg concerning the current and future land use of this magnificent area.

As our report will outline, there have been numerous meetings and discussions with interest groups and stakeholders, Northern Affairs and Métis communities and the leadership and residents of First Nations communities, the latter comprising over 96 per cent of the population of the east side of Lake Winnipeg. As the first prototype and flagship initiative emanating from the recommendations of the Consultation on Sustainable Development Implementation, this status report will affirm that the Government of Manitoba has embarked on a unique and promising venture – a venture that seeks to empower the residents of the east side of Lake Winnipeg and engage them in a process that increases their access and control over decisions that will affect the quality of their lives. On their behalf, we commend your government for initiating this most important dialogue.

The development of the Broad Area Plan has not been completed. Yet much has been accomplished in defining a sustainable land use plan for an area equivalent to one-eighth of the land mass of Manitoba. While this status report provides you with a measure of our progress, much remains to be done in our quest to protect the environment, assure sustainable development in the area and achieve certainty for investment and economic development ventures.

We believe that our preliminary observations and recommendations chart a precise and measurable course on the path to completing the Broad Area Plan and we strongly recommend that the Government of Manitoba stay the course through to its completion. The *Memorandum of Understanding* with First Nations communities and the promise of one with the Métis Nation residents on the east side of Lake Winnipeg, the extensive consultations with Northern Affairs communities, and the pending comprehensive dialogues with Manitoba's First Nations communities on the east side of Lake Winnipeg, will shape a Broad Area Plan based on thorough consultations and a sensitivity to the environment that is unparalleled in recent Manitoba history.

The recommendations contained in this report are based on extensive preliminary consultations with communities on the east side and the dedicated work of our colleagues on the East Side Round Table, the First Nations Council and the Advisory Committee. We are convinced that this East Side Planning Initiative will produce a Broad Area Plan that will not only serve the residents of the area and the interests of all Manitobans, but will also define the future of Broad Area Planning and sustainable development in Canada.

We commend this work to your attention and respectfully request that it be permitted to reach its natural and positive conclusion.

Respectfully yours,

Chief Phil Fontaine
Chair
East Side Planning Initiative

Elder Ed Wood
Associate Chair
East Side Planning Initiative

Acknowledgements

September 2004

The Honourable Stan Struthers
Minister of Conservation
Government of Manitoba
Room 330 Legislative Building
450 Broadway
Winnipeg, MB R3C 0V8

Dear Minister Struthers:

The preparation and submission of this status report, *Promises to Keep,* and the separate executive summary which accompanies it, is premised on the assumption that it is but an important waypoint on a path that will lead to Manitoba's first Broad Area Plan based on the sustainability principles identified in the *Consultation on Sustainable Development Implementation,* which your government has adopted as policy. The East Side Planning Initiative (ESPI) has begun a comprehensive and inclusive process of information sharing and gathering. The complexities of the many issues at hand require no less.

This status report, the contextual observations and many recommendations it contains, owes its genesis, first and foremost, to the many people resident on the east side of Lake Winnipeg who took the time to attend community meetings and express their concerns and ideas. This report, in thanks for their participation, is dedicated to them and their fellow citizens.

The East Side Round Table and the First Nations Council, as duly constituted and in working groups, have spent countless hours hearing of people's concerns, listening to presentations, sifting through forests of documents, reports and expert opinion, debating the issues and, finally, crafting this status report. That they were able to do so while respecting the diverse views and disparate interests of those around each table, is a testament to their dedication and commitment to this process. Thanks are also extended to the members of the East Side Advisory Committee who took the time to attend meetings, and furthermore, took advantage of the opportunity to submit observations and recommendations to the ESPI.

Appreciation is also extended to Phil Fontaine who retained his role as chair of the East Side Round Table and First Nations Council even after assuming the onerous role of National Chief of the Assembly of First Nations. A particular vote of thanks is given to associate chair Ed Wood who so often went above and beyond the call of duty in encouraging participation, supporting the goals of the process and providing his expertise, influence and credibility in developing a common agenda.

Our appreciation is also extended to community leaders, elders, and co-coordinators who facilitated and took an active part in assisting the ESPI process; to community residents who attended meetings, prepared thoughtful interventions and attended ESPI Open Houses; to the many presenters who appeared before the Round Table and the First Nations Council; to the numerous organizations and individuals who supported the preparation of the East Side Youth Conference, which we hope will materialize in the fall of this year.

Thanks are also offered to the minister and officials of Manitoba Conservation, as well as those departments and agencies of the provincial government that facilitated and supported the work of ESPI.

And finally, I would like to thank each member of the secretariat and the consultants who have supported our work. Their tireless pursuit of excellence and the professionalism and respectably demonstrated in supporting both the East Side Round Table and the First Nations Council in their pursuit of an independent course in crafting this report, have been very much appreciated. I know that I speak for both the Round Table and the First Nations Council in expressing appreciation for the efforts in preparing the numerous drafts and re-drafts of this report.

Without these contributions, the Round Table and the First Nations Council would not have achieved its impressive list of accomplishments in preparing *Promises to Keep.* As the title suggests, this status report is but a stop along the pathway that we must continue to walk to fully complete the Broad Area Plan for the east side of Lake Winnipeg and its accompanying protocols. In starting this important initiative, it is hoped that the Government of Manitoba will see it through to its fruition.

Peter André Globensky
Executive Coordinator
East Side Planning Initiative

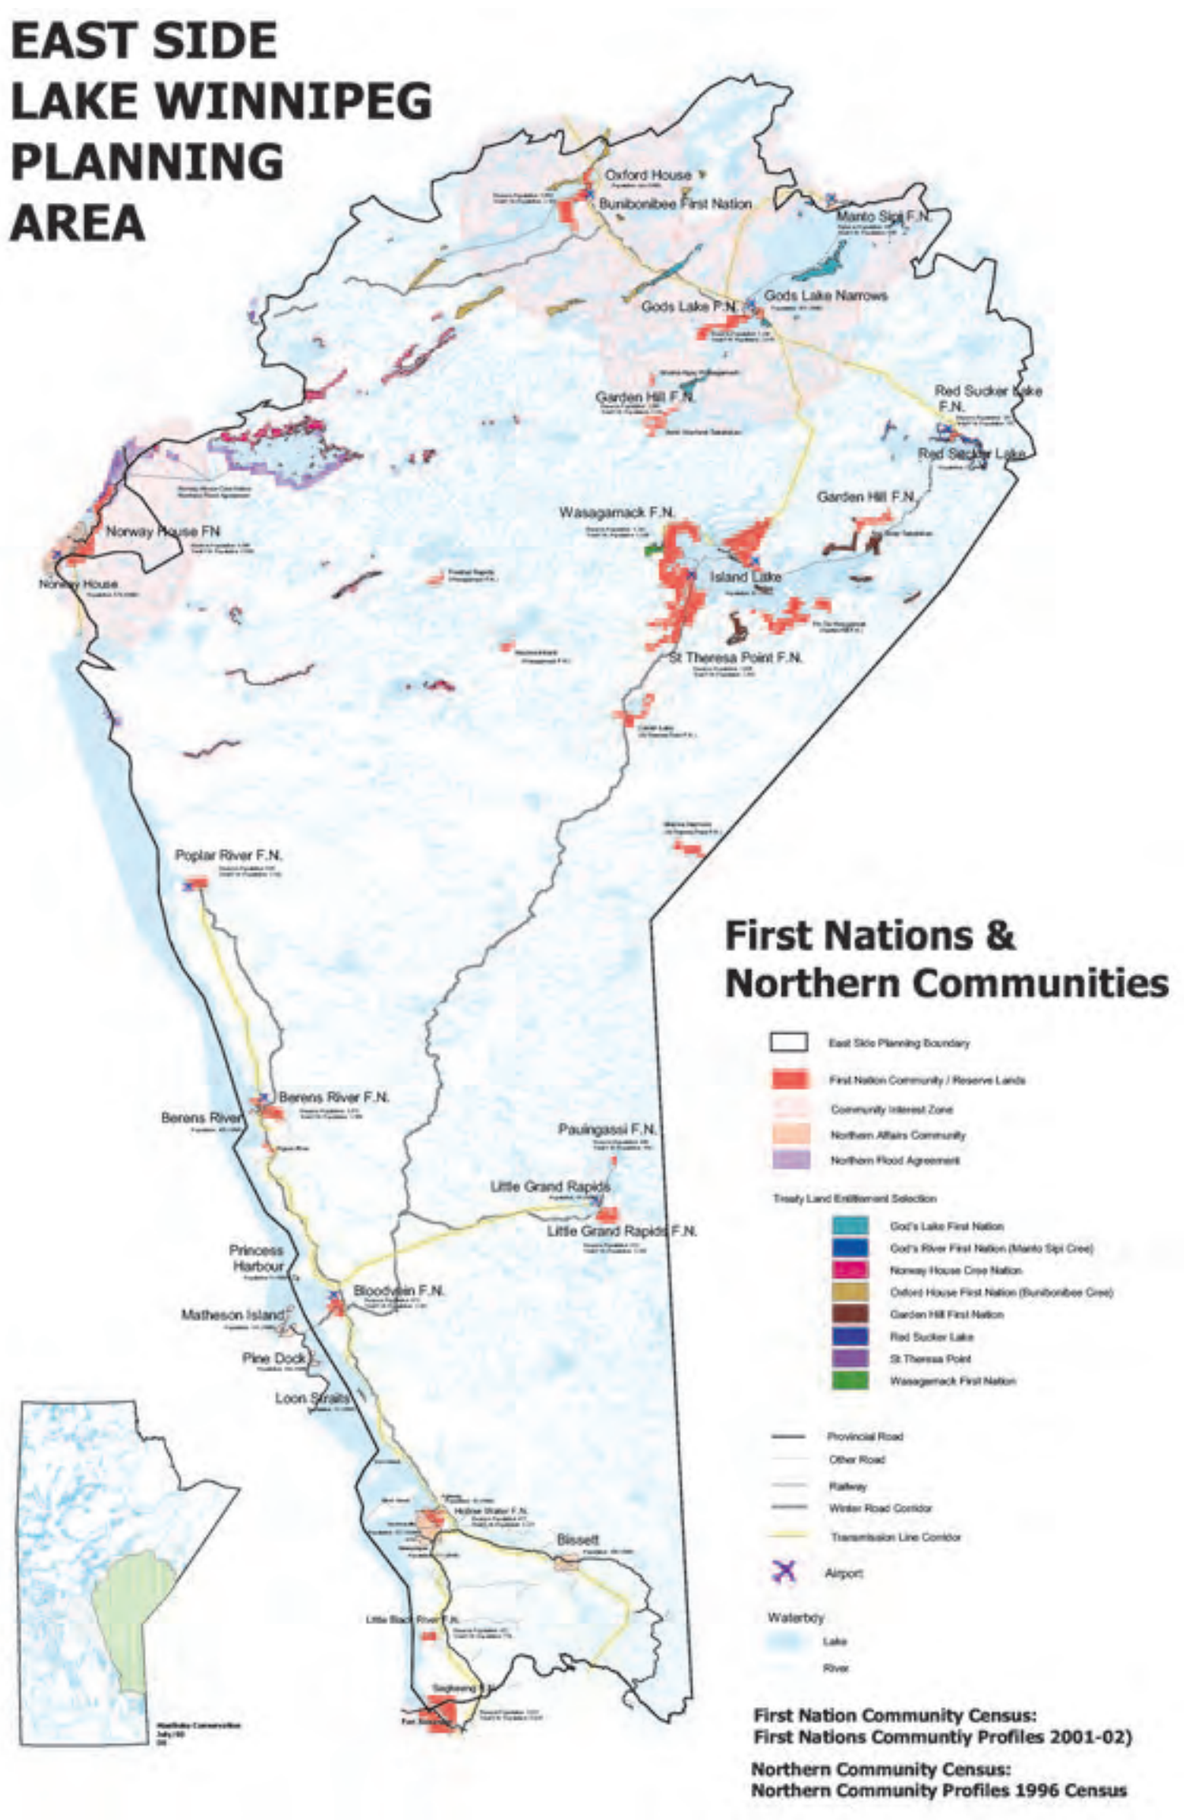
2. Introduction

The East Side Planning Initiative was born out of the Consultation on Sustainable Development Implementation (COSDI) that was undertaken between the fall of 1997 and the spring of 1999. The multi-stakeholder, consensus-based process produced a report that was adopted by government in October 2000. The report recommended that the implementation of sustainable development include the creation of broad area plans (BAPs) across the province. Broad area planning is defined as *integrated and coordinated planning that is based on the sustainability of the ecosystem.* Such a planning process ensures that future land, resource and development decisions address the environmental, social, health, cultural and economic needs of the public, local communities, First Nations and various stakeholders and interest groups.

The COSDI report outlines the basic framework for such a planning process. Advocating that all planning must be based on principles of sustainability, the report made recommendations regarding openness and transparency in the process, the need for relevant information to be readily available on a timely basis, the use of traditional ecological knowledge (TEK), the development of protocols to guide consultation with Aboriginal peoples and the development and use of capacity-building mechanisms to enable meaningful public participation.



The East Side Planning Initiative (ESPI) is the first large-area planning exercise since the adoption of the COSDI report. It is a complex area, requiring a complex process. It covers a large geographic area – approximately 82,000 square kilometres – housing many diverse and disparate interests. Although its population is largely situated in 16 First Nations communities, each with its own aspirations, there is a significant interest in the area by other Manitobans because it represents to some an area of pristine beauty and to others, exciting economic development potential.

East Side
Planning Initiative

To address this mix of aspirations, and remain consistent with the COSDI philosophy, the ESPI has undertaken the task of involving local residents in the details of the planning for the future of their area.

This is a status report on the progress being made by the ESPI process in the development of a Broad Area Plan for the east side of Lake Winnipeg. By July 2004, the deadline set by government for submission of a draft plan, the process of plan development is incomplete. The East Side Round Table has engaged in the most rigorous public consultation process in the history of the province, and in the course of doing so, has developed a proposed vision for the plan area and some preliminary recommendations, as listed below. However, the process is not yet finished. More discussions with communities and First Nations are necessary in building a broad consensus for the direction to take in the emerging plan. This direction is forming, but has not yet fully formed.

This executive summary provides a detailed synopsis of the contents of the main "Promises to Keep" Status Report. A lengthy list of references used or received is also included in the master document, copies of which will be made available to east side communities. The executive summary and the main report will be available to the public in both print, electronic and CD versions and will be posted on the ESPI website. Copies of the extensive references will be available at all Manitoba Public Registry offices.

3. The Broad Area Plan: A Statement of Vision and Values

The area of eastern Manitoba contained within the boundaries of the East Side of Lake Winnipeg Broad Area Plan is one of unparalleled beauty and rugged fragility. It is some 82,000 square kilometres in area. Thirty-six thousand residents living in 34 communities inhabit the east side, and over 96 per cent of that population is First Nations peoples. The geography is part of the largest ecozone in Canada (Boreal Shield) and contains the fourth largest, contiguous boreal forest in the world. As any of its residents who live there will tell you, it is a special place, deserving of special measures to ensure that the environment is protected and all development is sustainable.

The East Side Planning Initiative (ESPI) seeks to put into practice the vision articulated in COSDI. This was "To develop an integrated framework for large area and municipal planning, significant resource allocations and environmental management decisions to ensure sustainable development in Manitoba."

The vision for ESPI is based on the fundamental principle that the land is and must continue to be protected.

Further, it is a vision which:

- equates the importance of human development with the requirement for a wise and sustainable stewardship of the land, thereby recognizing the rights of the inhabitants who live there to have access to services and necessities that will improve the quality of their lives;
- regards the East Side as a protected landscape within which economic development activities are permitted if it is agreed that they are sustainable and benefit local communities;
- believes human development must be grounded on integrated and coordinated planning that honours the social integrity of communities and the natural integrity of the environment;

East Side Planning Initiative

- commits to planning for the sustainability of the ecosystem, where our human interactions with it must maintain or restore ecological integrity and not cause it to deteriorate;
- invites Manitobans to steward and value all the resources that may be found there. These resources include the cultural uniqueness of those who live there and the natural resources that have defined and contributed so significantly to our economy; and
- embraces the immeasurable value to our spiritual and psychological well-being that is provided by a landscape of animals, forests, water, air, soil and rock all of which comprise the natural capital of the area. This landscape has contributed to the definition of our character and identity as Aboriginal peoples, Manitobans and Canadians.

There are a number of fundamental values that surround the broad area plan and give it integrity. It is critical that the interests and desires of those who live on the east side of Lake Winnipeg be incorporated into the fabric of the plan. As well, it must incorporate an ongoing mechanism that will provide for meaningful public participation in the further development and governance of the plan. The broad area plan must recognize the enormous influence of the area's cultural landscape. As such, it will honour the significant historical relationship that continues to exist between the land and its first inhabitants, and will recognize, affirm and be in compliance with Aboriginal rights and treaty obligations. It will incorporate inclusive *Protocols of Agreement,* recognizing the importance of the consultative process and the nature of the government-to-government relationship.

The Broad Area Plan places an exceptional value on the importance of traditional ecological knowledge and sound science in the development of a comprehensive land-use planning information database. In the temporary absence of such, the "precautionary principle" will become the automatic default mechanism. In other words, in the absence of adequate information about natural resources or threshold limits, decision-making will be on the side of caution. Planning precedes development; therefore, planning must be based on verifiable and comprehensive knowledge. Without data available to support human activity or development, it is not in our best interests, nor that of the environment, to proceed.

Once completed, the East Side of Lake Winnipeg Broad Area Plan will provide strategic advice and direction to east side communities, government departments and agencies, and everyone engaged, or thinking of engaging, in commercial and recreational activities in the area.

It is with this comprehensive and collective vision, and upon these values, that the Broad Area Plan for the east side of Lake Winnipeg will be developed.

4. The East Side of Lake Winnipeg Broad Area Plan

Following the announcement of the Broad Area Planning Initiative for the east side of Lake Winnipeg in 2000, a three-member government review panel was established to discuss elements of the initiative with First Nations, local communities, the public, industry, non-government organizations and others interested in the future of the area. These elements included the boundaries for the planning area; the steps and timing for the planning process; major issues within and options for the area; and appropriate mechanisms to guide the input and formulate the plan. A final report was released to the public through Manitoba Conservation's Public Registry Network. The report was also placed on the East Side Planning Initiative website at ***www.gov.mb.ca/conservation/eastsideplan***. Subsequently, an East Side Round Table, an East Side First Nations Council and an Advisory Committee were struck to respectively direct and advise the process, all of which were served by a Secretariat.

Following numerous orientation and issue–presentation sessions, the Round Table and First Nations Council moved to establish an extensive round of community information sessions for residents of the east side of Lake Winnipeg.

The objectives of the community visits were to present information on ESPI; to elicit community feedback representative of community sectors that included women, youth and Elders regarding conservation, environmental issues, etc. and to exchange information to create greater awareness regarding the east side plan. The purpose and objectives of ESPI were produced on video and in print form in English, Cree, Ojibway and Oji-Cree to assist in communicating consistent information to communities and organizations.

In November 2003, members of the Round Table and the First Nations Council, with the assistance of members of the Secretariat, began a process that would engage all 34 east side First Nations, Northern Affairs and Métis communities in over 80 initial meetings. Comments from the community visits were

East Side Planning Initiative

carefully recorded and presented in a document entitled *What We Heard* (see full report appendices, Public Registry and ESPI website).

Using working groups derived from the membership of the Round Table, the First Nations Council and Advisory committees, the process then focused on preparing preliminary recommendations for the BAP. With the knowledge that a final plan was not possible to achieve within the time frame specified by government, the Round Table and First Nations Council decided to compile a status report based on the observations, submissions and recommendations gathered to date. As a result of this, the need for an ongoing mechanism was seen as critical.

The majority of recommendations in this report are drawn from the issues identified during the community visits and summarized in the "What We Heard" documents. It must be emphasized that the initial community visits were strictly introductory, and should not be viewed as consultative. In fact, a commitment was made to provide resources for engaging in community planning to provide more deliberate input to the process. This is one of the "promises to keep." It also means that the specific recommendations in the report must be considered provisional until further discussion and consultation opportunities are completed and the East Side First Nations Council has had the opportunity to formulate additional community-based recommendations.

Parallel to this process, the First Nations Council initiated negotiations with the Government of Manitoba to strike a *Memorandum of Understanding* committing First Nations governments on the east side of Lake Winnipeg and the Government of Manitoba to negotiate *Protocols of Agreement* that would become a central component of the Broad Area Plan. The Manitoba government committed to a similar process for the Métis Nation resident on the east side of Lake Winnipeg.

Mandate Summary

The mandate provided by the Minister of Conservation to the East Side Round Table (ESRT) and the First Nations Council (FNC) was identified in the *Phase I Final Report.* It called for recommendations for the development of a broad area plan that would take the following topics into consideration. Chapters 5 and 6 elaborate each of the mandate issues:

Treaty and Aboriginal Rights; Aboriginal and Community Development; Traditional Activities; Protected Areas; Consultations on Land and Resource Allocations; Existing Land Uses and New Development Proposals; Forest Resources; Transportation Issues; Tourism and Recreation; Hydro Issues; Mining Issues; and Other Issues such as research and data needs.

As well, the mandate identified the minimum components of the plan as:

"A vision for the planning area; goals and objectives based on the needs of the area; ecosystem, land use and resource management principles and/or

codes of practice; a land use zone map with policies and/or guidelines for each zone; procedures for the regular review and amendment of the approved plan; and a glossary of significant resource allocations, licenses, permits and other allocations and the issuing body."

While many components have been incorporated into the status report, the analysis and recommendations are but preliminary and the development of the Broad Area Plan remains very much a work-in-progress.

The Public Participation Process

In launching the East Side Planning Initiative, the government committed to a public participation process to gather the views of residents of the east side of Lake Winnipeg, stakeholders and all Manitobans. The future of this important and delicate ecosystem will be determined by the principles of wise stewardship and sustainable resource management that are established within the Broad Area Plan. It is why the government called for comprehensive public engagement in charting a future for this resource-rich and ecologically significant environment.

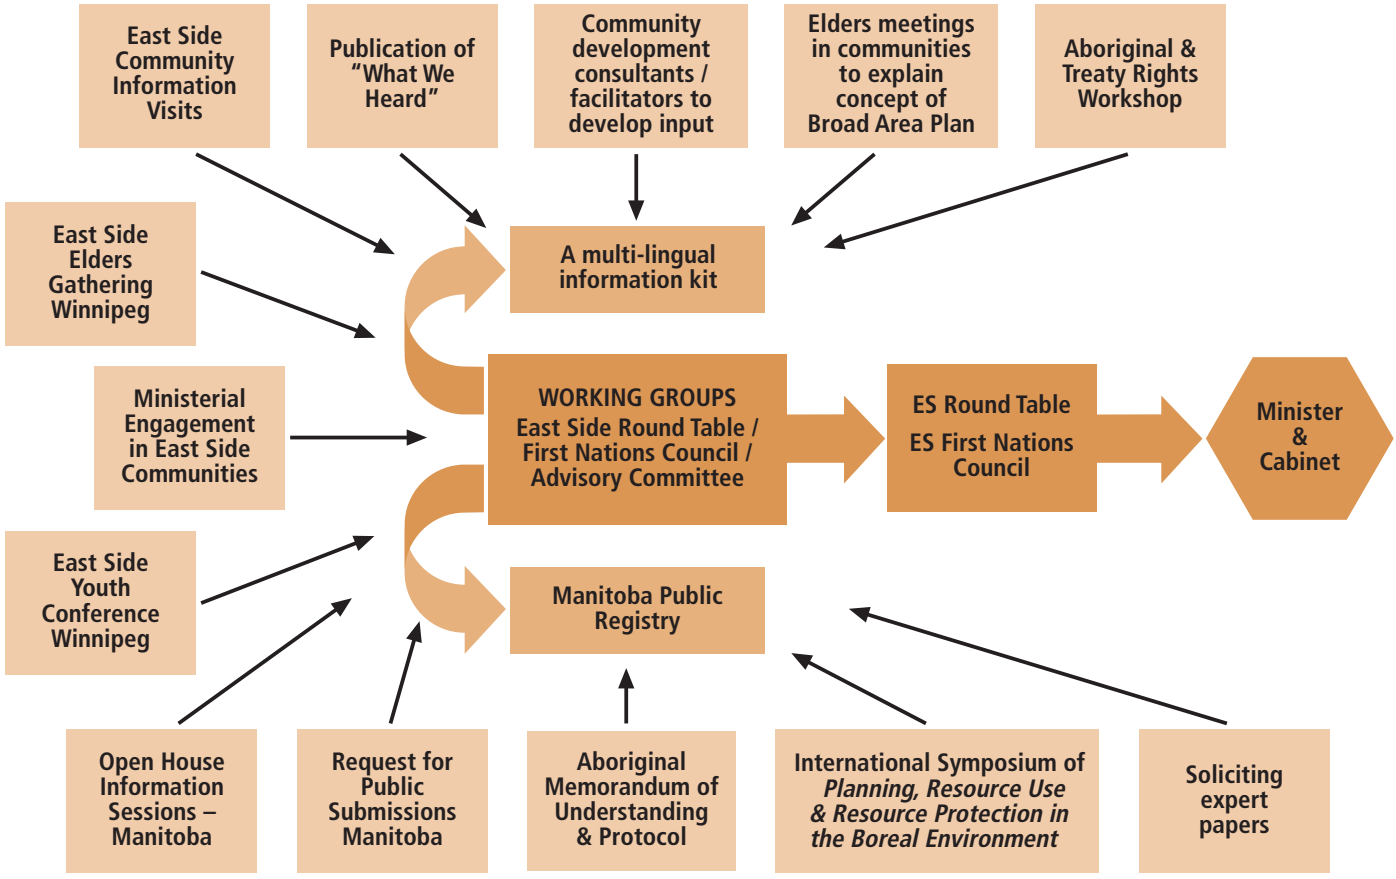
It is a cornerstone of our democratic heritage that people have an inherent right to be engaged in decision-making processes that affect the quality of their lives. While much remains to be completed in this process, it is clearly evident that all participants have committed themselves to as rigorous and thorough a public process as resources will permit.

In the preparation of preliminary recommendations for the Government of Manitoba on the general content of the Broad Area Plan, and some of the more important processes that must now be pursued (the *Protocols of Agreement*), the East Side Round Table and the First Nations Council committed themselves to an extensive and comprehensive public consultation process. Some of the many activities are summarized below:

- Substantial documentation and information including public comments received during the preliminary discussions phase of the planning initiative and Round Table & First Nation Council minutes and presentations, have been placed on the Manitoba Public Registry (Registry File # 4718.00) and on the East Side Lake Winnipeg Planning Initiative website. ***http://www.gov.mb.ca/conservation/eastsideplan/***
- A multilingual information kit (English, Cree, Ojibway, Oji-Cree & Syllabics) consisting of a video presentation, CD, core summary documents, detailed maps and a community questionnaire, has been prepared for public review.
- A first round of community, information-sharing visits engaging the 34 First Nations, Northern Affairs and Métis communities on the east side of Lake Winnipeg has been completed. To date, over 80 community visits and meetings have been held on the Broad Area Plan.
- The East Side Round Table published and distributed *What We Heard,* a compendium of observations, recommendations and concerns expressed by

"There are communities like ourselves all over the country who have long looked after lands not as owners, but as caretakers of this great land. This is how we were taught as Native people; land is not something you own, land is a gift that you use, to live on it, to protect it and look after it. That principle was used by our people and continues to be used today."

(Poplar River community member
Poplar River – Website)



community residents gathered during the first round of community visits. The document is cross-referenced by community and by issues.

- Resources will be made available through the engagement of community development consultants to assist the east side communities in further developing their positions and inputs to the Broad Area Plan through the second stage of community visits.
- As 96 per cent of the population of the east side of Lake Winnipeg consists of First Nations peoples, the Round Table and the First Nations Council organized an Elders gathering to begin receiving their recommendations and concerns about the Broad Area Plan. Elders are invited to all Round Table and First Nations Council meetings.
- The Round Table and the First Nations Council organized a workshop on "Recent Case Law and Aboriginal & Treaty Rights and Entitlements" to consider the impact of such on the east side of Lake Winnipeg.
- There were three Open House information sessions in Manitoba where documentation was made available and the scope and intent of the Broad Area Plan was explained to interested Manitobans. Submissions, recommendations, concerns and observations were solicited through questionnaires.
- The First Nations on the east side of Lake Winnipeg and the Government of Manitoba have signed a *Memorandum of Understanding,* the first step in negotiating *Protocols of Agreement* that will be incorporated into the Broad Area Plan. A similar process has been recommended to the Government of Manitoba regarding the Métis Nation resident on the east side of Lake Winnipeg.

The public participation process is an integral and vital part of the development of the Broad Area Plan for the east side of Lake Winnipeg.

Public Participation Process

5. Overarching Themes & Recommendations of General Application

5.1 Solidifying an Ongoing Process: Continuing the Creation of a Broad Area Plan & Possible Options – An Interim Planning Authority

As has been indicated above, it is clear that much has been done, and much remains to be done. The submission of this preliminary report can be but a bridge to the ongoing work required to complete this complex and important process. This unique initiative has both raised expectations and provided all parties with an opportunity to chart new, more constructive relationships.

Indeed, few jurisdictions in Canada have undertaken an initiative of such breadth, scope and vision. With patience and perseverance, it has the potential to significantly contribute to broad area planning in Canada. The essence of this broad area plan will be the significant breadth of community support that it will enjoy because of the engagement of communities, residents and stakeholders who have an abiding interest in the future of the east side.

It is, therefore, essential that the government not break faith with this process and that the development of the Broad Area Plan proceed, unimpeded. The East Side Round Table and the First Nations Council have been told repeatedly that this is one of the most comprehensive public participation processes that the Government of Manitoba has undertaken. If it continues to be done with care and patience, the end product will be well worth the effort expended.

The East Side Round Table and First Nations Council remain convinced that an ongoing structure and mechanism external to, but reliant upon, government and partner resources is essential to the completion of the Broad Area Plan for the east side of Lake Winnipeg and its accompanying protocols. This ongoing mechanism, which we characterize as an *East Side First Nations Council*

East Side
Planning Initiative

(ESFNC), would be an interim structure with specific responsibilities and authorities. The ESFNC would continue until such time as the Broad Area Plan is formally adopted and replaced with an appropriate, permanent collaborative governance mechanism. Options for the establishment of the ESFNC are considered below. Because this is an interim arrangement, the establishment of the ESFNC must be simple to accomplish. There will be no time for lengthy administrative or legislative processes to establish and empower the ESFNC. As well, the system under which the ESFNC makes decisions and recommendations must be straightforward and efficient.

The short-term nature of this arrangement also means that the current legislative and regulatory decision-making processes, such as environmental assessment and licensing, natural resources permitting and forest management practices, will remain in place. The challenge is to provide the ESFNC with the ability to make decisions where legislation allows and have extraordinary influence in areas where it has no explicit legislative support.

There are a number of ways such a body can be established and a number of factors to consider regarding the options for establishing and empowering the ESFNC. Current legislation and negotiated agreements provide authority and precedent for the establishment of the ESFNC with appropriate powers for an interim regime on the east side.

The Planning Act provides two options for establishing and empowering the ESFNC on the east side of Lake Winnipeg. Section 10 of the act allows Cabinet, following consultation with the councils of nearby communities, to designate an area of special regional or provincial significance as a "special planning area." The designation enables, among other things, the protection and conservation of the environment and of natural resources. The designation includes conditions attached to the area during the planning process, including the temporary suspension of existing development plans and a moratorium on new development except with the written permission of the minister.

Another designation option exists under *The Planning Act* (Section 99). The act deems the Minister of Northern Affairs to be the council for areas that are not incorporated communities and allows the minister to delegate some of his/her powers to a local committee or community council – to enact a development plan bylaw and a zoning bylaw for the area.

Under either of these designations, and based on the principles and recommendations articulated in this status report, the ESFNC could work co-operatively with First Nations governments, the Métis Nation government and the councils of the incorporated communities to develop some interim principles and criteria for development. Proposed developments would be vetted by the ESFNC to ensure they were consistent with these principles and criteria.

As a third option, *The Northern Affairs Act* provides the Minister of Northern Affairs with the authority needed to ensure orderly governance in the northern parts of the province. To this end, the minister acts as a municipality (except in incorporated communities). The minister can designate an area as a community and appoint a local committee to provide local services and act in an advisory/consultative capacity to him/her. The minister can delegate planning and management services to the local committee.

In a similar fashion to the options under *The Planning Act,* the Minister of Northern Affairs could establish the ESFNC as a local committee under *The Northern Affairs Act* and provide it with bylaw-making powers with respect to interim planning and management services.

As a possible supplement to the above options, there is opportunity under *The Wildlife Act* to strengthen the wildlife management capability of the ESFNC. The act provides for the minister to enter into agreements with any group or individual for the joint management of wildlife, which includes the development and implementation of joint informational, educational or training programs; the conduct of joint biological or ecological investigations; and the joint management of wildlife habitats. A fourth option involves the *Northern Flood Agreement (NFA),* negotiated in response to the adverse environmental and social impacts caused by hydroelectric development in northern Manitoba. It led to the development of share-management agreements with the First Nations that were signature to the NFA. Other First Nations communities have also negotiated share-management agreements.

The use of a share-management agreement with the ESFNC, as representative of the area outside the incorporated communities, is a possible approach to providing the ESFNC with the authority it needs to undertake its interim responsibilities. A problem is that the development of a share-management agreement is generally a negotiated process that takes considerable time to complete. Given the wide representation on the ESFNC, there could be quite diverse opinions about the terms of the agreement. As well, the *Protocols of Agreement,* which are to be a fundamental part of the final Broad Area Plan, are likely to focus extensively on share-management agreements.

The proposed arrangement raises the question of the relationship between the larger area and the local communities. ESFNC should develop principles for decision-making during the interim period vis-à-vis the relationship between the ESFNC and individual communities.

However it is accomplished, it is critical that through whatever means are available, the ESFNC should be given sufficient status to influence the legislated government decision-making processes currently in place.

"After some 500 years of a relationship that has swung from partnership to domination, from mutual respect and co-operation to paternalism and attempted assimilation, Canada must now work out fair and lasting terms of coexistence with Aboriginal people."

(RCAP)

5.1 Recommendations

5.1.1
The Government of Manitoba commit to continuing a comprehensive process of dialogue, negotiations and consultations with the inhabitants of the east side of Lake Winnipeg, and stakeholders to ensure the development of all components of the Broad Area Plan for the east side of Lake Winnipeg including a *Protocol of Agreement* with East Side First Nations Governments which must respect, recognize and protect Aboriginal and Treaty Rights.

5.1.2
The Government of Manitoba also commit to negotiating, as part of the Broad Area Plan for the east side of Lake Winnipeg a *Protocol of Agreemen*t with the Métis government representing the Métis Nation resident on the east side of Lake Winnipeg, which must respect, recognize and protect Aboriginal Rights.

5.1.3
The Government of Manitoba acting solely or in concert with other partners provide adequate human and financial resources to permit the comprehensive on-going process to complete all components of the Broad Area Plan including the *Protocols of Agreement.*

5.1.4
The Minister of Conservation actively explore the possibility of creating a resources and financial partnership with other provincial departments, the federal government, east side First Nations, the private sector, public agencies and environmental non-governmental organizations in order to generate a pool of funds and other resources to permit the on-going development of a comprehensive Broad Area Plan.

5.1.5
The Government of Manitoba re-organizes the structural and operational support mechanisms for the on-going process by continuing with the East Side First Nations Council, which would receive advice from an advisory body, and would serve until such time as the Broad Area Plan and the *Protocols of Agreement* are completed and adopted by the Government of Manitoba, First Nations and Métis governments.

5.1.6
The East Side First Nations Council be provided with a renewed mandate:

- To continue to facilitate and support negotiations and consultations on Protocols of Agreement with the First Nations governments;
- To continue to facilitate and support negotiations and consultations on a Protocol of Agreement with the Métis government representing the Métis Nation resident on the east side of Lake Winnipeg;
- To continue to provide and collect information, consider and analyze community and individual submissions, engage in discussions and prepare

the final recommendations for the Broad Area Plan for the East Side of Lake Winnipeg pursuant to the mandate initially provided by the Minister; and

- To assume planning authority for land use and development within the territory of the broad area plan in providing the Government of Manitoba with direction and advice on major, large-scale land use developments or initiatives.

Until such time as the Broad Area Plan and the Protocols of Agreement have been concluded, the East Side First Nations Council shall assume planning authority for lands in the planning area at the earliest possible opportunity.

5.1.7
The Government of Manitoba consider the options identified in 5.1 in establishing and defining the planning authority for the East Side First Nation Council.

5.1.8
The Government of Manitoba shall consult with the East Side First Nations Council and seek its direction and recommendations on all major new land use developments, including cottage lot developments, or initiatives, such as those described in Phase 1 – Final Report, occurring within the planning boundaries of the east side of Lake Winnipeg. As such, the East Side First Nations Council will exercise regional planning powers to the maximum extent allowable under existing legislation or case law, until such time as the Government of Manitoba is in receipt of the final recommendations constituting the draft Broad Area Plan for the east side of Lake Winnipeg. It is understood that this authority extends only to those lands outside of reserve lands or Treaty Land Entitlements within the planning region, and in which First Nation and Métis Nation Governments, and the Government of Manitoba assert sole or joint interest and jurisdiction.

5.1.9
With respect to the composition of the East Side First Nations Council (ESFNC),

- The ESFNC be presided over by an independent Chair whose appointment is subject to the mutual agreement of the ESFNC and the Government of Manitoba;
- The ESFNC will consist of the twenty-one (21) members – sixteen (16) East Side First Nation Chiefs or their designates, one (1) representative from the Métis Nation government, or their designate, and four (4) representatives nominated by the East Side Round Table, with a preference for the inclusion of current members; and
- The ESFNC will be assisted by an East Side Advisory Committee, the members of which shall be agreed upon by the ESFNC and the Government of Manitoba.

5.1.10
All decisions of the ESFNC be subject to the principle of a "double majority", that being the majority of the ESFNC members and the authorized representative to the ESFNC of the First Nation governments within whose traditional lands, the land use activity is proposed to take place. It is understood by this principle, that no major developments may proceed without the expressed consent of the First Nation so affected. Conversely, should the ESFNC not approve a First Nations land-use initiative, it is incumbent upon the applicant First Nation, as part of a mediation process, to indicate how the initiative is consistent with the values and principles of the Broad Area Plan.

5.1.11
The ESFNC be supported by a sufficiently resourced and independent Secretariat, the head of which is appointed following the joint concurrence of ESFNC and the Government of Manitoba.

5.1.12
The ESFNC be assisted in the process of finalizing the Broad Area Plan recommendations for the east side of Lake Winnipeg by the East Side Advisory Committee recognizing that membership in this committee may have to be re-constituted so as to remain current. The ESFNC may wish to continue to use existing Broad Area Plan Working Groups or create other such support mechanisms.

5.1.13
It is understood that all such developments or initiatives identified in recommendation 5.1.8 above be subjected to a comprehensive *Aboriginal and Treaty Rights and Traditional Lands Impact Assessment as part of any Environmental Impact Assessments* that may be required. It is further recommended that the ESFNC, early in its mandate, commission research in order to establish an acceptable methodology for conducting such an assessment.

5.1.14
Consistent with the approach identified in 5.3 *Initiatives to Protect the Integrity of the Boreal Environment*, that all of the lands within the boundaries of the Broad Area Plan for the east side of Lake Winnipeg, external to human settlements are considered as "Protected" as further elaborated in Chapter 5.3, and pursuant to the processes defined above, it is understood that in this context, the ESFNC will assume planning authority for land use and development within the territory of the Broad Area Plan in providing the Government of Manitoba with direction and advice on major, large-scale land use developments or initiatives.

5.2 Building Positive Relationships with Aboriginal Peoples: *Protocols of Agreement*

Mandate

"The east side plan recognize, affirm and be in compliance with treaty obligations and Aboriginal rights and be consistent with the consultation/ protocol guideline recommendations of the COSDI Report respecting First Nations and Aboriginal peoples."

The majority of the residents living on the east side of Lake Winnipeg are Aboriginal peoples, the greater numbers of which are First Nations. Sixteen First Nations communities make up nearly 96 per cent of the total population resident on the east side. Members of the Métis Nation are comparatively smaller in number and most live within communities under the jurisdiction of Aboriginal and Northern Affairs.

Developing a Broad Area Plan for the east side of Lake Winnipeg is the objective of the ESPI. Because First Nations peoples represent the majority population and because of their historical and cultural relationship to the land First Nations people are a key component to this process. The Métis Nation also has this special relationship to the land. For that reason, their views and concerns must be an important component to the planning process.

Within the past eight months, ESPI teams made approximately 80 visits to communities throughout the east side of Lake Winnipeg to provide information and listen to concerns of residents. The message from many communities was the hope that the ESPI process could give them a forum to convey views and opinions on the pressing issues, respecting their traditional territories and the environment. Among the concerns heard in many communities was that resource development and economic activity often happened in and around their areas without local input or benefit.

As noted in this report, because of Treaty and Aboriginal rights and a unique relationship with the land, First Nations governments and the Métis Nation government on the east side of Lake Winnipeg must be not only participants, but also partners, in future planning on the east side. To help ensure this partnership, a *Memorandum of Understanding* (MOU) was signed in April, 2004, between the Province of Manitoba and 13 First Nations on the east side of Lake Winnipeg. The MOU represents a commitment by both parties to work together in protecting the environment and boreal forest on the east side and ensuring a safe and secure future for all who live there.

The next stage of this process is to resolve issues and build consensus on initiatives respecting a Broad Area Plan for the east side of Lake Winnipeg. It is believed this will best be achieved through *Protocols of Agreement* between First Nations on the east side of Lake Winnipeg and the Province of Manitoba. This agreement would contain a set of rules for working towards negotiation

"Manitoba work in partnership with Aboriginal peoples to develop a cooperative protocol to address the involvement of Aboriginal peoples where their land and resource use planning, significant resource allocation, development assessment and review and regulatory mechanisms, including effects assessment tools and documents are affected."

(Consultation on Sustainable Development Implementation – 1999)

and consensus. There will also be a need for a separate protocol negotiation process between the province and Métis Nation resident on the east side of Lake Winnipeg.

5.2 Recommendations:

5.2.1
A Protocol of Agreement be developed between the Government of Manitoba and First Nation governments on the east side of Lake Winnipeg and that the agreement will become an integral part of the Broad Area Plan and serve to guide its implementation.

5.2.2
A Protocol of Agreement be developed between the Government of Manitoba and the Métis Nation government representing the Métis Nation resident on the east side of Lake Winnipeg and that the agreement will become an integral part of the Broad Area Plan and serve to guide its implementation.

5.2.3
The Government of Manitoba should finalize outstanding Treaty Land Entitlement issues with First Nation governments on the east side of Lake Winnipeg.

5.2.4
The Government of Manitoba must develop a resource-sharing framework for the east side of Lake Winnipeg within the context of the Protocols. The framework may require two levels: an umbrella agreement between Governments of Manitoba, First Nations and the Métis Nation to serve as guiding principles for the area. Second level agreements will be required between Governments of Manitoba, First Nations and the Métis Nation Governments on specific land use. Agreements for specific land use decisions would include but would not be limited to access, revenue sharing, procurement, capacity building, shared stewardship, and environmental management.

5.2.5
Such agreements should be concluded on all resource uses within Aboriginal traditional territories prior to implementation of recommendations of the Broad Area Plan. For example, these agreements could include share-management arrangements for various natural resources within the planning area, including but not limited to provisions for royalty and/or revenue sharing and other benefits with First Nations Governments and the Métis government representing the Métis Nation resident on the east side of Lake Winnipeg for resources removed from traditional lands.

5.2.6
The Government of Manitoba, crown corporations and other public agencies, and the private sector must recognize, respect, and honour local agreements between east side First Nations Governments and the Métis Nation resident on the east side of Lake Winnipeg respecting development within traditional, cultural, and resource territories, as this is instrumental in creating greater control and participation for local communities.

5.2.7
Community-based land use planning, consistent with the values and principles of the Broad Area Plan, should be initiated or completed prior to any development activities within their traditional lands. It should guide the identification and development of resource-based opportunities, including protected areas and infrastructure development in the east side planning area. As has been indicated elsewhere in this report it is of paramount importance that adequate resources be made available to assist First Nation and Métis Governments and Northern Affairs communities in land use planning. Community-based land use planning must be given priority attention by all governments engaged or impacted by this process.

5.2.8
All future discussions, consultations and negotiations between the public and private sectors, and First Nations and Métis Governments and Northern Affairs communities on the east side of Lake Winnipeg be subject to the protocols defined for such activities in the on-going governance mechanism adopted to oversee the implementation of and adherence to the Broad Area Plan for the East Side of Lake Winnipeg.

5.2.9
Whatever on-going mechanism is established to oversee the implementation of and adherence to the east side of Lake Winnipeg Broad Area Plan, it include monitoring and compliance powers to ensure that both public and private sector resource users comply with all components of the Protocols with First Nations and Métis governments respecting the Broad Area Plan for the east side of Lake Winnipeg.

5.3 Initiatives to Protect the Integrity of the Boreal Environment

One of the three fundamental principles guiding the advice the East Side Round Table provides to government on the Broad Area Plan is: "Maintaining the ecological integrity and biological functions of the boreal forest within the planning area."

Based on this principle, maintaining the integrity of the boreal environment on the east side has been a core consideration in the development of the plan. Generally, this means the free operation of natural ecological processes that

bring about ecosystem self-organization, diversity, resilience, long-term change and renewal. Ecological integrity is an ecosystem state of being, and needs to be seen as something to be maintained over time. It results in a landscape in which there is a full complement of species, natural populations, interdependent relationships, diverse habitats and multiple pathways for energy flow through the ecosystem. On the east side, we are also speaking of a landscape that continues to support Aboriginal people who occupy and use the land.

The boreal environment in the east side planning area is unique in several ways. It is inhabited by 16 First Nations that have occupied it for millenniums, and it is large – approximately 82,000 square kilometres. It is a mostly undisturbed (by human activity) and contiguous forest and wetlands complex representing one of the few remaining, mainly untouched, broad area landscapes in mid-Canada. As well, there has been relatively little economic development within it, although it is widely recognized that the economic development potential on the east side is high and virtually unexploited. This makes sound planning a necessity.

Potential threats to ecological integrity on the east side take the form of unsustainable levels of economic activity, or allowing it to occur in sensitive locations. There are also concerns over the gradual inhabitation of shorelines by cottage owners and their subsequent demand for services, and the suppression of wildfire, which gradually threatens the whole forest with major conflagration. The challenge is to achieve a consensus on how to use and protect this landscape in a sustainable manner and to do so using current scientific data and traditional ecological knowledge.

There have already been several initiatives aimed at achieving long-term protection for portions of the east side. The protected area network is intended to contain adequate representation of significant enduring features in each of the 18 natural regions and sub-regions in Manitoba. On the east side, 14 per cent of the land area is already under formal protection within parks and includes the Poplar/Nanowin Rivers Park Reserve. This reserve comprises approximately 7,400 square kilometres of the traditional lands of the Poplar River First Nation. The First Nation is presently engaged in a community-based, land-use planning project to determine what land uses and further protections will be applied within the Park Reserve area.

In *Manitoba's Action Plan for a Network of Protected Areas,* the province has committed to a public process for reaching decisions on designating protected areas under the act. The 1998 *Memorandum of Understanding* between Manitoba and the Assembly of Manitoba Chiefs and the Manitoba Keewatinowi Okimakinak (MKO) outlines a process of identifying, establishing and managing a network of protected areas. These decision-making processes should be developed as a component of the Broad Area Plan.

In 2002, Poplar River, Pauingassi, Little Grand Rapids and Bloodvein First Nations, along with Pikangikum in Ontario, agreed in a signed accord, to join

their traditional territories together, as one large protected area under their stewardship. This huge area includes the traditional territory of the Pikangikum First Nation on the Ontario side. Together, the five First Nations have agreed to co-operate in the protection and care of these lands as a sacred trust. Further, the five First Nations in the accord have requested that their initiative be given international recognition by being considered as a UNESCO World Natural and Cultural Heritage Site.

A related activity stems from the Canadian Boreal Initiative. The initiative has advanced a framework for boreal forest conservation that seeks to give the highest level of protection to at least 50 per cent of the forest, and support sustainable communities in the remainder, through development based on state-of-the-art stewardship and management practices. The vision of the initiative is to safeguard ecological integrity in the forest, apply sustainable development practices, and ensure local and First Nations engagement in land management decisions.

To accomplish this, the framework calls for an interconnected network of large protected areas across the boreal band of forest. It should be stressed that the Canadian Boreal Initiative envisions protection and sustainable communities on the same landscape. The initiative does not conflict with the goals of protection as advanced by First Nations in their 2002 accord.

It is clear that the meaning of the term "protection," as used in the First Nations Accord, although not specifically defined, is different from its meaning in the Manitoba Parks Act or other acts and regulations. The difference seems to be two-fold. First, protection in legislation involves the prohibition of certain land uses such as mining and logging. If managed within the framework of traditional values and knowledge and under the guidance of Elders, it is apparent that the First Nations' concept of "protected" does not necessarily prohibit these land uses, and could include local stewardship of forest resources and other developments.

With these differences in mind, there are two notions of what we mean by "protected". To some, "protected" means lands on which some land uses, such as resource extraction, are prohibited by law. To others, "protected" means lands that are cared for and used according to traditional approaches and the land is passed undamaged to subsequent generations. Both notions need to apply within the plan area.

It is important, therefore, to conceive of the whole planning area as protected, and that within it, there are sub-areas with different levels of protection. The highest level of protection could be the parks and other areas that are protected through legislation. These could continue to be land areas where certain uses are prohibited by law. Other levels of protection can be applied to other land uses within the plan area. These require the stipulations that land use decisions need to be based on adequate knowledge of effects and thresholds, as well as on the clear preferences of the communities affected, based on a thorough process for consultation.

"The northern boreal ecoregion accounts for about one third of this planet's total forest area. It is comprised of a broad circumpolar band which runs through most of Canada, Russia, Scandinavia and parts of Northern Scotland. Compared to much of the world, this ecoregion enjoys a sparse population and thus one would think, few threats to its immense and majestic beauty. However the reality is quite different."

- Sierra Club

5.3 Recommendations

5.3.1
The entire planning area is envisioned as "protected", in the sense that First Nations use the term, as described above. In practice, decisions on new economic developments (forestry, mining, tourism, etc.), or on the limitations imposed pending completion of the Broad Area Plan, would require the concurrence of the East Side First Nations Council (ESFNC). All resource development decisions that are made for the area would be assessed on the basis of whether they affect protection, in addition to the usual considerations. Existing licenses and developments would continue. This approach is similar to and mirrors the intent of the protection afforded the territorial lands of the five First Nations that signed the Protected Area Accord.

5.3.2
The Government of Manitoba play an active role with the federal government in establishing a UNESCO (U.N.) World Natural & Cultural Heritage Site on the east side. The site should include the land area encompassed in the application by the five First Nations signatory to the protected areas Accord, and Atikaki[1] and Woodland Caribou Provincial Parks.

5.3.3
The Government of Manitoba request the East Side First Nations Council to identify specific levels of protection within the planning area, including protection conferred by Order-in-Council, and other forms of protection, as determined by the ESFNC. In so doing, the guidance and principles given by the Boreal Forest Conservation Framework should be considered. This would result in a portion of the planning area receiving the highest level of protection, consistent with the principles of the Canadian Boreal Initiative, and other areas identified to support sustainable communities and resource stewardship activities.

5.3.4
First Nations and the Métis Nation resident on the east side who have been denied traditional uses of designated protected areas within established parks, such as Atikaki, should be advised that they have these rights.

5.3.5
The process for evaluating and recommending areas to be formally protected by Order-in-Council should be accelerated and improved to ensure that First Nations, the Métis Nation resident on the east side, local communities and affected stakeholders are brought together and strive for a consensus, and that east side communities have a higher standing in the process.

5.3.6
The improved and accelerated review process should be followed for the eight large ASIs in Natural Region 4b, in order to ensure that these enduring

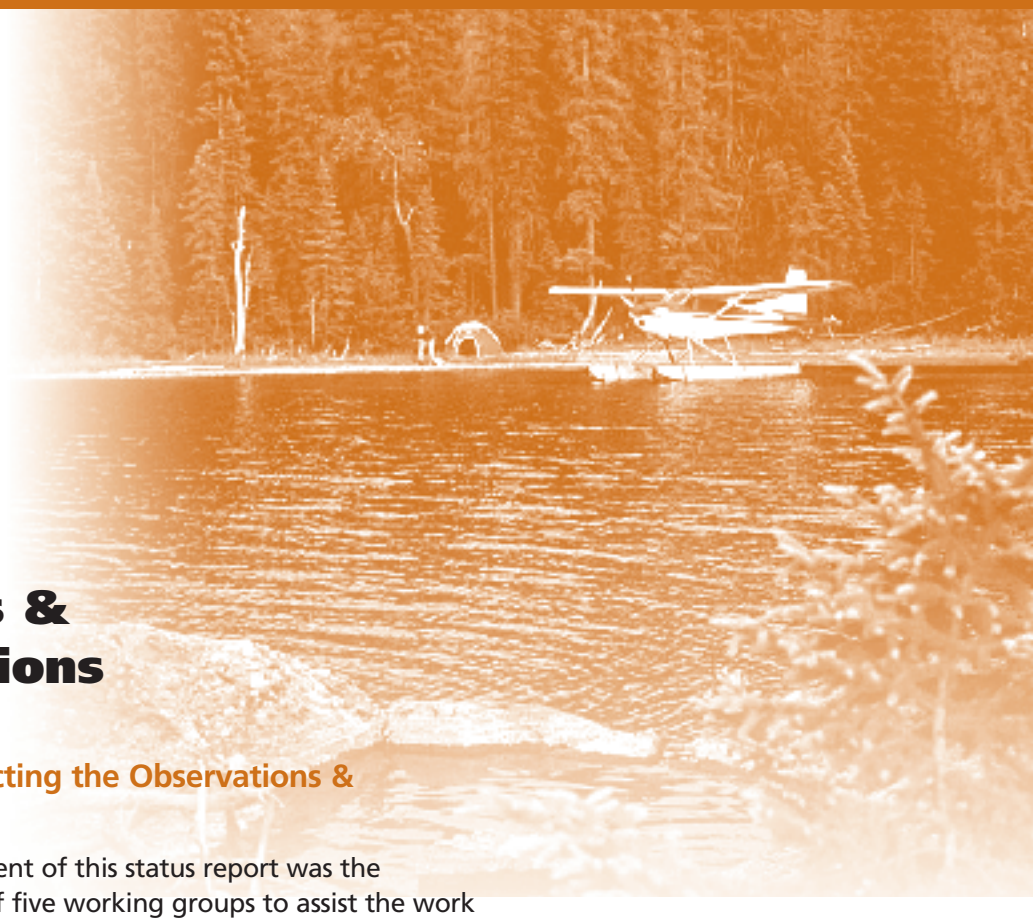
[2] Atikaki – From the Ojibway words "Atik" meaning "caribou" and "Aki" meaning "land".

features are properly recognized and captured within the protected areas network. In addition, the improved review process should be used to evaluate and recommend the three smaller protected area proposals in Natural Region 4c.

5.3.7
The Government of Manitoba provides the necessary resources to complete these evaluations for ASIs in Natural Regions in 4b and 4c within the next two years, and updates its Action Plan for a Network of Protected Areas, including goals objectives and timelines, by the end of the current fiscal year.

5.3.8
The 1998 Memorandum of Understanding signed between the Manitoba Government and First Nations on how they will cooperate on protected areas should be extended and followed.

5.3.9
Two new land use categories are needed for designating protected areas under appropriate provincial legislation. One is needed to protect First Nations' and Métis Nation's sacred, historical and burial sites without disclosing the exact location. This is to protect the sites from damage and impacts. These do not need to be parks or ecological reserves. The other is recognition of First Nation Traditional Lands. These lands could be situated inside or outside of parks. This recognition would mean lands protected and cared for utilizing traditional First Nation and Métis Nation values, approaches and ecological knowledge, and with activities prescribed by local decision-making and control. Where there are shared traditional territories, First Nations would be invited to develop a common approach which would satisfy their mutual interests in the territory.



5.3.10
Individual protected areas in parks without management plans should have them developed, and a plan review process established within 2 years. Protected areas without management plans, outside of parks, should have them developed and a plan review process be established within two years. All protected areas should be reviewed against the potential impacts of climate change, fire, insects and disease, maintenance of ecological processes, surrounding incompatible land uses in the area, and appropriate strategies developed (e.g., Fire Smart Program in Jasper National Park). This formal periodic review should be supported by continued monitoring efforts that involve and employ local people.

5.3.11
The Government of Manitoba develop and utilize adaptive ecosystem based management standards and practices. As an example, measures are needed to protect water ways and bank (riparian) features.

5.3.12
The Government of Manitoba secure sufficient financial and human resources, including contributions from other partners (federal government, public & private sector, environmental non-government organizations) to permit east side First Nations to undertake and/or complete *Traditional Ecological Mapping* of their traditional territories.

5.3.13
With the fundamental recognition that accurate and proficient land use planning can only proceed with timely and topical information, and mindful of the equally fundamental application of the precautionary principle, the Government of Manitoba move with all possible dispatch to ensure that all necessary environmental data concerning the east side of Lake Winnipeg is both acquired or updated at the earliest possible opportunity.

6. Priority Issues & Recommendations

6.1 Working Groups: Constructing the Observations & Recommendations

A significant step in the development of this status report was the establishment in January 2004 of five working groups to assist the work of the East Side Round Table (ESRT), discuss specific issues and get down to identifying specific recommendations.

An Aboriginal Protocol Working Group was established to consider the development of a *Memorandum of Understanding* leading to a protocol that would be followed throughout the ESPI process and the implementation of recommendations arising out of the final report.

Three Regional Working Groups (a northern, central and southern) were established to consider a minimum of three of the main planning issues associated with their geographic areas. (These issues are defined on pages 4 and 5 in the *Executive Summary of the East Side of Lake Winnipeg – Broad Area Planning Initiative: Phase 1 Final Report).* Each RWG was chaired by a member of the ESRT or FNC and limited to 12 members from the membership of the ESRT, FNC and ESAC. In this arrangement, participation in the detailed planning discussions was as broad as possible. A key objective of each RWG was to make sure it considered Aboriginal and treaty rights and traditional ecological and local knowledge in its discussions.

A fifth working group, the Plan Co-ordination & Implementation Working Group, was also established. Its role was to develop a 'Vision and Values' statement to guide the work of the working groups, consider and propose plan governance and implementation mechanisms for the Broad Area Plan, and integrate the observations and recommendations of the three geographic working groups into a series of recommendations.

East Side Planning Initiative

An extremely important factor in the development of the vision and recommendations contained in this status report is the high degree of participation in the discussions by Round Table and First Nations Council members, members of the ESAC and others.

6.2 Aboriginal and Community Development

Mandate

"The east side round table review the status of community planning in the planning area and provide advice on ways and means to meet the needs for community plans".

"The east side round table provide advice on the relationship that should be established between the broad area plan and local community plans and how they may be integrated into the large area plan for the east side of Lake Winnipeg."

Poplar River, Black River and Hollow Water First Nations are in the process of developing land use plans for their traditional areas. Berens River First Nation and the Island Lake Tribal Council have indicated their intentions of doing the same. The communities of Manigotagan and Wasagamack are in the process of developing community plans. In spite of these initiatives, the majority of communities in the study area have not undertaken any form of planning, community or otherwise, even though they desire to do so.

There are community development issues on the east side that are broader than those captured by the mandate. These include:

- the increasing population of First Nations Peoples in the area and the lack of economic opportunities, due to the lack of opportunity;
- non-local ownership of businesses and cash outflows, possibly due to policy and regulatory roadblocks preventing access to financing and an inability to acquire licenses for various activities;
- difficulty in starting and running small businesses, because of too many regulations (Trapline regulations, for example, are too costly and restrictive);
- too few training and local employment opportunities; and
- a seeming lack of interest and support from government in pursuing potential local partnerships, in spite of possible new opportunities for economic development on the east side.

The *Memorandum of Understanding* and resulting *Protocols of Agreement* between First Nations and Métis Nation on the east side of Lake Winnipeg and the Government of Manitoba will serve as the foundation for meaningful involvement in economic development and land use decisions affecting their communities and traditional territories.

6.2 Recommendations

6.2.1
All First Nation governments, the Métis Nation government representing Métis residents on the east side of Lake Winnipeg, and Northern Affairs communities in the east side planning area be provided the necessary financial and other resources to develop and produce plans for both their community and surrounding areas of interest, including Traditional Ecological Knowledge, before significant development expansion, new developments, or new licenses are issued in any potentially affected area.

6.2.2
Future development must be contingent on the establishment of processes and policies that ensure community involvement, training and employment and that resource allocation decisions involve local communities.

6.2.3
The Government of Manitoba provide capacity building initiatives and programs for people to participate more fully in resource activities in their traditional territories. Effective skills training programs must be developed to maximize local input in community economic development initiatives.

6.2.4
A formal assessment be done that would identify current and anticipated economic opportunities and skill sets that will be required to take advantage of these opportunities. Training programs such as business management skills must then be designed and delivered to meet these needs. Other programs could include emergency fire fighting, first aid, dangerous goods, presentation skills, emergency readiness, ecotourism, life skills, and proposal preparation.

6.2.5
Certification training programs be established for those occupations where certification is currently not required – e.g. tourism industry, timber harvesting, mining and commercial fishing.

6.2.6
The development of local enterprise and ownership be encouraged in addition to ensuring that there is local benefit, training and employment when the public or private sector is operating in the planning area.

6.2.7
The Government of Manitoba must support joint ventures / partnerships / local ownership creating the means for communities to gain benefits from resource initiatives and economic activities within communities and traditional territories. All economic development initiatives undertaken by the public or private sector within the planning area should ensure training and employment opportunities for local residents where possible.

6.2.8
First Nations, Métis and local community governments be given representation on Manitoba government boards, agencies, commissions and committees in order to gain more information and participate more actively with respect to planning and development issues that impact their traditional territories.

6.2.9
The Government of Manitoba commit to working with the ESFNC and First Nation governments to establish a natural resources management authority that would be operational within three years. The authority must be grounded on the principles of the seven generations and the structure and authorities of the Great Lakes Indian Fish and Wildlife Commission is offered as a desired model.

6.2.10
The Government of Manitoba actively engage the Métis Nation resident on the east side of Lake Winnipeg and local communities in developing and enhancing their own conservation capacity and engagement in formal conservation practices and activities in the planning area.

6.3 Forest Resources

Mandate

"The east side round table provide advice on protecting the values of the boreal forest, its sustainability, and sustainable use including, but not limited to:

- *maintaining biological diversity and ecological functions;*
- *role in carbon storage;*
- *non-timber forest products;*
- *ecotourism; and*
- *sustainable forest harvesting activities.*

The province not permit any major new timber allocation beyond the annual allowable cut, as determined by Manitoba Conservation within Forest Management License #1 and historical allocation levels in Integrated Wood Supply Area #1, subject to annual public review and pending completion of the broad area plan."

Forest resources on the east side are valuable. Commercial logging and processing operations constitute an important economic activity. The forest provides much more than wood; it is a habitat for hundreds of species and provides valuable ecological services (see Chapter 5.3). It is also the focus of interest for First Nations and the Métis Nation on the east side, because of their ancestral habitation of the area, their use of the forest for food, furs, medicines, spiritual and ceremonial purposes, and economic interests. The

priority for the future will be on the sustainability of these values and services, and where there are commercial operations, on making the economic benefits available to local communities.

Tembec Industries Inc. is the principal private sector interest in forestry operations in the area. Its Evergreen Forest Management License Agreement operates on a 20-year term, and is renewed every 10 years for an additional 10-year term. This provides a minimum of 10 and a maximum of 20 years to the agreement.

The agreement assigns management and reforestation responsibility for Forest Management License #1 (FML#1) to Tembec, while the Government of Manitoba retains these responsibilities for timber sales in the Integrated Wood Supply Areas east and west (1 & 2) of Lake Winnipeg. Forest management operations in FML #1 are authorized through Environment Act licenses awarded to 10-year forest management plans. Expansion of the license area would require the renegotiation of the Forest Management License Agreement.

In the northern portion of the planning area, north of approximately the 53rd parallel, the forest inventory is over 30 years old. Absence of current data on timber species, volumes and operability limits commercial forest management and planning in this large area. Also, absence of a transportation infrastructure in the northern half of the planning area severely limits commercial forestry activities.

Because there are multiple users of the forest, and multiple interests competing to have their interests met, finding the right balance is an ongoing challenge. Forestry operations, local benefits, community growth and development, and the transportation network, are all linked. The development of an all-weather road north of Hollow Water First Nation to Bloodvein First Nation and beyond is seen by some as the key to expanding forestry operations further north.

Ascertaining forest values is fundamental to finding the appropriate balance. Various techniques, such as those developed by the Forest Stewardship Council or The World Wildlife Fund–Canada, can be used to provide assessments of high value forests and forest attributes. Subsequent management decisions would require the maintenance or enhancement of the defined attribute and a monitoring program would have to be established to assess the effectiveness of the measures employed.

A long-term threat to forest resources is an increased risk of large forest fires as the climate changes and the predicted drier summer conditions occur. This threat could escalate with increased recreation access in the future.

Comments from communities indicate good support for forestry development that is sustainable, as long as there is local input to the process, and as long as benefits accrue to communities directly.

"All communities in the southern portion of the study area have been developed around logging. We need logging and mining on the east side. Logging is much more environmentally sensitive today."

(East Side Resident)

6.3 Recommendations:

6.3.1
To ensure sustainable forestry practices are maintained on the east side of Lake Winnipeg, all commercial forestry activities are encouraged to operate according to standards and procedures established or recommended by management and forest certification systems.

6.3.2
When Manitoba renegotiates the FML #1, it does so through the East Side First Nations Council ensuring more timely opportunities for input. When stakeholders operate outside FML-1, such as within the Integrated Wood Supply Area #1, First Nations governments and the Métis Nation resident on the east side of Lake Winnipeg must be consulted and accommodated.

6.3.3
Provisions are needed for royalty, revenue sharing or other benefits for First Nation and Métis governments on the east side of Lake Winnipeg for timber removed from the planning area.

6.3.4
A comprehensive Forest Resource Inventory (FRI) should be completed for the entire planning area to guide the review of commercial forestry expansion, new developments, or new licenses proposed within the planning area.

6.3.5
Using assessment tools such as the High Conservation Value Forest method, identify and quantify the values contained within the forests in the planning area. Such an assessment could address environmental, social, health, Aboriginal and treaty rights, cultural, and economic factors. Models such as the Whitefeather example in Ontario could be used in developing forest plans for each First Nation, commercial forest interest, and local community.

6.3.6
The development of local enterprise and ownership should be encouraged, in addition to ensuring that there is local benefit, training and employment when companies based outside the planning area are operating within the planning area. There may be alternatives to selling timber within a local market, such as bartering, trading, etc., that should be explored.

6.3.7
Alternatives to conventional forest uses be explored and developed, such as using the forest for carbon storage, non-timber forest products, biodiversity services, and other non-forestry uses. For example, there may be economic value in the carbon storage capacity of the forest for emissions trading purposes.

6.3.8
Genetically modified or otherwise “improved” trees should not be used in the planning area, as there is a concern over the eventual decrease in genetic diversity that can result.

6.3.9
Affected First Nations, Métis and local governments and affected stakeholders should be consulted and accommodated prior to the planning or decommissioning of forest roads within the plan area.

6.3.10
Any permitted or licensed forestry development or activity must investigate, identify and mitigate impacts on other licensed or permitted activities such as trapping, wild rice propagation, lodges and outfitters, and others. The Government of Manitoba shall work with the East Side First Nations Council to establish a process to ensure sufficient communications between license holders and provide a mechanism to resolve any conflict or disputes that may arise due to competing licensed interests. Conflict resolution by a third party mediator could be a consideration.

6.4 Transportation

Mandate

"The east side round table provide advice on the proposed transportation assessment work plan of Manitoba Transportation and Government Services which will include the planning, consultation, upgrading and construction of the road to the Bloodvein community."

In August 1999, Manitoba Transportation retained Dillon Consulting Limited to undertake a study to look at the feasibility of developing an all-weather road system to improve access to remote communities on the east side of Lake Winnipeg. The study was to be a preliminary, cost-benefit assessment to determine if more comprehensive considerations of an all-weather road development in the study area were justified.

In a report prepared by Dillon Consulting entitled *East Side of Lake Winnipeg All Weather Road Justification and Scoping Study (August, 2000),* two all-weather road route scenarios, with different points of origin, were evaluated. In one scenario, all east side communities would be connected from the south via Manigotagan. In the other, the northern communities would be connected from the west via Norway House/Cross Lake with a separate connection from Manigotagan serving only the southern communities.

The report's general conclusion was that an all-weather road in the east side of Lake Winnipeg could be justified for many communities on the basis of long-term transportation cost savings alone.

In February 2001, Paskanake Project Management provided a review of the findings in the Dillon report for Whelan Enns Associates Inc. It questioned the report's overall justification levels for the all-weather road scenarios and suggested the level and degree of community support presented for an all-

"The construction and maintenance of a local airport would bring much needed jobs in the area as well as bring the costs of goods and services down to acceptable levels."

(East Side Resident)

weather road, with respect to the majority of affected communities, was overstated.

In 2001, Dillon Consulting prepared a second report for Manitoba Transportation entitled *Work Plan to Develop an All-Weather Road Network for the East Side of Lake Winnipeg – Final Report (Dillon Consulting Limited and N.D. Lea, October, 2001).* It presented a planning approach and overall work plan to design and service east side of Lake Winnipeg communities with an all-weather road network.

While roads can have both positive and negative implications relative to economic, social and environmental considerations, it can generally be concluded that there is support for upgrading the existing Rice River Road and its extension to the community of Bloodvein. As well, there is support from most communities for a regional all-weather road network beyond Bloodvein. With respect to Berens River First Nation, a letter dated July 30, 2002, to Mr. Phil Fontaine, Chair of the East Side Round Table, on behalf of the Berens River Chief and Council, stated that the construction of an all-weather road is the highest priority in terms of developing the east side of Lake Winnipeg.

6.4 Recommendations

6.4.1
Manitoba Transportation proceed with its proposed planning process to undertake the Rice River Road upgrade and its extension to the community of Bloodvein on the following conditions:

- Manitoba Transportation conduct a thorough review of routes in collaboration with directly affected First Nation, Métis Nation resident on the east side of Lake Winnipeg, NACC and non-Aboriginal communities;
- The final route selection follow from results of an independent environmental assessment of alternatives;
- The environmental impact assessment to include: as proposed in 5.1, an Aboriginal and Treaty Rights Impact Assessment, and a multiplier effect projection; and
- Locating the Bloodvein crossing so as to avoid Longbody Creek and locating a road corridor as close as possible to the lakeshore to minimize environmental impacts.

6.4.2
Manitoba Transportation provide the UMA engineering study to the ESPI secretariat for distribution to and consideration by the East Side First Nations Council and ESAC.

6.4.3
Manitoba Transportation amend its proposed planning process to upgrade the Rice River Road, by extending it to the community of Berens River.

6.4.4
Manitoba Transportation apply for an environmental license for the upgrade of the Rice River road presenting the final road alternative to the Manitoba Clean Environment Commission.

The following recommendations concern Component 2 of *Manitoba Transportation's Work Plan to Develop an All-Weather Road Network for the East Side of Lake Winnipeg – Final Report (Dillon, 2001):*

6.4.5
Manitoba Transportation undertake an amended Regional Transportation Network Study to consider other means of access, such as rail, bridges, dirigibles, hovercraft and ferries, to communities on the east side of Lake Winnipeg in addition to an all-weather road option.

6.4.6
Consider existing case studies on the impact of road access on remote communities and through wilderness areas in order to better understand both positive and negative environmental and social impacts, and to prepare mitigation measures where needed.

6.4.7
Manitoba Transportation facilitate independent research leading to a comprehensive understanding of all social, environmental, economic and cumulative affects consequences of an all-weather road system on the east side. As identified in recommendation 5.1.13, the required Environmental Impact Assessment must include a comprehensive Aboriginal and Treaty Rights and Traditional Lands Impact Assessment. This research should also include an examination of alternative transportation routes and methods and must proceed in advance of all-weather road development proposals beyond the Rice River road.

6.4.8
The East Side First Nation Council be involved in the review of road corridor alternatives and prior to final route selection, Manitoba Transportation apply for an environmental license and present the final road alternative to the Clean Environmental Commission.

6.4.9
Prior to any construction, regardless of road standard, Manitoba Transportation and other road developers develop road management plans for all roads. These plans would include standard options, location options, environmental impact mitigation plans, decommissioning plans and access restriction plans. The process of road management planning should also have a thorough public consultation process built in.

6.4.10
An environmental impact assessment address the cumulative impact of rights-of-way for both an all-weather road and Hydro Bi-Pole III.

6.4.11
Ferry and barge services to east side communities remain commissioned and unchanged until alternatives are in place, at which time, private ownership could be encouraged as an option to services not publicly owned.

6.4.12
An economic assessment be undertaken to evaluate potential impacts that might occur as a result of the loss of existing business relationships between east Lake Winnipeg and west Lake Winnipeg businesses through the decommissioning of ferry/barge services.

6.4.13
The on-going maintenance and upgrading of airports, or the development of new airports, will remain a government responsibility and priority and not be at the expense of any work on an all-weather road.

6.4.14
Prior to the establishment of new all-weather road developments, and with local community involvement, comprehensive plans should be developed to protect wildlife (e.g., refuge corridors) that could be impacted by increasing road access.

6.4.15
Any transportation development or activity with a permit or license to proceed or operate must investigate, identify and mitigate impacts on other licensed or permitted activities such as trapping, wild rice propagation, lodges and outfitters, and others. The Government of Manitoba must work with the East Side First Nations Council to establish a process to ensure sufficient communications between license holders and provide a mechanism to resolve any conflict or disputes that may arise due to competing licensed interests. Conflict resolution by a third party mediator could be a consideration.

6.5 Tourism and Recreation

Mandate

"The east side round table consider and address the opportunities and acceptability of ecotourism and tourist development in the planning area."

It is generally agreed that there is a high potential for tourism and recreation in the planning area. Recreational opportunities are especially high for wilderness and ecotourism, cultural tourism and backcountry camping and canoeing. There are dozens of locations of campgrounds, outfitter camps and caches, and numerous commercial lodges throughout the southern portion of the planning area. There are fewer facilities north of the Poplar/Nanowin Rivers Park Reserve. Licenses to lodges and outfitter camps are issued by the Licensing Advisory Committee, a committee internal to government, formed

under the *Resource Tourism Operator's Act.* There is a local perception that this committee is biased against new license applicants from within the planning area.

The opportunities for further development of tourism and recreation in the planning area have not yet been considered in detail by the Round Table. This is an area for further elaboration in the development of the Broad Area Plan. To date, indications are that further development of this potential is wanted and needed, and that the focus should be on creating improved local capacity and benefits. More tourism development in the area is strongly linked to the transportation network. More local benefits in this sector would flow from the development of all-weather roads. However, there is a great concern over the creation of new cottage developments, because these tend to be followed by incremental demands for improvements in services and access.

6.5 Recommendations

6.5.1
Decisions on development of tourism facilities should be tied into other decisions on infrastructure, such as roads and other services. Better coordination of these decisions is needed in the placement of tourism developments. This is particularly important if tourism developments are spurred by the Aboriginal Tourism Strategy being developed by the province.

6.5.2
A local decision-making mechanism for approval of new or expanded tourism facilities is needed, and must be based on joint governance arrangements between First Nations, local communities and the province. The Licensing Advisory Committee should seek advice from a local decision-making mechanism. The criteria for making these judgments need to be clear and complete explanations given to applicants when permits and licenses are turned down. A process for resolving disputes and appealing decisions is also required.

6.5.3
The expansion of opportunities for non-consumptive forms of recreation, such as outdoor education and ecotourism, in addition to the existing hunting and fishing opportunities, is encouraged. Provision should be made for the hiring and training of significant numbers of local residents for advancement in the industry.

6.5.4
Provision for hiring and training people for advancement in the industry from the local community must be a condition of licenses and permits in future tourism facilities. Training programs should provide accreditation to recognized standards and certification.

6.5.5
Provide First Nation, Métis and local communities with better access to information and training in tourism development, marketing and entrepreneurship.

6.5.6
Because of potentially significant environmental impacts, new cottage developments must be subject to rigorous environmental impact assessments. New road locations to cottage developments should not negatively affect ecotourism and entrepreneurship opportunities.

6.5.7
The Government of Manitoba support a comprehensive Aboriginal tourism strategy and provide resources for its implementation.

6.5.8
The Government of Manitoba support the creation of a Manitoba First Nations Tourism Group with financial and technical assistance to, in part, facilitate their participation in the areas of ownership in lodges, outposts, camps, etc., and in training and advocacy. Provision for hiring and training of members of First Nations communities for advancement in the industry should be a condition of licenses and permits in future tourism facilities.

6.5.9
Any tourism and recreation development or activity with a permit or license to operate must investigate, identify and mitigate impacts on licensed or permitted activities such as trapping, wild rice propagation, lodges and outfitters, and others. The Government of Manitoba shall work with the East Side First Nations Council to establish a process to ensure sufficient communications between license holders and provide a mechanism to resolve any conflict or disputes that may arise due to competing licensed interests. Conflict resolution by a third party mediator could be a consideration.

6.5.10
The East Side First Nations Council develop a clear consultation process regarding the allocation of non-resident big game licenses as the current process appears to be unfair to local entrepreneurs.

6.6 Hydro Transmission Corridor Issues

Mandate

"As part of the planning process, Manitoba Hydro co-ordinate any future transmission line communications and public consultation activities with the east side round table. The east side round table provide regional guidance relative to Manitoba Hydro in regards to future electrical transmission facilities within the planning area. Manitoba Hydro work with the east side planning

secretariat and directly with the east side round table to ensure the effective and efficient co-ordination of planning and communication activities in the planning area."

The purpose of the initial east side community visits initiated by Manitoba Hydro was to gauge public interest and reaction to the possible location of a hydroelectric transmission corridor down the length of the east side of Lake Winnipeg. Manitoba Hydro had not completed its full round of community visits when, by mutual agreement between Manitoba Hydro and ESPI, the former agreed to suspend all community information sessions/consultations until ESPI had completed its first round of community visits.

A wide range of issues and concerns were broached in submissions to ESPI from east side communities and residents, numerous stakeholders and Manitoba citizens on the subject of hydroelectric transmission. They ranged from what ESPI has termed "legacy issues" – expressions of distrust and resentment over past relationships between First Nations and Métis nation peoples and Manitoba Hydro to practical concerns about the absence, adequacy and cost of electrical energy in many communities, to more macro-level policy considerations of the vital importance of hydroelectricity in reducing greenhouse gas emissions and mitigating the onslaught of climate change.

East Side Round Table members were impressed with the breadth and depth of concerns expressed by residents of the east side of Lake Winnipeg respecting past relationships with Manitoba Hydro. Many compelling statements and arguments were put before Round Table and First Nations Council members asking for assurances that local communities would benefit economically from the installation of transmission lines on the east side. Equally, concerns were expressed about the impact that such installations might have on the natural environment – from the introduction and leaching of pesticides into water tables and courses, to the disruption of traditional activities such as hunting and trapping. There were few communities visited by Round Table and First Nations Council members that did not have strong opinions and concerns about the possible future location of a hydro transmission corridor on the east side of Lake Winnipeg.

Manitoba Hydro has a legacy issue with which it has to contend. When the topic of Manitoba Hydro or the issue of the possible east side location of BiPole III was raised in communities through the ESPI process, reaction to the corporation and the proposed transmission line corridor on the east side of Lake Winnipeg was either uniformly negative, or contained significant overtones of mistrust and suspicion.

East Side Working Group members who considered this issue were consensual in their opinion that the transmission corridor not proceed unless and until Manitoba Hydro can clearly indicate that there are clear and permanent economic benefits to be accrued by communities on the East Side.

"We have heard from Hydro before. They came to us, but did not give us enough time to respond. You have to give us more time. There is a lack of information provided by Hydro for the community to adequately respond or participate. We do not want a poor consultation process."

(East Side Resident)

6.6 Recommendations:

6.6.1
All future discussions, consultations and negotiations between Manitoba Hydro and First Nations and Aboriginal communities on the east side of Lake Winnipeg be subject to, as and when they are developed, the *Protocols of Agreement* with First Nations and the Métis Nation resident on the east side of Lake Winnipeg respecting the Broad Area Plan for the east side of Lake Winnipeg between the Government of Manitoba and First Nations governments and Aboriginal communities located on the east side of Lake Winnipeg.

6.6.2
A comprehensive *Aboriginal Treaty Rights and Traditional Lands Impact Assessment* be completed as part of the Environmental Impact Assessments that must be undertaken as part of the possible location of the BiPole III line on the east side of Lake Winnipeg. Should such an assessment indicate that impacts are anticipated, and compensation or revenue – sharing is required, it is further recommended that Manitoba Hydro reach an agreement-in-principle on compensation, or such revenue – sharing as a component of, and prior to, the conclusion of the Environmental Impact Assessments.

6.6.3
Manitoba Hydro identify the location of all potential corridor routes for transmission lines, including those external to the east side of Lake Winnipeg Planning Area.

6.6.4
Should the location of a BiPole III hydro transmission corridor on the east side of Lake Winnipeg continue to be considered as a viable option by Manitoba Hydro that it expend the resources necessary, including the provision of resources to the communities themselves to ensure that communities on the east side of Lake Winnipeg are fully informed, involved and consulted on all components of the intended proposal, including the likely impact of the corridor on the nominated UNESCO World Heritage site.

6.6.5
With respect to the possible location of a BiPole III hydro transmission corridor on the east side of Lake Winnipeg, that should it proceed, Manitoba Hydro provide assurances that, wherever possible, the corridor be adjacent to other vehicle transportation corridors, unless an environment impact assessment determines this is not advisable. Where hydro and transportation corridors diverge, there will be no road access to the hydro transmission corridor.

6.6.6
With respect to the possible location of a BiPole III hydro transmission corridor on the east of Lake Winnipeg, that should it proceed, Manitoba Hydro provide assurances to local communities that employment opportunities will be provided and local resources utilized on a priority basis.

6.6.7
With respect to the possible location of a BiPole III hydro transmission corridor on the east of Lake Winnipeg, should it proceed, Manitoba Hydro provide assurances that where the transmission lines cross recreation or navigable rivers that transmission line support pylons will be located so as to be hidden from normal sight lines on or adjacent to the river, and, should environmental assessments prove such is feasible, that the transmission lines corridors be buried at key river crossings.

6.6.8
As concerns have been expressed about the potential negative impact on human and animal health caused by the possible creation of magnetic fields in the area of transmission corridors with operating hydro transmission lines, any HVDC transmission lines must maintain a minimum five hundred metre distance from settlements and residences. Manitoba Hydro should make available to the public all current research on this issue. Should such research indicate that there are possible negative effects upon human health, Manitoba Hydro must inform residents potentially exposed to these corridors of what steps the agency plans to take to eliminate the possible health hazard.

6.6.9
Any hydro transmission development or activity with a permit or license to operate must investigate, identify and mitigate impacts on licensed or permitted activities such as trapping, wild rice propagation, lodges and outfitters, and others. The Government of Manitoba shall work with the East Side First Nations Council to establish a process to ensure sufficient communications between license holders and provide a mechanism to resolve any conflict or disputes that may arise due to competing licensed interests. Conflict resolution by a third party mediator could be a consideration.

6.6.10
The Government of Manitoba encourage and mandate Manitoba Hydro to fully and publicly explore the viability of locating alternative energy source infrastructure (wind and solar) on the east side of Lake Winnipeg and create opportunities for east side residents and all Manitobans to benefit from these low-impact energy sources.

6.7 Mining Issues

Mandate

"The east side Round Table consider the potential for mineral development and its acceptability within the various land use zones that may be designated in the planning area.

Mining exploration and development in the planning area continue as per existing established public consultation requirements, environmental review and licensing requirements and other required reviews and permitting processes and procedures."

Mineral exploration and development within the planning area is manageable within established procedures and approval mechanisms, but requires more attention to local communications and co-operation. Exploration is ongoing to a limited extent, and the mineralized belts are generally well identified. Information sources, maps and reports are available online through the Manitoba government website.

Although the mineral potential and the geology of the southern area are relatively well known and developed, this is not the case with the central and northern areas. Mineral exploration within these areas has been sporadic, due to the relative remoteness and poor access to these areas, and because the geology of these areas has only been mapped on a reconnaissance level. The mineral potential of the northern part of the planning area remains poorly understood.

A process has been developed between the government and the minerals sector through which new protected area proposals are screened. Where no conflicts arise, there is a green light from the sector. Where conflicts arise, a resolution is negotiated, which sometimes requires more detailed information about the mineral potential and the Area of Special Interest (ASI). This process has successfully screened the ASI within the planning area.

The ESPI planning process has not advanced far enough to enable identification of specific land use zones, other than existing protected areas, where mineral exploration and development would potentially be excluded.

In March 2000, the mineral sector, Manitoba government, First Nations groups and other stakeholders developed a Manitoba Minerals Guideline containing the principles that should be followed for building relationships and creating opportunities during the mineral development process. This guide set a standard for how the mining industry and communities on the east side should be co-operating.

Active mineral claims give certain land access and occupation rights to the holder. People in local communities may not realize that these rights of occupation of land by mineral exploration companies are included when mineral claims are staked. Sudden unannounced or unexpected activity by an exploration company near a small community can surprise the local residents. These surprises can and should be avoided through the use of the Manitoba Minerals Guideline.

6.7 Recommendations

6.7.1
The East Side First Nations Council develop a consultation process regarding potentially affected peoples and licensees prior to the approval of mineral exploration programs, permits and staking activity.

6.7.2
Mineral exploration and development is an acceptable activity within the planning area, provided that the proposed East Side First Nations Council plays an oversight role in consultation and approval mechanisms, decisions are taken on a case by case basis, and there is local benefit from the activity.

6.7.3
The Manitoba Minerals Guideline (2000) principles for community consultation, information sharing, protecting environmental integrity, policy review and development and creating opportunities be accepted as the starting point for guiding relationships between the minerals industry and communities on the east side of Lake Winnipeg.

6.7.4
The onus for using the Guidelines falls on both the mining companies and the communities. Even with best efforts, not everyone in a community may be satisfied with the information they receive about exploration or mining activities. As much effort needs to be made within the community to share this information, as is made by the industry to make it available.

6.7.5
Any mining development or mining exploration activity with a permit or license to operate must investigate, identify and mitigate impacts on licensed or permitted activities such as trapping, wild rice propagation, lodges and outfitters, and others. The Government of Manitoba shall work with the East Side First Nations Council to establish a process to ensure sufficient communications between license holders and provide a mechanism to resolve any conflict or disputes that may arise due to competing licensed interests. Conflict resolution by a third party mediator could be a consideration.

6.8 Additional Significant Issues

Mandate

"The government should seek the advice of the round table on any significant issue which might arise during the course of the planning process."

Research Needs

In the course of this planning activity, it has become evident that several areas of ongoing research are needed to further support Broad Area Planning, and refine management approaches and techniques. One prominent concern is

the lack of natural resource data available for the planning area north of the 53rd parallel. There, species inventories, lake surveys, forest inventory, mineral exploration, and historic and archeological investigations are all needed to develop better information to support land use decisions. More information is also needed on threatened or sensitive species such as woodland caribou.

A more complete assessment of the research needs in the planning area will be part of the ongoing development of the Broad Area Plan. At this stage, the need for further research is noted.

6.8 Recommendations

6.8.1
To assist in developing a better understanding of research needs on the east side, it is recommended that a group of advisors be assembled from various Manitoba research and other institutions. This group could advise government on research needs and priorities. Membership of this group could be drawn from the universities, the Centre for Indigenous Environmental Resources, the Natural Resources Institute, Freshwater Institute, etc.

Other Recommendations

6.8.2
The Government of Manitoba be consistent in fulfilling its public policy commitments by not issuing licenses and permits for new development within the planning area that would violate standards, regulations or policies for water quality protection.

6.8.3
The Government of Manitoba continues to fulfil its obligation to protect species when reviewing development expansion, new developments or new license proposals within the planning area.

6.8.4
To provide an additional level of protection to the boreal environment when undertaking business developments, that all new business ventures, with 25 or more employees, are encouraged to secure and maintain registration with an independent organization which is designed to address the potential environmental effects of the operation. At a minimum, such systems will identify potential environmental impacts, develop and implement controls to mitigate negative environmental impacts and require an independent assessment by a registered auditor. Existing business (with 25 or more employees) developments will be required to comply with this requirement within 5 years. As all existing systems are voluntary, the Government of

Manitoba would have to establish the necessary policy framework to support the recommendation.

6.8.5
Impact benefit agreements with standardized criteria should be mandatory for development initiatives impacting land use within the Broad Area Plan for the east side of Lake Winnipeg.

7.0 Conclusion
The Path Forward: Challenges & Opportunities

Negotiations and discussions on many of the planning, protection and development issues identified in the original mandate for the Broad Area Plan have not been completed, nor has there been adequate opportunity for east side residents to prepare their input to this planning process. It is to the credit of the Government of Manitoba and its commitment to this exercise that it will likely extend the period for community input.

The signed *Memorandum of Understanding* between East Side First Nations governments and the Government of Manitoba commits both parties to a process of negotiations and consultations which may lead to *Protocols of Agreement.* Consistent with the recommendations in COSDI, the Government of Manitoba is strongly encouraged to commit to a separate process of protocol negotiations with the Métis Nation Government of the east side of Lake Winnipeg. It is essential to the overall success of the East Side Planning Initiative to recall that the broad area planning and protocol processes are inextricably intertwined. One cannot proceed without the other.

Another facet of the Broad Area Plan is a governance mechanism that will ensure adhesion to the Broad Area Plan and *Protocols of Agreement.* The necessary authority will have to be vested in such a mechanism to guarantee local community input while adhering to the principles of sustainable development and protection of the environment, which are the foundations of the Broad Area Plan.

An ambitious undertaking, if done with respect for the necessary complexity of the process, the Broad Area Plan for the east side of Lake Winnipeg will represent a watershed in the evolving relationship between government and Aboriginal communities in Canada. It will alter the social and economic relationships between the Government of Manitoba and First Nations governments on the east side of Lake Winnipeg.

There are numerous and daunting challenges to this enterprise: The constant challenge of ensuring that information and data is adequately shared with the population of the east side; the need for vigilance and persistence in "following through" with all components of the planning exercise; the

essential requirement for improved horizontal communications among provincial government departments, thereby reducing "stovepipe bureaucracy."

The Government of Manitoba can enjoy a measure of pride in undertaking this risk-filled venture and committing itself to staying the course. The successful completion of both the protocols and the Broad Area Plan will contribute immeasurably to redefining relationships that have been marked historically by mistrust and bitterness. Should this venture succeed and allow Aboriginal communities to play the predominant role in charting their own futures with the access to the resources to do so, all Manitobans will benefit.

Another opportunity realized with the adoption of the Broad Area Plan for the east side of Lake Winnipeg is an unprecedented measure of protection for a significant and contiguous boreal environment.

This status report is but a benchmark along the way, and the path ahead does finally offer a glimpse of what a fully functional Broad Area Plan may look like. The fragile coalition of interests which have contributed to the preparation of this report and support its objectives must now rely on the good faith and good will of the government which commissioned this initiative. Let us hope that this faith and this will has not been misplaced so that *"Promises to Keep"* will become promises kept.

Hilda Flett	Berens River First Nation
Frank Young Dwayne Bushie (Alternate)	Bloodvein First Nation
Chief Bailey Colon	Bunibonibee Cree Nation
Jack Fiddler	Garden Hill First Nation
Chief Gilbert Andrews	God's Lake First Nation
Larry Barker succeeded by Chief Ian Bushie Ferlon Barker (Alternate) Rene Barker (Alternate)	Hollow Water First Nation
Jonas Peebles	Little Black River First Nation
Nelson Keeper	Little Grand Rapids First Nation
Chief Roger Ross, succeeded by Chief Moses Okimaw	Manto Sipi Cree Nation
Jim Cromarty	Norway House Cree Nation
Albert Pascal, succeeded by Sheldon Kent	Pauingassi First Nation
Eddy Hudson	Poplar River First Nation
Lawrence Harper, succeeded by Chief Fred Harper	Red Sucker Lake First Nation
Joe Daniels	Sagkeeng First Nation
Roy A. Mason	St. Theresa Point First Nation
Chief Cornelius Wood	Wasagamack First Nation
Simon Fobister Joe Kuhn	Grand Council Treaty #3

East Side Advisory Committee

Note: While other groups were contacted by the East Side Secretariat for membership on the East Side Advisory Committee, no other names were forwarded.

Aboriginal Resource Council	Richard Gaywish
Aghaming Community Council	Bob Bull

Berens River Community Council	Henry McKay & Brian Whiteway
Bissett Community Council	Patti Grapetine
Gods Lake Narrows Community Council	Mayor Leslie Anderson Sr.
Island Lake Community Council	Jerry Bilewitch
Little Grand Rapids Community Council	George Quantrill
Loon Straits	Edgar Bruce
Manigotagan Community Council	Dale Boulette & Greg Wood
Matheson Island Community Council	Harold Bennett & Terry Bennett
Norway House Community Council	Glen Flett
Oxford House Community Council	Tommy Weenusk
Pine Dock Community Committee	Margaret Johnson
Princess Harbour Community Council	Marlene Monkman & Myrtle Magnusson
Red Sucker Lake Community Council	Heather Disbrowe
Seymourville Community Council	Ted Seymour & Brian Lepott
Eastman Regional Development, Inc.	Ron Funk
St Georges Economic Development Council	Dianne Dube
Winnipeg River Brokenhead Futures	Mary Greber
Anishaabe Turtle Island Protectors	Gary Raven
Canadian Parks and Wilderness Society	Krista Scott
Canadian Nature Federation	Gaile Whelan-Enns Jared Whelan (Alternate)
Manitoba Eco-Network	Anne Lindsey
Manitoba Future Forest Alliance	Sara Peloquin
Manitoba Model Forest	Carl Smith
Manitoba Naturalists Society	Les McCann
Northern Lights Heritage Services	Virginia Petch
Resource Conservation Manitoba, Inc.	Liz Dykman

T.R.E.E.	Dr. John Sinclair
Western Canada Wilderness Committee	Ron Thiessen
Canada Wild Rice Council	Lorne Williams
Manitoba Hydro	Wade Munro
Manitoba Prospectors & Developers Association	Ryan Cooke
Manitoba Trappers Association	Stewart Jansson
Mining Association of Manitoba	David Markham
TEMBEC Pine Falls Operations	Vince Keenan
RM of Alexander	George Harbottle
RM of Lac du Bonnet	Bob Bruneau & Don Halbert
LGD of Pinawa	Leonard Simpson
Village of Powerview	Ted Pichor
Island Lake Tribal Council	Chief Goliath Harper
Manitoba Keewatinowi Okimakanak Inc.	Michael Anderson
Manitoba Metis Federation	Dan Benoit
Manitoba Metis Federation Interlake Region	Bill Flett
Manitoba Metis Federation Thompson Region	Lyle Mulholland
Manitoba Metis Federation Southern Region	Marcella Vezina
Southern Chiefs Organization	Dina Bruyere
Manitoba Wildlife Federation	Roger Venton
Manitoba Aviation Council	Fred Petrie
SnoMan, Incorporated	Duncan Stokes

Phase I (August 2000 to March 2002)

Government Review Panel:

Bill Barto

Bruce Bremner

Blair McTavish

Joe Morisseau

Sandy Thompson

Phase 2

East Side Secretariat (March 2002 to July 2003):

Mike Waldram – Executive Coordinator

Bill Anderson

Paulette Delaquis

Joann Hiebert

Barb Hobson

Moses Okimaw

Jennifer Tavares

East Side Secretariat (July 2003 to September 2004)

Peter Globensky – Executive Coordinator

Bill Anderson

Bruce Bruyere

Barb Hobson

Rick Ratte

Dale Sobkowich

Jennifer Tavares

Pat Williamson

Bernie Wood

8.20 Legislation Under Which Areas Are Designated Under Manitoba’s P.A.I.

.

Glossary of Terms

- **Aboriginal Peoples** – The definition of "Aboriginal peoples" being used in this document is the legal definition contained in the Constitution of Canada. This includes Indians (on and off reserve Status Indians, First Nations, non-Status Indians, Treaty and non-Treaty Indians), Métis and Inuit.

- **Aboriginal Treaty Rights and Traditional Lands Impact Assessment** – It is necessary to determine the existence of Aboriginal rights and the implications of proposed resource management or development activities on those rights and on the continued use of traditional lands, and whether the approval of the proposal can co-exist with the Aboriginal rights and the continued use of the traditional lands.

- **Area Of Special Interest (ASI)** – These are areas being studied for possible future designation as "protected areas." The studies, utilizing "enduring features" methodology, identify the combinations of soils, geology, climate and landforms (enduring features) that influence biodiversity. The methodology also assesses the contribution of each protected area or ASIs in representing biological diversity within a natural region, and designs study areas to fill gaps in enduring feature and natural region representation. Areas of Special Interest are used to focus consultations and are not protected in any formal manner. In most cases, ASI boundaries are flexible and can be changed to respond to new information.

  According to a protocol established between the departments of Conservation and Industry, Economic Development and Mines, ASIs that meet predetermined criteria are requested in writing by the director of Parks to be placed in a "withdrawal pending" status, meaning that the Crown mineral rights in these areas are not available for new mineral dispositions, pending final resolution of the area's status and future designation of protected lands.

- **Assessment and Review of Effects** – This refers to an assessment and review of all sustainability factors such as environmental, economic, social, cultural and human health. The terms "assessment and review of effects," "assessment and review process," "assessment process," "assessment and review," and "effects assessment" will be used synonymously. The assessment process is generally guided by legislation (such as the Canadian Environmental Assessment Act or Manitoba's Environment Act) which defines both the substantive and procedural requirements, including the scope of the project/undertaking, information requirements, matters to assess and public participation.

- **Biodiversity** – The variability among living organisms from all sources including, among other things, terrestrial, marine and other aquatic ecosystems, and the ecological complexes of which they are a part. This includes diversity within species, between species and of ecosystems (Convention on Biological Diversity, 1992).

  Biodiversity has been seen as the total (and irreducible) complexity of all life, including not only the great variety of organisms but also their varying behaviour and interactions. One of the more broadly shared and economically defensible values for conserving wholesale biodiversity (rather than just the few components or 'biospecifics' with obvious high use value at present) may be seen to lie in ensuring continued possibilities both for adaptation, and for future use, by people in a changing and uncertain world (Natural History Museum, Biodiversity and Worldmap website).

- **Boreal Forest (contiguous)** – Canada's boreal forest is the largest contiguous, intact forest left on earth, covering 35 per cent of the country's land mass and stretching across the north from Newfoundland to the Yukon. It includes the east side planning area. These northern forests are the breeding grounds for over 60 per cent of Canada's bird population with approximately three billion birds nesting there annually. The boreal is also home to the world's largest caribou herd, the second-highest wolf population, and polar, black and grizzly bears.

  Thousands of species of plants, insects and animals – most of which have not been scientifically described but many of which have long been used by Aboriginal people for food and medicinal purposes – are found in boreal ecosystems.

- **Boreal Forest Conservation Framework** – The Boreal Forest Conservation Framework reflects the collective wisdom of the Boreal Leadership Council and is based on the best information currently available. The framework is based on a shared vision to sustain the ecological and cultural integrity of the Canadian boreal forest region, in perpetuity.

  The framework's goal is to conserve the cultural, sustainable, economic and natural values of the entire Canadian boreal region by employing the principles of conservation biology to:

  – protect at least 50 per cent of the region in a network of large interconnected, protected areas; and

  – support sustainable communities, world-leading ecosystem-based resource management practices and state-of-the-art stewardship practices in the remaining landscape

  The Boreal Forest Conservation Framework represents a national vision and goal for the region as a whole, rather than a formula to be applied on a unit-by-unit basis in a particular part of the boreal. In promoting a conservation approach for the entire boreal, the framework recognizes that conservation challenges and opportunities will vary. (Canadian Boreal Initiative website)

- **Boreal Shield** – At 195 million hectares the Boreal Shield is the largest ecozone in Canada. It is almost 80 per cent forested and much of the ecozone remains in a wilderness condition. Most of this ecozone is covered with an immense coniferous forest, consisting primarily of black spruce, white spruce, jack pine, balsam fir and tamarack. Further south, red pine, jack pine and eastern white pine occur, along with some hardwoods, such as white birch, yellow birch and trembling aspen. Black ash, mountain maple and eastern white-cedar also grow in some places. Characteristic mammals of this ecozone include woodland caribou, moose, white-tailed deer, black bear, wolf, marten, snowshoe hare, fisher, Canadian lynx and bobcat. Common bird species include the common loon, boreal owl, great horned owl, yellow-rumped warbler, blue jay, evening grosbeak and white-throated sparrow. (Natural Resource Canada website)

- **Broad Area Planning (BAP)** – This is an integrated and coordinated planning that is based on the sustainability of the ecosystem, to ensure future land, resource and development decisions address the environmental, social, health, cultural and economic needs of the public, local communities, First Nations and various stakeholders and interest groups.

- **Canadian Boreal Forest Initiative** – The Canadian Boreal Forest Initiative, or the Canadian Boreal Initiative (CBI), is an independent organization working with conservationists, First Nations, industry and others to link science, policy and conservation activities in Canada's boreal region. On December 1, 2003, the CBI released the Boreal Forest Conservation Framework. The framework was developed in concert with leading conservation organizations, resource companies and First Nations. Convened by the CBI, this group forms the Boreal Leadership Council, committed to the conservation and sustainable development of Canada's boreal forest region. (Canadian Boreal Initiative (CBI) website)

- **Co-Management (Share-management)** – Share-management is a tool that helps address resource management issues and opportunities between government and users by negotiating shared roles and responsibilities, such as involvement in decision-making and monitoring. (Manitoba Conservation)

- **Consultation** – As perceived by COSDI, consultation is the provision of meaningful opportunities for the public, other governments and stakeholders to influence government or other decisions about matters of concern to them. The concept of meaningful consultation is being more specifically defined by the courts as it applies to the nature of the opportunities for Aboriginal people.

- **COSDI** – The Consultation on Sustainable Development Implementation (COSDI) was a multi-stakeholder, consensus-based process commissioned in 1997 by the government to "consider and make recommendations… on how Manitoba can best implement Sustainable Development Principles and Guidelines into decision-making, including environmental management, licensing, land-use planning and regulatory processes." An 18-member core group and 60-member advisory committee collaborated on the preparation of a report with recommendations. The COSDI Report was submitted to government in June 1999. After an election, the current government adopted the report as a central component of its Sustainable Development Strategy in 2000.

- **Double Majority** – In the context of the East Side Broad Area Plan, double majority is a method for decision-making that allows communities to have a strong voice in decisions affecting the areas they live in. In a vote about a decision affecting a particular community, the decision would require both the vote of the community and a majority of the East Side First Nations Council.

- **Ecological Integrity** – Ecological integrity refers to the quality of a natural, unmanaged or managed ecosystem in which the natural ecological processes are sustained, with genetic, species, and ecosystem diversity assured for the future. Ecosystems have integrity when they have their native components intact, including: abiotic components (the physical elements, e.g., water, rocks), biodiversity (the composition and abundance of species and communities in an ecosystem, e.g., tundra, rainforest and grasslands represent landscape diversity; black bears, brook trout and black spruce represent species diversity) and ecosystem processes (the engines that make ecosystems work; e.g., fire, flooding, predation) – Parks Canada website

- **Ecosystem** – A community of all plants and animals and their physical environment, functioning together as an interdependent unit. (forestry)

- **Ecozone** – Canada has been divided into 15 terrestrial ecozones. Each represents areas of the country which can be easily identified by their general living (biotic) and non-living (abiotic) characteristics. The east side of Lake Winnipeg falls within the Boreal Shield ecozone.
- **Effect** – This is a neutral term including positive and negative impacts of a plan or project.
- **Endangered Species** – Manitoba's Endangered Species Act provides for the minister to designate species as endangered, extinct, extirpated or threatened, depending on their number and status. The different designations allow for different levels of protection.
- **Environmental Thresholds** – The environment, as an integrated system, is healthy as long as its components and their interactions are maintained in a state where they can continue to perform their natural functions. If significant changes are made to any components of the system, the efficiency of the system is affected and the environment is thrown off balance. The environment has a degree of resiliency built into it, which gives it the ability to cope with, or adapt to, some change without damaging effects. Environmental thresholds define those allowable changes. Used in planning or assessment purposes, they help decision-makers know what change to the environment will be within the threshold and therefore acceptable, and what change should be avoided. A common threshold is the assimilative capacity of a waterway. How much of a specified substance can be added to a river without altering the characteristics of the river to a degree that it will adversely impact biota, fish, people, etc.? The thresholds can be developed in advance of development, as a part of the planning process, or in response to a proposed development, as a part of the environmental assessment process.
- **Forest Stewardship Council** – The Forest Stewardship Council (FSC) is an international, non-profit organization founded in 1993 to support environmentally appropriate, socially beneficial and economically viable management of the world's forests. It supports the development of national and regional standards to be used to evaluate whether a forest is being well-managed.

  It is an association of members consisting of a diverse group of representatives from environmental and social organizations, forest and product industries, Indigenous People's organizations, community forestry groups and certification bodies from around the world. With its head office in Bonn, Germany, FSC is governed by an elected board.
- **Fragmentation** – Fragmentation occurs when a large region of, in this case, forest has been broken down or fragmented into a collection of smaller patches of habitat. Fragmentation typically occurs when land is converted from one type of habitat to another. For example, a forest habitat may become fragmented when a highway is built across the forest. The highway would split a single, large, continuous patch of forest into two smaller patches. The greater the degree of fragmentation, the greater the effect, as the once large, continuous forest habitat becomes a series of small, disconnected habitats. Because the characteristics of small forests differ from those of large ones, the characteristics of habitat and its suitability for the pre-existing species can change as well.

- **Genetic diversity** – Genetic diversity refers to variety within individuals within a species or a population, or more specifically, the variety of DNA within a species or population.
- **Great Lakes Indian Fish and Wildlife Commission (GLIFWC)** – The GLIFWC is an inter-tribal, co-management agency committed to the implementation of off-reservation treaty rights on behalf of its 11 Ojibway member tribes. Formed in 1984, and exercising authority specifically delegated by its member tribes, GLIFWC's mission is to help ensure significant, off-reservation harvests while protecting the resources for generations to come.
- **Guidelines** – They refer to instructions provided to the proponent for the information requirements and the conduct of an effects assessment in Manitoba.
- **Habitat** – 1. Those parts of the environment (aquatic, terrestrial, and atmospheric) often typified by a dominant plant form or physical characteristic, on which an organism depends, directly or indirectly, to carry out its life processes. 2. The specific environmental conditions in which organisms thrive in the wild.
- **High Conservation Value Forest** – All forests contain environmental and social values, such as wildlife habitat, watershed protection or sacred sites. Where these values are considered to be of outstanding significance or critical importance, the forest can be defined as a High Conservation Value Forest (HCVF). The idea of HCVFs was developed by the Forest Stewardship Council (FSC) and first published in 1999. This concept moves the forestry debate away from definitions of particular forest types (e.g., primary, old growth) or methods of timber harvesting (e.g., industrial logging) to focus on the values that make a forest important. By identifying these key values and ensuring that they are maintained or enhanced, it is possible to make rational management decisions that are consistent with the maintenance of important environmental and social values.

  High Conservation Value Forests are those that possess one or more of the following attributes:

  a. forest areas containing globally, regionally or nationally significant :
     i. concentrations of biodiversity values (e.g., endemism, endangered species, refugia);
     ii. large landscape level forests, contained within, or containing the management unit, where viable populations of most (if not all) naturally occurring species exist in natural patterns of distribution and abundance;
  b. forest areas that are in or contain rare, threatened or endangered ecosystems;
  c. forest areas that provide basic services of nature in critical situations (e.g., watershed protection, erosion control); and
  d. forest areas fundamental to meeting basic needs of local communities (e.g., subsistence, health) and/or critical to local communities' traditional cultural identities (areas of cultural, ecological, economic or religious significance identified in co-operation with such local communities).

- **Impact Benefit Agreement** – Often arising out of a consultation process, agreements can be developed between a proponent of a development and the host community/region, often an Aboriginal community. The agreement can address one

issue, or can be an umbrella agreement covering all the issues respecting the proposed development – environmental, social, and economic.

- **Land-Use Planning** – This refers to the systematic assessment of land and water potential, alternative patterns of land and resource use and other physical, social and economic conditions, for the purpose of selecting and adopting land and resource use options that are most beneficial to land users, without degrading the resources or the environment. Land-use planning also helps with the selection of measures most likely to encourage such land uses. Land-use planning may be at international, national, district (project, catchment) or local (village) levels. It includes participation by land users, planners and decision-makers and covers educational, legal, fiscal and financial measures.

- **Manitoba Model Forest** – The Manitoba Model Forest is a non-profit organization representing over 25 diverse forest interests. The Model Forest brings together environmentalists; industry; all levels of government; local communities, including First Nations; economic development groups; unions; universities; and Aboriginal organizations, to share their knowledge and resources in their mutual quest for sustainable forests. The Manitoba Model Forest comprises 1.05 million hectares of boreal forest that stretches eastward from Lake Winnipeg to the Manitoba-Ontario border.

  Activities in the Manitoba Model Forest include research, development, education and communications on a wide range of subjects, such as:

  - migration patterns of woodland caribou with the purpose of designing a harvesting plan that will protect the animal's habitat;
  - improving inventories of forest resources; and
  - building lasting partnerships among diverse stakeholders.

- **Manitoba Minerals Guideline** – In May 1998, a process was initiated by the Province of Manitoba's Energy and Mines department (now Manitoba Industry, Economic Development and Mines) to bring together representatives of First Nations, Métis Nation, Northern communities and the Manitoba minerals industry to begin a relationship-building process. The purpose of this process continues to be to strengthen the links between parties, learn about common aspirations, cultural values and communication needs, and to create a climate for mutually beneficial opportunities in the building of a strong minerals industry within Manitoba. The document is a guide to facilitate relationship-building between those involved in, or affected by, minerals activity within the province.

- **Manitoba Principles and Guidelines of Sustainable Development** – These are the principles and guidelines of sustainable development as adopted by Manitoba and set out in *The Sustainable Development Act.*

- ***Memorandum of Understanding*** **(MOU)** – A *Memorandum of Understanding* is one form of written agreement signed by two or more parties. In the case of ESPI, the MOU is preliminary to the negotiation of a protocol that will guide the future relationship between the First Nations on the east side of Lake Winnipeg and the Government of Manitoba with respect to the matters of the east side.

- **Non-Timber Forest Products** – These are all forest products, except timber, including other materials obtained from trees, such as resins and leaves, as well as any other

plant and animal products produced by the forest. In the boreal forests of Canada, there are many commercial enterprises based on non-timber forest products, such as hunting and fishing lodges, trapping operations, outfitting, remote tourist operations and youth camps

- **Precautionary Principle** – "The Precautionary Principle" is Principle No. 15 of the *1992 Rio Declaration on Environment and Development.* It states, in part: "Where there are threats of serious or irreversible damage, lack of full scientific certainty shall not be used as a reason for postponing cost-effective measures to prevent environmental degradation." Although generally accepted, since that time governments and industry have been striving to understand the implications and fine-tune the meaning and application of the principle.
- **Proponents** – Proponents are any persons, including the government, interested in proposing a plan, a significant resource allocation or a development.
- **Protected Area** – This is a parcel of land that is protected from most industrial or commercial activities to preserve its natural features or diversity. This is usually land that is designated by law, or Order in Council, as protected. In Manitoba, *The Parks Act* and other legislation allows for the creation of protected areas. Usually, only non-consumptive recreation is permitted in protected areas. Treaty and Aboriginal rights can be exercised in protected areas.
- **Protected Area Accord** – The *Protected Areas and First Nation Resource Stewardship: A Cooperative Relationship Accord* is a March 2002 accord between Poplar River, Pauingassi, Little Grand Rapids and Pikangikum to create a network of linked, protected areas on ancestral lands, and apply for its designation as a world heritage site. Since 2002, Bloodvein has also signed the accord.
- **Protected Areas Initiative (PAI)** – Manitoba's Protected Areas Initiative is a government program dedicated to building a network of protected areas that contains the tremendous biological diversity found in Manitoba's varied landscapes. Since the start of the PAI in 1990, the area of protected lands has increased from 350,000 hectares to just over 5.4 million hectares in 2004. Approximately 8.4 per cent of Manitoba's lands are protected.
- **Protected Area Network** – This refers to the total network of places and locations, protected by various means within a forest or an area, including riparian reserves, habitat reserves, parks and all other protected areas.
- **Protocols of Agreement** – The COSDI report recommended: "Manitoba work in partnership with Aboriginal peoples to develop a co-operative protocol to address the involvement of Aboriginal peoples where their land and resource use planning, significant resource allocation, development assessment and review and regulatory mechanisms, including effects assessment tools and documents, are affected." The ESPI has been instrumental in negotiating a *Memorandum of Understanding* to guide the development of a more comprehensive agreement – the *Protocols of Agreement,* specifically for the east side First Nations. The protocols will contain an official procedure or set of rules for working towards negotiation and consensus. It is a guide that parties must adhere to in attempting to establish working relationships and share management arrangements. The protocols would focus both on the process and contents of agreements that will meet the objectives of both parties.

Similarly, efforts will be made to negotiate *Protocols of Agreement* with the members of the Métis Nation resident on the east side of Lake Winnipeg. These protocols will govern the relationship between the parties with respect to resource and environmental decision-making on the east side of Lake Winnipeg, including consultation mechanisms and practices.

- **Public** – "The public," for the purposes of this report, has two uses. For notice provisions and a variety of other matters, "the public" means the entire public. In other cases, especially related to participation in effects assessment or planning, "the public" means all those persons whose interest in involvement is neither frivolous nor meant to cause difficulties.

- **Public Participation Process** – This is a formal process of public involvement as a part of a decision-making process. Public participation processes range from relatively passive opportunities for information sharing and comment, to interactive processes which ordinarily involve a defined membership, established ground rules and expectations, opportunities for interaction among participants and the provision for ongoing involvement.

- **Resources** – For the purposes of this report, resources refer to Manitoba's natural resources, air, water and land, unless otherwise indicated.

- **Stakeholder** – Although the normal legal definition relates to the holder of the "stake" during a bet or wager, the word is used quite differently in the context of public consultation processes, especially relative to government decision-making. In this context, "stakeholder" refers to a party with a "stake" or legitimate interest in the outcome of a decision to be made. The word, stakeholder, generally includes non-government entities, usually the ones that have a desire to influence the decision. Thus, stakeholders in a planning process would include the land-users, property owners, non-governmental associations, interest groups, potential developers and individuals. The parties that are governments or decision-makers are not considered stakeholders.

- **Sustainable Development** – This is defined in *The Manitoba Sustainable Development Act* as "meeting the needs of the present without compromising the ability of future generations to meet their own needs." The definition is supplemented by the inclusion in *The Manitoba Principle and Guidelines of Sustainable Development Act.*

- **Sustainable Development Components** – The use of the phrases "sustainable development components," "sustainable development," "sustainability," and "sustainability factors" in recommendations all include economic, social, environmental, human health, and cultural considerations.

- **Tenure** – Tenure refers to socially defined agreements held by individuals or groups, recognized by legal statutes or customary practice, regarding the "bundle of rights and duties" of ownership, holding, access and/or usage of a particular land unit or the associated resources there within (such as individual trees, plant species, water, minerals, etc.).

- **Terms of Reference** – This refers to instructions provided to hearing panels, such as the Clean Environment Commission, for the conduct of such activities as public hearings.

- **Traditional Ecological Knowledge** – Traditional ecological knowledge (TEK) is the knowledge base acquired by indigenous and local peoples over many hundreds of years through their direct contact with the environment. This knowledge includes an intimate and detailed knowledge of plants, animals and natural phenomena, the development and use of appropriate technologies for hunting, fishing, trapping, agriculture and forestry, and a holistic knowledge, or "world view", which parallels the scientific discipline of ecology. When TEK and western scientific knowledge are used in an appropriate and complementary fashion, the two knowledge systems provide a powerful tool for managing natural resources and achieving sustainable development. (Newsletter – Centre for Traditional Knowledge, Canadian Museum of Nature)

- **Traditional Ecological Mapping** – The use of mapping technology is being expanded to accommodate TEK. Most GIS applications have been traditionally concerned only with scientifically derived data. The spatial analytical capabilities of this technology offer great potential to aid in land-oriented decision-making. The quantifiable nature of GIS output supports First Nations positions within political negotiations and legal contexts.

  The challenges are with respect to the informal nature of traditional knowledge. There are several ways to address this issue. First of all, by its very nature GIS has the potential to be more reflective of a holistic world view than static analogue maps. The ability to layer diverse themes, variables and landscape characteristics can more closely approximate a less reductionist, more encompassing environment. The update capabilities of GIS, moreover, can incorporate dynamic conditions in the real world into the analysis.

- **UNESCO – World Natural and Cultural Heritage Site** – The United Nations Educational, Scientific and Cultural Organization (UNESCO) seeks to encourage the identification, protection and preservation of cultural and natural heritage around the world, considered to be of outstanding value to humanity . This is embodied in an international treaty called the *Convention Concerning the Protection of the World Cultural and Natural Heritage,* adopted by UNESCO in 1972. Cultural heritage refers to monuments, groups of buildings and properties with historical, aesthetic, archaeological, scientific, ethnological or anthropological value. Natural heritage refers to outstanding physical, biological and geological formations, habitats of threatened species of animals and plants, and areas with scientific, conservation or aesthetic value. UNESCO's World Heritage mission, among a lengthy list of objectives, is to encourage countries to sign the 1972 *Convention* and to ensure the protection of their natural and cultural heritage, as well as encourage States Parties to the *Convention* to nominate properties within their national territories for inclusion on the World Heritage List.

- **Watershed** – This is the area that drains to a common waterway, such as a stream, lake, estuary, wetland, or even the ocean. (EPA)

- **Wetlands** – Wetlands are areas where water covers the soil, or is present either at, or near, the surface of the soil all year or for varying periods of time during the year, including during the growing season. Water saturation (hydrology) largely determines how the soil develops and what types of plant and animal communities are living in and on the soil. Wetlands may support both aquatic and terrestrial

(both water and land) species. The prolonged presence of water creates conditions that favour the growth of specially adapted plants (hydrophytes) and promote the development of characteristic wetland (hydric) soils.

Wetlands vary widely because of regional and local differences in soils, topography, climate, hydrology, water chemistry, vegetation and other factors, including human disturbance. Indeed, wetlands are found from the tundra to the tropics and on every continent except Antarctica. (EPA)

Capital Expenditure Forecast Summary Table

Manitoba Hydro
Consolidated Capital Expenditure Forecast (CEF14)
For the Years 2014/15 – 2033/34

1.0 Overview

The Capital Expenditure Forecast (CEF14) is a projection of Manitoba Hydro's capital expenditures for new and replacement facilities to meet the electricity and natural gas service requirements in the Province of Manitoba as well as expenditures required to meet firm sale commitments outside the province. Expenditures included in the Capital Expenditure Forecast will provide for an ongoing safe and reliable supply of energy in the most efficient and environmentally sensitive manner.

The Capital Expenditure Forecast is comprised of a number of specifically identified large projects or "major items" as well as numerous unspecified smaller projects referred to as "base items." Major items are normally greater than $50 million in total cost and the construction period on each major item usually extends beyond one year. Base capital expenditure items typically represent sustaining capital requirements to meet electricity and natural gas service replacements and expansions throughout the province. All major and base capital projects are subjected to a rigorous review and approval process before being included in the Capital Expenditure Forecast

The CEF14 includes Major New Generation & Transmission projects which increase capacity and energy or provide increased reliability. In August 2013, the Province of Manitoba issued an Environmental Act licence for the Bipole III Reliability project and construction has commenced with a planned in-service date of 2018/19. In July 2014 the Province of Manitoba issued an Environmental Act licence for the Keeyask Generating Station and construction has commenced with a planned in-service date of 2019/20. Manitoba Hydro continues to develop the Manitoba-Minnesota Transmission Project, a transmission interconnection into the U.S. which supports enhanced export capability, reliability and drought risk mitigation. The Province also endorsed Manitoba Hydro's new, more aggressive demand side management PowerSmart plan which targets a 250% increase in consumption savings.

For CEF14 forecast purposes, it is assumed that the Conawapa Generating Station has been suspended and replaced with a gas turbine required in 2037/38 to meet firm capacity requirements. While the majority of the planning and licensing activities on Conawapa have been suspended, Manitoba Hydro continues to pursue dependable firm export sales based on the earliest possible in-service date of Conawapa in 2029/30 and will re-evaluate the business case (currently anticipated by Fall of 2016).

Base capital targets established for fiscal years 2014/15 through 2020/21 in CEF14 considered increased requirements for aging infrastructure based upon asset condition assessments. Beginning in 2021/22, base capital targets are escalated at a minimum 2% annually.

Capital Expenditure Forecast Summary

The CEF14 totals $25 953 million for the twenty year period to 2033/34. Expenditures for Major New Generation & Transmission (MNG&T) total $12 611 million, with the balance of $13 342 million comprised of expenditures for infrastructure renewal, system safety and security, new and increasing load requirements, and ongoing efficiency improvements.

Comparison to CEF13

The CEF14 for the twenty year period to 2033/34 totals $25 953 million compared to $33 474 million for the same twenty year period included in last year's Capital Expenditure Forecast (CEF13).

Manitoba Hydro
Consolidated Capital Expenditure Forecast (CEF14)
For the Years 2014/15 – 2033/34

ELECTRIC OPERATIONS:

MAJOR NEW GENERATION & TRANSMISSION:

Wuskwatim - Generation

Description:
Design and build the new Wuskwatim generating station with three generators and installed capacity of approximately 200MW on the Burntwood River upstream of Thompson.

Justification:
This project increases generation for both export power purposes and domestic load requirements.

In-Service Date:
First power June 2012

Revision:
Cost flow revision only.

	Total	2015	2016	2017	2018	2019	2020-34
Previously Approved	$ 1 448.6	$ 23.8	$ 12.1	$ -	$ -	$ -	$ -
Increase (Decrease)	-	16.7	0.8	14.7	-	-	-
Revised Forecast	$ 1 448.6	$ 40.5	$ 12.9	$ 14.7	$ -	$ -	$ -

Keeyask - Generation

Description:
Design and build the Keeyask generating station with seven generators and nominal capacity of 695MW on the Nelson River downstream of the Kelsey generating station. Project costs also include activities necessary to obtain approval and community support to proceed with the construction of the future generating station. These costs are comprised of extensive First Nations and other community consultations, pre-project training, joint venture business developments, environmental studies, impact statement preparations, submissions, regulatory review processes, detailed pre-engineering requirements, acquiring all necessary licensing, the design and construction of associated transmission facilities, and improvements to access roadways.

Justification:
This project increases generation for export power purposes and ultimately domestic load requirements.

In-Service Date:
First power November 2019

Revision:
The Keeyask Project control budget was updated in March 2014 as part of the NFAT review of the preferred development plan. The last detailed project estimate was completed in 2009. The control budget includes bid prices from the major contractors including the General Civil Contract, current budget of the Keeyask Infrastructure Project and cost flow revisions.

	Total	2015	2016	2017	2018	2019	2020-34
Previously Approved	$ 6 220.1	$ 471.0	$ 639.3	$ 865.1	$ 1 111.4	$ 942.3	$ 1 201.1
Increase (Decrease)	276.0	305.3	37.1	97.1	239.9	(14.4)	(316.3)

Manitoba Hydro
Consolidated Capital Expenditure Forecast (CEF14)
For the Years 2014/15 – 2033/34

Grand Rapids Hatchery Upgrade and Expansion

Description:
Expand the capacity of the existing facility through tank replacement/reconfiguration and upgrade of supporting water treatment infrastructure. Modifications to the Research Centre (a separate facility on the GRH site), including well and potable water supply, to serve as a temporary production facility during hatchery upgrade and expansion, and the purchase of portable satellite facilities to allow for fish rearing during hatchery construction. Install electrical service from Grand Rapids Generating Station service to the hatchery.

Justification:
Upgrades to the Grand Rapids hatchery are a requirement of the Keeyask Environment Act licence as well as recently introduced national and provincial regulatory requirements for water quality and biosecurity.

In-Service Date:

March 2018

Revision:
New item.

	Total	2015	2016	2017	2018	2019	2020-34
Previously Approved	$ -	$ -	$ -	$ -	$ -	$ -	$ -
Increase (Decrease)	23.5	1.9	4.7	9.3	6.8	-	-
Revised Forecast	$ 23.5	$ 1.9	$ 4.7	$ 9.3	$ 6.8	$ -	$ -

Conawapa - Generation

Description:
Design and build the Conawapa generating station with ten generators and nominal capacity of 1 485MW on the Nelson River downstream of the Limestone generating station. Project costs also include activities associated with extensive First Nations and other community consultations, pre-project training, environmental studies, impact statement preparations, submissions, regulatory review processes, acquiring all necessary licensing, improvements to access roadways, and detailed pre-engineering required to obtain a license and all necessary approvals to construct the Conawapa generating station.

Justification:
This project increases generation for export power purposes and ultimately domestic load requirements.

In-Service Date:
Under review pending re-evaluation of the business case.

Revision:
Majority of expenditures have been suspended pending re-evaluation of the business case. Remaining expenditures are for the wrap up of preliminary engineering studies and limited environmental and aboriginal studies including capitalized interest on construction in process through August 2016.

	Total	2015	2016	2017	2018	2019	2020-34
Previously Approved	$ 10 491.5	$ 70.1	$ 125.9	$ 99.4	$ 240.6	$ 308.1	$ 9 317.0
Increase (Decrease)	(10 094.5)	(26.7)	(94.5)	(78.4)	(240.6)	(308.1)	(9 317.0)
Revised Forecast	$ 397.0	$ 43.4	$ 31.4	$ 21.0	$ -	$ -	$ -

Manitoba Hydro
Consolidated Capital Expenditure Forecast (CEF14)
For the Years 2014/15 – 2033/34

Kelsey Improvements & Upgrades

Description:
Overhaul and uprate all seven Kelsey generating station units including the replacement of turbine runners, bottom rings, discharge rings or weld overlays, transformers, generator windings and exciters. Perform model testing to refine runner design, perform extensive intake gate rehabilitation, perform draft tube modifications, perform an 8 000 hour inspection, and upgrade rail spur and overhead crane. Upgrade transmission facilities necessary to integrate the additional Kelsey generation into the Manitoba Hydro system network.

Justification:
Rerunnering presents the best economic solution for increasing efficiency at the Kelsey generating station and for adding system capacity without flooding or requiring a new water power license. Overhauling the units will improve the unit output by up to 11MW per unit. The transmission upgrade of a portion of the Kelsey 138 and 230kV buses and the revisions to the Northern AC Cross Trip scheme are required to accommodate the 77MW of additional Kelsey output.

In-Service Date:
October 2016

Revision:
In July 2013, the overhauls on all seven units had been completed and placed back in-service. Significant work remains to fix deficiencies on the head covers of all the units to improve safety and reliability. Wastewater treatment upgrades, required to accommodate the increased workforce during the overhauls, was higher than anticipated due the original design not meeting environmental limits. Final In-service date deferred 26 months from August 2014.

	Total	2015	2016	2017	2018	2019	2020-34
Previously Approved	$ 301.7	$ 2.2	$ -	$ -	$ -	$ -	$ -
Increase (Decrease)	39.0	11.9	9.1	12.9	1.3	-	-
Revised Forecast	$ 340.4	$ 14.1	$ 9.1	$ 12.9	$ 1.3	$ -	$ -

Kettle Improvements & Upgrades

Description:
Rewind stator for units 5-12 and install a new stator frame, core and winding for units 1-4. Perform rotor refurbishment, thrust runner replacement, new excitation transformers, rebabbitting of bearings, excitation upgrade replacements, control and protection system replacements, mechanical systems replacements, and intake gate and wicket gate work for units 1-4.

Justification:
The stator windings at Kettle are polyester bonded mica which is prone to internal degradation as a result of thermal and electrical stresses. There has been a much higher failure rate for stator coils at Kettle than in any of our other generators installed since 1960. Analysis of the internal conditions of the insulation system is ongoing. Re-wedging units at Kettle is an opportunity to repair isolated cases of severe slot discharge, necessary to avoid deterioration. Unit 4 requires repairs due to an incident that occurred in August 2006, where a top clamping finger on the unit broke off and fell into the air gap causing extensive damage to the windings and core.

In-Service Date:
March 2026

Revision:
To reflect final costs for Unit 4, including scope increase for thrust runner replacement, new excitation transformer, re-babbiting of bearings and removal and disposal of the old stator for units 1-4.

	Total	2015	2016	2017	2018	2019	2020-34
Previously Approved	$ 165.7	$ 7.7	$ 23.7	$ 17.3	$ 1.0	$ 31.7	$ 29.5
Increase (Decrease)	25.9	(1.1)	(0.2)	7.3	21.0	-	(0.0)
Revised Forecast	$ 191.6	$ 6.6	$ 23.5	$ 24.6	$ 22.0	$ 31.7	$ 29.5

Manitoba Hydro
Consolidated Capital Expenditure Forecast (CEF14)
For the Years 2014/15 – 2033/34

Pointe du Bois Spillway Replacement

Description:
Design and build a new spillway and new concrete and earth fill dams to replace the existing spillway structures. Includes engineering and environmental studies, community consultation, obtaining regulatory approval, and de-commissioning the existing spillway.

Justification:
Pointe du Bois does not currently meet dam safety guidelines with respect to spillway capacity. A new spillway is required to meet these guidelines.

In-Service Date:
October 2015

Revision:
Deferred spillway in-service due to a late start to concrete placement, lower than planned productivity pushing concrete work into winter months and increased gate installation time. In addition to the delay in the spillway in-service, dam placement activities were suspended due to the late spring melt and higher than average precipitation flows on the Winnipeg River. As a result, final in-service date deferred one year from October 2014.

	Total	2015	2016	2017	2018	2019	2020-34
Previously Approved	$ 559.6	$ 125.3	$ 5.5	$ -	$ -	$ -	$ -
Increase (Decrease)	15.0	(11.2)	46.1	3.8	-	-	-
Revised Forecast	$ 574.8	$ 114.1	$ 51.6	$ 3.8	$ -	$ -	$ -

Pointe du Bois - Transmission

Description:
Redevelop Stafford Terminal station (formerly Scotland station), replace Bank 7 at Pointe du Bois switchyard station, salvage 66kV P lines between Pointe du Bois and Rover stations, install a 115kV transmission line between Pointe du Bois and Whiteshell stations, add Bank 8 to Pointe du Bois switchyard, install a 66kV line between Ridgeway and Rover stations, and upgrade protection at Slave Falls switchyard station.

Justification:
The 66kV lines P1, P2, P3, and P4 between Pointe du Bois and Rover stations have exceeded their expected serviceable life and pose threats to public and employee safety. The reliability of the transmission system in the Winnipeg Central area has been degraded due to the poor physical condition of these lines. In order to successfully operate the power system and continuously deliver high quality power to our customers and protect the public, the P Lines should be removed. The rebuild of Stafford station is required to address due diligence concerns, including Manitoba Hydro grounding and switching standards and public safety, and to increase Winnipeg Central capacity. This work involves converting the 138kV system to 115kV, so work at Pointe du Bois is also required.

In-Service Date:
December 2017

Revision:
Cost flow revision only.

	Total	2015	2016	2017	2018	2019	2020-34
Previously Approved	$ 114.3	$ 8.6	$ 12.3	$ 21.9	$ 7.4	$ -	$ -
Increase (Decrease)	-	7.2	4.8	(8.2)	(3.1)	-	-
Revised Forecast	$ 114.3	$ 15.8	$ 17.1	$ 13.8	$ 4.3	$ -	$ -

Gillam Redevelopment and Expansion Program (GREP)

Description:
Redevelop and expand the Town of Gillam infrastructure in Phases 1B, 2 and 3. Phases 2 & 3 will require further definition based on conceptual design and the requirement of Manitoba Hydro's construction of new facilities in the North.

Justification:
Redevelopment of the Town of Gillam is required to address existing operational needs and to prepare for the growth associated with new generation facilities. The GREP will improve the overall quality of infrastructure in Gillam, which will positively affect attraction and retention for existing and new generation facilities. The GREP supports Corporate initiatives to develop the hydroelectric potential of the Lower Nelson River.

In-Service Date:
March 2027

Revision:
A re-evaluation of the project resulted in cost reductions due to optimization of the project through a redesign of the town centre, residential site development, trailer park and industrial park as well as a re-analysis of customer requirements resulting in a reduction in scope of work.

	Total	2015	2016	2017	2018	2019	2020-34
Previously Approved	$ 366.5	$ 27.0	$ 30.2	$ 30.5	$ 29.5	$ 27.9	$ 221.3
Increase (Decrease)	(100.0)	(7.0)	(7.8)	(7.8)	(7.8)	(7.7)	(62.0)
Revised Forecast	$ 266.5	$ 20.0	$ 22.4	$ 22.8	$ 21.8	$ 20.2	$ 159.3

Bipole III - Transmission Line

Description:
Design and build a +/- 500kV HVdc transmission line of approximately 1 341km (west of Lakes Winnipegosis & Manitoba) from Riel Converter Station to Keewatinohk Converter Station. Conduct environmental impact assessment, acquire property, and obtain licensing necessary for a +/- 500kV DC transmission line and converter stations at Riel and Keewatinohk.

Justification:
Provides increased reliability to the Manitoba Hydro system due to the critical risk to the Province and the Corporation of not mitigating an Interlake (Bipole 1 and 2) corridor outage or a Dorsey station common mode outage. In normal steady state operation, it will also provide an increase in southern power, due to decreased line losses (approximately 76MW under full existing generation). The rating for Bipole III was increased from 2000MW to 2300MW to ensure adequate spare HVdc transmission on the northern collector system. The increased rating ensures future generation can be transmitted via Bipole I, Bipole II and Bipole III in the event of a single valve group outage.

In-Service Date:
July 2018

Revision:
The revised estimate incorporates a more detailed scope based on an issued environment act licence, approved finalized route and right-of-way width, as well as up-to-date market information. The project licence and permits were received later than planned, resulting in 1.5 lost winter seasons of 5 total planned. The estimate is based on the need for at least 4 more winter seasons to construct the transmission line. Project in-service date deferred nine months from October 2017.

	Total	2015	2016	2017	2018	2019	2020-34
Previously Approved	$ 1 259.9	$ 265.9	$ 381.9	$ 263.7	$ 195.2	$ -	$ -
Increase (Decrease)	395.5	(62.4)	(21.5)	117.3	298.6	75.3	-
Revised Forecast	$ 1 655.4	$ 203.5	$ 360.5	$ 381.0	$ 493.8	$ 75.3	$ -

Manitoba Hydro
Consolidated Capital Expenditure Forecast (CEF14)
For the Years 2014/15 – 2033/34

Bipole III - Converter Stations

Description:
Design and build an HVdc converter station with a rating of 2300MW at the proposed Keewatinohk (Keewatinoow) site, including property acquisition costs and the Keewatinohk 230kV AC switch yard. Design and build an HVdc converter station with 2300MW of converters at Riel, including four LCC HVdc synchronous condensers, property acquisition costs and expansion of the Riel 230kV AC switch yard.

Justification:
Provides increased reliability to the Manitoba Hydro system due to the critical risk to the Province and the Corporation of not mitigating an Interlake (Bipole I and II) corridor outage or a Dorsey station common mode outage. The rating for Bipole III was increased from 2000MW to 2300MW to ensure adequate spare HVdc transmission on the northern collector system. The increased rating ensures future generation can be transmitted via Bipole I, Bipole II and Bipole III in the event of a single valve group outage.

In-Service Date:
July 2018

Revision:
The selection of LCC technology has resulted in synchronous condensers being included in the revised estimate. Additionally, the awarded contract prices for the Keewatinohk Camp, Keewatinohk Site Development and the Keewatinohk 230kV AC Switchyard have been incorporated into the revised estimate. The rating for Bipole III was increased from 2000MW to 2300MW to ensure adequate spare HVdc transmission on the northern collector system. Project in-service date deferred nine months from October 2017.

	Total	2015	2016	2017	2018	2019	2020-34
Previously Approved	$ 1 828.5	$ 262.6	$ 493.2	$ 410.2	$ 181.5	$ 127.4	$ -
Increase (Decrease)	846.6	(41.6)	87.6	418.5	326.1	67.7	23.0
Revised Forecast	$ 2 675.1	$ 221.1	$ 580.8	$ 828.7	$ 507.7	$ 195.1	$ 23.0

Bipole III - Collector Lines

Description:
Design and construct three permanent and two temporary 230kV collector lines for the Keewatinohk Converter Station. Construct power substation for the Keewatinohk Converter Station, 138 kV line, microwave tower, and distribution feeders for the Keewatinohk Converter Station. Design and construct the Riel and Keewatinohk electrode lines, sectionalize the 230kV transmission line R49R at Riel. Includes the property acquisition and/or easements for the collector lines and the electrode lines. Design and construct a new bay and modify existing Long Spruce 230 KY AC switchyard for the new collector line to Keewatinohk Converter Station. Design and construction of a new bay and modifications at existing Henday 230 KY AC switchyard for the four new collector lines to Keewatinohk Converter Station. Design and construction of breaker replacements at existing stations (Ridgeway, Rosser, and McPhillips) for Bipole III.

Justification:
Provides increased reliability to the Manitoba Hydro system due to the critical risk to the Province and the Corporation of not mitigating an Interlake (Bipole 1 and 2) corridor outage or a Dorsey station common mode outage.

In-Service Date:
July 2018

Revision:
The revised estimate incorporates a more detailed scope including double circuit for one collector line, increased reliability design for electrode lines, updated assumptions for direct negotiated clearing and construction contracts based on an issued environment act licence and increased scope for Long Spruce and Henday switchyard additions and breaker replacements at existing stations. Project in-service date deferred nine months from October 2017.

	Total	2015	2016	2017	2018	2019	2020-34
Previously Approved	$ 191.4	$ 63.5	$ 46.2	$ 37.7	$ 8.5	$ -	$ -
Increase (Decrease)	69.0	(5.0)	29.4	14.0	28.2	4.7	-
Revised Forecast	$ 260.2	$ 58.4	$ 75.5	$ 51.7	$ 36.7	$ 4.7	$ -

Manitoba Hydro
Consolidated Capital Expenditure Forecast (CEF14)
For the Years 2014/15 – 2033/34

Bipole III - Community Development Initiative

Description:
Establishment of an obligation for a Community Development Initiative to provide benefits to First Nations, Community Councils, rural Municipalities and incorporated Towns and Villages within the vicinity of the Bipole III Project.

Justification:
Manitoba Hydro is responding to community feedback seeking longer term benefits for communities in proximity to high voltage transmission facilities. These funds will be available for community development projects that benefit a broad segment of eligible communities.

In-Service Date:
July 2018

Revision:
Net Present Value calculation increased due to the nine month in-service deferral from October 2017.

	Total	2015	2016	2017	2018	2019	2020-34
Previously Approved	$ 60.8	$ 2.2	$ 2.0	$ 1.8	$ 0.9	$ -	$ -
Increase (Decrease)	1.2	0.1	(0.0)	0.0	0.7	0.5	-
Revised Forecast	$ 62.0	$ 2.3	$ 2.0	$ 1.8	$ 1.6	$ 0.5	$ -

Riel 230/500kV Station

Description:
Conduct environmental impact assessment and obtain licensing necessary for the Riel 230/500kV station. Design and construct a 230/500kV station at the Riel site including the installation of a 230kV bus with a maximum of five Bays, the installation of a 500kV ring bus, the installation of a 230/500kV 1200MVA transformer bank using two 230kV and one 500kV breaker, and the installation of 500kV line reactors with relocating of a reactor phase from Dorsey. Install a second reactor phase from Dorsey as a spare at Riel after the Riel reactors are in-service and salvage the third reactor phase at Dorsey. Sectionalize two 230kV transmission lines R32V and R33V into Riel station using eight 230kV breakers and associated equipment resulting in two Riel-Ridgeway and two Riel-St. Vital transmission lines. Sectionalize 500kV transmission line D602F into Riel station using two 500kV breakers and associated equipment resulting in Dorsey-Riel and Riel-Forbes 500kV circuits.

Justification:
The sectionalization of the 500kV line allows power to be imported during a catastrophic Dorsey outage, as well as an alternate path for power export during a Dorsey transformer outage.

In-Service Date:
October 2014

Revision:
Cost flow revision only.

	Total	2015	2016	2017	2018	2019	2020-34

Manitoba-Minnesota New 500kV Transmission Line

Description:
Design, construct and commission a 235km 500kV AC single-circuit transmission line from Dorsey Station to the US border. Design and install one 500kV breaker, one 150MVAr 500kV shunt reactor, one double-wye ungrounded 46kV 73.4MVAr shunt capacitor bank and associated communications and protection at Dorsey. Design and install two 500kV breakers, one 230kV breaker, two double-wye ungrounded 46kV 73.4MVAr shunt capacitor banks, a 1 200MVA 230/500kV autotransformer and associated communications and protection at Riel. Acquire property for right-of-way, conduct environmental impact assessment, conduct community consultations, obtain licensing and perform environmental monitoring for all new facilities. Design, procure and install a new 300MVA phase shifter at Glenboro Station and re-align the transmission lines at the Glenboro Station to accommodate the new transformer.

Justification:
Power sale term sheets have been negotiated with Minnesota Power (250MW) and Wisconsin Public Service (300MW). The existing tie line capacity is insufficient to accommodate the additional sales and therefore a new export line is needed. The proposed transmission facilities will increase the Manitoba to U.S. transfer capability for both export and import purposes.

In-Service Date:
May 2020

Revision:
Cost flow revision and in-service date deferred seven months from October 2019.

	Total	2015	2016	2017	2018	2019	2020-34
Previously Approved	$ 350.3	$ 3.8	$ 29.7	$ 101.1	$ 58.7	$ 63.5	$ 91.8
Increase (Decrease)	-	3.2	3.0	(1.5)	0.7	2.2	(8.3)
Revised Forecast	$ 350.3	$ 7.0	$ 32.7	$ 99.6	$ 59.5	$ 65.7	$ 83.5

Firm Import Upgrades

Description:
Reconductor and resag transmission lines SC25, WT34, and SM26, and replace risers and/or current transformers for stations at Whiteshell, Ridgeway, Transcona, and Parkdale.

Justification:
This project will increase to 100MW Manitoba Hydro's firm import capability from Ontario. Increasing the transmission capability will permit greater volume of energy imports during periods when additional energy may be required.

In-Service Date:
Cancelled.

Revision:
Project cancelled. Since the project was initially approved in 2008 and additional funding approved in 2011, market and corporate conditions have changed, and this import upgrade is no longer a priority considering the capital needs for major projects which must be undertaken. This project is not required for reliability or safety, and its cancellation will not negatively impact financial projections.

	Total	2015	2016	2017	2018	2019	2020-34

Revised Forecast	$ -	$ -	$ -	$ -	$ -	$ -	$ -

Demand Side Management

Description:
Design, implement and deliver incentive based PowerSmart conservation programs to reduce electricity consumption in Manitoba.

Justification:
The electric Demand Side Management plan is cost effective as a resource option and is included in Manitoba Hydro's Power Resource Plan (PRP). The DSM plan provides customers with exceptional value through the implementation of cost-effective energy conservation programs that are designed to minimize the total cost of energy services to customers, position the Corporation as a national leader in implementing cost-effective energy conservation and alternative energy programs, protect the environment and promote sustainable energy supply and service.

In-Service Date:
Ongoing.

Revision:
Revisions to energy saving and expenditures for a number of programs to reflect current market information and designed to aggressively pursue cost-effective market-achievable savings. It is assumed that upon adoption of IFRS in 2015/16, the demand side management programs will continue to be capitalized, under the interim standard that continues to permit rate-regulated accounting.

Manitoba Hydro
Consolidated Capital Expenditure Forecast (CEF14)
For the Years 2014/15 – 2033/34

MAJOR CAPITAL:

GENERATION OPERATIONS:

Pine Falls Units 1-4 Major Overhauls

Description:
Rehabilitation, replacement of and addition to various equipment such as generator re-wind, stator radial keys, breakers, cooling radiators, instrument transformers, unit control & monitoring systems, excitation system upgrades, governor upgrades, meter upgrades, and powerhouse crane refurbishment. Replace unit 1-4 turbine runners with more efficient new design runners, rebuild existing servomotors for increased wicket gate opening allowing more discharge, and rewind the generator stators utilizing modern insulating materials. Conduct a model test and up-rate study.

Justification:
Assessment of the mechanical systems has identified concerns in terms of obsolete equipment, safety, fire risk and adaptability to present day operating conditions and standards. Upgrading is necessary to ensure reliable safe and economical operation. Pine Falls consistently spills more water than the other Winnipeg River plants. Additional generation can be obtained (approximately 17%) with increased discharge capability. Tests have confirmed that the two stator windings are in danger of failure at any time.

In-Service Date:
September 2019

Revision:
Cost flow revision and in-service date deferred five months from April 2019.

	Total	2015	2016	2017	2018	2019	2020-34
Previously Approved	$ 142.2	$ 8.0	$ 5.0	$ 21.9	$ 30.2	$ 27.0	$ 16.0
Increase (Decrease)	-	(0.8)	(4.3)	(7.9)	(3.8)	2.6	24.9
Revised Forecast	$ 142.2	$ 7.2	$ 0.7	$ 14.0	$ 26.4	$ 29.6	$ 40.9

Jenpeg Overhaul Program

Description:
Major overhaul of all six generating units to inspect, repair, modify, and replace components of the turbine/ generator. Areas of concern include journal bearings, thrust bearings, turbine seals, servo motors, wicket gate seals and bushings, waterhead and oil head, stator and rotor, and auxiliary systems.

Justification:
A complete overhaul is required to ensure reliable operation of the units when maximum power requirements on the system are essential.

In-Service Date:
December 2031.

Revision:
None.

	Total	2015	2016	2017	2018	2019	2020-34
Previously Approved	$ 115.9	$ -	$ -	$ -	$ -	$ -	$ 115.9
Increase (Decrease)	-	-	-	-	-	-	-
Revised Forecast	$ 115.9	$ -	$ -	$ -	$ -	$ -	$ 115.9

Slave Falls Major Overhauls

Description:
Perform major overhaul for all eight units at Slave Falls generating station, including spillway improvements/ replacements, excitation upgrades, the addition of a Unit Control and Monitoring System (UCMS) Framework, access road upgrades, and a new walkway across the spillway.

Justification:
Many safety, reliability, environmental, efficiency, operational & dam safety issues have been identified relating to the Slave Falls infrastructure. Extensive repairs, modifications and/or replacements will be required to ensure the serviceability of the plant and spillway infrastructure. Economics of this work may suggest that a new spillway be constructed to replace existing spill infrastructure. Current operating procedures include ice load reduction activites at the spilling structures to ensure structural stability. A dam safety concern has been identified with respect to the minimal remote spilling capability at Slave Falls.

In-Service Date:
September 2027.

Revision:
In-service date deferred six years from September 2021.

	Total	2015	2016	2017	2018	2019	2020-34
Previously Approved	$ 126.1	$ 0.2	$ 0.9	$ 5.3	$ 26.6	$ 30.3	$ 62.9

Revised Forecast	$ 126.1	$ -	$ -	$ -	$ -	$ -	$ 126.1

Water Licenses & Renewals

Description:
Conduct hydraulic studies, geotechnical assessments, property status and severance line determinations, mapping, license documentation, environmental reviews, and community informational sessions necessary to secure license finalization and/or renewals for the Corporation's hydraulic plants.

Justification:
All hydraulic generating facilities must be authorized under water power licenses and these licenses need to be clearly in force to significantly reduce risk exposure, maintain operating flexibility, maximize export revenues, and contribute to financial strength.

In-Service Date:
Various

Revision:
This item is made up of numerous License Finalizations, Renewals and other programs included to proactively protect the environment and contribute to the corporation's sustainable development principles. It is considered an on-going program cost therefore the budget is now included in Generation Operations Base Target.

	Total	2015	2016	2017	2018	2019	2020-34

Manitoba Hydro
Consolidated Capital Expenditure Forecast (CEF14)
For the Years 2014/15 – 2033/34

Pointe du Bois GS Rehabilitation

Description:
Implement safety upgrades for the Pointe du Bois generating station including fire protection, mechanical hazards, electrical hazards, operational hazards, trips and fall hazards, and various other safety upgrades. Additionally, implement turbine and generator, equipment and civil rehabilitation and upgrades.

Justification:
To provide a high level of health and safety upgrades as well as improved reliability and control, along with a reduction in potential environmental impacts from catastrophic events such as fire or flooding. The plan provides the most economical solution to operate the generating station for an additional twenty years.

In-Service Date:
March 2021

Revision:
Cost flow revision and advanced in-service date five years and four months from July 2026.

	Total	2015	2016	2017	2018	2019	2020-34
Previously Approved	$ 182.9	$ 10.3	$ 15.3	$ 21.7	$ 19.5	$ 20.4	$ 81.5

Great Falls Unit 4 Overhaul

Description:
Major overhaul to generating Unit 4 including generator rewind, turbine re-runnering, new water passage embedded components, one 3-phase unit transformer, and modernization of components.

Justification:
The re-runnering and major overhaul will provide an opportunity to upgrade/modernize the unit while taking advantage of an already planned outage for the intake gates. The re-runnering will add both capacity and efficiency. The existing transformer is in poor condition and water passage components are starting to fail. The overhaul will increase reliability and extend the asset life by 40 to 50 years.

In-Service Date:
August 2015.

Revision:
Cost flow revision only.

	Total	2015	2016	2017	2018	2019	2020-34
Previously Approved	$ 53.6	$ 16.5	$ 11.9	$ -	$ -	$ -	$ -
Increase (Decrease)	-	(0.8)	2.3	-	-	-	-
Revised Forecast	$ 53.6	$ 15.8	$ 14.2	$ -	$ -	$ -	$ -

Brandon Units 6 & 7 "C" Overhaul Program

Description:
Perform C inspections/overhauls of the Brandon gas turbines Unit 6 & 7 when each of them acquires 24,000 Equivalent Operating Hours (EOH).

Justification:
The reliability of the hot gas path components cannot be predicted after 24,000 EOH. Failure of hot gas path parts could lead to significant collateral damage and an extended forced outage of the units.

In-Service Date:
March 2024.

Revision:
None.

	Total	2015	2016	2017	2018	2019	2020-34

Manitoba Hydro
Consolidated Capital Expenditure Forecast (CEF14)
For the Years 2014/15 – 2033/34

TRANSMISSION:

Rockwood East 230/115kV Station

Description:
Design and construct a new 230/115kV Rockwood East Station adjacent to 230kV circuits A3R (Ashern-Rosser) and S65R (Silver-Rosser) including associated equipment, protection, control and communication systems. Sectionalize and extend 230kV and 115kV transmission lines as required and provide communication and protection upgrades.

Justification:
Construction of the Rockwood East Station with three 115kV line terminations would alleviate the overload scenarios for Rosser 230/115kV Banks 2 and 4 and for 115kV circuits CR4 or CR2 between Rosser and Parkdale Stations. It would also increase the 115kV capacity in the Rosser/Parkdale/Selkirk area. The existing Parkdale 115/66kV Station switchyard has very limited opportunity for adding new capacity due to the station's poor condition and limited space.

In-Service Date:
November 2015.

Revision:
Cost flow revision only.

	Total	2015	2016	2017	2018	2019	2020-34
Previously Approved	$ 53.3	$ 29.1	$ 8.6	$ -	$ -	$ -	$ -
Increase (Decrease)	-	(2.5)	2.5	-	-	-	-
Revised Forecast	$ 53.3	$ 26.6	$ 11.1	$ -	$ -	$ -	$ -

Lake Winnipeg East System Improvements

Description:
Build a new 115/66kV Manigotagan Corner Station complete with two 6OMVA transformers, a new 65km, 115kV transmission line from Pine Falls Station to Manigotagan Corner Station and the associated terminations and communications.

Justification:
Pine Falls Station currently operates over firm transformation during winter peak. The absence of firm transformation would cause customer outages in the Lake Winnipeg East area during a Pine Falls transformer outage. The outage would last greater than a week until a spare transformer could be brought in from Winnipeg and connected. A transformer outage would affect more than 1,300 permanent customers and more than 13,000 seasonal (summer) customers. Deferral will place customers at risk of no supply. The new 115/66kV Manigotagan Corner Station and Pine Falls – Manigotagan Corner 115kV Transmission Line will provide firm capacity for area load for the next 20 years, as well as enable the Bloodvein SVC to control effectively the voltage at Bloodvein, Little Grand Rapids, Beren's River and Poplar River for the next 20 years. It also reduces the loading on Pine Falls 115/66kV Station, thereby accommodating load growth in the Victoria Beach, Grand Beach and Bissett areas.

In-Service Date:
October 2016

Revision:
Cost flow revision and in-service date deferred eleven months from November 2015.

	Total	2015	2016	2017	2018	2019	2020-34

Manitoba Hydro
Consolidated Capital Expenditure Forecast (CEF14)
For the Years 2014/15 – 2033/34

Letellier - St. Vital 230kV Transmission

Description:
Design and construct a new 230kV line from Letellier Station to St. Vital Station including associated terminations and communications. Includes environmental licensing and monitoring, and property rights acquisition.

Justification:
The supply to Letellier Station must be improved in order to overcome the contingency loading and low voltage problems in the south central area of Manitoba caused by load growth, as well as to maintain export levels on the 230kV Tie Line L20D (Letellier to Drayton) at these increased loads.

In-Service Date:
July 2017

Revision:
Cost flow revision and an eleven month deferral from August 2016.

	Total	2015	2016	2017	2018	2019	2020-34
Previously Approved	$ 59.0	$ 3.0	$ 34.9	$ 18.1	$ 1.6	$ -	$ -
Increase (Decrease)	-	(1.7)	(31.2)	18.9	12.3	1.6	-

Transmission Line Upgrades for NERC Alert

Description:
This project consists of a nine year program to upgrade over 1000 transmission line spans to meet CSA Standards for line clearance. A priority listing of the transmission lines and spans requiring mitigation will be developed based on assessment work considering operational and safety risks specific to each line/span.

Justification:
This program addresses discrepancies between the design ratings and actual field ratings of transmission lines thereby ensuring continued reliability and operation of the electrical system as well as mitigating risks to public safety due to insufficient line clearance.

In-Service Date:
March 2023.

Revision:
Cost flow revision only.

	Total	2015	2016	2017	2018	2019	2020-34
Previously Approved	$ 151.3	$ 1.1	$ 8.9	$ 9.0	$ 9.1	$ 23.7	$ 99.5
Increase (Decrease)	-	(0.1)	(0.2)	(0.2)	(0.2)	(0.4)	1.1
Revised Forecast	$ 151.3	$ 1.0	$ 8.6	$ 8.8	$ 8.9	$ 23.3	$ 100.6

HVDC Dorsey Synchronous Condenser Refurbishment

Description:
For all nine (9) Synchronous Condensers at Dorsey, project includes major mechanical refurbishment consisting of re-wedging the stator, refurishment of bearings, rotor, and poles, and replacement of protection and control cubicles, Motor Control Center (MCC), excitation system and cables. Other work includes replacing the H2/CO2 ventilation and detection systems (except SC9Y), vibration monitoring, pony motor brushgear, and liquid mixing valves.

Justification:
Synchronous condensers are required for proper operation of the HVDC system, voltage regulation of the southern AC system and to provide reactive power for power export to the United States. A major inspection and overhaul of each machine is necessary to prevent catastrophic failure, involving the rotors and rotor bolts as indicated by the failures of SC12Y in 1987 and SC11Y in 1988. The cost of repairing a failure when combined with the inability to export power will well exceed the cost of major inspection and overhaul.

In-Service Date:
October 2021.

Revision:
Cost flow revision and in-service date deferred two years from October 2019.

	Total	2015	2016	2017	2018	2019	2020-34
Previously Approved	$ 73.3	$ 7.9	$ 8.9	$ 8.5	$ 5.9	$ 3.4	$ 0.8
Increase (Decrease)	-	0.8	(0.4)	(5.8)	(0.7)	(1.2)	6.6
Revised Forecast	$ 73.3	$ 8.7	$ 8.5	$ 2.7	$ 5.2	$ 2.2	$ 7.3

Dorsey 230kV Phase II Zone Building

Description:
Construction and equipping of two new zone buildings and refurbishing of the existing relay building and equipment. This project also includes installing and replacing various pieces of equipment and modifications to the switchyard.

Justification:
Construction of two new hardened relay buildings plus the hardening and conversion of the existing relay building is the most cost effective and practical option. This approach segregates the 230kV switchyard into three sections, providing for the majority of the 230kV switchyard to remain operational following the loss of a zone building. This meets Manitoba Hydro's system restoration criteria.

In-Service Date:
Cancelled

Revision:
Item cancelled. The Phase I improvements to Dorsey's 230kV Relay Building have significantly reduced the risk of catastrophic failure caused by severe weather and/or fire. The building has been fortified to withstand an F3 category tornado and the implemented fire mitigation measures have reduced the probability of a major fire with the Relay Building by greater than 200 times. These enhancements combined with the future addition of Bipole III have reduced the risks sufficiently to eliminate the need for Phase II.

	Total	2015	2016	2017	2018	2019	2020-34
Previously Approved	NA	$ -	$ -	$ 0.4	$ 16.5	$ 33.2	$ 13.3
Increase (Decrease)	-	-	-	(0.4)	(16.5)	(33.2)	(13.3)
Revised Forecast	NA	$ -	$ -	$ -	$ -	$ -	$ -

Bipole 2 Thyristor Valve Replacement

Description:
Removal of the existing eight (8) thyristor valve groups and their controls, and replace them with eight new de-ionized water cooled HVDC thyristor valve groups and controls.

Justification:
The Bipole 2 thyristor valves and controls are nearing the end of their useful life and require replacement. Replacing the existing thyristor valve groups and controls with new ones will result in reducing the probability of forced outages. This will result in a significant decrease in failures, reduce maintenance requirements, and generally improved reliability for Bipole 2.

In-Service Date:
October 2023

Revision:
Cost flow revision only.

CUSTOMER SERVICE & DISTRIBUTION:

New Madison Station - 115/24kV Station

Description:
Build a new 115/24kV St. James Station, new and upgraded feeders, and conversion of St. James, Ness, Berry and King Edward station feeders from 4kV to 24kV. Install 1.5km of new 115kV cable from St. James Station and protection upgrades required at Rosser, Inkster Sherbrook, Mohawk and La Verendrye stations.

Justification:
This project is required to ensure firm supply and a reliable system in the St. James area.

In-Service Date:
March 2017.

Revision:
The installation of 1.5km of 115kV cable from St. James Station to Madison Station is now required because tapping off existing infrastructure in the area is not viable. The contract bid price for the construction of the station and the internal labour to support the contract was higher than previously estimated. The protection upgrades at other stations was not included in previous estimates. The multi in-service date is deferred by twelve months to March 2017 without changing the Madison Station in-service date of March 2016.

	Total	2015	2016	2017	2018	2019	2020-34

Burrows New 66/12kV Station

Description:
Build a new two bank 66kV/12kV indoor station, complete with 12 feeder positions and protection to replace the Alfred and Charles stations.

Justification:
Most of the equipment in this part of Winnipeg has been in service for 77 years. Alfred Station (which supplies Charles Station) lacks access to a satisfactory alternate supply in the event of a 12kV interruption out of Rover Station. Remedial action was recommended for both stations in the Due Diligence Report. It indicated the 4kV switchgear lineups at Alfred and Charles Stations lack arc-resistance and at Alfred Station are sometimes underrated for the available fault current during normal operating conditions. It also had concerns that neither station has an appropriate battery room, all station transformers have patched leaks, they contain asbestos materials, and that spare parts are in short supply.

In-Service Date:
March 2015.

Revision:
Cash flow revision only.

	Total	2015	2016	2017	2018	2019	2020-34

New Adelaide Station 66/12kV

Description:
Construct a new Adelaide Station with 3 x 66-12kV, 30 MVA transformers and three line-ups of switchgear for twenty-three feeder positions. Install a control building for 12kV switchgear, communication, control and protection equipment. Install a 66kV GIS building/equipment for station supply terminations. Install 2 x 3km lengths of 66kV cable through new ductline to extend 66 kV line W6 to terminate at new station. Install new distribution ductline egresses from new station to connect to existing ductline system in downtown area.

Justification:
Constructing the new Adelaide Station will allow for the decommissioning of King Station, addressing all concerns with safety and aging infrastructure at King Station. Adelaide Station also provides sufficient area capacity to allow the proposed William Station project to be deferred. Five feeders from the new Adelaide Station will be expressed through new ductline towards the Health Science Centre (HSC) to aid Sherbrook Station in supplying that area. Sherbrook Station does not have capacity to continue to handle load growth around the HSC Complex by itself.

In-Service Date:
October 2023

Manitoba Hydro
Consolidated Capital Expenditure Forecast (CEF14)
For the Years 2014/15 – 2033/34

BASE CAPITAL:

ELECTRIC OPERATIONS:

Generation Operations

Description:
These projects are required to provide safe, reliable, efficient supply of power, and to replace plant facilities which are at the end of their useful life. This is comprised of:

GENERATION – Projects relating to upgrading or replacing infrastructure, controls, transformers, breakers, and other equipment at existing generating stations.

GENERATION TOWN SITE SERVICES - Projects required to maintain facilities and provide services to town sites such as Gillam, Grand Rapids and Seven Sisters.

OTHER CAPITAL - Projects relating to upgrading replacing or enhancing domestic water and waste water systems, security systems, office, plant and field equipment replacements; communications; tools and test equipment as well as water licenses & renewals.

Justification:
The generation availability of the older assets has been declining over the last ten years. As Generation Operation's assets age, there is an increase in risk to their availability, which could result in months or years of unit outages and significantly impact the ability to produce power to the transmission system. Enhancements or rehabilitation to the power supply facilities will ensure a safe, reliable and efficient source of energy.

Revision:
Combined Major and Base targets revised through to 2020/21 and escalated at 2% thereafter to consider increased requirements for aging infrastructure replacement based on asset condition assessments.

The tables below show the changes in Base Targets and Major & Base targets.

Generation Operations Base Target

Transmission

Description:
The majority of projects consist of additions, improvements and replacement of transmission lines; replacement, development and upgrades to HVDC facilities; replacement, development and upgrades to communication systems; additions and replacement of field maintenance equipment; and station upgrades. This is comprised of:

SYSTEM RELIABILITY – Projects that address the reliability or capacity of the transmission, or communication systems, including system emergencies and regulatory compliance.

HVDC FACILITIES - Projects relating to upgrading or replacing transformers, breakers, smoothing reactors, protection, controls and other equipment at HVDC facilities.

CUSTOMER SERVICE - Projects that address new or existing service extensions to larger customers.

ENVIRONMENTAL - Projects that enhance or restore the environment, mitigate damage or potential damage to the environment or remove/salvage plant.

SAFETY – Projects that address risk to public or employee safety or emergency preparedness.

OTHER- Projects to acquire tools and equipment that support operation and maintenance of the electric system.

Justification:
This program ensures the reliability of transmission with respect to load, outages, and import/export requirements; as well as addresses safety issues and provides the necessary support for the operation of the HVDC, transmission and communication systems.

Revision:
Combined Major and Base targets revised through to 2020/21 and escalated at 2% thereafter to consider increased requirements for aging infrastructure replacement based on asset condition assessments.

The tables below show the changes in Base Targets and Major & Base targets.

Transmission Base Target

Customer Service & Distribution

Description:
These projects are required to extend sub-transmission, distribution, and transformation facilities to supply service to residential, farm, commercial and industrial customers, and to replace plant facilities whose useful life has been exceeded. Specific types of expenditures include station and line additions, modifications and rebuilds, bank additions, breaker replacements, defective cable replacement, highway changes, field maintenance equipment, woodpole replacements and ice melting requirements. These costs are spread over many facility locations throughout the Province and are comprised of:

SYSTEM IMPROVEMENTS - Projects relating to additions and modifications to the existing electric distribution network to maintain system reliability and standards of safety, as a result of customer load growth, aging infrastructure and operational standards of performance. Assets and facilities include distribution stations, poles, conductors, transformers, streetlights, cables, duct lines and manholes.

CUSTOMER SERVICE - Projects relating to new or existing service extensions to commercial and residential customers.

NEW STATIONS - Projects relating to station development requirements in both Winnipeg and rural Manitoba to address capacity limitations.

OTHER CAPITAL - Projects relating to VHF radio replacements and field maintenance equipment.

Justification:
The residential, farm, commercial and industrial loads are expected to grow at an average rate in excess of 1.5% per annum and will require a program of additions to the system to accommodate these anticipated loads. As the distribution assets are approaching the end of their designated lifespan a four year program has been established to replace critical infrastructure.

Revision:
Combined Major and Base targets revised through to 2020/21 and increased thereafter to consider increased requirements for aging infrastructure replacement based on asset condition assessments.

The tables below show the changes in Base Targets with and without Major Projects > $50M.

Customer Care & Energy Conservation

Description:
This program covers the additions and replacements of meters, transformers and related equipment and is comprised of:

CUSTOMER SERVICE – Projects that address service to a customer or customer-driven requests, including costs associated with new and replacement metering equipment, metering transformers and associated equipment.

OTHER– Projects to acquire tools and equipment that support operation and maintenance of the electric system.

Justification:
As required for the connection of new customers to the system, as well as replacement of existing time expired or faulty meters.

Revision:
Increase due to the addition of meter exchanges and sampling which will be reclassified from operating expenses to capital upon adoption of IFRS in 2015/16.

	Total	2015	2016	2017	2018	2019	2020-34
Previously Approved	NA	$ 3.1	$ 3.2	$ 3.3	$ 3.3	$ 3.4	$ 59.8

Revised Forecast	NA	$ 3.2	$ 4.0	$ 4.1	$ 4.1	$ 4.2	$ 61.5

Human Resources & Corporate Services

Description:
The program consists of information technology hardware and software upgrades and application development, corporate building refurbishments and new building programs, fleet vehicle refurbishment and replacement as well as projects associated with property easements, and acquisition of equipment for the training centre, print shop, fleet, materials management, and facilities.

CORPORATE BUILDINGS - Projects associated with the cyclical acquisition, and/or replacement of corporate administrative facilities throughout the Province.

FLEET ACQUISITIONS - Projects associated with the cyclical procurement, refurbishment and/or replacement of corporate fleet vehicles and equipment.

INFORMATION TECHNOLOGY HARDWARE / SOFTWARE - Projects associated with the purchase and installation of hardware and software upgrades, personal computers, networks and cabling.

INFORMATION APPLICATION DEVELOPMENT - Projects associated with installing, developing or upgrading computer applications for the corporation.

OTHER – Projects associated primarily with property easements and equipment for the training centre, print shop, fleet, materials management and facilities.

Justification:
To provide safe, efficient and productive; corporate buildings, fleet vehicles and equipment. Also to enhance computer systems throughout the corporation to achieve ongoing improvement in productivity and reliability.

Revision:
Base targets revised through to 2020/21 including new district office buildings and completion of Enterprise Asset Management project and escalated at 2% thereafter to consider increased requirements for aging infrastructure replacement.

	Total	2015	2016	2017	2018	2019	2020-34
Previously Approved	NA	$ 75.7	$ 54.8	$ 54.8	$ 34.4	$ 32.1	$ 638.7

Revised Forecast	NA	$ 75.0	$ 75.0	$ 55.0	$ 55.0	$ 55.0	$ 933.6

Finance & Regulatory

Description:
This program is primarily for meter purchases (for load research monitoring), and handheld devices associated with the load research function. Other items include the purchase of additional servers and other information technology related equipment and specialized software.

Justification:
The load research program supports the development of customer rates and also supports Power Smart initiatives in terms of planning and support.

Revision:
None.

	Total	2015	2016	2017	2018	2019	2020-34

GAS OPERATIONS:

Customer Service & Distribution

Description:
This program consists of projects required to extend, rebuild or upgrade: transmission pipelines, distribution pipelines, regulating stations, and customer service lines. This is comprised of:

SYSTEM IMPROVEMENTS – Projects relating to system modifications and betterment. Significant work includes capacity upgrades, system integrity upgrades, regulator station upgrades and cathodic protection upgrades.

NEW BUSINESS - Projects for installing new services and distribution mains for both commercial and residential customers.

Justification:
Required to provide ongoing safe and reliable supply of natural gas to customers.

Revision:
None.

	Total	2015	2016	2017	2018	2019	2020-34

Customer Care & Energy Conservation

Description:
This program consists primarily of costs to design, implement and deliver incentive based PowerSmart conservation programs to reduce gas consumption and greenhouse gas emissions in Manitoba, as well as meters, transformers and related equipment. This is comprised of:

GAS DEMAND SIDE MANAGEMENT – Projects to design, implement and deliver incentive based PowerSmart conservation programs to reduce gas consumption and greenhouse gas emissions in Manitoba.

CUSTOMER SERVICE – Projects that address service to a customer or customer-driven requests, including costs associated with new and replacement metering equipment, metering transformers and associated equipment.

Justification:
The natural gas Demand Side Management plan provides customers with exceptional value through the implementation of cost-effective energy conservation programs that are designed to minimize the total cost of energy services to customers, position the Corporation as a national leader in implementing cost-effective energy conservation and alternative energy programs, protect the environment and promote sustainable energy supply and service. Also required for the connection of new customers to the system, as well as replacement of existing time expired or faulty meters.

Revision:
Revisions to energy saving and expenditures for a number of programs to reflect current market information and designed to aggressively pursue cost-effective market-achievable savings. It is assumed that upon adoption of IFRS in 2015/16, the demand side management programs will continue to be capitalized, under the interim standard that continues to permit rate-regulated accounting.

Tab 44

Executive Summary

Introduction

Manitoba Hydro, a Crown Corporation, is committed to maintaining reliable, affordable and environmentally sustainable energy for its customers, while ensuring long-term financial sustainability. Manitoba Hydro meets its commitment through investments in Demand Side Management (DSM or Power Smart), new generation, and by exporting surplus electricity to utilities in United States (U.S.) and Canada. Exports have been a key factor in keeping Manitoba rates among the lowest in North America, contributing close to one-third of Manitoba Hydro's total revenues over the past decade.

Manitoba Hydro is seeking government approval for its Preferred Development Plan, which requires the following commitments in June 2014:

- start construction of the Keeyask generating station (G.S.) for a 2019 in-service date (ISD)
- proceed with a 250 MW export agreement with Minnesota Power (MP)
- proceed with a 100 MW export agreement with Wisconsin Public Service (WPS)
- proceed with a 750 MW U.S. transmission interconnection
- proceed with a 300 MW export agreement with WPS subject to satisfactory conclusion of negotiations currently still underway.

In addition, the plan would include Conawapa G.S., 1,485 MW, with an earliest ISD of 2026, although decisions on whether to construct Conawapa and its timing are not required now and would be made over the next few years.

Undertaking this plan would not preclude modifying it should future conditions suggest that it is prudent to do so. Activities would continue by Manitoba Hydro to protect an ISD for Conawapa as early as 2026, but conditions will be continually monitored to determine if such continued investments are worthwhile and, ultimately, to determine if Conawapa should be constructed

and for what ISD. These decisions will be influenced by factors such as the 300 MW WPS export agreement, other export agreement possibilities, energy prices, capital cost and load growth. The early ISD of 2026 for Conawapa could be protected with a modest investment (approximately $50 million) up to the filing of the Environment Impact Statement in the summer 2015 after which the amount of investment would increase. A final decision on construction of Conawapa for an ISD of 2026 must be made by 2018.

In addition to the above major components, the Preferred Development Plan includes continued substantial investment in DSM/Power Smart and efficiency improvements to existing generation. Wind generation and natural gas generation will be incorporated into future development if and when required and other energy technologies may also be included in future development if and when they become economically viable.

Background

Purpose of the Needs For and Alternatives To Review

Manitoba Hydro has been created, and its activities governed, by *The Manitoba Hydro Act.* According to the Act, the purpose of Manitoba Hydro is to "provide for the continuance of a supply of power adequate for the needs of the province, and to engage in and to promote economy and efficiency in the development, generation, transmission, distribution, supply and end-use of power."

In light of a demonstrated need for new Manitoba power supply by around 2023, Manitoba Hydro has formulated a Preferred Development Plan. This plan and alternatives to it are being assessed through Needs For and Alternatives To (NFAT) review under the auspices of the Manitoba Public Utilities Board (PUB). The PUB panel is to provide a report with recommendations to the Minister responsible for the administration of *The Public Utilities Board Act* by no later than June 20, 2014.

In addition to the NFAT review and government approval process, generation and transmission projects included in the development plan are subject to other regulatory processes at federal and provincial levels, including comprehensive environmental impact assessments. Matters included in those reviews are not addressed in this NFAT submission.

Manitoba Hydro Profile

With over $14 billion in assets and 5,700 megawatts (MW) of installed electricity capacity, Manitoba Hydro is one of the largest integrated electricity and natural gas distribution utilities in Canada. Manitoba Hydro serves 548,000 electricity customers across Manitoba and 267,000 natural gas customers in the southern part of the province.

The vast majority of the electrical energy that Manitoba Hydro typically produces each year is from hydropower (approximately 98% on an energy basis). Manitoba Hydro also maintains two thermal generating stations to back up its hydro-electric system and purchases electricity from two independent wind farms. The provincial economy benefits from Manitoba Hydro's ongoing operations and future projects through employment, business transactions and the payment of taxes and levies.

Manitoba Hydro is highly rated (consistently higher than the national average for electric utilities) by its customers, according to the 2012 Canadian Electricity Association Public Attitudes Research Project, and continues to offer its customers the lowest average retail electricity price in North America.

Manitoba Hydro is committed to protecting the environment, contributing to the global reduction of greenhouse gas (GHG) emissions and maintains a diverse workforce including significant Aboriginal representation.

Manitoba Hydro recognizes the need for sustainability in all aspects of its operations. Economic, environmental and societal decision criteria are applied in the assessment of major projects and plans, including public and stakeholder consultation.

Manitoba Hydro's annual planning process includes the Corporate Strategic Plan, corporate-wide risk analysis, and an integrated planning cycle which includes development of an annual Economic Outlook, Load Forecast, Power Smart Plan, Power Resource Plan, Forecast of Interchange Revenues, Capital Expenditure Forecast and Integrated Financial Forecast.

Governance over Manitoba Hydro's plans is provided by the corporation's board, audit committee, Manitoba Crown Corporations Council, Crown Corporations Standing Committee of the Legislature and the Auditor General of Manitoba. Regulatory oversight is carried out by a number of provincial and federal authorities, including the Manitoba PUB.

Preferred Development Plan Facilities

The Preferred Development Plan consists of four main capital project components:

- the 695 MW Keeyask Project
- the 1,485 MW Conawapa Project
- the North-South Transmission Upgrade Project, with an ISD to coincide with the last units of Conawapa
- the 750 MW, 500 kilovolt (kV) Alternating Current (AC) Manitoba-Minnesota Transmission Project.

Keeyask

The Keeyask Project will take seven years to construct, with a total budgeted in-service cost estimate of $6.2 billion including interest and escalation based on a 2019/20 ISD. Manitoba Hydro will own and operate the Keeyask Transmission Project, whereas the Keeyask Generation Project will be owned by a partnership between Manitoba Hydro and four Keeyask Cree Nations (KCNs): Tataskweyak Cree Nation (TCN), War Lake First Nation (WLFN), York Factory

First Nation (YFFN) and Fox Lake Cree Nation (FLCN). The Joint Keeyask Development Agreement addresses the KCNs' income-sharing, training, employment, business opportunities, and involvement in environmental and regulatory affairs.

The Keeyask Infrastructure Project consists of the access road and the first stage of the construction camp. Work on this project is proceeding ahead of the decision to construct the generating station in order to provide employment, training and capacity building benefits to the four KCN partners, as well as to reduce lead times and risks for the project as a whole.

Efforts have been undertaken and continue with First Nation partners, to mitigate and reduce any adverse effects of the Keeyask Project and make environmental and socio-economic impacts as positive as possible.

Manitoba Hydro and its KCN partners are paying special attention to Lake Sturgeon. The Committee on the Status of Endangered Wildlife in Canada has designated the Nelson River sturgeon population as endangered, and the federal government is considering listing the species under the *Species at Risk Act*. Various measures will be implemented to address potential effects caused by the project: these include habitat replacement and a stocking program with the objective of an overall enhancement of sturgeon stocks in the Lower Nelson River.

Conawapa

The Conawapa Project will take 10 years to construct, with a budgeted in-service cost estimate of $10.2 billion, including interest and escalation based on a 2025/26 ISD.

Although the generation ownership structure has not been finalized, Manitoba Hydro is committed to providing the First Nations in the vicinity of the project with long-term sustainable benefits, early involvement and extensive consultations, and opportunities to participate in the environmental governance of the project. Manitoba Hydro has Conawapa

process agreements in place with the Cree Nations while discussions and negotiations take place.

As with the Keeyask Project, plans for the Conawapa Project will include positive measures to address environmental and socio-economic effects. Studies in the past decade have involved five local Cree Nations in the vicinity of the project: FLCN, YFFN, TCN, WLFN and, to a somewhat lesser extent, Shamattawa First Nation.

North-South Transmission System Upgrade Project

The majority of the Conawapa G.S. power will be transmitted from northern Manitoba to southern customers on Manitoba Hydro's high-voltage direct-current (HVDC) transmission system. To transmit south the full amount of generated power once both Keeyask and Conawapa are in place, upgrades are required to the existing northern 230 kV AC system. This North-South Transmission System Upgrade Project will have an ISD coinciding with that of the last Conawapa units. The upgraded North-South Transmission System would be owned and operated by Manitoba Hydro and would cost an estimated $500 million including interest and escalation.

Manitoba-Minnesota Transmission Project

This proposed project consists of a 750 MW, 500 kV AC transmission line[1] in southeastern Manitoba, connecting at the border with MP's proposed Great Northern Transmission Line with an ISD of 2020. The project would enable power to be exported to the U.S. based on current sales agreements, improve reliability and import capacity in emergency and drought situations, and increase access to markets in the U.S.

This project is still in the study and negotiation phase. Manitoba Hydro will be responsible for the Manitoba portion of the interconnection, which is estimated to cost $350 million. Manitoba

[1] It should be noted that the transmission lines can be described by voltage size (kV) or by transfer capability (MW).

Hydro will also be responsible for some portion of the capital and ongoing operating costs associated with the U.S. portion of the facilities. For the Preferred Development Plan, it is assumed that Manitoba Hydro will be responsible for 40% of the capital and ongoing operating costs associated with the U.S. portion of the 750 MW interconnection facilities, with the remainder of the transmission costs to be borne by MP and WPS. The total cost of the U.S. portion of the 750 MW interconnection is in the order of $700 M (2020 base dollars, not including interest).

However, WPS recently advised that an investment in the 750 MW Interconnection Transmission does not match their current business objectives and that they will not invest in the line. They also advised that they will continue to negotiate the 300 MW Power Purchase Agreement; as of this writing that negotiation is proceeding under the auspices of the term sheet agreed to previously. In order to avoid becoming a majority owner in a U.S. transmission line, Manitoba Hydro will only enter into an arrangement where it will not own more than 49% of the interconnection facilities in the U.S. In return for investing in the U.S. portion of the transmission interconnection, Manitoba Hydro will benefit by having the right to use and/or sell its proportionate share of the U.S. transmission service associated with the new interconnection. Manitoba Hydro will also have the right to sell its share in the future. In the development plans without the WPS sale but with a 750 MW interconnection, a conservative assumption has been used whereby Manitoba Hydro will be responsible for approximately two-thirds of the capital.

While the Preferred Development Plan includes a 750 MW interconnection, some alternative development plans reduce the interconnection capacity to 250 MW. With a 250 MW, 230 kV AC line, Manitoba Hydro would be responsible for $95 million (including interest and escalation) in capital costs for the Manitoba portion but would not be responsible for capital or ongoing operating costs associated with the U.S. portion of the interconnection facilities.

Trends and Factors Influencing North American Electricity Supply

Several notable trends and factors are currently influencing electricity markets and resource decisions. These trends affect existing resources, the need for new generation, the costs of competing resources, and the market price for electricity. The need for new generation in the U.S. and Canada is being driven by:

- modest load growth
- an aging generation fleet
- uncertainty as to the life expectancy of nuclear plants
- various environmental and energy policies that could hasten the retirement of coal plants.

North American Demand for Electricity

Electricity demand in both Canada and the U.S. is expected to continue to increase over the 35-year planning horizon, although at a slower rate than has been historically observed. Recent years have seen lower rates of demand growth for electricity throughout North America due largely to increasing energy efficiency and the migration of industrial processes to other countries. Despite this trend the U.S. Energy Information Administration's Annual Energy Outlook 2013 reference case projects overall U.S. load growth of 28% between 2011 and 2040 (0.9% per year).

Environmental and Energy Policies

Environmental considerations and policies are and will continue to be major factors influencing electric power resource choices and the market price for electricity. Policies such as renewable portfolio standards that encourage an increasing percentage of renewable energy within specific jurisdictions are widespread. The eligible renewable technologies within each specific program vary by state but in general are trending towards more inclusive treatment of hydropower. Minnesota's program includes hydropower from stations that are less than 100 MW while Wisconsin's program will include all new hydro regardless of its size.

Global interest and attention to the effects of climate change are having an impact on the energy industry. Manitoba Hydro expects that some form of significant climate change regulation or legislative action in the U.S. is likely within the next 10 years. This would be a significant driver for increasing electricity market prices and would favour hydropower as a virtually GHG-free form of generation.

Energy Price Considerations

Fuel pricing is one of the most important considerations driving electrical resource decisions and regional market prices for electricity. Recent reductions in cost due to developments in shale gas extraction have increased the attractiveness of natural gas as a supply source, particularly in relation to coal.

Natural gas prices have exhibited considerable historic volatility. However, industry analysts generally foresee a range of potential prices, with reference cases—i.e. most likely outcomes—that project moderate price growth over the next decade as marginal production costs rise and demand grows.

Market prices for electricity have dropped markedly since 2006-2008 in the Midcontinent Independent System Operator, Inc. (MISO) region. However, moderate real price growth is expected in the future, based on a corresponding escalation in natural gas and coal prices, increased environmental regulations, expected coal generation retirements and future regulations to reduce GHG emissions. The general outlook for moderate real growth in electricity prices is confirmed by independent North American price forecast consultants.

Implications For Preferred Development Plan

These industry trends support Manitoba Hydro's Preferred Development Plan in confirming that there is a need for new sources of supply, a growing preference for clean, renewable, non-emitting power and an expectation that wholesale electricity prices will increase in real terms.

While resulting in low emissions relative to coal, natural gas generation still carries a considerable GHG emission liability and as well is exposed to expected price increases and likely price volatility.

Manitoba Hydro's Need for New Power Resources

To determine Manitoba's electricity supply need, Manitoba Hydro regularly assesses domestic demand (load growth net of reductions resulting from DSM) and firm export commitments to arrive at total demand. Total demand is then compared to current supply. Total demand is currently projected to exceed existing supply beginning around 2023 even with no new export commitments. The need for new supply to meet Manitoba domestic load is the principal driver of the Preferred Development Plan.

Domestic Load Growth

Manitoba's electrical energy consumption has grown, on average, at an annual rate of 1.7% over the past 10 years. Over the next 20 years, growth in energy consumption is forecast to continue at an average annual rate of 1.6%. This trend takes into account the effects of future savings due to energy efficiency codes and standards but not DSM programs. When projected DSM (Power Smart) programs are taken into account, forecasted energy use growth rate is reduced by about 0.1% to 1.5%.

The Manitoba load is expected to grow in all sectors, the result of population growth, increased average energy use per residential customer and anticipated industrial and commercial expansion by a number of businesses.

Reducing Demand Through Demand Side Management

Manitoba Hydro's DSM programs consist of energy conservation and load management activities designed to reduce customer demand for power. Savings to date have deferred the need for new generation by 4 years. The 2013-2016 Power Smart Plan targets additional energy savings of 1,552 gigawatt (GWh) and 490 MW by 2027/28.

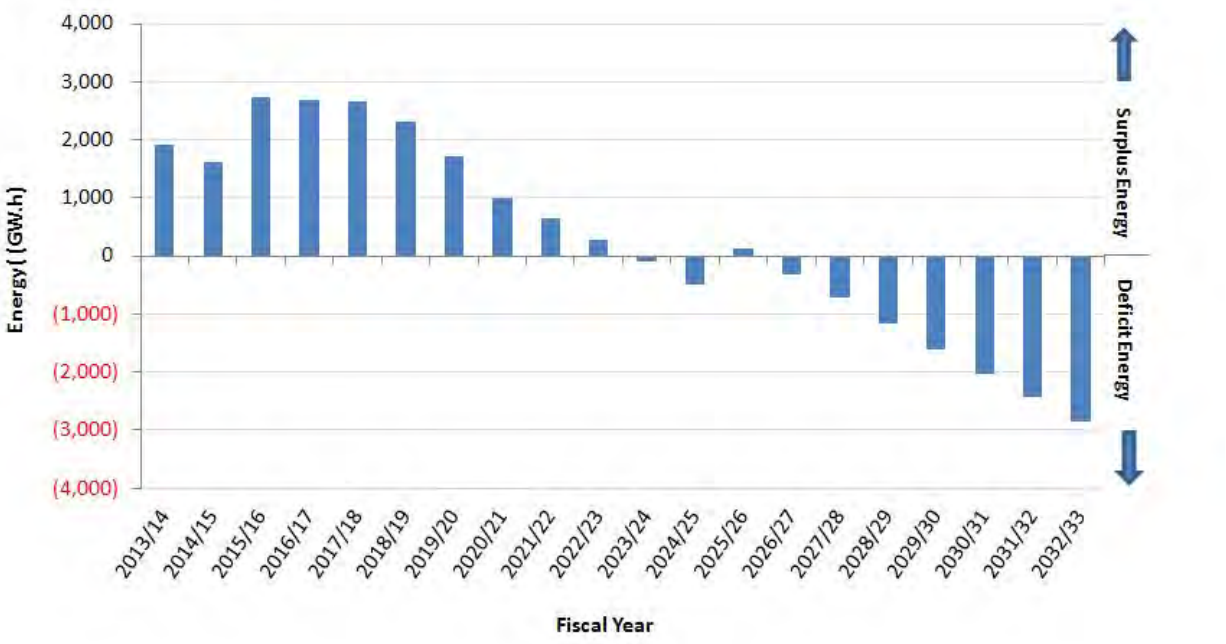
Manitoba Hydro's DSM strategy for the future involves a long-term commitment to pursuing all energy efficient opportunities which have been identified as being economically viable in Manitoba. An updated DSM Market Potential Study has recently been completed and is included in the NFAT submission. Manitoba Hydro will update its Power Smart Plan, in consultation with government by March, 2014 and will incorporate the information contained in the DSM Market Potential Study. The updated Power Smart plan will be included in future Power Resource Plans as part of any development plan that is pursued by Manitoba Hydro at the conclusion of the NFAT process.

Firm Export Sale Commitments

The wholesale electricity export market is integral to Manitoba Hydro fulfilling its mandate to provide economical and reliable power to Manitobans.

Export sales, both firm and surplus, provide an outlet for excess electricity in the early years of new hydropower generating stations and for the many years when water flows exceed minimum (dependable) levels. In times of drought or extremely cold weather or system emergencies, firm arrangements with export customers allow for imports to ensure reliability of supply.

Long-term firm export sales contracts entail an obligation to supply except in agreed-upon situations where security and reliability of supply to Manitoba customers would be compromised, for example during periods of system emergencies and under certain drought conditions.



Supply and Demand

Manitoba Hydro plans its system so as to have sufficient dependable energy resources to supply firm energy demand in the event of a repeat of the lowest water supply conditions on record. System capacity must also be sufficient to meet the Manitoba winter peak demand. To

determine if new supply is needed, Manitoba Hydro annually compares supply and demand values for each year.

Manitoba Hydro's analysis of current supply shows that supply will be exceeded by demand in or around 2023.

Figure 1 ENERGY BALANCE – DEPENDABLE ENERGY SHOWING DEFICIT BY **2023**

The exact year that new supply is required will depend on load growth rates and supply factors such as earlier retirement of the natural gas generation at Selkirk and availability of dependable energy imports. It is prudent and necessary, therefore, to plan for providing new Manitoba supply starting in or around 2023.

The Manitoba Hydro System, Interconnections and Export Markets

Generation

Manitoba Hydro's existing supply resources can be divided into four resource types: hydro-electric generation, thermal generation, wind generation and imports. Hydro-electric power is by far the most significant resource in the Manitoba Hydro generating system, providing almost

90% of the generating capacity that Manitoba Hydro owns and typically about 98% of electrical energy.

Manitoba Hydro's generation is affected by variability in water supply. There is a 350% difference between the lowest and highest recorded water supply conditions on record. Generating stations are planned to meet the energy demand under the lowest flow on record (as well as the highest winter peak demand). As a result, in all but drought years there will be surplus energy which can be sold on the export market if transmission interconnections are available. Surplus energy is also available as a result of the large-scale increments of generation typical of hydro development. Until domestic load has caught up with the total supply from new hydro generation, this surplus energy is either exported or the production is foregone and the water is spilled.

Transmission

Electricity is delivered from Manitoba Hydro's generating stations to Manitoba customers over a network of transmission lines with two major components – the AC transmission system and the HVDC system, which transmits electricity south from the generating stations in the north.

Cross-Border Interconnections and Their Benefits

Manitoba Hydro's transmission interconnections with adjacent provinces and states are a very important part of Manitoba Hydro's transmission system, providing benefits as follows:

- improving reliability by enabling imports during drought conditions and under supply contingencies (e.g. temporary loss of supply due to equipment outages)
- increasing revenues by enabling the export of surplus hydro power and import of market energy at costs lower than the cost of thermal resources available within Manitoba
- providing the predominantly hydro system with needed resource diversity as a supplement to thermal generation in Manitoba

- displacing fossil fuel generation in export markets. Manitoba Hydro currently estimates that, globally, its exports displace 0.75 tonnes of CO_2 per megawatt-hour (MWh).

Manitoba Hydro currently has five cross-border interconnections with Saskatchewan, three interconnections with Ontario and four interconnections with the U.S. Current technical limits are indicated in Table 1:

Table 1 EXPORT TRANSFER LIMITS AND IMPORT TRANSFER LIMITS

Interconnection	Firm Export Schedule Limit	Firm Imports Transfer Capability for the Planning Horizon
U.S.	1,950 MW	700 MW
Ontario	200 MW	0 MW
Saskatchewan	150 MW	0 MW

The 1,950 MW export limit to U.S. markets is equivalent to 2% of the peak demand in the MISO region; the large size of the MISO system gives assurance that energy imports and emergency capacity support will be available for Manitoba when it is needed—both for the current interconnection size and if the import capability is expanded by the new interconnection from 700 MW to 1,450 MW. Similarly, the MISO market is large compared to Manitoba export levels, increasing confidence in the ability for Manitoba to obtain either short-term or long-term export sales.

In terms of opportunities in Canadian markets:

- The Ontario energy market is approximately one-quarter the size of the MISO market. There are two major barriers to a major long-term Manitoba Hydro power sale to Ontario: distance and Ontario government policy which strongly favours in-province generation. The Manitoba-Ontario interconnection is with Northwestern Ontario, a large, sparsely populated area with a proportionally small peak load of 750 MW.
- With respect to Saskatchewan, Manitoba Hydro and SaskPower have recently signed Memoranda of Understanding whereby the utilities are to engage in sale discussions for

existing and new hydro exports to both northern and southern Saskatchewan—across all time frames—for volumes ranging from 25 MW to 500 MW; discussions are also to include the possibility of new transmission interconnections.

The Window of Opportunity for a New U.S. Interconnection

When new transmission is added to the system, Manitoba Hydro's access to markets is enhanced for the entire life of the transmission facilities, not only for the term of committed contracts. Additional interconnection capacity is important to increase short-term export sales by helping to minimize spill at the hydro plants in periods of ample streamflow conditions and to maximize export of energy during the higher valued on-peak periods rather than off-peak periods.

Manitoba Hydro, working with its export customers, currently has the opportunity to influence what new transmission is built in the U.S. MISO region and to ensure that it is compatible with Manitoba Hydro's Preferred Development Plan. A new 750 MW interconnection is required to enable the additional long-term export sales to MP and WPS. These two sales, plus a sale to Northern States Power (NSP) which has already been approved, would provide financially attractive fixed prices. Manitoba Hydro would therefore receive predictable and stable revenue to reduce the costs borne by domestic customers. Specifically, these sales are:

- MP — 250 MW (2020-2035)
- WPS — 300 MW (2020-2040), subject to satisfactory conclusion of negotiations
- NSP — 125 MW expansion of existing approved sale (2021-2025).

There is risk inherent in deciding not to proceed with a new interconnection as part of the development plan. MP has committed to champion a new transmission interconnection with Manitoba through its service territory, in which it has a strong relationship with the local land owners—a critical component of building a new transmission line. However, the current favourable political, regulatory and business conditions in the U.S. for constructing a new transmission interconnection will not continue indefinitely. Our U.S. utility customers are

currently making decisions on their future energy supply mix, as they move away from nuclear and coal-generated energy and consider the price volatility of the natural gas market. Should Manitoba Hydro be unable to supply adequate amounts of hydropower, these utilities will pursue other supply sources. As well, federal and state administrations continuously modify their policies and it cannot be assumed that a new U.S. transmission interconnection can be approved and constructed at a given future date. This represents a window of opportunity for Manitoba Hydro given that it would be extremely difficult, probably impossible, for Manitoba Hydro to develop a line in the U.S. without the committed participation of a U.S. partner like MP.

Foregoing this opportunity would likely preclude the building of significant new interconnection capability until well beyond the required 2023 time horizon for new Manitoba energy supply.

Screening of Manitoba Resource Options

A multi-stage screening process was utilized to narrow the field of appropriate resource supply options. The candidates consisted of 17 resource option technologies potentially suitable for utility-scale generation, including DSM (Power Smart), imports, wind, solar, biomass, natural gas as well as hydro.

The screening process included evaluations of technical, environmental, socio-economic and economic characteristics of each of the options.

Based on these evaluations, resources such as solar, nuclear, coal and biomass were screened out as not sufficiently attractive to consider as primary supply contenders in the development plans.

Specific resource options were selected at the conclusion of the screening as suitable candidates to be included within individual development plans mainly because of their cost competitiveness and environmental attractiveness:

- additional DSM
- Keeyask G.S.
- Conawapa G.S
- GE 7FA Heavy Duty Combined-Cycle Gas Turbine
- GE 7FA Heavy Duty Simple-Cycle Gas Turbine
- GE LM6000 PH Aeroderivative Simple-Cycle Gas Turbine
- generic 65 MW Wind Farm
- contractual import agreements.

Determination of Potential Development Plans

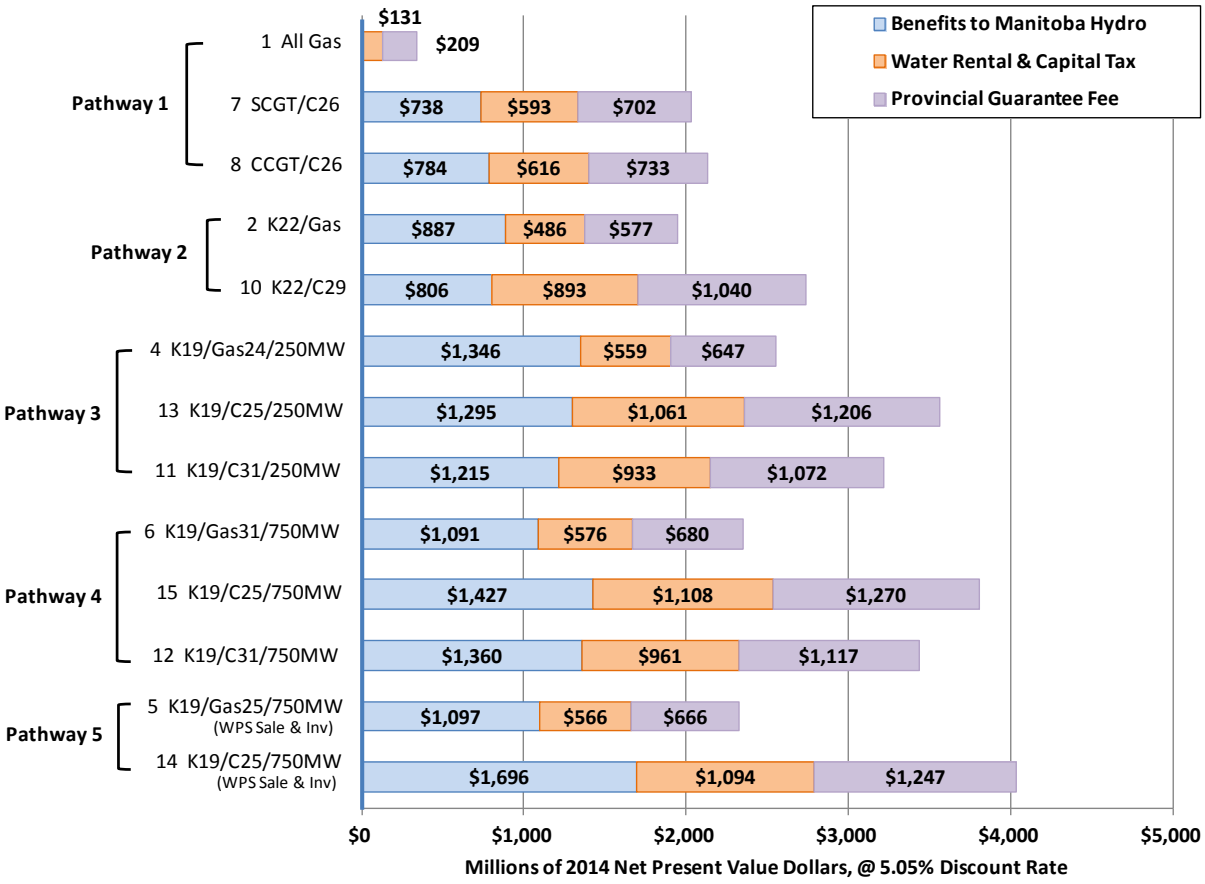
The next step was to develop and evaluate potential alternative development plans using the short-listed resource options. The number and size of resource options were selected to cover Manitoba's energy and capacity needs for the next 35 years.

Different combinations of supply resources enable comparison of the trade-offs between their characteristics. For example, the low capital cost and high operating cost of gas turbines can be compared to the export revenue potential and low operating costs of hydro-electric generation. This analysis led to the identification of 15 alternative development plans that were evaluated based on three groupings:

- Keeyask 2019 with a 750 MW U.S. Interconnection
  - Both MP and WPS Sales - two plans (one with Conawapa (preferred) & one with gas generation to follow Keeyask)
  - MP Sale but not the WPS Sale – three plans
- Keeyask 2019 with a 250 MW U.S. Interconnection – three plans
- Plans that meet Manitoba Hydro's domestic load and firm export commitments starting in 2022/23 with no new export sales or U.S. interconnection – seven plans

(The 750 MW interconnection would have 750 MW of export and import capability whereas the 250 MW interconnection is assumed to have 250 MW of export capability but only 50 MW of import capability.)

Included in the 15 plans above, are two plans with wind generation which were also evaluated, but were found to be clearly uneconomic and thus were not carried through the full set of evaluations.



Economic Evaluation of the Potential Development Plans

The third step was to comparatively evaluate the preferred and alternative development plans using economic evaluation principles in order to allow the comparison of alternative options on the basis of their relative costs and benefits. The economic evaluation of development plans was conducted over four phases of analysis:

- analysis using "reference" (most likely) assumptions
- probabilistic analysis to test potential variations to reference assumptions
- sensitivity and "stress testing" of the proposed plan and the best alternative plans
- "Pathways" analysis to assess the flexibility of options to change course based on future conditions. The use of pathways recognizes the reality of allowing decisions to be made incrementally as uncertainties resolve.

The following figure sets out the Net Present Value (NPV) comparison for 13 of the development plans, including benefits to Manitoba Hydro and potential cash transfers to the Province through the provincial guarantee fee, water rental and capital tax. The calculations were done using reference assumptions and show the incremental net benefits accumulated during the life of each plan discounted to today's dollars.

Figure 2 COMPARISON OF DEVELOPMENT PLAN NET PRESENT VALUES INCLUDING POTENTIAL CASH TRANSFERS TO THE PROVINCE

Note: NPVs calculated with a real discount rate of 5.05%

This evaluation, based on 2012 reference scenario assumptions, indicates that:

- The plan with the 750 MW Interconnection and WPS sale ("the Preferred Development Plan") provides higher economic benefits than any of the other plans.
- The plans with the most benefit are those that include Keeyask G.S., Conawapa G.S. and a new interconnection.
- Compared to the All Gas Plan, the NPV benefit of the Preferred Development Plan is higher by $1,696 million considering only Manitoba Hydro economics and $3,697 million when also considering Manitoba Hydro transfers to the Province from provincial debt guarantee fees, water rentals and capital taxes. The total corporate and provincial economic NPV of $3,697 million is equivalent to almost $300 million (2020 $) per year

for 60 years starting in 2020 or about $600 per year for each of Manitoba's approximately 500,000 residential households.

Economic Uncertainty Analysis, Probabilistic Analysis and Sensitivities

Manitoba Hydro then tested the sensitivity of the most attractive development plans to changes in assumptions.

The uncertainty analysis was performed through a combination of (i) sensitivities, in which a single variable was tested, and (ii) scenarios, in which multiple variables were tested in combination. In order to fully understand the uncertainty of the evaluations, a comprehensive review was conducted of all the variables that contributed to the economic evaluations.

Analysis demonstrated that three of these variables had the most significant impact on the economic evaluations:

- energy market prices (natural gas and electricity)
- capital cost of new supply
- Manitoba Hydro discount rate (cost of capital).

The reference assumptions (i.e. most likely conditions) were combined with low and high assumptions for each of these three variables to create 27 (3 X 3 X 3) scenarios applied to each of the 15 plans, resulting in 405 (27 X 15) distinct cases. (The two wind generation plans are not included in the tables and figures). Probabilities were then assigned to the scenarios to determine the expected value for each development plan. Tables 2 and 3 summarize the resulting analysis and cases.

These 27 cases for each plan are combined using their respective probabilities to create cumulative probability curves for each plan which are a standard representation of this analysis. These curves were used to assess the relative attractiveness and risk profile of each plan under a broad range of potential future outcomes. The curves for selection of main plans are depicted

in Figures 3 and 4. An explanation of cumulative probability curves can be found in ***Chapter 10 - Economic Uncertainty Analysis - Probabilistic Analysis and Sensitivities***, Section 10.1.4.1 of the submission.

Table 2 depicts the economic evaluation comparisons to account for uncertainties in the export/gas prices, capital cost and discount rate. There are 27 scenarios comprising all the combinations of high, reference and low for each of the three parameters export/natural gas prices, capital cost and discount rate. Green and red shadings are used to indicate the relative favourability or un-favourability of results.

At the top of the table there is reference to five "pathways". Such groupings recognize the need for flexibility as to how any development plan will unfold over the long-term after the initial decisions are made at the completion of the NFAT process in mid-2014. The pathways are thus representative of the outcomes flowing from the choices that will be decided upon as the next step in Manitoba's electricity future. Some of the questions addressed in the pathway analysis include:

- Should the next major electrical resource in Manitoba be gas or hydro? (i.e., a choice between Pathway 1 and one of the other pathways)
- Should a 250 MW interconnection proceed along with the 250 MW MP sale? (i.e., should Pathway 3 proceed?)
- Should a 750 MW interconnection proceed along with the 250 MW MP sale? (i.e., should Pathway 4 proceed?)
- Should a 750 MW interconnection proceed along with the 250 MW MP sale, 300 MW WPS sale and transmission development agreements with both MP and WPS? (i.e., should Pathway 5 proceed?)

Pathways 4 and 5 are both associated with the Preferred Development Plan because, compared to the other pathways, the single most defining feature of the Preferred Development Plan relative to the other plans is the 750 MW interconnection. The main difference between

Pathway 4 and 5 is that in Pathway 5 it is assumed there is a concluded sale and related transmission development agreement with WPS, while in Pathway 4 this is not the case.

Table 2 NET PRESENT VALUE BENEFITS OF ALTERNATIVE DEVELOPMENT PLANS UNDER 2012 HIGH, REFERENCE AND LOW ASSUMPTIONS FOR ENERGY PRICES, CAPITAL COSTS AND DISCOUNT RATES

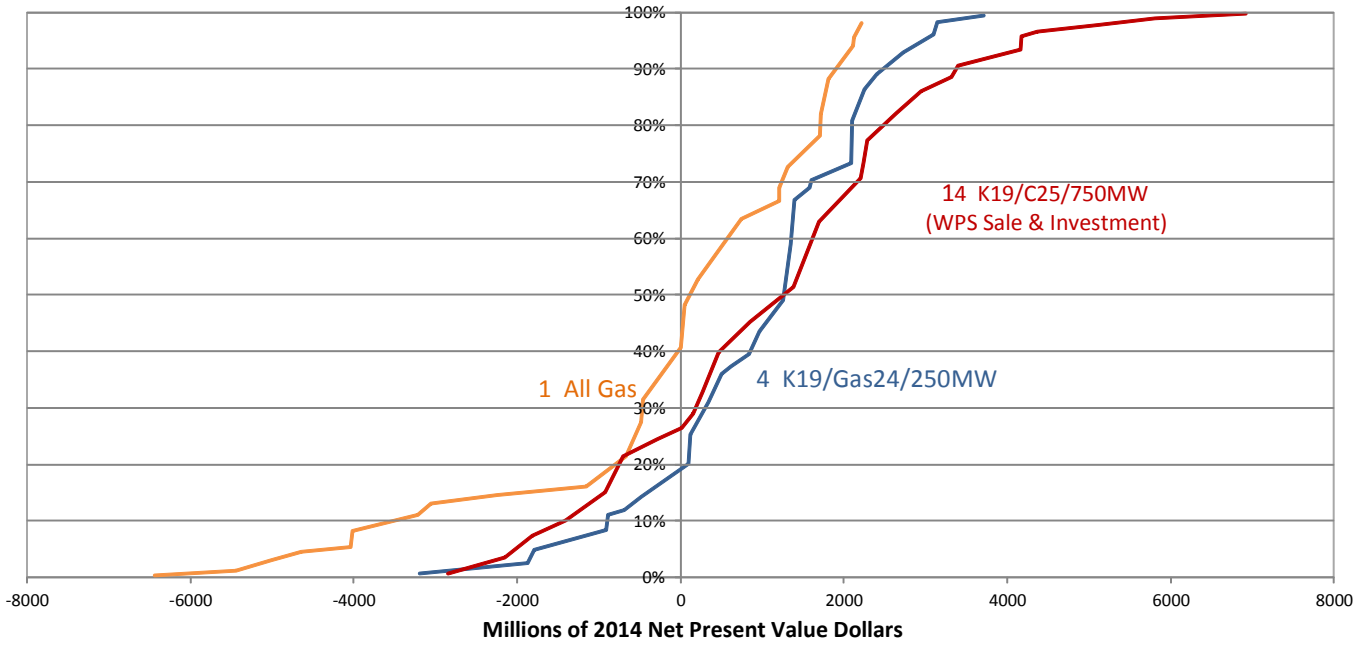
"Ref-Ref-Ref NPV" = results for reference scenario assumptions for energy prices, capital costs and discount rate (relative to All-Gas reference case result)

"Expected Value" = probabilistic weighted average of results for each of the 27 scenarios (relative to All-Gas Expected Value)

"90th Percentile-Reward"= 90th percentile probability upside benefit potential of that plan (relative to All-Gas reference scenario result)

"10th Percentile-Risk"= 10th percentile probability downside risk of that plan (relative to All-Gas reference scenario result)

Figure 3 PROBABILITY CURVES FOR 3 PLANS:
ALL GAS, 250 MW INTERCONNECTION 750 MW INTERCONNECTION & WPS



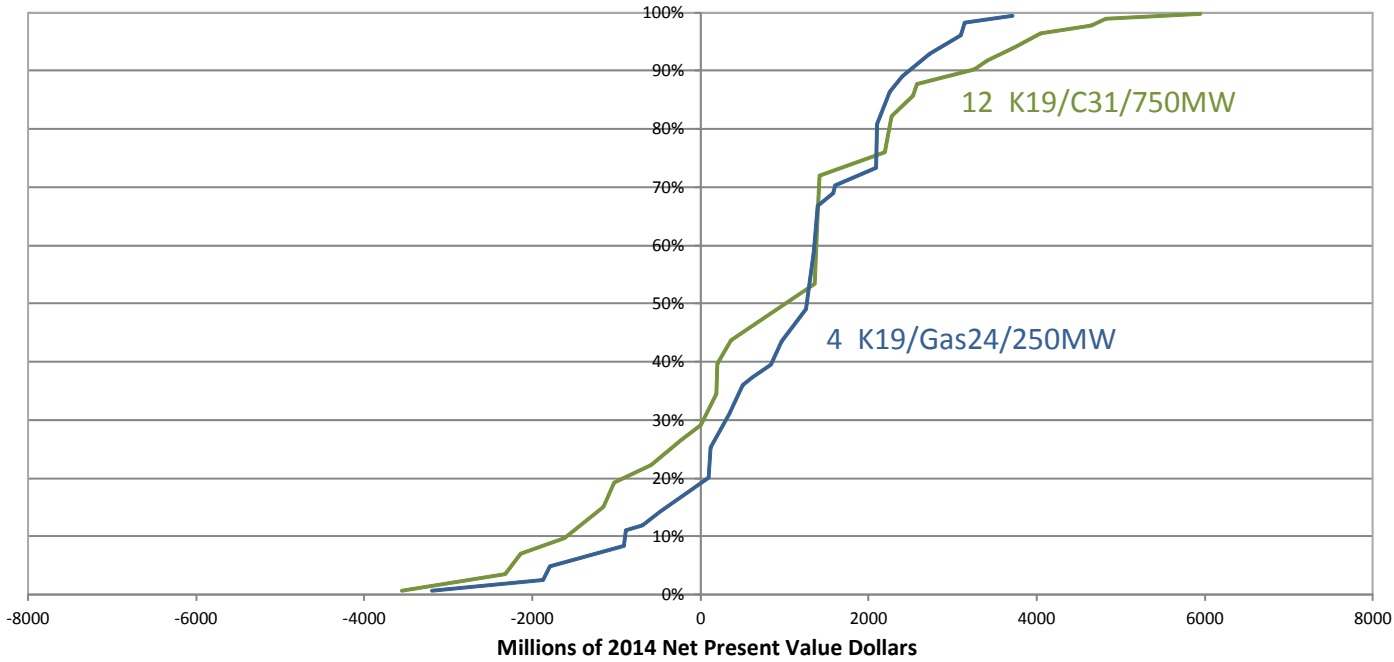


Figure 4 PROBABILITY CURVES FOR 2 PLANS: 750 MW INTERCONNECTION WITH
& WITHOUT WPS

The brief conclusions from the economic evaluations summarized above and contained in ***Chapters 9 - Economic Evaluations - Reference Scenario*** and ***Chapter 10 - Economic Uncertainty Analysis - Probabilistic Analysis and Sensitivities*** are:

- For plans with no new interconnection:
  - Plans with hydro next and no interconnection are clearly more economic than the All Gas Plan.
  - Plans with Keeyask G.S followed by Gas and no interconnection are more economic than plans with Conawapa G.S next.
- Plans with either 250 MW or 750 MW new interconnections are clearly more economic than plans with no new interconnections.
- Comparing plans with a 250 MW new interconnection (Pathway 3) and a 750 MW new interconnection but without the proposed 300 MW WPS sale (Pathway 4), the economic evaluations indicate no clear overall preference between Pathways 3 and 4 and suggest that:
  - If there is an expectation Conawapa will be built within the next two decades, the 750 MW interconnection (Pathway 4) is more economic.
  - If there is an expectation Conawapa will not be built for several decades, the 250 MW interconnection (Pathway 3) is more economic.
- The most economic plan with the 250 MW interconnection (Pathway 3) is more economic than the most economic plan with the 750 MW interconnection (Pathway 4).
- The Pathway 5 plan with the proposed 300 MW WPS Sale and WPS Transmission Agreement and Keeyask G.S. followed by Conawapa G.S. is generally more economic than the other plans. However, under certain scenarios it is less economic. One driver of such cases is when energy prices are low; this can be mitigated by displacing Conawapa G.S. with gas generation.
- The economic evaluations undertaken conclusively demonstrate that Pathway 3, 4 and 5 plans are clearly preferred to Pathway 1 and 2 plans. However, a clear and decisive preference between the 250 MW and 750 MW interconnection plans (Pathways 3, 4

and 5) cannot be established on the basis of only these evaluations but must consider additional information such as:

- qualitative consideration of factors not currently included in economic (and financial) evaluations such as the outcome of WPS negotiations, possible alternate or additional export agreements and updates to interconnection capital costs
- financial and multiple accounts evaluations
- flexibility and risks
- reliability and energy security
- environmental and socio-economic impacts and benefits.

Financial Evaluation of Development Plans

The financial evaluation was performed on 8 development plans that provide a representative sample of the range of potential plans with respect to the economics as well as mix of generation resources. The financial evaluation was prepared using information from pro forma financial statements that utilize the same framework for scenario uncertainty analysis that is used in the economic uncertainty. This resulted in 27 (3 x 3 x 3) scenarios for each of the 8 plans, for a total of 216 pro forma financial statements. The financial evaluation focused on the comparative impact on future customer rates and Manitoba Hydro's comparative exposure to financial risk of the various development plans.

Recognizing that during the capital investment period associated with new generation there will be downward pressure on Manitoba Hydro's financial ratios, the financial evaluation assumes even-annual rate increases in order to achieve the targeted debt:equity ratio of 75:25 by the end of 2031/32. Once the debt:equity target is reached, the projected annual rates for the remainder of the 50-year financial forecast period are calculated to maintain the corporation's interest coverage ratio target of 1.20. The financial evaluation has not been designed to establish specific rate strategies but to compare impacts on rates and on Manitoba Hydro's financial strength among alternative plans.

The following table sets out the projected key financial metrics for the 8 development plans evaluated, including cumulative nominal rate Increases by 2061/62 - compared to All Gas, projected even-annual rate increases (2014/15 to 2031/32), equivalent even-annual rate increases over the forecast period (50-years), the nominal balances of net fixed assets, net debt and retained earnings as at 2031/32 and 2061/62. The projected financial metrics are summarized from the pro forma financial statements using reference assumptions.

Table 4 FINANCIAL EVALUATION SUMMARY

Pathway	Interconnection	Development Plan	(A) Cumulative Nominal Rate Increases by 2061/62 - Compared to All Gas	(B) Projected Even-Annual Rate Increases (2014/15 to 2031/32)	(C) Equivalent Even-Annual Rate Increases over the Forecast period (50 Years)	(D) Net Fixed Assets	(E) Net Debt	(F) Retained Earnings	(G) Net Fixed Assets	(H) Net Debt	(I) Retained Earnings
						As at 2031/32 in Billions of Nominal Dollars			As at 2061/62 in Billions of Nominal Dollars

The following summarizes the financial evaluations, with a focus on the comparative impact on future customer rates and Manitoba Hydro's comparative exposure to financial risk:

Future Customer Rates

- Rate increases are required for all evaluated alternatives. The financial evaluation shows that higher rates are required in the medium term under all of the development plans, regardless of whether the plan is gas-based or hydro-based. New energy supply cannot be provided at the same current low rates that Manitoba Hydro customers have enjoyed over the last two decades.
- In the long-term, development plans with both Keeyask and Conawapa G.S. are projected to have the lowest cumulative rate increases which range between 65% to 70% lower than the All Gas plan under the reference scenario. Development plans with both Keeyask and Conawapa G.S. provide incremental dependable and surplus energy which translate to savings for Manitoba customers in the long run.
- In the medium term, the capital intensive plans that include both Keeyask and Conawapa G.S. are projected to have cumulative rate increases that are generally higher than other alternatives. Cumulative rates under the Preferred Development Plan "cross-over" compared to all other plans and begin to provide benefit to customers in a relatively short timeframe (10-15 years) following the ISD of the Conawapa G.S.
- The Preferred Development Plan is projected to have the lowest overall rates to Manitoba customers in the long-term.

Financial Risk

- In the long-term, development plans that include Keeyask and Conawapa G.S. have the strongest projected balance sheet with high levels of fixed assets and retained earnings. By the end of the study period retained earnings are projected to be between $4.9 billion to $6.1 billion higher than the All Gas plan.
- Net debt levels converge towards the end of the study period for all development plans.

- In the medium term, while net debt levels are the highest with the development plans that include both Keeyask and Conawapa G.S., as these plans have the overall highest capital investment, they also have the highest fixed assets and retained earnings.
- Development plans with both Keeyask and Conawapa G.S. are more robust in their ability to absorb adverse financial impacts, in the medium term and extending through to the end of the study period, given their comparatively higher level of retained earnings.

2013 Update to Forecasts and DSM Sensitivities

The economic and financial evaluations discussed above were based on the 2012 load forecast and other related planning assumptions, with the export price forecast adjusted, primarily downward in anticipation of 2013 updates. The following factors have changed for the 2013 analysis compared to the NFAT analysis:

- domestic load forecast is slightly lower
- export price forecasts are approximately 7% higher
- real discount rate has increased from 5.05% to 5.4%
- an export arrangement (the Great River Diversity Exchange) is extended to end in 2030 instead of 2025.

As a consequence of these changes, ISDs for new generation have been deferred by approximately 1-year, and NPVs have changed, though not to a degree that alters the conclusions as the relative ranking between the respective plans and pathways remains the same.

A sensitivity was undertaken using an increased level of DSM equal to 1.5 times the 2013 DSM forecast and a stress test was also undertaken using an increased level of DSM equal to 4.0 times the 2013 DSM forecast. The sensitivity and stress test demonstrated that increasing the DSM within a reasonable range (1.5 times) and for an ideal range (4.0 times): 1) did not change the conclusion that the plans with 750 MW or 250 MW interconnections are clearly more

economic compared to plans without new exports or new interconnection and 2) did not change the relative rankings of the 750 MW and 250 MW plans with respect to each other. Based on these results, it was not necessary to further include different levels of DSM in the detailed evaluations of the development plans to be able to assess the attractiveness of the plans with the new interconnections and exports.

In addition, some recent developments of strategic significance are:

WPS Export Sale and Transmission Investment Agreement Status

The proposed 300 MW WPS Export Sale and the transmission investment arrangements with WPS and MP are still in negotiation as of early August 2013 while this NFAT submission is being finalized. As noted earlier, WPS recently advised that they will not invest in the 750 MW interconnection transmission line but will still negotiate the 300 MW Power Purchase Agreement.

Concurrently, negotiations are proceeding between MP and Manitoba Hydro to revise the arrangement with MP to increase their investment in and ownership of the 750 MW Interconnection. Manitoba Hydro would increase its investment and ownership but would not become a majority owner.

It should be noted that, unlike the 300 MW WPS Sale, the 250 MW MP Sale Power Purchase Agreement is final, has been signed and has been approved by MP's state regulator but is still subject to other regulatory approvals in the U.S. and Canada.

Manitoba Hydro Investment in a 750 MW Interconnection

The evaluations of Pathways 4 and 5 assume that Manitoba Hydro will be investing in and owning a portion of the U.S. segment of the 750 MW, 500 kV interconnection and that the percentage amount owned stays constant for the life of the interconnection asset. It will be Manitoba Hydro's intent to arrange for some or all of the Manitoba Hydro ownership to be

transferred to another owner for the economic benefit of Manitoba Hydro as soon as an appropriate opportunity can be developed.

Decrease in Capital Cost Estimates for U.S. Portion of 750 MW Interconnection

Recent more detailed cost estimates are indicating that the costs of the U.S. portion of the 750 MW interconnection will be less than originally estimated. This would improve the economics of the interconnection in Pathways 4 and 5.

Other Potential Firm Export Sales in the U.S. and Canada

The MP and WPS sales will only utilize part of the 750 MW export capacity of the 750 MW interconnection leaving capacity available for long-term export contracts for additional sales to Wisconsin, Minnesota and to other utilities. In addition, early Conawapa G.S. would enable the extension of the 375/500 MW NSP sale which currently ends in 2025. This extension requiring advancement of Conawapa G.S. would benefit the economics of the 750 MW interconnection plans; the 250 MW plans would not benefit as much because the 250 MW interconnection would be already utilized by the 250 MW MP Sale.

In addition, Manitoba Hydro is in active negotiations with SaskPower regarding long-term export sale possibilities up to 500 MW, along with Saskatchewan interconnection transmission additions required to enable the sale. A sale would require early Conawapa G.S. (e.g. in-service prior to 2030). The excess power from Conawapa G.S. would also be exported over the U.S. 750 MW interconnection and improve its economics.

Integrated Comparisons of the Development Plans – Multiple Account Analysis

The results of a multiple account benefit-cost analysis (MA-BCA) are presented in ***Chapter 13 - Integrated Comparisons of Development Plans - Multiple Account Analysis***. The analysis compares Manitoba Hydro's Preferred Development Plan to a plan with a smaller interconnection and less firm export sales (K19/Gas 24/250MW), and two plans without a new

interconnection and firm export sales, one with Keeyask (K22/Gas) and one assuming All Gas to meet growing Manitoba requirements.

MA-BCA is a variant of traditional cost-benefit analysis. It extends Manitoba Hydro's economic evaluation of the different plans to take into account consequences and net benefits or costs for customers, taxpayers, workers and the economy, the environment, affected communities and Manitobans generally. These net benefits and costs are not reflected in the NPV of the different plans from the perspective of Manitoba Hydro and its project partners. The MA-BCA is intended to assist the NFAT panel address the question of the overall socio-economic benefit of the preferred and alternative plans, and more specifically the relative advantages and trade-offs they entail.

MA-BCA recognizes that not all consequences can be monetized in order to calculate a 'bottom line'; as well there are important distributional consequences that need to be considered in the assessment of the relative advantages or disadvantages and trade-offs that the different plans entail. The results of the MA-BCA are presented under a disaggregated set of evaluation accounts:

- market valuation
- customers
- government
- Manitoba economy
- environment
- social
- risk.

Table 5 presents a summary of the findings based on the NFAT Reference Scenario set of assumptions, with monetized values reported relative to the Preferred Development Plan (positive values indicating a net advantage relative to the Preferred Development Plan and negative values a net cost disadvantage).

Table 5 SUMMARY OF MULTIPLE ACCOUNTS ANALYSIS - REFERENCE SCENARIO ASSESSMENT

	Preferred Development Plan	K19/G24/250MW	K22/Gas	All Gas
Market Valuation • Net revenues (cost) to MH and partners	--	17.0	(270.5)	(654.1)
Customer Account • Cumulative rate increase	Preferred Development Plan has the lowest projected rate increases over long-term, with the highest projected rate increases in first 20 years.			
• Reliability	Preferred plan and to lesser extent the alternative with the smaller interconnection provides greater load carrying capability, lower expected loss of unserved energy and greater ability to manage extreme drought			
Government • Incremental revenues net of costs/risk	--	(353.5)	(395.9)	(674.2)
Manitoba Economy • Employment net benefits	--	(123.7)	(150.0)	(260.3)
Environment • Manitoba GHG external cost	--	(208.6)	(174.3)	(320.3)
• Global GHG impact	Preferred plan and to lesser extent the two plans with Keeyask would contribute to a reduction in global emissions by displacing thermal generation in US.			
• Manitoba CAC damage cost	--	(8.6)	(7.1)	(13.3)
• Residual biophysical	Aquatic and terrestrial impacts with hydro projects in preferred plan and plans with Keeyask; subject to detailed environmental hearings, residual effects and local external cost expected to be relatively small with initial design, extensive mitigation, monitoring, compensation and benefit-sharing arrangements.			
Social • Partner net return	Significant net returns from up to 25% interest in Keeyask and income benefits from Conawapa in preferred plan; significant benefits from up to 25% interest in two alternatives with Keeyask, greater with new sales and interconnection.			
• Community impacts	Wide range of potential impacts on local employment and business; population, infrastructure and service; social and community well-being; owners of land needed for rights of way and easements; major commitments and plans to minimize adverse residual effects with extensive mitigation, monitoring, compensation and partnership arrangements.			
• Other Manitoba	Potentially significant bequest value from the hydro assets remaining at end of planning period; greatest with preferred plan and to a lesser extent in the alternatives with Keeyask.			
Overall Monetized Net Benefit (Cost)	**--**	**(677.4)**	**(997.4)**	**(1922.2)**

(2014 Present Value in millions 2014$)

Overall, the main conclusions of the MA-BCA are as follows:

- Developing Keeyask G.S. to meet domestic load offers significant net benefits relative to the All Gas plan not only for Manitoba Hydro but also more broadly to society as a whole; it offers significant tax, employment, GHG and social benefits that go beyond the benefits to Manitoba Hydro.
- Plans that include a new interconnection offer significant net benefits to those that don't. They significantly enhance the net benefits for Manitoba Hydro and its partners.
- The alternative with the 250 MW interconnection and the development of Keeyask G.S. but not Conawapa G.S. offers the same expected net benefit to Manitoba Hydro and its partners as the Preferred Development Plan, without the short- to medium-term rate trade-off that the Preferred Development Plan gives rise to. At the same time it doesn't offer the same long-term legacy value or upside potential as the Preferred Development Plan. Nor does it offer the long-term rate, tax, employment, GHG and social benefits as the Preferred Development Plan.
    - The Preferred Development Plan offers the lowest rate impacts for the long-term and significantly greater benefits to society as a whole than the smaller tie alternative. It does, however, require higher rate increases in the short- to medium-term than the other plans. The more weight one places on the broader public interest consequences and the longer term effects, the more one would favour this plan.

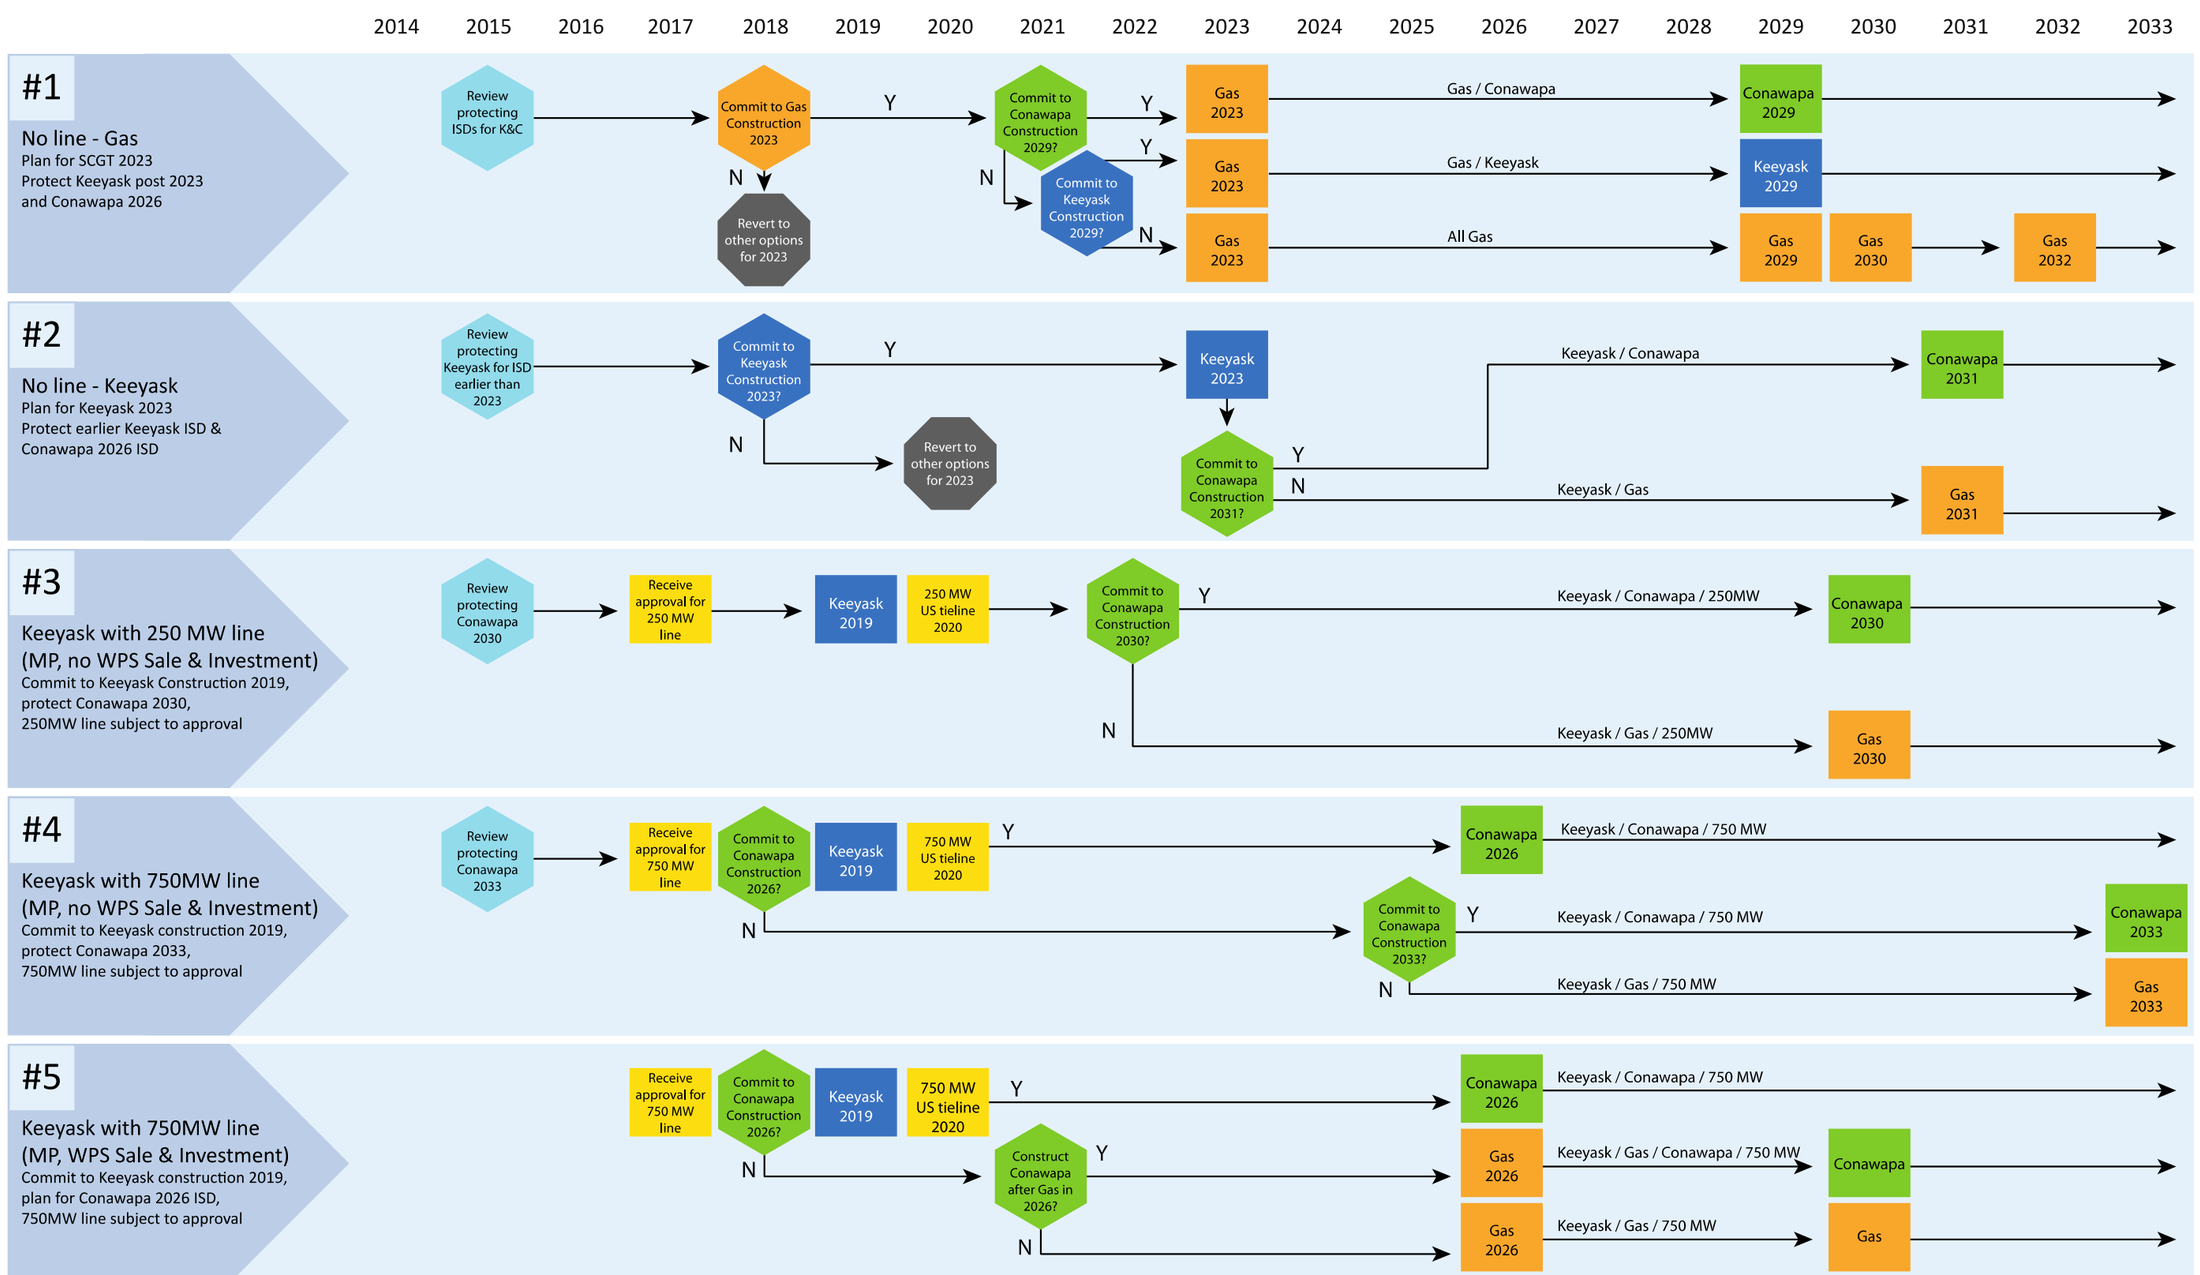
Conclusions – Which Development Plan and Pathway to Choose

Planning for Uncertainty

The economic, financial and multiple accounts evaluations by necessity considered mainly plans with specific choices of generation options and timing. For example, the Preferred Development Plan was put forward as "Keeyask ISD 2019 followed by Conawapa ISD 2025," while the Natural Gas Plan was put forward as "Natural Gas Generation in 2022 followed only

by Natural Gas Generation in subsequent years." Clearly, in reality, such choices are not rigidly frozen but rather will respond over time to evolving conditions and societal expectations.

Load growth, Power Smart plans, new export contracts, natural gas price forecasts, export price forecasts, capital cost estimates, retirement of existing gas generation and other parameters will be continually monitored and reviewed. There are certain circumstances in which the passage of time will make updated information or learnings available, which can reduce uncertainty and allow decisions to be made more confidently in the future than if they were made now. For example, deciding the start of Conawapa construction in 2018 for a 2026 ISD would have 4 years less uncertainty than if that decision were made in 2014, more than 12 years in advance of the ISD.



Alternative Development Pathways

The long-term flexibility to respond to events or the trajectory of critical parameters as they unfold over time is fundamental to managing risks and dealing with uncertainties. It is useful to consider the evaluations not as leading to a choice between fixed plans with fixed in-service dates, but rather a choice between different pathways. The five general approaches for "development plan implementation pathways" identified here are representative of the choices to be decided upon as the next step in Manitoba's electricity future:

- Pathway 1 Gas Only, No New Interconnection, No New Exports – domestic load only
- Pathway 2 Keeyask 2023, No New Interconnection, No New Exports – domestic load only
- Pathway 3 Keeyask 2019, 250 MW Interconnection, Small Export - 250 MW MP sale and 125 MW NSP extension; no WPS sale
- Pathway 4 Keeyask 2019, 750 MW Interconnection, Small Export - 250 MW MP sale and 125 MW NSP extension; no WPS investment in interconnection and no sale
- Pathway 5 Same as Pathway 4 but with Large Export - e.g. also includes WPS sale and investment in interconnection.

Figure 5 chronologically presents the decisions and options associated with each pathway.

Figure 5 PATHWAY DECISION TREE - ISDs BASED ON 2013 LOAD FORECAST AND RELATED ASSUMPTIONS

In-depth comparisons of the five pathways are contained in ***Chapter 14 - Conclusions*** of the submission. The Preferred Development Plan is included within Pathway 5 if the WPS sale is successfully concluded and in Pathway 4 if it is not. Both cases assume Keeyask in 2019, the 750 MW interconnection and the MP and NSP sales. Both cases provide the flexibility, if conditions change, to defer Conawapa or replace it with natural gas generation.

The use of pathways recognizes the reality that plans are continuously modified over time. A current example of such a modification is that the Conawapa planned ISD was recently deferred from 2025 to 2026 in association with a drop in the Manitoba load growth forecast.

In the future, if the Preferred Development Plan were adopted but then natural gas and export prices were found to be following a low price trajectory, Conawapa could be deferred or could be completely displaced with other new generation such as natural gas. Similarly, Conawapa could be delayed if there were a major reduction in forecast load growth or a major increase in power savings resulting from DSM.

Overall Conclusions

The economic, financial, multi-account and pathways analyses lead to the following broad conclusions in regard to the components, timing, expected impacts and risk/reward characteristics of Manitoba Hydro's Preferred Development Plan.

Components of Preferred Development Plan

- A plan comprising only natural gas additions is **not** attractive, economically, financially or environmentally.
- Plans which include the **new transmission interconnection and related hydro export sales** provide the highest expected economic and financial benefits in the long-term compared to plans with no new interconnection, whether they involve hydro or gas generation.
- **Keeyask** is the best option to meet the electricity supply gap in the early 2020s because it provides clean renewable energy and superior economic returns compared to natural gas

generation. Also, Keeyask's pre-construction phase is already underway and is supported by the in-vicinity Aboriginal communities.

- **Conawapa** is the more economic supply option after Keeyask in cases in which a large (750 MW) interconnection is installed. If the interconnection is smaller (250 MW), natural gas generation is more economic.
- **DSM** could be doubled or tripled without affecting the conclusions on the favourability ranking of plans with these components.

Timing

- Keeyask would come into service in 2019. The date could be deferred until 2023 if a decision were made not to proceed with the U.S. interconnection or related new export sales and net load did not increase. However, such a decision would give up substantial benefits and close the door to new export opportunities and a new interconnection for the foreseeable future.
- Conawapa could come into service at the earliest in 2026/27. Based on the 2013 load forecast and other 2013 assumptions, the date could be deferred to 2033 if the WPS sale or other attractive new export sales are not concluded. Activities would continue to protect an ISD for Conawapa as early as 2026, but conditions which are pertinent to this schedule will be continually monitored to determine if such continued investments are worthwhile and, ultimately, to determine if Conawapa should be constructed, for what ISD and if protection of an early ISD is warranted.
- The new interconnection is expected to receive U.S. approvals by no later than 2017 before Conawapa construction must be committed for a 2026 ISD.

Risk and Reward

- The Preferred Development Plan demonstrates greater economic variability (greater upside and downside) than plans which do not include new export sales and which are focused only on serving Manitoba needs.

- Financial resources may be strained in the medium-term if Conawapa is constructed for 2026 and if adverse conditions occur in the same time frame (e.g. higher capital costs, lower energy prices, low regional load growth, drought etc.).
- However, financial and other risks are mitigated by the ability to defer Conawapa or substitute gas generation if considered prudent to do so over the next few years.
- Greater variability also brings the possibility of higher reward. If energy prices are higher than forecast or even evolve as currently expected, the long-term benefits of the Preferred Development Plan could be substantially increased.
- Plans with the 750 MW interconnection provide overall the most flexibility to manage risks such as higher or lower load growth, uncertainty in level of future DSM, severe drought and increases and decreases in river flows due to climate change and to take advantage of future opportunities such as other export sales in addition to or instead of WPS.

Expected Benefits

Under expected conditions, the plans which include Keeyask 2019, 750 MW interconnection, new export sales, and Conawapa are generally expected to have the following positive impacts relative to other alternatives:

- Lower long-term customer rates (though generally higher during upcoming periods of construction).
- Supports Manitoba Hydro's long-term fiscal health with higher levels of fixed assets and retained earnings, which provide enhanced protection against adverse events such as severe drought.
- Highest level of system reliability (e.g. to deal with generation or major transmission outages or unexpectedly high load peaks) and energy security (e.g. to deal with unexpectedly severe droughts or unexpectedly high energy consumption).
- Greatest number of jobs and socio-economic benefits.
- Lowest GHG emissions and greatest support for Manitoba Clean Energy Strategy.
- Benefits to Aboriginal communities in the vicinity of the new dams.

- Use of Manitoba's renewable hydro resources rather than carbon-based energy from out of province.
- Largest payments to the Province through taxes and fees.
- Provision of an infrastructure legacy for future generations.

In summary the Preferred Development Plan as discussed on page 1 of this ***Executive Summary*** is preferred because it offers the greatest flexibility and largest range of potential benefits of any of the options examined.

Implementation and Risk Management Plan

Manitoba Hydro has a well-developed and comprehensive approach to undertake the plan and manage the risks of the Preferred Development Plan. This approach includes an implementation schedule containing portfolio risks, potential impacts and decision points. This schedule and a full range of risk mitigation measures are discussed throughout the submission and, in particular, in ***Chapter 15 – Implementation and Risk Management Plan for Preferred Development Plan***.

Tab 45

Provincial and Territorial Energy Profiles – Manitoba

Energy Production

Crude Oil

- In 2018, Manitoba produced 40 thousand barrels per day (Mb/d) of light crude oil (**Figure 1**). Manitoba accounted for less than 1% of total Canadian crude oil production (including condensate and pentanes plus).
- All of Manitoba's current oil production is located in the southwestern corner of the province.
- Manitoba's remaining resource of crude oil is estimated to be 747 million barrels when production to year-end 2018 is subtracted.

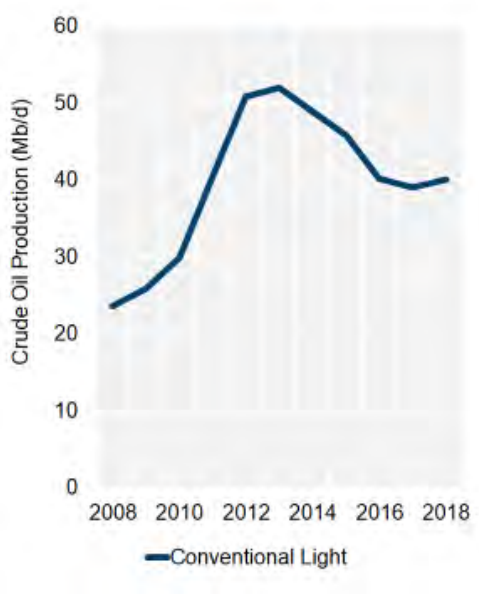
More Information

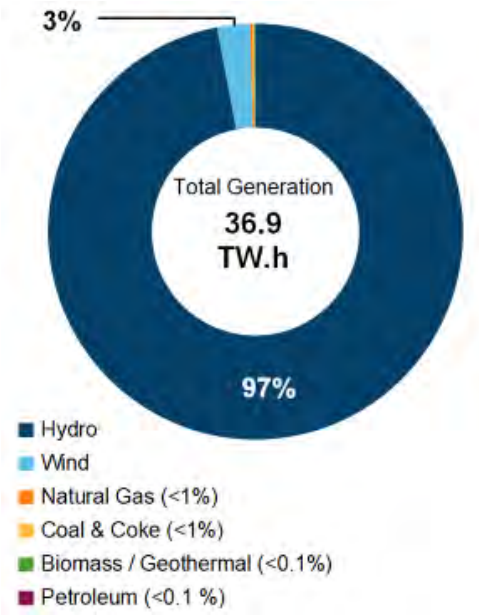
Figure 1: Hydrocarbon Production



- There are no refineries in Manitoba.

Natural Gas/Natural Gas Liquids (NGLs)

- There is no natural gas or NGL production in Manitoba.

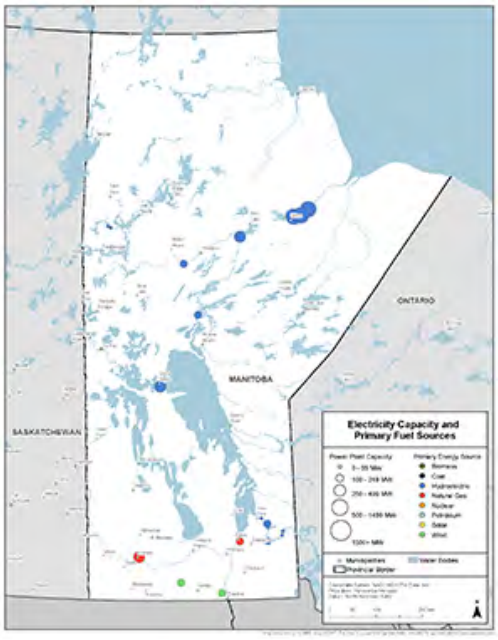


Electricity

- In 2018, Manitoba generated 36.9 terawatt hours (TW.h) of electricity (**Figure 2**), which is approximately 6% of total Canadian generation. Manitoba has a generating capacity of 6 141 megawatts (MW).
- Though 87% of Manitoba's installed generation capacity is hydroelectricity, 97% of its generation was derived from hydroelectricity. There are 15 major hydroelectric generating stations, the largest of which is located along the Nelson River (**Figure 3**).
- The Wuskwatim Generation Station on the Burntwood River was completed in 2012 with a capacity of 200 MW. This project, developed by Manitoba Hydro and the Nisichawayasihk Cree

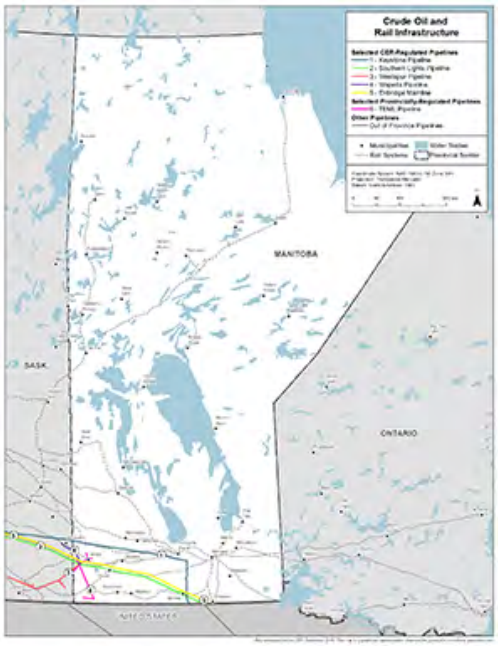
▶ Source and Description:

Figure 2: Electricity Generation by Fuel Type (2018)



▶ Source and Description:

Figure 3: Electricity Capacity and Primary Fuel Sources Map



Nation, marked the first time Manitoba Hydro had entered into a formal partnership with a First Nation to develop and operate a hydroelectric project.

- Construction of the Keeyask Project 725 kilometres (km) northeast of Winnipeg on the lower Nelson River is scheduled to be completed by 2021, with its first generator expected to go into service October 2020. Once completed, Keeyask will be Manitoba's fourth largest generating station, with a capacity of 695 MW.
- In 2018, wind contributed approximately 3% to Manitoba's electricity generation. Between 2005 and 2018, over 238 MW of wind was added to Manitoba's power capacity.
- In August 2018, the last coal-fired generating unit in Manitoba ceased operation and is now being used as a synchronous condenser to help stabilize the transmission system.
- Manitoba Hydro is responsible for the design, construction, and operation of hydro facilities, and is the

▶ Source and Description:

Figure 4: Crude Oil Infrastructure Map

▶ Source and Description:

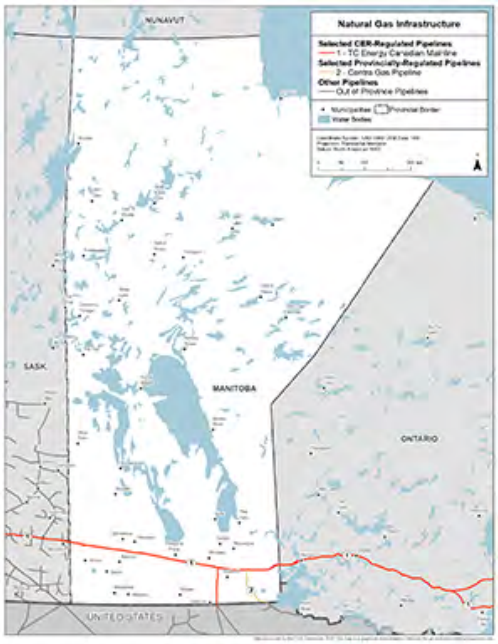


Figure 5: Natural Gas Infrastructure Map

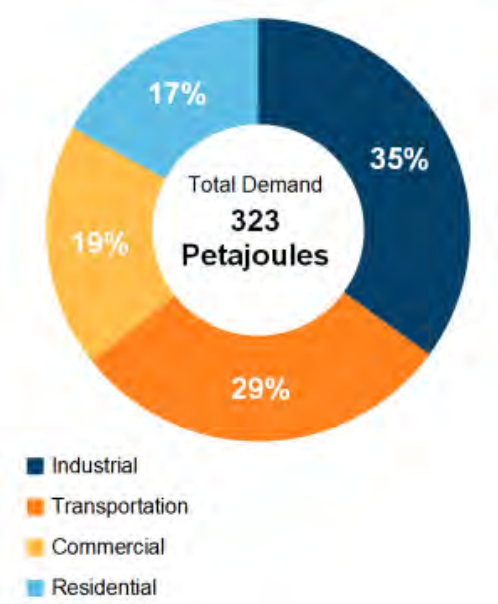
largest producer of electricity in Manitoba. Manitoba Hydro also operates two natural gas-fired generating stations and four remote diesel generating stations. Wind, biomass, and some solar facilities are operated by independent producers.

Energy Transportation and Trade



Crude Oil and Liquids

- There are two major export pipelines that pass through Manitoba: TC Energy's Keystone and Enbridge's Mainline.
- Keystone ships western Canadian crude oil from Hardisty, Alberta to U.S. Midwest refineries. Keystone also ships to the U.S. Gulf Coast markets via TC Energy's Marketlink Pipeline. Keystone delivered a record of nearly 590 Mb/d of crude oil in 2018, almost all of which was heavy oil.
- Enbridge Mainline ships western Canadian crude oil and liquids to the U.S. and Ontario markets. It enters Manitoba from

▶ Source and Description:

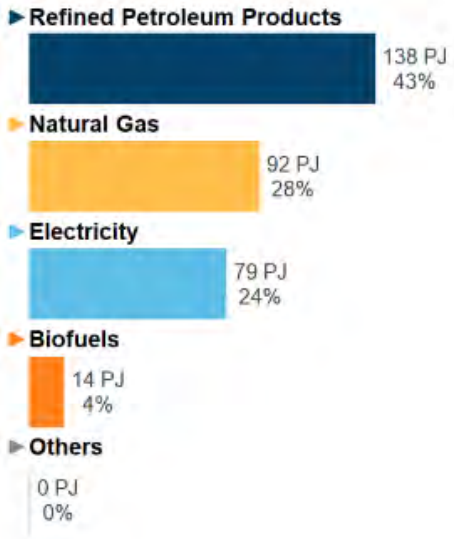


Figure 6: End-Use Demand by Sector (2017)

▶ Source and Description:

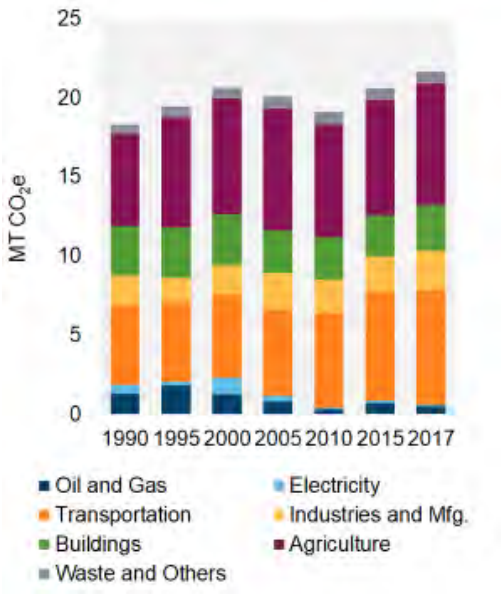

Figure 7: End-Use Demand by Fuel (2017)

Saskatchewan near Cromer, and exits at the U.S. border near Gretna, where it becomes the Enbridge Lakehead system. Enbridge Mainline is Canada's largest crude pipeline transporting nearly 2 700 Mb/d in 2018. Enbridge Mainline's Line 3 Replacement (L3R) Project is underway. The Canadian portion of L3R came into service in December 2019, while the U.S. portion is currently facing delays in receiving final approvals needed to complete construction.

▶ Source and Description:

Figure 8: GHG Emissions by Sector

▶ Source and Description:

- The Enbridge Cromer Terminal has a capacity of about 2.4 million barrels, and is the gathering point for all light and medium crude oil produced in southwestern Manitoba and southeastern Saskatchewan. The Enbridge Cromer Terminal connects the Mainline with Kingston Midstream's (formerly Tundra Energy Marketing) Westspur, Enbridge's Bakken, and Plain Midstream's Wapella pipelines (**Figure 4**). Westspur and Enbridge Bakken pipelines are two smaller pipeline systems that transport crude oil from North Dakota and south Saskatchewan to the Enbridge Mainline. The Wapella pipeline carries crude oil from southern Saskatchewan to the Enbridge Mainline.
- Enbridge's Southern Lights pipeline parallels the Enbridge Mainline in Manitoba, but it is used to import condensate from the U.S. to Alberta.
- The Winnipeg Products Pipeline delivers RPPs from the Enbridge Mainline at Gretna to Winnipeg.

- There are two crude oil rail loading facilities in Manitoba, with a total estimated capacity of 68 Mb/d. Cromer Rail Terminal, operated by Kingston Midstream, is the largest with a 60 Mb/d capacity. The CN/Watco Rail Terminal in Woodnorth is operated by Watco Terminal and Port Services.

Natural Gas

- TC Energy's Canadian Mainline crosses through southern Manitoba and carries natural gas from western Canada to markets in Manitoba, Ontario, Quebec, and the U.S. (**Figure 5**). Nearly all of the natural gas used in Manitoba is delivered on the Canadian Mainline.
- The Mainline has two interconnects at the Canada/U.S. border near Emerson, Manitoba: Emerson 1 connects with the Viking Gas Transmission Pipeline, and Emerson 2 connects with the Great Lakes Gas Transmission Pipeline. Exports averaged approximately 0.3 Bcf/d from Emerson 1 and 1.2 Bcf/d at Emerson 2 in 2018.
- Manitoba also can import gas from the U.S. at Emerson during periods of peak winter demand, although there have been no imports since 2016.
- Centra Gas distributes natural gas to over 275 000 customers in more than 100 communities in southern Manitoba. Centra is owned by Manitoba Hydro and is regulated by the Manitoba Public Utilities Board.
- A Manitoba Hydro compressed natural gas station in southwest Winnipeg provides back-up supply of natural gas for customers in southern Manitoba.

Liquefied Natural Gas (LNG)

- There are no proposed or existing LNG facilities in Manitoba.

Electricity

- In 2018, Manitoba's net electricity interprovincial and international outflows were 5.5 TW.h. Manitoba's trading partners include the U.S. Midwest, Ontario, and Saskatchewan.
- Manitoba has more than 13 800 km of electricity transmission lines and more than 75 500 km of distribution lines. Nine interconnections link Manitoba's electricity system with Saskatchewan, Ontario, and the U.S.
- Manitoba Hydro is building the Manitoba-Minnesota Transmission Line, a 500 kilovolt (kV) line in southeastern Manitoba with a projected mid-2020 in-service date. This new transmission line will allow for up to 883 MW of additional electricity to be exported to the U.S.
- The Bipole III Transmission Line was completed in July 2018, and now delivers electricity to southern Manitoba and the U.S.

- Manitoba Hydro has plans to construct a new 230 kV transmission line (the Birtle Transmission Project) to the Saskatchewan border. The new line would facilitate the sale of 100 MW of electricity from Manitoba to Saskatchewan.

Energy Consumption and Greenhouse Gas (GHG) Emissions

Total Energy Consumption

- End-use demand in Manitoba was 323 petajoules (PJ) in 2017. The largest sector for energy demand was industrial at 35% of total demand, followed by transportation at 29%, commercial at 19%, and residential at 17% (**Figure 6**). Manitoba's total energy demand was the 6th largest in Canada, and the 7th largest on a per capita basis.
- RPPs, including gasoline and diesel, were the largest fuel type consumed in Manitoba, accounting for 138 PJ, or 43%. Natural gas and electricity accounted for 92 PJ (28%) and 79 PJ (24%), respectively (**Figure 7**).

Refined Petroleum Products

- The majority of the gasoline consumed in Manitoba comes from refineries in Alberta and Saskatchewan. RPPs from Alberta are mainly transported by the Enbridge Mainline, while RPPs from Saskatchewan and elsewhere are delivered primarily by rail.
- Total 2018 demand for RPPs in Manitoba was 71 Mb/d, or 4% of total Canadian RPP demand. Of Manitoba's total demand, 35 Mb/d was for motor gasoline and 27 Mb/d was for diesel.
- Manitoba's per capita RPP consumption in 2018 was 3 101 litres (20 barrels), or 2% above the national average of 3 038 litres per capita.

Natural Gas

- Manitoba consumed an average of 213 million cubic feet per day (MMcf/d) of natural gas in 2018, which represented 2% of total Canadian demand.
- Manitoba's largest consuming sector for natural gas was the industrial sector, which consumed 84 MMcf/d in 2018. The commercial and residential sectors consumed 72 MMcf/d and 58 MMcf/d, respectively.

Electricity

- In 2017, annual electricity consumption per capita in Manitoba was 16.1 megawatt hours (MW.h). Manitoba ranked 6th in Canada for per capita electricity consumption and consumed 15% more than the national average.

- The largest consuming sector for electricity in Manitoba in 2017 was residential at 8.2 TW.h. The commercial and industrial sectors consumed 7.0 TW.h and 6.3 TW.h, respectively. Manitoba's electricity demand has grown 8% since 2005.

GHG Emissions

- Manitoba's GHG emissions in 2017 were 21.7 megatonnes (MT) of carbon dioxide equivalent (CO_2e) [1] . Manitoba's emissions have increased 18.4% since 1990.
- Manitoba's emissions per capita are 16.2 tonnes of CO_2e – 17% below the Canadian average of 19.6 tonnes per capita.
- The largest emitting sectors in Manitoba are agriculture at 35% of emissions, transportation at 33%, and buildings (residential and service industry) at 14% (**Figure 8**).
- Manitoba's GHG emissions from the oil and gas sector in 2017 were 0.5 MT of CO_2e, attributable to crude oil production and oil and gas transmission.
- Manitoba generates virtually all of its electricity from renewable sources. As such, it emits less than 0.1 MT CO_2e emissions from electricity generation, or 0.1% of total Canadian GHG emissions from power generation.

- CER – Market Snapshot: Increasing western Canadian non-oil sands oil production varies by province
- CER – Market Snapshot: Canadian electricity exports to the U.S. focused on renewable power exports to specific markets
- CER – Market Snapshot: Canadian tight oil production decreased after 2014 due to less drilling activity

1 Data for Canada's GHG emissions are produced annually by Environment and Climate Change Canada (ECCC). GHG data for 2018 will be available on ECCC's website in April 2020.

Data Sources

Provincial & Territorial Energy Profiles aligns with CER's latest Canada's Energy Future 2019 datasets. Energy Future uses a variety of data sources, generally starting with Statistics Canada data as the foundation, and making adjustments depending on individual province/territory circumstances. Adjustments are necessary to ensure consistency and comparability across provinces/territories.

4 The Need for New Resources

4.0 Chapter Overview

This chapter describes how Manitoba Hydro establishes the need for new supply resources in order to meet Manitoba Hydro's expected domestic load and firm export commitments. Both current load, and load growth assumptions, as well as Demand Side Management (DSM) programs are described and, when combined, result in net load in Manitoba. The remainder of the chapter describes Manitoba Hydro's existing sources of supply, which represent the ability of the current system to meet load without new resources. The determination of the need for new resources is then based on a comparison of load and supply. The information here provides the basis for the preparation of development plans, described in ***Chapter 8 — Determination and Description of Development Plans***.

Load information in this chapter is based on the 2012 Electric Load Forecast and supply information is based on the 2012/13 Power Resource Plan. The chapter also includes a discussion of Manitoba Hydro's 2013 - 2016 Power Smart Plan. In terms of DSM, the analysis contained in the NFAT submission is based upon DSM projections prepared early in 2012 as a component of the corporation's regular corporate planning cycle; for the purposes of the submission these projections are referred to as "the 2012 base DSM forecast". The 2012 base DSM forecast is consistent with and formalized under the 2013 - 2016 Power Smart Plan.

4.1 Introduction

As described in ***Chapter 1 —Introduction***, Manitoba Hydro is mandated by *The Manitoba Hydro Act* to provide for the continuance of a supply of power adequate for the needs of the province, and to engage in and to promote economy and efficiency in the development of generation, transmission, distribution supply and end-use of power. Manitoba Hydro conducts a review of

the need for new supply resources on an annual basis as part of the resource planning process described in ***Chapter 1 — Introduction***. Manitoba Hydro's commitments include:

- Manitoba domestic electricity load (net of DSM programs)
- long-term firm export sale commitments.

Manitoba's domestic electrical energy consumption has grown, on average, at an annual rate of 1.7% over the past ten years. Observed domestic energy usage includes the effect of energy codes and standards and Manitoba Hydro's past DSM programs. Manitoba's domestic energy usage would have grown another 0.4% per year in the absence of DSM.

Manitoba Hydro's forecast net energy load is determined by considering both domestic energy growth and forecast DSM programs. Over the next 20 years, a growth trend in energy consumption is forecast to continue at an average annual rate of 1.6% (2012 load forecast). This trend takes into account the effects of future savings due to energy efficiency codes and standards but not DSM programs. Projected DSM programs would reduce the energy use growth rate by approximately 0.1% to 1.5%.

Similarly, Manitoba's peak demand has grown, on average, at a rate of 1.4% per year over the past 10 years. The observed domestic demand includes the effect of codes and standards and Manitoba Hydro's past DSM programs. Manitoba's domestic demand would have grown another 0.4% per year if not for the effect of codes and standards and Manitoba Hydro's past DSM programs.

Manitoba Hydro's forecast net peak load is determined by considering both domestic demand growth and forecasted DSM programs. Peak demand is forecast to continue to grow at an average rate of 1.6% per year for the next 20 years. This reflects future savings due to codes and standards but not DSM programs. Forecast DSM programs would reduce the forecasted demand growth rate by approximately 0.1% resulting in an average rate after DSM of 1.5%.

In terms of causes for growth, the province of Manitoba is growing, both in population and economically. Growth in population results in more housing and in increases in related services within the commercial sector to accommodate that growth. Economic growth results in the anticipated expansion associated with commercial and industrial customers. Together, forecast population growth and economic growth result in a Manitoba load that is expected to grow in all sectors.

The electricity demands of a growing Manitoba population and a growing economy can be slowed but not reversed. DSM programs have been used successfully by Manitoba Hydro to reduce customer load in Manitoba, resulting in the deferral of new resources. By the end of fiscal year 2012/13, codes and standards and Power Smart programs were estimated to have achieved an annual load reduction of 1,990[1] gigawatt-hours (GWh) in energy and 586 megawatts (MW) in demand (at generation)[2] and have deferred the need for new resources by approximately four years. These savings are reflected in the historical domestic-load growth rates. Yet, despite the efforts of Manitoba Hydro with its industry-leading DSM programs, Manitoba electricity consumption is growing faster than it can be conserved.

Manitoba Hydro's future DSM strategy involves a continued long-term commitment to pursuing all available economic energy efficiency opportunities. The 2013–2016 Power Smart Plan targets additional energy savings of 1,552 GWh and 490 MW of capacity savings by 2027/28. This represents approximately four years of domestic energy load growth and six years of peak load growth. Forecast DSM defers the requirement for future generation by approximately three to four years.

Manitoba Hydro's primary focus is the provision of power to its Manitoba customers. Manitoba Hydro also exports surplus firm energy and capacity through long-term firm sale agreements,

[1] All load and supply values have been adjusted, as necessary, to reflect a common reference point. This reference is at the point of generation.
[2] Interim estimate as of March 31, 2013.

which form the second component of Manitoba Hydro's firm electricity commitments. However, in order to maintain security and reliability of supply to Manitoba customers, long-term firm sale agreements may contain reduced delivery obligations for example during periods of system emergencies and under certain drought conditions. Contracts which take the form of diversity agreements provide for the seasonal exchange of power between utilities during their respective peak load conditions, helping to optimize operations by having Manitoba Hydro export to customers with peak loads in the summer period while having the ability to import from these same customers during Manitoba's winter peak period. Such arrangements result in lower power costs to both parties by deferring the expansion of generating resources that would otherwise be required to meet peak load.

System supply evaluations are based on Manitoba Hydro's generation planning criteria and are assessed from the perspective of both dependable energy and peak winter capacity. The Manitoba Hydro base supply, including electricity imported from outside the province, is expected to provide 6,244 MW of winter peak capacity and 30,253 GWh of dependable energy in the year 2013/14 resulting in a surplus of 583 MW winter peak capacity and 1,536 GWh of dependable energy.

Based on 2012 planning assumptions, a surplus of dependable energy continues until 2022/23 when the base supply is no longer sufficient to satisfy anticipated energy demand. There continues to be surplus capacity in the system beyond 2022/23. Over the last five years, the requirement for new resources has varied from as early as 2019/20 to as late as 2022/23 and has consistently been due to a need for energy as opposed to capacity.

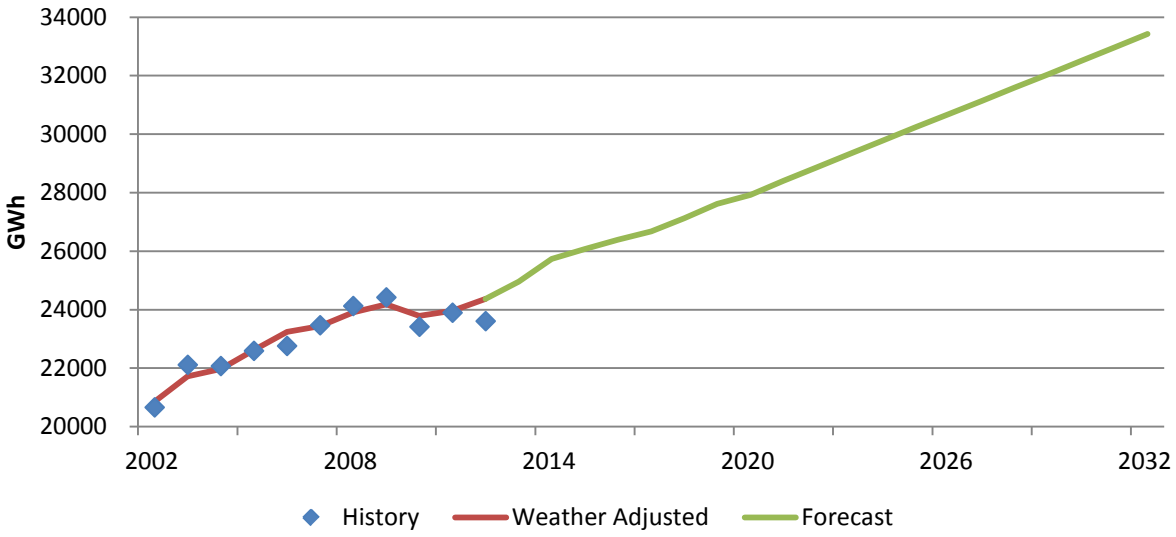
4.2 Total Demand on the Manitoba Hydro System

4.2.1 Manitoba Hydro's Domestic Electricity Load

Manitoba Hydro's forecast of electrical energy consumption and peak demand is detailed in the report 2012 Electric Load Forecast (hereinafter referred to as the "2012 Load Forecast"). This report is provided in ***Appendix C – 2012 Electric Load Forecast***. The load forecast is reviewed and updated on an annual basis as part of the annual corporate planning cycle.

Manitoba peak demand is defined to be "the maximum average hourly load, measured in MW, in Manitoba to be served by Manitoba Hydro's system". Energy consumption is defined to be "the electrical energy used by a customer, measured in kilowatt-hours (kWh) or megawatt-hours (MWh)".

Considerations for the 2012 Load Forecast:



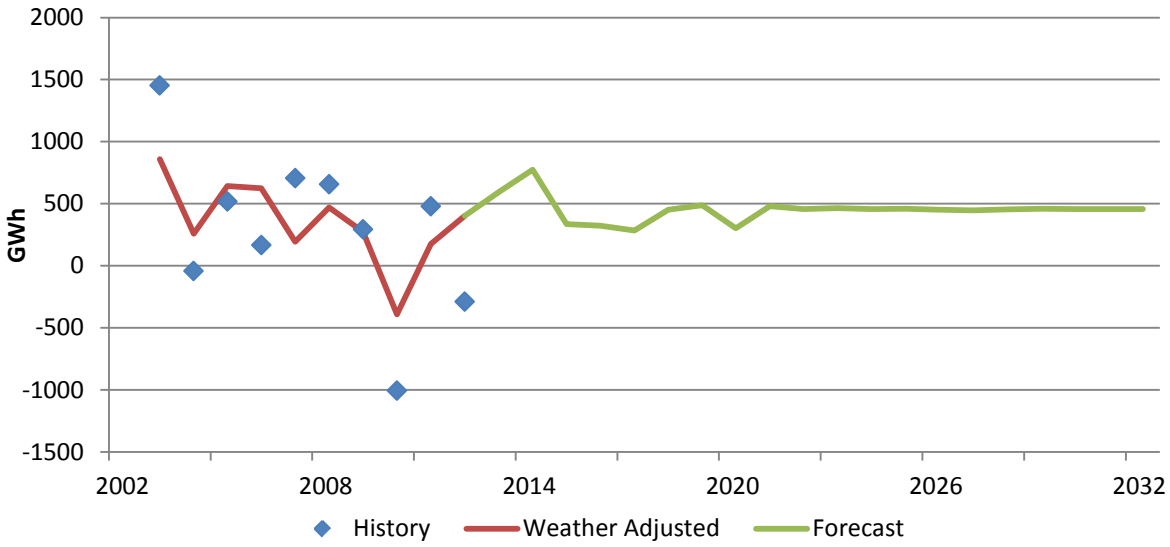
- Historical load values include the effect of Manitoba Hydro's past DSM, including both improvements to energy codes and standards as well as market-based programs.
- Forecasted load values reflect the future impact of implemented energy codes and standards, but not future activity under market-based DSM programs.
- Customer self-generation is recognized as avoided load; the avoided load is not in the load forecast.
- Given that forecast activity under market-based DSM programs has not been removed from the 2012 Load Forecast, Manitoba Hydro's forecast net load is determined by considering both forecast domestic energy growth and projected future DSM program activity.

As established in Table 3.1 of ***Chapter 3 – Trends and Factors Influencing North American Electricity Supply***, overall loads across Canada and the U.S. are projected to grow, with average

annual growth rates varying by region, reflecting the unique characteristics of their individual markets.

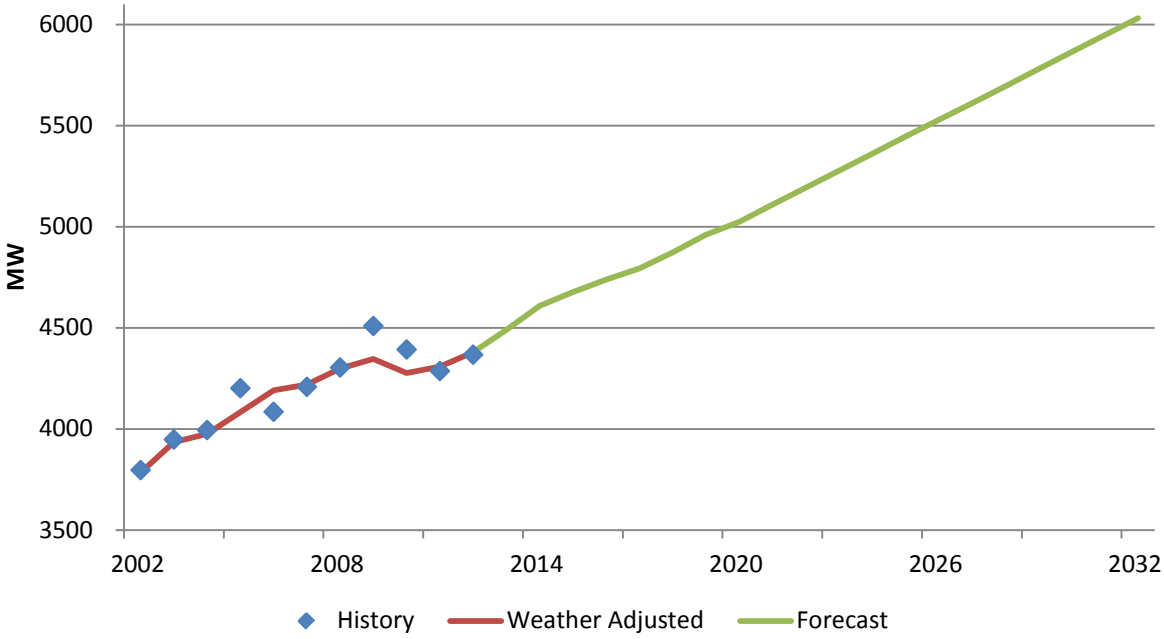
Historical and forecast energy consumption for Manitoba is shown in Figure 4.1. Energy consumption increased from 20,656 GWh in 2001/02 to 24,367 GWh in 2011/12, representing an approximate 18% increase over the past 10 years at a compounded growth rate of 1.7% per year. Energy use is forecast to grow another 18% over the next 10 years to 28,859 GWh in 2021/22, and 37% over the next 20 years to 33,425 GWh in 2031/32 at growth rates of 1.7% and 1.6% respectively. Forecast values assume normal weather (e.g., 25 year average) will occur, and are therefore comparable to historical weather-adjusted values.

Figure 4.1 MANITOBA ENERGY CONSUMPTION (GWH) – HISTORY & FORECAST



Manitoba's domestic energy consumption has grown, on average, at an annual growth rate of 1.7% or 371 GWh over the past 10 years. This growth trend is forecast to continue for the next 20 years at an average annual growth rate of 1.6% or 453 GWh. On an annual-average basis, forecast load growth is consistent with the average annual historical growth trend.

Annual energy growth varies from year to year. The variation is mostly due to increases or decreases in energy consumption by Manitoba's largest electricity customers. The effect of the



closure of one of these customers in 2009 can be clearly seen in the weather-adjusted history shown in Figure 4.2. The effect of major expansions by large customers in 2013, the planned closure of a smelter and refinery in 2015, and the drop of some operations in 2019 can be seen in the forecast.

Figure 4.2 MANITOBA ENERGY ANNUAL GROWTH (GWH)

Historical and forecast peak demand values are shown in Figure 4.3 below. Peak demand grew 15% over the past 10 years from 3,797 MW in 2001/02 to 4,380 MW in 2011/12. Peak demand is forecast to grow another 19% to 5,192 MW by 2021/22, and 38% to 6,032 MW by 2031/32. Forecasts are based on weather-adjusted values.

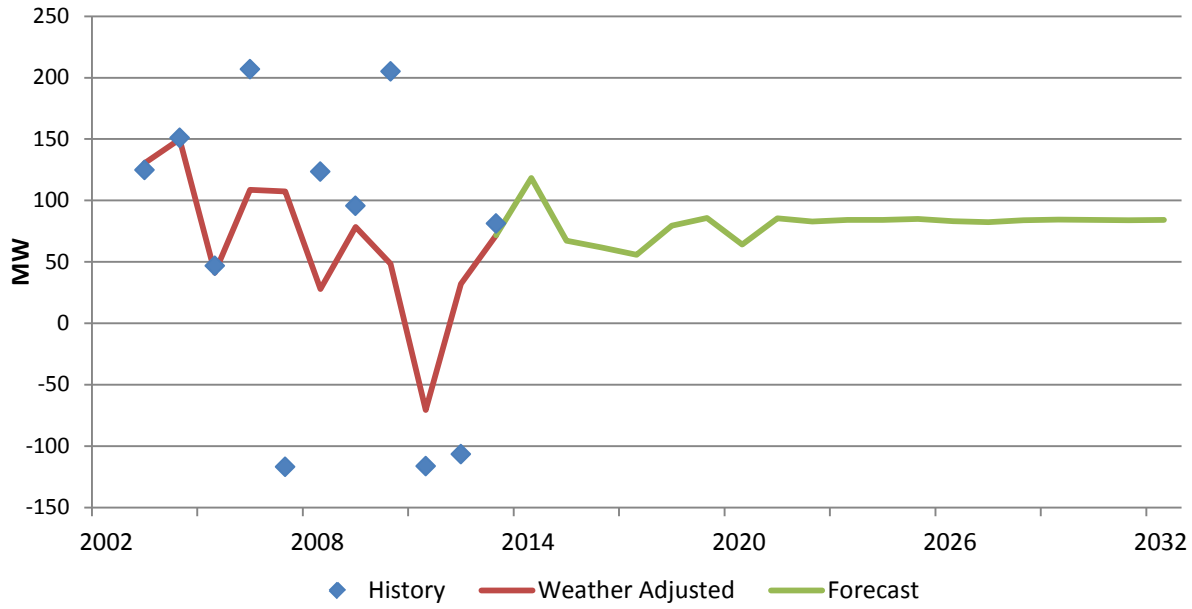


Figure 4.3 MANITOBA PEAK (MW) – HISTORY & FORECAST

As shown in Figure 4.4 below, Manitoba peak demand has grown, on average, at an annual growth rate of 1.4% or 58 MW per year over the past 10 years. It is forecast to grow at an average annual rate of 1.6% or 83 MW for the next 20 years. In the mid-2000s when large electricity customers were expanding, peak demand had been growing at a slower rate than energy consumption. However, increased growth in electric-heat customers is forecast to bring the future peak-demand growth rate up to that of Manitoba energy consumption (1.6%).

Manitoba peak demand tends to grow at a very similar rate to Manitoba energy consumption. It is of note that higher energy use by the largest electricity users in Manitoba, who have relatively constant consumption of energy over the year, causes the peak demand to grow at a slower rate than the requirement for energy. Conversely, electric-heat customers, who peak on the coldest day of the winter, cause peak demand to grow at a faster rate than the requirement for energy.

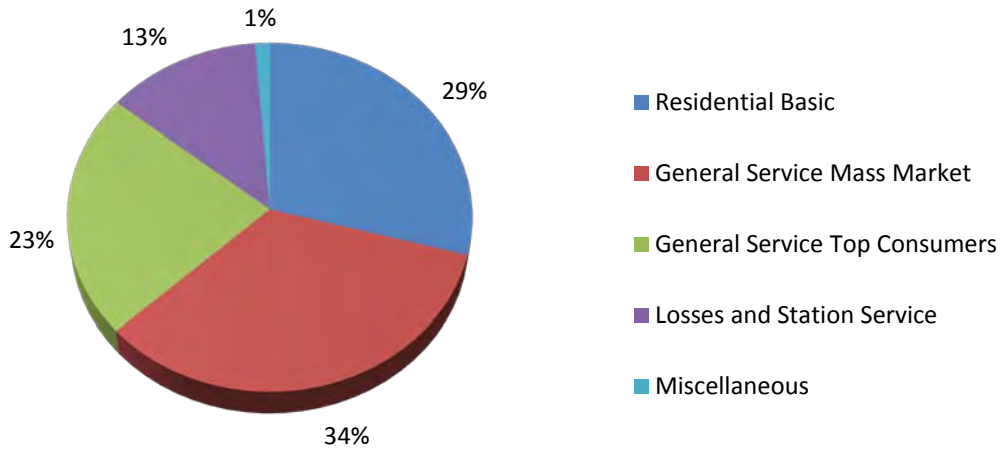
Figure 4.4 MANITOBA PEAK DEMAND ANNUAL GROWTH (MW)

Over the next 20 years, Manitoba energy consumption is forecast to grow at an average of 453 GWh per year and peak demand is forecast to grow at an average of 83 MW per year, with the expectation that in the future large electricity customers will continue to affect individual years, causing some years to be above and some years to be below that average.

4.2.1.1 Domestic Load Growth by Sector

Domestic load is forecast for the following sectors: Residential Basic, General Service - Mass Market, General Service - Top Consumers, Losses and Station Service, and Miscellaneous. Figure 4.5 and Figure 4.6 show the percentage breakdown by sector for the years 2011/12 and 2031/32 respectively. The sector percentages are not expected to change significantly since all sectors are expected to grow at approximately the same rate.

Figure 4.5 SECTORS OF DOMESTIC LOAD FOR 2011/12



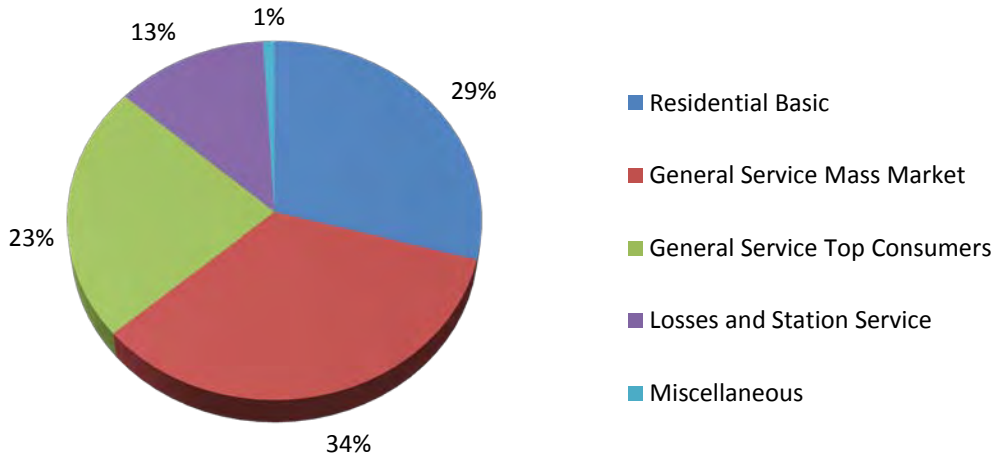


Figure 4.6 SECTORS OF DOMESTIC LOAD FOR 2031/32

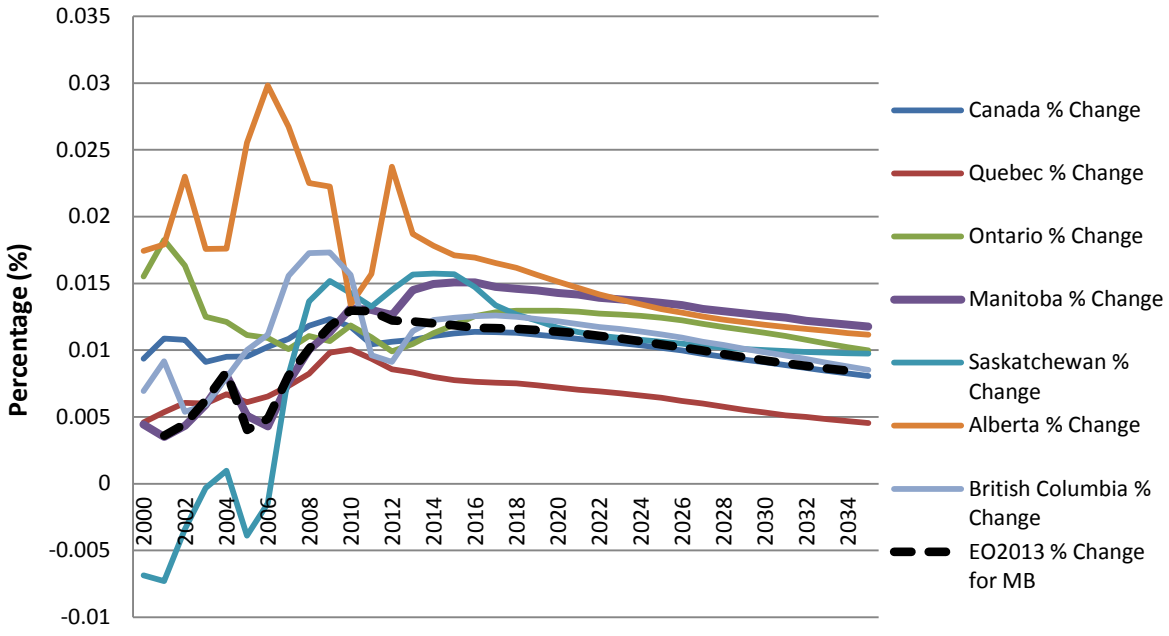


Residential Basic

The residential sector—excluding seasonal, diesel and flat-rate customers—is known as Residential Basic. Residential Basic had 450,748 customers in 2011/12, whose weather-adjusted energy consumption was 29% of the total energy consumed in Manitoba or 7,114 GWh. The major driver of Residential Basic load in the 2012 Load Forecast is the Manitoba population. Manitoba's population in 2011/12 was 1,255,000. Manitoba Hydro has one residential basic customer for every 2.8 people in Manitoba, and this ratio is expected to remain at about this level.

Under Manitoba Hydro's 2012 Economic Outlook, Manitoba's population is forecast to grow from 1,255,000 in 2011/12 to 1,596,000 in 2031/32, representing an average annual growth rate of 1.2%. In the 2012 Load Forecast, the number of Residential Basic customers is expected to grow at an average annual rate of 1.2% over the next 20 years, reaching 576,545 customers by 2031/32.

For the 2013 Load Forecast, the forecast population annual growth rate was reduced from 1.2% per year to 1.1% per year, with the Residential Basic customer forecast correspondingly reduced from 1.2% to 1.1%. Some industry forecasters, as evidenced in Figure 4.7, are projecting population growth in Manitoba to be among the highest in Canada contributing to the overall growth in Manitoba's future energy requirements. The effect of Manitoba Hydro's 2013 Economic Outlook and updated population forecasts, as noted by line EO2013 in Figure 4.7, are reflected in the 2013 Electric Load Forecast as outlined in ***Chapter 12 – Economic Evaluations – 2013 Update on Selected Development Plans***.

Figure 4.7 ANNUAL POPULATION GROWTH BY PROVINCE (%): COMPARISON TO EO2013

Source: Conference Board of Canada 2013 Values

Due to the expectation that a larger proportion of customers will continue to choose electricity for space and water heat as well as miscellaneous end-uses, the average energy usage per residential customer is expected to rise by 0.4% /year. Electricity is currently used for space heating by approximately 35% of Residential Basic customers—forecast to grow to approximately 40% by 2031/32 as a progressively higher percentage of new homes and apartments choose electricity for space heating.

Electric water heating is currently used by approximately 47% of Residential Basic customers—forecast to grow to approximately 69% by 2031/32 in the 2012 Load Forecast. The current trend is for new homes to install electric water heaters; in addition, a growing number of existing natural gas water heaters are also being replaced with electric units.

The influence of improved efficiency requirements for natural gas furnaces and resulting impact on the fuel choice for water heating on the average electricity usage per customer will differ from region to region. This difference depends upon the level of saturation of electric space and water heating in a region, building practices, historic and current energy pricing and other market characteristics. These trends in space and water heating in Manitoba are expected to be mitigated through the corporation's planned heating fuel choice initiatives, with the effects reflected in the 2013 Electric Load Forecast as outlined in ***Chapter 12 – Economic Evaluations – 2013 Update on Selected Development Plans***.

The 1.2% annual increase in Residential Basic customers due to population growth combined with the 0.4% annual increase in average electricity use results in an annual growth rate of 1.6% for the Residential Basic sector over the next 20 years.

General Service – Mass Market

The Mass Market sector is made up of commercial and industrial customers, excluding the Top Consumers. This sector had 65,546 customers in 2011/12, whose weather-adjusted energy

consumption was 8,270 GWh, or 34% of the total energy consumed in Manitoba. Over the past 10 years, this sector's consumption has grown at a fairly constant rate of 119 GWh (1.6%) per year, and is forecast to grow at a slightly higher rate averaging 161 GWh (1.7%) per year for the next 20 years due to the expected population growth in Manitoba. The number of Mass Market customers themselves is also expected to increase as more commercial entities seek to provide services for the growing population.

This sector is made up of a wide variety of commercial and small-industrial customers, including offices, retail, wholesale, apartment complexes, schools, hospitals, agriculture, and small manufacturing. Their energy use is not as significantly affected by the economy as other sectors as the related facilities continue to use energy between periods of tenancy.

General Service - Top Consumers

The Top Consumers sector is made up of the 17 industrial and commercial companies, which represent the largest energy users in Manitoba. In 2011/12, the Top Consumers used 5,531 GWh, or 23% of the total electricity consumed in Manitoba.

Energy use for Top Consumers is forecast on a per-company basis to include their respective short-term committed plans and expectations—the forecast excludes longer-term plans that are uncommitted or subject to change. The impact of these plans is reflected generally within the first three years of the load forecast.

During the recent economic slow-down, overall sector load declined due to the loss of one customer in the pulp and paper industry; another major reduction is currently projected in 2015 for primary metals. However, growth among other Top Consumers is expected to make up these load losses, primarily in the pipelines and chemical industries. Overall, short-term plans indicate that Top Consumers should grow by 680 GWh (12%) in the next two years, since a number of customers are planning major expansions.

For the longer term, the future energy requirements of individual customers within the Top Consumers sector cannot be reliably forecast: their growth is too dependent on their particular industry, the economy, and their own competitive situation. One company may be in the right industry at the right time and decide to expand; another may be forced, by a number of unforeseen circumstances, to cut back or even shut down.

To estimate the longer-term growth for the Top Consumer sector, the sector is forecast as a whole. The growth for the longer-term is called Potential Large Industrial Loads and includes consideration for company expansions, cutbacks and shutdowns; new startups of 50 GWh a year or more; and the long-term normal incremental growth of all the companies combined. Since short-term customer intentions are known, Potential Large Industrial Loads is not added to the first three years of the forecast.

In the past 20 years, there have been 14 major increases of load of 100 GWh or more, and two major losses of load of 100 GWh or more within the sector. The net effect has been an addition of about 85 GWh per year. Normal company growth among these customers has added another 7 GWh per year. The combined effect is that Top Consumers has grown from 3,783 GWh in 1992/93 to 5,531 GWh in 2011/12, a growth of 92 GWh or 2.0% per year.

Potential Large Industrial Loads are forecast to be 100 GWh per year. By 2031/32, their contribution is forecast to be 1,700 GWh. Including Potential Large Industrial Loads, General Service Top Consumers is forecast to grow from 5,531 GWh in 2011/12 to 7,698 GWh in 2031/32, for an average growth of 108 GWh or 1.7% per year.

In general, the economy continues to have a significant impact on Top Consumers. Their electricity consumption is dependent upon the state of the economy in their specific industries: in robust economic times they expand operations, increasing their electricity consumption;

while in recessionary times, they reduce shifts and cut back production, thereby decreasing consumption.

Manitoba recently went through an economic downturn, and with the loss of a major customer, electricity consumption of the Top Consumers sector still remains below what it was at its peak in 2008/09; however, Manitoba is a growing province in terms of population and gross domestic product. It is therefore not reasonable to expect that the recent experience of no growth in this sector will continue. It would only take one or two large new customers over the next 20 years to provide the entire additional load that is forecast for the Top Consumers sector until 2031/32.

Losses and Station Service

In 2011/12, distribution losses, transmission losses and station service accounted for 3,156 GWh or 13% of the total energy consumed in Manitoba. This percentage is expected to remain generally the same over the duration of the forecast. (The addition of Bipole III will reduce losses but this is captured separately in the Power Resource Plan due to it being a future project at this time.)

Miscellaneous

Miscellaneous sectors—including seasonal, flat rate, diesel and lighting—used a total of 296 GWh, or 1% of the total energy consumption in Manitoba. The growth in these sectors has minimal effect on overall domestic growth.

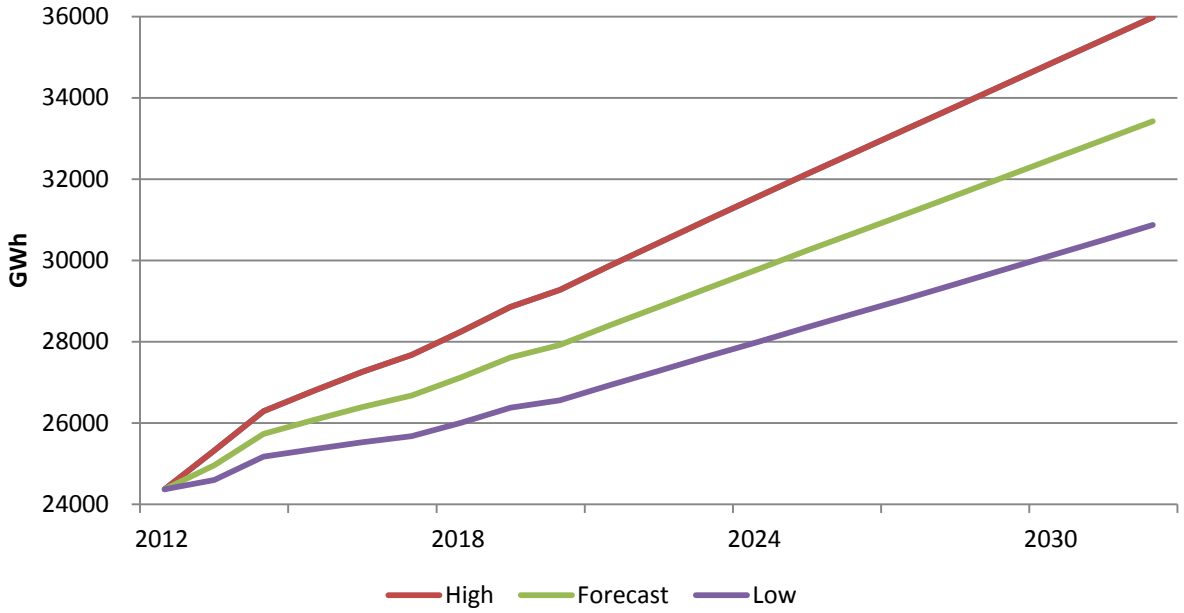
4.2.1.2 Load Variation and Forecast Accuracy

Load Variation

Uncertainty is an inherent characteristic of forecasting. The load will vary both year to year and in the long-term because of underlying changes in population growth, economic growth, changes in the operations of Top Consumers, and overall use patterns. An economic recession

will slow energy growth; an economic boom will increase it. Cycles cannot be predicted in advance so that an appropriate mid-point value must be chosen as the forecast.

As outlined in section 4.2.1, domestic energy is expected to increase from 24,367 GWh in 2011/12 to 33,425 GWh (+37%) in 2031/32 and, over the same period, peak demand is expected to grow from 4,380 MW to 6,032 MW (+38%). Such a forecast was created as Manitoba Hydro's best estimate of Manitoba's future energy requirement. The load forecast is based on information from the ***Appendix F - Economic Outlook 2012 - 2033***, including the forecasts of economic growth and population. These forecasts represent the best estimate of what will happen, and each has the expectation that there will be a 50% chance that actual growth will be higher than the forecast, and a 50% chance that actual growth will be lower than the forecast.



Using a mid-value forecast means that a period of high economic growth or higher-than-normal population growth will result in higher electricity consumption than has been forecasted. A period of low economic growth or low population growth will result in lower electricity consumption than forecasted.

To evaluate the potential for variation, historic load variability has been analyzed using a probabilistic-based approach, e.g., variations in annual weather-adjusted load that have occurred in the past are used to estimate future variation. This approach provides an estimate of the magnitude of the potential load variation from the forecast due to population, economy and other effects.

Figure 4.8 shows high and low probability bands of future requirements. Under this analysis, there is a 10% probability of actual loads being lower than the low band and a 10% probability of actual loads being higher than the high band. There is an 80% chance that the actual amount of electricity required will be between the low and high bands. These bands correspond to an

annual growth of 1.2% for the low band and 2.0% for the high band, compared to 1.6% for the base forecast (green line). What actually happens and where the load will be relative to the bands will depend on actual population growth and customer activity levels. By 2031/32, the actual amount of electricity required could therefore vary by over 2,500 GWh or ±8%.

Figure 4.8 ENERGY FORECAST PROBABILITY BANDS (GWH)

Forecast Accuracy

Due to the load variation caused by population growth and economic growth previously described, only a certain level of accuracy can be obtained. Looking 10 years ahead, the probability bands vary +/- 1,576 GWh from the forecast of 28,859. This means that there is an 80% chance that the actual load in 2021/22 will be within 5.5% of the forecast.

Recognizing the inherent uncertainty of forecasting, historic forecast variation has been tracked. Manitoba Hydro's objective is that a five-year forecast be within 5% and a 10-year forecast be within 10% of actuals. Generally, this objective has been achieved in more than half the years across 21 previous forecasts for both energy and peak as evidenced in Tables 35 and 36 of ***Appendix C – 2012 Electric Load Forecast***.

Whenever there are unexpected periods of recession or periods of higher than normal growth, previous forecasts will have overestimated or underestimated the load. These periods happen gradually and take a few years before they can be recognized as representing more than just year-to year-random variation.

Every year, a new load forecast is produced to take into account changes in the economy and in customer usage as well as new outlooks into the future. This allows the planning process at Manitoba Hydro to make annual adjustments to account for incremental changes and adjust for longer-term trends.

4.2.2 Demand Side Management

Manitoba Hydro's DSM initiative, Power Smart, consists of energy conservation and load management activities designed to capture energy efficiency and economic opportunities. Manitoba Hydro has been successfully delivering DSM for over 20 years in an effort to meet the energy needs of Manitoba in a more sustainable manner while assisting customers in using energy more efficiently and reducing their energy bills. Manitoba Hydro is committed to DSM with a focus on pursuing all cost-effective energy efficiency opportunities and continually monitoring the market for emerging trends and opportunities, which may become economically viable.

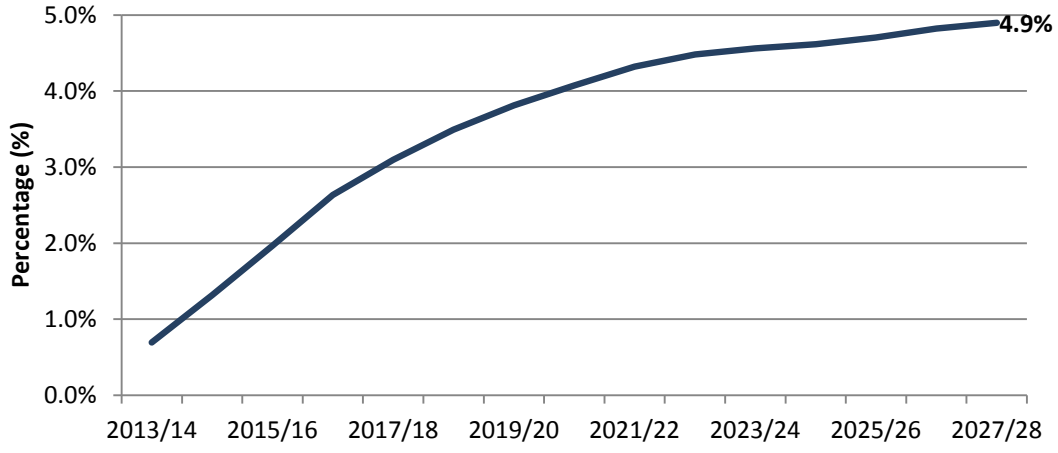
Manitoba Hydro's future DSM efforts and initiatives are provided in the corporation's 2013-2016 Power Smart Plan. Pursuant to s.7(1) of *The Energy Savings Act*, this plan was prepared in consultation with the Minister of Innovation, Energy and Mines and is provided in ***Appendix E – 2013 - 2016 Power Smart Plan***, along with the "2013 - 2016 Power Smart Plan – 15 Year Supplementary Analysis Report". The corporation's DSM plan is typically reviewed and updated on an annual basis as part of Manitoba Hydro's overall integrated planning process. DSM projections were prepared early in 2012 as a component of the regular corporate planning process for inclusion as the base DSM forecast within this submission. The 2012 base DSM

forecast represents an update to the approved 2011 Power Smart Plan and is consistent with the current approved 2013 - 2016 Power Smart Plan—the latter being a further update to the 2012 forecast.

The energy savings achieved through DSM is forecast separately from the electric load forecast as described in section 4.2. The energy savings forecast to be achieved through DSM is included as part of the Power Resource Plan and is evaluated utilizing corporate-approved and consistent economic data.

Manitoba Hydro currently offers a broad portfolio of programs in its effort to pursue all economic DSM opportunities. The Power Smart Commercial Lighting Program is one example of an energy efficiency initiative encouraging the installation of more energy-efficient lighting technologies that provide similar or improved lighting levels. A number of other energy efficiency initiatives are currently being offered.

Load-management initiatives are designed to capture available economic opportunities by modifying customer demand for energy at a particular time, or shifting demand from one period to another. Manitoba Hydro's Curtailable Rates Program is an example of a load-management initiative whereby participating customers curtail a contracted amount of load at Manitoba Hydro's request for a specified period of time.



Another significant component of Manitoba Hydro's DSM plan involves permanently capturing energy efficiency opportunities through changes made in codes and standards. As a result of combined utility and government efforts, the market adoption of energy efficient products and activities has resulted in significant changes in manufacturers' performance standards and in efficiency legislation and codes.

Manitoba Hydro's long-term aggressive commitment to DSM has resulted in 90% awareness of the Power Smart brand in Manitoba, with over 60% of residential customers able to recall, unaided, Manitoba Hydro programs available to help manage their energy bills and a third of customers indicating they have participated in at least one program to date. By the end of 2012/13, Power Smart is estimated to have achieved an annual load reduction of 1,990 GWh and 586 MW (at generation)[3].

4.2.2.1 Future DSM Plans

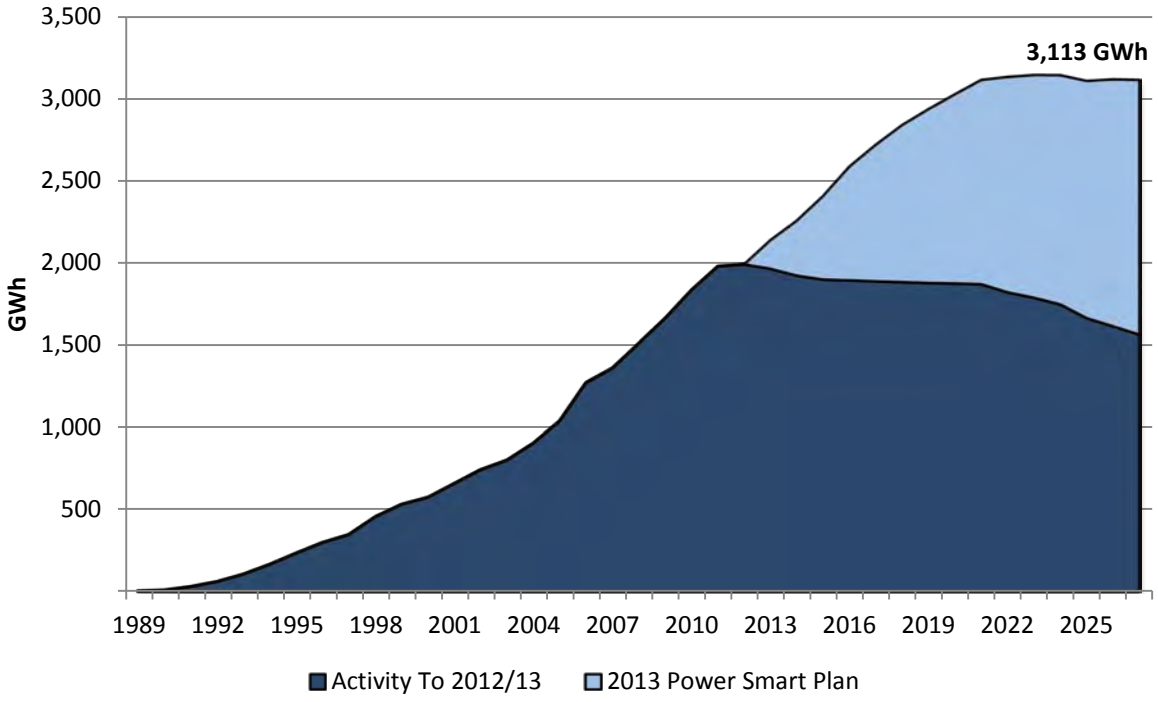
Manitoba Hydro's future DSM strategy involves a continued long-term commitment to pursuing all available economic energy efficiency opportunities. The 2013 - 2016 Power Smart Plan outlines an additional investment of $83 million (2012$) to achieve electricity savings of 510 GWh/year and 280 MW by 2015/16. Beyond 2015/16, Manitoba Hydro has budgeted an investment increasing to $326 million (2012$) overall and expects energy savings to increase to 1,552 GWh/year and 490 MW by 2027/28, which represents 4.9% of the forecast electricity load at the benchmark year. See Figure 4.9.

Figure 4.9 CUMULATIVE DSM ELECTRICAL SAVINGS AS A % OF ANNUAL LOAD

[3] Interim estimate as of March 31, 2013.

Combined with energy savings achieved to date, total electrical savings of 3,113 GWh and 846 MW will be realized by 2027/28, with a cumulative investment of $762 million (2012$). See Figure 4.10 and Figure 4.11.

Figure 4.10 ANNUAL DSM ENERGY SAVINGS 1989 -2027 (GWH AT GENERATION)



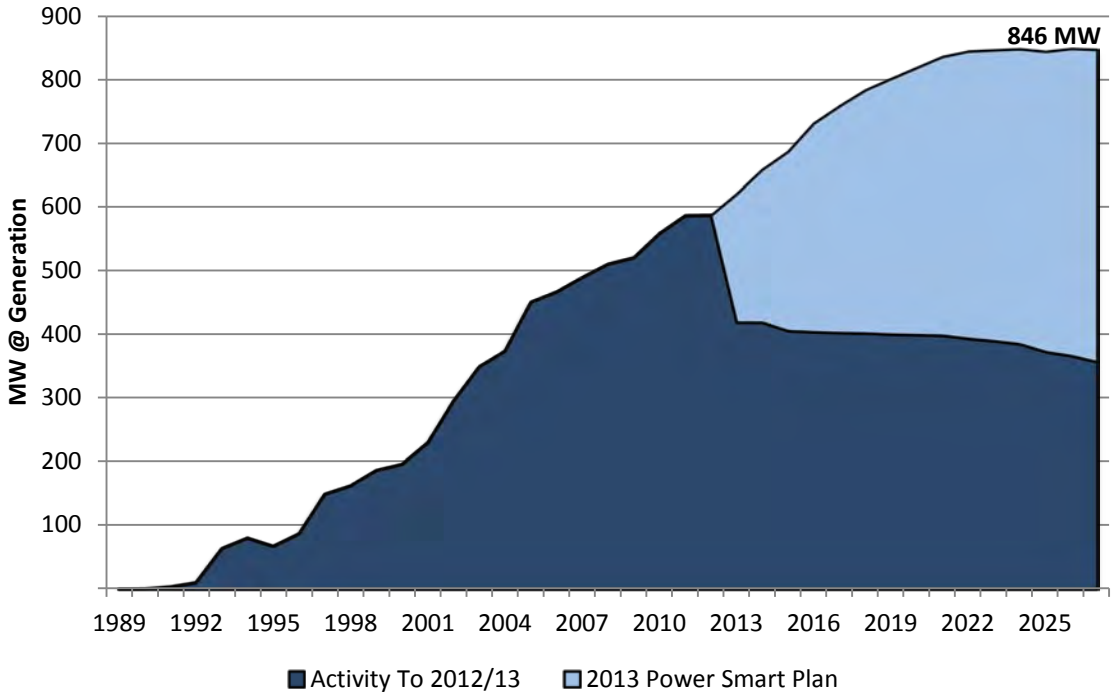


Figure 4.11 ANNUAL DSM CAPACITY SAVINGS 1989 – 2027 (MW AT GENERATION)

Through the planned DSM initiatives, participating customers can expect to save $52 million in 2027/28 and $486 million cumulatively by 2027/28 (2012$) on their electricity bills. When combined with electricity bill reductions achieved to date, participating customers can expect to save $91 million in 2027/28 and over $1.9 billion cumulatively (2012$).

4.2.2.2 Assessing Economic DSM Opportunities

In assessing DSM options, Manitoba Hydro considers the economics associated with DSM opportunities from a number of perspectives, including:

- The economics of implementing a specific DSM opportunity, irrespective of who benefits from and who pays for implementing the DSM initiative. The Marginal Resource Cost (MRC), Total Resource Cost (TRC) and the Societal Resource Cost (SRC) metrics are used for assessing the economics of a DSM opportunity from this perspective.
- The economics of implementing a specific DSM opportunity from an aggregate ratepayers' perspective. The Levelized Utility Cost (LUC) and Rate Impact Measure

metrics are used for assessing the general economics of a DSM opportunity from this perspective. Caution needs to be exercised in using the LUC, as this metric only assesses the costs associated with a DSM opportunity. The LUC for DSM opportunities cannot be simply assessed against alternative LUC's for generation options because the revenue impacts of DSM initiatives and supply-side options are different. In addition, DSM LUC's cannot be measured simply against the corporation's proxy for its marginal value (cost) as a single value due to the timing impacts on marginal values of energy. A proper economic assessment of DSM options relative to alternative supply-side options involves an assessment of the revenue and cost impacts.

- The economics of implementing a specific DSM opportunity from a participating customer's perspective. The Customer Simple Payback metric is used for this purpose.

To assess options for supporting and pursuing a DSM opportunity, Manitoba Hydro considers:

- the economics of the opportunity from all perspectives (e.g., irrespective of who benefits and pays; from the aggregate ratepayer perspective; and from the participating customer perspective)
- the barriers to participation and
- the fairness of all ratepayers (including non-participating) contributing to the paying for a DSM opportunity, which benefits only participating customers, along with the associated non-energy benefits.

To assist in assessing the merits of various approaches to supporting and promoting a DSM opportunity, Manitoba Hydro uses the above-mentioned metrics as guidelines in choosing a particular DSM strategy. In addition to quantitative assessments, Manitoba Hydro also considers various qualitative factors, including equity (e.g., reasonable participation by various ratepayer sectors such as lower income) and overall contribution towards having a balanced energy conservation strategy and plan.

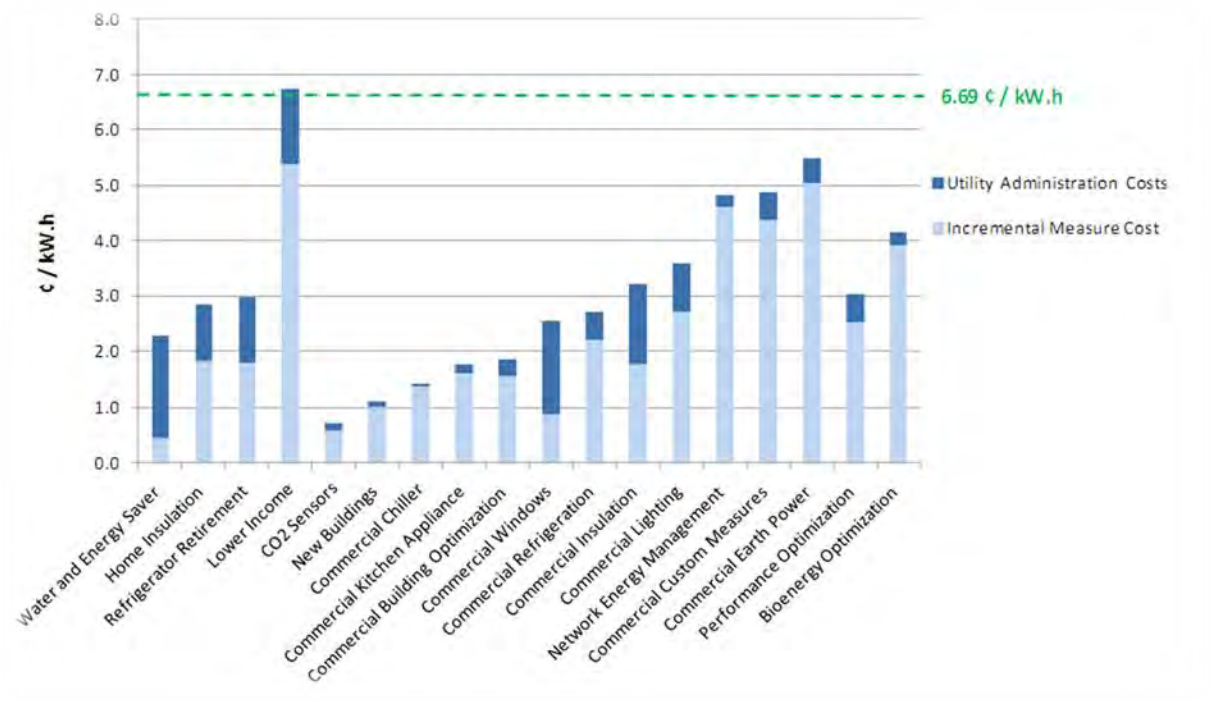
Manitoba Hydro designs DSM programs balancing the following objectives:

- capturing all available economic energy-efficient opportunities
- being fiscally responsible as to how ratepayer dollars are spent and
- being considerate to the net impact on all customers.

In balancing these objectives, Manitoba Hydro attempts to direct or proportion DSM costs to those entities and customers who realize the benefits associated with the DSM initiatives. For example, the benefits/costs associated with a DSM opportunity (irrespective of who benefits and who pays the costs as measured by MRC, TRC and SRC) primarily consist of the benefits/costs of participating customers, non-participating customers and external parties (e.g., social or government agencies in the case of reduced energy bills being paid by Employment Income Assistance).

From the perspective of non-participating customers, the net benefit is the difference between the corporation's marginal value (cost) and the lost domestic revenue associated with the DSM opportunity (see Figure 4.12) and the cost is the DSM program costs associated with the DSM program (e.g., incentives, administration, marketing, etc).

From a participating customer's perspective, the benefits are reduced energy bills and any non-energy benefits (e.g., reduced maintenance cost) while the costs are those associated with installing the DSM opportunity (net of any incentives). The extent to which external parties may benefit from DSM programs varies by program; however, benefiting entities could include government social agencies (e.g., Employment Income Assistance when paying energy bills directly; and Manitoba Housing Authority when retrofits are undertaken in Government-owned homes) and society at large (e.g., environmental benefits).



With DSM opportunities, it is important to recognize that the relevant cost associated with DSM opportunities is the total cost of DSM opportunities, which includes the participating customer's cost in addition to the utility's cost. Similar to supply-side options, ratepayers

ultimately pay the entire cost of DSM options; with DSM, the initiatives are paid for by participating customers and by ratepayers via a utility's investment in DSM initiatives.

As each DSM opportunity is an independent decision, Manitoba Hydro assesses the economics of pursuing each energy efficiency opportunity individually. This approach is consistent with assessing each supply-side option on its own merits. However, due to concerns regarding reasonable participation by specific market sectors such as the lower-income market, Manitoba Hydro also assesses the merits of pursuing energy efficiency opportunities within specific market sectors through a broader analysis, which includes fairness considerations.

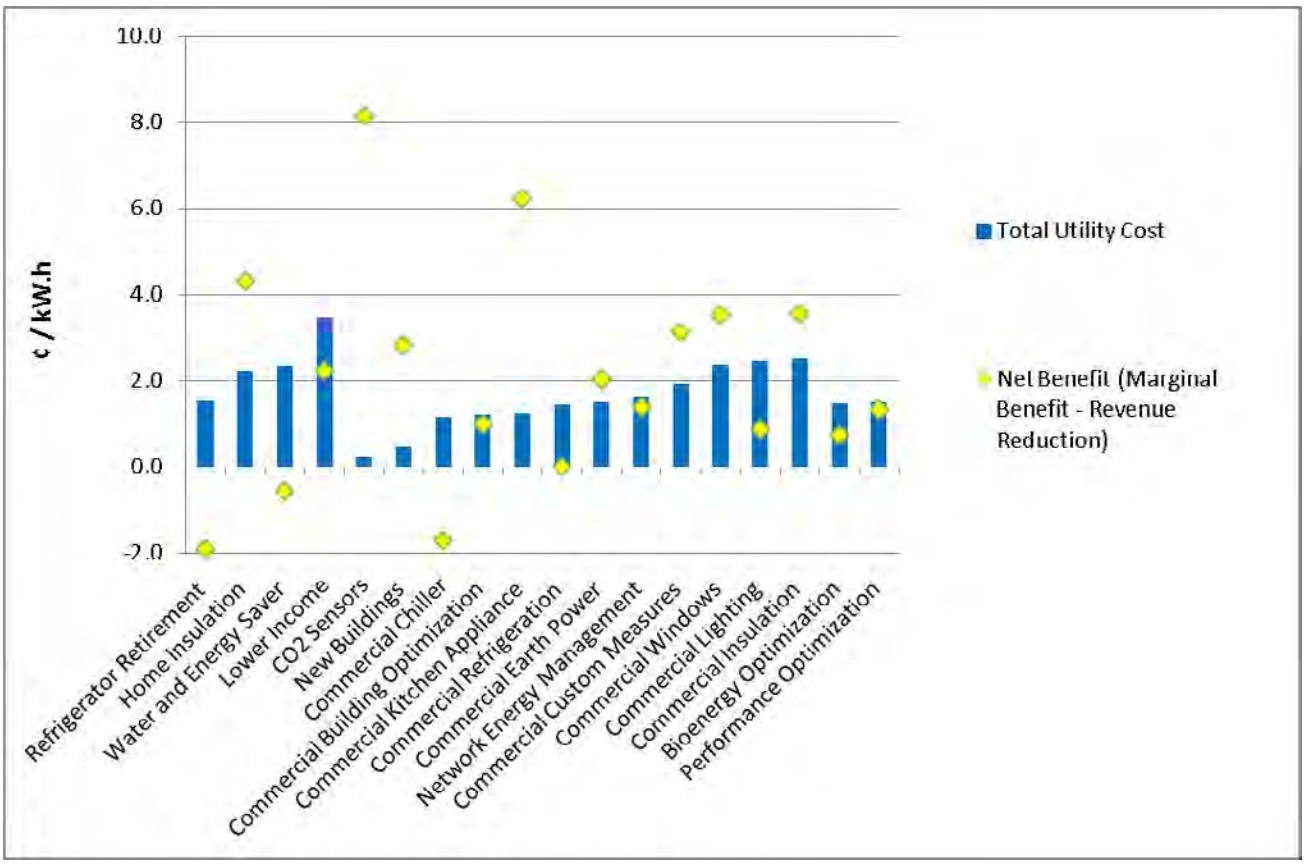
Figure 4.12 presents the levelized resource costs for individual Power Smart opportunities included under the 2013 - 2016 Power Smart Plan.

Figure 4.12 LEVELIZED RESOURCE COST (2012$) 2013-2016 POWER SMART PLAN

The levelized Total Resource Costs for programs presented under this plan range from 1 cent/kWh to 6.7 cents/kWh, with an overall average levelized resource cost of 3.9 cents/kWh. The range in resource costs demonstrates Manitoba Hydro's commitment to pursue all those

DSM opportunities with a levelized resource cost less than the corporation's marginal cost value.

Manitoba Hydro is also committed to finding additional economic DSM opportunities and, as such, the corporation monitors technologies and programs being offered in other regions on an ongoing basis to assess their potential fit for Manitoba, while giving consideration to Manitoba's load characteristics, climate, and marginal values. The following are a select, but not exhaustive, list of technologies that have been assessed but are not being pursued at this time:



- Heat-pump water heaters are not suited to Manitoba's marketplace. The technology pulls heat out of the space in which the water heaters are located and puts that heat into the water. This technology is popular in more moderate climates and in regions where the water heater is not located in a conditioned space (e.g., mechanically heated or cooled). In Manitoba, due to our long heating season, water heaters are located inside our homes and buildings.
- With a levelized marginal-resource cost of 14 cents/kWh, solar water heaters are not cost effective in Manitoba.
- With a levelized cost of 24 cents/kWh, ductless heat pumps are not cost effective in Manitoba.
- With a levelized cost of 9 cents/kWh, initiatives promoting individuals to conserve energy through bill comparison challenges are not cost effective. Manitoba Hydro is currently monitoring the results of this opportunity within other regions and intends to maintain this option as a possible opportunity to consider in the future.

The approach and strategy undertaken by Manitoba Hydro to pursue each DSM opportunity is determined after undertaking a detailed assessment of each opportunity. The subsequent approach taken by Manitoba Hydro may consist of an incentive-based program, an education/awareness initiative, a code/regulation initiative or a combination of the available

approaches. The degree and context of Manitoba Hydro's support for a specific opportunity is dependent on many factors, including the economics of the DSM opportunity from the various perspectives and at what stage within the customer market-acceptance curve the specific opportunity is at within a particular time. For example, if an energy efficiency opportunity is not economic—irrespective of who benefits or pays (e.g., an emerging technology such as solar-assisted hot water tanks)—then Manitoba Hydro's approach for supporting the DSM opportunity may simply be through education, awareness and research initiatives. If a technology is at the latter stage of a market acceptance curve (e.g., Energy Star appliances), Manitoba Hydro support may be through awareness and education initiatives.

Figure 4.13 presents the levelized utility costs for individual Power Smart opportunities included under the 2013 - 2016 Power Smart Plan, with the net benefit to the utility (e.g., ratepayer) being the difference between the marginal cost and the foregone domestic revenues associated with each Power Smart opportunity. The average levelized utility cost of Manitoba Hydro's aggregate Power Smart plan is in the range of 2.4 cents/kWh, with individual DSM opportunities having levelized utility costs ranging from 0.2 to 3.5 cents/kWh.

Figure 4.13 LEVELIZED UTILITY COST (2012$) - 2013 - 2016 POWER SMART PLAN

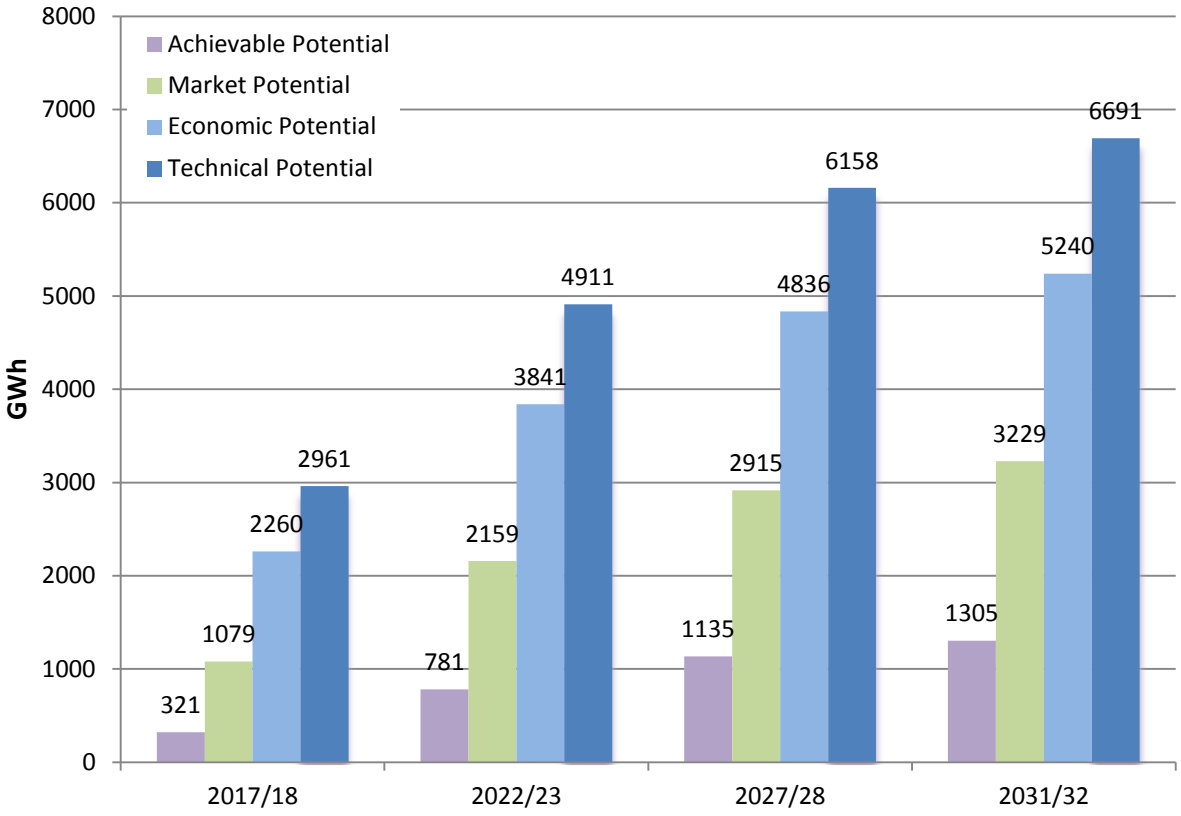
4.2.2.3 Additional DSM Opportunities

Manitoba Hydro's DSM Plan only includes those technology initiatives identified as being available and economic today (e.g., energy savings are demonstrated and are economic under the current incremental installed cost compared to the forecast benefits to be realized over the expected life of the technology). As such, Manitoba Hydro recognizes its future DSM plan is conservative in nature. There are a number of possible initiatives and program strategies currently being explored that, once program implementation is approved, will be included in future DSM plans. Initiatives currently being investigated include, but are not limited to, a new home program, residential LED lighting program and LED street lighting conversion program. Recently, Manitoba Hydro approved a community-based residential geothermal program, which will be included in the next update of the corporation's Power Smart Plan.

To complement Manitoba Hydro's ongoing and internal efforts to identify and quantify potential DSM opportunities and energy savings, Manitoba Hydro hired a third-party consultant to undertake a DSM Market Potential Study in Manitoba in concert with the corporation. The study broadly examines, at a conceptual level, the market potential of existing energy-efficient technologies, which are economic in Manitoba and those technologies that may be "on the horizon". A copy of this study is provided in ***Appendix 4.3 – Demand Side Management Potential Study***.

For purposes of the study, DSM potential is defined within four contexts: 1) technical, 2) economic, 3) market and 4) achievable.

1. The absolute level of DSM without regard for cost and other barriers is defined as the technical potential.
2. "Economic potential" represents the adoption of all energy efficient measures that are cost-effective from a resource perspective (MRC > 1). Technical and economic potential both represent theoretical limits to efficiency savings.
3. Estimating market potential involves the inherent uncertainty of predicting human behaviors and responses to market conditions. This recognizes that any estimate of electricity consumption or potential savings that spans a 15-20 year period is necessarily subject to uncertainty. Numerous external factors create this uncertainty underlying the estimate, including varying levels of market barriers to adoption and factors beyond the influence of Manitoba Hydro (e.g., the levels of complementary support for energy efficiency provided by the federal or provincial governments). Market potential represents the absolute level of energy and demand savings that are technically feasible, economically attractive assuming ideal market conditions. These ideal market conditions could be characterized by the presence of a focused and coordinated effort across organizations/governments (federal, provincial and utilities) eliminating all material market barriers to adoption, such as product availability and market capacity, product awareness and knowledge, price differentials, etc. The probability of these ideal



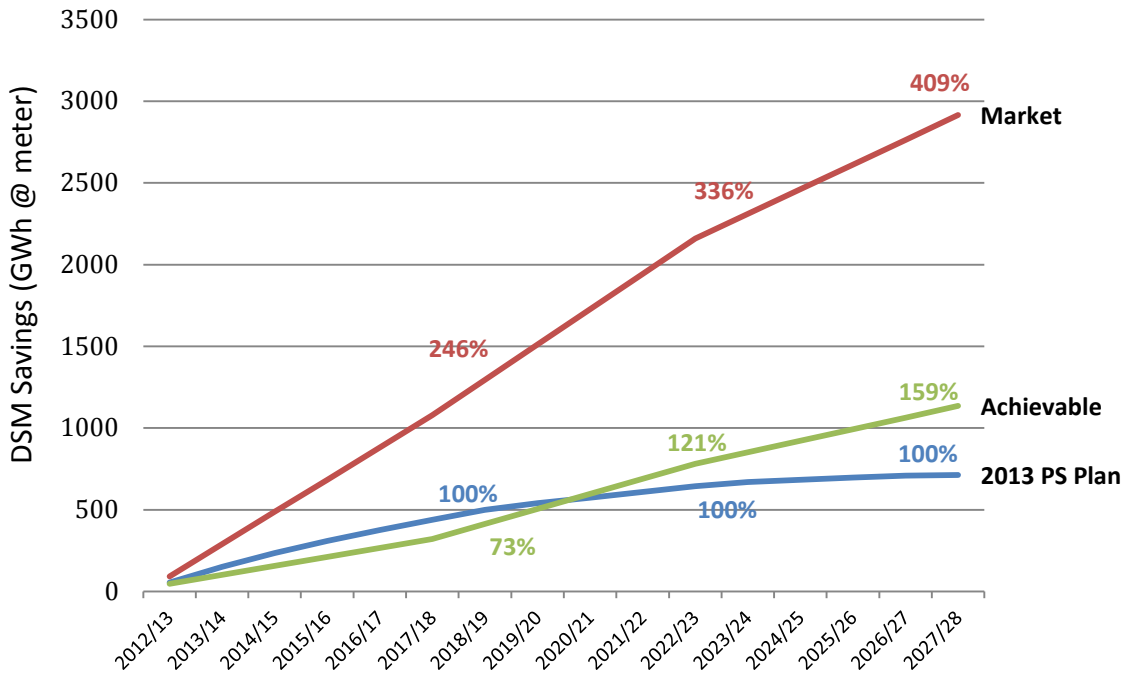
market conditions being present in combination is doubtful and therefore represents a theoretical limit.

4. "Achievable potential" recognizes that market conditions are not ideal and projects energy savings that may be reasonably captured recognizing that there are material market barriers to address.

Caution must be exercised in interpreting the results of a DSM market potential study: the estimates are forecast at a high level and do not account for the investment or the specific strategies required to support the market intervention required to eliminate market barriers, such as education, research and demonstrations, training, capacity-building, incentives, advertising, etc. The setting of specific Power Smart targets involves more detailed and market-specific analysis beyond the scope of the market potential study. The key to developing a sustainable realistic DSM program and overall plan is to recognize the real market constraints and to work within existing market channels (e.g., trade allies, retailers, distributors) to create an effective market change over time.

Figure 4.14 presents the conceptual-level projections of energy efficiency potential in Manitoba.

Figure 4.14 ENERGY EFFICIENCY POTENTIAL PROJECTIONS



The DSM Market Potential Study undertaken for Manitoba Hydro indicated that, across all sectors, the energy savings range from 321 GWh for achievable potential to 1,079 GWh for market potential in 2017/18 and from 1,135 GWh for achievable potential to 2,915 GWh for market potential in 2027/28. Current projected savings under Manitoba Hydro's 2013 - 2016 Power Smart Plan represent approximately 62% of the forecast achievable potential in 2027/28.

For the purposes of this submission, a sensitivity analysis for increased DSM was undertaken, including increasing Manitoba Hydro energy savings through DSM by 1.5 times, and, similarly, a stress test for increased DSM was undertaken at 4 times the current planned DSM. Based on the results of the market potential study and as evidenced in the following graph, the sensitivity analyses capture the potential for increasing Manitoba Hydro's DSM plans to include both reasonable additional and "ideal" market-threshold energy savings through DSM initiatives. As

Figure 4.15, shows the Achievable Potential of 1,135 GWh and Market Potential of 2,915 GWh represents 159% and 409% respectively of the current planned savings for 2027/28.

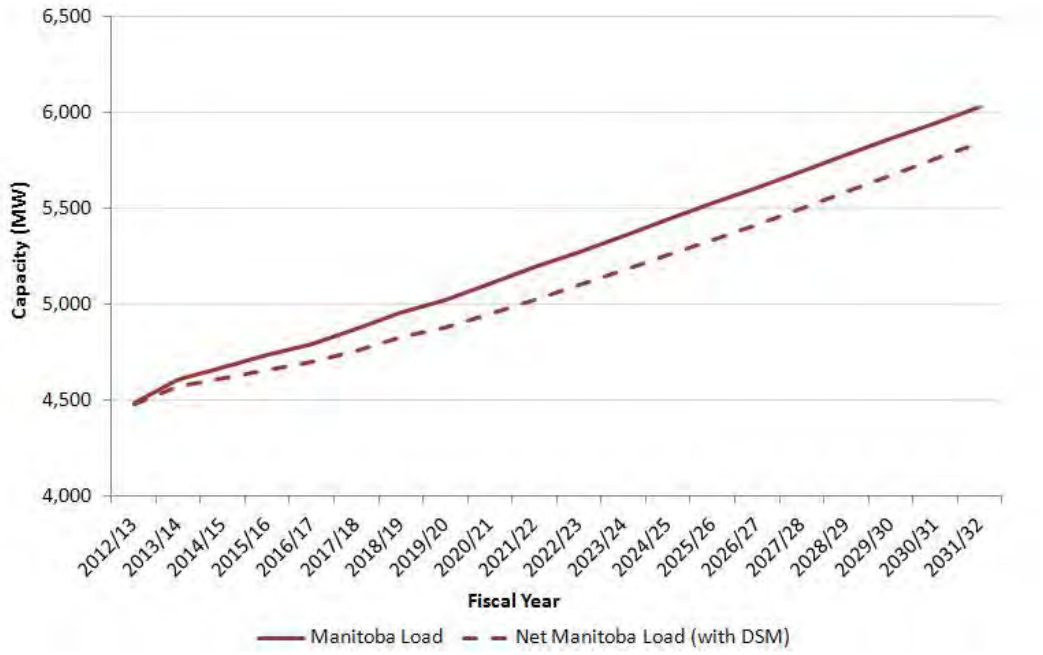
Figure 4.15 COMPARISON OF THRESHOLDS FOR POTENTIAL ADDITIONAL DSM 2012/13 TO 2027/28

In accordance with Manitoba Hydro's planning cycle, the corporation's Power Smart Plan will be updated by March 31, 2014. The updated plan will be prepared in consultation with the Minister of Innovation, Energy and Mines and responsible for Manitoba Hydro as directed in *The Manitoba Energy Savings Act*.

4.2.3 Manitoba Net Load

Manitoba net load results from combining the load forecast for Manitoba with the expected savings from planned DSM programs. Figure 4.16 and Figure 4.17 show the Manitoba net load from the perspective of peak demand and energy, respectively.

Figure 4.16 MANITOBA NET LOAD – WINTER PEAK DEMAND



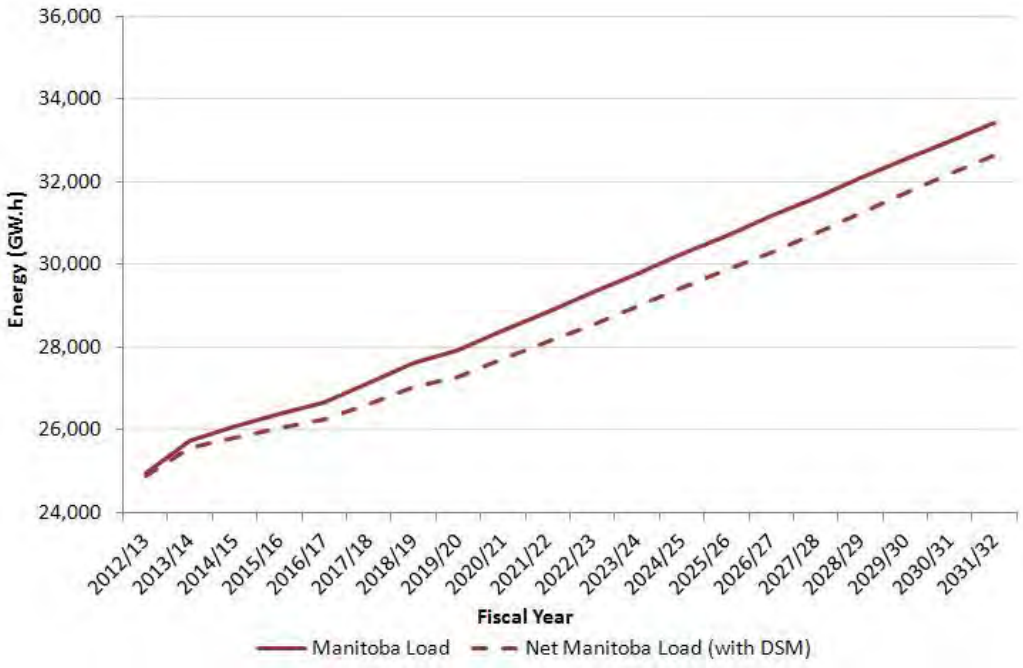


Figure 4.17 MANITOBA NET LOAD – ENERGY

4.2.4 Export Commitments

Manitoba Hydro exports firm energy and capacity surplus to the needs of Manitobans through long-term sale agreements with neighboring utilities. A calculation of the total demand on the Manitoba Hydro system must include—in addition to determining Manitoba net load—the requirements of long-term firm export sale commitments.

From the perspective of winter peak demand, the total of Manitoba Hydro's long-term firm export obligations during winter peak is currently 605 MW, reduces to 358 MW in 2015/16 and continues at this level until 2024/25 when the last contract expires.

The total of Manitoba Hydro's energy export obligations is 3,156 GWh in 2013/14. This obligation reduces to 1,804 GWh in 2016/17 and continues annually at this level to 2024/25. From 2025/26 to the end of the study period the firm export obligation is 145 GWh per year.

Manitoba Hydro currently has a portfolio of 500 MW of seasonal diversity contracts, which provide for the exchange of power between utilities during their respective peak load conditions. These contracts help to optimize operation of the utilities' respective systems and to minimize capital investment. Diversity arrangements allow Manitoba Hydro to purchase power in the winter season to meet peak heating demand and require Manitoba Hydro to sell power to U.S. utilities in the summer season to meet their peak air-conditioning load.

In addition, under certain circumstances, export contracts allow Manitoba Hydro to reduce its delivery obligations, for example, under low-water conditions.

4.2.5 Total Demand

The combined total of all demand components is shown in Table 4.1 and Table 4.4 below from the perspective of capacity and energy, respectively. In Section 4.4, the total demand will be compared to the total base supply.

Table 4.1 TOTAL WINTER PEAK DEMAND FOR SELECT YEARS (MW) @ GENERATION

Winter Peak Demand, MW				
Fiscal Year	2013/14	2021/22	2022/23	2026/27
Manitoba Load	4,609	5,192	5,276	5,611

Total Energy Demand	**28,717**	**29,923**	**30,344**	**30,438**

4.3 Manitoba Hydro System Supply

4.3.1 Manitoba Hydro's Generation Planning Criteria

Manitoba Hydro's generation planning criteria, as described in ***Appendix 4.1 Manitoba Hydro Generation Planning Criteria***, provides the basis for determining when new resources are required to ensure an adequate supply of capacity and energy for Manitoba. All development plans evaluated in this submission meet or exceed these planning criteria.

The generation planning criteria consist of two components, both of which must be satisfied. First, there is a capacity criterion, used to determine the minimum quantity of generation

capacity required. Second, there is an energy criterion, used to determine the minimum quantity of energy required. These two criteria are outlined in the following sections.

4.3.1.1 Capacity Criterion

Manitoba Hydro's capacity criterion, as described in ***Appendix 4.1 – Manitoba Hydro Generation Planning Criteria***, requires that:

> Manitoba Hydro will plan to carry a minimum reserve against breakdown of plant and increase in demand above forecast of 12% of the Manitoba forecast peak demand each year plus the reserve required by any export contract in effect at the time."

The reserve is intended to protect against capacity shortfalls resulting from breakdown of generation equipment, or increases in winter peak load due to unexpected load growth or extreme weather conditions. The reserve is calculated as 12% of the Manitoba forecast peak winter demand plus the reserve required by any export contract in effect at the time for each year that is forecasted.

The maximum demand for capacity in Manitoba occurs in the winter season, and therefore the reserve margin of 12% is applied to the winter peak demand.

Historically, the reserve margin of 12% has been adequate for Manitoba Hydro's predominantly hydro-electric generation based system because of relatively low outage rates combined with the relatively small size of hydro-generating units. In comparison, reserve margins in predominantly thermal generation based systems are typically in the 15% range.

Manitoba Hydro is a member of the North American Electric Reliability Corporation (NERC), whose mission is to ensure the reliability of the North American bulk power system. Manitoba

Hydro's capacity criterion is in alignment with recommendations provided by NERC on this subject as per the following:

> "Achieving reliability in the bulk electric systems requires, among other things, that the amount of generating capacity resources exceed customer demands by some amount. That amount (expressed as a percent of peak demand is termed a reserve margin and when expressed as a percent of generating capacity is termed capacity margin) must be sufficient to cover planned maintenance and unplanned or forced outages of generating equipment, de-ratings in the capability of demand-side and supply-side resources, system effects due to reasonably anticipated variations in weather, variations in customer demands or forecast demand uncertainty, delays in the construction of generating capacity, and other system operating requirements." (NERC Resource and Transmission Adequacy Recommendations, June 15, 2004, page 10).

4.3.1.2 Energy Criterion

In addition to a capacity criterion, Manitoba Hydro has an energy criterion which recognizes the energy-constrained limitation of a hydro-electric generating system during drought conditions.

Such an energy criterion is typical for a predominately hydro region as noted by NERC. Manitoba Hydro's system is another example of an energy constrained system:

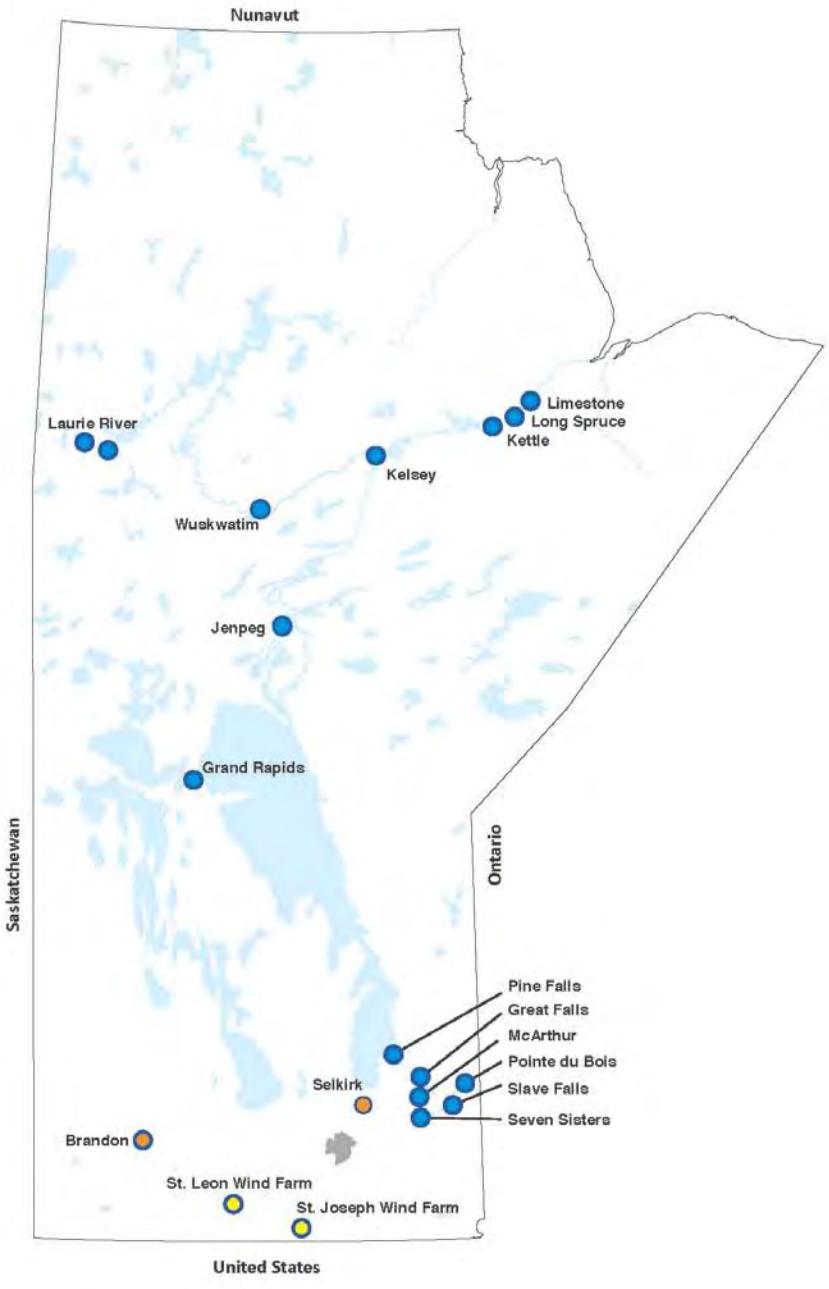
> "In areas where the majority of supply-side resources are energy-constrained (such as the hydro-dominated Northwest[4]), achieving reliability may also require that the energy available to the area is, at least, equal to the customer demand and some reserve requirement during a certain critical design period for the constrained resources." (NERC Resource and Transmission Adequacy Recommendations, June 15, 2004, page 10)

[4] Manitoba Hydro notes that Manitoba, like the Northwest region of the U.S., is also energy constrained.

Manitoba Hydro's energy criterion, as described in more detail in ***Appendix 4.1 — Manitoba Hydro Generation Planning Criteria***, requires that the corporation plan to have adequate energy resources to supply the firm energy demand in the event that the lowest recorded coincident water supply conditions are repeated (e.g., "dependable energy"). Historic system inflows are derived from the available record of river flows (1912-2010), which have been adjusted to represent present-use conditions and to account for systemic changes due to expected future water use and withdrawals upstream of Manitoba.

Dependable energy available in the Manitoba Hydro system is the total energy supplied from:

- hydro-electric generating stations
- thermal generating stations
- wind generation (energy only)
- planned DSM
- imports from neighbouring utilities.



Imports may be considered as dependable energy resources under certain conditions. The total quantity of energy considered as dependable energy from imports is limited to that which can be imported during the off-peak period, and will not exceed the quantity of export contracts in effect at the time, plus 10% of the Manitoba load. The Midcontinent Independent System Operator, Inc. (MISO) market footprint has in the order of 130,000 MW of generating resources. In the off-peak period, MISO market loads are on the order of 60,000 MW or less, leaving ample surplus resources capable of generating energy for import to Manitoba.

4.3.2 Manitoba Hydro's Base Supply of Power – Planning Assumptions

This section provides an overview of the resources that form the base supply of power available to meet Manitoba Hydro's electricity load commitments. The base supply of power is comprised of the following system resources that are common to all development plans being evaluated:

- generating resources owned/operated by Manitoba Hydro including any planned upgrades
- power purchases from Manitoba wind generators
- imports from neighbouring U.S. utilities
- projects to replace existing generating resources where plans are in place
- reduced losses due to increased bipole capacity.

Figure 4.18 MANITOBA HYDRO'S BASE SUPPLY OF POWER

The following describes the resources that contribute to the base supply of power available to meet Manitoba Hydro load and firm export commitments.

Manitoba Hydro-Operated Facilities – Hydro and Thermal Generation

Manitoba Hydro currently operates facilities with a total generating capacity of approximately 5,700 MW. Hydro-electric power is the predominant generation resource in the Manitoba Hydro generating system, providing on average over 90% of the total generating capacity and 98% of electric energy.

Approximately 5,200 MW of renewable hydro-electric generating capacity is available from 15 stations on the Nelson, Winnipeg, Saskatchewan, Burntwood and Laurie rivers. The three hydro-electric generating stations located along the lower Nelson River—Limestone, Long Spruce and Kettle, account for approximately three-quarters of Manitoba Hydro's current hydro-electric capacity.

The remaining 500 MW of Manitoba Hydro generating capacity utilizes thermal technology. The Selkirk Generating Station (G.S.) consists of two natural gas-fired steam turbine generating units. At the Brandon G.S., there are two natural gas-fired combustion turbine generating units and one coal-fired steam turbine unit. For planning purposes, it is assumed that Manitoba Hydro's last coal-fired steam turbine unit, of approximately 100 MW, will be retired in 2019/20 reducing the total generating capacity to approximately 5,600 MW.

Manitoba Hydro Power Purchases - Wind Generation

Manitoba Hydro purchases power through contracts from privately owned wind facilities in southern Manitoba – St. Leon Wind Energy LP in St. Leon and Pattern Energy in St. Joseph with a total installed capacity of approximately 250 MW. For planning purposes, it is assumed these contracts will provide a combined total of 777 GWh of dependable energy each year. Contracted purchases of wind generation are assumed to be renewed using the same terms

and conditions after the expiration of the current contracts and to extend through to the end of the study period.

Wind turbines have operating restrictions during extremely cold weather, the very period in which the Manitoba load reaches its annual winter peak. Therefore, wind generation is not considered a capacity resource for the purpose of meeting winter peak loads as it is not assured to be available at the time of system peak loads.

Manitoba Hydro Power Purchases – Imports

As described in Section 4.2.4 Export Commitments, Manitoba Hydro currently has a portfolio of 500 MW of seasonal diversity contracts which provide for the seasonal exchange of power between utilities during their respective peak load seasons. The diversity agreements provide for an exchange of capacity of up to 500 MW in 2013/14, increasing to 550 MW in 2014/15 and remaining at that quantity until 2024/25 when the last of these contracts expires. In addition to the diversity agreements, Manitoba Hydro has a 500 MW Energy Service Agreement, which provides access to energy throughout the year, but as the contract does not have a capacity component it is not guaranteed for any particular hour.

Under these agreements, for planning purposes Manitoba Hydro can rely on 2,705 GWh of energy in 2013/14. The value reduces to 2,575 GWh by 2016/17 and continues at this quantity until 2024/25.

Although Manitoba Hydro has access to large quantities of energy under contract there are limitations to the amount of imports that can be relied upon for planning purposes. As described in more detail in ***Appendix 4.1 Manitoba Hydro Generation Planning Criteria***, Manitoba Hydro's long-term firm import limit on existing transmission lines from the U.S. is 700 MW. As a result, Manitoba Hydro cannot import the total amount of energy available to it under its import contracts, which in 2014/15 totals 1,050 MW—the situation will not change

until new transmission interconnections are built or existing transmission is upgraded. However, the excess of import capability under the contracts provides flexibility in choosing the source of its imports and recognizes that short-term import limits can be higher than the long-term firm limit of 700 MW.

There is no firm import capability from either Ontario or Saskatchewan that Manitoba Hydro can rely upon for planning purposes.

Manitoba Hydro also relies on market purchases up to the prescribed import limit to the extent permitted under the energy criterion described in Section 4.3.1.2 – Energy Criterion, for planning purposes. These purchased imports from the market are in addition to imports available under the long-term agreements described above.

Supply-Side Enhancements

The Manitoba Hydro system is continuously reviewed for opportunities to upgrade infrastructure that will result in increased output from existing facilities. These upgrades, referred to as "supply-side enhancement" projects, go beyond routine maintenance required to maintain supply and, from an efficiency perspective, are typically timed with major maintenance projects. In 2012 the Kelsey Rerunnering Project was in its final stages which, when completed, will add a total of 77 MW of winter capacity to the Manitoba Hydro generating system and will increase the amount of energy available, on average, from this plant.

Pointe du Bois Generating Station

No decision has been made on the future of the Pointe du Bois powerhouse. For planning purposes, the assumption has been made that the Pointe du Bois powerhouse will be rebuilt, resulting in an increase of 43 MW and 150 GWh over the existing plant ratings with first power to be delivered in 2030/31. Until Pointe du Bois is rebuilt, it is assumed that the existing facility

will be maintained to continue to operate at or near full capacity. This assumption is common to all development plans in this submission.

Reduced Losses due to Increased Bipole Capacity

Bipole III is a new high-voltage direct-current (HVDC) transmission project required to improve overall system reliability with a planned in-service date of 2017/18.

As a transmission project, Bipole III does not provide any new generation but will reduce the transmission losses that exist on the HVDC system by transmitting power over three bipoles rather than two, making more power available for use. The reduction in losses is expected to result in 90 MW of additional capacity and 239 GWh/year of energy under drought conditions. For planning purposes, the savings from reduced losses are included as part of the base supply of power. It is recognized that the loss savings would decrease as new northern generation is connected to the HVDC system.

4.3.3 Summary of Manitoba Hydro System Supply

Manitoba Hydro plans its system supply in accordance with the Generation Planning Criteria as described in Section 4.3.1. Since the demand on the Manitoba Hydro system peaks in the winter, primarily due to heating requirements, Manitoba Hydro plans its system capacity to meet the Manitoba winter peak. Manitoba Hydro plans its system supply to provide a supply of energy that is dependable under a repeat of the lowest recorded water supply conditions.

Summaries of Manitoba Hydro's system supply in terms of winter peak capacity and dependable energy are provided below.

Winter Peak Capacity

As shown in Table 4.3 below, the Manitoba Hydro system is capable of providing 6,244 MW of capacity at winter peak in 2013/14. For planning purposes, the winter peak capacity is reduced

to 5,679 MW by 2026/27 due to the anticipated retirement of the Brandon G.S.'s last coal-fired unit in 2019 and the expiration of certain import contracts. Reductions in transmission losses due to the construction of the Bipole III HVDC transmission line are expected to provide an additional 90 MW by 2017/18.

Table 4.3 TOTAL WINTER PEAK CAPACITY FOR SELECT YEARS (MW) @ GENERATION

Winter Peak Capacity, MW				
Fiscal Year	2013/14	2021/22	2022/2	2026/27
Hydro	5,177	5,177	5,177	5,177
Thermal	517	412	412	412
Wind (Power Purchase Agreements)	0	0	0	0
Imports	550	605	605	0
Bipole III Loss Reduction (2017/18 in-service date)	0	90	90	90
Total Base Supply	**6,244**	**6,284**	**6,284**	**5,679**

Dependable Energy

As shown in Table 4.4 below, the Manitoba Hydro system is capable of providing 30,253 GWh of dependable energy in 2013/14. For planning purposes, dependable energy is reduced to 29,176 GWh by 2026/27 due to the anticipated retirement of the Brandon G.S.'s last coal-fired unit in 2019 and the expiration of certain import contracts.

Table 4.4 TOTAL DEPENDABLE ENERGY FOR SELECT YEARS (GWH) @ GENERATION

Dependable Energy, GWh				
Fiscal Year	2013/14	2021/22	2022/23	2026/27
Hydro	22,290	22,684	22,674	21,810
Thermal	4,118	3,307	3,307	3,307
Wind (Power Purchase Agreements)	777	777	777	777
Imports	3,068	3,068	3,068	3,043
Bipole III Loss Reduction (2017/18 in-service date)	0	239	239	239
Total Base Supply	**30,253**	**30,075**	**30,065**	**29,176**

4.4 Need for New Resources

The need for new resources is determined by comparing annual supply and annual demand values for each year of the 35-year study period. This comparison determines the surplus or deficit of both winter peak capacity and dependable energy on an annual basis. The need for and timing of major new resources to address a deficit in either winter peak capacity or dependable energy is established when persistent deficits occur. Intermittent or short-term deficits would likely be met with imports, which would be arranged closer to, but in advance of the need.

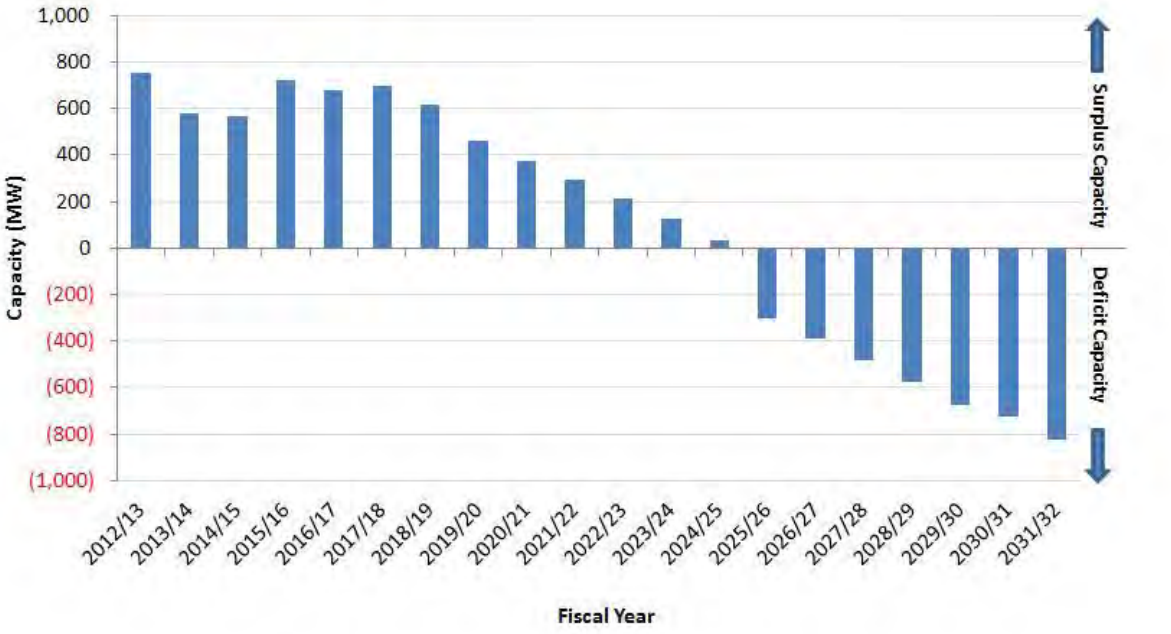
The Need for Winter Capacity Resources

Figure 4.19 shows the capacity balance as either a surplus or deficit for the next 20 years (2012/13 to 2031/32), assuming no further resource additions to the system and no change to DSM. Similarly, Figure 4.20 compares the Manitoba Hydro base supply to the Manitoba net load and total demand to further demonstrate the need for and timing of new capacity resources.

Based on the current supply and demand assumptions for capacity, as described throughout this chapter, the Manitoba Hydro system will have a winter peak capacity surplus until the year 2025/26 at which time there will no longer be sufficient capacity in the winter available to meet the forecast Manitoba winter peak demand and export commitments. Without the savings

from Manitoba Hydro's DSM programs, new resources would have been required earlier, in 2023/24.

Figure 4.19 CAPACITY BALANCE – WINTER PEAK CAPACITY



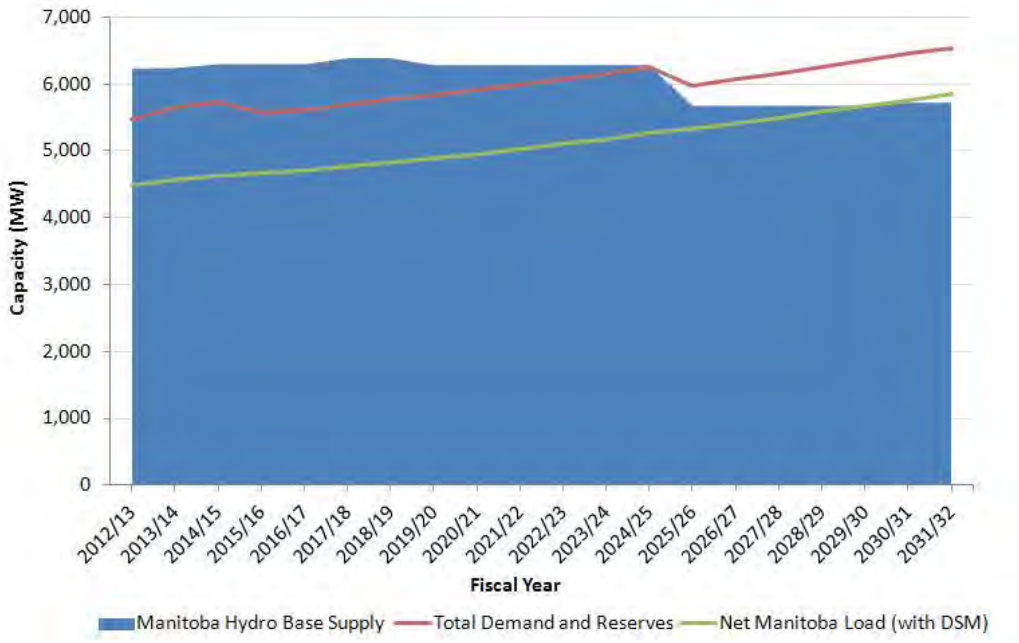


Figure 4.20 NEED FOR NEW RESOURCES – WINTER PEAK CAPACITY

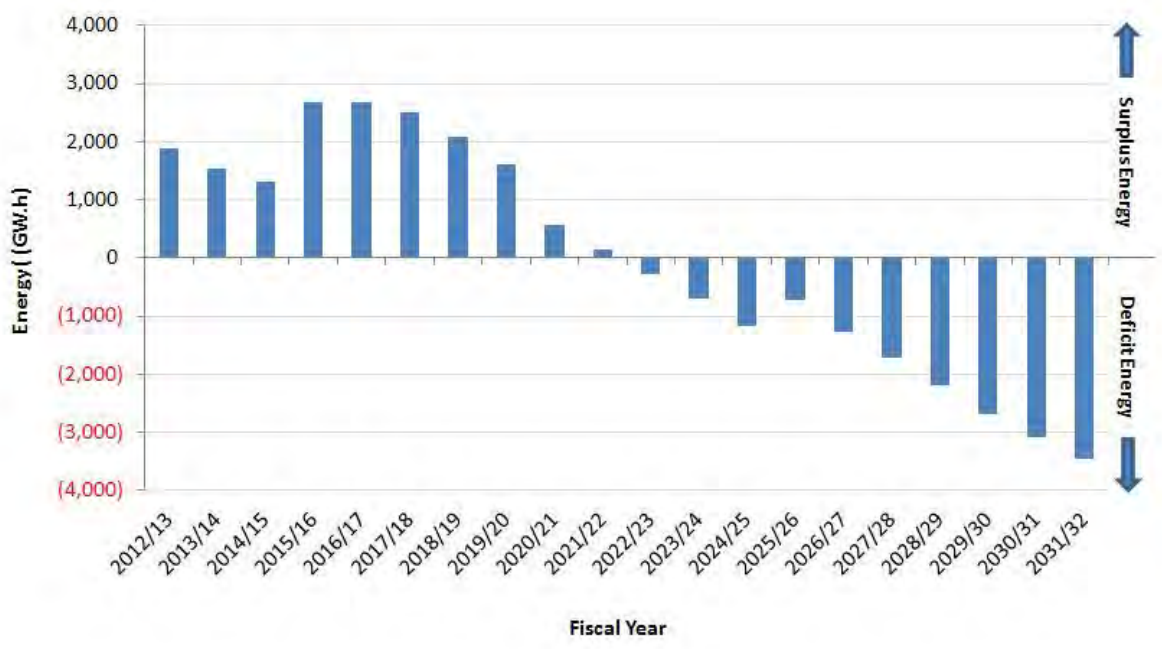
The Need for Dependable Energy Resources

Figure 4.21 shows the dependable energy balance as either a surplus or deficit for the next 20 years (2012/13 to 2031/32), assuming no further resource additions to the system supply and no change to DSM. Similarly, Figure 4.22 compares the Manitoba Hydro base supply to the Manitoba net load and total demand to further demonstrate the need for and timing of new energy resources.

Based on the current supply and demand assumptions for energy, the Manitoba Hydro system will have a dependable energy surplus until the year 2022/23 at which time there will no longer be sufficient dependable energy available to meet the forecasted Manitoba energy demand and export commitments. Without the savings from Manitoba Hydro's DSM programs, new resources would have been required earlier, in 2020/21.

Figure 4.21 ENERGY BALANCE – DEPENDABLE ENERGY



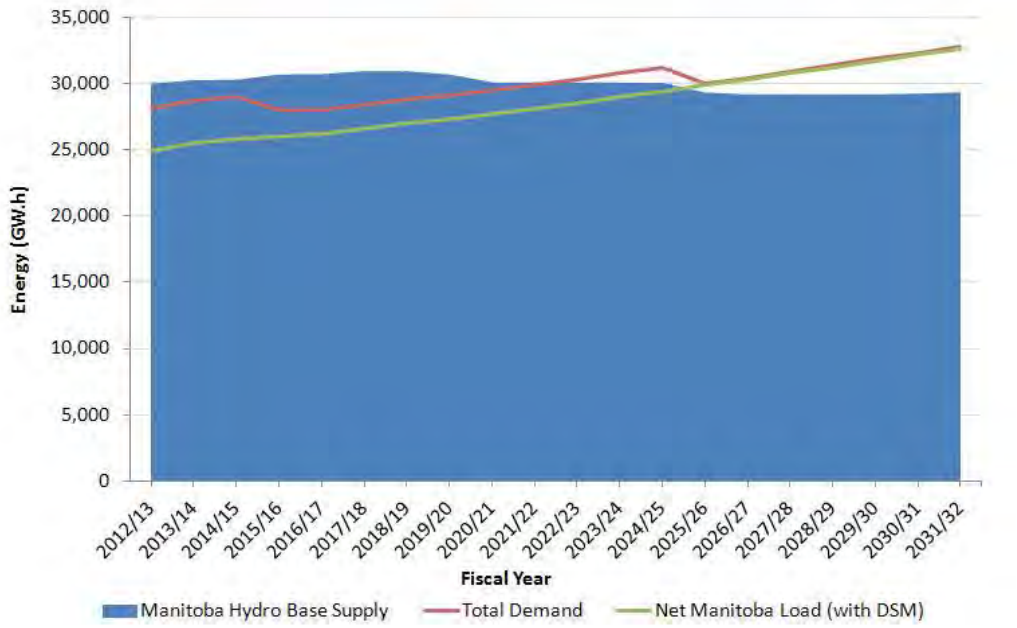


Figure 4.22 NEED FOR NEW RESOURCES – DEPENDABLE ENERGY

Since persistent dependable energy deficits begin earlier than persistent capacity deficits, it is the shortfall of dependable energy which drives the need for new resources in the year 2022/23.

The above analysis is based on 2012/13 resource planning assumptions. It is recognized that there is inherent variability in the assumptions, particularly due to the length of the planning horizon, which is 35 years. As a result, Manitoba Hydro updates this analysis each year incorporating the most current information, including updates to the load forecast, fuel price forecast, electricity export price forecast, capital cost estimates, plant assumptions, economic factors, and other planning assumptions as part of the power resource planning process as described in ***Chapter 1 – Introduction***.

Tables 4.5 and 4.6 summarize the supply and demand values for key dates from the 35-year study period to demonstrate whether a surplus or deficit is expected. More detailed versions of

these tables showing each year of the study period are included in ***Appendix 4.2 – Manitoba Hydro Supply and Demand Tables.***

EXECUTIVE SUMMARY

Overview

Gross Firm Energy is forecast to grow from weather adjusted value of 24,404 GW.h in 2012/13 to 28,605 GW.h in 2022/23. This average growth is 420 GW.h or 1.6% per year for 10 years. By 2032/33, Gross Firm Energy is forecast to be 32,667 GW.h, a twenty-year growth rate of 413 GW.h or 1.5% per year.

Gross Total Peak is forecast to grow at about the same pace, growing 79 MW or 1.7% a year for the next 10 years, and 76 MW or 1.5% a year for the next 20 years. In 20 years, the peak will grow 1,527 MW to 5,959 MW.

Growth is expected in all sectors. The 20 year growth rates in the Residential Basic, General Service Mass Market and General Service Top Consumers sectors are forecast to be 1.4%, 1.5% and 1.6% respectively.

During the last 10 years, Gross Firm Energy has grown 266 GW.h or 1.2% per year. This ten year period includes the 2009 economic downturn that slowed growth.

The primary driver of growth in Manitoba is the population, with the secondary driver being the economy. Manitoba Hydro's 2013 Economic Outlook provides both the forecast of the population and the resulting forecast of Residential Basic customers that is used in this document. The population of Manitoba has grown from 1,156,600 people in 2002 to 1,267,000 people in 2012 averaging 0.9% growth per year. The forecast is that Manitoba's population will grow to 1,568,500 by 2032, averaging 1.1% per year. The primary reason for the expected increase of population growth in Manitoba is due to government immigration initiatives.

Residential Basic customer growth is expected to mimic population growth, growing 1.1% per year over the next 20 years. An increase in average use per customer adds 0.3% to the growth and is primarily due to increased use of electric space heating and electric water heating in homes.

General Service Mass Market is forecast to grow at an average 1.5% per year, comparable to its historic growth of 1.4% per year over the past ten years.

General Service Top Consumers is forecast to grow at 1.6% per year. This is higher than its 0.5% growth per year during the past ten years which included the loss of a customer and an economic downturn. But it is less than the 3.3% growth per year during the prior ten years. Combined, the 20 year historical growth of the Top Consumers has been 2.0% per year. Short term committed customer plans will amount to 355 GW.h of growth, even after accounting for the expected major load decrease by 2016 of one customer.

Comparison with the 2012 Forecast

The Gross Firm Energy forecast is down 495 GW.h in 2013/14 due to initial-year decreases to the GS Mass Market and GS Top Consumers forecasts and associated decreases to losses. The growth of Residential Basic customers has been reduced from the 2012 forecast resulting in a lower Residential and GS Mass Market forecast. Gross Firm Energy is down 717 GW.h (1½ years of load growth) in 2022/23 and down 1159 GW.h (almost 3 years of load growth) in 2031/32.

The reduction in peak in 2022/23 is 54 MW, about 2/3 of a year of load growth. The reduction in peak in 2031/32 of 146 MW amounts to a reduction of almost 2 years of load growth.

Load Variability and Possible Events

The forecast presented in this document is Manitoba Hydro's best estimate of Manitoba's future electricity requirements. Analysis of historical variation indicates there is an 80% chance that by 2032/33, the load could vary by ±2,471 GW.h (7.6%) from the forecast.

In addition, Manitoba Hydro examines possible events of interest for their potential impact on system load requirements. These events are deemed to be captured within the overall load variability analysis of the forecast, but are presented so their individual effects may be considered from a sensitivity perspective if the need arises:

	Energy Effect (GW.h)	Peak Effect (MW)
Climate Change per Degree Celsius Warmer	+100	-40
One New Very Large Industrial Customer	+1,500	+180
One Less Very Large Industrial Customer	-1,500	-180
Additional Load if Electric Vehicles Grow to 70%	+2,312	+289
10% of all Res Customers switch to Electric Heat	+746	+246
10% of all Res Customers switch to Electric Water Heaters	+198	+23

(For comparison, 1 year of load growth is approximately 420 GW.h or 80 MW)

INTRODUCTION

This document is prepared annually as Manitoba Hydro's forecast of its future load requirements for its service area. The service area consists of all of Manitoba (99.83% of sales), as well as two resale customers that supply energy to Creighton, Sask. (0.14% of sales) and the Northwest Angle, Minn. (0.03% of sales). Exports of power to other utilities are not included.

This information is provided for several purposes. Rate making and accounting require short term forecasts of sales by billing month within rate groups so they can forecast revenue. Operations and power planning require short and long term forecasts of energy and peak by calendar month so they can determine supply requirements.

A "customer" in this document usually refers to a metered electrical service. Unmetered services, such as flat rate water heating and sentinel rentals do not count as customers, and street lights group a number of services as one customer. A customer is not the same as a building. One building can have multiple electric services and may count as more than one customer, or multiple buildings may have only one service and may count as only one customer. A customer in this document is also not the same as a customer on the billing system. The latter is a person or organization that Manitoba Hydro serves. One billing customer may pay the bill for multiple services and thus count as multiple customers in this document.

Electric consumption is read from a customer's meter in units of kilowatt-hours (kW.h). A typical home not using electricity for heating might use 10,000 kW.h per year. This document reports electric use in terms of gigawatt-hours (GW.h). One GW.h equals one million kW.h, which is approximately the energy of 100 typical homes not using electricity for heating.

The highest load requirement for a time period is known as the peak load. It is given in terms of megawatts (MW). One MW equals one thousand kilowatts (kW). A typical home not using electricity for heating would use a maximum of about 2.5 kW sometime during the year. However, homes will not all be at their maximum use at the same hour. The maximum use at the same hour is known as the coincident load at the system peak hour. A typical home not using electricity for heating would use about 1.6 kW at the coincident peak. Therefore 1 MW is approximately the coincident peak requirement of 600 typical homes not using electricity for heating.

Components of Manitoba's Electricity Use – 2012/13

General Consumers Sales (also referred to as Total Sales) includes the energy supplied to all of Manitoba Hydro's individually billed customers. In 2012/13, Manitoba Hydro averaged 545,660 General Consumers Sales customers who used 21,477 GW.h.

The major groups include

(1) Residential Basic, with 456,130 customers who used 7,223 GW.h or 33.6% of Sales. These are mostly residences that include single-family homes, multi-family homes and apartment suites.
(2) General Service Mass Market, with 65,974 customers who used 8,434 GW.h or 39.3% of Sales. These are small to large Commercial and Industrial customers.
(3) General Service Top Consumers, with 31 customers who used 5,560 GW.h or 25.9% of sales. These are 17 high-usage companies (some count as multiple customers) that are forecast individually.

The remaining customers include Seasonal customers (billed twice a year rather than monthly), Diesel customers (four remote towns not connected to the integrated grid system), Flat Rate Water Heating and Area and Roadway Lighting. Their electricity use totals only 260 GW.h or 1.2% of Total Sales. Over 50,000 of these services do not count as customers.

Manitoba Load at Common Bus is the total load metered at all the substations in the province that supplies Manitoba Hydro's non-Diesel customers and includes Distribution Losses and Construction Power. In 2012/13, Common Bus was 22,699 GW.h or about 5.7% more than Total Sales.

Gross Firm Energy is the total load needed to be generated for domestic firm load requirements on the Integrated System (excludes diesel). It includes Transmission Losses and Station Service. Some customers are on non-firm contracts (Surplus Energy Program), and their load is not included as part of Manitoba Hydro's generation requirement. In 2012/13, Gross Firm Energy was 24,759 GW.h or about 15.3% more than Total Sales.

COMPONENTS OF MANITOBA ELECTRICITY USE 2012/13 (Customers, Consumption and Average Use)				
Forecast Group	**Cust/Serv**	**GW.h**	**% of Sales**	**kW.h/cust**

FORECAST OVERVIEW

General Consumers Customer Forecast

In 2012/13, there was an average of 545,660 General Consumer Sales customers. These were made up of 456,130 Residential Basic customers, 65,974 General Service Mass Market customers, 31 General Service Top Consumers customers, 28 SEP (Surplus Energy Program, i.e. non-firm) customers, with the rest being Diesel, Seasonal and Area and Roadway Lighting.

During the last 10 years, Residential Basic customers have grown at an average of 4,232 (1.0%) per year. Manitoba Hydro's 2013 Economic Outlook provides the forecast of Residential Basic customers, and this document uses that forecast. It calls for a growth of 5,577 (1.2%) per year over the next ten years and 5,423 (1.1%) per year over the next 20 years. The primary reason for the increase is an expectation of increased population growth in Manitoba due to government immigration initiatives which will impact both the Residential and Commercial Sectors.

General Service Mass Market customers have grown 571 (0.9%) per year over the last 10 years. They are forecast to grow 545 (0.8%) over the next ten years and 512 (0.7%) over the next 20 years.

Residential Seasonal customers, who are mainly cottages with lower usage, are growing at a slower rate than Residential Basic averaging 51 (0.3%) customers per year over the last 10 years. They are forecast to grow at 96 (0.5%) over the next 10 years and 98 (0.5%) over the next 20 years.

Area and Roadway Lighting customers were re-grouped in 2006 when Manitoba Hydro changed its billing system, and the lighting customer counts changed at that time. Area and Roadway Lighting is expected to grow at 4 (0.4%) customers over the next 10 years and 5 (0.4%) over the next 20 years.

Manitoba Hydro purchased Winnipeg Hydro in September 2002. Their customers were integrated into the Manitoba Hydro billing system in June 2004. Historical customer and energy numbers in this document include Winnipeg Hydro customers.

General Consumers Sales Forecast

During 2012/13, Total General Consumer Sales was 21,477 GW.h. The fiscal billing year (using weather from March 16, 2012 to March 15, 2013) was warmer than normal in the winter months resulting in a winter weather adjustment of 98 GW.h, and was hotter than normal in the summer resulting in a summer weather adjustment of -130 GW.h. Overall, the weather adjustment for the year was -32 GW.h giving a weather adjusted Total Sales value of 21,445 GW.h.

During the last 10 years, Total Sales have grown at 258 GW.h (1.3%) per year. The growth was 1.8% per year in Residential Basic, 1.4% per year in General Service Mass Market, but only 0.5% in General Service Top Consumers due to the economic downturn in 2009 that included the loss of one Top Consumer customer. This historical growth includes the effect of past Demand Side Management (DSM) initiatives.

Sales are forecast to grow at 364 GW.h (1.6%) per year over the next 10 years and 361 GW.h (1.5%) over the next 20 years before accounting for future market-based DSM programs as outlined on page 57.

Most of the growth is forecast to occur in General Service Mass Market, growing 144 GW.h (1.5%) per year over the next twenty years, followed by Residential Basic at 112 GW.h (1.4%). Top Consumers are expected to return to their normal growth rate and are forecast to grow at 103 (1.6%) per year.

Manitoba Energy Forecast

The actual Gross Firm Energy was 24,759 GW.h in 2012/13. Gross Firm Energy has grown 266 GW.h (1.2%) per year for the past 10 years. This historical growth reflects the effect of past Demand Side Management (DSM) initiatives. Gross Firm energy is forecast to grow to 32,667 GW.h by 2032/33 at an average growth of 413 GW.h or 1.5% per year. This is before accounting for future market-based DSM programs as noted on page 57.

Distribution losses, which is the difference between Manitoba Hydro's substations and the customers' meters, has a wide variance from year to year and has ranged between 3.5% and 5.5% of Total Sales. It is forecast to be 4.4% of Sales for the entire forecast.

Transmission Losses which is the difference between the generators and the substations is forecast to be 9.3% of Total Sales for the entire forecast.

Distribution Losses, Transmission Losses, Construction and Station Service amount to an additional 14% that needs to be added to Total Sales to estimate Gross Firm Energy. This 14% value should generally be used to estimate load at generation when only load at the customer's meter is known, for example to convert Power Smart program savings from the customer meter to generation. The exception is for large General Service customers who own their own transformation and incur minimal Distribution Losses. For these customers, a 10% value should be used.

Comparison of the 2012 Forecast to Actuals

Comparison of the 2012 Forecast to the 2012/13 Weather Adjusted Actuals

The weather adjusted General Consumer Sales for 2012/13 was 21,445 GW.h which was 352 GW.h lower than the 2012 forecast of 21,797 GW.h.

The weather adjusted Residential Basic sector for 2012/13 was 7,219 GW.h which was 9 GW.h lower than the 2012 forecast of 7,227 GW.h. The weather adjusted General Service Mass Market sector for 2012/13 was 8,406 GW.h which was 82 GW.h lower than the 2012 forecast of 8,488 GW.h.

The Top Consumers sector for 2012/13 was 5,560 GW.h which was 261 GW.h lower than the 2012 forecast of 5,821 GW.h primarily due to project delays by two Top Consumers. Projected load growth for those specific projects is still expected and is included in the 2013 Forecast.

Distribution losses were forecast to be 950 GW.h, but came in at 1,176 GW.h. Distribution Losses account for the difference between Common Bus and General Consumer Sales. Common Bus is measured month-end to month-end at the substation level, whereas Sales are measured at the customer's meter and by billing cycle, which generally map to mid-month. The extreme warm weather that occurred from March 16 to 31, 2012 combined with the extreme cold weather experienced from March 16 to 31, 2013 resulted in about 300 Heating Degree Days difference between the two measurements. This also caused a very large weather adjustment of -295 GW.h. After accounting for weather adjustment, Distribution Losses were 881 GW.h which was 69 GW.h lower than the 2012 forecast of 950 GW.h.

Weather adjusted transmission losses were 1,923 GW.h which was 112 GW.h less than the 2012 forecast of 2,034 GW.h.

Overall, the weather adjusted Gross Firm Energy was 24,404 GW.h which was 557 GW.h lower than the 2012 forecast of 24,961 GW.h due to delays in the plans of two Top Consumers and lower than normal Distribution and Transmission Losses.

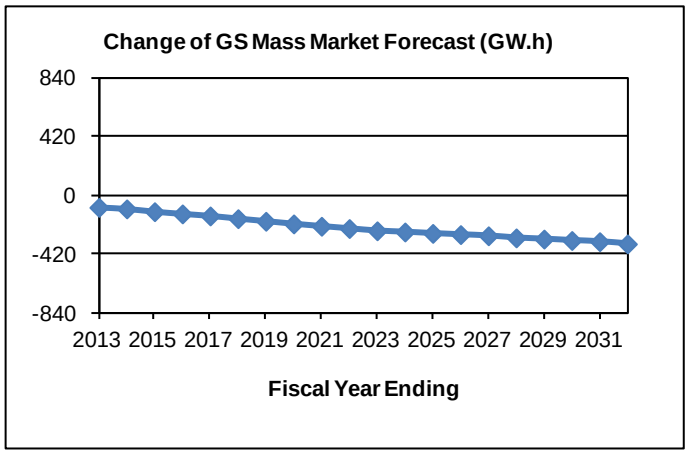
Change between the 2012 and 2013 Forecasts

Change Between the 2012 and 2013 Residential Basic Forecast

Figure 1 - Change of Res Basic Forecast

The Residential Basic Forecast is down from the 2012 forecast. By 2031/32 the difference is 423 GW.h or 4.3%. This is equivalent to about 1 year of Manitoba system load growth (1 year = approximately 420 GW.h).

Changes made (and the 2031/32 effect):



1. The customer forecast was reduced by 16,901 customers (-282 GW.h).
2. The appliance unit energy consumptions (UECs) or average use per appliance per year were updated in the Residential End Use model. The update was done using a preliminary Conditional Demand Analysis of the 2009 Residential Energy Use Survey data with customer billing data (+212 GW.h).
3. An adjustment to reflect initiatives being undertaken by Manitoba Hydro was included to reduce the number of customers choosing electric space and water heat (-366 GW.h).

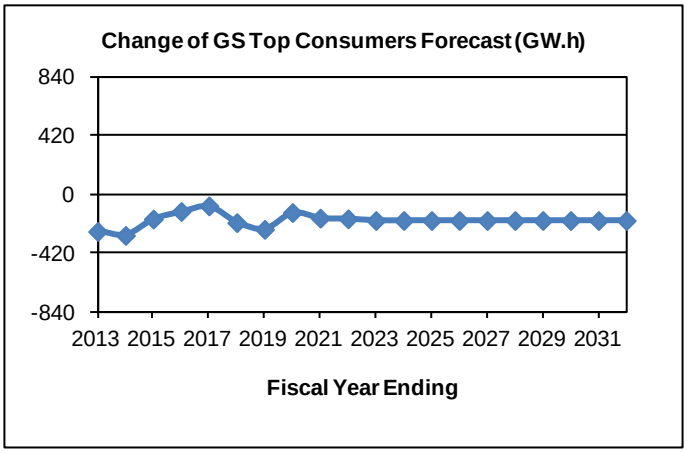
Change Between the 2012 and 2013 GS Mass Market Forecast

Figure 2 - Change of GS Mass Market Forecast

The General Service Mass Market Forecast is down 343 GW.h in 2031/32, primarily due to the reduction in the residential customer forecast, which also affects commercial growth. This represents less than a year of Manitoba system load growth (1 year = approximately 420 GW.h).

Changes made (and the 2031/32 effect):



1. The residential customer forecast was reduced leading to a reduction in the GS Mass Market customers (-191 GW.h).
2. The average use per customer in each size class was updated and reduced the overall GS Mass Market load. (-107 GW.h).

Table 9 - Change of GS Mass Market Forecast

CHANGE OF GS MASS MARKET FORECAST (GW.h) Comparison of 2012 to 2013 forecast

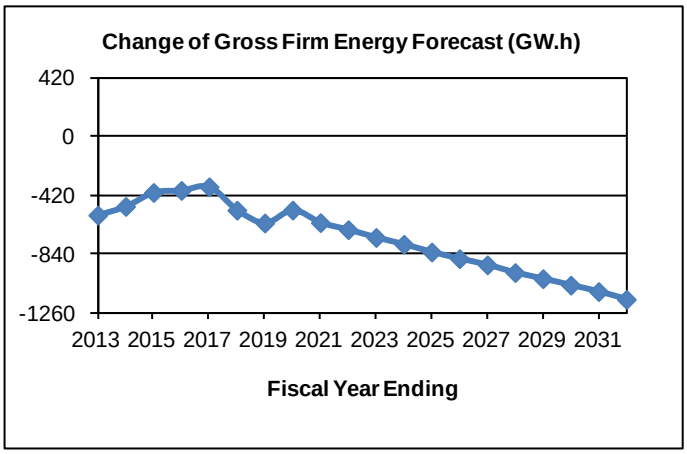
Change Between the 2012 and 2013 GS Top Consumers Forecast

Figure 3 - Change of GS Top Consumer Forecast

The General Service Top Consumers is down 289 GW.h in 2013/14 due to delays in some of the short term committed customer plans. By 2031/32, the decrease is 182 GW.h. This is equal to the loss of slightly less than a half year of Manitoba system load growth (1 year = approximately 420 GW.h).

Changes made (and the 2031/32 effect):



1. Short term committed plans of two Top Consumers were delayed with an effect of 305 GW.h in the first two years of the forecast (0 GW.h)
2. Potential Large Industrial Loads begins in the 4th year of the forecast, which in the 2013 forecast is one year later giving one less year of PLIL growth (-100 GW.h).
3. Changes to the forecasts of the Top Consumers up to 2021/22 mostly in the Primary Metals sector (-83 GW.h).

Table 10 - Change of GS Top Consumer Forecast

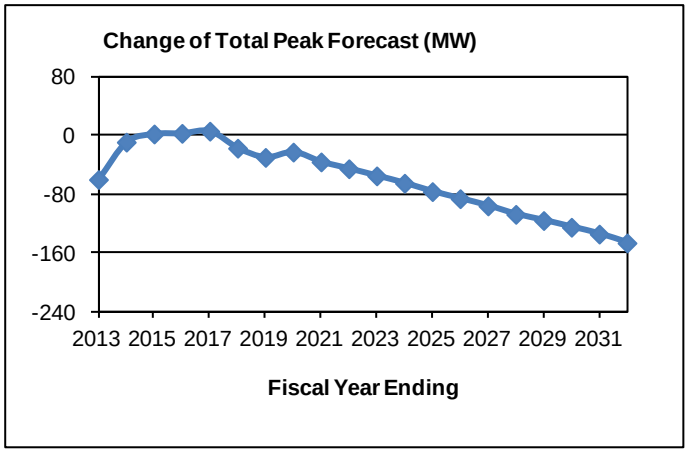
Change Between the 2012 and 2013 Gross Firm Energy Forecast

Figure 4 - Change of Energy Forecast

The Gross Firm Energy forecast is down 557 GW.h in 2013/14 due to initial-year decreases to the GS Mass Market and GS Top Consumers forecasts and associated decreases to losses. This difference grows to 1159 GW.h by 2031/32 due to the reduction of the Residential Basic customer forecast and its effect on the Residential and GS Mass Market forecasts. This is a 3.5% reduction in the forecast of 2031/32, which is equivalent to a loss of almost 3 years of load growth (1 year = approximately 420 GW.h).

Changes made (and the 2031/32 effect):



1. Residential Basic forecast (-423 GW.h), primarily due to the decrease in the forecast of Residential Basic customers and heating fuel choice initiatives being undertaken by Manitoba Hydro.
2. General Service Mass Market forecast (-343 GW.h), primarily due to the decrease in the forecast of Residential Basic customers.
3. General Service Top Consumers forecast (-183 GW.h), mostly in the Primary Metals sector.
4. Other Sales and Losses (-210 GW.h).

Change Between the 2012 and 2013 Gross Total Peak Forecast

Figure 5 - Change of Peak Forecast

The Gross Total Peak forecast is down 146 MW (2.4%) by 2031/32 from the 2012 forecast. The peak forecast very closely follows the energy forecast, and the reasons for reduction in peak are similar to those for energy.

The reduction in peak in 2022/23 amounts to 54 MW, less than one year of load growth. The reduction in peak in 2031/32 of 146 MW amounts to a reduction of almost 2 years of load growth. (1 year = approximately 80 MW).

FORECAST DETAILS

Residential Basic

Figure 6- Residential Basic Sales

In 2012/13, there were 456,130 Residential Basic customers. 80% are single detached, 7% multi attached, and 13% individually metered apartment suites. 54% are in Winnipeg where natural gas is available, 28% in natural gas available areas outside Winnipeg, and 18% do not have natural gas available.

Residential Basic has grown 99 GW.h (1.6%) per year for the past 20 years and 121 GW.h per year (1.8%) for the past 10 years which includes the effect of past Demand Side Management (DSM) initiatives. It is forecast to grow 107 GW.h (1.4%) per year for the next 10 years and 112 GW.h (1.4%) per year for the next 20 years.

The primary drivers of Residential Basic growth are population and average use per customer. The population is forecast to grow 1.1% per year over both the next 10 and next 20 years. The increase in average use per customer is expected to add another 0.3% to the growth.

Electric Heat Billed: Customers who have electric space heating included with their electric bill.
Other: Customers who do not have electric space heating included with their electric bill.
% Elec Space Heat: The proportion of Total Basic customers who are Electric Heat Billed.
% Elec Water Heat: The proportion of Total Basic customers who have Electric Water Heaters.

The average use (kW.h/customer) for Electric Heat Billed customers is decreasing as apartments are making up a higher proportion of the growth and as existing homes become better insulated. The average use for Other customers is increasing primarily due to the increase in electric water heaters.

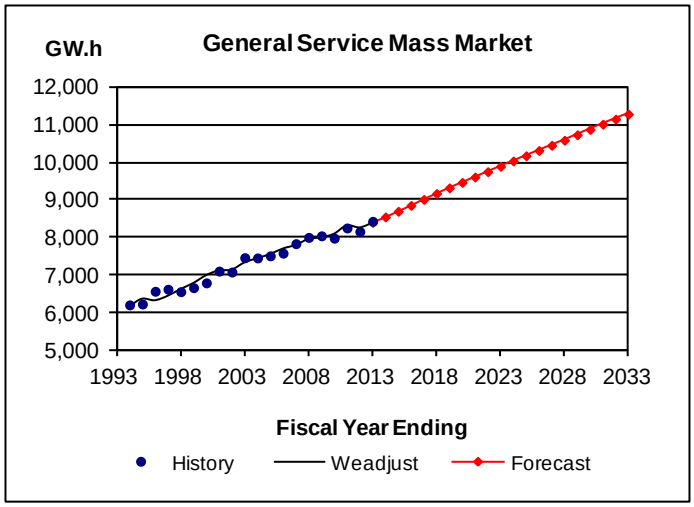
Residential Diesel, Seasonal, and Flat Rate Water Heating

Residential Diesel

There were 577 Residential Diesel customers that used 8 GW.h in 2012/13 at an average of 14,640 kW.h per customer. They have 60 amp service that does not allow for electric space heating. Space heating in these four communities is mainly provided by fuel oil. The number of customers is expected to grow to 716 and usage is expected to increase 2.0% a year to 13 GW.h by 2032/33 under the assumption that the communities continue to be separate from the Integrated System.

Residential Seasonal

There were 20,731 Residential Seasonal customers in 2012/13. The number of customers is expected increase to 22,686 customers by 2032/33. Seasonal customers are billed only twice a year either due to low usage (being a seasonal residence or cottage) or because of a location that makes it difficult to access for more frequent meter readings. The average use of a seasonal customer is 3,911 kW.h per year. The usage of Residential Seasonal customers is expected to increase 1.9% a year to 118 GW.h in 2032/33.



Residential Flat Rate Water Heating

Residential Water Heating is a flat rate unmetered service. This service has not been available to new customers since November 12, 1969. There were 4,089 remaining services in 2012/13. The number of services and usage is expected to decrease 5% per year throughout the forecast period. Usage was 21 GW.h in 2012/13 and that will decrease to 7 GW.h by 2032/33.

General Service Mass Market

General Service Mass Market includes all Commercial and Industrial customers, excluding the General Service Top Consumers. There were 65,974 General Service Mass Market customers in 2012/13. Approximately 85% are Commercial and the others are Industrial.

Figure 7 - General Service Mass Market

GS Mass Market has grown 118 GW.h (1.7%) per year for the past 20 years and 107 GW.h per year (1.4%) for the past 10 years. This historical growth includes the effect of past Demand Side Management (DSM) initiatives. It is forecast to grow 149 GW.h (1.6%) per year for the next 10 years and 144 GW.h (1.5%) per year for the next 20 years.

The primary driver for growth in the GS Mass Market is the number of Residential Basic customers. As population grows, commercial and industrial services grow to service the population. The secondary driver is the economy. Changes in the Manitoba Gross Domestic Product (GDP) are reflected in the GS Mass Market's electricity use.

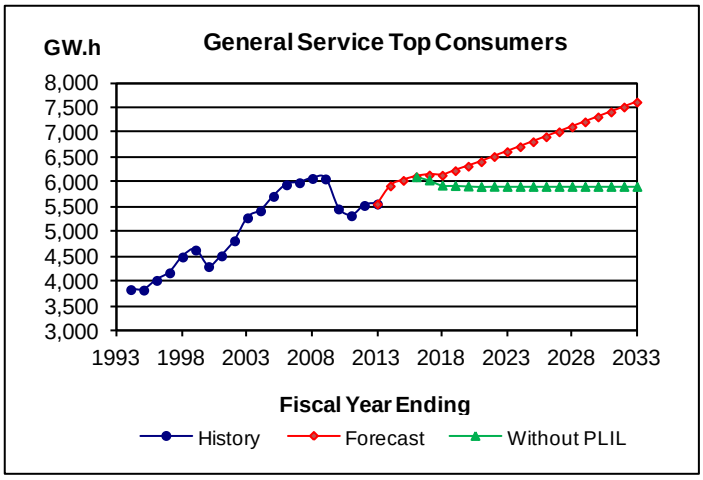


Table 15 - General Service Mass Market

General Service Top Consumers

General Service Top Consumers includes the top energy consuming businesses in Manitoba and represents 26% of all General Consumers Sales. GS Top Consumers includes 17 companies that account for 31 customers in the Primary Metals, Chemicals, Petrol/Oil/Natural Gas, Pulp/Paper, Food/Beverage and Colleges/Universities sectors.

Figure 8 - General Service Top Consumers

GS Top Consumers has grown 91 GW.h (2.0%) per year over the past 20 years and but only 28 GW.h per year (0.5%) over the past 10 years. The loss of one Top Consumer and the effect of the economic downturn from 2008 to 2011 lowered the past 10 year growth rate. The 2013 forecast is expected to grow 106 GW.h (1.8%) per year for the next 10 years and 103 GW.h (1.6%) per year for the next 20 years. A loss of a major load is expected by 2016. This loss is more than offset by confirmed plans and expected increases of other Top Consumers. In the long term, GS Top Consumers is expected to grow at a rate reflective of its historic growth.

Table 16 - General Service Top Consumers

2011/12	5531	2031/32	5915	1600	7515
2012/13	5560	2032/33	5915	1700	7615

GS Top Consumers are forecast individually as their usage does not grow in a slow, steady, predictable pattern. These types of load changes are not conducive to econometric forecasting models and must be examined on an individual basis. The forecast for each company includes their short term committed plans and expectations over the next several years, but excludes longer term plans that are uncommitted and subject to change.

The sum of the individual company forecasts grow from 5,560 GW.h in 2012/13 to 5,915 GW.h by 2022/23. This growth of 355 GW.h includes the load changes due to committed plans of companies, and also includes an expected major load decrease by 2016 of one customer.

Top Consumers do not add small amounts of load on a regular basis. Instead, they make major changes that add or remove a large amount of load at one time. Load changes are related to individual business cycles and it may be years between one of these changes.

For the longer term, an average expected growth is included for all customers together. This added growth is called Potential Large Industrial Loads (PLIL). It includes consideration for company expansions, cutbacks and shutdowns, new startups of 100 GW.h a year or more, and the long term normal incremental growth of all the companies within the Top Consumers sector combined. Since customer intentions are generally known for the first three years, PLIL is not added until 2016/17, the fourth year of the forecast.

GS Top Consumers has grown at 91 GW.h (2.0%) per year over the past twenty years. During that time, there were four new customers totaling 1,100 GW.h of consumption, nine instances of customers with major expansions totaling 1,400 GW.h, and two existing customers who closed operations reducing consumption by 700 GW.h. None of these events could have been predicted five years before they occurred. One new customer and four expansions occurred within the past 10 years despite the economic downturn. These major events amount to a net 1,800 GW.h increase in the past 20 years. On this basis, PLIL has been set to be 100 GW.h (1.5%) per year starting in the fourth year of the forecast and will total 1,700 GW.h by 2032/33, the 20th year of the forecast.

1,700 GW.h is approximately equivalent to the load of Manitoba Hydro's largest consumer. If only one other customer of similar size starts up in Manitoba within the next 20 years, this one new customer alone would consume all of the provision that PLIL has allowed.

General Service Diesel, Seasonal, and Flat Rate Water Heat

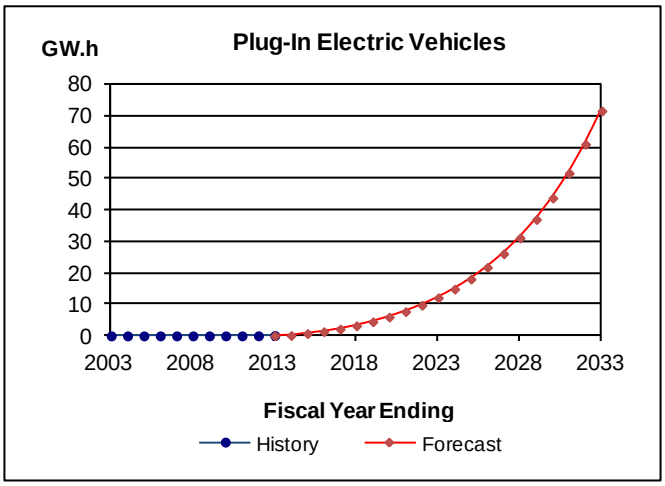
General Service Diesel

In 2012/13, there were 175 General Service Diesel Full Cost customers. They used 5 GW.h in 2012/13. The group is forecast to use 6 GW.h by 2032/33.

General Service Seasonal

There were 850 General Service Seasonal customers in 2012/13. Consumption was 5 GW.h in 2012/13 and is expected to grow to 6 GW.h by 2032/33.

General Service Flat Rate Water Heating



General Service Water Heating is a flat rate unmetered service that has not been available to new customers since November 12, 1969. There were 408 remaining services in 2012/13. The number of services is expected to decrease 5% per year throughout the forecast period. Consumption was 7 GW.h in 2012/13 and that is forecast to decrease to 3 GW.h by 2032/33.

General Service Surplus Energy Program

Participants in the Surplus Energy Program (SEP) used 28 GW.h in 2012/13 and are expected to grow to use 38 GW.h per year by 2017/18 and continue at that rate for the remainder of the forecast. This energy is considered to be “interruptible” and thus “non-firm”. The energy used by these customers is included in Sales. But it is excluded from the Gross Firm Energy forecast.

Plug-In Electric Vehicles

Figure 9 - Plug-In Electric Vehicles

This forecast includes an estimate of the future adoption of Plug-In Electric Vehicles (PEVs). This is made up of two types:

(1) Plug-In Hybrid Electric Vehicles (PHEVs) that run on an electric battery but use an internal combustion engine (ICE) when the electricity runs low. An example is the Chevrolet Volt.

(2) Battery Electric Vehicles (BEVs) that run only on electric battery power, such as the Nissan Leaf.

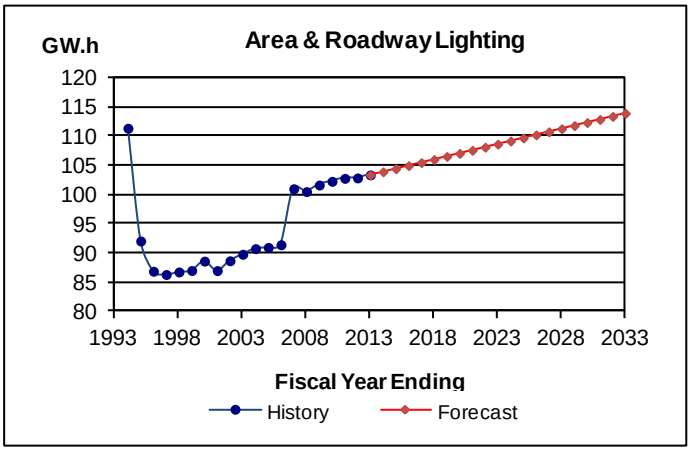
The forecast of PEVs does not include Hybrid Electric Vehicles (HEVs). These vehicles, such as the Toyota Prius, have an internal combustion engine as well as a battery and electric motor to drive the wheels. The HEV battery is charged with power from the ICE and through regenerative breaking. It is not charged by plugging in and therefore does not affect electricity consumption in Manitoba. As of March 1, 2013 and after 12 years in the market, there were only 3,581 HEVs registered in Manitoba, making up about 0.46% of all registered vehicles.

For the most part, electric cars have not enjoyed their expected success anywhere. Range anxiety and price are cited as the main reasons for limited sales. In general, electric vehicles are part of a niche market whose demographic is the environmentally aware, very well educated, upper-middle class white male in his late 40s to early 50s with a garage equipped with an electric outlet. General Motors expected to sell 60,000 Chevy Volts globally in 2012, but sold just half that many. Sales of Nissan's all-electric Leaf grew 22% around the world last year to 26,000, short of Nissan's projected 50% growth. One exception has been American high end electric car maker Tesla Motors, which recently posted the first profitable quarter in its 10-year history and whose share price exceeded $100 US for the first time on May 28, 2013. The price of Tesla shares has almost tripled this year, and its $90,000 Model S sedan got a near-perfect rating from May 2013 Consumer Reports. On March 1, 2013 there were 4 Tesla vehicles registered in Manitoba with one more on order.

The Electric Vehicle Forecast

As of March 1st, 2013, there were 37 plug-in electric vehicles registered in Manitoba according to the Manitoba Public Insurance Corporation. The 2012 Load Forecast had predicted 34 such vehicles to be registered in Manitoba at fiscal year ending 2013. The number of new PEVs is expected to slowly increase until it reaches about 1.3% of vehicle sales (828 per year) in 2022/23 and 5.4% of sales (4,576 per year) in 2032/33. The total number of electric vehicles on the road is expected to be 4,038 (0.4%) in 2022/23 and 23,879 (2.1%) in 2032/33.

The EPA rating for the pure electric 2012 Nissan Leaf is 3,400 kW.h for 16,000 km. Other electric vehicles, including the plug-in hybrid Chevrolet Volt, have similar EPA ratings. Actual usage depends on the distance driven. For this forecast, the average PEV is assumed to use 3,000 kW.h per year, which is almost equivalent to the annual energy use of an electric hot water tank. There are different opinions on average peak contribution per vehicle, but an acceptable expectation is that peak load use will approximately be equal to non-peak use. A load factor of 91% was chosen to derive the load coincident to Manitoba Hydro's system peak on a cold winter day.



The following table provides the estimate of the number of new vehicles and total vehicles each year in Manitoba, as well as the corresponding numbers for Plug-In Electric Vehicles. The PEV MW is at Hydro's system peak. Forecast energy usage for PEVs in Manitoba is expected to be 12 GW.h in 2022/23 and 72 GW.h in 2032/33. Forecast peak usage at system peak is expected to be 1.5 MW in 2022/23 and 9.0 MW in 2032/33.

Area & Roadway Lighting

Figure 10 - Area & Roadway Lighting

The Area and Roadway Lighting sector represents 0.5% of all sales within Manitoba. This sector includes electricity sales for the Sentinel Lighting and Street Lighting rate groups. Sentinel Lighting is an outdoor lighting service where units are available either as rentals to an existing metered service or on an unmetered, flat rate basis. Street Lighting includes all roadway lighting in Manitoba. Energy-efficient street lighting initiatives caused the significant drop in usage in the mid 1990's. In 2006, a readjustment of the rate classes moved some flat rate General Service meters into the Lighting sector. Only Street Lights count as customers.

The Area and Roadway Lighting sector is forecast to increase from 103 GW.h in 2012/13 to 114 GW.h by 2032/33 at an average growth rate of 1 GW.h or 0.5% per year.

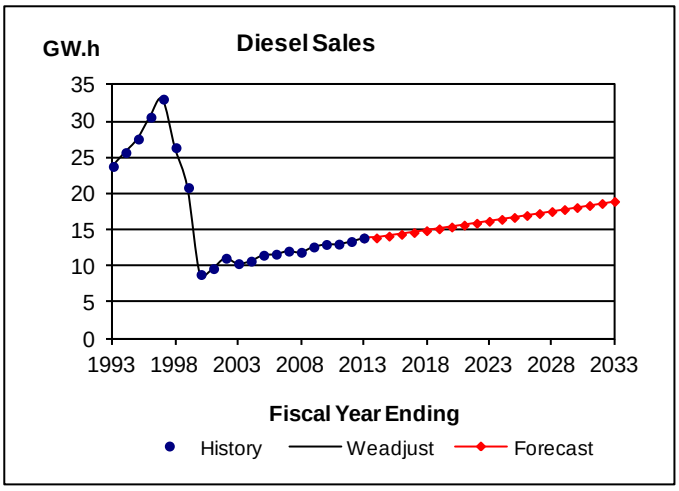
Total General Consumers Sales

Figure 11 - General Consumers Sales

General Consumers Sales includes sales to all of Manitoba Hydro's individually billed customers, but excludes export sales. This includes the total of all sales from the Residential, General Service and Lighting sectors. The General Service sector makes up about two-thirds, the Residential sector makes up about one-third and the Lighting group is only 0.5% of all sales.



Weather adjusted General Consumers Sales has grown 303 GW.h (1.7%) per year for the past 20 years and 258 GW.h (1.3%) per year over the past 10 years. This historical growth includes the effect of past Demand Side Management (DSM) initiatives. Sales are forecast to grow 364 GW.h (1.6%) per year for the next 10 years and 361 GW.h (1.5%) per year for the next 20 years.

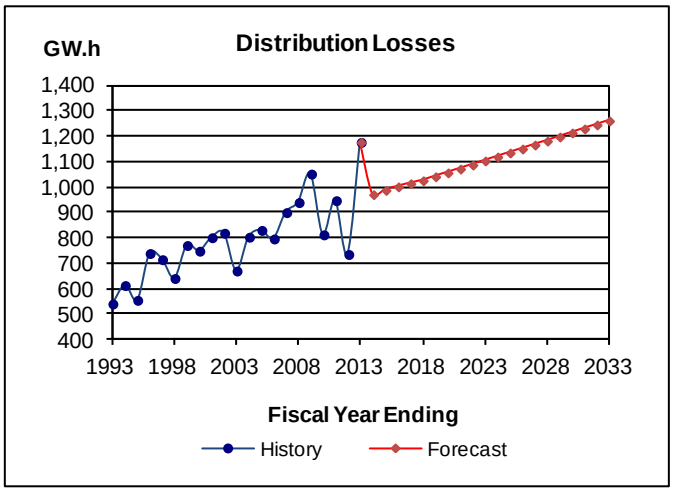
Diesel Sales

Figure 12 - Diesel Sales

There are four communities served by diesel generation in Manitoba: Brochet, Lac Brochet, Tadoule Lake and Shamattawa. Sales within these communities are included in General Consumers Sales, but are not part of the Integrated System, and are thus not part of Common Bus or Gross Firm Load.

Between 1997 and 1999, eleven communities previously served by diesel generation were connected to the Integrated System resulting in the drop in overall sales. The four sites that were to remain diesel were converted from 15 amp service to 60 amp service between 1991 and 2001 causing the increase in those years.



Diesel customers do not have electric heat, which requires a minimum 200 amp service, therefore there is no weather effect.

Table 21 - Diesel Sales

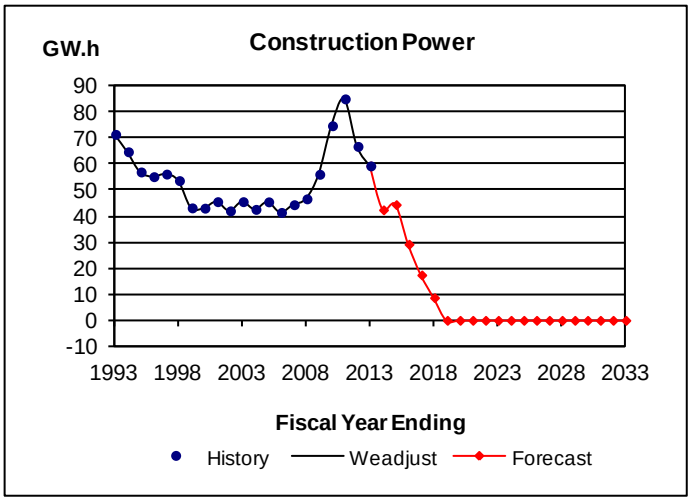
Distribution Losses

Figure 13 - Distribution Losses

Distribution Losses are made up of the power loss between the distribution substation (Manitoba Load at Common Bus less Construction) and the customer's meter (General Consumers Sales less Diesel), as well as all other differences between what was billed and what was metered. The other differences include:

1. The offset between cycle billing (General Consumers Sales) and actual calendar month usage (Common Bus).
2. Customer Accounting adjustments,
3. Inaccuracies associated with estimated billing (including flat rate estimates),
4. The metered but unbilled consumption of Manitoba Hydro offices, and
5. Energy lost due to theft.



Distribution Losses are forecast in 2013/14 to be 4.4% of the General Consumers Sales less Diesel and remain at about that level throughout the forecast.

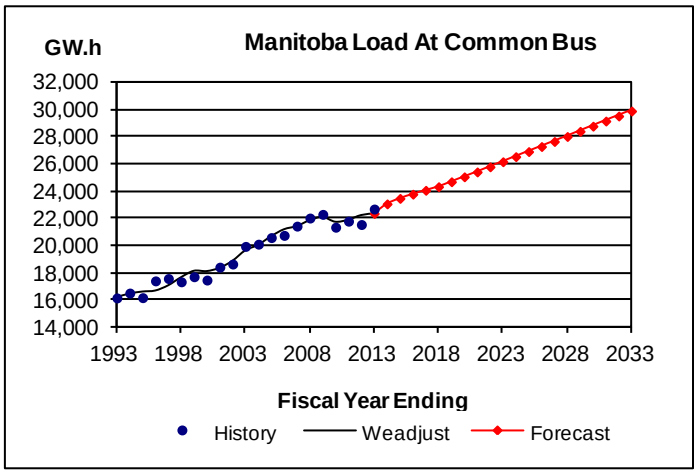
Construction Power

Figure 14 - Construction Power

Construction Power represents the energy used by Manitoba Hydro and its contractors in the construction of major capital works such as generating stations, converter stations and major transmission lines. Construction Power also includes Station Service until a plant is commissioned. Until 2013, about 48 GW.h of heating load at the Gillam, Limestone and Kettle town sites was included in Construction Power. This energy is now included in Distribution Losses.



The Construction Power forecast includes: (1) the Wuskwatim generating station, now in-service with completion expected in 2013/14, (2) the Pointe Du Bois spillway replacement started in April 2013 with expected completion in January 2015, and (3) the Keewatinoow Converter Station, started in January 2012 with expected completion in December 2017. Construction Power does not include construction power estimates for any sites that do not yet have a committed inservice date (e.g. Keeyask and Conawapa).

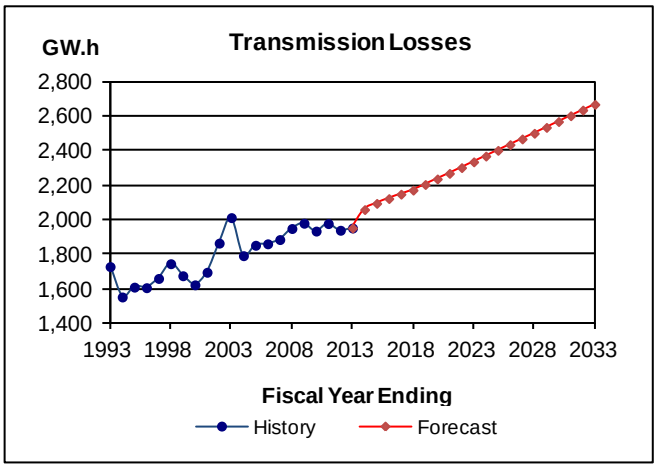
Manitoba Load at Common Bus

Figure 15 - Manitoba Load at Common Bus

Manitoba Load at Common Bus is the total load measured from all the distribution points (i.e. substations) within Manitoba. It includes all energy supplied to General Consumers Sales customers, Construction Power plus associated Distribution Losses, but excludes Diesel customers, Transmission Losses and Station Service.

Common Bus is metered and totaled to correspond exactly to each calendar month. Weather adjustment is done on a calendar month basis.



Weather adjusted Common Bus has grown 314 GW.h (1.6%) per year for the past 20 years and 275 GW.h (1.3%) per year during the past 10 years reflecting the recent economic downturn. This historical growth includes the effect of past Demand Side Management (DSM) initiatives. Common Bus is forecast to grow 380 GW.h (1.6%) per year for the next 10 years and 377 GW.h (1.5%) per year for the next 20 years.

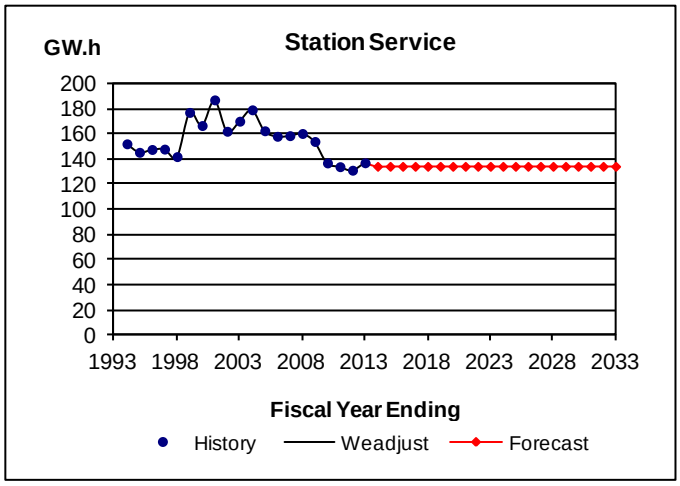
Transmission Losses

Figure 16 - Transmission Losses

Transmission Losses are the amount of energy lost while delivering power from the generation stations to all of the distribution substations that make up Common Bus. Transmission Losses only contains losses associated with supplying Manitoba customers. Losses attributable to exports and the gains attributable to imports are excluded. Transmission Losses are substantial because most of the northern generation is transmitted to southern distribution points 900 kilometers away. Transmission Losses vary year to year depending on water conditions, system configuration, outages and the magnitude of the load. Losses were up significantly in 2002/03 due to two High Voltage Direct Current (HVDC) transformer failures.



Transmission Losses are forecast to be 9.3% of the General Consumers Sales less Diesel Sales.

Station Service

Figure 17 - Station Service

Station Service is the energy used by power plants to generate power and service their own load. Station Service energy was not measured prior to 1993/94 but was previously included within Transmission Losses.

Station Service energy is forecast to be 134 GW.h from 2013/14 to 2032/33. Station Service for non-committed sites (e.g. Conawapa and Keeyask) is not included in the forecast.

Gross Firm Energy

Figure 18 - Gross Firm Energy

Gross Firm Energy is the energy required to serve Manitoba Hydro's customers on the Integrated System. It excludes exports, interruptible (non-firm) loads, Diesel Sales and Station Service for non-committed plants.

Gross Firm Energy has grown steadily during the past twenty years, except for the economic slowdown in the early 1990's and more recently in 2009.

Weather adjusted Gross Firm Energy has grown 334 GW.h (1.6%) per year for the past 20 years and 266 GW.h (1.2%) per year during the past 10 years reflecting the recent economic downturn. This historical growth includes the effect of past Demand Side Management (DSM) initiatives. Energy is forecast to grow 420 GW.h (1.6%) per year for the next 10 years and 413 GW.h (1.5%) per year for the next 20 years.

Gross Total Peak

Figure 19 - Gross Total Peak

Gross Total Peak is the maximum integrated (i.e. average) hourly load required to serve Manitoba Hydro's customers on the Integrated System. It excludes exports and Diesel Sales. It includes Station Service and Curtailable Loads.

Typically, the peak occurs on a very cold winter weekday either in the morning (often from 8 a.m. to 9 a.m.) or in the afternoon, (from 5 p.m. to 6 p.m.) Electric heating contributes by placing the peak on one of the coldest days, whereas the operation or lack thereof of large industrials often makes the difference as to the specific day and peak hour.

Weather adjusted Gross Total Peak has grown from 3,547 MW in 1993/94 to 4,559 MW in 2012/13 at an average growth of 44 MW or 1.2% per year. It is forecast to grow to 5,959 MW at 76 MW (1.5%) per year by 2032/33.

Peak load is measured and recorded differently than energy data. The system load at every hour is calculated by System Operations as:

Hourly Gross Total Peak (t)

= Hourly Total Generation (t)

- Hourly Metered Exports (t) + Hourly Metered Imports (t)

- Losses Associated with Exports (t) + Gains Associated with Imports (t)

+ Curtailments (t)

Losses for exports and gains for imports are only known on a monthly energy basis. The hourly value is obtained by using the ratio of exports/imports for the hour to the total exports/imports for the month and applying that to the total metered loss/gain for the month. The remaining difference between the balance of the load and Common Bus is taken as the Transmission Losses associated with Manitoba load.

Curtailments for individual customers are calculated as the difference between what the customer would have used if not curtailed versus what they did use. This is not the same as the calculation used for billing.

Annual Peak

The forecast annual peak is higher than the maximum of the monthly peaks. This is due to the peak being possible in any of the winter months and must be higher than the peak of the other months. For studies requiring yearly data, the annual peak should be used.

16 Hour Peak

The peaks in this document are integrated hourly peaks. For some studies and analysis of avoided cost or DSM savings, an estimate of the average peak during onpeak hours (from 6 a.m. to 10 p.m.) may be desired. To convert hourly peak to 16 hour peak, multiply the hourly peak in the associated month by the following percentages:

Jan	Feb	Mar	Apr	May	Jun	Jul	Aug	Sep	Oct	Nov	Dec	Annual
94.4%	94.9%	95.8%	96.0%	96.3%	96.0%	96.6%	95.6%	95.8%	96.6%	95.6%	95.5%	94.8%

VARIABILITY AND ACCURACY

Weather Effect and Weather Adjustment

The weather effect is determined in any sector by regressing the last two years of actual monthly energies against the actual DDH and DDC for the month. This results in a GW.h per DDH effect and a GW.h per DDC effect for that sector.

Only sectors whose major variation is due to weather can have a weather effect estimated. Sectors that vary primarily due to industrial output levels or seasonal but non-weather reasons may yield false weather effects if estimated. Weather effects are not determined for the GS Top Consumers, Seasonal, Diesel, Water Heating and Lighting sectors. Assigning them a weather affect and weather adjusting them will not improve their forecast.

For sectors where a weather effect is calculated, this document will show energy as the reported value and as a weather adjusted value. Forecasts are based on the weather adjusted values. The calculations are:

Weather Adjustment = DDH weather effect * (DDH actual - DDH normal)
+ DDC weather effect * (DDC actual - DDC normal)

Weather Adjusted Actual = Actual - Weather Adjustment

Following are the DDH and DDC weather effect factors by sector:

Residential: 0.6 GW.h / DDH, 1.1 GW.h / DDC
GS Mass Market: 0.3 GW.h / DDH, 0.9 GW.h / DDC
General Consumers Sales: 0.8 GW.h / DDH, 2.0 GW.h / DDC
Gross Firm Energy: 1.1 GW.h / DDH, 2.3 GW.h / DDC
Gross Total Peak: 40 MW / degree (at -30 degrees Celsius),
120 MW / degree (at +30 degrees Celsius)

Effect of Extreme Weather

A record cold winter will increase load 4% and a record warm winter will decrease it 4%. An additional 2% load increase is possible due to a record hot summer and a 1% decrease due to a record cool summer.

The effect of extreme weather is larger on a monthly basis, and even larger on a daily basis.

		Effect of Weather due to Winter Extremes on Gross Firm Energy							
	GW.h/DDH	Normal		Record Warm			Record Cold		
	1.1	DDH	GW.h	DDH	GW.h	Effect	DDH	GW.h	Effect
Year:	2013/14	4541	25239	3678	24289	-4%	5439	26227	4%
Month:	Jan 2014	944	2772	663	2463	-11%	1261	3122	13%
Day:	Jan 2014	30	89	6	63	-30%	56	118	31%

		Effect of Weather due to Summer Extremes on Gross Firm Energy							
	GW.h/DDC	Normal		Record Cool Summer			Record Hot Summer		
	2.3	DDC	GW.h	DDC	GW.h	Effect	DDC	GW.h	Effect
Year:	2013/14	190	25239	69	24960	-1%	364	25639	2%
Month:	July 2013	71	1845	6	1695	-8%	142	2007	9%
Day:	July 2013	2	60	0	54	-9%	14	86	45%

The residential sector has a larger proportional effect of weather, varying from an increase of 7% in a record cold winter to a decrease of 7% in a record warm winter, and a possible additional increase of 3% due to a record hot summer and a 2% decrease due to a record cool summer.

		Effect of Weather due to Winter Extremes on Residential Energy							
	GW.h/DDH	Normal		Record Warm			Record Cold		
	0.6	DDH	GW.h	DDH	GW.h	Effect	DDH	GW.h	Effect
Year:	2013/14	4541	7339	3678	6821	-7%	5439	7878	7%
Month:	Jan 2014	944	996	663	827	-17%	1261	1187	19%
Day:	Jan 2014	30	32	6	18	-45%	56	47	48%

		Effect of Weather due to Summer Extremes on Residential Energy							
	GW.h/DDC	Normal		Record Cool Summer			Record Hot Summer		
	1.1	DDC	GW.h	DDC	GW.h	Effect	DDC	GW.h	Effect
Year:	2013/14	190	7339	69	7206	-2%	364	7531	3%
Month:	July 2013	71	426	6	355	-17%	142	504	18%
Day:	July 2013	2	14	0	11	-18%	14	27	94%

Load Variability

Uncertainty is an inherent characteristic of forecasting. The load will vary both year to year and long term because of underlying changes in population growth, economic growth, changes in the operations of Top Consumers, and overall use patterns. An economic recession will slow energy growth. An economic boom will increase it. Cycles cannot be predicted in advance so some appropriate midpoint must be chosen as the forecast.

This forecast was created as Manitoba Hydro's best estimate of Manitoba's future energy requirement. The expectation is that there will be a 50% chance that actual growth will be higher than the forecast, and a 50% chance that actual growth will be lower than the forecast.

To evaluate the potential for variation, historic load variability has been analyzed using a probabilistic-based approach. Variations in annual weather adjusted load that have occurred in the past are used to estimate future variation. Doing this provides an estimate of the magnitude of the potential load variation from the forecast due to population, economy and other effects. 10% and 90% confidence bands (-/+ 1.28 standard deviations) were selected to be a proxy for the Low and High Load Forecast Scenarios for use in risk analysis studies. They are calculated as follows:

Load = Base Forecast -/+ 1.28 x Standard Deviation

For other probability points, substitute for the 1.28 the following numbers:

Prob	0.1%	2.5%	10%	20%	50%	80%	90%	97.5%	99.9%
Z(Prob)	-3.09	-1.96	-1.28	-0.84	0.00	0.84	1.28	1.96	3.09

This calculation gives the variability due to long term economic effects. It does not include variability due to weather which was removed through the use of weather adjusted load.

If variability due to weather is needed, the standard deviation of annual energy or annual peak due to weather has been found to be approximately 2% of the load. This 2% of load can be used as the standard deviation in a probability point calculation. The resulting variance can be added to the economic-based variance if a combined variance is needed. A straight addition of variances can be done because the weather is mostly independent of the economy.

The following four charts and tables summarize the variability for energy and peak. By 2032/33, the Load Forecast has an 80% probability of being accurate to within ±2,471 GW.h or ±7.6%. Due to the inherent variability of the load, this is the best level of accuracy possible.

5 and 10 Year Forecast Accuracy

Due to the load variation caused by population growth and economic growth, there is only a certain level of accuracy possible. Recognizing the inherent uncertainty of forecast, historic forecast variation has been tracked. Manitoba Hydro's objective is that a five year forecast is within 5% and a ten year forecast is within 10%.

The following four figures and tables compare previous load forecasts to actual results 5 and 10 years later.

The energy savings achieved under Manitoba Hydro's market-based DSM programs between the year the forecast was prepared and the year being forecast was subtracted first from the forecast value. The difference is taken as the accuracy of the forecast.

The following figures and tables may seem to give the impression that there may be cycles in the forecast made up of alternating periods of over-forecasting and under-forecasting. But these are not so much due to a bias in the forecast as they are due to unexpected periods of recession or economic growth. Once one of these unexpected periods occur, it will affect the accuracy of the previous five 5-year forecasts for 5 years, and the accuracy of the previous ten 10-year forecasts for ten years.

Compensation for these periods of over and under-forecasting cannot be applied until after the events occur and only then can be identified and quantified. The forecast assumes average expected economic conditions. When that does not occur, the forecast will be high or low.

The weather adjusted Gross Firm Energy is shown in two separate columns in the Energy Accuracy table and they vary in each year due to the difference in weather normals used in each of the respected forecasts. Those weather normals differences are due to the use of a 25 year rolling average which relies on the previous 25 years of weather data at the time the forecast is created.

POSSIBLE EVENTS

Manitoba Hydro examines possible events of interest for their potential impact on system load requirements. These events are deemed to be captured within the overall load variability analysis of the forecast. Although not specifically identified within the analysis, they are presented so their individual effects may be considered from a sensitivity perspective if the need arises. These events are summarized in the following table.

	Energy Effect (GW.h)	Peak Effect (MW)
Climate Change per Degree Celsius Warmer	+100	-40
One New Very Large Industrial Customer	+1,500	+180
One Less Very Large Industrial Customer	-1,500	-180
Additional Load if Electric Vehicles Grow to 70%	+2,312	+289
10% of all Res Customers switch to Electric Heat	+746	+246
10% of all Res Customers switch to Electric Water Heaters	+198	+23

To provide context for the previous table, one year of energy growth is approximately 420 GW.h and one year of peak growth is approximately 80 MW.

Climate Change

The Intergovernmental Panel on Climate Change projects an increase in global temperature as a result of rising concentrations of greenhouse gases in the atmosphere. Changes to temperature and extreme events have the potential to influence future energy demands.

In the last 100 years, the city of Winnipeg's 25-year average temperature has resulted in Degree Days Heating (DDH) in the range of 4500 to 5000 each year. A 25 year moving average has been selected for the forecast to help minimize the effects of year to year variability and to represent the long term climatology. This section quantifies the general effect caused by a 1°C increase in average daily temperature throughout the year.

In Manitoba Hydro's case, if Winnipeg experienced a uniform 1°C warming throughout the year, winter months would be subject to less heating while summer months would be subject to more cooling. Over 200 winter days, every degree Celsius of temperature rise above average conditions will result in an approximate decrease of 200 Degree Days Heating (DDH) per year, and a corresponding approximate increase of 100 Degree Days Cooling (DDC) per year over 100 summer days.

Applying the Weather effect for Manitoba Hydro at Generation gives:

Decrease of 200 DDH ➔ -200 GW.h and -40 MW in the winter

Increase of 100 DDC ➔ +300 GW.h and +120 MW in the summer

The resulting total effect of every one degree increase in temperature would be:

An increase of 100 GW.h to annual energy and a decrease of 40 MW to system peak.

	Energy (GW.h)	**Peak (MW)**
Climate Change per Degree Celsius Warmer	+100	-40

Potential Load from Very Large Industrial Customers

This forecast includes an expectation that there may be new large industrial users of electricity that may come to Manitoba. GS Top Consumers includes a Potential Large Industrial Loads category that adds 1,700 GW.h to GS Top Consumers by 2031/32. This is expected to be made up of increases and decreases by current top consumers, additions of new top consumers and company closures. However, this forecast does not anticipate the scenario of a single customer using up the entire PLIL category.

Manitoba Hydro's largest customer currently uses in excess of 1,500 GW.h annually and has a coincident peak load of about 180 MW. It is feasible that one or more customers of this size could decide to start up in Manitoba in the next 20 years. A single large new customer could use the entire 1,700 GW.h of energy that has been reserved in the Potential Large Industrial Loads category.

Similarly, there is a chance that one or more very large customers can close down. This could also be the equivalent of losing Manitoba Hydro's largest customer.

	Energy (GW.h)	**Peak (MW)**
Additional Load for one new very large customer	+1,500	+180
Loss of Load for the loss of our largest customer	-1,500	-180

Potential Load from High Adoption of Electric Vehicle Technology

This forecast already assumes there will be a noticeable impact due to adoption of electric vehicles within Manitoba over the next twenty years. The specifics have been detailed in the Plug-In Electric Vehicles section of this document.

But there is a possibility that the current technological challenges will be solved, price will match those of internal combustion vehicles, and range anxiety will be alleviated. Should breakthroughs and advances in battery technology, changes in consumer perceptions, and price reductions happen in the next few years, it is possible that electric vehicles may grow to be the dominant vehicle. Under this assumption, electric vehicles may grow to be 70% of the market share in 20 years.

Assuming 70% of all vehicles in Manitoba in 2032/33 are Plug-In Electric Vehicles (PEVs), then these vehicles would use 2,384 GW.h and 298 MW. Currently, the forecast includes 72 GW.h and 9 MW for PEVs, therefore 70% saturation would be an increase of 2,312 GW.h (5½ years of load growth) and 289 MW (about 3½ years of peak growth).

	Energy (GW.h)	Peak (MW)
Additional Load with 70% Electric Vehicle Saturation Rate	+2,312	+289

Increased Residential Use of Electricity for Space heat

Under current natural gas prices, it is cheaper to heat one's home with a high efficiency natural gas furnace than with electricity. This forecast assumes that natural gas will retain its price advantage over electricity over the next 20 years. The forecast is that by 2032/33, 221,868 or 39.3% of Residential Basic customers will heat their home with electricity.

However, there is a possibility that more customers could switch to electric space heat. If the percentage of electric heat billed customers rises by 10% to 49.3%, then by 2032/33, 278,341 electric heat customers would use 24,869 kW.h each, and 286,245 other customers would use 11,487 each. Total usage would be 746 GW.h higher than forecast (almost 2 years of load growth) in 2032/33. At a 35% load factor, this would add 246 MW to the peak (3 years of peak growth).

	Energy (GW.h)	Peak (MW)
10% of all Res Customers switch to Electric Heat	+756	+246

Increased Residential Use of Electricity for Water heat

New homes are now primarily built with electric water heaters rather than natural gas water heaters regardless of their space heat fuel choice. In existing homes, as standard and mid-efficiency gas furnaces are being replaced with a high efficiency gas furnace, some homeowners are choosing to replace their existing natural gas water heaters with electric water heaters.

However, there is a possibility that more customers could switch to electric water heaters. If the percentage of customers with electric water heaters rises by 10% to 72.5%, then by 2032/33, 56,459 additional electric water heaters would use 3,500 kW.h each. Additional usage would be 198 GW.h (about ½ year of load growth). At a 100% load factor, this would add 23 MW to the peak (about ¼ of a year of peak growth).

	Energy (GW.h)	Peak (MW)
10% of all Res Customers switch to Electric Water Heaters	+198	+23

ASSUMPTIONS

Economic Assumptions

Economic forecast assumptions are taken from the 2013 Economic Outlook and the 2013 Energy Price Outlook. These documents contain Manitoba Hydro's forecasts of economic variables including prices of electricity, natural gas and oil, Gross Domestic Product (GDP), Manitoba population and residential customers.

The following are the economic variables used in the preparation of this Electric Load Forecast:

Residential Customers - The number of Residential Basic customers in Manitoba is forecast to increase by 1.2% (5,633 units) in 2013/14 and averages 1.1% per year over the forecast period. This compares to a historical average increase of 1.0% per year over the last ten years. This is used in the Residential and GS Mass Market customer forecasts.

Electricity Prices - The electricity price forecast is based on CPI and rate increase projections contained in the Integrated Financial Forecast. The real electricity price is forecast to increase by 1.7% in 2013/14, and then increase by 2.0% per year throughout the rest of the forecast period.

Natural Gas Prices – Manitoba Hydro views the natural gas price forecast as commercially sensitive information. Consistent with the Clean Environment Commission and Electric General Rate Application, this information will not be publicly disclosed.

Gross Domestic Product (GDP) - Real economic growth in Manitoba is forecast to be 2.4% in 2013/14. It is expected to stay at approximately that level for several years, then decline to 1.7% by 2019/20 and remain at that level for the remainder of the forecast period. This is used in the GS Mass Market customer forecast.

Normal Weather Assumptions

Weather for forecast purposes is measured by degree days. Winnipeg temperatures are used, as Winnipeg is central to most of the weather-dependent load (Residential and General Service Mass Market) in Manitoba.

Cold weather is expressed in Degree Days Heating (DDH), which is the number of average degrees colder than 14 degrees Celsius each day. Hot weather is expressed in Degree Days Cooling (DDC), which is the number of average degrees warmer than 18 degrees Celsius each day. Daily temperature is the average of the high and low temperature for the day. The equations are:

DDH = sum (max(0, 14 - (Daily high + Daily low) / 2))

DDC = sum (max(0, (Daily high + Daily low) / 2) - 18)

The base temperature of 14 degrees for DDH is the temperature below which most buildings have their heating systems (furnaces) running.

The base temperature of 18 degrees for DDC is the temperature above which buildings start to run their space cooling systems (air-conditioning).

The forecast is prepared assuming normal weather. Normal weather is determined from the 25 year average of Degree Days Heating and Degree Days Cooling in Winnipeg over the period April 1988 to March 2013.

The 25 year weather normals used for every year of this forecast are 4,541.3 DDH and 190.1 DDC. This is an increase of 22.9 DDH from last year's normal of 4,518.4 DDH, and an increase of 2.0 DDC from last year's normal of 188.1 DDC.

The range of DDH from 1988 to 2013 was from a warm winter of 3,677.6 DDH in 2011/12 (863.7 DDH below normal) to a cold winter of 5,439.3 DDH in 1995/96 (898.0 DDH above normal).

The range of DDC from 1988 to 2013 was from a cool summer of 71.8 DDC in 2004/05 (118.3 DDC below normal) to a hot summer of 364.1 DDC in 1988/89 (174.0 DDC above normal).

Demand Side Management (DSM) in the Forecast

This forecast reflects future DSM savings associated with existing Provincial building codes and improved equipment efficiency standards (Codes and Standards). This is the only DSM initiative that is specifically accounted for in the forecast.

Savings due to DSM programs to date are embedded in the historical data that is the basis for this forecast. The current level of past achieved DSM savings is assumed to remain in place throughout the future. Future DSM savings arising from future Power Smart offerings and market engagement above the current level and incremental to the above mentioned Codes and Standards are treated as a supply-side resource and are not included in this forecast. They are accounted for separately in Manitoba Hydro's Power Smart Plan and Power Resource Plan.

As a result, historical growth rate in this document are not directly comparable to future growth rates because the history includes the effect of past DSM initiatives, but the forecast does not.

For customers involved in DSM initiatives such as the Load Displacement and Alternative Energy, the most recent years of history are used as the basis of their forecast. Any increase or loss to their alternative energy supply will not be included in the forecast, and are accounted for with the other DSM initiatives within the Power Smart Plan.

METHODOLOGY

Residential Basic Methodology

The Residential Basic forecast was determined using a combined electricity and natural gas end use approach. The end use assumptions include usage information and efficiency improvement information. The number of appliances and their estimated usage were multiplied together to calculate an energy forecast for each end use, and then all uses were combined to calculate the total use for the Residential End Use Forecast. The following steps were used:

1. **Total Number of Residential Customers** - The forecast of the total number of Residential Basic customers for the 2013/14 to 2032/33 period is taken from Manitoba Hydro's 2003 Economic Outlook that is produced by the Economic Analysis Department. This customer forecast was the primary input for the Residential End Use Model.

2. **Residential Survey Data** – The 2009 Residential Survey was used to provide estimates as of November 2009 of the following:

    a) **Customers by Dwelling Type and Area:** Dwelling types include: Single Detached, Multi-family Attached, and Individually-Metered Apartments. Single detached dwelling types are sub classified into three Areas: Winnipeg, Gas Available Areas Outside of Winnipeg, and Gas Unavailable Areas.

    b) **Customers by Heating Type** - Each combination of Dwelling Type and Area are divided into three Heating Types: Electric Heat Billed customers, Natural Gas Heat Billed customers and Other Heat customers. Electric Heat Billed customers pay for their space heat with their electricity bill. Natural Gas Heat Billed customers pay for their space heat with their natural gas bill. Other Heat customers may use fuel oil, propane or wood, or may use electric or natural gas heat but are not billed on their own electricity or natural gas bill for their heat.

    c) **Age of Home and Heating System** – Home age was used to determine new home construction rates by dwelling type, area and heating type. Heating system age was used to determine heating system replacement rates.

d) **Appliance Saturations and Ages** – Appliance saturations were used to estimate the number of various types of appliances, and appliance ages were used to estimate their replacement rates.

3. **Determination of Average Use** – Conditional Demand Analysis was then performed on the Residential Survey data combined with the Billing data to derive the average annual energy use per appliance calibrated to the whole-house usage. Usage of newer appliances can differ from that of older appliance. Average use for new appliances was determined where there was a difference.

4. **Calibrate Starting Year** – Customers, saturations and average usage were combined to give starting values for the 2009/10 fiscal year corresponding to the 2009 Residential Survey results. These were also calibrated to the billing data for 2009/10.

5. **Calibrate History** – Growth and replacement rates from the Survey were applied to starting year values to derive values for 2010/11, 2011/12 and 2012/13. These were calibrated to billing data for those same years.

6. **Future Growth** – Forecasts of the number of homes, heating systems and appliances, their average usage and their total use were calculated as follows:

   a) **New Construction** - The percentage of newly constructed homes choosing electric space heat was forecast for each area using the 2009 Residential Survey estimate. This estimate was adjusted to reflect Manitoba Hydro's initiatives being undertaken to reduce the number of customers choosing electricity for space and water heat.

   b) **Appliance Forecast** - Historical saturation and age distribution data was collected from the 2009 Manitoba Hydro Residential Survey. Saturations were forecast using a birth/death/replacement model.

   c) **New Appliance Usage** - Average use for new appliances was taken from Conditional Demand Analysis.

d) **Total Energy Use -** The forecast number of appliances was multiplied by the forecast average use to get the total forecast usage for each appliance. The appliance usages were summed to get the total forecast energy use for the Residential Basic rate class.

7. **Final Adjustments** – Electric Vehicles were added, and savings from Standards and Codes are subtracted.

   Ninety percent of the Plug-In Electric Vehicle forecast was added to the Residential GW.h. (The other ten percent of the electric vehicle forecast was allocated to the General Service Mass Market forecast.)

   Estimates of improvements due to future Codes and Standards that were not handled by the new appliance average usages were obtained from the Power Smart Planning and Evaluation Research Department and were subtracted.

General Service Mass Market Methodology

A) General Service Mass Market Customer Forecast

Econometric analysis of sales data is used to develop models for the number of customers. Forecasts of Manitoba GDP and Manitoba Hydro Residential Customers from the Manitoba Hydro 2013 Economic Outlook are then input into the models, which generate forecasts for the number of customers for each year of the forecast period.

The number of customers at fiscal yearend was forecast using the following calculations for each year (t):

Number of Customers (t)
= Number of Customers (t-1)
+ Change in the Number of Customers (t)

Change in the Number of Customers (t)

= Number of Customers (t-1)
x Percentage Change in Number of Customers (t)

The percentage change in number of customers was modeled using yearend historical customer data from 1984/85 to 2012/13. The resulting model and parameters are as follows:

Percentage Change in Number of Customers (t)
= -0.003 + 0.132 x CGDP + 0.660 x CRES

CGDP - Annual Percentage Change in Manitoba Gross Domestic Product
CRES - Annual Percentage Change in Residential Basic Customers

R-squared: 58.9%
T-stats:
Constant : -1.58
CGDP : 3.72
CRES : 4.05

General Service Mass Market customer growth is allocated to Medium and Large classes using their 10 year average percentage of Mass Market customer growth, the Small Non-Demand class is allocated 10% of new customers, and the rest of the growth is allocated to the Small Demand class.

B) General Service Mass Market Average Use Forecast

Average use for new customers in each rate class is forecast to be the five year average use of its respective class for the duration of the forecast period. Specifically these are:

i) Small Non-Demand - 31,075 kW.h per year
ii) Small Demand – 166,315 kW.h per year
iii) Medium - 1,572,917 kW.h per year
iv) Large - 5,834,523 kW.h per year

Top Consumer customers are excluded from these classes for forecasting purposes.

Customers are assigned to a rate class depending on their usage. If usage by an individual customer increases (or decreases) sufficiently then they will be re-assigned to the appropriate rate class. These shifts tend to offset each other over time so individual classes have not shown significant upward or downward trends in average use. By definition, the truncation of these classes results in relatively stable average use for each class.

C) General Service Mass Market Total Use Forecast

Total GW.h for the General Service Mass Market sector is forecast by multiplying the forecast number of customers in each rate class by the forecast average use per customer in each rate class. The total number of customers in the GS Mass Market sector is forecast using econometric models, and then the total is allocated among the rate classes based on historical data. The average use per customer is forecast using the five year average for each rate class.

Ten percent of the Plug-In Electric Vehicle forecast is added to the GW.h for the Small Non-Demand rate class. (The other ninety percent of the electric vehicle forecast is allocated to the Residential forecast.) Forecast savings from future Codes and Standards are taken off of the forecast to calculate the Total Use.

Total Use (t) in GW.h

= Weather Adjusted Actual Usage for the Current Year
+ Number of New Small Non-Demand Customers (t)
x Average Annual Use of Small Non-Demand Customers (t)
+ 10% of Plug-in Electric Vehicle Forecast
+ Number of New Small Demand Customers (t)
x Average Annual Use of Small Customers (t)
+ Number of New Medium Customers (t)
x Average Annual Use of Medium Customers (t)
+ Number of New Large Customers (t) x Average Annual Use of Large Customers (t)
- Forecast Savings from Codes and Standards (t)

General Service Top Consumers Methodology

Top Consumers is made up of the largest electricity users of Manitoba Hydro. The general criterion is that a company needs to have used 80 GW.h in a year, or have the potential to consume 80 GW.h in a year. A Top Consumer is not necessarily located in one place, but may consist of services at number of locations throughout the Province. A Top Consumer will be one company, but may count as multiple billing customers.

Each company in the Top Consumers group is forecast individually. Information on individual company operating plans is collected from industry news, Manitoba Hydro's economic experts and Manitoba Hydro's Key & Major Account representatives. This information is used to prepare company specific forecasts.

Normally, information is only available over the next 3 to 5 years for any company. These short term considerations are taken into account, and then the company's individual forecast is held constant.

To account for longer term growth in this group of consumers, a special classification called Potential Large Industrial Loads (PLIL) has been created. PLIL is used instead of attempting to forecast each consumer individually for the long term. It represents the natural growth of all the top consumers as a group, as well as unexpected major expansions, new customers, or loss of customers from GS Top Consumers.

Starting in 2014/15, 100 GW.h a year is forecast for PLIL to account for unforeseen expansion, contraction and growth. This will result in the addition of 1,700 GW.h of PLIL after 20 years.

Electric Vehicles

The methodology for forecasting Electric Vehicles was to research relevant recent literature and to apply appropriate assumptions from this literature to Manitoba's situation. Historical data on automobile registrations per year in Manitoba was used to help estimate future trends. The forecast section on Electric Vehicles provides the details.

Other Sectors

Seasonal, Water Heating, Lighting

Most of the smaller sales sectors, including Seasonal, Flat Rate Water Heating and Area and Roadway Lighting were done by analysis of changes in the number of customers or services and in changes in average use per customer or service. Growth rates were applied based on history and a best estimate as to what the future will bring.

Diesel

Each of the diesel towns was individually forecast and included in the forecast under the assumption that the diesel towns will not be part of the Integrated System during the forecast period.

Monthly Sales Allocations

Monthly percentages of customer growth through the year and GW.h for the month of the year were averaged for the past five years. These were then applied to the forecast annual customers and kW.h to get the monthly forecast.

Monthly and Annual Gross Firm Energy and Gross Total Peak

The 5 year monthly percentage of Common Bus and Station Service are applied to their annual energy to calculate their monthly values. Transmission Losses are calculated using a 5 year average of their ratio to Common Bus. Monthly Common Bus, Transmission Losses and Station Service are added up to give the Monthly System Energy. Monthly Common Bus, Transmission Losses, Station Service and Gross Firm Energy are totaled to give the Annual Gross Firm Energy.

The Gross Total Peak is calculated from Load Factors applied to the forecast monthly Gross Total Energy. Prior to calculating the Load Factors, the Top Consumer energy and peak are subtracted because the Top Consumers have a higher average hourly energy relative to their peak value than the Residential and General Service Mass Market Customers. A 10 year

historical average Load Factor is calculated for the remaining energy and is applied to the forecast monthly and annual energy to get the peaks for the remaining energy. The Top Consumer peaks are added using an 85% Load Factor applied to the Top Consumer monthly and annual energy.

A 10 year average Load Factor is used instead of a 5 year average due to its variability from year to year. Historical weather adjusted energy is used to calculate Load Factors. The number of hours in the month is used to calculate monthly Load Factors and the number of hours in the year is used to calculate annual Load Factors.

GLOSSARY OF TERMS

Area and Roadway Lighting sector - includes electricity sales for the Sentinel Lighting and Street Lighting rate groups.

Common Bus - is the total load measured from all the distribution points (i.e. substations) within Manitoba. It includes all energy supplied to General Consumers Sales customers, Construction Power plus associated Distribution Losses, but excludes Diesel customers, Transmission Losses and Station Service.

Customer – Most metered electrical services count as a customer. Unmetered services such as flat rate water heating and sentinel rental services do not count as a customer. Street lighting counts all the services grouped as a premise as one customer.

Codes and Standards – A Demand Side Management (DSM) initiative associated with existing Provincial building codes and improved equipment efficiency standards. This is the only DSM initiative that is specifically accounted for in the forecast.

Curtailable - is a load that can be curtailed on short notice. A discount is given for subscribing to this program. Curtailable loads can affect peak demand because some periods of curtailment may be at or near the system peak.

Degree Days Cooling (DDC) - DDC is a measurement designed to reflect the demand for energy needed to cool a building. DDC is the number of degrees warmer than 18 degrees Celsius each day is, based on the average of the high and low temperature of the day.

DDC = sum (max(0, (Daily high + Daily low) / 2) - 18)

Degree Days Heating (DDH) – DDH is a measurement designed to reflect the demand for energy needed to heat a building. DDH is the number of degrees colder than 14 degrees Celsius each day is, based on the average of the high and low temperature of the day.

DDH = sum (max(0, 14 - (Daily high + Daily low) / 2))

Gas Available Area – A city or town in Manitoba where customers have natural gas service available and can choose to heat their home with either natural gas or electricity.

Approximately 82% of Residential Basic customers, including the entire city of Winnipeg, have gas available.

General Consumers Sales - includes the energy supplied to all of Manitoba Hydro's individually billed customers. It excludes export sales.

General Service Mass Market - includes all Commercial and Industrial customers, excluding the Top Consumers group.

General Service sector - made up of sales to Commercial and Industrial businesses served by Manitoba Hydro. This sector consists of five rate groups (Basic, Diesel, Seasonal, Flat Rate Water Heating and Surplus Energy Program).

General Service Top Consumers - is made up of the largest electricity users of Manitoba Hydro.

Gross Firm Energy - is the energy required to serve Manitoba Hydro's customers on the Integrated System. It excludes exports, interruptible (non-firm) loads and diesel customers.

Gross Total Peak - is the maximum integrated (i.e. average) hourly load required to serve Manitoba Hydro's customers on the Integrated System. It excludes exports and diesel customers. It includes curtailable loads.

GW.h (gigawatt-hour): The unit of energy primarily used in this document. One GW.h equals one million kW.h (kilowatt-hours), which is approximately equal to the energy of 100 typical homes not using electricity for heating, or 40 homes that use electricity for heating.

Integrated System - is the power grid that connects Manitoba Hydro's generation sources to its customers. All Manitoba Hydro's customers except diesel are on the Integrated System.

Interruptible (Non-Firm) Energy - includes all energy sold to Manitoba customers on a non-firm basis. Currently, the only rate group for this is the Surplus Energy Program (SEP).

kW.h/cust (kilowatt-hours per customer): The unit of energy primarily used in this document to represent the average use of one customer. The total usage in GW.h of a group of customers is divided by the number of customers and then multiplied by one million.

Load Factor - is the ratio of the average hourly energy over a period, usually a year, divided by the energy used at a specific hour, usually the hour of system peak. A load factor of 25% means that the average energy is one-quarter of what is used at system peak. A load factor greater than 100% means that the average hourly energy is more than what is used at system peak. Given a specific energy, a lower load factor means a higher peak. The equation is:

Load Factor = (Total Energy / Hours) / (Energy over the hour of system peak)

Manitoba Load at Common Bus - is the total load measured from all the distribution points (i.e. substations) within Manitoba. It includes all energy supplied to General Consumers Sales customers plus associated Distribution Losses, but excludes diesel customers, Transmission Losses and Station Service.

MW (megawatt): The unit of peak demand primarily used in this document. One MW is a million watts. One thousand MW of peak demand for one hour equals one GW.h of energy. Alternatively, one MW for a thousand hours also equals one GW.h of energy.

Net Firm Energy and **Net Total Peak** - are the same as Gross Firm Energy and Gross Total Peak except they exclude Station Service. The reporting of Manitoba Load in the Load Forecast used "Net" until 2008. It presented both until 2011. Starting with the 2012 forecast, only the "Gross" is presented. Net can be calculated when needed by subtracting Station Service from the Gross.

Residential Basic – is the primary residential customer group made up of single detached and multi-family dwellings as well as individually metered apartment suites.

Residential sector - made up of sales to residential customers for non-business operations. The Residential sector is comprised of four rate groups (Basic, Diesel, Seasonal, and Flat Rate Water Heating).

Station Service - is the energy used by power plants to generate power and service their own load.

Need for New Resources

JOANNE FLYNN
MARCH 10, 2014

Need for New Resources (with no new exports)

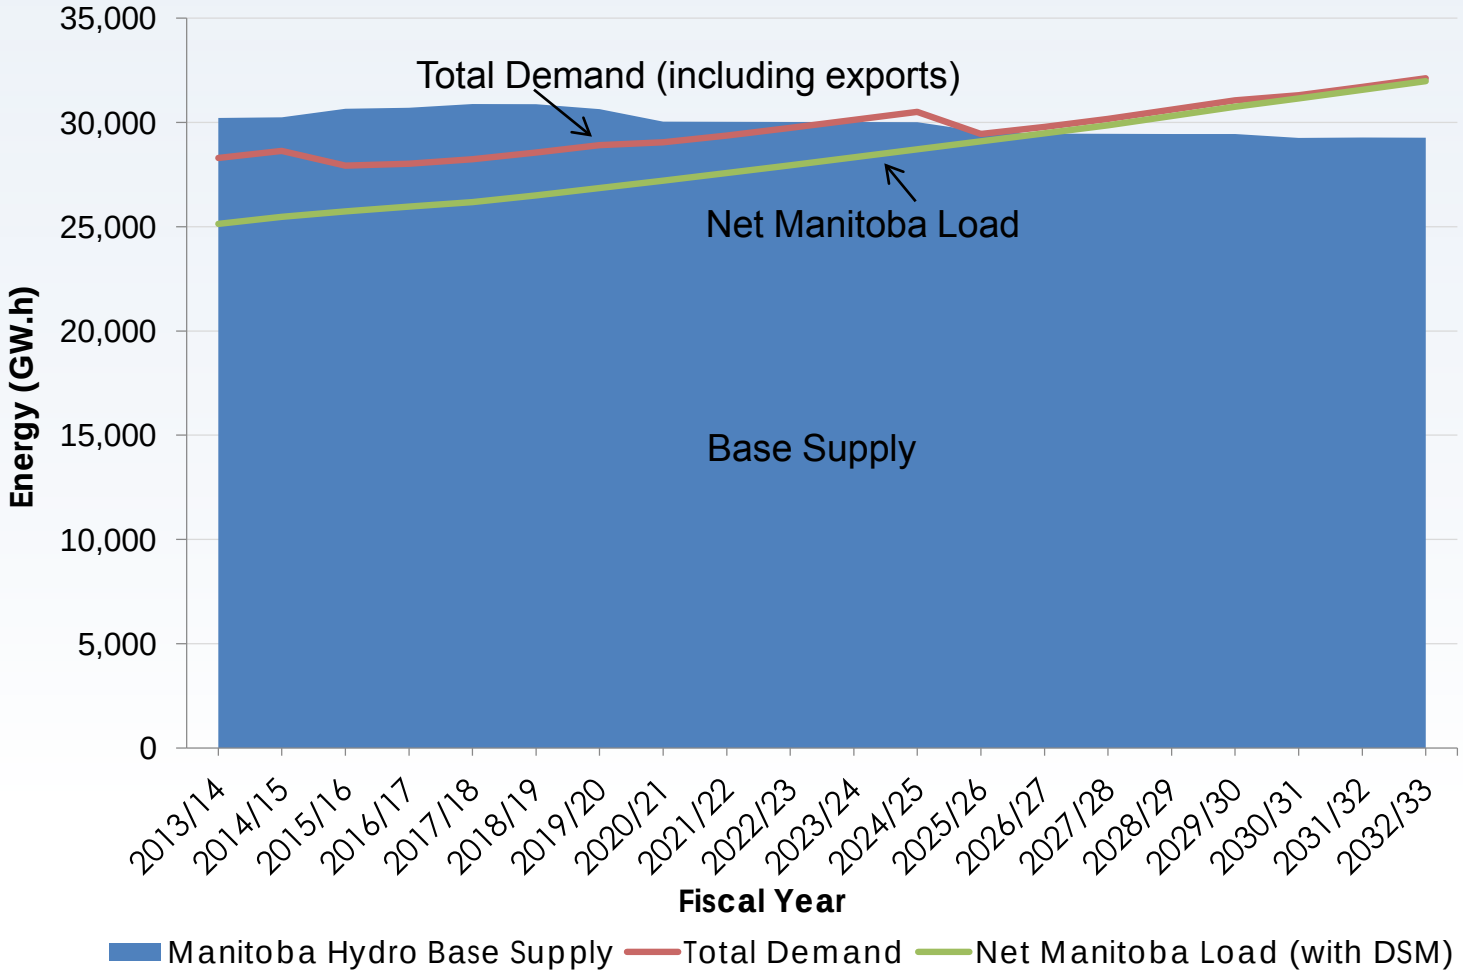
	Dependable Energy	Winter Peak Capacity
2012 Planning Assumptions	2022/23	2025/26
2013 Planning Assumptions	2023/24	2026/27
NFAT DSM 1	2028/29	2030/31
NFAT DSM 2	2031/32	2031/32
NFAT DSM 2 with increased pipeline load	2027/28	2030/31
NFAT DSM 3	2033/34	2033/34
NFAT DSM 3 with increased pipeline load	2029/30	2030/31

Calculations of # Years Advancement of Keeyask for MP, WPS & NSP Sales

NFAT Submission assumed Keeyask Advancement would be:

- 3 to 4 years with base load growth
- 9 years with low load growth
- 11 years with base load and 4X DSM

1. NFAT DSM 2 (all of Option 2) = 2031 Keeyask ISD
2. NFAT DSM 2 (reduced somewhat) = 2029 to 2030 Keeyask ISD
3. Add pipeline load & reduce growth due to elasticity, codes and fuel choice = 2026 to 2028 Keeyask ISD



<u>Keeyask Advancement from 2019 = 7 to 9 years</u>

4. If Keeyask deferred from 2019 to 2020

<u>Keeyask Advancement from 2020 = 6 to 8 years</u>

Thus overall, **<u>Keeyask Advancement likely would be from 6 to 9 years</u>**

Need for New Resources - 2013 Dependable Energy

Generation Planning Criteria

JOANNE FLYNN
MARCH 10, 2014

Manitoba Hydro's Generation Planning Criteria

- Fundamental criteria design is to ensure that the "lights stay on" for many years into the future
- Technical criteria designed to ensure "the continuance of a supply of power adequate for the needs of the province"
- Determines when new supply is needed, and how much
- Does not determine what type of new supply is chosen – that is the purpose of the economic and financial analysis
- Criteria described in Chapter 4, Section 4.3.1 and Appendix 4.1- Generation Planning Criteria of the NFAT submission

Elements of the Generation Planning Criteria

- Capacity Criterion
  - Utilized in all power systems
  - A reserve of generation capacity above the forecast peak load to account for weather related load forecast uncertainty and outages or breakdowns of generation equipment
  - Pertains to system peak conditions – experienced a small number of hours per year
  - MH carries a 12% reserve
- Energy Criterion
  - Utilized only in predominately hydro or other systems where running out of energy due to an extreme drought or fuel supply limitations are a possibility
  - Ensure sufficient energy will be available during a critical energy event – generally the worst drought on record for a hydro system (dependable flow year)
  - Imports are considered as dependable energy resources under certain conditions
  - Pertains to energy use throughout the entire year

Degree of Reliance on Imports

- Limiting imports is reasonable and necessary to ensure an adequate supply of energy for the province of Manitoba.
- Degree of reliance limited for system design to manage the risk associated with energy contingencies at time of operation such as
  - Weather colder than expected (50 percentile) forecast
  - Extended outages of thermal generation or transmission capability for imports
  - Water flow uncertainty within the operating year (in a severe drought)
  - Possibility of a drought worse than the drought of record
- Such import / interconnection limits are common in power system planning
  - Despite having projected loads which are over 2x larger than that of MH and import capability that is 4x larger than MH, BC Hydro relies on a lower percentage imports than does MH
  - US Pacific Northwest has similar restrictive limits on imports from California

Screening of Resource Options

JOANNE FLYNN
MARCH 10, 2014

Screening of Resource Options

- MH monitors a wide range of resource supply options and maintains an inventory of options which are potentially available to meet future Manitoba needs.
- 16 utility-scale supply technologies were considered in the screening process.
- Screening characteristics are grouped into the following categories:
  - Technical
  - Environmental
  - Social and Policy
  - Economic

Resource Screening Characteristics

- **Technical**
  - Maturity of Technology
  - Technical Challenges in Manitoba
  - Ease of Integration into System
  - Intermittency of Energy Supply
  - Seasonality of Energy Supply
- **Social & Policy**
  - Proximity to Load Center (includes issues associated with longer transmission)
  - Regulatory Constraints
  - Social Acceptability
- **Environmental**
  - Water Quality Impacts
  - Hazardous Air Pollutants
  - Greenhouse Gas Emissions
  - Land Use Impacts
  - Wildlife Species of Interest
- **Economic**
  - Delivered Fuel Costs in Manitoba
  - Levelized Cost of Energy - independently sourced & publically available

Technologies Screened Out

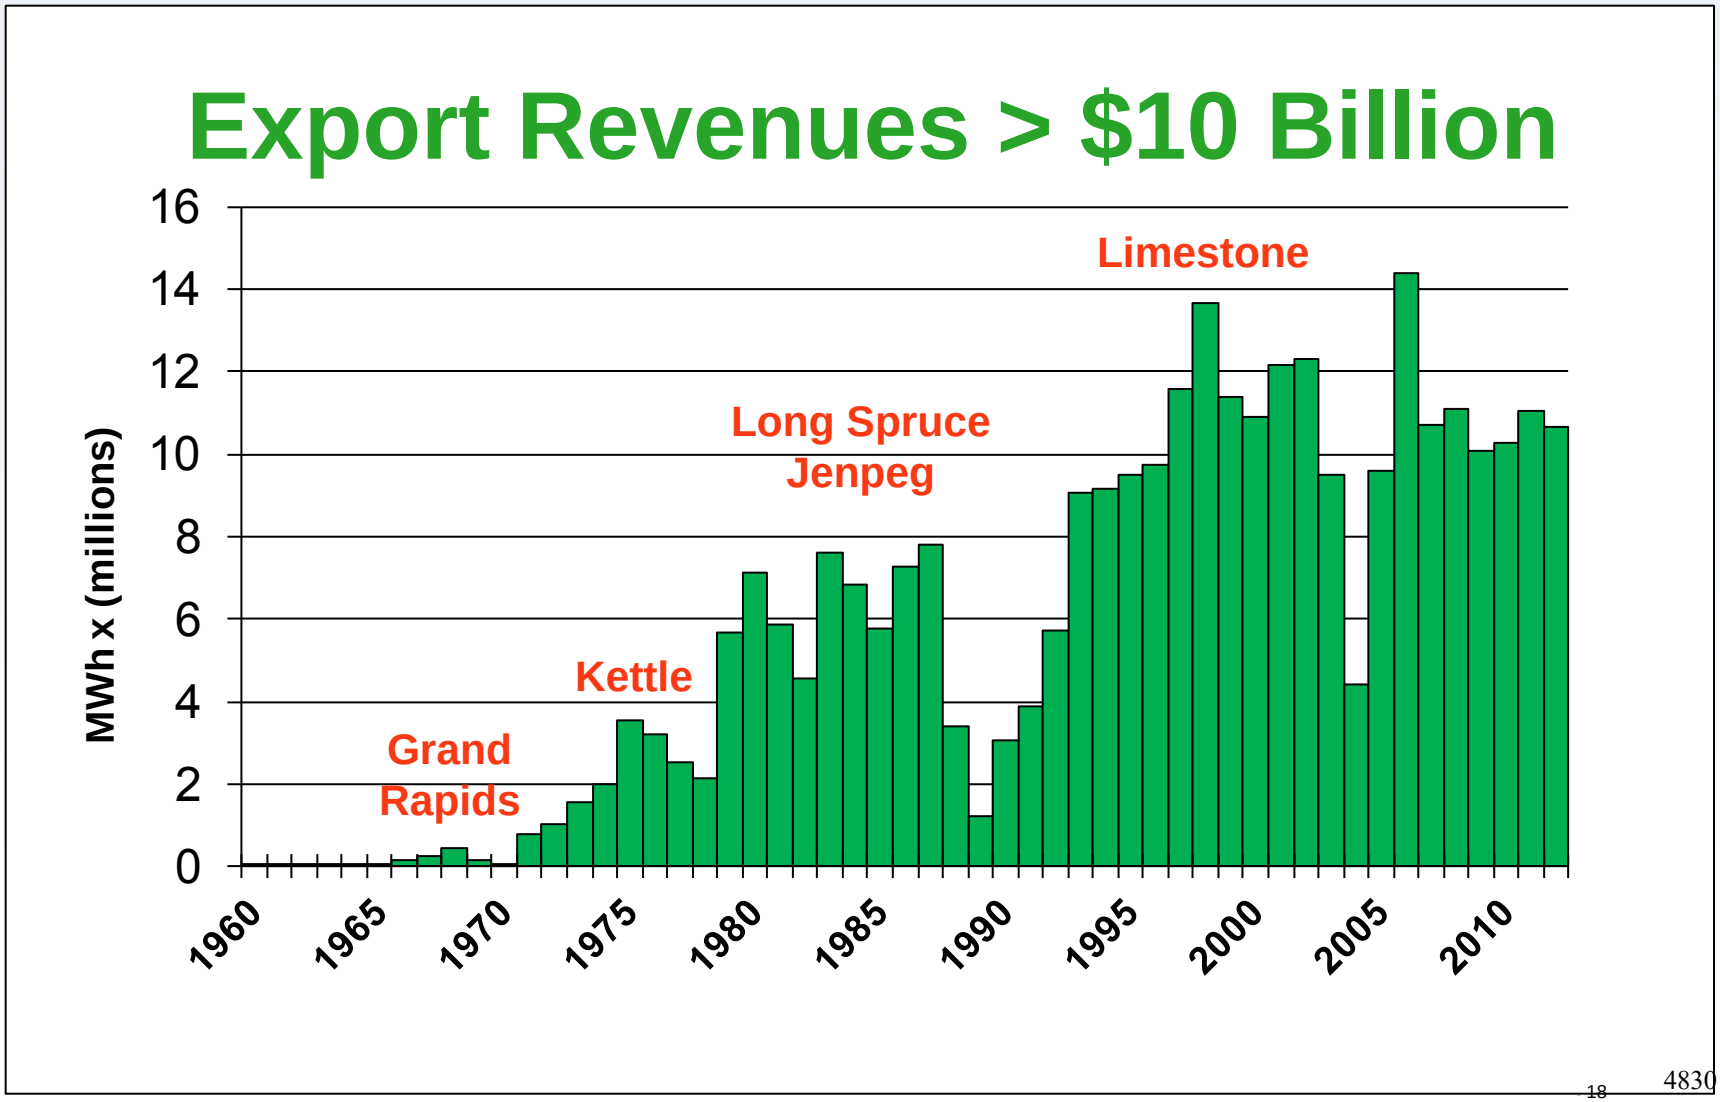
- Of the 10 resource technology categories screened, which include16 technologies, 5 were screened out:
  - Coal, nuclear, enhanced geothermal, biomass and solar

- Utility Scale Solar Generation
  - Screened out as utility scale generation resource on basis of
    - Cost
    - Intermittency – requires either backup generation or storage technology
    - Manitoba peak load occurs in winter when there are reduced sunlight hours

Selected Resource Options

- DSM
- Hydro
  - Keeyask
  - Conawapa
- On-shore Wind Generation
- Natural Gas-fired Generation - SCGT and CCGT
- Imports

Exports



A. DAVID CORMIE, P. ENG.
MARCH 2014

Benefiting from Neighbours Working Together

- Efficient Use of Capital
  - Utilizing surplus capacity
  - Optimizing capacity in-service dates
  - Sharing capacity as a result of load diversity
  - Generation reserve sharing
- Production Cost Savings
  - Economic dispatch
  - Minimizing wasted resources
- Emergency Assistance
- Protecting the Environment
  - NOx, SOx, Hg, particulates
  - Greenhouse gases

Interconnecting Transmission is the Key

50 Years of Being Interconnected

4830

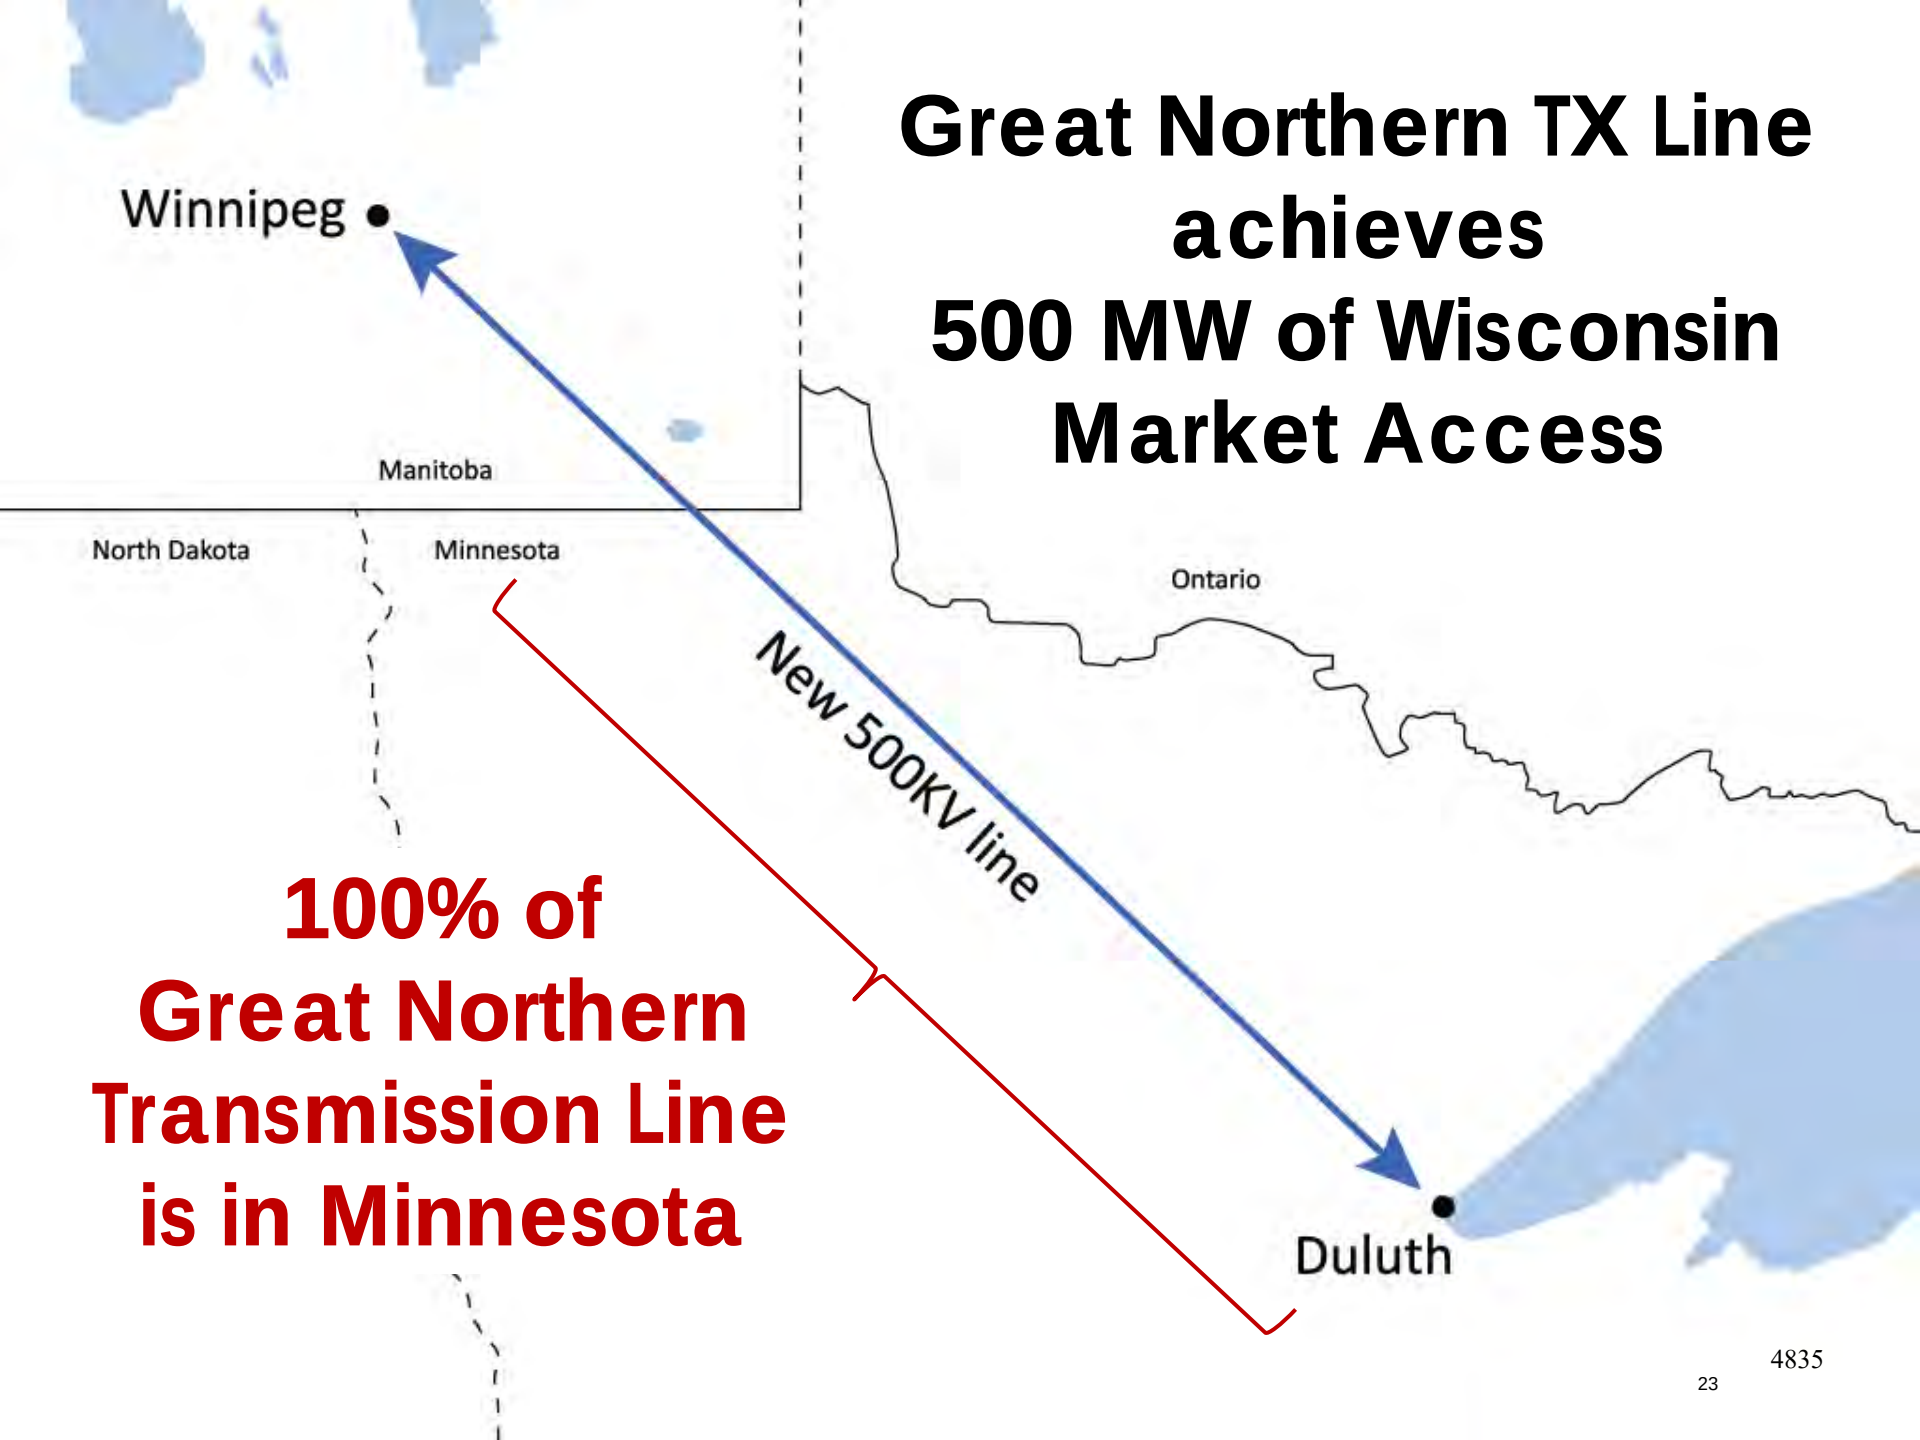
Window of Opportunity
Neighbours Are Making Strategic Decisions Now

- MP, WPS, NSP, GRE, SPC
  - Load is growing
  - Fleet is aging
  - Emissions are being outlawed
  - Gas prices are volatile
  - Wind and gas are only partial solutions
- Hydro purchase is an attractive option
  - Discussions, planning, and agreements since 2008
  - Long term commitments
  - Stable predictable pricing
  - Resource diversity
  - Long term access to surplus hydro energy
  - MH reputation

Window of Opportunity
Signed Agreements

- NSP 125 MW System Power Sale
  - May 1, 2021 – April 30, 2025
  - Subject to Keeyask
- WPS 100 MW System Power Sale
  - June 1, 2021 – May 31, 2027
  - Subject to Keeyask
- MP 250 MW System Power Sale
  - June 1, 2020 – May 31, 2035
  - Subject to Keeyask and new US interconnection
- WPS 308 MW System Power Sale
  - 2027 – May 31, 2036
  - Subject to Keeyask, Conawapa and new US interconnection

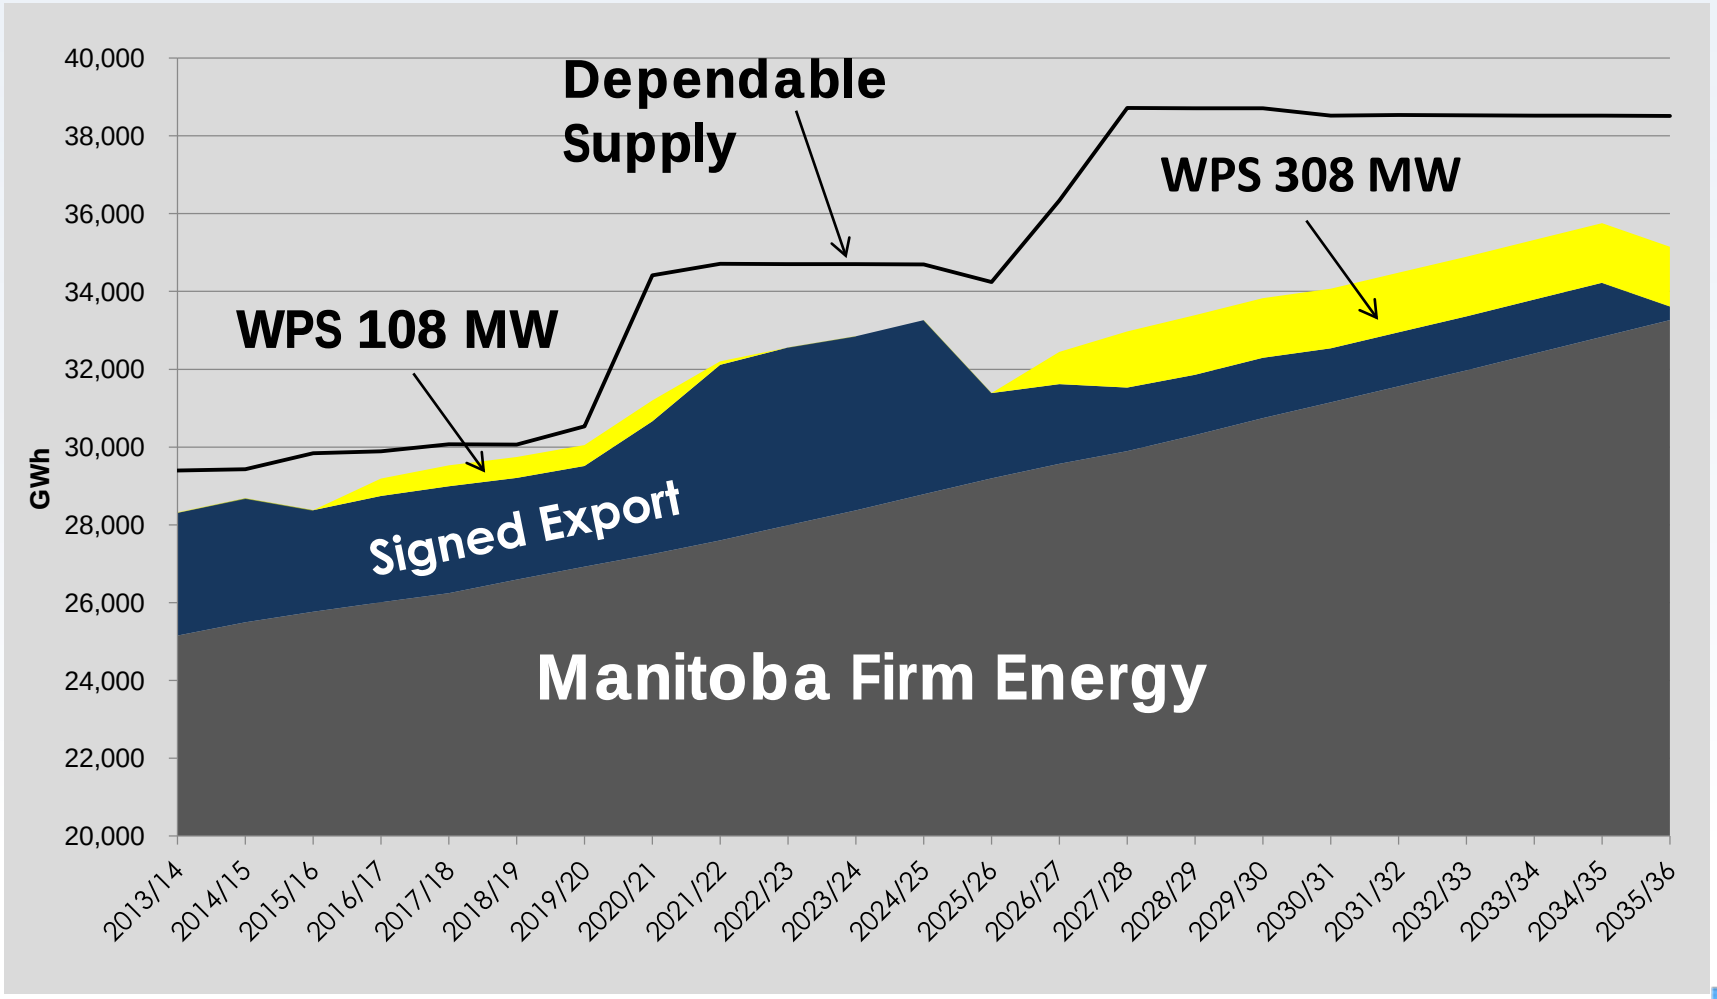
These MH supply obligations have displaced the need for other resources



Window of Opportunity
Potential Sale Agreements

- WPS - 500 MW Term Sheet
  - up to 200 MW beyond the 308 MW
  - Subject to Keeyask, Conawapa and new US interconnection
- GRE - 600 MW MOU
  - Subject to Keeyask, Conawapa and new US interconnection
- SPC - 500 MW MOU
  - 25 MW Term Sheet
  - Additional MW subject to Keeyask, Conawapa and new transmission
- Others - 250 MW
  - In various stages of discussions
  - Subject to Keeyask, Conawapa and new transmission

Window of Opportunity
MP Will Champion Major Interconnection



- US transmission required under MP 250 MW Sale Agreement
  - Minnesota Public Utilities Commission has recognized the need
- MP has agreed to permit and construct 750 MW line
  - At least 750 MW export and import capability
  - Great Northern Transmission Line project
  - Subject to compensation and additional consideration
  - Significant scale of economy transmission cost savings
- 500 MW of market access to Wisconsin
  - 2008 Term Sheet
  - Possible because of 2008 MISO Transmission Service Requests

Great Northern TX Line achieves 500 MW of Wisconsin Market Access

100% of Great Northern Transmission Line is in Minnesota

New WPS Agreements

New WPS Agreements

- 108 MW System Power Sale
  - 2016 – 2021
  - Fixed price energy 5 days/week x 16 hrs/day
  - From existing generation and transmission resources
- 308 MW System Power Sale
  - Fixed price energy 7 days/week x 16 hrs/day
  - Up to ten year agreement terminating May 31, 2036
  - Commences with in-service of a 4th Conawapa unit
  - No obligation to build
  - Requires 200 MW of new transmission service on the new 500 kV line to US
    - MH recovers transmission costs in PPA price
- Energy deliveries relative to Conawapa generation
  - 1400 GWh - 33% of dependable energy
  - 1800 GWh - 29% of average energy

Other New WPS Agreements

- 200 MW Energy Purchase Agreement
  - 2020 – 2036
  - Secures 1,600 GWh of dependable energy if needed
  - Dependant on new 500 kV interconnection
- 8 MW Energy Sale Agreement
  - 2023 – 2029
  - Surplus energy sale to bridge between 108 MW and 308 MW sales
- 500 MW Term Sheet Extended

MP-MH
US Interconnection Term Sheet

- Who will build? – Minnesota Power Great Northern Transmission Line
- Who will invest and own?
  - 51% Minnesota Power
  - 49% Manitoba Hydro
    - Owner of last resort – ongoing discussions with other US transmission owners
    - Business structure under negotiation
- Who will pay?
  - First 33% - Minnesota Power
  - Next 66% - Manitoba Hydro
  - Interconnection Term Sheet
    - Necessary to increase MP ownership to 51%
    - Under negotiation
- Who will use? – Manitoba Hydro has first dibs
  - Southbound
    - 250 MW MP - MH 250 MW Power Sale Agreement
    - 200 MW WPS - MH 308 Power Sale Agreement
    - 300 MW - Manitoba Hydro
  - Northbound -100% Manitoba Hydro

Great Northern Transmission Line 750 MW

- October 2013
  - MP filed for Certificate of Need with Minnesota PUC
- Spring 2014
  - Business arrangements with MH finalized
  - US Presidential Permit Approval Request
  - Facility Construction Agreement Signed
- October 2014
  - Public hearings commence
- Spring 2015
  - Certificate of Need approval
  - Presidential Permit Approval
- Fall 2016
  - Construction commences
- Spring 2020 - In-service

Great Northern Transmission Line 250 MW option is hypothetical

- Minnesota Power Certificate of Need filing
  - 250 MW project would not meet the long-term needs of the region
  - 250 MW project would not prove to be cost-effective for customers
  - Not environmentally preferable over the long-term
    - Maximize use of transmission corridors
    - Size it right in the first instance
- 250 MW option eliminates wind storage synergies
  - Conawapa and 750 MW line produce wind storage synergies
  - Minnesota Power, other Minnesota and MISO utilities would lose significant load cost savings
- In-service date at risk if switch is required
  - Current process for 750 MW line would have to be abandoned
  - Public, state and federal regulatory processes would have to be restarted
- Additional costs may jeopardize the 250 MW Sale Agreement
  - Loss of economy of scale savings
  - Loss of other significant benefits from 500 kV Term Sheet

Great River Energy
200 MW Diversity Exchange Agreement

- Term - November 1, 2014 to April 30, 2030
- Provides Manitoba Hydro with
  - 200 MW winter capacity
  - Secures 1908 GWh dependable energy
  - Rights to 200 MW firm northbound MISO TX
- Part of Preferred Development Plan
- No capital investment required
- No net cost
- NEB approval received

Development Plans

JOANNE FLYNN
MARCH 10, 2014

Formulation of Development Plans

- All plans meet expected domestic load and existing firm commitments for the 35 year detailed study period.
- Development Plans are formulated using the resource options selected through screening.
- Consider strategic opportunities for the overall benefit of Manitoba.
  - Window of opportunity for new US interconnection

Development Plans

2012 Assumptions	2013 Assumptions
Plans with a 750 MW Interconnection 14. K19/C25/750MW (WPS Sale & Inv) 15. K19/C25/750MW 5. K19/Gas25/750MW (WPS Sale & Inv) 12. K19/C31/750MW 6. K19/Gas31/750MW	**Plans with a 750 MW Interconnection** 14. K19/C25/750MW (WPS Sale & Inv) 12. K19/C31/750MW
Plans with a 250 MW Interconnection 13. K19/C25/250MW 4. K19/Gas24/250MW 11. K19/C31/250MW	**Plans with a 250 MW Interconnection** 4. K19/Gas30/250MW

Updated DSM Evaluation

Development Plans
1. All Gas 5. K19/Gas/750MW (WPS Sale) 14. Preferred Development Plan

DSM Options	2027/28 Energy levels	
2013 DSM	773 GWh	(1x DSM)
Level 1	1,704 GWh	(2x DSM)
Level 2	2,961 GWh	(4x DSM)
Level 2 DSM with New Pipeline Load Net Reduction in Load	2,961 GWh -1,478 GWh 1,483 GWh	(2x DSM)
Level 3 DSM	3,546 GWh	(5x DSM)
Level 3 DSM with New Pipeline Load Net Reduction in Load	3,546 GWh -1,478 GWh 2,068 GWh	(2.7x DSM)

DSM Options Evaluated 2013 Reference Scenario

DSM Levels	Plan 14 Preferred Plan Keeyask19 Conawapa 750 MW	Plan 5 Keeyask19 Gas 750 MW	Plan 1 All Gas Plan
2013 DSM (1 X DSM)	X	X	X
2014 Level 1 (2 X DSM)	X	X	X
2014 Level 2 (4 X DSM)	X P	X P	X P
2014 Level 3 (5 X DSM)	X P	X P	X P

P = Expected Pipeline Load

3 plans x 4 levels of DSM = 12 cases without pipeline load
3 plans x 2 levels of DSM = 6 cases with expected pipeline load

2013 Planning Assumptions with updated capital costs for Keeyask and Conawapa, no WPS investment in interconnection.

Economic Analysis Methodology

JOANNE FLYNN
MARCH 10, 2014

NFAT Analysis is Robust

MH has provided 3 major sets of analysis:

- Economic
  - Overall economic value each plan creates relative to other plans
  - Evaluated over the life of the longest lived assets
- Financial
  - Future customer rate impacts
  - Exposure to financial risk
  - Affordability
  - Temporal distribution of costs and benefits
- Multiple Account
  - Overall socio-economic benefit

Economic Evaluation

- Evaluate overall economic value each plan creates relative to other plans

- Compare the incremental costs and benefits associated with one alternative development plan to another from an overall project perspective

- Economic Evaluation does not include:
  - costs and benefits common to all plans
  - sunk costs which cannot be changed relative to the decision point

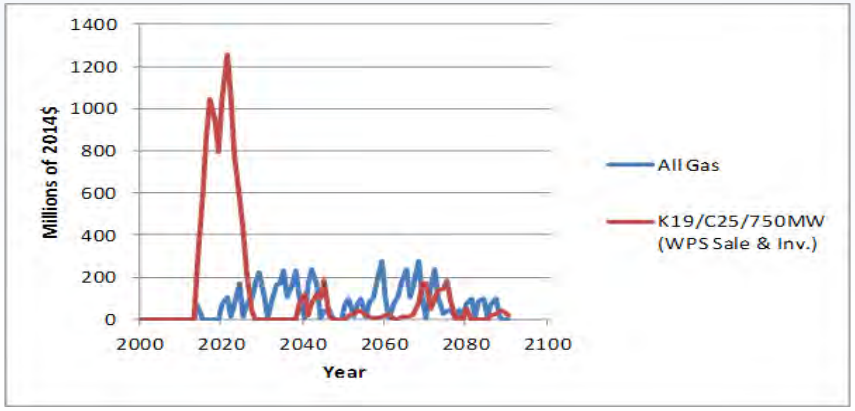
Net Present Value

- Standard Economic Analysis for project evaluation.
- Allows for comparison of development plans on an equivalent basis.
- Requires that benefits and costs over the entire life of the assets be included.
- Discounted at Manitoba Hydro's real weighted average cost of capital.
  - Constant dollars with real escalation, ignoring general inflation

Residual Value

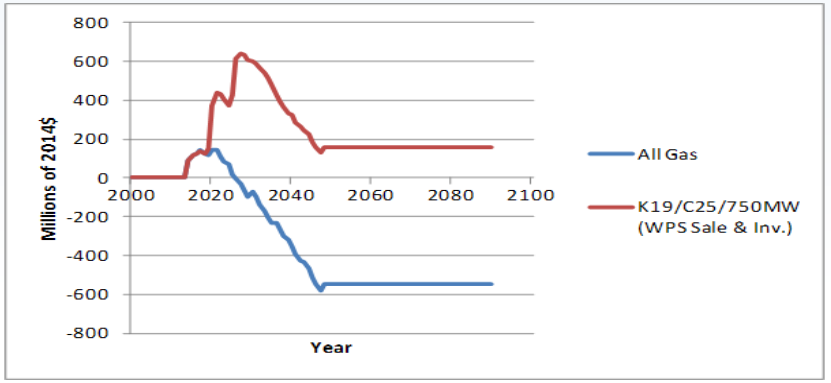
NPV analysis includes the benefits and costs over the entire life of the assets in the evaluation. Residual value is required if the life of assets is greater than the end of the study period.

Residual Value is determined by either:



- Calculating the salvage value of the asset and subtracting it from the asset cost
- Indentifying the remaining market value of the assets and adding it to the analysis.

Residual value allows for comparability between plans.

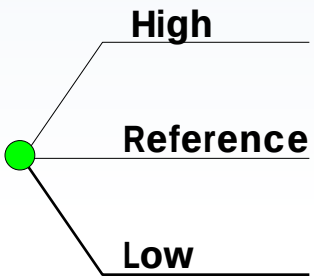


78 Year Study Period

- Economic analysis is meant to determine the investment value over the asset life
- 78 year study period captures the economic lives of assets which extend beyond the 35 year detailed study period
  - combines 35 year detailed evaluation with the extension of
    - Replacement capital costs
    - Fixed O&M costs and average net revenues

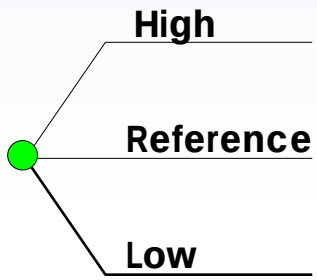
Timing and Value of Replacement Capital Costs: Total Capital

Timing and Value of Net Production Costs: Net Revenue



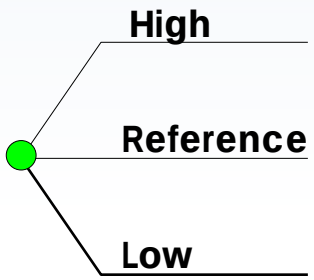
4854

Uncertainty Analysis - Probabilistic Analysis using Scenarios



- Reference Scenario
  - Inputs and Assumptions associated with “most likely” outcomes

- Probabilistic Analysis
  - reference, high and low values for the high impact factors



Energy Prices

Capital Costs

Discount Rate

3^3 = 27 distinct scenarios per development plan

Sensitivity Analysis

- Determine the effect on the economic value of selected development plans of single high impact variables.
- Sensitivity Analysis was conducted for:
  - Drought
  - Climate Change
  - Manitoba Load
  - In-Service Date Delay
- DSM Sensitivities
  - 1.5 times DSM
  - 4 times DSM

Economic Indicators

IAN PAGE
MARCH 10, 2014

Economic Outlook

- Annual forecast of key economic variables for Corporate use
- Consensus forecast from numerous sources

Projected Long-Term Economic Variables

Variable	2012 Application	2013 Update
Manitoba CPI	1.9%	2.0%
MH Long Term Debt	6.3%	6.75%
Canadian/US Exchange	1.04	1.03
MB Real GDP Growth	1.7%	2.0%
MB Population Growth Rate	1.2%	1.0%
Real Weighted Average Cost of Capital	5.05%	5.40%

Basis for Economic Analysis

- Net Present Value primary measure from Hydro's perspective
- NPV a measure of projected wealth creation: Is the project or plan worth pursuing?
- Summation of cash outflows and inflows discounted to reflect time value of money
- Other methods used to supplement economic decisions as well as considering perspectives of ratepayers and broader societal impacts

Different Discount Rates for Different Perspectives

Perspective	Discount Rate	Discount Rate Value
Market Valuation Economics CH9-10,12,	WACC	5.05% (5.40% 2013) (Real)
	Low Case	3.35% (Real)
	High Case	6.5% (Real)
Social Benefit Cost Ch 13	Social Discount	6.0% (Real)
MH Customer (Cumulative present value of consumers general revenue) CH 11 & PUB/MH I-149a	Social Time Preference & Opportunity Cost of Capital	1.86% (Real)

Selection of the Discount Rate

- Opportunity cost of investing in a project versus an alternative of similar risk
- For a utility, the opportunity cost is typically their weighted average cost of capital (WACC) plus any necessary risk adjustments
- Many utilities regulated on a rate of return basis so the cost of capital is approved by the regulator
- Manitoba Hydro is regulated differently so a proxy is used to estimate an appropriate cost of capital (2012 calc):
  - MH cost of debt (6.3%) + 3% return on equity x 25%
  - MH cost of debt (6.3%) x 75%
  - 7.05% nominal, 5.05% real

Risk Adjusted Discount Rates

- Investors often use a risk-adjusted discount rate to calculate Net Present Value
- MH base WACC incorporates a 3% equity premium to accommodate normal business risks including ongoing contributions to retained earnings
- MH policy is to adjust WACC to incorporate additional risks: corollary is that if risk has been accounted for by some other means, then the risk adjustment factor can be reduced accordingly
- For the PDP, detailed probabilistic approach to large impact risks, rather than attempt to capture these risks in the discount rate

Economic Uncertainty Analysis

NAVIGANT
ENERGY

Overview

- The Manitoba Hydro (MH) planning environment includes a variety of uncertainties. Under the direction of Dr. Adam Borison, Navigant helped MH analyze these uncertainties in three major steps:
  - Formulation – deciding on the elements of the analysis and their relationships
  - Inputs – collecting and processing the data that goes into the analysis
  - Outputs – generating and interpreting the results of the analysis
- Adam Borison is a Director in Navigant's Energy Practice.
  - Expert in decision/risk analysis, economic and financial analysis, real options, optimization, and related methods
  - Nearly 30 years of consulting experience applying these methods to investments and operations in electric power, oil/gas and biofuels
  - Particular expertise in electric power resource planning, beginning with Stanford Ph.D. work on generation expansion planning under uncertainty sponsored in part by the Electric Power Research Institute (EPRI)
- Navigant is a NYSE–listed specialized consulting company with more than 2,500 employees and 50 offices. Navigant's Energy Practice has over 350 professionals, along with dozens of specialized independent advisors.

©2013 Navigant Consulting, Inc.
Confidential and proprietary. Do not distribute or copy.

Formulation

- Formulation specifies four elements of uncertainty analysis:
  - Decisions
    - Resource options to be screened; resource plans to be evaluated
  - Uncertainties
    - Eleven potentially-important uncertainties identified
    - Three selected for probabilistic evaluation
      - energy market prices (natural gas, electricity and carbon)
      - new supply construction cost
      - MH discount rate (cost of capital).
  - Objectives
    - Many metrics (IRR, near-term NPV) considered
    - Long-term (78-year) NPV chosen as best for economic evaluation
  - Optionality
    - Value of learning and adaptation incorporated

NAVIGANT
ENERGY

Inputs

- Inputs are the probabilistic data used to represent uncertainty:
  - Probabilities assigned to outcomes for three major uncertainties
    - Energy Prices
    - Capital Costs
    - Discount Rate (and other Economic Indicators)
  - These uncertainties were considered to be both:
    - most significant, and
    - most subject to rapid dramatic change.
  - Uncertainties modeled as independent based on historical data and expert judgment.
  - Each uncertainty modeled with three discrete outcomes per sound analytical principles and common practice.

NAVIGANT
ENERGY

Outputs

- Four outputs show how each alternative performs in a world of uncertainty:
  - Scenario Value
    - the most basic output
    - the NPV for each alternative in each scenario compared to a fixed base
  - Expected Value
    - the most basic probabilistic output
    - the sum of (each scenario NPV) x (the probability of each scenario).
  - Risk
    - NPV quilts, scatter plots, box & whisker plots and S-curves
    - shows the range and likelihood of potential outcomes
  - Value of Optionality
    - the added value of learning and adaptation
    - compares the expected value and risk of flexible pathways with fixed plans

NAVIGANT
ENERGY

FAQ 1: Is it reasonable to use NPV as the primary metric?

- Yes
- Different metrics can be used for different purposes for evaluating resource plans. Economic evaluation is specifically intended to determine the overall value each plan creates. In this context, NPV is the "gold standard."
- As corporate finance experts Ross, Westerfield and Jaffe state:
  - *While we found that the alternatives [payback period, discounted payback period, accounting rate of return, IRR, and profitability index] have some redeeming qualities, when all is said and done, they are not the NPV rule; for those of us in finance, that makes them decidedly second-rate.*

©2013 Navigant Consulting, Inc.
Confidential and proprietary. Do not distribute or copy.

FAQ 2: Is it reasonable to use a 78-year time horizon for NPV?

- Yes
- With NPV, the time horizon should capture the major potential impacts of the investment alternatives over their lives. The 78-year time frame was chosen because of the life of the assets in question. Discounting over this time horizon allows for the appropriate balancing of near-term and long-term impacts. Shortening the time horizon (without adding appropriate residual value) is akin to applying a 100% discount rate or assigning a zero value to long-tem impacts with certainty.

Confidential and proprietary. Do not distribute or copy.

NAVIGANT
ENERGY

FAQ 3: Is it reasonable to treat discount rate as an uncertainty?

- Yes
- In the economic evaluation, the discount rate reflects the return that markets require for the type of investment in question. In many applications involving large-scale and long-term investments, this required market return is not known with certainty and it is accepted practice to treat discount rate as an uncertainty.
- As Harvard Professor Martin Weitzman states:
  - *There are many reasons why the far-distant-future interest rate might be considered to be a… random variable from today's perspective.*

©2013 Navigant Consulting, Inc.
Confidential and proprietary. Do not distribute or copy.

NAVIGANT
ENERGY

FAQ 4: Is the approach to discount rate uncertainty reasonable?

- Yes
- Discount rate uncertainty was addressed by:
  - assigning probabilities to different discount rate outcomes,
  - calculating NPV's given specific outcomes, and
  - calculating the expected NPV (ENPV) across these outcomes.

  In this context, discount rates and interest rates are linked.
- As a team of economists led by Nobel Laureate Dr. Ken Arrow states:
  - *An alternate approach to modeling discount rate uncertainty that is more empirically tractable is the expected net present value (ENPV) approach.*

©2013 Navigant Consulting, Inc.
Confidential and proprietary. Do not distribute or copy.

NAVIGANT
ENERGY

FAQ 5: Is it reasonable to take a "utilitarian" approach to comparing plans?

- Yes
- In the economic evaluation, alternatives are compared based on the value each produces in each scenario compared to a fixed base. Differences reflect actual value gained or lost. This is called the utilitarian or expected utility approach; it has broad and deep analytical foundations, and is widely accepted as a guide to better decision-making. This is the basis of the quilts, scatter plots, box & whisker plots and S-curves.
- As UCLA Professor L. Robin Keller states :
  - *Expected utility is well suited as a prescriptive model of decision-making under risk.*

©2013 Navigant Consulting, Inc.
Confidential and proprietary. Do not distribute or copy.

NAVIGANT ENERGY

FAQ 6: Is it reasonable to take a "regret" approach to comparing plans?

- No, it is a descriptive tool with intuitive appeal, but should not be used formally for evaluating decisions.
- In another approach, alternatives are compared based on the value each produces in a scenario compared to the value produced by a base alternative in that same scenario. Differences reflect disappointment or relief. This is called the regret approach; it is generally viewed as descriptive and is not widely recommended as a guide to better decision-making.
- The regret approach produces what most view as illogical results. For example, the alternative that is chosen as the base appears as riskless because there is no disappointment or relief when compared to itself. Of course, in reality, each alternative has risk.
- As Dr. Bell, a leading author on the regret approach, states:
  - *[This]… paper does not suggest that people ought to make financial tradeoffs to avoid disappointment.*

MISO Pricing Trends and Energy Policy

JOANNE FLYNN
MARCH 10, 2014

Electricity Prices in MISO are Expected to Increase

- Over the forecast horizon, electricity prices in the MISO region are expected to increase due to the following key drivers:
  - Need for additional generation resources
  - Increasing fossil fuel prices
  - Expectation of carbon pricing
- To provide this forecast of future prices in the MISO region, Manitoba Hydro engages a number of expert North American energy analysts to provide their independent views of the range of future price trajectories for electricity and its key drivers.
- Manitoba Hydro's electricity export price forecast capture the expectation of rising prices through the independent views of expert energy analysts.

Need for Additional Generation Resources in MISO

There are a number of factors driving the need for new supply:

- **Retirement of Existing Generation Supply**
  - EPA Regulations – New mercury standard requires costly environmental control technology. Expectations, 60 GW of US coal fleet is expected to retire in the near term (EIA's 2014 Annual Energy Outlook).
  - MISO projecting 12.6 GW of coal retirement or about 20% of existing coal fleet (MISO MTEP 2013).
  - Numerous nuclear plants reaching end of 60 year operating license by mid-2030s.
- **Gradual regional electric load growth**
  - Regional load growth of 0.5-1%/year is forecasted by numerous independent energy analysts, regional utilities and US EIA.
- **Meeting New Generation Needs in MISO**
  - Natural gas generation
  - Renewable and Non-Emitting Generation Resources are Viewed as Preferable

Fuel Prices Are Expected to Increase

- Average cost of fossil fuels has been the most influential determinant of market prices for electricity in the US as conventional thermal generation is dominant in almost all regions.
- Shift in natural gas market
  - Prior to 2008 – high prices, concerns about resource scarcity, LNG import capabilities being developed
  - Post 2008 – economic downturn, commercialization of new extraction process (hydraulic fracturing) resulting in a domestic surplus of natural gas
    - New gas outlook has been incorporated in annual gas and electric forecasts.
- Fuel prices are still expected to grow in real terms
  - Natural Gas: EIA's 2014 Annual Energy Outlook projects real price growth of 3.7%/year between 2012-2040
  - Coal: Delivered coal prices are projected to increase at 1%/year over same horizon

Environmental Policy Trends

U.S. EPA Regulations

- Mercury and Air Toxics Standard (MATS) – Implementation 2016-17. Primarily driver for 60 GW US coal retirements.
- Other regulations add environmental costs but are not as significant as MATS for coal retirements
- Performance Standards to limit CO_2 emissions from new and existing power plants
  - Draft regulation for new power plants released in September 2013, to be finalized in 2014.
    - Effectively ban on new conventional coal (without CCS).
  - Draft regulation for existing power pants expected in June 2014 , to be finalized by June, 2015.

State/Provincial Level

- Cap and Trade – Quebec, California, RGGI states
- Carbon Pricing – BC, Alberta, Manitoba (coal only)
- Some Other States Require Planning For Carbon Price Risk and/or Externalities
  - Minnesota requires utilities to include future cost of carbon regulations of $9, $21.5 & $34/ton of CO2 in resource plans beginning in 2019. (Minnesota Statutes § 216H.06)

Environment Canada Regulations

- Regulations limiting GHG emissions from coal-fired power plants finalized in September, 2012
- Currently discussing performance standards to limit GHG emissions from natural gas-fired power plants.

Expectation of Carbon Pricing

- There are broad expectations for carbon pricing within the next 10 years for the US electricity sector.
  - The timing, magnitude and pricing mechanism are uncertain.

- Manitoba Hydro manages this uncertainty and expected valuation similar to other key inputs into export price forecast.
  - External consultants provide their own, independent expectations for the timing and valuation (if any) of a carbon price under their Reference/Base case as well as for high & low sensitivity cases.

- In 2013, the majority of the consultants included a carbon price in their Base/Reference and high sensitivity cases. While some consultants expect no carbon price in their Base/Reference case through the forecast horizon.

- The Low Case has no carbon price expectations

Price Forecasting Process Relies on a Consensus of External Industry Experts

- Consensus forecasting supported in literature as increasing forecast accuracy over use of a single forecast.

- Manitoba Hydro employs a consensus forecasting approach from at least five of independent market experts.
  - This avoids risk of assigning too much weight to one single view of the future (either optimistic or pessimistic).

- Manitoba Hydro engages price consultants that are well-established, reputable and are active throughout North America in providing expert advice on regulatory, financial and technical issues to electricity industry stakeholders.
  - They utilize sophisticated methodologies and simulation tools to model market operations.

- Three future outlooks provide a range of plausible price futures and support assessing uncertainty in power resource planning
  - For example the low priced case would typically contain (for example) assumptions of abundant domestic natural gas resources, minimal environmental regulations, low economic growth and low electric demand.

- Manitoba Hydro's electricity export price forecast is robust and appropriate for long-term resource planning purposes.

The Brattle Group

Power Price Overview for Manitoba Hydro's Export Market in MISO

Prepared for
Manitoba Hydro's NFAT Hearing

Dean Murphy
The Brattle Group

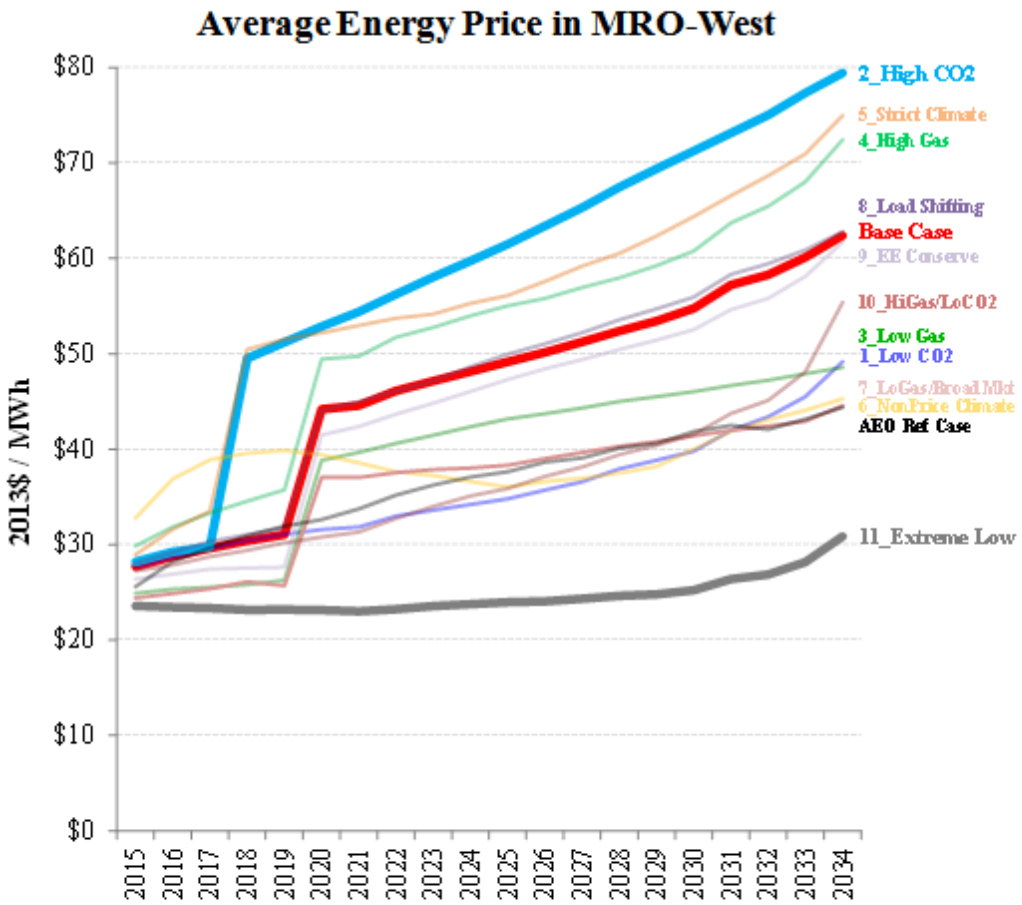
March 2014

Copyright © 2014 The Brattle Group, Inc.

Primary Drivers of Long-Term MISO Power Prices

Many factors can influence long-term power prices, but a few key factors are the primary drivers

- **Fuel price**
  - Primarily natural gas: prices have fallen in past several years
  - Coal prices can also be important, but tend to be more stable
- **Climate policy** – stringency and form both have an effect
  - CO_2 price (cap, tax) vs. non-price mechanisms (promote renewables, retire coal, efficiency…)
  - Little movement on federal climate policy, but other means are possible
- **Coal retirements**
  - Driven partly by new EPA environmental requirements; also by low gas prices
  - Strict climate policy, if enacted, could trigger many additional retirements



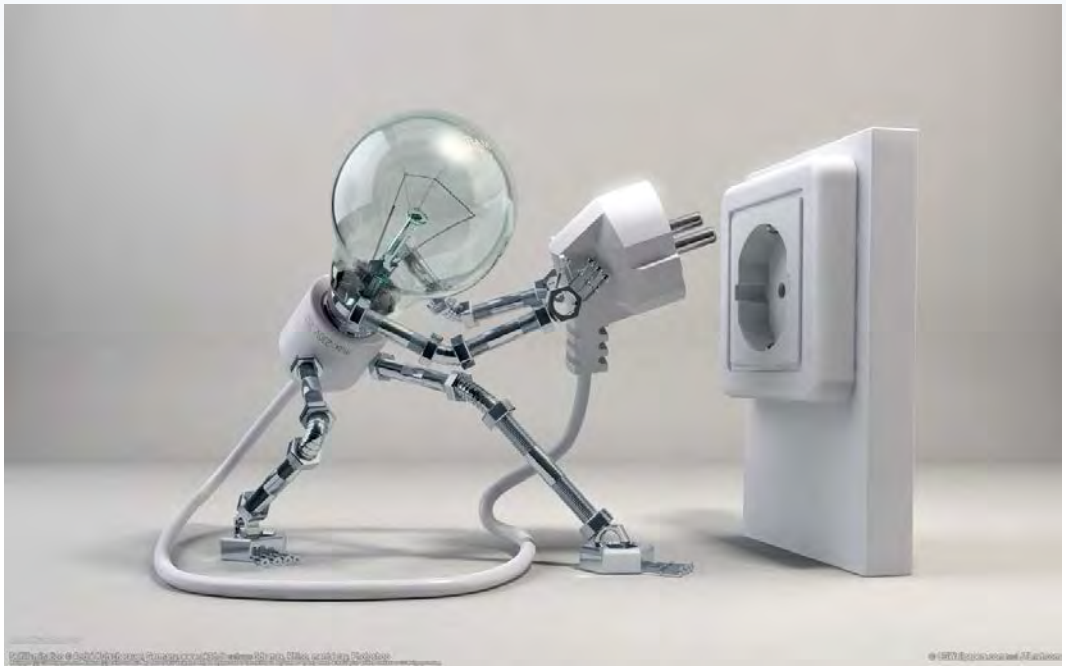
Primary Drivers of Long-Term MISO Power Prices

Somewhat less important factors

- **Load growth**
  - Growth has been very low in the past 5-10 years (vs a few decades ago), and will likely remain low
  - But supply responses (more or less retirements, additions) mean load has a modest long run effect

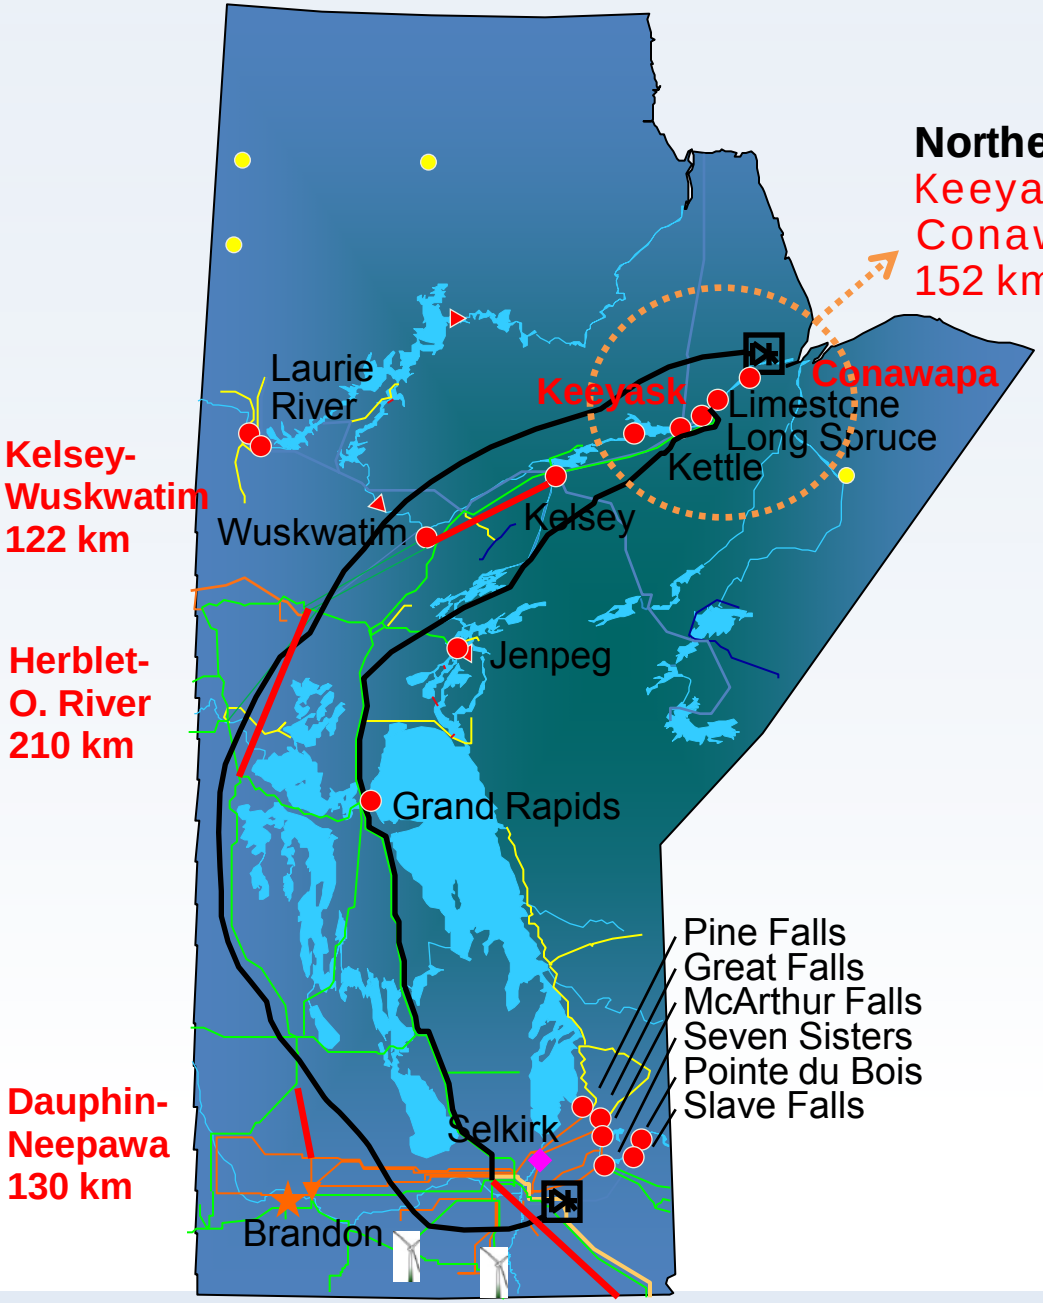
- **Renewable additions (and transmission expansion)**
  - Driven by state Renewable Portfolio Standard (RPS) requirements and subsidies
  - Large additions also require regional transmission expansion
  - Tend to offset the effects of coal retirements, though offer less capacity value

Range of Power Prices



Scenarios evaluated show a broad range of possible future market prices. By 2030, scenarios show energy prices ranging from $25/MWh to $70/MWh.

- CO_2 price drives the extreme values
  - Heavily coal-based regional generation fleet is strongly influenced by CO_2 price
- Gas prices also have a significant effect, though smaller than CO_2
- Coal retirements increase power prices; how much depends on prevailing CO_2 and gas prices
  - More retirements lead to higher prices, and greater gas sensitivity
  - More coal retirement causes slightly higher prices vs. 2012 forecast
- Large renewable additions may push prices down somewhat, but effect is limited if transmission is also expanded, as is likely
- Load levels (including DSM) only modestly affect energy prices
  - Load shifting affects only a few peak hours, but delays capacity needs
  - EE may cut energy price a couple dollars



Summary of Factors Affecting Power Price

Factor	Effect on Power Price	Likely Change in Factor
CO_2 price	CO_2 price increases power price directly	Large effect; upside potential only
Gas price	Gas price rise increases power price directly	Up from 2012 lows; expected to increase further (though slowly)
Coal Retirements	Retirements increase power price modestly	Large announced retirements, with additional retirements likely
Load Growth	Growth increases power price modestly, all else equal	Likely low load growth
Renewable Additions	More renewables lowers power price modestly	Continued renewable additions likely (coal retirements mitigate)
Transmission (w/ Renewables)	Large transmission additions could raise Minn Hub price slightly	Some additions likely, especially if there are large renewable additions

Transmission Facilities

DAVID JACOBSON, PH.D., P.ENG.
DATE: MARCH 10, 2014

Northern Collector System (3554 -> 5554 MW)
Keeyask – 630/695 MW;
Conawapa – 1395/1485 MW
152 km new transmission

844 km new transmission

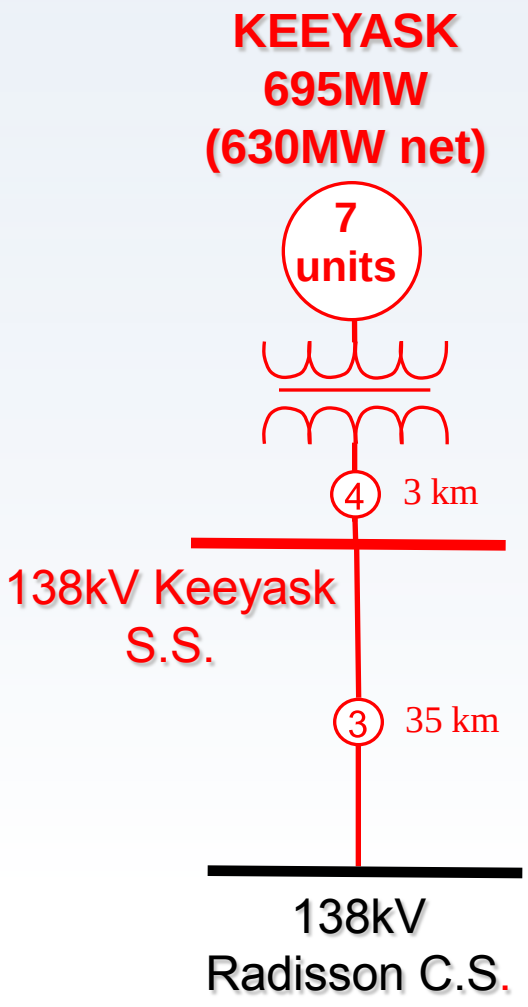
$775M ($2012) or $1065 ($2020)

Kelsey-Wuskwatim 122 km

Herblet-O. River 210 km

Dauphin-Neepawa 130 km

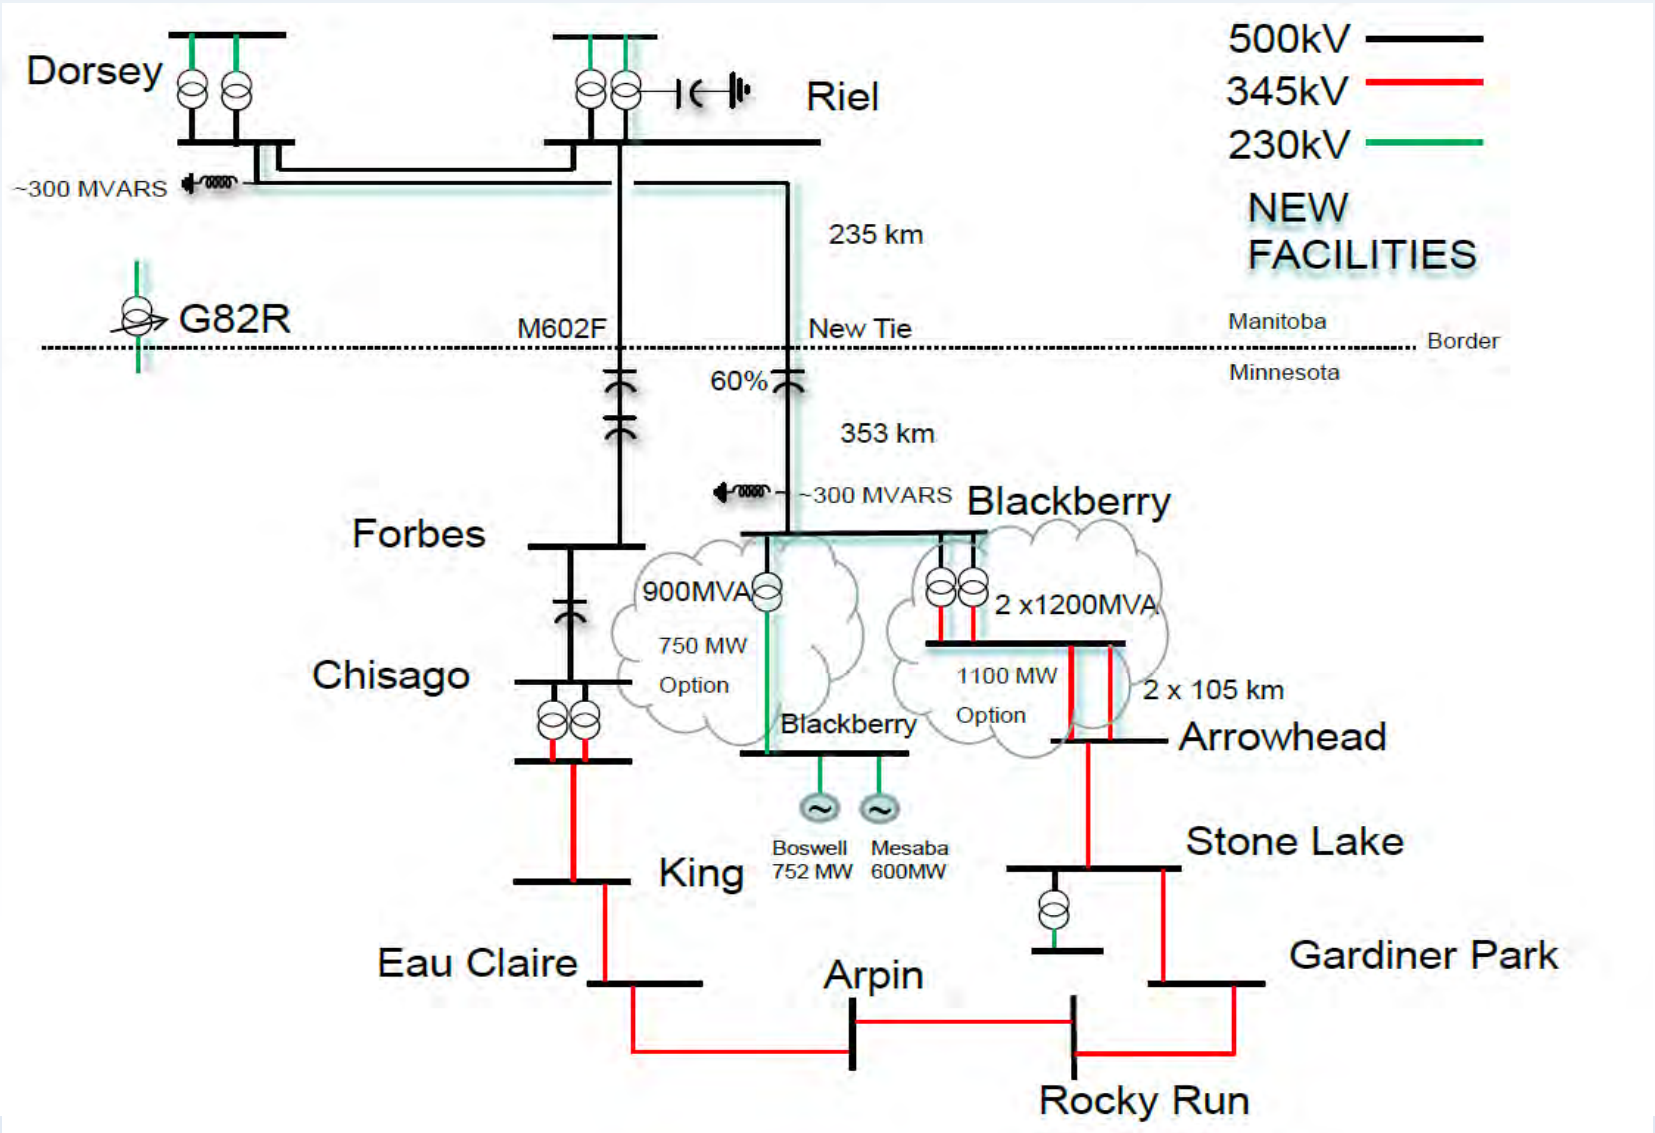
MMTP (230 km)



PDP
HVDC
Other Transmission

Selkirk - Gas
Brandon – Coal
Brandon – Gas
Control Structures
Diesel Sites
Hydraulic G.S.'s
Wind plant

Example – 400 MVA Transformer – 195 ton – similar to space shuttle



Keeyask Transmission Project

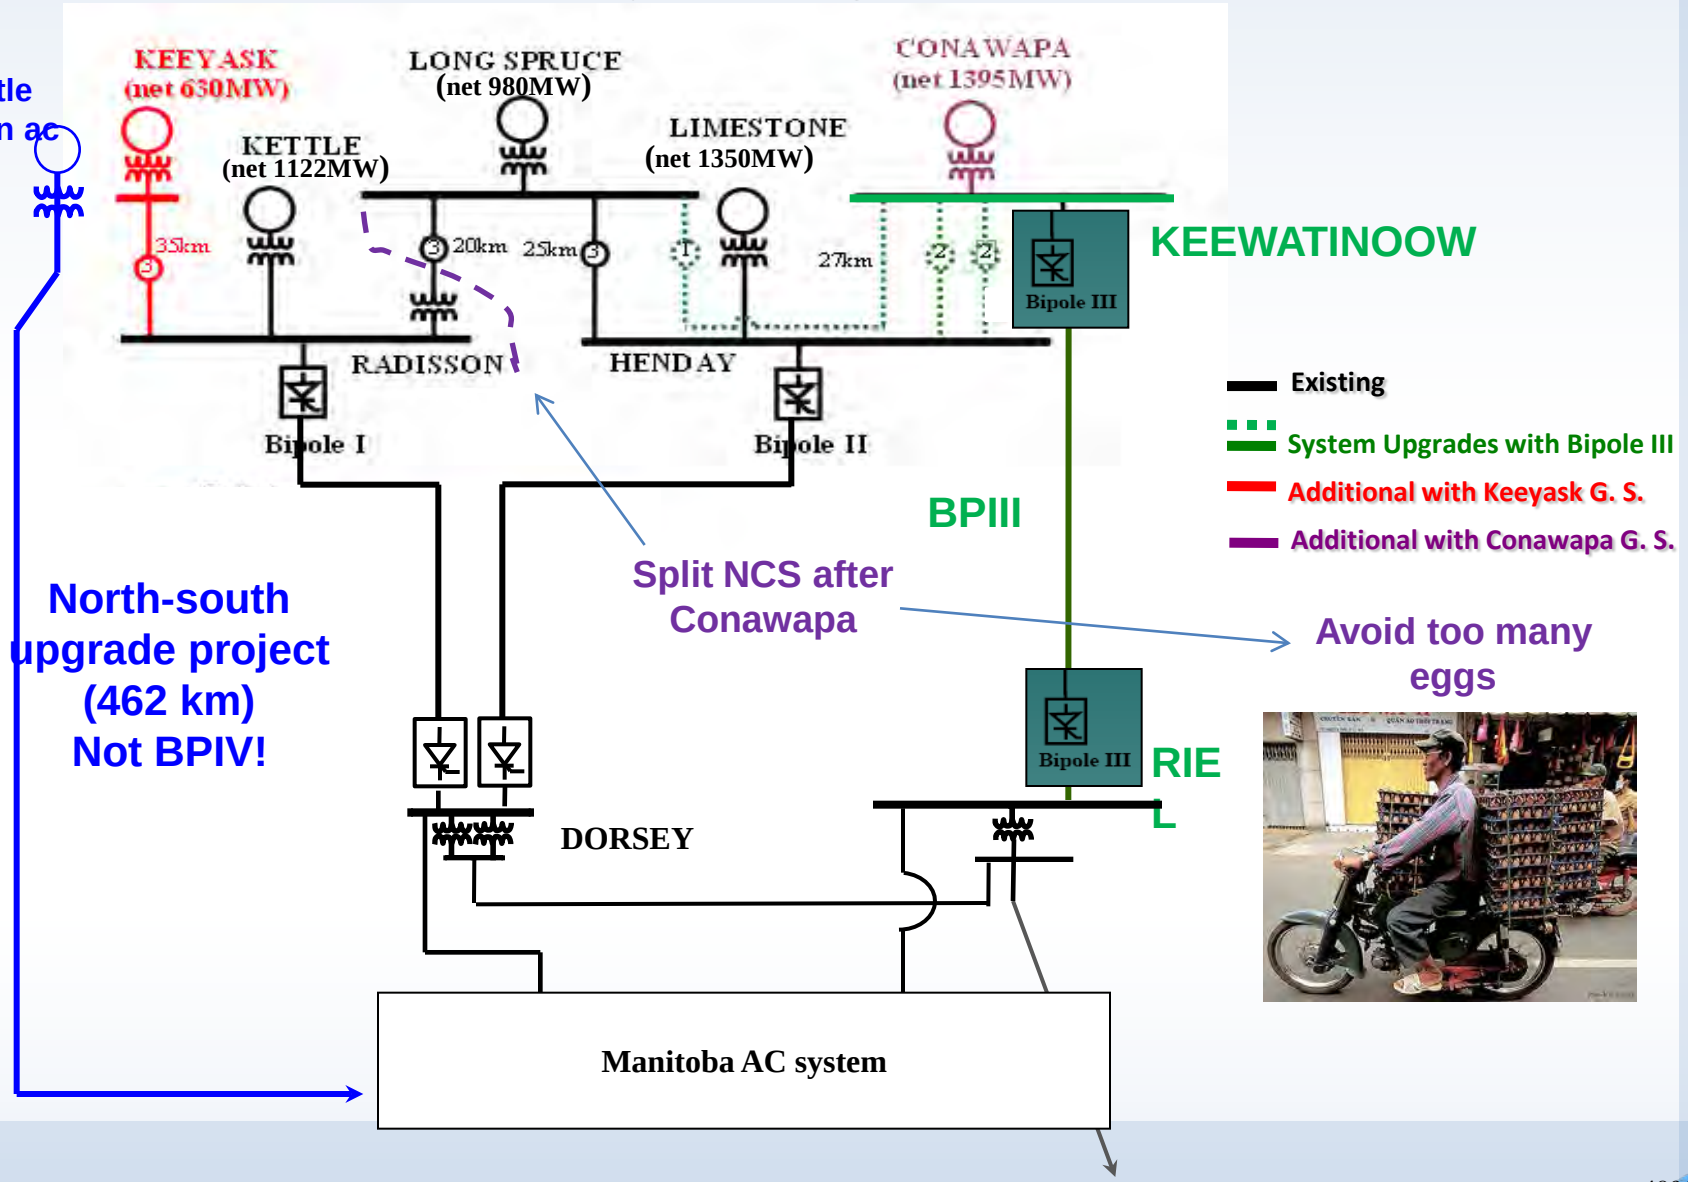
- Four (4) unit lines and three (3) Keeyask-Radisson 138 kV ac lines ($86M - $2012)
- Keeyask Switching Station ($40.3M - $2012)
- Radisson Station Termination circuit breaker replacement (31) due to increased fault levels $30.4M - $2012
- Total: $156.7M ($2012)

500 kV (750 MW) Interconnection

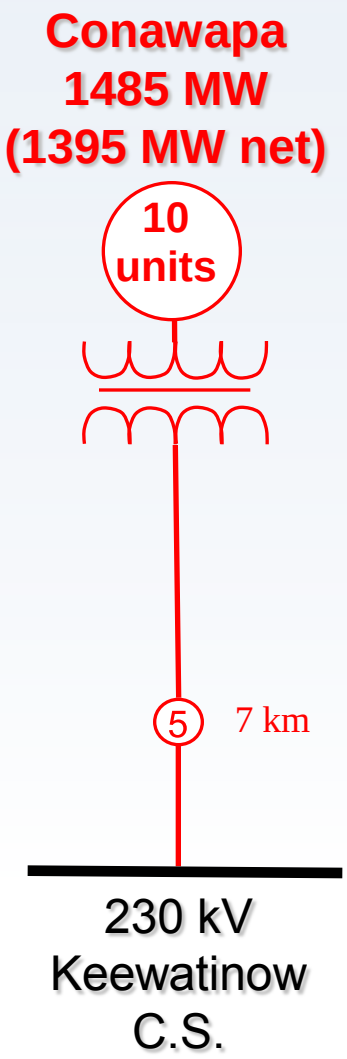
Manitoba Minnesota Transmission Project

- **235 km 500 kV line to US border ($173.6M - $2012)**
- **Dorsey line termination; shunt reactor; Riel 230/500 kV 1200 MVA transformer; 3x73.4 MVAr capacitors ($77.5M - $2012)**
- **Glenboro 300 MVA Phase Shifter $16.5M - $2012**
- **Total: $267.6M ($2012)**
- **Today: $281.4M ($2013)**

Great Northern Transmission Line



- **240 mile 500 kV line to US border ($524.3M - $2012)**
- **Blackberry station; 300 MVAr shunt reactor; 230/500 kV 900 MVA transformer; 60% series compensation ($54.4M - $2012)**
- **Total: $578.7M ($2012 US)**
- **Today: $507 M ($2013 US)**



New Interconnection Summary

- Currently finalizing Study Report. Identified 750 MW facilities may be able to transfer 883 MW at no extra cost.
- **Window of Opportunity** – MISO approved $5B in upgrades in MTEP11 to facilitate renewable integrations (Multi-Value Projects). Roughly **$2B** of these facilities increase the Minnesota to Wisconsin transfer capability before 2020. The timing of the Manitoba to WPS export requests capitalize on these investments in MISO. Submitting new requests today would likely require significant additional investment.

Transmission System upgrades – Conawapa

Conawapa Transmission Outlet Project

- **Five (5) unit lines ($3M - $2012)**
- **Keewatinoow Station Termination ($7M - $2012)**
- **Total: $10M ($2012)**

4896

North-South Transmission Upgrade Project

- AC Upgrades ($198 million - $2012)
  - 80 km Kelsey to Birchtree 230 kV line
  - 42 km Birchtree to Wuskwatim 230 kV line
  - 210 km Herblet to Overflowing River 230 kV line
  - 130 km Dauphin to Neepawa 230 kV line
  - Equipment upgrades (50 MVAr SVC, line retensions)
- DC upgrades ($143 million - $2012)
  - Splitting northern collector system; Allow for 3 switchable Kettle units
  - 300 MVAr filter at Radisson
  - 250 MVAr Synchronous Condenser at Riel
  - Circuit breaker replacements
- Total ($340 million - $2012)

Economic Evaluation - Interconnection Assumptions

JOANNE FLYNN
MARCH 10, 2014

Economic Evaluation Assumptions
US Interconnections (250 MW & 750 MW)

- Manitoba Portion of a new US Interconnection
  - Manitoba Hydro responsible for 100% of the capital and operating costs of the Manitoba Portion of any new US interconnection.
- 250 MW US Interconnection (high risk of not being approved)
  - Manitoba Hydro is not responsible for any costs associated with the US portion of the 250MW interconnection
- 750 MW US Interconnection
  - Manitoba Hydro is responsible for a portion of the capital and ongoing operating costs of the US interconnection. This obligation is dependent on whether WPS sale and investment is included in the development plan
    - Plans with WPS Sale – MH portion of capital and ongoing operating costs = 40%
    - Plans without WPS Sale - MH portion of capital and ongoing operating costs = 66%

750 MW Transmission Interconnection

Proportion of Combined Capital & Operating Costs Assumed by Manitoba Hydro for Evaluation Purposes

	MANITOBA Manitoba-Minnesota Transmission Project			US Great Northern Transmission Line		
	%	Capital Cost (2014$)	Ongoing O&M (2014$)	%	Capital Cost (2014$)	Ongoing O&M (2014$)
Plan 5 K19/Gas25/750MW (WPS Sale & Inv)	100%	$277 M	$12 M	40%	$122 M	$499 M
Plan 6 K19/Gas31/750MW	100%	$277 M	$12 M	66%	$304 M	$567 M

Plan 14 K19/C25/750MW (WPS Sale & Inv)	100%	$277 M	$12 M	40%	$122 M	$499 M
Plan 15 K19/C25/750MW	100%	$277 M	$12 M	66%	$304 M	$567 M

Capital Costs
- Thermal and Wind

JOANNE FLYNN
MARCH 10, 2014

Capital Costs - Sources

- Natural Gas-Fired Generation
  - Manitoba Hydro contracted Gryphon International Engineering Services Inc to recommend technology options and provide Manitoba specific costs for natural gas-fired generation.
- Wind Generation
  - Manitoba Hydro contracted GL Garrad Hassan to provide Manitoba Specific costs for wind generation.
  - Manitoba Hydro participates in wind industry organizations keeping current with technology costs, and continually monitors price and technology trends for updates to assumptions used in planning processes for wind technologies.

Capital Costs – Uncertainty and Cost Ranges

- Natural Gas and Wind generation
  - Manitoba Hydro contracted Validation Estimating LLC to conduct an independent, third party review of risk and uncertainty of natural gas and wind generation cost estimates used in the NFAT analysis, including assumed transmission associated with these projects
  - Review by an independent party removes bias by the estimator in terms of Class of estimate and contingency required in the estimate to obtain specific confidence levels in the estimate
  - The uncertainty and risk assessment recognizes modularity and known technology of wind and natural gas-fired resources as factors which reduce uncertainty, as stated in Validation Estimating LLC reports
  - The level of capital cost estimate for wind and natural gas-fired projects used in the NFAT Business Case is a Class 5 estimate which has a higher uncertainty due to the lesser amount of overall engineering completion

Capital Cost Ranges – Thermal & Wind

Resource	Low	Reference	High
		(Millions of 2014$)	
CCGT 357MW	$312	$443	$612
SCGT 245MW	$127	$176	$240
LM6000 55MW	$56	$78	$105
Wind 65MW	$104	$141	$189

Keeyask and Conawapa Estimate Update

Control Budget (CEF/IFF) and NFAT Low, Ref, and High

DAVE BOWEN, P. ENG
DATE: MARCH 10, 2014

Terminology

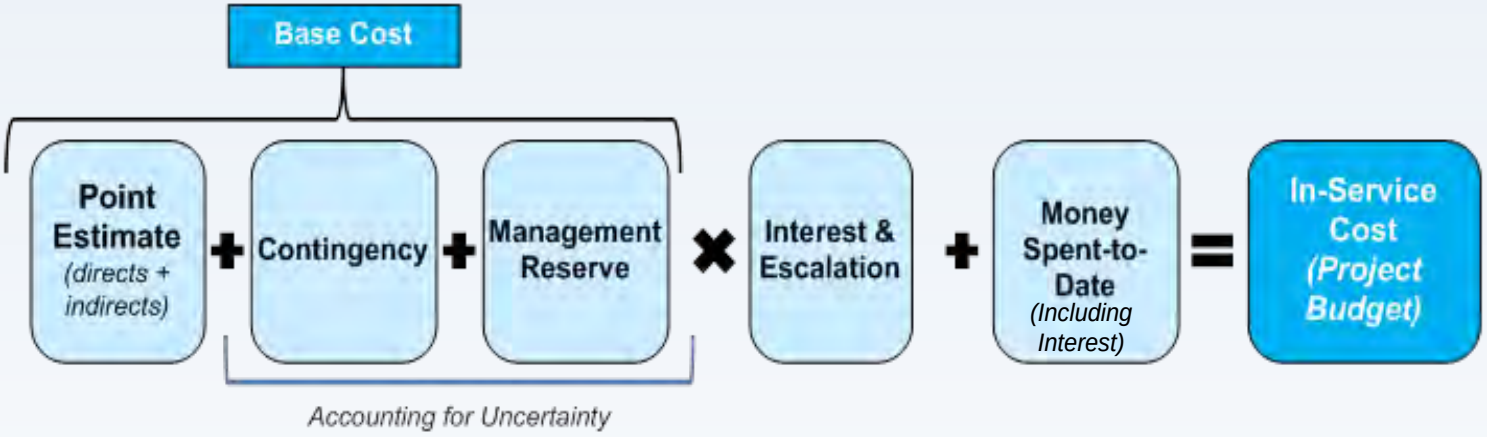
- Estimate - the calculation of a range of costs to complete the project based on a set of assumptions. Critical assumptions include the project scope/level of definition, schedule, and in-service date.

- Control Budget – is established when the estimate is approved and is the benchmark for measuring project cost performance. It includes a contingency at a P50 value and management reserves for Keeyask and Conawapa. This will then form the basis of the capital expenditure forecast and integrated financial forecast (CEF/IFF).

- NFAT Low, Reference and High – representative range of possible capital costs that could occur that are inclusive of project risks and the labour reserve. These are inputs to the NFAT economic and financial probabilistic analysis. The low, reference and high correspond to P10, P50 and P90 values.

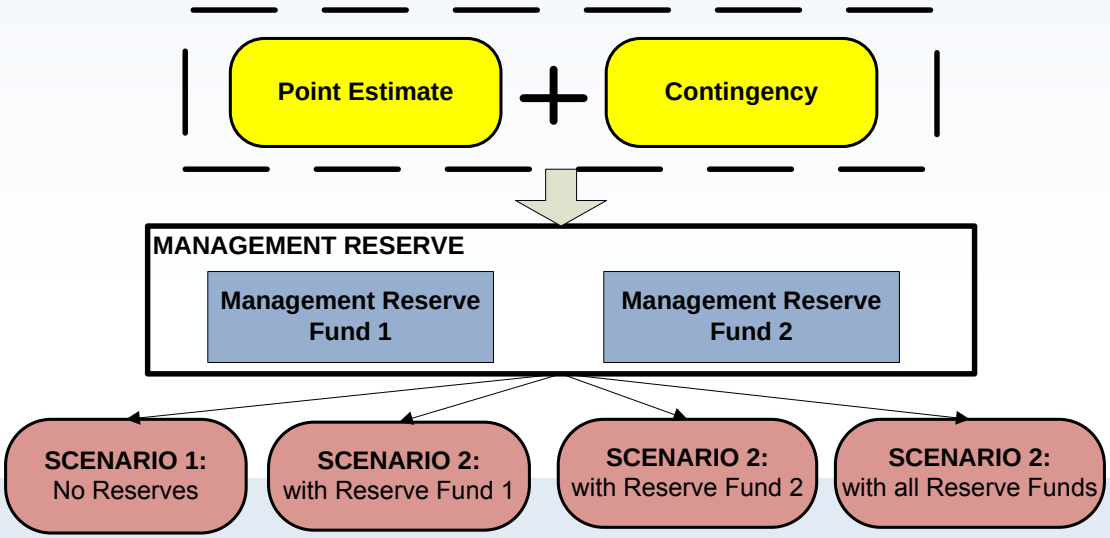
Topics

- Overview
  - Why and What are we updating
    - Control Budget: Reviewed and updated
    - NFAT: Reviewed and updated representative range of possible costs that could occur
  - Recent Estimate History & Methodology
- Part A – Review and Update to Control Budget
- Part B – Review and Update to NFAT Low, Reference and High
- Project Execution

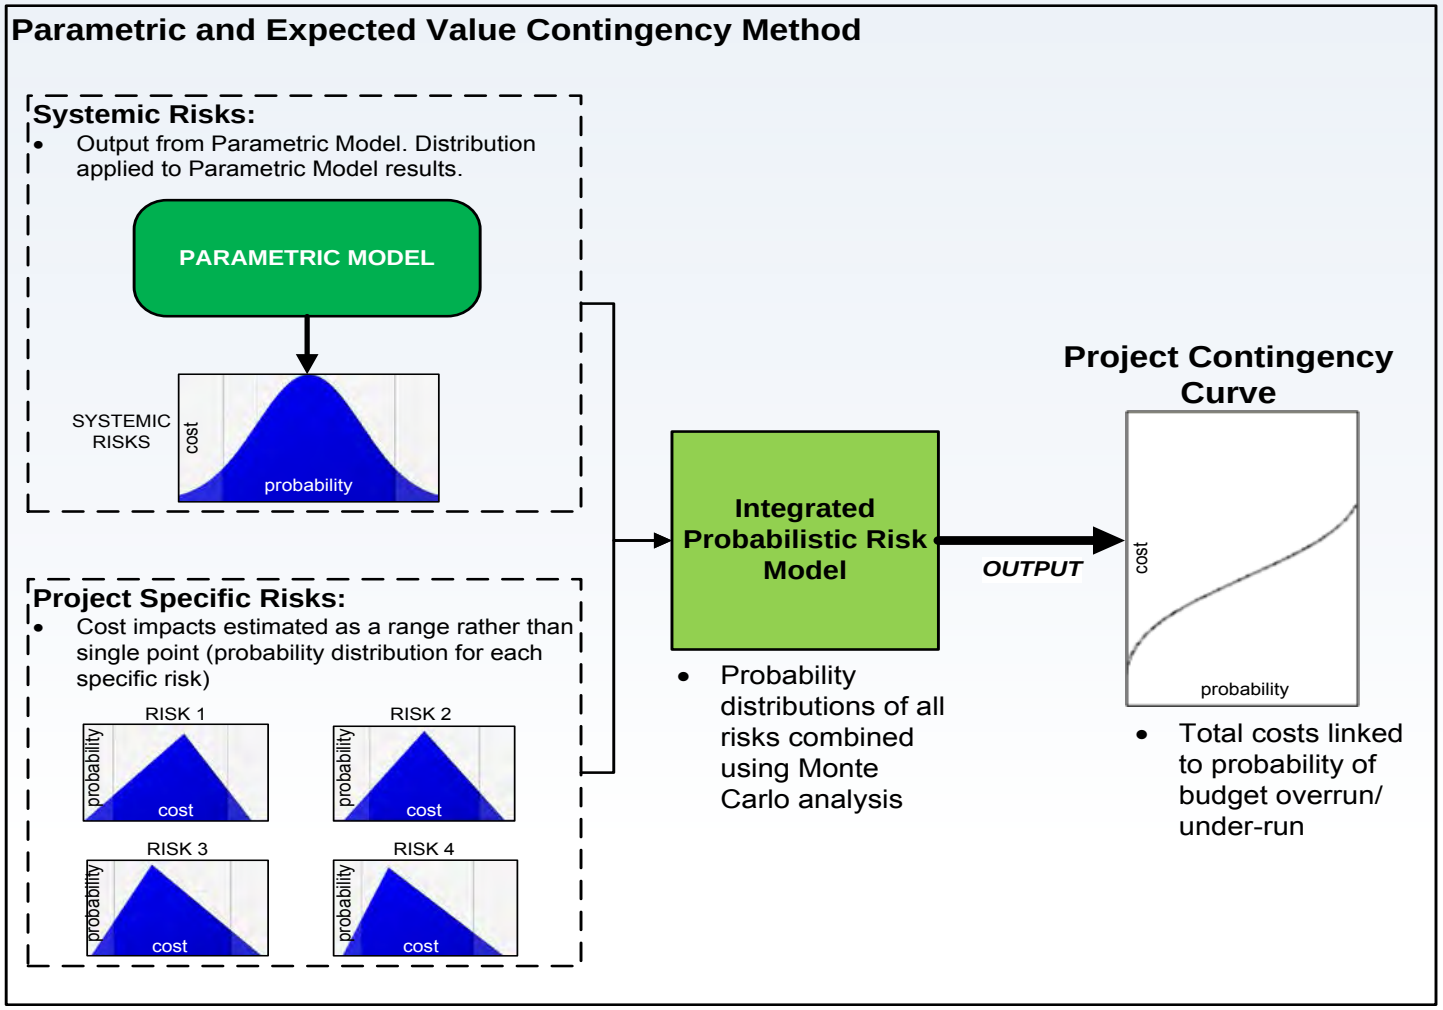


Why has the Keeyask estimate been updated and what has been updated?

- The Keeyask General Civil Contract (GCC) closed in December, 2013
- Since this time, our team has been evaluating the bids, and reviewing both the control budget and NFAT low, reference and high costs.
- The GCC is the largest contract and drives site construction and risks
- As part of on-going management of project, MH continues to review adequacy of estimate and forecast to complete
- Review included main parts of the estimate, contingency and management reserves



Methodology - Estimate and Budget



Step 1 – Estimate Development

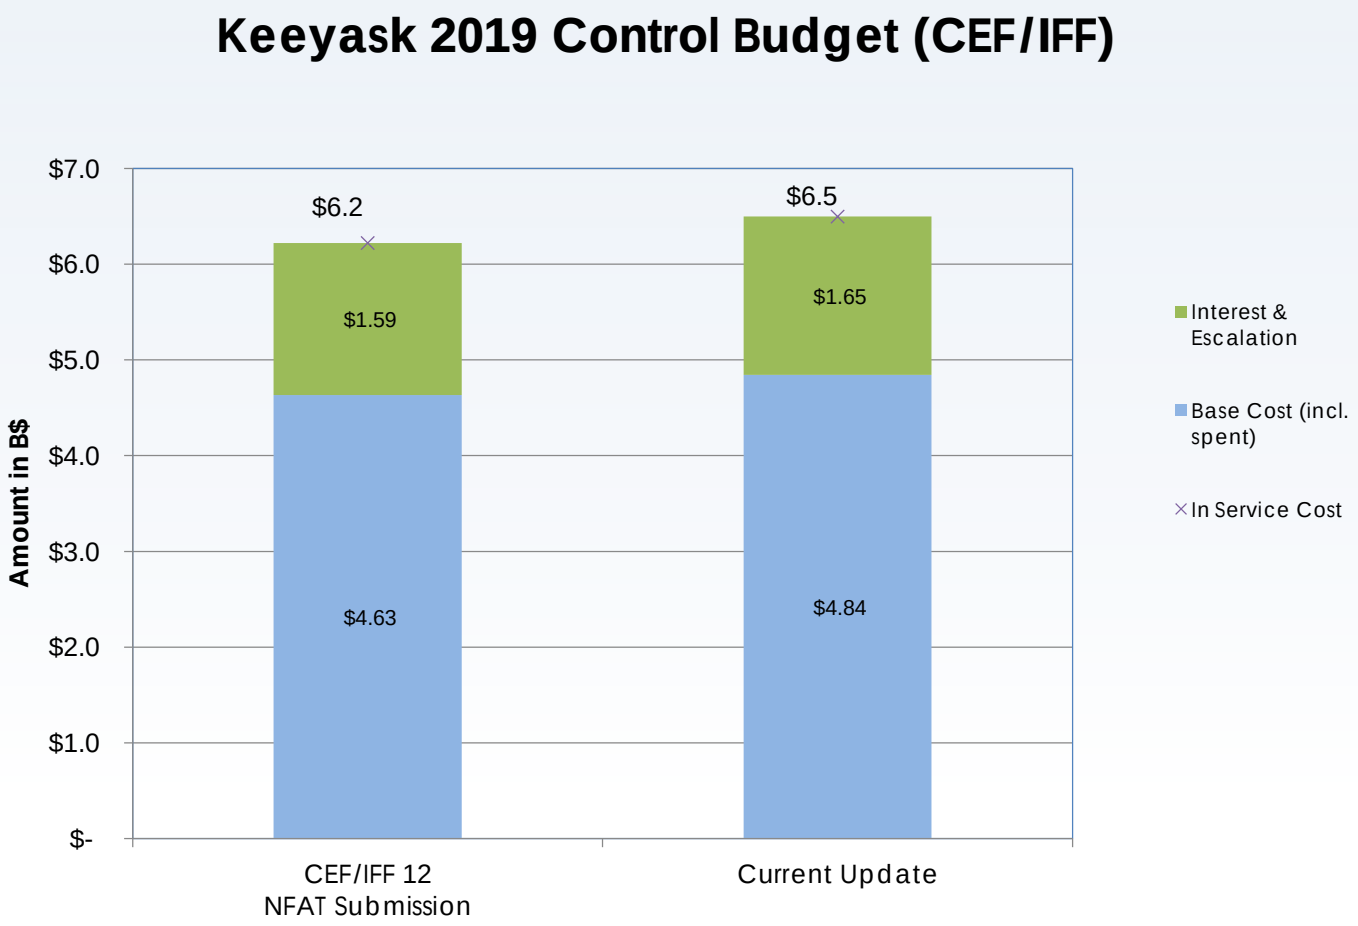
Step 2 – Budget Scenario Development

Methodology – Contingency Analysis

Part A – Control Budget Results

Summary of Work/Key Findings:

- Examined the adequacy of the Point Estimate, Contingency and Management Reserves.
- Point Estimate updated based on Keeyask General Civil Contract proposals, changes to estimate assumptions, and pricing received for committed contracts to date.
- Contingency analysis re-run testing adequacy to completion.
- Labour risk reviewed and reserve updated.
- Escalation reserve continues to be included for escalation beyond CPI.
- Updates to Conawapa based on Keeyask findings.

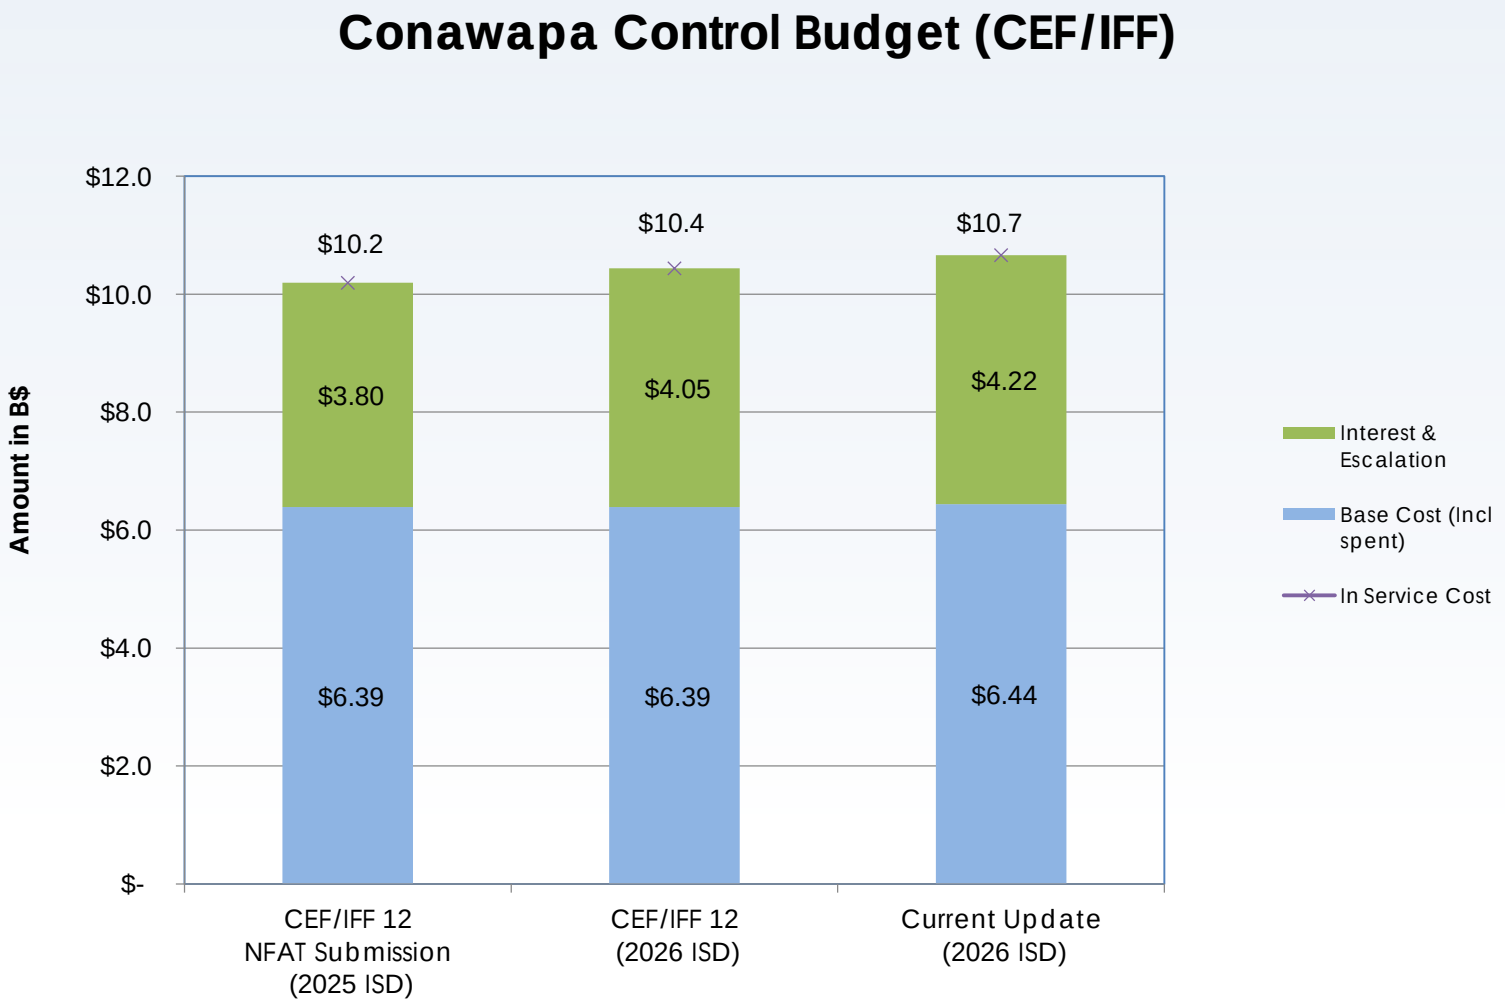


Part A – Keeyask Key Assumptions

Key assumptions:

- Award of GCC in March, 2014
- Subject to all approvals start in-stream construction July, 2014
- First unit in-service November, 2019
- Incorporate results from GCC and all current contracts
- Scope of work to construct Keeyask is the same

Keeyask 2019
Updated Control Budget Variance

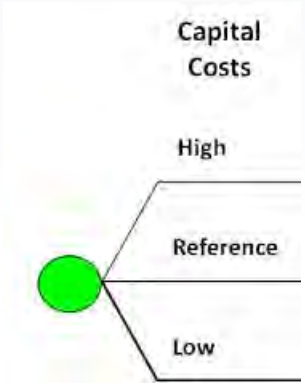


Part A – Conawapa Key Assumptions

Key assumptions:

- Start construction Jan, 2018
- First unit in-service May, 2026
- Incorporate findings from Keeyask GCC and contracts into estimate
- Scope of work to construct Conawapa is the same

Conawapa 2026
Updated Control Budget Variance



Part A – Control Budget Conclusion

- Updated estimate reflects the most current project information
- Estimate methodology applies industry best practices and addresses risks using contingency and management reserves
- This updated estimates will form the control budget to manage the execution of the project

Part B – NFAT Low, Ref, & High

Summary of Work/Key Findings:

- NFAT low, reference and high are key inputs into the economic and financial probabilistic analysis.
- Original values were based on the stress test contingency curve used to establish the 2012 Control Budgets for Keeyask and Conawapa
- Key variables include contingency, and labour reserve.

Part B – NFAT Low, Ref, & High

Summary of Work/Key Findings:

- Labour reserve has been incorporated into the contingency curve. It was formerly modeled outside of this curve.
- Contingency is based on updated contingency assessment and curve. Range of results now larger.

NFAT Results - Keeyask

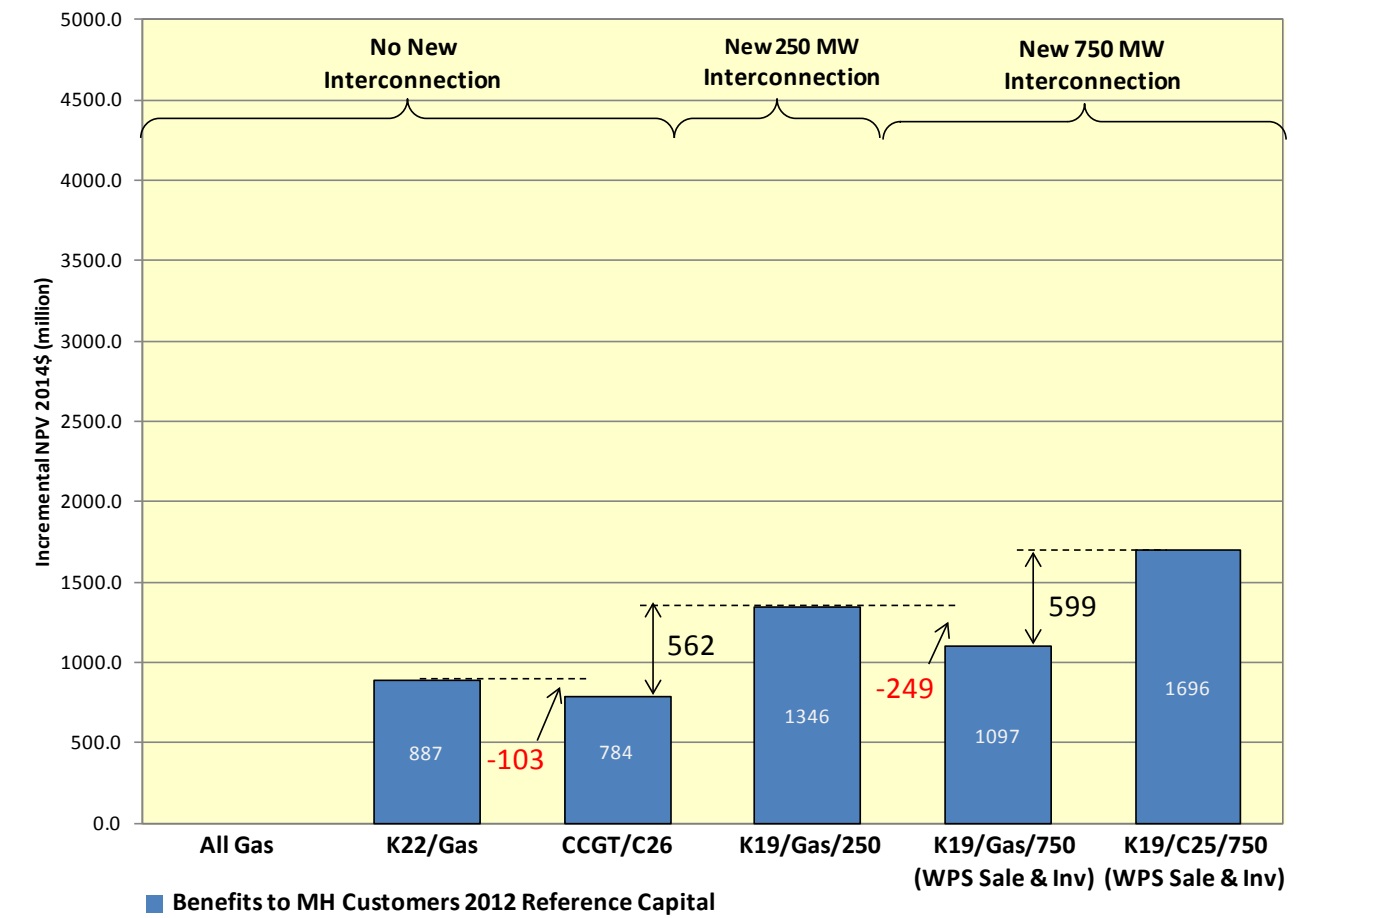
	Keeyask 2019/20 (Billions of $)		
Description	**Low**	**Reference**	**High**
A) Key Variables (2014 Update)			
i) Contingency	-0.18	0.31	0.88
ii) Labour Reserve	0.18	0.19	0.19
iii) Escalation Reserve	0.04	0.09	0.14
B) Base Cost (Including Sunk)			
i) 2012 Values (2013$)	4.07	4.39	4.87
ii) 2014 Update (2013$)	4.36	4.95	5.62
Base Cost Difference	**0.29**	**0.56**	**0.75**
C) Total In-Service Costs			
i) 2012 Values	5.31	5.71	6.33
ii) 2014 Update	5.61	6.35	7.18
In-Service Cost Difference	**0.30**	**0.64**	**0.85**

NFAT Results - Conawapa

	Conawapa 2026/27 (Billions of $)		
Description	**Low**	**Reference**	**High**
A) Key Variables (2014 Update)			
i) Contingency	-0.47	0.46	1.56
ii) Labour Reserve	0.35	0.36	0.38
iii) Escalation Reserve	0.13	0.31	0.51
B) Base Cost (Including Sunk)			
i) 2012 Values (2013$ - 2026/27 ISD)	5.40	5.97	6.65
ii) 2014 Update (2013$ - 2026/27 ISD)	5.23	6.36	7.68
Base Cost Difference	**-0.17**	**0.39**	**1.03**
C) Total In-Service Costs			
i) 2012 Values (2026/27 ISD)	8.82	9.70	10.76
ii) 2014 Update (2026/27 ISD)	8.64	10.40	12.48
In-Service Cost Difference	**-0.18**	**0.70**	**1.72**

Project Execution

- Sound Project Delivery Strategy
- Comprehensive Project Schedule
- Project Team
  - World Class Consultants
  - Top Tier Suppliers
- Mitigation Strategy for Labour Risk
- Incorporate Lessons Learned From Wuskwatim and Other Projects



Results from Economic Evaluation

Plans 2, 4 and 14
- DSM Sensitivity (1.5x DSM)
- DSM Stress Test (4x DSM)

Sensitivity Analysis

- Determine the effect on the economic value of selected development plans of single high impact variables.
- Sensitivity Analysis was conducted for:
  - In-Service Date Delay
  - Drought
  - Manitoba Load
  - Climate Change

Sensitivity Analysis - Drought

- The risks involved with drought have been either captured directly or studied separately in the various stages of MH's analysis:

Captured Directly in Economic & Financial Analysis

- Supply Risk: by planning for resource needs as per the Generation Planning Criteria
- Financial Risk: through inclusion of revenue projections from all low flow conditions in the overall revenue forecasts for each case studied (the averaging of revenues for all 99 flow cases in the historical record)

Studied Separately

- Financial Risk: sensitivity analysis of a prolonged 5-year drought
- Supply Risk: qualitative and quantitative analysis of emergency energy available

Sensitivity Analysis - Drought

- Duration of drought
  - Five year extended drought is captures the incremental impact between choice of development plans
- Timing of Drought:

  5 year Drought beginning in:
  - 2014/15 - during construction of Keeyask
  - 2021/22 - affecting early revenues from Keeyask and during construction of Conawapa
  - 2027/28 – affecting early revenues from Conawapa
  - 2032/33 – beyond early revenues from Conawapa
- Impact of Energy Prices:
  - High, Reference, Low Energy Prices

Sensitivity Analysis - Drought

Analysis Conclusions:

1. The impact of a severe drought is significant for all plans studied.

2. Development plans with new hydro resources will yield incrementally higher revenues under high flow periods and incrementally lower revenues under low flow periods.

3. Incremental negative impact of drought is greater for plans with increasing amounts of new hydro-electric generation and a larger interconnection due to a proportionally greater loss in flow-related revenue.

4. The All Gas plan has the greatest relative sensitivity to changes in energy prices over the course of a 5–year drought .

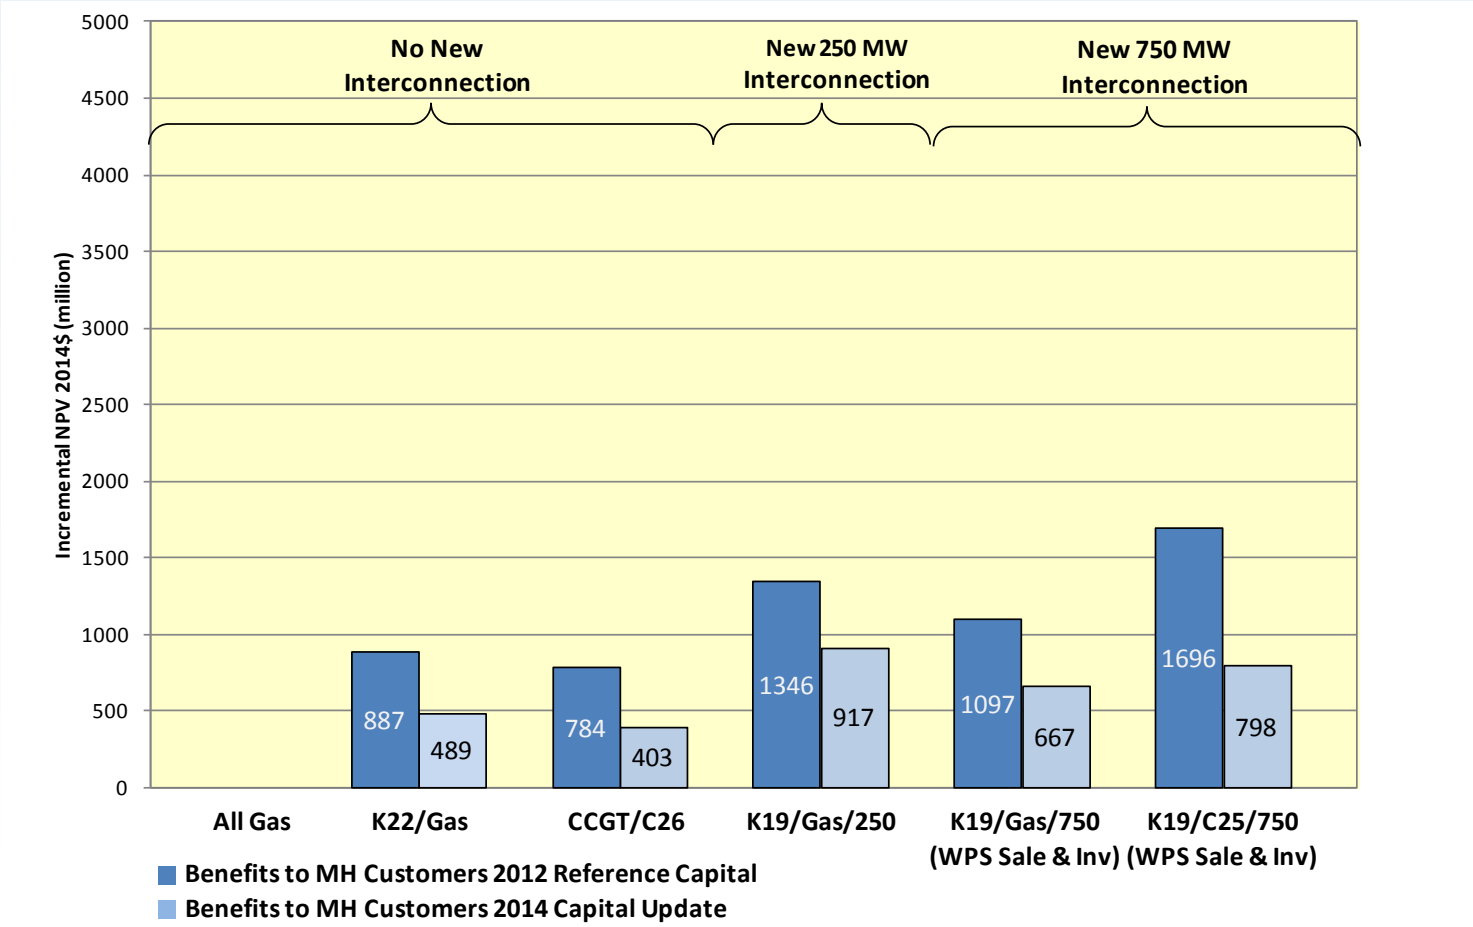
Sensitivity Analysis – Manitoba Load

1. Sensitivity analysis based on the 90th percentile and 10th percentile probability bands for energy and capacity 2012 Manitoba load forecasts.
2. Under low and high load sensitivities the economic ranking of the development plans does not change.
3. Load changes have the largest impact on the All Gas Plan.
4. Low load sensitivity – incremental NPV of plans with new hydro and new interconnection decrease relative to the All Gas Plan
5. High load sensitivity – incremental NPV of plans with new hydro and new interconnection increase relative to the All Gas Plan

Sensitivity Analysis – Climate Change

- Manitoba Hydro collaborates with national and international climate change experts to better understand the potential impacts of climate change on Manitoba Hydro's system.
- Impacts of climate change on future water supply
  - Large ensemble of global climate models project a range of future water supply conditions.
  - Most projections show average annual future water supply to increase.
  - Captures large source of climate change uncertainty.
  - Relative changes to average streamflow seasonality are expected to be minimal with respect to the observed inter-annual variability.
  - Low confidence in climate model projections of extremes into the future
  - Currently there is no utility accepted standard to assess potential climate change impacts on extreme system-wide hydrologic drought.
- Incremental NPV analysis favors the Preferred Development Plan under all assessed climate change scenarios.
- Large new interconnection assists in managing extremes.

Economic Results – DSM & Updated Keeyask and Conawapa Capital Costs



- Probabilistic Analysis - Keeyask & Conawapa Capital Costs

- Reference Case Analysis for higher levels of DSM

2014 Capital Cost Update – Keeyask and Conawapa Expected Values

Updated DSM Evaluation

Development Plans
1. All Gas 5. K19/Gas/750MW (WPS Sale) 14. Preferred Development Plan

DSM Levels	2027/28 Energy levels	
2013 DSM	773 GWh	(1x DSM)
Level 1	1,704 GWh	(2x DSM)
Level 2	2,961 GWh	(4x DSM)
Level 2 DSM with Pipeline Load Net Reduction in Load	2,961 GWh -1,478 GWh 1,483 GWh	 (2x DSM)
Level 3 DSM	3,546 GWh	(5x DSM)
Level 3 DSM With Pipeline Load Net Reduction in Load	3,546 GWh -1,478 GWh 2,068 GWh	 (2.7x DSM)

DSM Analysis – 3 Additional Levels

What level of DSM is economic?

	Total Resource Cost Without Pipeline Load Includes all costs and does not account for changes in Domestic revenue [with pipeline load for level 2 to level 3 only] Incremental NPV (millions of 2014$) of implementing higher level of DSM		
	All Gas	K19/Gas/750MW	K19/C/750MW
Base to Level 1	535	497	285
Level 1 to Level 2	816	887	737
Level 2 to Level 3 [with pipeline]	-49 [-60]	-86 [-39]	-102 [-85]

Note: ISD changes with Level of DSM for Conawapa (DSM1:2030, DSM2:2031, DSM3:2033) and All Gas (DSM1:2028, DSM2:2031, DSM3:2033).

Impact of DSM Levels on Development Plan Economics

	Without Pipeline Load [with pipeline load for level 2 and level 3 only] Incremental NPV (millions of 2014)$ Relative to All Gas at specified level of DSM			
	Base DSM	Level 1 DSM	Level 2 DSM	Level 3 DSM
Plan 5 K19/Gas/750MW [Pipeline]	377	339	410 [339]	373 [361]
Plan 14 K19/C/750MW [Pipeline]	374	124	45 [139]	-7 [114]

Equity Return in the real WACC of 5.4% -return on equity above borrowing cost

2013 Base DSM NPV in 2014$ incremental to All Gas Base DSM)

	RWACC 5.4%	Debt Rate 4.65%	(RWACC - Debt Rate) Embedded Return On 25% Equity
K19/C26/750MW	$374M	$1887M	**$1513M**
K19/Gas26/750MW	$377M	$1098M	**$721M**

2014 Level 2 DSM (NPV in 2014$ incremental to All Gas Level 2 DSM)

	RWACC 5.4%	Debt Rate 4.65%	(RWACC - Debt Rate) Embedded Return On 25% Equity
K19/C31/750MW	$45M	$1364M	**$1319M**
K19/Gas31/750MW	$410M	$1152M	**$742M**

- Portion of embedded return on equity required to maintain debt equity ratio 75:25
- Not suggesting replacing WACC in corporate economics but demonstrates return on equity available to Manitoba Hydro, which is embedded in the WACC

Integration of Economics with Other Perspectives

Rolling Blackouts In Alberta Due To Extreme Heat

THE CANADIAN PRESS

CP | By The Canadian Press
Posted: 07/02/2013 7:20 pm EDT | Updated: 07/02/2013 8:51 pm EDT

CALGARY - Soaring temperatures on Tuesday pushed Alberta's demand for electricity beyond what it can deliver, so the power regulator ordered some utility companies to use less, which caused temporary rolling blackouts.

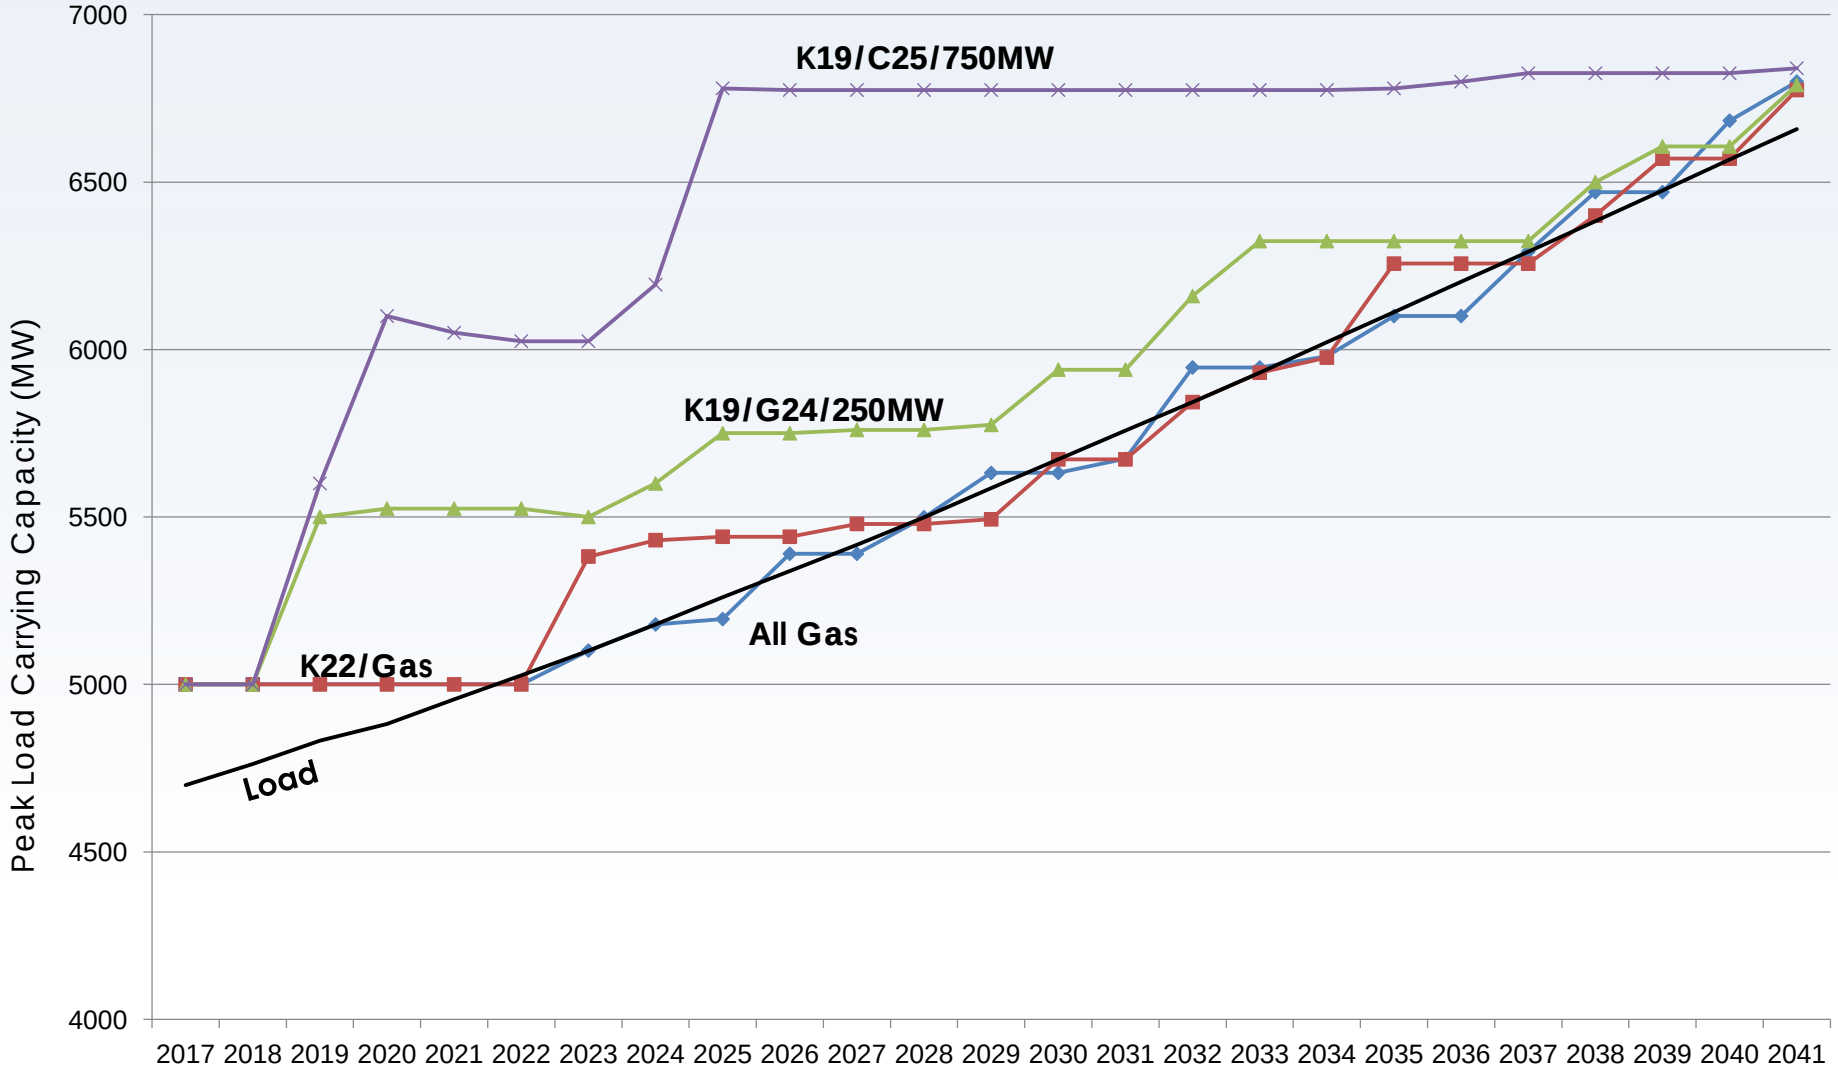
Cause of massive Saskatchewan blackout under investigation

0

By Tim Cook
Wednesday, September 19, 2007 6:41:54 EDT AM

Saskatchewan's government-owned power utility is investigating a series of events that caused a massive blackout, leaving alarm clocks flashing in bedrooms across the province early Tuesday morning.



Newfoundlanders asked to save power as cold snap pushes grid to limit

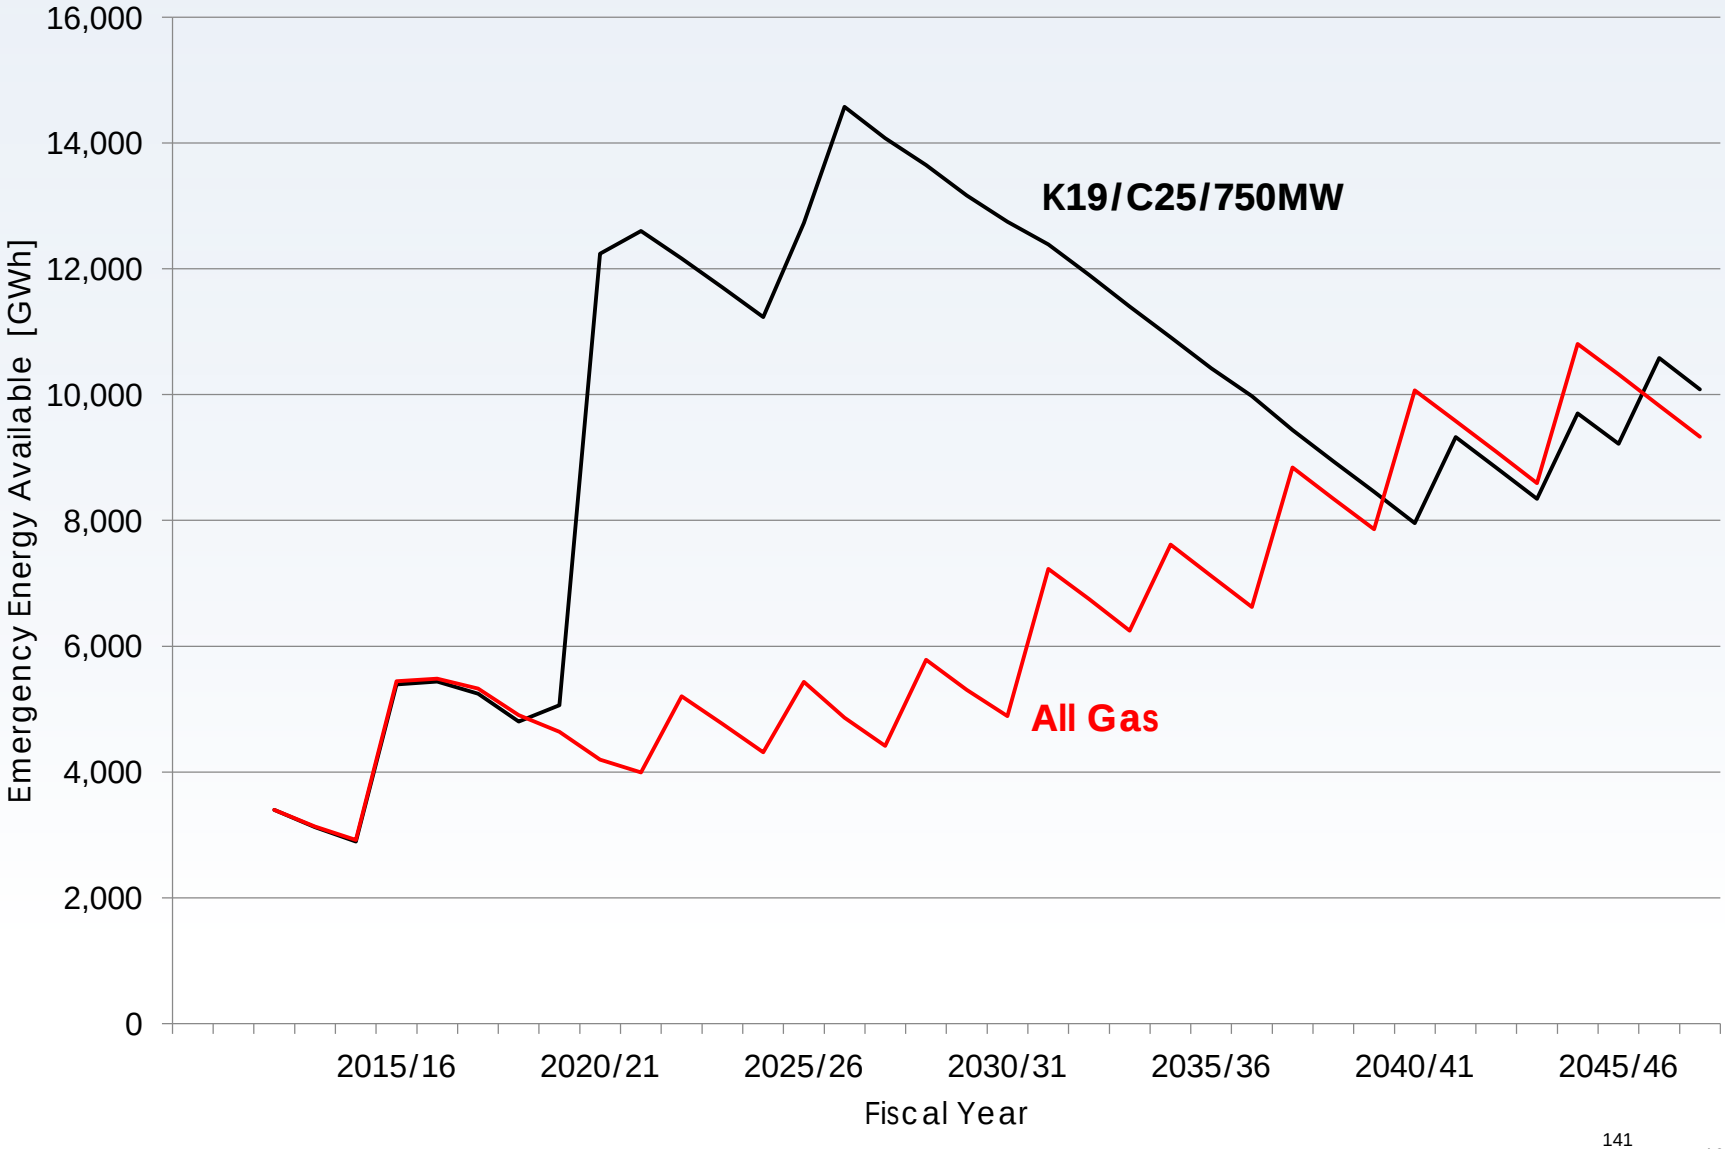
Reliability Analysis

- Loss of Load Expectation Measure of Reliability
  - Engineering analysis used to compare the reliability of different development plans
  - Analysis of the expectation (probability) that available generation will be insufficient to serve domestic peak load
  - 0.1 day/year is NERC metric to demonstrate resource adequacy (guideline used widely including MH)
  - Not a North American standard yet but results are published annually and industry expected to meet
- Plans with 750 MW Interconnection much more reliable
  - 500 to 1000 MW more ability to carry MB domestic load fro 2020 to 2040
  - compare to Keeyask = 695MW

Bulk System Reliability: Peak Load Carrying Capacity



4951

Energy Security Analysis

- Emergency energy available to Manitoba domestic load if:
  - drought more extreme than drought of record or
  - load higher than P50
  - major outages of generation or transmission
  - emerging risk of natural gas delivery infrastructure
- In such emergency :
  - can stop delivery to exports (force majeure)
  - would use all import room on interconnection
- Plans with 750 MW Interconnection much more secure under droughts more extreme than planned for
  - 3000 to 4500 GWh/year more emergency energy for MB domestic load from 2020 to 2040
  - compare to Keeyask = 3003 GWh

Emergency Energy Available
Including Non-Firm On-Peak Imports

NFAT Decisions & Pathways

NFAT Future Electricity Supply Plan Decisions

Fundamental decision: long term Manitoba electrical future

- Should next major electrical supply be hydro or gas?
  - DSM expanded in all plans

Associated decisions if next supply is hydro

- Should interconnection expansion opportunity be pursued?
  - need Keeyask 2019 & 250 MW MP sale
- Should interconnection be 750 MW or 250 MW?
- Should WPS 308 MW sale be pursued?
  - need 750 MW interconnection

Development Plan Implementation Pathways

-All include DSM (& potentially wind, etc.)

1	Gas 2023 only for domestic load	Later gas generation or hydro
2	Keeyask 2023 only for domestic load	Later gas generation or Conawapa
3	Keeyask 2019, 250 MW interconnection, MP 250 MW Sale, 125 MW NSP extension, 100 MW WPS sale	Later Conawapa or gas generation
4	Keeyask 2019, 750 MW Interconnection, MP 250 MW Sale, 125 MW NSP extension, 100 MW WPS sale	Later Conawapa or gas generation
5	Keeyask 2019, 750 MW Interconnection, MP 250 MW Sale, 125 MW NSP extension, 308 MW WPS Sale	Later Conawapa or gas generation

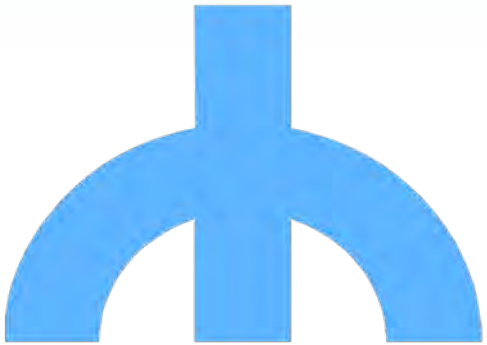
Short List: Three Pathways

1	Gas 2023 only for domestic load	Later gas generation or hydro
2	Keeyask 2023 only for domestic load	Later gas generation or Conawapa
3	Keeyask 2019, 250 MW interconnection, MP 250 MW Sale, 125 MW NSP extension, [illegible]	Later Conawapa or gas generation
4	Keeyask 2019, 750 MW Interconnection, MP 250 MW Sale, 125 MW NSP extension, [illegible]	Later Conawapa or gas generation
5	Keeyask 2019, 750 MW Interconnection, MP 250 MW Sale, 125 MW NSP extension, 308 MW WPS Sale	Later Conawapa or gas generation

250 MW Interconnection now hypothetical, likely not viable

308 MW WPS now signed, clearly beneficial with 750 MW line

Narrows to Two Key Decisions



1. Should Keeyask be next supply built for Manitoba Load?
   - NO ► Stay on Pathway 1 (Gas 1st)
   - YES ► Start on Pathway 2 (Keeyask 1st)

2. If yes, should Keeyask be advanced to take advantage of opportunity for interconnection infrastructure and exports?
   - NO ► Stay on Pathway 2 (Keeyask later for MB Load)
   - YES ► 750MW ► Start down Pathway 5 (Keeyask 2019, 750 MW Line)

Overall Conclusions

- Keeyask Gas plan with 750MW line & MP/WPS/NSP
  - Approx $300 to $400M corporate benefits in new scenarios
  - Over $1 Billion including provincial transfers
  - Justified as being economic and by other benefits- rates, reliability, energy security, environment, economy, aboriginal

- Keeyask Conawapa plan with 750MW line & MP/WPS/NSP
  - $ Zero to $400M corporate benefits in new scenarios
  - Over $ 1 ½ Billion including provincial transfers
  - Likely justified as being economic and by other benefits- rates, reliability, energy security, environment, economy, aboriginal
  - Will confirm in future if proceed with Conawapa depending on additional export contracts, gas/export prices forecasts, load growth, DSM, capital costs, interest rates, etc.

Coalition/MH I-45a; 2015/16 GRA PUB/MH I-57

PREAMBLE TO IR (IF ANY):

QUESTION:

a) Please add two columns to the table in Coalition/MH I-45a: 2013 Forecast and 2013 Forecast with Update reflecting the additional pipeline load contemplated at the NFAT (as seen in the response to 2015/16 GRA PUB/MH I-57).

b) Please identify the specific pipeline loads that are forecast along with their annual energy and capacity requirements.

RATIONALE FOR QUESTION:

RESPONSE:

Public disclosure of the response to this IR (or portions thereof) would result in the release of information considered to be confidential and commercially sensitive. As directed by the PUB, Manitoba Hydro will be filing a motion seeking confidential treatment of the redacted information contained in this response pursuant to Rule 13.

a) The NFAT 2013 update filed as part of the NFAT proceedings was a scenario update to the 2013 Forecast designed to approximately represent emerging information related to new planned pipeline expansions in the Petroleum sector. This scenario update did not specifically increase customer usage within the pipeline sector forecast; but was approximated by advancing 1700 GWh of the forecast Potential Large Industrial Load ("PLIL") into the first four years of PLIL (Years 4 to 8 of the 20 year forecast period) and continuing with 100 GWh per year PLIL growth thereafter.

   The following table presents the forecast for the Pipeline sector under the 2013 Forecast and the 2013 scenario with the adjustment of 1,700 GWh assigned to the

pipeline sector. It should be noted that the values in the response to 2015/16 & 2016/17 Electric General Rate Application PUB/MH I-57 were presented at Generation and the 2013 forecast scenario would present a net increase to the Top Consumers overall of 1,300 GWh as compared to the 2013 Load Forecast.

PIPELINE FORECAST COMPARISON

--- Upon commencing at 9:05 a.m.

THE CHAIRPERSON: Good morning. I believe that we're ready to commence today's proceedings. I will turn over the microphone to Mr. Hombach. Good morning, Mr. Hombach.

MR. SVEN HOMBACH: Good morning, Mr. Chairman and members of the Board. I'm advised that there aren't any administrative matters from counsel. Before we do get started and continue the public cross-examination of Manitoba Hydro's load forecast and DSM panel, I would like to remind everyone that this afternoon there will be an in-camera session for the Board where commercially sensitive information will be discussed.

At that point, the audio feeds to the other rooms will be cut and the doors will be locked. I anticipate at this point that that session will take place after lunch, but that depends on how long Intervenor counsel need this morning.

My Friend, Ms. Boyd, has advised me that there currently aren't any undertakings by Manitoba Hydro to address, so I would suggest that the panel call upon M. Hacault to continue he examination. Thank you.

THE CHAIRPERSON: Bonjour, M. Hacault.

MANITOBA HYDRO PANEL 3 CONTINUED:

DALE FRIESEN, Previously Affirmed

LLOYD KUCZEK, Previously Sworn

LOIS MORRISON, Previously Sworn

IAN PAGE, Previously Sworn

INGRID ROHMUND, Previously Sworn

ED WOJCZYNSKI, Previously Sworn

CONTINUED CROSS-EXAMINATION BY MR. ANTOINE HACAULT:

MR. ANTOINE HACAULT: Bonjour, good member -- good morning, members of the panel. Perhaps, if appropriate, I'll just start with where I'm intending on going today. I'm going to be asking some questions -- further questions with respect to DSM. I will also be asking some questions with respect to the parameters of, let me see, the stress tests that was touched upon in the presentation, and some short issues, such as the curtailable program which affects part of the MIPUG group.

So those are the general subject areas. And I'll be notifying the panel of Hydro and of this Board as and when I get into these different issues.

As a recap for yesterday, I'd ask -- and it hasn't been -- I think it's being brought upon the screen, it's at Tab 1. For some reason, that -- it's -- it should be up a couple pages. It's the beginning of the Power Smart section of Tab 1. That's where all the metrics were. And there's a summary -- at least it's -- it's page 5, sorry. I misstated the page for the person who's doing this.

So am I correct, Mr. Wojczynski, that this is from your document, Manitoba Hydro's document, what I'm putting up on the screen, firstly?

MS. MARLA BOYD: Sorry, Mr. Hacault, I'm having a bit of trouble locating it. Was it -- were you referring to pa -- page 5 in your book of documents?

MR. ANTOINE HACAULT: Page 5, Volume II of our book of documents.

MS. MARLA BOYD: I have the wrong volume. Do you have the volume?

MS. LOIS MORRISON: Yes, this is a section from our Power Smart plan.

CONTINUED BY MR. ANTOINE HACAULT:

MR. ANTOINE HACAULT: Okay. And yesterday I was making a valiant attempt, I don't know

if I managed to, to compare some of the metrics that Hydro has listed in its Power Smart Program.

Do you recall my valiant attempt?

MR. LLOYD KUCZEK: Yes.

MR. ANTOINE HACAULT: So for the integrated metric, am I right in understanding that this takes into account, if we look at our example, not only the cost to the Utility, but the cost to the customer?

MR. LLOYD KUCZEK: That's correct.

MR. ANTOINE HACAULT: Okay. So when we're looking at that metric, we've got to be careful because if we're focussing on the cost to the Utility, any of the ones listed under 'integrated metrics' includes costs in addition to those incurred by the Utility, correct?

MR. LLOYD KUCZEK: Correct. And as I mentioned -- I -- I am repeating myself, but I think it's always important to keep in mind that it's -- it's that cost, that's the most important because customers pay that cost --

MR. ANTOINE HACAULT: Okay.

MR. LLOYD KUCZEK: -- at the end of the day.

MR. ANTOINE HACAULT: And in effect to

a certain extent, if you're using that metric, you're making a decision as to what the customer might or might not want to do with respect to that extra cost, correct?

MR. LLOYD KUCZEK: It's more to do with it's a relevant cost to look at from the perspective of a resource option. So when you're looking at a generation option, the customers pay the whole cost; an alternative is DSM options, so the relevant cost is the total cost.

MR. ANTOINE HACAULT: Correct. And in the example that we went over, we went through a second category of metrics which you've categorized as 'utility metrics', correct?

MR. LLOYD KUCZEK: Correct.

MR. ANTOINE HACAULT: And two (2) of those were firstly the -- the first one listed under that heading is a rate impact measure cost, correct?

MR. LLOYD KUCZEK: Correct.

MR. ANTOINE HACAULT: And we had also, I believe, looked at the levelized utility cost.

MR. LLOYD KUCZEK: Correct.

MR. ANTOINE HACAULT: And then finally you list another metric. It's at the bottom of the page. It's on the screen. It's the one that focusses

on the effect of the particular program on the consumer, the consumer metrics.

MR. LLOYD KUCZEK: Correct.

MR. ANTOINE HACAULT: So your initial slide had shown a base case of seven (7) cents as a rate. When -- this was part of the presentation, correct?

MR. LLOYD KUCZEK: Correct.

MR. ANTOINE HACAULT: And what you were trying to illustrate is if we had a hundred gigawatts of generation built at ten (10) cents, that would bring our cost to the Utility and ratepayers at seven point two seven (7.27) so -- compared to the base case, correct?

MR. LLOYD KUCZEK: Correct. As a rate impact, you do it on new generation.

MR. ANTOINE HACAULT: But the math you wanted to illustrate didn't automatically follow that if you -- if DSM cost you ten (10) cents, that wouldn't lead you to a rate of seven point two seven (7.27).

MR. LLOYD KUCZEK: That's correct.

MR. ANTOINE HACAULT: So do I take it that we have to be careful -- if we're talking about spending ten (10) cents on new generation and ten (10)

cents on DSM for the same gigawatt hours, we don't necessarily get the same results mathematically?

MR. LLOYD KUCZEK: You don't, but that's where the fairness issue comes into play. If you didn't care about the fairness issue, you could spend up to that because the total customer bills in aggregate are the same as measured by the cust -- or the Utility's revenues.

But as I pointed out, the fairness issue deals with -- or -- or the point being not all customers are impacted the same way. Now, you create an argument about all customers have access to programs but, you know, you get into all sorts of issues about customers have already participated in the Power Smart Programs. And, so it's -- it's a consideration that we think is important to take into account in designing programs.

MR. ANTOINE HACAULT: Yes. So if you had 5 percent of the population that was benefiting from a program that costs ten (10) cents, it would be the remaining portion of the population that would be subsidizing, in effect, the people who are benefiting from the higher-cost DSM?

MR. LLOYD KUCZEK: Yes.

MR. ANTOINE HACAULT: And the last

alternative was actually spending less on DSM with an effect that nobody would be paying a higher rate than the generation option.

MR. LLOYD KUCZEK: That's correct.

MR. ANTOINE HACAULT: But to achieve that we had to downscale the DSM mathematically to -- from ten (10) cents down to two point seven (2.7) cents, correct.

MR. LLOYD KUCZEK: From a utility perspective. But from an -- an integrated perspective the customer -- the DSM still costs the same as -- as the example in my mind that I was contemplating when I drafted that example. So the DSM cost didn't change. It was just the -- the question of sharing.

And so when I talk about program designs, that's one (1) of the -- one (1) of the considerations you need to think about, is how to share that cost. And at the same time you've got to think about the program being effective, in terms of achieving the results, so.

MR. ANTOINE HACAULT: Understood.

MR. LLOYD KUCZEK: And -- and so when I -- I do want to point out when you -- when I provided that example it wasn't to suggest that that's how we do things. We still take each program and

assess it individually and --

MR. ANTOINE HACAULT: Just --

MR. LLOYD KUCZEK: -- we're willing to go above that line, and have customers subsidize other customers to a reasonable degree.

MR. ANTOINE HACAULT: Thank you very much. Again, when I'm asking questions, I'll repeat the same caveat that coun -- Board counsel said. If I get anywhere close to CSI, just let me know. I don't think any questions will. And whoever deems it appropriate to answer my question most certainly can -- can answer it.

The -- I'm going to be getting into the stress test area with respect to how we're approaching evaluating some of the alternatives. Let me start with a little bit of introduction to that.

It's my understand that if we took simply a needs-based approach, that we wouldn't be building Keeyask as early as we're now proposing based on the opportunity that's being created as a result of certain circumstances for export and other reasons, correct?

MR. ED WOJCZYNSKI: Correct.

MR. ANTOINE HACAULT: So that -- I would suggest that with respect to the needs

perspective, if we were just looking at that, we'd be looking at, from what I understood, more a 2023 perspective than a 2019 perspective.

MR. ED WOJCZYNSKI: With the 2013 load forecast and 2013 IFF assumptions, the -- the date would be 2023. As I indicated in -- in some -- in -- in Exhibit 90 yesterday, that date would vary depending on -- on the -- in the future on diff -- other assumptions. But the -- the 2013 IFF information is 2023, yes.

MR. ANTOINE HACAULT: And there's some information as proceeding suggesting that if you're ramping up the DSM, it might actually push out that date further for Keeyask, correct?

MR. ED WOJCZYNSKI: It would push it out later than 2023, yes.

MR. ANTOINE HACAULT: And I would suggest that this puts some pressure from -- if you're looking at a needs perspective, to make sure that if we're advancing something that we've got our stress tests right to take into account what might happen if we took a needs approach as opposed to an opportunity approach.

MR. ED WOJCZYNSKI: Yes. Yes.

MR. ANTOINE HACAULT: At Tab 3 of our

book of documents we've got certain load forecasts. And I'm going to take whoever is appropriate through some of these documents to best understand how the NFAT material is being presented now, how it relates to the experience that you've put in your slides, and how it relates to previous approaches by Manitoba Hydro. That's where I'm going.

So if I look at Tab 5 of our book of documents, which is page 23, I believe, you had taken us through the forecast accuracy of Manitoba Hydro using this table.

Was I correct in understanding that?

MS. LOIS MORRISON: That is correct.

MR. ANTOINE HACAULT: Okay. Now, I just want to understand how this slide works. I think I know, but I'm not too sure. If I look in 1992, I see a darker bar which goes somewhat over the 5 percent.

Do you see that?

MS. LOIS MORRISON: Yes.

MR. ANTOINE HACAULT: Okay. And am I correct in understanding that the forecast for that bar would have been made in 1982, ten (10) years before?

MS. LOIS MORRISON: That is correct.

MR. ANTOINE HACAULT: Okay. And there's a practically imperceptible bar. So that time, you were bang on for the five (5) year accuracy. So that would have been a forecast that would have made -- been made five (5) prior to that.

And that would have been, I think, 1987?

MS. LOIS MORRISON: That is correct.

MR. ANTOINE HACAULT: Okay. So we've got two (2) metrics here that we're looking at over a twenty (20) year time period. Did Hydro believe that this sampling was something that was representative of what it -- what might happen with the forecasting? Is that why it put this twenty (20) year graph? Because you could have chosen ten (10) years. You could have chosen fifteen (15). You could have chosen thirty (30). 2 50

Why did you choose twenty (20)?

MS. LOIS MORRISON: We -- you're correct. We could have used ten (10) years. We could have used fifteen (15) years. We could have used five (5) years. What we do is we're -- we're showing back twenty (20) years only to demonstrate that, as with all forecasting, you're looking at a longer period of time.

And if we did look at the five (5) years we would probably be limiting our -- the -- the -- it would be limiting your view of how the economy cycles when you're -- and it would pro -- it would -- it may disproportionately show the influence of past economic changes on a shorter period of time.

So we look at the twenty (20) year horizon so that we can better demonstrate the cycles that occur within over time and to show that forecasting can -- will vary over time due to cycles. And so what we're trying to demonstrate is how accurate our -- or how well our -- our forecasts have performed compared to what's actually occurring in the marketplace over a longer period of time.

MR. ANTOINE HACAULT: Now, did the forecasting methodology change significantly, or was it sufficiently the same, to use this example, throughout the twenty (20) year time period?

MS. LOIS MORRISON: There have been adjustments to the forecast over this time period. We're looking at more than twenty (20) years of data, given that, as you -- as you mentioned, in 19 -- the -- the information presented for 1992 would have been ten (10) years prior to that.

So now we're looking at -- sorry, it is

a twenty (20) year horizon. So there has been some adjustments to our forecasting over that period of time where we've made improvements and adjustments. But the adjustments, we feel, have added to the value of the forecasting and have not, I believe, materially impacted the performance of our forecasting.

MR. ANTOINE HACAULT: Okay. Do you know about when you put those enhancements that you're talking about? Although they don't materially impact the forecasting, when did they occur?

Just, like, when did you start making these enhancements?

MR. LLOYD KUCZEK: If -- if you go back to the '70s, there was quite a difference back then. So this only includes from 1982 and -- and onwards. And that's going back to when employees were in place thirty (30) years ago, and I honestly, as well as Ms. Morrison, don't -- don't recall what methodologies were employed.

But I do know in that time frame in the early '80s we did start undertaking more sophisticated forecasting methodologies. And I don't recall, and I'm not familiar with, how those changed over time. But I know those refinements always -- continuously being made as we moved into the future

MR. ANTOINE HACAULT: Thank you. I just wanted to get some sense as to whether we're talking apples and oranges. Sometimes you've introduced certain computer models or certain metrics that change significantly.

But based on what I've understood right now, there hasn't been any significant changes in the metrics for forecasting -- this forecasting, correct?

MR. LLOYD KUCZEK: I would suggest nothing significant. The significant change occurred from the '70s to somewheres -- either late '70s or early '80s. And prior to that, my understanding was it was a pretty crude forecasting methodology that was used.

MR. ANTOINE HACAULT: Thank you. Now, the one thing I'm not absolutely sure I understand is if we go back to the 1992 bar, the dark blue one, which was the ten (10) year forecast, the bar goes above the 5 percent. Is that an indication that the forecast was too optimistic?

In other words, you talk -- thought in 1982 that your load was going to be higher than it actually was in 1992.

MS. LOIS MORRISON: Yes. It means in 1992 our forecast was five (5) -- was -- was that

degree higher than the actual.

MR. ANTOINE HACAULT: Okay. So conversely if we go in the range of 2007, the forecast was too low. You thought that the load was going to grow at a certain rate, but in fact it didn't grow that quickly. It was at a lower load.

MS. LOIS MORRISON: Yes. During that period of time the actual consumption was greater than what we had forecast.

MR. ANTOINE HACAULT: Okay. Now, it was explained, and it's in the rebuttal also, that if Manitoba's -- Hydro's goal, as I understand it, for the ten (10) year metric is to achieve 10 percent accuracy, and -- and that would be what you can reasonably expect to achieve for a ten (1) year forecast.

Did I understand that correct?

MS. LOIS MORRISON: Yes. We believe that the forecast is -- is reasonably performing if we are within 10 percent.

MR. ANTOINE HACAULT: So I would suggest to you that if -- if that's the standard and your expectation that you can achieve that accuracy, that an appropriate stress test level going forward would be whether or not we're, I'm going to call it,

in that cone of a 10 percent range in a ten (10) year time frame.

Do you agree with that?

MS. LOIS MORRISON: Yes.

MR. ANTOINE HACAULT: Okay.

THE CHAIRPERSON: Just so I -- just to make sure I understand. So your fore -- your five (5) year forecast -- sorry, your forecast five (5) years out is inaccurate to the percentage that's shown there, but you're only taking the one (1) year.

So for example, if you're looking at the year that we're talking about, 1994, you were, say, 7 percent out five (5) years prior to that, for that one (1) year alone.

MS. LOIS MORRISON: Yes, if you -- if we're looking at the 1994 forecast, what we do is we go -- if we're looking -- what we look at is the 1994 year. Then we say, What did we forecast five (5) years ago for that year, and are we within 5 percent of that? And so we look at each forecast for all those years. We look back to the forecast for that year, five (5) years prior, and for ten (10) years prior.

THE CHAIRPERSON: But you can't infer from that that -- so, for example, looking at the most

recent year, the -- the latest year for which there is 9 percent accuracy over -- over estimate, you can't assume, then, that -- I guess what I'm getting at is that you would be looking at a -- a range of years in -- in assessing your forecast. And all this is telling you is that you're out one (1) year by 8 percent. But it doesn't tell me what the rest of the time savings is like.

In other words, when you do your forecast you don't -- you don't just do five (5) years out. You're doing twenty (20) years out. And what I'm trying to understand is this tells me that you're ten (10) -- your 8 percent out five (5) years forward. How much are you out for the rest of the years?

Because, I mean, you're -- you're now saying to us: We're going to build a dam. We're projecting fifteen (15) years from now, we're -- we're projecting a need.

Not fifteen (15) years, but say eleven (11) years out. And all this is telling me is that five (5) years from now you're going to be anywhere from minus ten (10) to minus -- plus ten (10) out.

How -- you know, how much out are you going to be eleven (11) years from now, which is probably a more germane figure?

MS. LOIS MORRISON: In our work with Elenchus we did provide them with detail about the forecast accuracy for fifteen (15) and twenty (20) years also. It -- it's more so we present -- we could present that also. It's just for the purposes of discussion we generally present the five (5) and ten (10) year, because we can provide more in -- more information. If we go to fifteen (15) years, obviously, there'll be less bars. If we go to twenty (20) years there's, again, less bars.

So this was more so to demonstrate the impact of cycling and -- and to show that there's going to be periods of what appears to be over-forecasting and under-forecasting. That's the -- that's the purpose of this -- this chart and that it's not necessarily that the -- that the forecast is consistently over forecasting or consistently under forecasting. It was more so to demonstrate that perspective. But we -- we do have the data to look at, the fifteen (15) year and the twenty (20) year performance also.

MR. LLOYD KUCZEK: I -- I should add that we -- we don't just provide this for external parties, too. We -- it's an -- it's an internal tool as well for us just to have some sense of what -- how

the load forecasting has been performing, in terms of accuracy in the past. We do know that -- and -- and it's understood that the forecast will always be wrong. So it's just -- it's the only metric that we could come up with for looking back and just how is it doing.

CONTINUED BY MR. ANTOINE HACAULT:

MR. ANTOINE HACAULT: Hopefully some of my subsequent questions will help clarify the question of the Board Chair. Now, there's two (2) things that I understand are being done with the load forecasts.

The first is you readjust your load forecast each year, correct?

MS. LOIS MORRISON: That is correct.

MR. ANTOINE HACAULT: Okay. The second thing is that you weather adjust your load forecast.

So if you've had an unusually high flow or an unusually -- sorry, unusually cold weather, you would weather adjust the load forecast, correct?

MS. LOIS MORRISON: That is correct. We weather adjust the year to ensure that we're working from a normal weather point.

MR. ANTOINE HACAULT: Okay. So if we look at the last three (3) years of the five (5) year accuracy, in each of those years, if I've understood correctly, the forecast was too high?

MS. LOIS MORRISON: For the last four (4) years, the five (5) year accuracy would demonstrate that we forecast greater energy use than what was consumed. But that's also a period that reflects the economic downturn, and it reflects a forecast that would have been prepared at a time just before the beginning of the economic downturn.

MR. ANTOINE HACAULT: Thank you. And that's why it was useful, because we see how the effect of economic cycles and that uncertainty in economic cycles -- and we'll be talking about that in the hearing, with respect to a number of other factors -- can affect the load forecast accuracy, correct?

MS. LOIS MORRISON: Yes, that is correct.

MR. ANTOINE HACAULT: Okay. Now, I'll want to next go to one of the -- I'm going to call graphs that are used in the NFAT proceeding to kind of see how the stress testing is comparing to the metric of your forecast accuracy.

So if we could turn to page 16 of the

book of documents. That's Tab 3, page 16.

(BRIEF PAUSE)

MR. ANTOINE HACAULT: As I understand this graph, we've got the dark blue line that we see being actuals.

Is that correct?

MS. LOIS MORRISON: The dark blue line represents our weather-adjusted actuals.

MR. ANTOINE HACAULT: Okay.

MS. LOIS MORRISON: The blue dots represent the actual consumption.

MR. ANTOINE HACAULT: Okay. And if we're going out ten (10) years, so that's the ten (10) year metric, and it should be highlighted on everybody's screen and in the document, we would go out to 2022 and 2023.

Do you see that?

MS. LOIS MORRISON: Yes, I do. Thank you.

MR. ANTOINE HACAULT: Okay. And I believe we've established that would be about the date if we approach this on a needs basis that we would anticipate, at least for the time being, requiring

Keeyask, correct?

MS. LOIS MORRISON: As Mr. Wojczynski said, based upon the filing of the '13 Resource Plan and the '13 IFF.

MR. ANTOINE HACAULT: Okay. And what I've also included, it's a couple pages in, it's page 19, is taking those figures. And you'll see it's Table 1.

Has anybody at Hydro had the opportunity to check to see whether we've properly transcribed numbers and made the calculations correctly?

MS. LOIS MORRISON: Yes, they appear to be correct.

MR. ANTOINE HACAULT: Okay. So midway through the table there's a heading, "2013-2014 Forecast." And we had just looked at the table for 2022/2023, which was the tenth year out, correct?

MS. LOIS MORRISON: That is correct.

MR. ANTOINE HACAULT: And if we do the mathematical calculation, Manitoba Hydro, in its NFAT stress test, is suggesting a 5 percent bandwidth for the stress test, correct?

MS. LOIS MORRISON: That is correct, based upon the information provided in the 2013

forecast.

MR. ANTOINE HACAULT: Yes. And if we flipped back we would see that if we go twenty (20) years out, the stress test being suggested by Hydro is a margin of 7.6 percent either to the positive or the negative, correct?

MS. LOIS MORRISON: That is correct.

MR. ANTOINE HACAULT: So the Chairperson had asked a question. And this is the way the information is being presented as far as what might be the best outcome or the worst outcome with respect to forecasting in Hydro's filing for this proceeding as of those time periods?

MS. LOIS MORRISON: Yes, that is correct.

MR. ANTOINE HACAULT: Okay. And the calculation for the ten (10) year time period that -- I didn't put the number which was mathematically derived by -- in the column 2022 to 2023, the base year is twenty-eight thousand six-o-five (28,605), and Hydro is saying, Well it might go on the probabilities to 10 percent down to twenty-seven (27) -- or only increase to twenty-seven thousand sixty-five (27,065), correct?

MS. LOIS MORRISON: That is correct.

MR. ANTOINE HACAULT: So that's a little bit over 1,500 gigawatts, and if we had increased that to the 10 percent metric for ten (10) years as we've just reviewed, the bandwidth would actually be over -- about 3,000 gigawatts?

MS. LOIS MORRISON: That is correct.

MR. ANTOINE HACAULT: Okay. And 3,000 gigawatts is approximately a Keeyask?

MS. LOIS MORRISON: That is correct.

MR. ANTOINE HACAULT: So for the NFAT material, we're showing about half a Keeyask stress test at the ten (10) year time period, but if we use the 10 percent metric we actually end up having a full Keeyask of variability at the ten (10) year time period, correct?

MS. LOIS MORRISON: That is correct.

MR. ANTOINE HACAULT: Now, if we could go back to the actual experience of Manitoba Hydro over a ten (10) year time period -- and that was at Tab 5, I believe, page 23.

(BRIEF PAUSE)

MR. ANTOINE HACAULT: If we go and look at actuals, and we were just looking at a ten

(10) year metric, and the stress test being proposed by Manitoba is 5.4 percent, would 1992 for example meet the stress test which Hydro is proposing?

MS. LOIS MORRISON: It would be just slightly higher.

MR. ANTOINE HACAULT: Okay. And we see one (1) bar about the fourth year in which is over 10 percent, so that clearly wouldn't meet the stress test that Manitoba Hydro is proposing for the ten (10) year metric?

MS. LOIS MORRISON: That is correct.

MR. ANTOINE HACAULT: And the same thing for the next year; it seems not too far off, but probably doesn't meet that metric either?

MS. LOIS MORRISON: That is correct.

MR. ANTOINE HACAULT: And if we continue down the next one might be pretty close. That -- I don't know if that ends up being 1998 or 1999, correct?

MS. LOIS MORRISON: That is correct.

MR. ANTOINE HACAULT: And then we've got two (2) that don't meet that metric that follow, correct?

MS. LOIS MORRISON: That is correct.

MR. ANTOINE HACAULT: They're at 10

percent approximately, correct?

MS. LOIS MORRISON: That is correct.

MR. ANTOINE HACAULT: And then if we go further on into the graph we see also, I would suggest, probably another five (5) years where the metric's not met, the five point four (5.4) metric?

MS. LOIS MORRISON: After the two (2) that don't meet that are --

MR. ANTOINE HACAULT: After the two (2) --

MS. LOIS MORRISON: -- 10 percent?

MR. ANTOINE HACAULT: -- year 2002.

MS. LOIS MORRISON: Oh, after the 2002. Yes.

MR. ANTOINE HACAULT: And going forward to 2012, there appears to be at least five (5) clear indications there that the stress test would not be met at five point four (5.4).

MS. LOIS MORRISON: That is correct.

MR. ANTOINE HACAULT: Yeah. Okay. So that it appears that, for the first sector, where we're too optimistic, there may be -- although I don't have the exact data points, one (1), two (2), three (3), four (4), five (5), six (6), probably, that don't meet the 5.4 percent stress test. And then another

five (5) in the years that follow for approximately eleven (11) times out of this twenty (20) year time period where the stress test is not met, correct?

MS. LOIS MORRISON: I -- I don't think we would necessarily characterize this as a stress test, as more so a feedback metric as to how well we've been performing.

MR. ANTOINE HACAULT: Okay. Thank you for that clarification, but at one (1) point in time going forward, and even today somebody's making some estimates on which to base the NFAT decisions, correct?

MS. LOIS MORRISON: That is correct.

MR. ANTOINE HACAULT: And it appears that, at least based on the five point four (5.4) metric that's shown in that cone that we looked at, if we use that as a reference point approximately half the time Manitoba Hydro might be meeting that, and the other half of the time it might not be meeting it based on actual experience shown on this graph.

MS. LOIS MORRISON: If you're using the 5.4 percent that you included, yes.

MR. ANTOINE HACAULT: Yes. Thank you. Now, the other thing that I wanted to compare, I indicated that I would compare, is Manitoba Hydro's

approach to stress test metrics prior to its adopting the 90 percent and 10 percent approach for this filing. And that was found at page 18 of our materials. It doesn't have a title, but in the index we'll see that it's a -- oh, sorry, 2004/2005 load forecast.

Do you see that?

MS. LOIS MORRISON: Yes. Thank you.

MR. ANTOINE HACAULT: Okay. And if we go down that particular slide there should be, again, the 10 percent and the 20 percent years as far as time-frames.

Do you see those highlighted?

MS. LOIS MORRISON: Yes. Thank you.

MR. ANTOINE HACAULT: Okay. And if we go back to -- a little bit higher on this page, we see the cone widens quicker when compared to the NFAT filing cone, correct?

MS. LOIS MORRISON: That is correct.

MR. ANTOINE HACAULT: And, again, I would take you to the mathematical calculations which follow this at page 19. I think it's the next page. And with respect to the ten (10) year metric, Hydro in its previous forecasting metrics, at least on this particular year, was varying from a 9 percent to

approximately 13 percent variation depending on what kind of metrics we used; whether it was a 95 percent lower confidence, or we did the medium-low scenario at 10 percent probability, correct?

MS. LOIS MORRISON: That is correct.

MR. ANTOINE HACAULT: And for the twenty (20) years out, the metrics that were used by Manitoba Hydro depending on whether it was 95 percent approach or a 10 percent to 90 percent approach, varied from approximately 11.9 percent up to 15.8 percent.

That was the variation, correct?

MS. LOIS MORRISON: That is correct.

(BRIEF PAUSE)

MR. ANTOINE HACAULT: Just to clarify the table, if we look at the actual forecasts, when we have the title, looking at the top, there's 95 percent lower confidence interval. We'll see that in the 2004 and 2005 forecast and we will also see something that's called 'medium-low scenario.' That relates to the 2004/2005 forecast.

The next metric that's shown, 10 percent probability point, relates to the new

forecast. And you'll see that in the new forecast, 2013/2014. Correct?

MS. LOIS MORRISON: That is correct.

(BRIEF PAUSE)

MR. ANTOINE HACAULT: Now, did I understand -- and this was the discussion I think Mr. Wojczynski had -- if we show a higher load directionally, this makes Hydro projects look better?

MR. ED WOJCZYNSKI: Generally, yes.

MR. ANTOINE HACAULT: Okay. And is the reverse true? Because it doesn't always follow.

MR. ED WOJCZYNSKI: Generally, yes, but not to the same degree as the -- the high benefits. And this may be an appropriate time to comment on resource planning for new generation, whether it's in Manitoba or any other jurisdiction in North America, or elsewhere, for that matter, that no one is ever going to get a perfect forecast, a load forecast, and there's always, always going to be uncertainty on what was that -- what would have been the perfect date when you would exactly meet your criteria. No one ever claims they can get that perfect. And so one (1) of the considerations

planners always have, and -- and decision makers, when deciding on putting in additional resources is to recognize that uncertainty.

We have in our 12 percent reserve criteria a little bit of space for a load which is higher than you forecast, 'cause you could have higher -- a very cold winter that takes us out of the normal range. You might have a spurt of load growth tha -- that year some -- that wasn't expected, but there isn't a lot of room for that.

And if you have these cycles in the -- in the economy that are fundamental that are always going to be there and you have -- you can have larger industrial type of loads come in in relatively short notice, there's al -- there's always a significant risk. Your load can be higher than you were forecasting. Conversely, it can be lower.

It's easier, generally, in planning, again, whether it's Manitoba or somewhere else, to have over-planned than under-planned. The concept is the -- the risk on having the load higher than lower is -- is worse than the risk that your load is -- is lower than you forecast.

Or to put it differently, if you -- if you try and get it perfectly right, you have a bigger

risk that the load is -- is too high and you have to play catchup. That's a bigger risk than you tried to get it perfectly, and then the load was too low and you have surpluses.

And there had been studies years ago. It's a fundamental done by EPRI on that; it's called 'Over/Under Capacity Planning.' It doesn't -- the exact name, but it's -- it's a general concept that resource planners have been aware of and -- and are very conscious of when we do our planning. And I think that's part of perhaps the context when we're looking at these things.

They're -- we can have significantly higher load forecast than the ones we're using in our sensitivities. We -- we recognize that, and we're aware of that. And that's one of the reasons we talk about one of the criteria we apply, and I talked about the first day in the -- in the evening or the end of the day, that there's this energy security and capa -- and reliability benefit going above the criteria because of those kind of uncertainties.

And so certain plans are better able to withstand errors in load growth than other plans. And we argue that the plans for the 750 megawatt tie-line and advanced hydro are better able to deal with that

uncertainty than -- than some of the other plans.

MR. ANTOINE HACAULT: Thank you very much for that explanation, Mr. Wojczynski. I think the focus of my questions were: Did we go high enough, and did we go low enough. And -- and it's just trying to understand what metrics, as far as did we go high enough and did we go low enough, that I'm exploring.

So we've explored the 10 percent desire on accuracy, and we've explored how the metrics used to be wider, and how for this filing the metrics perhaps don't give that flexibility that you talked about to handle the higher loads that might be coming with either a big industrial or unforeseen circumstances to properly test.

But we'll get into the alternatives. I just wanted to set out the metrics that were being used; and I think you're going to have a separate panel on the alternatives, correct?

MR. ED WOJCZYNSKI: Yes. And you just laid out a certain kind of conclusion about the metrics. And I would, as a resource planner, agree with what you said.

MR. ANTOINE HACAULT: The one thing that hasn't been filed, and I don't know if it's -- it

exists and is readily filed, we saw in -- in the previous forecasts that there was actually the wider metric of 95 percent confidence level up and down. For this filing, it's been narrowed to 90 and -- 90 percent and 10 percent.

Does Hydro maintain the 95 percent confidence level data with respect to, for example, what's being presented now?

MS. LOIS MORRISON: It's not that we don't include it. It's in the -- the way we've presented it within the load forecast, I believe on page -- it's actually in your book of documents, page 15 of your book of documents.

What we've -- we've done is we have basically outlined -- there's -- you can calculate the 95 percent based on the information that's provided there, and what we present is the 90/10. So if -- if an individual or an organza -- if we wanted to look at beyond -- if we wanted to look at 20 percent/80 percent probability projections, or if we wanted to look at the 95 -- 95/5 percent, we could -- oh, I apologize, we're missing the 95/90 (sic). We could provide that.

MR. ANTOINE HACAULT: Okay. Well, then if you could provide the table that is set out on

the following page, I'd like an undertaking to provide that table, but with the 95 percent metric as opposed to the -- sorry. Well, firstly we'll deal with that one.

Would it be possible to provide that same table that's found on the next page of our book of documents with the 95 percent metric?

MS. LOIS MORRISON: Yes, we can provide that.

MS. MARLA BOYD: I believe it's Table 33 from page 16 of the MIPUG book of documents, is that correct?

MR. ANTOINE HACAULT: Okay. So the undertaking is to provide a revised Table 33 shown at page 16 of our book of documents but with respect to the 5 percent and 95 percent probability metric.

Is that correct?

MS. LOIS MORRISON: Yes, that is correct.

(BRIEF PAUSE)

MR. ANTOINE HACAULT: Would it be very difficult to also provide the same table, but with the other two (2) metrics at the other ranges shown on

page 15 of our book of documents, the 1 percent and the 2.5 percent? Because I don't know exactly what the 5 percent metric will give us at a ten (10) year range, whether it -- it will lead to a 10 percent bandwidth in the ten (10) year time frame or not.

MS. LOIS MORRISON: So you would like us, just so I'm clear, to provide you with the table -- a repeat of that same Table 33 at the 2.5 and 97.5 percent and at the 0.1 percent and the 99.9 percent?

MR. ANTOINE HACAULT: Correct.

MS. LOIS MORRISON: Okay. Yes, we can do that.

MR. ANTOINE HACAULT: Does the court reporter need that repeated for an undertaking? It can be dealt with as one (1) undertaking, if that's okay.

--- UNDERTAKING NO. 19: Manitoba Hydro to provide a revised Table 33 shown at page 16 of the MIPUG book of documents but with respect to the 5 percent and 95 percent probability metric, as well as the 2.5 and 97.5 percent and at

the 0.1 percent and the 99.9 percent

CONTINUED BY MR. ANTOINE HACAULT:

MR. ANTOINE HACAULT: The next subject matter I'm getting into will be a very short item, and it still deals with load forecast. But we've discussed getting load forecast information from top consumers. I don't know who might be best to an -- answer this, but I would suggest that these top consumers are very concerned about the confidentiality of their load forecasts.

Is that fair?

MR. DANIEL FRIESEN: That would be fair.

MR. ANTOINE HACAULT: Okay. And to date, has Hydro been able to secure on a voluntary -- or -- basis some load forecast information from its top consumers?

MR. DANIEL FRIESEN: Yes, we have.

MR. ANTOINE HACAULT: And can you indicate the level of, I'm going to say, concern that top consumers might have with respect to keeping that information private?

For example, would you have situations

where the companies would insist that it not be the same Manitoba Hydro representative that gets the information?

MR. DANIEL FRIESEN: I can speak to that in -- in a couple of different ways. I think, first of all, we have to recognize that the top consumer group, like Manitoba Hydro, make substantial investments in infrastructure. And those investments are recovered over long periods of time. And they're very dependent on market conditions, market opportunities, et cetera.

They're not competing in a local market. They're completing (sic) in a national, interna -- gl -- continental, and international market. So there's a certain degree of positioning that needs to occur for them to take the best advantages of the opportunities that they see. So confidentiality is extremely important to them, and I think all of us can easily recognize that.

So the -- the challenge sometimes arises in situations where we have two (2) large players in the same industry located within Manitoba. And they're in a competitive business. And so we have had instances where we have had companies in the same industry sector request from us specifically that not

only do we have their representative be different, they also be in different departments reporting through different managers. And they have relied on us to respect those lines and relied on us not to share information back and forth between those individuals. And we have, to the best of our ability, always respected that request.

MR. ANTOINE HACAULT: Thank you. The next subject matter which I'll deal with relates to some of the information Ms. Rohmund -- hopefully I've pronounced that correctly -- provided to us.

You had -- in one (1) of your slides, we don't need to go to it, but it was Slide 42, you had sourced something from the American Council for an Energy-Efficient Economy. And we've extracted what we understand to be that document at Tab 6, starting at page 38; so Tab 6, page 38.

(BRIEF PAUSE)

MR. ANTOINE HACAULT: First, is this document so -- or something similar to it -- have you had a chance to review it?

MS. INGRID ROHMUND: Yes.

MR. ANTOINE HACAULT: Okay. And it --

could you explain your understanding of this document? What does it outline?

MS. INGRID ROHMUND: This document, to the best of my knowledge, describes the status of the individual states in the United States with respect to whether or not they have energy efficiency standards and renewable energy standards.

MR. ANTOINE HACAULT: Okay. And am I correct in understanding -- or is it your understanding that several of these states have targets imposed by elected bodies?

MS. INGRID ROHMUND: That is correct.

MR. ANTOINE HACAULT: Okay. I would suggest then that these policy decisions made by elected bodies are things that these utilities have to follow to the extent that they can?

MS. INGRID ROHMUND: Yes.

MR. ANTOINE HACAULT: So that -- would it be fair to say that it wouldn't always be appropriate to just apply to Manitoba policy decisions that are made by elected bodies in other states? There may be, in Manitoba, a different policy decision. We haven't seen one yet through the legislature.

But there may be different policy

considerations by this government?

MS. INGRID ROHMUND: I -- I should comment on that. I don't feel that I have the -- that I should do that.

MR. LLOYD KUCZEK: But -- but just to point something out. We do have legislation that requires us to consult with the Minister responsible for Manitoba Hydro. So that's the process that we're going to use in Manitoba, and we have to now.

MR. ANTOINE HACAULT: Yeah, understood. So if there's a new policy that might be discussed or implemented by this government through that consultation process, and being mindful of your counsel's comments not to get into those, but that might be something that Manitoba Hydro is required to follow if there is such a directive by this government?

MR. LLOYD KUCZEK: In the end, the Power Smart energy efficiency plans will be developed in consultations with the government. And -- and if they have policies, that'll be part of the considerations, I'm sure, as -- as part of those consultations.

MR. ANTOINE HACAULT: Thank you.

(BRIEF PAUSE)

MR. ANTOINE HACAULT: The next area which I want to understand with respect to stress tests is for DSM, have we chosen the appropriate outer boundaries. And to understand that a bit better, I think we've put it at Tab 2, page 14.

(BRIEF PAUSE)

MR. ANTOINE HACAULT: Some of the DSM options. And I'm not going to get into the debate as to whether it should be a separate alternative or it should be integrated.

But, as I understand it, these options represent Manitoba Hydro's effort to try and, much the same as the load forecast, set out might be an outer limit for a stress test on the new projects that are being considered?

MR. LLOYD KUCZEK: I -- I wouldn't consider this a stress test. We develop these options to undertake some sensitivity analysis, that Mr. Wojczynski could talk about, but the -- the options themselves were, as I mentioned before, developed at a high level. They won't necessarily be options that we

have to follow as outlined within each particular option. We will be assessing the -- the individual components within each option to develop an overall energy efficiency or demand-side management plan going forward.

MR. ED WOJCZYNSKI: Yeah. And -- and, as Mr. Kuczek was just saying, we're -- these were high-level concepts for the DSM to do an evaluation, preliminary evaluation, of what kind of level of DSM on -- on the -- on the spectrum of possibilities would -- would make sense. And then more refined work would happen to land on the specific programs and the exact specific level.

But it's also meant, this exercise with these evaluations and levels of DSM, to -- to test what the impact would be on the Alternative Development Plans. So it's -- it's -- this is serving two (2) purposes at the same time.

MR. ANTOINE HACAULT: And thank you for that. I maybe used the wrong word when I said "a stress test." But it -- I understood it to be a test, because if we flip to page 28 of our book of documents, as part of a presentation, we saw where the baseline was and what the different options on DSM would do to the energy consumption. Hydro tried to

model that, correct?

(BRIEF PAUSE)

MS. LOIS MORRISON: The -- the graph that's being presented there, the -- I think as Ms. Rohmund pointed out -- the two (2) lines that would be more so applicable would be the achievable potential and the market potential.

The economic potential and the technical potential that are presented here for demonstration purposes are merely theoretical levels of potential, and are not what would deem to be achievable in this marketplace, or any marketplace that's undertaking a DSM potential study. It's -- it's merely setting comparison points, and as part of the process that Ms. Rohmund outlined, to get to the point where you can start putting some parameters around what might be achievable in a marketplace, you have to have an understanding of what's technically available, what's economically available, and then being to talk about what influence you might be able to have within a marketplace.

So that would then be looking at the -- what is denoted here as the achievable potential and

the market potential.

MR. ANTOINE HACAULT: Thank you. And that is a nice segue to the line of questioning I was going to get a little bit of clarification.

With respect to what's referenced as market potential, Mr. Byron Williams yesterday had taken Ms. Rohmund to -- through some other reports, and as I understood the evidence -- and perhaps we can bring up -- could we bring up CAC book of documents yesterday at page 120 and 121.

(BRIEF PAUSE)

MR. ANTOINE HACAULT: Yes, that's -- that's the correct page. So in this particular analysis, Ms. Rohmund, you had, for this particular utility, broken down what -- okay, let's break this down a little bit.

The RAP here is equivalent to what in your Hydro study?

MS. INGRID ROHMUND: RAP stands for realistic achievable potential, and that is the -- analogous to the achievable potential in the Manitoba Hydro study.

MR. ANTOINE HACAULT: Okay. So

although Hydro didn't ask you to do this, this other utility within the achievable category requested three (3) subsets of that achievable category.

Am I understanding that correct?

MS. INGRID ROHMUND: Yes, that's correct. The -- in this study, which was for Consolidated Edison of New York, we developed -- the primary metrics we developed were the maximum achievable potential and the realistic achievable potential. And at the very end of the study they said, We want a -- a range around the realistic achievable. And they gave us the parameters for that. It was a plus or minus percentage amount that I don't recall. I think 10 or 15 percent, something like that.

MR. ANTOINE HACAULT: Okay. So I just want to take it one (1) step at a time. When Hydro shows its achievable through your study, part of that achievable would be an upper boundary based on a -- and I'm reading from the number 1 on the screen:

> "Based on an optimistic assessment of measure-specific assumptions about market availability and access."

Now, part of that 'achievable' category

would be comprised of that subset, correct?

(BRIEF PAUSE)

MS. INGRID ROHMUND: So the -- as I said, the work that we did in the study was to estimate the maximum achievable potential and the mid-level realistic achievable potential. That's where all of the parameters fed those two (2) forecasts of potential. So the mid-level realistic achievable potential here would be analogous to the achievable potential in the Manitoba Hydro study. And the high and the low RAP that the client wanted to show was a fairly arbitrary distinction, along with their definitions of how they wanted to reflect those.

MR. ANTOINE HACAULT: Thank you. That's what I was trying to clarify. I wasn't too sure when we -- for the Manitoba Hydro categorization of achievable, and then there's the next metric, the market, whether or not the achievable really was a compilation of numbers 2 and 3 of what we see on this page.

So when we talk about Manitoba Hydro achievable, does it represent the mid-level estimate of realistic achievable potential:

"Based on reasonable estimates of future customer acceptance, drawing on the experience of other utilities and organizations with existing energy efficient programs."

Is that the upper bound of the 'achievable' category that you've used for Manitoba Hydro?

(BRIEF PAUSE)

MS. INGRID ROHMUND: So the -- the Manitoba Hydro study uses a different definition of 'achievable potential', slightly different, as is the case with every study. Every client wants to characterize the achievable potential in language that they feel comfortable that they can meet. So the -- the language you see here is Con Edison's language, and Manitoba Hydro's definition of 'achievable' is their definition. But the -- reading the words here and recalling how he did the study, then the -- the definition of 'mid-level RAP' here is analogous to Manitoba Hydro's achievable.

MR. ANTOINE HACAULT: Thank you. I wanted to get that clarification because I was

starting to get confused when Mr. Williams was asking questions and -- and were saying his -- this RAP was the same as the achievable. And I'm saying, well, does the high RAP really fit in Manitoba Hydro's definition. Now you've helped clarify that. Thank you.

So with respect to the market portion, that would be in Manitoba Hydro definition. And we -- if we can flip back to our graph at page 28, we see the baseline at the top which hits about 25,000 gigawatt hours.

Is that correct?

MS. INGRID ROHMUND: Correct.

MR. ANTOINE HACAULT: And the achievable potential, we've just gone through that, is somewhere down from there; and then, finally, the market potential. That's the more tenuous, say, results or objectives.

They're not as sure as the achievable ones?

MS. INGRID ROHMUND: That's definitely true, yes. That is the upper bound of ach -- of what can be achieved.

MR. ANTOINE HACAULT: Okay. And the economic and technical potentials, those were

theoretical, as I understand?

MS. INGRID ROHMUND: Correct.

(BRIEF PAUSE)

MR. ANTOINE HACAULT: Now, I just want to get a little bit more clarification. We had looked at the -- like the max RAP and we read that definition.

Is the market potential even more tenuous than that definition?

MS. INGRID ROHMUND: The market potential that we estimated for Manitoba Hydro is analogous to the maximum achievable potential that we developed in the Con Edison study.

So their maximum achievable and market potential are both theoretical -- theoreticor -- theoretical upper limits on what can be achieved in the marketplace. You need to have ideal circumstances in order to achieve that in terms of regulatory utility programs, perfect information, all the things that facilitate the adoption of energy efficiency.

MR. ANTOINE HACAULT: Thank you.

(BRIEF PAUSE)

MR. ANTOINE HACAULT: So as I recall your numbers, the market potential more or less corresponds with -- if we flip back to page 19, and you can perhaps check your number, page 19 of -- or sorry, 14 of our book of documents.

Can you tell us, if we're looking at the options that were set out on this table, which option does your market potential for 2027/2028 energy levels correspond to?

(BRIEF PAUSE)

MR. ANTOINE HACAULT: Actually, I think if you -- if the document management people go to the rebuttal evidence at page 29, we did include that in our book of documents.

But page 29 of your rebuttal evidence, there is some graphing of those numbers?

MS. LOIS MORRISON: Yes. Mis -- what is presented in the table of page 14 of your evidence and cor -- information that's somewhat similar that's presented on page 29 of the rebuttal evidence, we have to recognize that the DSM Potential Study that Ms. Rohmund assisted us with focussed on energy conservation initiatives, and did not include items

such as load displacement and fuel switching, and did not specifically speak to conservation rates, although those are one of the tools that can be used to help -- help us move towards that market achievable, or market potential.

And those are items that are included within these levels of DSM that are being presented in -- both on page 14 and in -- on page 29 of the rebuttal evidence.

If you're looking solely just at gigawatt hours and the equivalency, the Level 3 DSM is in the range of what was presented as market potential. But again we didn't model market potential in our analysis for Level 3. There's -- there's -- Level 3 DSM includes enhanced energy efficiency programming, plus it also includes the items that I just mentioned: load displacement, energy conservation rates, and fuel switching from natural -- from electricity to natural gas.

MR. ANTOINE HACAULT: Thank you very much. Now, Ms. Rohmund, looking at page 29 of the rebuttal evidence, is it your opinion then based on what you've been able to determine that the Level 1 DSM is a little bit higher than what your conclusion was on what Hydro could reasonably achieve?

(BRIEF PAUSE)

MS. INGRID ROHMUND: So I think I want to distinguish between what we did in the potential study and what is shown as the plan options here. So we did the analysis and identified measures and sectors and -- and aggregated all that up to get our achievable potential, which is identified here in words on the -- on the -- and -- and the lines on the chart.

Manitoba Hydro took that information and has developed its plan. And it has taken some -- I'm sure taken some elements from the study but also taken its own history and experience to develop that plan. So the numbers are comparable but what is underlying those numbers are -- are different things, as they -- as they typically are.

Our -- our study provides guidance to the development of the plans.

MS. LOIS MORRISON: I believe Mr. Kuczek, in his introductory statement, did characterize that the DSM potential study is there to help us frame our future efforts, and it was a starting point. It's a high-level projection. And we took that information to then help better form other

initiatives that we may pursue, and it's from there.

And then also as he's mentioned, this is -- again these are more high-level programming. The Level 1 will include some detailed program where, as he's mentioned, we've launched those programs, or those enhanced initiatives. But there's also some components within that programming that are a little bit -- still require some fine tuning and more detailed analysis.

MR. ANTOINE HACAULT: Thank you. I was --

MR. LLOYD KUCZEK: Excuse me, just -- just to add some clarity. These are options. They're not our plan. We developed these options as an interim step for the purpose of doing sensitivity analysis. So just -- Ms. Rohmund used the word 'plan' -- 'our plan'. These aren't our plans. We're currently finalizing our plans.

MR. ANTOINE HACAULT: Yeah. Thank you for that. So am I to take from that that I can't just automatically look at the conclusions of -- of -- I'm not going to say EnerROC (sic), because I don't want to take Byron's thunder away, but EnerNOC, I can't just take those conclusions and say, Well, listen, Hydro can achieve -- this is a market potential, and -

- and we can achieve that. We -- I can't just jump to that conclusion?

MS. INGRID ROHMUND: That is correct.

MR. ANTOINE HACAULT: Okay. Now, there's a lot of material; and I apologize if it's in the material.

Is there something that tells us how Manitoba Hydro comes up with the Level 2 savings at twenty-nine sixty-one (2,961)?

In other words, what programs are added, and what is the quantity of additional cumulative savings attributed to each of those programs that would meet -- or bring us up to the Level 2?

(BRIEF PAUSE)

MS. MARLA BOYD: We're just getting things lined up here. Patti and I have had an exchange with Mr. Williams this morning, trying to clarify their arm wrestling match. And I'm not sure it's actually going to come down to arm wrestling, but we have an undertaking in the works with CAC that I suspect will address the question that you're asking. So while we can't provide it to you instantly, we will

be able to provide that description in the context of the response to the undertaking.

CONTINUED BY MR. ANTOINE HACAULT:

MR. ANTOINE HACAULT: Okay. So I'll just repeat what I'm trying to determine. There must be some numbers and some calculations and some programs that bring us from Level 1 at 1,704 gigawatts up to 2,961 gigawatts.

I'd like to know what those programs and numbers are that back up the graph. So --

MR. LLOYD KUCZEK: I -- I could provide you with that now, because Level 2 involv -- it -- it's composed of three (3) initiatives. One (1) is the energy conservation rates, one (1) is the load displacement initiative, and one (1) is the fuel-switching initiative.

So our high-level estimates of what potentially could be achieved -- and this is very high level, with each one (1) being somewhat different. But the conservation rate's approximately 400 gigawatt hours -- three ninety (390) is on my page here. I'll give you the specific numbers. Two eighty-five (285) for fuel choice, and four fifty (450) for the load displacement.

MR. ANTOINE HACAULT: Thank you very much. And is that as of 2027/2028?

MR. LLOYD KUCZEK: '27/'28, and -- and we'll confirm those numbers. Mr. Friesen's suggesting one (1) of them might be slightly different. I'm not -- a work in progress, again, but in that range.

MR. ANTOINE HACAULT: And none of those were specifically in EnerNOC's scope of work.

Is that correct?

MR. LLOYD KUCZEK: That's correct.

MR. ANTOINE HACAULT: Thank you. Now, I probably have about twenty (20) minutes left, fifteen (15) to twenty (20) minutes. I don't know what the Board's wishes is.

THE CHAIRPERSON: Let's con -- let's continue.

CONTINUED BY MR. ANTOINE HACAULT:

MR. ANTOINE HACAULT: Thank you. Now, could I ask the document manager to go to page 1 of our book of documents -- or, sorry, page 2. And what I'd like to have expanded is the very bottom right corner, the very bottom right corner.

(BRIEF PAUSE)

MR. ANTOINE HACAULT: Now, this column which leads to the bottom right corner, at the top has the year 2027. We don't need to go there; for the document manager. And on the left-hand side at the very bottom indicates, "total gigawatts at generation."

Do I have that right so far?

MS. LOIS MORRISON: That is correct.

MS. MARLA BOYD: Are we to be looking at page 1 or page 2 of your book of documents?

MR. ANTOINE HACAULT: Page 2 of the book of documents.

MS. MARLA BOYD: Thank you.

CONTINUED BY MR. ANTOINE HACAULT:

MR. ANTOINE HACAULT: And -- yeah, that was the same thing, just like -- it's small numbers. You're testing my eyes for sure.

MS. LOIS MORRISON: We actually had smaller ones.

MR. ANTOINE HACAULT: But -- but this comes from Hydro's 2013 to 2016 Power Smart Plan, showing the annual energy savings projected in that plan, correct?

MS. LOIS MORRISON: That is correct.

MR. ANTOINE HACAULT: And if I look at the bottom number, we've been talking -- so this would be at generation, there's about three thousand (3,000) -- and it says 113 gigawatts total at generation to 2027/'28, correct?

MS. LOIS MORRISON: That is correct.

MR. ANTOINE HACAULT: So we're basically saying that the current Power Smart Plan, if it works out as forecasted, would be generating, is it annual savings compared to the baseline of about a Keeyask?

MS. LOIS MORRISON: The number you're referring to includes savings to date. So by the time we reach '27/'28, including all activity to date, we will have created a virtual dam the size of approximately Keeyask.

MR. ANTOINE HACAULT: Okay. So I had done a hearing way long ago in Limestone that's probably -- nobody fer -- remembers, and DSM was a big issue. We got Ed shaking his head.

DSM was -- was kind of a new subject. And so from the time these programs have been put into place, some of them are of shorter duration, but the total continued expected savings will be roughly a Keeyask?

MS. LOIS MORRISON: Including all of the efforts undertaken in the area of energy efficiency, which includes programs that you're more familiar with, incentive-based programs, and codes and standards.

MR. ANTOINE HACAULT: Okay. Thank you for that clarification.

Now, there was some discussion about industry DSM, and I'd just like to get a handle on some of those numbers. So if we go to page 4.

(BRIEF PAUSE)

MR. ANTOINE HACAULT: It's even smaller numbers. But there should be a highlighted line there that hopefully we can expand. It's under the heading, "Industrial".

So the heading of that sheet, if I can read the small writing correctly, says:

"2013/2016 Power Smart Plan annual energy savings, gigawatt hours, for the time period going up to 2012/'13."

Do I have that right?

MS. LOIS MORRISON: Yes, that would re

-- represent the savings to date.

MR. ANTOINE HACAULT: So this is not the projection; this is the historical part of what we were talking about, correct?

MS. LOIS MORRISON: That is correct.

MR. ANTOINE HACAULT: So if we move across the line we see that at the start of this period under the industrial heading, "Performance Optimization Program," initially there doesn't appear to have been a program because we zeros, correct?

MS. LOIS MORRISON: That is correct. This timeline projects is based upon the -- when we first launched our initiatives. And so we had initiatives that were launched as early as 1989.

MR. ANTOINE HACAULT: Okay. And if the document person could scroll to the right, we see, over the years, the various amounts that have been achieved, and if we continue to the right -- I'd rather have the numbers, but we'll look at the -- the headings.

There's -- three (3) columns to the left, there's a number of three hundred and eighty point zero four (380.04) that's highlighted.

Has everybody found that?

(BRIEF PAUSE)

MR. ANTOINE HACAULT: There, it's bigger. Have you found it?

MS. LOIS MORRISON: Yes, thank you.

MR. ANTOINE HACAULT: Okay. And you -- can you confirm what heading that is?

MS. LOIS MORRISON: That's the interim estimate of the savings as of 2012/'13 for the initiative to-date.

MR. ANTOINE HACAULT: Okay. And then there are headings -- or there's another column next to it which says -- has the number two hundred and fifty-six-o-six (256.06)

What's that number intended to reflect?

MS. LOIS MORRISON: That reflects the savings as of the benchmark year '27/'28.

MR. ANTOINE HACAULT: So what is involved in the thought process in concluding that this program as of that time-frame would go down in effectiveness to two hundred and fifty-six (256)?

MS. LOIS MORRISON: What's being presented here is more so -- it -- it's the end of certain initiatives come -- it's -- certain initiatives coming to the end of their lives, and it's

a persistence of savings going forward. We recognize, and are making corrections to, how our initiatives are tracking savings. And so in future initiative -- further reporting you'll see that those savings will be continuing forward.

This is presented solely for the purposes of economic analysis in our shop, and we recognize that those savings will be continuing on into the future.

MR. ANTOINE HACAULT: And finally, the extreme right column at two ninety-nine point eight five (299.85) still under the heading "Industrial". Is that just increased to give you added generation numbers?

MS. LOIS MORRISON: Yes, that is correct.

MR. ANTOINE HACAULT: Okay. And if we go up to the residential analysis -- I don't know -- if you scroll up the page, document management person, I'll -- where residential total, you just had it in the middle. Whoa. You're going -- yeah, and if you bring us to the right again for the last three (3) numbers.

So what we've done, we've brought up on the screen the residential total, the two forty-six

ninety-nine (246.99) is what again?

MS. LOIS MORRISON: That's the interim estimate of savings to-date for all activity to-date.

MR. ANTOINE HACAULT: Okay. And if we go to the next column, that again is the expected, I'll call it, 'staying power of those programs', it goes down from two forty-six (246) to one-o-three (103).

Is that correct?

MS. LOIS MORRISON: It's recognizing the end-of-life for certain technologies and, so there is a diminishing amount. However, we recognize that those energy savings are continuing into the future whether or not they're -- they're reinvested on -- by Manitoba Hydro or by the customer.

So there is -- there is a slight decline that will be corrected -- that has been corrected in our future programming.

MR. ANTOINE HACAULT: Okay. So I know we're talking generalities, but roughly the staying power of the industry DSM with respect to the categories that we've looked at, is roughly two and a half (2 1/2) times that of the residential total shown on this particular table.

But we exclude codes in that, correct?

MR. DANIEL FRIESEN: To kind of address what you're saying there in a -- in a generic sense, when we look at industrial loads a lot of the measures that we support result in fundamental changes to processes. And when that technology reaches the end of its useful life, it's highly unlikely in most cases that the customer is going to revert to an older technology. The process has been changed. So at the minimum they'll reinvest in the technology that was present at end-of-life. So, in general, we assume persistence of most industrial measures to be quite -- quite strong.

Now, as Lois pointed out, we -- you know, we're examining persistence in quite a bit of detail in the midst of our current -- developing a better understanding of what our future savings are going to be. And that covers all categories from residential right through to industrial.

And we're -- we're in -- in a big picture way, we're assuming that those savings will carry forward into the future. How we record them, I think is a little bit of an issue right now, and we're working to clarify that.

MR. ANTOINE HACAULT: Thank you very much. But the numbers as you present them today show

the staying power of the industrials, for the reasons that you've explained, to be a bit higher than the staying power of the residential numbers?

MS. LOIS MORRISON: I -- I don't think we would make that characterization. What this is more representing is how we looked at it from an economic perspective. But when we look at it from an actual impact to our system, we're recognizing that when -- on the residential sector, when a customer goes and, say, installs their -- or purchases a new appliance, when they to repurchase a -- that appliance when it comes to its end-of-life, they're not going to go back and replace it with something that is less efficient than what they've purchased to date.

And so -- although this number is showing a diminishment, it's not what's -- this number was presented based on an economic analysis of the program per se for our -- for our investment purposes. It was not based on recognizing that that savings will continue on into the future. And it is something that we have addressed in IRs that we will be -- that is -- that will be adjusted and has been adjusted in the 2000 and -- in the level 1s, 2s, and 3s that we've investigated, and it is being adjusted in our -- in our Power Smart planning that is being undertaken

right now.

And -- but the degree of that influence is very minor overall. You can see that the drop in the residential sector, although you are characterizing it as 2:1 ratio, the -- the drop in terms of an actual absolute value is quite small.

MR. ANTOINE HACAULT: Thank you. And -- and the chart speaks for itself. But the industrials were expected, for 2012/2013, to have an impact of about 380 gigawatt hours, correct?

MS. LOIS MORRISON: That is correct.

MR. ANTOINE HACAULT: And the residential sector was ex -- was expected to have an impact of about 246 gigawatt hours, so some 130 odd gigawatt hours less impact, correct?

MS. LOIS MORRISON: Yes, that is a correct comparison.

MR. ANTOINE HACAULT: If we could go to page 2 of our book of documents.

MS. LOIS MORRISON: I should probably characterize, before we move on, that -- that drop, or that -- that change that we were talking about, in terms of the -- the difference between the interim estimate and what's presented in the plan. Because it's savings to date it's actual activity; it does not

affect our load forecast. I -- I do want to get that on the record, because our load forecast takes our actual consumption to-date and forecasts forward from there.

So this difference that you're looking at, in terms of the 2012 year and the comparison at benchmark, is not -- it has -- has been captured and -- and is appropriately reflected in our load forecast, because we don't drop the savings. The savings don't diminish in our load forecast, they are continued forward.

MR. ANTOINE HACAULT: Thank you for that clarification.

Going to page 2, if we could zoom in on the residential, the right-hand side of the table. This is part of the 2013/2016 Power Smart Plan, correct? This is annual energy savings?

MS. LOIS MORRISON: This is correct.

MR. ANTOINE HACAULT: And if we could go to the extreme right of this table, please, document manager. With respect to how this has been categorized, there's two (2) numbers that are recorded. One (1) is an incentive-based total as of 2027/'28 of 22.1 gigawatt hours, correct?

MS. LOIS MORRISON: That is correct.

MR. ANTOINE HACAULT: And we see the increase that's been previously talked about to give us at -- an at-generation number as of 2027 to 2028 of 25.2 gigawatt hours, correct?

MS. LOIS MORRISON: That is correct.

MR. ANTOINE HACAULT: So that's one (1) component. That's the incentive-based. And then there's another category called, "Customer Service Initiatives," and that gives us a different number of thirty point seven (30.7) as of '27 -- 2027/2028, correct?

MS. LOIS MORRISON: That is correct.

MR. ANTOINE HACAULT: And again, that amount, however, is increased at a slightly higher rate, 4 percent, to give us at-generation, correct?

MS. LOIS MORRISON: No, it's not multiplied by the 4 percent.

MR. ANTOINE HACAULT: Increased?

MS. LOIS MORRISON: No, it's -- the 4 -- the 4 percent of what it represents of the overall total --

MR. ANTOINE HACAULT: Ah, okay.

MS. LOIS MORRISON: -- energy savings. It's not a multiplication by.

So -- so what we're doing is we're

converting the energy projection of '27/'28 to generation. And that factor is a factor of 14 percent, which represents transmission and distribution losses that we -- we recognize is the difference between the -- what the generation is -- the en -- the -- the energy at generation versus the energy at the meter.

MR. ANTOINE HACAULT: Okay. And there's a fairly big number in this last component, twenty-two point one (22.1), of the customer service initiatives.

Am I right in understanding that that would be geothermal?

MS. LOIS MORRISON: Yes, that is our geothermal residential energy earth power loan, which represents primarily geothermal energy.

MR. ANTOINE HACAULT: So it's the hope of the Corporation that that program will have a fair amount of success?

MS. LOIS MORRISON: Yes.

MR. ANTOINE HACAULT: Okay. Fair enough. So we've seen a total of about 7 percent. You -- thank you for that explanation.

So 3 percent plus the 4 percent relates to residential, correct?

MS. LOIS MORRISON: Represents those residential initiatives, yes.

MR. ANTOINE HACAULT: Yes. But there would be, in addition to that, code impacts, et cetera, and those are dealt with later on in the table, correct?

MS. LOIS MORRISON: That is correct.

MR. ANTOINE HACAULT: Now if the document manager could go down there should be some highlight that pops up. And we see the number of one ninety-three point five (193.5); that relates to the: "Industrial Optimization Program;" is the heading.

What's that about?

MS. LOIS MORRISON: Are you asking us to explain the Performance Optimization Program?

MR. ANTOINE HACAULT: Just so we can understand. You know, just briefly. I -- I don't --

MS. LOIS MORRISON: Yeah.

MR. ANTOINE HACAULT: -- need a large explanation. But really I don't think the Board understands.

MR. DALE FRIESEN: Yeah. So one of the challenges you are faced with in the industrial sector is that a lot of the measures -- and individual measures might be an air compressor, might be an

electric motor, might be a particular segment of a process system -- are very inter -- interrelated.

So when you change one (1) component of that process or that system, you end up impacting other components of that system. And there are also decisions that are made with respect to sizing of equipment, that it can -- upstream and downstream implications for the energy performance of that equipment.

So what the Performance Optimization Program does is it draws a boundary around a particular process, and looks at that process within the context of that boundary, and examines the energy performance as a system versus an individual measure. And that allows us -- it's more appropriate for the industrial sector in the way the industrial sector plans and operates equipment.

MR. ANTOINE HACAULT: Thank you -- thank you for that clarification. Now, Mr. Friesen, would you have an idea of what the load of the industrial group would be?

MR. DALE FRIESEN: It's in the range of about 7,500 gigawatt hours.

MR. ANTOINE HACAULT: So that represents approximately what if we do the math on the

--

MR. DALE FRIESEN: Roughly a third, give or take a little bit, of the domestic consumption.

MR. ANTOINE HACAULT: Okay. And with respect to the residential load, is that approximately what of the...

MR. DALE FRIESEN: Yeah, we -- we had a slide in Mr. Kuczek's presentation that provided that segmentation. It's not quite in a correct -- if you look at Slide 2 of Mr. Kuczek's presentation...

MR. ANTOINE HACAULT: Yes.

MR. DALE FRIESEN: That's not a full representation of the industrial load. The 22.8 percent you see on that slide is the top consumer load, which is predominantly industrial load. But the red portion, the 34.4 percent general service mass market, also includes a fairly substantial component of industrial load.

So when you -- when you break out industrial load separately, as you saw in the DSM Potential Study, that number works out to approximately one-third (1/3) of the total domestic load.

MR. ANTOINE HACAULT: Okay. Thank

you. So we were looking at 28 percent participation or effectiveness in this Power Smart Program with respect to that particular heading under the industrial.

And that relates to approximately their profile as a load profile in Manitoba?

MR. DALE FRIESEN: It's reasonably close.

MR. ANTOINE HACAULT: Okay.

MR. DALE FRIESEN: One of the advantages that we do have in the -- in the industrial sector is that industrial users have a tendency to make a very conscious decision about their costs and the measures that will address those costs.

They're used to undertaking economic evaluations. They're used to understanding payback -- they understand paybacks. They understand rates of return. And therefore, they make more conscious decisions about energy efficiency. And that's helpful in -- in penetrating those markets.

MR. ANTOINE HACAULT: And thanks. That leads quite nicely to what I wanted to do, is have some sense of the residential load and the annual energy savings of that particular sector.

So is it fair to say that the

residential, as shown on this graph, is about 30 percent of the load profile of Manitoba?

MR. DALE FRIESEN: That's reasonable, yes.

MR. ANTOINE HACAULT: Okay. And when we looked at the graph and compare that to the industrial participation, we've got 28 percent for about a third of the industrials, but if we go up -- back up to the top of the graph on residential there are challenges to getting the residential group above -- or at that level on programs?

We just have about 7 percent total?

MS. LOIS MORRISON: There's a different approach. I -- I think it would probably be more appropriate for us to -- to represent how Manitoba Hydro working with provincial and federal government is working towards improving efficiency in the different sectors.

Codes and standards are generally much more effective in the residential market, and much more influencing the residential. So a substantial amount of the code impact that we are projecting is in the residential market. And so -- and codes and standards are a very effective and cost-effective mechanism for creating energy efficiency improvements.

And so it's probably not necessarily an accurate representation to say that we're only projecting or anticipating getting 7 percent of our savings through the residential sector. We're actually anticipating getting a substantial amount, but a -- a large proportion of that comes through effective codes and standards.

MR. DANIEL FRIESEN: Yeah. To give you just a little bit of understanding how codes and standards differ from sector to sector, when you look at the measures and the activities across Canada and the United States that are related to codes and standard initiatives, in general, codes and standards initiatives related to residential and commercial measures are quite prescriptive in nature. They -- they set minimum energy performance levels for equipment that are then regulated at some point by a provincial or federal authority. It impacts the buying decision that the -- the purchaser makes.

In the industrial sector our codes and standards are more process based. They're designed to help the industrial user make a better decision about how they use their energy. It's very difficult to put a prescriptive regulation in place for an industrial process, because they differ. The mining sector uses

equipment differently than the pulp and paper sector, et cetera.

And so the -- the measures are different. As a result, it's much harder to physically ascribe codes and standards savings to industrial measures than it is to residential measures. So the point Ms. Morris (sic) makes is very, very important, that when you look at the codes and standards contribution in -- in -- that's tabulated towards the bottom of this page, a large portion of that is residential and commercial use. So that should always be kept in mind.

MR. ANTOINE HACAULT: Thank you. So then I -- I think that ties in nicely with some of the questions I asked of Ms. Rohmund on policy. Because codes, you would agree with me, are legislated through the Building and Mo -- well, you might not know that it's through the Building and Mobile Homes Act. But it is a legislated requirement which, when a builder builds, he can't build a house like I have with R12. He needs to comply with the new standards.

And it's prescriptive and it doesn't cost Manitoba Hydro any money to make those people comply with the codes, correct?

MS. LOIS MORRISON: Well, I -- I would

-- I would say that Manitoba Hydro, particularly in regards to Part 9 of the building code requirements, was instrumental in and -- and invested in getting those building codes in place. So we did actually engage and invest in that to -- to achieve that code change.

MR. DANIEL FRIESEN: Manitoba Hydro invests quite heavily in codes and standards development. I think if you would speak nationally, we are considered to be one (1) of the leaders with NRCan, BC Hydro, the Ontario Ministry of Energy, as funders of activities to develop new standards that are implemented in the future within federal and provincial regulations, energy efficiency regulations. So Manitoba Hydro does have a considerable investment in codes and standards. We work closely with provincial authorities. We work with federal authorities on many levels to achieve those.

MS. LOIS MORRISON: And -- and I might add to the discussion that it's particularly -- again, going back to the Part 9 code improvements, it's only recently that -- it -- it's as a result of Manitoba Hydro's involvement that we actually have energy components in the building code. The Part 9 code that was enacted recently is a representation of what was

previously our Power Smart new homes standards.

And it was that program, and our investment in our program, and working with builders that we were able to come to a point where the code community, which is separate from and is -- is governed by the Office of the Fire Commissioner, was able to bring that code in place. As we all know, if we were to simply show up with a new code without public consultation, without public support, without support of the builders and -- and the building industry, it would not be well received and there would be push back.

And so it's these types of investments that the Corporation makes working with home builders, bringing programs out, and moving forward we're -- with the government, that we're able to bring these codes in and bring them in so that the capacity is in the marketplace to deliver what the code is requiring. The builders know how to build to that standard, and they have the -- the mechanisms in place and their processes in place to deliver that. So we would -- would -- we do invest heavily in this area.

MR. ANTOINE HACAULT: So is it fair to suggest that these are viewed by the Corporation as very good, high return investments with respect to

energy savings?

MR. LLOYD KUCZEK: Just to give you an example, we have travel constraints on, but when it comes to an individual attending one (1) of the code meetings, I don't have to think too much about it: the person always attends.

MR. ANTOINE HACAULT: Thank you.

THE CHAIRPERSON: M. Hacault, are you getting --

MR. GEORGE ORLE: Excuse me, Mr. Chair, we -- we didn't hear that last answer at all back here. If it could be repeated either by the transcriptor or the -- the person making the answer.

MR. LLOYD KUCZEK: I'll -- I'll repeat it, and I might not use the same exact words.

But I -- I was just trying to provide an example of how important this is to Manitoba Hydro in terms of our Power Smart efforts. And I -- what I stated was that we have travel constraints on within the company, but when I get travel requests related to our staff participating in initiatives to try to influence codes and standards, I -- I don't think too much about it, those -- those travel requests are always approved.

MR. ANTOINE HACAULT: Mr. Chair, I

really apologize, because there's answers that were quite a bit -- they were very useful, but they were quite a big lengthier. There's just one (1) page I'd like to refer to on -- in our book of documents to complete this illustration or line of questioning. Page 26, please.

The reason why I took the witnesses through some of this information was to contrast it with part of the presentation that was made with respect to the ind -- industrial potential summary. You see on this slide that shows that they were not projecting 28 percent of the baseline projection, but only 2.7 percent in this particular slide.

There's just one (1) other explanation. I would suggest that we take a break, because I -- that I want the panel to give a bit of information -- or to the PUB. It's on the Curtailable DSM Program. I have a couple of questions which would seek to have this panel explain, because there's some lack of clarity in the material.

(BRIEF PAUSE)

THE CHAIRPERSON: Forge ahead.

MR. ANTOINE HACAULT: Okay.

(BRIEF PAUSE)

THE CHAIRPERSON: I'll take that back. Let's -- fifteen (15) minutes.

--- Upon recessing at 11:06 a.m.

--- Upon resuming at 11:26 a.m.

THE CHAIRPERSON: Okay. I believe that we're ready to resume the proceedings once everybody is in position.

MS. MARLA BOYD: Could I just have a moment, just to take care of a couple of items? I have a list from -- so, first off, if I could ask Mr. Wojczynski, please, to comment with respect to a undertaking made yesterday and responded to as Exhibit Number 90. There was one (1) item that needed to be added. It was discussed at transcript page 986. If he could just have a moment to add an additional item.

MR. ED WOJCZYNSKI: Yes, I -- I think a -- a clarification to add to what I said in terms of Undertaking 11 yesterday. Undertaking 11 was asking about the financials for the five (5) plans, and when we were going to update them; the five (5) plans being the five (5) key development plans. And what I said

was we were not going to be doing an updated financial analysis on those. We were -- it was the other ones that we talked about in the -- in the Undertaking 10.

But I think what would probably have been helpful for me to indicate that probably where some people might have had the impression we were going to update the financials for those five (5), is that I'd indicated, I believe it was in day 1, that we were going to update the analysis on five (5) of the key plans. And by -- and I was referring to the economic analysis, and that would be provided on the Monday.

So where we had -- in Chapter 10 we had fifteen (15) plans we worked on. We're taking actually the six (6) most key plans, including the 250 megawatt plan that Mr. Williams was interested in, and we're going to provide a partial update to what we did there to account for the higher capital cost, and we'll be doing that on the -- on the upcoming Monday. So that's just a bit of extra information.

Secondly, when -- there was the questioning this morning on the possibility of a higher or a lower load forecast, and I -- and there was question about the implications of that for Manitoba Hydro. And this will be dealt with more

extensively next week, but as -- given that we've got the load forecast panel here I thought it would be appropriate to mention that, as a resource planner and as the operators, an example of the kind of thing that we have to deal with is that this year the peak load forecast -- we all know this is an exceptionally cold winter, so obviously that drives the load.

In January -- January 6th, I think it was, and -- that we had a peak load, a net peak load, which was -- an actual load of -- which was 4,719 megawatts which was a new record peak for us. And the previous record peak from previous years had been actually the year before, and as a -- and, sorry, it was 184 megawatts higher than the previous years peak. That's almost the size of Wuskwatim. The -- the peak grew from one (1) year to the next, in terms of -- the record peak by about almost the size of Wuskwatim.

If you take the peak that happened this year, and not weather adjusted, just the actual peak, and compare it to the forecast peak, it was 143 megawatts higher than the forecast peak.

Now, we expect those kind of variations and -- and we put it in to our reserves, and we put it into our planning. That's -- that's probably mostly weather related. But it -- it's the kind of

uncertainty we -- we have to provide for with our criteria, with the reserves, and -- and if you have underlying load growth that happens faster, then that becomes even more of a problem. But I just thought the example this year of how much the peak jumped was quite pertinent to this discussion of load forecast uncertainty.

The third issue that Ms. Morrison asked me to comment on was there was a bit of discussion on -- we are using 90/10 -- a 90 percent and 10 percent confidence intervals on the -- on the load forecast, and -- and we used to use 95/5. And -- and one of the reasons we did that was that the resource planning side of things, when we are setting up our scenarios and setting up the sensitivities we're doing, and the -- the -- that what we are looking for is values which were not really extreme but something which had a medium level of occurrence.

That's why we used for capital costs a P90 and a P10, 90 percent probability, 10 percent probability on the -- on the capital costs. And we are trying to achieve that -- something like that on the other factors, and that was one of the reasons we went to a 90/10 on the load forecast.

But the fact you can have a 95 percent

or 99 percent, and they hap -- they will happen at some point, that's obviously still very critical. It's just for the analyses we were using something which was a more moderate range.

MS. MARLA BOYD: Just to follow up perhaps with Mr. Wojczynski's comments regarding uncertainty, Mr. Friesen needs to add an item of information related to the load forecast, as well.

MR. DALE FRIESEN: Over the course of the last number of days there have been several discussions about perspective or projected pipeline load growth put forward in both Mr. Thomson's opening comments and in subsequent presentations by both Mr. Wojczynski and Mr. Kuczek.

I'd like to place some information on the public record with respect to what Manitoba Hydro knows of that load growth. Most of what I will be speaking to is on the public record. There are some aspects of that discussion that I would not be comfortable speaking with outside of the con -- the CSI sessions that we have planned for later to -- later today.

But in -- in summary, we have two (2) major pipeline companies that operate within Manitoba, those being Enbridge and TransCanada. And I'll speak

to each one individually so that you have a little bit of an understanding of what we see and what they see going forward over the course of the next -- about the next six (6) -- five (5) or six (6) years.

I'll start with Enbridge. Enbridge has seven (7) pumping stations located in Manitoba. Oil enters the Mani -- enters Manitoba at the Saskatchewan border, and then exits Manit -- Manitoba near the Cana -- near Gretna, the get -- the Canada-US border.

They have, over the course of the last number of years, discussed several enhance -- enhancements and upgrades to their pumping infrastructure, the first of which received NEB approval. The Alberta Clipper Phase 1 project received NEB approval in 2013 and is expected to become -- to go into service sometime in the latter half of 2014.

That involved an upgrade in pumping capacity, not new pipeline, to increase flows from about four hundred and fifty thousand (450,000) barrels per day to five hundred and seventy thousand (570,000) barrels per day, and that's a matter of public record.

In addition to that Phase 1 improvement there has -- Enbridge has announced a Phase 2

improvement to that same pipeline, the Alberta Clipper pipeline, that will increase flows from five hundred and seventy thousand (570,000) barrels per day to eight hundred thousand (800,000) barrels per day. That application received NEB approval about a month ago, on February 10th, and it is now subject to various provincial approvals on a variety of different aspects of that project.

The company anticipates that once they've completed all of their approvals, the in-service date will be about fifteen (15) months after that. So we're looking potentially at that load coming into service sometime in 2015, probably around the middle of 2015.

In addition, Enbridge announced this week that they're undertaking a mainline enhancement, basically, a rehabilitation of Line 3, which is one (1) of their old -- the older pipelines in their system. And that enhancement will result in a capacity increase from the current pumping level of about three hundred and ninety thousand (390,000) barrels per day to seven hundred and sixty thousand (760,000) barrels per day. Again, that will require some additional pumping stations, and it will require some additional work in Manitoba, and the projected

in-service date of that is in and around 2017.

It's -- in respect to our load forecast, if you look at the Phase 1 and Phase 2 expansions, or upgrades of the Alberta Clipper line, some of that load is already represented in the Manitoba Hydro forecast. I can't give you the specific amount, but some of that expansion or upgrade is already included in our 2014 -- or sorry, 2013 forecast as was filed with this proceeding.

And Enbridge is still working through some of their hydraulics analysis. And they have provided us with information, but I would not be prepared to discuss that in this forum, and that was something we could address in the CSI forum later today.

The second major pipeline, as I mentioned, is TransCanada Pipeline. In the instance of TransCanada, we essentially have three (3) distinct operating regimes that impact Manitoba Hydro. The -- the longest standing operation of TransCanada in Manitoba has been their natural gas pipeline which carries natural gas from Alberta through to eastern markets in both Canada and the United States.

That operation involves five (5) compression stations within Manitoba. One (1) of

those has the option to use either gas or electric as a pumping -- a source of energy for pumping. As has been documented quite publically over the last number of years. TransCanada has experienced a significant decline in natural gas volumes in that main line, primarily due to shale gas development in Eastern -- in Central North America. And that's challenged the business model of that pipeline significantly. It's also resulted in some reductions in the amount of energy that they consume as supplied by Manitoba Hydro.

In and around 2008 and '09, TransCanada undertook a project to convert a portion of the natural gas pipeline from Alberta to Manitoba to oil through a company called TransCanada Energy, and then build new line into the US. That resulted in the construction of six (6) oil pumping stations in Manitoba. It's been referred to as the Keystone Project. That should not be confused with the Keystone XL Project in the US that's receiving considerable public attention. The Keystone Project has been in operation since 2010 and is recognized in our 2013 load forecast.

The -- the third project, or the third significant undertaking by TransCanada, is the Energy

East Project. TransCanada made a public announcement in April of 2013 that they would be entering an open season to establish commitments for use of this pipeline. And they indicated broadly that the pipeline would consist of conversion of about 3,000 kilometres of existing natural gas pipeline and the construction of about 1,400 kilometres of new construction. They estimated that that pipeline would carry about eight hundred and fifty thousand (850,000) barrels per day.

In two thou -- August of 2013, they announced that the results of their open season and indicated that their estimated increase to 1.1 million barrels per day and that they were planning to invest about $12 billion in the project across Canada.

The expansions, in terms of the impacts to Manitoba, there'll be expansions at four (4) existing oil pumping stations, and there will be addition of four (4) new electric pumping stations within Manitoba.

Last week -- sorry, maybe this week actually, Enbridge filed their initial filing for the -- the Energy East Project with the National Energy Board. That filing is publicly available and it includes a little bit more information about the

pumping locations within Manitoba. There will be eight (8) stations in total. The expected in-service date is 2019. I can't give you an exact time frame as to when in 2019, but it will result in expansions to four (4) existing stations and four (4) new stations, like I mentioned.

One (1) of the key aspects of projects like this, and it's not exclusive to the pipeline industry, is that MIPUG raised the issue of customers voluntarily sharing load information with us. It is -- it is really in the best interests of our top consumers to share that information with us. And that relates to the whole process of providing them with service. Energy is a critical component to most of the -- most of the operations that our top consumers engage in, and facilitating service can be a rather time-consuming process.

A new transmission service in Manitoba presently has a fairly long lead time. We're talking a process that can take from three (3) to five (5) years. And that may be well in advance of when a company is willing to make a public pronouncement about a particular project, for a variety of reasons: shareholder reasons, regulatory reasons, et cetera.

So we commonly find that our top

consumers are quite willing and eager to share information with us, but stress the confidentiality of sharing that information; and are quite concerned that that information will become public, which is one (1) of the reasons that Manitoba Hydro has gone to considerable lengths to establish the confidentiality of -- of our customers' information. Thank you.

MS. MARLA BOYD: Thank you. I also have available the response to Manitoba Hydro's Undertakings number 5 and 6, which were taken from transcript pages 261 and 263. My colleague is circulating those at the moment. I believe they would be Manitoba Hydro Exhibit number 91. Am I correct, Mr. Simonsen?

--- EXHIBIT NO. MH-91: Response to Undertakings 5 and 6

MS. MARLA BOYD: I can also advise the Board that Manitoba Hydro filed electronically this morning the CVs for the upcoming panel, so I believe that could be assigned an exhibit number, as well. I do not have paper copies at the moment, but they were filed electronically at 10:00 this morning, and we'll make them available later. And I would suggest that

those CVs be marked as Manitoba Hydro Exhibit number 92.

--- EXHIBIT NO. MH-92: CVs for MH panel 4

MS. MARLA BOYD: And one final matter. I spoke with my friend, Mr. Monnin, this morning. He brought to my attention page 7 of Manitoba Hydro's rebuttal evidence. At line 19 of that evidence in a description of position in response -- or in respect of Elenchus's report, Manitoba Hydro has used the word, "as advocated by Elenchus."

I have with Mr. Monnin discussed that, and we agree that that word should be substituted to be, "as assumed by Elenchus." So if I could ask the record just to reflect that, please?

(BRIEF PAUSE)

MS. MARLA BOYD: Thank you for your indulgence. I -- I'm finished.

CONTINUED BY MR. ANTOINE HACAULT:

MR. ANTOINE HACAULT: Thank you very much. If our document management person could bring

up the screen? She's bringing up page 3 of our book of documents. It's -- perhaps, Ms. Morrison, you can confirm, this is a different table than what we were looking at.

We were looking at energy tables and now we've switched to a capacity table?

MS. LOIS MORRISON: Yes, that is correct.

MR. ANTOINE HACAULT: And this is still part of your 2013/2016 Power Smart Plan, correct?

MS. LOIS MORRISON: Yes, that is correct.

MR. ANTOINE HACAULT: And it's for the time period ending in 2012 to 2013, correct?

MS. LOIS MORRISON: Sorry, I thought you were on the future projections. You're on which page, could you --

MR. ANTOINE HACAULT: Page 3 of our book of documents.

MS. LOIS MORRISON: Yes, that is for savings to date.

MR. ANTOINE HACAULT: Okay. So the document management person has brought up on our screens the industrial total, and there should be a

highlight on everybody's copy for the Curtailable Rate Program. So we start with that program being at zero. And if we could move to the right, it has some variations in it going forward. Continue, please, document manager. Not quite that far. That's okay, we can stop there.

A couple years out this program had a capacity on a DSM perspective of around 180 megawatts, correct?

MR. DALE FRIESEN: That is correct.

MR. ANTOINE HACAULT: Okay. And we just heard Mr. Wojczynski say that a hundred and eighty-four (184) was practically the size of Wuskwatim.

So this particular program in that particular year was practically the same size as the additional peak demand in this current year, correct?

MR. DALE FRIESEN: That is correct, with one (1) slight caveat. We have to recognize that the dependable energy available from Wuskwatim is very different than the amount of energy that we would be able to release through the Curtailable Rates Program.

MR. ANTOINE HACAULT: Thank you for that clarification. Now, this is program -- the subject matter of possible being -- possibly being

capped. Now, we see going further right before we hit the zero-zero (00), a hundred and forty-six point four three (146.43).

What's that number?

MS. LOIS MORRISON: The one forty-six point forty-three (146.43) represents the interim estimate of savings as of 2012/'13.

MR. ANTOINE HACAULT: Now, if we can perhaps go to Tab 4, pages 20 to 21, could someone from the panel please help us understand this DSM program and what it does for Hydro operations?

MR. DALE FRIESEN: I can address that. The -- the intent and the purpose behind the Curtailab -- Curtailable Rates Program has been the subject of some confusion in some of the evidence that was presented to this -- to this proceeding. And we attempt to clarify that on page 46 of the Manitoba Hydro rebuttal evidence under their Section 3.9, 'Curtailable Rates Program'.

And I'll just read through that paragraph to bring it into the public record, but --

MR. ANTOINE HACAULT: Sorry, just to interrupt. So our document manager can go to page 20 of our --

MR. DALE FRIESEN: Sorry.

MR. ANTOINE HACAULT: -- book of documents, please.

MR. DALE FRIESEN: So --

MR. ANTOINE HACAULT: This is from your rebuttal, sir?

MR. DALE FRIESEN: Yeah. So I won't read it. As my legal counsel informs me, I don't need to be wordy. But the -- the purpose -- the intent and the purpose of the -- of the Curtailable Rates Program is articulated, I believe, quite well in our rebuttal.

MR. ANTOINE HACAULT: So if --

MR. DALE FRIESEN: Sorry. I'll -- I'll take a step backwards. And we'll excuse my inexperience on this, hopefully. The -- the intent is really to support our generation operations. So we use the Curtailable Rates Program to minimize disruptions to our firm customers in the event that we have a loss -- unexpected loss of transmission or generation or an unexpected increase -- and by, "increase," I mean a very short duration increase -- in firm load.

And it also enables us to fill our -- fulfill our specific level of planning reserves and operating reserves that re -- required as part of our ob -- reliability obligations --

MR. ANTOINE HACAULT: Can I stop you right there? Could you --

MR. DALE FRIESEN: -- within the power pool.

MR. ANTOINE HACAULT: Could you give us an example of a short-term unexpected increase in firm load where you would use that -- am I right in saying resource or capacity?

MR. DALE FRIESEN: That's correct. A good example this past summer occurred when we lost one (1) of our bipoles for a short period of time. And so it was, I believe, a fairly warm period of time or a very fairly high temperatures. We have fairly high peak loading in our system at that time. And we used the curtailable load to manage our system peak load within the province while we rectified the situation with the bipole.

So that would be a typical example; unexpected, and it provided us with a very rapid short-term response. And by, "rapid," I mean about a five (5) minute response.

MR. ANTOINE HACAULT: Thank you. Please continue.

MR. DALE FRIESEN: So the -- an important aspect of the Curtailable Rates Program is

that we have a series of options which customers can subscribe to, and those options dictate response time. They dictate the frequency of the interruptions that we can impose upon the customer and the duration of those interruptions.

So they're clearly laid out in a contractual document that's been filed with the Public Utilities Board previously at various GRAs.

MR. ANTOINE HACAULT: Thank you very much. And I won't make the witness go through the particular part, but there's some parts that are highlighted in this. And if the panel has any questions to clarify --

THE CHAIRPERSON: Mr. Friesen, I would if you couldn't take us through the basics of describing the Curtailable Rate Program for the new members of the panel, please.

MR. DALE FRIESEN: Sorry, could you repeat that?

THE CHAIRPERSON: Could you give us a more -- a more basic explanation of the Curtailable Rate Program, defining it a little bit more granular?

MR. DALE FRIESEN: Yeah, I'll give you a little bit of a practical example. So what the Curtailable Rate Program does is it allows customers

to subscribe blocks of load that they are willing to interrupt in exchange for some type of compensation. And the value of that compensation is determined by the value to Manitoba Hydro of that response mechanism.

So we have different options for responding to different types of events. We could build a peaking plant. We could build -- we could have energy in storage. We could build more firm capacity. We -- there are many different options that are available to respond to events within the system that may cause sudden increases in load or may result as a result of equipment failing or equipment going out of service suddenly.

Our program requires customers to subscribe a minimum of a 5 megawatt block, so that precludes, at this point, smaller customers from participating in that program. It's primarily our larger customers that can participate in this program.

And they -- what they have done, it -- particular customers that have processes that can be shut down very quickly with minimal disruption and restarted quite quickly with minimal dis -- disruption. There are many industries where you cannot do this. An interruption of this type would

result in an eight (8) -- six (6) to eight (8), ten (10), twelve (12) hour recovery period. But in certain in -- industries, it's possible to very rapidly turn down load and then very rapidly turn up load when the event has -- has passed.

So at present we have four (4) customers enrolled in this program, all in our top consumer group. And they provide us with these services in exchange for both a standby payment, depending on the option they choose, and a -- in some cases it's a -- a payment that occurs when we actually physically curtail them.

MR. ANTOINE HACAULT: Thank you very much. Those are all my questions in the areas that I intended to canvass with this panel.

MR. DANIEL FRIESEN: Thank you.

MR. SVEN HOMBACH: Mr. Chairman, I was advised by Mr. Orle earlier that he expected to be about half an hour with his cross-examination. Considering that it's currently about ten (10) minutes to noon, it would help if the panel could let me know if we should continue with one (1) more presenter or break for lunch right now.

THE CHAIRPERSON: Yes, let's continue, please. Mr. Orle...?

CROSS-EXAMINATION BY MR. GEORGE ORLE:

MR. GEORGE ORLE: Thank you, Mr. Chair, members of the panel, and members of the Hydro panel. I don't have the familiarity that my colleagues here have with the Manitoba Hydro. I may get your names mixed up. I'm sorry. I may even forget what your name is.

So some of these questions will be sent out as a lob. Whichever one of you wants to hit it back, I'll accept that answer.

My questions are going to be limited to the demand-side management. It won't be dealing with the forecast whatsoever. And my first question will be to the EnerNOC representative.

And I'm just going to repeat what I believe was your evidence on March the 3rd, and that was that in speaking of the residential sector, Maniti -- Manitoba Hydro had recently done a saturation survey and had extensive information about its customer segments.

Do you recall saying that?

MS. INGRID ROHMUND: Yes, that's correct.

MR. GEORGE ORLE: Okay. Can you please confirm that the demand-side management

assessment for the residential sector began with and is essentially based on the Manitoba Hydro saturation survey?

MS. INGRID ROHMUND: The saturation survey was a very important input into the analysis and we used it extensively. It was all -- it was, however, supplemented with other sources of information.

MR. GEORGE ORLE: Okay. And what other sources of information would that be?

MS. INGRID ROHMUND: Manitoba Hydro billing data, secondary sources -- other projects that we've done, other Canada-specific sources. I'd have to go into the report to read off the specifics. It's in Chapter 2.

MR. GEORGE ORLE: Okay. But the saturation survey would have been the primary tool that you used?

MS. INGRID ROHMUND: For some of the data elements, yes.

MR. GEORGE ORLE: Okay. And do you have a copy of that Hydro saturation survey available?

And -- and, forgive me, I'm -- I'm new here. I don't know if it's been filed before. I came

in after the requests were available.

MS. LOIS MORRISON: Perhaps I can help. The -- a copy of the 2009 Residential Energy Use Survey was filed by Elenchus in response to one (1) of the Public Utility Board interrogatories. If you give me one (1) brief minute, I can find it.

MR. GEORGE ORLE: Thank you.

(BRIEF PAUSE)

MS. LOIS MORRISON: The interrogatory I'm referring to is the response by Elenchus to PUB/Elenchus-1 -- oh, sorry, PUB-Elenchus -- sorry, PUB/Elenchus-2. I apologize.

MR. GEORGE ORLE: Okay.

MS. LOIS MORRISON: That's where -- there includes a copy of the 2009 Residential Energy Use Survey.

MR. GEORGE ORLE: Thank you. Ms. Rohmund, does -- also part of your testimony you indicated that you analyzed separately twenty-nine (29) customer segments, and I believe that those are set out on page 29 of Manitoba Hydro Exhibit, I believe it's, 87. If the document manager could please put that -- thank you. It's there already.

The twenty-nine (29) customer segments that you spoke of in your testimony, those are the segments shown on the right-hand side of that page?

MS. LOIS MORRISON: That is correct.

MR. GEORGE ORLE: Were residential customers and First Nations communities in general identified in any of these twenty-nine (29) categories?

MS. LOIS MORRISON: Yes, they were. They would be identified as -- going down the list here, single family electric non-gas reserve. Then going down further down the list there was -- which -- which is represented by, MF electric non-gas reserve, would be the multi-family electric non-gas reserve.

And I believe that was it. We don't -- didn't have apartments for those communities.

MR. GEORGE ORLE: And those are specifically to reserves?

MS. LOIS MORRISON: Yes.

MR. GEORGE ORLE: Okay. And was there any differentiation made between southern reserves, northern reserves?

MS. LOIS MORRISON: Not within the study, no.

(BRIEF PAUSE)

MR. GEORGE ORLE: In the commercial sector, I believe you've got eighteen (18) segments. Are any of those segments commercial buildings on reserve?

(BRIEF PAUSE)

MS. INGRID ROHMUND: The commercial buildings that were included in the study included commercial buildings on reserves. However, they were not isolated as separate segments.

MR. GEORGE ORLE: Okay. You have the segments set out for residential. Do you have a list of the -- the segments that were used for commercial?

MS. INGRID ROHMUND: Yes.

MR. GEORGE ORLE: And where would I find that?

MS. INGRID ROHMUND: I'll look it up for you in the report.

(BRIEF PAUSE)

MS. INGRID ROHMUND: Page 312 of the

DSM Potential Study Report.

MR. GEORGE ORLE: Thank you. And are you able to segregate southern and northern reserve commercial institutions?

MS. INGRID ROHMUND: No, we were not.

MR. GEORGE ORLE: I'm not sure if I asked this: Are you able to do that for residential; differentiate between northern and southern reserves?

MS. LOIS MORRISON: The study that was undertaken by EnerNOC we did not differentiate within that. However, within our residential energy-use survey we are able to differentiate between northern areas and southern areas.

MR. GEORGE ORLE: Okay. If you refer to page 31 of the same exhibit.

(BRIEF PAUSE)

MR. GEORGE ORLE: Pardon me. When we take a look at page 31 there's a sample of -- of twenty (20) key residential measures and a comparison of a levelized cost of eighteen (18) residential and commercial measures on page 69.

Where would I find a complete list in the exhibit or in the filings of all residential and

commercial measures that were considered in Manitoba Hydro's assessment of DSM potential for residential and commercial sectors?

MS. INGRID ROHMUND: In Chapter 5 of the DSM potential study report we identify the measures that we considered in the study.

MR. GEORGE ORLE: Looking at the list of twenty (20) key residential measures on page 31, which of those measures are presently available to all First Nation communities?

MS. LOIS MORRISON: I -- I think we need -- could you please clarify your question. These measures are not specifically aligned with programs being offered now, although a number of these measures are covered by existing programs.

So I guess I'm -- I -- I would like to know, are you asking program specific or are you asking in terms of this particular study? In this particular study, the majority of these init -- these measures may be present within any of the First Nation homes. It was focussed around insulation, interior lighting, housing construction, geothermal heat pumps, infiltration control, which is air sealing, low-flow showerhead, refrigerators, appliances, electronics.

The majority of these, I would expect,

are very -- are consistently available in most of the housing across the province.

MR. GEORGE ORLE: Okay. And that includes housing on reserves. The programs that you have, these measures included in all of those programs would be available and householders on reserves would be eligible to apply for those programs?

MS. LOIS MORRISON: Yes, they are.

MR. GEORGE ORLE: Okay. Has Manitoba Hydro or EnerNOC made an assessment of the actual penetration of these key residential measures in the programs in the First Nation communities?

(BRIEF PAUSE)

MS. LOIS MORRISON: Are you asking about whether we keep track of the actual penetration of our existing programs in First Nation communities?

MR. GEORGE ORLE: Yes.

MS. LOIS MORRISON: Yes, we do.

MR. GEORGE ORLE: Okay. And where would I find that information?

MS. LOIS MORRISON: We have quite a bit of information on the record to date regarding participation by individuals and working in the First

Nation programs. We -- as part of this filing specifically, we did not file specific information about participation in specific programs unless it was requested under an interrogatory.

If you would like information, Mr. Kuczek and I both have quite a bit of information related to those programs. But as I mentioned, that has been provided under the past electric GRAs. We've given statuses or updates as to the -- the uptake of the pro -- of the initiatives that we work with in those communities.

MR. GEORGE ORLE: And could I ask you as an undertaking to provide that information?

MS. LOIS MORRISON: Could you be a little more specific about what particular information you're looking for? That's a very broad request.

MR. GEORGE ORLE: Well, the -- the -- I gather the programs that are available to First Nations are the ones that they're actually taking an active part in as to what amount or -- or how much of the community actually takes it up.

And -- and what I'm looking for is, essentially, a comparison as to -- to how well these programs are being delivered to the First Nations communities as opposed to the outside or reserve

communities.

MS. LOIS MORRISON: Well, we do have a ver -- we have a program that is specifically targeted to First Nation communities, working with the bands and the councillors specifically, where we actually help -- work with them to identify -- they identify housing which requires insulation upgrades. And we work with the community to install those insulation upgrades at no cost to the community. We provide the materials and pay for the labour and shipping of those materials.

We have worked with, I believe, the vast majority -- and Mr. Kuczek can give a better update on the specifics of those details, because that program actually reports directly to his office because of the priority of that program.

In addition to that, we have initiatives where we are working with, or attempting to contact, the band offices to provide walkthrough audits or walkthrough energy assessments for the commercial facilities in those communities. So it's -- it's an area that we've got quite a few undertakings with.

And so if you'd like a status update on our First Nations Energy Efficiency Program, in terms

of the number of houses that we have improved the energy efficiency of, the types of measures that we've included in those upgrades, we could provide that.

MR. GEORGE ORLE: Thank you. I -- I'd like that.

MR. LLOYD KUCZEK: I can just add a little bit more information. We've taken a different approach with the First Nation communities. And -- and the pace of progress is really dependent on each community or First Nation that we're working with. But our approach is to work with each one, and as Ms. Morrison pointed out, work with the individual communities. And it's usually the housing manager that we work with.

And we're -- we're trying to clean up, certainly, all of the residential homes that re -- that can use additional insulation. So we've retrofitted over a thousand in over -- I believe it's about thirty-seven (37) First Nation communities. Some First Nation communities still haven't participated yet, but that's their choice. We're certainly willing to work with any First Nation community that's willing to participate with us.

And on the geothermal side, I mentioned earlier in the hearing that we're working with two (2)

First Nation communities, and we have installed over a hundred geothermal systems in -- we haven't, they have actually, have installed over a hundred geothermal systems in those communities. And there's discussions with four (4) additional First Nation communities to potentially do the same thing there.

So the approach is somewhat different with the First Nation communities, and -- and in some -- in some ways much more successful when they're willing to participate and work with us on implementing these measures. Because if they're on board in terms of doing it, certainly with the residential side there's no cost to them. The geothermal side we're -- would be homes that are eligible in terms of being economic. There's no cost as well. So it's -- it's turned out to be successful to that degree.

MR. GEORGE ORLE: Are these delivered under a...

(BRIEF PAUSE)

MR. GEORGE ORLE: Okay. I believe that the undertaking was for you to provide us with a -- either the results or the -- the success of the

programs that you've -- you've had so far with -- with the First Nations communities.

Am I right in that?

MS. LOIS MORRISON: Yes, we have committed to provide you with an update as to the number of homes that we've insulated, along with the measures that have been installed.

--- UNDERTAKING NO. 20: Manitoba Hydro to provide an update on the number of First Nations homes insulated along with the measures that have been installed

CONTINUED BY MR. GEORGE ORLE:

MR. GEORGE ORLE: And would I be able to tell from -- from those figures the -- the ratio of how well these programs are being delivered to the general population as opposed to the reserve communities?

MR. LLOYD KUCZEK: That's difficult to answer. So it depends on each First Nation community. So there's three (3) communities that we've totally retrofitted all the homes that fall into the category

of being eligible. In other words, they -- they require insulation.

So we've done all the homes in those communities, so if we compared those communities to the general population of Manitoba, we're doing much better. If you compare it to communities that have been signed up or are working with us -- 'signed up' is the wrong term for it, but that currently are not participating in the programs, it -- clearly not as good as the general population in Manitoba. So it varies by community.

MR. GEORGE ORLE: Okay. So what you're saying is that if a community wants to bring these programs in, they can have as much penetration as they want or as much as the program allows.

And this is the basis of who asks as opposed to where it's being delivered to?

MR. LLOYD KUCZEK: It's actually -- we -- we are approaching the communities, so it's a question of them responding. And -- and sometimes that takes time for them to understand what's all involved. But there's -- there's no limitations of participation. It's -- it's more to do with, as I mentioned earlier, the pace of the First Nations community -- communities' willingness to participate.

MR. GEORGE ORLE: Okay. If you'd refer to -- to page 69, and I'm just going to ask -- this is a general question again.

The -- the programs that are shown on page 69, again, are all of those available to the First Nations communities?

MS. LOIS MORRISON: Yes.

MR. GEORGE ORLE: Okay.

(BRIEF PAUSE)

MR. GEORGE ORLE: And on page 83 of that same exhibit, the new programs that are being proposed, again, and just a general question: Are -- are these new programs all -- all three (3) available to First Nations communities?

MS. LOIS MORRISON: Yes.

MR. GEORGE ORLE: Okay.

(BRIEF PAUSE)

MS. LOIS MORRISON: We should state though that as Mr. Kuczek noted, one of the programs has not yet been approved. It's potentially going to be -- it's still under review, and subject to approval

--

MR. GEORGE ORLE: Okay.

MS. LOIS MORRISON: -- and that was the LED lighting program.

MR. GEORGE ORLE: And as you go into consideration of new programs or enhancing programs, do you have any -- any policy in terms of consultation with First Nations communities in regards to what new programs might be available, or what programs might be available that the First Nations would -- would appreciate receiving, as opposed to the ones that you're already delivering?

(BRIEF PAUSE)

MS. LOIS MORRISON: In terms of our program design, we -- all of the opportunities that we pursue where -- particularly where it's geared to a market that's served by electric heat -- electric space and water heating, is to the benefit of, we would assume, First Nation communities also.

It's more so on the lines of the delivery of how do we get that measure or that opportunity to the First Nation communities, or the members of the First Nation community. And we get

information through our interactions with the communities, so we take their thoughts.

And the ones that we're working with, they provide us with insight as the best way to deliver those types of programs to -- to their members.

MR. GEORGE ORLE: Okay, is there a specific policy in how you deal with that? You -- you talk about talking to the communities. Is it -- is it a matter of a formal consultation? Is it just word of mouth, things that you may hear from -- from the communities?

I'm just wondering whether you have a process in place to -- to have these consultations.

MR. LLOYD KUCZEK: There isn't formal consultations, per se. The opportunities within a First Nation community are generally the same opportunities that are available to outside the communities.

What we have in place is we have an individual that's dedicated just to working with the communities. And so that individual works with the housing manager and explores opportunities.

Right now, the focus is primarily on the residential sector, but discussions are ongoing as

far as expanding that to the commercial, as well. And -- and this is something that has evolved over time. I'm not sure if we put it in place four (4) years ago or thereabouts, but prior to that, participation wasn't as good in the First Nation communities.

And so we're -- we've found that this is working quite well for us, actually, as well as the First Nation community, so it's a big improvement.

MR. GEORGE ORLE: Does Manitoba Hydro have a First Nation Power Smart program?

MR. LLOYD KUCZEK: We -- we call it that, but it's essentially the same program as the Affordable Energy Program. It -- it -- the only difference would be the delivery, where we have the individual working with the First Nation community, and usually he's working directly with the housing manager --

MR. GEORGE ORLE: Okay.

MR. LLOYD KUCZEK: -- in the community.

MR. GEORGE ORLE: I didn't see it mentioned in any one of the -- the programs available here. So is it just a title that's given to the manner of delivery as opposed to a program of its own?

MR. LLOYD KUCZEK: That's correct.

(BRIEF PAUSE)

MR. LLOYD KUCZEK: And just to add a bit more to that, we -- we track progress separately with -- but it's a subset of the overall Affordable Energy Program.

(BRIEF PAUSE)

MR. GEORGE ORLE: Are any of the programs specifically designated under the First Nations Smart Program?

I had earlier asked you whether it was just a name for the delivery of the services there, but are there any programs within that that are -- are different than the programs available under the general programs you've set out already?

MR. LLOYD KUCZEK: They -- they are different from the sense that they're a community -- they're -- they're the same programs, but they're a community approach. So the geothermal community initiative that we have in place, the only two (2) participants currently are two (2) First Nation communities.

And again, it works very well when the communities are interested and -- in participating because the delivery -- or the effort on our part is -- - is minimized and the -- the participation is substantial given our effort because the First Nation community ends up delivering the program within their community. And we provide resources as well as -- well, technical and financial support to implement those opportunities.

So that fall -- that -- that is the case both with the community Geothermal Program as well as our Affordable Energy Program, which is primarily focussed on insulation, but it includes some low -- lower cost opportunities as well.

MR. GEORGE ORLE: Thank you.

MS. LOIS MORRISON: Maybe a way to -- to characterize it would be that, as you know, we have a Home Insulation Program. We have a Water and Energy Saver Program specifically noted here. They ha -- they -- they address certain measures.

We also have, as Mr. Kuczek mentioned, the Affordable Energy Program of which we are specifically targeting. There are components that have different program mechanisms that help us target specific sectors of the marketplace and -- and

increase our reach and increase our penetration.

But they're, essentially, taking the Home Insulation Program and measures from the Water and Energy Saver Program, rebundling them, repackaging them and offering additional services, such as the -- as paying for the labour in the Affordable Energy Program. And in the First Nations sector, specifically targeting the First Nations sector, we work with the -- the community -- with the Band, the housing manager, to actually pay for the labour to -- we pay them to have them install the measures.

It's -- it's a different repackaging to specifically get those measures that we see as benefiting the individuals into those homes. So when we were talking about being a special program, or a specific program, it's -- it's takin -- it's repackaging things that are offered in other areas and, specifically, developing a program delivery mechanism that helps us get greater reach in those communities.

MR. GEORGE ORLE: Thank you. I -- I appreciate those answers. And it gives me a better understanding of -- of what the delivery and the models are that are being used here. And, again, I apologize if this is material that's already been

presented. There's been a -- a lot of material to try to go through. Thank you. I appreciate.

Ms. Rohmund, I'll direct another question to you. In -- in the process of determining the segments for the residential customers, are demographics of these customers, such as income, household age, household preferences, developed as part of that?

(BRIEF PAUSE)

MS. INGRID ROHMUND: The characteristics that we used to segment the residential sector were the heating fuel, gas or electric, whether gas is available or not; and -- and geographic region, where we could, north and south; and reserve; and the age of the home, so built before 2000, or from 2000 forward; and then income level were the variables that we used.

MS. LOIS MORRISON: And this is all detailed on page -- on -- in Table 3-1 of the report, how we identified or broke out the segments and characterized them.

MS. INGRID ROHMUND: As well as the number of customers in each segment and their energy -

- their electricity use in 2010/'11.

MR. GEORGE ORLE: Okay. Thank you. I won't refer specifically to the document. I think you may remember it. It -- it was your Ameren Illinois study. And in that you included a development of residential attitudinal segment distribution.

Was that something that was asked of you in -- in this particular study by Manitoba Hydro? Did you develop any of that?

MS. INGRID ROHMUND: No, we did not. I should add that -- that Ameren -- unt -- until this year, Ameren is the only client that we've worked with that has taken that approach. They are -- there's one (1) person at Ameren who is responsible for all three (3) studies that we did who believes strongly in that approach and is able to get the funding to support that level of research as well. The other utilities, the other thirty (30) plus studies that we've done, use a similar approach to what we used with Manitoba Hydro.

MR. GEORGE ORLE: Okay. I hate to say anything is a given when I start a question, because so often it turns out that I'm the one that's wrong on it.

But would it be fair to say that a unit

of electricity saved, whether it comes from the north or whether it comes from the south, has the same value?

MR. ED WOJCZYNSKI: Nearly. The -- the difference is --

MR. GEORGE ORLE: Well, that's halfway. I'm happy with that. Thank you.

Maybe you could just explain to me what -- what the difference might be.

MR. ED WOJCZYNSKI: Load in the south requires transmission from the north to the south, which has its capital cost, but including things like Bipole III, which -- and -- and any other similar north-south. So to the degree reductions in load in the south can prevent or defer those north-south enhancements, the northern load doesn't tend to provide quite the same big deferals. On the other hand, the northern loads, some of them tend to be in more remote areas where there are smaller amounts of load for a significant amount of -- of transmission investment. So it -- it would actually depend a little bit on where that northern load is and what type it is.

If you're referring to the type that are in some of the First Nations, some of them would

have fairly high transmission upgrade costs down the road if load were to grow, so you'd have to do a very specific study to really get a good answer on that.

MR. GEORGE ORLE: Okay.

MR. ED WOJCZYNSKI: So I -- I guess it's nearly, and it depends.

MR. GEORGE ORLE: Then in -- in terms of the value of the programs that you put together, there would be -- I think if you were looking at it on a -- on a cost-effective basis, a program delivered to the south would probably be of -- of more value to Manitoba Hydro than -- than ones delivered to the north?

MS. LOIS MORRISON: We don't characterize it that way when we're developing our programs. Our programs, we -- we develop them based on one (1) overall value assigned to the -- to -- to the province, is how we assess our investment in programming.

MR. GEORGE ORLE: Okay. And I'd just like to ask another question related to -- to an aside made on -- on Monday, and that's in regards to: When putting these plans together you -- you take a look at whether or not they make economic sense. And ,I believe, Mr. Kuczek, you were talking about that in

terms of sending your people back when they brought you a program that made no sense. But that's not the case in every one of your programs.

When I -- I recall that you were talking about a program, a lower-income program, where essentially the -- the benefits to the customer were being given to them for, I believe you said, almost free.

MR. LLOYD KUCZEK: So -- so that's the Affordable Energy Program. And so that's the same program that the First Nation communities are participating in as well, and so there's no cost to the First Nation communities.

And you mentioned income before, so it might be of interest to you, a well, to know that what we do with the First Nation communities is we don't -- with the Affordable Energy Fund -- Program, not fund, but the Energy Affordable Program throughout Manitoba, there is a income eligibility component to that that customers have to meet to be eligible for that program and participate. With First Nation communities we don't look at income. If there's a residential building within that community, First Nation community, they're eligible.

MR. GEORGE ORLE: Okay. And I would

assume that the -- the basis for that is that you don't always look at cost. There's a -- there's an equitable factor that comes into play occasionally in dealing with these programs?

MR. LLOYD KUCZEK: That -- that is true. With -- with the First Nation communities, we realized that there is a number of -- there'd be challenges getting income levels, and we talked about it outside the First Nation communities as well, one (1) neighbourhood in Winnipeg, whether we should take the same approach and not worry about the income of those individuals. And the reason you do that I because it just may be a more effective way of achieving what you're -- you're attempting to achieve through the Power Smart programs, and that's capture cost-effective energy efficient opportunities. And some of those sometimes are not, as I mentioned when we talked about our different options. Embedded in a package could be some stuff that on the increment is not cost-effective.

But we do not require through the Affordable -- or the Affordable Energy Fund Program which includes the First Nations program, it does not have to meet those cost-effective tests. This program is supported through the affordable energy fund, and

the -- that fund is established through legislation as well. And it's directed -- or part of the -- one of the primary objectives is to ensure that those in a lower income and those that live in Northern Manitoba have access to the same programs as other Manitobans.

MR. GEORGE ORLE: Okay. Has there ever been any thought of -- of enhancing the programs that are available to -- to low income or -- or northern communities to -- to offset what -- what I would characterize as -- as a better ability on the part of consumers in the southern part of the province to -- to take the benefit of -- of certain savings?

(BRIEF PAUSE)

MR. LLOYD KUCZEK: We -- we effectively think we're achieving that through that Affordable Energy Program, and the First Nations component within that program.

MR. GEORGE ORLE: Okay. Maybe I might do this better as an example. I find that my mind works better with practical examples rather than philosophical questions. But I'm going to refer to the -- the brochure that -- that we talked about. That's Exhibit Number 88.

And -- and I'm going to use, as an example, the difference between someone in the south part of the province, and -- and someone living in, say, an area like Island Lakes. I used to use just an ordinary citizen from River Heights, but I kept getting badgered about the fact that I shouldn't use people from River Heights, as every one (1) of my examples. So I now just use myself, and it makes it a lot easier.

In my home, I have an electric water heater. When I saw this brochure, I realized that that's probably not the best decision for me to make. I can switch over and, in effect, I get myself a fifteen hundred dollar ($1,500) benefit. That's worth a considerable amount of money to me.

I have a neighbour that's just a few doors down, and his house is heated with gas and also has a gas water heater. When I go to the second side of the brochure, there's a -- a fifteen thousand dollar ($15,000) saving that my neighbour could get. That's a -- a significant saving, and I believe that we were told that this is based upon current rates, not if -- if the proposal is accepted in the rates that we've been talking about. Those aren't even included in these savings.

Am I -- am I right on that?

MS. LOIS MORRISON: You are correct. These are based upon current rates.

MR. GEORGE ORLE: Okay. So I'll -- I'll take, as an example, one (1) of my friends, and I -- I do have friends in Island Lake so I can use this and I -- I'll make a composite name, a common first name, a common last name in several of the communities, Steven Harper.

My friend Steven Harper has a house heated by gas -- I'm sorry, by electricity. Water is heated by electricity. He pays the current Hydro rates. He does not have an option to switch over to natural gas. He foregoes a significant saving in rates. More importantly, he'll be paying the new rates that are going to come in, if this is approved, for the next twenty (20) years.

On the other hand, myself, who has now divested myself of anything running on electricity to heat my home, or to heat my water, will not have to pay those high rates for the next twenty (20) years. There seems to be a -- a level of inequity in that, in terms of if programs are set up and a benefit is -- or the programs are all equally available, that if one (1) area of the province can obtain a significant

benefit from a program that perhaps there should be resources put into the other areas that would match that or would be equivalent.

I don't know how much goes into the -- the low income programs, but would it be close to the types of savings that would be available to just a regular, middle-class homeowner in -- in Winnipeg?

MR. LLOYD KUCZEK: The savings that you achieve through participating in the Affordable Energy Fund Program vary by each -- each customer that participates, because it's dependent on the measures that are implemented. So it's the starting level of the insulation, for example, to the finishing level.

You could easily save five hundred dollars ($500) if your -- if your -- your base home didn't have the basement insulated, for example, and the attic insulated very well. So you -- you could save in the range of five hundred dollars ($500). So you're not going to get the savings that customers have -- to the same degree as customers have in terms of fuel choice. But fuel choice and the access to natural gas is not something that influence us as -- influences us in terms of what we offer customers on an individual measure basis. We assess those based on the economics.

So those measures which you're bringing into the discussion is the issue of whether or not there's -- or -- and how you deal with this -- the -- the economics of bringing -- bringing natural gas to --

MR. GEORGE ORLE: Yeah.

MR. LLOYD KUCZEK: -- areas that currently don't have access to it.

MR. GEORGE ORLE: And I'm sure we'll get into this later on in the -- in the hearing, but the -- the other corollary of that example that I used is that, after I've avoided the twenty (20) years of increased rates, I'm still eligible for the dividend if it's going to come at the end of those twenty (20) years.

When I say "dividend," I'm talking about what we're talking about as a benefit to -- to all Manitobans at the end of that year from the payment of the rates and delivery of the new -- new dams. We're all going to be benefiting from that. And even though I haven't paid anything towards the increased rates, I'll be entitled to that -- that as I call dividend the same as anyone else would be.

I -- I think that's more of an aside. I -- I'm not asking for --

MR. LLOYD KUCZEK: You lost me there. I'm sorry.

MR. GEORGE ORLE: All right. Thank you.

THE CHAIRPERSON: Mr. Orle, are you -- are you done? Are you -- I'm sorry to interrupt.

MR. GEORGE ORLE: Yeah.

THE CHAIRPERSON: Thank you.

MR. GEORGE ORLE: Those are all my questions. Thank you very much to the panel. Thank you to the Board.

THE CHAIRPERSON: I wonder if -- before we break for -- for lunch, I wonder if I could ask the Manitoba Hydro to undertake to explain to the panel the rates that are actually paid by First Nations communities in Northern Manitoba.

And the reason I'm asking you this is because we heard from some presenters on Thursday last that First Nations people living in the shadow of some of those dams were paying far more for their electricity than somebody located in -- in southern Manitoba.

So I wonder if you could undertake to inform the -- the panel just how rates for First Nations communities in northern Manitoba are

calculated and paid. So we want an understanding of -- we want to understand if there was any -- if the statements that we heard were -- were factual or not.

MS. LOIS MORRISON: I -- I think we can address that right now. Manitoba has uniform rate legislation which requires us to, essentially, charge everyone the same set of rates, with the exception of those individuals in the diesel-served communities.

But for residential customers, everyone is charged the same rate, even those individuals leaving -- living in the diesel-served communities. They are paying the same basic monthly charge, they pay the same uniform rate per kilowatt hour.

And I -- I -- the individuals who were here and presented from the community were -- are being paid -- are being charged the same rate per kilowatt hour and the same basic monthly charge across Manitoba.

THE CHAIRPERSON: Thank you. Let's -- let's adjourn for lunch. And I would suggest that we return here at 1:15.

MS. LOIS MORRISON: I could offer you one (1) more item, Mr. Chair --

THE CHAIRPERSON: Okay.

MS. MARLA BOYD: -- for your lunchtime

reading pleasure, if you -- if you like. Manitoba Hydro is in a position to file its response to Undertaking Number 13, which included any late 2013 external population forecasts and the 2014 economic outlook. It's available here, and we have copies being circulated.

I believe it would be Exhibit Number 93. Thank you.

--- EXHIBIT NO. MH-93: Response to Undertaking 13

THE CHAIRPERSON: Ms. Boyd, does that give you enough time for your team to have lunch if we resume at 1:15?

MS. MARLA BOYD: Could we perhaps go to 1:30? Thank you.

THE CHAIRPERSON: Let's do 1:30. Thank you.

--- Upon recessing at 12:42 p.m.
--- Upon resuming at 1:37 p.m.

THE CHAIRPERSON: Good afternoon. The -- we'll restart the proceedings.

MR. SVEN HOMBACH: Yes. Thank you,

Mr. Chairman. Before we proceed, just a few administrative matters.

First of all there are three (3) sessions left this afternoon. The lawyer for MMF will be examining next followed by counsel for the Independent -- Independent Expert Consultants. I anticipate that this will take about an hour.

After that, as I advised this morning and yesterday, there will be a closed in camera session where members of the public will be included, where commercially sensitive information will be discussed. At that point, the audio and video feed out of this room will be disconnected, as well. I would likely call for a ten (10) minute break before that session so that the necessary technical arrangements can be made.

I've also been advised by My Friend Ms. Ramage that Manitoba Hydro has a few administrative matters to address, so perhaps I can turn it over to Ms. Ramage.

MS. PATTI RAMAGE: Thank you. My administrative matters actually don't deal with this panel so much as the next panel. Next week we'll be putting up a different panel. It's a fairly large panel and it's a complex subject matter.

It'll be -- that's when we're going to be dealing with the economic analysis, and -- and uncertainty. And included in those materials are -- when we review is discount rates, and I don't know about the rest of the room but I find it really, really hard to understand.

And so what I asked our people to do was put together a package of recommending reading, and we've done this for the room, so everyone can have it. We've picked out what we though were some of the key IRs on discount rates, and some of the academic articles that were referenced in our IR responses.

And we have to admit when we looked at them one (1) of the things we found was a couple of them, when you clicked on the link, you found that you had to pay to get to read it. So Manitoba Hydro has gone in and we have bought those articles for people in the room and we have a package.

So that when we get to our tough sledding next week I think it'll really help if people will have read these materials ahead of time, so that we're hopefully a little further down the path in terms of getting there. So our folks upstairs are just putting the final touches on making sure there's copies.

(BRIEF PAUSE)

MS. PATTI RAMAGE: Oh, they're amazing. Ms. Fernandes has them and they're available. We will be distributing them throughout the room. So it's your recommended reading. It's already all on the record, but we thought it would help move things along next week.

THE CHAIRPERSON: So the day of recess tomorrow is we have homework assigned, is what you're saying?

MS. PATTI RAMAGE: That is exactly correct.

MR. KURT SIMONSEN: Is that going to be an exhibit, Patti?

MS. PATTI RAMAGE: I wasn't planning on making it an exhibit, simply because it's all material on the record. We've com -- we've -- we've just compiled it for reading. If that's something we decide we want to do, I -- maybe after parties have addressed it, and if they would like it to be made as an exhibit, we can do that then, but...

MR. SVEN HOMBACH: Ms. Ramage, I would expect that probably at least one (1) of the parties will refer to those articles. If they're going to

refer them on the record, it might be a benefit to have them as exhibits. Now, would the copyright restrictions allow that to have them made exhibits, or does Manitoba Hydro have any concerns?

MS. PATTI RAMAGE: That's a good point, Mr. Hombach. What we did with the articles that had to be paid for, we only have permission to make twenty-five (25) copies. And so those articles cannot go on the record of the proceeding per se, in terms of on the website. They have to be limited to what we produce in the room. That is the permissions we were able to -- to purchase.

THE CHAIRPERSON: So could I suggest that maybe on Monday we have a document which can go on the record and that becomes the exhibit.

MS. PATTI RAMAGE: We can do that, but that would be the actual -- the IR response that's already there, and that's why I was thinking --

THE CHAIRPERSON: Oh, I see. Okay.

MS. PATTI RAMAGE: -- it didn't necessarily have to be an exhibit, because if you look it could be -- and it's not the first one in this package -- but it could be IR PUB/Manitoba Hydro First Round 151c. That's when the article is referred to and it's footnoted. We've just attached the actual

article now.

So if people wanted to refer to it, they already have that reference. That's why I was thinking it didn't need an exhibit number 'cause there's nothing new here. It's already on the record.

(BRIEF PAUSE)

MS. PATTI RAMAGE: Ms. Boyd just suggested maybe we could provide a list of what's there that could go on the record just in one (1) document to show what the -- the package was.

MR. SVEN HOMBACH: That might be helpful. Thank you.

MS. PATTI RAMAGE: Okay. And I'm going to turn the chair back over to Ms. Boyd now.

THE CHAIRPERSON: I will turn the microphone over to Mr. Corey Shefman, acting on behalf of the Manitoba Metis Federation. Mr. Shefman, please.

MR. BYRON WILLIAMS: Mr. Chair, if -- it's Byron Williams here, if I might. Sorry, Mr. Shefman.

I think I -- I will not suggest that any arm wrestling took place, but I think we have an

agreement with the help of Mr. Kuczek, Wojczynski, Boyd, and Ramage in terms of the undertaking about DSM. And I'll -- I'll try and state it accurately. And then Hydro will correct me.

Manitoba Hydro is undertaking to provide the projected savings per program aggregate over fifteen (15) years as represented in the Power Smart program, the 2013 program, as well as scenario 1, scenario 2, and scenario 3. In addition to that, they will provide the levelized utility cost for each program for each scenario.

As long as Hydro confirms that, I think that's what we've got. And the levelized utility cost was by program.

MS. MARLA BOYD: In the benchmark year, correct?

MR. LLOYD KUCZEK: Correct. And the scenarios being the DSM option 1, 2, and 3, as we referred to earlier.

MR. BYRON WILLIAMS: In the benchmark year.

MR. LLOYD KUCZEK: Correct.

THE CHAIRPERSON: Could I suggest to Mr. Kuczek and Mr. Wojczynski, please, if you could move your microphone over to the -- to the other side

of your -- where you're sitting so that you're facing immediately -- you're facing the microphone when you're answering questions in that direction. I think it would be more helpful for me, at least.

CROSS-EXAMINATION BY MR. COREY SHEFMAN:

MR. COREY SHEFMAN: Thank you, Mr. Chair. Most of my questions today are going to be for -- I believe for Mr. Kuczek, but you're welcome to pass it on, as the case may be.

I'm going to start by looking at this slide from your presentation the other day. It's slide 83. In discussing the levelized resource cost comparison from your presentation you discussed, in particular, the success of the Community Geothermal Program. And that's come up a number of times throughout this panel.

Can you confirm that this is the program you were referring to when you made mention of the programs that Manitoba Hydro is working on with Fisher River and Peguis?

MR. LLOYD KUCZEK: That's correct.

MR. COREY SHEFMAN: And although we -- I know we've gone over the fact that these numbers, for 2014 in particular, aren't finalized.

Is the level of funding or price per kilowatt hour generally in the range of where it should be, that -- in that it's higher than most of the other programs on this chart?

MR. LLOYD KUCZEK: The levelized resource cost is -- is higher than most of the programs for geothermal, generally speaking, and that it would be the case with this opportunity, as well.

MR. COREY SHEFMAN: Thank you. When you spoke of this program, in particular, and when we were having that discussion about Peguis and Fisher River, you indicated that Manitoba Hydro would be looking to pursue similar opportunities in other communities.

Is that correct?

MR. LLOYD KUCZEK: That's correct.

MR. COREY SHEFMAN: Is that desire specific to the Community Geothermal Program or does it include other programs that engage in -- engage communities in DSM-related power generation?

MR. LLOYD KUCZEK: It goes beyond the geothermal. The other -- the other program is -- the Affordable Energy Fund Program is certainly something that we've discussed and we were exploring and interested in working with other communities to

achieve more energy savings on a more cost-effective basis through that program where it makes sense, and so we're interested in that.

MR. COREY SHEFMAN: Can you describe in a little bit more detail what kind of power generation is -- comes out of the program?

MR. LLOYD KUCZEK: The -- it's the energy savings and the measures. The -- the big measures in that program -- well, there's two (2) big measures: One (1) is natural gas furnaces if they're standard efficient furnaces, so there's significant savings there. But that would only apply to those that have natural gas, of course.

The other measures are the -- that's significant is the insulation. And then we offer a number of little things like a -- six (6) CFLs usually goes with the package -- some pipe wrap, and -- and so those opportunities as well. But the energy savings associated with those aren't as significant.

MR. COREY SHEFMAN: I'm sorry, to clarify when I was talking about the geothermal -- geo -- geothermal, and correct me if I'm wrong, but my understanding is that the Geothermal Program is actually generating new power for these communities?

MR. LLOYD KUCZEK: No.

MR. COREY SHEFMAN: Okay.

MR. LLOYD KUCZEK: It's -- a geothermal is a -- a replacement for a heating system which is -- it's still an electric -- it uses electricity for a heat source, but it also uses -- captures the heat from either the ground, it could be the water, but another heat sink, and supplements that. So you end up, effectively, heating a home for about a third of the -- the amount that you would require otherwise with an electric furnace.

But an elect -- a geothermal system has an electric furnace, effectively, in it. If -- if you just visualize a box that looks like a furnace in your house, you still have that box. If you open it up, you'll see an electric heater, actually, as a component of that. That only comes on when the geothermal system that's drawing the heat out of the ground, for example, can't -- can't maintain the heat within the home.

So I have a geothermal system. So on my second box already, and the first one (1) used -- it was a -- a larger unit, so it used to not -- the backup didn't kick in until it was about minus twenty-seven (27). So this time I put a smaller system in, but it kicks in at minus seventeen (17), roughly.

MR. COREY SHEFMAN: Right. So you don't appear to have mentioned biomass programs in -- when we're -- when you're talking about these community DSM programs, efforts to reduce to -- to encourage generation of other sorts.

Can you tell us why you haven't discussed them?

MR. LLOYD KUCZEK: We actually are discussing that opportunity right now. What we're looking at doing as doing a feasibility study to see if it makes sense to do something like that. The -- the obvious and -- and the most simplest way of doing that would just be a -- have a wood stove in your house. But we're looking at something a little broader than that right now. But we're -- we're going to start with a feasibility study.

MR. COREY SHEFMAN: And you'll have to excuse me, I'm new to this process, but is the feasibility study just a -- an in-office thing, or are -- are you actually taking it out into communities? And if so, where -- where is the study taking place?

MR. LLOYD KUCZEK: It would be an academic study. It wouldn't be a practical study where you're actually doing a pilot or a demonstration project.

MR. COREY SHEFMAN: Do you have a timeline for moving on to a pilot project for biomass generally, or for wood stoves in particular?

MR. LLOYD KUCZEK: No, the -- that decision is usually made after you do a feasibility study. So the reason for doing a feasibility study is to assess whether or not it makes any sense to go to the next stage.

MR. COREY SHEFMAN: Okay. We're going to return to this a little bit later in my questions, but one (1) of the other things you mentioned in your presentation in or around this chart, was that fuel switching generally was a topic of discussion at Hydro, more perhaps than it has been in the past. And that some discussions were being contemplated with the government to put more emphasis on fuel switching.

Can you indicate to us what programs or what type of fuel switching might be on the table for discussion between Hydro and the government?

MR. LLOYD KUCZEK: Well, maybe I'll break that into two (2) components. One (1) is we -- we effectively have a fuel switching initiative through our Affordable Energy Fund Program currently. So if a customer is -- comes to us and they have propane and oil we will -- we have a program to help

them convert to electricity, or natural gas, or geothermal if -- if that made sense.

But, generally speaking, if they have access to natural gas we would look at that opportunity first and help them out. If they were in an Affordable Energy Fund Program, they're just eligible for the program just as if they had a standard efficient furnace. And they can convert to an electric furnace if they propane or oil as well.

With the -- the fuel switching that generally was spoken about earlier, that's all related to space heating and the choice between natural gas and electricity at this point.

MR. COREY SHEFMAN: So in Hydro's opinion, there isn't any real alternative to natural gas on the one (1) hand or electricity on the other for space heating or water heating at this point?

MR. LLOYD KUCZEK: Geothermal's an option, as well.

MR. COREY SHEFMAN: Okay. So we've established through the -- through your testimony over the last few days that gas -- and again, correct me if I'm wrong -- that ga -- natural gas is the preferred method in terms of -- from the consumers' end for water and space heating.

Is that correct? Is that a fair assessment?

MR. LLOYD KUCZEK: With space heating, if you have your choice, it makes -- it makes sense to do that. For water heating, it depends on the particular situation. So when you -- from -- and from which perspective.

And Ms. Morrison is actually more familiar with the different scenarios, but it's more costly to install a natural gas furnace -- or a hot water tank than it is an electric hot water tank.

MR. COREY SHEFMAN: So let's talk then just -- for the sake of this discussion, just about space heating. We've established as well that natural gas isn't available or isn't a viable option in northern Manitoba.

Is that correct?

MR. LLOYD KUCZEK: And other areas in southern Mani -- certain areas in southern Manitoba as well.

MR. COREY SHEFMAN: Right. And in previous testimony, the panel spoke about how geothermal isn't a real -- at this point, isn't a realistic, broadly implementable alternative; mainly due to costs, but I'm sure there are other issues as

well.

Is that correct?

MR. LLOYD KUCZEK: Cost is the big issue. Usual -- usually you can -- if -- if you didn't care about costs, usually you can install a geothermal system. It's just much more costly if you have to drill into bedrock, for example.

MR. COREY SHEFMAN: Sure. And in the panel's response to MKO's questions a short time ago, the panel acknowledged that individuals in the North, generally speaking, in addition to not being able to benefit from fuel switching, are more reliant on electri -- or because they can't be -- benefit from natural gas fuel switching, they are more reliant on electricity.

So my question is: Why isn't Hydro putting more emphasis or paying more attention to other and more diverse fuel-switching initiatives that might give those in the North more options when it comes to this arm of DSM?

(BRIEF PAUSE)

MR. DALE FRIESEN: Sorry. Could you repeat the question?

MR. COREY SHEFMAN: Absolutely. Given what we've established, in -- in particular that individuals in the North can't at present benefit from fuel switching in the same way that those in Winnipeg and other parts of southern Manitoba can benefit, why isn't Hydro paying -- or spending more effort and energy to promote other alternatives in the North or to -- to provide fuel-switching alternatives to northern Manitobans?

MR. DALE FRIESEN: I think in many instances the base case for switching to other forms of fuel such as biomass, for instance, or solar or small wind, et cetera, hasn't been established to our satisfaction, so that we feel comfortable that the technology is suitable for the installation. We're currently doing a fair amount of work in a few areas, bio-energy being one (1) of them, where we're examining biomass-to-energy pathways. We're undertaking a series of five (5) demonstrations with funding from the -- from the Canadian Federal Government through the Clean Energy Fund.

We're taking the lessons learned from those five (5) demonstration projects and we're examining each of those technologies as a possible solution for remote communities, and northern

communities in general. And from that, we're establishing a sixth demonstration possibility that, if we aren't able to physically locate it in the North, it will at least give us the ability to simulate the conditions of the North in a southern demonstration that we can keep our hands on a little better and maintain a little better control of.

And we're hoping the outcome of those demonstrations will be one (1) or two (2), potentially three (3) options, that we can pursue in on-site demonstrations in the North that will hopefully eventually lead to -- to an option that provides for a more carbon-neutral and lower cost solution, and potentially one that's better suited to the resource -- energy resource availability in the -- in the area, such as biomass, for instance.

MR. CORY SHEFMAN: Thank you. Following up on your answer, you mentioned solar and small wind. What work is Hydro currently doing to make these alternatives more viable for those in the North?

MR. DALE FRIESEN: I'll speak to solar specifically. We've undertaken a demonstration with the -- with Red River College here in Winnipeg to examine the feasibility of solar parabolic technology.

Instead of going the PB route where you take the sun's energy and convert it to electricity, we're looking at redu -- improving the efficiency by going directly from the sun's energy to thermal -- to thermal -- let me rephrase that.

We want to direct the -- the sun's energy in a way that focusses it -- allows us to collect it as thermal energy which we can then use to directly heat. So that -- that project has got a little bit more than a year under it's belt right now. We're continuing to examine different ways. The first stage was just looking at the collection technology itself. The next stage will actually be using that energy to physically heat a building. But that's a technology that has some promise. It still wouldn't be cost effective in the North, given the intermittency of the sun's hours, but it's a technology we're looking at in the solar world.

There's plenty of experience, I believe, with small wind. The challenge we have with small wind is that when you combine the intermittency and the very high cost of small wind, it's -- generally doesn't -- the economics doesn't work out favourably for it.

MR. CORY SHEFMAN: Moving to a kind of

related area, it's just -- in particular Hydro's efforts to promote DSM and promote its adoption, in Mr. Hombach's examination or cross-examination yesterday, or earlier anyways, on the matter of Hydro's fuel-switching initiative you indicated that Hydro has an extensive advertising and education campaign.

In your explanation of Hydro's efforts in this regard it was suggested that the campaign was targeted specifically to the southern areas of Manitoba where gas is available, where natural gas is available; that the customers who are receiving this education and promotion are generally homeowners or home builders; and that involved a particular focus on the actual building of the homes.

Do we recall that -- that discussion?

MS. LOIS MORRISON: Yes, we do.

MR. CORY SHEFMAN: Perfect. The flyer that was distributed yesterday, is that part of that strategy?

MS. LOIS MORRISON: That's part of the heating education campaign. That's not part of our overriding Power Smart campaign.

MR. CORY SHEFMAN: Okay. What is Hydro's strategy to educate customers in northern

areas who rely more heavily on electric heat?

What kind of material has been made available, or what promotion has been done to educate northern consumers as to all of their options like we see on the screen?

MS. LOIS MORRISON: Well, first off, Manitoba Hydro has had a long-standing overriding initiative to promote Power Smart itself. We've been -- we've been promoting the Power Smart brand since 1992 across the province. And so we -- what we do is we -- we've created an overriding strategy to just generally promote brand awareness of Power Smart.

Then individually for each program we have individual promotion strategies to educate and encourage customers to participate that's targeted to each of those different sectors.

Now, to bring it to -- to your area of concern specifically, and I -- and I understand -- I'm -- and I'm -- I'm taking from your -- your question that you're interested in our efforts to promote energy conservation in the North to residential customers.

MR. CORY SHEFMAN: M-hm.

MS. LOIS MORRISON: And so building on that, we've actually in the past -- since we launched

our home insulation program, to use that as an example, what we've done is we specifically target those areas that have a high penetration of electric heat. And so we will do specific advertising and radio communication in -- in those areas.

So we've done specific advertising in the Northern newspapers, in community newspapers, and in the -- the community radio stations. We've done, in addition to that, specifically in the North -- we did an oil and propane conversion program to offer up assistance through the Affordable Energy Fund that Mr. Kuczek referred to earlier to help customers, if they were heating with oil and propane, to convert to -- either to electricity, which is more economic than heating with oil or propane; or, if they chose to, to convert to at least a high-efficiency propane.

In addition to that, for each of our programs we -- we set out a strategy to try and target areas that we can get greater penetration. We also look at our markets and say, If we're not getting the penetration we expected to in that region, we'll do additional concerted efforts to -- to promote in those regions.

So that's kind of broadly what we do. And we've been doing that approach since the early

'90s.

MR. COREY SHEFMAN: Does Hydro track penetration data in Aboriginal communities, in terms of adoption of these programs?

MS. LOIS MORRISON: As Mr. Kuczek alluded to earlier, we have -- we have specific data on our efforts in the First Nation communities that are targeted under the Afford -- under our First Nation community program. We also have tracked specifically uptake -- program uptake, in terms of what was previously our Power Smart New Home Program. And we also track the number of projects undertaken in our commercial buildings in First Nation communities.

And as I mentioned earlier, we have been approaching First Nation communities to offer up the services of -- for -- for their band buildings, the band-owned buildings or the band-operated buildings, to have energy assessments.

And basically what we do at the end of that is we provide a report that explains what opportunities -- energy-efficient opportunities there might be and what incentives might be there to support the implementation of those energy efficiency oppor -- opportunities in those buildings.

MR. COREY SHEFMAN: Thank you. Moving

on a little bit to load shifting. In your previous presentation it was explained that one (1) of the challenges of load shifting, especially given that 50 percent of our -- and correct me if that statistic is wrong -- of Manitoba's energy is consumed for heat.

One (1) of the challenges of load shifting is that curtailing the use of electricity for heat for one (1) period has to be -- has to be made up at another time.

And so was that -- is that correct, generally speaking?

MS. LOIS MORRISON: That is correct.

MR. COREY SHEFMAN: So then programs in -- into reducing the use of electric heat, period, would -- are important to pursue?

MS. LOIS MORRISON: At this point, we focus -- and I believe Mr. Friesen referred to that earlier in our testimony. That our pro -- programs are primarily focussed on saving energy. And with that saving energy is a corresponding reduction to demand or peak.

But, yes, what we -- what we look at is there's additional benefit -- or we focus, obviously, on elec -- reducing the electric heat consumption because that has added benefit to our system of

reducing both energy because we're ver -- we're concerned about energy constraints, and peak.

MR. COREY SHEFMAN: And I acce -- I -- I understand now and that you have a study ongoing on these wood stoves.

No feasibility study?

MR. LLOYD KUCZEK: No, there's no feasibility study on wood stoves. Per -- the feasibility study is -- that we're looking at undertaking is whether or not -- on a community-based initiative, whether or not they're -- it makes sense to have a bioenergy system in place --

MR. COREY SHEFMAN: Okay.

MR. LLOYD KUCZEK: -- which might be a district system --

MR. COREY SHEFMAN: Okay.

MR. LLOYD KUCZEK: -- as opposed to the stoves. But the stoves that exist today, there's high-efficient stoves -- high-efficient stoves that are combined with electric heat. And Dale's probably more familiar with those, but...

MR. DALE FRIESEN: So to sort of build on what Mr. Kuczek said, we are looking at district heating systems as being one (1) option. The -- the advantage you gain with district heating systems is

that your energy source, whatever you're using for heating, can be managed in a more economical fashion, and it creates better economics for alternative fuels.

So that's -- that's one (1) of the driving factors behind that. And those -- those off set some of those costs that go along with distributing that energy throughout a community. It also makes implementation and maintenance of the systems over the long-term easier because you have that more centrally located. There are challenges though.

And currently probably one (1) of the biggest challenges we face in Manitoba with bioenergy is a lack of refined biomass fuel. We have a lot of raw biomass fuel in Manitoba, but we don't have sufficient refining capacity to produce it into a form that we can use effectively. And that's -- that's one (1) of our challenges, and one (1) of the areas we're looking at, is how do we refine biomass into a usable fuel?

MR. COREY SHEFMAN: But is it not the case -- I -- I take your points, but is it not the case that when consumers use wood stoves and potentially only use wood stoves to heat their homes -- and I'm just using wood stoves as an example here --

that the reduced load would contribute positively to the -- the goal that we've been discussing of reducing load from the infrastructure?

MR. DANIEL FRIESEN: Yes, it would reduce -- it would reduce the -- the infrastructure requirement for electricity, for instance, if electric heat was the option -- other option, yes.

MR. COREY SHEFMAN: Thank you. And you're aware that there are a number of communities currently in northern Manitoba -- currently in northern Manitoba that utilize wood stoves for heat during the winter?

MR. DANIEL FRIESEN: Yes.

MR. COREY SHEFMAN: Now, you may be aware that a number of my client's community members use wood stoves as a matter of preference, because it's something they've done for many years.

Am I correct in my understanding that this sort of program is accomplishing exactly the sort of thing that Manitoba Hydro is trying to do in the south by freeing up load?

MR. DANIEL FRIESEN: In a -- in a big picture way, yes. It -- it is displacing electric -- it -- you know, it is displacing heat that might otherwise come from an electric source. So in that

sense, you're correct.

MR. COREY SHEFMAN: Thank you.

MR. DANIEL FRIESEN: It's not an initiative that is being driven per se by Manitoba Hydro in the -- in the same manner, but I understand what you're saying, yes.

MR. COREY SHEFMAN: So Manitoba Hydro is not providing the people that are using wood stoves -- as, again, as an example -- with information as to what the benefits are of them doing so, or to continuing to do so?

MR. DANIEL FRIESEN: Yeah, we -- we don't have any information.

MS. LOIS MORRISON: At this time I don't believe we traditionally produce that information. It's not publicly available on our website, the benefits of heating with wood stove versus natural gas, or biomass, or any of the other options. You are correct, we don't have that on our website at this point --

MR. DANIEL FRIESEN: And -- and sort of to -- to build on that a little bit: We aren't offering incentives per se for people to use wood stoves in southern Manitoba either. What our -- the way our program is -- the Bio-Energy Program is

designed is, we look at -- we're looking for carbon-neutral, or low cost, or no cost fuel sources to use in biomass to energy pathways. And that energy may be thermal for heat, or it may be electricity.

And we're looking at the resource cost of that pathway, and then addressing appropriately if there's a situation where that makes economic sense. So we're not per se paying -- like, our -- our objective isn't purely to look at using wood in wood stoves. That's the -- that's not a primary focus of -- - of that Bio-Energy Program. It is -- it isn't intended to subsidize heating with wood. That -- that's not -- not the intention of the program.

MR. COREY SHEFMAN: And my purpose for asking this question is because it is an example of a -- let's call it a 'made in the North' solution -- to these sorts of issues.

Has Hydro -- or does Hydro see a place for these sorts of community solutions, or made in the North solutions, to the problems that we're discussing here?

MR. LLOYD KUCZEK: We -- we've actually had some discussions about that, but would be similar to natural gas and us offering incentives to use natural gas. And so we don't offer customers to

use -- an incentive to use natural gas right now, too. But in the broader context of a fuel- switching program, one would have to think about it from the provincial perspective in the North, for those that don't have natural gas, and it doesn't make sense. And you get into the free ridership issue and what not. But that -- from the overall fuel-switching persp -- perspective, you really should assess that.

MR. COREY SHEFMAN: Okay. Ms. Morrison, I believe it was you who said during the initial evidence that it's best to ask the customer what's important to them, and provide them with the information that they need to make decisions which meet their needs when we're talking about moving away from reliance on electric heat.

Has Manitoba Hydro done this specifically in the North, and specifically with the Metis community?

MS. LOIS MORRISON: I believe my -- my analogy was that if someone were to ask me --

MR. COREY SHEFMAN: M-hm.

MS. LOIS MORRISON: -- what the prefer -- preference would be for hea -- their fuel source, that I would ask them what was important to them at that time. That was more in line with the question

that was asked of Mr. Thomson as to whether he would recommend natural gas over electric -- electricity for heat.

We have not specifically gone out and asked anyone in the province what their specific preferences are and what they want in terms of heat. So to say, Have I specifically excluded anyone in the -- in the Metis communities? No. We've -- we've generally asked through our broad-based customer residential energy survey, through our general surveys across the province, what people are interested in and what their thoughts are and what their preferences are.

So the surveying that we've done, or the information gathering that we've done, has been at the provincial level and not specifically isolating any one (1) particular community.

MR. COREY SHEFMAN: Thank you. I just have one (1) more area I'd like to discuss with the panel. In your -- in the panel's answer -- and I'm not -- I'm sorry, I'm not sure who it was specifically that gave the answer -- on the subject of the benefits of DSM programs -- and I believe it was panel member Grant that asked the question -- it was indicated that customers -- even customers who are well informed of

the programs weren't taking them up. There was not as much use of Hydro's DSM programs as we perhaps would like there to be. And a mention was made of a focus group that was convened on the subject, and I'd like to talk a little bit about that focus group.

My first question is: What was the -- what was the purpose of the focus group? What question -- what was the broad theme or question that was asked?

MR. LLOYD KUCZEK: We don't have a -- we just undertook that focus group session, and I -- I sat through a couple of them, but we didn't -- I don't recall the specific question, per se. But it was along the lines of, you know, What would it take for cus -- you to implement a measure in terms of payback?

And so there was a question asked along those regards. And the -- the moderator was trying to get some sort of sense of whether they would willing -- be willing to invest if it was a 5 percent return, 10 percent return. But the general just -- just the message that I got back -- and again, I'd have to see the report and what the report's going to say -- was that a lot of the participants at the sessions that I was at were more concerned about the waste element of it, of just disposing of something that was still

useful yet.

And certainly a payback of -- it was either five (5)-- I think it was 10 percent, it just wasn't enough. Like, you know, 10 percent investment might be okay when you're investing in a financial instrument, but it didn't seem to work with them in terms of the Power Smart initiatives. And -- and they drew on the fact that they're disposing of something that was still useful.

MR. COREY SHEFMAN: Sure.

MR. LLOYD KUCZEK: And just to add to that, we were doing focus group sessions in Winnipeg, Brandon, and as well as the North, so we recognize that there's differences throughout Manitoba.

MR. COREY SHEFMAN: Perfect. And that was going to be -- my next question is: Where were they held? And so thank you for -- for anticipating that.

In addition to where they were held, I'm also interested in some of the demographics of the focus groups. Can you tell me whether there was any First Nation representation in the focus groups?

MS. LOIS MORRISON: There was Aboriginal representation in the focus groups.

MR. COREY SHEFMAN: Can you tell me

whether there was any First Nations and whether there was any Metis representation?

MS. LOIS MORRISON: They didn't delineate it specifically based on status versus non-status Aboriginals. We classified them simply Aboriginal background. Either they self-identified as Aboriginal or they did not self-identify as Aboriginal.

MR. COREY SHEFMAN: Okay. Sorry, can I have a moment? Thank you.

(BRIEF PAUSE)

MR. COREY SHEFMAN: All right. My last question then would be the -- with respect to the focus groups that were held, and I guess I'm particularly interested in the one that was held in the North, or ones I suppose if there were more than one (1), how is that data -- where is that data being fed into? How is that data being used to help Hydro improve its outcomes when we're talking about adoption of DSM programming?

MS. LOIS MORRISON: The purpose of the focus groups was to help us better brand Power Smart. We had initiated them to get a better understanding as

to what messaging would resonate with people and actually get them to adopt or -- or think that, This is something that I should be interested in.

It's -- it's -- what messaging would drive them to -- to take that call to action to contact Manitoba Hydro, find out more about what they need to do to make their homes more energy efficient.

And so the purpose of the -- the focus group testing was to test a number of different messages around Power Smart and about ener -- around energy efficiency, and which ones resinated. So, as Mr. Kuczek mentioned, there was a return on investment message. Is that what you need to hear in order to get you to -- to motivate you to -- to take action?

So all of the messaging -- so -- so the purpose of the focus groups was to test messaging, and that's why we wanted to test in different jurisdictions, because we recognize that people in Winnipeg are different from people in rural southern Manitoba, and from northern Manitoba. And, so that information that was test -- collected through those focus groups is going to feedback to help us in -- in determining how do we structure our next advertising campaign. What messages are really going to resinate with our customers best?

MR. CORY SHEFMAN: I'm wondering if we could have Hydro take an undertaking on the question of the makeup of those focus groups? Who was participating? How those people were selected? And -- and unfortunately it doesn't appear that you've broken down the demographics quite as clearly as we'd like, but as far -- as broken down as we can get them?

(BRIEF PAUSE)

MS. LOIS MORRISON: Okay. The -- we don't have the report yet, as Mr. Kuczek mentioned. What we -- and -- and working within what the ad agency and the -- the research firm is allowed to provide us with, in terms of the breakdown of the groups, but we -- yes, we can provide -- once we have the information, we can provide a identification of, say, the demographic of the individuals that were at -- were selected for the focus group.

MR. CORY SHEFMAN: And as well as how they were selected?

MS. LOIS MORRISON: Yes, we can provide the -- a brief description of the methodology for which they were selected by.

MR. CORY SHEFMAN: Thank you.

MS. LOIS MORRISON: The undertaking is that Manitoba Hydro will provide a brief description of the methodology used to select or to canvass can -- candidates to participate in a -- in a focus group test -- in our focus group testing, and we will also provide a summary of the demographics.

--- UNDERTAKING NO. 21: Manitoba Hydro to provide a brief description of the methodology used to select or to canvass candidates to participate in focus group testing, and provide a summary of the demographics

MR. CORY SHEFMAN: And with that, Mr. Chair, I am finished with our questions.

THE CHAIRPERSON: Thank you, Mr. Shefman. I now turn over the microphone to Me. Monnin.

MR. SVEN HOMBACH: Mr. Chairman, I wonder if Ms. -- if Mr. Monnin would prefer to sit in the front, if we should take a one (1) minute break, to allow parties to switch so that his face can be

seen?

MR. CHRISTIAN MONNIN: I will accept the complimentary Air Canada bump up to first class.

(BRIEF PAUSE)

CROSS-EXAMINATION BY MR. CHRISTIAN MONNIN:

MR. CHRISTIAN MONNIN: Merci, Mr. President. And just to be clear, my earlier comment wasn't a critique of the -- what I've been referring to as the Statler and -- and Waldorf section of the -- of the PUB. A bit more context on that. Those are the two curmudgeons and Muppets who were back on the -- the balcony. It's quite comfortable back there. I look forward to going back.

The questions that I'll be asking today are not levelled at anyone in particular, and so, to the extent that anyone on the Board or in this panel, rather, is in a position to answer, please do so. And as most of My Learned Friends have said, if the questions that I ask to elicit CSI, please advise, and we'll -- we'll deal with that accordingly.

For the purposes of this cross-examination, which will be a short one, I assure you, we've prepared a book of documents with nine (9) tabs

in -- in that book of documents. There's an index in the book of documents just to -- to -- if -- if you can pull that up, please, to just indicate that there is method to our madness.

You'll see, for example, Tab 1, page 3, is page 3 of the book of documents, and then MH-85 is the exhibit; it refers to Manitoba Hydro rebuttal evidence page 14. In reality, that's -- that's she -- 7 of the rebuttal, but because MH-85 has some introductory documents, it's the 14th page of that exhibit. So when I'm referring to page 7 of -- which we referred to earlier with Madam Boyd, it comes up as 14 in the exhibit. And that's just to explain how -- how this index works.

If we can turn to Tab number 2, page 5, of our book of documents. And I just want to ask you a few questions on -- on load forecast at this point in time, and specifically line 10 and 11 of that page. The purpose of load forecast is to present the best estimate of long-term future energy requirements for Manitoba. And -- and I just want to ask some questions of this panel with respect to -- to that.

And do I understand correctly that the long-term -- or the load forecast for NFAT is not the same as one that would be prepared for a GRA?

MS. LOIS MORRISON: The load forecast used in the NFAT is the same load forecast that Manitoba Hydro uses for all forecasting purposes.

MR. CHRISTIAN MONNIN: And as my wife would say, I never miss an opportunity to demonstrate how ill-informed I am. Are -- so are there no distinctions between the methodology used for the NFAT load forecast and GRA load forecast?

Do I have that correct?

MS. LOIS MORRISON: No, I don't believe there are any differences --

MR. CHRISTIAN MONNIN: Okay.

MS. LOIS MORRISON: -- subject to check, but...

MR. CHRISTIAN MONNIN: In -- in that regard, still along the same lines, but a broader question and broader scope, would -- would you agree with the statement that a longer-term view, for example, here the NFAT, which I understand is seventy-eight (78) years, implies a greater uncertainty and, therefore, must concern long-term risks that ought -- that need not to be considered in short-term?

Would you agree with the statement -- that statement?

MR. ED WOJCZYNSKI: Sorry, could you

repeat the question.

MR. CHRISTIAN MONNIN: Absolutely. A longer-term view, for example, here we're using obviously the NFAT, implies a greater uncertainty and, therefore, must concern long-term risks that need not be considered in the short term?

MR. ED WOJCZYNSKI: Yeah.

MR. CHRISTIAN MONNIN: Okay. And then going back to it, a view from another angle, for example, in the GRA context, a load forecast is used to set rates until the next GRA.

Do I understand that correctly?

MR. LLOYD KUCZEK: We don't have a -- we -- we don't undertake a GRA every year, but we do produce a load forecast every year for planning purposes. So if there is a GRA, we will use the most current load forecast, which is produced every year, so. And it was the same thing with the NFAT process. Whatever the most current forecast was at the time, that's what's used.

(BRIEF PAUSE)

MR. COREY SHEFMAN: And -- and in -- in the context of a -- a longer torm -- term forecast

like the NFAT, am I correct to -- to -- when I state that there would be a greater risk of a fundamental shift in electricity use, so I'll refer to it as a structural change, for example, due to grid parity over the seventy-eight (78) year time frame than there would be in a GRA context?

MR. ED WOJCZYNSKI: I'm not going to -- my part of the answer is going to deal with going from thirty-five (35) years or the twenty (20) years at the end of the forecast to seventy-eight (78) years. My colleagues can comment on the earlier part of that. That is, the first twenty (20) or thirty-five (35) years.

As we were discussing somewhat earlier in these proceedings, the analysis that Manitoba Hydro does to go out to -- from the thirty (30) -- the end of the thirty-five (35) years to seventy-eight (78) years is not an economic analysis that -- that is reliant on having a precise forecast. It is an estimate of what the residual value is.

And as we discussed the other day, we freeze the -- the load amount -- the load forecast at the -- the year -- at the end of the thirty-five (35) year period and fix various assumptions so we get an estimate of what the value of the residual asset is.

And whether the load growth after that is somewhat higher or somewhat lower, is -- is not -- is not mat - - particularly material to that estimate.

It's simply a way to deal with the fact that we have an asset life of sixty-seven (67) years, which is longer than the study period which we're using the -- the detailed load forecast for. So it -- - so going beyond thirty-five (35) or twenty (20) years, I think I dealt with that. For your question for the earlier years, I think I'd have to look -- look to our load forecast people.

MR. CHRISTIAN MONNIN: Thank you.

MR. DANIEL FRIESEN: The question of disruptive technologies, as they've been referred to in some evidence, going forward into the future is something that we see as being something we would capture in the technical potential of our studies, both current and future, that may -- that may occur as we move forward and move towards those dates when some of those technologies become economic.

That same uncertainty you specify with respect to glo -- load growth, I think also exists with respect to those technologies. There's a considerable degree of uncertainty as to when that grid parity moment will happen. And as we discussed,

grid parity is just an indicator of the start of a transition. It's not as though we would expect to see a step change occur at the date of grid -- grid parity.

And all of these conspire together to allow Manitoba Hydro, and our process which forecasts on an annual basis, to adapt, to adjust. And as we've spoken in various parts in this proceeding, we're not inflexible to -- to adapting to the future. We -- we adapt our DSM programs, we dava -- adapt our development plans as information becomes clearer. So there are some pathways to -- to adapt built into our structure and our process.

MR. CHRISTIAN MONNIN: Okay. Can you please go to Tab 3, page 7 of our book of documents, then? And -- and if I just look at -- for example, I -- I believe we've included four (4) graphs in our book of documents. And based on what -- what Mr. Wojczynski just said, what I think I understand is you -- you cap it around the thirty (30) year period.

And -- and are these just really linear extrapolations of what occurred in the past and that's really the best that we can do, and that's why you just see a gradual line going through the years?

Do I have that correctly?

MS. LOIS MORRISON: Are you referring to our forecast methodology for the first twenty (20) years, or are you referring to the thirty (30) -- to the period after the twenty (20) years?

MR. CHRISTIAN MONNIN: Yes, after the twenty (20) years. And -- and so -- and if you go to the next frame as well it's just -- I'm not getting down into the substance of these particulars frames. It's just they all, from my perspective, seem to show the same linear extrapolation on a continual basis.

And -- and can -- the takeaway that I get from these graphs is simply that Hydro was saying that nothing is really going to change on a going-forward basis as we go through the evolution of this -- - the -- the seventy-eight (78) years of the -- the NFAT.

MS. LOIS MORRISON: I -- I think that the forecast that you're looking at here is not merely an extrapolation of the past historical energy consumption. What the forecast represents,, as we mentioned before, is the projection of the population growth, along with the average use of energy for -- per customer.

Now, if the population growth is higher or lower, the slope of that line changes. It may

mimic what we've seen in the past, or it may not mimic what we've seen in the past. It may be higher or lower. Based upon that, for -- for the majority of our -- of our population forecasts, as -- as Mr. Kuczek mentioned in his presentation, we forecast for the residential sector, the commercial sector, and the top consumers.

Now, what you see here -- depicted here is the twenty (20) year horizon going forward. And that's influenced, as we mentioned, before by a population forecast which is growing at an average rate of 1.1 percent in the 2013 forecast, plus we are seeing an average -- an increase in the average use per customer, and that's resulting in the 1.5 percent. This is also prior to adjustments for our DSM initiatives.

As Mr. Kuczek mentioned earlier, under the 2013 forecast, that was -- would reduce it to 1.4 percent. As we spoke to, I believe, yesterday in terms of the Level 1, 2, and 3, that growth can change. We are awaiting -- we will be publishing the updated Power Smart Plan and releasing it in -- at the end of March, as Mr. Kuczek also mentioned.

So there are a number of things that -- to simply state that we are anticipating that to

continue at that rate just because it happened in the past is an inaccurate statement.

MR. CHRISTIAN MONNIN: Well, in that -- that regard, is -- is -- in its forecasting, is Hydro taken into account the possibility of low probability, high impact events?

And if so, in what nature are they doing that?

(BRIEF PAUSE)

MS. LOIS MORRISON: We do include in the forecast examples of what the impact of unexpected high growth or high -- or a load loss, so an unexpected increase in, say, electric vehicles, or an unexpected loss of a -- of a large consumer are reflected as possible events and what those -- what those events might look like if they were to occur on our system.

We also prepared for -- for analysis we prepare a projection of high and low load growth for -- for the analysis of risk for planning. But as -- as we've outlined on page 50 of our 2013 load forecast, we do recognize that there are occurrences that can happen in the marketplace that can have substantial

change on our forecasts.

We don't arbi -- we don't arbitrarily assign a probability of those types of occurrences coming because we don't know. We don't know if there's going to be say a 70 -- say -- say we were to go to the point where 70 percent of our -- our automobiles and -- and transportation vehicles were to be electric car -- plug-in electric vehicles. We -- we look at that as to say, Well, what kind of impact would we see on our system if that were to occur? But we're not going to arbitrarily put that into our forecast and say, What would ha -- you know, are we going to plan for that now? No. But are we -- we recognize it is something that may happen.

Is that likely to happen? We -- we can't assign a probability to that event, and so we don't attempt to.

MR. ED WOJCZYNSKI: I -- I might add to that, that when you're talking about low probability, high impact events, do we plan for that, there's one (1) aspect there in the load forecast itself. Obviously, it's true in other elements of our planning, as well. But -- oh, sorry.

The -- I think some -- maybe some of the events that you're thinking of are what some

people term Black Swan events, where they're the unexpected things that you can't plan for because you don't know they're going to happen.

And -- and in -- in that, you want -- well, a terms that's also used, anti-fragility, so that you can respond to uncertain future events like the ones you're talking about. And our argument is that one (1) of the best ways for electrical systems to do that is to be strongly interconnected across all of North America so that we -- we all are much more able to respond to changes and -- that we're not expecting.

MR. CHRISTIAN MONNIN: I think in --

MR. ED WOJCZYNSKI: So that's the other part, maybe, to your question.

MR. CHRISTIAN MONNIN: Thank you. I think in the spirit of these -- these proceedings I'll refer to them as the blackout events. And -- and your considerations, I -- I think I know the answer, but I just want to throw these out there.

In some of the -- the risk analysis that Hydro took upon itself when -- going through this process, has -- has there been -- have the following been considered: a risk that an unexpected demand growth could result in a blackout.

Has that been considered in -- in your deliberations?

MR. ED WOJCZYNSKI: Yes, and that's why we talk about having increased energy security and increased capacity liability benefits from the Preferred Plan compared to some of the other plans, and that -- but that will be dealt with in more detail next week.

MR. CHRISTIAN MONNIN: Okay. And I suspect maybe the following will be dealt with, as well. But is there consideration of the risk that the projected escalation of Hydro rates will -- will change consumer expectations in the coming years and the perception of electricity is cheap in Manitoba will change?

Has that been considered?

MR. ED WOJCZYNSKI: Yeah, the load forecasting people, I'm sure, will want to answer as well, but that's why, right in the submission, we -- there's a whole number of reasons why we might have low load growth as opposed to high load growth.

And -- and so that's why we did a stress test using low load growth and -- in our -- in our work as well, as high levels of DSM. But I'm sure the load forecasting people might want to add to that.

MS. LOIS MORRISON: Actually, Mi -- Mr. Wojczynski, you -- you handled that very well. I was going to mention that, although we -- we did note that we will be looking at the issue of price elasticity in more detail as we go forward, there is -- there is the -- as we mentioned, we do look at a high/low scenario, and there is the op -- there is the potential that that could be encapsulated within the load -- the -- the low scenario.

MR. CHRISTIAN MONNIN: And on the issue of low domestic demand, do I understand correctly that the primary protection against risk related to low domestic demand is the fact that power can be exported instead?

Does that statement make sense?

MR. ED WOJCZYNSKI: That's one of the ways. The other is in our plan we have -- as Mr. Thomson discussed the first day here, that whereas the plan has Keeyask '19 and Conawapa '26, if we see load growth dipping or -- or something else happening that ca -- like higher DSM, then we always have the option of pushing back Conawapa's in-service date in the next four (4) years.

And even once we've started on Conawapa, there's a number of years before we have to

commit to the general civil contract, so it's longer. It's probably six (6) years in that order that we have to -- to start seeing a surprising drop in load growth. So that would be a very effective way to respond to it as well.

MR. CHRISTIAN MONNIN: Okay. And -- and I think that answer that you've just provided will apply to this next question that I'm -- I'm going to put forward is -- is that, in that regard, the real risk related to the load forecast is the risk that the export price will be below the price needed to recover the full cost of Keeyask and Conawapa.

MR. ED WOJCZYNSKI: As I just indicated, in the case of Conawapa, what we would do is defer it. In the case of Keeyask, that -- if all -- if we started building Keeyask and all of a sudden load growth stopped and we had no more load growth, then -- then Keeyask would be subject to the export -- the economics of Keeyask in that case would be subject purely what we could obtain on the export market.

But as Mr. Thomson indicated, with the contracts on the opportunity market, we're always going to be exposed to uncertainty in that price. We have long-term firm contracts where the price is already fixed, and that will be just the -- the

quantum of that will be discussed in the CSI portion. But those contracts have prices which are quite favourable.

I -- I should add as well, as -- as Mr. Thomson indicated, we -- the Keeyask is -- is the majority of the dependable output for Keeyask is being sold under contract -- well, not forever, but certainly for the front end -- with the three (3) sales we have -- that we have signed contracts for. And that's the MP 250, the WPS 308, and the NSP 125.

MR. CHRISTIAN MONNIN: I just have a few questions with respect to top consumers. And if we could go to page 17 of our book of documents. Looking firstly at line 3 through 5, which reads as follows:

> "Give the risks associated with the shortfall of a suitable energy supply, it is in the best interests of consumers -- [sorry] customers to provide Manitoba Hydro with accurate information regarding their future energy needs."

Keeping that in mind, I understand that the top consumer would run the risk of Hydro being unable to supply the power that they require if the

top consumers were to underestimate future demand.

Is that correct?

MR. DALE FRIESEN: Sorry. Could you just repeat your question, please?

MR. CHRISTIAN MONNIN: Absolutely. I understand that the top consumers would run the risk of Hydro being unable to supply the power they require if they, the top consumers, were to underestimate the future demand.

Is that correct?

MR. DALE FRIESEN: That's correct. And --

MR. CHRISTIAN MONNIN: From --

MR. DALE FRIESEN: Sorry. And to add to that, that extends beyond generation. That extends to transmission and distribution capability as well.

MR. CHRISTIAN MONNIN: So keeping that in mind, there -- there's a strong incentive on top consumers to avoid underestimating.

MR. DALE FRIESEN: Of course.

MR. CHRISTIAN MONNIN: Now, keeping that in mind, if -- if a top consumer is uncertain of its future demand, wouldn't it be prudent, from a top consumers' perspective, to provide the highest potential electricity demand?

MR. DALE FRIESEN: It would appear obvious that that would be a risk that we would face when customers provide -- provide that information to us. And that is why, when we go forward and we seek information from customers, we don't focus purely on demand.

We recognize that their capacity numbers will be such that they can accommodate future load growth or future expansion plans that they may have beyond their initial -- their initial projection.

We also press them for information related to their energy consumption and their load factor and how they foresee that to change over time. And we have found that, in general, most of our top consumers are quite open to discuss that and -- and share what they see as their future. And when we ask them to support that, they're generally willing to do that as well.

MR. CHRISTIAN MONNIN: In a scenario where top consumers have an incentive to overestimate their -- their demand, would -- would that have any impact on over-forecasting?

MR. DANIEL FRIESEN: Our forecast is weighted towards energy, in terms of the information that we provide from the top consumers. The capacity

requirement probably intra -- impacts the transmission and distribution facilities that we provide to a -- to a greater degree. And since our top consumers fund, directly, a large portion of the capacity improvements that are required to serve them, it's really not in their best interest to wildly exaggerate the capacity numbers that they give us, because they'll have to pay for that infrastructure directly.

MR. CHRISTIAN MONNIN: I -- I don't think it's in anyone interest to wildly exaggerate, but over -- you would agree with me that there's a distinction between wildly exaggerating and overestimating?

MR. DANIEL FRIESEN: I agree that -- I agree with your premise, yes.

MR. CHRISTIAN MONNIN: Okay. You'll be pleased to note that I'm -- I'm almost done. If you could just turn to page 22 of our book of documents, please. And just a -- a quick question -- a few questions with respect to Section 8.2.2.2, starting at page 22 -- sorry, line 22. Elenchus, in their report titled, "NFAT Review":

> "Review of Manitoba Hydro's Demand-side Management Plan recommends that ecological footprint analysis is

required to assess all alternatives, including demand-side management options."

And going further down, line 28 and 29, it's -- the closed notes version of it is that:

"Opting for a -- an ecological footprint analysis is misguided."

And I just have a few questions with respect to that.

MS. LOIS MORRISON: I -- I -- this section is actually better handled by a subsequent panel --

MR. CHRISTIAN MONNIN: Okay.

MS. LOIS MORRISON: -- related to the GHG components of our filing.

MR. CHRISTIAN MONNIN: Very well.

MS. LOIS MORRISON: So --

MR. CHRISTIAN MONNIN: Well, you've managed to sort -- short-circuit the remainder of my cross-examination.

MS. LOIS MORRISON: Not intentionally.

MR. CHRISTIAN MONNIN: That's fine. That's fine. A la prochaine fois. Thank you, M. -- M. President.

MR. SVEN HOMBACH: Thank you, Mr.

Monnin. The Board counsel book of document, would you like that introduced as an exhibit?

MR. CHRISTIAN MONNIN: Yes, please. Number 1, I believe.

MR. SVEN HOMBACH: It's, I believe, Hillco Exhibit Number 7, Mr. Simonsen?

MR. KURT SIMONSEN: Correct.

--- EXHIBIT NO. HILLCO-7: Book of documents

DISCUSSION:

MR. SVEN HOMBACH: Now, Mr. Chairman, that concludes the public examination of this particular panel. Next on the agenda is the closed in camera session with respect to commercially sensitive information. I would suggest we take a five (5) minute break to allow the parties to set up. At this point I would ask anybody that has not signed a non-disclosure agreement or undertaking to excuse themselves while they -- from the hearing room. That would include members of the public, and I believe that includes, at this point, all Intervenor counsel as well.

MS. MARLA BOYD: Just before we do that, Mr. Chair -- sorry. Oh, Marla Boyd. I do have

one (1) more undertaking that could be filed. It is Manitoba Hydro's response to Undertaking number 16. We can circulate copies. I believe it should be Exhibit number 94.

--- EXHIBIT NO. MH-94: Response to Undertaking 16

MS. MARLA BOYD: I would also ask your permission that not all of our panel is actually required for the CSI portion of this hearing. So if I could ask that you would excuse Ms. Rohmund and Mr. Page from the panel, we'll carry on from there.

THE CHAIRPERSON: That's fine. Thank you. So we will recess for approximately ten (10) minutes. I'm sorry? Oh, go ahead. M. Hacault, go ahead.

MR. ANTOINE HACAULT: This may be a little bit more technical, but there's some ongoing decisions to be made with respect to CSI undertakings and what's going to happen. And we're just stating for the record, and we won't repeat it, but that our clients are reserving their rights with respect to those issues. So that we -- our silence isn't interpreted as agreeing to the process proceeding without those things being dealt with.

And the second part is, and I've spoken to Board counsel about this, we don't know, because we won't be there whether there's some questions that are truly not CSI questions or some responses that go beyond CSI information.

And we had asked Board counsel to consider whether or not it might be appropriate to also consider putting a redacted transcript, to the extent that that is feasible or necessary, to ensure that any questions that go beyond specific CSI would be made available, as far as the questions and answers, because I could see us just asking general questions. You may have to sometimes to go further afield than specific CSI. So we had made that request, that that be considered as to whether or not we could have that part of the transcript that's not truly CSI disclosed to us.

And finally, we just repeat our previous encouragement to this Board that as much as possible, and we've seen some correspondence on that, that we keep the most information available to the public and to members of the public, including us. So that if we could continue to be mindful of that.

I know in the past there was some pretty innovative ways to deal with things. For

example, if we didn't want to put specific numbers, we -- we put ranges, or we had statements like Mr. Wojczynski just indicated, you know, the prices generally are favourable.

So if there's ways to deal with it so that the public has some kind of general sense, that would also be appreciated. Thank you.

MR. BYRON WILLIAMS: Mr. Chair, I'll be less technical than My Friend Mr. Hacault. Our client has been concerned that their ability to make meaningful representations is materially impaired by the CSI process in place, particularly with the undertaking as currently framed.

And so we'll just be registering our objection to this process. And rather than repeating my objection every time the panel goes into CSI, please take this as an ongoing objection to the process on the basis of our concern that it is impairing our ability to make meaningful representations and that the undertaking as currently framed effectively prevents our client from participating. Thank you.

THE CHAIRPERSON: Okay. Mr. Shefman...?

MR. CORY SHEFMAN: Thank you. For the

record, my client has the same concerns as just described by counsel for the CAC, and just for the record we wanted that to be said.

MR. GEORGE ORLE: Mr. Chairman, also I -- on behalf of my client I -- I repeat the same concerns raised but I -- I have an additional one. And that is based upon the opinion that we have received from the Law Society of Manitoba, counsel is precluded as a matter of ethics from signing the confidentiality agreements that have been prepared on behalf of the Board.

So it's not a matter of just indicating that we can't sign. We will be in breach of our obligations to the Law Society. And the -- the manner in which it's been put forward prevents us from actually even taking any part in -- in signing or signing anything close to what's been prepared by the Board.

THE CHAIRPERSON: Thank you for your comments and objections. They've been noted. Some of the issues that have been raised will be addressed in due course by the panel. Thank you very much. So we're recessed --

MS. PATTI RAMAGE: Mr. Chair, before we --

THE CHAIRPERSON: I'm sorry.

MS. PATTI RAMAGE: -- recess -- and I don't intend to respond to the various comments that were made with respect to the -- the objections to CSI. There are motions on the record, and you have Manitoba Hydro's position.

I would clarify that I don't believe there's a Law Society opinion that -- there was some preim -- some preliminary comments. But that wasn't actually the reason I wanted to get on the mic.

I ran down here because the people upstairs said they've locked the door. So I'm a little out of breath. I was trying to get in. Because there is another CSI matter I wanted to deal with. I thought we'd be dealing with it once the room had cleared, but it's not necessary to clear -- to clear the room for this, as it turns out.

As -- as the panel will know, last Friday they issued a letter to Manitoba Hydro requesting that Manitoba Hydro do two (2) things. One (1) was to justify the CSI, the -- the -- I -- I believe it was the Board advisors went through the redactions Manitoba Hydro had made and put in their comments, whether they agreed or disagreed.

Manitoba wa -- Hydro was to file by

tomorrow its response to those redactions. We ran into a roadblock this week. Our people, as it turned out, were chasing their tails a bit because they couldn't figure out the redactions. And it turned out there was an inadvertent error and the redactions that had been proposed in some case were not ones that had been made by Manitoba Hydro and they were working -- the PUB staff, Mr. Hombach can clarify, were -- had provided redactio -- had comments on redactions that Manitoba Hydro hadn't asked for.

And it was -- it took our people a little bit of time to figure out what was going on. And what it's done is put us behind. And today, PUB counsel provided us with their comments on the actual redacted reports according to the redactions that were in fact made by Manitoba Hydro.

I believe -- and I don't want to speak for others because I don't know for sure where the reports... I believe some the IECs had -- had proposed redactions, and that's what the comments were made on instead of the actual report. So that's now been clarified. Mr. Hombach gave us that today, but it means we will not be able to file our comments tomorrow. Our goal at this point is to file them on Wednesday to -- to catch up.

The other thing that the Board had asked was that we file redacted IRs on any CSI IRs. That is a real issue for our people, because the same people who have to deal with the redactions are the people who are in front of you now and next week.

And so what we've asked our staff to do, and we want to keep the Board apprised because we're making our best efforts in doing everything we can, is to start working on it, but they can't be in two (2) places at once. And so they're going to start. And we will file as we -- as we get those redacted IRs with the goal to be completed by the end of March, but we simply -- they can't get them done by the end of the next. And particularly, this hiccup has really thrown a wrench into things, in terms of getting those redactions done.

So with all of that, I have to tell you that the wind just got taken right out of me when I heard that we're going to be asked to redact transcripts. I just don't know where the time's going to come. And that's -- people can't testify and redact at the same time, and we just don't have the -- the ability to do that.

And I look at my notes and there's one (1) other comment I have. I said Wednesday for the

redactions. There are two (2) reports that deal with transmission. We're going to need longer to deal with those transmission reports. That's the power engineers and the section of LCA. The redactions there are different from what I think PUB advisors thought they were. They were looking at them from a financial point of view.

My understanding is the redactions there deal with something called, what we would look at as our criteria, critical infrastructure prote -- protection under NERC standards and critical energy infrastructure information under US Federal Power Act.

And those are the type of things that we'd be looking for in a transmission report. And our transmission people are going to be on the stand on Monday. So we're going to need more time for them to go through that because that's not something that our finance and economics people can help with. It's a very specialized area where they're looking for -- and that goes to the physical security of the system.

And that's not what this group deals with, but that's protecting our system from -- from acts of terrorism, that sort of thing. And they take -- they look at -- at the information to see if it releases any -- any soft points, that sort of thing.

And that's required under other legislation. So it wouldn't be -- have necessarily been redacted under the terms of reference, per se, although it certainly has financial consequences if -- if something like that happened.

So we're relying on someone else to do that, and we run into the same problem. So I just wanted to keep the Board apprised of what's going on with that.

MR. SVEN HOMBACH: Mr. Chairman, perhaps I can suggest that during the break I'll have a fre -- chat with Ms. Ramage and we can see whether the timing of the issue can be resolved. And we'll regroup on ten (10) minutes.

THE CHAIRPERSON: Okay. So again, all those comments have been noted and will be considered in due course. And I must say that we will try to make this a priority because we understand that we need to address these promptly. So that will certainly be a priority of the panel.

Thank you very much. So for those of you who are leaving us, having a good evening. And we will recess for ten (10) minutes.

(PANEL STANDS DOWN)

--- Upon adjourning at 3:02 p.m.

MANITOBA PUBLIC UTILITIES BOARD

Re: MANITOBA HYDRO
NEEDS FOR AND ALTERNATIVES TO
REVIEW OF MANITOBA HYDRO'S
PREFERRED DEVELOPMENT PLAN

Regis Gosselin	- Chairperson
Marilyn Kapitany	- Board Member
Larry Soldier	- Board Member
Richard Bel	- Board Member
Hugh Grant	- Board Member

HELD AT:

Public Utilities Board
400, 330 Portage Avenue
Winnipeg, Manitoba
March 4, 2014
Pages 321 to 636

APPEARANCES

LIST OF EXHIBITS

No.	Description	Page No.
1	Order in Council 128/2013 Date: April 17, 2013	
2	Terms of Reference - Needs for And Alternatives to (NFAT) Date: April 17, 2013	
3	Public Notice of May 16, 2013 prehearing conference Date: May 16, 2013	
4	Transcript of prehearing conference on May 16, 2013 Date: May 16, 2013	
5	Olthuis Kleer Townsend Letter to PUB re prehearing conference Date: May 29, 2013	
6	PUB Board Order 67/13 Date: June 11, 2013	
7	Pimicikamak Review & Vary Application Date: June 25, 2013	
8	PUB letter to Manitoba Hydro re IEC access to Manitoba Hydro staff/ information Date: August 9, 2013	
9	PUB Board Order 91/13 Date: August 9, 2013	

LIST OF EXHIBITS (Con't)

EXHIBIT NO.	DESCRIPTION	PAGE NO.
10	PUB Board Order 92/13 Date: August 9, 2013	
11	Olthuis Kleer Townsend letter to FR re Order 91/13 Date: August 29, 2013	
12	Transcript of NFAT prehearing conference on September 4, 2013 Date: September 4, 2013	
13	Pimicikamak Notice of motion for leave to appeal Date: September 9, 2013	
14	Olthuis Kleer Townsend letter re Service of Notice of motion Date: September 9, 2013	
15	Affidavit of D. Paupanakis sworn September 25, 2013 Date: September 25, 2013	
16	PUB letter to Manitoba Hydro re NFAT motion day Date: September 26, 2013	
17	Transcript of Manitoba Hydro motion re round 1 IRs on September 30, 2013 Date: September 30, 2013	

LIST OF EXHIBITS (Con't)

EXHIBIT NO.	DESCRIPTION	PAGE NO.
18	PUB Board Order 119/13 Date: October 4, 2013	
19	PUB Board Order 126/13 Date: October 21, 2013	
20	PUB Board Order 127/13 Date: October 21, 2013	
21	PUB letter to Manitoba Hydro re internal load forecast Date: October 23, 2013	
22	PUB letter to Manitoba Hydro re scope of work for IECs Date: October 23, 2013	
23	PUB subpoena to Manitoba Hydro Date: October 29, 2013	
24	PUB/Manitoba Hydro round 1 Information Requests Date: November 2013 - 1 load forecast - 2 population and customer growth - 3 weather adjustment calculations - 4 weather adjustment calculations - 5 typical space and water heating costs	

LIST OF EXHIBITS (Con't)

EXHIBIT NO.	DESCRIPTION	PAGE NO.
PUB 24	- 6 top consumer/industry sector load growth	
	- 7 Mass Market consumers	
	- 8 MISO Exports	
	- 9 MISO Exports and Imports	
	-10 MISO Unit export revenues	
	-11 MISO Energy Resources	
	-12 MH Export revenues v. Exchange rate	
	-13 Natural Gas Supply Forecasts	
	-14 MISO Market Energy Demand Growth	
	-15 CCCT natural gas Generation vs. MISO Market Prices	
	-16 Transmission Constraints	
	-17 MISO market	
	-18 MISO & Other market activities	
	-19 MISO market	
	-20 MISO Market	
	-21 MISO market	
	-22 Export Energy/Energy Supply	
	-23 Dependable Hydraulic Energy Definition	
	-24 Alternative Power Resource Scenarios previously considered	

LIST OF EXHIBITS (Con't)

EXHIBIT NO.	DESCRIPTION	PAGE NO.
PUB 24	-25 thermal generation considerations	
	-26 Wind energy	
	-27 DSM energy	
	-28 Export contracts	
	-29 Export contracts	
	-30 Export contracts	
	-31 Export contracts	
	-32 Monthly hydraulic generation and river flows	
	-33 Annual System Flows/hydraulic generation net revenue	
	-34 Total Energy in Reservoir Storage	
	-35 Drought impacts and mitigation	
	-36 Progression of major G&T Project costs	
	-37 New generation incremental energy costs	
	-38 Wuskwatim cost escalation	
	-39 Wuskwatim component costs	
	-40 Keeyask and Conawapa cost escalation	
	-41 Transmission - HVDC peak demand levels	

LIST OF EXHIBITS (Con't)

EXHIBIT NO.	DESCRIPTION	PAGE NO.
PUB 24	-42 Transmission - HVDC functional Usage	
	-43 Greenhouse gas displacements in the MISO market	
	-44 On-peak and off-peak sales into MISO	
	-45 Greenhouse gas impacts	
	-46 Greenhouse gas impacts	
	-47 Minnesota-Manitoba Transmission line	
	-48 Minnesota-Manitoba Transmission line	
	-49 Minnesota-Manitoba Transmission line	
	-50 Minnesota-Manitoba Transmission line	
	-51 Minnesota-Manitoba Transmission line	
	-52 Financial forecasts	
	-53 Financial forecasts	
	-54 Financial forecasts	
	-55 Financial forecasts	
	-56 Financial forecasts Assumptions	

LIST OF EXHIBITS (Con't)

EXHIBIT NO.	DESCRIPTION	PAGE NO.
PUB 24	-57 Financial forecasts Assumptions	
	-58 Financial forecasts Assumptions	
	-59 Export price forecasts	
	-60 KPMG report	
	-61 Financial forecasts	
	-62 In-service revenue requirement

UNDERTAKINGS

No.	Description	Page No.
7	Manitoba Hydro to provide a calculation on page 33 of the Board's book of documents Volume II based on a success rate of the fuel switching initiative	551
8	Manitoba Hydro to provide an order magnitude for average degree-day cooling adjustment per year in the load forecast	568
9	Manitoba Hydro to explain: a) attribution of 600 additional gigawatt hours per year to domestic losses; and b) whether this is because of longer transmission lines or whether incremental export losses are attributed to domestic demand	600
10	Manitoba Hydro to indicate an estimated time for financials to be filed	625

UNDERTAKINGS (Con't)

No.	Description	Page No.
11	Manitoba Hydro to indicate when the plans on page 15 of Mr. Wojczynski's presentation, and financials for the five (5) plans will be filed	627
12	Manitoba Hydro to confirm assumptions going into DSM analysis	635

-- Upon commencing at 9:10 a.m.

THE CHAIRPERSON: Good morning. I believe we're ready to start. So we apologize for the technical glitches, but -- so, good morning. This isI -- we -- second day of the -- the hearing process. And I turn the microphone over to Mr. Hombach.

MR. SVEN HOMBACH: Yes. Good morning, Mr. Chairman, good morning members of the Board, and good morning to the Manitoba Hydro panel and all the Intervenors in the room. Today is reserved for Manitoba Hydro's presentation on load forecast and DSM, and cross-examination by Board counsel.

But before we go ahead with Manitoba Hydro's presentation, there are a few housekeeping matters. The Public Utilities Board has a few exhibits it would like introduced.

Firstly, I filed a book of documents of Board counsel that should be Exhibit 58-2. Manitoba Hydro should have electronic copies of it. The panel should have paper copies in front of it. If anybody else would like a paper copy, I have a few spares but not enough for everybody in the room.

--- EXHIBIT NO. PUB-58-2: Board counsel book of

documents

MR. SVEN HOMBACH: The second exhibit is Exhibit 59. That is a chart prepared by PUB advisors that was circulated yesterday evening.

--- EXHIBIT NO. PUB-59: Chart prepared by PUB advisors

MR. SVEN HOMBACH: Exhibit 60 should be the Information Requests from the PUB to CAC's witness Mr. Gotham.

--- EXHIBIT NO. PUB-60: Information Requests from the PUB to CAC's witness, Mr. Gotham

MR. SVEN HOMBACH: Exhibit 61 should be the PUB's Information Requests to CAC's witness Mr. Harper.

--- EXHIBIT NO. PUB-61: PUB's Information Requests to CAC's witness Mr. Harper

MR. SVEN HOMBACH: Now, do any of the other parties have exhibits this morning that they'd like to see introduced?

MS. MARLA BOYD: I will be introducing exhibits in connection with this panel. I can also confirm the exhibit number from the presentation that was filed yesterday, if this is the appropriate time to do that.

MR. SVEN HOMBACH: Yes, please.

MS. MARLA BOYD: Exhibit number 86 was the tentative number given to the presentation yesterday by Mr. Wojczynski, so I've confirmed that number now with Mr. Singh this morning. And I can also ask that the presentation that's been circulating for the load forecast and DSM panel be marked as Exhibit number 87.

--- EXHIBIT NO. MH-87: PUB presentation on load forecast and DSM

MR. BYRON WILLIAMS: Mr. Chair, Byron Williams here. We will be getting the appropriate number for our PowerPoint and ask at the break. We'll provide our advice after that and the exhibit number that should be assigned.

MR. SVEN HOMBACH: Mr. Chairman, I now suggest that the panel call upon Manitoba Hydro to deliver its presentation.

THE CHAIRPERSON: Good morning, Ms. Boyd. I turn it over -- back to you.

MS. MARLA BOYD: Thank you. Good morning. Good morning, Mr. Chair, Board members Kapitany, Bel, Grant, and Soldier. My name is Marla Boyd, and I'm pleased to present to you this morning the load forecast and DSM panel.

By way of introduction, we have a little bit of juggling because Mr. Wojczynski is part of this panel and is seated in the second row, so you may hear the odd voice from the wilderness. Mr. Wojczynski was introduced to you yesterday and is still sworn after yesterday.

To my immediate left is Mr. Dale Friesen, who's the division manager of Industrial and Commercial Solutions. Next to him is Mr. Lloyd Kuczek, vice president, of Customer Care and Energy Conservation. Next to Mr. Kuczek is Ms. Ingrid Rohmu -- Rohmund. She's the director of Energy Analysis and Planning for EnerNOC Inc. Next to her is Ms. Lois Morrison. She is the division manager of Consumer Marketing and Sales. And finally, Mr. Ian Page is

division manager of Corporate Planning and Strategic Review.

I might also introduce the row behind me. Immediately behind me is Mr. Rob Armstrong. He's the manager of Customer -- Custom Eng -- Customer Engineering Services. Next to him is Ms. Colleen Kuruluk who's the Marketing Programs manager. Cheryl Pilek is the Power Smart Planning Evaluation and Research manager.

Next to her is Mr. Louis Kessler, who is the Market Forecast manager. Then we have Mr. Wojczynski. And to his left is Tyler Markowsky, who's the senior economist with Manitoba Hydro.

The panel is ready to be sworn. And then we can proceed, please.

MANITOBA HYDRO PANEL 3:

DALE FRIESEN, Affirmed

LLOYD KUCZEK, Sworn

LOIS MORRISON, Sworn

IAN PAGE, Sworn

INGRID ROHMUND, Sworn

ED WOJCZYNSKI, Previously Sworn

EXAMINATION-IN-CHIEF BY MS. MARLA BOYD:

MS. MARLA BOYD: Mr. Friesen, could you please outline your qualifications and areas of responsibility with respect to this portion of Manitoba Hydro's filing?

MR. DALE FRIESEN: Thank you, Marla. Sorry for that. Good morning, Mr. Chairman, members of the Board, Intervenors, and others present. My name is Dale Friesen, and I hold the position of division manager for the Industrial and Commercial Solutions Division within the Customer Care and Energy Conservation Business Unit.

I'm a graduate of the University of Manitoba, Faculty of Engineering, holding a bachelor of science degree in mechanical engineering. I have been a profes -- registered professional engineer in the Province of Manitoba since 1993. I have served with Manitoba Hydro for over twenty-two (22) years, and for much of that time worked in various roles supporting our Power Smart initiatives, with an emphasis on industrial and large commercial sector programming.

Throughout my time at Manitoba Hydro I have been an active participant in the development of national and international codes and standards governing the energy performance of electric

equipment, working with Natural Resources Canada and others to implement energy efficiency codes, standards, and regulation across a broad range of equipment and end-use sectors, impacting the Manitoba market.

In this capacity, I serve as Manitoba Hydro's representative on the Canadian Standards Association, Steering Committee on the Performance of Energy Efficiency and Renewables, otherwise known as SCOPEER, where I also serve is the chair of the Technical Committee for the Industrial Committee -- or for Industrial Equipment, sorry.

Prior to my role, current role, I co-led the team responsible for the development of the -- time-of-use rate structure for Manitoba Hydro's largest general service consumers, including the majority of Manitoba Hydro's top consumers and other larger industrial and commercial users, accounting for approximately 25 percent of Manitoba's domestic energy consumption.

I am responsible for management of Manitoba Hydro's commercial and technical relationship, with four hundred (400) plus key and major account customers that represent Manitoba's largest domestic energy users.

The division also provides core technical and end-use expertise and support for Manitoba Hydro's Power Smart and customer service initiatives, including power in quality and customer-sided renewables, such as biomass and solar.

In my testimony today and in the next couple of days, I will be providing evidence with respect to Manitoba's top consumers and consideration of demand-side management opportunities, including codes, standards, industrial programming, load displacement, industrial conservation rates, demands and response programming, and energy efficiency measures contained within the DSM Potential Study and Manitoba Hydro's Power Smart programming. Thank you.

MS. MARLA BOYD: Mr. Kuczek, could you please outline your areas of responsibility with respect to this proceeding?

MR. LLOYD KUCZEK: Good morning, Mr. Chairman, members of the Board, and others present here this eve -- this morning. As vice president of Customer Care and Energy Conservation, I will be addressing policy issues and related manners which fall in -- fall under my responsibility, including energy conservation and load forecasting.

MS. MARLA BOYD: And can you please

outline your qualifications for the Board?

MR. LLOYD KUCZEK: I have over thirty (30) years of broad experience working at Manitoba Hydro, including having responsibility for Manitoba Hydro's load forecasting and demand-side management, functional responsibilities for an extensive period. My academic qualifications include an MBA and a bachelor of science degree in electrical engineering.

I'm also a member of the Canadian Electrical Association Customer Council Committee and the Canadian Gas Association Market Development Committee, both of which we dialogue and share information of participating utilities' demand-side management activities.

MS. MARLA BOYD: Thank you, Mr. Kuczek.

Ms. Morrison, could you please outline your qualifications and areas of responsibility with respect to this portion of Manitoba Hydro's filing?

MS. LOIS MORRISON: Good morning. Having my own technical difficulties here. Good morning Mr. Chairman and Members of the Board, Intervenors, and others present. My name is Lois Morrison, and I hold the position of division manager of Consumer Marketing and Sales of the Customer Care

and Energy Conservation Business Unit. I'm a graduate of the University of Manitoba Faculty of Commerce, and I have been with Manitoba Hydro for over twenty-four (24) years, and for the majority of that time working in various roles, supporting our Power Smart initiatives.

In 2007 I moved into the role of division manager of Business Support Services, with responsibilities including billing, metering, and collections, returning to the Consumer Marketing and Sales Division in 2010. I have been involved in several proceeding related to Manitoba Hydro's electrical and natural gas applications.

In my testimony, I'll be providing evidence with respect to Manitoba Hydro's electric load forecast and the Corporation's heating fuel choice initiatives. I will also be providing evidence with respect to Manitoba Hydro's demand-side management initiatives, focussing on the residential and commercial markets. Thank you.

MS. MARLA BOYD: Thank you, Ms. Morrison.

Mr. Page could you please outline your qualifications and areas of responsibilities with respect to the filing?

MR. IAN PAGE: Good morning, Mr. Chairman and members of the Board, Intervenors, and others present. My name is Ian Page, and I hold the position of division manager of Corporate Planning and Strategic Review within the Corporation -- Corporate Relations Business Unit. I am a certified management accountant and have an MBA in finance from the University of Manitoba.

I have been with Manitoba Hydro for over twenty-six (26) years, a majority of which was actually in the financial planning area. I moved into the role of division manager of Corporate Strategic Re -- Review in 2009, which then evolved into my current role in 2011. I am responsible for the corporate planning, corporate review, and economical analysis functions.

I have previously testified before the Public Utility Board as part of an electric rate hearing. I will provided (sic) evidence at this hearing on a number of areas throughout the hearing, such as discount rates, the appropriateness of using net present value, and on economic impact analysis. For the purpose of this panel, I will be giving evidence regarding the population growth forecast.

MS. MARLA BOYD: Thank you, Mr. Page.

Ms. Rohmund, you are the director of Energy Analysis and Planning at EnerNOC Inc.?

MS. INGRID ROHMUND: Yes.

MS. MARLA BOYD: And you are responsible for the preparation of the DSM Potential Study for Manitoba Hydro?

MS. INGRID ROHMUND: Yes.

MS. MARLA BOYD: Could you please describe for the Board your qualifications in respect of that work?

MS. INGRID ROHMUND: In my role as leader of the Energy Analysis and Planning practice at EnerNOC Utility Solutions, I direct projects in the areas of energy efficiency and demand response that include market assessments, end-use forecast, resource potential assessment, program design, strategic planning, and business strategy.

I have over twenty-five (25) years of experience conducting and managing large-scale research and consulting engagements for the energy industry. I am a recognized expert in the -- in energy efficiency and demand response, planning, load forecasting, energy and technology modelling, and market assessment.

In the past five (5) years with

EnerNOC, and previously with Global Energy Partners, I have led more than thirty (30) energy efficiency potential studies for utilities across North America, including Seattle City Light, Los Angeles Department of Water and Power, Tennessee Valley Authority, the Ameren companies, the State of New Jersey, and the State of Hawaii, and, of course, Manitoba Hydro.

In addition to the experience with potential studies and planning, I've also directed the development of several software tools that include end-use forecasting models, energy analysis software, building simulation software, and technology assessment software. Thank you.

MS. MARLA BOYD: Thank you. Mr. Chair, with that we would ask that Ms. Rohmund be accepted as an expert for the purposes of providing evidence in this proceeding on the analysis of DSM potential in North American utilities.

MR. SVEN HOMBACH: No objections from Board counsel. Does anybody else wish to make submissions?

MR. BYRON WILLIAMS: We -- on behalf of CAC, we certainly accept the qualifications of this witness.

MR. ANTOINE HACAULT: No objections

from MIPUG.

MR. WILLIAM GANGE: No objections from Green Action Centre either, Mr. Chair.

MR. MICHAEL ANDERSON: No objection from MKO.

MR. CORY SHEFMAN: No objection from MMF.

THE CHAIRPERSON: Welcome.

(BRIEF PAUSE)

MR. CORY SHEFMAN: I apologize, my name is Cory Shefman, S-H-E-F-M-A-N.

THE CHAIRPERSON: I'm sorry, Messr. Monnin...?

MR. CHRISTIAN MONNIN: Merci, Messr. President, no objections either from the IECs.

THE CHAIRPERSON: Back to you, Ms. Ramage.

MS. MARLA BOYD: I have a little trouble with the red light. Mr. Kuczyk, if you'd like to begin with your presentation, please, for the Board? This has been marked as Exhibit number 87.

MR. LLOYD KUCZYK: Okay. I -- I prepared a presentation on primarily demand-side

management and -- and just a short presentation on load forecast, which we'll start with. And through both of those I will be providing you with an update where we are in terms of our thinking in terms of the load forecast, as well as our demand-side management plans at this time.

Just a few slides to quickly put things in perspective in terms of where we are. This is what our load currently looks like in Manitoba. We have 24,400 gigawatt hours roughly of consumption currently, and we break that down into our different market sectors: residential, general service mass, and the top consumers are the primary categories. And we'll talk about how we forecast -- or how the forecast is for over -- the overall market, as well as each sector.

So before I get into that, the forecast is updated annually to reflect the most current available information. We do this each and every year. Forecast for each load sector is forecasted separately, and we use different methodologies for forecasting each sector. We believe there's sound justification for doing that. Each sector is -- has its own unique characteristics, and one particular model isn't necessarily the best to do -- to undertake

forecasting for each of the sectors. We fore -- the forecast models and methods are adjusted whenever appropriate to make improvements. This is done on an annual basis whenever deemed appropriate.

And we also, as a feedback loop, we monitor how our forecasts have been in -- in the past with regards to accuracy. So we look at the -- the past five (5) years' forecast and the past ten (10) years and monitor that.

In terms of our forecast, we're forecasting our load growth to grow by 1.5 percent overall in the Manitoba market over the next twenty (20) years; broken down by sector, pretty much the same in all sectors, 1.4 percent in the residential sector, primary drivers, population, and the market share of electric heat.

General service mass market, 1.5 percent over the next twenty (20) years and the primary drivers are population and the general GDP and economy growth in Manitoba. And the general service -- the top -- general service top consumers we're forecasting to grow by 1.6 percent per year over the next twenty (20) years.

Just a quick slide on how our forecast compares to other regions. And this is the data from

a number of utilities under -- undertaken by the North American Electric Reliability Council, a survey that they undertook to -- compares load forecasts or -- forecasts throughout North America. And you can see that Manitoba Hydro's forecast is in the general range of other forecasts throughout the US, slightly higher than the Canadian average, and slightly lower than the US average.

The other thing I want to just quickly cover is the general framework for our load forecast and what's included in it. We -- I guess going back to the North American Electric Reliability Corporation, the survey there, they exclude station service as well include -- they include DSM. So the forecast there is different than what our load forecast is.

Our load forecast, if you adjust for those factors, is 1.14 percent. Our -- our internal forecast that we do is slightly different. We include the codes and standards of our DSM efforts in our forecast and we exclude our DSM marketing initiatives from the forecast. So you can see the three (3) lines there. The blue line, if you took out the codes, our load forecast would be growing by 1.6 percent, and our official forecast states 1.5. And if you were to

subtract the DSM efforts, it's 1.4 percent.

In terms of accuracy, we're comfortable with the accuracy that our load forecast has achieved over the past number of years. We think it's reasonable that with -- if you look forward five (5) years, that it be within a band of approximately 5 percent.

And we think it's reasonable because when you look at the -- or you take into account the -- the inherent nature of forecasting, there's -- you -- it's always going to be wrong, as was stated yesterday. And the other factor that has a significant impact on each year, of course, is the -- how the economy changes. And there's different growth periods within our ec -- our economy over the years. And there's recessions, as well, as we recently experienced in 2008 and '09.

And the ten (10) year forecast, our objective is to try to be within a band of a plus/minus 10 percent. And you can see we're generally within that range.

Probably the more important slide is this one, and it provides you with an update of our current thinking. I will caution you though, this is -- this high level. It requires further analysis.

And when we undertake our 2014 forecast this summer was -- we will be assessing each one of these factors, and possibly other ones, in more detail.

Each year, when we do a load forecast there's always pluses and minuses. And this year, the pipeline sector is a significant plus. And there's been some discussion about that already, and so what we offer is a -- just as a proxy is possibly seventeen hundred (1,700). We don't know exactly what the load growth's going to be and -- but that's what we're using currently as a proxy.

Codes and standards, we're aware of some changes due to codes and standards that need to be incorporated into our load forecast. That'll take 300 gigawatt hours off our forecast. And again, we need to do more work to confirm that that'll be the number, but it's in that range at this point is our thinking.

Price elasticity, we -- we actually agree that, given our rate increases on a go-forward basis being higher than inflation and higher than the past, that we need to consider that. And at this point, we're currently thinking that could be in the 5 to 600 gigawatt hour range. And we're planning to do more work in that area certainly to refine that

estimate.

Fuel choice, we're planning to increase our education efforts in -- on that front. And we think we're likely going to reduce the -- the load forecast by about a hundred gigawatt hours due to that effort.

And --

THE CHAIRPERSON: Mr. --

MR. LLOYD KUCZEK: And the other thing that we'll have to concurrently do is we'll have to review our potential large industrial load value that will be used in the 2014 load forecast.

THE CHAIRPERSON: Could you explain the date? I'm trying to understand why --

MR. LLOYD KUCZEK: Oh.

THE CHAIRPERSON: -- for example --

MR. LLOYD KUCZEK: The dates are just when we expect those impacts to actually occur. So I don't have all the same dates for you, but the pipeline sector, we're just thinking that if the pipelines are actually going to take -- or if there is going to be new pipeline growth, it'll be by that date.

And codes and standards is just -- and the other three (3) are just a benchmark '27/'28. So

those numbers could change as you move forward into the future, correct?

THE CHAIRPERSON: Just to clarify again, on the price elasticity, I would think that that number -- you know, the increases in rates would have impact annually over a length of time.

And this suggests to me -- I'm just wondering why you picked that date in particular.

MR. LLOYD KUCZEK: I -- I actually would have preferred to have all the same dates. But we picked '27/'28, I believe, because that's when our Power Smart Plan is roughly. Yeah. There -- there was no particular reason other than we needed a date. We needed a date into the future and far enough that made some sense.

But it will be a gradual increase and we'll have to do more analysis in terms of how that's going to take place. And this is a cumulative number. It's not... So in the first year it'll certainly be a smaller number, and as we move forward...

Just some background. We undertook a market potential study and hired EnerNOC. We signed a contract in 2011. And the -- the rationale for undertaking this study was to get more insight into our marketplace and seek some expertise from a -- from

an external party.

The concept between -- behind undertaking a market potential study is to -- is to use our internal expertise, along with the consultant, to develop the load for -- or the market potential study. The -- it's -- it's not just relying on what the consultant brings to the table. It's important to recognize that our internal resources understand our marketplace, and they -- they bring value in that regard. So it's a team effort. And the result of the study is -- is more valuable to us by taking that approach.

The other comment I'd like to make about the market potential study is you need to -- you need to use the information with -- in the context that it's undertaken. It's a very high-level study. Generally, when you undertake these studies, the next step is to actually do a more detailed analysis within the particular DSM opportunities that are identified and refine both the targets and -- and develop strategies, in terms of how you're going to achieve those -- those DSM targets.

And one (1) more comment. We actually had Ingrid provide a presentation to our board, and it's on the market potential study. It's the same

presentation. And we also asked her to provide comments on her views in terms of target setting. And so given Ingrid's here, we thought we might as well have her present that to you, as well.

(BRIEF PAUSE)

MS. INGRID ROHMUND: Thank you, Lloyd. So what I would like to do now is walk through several areas -- several topics, starting with our experience conducting these types of studies; high-level review of the study objectives; an overview of how we conduct the analysis, how we conducted the analysis for Manitoba Hydro and how we conduct it for other entities as well; and then delve into some of the specifics of the studies. And we'll conclude with talking about setting targets, focussed primarily how it's done in the -- in the United States.

Okay, so leading off with our experience in these types of DSM market potential studies, I show a map here of North America. The shaded areas, the blue shaded areas, light and dark, represent EnerNOC Utilities Solutions's experience with program planning, market assessment, and evaluation. The dark-blue areas are the states and

provinces in which we have conducted potential studies like the one for Manitoba Hydro.

So you can see, we -- we have worked all over North America. We even have some studies that are outside of the US, and we have done several studies that are regional or national with respect to the US. We did a national study for the Electric Power Research Institute. We've done studies for the Institute of Electric Efficiency, and for firm on-demand response. So we have a lot of experience in diverse settings, and we have several clients indicated with asterisks who have worked with us more than once to develop their potential studies.

And our hallmark is we have a very well established process that I'll describe. We have a tool that we've developed and -- and refined over time for these studies that we deliver to our clients for their -- some clients for their use. And we -- we bring independent and an unbiased look at potential in each of the regions we work in.

So our goal for this study when we set out in 2011 was to develop updated estimates of technical, economic, and market-attainable savings by performing a quantitative assessment of the opportunities, the technology opportunities and the

market opportunities. And we worked closely with Manitoba Hydro staff to bring the local experience and knowledge to the -- to the project. This is invaluable in every one of our studies. And we bring a well-vetted process and perspective of how things are done elsewhere to the -- to the study.

So we used 2011 as the reference year, and we developed estimates out to 2031 -- fiscal year 2130 -- 2031/'32.

So I'll walk through a few definitions that we use throughout the study. The first is the LoadMAP baseline projection. LoadMAP is our tool. It stands for Load Management Analysis and Planning, and that's the tool we use. And as a first step, we characterize how customers use energy currently or in the base year, in 2011. And then we project that forward to describe what energy use would be in the absence of future energy efficiency programs.

And this baseline projection includes the effects of building codes and appliance standards, and naturally occurring conservation. It is separate and distinct from the load forecast. It is developed specifically for the purposes of estimating the energy efficiency potential.

Once we have developed that projection

-- and in later slides we show an example -- we then assess the energy efficiency potential. And in accordance with industry practice, we develop -- we develop four (4) levels of energy efficiency potential as outlined here; technical being the broadest definition, and achievable being the -- the most narrowly defined. And we'll walk though those one (1) at a time.

And this is standard industry practice in North America to develop these four (4) levels. Sometimes it's only one (1) level of marketed achievable, but we prefer to estimate a range of potential that is characterized as achievable in market in this study.

So the -- the broadest definition of energy efficiency potential is called technical potential, and this is the theoretical upper limit of potential. It assumes that all customers will replace their failed equipment with the most efficient option available in the market at that time regardless of cost.

So we don't assume that -- that everything is replaced in a flash cut, but rather when refrigerators fail, or fridges fail, and when air conditioners fail and furnaces fail, that they are

replaced with the most efficient option. And -- and every customer does this.

And then there are other measures like insulation and programmable thermostats and non-equipment measures, as we call them. Those also get re -- get installed over time.

A subset of technical potential but also a theoretical upper limit is economic potential. And to estimate economic potential we take every measure in every segment in every year of the forecast, and we run those measures through a cost-effectiveness screening using a TR -- total resource cost test.

And measures with a benefit cost ratio of one (1) or greater pass the economic screen and are included in economic potential, and those with a benefit-cost ratio of less then one (1) are excluded from that estimate. As far as customer adoption, it is like technical po -- potential and it assumes that everyone will adopt those cost-effective measures. Okay.

So the mar -- the third level and subset of economic potential now is market potential. And this is the amount of savings that can obtained through market intervention -- and these are carefully

chosen words -- under ideal market implementation, regulatory and customer preference conditions.

So everything is favourable towards the adoption of energy efficiency, and the only real barrier is customer preference for a technology or measure. And an excellent example is compact fluorescent lamps. There is widespread use in parts of North America; however, in some applications they are not preferred.

And at the risk of -- of showing gender bias, women, in particular, do not like compact fluorescent lamps in bathrooms because we don't look good under compact fluorescent lamps. So there is a resistence to those lamps, and unless forced to do so, they will find an alternative. So we look -- we -- we think of market potential as a theoretical upper bound on what can actually be achieved.

And then finally, we look at the achievable potential. This is a subset of -- of the market potential, as well, and it recognizes that the -- the market conditions are not ideal. There is not perfect information. There is not perfect program implementation. The regulatory circumstances may not be ideal, as well.

So this is -- this is a level of

potential that can be achieved. And the way we think of it, as -- as the -- as the consultant, is that it is -- it -- it is the goal that can -- that can be met and there is -- but it is -- we view this as a range. A range of potential is achievable to market, and somewhere in there are utilities generally choose a path, doing much more analysis about specific programs and how measures might be presented to customer segments or how they might be grouped together to develop the actual program plan.

So we provide guidance through these estimates and solid information from -- with which our clients can move forward to develop their specific program plans. So we did not engage in that part of the analysis.

THE CHAIRPERSON: Can I ask a question to --

MS. INGRID ROHMUND: Of course.

THE CHAIRPERSON: -- clarify in my own mind. In respect of classifying these data, the test that you're using for the work you did for Manitoba Hydro is not using values or formulas different than elsewhere in North America?

MS. INGRID ROHMUND: Correct, correct.

THE CHAIRPERSON: So, for example,

total resource cost is what you're using for any of the other studies you're going to cost?

MS. INGRID ROHMUND: In most of the studies, because some of -- some states require that -- in the US require that a different test be used. There is -- there -- in some states there's a move now towards the utility cost test. So -- but the majority, the vast majority, of the studies rely on the total resource cost test.

THE CHAIRPERSON: Another question. In -- in relation to looking at the market potential, that excludes any activity the government might undertake to subsidize DSM adoption? In other words, if the government was to say, We're going to subsidize -- let you buy a cheaper fridge, we'll give you a subsidy for a fridge, that would mean what in -- in the calculations you're doing here? They're as exogenous to...

MS. INGRID ROHMUND: Yes, in the -- in the definition of market potential, we -- the only barrier is the customer preference towards the -- towards the technology as I described with the compact florescent lamps. So if -- if a subsidy or other mechanism were employed outside of Manitoba Hydro, that would be part of market potential.

MS. MARILYN KAPITANY: But just further to that question, any of the subsidies employed by Manitoba Hydro would be part of this analysis?

(BRIEF PAUSE)

MS. INGRID ROHMUND: Could I ask you to -- to repeat the question?

MS. MARILYN KAPITANY: Yes. So if there are subsidies by Manitoba Hydro that -- that would encourage people to put in more insulation, for example, would -- that type of subsidy would be included in your analysis?

MS. INGRID ROHMUND: The fact that the subsidy is taking place would be included in the analysis. The actual dollar amount would not.

MS. MARILYN KAPITANY: And could you just clarify your last point, the last bullet point on this slide, where it says:

"Not synonymous with setting specific DSM targets or with program design."

MS. INGRID ROHMUND: So the -- the analysis is designed -- was designed to provide

guidance to Manitoba Hydro to develop its programs, develop and refine its programs. And so as a next step they would look at the specific results by measure, and by customer segment, and for new and existing buildings, and they would look at those results and say, Okay, over -- over time, and use that information to develop the program more specifically.

So perhaps they might combine some programs to -- measures together into a specific program for a specific market, say hospitals, for example. Or they may chose to accelerate or decelerate the timing of some of our modelling results.

So as I said, this provide guidance into that process, and therefore it is not synonymous with setting the targets or with program design.

(BRIEF PAUSE)

MS. INGRID ROHMUND: Okay. So now I'd like to give you an overview of how we conduct the study. So we use what is called a bottom-up analysis approach. So working on this slide form the bottom to the top.

We always start with our clients'

objectives in mind. And, so as -- as I said, our pro -- our process here was to provide guidance to Manitoba Hydro for its program planning process. And -- and each client has its own specific objections, and that was our objective for the study.

The first step we do is to characterize the market, as we call it. And so the -- the actions that we take are on the left side moving up by the arrow, and the horizontal bars in grey and blue identify the interim deliverables that we develop along the way.

And so to characterize the market we use a variety of data sources. Those are the ones in the -- in the white space: Manitoba Hydro billing data, Manitoba Hydro surveys, program data, and our own energy market profiles data base to characterize how customers use energy in -- in the base year, which was 2011.

And it's at a very granular level. We segment the market: residential, commercial, and industrial. There are segments within those -- those sectors. There are end uses and fuels, and then there are technologies. So it is a very specific characterization of the market, and we feel it's very important to start in the right place as -- as best as

we can define it, so that when we move forward we're -- we're moving forward appropriately.

After we develop that characterization, we project the baseline, and this is the expected energy use for all those granular segments in absence of future programs. And so we take into account codes and standards. We take into account some of the data that Manitoba Hydro uses to develop its forecast. And then we supplement, as needed, for our model with other secondary sources. And that gives us the jumping-off point for assessing the potential.

And, as I said, it's distinct from the load forecast. It's a different process, and often results in a different projection than what the load forecast shows.

Once we have the baseline forecast, we look at -- at other efficiency options for equipment and other measures that could be adopted by customers and would generate savings. So we have a -- a process where we develop that list of measures. We characterize those measures in terms of their cost and savings. We utilize Manitoba Hydro data as much as we can, because it is local and has been used in practice. And then we supplement with data from other sources.

We use that information to calculate technical and economic potential. It's very straightforward, as described earlier. And that gives us those estimates.

And then the final step is to establish customer acceptance of those measures, and we develop a set of acceptance rates that reflect market potential and also reflect achievable potential. And that allows us then to calculate the market and achievable potential.

MS. MARILYN KAPITANY: When you establish customer acceptance, how do you stratify customers, or is it just customers writ large? Or do you look at, you know, income? Do you look at people inside Winnipeg, outside Winnipeg? How is that stratified?

MS. INGRID ROHMUND: So in -- in the next slide, we'll show you how the -- for example, the residential segment is -- sector is segmented. So it's a -- it's consistent with how we are characterizing everything else in the study, in terms of the -- the sector, the segment, and the end use; we have acceptance factors. So it can be very granular.

So now we'll describe the market segmentation. This is the -- the market

characterization. We took the billing data for 2011 and segmented into residential, commercial, and industrial. And our definition for commercial and industrial is usually different than what our clients may be tracking as commercial and industrial. We look at commercial buildings, so office buildings, hospitals, schools, colleges, et cetera. And the industrial sector is defined as -- as manufacturing -- primarily manufacturing facilities.

And so you see that -- that the service territory is -- is fairly well balanced, meaning roughly equal shares of energy use for each sector. Although, the industrial sector is the largest; and that's a bit unusual for our studies, that the industrial sector is the largest.

The measure assessment step that we take is to develop a list of measures. We have a list that EnerNOC maintains that's developed and maintained from studies that we do all over the place. And then we provide that to Manitoba -- provided it to Manitoba Hydro and got feedback on that measure list. So review and feedback, measures were added, measures were excluded, and we ended up with the list of measures we used for this study.

And so we went through that process

together to identify those measures that are the most relevant for the service territory. We try to be -- we are comprehensive in our measure list, but not necessarily exhaustive, including every possible measure, since we do have to perform the calculations and get through the study. So we do introduce a bit of practicality into the process here.

Once we have developed the measure list, we characterise the savings, the cost, the lifetime and the applicability. We have values that we have developed from other studies and a database that we now maintain over time. But we always rely on our clients to provide us with local information, particularly for the industrial sector. It's -- it's critical that we work together to develop these assumptions.

So what I'd like to do now is to walk you through the residential sector in a bit more detail, to give you a feel for how we go through the process, and to show you some of the results.

So, for the residential sector, Manitoba Hydro had -- has done recently a saturation survey and had extensive information about it's customer segments. And we -- we analyzed separately twenty-nine (29) customer segments, and the largest of

those is the blue-shaded area in the upper right. It's the single family homes with gas, space heating, that were cons -- that were constructed before 2000; and those homes account for 26 percent of the electricity used in 2000 -- 2011. And then the second largest is the single family electrically heated homes where gas is available that were constructed before 2000, with 16 percent of the use. So you can see, we'd -- we went at -- at the segmentation in a very granular fashion.

For the commercial sector we did building types, I believe the number was eighteen (18). I have to look these things up to be specific. And then the industrial sector was approximately eight (8) industries that we isolated. For each of these segments then, we characterized electricity use by end-use.

So the bar chart in the lower right shows the intensity, that's the use per household in 2011, differentiated by end-use. And red is space heating, and in some segments is more than half of the electricity use, particularly in those areas where gases may not be available. And, I'm sorry, where elec -- yes where gas may not be available.

And then cooling is blue; you can see

that's very small across all the segments. Appliances, includes refrigerators, clothes washers, dishwashers, all white goods, appliances, is the green bar; and then the miscellaneous use is the remainder, and electronics.

So there's a wide variety of -- ride -- variety of intensities across the service territory. The pie chart in the upper left shows, across all homes in 2011, our estimate of usage by end-use.

I -- I think I'll mention also the miscellaneous category is -- stands at 14 percent in 2011. That includes all the uses that we did not classify elsewhere. So we -- we're very granular about heating and cooling and technologies within those, but then there are many other uses that -- that we don't break out separately: the plug loads, the air compressors, power tools, exercise equipment, hair dryers, all those things get lumped into miscellaneous.

Okay. As far as the potential results, this slide shows you the savings, the cumulative achievable savings, that we estimated for 2031/'32. And these are the measures, the top twenty (20) measures, that account for 92 percent of the cumulative savings, in that year. And, as was not a

surprise to us, savings associated with heating, space heating, whether it be equipment measures or insulation or other thermal shell measures, account for more than half of the savings. And the other end-use: lighting is always a -- a significant cont -- contributor to savings in the studies we conduct and -- because the technology is changing. And -- and then we have savings from all the other uses as well.

On -- on the next slide, we show the summary across all of the measures for the residential sector. And we show -- here we show all four (4) levels of potential in the bar chart, and also in the table. And so the achievable savings -- and these are -- are at 570 gigawatt -- cumulative gigawatt hours in 2031/'32. And as a percentage of our baseline projection, it's about 6 1/2 percent of the savings in that year. And the market potential estimate in that year is about twice that, so that, in our minds, is -- is the range of -- of achievable -- of potential savings that could be achieved through programs.

We don't go through all the detail for the other sectors. It is exactly the same process in terms of the market characterization and the baseline projection and the measure characterization and the identification of the top measures.

The commercial sector has the highest potential of the three (3) sectors in Manitoba's service area, with just over 1,100 gigawatt hours of achievable potential in 2031/'32. And that's about 17 percent of our baseline projection in that year.

The industrial sector has the lowest level of achievable savings. This is typical of potential studies and of our potential studies as well. The industrial sector included all of the industrial sector, including very large customers who are already very active in developing their own energy efficiency, meeting their own goals. And so it is not unusual for the -- for the savings from the industrial sector to be the smallest.

Okay. So as a summary across all three (3) sectors, we estimated just under 2,000 gigawatt hours of savings, achievable potential savings, in 2031/'32. That's just under 8 percent of the baseline projection that we developed. And this particular slide shows you all -- again, all four (4) levels of potential.

The -- the pattern you see here for technical potential being around 30 percent, economic potential at about 25 percent -- and I'm looking at 2031/'32 and across all sectors -- is -- is consistent

with findings from other studies. And then the range of -- of market and achievable potential in the range of 8 to 16 percent. And -- and that representative fraction of economic is also representative.

THE CHAIRPERSON: You indicated other studies. Do you mean other studies outside Manitoba?

MS. INGRID ROHMUND: Yes. Yes, other studies we've conducted.

So in -- this is a different view of the study results. So this is -- this is now looking at it from the perspective of the projections. And so the blue line on the top is our baseline projection that we developed for the study, and the other lines show the potential projections for each level.

And so if you were to focus on the achievable potential line and the gap between it and the baseline projection, the achievable potential offsets about a third of the -- of the expected growth in energy use, which is -- and the market potential offsets almost all the growth. So these are -- these are pretty significant savings.

And here's the summary by sector. So as I already alluded to, the -- the commercial sector offers the largest amount of savings throughout the -- the forecast horizon. The residential sector comes in

second. It is -- we have found in our studies that the amount of potential from the residential sector is declining because of naturally occurring conservation and appliance standards.

So there is -- and already the significant adoption of efficient technologies, like compact fluorescents and the successive programs. So the future potential for the residential sector is smaller now than it was, say, three (3) or four (4) years ago when we did this -- these studies.

And as mentioned, the industrial sector is -- is the smallest wedge here because that sector is also -- is already active. And -- and that is consistent also with what we see in other studies.

Okay. So I'll add -- add a little bit of information about target setting. And my experience with target setting is limited to the -- to the US. And we work with some clients to develop their targets, and in other cases we provide the information so that they develop the targets on their own, or that the regulators -- or the legislatures develop the targets.

So there are basically two (2) approaches for developing the targets that are used in the US. The bottom-up method is typically based on

analyzes like we did for Manitoba Hydro. And using that as information, the targets are set. We -- judgment is used to determine the amount and timing of the annual savings targets.

So it may be that -- that more -- the targets are higher in the early years, or they may be less and ramping up. All of that gets decided based on the information that's provided. And this usually involves a negotiation between the utility and the regulators and/or the stakeholders to develop targets that can be met and that can -- that -- the budgets also get taken into account in this process. Something that we did not consider in the Manitoba Hydro study.

The other approach is a top-down approach, where -- where targets are specified as a -- as a -- an absolute number in each year in terms of -- of gigawatt hours, or in -- as a percentage of the forecast. And these are usually set by legislators or regulators in the US. And they may -- may be based more on what are the neighbouring states doing, or other states that we want to be like. What are they doing, rather than on a bottom-up assessment.

There are advantages to -- pros and cons, as we say, to each of these methods. The

bottom-up method is generally preferred by utilities because they are grounded in an analysis that the utilities generally participate in. And the downside that has been called out by stakeholders is that they may not be aggressive enough and may not push the utilities enough to achieve higher targets.

The top-down method may end up in targets that cannot actually be achieved, or will be very expensive to achieve. And when those targets are imposed in a top-down approach, it -- there may be an adversarial relationship between the utilities and the regulators, especially when the regulatory mechanism doesn't support the -- the achievement of those targets.

So in the US, here's this -- a picture -- a state map showing in green the utilities that have an energy efficiency resource standard, and a couple of states that have a combined energy efficiency and renewable energy standard: so Nevada, North Carolina, and Hawaii.

And so twenty-five (25) states have energy efficiency resource standards, and that represent 61 percent of US electricity use. So these are -- are fairly popular in the States. And the form of those requirements vary from state to state. And

there is a ACEEE document that describes that, summarizes that. And there is some flexibility in terms of how states meet those requirements. So I just give two (2) examples.

Washington State has a requirement to achieve all cost-effective conservation. That is the mandate. But utilities set their own goals every two (2) years; they're two (2) year goals, biennium goals. And they -- the utilities have a choice on how they develop those goals. They can do a conservation potential assessment and use that assessment to help them set the goals. And we've worked with several utilities in Washington State to help them set their -- their goals.

The State of Illinois is ano -- is -- is at a different -- takes a different approach. It has set a requirement of 2 percent savings per year, that's off the load forecast, and it has also imposed a spending limit. And those two (2) metrics are not in alignment in some -- in -- from some utilities.

The -- the one that we did the analysis for, the -- the savings -- the 2 percent savings was very difficult to achieve and it required much more spending than that cap allowed. So there was a negotiation that was underway after we finished the

project.

Many states have a stakeholder process whereby stakeholders are involved along the way as the goals are set. And the -- the stakeholders tend to push for high goals. On the other side is the states being under -- being under pressure to keep rates low and sometimes adopt pushing for additional energy efficiency will push the cost -- the price up. So the regulatory mechanism may not be in alignment with promoting additional energy efficiency. And each one (1) of these twenty-five (25) states has its own specific story.

So as far as target setting goes, we do recommend that -- that targets are grounded in detailed bottom-up assessments of energy efficiency savings. And it may be wi -- prudent to average the savings over a few years. So rather than taking the -- the modelling results literally for the first year and second year and third year, it may be better to average across those three (3) years to get an average target.

And in developing the targets or developing programs, it may be appropriate to increase or decrease individual measure savings goals, taking into account how those measures might be implemented

or on specific knowledge of the market. And we believe it's important to have good systems in place to track the results on an ongoing basis so that those can be used in future planning and program design efforts.

And we recommend that these -- these planning studies be conducted periodically. You know, we'd like to say annually or every two (2) years, in practice. It is often longer than that. But at least a routine that says we're going to come back and look at how we've done and use that information to develop the goals for the next planning period.

Questions?

MS. MARILYN KAPITANY: I have a question, but it's actually for you, Mr. Kuczek. You had mentioned in your presentation that you're looking at load growth of 1.5 percent over twenty (20) years, 1.4 percent with DSM.

Could you just let me know how that 1 per -- 1.4 percent relates to the numbers that we just heard in terms of potential savings?

(BRIEF PAUSE)

MR. LLOYD KUCZEK: I'm just wondering

if it might be better to -- to go through my presentation and maybe try to address that at that point.

MS. MARILYN KAPITANY: Sure. That would be fine. Thanks.

DR. HUGH GRANT: Could I ask, while we're on the topic of load forecast, could you go back to slide, I think, 10. It was with respect to forecast accuracy.

(BRIEF PAUSE)

DR. HUGH GRANT: Could -- could you explain this a bit further? Because I don't really understand this slide.

Is this forecasting how accurately you've forecast the annual rate of growth, or is it how accurately you've forecast the absolute level of consumption?

MR. LLOYD KUCZEK: I'll give you an example. It probably would explain it the simplest. So if we were testing our -- our five (5) year forecast, what we would do is -- the accuracy of it, we would go back five (5) years, look at the forecast of what we were forecasting for the current year, and

-- and compare it to the weather adjustment actuals. And that difference would be the measure of accuracy.

And so you can go back five (5) years and look at this year. You can go back six (6) years, but then you would look at the prior year.

DR. HUGH GRANT: Okay. But that would be of total consumption as opposed to the rate of growth in consumption?

MR. LLOYD KUCZEK: Correct.

DR. HUGH GRANT: Okay. And just -- one (1) other small point. Do you do your own population forecasts, or do you just rely upon Canadian -- StatsCan, Conference Board?

MR. IAN PAGE: I can -- I can address that. Our population forecast is produced by a -- from a consensus of another -- a number of independent forecasts that we purchase. So for the 2013 forecast, there would have been five (5) separate forecasts that we would have used.

THE CHAIRPERSON: I have a question for Ms. -- Ms. Rohmund. And specifically, what I'm -- what I'm trying to understand is when you assessed the potential of the measures, you were given a set of measures by Manitoba Hydro to assess.

In other words, were you looking at the

full range of measures applicable in North America, or were you just looking at those measures that Manitoba Hydro said, These are the measures we'd like you to address?

MS. INGRID ROHMUND: In our process, we start with the measure list. We -- we deliver a preliminary measure list to our client; so to Manitoba Hydro. And they reviewed the measure list and gave us feedback. And in that process, some measures were added to our list that -- that are relevant here, and other measures were taken off of the list.

THE CHAIRPERSON: One (1) of the experts has indicated to us that the tests that are used by Manitoba Hydro to identify those measures which might be useful in Manitoba are not the same as those used elsewhere. And -- and ergo, that means that some measures are being screened out that had market potential in Manitoba.

And I guess the question I'm trying to get at is -- what I'm trying to get at is trying to understand to what extent that those measures that you used were uninfluenced by the screening-out that might have been done by Manitoba Hydro?

MS. INGRID ROHMUND: So the measures -- each measure goes -- goes through the screening

process using the total resource cost test. And that results in a benefit-cost ratio.

And we included the measures with benefit-cost ratios of one point zero (1.0) and higher and excluded the ones that were less than one (1), which is what we've done in all of our studies. So -- and that is -- that is standard practice for our studies.

If a client were to tell us to lower the threshold, then that would give a different potential. But one point zero (1.0) is what we've used in our studies, and it's -- it's common.

DR. HUGH GRANT: Can I just follow up on that? Because you mentioned, when you looked at the achievables, you listed things that passed the sort of cost-benefit test. That's cost-benefit to whom?

Is that a social cost-benefit, or is it specific to Hydro?

MS. INGRID ROHMUND: It is a -- it is a total resource cost test, but it is specific to Manitoba Hydro in the sense that the savings and the -- from the measures and the costs of the measures reflect local conditions, and the benefits through the avoided cost are specifically Manitoba Hydro's.

So the formula is the same across the studies, but the -- the data in the formula are specific to Manitoba Hydro.

DR. HUGH GRANT: If -- if I could pose it differently then, suppose there was a DSM measure that was determined not to be of net benefit to Manitoba Hydro but might potentially be of net benefit to the province.

Would that get screened out?

(BRIEF PAUSE)

MS. INGRID ROHMUND: So the total resource cost test looks at the -- the benefit and the cost of the resource independent of who pays for it. And so it's -- the -- the information is the avoided cost and the savings and measure costs are all Manitoba specific, but the meth -- it -- it wouldn't matter if it were.

(BRIEF PAUSE)

MR. RICHARD BEL: Could you give us an example of a measure and how you would screen it? For example, we heard a presentation on Thursday that

discussed switching residences who don't have the option of gas from electric heat to geothermal by Hydro financing the upfront capital cost. And it was claimed at that -- in that presentation that that would generate additional available energy at three (3) cents a kilowatt hour. Is that correct?

So how would -- how would you approach that measure? A concrete example. So is -- is geothermal considered a measure to switch people to geothermal?

How would you evaluate that?

MS. INGRID ROHMUND: So geothermal heat pumps were a measure, and we looked at customers with electric resistence heating switching to geothermal heat pumps. We did not...

(BRIEF PAUSE)

MS. LOIS MORRISON: Hello. In the study we did include geothermal heat pumps as one of the measures, and that's one that we actually specifically requested to be included in the study. And so it did get screened in and was looked at based on the energy efficient -- the energy savings that are realizable within the Manitoba market.

And as Ms. Rohmund referred to, we looked at specifically in the case of electric resistence heating or where there's an electric furnace in existence, because you -- there -- you need the ducting to -- to make the system operational.

And so, yes, those measures were included in this analysis. And then to build on -- I believe it was Mr. Lorenz's presentation, Manitoba Hydro does offer financing for geothermal heat pump systems through our earth -- our Residential Earth Power Program. We also offer funding -- or financing through our residential Power Smart PAYS Program. We also have incentives to support geothermal heat pump systems in non-gas-available areas for commercial buildings.

THE CHAIRPERSON: Okay.

MS. MARLA BOYD: Mr. Chair, just being mindful of the hour. I expect Mr. Kuczyk's -- the balance of his presentation will be about fifty (50) minutes. I don't know if you'd prefer a morning a morning break now, or if you'd like to hear the balance of the presentation.

THE CHAIRPERSON: I think we should do it now. Before -- I have one (1) more question I wanted to -- to understand, and this is to do with the

total resource test -- the total resource cost test.

One of the experts that we -- expert reports has indicated that -- that we should be addressing these measures at a portfolio level as opposed to a individual measure level, which would suggest to me that as long as the portfolio is lower than one (1) and -- globally, you should be considering other measures that otherwise would fail the introductory test.

Now, in your case you looked -- you were looking at the total resource cost for individual measures, right? You -- you didn't consider measures that would otherwise have failed an individual test.

MS. INGRID ROHMUND: That is correct.

THE CHAIRPERSON: Okay.

MR. LLOYD KUCZYK: I'm not sure I'm going to make fifty (50) minutes, but I'll -- I'll do my best here. There's a lot of issues with DSM that seem to get confused at times, and what I'm going to try to do here is clarify some of the issues so that when we have a dialogue in the next -- about DSM in the next three (3) days, that we're all on the same ground.

And there's some areas of concern that were also brought up that I'd also like to address and

hopefully provide some clarity on.

The first area that I want to touch on is our Integrated Resource Plan. And the concern expressed there was that Manitoba Hydro doesn't include options, DSM options, and so for -- the end result is our resource plan is not optimal.

And what I'd like to do is go through what our combined DSM integrated resource proc -- planning process is at Manitoba Hydro, which should provide some clarity and hopefully some comfort that the end result is that we are including in the -- at least in the ideal case, all economic opportunities within our resource plan.

So it starts with -- and it's not quite as simple as I've got it on this diagram. But on the left side, this would be a integrated resource planning staff. They update the marginal value. And this is the value of energy at the margin to Manitoba Hydro.

They provide that value to our DSM staff. Our DSM staff update the plan based on that value. They do the screening, and I'll get into that. And then we provide our plan back to the resource planning people, and they undertake their integrated resource planning process.

So if we go to the DSM process, once -- once the marginal value has been provided to us we undertake an assessment of opportunities and basically filter out those that are economic and those that aren't. And we use what's called a resource cost. And -- and I'll just point out, when we say, "resource cost," this is the total cost of the -- implementing DSM; it's not just the utilities cost.

And this is what Ingrid mentioned earlier that people take into account. It -- it really shouldn't matter who's paying for the DSM measure. The relevant cost is the total cost because if a utility pursues a supply-side option, ratepayer -- customers pay for that cost, the total cost for rates.

If you pursue a DSM option, customers also pay for the total cost. Part of that's paid through the utilities rates which incorporate the DSM investment, and the other part is through the participating customers' contributions through the DSM. So at the end of the day, it's the integrated cost that really matters, and measuring that against the marginal value.

THE CHAIRPERSON: And you -- I'm sorry, could you define 'marginal value' for me?

MR. LLOYD KUCZEK: The marginal value is the value to the Corporation of energy at the margin.

THE CHAIRPERSON: Could you tell me what the number is roughly?

MR. LLOYD KUCZEK: Oh, that's the number you'll hear when we provide you with a proxy of seven point four (7.4) cents. I think -- what is it, seven point four (7.4) right now roughly? It varies each and every year, but...

THE CHAIRPERSON: In the neighbourhood of seven (7) point something, right?

MR. LLOYD KUCZEK: Seven point five (7.5). It's been at eight (8) cents and...

And so in the -- the ideal world, and -- and there's never an ideal world, but the result of our -- our DSM annual review is that the economic opportunities are supposed to get filtered out. They're combined as a package, as what we refer to as the Power Smart Plan. And then we provide that back to the resource planning people.

So what you see is they get a package. And, essentially, it's just one (1) bubble. And they -- they used to compare it to other resource options. But what they found is that it was always economic.

And then it just ended up in -- I'm not sure what year they started doing this, but, you know, it was just on the base cases, clearly part of our resource plan and didn't need to be assessed against the more cost of -- more costly options.

So if -- if you look at the combined process, we do the filtering in the DSM shop, provide that package of, hopefully, all economic opportunities. And as we get into the discussion further and where we're going you'll -- you'll actually -- there's -- there's actually some red in there, as well. And that's where you get into combining, and so -- and at the margin it might not be cost effective, so a lot -- a lot of judgment is used in that regard.

But at the end of the day, the DSM package is there and you have your metrics to tell you what the value and the costs are associated with that DSM plan.

In theory, you could integrate the two (2) filters and we could provide the resource planning people with all those options. In reality, there's an infinite number of options, so it's -- in practice, it's -- it's really not practical.

So if you wanted to drill down and --

and identify all the individual technology opportunities, that would be one (1) way of doing things. But what you really have to do is you have to develop a program. And so there's -- there's many ways of pursuing DS -- DSM opportunities, including various incentive levels, incenting the customer, incenting the -- the suppliers. So -- so there's many ways of doing it.

So in practice what you end up doing is you -- you come up with what you think is the most appropriate plan for a particular initiative, and you filter it through that filter. And if it's economic, it gets passed on as a package to resource planning. And -- and later on I'll explain that we actually will -- we approve programs without -- we don't just approve programs, individual programs, once a year, we -- it's a continuous process at Manitoba Hydro.

And so the marginal value that we -- and this may help in understanding, but it also provides some comfort in terms of -- the value that we use is developed using the same model that is used to provide the incremental system costs and benefits for economic comparison of resource options and from the perspective of indivi -- incremental system value.

So in theory, in the ideal world, it --

it should at least be -- the economic opportunities should filter through. The bigger issue would be whether or not those economic opportunities are developed in concept.

So the conclusion that I've come to monitoring this process, is that, given how the marginal value is determined, Manitoba Hydro's combined DSM integrated resource process should result in all those economic DSM opportunities being filtered into the Corporation's plan; in the ideal -- ideal world.

I want to talk just at a high level about what our strategy is. And if somebody were to ask me what Manitoba Hydro's DSM strategy is, it -- it's basically this in -- in a simple sense: It's to pursue all cost-effective DSM opportunities, and as measured by what I'll explain later is a modified total resource cost ratio. It's the same -- same test that Ingrid was mentioning, except slightly modified. And then, combined with that, we have to balance being fiscally responsible and being considerate to ratepayers and all customers. And I'll touch on that later to explain what that means.

Our strategy is also a comprehensive approach. It's not about just offering incentives,

offering programs. Codes and standards is probably the most effective way of achieving energy savings, and it's a very important component of our strategy. Education is another important component of our strategy, programming where appropriate, and economic -- a lot of judgment on the economic, and we'll talk more about that, and also monitoring and supporting emerging technologies.

I mentioned codes and standards is a very important component of our strategy. The green shaded area shows what we're expecting to achieve through codes and standards, and the red is what -- what we're expecting to achieve through our DSM programs.

And while I'm here, for -- for the -- the most part, it -- it's important to recognize, you know, when you're -- when we're looking at what's been achieved within a region, not just looking at what's achieved through the marketing programs, but it's the combined effort. At the end of the day, from an integrated resource planning process, whether it's included in the load forecasts or codes and standards or through the DSM programs, it really doesn't matter. It's -- that would be the net impact on your load in -- in Manitoba, in this case.

So I'll talk about the DSM screening and the metrics, and touch base on how Manitoba Hydro uses it. And given that RIM has been such a topic of discussion over the past number of years, I also want to touch on that and provide clarity.

So in terms of the industry, there's a number of DSM metrics. You can put them in three (3) buckets. One (1) is from the resource perspective. And -- and it's important, when people talk about metrics, economics, there's -- there's three (3) different perspectives, generally speaking. So if somebody were to say to me, Something's economic, I would right away ask, From what perspective are you talking about? So there's confusion sometimes.

So the resource perspective is irrespective of who pays for it, and -- and that's how we filter DSM opportunities out. And our -- our view is, and our strategy is, to pursue all OF those opportunities. As the Utility here to serve Manitobans, we think it's in the integrated perspective that makes the most sense.

Then within that category, you get into what's called a societal resource cost, which is -- is a modified version of the total resource cost, and you're -- you're including non-energy benefits. And -

- and I mentioned that we use a modified version and I'll talk about what that is.

And then there's the levelized resource cost, which is just the denominator of that ratio. So the total resource cost is a simple benefit cost ratio; the levelized resource cost is the -- is the denominator, which is just the cost component.

From the Utility perspective, the general metrics that are used is the levelized utility cost. And again this is just the cost. It's not looking at what the revenue impacts are. The rate impact measure, which is -- I'll talk about that. And then NPV which I think most people understand what that is. And also the customer perspective.

There's a benefit cost ratio that's used that's called a participant customer cost test which is just benefit over cost from the customer's perspective. And then we use also a simple payback period, because a lot of customers just think in those terms.

So how are DSM metrics used? And -- and this is in general, and it -- it -- there's no -- it's not consistent across all regions, but in general the TRC, or a modified verison of that, is used as a go/no go decision. It -- it -- generally speaking,

the benefit should be greater than the cost from the combined utility customer perspective if you're going to pursue it. So it just makes sense.

In terms of program design decisions, that's where you start to use all the other metrics. And what you're trying to decide there is: What is the best program to pursue the DSM opportunities available? And you have to take into account trying to maximize the energy savings, take into account how those should possibly be shared, the costs should be shared between the utility which is basically all ratepayers, and those that are benefiting by participating in the programs. And you should also think about how you should change the design possibly over time, because having a static program might not be necessarily the optimum approach to take.

Just to share with you some information from an ACEEE report that was undertaken -- and I won't run through all the numbers, but you can see that utilities use -- regions and utilities use a variety of the metrics. And it -- this won't add up to fifty (50) states; this was a survey undertaken and about forty-three (43) or forty-four (44) states responded, as far as I know.

This is the simple equation for the

total resource cost test -- benefits over costs, as I mentioned -- and at a true total resource cost ratio test without being modified. That's just taking that marginal value to a utility and dividing that by the resource cost: not the utility's cost, the resource cost. The resource cost is the combination, as I mentioned before, of the utility cost plus the customer cost.

And -- and I've seen it in evidence provided at this hearing where people will actually talk about the utility cost and measure that against the marginal value. You -- you can do that, but when you're really looking at the -- making a decision on whether or not to pursue an opportunity, the relevant measure is against the resource cost. It's okay to look at the utility cost, but just keep in mind what decisions you're going to make when you're -- when you're doing that, and what relevance it has.

So how do we use the TRC? I've explained this before. In the bottom part of the slide it -- it shows what we use as an equation. And what we've decided to do is we include any measurable non-energy benefits as part of that equation. And an -- an example of that would be if there was savings in -- in water use, we -- we would take that into account

as clearly something that could be measured.

We considered using the societal resource cost test s number of years ago; looked at what other utilities were doing, and, generally speaking, what it amounts to for the most part, and things may have changed, but when I looked at it it was just adding an adder. You know, like you -- it's very difficult to measure what those benefits are, and so we thought about -- I -- what we do with ours, we -- we do calculate it, but it's just adding 10 percent onto the -- the marginal value.

So the conclusion that -- that I come to in terms of our use of DSM metrics, it's generally consistent with the industry, and the metrics are -- should be used as guidelines rather than rules, and I'll talk a bit about that. But the general gist of that is, is by using guidelines as opposed to rules, in my -- my opinion, I think you can achieve more; and I'll talk a bit about why that makes sense.

So first, each DSM opportunity is uni -- has unique characteristics. The target market's different and you need to take that into account. And I'll give you an example: If you're pursuing a low-income target market and you're looking at how you're going to split the costs, we've decided we'll just pay

the -- the total cost when it comes to the insulation component of that program. And there's another program called the Water and Energy Savers Program. We decided with that program it was best for Manitoba Hydro just to pay the entire cost. So each opportunity we assess differently depending on the barriers and the situation. No hard rules.

So at the end of the day, when staff come up with a design, it's supposed to be what we would consider and the staff consider the most appropriate design, taking into account all the metrics and the Corporation's objective of achieving all cost-effective measures, and still being fiscally responsible.

The other thing that you need to take into account is where on the market transformation curve you are. And when I say, "market transformation curve," if you -- if you take -- talk natural gas furnaces, for example, if you're trying to convert that market from standard to high efficiency, you're -- you're at the -- you're -- you're at the far end of the transformation curve already, because there's not a lot of furnaces left in the marketplace. There's more than what we'd like, but you're further up the curve.

So you need to take into account where you are within that market transformation curve. You need to take into account wha -- what options the customer has should that oppor -- or in -- in this case, a furnace -- when they're going to potentially die, what -- and it's the same with the inefficient refrigerators that are in place in the marketplace. And there's different barriers that need to be considered.

And another important point that I would like to make is DSM proging -- programming isn't an exact science. And when we make judgment calls in terms of what program design is acceptable we're not concerned about the rounding error in our shop. We're more concerned about a long-term plan, being in the marketplace and not -- not entering the marketplace, and then when things change, pulling out and going back in later when -- when our marginal cost numbers, for example, change.

So we'll -- we will take into account market conditions. For example, in 2008 and '09, when there was a recession, we didn't think -- and the market prices and the export market were slow, well, we didn't think it was necessarily the best time to be launching some new -- new programs.

Levelized utility cost. During -- we're -- we're -- we don't believe rules should be established for that, as well. And we're willing to -- - we're willing to have programs with different levelized utility cost for two (2) reasons. One (1) is it may make more sense to achieve the -- the DSM opportunities within a particular opportunity because the barriers, and we just have to pay more, like the Water and Energy Savers Program. The other reason is, and this is very important, is our mar -- when we compare it to the marginal value, that marginal value number that you hear is just a proxy number. The energy is worth more to us depending on the season and depending on the year. So if the energy's being captured during the wintertime, we're willing to pay more for that because it's worth more to us.

And my last point is the optimum program designs may mean offering different incentive levels over time.

And my other point is it's not all about -- and I mentioned this already -- about paying higher incentives, and I have a few examples to demonstrate that.

So this is our home insulation program and on the top, the different coloured coding is when

-- indicates when the incentives offered to customers changed. This is the combined incentives that -- offered to customers by Manitoba Hydro, and the Federal Government in this case. So we started the program by offering -- and this is just a typical number -- it's each -- each customer -- it depends on which measures you put in place, but just typically about five hundred dollars ($500) for the first period of time, you'll see in blue there. And the -- just to orient you, that's the number of customers that participated within a quarter. And what happened approximately a year later, a little longer, is the Federal Government came with -- came out with Eco-Energy Program, offering a thousand dollars. So incentives were tripled at that point, and you can see that participation didn't triple.

So it's not all about offering incentives. And -- and so if you were to measure how cost effective that ext -- additional thousand dollars were that the gov -- Federal Government offered, you really should assess it from an incremental perspective and say what would have happened without it, and -- and evaluate the -- the cost relative to just the incremental energy savings that would have been achieved with that additional thousand. And you

have to keep in mind when you are accessing that cost, all customers that participated in that program, whether influenced by that thousand, or just Manitoba Hydro's five hundred (500), would have to be taken into account on that assessment. So at the margin, just looking at that, I -- I would suggest that, that was not cost-effective on their part.

They subsequently came out with inc -- an initiative to increase that to twelve hundred and fifty (1,250) instead of a thousand and they also had a tax credit associated with that. And I believe it was time limited. Time limited actually will assist in influencing customers as well.

And you could see that there was a spike, and I would suggest that the time limited component of that actually drove the spike. But if you look under the shaded area of the green there, and if you were to evaluate that program, or -- or that particular incremental component of the federal contribution, you -- you might not conclude that, that's economic either because what probably happened was that you advanced some people from -- to -- advanced some customers that would have installed the measures anyways had you not added that incremental incentive there. So it -- it becomes quite

complicated and there is a lot of judgement that would be used.

So when you hav -- offer something like that for a time limited period, in our judgement is, you advance some and -- customers that would participate otherwise and -- and they just part -- participate earlier. And of course some are actually are impacted by that opportunity.

The subsequent period is in purple there. This is when we went back to just Manitoba Hydro's incentive, and you can see the participation actually declined. But I'll also point out that you'll notice that there's an overall decline throughout this entire period, and that's generally what you expect to happen when you're pursuing a particular opportunity; the market size is diminishing as you get more and more custom -- customers to participate, similar to furnaces. At one (1) time we had about sixty thousand (60,000) standard efficient furnaces. As you move along in time, it's fifty (50), then forty (40), and so there's less customers that are available in your target market.

Subsequent to that period -- and I'll go to the -- the orange there -- the Federal Government came out with the an -- an aggressive eco-

energy program which was comparable to what they had before they re-announced it. And we increased our incentives at the same time, and you can see that, that -- that captured a number of customers -- or influenced a number of customers to participate, so.

But at that point, now you're at four point six (4.6) times the incentive level, but -- and not increasing participation by four point six (4.6). And now we're back to where our current program is, at -- at eight hundred dollars ($800).

So -- so there are some lessons to be learnt in and -- and just looking at what happened under that program. And well I've -- I've mentioned them already, but it's not all about incentives; it may make sense to change your incentives over a period of time; it may make sense to offer time-limited incentives to influence people. But in the end, it takes time to get customers to participate.

There's -- there's different customers. Customers are at different space in -- at -- at different times in the future, and so as you move along in time, more customers are -- might be willing to insulate their home for different reasons: They're -- they maybe have more money. They're at a different stage in their life. People change homes that they

live in, so new people moving into a home after they've been there for a while might be willing to do it as opposed to the previous people.

Geothermal: You mentioned geothermal as -- I could talk about geothermal for quite a while. So -- so geothermal -- there's a couple things about geothermal. The one (1) thing that I -- I -- I'll start with, the level of incentives offered here did not result in a lot of participation. So if you start on the left in pink, red, the incentive levels were thirty-five hundred dollars ($3,500), they weren't insignificant, and the participation was extremely low.

In the green area, you can see participation again was not high. And at that point, the -- these are Federal Government incentives -- the Federal Government raised it from thirty-five hundred (3,500) to forty-three hundred dollars ($4,300).

And -- and then when we move to the orange, they increased the incentives to over five thousand dollars ($5,000). And you could see that certainly more customers participated, but is not a significant number.

Geothermal -- and I'll just offer a few comments on geothermal. I've been working on

geothermal going back to the Waverley West days, if you recall, with the Manitoba Government interested in installing geothermal in Waverley West. I've been involved in the Canadian GeoExchange Coalition. I was a chairman. I chaired the board on that -- that coalition for -- for a year and I was a board member for a number of years. But the Federal Government and Coalition, as well as our local government, as well as Manitoba Hydro, have been scratching their heads and trying to figure out a way of making geothermal work and getting more customers to participate in geothermal.

The challenge with geothermal is, is it's not a mature market. So when you don't have a mature market, the cost of installing geothermal can be rather high, and so the payback period isn't very good on geothermal, and it's a significant cost. If you got a quote for a geothermal system, you'll be looking at over twenty thousand dollars ($20,000). It's like buying a car.

So when customers are thinking about installing a heating system that could cost thirty-five dollars ($3,500), four thousand dollars ($4,000), and they -- they have that option, it -- it's very difficult to go down the geothermal path.

And if you're in an existing home, the other thing that you'll be -- become aware of, if you look into it, is your yard is going to become a mud bath when it's installed. It -- you have to totally la -- re-landscape, so it's not just the cost of installing geothermal; it's also the cost of re-landscaping. So fairly significant.

We have been successful with working with a couple of First Nation communities, however. And this part summer, Peguis First Nation and Fisher River have become very inter -- well, they're interested in installing geothermal. And we have a program with them that's called the Community Geothermal Initiative. And by taking a utility model, you can drive down the cost and it can become more cost effective. And so tha -- we were able to do that with them, and working with the industry to install geothermal systems at a much lower cost, so that they would be cost effective. But even then they're not cost effective for every home.

So we're currently doing that. There was a hundred and seven (107), I think, installed this last summer where they're -- the communities are planning to install more next year. I think both communities are planning to install at least fifty

(50) per community. We're working -- talk -- discussing the same initiative with four (4) other communities.

But geothermal doesn't always work in every area. So one (1) of the communities that we've talked to, the home is very small. So if the homes aren't big enough there's just not enough savings there, so those homes don't make sense, so.

The other thing to take into account, if you have to drill through rock to put the loops in, very expensive, so that doesn't make sense. So even when you do the utility model or community model those aren't cost effective either, so.

So the -- the applications of geothermal are limited and the barriers to -- in getting a significant number of geothermals installed in the marketplace is very challenging.

(BRIEF PAUSE)

MR. LLOYD KUCZEK: A couple of comments on the use of RIM. I think it's been mentioned by others that it's a crude metric and it doesn't have much value. I'll agree that it's a crude metric, but we do pro -- we do think it provides

marginal -- some value to Manitoba Hydro in the context of all the metrics that we use.

And so given that it provides some value, we still calculate the RIM and provide that information, along with all the other metrics, when we look at program designs. So it provides some insight in terms of directional impact. If the directional impact is negative, that doesn't mean Manitoba Hydro won't -- will not pursue a program. The key measure for us is if the benefits are greater than the costs, we should be pursuing that program. It's really the program design that makes the most sense to us.

And it also provides some insight when we're looking at that total resource costs or the levelized resource cost because of the seasonal different values.

So when staff are presenting me with some information and I see a levelized utility cost for two (2) different opportunities that are the same, it might be more -- one might be more valuable to me. And all I have to do is look at the RIM and it tells me that. And it's just a comparative measure. That's all it really is.

(BRIEF PAUSE)

MR. LLOYD KUCZEK: So some people also ask the question: Why doesn't Manitoba Hydro invest more in DSM? Our levelized utility cost is only two point four (2.4) cents and our marginal cost is much higher.

The simple answer is we pursue all cost-effective measures. So when we talk about what the program cost is, that is the average of all our initiatives. So it's inherent that if you're pursuing all opportunities that are below your marginal value, there's going to be some that are less than that or -- they're all going to be less than that, and some that are going to be considerably less than that. So when you do the average for the program -- the plan, clearly the number's going to be lower.

The other -- the other reason is -- is because we share the costs with our participating customers. We don't always pay it. In this diagram here, it'll show you what -- how they're shared between our customers with the different programs, the green being what Man -- the customer contributes, and the red being -- or the blue being what the Utility contributes.

And you can see the first one I mentioned, that on your left is the Water and Energy

Savers Program, where we pay the entire cost, and the third one is lower income, where we pay the entire cost. And the -- the sharing is different for each program, as I mentioned to you before.

We -- we come up with a -- a sharing based on what we think was -- would be the most effective program to achieve the results. And as you move along in time, that ratio could change.

The other -- the other point I guess I should make as well is: How do we compare to other utilities? Is -- is our levelized utility cost extremely low compared to what other utilities invest in?

And I don't have a slide that shows this, but Mr. Dunsky's testimony provides on page 34 a graph that compares what Manitoba Hydro's first-year costs, I believe, are compared to other utilities. And it's generally -- with the exclusive of four (4) utilities, generally in the same range. There's variations among regions, but generally in the same range. BC Hydro's two point nine (2.9); we're two point four (2.4).

This subject is a little more complex, but I gave a -- in -- in -- I'll provide you with the reference. This is PUB/Manitoba -- or our response to

PUB/Manitoba Hydro-1 to 16(b). I provided there an example to hopefully shed some light into why utilities don't spend more possibly on -- in terms of DSM costs than what you see being spent in the industry.

And -- and so it tries to address: Why do utilities not invest as much on DSM as they do on generation? So one (1) of the considerations is -- is, first of all, you need to look at the total resource and the cost, not just Manitoba Hydro's cost. So when we're talking to the utility cost, that's just that component to start with.

So the example I -- I provided there -- and this is very simple. This is not the real world; that I provided a very simple example just to help people understand why this might be the case.

So one of -- one of the key principles to understand is -- is DSM is different than supply-side options in the sense that when you pursue DSM in an ideal world, and if you're not interconnected with other utilities, there is no revenue associated with DSM, whereas with supply-outside options, there is revenue associated with generation because your -- your load is increasing, you build more generation and, so there's more revenue coming to the -- into the

company.

So what -- what the example is intended to show is if you just look at a simple utility not interconnected, what would be the impact of the decision to either pur -- pursue new generation, which is at a higher cost, or pursue DSM options?

So I -- I provided a very simple example where the generation is equal to the load to start with, 1,000 gigawatt hours of load, 1,000 gigawatt hours of generation. The utility's rate is seven (7) cents; just call it levelized for argument's sake. And the total revenues brought in through the company are 70 million. So I'll just walk you through if -- what would happen if you chose different paths.

So this is the existing situation. The rates are seven (7) cents. And I'll suggest they're levelized just for argument's sake. The bills being paid by the customers -- and people argue that bills are more important than rates and we agree with that. It's -- it's the total bills that the customers pay that's relevant. And each customer in this case have paid seven hundred dollars ($700) for a yearly energy bill.

If you pursue the generation option, which has higher cost of ten (10) cents, and you do

the math the utility has a larger customer base and -- but its costs have gone up because the -- the incremental generation costs ten (10) cents as opposed to its embedded cost of seven (7) cents prior to that.

So now it has to raise rates, and the math -- it'll come out to seven point two seven (7.27) cents. Customer -- customers' total bills are 80 million. And the customer average bills, even the -- if you consider each customer being the same and -- their bills go up. So there's new customers, everybody uses the same, but now the bills are up 'cause new generation cost more. It's just all the math, if you roll through it.

Now, if you take the alternative option of pursuing DSM and your position is, is that you're going to spend just as much on DSM as you spent on new generation, what happens there is, is that the rates have to go up even more. And the reason the rates have to go up even more is because now you have -- you don't have as much energy that you're selling, and you spent the same amount on -- that you would have on generation. So if you do the math, now the rates actually have to go higher.

And so the total bills for the customers in aggregate is the same. So -- so the

argument is the total bills is what's relevant, and you -- you should be indifferent, Manitoba Hydro -- or utility, and you should spend that. The concern is the fairness issue, and -- and this is the point.

So what happens is participating customers' total bills are actually lower than they were before, and the total bills of non-participating customers are higher, so...

So what I did was I -- I did the calculation to say, Well, what -- what would you have to do if you were a utility and you were -- you wanted to be fair to your customers? And so then you should invest in DSM at least to the same degree as what their impact -- bill impacts would be the non-cust -- participating customers as they would be if you pursued new generation options.

And -- and so the outcome of that would be is that the bills for the non-participating customers, they go up from the base case just like they do with new generation, but they go up no higher than they would should you chose new generation. So those customers aren't impacted in a negative way. The participating customers' bills are even lower. But the offset, of course, to that is they have to invest in the DSM opportunity and -- and pay a portion

of that.

So I offer that as an example, as a simple example to -- to give you a feel for what may make sense from a utility's perspective if you were taking fairness into account. This is very crude, this example. We -- we don't think in terms of this. The real world is much different. But it provides some insight if you take into accou -- just recognize that with DSM there -- there is no revenue associated to that when you pursue DSM; with generation options, there are.

And the other point I'll add, because it's come up at our GRA, is the marginal value relative to the export market. So people -- you -- you've asked the question about, you know, like, how -- how do you think in ter -- or how do you compare that, what I just explained, and co -- compare spending on DSM relative to new generation as opposed to the export market.

So if the value is determined by the export market, what I would suggest is, from a utility's perspective, the relevant metric would be you should -- or -- or a guideline should be that you should spend just as much -- you should be willing to spend an amount that's equal to the difference between

the value in the export market relative to what your loss revenue is domestically, because that's the economic benefit to you as a utility, so...

And so generally speaking, if you looked at the export market and if your rates were five (5) cents domestically and the export market was seven (7) cents, you should be willing to spend two (2) cents on your DSM opportunities, because there's an economic benefit to you as the utility.

So in the real world it's much more complicated. And -- and you could -- the -- the panel that deals with our integrated resource planning process can discuss all those issues. But the point I was just trying to make here is -- and trying to assist you with is trying to understand that it's generally in the same range. And also, the important -- the other important part is the fairness issue.

Having said that, I would say that Manitoba Hydro doesn't -- doesn't look at it that specifically in terms of what we're willing to spend on DSM on a particular measure. Our primary criteria in our decision making is what's the most effective, in terms of a program design to achieve the -- our objectives.

And I think -- I think I've already

talked about this slide. So benchmarking. Based on my experience being in this industry, or at least working in the DSM area, I offer three (3) comments. Benchmarking should consider a utility's DSM efforts from a broader perspective beyond just programming achievements. And I touched on that earlier in terms of codes and standards is very important, but it goes beyond that; as well as looking at what's been achieved through codes and standards, the -- the marketing efforts, the -- the education, and supporting emerging technologies.

My second comment is -- and observation has been that there's no single metric that should be used to benchmark DSM efforts among utilities. Regional differences can result in misleading information.

And the third point, probably the most important, is caution needs to be exercised in any comparative analysis, as reported. Energy savings can be misleading. There's gross energy savings relative to net energy savings. There's inner active effects that some utilities take into account, others don't.

Accuracy of baselines. I've got a slide that'll explain this in a little more detail. And there's the free ridership issue. I mentioned

there's a lot of judgment used in -- in this industry. And -- and because of that, a lot -- one has to be careful with comparative measures.

When one talks about gross savings, that -- that's just looking at what's been achieved regardless of whether -- what's been achieved in the marketplace through both natural conservation and what would have happened with and without programming. And -- and so that's what gross means.

The net savings is, is looking at what is really being achieved only because of your programming efforts. And it even becomes more complicated within programs, as I mentioned earlier, because when you're thinking about program designs and you want to start assessing things from an incremental perspective, your brain could explode sometimes thinking about the different options that are available.

So -- so you -- you can't get lost in the detail in terms of looking at too many infinite opportunities. You have to just decide on a program that makes general sense.

Baselines: there's a lot of judgment. When I say "baseline", that's what's going to happen in the marketplace for a particular opportunity if you

don't intervene in the marketplace. So that's just a projection of what you think's going to happen.

So if you take LED lighting right now, our staff would be looking at the marketplace and trying to project what the participation is going to be with L -- LED lighting into the future. There's a lot of judgment in -- into that. The -- the projection of what that would be today is different than what it would have been a year ago, because the marketplace has moved faster than what -- what we thought.

Okay. I'm going to move into the sensitivity analysis and how...

MS. MARLA BOYD: Apparently we need a bit of a time out, Mr. Chair.

THE CHAIRPERSON: Think it would be an opportune moment to take a break. Why don't we take -- ten (10) minutes enough, or do we need fifteen (15)?

MS. MARLA BOYD: Either's fine, sir.

THE CHAIRPERSON: Okay. So let's resume again at twenty (20) after, please. Okay. Twenty-five (25) after.

--- Upon recessing at 11:14 a.m.

--- Upon resuming at 11:28 a.m.

THE CHAIRPERSON: I believe that we're ready to resume the proceedings. Before we ask further questions, Mr. Williams, you had some --

MR. BYRON WILLIAMS: Yes. Lest Mr. Simonsen get too -- too angry with me, I'd ask that the PowerPoint presentation of the opening statement of CAC (Manitoba) be marked as CAC Exhibit Number 44.

--- EXHIBIT NO. CAC-44: PowerPoint Presentation of Opening Statement of CAC (Manitoba)

THE CHAIRPERSON: The panel has no further questions, at least at this time, for -- for you, Mr. Kuczek. So I wonder -- we're now proceeding to -- to you, Mr. -- I might go back to you -- back to you, Ms. Boyd.

MR. SVEN HOMBACH: I -- I don't think Manitoba Hydro is completely finished with its presentation.

THE CHAIRPERSON: Okay.

MS. JESSICA SAUNDERS: And my apologies, Mr. Chair. Mr. Chair, Jessica Saunders. I -- I intended to jump in right after Mr. Williams, but in terms of outstanding matters from yesterday we also

need to name our book of documents Volume I from the cross-examination of Mr. Thomson from yesterday as Exhibit number 28. So I would ask that that be added as MMF Exhibit 28, please. Thank you.

--- EXHIBIT NO. MMF-28: MMF Book of documents Volume I

THE CHAIRPERSON: Thank you. Mr. Kuczyk, back to you then.

CONTINUED BY MS. MARLA BOYD:

MR. LLOYD KUCZYK: Thank you. The remaining slides I have shouldn't take too long. There's -- there's not a lot of detail discussed within each. But the first area that I want to talk about is the sensitivity analysis that our staff are undertaking with regards to DSM options, and I want to just share with you how we develop those options.

And so what we did is we -- we looked at our existing opportunities, programs that we're pursing today, and we asked staff to drill down and see if they could come up with program designs that were more aggressive. And they did that. And then we sat down and we -- we reviewed those designs. Some of

them actually were well under way anyways, and we were planning to pursue those. Some were not, so not quite as much analysis went into them. So I'll just suggest you need to use some caution with some of the program designs that we included.

But so we -- we looked at the number of programs that were offered, and we put into the bucket -- one bucket the ones that we -- were economic as -- as filtered out by that marginal value, and we ended up calling that Level 1. And the other bucket, we threw in some program designs that were non economic as measured by the margin of value, and we ended up calling that Level 3.

And so I'll -- I'll talk a bit more about what those programs are, but essentially they're the same programs just different designs. And there's a few new programs that were on the horizon related to LED lighting that -- where the costs have recently dropped and we decided we would pursue those, or at least include them in this package. But we have decided that we're pursuing them anyways.

The other category of options that we looked at was -- and -- and they're somewhat different than energy efficiency, so we included them as -- in a different bucket. And these are initiatives that we've

been looking at for a while.

Fuel choice, a campaign that we've had in place. We mentioned that our current strategy was to use an education approach and try to convince customers, or educate customers and let them make a choice. And our -- our -- we felt that they would chose natural gas over electricity should they have the choice for the most part.

What we did with that particular initiative is we said, What if we were more aggressive and offered a potential incentive program? Could we get more customers to actually change out their existing systems, and go to natural gas? So that's -- that's one of the opportunities we included in this package.

The other one is load displacement. We've been doing some work on load displacement for a while. We actually had a pilot in place. It goes back to roughly 2006, where one of our customers was doing -- undertaking self-generation. And we discontinued that one when the export market went down in 2008/'09. I -- I forget the year that we cancelled it, but that program was the -- was based on the economics associated with the export market.

It was a short-term arrangement with

the customer. I can't recall if it was based on a six (6) month time period, but the value to us was based on the short-term market, so it wasn't there anymore. And -- and there's some other initiatives that we currently have in place that we've been pursuing under that load displacement category.

What we did do is we looked at -- into the future and looked at -- for potential other opportunities for the load displacement. And so what we included in that bucket was those opportunities as well. So that's another category.

And the third category that we included in here was having energy conservation rates, and we started down that path in 2010, and -- which ended in 2011. Wasn't a very aggressive approach. And so what we included in the package was conservation rates but more along the lines of what BC Hydro is offering their customers, and it's a more aggressive approach.

So it's a two (2) tiered system where the rates would be significant enough to impact customers, and -- and you'd have some influence in terms of reduced electrical consumption in Manitoba.

So that's the three (3) packages. We did some high-level estimates in terms of what it would cost, the energy savings. And when we looked at

that second category that I talked about, put it through the filter, it -- it was economic. So we called that Level 2 because Level 1 was economic based on our assessment, Level 2 was economic, and Level 3 wasn't. And we provided that to our integrated resource planning staff for assessment, and they're undertaking that assessment.

So this graph here shows you the high-level estimate of what the energy savings we thought we could potentially achieve. Again, this was a very high-level estimate, and so I caution you to use it in that regard -- or in -- taking that into account.

And my last point would be that our 2014 Power Smart Plan that we're currently working on updating will be different than any of those levels, which brings us to what can I tell you about our 2014 DSM Plan.

You can expect most programs identified in DSM Option 1 will be pursued. Not all, but there'll be modifications.

Level 2 DSM initiatives required broader consideration. Load displacement looks promising, I would say. Energy conservation rates need to be thought through carefully. They also require the Public Utility Board approval. And I'm

sure the Intervenors will have an interest in what we do in that regard. And fuel switching requires further discussion with our -- our government.

Level 3 DSM initiatives is not likely to be pursued.

So I want -- I want to just share a bit of information with you in terms of those programs. So one might be left with the impression that there was a lot of new opportunities that came out of the market -- the market potential study, and that's not necessarily the case. The programs that we're looking at for the most part, other than three (3) new programs, are the existing initiatives that were economic before, still are economic. We've just changed -- we did two (2) things.

One is we -- we've extended the time period where we're going to be offering these programs, and we estimated what we would get for participation there. So naturally you're going to get more energy savings because of this extension of some programs; not all programs.

And the other thing we did is -- with some programs is we took a more aggressive approach; so in some cases, higher incentives. And -- and so that ended up with more energy savings.

The three (3) new programs, they were on our -- our radar screen for a while now. We've been assessing roadway lighting; we've done some pilots. It would be only appropriate to maybe discuss our 2013 plan. We've stated that, I believe, in our rebuttal, that it was a conservative plan.

What we decided to do with our -- when we designed our 2013 plan is to only include those opportunities which were approved for the most part. And so it did not include the LED lighting at that time.

The other two (2) ini -- one was roadway lighting that we included; the other one is residential LED lighting, so both related to LED lighting.

The price has dropped substantially. I still recall when Philips announced the -- the typical bulb was going to be around ten dollars ($10) as opposed to, I think, thirty-five (35) before that. So that was a significant change in price. And it prompted us to look at the -- the opportunity more seriously.

And the community geothermal program, we launched that this summer. And there's a lot of challenges with geothermal. But given how successful

we were with Peguis and Fisher River, we're hoping to pursue more opportunities with communities like that and capture some opportunities there.

(BRIEF PAUSE)

MS. MARILYN KAPITANY: Mr. Kuczek, just before you move, could you give a couple of examples of what these Level 3 DSM initiatives that are not likely to be pursued?

MR. LLOYD KUCZEK: They're actually the same opportunities. So -- so what we did, and I meant to share this with you as well, is -- so we tried doing this actually in 2007/'08 -- I'm not sure what year it was -- was I asked my staff to take a look at all their programs and try to come up with an option that's more aggressive. And so what I tried to do is assess whether or not it made economic sense to take a more aggressive approach and assess it from an incremental perspective.

Because there's so much judgment involved in designing programs and -- and the participation levels and the baseline and all that, what -- what the outcome of that was is that the incremental cost back then was so high, nothing looked

like it was going to make sense. So we just stayed with our existing programs for a number of years.

What we did this time is we -- we've moved along in time, and staff are more informed and more aware of what the issues are and what the opportunities are. Plus the time frame for when the programs were scheduled to end was much closer. So when they looked for options to get more savings, they were able to have a better sense of what they can capture in the future because the time frame wasn't so far out.

You asked for examples within -- so if I took lighting, you would just -- you might give them away free and -- as opposed to -- buy one (1), get one (1) free sort of -- sort of thing.

So the -- the outcome of our -- the assessment was such that, even on the -- with our Level 1 option that we developed at the margin, it still came in at over eight (8) cents.

So when I mentioned earlier that -- the bubbles that are filtering down through the filter there, there's still some red in there because -- and that's what becomes complicated about these program designs because you can always have an infinite number of designs. So it's best to just look at fairly

significant changes and try to assess what the economics are associated with that.

So you get into this realm of, okay, so what's acceptable in terms of having some red in there? And it's this averaging as opposed to just, you know, what's -- if you -- if you pursue it -- and when I talked about the insulation program, for example, so when you first launch that program, you offer five hundred dollars ($500). You could have offered -- a thousand dollars ($1,000) or two thousand dollars ($2,000) probably didn't make sense.

So -- so when you look at those two (2) different options, you try to assess what you're -- what -- what you're going to achieve with the incremental incentives, and -- and do the economics based on that.

And so when we did our economics of Level 1 against our current program, it came in at around eight (8) cents. So not economic, but we're really not -- you know, you don't want to get concerned about that -- that sort of detail because it's just too much judgment involved.

Level 3 was just taking it another step beyond that. And that came in I believe around nine (9) cents, but there's a lot of uncertainty associated

with that, but the same opportunities.

THE CHAIRPERSON: The Level 2 DSM initiatives that you're considering will show up when in the rate application?

Would you expect not the current one that's slated to be tabled --

MR. LLOYD KUCZEK: The --

THE CHAIRPERSON: -- shortly, or --

MR. LLOYD KUCZEK: -- the energy conservation rates? No, that -- that would prob -- that's going to take us, I would suggest, a year. And at that point, we would, subject to receiving internal approvals, like -- likely bringing something forward. But again, that has to be discussed internally. That'll have to be discussed with government as well. It's -- it -- it would be a significant change in terms of what we offer our customers.

DR. HUGH GRANT: Could I -- could I come back to this marginal value argument again? Could you explain how you reached this marginal -- marginal value with respect to, say, domestic price or export price, or what other considerations you have in mind?

MR. LLOYD KUCZEK: Well, the marginal -- I'm not an expert in this, so I'm not going to --

it's subject to correction by the panel that will deal with this. But the marginal value is determined by a computer model taking into account -- oh, go ahead.

MR. ED WOJCZYNSKI: Good morning. Ed Wojczynski speaking. The marginal value of what we -- there's three (3) components to the marginal value. There's a generation component, a transmission component, and distribution component. The largest component is the generation component.

What we do -- and I'll -- I'll take a -- a example of a base load, the simplest explanation I can give, where it's a flat load through the whole year. Something like a very large industrial customer might be like.

So what we do is take the -- every year we do a calculation, we take the Power Resource Plan -- Plan, the same one you see in the IFF, and we apply a five hundred (500) gigawatt hour load reduction across the plan and all year, summer and winter evenly. And we do an evaluation without the reduction. We do an evaluation with the reduction.

And the change in the generation production costs, meaning exports thermal operation, everything across all the flows, just like we do in a IFF and we do in the normal generation evaluations, we

determine the cost saving or the cost benefit by reducing the load.

And -- and that would be the component of marginal value for that five hundred (500) gigawatt hours from the generation side. Then we divide by the energy and you get a dollars-per-megawatt-hour or cents-per-kilowatt-hours saving.

The second component would be transmission, and the third is distribution. And there we do something much different. We go periodically, we take the next ten (10) years of capital expenditures on gen -- on transmission, and we determine which of those, if we had that same load reduct -- kind, a one (1) year's load reduction in load growth. And we -- we determine how much of that capital forecast would be pushed back by that year. And we divide that by the amount of load reduction and we get a dollars per kilowatt or -- savings or benefit. And it's only capacity, not energy.

And similarly on the distribution side, we look at what the distribution budget is, how much it would be reduced or deferred, if we had a load reduction and -- and then we applied that for the capacity. And then we put those all together and get a number, depending on which year, it's varied from

year to year, but in the order of seven (7) cents a kilowatt hour.

DR. HUGH GRANT: So -- so the marginal value is generally higher or lower than the average cost that, say, a residential consumer would pay?

MR. ED WOJCZYNSKI: That would depend on the year and the exact rate. I -- I -- the -- the number in 2012 was six point six-nine (6.69) cents for this flat load that I'm talking about, which isn't what a residential consumer has. A residential consumer is more peaky than that. So the cost by the residential consumer would be higher than that. But off -- offhand I don't know how much more it would be.

So you'd have to go to the specific customer load shape and then compare against the specific rates for that customer. So that would be fairly customer segment specific.

DR. HUGH GRANT: I guess the reason I ask is in -- in terms of demand-side management, if you have many instances where the marginal benefit to the, say, residential consumer is greater than your marginal evaluation, then why are you engaged in this activity at all? Right, in other words, the residential consumer can look at there own cost and benefits and if they're a fully informed consumer,

which is a bold assumption, then they would just undertake these initiatives on their own -- their own right.

MR. LLOYD KUCZEK: The problem is they don't though. So there's -- there's a broag -- broad range re -- broad range of reasons why customers don't participate. But I'll -- I'll go to the very simple example of our lower-income program, where we pay for everything on the insulation side. And I've thrown -- thrown out a comment before, you would think when you offer a program like that, people would be lined up at our front door at 360 Portage to sign up for that program. That's not the case, we struggle to get people to sign up for that program.

You know, if you -- you would think if a customer had a natural gas standard efficient furnace, that was twenty-five (25), thirty (30) years old, and you offered seven hundred dollars ($700), why -- why wouldn't they take that seven hundred dollars ($700) and replace it today, as opposed to waiting for it to possibly break or fail in the wintertime next year? But -- but they just don't.

Even customers that are well informed, including the person to my left, did not replace their furnace, knowing all that. You know so, another one

(1), two (2) to my right, by the way.

So -- so, you know, they all have their reasons. Work too hard, I think is one (1) of the reasons I was given on the left.

And not a priority. You know, we had a focus group session with some customers where we asked questions about, you know, would they be willing to implement DSM measures if they -- if there was a 10 percent -- I think it was a 10 percent rate of return. We tried to get a sense for -- and the -- the comment we got back was -- or the sense was not top of mind, not a big enough rate of return.

And then the other concern, which is really interesting, was if the particular technology or -- or clients, whatever the measure was, if it wasn't at -- at its end-of-life, they were concerned about disposing something that was still useful yet.

MS. LOIS MORRISON: I would like to go on the record that I have replaced my furnace. Thank you.

MR. LLOYD KUCZEK: After it failed. Okay. So I just wanted to touch base with -- or -- or touch on the -- the actual process we do within Manitoba Hydro. It's not all linked to the integrated

revor -- resource process.

So when we have a DSM opportunity whatever time of the year that there is, that we've done our assessment, and it makes sense based on the marginal value that we have at the time, we take that initiative to our executive committee and we approve it -- or we seek approval. If approved, we implement it at that time. It does not have to go through the integrated resource process.

And just to exemplify that, we're -- we're already ramping up with our programs in terms of pursuing a more aggressive approach. These are the programs that we've approved at the executive level and are currently either implementing or actually in the process of implementing. And I also have two (2) more in my office that I need to review when I'm done on this panel, so. And Ms. Morrison might have some more in her office.

But the plan is, is to actually -- I mentioned, you can expect that most of the programs at Level 1 will be implemented, and this -- this demonstrates that, or it gives you some indication that it's likely that would be the case.

So in terms of time-lines, we're -- we -- we have a different process in the last year plus

with the legislation that's in place, the Energy Savings Act. We have to now complete our energy plan by March 31st of every year in consultation with the Minister responsible for Manitoba Hydro.

So what we did last year is we prepared a three (3) year plan under those consultations. And then, subsequent to that, we created what was called a fifteen (15) year supplemental plan. And the reason we created the supplemental plan is we require that for internal proc -- our internal planning processes.

So on a go-forward basis, is that going to change? It's looking like -- we're -- we're into March now -- it's looking like we are going to develop an updated three (3) year plan. And then we'll have to create a fifteen (15) year supplement plan, as well.

Time-line's March 31st. Clearly we got to do that, according to legislation, and complete that. And our supplemental plan we're hoping to have completed by April 30th. Thank you.

MS. MARLA BOYD: That concludes our direct examination, Mr. Chair. We're available for cross.

MR. SVEN HOMBACH: Thank you. Mr. Chair, I note it's about eight (8) minutes to noon.

I'll be happy to use those eight (8) minutes wisely, or if the panel prefers to break for lunch now, I'd be happy to start after the lunchbreak.

THE CHAIRPERSON: I think that the panel concludes that we should have lunch now. And so resume again at say quarter to 1:00. Is that possible? Quarter to 1:00. Thank you.

--- Upon recessing at 11:54 a.m.

--- Upon resuming at 12:54 p.m.

MS. MARLA BOYD: Just before Mr. Hombach begins his cross-examination, Board member Bel asked Mr. Wojczynski a question yesterday regarding the gas and Keeyask scenario. Mr. Wojczynski was looking for and has been able to locate the material in the record. So if we could have just a minute to speak to it, that would be useful.

MR. ED WOJCZYNSKI: Yes, Board member Bel asked me yesterday in all the plans and pathways that there wasn't a pathway that had Keeyask gas. We had -- pardon me, we had Keeyask gas, but we didn't have gas-Keeyask. And I'd indicated in a somewhat fumbled answer, I might say, that we did have that kind of information and that -- that it wasn't

economic.

But we located that piece of information and it was in an Interrogatory, LC and Manitoba Hydro, Round 1, 336. And in it we provided, at the reference scenario, three (3) plans: the all gas plan, and the Keeyask gas plan just like is in the submission, but we provided an additional plan that had two (2) gas turbines prior to Keeyask, and then Keeyask in 2028; and that's with no sales, just domestic load growth.

And what we found in there is that the gas-Keeyask plan was $709 million more economic than the all-gas plan, but that the Keeyask gas plan, where Keeyask goes first was $887 more beneficial.

So in other words, having Keeyask before gas was more economic by $178 million compared to gas and then Keeyask. Okay.

CROSS-EXAMINATION BY MR. SVEN HOMBACH:

MR. SVEN HOMBACH: Thank you and good afternoon. My name is Sven Hombach. I'm counsel to the Public Utilities Board. I will be having a few questions for you. I'll likely take the better part of the day. But before we get started, I'd like you to know that my questions will be questions to the

panel. They will not be questions to individual witnesses. So by all means, choose who the most appropriate pers -- person is to answer those questions. And if you need to consult with your colleagues, or if you need to consult with your backbench, go ahead.

Also, you should be aware that I'm not trying to elicit any commercially sensitive information, or CSI. If I'm asking a question to which you believe the answer entails CSI, I don't expect you to answer it on the record. There will be a brief CSI session on Thursday afternoon. I also fully expect that Ms. Boyd will have her finger on the buzzer in case I'm about to elicit anything.

Now, having heard the presentation from Manitoba Hydro's CEO Scott Thomson yesterday and the presentation from this morning, does Manitoba Hydro see it as its primary responsibility to meet the needs of Manitobans for electricity?

MR. LLOYD KUCZEK: I -- I thought that question was asked of Mr. Thomson yesterday?

MR. SVEN HOMBACH: And I -- I wasn't quite clear whether it was to be one (1) of the top three (3) or whether it was to be the primary one, but -- I -- I didn't anticipate this to be a controversial

question.

MR. LLOYD KUCZEK: Well, I got to be careful that I don't say something different than what Mr. Scott Thomson said.

MR. SVEN HOMBACH: Right. But -- but this Board is being asked to assess the Need and Alternatives to Manitoba Hydro's Preferred Development Plan. And -- and dealing for a moment with just the need, does need to you mean the ability to serve the electricity demand in Manitoba at any given point in time, including during peak load?

MR. ED WOJCZYNSKI: Ed Wojczynski, here. I'll answer that one. Yes.

MR. SVEN HOMBACH: All right. And Manitoba Hydro determines its ability to meet the need based on prospective load forecast that it prepares on an annual basis.

Does it not?

MR. ED WOJCZYNSKI: Yes.

MR. SVEN HOMBACH: Those load forecasts are prepared once a year?

MR. ED WOJCZYNSKI: Yes.

MR. SVEN HOMBACH: When are they usually issued?

MR. JARED WHELAN: Mr. Kuczek can

answer that better.

MS. LOIS MORRISON: They're issued in June of each year.

MR. SVEN HOMBACH: The NFAT filing is based on Manitoba Hydro's 2012 load forecast projections, is it not?

MR. ED WOJCZYNSKI: It's actually -- it -- it is based on the 2012 load forecast, but also within it was the 2013 load forecast where we had, in Chapter 12, an update to the earlier information. Because of the timing of getting the forecast, because of the timing of the IFF cycle, and the -- and the long duration of time to do all of the studies and write the report, we -- we -- it's inevitable that you cover more than one (1) cycle. So we did the majority of work using the 2012 load forecast, but then we provided an update in -- in Chapter 12, as I said.

MR. SVEN HOMBACH: The 2014 load forecast is not available yet, I assume?

MS. LOIS MORRISON: No, it is not.

MR. SVEN HOMBACH: I'd like you -- to refer you to an excerpt from the 2013 load forecast which was filed as Appendix D to Manitoba Hydro's NFAT filing, which I believe is Exhibit -- Manitoba Hydro Exhibit 14. The document on the screen in front of

you is Table 2 from the 2013 load forecast, which is page Roman Numeral IV of the document.

And on a weather adjusted basis, this shows that the total demand for energy in Manitoba during the 2012/'13 year was 24,404 gigawatt hours. That's correct data?

MS. LOIS MORRISON: That is correct.

MR. SVEN HOMBACH: And the actual amount was slightly more than that: 24,759 gigawatt hours. And weather adjustment just means that you are adjusting it to a weather-normalized basis, so that if there's an exceptionally cold winter, or an exceptionally hot summer that doesn't skew the demands?

MS. LOIS MORRISON: That is correct.

MR. SVEN HOMBACH: So those twenty-four thousand four hundred and four (24,404), that compares to an average projected output for Keeyask of about 4,400 gigawatt hours per year?

MR. ED WOJCZYNSKI: Dependable energy, yes.

MR. SVEN HOMBACH: Mr. Wojczynski, I believe the dependable output for Keeyask is about 3,000 gigawatt hours?

(BRIEF PAUSE)

MR. SVEN HOMBACH: If I refer you to Table 2.1 of the NFAT filing, chapter 2, page 4 of 59, which should be on the screen in front of you. It's about three thousand (3,000)?

MR. ED WOJCZYNSKI: Oh. Yes, that's the problem with turning sixty-two (62), your memory starts going.

So, yes, the dependable ener -- that was the average energy that -- that I -- not the dependable energy that I was thinking of.

MR. SVEN HOMBACH: And for Conawapa, dependable energy would be about 4,650 gigawatt hours?

MR. ED WOJCZYNSKI: In -- in -- around there, four thousand six hundred (4,600), yes.

MR. SVEN HOMBACH: And -- and to be clear on that distinction between average and dependable, dependable energy means the energy that you can produce during the worst drought on record --

MR. ED WOJCZYNSKI: Yes.

MR. SVEN HOMBACH: -- in Manitoba Hydro's hundred year history, to make sure that demand can always be met?

MR. ED WOJCZYNSKI: The answer is yes,

but I -- just a slight twist to that. It's not that it can always be met. You can have a situation worse than the worst drought on record, but to meet -- supply the load under that condition.

MR. SVEN HOMBACH: So when Manitoba Hydro is internally trying to assess the need for the Province of Manitoba, it must meet the need projected in the load forecast from dependable generation?

MR. ED WOJCZYNSKI: Yes.

THE CHAIRPERSON: Just to clarify that -- what you just described as the worst of the -- worse than the worst drought you've had on record. Does that constitute dependable energy? No, I --

MR. ED WOJCZYNSKI: Our -- our -- the definition of dependable energy we use is that energy that is available under the -- the worst drought on record. And we've actually had a -- two (2) -- more than one (1) that had more or less the same low level, so it's -- it's not just once in the hundred years, it's a -- a few times.

But it is -- it has happened, historically, from anecdotal information, that the -- the flows on the rivers in Manitoba in -- in the last few hundred years have been lower than that. And there is a significant likelihood, with climate

change, that we'll get some greater volatility and we could have -- we might have higher average energy from our system, but there could be more volatility which might mean some droughts worse than the ones we've seen.

THE CHAIRPERSON: But in assessing drought risk in relation to the application -- or, pardon me, the plan that's before us, you didn't -- the numbers you used for dependable energy are in relation to the worst drought on record as opposed to what could potentially be the worst?

MR. ED WOJCZYNSKI: Yes. And as I'd indicated yesterday, you look at energy security from two (2) points of view. One (1) is what is our criteria for dependable energy, which is the worst drought on record; and the other, the second part, is that you -- you can have droughts that are worse than that, and so you get -- some of the plans provide energy security above that minimum amount. And that's -- that is a benefit to Manitobans, and we do evaluate that separately. And that will be covered in the -- the panel next week.

MR. SVEN HOMBACH: Now, when Manitoba Hydro is projecting the need of Manitobans into the future, it's projecting both the total energy as well

as the peak capacity. And could you please explain for the panel on what the distinction is between the energy usage versus the peak capacity to deliver?

(BRIEF PAUSE)

MR. ED WOJCZYNSKI: Sorry. I thought somebody else was answering. With -- both peak and energy drive us.

MR. SVEN HOMBACH: And, Mr. Wojczynski, if it's easier for me to direct my questions to a specific witness, I'll be happy to do so. I try to accommodate Manitoba Hydro.

MR. ED WOJCZYNSKI: No. We'll just look at each other a bit more.

MR. SVEN HOMBACH: So peak, though, essentially means the ability to flow a certain quantity of electricity through at a given amount in time, total energy; that is the total usage number of kilowatt hours or gigawatt hours actually consumed in Manitoba, correct?

MS. LOIS MORRISON: That is correct.

MR. SVEN HOMBACH: Now, in chapter 12 of its NFAT filing, Manitoba Hydro indicated that there were some changes between the 2012 forecast and

the 2013 forecast that only became available in the summer. And I'm referring you to one (1) of the pages; it's chapter 12 of the NFAT filing, page 2.

That highlights some of the changes. And it's my understanding that what happened is, the 2013 projection for energy is quite a bit lower. It's a reduction of 1,159 gigawatt hours over a, essentially, twenty (20) year period, until 2031/'32.

And I believe peak demand is also projected to be lower, is it not?

MS. LOIS MORRISON: Yes, that is correct.

MR. SVEN HOMBACH: And to put that into perspective, in the NFAT, Manitoba Hydro indicated that one (1) year of growth is approximately equivalent to 420 gigawatt hours.

Is that still the number that's being used today?

MS. LOIS MORRISON: It's close. Under the 2013 forecast, one (1) year growth is equivalent to approximately 413 gigawatt hours.

MR. SVEN HOMBACH: But either which way, what that means is the twenty (20) year projection and the 2013 forecast shaves off about three (3) years worth of growth, give or take?

MS. LOIS MORRISON: You're referring to the change between the two (2) forecasts?

MR. SVEN HOMBACH: Correct.

MS. LOIS MORRISON: Yes, that is correct.

MR. SVEN HOMBACH: I'd earlier taken you to Table 2 of the 2013 forecast, which shows a projection over a -- a period of twenty (20) years.

Is it usual for Manitoba Hydro to only project use over a twenty (20) year period in its forecasts?

MS. LOIS MORRISON: Yes. We have traditionally prepared our load forecast on a twenty (20) year horizon, at which it is passed over to our resource planning group who project it to a longer period of time for planning purposes.

(BRIEF PAUSE)

MR. SVEN HOMBACH: So beyond the twenty (20) year time-frame, could you please explain to me what methodology you use to project load growth beyond the twenty (20) year time period?

MR. ED WOJCZYNSKI: I can give you a preliminary answer here and -- and the panel next week

could give a more detailed one, if you want. But we simply take the -- the end of the forecast that was done in detail and then just -- essentially just extrapolate it. And that's for -- that's to the end of the thirty-five (35) year study period.

MR. SVEN HOMBACH: And is it a -- a linear extrapolation?

MR. ED WOJCZYNSKI: Yes.

MR. SVEN HOMBACH: Based on what? Based on a regression analysis of the data points over twenty (20) years or just using --

MR. ED WOJCZYNSKI: No, just the -- the latter years, not through the whole time period.

MR. SVEN HOMBACH: Now, it appears from looking at Manitoba Hydro's financial analysis that was filed in the NFAT, that beyond the year 2047 you're not projecting any additional growth.

Do I have that right?

MR. ED WOJCZYNSKI: Yes. And that -- that is not part of the thirty-five (35) year study period. That's where we us -- we calculate a residual value at the end of the thirty-five (35) year study period. So it's not the -- it's not the normal detailed resource planning evaluation. It's a -- an evaluation of residual value. So it's done

differently in a somewhat conservative manner.

MR. SVEN HOMBACH: Right.

MR. ED WOJCZYNSKI: Trying to keep assumptions flat.

MR. SVEN HOMBACH: Now, for purposes of conducting the NFAT though, you're looking at a seventy-eight (78) year net present value period. So you're looking beyond the twenty (20) years and you're looking beyond the thirty-five (35) year horizon.

Does that mean that beyond 2047, for purposes of conducting your analysis, you're not assuming any increase in demand in Manitoba?

MR. ED WOJCZYNSKI: We -- we -- what the analysis beyond 2047 is doing is not attempting to assume whether there will be continued load growth or not. What it's doing is saying at that point in time we're going to stop our detailed studies and we have to get -- give some value, pres -- probably a conservative value of: You've got an asset that still has life, what would the value of that asset be at that time?

So we took a somewhat conservative assumption to say the -- for instance, that load growth did not continue and -- and use that. But that is in no way an attempt to forecast that there would

not -- whether there was load growth or not. We -- we were not making that conclusion.

MR. SVEN HOMBACH: So, Mr. Wojczynski, if I'm looking at Appendix 11.3 of the NFAT, and I'm currently showing page 2 of that document, beyond 2047 the domestic revenue projections are essentially staying the same. That then is based on the underlying assumption for analytical purposes, that there's no additional Manitoba demand, I take it?

MR. ED WOJCZYNSKI: Correct.

(BRIEF PAUSE)

MR. SVEN HOMBACH: And you mentioned that the assumption for load forecast is -- was done as a conservative method.

Total exports though are contingent on how much need you actually have in Manitoba and how much is used locally, is it not?

MR. ED WOJCZYNSKI: Yes.

MR. SVEN HOMBACH: Can you explain to me on -- on why it's conservative then to assume that there is no further load growth beyond 2047?

MR. ED WOJCZYNSKI: It -- it -- this is related to the fact that in any given year in the

future, you do -- there is a -- a wide range of amount of energy that would be available. And if you are fixing the amount of hydro we have in your system and -- and continuing to add, let's just say it's gas generation, the higher the load you have in your system, the more often -- the -- the more often the high flow years with lots of water produce a -- a higher value.

So even though you -- you are not adding more hydro generation, if you're adding more gas generation as the load grows, the hydro projects tend to get increasingly valuable because more and more of the high flow energy is very highly valued in terms of stopping imports, or -- or -- yeah, stop -- displacing imports or displacing a gas generation from operation.

MR. SVEN HOMBACH: But anything beyond dependable energy though, does not get taken into account for meeting the need, right? It just would be surplus power to export?

MR. ED WOJCZYNSKI: There's -- but in -- when you evaluate the -- the costs and benefits, you look at when you need new generation, but also, in each and every year what is the cost of running that generation. And even though you don't add more --

with -- within -- post-2047, if we had increasing load growth -- no, pardon me, if we had continued load growth we would find the hydro projects become -- provide more value in -- in the production costing in the year-to-year operation. But by keeping the load flat, we -- we don't provide the hydro that benefit.

MR. SVEN HOMBACH: Have you actually conducted that analysis where you've taken a scenario where you're assuming ongoing load growth and determined how that affects export revenue as opposed to analyzing it how you just described it?

MR. ED WOJCZYNSKI: No, but what -- what I've just described is -- and I -- we don't know how significant that additional benefit would be, but we generally know that's the tendency.

MR. SVEN HOMBACH: So you haven't actually analyzed that effect on export revenue of this assumption?

MR. ED WOJCZYNSKI: No, we haven't. No.

MR. SVEN HOMBACH: Now --

MR. ED WOJCZYNSKI: But maybe I can just add, we're confident it wouldn't go the other way.

MR. SVEN HOMBACH: Okay. If -- if you

haven't analyzed it, you -- you've obviously given the matter some thought. Is -- have you conducted an -- an analysis on that issue?

MR. ED WOJCZYNSKI: It is from -- un -- understand the underlying principles of how a integrated hydraulic, thermal, and import system work. And it's from the -- all the analysis we've done over many years in many different circumstances that I could draw that conc -- judgment and conclusion.

MR. SVEN HOMBACH: Generally though, do you disagree -- do you agree with me in that if there was increased domestic demand, that would result in lower export revenues? Or is there something that I'm not understanding correctly?

MR. ED WOJCZYNSKI: Yeah. Okay. Oh, yeah. No, I -- I think I see where you're going. In the hydro plan -- let's say we're -- we're comparing the hydro plan versus an all-gas plan. I think that's what we're probably talking about. In the Hydro plan, if you had increased domestic load post-2047, instead of keeping it flat, you would have less export revenue and -- and higher import cost in that hydro plan. In the gas plan, you'd have an even higher increase in costs.

So both, all-gas plan and the hydro

plan, would have, with the continued load growth, would both have increased costs, production costs, but the increase would be more with the all-gas sequence.

MR. SVEN HOMBACH: So are you saying then, that if you're comparing it across several plans, it doesn't matter that you're keeping the load flat after a certain point in time because that doesn't change the analysis between those plans?

MR. ED WOJCZYNSKI: What -- what I was trying to say earlier is that I -- I think my judgment is that we took a conservative approach by doing that. And I think the trend would be if you extended the load growth longer the -- the plans that have hyd -- more hydro versus more gas, the ones with more hydro would -- would get some additional benefit. How large that benefit is, I don't know. But we decided to not -- is to take the conservative approach and just it flat. And -- and the -- we felt the analysis was already a complex analysis, and -- and we were trying to keep it as simple as possible.

And also, as I said, we are calculating not doing a detailed -- as detailed analysis out there. We were simply trying to calculate and get an estimate of the residual value of the asset at that time, which is a bit different than -- than the front-

end, which is a full scale, detailed evaluation.

MR. SVEN HOMBACH: Okay. So that's dealing with the actual twenty (20) year period that you're forecasting as part of the electric load forecast. I'm showing you the index of the 2013 forecast just to show the different classes. Manitoba Hydro's projecting load growth by customer class, is it not? And there's, broadly speaking, the residential group, the general service mass market group, the top consumer group, and a few other minor ones?

MS. LOIS MORRISON: That is correct.

MR. SVEN HOMBACH: And just to put that into perspective, if I can refer you to Board counsel's book of documents, page 18. It's PUB Exhibit 58-2. That just provides a broad overview with how much, on a percentage basis, each of the different classes are consuming.

And it's about 29 percent, or 30 percent, for residential customers, 34 percent for general service mass market, about 23 percent of top consumers. And then there's another category that has about 13 percent that's losses and station service. I wonder if you could please explain what that pertains to.

MS. LOIS MORRISON: Losses and station service would be the -- the losses that occur through the transmission lines, taking the energy from the generation stations to the substations. There is a loss of electricity in that process.

Then there's also the distribution losses, which is the point where you take it from the substation to the customer's home. And in addition to that is -- there's energy consumed by our stations themselves. So those are primarily what's composed of that sector.

MR. SVEN HOMBACH: How does Manitoba Hydro distinguish between transmission and distribution? Is it a 50-kilovolt cutoff like some other jurisdictions use, or just based on the location of the substation? How -- what does Manitoba Hydro consider to be transmission versus what it considers to be distribution?

MR. LLOYD KUCZEK: Subject to check, I think it's the 66 kV.

MR. SVEN HOMBACH: So I'd like to deal first with the residential class, and I'll take you through some of the load forecast projections for the different classes.

Now, the primary focus for determining

future residential consumption is the population level in Manitoba, is it not?

MS. LOIS MORRISON: Yes, the population forecast is a primary input.

MR. SVEN HOMBACH: And I believe I heard -- I wasn't sure if it was you, or if was Mr. Kuczek this morning, saying that Manitoba Hydro obtains external population forecasts?

MR. IAN PAGE: Sorry, that was me who provided that.

MR. SVEN HOMBACH: Okay. Are you at liberty, sir, to disclose those forecasts, or is that commercially sensitive information?

MR. IAN PAGE: No, they're not commercially sensitive. They were provided in the response to ERA-MH Round One, Question 3F.

MR. SVEN HOMBACH: Okay. Can you just briefly explain who those service providers are?

MR. IAN PAGE: They're -- they're I guess professional forecasting agencies. There's Conference Board, which I'm sure a lot of people are familiar with, Spatial Economics, Global Insights, Infometrica, and the Manitoba Bureau of Statistics.

MR. SVEN HOMBACH: And does Manitoba Hydro simply average those five (5) forecasts, or how

does it --

MR. IAN PAGE: Yes, we do. We -- yeah, we just simply average them.

MR. SVEN HOMBACH: Okay. So the economic outlook that Manitoba Hydro prepares, that's the average on an annual basis?

MR. IAN PAGE: Yes, it is.

MR. SVEN HOMBACH: Now, there's been some variation in the economic outlook over the past three (3) years where it increased between 2011 and 2012. And then, for the 2013 forecast, it decreased again.

Can you explain the reason for that increase from one year followed by a decrease for the next?

MR. IAN PAGE: Are we referring to strictly a population?

MR. SVEN HOMBACH: Yes.

MR. IAN PAGE: What the -- the forecasters will do is, we'll -- they'll look at the results of current -- current trends, and -- and particularly things like the success of the Provincial Nominee Program. And there was a -- in 2011, there was a -- I guess, since about 2005, there had been a very steady increase in -- in the amount of

immigration into Manitoba. That -- in 2011, that number was -- was quite high. So that information was available for the 2012 forecast.

There was a cap that was put on federally in 2010, but that didn't sort of -- because of the lag results, didn't real -- didn't really affect the immigration levels until 2012. So the 2012 number was slightly lower than the 2011 number. So the 2013 forecast reflected that -- that newer information, so -- so it would -- made a projection based on that lower number.

MR. SVEN HOMBACH: Do you know where those numbers are heading for 2014, or is that not information you've received yet?

MR. IAN PAGE: We -- we're just at the preliminary stage of putting together the information, but it appears that it's very similar to what we saw in -- in 2013.

(BRIEF PAUSE)

MR. SVEN HOMBACH: Is it the 2012 numbers that Manitoba Hydro used to prepare the NFAT?

MR. IAN PAGE: Those -- those were what was pro -- was -- formed the basis for the

majority of the NFAT document, but as Mr. Wojczynski has -- has referred to, they were -- the 2013 numbers were included in that Chapter 12 update.

MR. SVEN HOMBACH: Just for illustration purposes I'm taking you to page 8 of the Board counsel book of documents, which is Appendix A.1 from the spring 2012 economic outlook.

And in each year, Manitoba Hydro takes the population level and then calculates the number of residential customers. Can you explain to me how that number of residential customers gets determined?

MR. IAN PAGE: Sure. The residential customer number -- forecast is based on the population forecast. And we look at the ratio, the historical ratio, of residents -- residential customers to population. And that number had been declining over the last few years. In the early '70s it was around four (4) people per -- per residential customer. I may inadvertently say per residence, but I mean residential customer.

And that number has declined to -- in the early '90s to about two point eight (2.8), and it's remained relatively flat ever since. So that two point seven nine (2.79) is actually the average of the last two (2) years, and that's what we use at our

forecast.

MR. SVEN HOMBACH: And, sir, I've seen the number of two point seven nine (2.79) in several documents, but when you calculate it, it also seems to go to two point seven seven (2.77).

Is it two point seven seven (2.77), or two point seven nine (2.79)?

MR. IAN PAGE: Well -- well, the two point seven nine (2.79) was -- was used in the forecast. It depends on how many years you include in the average.

MR. SVEN HOMBACH: Now, looking back at the past few years, what the charts do show is that on a year over year basis, the increased number of people in Manitoba and the increased number of customers show that the incremental additions are actually at a higher rate than the two-point-seven-seven (2.77) or two point seven nine (2.79).

Do you agree with that?

MR. IAN PAGE: I -- I would agree with -- mathematically with that result, but I think that what we're getting into is -- is -- I think it's a bit of a false premise to make that calculation that way, because it -- you're -- what that number would be trying to do is attribute all of the changes in -- in

residential housing -- or resident -- customers per -- people per residential customer to -- to the changes in population.

But even if that population were to remain fixed, we'd see a lot of variation in the -- in the, you know, people -- people as they age and -- people get married, people get divorced, people have kids, people get older and move to retirement homes. So there's a lot of changes in the underlying number of people per -- per customer than even outside of what's happening on the -- on the population growth side.

MR. SVEN HOMBACH: When Manitoba Hydro made that argument in its rebuttal that one shouldn't just be looking at a few years, one should be --

MR. IAN PAGE: No, I wasn't just referring to the number of periods. If -- I was actually referring to the calculation that was done on the -- on the document you've got up on the -- up on the screen right now, where -- where the change in customers is -- is compared to the change in population.

Whereas when we're doing the forecasts, we look at the change in residential -- in the -- change in residential customers compared to the change

in population, which is a much, much more stable number and it does incorporate that underlying change in the -- in the number of people per -- per residence that would happen irrespective of population growth.

MR. SVEN HOMBACH: Okay. And I'd like to explore that issue with you just a bit further to determine the impact, if any, on the load forecast.

For the record, the chart you're referring to, that's page 13 of the Board counsel book of documents?

MR. IAN PAGE: Yes, that's correct.

MR. SVEN HOMBACH: It's a chart prepared by PUB advisors?

MR. IAN PAGE: Yes.

MR. SVEN HOMBACH: It's not a Manitoba Hydro document, so I'm not asking you to accept the numbers unless it's subject to check.

But what that document shows is that, if you look back to 2006/'07 and calculate it to today, the incremental addition is about two point nine three (2.93) people per household --

MR. IAN PAGE: And that's the number I would disagree with.

MR. SVEN HOMBACH: Yeah. Well, you mentioned before, sir, that --

MR. IAN PAGE: I -- I'm not disagreeing with the mathematics that, yes, eighty-five (85) divided by twenty-nine (29) gives you two point nine three (2.93). What I'm disagreeing with is that attributing column -- the change in column 4 to the change in column 2, and I'm saying that there's things -- items -- things that are happening within -- in column 1, the total population, that this type of calculation is ignoring. And -- and I -- and I think that's erroneous to do that.

MR. SVEN HOMBACH: So let's take that issue in two (2) parts. The -- most of the population growth appears to be due to immigration, does it not?

MR. IAN PAGE: A good portion of it. But you'll see that -- if you look at -- at the increase in population, you'll see that it's also happening -- the number is increasing over time.

And -- and the calculation that you've done would also put greater weight on those later years, which is saying that -- that the population changes -- how the population and customer numbers are changing in 2011 or '12 or '13 is more important than what happened in -- in 2007 and '08. And, again, I don't think that's a correct assumption to make.

MR. SVEN HOMBACH: Well, there's an

article that we included at page 14 of the Board counsel document. It's an article from the Winnipeg Free Press --

MR. IAN PAGE: Yes.

MR. SVEN HOMBACH: -- a few weeks ago, that suggested that about 80 percent of the population growth in this province is attributable to the provincial nominee program -- immigration from other countries.

MR. IAN PAGE: And I -- and I -- and that number's not correct. The -- about 80 percent of the change in Manitoba's population is due to immigration, but a large portion of that is not due to the provincial nominee program.

People who ex -- who already are in Manitoba can -- can bring relatives in. There's refugee programs, there's a number of things that -- that are -- have to be included in -- in that total immigration.

MR. SVEN HOMBACH: Now, I appreciate your point, sir, that if you take these numbers, the incremental addition is not the only thing that you need to take into consideration, because there might be demographic shifts happening in the population that's already here that could change it. But does

Manitoba Hydro have any handle on that? Has it ever analyzed to what extent --

MR. IAN PAGE: We -- we haven't -- we haven't gone into that in detail, because we didn't see the value in trying to do that. Even if -- if you just look at it from a pure mathematical basis, that you -- the number you've just scrolled off the screen, the -- that right-hand column, you see incredible variation in that number. And if you just did a quick standard deviation of that column, you'll see your two point nine three (2.93) has got a standard deviation of point eight (.8). If we do our calculation, I get two point seven seven (2.77) using those particular years, a standard deviation of point zero one (.01).

And I would suggest that if that's something that's got a variation of eighty (80) times greater than doing it another way, it would not give you a meaningful forecast.

MR. SVEN HOMBACH: So there's not a lot of precision to those numbers --

MR. IAN PAGE: No. And -- and actually, if you really want to get down into high school maths, you can get it -- you say, Well, there's only one (1) significant digit in there, so really you're saying it's three (3) and -- and you've got a

variation from two (2) to four (4). And that's absolutely worthless for forecasting.

MR. SVEN HOMBACH: You should never threaten a lawyer with high school math.

MR. IAN PAGE: Oh, we're getting -- we're getting to -- oh.

MR. SVEN HOMBACH: But -- but all I'm trying to show, sir, is that there is -- there is a potential impact, just what -- if -- if you take the two point nine three (2.93) and if you carry it through, that means, pursuant to that number, there might be fifty-three hundred (5,300) fewer customers down the road --

MR. IAN PAGE: What I would -- what I would say, there's a large number of dynamics involved in population forecasting, and that's why we do it on an aggregate basis. If we try to pick apart individual pieces, we're going to see numbers that -- that are -- are meaningless on their own.

And I think to -- to do an extrapolation then based on a number that's arrived from using a meaningless calculation in itself would be meaningless. So I -- I cannot attest -- I can say that mathematically, yes, if you use two point nine three (2.93) instead of two point seven nine (2.79)

you will get a different number.

I -- what I am saying is that I don't believe there's any basis for using two point nine three (2.93).

MR. SVEN HOMBACH: The consensus forecast, did you actually file those in response to the undertaking you refer to on the record?

MR. IAN PAGE: That ERA question that I referred to, 3F, has the year-by-year numbers for each -- each of those forecasts, and it has some of the documentation that was -- that we received with those forecasts. I think that's all that we had available to us.

MR. SVEN HOMBACH: Does Manitoba Hydro ever track the precision of the population forecast similar to the way it tracks the overall load forecast precision?

MR. IAN PAGE: We -- we don't. And it's because, you know, as we've said, there's -- there's -- there have been changes with things like the Provincial Nominee Program. So a forecast that was done years ago that didn't assume the Provincial Nominee Program was obviously going to be too low. So we're trying to -- trying to recognize the current events to the best we can.

MR. SVEN HOMBACH: And have you adjusted for all the recent changes to the program at all?

MR. IAN PAGE: Yes, the -- the 2013 forecast was lower than the 2012 due to that -- the lower number of immigrants that have came in under the Provincial Nominee Program.

(BRIEF PAUSE)

MR. SVEN HOMBACH: The chart I'm showing you now is tab -- page 19 of the Board counsel book of documents, and that show's Manitoba Hydro's projections for just residential customers and the differences between the 2012 forecast and the 2013.

So do you agree with that number, sir, that --

MR. IAN PAGE: I -- I can't speak to that number, because now we're into the electric heat customers. So I think Ms. Morrison would be better to speak --

MR. SVEN HOMBACH: Sure.

MR. IAN PAGE: -- to that.

MR. SVEN HOMBACH: And there's two (2) -- just for the record, there are two (2) charts.

There is a similar chart for residential standard customers and for residential electric heat customers.

Ms. Morrison, can you --

MS. LOIS MORRISON: Yes, I've found those pages.

MR. SVEN HOMBACH: -- confirm the numbers?

MS. LOIS MORRISON: M-hm.

(BRIEF PAUSE)

MS. LOIS MORRISON: Yes, I've found the reference. Could you repeat the question, please?

MR. SVEN HOMBACH: Do you agree with the number on this page that the distinction be -- the difference between the 2012 forecast on which the NFAT was based and the 2013 forecast is about fourteen thousand seven hundred and fourteen (14,714) electric customers?

MS. LOIS MORRISON: Yes, there is that difference in electrically heated customers.

MR. SVEN HOMBACH: And it's about two thousand two hundred and eighty-seven (2,287) fewer standard customers?

MS. LOIS MORRISON: That is correct.

MR. SVEN HOMBACH: And a standard customer compared to an all electric is somebody that uses a gas furnace to heat, correct?

MS. LOIS MORRISON: They heat with another source other than electric, so it would include any other type of fuel source.

MR. SVEN HOMBACH: So wood burning stoves, pellet stove, oil tank?

MS. LOIS MORRISON: That is correct.

MR. SVEN HOMBACH: What's Manitoba Hydro's reason for keeping track of these two (2) customer groups on a separate basis, all electric versus standard?

MS. LOIS MORRISON: We have information in our billing system that allows us to code people either as electric-heat billed, or non-electric heat billed. We also coordinate that -- or -- or verify that through our residential energy use surveys to make sure that the information in the billing system is accurate.

MR. SVEN HOMBACH: And the electric heat customers usually use quite a bit more electricity than standard heat customers?

MS. LOIS MORRISON: Yes.

(BRIEF PAUSE)

MR. SVEN HOMBACH: Now, trying to translate this number on the chart in front of you at page 19 into actual annual usage, the number I'm coming up with is a reduction of about 306 gigawatt hours.

Does Manitoba Hydro agree with that, or can you take it subject to check?

MS. LOIS MORRISON: We'll take it subject to check.

MR. SVEN HOMBACH: And if that's correct, that number's not quite one (1) year worth of deferral or one (1) year worth of growth, but it's pretty close to the four hundred and sixteen (416), was it?

MS. LOIS MORRISON: Yes. It's just shy of the four hundred and thirteen (413) one (1) year reduction.

MR. SVEN HOMBACH: Can you explain the reasons for this very significant reduction, specifically with respect to the all-electric group?

MS. LOIS MORRISON: What you're seeing here is the reflection of the changes in our forecast due to the change in the population forecast going

from the 1.2 percent on average annual growth being reduced to 1.1 percent annual growth.

And it's also reflecting the -- our anticipated success with our heating education campaign. We adjusted our targets to our -- our -- we adjusted our future penetration of electric space and water heating to reflect our -- our anticipated success with that program.

So what we saw -- what you're seeing here is we reduced -- even if we had held the population forecast constant, you would have seen a reduction in the number of electric heat customers because we were reducing the saturation to reflect that -- that heating education campaign.

MR. SVEN HOMBACH: Does that include that fuel switching initiative when you were discussing the education campaign, or is that the same program?

MS. LOIS MORRISON: Our -- the -- what I'm referring to is our education. The fuel switching initiative, we've called it that. We've called it the heating education campaign. That's what we're referring to.

MR. SVEN HOMBACH: So that campaign was not included in the 2012 forecast?

MS. LOIS MORRISON: No, that was not reflected in the 2012 forecast.

MR. SVEN HOMBACH: Which means it's not reflected in the NFAT economic analysis either.

MS. LOIS MORRISON: As Mr. Wojczynski noted, it was reflected in the Chapter 12 analysis that was undertaken in the update.

MR. SVEN HOMBACH: Has Manitoba Hydro analyzed the geographic distribution of these changes? Does it -- is -- is there any significant expected reduction in all-electric customers in one (1) area of the province but not the other?

MS. LOIS MORRISON: Well, we've -- I believe we've filed a number of interrogatories relates to where we're seeing the increased number of electrically heated customers in gas-available areas. And that is the south gas-available area of Manitoba.

And so where we adjusted our targets or our anticipated saturation rate is in that area specifically because we are targeting our education campaigns to those individuals building in that area and heating in that area to encourage them to choose natural gas where it's economically attractive.

MR. SVEN HOMBACH: Is it fair to assume that in the areas where gas currently is not

available, that you're not expecting a switch away from electric heat to any significant extent?

MS. LOIS MORRISON: It's a reasonable assumption to make. We are -- as Mr. Thomson referenced, we are continuing to -- where it's economic and we're able to extend gas, we are bringing gas into areas. And so in those areas we are seeing some conversions.

And -- but as he mentioned, a lot of our focus lately has been on assisting those in -- those organi -- operations that are facing the upcoming coal ban.

(BRIEF PAUSE)

MR. SVEN HOMBACH: Dealing then with standard customers, I've taken you to the chart that showed that the expected reduction compared to the 2012 load forecast is about two thousand two hundred and eighty-seven (2,287) customers. Again, by my math, that would equate to a reduction of about 117 gigawatt hours.

Can you accept that, subject to check?

MS. LOIS MORRISON: Subject to check, yes.

MR. SVEN HOMBACH: Yeah. So adding that to the previous number, you'd actually get a load reduction slightly in excess of about one (1) year's worth of growth?

MS. LOIS MORRISON: Yes, that is correct.

(BRIEF PAUSE)

MS. LOIS MORRISON: I believe at page 12 of our 2013 load forecast that you referenced, we do denote the difference that was as a result of the change in the population forecast and the change that was as a result of our anticipated heating education campaign, specifically broken out between the 2012 forecast and 2013 forecast.

MR. SVEN HOMBACH: And in your rebuttal evidence at, I believe, page 10, Manitoba Hydro indicated that it's expecting growth of about 1.4 percent exclusive of DSM.

So that heating education campaign, or the fuel switching initiative, or whatever it's called, is that included in the 1.4 percent, or is that also factored out?

MS. LOIS MORRISON: Yes, it is

reflected in the 1.4 percent.

(BRIEF PAUSE)

THE CHAIRPERSON: To clarify in my own mind, the fuel switching campaign that you referenced is not the same thing as what was mentioned this morning as fuel changes? This -- we're talking about an incremental initiative and -- which would impact the results we're seeing here, obviously?

MS. LOIS MORRISON: Yes, the fuel switching -- or the fuel switching program that Mr. Kuczek referenced would be in addition to the heating education campaign anticipated results.

CONTINUED BY MR. SVEN HOMBACH:

MR. SVEN HOMBACH: Now, also in the rebuttal at page 10, you should actually have it in the screen in front of you now, you indicate that the average use per customer is still being forecast to grow at the rate of 0.3 percent for the next twenty (20) years.

Why is that?

MS. LOIS MORRISON: I believe if we go further into the rebuttal, we do provide some

additional detail into that. Specifically, even just with our standard heated customers we're seeing an increase in the energy consumption related to furnace fan motors as customers convert from standard-efficiency or even mid-efficiency fans. We have single-stage fans moving into the high efficiency fans. Most are choosing the two (2) stage fans, which operate at the lower level, but operate on a con -- operate on a continuous basis to provide more comfort and ventilation. And that's adding to our electricity use of a standard heated customer.

In addition to that, when we go -- there's -- there's further points down on -- at the end of -- on that page that speak to our building codes in Manitoba. We require all new homes to be constructed with an HRV now -- which is a heat re -- heat recovery ventilation unit.

Now, what that does is in an electric-heated home it will reduce your electricity consumption. But on a natural-gas-heated home it will increase your electricity consumption. It will save you on your natural gas cost, but it will increase your electricity consumption.

So these components are -- along with still anticipating a higher saturation of electric,

space, and water heating, these are all contributing to our overall increase in energy in average use.

MR. SVEN HOMBACH: So does this .3 percent in -- include other energy efficiency matters? This morning we heard LED bulbs are becoming cheaper. Other appliances might be getting more efficient.

Is this a net number?

MS. LOIS MORRISON: The .3 percent reflects the codes and standards that we've reflected within the load forecast. So it reflects the minimum energy performance standards that have been outlined for lighting. It would reflect improved code requirements for new homes. It would reflect new -- improving appliance standards that we are aware of today. It would not reflect any of the programming or the opportunities that we're going to be pursuing in the future, ones that Mr. Kuczek alluded to this morning in his presentation.

MR. SVEN HOMBACH: I'd like to speak to you for a minute about price elasticity. And I'm not sure if that's your bailiwick, Ms. Morrison, or one (1) of your colleagues. So by all means feel free to punt the question. Manitoba Hydro has filed several IFFR documents that show the rate increases it's projecting over the next twenty (20) years. And

I'm wondering whether you've given some thought to price elasticity. And you've addressed it in your rebuttal. And you've said the numbers are inconclusive.

But have you compared the cumulative increases that you are currently projecting to prices in other jurisdictions, let's say even other Canadian cities that have higher rates, to see what -- how it affects customers?

(BRIEF PAUSE)

MS. LOIS MORRISON: We haven't done a province-by-province or jurisdiction-by-jurisdiction review of price -- projected price increases and -- compared to our jurisdiction. We've taken a very cursory review. As you mentioned, we have not to date been able to determine or derive a -- a reasonable or a -- a -- an elasticity that would be -- that we could rely upon. However, we've -- we recognize that given the price increases that we're looking at going into the future, that we do want to take a closer look at this. And we'll be incorporating this into our future forecasting.

MR. SVEN HOMBACH: Are you at liberty

to tell whether that's something that'll be reflected in the 2014 load forecast, or is that something to be left for future years?

MS. LOIS MORRISON: We are looking at incorporating an adjustment for the 2014 forecast. However, we recognize that it would be a very rudimentary adjustment at this point, because we do need to undertake a -- an in-depth study to look at the Manitoba marketplace in and of itself, recognizing that it is unique. And so we will be doing a study to -- to identify the elastic -- elasticity that would be appropriate for Manitoba.

But as part of our crude review that we've done to date, we'll be incorporating some of that information. And we will, as Mr. Kuczek pointed out in his presentation, look to include some representation of price elasticity in the 2014 forecast.

MR. SVEN HOMBACH: All right. Yesterday, your CEO commented on the fact that Manitoba Hydro intends to file a new general rate application soon.

Is that going to be based on the 2014 forecast, or is that forecast not going to be ready for a few months?

MS. LOIS MORRISON: Could you refresh my memory as to when he's planning to file it? Because that will tell you whether or not it'll incr - - I -- the -- the 2014 load forecast will not be available prior to June.

MR. SVEN HOMBACH: Okay.

MS. LOIS MORRISON: And that application, I believe, is coming to the Board prior to that date. So it will not be including or reflecting that.

MR. SVEN HOMBACH: Which answers my second question as to whether or not it's going to be filed in this NFAT. But you're telling me that won't be the case.

MS. LOIS MORRISON: We physically can't begin the load forecasting process until the fiscal year is complete. So we can't begin the forecasting process until March 31st -- or April 1st.

THE CHAIRPERSON: I want to explore that issue of price elasticity a little bit more. There are a number of published studies that address price elasticity of electricity in North America.

And I -- I admit that there may be adjustments required for Manitoba, but could you explain to me what you -- what you perceive as being

adjustments that are unique to Manitoba, relative to what they would be elsewhere?

MS. LOIS MORRISON: Well, Manitoba is a marketplace where we have not seen significant rate increases over or about the rate of inflation for a very long period of time. We're also a marketplace that has currently a relatively low cost for energy. We're a very heavily heat-dominated market. We have a lar -- we have a large number electrically heated homes.

So there -- there are certain characteristics that would affect an elasticity that would be appropriate for Manitoba as opposed to, say, an environment where you're primarily cooling dominated and you have customers that might be more willing to accept a slightly warmer temperature in the house as opposed to a slightly colder temperature in the house. We ha -- or a starting rate that is, say, in the range of thirty (30) cents a kilowatt hour.

We recognize that all of those components, where you start from, will influence what elasticity might be applied to the marketplace. We also recognize that we're not the expert in this and that we would be well served to bring someone in that would be able to aid us in this.

(BRIEF PAUSE)

CONTINUED BY MR. SVEN HOMBACH:

MR. SVEN HOMBACH: Now, before I continue, it's my intention to keep asking questions with respect to the load forecast, but I appreciate that you have an external consultant on the panel.

Is Ms. Rohmund planning to be here tomorrow to answer question on DSM, or should I be asking DSM-related questions today?

MS. LOIS MORRISON: I believe Ms. Rohmund had committed to stay with us for the duration.

MR. SVEN HOMBACH: Fair enough.

(BRIEF PAUSE)

MS. MARLA BOYD: That's assuming it ends on Thursday.

THE CHAIRPERSON: I don't -- I don't want to belabour this point, but just in your re -- you know, following up on what you just said about price elasticity of demand in Manitoba relative to other jurisdictions, I'm getting the sense that you -- you are of the view that perhaps the price response in

Manitoba is less than would be the case in other jurisdictions, given that we're paying lower rates?

MS. LOIS MORRISON: I -- I don't necessary want to draw a conclusion at this point yet, because I'm not an expert in price elasticity. However, what -- based upon our crude review to date, we have found that there -- that some of those components might drive a different price elasticity than, say, a jurisdiction that would have a high starting point for a rate or have different characteristics, as I mentioned.

So we want to make sure that what we're doing is what's appropriate within the Manitoba marketplace.

MR. DALE FRIESEN: In support of what Ms. Morrison is saying -- sorry, it's Dale Friesen speaking. I think we have to recognize that there's some technical considerations to the Manitoba market that are rea -- very, very important to consider, given the fact that we are heat dominated.

So you have to look at the measures that cus -- consumers might undertake as price elasticity responses. So let's take an obvious measure: turn out the lights. So all of us might become a little bit more conscious about how many

lights we leave on in the room. Well, if we make that initiative to turn out more lights, we are effectively reducing the amount of heat that is in that space. That heat has to be replaced. That's a particularly important consideration in a heat-dominated climate such as Manitoba.

So in the case of a -- of a gas heat home, the replacement will be gas heat, and the customer may realize a benefit in their electricity bill. In the case of an electric heat home, the furnace will need to operate for a longer period of time to make up for that energy that would norm -- or that heat that would have normally been gained from the lighting system.

As a result, the net impact that the customer may realize on their energy bill will be minimal. And that may be a discouraging aspect to conserving energy, because the customer doesn't realize the net benefit from their effort.

So when you look at how this interplays in the context of our particular climate, you have to recognize that that may, over the long-term, have an important impact on price elasticity. And then you look at what measures could a customer implement to achieve real change.

And real change, I mean, how could they reduce their heating requirement. And a measure such as building envelope improvements, et cetera, are relatively expensive measures. And that may discourage the customer from implementing them at a rate that other jurisdictions may not recognize in their price elasticity consideration.

So there are unique characteristics to the Manitoba market relative to many of the price elasticity studies that have been done in other regions. And I think what Ms. Morrison is telling you is that we haven't had a chance to really sit down and work with price elasticity experts to fully recognize what those differences will result in or what the outcome -- how the outcome will change if we recognize those differences.

DR. HUGH GRANT: It just -- it just comes as a bit of a surprise that if you're doing -- essentially forecasting demand, you don't have a price variable at all. Is this -- let me put it this way.

Is it -- is it true, then, in your load forecast you're assuming a price elasticity of zero?

MR. DANIEL FRIESEN: I'll let Ms. Morrison answer that.

MS. LOIS MORRISON: We are not

assuming, necessarily, the price elasticity is zero. But you are correct that we do not have a component reflecting price elasticity. We -- prior to 2013, we used to look at the ratio of the change in the electricity cost to the ratio of the change in the gas price in order to assign fuel share. Like, who was going to choose electric heat versus who was going to choose a natural gas alternative for heating their home.

And what we found was that when we were obs -- what we observed with our model was that the model was no longer predicting that -- that behaviour. There -- the -- the model was no longer showing that relationship. And so in 2013, we removed that model from -- from that component of the forecast. So it's not that we've ignored price in its entirety, but there are two (2) components.

So -- so we did look at it from that perspective prior to the 2013 forecast. And in addition to that we have looked at it, but when we do our models we've not had price come out as a significant variable. It tends to get overshadowed by the other components because our price changes haven't been enough to -- to derive a -- a relationship that we could use in our models.

DR. HUGH GRANT: Normally one questions their model, then. But in any event, can I ask you a more question about this forecasting? It's more out of curiosity than anything.

Do general patterns, residential -- shifting residential patterns enter into a load forecast at all? I'm thinking of population aging, or a trend away. Say, a trend towards home ownership as opposed to a -- a rental accommodation. Do -- do factors like that enter into it? Let me put it this way.

A hundred people living in single-family dwellings suddenly all move into one (1) large apartment building.

MS. LOIS MORRISON: We -- our -- our residential forecast is -- recognizes and is based on a forecast for single detached -- electric-heated single detached, natural gas -- or, sorry -- other than electric heated, multi-attached row housing, side-by-sides, and also does apartments. So we do forecast based on those building types.

DR. HUGH GRANT: Do you forecast changes -- changing patterns within those building types?

(BRIEF PAUSE)

MS. LOIS MORRISON: We use our residential energy survey and calibrate it to information in our billing system to look at more recent penetrations or market penetrations of those different sectors, and apply that going forward. So we would look at the penetration of single detached homes in 2009, not the overall system as a whole, and then move forward.

So it -- it's -- it's, to a certain extent, recognizing that shift as to whether or not there's more people living in apartments versus living in single detached homes.

CONTINUED BY MR. SVEN HOMBACH:

MR. SVEN HOMBACH: So to follow up on Board member Grant's question, when -- you're not projecting changes then over the twenty (20) year forecast period. You're looking at where the situation currently is, you're taking changes into account.

But are you projecting changes going out twenty (20) years?

(BRIEF PAUSE)

MS. LOIS MORRISON: We adjust based on the penetration going forward, and there are some areas where we do make some projections, anticipating greater growth in. So as I mentioned, in the south gas-available area, we make a projection for increased -- we make a projection for new homes and single detached homes and in the Winnipeg area and in the non-gassable areas.

And those projections are done so that they're reflecting trends that we're seeing in growth in those areas. But the -- the building demographic is applied based on that 2009 survey.

MR. SVEN HOMBACH: And we've discussed the -- the fuel switching initiative a bit. And Manitoba Hydro provided us with an answer to Information Requests. It's PUB-MH-1-253A, which is found at page 29 of Board counsel's book of documents.

Can you provide a brief overview, Ms. Morrison, please, what that initiative actually entails in them more or less?

MR. IAN PAGE: I believe we gave a very detailed description of what was involved in the heating education or the fuel choice initiative at our

response to PUB-253B.

Primarily at this point in time, we are aggressively advertising our education campaign. We are specifically targeting the south gas-available area. We are also targeting Winnipeg, but we're -- as I mentioned, the majority of our focus is in the south gas-available area.

We are working with home builders and developers, and we are also having a -- an advertising campaign targeted to those communities. The -- let's see if I can find my...

(BRIEF PAUSE)

MS. LOIS MORRISON: And so what we've done, as I mentioned, we -- we've -- we've got an -- an aggressive advertising campaign that's targeted to the south gas area available (sic) primarily. We're looking at -- the advertising is broken into two (2) different targets. We're focussed on new homes and people purchasing new homes in that area, and giving them -- giving them the appropriate messaging as to what they should consider when they're purchasing heating systems.

They should be looking at, from our

perspective, the life cycle costs and not just the up-front costs. And with that, we're supporting it with information on our website. We have a heating fuel choice calculation tool where you can put information into the website about what your choices are for heating systems, the costs and such, and it'll tell you what the -- what -- what the different costs are if you were to choose a natural gas system over an electric heated system, or if you were to choose a geothermal system.

And in addition to that, we've -- doing bill inserts and other general information mailers. We are working with home builders. We attend -- we have regular developer sessions with the developers to talk about changes with services and such, and we've been working -- attending those developer sessions to explain to them what is in the best interests of the customers, and to ensure that they are fully aware of what the different costs are of the different fuel choices are, and of the different implications from an environmental perspective.

MR. SVEN HOMBACH: And Manitoba Hydro's perspective is it's better for the customer to have a gas furnace than an electric furnace? Cheaper, in any case.

MS. LOIS MORRISON: Maybe to answer the question that you posed to Mr. Thomson yesterday, that if you were to ask me what I would tell a customer, is I would ask the customer what's important to them, what's driving their decision making, and provide them with the information they need to make sure that the decision best meets their needs.

MR. SVEN HOMBACH: Okay. Appreciating that Manitoba Hydro focusses on information, and appreciating that this was a very diplomatic answer, has Manitoba Hydro considered actually setting any incentives or disincentives for builders to put in gas compared to electric? Because you've focussed only on information so far.

MS. LOIS MORRISON: M-hm. That is one (1) of the things that we are considering, and is actually one (1) of the -- the -- I almost want to call it a white paper, but it's not a white paper. It's -- it's a topic that's sitting on my desk. One (1) of those topics that Mr. Kuczek alluded to is sitting on our desks waiting for us to -- to spend some time on.

But, yes, we have considered what opportunities there might be from a service extension policy perspective, working with -- with builders and

developers.

MR. SVEN HOMBACH: When a builder's currently putting in a new subdivision or putting in a home, is Manitoba Hydro charging them a connection fee to hook up hydro?

MS. LOIS MORRISON: When -- it's a -- yeah. When a bel -- when a -- when a developer comes to us to have service extended to a development, they pay for the -- the development to be serviced. And we have to differentiate between the developer and the home builder. The devel -- the home builder and the developer are not always the same people.

And so when a developer comes to Manitoba Hydro and they say they would like service, they will come -- we -- we will provide them with information on how to -- they will provide them with a quote on extending electrici -- electric service and natural gas service to their development. In many cases, particularly in areas where gas is available, if there's enough -- most times, the developer won't have to pay to have gas installed, because we expect a certain level of connection or attachment rates with the appliances, or the home builders building homes in that area.

There is a cost that the developer does

pay up front for the electricity. And if -- depending on how many attachments we get for the electricity -- sorry, for the houses; I shouldn't call them electricity -- how many attachments we get for the houses, they'll get an allowance back, based on the fact that they have attached so many. So they basically prepay, and then if the house attaches service then the developer will receive a certain contribution back on their -- their service.

The difference is, on the gas side, that contribution is applied at the beginning of the service. This is where there's differences between the gas side of our operations and the electric side of our operations. And -- and I -- I know the Board is fully aware of why that is.

So -- so there are costs that the -- that the developer pays up front.

The builder does not pay for a service connection if they're in a development that's already served. The developer takes that responsibility.

MR. SVEN HOMBACH: And Manitoba Hydro wouldn't have any control over whether the developer passes the cost on to the builder or not, or how that is done?

MS. LOIS MORRISON: Yes. We're

getting quite far into the allowances here. We have less control over the home builder in that scenario. There is a cost for connecting the house, but generally the allowances pay -- cover that cost from the electric side. The same -- and -- and so when the -- so the developer pays for it up front, and the allowance is then applied to the developer, and the developer has -- has already passed on that savings to the home builder.

So -- and this is getting into some of the complexity of how our -- our ser -- service extension policies are set up, and some of the -- the nuances of how it -- the allowances work, that we're trying to work through and determine a best way to -- to encourage builders to move in the right direction. And is there an opportunity using these allowances and these -- these connection -- we don't have a connection charge per se in place right now for home builders, but are there opportunities right now? But it would be something outside of what we normally do.

MR. SVEN HOMBACH: Now, at page 29 of the Board counsel's book of documents, you've listed the expected savings that you're attributing to the fuel savings initiative. And if my high school math still serves me okay, it's -- you're looking to shave

down total demand by about 366 gigawatt hours.

First of all, do -- do you agree with the math?

MS. LOIS MORRISON: Yes, your math is good.

MR. SVEN HOMBACH: That's -- that's heartening. My second question on that issue is does -- does that include any of the measures that are set out in the white paper you discussed, Ms. Morrison? Or is that just purely based on the current educational initiatives?

MS. LOIS MORRISON: When we set these initiatives out, or these -- these targets out, we were considering the possibility of if we were not -- if the heating education campaign did not achieve what we were setting out to achieve, then we look at other intervention strategies, which could possibly include the -- looking at service extensions and -- and allowances.

So, to answer your question, it's something that could be used to get to these targets if we were in -- if we were realizing we were not getting there.

MR. SVEN HOMBACH: And at page 34 of the Board counsel book of documents is a chart that --

that calculates what we think the reduction would be if the program were to be a hundred percent effective. It's -- it's on screen in front of you, Ms. Morrison. The -- the three-sixty-six (366) is Manitoba Hydro's projection. 942 gigawatt was our calculation of what it would be if you were a hundred percent successful, appreciating that one rarely is.

Are we in the ballpark?

(BRIEF PAUSE)

MR. SVEN HOMBACH: I mean, I'd be happy to walk you through how we get to those numbers if that helps.

MS. LOIS MORRISON: I -- I would appreciate that. I -- I have notes here --

MR. SVEN HOMBACH: All right.

MS. LOIS MORRISON: -- assuming that there's zero new electric space heated homes in Manitoba, in the gas available area, and zero new electric water heated and no con -- conversions, is that what you were -- yes, I would appreciate if you could tell me your assumptions underlying this.

MR. SVEN HOMBACH: Yeah. I mean, I'll -- I'll walk you through the -- the first one, for

example, a new home space heating. We assumed that there would be thirty-four hundred (3,400) new homes in the gas area, of which 34 percent would choose electric heat. So over the course of a 20-year forecast.

So you multiply thirty-four hundred (3,400) new homes by twenty (20) -- so it's on an annual bas -- basis -- times 34 percent. That gives you approximately twenty-three thousand (23,000) homes that would choose electric heat. Average customer use is about 18,500 kilowatt hours per year.

So multiplying those two (2), that would get -- get you to the four hundred and twenty-five (425). And I appreciate it's not an exact science, but I just want to get a handle on what percentage of success Hydro is projecting compared to total potential.

MS. LOIS MORRISON: The eighteen thousand five hundred (18,500) is the average use per home. It's not the average use of an electrically heated -- it's not the electric heat component of a -- or is -- is -- I guess I'm wondering -- 'cause you said it's the average use of a home. Are you assum -- are you adding the water heating to the space heating to come up with that number, or how are you deriving

that?

MR. SVEN HOMBACH: It should just be for the -- it's my understanding that that number is just for the furnace.

MS. MARLA BOYD: Do you have a source for the number?

(BRIEF PAUSE)

CONTINUED BY MR. SVEN HOMBACH:

MR. SVEN HOMBACH: That calculated from the numbers on page 33 of the Board counsel book of documents.

But, either way, Ms. Morrison, it's -- it's -- I'm not asking for an exact science. We're -- just try to get a handle on what percentage of success Manitoba Hydro was actually projecting, and how the 366 gigawatt hour reduction would compare to, let's say, 100 percent success rate.

(BRIEF PAUSE)

MR. SVEN HOMBACH: I believe in the 2012 fuel switching report you actually gave a number of 875 gigawatt hours per year.

MS. MARLA BOYD: Mr. Hombach, perhaps we can undertake to have a look at this and -- and try and confirm it. It's -- it's a bit difficult without having all of the material in front of us to be able to make a -- a reasoned answer.

MR. SVEN HOMBACH: That's fine, Ms. Boyd. If I can get an undertaking from Manitoba Hydro just to advise what it's calculation would be based on 100 percent success rate, that's fine.

MS. MARLA BOYD: Yes, we'll do that.

--- UNDERTAKING NO. 7: Manitoba Hydro to provide a calculation on page 33 of the Board's book of documents Volume II based on a success rate of the fuel switching initiative

CONTINUED BY MR. SVEN HOMBACH:

MR. SVEN HOMBACH: Now, Ms. Morrison, I took you through the reductions from the 2012 to the 2013 forecast, both for all-electric and for all-gas. And just to recap those numbers, were 306 gigawatt hours per year -- sorry, for all-electric, and 117 gigawatt hours for standard.

Those 366 gigawatt hours that Hydro is projecting are attributing to the fuel switching initiative. Would those be subsumed in those initial numbers, or is that additive?

MS. LOIS MORRISON: As I mentioned, the 366 gigawatt hours is reflected within those numbers, but there were other changes that were presented in that -- or adjustments to the forecast between the 2012 and the 2013 for the residential sector. I mentioned they were at page 12 of our forecast. And in it we referenced point 3 of the -- point 3 on the page states:

> "An adjustment to reflect the initiatives being undertaken by Manitoba Hydro was included to reduce the number of customers choosing electric space and water heating, and it represents 366 gigawatt hours."

The -- the other two (2) adjustments to -- between the 2012 and the 2013 forecast were related to the population forecast dec -- decreasing by approximate -- well, by -- not approximate -- by sixteen thousand nine hundred and one (16,901) customers, which represented a reduction of 282

gigawatt hours in the -- between the 2012 forecast and the 2013 forecast.

And then there was also an adjustment to our appliance and unit energy consumptions based on our conditional demand analysis model that adjusted the -- the energy use up by about 212 gigawatt hours. So those are the three (3) components that led as a net.

So yes, the changes that you are speaking to in your charts do reflect that 366 gigawatt hours of reduction.

MR. SVEN HOMBACH: Okay. Thank you for that clarification.

(BRIEF PAUSE)

MR. SVEN HOMBACH: I would like to take you to page 35 of the Board counsel book of documents, and discuss the consumption without water heating for a minute.

But first of all, in terms of the major consumption, somebody can have a gas or electric furnace, and a gas or electric water heater, correct? Those are basically the choices, leaving aside pellet stoves, or other niche products.

MS. LOIS MORRISON: Yes, those are your -- those are the -- those are the most commonly chosen options for -- for heating.

MR. SVEN HOMBACH: And this chart in front of you, that's a PUB adviser chart, once again not a Manitoba Hydro document. And one (1) of the assumptions that this makes is that somebody who has a gas furnace may choose to have an electric water heater. But somebody who gets a -- has a gas water heater probably is not going to make the choice to have an electric furnace, given the cost impact.

Is that a reasonable assumption, from Hydro's perspective?

MS. LOIS MORRISON: Yes, that's a reasonable assumption.

MR. SVEN HOMBACH: So what we try to do is factor in -- factor out the impact of water heating to determine the actual average consumption that you are projecting. And the numbers for this document and the math is found at page 36 behind -- and -- and what the chart shows is that even though the overall numbers for the 2013 load forecast are lower, you're actually projecting a sharper increase in the per capita consumption for standard customers.

And is that just attributable to what

you spoke about earlier, the heat recovery ventilation systems and other matters?

MS. LOIS MORRISON: Yes, there's -- there's one (1) nuance to the math that isn't being incorporated into your table, related to the fact that not all customers with electric space heat have water -- electric water heatings -- systems. That would be our apartment dwellers. Some of the people in apartment buildings don't have electric water tanks.

But, fundamentally, the majority of this would be likely derived from the increase in the HRVs, as I mentioned, in the homes, and the multi-speed fans being used in standard heated homes..

MR. SVEN HOMBACH: And on the electric side you wouldn't see a similar increase because people have an overall reduction --

MS. LOIS MORRISON: In -- in an electrically heated home, the customer installing an HRV would have a reduction in their energy consumption overall, yes.

(BRIEF PAUSE)

MR. SVEN HOMBACH: Mr. Chairman, I'm about to start the next topic. Would the panel like a

break, or are we good to continue?

THE CHAIRPERSON: I think it would be a good idea to have a break. Let's take ten (10) minutes.

--- Upon recessing at 2:27 p.m.

--- Upon resuming at 2:45 p.m.

THE CHAIRPERSON: Okay. I believe we're ready to resume the proceedings. Back to you, Mr. Hombach.

MR. SVEN HOMBACH: Mr. Chairman, we seem to be having some technical difficulties again with the little wireless device.

(BRIEF PAUSE)

MR. SVEN HOMBACH: The computer is telling me that the issue has been resolved. I'll have to trust it.

CONTINUED BY MR. SVEN HOMBACH:

MR. SVEN HOMBACH: We briefly touched on the issue of weather adjustment earlier, and that Manitoba Hydro adjusts weather on a weather normalized

basis, so that if there's an exceptionally hot summer or an exceptionally cold winter, that doesn't skew the load forecast or isn't assumed to be usual.

And those are based on the concept of degree-day heating and degree-day cooling, are they not?

MS. LOIS MORRISON: That is correct.

MR. SVEN HOMBACH: And a degree-day cooling is one where the average number between the daily high and the daily low for that particular day is higher than 18 degrees Celsius?

MS. LOIS MORRISON: That is correct.

MR. SVEN HOMBACH: And for heating, it's basically the same thing in reverse, where the average between the coldest point of the day and the hottest point of the day is less than 14 degrees Celsius?

MS. LOIS MORRISON: That is correct.

MR. SVEN HOMBACH: Can you explain why eighteen (18) is used for cooling but fourteen (14) for heating?

(BRIEF PAUSE)

MS. LOIS MORRISON: A number of years

ago, we used 18 degree days, 18 degrees for both heating and cooling. And with the purchase of the natural gas company, the natural gas company determined a number of years ago that 14 degrees was better for forecasting on the gas side.

We later aligned the electricity side to the gas side after we did an analysis and determined that the differential for the degree-day heating was that there was no -- that there -- there was no material difference between using a fourteen (14) as the -- as -- as the degrees or eighteen (18) as the degrees for the heating side, in terms of calculating the degree-day heating.

MR. SVEN HOMBACH: And Manitoba Hydro determines sensitivity coefficients on an annual basis, right? Does it compare the actuals against the projected DDH or DDC numbers? Or how are those sensitivity coefficients determined?

Specifically, Ms. Morrison, I'm referring you to a -- a list of coefficients that was produced by Elenchus, one (1) of the independent experts appointed by the Board, which is reflected at page 38 of Board counsel's book of documents.

(BRIEF PAUSE)

MS. LOIS MORRISON: Mr. Hombach, I would -- I would refute -- refer to our page 22 of our rebuttal, which outlines how those degree-day se -- coefficients are -- are created. And it's through a regression-based model.

And I believe our updated model is on page -- sorry, I correct that -- is on page 24. And it is a model that is based upon the difference between -- it's based on a regression analysis.

(BRIEF PAUSE)

MS. LOIS MORRISON: Sorry. I apologize. It is, as I noted, at the beginning of page 24 on our rebuttal, we outline it is statistically derived using the previous twenty-four (24) months of data to determine the coefficients.

MR. SVEN HOMBACH: And help me understand this concept. When you're determining the coefficients, do you only look at these that qualify as DDH or DDC days, meaning that where the average, let's say, for degree-days cooling exceeds 18 degrees, or is it every day of the month and then you just tally them up over the course of the month?

MS. LOIS MORRISON: It's every day of

the month and tallied over.

MR. SVEN HOMBACH: What's Manitoba Hydro's reason for only looking at the past, is it two (2) years, to determine the coefficients?

(BRIEF PAUSE)

MS. LOIS MORRISON: We look at the past two (2) years, because we have found that in order to -- to effect the best possible weather adjustment in the current year, weather coefficients need to be determined from the most recent data, ideally the previous year. However, twelve (12) months of data points were found to be insufficient to produce good estimates of the base -- the D -- the degree-day heating, and DD -- degree-day cooling coefficients, and so we moved to twenty-four (24) months.

(BRIEF PAUSE)

MS. LOIS MORRISON: And that explanation is outlined at page 23 of our rebuttal, between lines 18 and 36.

MR. SVEN HOMBACH: Okay. If I'm

looking at page 39 of the Board counsel book of documents, there is a -- a chart that Manitoba Hydro provided that shows the monthly degree-days heating in Winnipeg over the past fourteen (14) years.

And a high number of degree-days heating means you get an exceptionally cold year, does it not?

MS. LOIS MORRISON: That is correct.

MR. SVEN HOMBACH: And conversely, a high number of DDC means -- DDC days means you've got an exceptionally hot year? Or at least an exceptionally hot summer?

MS. LOIS MORRISON: Yes.

MR. SVEN HOMBACH: So let me take you to page 40 of the Board counsel's book of documents. There's a chart in front of you that shows the degree-days cooling. Now, what's apparent when you're comparing the DDH and the DDC charts is the degree-days cooling seem to be compressed into a significantly shorter time span year-over-year, no?

MS. LOIS MORRISON: That is correct.

MR. SVEN HOMBACH: It's rare that, for example, in April or in October anybody needs to run their air conditioner?

MS. LOIS MORRISON: I think that's a

very safe statement for Manitoba, yes.

MR. SVEN HOMBACH: Well -- so if, for example, on this chart in front of you, I was to look at the 2009 year where the total number of degree-days cooling is only a hundred and nineteen (119), that would indicate to me that it was a pretty cold and miserable summer?

MS. LOIS MORRISON: Yes.

MR. SVEN HOMBACH: Okay. The same for 2004, for example, where it was actually only seventy-two (72)?

MS. LOIS MORRISON: That is correct.

(BRIEF PAUSE)

MR. SVEN HOMBACH: Now...

(BRIEF PAUSE)

MR. SVEN HOMBACH: If I'm looking at what's happening after those very cold years -- and I'm taking you back to page 38 of the Board counsel book of documents -- where Elenchus provided the sensitivity coefficients -- again, we established 2004 and 2009 were very cold years. After 2009 the

kilowatt hours for DDC, the coefficient, is substantially higher.

Does that -- should I take that to mean that if you've got any summer that's just an outlier that's exceptionally hot or that's exceptionally cold, that that disproportionately skews the sensitivity coefficient?

MS. LOIS MORRISON: What we found is, after working with Elenchus -- Elenchus, was that when you have a large number of -- degree-day cooling is somewhat more difficult to determine within the Manitoba marketplace when we're dealing with a short period of time that's primarily heavily heat dominated and where you have -- sorry.

(BRIEF PAUSE)

MS. LOIS MORRISON: So there is difficulty in establishing the cooling coefficients in Manitoba because of the fact that we have a -- there's quite a bit of variation within the month -- month to month. And there's quite a bit of possibility for higher energy consumption in those months due to heating that may occur in the same month that you're cooling. And so when the coefficient -- when -- when

we were looking at our model, the way our -- our model picks the -- the data in, it'll pick in a month that may have large energy consumption tied to a low cooling degree-day.

There may be a cooling degree-day in there, but it'll pull in large energy consumption but won't pull in -- and then it'll compare it to a month that, say, had a high de -- degree-day cooling but then a -- but a low energy consumption. So we end up with variations within the designation for the cooling degree-days that -- that causes more bouncing around or -- or more variation from year to year within the cooling degree-day de -- coefficients.

MR. SVEN HOMBACH: Okay. And there is a -- a chart that was provided in response to Information Requests by Elenchus that seems to illustrate this quite well. It's at Elenchus Information Request 11. That takes the sensitivity coefficients that Manitoba Hydro provided and -- and charts them both for heating and for cooling.

Do you have the chart in front of you, Ms. Morrison?

MS. LOIS MORRISON: I -- I do, on the screen. Thank you very much.

MR. SVEN HOMBACH: Okay. Now --

MS. MARLA BOYD: Is that in your book of documents? I'm sorry, just to follow along.

MR. SVEN HOMBACH: I beg your pardon?

MS. MARLA BOYD: Is it in your book of documents?

MR. SVEN HOMBACH: Yeah -- no, it -- it is not, sorry.

CONTINUED BY MR. SVEN HOMBACH:

MR. SVEN HOMBACH: And -- and that shows a gradual, slow upward trend for heating, but shows the sensitivity coefficients really being all over the map for -- for cooling?

MS. LOIS MORRISON: Yeah.

MR. SVEN HOMBACH: Now, if -- if that's the case, does it actually make sense for Manitoba Hydro to adjust on a cooling basis when it predicts demand?

MS. LOIS MORRISON: Well, what we've determined after this analysis is that we -- overall, the impact to our weather adjustment for the year isn't affected, because either the cooling degree -- either the kilowatt hours for the cooling degrees go into heating, or they go into cooling. They don't disappear. They go to one (1) bucket or the other.

And what we've determined is that when we're going -- to -- to try and limit some of this variation, we should in the future when we're looking at our model, make sure that we aren't picking up months that have a heating component to them when we're doing our -- our calculation for degree-day cooling. So we wouldn't necessarily pick up a September that might have had a warm -- had a warm day and had some degree-days cooling, but then may have had heating attached to it also.

So what we're finding is that we are -- we believe that we'll be able to -- to -- there will still be variation, just because of the fact that cooling is a much smaller component of our overall load in terms of -- and we are only dealing with four (4) months of the year -- of -- of two (2) years of data for determining that cooling coefficient.

But we think that we can eliminate some of that variation by -- by focussing on months that don't have a high degree-day heating within the same month that a degree-day cooling is occurring.

MR. SVEN HOMBACH: Give or take, what -- what approximate range of cooling adjustments does Manitoba Hydro perform on an annual basis?

How many gigawatt hours are we talking

about?

(BRIEF PAUSE)

MR. SVEN HOMBACH: I'm just trying to get a handle on what the uncertainty is that this actually introduces.

MS. LOIS MORRISON: I'm -- could you clarify your question? Are you asking us to what effect a -- a change in degree-day cooling would affect our forecast?

MR. SVEN HOMBACH: I'm -- I'm asking on a cumulative basis over the year. You're providing in your load forecast the actuals for the year as well as the weather adjustment?

MS. LOIS MORRISON: Yes.

MR. SVEN HOMBACH: But that doesn't actually break it down. I'm just wondering, in a regular year, are we talking about an adjustment of 10 gigawatt hours, are we talking about 100 gigawatt hours, are we talking more than that attributable to a cooling-weather adjustment?

(BRIEF PAUSE)

MR. SVEN HOMBACH: If it makes more sense to deal with this by way of undertaking, I'll happily do that.

MS. LOIS MORRISON: I think that would be more appropriate. Thank you very much.

MR. SVEN HOMBACH: It's to provide an order of magnitude for the average degree-day cooling adjustment per year in the load forecast.

--- UNDERTAKING NO. 8: Manitoba Hydro to provide an order magnitude for average degree-day cooling adjustment per year in the load forecast

MR. SVEN HOMBACH: So we -- we've covered residential rates. Taking you back to page 18 of the book of documents, that just shows the total usage broken down into customer classes. Residential is one of the largest, but general service mass market is actually larger than that.

And it's my understanding that mass market is basically everything that is commercial and everything that is industrial, excluding the top consumers.

Do I have that right?

MS. LOIS MORRISON: That is correct.

MR. SVEN HOMBACH: Okay. And EnerNOC this morning provided a slightly different pie chart, but that's because EnerNOC actually distinguishes between industrial and commercial rather than just everything commercial and the top consumers.

MS. LOIS MORRISON: Yes. Our forecast is based on rate classifications. So anyone in the general service rate classification is included, is -- is forecast separately. We then exclude specific customers in our top consumers.

MR. SVEN HOMBACH: Now, to determine your mass market forecast, you take two (2) things into account, do you not?

You take the Manitoba population, as well as the projected GDP?

MS. LOIS MORRISON: That is correct. We -- to forecast our number of customers -- for the general service mass market sector, we forecast based on the change in pop -- there's a factor that aff -- accounts for the change in population, or the change -- actually the change in the number of residential customers, and the change in GDP.

MR. SVEN HOMBACH: And you provided a

Elenchus with a formula that's set out in the Elenchus report.

That's actually the correct formula that you use?

MS. LOIS MORRISON: That is correct.

MR. SVEN HOMBACH: The GDP numbers, are those coming from the same five (5) commercial forecasters that you used for population, or where do you obtain your GDP projections?

MR. IAN PAGE: Yes, it's the same five (5) forecasters.

MR. SVEN HOMBACH: And all in all, looking at the formula, the population level is about five (5) times as -- as influential in determining your mass market forecast as GDP, correct?

MS. LOIS MORRISON: That is correct.

MR. SVEN HOMBACH: What I am curious about is why there is no assumed impact from large industry, meaning the top consumers. Can you explain that to me? The formula that you provided looks at the GDP. It looks at the Manitoba population. But it doesn't look at the top consumers. So it doesn't assume that there's any trickle-down effect from large heavy industry, for example, on other commercial demand.

Why is that?

(BRIEF PAUSE)

MS. LOIS MORRISON: We haven't yet seen a relationship between the two (2) to be determined within our forecast. And their energy consumption has been -- we -- we separate them because their energy use is substantially different. And previously when we did include them within the overall -- many, many years ago, when we included them together, with the exception of two (2) top consumers, the outcome was that they were -- they were somewhat skewing the results of our models. So we pulled out the top consumers and forecasted them individually.

MR. SVEN HOMBACH: Now, you've also made some changes between 2012 and 2013. You were projecting annualized growth of about 1.5 percent for this customer group, which accounts for about 34 percent of total load. I'm sorry, you -- you're currently projecting 1.5 percent. You were projecting 1.7 percent.

That just follows the formula you've -- you've ...

MS. LOIS MORRISON: That's correct.

MR. SVEN HOMBACH: Okay.

(BRIEF PAUSE)

MR. SVEN HOMBACH: I'm showing you page 52 of the Board counsel book of documents. That is Table 5 from the 2013 load forecast. Sorry, I misspoke. Page 52 of the book of documents. And if you look at the middle of the page, you can see that your actual experience for residential growth was annualized growth of about 1.8 percent, less than that for the mass market group of about 1.4 percent, and really very little year over year growth for the top consumers.

You see that? Middle of the page, where it says that -- it shows you the ten (10) year average?

MS. LOIS MORRISON: Yes, that is correct.

MR. SVEN HOMBACH: Do you usually expect to see mass market growth to grow less quickly than residential? Or is this just an effect of the recession in 2008?

(BRIEF PAUSE)

MS. LOIS MORRISON: Okay. What we observed here was a higher residential growth due to the increased penetration of electric space heating and other -- and the adjustments to the -- and the increased end uses as opposed to the population and factors that are driving -- that are being observed in the mass market.

MR. SVEN HOMBACH: Is the increase in electric heating, though, something that you've just seen recently, or is that something that is incorporated into your overall formula for determining mass market growth?

MS. LOIS MORRISON: We don't factor electric space heating growth into the mass market forecast. I -- I'm speaking about the -- you asked about the -- the comparison between the residential market having 1.8 percent and the general service mass market having 1.4 percent.

And the 1.4 percent is -- the 1.8 percent reflects an increase -- what we would have -- we were supp -- we were a little more -- we had not yet anticipated that we were seeing in terms of the growth in electric heat, more so than -- we wouldn't -- we -- I guess I'm saying the converse to your -- your question where you said, Would we expect the

general service mass market to be growing at a slower rate than the residential sector.

MR. SVEN HOMBACH: So you're saying without the switch to electric heating, you might see -- might have seen less than the 1.8 percent residential growth, but it wouldn't have affected mass markets, because you're basing it on total population.

You're not tying it to the actual demand by --

MS. LOIS MORRISON: For --

MR. SVEN HOMBACH: -- the residential customers?

MS. LOIS MORRISON: Yes, that is correct.

MR. SVEN HOMBACH: Well, what -- what we're seeing here is you've got the highest growth for the past ten (10) years for residential customers, second highest for mass market, very little for top consumers. What you're projecting, though, for the next ten (10) years is the opposite.

If you look two-thirds (2/3s) down the page, you're projecting the highest growth for top consumers, second highest for mass market, lowest for residential.

So why the switch if that really hasn't been your experience over the past ten (10) years?

MS. LOIS MORRISON: Well, I think in looking, the -- the first thing we have to look at is the top consumers over the last ten (10) years, their growth over the last ten (10) years is not what you would have seen as their growth overall over the last twenty (20) years. The last ten (10) years, as we're all very aware of, saw an economic downturn that the industrial customers, or the large industrial customers, are now recovering -- appear to be recovering from.

And we also, during that period of time, saw the loss of one (1) very large top consumer entirely. And that will be reflected in that growth -- that overall growth over the last ten (10) years of -- of .5 percent as a -- as an average annual growth.

So going forward when we look into the future, for the top consumers we are looking at -- what we're anticipating to see is based on their short-term projected plans. And then what we're anticipating after that is average growth, which would be reflected by a period of -- a longer period of time, which is -- has periods of growth and recession.

MR. SVEN HOMBACH: Taking you back to

page 18 just for a second to -- to visualize this, top consumers, 23 percent of total amount right now?

MS. LOIS MORRISON: That is correct.

MR. SVEN HOMBACH: Really very broadly simplified, it's about a one-third (1/3), one-third (1/3), one-third (1/3) split between residential, mass market, and top consumers?

It's actually a bit less for top consumers.

MS. LOIS MORRISON: Yes, this is reflecting the loss of the one (1) top -- one (1) top consumer, which prior to that this split was more closer to the one-third (1/3), one-third (1/3), one-third (1/3).

MR. SVEN HOMBACH: Okay.

(BRIEF PAUSE)

MR. SVEN HOMBACH: Now, on the subject of top consumers, if you go to page 57 of the Board counsel book of documents, that is an answer to PUB-MH Information Request 1-102a revised. And that shows a chart of Manitoba Hydro's top consumer projections and how they changed between 2000 -- the 2007 forecast and the 2013 forecast.

MS. LOIS MORRISON: That is correct.

MR. SVEN HOMBACH: And that -- that large dip that you see occurring, Ms. Morrison, starting at about 2007, where actual top consumer demand declined by what appears to be about 750 gigawatt hours per year, is that primarily attributable to that loss of the one (1) top consumer you spoke about?

Or is this other consumer -- top consumers also reducing their demand?

MS. LOIS MORRISON: This period of time reflects reduction due to the loss of one (1) top consumer that was in the range of 500 to 600 gigawatt hours. And it also reflects the reduction in some other top consumers' operations as they optimized during the -- the economic downturn. They opim -- they optimized their operations, so they relied on existing inventories and such, and ran fewer shifts in order to -- to work through the recession.

MR. SVEN HOMBACH: Now, if I'm looking at this chart, it -- it seems that ever since the 2009 forecast you're moving the starting point? But otherwise the slope of your projected demand increase is basically the same.

Am I -- am I -- first of all, am I

reading that correctly?

MS. LOIS MORRISON: Yes, to a certain extent. Yes.

MR. SVEN HOMBACH: So given that Manitoba Hydro's appear -- experience appears to be that over the past five (5) years, the starting point keeps moving down.

What makes you think that ongoing demand is still going to take place at that same slope? Are you basically -- if -- if I had to simplify it, are you -- are you thinking that this is just a reset of the starting point, but that there hasn't been any actual shift with how companies do business in light of the recession?

MS. LOIS MORRISON: I -- I would agree with that, and Mr. Friesen can probably provide a little more insight.

MR. DANIEL FRIESEN: I think the question you have to ask yourself in some context around this is: Has the competitives -- competitiveness of the top consumers based in Manitoba, relative to the other -- the other companies they compete with world wide, changed as a result of the economic recession. And I would argue that it has not. In some ways, it's actually improved.

And, as a result, we expect once -- if you look at the -- the global recession as a market correction, and if you -- particularly if you look at the recovery over the last couple of years, the recovery over the last couple of years very much matches the load growth prior to the recession.

And we expect that, given that Manitoba industry remains competitive, in much the same way as it was before the recession, the growth is reasonable, and it -- it's in prox -- in proximity to what we've seen historically. So we don't expect the competitive position of Manitoba to change dramatically as a result of the global recession, so we don't foresee the reason to change the forecast dramatically either.

MR. SVEN HOMBACH: Okay. Two (2) issues on that. Now, when you say, "couple of years," can you see the cursor on the screen in front of you?

MR. DANIEL FRIESEN: Yes, I can.

MR. SVEN HOMBACH: This -- you're referring back to about 2011, 2012, when actually the amount kept increasing?

MR. DANIEL FRIESEN: If you look at the numerical data rather than the text, you'll see that the -- the lowest point was 2009/'10. And then we've seen con -- growth since 2009/'10 in our actual

consumptions.

MR. SVEN HOMBACH: But have you seen it at the same level that growth occurred before the recession?

MR. DANIEL FRIESEN: Yes, in -- in the -- over the -- over the last -- those two (2) -- that two (2) year period, it's been about an average of 2 percent per -- or an average of 2 percent per year.

MR. SVEN HOMBACH: Now, correct me if I'm wrong, sir, but top consumer demand is estimated in two (2) tranches if you will, right? You're looking at actual projections for specific consumers for about three (3) years out.

And after that you're relying primarily on what Manitoba Hydro calls PLIL, or potential large industrial load?

MR. DANIEL FRIESEN: That is correct. And I would say that period varies a little bit from industry to industry, that short-term period. But it's about two (2) to -- two (2) to five (5) years.

MR. SVEN HOMBACH: Now, with Manitoba Hydro's projections, does anything that extends beyond three (3) years automatically get lumped in as PLIL?

Or do you actually project for specific customer groups or industry groups beyond three (3)

years?

MS. LOIS MORRISON: If we have specific committed plans within that three (3) to five (5) year window, those committed plans go into the short-term forecast. It's in year 4 that we begin to introduce the -- the average annual growth that you mentioned, the potential large industrial, or the PLIL, gets introduced in year 4 to recognize that we don't necessarily -- and -- and that's to reflect growth for the overall sector based on past historic growth.

MR. SVEN HOMBACH: Now, on that subject of PLIL, you said "based on past historic growth." To determine PLIL, do you actually look at specific industry groups to determine, well, this industry group would probably grow beyond four (4) years while another one may not? Or do you just base it on what the slope has been historically?

MS. LOIS MORRISON: We look at the sector as a whole, and we take the average growth for that sector as a whole and -- and average that. We -- to -- to -- we -- we don't think that we can state that in ten (10) years from now, or twenty (20) years from now we'll know what industry is going to be here or grow. We do believe that the past history of

twenty (20) years, where we've had a period of growth, and we've had a period of significant recession or economic downturn, provides us with a reasonable benchmark, or -- or average to -- to project future growth.

It's -- it's a period that has, as I said, quite a bit -- a -- a period of growth and a period of -- of economic downturn.

MR. SVEN HOMBACH: Now, taking you to page 58 of Board counsel's book of documents, that's an excerpt from your 2013 load forecast that shows the projections for top consumers. And the orange line that keeps going up, that shows the potential large industrial load. And the green flat line, that would be the demand without the potential large industrial load; just based on what you currently know for specific industry sectors, correct?

MS. LOIS MORRISON: That is correct. It's -- the green line isn't what we know the customer will be doing. I -- I think what we're saying is that the green line is a bit misleading in that what we're showing is the -- is the short-term forecast. The green line depicts the short-term forecast, and we should probably, essentially, truncate it after the fifth year or the third year, and say -- and not show

any more dots going forward.

Because we -- what we're saying is, we don't know specifically what any one (1) of those top consumers is going to do five (5) years out. We do know, and we believe it's reasonable to expect, that there will be some growth overall in the top consumer sector.

And so what we're saying is that they're -- to -- to hold it flat into the future isn't realistic. We're not going to see a situation -- or we don't anticipate seeing a situation where there's absolutely no growth at all in the top consumer sector. However -- so -- so we do apply what we feel is a reasonable estimate of what the anticipated future growth is year-by-year.

MR. SVEN HOMBACH: Of the three (3) customer classes that we've covered, residential, mass market, and top consumers, is this really the one where there's the most uncertainty from Hydro's perspective in the long-term?

MS. LOIS MORRISON: We -- there's uncertainty in all forecasting. We have -- we are more -- there's -- there's more potential for var -- year-to-year variation because the load that is going to come on as a top consumer is going to come on at

year 8, maybe. Or maybe it's going to come in at year 10. We don't know what year it's going to come in, so -- but we -- we do believe that it's going to come in. It's going to come in around maybe a hundred -- what would be accumulating to a hundred gigawatt hours a year. But we just can't say when.

So if you were to look at a year-by-year basis, there will be uncertainty. But to look at it as a whole, and looking at the long-term, I don't believe there's any more uncertainty than -- than any other area of a forecast.

MR. SVEN HOMBACH: And you're basing that, essentially, on the rate of growth over the past twenty (20) years?

MS. LOIS MORRISON: That is what we've -- we've put our future forecast based upon, yes.

THE CHAIRPERSON: Let's talk about that in more detail, because it seems clear to me that a fairly large industrial customer arriving in Manitoba throws this whole thing out of whack, from a top consumer perspective.

MS. LOIS MORRISON: That is correct.

THE CHAIRPERSON: So -- so the reverse is also true; if somebody decides to leave the province, that also throws the load forecast out of

whack?

MS. LOIS MORRISON: Yes, it does.

THE CHAIRPERSON: Okay. Now, let's think about this positively. And -- and this morning we heard from Mr. Kuczek that the pipeline sector is a potential growth sector for the province, given what's going on with respect to the east-west movement of -- of commodity and so on.

So, in effect, if I -- if I read this correctly, we're -- we're beyond the bottom line now. If -- if we are successful in attracting pipeline users to use electricity as the basis -- as the -- as the method of energy, we're into the redline -- we're back into the redline, aren't we?

MS. LOIS MORRISON: Yes.

THE CHAIRPERSON: So if -- you know, if we get seventeen hundred (1,700) -- seventeen hundred (1,700) is the amount we saw this morning, we're into the redline?

MS. LOIS MORRISON: If -- if the pipeline loads were to come in, it would be similar to what MIPUG had asked us to look at in terms of a scenario under MIPUG Round 1, 43b -- or 'a' and 'b', where we would be looking at it -- where they asked us to advance all of the potential large industrial load

to be on the system by 2019/'20.

So, essentially, if we were to -- to use their scenario for what would be the pipe -- representing the pipeline load, you would take that redline and you would -- that's in 2031/'32, and you would move it to be back to -- you would be advancing the redline on the graph to -- to 2019 and -- and you would be hitting that peak. You would be hitting that at that time instead of '31/'32.

THE CHAIRPERSON: But just to explore that a little bit more. Inasmuch as there's some vagaries associated with the load forecast, the -- the principal vagaries are in relation to this particular class, the top consumer class. I mean, they -- they -- the resident -- residential customer is not going anywhere. I mean, the residential customer is -- is living in the province and, you know, there may be some slight changes around movement in and out of the province, but, I mean, they're staying here. And commercial classes, largely the same thing, with the exception of the top consumers who have said that if we increase rates -- if you increase rates we may think about going somewhere else.

Now, I guess what I'm getting at is, in terms of the load forecast, the behaviour of the top

consumers is -- is really what we need to be most cognizant of, in terms of assessing the risk associated with this load forecast.

MS. LOIS MORRISON: You are correct. In terms of the residential and the general service mass market areas, the forecast grows at a much more gradual basis. With top consumers, we are -- there -- there is the risk of the load coming in in a lar -- it comes in large chunks, or it drops off in large chunks.

And, as Mr. Friesen alluded to, it depends on how competitive they are on the global markets, it depends on what their options are, it depends on where -- where they can -- if they want to move their operations to another location, if they have that type of mobility, then all those factors come into play. You're correct, that we -- that -- that there is different drivers for their -- their purpose in being Manitoba, and their -- their use of energy.

MR. DALE FRIESEN: I'd like to also highlight, in respect to the mobility question, that we have to be very careful in how we characterize mobility. Most of the top consumers are resource-based companies, or they deal in a service, pipelines,

where they're resourced -- and the market have fixed locations. So in the case of the pipelines we're not, in particularly, attracting their load; we're in line with their load.

So we're -- we're not attracting that load to Manitoba. We just happen to be physically located between the resource and the market and, as a result, they're coming to us to request service of that load.

So we have to be a little character -- careful in how we characterize mobility, because rates alone may not be the primary driver to their mobility, or to that load growing or shrinking.

So it's just -- it's just something to keep in mind.

MR. LARRY SOLDIER: Could you tell me what the status of this smelter in Thompson is at? I know they announced a shutdown and then they delayed it a year. And what impact would it -- would that have on -- on Hydro if they were to shut down the smelter?

MS. LOIS MORRISON: The -- the smelter that you're referring to is still scheduled to be -- the smelter and refinery is still scheduled to be decommissioned in 2016. They are publicly on the

record that that will be continuing forward.

That load reduction is reflected in our load forecast already. We've already anticipated that. And I believe we are on the record for saying that it is in the same range of energy reduction as the top consumer that we lost in 2010. So it's around the 500 gigawatt hour range. But that has been reflected in the load forecast.

MR. DALE FRIESEN: And, as you mentioned, there is some variability in that date, as you've noted, over the past number of years. The -- that -- that date has been changing. And based on -- you know, there are a lot of factors that are going into that change. The primary one is regulatory, and it's related to the status of that smelter being able to continue operating for environmental reasons. So that's the primary driver there.

CONTINUED BY MR. SVEN HOMBACH:

MR. SVEN HOMBACH: Now, on page 67 of the book of documents, there's actually a chart on a sector-by-sector basis. And, Ms. Morrison, I will have some questions in the in camera session on CSI on this, as well.

But you indicated that the loss of the

smelter is already reflected here. That, I take it, would be the loss in the primary metal sector on this chart?

MS. LOIS MORRISON: That is correct.

MR. SVEN HOMBACH: And really, if we look at this chart, going out to 2020/'21, the only industry sector where you're currently projecting increased growth is the petroleum sector, is it not?

MS. LOIS MORRISON: The only sector that we are specifically in the short term projecting growth is the petroleum sector, that is correct.

MR. SVEN HOMBACH: Okay. Are you -- can you say, in the public session here, what that load is attributed to in the petroleum sector? Which expansions?

MS. LOIS MORRISON: No, I believe I cannot.

MR. SVEN HOMBACH: We will have an opportunity to explore this on Thursday.

Now, the last of the four (4) larger groups of losses that -- or loads that we discussed is the transmission and distribution losses. And again, to put that into perspective, that accounts for about 13 percent of total demand in Manitoba, according to the chart on page 18?

MS. LOIS MORRISON: That is correct.

MR. SVEN HOMBACH: And Manitoba Hydro advised, by way of an answer to Information Request, that it adds transmission losses of about 9.3 percent, distribution losses of 4.4 percent to domestic loads.

Do I have the numbers right?

MS. LOIS MORRISON: Those are -- yes, those are correct.

MR. SVEN HOMBACH: Are those allocated on an equal basis to domestic load and to export load per kilowatt hour or gigawatt hour?

(BRIEF PAUSE)

MS. LOIS MORRISON: We add transmission losses to the top consumers, and we add distribution and transmission losses to the other sectors.

MR. SVEN HOMBACH: Okay. And to export, is it transmission only?

MS. LOIS MORRISON: I am not able to answer how the -- how we account for the export.

MR. SVEN HOMBACH: Is -- is somebody else on the panel able to -- to speak to those issues?

MR. DANIEL FRIESEN: That is a cost of

service issue, so that would be han -- typically handled by our Rates and Regulatory Affairs group. So if it's pertinent that we provide you a response to that, it would probably have to be an undertaking.

MR. SVEN HOMBACH: I -- I -- well, but before I ask for the undertaking, perhaps, let me explore this issue just a little bit further and then we'll just have a single or -- or two (2) undertakings.

Now, at minimum, I believe, Mr. Wojczynski indicated yesterday that he's an electrical engineer, so I'm -- I'm confident that he can answer this.

Losses don't increase on a linear basis, right? It's an exponential function tied to the square of the current?

MR. ED WOJCZYNSKI: It's -- it's a squared function, yes.

MR. SVEN HOMBACH: Resistance times the square of the current?

MR. ED WOJCZYNSKI: Yes.

MR. SVEN HOMBACH: And you'll -- you'll see that as a lawyer I try to just grossly simplify this in atrocious writing. I actually passed little diagram to Mr. Simonsen earlier. Perhaps we

can put this on --

MR. DANIEL FRIESEN: It's actually -- it's actually IR squared.

MR. SVEN HOMBACH: Okay.

MR. DANIEL FRIESEN: It's resistance squared, current times resistance squared.

(BRIEF PAUSE)

MR. SVEN HOMBACH: So he said it's currents times resistance squared, not -- so it doesn't increase exponentially with the current? Just with the resistance?

MR. DANIEL FRIESEN: Obviously, the squaring the resistance creates a multiplier, but it isn't perfectly linear --

MR. SVEN HOMBACH: Okay.

MR. DANIEL FRIESEN: -- but you're right. Yeah.

MR. SVEN HOMBACH: So grossly simplified, then, if I -- if I were to double the amount of electricity flowing through this -- a line, is there any effect, or would it be more or less linear because the resistance itself in the line doesn't change?

MR. ED WOJCZYNSKI: Just -- just wait a second. Maybe we need a -- it's 'I' squared 'R'.

MR. DANIEL FRIESEN: Yes, yes.

MR. SVEN HOMBACH: So I did have that correct?

MR. DANIEL FRIESEN: We're -- we're all on the same page now. You -- every now and then you shouldn't listen to mechanical engineers.

THE CHAIRPERSON: Okay. We're going to have to -- I have to intervene here for a discussion amongst engineers for the non-engineers in the room.

Could you walk us through the -- the symbols here and so -- what we're discussing?

MR. SVEN HOMBACH: Now that I realize, Mr. Chairman, that venturing beyond high school math is an exceedingly bad idea for me, because I've been challenged on it.

CONTINUED BY MR. SVEN HOMBACH:

MR. SVEN HOMBACH: What I'm trying to get at is what -- if -- if it's tied to the square, there's a chart in front of you, Mr. Chairman, and -- and by all means, correct me if the chart isn't correct.

What that basically means is if you are doubling the amount of electricity flowing through a line, you're quadrupling the line losses, give or take; you're not doubling the line losses.

MR. ED WOJCZYNSKI: Yes.

MR. SVEN HOMBACH: So on an incremental basis, the more electricity you're showing through the line, it will have a -- a disproportionate effect?

MR. ED WOJCZYNSKI: Yes.

MR. SVEN HOMBACH: Mr. Simonsen, I don't need the chart any more. So Manitoba Hydro is a -- is an electric utility that meets domestic demand but that also exports a lot of electricity.

What I was trying to get at with the question, and you may have to deal with by way of undertaking is, if -- if you're adding a large amount of exports to the electricity that you are sending through the lines for domestic purposes, are you assigning the incremental transmission and distribution losses to export?

Or are you just assuming that on a percentage basis it's allocated fifty (50) fifty (50) to each of them?

MR. ED WOJCZYNSKI: When we do our

economic evaluations we -- sorry -- we use an -- an incremental value of 10 percent for the export losses. And what you have to keep in mind is the exports go over the high voltage system and don't use any of the lower voltage transmission.

So you -- you can't just look at the losses in our system and then think they're going to increase in the manner you are -- of a -- a -- the quad -- quadratic relationship, that 'I' squared relationship, because you are using the higher voltage system, which has less resistance on it.

So it's -- it -- so -- but -- but aside from that, we do account in our evaluations for the incremental losses due to exports.

MR. SVEN HOMBACH: So, sorry, Mr. Wojczynski, you said you're assuming that the incremental losses will be 10 percent for export?

MR. ED WOJCZYNSKI: Overall, that's what we tend to do. That would be accurate, plus or minus 1 percent. And again, I repeat, that's because we're using the high volt -- the high-voltage system. We don't use the entire grid.

So if you -- for exporting, let's say, additional power from the Nelson River, we're using the HVDC system, which has -- which has -- on an

incremental basis has relatively low losses compared to, say, 230 kV transmission. And then we're using the -- from, say, Dorsey, we would use the 500 kV line and the -- the 230s, but the 500 kV line carries the most. So the losses are lower on that than they would if they were on, say, a 230 kV.

The other thing is the DC system also has some fixed losses which don't vary by the current. When we answered yes to your question about the 'I' squared 'R', we were trying to keep it simple, but it's more complex in that there are fixed losses as well that don't vary by the current. The line losses are the ones, but there's other losses that don't vary by it.

MR. SVEN HOMBACH: Okay. Now, Mr. Wojczynski, we -- we covered this morning that, in its load forecast, Manitoba Hydro is assuming that there's no additional domestic load growth beyond 2047. So that gives us a good starting point beyond 2047. In its financial analysis, Manitoba Hydro's assuming load stays flat.

And what I'd like to know is if we go through the various financial analysis that Hydro has done and the various development plans, the line losses that Hydro's attributing to domestic customers,

not to export customers, are actually different between those plans.

And perhaps let me illustrate on -- on where I'm getting at. If you have a look at page 2 of Appendix 11.3 of Hydro's business case, that's the analysis of the all-gas plan. You should have it on the screen in front of you.

Underneath the highlight, you'll see that domestic losses that Hydro assumes are about 4,000 gigawatt hours per year, 3,927. And that stays flat, which makes sense considering that the load forecast stays flat.

MR. ED WOJCZYNSKI: Yes.

MR. SVEN HOMBACH: If you compare that with Manitoba Hydro's Preferred Development Plan, and let me just pull that up on screen, you'll see that for the same time period, you're attributing about 600 additional gigawatt hours per year to domestic losses, despite the fact that the domestic demand is actually the same.

Can you explain to me where that 600 gigawatt hours of difference comes from?

MR. ED WOJCZYNSKI: Could the person controlling this go the extreme left so we can see what the label is on that row?

MR. SVEN HOMBACH: Sure. That -- that person controlling it is me, if --

MR. ED WOJCZYNSKI: Okay. Okay.

MR. SVEN HOMBACH: I'd be happy to --

MR. ED WOJCZYNSKI: Oh, there.

MR. SVEN HOMBACH: -- to blow it up a bit.

MR. ED WOJCZYNSKI: Yeah.

MR. SVEN HOMBACH: It's the same excerpt, but from the --

MR. ED WOJCZYNSKI: Okay.

MR. SVEN HOMBACH: -- Preferred Development Plan.

MR. ED WOJCZYNSKI: You know, I -- I can't answer that question. I think we'll have to take that as an undertaking. It's -- it's not obvious to me at this moment.

MR. SVEN HOMBACH: Fine.

MR. ED WOJCZYNSKI: It's in the -- is it in the book?

MR. SVEN HOMBACH: I'll accept an undertaking, Mr. Wojczynski, but I'd like that to be a two (2) part undertaking. First of all, I'd like Manitoba Hydro to explain why that difference exists.

But I'd also like them to explain

whether this is simply because one (1) of the plans relies on a longer transmission line as opposed to building the load south, or whether you're actually attributing some incremental export losses to Manitoba Hydro domestic demand.

MR. ED WOJCZYNSKI: We'll accept that undertaking.

MR. SVEN HOMBACH: Thank you.

--- UNDERTAKING NO. 9: Manitoba Hydro to explain: a) attribution of 600 additional gigawatt hours per year to domestic losses; and b) whether this is because of longer transmission lines or whether incremental export losses are attributed to domestic demand

MR. ED WOJCZYNSKI: And this is actually probably a topic that is better addressed in the panel next week, which would be dealing with these evaluations and these calculations. So what I was doing today was trying to provide an -- a high-level

answer so we could keep the momentum going. But this -- this particular topic is actually better suited to next week's panel.

MR. SVEN HOMBACH: I appreciate that. Now, just -- just one (1) last question on this particular issue. On a year-over-year basis, approximately how many gigawatt hours does Manitoba Hydro export?

MR. ED WOJCZYNSKI: I'm not -- I don't have that number at the top of my head. Ms. Flynn would have that number in her head, or Mr. Cormie. I could look it up quickly, but I don't -- it's not -- it's not a number I carry in my head, sorry.

MR. SVEN HOMBACH: But you said that the incremental losses when you're exporting are about 10 percent?

MR. ED WOJCZYNSKI: That's what we typically use in our calculations, yes.

MR. SVEN HOMBACH: So that it -- it would follow then that if you weren't exporting electricity, those additional 10 percent are not something that you would have to generate to meet Manitoba demand, because those 10 percent wouldn't be lost?

MR. ED WOJCZYNSKI: If we didn't have

the exports and the -- then the transmission system, if that energy wasn't being used for domestic load, then -- then the -- the losses in our system would be less by that amount, yes.

(BRIEF PAUSE)

MR. SVEN HOMBACH: Now, we've covered the various adjustments to different customer groups between the 2012 and the 2013 load forecast, and perhaps you can recap just what that means for the earliest required in-service date for new generation?

MR. ED WOJCZYNSKI: I'm -- I'm sorry. I was still trying to read your book, and I don't have a magnifying glass, so I was trying to prepare for your question. You asked a different question than I was expecting. Sorry, could you repeat that?

MR. SVEN HOMBACH: Yes, I can. I -- I said we -- we covered the various adjustments today between the 2012 and the 2013 forecast, and the reductions. What exactly does that mean for when Manitoba Hydro is saying Keeyask will now be necessary, or some new generation in Manitoba would be necessary?

MR. ED WOJCZYNSKI: That actually is

an item for next week's panel, because of the -- that's that need panel which deals with that. But what I can tell you is that -- I do have this in my head, that going from the 12th -- 2012 forecast to the 2013 forecast, and with -- there were some other small changes in the overall assumptions, but the need for Keeyask in a -- a no-sale case, in a case with no new sales moves from 2022 to 2023.

MR. SVEN HOMBACH: So a one (1) year deferral, essentially?

MR. ED WOJCZYNSKI: Yes.

MR. SVEN HOMBACH: Now, before we move on to the subject of DSM, the last issue I wanted to canvas with the panel is the risk of disruptive technology. That was one (1) of the issues that Elenchus had identified in its expert report dealing with load forecasts, and I understand that Manitoba Hydro has looked at some potential future technologies like solar photo -- photovoltaic cells, and ultimately dismissed them at -- as not currently being financially feasible alternatives.

But has Manitoba Hydro had an opportunity to review Elenchus's evidence on disruptive technology and the example in Philippe Dunsky's expert report dealing with projected cost

decreases for solar photo -- photovoltaic and actually try to determine that impact on Manitoba Hydro's future load forecast?

MR. DALE FRIESEN: We have not evaluated it in the context of the forecast. We have evaluated it at a high level in the context of future potential DSM savings, yes.

(BRIEF PAUSE)

MR. SVEN HOMBACH: You've seen the evidence in Philippe Dunsky's report about grid parity, dealing with --

MR. DANIEL FRIESEN: Yes. I -- yes, I have.

MR. SVEN HOMBACH: And I'm -- I'm not trying to cover issues that will be covered by Intervenors, but does Manitoba Hydro agree with the potential time frames, or does it assume these are not realistic?

MR. DANIEL FRIESEN: I would say it's fair to say that those potential time frames reflect the uncertainty that's in the industry today. Manitoba Hydro hasn't done its own projection of when grid parity would occur, as there is a lot of

uncertainty as to where those solar prices will be in the future, and I think all you have to do is look at Mr. Dunsky's own evidence to support that there is a great deal of uncertainty.

So based on some of the industry projections for where those prices are headed, I believe that the range of time when we could see grid -- grid parity could be within the range that Mr. Dunsky projects. It could be later as well. It all depends on where the industry ends up going.

MR. SVEN HOMBACH: Now, does Manitoba Hydro have any tools at its disposal to either encourage the use of such technology or to discourage it?

Like, for example, encouraging people to feed into the grid or not permitting people to feed into the grid?

MR. DANIEL FRIESEN: We do, and if you look at -- we -- we currently have programs in place that would support the installation of solar. If you go to -- and you've looked at Cana -- Manitoba Hydro's current bio-energy optimization program, solar would be an eligible measure under that program.

So if a customer came forward with a solar project today, we would have the potential to

evaluate it under that project and determine whether, you know, what -- what type of incentive and what level of incentive we would provide. So we -- we don't explicitly discourage solar in any way today. We do believe that, today, that technology is not economic in Manitoba, but we do not discourage it.

MR. SVEN HOMBACH: Does Manitoba Hydro currently allow feeding into the grid? If, let's say, a commercial building wanted to install solar panels or other generation?

MR. DANIEL FRIESEN: We do allow it, and we have a policy that allows for it, yes.

MR. SVEN HOMBACH: So has Manitoba Hydro assessed the amount of uncertainty that this imposes on the load forecast?

MR. DANIEL FRIESEN: Like I said, we have looked at it from the standpoint of future DSM savings, and in general, I would say it's safe to assume that we would not expect significant savings to be -- to begin to develop until some time after the 2020 time frame. Even if you look at Mr. Dunsky's data and you look at a -- a grid parity date for Manitoba of 2018, if you assume that -- that to be correct, there would still be an implementation phase.

There would be a ramp-up stage over

which the industry would develop the resources to install the systems, and customers would begin to accept and -- and move forward with purchases of the systems. That -- that's going to involve a time lag, so grid parity is really just an indication at what point the technology -- the cost of generating power with the technology becomes equal to the price the customer is paying on the grid. It doesn't really tell you at what point the customer will begin adopting the technology.

And there are many factors that go into -- into that equation which would indicate that you would expect to see a gradual adoption rate develop after grid parity at some point, and then as momentum is gained, and the cost -- the economic advantage becomes greater, you're going to see an acceleration of that. But we would not expect to see an immediate -- it would be a very gradual impact on -- on the load in Manitoba. It wouldn't be a -- a step change in load.

MR. SVEN HOMBACH: And among the various development plans that Hydro is presenting, there are some long-lived options like hydroelectric power with a lifetime of likely in excess of a hundred years of -- Pointe du Bois, for example, is an

indication -- other technologies with a shorter lifetime, like gas or wind.

Once you've built an asset, Manitoba Hydro doesn't have a choice but to recover the cost of that assets in rates, does it not?

MR. DANIEL FRIESEN: Correct.

MR. SVEN HOMBACH: It's currently required to recover those costs under the Manitoba Hydro Act.

MR. DALE FRIESEN: Yeah.

MR. SVEN HOMBACH: So given the potential uncertainty about implementation and the time frames, how does that impact your decision making between choosing a long-lived asset like a hydro dam or a shorter-lived asset that might only have a quarter of the lifespan where you're not committed for an extended time frame?

MR. DALE FRIESEN: It would probably be better if Mr. Wojczynski answered that question.

MR. ED WOJCZYNSKI: There -- again, this is something we can address in more detail next week in the other panel. But as a first-cut answer, there are numerous uncertainties in -- in the load forecast in the short run and the long run.

We've already been talking about some

of those factors. And so we would view that as being one (1) factor that could cause a lower load forecast than we're looking at, and that's a risk and an uncertainty. And we do look at low load growth as well as high load growth as possibilities.

So we -- we consider it a risk and uncertainty that we'd address just like we do with the other uncertainties we're dealing with. So when we have a -- a -- we -- we do recognize and we do state it in the submission in Chapter 10 where we're dealing with uncertainty. We -- we looked at low load growth and high load growth, and the -- the natural gas plans do have some greater flexibility in the long run to deal with low load growth than the Preferred Plan.

There -- but there are some offsets from that as well in -- in that if you have the tie-line, you can deal with the lower load growth and -- and sell the exports from the additional surplus. But -- so we did assess that in our -- in our uncertainty and risk analysis, and that was included in our decisions and conclusions.

THE CHAIRPERSON: You talked about slow adoption of -- of solar technology; new technology, let's say. And it seems to me the early literature seems to suggest -- on this topic seems to

suggest that -- that large-scale applications are more -- more viable than, say, a -- a residential application would be.

So in a -- in a context where -- of consumers, that's such an important part of the load for Manitoba, do you -- do you think that's also the case for slow -- slow adoption would apply to those top consumers?

MR. DALE FRIESEN: If the you look at the consumption characteristic of a top consumer, a top consumer has a very high load factor. So their -- generally, their load factor is point eight (.8) or higher, often as high as point nine (.9). So they have a fairly continuous requirement for energy at or near their peak capacity requirements on an almost twenty-four (24) hour basis.

Solar's a very intermittent supply. As a result, I would not expect that a top consumer would choose solar as their first option in supplying their needs due to it -- due to its intermittency.

THE CHAIRPERSON: A follow-up question then would be: They would view electricity as being a supplement to their own internal generation source, wouldn't they?

MR. DALE FRIESEN: If you look at the

-- at the energy requirements of Manitoba's top consumers and you look at their opportunities for self-generation, in -- while there are opportunities for self-generation as a percentage of their total load, those opportunities are relatively small.

Like I said, they are available, but on a -- on an aggregate basis, they're -- they're relatively small. Generally, when you look at customers that pursue self-generation, particular large customers, they're taking advantage of either a low-cost or a no-cost waste stream of some type, whether it's biomass, whether it's hydrogen, whether it's flare gas in the oil field.

That really limits their access to low-cost self-generation or economical self-generation.

CONTINUED BY MR. SVEN HOMBACH:

MR. SVEN HOMBACH: So between those three (3) major customer classes -- residential, mass market, and top consumers -- which one of those has the largest variability between peak and off peak? You mentioned for a lot of the industrial consumers, they're actually operating fairly close to the limit?

MR. DANIEL FRIESEN: Yeah, the top consumer group would have the highest load factor.

The commercial and residential sectors would have lower load factors because of the variability in their demand over the course of the twenty-four (24) hour period, and on a seasonal basis. So I can't give you the exact numbers.

Our system load factor is in the or -- in -- in the range of about point six-three (.63), if you look at the information we've provided. So giving that the large consumers are in that point eight-two (.82), point eight-three (.83) range as a group, I would expect that -- that points to the residential and commercial classes being considerably lower.

MR. SVEN HOMBACH: So if you wanted to look at load shifting as opposed to load reduction to manage need, those are the classes you'd have to focus on?

MR. DANIEL FRIESEN: Load shifting is more of a challenge in the top consumer group than some people may initially believe. And the primary reason for that is their lo -- high load factor, yes.

MR. SVEN HOMBACH: Fine. But you -- you mentioned there's more variability with residential customers.

MR. DANIEL FRIESEN: Correct.

MR. SVEN HOMBACH: That's why I made

that comment.

MR. DANIEL FRIESEN: Yeah, but the question you have to ask yourself with the residential class, though, is: What is driving their consumption?

So what is typically driving the consumption, peak periods of consumption, in the resident -- residential sector, if you -- if you leave heat out of the equation, is the activities that occur at the beginning of the day and the end of the day. And I'm not sure about you, but I'd probably be a little resistant to deciding to cook my dinner at midnight as a load shifting initiative.

(BRIEF PAUSE)

MR. SVEN HOMBACH: Electric heating, though, has the largest influence, does it not? It's -- it's the largest component of at least those customers that use electric heating?

MR. DANIEL FRIESEN: Electric heat is a large component of energy consumption in the province, period. It -- it consumes about 50 percent of the energy that -- that we consume in this province is for heat in and of itself. The challenge with heat

is you will see load shifting programs in southern climates that are cooling dominated. They're quite common. They're typically characterized as demand response programs.

The problem we have with heat is that you're -- if you -- if you decide to curtail your -- your use of energy for heat for a period of time, you have to make it up in our climate. You can't do without it. At some point you have to replenish that supply. The longer you wait, and particularly in Manitoba, it's colder at night than it is during the day.

So if I curtail my heat requirement during the day, I'll have to add that plus an amount at night in order to make up for the heat loss, because I'm dealing with a colder climate at night. So it is -- curtailing heat and load shifting heat requirements is a very challenging exercise.

MR. SVEN HOMBACH: So explain this to me. Year over year Manitoba is a winter-peaking jurisdiction, with demand -- total peak demand being higher in winter than in the summer.

MR. DANIEL FRIESEN: That is correct.

MR. SVEN HOMBACH: And that's different from MISO, where it's summer peaking,

meaning you've got more demand during the summer air-conditioning season?

MR. DANIEL FRIESEN: Many jurisdictions within MISO are summer peaking, yes.

MR. SVEN HOMBACH: So on a -- on a day-to-day basis, let's say on a winter day and when you've got a lot of heating load, what time of day do you see the highest peak load in Manitoba?

MR. DANIEL FRIESEN: Traditionally we see the highest peak loads in Manitoba either in the early morning or later afternoon. So those correlate with the heaviest times of energy use for residential customers as well. So it -- the variability is probably largely created by residential customers, with the lar -- top consumers providing more of a base load component to that.

MR. SVEN HOMBACH: Okay. I'd like to address this issue a bit further in the DSM. But before we go there, I do have a question for Ms. Rohmund. I understand that EnerNOC, in preparing its demand potential study, or DSM Potential Study, prepared its own baseline load forecast.

Was that done using the LoadMAP model?

MS. INGRID ROHMUND: Yes, we --

MR. SVEN HOMBACH: Is -- is LoadMAP a

commer --

(BRIEF PAUSE)

MS. INGRID ROHMUND: Yes, we developed a baseline projection using LoadMAP.

MR. SVEN HOMBACH: Is -- is that a commercial program, or is that something that you developed yourself?

MS. INGRID ROHMUND: It's something we developed, yes.

MR. SVEN HOMBACH: And what's the reason for EnerNOC preparing its own load forecast rather than using that of Manitoba Hydro?

MS. INGRID ROHMUND: So just to be -- LoadMAP -- the tool LoadMAP was developed by Global Energy Partners when I was employed there before we were acquired by EnerNOC.

So we developed that tool -- oh, you asked why we used that to develop our projection. When I joined Global Energy Partners and their -- they had a framework for doing potential studies, but it was one that I was not completely enamoured with. So I was -- I come from a long history of end-use forecasting, which basically allows you to tell a

story of what -- about what's happening in the forecast, and allows you to explicitly account for lots of factors that drive the forecast -- or drive a projection.

And using an -- the approach that we developed in LoadMAP pre -- prevents us from overstating the savings that could happen through DSM. And in particular, there was an example in the -- I want to say -- it must be the early '90s, during the first wave of DSM in our industry, and ut -- utilities were doing potential studies.

And Xcel Energy, I think they were Xcel Energy at the time, in Colorado, did a -- did a study of potential and came out with estimates of lighting savings for -- that they could achieve through programs. And the savings that they said that they could achieve were larger than the consumption of lighting in total, and using the end-use forecasting framework, it was very, very embarrassing for them.

And we were doing end-use forecasting at the time and we said if you -- they had taken an end-use forecasting approach that accounts for -- starts with lighting energy use and then subtracts from that usage, then you will never find yourself in that position of overstating the savings in that way.

So that is --

MR. SVEN HOMBACH: Now, in term -- now, in terms of the methodology that you use, do you rely on the same statistical factors that Hydro uses, or do you rely on their input data? How do you arrive at your own load forecast?

MS INGRID ROHMUND: So our projection uses -- it is fundamentally different than what -- what Manitoba Hydro uses and also what many utilities in -- in the States use for their forecasting processes.

It -- when we can, we try to bring in the same growth assumptions and other drivers of the forecast that our clients use. And we are more or less able to do that, depending on the circumstances.

So for Manitoba Hydro, we were able to bring in some of the factors, but as you saw, the Manitoba Hydro forecast is based on rate classes. It's different groupings of customers, and -- and so it is -- the assumptions are not completely the same that drive both projections.

MR. SVEN HOMBACH: Now, you've heard the discussion, Ms. Rohmund, about the changes from Hydro's 2011 to the 2012 forecast where consumption went up and then back down.

MS. INGRID ROHMUND: M-hm.

MR. SVEN HOMBACH: The most recent amendment to your company's study that was filed with the November changes to the NFAT filing --

MS. INGRID ROHMUND: M-hm.

MR. SVEN HOMBACH: -- is that based on input data that reflects Manitoba Hydro's 2013 data, or did you make any changes to the baseline forecast?

MS. INGRID ROHMUND: It's -- it is based on the 2000 -- primarily based on the 2011 forecast.

MR. SVEN HOMBACH: Okay.

(BRIEF PAUSE)

MR. SVEN HOMBACH: I'd like to project again, but I see that my screen is down. There we go.

On the screen in front of you is an excerpt from First Round PUB/Manitoba Hydro Information Request. It's PUB-MH 1-248. And I apologize, that is not in Board counsel's book of documents.

That shows the difference between Hydro's 2011 load forecast and the one that was used for the baseline for this DSM potential study. And if

you go to the 2027/'28 column, there's a difference of over -- or of close to 3,000 gigawatt hours. Now, we've heard this morning that annual growth is in the vicinity of around 420 gigawatt hours. So that would represent about six (6), seven (7) years of growth.

How does that -- how do those discrepancies affect the DSM potential study? It appears that EnerNOC is -- sorry, Manitoba Hydro's projecting quite a bit more load than -- than you are.

Does that mean you'd see less potential for DSM than if you had started with Manitoba Hydro's higher forecast?

MS. INGRID ROHMUND: No, we don't believe that is a -- a conclusion that you can draw from that. When we -- as I explained this morning, we start with a -- a characterization of the market, and the pie charts and the bar charts that show how customers use energy in the base year, which was 2011, and then we apply the customer growth forecast and many other factors, the codes and standards that are -- are expected to be in place, or that we know are going to be in place. We have naturally occurring conservation. We have price effects.

We have -- probably the biggest -- the -- the two (2) biggest -- the biggest one is the

naturally occurring conservation, and so we do -- we apply those factors on an end-use and customer basis, and we -- we are confident that we have estimated those correctly. And then -- so the -- the fact that we differ from Manitoba Hydro's -- oh, let me back up for a second.

We developed this projection for the purposes of the study. It is an -- it is a stepping stone in the development of the potentials. It is not -- it -- it is never intended to be the load forecast. We don't own the load forecast. We're developing a projection for the basis of the study so that we can estimate the savings that come from all those end-uses and technologies.

So it is often the case that our potential study projections, baseline projections, are lower than the utility forecast, because there are factors that we are not taking into con -- account. We are not intimately familiar with all the details that go into the load forecast.

So that difference between the load forecast and our projection, I would argue could be put into a miscellaneous -- miscellaneous category to which no future DSM potential savings are attributed.

In cases where our clients have

required that we align with their forecast -- we have a few who have done that -- the question is what do we do with that difference? And we recommend, and -- and our clients generally agree that we will put that difference into the miscellaneous category wherein there are no future savings.

MR. SVEN HOMBACH: Okay. Now, this morning during Manitoba Hydro's presentation, there was one (1) particular slide that showed where the various jurisdictions where your company has done work, and I'll see if I can pull that --

MS. INGRID ROHMUND: Okay.

MR. SVEN HOMBACH: -- up on the screen for a moment. Do you have the slide in front of you? That's from today's presentations. The -- the difference between the Hydro load forecast and the one that you arrived at with the load forecast model, is that within the same zone of variation that you see when you're preparing your own baseline in other jurisdictions?

MS. INGRID ROHMUND: Yes, we have seen differences of the same magnitude in other jurisdictions. We've also seen less.

MR. SVEN HOMBACH: So you're saying this is not a difference that would concern you?

MS. INGRID ROHMUND: Not necessarily, no.

MR. SVEN HOMBACH: Now, on the issue, then, of DSM. Now, during Mr. Wojczynski's presentation yesterday, there was an indication that Hydro was increasing the DSM in its analysis and that it expected to file information within a week or two (2).

And I'm just wondering if you could elaborate, Mr. Wojczynski, what the nature of that information is that the Board should expect to be filed, and to what extent DSM will actually be expanded in -- in the new filings?

MR. ED WOJCZYNSKI: This is, again, the topic of the panel next week, but what I can say is that what we -- I had a little chart yesterday in my presentation --

MR. SVEN HOMBACH: This --

MR. ED WOJCZYNSKI: Yes, that one.

MR. SVEN HOMBACH: -- fifteen (15)?

MR. ED WOJCZYNSKI: Thank you.

MR. SVEN HOMBACH: You're welcome.

MR. ED WOJCZYNSKI: And so what we will -- we are finishing and have some preliminary results and -- and anticipate sharing at least some of

what's on this chart next week is we'll be having -- using 2013 assumptions, load forecast, and all the -- all the other assumptions, and starting with the 2013 load forecast and export prices and discount rate and everything else.

And we're ev -- evaluating using the Preferred Plan, the -- the base DSM, which is the old DSM level where -- which is called 2013 DSM here, and then the three (3) new DSM options that Mr. Kuczek was mentioning and talking about this morning.

So we will do a pow -- a -- a plan evaluation of that one (1) plan with our four (4) levels of DSM and compare those four (4) levels of DSM.

The other thing we're doing is, for the Preferred Plan, the Keeyask Gas 750 Plan, and the all-gas plan, evaluating those three (3) plans at the option 3 level of DSM, and also evaluating at the option 2 level of DSM.

And so that'll give us an indication of the impacts on the plan of the higher levels of DSM. They're also an indication, by going from option 2 to option 3, what the economics of those would be.

And what our finding was so far was in -- in -- on the economics -- we haven't done the

financials yet -- is that going from the -- the option -- option 1 DSM to the option 2 DSM, that was economic, but that going from option 2 DSM to option 3 DSM was not economic. So that's the information we will be presenting next week.

MR. SVEN HOMBACH: Do you intend to file financials when those will be ready as well?

MR. ED WOJCZYNSKI: Yes, but the financials always take longer, and the Financial Panel is the following week, and I -- I don't know at this point where their -- how far their analysis on the DSM options is right now.

I don't think they'll be able to do as much as the economics will. I expect they will do the levels of DSM on the Preferred Plan, that they will have that. I -- I can't say right now how much more they'll have.

MR. SVEN HOMBACH: Can you undertake to update the Board once you've canvassed with your staff to provide an estimated time for financials to be filed?

MR. ED WOJCZYNSKI: We can undertake to do that, yes.

--- UNDERTAKING NO. 10: Manitoba Hydro to indicate

an estimated time for financials to be filed

CONTINUED BY MR. SVEN HOMBACH:

MR. SVEN HOMBACH: Now, in chapter 12, you said that you were providing updates for five (5) plans that you were looking at. Are those financials ready yet, or do you anticipate having those ready soon?

MR. ED WOJCZYNSKI: Par -- could you repeat that question, please?

MR. SVEN HOMBACH: The -- the five (5) plans that were analyzed in chapter 12, have you done the financials for the update?

MR. ED WOJCZYNSKI: I don't believe those have been done. The update they were going to do were the same ones we just talked about here. They -- but I -- I'll -- is -- perhaps I could take another undertaking to get back to you on that.

MR. SVEN HOMBACH: Certainly. Thank you. Yes. The -- the undertaking is to advise when financial information relating to the plans outlined on page 15 of Mr. Wojczynski's presentation will be filed, and to advise when financial documentation relating to the five (5) plans analyzed in chapter 12

of the NFAT will be filed.

--- UNDERTAKING NO. 11: Manitoba Hydro to indicate when the plans on page 15 of Mr. Wojczynski's presentation, and financials for the five (5) plans will be filed

CONTINUED BY MR. SVEN HOMBACH:

MR. SVEN HOMBACH: Now, in the absence of -- of having some of this information available yet, Mr. Wojczynski, it would help to just have a visual of -- of what it means for Manitoba Hydro to be analyzing five (5) times DSM.

The document that I'm showing you is page 103 of the Board counsel book of documents, which is Figure 12 from the expert report of Mr. Dunsky. It's not a Board or Manitoba Hydro document.

This shows a chart that purports to project the year-over-year DSM over time from Manitoba Hydro (sic) latest Power Smart Plan, the one point five (1.5) times DSM scenario, and then the four (4) times DSM scenario.

First of all, has Manitoba Hydro had an

opportunity to -- to look at this chart, and does it accurately reflect the projected DSM?

MS. LOIS MORRISON: This representation does not fully characterize the new options that are being assessed currently. As Mr. Kuczek mentioned, there are a number of programs where the savings have been extended and have been increased, and if I could draw your attention to the rebuttal, specifically looking at page 31, if -- if we could pull that up?

(BRIEF PAUSE)

MS. LOIS MORRISON: The chart at the bottom, or the graph at the bottom. The graph at the bottom denotes the comparison of the option -- of the -- of the levels being assessed currently related to the -- 2013 Power Smart Plan. And the -- these are the -- these are the options being assessed by our resource planning group and will be discussed next week.

MR. SVEN HOMBACH: So the five (5) times DSM is -- the level 3, does that reflect the five (5) times DSM, or should we expect a similar charge just with a --

MS. LOIS MORRISON: Yeah.

MR. SVEN HOMBACH: -- a higher line?

MS. LOIS MORRISON: The level 3 that's being denoted here is what is comparable to what Mr. Wojczynski is referring to as that five (5) times.

MR. SVEN HOMBACH: Okay.

MS. LOIS MORRISON: I should note that what's being presented here is a year-by-year. If you cumulate it, and cumulate the savings over time, that's where the analo -- the -- the analogy of the five (5) times is.

You could also -- to give you a -- a perspective of what it -- the impact is to the load forecast, if you turn to page 32, you can see what -- what the different levels represent in terms of an adjustment to our load forecast.

(BRIEF PAUSE)

MR. SVEN HOMBACH: So again appreciating that not all of the information is available yet, EnerNOC draws the distinction between technical potential, achievable potential, market potential.

Are all three (3) levels what you, or

what EnerNOC would consider to be achievable potential?

MS. LOIS MORRISON: Mr. Kuczyk characterized it at the beginning that these levels that we've introduced, we are very confident in terms of the level 1 in terms of being achievable. There's a lot more analysis that has gone into those program charact -- program projections in terms of what the market uptake would be, what the different technologies included are, and such.

Level 2 requires more additional investigation. So in terms of the certainty of being able to attain those savings, I think when we're talking about the achievable versus the market, what you're getting into is that degree of certainty of being able to achieve it. The closer you get to market the more -- the more uncertainty there is attached to achieving it, and, so if you go through our levels, there's more uncertainty.

MR. SVEN HOMBACH: And are you in a position to state at this point what the deferral prospect for new generation are if you apply level 2 or a level 3? Has that analysis been done?

MR. LLOYD KUCZEK: That's not our panel.

MR. SVEN HOMBACH: So will the next panel be able to speak to that issue?

MR. ED WOJCZYNSKI: Could you repeat the question, please?

MR. SVEN HOMBACH: There's some new evidence with respect to the level 1, level 2, level 3. I'm wondering if Manitoba Hydro has analyzed to what extent this means new generation can be deferred if you're applying level 2 or if you're applying level 3?

MR. ED WOJCZYNSKI: Oh, yes. That's definitely part of that analysis.

MR. SVEN HOMBACH: Okay. And --

MR. ED WOJCZYNSKI: And that will be provided next week, on Monday. Now -- and -- and it -- I mean, it's -- it de -- will defer, in the no-sale case does defer the requirement for the next generation absolutely, yes.

MR. SVEN HOMBACH: This particular chart that's currently still on screen from page 32 of Hydro's rebuttal just goes to 2028. Has Manitoba Hydro analyzed the DSM potential going out further?

MS. LOIS MORRISON: We -- as Mr. Kuczek stated, we do a fifteen (15) year plan for the purposes of resource planning. We don't look out

beyond that period of time at this point.

MR. SVEN HOMBACH: M-hm. And I don't know if you're in a position to -- to answer the next question, but would you just assume that going forward it flatlines at a certain annual percentage basis, or would you assume that there is no further DSM potential beyond 2028, in your analysis?

(BRIEF PAUSE)

MR. LLOYD KUCZEK: It -- it's very difficult to project out that far in terms of what could be achieved. And we recognize a projection of zero beyond a certain point isn't realistic either. What we're going to try to do is come up with a projection at least in the fifteen (15) year period that we think is our best estimate of what it's going to be as opposed to having a conservative plan in the past.

So -- but -- be going -- going beyond '27, '28, you know, it really comes down to how many homes are left that need insulation, how much can you really expect technology changes after a certain point?

I'll just give you an example with

lights. Like you -- you know, substantial gains from a 60 watt to 11 watt, for example, well -- and if you think in terms of percentages, that -- that's huge. Where are you going to go from 11 watts? Like what's really realistic?

If you look at fridges, we went from 1,600 kilowatt hours a year down to 500 kilowatt hours a year. Now, what's realistic beyond that, you know? Natural gas furnaces from 60 percent up to 92, 94 percent. Well, where do you go from there, you know?

So -- so from -- if -- if there's anything to happen in the future, in my mind, I think there will be some opportunities that we could maybe capture. What they are, I think it's going to be diminishing as we move into time. I don't know if there's going to be additional end-use applications that are going to come into play. But when you certainly start to talk about the applications of solar, that -- that would be significant, relative to where I think some changes could occur with the technologies that we're currently looking at, or where there's improvements on efficiencies.

MR. SVEN HOMBACH: Well, you've indicated that Manitoba Hydro will file an economic analysis. And we've determined this morning through

testimony from Mr. Wojczynski that, for example, Manitoba Hydro extrapolates further load growth beyond twenty (20) years, but then stops projecting incremental load growth after 2047.

I'm just wondering what assumptions are you making for the economic analysis? Are you cutting off all DSM beyond fifteen (15) years, or are you continuing to assume that DSM is included?

(BRIEF PAUSE)

MS. LOIS MORRISON: Under the current plan -- or, sorry, under the options that are being looked at, we aren't introducing new programs or new technologies past the fifteen (15) years.

So what would happen is we wouldn't see any new additional reductions coming in on an annual basis. The reductions that are projected here would stay and continue on, but we wouldn't see new incremental ones coming in except -- sorry, so that would be it, yeah.

MR. SVEN HOMBACH: So no additional annual reductions?

MS. LOIS MORRISON: No additional annual reductions at the end of the -- the fifteen

(15) -- I think it's -- just a minute.

(BRIEF PAUSE)

MR. LLOYD KUCZEK: Like, certainly if you far enough into the future and homes get torn down and rebuilt, they're going to be rebuilt to more efficient standards, so you know, you're going to -- you're going to achieve some opportunities there.

MR. SVEN HOMBACH: Right. And, again, perhaps I can simply ask that when the economic analysis is filed that the assumptions that are going into DSM are confirmed with that analysis, to the extent that what you indicated on the record today may not be the case.

MS. LOIS MORRISON: We will confirm the assumptions going into the analysis for DSM.

--- UNDERTAKING NO. 12: Manitoba Hydro to confirm assumptions going into DSM analysis

MR. SVEN HOMBACH: Thank you. Now, Mr. Chairman, it's 4:30. I promised that we would break at 4:30 today. I do have a few additional

issues with respect to DSM to cover in the morning, but it hopefully will not take much more than an hour. So if the panel is prepared to adjourn for the day, we may wish to do so.

THE CHAIRPERSON: Yes, I think we are prepared to adjourn for the day.

Now, I wonder are there any administrative matters to attend to before we recess? I'm looking -- it doesn't appear that we have anything.

MR. SVEN HOMBACH: Nothing further that I'm aware of, Mr. Chair.

THE CHAIRPERSON: Okay. Well, thank you very much, everyone. We'll see each other again tomorrow morning at nine o'clock. Thank you.

(PANEL RETIRES)

--- Upon adjourning at 4:33 p.m.

Certified Correct,

_____
