Tab 52

REFERENCE: Appendix C 2012 Electric Load Forecast and Appendix 4.2

QUESTION:

Please provide supply and demand tables for the "no new resources" and for the Preferred Plan showing the situation if the PLIL projected to arise by 2031/32 had fully arrived on the system by 2019/20 (6 years from today) and no further growth in PLIL arrives after that time through 2031/32 such that for all periods after 2031/32 the load forecast is unaffected.

RESPONSE:

Provided below are the requested Supply and Demand Tables with the 2012 Electric Load Forecast altered such that the PLIL growth that was previously forecast over the 17 years at 100 GWh per year starting from 2015/16 to 2031/32 has now been added to the forecast from years 2014/15 to 2018/19 such that total growth of the 1700 GWh for the PLIL group are now completely added by 2019/20. This equates to approximately 370 GWh and 50 MW per year growth from 2014/15 to 2018/19 and 0 from that point on such that the 2031/32 fiscal year and beyond remains the same as the original Load Forecast. No changes to the amount and timing of new resources for the Preferred Development Plan Supply and Demand Tables were made to reflect these load changes.

12.0 Export Markets 84
13.0 Special Rates 88
14.0 Presenter Submissions 92
15.0 IT IS ORDERED THAT: 96

1.0 Executive Summary

By this Order, the Public Utilities Board of Manitoba (Board) approves rates for Manitoba Hydro for the April 1, 2014 to March 31, 2015 fiscal year and also for the April 1, 2015 to March 31, 2016 fiscal year.

The Board approves a total 3.95% increase in Manitoba Hydro consumers' billed rates effective August 1, 2015. This will increase the monthly bill of an average residential customer without electric space heat (using 1,000 kWh per month) by $3.20 and an average customer with electric space heat (using 2,000 kWh per month) by $6.11.

However, of the 2015/16 rate increase, only the revenues from a 1.8% rate increase will flow to Manitoba Hydro's general revenues to improve its financial position.

The revenues generated from a 2.15% rate increase are to be placed in the previously established deferral account to mitigate rate increases when the Bipole III Transmission Reliability Project (Bipole III), including the Riel Converter Station, comes into service in 2018/19. Because very significant rate increases will be needed at that time, the Board sees a compelling policy reason to gradually increase rates to avoid rate shock for consumers three years from now.

This Order also finalizes the previously approved interim 2.75% rate increase for Manitoba Hydro's 2014/15 fiscal year. Because this increase was previously granted and is already being collected, there will be no additional impact on ratepayers.

Reasons for the Rate Increases

Manitoba Hydro is making very large capital investments to meet its projected energy and capacity requirements and to replace its aging assets. These investments, which will double Manitoba Hydro's assets and associated costs, will be funded mostly by debt and the remaining balance funded by monies generated from its ongoing operations. Including the refinancing of old debt, Manitoba Hydro projects that it will borrow $2.4 billion in 2015/16 and approximately $3 billion annually between 2016/17 to 2018/19.

Manitoba Hydro has advised that its investments will place pressure on its financial strength and will require significantly higher electricity rates to support its increased costs.

The 1.8% portion of the total rate increase will generate additional revenues that will strengthen Manitoba Hydro's finances and support its borrowing plans. The increase is broadly aligned with the anticipated inflation rate.

The funds set aside in the Board-ordered deferral account, including the revenues from the 2.15% portion of the total rate increase, will be used to smooth the significant rate increases that may otherwise be required when the Bipole III Transmission Reliability Project (Bipole III) is completed, mitigating the resulting rate shock. The capital costs of Bipole III have increased by $1.4 billion (or 44%) in the past year, resulting in a total projected capital cost of $4.6 billion. The project is currently expected to increase Manitoba Hydro's annual costs by $384 million in 2020 and will not generate any related offsetting incremental revenues. A rate increase in excess of 20% would be needed to support this annual cost.

Furthermore, Manitoba Hydro has forecasted lower export revenues, largely because of continued lower export prices. Because export revenues are decreasing, domestic rates will need to increase.

Manitoba Hydro announced that successive increases of 3.95% are indicated until 2031. Despite those rate increases, the utility still projects losses from 2019 to 2025 (the total to exceed $980 million) and deterioration in its financial condition.

While the Conawapa Generating Station is no longer part of Manitoba Hydro's Capital Expenditure Forecast, the combination of higher capital expenditures than initially planned, increased investments in energy efficiency measures and declining export revenues means that significant rate increases will be needed for the next decade.

The Board is extremely concerned about the impact of successive and significant rate increases on ratepayers. However, in setting just and reasonable rates, the Board must balance the interests of ratepayers with the financial health of the utility.

Manitoba Hydro has advised that rate increases in excess of inflation are required into the future. The Board will scrutinize all future requested rate increases and approve rates that are justified by the evidence examined. Because financial projections are highly variable, regular applications and reporting by Manitoba Hydro will allow the Board to be better informed and responsive to changing conditions.

The Board previously advised Manitoba Hydro that it would not consider new rates for April 1, 2016 in the Hearing. Manitoba Hydro is studying the financial targets that are embedded in its integrated financial forecasts. The Board will consider various options regarding a process to review rates for April 1, 2016. The Board does not expect to award any further rate increases until a Cost of Service Study (COSS) Application has been filed and the Board has sufficient time to review the COSS Application.

Bill Affordability

The Board recognizes that higher electricity rates will have an impact on all Manitobans but especially lower income Manitobans. In this Order, Manitoba Hydro is directed to file Terms of Reference for a collaborative process led by Manitoba Hydro to develop a bill affordability program harmonized with Manitoba Hydro's other programs supporting low-income ratepayers. The goal of the process should be to develop a program for implementation within one year from the Board's approval of the Terms of Reference.

The Board continues to support the implementation of Manitoba Hydro's Affordable Energy Program (AEP) which offers assistance to lower income homeowners who are in need of energy efficient upgrades such as insulation. The Board approves the proposed increased budget to the AEP for 2015 and directs Manitoba Hydro to consider additional measures to increase participation rates and to assist all-electric customers, particularly those living in communities without access to natural gas heating options,

and to provide regular reports on the implementation of the Program and any additional measures developed.

The Board recommends to the Consumer Coalition, the Green Action Centre, the Manitoba Métis Federation and Manitoba Keewatinowi Okimakanak that these interveners encourage their eligible members to take advantage of potential savings that can be generated by the AEP along with other energy efficiency measures. The Board is encouraged by Manitoba Hydro's increased efforts to identify customers eligible for the AEP, and believes that these interveners may have additional valuable information to contribute.

Manitoba Hydro's Capital Expenditures

In addition to investing in major new capital projects, such as the Keeyask Generating Station and Bipole III, Manitoba Hydro also intends to increase its investment in base or sustaining capital (i.e., electric service replacements and expansions), and Demand-Side Management (DSM).

Manitoba Hydro is bringing several major new generation and transmission projects, including the two projects discussed above, into service in Manitoba Hydro's fiscal years 2018/19 and 2019/20, respectively. The Keeyask Generating Station was reviewed by the Board at the NFAT Review in 2014, while Bipole III was excluded from that review. Manitoba Hydro advised that Bipole III, which is currently under construction, is intended to increase system reliability and decrease the risk of outages by providing a third transmission line from northern Manitoba to the south.

When these projects enter service, they will increase Manitoba Hydro's revenue requirement, as Manitoba Hydro will need to recover depreciation, finance costs, operations, maintenance, and administration costs (OM&A), and other expenses related to these projects on an annual basis. As Manitoba Hydro's rates are set to recover its revenue requirement, rates would need to increase by the amounts shown in the following table if these projects were considered in isolation. Manitoba Hydro is

indicating that 3.95% annual rate increases may be sought for the next 15 years, a concept known as rate smoothing, instead of large, lump-sum increases when these projects enter service. Manitoba Hydro projects to incur losses beginning in 2018/19 which will temper the need for rate increases in the near term, such that the cumulative rate increase proposed by Manitoba Hydro is 42% by 2024, even though larger rate increases would be required to avoid the projected losses. The rate increases approved by the Board for 2014/15 and 2015/16 reflect a policy decision by the Board to mitigate rate shock to consumers by phasing the rate increases in over time.

The following table illustrates Manitoba Hydro's new revenue requirements attributable to new major projects, starting in 2019:

Revenue Requirement Impacts ($ Million)

Year Ending March 31	**2019**	**2020**	**2021**	**2022**
Bipole III Transmission Reliability Project	234	384	382	377
Keeyask Generating Station	28	80	316	462
Manitoba/Minnesota Transmission Project / Great Northern Transmission Line	1	5	85	115
Conawapa Sunk Costs	35	34	34	33
Additional Annual Revenue Required for New Projects	298	503	817	987
Cumulative Indicative-Only Annual Rate Increase Required to Pay New Costs	20%	34%	54%	65%

Sources: Application Appendix 11.15, Exhibit MH-118

Although all of Manitoba Hydro's new major capital projects have been approved by the Province, the Board is very concerned about possible cost escalations associated with these projects. Any future capital cost increases have a direct impact on domestic rates. Over the past year, the projected cost of Bipole III has increased by $1.4 billion to $4.6 billion and projected cost of the Great Northern Transmission Line has increased from $507 million to $676 million US dollars.

The Board expects Manitoba Hydro to demonstrate cost control efforts with respect to its capital expenditures, including its staffing for these projects. Furthermore, in order to

obtain timely and transparent information on the evolution of Manitoba Hydro's capital projects, the Board directs Manitoba Hydro to file quarterly progress reports on its major capital projects. These reports are to outline the proposed budget (at time of contract), budget changes and the reasons for such changes, and the revised projected in-service costs. Where capital costs have increased materially, Manitoba Hydro is to explain how such increases will impact domestic revenue requirements and projected impacts on Manitoba Hydro's financial forecasts and targets.

Given the significant risks Manitoba Hydro ratepayers are facing during this decade of large capital expenditures, the Board reiterates its recommendation to the Province of Manitoba that the Board should be provided with the statutory jurisdiction to review and approve Manitoba Hydro's major capital projects.

Sustaining capital expenditures address aging utility assets, improve the capacity of the existing system and maintain system reliability. The Board is approving the recovery, through rates, of increased sustaining capital investments during the 2013/14 and 2014/15 fiscal years. However, the Board directs Manitoba Hydro to file terms of reference for a more comprehensive asset condition assessment report before approving the rate impacts from increased sustaining capital spending for future years.

Operating Expenditures

The Board is encouraged by Manitoba Hydro's plans to slow the growth of its operating and maintenance costs to 1% annually, since this is below the expected increase in inflation. The Board directs Manitoba Hydro to provide quarterly reports on its current OM&A expenditures so as to demonstrate that its target is being met.

Accounting Changes

The Board accepts some of the proposed accounting changes, but denies Manitoba Hydro's request to calculate depreciation expense using the Equal Life Group (ELG) method and requires Manitoba Hydro to continue to utilize the existing Average Service

Life (ASL) method for rate-setting until a full comparison study has been filed for the Board's consideration.

Load Forecast, Demand-Side Management and Power Resource Plan

Manitoba Hydro's load forecast predicts reduced load growth in the future, largely as a result of decreases in the projected pipeline load. This further erodes any potential business case for the Conawapa Generating Station and pushes back the need for new post-Keeyask generation for Manitobans to more than 20 years from now.

Demand side management (DSM) is another way to mitigate the impact of rate increases. While the Board recommended to the Government of Manitoba that Manitoba Hydro be divested of its responsibilities for DSM, this recommendation has yet to be implemented and Manitoba Hydro continues to be responsible for DSM. The Board supports plans and the associated expenditures to enhance DSM programs, such as improved codes and standards, and to increase investments in energy efficiency measures by $0.9 billion over the next 20 years as a means of mitigating the impacts of future rate increases.

DSM reduces the utility's revenues but defers the need for new generation and provides ratepayers with a means to reduce their electricity bills.

The Board is encouraged by Manitoba Hydro's increased DSM efforts but notes that the utility's 2014/15 DSM budget was underspent by approximately $19 million, while Manitoba Hydro is planning to significantly increase expenditures for 2015/16. As a result, the Board orders Manitoba Hydro to retain the DSM deferral account and place the 2014/15 underspent funds in that account, to be utilized for Board-approved ongoing DSM expenditures.

Special Rates

By this Order, the Board further addresses a number of special rates, namely Light-Emitting Diode rates for Area and Roadway Lighting, the Curtailable Rate Program and the Surplus Energy Program.

2.0 Overview

Previous Rate Increases

In Order 43/13, the Board approved a 3.5% increase in Manitoba Hydro consumers' billed rates effective May 1, 2013. However, the revenues from a 1.5% rate increase were to be placed into a deferral account to mitigate required rate increases when the Bipole III Transmission Reliability Project (Bipole III) and related infrastructure, including the Riel Converter Station, comes into service later this decade. The Board also set Manitoba Hydro's revenue requirement based on Demand-Side Management (DSM) spending of $24 million for 2012/13 and $35 million for 2013/14, ordering the discrepancy resulting from any underspend to be placed into a deferral account for disposition at the present General Rate Application (GRA).

In Order 49/14, the Board further approved a 2.75% increase in Manitoba Hydro consumers' billed rates effective May 1, 2014 on an interim basis. However, of this increase, the revenues from a 0.75% rate increase were to be placed into the Bipole III deferral account established in Order 43/13. In Order 49/14, the Board further directed Manitoba Hydro to file a two-year GRA for the 2014/15 and 2015/16 fiscal years.

The Current General Rate Application

On January 16, 2015, Manitoba Hydro filed the current GRA for a three-year period, involving the 2014/15, 2015/16 and 2016/17 fiscal years. In the GRA, Manitoba Hydro sought the following approvals:

(a) Approval, on an interim basis, of rate schedules incorporating an across-the-board 3.95% rate increase to all components of the rates for all customer classes effective April 1, 2015, sufficient to generate additional revenues of $57 million in 2015/16;

(b) Approval of a further 3.95% across-the-board rate increase to all components of the rates for all customer classes effective April 1, 2016, sufficient to generate additional revenues of $60 million in 2016/17;

(c) Final approval of Orders 49/14 and 51/14 which approved, on an interim basis, a 2.75% rate increase effective May 1, 2014 applied on an across-the-board basis, and final approval of any other interim rate Orders issued subsequent to the filing of the Application and prior to conclusion of this proceeding;

(d) Final approval of the Light Emitting Diode (LED) rates for the Area and Roadway Lighting class approved on an interim basis in Order 79/14;

(e) Approval to implement Time-of-Use Rates for the General Service Large customer class served at greater than 30 kilovolts ("kV"), effective April 1, 2016, including the change in the definition of billing demand to be the highest measured on-peak demand in the month, 50% of contract demand or 50% of the highest on-peak demand in the previous 12 months;

(f) Confirmation that the Board accepts the rate approval process given proposed modifications to the Terms and Conditions of Option 1 of the Surplus Energy Program (SEP) as outlined in Tab 6 of this Application, that were approved on an interim basis in Order 43/13;

(g) Confirmation that the Board accepts the rate approval process given proposed modifications to the Curtailable Rate Program ("CRP"), as outlined in Tab 6 of this Application, that were approved on an interim basis in Order 43/13;

(h) Final approval of all SEP interim ex parte rate Orders as set forth in Tab 10 of this Application, as well as any additional SEP ex parte Orders

issued subsequent to the filing of this Application and prior to the Board's Order in this matter;

(i) Final approval of CRP ex parte Order 46/14 as well as any additional ex parte Orders in respect of the CRP issued subsequent to the filing of this Application and prior to the Board's Order in this matter;

(j) Final approval of Orders 116/12 and 117/12 that approved, on an interim basis, a 6.5% rate increase to the full cost portion of the General Service and Government rates in the four remote communities served by diesel generation effective September 1, 2012, and final approval of diesel zone interim Orders 17/04, 46/04, 159/04, 176/06, 1/10, 134/10, 1/11 and 48/11, subject to confirmation that MKO has provided the parties to the agreement with the required affidavits from representatives of signatories to the agreement; and,

(k) Approval to rescind the Demand-Side Management deferral account established pursuant to Order 43/13 for the 2012/13 and 2013/14 fiscal years and on a go-forward basis.

The Current General Rate Application – Procedural Matters

The Board considered Manitoba Hydro's GRA and, by letter dated January 27, 2015, advised Manitoba Hydro that it would not set rates for 2016/17 at this time and would limit the GRA process to 2014/15 and 2015/16, as per its directive in Order 43/13. In the letter, the Board further indicated that it did not consider interim rates effective April 1, 2015 to be in the public interest and instead would seek to set final rates in the GRA process.

On January 30, 2015, Manitoba Hydro applied to review and vary the Board's decision, as set out in the January 27 Board letter, submitting that a three-year rate approval

would be a more practical and efficient process, and that a lack of new interim rates on April 1, 2015 would result in lost revenues in the amount of $4 million per month.

In Board Order 17/15, the Board denied Manitoba Hydro's request to review and vary the Board's decision set out in the January 27 Board Letter.

On February 5, 2015, the Board held a Pre-Hearing Conference with prospective interveners at the Board's offices in Winnipeg. Subsequent to the Pre-Hearing Conference, the Board granted Intervener status to the following entities by way of Board Order 18/15:

- The Consumer Coalition, a coalition between The Consumers' Association of Canada (Manitoba) Inc. and Winnipeg Harvest;
- The Green Action Centre;
- The Manitoba Industrial Power Users Group;
- Manitoba Keewatinowi Okimakanak Inc.;
- The Manitoba Métis Federation; and
- The City of Winnipeg.

Two rounds of written Information Requests were directed to Manitoba Hydro, and one round of Information Requests to Interveners. The Board received oral evidence from May 25, 2015 to June 15, 2015, with closing submissions taking place on June 17, 18 and 19, 2015.

3.0 Rate Increases for 2014/15 and 2015/16

Issues

In the current General Rate Application (GRA), Manitoba Hydro requests the 2.75% rate increase, awarded on an interim basis in Orders 49/14 and 51/14 for the 2014/15 fiscal year, to be finalized and an additional 3.95% increase for the 2015/16 year to be approved. The 2.75% rate increase generated $35 million in additional revenue in fiscal 2014/15 and is projected to generate $39 million of additional revenue in 2015/16. The proposed 3.95% rate increase for 2015/16 is projected to generate $57 million of additional revenue in that year.

Combined with the interim 2.75% rate increase granted for 2014/15, Manitoba Hydro is seeking approval to collect an additional $96 million annually from consumers.

The requested rate increases will raise over $1 billion for Manitoba Hydro over the next 20-year period.

Operating Results Update

In April 2014, in support of its Interim Application, Manitoba Hydro filed Integrated Financial Forecast IFF13 with the Board. In that forecast, Manitoba Hydro indicated it would have net income of $116 million for the year ended March 31, 2014. Actual results for that year were $147 million, or $31 million better than forecast, due mainly to the effects of the coldest winter in 100 years in Manitoba.

Manitoba Hydro filed IFF14 in support of its application for 2014/15 & 2015/16 rates, which included the interim rate increase of 2.75% granted May 1, 2014. Manitoba Hydro's forecast net income was to be $55 million for 2014/15 and $12 million for 2015/16. In IFF14, Manitoba Hydro revised its forecast for 2014/15 to $102 million, which is a $48 million improvement, and revised its forecast for 2015/16 to $115 million, which is a $103 million improvement from IFF13.

Overall, Manitoba Hydro's recent financial outlook for 2013/14 to 2015/16 has improved by $182 million as reflected in the following table:

Comparison of Forecast /Actual Net Income IFF14 vs. IFF13 ($Millions)

Fiscal Year	IFF14	IFF13	Change
2013/14 (Actual to Forecast)	$147	$116	$31
2014/15 (Revised Forecast)	$102	$55	$48
2015/16 (Revised Forecast)	$115	$12	$103
Total Net Income	**$364**	**$183**	**$182**

Manitoba Hydro attributed the improvement largely to favourable water flows, lower financing costs and lower depreciation expense, although this was partially offset by lower than expected export prices.

During the hearing, Manitoba Hydro provided an update of its forecast for 2014/15 indicating that the net income forecast of $102 million would be lower than forecast by no more than $10 million. This lower financial result was in part attributed to lower export revenue as well as the renegotiation of the Wuskwatim Power Limited Partnership Agreement, which resulted in an estimated net income reduction to Manitoba Hydro of $16 million in 2014/15.

Forecast Need for Rate Increases

Manitoba Hydro indicates 3.95% annual rate increases must be implemented for the next decade and a half, even in years with average water flows and projected financial results. According to Manitoba Hydro, the long term rate setting perspective is beneficial to customers. Focusing only on the shorter-term financial outlook will defer required rate increases several years into the future, resulting in larger rate increases in future years and rate instability for ratepayers. Manitoba Hydro stated that confirmation of the interim

rate increase of 2.75% and the approval of a 3.95% rate increase for the 2015/16 fiscal year will start Manitoba Hydro on a sustainable path that will prevent higher rate increases in future years.

Manitoba Hydro maintains that the approval of the proposed rate increases is necessary to maintain net income and financial ratios at acceptable levels and to promote longer term rate stability for customers. Absent approval of the proposed 3.95% rate increase, Manitoba Hydro is projecting net income of $57 million in 2015/16. Manitoba Hydro indicated that rate increases in line with inflation of 2% would result in Manitoba Hydro earning $87 million in 2015/16.

Manitoba Hydro attributes the need for rate increases to several factors. One of the factors cited was lower forecast net export revenues. The utility has seen a material decline in export revenue since 2009. Historically, net export revenues have enabled Manitoba Hydro to maintain low electricity rates for Manitobans, with export revenues averaging $365 million a year between 2005 and 2009. Net export revenues have not been as strong as in previous years and are projected to be $150 million in 2014/15 and $181 million in 2015/16. Manitoba Hydro believes that rates need to gradually increase to compensate for this reduction in export revenues.

Another factor cited by Manitoba Hydro for the requested rate increases was the need for additional cash flow to assist in funding major and sustaining capital investments. Manitoba Hydro is entering a period of extensive capital investment to meet growing energy requirements of its export and domestic customers, to replace aging utility assets and address increased capacity constraints on its system.

Manitoba Hydro plans on increasing its base (also referred to as ‘sustaining’) capital spending, which excludes Major New Generation and Transmission, by about $100 million annually from previous levels and forecasts. Base capital expenditures typically represent requirements to meet electricity service replacements and expansions throughout the province. The utility spent $470 million in base capital spending in

2013/14 and plans on increasing its base capital spending to $571 million in 2014/15 and $577 million in 2015/16. IFF14 reflects $12.3 billion in base capital spending over the 20 year forecast.

Manitoba Hydro stated that cash flow is an important consideration for rate-setting purposes and that rates should generate sufficient cash flow to fund its operations, including its sustaining capital expenditures. Manitoba Hydro indicated that it needs rate increases to generate additional cash flow to meet its higher level of sustaining capital spending.

Manitoba Hydro stated that the 3.95% rate increase would not provide sufficient cash flow to fully fund sustaining capital requirements in all years of the forecast. The funding of Manitoba Hydro's forecast sustaining capital from its revenues falls short in six of the next ten years of the forecast. Manitoba Hydro is projecting that it may be required to borrow funds to finance sustaining capital expenditures in these years.

Manitoba Hydro also experienced significant increases in the capital costs of Major Generation and Transmission projects. In the past year, the cost of the Bipole III Transmission Reliability Project (Bipole III) has increased from $3.2 billion to $4.6 billion, a $1.4 billion or 44% increase in the cost estimate previously provided to the Board. Coupled with the current estimated cost of the Keeyask Generating Station of $6.5 billion, the proposed amortization of $397 million in Conawapa Generating Station sunk costs, as well as updated costs for the Great Northern Transmission Line to $675 million, these new major capital projects are contributing to the need for rate increases.

Domestic revenues must increase to cover some of the costs to bring these new major capital projects into service. The 2019/20 additional annual in-service revenue requirement of Bipole III will be $384 million. The additional 2021/22 annual revenue requirement of a fully in-service Keeyask Generating Station will be $462 million after deducting the net export revenues.

To support and fund these new capital expenditures, Manitoba Hydro indicated that electricity rates will have to increase by 42% by 2024.

Manitoba Hydro acknowledged that these investments in new capital spending will place pressure on Manitoba Hydro's financial strength. The current IFF14 forecasts operating losses commencing in 2019 and totaling $980 million over eight years.

The Consumer Coalition (Coalition) submitted that the Board should approve, as final, the 2.75% interim rate increase granted for 2014/15. The Coalition further recommended the Board approve a 2.5% rate increase for 2015/16. The Coalition did not support rate smoothing in principle, suggesting that rate increases should be assessed based on the needs in each year under consideration.

The Coalition did not believe the higher requested rate increase for 2015/16 was supported and that Manitoba Hydro should first demonstrate it has its financial house in order, including demonstrating that its interest rate forecast is accurate.

The Coalition has no confidence in the current financial forecast which it believes embeds a financial cushion. The Coalition also believes that higher rate increases should not be considered until the planning and prioritization of sustaining capital spending is refined. The Coalition expressed concerns with the quality of information used in determining the level of sustaining capital spending. The Coalition also noted Manitoba Hydro's current financial position, which is expected to improve by $180 million for a three-year period, should assist in affording a lower rate increase while Manitoba Hydro addresses its information shortcomings with respect to sustaining capital.

The Manitoba Industrial Power Users Group (MIPUG) agreed that the 2.75% interim rate increase for 2014/15 should be confirmed as final. MIPUG did not support the 3.95% rate increase sought for 2015/16. MIPUG stated that cash flow is not the normal tool for determining appropriate rate levels. MIPUG noted that Manitoba Hydro could take internal actions to improve its cash flow forecast position, such as pacing and

prioritization of spending on Demand-Side Management (DSM) and sustaining capital, as well as recognizing higher staff vacancy rates than forecast. MIPUG indicated that the pacing and prioritization of capital spending merits attention as a way to reduce rate increase requirements over the next ten years.

MIPUG submitted that DSM spending during the period of investment merits review to avoid adding to operating cash flow issues when export revenues are low and other capital spending is in a 'bulge' period, with a large amount of new hydro generation coming into service.

MIPUG also noted that the cash flow forecast could be further improved if interest rates remain lower than forecast, or if any government relief – from current fixed charges on capital spending or water rentals – was provided during the major investment period.

MIPUG recommended the Board grant a 2015/16 rate increase in the range of 2% to 3% and urged the Board to set requirements for the next GRA, including a meaningful assessment of pacing and prioritization of: capital spending, Operations, Maintenance, & Administration (OM&A) spending, DSM, and how such options could reduce future rate increase requirements below 3.95%.

The Manitoba Métis Federation (MMF) did not support Manitoba Hydro's requested rate increase in light of the MMF's opinion that Hydro has failed to provide adequate mitigation opportunities through DSM initiatives or bill assistance, most notably for the MMF's citizens, many of whom are all-electric customers who heat their homes or businesses using electricity. The MMF submits the Board's jurisdiction and mandate is to set just and reasonable rates for Manitoba Hydro that are in the public interest, which includes consideration of the fiscal health of the utility, as well as the impact of rates on customers. According to the MMF, it is not in the public interest to award the rates sought by Manitoba Hydro in the present GRA without providing the utility with the necessary motivation to ensure it provides vulnerable customers with the required tools to alleviate the burden associated with a long term forecast of rate increases. The MMF

did not offer a recommendation on the alternative level of rate increase, deferring to other interveners.

Manitoba Keewatinowi Okimakanak Inc. (MKO) recommended that there be no increase in rates over the amount of 2% for the next two years. MKO submitted a rate increase of 3.95%, or 5% as alternatively presented by Manitoba Hydro, would be severely prejudicial to MKO ratepayers. The percentage of customers in arrears in MKO First Nations communities ranges from 27% to 80% and having these new rates put into effect immediately is going to result in a majority of the MKO communities not being able to pay their bills. According to MKO, Manitoba Hydro has not proposed any solutions to mitigate the impact of the rate increases.

Board Findings

The Board will approve as final the 2.75% rate increase granted on an interim basis in Order 43/13.

The Board will grant a further rate increase of 1.8% effective August 1, 2015 to improve Manitoba Hydro's financial position. The Board considers this increase to be justified in light of decreased export revenue projections and the revenue requirement created by Manitoba Hydro’s newly renegotiated agreement with its First Nations partners in the Wuskwatim Generating Station, the wages and benefit increases by the utility and the impacts of additional planned base capital expenditures. The Board notes that this rate increase broadly aligns with the anticipated inflation rate.

Manitoba Hydro is already ramping up borrowings because it is entering a period of significant investment in its physical installations. The 1.8% rate increase will improve Manitoba Hydro's retained earnings and its financial ratios in the near-term. The Board will expect Manitoba Hydro to manage its operations with this increase in rate revenues.

Bipole III Transmission Reliability Project Deferral Account

The Board notes that Manitoba Hydro is continuing to spend money for the construction of Bipole III, which capital cost estimate has increased from $3.2 billion to $4.6 billion.

In Order 43/13, the Board determined that the project will require additional annual revenue requirements of approximately $300 million when put into service, which yearly amounts will have to be recovered from domestic customers' rates. Based on the updated capital cost estimate, the annual revenue requirement when Bipole III is fully in in-service has now increased to $384 million.

As part of the last GRA, the Board in Order 43/13 required Manitoba Hydro to establish a deferral account into which the revenues from a 1.5% rate increase were to be accumulated to defray a portion of the rate impacts of the project. In Order 49/14, while approving a 2.75% interim rate for 2014/15, the Board directed that revenues from 0.75% of the 2.75% rate increase granted be accumulated in the deferral account.

The Board notes that along with the annual $384 million impact of Bipole III starting in 2020, the annual revenue requirement of the Keeyask Generating Station will be approximately $462 million, net of revenues from export sales, when it is brought fully into service in 2022.

In light of these looming costs, the Board will approve an additional rate increase of 2.15%, the revenues from which are to be directed into the Bipole III deferral account that will be used to meet the rate increase impacts required when Bipole III comes into service. The disposition of the deferral account will be addressed at a future GRA.

When the Board is requested by Manitoba Hydro to review and approve changes to electricity rates, the Board seeks to determine whether the proposed changes in rates are just and reasonable in relation to the public interest. In broad terms, the public interest includes the balancing of the interests of the utility's ratepayers with the financial health of the utility. Included in the many factors that may be considered by the

Board, in reaching a decision as to new rates, are the policy considerations that the Board considers relevant to the matter.

The following table shows the revenue requirements when Manitoba Hydro's major capital projects come into service and the cumulative indicative only rate increases required at that time:

Revenue Requirement Impacts ($ Million)

Year Ending March 31	**2019**	**2020**	**2021**	**2022**
Bipole III Transmission Reliability Project	234	384	382	377
Keeyask Generating Station	28	80	316	462
Manitoba/Minnesota Transmission Project - /Great Northern Transmission Line	1	5	85	115
Conawapa Sunk Costs	35	34	34	33
Additional Annual Revenue Required for New Projects	298	503	817	987
Cumulative Indicative Only Annual Rate Increase Required to Pay New Costs	20%	34%	54%	65%

Sources: Application Appendix 11.15, Exhibit MH-118

The Board has determined that there is a compelling policy interest to phase in the required rate increases over a number of years in advance of the in-service dates of the new major capital projects and avoid rate shock for consumers. If the Board waited until the new capital projects come into service before raising consumer rates, the rate increases would have to be substantially higher. For example, compared to current rates, when the revenue requirement impacts of Bipole III fully materialize in 2020, a rate increase of 25% would be required to pay the additional $384 million of annual Operating Statement costs.

The Board accordingly directs that the annual revenues from a 2.15% rate increase (of the total 3.95% rate increase) should also be designated to flow into the Bipole III deferral account to assist in the payment of future in-service costs.

The Board will consider various options regarding a process to review rates for April 1, 2016. The Board does not expect to award any further rate increases until a Cost fo Service Study (COSS) Application has been filed and the Board has sufficient time to review the application.

4.0 Bill Affordability

Issues

In light of above-inflation rate increases projected by Manitoba Hydro for the next 17 years, the affordability of electricity bills to lower-income ratepayers will become an ever greater concern. Manitoba Hydro is currently offering ratepayers some relief through its Demand-Side Management (DSM) programs, including the Affordable Energy Program (AEP) (both of which are discussed in Chapter 10.0), but it is prudent to recognize that bill affordability will become a more pressing issue in the years to come and that some additional measures may be required.

Manitoba Hydro's current targeted bill affordability programs include emergency bill assistance through the Neighbours Helping Neighbours program administered by the Salvation Army as well as deferred payment arrangements for customers in arrears. Green Action Centre's (GAC) witness noted that Manitoba Hydro's deferred payment arrangements fail 50% of the time, indicating that this is not a suitable response to bill affordability. In GAC's view, Manitoba Hydro has not investigated non-payment of bills resulting from affordability problems.

GAC recommended that the Board direct the establishment of a collaborative process that would address bill affordability for lower income ratepayers. GAC's witness explained several different bill affordability models are used throughout North America, but did not recommend a particular model for Manitoba. Those different models include capping a customer's bill, providing a fixed credit on the bill, a fixed credit percentage on the bill, or a tiered rate discount, all based on household income. Additional models include a uniform rate discount for all customers or an inclining block (inverted) rate. According to GAC's witness, with a bill affordability program, Manitoba Hydro can expect to receive a greater percentage of bills paid in full, overall greater recovery of billed amounts, and improved cost effectiveness of its collections activities.

GAC submitted that the Board has the jurisdiction to require Manitoba Hydro to implement a bill affordability program and cited the case of *Advocacy Centre for Tenants-Ontario v. Ontario Energy Board* (2008), O.J. No.1970 in support of its proposition.

The collaborative process as proposed by GAC would be directed by the Board with stakeholders including Manitoba Hydro. GAC's expectation is that the collaborative process will not result in a consensus among all stakeholders. Where there is disagreement, GAC expects the Board to adjudicate and direct the implementation of a program to address bill affordability. GAC recommended that conservation rates, otherwise known as inverted rates, should be considered in the collaborative process. Conservation rates are proposed to be implemented in 2018/19 by Manitoba Hydro as part of its Power Smart Plan.

The Manitoba Metis Federation (MMF) stated that Manitoba Hydro's current bill assistance programs are inadequate and recommended elimination of late payment charges on accounts in arrears, or, alternatively, reduce the interest rate from 16% to the equivalent interest rate charged by Manitoba Hydro for its Pay-As-You-Save program. Manitoba Keewatinowi Okimakanak Inc. (MKO) recommended that all current arrears be alleviated by a combination of long term repayment terms and write-offs of interest on past due accounts. MMF and MKO supported GAC's collaborative process. Manitoba Keewatinowi Okimakanak MKO asserted that it needs to be involved in the collaborative process because of the unique needs of lower income First Nations customers.

Manitoba Keewatinowi Okimakanak (MKO) recommended that all current arrears be alleviated by a combination of long term repayment terms and write-offs of interest on past due accounts. MMF and MKO supported GAC's collaborative process. MKO asserted that it needs to be involved in the collaborative process because of the unique needs of lower income First Nations customers.

Manitoba Hydro submitted that a bill affordability program falls outside of Manitoba Hydro's legislative mandate as set out in *The Manitoba Hydro Act.* According to Manitoba Hydro, the utility is legally required to recover the cost of supplying power pursuant to section 39(1) of that statute and section 43(3) prohibits the use of Manitoba Hydro's funds for purposes of the Government or any government agency. Manitoba Hydro further submitted that the Board does not have the jurisdiction to order it to implement a bill affordability program as the Board's jurisdiction is limited to setting the prices to be charged for the provision of power but does not extend to the setting of social policy. Manitoba Hydro also indicated that in *Dalhousie Legal Aid Service v. Nova Scotia Power Inc.,* 2006 NSCA 74, the Nova Scotia Court of Appeal found that the Nova Scotia Utility and Review Board had no jurisdiction to order a bill affordability program to be implemented. Manitoba Hydro acknowledged that cases in other jurisdictions are not determinative of this Board's jurisdiction to order such a program in Manitoba.

Board Findings:

The Board recognizes that higher electricity rates will have an impact on lower income ratepayers. This is a particular concern with respect to all-electric customers, many of whom live in areas in which natural gas is not available as an alternative heating source.

The Board sees merit in the approach recommended by GAC's witness to start a collaborative process to determine the best options to address affordability issues. However, it is the Board's view that Manitoba Hydro is in a better position to lead such a process than the Board. Manitoba Hydro has expertise with respect to low-income programs, as evidenced by the recent successes in the AEP discussed in Chapter 10.0.

The Board therefore directs Manitoba Hydro to initiate a collaborative process to develop a bill affordability program harmonized with Manitoba Hydro's other programs supporting low-income ratepayers. Manitoba Hydro shall file, for Board approval, Terms of Reference for this process (including proposed facilitators and proposed stakeholder

participants) by October 31, 2015. The Terms of Reference should explain and include items in scope as well as items specifically out of scope. If Terms of Reference cannot be agreed upon between Manitoba Hydro and participating stakeholders, the Board is prepared to receive submissions from the parties and adjudicate the appropriate scoping. The goal of the process should be to develop a program for implementation within one year from the approval of the Terms of Reference.

The Board is prepared to entertain submissions for participant funding to be charged to Manitoba Hydro in appropriate cases and in accordance with the Board's Rules of Practice and Procedure.

Upon completion of the collaborative process the Board will evaluate the options presented and decide on their implementation.

The Board has been asked to consider establishing a bill assistance program before, notably in Order 116/08, in which the Board required Manitoba Hydro to propose such a program for approval. In Order 116/08, the Board concluded that it has jurisdiction to order the implementation of a bill affordability program. This remains the Board's view. However, the Board notes that at this time, it is not ordering such a program to be established and the collaborative process should not be limited to the consideration of special lower income rates. From a policy perspective, there may well be better solutions that have not been proposed to date. Furthermore, the optimal solution may well involve a portfolio of measures rather than a single measure. However, the idea of lower income rates should not be discarded upfront due to jurisdictional concerns.

The Board interprets section 39(1) of *The Manitoba Hydro Act* to require the aggregate price of power realized by Manitoba Hydro to be such as to achieve full cost recovery, subject to the requirement that such rates must be just and reasonable. This is illustrated by several examples:

- The power from historical generating stations is currently being sold for significantly more than the actual cost to generate, while power from new

generating stations is sold for significantly less than the cost to generate. Rates are set based on Manitoba Hydro's aggregate revenue requirement, not the cost attributable to individual stations.

- While Manitoba Hydro exports some power (primarily firm power) at prices higher than the average cost to generate, it also sells opportunity power for less than the average cost to generate, attributing no fixed costs to such power.

- Certain classes of customers, such as existing Curtailable Rate Program customers, achieve benefits not available to other customer classes or customers in the same class.

The Board does not read the legislative requirement for "postage stamp" rates to prohibit the creation of a lower income customer class, provided that no geographic limitations are imposed on such a class. Similarly, while subsection 43(3) prevents the commingling of government funds with Manitoba Hydro funds, it does not prohibit the creation of a rate class that pays less than the average cost to serve such customers.

The Board notes that while Manitoba Hydro is regulated on a cost of service basis, section 26(4) of *The Crown Corporations Public Review and Accountability Act* specifically authorizes the Board to consider "any compelling policy considerations that the Board considers relevant to the matter." In that respect, the Board's jurisdiction is similarly broad as that of the Ontario Energy Board pursuant to *The Ontario Energy Board Act, 1998*. Subsection 26(3) of *The Crown Corporations Public Review and Accountability Act* further stipulates that *The Public Utilities Board Act* applies with any necessary changes to the Board's rate-setting mandate. As such, rates are not only required to meet the requirements of subsection 39(1) of *The Manitoba Hydro Act* but must also be "just and reasonable." In the Board's view, affordability is a factor to consider when setting just and reasonable rates.

As such, it is the Board's intention to evaluate any future proposals for bill assistance programs from a comprehensive policy perspective rather than through the lens of

jurisdictional constraints, provided that such proposals fall within the legislative framework set by *The Manitoba Hydro Act*, *The Crown Corporations Public Review and Accountability Act*, and *The Public Utilities Board Act*.

5.0 Operation, Maintenance & Administration Expenses

Issues

Growth in Operating Expenses

Operation, Maintenance & Administration (OM&A) expense is one of Manitoba Hydro's highest expense categories constituting its revenue requirement, most of which relates to labour costs.

From 2011/12 to 2015/16, Manitoba Hydro's total annual electric OM&A cost has grown from $773.8 million to $883.3 million. The increase is due to growth in staffing levels driven by the major capital projects as well as accounting policy changes, including the implementation of International Financial Reporting Standards (IFRS).Taking into account the portion of the electric operating costs that are capitalized, OM&A expense has increased from $412.0 million in 2011/12 to a forecast $541.7 million in 2015/16.

The actual and forecast OM&A expenses for fiscal years 2011/12 to 2015/16 are as follows:

Operating, Maintenance and Administrative Costs ($Millions)

	Actual				IFF14-1	
Fiscal Year	2012	2013	2014		2015	2016
Labour and Benefits	$611.4	$658.1	$700.0		$725.0	$751.5
Other Expenses	185.1	183.1	188.0		199.8	198.5
Total OM&A	796.5	841.2	888.0		$924.8	$950.0
OM&A Charged to Centra	(62.7)	(63.7)	(66.8)		(67.8)	(66.7)
Total Electric Costs	**$733.8**	**$777.5**	**$821.8**		**$857.0**	**$883.3**
Capitalized Costs	(321.8)	(314.5)	(340.4)		(371.2)	(341.6)
Total OM&A Expense	**$412.0**	**$463.0**	**$480.7**		**$485.8**	**$541.7**

Manitoba Hydro capitalized $321.8 million (44%) of OM&A cost in 2011/12 and forecasts to capitalize $371 million (42%) in 2015/16 and $341.6 million (41%) in 2015/16. The vast majority of costs capitalized are labour and benefits. Employees involved with capital projects have grown in 2013/14 from 2,204 Equivalent Full Time positions (EFT) with a payroll cost of $234.5 million to a forecast in 2015/16 of 2,568 EFTs with a payroll cost of $287.9 million.

Accounting Changes

Since 2007/08, Manitoba Hydro has made changes to its capitalization practice to move away from “full cost” accounting and provide consistency with other Canadian utilities. Manitoba Hydro capitalizes overhead costs directly attributable to capital initiatives and has identified certain previously capitalized costs that it now plans to expense as period costs. Canadian Generally Accepted Accounting Principles (CGAAP) have converged in some areas to be consistent with IFRS. Manitoba Hydro has adopted these changed accounting policies gradually in its transition to IFRS in 2015/16. Manitoba Hydro made system changes in 2012/13, including changes to its cost allocation methodology and overhead rates to support Manitoba Hydro's transition to IFRS. The change in capitalization practice is consistent with CGAAP and is directionally consistent with IFRS.

In total, Manitoba Hydro indicated at the last General Rate Application (GRA) that $93 million in overhead costs would be expensed. However, in this GRA, Manitoba Hydro proposed that $118 million in overhead costs be expensed when IFRS is implemented in 2015/16.

Manitoba Hydro will adopt interim standard IFRS 14 Regulatory Deferral Accounts upon transition to IFRS. This interim standard allows Manitoba Hydro to continue to recognize rate regulated assets and liabilities. Manitoba Hydro’s forecast assumes that regulatory deferral accounts will continue to be recognized throughout the 20-year forecast period.

The International Accounting Standards Board (IASB) is continuing its comprehensive rate-regulated activities project, which could result in a standard on rate regulation or decision not to develop specific requirements. By issuing IFRS 14, the IASB has indicated it is not anticipating the outcome of the comprehensive project.

The Manitoba Industrial Power Users Group (MIPUG) recommended the Board reject Manitoba Hydro's proposal and maintain, for rate-setting purposes, capitalization policies consistent with those in place prior to IFRS. This change is consistent with the longstanding interpretation of fair cost distribution, balancing costs that should be paid today versus those that are capitalized and paid over the life of the new capital plant. The Board, by clarifying this requirement, will provide Manitoba Hydro options on how to reflect the decision in its IFRS-compliant financial statements.

Staffing Levels

Almost 79% of OM&A costs relate to labour costs, including employee benefits. Wages and salaries have increased by an average of 4% per year, primarily as a result of contract settlements with bargaining units and an increase in total Equivalent Full-Time positions (EFTs). Staffing levels are projected to grow from 5,769 EFTs in 2004 to 6,902 EFTs in 2015/16, an increase of over 1,100 EFTs. Manitoba Hydro attributed the increase in EFTs to growth in its capital program, including new generation and transmission projects such as Bipole III, the Keeyask Generating Station and the Pointe du Bois Generating Station spillway.

Cost Containment Measures

Manitoba Hydro committed to containing the growth of OM&A expenses to one percent, excluding the impact of accounting changes. Manitoba Hydro completed a review of staffing and operational efficiency to meet customer needs in the most cost effective and efficient manner. As part of the process, the utility committed, within the next three years (2014/15 through 2016/17), to reduce its full time staff complement by at least 331 positions through attrition and process efficiencies as follows:

Planned Position Reductions:

	2014/15	2015/16	2016/17	Cumulative
President & CEO	2	2	2	6
General Counsel & Corporate Secretary	1	1	1	3
Human Resources & Corporate Services	33	27	21	81
Corporate Relations	3	2	1	6
Finance & Regulatory	4	3	3	10
Generation Operations	9	12	6	28
Major Capital Projects	1	1	0	2
Transmission	30	18	42	90
Customer Service & Distribution	46	19	13	78
Customer Care & Energy Conservation	16	6	5	27
Annual Commitment	**146**	**91**	**94**	**331**
Forecast Cost Savings:				
Annual Savings ($M)	$ 7.3	$ 12.3	$ 10.0	$ 5.1
Cumulative Annual Savings ($M)	7.3	19.3	29.7	35.8

Manitoba Hydro reported that for 2014/15, it exceeded its targeted position reductions by 80 positions for that year. Manitoba Hydro had forecast 146 operational position reductions in that year and attained 226 position reductions, which represents an additional $8 million in OM&A expense savings.

Further, Manitoba Hydro set a target to limit operating cost increases to 1% per year over the ten-year period, excluding the impacts of accounting changes. To accomplish this 1% target, the utility has identified the need for an additional 600 position reductions by 2022/23.

The Coalition acknowledged Manitoba Hydro's efforts related to cost containment to manage operating costs but is not satisfied with capital cost containment efforts related to capital spending.

First Nation Partnerships

Manitoba Hydro currently incurs ongoing expenditures related to its First Nations partnership arrangement with the Wuskwatim Power Limited Partnership (WPLP). The WPLP Operating Statement indicates allocated revenues of $100 million to $150 million per year out to 2034/35.

Manitoba Hydro amended the contractual arrangement with WPLP and filed finalized documentation during the hearing. Overall, the amendments reduce net income to Manitoba Hydro by $16 million for each of 2014/15 and 2015/16, as well as $15 million on average annually thereafter.

When the Keeyask Generating Station comes into service, contractual arrangements with the Keeyask Hydropower Limited Partnership will also have a revenue requirement impact on Manitoba Hydro. The contractual arrangements have not been finalized.

Board Findings

At the last General Rate Application (GRA), the Board agreed that the accounting changes were appropriate for 2012/13 and 2013/14 and that no further accounting changes be made for rate-setting purposes until the Board had reviewed an IFRS status update. The Board understood that with the adoption of IFRS, additional overhead costs of $36 million per year would be no longer capitalized. The quantum of those costs has increased materially in Manitoba Hydro's Status IFRS Status Update, by $20 million per year.

The Board understands that Manitoba Hydro has made changes in 2012/13 to its integrated cost allocation methodology and overhead rates in its compliance with IFRS. The increases in overhead costs have been primarily attributed to changes in capital activity and overhead allocations. The Board will not accept the higher level of OM&A costs requested in this application but will allow $36 million of additional costs be

expensed for 2015/16 as indicated at the last GRA. The remaining administrative costs will continue to be capitalized as per existing practices.

6.0 Depreciation and Amortization

Issues

Overview

Depreciation Expense is Manitoba Hydro's third-highest expense category and is scheduled to almost double by 2033/34 as a result of both new major generation and transmission assets and planned sustaining capital expenditures. Depreciation Expense was $410 million in 2013/14 and is forecast to be $404.5 million in 2014/15 and $401 million in 2015/16.

Depreciation Expense is forecast to grow to $873 million by 2033/34.

Proposed Changes to the Calculation of Depreciation Expense

Depreciation Expense is recognized on a straight-line basis over the estimated remaining service life of assets, based upon depreciation studies conducted periodically by the utility. Manitoba Hydro engaged Gannett Fleming Inc. to prepare an updated depreciation study of assets in service as of March 31, 2014. The depreciation study and recommended depreciation rates replace the rates that have been in effect since April 1, 2011 based on a depreciation study of assets in service as of 2010 which was presented at Manitoba Hydro's 2012/13 & 2013/14 General Rate Application (GRA).

Gannett Fleming provided updated service lives for several asset classes as well as rates for new asset classes. The study resulted in changes that extended the average service lives of certain plant components, such as substation transformers, whose service lives were extended from 35 years to 50 years based on updated historical experience. The changes in expected service lives resulted in a reduction of depreciation expense of $25 million in 2014/15 and $29 million in 2015/16 compared to the methodology from the 2010 depreciation study.

Gannett Fleming also developed new rates reflecting two changes in the depreciation methodology effective April 1, 2015, namely:

- Switching from the Average Service Life (ASL) methodology of group depreciation to the Equal Life Group (ELG) procedure; and
- Removing the pre-collection of net salvage costs from depreciation. To date, Manitoba Hydro has added 10 percent to the up-front cost of capital assets to recover the eventual cost of decommissioning.

The combined annual financial impacts of the proposed changes to the calculation of depreciation expense during 2014/15 and 2015/16 are as follows:

Revenue Requirement Impacts of Depreciation Study Changes

($ millions)	**Years Subject to this GRA IFF14-1**		**Outlook IFF14-1**	
Fiscal Year ended March 31	**2015**	**2016**	**2024**	**20 Year Total**
Change in service life – Property Plant & Equipment (net of contributions)	(25)	(29)	(42)	(746)
Overhead Ineligible for Capitalization	-	-	(14)	(310)
Change to (ELG) Procedure	-	36	69	1,238
Removal of Asset Retirement Costs (Net Salvage)	-	(60)	(119)	(2,141)
Net Impact	**($25)**	**($53)**	**(106)**	**($1,959)**

Manitoba Hydro recommended that the Board should consider the combined overall impact of the collective depreciation changes for rate-setting purposes under the regulatory principle of fairness, rather than concentrating on any individual changes. According to Manitoba Hydro, the overall impact of the changes is to reduce Depreciation Expense and the associated revenue requirement.

Equal Life Group vs. Average Service Life

To date, Manitoba Hydro has used the ASL methodology of calculating Depreciation Expense. Gannett Fleming testified on behalf of Manitoba Hydro to recommend a switch to the ELG procedure. While the ASL methodology groups assets by type of asset and then depreciates the assets in the group according to their average service lives, ELG groups assets according to their lifespan, not the type of asset. According to Gannett Fleming, the ELG approach more closely tracks the actual depletion of the underlying assets. In Canada, both methods are in use by utilities.

Both the ELG and ASL methodologies are appropriate under International Financial Reporting Standards (IFRS). However, Gannett Fleming indicated that if ASL were to be utilized, the level of componentization into asset groups would have to be more granular than what is currently being presented. Gannett Fleming was of the opinion this additional componentization would significantly reduce the annual difference in Depreciation Expense between ASL and ELG.

Manitoba Hydro estimated that it would cost approximately $2.5 million to further componentize its plant assets to the degree required in order to be IFRS compliant using the ASL procedure. Gannett Fleming further submitted that changing to the ELG procedure would comply with the depreciation requirements of IFRS without the need to further componentize to the level of detail that using an ASL method would require.

Manitoba Hydro also noted that in applying the ASL method to an asset group with a wide dispersion in service lives, it can be expected that assets will retire at ages different than the average life used to depreciate the group resulting in gains and losses

upon retirement. IFRS requires that these gains and losses be recognized immediately to net income. Manitoba Hydro submitted that such gains and losses are expected to be much smaller under ELG since this method calculates depreciation with consideration of the different service lives of the assets in a component group.

Manitoba Hydro acknowledged that the existing regulatory practice, whereby asset retirement gains and losses are recorded in the accumulated depreciation account for the retired asset's respective component group and then factored into future depreciation rate changes for the group, may be continued for rate-setting purposes if ordered by the Board pursuant to rate-regulated accounting.

Manitoba Hydro also indicated that if the ASL methodology was retained for rate-setting purposes, IFRS would require Manitoba Hydro to establish a regulatory deferral account and to maintain two separate sets of asset sub-ledgers to capture the differences between depreciation determined for financial reporting and depreciation determined for rate-setting purposes.

Manitoba Hydro initially indicated to the Board that it wanted to switch to ELG in its 2012/13 & 2013/14 GRA. In Order 43/13 the Board stated:

> *The Board also is concerned that not enough information has been provided to date to assess the true impact on ratepayers of a switch to Equal Life Group. As such, the Board will require Manitoba Hydro to file additional information, including a determination of depreciation rates and schedules based on the Average Service Life methodology, to provide a meaningful comparison between the two approaches. [Order 43/13 pg 18]*
>
> *The Board will require Manitoba Hydro to provide a comparison, for the next General Rate Application, of the impact on the Integrated Financial Forecast of an Average Service Life methodology (without net salvage) and an Equal Life Group methodology (without net salvage), where each of the accounting methodologies are applied to planned major capital additions in the Integrated Financial Forecast. Given the forecast to increase net plant by over $21 billion over a 20 year period, it will be important to understand the*

> *implications on ratepayers of using each approach at the next General Rate Application.*
>
> *The Board further expects Manitoba Hydro to file, as part of its next General Rate Application, additional information to support Manitoba Hydro's view that an Average Service Life methodology compliant with International Financial Reporting Standards requires increased componentization. As part of this information, the Board expects to see evidence as to what level of componentization would be required, and how such level of componentization would increase Manitoba Hydro's costs, if at all. [Order 43/13 pg 18- 19]*
>
> *…*
>
> *IT IS THEREFORE ORDERED THAT:*
>
> *…*
>
> *8. That Manitoba Hydro file updated depreciation rates and schedules based on an International Financial Reporting Standards-compliant Average Service Life methodology with the next General Rate Application.*
>
> *9. That Manitoba Hydro file with the Board, with the next General Rate Application, a chart showing a comparison of the impact on its Integrated Financial Forecast (i.e. 'Budget') of asset depreciation pursuant to the Average Service Life methodology (without net salvage) and the Equal Life Group methodology (without net salvage), applying both methodologies to all planned major capital additions.*

Instead of preparing a depreciation study based on IFRS-compliant ASL, Manitoba Hydro submitted an extrapolation study prepared by Gannett Fleming, based on a sample of plant accounts representing approximately 20% of Manitoba Hydro's total asset base. The analysis was not based on a random statistical sample but based on plant accounts chosen collaboratively with Manitoba Hydro based on select criteria. A random statistically-based sample was not considered because of the time and effort required to evaluate the level of componentization of the selected accounts on this basis.

Based on the results of the study, Gannett Fleming determined a difference in depreciation expense of $700,000 on the plant accounts tested. Extrapolating the results of the analysis indicated that an ASL-based IFRS-compliant depreciation methodology would result in a depreciation expense $3.6 million lower than one based on the ELG procedure.

In cross-examination, it was demonstrated that the extrapolation study was sensitive to changes in assumptions. For example, one of the asset components analyzed was Manitoba Hydro's head office building, which represented less than three percent of Manitoba Hydro's total asset base. Exclusion of this account from the extrapolation analysis increased the difference between ASL and ELG to $4.4 million. Similarly, while the extrapolation study analysis included the Bipole III Transmission Reliability Project, it focused on synchronous condensers, which represent approximately 15% of the cost of the project, but not the metal transmission towers and conductors, which represent approximately 36%. In cross-examination, Gannett Fleming indicated that using the towers and conductors would increase the difference between ASL and ELG.

Both the Consumer Coalition (Coalition) and the Manitoba Industrial Power Users Group (MIPUG) recommended that the Board not approve Manitoba Hydro's proposal to change to the ELG procedure for rate-setting purposes, but retain the ASL methodology without including any net salvage in depreciation rates.

MIPUG submitted that ASL is appropriate for rate setting and is used by the vast majority of regulated North American utilities, particularly Canadian Crown utilities and hydro-based operations.

MIPUG submitted that the use of ASL benefits the intergenerational perspective and that a Crown-owned, hydro-electric utility, such as Manitoba Hydro, should take a consistent and properly matched long term approach to collection of depreciation which matches the use and usefulness of the assets. This is done by using ASL, which charges the same depreciation rate in each year of the asset's life.

MIPUG further submitted that ELG is not a more precise method of depreciation as the claims of ELG precision are linked to a theoretical construct of ELG that is not used in practice, where the theoretical purity of the method is significantly diluted.

Both the Coalition and MIPUG expressed concern related to the extrapolation analysis. An expert witness on behalf of the Coalition and MIPUG testified that the extrapolation study was not reliable and counterintuitive as ELG with a growing asset base will always lead to a higher depreciation expense. MIPUG submitted that the Board should not attribute any evidentiary weight to the extrapolation study.

Both MIPUG and the Coalition argued that the extrapolation study does not comply with the Directive given in Order 43/13 for an IFRS-compliant ASL study. The Coalition recommended the Board find that Manitoba Hydro has not complied with Board Directive 8 from Order 43/13, in which Manitoba Hydro was to file updated depreciation rates and schedules based on IFRS-compliant ASL methodology. The Coalition also recommended that the Board find that its response to Board Directive 9 is inadequate.

The Coalition recommended that the Board not accept ELG for rate-setting purposes on the grounds that Manitoba Hydro failed to comply with Board Directives 8 and 9. The Coalition further recommended that the Board direct Manitoba Hydro to provide a timeline by which it intends to comply with Directives 8 and 9 and, until then, set Manitoba Hydro's revenue requirement based on the traditional ASL methodology.

Removal of Net Salvage

Gannett Fleming advised that IFRS would no longer permit the inclusion of net salvage in the depreciation rate calculations for financial reporting purposes. Depreciation rates currently include a provision for net salvage, representing the cost of disposal of property, plant, and equipment when it is taken out of service. Under IFRS, the future cost to retire and salvage assets will become a cost of the replacement asset.

Manitoba Hydro plans on removing net salvage from depreciation rates when it implements IFRS in conjunction with its proposed change to the ELG methodology.

Manitoba Hydro indicated that it was a policy decision to not request the Board to allow Manitoba Hydro to establish a regulatory deferral account. Manitoba Hydro suggested that this choice was made to reduce the impact of switching to the ELG methodology of depreciation. Manitoba Hydro indicated the impact of removing net salvage from depreciation rates is to lower Depreciation Expense by approximately $60 million in 2015/16.

The Coalition supported MIPUG's recommendation that the Board approve Manitoba Hydro's request for the elimination of ongoing accumulation of net salvage charged through depreciation. MIPUG believes net salvage should be removed from annual calculations as a sound regulatory principle, as the assets are expected to be replaced upon retirement with a new generation of assets that benefits from the pre-existence of the original assets.

Book Accumulated Depreciation Surplus

The change in estimated service lives resulted in a book accumulated depreciation surplus of over $474 million. Book accumulated depreciation surplus is 'over-depreciation' that has resulted from an excess of collected Depreciation Expense on Manitoba Hydro's books. Removing net salvage from the current ASL methodology-based depreciation rates increases the accumulated depreciation surplus to over $1 billion. If depreciation is calculated based on the ELG methodology and no net salvage, the book accumulated depreciation surplus is reduced to approximately $603 million. Manitoba Hydro proposes an annual true-up to refund the balance over the remaining life of each asset account. This approach is consistent with the approach followed in prior depreciation studies.

Board Findings

The Board accepts the calculated book accumulated depreciation surplus based on the 2014 Gannett Fleming study.

The Board also accepts Manitoba Hydro's position that net salvage should be removed from depreciation rates as of April 1, 2015, concurrent with Manitoba Hydro's implementation of IFRS. The Board notes that while the inclusion of net salvage creates a cash flow due to eventual asset removal obligations, any such cash flow is not sheltered in any reserve accounts and forms part of the general revenue requirement of Manitoba Hydro instead. The Board heard evidence that energy-generating assets are rarely decommissioned and removed entirely, and are most frequently replaced. In such instances, IFRS requires removal costs for the existing asset to form part of the overall capital cost of the new asset recovered from future ratepayers. In the Board's view, there are no compelling reasons to set up a deferral account to allow for the continued collection of net salvage.

However, the Board, at this time, is not prepared to determine Manitoba Hydro's revenue requirement for rate-setting purposes based on a switch from the ASL methodology to the ELG procedure.

Under either ASL or ELG, Manitoba Hydro is eventually made whole, since by the time an asset is decommissioned, the entire capital cost has been recovered by Manitoba Hydro from ratepayers. However, there is no doubt that over the next twenty years (the timeframe for Manitoba Hydro's integrated financial forecast), a switch to ELG would increase Depreciation Expense in every single year. Furthermore, Manitoba Hydro was unable to advise the Board at which point ratepayers should expect a "crossover point" at which the increased Depreciation Expense recovered in the early years reduces Depreciation Expense in the later years. As such, the Board must assume that during the entirety of the foreseeable 20 year planning horizon, a switch to ELG would increase the amount of Depreciation Expense consumers are expected to fund through their rates.

For purposes of rate-setting, the Board orders Manitoba Hydro to continue to determine Depreciation Expense based on its existing ASL methodology at this time.

This is not to say that the Board is rejecting outright an eventual adoption of ELG. However, to the extent that the choice is between IFRS-compliant ASL and IFRS-compliant ELG, the Board does not currently have sufficient information upon which to make a decision. As shown in the table above, a change in methodology leads to significant long term consumer rate consequences and is a decision which the Board cannot make on an incomplete record.

While the Board considers the extrapolation study filed by Manitoba Hydro to be illustrative, and the Board accepts that additional componentization would reduce the difference between ASL and ELG, the Board does not consider the extrapolation study reliable enough to base a rate-making decision on it. As such, the Board will order Manitoba Hydro to retain the existing ASL methodology for rate-setting purposes until Directives 8 and 9 from Order 43/13 have been complied with and the Board has been provided with an IFRS-compliant depreciation study based on ASL.

Accepting Gannett Fleming's testimony that additional componentization tends to reduce the difference between ASL and ELG, the Board requests that the IFRS-compliant ASL depreciation study, if and when filed by Manitoba Hydro, be based on the minimum level of additional componentization required by IFRS, but avoid optional additional componentization. The study should also demonstrate whether and when there would be a cross-over point at which time Depreciation Expense as calculated using ELG becomes lower than that calculated using ASL. If Manitoba Hydro is able to file such a study in time for the next GRA, as well as comply with Directive 9 from Order 43/13, the Board intends to make a final disposition with respect to the appropriate long term depreciation methodology for rate-setting purposes at the hearing of that Application.

7.0 Finance Expense

Finance expense, which includes the annual interest payments on Manitoba Hydro's debt, is forecast in Integrated Financial Forecast IFF14 to be $495 million in 2014/15 and $510 million in 2015/16. After Operating and Administrative expenditures, Finance Expense is the second largest annual expenditure by Manitoba Hydro in 2015/16 and is expected to be the largest component of revenue requirement by 2017/18.

At the last General Rate Application (GRA), Finance Expense was forecast to be over $1.6 billion in 2028. Given the termination of the $10.2 billion Conawapa Generating Station and the current historically low interest rates, Finance Expense is now forecast to peak at $1.3 billion in 2023/24, some $300 million lower than what was forecast at the last GRA.

Manitoba Hydro capitalizes all interest on capital projects until the project is placed into service, which means the annual interest payments are added to the cost of the capital project and are not recovered from current year revenues. Once the capital project is brought into service, then the previously capitalized interest payments are included in Finance Expense in the annual operating expenses of Manitoba Hydro.

Of its total annual interest costs, Manitoba Hydro is forecasting to capitalize $146 million (or 23%) in 2014/15 and $207 million (or 29%) in 2015/16. Manitoba Hydro has capitalized over $2.1 billion of interest costs as of 2013/14. Based on IFF14, Manitoba Hydro is forecasting to capitalize an additional $2.2 billion in interest over the next 20 years which will result in $4.4 billion of capitalized interest.

In the near term, Manitoba Hydro plans on new borrowings, including refinancing of existing debt, totalling $1.9 billion in 2014/15, $2.4 billion in 2015/16, and in the order of $3 billion annually between 2016/17 to 2018/19 to fund its capital program. Long term interest rates in IFF14 were estimated based on a Fall 2014 interest rate forecast.

Manitoba Hydro's long term interest rates were projected to be 4.50% in 2014/15 and 5.10% in 20115/16 (inclusive of the 1% Provincial Debt Guarantee Fee Manitoba Hydro pays to the Province of Manitoba in exchange for guaranteeing Manitoba Hydro's debt).

Manitoba Hydro is forecasting long term interest rates to increase from 5.10% in 2015/16 to 5.50% by 2016/17, to reach 6.2% in 2019/20, and to remain at that level for the remainder of the forecast through 2033/34.

However, Manitoba Hydro provided a January 2015 update to its interest rate forecast. The update indicated that long term rates had fallen by 30 basis points in 2014/15 from 4.50% to 4.20%. The long term interest rate for 2015/16 dropped by 110 basis points to 4.0%. The interest rates over the forecast period have all declined from Manitoba Hydro's forecast level with the forecast long term rate falling by 45 basis points to 5.75%. Manitoba Hydro stated that it had taken advantage of the low interest rates with its new borrowings to the benefit of ratepayers.

Manitoba Hydro provided a further update based on the Spring 2015 Economic Outlook and forecasts received in May and June 2015. These forecasts indicated that rates for 2015/16 had fallen from the January 2015 update by an additional 5 basis points in 2015/16 to 3.95% and by 15 basis points for 2016/17 to 4.40%.

Manitoba Hydro indicated that based on the January 2015 update, Finance Expense in 2015/16 would be lower than initially forecast by $13 million. The updated forecast also indicated that the long term interest rate beyond 2017/18 increased to be more in line with the rates included in IFF14.

The Consumer Coalition (Coalition) stated that it had little confidence in Manitoba Hydro's interest rate forecasting and that the utility has consistently overestimated short and long term interest rates. The Coalition cited recent new debt issues negotiated by Manitoba Hydro which were at lower rates than what is forecast in the IFF. The Coalition believes that the Finance Expense for 2015/16 and 2016/17 will be lower than that forecast by Manitoba Hydro and that the utility will benefit from some positive

developments due to lower interest rates over the short term. In this current year, the Coalition submitted there is an ability to lock in substantially lower than forecast interest rates, suggesting a reduction of risk for this very substantial year of borrowing, and a significant rate mitigation opportunity.

The Coalition stated that Manitoba Hydro's interest rate forecast has been a source of substantial uncertainty, with a prevailing trend to overestimate interest rates. The Coalition noted anecdotally that this uncertainty is also prevalent with Manitoba Public Insurance and recommended the Board direct a technical conference involving both Manitoba Hydro and Manitoba Public Insurance to address interest rate volatility and forecasting.

The Manitoba Industrial Power Users Group (MIPUG) also noted the lower interest rates as a positive factor for ratepayers, indicating that favourable changes since last Integrated Financial Forecast (IFF) can have large impacts on Manitoba Hydro's forecasts which remove an immediate need for the 3.95% rate increase.

Board Findings

The Board notes that Manitoba Hydro's long term debt is forecast to grow from $10.8 billion in 2013/14 to peak at over $24.5 billion by 2028/29. This will lead to Finance Expense that will exceed $1.3 billion in 2021/22 once the Keeyask Generating Station is in service. The annual Finance Expense to pay the carrying costs of the debt, along with other revenue requirement items, will ultimately be borne by ratepayers when assets are placed into service.

The Board notes that in the near term, there is a benefit of lower interest rates and borrowing costs that is not currently reflected in Manitoba Hydro's financial forecast. Additionally, and since the close of evidence at the GRA, the Board notes that the Bank of Canada has further reduced interest rates. A lower long term trend in interest rates, if sustained, would be to the benefit of ratepayers due to lower borrowing costs.

The Board also notes that Manitoba Hydro remains vulnerable to the risk of rising future interest rates above those currently forecast. There is great uncertainty related to interest rate movements in Manitoba Hydro's forecast. The Board awaits reviewing the risk report Manitoba Hydro commissioned from KPMG (a business consulting firm), which is expected to examine Manitoba Hydro's interest rates, at the next GRA.

The Board will not require a technical conference on interest rate forecasting at this time, as recommended by the Coalition. The Board notes that Manitoba Hydro has implemented Board-recommended changes to its interest rate forecasting methodology and obtains forecasts from a number of external sources. Furthermore, interest rate risk is expected to be examined in the KPMG report, allowing the Board to conduct a more comprehensive review at the next GRA. As such, the Board is of the view that it is premature to start an interest rate forecasting review outside the regular GRA process.

The Board also takes judicial notice that Manitoba Hydro's credit rating was not affected by Moody's recent downgrade of the provincial credit rating.

8.0 Risks and Financial Targets

Issues

As a proxy for its financial strength, Manitoba Hydro has the stated goal of meeting a set of three financial targets:

- To achieve and maintain a minimum debt to equity ratio of 75:25.
- To achieve and maintain an annual gross interest coverage ratio of greater than 1.20, meeting all interest payment obligations from annual operating revenues without having to borrow additional funds to make interest payments; and
- To achieve and maintain a capital coverage ratio of greater than 1.20, funding all base or sustaining capital expenditures from internally generated funds.

In setting its financial targets, Manitoba Hydro recognizes that targets may not be attained during years of major investments in the generation and transmission system. While credit rating agencies are aware that financial targets will not be met during the period of Manitoba Hydro's major capital expansion program, Manitoba Hydro indicated that rate increases were needed so as to demonstrate progress towards attaining the targets over the long term.

Manitoba Hydro advised the Board that it commissioned a risk review study from KPMG (a business consulting firm), which is expected later this year. As part of KPMG's mandate, the firm will review and consider the appropriateness of Manitoba Hydro's financial targets.

Debt-to-Equity Ratio

The debt to equity ratio measures the relationship of long term and short term debt less short term and sinking fund investments to equity (retained earnings including Accumulated Other Comprehensive Income and unamortized customer contributions).

This ratio is used to assess the overall financial risk to Manitoba Hydro by examining the level of debt in relation to the amount of equity held. Historically, Manitoba Hydro's equity has ranged from a low of 5% in 1990 to a high of 25% in 2009 when the utility met its target level several years ahead of schedule.

Manitoba Hydro's capital structure is forecast to weaken to a debt to equity ratio of 90:10 over the period 2022/23 to 2026/27 due to planned capital spending on major projects. Manitoba Hydro stated that it is important that its financial position improve following the investment period as external stakeholders, such as credit rating agencies and lenders, will closely monitor Manitoba Hydro's progression towards its financial targets. Further, the utility indicated that, in its judgment, the projected deterioration in the debt to equity ratio in IFF14 to 90:10, predicated on the requested 3.95% rate increase, is the minimum acceptable financial operating level. Manitoba Hydro indicated that it would be financially vulnerable to drought risk if the ratio dipped any lower.

As previously mentioned, Manitoba Hydro retained KPMG to conduct a review of its financial targets, which is expected to be completed in the fall of 2015. At that time, Manitoba Hydro will consider the recommendations from KPMG's report as well as further internal financial modelling changes and submit the recommendations to the Manitoba Hydro Electric Board for approval for inclusion in the next Integrated Financial Forecast (IFF15). Manitoba Hydro submitted that until the financial target review is complete and the results of the review have been approved by the Manitoba Hydro Electric Board, the current financial targets remain as the key measure of the utility's financial strength and are the appropriate guide for rate-setting purposes.

Manitoba Hydro noted that even with on-going 3.95% annual rate increases, the debt to equity ratio target of 75:25 will not be reached again until 2033/34.

Based on IFF14, long term debt is forecast to be over $24 billion in 2029 versus $29 billion forecast in IFF11-2 at the previous General Rate Application (GRA). The lower debt level is due to the suspension of construction of the $10.2 billion Conawapa G.S.,

offset by increased capital spending of $1.4 billion on the Bipole III Transmission Reliability Project and approximately $2 billion of increased sustaining capital spending.

Interest Coverage Ratio

The Interest Coverage Ratio is calculated to measure the degree to which Manitoba Hydro can meet its interest payment obligations from the current year's operating revenues. An interest coverage ratio below 1.0 indicates that Manitoba Hydro may have to finance interest payments with new debt rather than pay them out of revenue from operations. In IFF14, the 1.20 target is not achieved throughout the forecast period with the ratio falling below 1.0 from 2019 to 2026, an extended period during which Manitoba Hydro is forecasting $900 million in losses.

Manitoba Hydro is considering changing the determination of the interest coverage ratio to include consideration of depreciation and amortization, a non-cash expense. KPMG has recommended that Manitoba Hydro change its interest coverage ratio to be based on earnings before interest, taxes and depreciation and amortization (EBITDA) rather than earnings before interest (EBIT). This change would be consistent with the way credit rating agencies view the interest coverage ratio.

Manitoba Hydro indicated that in the company's 20-year forecast, the lowest interest coverage ratio calculated based on the existing methodology will be 0.85; however, on an EBITDA basis, the ratio would not fall below 1.35. The Manitoba Industrial Power Users Group (MIPUG) noted that, based on the revised formula, even in the worst year of the forecast, Manitoba Hydro has a substantial ability to meet its interest obligations.

Capital Coverage Ratio

The capital coverage ratio measures the ability of internally generated funds from the current period to finance sustaining capital expenditures (excluding major new generation and transmission capital expenditures).

A capital coverage ratio less than 1.0 indicates that Manitoba Hydro must borrow to fund some of its sustaining or base capital requirements. Manitoba Hydro's target capital coverage ratio is set at 1.20. To the extent the ratio exceeds 1.0, it provides internally generated funds that are used by Manitoba Hydro to fund major capital projects. The use of such funds displaces the requirement for additional borrowings that are the primary source of funding major capital projects. Manitoba Hydro has historically funded its sustaining capital spending from internally generated funds.

In 2013/14, the utility spent $470 million on sustaining capital projects. Manitoba Hydro forecasts increased spending in the order of an additional $100 million annually over the next ten years and specifically $571 million in 2014/15 and $577 million in 2015/16. As a result of the increased level of spending, the utility is forecasting capital coverage ratios below 1.0 in six years of the 10-year forecast, which indicates that the utility will not generate sufficient revenues to fund its sustaining capital expenditures and must borrow in order to renew or replace existing infrastructure.

Risk Factors Identified by Manitoba Hydro

Manitoba Hydro's risk analysis was largely focused on three risk areas:

- Drought Risk, which reflects a five-year drought starting in 2016/17 that reduces net revenues by a total of $1.7 billion or a seven-year drought starting in 2016/17 that reduces net revenues by a total of $2.3 billion. Manitoba Hydro also indicated that a 15-year low-water scenario (e.g. 1929/30 to 1943/44) starting in 2016/17 would reduce net revenues by $4 billion.

- Infrastructure Failure Risk, wherein Manitoba Hydro has flagged an "unspecified" major facility failure outage resulting in a revenue reduction of $2 billion or more. Manitoba Hydro did not provide a specific project scenario that supports this value.

- Loss of Export Market Access, wherein Manitoba Hydro suggested that 30% of total revenues are at "risk". It is unclear whether this risk relates to current contract sales, future contract sales, or all export sales. Manitoba Hydro estimates that a loss of export market access could result in a revenue reduction of $200-300 million per year.

Another risk currently facing Manitoba Hydro is the pending finalization of the utility's Lake Winnipeg Regulation licence by the Clean Environment Commission. Manitoba Hydro indicated that if the Clean Environment Commission was to reduce the upper licence limit for Lake Winnipeg water levels from 715 feet to 714 feet, it could reduce Manitoba Hydro's retained earnings by $172 million by 2022.

Only MIPUG took issue with Manitoba Hydro's evaluation of drought risk, suggesting that Manitoba Hydro's use of 100 years of flow scenarios input to the SPLASH Model already account for the financial impact of historical droughts. MIPUG suggested a reduced level of retained earrings be employed and that the rate increases during the drought would avoid depletion of the retained earnings reserve.

Drought Reserves

Manitoba Hydro indicated that its current retained earnings are $2.7 billion and are forecast to fall to $2 billion by 2024. According to the utility, this level of retained earnings is just sufficient to absorb the $1.7 billion impact of a five-year drought. Historically, Manitoba Hydro has experienced drought situations in approximately 25 of the last 100 years.

The Board previously expressed concern with respect to the level of reserves to meet drought and other risks and stated as follows in Order 43/13:

> *The Board is concerned that, by moving towards a 90:10 debt-to-equity ratio by the end of the decade, there will be an insufficient retained earnings reserve to deal with droughts and other risks such as infrastructure failure or rising interest rates. The Board*

> *sees a need to further examine and quantify the other risks that Manitoba Hydro faces at the next General Rate Application and determine whether these should be subject to separate reserve provisions. The Board will require Manitoba Hydro to provide an analysis of risks on a quantitative and probabilistic basis at the next General Rate Application. [Order 43/13]*

Manitoba Hydro did not provide this analysis at this application, but requested KPMG to provide this analysis in conjunction with the review of Manitoba Hydro's financial targets.

MIPUG submitted that Manitoba Hydro's focus on keeping its equity at $1.7 billion or higher is misplaced, as the level is arbitrary in light of the current review of financial targets being undertaken by KPMG. MIPUG further suggested that the forecast level of retained earnings is also not reasonable in light of the current investment spending and the utility's historical track record of having an equity level of less than 10 percent for extended periods of time. According to MIPUG, the existing retained earnings level exceeds the estimated cost of a five-year drought throughout a period of intense capital spending pressures, providing an exceptional level of financial protection for Manitoba Hydro.

Board Findings

The Board notes that Manitoba Hydro's financial targets are not going to be fully achieved over the next 10 years of the 20-year forecast. The Board reiterates its concern expressed in Order 43/13 of the forecast deterioration in the utility's financial measures and notes that the current outlook contemplates a further deterioration from what was presented to the Board at the last GRA.

The Board recognizes that Manitoba Hydro's near-term drought risks are adequately reflected in the 5-year and 7-year drought net revenue reductions. However, it is questionable whether a retained earnings level of $2.5 billion is sufficient to also cover the loss of major infrastructure or loss of export market access. These additional risk consequences can be concurrent with low water or drought events. However, the

financial impacts of a temporary loss of infrastructure will be reduced when the Bipole III Transmission Reliability Project and Keeyask Generating Station come into service later this decade.

To the Board, it seems likely that the pending U.S. Environmental Protection Agency's Clean Energy Rule and the Clean Environment Commission's Lake Winnipeg Regulation licence constraints will be resolved within the next four to five years. At this time, the Board cannot anticipate whether they will impact Manitoba Hydro's financial position positively or negatively.

The Board reiterates its concern raised in Order 43/13 that the move towards a 90:10 debt-to-equity ratio by the end of the decade may not provide sufficient retained earnings reserves to deal with droughts and other risks faced by the utility. The Board's ruling in this Order should not be taken as a tacit acceptance of a 90:10 scenario. However, in light of KPMG currently examining Manitoba Hydro's risk and being scheduled to provide a comprehensive report later this year, the Board considers it premature to stray from Manitoba Hydro's existing plan. The Board notes that in setting rates, it has balanced consumer rates with improving Manitoba Hydro's financial strength and meeting the utility's internally established financial targets, including the 75:25 debt to equity target. In its Needs for and Alternatives To (NFAT) report, the Board supported a relaxation of Manitoba Hydro's 75:25 debt-to-equity ratio to moderate proposed rate increases.

The Board looks forward to reviewing the KPMG report, which will analyse the adequacy of reserves on a quantitative and qualitative probabilistic risk basis. Among other things, the Board expects this report will examine the Board's NFAT recommendation. The Board will reserve judgment on this very important issue until it has an opportunity to review the KPMG report with a fulsome public review of this issue at the next GRA.

9.0 Capital Expenditures

Issues

Major New Generation and Transmission

Manitoba Hydro is currently in the midst of an unprecedented capital investment campaign. After the Needs For and Alternatives To (NFAT) Review of Manitoba Hydro's Preferred Development Plan in 2014, the Board recommended that spending on the Conawapa Generating Station be discontinued. The Province of Manitoba adopted that recommendation, but allowed technical environmental studies and analyses required to preserve knowledge gained through extensive fieldwork and Aboriginal Traditional Knowledge (ATK) studies to continue. Manitoba Hydro also continues to invest in the Bipole III Reliability Project (Bipole III) as well as the Keeyask Generating Station.

Manitoba Hydro's IFF14 forecasts $25 billion of capital spending over the next 20 years, $12.6 billion of which relates to major new generation and transmission. $3.8 billion of electric assets are projected to be placed into service by 2017 and $20.1 billion between 2015 and 2024. In the medium term, it is this investment in new assets that drives the requirement for rate increases and higher revenue requirements over the next 20 years. The projects have been approved by the Province of Manitoba and received the requisite environmental licences.

By 2021/22, the annual in-service costs for the Major New Generation and Transmission projects will be $1.14 billion, consisting of revenue requirements for the Wuskwatim Generating Station, Bipole III, the Riel Converter Station, the Manitoba-Minnesota Transmission Project, Great Northern Transmission Line, the Keeyask Generating Station, and the write-off of expenditures with respect to the Conawapa Generating Station.

The Impact of Successive Cost Escalations

The impact of the various projects on Manitoba Hydro's revenue requirement is amplified by increases in the projected cost of those projects over successive capital expenditure forecasts. The following table illustrates how the projected capital costs have increased over the past eight years.

Progression of Capital Cost Estimates

	Capital Expenditure Forecast Year (CEF)								
($ millions)	CEF6	CEF7	CEF8	CEF9	CEF10	CEF11-2	CEF12	CEF13	CEF14

500 KV Dorsey U.S. Border	-	-	205	205	205	205	205	350	350
Total	**9,606**	**10,359**	**14,451**	**16,190**	**21,515**	**21,629**	**24,894**	**25,322**	**17,270**

The significant drop in the Capital Expenditure Forecast CEF-14 "total" amount is due to the removal of Conawapa. In CEF-14, the most significant jump is a $1.4 billion increase to the projected cost of Bipole III. Manitoba Hydro indicated that the increase reflects a change to the approved control budget. This will place significant upward pressure on domestic electricity rates, since there is virtually no export revenue associated with this transmission line to mitigate or offset such cost increases.

The projected cost of the Keeyask Generating Station also increased an additional $300 million but remains within the overall budget presented to the Board at the NFAT.

Since Bipole III was outside of the scope of the Board's NFAT Review into Manitoba Hydro's Preferred Development Plan, the Board has not been in a position to assess the economics of the project or the risk factors with respect to capital cost escalations. However, given the very significant projected cost increase of which the Board was advised in this hearing, the causes of the cost escalation were explored further.

Manitoba Hydro advised that the Bipole III cost increase is primarily attributable to a price increase related to the converter stations. Manitoba Hydro was initially optimistic that it could utilize lower-cost voltage-source conversion (VSC) technology in the Bipole III converter stations. However, while vendors initially indicated that the use of this technology was feasible, they ultimately were not prepared to design and provide VSC technology, resulting in a requirement for line-commutated converter (LCC) technology and synchronous condensers to meet performance requirements.

Manitoba Hydro advised that the three bids for High Voltage Direct Current (HVDC) conversion equipment closed on March 20, 2014. All bids were based on LCC technology. Manitoba Hydro completed its technical review of the proposals by June 20, 2014. The revised control budget was prepared in August of 2014 and approved by Manitoba Hydro's executive committee in August 2014. Manitoba Hydro indicated that it did not advise the Board of cost increases during the NFAT since it took several months to prepare the control budget.

Manitoba Hydro also currently includes a replacement of the Pointe du Bois Powerhouse in its Capital Expenditure Forecast, at a cost of $1.8 billion. Like Bipole III, this project was expressly excluded from the Board's NFAT mandate and review that took place last year. Accordingly, the economics of this project have not been independently reviewed to date.

Manitoba Hydro is also investing in the Manitoba/Minnesota Transmission Line and taking responsibility for the majority of the cost of the Great Northern Transmission Line in the United States. Starting in 2021/22, these projects will create an in-service revenue requirement of $115 million annually for Manitoba Hydro. The two projects will be used to facilitate 1,000 GWh per year of 5x16 (5 weekdays by 16 hours per day) dependable sales and 400 GWh per year of 2x16 (i.e. 16 hours on weekends) dependable sales to Minnesota Power. At this time, there are no other contracted export revenues to offset the in-service cost of these two transmission line projects, nor is there any indication that Manitoba Hydro will receive transmission tariff revenue.

The Consumer Coalition (Coalition) noted that the Board identified during the NFAT Review that the cost of Bipole III may have been understated and expressed disappointment that Manitoba Hydro was still pursuing a 3.95% rate increase despite development on Conawapa ceasing. The Coalition further noted that salary and benefits charged to capital projects are increasing at a rate of 7.6% per year and that Manitoba Hydro should be directed to demonstrate, for the review of 2016/17 rates, that the utility is implementing cost control measures with respect to its capital program. The Coalition also requested the Board to recommend to the Province that the Board receive authority to review and approve Manitoba Hydro's major capital projects.

The Coalition submitted that to the extent Manitoba Hydro is seeking gradual rate increases to avoid rate shock at the time the new major projects come into service, there is a difference between increasing rates to fund adequate reserves and increasing rates to fund projects that are not yet in service. The Coalition stated that it was not convinced that the Board had the authority to require current ratepayers to pay for future projects.

The Manitoba Industrial Power Users Group (MIPUG) questioned Manitoba Hydro's transparency with respect to capital costs, noting that since the NFAT Review last year, the parties have been presented with an additional $2 billion in capital costs. MIPUG submitted that a repeat of the Bipole III experience, with several successive rounds of

significant cost increases, must be avoided. In MIPUG's submission, the parties should move away from an adversarial information-gathering process with respect to capital cost estimates.

MIPUG also suggested that since a final decision as to whether to pursue the construction of Conawapa has not yet been made, and Manitoba Hydro is keeping open the option to revive the project, it would be inappropriate to include $19 million of Conawapa's amortization costs in 2016/17 rates as Manitoba Hydro is currently planning. If Conawapa is permanently stopped, MIPUG suggests extending the amortization of existing costs over 30 years.

MIPUG also expressed disappointment with Manitoba Hydro's current capital spending plan and submitted that there was a need for a stepped approach and adequate prioritization. In MIPUG's view, the capital savings associated with the discontinuance of Conawapa were replaced with other capital spending in only six months.

Sustaining Capital Expenditures

Sustaining capital (also known as "base capital") spending is used to replace and refurbish existing assets, extend the electrical distribution system to new customers, and to meet the load growth of existing customers. In 2013/14, Manitoba Hydro spent $470 million on sustaining capital. In CEF-14, Manitoba Hydro plans on increasing its sustaining capital spending by approximately $100 million annually to $570 million in 2014/15. This represents planned spending of $5.6 billion over the next ten years and $12.4 billion over the 20 year forecast period, which is a $1.8 billion increase in sustaining capital spending forecast in CEF-13. Manitoba Hydro justified this planned increase as being required to address system reliability issues, stating that much of the existing infrastructure was built decades ago and is nearing the end of its life span.

Manitoba Hydro attempts to fund all sustaining capital expenditures from cash flow, without taking on new debt to make such investments. Even with the additional planned spending during the 2014/15 and 2015/16 fiscal years, Manitoba Hydro will continue to

be able to fund such expenditures from cash flow. However, Manitoba Hydro states that in the absence of the proposed rate increases, Manitoba Hydro would be required to fund an increasing portion of its sustaining capital expenditures through debt financing as opposed to cash flow generated from operations. These rate increases reduce the need for borrowing and additional financing costs that must be borne by customers through rates.

Despite the fact that sustaining capital expenditures replace existing assets, any such investments are fully capitalized, which means they are depreciated over the expected life of the new asset. As such, the incremental effect on revenue requirement of the $100 million spending increase during 2015/16 is only approximately $4 million, and sustaining capital is not a significant driver of the 2015/16 rate increase.

Manitoba Hydro established the following sustaining capital expenditure budgets to 2020:

- $132 million per year for seven years for generation projects;
- $125 million per year for six years for transmission projects; and
- At least $206 million per year for six years for distribution projects.

In its prior capital expenditure forecasts (e.g. CEF-08), Manitoba Hydro provided details of individual capital projects over $1 million. Now, Manitoba Hydro provides a top-down budget for each of generation, transmission, and distribution and separately identifies only projects over $50 million. As a result, the number of specific projects identified in the CEF decreased from 98 in CEF-08 to 11 in CEF-14.

Manitoba Hydro's Asset Condition Assessment Process

In Board Order 116/08, the Board directed Manitoba Hydro to prepare an Asset Condition Assessment Report that set out the following:

(a) major assets and categories of assets;

(b) the estimated remaining economic life of each major asset and category of asset;

(c) an indication of the implications for operation, maintenance & administration (OM&A) costs related to required and scheduled maintenance;

(d) a listing of scheduled, planned or anticipated major upgrading/decommissioning of major assets and/or categories of assets;

(e) forecast expenditures for planned renovations and/or replacements with respect to now available energy supply and transmission; and

(f) Dam Safety Condition Assessment and Maintenance requirements.

In Order 150/08, the Board varied this Directive and set a timeframe for Manitoba Hydro to file terms of reference by June 30, 2009. No terms of reference were ever filed, and in Board Order 73/13, the Board directed Manitoba Hydro to file an Asset Condition Assessment Study no later than the filing of the next depreciation study.

Manitoba Hydro submits that the Asset Condition Assessment Study filed during the current hearing meets the Board's directive, and that the utility also prepared an in-house distribution asset study, a transmission asset study by Kinectrics, and an in-house generation asset study. It further indicated that Manitoba Hydro's view on the life expectancy of its distribution assets was primarily based on age for planning and forecasting purposes, but Manitoba Hydro makes the decision to replace or refurbish assets based on the internal staff views of the condition of the specific assets. Manitoba Hydro also advised that in 2010 it purchased an asset investment planning system called Copperleaf to assist it in planning and prioritizing expenditures.

The Coalition was critical of the distribution asset study filed as part of Manitoba Hydro's GRA and stated that Manitoba Hydro provided a 'pitch', not a 'plan'. In the Coalition's view, the Board has been asking for a plan since 2008 and the quality of capital

planning material filed is not appropriate for approving an increase in capital costs. According to the Coalition, both the Kinectrics report and the distribution asset study were available prior to CEF-13. Additional sustaining capital spending could have been included in CEF-13, yet Manitoba Hydro now insists that an additional $100 million annually is needed in CEF-14.

The Coalition suggested that the Board has not been provided with an adequate explanation of the capital spending optimization process, the types of alternatives considered, the reasons for significantly increasing distribution expenditures, and the anticipated performance outcomes. The Coalition provided information requirements mandated in other jurisdictions and suggested that such information might indicate different levels of required spending. The Coalition called the increases in distribution project spending individually desirable but collectively not sustainable. The Coalition also submitted that the spending increase with respect to buildings cannot be said to be linked to reliability and that the utility's asset planning report provides conclusions without sufficient supporting analysis. The Coalition requested that the Board find that it is unable to conclude whether the proposed magnitude of sustaining capital investment in 2014/15 and 2015/16 is prudent and direct Manitoba Hydro to provide a more robust asset health assessment and capital asset management strategy for the next General Rate Application (GRA).

The Coalition's submissions were largely mirrored by MIPUG, which suggested that Manitoba Hydro has not proved that it is adequately pacing and prioritizing its capital spending, and that existing asset conditions are good, with no urgent, short term replacement needs. MIPUG also argued that Manitoba Hydro's sustaining capital plan for generation assets is a placeholder, not an actual plan. In addition, since at the NFAT Manitoba Hydro alleged that it could safely maintain assets based on CEF-13 spending levels and the current spending levels fill some of the gap created by the discontinuance of Conawapa, the Board should view Manitoba Hydro's plan skeptically. MIPUG further

suggested that it might make sense to fund some of the replacement of long-lived assets through borrowing rather than from cash flow.

Board Findings

Manitoba Hydro's medium-term revenue requirements are primarily driven by major new generation and transmission assets, the cost of which will amount to two-thirds of Manitoba Hydro's $3.2 billion revenue requirement by 2021/22. This cost will be borne by Manitoba ratepayers, as available projected net export revenues in 2021/22 are estimated at $553 million, which roughly equates to the in-service requirements for the Pointe du Bois spillway, Demand-Side Management (DSM) expense, and the incremental sustaining capital requirements.

The Board reviewed Manitoba Hydro's Preferred Development Plan but not the Bipole III or Pointe du Bois at the NFAT Review last year due to a provincial directive as to the scope of that proceeding. The Board has no inherent jurisdiction to review and approve the costs and economics of Bipole III. The Board agrees with the Coalition's suggested recommendation to the Province of Manitoba for a change in legislation and that the Board should have approval authority relative to Manitoba Hydro's major capital projects. Between planning to spend $4.6 billion on Bipole III (which, in and of itself, will lead to an annual revenue requirement of $384 million in 2019/20) and $1.8 billion on the Pointe Du Bois powerhouse replacement, Manitoba Hydro is making very large capital investments without independent oversight. The utility is a provincially owned Crown corporation regulated on a cost of service basis, which means that any downside risk of these investments is borne by the ratepayers of Manitoba.

The Board shares the concern expressed by Interveners that updated capital cost information with respect to major new generation and transmission projects is not provided on a timely and transparent basis.

The Board is of the view that Manitoba Hydro knew or ought to have known prior to the conclusion of the NFAT that bidders were opting for the LCC converter technology

which Manitoba Hydro had priced at $2.48 billion in August of 2009 - $0.65 billion higher than Manitoba Hydro's March 2011 estimate for the converter contract(s). As such, there is information to suggest that the Bipole III cost estimate provided during the last GRA hearing was out of date and an updated budget should have been provided during the NFAT Review as opposed to a year later.

With respect to the Keeyask Generating Station, the Board is concerned that Manitoba Hydro's project costs are not updated annually and that contingency reserves and management reserves are not tracked separately in the capital cost justifications. A quarterly reporting process on each of the Keeyask contracts, identifying costs to date and an update of the project cost target for each contract, would allow potential problems to be identified earlier.

While the Board has never been asked to consider the economic viability of the Pointe du Bois powerhouse rebuild, the Board is skeptical of the economic viability of the project and recommends that a thorough cost-benefit analysis be performed and alternatives considered.

The Board also sees a need to monitor both the project costs and the revenues attributable to the Manitoba-Minnesota Transmission Project and the Great Northern Transmission Line.

Overall, the Board sees a need for Manitoba Hydro to file detailed quarterly reports for all Major New Generation and Transmission projects, including the ones currently under development. These reports are to outline the proposed budget (at time of contract), budget changes and reasons for such changes, and the revised projected in-service costs. Where capital costs have increased materially, Manitoba Hydro is to explain how such increases will impact domestic revenue requirements and projected impacts on Manitoba Hydro's financial forecasts and targets. These reports will allow the Board to identify capital cost overruns and the associated impact on revenue requirement in a timely manner.

As part of the quarterly reports, the Board should be provided with all capital cost justifications for Major New Generation and Transmission and other projects greater than $50 million approved by the appropriate Division Vice Presidents, even if such capital cost justifications are subsequently deferred by the Manitoba Hydro Electric Board or Manitoba Hydro's Executive Committee.

The Board accepts that Manitoba Hydro is faced with aging infrastructure and there may be a genuine need to expand sustaining capital expenditures. As such, for the 2014/15 and 2015/16 fiscal years, the Board accepts Manitoba Hydro's increased sustaining capital spending. However, the Board is not satisfied that Manitoba Hydro has adequately evaluated the long term pacing and prioritization requirements. The Board considers that top-down caps or placeholders are insufficient to justify increased spending in the future. As such, the Board's acceptance of the increased sustaining capital spending during this GRA should not be construed as an endorsement of Manitoba Hydro's long term sustaining capital plan.

To bridge what the Board considers to be an information gap, the Board expects Manitoba Hydro to file, by October 31, 2015, updated Terms of Reference and schedules for an Asset Condition Assessment. The schedules should contemplate completion of the Assessment in advance of the next GRA. In the Board's view, the Terms of Reference should, at minimum, include the items set out in Appendix G of this Order.

10.0 Load Forecast and Demand-Side Management

Issues

Load Forecast

Manitoba Hydro prepares an annual Load Forecast of domestic electricity consumption, the most recent of which was prepared in 2014. Manitoba Hydro forecasts growth over the next ten years in residential electric consumption of 1.4% per year and in the General Service (i.e., mass market commercial) sector of 1.7% per year. In prior years, General Service load growth tended to closely track Residential load growth. Manitoba Hydro is forecasting load growth for Top Consumers (the utility's largest customers, for whom consumption is forecast individually for the short term) of 2.8% per year for the next ten years, despite this sector experiencing essentially zero load growth over the past ten years.

By 2023/24, the gross firm energy forecast is 29,626 GWh and the gross total peak forecast is 5,400 MW, compared to the 2013/14 weather-adjusted actual load of 24,677 GWh and 4,587 MW.

These projected growth forecasts are lower than Manitoba Hydro forecasted at the Needs For and Alternatives To (NFAT) Review, where Manitoba Hydro forecasted gross firm energy of 30,491 GWh and a gross total peak of 5,498 MW by 2023/24. The following charts show the progression of load forecasts since 2012:

	Energy (GWh)				
	2012 Base Forecast	2013 Base Forecast	NFAT 2013 Update (with pipeline)	2014 Base Forecast	NFAT 2013- 2014 Difference

Notably, the weather-adjusted actual load in 2013/14 was 562 GWh lower than forecasted in the NFAT Updated forecast, while the forecasted load for 2014/15 is nearly the same in the NFAT Updated forecast and the 2014 Load Forecast.

The NFAT load forecast included expected growth in the Top Consumers sector attributed to increased pipeline load in the oil and gas sector. The reduction in the load forecast from the NFAT to 2014 was primarily attributed to the reduction in the expected pipeline load. The pipeline load initially forecasted by Manitoba Hydro at the NFAT was 1,700 GWh, which was reduced to 1,487 GWh by the end of the NFAT. According to Manitoba Hydro, this was further revised downwards in the 2014 Load Forecast to 655 GWh based on more current information obtained by Manitoba Hydro from the pipeline operators. Manitoba Hydro does not include an assessment of the load factor (as a percentage of the contract demand) in its load forecasting, nor does it forecast demand by customer or sector.

Also in the Top Consumers sector, Manitoba Hydro includes Potential Large Industrial Load (PLIL) of 91 GWh per year starting in Year 4 of the Load Forecast. The inclusion of PLIL recognizes that industrial load is not added gradually in the same way as residential or General Service load, but through infrequent, large increments. PLIL adds about 1,700 GWh to the 20 year forecast for the Top Consumers load.

Manitoba Hydro re-introduced a price elasticity variable into its Load Forecast to account for the fact that some customers have the option to switch from electricity to natural gas for space and water heating. The price elasticity variable reflects the ratio of gas rates to electricity rates. Manitoba Hydro hired an external consultant to review the price elasticity in its load forecast model, although the consultant's findings are not yet available.

Keeyask is expected to enter service in 2019 with full operation in 2020. The reduction in the domestic load forecast, specifically the pipeline load, coupled with the projected energy and capacity savings from Manitoba Hydro's Power Smart Plan, means that

energy from Keeyask is not needed to meet domestic load and existing export commitments until 2030/31. On a capacity basis, without Keeyask, Manitoba Hydro would need other capacity resources such as diversity exchanges in 2021/22 to address a capacity shortfall of approximately 50 to 150 MW. With Keeyask, new capacity resources are needed initially in 2033/34 but not on a persistent basis until 2037/38, while new energy resources are not needed until approximately 2038. This further highlights that there is no requirement for Conawapa or its associated expenses in the foreseeable future.

Conawapa's average annual energy output of 7,000 GWh would have an in-service cost of approximately 13 ¢/kWh. In 2029/30, Manitoba Hydro currently forecasts average unit export revenues of 9 ¢/kWh. In the Board's view, based on the large surplus of dependable generation from Keeyask and the more economical alternatives to supply new capacity, there is no evidence to support construction of Conawapa in the foreseeable future. Based on the current forecasts of export prices, Conawapa as a merchant plant does not seem viable.

Demand-Side Management

Demand-Side Management (DSM) is the reduction of the demand for electricity through targeted measures. While DSM reduces a utility's net income in the short term, it has the potential to defer or eliminate the need for new generation in the long term.

The Power Smart Plan is Manitoba Hydro's plan for DSM energy conservation and load management activities designed to lower the demand for both electricity and natural gas in Manitoba. In Accordance with *The Energy Savings Act*, Manitoba Hydro prepares a Power Smart Plan annually in cooperation with the provincial government. The most current Power Smart Plan for 2015/16 is a single year plan, in contrast with the previous two Power Smart Plans which are three year plans. For its long term internal planning purposes, Manitoba Hydro also prepares a 15 year supplement to the Power Smart Plan. Manitoba Hydro has not updated the supplement since 2014, but it has updated

its forecast of capital expenditures related to DSM. Compared to CEF-13, Manitoba Hydro has forecast increased spending on DSM of $900 million over the next 20 years, with an additional $500 million over the first ten years.

Manitoba Hydro forecasts increased energy savings along with the increased spending in each of 2014/15 and 2015/16, although the overall savings for 2015/16 year compared to those projected a year ago are significantly reduced. Energy savings targets have increased to 1,136 MW and 3,978 GWh (including savings resulting from changes to codes and standards) over 15 years, compared to the targets in the 2013-16 Power Smart Plan of 490 MW and 1,552 GWh. The 3,978 GWh of energy savings represents 12.7% of the base load forecast for 2028/29. In 2015/16, the utility intends to spend $63.4 million to achieve 217 GWh of savings at the customer meter.

Manitoba Hydro's DSM priorities include lower income, Aboriginal, and Northern community customers, as well as customers that were previously excluded from Power Smart programs because they were in arrears. For industrial customers, Manitoba Hydro is focusing on load displacement measures, which are typically onsite generation facilities. In Aboriginal communities that do not have access to natural gas, Manitoba Hydro is promoting community geothermal programs implemented by AKI Energy, a third party organization to which Manitoba Hydro supplies funding. AKI Energy trains First Nation members to install the geothermal systems, and has installed 177 geothermal systems to date in four First Nation communities.

The Consumer Coalition (Coalition) supported DSM as one of only a few tools customers have to mitigate the impacts of increasing rates. The Coalition did not support cutting back on DSM as part of the pacing and prioritization that it recommends Manitoba Hydro undertake with respect to its other capital programs, but it did suggest that Manitoba Hydro consider amortizing the cost of DSM over a longer period than the current ten years to mitigate rate impacts. MIPUG recommends DSM programs be amortized over the life of the benefits realized from each measure, not at an arbitrary ten years.

The Manitoba Industrial Power Users Group (MIPUG) questioned whether it made sense to aggressively invest in DSM at the same time as constructing Keeyask, recognizing that Keeyask's output will primarily be sold as opportunity exports at depressed prices in the near future. MIPUG characterized this as spending money on DSM in order to lose money on export sales.

Natural gas is currently a more efficient and economical fuel choice for space and water heating, with the cost of heating with gas approximately half that of electricity. Manitoba Hydro educates consumers on the benefits of natural gas through its Heating Fuel Choice Initiatives, which are educational and advertising programs. Natural gas is only available in Southern Manitoba, and not to all rural communities, although Manitoba Hydro stated it had a submitted an application to Natural Resources Canada for funding of a gas pipeline extension to The Pas.

The Manitoba Metis Federation (MMF) recommended that DSM efforts be expanded to assist lower income customers in Northern and rural communities that do not have access to natural gas and thus incur higher bills due to use of electricity for heating. Such programs could include incentives for air source heat pumps, appliance replacements, and fuel switching opportunities. Education and incentives should be provided to home builders to encourage construction of homes with natural gas heating.

Manitoba Keewatinowi Okimakanak Inc. (MKO) recommended implementation, over the next two years, of First Nations DSM programs that provide equivalent bill savings to customers as would be available if those customers were to switch to natural gas for space and water heating.

Manitoba Hydro noted that geothermal heating is the only technology that has the potential for energy bill savings comparable with switching from electric to natural gas heating. However, geothermal heating does not lower the overall cost to the customer because the high cost of financing the installation. Manitoba Hydro stated that the payback period on geothermal installations is typically in the order of 25 years.

The Green Action Centre (GAC) and MIPUG recommended that, contrary to the Board's NFAT recommendation, Manitoba Hydro should retain control over DSM instead of creating a new, external entity to deliver DSM programs. According to GAC, removing responsibility for DSM from Manitoba Hydro will have a disruptive effect and there is a risk that Manitoba Hydro's DSM expertise will not adequately be replicated in the external entity.

At the 2012/13 GRA, Manitoba Hydro initially presented its 2011 Power Smart Plan. It then presented a revised 2013-16 Power Smart Plan with reduced forecasts of spending on DSM programs. The Board ordered a DSM deferral account to be established which captured any deficiencies in spending compared to the minimum spending levels in 2012/13 and 2013/14, which the Board set at the levels forecasted in the 2011 Power Smart Plan. In 2012/13 and 2013/14, Manitoba Hydro underspent the targets by a total of $16.3 million. Accordingly, this amount accrued to the DSM deferral account.

Manitoba Hydro applied to have the DSM deferral account rescinded for 2014/15 and future years, citing the increased DSM budgets and savings forecasts in its revised Power Smart Plan and Supplement compared to the 2013-16 Power Smart Plan. MMF supported the continuation of the deferral account, using the 2015/16 spending target in the 2015 Power Smart Plan.

In the 2014-17 15-year Power Smart Plan supplement filed during the NFAT Review, Manitoba Hydro planned to spend $52.3 million in 2014/15. Actual spending levels fell short of this goal by $19 million. Manitoba Hydro attributed this primarily to a temporary delay in the implementation of several programs but expressed optimism about meeting its expanded 2015/16 spending target.

In its NFAT report, the Board recommended the Province of Manitoba mandate incremental annual DSM savings targets in the order of 1.5% of domestic electricity sales. Manitoba Hydro presented a forecast of energy savings that meets or

approaches this target in the years 2016/17 through 2020/21, but then the forecasted savings diminish over time to 0.4% per year. At this time, there is no legislation in place to mandate specific DSM targets, although the Board notes that pursuant to *The Energy Savings Act*, the Province of Manitoba reviews and approves Manitoba Hydro's Power Smart Plans.

Affordable Energy Program

On several past occasions, the Board expressed concerns about the effect of continued rate increases on lower income customers. Manitoba Hydro's Affordable Energy Program (AEP) provides DSM measures to lower income residential customers to help them to offset some of the rate increases through energy efficiency measures. Eligibility is based on the Statistics Canada Low Income Cutoff (LICO) measure, which is based on the number of persons in a household and the size of the community. Until 2014, Manitoba Hydro used 125% of the LICO for each respective community size. In 2014, Manitoba Hydro changed the eligibility criterion across Manitoba to use Winnipeg LICO-125, which extends the program eligibility to more customers in rural areas by setting the income thresholds at higher levels.

Manitoba Hydro has 115,000 lower income customers, excluding customers in apartments, as defined by Winnipeg LICO-125 that are the targets of the AEP. Approximately 11,000 households have participated in the AEP to date. Manitoba Hydro expects 45,500 households to participate by 2028/29. Manitoba Hydro also recently extended eligibility of the AEP to private landlords who commit to having lower income tenants for at least one year.

The energy efficiency measures available under the AEP include water saving and weatherization measures, energy efficient lighting, and improved insulation. These measures are all free to the occupant. If a home has a low-efficiency natural gas furnace, it is eligible to be replaced with a high efficiency furnace at a cost to the occupant of $9.50 per month for five years.

At the NFAT, the Board heard that customers in arrears were not eligible for Power Smart programs, including the AEP, unless they had made and were current with alternative payment arrangements. The Board concluded that the exclusion of customers in arrears from Power Smart programs precluded those that are most in need of these programs from receiving their benefits and that Manitoba Hydro should immediately address this exclusion. Following the NFAT, Manitoba Hydro removed the requirement that customers in arrears must be current in their pay arrangements to access the AEP.

In its NFAT report, the Board was of the view that an independent evaluation of the DSM program performance was important. Manitoba Hydro undertook a third-party evaluation of its AEP by Dunsky Energy Consulting and Summerhill Group. This evaluation concluded that the AEP was “well managed”, was “achieving strong results”, used “best practices”, and that “results [participation rates and savings] are strong”. Shortcomings identified include Manitoba Hydro relying on estimates of energy savings instead of verifying actual energy savings, and that there were not many measures for electrically heated homes. Dunsky and Summerhill recommended making the AEP mandatory if and when emergency bill assistance (the Neighbours Helping Neighbours program) is received as well as adding measures for electrically heated homes.

The Coalition noted Manitoba Hydro has made progress with its AEP since 2013 but would still like to see a faster implementation pace. The Coalition, MMF, and MKO see a gap in measures available to rural electrically-heated homes because, if gas is not available, there are no measures available under the AEP to reduce bills to the same extent.

The MMF recommends that Manitoba Hydro hire an engineering contractor to conduct a physical survey of insulation levels in homes to assess the quality of existing insulation levels. The MMF also recommends that Manitoba Hydro enhance its efforts to increase the pace of the program, consider the cost effectiveness of an appliance replacement program, and implement a cold climate air source heat pump pilot project in the AEP.

Board Findings

Load Forecast

The Board learned that expected domestic demand stemming from the increased pipeline load has been revised downward, further delaying the need for new generation after the completion of Keeyask. Manitoba Hydro forecasts that it will have an even greater surplus of electricity that it can export, due to the decreased domestic demand. The Board previously recommended to the Province of Manitoba that the Conawapa project and the North-South Transmission Upgrade Project be discontinued, and the forecasted reduction in future load further supports this recommendation. With the reduction in the load forecast, Keeyask will primarily be serving the export market until 2030 and new generation after Keeyask would not be needed for domestic demand until approximately 2038. The reduction in the load forecast further highlights that there is no requirement for Conawapa in the foreseeable future, as once Keeyask is built, no additional energy will be required for two decades.

The Board welcomes the external review of the price elasticities re-introduced into the 2014 Load Forecast. Continued growth in the saturation of electric space and water heating appears inconsistent with escalating electricity rates and stable natural gas prices. Appropriate price elasticities in the Load Forecast model should result in more accurate forecasts as consumers respond to the increasing price advantage natural gas is expected to have over electricity for space and water heating.

There is evidence that Manitoba Hydro consistently over-estimates the Top Consumers load growth. The first year of each load forecast for the past five years over-estimated the Top Consumers load in the greater-than-100 kV sub-class. The Potential Large Industrial Load (“PLIL”) does not recognize the last ten years of near-zero load growth in the Top Consumers sector, or that using PLIL in addition to large pipeline load additions overlaps in some years and may be double-counting. The Board sees Manitoba Hydro's PLIL as an inappropriate upward adjustment that does not reflect the

recent Top Consumers load growth history. The Board recommends that Manitoba Hydro take a more rigorous approach to forecasting the Top Consumers load.

Demand-Side Management

The Board reiterates its view from Order 43/13 that Manitoba Hydro should be providing ratepayers with the tools to mitigate their exposure to rising electricity rates through DSM. The Board supports Manitoba Hydro's DSM priorities as these were the same priorities articulated by the Board in its NFAT report. While DSM reduces revenue in the short term, DSM has the potential to push back or eliminate the need for new generation in the long term.

The Board heard that Manitoba Hydro underspent its 2014/15 Demand-Side Management target of $52.3 million by $19 million. Manitoba Hydro explained that a number of projects were delayed or deferred, including $5.5 million that was expected to be spent to upgrade Area and Roadway Lighting to energy efficient light-emitting diodes (LEDs). The Board recognizes that in some instances, delays to DSM initiatives are beyond Manitoba Hydro's control, but that further reinforces the need for the deferral account. Accordingly, the Board denies Manitoba Hydro's application to rescind the DSM deferral account.

The Board wants to be sure that Manitoba Hydro has the necessary funding for any DSM programs that are delayed to a future year. In the case of the $19 million of projects that were not implemented in 2014/15, Manitoba Hydro is to record this amount in, and can draw on the funds in, the DSM deferral account to implement those projects in 2015/16, without affecting the available funds for any projects previously planned for 2015/16. As such, in setting rates for 2014/15, the Board will order the $19 million to be placed in a deferral account, and will direct the accrued amount from 2012/13 and 2013/14 to remain in the account.

In setting rates for 2015/16, the Board sets the DSM spending target at the forecast spending level in the 2015/16 Power Smart Plan of $63.4 million, inclusive of

contributions from the Affordable Energy Fund. The accrued amounts in the DSM deferral account can be used to cover any spending increase above the planned $63.4 million in 2015/16.

At this time, the Board will continue the amortization of DSM capital expenditures over ten years.

Affordable Energy Program

The Board continues to support the AEP, including the increased budget of $9.4 million for 2015/16, compared to the previous budget of $7.3 million. The Board notes, however, that these amounts include spending on natural gas matters, and are not solely devoted to electric DSM.

The Board heard that Manitoba Hydro no longer excludes customers in arrears from participating in the AEP, which the Board applauds. The Board is pleased with the progress made by Manitoba Hydro in reaching out to First Nations communities with AKI Energy community geothermal projects as well as with the AEP.

The Board recommends to the Consumer Coalition, the Green Action Centre, the Manitoba Métis Federation and Manitoba Keewatinowi Okimakanak that these interveners encourage their members to take advantage of potential savings that can be generated by the AEP. The Board is encouraged by Manitoba Hydro's increased efforts to identify customers eligible for the AEP, and believes that these interveners may have valuable additional information to contribute.

11.0 Power Resource Plan

Issues

Manitoba Hydro annually prepares a Power Resource Plan that identifies the domestic load and export commitments as well as the generation and import resources to meet the expected load.

According to the 2014/15 Power Resource Plan, new generation resources are not needed until 2033/34 due to a shortage of winter generation capacity, with persistent capacity shortages starting in 2037/38. A shortfall in dependable energy does not occur until 2038/39. Therefore, the earliest post-Keeyask date that new resources are needed is 2033/34. Manitoba Hydro currently assumes that single cycle combustion turbines will be installed beginning in 2037/38, although that new generation is not the only option. Other options available to address capacity shortfalls could include:

- capacity from a modified Curtailable Rate Program that includes long term commitments from industrial customers, although Manitoba Hydro stated that it is not interested in contracting for additional capacity through the Curtailable Rate Program now when that additional capacity is not needed for 15 years;

- extension of existing diversity exchange agreements with utilities in the United States. Manitoba Hydro currently has 550 MW of diversity exchange agreements with Great River Energy and Northern States Power;

- contracted imports from the United States, especially considering the additional 700 MW of import capacity provided by the Manitoba-Minnesota Transmission Project;

- advancing combined cycle combustion turbines by several years to provide 200-300 MW of capacity as well as a more economical supply of energy than a single cycle combustion turbine; and

- capacity inputs to Manitoba Hydro's grid from self-generation by customers.

Manitoba Hydro undertakes periodic maintenance and repair of its hydraulic generating stations. Hydraulic generation outages over the last five years averaged approximately 2.5% of total generation, or about 100 MW per year. These outages primarily relate to four generating stations that are not on the Lower Nelson River. These maintenance outages may be accounted for in the Power Resource Plan under winter capacity reserves, but do not appear to be included in the dependable energy calculations.

More hydraulic generator drive-train units are approaching replacements in the next 5-15 years. In the longer term, Manitoba Hydro indicated that it plans to replace all 32 Lower Nelson drive-train units within next 14 to 49 years with an average generator size of 98 to 135 MW. This will result in significant capacity outages while generators and turbines are replaced or refurbished.

Typically, Manitoba Hydro expects these outages to last about two years for each unit. This suggests that two units will be out of service every year for 35 years, with a corresponding outage rate of 200 MW per year or 5% of total generation. These outages would be in addition to ongoing outages of generating units on the Winnipeg River, Saskatchewan River, and Upper Nelson River, resulting in total outages of 7.5% or 300 MW per year.

It does not appear that the pending major outages of generation on the Lower Nelson are reflected in either IFF14 as a reduction in export revenue or in CEF-14 as a capital cost.

Board Findings

The Board notes that new post-Keeyask generation is not needed until 2033/34 at the earliest or 2037/38 with the addition of new capacity resources, such as the extension of existing diversity exchange agreements or an expansion of the Curtailable Rate Program.

At the NFAT, the Board heard that a major benefit of the Manitoba-Minnesota Transmission Project was enhanced intertie transmission capacity and the ability to access more capacity and energy resources from the United States. The 2014 Power Resource Plan does not recognize this resource and the 700 MW of additional available import capacity.

The Board notes that Manitoba Hydro's existing hydraulic generation refurbishment and replacement program does not appear to have been integrated into either the 2014 Power Resource Plan or defined in the CEF14 sustaining capital requirements.

12.0 Export Markets

Issues

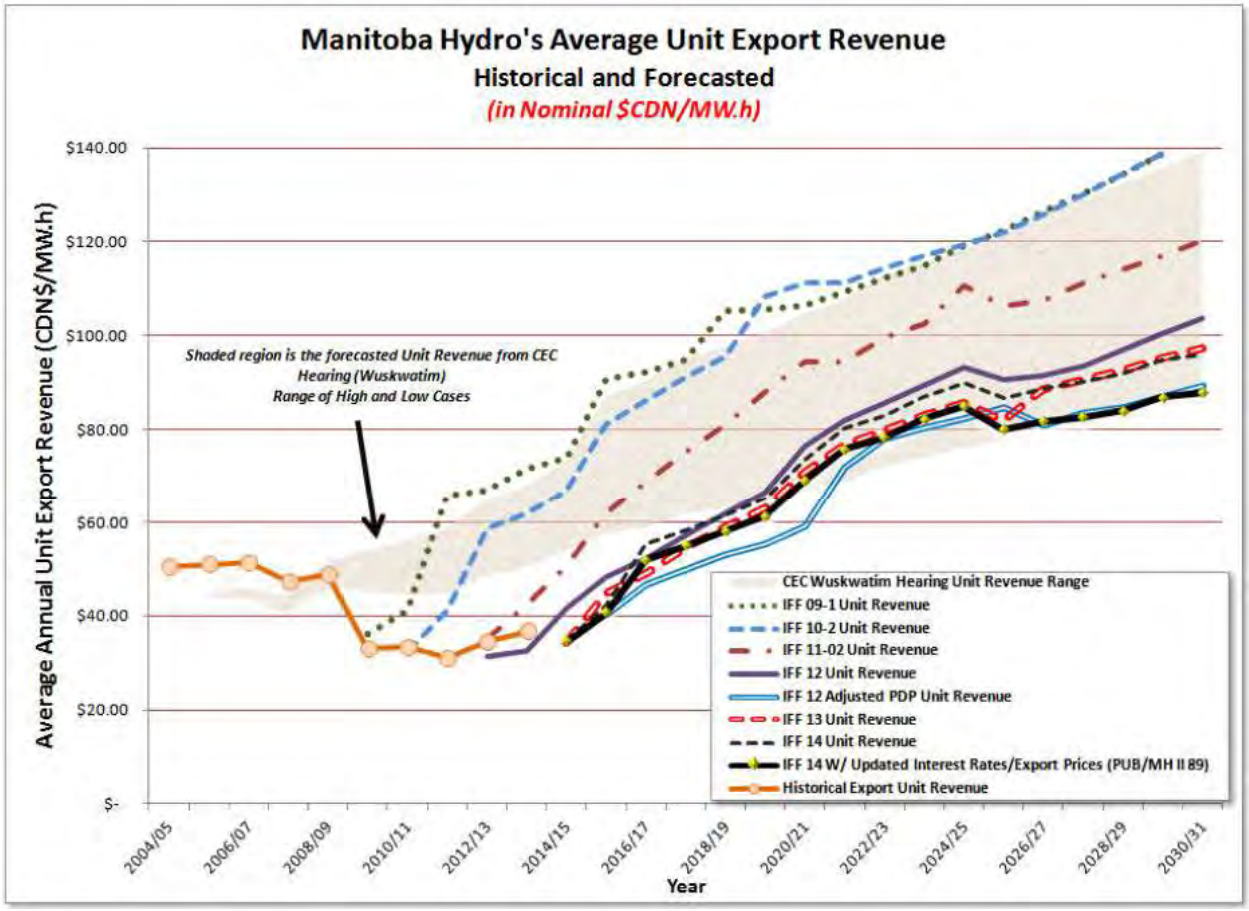
Manitoba Hydro exports electricity, primarily to the United States, by way of long term fixed price contracts with U.S. utilities and also by way of opportunity sales into the Midcontinent Independent System Operator (MISO) market. The opportunity sales are made during either 'On-Peak' hours or 'Off-Peak' hours. Typically, the volumes of electricity sold on the opportunity market greatly exceed the volumes of electricity sold pursuant to long term fixed-price contracts, as the latter sales are made from 'dependable' resources whereas opportunity sales are made from surplus hydraulic generation in years when water flows are above minimum flows.

Since 2008/09, Manitoba Hydro has been competing with natural gas-fueled electricity generation, such as combined cycle combustion turbine (CCCT) generators, for peak MISO opportunity market share. The on-peak market price has been 3.0 to 4.5 ¢/kWh, while off-peak market prices have averaged about 2.5 ¢/kWh.

Over the past seven years, export prices have not materialized as planned, with prices significantly decreasing around the time of the 2008 recession. This has placed, and continues to place, upward pressure on domestic rates, as any revenue that cannot be obtained from exports must be obtained from domestic ratepayers. However, the overall impact on rates has been somewhat mitigated by many years of higher-than-average water flows, allowing Manitoba Hydro to generate and sell more energy into the export market.

Manitoba Hydro's 2014 export pricing projections do not assume any additional value attributable to carbon dioxide (CO_2) through 2019/20 and, combined with continued low natural gas prices, may signal opportunity market prices remaining below 4 ¢/kWh.

Manitoba Hydro obtains forecasts from five independent forecasters to prepare its own forecast. Manitoba Hydro's export price update in IFF14 shows average prices down



7% over the next 20 years, compared to the prior forecast based on the suite of Manitoba Hydro's independent consultants' price forecasts.

Manitoba Hydro's update to IFF14 suggests net export revenues will decline a further $276 million in the next 10 years and $838 million over the next 20 years, which is an approximate further decline in export revenues of 5%.

Manitoba Hydro is awaiting clarification of the U.S. Environmental Protection Agency's (EPA) Clean Power Rule which is expected in the summer of 2015. This EPA Rule may provide some clarity to the expected reduction in coal generation which may be replaced by natural gas-fired combined-cycle combustion turbines (CCCTs), wind generation, and solar generation. Until the final Rule is released, the future role of Manitoba Hydro exports into the U.S. is unclear as is the value of future export contract opportunities.

The graph below illustrates the history of Manitoba Hydro's average unit export revenues and export forecast projections. Since IFF09-1, when Manitoba Hydro signed most of its term sheets, the average unit revenue forecasts circa 2024/25 have trended downward about 33% from $120/MWh to $80/MWh. Actual average unit revenues since 2008/09 have been below $40/MWh.

Average Unit Export Revenue Forecasts

Interveners also commented on the adverse export price declines in the successive Manitoba Hydro forecasts. The Consumer Coalition (Coalition) noted that since Manitoba Hydro provided IFF10-2, the value of the export revenues declined approximately $3.9 billion and this decline places stress on domestic ratepayers to fund Manitoba Hydro's operating revenue shortfall through rate increases.

The Coalition submitted that Manitoba Hydro's export price forecasts are 'perpetually too high', such that the Board should have little confidence in them when setting rates. The Coalition suggested that the strengthening U.S. economy, coupled with the weakening of the Canadian dollar, could change the export pricing paradigm.

Board Findings

The Board is concerned that successive Manitoba Hydro export price forecasts have been revised downward and consistently overestimate actual results. That trend continues since, according to IFF14, Manitoba Hydro expects a further price decline which will negatively impact the business case for Manitoba Hydro's new investments in generation and transmission.

The Board notes that Manitoba Hydro's latest export price and export revenue forecasts still appear to increase annually due to assumed, but uncertain, increasing natural gas prices.

The Midcontinent Independent System Operator (MISO) market that Manitoba Hydro exports into has changed since 2008 when Manitoba Hydro signed term sheets with Northern States Power and Minnesota Power. The Board anticipates that new contracts for firm export sales may not achieve prices that are as attractive as those agreed to by Northern States Power and Minnesota Power in 2008.

The Board notes that Manitoba Hydro's future exports into the United States are highly dependent on evolving United States Environmental Protection Agency (EPA) rules on carbon dioxide (CO_2) emissions reductions. These future export sales will be competing with new wind, solar, and natural gas-fired combined cycle combustion turbine generation. Manitoba Hydro's hydraulically generated energy is not assured of favourable treatment under the EPA Clean Power Rule as are other United States-based renewable energy resources.

In the Board's view, Manitoba Hydro's export price and export revenue forecast will be affected by the pending EPA Rule, the cost of natural gas-fired generation in MISO, the subsidies provided to other renewable energy generation options, and the access to additional markets through increased peak period intertie transmission capacity.

13.0 Special Rates

Curtailable Rate Program

Manitoba Hydro's Curtailable Rate Program (CRP) allows Manitoba Hydro to curtail a portion of participating industrial customers' peak load in exchange for reduced rates on the same portion of the load when not curtailed. The program currently has three customers, only two of which received any credits in 2013/14. Manitoba Hydro stated that the value of short term capacity in the MISO market has greatly diminished, and because the capacity is contracted on an annual basis, it is not included as a capacity resource in the utility's Power Resource Plan. Manitoba Hydro indicated that, to date, it has not considered entering into multi-year contracts to allow the program to be used as a capacity resource in future planning.

Manitoba Hydro seeks to reduce the amount of Option A and Option R loads available to customers, while eliminating options C and CE entirely and making changes to the terms and conditions imposed on participating customers. According to Manitoba Hydro, this would not affect the current operations of existing customers.

The Manitoba Industrial Power Users Group (MIPUG) was critical of the plan to cap the program and suggested that Manitoba Hydro should take a long term view and consider multi-year contracts, stating that the CRP currently represents 23% of the capacity savings in the Power Smart Plan.

Board Findings

The Board accepts Manitoba Hydro's explanation that, at the present time, the value of the CRP is diminished and notes that new long term capacity resources in Manitoba, once Keeyask is constructed, will not be required until 2033/34. As such, while the Board believes that there may be merit in MIPUG's suggestion that an expanded CRP with long term contracts could provide capacity benefits, it is premature at this time to expand the program. The Board therefore approves the finalization of Manitoba Hydro's proposed changes to the CRP, including the proposed cap.

Surplus Energy Program (SEP)

The Surplus Energy Program (SEP) is a system by which Manitoba Hydro prices electricity generated in excess of its immediate requirements and then sells it based on a pricing mechanism approved by the Board. The pricing of the SEP energy is established to approximate the price offered by Manitoba Hydro to export sales customers on the opportunity market or, in the case where the utility expects to import power, at a price reflective of Manitoba Hydro's cost with a 10% surcharge.

Board Findings

In Order 43/13, the Board approved several changes to the SEP on an interim basis, to be reviewed at the Cost of Service proceeding. With a Cost of Service hearing expected to take place prior to the next General Rate Application (GRA), the Board will keep those changes approved on an interim basis and not finalize them at this time.

The Board approves SEP rates on a weekly basis by way of interim orders that Manitoba Hydro seeks to finalize in this proceeding. In this Order, the Board approves the finalization of all interim SEP Orders since the issuance of Order 43/13.

The Board notes that Manitoba Hydro has undertaken to provide enhanced quarterly SEP reporting upon formal direction of the Board. The Board will therefore direct Manitoba Hydro to set out, in each quarterly report, the National Energy Board pricing and other factors that have influenced prices over the past quarter.

Time of Use (TOU) Rates

In its GRA, Manitoba Hydro applied for the approval of Time of Use (TOU) rates effective April 1, 2016. However, the Board determined that TOU rates would be addressed as part of the upcoming Cost of Service hearing rather than the GRA. As such, the matter was not explored and the Board makes no findings on TOU rates in this Order.

Area and Roadway Lighting Rates

Manitoba Hydro's annual billings for Area and Roadway Lighting are approximately $23 million, approximately half of which is for service to the City of Winnipeg. Area and roadway lighting is not metered – rather, a flat rate is charged for each type of luminaire. The City of Winnipeg was critical of what it perceived to be a lack of data as to the actual luminaires based on which the City of Winnipeg is billed. Manitoba Hydro indicated that its data are improving due to the use of a geographic information system (GIS), and that the utility relies on data provided by the City of Winnipeg at the time Manitoba Hydro acquired Winnipeg Hydro.

Manitoba Hydro indicated that it is currently involved in a seven-year project to replace existing Area and Roadway Lighting with light-emitting diode (LED) luminaires, and seeks final approval of the LED rates. Manitoba Hydro derived the proposed LED rates by determining the annual kilowatt hour savings expected to be achieved by converting from high-pressure sodium (HPS) lighting to LED. Manitoba Hydro then determined the monthly cost savings using the Area and Roadway Lighting energy charge from Manitoba Hydro's 2013 Prospective Cost of Service Study (PCOSS13) updated to reflect the actual and proposed rate increases. The monthly cost savings were then deducted from the proposed April 1, 2015 HPS rates to determine the proposed LED rates.

While the City of Winnipeg did not object to the LED conversion program, which will reduce rates per luminaire, it expressed concern about Manitoba Hydro intending to wait until completion of the program to prepare another Area and Roadway Lighting-specific cost of service study. The City of Winnipeg noted that the most recent study is already over 25 years old and there is no guarantee that the LED conversion program will be completed on schedule. Manitoba Hydro suggested that the LED conversion program should run its course before another Area and Roadway Lighting-specific cost of service study is prepared.

Board Findings

The Board agrees with the City of Winnipeg's submission that there are deficient data on which the City is being billed almost $12 million per year. The Board was provided with insufficient evidence to determine whether the lack of data is due to the state of Winnipeg Hydro's records at the time of sale or the historical state of Manitoba Hydro's own records, but notes that technology now exists to significantly improve data, as evidenced by Manitoba Hydro's GIS system. Nonetheless, no conclusive evidence was presented as to whether there are actual errors in the City of Winnipeg's bills and, unless such errors are proven, the Board has no reason to doubt that Manitoba Hydro's bills are fair and reasonable.

The Board will direct Manitoba Hydro to, by December 31, 2015, file with the Board a five-year plan to complete the City of Winnipeg's luminaire GIS mapping.

The Board shares the City of Winnipeg's concern about the most recent Area and Roadway Lighting-specific cost of service study now being over 25 years old. However, in light of most HPS lighting being replaced over the next six years, the Board cannot justify an Area and Roadway Lighting-specific cost of service study at this time. The Board notes that the overall cost allocated to the Area and Roadway Lighting class will be reviewed at the upcoming Cost of Service hearing, while the City of Winnipeg's bills for the Area and Roadway Lighting class are expected to be reduced as the conversion program proceeds. In the Board's view, an Area and Roadway Lighting-specific cost of service review should take place upon the completion of the LED conversion program. Since the timeframe for the completion of this program is not yet certain, the Board will not schedule such a review at this time. However, the Board expects to be apprised of the LED conversion progress at each GRA hearing.

14.0 Presenter Submissions

The following parties made presentations to the Board in respect of this proceeding. Presentations are not sworn evidence and do not form part of the evidentiary record.

Allan Ciekiewicz

Mr. Allan Ciekiewicz indicated that while the current proceeding does not discuss inverted rates, any future proceeding on inverted rates must address the all-electric customer without an alternative source of heating. He also expressed his concern about the implications on having to supply pipeline projects with electricity during a drought. He submitted that the $1.4 billion already spent on Keeyask would have been better spent on efficient gas turbine generators, that the existing plan is subject to drought risk, and that Manitoba Hydro should focus on domestic needs first.

Mike Velie – International Brotherhood of Electrical Workers

Mr. Mike Velie presented on behalf of the International Brotherhood of Electrical Workers (IBEW), Local 2034, which represents 2,849 employees of Manitoba Hydro. IBEW supports Manitoba Hydro's rate application, stating that otherwise there would be an impact to safe and reliable service. As an example, Mr. Velie provided a freeze on training and a migration of workers to other employers and provinces. According to Mr. Velie, financial constraints led Manitoba Hydro to fall into a deficit position with respect to asset maintenance and 40% of substations are operating above their limitations. He submitted that outside contractors do not have the same level of understanding of the utility's operations, nor the same commitment as Manitoba Hydro employees, and provided an example in which a decision to save on protective equipment injured an employee. Mr. Velie identified the planned reduction in the workforce as a false economy if quality would suffer as a result.

Albertine Spence

Ms. Albertine Spence stated that the communities along the Nelson River are significantly impacted by hydroelectric development, and that these communities have approximately $6.4 million in arrears. She stated that her Manitoba Hydro bill for a trailer has been between $327 and $437 a month when her annual income was less than $32,000. She indicated that she moved to Winnipeg in December 2014 but still receives billings from Tataskweyak Cree Nation, referencing creative accounting and the need for an audit. She also described some of the hardships faced by people in the communities due to electricity bills, and suggested that low-income earners should pay reduced rates.

Dave Mouland

Mr. Dave Mouland with Winnipeg Harvest spoke to the effect of continued rate increases on people living in poverty, stating that the budgets of those living on poverty do not go up by 3.95% every year. Even if utilities are paid through EIA, costs are still indirectly passed on through higher food prices. He also submitted that every major project drives Manitoba Hydro deeper into debt, while little is done to renew existing infrastructure.

Bill Turner (MIPUG) and Dale Bossons (Canexus)

Messrs Bill Turner and Dale Bossons, the chair and co-chair of MIPUG, spoke to the impact of rate increases on industrial consumers. They expressed concern about Manitoba Hydro's proposal to introduce caps on the Curtailable Rate Program (CRP), stating that companies such as Canexus have invested significantly to avail themselves of the program. They also stated that companies in the U.S. can alter their loads to capture the benefits of daily or seasonal energy price fluctuations. According to MIPUG, Manitoba used to be among the lowest-cost jurisdictions, but no longer is at this time. MIPUG also expressed concern regarding industrial DSM being removed from Manitoba Hydro, stating that the utility has the in-depth knowledge and longstanding relationships with industry required for these programs. Lastly, MIPUG expressed surprise that even

with Manitoba Hydro no longer pursuing Conawapa, the utility continues to request 3.95% rate increases, stating that industry could not survive with another decade of such rate increases. Mr. Bosson's added that a 3.95% rate increase represents an additional $2.5 million cost increase to Canexus per year.

Pam Pugh

Ms. Pam Pugh farms west of Portage la Prairie and will have the Bipole III transmission line cross her land. She spoke to security issues with respect to the line, stating farmers do not want to be liable for coming into contact with electric poles, and submitted that the line should be routed underground.

Garland Laliberte and Dennis Woodford – Bipole III Coalition

Messrs Garland Laliberte and Dennis Woodford spoke on behalf of the Bipole III Coalition. They addressed the changing ways in which we use electricity and spoke to the development of microgrids in the U.S. and Europe. They also submitted that once solar grid parity is achieved, it would be reasonable for residential customers to generate with solar power. With respect to the Bipole III transmission line, Mr. Woodford stated that if the Bipole III converters already purchased would be connected to the Bipole I and II transmission lines, there would be sufficient capacity for Keeyask. The Coalition also questioned Manitoba Hydro's case for the reliability need for the Bipole III Transmission Reliability Project, stating that Manitoba Hydro's assumption that a failure of the two existing lines could occur once every 17 years is incorrect, and such a failure would occur only once in 90 years.

Manitoba Hydro

Manitoba Hydro offered to provide, and the Board accepted to hear, a presentation by Manitoba Hydro in response to the presentation made by the Bipole III Coalition. Like the other presentations received by the Board, Manitoba Hydro's presentation was not received as sworn evidence and as such does not form part of the evidentiary record of the proceeding.

Manitoba Hydro indicated that from a global perspective, Manitoba Hydro currently routes a disproportionate amount of power through a single system. Dr. Swatek referred to the 1996 wind storm in which 19 HVDC towers were lost, submitting that risks to the system are not just academic. He suggested that if an F5 tornado were to hit the Dorsey Converter Station, outages could last from several months to three years. Dr. Swatek also spoke to the NERC reliability criteria Manitoba Hydro has to comply with and stated that if Dorsey or the Interlake corridor was lost, Manitoba Hydro would be 1,500 MW short at this time, while in 2020, there would be a deficit of 700 MW compared to a surplus of 1,300 MW with the Bipole III Transmission Reliability Project in service.

Per Stokke

Mr. Per Stokke filed a written presentation but did not make oral submissions. His submission focused on the Pointe du Bois and Wuskwatim spillways. With respect to Wuskwatim, Mr. Stokke alluded to a number of alleged planning errors that caused the initial construction cost estimates to be significantly exceeded. With respect to Pointe du Bois, Mr. Stokke questioned Manitoba Hydro's conclusion that the spillway had to be replaced.

15.0 IT IS ORDERED THAT:

1. The rate increase of 2.75% previously approved as interim on May 1, 2014 **BE AND IS HEREBY APPROVED AS FINAL**.

2. Manitoba Hydro's Application for a 3.95% across-the-board rate increase effective April 1, 2015 **BE AND IS HEREBY DENIED** as filed.

3. A 3.95% overall increase in billed rates for the Basic Charge, the Demand Charge, and the Energy Charge for all rate classes to take effect August 1, 2015, with revenues from a 2.15% portion of the rate increase accruing into a deferral account to be utilized to mitigate the required rate increases when Bipole III enters service and 1.8% accruing to Manitoba Hydro's general revenues, **BE AND IS HEREBY APPROVED**.

4. Manitoba Hydro recalculate and refile, for Board approval, a schedule of rates reflecting a 3.95% increase effective August 1, 2015 to the Basic Charge, Demand Charge, and Energy Charge for all rate classes, together with all supporting schedules including proof of revenue, customer impacts, and revenue requirement.

5. Manitoba Hydro shall lead a collaborative process to develop a bill affordability program harmonized with Manitoba Hydro's other programs supporting low-income ratepayers. Manitoba Hydro shall file proposed Terms of Reference for this collaborative process with the Board (including proposed facilitators and stakeholder participants) by no later than October 31, 2015. If Terns of Reference cannot be agreed upon between Manitoba Hydro and participants, the Board is prepared to receive submissions and adjudicate the issue.

6. Manitoba Hydro shall consider additional measures to increase participation rates in the Affordable Energy Program and to assist all-electric customers, particularly those living in rural Manitoba and aboriginal communities without

access to natural gas heating options, and to provide annual reports on the implementation of the Affordable Energy Program and any additional measures developed by the end of June of each calendar year.

7. Manitoba Hydro shall file terms of reference for an Asset Condition Assessment Report for approval by the Board that, at minimum, include the information set out in Appendix "F" of this Order, by no later than October 31, 2015.

8. The removal of net salvage from 2015/16 depreciation rates in the 2014 Depreciation Study **BE AND IS HEREBY APPROVED**.

9. The incorporation of the use of the Equal Life Group methodology to set depreciation rates in 2015/16 as set out in the 2014 Depreciation Study **BE AND IS HEREBY DENIED**.

10. Manitoba Hydro is to continue to use its existing Average Service Life Methodology for calculating depreciation rates for rate-setting purposes until the Board is satisfied that a change in methodology is warranted.

11. Manitoba Hydro's request to rescind the DSM deferral account **BE AND IS HEREBY DENIED**.

12. Manitoba Hydro is to continue the DSM deferral account to capture shortfalls in Demand-Side Management spending compared to the forecast spending in the Power Smart Plan. The shortfall in Demand-Side Management spending in 2014/15 of $19 million shall accumulate in the DSM deferral account. To the extent Manitoba Hydro's actual spending on Demand-Side Management in 2015/16 falls below the forecasted spending in the 2015 Power Smart Plan of $63.4 million, the shortfall shall accumulate in the DSM deferral account. To the extent Manitoba Hydro's actual spending on Demand-Side Management in 2015/16 exceeds $63.4 million, the excess shall be paid from the balance of the DSM deferral account. The DSM deferral account is to continue with each annual

spending target equal to the forecast spending stated in the most current Power Smart Plan, inclusive of funding from the Affordable Energy Fund.

13. Manitoba Hydro shall file detailed quarterly reports for all Major New Generation and Transmission projects, including the ones currently under development. These reports are to outline the proposed budget (at time of contract), budget changes and reasons for such changes, and the revised projected in-service costs. Where capital costs have increased materially, Manitoba Hydro is to explain how such increases will impact domestic revenue requirements and projected impacts on Manitoba Hydro's financial forecasts and targets.

14. Manitoba Hydro shall file quarterly updates regarding its Operation, Maintenance & Administration (OM&A) expenditures and the actual OM&A expenditures compared to Manitoba Hydro's target.

15. Manitoba Hydro shall identify and provide details of individual capital projects with a value greater than $1 million in future Capital Expenditure Forecasts.

16. The Curtailable Rate Program changes approved on an interim basis by way of Directive 13 of Order 43/13 **BE AND HEREBY ARE APPROVED AS FINAL**.

17. All Curtailable Rate Program Orders from Order 46/14 up to and including all Curtailable Rate Program Orders issued prior to the date of this Order **BE AND HEREBY ARE APPROVED AS FINAL**.

18. All weekly Surplus Energy Program interim ex-parte rate Orders – from Order 47/13 up to and including all Surplus Energy Program Orders issued prior to the date of this Order, **BE AND ARE HEREBY APPROVED AS FINAL**.

19. As part of any future quarterly Surplus Energy Program reports, Manitoba Hydro include an explanation of the National Energy Board (NEB) pricing and other factors that have influenced the pricing during the quarter addressed by the report.

20. By December 31, 2015, Manitoba Hydro shall file with the Board a five-year plan to complete the City of Winnipeg's luminaire geographical information system (GIS) mapping.

Board decisions may be appealed in accordance with the provisions of Section 58 of *The Public Utilities Board Act*, or reviewed in accordance with Section 36 of the Board's Rules of Practice and Procedure. The Board's Rules may be viewed on the Board's website at www.pub.gov.mb.ca.

THE PUBLIC UTILITIES BOARD

Régis Gosselin, B ès Arts, MBA, CPA, CGA
Chairman

"Kurt Simonsen"
Acting Secretary

Certified a true copy of Order No. 73/15 issued by The Public Utilities Board

Acting Secretary

APPENDIX A – APPEARANCES

R. Peters / S. Hombach	Counsel for the Manitoba Public Utilities Board
O. Fernandes / B. Czarnecki	Counsel for the Manitoba Hydro-Electric Board
D. Pambrun	Counsel for the City of Winnipeg
B. Williams	Counsel for the Consumer Coalition
B. Gange	Counsel for the Green Action Centre
A. Hacault	Counsel for the Manitoba Industrial Power Users Group
G. Orle	Counsel for Manitoba Keewatinowi Okimakanak Inc.
T. Masi	Counsel for the Manitoba Métis Federation

APPENDIX B – WITNESSES FOR MANITOBA HYDRO

S. Thompson	President & CEO
D. Rainkie	VP, Finance & Regulatory
L. Kuczek	VP, Customer Care & Energy Conservation
S. Bauerlein	Corporate Controller
D. Cormie	Division Manager, Power Sales & Operations
T. Miles	Division Manager, Power Planning
R. Elder	Division Manager, Bipole III Project
D. Bowen	Manager, Keeyask Project
N. Read	Manager, Generation Maintenance Engineering
D. Swatek	Manager, System Planning (Transmission)
M. Morin	Manager, Distribution Asset Maintenance
L. Carriere	Manager, Financial Planning
M. Schulz	Corporate Treasurer
I. Page	Division Manager, Corporate Planning & Strategic Review
G. Barnlund	Division Manager, Rates & Regulatory Affairs
P. Chard	Division Manager, Business Support Services
L. Morrison	Division Manager, Consumer Marketing and Sales
C. Galbraith	Affordable Energy Supervisor
M. Hooper	Asset Accounting Systems Supervisor
L. Kennedy	External Depreciation Expert, Gannet Fleming

APPENDIX C – INTERVENERS OF RECORD & WITNESSES

City of Winnipeg
Consumer Coalition (P. Lee)
Green Action Centre (R. Colton)
Manitoba Industrial Power Users Group (P. Bowman, P. Lee)
Manitoba Keewatinowi Okimakanak Inc.
Manitoba Métis Federation

APPENDIX D

A. Ciekiewicz	Private Citizen
M. Velie	International Brotherhood of Electrical Workers
A. Spence	Private Citizen
D. Mouland	Winnipeg Harvest
B. Turner & Dale Bossons	Manitoba Industrial Power Users Group
Pam Pugh	Private Citizen
G. Laliberte and D. Woodford	Bipole III Coalition
Manitoba Hydro	
P. Stokke (written presentation only)	Private Citizen

APPENDIX E – UNITS OF MEASUREMENT

Demand/Power represents the size of electricity load over a specific period of time.

expressed in:

- Watts (W)
- Kilo-watts (kW) - 1,000 watts
- Mega-watts (MW) - one million watts
- Giga-watts (GW) - one billion watts

Energy represents the amount of electricity provided to customers to do work or create heat, light, or sound. It is typically expressed as:

- Kilo-watt hours (kWh) - 1,000 watt hours
- Mega-watt hours (mWh) - 1,000 kilo-watt hours
- Giga-watt hours (GWh) - one million kilo-watt hours

Voltage represents the electric potential between two points expressed in**:**

- Volts
- Kilo-volts (kV) – 1,000 volts

Water Flow represents the rate at which water enters or leaves a system, expressed in:

- Cubic Meters per Second (m3/s)

APPENDIX F – LIST OF ABBREVIATIONS

AEP	Affordable Energy Program
ASL	Average Service Life
ATK	Aboriginal Traditional Knowledge
CCCT	Combined-Cycle Combustion Turbine
CEF	Capital Expenditure Forecast
CGAAP	Canadian Generally Accepted Accounting Principles
COSS	Cost of Service Study
CRP	Curtailable Rate Program
DSM	Demand-Side Management
EBIT	Earnings Before Interest and Taxes
EBITDA	Earnings Before Interest, Taxes, Depreciation and Amortization
EFT	Equivalent Full-Time
ELG	Equal Life Group

APPENDIX G - MINIMUM TERMS OF REFERENCE FOR ASSET CONDITION ASSESSMENT

Manitoba Hydro's Asset Condition Assessment Report should include, at minimum, the following:

- For each of Manitoba Hydro's hydraulic generating stations and thermal generating stations, a timeline for the refurbishment and/or replacement up to 2049/50 along with an Asset Health Index. For the hydraulic generating stations, this should include the following components:
  - powerhouse structure and gates.
  - spillway structures and gates
  - main dam
  - secondary dams/dikes/weirs
  - access lands and building facilities.
  - breakers
  - exciters (separately for each unit)
  - generators (separately for each unit)
  - governors (separately for each unit)
  - transformers
  - turbines (separately for each unit)
- Identification of specific components of generating assets that are scheduled for replacement based on chronological age life expectancy as opposed to an Asset Health Index.

- For each of Manitoba Hydro's HVDC and HVAC transmission systems, a timeline for the refurbishment and/or replacement up to 2049/50 along with an Asset Health Index. This should include the following components:
  - Bipole I & II, further broken down into:
    - HVDC breakers
    - HVDC transformers
    - HVDC transmission steel structures.
    - HVDC transmission tower footings.
    - HVDC transmission line cables
    - HVDC converter transformers.
    - HVDC valve groups.
    - HVDC synchronous condensers
    - HVDC shunt reactors.
    - HVDC smoothing reactors
  - Bipole III (to include same listing as above out to 2049/50)
  - HVAC regional transmission lines (to include for each region and as applicable):
    - transmission breakers
    - transmission transformers
    - protector relays

- ♦ AC transmission steel towers
- ♦ AC transmission tower footings
- ♦ AC transmission wood poles
- ♦ AC transmission overhead

- For each of Manitoba Hydro's regional distribution systems, a timeline for the refurbishment and/or replacement up to 2049/50 along with an Asset Health Index. This should include the following components:
  - City of Winnipeg
    - ♦ underground services
    - ♦ overhead services
  - Southern Manitoba.
    - ♦ natural gas available.
    - ♦ natural gas not available.
  - Eastern Manitoba
  - Northern Manitoba

I. Introduction

A. Scope of Report

La Capra Associates (LCA) has prepared this Technical Appendix to address six elements of our Needs For and Alternatives To (NFAT) Scope of Work (LCA SOW) and support other elements of our work that rely on the materials in this report. The specific LCA SOW elements addressed here are:

Power Resource Planning and Economic Evaluation

2. *Assess whether Manitoba Hydro's approach to comparing generation sequences follows sound industry practice; and*
6. *Develop power resource plans and alternatives, including identifying other scenarios that could potentially compete on an economic basis with Manitoba Hydro's Preferred Development Plan; and*
10. *Examine the No New Generation scenario and the potential for extended use of imports to meet Manitoba Hydro's domestic load requirements; and*
13. *Assess the maximum deferral prospects for Keeyask G.S. and/or Conawapa G.S.; and*

Business Case and Risk Assessment

1. *Analyse the financial and economic risks of the Preferred Development Plan and export contracts and export opportunity revenues in relationship to alternative development strategies; and*
5. *Examine and evaluate the treatment of risk in Manitoba Hydro's development of Power Resource Plans and resource scenario models. Incorporate expert opinions on flood and drought risks and optimal strategy.*

The Manitoba Hydro (MH) NFAT process determined the timing of need for new resources, examined potential resource options available, created development plans which would fulfill the resource need, and performed comparative economic and financial analysis on those proposed plans to determine the preferred option.

The specific focus of this Technical Appendix is to review and critique Manitoba Hydro's screening of resource options and creation of the alternative development plans. This report also discusses potential plans that were not initially evaluated by

Manitoba Hydro. Technical Appendix 1: Resource Planning reviews the resource planning criteria and resource needs analysis.

B. Pending supplemental filing

Early in La Capra Associates' review of MH's development plan process we determined that the portfolio of plans developed by MH did not cover the full spectrum of resource planning options. La Capra Associates developed multiple alternative development plans that would provide additional analysis and a wider scope of options for resource planning.

La Capra Associates communicated with Manitoba Hydro regarding these additional alternative plans and MH agreed to perform the modeling and economic analysis on two additional plans. These plans are discussed in Section VI A. Manitoba Hydro has only recently provided the results of this analysis and modeling. La Capra Associates is currently in the process of reviewing the results and will be filing a supplement to this Technical Appendix to provide our analysis of these alternative plans.

C. La Capra Associates' approach to evaluating Manitoba Hydro's plan development

Our approach to evaluating MH's resource option screening and creation of the development plans included the following:

1) LCA reviewed materials relevant to this assessment, including:
   - The information contained in the NFAT submission pertaining to resource needs assessment, resource option screening, and MH's creation of the alternative development plans;
   - MH's responses to Information Requests and information provided to LCA in lieu of responses to IRs; and
   - Publically available information regarding technology cost assumptions.
2) LCA held discussions with MH personnel to discuss needs assessment analysis, generation cost assumptions, and resource plan development.

3) LCA conducted independent analysis on to MH's cost assumptions regarding wind generation and the impact on the economic analysis results of changing these cost assumptions.

The following review and analysis is the product of this approach.

II. Overview of Manitoba Hydro's Plan Development

The NFAT Application under evaluation includes analysis in support of the requested approvals from Manitoba Hydro's resource planning process. The process consists of a series of stages to identify resource need, evaluate potential resources to fulfill the need, develop discrete potential alternative plans, and perform comparative analysis on the alternative plans.

This section of the appendix provides an overview of each of the various stages contributing to the creation of the development plans.

A. Resource needs analysis

The first stage of Manitoba Hydro's process is the resource needs analysis, which compares the forecasted peak and annual energy demand with resource supply available to Manitoba Hydro. The purpose of this process is to determine when additional capacity and energy resources are required.

Manitoba Hydro completes this analysis on an annual basis as part of its Power Resource Plan and has included an updated analysis in Chapter 4 of the NFAT. The analysis concludes that Manitoba Hydro will need new dependable energy resources in 2022/23 and new capacity resources in 2025/26.[1]

MH's resource needs analysis is discussed and critiqued in detail in Technical Appendix 1: Resource Planning.

[1] NFAT Submission, Chapter 4, pp. 46-50.

B. Resource technology screening

Once the need for new resources has been established, MH evaluates generation technologies available to address the need. The NFAT analysis includes a "high-level" evaluation of 16 resource technologies across 15 resource characteristics in order to screen out technologies that are not suitable for further evaluation.[2]

MH screened the following resource technologies:[3]

1. Additional demand-side management (DSM)
2. Hydro with storage
3. Run of River Hydro
4. On-Shore wind
5. In-Lake Wind
6. Solar photovoltaic (PV)
7. Solar Thermal
8. Enhanced Geothermal
9. Simple Cycle Gas Turbine (SCGT)
10. Combined Cycle Gas Turbine (CCGT)
11. Conventional Coal
12. Coal - Integrated Gasification Combined Cycle (IGCC)
13. Nuclear
14. Biomass: Crop Residue
15. Biomass: Wood based fuel
16. Imports

The technologies were screened on the following 15 characteristics, grouped into four categories:[4]

- Technical (Section 7.1.1.1)
  - Maturity of Technology
  - Technical Challenges in Manitoba
  - Ease of Integration into System
  - Intermittency

[2] NFAT Submission, Chapter 7, p. 1.

[3] NFAT Submission, Chapter 7, Table 7.1, p. 3.

[4] *Id.* pp. 4-11.

- Seasonality

- Environmental (Section 7.1.1.2)
  6. Water Quality Impacts
  7. Hazardous Air Pollutants
  8. Greenhouse Gas Emissions (over life cycle)
  9. Land Use Impacts
  10. Wildlife Species of Interest
- Social/Policy (Section 7.1.1.3)
  11. Proximity to Load Center
  12. Regulatory Constraints
  13. Social Acceptability
- Economic (Section 7.1.1.4)
  14. Manitoba Delivered Fuel Costs
  15. Forecast USA Unit Costs ($/MWh)

Each technology was evaluated on each characteristic and given a categorization - red, yellow, or green. Some resource characteristics were scored qualitatively (e.g. land use impacts, regulatory constraints, etc.) and other were characterized quantitatively (e.g. proximity to load, unit costs, etc.).[5] Resources receiving a red rating on any characteristic were screened out.

Of the 16 technologies evaluated, seven passed the initial analysis. The remaining technologies were screened out for various reasons. Figure 3-1 presents the results of the resource technology screening process.

[5] NFAT Submission, Chapter 7, pp. 4-11.

Technology	Result	Reason for failure
Additional DSM	Passed	
Hydro with storage	Passed	
Run of River Hydro	Passed	
On-Shore wind	Passed	
In-Lake Wind	Failed	High unit costs, lack of experience
Solar PV	Failed	High unit cost, intermittency
Solar Thermal	Failed	High unit cost
Enhanced Geothermal	Failed	Low grade resource
Simple Cycle GT	Passed	
Combined Cycle GT	Passed	
Conventional Coal	Failed	Regulatory constraints, public opinion
IGCC	Failed	Low maturity, regulatory constraints
Nuclear	Failed	Difficult to integrate, complex regulations, public opinion
Biomass: Crop Residue	Failed	High collection and transportation costs
Biomass: Wood based fuel	Failed	High collection and transportation costs
Imports	Passed	

Figure 3-1: Results of resource technology screening

Summary of Resource Technology Screening

The resource technology screening process provides a high-level review of the suitability of the various resources for development to meet Manitoba's energy and capacity needs. Based on this review, MH selected seven of fifteen potential technologies for further consideration in the next planning step, the resource option screening process.

The assumptions used by MH in this process are also discussed in Technical Appendix 2: Generation Alternatives.

C. Resource option screening

The seven technologies that passed the initial screening were evaluated further by MH in the "resource option screening" process in order to determine the specific unit configurations that will be incorporated into the alternative development plans. The

purpose of this process is "the selection of specific resource options from each of the resource technologies" that passed the technology screening process.[6]

The following sections review MH's assessment of each resource option.

Additional DSM

MH's further consideration of DSM resources is based on its "continued long-term commitment to pursuing all cost-effective energy efficiency opportunities and to continually monitoring the market for emerging trends and opportunities which may become economically viable."[7]

Manitoba Hydro recently contracted for a DSM potential study which found that there is considerably more DSM potential than MH currently includes in its Power Smart Plan. The study was not available in time for the NFAT analysis, but MH performed a sensitivity analysis incorporating additional DSM.[8] MH is currently conducting alternative development case analysis with DSM estimates derived from this potential study and has indicated its intent to complete those studies (economic and financial analysis) in February and introduce those results in this NFAT proceeding at that time.

This DSM sensitivity case is also discussed in Technical Appendix 1: Resource Planning.

MH concludes the resource option screening of DSM by noting that DSM relies on program participation and does not "carry the same degree of certainty that a generation resource provides."[9]

Unlike the generation options described below, MH did not develop specific parameters for including additional DSM in the alternative development plans. Despite the fact that it passed the technology screening process, no potential plans were developed with DSM. This issue will be discussed further in the alternative development plan critique section below.

[6] NFAT Submission, Chapter 7, p. 20.

[7] *Id.*, pp. 20-21.

[8] *Id.*, pp. 21-22.

[9] *Id.*, p. 23.

Elenchus Research Associates has also reviewed MH's DSM assumptions and potential studies in its report *NFAT Review: A Review of Manitoba Hydro's Demand Side Management Plan*, filed with the PUB.

Hydro

The hydro portion of the resource option screening stage involves the evaluation of total hydro potential and the identification of the projects that are most suitable for development.[10] Overall, MH has identified 8,200 MW of additional hydro potential remaining in the province. Due to various agreements and regulations[11], there are twelve projects representing 4,700 MW available for development. Of these twelve projects, MH's assessment concludes that only two are at a development stage where they could be ready in the 2022/23 time frame.[12]

Keeyask is the most economic project on a levelized cost of energy (LCOE) basis at $60/MWh and has a lead time of seven years. Conawapa is next with an LCOE of $67/MWh and lead time of 13 years.[13] Due to the fact that the other projects have higher estimated levelized costs and longer development timelines, Keeyask and Conawapa were included as resource options for incorporation into the alternative development plans.

Of the ten hydro projects not selected, the Notigi project is furthest into the development process, with a listed lead time of ten years and an LCOE of $88/MWh. This project was not selected because it is small and the lead time would likely be longer than listed because the feasibility studies are of an older vintage – suspended in 2002.[14]

---

[10] NFAT Submission, Chapter 7, pp. 23-28.

[11] These agreements include the Treaty Land Entitlement Framework Agreement and the Canadian Heritage Rivers System, which are discussed in the NFAT Submission in footnote #3 in Chapter 2 and Chapter 7, p. 23.

[12] NFAT Submission, Chapter 7, p. 24.

[13] *Id.*, p. 26. The LCOE figures for Keeyask and Conawapa are net of all sunk costs prior to June 2014, so they are not inclusive of the full capital costs of the project.

[14] NFAT Submission, Chapter 7, pp. 27-28.

Natural gas resources

MH identified gas generation as a suitable resource technology. The resource options screening analysis considered three types of gas units: simple cycle gas turbine (SCGT), combined cycle gas turbine (CCGT), and aeroderivative simple cycle gas turbine. The resource screening concluded with the following evaluation of the specific generator options:[15]

- Heavy duty SCGT: Suitable for large increments of new capacity (>200MW) and infrequent operation (<20% capacity factor). SCGT's have short lead times of 3-5 years. MH evaluated a configuration featuring a 209 MW GE 7FA unit with a heat rate of 9,906 btu/kWh.
- Heavy duty CCGT: Suitable for large increments of new capacity (>200MW) and more frequent operation (>40% capacity factor). Compared to SCGTs, CCGTs have higher upfront capital costs but lower operational costs. Like SCGTs, the CCGT also has a short lead time of 3-5 years. MH evaluated a configuration consisting of a 308 MW GE 7FA unit with a heat rate of 6,652 btu/kWh.
- Aeroderivative CCGT: Most suitable for small capacity increments and infrequent operation, the aeroderivative units have the shortest lead time (3 years) but the highest capital and operational costs. MH evaluated a 47 MW GE LM6000PH with a heat rate of 9,475 btu/kWh.

The NFAT has provided no discussion of any other specific generators considered by MH as part of the resource options screening process. The Knight Piésold Independent Expert Consultant Report ("KP Report") explains that MH contracted for a study by Gryphon International Engineering Services, Inc. to review natural gas generation options and estimate capital and O&M costs.[16]

The configurations discussed above were chosen for inclusion in the alternative development plans.

[15] *Id.*, pp. 28-31.

[16] Knight Piésold Independent Expert Consultant Report, pp. 51-55.

Wind resources

Wind generation passed the initial technology screening process as an approved resource. As part of the resource option screening process, MH evaluated the potential for wind development to fulfill generation need. Southern Manitoba is suitable for several thousand MWs of wind farm development, which can be installed in a modular fashion to match resource need.[17]

In MH's analysis, wind generation is assumed to have zero winter peak capacity due to its intermittent nature and that generators are not reliable at temperatures below -30C, which are the temps that produce the winter peak.[18] Therefore wind projects address energy needs only.

For the purposes of resource planning, MH assumed a wind project configuration of 65 MW with a 40% capacity factor. MH also assumed that the "dependable" portion of the energy generated by a wind project is 85% of the total generation. This total provides enough dependable energy to cover approximately one year of load growth on the MH system. MH assumed that the wind project would be owned and operated by MH, rather than a third party. [19]

Imports

The final resource that passed the resource technology screening is imports. MH notes that imports are an option for either energy or capacity, subject to the limits placed on import energy by the planning criteria.[20] MH several options to take advantage of economical import opportunities, including seasonal diversity agreements in which the winter-peaking MH and summer-peaking United States (US) Midcontinent Independent System Operator (MISO) systems agree to supply capacity to each other during each system's season of surplus.[21]

As with the treatment of DSM as a resource option (discussed above), MH did not specifically develop a configuration of import energy to be used in the development

[17] NFAT Submission, Chapter 7, p. 31.

[18] *Id.*, pp. 31-32. See also NFAT Submission, Appendix 7.4.

[19] *Id.*, pp. 32-33.

[20] NFAT Submission, Chapter 7, p. 34.

[21] *Id.*, pp. 34-35.

plans. Instead, the NFAT submission discusses the qualitative considerations on the use of imports and the limitations codified in the resource planning criteria.[22]

Summary of resource option screening

MH's resource option screening process is a continuation of the resource technology screening whereby more specific resource configurations were established for inclusion as resources in the development plans. At the conclusion of this process, MH had identified two possible hydro options (Keeyask and Conawapa), three possible gas generators (CCGT, SCGT, and aeroderivative SCGT), and a generic wind development option. Specific configurations were not developed for the DSM or import resource options.

D. Alternative plan development

The next stage of the resource planning process is the creation of the development plans. According to MH, "once the initial timing of the need for new resources has been determined, development plans are identified using a number of combinations of new generation options and export opportunities available to [MH]."[23]

Using different configurations and timing of the resource options that passed the initial screening, MH created multiple plans that meet the energy and capacity requirements. In addition to generation resources, the alternate development plans vary depending on the additional transmission capacity assumed in each.[24]

During this stage of the process, 15 plans were developed. Five plans include 750 MW of additional import/export capability with the US, three plans include 250 MW of export and 50 MW of import capability with the US, and seven plans fulfill MH's needs with no new US interconnection. Figure 3-2 below summarizes the development plans created by MH.

[22] This issue is discussed in further detail in Technical Appendix 1: Resource Planning.

Figure 3-2: MH's potential development plans[25]

[25] NFAT Submission, Chapter 9, Table 9.3, p. 12

These 15 development plans were evaluated based on the economic and financial analytical framework described in the NFAT Submission, Chapters 9-12. These economic and financial analyses are evaluated fully in Technical Appendix 9: Economic Analysis, and Technical Appendix 10: Financial Analysis.

III. Critique of Manitoba Hydro's Resource Needs Analysis

La Capra Associates has reviewed and critiqued MH's resource needs analysis. Our evaluation and conclusions are discussed extensively in Technical Appendix 1: Resource Planning.

Overall, we conclude that MH's resource needs analysis is overly conservative, and that MH's identified timing of energy and capacity need are likely sooner than the actual need will develop. In addition, our assessment concludes that in the near term there are alternative options to address the eventual resource need other than large hydro development that could further delay the large investments necessary for the Preferred Development Plan.

IV. Critique of Manitoba Hydro's Resource Technology Screening

Manitoba Hydro's resource screening process is accomplished in two steps – resource technology screening and resource option screening. The distinction between the two steps is very minimal and for the purposes of this report we will critique the two steps together.

Overall, the screening process has several shortcomings which result in technologies being unnecessarily screened out from further consideration. The following section provides LCA's evaluation of the screening process, and provides specific critiques of MH's treatment of individual technologies.

A. Process Critiques

In general, our primary concern with the technology screening process is that the purpose and process of the screening has been poorly defined by MH and as a result, it has not provided a clear argument for the further consideration of certain technologies and exclusion of other technologies.

"High Level Screening"

As noted in the NFAT report, this initial, "high-level screening of technologies uses a general characterization to determine whether a technology will proceed to the next stage of evaluation."[26] For most of the resource characteristics, the assessment is at least partially subjective and there are no specific thresholds for screening out a technology on that basis. As an example, nuclear technology received a "screened out" rating for several reasons, including due to its "complex & lengthy approval process."[27] There is no discussion of this rating or comparison of the incremental complexity of the nuclear approval process beyond the approval process for hydro or natural gas.

Of the technology characteristics that can be quantified, MH often did not define the thresholds for screening a unit out. For example, in rating technologies on the "proximity to load center" characteristic, the distances from potential new generation were grouped into five categories based on range in kilometers.[28] While various technologies were given yellow or green ratings, MH does not explain which of the five categories corresponds to the various color designations, nor why a resource far from a load center would not be feasible for development since additional cost considerations should be factored in elsewhere in the screening process.

Manual screening vs. optimization process

Manitoba Hydro's process relies on a manual screening of a combination of qualitative and quantitative factors. In many respects the technologies that were screened out were removed not because they are not able to be developed in Manitoba, but because they are not preferable based on the set of base assumptions by which the technologies were evaluated. As discussed below, the assumptions regarding solar PV led to the

[26] NFAT Submission, Chapter 7, p. 11.

[27] *Id.*, Table 7.1, p. 3.

[28] NFAT Submission, Chapter 7, p. 8.

technology being screened out despite industry expectations of large cost declines during the study period. This method, rather than one based on a resource optimization process, can inappropriately remove technologies from potential development. This issue of optimization is address in more detail in the critique of the development plan process below.

Inappropriate unit cost metrics

The primary characteristic that determined which technologies were screened out was unit cost. For this characteristic, MH utilized the US Energy Information Administration estimates of levelized cost, rather than the Manitoba-specific levelized costs it calculated. Regardless of the previous discussion of optimization vs. manual screening, simple reliance on generic US EIA estimates does not incorporate Manitoba-specific characteristics that should be included in the technology screening process.

Screening ignores future technology trends

MH's planning horizon for the NFAT analysis is 78 years and across the development plans, individual scenarios have resources going into service as late as 2047. By performing the resource screening in 2012 and eliminating technologies from consideration through the entire 78 year planning horizon, MH's process ignores future changes in all the characteristics upon which it evaluated the technologies. MH has recognized that wind, solar and combustion turbine technologies are expected to see improvements over time. It is conceivable that by 2047 the evaluation of many technologies would change in regards to public opinion, regulatory status, and particularly cost (discussed in more detail below).

Technical Appendix 2: Generation Alternatives provides additional analysis and discussion of this issue.

B. Technology-specific critique

Our assessment of MH's process criticized the concept of screening out technologies, rather than utilizing an optimization process. Without disregarding this critique, this section of the report reviews the technologies that were eliminated from further consideration by MH's technology screening process and provides a critique of their conclusion.

In-lake wind

The resource technology screening process eliminated in-lake wind as a potential resource primarily due to high resource cost. MH also discusses other potential barriers such as lack of experience, technical challenges, and conflicts with commercial and recreational water uses.[29]

Given the large amount of undeveloped on-shore wind potential, it is reasonable to delay consideration of in-lake wind at this time. However, the technology is promising due to higher performance characteristics and lower development obstacles in certain circumstances. MH should monitor development of marine and in-lake wind projects elsewhere in North America and should study wind conditions for future development in Manitoba.

Solar – PV

Despite acknowledging a good-quality solar resource in southern Manitoba, MH screened out solar PV due to high LCOE costs and intermittency issues.[30]

Technical Appendix 2: Generation Alternatives, provides a review of MH's resource cost and performance assumptions.

Generally, MH has noted that the industry forecasts anticipate solar PV installed cost declines of up 50% by 2020.[31] Yet the technology was screened out from further consideration based on the EIA Annual Energy Outlook 2013 price estimate. The screening based on these estimates eliminated solar PV with an average LCOE estimate of approximately $150/MWh. A 50% decline in costs would make that technology extremely cost competitive with other energy resources.

Based on the long horizon on the NFAT analysis, it would be reasonable for MH to calculate comparative costs between resources farther in the future incorporating cost trends to determine if solar PV may be a cost competitive option.

[29] NFAT Submission, Chapter 7, p. 18.

[30] NFAT Submission, Chapter 7, p. 18.

[31] NFAT Submission, Appendix 7.1, pp. 43-45.

Solar thermal

MH screened out solar thermal due to high LCOE costs. The report also notes concerns with resource intermittency and a mismatch between resource availability and Manitoba's winter system peak. [32] Based on the status of the development of solar thermal technology, there is no compelling reason to consider it more viable than resource underconsideration.

Geothermal

Geothermal was screened out during the resource technology evaluation due because "heat gradients required for these systems remain unproven in Manitoba," as well as other technical and economic challenges.[33]

Based on the status of geothermal technology and the availability of more economic base load resources with fewer technological challenges, there is no compelling reason to pursue geothermal resources at this time.

Coal – Conventional and IGCC

Both coal resources were screened out from further consideration due to the regulatory constraints imposed by the *Climate Change and Emissions Reductions Act*.[34] This legislation requires the phase-out of the use of coal-fired generation.

Based on the regulatory restrictions in place and larger trends in the North American utility industry, it is reasonable for MH to screen out the coal technologies.

[32] NFAT Submission, Chapter 7, p. 18.

[33] NFAT Submission, Chapter 7, p. 19.

[34] *Id.*

Nuclear

MH's resource technology screening process eliminated nuclear as an option due to the high capital investment, difficulty of integrating large units, and regulatory restrictions on storing radioactive waste imposed by *The Manitoba High-Level Radioactive Waste Act*.[35] There are several issues with these justifications for the elimination of nuclear as a potential resource.

MH did not provide analytical support for the exclusion of nuclear due to the high upfront capital investment, particularly given the magnitude of investment being proposed for the hydro units. Regarding integration difficulty, MH provided no analysis supporting any claim that integrating a large nuclear unit is not feasible. In addition, the legislation cited by MH is targeted primarily at preventing the storage of radioactive waste and spent fuel that is generated outside Manitoba. It is not clear from the legislation that nuclear generation would be prohibited.[36]

Despite these issues, it was reasonable for MH to eliminate nuclear as a potential resource option due to high cost uncertainty, high regulatory risk, and environmental concerns.

Biomass (crop residue and wood fuel)

Both biomass technologies evaluated were screened out for the same reason: According to MH's analysis the cost of energy from these resources is "not yet competitive with other forms of generation and are highly dependent upon the uncertain price of transportation fuels."[37] This conclusion is not supported by any analysis of transportation fuel costs or sensitivities.

MH's own analysis shows that there is potential for more than 630 MW of capacity and 4,800 GWh of annual energy from domestic biomass resources. Much of the biomass fuel is located within 100 km of Winnipeg.[38]

---

[35] *Id.*, pp. 19-20.

[36] *The High-Level Radioactive Waste Act*. C.C.S.M. c. R10, July 17, 1987. http://web2.gov.mb.ca/laws/statutes/ccsm/r010e.php

[37] NFAT Submission, Chapter 7, p. 20.

[38] NFAT Submission, Appendix 7.1, Section 4.2.

The cost of energy from both biomass and natural gas generators are highly dependent on fuel costs, yet MH's analysis does not include any evaluation of fuel price sensitivity which would support the exclusion of biomass from further consideration.

Biomass generators are common across North America and MH's technology screening process does not provide a comprehensive justification for screening out this resource.

See Technical Appendix 2: Generation Alternatives, for a full discussion of MH's biomass assessment.

V. Critique of Manitoba Hydro's Alternative Development Plans

As discussed above, MH utilized the resource options that passed the screening process to manually create a variety of potential development plans that fulfill forecasted resource need and, in some cases, take advantage of export opportunities.

This section critiques MH's presentation of its process of creating the alternative development plans for further analysis.

A. Omission of DSM resources, lack of imports

MH's resource screening process identified select resources that were suitable for inclusion in the development plans. While DSM passed all screening tests, MH did not formulate any development plans that include specific levels of DSM programming.

MH has stated that it is committed to pursuing cost-effective DSM opportunities.[39] However, given the analysis that identified DSM as a suitable resource, it would have been appropriate for MH to create development plans that specifically targeted and funded additional DSM programs as a viable resource option.

Similarly, imports were identified as a feasible resource option. Yet only a few plans feature additional import development, and none of the plans are specifically

[39] NFAT Submission, Chapter 7, pp. 20-21.

formulated to take advantage of excess capacity in MISO in lieu of constructing new domestic resources. This issue is addressed further in the following section.

B. No evidence of plan optimization

MH's process for creating and testing the alternative development plans lacks a process of optimization. MH manually develops a variety of plans that follow certain "pathways" that generally represent an informed sample of potential resource options. These plans are then evaluated using the SPLASH model and economic analytical models. It was from this analysis that the Preferred Development Plan was identified.

This process lacks quantitative optimization that is typically used by utilities in resource planning. Internal or third party model software (such as Ventyx Strategist) offer resource planning tools that optimize resource build out given a set of inputs.

This type of optimization can help identify the most beneficial timing of resource addition in a way that MH's process will not. For example, one of MH's development plans calls for the development of Keeyask in 2022, followed by gas capacity beginning in 2029. By manually creating and testing this plan, there is no conclusive evidence that a similar plan with Keeyask in 2021 or 2020 wouldn't be more beneficial or that the timing on the gas capacity couldn't be altered to improve the plan. This example argument applies to all of MH's manually developed plans. MH's modelling process limits their ability to test alternative development plan due to the considerable time requirements to conduct the analysis for a single development plan.

This limitation is an important consideration in the comparison of alternative development plans as MH has done for this NFAT. In the comparison of two development plans, it is not possible to determine whether either plan has been developed with an optimal sequencing of resource additions. The difference in costs between the two plans could be due to the inherent advantages or disadvantages of the resources featured in the two plans or it could, in part, be due to the cost of a resource sequencing that is less optimal in one plan as compared to the other. As a result, the cost differential between two development plans must be viewed with some caution.

C. Single-pass analysis abbreviates process

In lieu of an optimization analysis to develop alternative development plans, other techniques could be employed to test the manually selected plans and enhance them with analysis. However, MH planning process does not incorporate this concept.

MH created the 15 potential development plans and then performed all analysis and sensitivities on these initial plans. From the results of this analysis the Preferred Development Plan was selected after only a single pass through the process. The primary drawback of this strategy is that it does not take advantage of any economic analysis in the plan development process. These initial plans, uninformed by economic analysis, likely do not represent the optimized plan configuration. MH could revise their process to use the initial results as indicative and redevelop the plans based on the lessons learned.

As an example, the two development plans that included wind generation were not the highest performing plans. These plans represent a narrow view of the incorporation of wind into a resource portfolio, rather than a variety of development options. As a result of the poor economic performance, MH is not planning to develop any wind resources. As discussed above, with a strong domestic wind resource, modular development options, and declining resource costs, it is very likely that at least some wind development should be included in an optimized development strategy.

D. Critique of CCGT/SCGT optimization process

When creating development plans with natural gas generators, MH developed a process for determining whether a CCGT or SCGT unit would be included. This process, however, only optimizes between CCGTs and SCGTs under reference assumptions and average water flow years. This exposes MH's planning process to significant risk based on the sensitivity of results to uncertain assumptions. In the context of the MH hydropower system, thermal unit additions serve as sources of capacity and generally provide energy during times of low water. Use of the average water flow year in the process does not appropriately consider the drought hedge value of a thermal resource in the plan development process.

MH followed their specific optimization process to determine the choice of which natural gas generation to add in its All Gas development plan.[40] The optimization attempted to capture the trade-off of whether to invest in the higher cost and more efficient CCGT or utilize the SCGT with its lower capital cost and lower efficiency. MH's process began by developing busbar costs to compare the technologies under reference assumptions. From this MH established a capacity factor threshold required for a new resource below which they would add a SCGT unit and above which they would add a CCGT unit. MH's first pass at modeling through SPLASH would install a generic or average efficiency natural gas generation capacity when its dependable energy and capacity needs analysis established a need for new resources. MH would then review the capacity factor of each of the generic or average natural gas capacity added. MH then would substitute either a CCGT or SCGT as determined by the capacity factor of the generic unit. This new generation sequence of CCGTs and SCGTs then became the All Gas Plan.

MH discussed in its NFAT application that the thermal generation efficiency has its greatest importance during the simulation of low flow or drought water years.[41] It is under these conditions that the thermal units operate at their highest capacity factors. The gas optimization process as discussed above utilizes the average of 99 water flow years to determine the capacity factors of the generic natural gas units to decide on choice of CCGT or SCGT. Even if the use of the average of the 99 years was appropriate, this method gives weight to operational characteristics over economic benefits. Additionally, the averaging method does not allow for placing more importance on a SCGT's ability to help mitigate the risk of drought conditions, a key feature of gas generation resources.

E. Lack of risk analysis

MH's explanation of the process of creating the alternative development includes no evidence of the incorporation of risk analysis into the creation of the plans – only a sensitivity analysis on economic performance of the plans that were developed. Without incorporating risk analysis into the manual plan creation, MH's process is

[40] The methodology is described in SP-018 NFAT Confidential – Optimization of Natural Gas-Fired Generation into the Manitoba Hydro System.pdf.

[41] NFAT Submission, Chapter 5, pp. 33-34

likely resulting in plans susceptible to external factors that will render them sub-optimal.

The following are examples of elements of risk analysis that are missing from the MH plan development process that would likely influence the components and timing of the alternative plans:

- Economic and financial risks: Macroeconomic conditions can strongly influence the performance of resource plans by, for example, impacting interest rates and financing conditions. This is particularly relevant to development plans with high capital expenditures. Additionally, the general condition of the provincial and regional economy can strongly impact demand.
- Export price risk: MH's process created development plans that either target additional exports or not. Export prices have a strong impact on the viability of certain development plans.
- Natural gas price risk: Fuel prices, particularly natural gas, have experienced drastic volatility over the past decade. MH's plan development process does not consider this volatility and the exposure of the plans to this price risk.
- Flood and drought risk: As a hydro dependent system, MH is exceedingly susceptible to water flow conditions. This risk is only evaluated later in the process, well after the plans have been structured.
- Load forecast risk: The Keeyask and Conawapa investments are large, long-term commitments for supply with long lead times to plan and construct. The value of these investments relies in part on future load being as high as forecasts. Other supply options can be added in more modest increments with shorter planning lead times to better match lower load growth.

One way in which these types of risks are often addressed in utility planning is by considering modularity and flexibility in resource options. The flexibility of modular, shorter-lead time resources provide some value in mitigating load forecast risk. For example, by giving priority to modular resource development such as smaller gas units that require shorter lead times, MH's planning can adapt to, for example, gas price volatility or export price erosion. There is no evidence that MH's plan development process includes any consideration for the differences in this flexibility between resources options.

F. Portfolio Analysis vs. Resource Option Evaluation

MH's fifteen alternative development plans are each a portfolio of resource additions combined to meet energy and capacity requirements over 78 years, designed to meet a theme (e.g., all gas, max wind, all hydro). This is typical of a long-term resource planning process which seeks to develop a reasonable scenario of development over time to serve as a basis for specific planning decisions that a utility must make.

Beyond this initial analysis, to evaluate the next specific resource commitment decisions that are to be made typically entails more specific analysis and investigation. In this NFAT, the specific commitment decision posed by MH is for authorization to proceed with the Keeyask Project, the Minnesota Power contract, and the 750 MW transmission line to Minnesota. However, the economic metric used to support that decision is the net present value (NPV) of 78 years of the portfolio performance. The analysis does not evaluate the more specific case of this option as compared to the set of commitments that would need to be made now in the alternative, for example in the All Gas plan.

G. Summary of critique alternative development plan process

MH's process of creating the alternative development plans is not well documented in the NFAT submission or accompanying materials. After identifying suitable resources in the screening process, there is very little detail provided as to how certain resource combinations were created, how the timing of resources was determined, etc.

Overall, despite creating fifteen different plans, MH's range of options represents a relatively narrow view of future development. Additionally the plans do not even fully take advantage of the few resource options that passed MH's screening process, namely DSM and imports. The combination of the manual development process (rather than an optimized process) and the single-pass analysis prevents the planning process from taking advantage of insight that can be gleaned from the economic and financial analysis steps. Finally, MH's plan development process does not incorporate risk analysis during the plan development stage, and therefore exposes the planning to extra risk.

VI. Alternative Plans and Results

La Capra Associates has concluded that MH's review of the alternative development plans has several shortcomings, including an overly narrow range of potential development plans and the use of outdated or inappropriate generation cost assumptions. To address the first issue we have worked with MH to create two additional development plans. This is discussed in Section A below. As noted, Manitoba has only recently completed this analysis and therefore our review of their results will be included in a supplemental report.

To address the second shortcoming, we have prepared analysis evaluating the impact of changing the wind cost assumptions to more current and reasonable estimates. This analysis, discussed in Section B below, provides indicative results that assess the sensitivity of MH's conclusions to the capital cost assumptions.

A. Supplemental resource development plans

Based on our conclusion that MH's plan development process did not produce a full range of potential resource plans, La Capra Associates has worked with MH to develop two additional plans. MH developed the plans and performed a full analysis including SPLASH runs and economic analysis on the results. The plans are summarized below:

- Combined Cycle Plan (CCGT): This development plan builds only CCGT units (i.e., no hydro, no SCGT, etc.). Over the study period, seven CCGTs are built with no new transmission. It has been modeled in SPLASH and the Economic model for all 27 branches of the uncertainty analysis using 2012 vintage data as requested. It has not been evaluated through the financial model. We have also requested analysis using three historical drought conditions, with the Reference-Reference-Reference assumptions being run through MH's financial modeling process.
- No Build / Import Reliance Plan: This plan will test an alternative development strategy to delay new generation build as long as possible. The plan relies on increased DSM (assumed to be 1.5 times the reference DSM), and the promotion of fuel switching to convert existing electric heat to natural gas as well as a reduction in the penetration of electric heating for new dwellings. This plan also assumes the addition of the 750MW transmission interconnection to the US. The

transmission capacity increase would work in concert with a relaxed MH policy constraint on imports, allowing up to 20% of the dependable energy to come from net imports. The timing of the transmission addition would coincide with the need for dependable energy, estimated to be 2029. This plan adds SCGTs and CCGTs over the remainder of the modeled study period in the same sequence as the All Gas Plan.

MH has only recently completed the analysis requested and provided the results. Therefore, La Capra Associates will be filing a supplemental report reviewing the performance of the CCGT and Expanded Imports cases.

B. Wind cost assumption analysis

Given the research showing that MH's onshore wind assumptions were higher than published industry estimates as discussed in Technical Appendix 2: Generation Alternatives, LCA used its version of MH's economic model to rerun the two wind development plans, the Wind Gas and Wind Conawapa, with new onshore wind cost assumptions. This analysis is a sensitivity analysis, using all of MH's assumptions and results from the reference case analysis of the Preferred Development Plan and the Wind Plan, except as noted below.

LCA's wind assumptions for this analysis are included in the table below.

Input	Manitoba Hydro	LCA
Capital Costs	$2400	$1750
Capacity Factor	40%	43%
Lifetime	20 years	25 years
Cost Decline Over Time	None	1%/year through 2032

Figure 3-3: Wind Cost Assumptions for Sensitivity Analysis

LCA implemented its assumptions in the economic model one at a time for each development case. Capital costs were changed first, then an adjustment was made to simulate a higher capacity factor, the project life and then cost decline over time. The charts below show the impact of each variable on the net present value cost of the Wind Gas and Wind Conawapa Development Plans. Changing the onshore wind assumptions does not make either plan less costly than the Preferred Development Plan, but it does bring the NPV cost of the wind plans significantly closer to the

preferred plan on a 78 year NPV metric given the reference case assumptions. The total impact of LCA's assumption on the Wind Gas Development Plan NPV was $1.23 Billion and the total impact on the Wind Conawapa Development Plan NPV was $0.43 Billion.

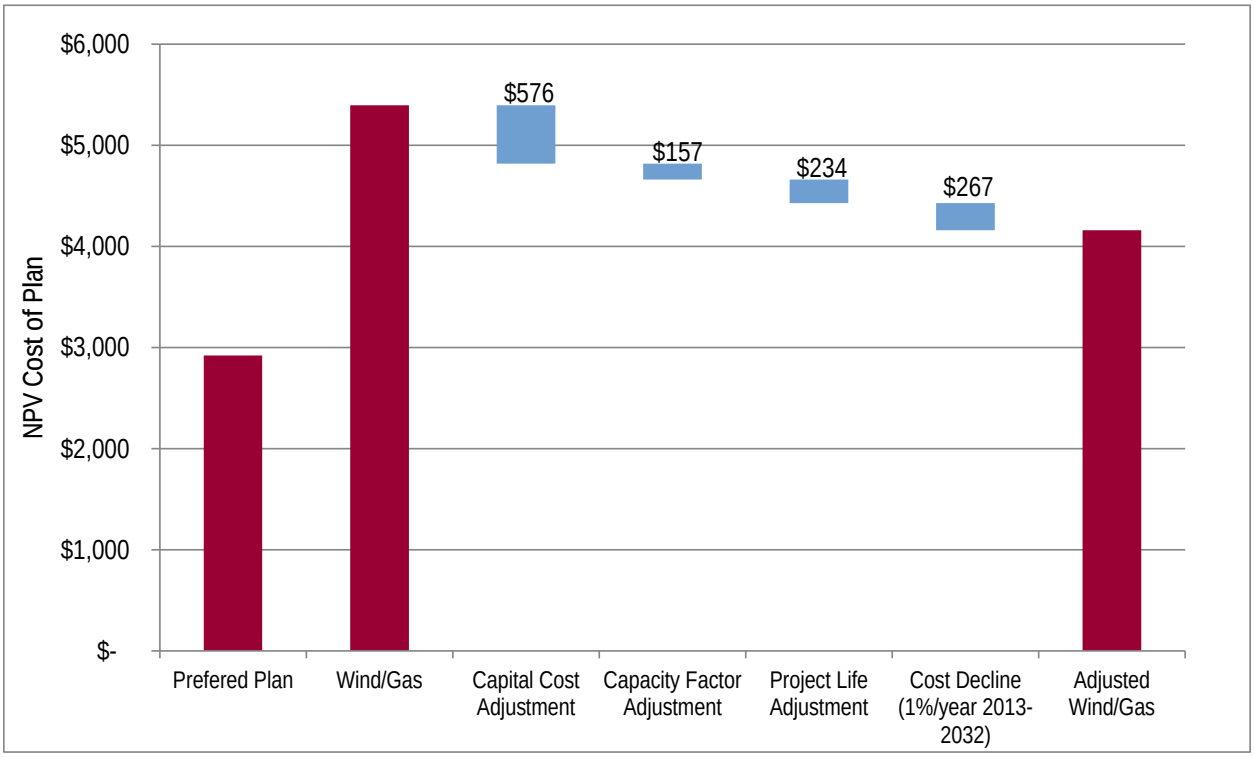

Figure 3-4: Impact of Wind Cost Changes on Wind Gas Development Plan NPV

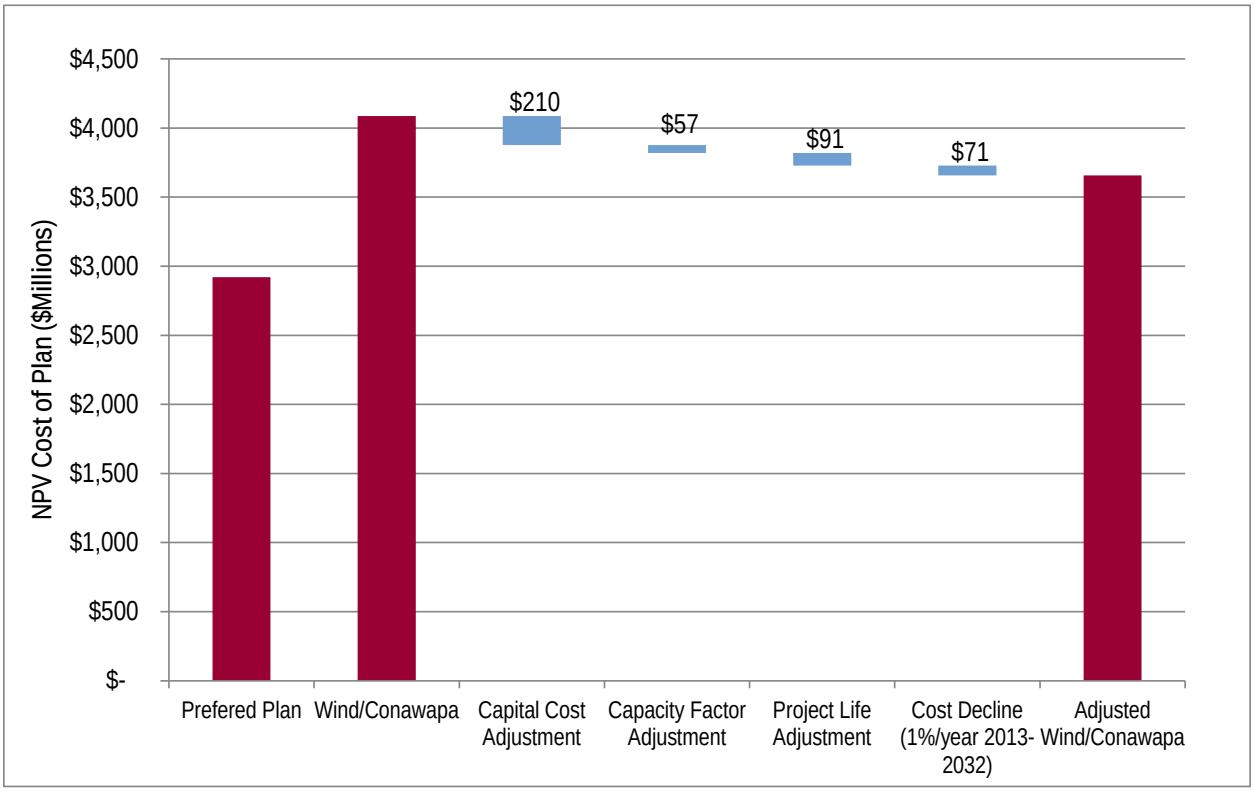

Figure 3-5: Impact of Wind Cost Changes on Wind Conawapa Development Plan NPV

Because of the large upfront capital investment required in the preferred plan, either wind plan has a lower cumulative present value (CPV) than the Preferred Plan for many years into the future. Using MH's assumptions, the crossover point when the Preferred Plan has a lower CPV than the Wind Gas Plan is around 2046 and it is around 2042 for the Wind Conawapa Plan. LCA looked at the impact on this crossover point of using LCA's onshore wind assumptions in the economic analysis. This is shown in the figures below. The crossover point is the point where the CPV line crosses the x-axis. Changing to LCA's wind assumptions moves the crossover point out 11 years to 2057 for the Wind Gas Plan and 10 years to 2052 for the Wind Conawapa Plan.

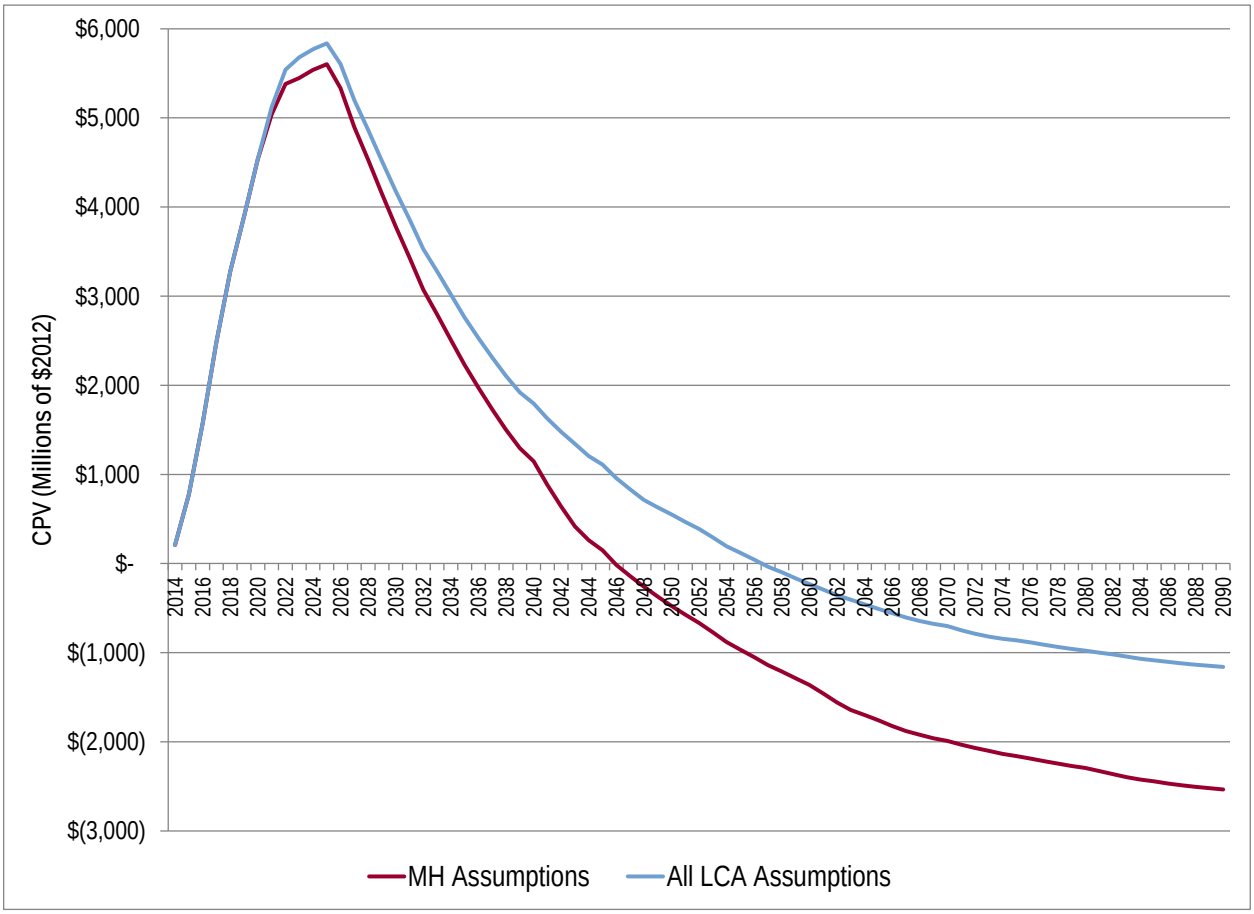

Figure 3-6: Impact of Wind Cost Changes on Wind Gas minus Preferred Plan CPV

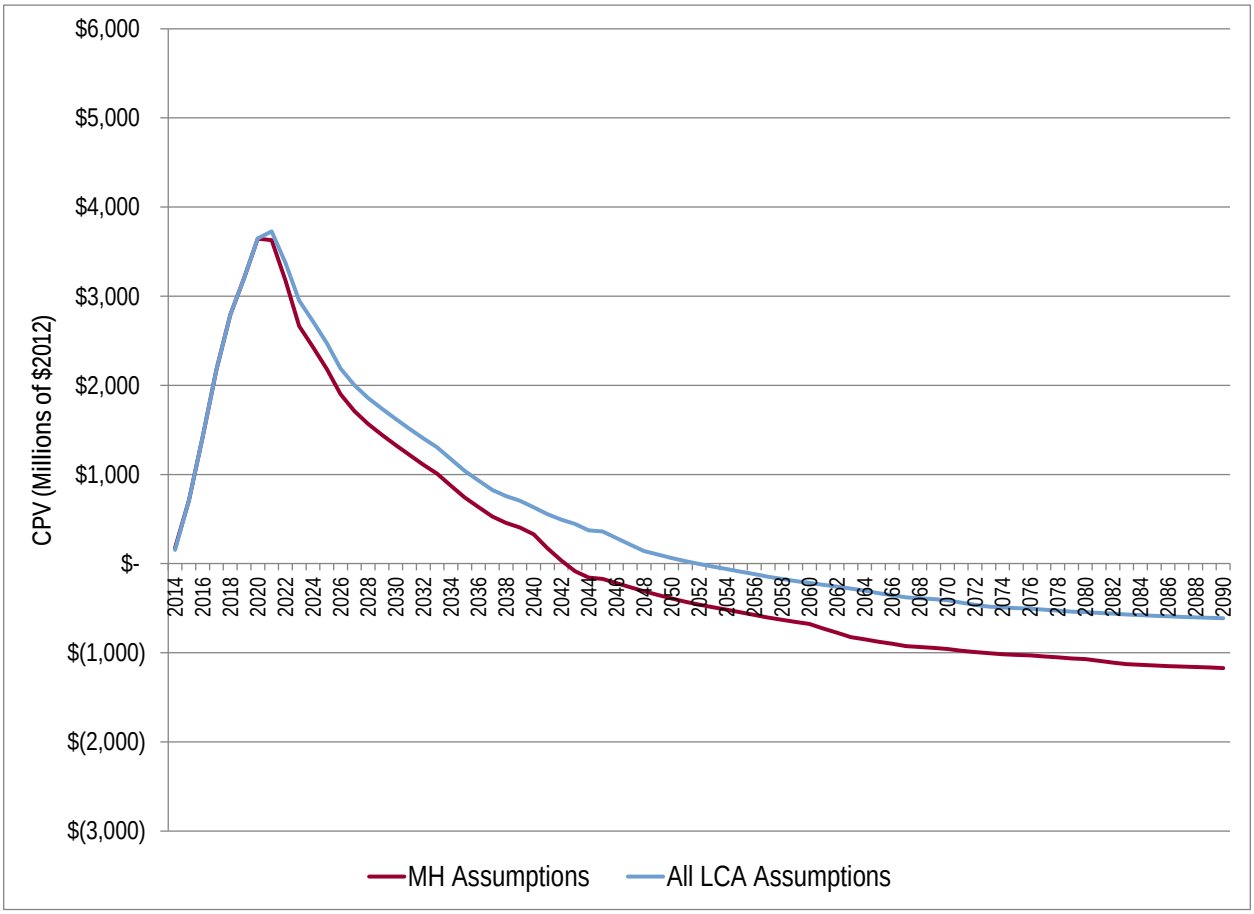

Figure 3-7: Impact of Wind Cost Changes on Wind Conawapa minus Preferred Plan CPV

In addition to the cost assumptions discussed above another issue of MH's treatment of wind is that it places no value on the modularity of wind. In contrast to the Conawapa and Keeyask projects, wind generation is modular and can be built in relatively small quantities and on a relatively short timeline. With wind in its planned portfolio, MH will have the luxury of assessing the project need close to the time of development.

The foregoing analysis indicates the sensitivity of the MH wind cases to the cost and performance assumptions for wind. LCA will be conducting additional analysis on alternative development plans for the supplemental analysis and will be providing additional considerations on the comparison of alternative wind plans to other development plans at that time.

VII. Summary and Conclusions

LCA has reviewed MH's process of creating the alternative development plans. The process begins with the needs analysis and resource option screening, and concludes with the manual development of the potential resource plans. Based on our review and analysis, we offer the following conclusions:

A. Resource needs analysis is overly conservative

MH's process begins with the evaluation of resource need. LCA has evaluated this issue fully in Technical Appendix 1: Resource Planning. Our general conclusion is that MH relied on conservative assumptions and that the actual year of resource need for both energy and capacity will likely be later than MH forecasts. In addition, we identified several ways in which MH could delay the construction of new generation resources to fulfill need.

B. Resource technology screening removes too many options on subjective or misplaced criteria

The resource technology screening process is based on both qualitative and quantitative factors. This manual process is partially based on subjective criteria and does not incorporate any future changes in certain assumptions. An example of this is the screening out of solar PV without considering the significant cost declines expected in the future.

C. DSM not considered as a resource option during plan development

MH included additional DSM as a resource to be included in the development plans because it passed all screening criteria as a feasible and cost effective resource. However, none of the final development plans that were evaluated in the economic and financial analyses included additional DSM.

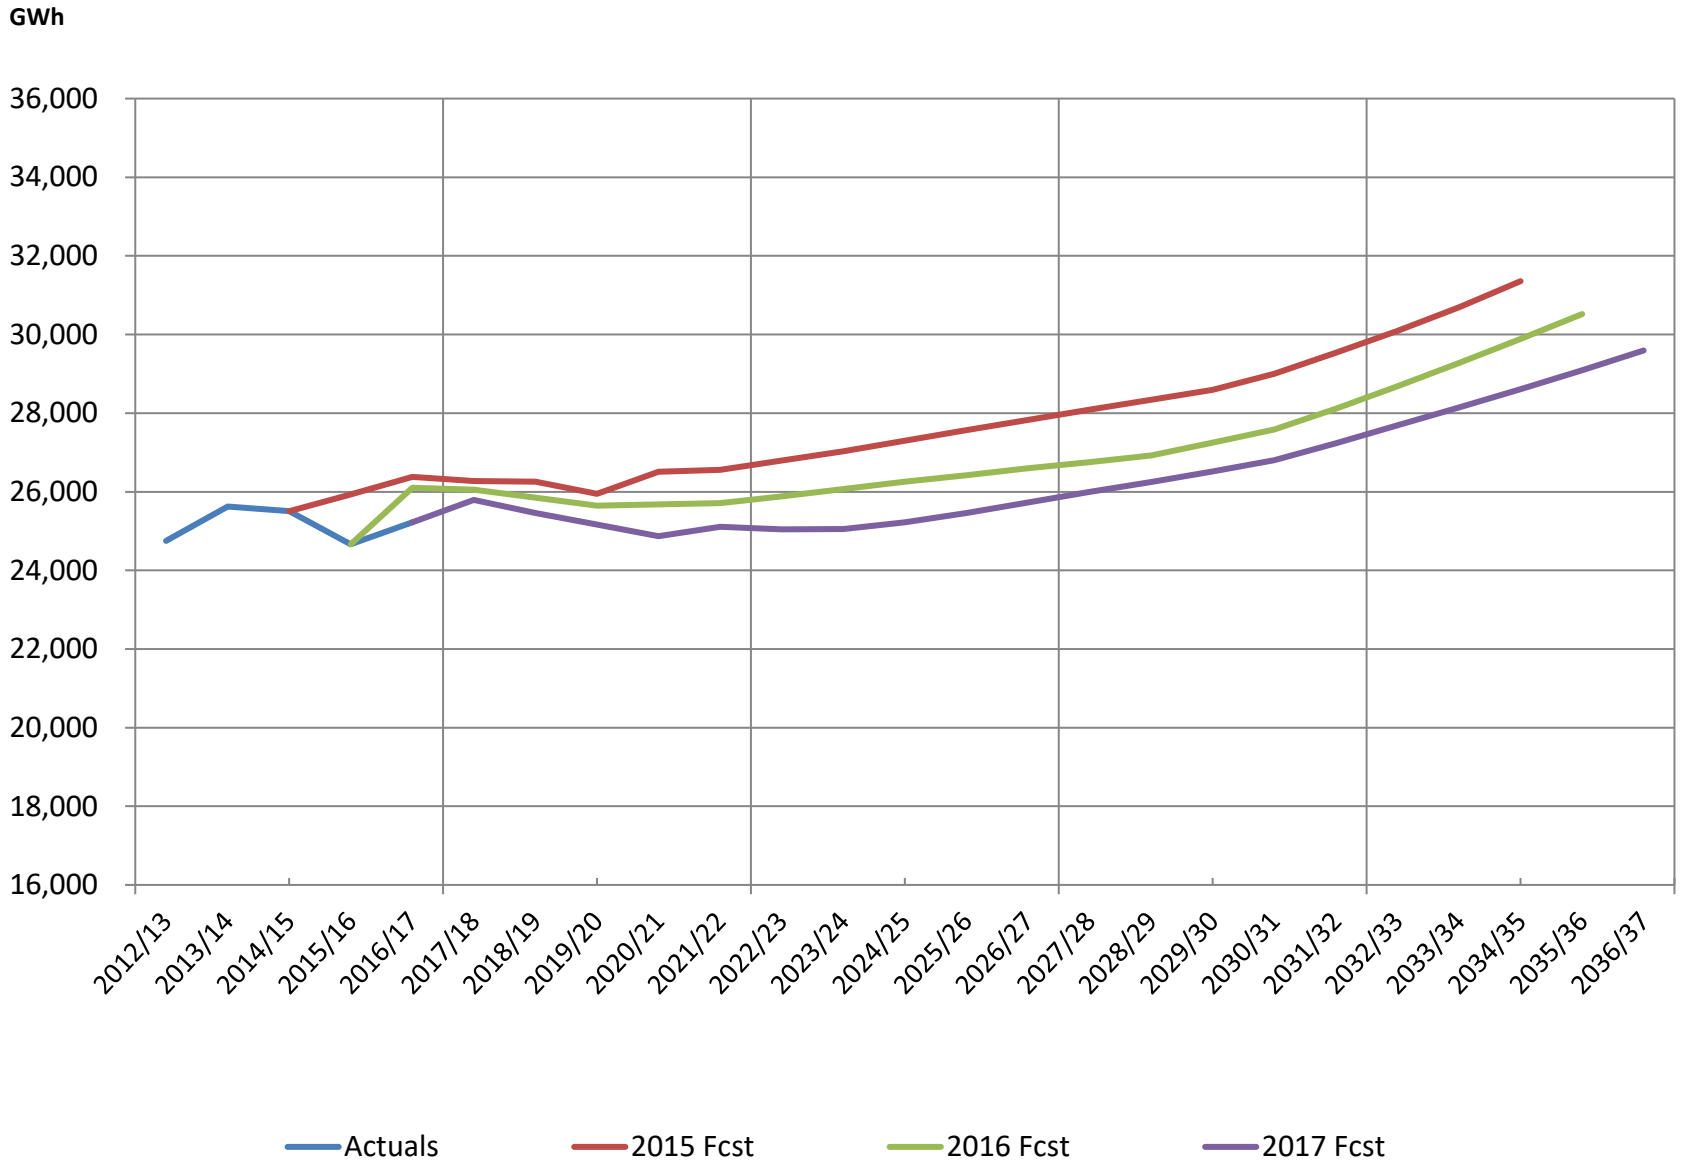
D. Alternative development plans were manually created instead of optimized, represent limited spectrum of options.

MH considered the forecasted timing of resource need, as well as export opportunities, and manually created the alternative development plans using the resource options that passed the screening process. MH did not perform any optimization analysis during

the plan development process, so there is no analytical foundation for determining whether adjusting timing or parameters would produce a more beneficial result.

The various development plans are developed prior to any economic or financial analysis, and the plan configurations are not revised after this analysis. This single-pass process results in plans structured without the benefit of any analytical results.

Finally, the 15 plans evaluated represent a limited spectrum of possibilities. LCA has worked with MH to develop and model two additional plans. LCA's review of the results of these plans will be submitted in a supplemental filing.



E. Wind cost assumptions provide skewed results

MH prepared its analysis using assumptions for wind generation costs that significantly exceed current industry estimates. LCA has performed analysis using MH's economic model to demonstrate that with more current assumptions, development plans featuring wind capacity are much more competitive than MH has concluded.

MH's process evaluated plans that were heavily dependent on wind. Since those plans did not perform as well as the Preferred Development Plan, wind was essentially excluded as a potential resource. Based on our analysis, an optimized development plan would include some additional wind resources with more realistic assumptions could potentially produce a competitive alternative development plan.

--- Upon commencing at 9:04 a.m.

THE CHAIRPERSON: Good morning, everyone. I hope you had a nice weekend.

Ms. Steinfeld, would you like to sort of give us an overview of the week, and -- and then talk about today?

MS. DAYNA STEINFELD: Certainly, Mr. Chair. For the week we will have Manitoba Hydro's revenue requirement panel up for cross-examination. Board counsel will be concluding its cross-examination of this panel today. If it is agreeable to the Board, Mr. Peters is going to take -- after discussion with Dr. Williams, another hour in the afternoon for a total of approximately four (4) hours on cross-examination and then Dr. Williams will take the remainder of the day.

We're scheduled to sit to 5:30. Dr. Williams will continue his cross-examination tomorrow and into the morning on Wednesday, at which time Mr. Hacault from MIPUG will begin his cross-examination. We do have a shorter day scheduled right now for Wednesday. We're expecting to conclude at 4:30 that day, and then MIPUG will continue its cross-examination through the day on Thursday. Thank you.

THE CHAIRPERSON: Thank you. Ms. Ramage...?

MS. PATTI RAMAGE: Yes, thank you, Mr. Chair. On Friday -- or Thursday I should say you ended last week by raising a process concern related to Manitoba Hydro's revenue requirement panel being cross-examined on independent expert consultant evidence prior to Manitoba Hydro having been -- having filed its written rebuttal on the evidence.

And I want to thank you for recognizing that concern. It's consistent with the concerns Manitoba Hydro raised in its September 18th letter when the possibility of delays first were raised and at that time we indicated the view that natural justice required ICs' work be available and for review and discovery prior to the start of the oral hearing.

Unfortunately, as you indicated, the scheduling problem could not be resolved and we find ourselves in a less than ideal position of being on the stand while the IC reports are coming in while IRs are still being posed and answered and while the rebuttal evidence isn't filed.

And at this point, the best we can say is that it is what it is. And we have to make the best of it and we have to adapt and we have to make

this process work. Having said that, I didn't want to leave the panel with the impression that we don't have concerns. The reality is from the time the decision was made to extend the schedule, this is the inevitable result so the goal is to deal with it the best we can. We're counting on being afforded reasonable accommodation in order to address each of the reports.

From our perspective, that means we likely won't be able to address IEC con -- reports fully or perhaps at all in our direct testimony or under cross-examination, and we may have to ask the revenue requirement panel be recalled. We will work with Board counsel to -- to overcome that and -- and that's Manitoba Hydro's position on it at this point.

But at the end of the day Thursday there was a comment made that our concerns regarding the timing of the MGF report were perhaps overstated and -- because of the fact there's going to be a major capital panel later on and -- and I just want to bring -- to address that specific comment.

Manitoba Hydro's major capital panel will be here to address the management of the projects, their budgets and the concerns raised by MGF. They, and by that I mean, the capital panel are

not the ones to re -- to address revenue requirement issues that may arise from the conclusions of the MGF report; that falls squarely within the bailiwick of this panel, the revenue requirement panel.

Major capital by necessity is being dealt with at the end of January, and that's the rub. The revenue requirement panel will step down on December 19th without addressing what is one (1) of the largest drivers of rates - capital spending. If risks with the major projects are identified, and given Mr. Shepherd's evidence, I think it's a fair assumption. It will be identified. I fully expect the PUB's going to want to hear how those risks could impact the Corporation's financial forecasts.

That's not something that the cap -- the major capital panel can address. And if the PUB wants that perspective, I just want to give the heads-up that we're going to have to plan for it. That the revenue requirement panel is going to have to come back. They're going to have to give direct evidence on -- and they're going to, I assume, be cross-examined.

So I appreciate your bringing that up, and -- and it's something that we'll work with Board counsel to deal with but I didn't want to suggest that

it was not an issue by not addressing it.

The other process issue we would like to bring to the panel's attention is that on Friday we were provided two (2) sets of materials by the Coalition; their index of documents and, secondly, what the Coalition is referring to as Notice of Questions which are, from our perspective, quite clearly Information Requests.

I don't believe that it's Information Requests on the rebuttal evidence. I don't know that this has been provided to the Board, but we want to comment that there is nothing in the schedule or the PUB's process which suggest an Intervenor has the ability to file IRs on rebuttal evidence. The record should stand on completion of Manitoba Hydro's rebuttal evidence. There is no surrebuttal.

And this Board gets the best evidence where witnesses are focused and know the record. Distracting witnesses by sending them off to respond to more IRs the weekend before they're to -- to testify is -- is simply -- it's a distraction, and in our view it's, frankly, because the rebuttal evidence is strong and they need to try a different tact, but that's not how the rules work. These questions could have been asked during the IR process and it's not

reasonable to ignore the process and allow additional IRs to be submitted at any time.

Having said that, we will be making it easier. We're -- we're bringing the issue to the Board's attention in the hope that we can address it going forward. We're able to make it easier, I think on everyone, because the fact is that most of the information the Coalition is looking for is already on the record and we will arrange to have our witnesses point out where that is, and hopefully move on, but these kind of distractions are -- are -- are a problem from Manitoba Hydro's perspective, and -- and we're looking for what were -- we object to the disregard for the process.

We were also provided with an index of documents by the Coalition on Friday. The index directed Manitoba Hydro to nineteen (19) documents which the Coalition indicated they may be referring to during their cross-examination of the panel. We have concerns with the number -- with a number of these documents. For example, five (5) of the documents that are -- were cited in the -- that index, Friday's index, they're referenced in an appendix to the METSCO report. It is accurate to say that the documents are referred to in the METSCO report, but to be clear,

they're not citations in support of a position and they are not documents that were appended to the METSCO report, rather, they're reports or studies provided as examples of utilities with mature asset management report programs. Name of utility; name of study, nothing more.

Now, one (1) of the five (5) we were directed to on Friday is a Toronto Hydro study; that study is twenty-five hundred (2500) pages long. There's no highlighting to so -- show where we're going in that study or why we are being cross-examined on it. And I said it -- and I specifically said it was when we were being directed to. On Sunday night we got a new index of documents. It's not there anymore. Our witnesses' time was wasted. They're trying to keep up and they spent their weekend looking at these materials and it's gone now.

We were also given notice to prepare to be cross-examined on the Tennessee Valley Authority's Form 10K. Why? Because it's referenced in MPA's report. It is not appended, it's referenced. We were told to be referenced -- to be ready to be cross-examined on the Bonneville Power Administration's 2016 annual report. It's not on the record anywhere. It's not a footnote. We were also told to be ready to be

cross-examined on Chapters 7 and 8 of Bonbright, 1988. Those chapters are competitive price as a rate regulation standard and social principles of ratemaking. We asked for copies of the reference materials with passages highlighted to assist in getting ready. We have the book, but we want to make sure we're working from the same version, and we're trying to narrow the focus going forward.

Now Sunday night we were provided excerpts, not from chapter 7 and 8 from chapters 12 and 13; completely different parts of the book. So it would appear, again, our time preparing was wasted. The revised index provided on Sunday evening had instead of nineteen (19) documents listed, it had fifteen (15) documents listed and of the nineteen (19) original, ten (10) are gone entirely and new ones have been added to the fifteen (15) page index.

We've spent eight (8) months preparing for this hearing and have amassed thirty-two thousand (32,000) pages of materials doing so. Witnesses prepare and they prepare based on the record. In legal circles, this tactic is sometimes called it -- or it's similar, at least, to trial by ambush. It's not fair to Manitoba Hydro witnesses, and it's not fair this panel. Because if the information is

important, it should be laid out for the panel in a clear manner. It should run through the process, just like all of Manitoba Hydro's evidence runs through the process.

The purpose of the evidentiary process is to get the best information in front of the Board and this is not, in our view, the -- the means of getting the best information to you. It truly brings the process into disarray and does not promote getting the facts before the panel when these reports are introduced this way. How do we examine the authors? What is their probative value? How are they rel -- relevant? How do we test them?

Now some of the new documents, Mr. Will -- Dr. Williams has introduced in his Sunday night book of documents are his submissions from previous hearings. From Manitoba Hydro's perspective that's not evidence. It's argument. And it's something that our witness -- witnesses should not be asked to deal with. We can deal with that as it arises, but I want to bring this issue to the Board's attention.

In addition to the Bonbright references a list of Board Orders has -- is -- appears in the index. This is something Manitoba Hydro -- this panel

is not the best one to deal with; that's not -- that's something I can deal with Dr. Williams and -- and suggest these questions be deferred to the -- the rate design panel where Mr. Barnlund sits and where they are best dealt with. Those were only introduced last night, so it's not something we could do ahead.

So in the end, and after all of this, I can say Manitoba Hydro will do the best it can to deal with this evidence, however, if witnesses feel they need to clarify the record, it may be -- be again necessary for them to come back.

I can assure you it's not what we want to do, we have enough on our plates but if we want the best evidence in the circumstances, that's what we may have to do if materials are thrown at us at -- this manner. I can -- getting materials while I'm sitting in Eric Coy Arena on a Sunday night where you have to step outside and hold your phone in the air is not the best way to receive evidence.

And -- and we wanted to bring that to the Board's attention, bring it to the Coalition's atten -- our concerns to the Coalition's attention and I assume we will address that when the Coalition begins his cross-examination to understand where we're going with all these materials.

THE CHAIRPERSON: I'm going to call on Ms. Dilay but before I do, on the issue of the Notice of Questions which you sort of categorized as IRs, was it to put you on notice that these questions would be asked or did they actually ask that information be provided to them prior to testimony?

MS. PATTI RAMAGE: I wish I had them copied. They are -- from my -- they are IRS. They're in the same format as Irs. They have a preamble. They've used the IR format, and given us to them --

THE CHAIRPERSON: But is it your understanding, they ex -- they expected something prior to cross-examination in that you would provide the material before cross-examination or is it simply they put you on notice that these are the -- these are the questions they would be putting to you in cross-examination?

MS. PATTI RAMAGE: I think they're materials that -- I -- I don't think the Coalition expected they'd be provided ahead of time because it wouldn't be possible, the time it could potentially take to do them. It would be something akin to an undertaking only because they have already -- these matters have already been addressed. It's not like a question in cross-examination that we can't answer on

the fly. It's because it's already been addressed back in the IR process. It just wasn't asked back that but, as I say, these materials are -- if you go through, you can find the answers.

THE CHAIRPERSON: Okay, Ms. Dilay...?

MS. KATRINE DILAY: Thank you. So in terms of the -- the questions, I can indicate our -- our intention was not to receive the information before the cross-examination, it was I guess a notice of technical questions that the ans -- the answers may not readily be provided during cross-examination.

With regard to the documents that were -- the book of documents that was provided, I believe that Dr. Williams will address that this afternoon either as the issues come up or he might speak to it at the beginning.

THE CHAIRPERSON: Okay, any -- thank you for putting on the record. We were trying to design the process as much as possible so everybody would have a fair opportunity to under -- understand what case they had to meet and we'll certainly take your notice under advisement, Ms. Ramage.

MS. PATTI RAMAGE: Thank you.

THE CHAIRPERSON: I will indicate -- I'm going to talk to counsel at the break and we --

we may have to adjust the procedure at a later date in order to ensure that the -- our goal of having all the evidence on the record is met. Mr. Peters...?

CONTINUED CROSS-EXAMINATION BY MR. BOB PETERS

MR. BOB PETERS: Thank you. Good morning, Mr. Chair, Board panel members, Manitoba Hydro witnesses, ladies and gentlemen.

I'd like to ask that volume 1, page 179 be put on the screen just to orientate ourselves this morning.

Ms. Bauerlein, good morning, we see on the screen in front of us from Board counsels' book of documents, which is Exhibit 42-1, page 179. And that's the income statement of the integrated financial forecast that Manitoba Hydro has prepared.

Is that correct?

MS. SANDY BAUERLEIN: Good morning, Mr. Chairman, Madam Vice-Chair and Board members.

Yes, it is the income statement of Manitoba Hydro projected.

MR. BOB PETERS: All right. So we're going to focus for the next short -- short while, on the operating and -- operating and administrative expenses under the test year 2018, and that's $518 million in this forecast?

MS. SANDY BAUERLEIN: That is correct.

MR. BOB PETERS: And then likewise, in the following test year 2019, it shows up as $501 million, correct?

MS. SANDY BAUERLEIN: That is correct.

MR. BOB PETERS: All right, if we could jump well forward to volume 4 of Board counsels' book of documents, and volume 4 is Exhibit 42-4. We're to be in tab 62, and specifically at page 231.

Are you with this, Ms. Bauerlein?

MS. SANDY BAUERLEIN: Yes. Yes.

MR. BOB PETERS: When Manitoba Hydro filed its operating and administrative expense breakdown it was a bit unusual, was it not, in this General Rate Application because Manitoba Hydro was unable to provide the level of detail it had previously provided in -- in other hearings?

MS. SANDY BAUERLEIN: Correct. We had set targets for both the 2017/'18 fiscal year and 2018/'19, but had not undergone a detailed budgeting exercise to break that down into all the individual components.

MR. BOB PETERS: So is the $518 million for the 2018 forecast year, the target?

MS. SANDY BAUERLEIN: That is correct. That is the approved forecast or you may phrase it as a target, yes.

MR. BOB PETERS: Can you explain to the panel why Manitoba Hydro does not have the detail at this point in time?

MS. SANDY BAUERLEIN: So we establish the targets by looking at what we had spent in 2016/'17 and we adjusted it for what we anticipated to be the impacts of the voluntary departure program.

Manitoba Hydro throughout this filing

is continuing to feel the effects of that restructuring. When we -- we -- to put all this together, we made a lot of assumptions in terms of how many people would leave, what the salary of those people would be and even though now we do you have -- we do have a -- a number, a clear number of the eight hundred and twenty-one (821) that are leaving, we continue to be in a process of restructuring throughout many departments where functions are being changes, individuals are being transferred and moved around.

So, the ability to be able to prepare a detailed forecast isn't there. So we manage the total operating and administrative costs at the company level.

MR. BOB PETERS: On the sheet in front of us under Capitalized Labour and Overhead, Ms. Bauerlein, there's the 2016/'17 outlook number of $355.9 million, correct?

MS. SANDY BAUERLEIN: That is correct.

MR. BOB PETERS: Now, I may have put some misinformation through this panel on the record. When I look at that $355.9 million number and compare it to the total employee related expenditures of $854.7 million, it appears that Manitoba Hydro is

actually capitalized -- or had capitalized in 2017 approximately 42 percent of their workforce.

MS. SANDY BAUERLEIN: That's a -- from a point of view of the total costs that are being capitalized.

MR. BOB PETERS: Not necessarily the number of people?

MS. SANDY BAUERLEIN: When I was talking 30 percent, it's the workforce, the number of hours that typically are capitalized.

MR. BOB PETERS: So in addition to the wages, there are overheads capitalized in that $355 million number?

MS. SANDY BAUERLEIN: The three fifty-five (355) is really the capitalization of all the costs that you see in the eight fifty-four (854) number up above. So it's the wages of the employees; the amount of overtime that's related to our capital projects; the amount of benefits that get added to that labour and then charged to the capital projects; as well as other types of costs. For example, motor vehicles, when a crew is working on a capital project they might have some -- some -- a bucket truck, for example, with them. So those costs would also be charged to the capital project through something that

we call an activity rate.

MR. BOB PETERS: Okay. Thank you for that. On page 263 of the same volume 4 of Board counsel book of documents, Exhibit 42-4, Manitoba Hydro provides what is called the headcount and this is the headcount, Ms. Bauerlein, of the employees that have applied for and have been accepted in the voluntary departure program?

MS. SANDY BAUERLEIN: That is correct with the one (1) exception, there were four (4) employees -- additional employees related to our subsidiaries. So because this was an organizational view of our -- our operating and corporate groups, the total year is eight hundred and seventeen (817) but you may have also heard us quote the eight twenty-one (821), which is the total including subsidiaries.

MR. BOB PETERS: And so, for example, which subsidiaries would those four (4) additional people --

MS. SANDY BAUERLEIN: Related to MHI.

MR. BOB PETERS: Manitoba Hydro International?

MS. SANDY BAUERLEIN: Yes.

MR. BOB PETERS: All right. Does this headcount include not only the voluntary departure

program employees, but any other employees whose services may have been terminated by the Corporation?

MS. SANDY BAUERLEIN: No, it does not. It only includes those employees that accepted the voluntary departure program. In some cases it may be management, but it is those that applied for and were accepted under the voluntary departure program.

MR. BOB PETERS: In addition to the eight hundred and seventeen (817) headcount on the Manitoba Hydro electric side, how many additional employees have been terminated?

MS. SANDY BAUERLEIN: I think it was discussed by Mr. Shepherd, there was three (3) executive and I believe approximately forty -- forty-eight (48) or forty-nine (49) but some of that management would be in here and some of it would be through severance.

MR. BOB PETERS: Okay. I was just trying to get a handle for the panel, Ms. Bauerlein, that of the eight hundred and seventeen (817) headcount, as it's called on your -- page 263 of Board counsels' book of documents, Manitoba Hydro estimates that the costs, the salaries associated with those eight hundred and seventeen (817) works out to $91.9, million a year?

MS. SANDY BAUERLEIN: Yes, that is an approximation, yes

MR. BOB PETERS: Now, I'm trying to get in addition to that eight hundred and seventeen (817) it sounds like there could be 53 additional, some of which will be, I suppose, included in the headcount, some of which are not.

MS. SANDY BAUERLEIN: That is correct. Some of them would be included in the headcount and some would not.

MR. BOB PETERS: Are you able to provide the panel with an estimate as to how many over and above the eight hundred and seventeen (817) are employees that will be departing the Company?

(BRIEF PAUSE)

MS. SANDY BAUERLEIN: Sorry, about that. There was approximately ten (10) to fifteen (15) that were severed, the rest would be in that count.

MR. BOB PETERS: And are you able to advise the Board of those ten (10) to fifteen (15) that are severed, they're not included in this headcount or this dollar calculation shown on page

263?

MS. SANDY BAUERLEIN: Correct. This was providing information on the -- the headcount numbers and the savings through the voluntary departure program only.

MR. BOB PETERS: So for the additional ten (10) or fifteen (15), what is the estimated additional savings attributed on an annual basis by not having those salaries and benefits?

MS. SANDY BAUERLEIN: I would have to do a check on that. But I would assume it would be at approximately two hundred thousand (200,000) empl -- I think that would be 150 -- 150,000 in employee plus benefits.

MR. JAMES MCCALLUM: Yeah, I -- I think the -- the order of magnitude here is -- is in the range of $2 million for the additional -- and it's an approximation, ten (10) or fifteen (15) people that were severed as opposed to left the Company through the voluntary departure program. Those were in the main reasonably senior managers and so I think $2 million is probably a good number to work with.

MR. BOB PETERS: And thank you, Mr. McCallum. Were those positions deleted or were just the people terminated?

MS. SANDY BAUERLEIN: Are you talk --

MR. JAMES MCCALLUM: Go ahead, Sandy.

MS. SANDY BAUERLEIN: Are you asking about the voluntary departure program or the ten (10) to fifteen (15) in the management area?

MR. BOB PETERS: I was starting with the -- the management area, Ms. Bauerlein. Were those positions eliminated?

MR. JAMES MCCALLUM: In -- in some cases, yes, for example, the three (3) vice-presidents that left the Corporation, all of those positions were deleted and we consolidated the what we call groups, operating or corporate groups, we consolidated several together in order to permanently eliminate the three (3) vice-president positions. In other cases, we eliminated a department manager position, and combined departments. So, we were able to eliminate a position. In others, we had folks leave the Company and -- and move somebody else into their role.

MR. BOB PETERS: Would you accept, Mr. McCallum, that that if I take the fifteen (15) positions in addition to what's shown on page 263, and those fifteen (15) positions that were severed approximately four (4) of them the positions were removed but eleven (11) of the positions were

refilled?

MR. JAMES MCCALLUM: No, I don't think that's accurate. We would have to go back and look. I mean, these are approximations we're talking to. But in the main, I would say the majority of the positions that were severed, we have carried forward without filling the position. We've combined departments, combined operating groups in order to have one (1) person carry on in the place of two (2).

MR. BOB PETERS: So, Ms. Bauerlein, I'll leave it on the basis that of the -- in addition to the $91.9 million, the best evidence of the Company now is that there's an additional $2 million of annual savings expected from those that were severed from the Company not part of the voluntary departure program?

MS. SANDY BAUERLEIN: Yes, that would be approximation of the additional savings, yes.

MR. BOB PETERS: When would Manitoba Hydro have a more accurate number? Would it have to wait until year end?

MS. SANDY BAUERLEIN: We would wait till the -- for just the management piece or for the total?

MR. BOB PETERS: I was thinking the total.

MS. SANDY BAUERLEIN: We would wait until the end of the voluntary departure program. We're expecting the majority of people to be gone by February 1st of 2018. And at that time, we would have the actual salaries and -- and cost savings. This is, again, is an approximation.

MR. BOB PETERS: When you say the majority will be leaving before -- on or before February 1st of 2018, how long does this voluntary departure program carry on for?

MS. SANDY BAUERLEIN: It does really run till February 1st. There are a couple employees -- - a few employees, two (2) to three (3) that are staying on slightly longer than that timeframe to meet business requirements.

MR. BOB PETERS: So, Ms. Bauerlein, on page 235 of Board counsels' book of documents, volume 4, the forecast information that we were looking at in the response near the last paragraph of the page, the forecast assumed reductions of approximately five hundred (500) EFT's and it was for a partial year.

When we go back to page 231 and we look at that $518 million number, does that now include too few of the employees who are actually going to be

leaving the Company?

MS. SANDY BAUERLEIN: No, it -- it does not. The forecast was put together before we understood what the details of the voluntary departure program was going to be, exactly how many employees would -- would agree to the take-up of the program but, it had a bunch of assumptions in the forecast.

It assumed again, a lower number of people but it assumed many of them leaving sooner, so it assumed that many of those five hundred (500) would be gone earlier in the year.

It made assumptions in terms of salary, what the average of salaries of employees are. And so continually throughout the year, we've been doing analysis to ensure that the $518 million number is still a good number.

Again, many of the employees now are leaving later. The majority of the uptake is -- is in the end of the year, January. So we'll only have three (3) months worth of savings. As well, we've looked at what the -- you know, some of the actual salaries are of some of the employees that are leaving and the terms of the voluntary departure program.

During the forecast we weren't sure what those terms were going to look like. Right now

it's a -- it was -- at this point it's a thirty (30) week. They're getting thirty (30) weeks of -- of paid salary. At the time of the forecast it was forty (40) weeks.

So again, there was just different assumptions based in and we have continually reviewed that number to make sure that -- now that we know some differences that that five hundred and eighteen (518) is still a good number in terms of where we expect our operating and administrative costs to come in for the 2017/'18 fiscal year.

MR. BOB PETERS: If we turn to the 2018/'19 fiscal year, the forecast, Ms. Bauerlein, we see 501 million is the forecast operating and administrative costs, correct?

MS. SANDY BAUERLEIN: That is correct.

MR. BOB PETERS: And in that $501 million number, Manitoba Hydro has assumed is it five hundred (500) voluntary departures under the voluntary departure program?

MS. SANDY BAUERLEIN: Yes. We had assumed the same -- when we did the forecast, we had made the same assumptions in terms of that there would be five hundred (500) people gone and what the average salary would be, at the time we put the forecast

together.

MR. BOB PETERS: And so now you have a degree of confidence that that five hundred (500) number is too low, and there'll be...

MS. SANDY BAUERLEIN: No, again, what we've done is we've done further analysis to verify, you know, is the five hundred and one (501) number, a number that we want to take forward in the test years, and we believe so.

So, while we do have a higher uptake in the VDP, what we have to account for in our costs and what we've done is we've taken a look to say, okay, we now know wage settlement impacts. We know the people that are left. So we know the impacts of those negotiated collective agreements. So, we have an impact on wage settlements.

We also have -- have an impact in terms of -- taking approximately, you know, eight hundred (800) people out of the Company has a significant impact on the work. We're continually, as I mentioned, in trying to put together -- our inability to put together a detailed forecast is because things are changing. People are now needing to perhaps -- we're looking as -- as a manager, you're looking for what work do I need to do, what work can I stop doing,

what work do I do differently, and if I need to continue with that work, how do I do it differently? So I -- we'll need costs for retraining of staff. Some staff need to go into different types of work, so they need retraining for that.

We're also looking for opportunities to try and you -- to take advantage of different IT technologies to assist in enabling the Company to still operate at a -- with the -- such a reduced workforce. Examples that -- things that we're looking at, for example, is something called robotics process automation.

So all of these things that we need to do to be able to facilitate the Corporation in being able to operate and function will require some one (1) time costs that will be incurred in the 2018/'19 fiscal year. So while we've had a higher headcount, we also recognize that there are some costs needed to be able to allow the Company to continue to manage at that level.

So we still believe that 501 million is a -- a good forecast number, and a good target for what our costs need to be for the 2018/'19 fiscal year.

MR. BOB PETERS: Ms. Bauerlein, that

$501 million number only includes approximately $56 million of savings as a result of the voluntary departure program, though?

MS. SANDY BAUERLEIN: In the forecast, yes, but as I said, what we have done is we've taken the savings now, and we've adjusted for -- so we've incorporated the actual savings, which would be greater, but as I said, there's other costs that we anticipate to incur in the 2019 -- '18/'19 fiscal year to allow us to manage.

MR. BOB PETERS: Ms. Bauerlein, are you able to provide the Board with the analysis that you're referring to that will show the updated work by Manitoba Hydro, continues to support the 501 million in the $518 million forecast?

MS. SANDY BAUERLEIN: Yes, we could provide the analysis that shows that the five hundred and eighteen (518) and five hundred and one (501) are -- are still good operating and administrative targets for those years, or forecast for those years, yes.

MR. BOB PETERS: All right. So I'll -- I'll ask that as -- that's something that's not readily at hand, is it?

MS. SANDY BAUERLEIN: Not readily at hand.

MR. BOB PETERS: All right. So then I'll ask through your counsel, Ms. Ramage, if -- if Manitoba Hydro will provide an undertaking to provide its most current analysis to support the operating and administrative costs in the 2017/'18 year forecast as well as in the 2018/'19 year forecast, including the voluntary departure information. Would that be acceptable?

MS. SANDY BAUERLEIN: Yes, we except.

--- UNDERTAKING NO. 5: Manitoba Hydro to provide its most current analysis to support the operating and administrative costs in the 2017/'18 year forecast as well as in the 2018/'19 year forecast, including the voluntary departure information

CONTINUED BY MR. BOB PETERS:

MR. BOB PETERS: Okay. Thank you. The restructuring costs that you mentioned to the panel, Ms. Bauerlein, those aren't shown here, are they? Those would be in other expenses in the --

MS. SANDY BAUERLEIN: The costs that I was referring to are costs that we are going to con -- they're not a -- a direct -- we're not treating them as a direct cost to restructure. The restructuring costs are only the amounts being paid to employees as a result of the voluntary departure program. So the cost that I was referring to in terms of cost that -- for example, a training of staff, that will be charged to operating and administrative costs.

MR. BOB PETERS: Is that shown under the other line on -- on the page 231 that's in front of us?

MS. SANDY BAUERLEIN: It's -- it's not -- some of it might wind up in the other line. Some of it will wind up maybe in -- in other types of costs. So for example, if we hire consultants, for example, to help with some of the implementation of our IT technologies, that would appear in external services.

MR. BOB PETERS: Ms. Bauerlein, in addition to the voluntary departure program, Manitoba Hydro has previously committed to redo -- reduce the workload at the Corporation. Is that correct?

MS. SANDY BAUERLEIN: I'm not sure what you mean by work -- committed to reduce the

workload, yes.

MR. BOB PETERS: Let me rephrase the question. Leaving aside the voluntary departure program, Manitoba Hydro had previously embarked on reductions in the positions at Manitoba Hydro?

MS. SANDY BAUERLEIN: Yes, over the period 2014/'15 to 2016/'17, we reduced approximately for hundred and twenty-nine (429) operational positions.

MR. BOB PETERS: And the Board will see that on page 255 of Board counsels' book of documents, under Tab 65 of Exhibit 42-4. And Ms. Bauerlein, this chart summarizes what you've just told the Board, and that is in terms of what your committed reductions were compared to your actual reductions, Manitoba Hydro has reduced four hundred and twenty-nine (429) positions?

That is correct, four hundred and twenty-nine (429) operational positions were reduced over that three (3) year period.

MR. BOB PETERS: Right. Now, when we say four hundred and twenty-nine (429) operational positions have been reduced, does that mean the position itself was eliminated?

MS. SANDY BAUERLEIN: Yes. The

position was --

MR. BOB PETERS: I mean the --

MS. SANDY BAUERLEIN: -- we call it 'delimited'. The position was delimited. It no longer exists.

MR. BOB PETERS: What happened to the employee that was in the position?

MS. SANDY BAUERLEIN: In some cases, employees retired. In some cases employees had accepted other jobs in the -- in the Company, so they would bid on another job, and then that position would be vacant, and the manager would decide that -- that we were going to either, you know, stop the work, redistribute the work, and then therefore eliminate the position and not automatically fill that position when the employee either retired or moved on to another area.

MR. BOB PETERS: And this is showing the panel the four hundred and twenty-nine (429) positions were delimited bef --

MS. SANDY BAUERLEIN: That is correct.

MR. BOB PETERS: -- before the voluntary departure program?

MS. SANDY BAUERLEIN: That is correct.

MR. BOB PETERS: And the savings that

accrued to the Corporation as a result of that are shown at $43.2 million a year?

MS. SANDY BAUERLEIN: Yes.

MR. BOB PETERS: And on an annual basis --

MS. SANDY BAUERLEIN: That is the cumulative savings --

MR. BOB PETERS: Yes, but on -- on an --

MS. SANDY BAUERLEIN: -- over the three (3) years, yes.

MR. BOB PETERS: -- annual basis, it's -- what is Manitoba Hydro forecasting will be the annual savings as a result of the delimiting of four hundred and twenty-nine (429) positions?

MS. SANDY BAUERLEIN: It would be savings in terms of the incremental of not having those positions anymore. So again, you would be saving your 43.2 million cumulative, and you would save that basically on an ongoing basis, because those costs -- your OM&A would be higher by that much money if those positions still existed.

MR. BOB PETERS: And -- and put inversely, the OM&A expense that you have included in your budget way back on page 231 of Board counsels'

book of documents is $43.2 million lower as a result of the delimiting of those positions?

MS. SANDY BAUERLEIN: It is lower when you compare it over -- so again, we took our -- our outlook -- our -- our '16/'17 numbers. So the '16/'17, the 535 million would already have those savings built into it.

MR. BOB PETERS: In the undertaking that you've agreed to provide, will there be special recognition for these delimited positions in the savings that is accrued to them?

MS. SANDY BAUERLEIN: I was under the understanding I was trying to take you to -- from the five thirty-five (535) to the five eighteen (518). So that would include the impacts of the voluntary departure program and those that were severed. The five thirty-five (535) already embeds those other savings. Those -- those people were gone in the five hundred (500) -- or those positions were gone in the five hundred and thirty-five (535) starting point.

MR. BOB PETERS: All right. I'm still just not clear on the annual savings as a result of the delimiting of the -- of the four hundred and twenty-nine (429) positions. I have the cumulative total, but on an annual basis, what is Manitoba Hydro

expecting to realize as -- as savings by delimiting those four hundred and twenty-nine (429) positions?

MS. SANDY BAUERLEIN: You don't continually -- to see the savings in each year as a lower number because those savings are already built in. So you've -- you've had the 40 -- $43 million included in your 535 million. So your savings are really, Well, if you still had those people, what would have been my incremental cost? So my $518 million would be $43 million more, approximately.

MR. BOB PETERS: Is it correct that Manitoba Hydro has handled the voluntary departure program and this delimiting of positions internally, through its human resources, or has Manitoba Hydro contracted an external consultant on that matter?

MS. SANDY BAUERLEIN: Can you repeat the question?

MR. BOB PETERS: Well, let's start with the voluntary departure program. Is that being handled by Manitoba Hydro's human resource department, or is there an external consultant that's been engaged to deal with that?

MR. JAMES MCCALLUM: Well, I -- I guess there's a -- a few elements, I think, to your question, Mr. Peters, if I'm understanding it. Vis-a-

vis the kind of practicalities of identifying and dealing with eight hundred and seventeen (817) individuals and having them leave the Corporation, that we did in-house with our human resources department.

The job of figuring out how to continue running the Company after they're gone has been also managed in-house throughout the Company. I mean, every manager, director, and vice president has spent an enormous amount of their time over the last year figuring out an operational plan to continue running our business with 15 percent fewer people.

But if the question is, did we engage outside consultants at this stage to help us with that, we have not. Although, as Ms. Bauerlein spoke to, we recognize that there is going to be some effort and some help required to continue adjusting our business to what is a very significant workforce reduction.

We're kind of just at the initial stages of it, given that -- that of the eight hundred (800) people, you know, roughly only three hundred (300) have left to date with -- with more than five hundred (500) still to leave on February the 1st.

MR. BOB PETERS: All right. Thank

you, Mr. McCallum.

I'd like to turn briefly to Tab 70 of Board counsels' fourth book of documents, page 322, and my only point to turn to this is to bring to the panel's attention some questions that had been asked earlier by, I think counsel for MKO related to payments from government or payments to government.

This is a summary page, is it, that reflects what payments Manitoba Hydro makes on an annual basis to various government entities?

MS. SANDY BAUERLEIN: That is correct.

MR. BOB PETERS: And but for the column called municipal GILT, or gifts in lieu of taxes and business taxes, the other payments are made to the Province of Manitoba?

MR. JAMES MCCALLUM: I'd just correct that there -- it's not a gift in lieu of taxes, it's a grant in lieu of taxes, but -- but --

MR. BOB PETERS: 'Tis the season, Mr. McCallum?

MR. JAMES MCCALLUM: Ho ho ho. Yes, the balance goes to the Province.

MR. BOB PETERS: Does this -- does this chart include Manitoba Hydro's expected or anticipated payments to the Province on account of

Keeyask and Bipole III as well?

MS. SANDY BAUERLEIN: I'm not sure what -- what you're asking. In terms of the impact on our -- our provincial guarantee fee, or capital taxes? I'm -- I'm not --

MR. BOB PETERS: Let me try it this way. On -- on page 334 of Board counsels' book of documents, Manitoba Hydro has provided a chart of what payments Manitoba Hydro has made and expects to make to the Province of Manitoba related to the Keeyask project, correct?

MS. SANDY BAUERLEIN: Correct.

MR. BOB PETERS: And these payments are included in the previous schedule that we reviewed on page 322?

MS. SANDY BAUERLEIN: Yes.

MR. BOB PETERS: All right. Thank you. Also, on page 335, Manitoba Hydro has provided the Board with an indication of what payments Manitoba Hydro will -- has made and will be making on a forecast basis to the Province related to the Bipole III project, correct.

MS. SANDY BAUERLEIN: That is correct.

MR. JAMES MCCALLUM: I -- I might just caution, Mr. Peters, that these payments you've

referenced on page 335 and the other relating to Keeyask kind of have a simplifying assumption around how much debt remains attached to each of Bipole and Keeyask.

I think we -- we kind of talked about last week that we don't stream or finance individual projects individually. So the master sheet, and I've lost it -- ult -- ultimately, our debt guarantee fee, our capital tax are really determined by the capitalization and the business, regardless of where it's applied. As well, the water rental fees are -- are determined basis, the -- the generation of the business regardless of which station it -- it's generated at. So I think the -- the master schedule is probably the -- the best one to look to as to the payments to the Province.

MR. BOB PETERS: Do I understand the point of your comment, Mr. McCallum, to be telling the Board that even though Manitoba Hydro has calculated the payments to the Province for the Keeyask project and for the Bipole III project, that's not in practice how Manitoba Hydro does the math?

MR. JAMES MCCALLUM: That -- that's correct. We do it on a consolidated -- meaning at the electric segment level, a consolidated basis, if that

hopefully makes sense. I can try again.

MR. BOB PETERS: All right. Thank you. I'd like to leave OM&A expense, if I could, Mr. Chair, Board members, and turn over some power resource and some export issues. And I believe Mr. Cormie, you will be assisting the panel in this regard.

Could we start, please, on Board counsels' fourth book of documents, Exhibit 42-4 on page 102, 102.

(BRIEF PAUSE)

MR. BOB PETERS: And Mr. Cormie, help me as you can, and I -- I see Mr. Miles isn't far away. And if -- if additional information is required, certainly avail yourself of his assistance.

But what you're showing the Board on page 102 of Board counsels' book of documents is how Manitoba Hydro plans to meet its load each and every year in the forecast?

MR. DAVID CORMIE: Yes, that -- this table shows how we expect to meet the energy demand.

MR. BOB PETERS: And on page 102 of Board counsels' fourth book of documents, you say the

energy demand because you're wanting the Board to know that you also do a similar sheet, and we -- we'll -- we'll come to that, on the capacity side?

MR. DAVID CORMIE: Yes, the capacity is -- is to ensure that we have enough generating capacity to meet the peak demands of our customers plus our reserve obligations.

MR. BOB PETERS: And on this chart, Mr. Cormie, there's also in the heading, if we could just scroll up a little bit, we see the word "dependable resources," correct?

MR. DAVID CORMIE: Yes, that -- that's correct.

MR. BOB PETERS: You showed the panel in your direct evidence the last approximate hundred years of water flows with your -- with your bar chart, correct?

MR. DAVID CORMIE: I did, yes.

MR. BOB PETERS: And do the dependable resources reflect the resources that would be available to Manitoba Hydro if Manitoba Hydro suffered the lowest water levels in its recorded history?

MR. DAVID CORMIE: Yes, this reflects the -- the worst-case historic drought.

MR. BOB PETERS: So everything above

the historic drought will be surplus to what's on this chart?

MR. DAVID CORMIE: Yes. There will be surplus energy available under better than minimum flow conditions, yes.

MR. BOB PETERS: If we briefly look, the -- the top half of the page, or the -- sorry, the top third of the chart is -- is empty, and that reflects that Manitoba Hydro has no new power resources on the horizon?

MR. DAVID CORMIE: That's correct. On that -- on that page, I -- there is a -- a second page that carries on.

MR. BOB PETERS: And -- and if I'm looking at page 103, I -- I think it's likewise, nothing is included on the planning horizon at this point in time. Have -- would that be a correct interpretation?

MR. DAVID CORMIE: I think the purpose of this chart is to show -- whether we need them or not, this is the -- this is the supply and demand balance, assuming no new resources are put in.

MR. BOB PETERS: So let's go back, please, to page 102, and we look under "base power supp -- base supply power resources," in the left-hand

column. The existing and committed Hydro reflects the plants that Manitoba Hydro has online, plus what's going to be coming online, particularly, the -- the Keeyask project, correct?

MR. DAVID CORMIE: That's correct.

MR. BOB PETERS: And under the thermal resources -- well, before we get there, is -- is the -- I'm not sure if this is -- if it's -- is it the mothballing of Pointe du Bois, is that reflected in the supply and demand tables.

MR. DAVID CORMIE: I believe, Mr. Peters that we're assuming that four (4) units at Pointe du Bois are unavailable for service in this table.

MR. BOB PETERS: And does that carry forward into the forecast of export volumes in the integrated financial forecast?

MR. DAVID CORMIE: I think, Mr. Peters, it's better if Mr. Miles speaks to the issue of Pointe du Bois.

MR. BOB PETERS: I'd be pleased. If he wants the microphone from the back, or do you want him at the front row, Ms. Ramage?

MS. PATTI RAMAGE: We have Mr. Miles here. He hasn't been sworn, and we're ready for that,

but if Mr. Simonsen would like to come over and swear him, he can speak from the back row.

MR. BOB PETERS: Okay. Thank you.

TERRY MILES, Sworn

CONTINUED BY MR. BOB PETERS:

MR. BOB PETERS: Good morning, Mr. Miles. I think the panel would appreciate your update, then, on the Pointe du Bois and how it's been treated in the -- in the power resource planning.

MR. TERRY MILES: Okay. Well, good morning, everyone. So Pointe du Bois in this -- in this plan has been treated not going ahead with four (4) unit refurbishments moving forward. We were intending on having four (4) units in Pointe du Bois upgraded, if you will, and carry those on for probably thirty (30), forty (40) years into the future.

We've re-looked at those options, and given the capital costs, given the market value, and given our re-look at capital, we have chosen not to include those costs in our current budgeting and planning right now. So as a result, then, we've removed that work on a go-forward basis.

So under this plan, it assumes that in

the -- I think it's in the 2021 or 2022 timeframe, that then the existing units at Pointe du Bois will receive significant enough failures that we wouldn't refurbish them, and that would be considered as we go over in -- in time, but one (1) unit would remain. There's one (1) unit that is still in good working condition. It's this draft flow unit. That's an 8 megawatt unit that will then continue on for the planning horizon.

As a result of that, what happens then on the dependable side, which is probably what you're looking at, there's about 221 gigawatt hours of generation that would come from those other three (3) units that were -- that were there, and as a result, then, there's a reduction in dependable energy from Pointe du Bois.

MR. BOB PETERS: And thank you, Mr. Miles. So Pointe du Bois has had its capacity dropped from the previous 75 megawatts down to the current thirty-three (33), and you're indicating it's going to go down as low as 8 -- 8 megawatts?

MR. TERRY MILES: That's correct.

MR. BOB PETERS: And while we're on it, the Selkirk Thermal Plant appears limited to 33 megawatts because of transmission constraints? And I

don't know if the panel's heard of those before. Is that a new phenomenon?

MR. TERRY MILES: It -- it's not a new phenomenon. In the -- in the last Power Resource Plan, we'd assume that there would be upgrades for those transmission constraints that would increase the capacity of Selkirk from about 33 megawatts up to 125 megawatts.

Again we're revisiting those expenditures and have taken them out of our -- of our forecast plan going forward. And as a result, then, we've taken, then, the increase from 33 megawatts up to 125 megawatts out of our plan, and that's what's reflected in the tables.

And it's essentially because we don't have those in our plan to do maintenance, we can't include them in our plan, and from a transmission reliability perspective, we're unable to include that additional capacity until such a time as we have those transmission upgrades.

And what happens periodically is a transmission -- we'll do system studies that look at load changes in the system and generation, and depending on where load changes, so you could have a big industrial customer, say, on the Winnipeg River

somewhere, or elsewhere in the Province, and that changes the load dynamic, and it changes how the transmission system works. And when they do their studies, the balance of load in this case only allows 33 megawatts of Selkirk really to be usable under -- there's certain loading conditions that they study.

So that's essentially what caused us to go to the reduced -- the reduced loading, and then revisiting capital caused us to take those expenditures out of our plan. And we'll reconsider them. It doesn't mean it's off the table. It just means currently it's not in the plan and we don't have things in the budget for that.

MR. BOB PETERS: If we could turn to page 98, and Mr. Miles, perhaps you can assist here as well. We're -- we're switching to the capacity resources, and I think we see perhaps more accurately that Brandon Coal, or Unit 5 is scheduled for decommissioning in 2019, is that correct?

MR. TERRY MILES: So Brandon Unit 5 Coal operations, so Brandon Unit 5 is a coal unit. It's a coal-fired thermal unit. And in -- at the end of 2018, we've -- timing essentially with -- with Bipole III coming into service, Brandon Unit 5 as a reliability resource will no longer be required, and

coal operation will be ceased.

The Unit itself, the generation equipment will be -- will be used as a synchronous condenser on a go-forward basis to provide transmission system support in the area. So the Unit will -- will still be used. It's just we won't be using it as a coal unit. It basically acts as a motor to provide stability to the electrical system.

MR. BOB PETERS: But Unit 5 is still needed for emergency operations?

MR. TERRY MILES: Unit 5 will not be operated at all for generation after 2018/'19 until such time as changes to the generation system would be made. It will not have a generation capability beyond that.

MR. BOB PETERS: On the same chart on page 98 of Board counsels' book of documents number four, it appears that wind is now counting towards winter peak capacity. Is that correct?

MR. TERRY MILES: That's correct.

MR. BOB PETERS: And wind is not a dep -- I -- maybe I'll ask it this way. Is wind a dependable resource?

MR. TERRY MILES: Wind, from an energy perspective, is a dependable resource, yes. So in --

over -- over the course of the year, actually, wind -- wind -- we can rely on wind to provide a certain amount of energy over the course of the year.

MR. BOB PETERS: But you just can't dispatch it when you want it?

MR. TERRY MILES: You can't necessary dispatch it when you want it, but that doesn't mean that it can't provide some capacity value at -- when our peak load occurs in the winter. Initial assumptions with wind were that there wouldn't be sufficient generation at the peak load times in -- in the wintertime, and experience has shown that we can allocate a certain amount of capacity resource to wind, because it is there at times. And that's based on our number of years of experience with the wind and observing it in Manitoba under our -- our loading conditions. So that's where that capacity amount has been.

There's always been some in the summertime for the market case. There were always cold weather restrictions attached to the -- to the wind components, and it's in the order of, you know, below minus thirty (30) or minus thirty-five (35). The units, actually -- the -- the wind units that -- they have the turbines aren't guaranteed to operate,

and that's sort of a mechanical aspect of it.

But I think what we see is if they are operating and they are going, the temperature inside the wind turbine in the unit that's there is actually a little warmer than it is outside, so it's able to operate if they are operating. I believe if they weren't operating, and you had to start them up, they wouldn't be able to start up below that minus thirty (30) or minus thirty-five (35). So based on operational experience, we've adjusted that capacity factor in the winter, and allow that -- allow that.

MR. BOB PETERS: In that answer, Mr. Miles, I -- I think I heard you saying if it's too cold, these units might not work unless they're already idling. Is that, in essence, what you're saying?

MR. TERRY MILES: Unless they're actually operating, yeah.

MR. BOB PETERS: And to reflect wind as being a dependable resource, Manitoba Hydro has had to reduce its expectations of what would be available? Would that also be correct?

MR. TERRY MILES: From an energy or capacity perspective?

MR. BOB PETERS: From a capacity

perspective.

MR. TERRY MILES: Sp from the capacity perspective, it's -- it is based on our experience and the operation of the wind turbine.

MR. BOB PETERS: And Manitoba Hydro's relying on historical data or statistical calculations to provide it with the confidence level to include it in its dependable energy?

MR. TERRY MILES: Essentially.

(BRIEF PAUSE)

MR. BOB PETERS: If we could turn back briefly to page 102, and we'll scroll to the bottom two-thirds of this -- this chart.

Would it be correct, Mr. Cormie, in the -- the bottom third, you're telling this Board what Manitoba Hydro's domestic load is going to be expected to -- to consume?

MR. DAVID CORMIE: Yes, that's the -- the base load forecast less the DSM forecast pres -- results in the Manitoba net load.

MR. BOB PETERS: And this was -- as Ms. Morrison had explained to the Board --

MR. DAVID CORMIE: Yes.

MR. BOB PETERS: -- last week? And then Manitoba Hydro also has -- and you can see highlighted -- the net load. The net load number, Mr. Cormie, is -- is the net of the MS. DAYNA STEINFELD: -- demand-side management?

MR. DAVID CORMIE: Correct.

MR. BOB PETERS: And then once we know what Manitoba's load is, Manitoba Hydro also then has to add in what it's committed to provide by way of exports, export contracts that you've had arranged, correct?

MR. DAVID CORMIE: Correct.

MR. BOB PETERS: And under the proposed exports, nothing's on the short-term horizon, it doesn't appear, Mr. Cormie. Is that also correct?

MR. DAVID CORMIE: That's correct.

MR. BOB PETERS: But then less adverse water. And can you briefly explain to the panel why Manitoba Hydro is reducing its total energy demand by an amount related to adverse water?

MR. DAVID CORMIE: Adverse water conditions, Mr. Peters, exist in several of our export contracts that allow us to serve our sale obligations under -- under these extreme conditions by purchasing energy from the company who we're selling energy to.

So in effect, they're self-supplying energy under those conditions.

So it's not energy that Manitoba Hydro has to have on its system. It can rely on the contract provisions to meet its obligation to the customer. So in -- in effect, it reduces the -- our obligation in -- that's served from Manitoba. The obligation still has to be met, but it can be met through a purchase from the export customer.

MR. BOB PETERS: So the -- just to be clear, when Manitoba Hydro -- and this chart depicts the -- the worst historical drought that Manitoba has had. You're indicating that Manitoba Hydro still has to fulfil contractual arrangements, but it doesn't necessarily have to come from Manitoba electrons?

MR. DAVID CORMIE: That's correct. So if you look at the first column, it shows we have contracted for 3,410 gigawatt hours. We still have to provide that electricity in that year, but 370 of those gigawatt hours can be purchased from the export customer. And so it's being purchased off a generator in Minnesota rather than being supplied from a generator in Manitoba, so it doesn't need to show up in our supply and demand balance for Manitoba.

MR. BOB PETERS: And I'm not wanting

to go anywhere near commercially-sensitive information, Mr. Cormie, but does Manitoba Hydro have export contracts that will limit the amount that Manitoba Hydro has to export when it is in a drought, other than through adverse water?

MR. DAVID CORMIE: Yes, there are -- there are contracts where when Manitoba Hydro normally would have an obligation to supply, for example, energy on the weekend under the contract. We have the right not to supply that, and we would have to demonstrate to our customer that we're in that -- in that condition described generally as being in adverse water. And we would -- with the -- we would then be able to exercise our right not to deliver.

MR. BOB PETERS: Mr. Cormie, the last line on this sheet talks system surplus.

Do you see that?

MR. DAVID CORMIE: I see that, yes.

MR. BOB PETERS: Going from my memory, and you can correct me in front of the panel if you choose, that the Keeyask generating station is to add approximately 3,000 gigawatt hours a year of energy.

Do you accept that?

MR. DAVID CORMIE: Yes, I accept that.

MR. BOB PETERS: So when the panel

looks at this last line on page 102, which is in -- on the monitor, for every year in which the surplus exceeds 3,000 gigawatt hours, those would be years in which the energy from Keeyask wouldn't technically be needed to serve Manitoba's domestic load as well as their net export load.

MR. DAVID CORMIE: Not exactly, Mr. Peters, because the Keeyask project was developed in conjunction with the new US interconnection, so the U -- the new US interconnection provides dependable energy as well. And so you have to think of them as a package. You can't just attribute all the surplus to -- to Keeyask. There's a combination of both projects that result in an increase in dependable energy, or an increase in the system surplus that's shown on this table.

MR. BOB PETERS: Well, let's -- let's turn to page 103, the next page, and look at the bottom line, Mr. Cormie. And I suppose much like the checkbook there's some red ink showing up here. And it's in the -- if we can look at the top part of it. I believe it's in 2040? Yes.

If we can now scroll back to the bottom in 2039/2040, we see that the system surplus has turned negative; correct?

MR. DAVID CORMIE: Yes.

MR. BOB PETERS: And so that's telling Manitoba Hydro that if this is a persistent problem, Manitoba Hydro has to find some way to address that persistent shortfall, otherwise, it can't meet its total energy requirements.

MR. DAVID CORMIE: Yes. Under the assumptions associated with the table, yes. But both the Keeyask project and the new interconnection have moved that date of new need out into the 2040. It's not just the Keeyask project that's done that.

MR. BOB PETERS: Oh, I have --

MR. DAVID CORMIE: Absent both projects, it would be much earlier than that.

MR. BOB PETERS: Are you able to indicate how much earlier?

MR. TERRY MILES: It's in the order of 2032/'33.

MR. BOB PETERS: I'm sorry, Mr. Miles?

MR. TERRY MILES: It's in the order of 2032 -- 2032 time frame, that early 2030 time frame. It varies depending on assumptions that are -- that are there.

MR. BOB PETERS: Cut can you explain then, Mr. Cormie, what dependable energy comes from

the intertie by itself?

MR. DAVID CORMIE: The -- yeah, the new interconnection increases our import capability by 700 megawatts. So it essentially doubles it from 700 megawatts to 1,400 megawatts. And we count on a portion of that to add to the dependable energy supply of the system.

And so it's a -- it's -- it's the dependable energy that comes from Keeyask plus the dependable energy that comes from the new interconnection that -- that provides the overall dependable supply.

MR. BOB PETERS: Are the two (2), Keeyask and the intertie, additive in terms of dependable energy?

MR. DAVID CORMIE: Yes, but they're -- but -- but what you couldn't have had one (1) without the other. That's what I'm saying. They're linked. Like, we could -- we wouldn't have built Keeyask without building the interconnection.

MR. BOB PETERS: I remember the NFAT. Mr. Cormie, what you're telling the panel is that because you have now -- Manitoba Hydro now has an additional 700 megawatts of import capability under the new interconnection, Manitoba Hydro can, for

example, import into Manitoba at night and keep water in your reservoirs.

MR. DAVID CORMIE: We would import at night to serve the load demands under these low water conditions. We wouldn't -- we would -- we wouldn't just import to put it in the reservoirs. We'd import it to serve the load.

MR. BOB PETERS: I'm sorry then. So in terms of this -- these charts that we're looking at, this is the -- the worst year on record. So the reason for using the intertie would be to serve the Manitoba load, not just for enhancing storage capability.

MR. DAVID CORMIE: Yes. Serving it on a -- on a dependable basis. We -- we essentially guarantee that we'll be able to call on that 700 megawatts a certain percentage of the time to -- to serve our -- our needs. As opposed to building another generating station we can count on the import capability.

MR. BOB PETERS: All right. If we can go back to page should 98. This deals with the capacity side in the same -- in the same drought scenario; does it, Mr. Cormie?

MR. DAVID CORMIE: This is the -- the

cap capacity table, yes. And it's -- rather than the drought scenario, Mr. Peters, it's -- it's the winter peak demand, and it also includes the planning criteria that we maintain as re -- sufficient reserves as defined by our planning criteria.

MR. BOB PETERS: And you're telling the panel that this is an important chart, because Manitoba Hydro is a winter peaking utility, and we saw little bit of that weather this morning; correct?

MR. DAVID CORMIE: Yes.

MR. BOB PETERS: And if we -- if we look at the generation outages over system peak line item, what does that reflect, Mr. Cormie?

(BRIEF PAUSE)

MR. DAVID CORMIE: Mr. Peters, that is a planned generating -- generation outage that we know today will occur in that year, and -- and we're planning for that.

MR. BOB PETERS: And it's a planned outage for servicing or for...

MR. DAVID CORMIE: I don't know the details of it. It's just that that capacity which we would normally expect to be there is -- is not going

to be there that winter.

MR. BOB PETERS: Looking at the bottom line on page 98, Mr. Cormie, much like we saw with the energy, we can follow out here and see what the system surplus is.

And remind us again, Keeyask is 630 megawatts.

MR. DAVID CORMIE: That's the net addition. Yes, that's correct.

MR. BOB PETERS: So on that bottom line on system surplus, is it every year in which the system surplus exceeds 630 would be indicative of a year in which the capacity of Keeyask wouldn't be required in this dependable example?

MR. DAVID CORMIE: That's correct.

MR. BOB PETERS: If we follow over to page 99 --

MR. TERRY MILES: Mr. Peters, could I also add just a note to that just for the Board?

MR. BOB PETERS: Please.

MR. TERRY MILES: So these tables assume a number of assumptions. So we assume that our system will remain intact. All of our bay system will -- will be there. We talked about an outage, this 15 megawatt outage of a unit. So these tables assume

that we're doing all the maintenance and all those types of things into the future to remain -- keep our whole system intact. So that's the whole, you know, 5,000 plus megawatts of existing system impact between now and the mid-'20s. That's twenty (20) years out into the future.

It also assumes that we achieve the DSM savings and targets out at that time frame that we go in time to as well. So not to think of it at any -- any one (1) component that's there. We can draw the inference and say it's 630 megawatts for Keeyask and -- and do that math. That's a mathematical exercise, but I think we need to understand the base assumptions and what's sort of required and -- and what will be there, if you will, out at that time frame. Just to give a little more context around the assumptions behind the plan.

MR. BOB PETERS: Okay. Well, let's turn to page 99 of Board counsels' fourth book of documents, and look at the bottom line in the year -- I see it in the year 2041/2042.

That's when there is a 56 megawatt shortfall that first appears; correct, Mr. Cormie?

MR. DAVID CORMIE: Yes.

MR. BOB PETERS: And this would be the

beginning of where -- where Manitoba Hydro sees persistent shortfalls in their system planning under dependable conditions?

MR. DAVID CORMIE: With the exception of the -- using the word "dependable." It -- it is the year that -- that we would see persistent deficits under the assumptions that the table is prepared on.

MR. BOB PETERS: And Manitoba Hydro isn't proposing any new generation to meet that deficit; is that right?

MR. DAVID CORMIE: Not at this time. This table is -- is based on the assumption that we wouldn't put in -- we're not putting in -- we're not -- we're not putting -- planning on any resources. This -- the table just says, If we did nothing and our assumptions proved to be true, this is when we would see that shortfall, yes.

MR. BOB PETERS: And so what would Manitoba Hydro's assumption be if Manitoba Hydro had to do something for 2042?

MR. DAVID CORMIE: I don't know. That's a long way away, Mr. Peters. I'm not sure what my -- our children might be deciding to do at that time.

MR. BOB PETERS: So at this point in

time, for planning assumptions, Manitoba Hydro has sufficient time to consider its options and do its integrated resource planning and come up with some ideas?

MR. DAVID CORMIE: Yes, there's -- there's no need to make a decision today to -- when -- based -- based on these assumptions.

MR. BOB PETERS: And so these assumptions that we see include the Keeyask generating station; correct?

MR. DAVID CORMIE: That's correct.

MR. BOB PETERS: So post Keeyask no new resources are needed until, as shown here, 2042?

MR. DAVID CORMIE: Based on the assumptions that this table has made.

MR. BOB PETERS: Are --

MR. DAVID CORMIE: But as -- as Mr. Miles indicated, we assume our DSM program is fully effective. We assume the load forecast here is as expected. Imagine the DSM is less effective or the Manitoba load were to be the high Manitoba load, then resources would be required earlier than that.

MR. BOB PETERS: Thank you. I want to turn, still before the morning recess if I could, to a topic of risks and I'll come back I think, Mr. Cormie,

to you with some additional questions shortly. But one (1) of the reasons Manitoba Hydro is requesting 7.9 percent rate increases is in order to withstand the negative impacts of uncertainties in the forecast.

Would -- would that be correct, Ms. Carriere or Mr. McCallum?

MS. LIZ CARRIERE: That would be correct.

MR. BOB PETERS: If we turn to volume 4, page 134, Exhibit PUB-42-4, Manitoba Hydro has provided the Board with an uncertainty analysis.

Would that be the right way to describe that, Ms. Carriere?

MS. LIZ CARRIERE: I would characterize this table on page 134 as sensitivities to certain variables.

MR. BOB PETERS: All right. Let's go down to -- on the chart to the five (5) year drought line. And it says a five (5) year drought.

Have you located that, ma'am?

MS. LIZ CARRIERE: Yes.

MR. BOB PETERS: And we follow that over and we see that in 2024 Manitoba Hydro is telling the Board that if it had a five (5) year drought Manitoba Hydro's retained earnings would be $1.388

billion less than what is presently forecasted in Manitoba Hydro's integrated financial forecast 16.

MS. LIZ CARRIERE: Yes, if no rate action is taken.

MR. BOB PETERS: Well, let me -- let me understand that. Is it no rate action is taken or Manitoba Hydro is on the rate trajectory that's proposed in integrated financial forecast 16 updated with interim?

MS. LIZ CARRIERE: Yes, this sensitivity to determine the retained earnings impact holds the -- the rate trajectory 7.9 percent constant. What I meant was, is that there is no compensatory rate action taken to recover the $1.4 billion.

MR. BOB PETERS: All right. You're telling the panel that if the five (5) year drought hit and Manitoba Hydro's rate increases were as proposed by Manitoba Hydro, the retained earnings would be down $1.388 billion dollars from what's filed?

MS. LIZ CARRIERE: That's correct.

MR. BOB PETERS: All right. We'll come back to the rate action question. If we turn to page 135 and stay with the -- well, we'll turn there, 135.

Is the Board to understand that drought is the most significant risk that Manitoba Hydro faces?

MR. JAMES MCCALLUM: I wouldn't necessarily characterize it that way. Certainly, the -- as you look to a five (5) year impact, or a ten (10) year impact we don't see a greater diminution in financial condition from other variables as we see with drought. But looking over the longer term my point of view would actually be that debt and interest rate volatility are our greatest risk to the long-term health of the company and long-term rate stability.

MR. BOB PETERS: Okay. We'll -- we'll come back to that thought, Mr. McCallum, in a few minutes.

But from a financial perspective under these sensitivities, Manitoba Hydro is showing that the five (5) year drought or the seven (7) year drought is the one (1) that has the greatest impact on the retained earnings?

MR. JAMES MCCALLUM: That is true. I'm just trying to make clear that that is over a discrete period of time. The benefit, I guess, of a drought is that presumably at some point it will end and the damage will stop. The issue with interest

rates is that depending on where you are on a -- more of a cyclical basis you could end up chasing rates higher and higher for years to come.

MR. BOB PETERS: If we turn to page 135, which is on the monitors in front of us, would it be correct that Manitoba Hydro is showing the Board that if a five (5) year drought hits starting in 2019/'20, or alternatively, if it started in '22/'23, the financial impact on retained earnings is approximately the same $1.4 billion, Ms. Carriere?

MS. LIZ CARRIERE: Approximately, yes, that's correct.

MR. BOB PETERS: And then if we look at the seven (7) year drought, and again different starting dates, that has an impact of somewhere between 1.8 and $2 billion on the retained earnings?

MS. LIZ CARRIERE: Yes, that's correct.

MR. BOB PETERS: Now, I'll do it with one (1). I didn't want to do it with many, but on page 136 of Board counsels' book of documents, Manitoba Hydro has provided the integrated financial forecast runs that suppose a five (5) year drought occurs starting in 2019/'20; correct?

MS. LIZ CARRIERE: That's correct.

MR. BOB PETERS: Now, is it also correct that if we look at those -- that statement most of the years during the drought Manitoba Hydro still manages a positive net income?

MS. LIZ CARRIERE: Assuming the rate trajectory of 7.9 percent, that's correct. We only see financial losses in 2020 and 2021.

MR. BOB PETERS: So when Manitoba Hydro says that the impact of the drought is in the neighbourhood of $1.4 billion, what it's telling the Board is that it's not that the retained earnings are going to be depleted from where they currently are. It's just that they're not going to grow as much as Manitoba Hydro had forecast they would grow under the rate trajectory that Manitoba Hydro proposes?

MS. LIZ CARRIERE: No, I would say they're depleted because you're dropping down from -- if we go back to page -- I forget the page now -- 134. You can see the base -- the base case MH16 update with interim by the end of the drought is $5 1/2 billion. Or, sorry, $4.9 billion, nearly $5 billion. And under a drought case that would be $1.4 billion lower.

(BRIEF PAUSE)

MR. BOB PETERS: I understand your clarification, Ms. Carriere. You're telling the Board that compared to what Manitoba Hydro was forecasting, a drought would reduce the retained earnings from what was forecast by Manitoba Hydro?

MS. LIZ CARRIERE: That's correct.

MR. BOB PETERS: Now, if we look to the bottom part of the page that you brought us to at page 134, and we go down to the -- the line that talks about a five (5) year drought starting in -- it's '19/'20, that row depicts what is actually happening -- happening to the retained earnings account of Manitoba Hydro during the drought; correct?

MS. LIZ CARRIERE: Correct. That's the -- for that sensitivity your absolute level of retain -- or retained earnings will be $3.6 billion.

MR. BOB PETERS: But it starts off at 2.9. There is a -- you notice -- you brought to our attention the -- the one (1) year decline. And then it climbs slowly up to $3.58 billion; correct?

MS. LIZ CARRIERE: Yes, I -- I see your point, Mr. Peters, that you are going to $3.6 billion. But at the same time we are seeing net debt growing as well to compensate for that -- for the loss re -- retained earnings.

(BRIEF PAUSE)

MR. BOB PETERS: If we turn to page 149, we see a similar scenario runs. But this time, Ms. Carriere, instead of Manitoba Hydro's assumed rate trajectory of seven-point-nine-zero (7.90), Manitoba Hydro has assumed three-point-nine-five (3.95); correct?

MS. LIZ CARRIERE: That's correct.

MR. BOB PETERS: And at the bottom part of the table, we can also see the incremental decrease in retained earnings is roughly the same at $1.4 billion, as it was with the other rate plan on page 134?

MS. LIZ CARRIERE: Yes, that's correct.

MR. BOB PETERS: However, it appears when Manitoba Hydro ran the scenarios that -- and I'm looking at, I believe, page 150. Well, let's go 1 -- 152.

In these years under the rate trajectory of three-nine-five (395) Manitoba Hydro's net income turns negative for most of those five (5) ears?

MS. LIZ CARRIERE: That's correct.

MR. BOB PETERS: And that's a function of having less rate increase revenue to buffer against that drought; correct?

MS. LIZ CARRIERE: That would be correct.

MR. BOB PETERS: Now, back to page 134, I just want to maybe conclude on this with you this morning. In the far right-hand column, it reads:

"Incremental annual electric rate increase/decrease required.

Do you see the column, Ms. Carriere?

MS. LIZ CARRIERE: That's -- yes. 1.29 percent.

MR. BOB PETERS: And you had previously told the panel that the retained earnings would go down, and I'm gonna go to that to 2024 column, $1.4 billion, $1.388 billion. And you said if no, I believe, additional rate relief was provided.

MS. LIZ CARRIERE: That's right.

MR. BOB PETERS: So if we go over to the right-hand side we see that the incremental annual electric rate increase required is 1.29 percent?

MS. LIZ CARRIERE: Yes, that would be an even annual amount over and above the rates projected from 2019/'20 to '27/'28. So there's about

-- there's nine (1) -- eight (8) or nine (9) years of 1.29 percent required to get you to about the same level of retained earnings as the base case under two (2) -- 2027/'28.

MR. BOB PETERS: Is that a -- so just in my language, in addition to the seven-nine-zero (790) rate increases and then the four-five-two (452) then the 2 percent numbers that are in Manitoba Hydro's IFF16 updated with in -- interim, you're telling the panel Manitoba Hydro would need an additional 1.29 percent annual rate increase to keep it on the same financial track?

MS. LIZ CARRIERE: That's right.

MR. BOB PETERS: And this 1.29 percent of additional rate increase would be in each and every year for those eight (8) years that you mentioned?

MS. LIZ CARRIERE: Yes, that's right.

MR. BOB PETERS: Before I leave this table...

(BRIEF PAUSE)

MR. BOB PETERS: Ms. Carriere, on this chart you've shown a number of sensitivities and their impacts on retained earnings, and they should be

understood similarly to how you've explained the details of the five (5) year drought; correct?

MS. LIZ CARRIERE: That's correct.

MR. BOB PETERS: Now, if we go to that far right-hand column, and I'll make this up, we see a five (5) year drought starting in '19/'20. You're telling the Board that to hold Manitoba Hydro whole accor -- according to its current IFF16 updated plus interim plan, you'd need an extra 1.29 percent on top of the rate increases already in that plan?

MS. LIZ CARRIERE: That's correct.

MR. BOB PETERS: Now, if I layer on top of that hypothetical situation the high export price line item that's just above it, and that assumes just for argument's sake that Mr. Cormie goes and finds some attractive export contracts, or the export market improves in the MISO region, and Manitoba Hydro's export revenues are high, we see that there's a negative one-point-two-six (1.26) rate impact with that item.

Are you with me?

(BRIEF PAUSE)

MS. LIZ CARRIERE: I see that, but I'd

caution that the two (2) cases are not additive. You -- under a drought with high export prices, you would have actually a higher cost of drought.

MR. BOB PETERS: And maybe it's because I picked -- are you saying that none of these are additive on this chart, or just the two (2) that I happened to highlight?

MS. LIZ CARRIERE: I -- yeah, I -- I couldn't say that these are -- any of these cases are additive.

MR. BOB PETERS: What you can say is that if Manitoba Hydro uses its IF -- its integrated financial forecast 16 updated with interim with a 7.9 percent rate increases, and there is also high export price, Manitoba Hydro rates would be 1.26 percent too high on each of those eight (8) years to achieve the exact number that Manitoba Hydro was striving for?

(BRIEF PAUSE)

MS. LIZ CARRIERE: If you look at the -- the low export price case in isolation, your -- your rates could be on average 1.26 percent lower conceptually.

MR. BOB PETERS: You meant the high

export price?

MS. LIZ CARRIERE: Yes, sorry. The high export --

MR. BOB PETERS: Yes, and that was my point, is that you're just telling the panel that instead of a 7.90 percent rate increase under high export, if the rate increase was 1.26 percent lower than that Manitoba Hydro would still be on target.

MS. LIZ CARRIERE: That's correct.

MR. BOB PETERS: All right. Last point I want to cover is there's a $1 billion in capital overruns on this chart.

Do you see that, Ms. Carriere?

MS. LIZ CARRIERE: Yes, I see that.

MR. BOB PETERS: And I -- I think there was a -- an exchange between your president and the Board Chair about the P50, P90 costs related to Keeyask.

Were you aware of that?

MS. LIZ CARRIERE: Yes.

MR. BOB PETERS: So let's -- let's -- right now Manitoba Hydro is saying that the P50, the probability of 50 percent cost being correct on Keeyask would lead them to believe that $8.7 billion will be the completed cost of Keeyask.

MS. LIZ CARRIERE: That's correct.

MR. BOB PETERS: And if Hydro wanted more confidence in what number would absolutely provide greater certainty, not absolute certainty, but greater certainty and wanted to go to a 90 percent probability of what that number would look like, the number between the Chairman and your president was in the -- was either 9.6 or $9.9 billion.

Do you remember that?

(BRIEF PAUSE)

MR. JAMES MCCALLUM: Yeah, let me just jump in. We had a few numbers bouncing around, as we always seem to. But the $9.6 billion number reflects a -- when we -- when we approved the -- when the Board of Directors of Manitoba Hydro approved the new control budget for Keeyask, in that process we looked to the P90 estimate, which was $9.6 billion. The $9.9 billion figure reflected a scenario we ran which also included a further delay in Keeyask to being a thirty-two (32) month delay from -- from its original in-service date, or an additional eleven (11) months from what's in the IFF16 here.

MR. BOB PETERS: All right. Thank you

for that, Mr. McCallum. So let's -- let's stick with Manitoba Hydro's P90 number, and that number remains 9.6 billion today, Mr. McCallum?

MR. JAMES MCCALLUM: That's correct. Yes.

MR. BOB PETERS: All right. And it's approximately $1 billion more than the 8.7 P50 number that is on the record here?

MR. JAMES MCCALLUM: Yes.

MR. BOB PETERS: All right. So let's follow, Ms. Carriere, that $1 billion in capital overruns across.

And is Manitoba Hydro telling the Board that in addition to its 7.90 percent rate increase, it would need an additional 0.43 percent of a rate increase to hit the financial targets of IFF16 updated with interim?

MS. LIZ CARRIERE: That's correct. Spreading them evenly over that eight (8) -- eight (8) or nine (9) year period.

MR. BOB PETERS: Thank you. And Mr. McCallum brought up the scenario that perhaps led to some of the discussion as between the Chairman and your president. And back in Board counsels' volume 1 of its book of documents on page 437 and 438, let's

turn to page 439, please. Sorry. And thank you.

Mr. McCallum, this was the integrated financial forecast that you were referencing when the -- the $9.9 billion number surfaced. Would that be correct?

MR. JAMES MCCALLUM: You know, subject to check, I believe this scenar -- scenario reflects a $9.9 billion in-service cost and an in-service date of -- I guess would be roughly September of 2022 reflecting what we referred to as a thirty-two (32) month delay.

MR. BOB PETERS: And this came -- the Boston Consulting Group had first raised the sceptre (sic) that there could be a thirty-two (32) month delay.

Do you recall that, Mr. McCallum?

MR. JAMES MCCALLUM: Yes, I do.

MR. BOB PETERS: And layered on top of the thirty-two (32) month delay is the approximate billion dollars more in capital costs; correct?

MR. JAMES MCCALLUM: Recognizing that part of the reason for an increase in capital costs will actually be a -- a function of the delay in that we continue to capitalize interest to the project for another eleven (11) month period. So the -- the

underlying, you know, what you might call the hard costs of the project, you know, could -- could not -- you know, you could -- for example, might not change at all. However, simply by delaying the in-service you're going to capitalize more interest and thus drive the final project cost higher, but --

MR. BOB PETERS: And the capital costs assumed on this IFF, subject to your check, Mr. McCallum, is the $9.9 billion; correct?

MR. JAMES MCCALLUM: Inclusive of capitalized interest, yes.

MR. BOB PETERS: And we see that the percent increase on the rates across the row is the trajectory that Manitoba Hydro has put into its integrated financial forecast 16 updated with interim, 7.9 for six (6) years, followed by 4.5, followed by 2 percent and 2 percent?

MR. JAMES MCCALLUM: I see that.

MR. BOB PETERS: And is it also correct, then, that if -- if the Keeyask project was a billion dollars over its current price estimate that Manitoba Hydro would achieve a 24 percent equity in the 2027 year, the last year on the on the chart?

MR. JAMES MCCALLUM: That's what this scenario shows, yes.

MR. BOB PETERS: And that recognizes that this works with 9.9 billion as opposed to 9.6 billion; correct?

MR. JAMES MCCALLUM: And also works with a different in-service date than the sensitivity analysis we just reviewed.

MR. BOB PETERS: Eleven (11) months later?

MR. JAMES MCCALLUM: Correct.

MR. BOB PETERS: All right. Thank you. Mr. Chairman, I appreciate the indulgence of the panel. This would be an appropriate time for the morning recess if it suits the panel.

THE CHAIRPERSON: Thank you. We'll take fifteen (15) minutes. Thank you.

--- Upon recessing at 10:51 a.m.

--- Upon resuming at 11:09 a.m.

THE CHAIRPERSON: Mr. Peters...?

CONTINUED BY MR. BOB PETERS:

MR. BOB PETERS: Thank you, Mr. Chair. This morning --

MS. PATTI RAMAGE: Oh, Bob, sorry, if

I could just introduce -- I neglected to introduce Ms. Val Iderstine this morning when I dove in. Ms. Van Iderstine is also Manitoba Hydro counsel in this, and she will be dealing with anything to do with capital. So, as Mr. Peters bumps to capital we'll have our capital group move in and I will move out and Ms. Van Iderstine will move in just to let the Board -- let the panel know what's going on.

I also thought I should because, Mr. Chair, you asked at the beginning of the hearing for witnesses to state how long -- their experience at Manitoba Hydro. We sort of jumped Mr. Miles into the hearing without any of the panel members who weren't in the NFAT --

THE CHAIRPERSON: Mr. Miles has grey hair so I --

MS. PATTI RAMAGE: Well, he -- I can advise he's been with Manitoba Hydro twenty-five (25) years and eh is the Director of Power Planning so you are --

THE CHAIRPERSON: Thank you.

MS. PATTI RAMAGE: -- talking to a knowledgeable source.

THE CHAIRPERSON: Thank you.

MR. TERRY MILES: And I just add the

grey hair for effect actually, it's just -- it's not real.

THE CHAIRPERSON: Yeah, I add the baldness for effect too. Hasn't had much of an effect. Okay, Mr. Peters...?

CONTINUED BY MR. BOB PETERS:

MR. BOB PETERS: Thank you, Mr. Chair. This morning, Ms. Bauerlein, I had understood that approximately eight hundred and seventeen (817) Manitoba Hydro electric side employees will be departing the Company based on the voluntary departure program, correct?

MS. SANDY BAUERLEIN: That is correct.

MR. BOB PETERS: I understand from the materials filed that Manitoba Hydro has restructuring costs approximately 50 or $53 million in its budget to deal with the costs related to those employees' departures?

MS. SANDY BAUERLEIN: That is correct.

MR. BOB PETERS: Can you tell the panel whether the $53 million in restructuring costs includes any pension related costs?

MS. SANDY BAUERLEIN: No, it does not include any pension related costs. It is simply the

severance amounts and it's about 50 million for the -- the payouts to the employees for thirty (30) weeks of severance pay.

MR. BOB PETERS: Of the eight hundred and seventeen (817) employees leaving the Corporation, is it Manitoba Hydro's understanding that a percentage of those will draw their pension earlier than has been actuarially planned?

MS. SANDY BAUERLEIN: Yes, that is -- that there are -- will be some employees who are drawing their pension earlier than the actuarial assumptions would have indicated.

MR. BOB PETERS: Can you indicate to the Panel, what's the impact of that on Manitoba Hydro's financial position?

MS. SANDY BAUERLEIN: We are still working with our actuarial on some assumptions with respect to what our pension impact is in terms of the what we have now recorded as a liability, and what the potential impact to that liability is.

MR. BOB PETERS: How much of a liability are you forecasting?

(BRIEF PAUSE)

MS. SANDY BAUERLEIN: I can't recall the number off the top my head and I could check that.

MR. BOB PETERS: If you -- okay, I'd like you undertake to check the liability being forecast by Manitoba Hydro --

MS. SANDY BAUERLEIN: Or the pension liability.

MR. BOB PETERS: -- on account of pensions as a result of the eight hundred and seventeen (817) people that are --

MS. SANDY BAUERLEIN: We would be able to provide the Board what the current liability is. Again, we are working with our actuarial as part of this assessment. We have a December 31st assessment. We're actually in the process of -- of RFPing for our actuarial and what that impact will be on the liability for the March 31st, 2018 year end.

MR. BOB PETERS: In that answer, Ms. Bauerlein, are you telling the Panel that you don't know what, if any, impact there will be as a result of the voluntary departure program on the pension liability?

MS. SANDY BAUERLEIN: We are still assessing what that impact is what the actuarial's assistance.

MR. BOB PETERS: You haven't forecast an amount or estimated an amount?

MS. SANDY BAUERLEIN: No, we haven't at this time.

MR. BOB PETERS: And how -- Ms. Bauerlein, the pension liability that you spoke of, does not then reflect the -- additional liability that may come from the voluntary departure program?

MS. SANDY BAUERLEIN: It does not reflect the impact on the overall liability either in the -- the liability to Manitoba Hydro as a result of the eight hundred (800) and some odd people leaving the Company.

For example, some employees may decide to take out their commuted value out of the pension whereas some employees may decide they want to draw down their pension. So there's a lot of factors and analysis that goes in to assessing what the impact on our liability account will be.

MR. BOB PETERS: So the earliest that this Board would see that liability would be in the year-end financial statements on March 31 of 2018?

MS. SANDY BAUERLEIN: That is correct.

BOARD MEMBER GRANT: Could I ask about -- I'm assuming -- sorry. To be eligible for the

voluntary program, did you have to be eligible for the pension plan? Did you have to meet -- have the current eligibility requirements?

MS. SANDY BAUERLEIN: No, there were some employees who chose just to leave the Company so they would not be eligible to retire. The majority of the employees that chose were eligible to retire but there were some who were not who just, for whatever reasons, felt that they didn't want to continue their employment with Manitoba Hydro.

BOARD MEMBER GRANT: And these would be in the defined benefit retirement programs?

MS. SANDY BAUERLEIN: Yes, we have a refined benefit pension plan.

BOARD MEMBER GRANT: So -- so -- but there could be quite a number that would be leaving well before the actuarial forecast would have them leaving?

MS. SANDY BAUERLEIN: There are some that are leaving before -- when the actuary would have assumed.

BOARD MEMBER GRANT: Okay. And -- and if it did cause a significant increase in the pension liability, at what point would that come back into your -- the current expenses or expenditures? Would

you --

MS. SANDY BAUERLEIN: So we adjust the liability for a number of factors, including impact on the discount rate, et cetera. That will be reflected in the year-end financial statement with potentially some adjustment to our pension expense, which is in our O&A cost adjusting for the change in the liability.

BOARD MEMBER GRANT: Okay, thank you.

MR. BOB PETERS: Mr. Chair, last week, Board counsel also sent some questions to Ms. Ramage in an effort to, I thought, expedite the demand-side management to -- and not having to have Ms. Morrison come back. Apparently some of the questions that were asked weren't going to be for only Ms. Morrison and so while this Panel is here, Mr. Miles on page 79 of Board counsels' volume 4 of book of documents is a -- is a response to an Information Request.

And marginal costs number that flows out of the bottom, you'll see one (1) number left on this page, is 77.73 cents; correct?

MR. TERRY MILES: I see that, yes.

MR. BOB PETERS: And that was dollars per kilowatt per year?

MR. TERRY MILES: Dollars per megawatt hour.

MR. BOB PETERS: Yes. And is it correct that Manitoba Hydro wanted to update this information?

MR. TERRY MILES: That's correct, yes.

MR. BOB PETERS: Is that something you can advise the Panel as to when that would be updated?

MR. TERRY MILES: Well, I'll say we are very, very close to having it updated and will submit it under an undertaking when it is completed.

MR. BOB PETERS: I'm mindful that the undertaking that to Ms. Bauerlein was offering with respect to pension liability is not required because that would be something in the last annual report, in any event.

MS. SANDY BAUERLEIN: Correct. One (1) thing I should clarify, especially for Dr. Grant, is that as the majority of people are leaving February 1st, many of them will still -- or some of them are opting to take that thirty (30) weeks as leave. So, therefore, they may not be collecting pension until sometime in 2018/'19.

So we actually expect the bigger hit to be on our liability for the '18/'19 fiscal year rather

than the '17/'18 fiscal year.

MR. TERRY MILES: Mr. Peters, just for clarification. It's Terry Miles. The -- our plan would be to update this IR as part of the filing and it's PUB 2-57. So we would file an updated Information Request for that IR. Is that acceptable?

MR. BOB PETERS: Yes, that would be find and you say that that will be relatively shortly?

MR. TERRY MILES: I -- I anticipate that, yes. If there's any change from that we'll -- we'll advise the Board.

MR. BOB PETERS: All right, so there's no undertaking needed on that in terms of the transcript. We'll just await for Manitoba Hydro to revise that information.

Mow, Ms. -- Ms. Bauerlein, when it came to the DSM deferral account there happens to be sitting approximately $43.6 million in that account currently; is that your understanding?

MS. SANDY BAUERLEIN: Actually the current balance is 48.8. The 43.6 was based on some assumptions as where we thought the 2016/'17 year was going to be -- or to come in at in the MFR and it was subsequently updated in IR Coalition-MH-1-139A.

MR. BOB PETERS: And so can you

explain to the Panel what Manitoba Hydro is proposing to happen with this deferral account balance?

MS. SANDY BAUERLEIN: Right now we're not really sure what will happen to this deferral account balance until Efficiency Manitoba is fully established and it delivers on whatever its plan will be. It is uncertain as to what the impacts will be on our load and, therefore, what actions might be necessary to clear the balances in these accounts at this time.

MR. BOB PETERS: In that answer, Ms. Bauerlein, are you suggesting that Manitoba Hydro is -- - is envisioning having to transfer this over to Efficiency Manitoba, this 80 -- this $48.8 million?

MS. SANDY BAUERLEIN: Efficiency Manitoba would be unable to actually transfer the amount over as they are not a regulated -- or I don't envision they're going to be a regulated organization. So these balances will stay -- there's actually a regulatory deferral asset and a regulatory deferral liability equal to the same amount.

Those balances will stay until we sort of understand the full impacts of Energy Efficiency Manitoba and how it will integrate -- the financial part will integrate with Manitoba Hydro.

MR. BOB PETERS: Has this DSM deferral account, Ms. Bauerlein, impacted Manitoba Hydro's net income?

MS. SANDY BAUERLEIN: No, it has not. What impacts net income is the actual DSM expenditures which we expense. We then -- because those costs are deemed to be amortized over a ten (10) year period for ratesetting purposes, we remove those costs in our net movement and add back in the amortization of the DSM expenditures. So, that's what hits net income.

The difference -- the DSM deferral records what is actually spent versus what was projected to spend, and we -- we take that amount and we create a regulatory deferral asset and a regulatory deferral liability.

MR. BOB PETERS: Does Manitoba Hydro intend then to continue to amortize this deferral account balance through the net movement and regulatory accounts?

MS. SANDY BAUERLEIN: We are not amortizing at all the DSM deferral balance. What we are amortizing is the actual DSM expenditures. Sorry if I was unclear on that.

(BRIEF PAUSE)

MR. BOB PETERS: Manitoba Hydro is amortizing the accumulation of all of the DSM expenditures that it makes over a ten (10) year period, correct?

MS. SANDY BAUERLEIN: Correct. The actual demand-side management expenditures are amortized over a ten (10) year period. They're brought in to -- to as an expense into our -- our statement of income over a ten (10) year period.

MR. BOB PETERS: And is it Manitoba Hydro's intentions to continue that -- to amortize those cumulative expenses?

MS. SANDY BAUERLEIN: Yes, it is.

MR. BOB PETERS: Mr. Cormie, let's turn to some more export revenue issues if we could. In volume 4 on page 168 we have a busy looking graph and what Manitoba Hydro is attempting to show the Board on page 168, Mr. Cormie, is what has happened to net export revenue forecast compared to Manitoba Hydro's 2015 forecast, correct?

MS. LIZ CARRIERE: I'll try and help you out, Mr. Peters. Yes, that's what it's attempting to do.

MR. BOB PETERS: All right. And there are three (3) variables at play in this -- in this

graph and one (1) of them is the US exchange rate; correct?

MS. LIZ CARRIERE: That's correct. There's -- the green line represents the change from the previous forecast due to the exchange mainly.

MR. BOB PETERS: And the inverse relationship as the Canadian dollar weakens, we -- we see that Manitoba Hydro gains export revenue because of that factor?

MS. LIZ CARRIERE: That's correct.

MR. BOB PETERS: And compared to last time, it's fluctuating somewhere between 25 and $50 million a year additional revenue based on the exchange rate?

MS. LIZ CARRIERE: Yes. I should just point out for the Board, though, that those impacts are offset by a reciprocal relationship between -- we have coupon payments or interest payments that are also in US dollars, and they essentially -- and other -- other payments in US dollars, such as imports that offset that US exchange rate.

So overall, the impact on net income is relatively minor.

MR. BOB PETERS: I wasn't going to the net income line, but you've just reminded the Board

that Manitoba Hydro uses its -- the revenues that it receives in US funds to pay its US denominated debt under its exposure management program?

MS. LIZ CARRIERE: That's right.

MR. BOB PETERS: All right. Let's turn to the volume variable shown on this chart, and Manitoba Hydro is showing the Board that the volume of exports is falling on the redline at least until 2021; correct?

MS. LIZ CARRIERE: That's correct.

MR. BOB PETERS: Is that as a result of Keeyask being delayed?

MS. LIZ CARRIERE: Yes, that's correct.

MR. BOB PETERS: And when Keeyask is in service, then the volumes pick up again?

MS. LIZ CARRIERE: Yes.

MR. BOB PETERS: The price variable shown on this chart is telling the Board that as a result of Manitoba Hydro's export price forecast, export revenue is expected to be down somewhere showing 100 to 100 and -- to $200 million a year?

MS. LIZ CARRIERE: That's right. I should just make one (1) clarification about the volume. In the early years, it's declining because

we're drawing down reservoirs be -- from the -- from the above-average level of water flows down to average.

The other thing that's impacting volume that you can see in the longer term is because we have lower load. We have a little bit more in surplus sales as well available for exporting.

MR. BOB PETERS: The result of those three (3) variables shows the Board shaded in the grey what the variation is from the last time the load fore -- the export forecast was before them?

MS. LIZ CARRIERE: Yes, that's -- represents the total change from MH15.

MR. BOB PETERS: And -- and I recall in the materials -- tell me if I'm correct, that the -- the sum total of that shaded grey area is approximately an $800 million reduction over that forecast period?

MS. LIZ CARRIERE: That's correct.

MR. BOB PETERS: We see on page 169 of Board counsels' book of documents the average forecast unit revenues compared to what Manitoba Hydro actually received, and I just want to make sure that the panel is understanding what Manitoba Hydro is showing here, that the solid black line depicts where Manitoba

Hydro's average unit revenues are from its exports?

MS. LIZ CARRIERE: That's correct.

MR. BOB PETERS: And the average unit revenues include the firm fixed price contracts as well as the opportunity sales that Manitoba Hydro makes into the market?

MS. LIZ CARRIERE: That's correct.

MR. BOB PETERS: And would it be correct that to the extent that the water flows have been above average and were -- and Manitoba Hydro was making more opportunity sales, those opportunity sales are at lower prices than what Manitoba Hydro would be getting under fixed price contracts?

MS. LIZ CARRIERE: Yes, generally.

MR. BOB PETERS: And so generally, the average unit price is being suppressed or brought down by the heavy weighting of the opportunity sales that are going on?

MS. LIZ CARRIERE: That's correct.

MR. BOB PETERS: And the Board sees in this that -- and I think Mr. Cormie had maybe a cleaned-up version in his materials, but this started back in IFF, Integrated Financial Forecast 08 with -- I believe that's a red dotted line, and that was Manitoba Hydro's then expected trajectory for the

export revenue prices that it would receive on average?

MS. LIZ CARRIERE: Yes, that's right.

MR. BOB PETERS: And progressively, we can march through -- and we won't -- the different dotted lines, but it brings us up to the -- I'll call it the purple dashed line, where Manitoba Hydro is showing the Board that going forward, the forecast is not as -- as lucrative as it was previously?

MS. LIZ CARRIERE: Yes, that's right.

MR. BOB PETERS: And that's the 7.9 percent number shown on the right of the chart that ties to the -- the one that's in Manitoba Hydro's Integrated Financial Forecast 16?

MS. LIZ CARRIERE: That's correct.

MR. BOB PETERS: Can you explain to the panel what the -- the Integrated Financial Forecast 16 low and the Integrated Financial Forecast 16 update are to reflect?

MS. LIZ CARRIERE: So the IFF16 reference forecast was based on -- it was an adjustment to the original 2016 forecast made in January. The low was this -- the low forecast at approximately the same time.

And then the IFF16 update, that was the

MH16 update that was submitted in -- I believe it was July, which actually represents a 2017 forecast of -- of average unit revenues. All told, between the IFF16 and IFF16 update, we saw approximately a 20 percent reduction in prices on average.

MR. BOB PETERS: And on page 168, I -- I'd like to just go back and make sure that the panel has the latest information in light of what you're providing us, Ms. Carriere, that I believe I suggested to you and you agree that that grey shaded area represented an approximate $800 million negative development in terms of the export forecast going forward?

MS. LIZ CARRIERE: That's correct.

MR. BOB PETERS: If you -- we take that -- that $800 million. You've reminded me that Manitoba Hydro provided an update to its materials in the Integrated Financial Forecast 16 update. Do you recall?

MS. LIZ CARRIERE: Yes, that's right.

MR. BOB PETERS: And there was additional negative reduc -- a negative adjustment to the export forecast through that update?

MS. LIZ CARRIERE: Yes.

MR. BOB PETERS: And that was an

additional $310 million over the ten (10) years?

MS. LIZ CARRIERE: Subject to check, yes.

MR. BOB PETERS: Thank you. And when we look at the price line on page 168 of Board counsels' book of documents, we see that it is -- it has decreased relative to the previous forecast that Manitoba Hydro shared with the Board last yea -- or two (2) years ago, correct?

MS. LIZ CARRIERE: Can you repeat that please?

MR. BOB PETERS: Yes, and it might even be for Mr. Cormie. The price forecast that we see depicted on page 168, which is on the monitors, has declined relative to what the Board had presented last time to -- to it from Manitoba Hydro?

MS. LIZ CARRIERE: Relative to MH15, we're -- the -- we're seeing a reduction, yes, attributable to prices.

MR. BOB PETERS: And again, Mr. Chair and panel members, I'm -- I'm mindful that I'm not looking for anything that is considered by the Corporation to be confidential.

But Manitoba Hydro has made two (2) changes to their forecast assumptions that -- that is

contained in their Integrated Financial Forecast 16. Is that correct?

MS. LIZ CARRIERE: Yes, that's correct.

MR. BOB PETERS: And one (1) of them had to do with capacity value, and one (1) had to do with a -- a premium for being dependable?

MS. LIZ CARRIERE: That's correct.

MR. BOB PETERS: Can you explain to the panel why Manitoba Hydro had -- has made those -- those assumption changes?

MS. LIZ CARRIERE: Well, I'll start with the premium. That had been included in previous forecasts, and it was based on analysis that Manitoba Hydro had done looking at the -- the export prices that were achieved in -- in contracted sales relative to the market forecast at that time. And that premium was included in previous forecasts to -- to recognize the additional value we were getting in contracted sales relative to the market forecast.

We haven't signed any sales in recent -- recent years, and so we can no longer substantiate putting that premium into our forecast. We can't anticipate what we're going to achieve relative to the market forecast.

MR. BOB PETERS: And on that note, Ms. Carriere, before the morning recess, Mr. Cormie and Mr. Miles were explaining to the Board the adjustments that were made on their planning assumptions and the Power Resource Plan.

And we drew to the Board's attention the surplus energy that was at the -- at the very bottom of the chart. Do you recall that?

MS. LIZ CARRIERE: Yes.

MR. BOB PETERS: And what is at the bottom -- I suppose we can go back to page 102 briefly, if we could, in the fourth volume of Board counsels' book of documents.

The bottom of the chart will depict the system surplus. And this is system surplus that is dependable energy. Would that be correct?

MS. LIZ CARRIERE: That's correct.

MR. BOB PETERS: And so in previous forecasts, Manitoba Hydro would be ascribing some premium to this energy in its financial -- in its forecast, in it's Integrated Financial Forecast?

MS. LIZ CARRIERE: That's right. These are -- these would be sales -- potential sales that we could make from dependable energy, and previously, we would have assumed a premium on that --

on sale of that energy.

MR. BOB PETERS: And you're telling the Board that Manitoba Hydro can no longer assume that it's going to achieve a premium on this energy?

MS. LIZ CARRIERE: That's right. There's not enough certainty.

(BRIEF PAUSE)

MR. BOB PETERS: Are you able to tell the Board generally when the last time Manitoba Hydro was able to achieve a premium on this dependable surplus energy?

(BRIEF PAUSE)

MR. DAVID CORMIE: Mr. Peters, I -- I don't think we can -- we can tell you -- I can give you that answer without referring to a specific contract, but what I can tell you is that since we signed the last contracts in the United States utilities are able to purchase renewable energy equivalent to that -- what Manitoba Hydro would provide, and it's being subsidized.

And so they have -- they -- they no

longer have -- they no longer see that Manitoba Hydro has an advantage with regard to emission reductions or cost that they would previously be able to acquire for Manitoba Hydro. We have -- we now have competitors because of the subsidy who can provide the same product at a lesser -- at a lesser price. And so we've lost -- we've lost that market niche that we -- that we previously had.

When -- or utilities are purchasing subsidized wind now at a discount, and that provides them a long-term hedge for the length of the wind farm at -- at a fixed price. And so, you know, Manitoba Hydro's ability to provide fixed-price power for ten (10) or fifteen (15) or twenty (20) years is no longer an advantage. And those -- with those two (2) factors we've -- we no longer can ask for a premium for a product because they have alternatives.

MR. BOB PETERS: Does that answer -- and thank you, Mr. Cormie, relate to only subsidized renewables that are available in the United States?

(BRIEF PAUSE)

MR. DAVID CORMIE: The Canadian market is not -- is not subsidized. However, the Canadian

market does not have renewable targets that utilities are trying to achieve. Therefore, the Canadian market is not prepared to pay a premium as well.

MR. BOB PETERS: Can you explain to the panel what has happened, Mr. Cormie, with respect to the capacity value that Manitoba Hydro would -- would want to obtain for it -- from -- for its energy and its capacity? What's changed since 2015?

MR. DAVID CORMIE: And -- and what has changed is that Manitoba Hydro has taken out the capacity revenue from the forecast that we had previously assumed that we would be able to include in our revenue forecast. That is -- has been a -- has been a policy decision based on the fact that we do not have signed term sheets in place for that -- those capacity sales. And although we are having discussions, we are not in a position to say with confidence that that capacity revenue will show up.

And we've judged that the risk to customers and -- is -- is higher to count on that revenue in the forecast as opposed to putting the revenue in the forecast at some future time in -- at -- at some -- at -- at a future time when those term sheets are signed and we can start counting on it. Then I think that's the reason we've taken it out.

MR. BOB PETERS: So on page 98 of Board counsels' book of documents, you and Mr. Miles reviewed with the Board the -- the capacity side. The bottom line in terms of system surplus of capacity, we'll see at the very bottom of the page the -- this is dependable supply surplus, Mr. Cormie?

MR. DAVID CORMIE: Yes. And there's two (2) issues with this table, Mr. Peters, is generally we're limited by our summer capacity surplus, not our winter capacity surplus. So if we're looking at the capacity revenues it's -- would be better to look at the summer table.

MR. BOB PETERS: So then --

MR. DAVID CORMIE: If you have that exhibit handy.

MR. BOB PETERS: Let's turn to page 100 and 101. Let me -- let me just understand then -- and I thank you for -- for guiding me there, Mr. Cormie. What you're telling the Board is that a lot of Manitoba Hydro's capacity is needed in the winter, so your greatest surplus is in the summer.

MR. DAVID CORMIE: That's true. But what -- what is more important is that US utilities, they're peak demand's in the summer, so that's where the market is. So having an extra --

MR. BOB PETERS: Inverse to Manitoba Hydro because they need it presumably for things like air conditioning load?

MR. DAVID CORMIE: Having extra capacity in the winter doesn't help them. It's our ability to supply capacity in the summer that -- so it -- this is why this table is more -- is more appropriate.

MR. BOB PETERS: And we see on the bottom line, in terms of system surplus, that Manitoba Hydro does have considerable summer capacity surplus; correct?

MR. DAVID CORMIE: Yes.

MR. BOB PETERS: In previous export price forecasts Manitoba Hydro was making an assumption that this surplus capacity would have an adjustment to it and to increase the -- the forecast because the capacity had, Manitoba Hydro assumed, some value?

MR. DAVID CORMIE: Up to our ability to support it with firm transmission in this -- into the market. So, you know, this table shows 1,700 megawatts or 1,694 megawatts. I'm not sure what year that is on the bottom line. We would need to have 1,694 megawatts of firm transmission be able to sell

that capacity.

MR. BOB PETERS: All right. And you were going to explain to the panel what has happened since 2015 to lead Manitoba Hydro to conclude that that capacity adder wouldn't be available.

MR. DAVID CORMIE: Well, I -- I think the decision to remove the capacity revenue is a policy decision, and maybe Mr. McCallum could speak to that.

MR. JAMES MCCALLUM: Sure. I'll -- I'll maybe add a couple of points here. In this forecast we've elected to take out capacity values for contracts we don't have. So past forecasts would have assumed we are able to find a counterparty and agree to a dependable contract at an assumed price where we would receive this -- this capacity value.

For this forecast we've taken that out. The point of view being that while Mr. Cormie continues to work very hard with his team trying to find additional counterparties, this is not easy and can't be counted on. And back to some comments we made last week around the importance of what we put into a financial forecast or financial model, we can't kind of continue a pattern of assuming too many good things happen.

I think I would also just point out, and Mr. Cormie can speak better than I to the market dynamics, but really the -- our practical ability to enter into new capacity sales or new, dependable contract sales that would yield additional revenue in the next five (5), six (6), seven (7) years is pretty low.

Again, Mr. Cormie can speak more to this, but when a customer, as I understand it anyway, enters into a contract with us they are often doing it in lieu of -- of building their own capacity. And so if you -- if you're -- if you're running a major utility and you find yourself in need of -- of, you know, secure, firm, dependable power on anything, you know, shorter than five (5), six (6), seven (7) years in the future, you've probably done something wrong in your planning.

And so really we're talking about our ability to add contracts that generate revenue more towards the very tail end of this ten (10) year horizon we're focused on here. Makes really very limited difference in the next five (5) or six (6) years due to the practical inability to sell the power.

MR. DAVID CORMIE: Mr. Peters, I just

wanted to add to Mr. McCallum's comment. We're -- we're still faced with the uncertainty of the Keeyask in-service date. And so in the short term, you know, around '21/'22 and '22/'23, we would be reluctant to sell out the surplus that's shown on this table in those years. And -- and as Mr. McCallum suggested, the big jump in surplus capacity doesn't end until the NSP sales expire in 2025.

And -- and so, you know, the -- that's -- that's the large block of capacity that we are expecting to be able to take to market, but that -- that won't have an effect on the revenue projections until 2025. So it's a long way away outside -- essentially outside of the -- of the -- of where we're looking at the rate case today.

And then one (1) final point I wanted to make, and was reminded by my back row, that it's the lesser of the winter capacity or the summer capacity that determines the surplus and because the capacity market is an annual market and -- and we have to have it both winter and summer. So it's the summer demand, but it -- but that demand has to be supplied in the winter. So it's the minimum of the -- of the -- of those two (2) numbers shown on those two (2) tables that you took me through.

MR. BOB PETERS: Is that requirement, Mr. Cormie, for the capacity to be an annual market, is that a new MISO requirement?

MR. DAVID CORMIE: No, it's not. It's -- it's always been an -- an annual capacity market.

MR. BOB PETERS: And does Manitoba Hydro deal with that on its diversity exchange arrangements only on a seasonal basis?

MR. DAVID CORMIE: Well, we -- we can enter into the seasonal diversity contracts, but it's still an annual -- it's still an annual construct.

MR. BOB PETERS: Do you un -- do you know, Mr. Cormie, if the MISO market is changing the annual requirement for the capacity market?

MR. DAVID CORMIE: Yes, we've been active for several years trying to have the MISO capacity market become a seasonal market. As of today we haven't made progress there and it looks like that's less of a priority to the -- to the MISO market. And -- and it's going -- for our planning purposes it's going to remain as an annual for the near term.

MR. BOB PETERS: If we could turn to page 182 of Board counsels' fourth book of documents, Exhibit 42-4. There's a list, Mr. Cormie, of

contracts, and I think most of them have your fingerprints on them. You raised the topic before, but let me -- let me add to it. Absent from this list is the 308 megawatt sale to Wisconsin Public Service; correct?

MR. DAVID CORMIE: Yes.

MR. BOB PETERS: Can you explain why that is no longer on Manitoba Hydro's list?

MR. DAVID CORMIE: One (1) of the conditions precedent in that agreement with Wisconsin Public Service was Manitoba Hydro had the right to terminate the contract if we chose not to proceed with Conawapa. We've chosen not to proceed with Conawapa. Therefore, the contract is -- has -- has no effect anymore and we've removed it from our plans.

MR. BOB PETERS: Was that condition precedent that you talk about, that legal concept, was that for Manitoba Hydro's benefit, or was it for Wisconsin Public Service's benefit?

MR. DAVID CORMIE: That was for our benefit.

MR. BOB PETERS: So Manitoba Hydro had the choice whether to remove that contract from its list or not?

MR. DAVID CORMIE: We did, but

Wisconsin Public Service also had similar protection where they would require regulatory approval for the contract. And that's become a moot point because we are -- we've told Wisconsin Public Service we're not building the project and therefore the contract is of no consequence anymore.

MR. BOB PETERS: Okay. Could Manitoba Hydro have served that contract without Conawapa?

MR. DAVID CORMIE: No. That contract was tied to a commitment to build Conawapa.

MR. BOB PETERS: Okay. I'll -- I'll rephrase my question.

Could Manitoba Hydro have served that Wisconsin Public Service contract from the energy that's available on its system excluding what Conawapa would provide?

MR. DAVID CORMIE: For that to happen, Mr. Peters, Manitoba Hydro would have to renegotiate the contract. And I believe we would probably have the resources from Keeyask in order to do that. But more importantly is whether Wisconsin Public Service would be interested in -- in that it's not -- it's more of their willingness to renegotiate given the passage of time.

MR. BOB PETERS: And does Manitoba

Hydro have the transmission rights that would be necessary to serve that arrangement under the new Great Northern transmission line in the Manitoba Minnesota transmission plan project?

(BRIEF PAUSE)

MR. DAVID CORMIE: I'm reminded, Mr. Peters, that we're going into the details of contracts that we prefer not to talk about.

MR. BOB PETERS: All right. I -- I have your point. The last point on that contract is you -- you're telling this panel that as a result of actions by Manitoba Hydro there's no longer the negotiated arrangement in place and that if anything further was to be done it would require a new negotiation and a new contract?

MR. DAVID CORMIE: I -- I think what I can say, Mr. Peters, is we've removed that contract from our list of obligations and we're not planning to serve it. But to go into more of the details is -- it's -- it's getting into that grey area.

MR. BOB PETERS: All right. Let's stay away from that if we can, Mr. Cormie. But on that same list on page 182, is Manitoba Hydro still

able to serve all of these contracts, even with the delay in Keeyask that Manitoba Hydro has planned, the twenty-one (21) month delay?

MR. DAVID CORMIE: Yes, Manitoba Hydro has sufficient resources to meet all our obligations.

MR. BOB PETERS: Does that take into account that answer, Mr. Cormie, that if any of these arrangements required specific environmental attributes Manitoba Hydro would still have those available from its existing resources?

MR. DAVID CORMIE: Yes, Mr. Peters. As I said, we can meet all our obligations under our contracts.

MR. BOB PETERS: If Keeyask is delayed thirty-two (32) months can Manitoba Hydro still serve all of these contracts listed on page 182 that's on the monitor?

(BRIEF PAUSE)

MR. DAVID CORMIE: Subject to check, Mr. Peters, I believe we do. We also have the ability to acquire resources in the short term if that became necessary. We -- we can enter the market, and if it was necessary, acquire resources if -- if there were a

delay of thirty-two (32) months for an additional delay.

MR. BOB PETERS: One (1) of the larger contracts that begins in 2020, Mr. Cormie, is the Minnesota Power 250 megawatts sale?

MR. DAVID CORMIE: Yes.

MR. BOB PETERS: And would the Board be correct in understanding that the Manitoba Minnesota transmission line project may be delayed?

MR. DAVID CORMIE: Is there a question, Mr. Peters?

MR. BOB PETERS: Will the -- well, let me just under -- let me ask it this way. There was reports that Manitoba Hydro would have to embark on a different process to get approvals, regulatory approvals, for the Manitoba Minnesota transmission line project.

Is that correct?

MR. DAVID CORMIE: We've been advised by the National Energy Board that we require a certificate process for the approval of the Minnesota Manitoba transmission project. I've been advised by our transmission business unit that in spite of that certificate process that we will still achieve the targeted June 1st, 2020, in-service date. And there

is sufficient flexibility in the schedule to achieve the contracted in-service date.

MR. BOB PETERS: All right. Thank you for that, sir.

(BRIEF PAUSE)

MR. BOB PETERS: Mr. Chair, the last topic I had questions on is a matter that I know is also going to be canvassed by my friends opposite. So I'm proposing that if it suits the panel, we could take the lunch recess, the lunch break, and I will discuss with them who will be asking questions about the business operations capital of the Corporation. And it may be that the we can streamline it through those discussions. So if that suits the panel that's what we would do.

THE CHAIRPERSON: Ms. Ramage...?

MS. PATTI RAMAGE: I have no comment on that. I wanted to jump in and just -- Ms. Bauerlein had a clarification she wanted to make of one (1) of her answers. And so before we moved on to the topic --

THE CHAIRPERSON: Okay.

MS. PATTI RAMAGE: -- or moved to the

lunch break.

THE CHAIRPERSON: Certainly. Ms. Bauerlein?

MS. SANDY BAUERLEIN: Thank you. I just wanted to clarify, when we were discussing the operating administrative targets, while the target did assume a reduction of five hundred (500), it was five hundred (500) operational people. The eight hundred and twenty-one (821) that have left the company, a portion of those people will also work on our capital construction.

So many of our employees one (1) day may be working on a maintenance project and they timecard to that, so they would be in our operating administrative costs. And the next day they would be working on a capital construction project, so would -- those costs, that time that they're spending, their salary associated with when they're spending time on capital is not part of the O and A costs. So that eight hundred and twenty-one (821) is not all operational. It -- a portion of it is -- is the construction as well.

THE CHAIRPERSON: Mr. Peters, any follow-up from that?

MR. BOB PETERS: No. I thank Ms.

Bauerlein for the clarification.

THE CHAIRPERSON: Thank you. We will adjourn for one hour. Thank you.

--- Upon recessing at 12:01 p.m.

--- Upon resuming at 1:02 p.m.

THE CHAIRPERSON: Thank you, Mr. Peters...?

CONTINUED BY MR. BOB PETERS:

MR. BOB PETERS: Thank you. Good afternoon, Mr. Chair, Board members, Manitoba Hydro's updated witness panel and certainly to Ms. Van Iderstine.

Welcome. I would like to start the afternoon with just putting the context out by looking at the page 525 of Board counsels' fourth book of documents, which is on the screen in front of us. It is part of Exhibit PUB-42-4. I'll be referring to that volume in my questioning.

And, Mr. Wortley, it would be correct to say that Manitoba Hydro's in the midst of its largest capital expansion in the history of the Corporation?

MR. JOEL WORTLEY: Yeah, I think that would be fair to say.

MR. BOB PETERS: And would it also be correct if I could ask that one (1) of the Information Requests that My Friend Ms. Dilay had asked Coalition Manitoba Hydro first round 148.

Mr. Wortley, as I understand what's on the screen in front of us happens to be the system average interruption frequency index chart of Manitoba Hydro versus all other Canadian electric utilities.

Is that your understanding, sir?

MR. JOEL WORTLEY: Yes versus the CEA group of utilities.

MR. BOB PETERS: And when you say CEA that's the Canadian Electrical Association, which is the umbrella group that represents the electric utilities in Canada?

MR. JOEL WORTLEY: That's correct.

MR. BOB PETERS: And is it your understanding that the Canadian Electrical Association gathers data from the Canadian electric utilities and then provides it to the utilities?

MR. JOEL WORTLEY: That is my understanding.

MR. BOB PETERS: And Manitoba Hydro

would have contributed to that data collection?

MR. JOEL WORTLEY: I believe so, yes.

MR. BOB PETERS: All right. And I'll try to stay away from the acronyms. I'm not sure how well I'll do. But what's in front of the panel is the depiction of the four (4) different quartiles in which the Canadian utilities find themselves in terms of their -- the frequency of interruption of their systems; is that correct?

MR. JOEL WORTLEY: Yes, it is.

MR. BOB PETERS: And just to orient ourselves to this chart, the blue at the bottom is the first quartile, meaning the best quartile; is that your understanding?

MR. JOEL WORTLEY: That is my understanding.

MR. BOB PETERS: And then we see the second is in red, third in green and the fourth in orange; correct?

MR. JOEL WORTLEY: Correct.

MR. BOB PETERS: And there's a black line that's plotted against these other -- this collection of quartiles and that black line represents Manitoba Hydro's actual experience as to where it falls relative to the four (4) quartiles that the

Canadian Electrical Association has provided?

Do you agree?

MR. JOEL WORTLEY: Yes, I would.

MR. BOB PETERS: And would it be correct, Mr. Wortley, to suggest that Manitoba Hydro finds itself in the first quartile of Canadian electrical utilities with respect to the frequency of interruptions?

MR. JOEL WORTLEY: Yes, with some variation.

MR. BOB PETERS: And when I say "frequency of interruptions," in the left side access that's calibrated in minutes per year, is it?

I stand corrected. Sorry, this is the frequency of interruption. So, this is the absolute number of interruptions that Manitoba Hydro's customers on average would experience in the respective years?

MR. JOEL WORTLEY: Yes, I believe that's on a per customer basis.

MR. BOB PETERS: Thank you. So what -- what the -- what it's telling the Panel is that, on average, Manitoba Hydro's customers are interrupted approximately once a year.

Would I be reading that correct, sir?

(BRIEF PAUSE)

MR. JOEL WORTLEY: Yes, that is correct.

MR. BOB PETERS: Thank you, Mr. Wortley, and if we turn to the next page of this Information Request, we have a new acronym and a new chart, but this is the system average interruption duration index, as I understand it, correct?

MR. JOEL WORTLEY: That's right.

MR. BOB PETERS: And it also comes from the Canadian Electrical Association from their surveys of all Canadian electric utilities including Manitoba Hydro's, sir?

MR. JOEL WORTLEY: I couldn't comment on exactly what the Canadian Electrical Association membership is, but that's the right idea.

MR. BOB PETERS: All right. And on this chart it's also divided into quartiles, sir, correct?

MR. JOEL WORTLEY: Correct.

MR. BOB PETERS: And Manitoba Hydro is plotted as the -- the black line, mostly in the first quartile?

MR. JOEL WORTLEY: With some

variation, yes.

MR. BOB PETERS: And this is the system average index interruption duration index. So this one on the left-hand margin -- the left-hand axis, is that calibrated in -- in minutes?

MR. JOEL WORTLEY: Yes, it is.

MR. BOB PETERS: And would I be correct, Mr. Wortley, in looking at this chart to say that Manitoba Hydro's average duration of interruption is somewhere around the -- can I say, one hundred (100) minutes per year?

MR. JOEL WORTLEY: That's right. The five-year average is a hundred and thirty-four (134) minutes.

MR. BOB PETERS: And so with the variations that you've noted, Mr. Wortley, Manitoba Hydro ranks generally in the first quartile on both the duration index and the frequency index?

MR. JOEL WORTLEY: Correct.

MR. BOB PETERS: And would it also be correct that Manitoba Hydro is investing billions of dollars to further improve the reliability of Manitoba Hydro's system?

(BRIEF PAUSE)

MR. JOEL WORTLEY: The business operations capital that Manitoba Hydro reinvests in its systems every year is currently targeted really at maintaining its existing service level, not improving it as a -- as suggested?

MR. BOB PETERS: Well, let me re-ask the question. One (1) of the reasons Manitoba Hydro is investing in Bipole III is to improve the reliability of Manitoba Hydro's system?

(BRIEF PAUSE)

MR. JOEL WORTLEY: Yes, so my comment referred to the business operations capital. The Bipole III project falls under our major new generation and transmission investment segment and is a little different in that what we're seeing on the chart here with system average interruption, frequency and duration is a distribution or a customer centric metric.

Bipole III will re -- improve the bulk electric reliability of the system. And so it won't have a direct impact on SAIDI or SAIFI but it will make the grid system as a whole more reliable.

MR. BOB PETERS: And if the grid

system as a whole is more reliable, that may be reflected in the -- you called it the SAIDI and the SAIFI, which are these interruption duration and frequency indexes that we refer to.

MR. JOEL WORTLEY: It -- it -- it's possible. It's -- it's a different level of interruption that we're talking about. SAIDI and SAIFI are in -- are affected by numerous small events. For the bulk electric system to have a interruption, for instance, a -- have a Bipole I, II failure due to a weather event and have -- the impacts would be much, much larger. So, you'd have a very large number of customers impacted whereas mostly when we're talking with SAIDI and SAIFI, they're relatively small events.

MR. BOB PETERS: But if the -- but if the Bipole III system was interrupted or -- sorry, let me rephrase the question.

If the Bipole system was interrupted, would that be reflected on these charts that you and I have just reviewed?

MR. JOEL WORTLEY: It could. Depends on the magnitude of the disruption. So for instance, when Bipole I and II went down some years ago, everything was done within Manitoba Hydro's power to not have the customer impacted and, for the most part,

the customer wasn't.

And so, it really depends on how serious the event is. If it's large enough, certainly, there will be brownouts, blackouts, customers will be impacted but we'll do everything that we can to mitigate that impact.

MR. BOB PETERS: If we turn to page 591 of Board counsels' fourth book of documents. Again, Exhibit 42-4, there appears to be some information provided on page 591.

Would it be correct, Mr. Wortley, that this chart would suggest to Manitoba Hydro that its customers are satisfied with the existing performance of Manitoba Hydro system?

MR. JOEL WORTLEY: Yeah, I think that's a fair interpretation.

MR. BOB PETERS: So not only does the Canadian Electrical Association guidelines put Manitoba Hydro near the top, but it's Manitoba Hydro's own customers also appear to echo that with their satisfaction of the reliability of Manitoba Hydro?

Would you agree?

MR. JOEL WORTLEY: I would agree.

MR. BOB PETERS: If we go to page 592 there's some information here with Manitoba Hydro's

customers and their satisfaction with Manitoba Hydro's rate increase plan; is that correct?

(BRIEF PAUSE)

MR. JOEL WORTLEY: Sorry, I don't see here where it says that the customers were asked about the rate increase plan.

MR. BOB PETERS: Okay. Do you understand it to be your customer satisfaction with the price of electricity that they -- they have in Manitoba?

MR. JOEL WORTLEY: That seems appropriate, yes.

MR. BOB PETERS: All right. Let's turn the page then to page 594 and as I understand what Manitoba Hydro has provided here is the result of a 2013 survey that was done on Manitoba Hydro's customers, Mr. Wortley.

Are you familiar with that?

MR. JOEL WORTLEY: I see it here, yes.

MR. BOB PETERS: And in this particular survey the question asked of the customers is: Do you think an increase of 4 percent in your electricity bill each year for the next five (5) to

ten (10) years to invest in these improvements is a good idea you'd support; something you don't like, but think is necessary; a bad idea that you oppose; and then if support is opposed, would that be strongly or somewhat?

MS. HELGA VAN IDERSTINE: Mr. Peters -- Peters, I'm just interrupting at the moment because I'm not sure this is the right panel to the directing that kind of question to. And Mr. Wortley can correct me if I'm wrong, but this wouldn't be the sort of information that he would have been privy to, and been part of preparing.

So, I'm not sure he's the right person to be asking this of.

MR. BOB PETERS: Well, I'll -- I'll try and if Mr. Wortley is unable to provide us that information then we'll -- we'll move it along then, Ms. Van Iderstine.

CONTINUED BY MR. BOB PETERS:

MR. BOB PETERS: But Mr. Wortley, in looking at this survey, it appears that 68 percent of Manitoba Hydro customers that were surveyed are opposed to the annual 4 percent rate increases to invest in improvements in the Hydro system.

Is that your understanding, sir?

MR. JOEL WORTLEY: That's what I see here, yes.

MR. BOB PETERS: And you were aware of that, were you, before this rate case started?

MR. JOEL WORTLEY: I was not personally aware, no.

MR. BOB PETERS: So these results, if you take it subject to check, came out of a 2013/'14 customer survey.

Do you know if Manitoba Hydro has a more current survey than this one, sir?

MS VAN IDERSTINE: Sorry, I'm feeling at a bit of a disadvantage in terms of whether we take that subject to check because I'm not -- this is definitely not the panel to be asking that question of and so -- as we progress I'm -- if there's a more --

MR. BOB PETERS: How about if we take it, Ms. Van Iderstine, that unless Manitoba Hydro tells the panel otherwise, we'll take that this 2013/'14 survey is the most current.

Would you be satisfied with that, ma'am?

MS. VAN IDERSTINE: Yes, I think that we would --

MR. BOB PETERS: Okay, thank you for that.

MS. VAN IDERSTINE: And if there's something more recent than we will produce it, presumably in response to this same question that was asked here as the under -- the IR reference.

MR. BOB PETERS: Thank you, ma'am, that'll be fine.

CONTINUED BY MR. BOB PETERS:

MR. BOB PETERS: So, Mr. Wortley, the rate increase proposal in this survey was 4 percent, according to the materials. Do you agree?

MR. JOEL WORTLEY: I do.

MR. BOB PETERS: And if the survey asked about an 8t percent increase in electricity bills, would you -- would Manitoba Hydro expect more than 68 percent of its customers would be opposed?

MR. JOEL WORTLEY: I can't comment on that.

MR. BOB PETERS: Mr. Wortley, has Manitoba Hydro factored customer opposition to rate increases into the business operations capital budgeting process?

MR. JOEL WORTLEY: The business

operations capital planning process involves striking the right balance between cost performance and risk for the customer. No one wants to pay more than they have to. I'm a customer too. I don't want to pay more than I have to but I also want my lights to be on and I want my furnace to run when -- when it's cold out.

And so when we plan the business operations capital, it's with an eye towards keeping the system running safely and reliably for customers. And as much as we'd rather not have to pay when we -- for things that are necessary, if they are necessary and they're going to impact the reliability of the system, then we plan them and proceed with those investments.

So it's very much with an eye towards what's going to be the best for the customer and striking that balance between cost performance and risk that drive our planning processes.

MR. BOB PETERS: All right, Mr. Wortley, are you telling the Panel that the business operations capital planning has resulted in the rate impacts being reduced from what they otherwise would have been because of the biz operations capital's view of customer acceptance?

MR. JOEL WORTLEY: Sorry, I'm not sure I understand your question.

MR. BOB PETERS: Fair enough. I'll rephrase it. Do I take from your last answer to the Panel that the budget and the planning for the business operations group is not impacted by customer comments?

MR. JOEL WORTLEY: The -- the objective of the planning is to do what's best for the customer. There is not a process today to gather comments directly from the customer for consideration in that planning.

MR. BOB PETERS: It's what Manitoba Hydro then will determine, using its judgment, what would be best for the customers; correct?

MR. JOEL WORTLEY: That's correct.

MR. BOB PETERS: All right, on page 568 of Board counsels' fourth volume we have -- excuse me.

We have a comparison, Mr. Wortley, of Manitoba Hydro's capital expenditure 15 versus its capital expenditure 16, correct?

MR. JOEL WORTLEY: That's correct.

MR. BOB PETERS: And would this Panel be correct in -- in interpreting this information that

Manitoba Hydro actually increased the budgets for its transmissioning and its marketing customer service in CEF 16 relative to the capital expenditure forecast from 15?

MR. JOEL WORTLEY: Yes. As part of Manitoba Hydro's annual budgeting process for the business operations capital is a look at the three (3) portfolios to see you where we're sitting relative to what we feel our issues on our generation transmission and dissipation systems.

So in this case with -- with an objective of doing what's going to be best for the customer, some portfolio budgets were increased a little bit, others were decreased a little bit, and overall $240 million were taken out of the budget over ten (10) years. So, in fact, costs were reduced in this year-over-year analysis.

MR. BOB PETERS: Just a point of clarification, when you mentioned distribution, that's the -- the old name for marketing and customer service?

MR. JOEL WORTLEY: That's correct. The -- t he group is called marketing and customer service, the system is the distribution system.

MR. BOB PETERS: All right and you say

that -- we see in the bottom right hand that there's $240 million of lower spending on a ten (10) year total and that's what you drew the Board's attention to, sir?

MR. JOEL WORTLEY: That's correct.

MR. BOB PETERS: Can you confirm to the Board that at least $140 million of that is related to something Mr. Miles told them before lunch today and that was that there was a decision made to stop the major rebuilding of Pointe du Bois due to low export prices?

MR. JOEL WORTLEY: Subject to check on the number, I would confirm that that led to some savings, yes.

MR. BOB PETERS: If we could go back to that Consumers Coalition Information Request and the -- and the graphs, Coalition Manitoba Hydro first round 148.

Mr. Wortley, we're looking at the duration index, correct, on -- on the screen?

MR. JOEL WORTLEY: That's correct.

MR. BOB PETERS: Has Manitoba Hydro considered providing rate relief for ratepayers by targeting a second quartile reliability performance, rather than a first quartile reliability performance?

MR. JOEL WORTLEY: No, not in that -- within our systems as they exist today we are not able to make a direct prediction of what reliability performance will result from a given level of investment; that's something we're working on.

But it is also important to understand that reliability isn't the only -- the only thing at stake when it comes to investing in -- in the various systems. I think clearly on the distribution system the assets are throughout the province and public safety is a significant concern. Things like streetlight bases rusting out, potentially falling into traffic. Employee safety is another concern if we've got wood poles that are rotting and -- and employees need to be able to climb them safely so they need to be renewed on a -- before they become unsafe.

And so it's a significant challenge and a complicated assessment to be able to predict what say -- what investments would not occur which would push us to acute -- second quartile performance while keeping other risks in check; that -- that requires a very complex analysis to get it right.

MR. BOB PETERS: And Manitoba Hydro's not in a position to do that at this point in time?

MR. JOEL WORTLEY: We are not in a

position to that at this point in time. We are currently rolling out the tools and the processes that will enable that. It's coming.

MR. BOB PETERS: And not to steal some thunder from Mr. -- or Dr. Williams, but it's coming in -- in approximately -- is it a three (3) to five (5) year timeline.

MR. JOEL WORTLEY: Yeah, that -- we were very conscious that -- that these are difficult challenges, and that it's often easy to think from the front looking in that it's going to be easy and to underestimate how long it's going to take.

There are tools and processes that need to be rolled out. There are data sets that need to be gathered. And then with the new processes, time has to be given for them to mature, as in, people have to get good at them. And so you want to make sure that you can trust the output.

And so on that basis, making sure that we're confident in the timeframe, the current idea is three (3) to five (5) years to get to that point of maturity.

MR. BOB PETERS: Does that maturity take it past the five (5) years, and maybe more in the five (5) to seven (7) year range?

MR. JOEL WORTLEY: We don't expect so at this point, no.

MR. BOB PETERS: On page 566 of Board counsels' fourth book of documents is another a Information Request from Manitoba Hydro. And that at the top of the page, it's highlighted that:

> "No projects or programs identified for execution in the test years were deferred expressly to offset the impacts of major projects."

I read that correctly, Mr. Wortley?

MR. JOEL WORTLEY: You did.

MR. BOB PETERS: Does that suggest to this Board that no projects or programs were deferred as a result of Keeyask and Bipole III in the Manitoba/ Minnesota transmission line?

MR. JOEL WORTLEY: The statement refers to our budgeting process that does not have a total cap as the culmination or the accumulation of business operations capital and major new generation and transmission capital; such that if the major new generation and transmission spending went up, the business operations capital wouldn't automatically go down.

MR. BOB PETERS: And so on page 568 of

the book of documents, which is the budget that we -- or sorry, the comparison of the capital expenditure forecast from 15 to the capital expenditure forecast of 16, the fact that there was $240 million less in spending over a ten (10) year horizon is not tied to offset the impacts of any major projects such as Keeyask and Bipole III, sir?

MR. JOEL WORTLEY: Not directly, no. The reduction in capital spending is part of our broader initiative as a company to constrain spending, but also more granularly I look at each of our distribution, transmission and generation systems to see what spending was absolutely required in the test years and what could be reduced.

So it's a -- it's another look at the risks on the systems, the need to balance cost and performance, and doing -- making the best choices we can about where the money needs to go.

MR. BOB PETERS: If we look to the far right-hand side, the ten (10) year total under 2018 to 2027 on page 268, Mr. Wortley, that $140 million, I think you've agreed, subject to check, that that's mostly tied up with the Pointe du Bois project; correct?

MR. HAL TURNER: I'll figure this

out. Two (2) projects actually --

MR. BOB PETERS: Mr. Turner, tell us which two (2).

MR. HAL TURNER: So there was a -- a project to install some new units in Pointe du Bois and also some -- a project to address some -- the structure of the facility itself to do some improvements to the facility. So both projects were suspended.

MR. BOB PETERS: Both projects relating to one (1) generating station?

MR. HAL TURNER: Correct.

MR. BOB PETERS: Okay. Thank you, sir. And at the bottom of the page, Mr. Wortley, we go down to that same column and we see the $240 million number in brackets that you've referenced as being the savings over ten (10) years comparing the budgeted in '15 to the budget in '16, correct?

MR. JOEL WORTLEY: Correct.

MR. BOB PETERS: And we've already talked with Mr. Turner about 140 million. The remaining hundred million dollars, a lot of that seems to be tied up in this change in unallocated target adjustment.

Have I got that correct, it's $104

million adjustment on that line item?

MR. JOEL WORTLEY: Correct.

MR. BOB PETERS: Can you explain to the Panel what is in "unallocated target adjustment?"

MR. JOEL WORTLEY: These are adjustments that are put into the plan to smooth the cash flow from year to year and are bit of a -- bit of an artifact as we transition from past practices to future practices.

In past practices the targets were made up of particular projects forecasted to occur in particular years, and often they totalled more than we wanted to spend in a given year. And so an adjustment was put in to bring that back to the targeted level.

So this is something we are phasing out as we go forward, but it's still shown here as a vestige of past practice.

MR. BOB PETERS: Would be analogous to having a contingency fund, Mr. Wortley?

MR. JOEL WORTLEY: No, it would be more analogous to -- reflective of an uncertainty as to where the money is going to go in that particular year and -- but wanting to ensure that the constraint, the budget, is at the -- at a desirable level and so it's suggested down to apply appropriate rationing in

the budgeting process.

MR. BOB PETERS: And in other years this unallocated target adjustment would have been adjusted upwards; correct?

MR. JOEL WORTLEY: That's right. Those are years where the forecast spending does not total the target amount, largely because it's far enough out in the future that it's -- the visibility of potential spends in that timeframe is -- is not as clear as in the near term.

MR. BOB PETERS: So there was money in the budget, but there weren't enough projects to use up all the money?

MR. JOEL WORTLEY: That as -- from the current point in time and the -- the CEF, capital expenditures forecast, is a snapshot in time. It tells you what can be seen from a particular moment. From that particular moment, there was not enough visibility of projects in those years to -- to encompass the entire target.

MR. BOB PETERS: Thank you, sir, on page 260 -- 252 of Board counsels' fourth book of documents, Manitoba Hydro -- make it 652, please, thank you.

There is a chart provided by Manitoba

Hydro as to which proportion of the business operations capital categories cannot be deferred in the second test year that's before this Board, correct?

MR. JOEL WORTLEY: Correct.

MR. BOB PETERS: And if -- can I read this a different way, Mr. Wortley, that Manitoba Hydro is telling the Board that 100 percent of customer connections cannot be deferred in 2019.

MR. JOEL WORTLEY: That -- that's correct. This -- this -- these numbers were prepared to try to respond to the question of how much control does Manitoba Hydro have over spending in a given year.

And with customer connects the -- we are mandated to serve. So if a customer arrives and wants to be connected, we don't have the ability to put them off for a year.

MR. BOB PETERS: All right. Now, if I go down to the bottom of this chart under the business operation support, there is a line item called Generation, Building and Grounds.

And conversely to what you just answered to the Panel, Mr. Wortley, it appears Manitoba Hydro has the ability to defer 100 percent of

those expenditures passed the test year.

MR. JOEL WORTLEY: That is what the chart shows, and it reflects that these projects are not in the supply chain. They're not critical to the generation of electricity and so if -- if there was enough impetus they could be deferred, but deferring them means taking on whatever risks those projects were going to meda --- mitigate or taking on whatever additional inefficiencies or costs that come with not performing those projects. So it's a balance.

MR. BOB PETERS: What is the rationale for the claim that 98 percent of system load capacity projects cannot be deferred?

MR. JOEL WORTLEY: These again are -- are projects that are required to meet regional load growth or capacity issues that need -- are needed to keep the system reliable.

MR. BOB PETERS: Maybe seems so long ago to me but I had understood from Ms. Morrison's evidence that Manitoba Hydro's load growth is, essentially, flat for the next six (6) years.

MR. JOEL WORTLEY: On average over the province, that's true but regionally, it's not. There are areas of further or growing commercial development and residential development that are leading to

capacity issues. There are several of them.

MR. BOB PETERS: If a project, Mr. Wortley, has already been started by Manitoba Hydro, Manitoba Hydro is not in a position to defer it; is that also correct?

MR. JOEL WORTLEY: It is certainly not our preference to defer work that's already begun. It's inefficient, costly and so we would take the view that that would be unwise to defer such work.

MR. BOB PETERS: Manitoba Hydro wouldn't have conducted a cost-benefit analysis to do that, but it's based on the advice of your people that that should not be deferred at this point in time?

MR. JOEL WORTLEY: The -- I mean, it varies from project to project. I don't think I can give you a blanket answer there.

MR. BOB PETERS: Okay. Does Manitoba Hydro prepare cost benefit analyses to determine whether or not a project can be paused?

MR. JOEL WORTLEY: If there were some question as to the overall justification for the project, if something changed much as it did with the Pointe du Bois project, yes, there would be a cost-benefit analysis performed to see if we should carry on.

MR. BOB PETERS: Looking at that same chart under System Efficiency, under the sustainment category, Manitoba Hydro is telling this Board that 81 percent of the projects cannot be deferred a year or longer under system efficiency.

Can you explain why that's the case?

MR. JOEL WORTLEY: In this view -- sorry, give me a moment.

(BRIEF PAUSE)

MR. JOEL WORTLEY: So system efficiency in this view is -- totals $14 million of spending in the given year and the 81 percent would be referring to a number of those projects being in flight, and therefore, not good candidates for deferral; and a smaller number being not yet started and therefore deferred, if necessary, with the associated loss in efficiency that would be gained by performing those projects.

MR. BOB PETERS: And was that -- was that done with the ben -- with a cost-benefit analysis?

MR. JOEL WORTLEY: The system efficiency projects are justified by cost benefit

analyses. They're directly paying back and achieving a saving somewhere else.

MR. BOB PETERS: But the decision to defer them, Mr. Wortley, --

MR. JOEL WORTLEY: Oh please don't --

MR. BOB PETERS: -- more accurately the decision that you're not able to defer 81 percent of them is based not on a cost-benefit analysis?

MR. JOEL WORTLEY: So there would be a cost-benefit analysis to justify the project to begin with. If the project is already in flight and some money has been invested to defer it at that point and forego this -- the system efficiency that was to be achieved by the project, which was justified by the project spend to begin with, it's -- unless something has changed fundamentally in the -- in the business case for the project, it would only make sense to carry on.

MR. BOB PETERS: Mr. Wortley, before we leave that chart that's shown on the screen at page 652 of the book of documents, volume 4, has Manitoba Hydro calculated the dollar value of the projects that could be deferred?

MR. JOEL WORTLEY: That's where these numbers came from, yes.

MR. BOB PETERS: And so let me ask it directly then: By turning what -- what is the value of the business operation capital projects that could be deferred past 2019 based on this chart?

(BRIEF PAUSE)

MR. JOEL WORTLEY: Subject to check, I believe it's $160 million.

MR. BOB PETERS: Now in fairness, you might not have been enjoying all of Mr. McCallum's time on the microphone, but he indicated to the Panel that ostensibly $100 million of savings on the capital side doesn't move the needle - I think that was his words - and I'll find a transcript reference if he needs to, but I think we can show that to the Panel if we turn to page 134 of volume 4.

This is a chart that we looked at before the morning recess and there is a line item in the top half of the page where it says "capital down $100 million a year."

Do you see that, Mr. Wortley?

MR. JOEL WORTLEY: I do.

MR. BOB PETERS: And if you're comfortable answering; if not, Ms. Carriere's got her

hand poised and ready to -- to jump in.

This is a sensitivity impact that Manitoba Hydro calculated to show this Board what would happen if the capital spending came down $1 million per year.

Is that your understanding?

MR. JOEL WORTLEY: It is.

MR. BOB PETERS: If I said a million dollars I meant to say $100 million. But again, it's a different neighbourhood than I'm used to.

Mr. Wortley, would the Board be correct in interpreting that line item of capital down $100 million a year as indicating that if that happened, then the requested rate increases that Manitoba Hydro presently has before this Board could be reduced by 0.34 percent a year?

MR. JOEL WORTLEY: That is how I would read this chart.

MR. BOB PETERS: All right. Well, that's consistent with what Mr. Wortley had said in terms of --

MR. JOEL WORTLEY: I should point out that the --

MR. BOB PETERS: -- I'm sorry, McCallum said --

MR. JOEL WORTLEY: -- the deferral that we talked about a moment ago from the business operations capital might push the costs out a year, maybe a little bit longer, depending on the project and how much risk is willing to be taken in deferring those, but it certainly couldn't be adjusted by $100 million a year, every year. That would leave a far too large a -- the -- the corresponding balance of risk would be unacceptable, and so the -- the -- these two (2) are not directly comparable in terms of scenarios.

MR. BOB PETERS: The risk you refer to, Mr. Wortley, is that there may be more interruptions, or there -- the interruptions that happen could be longer in duration. That's what you're referring to?

MR. JOEL WORTLEY: That's one (1) potential impact. The -- these are risks to the safe and reliable operation of the system. So it -- it could be customer impacts in terms of reliability. It could be safety to the public, safety to our own staff. These -- these all come into play.

MR. BOB PETERS: Well, we've got your -- we've got your comments on that, Mr. Wortley, but let's follow that hundred million dollars of reduced

annual capital expenditures. And just so that we understand what happens to the -- to the financial forecast of the Company, we saw -- we saw on page 525 of Board counsels' book of documents, Volume IV, the total capital costs. And in 2018, it looks like $3.058 billion, and in 2019, it's $2.7 billion, correct, Mr. Wortley?

MR. JOEL WORTLEY: Correct.

MR. BOB PETERS: And of that amount, the business operations capital in the 2018 year is 526 million, and it's 517 million in the second test year, 2019. Have I got that right?

MR. JOEL WORTLEY: Yes.

MR. BOB PETERS: Manitoba Hydro was asked through an information request to explain the impact of, say, a million -- no, say $100 million reduction in spending. And I think if we go to page 671 of Board counsels' fourth book of documents, we can -- we can look at that.

(BRIEF PAUSE)

MR. BOB PETERS: Ms. Carriere, we may need some assistance in explaining this from you, ma'am, but the understanding is that the Integrated

Financial Forecast was run to assume $100 million of lower annual capital spending starting in 2019, ma'am?

MS. LIZ CARRIERE: That's correct.

MR. BOB PETERS: And on page 671, which we're looking at, that has a corresponding result of a increase in the net income to Manitoba Hydro in 2026 of $60 million?

MS. LIZ CARRIERE: That's correct.

MR. BOB PETERS: And it -- it grows from 2019, where it's 2 million, all the way through to 2026, correct?

MS. LIZ CARRIERE: Yes, that's right.

MR. BOB PETERS: Is there a quick explanation as to why that wouldn't be a linear number, because it's more exponential than that.

MS. LIZ CARRIERE: You -- it's because each year, you're spending $100 million, and there's assumptions around when that would go to service. Since we're -- the scenario we're trying to simulate a reduction in -- in revenue -- or a reduction in capital expenditures that -- for business operations capital, those projects tend to have a shorter in-service -- or shorter duration. So we're putting some of that into service.

So, you know, you're only seeing in --

in 2019, 100 million, basically half of that going into service. In the second year, you've got the full hundred million plus another half of the hundred million going into service. So only that portion of your -- your finance expense and depreciation are being -- impacting the income statement.

So that's -- as you're putting more in-service, you're -- you're -- or taking more out of service, technically, because this is a down scenario, then you're seeing the -- the -- on a cumulative effect, more and more being pulled out of the -- out of the -- the in-service and the -- and the associated carrying -- carrying costs. As Mr. Wortley suggested, this assumes a permanent reduction of roughly a billion dollars over the ten (10) year period.

MR. BOB PETERS: And if we turn, Ms. Carriere, to page 672, the next page, in the 2027 year -- excuse me -- what we see is that the equity ratio percentage improves. If we scroll up -- a bit further down, please -- and the at the bottom of the page, there we see the equity ratio improves by 2 percent by 2027, and 7 percent by 2034?

MS. LIZ CARRIERE: Yes, I see that.

MR. BOB PETERS: On page 675 of Board counsels' fourth book of documents, we have the

corresponding cash flow statement, Ms. Carriere. And I take it this cash flow statement assumes that there is $100 million less expended under the property, plant, and equipment line, net of contributions?

MS. LIZ CARRIERE: That's correct.

MR. BOB PETERS: It shows up as a positive number because this is generally a very large negative number, correct, that is, the property, plant, and equipment investment?

MS. LIZ CARRIERE: Yes. Property, plant, and equipment on the cash flow statement is shown as a cash outflow. That's why it's negative. So here, we're reducing the cash outflow, so it's showing as a positive number here.

MR. BOB PETERS: And the result in the bottom right-hand corner is that Manitoba Hydro has $545 million of more cash by the end of 2026? That's after eight (8) years of reduced capital spending?

MS. LIZ CARRIERE: Yes. The cash balance at that point in time would be $545 million higher.

MR. BOB PETERS: Higher than what was showed in your other IFF16 update plus interim?

MS. LIZ CARRIERE: That's correct.

MR. BOB PETERS: And I don't want to

dwell on this, but when I look at the financing activity, middle portion of the -- the chart, it appears that Manitoba Hydro assumes borrowing $200 million less in 2019, and then also borrowing 200 million less in 2020, correct?

MS. LIZ CARRIERE: That's correct. You're deferring the need for issuing long-term debt.

MR. BOB PETERS: So that would mean Manitoba Hydro has borrowed $400 million less over the eight (8) years?

MS. LIZ CARRIERE: That's correct.

MR. BOB PETERS: Now, let's follow that through even a bit further to understand the impact of the assumed hundred million dollars of annual reduction in capital spending on Manitoba Hydro's new modified cash flow to cash expense analysis.

And we did that way back in Volume II of Board counsels' book of documents, on page 358. And we'll have to put on the screen for, Ms. Carriere, if we could. That'd be Volume II, page 358.

And just so we're oriented on this page, Ms. Carriere, the heading, figure 2.6., this is Manitoba Hydro's IFF16 integrated financial forecast 16 updated with interim, but it -- instead of using

the rates that Manitoba Hydro is proposing, it reverts back to a 3.95 percent rate increase?

MS. LIZ CARRIERE: That's correct.

MR. BOB PETERS: So then if we look, Ms. Carriere, at the bottom, and we see in the year 2019, that Manitoba Hydro, under this analysis, shows a cash flow deficiency of $99 million, correct?

MS. LIZ CARRIERE: Yes, that's correct.

MR. BOB PETERS: Has -- does it follow, then, that reducing the -- the capital expenditures by a hundred million dollars would make that cash flow positive to the extent of a million dollars?

MS. LIZ CARRIERE: Well, if you're looking at this purely mathematically, yes, it would. But what you're not seeing here is, as Mr. Wortley was alluding to, was any changes to the cash receipts from customers for, you know, any lost revenue, either domestic or export revenue. You're also not seeing the cost of maintaining the system that would eventually go up.

MR. BOB PETERS: And Mr. Wortley -- and -- and Ms. Carriere, Manitoba Hydro has not yet been able to analyze what the loss of revenue would be

if there was a reduction in the business operations capital to the extent of a hundred million dollars a year?

MS. LIZ CARRIERE: That's correct.

MR. BOB PETERS: And likewise, Ms. Carrier, if there is an increase in the cost of maintenance for initially deferring a project and then picking it up some years down the road, at this point in time, Manitoba Hydro isn't able to quantify what that additional cost would necessarily be?

MS. LIZ CARRIERE: That's correct.

MR. BOB PETERS: And is it the Board to understand that at the end of this three (3) to five (5) years, Mr. Wortley, that we talked about, Manitoba Hydro would expect to be in a position to quantify those types of decisions?

MR. JOEL WORTLEY: The objective of the -- the planning processes that we're -- we're deploying right now are to have a longer outlook on the planning horizon, and a more confident outlook on the planning horizon, such that we wouldn't expect to stop/start a project. That would be highly irregular.

We do expect to be able to have more confidence in -- in how much money we need to support the system, and to have confident plans that we can

run through from beginning to end without disruption.

MR. BOB PETERS: And that state would be expected by Manitoba Hydro in approximately three (3) to five (5) years from today?

MR. JOEL WORTLEY: That's our current outlook, yes.

MR. BOB PETERS: Mr. Chair, at this time, I'd like to thank Manitoba Hydro's revenue requirement panel witnesses for their responses to my questions. I'll have no further questions at this time, and -- and honouring my agreement with counsel opposite, I would suggest the Board call on counsel for the Consumers Coalition for any questions they may have of these witnesses. Thank you.

THE CHAIRPERSON: Thank you. Dr. Williams...?

DR. BYRON WILLIAMS: Yes. Thank you, and good afternoon, members of the panel. I'll note that Ms. Desorcy from the Consumer -- Consumers Association of Canada, Manitoba branch, is in the back row, just to the left of Cheryl, with articling student-at-law, Robert Walichnowski. Cheryl, we'll give you the spelling at the coffee break.

Just before we start, we do have an exhibit, being Coalition 32-1 to distribute. I -- I

note from this morning, My Learned Friend Ms. Ramage expressed some concerns with our efforts to notify them, being Manitoba Hydro, of intended documents. So certainly, we're happy to deal with -- if there is an objection, to deal with them as they arise. But I just will indicate to the Board, we certainly undertook our efforts on Friday and the weekend with the best of intentions, trying to give Manitoba Hydro a heads-up as early as possible in terms of potential documents.

We did make one (1) error in that we sent them the wrong chapters reference for -- for Bonbright. We -- we believe we clarified that on Sunday and provided the actual references to them. So there was certainly no ill intent. I know My Friend also observes that some of the materials that we alerted Hydro that we might file weren't presented in the sustaining capital material today, and I would simply note, that's because they're not related to sustaining capital. We will have a -- a couple of matters tomorrow related to export revenues that we tried to give notice to Manitoba Hydro of on Friday.

I think the con -- current third concern of Manitoba Hydro is capsulated in Tabs 1 through 6 of this book of documents. These are

documents that were referenced expressly in the METSCO evidence, both in the main text and in the appendix. And you can see where they're referenced on the record. So certainly, our clients believe they're quite properly on the record. They would have expected that Manitoba Hydro, in the course of reviewing METSCO's evidence for rebuttal, would have at least add -- begun to address their minds to these material.

But for Board members who were here during the last General Rate Application, I'll simply say that you've heard from Manitoba Hydro this afternoon of where they want to be in three (3) to five (5) years, whether that's in predictive modelling or in terms of dialogue with consumers. These documents which are referenced on the record in METSCO's evidence are illustrative of where best practice is. And for our clients, and also for the Board members who were here a couple years ago, it's very hard to visualize, in our respectful submission, what do we mean by "predictive modelling"? What do we mean by "alternative scenario analysis"?

So these are excerpts from the record. We're not asking Manitoba Hydro to become an expert in EPCOR's scenario planning, but we want to use them as

illustrative of -- of what good practice scenario planning looks like, referencing documents that are already on the record.

So we're, again, happy to hear any objections at the appropriate point in time, but I -- I hope with that, those comments -- that may allay the concerns of Manitoba Hydro, and any -- if -- if there were any of the Board.

THE CHAIRPERSON: That's fine, Mr. Williams. We'll -- Dr. Williams, we will -- we'll deal with objections if and when they arise.

--- EXHIBIT NO. CC-32-1: Coalitions Book of Documents.

CROSS-EXAMINATION BY DR. BYRON WILLIAMS:

DR. BYRON WILLIAMS: Thank you, and good afternoon, members of the Hydro panel. Ms. Carriere, I feel I'm going to neglect you this afternoon, largely, but you know, pop -- pop up whenever you feel like it. I suspect most of my questions will go to Mr. Wortley, but if there are more appropriate -- whether to Mr. Steele, Turner, or Neufeld, again, I leave it to your panel's discretion in terms of how you handle the question.

Mr. Wortley, I've got a tough one for you right off the bat. You'll agree that Manitoba Hydro enjoys a monopoly in the retail sale of power in Manitoba, sir?

MR. JOEL WORTLEY: Yes, I would.

DR. BYRON WILLIAMS: And you may have to speak up. I can -- I can barely hear you, which may be my hearing, sir.

And the real -- the -- the upshot of that is that to the extent that residential customers are unhappy with either the price or quality of Hydro service, there is no other retail provider of -- of Hydro electricity in Manitoba, agreed?

MR. JOEL WORTLEY: I would agree.

DR. BYRON WILLIAMS: In that context, residential customers cannot vote with their pocketbooks, correct?

MR. JOEL WORTLEY: Correct.

DR. BYRON WILLIAMS: They -- and given that mon -- monopoly, you'll agree, Mr. Wortley, that Manitoba Hydro has a duty to steward its resources with prudence and care, agreed?

MR. JOEL WORTLEY: Yes. I believe I've said several times that Manitoba Hydro needs to do its best to get the right balance of cost

performance and risk for the customer.

DR. BYRON WILLIAMS: And that right balance. Always has to be considered in light of the recognition that there are not unlimited resources, agreed, sir?

MR. JOEL WORTLEY: That -- that I -- yes, that's -- that's the definition of balance between cost, performance and risk. If -- if one (1) of them was unlimited, there wouldn't need to be balance.

DR. BYRON WILLIAMS: And recognizing scarce resources, Hydro as you've agreed, has a duty to be mindful of both trade-offs and risks, agreed, sir?

MR. JOEL WORTLEY: I would agree.

DR. BYRON WILLIAMS: And not all investments in Manitoba Hydro's electrical infrastructure are created equal, sir?

MR. JOEL WORTLEY: No. That's why we have systems for evaluating them.

DR. BYRON WILLIAMS: And there may be some which are given a higher pri -- priority, whether for reasons of economics or real -- reliability, correct?

MR. JOEL WORTLEY: Correct.

DR. BYRON WILLIAMS: And there may be some investments, sir, which are just not necessary, agreed?

(BRIEF PAUSE)

MR. JOEL WORTLEY: There are investments that are considered and never -- and never executed. So, yes, I would agree that sometimes, what appears to be initially an investment of -- of merit, after further investigation, turns out not to be.

DR. BYRON WILLIAMS: And turning to asset management and -- perhaps we'll see if you agree with this suggested definition, sir.

I'll suggest to you that asset management today involves maximizing the value of the existing access base, serving customers by providing stable and reliable services, and making economically and operationally optimal decisions regarding whether, how and when to intervene in the asset base?

MR. JOEL WORTLEY: I'm not familiar with that particular definition.

DR. BYRON WILLIAMS: Any discomfort with that definition, sir?

MR. JOEL WORTLEY: Not at face value,

no.

DR. BYRON WILLIAMS: And as you discussed with My Learned Friend, Mr. Peters, even at a time of substantial investment by Manitoba Hydro in new generation and transmission assets, over the next decade, there are billions of dollars projected to be spent in terms of sustaining capital exp -- expenditures, agreed?

MR. JOEL WORTLEY: I would agree.

DR. BYRON WILLIAMS: Kristen, if you can turn to Appendix 5.1, being the UMS report for Manitoba Hydro's General Rate Application filing. And Kristin, if I call you Diana from time to time, you'll -- what's that -- you'll forgive me, and also see it as a compliment, because you're matching Diana's tremendous per -- performance.

(BRIEF PAUSE)

DR. BYRON WILLIAMS: Mr. Wortley, you're familiar with the UMS report?

MR. JOEL WORTLEY: I am.

DR. BYRON WILLIAMS: And perhaps we can turn to page 6. In essence, I'll suggest to you that UMS Group assessed Manitoba Hydro's asset

management practices against ISO -- ISO 55,000, and its general understanding of best practice asset management. Would that be fair, sir?

MR. JOEL WORTLEY: That would be fair.

DR. BYRON WILLIAMS: And what you see before you, sir, being page 6 of Appendix 5.1, is an AM maturity scale running on the left-hand side from innocence through awareness, development, competence, and towards excellence. Do you see that, sir?

MR. JOEL WORTLEY: I do.

DR. BYRON WILLIAMS: And in essence, Mani -- UMS defines competence as maturity level 3, correct?

MR. JOEL WORTLEY: Correct.

DR. BYRON WILLIAMS: Excellence is maturity level 4, agreed?

MR. JOEL WORTLEY: Agreed.

DR. BYRON WILLIAMS: And development is maturity level 2, sir, agreed?

MR. JOEL WORTLEY: Agreed.

DR. BYRON WILLIAMS: And this report was provided to Manitoba Hydro in December 2016, on or about, sir, subject to check?

MR. JOEL WORTLEY: That's correct.

DR. BYRON WILLIAMS: And overall, as a

collective, UMS ranked Manitoba Hydro as a one point five (1.5), sir; agreed?

MR. JOEL WORTLEY: Agreed.

DR. BYRON WILLIAMS: That's somewhere between the awareness and developmental scale, agreed?

MR. JOEL WORTLEY: Agreed.

DR. BYRON WILLIAMS: Far below the numb -- maturity level 3 ranking for competence, agreed?

MR. JOEL WORTLEY: Agreed.

DR. BYRON WILLIAMS: And in terms of the individual business units, sir, generations scored one point seven (1.7), correct?

MR. JOEL WORTLEY: Correct.

DR. BYRON WILLIAMS: Transmission, one point six (1.6), agreed?

MR. JOEL WORTLEY: Agreed.

DR. BYRON WILLIAMS: And customer service and distribution, one point three (1.3), sir?

MR. JOEL WORTLEY: Yes.

DR. BYRON WILLIAMS: We can go there if you need it, sir. Well, let's -- let's go back a page, to page 5 at the top, please, Kristin. You'll see a statement by UMS at the very top of this page, that in previous utility management transformations, I

-- they suggest that utilities have seen significant improvements in productivity and overall cost savings. Do you see that, sir?

MR. JOEL WORTLEY: I do.

DR. BYRON WILLIAMS: And just to be fair, UMS has not promised those type of savings to Manitoba Hydro?

MR. JOEL WORTLEY: No. They're just quoting their past experience and their past experience with different companies from which the starting point is not particularly known. And so it is worth noting that your starting point obviously reflects or influences what savings you may be able to achieve.

So Manitoba Hydro, already being at one point five (1.5), and therefore ahead of other companies, as noted in the US -- UMS report, who may be at zero, may not have as much potential to save as others, but we won't know until we work our way in and start to make those assessments.

DR. BYRON WILLIAMS: Are you aware whether or not UMS did studies for Toronto Hydro, sir?

MR. JOEL WORTLEY: I couldn't tell you off the top of my head, no.

DR. BYRON WILLIAMS: So you're not

aware of the score that Toronto Hard -- Hydro received in terms of its studies, sir?

MR. JOEL WORTLEY: I am not.

DR. BYRON WILLIAMS: Okay. Now, at -- I -- I wonder if we can turn to -- quickly to page 7, in the middle of the page, and then we'll go to page 8. Go down the Key Gaps.

Just on this page, Mr. Wortley, you'll agree that UMS is discussing some of what they articulated in December of 2016 as the Key Gaps in terms of the -- between Manitoba Hydro and best practice, agreed?

MR. JOEL WORTLEY: That's right.

DR. BYRON WILLIAMS: And we'll come back to this page, but we'll go to page 8. Right there is fine, thank you. And focusing your attention on the second full paragraph, sir, UMS informed Manitoba Hydro that there was no one (1) group or function responsible at that point in time for optimizing total asset life cycle costs, agreed?

Do you see that reference, sir?

MR. JOEL WORTLEY: I do.

DR. BYRON WILLIAMS: And UMS also informed Manitoba Hydro that, from its observations, most asset management efforts were focused on capital

spending, with minimal attention given to optimizing O&M, which is a key part of the asset life cycle, agreed?

MR. JOEL WORTLEY: That's what it says, yes.

DR. BYRON WILLIAMS: And by O&M, sir, you understand that to mean operations and maintenance?

MR. JOEL WORTLEY: I do.

DR. BYRON WILLIAMS: You'll see as well a concern being expressed by UMS in terms of the lack of form -- in the next paragraph, the lack of formal data management and government processes and metrics, agreed?

MR. JOEL WORTLEY: No. I'm sorry, you used the word "concern," and I think it's important to understand that the UMS report was commissioned to look for opportunities for improvement. So this was not an audit. This is not a -- a critique. It was a review of processes in comparison to best practice to see where there was opportunity to improve.

DR. BYRON WILLIAMS: Fair enough. So, sir, they observed a lack of formal data management, and government processes and matrices, agreed?

MR. JOEL WORTLEY: That's right.

DR. BYRON WILLIAMS: And going to the top -- the bottom of page 7 and rolling onto page 8, so if we can keep both screens, that's -- you also see an observation, sir from UMS in December of 2016 that there are no corporate risk standards, tolerance levels, or risk assessment requirements to guide the business units, leading to a situation in which risk is being avoided rather than managed. Do you see that reference, sir?

MR. JOEL WORTLEY: I do.

(BRIEF PAUSE)

DR. BYRON WILLIAMS: Just scrolling more fully on to page 7, there's just one (1) more of these observations. Just one (1) second. Right there is fine, Kristin.

Under Key Gaps, the second paragraph, the second line, sir, you'll see as line -- sorry, the third line, the -- the second sentence, you'll see as well the observation by UMS that asset management has developed independently in each business unit, and that the asset management functions are split within the business units, suggesting that it has led to a lack of standardization of processes and hindered the

sharing of best practices. You see that observation, sir?

MR. JOEL WORTLEY: I do.

DR. BYRON WILLIAMS: Kristin, if you can move to page 34 of -- of this document. And, sir, we won't go through these at this point in time, but you'll agree with me that in terms of closing the competence gap, UMS has made twenty-eight (28) recommendations to Manitoba Hydro? You can scroll through if Mr. Wortley's checking my math.

MR. JOEL WORTLEY: Yeah. That's correct.

DR. BYRON WILLIAMS: And I understand that, as it stands today, Manitoba Hydro has not developed a -- an official response to these recommendations because that will arise in Phase 3 of its overall rollout of its asset management strategy.

Is that correct, sir?

MR. JOEL WORTLEY: I would describe in that UMS has -- was hired to do a gap assessment, which they've done, and they've identified a number of areas where there are -- there is room for improvement. But they've also laid out a four (4) step process for closing those gaps. And that involves, first of all, creating the right

environment, designing the change, implementing the change, and then working on moving towards excellence.

And so there needs to be a plan built to follow that path. And so we are currently working at creating the right environment, and as that evolves out of our corporate restructuring and our voluntary departure program, we'll be in a place -- we'll be well situated to map out the -- the rest of the journey and -- and execute.

And so I don't see a future where we write a rebuttal to Man -- or to UMS's gap assessment. I do see a future where we embrace it and develop a plan to close the gaps where it's beneficial.

It's important understand, amongst other things, that everything comes at a cost, and standardization is a great example. Standardization is worthwhile, if you need to be able to compare the output on a common basis or a common denominator, if there's value of that in your decision-making. If there's not, standardization comes at a cost because you've got a police and promote consistent practice across your organization.

So we want to be very careful to make sure that as we institute the process improvements and as we close gaps that each one of them brings a

benefit, commensurate or -- or in proportion, to the cost. 'Cause these are not going to be inexpensive. These are -- are significant endeavours that require broad deployment across a large organization. That means a lot of change management. That means a lot of working with -- with people who are busy trying keep the lights on, and so we're taking them away from their business; we want to make sure that it's worthwhile.

So we will move forward, but will do it in a very deliberate way, making sure that every step is worthwhile.

DR. BYRON WILLIAMS: Mr. Wortley, I have no doubt your -- your response will be deliberate. I'll just note, I'm on a clock, so I let you finish that answer, and I'm always prepared to, but I'll -- I'll try and keep my -- my questions more directive.

MS. HELGA VAN IDERSTINE: Thank you, Mr. Wil -- Dr. Williams. I appreciate letting him respond fully.

CONTINUED BY DR. BYRON WILLIAMS:

DR. BYRON WILLIAMS: The -- Mr. Wortley, you -- you talked about the future. I'd like

to talk a bit about the past. And I'll direct your attention to Tab 7, page 127, of the Coalition's book of documents, being 32-1.

And, Mr. Wortley, this being an excerpt from Board Order 116/08.

You see that, sir?

MR. JOEL WORTLEY: I do.

DR. BYRON WILLIAMS: Okay. And -- and, Mr. Wortley, as we turn to -- to page -- excuse me just one (1) second.

I'll -- I'll direct your attention to page 128 of the document.

And you see that commentary here from the Manitoba Public Utilities Board, in terms of sustaining capital expenditures, being the first two (2) paragraphs. And you'll see the Public Utilities Board agreeing with Intervenors on the need for a pera -- periodic asset condition assessment study.

You see that, sir?

MR. JOEL WORTLEY: I do.

DR. BYRON WILLIAMS: And this is the Public Util -- this -- this is the Public Utilities Board, back in 2008, seeking asset condition assessment information.

Agreed?

MS. HELGA VAN IDERSTINE: All right. I think Mr. -- again, Dr. Williams...

(BRIEF PAUSE)

MS. HELGA VAN IDERSTINE: I -- I wanted to alert Dr. Williams to the fact that, in case he was a -- wasn't aware, that Mr. Barnlund will be coming to speak to -- on another panel, and he might be, again, the right person to talk about with the Board orders.

DR. BYRON WILLIAMS: With respect, this -- this goes to the credibility of -- of Manitoba Hydro in undertaking and responding to Board orders specifically relating to sustaining capital management. So these are the proper questions for this panel.

MS. HELGA VAN IDERSTINE: So, Mr. Chair, I just do want to raise the fact that Mr. Barnlund is the person responsible within Manitoba Hydro for responding and dealing with the Board orders. And I think that that -- he'd be the appropriate person to respond to questions relating to them.

THE CHAIRPERSON: I'm going to look -

- let the ques -- you know, Mr. Barnlund had some -- we've got all sorts of different issues arising from Board orders. I think that we'll let this go ahead.

But if the witness needs time to read this, certainly the witness can take whatever time's required to read the -- the Board order if he's not familiar with it.

CONTINUED BY DR. BYRON WILLIAMS:

DR. BYRON WILLIAMS: Mr. Wortley, you're -- you've been a long time employee of Manitoba Hydro?

MR. JOEL WORTLEY: Fifteen (15) years.

DR. BYRON WILLIAMS: You're familiar with the dialogue before the Public Utilities Board over that last fifteen (15) years?

MR. JOEL WORTLEY: Not directly. This is my first direct participation in a -- in a rate hearing.

DR. BYRON WILLIAMS: Do you need a couple minutes to review this material, Sir?

MR. JOEL WORTLEY: That really depends what kind of questions you asked me about it.

DR. BYRON WILLIAMS: Well, let's -- let's just leave that open to you, sir.

You see here, sir, the Board, in 2008, is seeking periodic asset condit -- asset condition assessment studies.

Do you see that, sir. You've not reviewed this book of documents, Sir?

(BRIEF PAUSE)

MS. HELGA VAN IDERSTINE: Sor -- sorry, Mr. Chair. I do want to raise the point that these are the documents that we were provided last evening. So to the extent that Mr. -- Dr. Williams is raising the issue of whether or not they've reviewed them, you know, again I -- it's come back to saying -- they -- we had them focus on the areas of their expertise. Mr. Barnlund is the appropriate person to be focusing on that, and he just received these, so.

DR. BYRON WILLIAMS: Sir, the -- these were to the Board -- these were also the subject of a Public Utilities Board Information Request, being 1-89(a) to (c), in which Manitoba Hydro provided this. So this is not anything new to Manitoba Hydro.

THE CHAIRPERSON: Well, if the witness requires time, I -- you know, I -- I don't know, Dr. Williams, If we need to go through each tab,

so the witness has time to review it, if the witness hasn't it. I still think that this is the appropriate -- if -- if the issue relates to this panel, the fact that Mr. Barnlund is the person responsible for orders, I -- I still think it should be going through this panel. But the witness needs an opportunity to review the material in order comment if the witness doesn't have it.

So if counsel wants to take ten (10) minutes and advise and discuss what issues are going to arise or he's going to address, so that the witness has -- or witnesses on this panel have an opportunity to review the material, you know, that's fine.

What I don't want, is I don't want to have every question, you know, falling into this -- into this area because it -- it's going to be delaying matters considerably.

DR. BYRON WILLIAMS: Just for efficiency reasons, and thank you for the Board's guidance, I would suggest then that we sit down for -- sit -- sit down for a few minutes and we can go through this with Manitoba Hydro.

THE CHAIRPERSON: Okay. We'll -- how long would you need?

DR. BYRON WILLIAMS: Well, personally,

I wouldn't have expected this would've taken very long, so --

THE CHAIRPERSON: Well --

DR. BYRON WILLIAMS: -- I'm going to suggest fifteen (15) to twenty (20) minutes.

THE CHAIRPERSON: Okay. We'll give twenty (20) minutes -- we'll adjourn for twenty (20) minutes and counsel can meet; 2:40, thank you.

--- Upon recessing at 2:20 p.m.

--- Upon resuming at 2:41 p.m.

THE CHAIRPERSON: Mr. Barnlund, how nice of you to join us.

MS. HELGA VAN IDERSTINE: Mr. Barnlund needs to be sworn in before he can give any evidence on this panel. So if we could have Mr. Simonsen take care of that for us.

THE CHAIRPERSON: Was he not sworn in earlier? Okay.

GREG BARNLUND, Sworn

THE CHAIRPERSON: Dr. Williams...?

CONTINUED CROSS-EXAMINATION BY DR. BYRON WILLIAMS:

DR. BYRON WILLIAMS: Yes, and good afternoon and welcome, Mr. Barnlund.

I'm going to be directing some questions to you. I may have a couple follow-up questions on this with Mr. Wortley as well, but, Mr. Barnlund, perhaps we can start with tab 7 of the Coalition's book of documents, page 129 -- 128, excuse me, towards the top of page 128. Thank you.

Mr. Barnlund, you'll agree this is an excerpt from Order 116/08?

MR. GREG BARNLUND: Yes, sir, it is.

DR. BYRON WILLIAMS: And, sir, you're a long time employee of regulatory affairs?

MR. GREG BARNLUND: Yes.

DR. BYRON WILLIAMS: And as part of your duties in regulatory affairs, you're responsible for follow-up to Board Orders?

MR. GREG BARNLUND: I am, sir.

DR. BYRON WILLIAMS: And for communicating those with -- with -- with the requisite departments; agreed?

MR. GREG BARNLUND: That's correct, yeah.

DR. BYRON WILLIAMS: And, sir, here you'll see and -- and no doubt will recall the Board

entering into a discussion related to capital expenditures that are not related to major generation and transmission projects.

Do you see that in the first paragraph, sir?

MR. GREG BARNLUND: Yes, sir, I do.

DR. BYRON WILLIAMS: And nowadays we call that sustaining capital?

MR. GREG BARNLUND: Correct.

DR. BYRON WILLIAMS: And the -- the Board, you'll agree, sir, is directing Manitoba Hydro to provide a asset condition assessment study.

Would that be fair?

MR. GREG BARNLUND: Yes, sir.

DR. BYRON WILLIAMS: And, sir, a -- so this is back in 2008 and, Mr. Barnlund, perhaps if we can go to the next page, being page 129 of Coalition 32-1. Towards the bottom you'll see that the Board is discussing Mr. Harper's evidence in terms of asset condition assessments.

Do you see that, sir?

MR. GREG BARNLUND: Yes, that's the Board -- literally that discussing Mr. Harper's evidence. Yes.

DR. BYRON WILLIAMS: And you'll

recall, sir, that Mr. Harper were -- was an evid -- a witness for the Coalition in that hearing?

MR. GREG BARNLUND: Yes.

DR. BYRON WILLIAMS: Okay and if we go to the top of the next page, being page 130. The point I really wish to draw you to, Mr. Barnlund, is -- is if we focus on Mr. Harper's evidence as characterized by the Board, he's talking about in the first full paragraph, the issue of prioritizing assets by way of asset condition assessment; agreed?

MR. GREG BARNLUND: Yes, that's correct.

DR. BYRON WILLIAMS: And so, Mr. Barnlund, I'm going to suggest to you that back in 2008 the dialogue before the Public Utilities Board was about two (2) things; one was getting a data assessment in terms of Manitoba Hydro's -- as it related to gen -- generation, distribution and transmission; and secondly, how it prioritized expenditures.

Would that be fair, sir?

MR. GREG BARNLUND: I think it's fair to say that -- that the Board was requesting that we provide a condition report. I'm not so sure -- sure that we went so far as to say, a report on the

prioritization of expenditures.

DR. BYRON WILLIAMS: And that's fair enough, sir, and I'm not -- I'm not asking you to agree that there was a request for report on the prioritization of expenditures, but you'll agree that there was a dialogue in terms of Manitoba Hydro's priortization of those expenditures; agreed?

MR. GREG BARNLUND: That was a matter that was discussed at that hearing, yes.

DR. BYRON WILLIAMS: Turning to tab 8 and -- and let's be careful --

MR. JOEL WORTLEY: Just before we leave that one, if I could, for just a quick second. I do note in the following paragraph that Mr. Harper further recommends that Manitoba Hydro undertake regular asset condition assessments every two (2) to three (3) years.

And I just wanted to note that within best practices and asset management, the frequency of your condition assessment should be tied to the decisions you need to make around the asset. And that the idea of a blanket frequency like this would not be an efficient way to proceed.

DR. BYRON WILLIAMS: Mr. Wortley, thank you for that. You're not suggesting that it

would be efficient to -- to not supply an assessment for many years, though, are you?

MR. JOEL WORTLEY: I'm suggesting that the data acquisition needs to be programmed, as required, to manage the assets.

DR. BYRON WILLIAMS: Mr. -- Mr. Barnlund, and I guess Mr. Wortley, you've read the material now?

MR. JOEL WORTLEY: I've skimmed it.

DR. BYRON WILLIAMS: Okay, we'll come back to that.

Mr. Barnlund, if we can turn to tab 8 of the Coalition's book of documents, and specifically page 134.

Sir -- sir, just to be clear, this is not an excerpt from a Board Order, this is an excerpt from a closing argument, being the closing arguments of a certain Mr. Williams; agreed?

MR. GREG BARNLUND: I understand that, yes.

DR. BYRON WILLIAMS: And sir, if I direct your attention back to lines 10 through 12 of this submission, that's fine. Right there, Kristin. Lines 9 through 13, excuse me.

You'll see there is a suggestion that

each functional area of Manitoba Hydro is separately addressing the prioritization process; would that be fair?

MR. GREG BARNLUND: I see that written there, yes.

DR. BYRON WILLIAMS: If we can turn to tab 9 and -- and specifically page 139.

Mr. Barnlund, this is now 2012 -- January of 2012; agreed?

MR. GREG BARNLUND: Yes.

DR. BYRON WILLIAMS: And here we are back to the Public Utilities Board speaking in Order 5-12?

MR. GREG BARNLUND: Yes.

DR. BYRON WILLIAMS: And you see the Board in 2012 expressing a concern that an asset condition study has been delayed.

Do you see that reference, sir?

MR. GREG BARNLUND: I do. And -- and, you know, it might be useful if I could also turn our attention to an Information Request that we had answered with respect to the chronology on this.

DR. BYRON WILLIAMS: And this is PUB-1-89, sir?

MR. GREG BARNLUND: First round 89 (a)

to (c), that's correct.

And maybe I could just -- if it, you know, would assist the Board in understanding that there was a -- I think there was a number of developments that occurred since the issuance of the initial directive to Manitoba Hydro in terms of an asset condition study that -- that had a rule in terms of the timing of how these things have come to pass.

And there was a fair bit of correspondence and communication back and forth between Manitoba Hydro and the Public Utilities Board through this timeframe. One (1) of the limiting factors that Manitoba Hydro encountered was the need to be do -- doing a new depreciation study that was going to be reflective of the introduction of international financial reporting standards.

And that was a -- a complication, if you would, in terms of us being able to do some of the -- the study work that was being requested because a lot of it would flow along with the depreciation study itself.

DR. BYRON WILLIAMS: Mr. Barnlund, thank you for that. You're not suggesting, sir, that other utilities were not able to conduct asset condition assessments at the same time that they

undertook depreciation studies, are you, sir?

MR. GREG BARNLUND: Well, I would suggest you, Mr. -- or Dr. Williams, that many other utilities adopted US GAAP through that period of time, and likely didn't have the complications that Manitoba Hydro faced.

If you recall the discussions we've had with regards to IFRS, there was a number of delays and a number of changes in the schedule of IR -- IFRS's adoption -- or finalization and adoption that tended to complicate things, where other utilities that would be reporting under US GAAP would not face that same set of complications as did Manitoba Hydro.

DR. BYRON WILLIAMS: Mr. Barnlund, I wonder if you can go with me to tab 12 being an excerpt from -- of the Coalition book of documents being an excerpt from Order PUB 49/14, and specifically page 163 in the middle of that page.

MR. GREG BARNLUND: Yes, sir.

DR. BYRON WILLIAMS: Again, sir, you'll see a reference to directive 7 of Order 43/13 requiring Manitoba Hydro to file an asset condition assessment no later than the filing of the next depreciation study; that will help continue the conversation, sir?

MR. GREG BARNLUND: Yes, I see that.

DR. BYRON WILLIAMS: Sir, move with me, if you would, to tab 13, specifically page 170(a).

MR. GREG BARNLUND: Yes, sir.

DR. BYRON WILLIAMS: And go down to the per -- just up the page a bit, that's perfect, Kristin.

Here you see the Board in Order 73/15 on the fourth line articulating a concern that Hydro has not -- that it's -- excuse me, that it's not satisfied that Manitoba Hydro has adequately evaluated the long-term pacing and prioritization requirements, sir? Agreed?

MR. GREG BARNLUND: I see it written there, yes.

DR. BYRON WILLIAMS: And at the last three (3) lines of that same paragraph, you'll see the Board suggesting that it --

> "It's acceptance of the increased sustaining capital spending during this GRA -- GRA should not be construed as an endorsement of Hydro's long-term sustaining capital plan."

Agreed?

MR. GREG BARNLUND: Yes, that -- that's their finding, and -- and I think that it's important to reflect on where Manitoba Hydro found itself in 2015 with regards to migrating to -- to the work that Mr. Wortley has been testifying to in terms of how we're going to be transitioning to our new asset management and investment strategies and -- and -- and -- and program.

So we were -- were -- we were sort of with one (1) foot in either camp here but -- at the time at this Order was written.

DR. BYRON WILLIAMS: With --

MR. JOEL WORTLEY: I think I could add that by no means has Manitoba Hydro been idle during this time and that asset management is often described as a journey and so it has to happen across many fronts in parallel, but also in sequence.

And so when I think about the history of Manitoba Hydro and the history of asset management at Hydro -- at Manitoba Hydro there have been many -- many steps made, many practices improved and to bring up page 11 of the UMS report appendix 5.1 from the General Rate Application, there's a convenient little graphic here that I -- I think will help understand a little bit.

Areas that Manitoba Hydro has made improvements in and areas where improvements are still to come. And so it's a little bit complicated. I -- I apologize for that. But if you think about the latter I showed in direct evidence where the customer drives from the top, influences what the objectives of the company need to be, and so on down to a particular asset decisions, the customer sits at the top left side of this diagram. It influences company strategy. That company's strategy drives the business objectives which turn into an asset management policy and strategy you can see in the centre -- top centre. That drives down into asset management objectives and targets and into the development of asset management plans, the bottom row middle.

Those plans affect what spendings can occur in Opex, or operating and maintenance and Capex, capital expenditures. Capital expenditures are optimized and then you can see on the far right side coming back, asset health indices are an input to this process.

So you can see which of the boxes are -- are our darker coloured and are rated by UMS as being close to competent and which areas still require -- or still have larger gaps to be closed.

And so significant progress has been made here, and UMS does note that we compare favourably to North American industry as a whole.

So while we have not always been able to produce the reports that have been asked of us, we have not been idle in advancing our asset management journey.

DR. BYRON WILLIAMS: Mr. Wortley, UMS gave you a score of 1.5 in aggregate, with confidence being at level -- at Level 3; agreed?

MR. JOEL WORTLEY: That's correct.

DR. BYRON WILLIAMS: Mr. Barnlund, going to tab 15 of the Coalition book of documents being Order 59/16, and specifically at page 181.

Sir, this is 2016 now?

MR. GREG BARNLUND: Yes, sir.

DR. BYRON WILLIAMS: And you see as -- going to the very last reference on page 181, you see the Public Utilities Board, again, requiring Hydro to file the complete asset condition assessment at the next General Rate Application?

MR. GREG BARNLUND: Yes, sir.

DR. BYRON WILLIAMS: Mr. Barnlund, it's always a pleasure, you're more than welcome to hang out for the rest of the day, subject to the

guidance of your legal counsel, in terms of the regulatory history, those are the questions that I intend to ask today. So I'll leave it to your -- leave it to you -- to you to decide whether you wish to be excused or not.

Thank you, Mr. Barnlund.

MR. GREG BARNLUND: Thank you.

DR. BYRON WILLIAMS: We're going make a just a quick dive into the Boston Consulting PowerPoints, and specifically MFR-72, appendix 1. Boston Consulting Group, page 176.

Mr. Wortley, have you seen this slide before?

MR. JOEL WORTLEY: I have.

DR. BYRON WILLIAMS: Okay. And you see the characterization of the Boston Consulting Group as Manitoba Hydro having strong current reliability; agreed? You see that at the top, sir? The headline?

MR. JOEL WORTLEY: Yes.

DR. BYRON WILLIAMS: And sir, when we -- when we look at asset management -- management planning, clearly, reliability and safety are -- are very important considerations; agreed?

MR. JOEL WORTLEY: They are.

DR. BYRON WILLIAMS: Cost-effectiveness is -- is also an important considerations, sir?

MR. JOEL WORTLEY: I would agree.

DR. BYRON WILLIAMS: And ultimately, the impact on ratepayers, both in terms of reliability as well as in terms of costs, are -- is an equally important consideration, sir?

MR. JOEL WORTLEY: They're both important.

DR. BYRON WILLIAMS: Thank you. Now I'm going to ask to pull up Manitoba Hydro's response to Coalition 2-68, attachment 1.

MR. JOEL WORTLEY: Sir, were we done with BCG benchmarking there or were we going to explore that --

DR. BYRON WILLIAMS: I was moving on, sir.

MR. JOEL WORTLEY: Before we move on, can we just take a quick stop at -- MFR-72, page 340.

I just want to comment that on this slide we see that albeit that BCG found that Manitoba Hydro's reliability to be currently good, aging assets are looming as an issue.

And if we go to the next slide, the

benchmarks indicate spend has been similar or less than peers.

And to the next one again, the system renewal capacity -- system renewal capital insufficient to replace aging assets. And so I just want to point out that with respect to benchmarking, these are interesting findings, but they're not sufficient with which to make any real decisions. You can't go increase the capital program simply because BCG found that potentially the dollars were less than someone else was spending. You got to go back to the reasons for the investments and make sure that each one is of value.

So, similarly, albeit we find BCG's findings on the other aspects to be of interest, I do note that they're not particularly useful for driving direct action.

DR. BYRON WILLIAMS: And one (1) of those reasons, sir, would be that BCG in terms of its retainer was at Manitoba Hydro for basically three (3) months; agreed?

MR. JOEL WORTLEY: I couldn't comment on it.

DR. BYRON WILLIAMS: Okay. Let's go to Coalition 2-68, attachment 1. And let's go to page

1 just for a second, please, Kristin.
Mr. Wortley, this is -- and whether this is to you or Mr. Turner. This is a report from the engineering services division generations op -- operations covering a period between May and -- and January -- May 2015 and January 29.
Would that be fair?
MR. JOEL WORTLEY: Yes, it would.
DR. BYRON WILLIAMS: And, Mr. Wortley, you'll recall from the UMS report of December 2016 a suggestion that most asset management efforts were focused on capital spending with minimal attention given to optimizing operations and maintenance.
Do you recall that, sir?
MR. JOEL WORTLEY: I do.
DR. BYRON WILLIAMS: And if we turn to page 3 of this page -- go to page 2 just for one second, Kristin.
This is a review of and an effort to develop a strategic maintenance plan for the general operations asset. Mr. Wortley, is that right?
MR. JOEL WORTLEY: I think that's fair.
DR. BYRON WILLIAMS: And going to page 3 and focusing your attention on -- on the second

bullet, one (1) of the challenges identified was that the current condition monitoring of the equipment was not adequate.

Do you see that reference, sir?

MR. JOEL WORTLEY: I do.

DR. BYRON WILLIAMS: And were you head of generation at this time, sir?

MR. JOEL WORTLEY: I was.

DR. BYRON WILLIAMS: And also going to the third bullet:

> "Information on the current condition of much equipment was also not adequate at that point in time."

Would that be fair, sir?

MR. JOEL WORTLEY: It would.

DR. BYRON WILLIAMS: Now, I'd like to go to Manitoba Hydro in -- in conducting this analysis did a survey of staff such as station manager, site supervisors and planners; agreed, sir?

MR. JOEL WORTLEY: Yes.

DR. BYRON WILLIAMS: And perhaps we can go to page 40.

And, Mr. Wortley, this was a survey in June of 2015. Has there been a survey subsequent to this, sir -- of this type of survey with -- with

regard to generation?

MR. JOEL WORTLEY: No, there is not.

DR. BYRON WILLIAMS: So, in essence, these are the -- the good folks in generation, the station manager, site supervisors and planners sharing with -- with Manitoba Hydro some of the major themes that they identified in terms of maintenance programs.

Would that be fair, sir?

MR. JOEL WORTLEY: Yes, this is ongoing and continuous improvement endeavour on behalf of those -- those staffers to look for opportunities for improvement and included in that was canvassing the -- the -- the station staff themselves to get a perspective from the shop floor.

DR. BYRON WILLIAMS: And certainly from the stops -- taught -- shop floor, frequent comment number 1 was the lack of quality maintenance procedures.

Do you see that, sir?

MR. JOEL WORTLEY: I do.

DR. BYRON WILLIAMS: And we'll go through some of those other themes, but you'll agree with me, those were the top five (5) frequent comments made by the front line staff?

MR. JOEL WORTLEY: Yes, I would.

DR. BYRON WILLIAMS: And if we can go down to theme 1, for a moment, Kristin, on this same page, being page 40.

And Mr. Wortley, you see in the first paragraph under Section 7.1, line 3, theme 1 being:

> "Unfortunately, the work management measure rep -- measures reports do not have desired effect of looking for improvements with the suggestion in some iss -- areas there's workarounds created to make the numbers look good but not to improve the process."

Do you see that, sir?

MR. JOEL WORTLEY: I do. This is -- one (1) of the reasons that these processes have been improved with our new enterprise asset management system, which is now enrolled out to all the generating stations --

MR. HAL TURNER: Correct.

MR. JOEL WORTLEY: -- and is -- is plugging many of these gaps.

DR. BYRON WILLIAMS: And there was, sir, at the time, a concern that administrative duties appear to be greatly increasing, and tool site -- time

for site maintenance staff is decreasing?

MR. JOEL WORTLEY: Yes, this is a real concern. Particularly as the industry gets more regulated with respect to safety and environment, there are more and more processes being added on site -- supervisory staff that takes them away from tool time.

DR. BYRON WILLIAMS: Sir, going to theme 3, in terms of the RCM Program and Philosophy, and directing your attention to just above (a) you'll see a common understand -- a suggestion that the common understanding of the current program seems to be lacking. Do you see that, sir?

(BRIEF PAUSE)

MR. JOEL WORTLEY: Yes, I do.

DR. BYRON WILLIAMS: And some specific areas of concerns, including no one is reviewing the results from the current maintenance updating failure modes and ensuring current task and intervals are appropriate, with the suggestion that the current program has not been reviewed since implementation greater than ten (10) years?

MR. JOEL WORTLEY: That's correct.

DR. BYRON WILLIAMS: Sir, we're not going to go through all of these, but let's go to theme 4 for a moment.

(BRIEF PAUSE)

DR. BYRON WILLIAMS: And sir, in particular with theme 4, I want to direct your attention to the last sentence, being a concern with the lack of predictive programs that was to be of -- implemented to move towards more condition-based maintenance. Do you see that reference, sir?

MR. JOEL WORTLEY: I do.

DR. BYRON WILLIAMS: And sir, when was EAM implemented?

MR. JOEL WORTLEY: The EAM implementation is ongoing. It wrapped up in the generating stations this year, I believe.

MR. HAL TURNER: Correct. The last generating station was put in in November.

MR. JOEL WORTLEY: And is --

MR. HAL TURNER: November, yes.

MR. JOEL WORTLEY: -- currently being rolled out in -- in other parts of the Company.

DR. BYRON WILLIAMS: Okay. Thank you.

We'll move to theme 5 for a moment, page 42. And focusing on the first three (3) lines, sir, there's a suggestion that there's a lack of proper documented and controlled maintenance procedures, and currently, the quality we have ranges from poor to excellent, but no one is -- was reviewing the procedures for adequacy, consistency or continuous improvement.

Do you see that theme, sir?

MR. JOEL WORTLEY: I do.

DR. BYRON WILLIAMS: Theme 6, sir, suggests that there's been too many forced extensions -- going to the second line, sir, too many forced extensions in the past few you -- years, suggesting a planning issue?

(BRIEF PAUSE)

MR. HAL TURNER: That's correct.

DR. BYRON WILLIAMS: Theme 8, being page 44 of 111, go to page -- yeah. My -- I misspoke, page 43.

Going to the second line and down, there is a suggestion in June of 2015, that some basic condition monitoring tasks, as well as oil analysis, were put into the maintenance program, but the higher

technologies, such as vibration or air gap monitoring, have had limited progress, even though they are key components for measuring and monitoring machine health. Do you see that reference, sir?

MR. HAL TURNER: I do. I think these themes are reflective of the -- a previous -- a -- a system that we had in place, which is -- and so the implementation of EAM is going to address a lot of these things.

We've got other tools that we're putting in. So when we -- when we look at condition monitoring, in the past, it's been very manual, and so we're -- we're putting in a tool called Meridium to help automate these kind of things to make it more -- less onerous, and so that we can get this kind of information processed easier, and we can use it to improve our maintenance practices.

DR. BYRON WILLIAMS: Thank you, sir. And to you, Mr. Wortley, you'll agree that a coordinated, optimized, and dev -- deliverable maintenance program is essential to ensure efficient use of operating funds, agreed?

MR. JOEL WORTLEY: I would certainly agree that maintenance is a critical part to managing assets for which maintenance can make a difference in

their performance or -- or life expectancy, yes.

DR. BYRON WILLIAMS: And it's also critical to improve operations and maintenance performance, agreed?

MR. JOEL WORTLEY: Sorry, maybe you could state the whole -- restate the whole question, please?

DR. BYRON WILLIAMS: Sir, I'll suggest to you that a coordinated, optimized, and deliverable maintenance program is essential to improve operations and maintenance performance, agreed?

MR. JOEL WORTLEY: Yes, I would agree with that.

DR. BYRON WILLIAMS: And sir --

MR. HAL TURNER: Actually, I'd just like to point out, I -- I agree it will help improve our operation and maintenance performance. But if you look back at the BCG benchmarking, you'll see that the generation, wholesales, operations, and administrative performance is actually quite good compared to our peers.

DR. BYRON WILLIAMS: And sir, as of January 16, 2016, and focusing on generation, would it be fair to describe the existing maintenance program activities as inconsistent, isolated, and not having

improved for a number of years?

MR. JOEL WORTLEY: Sorry, where are you quoting from, sir?

DR. BYRON WILLIAMS: Your strategic maintenance plan, Coalition 1-81, sir.

MR. JOEL WORTLEY: Can we bring that up?

DR. BYRON WILLIAMS: Yeah, we certainly can. It's page 13 of 86, Coalition-MH 1-181, first paragraph.

(BRIEF PAUSE)

MR. JOEL WORTLEY: And sorry, what was your question?

DR. BYRON WILLIAMS: As of January 2016, you described the existing maintenance pro -- program activities as inconsistent, isolated, and having not improved for a number of years. Would that be fair?

MR. HAL TURNER: I think that refers to the fact that the maintenance plans were created for each station, because the stations -- that's how we manage our assets at the station level, or that's how we managed our assets at the station level.

And this is speaking to the fact that we want to take more of a asset class approach to it, so that -- I think that's the context of those comments.

DR. BYRON WILLIAMS: Thank you for that. And if we can go to page 65 of 86 of this document, being Coalition 1-81, you'll see Mr. Turner -- Mor -- Mr. Wortley, a suggestion that a consultant review of the current maintenance plan must proceed to create standardized maintenance task templates by system or equipment type. Do you see that reference?

MR. HAL TURNER: I do.

DR. BYRON WILLIAMS: And has this been completed, sir?

MR. HAL TURNER: We did hire a consultant. Just one moment.

(BRIEF PAUSE)

MR. HAL TURNER: I we did hire a consultant to -- Hatch was the name of the consultant -- to look at our generators. Unfortunately, we found that the product that they delivered did not meet our expectations, and the price was significantly higher than originally quoted. So we are currently taking a

look at our cranes and our spillway. So this is as part of -- to support the Keeyask project. And so we are going to do this internally.

As part of our restructuring, we've been able to dedicate some staff to asset management initiatives, and we're going to do this internally, at least for these two (2) assets.

DR. BYRON WILLIAMS: And this task, sir, in terms of this report was described as a huge step towards consistency for the equipment maintenance? Do you see that, sir?

MR. HAL TURNER: Yes. We want to be more consistent than we have, but keep in mind that our plants have been in service since the early 1900, or as late as 2012, so it won't be exactly the same everywhere. There will be some similarities, and -- and sharing of best practice, but it will not be 100 percent consistent across every station.

DR. BYRON WILLIAMS: Now, am I correct in suggesting to you that as part of Hatch's original scope of work, the task of completing this template was to be completed by the 29th of December, 2017?

MR. HAL TURNER: One moment.

(BRIEF PAUSE)

MR. HAL TURNER: I'm sorry, can you repeat that date again? Did you say December 2017?

DR. BYRON WILLIAMS: Yeah.

MR. HAL TURNER: I -- I think it was December 2016, and then it ext -- ended -- ended up getting extended until about March of 2017.

DR. BYRON WILLIAMS: Okay. And that task ultimately wasn't completed and has now been assigned to internal staff? Is that right?

(BRIEF PAUSE)

MR. HAL TURNER: So the consultant was looking at generators, as I mentioned, and they started with the generators at the Grand Rapids Generating Station, and the cost of their exercise significantly exceeded or was trending to significantly exceed what they had originally told us the entire study would cost. So we stopped the generator study, and we are doing an internal review, but not of generators, of powerhouse cranes and spillways.

DR. BYRON WILLIAMS: Thanks. I'll be leaving in the generation maintenance issue, and I just want to have -- deal with some common -- what I

hope are common definitions with Manitoba -- Manitoba Hydro.

And again, Mr. Wortley or -- or otherwise, but in terms of run to failure, is that essentially when assets are run to reach physical end-of-life conditions, with no proactive asset replacement management strategies conducted?

Would that be fair?

MR. JOEL WORTLEY: Yeah. Run to failure is -- is used in the context where the consequence of an asset failing in service is tolerable, and so it is -- it is allowed to deteriorate to a point where it no longer meets its function, whatever that happens to be, before being replaced.

DR. BYRON WILLIAMS: And would you agree that economic end of life, as used in asset management, is the threshold when the asset ceases to be the lowest cost alternative to performing a particular function at a particular expected competence -- competency bundle of quality, safety and reliability?

(BRIEF PAUSE)

MR. JOEL WORTLEY: Sorry, could you repeat, please?

DR. BYRON WILLIAMS: Mr. Wortley, I'll do my best. As used in asset management, economic end of life is the threshold when the asset ceases to be the lowest cost alternative to performing -- performing a particular function at a particular expected competency?

MR. JOEL WORTLEY: I think that's reasonable.

DR. BYRON WILLIAMS: Theoretically, that's when you would want to replace an asset, because it costs you more to keep it than to replace it, agreed?

MR. JOEL WORTLEY: Theoretically, yes. In -- in practical application, it becomes a flag where -- where you should go make a deeper dive. So if the indication is that you're approaching economic end of life, that's the right time to go have a closer look at the asset, evaluate its particular -- you have to understand that economic end of life comes as a function of degradation and degradation or an asset health indices is an assessment of the average health of the asset.

So it doesn't tell you particularly how

that asset's going to fail, if it's just going to continue to degrade in terms of not to be able to turn as fast, or if it's going blow up, or what -- what actually is going to happen to this asset. So before you can make a decision, as to whether to intervene or not, you need to take a closer look at what are the failure modes tied to this particular asset, what is happening that its condition score has gone down to the point that it appears to be at economic end-of-life, do I really need to intervene now, what -- what risks do I carry by leaving it in service?

So, economic end-of-life is helpful in terms of knowing where to look, but it's not definitive in knowing how to act. Or how to react.

DR. BYRON WILLIAMS: And, sir, would it be fair to say that definitions of economic end-of-life change over time as utilities use new processes or equipment, which makes replacement or maintenance more cost-effective? Or the calculation, rather than the definition, sir.

MR. JOEL WORTLEY: The inputs certainly change.

DR. BYRON WILLIAMS: Fair enough. And that's why, sir, asset management, as you aim to practice it, is a comprehend -- comprehensive feedback

loop of theory and practice. Agreed?

MR. JOEL WORTLEY: Yeah. One of the great challenges we have with asset management is definition, so I'm -- I'm glad that we're -- we're clearing some of that up. It is very difficult or challenging in that we all tend to use the same words and mean slightly different things. It's important -- and this sounds almost ridiculous but it's true -- there's a marked difference between asset management and managing assets.

Managing assets is about making particular decisions about an asset, in terms of how to operate it, and how to maintain it, when to intervene.

Asset management is the coordinated activities of an organization to realize value from its assets. So it's that -- that ladder that I showed again in direct leading from the customer, in terms of an objective, right down to day-to-day asset decisions at the bottom of the scale, and making sure that these things are all in alignment.

DR. BYRON WILLIAMS: Okay. Thank you. Sir, hopefully this will be a quicker question.

System Average Interruption Duration, or SAIDI, measures the average outage duration

experienced by customers. Agreed?

MR. JOEL WORTLEY: Agreed.

DR. BYRON WILLIAMS: And System Average Interruption Frequency, or SAIFI, measures the average number of interruptions that customers have experienced. Agreed?

MR. JOEL WORTLEY: Yes.

DR. BYRON WILLIAMS: And for transmission and distribution, those are key long-term performance metrics. Agreed?

MR. GERALD NEUFELD: I would say that for transmission that would not be the case. And -- and the reason for --

DR. BYRON WILLIAMS: Simply for distribution, sir?

MR. GERALD NEUFELD: I'm sorry?

DR. BYRON WILLIAMS: Okay, go ahead.

MR. GERALD NEUFELD: And -- and the reason that the TSAIFI and TSAIDI are not the prominent metrics, is that -- that doesn't mean that there is an outage. What -- what a TSAIFI outage means is that there's a node which has lost one of its supplies. But it could have alternate supplies, so the power is still flowing.

DR. BYRON WILLIAMS: So -- thank you.

So, in essence, Hydro's agreeing that it is for tra -- for distribution? You're nodding your head, Sir?

MR. JOEL WORTLEY: Yes. Yes.

DR. BYRON WILLIAMS: Mr. Wortley, without asking you to elaborate on the corporate value framework, I'll ask you to agree that it was not used to determine which project should be executed within capital expenditure forecast 2016. Agreed?

MR. JOEL WORTLEY: That is correct. The corporate value framework is currently being piloted.

DR. BYRON WILLIAMS: And it would be fair to say that the capital and operating budgets in the current filing were not developed with -- using the new asset management methodologies?

MR. JOEL WORTLEY: Yes. As I described in -- again, in my direct evidence, that the investments in the test years are programmed by our operating and subject matter experts, based on risk assessments, in view of keeping the system operating in a safe and reliable manner in the short-term. And the longer-term forecasts are anchored in historic spending trends shaped around the best information we've got as to where things are going in the future.

MR. HAL TURNER: I need a course on

how to use this mic. I'm sorry.

I would like to add -- so the -- the CEF16 is a snapshot in time of the capital -- the Corporation's capital plan. And, as my colleague Mr. Wortley pointed out, generation wholesale is piloting the use of the corporate value framework. And we did use the corporate value framework to identify scope and set the timing of projects that do actually appear in the test years; they're just not necessarily documented in CEF16.

DR. BYRON WILLIAMS: So, just so I am clear, not transmission, not distribution?

MR. GERALD NEUFELD: Transmission did -- is not yet a position to be using the corporate value framework as a prioritization tool. However, we have a dif -- a -- a different tool, a prioritization tool, that we -- we established back in the early 2000s, which has been enhanced on a few occasions. And that's -- that's the -- the tool we use to prioritize for transmission projects.

MR. CHUCK STEELE: You know, I can comment on distribution. Generally our -- our asset replacement strategies are based around replacing assets that no longer meet our customers' requirements.

DR. BYRON WILLIAMS: Mr. Wortley, in -- and you adverted to this in my -- your conversation with my Learner Friend Mr. Peters.

In the terms -- in terms of determining the optimum design of its portfolio, Manitoba Hydro does not forecast or project SAIDI or SAIFI values. Agreed?

MR. JOEL WORTLEY: Agreed.

DR. BYRON WILLIAMS: And, it would be fair to say, more general -- generally, that Hydro does not forecast reliability improvements associated with the catural -- capital and operating expenditures related to specific projects or programs. Agreed?

MR. GERALD NEUFELD: I -- I would say that that's not true for transmission. We -- we have deve -- developed some tools that use a probability of failure in the analysis, and that's one of the inputs for the prioritization.

DR. BYRON WILLIAMS: You're referring to the System Reliability Risk Model, sir?

MR. GERALD NEUFELD: Yes.

MR. CHUCK STEELE: You know, if -- if I may, I'd like to put some context around SAIDI and SAIFI, and how it's utilized at Manitoba Hydro.

Certainly, my understanding is that our

counterparts at CEA have either advanced metering infrastructure or advanced remote monitoring, whereas Manitoba Hydro does not. So our SAIDI and SAIFI calculations are done on a relatively coarse methodol -- methodology compared to our counterparts.

So our expectation is that if we go down the path of adding more sophistication to be able to record SAIDI and SAIFI with more -- more accuracy, our -- our consultants tell us that the -- our reliability of figures will actually become worse once we have a more accurate accounting for them.

So when we're -- when we're comparing SAIDI and SAIFI, I think it's important to recognize, against our peers, that our method of calculating it is a more coarse method than what our peers would have.

DR. BYRON WILLIAMS: I don't want to follow this too far, sir, but just so I understand it, are you indicating that if the method of calculation improves, the results will be worsened?

MR. CHUCK STEELE: Well, to give an example, our -- our SAIDI calculation starts when a customer phones our contact centre and tells us that they're out of power, in -- in many circumstances. So that's when the clock starts ticking. In another

utility they might know the instant that customer does not have power.

Yeah, also, from a frequency perspective, we don't capture short duration outages. We don't have that sophistication. So if someone has a, you know, a three (3) second outage in their home that, through our system, we're able to reconnect, but we might not be aware that they were out for that -- for that duration you.

DR. BYRON WILLIAMS: Thank you. Thank you. Mr. Wortley, in the current opti -- optimization process, it would be fair to say that capital investment scenario analysis is not part of it?

And -- and if you need more precision, sir, I'm suggesting to you that Manitoba Hydro, for the test years, did not explicitly evaluate alternative investments sary -- scenarios for the test years to determine the relefe -- relative performance outcomes for different levels of investment. Agreed?

MR. JOEL WORTLEY: Yeah, that -- that's -- that is -- I would agree with that. One (1) of the capabilities of the corporate -- or Capital Portfolio Management Program that we are currently deploying, is to allow scenario analysis.

DR. BYRON WILLIAMS: Mr. Chair, I'm

not sure if the Board wishes or desires a -- a quick break this afternoon. If so, I'm going to move into a related area, but --

THE CHAIRPERSON: Well, we can -- we can either take it now or in a half an hour. How long is in the next area you're going into?

DR. BYRON WILLIAMS: I'm gonna say it will take forty-five (45) minutes to an hour.

THE CHAIRPERSON: Then let's take a -- we'll take a fifteen (15) minute break now.

--- Upon recessing at 3:29 p.m.

--- Upon resuming at 3:48 p.m.

THE CHAIRPERSON: Dr. Williams...?

CONTINUED BY DR. BYRON WILLIAMS:

DR. BYRON WILLIAMS: Kristin, if you can turn to Coalition 32-1, page 5.

Mr. Wortley, you'll recall just before the break a bit of a discussion about capital scenario analysis. Do you remember that, sir?

MR. JOEL WORTLEY: I do.

DR. BYRON WILLIAMS: And the indication was that that is something that Manitoba

Hydro aspires to as it moves forward in the next three (3) to five (5) years in terms of its capital asset management portfolio?

MR. JOEL WORTLEY: That's correct. We're laying the groundwork as we speak.

DR. BYRON WILLIAMS: And you're aware as well, sir, that other utilities currently use capital analysis -- excuse me, capital scenario analysis to consider impacts on projected performance metrics of different capital investments scenarios; agreed?

MR. JOEL WORTLEY: Yep.

DR. BYRON WILLIAMS: And you're aware as well that other utilities use capital scenario analysis to consider within a specific portfolio optimized investments aimed at achieving certain performance metrics; agreed?

MR. JOEL WORTLEY: That sounds reasonable.

DR. BYRON WILLIAMS: That your understanding, sir?

MR. JOEL WORTLEY: Yep.

DR. BYRON WILLIAMS: And, sir, recognizing that -- in the course of this hearing you've had the opportunity to review the evidence of

METSCO written on behalf of the Consumers Coalition?

You've reviewed that, sir?

MR. JOEL WORTLEY: I have.

DR. BYRON WILLIAMS: And recognizing that what is before us is not the METSCO report filed for the purposes of this hearing, but you're aware -- and you assisted as well, sir, in developing the Corporation's rebuttal to METSCO's evidence?

MR. JOEL WORTLEY: I did, yes.

DR. BYRON WILLIAMS: And you're aware, sir, that in the course of the METSCO evidence in the course of this hearing they cited a number of good practice examples of -- of different utilities in terms of capital asset management.

You're nodding your head?

MR. JOEL WORTLEY: Yep.

DR. BYRON WILLIAMS: And certainly, sir, you were made aware by your -- that some of those good practice examples might be referred to in the cross-examination of the Coalition; agreed?

As set out in this book of documents?

MR. JOEL WORTLEY: yes.

DR. BYRON WILLIAMS: And so, sir, have you reviewed at tabs 1 through 6 of the Coalition book of documents; you or your team?

MR. JOEL WORTLEY: I've -- would say I've reviewed them far enough to have a general understanding.

DR. BYRON WILLIAMS: Okay. And, sir, recognize as we go through these questions that to a significant degree we're trying to use these for illustrative purposes and not to delve deep into your personal knowledge of EPCOR or other utilities.

Do you understand that, sir?

MR. JOEL WORTLEY: Yes, it would be a short dive.

DR. BYRON WILLIAMS: And so, sir, let's -- let's walk our way through this and -- and just speaking of a short dive, in terms EPCOR, E-P-C-O-R, which I do not believe is an acronym but it's a brand, that, in essence, is Edmonton's power and water utilities, sir?

MR. JOEL WORTLEY: If -- if you say so.

DR. BYRON WILLIAMS: Okay, if you don't know that's fine. Sir, I want to draw you specifically -- before we get into the -- this document specifically, when we look at outage events, would it be fair to say that while some are within the control of the Corporation, there are others that

cannot be mitigated, or can only be partially mitigated.

Would that be fair, sir?

MR. CHUCK STEELE: Yes, I would say that's fair.

DR. BYRON WILLIAMS: Weather events would be one (1) of those where it's difficult to fully mitigate?

MR. CHUCK STEELE: Yeah, cert -- certainly there can be hardened designs of portions of the distribution network that would be better suited to withstand certain weather events but, yeah, generally speaking, a lot of those events are out of our control.

DR. BYRON WILLIAMS: And so when we look at causes of outages potential items such as scheduled outages may be elements that may be more controllable by the Utility; agreed?

MR. CHUCK STEELE: Yes, agreed.

DR. BYRON WILLIAMS: And defective equipment, at least to a certain degree, is a reflection of the -- the choices that a utility makes in terms of its investment decisions; would that be fir?

MR. CHUCK STEELE: Yep. Yes, it would

be fair.

DR. BYRON WILLIAMS: So in terms of outage causes, at least, those two (2) would be examples of ones that are more controllable; agreed?

MR. CHUCK STEELE: Yes and I would argue that I could add to that list: vegetation management. I think equal to defective equipment a large percentage of our outages are due to tree contacts for argument.

DR. BYRON WILLIAMS: Okay. So the big three (3) in terms of controllable would be vegetative management, defective equipment and scheduled outages, from the Corporation's perspective?

MR. CHUCK STEELE: I think that would be a fair summary.

DR. BYRON WILLIAMS: And I wonder if we can turn to tab 1, page 10 of Coalition 32-1. And scroll down the page a bit more. Thank you.

At a high level, and primarily for illustrative purposes, what the METSCO analysis in this document is attempting to do is to examine the consequences of different spending and investment decisions on key performance metrics.

Would that be fair?

MR. CHUCK STEELE: Yes.

DR. BYRON WILLIAMS: And in essence, if we focus on the third paragraph before us, one (1) of the options, one could examine in a scenario, is expenditure level designed to keep metrics at -- at the current level that they -- they are.

Would that be fair?

MR. CHUCK STEELE: Can -- can you maybe point to that a little bit closer.

DR. BYRON WILLIAMS: I'm directing your attention to the last sentence on the third paragraph suggesting mid-point scenarios contemplate maintaining SAIDI and SAIFI at recent levels.

MR. CHUCK STEELE: To the extent they're utilizing SAIDI and SAIFI as their performance benchmarks or metrics, sure, I agree.

DR. BYRON WILLIAMS: Okay.

MR. CHUCK STEELE: That that's what that paragraph says.

DR. BYRON WILLIAMS: And additionally, one could look, directing your attention to the fifth line of this same paragraph, at scenarios targeting improvement in either SAIDI or SAIFI in terms of investment decisions. Agreed?

MR. CHUCK STEELE: Agreed. Can I add some commentary about --

DR. BYRON WILLIAMS: You can, indeed, sir.

MR. CHUCK STEELE: Our -- Manitoba Hydro's investment drivers from a distribution perspective, we don't quantitatively target SAIDI or SAIFI whether it's to maintain or improve.

Our -- our investment drivers are very clearly to -- to meet our customer connection requirements; to ensure that the system is capable of supplying existing; and a reasonable amount of future customer connections. Then finally, we look at our system renewal spend based on condition assessments.

So -- so we don't target system renewal investments on changes or -- or maintaining SAIDI or SAIFI numbers, we -- we base our placements on system assessments -- or condition assessments of those assets.

DR. BYRON WILLIAMS: That's how you do it currently, sir, but --

MR. CHUCK STEELE: That is correct.

DR. BYRON WILLIAMS: -- you're not -- yes, you are not suggesting --

MR. CHUCK STEELE: Our -- our goal certain -- certainly, our goal is to increase our understanding of our system and to have better

analytics going for.

DR. BYRON WILLIAMS: And taking that goal further, sir, it is to be able to make investment dec -- decisions based on an informed understanding of what the potential outcomes may be in a variety of key metrics, including SAIDI and SAIFI; agreed?

MR. CHUCK STEELE: I would agree with that, with the -- maybe added caveat that in all these instances the -- the ends have to justify the means and that if we're going -- as we walk this path as we come down and get closer to being able to -- to build the models to make the predictive analyses, we want to make sure that the effort involved in making the prediction pays off in the decision that is affected by the prediction.

And so if we -- if we see that an unreasonable amount of investment in time and -- and data collection and analysis is going to be required to which they'll be very little impact to the decision, then we're -- we're not going to do it. It's got to make sense and it's got to pay back which is a -- a fundamental tenet of asset management. All of your activities have to carry value.

So if and when we get to a point where predicting outcomes on this scale is of value in the

decision-making, yes, we will do it.

DR. BYRON WILLIAMS: And just to finish what this analysis examines, we've already talked about looking at maintaining the SAI -- the performance metrics that are -- at -- at recent levels; agreed?

MR. CHUCK STEELE: With respect to EPCOR?

DR. BYRON WILLIAMS: Yeah.

MR. CHUCK STEELE: Yes.

DR. BYRON WILLIAMS: We've also talked about improving performance metrics; agreed?

MR. CHUCK STEELE: Again with respect of EPCOR, yes.

DR. BYRON WILLIAMS: Yes. And let's premise all this discussion on this is what can be done in terms of forward-looking practice.

Is that fine with you, sir?

MR. CHUCK STEELE: That's fine.

DR. BYRON WILLIAMS: And as Mr. Peters -- My Learned Friend Mr. Peters discussed with Mr. Wortley earlier, you could also target your investment scenarios, as EPCOR did here, in terms of considering lowering your performance metrics by 10 percent; agreed?

MR. CHUCK STEELE: You know I -- I did skim through the report. I did not look through it very closely. But my understanding was METSCO looked at EPCOR in terms of trends and whether you could have them improving or decreasing reliability metrics but -- but it wasn't specific as to targeting, you know, quantitative numbers so I'm not sure if that's what you're -- you're asking but...

But certainly my impression it was more of a trend that they -- they could target improving reliability or de -- decreasing reliability.

DR. BYRON WILLIAMS: And as you'll see on the third last line of the paragraph before you, sir, even investigating scenarios aiming at a managed 10 percent degradation of both metrics.

Do you see that, sir?

MR. CHUCK STEELE: Yep. Yes.

DR. BYRON WILLIAMS: And turning to page 11 of this document, recognizing this is EPCOR practice, sir, I'll suggest to you that on pages 11 and 12 are eight (8) different scenarios considered by EPCOR.

Will you agree with that, sir?

MR. CHUCK STEELE: Yes, I count -- I count eight (8).

DR. BYRON WILLIAMS: And again, sir, using run to failure as the base case, they examine the outcomes of investment decisions aimed at improving performance, keeping performance stable or having a 10 percent degradation in performance; agreed?

MR. CHUCK STEELE: Agreed.

DR. BYRON WILLIAMS: And if we turn to, sir, page 13 of this document focusing, you'll agree with me, sir, that the -- what this type of material would enable a decision-maker to consider are the outcomes of a family of investment decisions as they affect reliability metrics; agreed?

MR. CHUCK STEELE: You know, agreed. I guess I would add the caveat that I don't know that METSCO wrote this report on EPCOR'S -- EPCOR'S behalf but I don't know to the level that EPCOR accepted the recommendations or the -- the findings of this report.

DR. BYRON WILLIAMS: And sir, I'm not asking you to comment on the recommendations --

MR. CHUCK STEELE: But certainly, the -- the -- METSCO does present some curves that purport to do exactly what you say.

DR. BYRON WILLIAMS: And going to the next page, sir, being page 14, you see a contemplation

of the impacts of different investment scenarios on duration interruptions being figure E-6.

Do you see that, sir?

MR. CHUCK STEELE: Yes.

DR. BYRON WILLIAMS: And going to the next page, being 15, you see similarly scenarios contemplating the consequences of different investment paths on frequency interruptions also known as safety; agreed, sir?

MR. CHUCK STEELE: Agreed.

DR. BYRON WILLIAMS: Now, Mr. Steele, if we can go to page 21 of the tab 1. And if -- you'll see there, sir, the eight (8) scenarios presented by METSCO in this document, sir?

MR. CHUCK STEELE: Yes.

DR. BYRON WILLIAMS: And if we scroll down to the figure, right there is perfect. Thank you.

And what is presented here, sir, is in terms of specific -- and again for illustrative purposes in -- in -- in terms of specific investment choices, the relative cost of different investment choices in achieving systemwide reduction of key performance metrics.

Do you see that, sir?

MR. CHUCK STEELE: Yes, I see it.

DR. BYRON WILLIAMS: And this one on this page, being page 21, cues up in essence an optimal investment order for improving system SAIDI; agreed?

You'll see at that the top -- you see that sir? You're nodding your head.

MR. CHUCK STEELE: You know, I -- I see it. I'm not sure if I understand that it's -- it's prioritized by -- in terms of value. Is that what you're suggesting or...?

DR. BYRON WILLIAMS: Yes, and I'll direct your attention to the paragraph immediately above that, sir.

I'll suggest to you it's a cost-benefit analysis of each of the various investment options when looking to impact reliability performance, sir.

Do you see that?

MR. CHUCK STEELE: Yes. It's just not clear to me whether it's a -- the impact on total performance by each -- each of the vertical scale, or if it's -- or if it's done in the order of -- of value --

DR. BYRON WILLIAMS: Of value. And sir, in essence, what you're seeing from that

paragraph above the figure is that --

MR. CHUCK STEELE: Okay, optimal investment. Sorry when I read it on my piece of paper the type is too small, but if I look on the screen it's -- it's legible.

DR. BYRON WILLIAMS: It's an optimization exercise, sir?

MR. CHUCK STEELE: That's fine.

DR. BYRON WILLIAMS: Okay, so I think I hear you --

MR. CHUCK STEELE: Yes, I agree. I agree, yes.

DR. BYRON WILLIAMS: Okay. And if we go to the next page, being page 22, we see as well for system frequency an optimiz -- optimal investment cue as well.

Agreed, sir?

MR. CHUCK STEELE: Yes.

DR. BYRON WILLIAMS: And recognizing Mr. Wortley's advice about wanting to be cognizant of the cost-benefit of these exercises, this -- this is that what some utilities in Canada, New Zealand, United Kingdom are doing in -- in -- in evaluating different scenarios and in optimizing their portfolios, as measured against projections of future

performance. Agreed?

MR. CHUCK STEELE: You know, I suppose that's the case to the extent that those utilities would target SAIDI and SAIFI as having that value for the customers -- for their customers.

MR. JOEL WORTLEY: That -- that is the missing link here, right, is that they are targeting SAIDI and SAIFI but there's no measure of value in terms of what that really represents to the customer, and therefore, it's not enough information to make actual decisions on whether it's worth making the improvements.

Manitoba Hydro's corporate value framework includes customer impacts and by having it built in to the system for valuing our investments sets the stage such that when we are ready to do SAIDI and SAIFI projections we can actually tie that back to a customer value and make some real decisions with it.

(BRIEF PAUSE)

DR. BYRON WILLIAMS: This same type of exercise, sir, with an input of customer value as well as reliability figures could be done for any good practice corporation; agreed?

MR. JOEL WORTLEY: With enough time and money you can do anything, yes. There's definitely obviously a range of maturities to which we know that the Europeans and Australians are ahead of North Americans, and we know that certain North American industries -- or sorry, companies are further ahead than others.

Manitoba Hydro's progressing and actively pursuing asset management improvements. This is one that we will consider as we go forward.

DR. BYRON WILLIAMS: And certainly, sir, as it relates to the Board, based upon the conversation with Mr. Barnlund, you'll note that this is a conversation that has been going back at least a decade, agreed?

MR. JOEL WORTLEY: Agreed.

DR. BYRON WILLIAMS: If we can turn to Coalition Exhibit --

MR. HAL TURNER: Actually, I just wanted to add one (1) thing. I -- I think it's important to note -- I think the -- the Board should take note that METSCO, your -- your Intervenor expert witness commanded Manitoba Hydro on how we try and take customer impact into the CVF. We're not just basing it on a statistic.

As -- as Mr. Wortley pointed out, it's hard to know what point 1 and SAIDI or SAIFI is worth, but we take it a step further, and we try to understand how that's going to impact our customers so we can make the right investment decision.

DR. BYRON WILLIAMS: This -- Mr. Turner, just so I'm clear -- actually, to Mr. Wortley, just so I'm clear, in terms of the CEF, the Capital Expenditure Forecast for 2016, for the portfolio, this type of analysis was not conducted, although we -- we're -- we're aware of the -- the -- the trial with -- - with --

MR. HAL TURNER: I'm sorry, doc -- Dr. Williams, I thought we were talking about future state. I thought these exhibits were to talk about where we could go.

DR. BYRON WILLIAMS: Mr. Turner, just in terms of your response, you were talking about what we're doing. So simply, I was trying to take it back to what was put into the Capital Expenditure Forecast.

And I do apologize --

MR. HAL TURNER: Right, no. Fair enough. You're right. We're -- we're -- where we want to take it is that we are -- we built into the corporate value framework the ability to quantify the

impact of the customer, and that's where we're headed.

DR. BYRON WILLIAMS: Okay. Mr. Wortley, this type of ability for the overall portfolio of generation distribution and transmission is currently not available to Manitoba Hydro? You're not able to do this right now?

MR. JOEL WORTLEY: It's not part of our regular practices, no.

(BRIEF PAUSE)

DR. BYRON WILLIAMS: If we can turn to Coalition Exhibit 32-1, Tab 5, and specifically the Toronto Hydro distribution system plan. You can pick page 75 for right now.

(BRIEF PAUSE)

DR. BYRON WILLIAMS: And Mr. Steele, I'll -- I'll come back to you in just a second, or to Mr. Wortley. I'm -- I'm agnostic on -- on who answers the questions.

But Mr. Wortley, you're aware -- or sorry, you indicated in your conversation with My Learned Friend Mr. Peters earlier today that to your knowledge, in terms of the CEF16, that Manitoba Hydro

had not undertaken stakeholder research specifically investigating preferences for a trade off between rate increase and reliability performance? Is that your recollection of that conversation?

MR. JOEL WORTLEY: Yes, that is correct.

(BRIEF PAUSE)

DR. BYRON WILLIAMS: And would it be fair to say that currently, Manitoba Hydro does not regularly calculate life cycle cost for asset management purposes?

(BRIEF PAUSE)

MR. HAL TURNER: We may not calculate them explicitly, but we do take them into consideration in our investment decisions. So for example, if we were buying a new turbine runner, we would communicate to the vendor what the efficiency of the runner was worth to us in monetary terms, and so they could use that to optimize their design. So if it made sense for them to do some more testing to fine-tune the efficiency of the turbine runner, they

could understand what that's worth to us and help us make the right investment decision.

So correct that we do not explicitly calculate the life cycle costs for the asset, but we do consider life cyc -- cycle cost implications in our investment decisions.

DR. BYRON WILLIAMS: And -- and let me --

MR. CHUCK STEELE: Sorry, if I could just add to that?

DR. BYRON WILLIAMS: Go ahead, Mr. Steele.

MR. CHUCK STEELE: I -- I believe when we order transformers, for example, or when we go out for tender for transformers and -- and other electrical equipment that might have losses inherent to them, we -- we do a calculation based on the value of those losses over the life cycle of -- of the asset.

DR. BYRON WILLIAMS: Thank you for those that clarifications. Would it be fair to say that the portfolio is not opti -- optimized based on life cycle cost?

MR. HAL TURNER: That's fair, but the -- when we will be optimizing, as we have been in

generation wholesale, it's not just based on economics. It also considers the safety of the public, of our staff, the environment. So it's not just an economic decision when we optimize. We try and look at all those factors.

MR. CHUCK STEELE: I -- I don't know that it's fair to conclude, as you suggest, because we -- at the end of the day, we may have an optimized portfolio based on all of the factors and the -- and the balances that Mr. Wortley often talks about that may, by default, be the best portfolio, from a life cycle cost as well.

DR. BYRON WILLIAMS: And Mr. --

MR. HAL TURNER: Sorry, I just wanted to add one (1) other point. I apologize.

When we're optimizing, we're optimizing at the portfolio level, so we're looking at all of our investments. So I'm talking from a generation perspective --

DR. BYRON WILLIAMS: And -- and you're talking -- you're not talking about the entire portfolio, just --

MR. HAL TURNER: I'm -- I'm just talking -- so, for example, in -- in generation wholesale, when we optimize. So we're looking at all

of our investment needs. So we may choose a solution that doesn't offer the lowest life cycle cost for a particular asset because it may free up, for example, some capital that we could invest in a different asset and bring overall greater value to Manitoba Hydro.

So we don't deal with it on a investment by investment decision. We're -- part of the benefit of -- of the new capital portfolio management process and the corporate value framework is we're making our decisions at the portfolio level. And so we maximize value at the portfolio level, not necessarily at each individual investment.

DR. BYRON WILLIAMS: And again, just to go back to currently, the --

MR. HAL TURNER: Currently that's what we're doing in generation and wholesale.

DR. BYRON WILLIAMS: Right, currently for CEF16.

MR. HAL TURNER: As -- as documented in CEF16, no, test years in CEF16, yes.

DR. BYRON WILLIAMS: For generation and --

MR. HAL TURNER: For generation and wholesale, correct.

DR. BYRON WILLIAMS: So again, Mr.

Steele, this is distribution. If you're not -- are -- are you generally -- you've taken a quick look at the Toronto Hydro distribution materials, sir?

MR. CHUCK STEELE: Yes, I did skim through it.

DR. BYRON WILLIAMS: Okay. You've not memorized it yet?

MR. CHUCK STEELE: No, I -- I have not memorized it, sorry.

DR. BYRON WILLIAMS: And I apologize. Apparently the document as a whole was 2,500, and I --

MR. CHUCK STEELE: Yeah, when -- when I skimmed through it, I skimmed through the 2,500 pages, but I -- I noticed in your book of documents, it's the significantly less, so.

DR. BYRON WILLIAMS: And there was no in -- intent, sir. I -- I do apologize for that inconvenience.

If we can turn to page 78 of -- of this document, and -- and focus on figure 4. Mr. Steele, the narrative here by Toronto Hydro is -- as presented in figure 4, is that they've got a -- what they consider to be the economically optic -- optimal capital investment approach involving a big bang in 2015 of 2.56 billion, and then smaller amounts out to

2019, considerably smaller amounts. Do you see that, sir?

MR. CHUCK STEELE: Yes, I do.

DR. BYRON WILLIAMS: And again, if you you -- you -- If you need a reference, it's again on this page, but you see Toronto Hydro is, in essence, saying given the large step increases in rates, they wanted to look at a couple of different options. Is that your understanding of this -- this paper as well, sir?

MR. CHUCK STEELE: Yes, that is my understanding.

DR. BYRON WILLIAMS: And if we turn to page 81, you'll see a description by Toronto Hydro of an accelerated execution step -- strategy, consisting of investments of $840 million thereabouts in -- in five (5) consecutive years, being 2015 through 2019.

Would that be fair, sir?

MR. CHUCK STEELE: Yes.

DR. BYRON WILLIAMS: So that's one (1) of the options Toronto Hydro considered, and then if we go to page 82, sir, you'll see a consideration of the paced Ontario Hydro consideration, which is of investments, I'll suggest to you, from 2015 through 2019 in the range of half a billion dollars annually?

MR. CHUCK STEELE: Yes, absolutely.

DR. BYRON WILLIAMS: And then with an understanding that -- that this -- the magnitude of investments would have to be paced out -- out between 2020 and 2037? Is that fair, sir?

MR. CHUCK STEELE: Yes.

DR. BYRON WILLIAMS: And if you're not able -- able to comment on that -- this, sir, that's fine, but ultimately, what Toronto Hydro recommended was the paced strategy. Is that your understanding? And if you're not able to comment, that's fine.

MR. CHUCK STEELE: You know, I -- I can't comment. I'm not sure what they recommended.

DR. BYRON WILLIAMS: That's not a problem. If we go to page 83, though, sir, you'll see a comparison again, Toronto Hydro, although not as complex as -- as EPCOR, is projecting a comparison between -- in terms of the impacts upon duration, interruptions, and frequency interruptions between its recommended plan and run-to-fail.

Do you see that, sir?

MR. CHUCK STEELE: Yes, I -- I -- can -- can I assume -- it -- it's hard to tell the scale, but the -- or it's hard to tell the colours on this document, but I'm assuming the run-to-fail results in

worsening reliability.

DR. BYRON WILLIAMS: As compared -- yeah --

MR. CHUCK STEELE: As -- as compared to --

DR. BYRON WILLIAMS: I'll -- I'll suggest to you --

MR. CHUCK STEELE: -- as compared to their proposed plan?

DR. BYRON WILLIAMS: I'll ask you to accept that subject to check, sir.

MR. CHUCK STEELE: Okay.

DR. BYRON WILLIAMS: And again, sir, as comparison to EPCOR, this is a scenario analysis projecting future impacts on duration interruptions and frequency interruptions, albeit considerably less sophisticated?

MR. CHUCK STEELE: No, I -- I agree. I see the similarities, and I note that both are targeting reliability metrics and improvements to reliability.

DR. BYRON WILLIAMS: And --

MR. JOEL WORTLEY: It is interesting to note that, you know, the -- there's quite a bit of discussion about cost, and quite a bit of discussion

around performance, but not a lot of discussion around risk, and that certainly, if -- if the risks are acceptable in the paced solution, why would you ever go to the accelerated solution? It just makes sense --

DR. BYRON WILLIAMS: Okay --

MR. JOEL WORTLEY: -- provided the risks are acceptable.

DR. BYRON WILLIAMS: Thank you. I wonder if we can turn to page 84, and focus on the -- this section on customer needs and preferences.

And Mr. Steele. I don't know if you've had a chance to look specifically at lines 9 through 15, but I'll suggest to you that there you see the customer consultation process undertaken by Toronto Hydro with regard to its capital investment plan?

MR. CHUCK STEELE: Yes, I see.

DR. BYRON WILLIAMS: And you'll see, sir, focusing on line 11, that it included focus groups, agreed?

MR. CHUCK STEELE: Yes.

DR. BYRON WILLIAMS: An online workbook accessible to all customers, agreed?

MR. CHUCK STEELE: Yes, that's what it says.

DR. BYRON WILLIAMS: Facilitor --

facili -- it says that it includes -- included facilitator-led workshops with commercial and industrial users as well?

MR. CHUCK STEELE: Yes.

DR. BYRON WILLIAMS: And finally, a statistical telephone survey, agreed?

MR. CHUCK STEELE: Agreed.

DR. BYRON WILLIAMS: And then it also suggests that there was a final report on the process and findings of this consultation made available?

MR. CHUCK STEELE: Yes. I -- you know, if I can -- I just, you know, add -- to make sure I understand it correctly, my understanding is that Toronto Hydro specifically had -- had engagement with their ratepayers regarding their preferred plan to -- to look at investments directed towards improved reliability.

Certainly, from Manitoba Hydro's perspective, our investments, or the distribution space are driven by condition assessments, so I don't know that we would -- we would necessarily do the same thing, but -- but my understanding may not be correctly. Like I said, I only skimmed through the document.

DR. BYRON WILLIAMS: And let's just go

to that. Mr. Wortley, as -- as we look at the vision for sustaining capital and capital investments more broadly, are these type of consumer engagement undertaken by Toronto Hydro among the types that Manitoba Hydro might contemplate?

MR. JOEL WORTLEY: So an element of -- of Manitoba Hydro's new corporate plan is having a very -- customer focus. It's one (1) of the four (4) pillars of the Company and one to which we need to do considerable development in terms of engaging our customers and making sure that customers -- we understand what -- what customers expect in terms of value, and we deliver it. And so that -- that strategy has not been fleshed out yet, but I could see that something like this could be part of it.

MR. GERALD NEUFELD: I would like to comment on the -- on the SAIFI and SAIDI, and -- and while I believe that SAIDI and SAIFI are -- are good lagging measures, and upgraded -- system upgrade plans could be developed around SAIDI and SAIFI, they have the greatest relevance where there's a denser population areas, and the service feeds -- you have serve -- multiple service feeds int -- into that area.

We -- we have a system on the east side of Lake Winnipeg that -- where we responded on -- on

Coalition -- Coalition IR-157. And here's --here's our location which includes Poplar River, Berens River, Bloodvein River, Little Grand Rapids, Pauingassi, Sagkeeng, Manigotagan, Black River, and a -- a large cottage area. And they have a single feed in -- into there.

And if we lose that single feed, if we lose the transformer, we've got widespread outages for a long time. There is no communication into that area. And I would submit to you that the -- the study of SAIDI and SAIFI in an application like that probably has little relevance to what the -- what the final solution should -- will -- will look like under a -- under a -- a solution that balances cost and -- and reliability.

DR. BYRON WILLIAMS: Thank you, Mr. Neufeld, for sharing that. You're in no way suggesting, though, that there is not value in looking at the consequences for investment decisions on different performance metrics?

MR. GERALD NEUFELD: I absolutely am not saying that, but all I'm saying is that the SAIDI and SAIFI in using these outage statistics have their application, and there -- as Mr. Wortley had suggested earlier, there's a lot of parameters that we take into

account, whether it be raw liability -- safety -- safety measures could fall, and the reliability could be safe -- safety for the public, safety for Hydro workers, environmental aspects, and there's a wide spectrum of -- of factors that are key factors which we take into account as we prioritize our projects.

DR. BYRON WILLIAMS: I wonder if we can turn very quickly to Coalition Tab 2 of this book of not -- doc -- documents, and specifically page 27. I apologize, Kristin, 28's fine.

Mr. Steele, this is a -- a look at pole replacement and substation refurbishment, distribution unit cost benchmarking as undertaken by Hydro One, agreed?

MR. CHUCK STEELE: Yes.

DR. BYRON WILLIAMS: And currently, Manitoba Hydro has not undertaken bench makings -- benchmarking studies to compare its capital spending or asset units cost to other utilities, agreed?

(BRIEF PAUSE)

MR. CHUCK STEELE: Not that I'm aware of for distribution,

DR. BYRON WILLIAMS: Okay. Turning to

page 31 of this document. And really the last paragraph, and -- and if Hydro cannot answer this, this is fine.

But you can see Hydro One indicating that it had made efforts to include more Canadian utilities, but had been only successful in -- in garnering Hydro Quebec, BC Hydro, and three (3) Ontario local utilities.

You see that -- that reference?

MR. CHUCK STEELE: Yes, yes, I do.

DR. BYRON WILLIAMS: To your knowledge was Manitoba Hydro appointed -- approached in terms of this benchmarking study?

MR. CHUCK STEELE: You know, not to my knowledge. But certainly I was -- I was not personally approached, and neither was my colleague behind me who would've been the person to be approached.

DR. BYRON WILLIAMS: Okay. And we won't go through this, but I'll suggest to you, Mr. Steele, that if we look to pages 32 through 50 of this document, one would get an indication of some of the analysis undertaken in terms of the benchmark -- benchmarking costing exercise.

Fair enough?

MR. CHUCK STEELE: Yeah, fair enough. You -- you know, when I -- when I did skim through this document, that I did notice of some of the recommended actions on page 29 were consistent with some of Manitoba Hydro's current practices. For example, our Integrated Pole Maintenance Program and are -- are detailed overhead feeder inspection programs too, so.

DR. BYRON WILLIAMS: Thank you. Mr. Chair, just -- I'm not sure what that timeframe is for today.

THE CHAIRPERSON: 5:30.

DR. BYRON WILLIAMS: 5:30, okay.

MR. JOEL WORTLEY: Maybe I can just add that relative to -- to the benchmarking in general, that benchmarking has its utility -- has its utility as a -- as an indicator of where to look, let's say. And as Mr. Shepherd pointed out, I believe it was on Monday, it -- it's not terribly useful in terms of making particular decisions, but it can be very helpful in guiding you as to where to go next.

And so I would suggest that -- that studies like this certainly are of value, but need to be done at the -- the right time and place such that the information is fruitful in terms of the next step

in your decision-making. And so it is a useful tool when applied correctly. That's -- I just want to caution a little bit.

MR. CHUCK STEELE: Yeah, I -- I can also add, although we may not have participated in this study comparing capital costs, that I believe METSCO's report did reference that are pole replacement costs were -- were favourable to other utilities, but...

CONTINUED BY DR. BYRON WILLIAMS:

DR. BYRON WILLIAMS: Thank you for that.

Let's move away from -- from these examples of benchmarking. And -- and, Mr. Wortley, would it be fair to say that, in terms of corporate value management, the Corporation envisions a three (3) phase plan? And I can give you the phases, if that would assist user.

MR. JOEL WORTLEY: It -- it would help me if --

DR. BYRON WILLIAMS: Okay.

MR. JOEL WORTLEY: -- if you had a reference or -- I'm not sure what you're -- where's you're going.

DR. BYRON WILLIAMS: I'm -- I'm referring to -- it's certainly set -- I don't think we need to go there. I think you'll -- you'll -- you'll know what once I say it. But Section 5.11 of Tab 5 of the GRA.

But in essence, Phase 1 being assessment of current asset management practices, which is now complete. Agreed?

MR. JOEL WORTLEY: Yes.

DR. BYRON WILLIAMS: Phase 2 being the development of asset management policies and strategies. Agreed?

MR. JOEL WORTLEY: Agreed.

DR. BYRON WILLIAMS: And Phase 3, being the development of a detailed roadmap for the implementation of corp -- of a corporate asset management framework. Agreed?

MR. JOEL WORTLEY: That's right. And in terms of the -- this three (3) phase process you've indicated to My Friend Mr. Peters, that you anticipate the -- that the implementation plan will take a somewhere in -- in between three (3) to five (5) years. Agreed?

MR. JOEL WORTLEY: Well, it's a little bit more nuance Of that. So the -- as I try to

described a little bit earlier, there -- there's different scales of asset management. And so the -- the corporate asset management initiative and the three (3) phases as you've described, until we roadmap that out I don't really know how long that's gonna take, and I don't really know how far we're going to go, in that -- will -- will the appropriate time to stop be at a Level 3 maturity, or do we want to put the Level 4, beyond? I'm not sure. And we won't be able to make that decision till we see what it's going to cost to get there, and what value or what benefit we think we're going to -- going to achieve by getting there.

The three (3) to five (5) year timeframe apply specifically to our capital portfolio management and the ability to achieve our objectives of optimizing/executing portfolios and forecasting investment requirements on a -- on a needs basis into the future. And so, one (1) is part of the other. Capital investment, asset investment planning is a subset of asset management.

But asset management totality is a much larger endeavour, involving, as I mentioned earlier, the alignment of an organization's activities to particular goals that requires a culture shift and a -

- and a realignment of the entire organization to be fully effective. And that -- I'm not sure how long that's going to take.

DR. BYRON WILLIAMS: So, just so I understand, the three (3) to five (5) year timeframe applies to the subset, being the portfolio management. Agreed?

MR. JOEL WORTLEY: Correct.

DR. BYRON WILLIAMS: Okay. And -- and in terms of Phase 2 -- and again, you don't need to turn there, but referencing Coalition 2-67 -- at the time of Second Round IRs Phase 2 had not commenced. Agreed?

MR. JOEL WORTLEY: Correct.

DR. BYRON WILLIAMS: And that was due to competing organizational prior -- priorities in the Voluntary Departure Program. Agreed?

MR. JOEL WORTLEY: Yes, the Corporation -- the Corporation's restructuring and absorbing of the voluntary departures is our competing priorities. As well as, there's only so many improvement initiatives that can be undertaken at a time. And so the corporate -- the Capital Portfolio Management Program is -- is being executed, the enterprise asset management is being rolled out.

There -- there comes a point of saturation in to how much change can be absorbed by an organization.

DR. BYRON WILLIAMS: And, sir, in terms of commencing Phase 2, what is your most -- what is your current expectation?

MR. JOEL WORTLEY: My current expectation would be that we need to do some training, need to do some awareness -- some broad awareness around the organization, such that our leaders and our staff and our decision-makers understand the difference between managing assets and asset management, so that they're able to -- to meaningfully participate in discussions of -- of how to move the company forward. And I expect that that will occur beginning in the new year as we come out of the voluntary departure, which will be February 1. And we'll move forward as quickly as we can from there.

DR. BYRON WILLIAMS: Just so I understand, sir, are you suggesting that Phase 2 will commence in the new year?

MR. JOEL WORTLEY: Yes.

DR. BYRON WILLIAMS: And an output from Phase 2, sir, will be the development of corporate asset management strategies and policies. Those are anticipated to be completed in Phase 2,

agreed?

MR. JOEL WORTLEY: Correct.

DR. BYRON WILLIAMS: And it's expected that these documents will help provide consistent asset management strategies, standards, and clearly establish asset management roles and responsibilities. Agreed?

MR. JOEL WORTLEY: They will help, yes.

DR. BYRON WILLIAMS: And when -- given the start in 2018, when do -- does one expect Phase 2 to be completed.

MR. JOEL WORTLEY: The schedule for Phase 2 has not been fleshed out or adopted yet, so we will have to do the plan and determine the schedule as -- available to resource it.

DR. BYRON WILLIAMS: Ballpark, sir. A year? Three (3) years?

MR. JOEL WORTLEY: Oh, it's -- no, it's -- this is a shorter-term step, subject to -- to what else -- what else comes up to compete with it, it should certainly be complete within a year.

DR. BYRON WILLIAMS: I want to turn to a bit of a different subject matter. Probably, most of these questions will go to you, Mr. Steele. But,

Mr. Wortley, or the rest of the team, feel free to -- to chip in.

Would it be fair to say that on an individual asset basis, in general one can make better decisions, if you have information beyond the age of the asset?

MR. CHUCK STEELE: That -- that's probably fair to say. I would -- I would add the caveat that it probably depends on the asset, the level of information you would -- you would benefit from.

I think for a lot of distribution assets, it's -- it's more expensive to collect the information than it is to action on the asset when it fails, for example.

DR. BYRON WILLIAMS: It would also be fair to say that, given Manitoba's climate and unique operating characteristics, the life-cycle of its assets may differ from similar assets in other regions. Agreed?

MR. CHUCK STEELE: I -- I agree. I think every utility has its own unique set of circumstances, for sure.

DR. BYRON WILLIAMS: And certainly having high-quality data of your own may reduce the

reliance on industry life-cycle dat -- data, which may not necessarily be reflective of the Hydro experience. Agreed?

MR. CHUCK STEELE: Agree.

DR. BYRON WILLIAMS: And you'll recall, we just had a extensive discussion about predictive analytics -- analytics?

MR. CHUCK STEELE: Regarding other utilities' --

DR. BYRON WILLIAMS: Performance, yes.

MR. CHUCK STEELE: -- approach to reliability performance, yes --

DR. BYRON WILLIAMS: You recall that conversation?

MR. CHUCK STEELE: -- I recall.

DR. BYRON WILLIAMS: And certainly Manitoba Hydro's aware that the need to use replacement data to help build predictive models and evolve the Corporation's asset management capabilities is -- it's important. Agreed?

MR. CHUCK STEELE: Yes. And maybe as a point of clarification, generally speaking, in the -- - in the test years and in the short-term, assets are replaced based on condition assessments, actual -- actual field measurements of either visual or

mechanical assessments. But certainly you're correct in predicting future expenditures, the more data to -- to -- the more accurate those expenditures can be predicted.

DR. BYRON WILLIAMS: And that's particularly the case in terms of service terminal failure data, which is particularly important to the -- to help predictive models. Agreed?

MR. CHUCK STEELE: Sorry, the -- the phrase used: terminal failure data?

DR. BYRON WILLIAMS: I probably mispoke terribly. I meant to say 'service terminal failure data'.

MR. CHUCK STEELE: Service terminal failure date.

DR. BYRON WILLIAMS: Yeah.

MR. CHUCK STEELE: Like, you're -- you're suggesting the -- when -- when the ass -- predict -- predicting when the asset will actually fail and trying to, where it's -- where it's economic to do so, replace that asset just prior to failure? Like that, that -- that would be beneficial, yes.

DR. BYRON WILLIAMS: At a high level, Mr. Wortley, I'll send this to you, it would be fair to say that the operating groups within Manitoba Hydro

are at different levels of maturity, in terms of applying asset health indices data?

MR. JOEL WORTLEY: Yeah, that would -- that would be fair.

DR. BYRON WILLIAMS: And generally speaking, as compared to generation, transmission and distribution are developing their maturity? I knew Mr. Neufeld was going to jump for this one.

MR. GERALD NEUFELD: Thank you. Yes, we are developing the maturity. We have asset health curves. We've been working closely with Kinectrics.

But I'd like to take the -- the topic back to what some of the key drivers are for facilities where -- in the -- in the year process, or will shortly be embarking on, to improve -- to improve the reliability of supply in -- in southern parts of Manitoba. And I used -- I used the term 'a reliability of supply' rather loosely.

Because what I really mean is, we want to make sure that the -- the transmission feeds into the areas where we've got large residential loads, such as in the Steinbach area, or such as in the Morden/Winkler area where there's been a lot of -- a lot of -- of growth in the last number of years, that we're able to meet the --the loads.

This doesn't have to do with asset health indices. This has to do, simply -- very simply with having the of the -- the wires in place and the power transformers in place to be able to -- to meet the load demand. And it's that simple.

And so, asset health indices do have a substantial amount of value. And the value comes in to -- into play when all other factors are equal. And I'm in the suggest to you that the error that we're in on the transmission side, where we're trying to prove -- improve the reliability of supply to various parts of the province today, we probably wouldn't be using asset health indicators as a -- as the -- as the driver for -- for the recommended upgrades.

And there's another topic on here. And I'm -- I'm going to cut -- I'm going to keep this fairly short. But there are -- of this -- there's other -- other equipment that we're in the process of -- of replacing. It has to do with the Bipole III project, which is being installed.

And the net impact to the -- to the overall system in southern Manitoba with having Bipole III in play, is the there's a phenomenon called the 'short-circuit', or the amount of power that flows when -- when there's a connection say to -- from a

tree to the ground on the -- on the distribution system or, for that matter, on the transmission system, and the -- the impact of putting in a large facility, a substantial facility like Bipole III, is that we find ourselves with circuit breakers. And these are very large circuit breakers, for 230,000 volts and a hundred and -- 115,000 volts. And these -- the circuit ratings are being exceeded.

And it just simply wouldn't -- it would be a -- it -- we just simply couldn't operate Bipole III without having first replaced those breakers, and -- and there's quite a few of them.

So there's a couple of areas where asset health indicators are not the driver for -- for making improvement decisions. And these are fairly costly decisions.

DR. BYRON WILLIAMS: Mr. Neufeld, and certainly not wanting to invite a long answer, but just in terms of the question I posed, as compared to generation, and in terms of asset health indices and how they're integrated, there's some maturing to do on the transmissions. Agreed?

MR. GERALD NEUFELD: Agreed.

MR. CHUCK STEELE: If I can comment on --

DR. BYRON WILLIAMS: Mr. Steele, I was going to just ask for that.

MR. CHUCK STEELE: Yeah. Sorry.

DR. BYRON WILLIAMS: So go ahead.

MR. CHUCK STEELE: Thank you for the opportunity.

Yeah, you know, I agree, maturity somewhat relative between the three (3) operating groups. But certainly distribution being comprised of, you know, literally millions of low-cost assets, often it's probably more expensive to -- to do detailed health assessments, as opposed to allowing those assets to run to failure.

And then on the other end of the spectrum, as I pointed out in the Navigant report, with respect to their recommendations to Ontario Hydro, or Hydro One I guess it was, we -- we are leading industry with respect to some of our integrated pool maintenance programs.

DR. BYRON WILLIAMS: Okay. And Mr. Steele, in terms of distribution, your department has been blessed with two (2) recent studies from Kinectrics, one being the Manitoba Hydro 2016 Asset Condition Assessment, which is dated May 26, 2017. Agreed?

MR. CHUCK STEELE: Yes.

DR. BYRON WILLIAMS: The other being the Manitoba Hydro Acid Degradation Curve Development, which is dated July 20th, 2017. Agreed, sir?

MR. CHUCK STEELE: Yes.

DR. BYRON WILLIAMS: And if we could go to MFR, Minimum Filing Requirement, 92, and specifically the Kinectrics Manitoba Hydro 2016 Asset Condition Assessment. And page 30 -- just go to the cover page for a minute, so page 1. This is the 2014 one. We're actually looking for the one dated May 26th, 2017.

Mr. Chair, I wonder if we can just stand down for a second, just to make sure we can find this document.

THE CHAIRPERSON: Do you want to break, Mr. Williams, for --

DR. BYRON WILLIAMS: Well, just -- I know this is riveting material so I would -- I'd suggest maybe a brief five (5) minute break --

THE CHAIRPERSON: Yes, certainly.

DR. BYRON WILLIAMS: -- just to make sure we're cued up.

THE CHAIRPERSON: Okay.

--- Upon recessing at 4:45 p.m.
--- Upon resuming at 4:57 p.m.

THE CHAIRPERSON: Dr. Williams...?

CONTINUED BY DR. BYRON WILLIAMS:

DR. BYRON WILLIAMS: Yes, and thank you. And, Mr. Steele, just in terms of Kinectrics work on asset condition assessment, the term "data availability indicator" or DAI measures the amount of condition parameter data that an asset has as it's measured against the condition parameters included in the health index formula.

Would that be fair, sir?

MR. CHUCK STEELE: Yes.

DR. BYRON WILLIAMS: So an asset with all condition parameter data represented will, by definition, have a DAI value of 100 percent. Agreed?

MR. CHUCK STEELE: Agreed.

DR. BYRON WILLIAMS: If we can turn to table 1, page 34, I believe of this document. No, let's go to page 14. My apologies. Here we go. And actually, can we make sure that we have the DAI in -- that's perfect.

Mr. Steele, just in terms of some of

the distribution assets studied by Kinectrics, table 1 provides a health index results summary; agreed?

MR. CHUCK STEELE: Agreed.

DR. BYRON WILLIAMS: And on the left-hand side we see certain asset categories ranging from station breakers at the top to OH switches at the bottom; agreed?

MR. CHUCK STEELE: Agreed.

DR. BYRON WILLIAMS: And the last two (2) right-hand columns, the second last one captures the age availability; agreed?

MR. CHUCK STEELE: Agreed.

DR. BYRON WILLIAMS: And in essence, that represents the -- for that particular asset the percentage of asset items for which Manitoba Hydro has the information related to their age; correct?

MR. CHUCK STEELE: Correct.

DR. BYRON WILLIAMS: And if we look to the average DAI or data availability indicator that's on the extreme right-hand column, sir?

MR. CHUCK STEELE: Yes.

DR. BYRON WILLIAMS: And we see there in terms of those parameters a high in the range of 88 percent, which is about -- about seven (7) or eight (8) lines down. Do you see that, sir?

MR. CHUCK STEELE: Yes.

DR. BYRON WILLIAMS: And then we see that the availability of data for a number of these assets is at -- in terms of the parameters used by Kinectrics is -- is zero. Agreed?

MR. CHUCK STEELE: Agreed.

DR. BYRON WILLIAMS: And subject to check, sir, would you agree that for -- for fifteen (15) of these twenty-three (23) assets it is less than the average DAI is 50 -- is less than 50 percent?

MR. CHUCK STEELE: Subject to check. I -- I won't count them, but, you know, I question some of the relevance for those assets where it's identified as zero percent. I -- I believe that a lot of those are -- if not all of them referred to assets that are run-to-failure.

DR. BYRON WILLIAMS: And so my understanding of Hydro's position in terms of the parameters is that for some of these assets, it's acceptable to have them less than 50 percent, for others it is not.

Would that be fair, sir.

MR. CHUCK STEELE: That's fair.

DR. BYRON WILLIAMS: If we could pull up the other Kinectrics study, which is found as

attachment 1, the Coalition MH-1-160, and go to the executive summary, please, which I believe is at page 5. So that's Coalition MH 1-160, attachment one.

And I'm looking for Roman Numeral V. So I guess we need to go back a few pages.

THE CHAIRPERSON: Dr. Williams, there's no test on the formulas, is there?

DR. BYRON WILLIAMS: If there were, I would fail.

CONTINUED BY DR. BYRON WILLIAMS:

DR. BYRON WILLIAMS: But, Mr. Steele, this was -- this is relatively hot off the presses. This was received from Kinectrics by Manitoba Hydro in the summer; agreed?

MR. CHUCK STEELE: Agreed.

DR. BYRON WILLIAMS: And I just want to draw your attention on the executive summary to the -- the fifth paragraph in which Kinectrics suggests that Manitoba Hydro's assets tend to stay in service longer than in other jurisdictions.

Do you see that reference, sir?

MR. CHUCK STEELE: Yes.

DR. BYRON WILLIAMS: That was the finding of Kinectrics?

MR. CHUCK STEELE: Yes.

DR. BYRON WILLIAMS: Agreed? And the suggestion by Kinectrics, in this paragraph, is that since the removal based curves are rather conservative due to replacement of assets for reasons other than condition, the expectation is that the condition based curves will demonstrate even longer service lives.

Agreed?

MR. CHUCK STEELE: Agreed.

DR. BYRON WILLIAMS: And elsewhere in this document Kinectrics suggests that these longer asset lives may be a factor both of the weather -- the cold weather in Manitoba, as well as Manitoba Hydro's practices; fair enough?

MR. CHUCK STEELE: If I recall the document correctly, I believe you're -- you're correct there.

DR. BYRON WILLIAMS: Some short snappers to finish off the day and, Mr. Neufeld, I've neglected you so I -- I do have a couple questions about the transmission and -- and Copperleaf.

And, sir, I -- I want to direct your attention to Coalition Information Request first round 181. The attachment which is a lengthy document and specifically to page 80 of that attachment.

Mr. Neufeld, I'll give you a second to orientate yourself, but this is the asset investment. This is a document prepared by the transmission business unit in March 2015; would that be fair? Do you want to go back to page 1 to orientate yourself, sir?

Let's go to page 1, please. Oh, this is the -- excuse me, this is the generation slide. A bit further on in this document, sir, is the transmission side. You'll agree to that?

MR. GERALD NEUFELD: Let's -- let's -- let's find it.

DR. BYRON WILLIAMS: Okay. Boy, that generation slide says a lot, lots of pictures. Right. Let's go to page 76.

Sir, you'll accept that this is the -- the asset investment planning software implementation roadmap prepared by the Transportation Business Unit on or about March of 2015?

MR. GERALD NEUFELD: Right, that's the Transmission Business Unit.

DR. BYRON WILLIAMS: Okay.

MR. GERALD NEUFELD: We transport electrons.

DR. BYRON WILLIAMS: Okay. That's

your team, sir?

MR. GERALD NEUFELD: That's correct.

DR. BYRON WILLIAMS: I'm not that good with engineering humour, but I'm taking that -- that was funny, sir? Lawyer -- I'm sure engineers are way more funny than lawyers, let me just say that.

And I wanted, sir, to -- to direct you to -- to page. Just one second, please.

(BRIEF PAUSE)

DR. BYRON WILLIAMS: We're going to have to scroll through this. It's only a couple of pages, but I'm looking, sir, for the reference when -- when transmission is discussing the suitability of Copperleaf for -- for it. So keep scrolling through please, Kristin, and I apologize for this, Mr. Chair and members of the panel. Keep going please. Keep going, please. Keep going, please. It's probably going to be about page 85. Keep going. Okay, thank you. And my apologies for the delay. No, excuse me. Go back to page 85 for a second.

(BRIEF PAUSE)

DR. BYRON WILLIAMS: Oh, my apologies. I had it right in front of me. It's page 79 at the top. And my apologies. And just scroll up to page 78 for just a second. Now that I've succeeded in confusing everyone -- no, please keep -- yeah, right there at the bottom, the last paragraph on page 78.

Mr. Neufeld, you'll see a discussion starting at the bottom of page 78 where there's an indication that generation operations is currently using Copperleaf C55 as an -- as an AIP tool.

You'll see that, sir?

MR. GERALD NEUFELD: I do, sir.

DR. BYRON WILLIAMS: At the top of page 79, sir, you'll see the good folks at transmission -- I don't want to get into any jealousy between generation and transmission, but saying that this is a -- a more complex question for transmission, number 1, because it's more statistical in nature and reasons number 2 and 3 are set out there as well.

Do you see that, sir?

MR. GERALD NEUFELD: I do see that.

DR. BYRON WILLIAMS: And later on in this document, and at page 85 from Manitoba Hydro, there is a suggestion in the second paragraph -- the first full paragraph on this page, the second sentence

that to your knowledge, no AIP software tool has yet implemented a robust capability for modelling this type of risk.

So, Mr. Neufeld, you're nodding your head, so that -- you see that suggestion there in front of you, sir?

MR. GERALD NEUFELD: I do.

DR. BYRON WILLIAMS: So, sir, just -- this is some housekeeping, but this is the state of affairs as it was in 2015. In terms of the transmission's needs, has it been satisfied now that Copperleaf 55, has the robust capability being sought?

MR. GERALD NEUFELD: I'd just like to check with my colleague.

(BRIEF PAUSE)

MR. GERALD NEUFELD: So we have made some progress, and what we've done is we've worked with Copperleaf to -- to ensure that it would accept our system reliabi -- reliability risk model that's -- you made a reference to that earlier. And that was the gap that we had at the time of the -- that this was written and we've now closed that gap, and it will work.

DR. BYRON WILLIAMS: Okay. And Copperleaf 55 was implemented for transmission on or about August of 2017, subject to check?

MR. GERALD NEUFELD: That is correct.

DR. BYRON WILLIAMS: Mr. Chair and members of the panel, that was a lot of scrolling around for -- for those housekeeping questions, but I did want to ask Mr. Neufeld a couple questions before I'm finished with this -- this panel.

I am -- in terms of this panel, from my perspective, I know there's a wedding coming up for one (1) of them soon. I'm prepared to release them. I don't know if My Friend Mr. Hacault has any questions he anticipates for them or not.

MR. ANTOINE HACAULT: I don't think I do. I think Mr. Cormie and the members of the previous panel would be able to answer them. They're more of a general nature. So I don't have any questions that I would put to them today.

If -- I'm aware also that there's a -- I don't know which member, but one (1) of the members has got a -- a wedding restriction, so we were -- we certainly are understanding of that, and would have tried to ask any questions.

MR. CHUCK STEELE: Just -- just for

the purpose of putting it on the record, my -- my son is getting married this weekend.

THE CHAIRPERSON: Well, our -- our congratulations, Mr. Steele, I'll just ask if the panel has any questions.

I've got a -- a question, and I -- I don't know who goes to, and I think it may go to Mr. McCallum. And it's more of an educational request for myself, and I suspect for some of the newer members of this panel. And I -- I would suggest we don't do it now, that we'll do it first thing tomorrow morning. But if you could draw our attention, if there are materials already filed, if not, if we could have a -- sort of a ten (10) minute primer.

Here's what I'm interested in -- and we heard comments made from the panel in terms of their respective areas that in terms of establishing priorities, they have different ways of doing it. They look at different factors, and things of that nature.

And I'm interested in the business operations capital budget. And what the decision-making process is when they come to, I assume, Mr. McCallum or whatever, and you go through your departments and figure out how much money you would

like. And of course, there isn't enough money, and how you determine the allocation of the budget on the different areas, what factors you take into account now, and following the process you are undertaking right now on a system-wide basis, where you would like to be after you complete going through all of your -- all of your phases, because I -- I anticipate it will be to -- it'll be a different place.

But I'm trying to figure out, you know, you've got the multibillion dollar company. You've got all of these demands for transmission, generation, and distribution. Certainly, I suspect that there isn't enough money in the budget to meet everybody's requests. How do you -- how you make the decision or -- or decisions in terms of how -- who gets what money?

So if there is materials filed already. If you could draw it to -- to us. If not, if you could, you know, spend ten (10) minutes tomorrow and sort of explain the different processes.

Mr. McCallum's got a -- a frown. I -- I don't know if this -- if thi -- if this is too complicated, or --

MR. JAMES MCCALLUM: No, it -- it was -- it was -- no, definitely not a frown. It was just

trying to think of anywhere in -- in the 32,000 pages --

THE CHAIRPERSON: Yeah.

MR. JAMES MCCALLUM: -- of which, I've only reviewed 31,000. If we -- if we have the material. But we -- we can certainly speak to that.

THE CHAIRPERSON: Yeah, and it -- it -- if it's not, you know, first thing tomorrow, at some point, though. But I -- I would speak on behalf of myself. I'd like to understand the -- the decision-making process. Okay?

Thank you. We'll adjourn and -- and -- sorry, there's -- sorry. Ms. Van Iderstine? Yeah.

MS. HELGA VAN IDERSTINE: I'm a novice on these things. The -- I do have one (1) question on re-exam, if you don't mind, and I have a comment --

THE CHAIRPERSON: Certainly.

MS. HELGA VAN IDERSTINE: -- I'd like to --

THE CHAIRPERSON: Yeah.

MS. HELGA VAN IDERSTINE: -- address the -- to the panel.

RE-EXAMINATION BY MS. HELGA VAN IDERSTINE:

MS. HELGA VAN IDERSTINE: So if I

might -- and I know you've turned it off, Kristen. I'm sorry about that.

I would want to draw your attention -- or Mr. Wortley's attention back to the UMS report, which is filed as Manitoba Hydro -- in Manitoba Hydro's application, which was Manitoba Hydro Exhibit 5, I believe, Appendix 5.1. There we have it. Page 6.

And Mr. Wortley, you'll recall that my friend, Mr. -- Dr. Williams took you to this prior to the -- or very early on in his cross-examination of you, and he asked questions about the maturity level of Manitoba Hydro and -- and how it had been established.

If you could take a look at that executive summary again and comment to us -- let us -- the panel know a little bit more about where Manitoba Hydro fits in the overall -- in the landscape, I guess I'd say, of asset management and public utilities in North America and worldwide.

MR. JAMES MCCALLUM: Sure. I -- I'd be happy to. Maybe we can advance to page 11. That's a bit of a -- a visual. At the bottom of the page, we see here the same maturity scales going from zero on the left to four (4) on the right. And we see a

variety of companies around Canada and -- and internationally.

And we see primarily the ones on the -- on the right-hand edge of -- of the scale are overseas and we -- not shown here but in the text above you'll read that it says that:

> "While the scores may seem low compared to a competent standard of three (3) it is important to realize that many North American utilities would rate a zero (0) unaware of major asset management system requirements or a one (1) aware, but not yet developing. Overall Manitoba Hydro compares favourably against North American utilities in terms of its asset management maturity level; largely as a result of recent progress made, for inst --for example, in capital investment optimization, C-55, the corporate value framework, asset health indices, reliability centered maintenance and failure curves."

And so, overall, we've made quite a bit

of progress in -- in -- across many fronts and we've been at this for many years. Acknowledge fully that there are still gaps to go to -- to best practice but we embrace those gaps. We -- we're much happier knowing about them and being able to address them and close them than -- than not.

And as we reviewed this afternoon, we've got many different initiatives underway to get that going, including the strategic maintenance plan and generation that was talked about, the Kinectrics, our corporate asset management initiative. And so as much as, you know, we'd -- we'd like -- like to be in a better place we are where we are and we see a lot of value in -- in progressing from there.

THE CHAIRPERSON: Thank you.

MS. VAN IDERSTINE: Thank you. And I had one (1) comment I'd like to address the panel for consideration.

My Friend the Coalition of -- produced their book of documents as -- as did the, of course, the Board panel -- or the Board counsel, and I know that represents a lot of work to put those things together because I've had to do it myself. The difficulty is is that they put these documents in now as what they're calling exhibits.

You'll recall we had a concern about the number and the comp -- complexity of the ones that were presented and the index listed on Friday. This is a much smaller one that came to the Board today and -- but even still, not all of the referenced items were even put to the panel to comment.

And so you've now got a bunch of documents that been put in, essentially, as an exhibit. The panel has not had an opportunity to -- to comment on them and, in my submission, they are -- should not properly be before the panel. Even the ones that the panel have -- this panel had an opportunity to comment on, you'll recall in particular with the EPCOR report that they didn't accept that that report reflected anything that they had any knowledge about.

So, I'm -- I'm asking your direction and I would submit that specifically with respect to documents that weren't even brought to the -- to the panel's attention, that they be excluded from the book as an exhibit, and that with respect to those that they didn't accept the -- the content of that those ought not to be accepted by the panel.

You need, as you go forward, the best evidence you can, and this panel and the Manitoba

Hydro wants to provide that to you. And I know that the other Intervenors and the public participation is extremely important. And when they put it forward and ask questions, it's important that the answers that you are provided and the information you're provided is information that can be assessed and tested properly. Just as they've tested -- test the amount of Hydro panels.

So, going back to my concerns about the book of authorities or the book of documents, I would ask that those ones that they didn't reference be removed from the exhibit book and to the extent that they did not accept any of the -- the reports, that those also be removed and not be referenced.

THE CHAIRPERSON: Dr. Williams...?

DR. BYRON WILLIAMS: If I might, with respect in terms of this book of documents, the six -- the first six (6) tabs are expressly on the record already. They're referenced both directly in the METSCO evidence with a specific link provided to them, as well as referenced in the appendix -- appendix. And they are put there as illustrations of best practice. So with respect, they're already on the record.

In terms of the excerpts seven (7)

through fifteen (15), those are -- are from either Board Orders or Board transcripts and are quite properly before the Board. So, in our client's position, the submissions of our -- our friend are without merit.

And I would note regardless of, you know, there were some unpalatable truths perhaps in these documents from the perspective of Hydro's witnesses, but those were put forward, tabs 1 through 6 in the METSCO material. We could go through and -- and -- with them ad nauseam. One makes judgments in the midst -- midst of cross-examination in terms of the Board's tolerance level for conversations about sustaining capital.

In our view, given that they're already expressly referenced on the record, there's not an issue.

THE CHAIRPERSON: Ms. Van Iderstine, we'll take notice of your -- of your concerns and we'll put forward the position of the Panel at a later date.

MS. VAN IDERSTINE: Thank you.

THE CHAIRPERSON: Thank you. Nine o'clock tomorrow morning. Thank you

(PANEL RETIRES)

EXECUTIVE SUMMARY

Overview

The Gross Firm Energy in Manitoba is forecast to grow from a weather adjusted value of 25,870 GWh in 2017/18 to 28,627 GWh in 2027/28. This represents an average growth of 276 GWh or 1.0% per year for 10 years. By 2037/38, Gross Firm Energy is forecast to be 32,363 GWh, representing a growth rate of 325 GWh or 1.1% per year.

Gross Total Peak is forecast to grow at a similar pace, from an adjusted value of 4,751 MW in 2017/18 to 5,320 MW in 2027/28, growing 57 MW or 1.1% a year for the next 10 years. By 2037/38, Gross Total Peak is forecast to be 6,035 MW, representing a growth rate of 64 MW or 1.2% per year.

Growth is expected in all sectors with the Residential Basic, General Service Mass Market and General Service Top Consumers sectors forecast to grow annually by 1.2%, 1.5% and 0.2% respectively, over the next 20 years. During the last 10 years, Gross Firm Energy has grown 198 GWh or 0.8% per year. This 10 year period encompasses the 2009 global economic downturn that slowed growth and also reflects the influence of Manitoba Hydro's Demand Side Management activities.

The primary driver of energy growth in Manitoba is the population and the secondary driver is the economy. The population of Manitoba has grown from 1,191,000 people in 2007/08 to 1,342,000 people in 2017/18, averaging 1.2% growth per year. Manitoba's population is forecast to grow to 1,650,000 by 2037/38, averaging 1.1% per year. Real Manitoba Gross Domestic Product (GDP) is expected to grow 1.8% in 2018/19 and average 1.7% annually for the next 20 years. Canada and US Real GDP is forecast to grow 2.1% and 2.6% respectively in 2018/19 and average 1.9% and 2.1% annually for the next 20 years.

Three main components represent the majority of Manitoba's electricity use:

i. **Residential Basic** is forecast to grow at an average of 1.2% per year over the next 20 years. Customer growth, mimicking population growth, is growing 1.1% per year. Average use per customer is increasing, adding 0.15% per year. This is primarily due to the increased use of electric space heating, electric water heating and miscellaneous end uses in dwellings.

ii. **General Service Mass Market** is forecast to grow at an average of 1.5% per year, which is higher than the historic growth of 1.1% per year over the past 10 years. The growth is primarily due to the economic growth in Manitoba.

iii. **General Service Top Consumers** is forecast to grow at an average of 0.2% per year, which is higher than the 0.1% decline per year experienced during the past 10 years. It is less than the 3.1% growth per year during the prior 10 years. The 20 year historical growth of the Top Consumers has been 1.5% per year.

20 Year Avg Gr.	325	1.1%	64	1.2%	

Change between the 2017 and 2018 Forecast

The Gross Firm Energy Forecast starts 144 GWh (0.6%) lower in 2018/19 and by 2036/37 is 445 GWh (1.4%) higher than the 2017 Forecast. This is an increase of just over 1 year of load growth by 2036/37. (1 year of load growth = approximately 325 GWh).

The Gross Total Peak is 137 MW higher in 2036/37 than presented under the 2017 Forecast primarily attributable to an increase in the energy forecast but a reduced energy forecast in the Top Consumers sector which results in a lower load factor and higher peak impact. This is an increase of just over 2 years of load growth. (1 year of load growth = approximately 64 MW).

2031/32	29,991	28,995	997	5,580	5,349	232
2032/33	30,367	29,469	898	5,652	5,438	215
2033/34	30,733	29,942	791	5,722	5,526	196
2034/35	31,106	30,427	679	5,794	5,617	177
2035/36	31,492	30,929	563	5,869	5,711	157
2036/37	31,904	31,459	445	5,948	5,811	137
19 Year	318	284	34	63	55	8
Avg Gr.	1.1%	1.0%	0.1%	1.2%	1.0%	0.1%

The decrease in 2018/19 of 144 GWh is mainly attributable to changes in the Top Consumers short term operating plans.

By 2036/37, the 2018 Forecast is 445 GWh higher than previously assumed in the 2017 Forecast. The difference is attributable to the following:

Residential Basic (+210 GWh)

- Primarily higher due to an decrease in the forecast of electric price

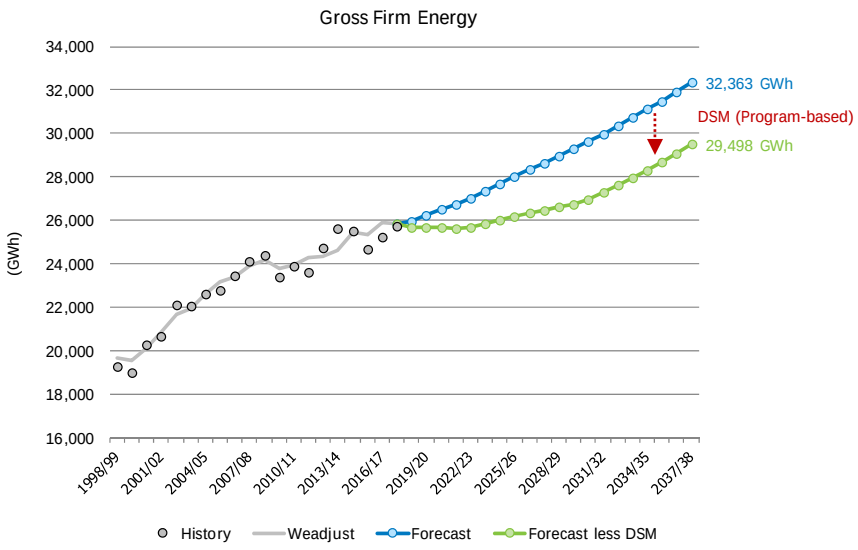
General Service Mass Market (+371 GWh)

- Primarily higher due to an increase in the average use forecast

General Service Top Consumer (-178 GWh)

- Primarily lower due to adjustments in customer short term plans and updates to the longer term growth forecast (PLIL)

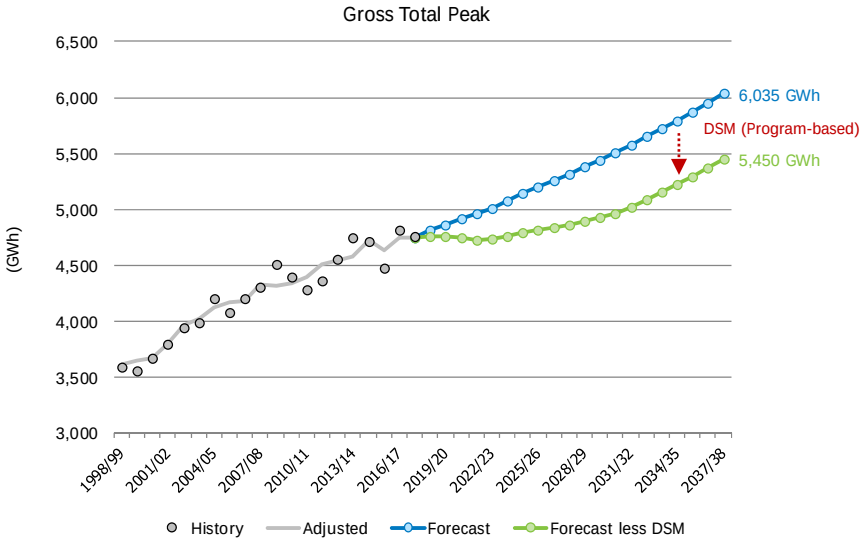
Other sales and losses (+42 GWh)



- Increases in other sales and losses

Program-based Demand Side Management (DSM)

Through its Demand Side Management (DSM) initiative, Manitoba Hydro develops and implements cost-effective energy conservation and alternative energy programs. These programs provide Manitoba customers with environmentally friendly initiatives that aim to reduce customer's energy consumption. The 2018 electric load forecast reflects future DSM savings associated with existing Provincial building codes and improved equipment efficiency standards and regulations (Codes and Standards). This is the only effect of DSM initiatives that is specifically accounted for within the forecast. DSM savings arising from future program-based offerings incremental to the above mentioned Codes and Standards are not reflected in this forecast. They are accounted for separately in Manitoba Hydro's DSM Plan and Power Resource Plan.



Although not explicitly included in this forecast, the program-based DSM has a significant impact on the projected future load growth expected in Manitoba. Program-based DSM reduces the Gross Firm Energy in 2037/38 from 32,363 GWh to 29,498 GWh, lowering the average growth of 325 GWh or 1.1% per year to an average growth of 181 GWh or 0.7% per year.

Figure 1 – Gross Firm Energy

Program-based DSM reduces the Gross Total Peak in 2037/38 from 6,035 MW to 5,450 29,498 GWh, lowering the average growth of 64 MW or 1.2% per year to an average growth of 35 GWh or 0.7% per year.

Figure 2 – Gross Total Peak

The following table outlines the impacts of incorporating program-based Demand Side Management activity:

Table 3 – Impacts of Demand Side Management

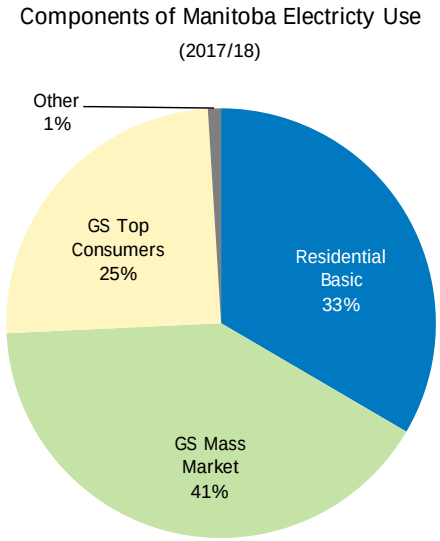
INTRODUCTION

This document is prepared annually as Manitoba Hydro's forecast of its future load requirements for its service area. The service area consists of the entire province of Manitoba (99.85% of sales), as well as two resale customers that supply energy to Creighton, Saskatchewan (0.12% of sales) and the Northwest Angle, Minnesota (0.03% of sales). Exports of power to other utilities are not included.

This information provided serves several purposes. Short term forecasts of sales by billing month within rate groups are needed to forecast revenue for rate design and accounting. Short term forecasts of energy and peak is needed for system operations. Long term forecasts of energy and peak are required by power planning to determine long term supply requirements.

A "customer" in this document refers to a metered electrical service. Unmetered services, such as flat rate water heating and sentinel rentals are not defined as customers. Street lighting group a number of services at the municipal and lighting type category and are each defined as one customer. A customer is not equivalent to a building structure. One building can have multiple electric services and may count as more than one customer. Likewise, multiple buildings may have only one service and will count as only one customer.



Electric consumption is read at the meter level in units of kilowatt-hours (kWh). This document reports electric use in terms of gigawatt-hours (GWh). One GWh equals one million kWh, which is approximately the energy of 100 typical residential dwellings not using electricity for heating. A residential dwelling not using electricity for heating uses approximately 10,000 kWh per year.

The highest load requirement during a time period is defined as the peak load. It is given in terms of megawatts (MW). One MW equals one thousand kilowatts (kW). A typical residential dwelling not using electricity for heating would use a maximum of about 2.5 kW sometime during the year. However, dwellings will not all be at their maximum use at the same hour. The use of all dwellings at any specific hour is defined as the coincident load. The coincident peak is the load at the hour of Manitoba's system peak. A typical dwelling not using electricity for heating would use about 1.6 kW at the coincident peak. Therefore 1.0 MW is approximately the coincident peak requirement of 600 typical dwellings not using electricity for heating.

Components of Manitoba's Electricity Use – 2017/18

General Consumers Sales (also referred to as Total Sales) includes the energy supplied to all of Manitoba Hydro's individually billed customers. During the 2017/18 fiscal year, Manitoba Hydro averaged 576,937 General Consumers Sales customers who consumed 22,573 GWh.

Figure 3 – Components of Manitoba Electricity Use

The major groups include:

i. **Residential Basic**, with 486,317 customers, who used 7,547 GWh or 33.4% of Total Sales are mostly residential structures that include single-family dwellings, multi-family dwellings and individually metered apartment suites.

ii. **General Service Mass Market**, with 68,105 customers who used 9,213 GWh or 40.8% of Total Sales are small to large Commercial and Industrial customers.

iii. **General Service Top Consumers**, with 26 customers who used 5,592 GWh or 24.8% of Total Sales are the 10 high-usage companies (some count as multiple customers) that are forecast individually.

In addition to the above major groups, there are four remaining group of customers who used 221 GWh or 1.0% of Total Sales:

i. Seasonal customers are those billed twice a year rather than on a monthly basis.

ii. Diesel customers are from four remote communities not connected to the integrated grid system.

iii. Flat Rate Water Heating customers.

iv. Area and Roadway Lighting sector which includes electricity sales for the Sentinel Lighting and Street Lighting groups.

Note: Over 50,000 of these services related to Flat Rate Water Heating and Area and Roadway Lighting do not count as customers.

Manitoba Load at Common Bus is the total load metered at all the substations in the province that supplies Manitoba Hydro's non-Diesel customers and includes Distribution Losses and Construction Power. In 2017/18, Common Bus was 23,799 GWh or about 5.4% more than Total Sales.

Gross Firm Energy is the total load needed to be generated for domestic firm load requirements on the Integrated System excluding Diesel customers. It includes Transmission Losses and Station Service. Some customers are on non-firm contracts (Surplus Energy Program), and their load is not included as part of Manitoba Hydro's generation requirement. In 2017/18, Gross Firm Energy was 25,742 GWh or about 14.0% over Total Sales.

FORECAST OVERVIEW

General Consumers Customer Forecast

In 2017/18, Manitoba Hydro had an average of 576,937 General Consumer Sales customers. These were made up of 486,317 Residential Basic customers, 68,105 General Service Mass Market customers, 26 General Service Top Consumers customers and 31 Surplus Energy Program (SEP), i.e. non-firm, customers, with the remaining customers being Diesel, Seasonal and Area and Roadway Lighting.

During the last 10 years, Residential Basic customers have grown at an average of 5,417 (1.2%) per year. Manitoba Hydro's Forecast of Key Economic and Financial Indicators provide the forecast of Residential Basic customers which is incorporated in the load forecast. Residential Basic customers are forecast to grow 5,968 (1.2%) customers per year over the next 10 years and 5,658 (1.1%) customers per year over the next 20 years.

General Service Mass Market customers have grown 425 (0.6%) per year over the last 10 years. The sector is forecast to grow 489 (0.7%) per year over the next 10 years and 490 (0.7%) per year over the next 20 years.

Residential Seasonal customers, mainly cottages with lower average energy use, experienced a reduction of customers over the past 10 years as higher energy consuming seasonal customers are transferred to the Residential Basic sector. The sector is forecast to decrease at 131 customers annually over the next 10 years and 133 customers annually over the next 20 years due to the continued transfer of higher usage seasonal customers to the Residential Basic sector.

Area and Roadway Lighting customers have grown 9 (0.7%) per year over the last 10 years. The sector is expected to grow at 6 (0.4%) customers annually over the next 10 years and 5 (0.4%) customers annually over the next 20 years.

General Consumers Sales Forecast

During 2017/18, Total General Consumer Sales was 22,573 GWh. The fiscal billing year (using weather from March 16, 2017 to March 15, 2018) was significantly warmer than normal producing a weather adjustment for the year of +165 GWh. The resulting weather adjusted Total Sales value was 22,738 GWh.

Over the last 10 years, Total Sales have grown at 182 GWh (0.8%) per year. The growth was 1.4% per year in Residential Basic and 1.1% per year in General Service Mass Market, and a decline of 0.1% in General Service Top Consumers due to the economic downturn in 2009 and the loss of one Top Consumer customer. The historical growth also reflects the effect of past Demand Side Management (DSM) initiatives.

Sales are forecast to grow at 235 GWh (1.0%) per year over the next 10 years and 281 GWh (1.1%) per year over the next 20 years before accounting for future market-based DSM programs.

Most of the growth is forecast to occur in General Service Mass Market, at 166 GWh (1.5%) per year over the next 20 years, followed by Residential Basic at 103 GWh (1.2%) per year and Top Consumers at 13 GWh (0.2%) per year. Starting in 2016/17, seven of the smallest Top Consumers, totaling 404 GWh, were moved to General Service Mass Market for forecasting purposes. The historical growth rates for the General Service Mass Market and Top Consumers are adjusted to reflect the migration between both sectors.

Manitoba Energy Forecast

The weather adjusted actual Gross Firm Energy was 25,870 GWh in 2017/18. Gross Firm Energy has grown 198 GWh (0.8%) per year for the past 10 years. This historical growth reflects the effect of past Demand Side Management (DSM) initiatives. Gross Firm Energy is forecast to grow to 32,363 GWh by 2037/38 at an average of 325 GWh (1.1%) per year. This does not reflect future market-based DSM programs.

Distribution Losses, which are the difference between Manitoba Hydro's substations and the customers' meters, have a wide variance from year to year. The differences have ranged between 3.5% and 5.5% of Total Sales. It is forecast to be between 4.8% and 4.9% of Sales for the entire forecast.

Transmission Losses, which are the difference between the generators and the substations, are forecast to be approximately 9.0% of Total Sales throughout the entire forecast period.

Distribution Losses and Transmission Losses, totaling almost 14%, need to be added to Total Sales to estimate Gross Firm Energy. The 14% value should be used to estimate load at generation when only load at the customer's meter is known. For example, to convert Power Smart program savings from the customer meter to generation. The exception is for large General Service customers who own their own transformation and incur minimal Distribution Losses. For these customers, a 10% value should be used.

Comparison of the 2017 Forecast to Actuals

Comparison of the 2017 Forecast to the 2017/18 Weather Adjusted Actuals

The weather adjusted General Consumer Sales for 2017/18 was 22,738 GWh which was 332 GWh higher than the 2017 Forecast of 22,407 GWh after incorporating the Demand Side Management (DSM) program savings achieved in 2017/18.

The weather adjusted Residential Basic sector was 107 GWh higher than the 2017 Forecast and the weather adjusted General Service Mass Market sector was 166 GWh higher than forecast.

In 2017/18, the Top Consumers sector consumed 5,592 GWh which was 71 GWh higher than the 2017 Forecast of 5,522 GWh. The difference is primarily due to an increase in production within the Metals & Forestry sector.

Distribution Losses were 66 GWh higher than forecast and transmission losses were 181 GWh lower than forecast.

Overall, the weather adjusted Gross Firm Energy for 2017/18 was 25,870 GWh which was 194 GWh higher than the 2017 Forecast of 25,676 GWh. The normalized Gross Total Peak for 2017/18 was 4,751 MW which was 43 MW higher than the 2017 Forecast of 4,708 MW.

Changes between the 2017 and 2018 Forecasts

Changes between the 2017 and 2018 Residential Basic Forecast

The 2018 Residential Basic Forecast starts 43 GWh higher compared to the 2017 Forecast. This is primarily due to the 2017/18 weather adjusted actual energy use being higher than forecast. The difference between forecasts increases to 615 GWh in 2027/28, primarily due to the change in the electric price forecast. By 2036/37, the difference between forecasts decreases to 210 GWh as the forecast of electric price reaches similar levels to those included in the 2017 Forecast.

Changes between the 2017 and 2018 General Service Mass Market Forecast

The 2018 General Service Mass Market (GSMM) Forecast starts 36 GWh higher compared to the 2017 Forecast. The difference between forecasts increases to 563 GWh in 2027/28, primarily due to the change in the electric price forecast. By 2036/37, the difference between forecasts decreases to 371 GWh as the forecast of electric price reaches similar levels to those included in the 2017 Forecast. 371 GWh represents approximately 1.1 years of system load increase.

Changes between the 2017 and 2018 General Service Top Consumers Forecast

The 2018 GS Top Consumers Forecast is lower in the first five years (short term) based on updates sourced from industry news and publications, company prospectuses, and Manitoba Hydro's Key and Major Account Advisors. In addition, changes to the key economic variables within the Potential Large Industrial Loads (PLIL) model further contribute to the difference between forecasts to be 178 GWh lower by 2036/37.

Major changes and energy impacts			
2036/37			
Primarily higher due to a decrease in the short term fcst. of electric price			
Resdiential Basic change	210	GWh	
Primarily higher due to an increase in the average use forecast			
General Service Mass Market change	371	GWh	
Primarily lower due to adjustments in customer short term plans and updates to the longer term growth forecast (PLIL)			
General Service Top Consumer change	(178)	GWh	
Increase in other sales & losses			
Other sales and losses change	42	GWh	
Total Change	**445**	**GWh**	

Changes between the 2017 and 2018 Gross Total Peak Forecast

The Gross Total Peak Forecast is higher by 137 MW by 2036/37 compared to the 2017 Forecast. The Peak Forecast is primarily based on the Gross Firm Energy Forecast, and as such the changes in energy impact the peak. Also contributing to the increase in gross total peak is a decrease in peak load factor from 61.8% in the 2017 Forecast to 61.2% in the 2018 Forecast. The load factor decrease is due to the reduced energy forecast of the Top Consumers sector, which has a high coincidence load factor of 91%.

The increase in peak in 2036/37 amounts to 137 MW, which is an increase of over 2.1 years of system load growth. (1 year of load growth = approximately 64 MW).

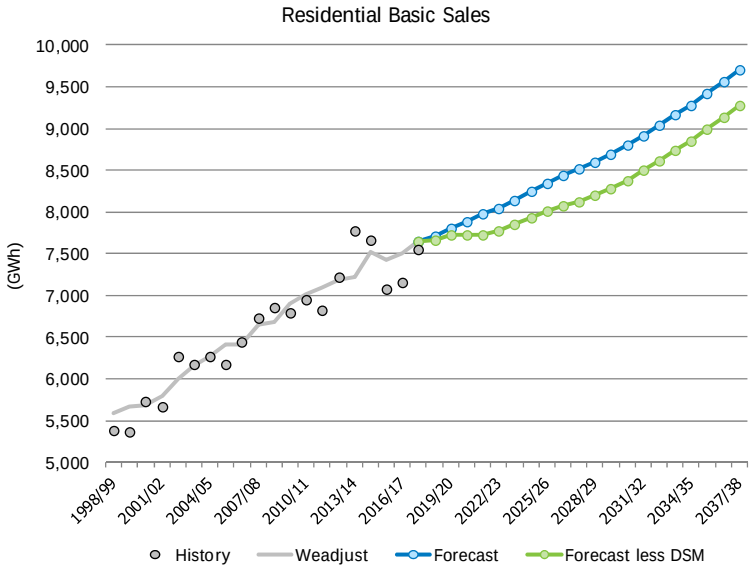
FORECAST DETAILS

Residential Basic



In 2017/18, there were 486,317 Residential Basic customers. Of these customers, 77% were single detached, 10% were multi-attached, and 13% were individually metered apartment suites. The majority of customers (54%) are in Winnipeg where natural gas is available, 29% are in natural gas available areas outside Winnipeg, and 17% are in areas where natural gas is not available.

Figure 10 – Residential Basic Customers

Residential Basic has grown 108 GWh (1.7%) per year for the past 20 years and 100 GWh per year (1.4%) for the past 10 years reflecting the effect of past Demand Side Management (DSM) initiatives. This sector is forecast to grow 87 GWh (1.1%) per year for the next 10 years and 103 GWh (1.2%) per year for the next 20 years, before future program-based DSM initiatives. Including program-based DSM, the sector is forecast to grow 82 GWh (1.0%) over the next 20 years. The primary driver of Residential Basic growth is population, which is forecast to grow 1.0% per year over the next 20 years.

Figure 11 – Residential Basic Sales

Notes:

(1) Electric Heat Billed is defined as customers who have electric space heating included with the electric bill.

(2) Non Electric Heat Billed is defined as customers who do not have electric space heating included with the electric bill.

(3) % Electric Space Heat represents the proportion of Total Res. Basic customers who are Electric Heat Billed.

(4) % Electric Water Heat represents the proportion of Total Res. Basic customers who have Electric Water Heaters.

2017/18 GWh and kWh/cust values are not weather adjusted

The average use (kWh/customer) for Electric Heat Billed customers is decreasing as individually metered apartment suites are making up a higher proportion of the growth. The average use for Non Electric Heat Billed customers is increasing mainly due to increased use of electric water heating and miscellaneous end uses in dwellings.

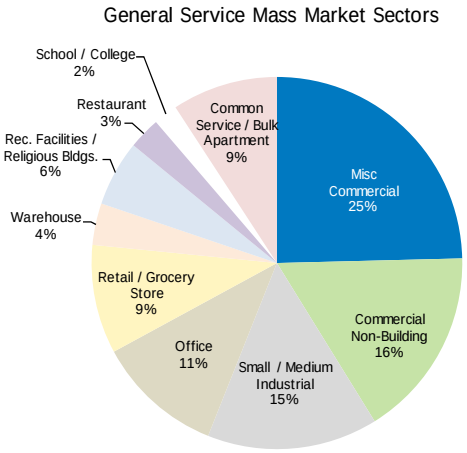
Residential Diesel, Seasonal, and Flat Rate Water Heating

Residential Diesel

There were 587 Residential Diesel customers that used 8 GWh in 2017/18 averaging 13,494 kWh per year per customer. Customers are only allowed 60 amp services which will not allow for electric space heating. Space heating in the four diesel communities is mainly provided by fuel oil. The number of customers is expected to grow to 637 and usage is expected to increase 0.4% a year to 9 GWh by 2037/38. The assumption is that the communities will continue to be separate from the Integrated System.

Residential Seasonal

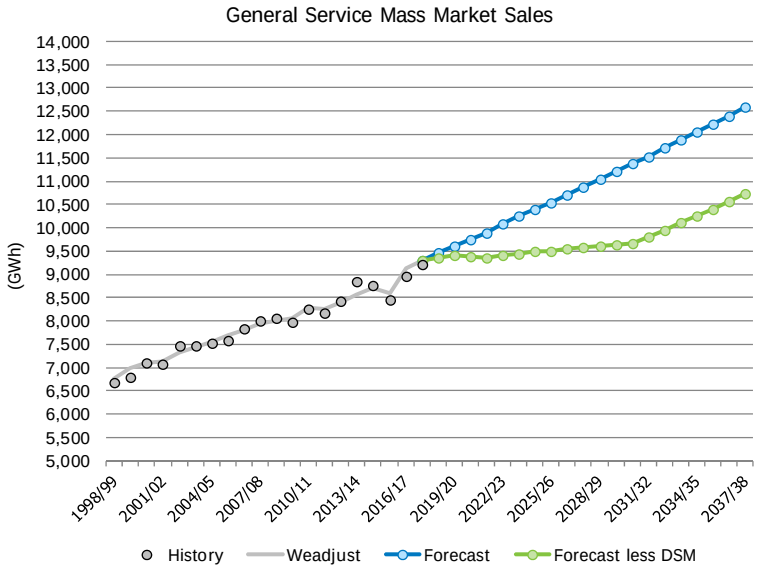
There were 19,507 Residential Seasonal customers that used 65 GWh in 2017/18, averaging 3,348 kWh per year per customer. The number of customers is expected decrease to 16,847 customers by 2037/38 due to transfers of higher using seasonal customers into the Residential Basic sector. Seasonal customers are billed only twice a year due to low usage, typically being a seasonal residence or cottage. The usage of Residential Seasonal customers is expected to decrease 0.02% a year to 65 GWh in 2037/38.



Residential Flat Rate Water Heating

Residential Water Heating is a flat rate unmetered service. This service has not been available to new customers since November 12, 1969. There were 3,129 remaining services in 2017/18. The number of services and usage is expected to decrease 5.0% per year throughout the forecast period. Usage was 16 GWh in 2017/18 and that will decrease to 6 GWh by 2037/38.

General Service Mass Market



General Service Mass Market includes all Commercial and Industrial customers, excluding the General Service Top Consumers. There were 68,079 General Service Mass Market customers in 2017/18. Approximately 15% are Industrial and 85% are Commercial.

Figure 12 – General Service Mass Market Customers

GS Mass Market has grown 111 GWh (1.4%) per year for the past 20 years and 93 GWh per year (1.1%) for the past 10 years. This historical growth reflects the effect of past Demand Side Management (DSM) initiatives and includes the seven Top Consumers, totaling 404 GWh in 2015/16, who were moved into the Mass Market sector. The Mass Market Sector is forecast to grow 159 GWh (1.6%) per year for the next 10 years and 166 GWh (1.5%) per year for the next 20 years before program-based DSM initiatives. Including program-based DSM, the sector is forecast to grow 73 GWh (0.7%) over the next 20 years. The primary drivers for growth in the GS Mass Market are the population and the economy. Changes in the number of residential customers and the Manitoba Gross Domestic Product (GDP) are reflected in the GS Mass Market's electricity use.

Figure 13 – General Service Mass Market Sales

The following table outlines historical and forecast details including the impacts of program based Demand Side Management activity:

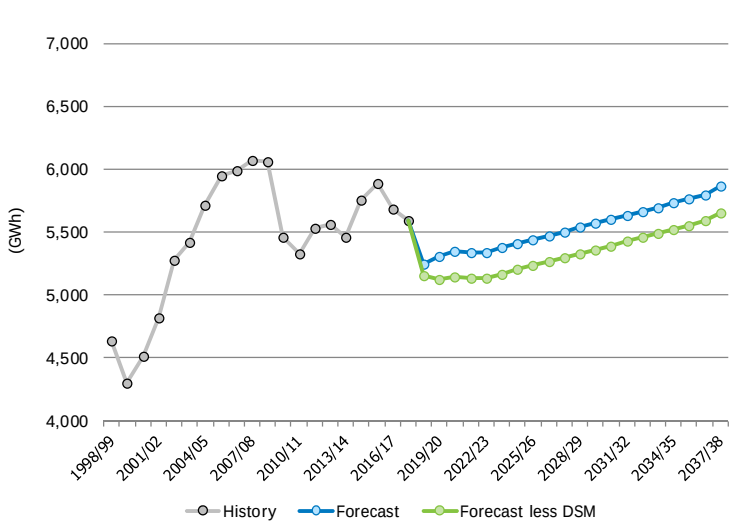
2037/38	12,599	(1,860)	10,740

General Service Top Consumers



General Service Top Consumers represent the top energy consuming operations in Manitoba accounting for 25% of all General Consumers Sales. GS Top Consumers include 10 distinct companies that count as 26 customers in the Mining & Forestry, Chemical Treatment, Petrol/Oil/Natural Gas sectors.

Figure 14 – General Service Top Consumer Sectors

GS Top Consumers increased 72 GWh (1.5%) per year over the past 20 years and decreased 8 GWh per year (-0.1%) over the past 10 years. The decrease was due to the economic downturn experienced from 2008 to 2011 and the loss of one Top Consumer. The historical growth rates also reflect the shift of the seven smallest Top Consumers to the GS Mass Market Sector, totaling 404 GWh in 2015/16. These were moved because their usage patterns more closely mimic customers within the GS Mass Market sector. The Top Consumers sector is now forecast to decline at an average of 9 GWh (-0.2%) per year for the next 10 years but grow an average of 13 GWh (0.2%) per year for the next 20 years. Including program-based DSM, the sector is forecast to grow 3 GWh (0.1%) over the next 20 years. Short term reductions are expected in the Petro/Oil/Natural Gas and Chemical Treatment sectors

2017/18	5,592	2037/38	5,343	519	5,862	(208)	5,654

For the short term, General Service Top Consumers are forecast individually. Expected increases and decreases from customer's current and upcoming operating and expansion plans are compiled for the first five years of the forecast but exclude longer term plans that are uncommitted and subject to change.

For the long term, the growth of existing Top Consumers is forecast together econometrically. The econometric long term Top Consumer forecast is referred to as Potential Large Industrial Loads (PLIL). PLIL is based on the historic growth and/or retraction of the ten companies that comprise the Top Consumers as well as one former Top Consumers customer that closed in 2009. These are large companies that both drive and help define the local, national and international economies. The historical data used for modeling PLIL includes company expansions, production increases and reductions due to planned and unplanned shutdowns, cutbacks and labor disruptions. Therefore, the long term forecast implicitly includes the same expectations.

Historical growth of the Top Consumer sector is modeled using Gross Domestic Product (GDP) and electricity price as independent variables. The historic correlation between GDP, price and Top Consumer growth has been very strong and is expected to continue in the future. Future projections of GDP and price are used to forecast the long term future increase in Top Consumer growth starting from the sixth year of the forecast.

The sum of the individual company forecasts is expected to decline from 5,592 GWh in 2017/18 to 5,343 GWh in 2022/23. After 2022/23, the individual forecasts for these customers are held constant and longer term growth is considered to be included in PLIL.

PLIL is added starting in year six of the forecast. The econometric forecast for PLIL is based on an expected annual Manitoba/Canada/U.S. real GDP growth rate of 1.9%, leading to a forecast growth of 0.2% annually. Historically, the real GDP growth rate over the past 20 years was 2.3%, the Top Consumers sector growth averaged 1.5% annually.

The Top Consumers sector is expected to decline 249 GWh in the first five years based on individual customer short term plans, and then growth 519 GWh in years 6 to 20 for PLIL.

General Service Diesel, Seasonal, and Flat Rate Water Heating

General Service Diesel

In 2017/18, there were 180 General Service Diesel Full Cost customers using 6 GWh. The General Service Diesel sector is forecast to use 6 GWh by 2037/38.

General Service Seasonal

In 2017/18, there were 957 General Service Seasonal customers using 5 GWh. The General Service Seasonal sector is expected to grow to 6 GWh by 2037/38.

General Service Flat Rate Water Heating

General Service Water Heating is a flat rate unmetered service that has not been available to new customers since November 12, 1969. There were 338 remaining services in 2017/18. The number of services is expected to decrease 5.0% per year throughout the forecast period. Consumption was 5 GWh in 2017/18 and that is forecast to decrease to 2 GWh by 2037/38.

General Service Surplus Energy Program

Participants in the Surplus Energy Program (SEP) consumed 28 GWh in 2017/18 and are expected to use 28 GWh in 2018/19 and for the remainder of the forecast period. This energy is considered to be “interruptible” and thus “non-firm”. The energy used by these customers is included in Sales, but it is excluded from the Gross Firm Energy forecast.

Plug-In Electric Vehicles

This forecast includes an estimate of the future adoption of Plug-In Electric Vehicles in the Manitoba Hydro service area. This is made up of two types:

i. **Plug-In Hybrid Electric Vehicles (PHEVs)** run on an electric battery but use an internal combustion engine (ICE) or gasoline powered generator to extend the driving range when the battery charge runs low. An example is the Chevrolet Volt. As of March 1, 2018 there were 133 PHEVs registered in Manitoba.

ii. **Plug-in Electric Vehicles (PEVs)** run only on electric battery power. Pure electric plug-in vehicles include the Nissan Leaf, the Tesla, Mitsubishi MiEV, and New Flyer Xcelsior transit bus. As of March 1, 2018 there were 144 PEVs registered in Manitoba.

The forecast of electric vehicles does not include non-plug-in Hybrid Electric Vehicles (HEVs). These vehicles, such as the non-plug-in Toyota Prius, have an internal combustion engine (ICE) as well as a battery and electric motor to drive the wheels. The HEV battery is charged with power from the ICE and through regenerative breaking. It is not charged by plugging in and therefore does not affect electricity consumption in Manitoba. As of March 1, 2018 and after 18 years in the market, there were only 5,065 HEVs registered in Manitoba, representing 0.6% of all registered road motor vehicles.

In Canada, 47,800 plug-in electric vehicles were registered as on December 31, 2017 according to FleetCarma, making up 0.195% of total 24.5 million road motor vehicle registrations. In Manitoba, as of fiscal year ending 2018, there were 277 plug-in vehicles making up 0.03% of total road motor vehicle registrations. About 96% of all plug-in electric vehicles in Canada are registered in three provinces: Quebec (43%), Ontario (35%), and British Columbia (18%).

The Electric Vehicle Forecast

As of March 1st, 2018, there were a total of 277 plug-in electric vehicles, including five electric buses, registered in Manitoba with the Manitoba Public Insurance Corporation. Last year's 2017 Load Forecast predicted a total of 278 plug-in vehicles to be registered in Manitoba at fiscal year ending 2018. The latest electric vehicle forecast is adjusted to incorporate actual registrations recorded in fiscal year ending 2018.

Table 18 details the Manitoba actual and forecasted number of new vehicles per year, the total number of vehicles each year, as well as the corresponding numbers for Plug-In Electric Vehicles. The forecast incorporates passenger as well as commercial category vehicles such as Sport Utility Vehicles (SUVs), light and heavy duty trucks, and transit buses. Pull-trailers, farm equipment, motor boats and motor cycles are not included in the count. A passenger PEV consumes approximately 3,100 kWh annually, similar to the use of one residential electric hot water tank. An electric transit bus consumes 87,500 kWh annually. That is the equivalent use of three electrically heated single detached dwellings. The number of new PEVs is expected to slowly increase until it reaches about 1.1% of new vehicle sales or 800 units in 2027/28 and 10.0% of new vehicle sales or 8,975 units in 2037/38. The total number of PEVs on the road is forecasted to be 0.3% of total vehicle registrations or 3,821 units in 2027/28 increasing to 2.8% of total road motor vehicle registrations or 40,704 units by 2037/38.

Total energy use for PEVs in Manitoba is forecasted to be 15 GWh in 2027/28 and 146 GWh by 2037/38. Peak usage coincident to Manitoba Hydro's system peak is forecasted to be 1.8 MW in 2027/28 and 18.3 MW in 2037/38.

Area & Roadway Lighting

The Area and Roadway Lighting sector represents 0.4% of all sales within Manitoba. This sector includes electricity sales for the Sentinel Lighting and Street Lighting rate groups. Sentinel Lighting is an outdoor lighting service where units are available either as rentals to an existing metered service or on an unmetered, flat rate basis. Street Lighting includes all public roadway lighting in Manitoba. In 2006, a readjustment of the rate classes moved some flat rate General Service meters into the Lighting sector and starting in 2016, the street lighting LED conversion program decreased energy consumption. Only Street Lights count as customers.

For 2018/19, the Area and Roadway Lighting sector was further reduced by 16 GWh to reflect additional street lighting LED conversions. Excluding the effect of future Demand Side Management (DSM) initiatives expected to occur, the Area and Roadway Lighting sector is forecast to remain constant at 72 GWh throughout the entire forecast period.

Figure 17 - Area & Roadway Lighting

The following table outlines historical and forecast details including the impacts of program based Demand Side Management activity:

Total General Consumer Sales

General Consumers Sales includes sales to all of Manitoba Hydro's individually billed customers, but excludes export sales. This includes the total of all sales from the Residential, General Service and Lighting sectors. The General Service sector makes up about two-thirds, the Residential sector makes up about one-third and the remaining sectors are only 0.4% of all sales.

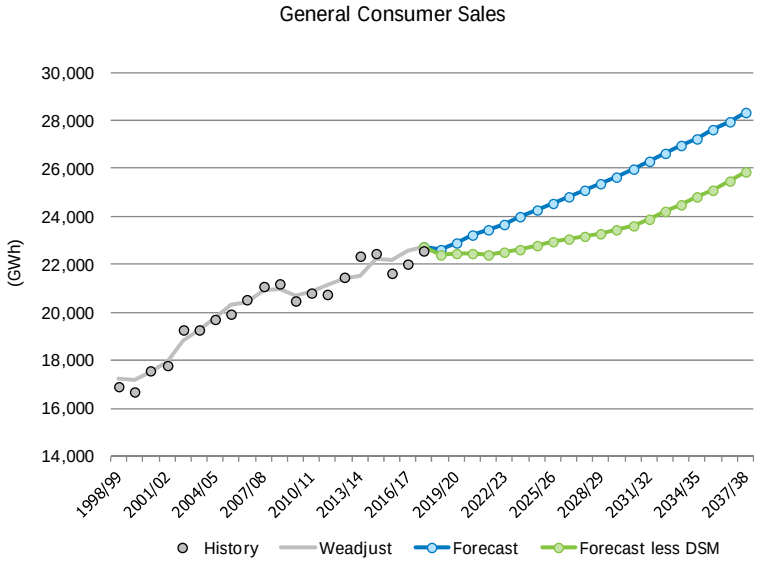

Figure 18 – General Consumers Sales

Note: Other category includes seasonal, flat rate water heating, area & roadway lighting, construction power and station service.

Weather adjusted General Consumers Sales has grown 290 GWh (1.5%) per year for the past 20 years and 182 GWh (0.8%) per year over the past 10 years. This historical growth includes the effect of past Demand Side Management (DSM) initiatives. Sales are forecast to grow 235 GWh (1.0%) per year for the next 10 years and 281 GWh (1.1%) per year for the next 20 years before program-based DSM initiatives. Including program-based DSM, the forecast is expected to grow 155 GWh (0.6%) over the next 20 years.

Diesel Sales

There are four communities served by diesel generation in Manitoba: Brochet, Lac Brochet, Tadoule Lake and Shamattawa. Sales within these communities are included in General Consumers Sales, but are not part of the Integrated System, and are thus not part of Common Bus or Gross Firm Load.

Between 1997 and 1999, eleven communities previously served by diesel generation were connected to the Integrated System resulting in the drop in overall diesel sales. The four sites that were to remain diesel were converted from 15 amp service to 60 amp service between 1991 and 2001 causing the increase in those years.

Diesel customers do not have electric heat, which requires a minimum 200 amp service; therefore there is no weather effect.

Distribution Losses

Distribution Losses are made up of the power loss between the distribution substation (Manitoba Load at Common Bus less Construction) and the customer's meter (General Consumers Sales less Diesel), as well as all other differences between what was billed and what was metered. The other differences include:

1. The offset between cycle billing (General Consumers Sales) and actual calendar month usage (Common Bus).
2. Customer Accounting adjustments,
3. Inaccuracies associated with estimated billing (including flat rate estimates),
4. The metered but unbilled consumption of Manitoba Hydro offices, and
5. Energy lost due to theft.

Distribution Losses are forecast in 2018/19 to be 4.8% of the General Consumers Sales less Diesel and remain between 4.8% and 4.9% throughout the forecast.

Construction Power

Construction Power represents the energy used by Manitoba Hydro and its contractors in the construction of major capital works such as generating stations, converter stations and major transmission lines. Construction Power also includes Station Service until a plant is commissioned. Until 2013, about 48 GWh of heating load at the Gillam, Limestone and Kettle town sites was included in Construction Power. This energy is now included in Distribution Losses.

The Construction Power forecast includes (1) the Keeyask Generating Station and (2) the Keewatinohk Converter Station, started in January 2012 with expected completion in the spring of 2020.

Manitoba Load at Common Bus

Manitoba Load at Common Bus is the total load measured from all the distribution points (i.e. substations) within Manitoba. It includes all energy supplied to General Consumers Sales customers, Construction Power plus associated Distribution Losses, but excludes Diesel customers, Transmission Losses and Station Service.

Common Bus is metered and totaled to correspond exactly to each calendar month. Weather adjustment is done on a calendar month basis.

Weather adjusted Common Bus has grown 308 GWh (1.5%) per year for the past 20 years and 210 GWh (0.9%) per year during the past 10 years reflecting the recent economic downturn. This historical growth also includes the effect of past Demand Side Management (DSM) initiatives. Common Bus is forecast to grow 238 GWh (1.0%) per year for the next 10 years and 291 GWh (1.1%) per year for the next 20 years before program-based DSM initiatives.

Transmission Losses

Transmission Losses are the amount of energy lost while delivering power from the generation stations to all of the distribution substations that make up Common Bus. Transmission Losses only contains losses associated with supplying Manitoba customers. Losses attributable to exports and the gains attributable to imports are excluded. Transmission Losses are mostly losses on the High Voltage Direct Current (HVDC) lines, and are substantial because of the distance of transmission from northern generation to southern distribution points, but are much less than what AC losses would be over that distance. Transmission Losses vary year to year depending on water conditions, system configuration, outages and the magnitude of the load. High losses experienced in 2002/03 were due to two HVDC transformer failures.

Transmission Losses are forecast to be approximately 9.0% of the General Consumers Sales less Diesel Sales and do not reflect future efficiency gains from the commissioning of Bipole III as of July 2018.

Station Service

Station Service is the energy used by power plants to generate power and service their own load. Manitoba energy or peak without Station Service is referred to as “Net”, and with Station Service as “Gross”.

Station Service energy is forecast to be 123 GWh and Station Service peak is forecast to be 21 MW from 2018/19 to 2037/38.

Station Service for Keeyask and for future non-committed plants is excluded from this forecast.

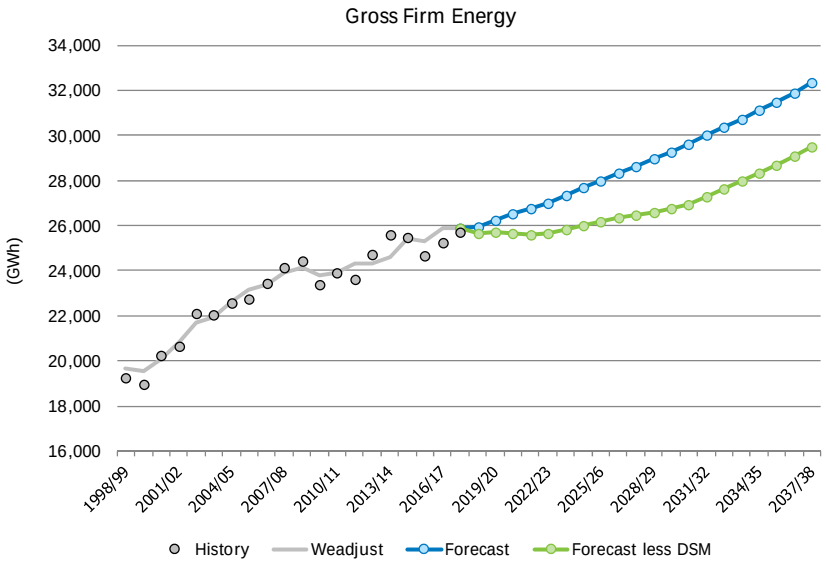
Gross Firm Energy

Gross Firm Energy is the energy required to serve Manitoba Hydro's customers on the Integrated System. It excludes exports, interruptible (non-firm) loads, Diesel Sales and Station Service for Keeyask and non- committed plants.

Figure 26 - Gross Firm Energy



Note: Other category includes seasonal, flat rate water heating, area & roadway lighting, construction power and station service.

Gross Firm Energy has grown steadily during the past twenty years, except during the economic slowdown in the 1990's and more recently in 2009.

Weather adjusted Gross Firm Energy has grown 328 GWh (1.5%) per year for the past 20 years and 198 GWh (0.8%) per year during the past 10 years reflecting the recent 2008 global economic downturn. This historical growth includes the effect of past Demand Side Management (DSM) initiatives. Energy is forecast to grow 276 GWh (1.0%) per year for the next 10 years and 325 GWh (1.1%) per year for the next 20 years before program-based DSM initiatives. Including program-based DSM, the forecast is expected to grow 181 GWh (0.7%) over the next 20 years.

Figure 27 - Gross Firm Energy

The following table outlines historical and forecast details including the impacts of program based Demand Side Management activity:

Table 31 - Gross Firm Energy

Gross Total Peak

Gross Total Peak is the maximum integrated average hourly load required to serve Manitoba Hydro's customers on the Integrated System. It excludes exports and Diesel Sales. It includes Station Service and Curtailable Loads.

Typically, the peak occurs on a very cold winter weekday either in the morning (often from 8 a.m. to 9 a.m.) or in the afternoon (from 5 p.m. to 6 p.m.). Electric heating is a main contributor to the peak on one of the coldest days, whereas the operation or lack thereof of large industrials often makes the difference as to the specific day and peak hour.

The adjusted Gross Total Peak has grown from 3,610 MW in 1998/99 to 4,751 MW in 2017/18 at an average growth of 60 MW or 1.5% per year. It is forecast to grow to 6,035 MW at 64 MW (1.2%) per year by 2037/38 years before program-based DSM initiatives. Including program-based DSM, the forecast is expected to grow 35 MW (0.7%) over the next 20 years.

Figure 28 - Gross Total Peak

The following table outlines historical and forecast details including the impacts of program based Demand Side Management activity:

Peak load is measured and recorded differently than energy data. The system load at every hour is calculated by System Operations as:

Hourly Gross Total Peak (t)

= Hourly Total Generation (t)

- Hourly Metered Exports (t) + Hourly Metered Imports (t)

- Losses Associated with Exports (t) + Gains Associated with Imports (t)

+ Curtailments (t)

Losses for exports and gains for imports are only known on a monthly energy basis. The hourly value is obtained by using the ratio of exports/imports for the hour to the total exports/imports for the month and applying that to the total metered loss/gain for the month. The remaining difference between the balance of the load and Common Bus is taken as the Transmission Losses associated with Manitoba load.

Curtailments for individual customers are calculated as the difference between what the customer would have used if not curtailed versus what they actually used.

Annual Peak

The forecast annual peak is higher than the maximum of the monthly peaks. This is because the peak can occur in any one of the winter months. The same characteristic is apparent in historical peaks. The average historical annual peak is higher than the maximum of the highest average monthly peaks. For studies requiring yearly data, the annual peak should be used.

16 Hour Peak

The peaks in this document are integrated hourly peaks. For some studies and analysis of avoided cost or DSM savings, an estimate of the average peak during on-peak hours (from 6 a.m. to 10 p.m.) may be desired. To convert hourly peak to 16 hour peak, multiply the hourly peak in the associated month by the following percentages:

Jan	Feb	Mar	Apr	May	Jun	Jul	Aug	Sep	Oct	Nov	Dec	Annual
94.4%	94.9%	95.8%	96.0%	96.3%	96.0%	96.6%	95.6%	95.8%	96.6%	95.6%	95.5%	94.8%

VARIABILITY AND ACCURACY

Weather Effect and Weather Adjustment

The weather effect is determined in any sector every year by regressing the previous two years of actual monthly energies against the actual HDD and CDD for the month. This results in a GWh per HDD effect and a GWh per CDD effect for that sector for that year.

Only sectors whose major variation is due to weather can have a weather effect estimated. Sectors that vary primarily due to industrial output levels or seasonal but non-weather reasons may yield false weather effects if estimated. Weather effects are not determined for the GS Top Consumers, Seasonal, Diesel, Water Heating and Lighting sectors.

For sectors where a weather effect is calculated, this document shows energy as the reported value and as a weather adjusted value. Forecasts are based on the weather adjusted values. The calculations are:

Weather Adjustment = HDD weather effect * (HDD actual - HDD normal) + CDD weather effect * (CDD actual - CDD normal)

Weather Adjusted Actual = Actual - Weather Adjustment

Following are the HDD and CDD weather effect factors by sector:

Weather Effect Factors by sector		
Sector	GWh/DDH	GWh/DDC
Residential Basic	0.6	1.1
GS Mass Market	0.3	1.0
General Consumers Sales	0.9	2.1
Gross Firm	1.2	2.7
	Winter @ -30°C MW/Deg	Summer @ 30°C MW/Deg
Gross Total Peak	49	112

Load Variability

Uncertainty is an inherent characteristic of forecasting. The load will vary both year to year and long term because of underlying changes in population growth, economic growth, changes in the operations of Top Consumers, and overall use patterns. An economic recession will slow energy growth and an economic boom will increase it. Cycles cannot be predicted in advance so some appropriate midpoint must be chosen as the forecast.

This forecast was created as Manitoba Hydro's best estimate of Manitoba's future energy requirement with an expectation of a 50% chance that actual growth will be higher than the forecast, and a 50% chance that actual growth will be lower than the forecast. This can also be called the P50 (50th Percentile) or Base Forecast.

To evaluate the potential for variation, historic load variability has been analyzed using a probabilistic-based approach. Doing this provides an estimate of the magnitude of the potential load variation from the forecast due to population, economy and other effects. 10% and 90% confidence bands (-/+ 1.28 standard deviations), also known as P10 and P90, were selected to be a proxy for the Low and High Load Forecast Scenarios for use in risk analysis studies. They are calculated as follows:

Load = Base Forecast -/+ 1.28 x Standard Deviation

For other probability points, substitute for the 1.28 the following numbers:

Prob	0.1%	2.5%	10.0%	20.0%	50.0%	80.0%	90.0%	97.5%	99.9%
Z(Prob)	-3.09	-1.96	-1.28	-0.84	0.00	0.84	1.28	1.96	3.09

This calculation gives the variability due to long term economic effects. It does not include variability due to weather which was removed through the use of weather adjusted load. The standard deviation of the weather variation has been found to be approximately 2% of both the energy and peak. Annual weather variations tend to be independent of the economy, so if a combined variance is desired, then the variance due to weather can be added to the variance without weather to derive an overall variance that includes weather.

The following four charts and tables summarize the variability for energy and peak. By 2037/38, the Load Forecast has an 80% probability of being accurate to within ± 1,743 GWh or ±5.5%. Due to the inherent variability of the load, this is the best level of accuracy possible.

The overall economic standard deviation in 2037/38 is 1,262 GWh or 3.9% of the forecast energy. Analyzed individually, the economic standard deviation of the Top Consumers sector is 1,305 GWh (22.3%), Residential is 487 GWh (5.0%) and Mass Market is also 474 GWh (3.8%), showing that the Top Consumers sector is the majority of the variance.

5 and 10 year Forecast Accuracy

Due to the load variation caused by population growth and economic growth, there is only a certain level of accuracy possible. Using the load variability estimates of the previous section, due to economic variability alone, there is only an 80% chance that a 5 year energy forecast will be within 3.2% of the actual, and an 80% chance that a 10 year energy forecast will be within 4.5% of the actual.

Recognizing this inherent uncertainty of the forecast, historic forecast variation has been tracked. The following four figures and tables compare previous load forecasts to actual results 5 and 10 years later.

The energy savings achieved under Manitoba Hydro's market-based DSM programs between the year the forecast was prepared and the year being forecast was subtracted first from the forecast value. The remaining difference is taken as an estimate of the accuracy of the forecast.

The following figures and tables may suggest cycles in the forecast made up of alternating periods of over-forecasting and under-forecasting. These are not so much due to a bias in the forecast as they are due to unexpected periods of recession or economic growth. Once one of these unexpected periods occur, the accuracy of the previous five 5-year forecasts for 5 years, and the accuracy of the previous ten 10-year forecasts for ten years will be affected thus causing periods of over- or under-forecasting.

Compensation for these periods of over and under-forecasting cannot be applied until after the events occur and only then can they be identified and quantified. The forecast assumes average expected economic conditions. When economic conditions are abnormal, the forecast will be high or low.

The weather adjusted Gross Firm Energy is shown in two separate columns in the Energy Accuracy table (Table 35) and they vary in each year due to the difference in weather normals used in each of the respected forecasts.

LOAD SENSITIVITY AND EXTREME EVENTS

Manitoba Hydro examines the effect of possible events on the load. The information presented here provides planners with an understanding of what the potential scale of these individual events may have on the system load requirements.

The individual effects of each event can be included in scenario or sensitivity analysis if the need arises. Each change in assumption can be individually applied to the forecast as required to capture the annual energy and peak effect of the desired assumption in any given year. All values are listed at Generation and include transmission and distribution losses.

The sensitivities provide an estimate of what effect a change in assumption will have on the annual energy and peak over the 20 year forecast period.

Effects are summarized below, and the details of each effect follow.

Sensitivity of the Load to an Assumption Change

Change in 20 year average annual growth rate	Energy (GWh)	Peak (MW)
0.1% Increase/Decrease in Population	± 303	± 56
0.1% Increase/Decrease in Income	± 52	± 9
0.1% Increase/Decrease in GDP	± 178	± 33
0.1% Increase/Decrease in Electricity Price	∓137	∓25
Climate Change per Degree Celsius Warmer	+30	-49

Evaluation of Extreme Events	Energy (GWh)	Peak (MW)
All Natural Gas in Manitoba to Electricity	+ 16,000	+ 7,000
Increase/Decrease of One Very Large Industrial Customer	± 1,500	± 180
Maximum Potential Effect of Increased Online Shopping	- 775	- 143
Additional Load if 100% Electric Vehicle Saturation Rate	+ 12,124	+ 1,516
Illustrated Effect of Grid Parity (e.g. Solar Panels)	- 857	0

In context, one year of energy growth is 325 GWh and one year of peak growth is 64 MW.

Population / Economic / Price Changes

The population, economy and prices are the most significant drivers of the load in Manitoba. These effect of each driver based on the coefficients found in the models is summarized below.

Population: A one-time 1% increase in population (13,422 people) results in a 1% increase in the number of Residential Basic customers (4,863 customers representing 75 GWh) and a 0.32% change in the number of GS Mass Market customers (215 customers representing 59 GWh). The total effect on Manitoba Gross Firm Energy would be 152 GWh (0.59%) for any given year. Assuming a 0.1% change in the annual average population growth rate over the 20 year forecast period, the total effect would be a change of 303 GWh in the 20th year of the forecast.

Income: A one-time 1% increase in real income results in a 0.30% increase in Residential average use (47 kWh per customer and 23 GWh overall). On Manitoba Gross Firm Energy it is 26 GWh (0.10%). Assuming a 0.1% change in the annual average income growth rate over the 20 year forecast period, the total effect would be a change of 52 GWh in the 20th year of the forecast.

GDP: A one-time 1% increase in Manitoba GDP results in a 0.55% increase in GS Mass Market Small and Medium average use (564 kWh per customer totaling 38 GWh). A 1% increase in MB/Canada/US blended GDP results in 0.29% increase in GS Large Customer average use (18,754 kWh per customer totaling 6 GWh) and a 0.62% increase in Top Consumers use (35 GWh). The total effect of a 1% increase in GDP on Manitoba Gross Firm Energy is 89 GWh (0.34%). Assuming a 0.1% change in the annual average GDP growth rate over the 20 year forecast period, the total effect would be a change of 178 GWh in the 20th year of the forecast.

Electricity Price: A one-time 1% increase in real electricity price results in a 0.28% decrease in Residential average use (-43 kWh per customer totaling -21GWh). It will also result in a 0.13% decrease in GS Mass Market Small and Medium average use (-133 kWh per customer totaling -9 GWh), a 0.46% decrease in GS Mass Market Large average use (-29,747 kWh per customer totaling -10 GWh) and a 0.37% decrease in GS Top Consumers use (-21 GWh). The total effect of a 1% increase in real electricity price on Manitoba Gross Firm Energy is -68 GWh (-0.26%). Assuming a 0.1% change in the annual average price growth rate over the 20 year forecast period, the total effect would be a change of 137 GWh in the 20th year of the forecast.

Below is a summary of the 20 year impact to the forecast should a change of 0.1% to the annual growth rate for each of the economic assumption is assumed.

Change in 20 year average annual growth rate	Energy (GWh)	Peak (MW)
0.1% Increase/Decrease in Population	± 303	± 56
0.1% Increase/Decrease in Income	± 52	± 9
0.1% Increase/Decrease in GDP	± 178	± 33
0.1% Increase/Decrease in Electricity Price	∓137	∓25

Climate Change

The Intergovernmental Panel on Climate Change projects an increase in global temperature as a result of rising concentrations of greenhouse gases in the atmosphere. Changes to temperature and extreme events have the potential to influence future energy demands. This section quantifies the general effect caused by a 1°C increase in average daily temperature throughout the year.

In Manitoba Hydro's case, if Winnipeg experienced a uniform 1°C warming throughout the year, winter months would be subject to less heating while summer months would be subject to more cooling. Over 200 winter days, every degree Celsius of temperature rise above average conditions will result in an approximate decrease of 200 Heating Degree Days (HDD) per year, and a corresponding approximate increase of 100 Cooling Degree Days (CDD) per year over 100 summer days.

Applying the Weather effect for Manitoba Hydro at Generation gives:

Decrease of 200 HDD ➔ -240 GWh and -49 MW in the winter
Increase of 100 CDD ➔ +270 GWh and +112 MW in the summer

The resulting total effect of every one degree increase in temperature would be:

	Energy (GWh)	Peak (MW)
Climate Change per Degree Celsius Warmer	+30	-49

Conversion of all Natural Gas Use to Electricity

Currently, about 275,000 Residential and General Service customers use natural gas as a fuel for space heating, water heating, cooking, etc. Given possible future green initiatives that could implement carbon taxes on fossil fuels, a scenario to consider is the conversion of all natural gas used as a fuel to electricity. The maximum additional load required over the current forecast for 100% saturation is 16,000 GWh (44 years of load growth) and 7,000 MW (about 108 years of peak growth).

Assumptions exclude industries using natural gas as an ingredient, not as a fuel, and use a fuel efficiency averaging 82% and a load factor of 26%.

	Energy (GWh)	Peak (MW)
All Natural Gas in Manitoba to Electricity	+ 16,000	+ 7,000

Potential Changes in Load from Very Large Industrial Customers

Manitoba Hydro's largest customer currently uses in excess of 1,500 GWh annually and has a coincident peak load of about 180 MW. It is feasible that one or more customers of this size could decide to start up in Manitoba in the next 20 years.

Similarly, it is possible that one or more very large customers may discontinue operations in Manitoba. This could also be the equivalent of losing Manitoba Hydro's largest customer.

	Energy (GWh)	Peak (MW)
Increase/Decrease of One Very Large Industrial Customer	± 1,500	± 180

Maximum Potential Load Effect of Increased Online Shopping

Online shopping is a growing service offering by many retailers. It is possible that this trend could lead to fewer retail establishments if online shopping becomes pervasive. The potential load reduction of such a scenario will be the electricity use of about 5,800 General Service customers in the Retail sector who currently use about 680 GWh. At generation, this represents a potential total of 775 GWh and 143 MW (using a 62% load factor). This assumes that the structures used for retail are torn down or are refurbished with other businesses that would otherwise have built a new structure.

	Energy (GWh)	Peak (MW)
Maximum Potential Effect of Increased Online Shopping	- 775	- 143

Potential Load from High Adoption of Electric Vehicle Technology

This forecast includes the expected impact due to adoption of electric vehicles within Manitoba over the next twenty years. The specifics have been detailed in the Electric Vehicle Forecast section of this document.

It is possible that the current technological challenges will be solved, price will match those of internal combustion vehicles, and range anxiety will be alleviated. If or when these issues are resolved, it is possible that electric vehicles may eventually grow to be the dominant vehicle.

The maximum load required, if 100% of all new passenger and commercial vehicles purchased every year within the forecast period are Plug-In Electric Vehicles (PEVs), would be 12,270 GWh of energy and 1,534 MW of load. Currently, the forecast for electric vehicles load by 2037/38 is 146 GWh and 18 MW. Therefore the maximum additional load required over the current forecast for 100% saturation is 12,124 GWh (37 years of load growth) and 1,516 MW (about 24 years of peak growth).

	Energy (GWh)	Peak (MW)
Additional Load if 100% Electric Vehicle Saturation Rate	+ 12,124	+ 1,516

Illustrated Effect of Grid Parity

Grid Parity is when a customer will have an economic option to provide some or all of the electricity needs their home or business requires with an alternative energy source. Grid parity requires the self-generated kWh cost to be competitive with utility power when considering operating, maintenance costs and a reasonable amortization period for capital costs.

Solar photovoltaic installations are frequently referenced in discussions related to grid parity as costs continue to decline. Initial adoption rates may be gradual and may take years to mature. For illustrative purposes, the effect at utility generation if 100,000 residential (2 kW system) and 10,000 commercial (50 kW system) customers added solar panels would be:

	Energy (GWh)	Peak (MW)
Illustrated Effect of Grid Parity (e.g. Solar Panels)	- 857	0

ASSUMPTIONS

Economic Assumptions

Economic forecast assumptions are taken from the economic variables that become part of Manitoba Hydro's Forecast of Key Economic and Financial Indicators and Energy Price Forecast.

Residential Customers - The number of Residential Basic customers in Manitoba is forecast to increase by 1.3% or 6,242 units in 2018/19 and averages 1.1% per year over the forecast period. This compares to a historical average increase of 1.2% per year over the last ten years. Residential customers are used in the Residential and GS Mass Market customer forecasts.

Electricity and Natural Gas Prices - The electricity price forecast is based on the Consumer Price Index (CPI) and rate increase projections contained in the Integrated Financial Forecast. The nominal electricity price is forecast to increase annually by 3.6% in 2018/19, 3.7% from 2019/20 to 2035/36 and then reduce to a 2% for the remaining 2 years of the forecast. In real terms, this will translates to an annual increase of 1.5% in 2018/19, between 1.6% and 1.8% from 2019/20 to 2035/36 and then reduce to 0% for the remaining 2 years of the forecast. Manitoba Hydro views the natural gas price forecast as commercially sensitive information. Consistent with the Clean Environment Commission and Electric General Rate Application, this information will not be publicly disclosed. The ratio of natural gas price to electric price is used in the Residential Basic forecast.

Manitoba Disposable Income - Real Manitoba disposable income per Residential Basic customer grew on average 1.6% over the past 20 years and 1.5% over the past 10 years. It is forecast to grow 0.6% annually for the next 20 years. Manitoba disposable income is used in the Residential Basic forecast.

Gross Domestic Product (GDP) - Real economic growth in Manitoba averaged 2.3% annually for the past 20 years and 2.1% annually for the past 10 years. Real Manitoba GDP is expected to grow 1.8% in 2018/19 and average 1.7% annually for the next 20 years. Real economic growth in Canada averaged 2.4% annually for the past 20 years and 1.7% annually for the past 10 years. It is forecast to grow 2.1% in 2018/19 and average 1.9% annually for the next 20 years. Real economic growth in US averaged 2.2% annually for the past 20 years and 1.4% annually for the past 10 years. It is forecast to grow 2.6% in 2018/19 and average 2.1% annually for the next 20 years. GDP is used in the GS Mass Market and GS Top Consumer forecasts.

Price / Income / GDP Elasticity

The economic effects of price, income and GDP have been incorporated into the 2017 forecast. The elasticity of each has been estimated from econometric modeling. A summary of the elasticities found is:

	Price Elasticity	Real Income Elasticity	Real GDP Elasticity
Residential Basic	-0.33	0.31	-
GS Mass Mkt Small/Medium	-0.12	-	0.55
GS Mass Mkt Large	-0.43	-	0.30
GS Top Consumers	-0.34	-	0.62
Gross Firm Energy	-0.28	0.11	0.36

See the Methodology section for more details.

Normal Weather Assumptions

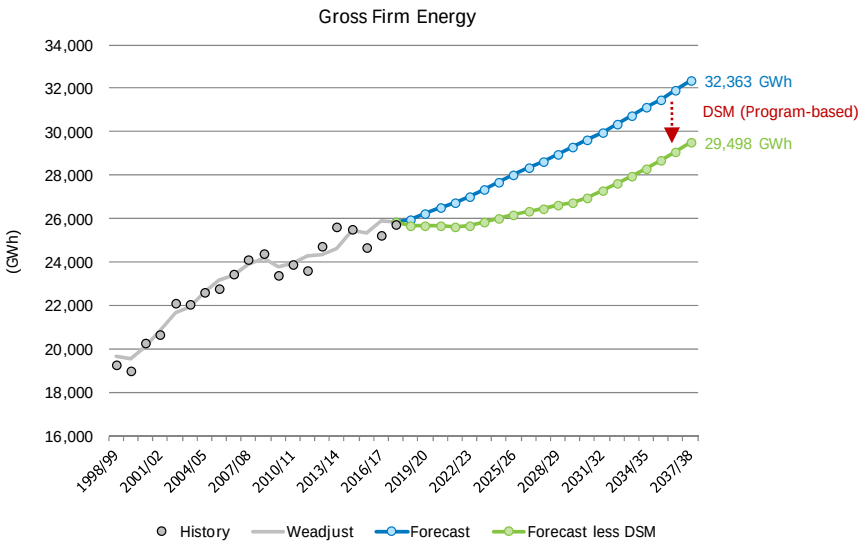
Historical weather adjusted actuals are the foundation of the underlying historical information used in the Residential Average Use and General Service Mass Market Average Use models. Manitoba Hydro forecasts with the assumption of normal weather. The process of adjusting annual historical usage to reflect the same weather pattern reduces the inherit variability caused by weather in the underlying data in each respective model.

Demand Side Management (DSM) in the Forecast

The base forecast reflects future DSM savings associated with existing Provincial building codes and improved equipment efficiency standards and regulations (Codes and Standards) and is the only effect of DSM initiatives that is specifically accounted for in the forecast. Savings due to DSM programs to date are embedded in the historical data that is the basis for this forecast with the current level of past achieved DSM savings is assumed to remain in place throughout the future. Future DSM savings arising from future DSM offerings and market engagement above the current level and incremental to the above mentioned Codes and Standards are not reflected in this forecast. They are accounted for separately in Manitoba Hydro's DSM Plan and Power Resource Plan. As a result, historical growth rates in this document are not directly comparable to future growth rates because the history includes the effect of past program-based DSM initiatives, but the forecast does not. For customers involved in Load Displacement and Alternative Energy initiatives, the forecast excludes the effect of the initiatives, and projects the load without the savings due to the initiatives.

Figure 33 – Gross Firm Energy (Net of DSM)

Although not explicitly included in the base forecast, the program-based DSM has a significant impact on the future load growth expected in Manitoba. Program-based DSM reduces the Gross Firm Energy in 2037/38 from 32,363 GWh to 29,498 GWh, lowering the average growth of 325 GWh or 1.1% per year to an average growth of 181 GWh or 0.7% per year.



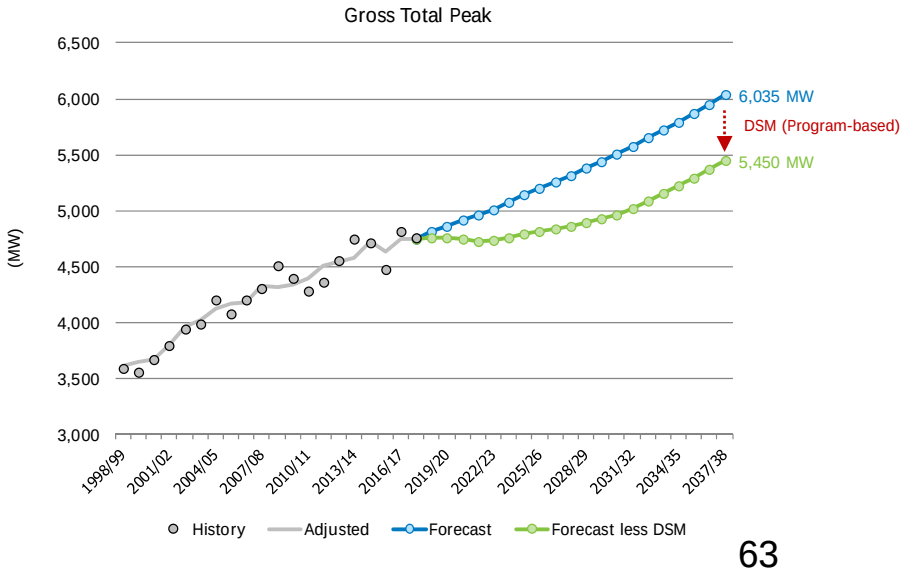


Figure 34 – Gross Total Peak (Net of DSM)

Program-based DSM reduces the Gross Total Peak in 2037/38 from 6,035 MW to 5,450 MW, lowering the average growth of 64 MW or 1.2% per year to an average growth of 35 MW or 0.7% per year.

METHODOLOGY

Residential Basic Methodology

Several different models and forecasts were used to determine the Residential Basic Model. These are the steps to produce the forecast:

i. **Forecast Residential Dwellings** - The forecast of Manitoba residential customers in Manitoba Hydro's Forecast of Key Economic and Financial Indicators was used for the total number of Residential Basic customers for the 2018/19 to 2037/38 period. The customer forecast was based on the average of several Manitoba population forecasts from various external agencies multiplied by a forecast of the people per residential customer ratio. The customer forecast was reduced by about 0.5% to account for customers with multiple services to obtain the forecast of individual dwellings.

ii. **Forecast Existing Dwellings** – Existing dwellings were broken down by dwelling type (single detached, multi attached, and Individually metered apartment suites) within each fuel region (Winnipeg, Gas Available outside Winnipeg and No Gas Available). The rate of change due to demolitions and type change (e.g. bulk apartments to individually metered) as well as customer switches of their space heating fuel were taken into account.

iii. **Historical Space Heating Systems** – The number of historical dwellings by type and region were each divided into nine space heating systems: Electric Forced Air Furnace, Electric Baseboard, Electric Ground Source Heat Pump, Electric Boiler, Gas High-Efficiency Furnace, Gas Mid-Efficiency Furnace, Gas Standard-Efficiency Furnace, Gas Boiler, and Other heat that is not billed for gas or electric. Percentages of each heat type in existing dwellings were based on the 2014 Residential Energy Use Survey.

iv. **Forecast of Space Heating Systems in New Dwellings** – Econometric equations were developed to forecast the number of electric space heating systems in new single detached and multi attached dwellings by region as follows:

Model: **Single Detached, Winnipeg**

Equation: Logit (Percentage of New Dwellings (t)) = -6.72 + 2.38 * T + 4.34 * PGEFF (lag(t))

Results:

Model R-Squared	Variable	Coefficient	t-stat
77.8%	Constant	-6.72	-13.45
	Trend	2.38	8.45
	PGEFF	4.34	6.03

Model: **Single Detached, Gas Available**

Equation: Logit (Percentage of New Dwellings (t)) = -2.06 + 1.49 * T + 2.89 * PGEFF (lag(t))

Results:

Model R-Squared	Variable	Coefficient	t-stat
92.2%	Constant	-2.06	-13.90
	Trend	1.49	10.86
	PGEFF	2.89	13.10

Model: **Multi Attached, Winnipeg**

Equation: Logit (Percentage of New Dwellings (t)) = -10.04 + 6.38 * T + 11.27 * PGEFF (lag(t))

Results:

Model R-Squared	Variable	Coefficient	t-stat
51.4%	Constant	-10.04	-4.96
	Trend	6.38	4.79
	PGEFF	11.27	3.88

Model: **Multi Attached, Gas Available**

Equation: Logit (Percentage of New Dwellings (t)) = -3.21 + 1.84 * T + 5.79 * PGEFF (lag(t))

Results:

Model R-Squared	Variable	Coefficient	t-stat
66.9%	Constant	-3.21	-5.62
	Trend	1.84	3.79
	PGEFF	5.79	7.07

Term definitions:

Logit - A log transformation of percentages used for saturation analysis
T - A trend variable capturing the effect of natural gas price changes
PGEFF - Ratio of the gas to electricity price for high efficiency furnaces
lag(t) - The weighted average (50%, 10%, 12%, 28%) of the 1,3, 4 and 5 year lags

The 2014 Residential Energy Use Survey was used to break the forecast of new electric heat dwellings and new non-electric-heat dwellings within single detached, multi attached and individually metered apartment suites across Winnipeg, Gas Available and No Gas Available areas into specific furnace types.

v. **Forecast of Space Heating Systems in Existing Dwellings** – The average age of heating systems in existing dwellings was determined from the 2014 Residential Energy Use Survey. The number of annual replacements was estimated using a Weibull distribution based on the average age of each furnace type. Fuel switching was estimated using survey respondents in older dwellings with newer heating systems and included saving estimates from the Heating Fuel Choice initiative.

vi. **Forecast of Water Heating Systems in New and Existing Dwellings** – Electric and natural gas water heater saturations and average age were estimated for dwellings with and without natural gas space heat using information from the 2014 Residential Energy Use Surveys. The number of annual replacements was forecast using a Weibull distribution based on the average age of water heaters and switches between fuels were taken into account when forecasting future numbers of water heaters. Saving estimates from the Heating Fuel Choice initiative were included.

vii. **Other End Uses** – Other major uses of residential electricity were forecast by dwelling type, including central air conditioning, major appliances, televisions and lighting using the saturation data from the 2014 Residential Energy Use Survey.

viii. **Determine Overall Average Use** – An econometric model was used to forecast the average annual electricity use per customer of the Residential Basic sector. The Average Use per customer without Demand Side Management (DSM) programs and Codes & Standards (C&S) savings was used as the dependent variable in the model. Historical data from 1992/93 to 2017/18 was modeled.

The resulting model and parameters are:

Model: **Overall Average Use**

Equation: Ln (Total Usage + DSM programs + C&S savings) / Customers

= 6.25 + 1.39 x Saturation – 0.33 x Ln (Price) + 0.31 x Ln (Income) + 0.01 x T(t)

Results:

Model R-Squared	Variable	Coefficient	t-stat
99.5%	Constant	6.25	6.77
	Saturation	1.39	2.16
	Price	-0.33	-5.50
	Income	0.31	3.33
	Trend	0.01	4.51

Term definitions:

Saturation - Electric Heat Customer Count / Total Res Basic Customer Count
Price - Manitoba Real Residential Electricity Price lagged 2.5 years
Income - Manitoba Real Income per Res Basic Customer
T - A trend variable capturing increases in electric use and house size

ix. **Appliance Use and Balancing** – Conditional Demand Analysis using the 2014 Residential Survey data combined with customer annual use from billing data was used to derive average annual energy use by type of heating system and appliance for existing and new dwellings. These average uses were multiplied by the number of each type of system and appliance to get the total energy use. This was balanced against Step 8 results to ensure reasonableness.

x. **Determine Total GWh used** – The forecast number of dwellings multiplied by the overall average use determined the GWh forecast. The forecast of energy savings from Codes and Standards as outlined in Manitoba Hydro's Power Smart Plan were subtracted. Additional energy savings due to the higher adoption of LED lights, and the future adoption of Electric Vehicles in the Residential sector were included. The end result was the forecast of Residential Basic customer total energy use. Excluded are savings attributable to future Demand Side Management initiatives.

General Service Mass Market Methodology

i. **General Service Mass Market Customer Forecast -** Econometric analysis of historical sales data was used to develop models to forecast the number of General Service Mass Market customers. Forecasts of Manitoba Gross Domestic Product (GDP) and Manitoba Hydro Residential Basic Customers were then input into the models to generate forecasts for the number of customers for each year of the forecast period. The number of Small Non-Demand, Small Demand and Medium customers was modeled using yearend historical customer data from 1985/86 to 2017/18.

The resulting model and parameters are as follows:

Model: **GS Mass Market Customer Forecast (Small ND, Small Demand and Medium)**

Equation: Number of Customers at yearend (t) = 35,877 + 0.21 x MGDP + 0.04 x RES

Results:

Model R-Squared	Variable	Coefficient	t-stat
	Constant	35,887	19.63
99.6%	MGDP	0.21	7.99
	RES	0.04	5.67

Term definitions:

MGDP - Manitoba Real Gross Domestic Product
RES - Year end number of Residential Basic Customers

General Service Mass Market customer growth was assigned to Small Non Demand, Small Demand and Medium classes by using their 3 year average use by class and allocating the customers appropriately.

The number of General Service Large customers was modeled using yearend historical customer data from 1989/90 to 2017/18. The resulting model and parameters are as follows:

Model: **GS Mass Market Customer Forecast (Large)**

Equation: Number of Customers at yearend (t) = -298 + 0.01 x CrGDP + 0.0011 x RES

Results:

Model R-Squared	Variable	Coefficient	t-stat
	Constant	-298	-6.48
98.8%	CrGDP	0.01	3.78
	RES	0.0011	6.93

Term definitions:

CrGDP - Manitoba / Canada / U.S. Blended Real Gross Domestic Product
RES - Year end number of Residential Basic Customers lagged 2 years

ii. **General Service Mass Market Average Use Forecast -** Historical Average Use per General Service customer was calculated after removing the effects of DSM and Codes & Standards. The average use of the combined Small Non-Demand (SND), Small Demand (SD) and Medium classes were forecast using an econometric regression model that included Electricity Price and Manitoba GDP. Historical data from 1989/90 to 2017/18 was used.

The resulting model and parameters are as follows:

Model: **GS Mass Market Average Use Forecast (Small ND, Small Demand and Medium)**

Equation: Ln Average Use per GS SND, SD and Medium

= 5.88 – 0.12 x Ln (Elec Price) + 0.55 x Ln (MGDP) + 0.04 x Dummy

Results:

Model R-Squared	Variable	Coefficient	t-stat
98.9%	Constant	5.88	18.94
	Elec Price	-0.12	-3.13
	MGDP	0.55	22.38
	Dummy	0.04	5.08

Term definitions:

Elec Price - SND, SD and Medium Average Real Electricity Price lagged 2 years
MGDP - Manitoba Real Gross Domestic Product
Dummy - "1" up to 2005/06 due to a billing system change causing a reclassification of customers in 2006/07

The Average Use for Large Mass Market customers was forecast in an econometric regression model that used Electricity Price and a blended Manitoba, Canadian, and U.S Real GDP as explanatory variables. Historical data from 1989/90 to 2017/18 was modeled.

The resulting model and parameters are as follows:

Model: **GS Mass Market Average Use Forecast (Large)**

Equation: Ln Average Use per GS Large

= 13.75 – 0.43 x Ln (Elec Price) + 0.30 x Ln (CrGDP) + 0.06 x Dummy

Results:

Model R-Squared	Variable	Coefficient	t-stat
96.6%	Constant	13.75	35.91
	Elec Price	-0.43	-5.79
	CrGDP	0.30	9.75
	Dummy	0.06	5.81

Term definitions:

Elec Price - GS Large Average Real Electricity Price lagged 2 years
CrGDP - Manitoba / Canada / U.S. Blended Real Gross Domestic Product
Dummy - Included from 1999/00 to 2005/06 to reflect the average use of the 750V-30kV group being higher for those years by about 250,000 kWh

The GS Mass Market Small, Medium and Large groups are further subdivided into rate groups that are based on customer's usage. If usage by an individual customer increases (or decreases) sufficiently then they are re-assigned to the appropriate rate group. This action results in the average use of each group to remain relatively stable. For the forecast, the average use of each rate group is held constant. The number of customers in each group is adjusted so that both the total number of customers and overall average use forecast by these models is achieved.

iii. **General Service Mass Market Total Use Forecast** - Total GWh for the General Service Mass Market sector was forecast by multiplying the forecast number of customers in each rate group by the forecast average use. The forecast of energy savings from Codes and Standards as outlined in Manitoba Hydro's Power Smart Plan were subtracted, and the future use of Electric Vehicles in the GS Mass Market sector was added.

General Service Top Consumers Methodology

There are 10 companies counting as 26 customers in the Top Consumers category, covering four industry sectors. Each customer is forecasted individually based on information collected on individual operating plans, including short-term expansion or contraction plans. The sources of information are derived from industry news and publications, company prospectuses, and from Manitoba Hydro's Key and Major Account Advisors. The information collected is used in the preparation of company specific short term forecasts for committed projects. The short- term plans are forecasted to occur within the first five years. For the long-term beyond year five, the energy in year six of each customer is held constant for the remainder of the forecast period.

To account for unexpected load increases or decreases for the current Top Consumers beyond year five, the Potential Large Industrial Loads (PLIL) category was created. PLIL is as an alternative to attempting long-term forecasts for individual Top Consumers. It is based on analyzing the historical changes in energy of the Top Consumers as a group rather than on focusing on individual customers. PLIL endeavors to account for long-term future growth or contraction, including unexpected major expansions, contractions, or potential loss of existing Top Consumer customers.

PLIL is forecast using an econometric model of Top Consumers historical energy activity from 1983/84 to 2017/18. During the historical period, 3 customers joined the Top Consumers sector and only the variations in operating activities were included in the analysis. The model fits the energy to the specific Top Consumers Electricity Price and to a blended Manitoba, Canadian, and U.S Real GDP.

The resulting model and parameters are as follows:

Model: **GS Top Consumer Forecast (PLIL)**

Equation: Ln Total Load = 3.35 – 0.34 x Ln (Top Price) + 0.62 x Ln (CrGDP)

Results:

Model R-Squared	Variable	Coefficient	t-stat
	Constant	3.35	4.43
89.9%	Top Price	-0.34	-2.05
	CrGDP	0.62	9.78

Term definitions:

Top Price - Manitoba Top Consumers Real Electricity Price lagged 1 year
CrGDP - Manitoba / Canada / U.S. Blended Real Gross Domestic Product

The forecasted growth from this model was used in years 6 through 20 as PLIL.

Electric Vehicles

The methodology for forecasting Electric Vehicles trends uses historical data supplied by Statistics Canada and Manitoba Public Insurance on automobile purchases and registrations per year in Manitoba. To help estimate future trends, appropriate assumptions from recent relevant literature were applied to Manitoba's situation. The forecast section on Electric Vehicles provides further details.

Other Sectors

Seasonal, Water Heating, Lighting

Most of the smaller sales sectors, including Seasonal, Flat Rate Water Heating and Area and Roadway Lighting were forecast by analysis of the changes in the number of customers or services and in changes in average use per customer or service. Growth rates were applied based on history and a best estimate as to what the future will bring.

Diesel

Each of the diesel generated supplied communities was individually forecast and included in the forecast under the assumption that these communities are not anticipated to be connected to the Integrated System during the forecast period.

Monthly Sales Allocations

Monthly percentages of customer growth through the year and GWh for each month of the year were averaged for the past three to five years. The most appropriate growths were applied to the forecasts of annual customers and GWh to get the monthly forecasts.

Monthly and Annual Gross Firm Energy and Gross Total Peak

The 5 year monthly percentage of Common Bus and Station Service are applied to their annual energy to calculate their monthly values. Transmission Losses are calculated using a 5 year average of their ratio to Common Bus. Monthly Common Bus, Transmission Losses and Station Service are added up to give the Monthly System Energy. Monthly Common Bus, Transmission Losses, Station Service and Gross Firm Energy are totaled to give the Annual Gross Firm Energy.

The Gross Total Peak is calculated from Load Factors applied to the forecast monthly Gross Total Energy. Prior to calculating the Load Factors, the Top Consumer energy and peak are subtracted because the Top Consumers have a higher average hourly energy relative to their peak value than the Residential and General Service Mass Market Customers. A 10 year historical average Load Factor is calculated for the remaining energy and is applied to the forecast monthly energy to get the peaks for the remaining energy. The Top Consumer peaks are added using a 92% Load Factor applied to the Top Consumer monthly energy.

The annual Gross Total Peak is calculated using the 3 winter months of December, January and February when the actual peak has typically occurred and applied a ratio from the January peak to be used as the annual peak.

Historical weather adjusted energy is used to calculate the annual Load Factor. The historical trend of the load factor increasing 0.08% per year is applied to the forecast in the winter months when the annual system peak occurs. The number of hours in each month is used to calculate monthly Load Factors.

Growth Rates

Annual GWh/year growth rates in this document are linear growth rates, calculated as: GWh growth / number of years.

Annual percentage growth rates in this document are compound growth rates calculated as: (final GWh / initial GWh) ^ (1 / number of years) – 1.

GLOSSARY OF TERMS

Area and Roadway Lighting sector - includes electricity sales for the Sentinel Lighting and Street Lighting rate groups.

Common Bus - is the total load measured from all the distribution points (i.e. substations) within Manitoba. It includes all energy supplied to General Consumers Sales customers, Construction Power plus associated Distribution Losses, but excludes Diesel customers, Transmission Losses and Station Service.

Customer – Most metered electrical services count as a customer. Unmetered services such as flat rate water heating and sentinel rental services do not count as a customer. Street lighting counts all the services grouped as a premise as one customer.

Codes and Standards – A Demand Side Management (DSM) initiative associated with existing Provincial building codes and improved equipment efficiency standards. This is the only DSM initiative that is specifically accounted for in the forecast.

Curtailable - is a load that can be curtailed on short notice. A discount is given for subscribing to this program. Curtailable loads can affect peak demand because some periods of curtailment may be at or near the system peak.

Gas Available Area – A city or town in Manitoba where customers have natural gas service available and can choose to heat their dwelling with either natural gas or electricity. Approximately 83% of Residential Basic customers, including the entire city of Winnipeg, have gas available.

General Consumers Sales - includes the energy supplied to all of Manitoba Hydro's individually billed customers. It excludes export sales.

General Service Mass Market - includes all Commercial and Industrial customers, excluding the Top Consumers group.

General Service Sector - made up of sales to Commercial and Industrial businesses served by Manitoba Hydro. This sector consists of five rate groups (Basic, Diesel, Seasonal, Flat Rate Water Heating and Surplus Energy Program).

General Service Top Consumers - is made up of the largest electricity users of Manitoba Hydro.

Gross Firm Energy - is the energy required to serve Manitoba Hydro's customers on the Integrated System. It excludes exports, interruptible (non-firm) loads and diesel customers.

Gross Total Peak - is the maximum integrated (i.e. average) hourly load required to serve Manitoba Hydro's customers on the Integrated System. It excludes exports and diesel customers. It includes curtailable loads.

GWh (gigawatt-hour) - The unit of energy primarily used in this document. One GWh equals one million kWh (kilowatt-hours), which is approximately equal to the energy of 100 typical dwellings not using electricity for heating, or 40 dwellings that use electricity for heating.

Integrated System - is the power grid that connects Manitoba Hydro's generation sources to its customers. All Manitoba Hydro's customers except diesel are on the Integrated System.

Interruptible (Non-Firm) Energy - includes all energy sold to Manitoba customers on a non-firm basis. Currently, the only rate group for this is the Surplus Energy Program (SEP).

kWh/cust (kilowatt-hours per customer) - The unit of energy primarily used in this document to represent the average use of one customer. The total usage in GWh of a group of customers is divided by the number of customers and then multiplied by one million.

Load Factor - is the ratio of the average hourly energy over a period, usually a year, divided by the energy used at a specific hour, usually the hour of system peak. A load factor of 25% means that the average energy is one-quarter of what is used at system peak. A load factor greater than 100% means that the average hourly energy is more than what is used at system peak. Given a specific energy, a lower load factor means a higher peak. The equation is:

Load Factor = (Total Energy / Hours) / (Energy over the hour of system peak)

Manitoba Load at Common Bus - is the total load measured from all the distribution points (i.e. substations) within Manitoba. It includes all energy supplied to General Consumers Sales customers plus associated Distribution Losses, but excludes diesel customers, Transmission Losses and Station Service.

MW (megawatt) - The unit of peak demand primarily used in this document. One MW is a million watts. One thousand MW of peak demand for one hour equals one GWh of energy. Alternatively, one MW for a thousand hours also equals one GWh of energy.

Net Firm Energy and Net Total Peak - are the same as Gross Firm Energy and Gross Total Peak except they exclude Station Service. The reporting of Manitoba Load in the Load Forecast used "Net" until 2008. It presented both until 2011. Starting with the 2012 forecast, only the "Gross" is presented. Net can be calculated when needed by subtracting Station Service from the Gross.

Residential Basic – is the primary residential customer group made up of single detached and multi attached dwellings as well as individually metered apartment suites.

Residential sector - made up of sales to residential customers for non-business operations. The Residential sector is comprised of four rate groups (Basic, Diesel, Seasonal, and Flat Rate Water Heating).

Station Service - is the energy used by power plants to generate power and service their own load.

2018 Electric Load Forecast

Tab 58

Demand Side Management (DSM) in the Manitoba Public Utility Board's (PUB's)Needs-For and Alternatives-To (NFAT) Review of Manitoba Hydro's (MH's)Development Plan

Russ Houldin

Elenchus Research Associates

April 2, 2014

Overview

- Purpose of evidence
  - To address the issues in the MPUB Scope of Work (SOW) on DSM
- General issues
  - Key messages
- Scope of Work (SOW) responses

Key Messages

- MH's approach to DSM is reasonable
  - Comparable to other North American utilities
- DSM on its own has minimal impact on the timing of Keeyask
- MH's approach could be improved
  - Move back to full Integrated Resource Planning (IRP)
    - Change delivery model (government decision)
  - Conduct studies to check assumptions
  - Model uncertainty explicitly
  - Multiple accounts evaluation could be made more complete
- The suggested improvements could affect Conawapa In-Service Date (ISD)
  - An opportunity for MH to keep up with the evolution of the incorporation of EE into system planning

Energy Efficiency Lexicon

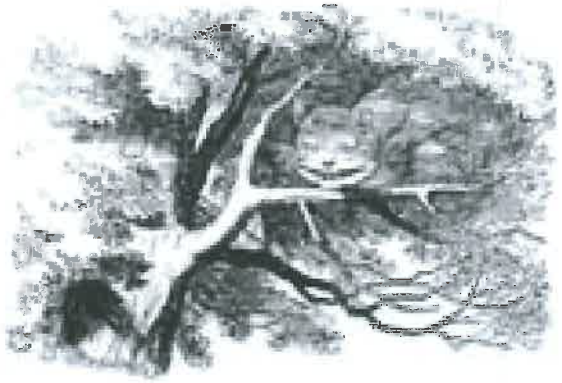
- Energy Efficiency (EE) – use of technologies that use energy more efficiently
- Conservation – education to change consumer behaviour
- Soft path – combination of EE and renewables
- Conservation and Demand Management (CDM) – programs that combine EE and conservation
- DSM – programs that deliver estimated customer savings through EE measures
- END-USE – the energy used by energy services
- Energy services- the services that energy performs (heating, cooling, lighting, mechanical action, process-specific, electricity specific)
- MEASURE - a component of a CDM or DSM program
- IRP – a method of treating supply and demand-side measures equivalently

Conceptual Framework

DSM SAVINGS AT TIME T *= SUM OVER ALL END-USE MEASURES OF:
(REFERENCE END-USE MEASURE TERTIARY ENERGY MINUS
EFFICIENT END-USE MEASURE TERTIARY ENERGY)*
(NUMBER OF END-USE MEASURES)

*E.G. 2014

TERM IN THIS BRACKET CANNOT BE MEASURED DIRECTLY; INFERRED FROM EITHER, BASELINE DATA OR ENGINEERING ASSUMPTIONS OR BOTH



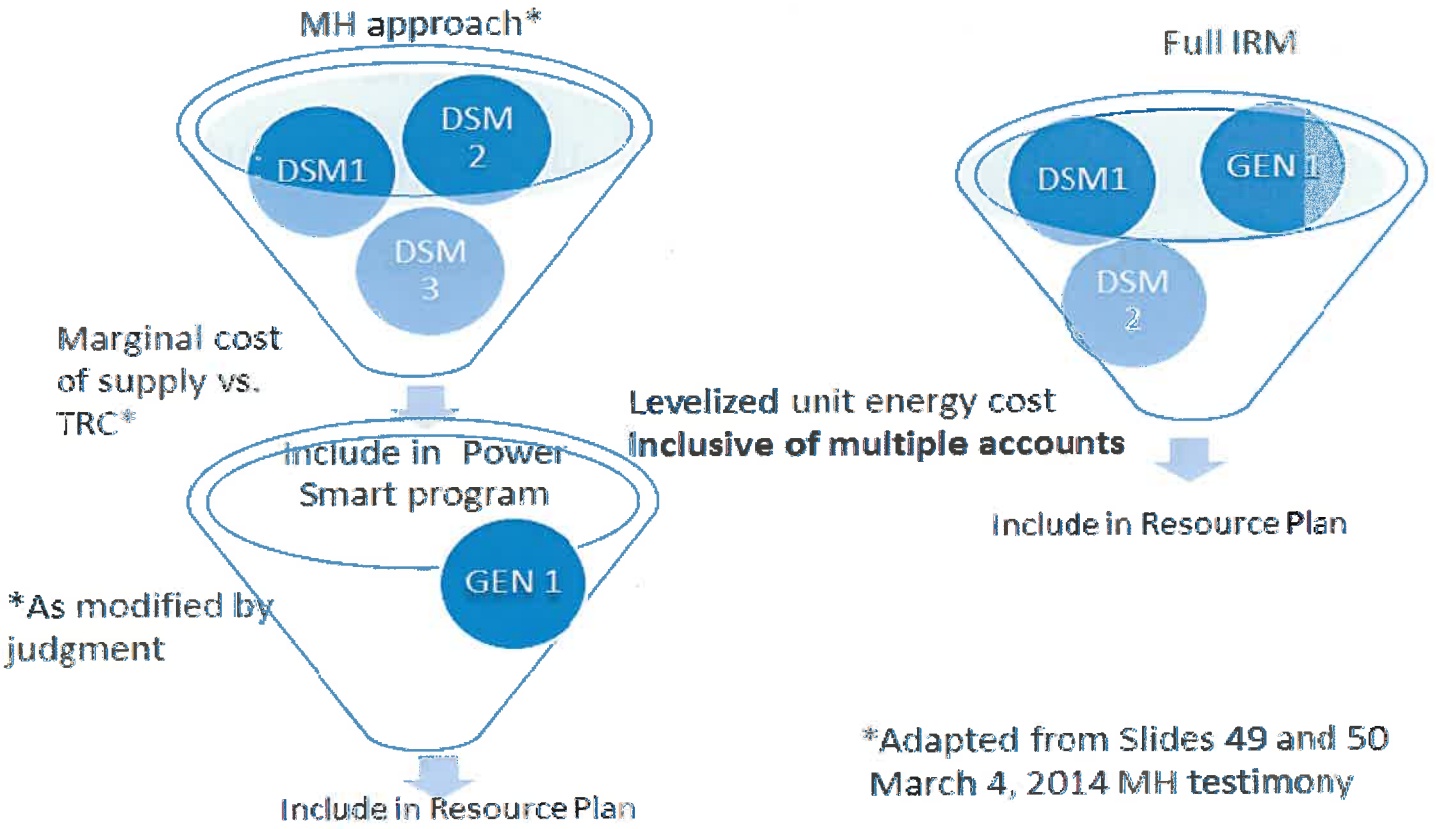
NUMBER OF END-USE MEASURES IS USUALLY DECOMPOSED AS:
NUM BER OF END-USE MEASURES = POPULATION OF SERVICES
PROVIDED BY END-USE MEASURE*SATURATION LIMIT (%)*PENETRATION (%)

THESE TERMS REQUIRE ASSUMPTIONS ABOUT MARKET BEHAVIOUR

DSM SAVINGS AT T+1 = DSM SAVINGS AT TIME T*DECAY RATE(%)

The Cheshire Cat: Central Concern with DSM

- DSM is the preferred institutional form of Energy Efficiency
  - Other forms; Energy Service Companies (ESCOs), pure incentive programs, education, codes and standards
- DSM savings cannot be measured
  - We cannot observe what might have happened
- Using baseline or engineering estimates has an inherent uncertainty
  - Underlying tertiary energy use
  - Assumptions about market response



Elenchus

DSM and System Planning

- A fundamental asymmetry between DSM savings estimates and supply estimates
- If DSM is underestimated capacity is not dispatched
  - Cost: underutilization
  - For MH firm export opportunities may be foregone
- If DSM is overestimated and capacity is not built this may increase the risks of brownouts and-or blackouts

How Does MH's DSM Approach Differ From "Full" IRP ?

*Adapted from Slides 49 and 50 March 4, 2014 MH testimony

elenchus

Coherence and Load factors

- Load factor suggested as a qualitative diagnostic tool for NFAT
  - Not "DSM demand and energy savings must be in the same proportions as system load"(MH Rebuttal p42l36)
  - Do the bottom-up DSM savings projections from Power Smart "hang together" with system planning and with 'top down' stress testing?
    - MH's system load factor is coherent
    - The system load factor and DSM load factors are coherent
      - Other than Curtailable Rates program, load factor differences are plausible

Projected & Historical Load & Capacity Factors & Capacity Reserve

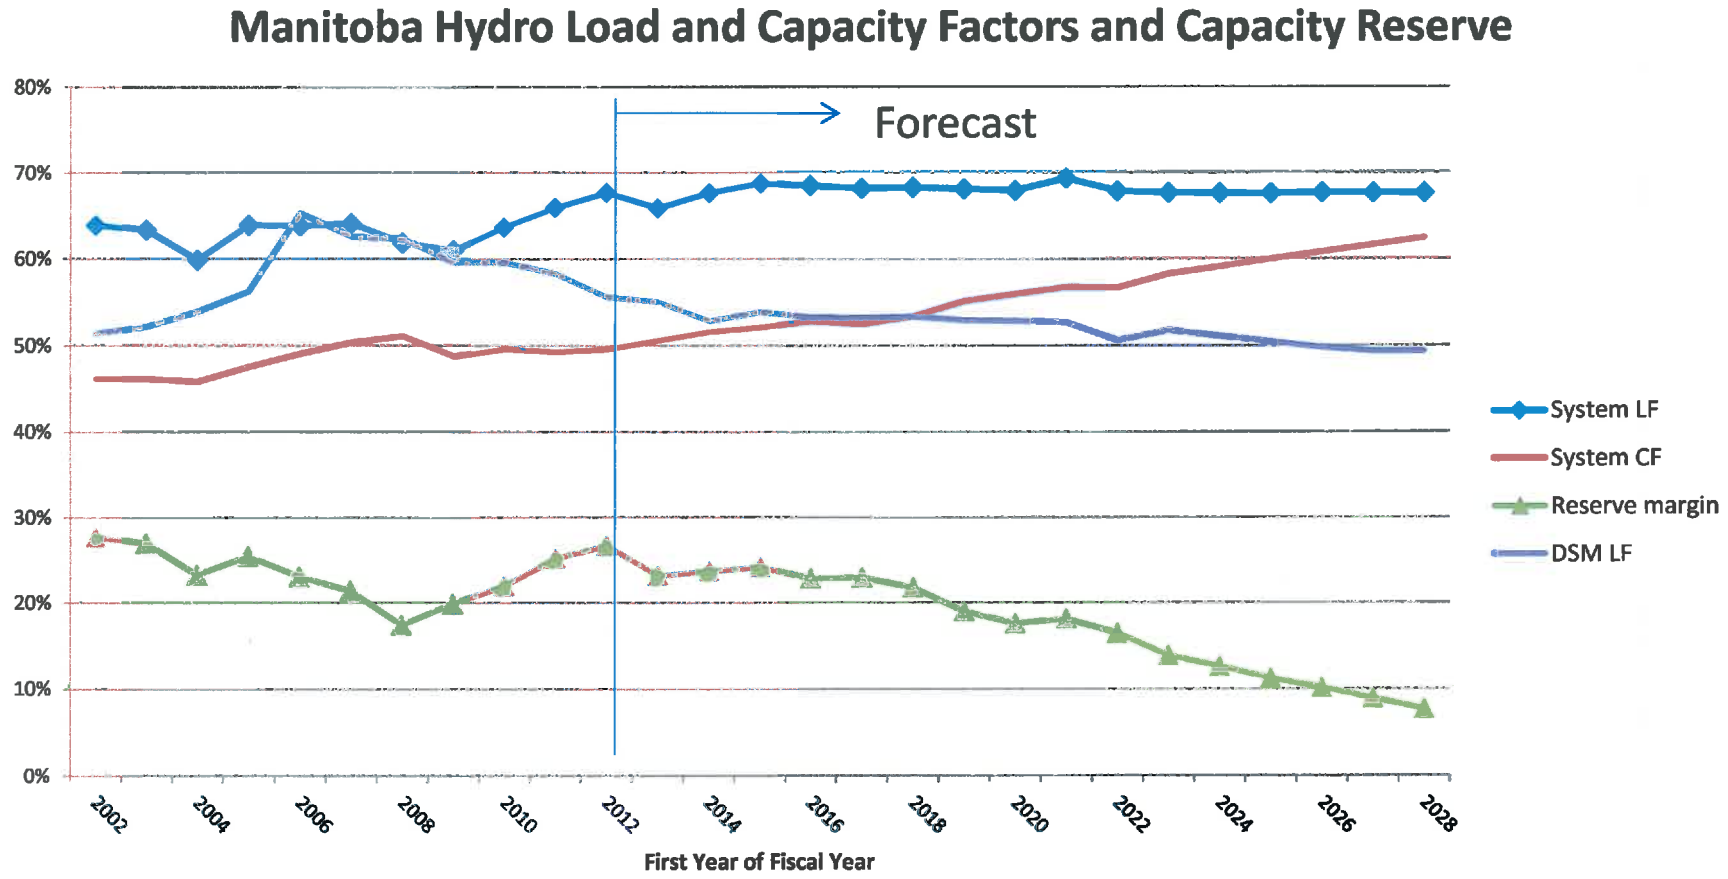


Figure 2 Elenchus DSM Report p 4

elenchus

What Are the Uncertainties of DSM Savings Estimates?

- While there is no doubt that rates of load growth have declined from the 1950-70 rates, there is no consensus on the relative contributions of:
  - Price effects (including substitution);
  - Income effects (including the rebound effect);
  - Autonomous technological change ;
  - Customer preferences;
  - Impact of 'conservation' messages;
  - Codes and standards; and
  - DSM and other EE programs.

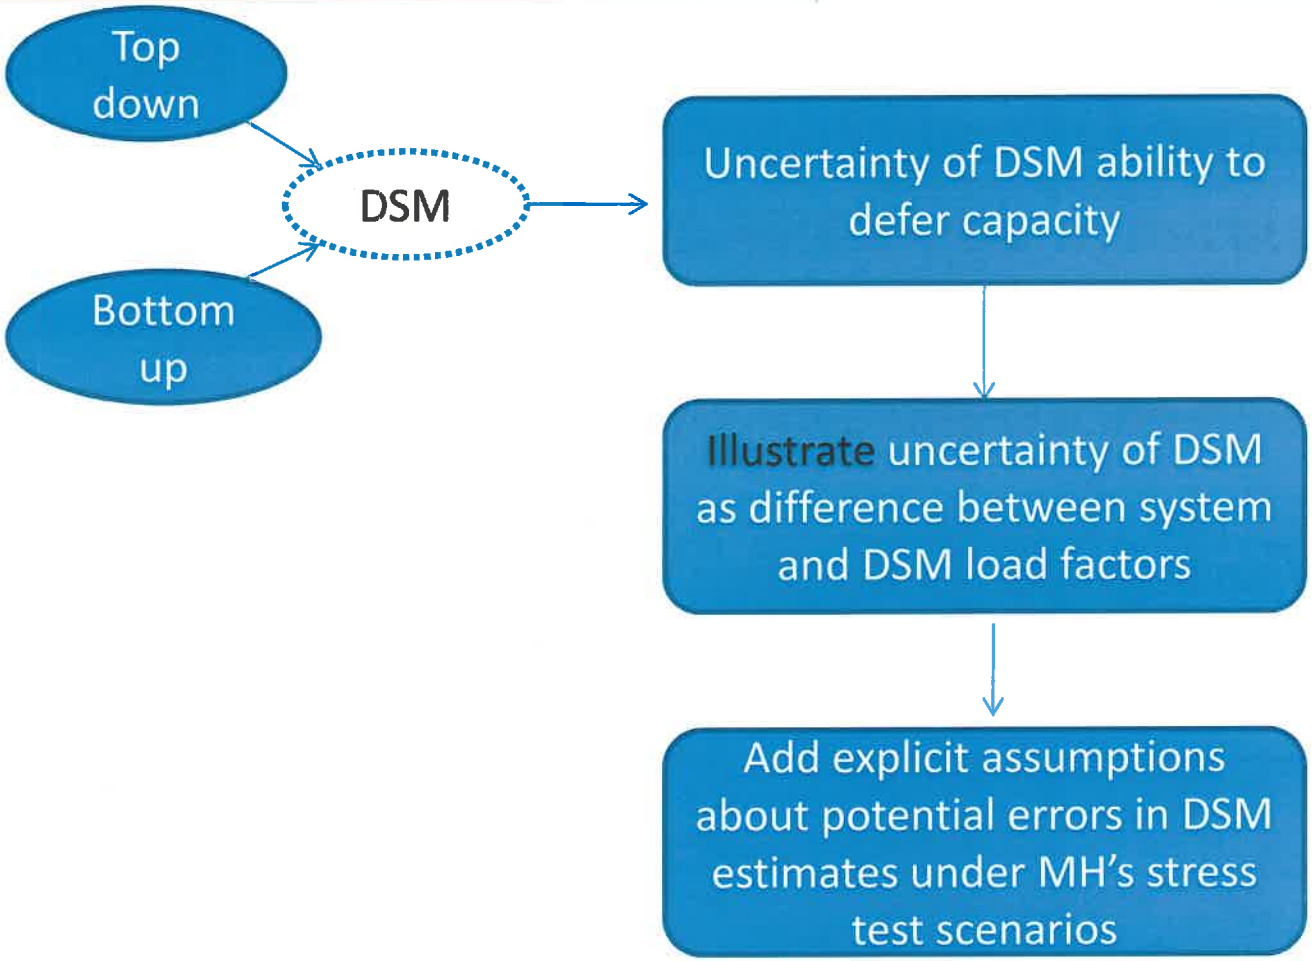
How Can DSM Uncertainties Be Handled?

- Need to acknowledge explicitly the uncertainties and the asymmetry problem
- Treat DSM estimates similarly to wind power
  - System operators are building up knowledge of the statistical distributions of wind output and use this to establish **expected values** for wind output that are equivalent to generation
  - Use methods from experimental theory
  - Improve knowledge of tertiary end use energy by retrospective statistical studies of DSM participants and non-participants

Why then, Should you Accept Dunsky and ENERNOC`s Evidence?

- The evidence of Dunsky and ENERNOC are "state of the art" for DSM
- But there are concerns with DSM
  - Measurability problem
  - Assumptions about markets
  - Institutional ambiguity
- This creates inherent uncertainty
- Should not throw out specific EE with the general DSM bathwater

Babies and Bathwater



- The flaws of DSM and its uncertainties should not blind utilities to the value of EE
- There is a large body of evidence that EE can `supply` a substantial amount of electricity services below the cost of new generation
  - While "barriers" to DSM analysis overstates the issues, it is reasonable to provide some degree of public support for EE
- Need simply to apply the best available evidence of DSM savings with an acknowledgement of uncertainties and the asymmetry problem, preferably with IRP

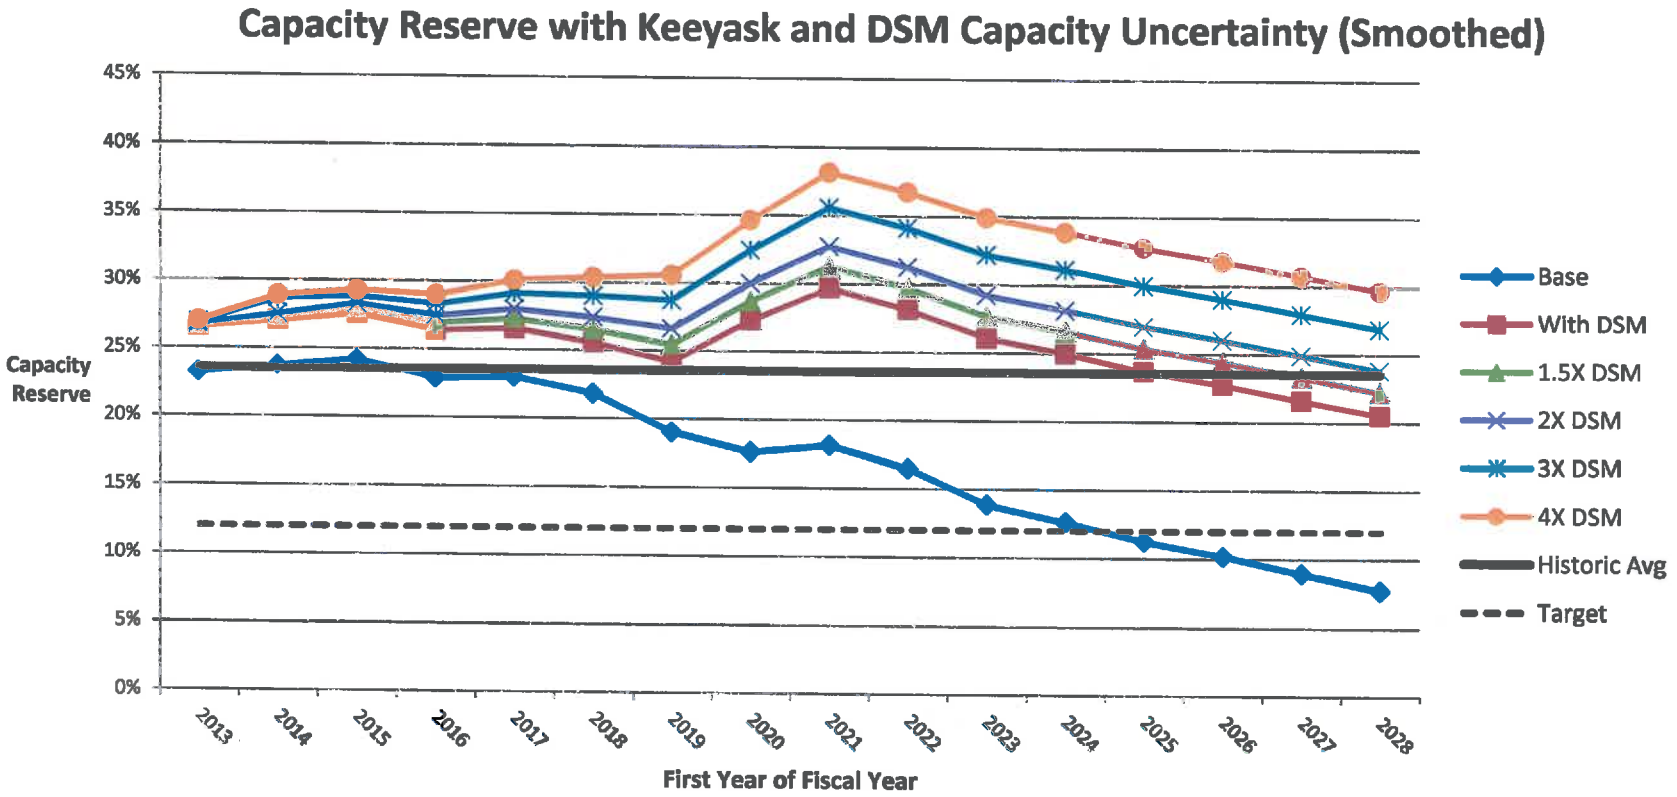
Stress Testing

- Elenchus' stress-testing builds on MH's top-down analysis
  - 1.5, 2, 3 and 4 times DSM (not multiples of spending on DSM*)
  - No imports or exports
- Under the assumption that the difference between system and DSM load factors results in overestimate of capacity (versus energy) as an **illustration** of uncertainty
- **Illustrative** examples of introducing arbitrary uncertainty assumptions – impact on capacity reserve
  - Manitoba only, no credit for load curtailment

*See SOW 12: MH's analysis was not based on multiples of spending (Exec Summary p31l25)

Logic of Stress Test

Heuristic Stress Test of MH's DSM Analysis (Updated)



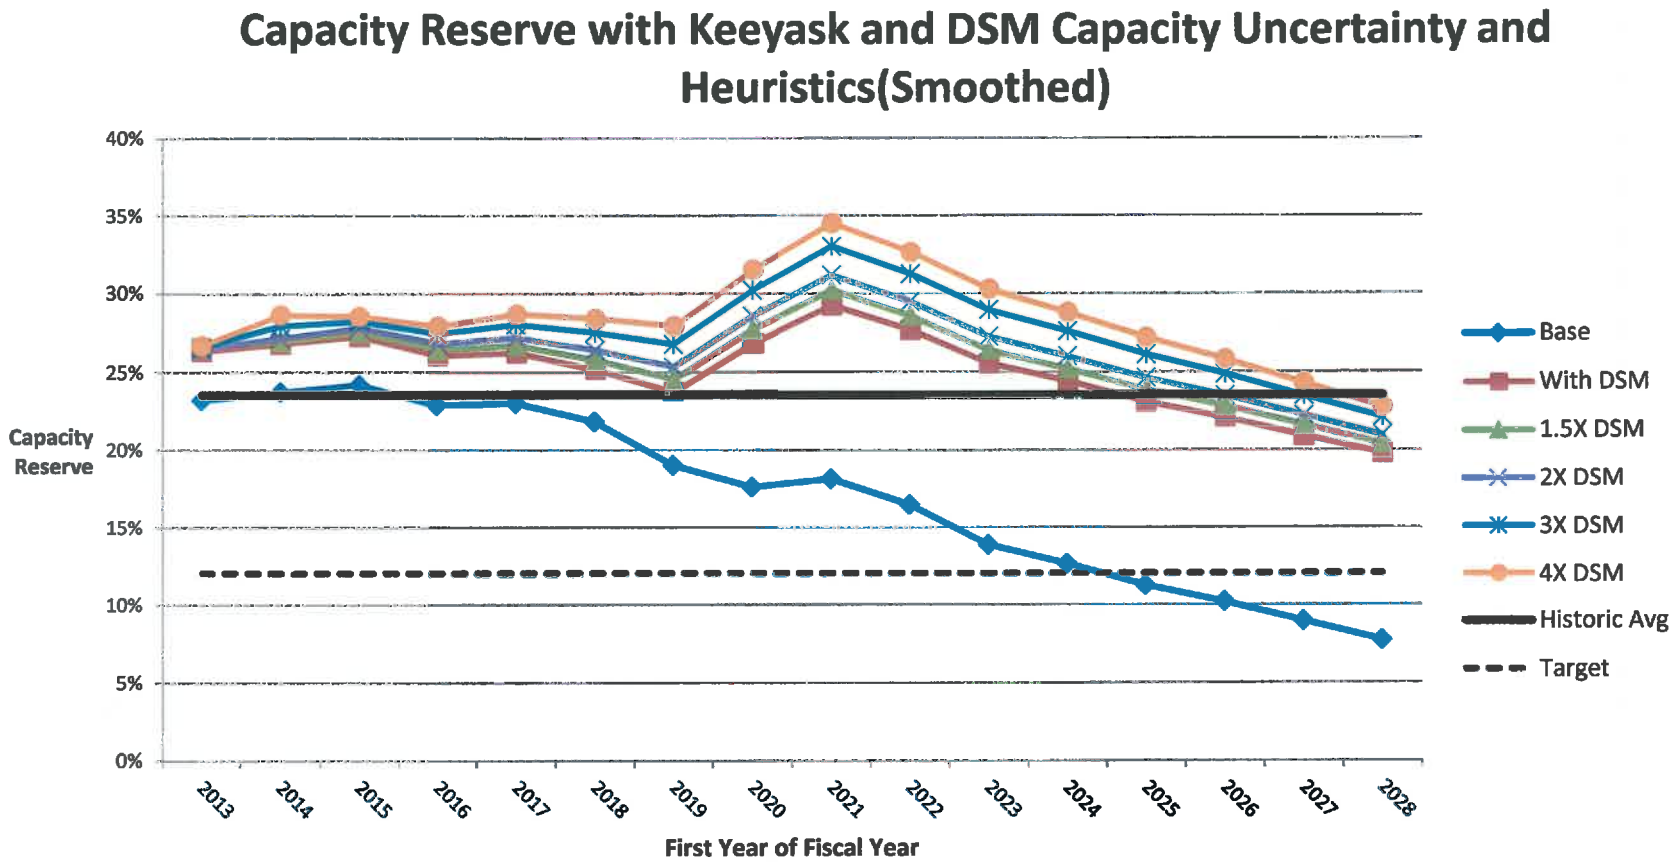


Figure 6 Elenchus DSM Report p 24

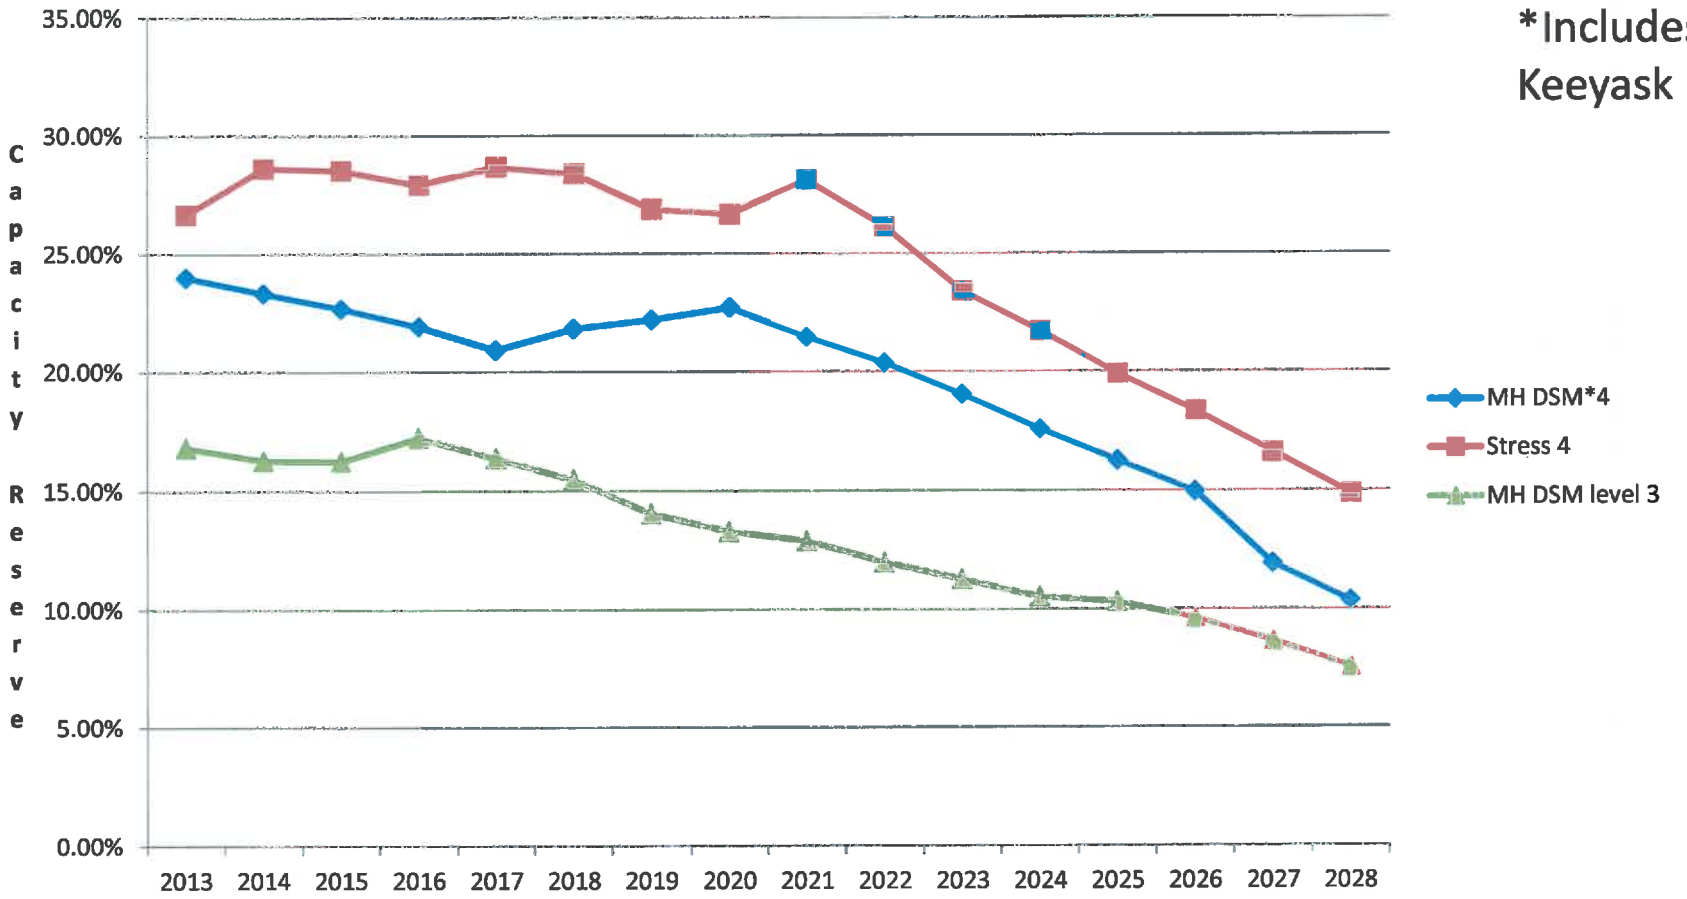
Heuristic Stress Test of MH's DSM Analysis (Updated)

Achievable potential declines at 2% pa for 1.5X case, 2.5% for 2X,3% for 3X and 3.5% for 4X



elenchus

Figure 7 Elenchus DSM Report p 25

Stress Testing Conclusions

- Simulations of uncertainties for top-down DSM savings scenarios show that MH`s analysis is robust
- DSM has a minimal impact on the timing of Keeyask
- Conawapa could be modestly affected
- Conclusions unaffected by new MH DSM analysis

Comparison of Updated Business Plan MH Scenarios (No New Resources) and Elenchus*

*Includes Keeyask

Refs:DSM4-Appendix 4.2p154;
Levl 3 - pp 21 and 23 of Exh 104-3

Elenchus

Ecological Footprint (EF)

- EF is only one methodology
- Two types: index or qualitative or single metric, e.g.
  - Single metric
    - Economic benefit-cost analysis ($s)
    - Net energy analysis (GJ, kWh etc.)
  - Index or qualitative
    - Environmental impact matrix
    - Sustainability analysis
- MH's multiple accounts approach is incomplete
  - MH's rebuttal also incomplete (p113 l14-22)
    - Good to avoid being driven to greater levels of detail
    - But need to evaluate all alternatives on commensurate data

Are Manitoba Hydro's Demand-Side Management Factors Complete, Reasonable and Accurate?

- Yes
- While MH does not itself refer to "DSM factors", MH's approach to DSM is complete, reasonable and accurate.

SOW 1; Elenchus DSM Report section 3.2.2

elenchus

Review MH's assessment of technical, economic and real DSM and energy efficiency opportunities relative to other jurisdictions

- MH's assessment of DSM opportunities is comparable to other North American jurisdictions.

SOW 2; Elenchus DSM Report sections 3.2.2 , 3.3.2.2 and 3.3.2.3

Review the extent to which MH has designed and implemented large utility DSM and energy efficiency programs at the residential, commercial and industrial levels in a manner consistent with other North American jurisdictions where such programs have been implemented

- MH's DSM programs for the major customer segments (residential, commercial and industrial) are consistent with utility practices in North America.

SOW 3; Elenchus DSM Report sections 3.2.1 and 3.2.2

Comment on the proper use of TRC and RIM evaluation tools as well as a TSC and benefit analysis from DSM and energy efficiency opportunities

- MH uses TRC, RIM and TSC in manner consistent with North American utility practices in relation to DSM and its consideration of other benefits is reasonable.

SOW 4; Elenchus DSM Report sections 3.2.1 and 3.2.2

Comment on MH's approach to measuring actual DSM and energy efficiency savings

- MH follows accepted industry protocols but these could be improved.
- Specifically, industry protocols do not adequately recognize inherent uncertainties due to un-observability of DSM savings

SOW 5; Elenchus DSM Report sections 3.3. 1.1 and 3.3.2.1

Comment on the appropriateness of MH's adoption of smart grid technologies for DSM

- MH's adoption of smart grid technologies for DSM is appropriate

SOW 6; Elenchus DSM Report section 3.4

Comment on MH's approach to determining marginal costs for measuring DSM

- MH follows accepted industry practice in basing its estimates of DSM marginal costs on reference standard technologies. However, this approach adds to the uncertainty of estimates of actual DSM potential.

SOW 7; Elenchus DSM Report sections 3.2.1.1 and 3.2.2.1

Comment on MH's approach to managing DSM and energy efficiency lost opportunity revenues

- MH includes estimated export revenues in its evaluation of DSM opportunities as part of its multiple metrics approach
- While reasonable, this also adds to uncertainty

SOW 8; Elenchus DSM Report section 3.3.2.6

Comment on the reasonableness, thoroughness and soundness of MH's DSM and conservation forecasts

- MH's DSM forecasts are reasonable, thorough and sound but their uncertainty could be made more explicit and addressed in an improved way.

SOW 9; Elenchus DSM Report sections 3.3.1 and 3.3.2

Comment on whether the preferred and alternative resource and conservation evaluations are complete, accurate, thorough, reasonable and sound.

- The preferred and alternative resource and conservation evaluations are largely complete, accurate, thorough, reasonable and sound.
- There is uncertainty over the accuracy of DSM savings and the evaluation would be more complete if the environmental impacts of DSM programs were evaluated.

SOW 10; Elenchus DSM Report sections 3.3.1, 3.3.2 and 4

Critically Assess Manitoba Hydro's DSM Potential Study

- The DSM Potential Study is a state-of-the-art study but its approach glosses over key uncertainties.
  - Fundamentally DSM savings estimates cannot be falsified
  - Market barriers analysis overstates importance of barriers
  - Evidence from private ESCOs suggests consumers are not willing to pay for DSM for savings kevels typically reported by participating utilities

SOW 11; Elenchus DSM Report section 3.3.2.2

Perform independent stress testing of Demand-Side Management levels and an assessment of the reasonableness of Manitoba Hydro's stress testing of 1.5 and 4 times Demand-Side Management spending

- Elenchus' stress testing of DSM levels supports MH's conclusion that DSM programs are not sufficient to justify the deferral of new hydro-electric capacity

SOW 12; Elenchus DSM Report section 3.3.2.4

Examine Manitoba Hydro's current and potential use of Demand-Side Management investments in terms of:

a) System Capacity Dispatchability

- MH treats DSM capacity as non-dispatchable and 100% dependable. Elenchus suggests that DSM should be treated as a non-dispatchable resource subject to **explicit** dependability factors.

SOW 13a; Elenchus DSM Report sections 3.3.1.2 and 3.3.2.5

Examine Manitoba Hydro's current and potential use of Demand-Side Management investments in terms of:

b) Dependable Energy Dispatchability

- MH treats DSM energy as non-dispatchable and 100% dependable. Elenchus suggests that DSM should be treated as a non-dispatchable resource subject to **explicit** dependability factors.

SOW 13b; Elenchus DSM Report sections 3.3.1.2, 3.3.2.5 and 3.3.2

Examine Manitoba Hydro's current and potential use of Demand-Side Management investments in terms of:

c) Backup Resources Required

- MH makes no provision for backup. For operating reserve this is appropriate but for capacity reserve MH should treat DSM as a non-dispatchable resource subject to **explicit** dependability factors.

SOW 13c; Elenchus DSM Report sections 3.3.1.2 and 3.3.2.5

Examine Manitoba Hydro's current and potential use of Demand-Side Management investments in terms of:

d) Cost Effectiveness

- MH considers the cost effectiveness of DSM in terms of the Total Resource Cost (TRC), Total Societal Cost (TSC),Levelized Utility Cost (LUC). These are appropriate tests.

SOW 13d; Elenchus DSM Report sections 3.2.1, 3.2.2, 3.2.1.1 and 3.2.2.1

Examine Manitoba Hydro's current and potential use of Demand-Side Management investments in terms of:

e) Carbon Dioxide Footprint

- While MH has made a thorough assessment of the CO2 impacts of new generation it has not looked at the lifecycle impacts of DSM
- If MH conducts a new assessment of Conawapa could consider an Ecological Footprint analysis as an alternative to its "multiple accounts" approach

SOW 13e; Elenchus DSM Report section 3.5

Examine Manitoba Hydro's current and potential use of Demand-Side Management investments in terms of:

f) The role of the Curtailable Rate (*sic*) (CR) Program (Peak)

- The Curtailable Rates program should play no role in since reliance on the capacity reductions would be imprudent
- Elenchus makes no comment on its other purposes
- MH's position on the treatment of (LC) as part of the DSM program is unclear
  - "Manitoba Hydro does not include the demand benefits available from the Curtailable Rates Program in the assessment and development of its Resource Plan." rebuttal p47l10
  - "Given industry-wide acceptance of demand response as a recognized DSM initiative, it would also appear to be reasonable to then also consider Manitoba Hydro's Curtailable Rates Program as a DSM initiative." p43l18

SOW 13f; Elenchus DSM Report sections 3.2.1.2 and 3.2.2.2

Examine Manitoba Hydro's current and potential use of Demand-Side Management investments in terms of:

g) The Role of the Surplus Energy (SE) Program

- The SE program plays no role in DSM.
- Elenchus makes no comment on its other purposes.

SOW 13g; Elenchus DSM Report sections 3.2.1.3 and 3.2.2.3

Examine Manitoba Hydro's current and potential use of Demand-Side Management investments in terms of:

h) Location of DSM

- MH uses qualitative factors as well as metrics in designing its DSM programs. Location could be a factor but Elenchus is not aware of this.

SOW 13h; Elenchus DSM Report section 3.3.2.7

Identify the potential of DSM or energy efficiency to defer new generation in Manitoba, including Keeysak G.S. and or Conawapa G.S. alone or in conjunction with other non-hydraulic resources

- DSM is not likely to defer Keeyask or Conawapa, alone or in conjunction with other non-hydraulic resources

SOW 14; Elenchus DSM Report section 3.3.2.4

Review and comment on the evidence with respect to Demand-Side Management arising from the last Manitoba Hydro General Rate Application, including the role of Demand-Side Management in deferral of Generation Investments put forth by the Consumer Association of Canada (Manitoba) Inc.'s expert witness. (Dunsky)

- Elenchus agrees with Dunsky's benchmarking of MH's DSM programs

SOW 15; Elenchus DSM Report section 3.3.2.3

Thank You!

Tab 59

A Review of Manitoba Hydro's Electric Load Forecasting
a 5 January 2018 presentation to the Manitoba Public Utilities Board
delivered by Dr. Garland Laliberte on behalf of the Bipole III Coalition
in the matter of Manitoba Hydro's 2017-18 and 2018-19 General Rate Application

Preamble:

For several years, Manitoba Hydro filed forecasts for electric load in support of its General Rate Applications that were well above forecasts published by other utilities in North America and that turned out to be well above actual experience as time advanced.[1] Its filed forecasts for Demand Side Management (DSM), on the other hand, have been inconsistent, frequently changing during hearings conducted in connection with these applications.

This presentation will show that the pattern of over-forecasting, in evidence for several years beginning about a decade ago, began to change shortly after Manitoba Hydro obtained approval for system expansion and licenses were granted for key elements of that expansion even though there was evidence for several prior years that electric load forecasts were not being met. It documents Manitoba Hydro's current and recent forecasts for electric load comparing them with historic records. Both Gross Firm Energy and Gross Total Peak are considered.

It also documents the impact of DSM as planned by Manitoba Hydro and as mandated by the Efficiency Manitoba Act. In all cases, at-generation values of electric load are used. Except for DSM mandated by Efficiency Manitoba, all data used are taken directly or calculated from Manitoba Hydro's submissions to the Manitoba Public Utilities Board (PUB).

The Efficiency Manitoba Act sets targets for energy but fails to set targets for peak load. DSM mandated by Efficiency Manitoba for energy is projected forward at 1.5% per year beginning with a 2017/18 value of Gross Firm Energy calculated from regressed weather-adjusted values reported by Manitoba Hydro for the most recent 10 historic years. No DSM savings for peak load are calculated for Efficiency Manitoba.

[1] Presentation by the Bipole III Coalition to the Needs For and Alternatives To (NFAT) review of Manitoba Hydro's Preferred Expansion Plan by the Public Utilities Board submitted on February 3, 2014 and accessible at http://www.pubmanitoba.ca/v1/nfat/pdf/bipole_3_nfat_presentation.pdf.

Recent Electric Load Forecasts Compared to 20-year Historic Data:

Figures 1 and 2 present graphs of 20 years of historic weather-adjusted data for Gross Firm Energy[2] and Gross Total Peak[3], respectively. Figures 1 and 2 also present graphs of (at-generation) values of Gross Firm Energy and Gross Total Peak forecast by Manitoba Hydro in 2015[4], 2016[5] and 2017.[6] The forecast values for 2015 and 2016 are identified in these figures as MH15 Forecast (orange line) and MH16 Forecast (grey line), respectively. For clarity, the current forecast, referenced as either MH16 or MH16 Update in Manitoba Hydro's submissions for the current Application, is identified, in this presentation, as MH17 Forecast (yellow line). The data for these graphs are presented in Tables 1 and 2 at the end of this presentation.

---

2 Weather-adjusted values for Gross Firm Energy from Manitoba Hydro 2017/18 and 2018/19 General Rate Application Tab 7: Appendix 7.1 (2016 Electric Load Forecast), Table 29, page 47/82, and also Tab 11: Public Utilities Board (PUB) Minimum Filing Requirements, PUB MFR 65 (Updated) (2017 Electric Load Forecast), Table 1, page 404/1382.

3 Weather-adjusted values for Gross Total Peak from Manitoba Hydro 2017/18 and 2018/19 General Rate Application Tab 7: Appendix 7.1 (2016 Electric Load Forecast), Table 32, page 49/82, and also Tab 11: Public Utilities Board (PUB) MFRs, PUB MFR 65 (Updated) (2017 Electric Load Forecast), Table 1, page 404/1382.

4 MH15 Forecast values of Gross Firm Energy and Gross Total Peak from Manitoba Hydro 2015/16 and 2016/17 General Rate Application Attachment 25 (2015 Electric Load Forecast and Power Smart Plans MFR 1), Table 2, page 6/81, and also from Manitoba Hydro 2017/18 and 2018/19 General Rate Application Tab 7, Appendix 7.1 (2016 Electric Load Forecast), Table 2, page 6/82, updated in PUB-MH I-56a-c Revised) filed by Manitoba Hydro as Exhibit MH70 on 7 December 2017.

5 MH16 Forecast values for Gross Firm Energy and Gross Total Peak from Manitoba Hydro 2017/18 and 2018/19 General Rate Application Tab 7, Appendix 7.1 (2016 Electric Load Forecast), Table 1, page 5/82, and Table 2, page 6/82, updated in PUB-MH I-56a-c Revised) filed by Manitoba Hydro as Exhibit MH70 on 7 December 2017.

6 MH17 Forecast values of Gross Firm Energy from Manitoba Hydro 2017/18 and 2018/19 General Rate Application Tab 11: Public Utilities Board (PUB) Minimum Filing Requirements, PUB MFR 65 (Updated) (2017 Electric Load Forecast), Table 1, page 404/1382, updated in PUB-MH I-56a-c Revised) filed by Manitoba Hydro as Exhibit MH70 on 7 December 2017.

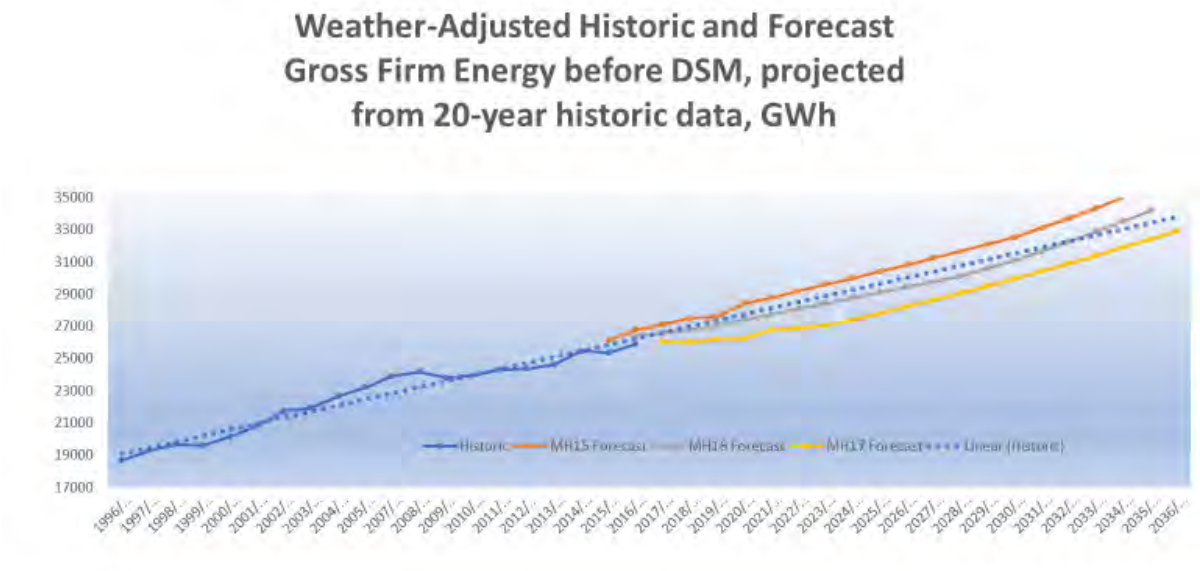


Figure 1: Weather-adjusted historic and forecast Gross Firm Energy before DSM, projected from 20-year historic data.

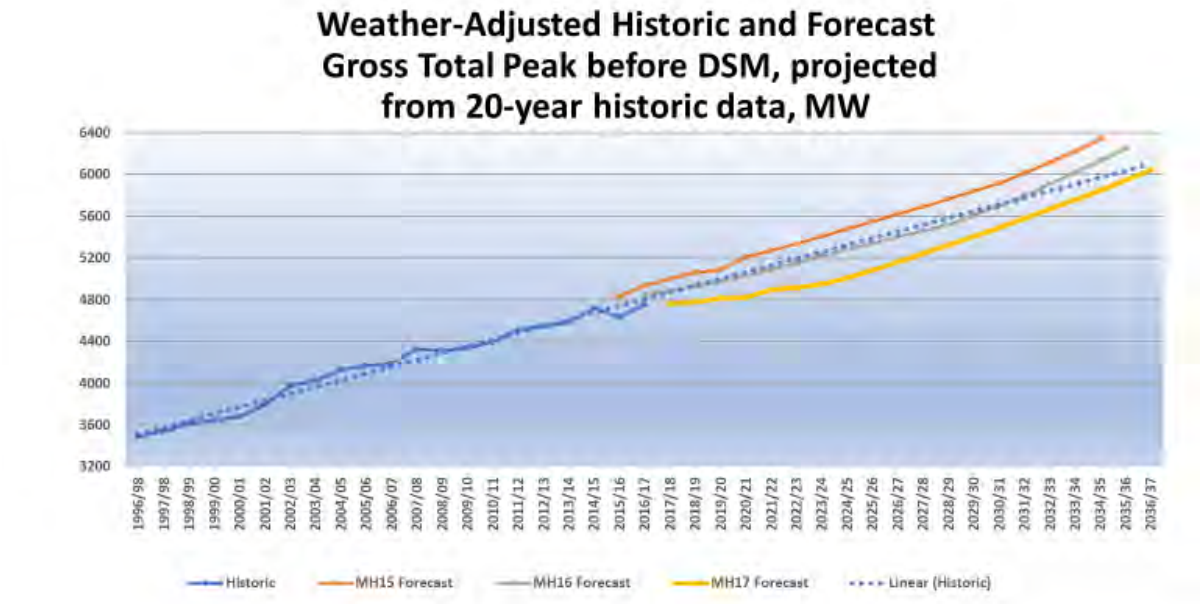

Figure 2: Weather-adjusted historic and forecast Gross Total Peak before DSM, projected from 20-year historic data.

The dotted line identified in both Figure 1 and Figure 2 as “Linear (Historic)” is the result of linear regression analyses of 20 years of data for Gross Firm Energy and Gross Total Peak, respectively.

The linear regression lines are extended forward to allow comparison of forecasts in 2015, 2016 and 2017 with past historic trends.

Some observations are possible from these graphs.

- Manitoba Hydro's recent forecasts for Gross Firm Energy and Gross Total Peak (2015 to 2017) are a reasonable reflection of the past, as long as 20 years of history is considered.

- Manitoba Hydro's forecasts of both Gross Firm Energy and Gross Total Peak have been decreasing in recent years.

- Generally, values forecast for both Gross Firm Energy and Gross Total Peak for several future years of its 2015 forecast are now not expected to be reached until two to seven years later.

- If the historic trends are examined more closely, growth for both Gross Firm Energy and Gross Total Peak does not appear to have been uniform over the 20-year historic period. For both energy and peak power but particularly for Gross Firm Energy, growth appears to have slowed down in the second half of this 20-year period compared to the first half.

Because recent trends are more likely to be a reasonable basis for forecasting than trends that are up to 20 years old, comparison of recent forecasts of electric load with more recent historic trends is strongly suggested.

Recent Electric Load Forecasts Compared to 10-year Historic Data:

Figures 3 and 4 present 10 years of recent historic weather-adjusted data for Gross Firm Energy and Gross Total Peak. Respectively, they also present (at-generation) values of Gross Firm Energy and Gross Total Peak forecast by Manitoba Hydro for 2015, 2016 and 2017. These are the same forecasts as those already presented in Figures 1 and 2 and all data supporting them are from Manitoba Hydro data appearing in Tables 1 and 2 at the end of this presentation.

The dotted line in Figures 3 and 4 is different from the dotted line in Figures 1 and 2 although both lines are identified as "Linear Historic". In Figures 1 and 2, the dotted line derives from a linear regression analysis of 20 years of historic data for Gross Firm Energy and Gross Total Peak, respectively. The linear regression line is extended forward to allow for comparison of forecasts in 2015, 2016 and 2017 with past historic trends. In Figures 3 and 4, the dotted line derives from a linear regression analysis of only the 10 most recent historic years for Gross Firm Energy and Gross Total Peak. It is notable that 10 years matches closely with the timeline since the 2008 recession. That match may not be the entire reason for the deflection in the electric load curve 10 years ago. But the recession could be a factor.

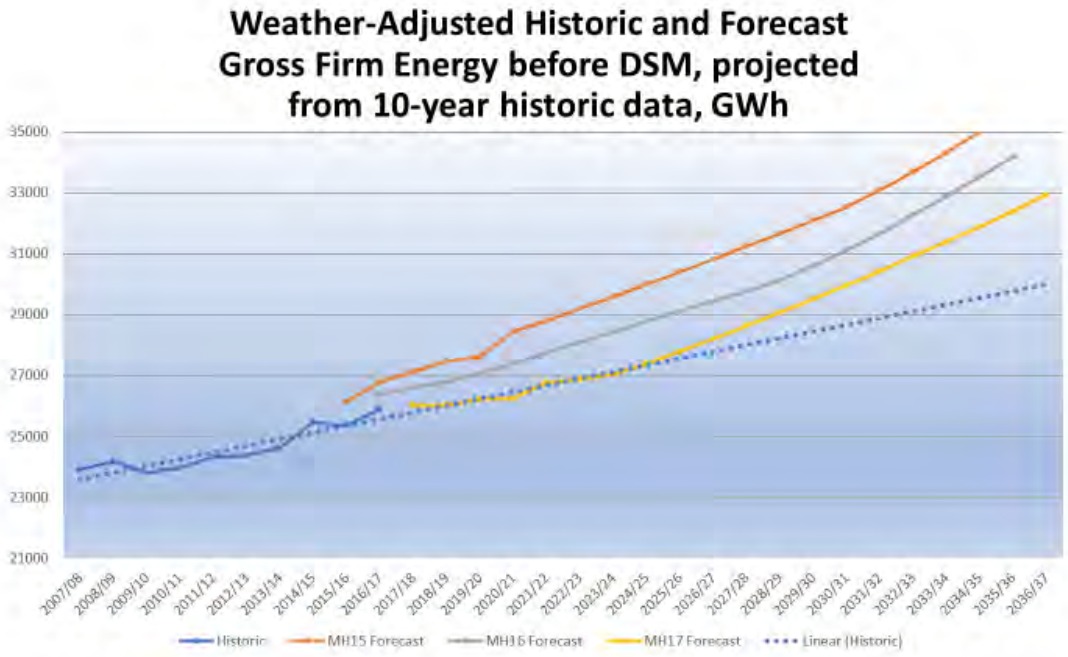

Figure 3: Weather-adjusted historic and forecast Gross Firm Energy before DSM, projected from 10-year historic data.

The slope of the dotted line in Figure 3 is 220.7 GWh per year (0.86% of the 25,583 GWh regressed value of Gross Firm Energy in 2016/17). The slope of the dotted line in Figure 4 is 52.1 MW per year (1.10% of the 4,746 MW regressed value of Gross Total Peak in 2016/17).

It is readily apparent from Figure 3 that, although recent forecasts of Gross Firm Energy before DSM have been adjusted downward in recent years, the current forecast (yellow line) reflects recent trends for only the next seven or eight years. Beyond then, Manitoba Hydro's forecasts for energy begin to depart significantly from a projection of recent trends. For example, Manitoba Hydro is currently forecasting energy levels for 2030 that recent trends would suggest are not likely to be reached until five years later. Manitoba Hydro forecasts a 20-year average annual growth rate of 1.2%, a figure that is inclusive of a growth rate in the first 10 years declared by Manitoba Hydro to be 0.9%.[7] But that masks an average annual growth rate of almost 1.7% in the final 10 years,

Whether or not this departure has a significant effect on domestic revenue will be examined later.

[7] MH17 Forecast values of Gross Firm Energy from Manitoba Hydro 2017/18 and 2018/19 General Rate Application Tab 11: Public Utilities Board (PUB) Minimum Filing Requirements, PUB MFR 65 (Updated) (2017 Electric Load Forecast), Table 1, page 404, page 417, and Table 6, page 418/1382, updated in PUB-MH I-56a-c Revised) filed by Manitoba Hydro as Exhibit MH70 on 7 December 2017.

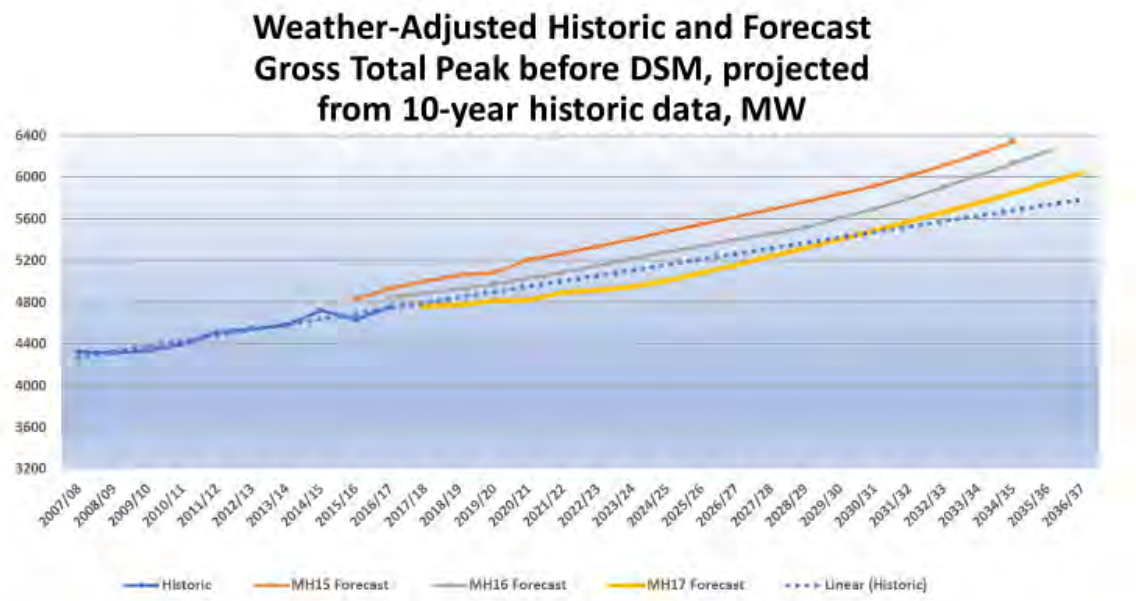

Figure 4: Weather-adjusted historic and forecast Gross Total Peak before DSM, projected from 10-year historic data.

Figure 4 reveals that Manitoba Hydro's current forecast of peak power (yellow line) more closely reflects recent trends than its forecast of energy does. However, Manitoba Hydro's peak power forecast does begin about 15 years out to depart from what past trends would indicate is likely.

Current Electric Load Forecast Net of Demand Side Management:

DSM has the potential to affect operating budgets. It can also delay when the next resource, possibly generation, is required, sometimes referenced as the year of need. Currently, responsibility for DSM is fluid in that The Efficiency Manitoba Act passed in the Legislature and given Royal Assent in 2017 has transferred responsibility for DSM to a new crown corporation called Efficiency Manitoba. At the present time, the appointment of a board for Efficiency Manitoba has not been announced and no programming appears to have been launched. In the circumstance, Manitoba Hydro has forecast DSM as part of its business plan, acknowledging, however, that responsibility for DSM will change as Efficiency Manitoba becomes operative.

It should be noted in this analysis that the Bipole III Coalition accepts Manitoba Hydro's logic that only program-based DSM should be applied to load forecasts. Further, Manitoba Hydro's rationale is accepted that, if DSM savings attributable to codes and standards are included in records of DSM, those savings should be first subtracted before applying the DSM values to load forecast. Finally, the Coalition also accepts Manitoba Hydro's logic that historic DSM savings should be considered to have a continuing effect going forward but that future DSM savings should be considered as reducing load that has to be served.

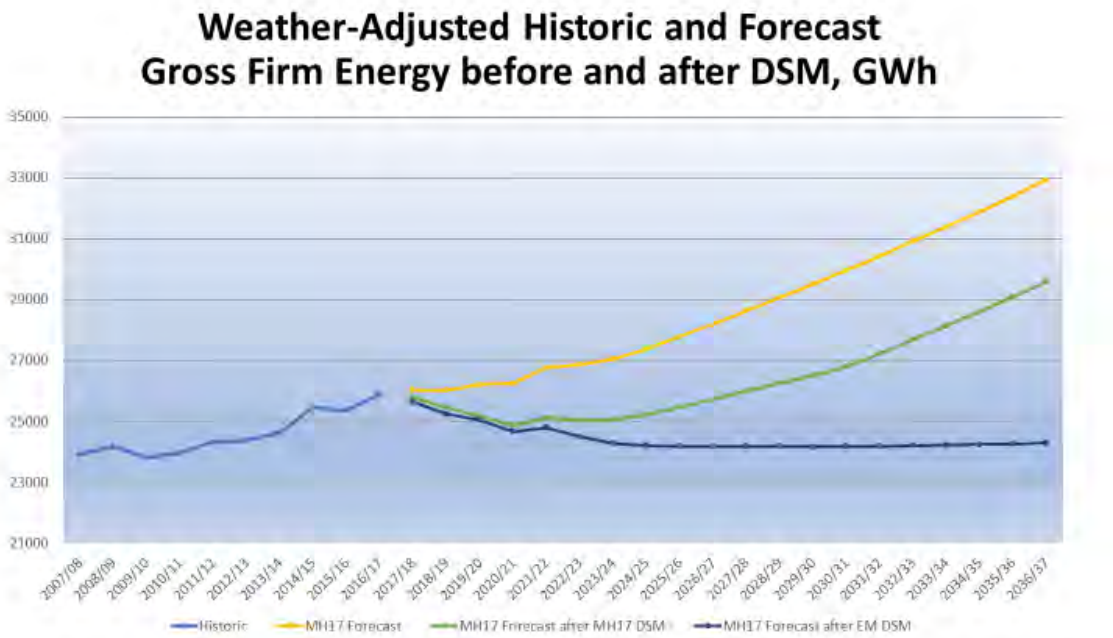

Figure 5: Weather-adjusted historic and forecast Gross Firm Energy before and after DSM.

Figure 5 presents the most recent historic 10 years of weather-adjusted data for Gross Firm Energy (blue line) and Manitoba Hydro's current 20-year forecast for Gross Firm Energy (yellow line). It also presents Manitoba Hydro's current 20-year forecast for Gross Firm Energy net of Manitoba Hydro's DSM forecast (green line).

The Efficiency Manitoba Act mandates 15-year targets for energy totaling 22.5%, to be achieved in yearly increments of 1.5%. Figure 5 also presents a forecast of Gross Firm Energy net of Efficiency Manitoba's 1.5% per year mandated target for DSM extended 20 years forward (navy line).

It needs to be emphasized here that the starting point in this analysis for determining Gross Firm Energy net of DSM is Manitoba Hydro's current forecast for Gross Firm Energy. As such, this analysis of the energy load that has to be served is independent of the Bipole III Coalition's perspective on Manitoba Hydro's energy load forecast.

It is evident from Figure 5 that DSM has the potential to create a significant impact on Gross Firm Energy. Moreover, Figure 5 reveals how much more aggressive Efficiency Manitoba's mandated targets for DSM are compared to Manitoba Hydro's. Both plans depress Gross Firm Energy below its current value in the intermediate term (for the next 10 years). Efficiency Manitoba's mandated targets force Gross Firm Energy well below its current value in the longer term (even beyond 20 years).

Whether or not the differential impact of Manitoba Hydro's DSM plan and Efficiency Manitoba's has a significant effect on domestic revenue will be examined later.

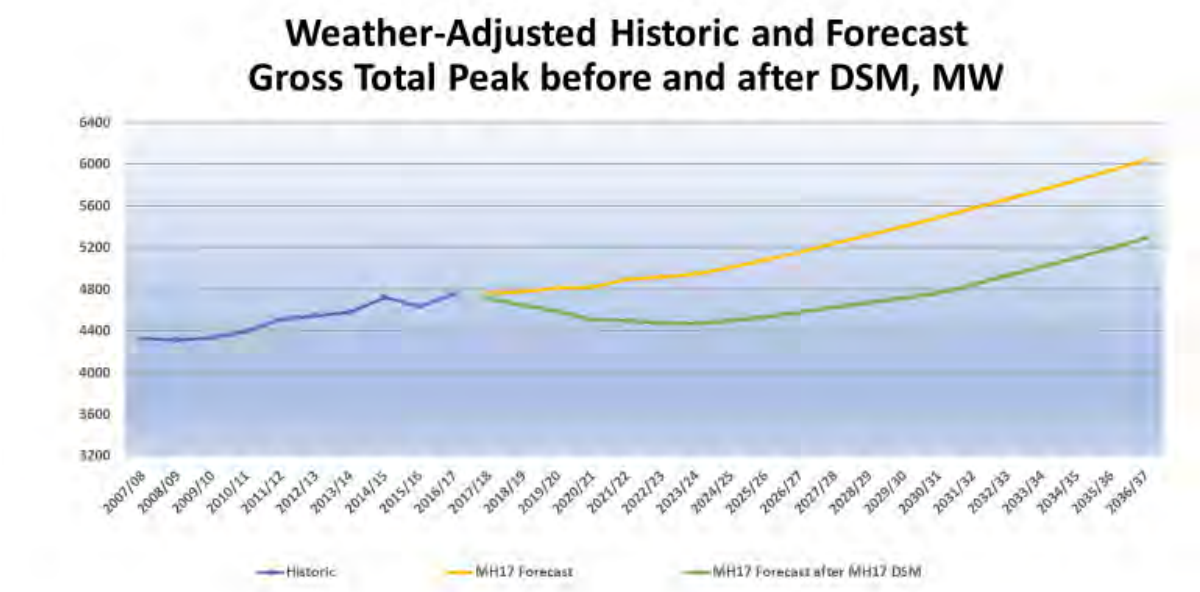

Figure 6: Weather-adjusted historic and forecast Gross Total Peak before and after DSM.

Figure 6 presents the most recent historic 10 years of weather-adjusted data for Gross Total Peak (blue line) and Manitoba Hydro's current 20-year forecast for Gross Total Peak (yellow line). It also presents Manitoba Hydro's current 20-year forecast for Gross Total Peak net of Manitoba Hydro's DSM forecast (green line). The Efficiency Manitoba Act is silent on targets for peak power, so it is not possible to present Gross Total Peak net of DSM as envisioned by Efficiency Manitoba.

It is evident from Figure 6 that DSM has the potential to create a significant impact on Gross Total Peak. Even with Manitoba Hydro's comparatively non-aggressive DSM forecast, Gross Total Peak can be expected to be depressed below its current value for the next 14 years. It is unclear what the impact of Efficiency Manitoba's mandated targets for energy will be on Gross Total Peak but it is highly probable that, as with Gross Firm Energy, they will drive Gross Total Peak below its current value even further into the future than the next 14 years.

Load Variability and Forecast Accuracy:

Turning our attention to the accuracy of load forecasts, Figure 7 extracts graphical and digital data used to support Manitoba Hydro's analysis of the accuracy of its forecasts of Gross Firm Energy[8].

[8] Forecast accuracy for Gross Firm Load from Manitoba Hydro 2017/18 and 2018/19 General Rate Application Tab 11: Public Utilities Board (PUB) Minimum Filing Requirements, PUB MFR 65 (Updated) (2017 Electric Load Forecast), Figure 22 and Table 35, page 457/1382.

Figure 22 - Energy Accuracy

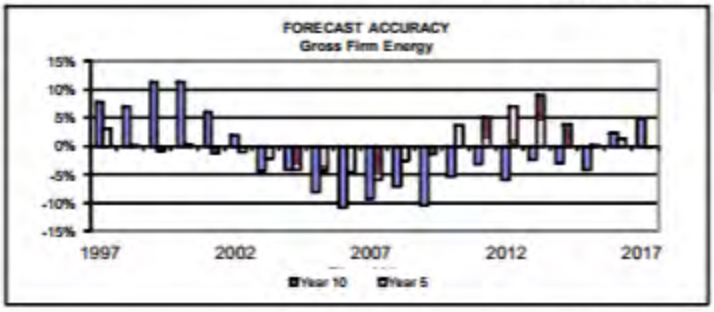

Table 35 - Energy Accuracy

Fiscal Year	Actual Gross Firm Energy	Forecast Prepared 5 Years Previous	W.A. Gross Firm Energy	5 Year Percent Accuracy	Forecast Prepared 10 Years Previous	W.A. Gross Firm Energy	10 Year Percent Accuracy
1996/97	19,321	19,395	18,810	3.1%	20,174	18,716	7.8%

Figure 7: Graphical and digital support extracted from Manitoba Hydro's analysis of the accuracy of its energy forecasts (Source: Manitoba Hydro).

At the outset of any discussion on load variability and forecast accuracy, it is important to recognize that Manitoba Hydro acknowledges that load variability is a significant challenge to forecast accuracy. It cites "underlying changes in the population growth, economic growth, changes in the operations of Top Consumers, and overall use patterns" as important contributors to load variability.[9] All sources of variability considered, Manitoba Hydro's current load forecast is considered to have only "an 80% probability of being accurate within ±1,737 GWh or ±5.1%" by 2035/36. Manitoba Hydro declares that "Due to the inherent variability of the load, this is the best level of accuracy possible".[10]

[9] Manitoba Hydro 2017/18 and 2018/19 General Rate Application Tab 11: Public Utilities Board (PUB) Minimum Filing Requirements, PUB MFR 65 (Updated) (2017 Electric Load Forecast), page 453/1382.

[10] Discussion of load forecast accuracy in Manitoba Hydro 2017/18 and 2018/19 General Rate Application Tab 11: Public Utilities Board (PUB) Minimum Filing Requirements, PUB MFR 65 (Updated) (2017 Electric Load Forecast), page 453/1382.

It is a conundrum for Manitoba Hydro that it recognizes the shortcomings and of its load forecasts, yet load forecasts are necessary for financial and resource planning. To illustrate, the confidence interval of ±1,737 GWh that Manitoba Hydro places on its forecast for Gross Firm Energy represents almost eight years of growth at the 220.7 GWh annual growth rate in recent years. not the sign of a very accurate forecast.

A problem with the approach that Manitoba Hydro uses to generate its load forecasts is that the sectoral forecasts employ subjective assessments of variables that are regarded as driving the forecasts. Some of these variables, such as population forecasts and forecasts of per capita consumption, while subjective in nature, can be mathematically linked to some of the sectoral forecasts, for example, the residential and general service mass market sectors. Most though do not benefit from an algorithm tying them to the load. They can be said only to "inform" what in the end is a subjective guess at a forecast value. The rhetoric that Manitoba Hydro to describe the methodology on which its load forecasts are based bears testimony to this observation and to the limitation on the confidence that should be placed in these forecasts.[11,12]

Another problem with the approach that Manitoba Hydro uses to assess the accuracy if its load forecasts is that the analysis does not evaluate the accuracy of current forecasts as would be desirable. Instead, its five-years-ahead forecasts are at least five-years old and the ten-years-ahead forecast are at least 10 years old when their accuracy is judged. Most five-years-ahead and ten-years-ahead forecasts are even older.

Moreover, there is absolutely no evaluation of the accuracy of load forecasts further than 10 years out. It is understandable that, given the vagaries of electric load forecasting, no attempt is made to evaluate the accuracy of forecasts further into the future. At the same time, it should be noted that an outcome of this constraint is that, without any analysis of accuracy in the longer term, long-term forecasts are "immune" from accountability for being inaccurate, on either the high side or the low.

Examining nearer-term forecasts, the most recent five-years-ahead forecast evaluated in this General Rate Application was produced in 2012. All other five-years-ahead forecasts were produced even earlier than 2012. Likewise, the most recent 10-years-ahead forecast evaluated in this Application was produced in 2007. All others are even older. When it comes to forecasting accuracy, the performance of forecasts five and 10 years ago is gauged but present performance gets a pass. For example, there is not even a review of the accuracy of last year's load forecast.

These serious deterrents to accurate forecasting notwithstanding, let's examine Figure 7 to judge how well Manitoba Hydro's electric load forecasts have been performing. An assessment of Gross Firm Energy forecast accuracy in Figure 7 reveals that the accuracy of Manitoba Hydro's five-

---

[11] MH17 Forecast values of Gross Firm Energy from Manitoba Hydro 2017/18 and 2018/19 General Rate Application Tab 11: Public Utilities Board (PUB) Minimum Filing Requirements, PUB MFR 65 (Updated) (2017 Electric Load Forecast), pages 426 to 429/1382, updated in PUB-MH I-56a-c Revised) filed by Manitoba Hydro as Exhibit MH70 on 7 December 2017.

[12] Manitoba Public Utilities Board Transcript of Proceedings, Manitoba Hydro 2017/18 and 2018/19 General Rate Application, pages 24 to 26/255.

years-ahead forecasts ranged from -5.9% to +9.0% for the 21 years for which the analyses could be performed. That is a pretty wide range. Between 2005 and 2012, the forecasts ranged from 0.1% low to 9.0% high. It is not surprising to the Bipole III Coalition which warned the Public Utilities Board[13] of the trend toward over-forecasting back in 2014. It also validates the calculations in Table 3 to be considered momentarily in this presentation.

Apart from the inaccurate picture of domestic revenue produced by a forecast that is, for example, 9.0% high, perhaps an even more serious result is the distortion it causes for resource planning. If the recent average annual growth rate for Gross Firm Energy of 0.86% is a valid indicator of future growth, a forecast that is 9.0% high signals a need for new resources more than 10 years earlier than they are actually needed.

Seven out of the eight five-years-ahead forecasts during the period between 2005 and 2012 were high. This is unfortunate because that period coincided with the period when Manitoba Hydro's expansion plan was most actively being developed. Over-optimism about the domestic consumption of electricity during those years is no doubt one factor among many for Manitoba Hydro's current financial predicament.

Turning to the ten-years-ahead forecasts, the accuracy ranged from -10.9% to +12.5% over the 21 years analyzed. Except for 2006 and 2007, forecasts of Gross Firm Energy have essentially been low every year since 1992. Of course, no measures of accuracy for 10-years-ahead forecasts since 2007 are available because those more recent forecast have not "matured" to a point when they can be judged. But, if 2006 and 2007 are any indication, it is looking like 10-years-ahead forecasts may have also been heading into a period of over-forecasting starting in 2006. This too would have unjustifiably fed the enthusiasm for system expansion in those critical years.

As mentioned earlier, Table 1 at the end of this presentation presents a comparison of Manitoba Hydro's current forecast of Gross Firm Energy with values that would be predicted by a straight-line extrapolation of recent historical values of the variable. The year-by-year differential between these two future values of Gross Firm Energy is calculated in the fourth column in Table 3.

It is notable that the +2,623 GWh result (32,398 GWh minus 29,775 GWh) for the differential in 2035/36 between Gross Firm Energy as would be suggested by a straight-line extrapolation of this variable and Manitoba Hydro's 2027 forecast is well outside Manitoba Hydro's 80% probability envelope of ±1,737 GWh for 2035/36. With an annual growth rate of 220.7 GWh, a differential of +2,623 GWh represents 12 years of growth. This finding challenges further Manitoba Hydro's claim that an 80% window is sufficient to gauge the accuracy of its electric load forecasts.

It is clear that the range of load variability considered by Manitoba Hydro in its analyses is not nearly wide enough. It is also significant that, in Table 3, 16 of the 20 values of the differential in the later years bear a + sign, indicating that Manitoba Hydro's forecasts tend to overpredict

[13] Presentation by the Bipole III Coalition to the Needs For and Alternatives To (NFAT) review of Manitoba Hydro's Preferred Expansion Plan by the Public Utilities Board submitted on February 3, 2014 and accessible at http://www.pubmanitoba.ca/v1/nfat/pdf/bipole_3_nfat_presentation.pdf.

regularly. With the scaling back of the 2017 load forecast significantly below the load forecasts for 2015 and 2016, it is likely that those earlier forecasts overpredicted on an even greater scale.

As noted previously, Manitoba Hydro's forecasts for electric load have been well above forecasts published by other utilities in North America for several years. Daymark Energy Advisors (formerly La Capra Associates), in a report currently before the PUB[14], identified several issues that distort Manitoba Hydro's current load forecast.

Among them are: exclusion of three Potentially Large Industrial Loads from the top consumers sector, "multi-collinearity issues", use of trend and dummy variables in the average usage models for both residential and general service mass market sectors, suppression of price elasticity effects in the top consumers sector, use of third party population forecasts that are too low, failure to use "scenario analysis" to permit insights into the impact of future alternative scenarios, absence of consideration of the impact of fuel switching and differing treatment in consecutive forecasts of DSM attributable to codes and standards.

Given the significant number of issues identified by Daymark, it is not surprising that Manitoba Hydro's approach to load forecasting would produce a result that is different than the one presented here which extrapolates from recent past experience.

Impact of Load Forecast on Domestic Revenue:

The question arises as to how important the impact of load forecasting is on future domestic revenue. Beyond presenting energy differentials resulting from differing future values of Gross Firm Load, Table 3 presents the opportunity for an analysis that puts a dollar value on the over-forecast energy. The area in Figure 3 between Manitoba Hydro's current forecast of Gross Firm Energy (yellow line) and an extrapolation of recent historic weather-adjusted values into the future (dotted line) is a proxy of the relative magnitude of the impact.

Manitoba Hydro has models that allow it to perform such an analysis easily. Because those models were not available to the Bipole III Coalition, we devised a methodology that evaluated, year-by-year, the at-meter values of energy (consumer sales). This would be the fundamental methodology that would allow the impacts to be cumulated over time.

First though, at-meter values of the energy differential were calculated by applying a factor of 0.86 to Manitoba Hydro's MH17 forecast values for Gross Firm Energy. This was necessary because Manitoba Hydro does not sell energy at generation.

[14] Daymark Energy Advisors, Independent Consultant Report: Load Forecast Review, November 15, 2017, PUB Exhibit DEA-2.

This calculation allowed the exclusion of transmission and distribution line losses, station service, construction usage and other-non-revenue-producing consumption, estimated to average 14%, in estimating approximate at-meter values of the energy differential.[15]

Next, we calculated annual unit values of energy at the meter, averaged over all sectors, relying on values for forecast consumer sales revenue available from the Projected Operating Statement in the 20-year Outlook for Manitoba Hydro's Electric Operations.[16]

The average annual unit values of the energy differential ($M/GWh) were the applied to the year-by-year values of the energy differential (GWh) to produce annual dollar values of the energy differential ($M) over the 20-year future period for which data were available. The result is presented in the last column of Table 3 identified as Revenue Differential (due to differing load forecasts).

Mathematically, the arithmetic sum $R_{\Delta LOAD}$ of the Revenue Differential over the 20-year future period (attributable to the departure of Manitoba Hydro's current load forecast from what would be suggested by recent history) is given by the equation.

$$R_{\Delta LOAD} = \sum_{n=2018}^{n=2037} (0.86\ \Delta E_n\ P_n) \qquad \text{(Eq. 1)}$$

where

0.86 is a factor reflecting the difference between Gross Firm Energy and Total Consumer Sales introduced to reflect system losses and usage that does not produce revenue,

ΔE_n is the Gross Firm Energy differential, in a given year, between Manitoba Hydro's current forecast and an extrapolation of recent 10-year historic values, in this presentation called Linear (Historic),

P_n is the unit price at the meter, in a given year, of energy, and

n is the year (identified in terms of the year end).

Table 3 shows that, over a period of 20 years, the arithmetic sum of the Revenue Differential $R_{\Delta LOAD}$ resulting from a forecast of Gross Firm Energy which exceeds a straight-line extrapolation of recent history is $2.329 million. Moreover, it demonstrates that, the annual revenue differential is much larger toward the end of the 20-year period and that it is growing each year. This analysis

[15] MH17 Forecast values of Gross Firm Energy from Manitoba Hydro 2017/18 and 2018/19 General Rate Application Tab 11: Public Utilities Board (PUB) Minimum Filing Requirements, PUB MFR 65 (Updated) (2017 Electric Load Forecast), page 427/1382, updated in PUB-MH I-56a-c Revised) filed by Manitoba Hydro as Exhibit MH70 on 7 December 2017.

[16] Domestic revenue from Manitoba Hydro 2017/18 and 2018/19 General Rate Application Appendix 3.3 Electric Operations (MH16 20-Year Outlook) Projected Operating Statement, pages 1 and 2/6.

indicates that **over-forecasting of load could result in over-predicting domestic revenue by more than $2.3 billion over a 20-year period**.

It should be acknowledged that the value of the energy not consumed domestically will not be entirely lost because the energy will be available for sale on the export energy market. But, at current prices, the offset will be only about one third of the foregone value.

It is important also to recognize that the foregone revenue will actually have a greater impact on retained earnings in 2036/37 than the simple arithmetic sum produced by this analysis indicates. To calculate the actual impact of over-forecasting electric load on retained earnings in 2036/37, a future value analysis should be conducted that brings all annual values for revenue differential forward to 2036/37.

Another (undesirable) impact of an overstated load forecast (beside its effect on the balance sheet) is that it advances unrealistically the year of need for the next energy resource. To illustrate, a close inspection of Figure 3 reveals that some values of Gross Firm Energy currently forecast by Manitoba Hydro would be reached up to six years earlier than would be predicted by a linear extrapolation of weather-adjusted Gross Firm Energy. Clearly, an over-stated load forecast has negative consequences for system resource planning.

The range of load considered by Manitoba Hydro in the load variability and accuracy analyses reported in this Application is insufficiently wide to circumscribe a linear extrapolation of recent historic experience.[17] This has been a pattern in the Bipole III Coalition's experience for some time, including its 2014 presentation to the NFAT review.[18]

Daymark Energy Advisors, in its report currently before the PUB[19] notes the narrowness of the range of load forecast contemplated by Manitoba Hydro. Daymark suggests an approach that would be more robust than Manitoba Hydro's methodology which relies on the P10 and P90 levels of base load. The more sophisticated approach suggested by Daymark would evaluate, with the help of probabilistic risk assessments, the inherent characteristics of each fundamental variable that contributes to base load. Manitoba Hydro should re-evaluate its approach to load forecasting.

---

[19] Daymark Energy Advisors, Independent Consultant Report: Load Forecast Review, November 15, 2017, PUB Exhibit DEA-2.

Impact of Demand Side Management on Domestic Revenue:

As with load forecast accuracy, the question arises as to how important the impact of DSM is on future domestic revenue. The area in Figure 5 between Manitoba Hydro's current forecast for Gross Firm Energy (yellow line) and Gross Firm Energy under its current DSM Plan (green line) invites a calculation that can evaluate that impact. Table 4 presents an analysis that evaluates the dollar value of domestic revenue foregone by Manitoba Hydro's current DSM Plan. But it also evaluates the dollar difference between Manitoba Hydro's current DSM Plan and Efficiency Manitoba's more aggressive DSM Plan. Neither analysis considers the delivery cost of these DSM Plans.

The methodology we devised for this analysis puts year-by-year values on projections of at-meter energy (consumer sales). The methodology shares some common approaches with the methodology we devised to evaluate the impact of load forecast differences on domestic revenue. It starts with Manitoba Hydro's current forecast of load so that any impact on domestic revenue will not reflect load forecast assumptions.

Mathematically, the arithmetic sum $R_{\Delta DSM}$ of the Revenue Differential over the 20-year future period attributable to the choice of DSM Plan is given by the equation

$$R_{\Delta DSM} = \sum_{n=2018}^{n=2037} (0.86\ \Delta E_n\ P_n) \qquad \text{(Eq. 2)}$$

where

0.86 is a factor reflecting the difference between Gross Firm Energy and Total Consumer Sales introduced to reflect system losses and usage that does not produce revenue,

ΔE_n is the Gross Firm Energy differential, in a given year, between Manitoba Hydro's current DSM Plan and Efficiency Manitoba's DSM Plan,

P_n is the unit price at the meter, in a given year, of energy, and

n is the year (identified in terms of the year end).

Table 4 reveals that, over a period of 20 years, the cumulative impact on domestic revenue of Manitoba Hydro's current DSM Plan can be expected to be in excess of $5.7 billion. It also reveals that, over a period of 20 years, the cumulative impact on domestic revenue of Efficiency Manitoba's more aggressive DSM Plan can be expected to be in excess of $10.8 billion. **The additional cumulative impact on domestic revenue of Efficiency Manitoba's Demand Side Management Plan above Manitoba Hydro's current DSM Plan is about $5.1 billion**. Coincidentally, this is about the value of the current cost estimate for Bipole III. This is much more serious than perhaps has been understood as the Government proceeded with passing the Efficiency Manitoba Act in the summer of 2017.

Like load forecast, a future value analysis of the choice of DSM Plan would show an even larger impact on retained earnings in 2036/37 than is indicated by an arithmetic approach. Also, like load forecast, the 'lost' revenue would be somewhat offset by revenue from additional sales on the energy export market. However, unlike load forecast, this analysis does not consider the additional cost of Efficiency Manitoba's more aggressive DSM Plan. If the Government passes the cost of Efficiency Manitoba's DSM Plan to Manitoba Hydro as is provided for in The Efficiency Manitoba Act, the additional delivery cost of that Plan will show up as a further negative impact on Manitoba Hydro's retained earnings. Table 4 demonstrates that most of that impact will occur in later years.

The transfer of responsibility for DSM from Manitoba Hydro to the Government is probably the least understood action this Government has taken. Its financial impact is on a par with the previous Government's routing decision for Bipole III, now roundly regarded as a serious mistake.

Outcomes:

For several years now, the linear extrapolation approach described in this presentation has consistently produced projected load that is in the same ballpark as load forecasts in other North American jurisdictions. Until the past few years, Manitoba Hydro's forecast has produced load forecasts that are an outlier among load forecasts in other relevant jurisdictions. Even today, Manitoba Hydro's load forecast is still well above what the majority is projecting.

Prior to 2015, Manitoba Hydro produced load forecasts with annual growth in the range 1.5% to 1.6%, well above recent historic trends.[20] Currently, Table 1 in this analysis demonstrates that Manitoba Hydro is forecasting 10-year growth for Gross Firm Energy at 0.81%, expressed by Manitoba Hydro as 0.9%. This is significantly down from earlier forecasts and from 1.46% in 2014[21]. Annual growth of 0.9% for the next 10 years is close to the 0.86% indicated by a linear extrapolation of recent historic values of weather-adjusted Gross Firm Energy presented here.

However, it is concerning that Manitoba Hydro's current forecast features a decided upturn in growth at the end of this 10-year forecast period. Manitoba Hydro's forecast for the second 10-year forecast period (2026/27 until 2036/37 in Table 1) reflects an annual growth rate of 1.7% during this 10-year period. Expressing growth rate over 20 years masks the highly optimistic forecast in the final 10 years of the forecast period. Manitoba Hydro justifies the upturn in terms of a return to 20-year historic growth patterns as a result of forecast population increases and a recovery from price elasticity impacts driven by seven years of 7.9% rate hikes currently under review.[22]

---

[20] Presentation by the Bipole III Coalition to the Needs For and Alternatives To (NFAT) review of Manitoba Hydro's Preferred Expansion Plan conducted by the Public Utilities Board submitted on February 3, 2014 and accessible at http://www.pubmanitoba.ca/v1/nfat/pdf/bipole_3_nfat_presentation.pdf.

[21] Daymark Energy Advisors, Independent Consultant Report: Load Forecast Review, November 15, 2017, PUB Exhibit DEA-2.

[22] Manitoba Public Utilities Board Transcript of Proceedings, Manitoba Hydro 2017/18 and 2018/19 General Rate Application, page 24/255.

It is significant how far out of line Manitoba Hydro's forecasts continue to be with relevant projections by reputable agencies. The U. S. Energy Information Administration, for example, is projecting annual growth rates out to 2040 for electricity use in the United States in the range from 0.6% to 1.0%.[23] This metric includes not only sales but also direct use. Comparing Manitoba Hydro's forecast of 1.2% annual growth in domestic energy consumption between now and 2036/37 reveals how overstated Manitoba Hydro's load forecast likely still is, even after scaling back since 2015.

The cumulative impact on domestic revenue of Manitoba Hydro's current DSM Plan, over the next 20 years, is $5.8 billion. Presumably, that impact and the cost of delivering that Plan is reflected in the current Integrated Financial Forecast. However, the additional impact on domestic revenue attributable to the Government's decision to establish legislatively mandated energy savings targets adds an additional $5.1 billion to that cost. In addition to absorbing the impact on domestic revenue, Manitoba Hydro will have to cover program delivery costs given that these costs are planned to be passed on from Efficiency Manitoba. These financial impacts are not reflected in the Integrated Financial Forecast. These impacts should be part of Manitoba Hydro's discussion with the Government to safeguard its financial health.

Consequences:

The combined cumulative impact on domestic income over the next 20 years attributable to load forecast choices and the more aggressive DSM Plan mandated by The Efficiency Manitoba Act is $7.4 billion ($2,3 billion plus $5.1 billion). Neither of these impacts are reflected in Manitoba Hydro's current Integrated Financial Forecast. Both are future impacts. Unless alternate funding sources are found, Manitoba Hydro will be requesting 7.9% rate increases even farther into the future than 2024.

Future Work:

Manitoba Hydro's focus for the past 18 months has been primarily on debt management. It does not appear to have devoted very much effort to increasing consumption of the glut of energy that it will own once Keeyask is in service. Electric energy export markets are uneconomical at current low export market prices, benefiting economies outside of Manitoba while not being useful to develop our own provincial economy. A concerted effort to advance electric transportation (cars, trucks and buses) and to promote a western Canadian transmission grid could change the prospects for both domestic revenue and extra-provincial revenue based on the potentially more profitable capacity and energy imbalance markets. Future work should reflect those opportunities.

The analysis in this presentation takes into account price elasticity only to the extent that the forecast values of Total Consumer Sales embedded in Manitoba Hydro's Integrated Financial

[23] U. S. Energy Information Administration Annual Energy Outlook 2017 with projections to 2050, Electricity Use growth projections (three-year rolling average) out to 2040, pages 67 to 88 but, in particular, page 75.

Forecast used in the analysis takes that factor into consideration.[24] A future analysis should assess whether price elasticity is adequately considered in Manitoba Hydro's electric load forecasting. Given that even short-term forecasts of load are currently at about the same level as recent historic trends when rate increases have been half or less of the 7.9% rate increases being requested for the next seven years, price elasticity impacts appear to be inadequately reflected.

Recommendations:

1. **The Public Utilities Board should direct Manitoba Hydro to revise its electric load forecast downward to more adequately reflect recent historic experience, price elasticity impacts and insights into factors driving load forecasts in other North American jurisdictions for consideration in its current General Rate Application.**

2. **The Public Utilities Board should direct Manitoba Hydro to conduct its own analysis of the impact on Manitoba Hydro's balance sheet of the Government's legislated plan for Demand Side Management of electric energy and to report its findings to the Public Utilities Board as part of its next General Rate Application.**

About the Bipole III Coalition:

The Bipole III Coalition is a grass-roots organization of concerned citizens established in November 2010 to promote public awareness among Manitobans that a route for Manitoba Hydro's planned Bipole III transmission line on the east side of Lake Winnipeg would be superior to the route chosen on the west side of the province. Soon after its establishment, the Bipole III Coalition broadened its mission in order to promote public awareness of its concern that Manitoba Hydro's corporate plan is not very well aligned with the interests of its ratepayers and not even with the interests of the citizens of Manitoba. It is concerned that Manitoba Hydro's corporate plan is not very well aligned with market challenges and opportunities. The Bipole III Coalition is not affiliated with any political party.

The presenter, Dr. Garland Laliberte, is Vice-President of the Bipole III Coalition.

[24] Manitoba Hydro 2017/18 and 2018/19 General Rate Application, transcript of proceedings for public hearing, pages 213-219 and 244-247 containing testimony on 7 December 2017 by Lois Morrison and Jamie McCallum of Manitoba Hydro confirming that, despite that the Chair of the Manitoba Hydroelectric Board had been publicly warning about the need for double-digit annual rate increases as early as 21 September 2016, the analysis of price elasticity impact on load forecasts included in filings on 5 May 2017 and in later summer updates, those forecasts contemplated a maximum annual rate increase of only 3.95% and not 7.9% as is presently being requested.

PUBLIC UTILITIES BOARD

WRITTEN FINAL ARGUMENT OF MANITOBA HYDRO

2017/18 & 2018/19 GENERAL RATE APPLICATION

February 5, 2018

Manitoba Hydro

Table of Contents

1. REQUESTED APPROVALS AND SUMMARY OF REASONS FOR THE RATE INCREASES 1

1.1 Background and Overview of Approvals Sought 1

1.1 Organization of the Final Argument 3

2 A 7.9% RATE INCREASE CANNOT BE WRONG 5

2.1 Manitoba Hydro Needs the Rate Increases Requested in this Application 5

2.1.1 Bipole III Reliability Project Entering Service 5

2.1.2 Current Rates Not Covering Current Costs and Cash Needs 7

2.1.3 Impact of Keeyask on future cost structure must be taken into consideration 12

2.1.4 Electricity Rates will continue to be Competitive 14

3 MANITOBA HYDRO'S NEW FINANCIAL PLAN 17

3.1 Taking Action on Unsustainable Debt Levels 17

3.1.1 Greater flexibility 18

3.1.2 Lessening interest rate risk 19

3.2 Interveners have a Lack of Comprehension with respect to Role and Ownership of Equity 24

3.3 Ratepayer Benefits 28

3.4 A 20-Year Financial Plan does not work 31

3.4.1 Prolonged and unmitigated exposure to interest rate increases 31

3.4.2 Cannot Forecast Breakeven or Negative Income 34

3.4.3 Prudent Financial Plans Do Not Depend on the Back-End of a Twenty Year Financial Forecast Proving Accurate 38

3.4.4 Capital markets are growing more concerned 40

3.4.5 Intergenerational Equity argument is flawed and hypocritical 41

3.5 Changing assumptions in the Financial Model in order to defer the need for rate increases is not prudent 43

3.5.1 Assumption of Capacity Values for Uncommitted Firm Energy. 43

3.5.2 Change regulatory accounting policy to increase income in the near term. 44

3.5.3 Assume 12 Year WATM. 44

3.5.4 Curtail DSM spending assumptions. 45

1. REQUESTED APPROVALS AND SUMMARY OF REASONS FOR THE RATE INCREASES

1.1 Background and Overview of Approvals Sought

In its 2017/18 & 2018/19 General Rate Application ("GRA"), Manitoba Hydro is seeking final approval of the 3.36% across-the-board rate increases implemented effective August 1, 2016 and August 1, 2017 (approved on an interim basis in Orders 59/16 and 80/17), as well as final approval of a 7.9% across-the-board rate increase effective April 1, 2018.

On November 18, 2015, Manitoba Hydro filed its 2016/17 Supplemental Filing seeking approval of an across-the-board rate increase of 3.95% effective April 1, 2016. The review of Manitoba Hydro's application resulted in Order 59/16, issued April 28, 2016, approving an across-the-board rate increase of 3.36% effective August 1, 2016.

On May 5, 2017, Manitoba Hydro filed its 2017/18 & 2018/19 GRA seeking approval of rate schedules reflecting an across-the-board rate increase of 7.9% applied to all components of the rates for all customer classes, effective in each of August 1, 2017 and April 1, 2018. As part of its GRA, Manitoba Hydro requested that the PUB approve the rate increase of 7.9% on an interim basis effective August 1, 2017. On July 31, 2017 the PUB issued Order 80/17 approving an across-the-board rate increase of 3.36% effective August 1, 2017.

In addition, Manitoba Hydro's GRA is seeking approval of the following:

- Final approval of the Light Emitting Diode ("LED") rates for the Area and Roadway Lighting class (Outdoor Lighting) approved on an interim basis in Order 79/14, and approval of new LED rates for the Area and Roadway Lighting class (Sentinel Lighting), and approval to remove the Area and Roadway Lighting (Festoon Lighting) and the Area & Roadway Lighting (Christmas Lighting) from Manitoba Hydro's rate schedule. Manitoba Hydro's evidence on this topic is contained in Tab 9 of the Application. PUB Counsel touched briefly on these topics, however, no intervenors have addressed the topic during the evidentiary portion of the proceeding;
- Endorsement of modifications to the Terms and Conditions of Option 1 of the Surplus Energy Program ("SEP") that were accepted on an interim basis in Order 43/13, as outlined in Tab 9 of the Application;

- Final approval of all SEP interim ex parte rate Orders as set forth in Tab 10 of this Application, as well as any additional SEP ex parte Orders as set out in Appendix 17.1 to Manitoba Hydro's Written Final Argument and issued subsequent to this filing and prior to the PUB's Order in this matter;
- Final approval of Curtailable Rate Program ("CRP") ex parte Order 54/16 as well as any additional ex parte Orders in respect of the CRP issued subsequent to this filing and prior to the PUB's Order in this matter;
- Endorsement of the proposed deferral and subsequent amortization of costs incurred with respect to the Conawapa Generating Station project, as discussed in Tab 3 of Manitoba Hydro's Application; and
- Endorsement of the proposed amortization period for disposition of the regulatory deferral accounts established to capture differences between overhead costs as well as gains and losses on disposition of assets calculated for financial reporting purposes based on International Financial Reporting Standards, and the amounts calculated for rate-setting purposes reflecting Order 73/15. Further details are outlined in Section 17.
- Endorsement of the proposed time frame for the recognition into revenue of the Bipole III deferral account established by Manitoba Hydro consistent with the direction provided by the PUB in Order 43/13. Further details are outlined in Section 17.
- Manitoba Hydro is not seeking final approval of the amortization period for the disposition of differences in depreciation methodology at this time. Manitoba Hydro is supportive of finding an alternate process where the requirements of the depreciation directives as set out in Order 43/13 can be discussed and resolution of this issue can be achieved. Further details are outlined in Section 17.

Manitoba Hydro notes that it is not seeking final approval of Orders 17/04, 46/04,/159/04, 176/04, 1/10, 134/10, 1/11, 148/11, 116/12 or 117/12 related to various interim Diesel Zone Orders. Manitoba Hydro's initial request set out in its Letter of Application filed on May 5, 2017 was made subject to confirmation that MKO has provided the parties to the Diesel Settlement Agreement with the required affidavits from representatives of signatories to the Agreement. Such confirmation has not been filed in this proceeding.

Manitoba Hydro accepts that it is difficult to impose a further rate increase to recover the shortfall in revenue arising from the difference between the requested 7.9% interim rate increase requested for August 1, 2017 and the interim rate increase of 3.36% approved by the PUB in Order 80/17 (Transcript page 805-806). As such, consistent with the evidence of both Kelvin Shepherd and Jamie McCallum, Manitoba Hydro is not seeking additional rate increases for fiscal 2017/18, recognizing the impact of the requested rate increase on consumers.

1.1 Organization of the Final Argument

Manitoba Hydro's Final Argument is organized as follows:

- Section 1 provides an overview of the approvals requested in the 2017/18 & 2018/19 GRA;
- Section 2 provides an overview of the facts supporting Manitoba Hydro's requested 7.9% rate increase;
- Section 3 provides an overview of Manitoba Hydro's financial plan, the role and ownership of equity and why a 20-year plan to address the Corporation's financial condition does not work;
- Section 4 outlines the reasons for the deterioration in Manitoba Hydro's financial outlook;
- Section 5 provides an overview of the significant increase in debt levels and exposure to interest rate risk, and the need for rate increases in order to meet financial targets;
- Section 6 provides an overview of Manitoba Hydro's financial targets and the role of reserves in managing Manitoba Hydro's risks;
- Section 7 outlines the limited value of long-term forecasts and the myth of "promised" 3.95% rate increases;
- Section 8 outlines the reasons for the decrease in projected revenues, including an overview of the load forecast, export revenues and price forecast, and interest rate outlook;
- Section 9 provides an overview of business operations capital, Manitoba Hydro's plans regarding asset management initiatives, and a response to recommendations for additional regulatory oversight;
- Section 10 outlines Manitoba Hydro's position with respect to various issues related to the Keeyask Generating Station, Bipole III, Manitoba-Minnesota Transmission Line, and the Great Northern Transmission Line;

- Section 11 outlines Manitoba Hydro's debt management strategy and the importance of cash flows generated through rate increases;
- Section 12 provides an overview of Manitoba Hydro's Operating & Maintenance cost reduction measures, and Manitoba Hydro's response to recommendations related to performance metrics;
- Section 13 provides Manitoba Hydro's position regarding the evidence on rate increases on the Manitoba Economy;
- Section 14 provides an overview of Manitoba Hydro's initiatives to address bill affordability;
- Section 15 provides Manitoba Hydro's response to Cost of Service and rate design issues raised during the proceedings;
- Section 16 outlines why Manitoba Hydro's requested rate increases do not constitute rate shock; and,
- Section 17 provides an overview of the approvals requested with regards to regulatory deferral accounts and the finalization of PUB Interim Orders.

2 A 7.9% RATE INCREASE CANNOT BE WRONG

2.1 Manitoba Hydro Needs the Rate Increases Requested in this Application

It is essential that the 7.9% rate increase that Manitoba Hydro has requested for April 1, 2018 be approved. There has been no evidence presented that contradicts the necessity of this increase. Regardless of conclusions on the appropriate capital targets and timing for achievement, on a cost recovery basis the present and immediate future circumstances of Manitoba Hydro give the PUB ample justification for an even greater increase to current rates than Manitoba Hydro is requesting for the 2018/19 fiscal year.

The requested April 1, 2018 rate increase is supported by the facts discussed in the following sections.

2.1.1 Bipole III Reliability Project Entering Service

The April 1, 2018 rate request of 7.9% is justified on the basis that it will not even address the entirety of the increase to Manitoba Hydro's revenue requirement due to the imminent in-service of Bipole III.

The Bipole III Reliability Project enters service in August 2018, which is less than six months following the conclusion of the hearing. Bipole III is an essential and necessary addition to Manitoba Hydro's system to ensure continued reliability. Bipole III adds effectively no revenue to the Manitoba Hydro system. No evidence has been presented disputing that the incremental carrying costs of this capital addition are properly added to revenue requirement to be borne by current ratepayers.

The incremental revenue requirement from Bipole III is substantial. PUB MFR 20 shows annual incremental revenue requirement (excluding amortization of the Bipole III reserve) of over $360 million per year. As shown in Manitoba Hydro's Written Rebuttal Evidence, page 31 (Exhibit MH-52), net of additional opportunity export revenues of $15 million from reduced line losses and depreciation of $20 million for the in-service Riel AC sectionalisation, the ongoing carrying costs of Bipole III are estimated to be approximately $332 million per year. Manitoba Hydro's domestic revenue in the nearly complete 2017/18 test year is estimated at $1,464 million net of rates allocated to the Bipole III reserve. On this basis, a 22.7% rate increase would be required to meet the incremental costs.

Current approved rates however include 11.1% of past increases which are being allocated to the Bipole III reserve account (inclusive of the August 1, 2017 3.36% interim increase as directed in Order 80/17). Therefore, upon in-service of Bipole III, Manitoba Hydro will begin to recognize in domestic revenue this portion of current rates. This incremental revenue will only offset approximately half of the incremental revenue requirement. An additional rate increase of approximately 10% is required in order to maintain cost recovery from current ratepayers. The requested 7.9% rate increase falls short of meeting this need.

In oral testimony (Transcript Page 6417, Lines 9-16), Mr. Bowman made the following statements:

> *"….we already have customers paying somewhere between 11 and 12 percent towards the Bipole project even though it's not in service. The first time I heard the idea, I wasn't favourable to it. I think in hindsight it was a very wise move by this Board and it's help phase that in and, as a result,* ***when Bipole comes into service there's very little more impact into rates that's isn't already built in****."* (Emphasis Added)

Mr. Bowman's erroneous assertion is based on his flawed analysis included in response to MH/MIPUG-6. Mr. Bowman includes in his analysis the benefit of amortization of the Bipole III reserve in determining the necessary rate increase over and above the 11.1% already embedded in today's rates. This is not appropriate. Manitoba Hydro corrected his analysis in on pages 30 to 31 of Exhibit MH-52 and it is reproduced below. The amortization of the Bipole III reserve reflects the accounting treatment of past rates paid already imbedded in the rate increases being deducted in determining incremental rate requirement. Mr. Bowman is effectively *"double counting"*. Moreover, the amortization is non-cash and unsustainable. It reflects a five year amortization of cash already received.

The Figure below (Figure 1.18 from Exhibit MH-52) compares Mr. Bowman's assertions to the corrected analysis which clearly supports at least a 7.9% rate increase solely in contemplation of the near immediate in-service of Bipole III.

Figure 2.1: Bipole III Rate Increases to Recover Revenue Requirement

2.1.2 Current Rates Not Covering Current Costs and Cash Needs

On a normalized basis, Manitoba Hydro has been experiencing effectively zero or negative net income for several years notwithstanding the growth of its asset base. This means that there has been no contribution to reserves from rates notwithstanding both Manitoba Hydro's governing legislation and the evidence of Morrison Park Advisors ("MPA") emphasizing the importance of rates including a contribution to reserves. Even excluding the essential need to make ongoing contributions to reserves, Manitoba Hydro has not been receiving sufficient rate revenue to meet its costs.

The following chart is taken from Manitoba Hydro's Policy Panel Presentation, Exhibit MH-64:

Figure 2.2 Adjusted Net Income/(Loss)

(In Millions of Dollars)	2014/15	2015/16	2016/17	2017/18

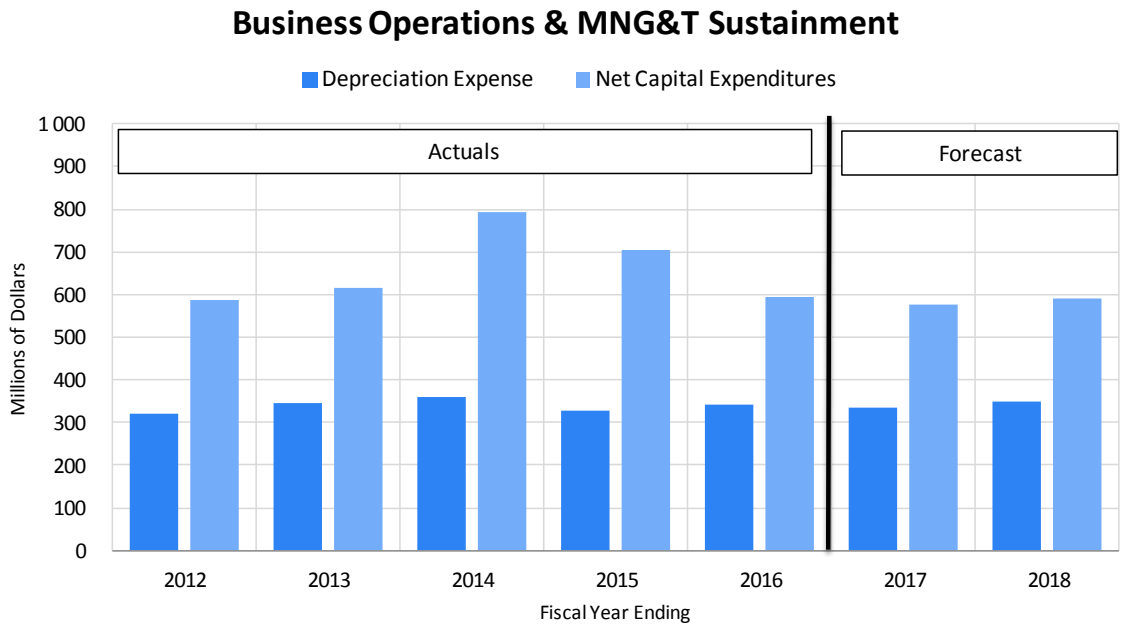
Source: Exhibit MH-64, Slide 44



As shown in Figure 2.2, excluding the impacts of non-sustainable contributions such as above average water flows, Manitoba Hydro is in a loss-making position at current rates.

Manitoba Hydro has additional ongoing (often perpetual) payment obligations each year on account of mitigation liabilities and the purchase of Winnipeg Hydro that are only minimally captured in revenue requirement through depreciation expense. Both MPA (MH/Coalition (MPA)-2(b)) and Mr. Bowman (at Transcript Page 6398) acknowledge these costs that must be included in the calculation of rates. As noted in Figure 1.10 on page 15 of Exhibit MH-52, these obligations totaled $42 million in 2015/16, $39 million in 2016/17 and are estimated at $75 million in 2017/18. Adding these costs to revenue requirement pushes the deficiency at current rates to between $84 million and $120 million over the last three years. On its own this would support a rate increase of approximately 6% to 7% simply to restore rates to where Manitoba Hydro is meeting its revenue requirement needs as determined by the income statement and ongoing liability payments associated with its current operations and without any contribution to reserves.

Manitoba Hydro submits that the PUB should not ignore the actual cash needs of Manitoba Hydro to continue its current operations. Some accounting in rates must be made for the fact that the actual replenishment costs of the system are significantly greater than what Manitoba Hydro current recognizes in revenue requirement through depreciation expense.

In order to meet its mandate to serve existing customers and extend service to new customers, Manitoba Hydro must continually reinvest in its system. Significant portions of Manitoba Hydro's current infrastructure were built decades ago. Manitoba Hydro has provided evidence at Tab 2 of the Application, pages 15 and 18 (reproduced below) that it has a material ongoing cash shortfall at present rates due in part to a substantial difference - over $250 million a year - between what it recovers in revenue requirement through annual depreciation charges and what it must expend annually to maintain, replace and enhance existing infrastructure in the normal course. The issue is that depreciation expense is determined based on the historical cost of assets when they were first installed. Manitoba Hydro's reality is that the cost of replacing these assets as they expire is an ongoing cash need that comes in the form of today's costs which, due to the age of its infrastructure and inflation in construction costs, bears almost no relationship to historical cost.

Figure 2.3

Source: Tab 2 of the Application, Page 15

Arguments opposing accommodating in rates the need to replenish the system are not valid. The suggestion that the cost of replacement equipment, while substantially more than the original cost of the assets being replaced, will be recovered in depreciation

over the life of the assets ignores cost and capital structure realities faced by the Corporation. Rate-making principles will be referenced in support of that argument. However, the principles cited are only sustainable in a rate of return based environment, not a cost recovery environment. A rate of return framework allows the utility to maintain adequate equity capitalization such that it does not need to increase only its debt simply to fund its operations. Manitoba Hydro has no such luxury. Without the support of rate revenue (i.e. net income and contribution to reserves), all investment in the ongoing core system in excess of depreciation expense must be debt funded which has, and will continue to, drive the debt of the Corporation ever higher at a rate significantly greater than its customer base or domestic load is growing. This is particularly acute in Manitoba Hydro's situation given the stagnant growth environment Manitoba Hydro finds itself in and the age of its asset fleet. Declining interest rates and above average water conditions have helped to obscure this issue but lack of rate support for reinvestment capital has become a critical matter for Manitoba Hydro's finances. In Manitoba Hydro's view, the PUB must consider the current costs of replacing the assets current ratepayers are depleting. A proper reading of the Bonbright principles finds no fault in doing so[1], particularly in the absence of a rate of return principle by which the Corporation can attract capital and remain financially sustainable (also a key Bonbright criterion[2]).

Bonbright discusses whether rate base should be set at historical cost less depreciation, or at some proxy for replacement value noting that this debate is the *"most widely disputed legal issue in the history of American public utility regulation."*[3] Bonbright does not take the position that replacement value based regulation is indefensible as suggested by Intervenors. To the contrary, Bonbright reviews the difficult question of determining value and the relative merits of different approaches, in different circumstances. Manitoba Hydro must wait to see how Intervenors address these various approaches and their application to Manitoba Hydro's unique corporate structure, in their final submissions in order to make informed comment. At this juncture, Manitoba Hydro would argue that all Bonbright requires is that the application of his various and sometimes competing principles be guided by the overarching public interest principle

[1] Principles of Public Utility Rates, James C. Bonbright, 1961, Chapters 11, 12 and 15.
[2] Principles of Public Utility Rates, James C. Bonbright, 1961, page 385.

[3] Principles of Public Utility Rates, James C. Bonbright, 1961, page 159.

(Bonbright's *"assumed goal of ratemaking"*[4]), and that the application of regulatory principles should never cause a utility to become financially unstable.

When the actual cash costs of replacing system assets are properly considered, a picture of substantial cash deficiency emerges as shown at page 15 of Exhibit MH-52, Figure 1.10, reproduced below:

**Represents Business Operations Capital Expenditures and MNG&T Capital Expenditures of a sustaining nature (excluding Bipole III costs).

Source: Exhibit MH-52, Page 52

The projections above are based on MH15 rates (i.e. 3.95% per year) for 2019 and beyond. However, the table clearly denotes that Manitoba Hydro has, in the last two years and the current year, been operating with a cash deficiency of between $153 million and $267 million. This alone would represent rate inadequacy of 10% to 18%. Adding the above noted costs for liability payments (mitigation, City of Winnipeg) brings the deficit range from $209 million to $296 million indicating rate insufficiency of approximately 14% to 20%. The results for 2015/16 and 2016/17 include the contributions from significantly above average water flow conditions. Likewise, the figures above for the 2017/18 and 2018/19 fiscal years assume high water flow conditions and have not been adjusted for Manitoba Hydro's updated outlook after a relatively dry summer. Manitoba Hydro has provided evidence (Exhibit MH-64, Slide 19)

[4] Principles of Public Utility Rates, James C. Bonbright, 1961, Chapter 2.

that above average water flow conditions contributed $62 million and $87 million in 2015/16 and 2016/17 respectively and, in the MH16 Update with Interim forecast, were anticipated to contribute $91 million in 2017/18. Cash flows should also be adjusted for non-recurring restructuring charges. Together, this pushes the cash deficit from operations, on a normalized basis, to between $271 million and $379 million representing rate inadequacy of between 17% and 25% (as summarized in Figure 2.5 below).

Figure 2.5 Rate Insufficiency

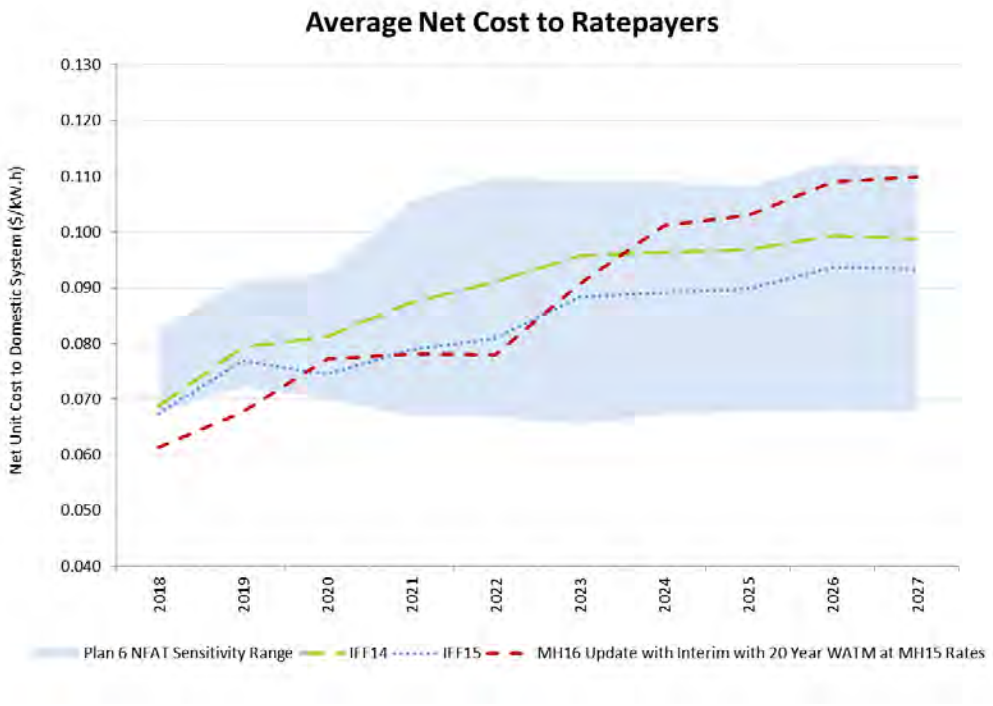
* Including contributions to Bipole III reserve

Therefore, by any measure the 7.9% rate increase requested for April 1, 2018 is justified by the need to address rate inadequacy today.

2.1.3 Impact of Keeyask on future cost structure must be taken into consideration



The Keeyask Generating Station is anticipated to provide first power in August of 2021 and be essentially fully in-service by the end of the 2022/23 fiscal year. Once this occurs, the incremental revenue, operating and carrying costs will impact Manitoba Hydro revenue requirement. Unfortunately, based on the current capital cost estimate and outlook for export prices, it is anticipated that the net impact to Manitoba Hydro's revenue requirement going forward will be negative and substantial. As identified in PUB MFR 20, the 2023/24 incremental costs of Keeyask will be $581 million which is anticipated to be more than double the incremental export revenue assuming normal

water conditions. The erosion of forecast load growth since NFAT has now pushed the date at which Keeyask is required to serve domestic load until at least the early 2030s. Given the outlook for export prices there results a significant cost for excess capacity which must be borne by ratepayers.

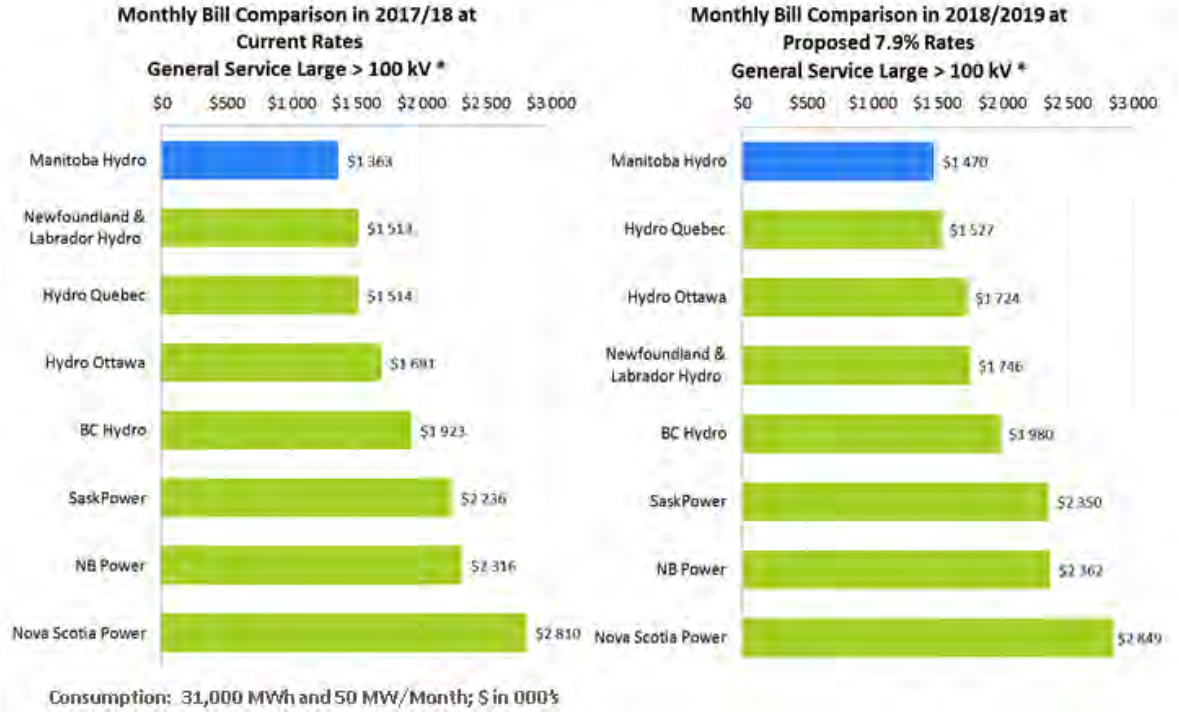
Manitoba Hydro asserts that the PUB, as it wisely did with Bipole III, must take a strong step now by approving the 7.9% rate request so as to begin incorporating into rates the pending impact of Keeyask. This is particularly so given the risk of further capital cost increases, the loss of an assumed major new load due to an energy sector project cancellation and further delayed recovery of export prices. Manitoba Hydro has provided testimony on these factors, none of which are reflected in MH16 Update with Interim.

The following chart from slide 70 of Exhibit MH-64 reflects net unit costs (costs net of export revenues) on a forecast basis:

Figure 2.6

Source: Exhibit MH-64, Slide 70

As can be seen above, unit costs are increasing sharply over the next six years driven by the in-service of the major capital projects. As demonstrated in Figure 1.1 of MH Exhibit 52 at page 2, net costs are estimated to increase 65% between 2017/18 ($0.061 per kWh of domestic load) and 2023/24 ($0.100 per kWh). It should be recognized that net unit costs do not include any contribution to reserves which might address capital renewal, debt retirement and rate stability. It is this net unit cost Manitoba Hydro must presumably, at a minimum, recover in rates. A 65% rate increase over six years is equivalent to 8.7% per year. On this basis, a first step of 7.9% as requested for April 1, 2018 is fully justified. It may even prove inadequate considering some of the potential risks to unit costs from the more up-to-date outlook for load growth and export prices and ongoing risks with Keeyask capital costs.



2.1.4 Electricity Rates will continue to be Competitive

Manitoba Hydro's domestic electricity rates are among the lowest in North America and support the competitiveness of Manitoba businesses. Manitobans will continue to enjoy a distinct advantage over most other Canadian jurisdictions with respect to the average monthly bills of residential and business customers. As shown in **Figure 2.7** (Exhibit MH-64, Slide 12) and **Figure 2.8** below (Exhibit MH-64, Slide 13), this advantage continued after implementation of the 3.36% effective August 1, 2017 and will continue with the proposed 7.9% rate increase effective April 1, 2018.

Figure 2.7

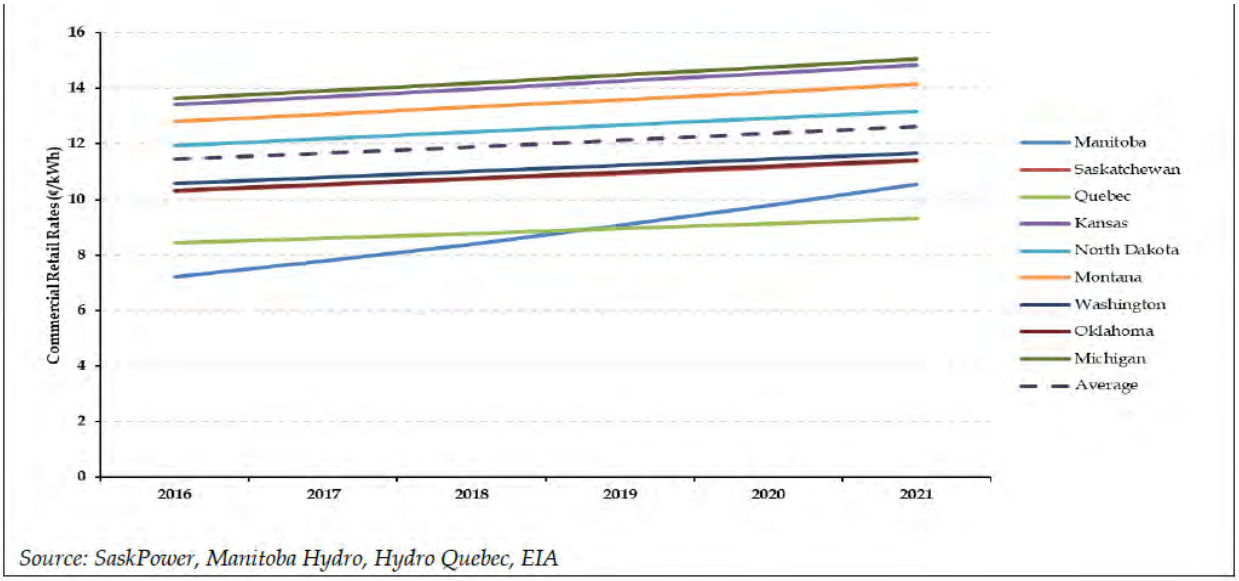


Figure 2.8

The reality of rate increases above inflation is not confined to Manitoba customers. As noted by Mr. Shepherd at Transcript Page 145, *"broadly speaking, electricity costs are going up at rates higher than inflation as utilities throughout North America grapple with changing demand patterns, higher regulatory costs, aging infrastructure, and for many, the transition from carbon generating sources to renewables."* While Manitoba Hydro is seeking rate increases in this proceeding that are above the rate of inflation, the evidence demonstrates that Manitoba customers will continue to be in a much better position in terms of electricity costs than customers in other jurisdictions, and that rates have considerable room to grow before Manitoba Hydro becomes even an average jurisdiction.

This is further demonstrated by the evidence provided by London Economic International ("LEI") in this proceeding. While LEI suggests in its evidence, filed on behalf of General Service Small and General Service Medium Customer Classes, Exhibit GSS-9, at page 16 that annual rate increases of 7.9% over five years will erode Manitoba Hydro's competitive margin on commercial rates compared to other jurisdictions, the same figure demonstrates that Manitoba Hydro will continue to be in the lowest quartile of commercial retail rates even after five years of indicative 7.9% rate increases.

3 MANITOBA HYDRO'S NEW FINANCIAL PLAN

3.1 Taking Action on Unsustainable Debt Levels

Manitoba Hydro's new financial plan is necessary to ensure the financial sustainability of the Corporation. In doing so it ensures that, in the intermediate and long-term, customers will benefit from more rate certainty, less rate volatility and overall lower rates. While short term adjustment is required, the broader Manitoba economy benefits from a higher level of long term cost certainty for existing and new businesses considering investment in addition to the certainty of lower rates in the long term relative to plans that see Manitoba Hydro carrying a larger debt burden and for longer.

Manitoba Hydro's plan represents an acceleration of rate increases but, overall, the ability to keep rates lower in the long run as seen in **Figure 3.1** below:

Figure 3.1 Even Annual Rate Increases of 4.14% To Reach 25% Equity Ratio By 2033/34

Source: Coalition/MH II-19,

Manitoba Hydro's plan is centered on taking action on the growth of debt to unsustainable levels. It does so by setting a rate plan which, when coupled with far more aggressive cost efficiency measures already implemented by Manitoba Hydro, enables the Corporation to generate positive net income and positive cash flow which can be used to modestly slow the accumulation of debt while Keeyask is completed and reduce debt once the project is in service. By taking more aggressive action now and over the next decade, the following is achieved:

3.1.1 Greater flexibility

MH16 Update with Interim is a financial plan based on numerable assumptions. It is a balanced best estimate of an unknowable future. The value of taking stronger rate action now is to provide greater flexibility to make different choices as the future unfolds.

The pattern of prior forecasts demonstrates a history of successive downward revisions to export price expectations and load growth forecasts. Likewise, expectations of capital costs have increased. The situation has not become more dire only by virtue of interest rates having declined in comparison to prior outlooks and the benefits of 14 years of higher than average water flows.

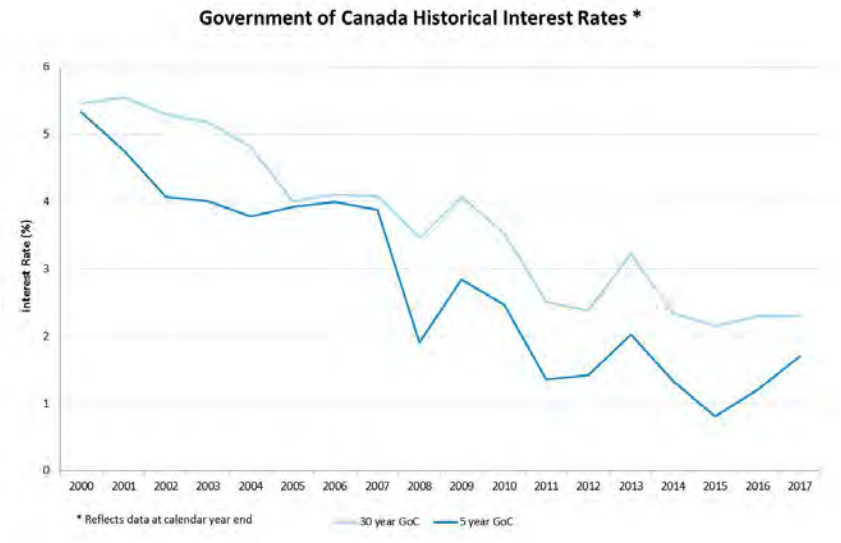
By implementing stronger rate action now, Manitoba Hydro is building its balance sheet to be more resilient in the face of uncertainty. As noted by Mr. Shepherd, Manitoba Hydro has more hydrology and export price risk than any other Crown-owned, hydro-based utility:

> *"No other major hydroelectric utility has the volatility in water conditions we face, nor does anyone else have such a small reservoir relative to their operations. Our exposure to mother nature in that respect is quite extreme. By just about any measure, we are heading towards having more debt than almost anyone else in our industry, and certainly more debt relative to the size of our business than potentially we have ever had"* (Transcript Page 196).

Mr. Shepherd further noted that while not exposed to fuel price volatility similar to a coal or natural gas utility, by financing itself in such an extreme manner, Manitoba Hydro is effectively replacing commodity price volatility with interest price volatility:

> *"We can't borrow at a fixed rate for the seventy (70) or a hundred years our generators are expected to last, so we are perpetually exposed to interest rate risk, all of which is borne by a relatively small customer base"* (Transcript Page 196)

The risks Manitoba Hydro needs net income and positive cash flow to address are not theoretical. Rising interest rates, softening export prices, slower load growth and low



water conditions have all been experienced before. A financial plan that does not include meaningful net income (relative to the scale of the assets and debt) offers no flexibility for the utility and its regulator to consider measured, patient responses to key planning assumptions being wrong.

3.1.2 Lessening interest rate risk

Annual interest payments will be, by a factor of two, the single largest burden on the Corporation by 2023/24. Even under the Manitoba Hydro plan, interest costs will consume $1.14 billion per year as shown in Appendix 3.8 of the Application. Current domestic rate revenues are $1.6 billion (including amounts allocated to the Bipole III reserve). Therefore without rate increases, interest will consume approximately 70% of each ratepayer dollar. With this level of interest expense relative to overall costs and revenues, Manitoba Hydro has no latitude to be wrong on interest rates.

As the **Figure 3.2** shows, interest rates have declined significantly since 2000:

Figure 3.2

Source: Exhibit MH-64, page 68

With interest rates at multi-generational lows already and practically speaking unable to go to 0%, it is clear that the risks of interest rate volatility are asymmetrical in nature. There is an extremely limited amount by which rates can go down further and an unlimited potential for increase. Exposing the Corporation, its customers and the

Province of Manitoba to this level of risk over 20 years is imprudent. History has shown – as does the chart above – that interest rates can often move 3 to 5% or more in a 10 or 15 year period. Almost all of Manitoba Hydro's debt is exposed to interest rate risk over the next 10 years (Manitoba Hydro's Written Rebuttal Evidence, Exhibit MH-52, Pages 11 to 14). An unforeseen interest rate increase of even 1% could cost Manitoba Hydro ratepayers an additional $200 million or more per year by the end of the next decade. A more focused approach to debt reduction helps mitigate part of this risk.

Address cash flow

While noting the apparent migration in views since NFAT (CAC/MPA I-002), Morrison Park Advisors ("MPA") asserts that cash flow is the principle concern of capital market participants in assessing Manitoba Hydro (in the context of their rating of the credit quality of the Province of Manitoba). As noted in MPA Evidence filed on behalf of the Consumer's Coalition, Exhibit CC-17, page 3, lines 35-37:

> *"It is apparent from reading various financial market reports that a primary focus is on the expected sufficiency of cash flows to satisfy debt obligations."*

Coalition/MH I-68f includes a cash flow from operations to CapEx table which updates Figure 2.16 from the Tab 2 of the Application for MH16 Update with Interim. That table only captures a portion of the cash flow deficiency in that payments on account of mitigation and City of Winnipeg liabilities are not captured. The following table in **Figure 3.3** augments Figure 2.16 (Updated) from Coalition/MH I-68f.

Figure 3.3

($ millions)

	MH16 Update with Interim

Cumulative Cash Flow Deficiency / Surplus	**(226)**	**(324)**	**(326)**	**(152)**	**235**

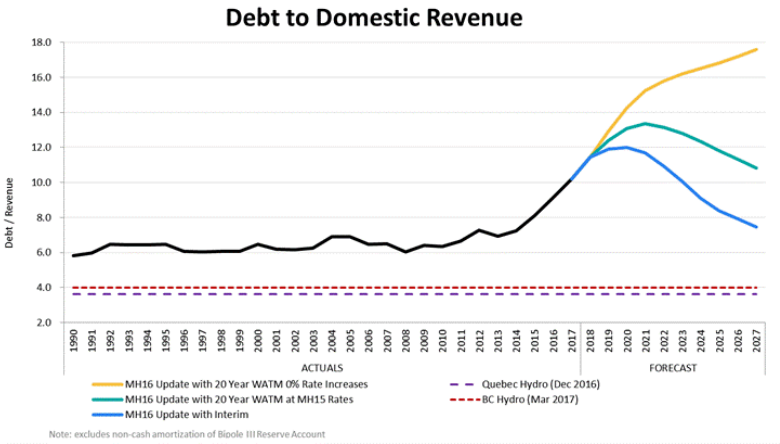
Source: Coalition/MH I-68f

The analysis above shows that the Manitoba Hydro plan takes a prudent, measured and multi-year approach to addressing the ongoing cash flow shortfall the Corporation is enduring at current rates. In the fourth year of the plan, Manitoba Hydro returns to a

cash flow positive condition. However, for the first five years of the plan, in aggregate Manitoba Hydro is essentially cash flow breakeven with only a modest $235 million being made available for debt reduction. This amounts to approximately 1% of Manitoba Hydro's forecast net debt of $23.6 billion in 2022 under the MH16 Update with Interim rate path.

Operating for at least three years with continued negative cash flow and taking five years to be cumulatively breakeven is, in Manitoba Hydro's assessment, at the outer bounds of credible as a commitment to having ratepayers meet the obligations of operating the utility and servicing its debts. The recent past has shown that outlooks can change and deteriorate quickly. In that context and in a quickly evolving utility industry, a willingness to endure multi-year cash flow shortfalls should not be expected to be well received by the debt investors who Manitoba Hydro seeks to have fund its balance sheet.

<u>Cap maximum debt at NFAT levels</u>



The overall deterioration of the outlook for Manitoba Hydro is discussed at Section 4. However, the consequence of the increase in capital costs, reduction in load growth and weaker export pricing is that net debt levels will peak at significantly higher levels than under any prior forecast (as shown in Manitoba Hydro Follow-up to Undertakings 7 & 8, Exhibit MH-93, Page 14).

The Manitoba Hydro plan takes action to address debt growth beyond forecast levels in NFAT. Under the NFAT Plan 5, net debt would peak at $21.6 billion in 2022/23, roughly three years after the then planned in-service of Keeyask. Under MH16 Update with Interim, the *"Manitoba Hydro Plan"*, debt grows to $23.6 billion which is 9% higher than the NFAT plan. It should be noted that this is to be supported by a domestic load that is expected to be 7% smaller than under the NFAT projection thus compounding the vulnerability of Manitoba Hydro and its customers to a debt that will grow to at least 12 multiples of domestic revenues.

The chart below in **Figure 3.4** from Manitoba Hydro's Policy Panel Presentation (Exhibit MH-64) demonstrates the relationship between debt and revenue dating back to the early 1990's when the Limestone Generating Station was brought into service. Even

under the Manitoba Hydro Plan, debt levels will still be, on a relative basis, roughly 30% higher than they were in the period from 1990 to 2010.

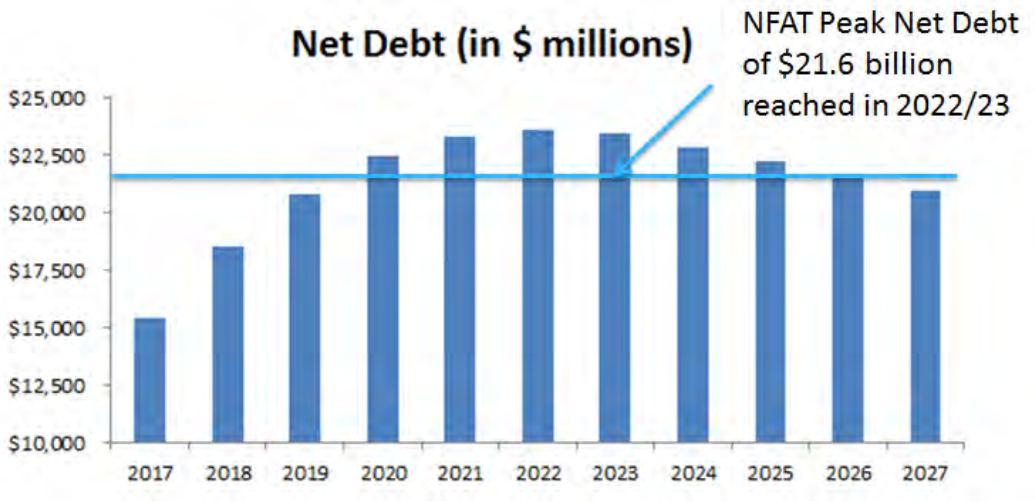


Figure 3.4

Source: Exhibit MH-64, Page 28

The chart below in **Figure 3.5** demonstrates how the Manitoba Hydro Plan will restore debt to levels contemplated under NFAT (Page 14 of Exhibit MH-93) on a longer time frame (5 years after first in service of Keeyask) than anticipated under NFAT and, as noted above, still requiring support from a smaller domestic rate base than assumed under NFAT. The Manitoba Hydro plan takes positive steps toward prudent debt management but should not by any means be understood to leave the Corporation and its customers at anything other than very high risk levels.

Figure 3.5

Source: Appendix 3.8 of the Application, Page 3

Expectation of sub-inflationary increases or better

Manitoba Hydro provided a fulsome discussion of the long-term benefits of proactively addressing Manitoba Hydro's weak and weakening balance sheet in its response to PUB/MH II-21. A reduction of debt translates to interest expenses avoided which results in reduced revenue requirement relative to plans that do not address unsustainable debt load. While Manitoba Hydro acknowledges its customers pay higher rates during the period of recovery, a residential customer using 1,000 kWh per month would experience lower bills over the period from 2017/18 to 2033/34, as shown in the table below.

Figure 3.6

	25% Equity Ratio Achieved	Cumulative Increase To 2026/27	Cumulative Increase To 2033/34	Average Monthly Bill - 2033/34	Cumulative Bills 2017/18 to 2033/34
PUB/MH II-21b Scenario based on MH16 - Update with Interim	2026/27	77.4%	38.8%	$121	$25,173
Coalition / MH II-19 Scenario even annual rate increases to 2033/34	2033/34	48.9%	97.7%	$172	$25,881
Difference			-60.3%	-29.9%	-2.7%

Source: PUB/MH II-21

This advantage applies even more so in a rising interest rate environment which has to be expected at some point in the next 20 years if not sooner. With significantly less debt to service and a healthier financial condition, Manitoba Hydro and its regulator will have established the flexibility to consider future rate changes with a then much clearer understanding of load growth, export pricing, interest rates and reinvestment needs for the years beyond 2027 than is available today.

Due to the inherent uncertainty associated with attempting to forecast results in the 2028 to 2036 time frame, it is impossible to predict the measures Manitoba Hydro would propose to abate equity growth to unnecessary levels. However, should Manitoba Hydro find itself in a relatively stable operating environment but with significant capital investment needs on the near to intermediate term horizon, it is reasonable to expect the pace and extent of rate increases necessary to support major renewal and growth investments will be significantly abated by entering this period with a balance sheet and rate levels capable of absorbing incremental debt financing needs.

In the alternative, without major expansion or other capital needs during or just beyond the 2028-2036 horizon, rate relief may be affordable and prudent. What ends up being appropriate in terms of rate action 10 or 15 years from now will be a function of events between now and 2027. PUB/MH II-21b demonstrates how dramatically different the future can be where the only difference is the time taken to restore the Corporation's financial health. The long term interests of ratepayers and the economy is served by taking steps today to bring debt back to levels that allow Manitoba Hydro to absorb risk.

3.2 Interveners have a Lack of Comprehension with respect to Role and Ownership of Equity

Manitoba Hydro's review of Intervener evidence reveals fundamental misunderstandings about the role of equity. A principal argument put forward by MPA and Mr. Bowman (Transcript Pages 4916, and 6420 to 6424) is that Manitoba Hydro's equity need only be scaled in some proportion to the financial erosion anticipated from a five or seven year drought. This argument continues that Manitoba Hydro's plan to build its equity to $6.9 billion by the end of 2026/27 is excessive in the face of losses on a five or seven year drought that are in the order of $1.2 billion to $1.5 billion.

The reality is that equity is not cash. MPA and Mr. Bowman both acknowledge this (Transcript Pages 5114 and 6382). Mr. Bowman also acknowledges that of Manitoba Hydro's $2.9 billion of equity, 90% was created more than 5 years ago and 75% was created during and before 2009 (Transcript Pages 6380 to 6382).

Equity in and of itself is of no useful service to Manitoba Hydro in the event of financial distress. Regardless of the equity recorded on the balance sheet, in the absence of rate adequacy to cover its costs, Manitoba Hydro will have to borrow money or raise rates. Equity is not a reserve funded with cash that can be drawn down to absorb losses. The value of a strong equity balance is it represents debt not borrowed and therefore interest payments that do not need to be made. The notion, put forward by MPA that equity represents Manitoba Hydro's capacity to borrow further and up to the value of its assets (Transcript Page 4859) is preposterous. It suggests there is no consequence to simply adding to the Corporation's debt burden in times of distress, forecast error or otherwise. A fundamental principal of Manitoba Hydro's Application is that debt growth in dollar terms must be curbed.

The financial risk facing Manitoba Hydro, its customers and the Province of Manitoba is driven by the absolute level of debt on its balance sheet. The customers of Manitoba Hydro are a finite group. $25 billion of debt represents the actual liability of the Company that must be met with cash payments of interest each year. It is a substantial burden for the customers of Manitoba Hydro to bear regardless of the notional equity balance (which is, in the Corporation's case, an accounting construct representing the aggregate net income of the Corporation since its inception).

The Interveners are caught in a myopic worldview that drought is Manitoba Hydro's largest financial risk and therefore reserves must only be scaled accordingly. In the short term, drought is Manitoba Hydro's largest potential financial loss. But drought will presumably have an end and therefore the erosion has a limit. Absent the rate adequacy Manitoba Hydro is proposing, a drought will be entirely debt funded and, in the 5 year example, add $1.2 billion (PUB/MH II-40 Figure 2) to Manitoba Hydro's $25 billion debt. This is dwarfed in comparison by the effectively limitless and perpetual damage that will be delivered upon Manitoba Hydro's ratepayers if steps are not taken to address the $25 billion debt balance while it is still manageable (i.e. before interest rates rise). If Manitoba Hydro and its customers find themselves on the wrong side of a long-term systemic rise in interest rates, the financial consequences are almost impossible to quantify. As can be seen in the response to MIPUG/MH II-19a, 10 years ago, the Government of Canada long bond yield was 200 basis points (2%) higher than it is today and 20 years ago it was over 500 basis points (5%) higher. On $25 billion of debt, even a return of interest rates to long term historical averages could cost Manitoba Hydro ratepayers hundreds of millions of dollars per year and, unlike with drought, no expectation of relatively near term abatement.

Manitoba Hydro's pursuit of the 75:25 Debt:Equity ratio is driven entirely by the need to reduce absolute levels of debt to levels consistent with NFAT (i.e. $21.5 billion)(Exhibit MH-93) albeit further in the future which presents incremental risk. Were it not for the importance of balancing rate action with customer impacts, more prescriptive action would be advocated.

The PUB clearly understood the intrinsic relationships between the concepts of the equity ratio, absolute debt levels, financial risk to ratepayers and ratepayer impacts in Order 90/08, pages 3-7:

"Notwithstanding the Board's appreciation of the negative implications of rate increases for MH's customers, and the Board's particular and on-going concern for low-income households, particularly, in this case, those relying on electricity for space heating, the Board will provide MH with a greater increase than the Corporation sought. This, because of a combination of concerns that are briefly cited below, matters the Board will elaborate on in more detail in a subsequent Order:

a) In its application, MH advised that its proposed series of 2.9% increases were required to maintain progress towards the eventual attainment of the Corporation's financial targets, primarily the achievement of the long-sought but not achieved target debt to equity ratio of 75:25. MH projected that notwithstanding its forecasts of annual rate increases and the assumption of continuing success with export markets, and taking into account forecast net income for 2007/09 to achieve or exceed $300 million, it still did not expect to achieve the debt:equity financial target of 75:25 by 2017/18 (let alone the current or previous earlier target dates);

Herein, and to be discussed in considerable depth in the subsequent Order, ***the Board reconfirms the validity of the targeted debt:equity ratio of 75:25, while expressing concern as to the likelihood of its achievement.***

b) MH's plans for capital expenditures may involve the expenditure of $18 billion or more over the next 15 years, expenditures predicated in part on what may or may not be overly optimistic export prices – ***this level of capital expenditure will result in significantly increased debt levels, export commitments and general business risks****;…*

g) ***Continuing business risks related to interest rates (now at recent historic lows)****, the risk of further currency fluctuations, drought, inflation, market access problems, and other concerns…*

> ***The Board is focused on the risks that lie ahead and determined to ensure as reasonably as possible that MH has the financial strength to meet the risks."*** (Emphasis Added)

MPA's views in this hearing on the value of equity during a drought, as canvassed by Mr. Ghikas during cross-examination of Mr. Colaiacovo at Transcript Page 4992, stand in contrast to views during NFAT when MPA was an Independent Expert Consultant ("IEC") to the PUB. At that time its concern with debt levels was more apparent as noted at CAC/MPA I-013

> *"The critical issue is the magnitude of outstanding debt on the balance sheet, not the size of the retained earnings. In the event of a persistent revenue shortfall caused by prolonged drought, for example, interest charges related to a large outstanding debt represent a real call on cash flow. A large pool of retained earnings in this environment would be beneficial in that the company balance sheet potentially could sustain a series of annual losses, but balance sheet retained earnings bear little relationship to the availability of cash resources."*

A further confusion amongst the Interveners is the idea that Manitoba Hydro's equity represents customer contributions *"held in trust"* and for their benefit as there is no *"shareholder per se"*. Therefore, such contributions must be limited to the greatest extent possible so as to minimize the opportunity cost to ratepayers of having their funds tied up in the reserves or retained earnings of the Corporation. This is false. Manitoba Hydro has an owner. It is the Province of Manitoba. Even in a *"cost-recovery"* framework, any residual revenue collected in excess of costs accrues to the equity holder. Manitoba Hydro gave considerable testimony during the direct evidence of its Policy Panel (Transcript Pages 230 to 236) regarding the nature of the relationship between Manitoba Hydro, its customers and the Province of Manitoba as shareholders. The Province of Manitoba is the beneficiary of Manitoba Hydro's equity as its owner. While it does not earn a return (or dividend) on such equity, it is still entitled to the assurance of sufficient reserves to be retained in the utility to severely limit the risk of being called upon to assist in the funding and support of the utility. Therefore, the duty of the ratepayer is to fund such reserve contribution with no expectation of refund or return.

Funding of net income through rates is the cost of providing for the buffer (i.e. net income reserves) that must be maintained and added to proportionately as the Corporation's asset base and debt grows so as to limit the likelihood of taxpayer funded intervention at any point including one of financial distress. This is the *"quid pro quo"* of Manitoba Hydro's relationship with the Province of Manitoba under which it is able to obtain financing at highly preferential terms to that which the Corporation could on its own and all for the benefit and account of the ratepayer. Absolute dollar levels of equity comprised of historical retained earnings are irrelevant to the fiscal management of the Corporation. It is the addition to equity reserves from regular and sufficient net income that abates the absolute level of debt which is the essential driver of Manitoba Hydro's financial risk.

3.3 Ratepayer Benefits

MPA's assertion on page 55 of Exhibit CC-17 that Manitoba Hydro's *"equity is essentially dead money. It earns no return, but nevertheless has been taken out of the hands of ratepayers who could otherwise use it"* is also erroneous. This stands in contrast to MPA's evidence at NFAT as a PUB IEC wherein the response to CAC/MPA 1-012(d) they stated:

> *"If Manitoba Hydro has a larger balance sheet, then it would be better able to absorb shorter term or less severe financial shocks, without the risk that it might be perceived as being no longer financially self-supporting. A more robust corporation could simply wait for fortunes to turn, rather than immediately seeking financial relief through higher rates. In this sense, a larger balance sheet can be understood as a ratepayer benefit."*

MPA later confirms in this hearing (Transcript Page 5115) that debt does have a cost and insofar as retained earnings result in avoided debt, ratepayers benefit in the form of not having to pay the cost of that avoided debt. In other words, while the ratepayer is duty bound to contribute to net income (in normal water years) as a trade-off for the Province of Manitoba providing access to low-cost capital and standing still on a rate of return, there is still substantial ratepayer benefit. It comes in the form of future interest savings which accrue to ratepayers at the Corporation's cost of debt. While in 2016/17

the Corporation's average cost of debt (used to capitalize interest) was 4.89%[5] which is a modest discount to the 5.0% *"social discount rate"* advocated by Morrison Park as a ratepayer cost of capital, it is entirely plausible in a prospective rising interest rate environment that the savings provided by having reduced debt will exceed this notional concept of a social discount rate. Moreover, the true benefit to ratepayers (and the broader Manitoba economy) of rate stability from lower debt levels is not captured anywhere in this calculus but is certainly a tangible benefit to customers.

Mr. Colaiacovo asserts at Transcript Page 5129 with respect to reserves:

> *"So yes. If the 7.9 percent method -- rate is going to build up larger reserves, then you will be able to resist more of the types of events that require reserves, but that doesn't necessarily mean it's a good idea to build up those reserves because you have to look at what the probability of those events are going to be and your actual requirement for those reserves before you decide to build them up."*

The purpose of building up financial strength through sufficient positive net income and cash flow, as Manitoba Hydro is proposing, is to limit the growth of debt and abate it to more sustainable levels relative to the size of its customer base and the inherent risks in its business. The benefit is not only derived from higher resistance to possible or even probable negative events. The benefit is the interest savings in and of itself and the relative rate stability that ensues. In PUB/MH II-21b, pages 4-23, Manitoba Hydro demonstrates how this benefit holds regardless of actualities that present in comparison to forecast.

MPA produced an analysis which compares the present value to customers of two alternate rate paths and concluded that at a *"social discount rate"* of above 4.93%, the 3.95% rate path is preferable at least by this measure (Exhibit CC-17, Pages 47 to 48). This conclusion is unsupportable, given the fundamental misunderstandings of the role, ownership and benefits of equity described above.

Manitoba Hydro demonstrated in its Rebuttal Evidence that, with the appropriate Weighted Average Term to Maturity ("WATM"), 3.95% rate increases are required

[5] see Note 7 on page 66 of Manitoba Hydro Electric Board 66th Annual Report for the year ended March 31, 2017, filed in the response to PUB MFR 13 Updated)

throughout the forecast period in order to restore the 25% equity ratio (Exhibit MH-52, Appendix 1.6 and 1.7). On this basis, the *"equalizing"* discount rate of the two compared rate paths climbs to 6.4%, well above the 5% MPA asserts as the appropriate social discount rate. At a social discount rate below 6.4%, the rate path assumed in PUB/MH II-21(b) produces present value benefits to ratepayers in addition to any advantages to Manitoba economic development that may stem from the prospect of lower, more stable rates sooner.

Manitoba Hydro has also noted that it is inappropriate to attribute the same discount rate to two rate paths with a wholly different likelihood of occurring. MPA confirmed in its response to MH/Coalition-(MPA) 20(a) that the 3.95% rate path has a higher likelihood of unexpected/unplanned rate action. Using the same discount rate to compare two scenarios with a different risk profile is inconsistent with financial theory.

The 3.95% rate scenario places increased risk on ratepayers. Even in the base case, equity falls to a level of 10% and is maintained for years. The PUB has indicated in the past its discomfort with 10% equity levels as noted on pages 2 and 23 of Order 43/13:

> *"The Board is concerned with the projected future deterioration of Manitoba Hydro's financial targets, in particular the debt-to-equity ratio that will fall from a current level of 75:25 to 90:10 by 2021, even with projected annual rate increases of approximately 4%, which is twice the projected level of inflation. This deterioration will put Manitoba Hydro in a weaker financial position given its planned capital spending over the next two decades."*
>
> *…*
>
> *"The Board is concerned that, by moving towards a 90:10 debt-to-equity ratio by the end of the decade, there will be an insufficient retained earnings reserve to deal with droughts and other risks such as infrastructure failure or rising interest rates."*

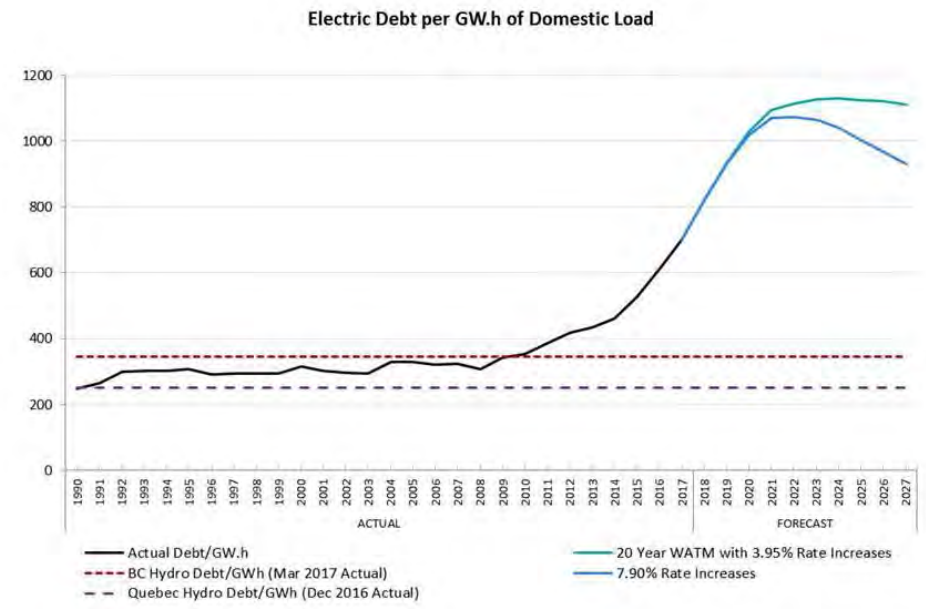
The PUB further noted the significance of maintaining capital adequacy to alleviate pressure on the Province of Manitoba in PUB Order 101/04 page 29:

> *"With a debt:equity ratio of 75:25 ratepayers would have increased assurance of future rate stability. Increased retained earnings would provide for a*

continuation of advantageous interest rates and finance costs. It would also provide increased confidence that a direct financial contribution to MH's capital would not be sought from the Province."

3.4 A 20-Year Financial Plan does not work

In the face of a rapidly changing industry, significantly higher capital investment needs and a deteriorated growth outlook, the 20 year path to addressing Manitoba Hydro's financial condition by 2033/34 advocated at NFAT and in the 2015/16 & 2016/17 General Rate Application ("GRA") is imprudent and unworkable.



While unpleasant, the reality is that Manitoba Hydro does not appear poised to grow its way into the significantly increased and unsustainable levels of debt it is incurring to complete major capital projects, such as the Keeyask Generating Station and the Bipole III Reliability Project. As such, earlier and more aggressive action than what was contemplated in previous 20-year financial plans is required to address a debt load that, left unchecked, could compromise rate stability and affordability for generations of Manitoba Hydro electricity customers.

Taking almost two decades to address Manitoba Hydro's weak capitalization fails for a number of reasons which are discussed in the sections that follow.

3.4.1 Prolonged and unmitigated exposure to interest rate increases

Section 3.2 above provides a discussion of the role of equity and net income in maintaining Manitoba Hydro's financial stability. The issue with Manitoba Hydro is not too little equity. The real issue is that too large a debt burden is being carried by a stagnant customer base. **Figure 3.7** below demonstrates that absolute levels of debt will grow to almost 4 times as indebted as Manitoba Hydro was immediately following Limestone. This is clearly out of all historical proportion to the size of Manitoba Hydro's business. Likewise, the debt burden on Manitoba Hydro's customers will be larger than any previous plan brought in front of the PUB. Stronger action must be taken to address this significant and unavoidable debt.

Figure 3.7

Source: Exhibit MH-52, Page 25

Under the 3.95% rate path, net debt will grow to $24.8 billion by the end of 2023/24 at which point the Keeyask Generating Station is fully in-service. Notwithstanding intervener conjecture (page 4-5 of Exhibit MIPUG-13) that Manitoba Hydro will be *"rapidly"* retiring debt, in fact net debt builds in the six years after Keeyask In-Service to $25.1 billion at the end of 2026/27 under a 3.95% rate plan. It is of note that despite cumulative rate increases of almost 50% by the end of that period under the MH15 rate plan (3.95% until 2028/29) debt remains within roughly 5% of this peak level until 2033/34 - 16 years from now (Exhibit MH-52, Appendix 1.3). The failure to make any appreciable repayment of debt in the face of such cumulative rate increases demonstrates the inadequacy of the 3.95% plan.

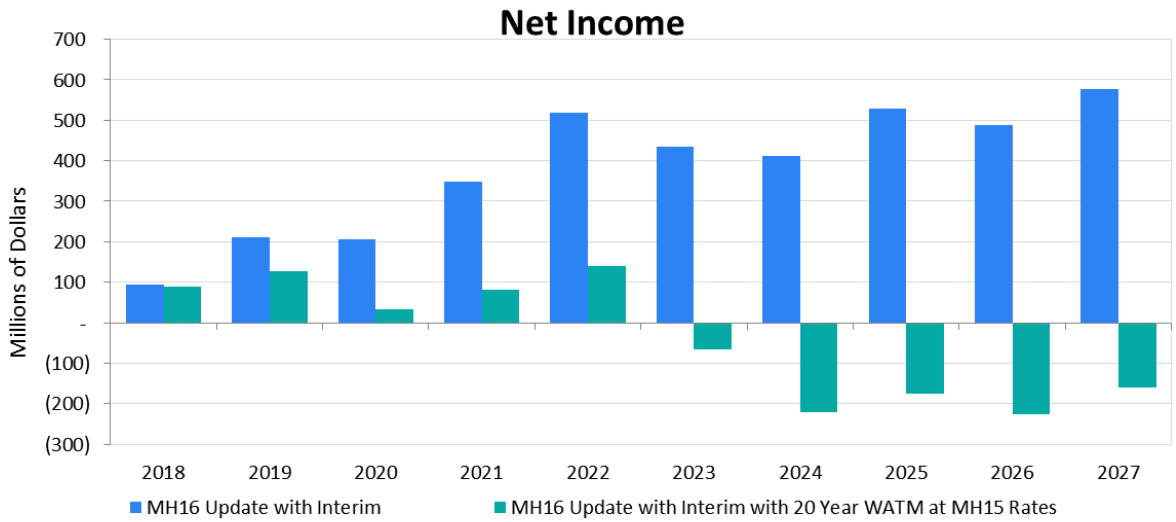
In financial terms, Manitoba Hydro has no greater risk than rising interest rates. Once Keeyask is in service, Manitoba Hydro will have annual interest expense of approximately $1.25 billion per year, assuming its projection for both interest rates and the final capital needs of the major projects prove accurate. This compares to $2.0 billion of domestic revenue in 2023/24 following the 3.95% rate path. In other words, Manitoba Hydro will be consuming 62.5% of every domestic revenue dollar paying interest expense (i.e. $0.63 of every dollar, as shown on Slide 21 of Exhibit MH-64). On $25 billion of debt, even a 1% increase in interest rates would have dire consequences.

Manitoba Hydro will see immediate and material increases in its revenue requirement should interest rates begin a path back from historic low levels to long-term average levels.

It has been of great benefit to Manitoba Hydro ratepayers to undertake such a significant expansion program with the benefit of low interest rates. However, it would be highly imprudent to not take action now to curb debt growth given the clear danger and unaffordable consequences of unplanned interest rate escalation. The presumption that interest rates will stay within sight of historic lows for more than the next decade is too large a wager to expose ratepayers to. As seen on in the chart on page 10 of Appendix 3.5 to the Application, interest rates have historically demonstrated the capacity to increase and decrease significantly over 10 year time frames let alone 15 or 20 years.

The need to address the impact of lower forecast domestic load growth cannot be overlooked. One way of considering debt load at the customer level is the amount of debt per kWh of consumption. This is appropriate as the interest servicing of each dollar of incremental debt load must be absorbed in customer rates which are expressed in cents per kWh. At NFAT, when net debt crested at $21.6 billion in 2022/23 (Exhibit MH-93, page 14), domestic load (at generation) was forecast at 26,567 GWh (PUB/MIPUG 1, page 4). Net debt/GWh of domestic load (at generation) was therefore forecast at $813,000/GWh. Manitoba Hydro's current forecast sees only 25,175 GWh of domestic load (at generation) in 2022/23 (PUB/MIPUG 1) which compares to forecast net debt of $24.8 billion (Appendix 1.3 to Exhibit MH-52). This translates to Debt/GWh (at generation) of $984,000. The consequence is that much greater debt is being shouldered by much lower customer volumes. On a proportional basis to domestic load, peak net debt per GWh will be almost 21% higher in 2022/23 under MH16 Update with Interim (i.e. 7.9% rate path) as compared to NFAT.

MH16 Update with Interim, notwithstanding higher rate increases, is still reflective of more financial risk than was contemplated at NFAT. The higher rate path assumed in MH16 Update with Interim, beginning with the 7.9% rate increase effective April 1, 2018 requested by Manitoba Hydro in this GRA, is essential in order to abate debt growth to levels more consistent with prior plans notwithstanding taking several years longer to do so.



3.4.2 Cannot Forecast Breakeven or Negative Income

All of Manitoba Hydro's integrated financial forecasts, including MH16 Update with Interim, are founded on the assumption of normal water conditions. Manitoba Hydro has been clear that it believes it is imprudent, as a planning matter, to pursue a rate strategy with a goal of negative net income in any one year let alone for a sustained period. It would appear that Mr. Colaiacovo from MPA agrees:

> *"And if the rates are high enough, well, then, that helps guide you to a- -- a decision that those rates are sufficient. Then, you would also ask yourself, if water was at more typical levels over that period, over that five (5) or seven (7) year period, what would be the effect? Would it be --* ***would we be making progress on our financial targets more broadly? Would be -- we be repaying capital?*** *Right?.... So, you know, you always want to make sure that in a challenging scenario, you have enough reserves,* ***but you also want to pay attention to what happens when water is at typical levels*** *and -- and -- and that -- that kind of an analysis, I think, would guide you to making a rate decision."* (Emphasis Added) (Transcript page 4941)

In the years following Keeyask ISD, implementation of the MH15 rate path results in: a) substantial, sustained net losses; b) significant deterioration in the equity ratio; and, c) increasing net debt levels.

Figure 3.8

Source: Exhibit MH-64, Slide 26

Given Mr. Colaiacovo's advice noted above, it is difficult to comprehend how he could endorse a plan that would see Manitoba Hydro losing in the range of $200 million per year with Keeyask in service.

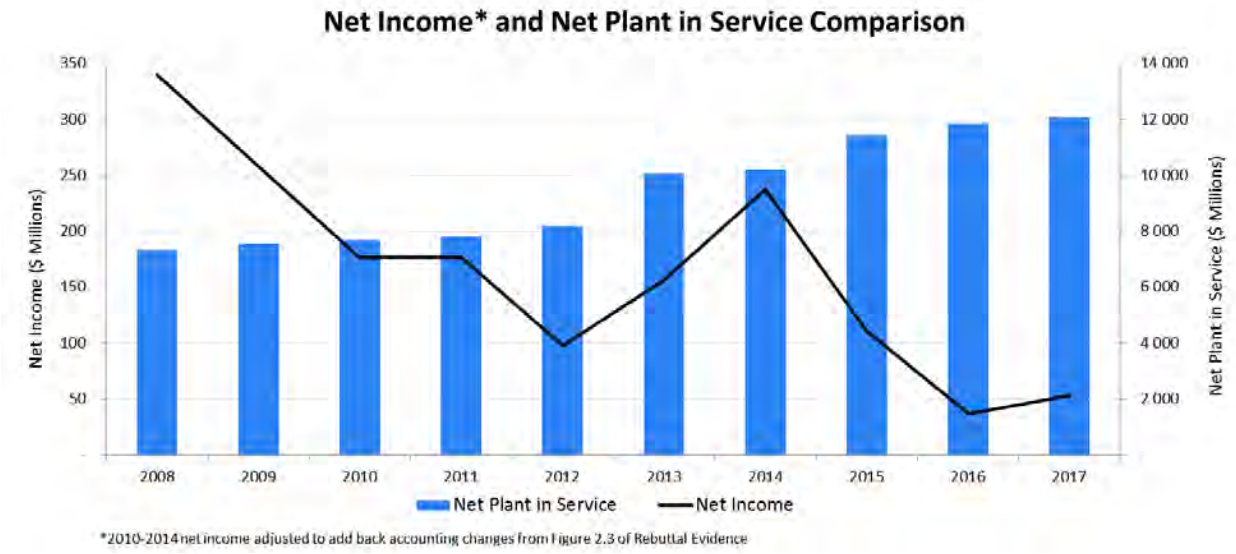
Manitoba Hydro must have sufficient domestic revenue that is recovered from ratepayers such that it can expect to make meaningful, positive net income in normal water conditions. When the unforeseen arises, net income can flex downward to avoid the need for immediate borrowing or rate response. If the planned net income is achieved, this income can be contributed toward debt retirement. However, it is acknowledged by both MPA (transcript page 5114) and Mr. Bowman (Transcript Page 6382) that equity is not cash reserves and that in the absence of net income, Manitoba Hydro will have no choice but to raise rates or increase debt in the event of below forecast conditions let alone drought or sharply rising interest rates.

The scale of targeted net income must take into account the scope of Manitoba Hydro's activities. A decade ago, Manitoba Hydro earned net income in the order of $250 million to $350 million on net plant in service of approximately $7.5 billion. (Exhibit MH-64, Slide 66). The PUB acknowledged the importance of net income relative to Manitoba Hydro's scale when it wrote, in Order 143/04, on page 84:

"While net income levels of $50 million are significant in absolute dollar terms, they are modest for a Corporation with the assets, debts, retained earnings and responsibilities of MH. MH's debt to equity ratio is below the Corporation's target and generally accepted industry standards."

At the time of that Order, Manitoba Hydro had net plant in service of approximately $7 billion and net debt of approximately the same amount. When Keeyask comes into service, Manitoba Hydro's net plant in service will be roughly four times greater ($27 billion) with debt, following the MH15 rate path, of $25 billion. The MH15 rate path produces a net loss in 2023/24 of $222 million and continuing to follow this plan does not lead to net income of greater than $100 million before 2030/31.

In the same Order, at page 86, the PUB noted:



"MH explained during the hearings that even in the absence of another drought it would not reach its targeted debt to equity ratio by 2013/14, and provided no plan to achieve its target within this 10-year planning horizon. The Board believes that this situation is not reasonable."

Manitoba Hydro notes the PUB's concern with both the debt to equity ratio and the 10 year path. Manitoba Hydro does not believe that the cause of the capital deficiency (drought vs. a major period of expansion) impacts the requisite steps to address the PUB's well documented concerns in PUB Orders 101/04, 143/04 and 90/08 regarding the risks of inadequate reserves and levels of debt. For example, in Order 90/08 page 18

"It is not reasonable to assume that a Utility can expend over $18 billion in new capital expenditures without an up-front investment in its capital structure, higher rate increases will provide that additional capital and reduce to some extent the debt that MH will have to take on to complete these projects. Debt comes with costs, interest and annual principle payments, and, as well, is associated the risk of future increases in interest rates. The Corporation's risks rise as its export opportunities, investments and debts increase. In the Board's view, this warrants a larger rate increase."

Accepting a path of rate increases that are insufficient to generate positive net income would be a concerning continuation of a trend wherein net income (and therefore, reserve contribution and balance sheet management) have been systemically eroded while the assets and debts of the business continued to expand as demonstrated in **Figure 3.9** below. It should be noted as well that this erosion occurred not withstanding above average water conditions in every year since 2004/05 and sharply declining interest rates throughout the period.

Figure 3.9

Source: Exhibit MH-64, Slide 66

When normalized for water conditions and other unusual items, Manitoba Hydro has already been in a loss-making position for several years as discussed in detail in Section 2.1.2.

Net income is an essential feature of prudent financial planning for a business of the scale, complexity, importance and volatility of Manitoba Hydro. The PUB recognized this in Order 90/08, on page 7 when it wrote:

> *"It is prudent that known risks are addressed now, in part through the provision of additional revenue, so as to best ensure adequate financial reserves ahead of uncertain times."*

3.4.3 Prudent Financial Plans Do Not Depend on the Back-End of a Twenty Year Financial Forecast Proving Accurate

Forecasting is inherently unreliable. Manitoba Hydro believes limited value should be ascribed to forecasts a decade or more in the future as the potential for volatility in key assumptions, many of which are beyond Manitoba Hydro's ability to control, reduces the second half of a twenty year forecast to little more than a hypothetical modeling exercise. The further out the forecast goes, the less likely it is to be accurate. As noted by Mr. Shepherd:

> *"A decade is a long time. In any business I've been around, forecasting ten (10) years in the future, let alone fifteen (15) or twenty (20), is very difficult, perhaps nearly impossible. So a plan that has you walking down a tightrope of essentially no net income until the early 2030s is begging for trouble, especially when your outlook for growth is as weak as ours has become. So in taking up to twenty (20) years to deal with a serious problem, you're choosing to take insufficient action upfront, action that is required to be in the position where you have some flexibility to make different choices as the future unfolds.*
>
> *Our previous plans relied to -- to far too great an extent on nothing adverse happening over a very long period of time. That's relying on hope.* ***Put another way, your financial strategy is to stay lucky for a very long time****."* (Emphasis Added) (Transcript Page 163)

Consider the response to PUB/MH II-41 wherein the range of net income outcomes on 918 model runs is charted under the MH16 Update with Interim at MH15 Rate Increases scenario. By 2027, the financial model under average of all 102 water flow conditions shows a net loss of $160 million; however, that level of net income is below the mid-point of a range from a $500 million net loss to $230 million in net income. In other words, with all the variables and assumptions that go into a financial forecast, actually achieving a forecast level of net income 10-20 years from now will be as much a matter of happenstance and luck as prescient forecasting. Therefore, Manitoba Hydro is of the view that assuming achievement of a plan over such a long horizon is not a prudent course of action.

Ratepayers should also take no confidence in such a plan. Businesses looking to invest or expand in Manitoba will be well aware that Manitoba Hydro's interest expense alone will be unpredictable and uncontrollable given the roughly $20 billion in new borrowing and refinancing Manitoba Hydro must execute in the next 10 years (Appendix 3.5 of the Application). They will see that interest expense of $1.251 billion (Appendix 1.3 of Exhibit MH-52), in a normal water year and once Keeyask is in service, will represent 40% of Manitoba Hydro's cost structure, 44% of its total revenue and 60% of its domestic revenues. The latter metric will be deeply concerning knowing that Manitoba Hydro has no ability to increase its export pricing and therefore the domestic customer will bear all of the volatility in interest rates. While a lengthy pattern of 3.95% rate increases may, when presented in a spreadsheet, appear steady and predictable, businesses will understand that more debt will foster more risk to rates. The 3.95% rate path (or any derivative thereof) will rightly be thought of as academic and an aberration. While conceptually interesting, it has a very low possibility of actually occurring.

Nonetheless, as demonstrated in the response to Coalition /MH II-19, the 20 year/3.95% plans make inconsequential progress toward the Corporation's financial goals in the first decade notwithstanding assumptions of significant rate growth, sustained low interest rates, appreciating export prices, normal water conditions and no further deterioration in capital costs. MH16 Update with Interim at MH15 Rates (Appendix 1.3 to Rebuttal Evidence) is indicative. Debt does not actually peak until the 10th year of 2026/27 which is well after the Keeyask in-service date of August 2021. The equity ratio deteriorates steadily and unabated. The EBITDA to Interest target, which Manitoba Hydro notes is favored by MPA, never comes close to being met. In the five years following the in-service of Keeyask, Manitoba Hydro actually loses close to $1 billion, increases its debt, sees its equity ratio drop to 10% and moves further away rather than closer to its financial goals.

It should not escape notice that Mr. Bowman's preferred 3.57% plan is based on the achievement of the 25% equity ratio by 2035/36. This is two years subsequent to the initial 2033/34 year time frame established at NFAT and repeated in IFF14 that was reviewed as part of the 2015 GRA. As well, Mr. Harper proposes continuing the 3.95% path for *"a few more years"* (five are actually required) in order to achieve the 25% target in 2035/36. MPA also acknowledges the 3.95% path needs to continue for longer time frames than forecast under NFAT, IFF14 or IFF15. The pattern should be clear. At

each rate application brought to the PUB for review, the advice will be to start working toward achievement of its financial targets anew with another 20 year plan.

In addition to taking yet another two years, Mr. Bowman's preferred plan is also characterized by requiring $793 million of net income in its penultimate year (2034/35) followed by $883 million in its final year (2035/36) as two more years of 3.57% rate increases are compounded on the 81% cumulative increases of the next 17 years (Exhibit MH-93). This level of annual net income is respectively 62% and 59% higher than under the Manitoba Hydro plan for 2025/26 and 2026/27 as it likewise completes the restoration of its fiscal health and reaches 25% equity. See Section 3.4.5 for a discussion of intergenerational equity paradoxes of Mr. Bowman's preferred plan. Nonetheless, on this path endorsed by Mr. Bowman, the regulator would be accepting that Manitoba Hydro would defer positive net income post-Keeyask until 2028/29. If the regulator were prepared to accept that level of financial weakness for that length of time, in Manitoba Hydro's view, it seems unlikely that the regulator would support the kind of rate increases and net income projected from 2030 onward in Mr. Bowman's preferred plan.

The end game is clear. The kinds of forecast errors that can befall such a razor-thin financial plan are not imaginary or implausible. Each of the major risks – rising interest rates, soft export prices, low water conditions or drought and capital overruns – have all happened before. Manitoba Hydro arguably bears more financial risk than any other Canadian hydro-based utility given its relative exposure to interest rate increases, hydrology and export prices. A willingness to tolerate such a plan signals a bias to not act proactively but rather wait until a crisis inevitably presents. It is ironic that the same parties who have for many years criticized Manitoba Hydro's forecasting abilities are now effectively encouraging the PUB to attribute a high degree of confidence in the back end of a twenty year forecast.

3.4.4 Capital markets are growing more concerned

The principal benefit of dealing with Manitoba Hydro's unsustainable debt is the payoff of lower, more stable electricity rates in the long run. There is no plausible future scenario wherein lower debt levels do not return lower rates to Manitoba Hydro's customers. PUB/MH II-21 provides some illustrative examples to demonstrate this benefit. A corollary benefit of addressing absolute debt levels which are now set to grow

beyond any previous forecast level is the continued support and confidence of capital markets participants which is vital to the Province of Manitoba and Manitoba Hydro's borrowing programs and interest costs.

Credit rating agencies are a reasonable proxy for the types of analysis debt investors undertake and the opinions they form. Any impartial review of recent credit rating agency reports demonstrates clear and urgent signaling that markets are concerned with the continued deterioration of Manitoba Hydro's financial profile.

3.4.5 Intergenerational Equity argument is flawed and hypocritical

The 19 year plan advocated by Mr. Bowman sees Manitoba Hydro building to $25 billion in debt post-Keeyask only to decline to below $24 billion in the 2032/33 fiscal year, which is over 15 years from today. The exposure to interest rate increases over that timeframe is immense. Even by 2032/33, at which time this plan would result in having implemented 75% cumulative increases while still not having increased equity beyond 17%, net debt will be more than 8 times domestic revenue (Exhibit MH-52, Appendix 1.3, Pages 2 and 4). Interest expense of $1.24 billion will be consuming 40% of domestic revenues even having increased rates cumulatively by 75% by that point. The argument in favour of this is *"intergenerational equity"*. In general terms, the theory is that it is unfair for current ratepayers (and those of the next 10 years) to be unduly contributing to the carrying costs of constructing the major new assets. Mr. Bowman's argument is paradoxical in that the consequence of not having today's ratepayer make any contribution to the continued erosion of the Corporation's balance sheet is exacerbated risk and cost to the next generation. To do so in the name of intergenerational fairness is disingenuous.

It is further hypocritical when the patterns of costs borne by ratepayers in each of the first decade (2018-2027) and the second decade (2028-2036) are compared (see Figure below):

Figure 3.10

	MH Plan 2018-2027	Bowman 3.57% Plan 2018-2027	Bowman 3.57% Plan 2028-2036
Cumulative Net Income	$3.8 billion (over 10 years)	$0.2 billion (over 10 years)	$3.7 billion (over 9 years)
Net Debt post Keeyask	$2.4 billion decrease (2023-27)	$0.3 billion **increase** (2023-27)	$3.6 billion decrease (9 years 2028-36)
Net Income in year target is achieved	$577 million (2027)	Equity ratio and EBITDA/Interest targets not achieved	$883 million (2036)
Cumulative Rate Increase	77.4% (to 2027)	41.7% (to 2027)	94.3% (to 2036)

Source: Manitoba Hydro Plan Appendix 3.8 and Mr. Bowman 3.57% Plan Exhibit MH-93

As can be seen from **Figure 3.10** above, notwithstanding 42% cumulative rate increases, Mr. Bowman's proposed plan makes no contribution to progress on financial targets or debt reduction, in fact the opposite. Debt increases during the period post-Keeyask while the equity ratio declines from 14% to 12% due to sustained net losses. Mr. Bowman's plan only produces positive, albeit immaterial, net income in aggregate in its first 10 years due to the impact of arbitrary accounting choices and the assumption of an ill-advised debt terming strategy. Even so, the plan produces $405 million of cumulative losses from 2022/23 to 2026/27.

Further, the profile of net income and debt reduction borne by the first decade's ratepayers under the Manitoba Hydro Plan (MH16 Update with Interim) is exactly the same as or better than the profile of net income and costs borne by the ratepayers in the second decade (in fact even further condensed into 9 years from 10) under Mr. Bowman's 3.57% plan. In other words, Mr. Bowman is proposing to take essentially the same pattern of reserve contribution and cash contribution Manitoba Hydro is proposing to be shouldered over the next 10 years and instead bestowing it on the ratepayers of the following 9 years and doing so in the name of intergenerational equity. In fact, there is no sharing or spreading of the costs of restoring Manitoba Hydro's financial health due to the simple fact that Manitoba Hydro's financial health not only does not improve in the first 10 years of Mr. Bowman's plan, it deteriorates. Mr. Bowman is simply making a choice of which generation to park the responsibility on. The next generation has the added burden of now paying rates 94% higher than today

(and only if things have gone to *"plan"* for more than a decade) and having done little to nothing before the early 2030's to reduce the rate volatility inherent in leaving debt unchecked.

3.5 Changing assumptions in the Financial Model in order to defer the need for rate increases is not prudent

The PUB has heard argument in favor of numerous alternate (and lower) trajectories supported by questionable assumptions inserted into a forecast scenario with the sole objective of providing support for deferring the rate action now required. A financial forecast is a compilation of hundreds of assumptions all of which can be modestly changed to engineer any outcome a party desires. Manitoba Hydro has put forward in MH16 Update with Interim its best effort at a baseline forecast from which to make longer term rate planning decisions. As the PUB has made clear, at issue is effectively one rate increase, the request for 7.9% to take effect on April 1, 2018. The actual path of future rate increase requests will be a function of updated assumptions and events between now and Manitoba Hydro's subsequent rate application(s).

However, it would be imprudent to make today's rate decision – in the context of important signaling on longer term financial goals the PUB wishes to support – based on overly optimistic assumptions particularly in matters well beyond Manitoba Hydro's or the PUB's ability to control. For example:

3.5.1 Assumption of Capacity Values for Uncommitted Firm Energy.

The proposition that there is capacity value recognized in the marketplace is not something Manitoba Hydro takes issue with. However, to build a financial plan incorporating such values in the absence of a contracted counterparty adds unnecessary risk to the financial plan. Manitoba Hydro has given evidence (PUB/MH I-50) that the likelihood of engaging a counterparty in the next 5 years is extremely low owing to the planning horizons of these kind of bilateral agreements. Daymark endorsed this view as follows:

> *"MS. MARLA BOYD: And I understood your evidence to be that that wouldn't be a significant source of revenue until -- at least for the next five (5) years, and perhaps 2025?*

*MR. DANIEL PEACO: We did not find a lot of evidence in -- in either individual counterparties or the MISO market generally being short of capacity until that time, right." (*Transcript Pages 4280 to 4281*)*

Beyond 5 years, it must be recognized that simply having the firm energy available provides no assurance of entering into a contractual agreement. Further, Manitoba Hydro's uncommitted firm energy is a depleting resource particularly beyond the 10 year forecast horizon when Manitoba load growth starts absorbing excess supply.

3.5.2 Change regulatory accounting policy to increase income in the near term.

The frenzied debate over depreciation methodologies has obscured the fact that the transition to IFRS has substantially reduced annual depreciation expense (even under IFRS ELG) due to the removal of negative net salvage value. Nonetheless, as noted in Exhibit MH-93, the proposed changes by Mr. Bowman, including 12 year debt, indefinite capitalization of ineligible overheads amortized over 30 years and ELG/ASL depreciation methodology differences not amortized at all, make an immaterial (0.15%) difference to the annual rate path and no difference whatsoever to the critical debt and cash flow issues facing Manitoba Hydro. Mr. Harper acknowledged the impact would be minimal in the test years:

MS. PATTI RAMAGE: Okay, fair enough. You'd agree that if the Board adopted these recommendations, it would have minimum impact on the requested rate increases in this proceeding?
MR. WILLIAM HARPER: Yes, in terms of the two -- of the two -- of the two (2) specific years we're looking at, yes.
(Transcript Page 5359)

Further commentary regarding Manitoba Hydro's proposed treatment of existing Regulatory deferral accounts can be found in Section 17.

3.5.3 Assume 12 Year WATM.

Mr. Bowman opined that Manitoba Hydro's actions regarding reducing the WATM of Debt are sensible and appropriate (Exhibit MIPUG-13, page 5-11) but took issue with Manitoba Hydro's position that this strategy is only prudent under Manitoba Hydro's

7.9% financial plan and instead argued a 12 year WATM is an appropriate debt management strategy when coupled with 3.95% rate increases.

Manitoba Hydro notes that Mr. Bowman acknowledges having no experience in capital markets (Transcript Page 6202) nor does his CV indicate treasury management experience. His willingness to place over $9 billion of refinancing risk into the 2023 – 2027 timeframe in the absence of any prospective cash flow to manage the risk is cavalier and indicative of an ongoing desire to maintain artificially low rates in the near term, regardless of the risk it may impose on future ratepayers.

3.5.4 Curtail DSM spending assumptions.

The Efficiency Manitoba Act has been enacted in order to establish Efficiency Manitoba, a new Crown Corporation charged with pursuing long range electricity savings targets that are meaningfully in excess of the projected savings in Manitoba Hydro's integrated financial forecast. The Efficiency Manitoba Act mandates cumulative 22.5 % energy savings over 15 years, a figure well in excess of Manitoba Hydro's current plan of 17.3% over 15 years.

Mr. Bowman's argument that Manitoba Hydro should assume lower DSM investment and projected savings, as a path to lower rate increases, on the basis that *"it is appropriate to consider that Efficiency Manitoba, its Minister, or the PUB will make a finding that continuing large scale DSM is not cost effective for at least the next 5-7 or so years"* (Pre-Filed Testimony of Patrick Bowman, Exhibit MIPUG-13, Page 6-25) is in the face of mandatory legislation to the contrary is untenable and self-serving. In reality, it is entirely plausible that once Efficiency Manitoba is formed and operational, that its plans may require more investment and create greater load loss. Against that backdrop, to assume significant savings on programming that is transitioning from Manitoba Hydro's control (but not financial responsibility as a means to support lower rate increases) is imprudent. For additional information regarding Manitoba Hydro's Demand Side Management program and Efficiency Manitoba see Section 8.2.7.

3.5.5 Curtail government payments.

A number of Intervenors have suggested the PUB recommend the Province of Manitoba forego certain payments currently required be made by Manitoba Hydro to the Province. To be clear, absent a signal from the Province of Manitoba of a willingness to

accommodate lower water rental, debt guarantee fees or capital tax payments from Manitoba Hydro, it would be irresponsible to factor such an assumption into any forecast underpinning a rate decision.

3.6 MH15 Rate Plan Fails

MPA concludes at page 34 of their report that, *"…the 3.95% rate path is reasonably robust from a cash flow perspective"* by relying on the modeling results of the EBITDA interest coverage ratio. MPA reaches this conclusion despite shortcomings of the EBITDA to interest coverage metric identified at page 9 of Exhibit CC-17:

> *"This measure alone does not clarify whether the company's debt is increasing,* ***since there is no information captured in this metric about the size of capital expenditures*** *(if capital expenditures are greater than 0.8x Net Finance expense, then Manitoba Hydro will have to borrow additional funds, but if capital expenditures are less than 0.8x Net Finance Expense, then the corporation could actually retire some debt principal). By the same token, this ratio provides no information on whether the Debt : Equity Ratio is rising or falling."* (Emphasis Added)

Manitoba Hydro annually funds $500 to $600 million a year in Business Operations Capital to continue to maintain and increase the capacity of the current system to meet customers' needs and to support its revenue projection. Additionally, Manitoba Hydro must fund other costs like mitigation and other liability payments that do not flow directly through the income statement and, therefore, EBITDA. In the very short term, Manitoba Hydro may defer some costs to future periods but at the end of the day these expenditures are not discretionary. Manitoba Hydro cannot defer system maintenance and replacement indefinitely or the Corporation will not be able to meet the service and reliability expectations of its customers. When system failure rates rise, Manitoba Hydro is unable to maximize all the revenue it is able to generate and puts downward pressure on the sufficiency of future revenues. Further, costs are deferred to periods when replacement is generally more expensive. As a result, EBITDA to interest does not provide a complete picture because it does consider whether the Corporation has enough cash to continue to run its operation, and therefore, it does not inform as to whether debt is going up or going down.

Regardless of the EBITDA to interest coverage metric limitations, the following table reproduced from Exhibit MH-64 shows that the ratio under the MH16 Interim with Update and MH15 Rate Increases scenario is well below the target of 1.80 times even before considering required investments in Business Operations Capital.

Figure 3.11

The table above also depicts Manitoba Hydro's former target ratio EBIT to interest coverage. Mr. Bowman points to this ratio as a critical test of rates sufficiency. The table shows that the 3.95%rate path that Mr. Bowman argues is adequate, grossly fails his own preferred test.

When the EBITDA to interest calculation is adjusted to incorporate Business Operations Capital and other non-discretionary cash needs as in the following table reproduced from Exhibit MH-64, the ratio of EBITDA to ongoing cash burdens is consistently below 1.0 times in all 10 years of the forecast period indicating that revenues are insufficient to fund interest and capital expenditures and the deficient portion must be borrowed. These tables demonstrate unequivocally that the 3.95 percent rate plan simply does not work.

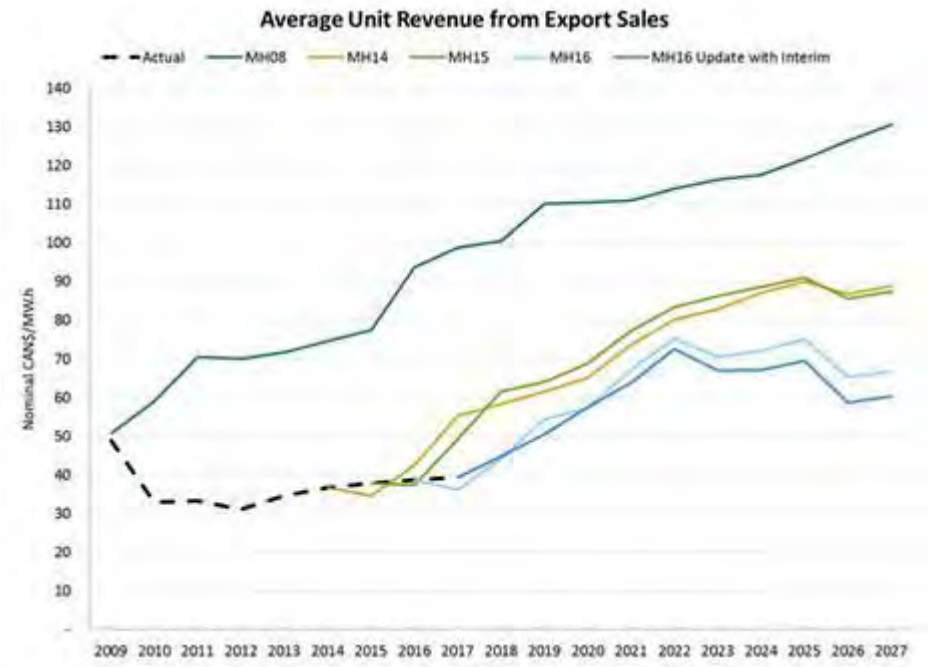
4 THE FINANCIAL OUTLOOK HAS DETERIORATED SIGNIFICANTLY



Intervener experts have asserted that there has been no deterioration in Manitoba Hydro's business such that the evidence advanced by the Corporation does not support the 7.9% rate increase trajectory included in Manitoba Hydro's current financial forecast. This is a significant assertion to Interveners as it is the fundamental underpinning of the belief that the 3.95% rate path put forward at NFAT and in the 2015 GRA (IFF14) remains viable (Section 5.0 of the Pre-Filed Testimony of Patrick Bowman, filed on behalf of the Manitoba Industrial Power Users Group, Exhibit MIPUG-13 and Section 3 of William Harper, Econalysis Consulting Services Evidence, filed on behalf of the Consumers Coalition, Exhibit CC-20).

Manitoba Hydro submits that the conclusions advanced by such experts do not consider all of the facts that are underpinning Manitoba Hydro's current outlook and which are summarized below:

4.1 Export Revenues Are Materially Lower

Since IFF14, the Corporation's outlook for opportunity export prices, which is based on third party forecasters, has decreased significantly (see chart below drawn from slide 39 from Manitoba Hydro's Policy Panel Presentation, Exhibit MH-64). As shown in the updated Schedule 10 provided in response to MH/Coalition (Harper)–5, forecast export revenues in the 2018-2027 period have declined from $8.0 billion under MH14 to $6.4 billion under MH16 Update with Interim meaning $1.6 billion of revenue has evaporated from Manitoba Hydro's expectations over the next 10 years.

Figure 4.1

Source: Exhibit MH-64, Slide 39

4.2 Domestic Load Growth and Revenues are Materially Lower

Manitoba Hydro's outlook for domestic load growth has also declined sharply as seen in the figure below (reproduced from slide 38 of Exhibit MH-64). As shown in the updated Schedule 10 provided in response to MH/Coalition (Harper) – 5, forecast domestic revenues in the 2018-2027 period have declined from $20.6 billion under MH14 to $19.3 billion under MH16 Update with Interim (at MH15 rates) meaning $1.3 billion of revenue has eroded from Manitoba Hydro's expectations over the next 10 years.

Figure 4.2

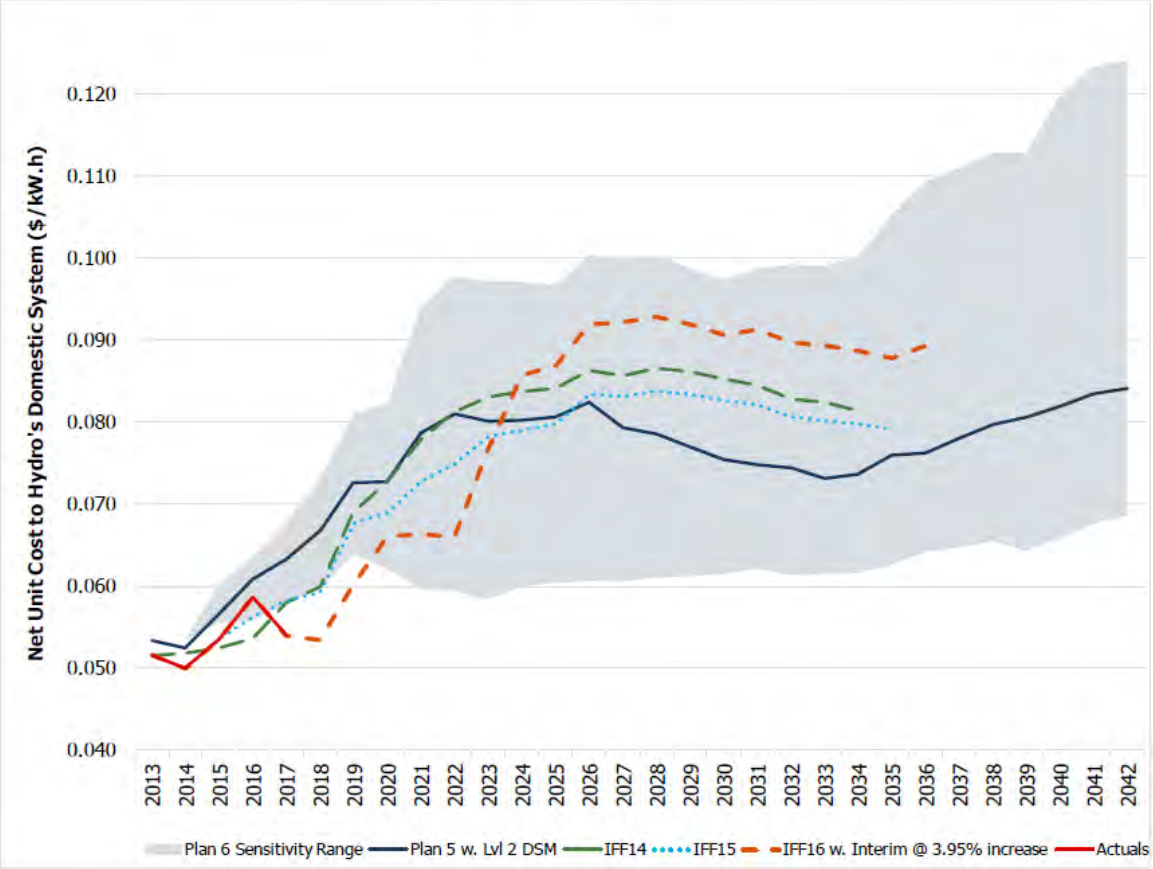
Source: Exhibit MH-64, Slide 38

Since MH14 and MH15, the capital costs for the major projects currently underway have increased significantly. The Bipole III reliability project budget has increased from $4.6 billion to $5.0 billion while the Keeyask Generating Station budget has increased from $6.5 billion to $8.7 billion. These two projects combined represent a 23% increase in capital costs in MH16 Update with Interim as compared to prior forecasts which, in turn, significantly increases the revenue requirement in the updated forecast.

4.3 Debt Has Gone Up

Since NFAT, Manitoba Hydro's outlook for peak net debt level has climbed by over 15% or $3.4 billion dollars (Manitoba Hydro Follow-up to Undertakings 7 & 8, Exhibit MH-93, Page 14).

Combined with the above noted deterioration in load growth since 2014, the debt load on customers is rising to more than four times the relative debt levels after Limestone went into service as demonstrated at Figure 1.16 of Manitoba Hydro's Written Rebuttal Evidence (Exhibit MH-52). As explained by Mr. McCallum in his direct evidence (Transcript Page 134):



> *"The debt we will inescapably build over the next several years is, simply put, unsustainable. The only -- the old way of thinking about how to fix Manitoba*

Hydro's finances, and how long to take to do it will simply not work. The old plans have clearly already failed. We cannot put this off any longer. Action to address today's immediate situation is required if we are to protect all stakeholders' long term best interests".

In PUB/MIPUG-1, Mr. Bowman provides a corrected chart (reproduced below) comparing net unit costs under NFAT Plan 5, IFF14, IFF15 and IFF16 Update with Interim (at MH15 Rates). While Manitoba Hydro takes issue with these calculations being done with an "at generation" domestic load, as seen in the chart below, under MH16 Update with Interim, net unit costs are now forecast to be significantly higher than under any of the prior forecasts.

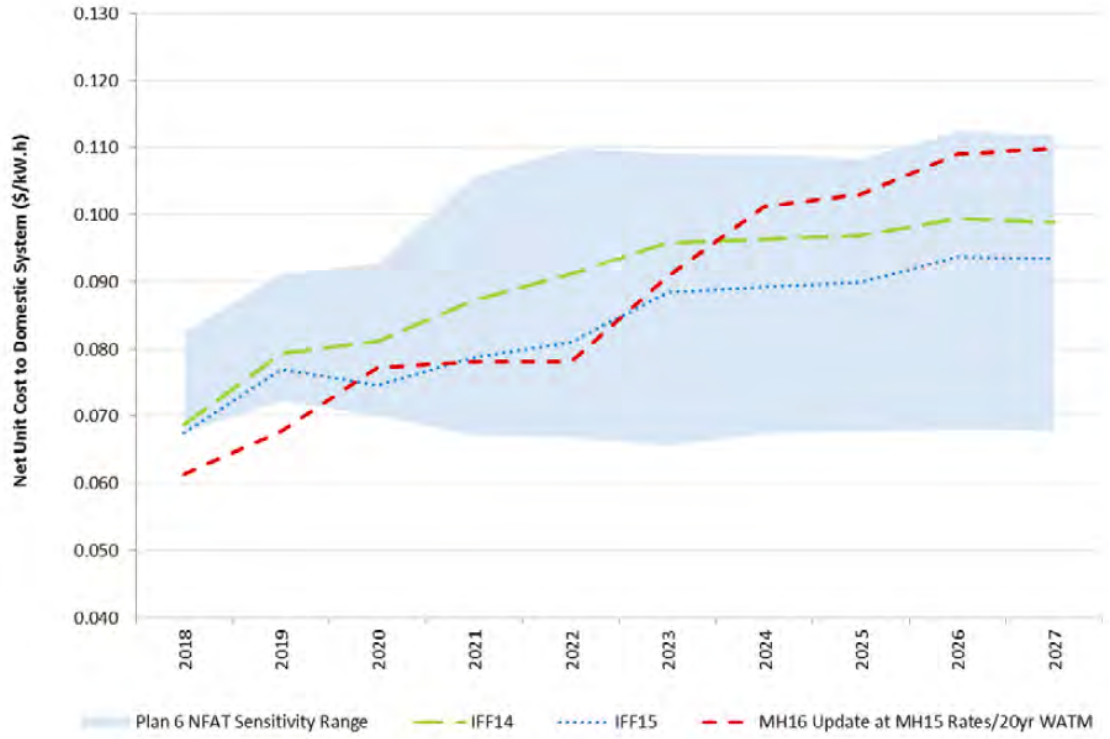


Figure 4.3

Figure 5-1: Net Unit Cost of Hydro's Domestic System (before reserves) Under NFAT Plan 5/6 versus IFF16 (assuming 3.95% increase scenario) – Updated for Load Forecast 2017 (PUB-MFR-65)

Manitoba Hydro reproduced at page 3 of Exhibit MH-52 the above chart using domestic load "at meter", which is the relevant metric given it is "at meter" by which Manitoba Hydro bills its customers. As can be seen, net unit costs are pushing right to the top of the range from NFAT.

Figure 4.4 Net Unit Cost to Domestic Sales ($/kWh)

Finally, in Figure 1.1 of Exhibit MH-52 Manitoba Hydro provided the following table:

Figure 4.5 Comparison of MH16 Update with Interim (at MH15 Rate Increases and 20 Year WATM) with MH15

	MH16	MH15	Difference	% Difference
2017-2027 Domestic Revenue	$20,865	$22,265	($1,400)	-6.3%
2017-2027 Export & OtherRevenue	$7,193	$8,746	($1,553)	-17.8%
2017-2027 Net Income	($325)	$607	($932)	-153.5%
Adjusted for Current 2017/18 and 2018/19 Outlook*	($78)		($78)	
Adjusted for Keeyask In-Service delayed 21 months**	($750)		($750)	
Proforma 2017-2027 Net Income Comparison	($1,153)	$607	($1,760)	-290.0%
2024 Net Income	($222)	$56	($278)	-496.4%
2024 Net Debt	$24,811	$22,449	$2,362	10.5%
2024 Equity Ratio	12%	12%	-	
2027 Net Income	($160)	$232	($392)	-169.0%
2027 Net Debt	$25,060	$21,838	$3,222	14.8%
2027 Equity Ratio	10%	14%	-4.0%	
2024 Net Cost per GWh***	$0.1000	$0.0900	$0.0100	11.1%
Increase from 2017/18 Net Cost per GWh	65.0%	32.0%	33.0%	
Cumulative Rate Increase after 2017/18	30.0%	30.0%	0.0%	

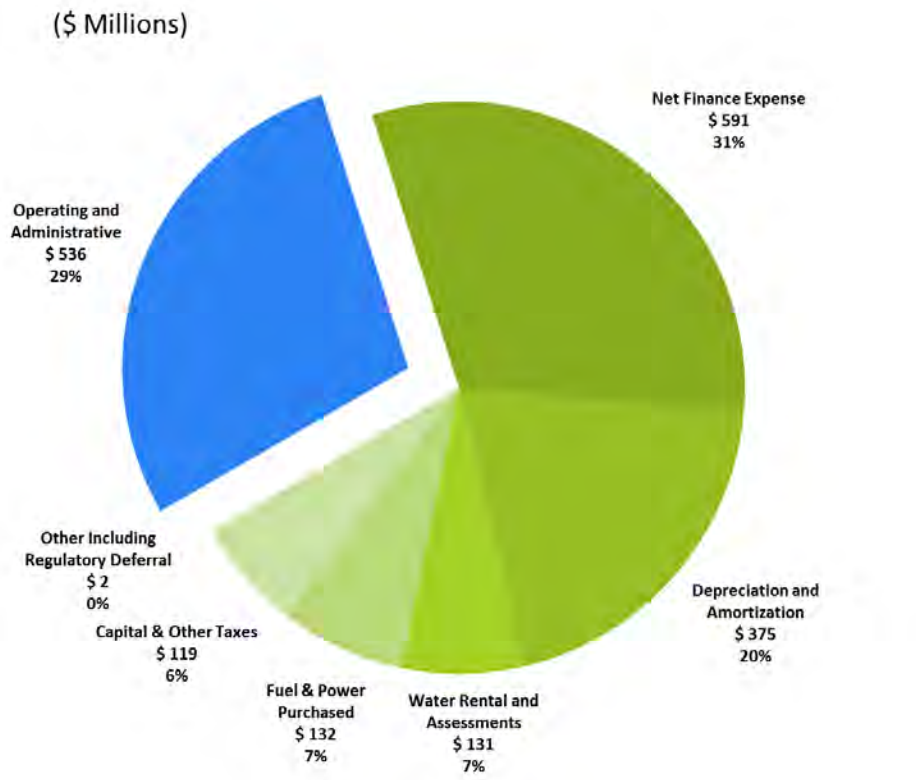
This table reveals in comparison to MH15 a 500% decline in forecast net income for 2023/24, a 170% decline in forecast net income for 2026/27 and an 11% increase in net unit costs. More urgently, this table shows that MH16 Update with Interim (at MH15 rates) projects a 65% increase in net unit costs per GWh between 2017/18 and 2023/24 wherein Keeyask is fully in service. Under MH15 the increase in net unit costs over that time frame was forecast at 32%. Cumulative rate increases of 3.95% from 2017/18 would result in a 30% cumulative rate increase which Manitoba Hydro submits is wholly insufficient in the face of unit cost escalation of 65%.

In Manitoba Hydro's view, there can simply be no basis for interveners to suggest there has not been any deterioration in Manitoba Hydro's financial outlook.

Manitoba Hydro takes issue with the fact that not one intervener has brought forward an expert with any experience in operating a business, especially not one the size and complexity of an integrated utility like Manitoba Hydro. Not one intervener has brought forward an expert with any experience managing the risks associated with a multi-billion dollar balance sheet and debt portfolio. And not one intervener has brought forward an expert with any credible experience working in the capital markets and dealing with investors. Manitoba Hydro has this expertise and therefore can assert that growth and

the continued expectation of growth are fundamental in order to relieve financial distress when it presents. Without growth, a business has lost the most vital tool a business has to get itself out of trouble, which in Manitoba Hydro's case means too much debt. The very best way to get out of this trouble is through growth; however, as explained in the application materials, in direct evidence throughout the hearing, and as summarized above, Manitoba Hydro cannot expect to do that anymore. As a result, the business, as compared to its prior forecast, has deteriorated.

Between 2017 and 2027, aggregate net income has gone from a positive $600 million to, on a like basis, a loss of almost $1.16 billion (not including any adjustment for the delay in Keeyask planned in-service). Mr. Harper understood this in his evidence; it is irrefutable (Transcript Pages 5406 to 5408).



Manitoba Hydro feels it is important to remind the PUB that there was no commitment at NFAT that if Manitoba Hydro got off track (with lower load growth, lower export price appreciation, higher capital costs, drought or other events) that the proposed rate path would remain at 3.95%. The 27 sensitivity scenarios reviewed at NFAT included compensatory rate increases to deal with downside scenarios. As noted in the footnote on page 5-3 of Exhibit MIPUG-13, Mr. Bowman's worst case scenarios included an assumption of 5.48% rate increases until 2032 to offset the hypothetical downside erosion that is now present in immediate effect. In other words, all of the analysis of NFAT said Manitoba Hydro was going to need to act if things do not go to plan. As demonstrated in MH16 Update with Interim, and throughout the GRA proceeding, things are not going as planned and, to reiterate Mr. McCallum's testimony cited above, Manitoba Hydro and the PUB must take action now.

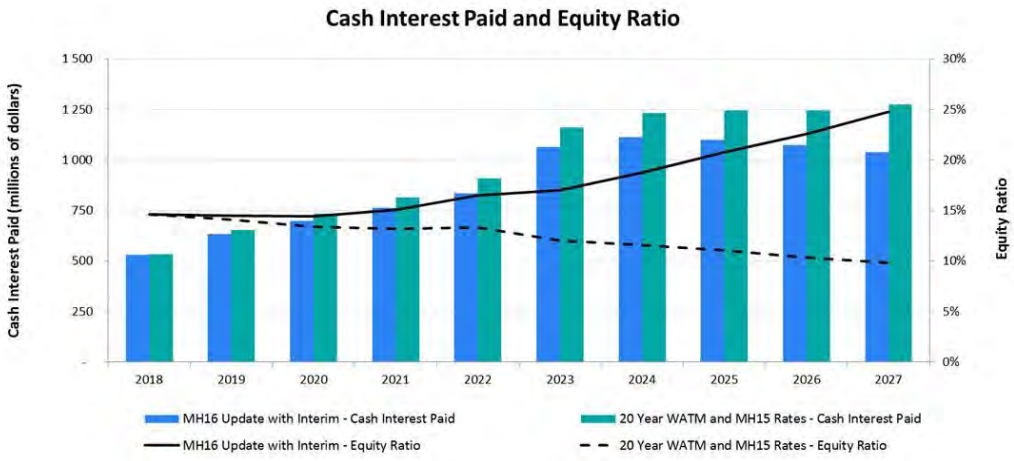
5 WITHOUT HIGHER RATE INCREASES MANITOBA HYDRO CANNOT SUPPORT ITS DEBT

5.1 Cost of Debt Financing is Manitoba Hydro's Largest Expense

As a capital intensive organization, Manitoba Hydro's assets drive its costs. Interest expense, incurred as a result of borrowing to fund asset investment, depreciation of assets and capital taxes drives over 60% of the current corporate cost structure. Slide 10 from Manitoba Hydro's Policy Panel Presentation, Exhibit MH-64, below, demonstrates the breakdown of the expenses on the income statement for the 2016/17 fiscal year.

Figure 5.1 Breakdown of Expenses

Source: Slide 10 of Exhibit MH-64



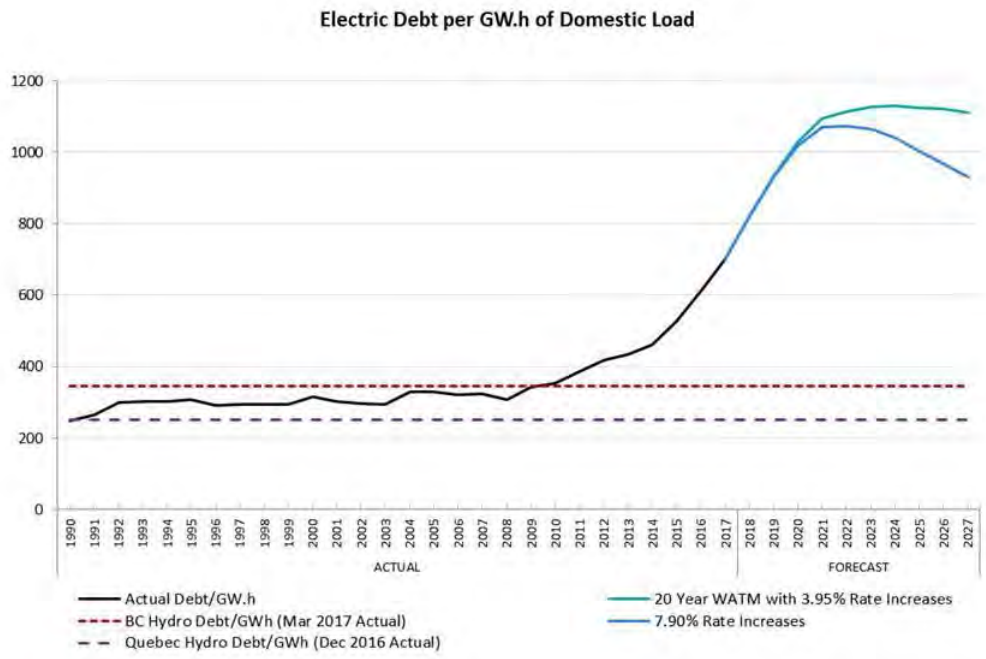
These costs will increase upon the completion of Bipole III and Keeyask adding nearly another $1 billion of annual depreciation and interest expense into Manitoba Hydro's revenue requirement once Keeyask is in service (PUB MFR 20).

Interest payments are, and will continue to be, Manitoba Hydro's largest requirement for cash outlays. As long as there are annual cash flow deficiencies, additional debt will be needed to fund the business and cash interest paid will increase. This connection

between cash flow and capital structure supports the need for a deliberate and sustained effort to restore the equity ratio (by lowering debt) in order to reduce the need for cash (and rate revenue) to fund interest costs. The amount of debt is the most significant driver of cash flow and financial health.

It is informative to consider the significant improvement to the Corporation's equity ratio, and cost-savings available to ratepayers resulting from the reduction in total interest by following the 7.9% rate path, rather than the 3.95% rate path, demonstrated by Figure 1.11 from Manitoba Hydro's Written Rebuttal Evidence, Exhibit MH-52.

Figure 5.2



Source: Exhibit MH-52, Page 16

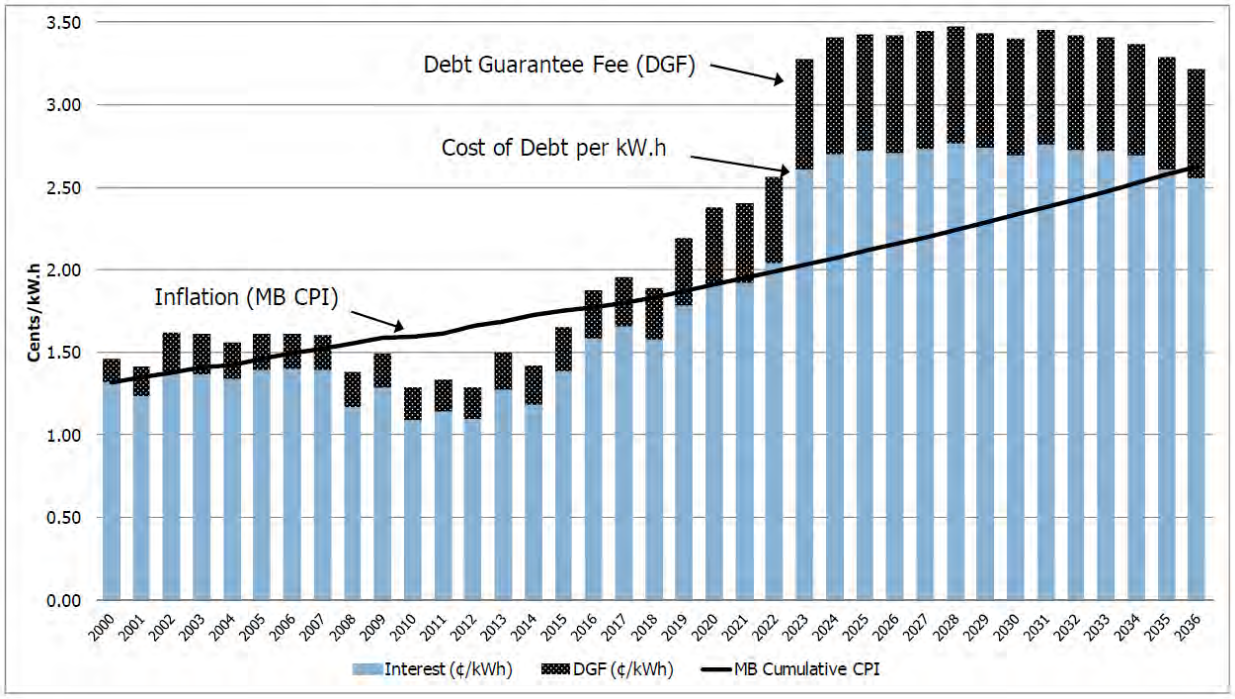
The negative net income and persistent annual cash flow deficiency under the 3.95% rate path contributes to an equity ratio decline of 5% (from 15% down to 10%) over the 10-year forecast period. In contrast, the 7.9% rate path generates surplus cash beginning in fiscal 2021, the cumulative cash flow deficiency is eliminated by fiscal 2022, the equity ratio begins to improve, and cash interest paid is lower in each year of the forecast and declines beginning in fiscal 2025.

5.2 No Precedent for Pending Level of Debt Burden on Domestic Customers

Manitoba Hydro's debt is growing out of all historical proportion to the size of the business. Manitoba Hydro's debt per gigawatt hour of domestic load or consumption has increased dramatically since 1990 as seen in Figure 1.16 of Exhibit MH-52.

Figure 5.3

Source: Exhibit MH-52, Page 25



As shown on slide 20 of Exhibit MH-64, in 1990 Manitoba Hydro had almost $250,000 of debt per gigawatt hour of annual domestic load. As borrowing increases for Keeyask and Bipole III, the debt per gigawatt hour of annual domestic load increases dramatically, and under a 3.95% rate plan this metric eventually climbs to over $1.1 million per gigawatt hour and remains at that level. Relative to the size of Manitoba Hydro's business, the Corporation is building to being roughly four times as indebted as it was immediately after the construction of Limestone. As compared to BC Hydro and Hydro Quebec, Manitoba Hydro is already much higher and will be multiples of their levels of relative indebtedness in the future. Domestic load is an appropriate measure by which to evaluate debt levels because it is a proxy for how much debt service will need to be carried by each kW.h of domestic sales. It is the domestic ratepayers that are responsible for this risk. If interest rates increase, every dollar of additional interest rate expense will need to be recovered from the domestic ratepayer. Understanding the degree of leverage which is placed upon domestic ratepayers is vital to appreciating the vulnerability of the situation. The MH16 Update with Interim rate path, beginning with the approval of the requested rate increases in this Application will begin to reduce the risk facing the Corporation and its ratepayers, but even this will not restore debt to the

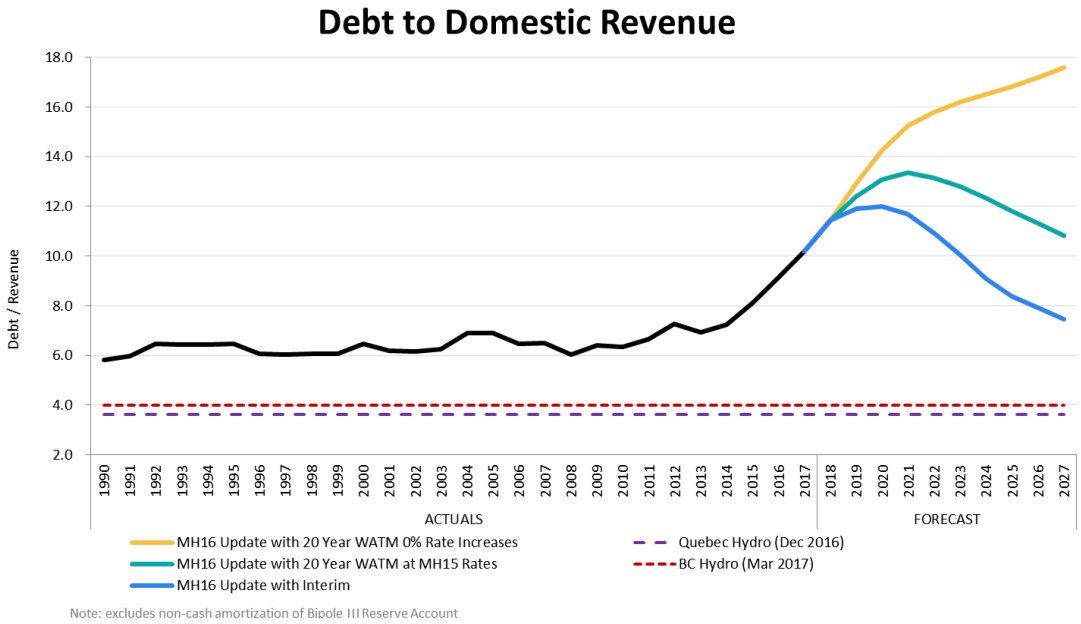
relative levels consistent with past practice, or to the levels consistent with its peers, BC Hydro or Hydro Quebec.

Figure 2 in the response to MH-MIPUG (Bowman) 23 illustrates the pressure debt is going to put on domestic ratepayers (reproduced below).

Figure 5.4

Figure 1: Manitoba Hydro Cost of Debt (Interest Payments & Debt Guarantee Fee) Comparison to MB CPI (cents/kW.h) MH16 w. Interim Update and MH15 Rate Increases – 2000 to 2036

Source: MH-MIPUG (Bowman) 23, Page 2



As can be seen from the chart above, the growth in the amount of interest expense per kW.h is dramatically outpacing inflation, notwithstanding declining interest rates from 2010 to 2017. This chart is prepared based on hydraulic generation. This chart is showing that the interest expense to be borne by each kW.h of generation will increase by more than 100% between 2018 and 2024. Were it to be done on domestic load at meter (which is the appropriate standard given where the liability for interest rate volatility resides), the pace of escalation would be even more dramatic. As shown in PUB MFR 18, cash interest paid in 2017/18 is approximately $900 million which would represent almost 60% of domestic revenue (including revenue allocated to the Bipole III

reserve). Therefore debt per kW.h is at least doubling for an annual cash burden that is already 60% of domestic rate revenue.

Manitoba Hydro has provided evidence demonstrating the interest costs as a share of domestic revenue. Once the major projects conclude and all of the interest flows through to the income statement, over 60% of each domestic revenue dollar is going to pay interest (Exhibit MH-64, Slide 21). There is not much revenue left with which to run the business and maintain assets. Should interest rates increase more than anticipated, this situation will only worsen, as shown in the Key Variable Sensitivity Impacts provided in the response to PUB/MH I-45.

The following chart from Exhibit MH-64 compares debt to domestic revenue.

Figure 5.5

Source: Exhibit MH-64, Slide 28

Similarly, the relationship of debt to domestic activity is critical as it is domestic customers who absorb 100% of the volatility that comes from any of the risks that face Manitoba Hydro's business including interest rates, water conditions and export prices. Since the in-service of Wuskwatim, debt has grown out of all proportion to Manitoba Hydro's business activities. This metric is now double historic norms for Manitoba Hydro and triple that of two of Manitoba Hydro's Canadian peers. MH16 Update with

Interim is more aggressive in bringing this relationship back toward pre-build norms however at the end of 2027 Manitoba Hydro still forecasts debt levels, on a relative basis, which are 30% above levels seen between 1990 and 2010. The 3.95% path does not make much progress on improving this metric. While domestic revenue goes up with the cumulative 47% rate increases over a decade, the lack of income and cash flow do not allow for debt retirement.

5.3 Debt Management Can't Mitigate Longer Term Risk

Manitoba Hydro must manage interest rate risk in order to control finance expense. In the short term this can be accomplished by managing refinancing risk through prudent debt management strategies. However, in the intermediate and longer term interest rate risk and finance expense can only be managed by reducing the total amount of debt. Manitoba Hydro's volume of debt is dependent upon the growth of the investment in assets. This growth must be funded by cash from operations or debt financing. The additional revenue generated by the requested 7.9% rate increase is a first step on a ten year path that, in the words of Mr. McCallum (Transcript Page 184), is "about getting our debt under some control to take some of the risk out of a perilous and unprecedented financial situation".

Manitoba Hydro will need to go to the markets to borrow between $19 and $23 billion over the coming decade which will increase the Corporation's exposure to interest rate risk. The table below illustrates borrowing requirements under two rate increase paths and is drawn from Exhibit MH-64, slide 36. Over the period, virtually all of Manitoba Hydro's debt will need to be initially borrowed and/or refinanced. This exposes ratepayers to risks from increases to interest rates. Should those interest rates increase unexpectedly, even in the order of 1%, this will have dire consequences for ratepayers.

Figure 5.6

In Billions of Dollars	MH Plan	3.95% / 12 Year WATM
2017/18 - 2021/22 Borrowing	$13.5	$14.1
2022/23 - 2026/27 Borrowing	$8.8	$9.7
2022/23 - 2026/27 Cash Flow	($3.1)	($0.4)
Total 10-Year Borrowing	$19.2	$23.4

Source: Exhibit MH-64, Slide 36

In the 2023-2027 timeframe, the higher cash flows from the 7.9% rate path limit new borrowing requirements by approximately $1 billion and create surplus cash of $3.1 billion that can be used to pay down debt as it comes due instead of refinancing debt. In contrast, there is virtually no debt retirement under the 3.95% rate path. As a result, all of this debt will be exposed to refinancing risk as it comes due. This was acknowledged by Morrison Park Advisors ("MPA") during cross-examination when Mr. Colaiacovo stated, *"Anything that is being refinanced within a period is subject interest rate risk within that period"* (Transcript Pages 5130 to 5131). Interest rate exposure will be lessened with a 7.9% rate path by removing $4 billion of debt from the balance sheet.

5.4 Debt to EBITDA is a Troubling Metric

Debt to EBITDA provides another way of understanding how much debt a corporation's cash flow is expected to service. Ratios of 6 and 7x are often considered highly leveraged. During cross-examination, MPA was referred the ratings methodology of Fitch Ratings (MPA Evidence filed on behalf of the Consumer's Coalition, Exhibit CC-17, Page 116) which describes Debt to EBITDA ratios of greater than 8x as *"Weaker"* and indicative of an insufficient rate structure. MPA acknowledged that Fitch Ratings would be looking for a suitable rationale for a corporation with a ratio of eight times, including perhaps investment in a major capital program, and admitted that if the ratio were in the order of 12 times, and projected to worsen to 13 times that they would expect after completion of the capital program that it would start to improve. (Transcript Page 5059).

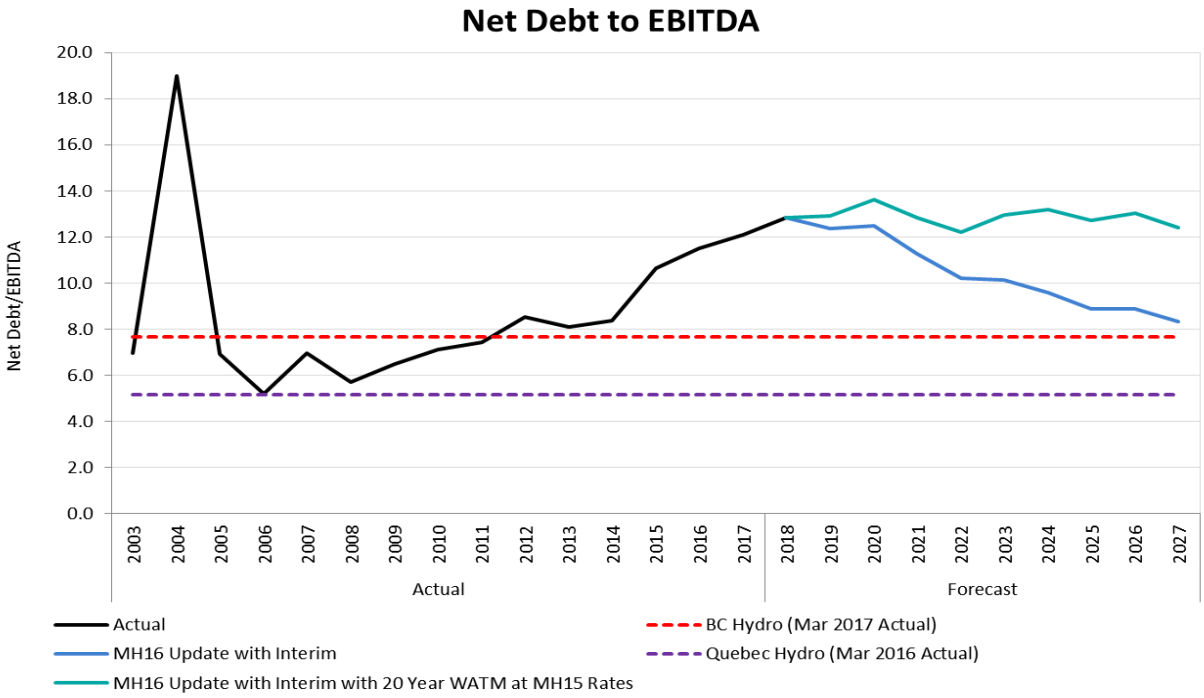
"MR. MATTHEW GHIKAS: Okay. And if we go to the weaker row, then, under that column, we see greater than eight (8) times debt with a suitable rationale can indicate deficient rate structure.

MR. PELINO COLAIACOVO: I -- I think you meant without a suitable --

MR. MATTHEW GHIKAS: Sorry, without a suitable rationale [can] indicate deficient rate structure?

MR. PELINO COLAIACOVO: Correct. And

MR. MATTHEW GHIKAS: Right. So – so you would expect that Fitch would be looking for a suitable rationale, for example, they had already been over eight (8) times for six (6) years.



MR. PELINO COLAIACOVO: And I think a suitable rationale is investment in a major capital program, and -- and that's what that is actually about.

MR. MATTHEW GHIKAS: And they would be looking for a rationale. Would you put it as the capital thing if the -- today it was a twelve (12) times and was going to get worse to thirteen (13) times?

MR. PELINO COLAIACOVO: Yeah, and --but they would expect that after the completion of the major capital expenditures, ***that would start to improve****."* (Emphasis Added)

The following graph from Exhibit MH-64 shows that Manitoba Hydro's debt to EBITDA has been steadily climbing even since before the start of the major build program.

Figure 5.7

Source: Exhibit MH-64, Slide 56

With a 3.95% rate path, this metric is forecast to reach nearly 14x before declining to the 13x range where it stays through 2027. This stands in stark contrast to what Mr. Colaiacovo asserts would be the expectation of ratings agencies who would expect to see recovery in the post-construction phase.

In 2003/04, when Manitoba Hydro lost over $400 million during a drought, the Debt to EBITDA ratio spiked to over 18x before returning to historic levels on the back of lofty export revenues. It should be very concerning to the PUB that under a 3.95% rate path, Manitoba Hydro will be building debt to a level directionally consistent with the temporary level reached during a terrible drought – a time when the PUB was so concerned about Manitoba Hydro's financial condition that it awarded the corporation a higher rate increase than requested (Order 101/04).

Mr. Colaiacovo spoke of the 2003/04 shock to cash flow in his testimony at Transcript Page 5053:

"MR. MATTHEW GHIKAS: And in your – in your testimony yesterday, in response to a question from member Kapitany …you referred back to the early 2000s. 2003, you believed went -- that was an extremely short, sharp shock in that period in the second lowest water year ever. Do you recall that generally?

MR. PELINO COLAIACOVO: Yes.

MR. MATTHEW GHIKAS: Okay. And you indicated that Manitoba -- Manitoba Hydro's cash flow plummeted through the floor?

MR. PELINO COLAIACOVO: That's correct.

MR. MATTHEW GHIKAS: And were you aware that during that period, this metric was only at nineteen (19) times?

MR. PELINO COLAIACOVO: That may well-- very well be the case."

MPA reports that the credit rating agency S&P regards Debt to EBITDA as one of two primary metrics that it focuses on with respect to cash flow (Exhibit CC-17, Page 33). MH16 Update with Interim takes action on this metric although by the end of 2027, it remains elevated from historic norms for Manitoba Hydro, above peers' current metrics and above levels categorized as evidence of rate inadequacy by Fitch Ratings.

5.5 Capital Markets Are Concerned with Rate Inadequacy

Manitoba Hydro's financial health and deteriorating financial metrics due to the imbalance between the growth of debt and lack of revenues have been of concern to its credit rating agencies.

In Moody's November 28, 2017 Report on the Manitoba Hydro Electric Board filed as Exhibit MH-61 in confidence, the rating agency states:

"While rates increases are nominally set on a cost-of service basis rate increases in recent years have clearly not kept up with costs as evidenced by ongoing weak financial metrics."

Additionally:

"As part of its debt management strategy, Manitoba Hydro targets certain financial metrics such as an interest coverage ratio greater than 1.8x and equity-

to-capitalization greater than 25%. However, both targets are not expected to be met for an extended period of time due to the large generation and transmission projects currently underway such as Keeyask and Bipole III and limited rate increases. For example on a last twelve month basis Moody's adjusted EBITDA to interest expense was 1.3x and debt to book capitalization was 88%. These financial metrics are among the weakest, if not the weakest, of any of Manitoba Hydro's peers, including vertically integrated provincially owned crown corporations in Canada."

In Exhibit MH-71 (DBRS Provincial Outlook Report November 28, 2017) it is reported that Manitoba Hydro's debt as a percentage of GDP is larger than its Canadian peers. In fact, by adding the Manitoba Hydro-Electric Board self-supported debt of 28.8% at March 31, 2017 (Exhibit MH-71, Page 95), to the Manitoba debt percentage of approximately 45% (Manitoba Hydro letter dated May 5, 2017, Exhibit MH-4, Page 6), Manitoba rivals Newfoundland for the highest debt burden as a percentage of GDP.

Rating agencies and investors clearly understand that elevated debt leaves an issuer much more susceptible to risks, particularly adverse interest rate movements. As noted in the response to PUB/MH I-45, Figure 4.4 - Key Variable Sensitivity Impacts to Retained Earnings filed in Tab 4 of the Application, has been updated based on MH16 Update with Interim Rate. The projected impact of a + 1% increase in Interest rates results in a cumulative decrease to retained earnings of $885 million to 2027/28. This results in the equity target not being reached until fiscal 2029 despite 7.9% rate increases for six years. MH16 Update with MH15 rate increases, with a greater debt burden, is prone to a greater degree of interest rate risk than MH16 Update with Interim. Given the 25% equity target is not reached until fiscal 2034 with the base case MH15 rate increases, a + 1% increase in interest rates would further pressure Manitoba Hydro's poor financial metrics.

5.6 Financial Targets Are Not Met Without Higher Rate Increases

On page 43 of their report (Exhibit CC-17), MPA makes a number of assertions about the sufficiency of various rate paths including the statement that:

"the 3.95% rate path is reasonably robust from a cash flow perspective for the first 10 years of the modeling period. After 2030, however, reducing the rate path down to 2% increase exposes the corporation to too much risk."

MPA goes on to states "It is not clear why annual rate increases were not kept at 3.95% for additional years beyond 2028/29 but based on this modeling, it would definitely be necessary." MPA points to sensitivity analysis drawn from PUB/MH II-41 and points out, in support of the need for the 3.95% rate increases to continue beyond 2028/29, that "net income actually becomes negative at the P20 position for more than half of the years of the model" (line 17-18, page 43).

The following table, sourced from PUB/MH II-41, sets out annual net income and EBITDA to Interest ratio (both under the MH15 rate path) at the P20 level for the years from 2028/29 to 2035/36 when the target equity ratio of 25% is nearly met (at the P50 level).

Figure 5.8

	MH16 Update with Interim at MH15 Rates							
	2029	**2030**	**2031**	**2032**	**2033**	**2034**	**2035**	**2036**
P20 Net Income	($130)	($73)	($53)	$16	$67	$137	$217	$216
P20 EBITDA to Interest	1.58x	1.64x	1.64x	1.70x	1.75x	1.83x	1.91x	1.93x

Source: PUB/MH II-41

The next table, sourced from Appendix 1.3 to Exhibit MH-52 lays out net income and the EBITDA to Interest ratio but instead at the P50 (i.e. reference) level. This scenario is MH16 Update with Interim with MH15 Rates and 20 Year WATM.

Figure 5.9

	Exhibit MH-52 (Rebuttal), Appendix 1.3							
	2024	**2025**	**2026**	**2027**	**2028**	**2029**	**2030**	**2031**
P50 Net Income	($222)	($176)	($226)	($160)	($91)	$17	$100	$182
P50 EBITDA to Interest	1.47x	1.52x	1.49x	1.54x	1.60x	1.69x	1.78x	1.87x

Source: Exhibit MH-52, Appendix 1.3

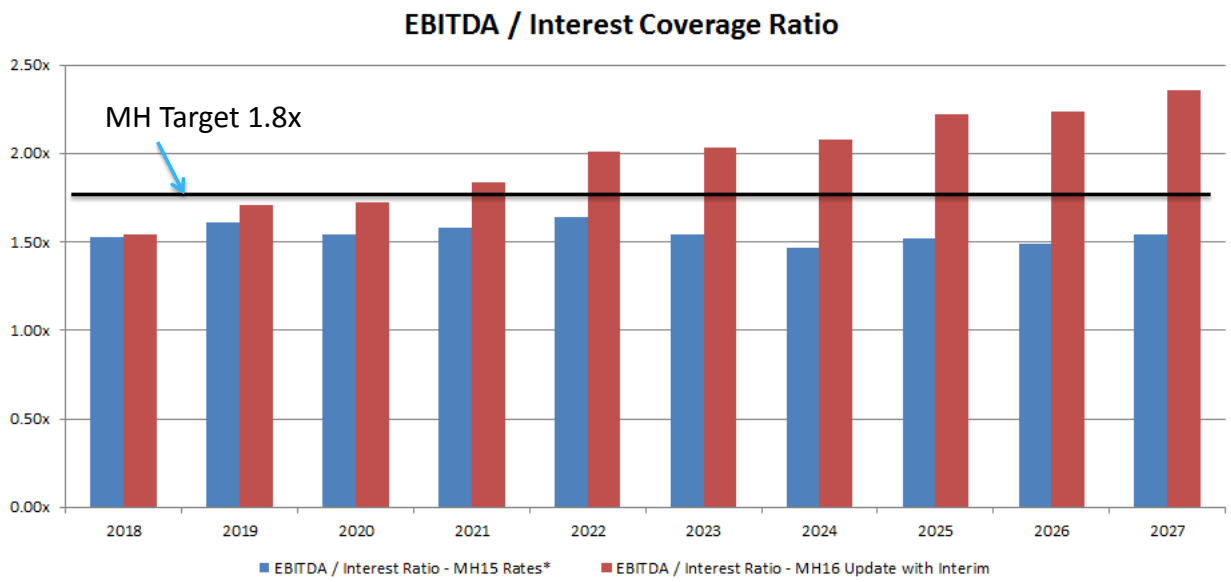
In comparing the two tables Manitoba Hydro notes a paradox in MPA's assertions on rate inadequacy. The *"reasonably robust"* rate path for the first 10 years produces large losses in the reference case for many years along with, for the most part, the EBITDA to Interest minimum target of 1.80x not being met. These losses are well in excess of the P20 level losses Morrison Park cites in support of it being *"too much risk to the corporation"* to reduce the rate path to 2% beyond 2028/29. Likewise the EBITDA to interest ratio is considerably lower. It is especially noteworthy that the income levels and EBITDA to Interest ratios cited as being *"too much risk"* occur at the P20 level meaning there is only a 20% chance (according to this analysis) that net losses would be worse. Meanwhile at the P50 level in the comparison, net losses are substantial larger and the interest coverage levels lower while having a 50% chance of being even worse and yet are *"reasonably robust"*. Manitoba Hydro is unable to reconcile how a forecast of comparatively modest losses and stronger interest coverage ratios with relatively lower likelihood can be deemed *"too much risk"* and yet larger losses that have a higher level of certainty of occurring are deemed *"reasonably robust"*. Manitoba Hydro is unable to reconcile how relatively stronger results much further in the future are a cause for concern while even larger losses and weaker metrics 5-10 years from now are *"reasonably robust"*. This is particularly confusing given the increases in potential variance are further into the future. For example, under the MH15 rate path, P50 net income for 2034 is estimated to be $530 million but with a range of a $207 million loss (P05) to $1.6 billion of net income (P95).

5.6.1 EBITDA to Interest

EBITDA is a very commonly used proxy for cash flow before any interest payments or capital expenditures. MPA describes it this way at page 8 of their report (Exhibit CC-17):

> *"The Interest Coverage Ratio…is often considered an important metric when assessing the credit-worthiness of an enterprise, because it provides information about the sufficiency of cash flow to cover interest cost….while this ratio serves as an <u>indicator</u> of the sufficiency of cash flow, it is an "accounting" measure and not a true "cash flow" measure of the results of the period for which the calculation is being made".* (Emphasis by MPA)

Manitoba Hydro concurs with the above statement. However, at page 42 to 43 of Exhibit CC-17, MPA states:



At the P01 position of the EBITDA to Interest plot on the 3.95% rate path, the ratio is never below 1. It should be noted that a ratio of 1 means that operating income is just sufficient to cover finance expense costs. In the parlance of the Moody's and DBRS, as long as Manitoba Hydro is able to continue to cover all of its costs – including operating costs and interest – it will continue to be regarded as "self-supporting", and not a burden to the Province"

MPA's use of the EBITDA to Interest coverage ratio in support of assertions regarding Manitoba Hydro's self-supporting status and overall rate adequacy is significantly flawed. An EBITDA to Interest coverage ratio of 1.0x on a sustained basis necessitates significant borrowing of new debt every year to meet sustainment capital needs and ongoing obligations. There is no argument that this is a financially prudent path or one that would be endorsed by capital markets participants as evidence of being self-supporting. Manitoba Hydro cannot continue to operate and generate EBITDA in the first instance without replenishing its assets. Manitoba Hydro cannot sell from inventory like another business can when its plant fails. Manitoba Hydro requires its assets to be in-service in order to generate revenue. During his testimony, Mr. Colaiacovo acknowledged that at an EBITDA to Interest level of 1.0x, no cash would remain, after meeting interest payments, to be used for any of capital expenditures, debt reduction, mitigation or City of Winnipeg liabilities (Transcript Pages 5068 to 5071). Exhibit MH-52, Figure 1.12 (reproduced in sub-section EBITDA to Cash Burdens below), demonstrates that the annual capital expenditures and other cash burdens on Manitoba Hydro are in a narrow range between $723 million and $822 million annually over the next 10 years. At an EBITDA to Interest level of 1.0x this would reflect, dollar for dollar, the incremental debt Manitoba Hydro would need to borrow to maintain its operations and meet its mandate.

Without an EBITDA to Interest ratio significantly above 1.0x, Manitoba Hydro is deficit funding its ongoing operations which, if sustained, is the very definition of not being self-supporting.

The following chart compares Manitoba Hydro's EBITDA to Interest ratio under MH16 Update with Interim and the same scenario with MH15 rates and 20 Year WATM (Exhibit MH-52, Appendix 1.3):

Figure 5.10

Source: Exhibit MH-52, Appendix 1.3

As can be seen from the above, under the 3.95% rate plan, Manitoba Hydro never reaches its minimum target and in fact barely crosses 1.50x throughout the period and with no pattern of improvement particularly after the in-service of Keeyask. Manitoba Hydro expects this would be deeply concerning to bond investors who watch trends carefully.

The table is a reproduction of Figure 1.10 from Exhibit MH-52, page 15. It sets out Manitoba Hydro's cash flows under the MH15 rate plan (Exhibit MH-52, Appendix 1.3):

Source: Exhibit MH-52, Appendix 1.3

As can be seen, and comparing with the EBITDA to Interest graph above, an interest coverage ratio in the order of 1.50x following the 3.95% rate path translates to significant, repetitive cash flow deficiency. Over the 10 year horizon, the ongoing operations of Manitoba Hydro require $1.1 billion of additional borrowing over and on top of the borrowing necessary to complete the major capital projects. In only one year (2021/22 at $12 million) does Manitoba Hydro generate any positive cash flow from its operations.

EBITDA to Interest Coverage is often regarded as a solvency metric in that it indicates a company's ability to service its interest costs out of operating earnings (before non-cash depreciation expense). However, as a test of financial durability and cash flow sufficiency, the metric has important shortcomings. It presumes that the cash interest requirements of the business can assert primacy over all the other cash burdens on the company such as capital reinvestment or payment of other contractual liabilities. In actual fact, EBITDA Interest Coverage does not consider that, other than under very short time frames, Manitoba Hydro must fund both its interest costs and its capital and other requirements. As Mr. McCallum noted (Transcript Page 225) *"When elements of the system wear out and fail, which happens every day, we have to replace them or we are not meeting our commitments to Manitobans."* If Manitoba Hydro does not have sufficient cash flow after interest payments to fund its ongoing capital and other cash

needs then it cannot support its revenue and meet its mandate without borrowing money.

Mr. Colaiacovo, at Transcript Page 4944, describes Manitoba Hydro's EBITDA to Interest target of 1.8x as *"reasonable because it's consistent with targets that public power utilities in the United States use, and one point five (1.5) to two (2) times, as Moody's recognizes is a reasonable target for a – a public power utility."* Likewise, at slide 33 of MPA's direct evidence (Exhibit CC-45), MPA asserts that *"1.8x is a "healthy" margin that gives comfort that under "normal" conditions, Manitoba Hydro will have* ***plenty of cashflow to satisfy obligations****"* (Emphasis Added). MPA further states that *"for Public Power Utilities 1.5x to 2.0x interest coverage is consistent with an "A" rating"* by Moody's. This stands in direct contrast to page 9 of Exhibit CC-17 wherein at line 13-15 wherein it is stated *"This measure alone does not clarify whether the company's debt is increasing, since there is no information captured in this metric about the size of capital expenditures".*

Manitoba Hydro asserts that the Moody's test is not EBITDA to interest but rather debt service coverage given that is how it clearly labeled in the referenced Moody's report. Mr. Colaiacovo acknowledged this at transcript page 5072. During cross-examination, Manitoba Hydro questioned Mr. Colaiacovo as to whether adjusted debt service coverage included principal payments:

> *"MR. PELINO COLAIACOVO: Not always. It actually just depends on the arrangements of the Utility.*
> *MR. MATTHEW GHIKAS: In common financial discourse debt service generally includes interest and principal, doesn't it?*
> *MR. PELINO COLAIACOVO: So it depends on your financial arrangements. Debt service coverage ratio is a typical term but in some instances debt service coverage ratio refers only to interest and some instances it refers interest and principal"* (Transcript Page 5072).

Manitoba Hydro submits that the evidence in this respect is unclear as to whether Moody's debt service coverage test would be applied to Manitoba Hydro using a calculation of interest or interest and principal payments. Nonetheless, even by the less stringent measure, Manitoba Hydro does not sustain itself at even the bottom end of

Moody's standard on a sustained basis and in fact does not meet its own internal target of 1.8x until 2030/31.

5.6.2 EBIT to Interest

The following table shows Manitoba Hydro's key financial metrics as well as other informative metrics.

Figure 5.12

Financial Ratios:	2017/18	2018/19	2019/20	2020/21	2021/22	2022/23	2023/24	2024/25	2025/26	2026/27

Source: Exhibit MH-64, Slide 53

Mr. Bowman points to the EBIT / Interest ratio as:

> *"the normal regulatory basis for determining an annual Revenue Requirement. The best metric used by Manitoba Hydro to measure this is the previous EBIT Interest Coverage ratio. Achieving an EBIT Interest Coverage ratio above 1.0x means that debt costs for the year can be funded from revenues for the year. The previous EBIT Interest Coverage ratio targeted 1.2 or better, reflecting a cushion above break even"* (MH-MIPUG (BOWMAN)-12).

The preceding table demonstrates that the 3.95% rate plan which Mr. Bowman advocates grossly fails his preferred test. Under the MH15 rate plan, Manitoba Hydro's EBIT to Interest ratio declines below 1.0 indicating, according to Mr. Bowman, that debt costs are not being funded by revenues.

More importantly, as Ms. Stephen testified (Transcript Page 953), Moody's has expressed concern to Manitoba Hydro with respect to the EBIT ratio falling below 1 for several years under a 3.95% rate plan. Ms. Stephen also testified that Moody's cautioned that if Manitoba Hydro is viewed as being unable to service its debt, and no steps are taken to mitigate the circumstances, the rating agency may change the self-supporting status of Manitoba Hydro's debt.

5.6.3 Capital Coverage Ratio

Mr. Bowman asserts that because the Capital Coverage Ratio is greater than 1.2x under the MH15 rate plan that Manitoba Hydro is attaining its goal to *"meet all financial obligations including debt service and capital reinvestment out of the revenues of the Corporation"*. However, as noted in its evidence, there are shortcomings in Manitoba Hydro's capital coverage ratio which must be recognized in order to properly determine the ratio.

Firstly, certain projects are included in *"Major New Generation and Transmission"* by virtue of their individual size resulting in the true sustainment capital needs of Manitoba Hydro's operations being understated. The exclusion of other non-discretionary cash payments such as mitigation, development and other liability payments and the annual payment to the City of Winnipeg compounds the understatement.

Secondly, without making any adjustment for capitalized interest on funds borrowed to finance reliability and sustainment projects like Bipole III, cash flow from operations (the numerator in the formula) essentially excludes the interest paid which is an immediate and ongoing cash outlay by the Corporation. Mr. Bowman's conclusion that the capital coverage ratio is maintained at or above target (1.2x) for the entire 20 year forecast under the 3.95% rate path (Pre-Filed Testimony of Patrick Bowman, on behalf of the Manitoba Industrial Power Users Group, Exhibit MIPUG-13, Page 5-10) fails to make the adjustments noted above or to acknowledge the declining trend line over the forecast period. Mr. Bowman asserts at lines 24-26, page 4-5 of MIPUG-13 that after 2022/23 Manitoba Hydro would be *"rapidly retiring debt"* in the absence of Major New Generation and Transmission investments. In fact, as demonstrated in the table above (Exhibit MH-64, Slide 53), Manitoba Hydro's net debt actually grows by $300 million

between 2022/23 and 2026/27 under the MH15 rate plan disproving Mr. Bowman's assertion that a sufficient capital coverage ratio is indicative of *"rapidly retiring debt"*.

5.6.4 EBITDA to Cash Burdens

Manitoba Hydro's ongoing, repetitive capital and other cash obligation needs in its core operations are anticipated to range between $700 million and $800 million per year as noted in the line *"Capital and Other Needs"* from the table below. This table reproduces Figure 1.12 of Exhibit MH-52 wherein the EBITDA interest coverage ratio is adjusted to include all the fixed burdens on Manitoba Hydro under the MH15 rate path. As can be seen, and consistent with its evidence that it is and will be *"deficit funding"* its core operations, other than in 2021/22 Manitoba Hydro never reaches parity or 1.0x wherein it has sufficient EBITDA to meet all of its cash obligations.

Source: Exhibit MH-52, Page 19

Under the MH15 rate plan, Manitoba Hydro never reaches parity or 1.0x wherein it has sufficient EBITDA to meet all of its cash obligations.

At page 54 of Exhibit MH-64, Manitoba Hydro also presented this illustrative ratio under the MH16 Update with Interim rate path wherein by 2019/20 Manitoba Hydro is

essentially cash flow break-even and by later in the forecast has an adequate cushion which can be used to deleverage and de-risk unsustainable debt loads.

5.7 Past Leverage Levels of No Current Relevance

Mr. Osler provided testimony attempting to put Manitoba Hydro's current circumstance in historical context. A large basis of the comparison was to the post-Limestone period (early 1990s onward) wherein Manitoba Hydro emerged from a period of major investment with an extremely low debt:equity ratio. Mr. Osler explains how this made sense in customary regulatory practice and should serve as a guide for the patient restoration of Manitoba Hydro's financial health in the current period.

The circumstances of the Limestone-era are vastly different from the scale of issues facing Manitoba Hydro at present. Mr. McCallum outlined these at Transcript Pages 184 to 186:

> *"After Limestone, we had $4 1/2 billion of debt. That was about ten thousand dollars ($10,000) of debt per customer. Today we have thirty- five thousand dollars ($35,000) of debt per customer. We're heading to about forty-two thousand dollars ($42,000) of debt per customer, four (4) times higher…*
>
> *In the ten (10) years after Limestone, we had net income of almost $1 billion. Those are in then dollars, not even adjusting for inflation over twenty (20) years. That was earning -- earned operating a business that averaged about $5 billion*

of net plant in service over that decade. It was earned operating a business in a significantly higher rate interest environment, three (3) to four (4) times higher, and in a decade where we enjoyed above-average water conditions in two (2) of the ten (10) years.

Let's turn to the 3.95 percent plan… our business is five (5) times larger. Our relative debt levels are four (4) times greater… instead of making the… 1 billion we did in the decade after Limestone, instead, if things go well, lose 400 million. The suggestion we were in the same place as we have been before is preposterous."

The addition of the Limestone generating station, for $1.43 billion (Manitoba Hydro's Written Rebuttal Evidence on the MGF Report, Exhibit 117, Appendix A), reflected roughly a 40% increase[6] to the plant in service of the Corporation. The additions of Keeyask, Bipole III and MMTP reflect a $14.2 billion combined investment (Appendix 3.1 of the Application, page 51) which more than doubles the in service asset base of today.

In summary, the scale of assets and debt being added to Manitoba Hydro relative to its pre-existing operations is entirely different. In every respect, the financial impact of Manitoba Hydro's development plan dwarfs that of Limestone and comes on the heels of a prolonged period of insufficient rates. Therefore the financial plan necessary to absorb this growth in the business must be dramatically different.

[6] Transcript page 185 notes an average $5 billion net plant in service in the decade after Limestone.

6 FINANCIAL TARGETS AND THE ROLE OF RESERVES IN MANAGING FINANCIAL HEALTH

6.1 Overview of Financial Targets

As discussed in Tab 4 of the Application, Manitoba Hydro has revised its primary financial targets following internal review and an external review by KPMG in May, 2015. These targets are described below.

6.1.1 Equity Ratio:

The debt:equity ratio measures the relationship of long-term and short-term debt to equity. Effectively, Manitoba Hydro's calculation of its debt:equity ratio compares net debt to total capital (calculated as net debt plus equity). This ratio identifies the capital structure of the Corporation and assesses the overall financial risk to Manitoba Hydro.

As indicated in Appendix 4.1 of the Application on page 16, the capital structure as measured through the debt:equity (or debt to capital) ratio is universally accepted by the capital markets and financial and investment industry as one of the primary measures of financial strength.

Manitoba Hydro's objective is to maintain the appropriate balance between debt and equity. An adequate level of retained earnings is required to withstand the financial impacts of risks faced by Manitoba Hydro, including but not limited to drought and water flow, and is an important consideration in credit ratings and financing costs.

Manitoba Hydro's current debt:equity target of 75/25 is a reasonable long-term target. KPMG did note that a target of 70/30 would provide additional financial strength to address the utility's unique financial challenges and risks and recommended that the debt:equity ratio should fall within the range of 75/25 to 70/30. Following an internal review in 2016, the Manitoba Hydro Electric Board and senior management team determined that the target should remain at 75/25, and that the Corporation should target attainment of the 25% equity in a period not longer than 10 years in order to reduce the financial risks to the Corporation (Tab 4, page 7).

6.1.2 Interest Coverage Ratio:

The Interest Coverage Ratio assesses the degree to which Manitoba Hydro can meet its interest obligations with the operating income generated annually. An EBITDA-based metric includes the cash flows associated with the accounting of depreciation and

amortization expense in the numerator of the interest coverage calculation. As these cash flows can be used to make interest payments, this indicator uses an approach for calculating coverage that is more cash-flow based than that using EBIT.

EBITDA, however, is not an exact measure of cash flow since it does not incorporate capital expenditure requirements or working capital adjustments. Nevertheless, it is closer to a cash-flow metric than EBIT.

KPMG recommended a minimum EBITDA interest coverage ratio at a target level of 1.8 or greater. Previously, Manitoba Hydro had maintained a minimum target for the EBIT interest coverage ratio of 1.2. The KPMG recommendation for an EBITDA interest coverage ratio with a minimum target of 1.8 was adopted by the Manitoba Hydro Board in December, 2015.

6.1.3 Capital Coverage Ratio:

The Capital Coverage Ratio measures Manitoba Hydro's ability to fund its sustaining capital expenditure (e.g. ongoing maintenance and replacement capital expenditure "capex"), excluding Major New Generation and Transmission, from its current cash flow from operations. KPMG found that the current target of 1.2 or greater for the capital coverage ratio is reasonable, and the Manitoba Hydro-Electric Board endorsed the ratio and target in December 2015. An inherent limitation of this ratio is that it does not reflect the financial challenges associated with major expansion programs. Hence it may be misunderstood or misinterpreted by stakeholders.

6.2 Financial Targets are a Measure of Financial Health

Achieving and maintaining financial targets is important for the financial health of the utility, supporting the interest of domestic ratepayers who ultimately bear the cost of operating, maintaining and renewing the system. Given the credit support provided to Manitoba Hydro by the Province of Manitoba, it is also fundamental that Manitoba Hydro be self-supporting in the eyes of credit rating agencies and lenders to avoid the unacceptable risk of having the Province's cost of borrowing impaired and implicitly or explicitly having to subsidize the continued financial viability of the electricity system. Presently, Manitoba Hydro enjoys a cost of financing that is significantly lower than what it could obtain without the Provincial Guarantee, while the quantum of borrowing required would likely be unattainable given the Corporation's current credit profile.

The equity ratio along with an EBITDA coverage ratio and a Capital Coverage ratio are conventional measures of financial health and credit-worthiness. Positive cash flow from operations inclusive of servicing debt is also relevant to a determination of self-supporting status.

As indicated in the response to PUB/MH I-42, Manitoba Hydro's financial targets are set in the context of being a government-owned entity with a modified cost of service rate regime. As such, targets are set based on a minimum level of financial strength that reasonably minimizes the risk of any contagion impact of the Corporation's financial profile on the credit rating and/or borrowing costs of the Province of Manitoba as well as ensuring Manitoba Hydro has the wherewithal to absorb adverse conditions such as below average water conditions or rising interest rates, or event risks such as asset failures, without having to look to ratepayers for emergency relief.

Such wherewithal stems from appropriate levels of income, cash flow and reserves. Manitoba Hydro's equity position can only be enhanced through net income and, as such, building an adequate equity position over a reasonable planning horizon. This is particularly critical in the early years of the current financial plan where the capacity to absorb risk is low due to current deficiencies in income and equity levels along with an unavoidable escalation in debt and operating costs as two major new projects are completed and commissioned. Attainment and maintenance of a 75/25 debt equity ratio also positions Manitoba Hydro to manage its unique set of risks including hydrology risk, export market risk, interest rate risk and its limited financial flexibility.

6.3 There is No Need to Adjust Targets for Purposes of Ratemaking

At Transcript Page 4938, Mr. Colaiacovo of Morrison Park Advisors ("MPA") states:

> *"And I would suggest that having a rule of some kind would help guide rate-making and allow you to make the kind of determination that I think you would like me to offer."*

Manitoba Hydro has established financial targets for the purposes of guiding, managing and reporting on its financial health. The financial targets used by Manitoba Hydro were established with the assistance of recommendations from two leading, globally

recognized experts (RBC Dominion Securities in 1995, KPMG in 2015). MPA asserts that some new vaguely defined *"rule"* is now required to address an unsupported argument of deficiency in Manitoba Hydro's current practices.

The PUB has acknowledged the importance of Manitoba Hydro having a sound plan to return to financial strength, and endorsed the 75/25 debt:equity ratio. For example, in Order 101/04, the PUB provided the following comments on Manitoba's Hydro's debt to equity financial target:

> *"Achieving a debt:equity ratio of 75:25 would provide increased rate stability benefits, and hold down financial charges. The 75:25 benchmark represents a modest target, one comparable with the current debt:equity ratios of similar Crown hydroelectric utilities in other Canadian provinces (BC Hydro and Hydro-Quebec). In summary, meeting this target within a reasonable period of time would reduce long-term pressure on domestic electricity rates, better assure bondholders and thus constrain financial charges and provide a hedge against a future drought"* (Page 31 of PUB Order 101/04).

The PUB also commented on the importance of Manitoba Hydro's financial strength in Order 116/08:

> *"It is the Board's [PUB] understanding that rating agencies look prominently at MH's financial strength in assessing the credit rating of the Province. A weakening of the financial strength of MH would not be viewed favourably by those credit agencies and may have implications impacting the credit rating of the Province, making provincial borrowing more expensive. Such a development would not be in the public interest"* (Page 130 of Order 116/08).

The PUB reiterated the importance of Manitoba Hydro's Financial Strength in Order 43/13:

> *"The Board is concerned that, by moving towards a 90:10 debt-to-equity ratio by the end of the decade, there will be an insufficient retained earnings*

reserve to deal with droughts and other risks such as infrastructure failure or rising interest rates….

The Board notes that Manitoba Hydro shares the benefit of the flow-through credit rating of the Province, which affords it preferential interest rates on its debt and access to funds to meet its major capital spending program. However, as its debt grows, there is a potential for Manitoba Hydro's financial condition to affect the credit rating of the Province. It is important that Manitoba Hydro remains a financially strong and viable organization" (Page 23 of Order 43/13).

6.4 The Role of Reserves in Managing Manitoba Hydro's Risks

At numerous points in the evidence, Manitoba Hydro as well as a number of intervenors acknowledged that reserves are essential to the corporation and in fact required by Section 40 of the *Manitoba Hydro Act*. Mr. Bowman acknowledged that operating with little or no equity is not a good idea and that it is clear that Manitoba Hydro requires substantial reserves:

"MR. MATTHEW GHIKAS: Right. Now, in terms of your reference to the many Crown utilities, both electrical and other, that have operated for long periods with little or no equity, first of all, irrespective of whether there have been other entities operating with little or no equity over time, doesn't necessarily mean that's a good idea when it comes to Manitoba Hydro, does it?

MR. PATRICK BOWMAN: I'm not suggesting this statement is -- is setting out that it's a good idea. I'm suggesting this statement is setting out the fact that -- that it's possible. And, as matter of fact, the very next line says ***it is clear Manitoba Hydro requires relatively substantial reserves"*** (Emphasis Added) (Transcript Page 6279).

Mr. Coloaiacovo of MPA stated:

"So, you know, you always want to make sure that in a challenging scenario, you have enough reserves" (Transcript Page 4942)

And later

"There's no question that Manitoba Hydro requires reserves. The only thing that we're debating is what the size of those reserves should be" (Transcript Page 5138).

As Manitoba Hydro's cash deficit evidence has amply demonstrated, current rates are not adequately funding maintaining operations and reinvesting in the utility (see Section 2.1.2 for further information regarding cash deficits).

MPA has asserted that reserves are important and that the 3.95% rate path appears *"reasonably robust"*. Manitoba Hydro notes that the trajectory of net income under the 3.95% rate path forecast over the next 10 years is worse than the net income actually earned by Manitoba Hydro over the prior 10 years. As such Manitoba Hydro sought to at least have MPA defend the conclusion that historic cash flows and income levels created or maintained sufficient financial reserves as a precursor to evaluating the sufficiency of the forward projection. At MH/Coalition (MPA) – 16, MPA responds:

> *"MPA does not assert that historic cash flows and income levels created "sufficient" financial reserves, merely that any reserves (or "equity") that are in place were the result of ratepayer contributions".*

As demonstrated at slide 66 of Manitoba Hydro's Policy Panel Presentation, Exhibit MH-64, Manitoba Hydro's net income has been dropping precipitously in the last 10 years notwithstanding above average water conditions, declining interest rates and a growing asset base. This is evidence that no contribution to reserves is being made in rates charged to current ratepayers. Moreover, the analysis Manitoba Hydro provided in response to new evidence introduced in the hearing by MPA reinforces the erosion of reserves over the last 5 years. Ignoring the impacts of the major capital projects, rate inadequacy has led to debt increasing 20% while equity <u>decreased</u> 10% resulting in a 5.4% decline in Manitoba Hydro's equity to debt ratio just as a result of core operations.

Figure 6.1 Deterioration in Capital Structure

	Net Equity	Net Debt	Equity Ratio	Debt Ratio	Accounting Standard
2017 Capital Structure per MPA Adjusted Analysis	$3,289	$8,961	26.8%	73.2%	Adjusted
Conawapa Construction Work in Progress	$0	($379)			
Bipole III Deferred Revenues [1]	($196)	$196

Source: Exhibit MH-135, page 6

Looking forward, the following **Figure 6.2** compares Manitoba Hydro's retained earnings from the MH16 Update with Interim scenario which assumed 20 year debt and the previous plan's 3.95% rate increases (MH Exhibit #52, Appendix 1.3, page 3) to the retained earnings as at March 31, 2017. **Figure 6.2** shows that customer revenues are just sufficient to make modest annual contributions to retained earnings until 2022, but that following Keeyask in-service, financial losses deplete retained earnings to a level below the current $2.7 billion at March 31, 2017.

Figure 6.2 Manitoba Hydro Retained Earnings at 3.95% Rate Increases

Depletion of retained earnings is evidence customer revenues are not sufficient to cover the operating and carrying costs of assets. Manitoba Hydro must borrow to cover these costs on top of the increased leverage resulting from the investments in Bipole III and Keeyask.

At MH/Coalition (MPA)–16(c), Manitoba Hydro asked how MPA concluded that the 3.95% rate plan effectively contributes to financial reserves to manage unforeseen risks or rate stabilization and received the following response:

"MPA does not make that conclusion…."

Rates must be set inclusive of proper reserve contributions. This comes in the form of a rate path that is expected to generate positive net income in normal water flow years.

At Transcript page 4941, Mr. Colaiacovo appears to agree that the forecast ought to include the assumption of progress on financial targets in normal water years:

> *"And if the rates are high enough, well, then, that helps guide you to a- -- a decision that those rates are sufficient. Then, you would also ask yourself, if water was at more typical levels over that period, over that five (5) or seven (7) year period, what would be the effect? Would it be -- would we be making progress on our financial targets more broadly? Would be -- we be repaying capital?"*

That reserves come in the form of ongoing expectations of net income (and cash flow) is critical given, as demonstrated above and confirmed by Intervener witnesses, retained earnings is non-cash and powerless to abate debt growth in the face of financial distress, poor hydrology or forecast error.

During NFAT, MPA (then as IEC to the PUB) made this statement at page 38, lines 15-18 of its January 2014 report (included as Tab 8 of Manitoba Hydro's Book of Documents #1, Exhibit MH-116-1):

> *"Retained earnings are driven in part by the rates approved by the PUB for electricity in Manitoba, which nominally should include a "return on equity" component in order to ensure that Manitoba Hydro actual (sic) earns net income that can be retained."*

Likewise at NFAT, in the response to PUB/MPA 1-030 (a) (included as Tab 3 of Exhibit MH-116-1) as follows:

> *"Since Manitoba Hydro's cash flows fluctuate dramatically with hydrology and export prices, and* ***Manitoba Hydro's target equity ratio is a comparatively thin 25%****, the use of an equity risk premium as low as 4.5% is notable. On the other hand, Manitoba Hydro is governed by "cost of service" legislation, which nominally requires Manitoba ratepayers to bear all of Manitoba Hydro's costs, and Manitoba Hydro benefits from a Province of Manitoba guarantee of substantially all of its debt. Assuming the legislation is accepted at face value and domestic rates could rise to whatever level were required at any given time to*

> *maintain Manitoba Hydro solvency, under any circumstances, then a legitimate question is whether an "equity risk premium" is applicable? On its face, the legislation coupled with the provincial debt guarantee suggests that there is no risk to equity, and hence the premium should be 0%.* ***In reality, however, rates do not rise and fall annually, but are smoothed over time. This suggests that equity returns should be built into rate structures to provide a cushion for inevitable swings in cash flow that derive from non-controllable events, such as hydrology and export prices. Moreover, the possibility of prolonged financial distress also suggests that equity premiums (and a healthy equity ratio target) are required."*** (Emphasis Added))

Manitoba Hydro was perplexed by the new assertion MPA makes in these proceedings, as an Intervener expert witness, that now reserves ought to only be maintained for hydrology risks (Transcript Page 4911). MPA takes the position that it is not appropriate to address interest rate risk or export price risk through reserves on the basis that because interest rates change slowly, Manitoba Hydro does not have large quantums of debt subject to interest rate risk in any one period, and that export prices cannot be forecast in the longer term due to unidentifiable technology change. As a result, MPA concludes (Transcript Page 4913) that the financial impacts of these risks cannot be smoothed over the longer term. Of interest, at Transcript Page 5011 Mr. Colaiacovo confirms that export prices and interest rates are *"noncontrollable"* which would be precisely the argument he makes at NFAT (per above quote) as necessitating a rate structure that contributes to reserves such that rates can be *"smoothed over time"*.

In Manitoba Hydro's view, neither the current rate increase request nor the Corporation's longer term financial plan are intended to shield customers from legitimate and enduring changes in cost drivers over the long term by absorbing them into reserves. Manitoba Hydro's objective in this Application has been quite the opposite – the request to advance rate increases from 3.95% to 7.90% is specifically intended to address the reductions in revenues attributable to reduced expectations for domestic load growth and export prices. As Mr. Shepherd indicated *"…[Manitoba Hydro] missed a great opportunity to add to our reserves and avoid more debt by taking advantage of many, many years of excellent water conditions which should have been used to boost net income."* (Transcript Page 243).

MPA's conclusion that *"…the amount of [Manitoba Hydro's] debt that is exposed to interest rates in any one (1) year is a relatively small portion; notwithstanding the fact that they're in the midst of issuing a lot of debt."* (Transcript Page 4911) is incorrect. Slide 62 of Exhibit MH-68 and pages 12-13 of Manitoba Hydro's Written Rebuttal Evidence (Exhibit MH-52) indicate that assuming adoption of a 7.9% rate path, between 2018 and 2022, Manitoba Hydro is projected to borrow $13.5 billion This means that a moderate 100 basis point (1%) increase in interest rates over that forecast in MH16 Update with Interim will result in an increase to finance charges of $130 million annually (not including the compounding effects over multiple years) or an equivalent one-time rate increase of 8%. Under a 3.95% rate path, the amount of new borrowing and refinancing risk exposure over the first five years of the forecast increases to over $20 billion. In Manitoba Hydro's respectful submission, $13 billion of new borrowing and refinancing over the next five years is not a *"small portion"* of Manitoba Hydro's net debt (forecast to end 2017/18 at $18.5 billion per Appendix 3.8) and should be considered in addition to the risk of drought in setting an appropriate level of reserves.

Manitoba Hydro noted with great interest MPA's disagreement in this proceeding with Manitoba Hydro's view that when managing distress caused by events such as drought, the critical issue is the magnitude of the outstanding debt on the balance sheet, not the size of the retained earnings:

> *MR. MATTHEW GHIKAS: Okay. Now, I'd suggest to you that when it comes to managing distress that comes with an event such as drought, the critical issue is the magnitude of the outstanding debt on the balance sheet, not the size of the retained earnings.*
> *MR. PELINO COLAIACOVO: I don't think I would necessarily agree with you.* ***I don't think magnitude of debt in isolation has any relevance.*** *Debt in relation to assets so, you know, if your assets are highly leveraged it wouldn't matter but if you have $50 billion of assets and $25 billion of debt is 25 billion an important number? I don't actually think so. So the magnitude of the debt in isolation is just a fact.* (Emphasis Added) (Transcript Page 4991)

MPA's evidence in this regard once again directly contradicts its response provided to its current client (Consumers Association of Canada) during the NFAT proceeding when, acting in the capacity of PUB Independent Expert Consultant it stated:

> ***"The critical issue is the magnitude of outstanding debt on the balance sheet, not the size of the retained earnings.*** *In the event of a persistent revenue shortfall caused by prolonged drought, for example, interest charges related to a large outstanding debt represent a real call on cash flow. A large pool of retained earnings in this environment would be beneficial in that the company balance sheet potentially could sustain a series of annual losses, but balance sheet retained earnings bear little relationship to the availability of cash resources"* (NFAT IR CAC/MPA-13 reviewed during cross-examination by Mr. Ghikas, (Emphasis Added) (Transcript Page 4992).

Upon being presented with this contradictory statement during cross-examination by Mr. Ghikas (Transcript Page 4992), while no explanation was provided for this dramatic about-face, MPA did acknowledge that retained earnings are not cash and that cash flow is the issue:

> *"The magnitude of the outstanding debt tells you how much interest, as it says here, the interest charge is related to the large outstanding debt represent a real call on cash flow because cash flow is the issue. And so if drought causes your cash flow to fall, you have a problem that you have to manage"* (Transcript Page 4993).

Presumably the *"[cash flow] problem that you have to manage"* is an issue regardless of whether it is caused by drought, interest rates increasing, export prices being non-responsive or capital costs going up. This position is consistent with the evidence of Manitoba Hydro's President, Mr. Kelvin Shepherd, regarding the role of reserves relative to the need for cash flow:

> *"Equity in and of itself does nothing for you. This is particularly the case when almost all of our equities is derived from cumulative earnings generated more than ten (10) years ago. Even more recently, the entirety of the growth in our equity has been a byproduct of unexpected profits owing to near record water conditions over the last several years.*

> *Equity is not cash. This is essential to understand. Equity is not a store of cash that we can use to mitigate rate increases when bad things happen. The only cushion to absorb unforeseen events and risk without having to raise rates even more and/or borrow yet more money is having rates at sufficient levels where your generating income and cash flow. And as we make clear, the old plan with its 3.95 percent rate path comes nowhere near close to doing this for us. Without this cushion when adverse events occur, the only choices available are to increase rates, potentially a lot, or borrow more money. We should not and cannot as a planning matter knowingly put ourselves in that position"* (Transcript Page 240).

Depleting Manitoba Hydro's reserves over a period of years under average water flow conditions and expected assumptions in the previous 3.95% rate plan as shown in **Figure 6.2** is neither sustainable nor prudent. As noted by Mr. McCallum,

> *"…as a planning matter, we don't believe you can target nil or breakeven net income for a businesses as large, complex, asset intensive, volatile, and indebted as ours. We have to plan, inclusive of in our rate strategy, for a cushion that allows for a margin of error and to create reserves in the form of paying down debt when things go right"* (Transcript Page 154).

It is interesting to note that despite Intervenors acknowledgement of the need to maintain adequate reserves, none presented evidence of a plan which in anyway served to contribute to and rebuild reserves.

It is of critical importance to move off the rate path of 3.95% to build reserves annually. As Ms. Carriere correctly observed *"…there is simply no additional capacity for the 3.95 percent rate plan to absorb any further increases in costs or deterioration in financial position [and]…the level of debt has grown out of proportion with our assets and the current level of revenues*" (Transcript Page 720). It should be noted that in the event Manitoba Hydro's forecasts of load and export revenues prove conservative and actual results turn out more favourably, customer contributions to reserves do not *"leak out"* as dividends as they would in a typical investor-owned utility. Customer contributions stay within Manitoba Hydro and under cost of service regulation, the PUB has an opportunity in future proceedings to adjust customer rates accordingly.

6.5 Debt Markets Care about Debt:Equity Ratio

On Pages 34 to 35 of MPA's Evidence filed on behalf of the Consumer's Coalition, Exhibit CC-17, MPA suggested that analysts serving the capital markets appear to place a higher priority on cash flow metrics and the ability to adjust rates as required to match operational requirements. It noted that, *"Certainly, the capital structure of a utility is important, and all analysts do recognize that, but few if any appear to make capital structure a centerpiece of their analysis in the way Manitoba Hydro does."*

The suggestion advanced by MPA that debt markets do not prioritize the strength of the equity ratio is not correct. Equity ratio is a good proxy for overall debt levels and investors care very much about that. Markets and rating agencies understand the intrinsic relationship between equity ratio and cash flow and all of the other financial metrics that analysts take into consideration.

Nonetheless, Section 2.2 of Manitoba Hydro's Application along with slide 46 of Exhibit MH-64 emphasize just how concerned the Corporation is with the level of forecasted cash flow and its ability to meet critical ongoing business requirements.

Manitoba Hydro presented a cash flow analysis *"Cash Flow from Operations to Capital Expenditures"* in Section 2.2 of the Application to better represent its capacity to meet its core obligations under different rate paths. Without the proposed rate increases, this metric demonstrates how cash flows will not be sufficient to cover the projected increase to interest payments associated with the unprecedented investment in major projects and the unavoidable capital requirements related to system renewal and expansion. This is consistent with what MPA suggests is a higher priority for analysts serving the capital markets.

In the August 2017 Supplementary Update to Manitoba Hydro's Financial Target Review, KPMG commented that, *"We note that Manitoba Hydro has developed an additional metric that examines adjusted cash flow to adjusted capital expenditures. This metric is intended to reflect overall cash flow impacts and related challenges in a more complete way during periods of major capital investment."* (Appendix 4.5 of the Application, page 11)

Manitoba Hydro's rate proposal was established to provide increased cash flow to meet two key objectives: (i) avoid deficit funding the ongoing business over the next five years and (ii) partially abate the increase in debt as the major capital projects are concluding and then begin retiring debt following Keeyask's in-service so as to mitigate future rate increases that may be required should interest rates rise. As such, Manitoba Hydro's plan to restore financial strength is centered on generating positive cash flow and managing the absolute level of debt.

6.6 The Importance of Manitoba Hydro Being Viewed as Self-Supporting

The key to preserving the credit of the province is for Manitoba Hydro to be viewed as self-supporting. MPA notes agreement with this concept and the importance of messaging to the markets:

> *"… I do think that managing the message to the capital markets is, indeed, important and in their application, Manitoba Hydro has talked about credit quality and the impact on credit ratings and the treatment of Manitoba Hydro in the province of Manitoba by the markets. And the very fact that Manitoba Hydro has made this application and has requested a series of 7.9 percent increases is in itself a message to the markets; a partial message, an initial message but nonetheless a message. And so, the Board's response to that application is also a message and I think the crafting of those messages is-- is important and has to be taken into account"* (Transcript Pages 4850 to 4851).

Credit rating agencies have indicated that they will continue to monitor the progress on the capital projects, rate increases, Manitoba Hydro's financial metrics and the financial outlook. Credit rating agencies monitor a variety of financial metrics as evidenced in this quote from DBRS on page of its credit rating report on the Manitoba Hydro-Electric Board from November 26, 2015 (Appendix 4.4 of the Application):

> *"The Utility has forecast leverage (81.0% as at March 31, 2015) to increase to around 88% during this period of high capex. Additionally, due to the significant lag before electricity rates fully reflect the cost of the ongoing major projects, Manitoba Hydro has forecast weaker earnings, including two years of negative net income, and significant free cash flow deficits for*

the medium term in its 2015 Integrated Financial Forecast. This will result in further pressure on the Utility's key financial metrics, which could be exacerbated in the event of an adverse circumstance (i.e., severe drought)."

MPA asserts at page 3 and 4 of Exhibit CC-17 that "*While the capital structure of a prospective borrower like Manitoba Hydro is important, it appears to be a secondary issue for the capital markets."* Yet in MPA's own evidence on page 33 MPA identifies seven metrics tracked by S&P in assessing financial risk and identifies that the two primary metrics are both associated with relative debt levels (not cash flow sufficiency alone). This is discussed at Transcript Pages 5043 to 5044:

"MR. MATTHEW GHIKAS: Now, you go on to line 21 there, where you say: "S&P further defined seven (7) -- seven (7) metrics that it focuses on with respect to cash flow. Note the first two (2) are the primary metrics, and the other five (5) are secondary, the sheer number of which provides an illustration of the level of focus on cash flow in S&P's typical financial risk analysis. These are..." And then you set them out?

MR. PELINO COLAIACOVO: Yes.

MR. MATTHEW GHIKAS: So the first two (2) are the primary ones, right?

MR. PELINO COLAIACOVO: Yes.

MR. MATTHEW GHIKAS: And both of those metrics are a function of debt?

MR. PELINO COLAIACOVO: They are."

Furthermore, notwithstanding MPA's assertions as to the primacy of cash flow, in their own report (Exhibit CC-17) at page 101, credit rating agency Fitch states:

"Fitch's analysis of financial metrics focuses principally on three core areas: cash flow, liquidity and capital structure. ***No single financial ratio stands apart from the rest.*** *On the contrary, the ratios are examined together,*

providing a context for a utility's financial position that informs a complete analysis."

Finally, on page 103 of Exhibit CC-17, Fitch indicates:

A rising equity ratio is viewed favorably, as it typically suggests ***adequate cost recovery in rates, load growth and a component of internal funding of capital investments****."*

Manitoba Hydro would observe that the 3.95% rate plan endorsed as *"reasonably robust"* by MPA results in the exact opposite which is to say an equity ratio that continue to decline following the in-service of Keeyask and thus, per Fitch, suggesting continued inadequacy of cost recovery in rates.

The financial viability and creditworthiness of the Corporation is assessed by credit rating agencies using debt:equity and interest coverage ratios as well as other relevant financial and risk profile information. The debt:equity and interest coverage ratios indicate the Corporation's ability to provide an *"equity cushion"* for possible losses and the Corporation's ability to meet all of its financial obligations when due. These ratios are used to assess whether the Corporation is financially self-supporting and capable of absorbing a variety of financial risks.

The overall debt level is inextricably linked to the cash flow of the corporation. Interest expense will be, by far, the largest cash flow burden on Manitoba Hydro's revenues. The pursuit of a 25% equity ratio target within a 10-year planning horizon triangulates with and reinforces generating the net income and cash flow sufficiency that lead to creation of necessary reserves against unforeseen events and contribute to overall debt reduction and support more stable and ultimately lower rates in the long-run than if the 3.95% rate path is pursued. Equity is not cash or a cash reserve that can be used to mitigate rate increases to address adverse / unforeseen events. The equity ratio can also be thought of as the Debt Ratio; the goal of the equity target is to get absolute levels of debt down. The equity ratio is the best indicator of progress on rate adequacy, sustainability and risk.

On cross-examination (Transcript Page 5010), MPA acknowledged his comment from the NFAT hearing that rate smoothing: *"… suggests that equity returns should be built into rate structures to provide a cushion for inevitable swings in cash flows that derive from noncontrollable events such as hydrology and export prices. Moreover, the possibility of prolonged financial distress also suggests that equity premiums and a healthy equity ratio target are required.*" In addition, on page 5006 of the transcript, MPA states that: *"…in a company like Manitoba Hydro where revenues go up and down with exports and with water, you can't actually predict these things perfectly in advance. It makes sense to have some cushion, to have some equity in the Company and to adjust your rates accordingly over time."*

In addition at Transcript Pages 5006 and 5007, MPA agreed that over time a healthy business should generate sufficient cash flows to pay for its capital expenditures and necessary interest and returns on equity associated with that capital, and that a sign that a business has been retaining net income over time is that the equity portion of the capital structure is increasing.

Manitoba Hydro agrees with MPA's comments that stipulate a healthy business should generate sufficient cash flows to generate net income and that net income is effectively a contribution to retained earnings.

MPA also discussed the importance of the Corporation's ability to maintain its self-sufficiency during an extended drought. *"…So, if there's a drought and the drought results in a Company having to issue lots more debt and rates do not go up in concert with the drought conditions, then the debt will continue to accumulate and, eventually, that will, you know, bring into question the Company's self-supporting status if it didn't have enough reserves to begin with."* (Transcript Page 5137). Mr. Colaiacovo went on to confirm that, consistent with his evidence during the NFAT, credit rating agencies which currently do not include Manitoba Hydro debt as an obligation of the province of Manitoba may reconsider that position, at least for a portion of Manitoba Hydro's debt, which could have a significant implications for the government.

Manitoba Hydro believes this commentary underscores the value of an appropriate level of equity for Manitoba Hydro as well as the Province of Manitoba.

6.7 What a Supportive Regulatory Regime Really Means

The Pre-Filed Testimony of Patrick Bowman, on behalf of the Manitoba Industrial Power Users Group, Exhibit MIPUG-13, states on page 4-7,

> *"… all indications are that there is no need to move to a 7.9%/year annual rate increase regime to achieve a utility that is self-supporting. If anything, a key conclusion… is the lack of need for a 7.9%/year rate increase today, but instead a significant requirement to communicate regulatory support and a reliable regulatory regime to lenders and credit rating agencies."*

The argument that showing a reliable and predictable regulatory regime to rating agencies and investors means maintaining a 3.95% rate increase regime is specious. A regulatory regime which is not responsive to changing business conditions under the guise of *"predictability"* would send the message to rating agencies and investors that Manitoba Hydro's financial health is not a high priority to the regulator. By not acting to address obvious financial health issues, Manitoba Hydro risks making its financial results and future rate increases even more unpredictable.

As indicated in the response to MIPUG/MH I-8, S&P's criteria indicate that the regulatory advantage assessment is MHEB's largest business risk component, at 60% weighting. The response quotes directly from S&P's Criteria| Corporates| Utilities: Key Credit Factors For the Regulated Utilities Industry (attached to the response) as follows:

> *When assessing regulatory advantage, we first consider four pillars and sub-factors that we believe are key for a utility to recover all its costs, on time and in full, and earn a return on its capital employed:*
>
> *Regulatory stability:*
> *• Transparency of the key components of the rate setting and how these are assessed*
> *• Predictability that lowers uncertainty for the utility and its stakeholders*
> *• Consistency in the regulatory framework over time*
>
> *Tariff-setting procedures and design:*
> *• Recoverability of all operating and capital costs in full*

• Balance of the interests and concerns of all stakeholders affected
• Incentives that are achievable and contained

Financial stability:
• Timeliness of cost recovery to avoid cash flow volatility
• Flexibility to allow for recovery of unexpected costs if they arise
• Attractiveness of the framework to attract long-term capital
• Capital support during construction to alleviate funding and cash flow pressure during periods of heavy investments

Regulatory independence and insulation:
• Market framework and energy policies that support long-term financeability of the utilities and that is clearly enshrined in law and separates the regulator's powers
• Risks of political intervention is absent so that the regulator can efficiently protect the utility's credit profile even during a stressful event

Mr. Bowman focuses on just two pillars to the exclusion of the remaining two. Financial stability to permit the timely recovery of costs and capital support during construction to avoid cash flow pressure, and the ability to recover all costs cannot be ignored. In Manitoba Hydro's case where the utility has been operating with insufficient cash flow for cost recovery for several years, regulatory support through the approval of required rates is especially critical for the utility to be self-supporting.

It is a fallacy to suggest that credit rating agencies will take comfort in the utility being permitted a rate increase insufficient to meet its needs simply because is it *"predictable"*. *"Predictable"* in this context must be understood to mean rate increases, the need for which have been communicated to ratepayers (as has been the case since May, 2017 when Manitoba Hydro first sought a 7.9% rate increase)[7], approved by a regulator who has demonstrated the willingness to respond to events as they unfold, having been satisfied that the request is supported by the weight of the evidence.

[7] See also the evidence of Dr. Yatchew at Transcript Page 4458

7 MYTH OF THE 3.95% RATE PROMISE

In the opening comments made by Consumers Coalition, Dr. Williams opined that, *"…[rate] promises that were made during the NFAT process have been broken by Manitoba Hydro"* (Transcript Page 81).

Similarly, Manitoba Keewatinowi Okimakanak ("MKO") stated in its opening comments at Transcript Page 115:

> *The MKO First Nations took an active role in the in the NFAT hearings on the understanding that if rate increases were necessary, they would be looked at, they would be examined, they would be made appropriate. And that's what was done, and the rate increases approved at that time were substantially lower than was being done right now* (Emphasis Added)

In MKO's cross-examination of Mr. Shepherd and Mr. McCallum, Manitoba Hydro legal counsel clarified for the record that the Needs For And Alternatives To ("NFAT") was not a rate hearing and the NFAT did not seek approval of any rate increases. The Chairperson affirmed the panel's understanding of the purpose of the NFAT and 2015/16 & 2016/17 General Rate Application ("GRA") as it related to rate increases:

> *NFAT dealt with a number of issues that -- as I understand it, the 3.95 arose in the GRA that was following NFAT in the 2015 hearing, which was a rate-setting hearing, and that one (1) did not relate to the other* (Transcript Page 603).

In the presentation by Manitoba Hydro's Revenue Requirement Panel (Exhibit MH-68), Ms. Carriere addressed the myth of the NFAT and 2015/16 & 2016/17 GRA rate promise:

> *With respect to the rate projections for each of the development plans, Manitoba Hydro was explicit in stating that the rate plans presented were developed for the purposes of comparing development plans* (Transcript Page 714);

> *Manitoba Hydro emphatically stated that minimum rate increases were necessary under all plans…* (Transcript Page 715); and
>
> *Importantly, Manitoba Hydro cautioned the NFAT panel that the rate projections set forth for each of the development plans were not applicable for rate-setting purposes* (Transcript Page 716).

At no point has Manitoba Hydro ever made rate promises based on its long term forecasts and has always been careful to distinguish between proposed and indicative rate increase projections – a distinction which the Chairperson and panel have also been acutely cognizant of through the course of this proceeding:

> *Notwithstanding the indicative information in the IFFs, the only rate approval requests by Manitoba Hydro before this Board at this time are the confirmation of the two (2) existing interim 3.36 rate increases, as well as the request to grant a 7.9 percent rate increase effective April 1st, 2018 from Manitoba Hydro's 2018/'19 fiscal year* (Transcript Page 4120)

In reality, forecasting is inherently unreliable. The further out the forecast goes, the less likely it is to be accurate. This view is confirmed by Daymark Energy Advisors.

> *…the use of [a forecast] is really in -- in understanding and preparing yourself for change. Forecasts are inherently wrong* (Transcript Page 3879).

As noted in Section 3.4.3 Manitoba Hydro believes limited value should be ascribed to forecasts a decade or more in the future. While the mid to latter years of forecasts provide important information on directional trends of financial results, they should not be relied upon for rate-setting purposes in specific test years. Forecasts are updated at least annually and future rate decisions are better made based on forecasted information available at that time.

Ms. Carriere reminded the panel that, at NFAT, Manitoba Hydro was careful to advise:

> *"…that due to the uncertainty of forecasting, the rate increases are indicative and are showing general directional trends in -- in rates. Actual rate increases will vary from those, and will depend on many other factors and not just the choice of development plan but due to changing water flows, weather and costs to maintain the system and economic variables"* (Transcript Page 715 to 716).

Historically in past orders, the Public Utilities Board of Manitoba ("PUB") has acknowledged and accepted that there is risk of forecast uncertainty and no "promise" in the rate increases in Manitoba Hydro's applications, and in certain circumstances, even in the rate increases approved by the PUB. In January 2004 in the midst of one of the lowest water flow conditions on record, Manitoba Hydro sought PUB approval for a 3% rate increase for April 1, 2004 and 2.5% for April 1, 2005 to recover reserves following the extreme financial loss of 2003/04, on the heels of other significant events such as the acquisitions of Centra Gas and Winnipeg Hydro and the special payment to the province, all of which contributed to the depletion of reserves. Prior to the 2004 application, Manitoba Hydro had last appeared before the PUB in 1996, where average increases of 1.5% effective April 1, 1996 and a further 1.3% effective April 1, 1997 were approved, and in the 2002 Status Update Filing, where the corporation sought no rate adjustment but the PUB directed rate reductions to the General Service Large and Small classes.

In the Order arising from the 2004 filing, the PUB approved more than Manitoba Hydro requested; 5% for August 1, 2004 and two conditional rate increases of 2.25% for April 1, 2005 and October 1, 2005. In granting the two conditional rate increases, the reasons cited by the PUB at the time are remarkably familiar:

> *In making the last two increases conditional, the Board provides a level of protection for the long-term interests of ratepayers. At the same time, these conditional increases provide reasonable assurance to MH that its revenue base will be strengthened if the need is present. In particular, conditional increases recognize the uncertainties present with respect to forecasting export sales and net income. These uncertainties are related to water levels and storage issues, export demand, pricing and other related matters* (Order 101/04, Pages 23 to 24).

Both conditional rate increases were subsequently approved as final.

The PUB further demonstrated an absence of rate "promises" in Orders 90/08 and 32/09. In Order 90/08, the PUB granted Manitoba Hydro a 5% rate increase for July 1, 2008 and a further 4% conditional rate increase for April 1, 2009. Manitoba Hydro had only sought 2.9% for each of 2008/09 and 2009/10; however, the PUB expressed a lack of confidence that the requested 2.9% were sufficient.

The PUB subsequently varied and approved a final rate increase in Order 32/09:

> *After a thorough and intense consideration of the evidence, and considerable contemplation, the Board will approve rate increases as of April 1, 2009 but will vary the level of the increases to 2.9%, to apply to all classes excepting for the Area and Roadway Lighting class.*
>
> …
>
> *By so doing, the Board balances MH's evidence of recent improvements in the Utility's financial situation and the pressures on its customers due to the recession with the Board's ongoing concern respecting the many risks faced by MH* (PUB Order 32/09, Page 1).

8 PROJECTED REVENUES ARE DOWN

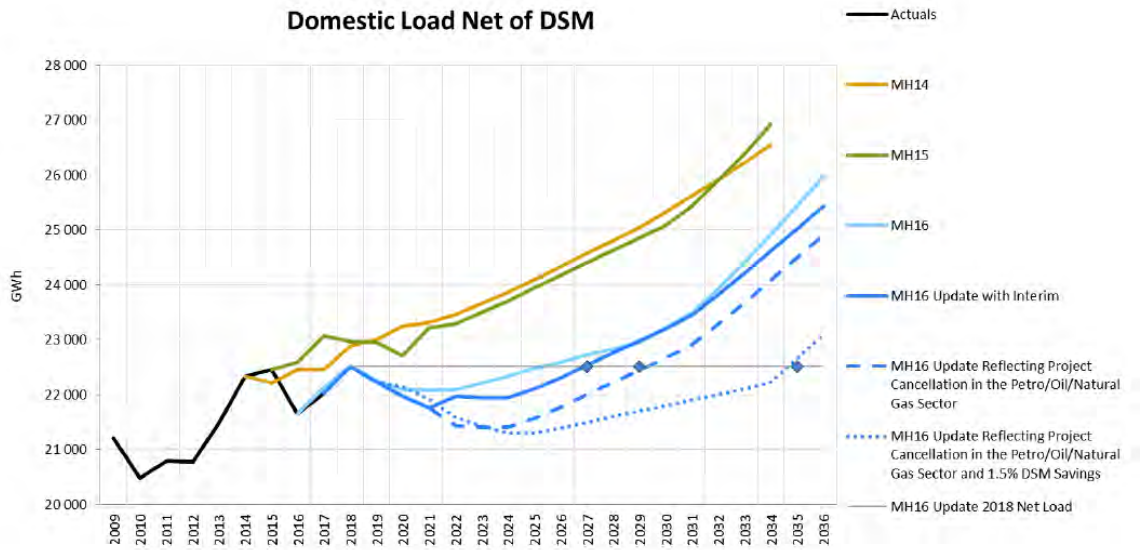
8.1 Overview

Manitoba Hydro's projected revenues are down, primarily as a result of the combined effect of a flattening of the domestic load forecast, export prices not rebounding as previously expected and increased capital costs associated with the major projects, Keeyask and Bipole 3.

- Manitoba load growth has not materialized as previously forecasted and the Corporation is now faced with 10 years or more of no net load growth (Slide 38 of Manitoba Hydro's Policy Panel Presentation, Exhibit MH-64);
- The forecast of export prices continues on a downward trend since MH15 (Slide 39 of Exhibit MH-64);
- The Keeyask control budget has increased by $2.2B to $8.7B and there has been a 21 month delay to the in-service date (Slide 40 of Exhibit MH-64).

The impacts of these risks have been somewhat offset by the following:

- Interest rates have remained at record low levels;
- Manitoba Hydro has enjoyed 14 consecutive years of greater than average system inflows (Slide 33 of Exhibit MH-64).



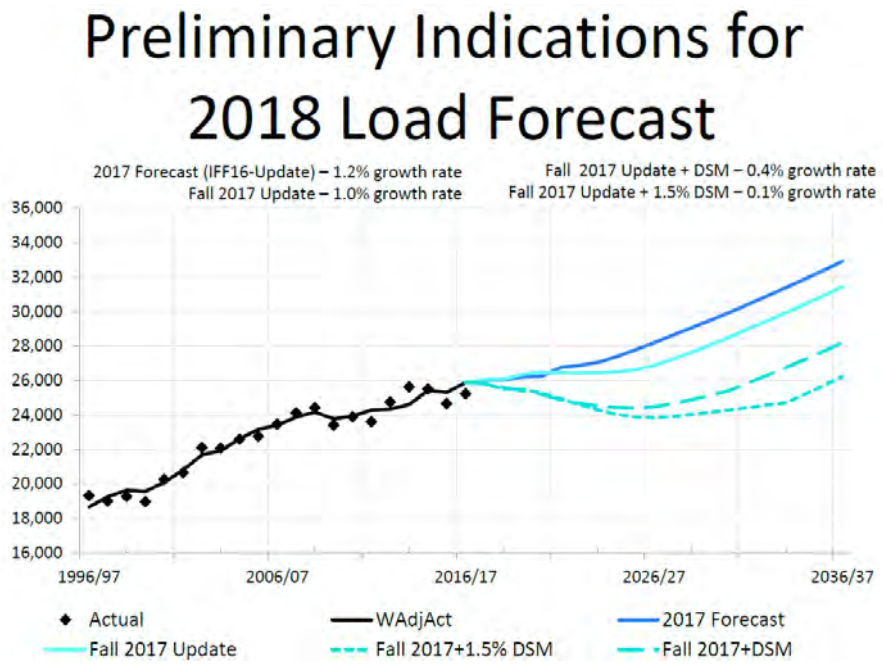
To assess the reasonableness of Manitoba Hydro's revenue projections, the Public Utilities Board of Manitoba ("PUB") retained Daymark Energy Advisors to review the corporation's Load Forecast, Export Price Forecast and Export Revenue Forecast. Daymark was provided unfettered access to Manitoba Hydro's information, including commercially sensitive information not available on the public record. In addition, Dr. Adonis Yatchew reviewed the price elasticity values incorporated in Manitoba Hydro's load forecast. While areas for enhancement were identified, no issues were reported that materially impacted forecast results or revenue projections.

8.2 Load Forecast

8.2.1 Future Manitoba Load Forecast is Trending Down

Manitoba's future domestic load requirements and domestic revenue expectations have deteriorated compared to previous load forecasts and including the impact of future demand side management ("DSM") programs are expected to exhibit no net load growth for the next 10 years as indicated in Manitoba Hydro's direct evidence (Exhibit MH-64).

Figure 8.1 Domestic Load Net of DSM



Source: Slide 40 of Exhibit MH-64

Ms. Morrison in her testimony provided preliminary indications as to where the 2017 Fall Update Load Forecast is compared directionally to the 2017 Forecast (Transcript Page 647). Manitoba Hydro has been forthcoming on the reasoning underlying the reduction in domestic load. Ms. Morrison advised that a large project in the petrol, oil and natural gas sector was recently cancelled which results in a reduction of approximately 530 GWh (Transcript Page 1126) to the 2017 Load Forecast (PUB MFR 65 Attachment 1).

Slide 20 of the Revenue Requirement Panel Presentation, Exhibit MH-68, compares the 2017 Electric Load Forecast with the preliminary 2017 Fall Update Forecast including the future DSM programs currently forecast in Manitoba Hydro's Power Smart Plan. It is noteworthy that Efficiency Manitoba has a mandate in the Efficiency Manitoba Act of achieving 22.5% over 15 years of overall energy savings targets as compared to Manitoba Hydro's current 2016/17 15-Year DSM plan, which has a cumulative target of 17.3% over a 15 year period. (Transcript Pages 646 to 647). Also presented below in Figure 8.2 is a representation of the 2017 Fall Update Forecast including Efficiency Manitoba's mandated efficiency target of 1.5% of load.

Figure 8.2 Preliminary Indications for 2018 Load Forecast

Source: Slide 20 of Exhibit MH-68

Further discussion on DSM programming and Efficiency Manitoba is contained in Section 8.2.7 of Manitoba Hydro's written final argument.

8.2.2 Load Forecast Methodology is Reasonable

Manitoba Hydro respectfully submits that its 2017 Load Forecast (PUB MFR 65, Attachment 1, page 1) and the supporting methodologies underpinning this Application are reasonable and are a reliable estimate of future energy requirements.

Manitoba Hydro's the load forecast is updated annually to include current information about Manitoba Hydro customer groups in order to produce a reasonable estimate of future load requirements. Key changes incorporated since the 2014 load forecast include updates to the economic inputs such as the forecasts of electricity and natural gas prices, population, GDP and income, and a change for potential long term growth in the Top Consumers sector (Transcript Pages 641 to 643). As Ms. Morrison stated at Transcript Page 641, *"some model enhancements were pursued with the change to the top consumers having a notable impact upon the long-term forecast. This enhancement was explored specifically to address past PUB concerns regarding the potential inappropriate upward adjustment in the forecasting for this sector"*.

As noted above, Daymark was contracted to review the reasonableness of Manitoba Hydro's Load Forecast and its supporting methodologies. In summarizing the overall findings of the Daymark Energy Advisors review of Manitoba Hydro's load forecasting methodologies, Ms. Kelly concluded:

> *"Manitoba Hydro's forecast methodologies are reflective -- fully reflective of industry practice. I've seen exactly what they're doing in other places before, and other - - most utilities are relying on similar tools and technologies to do their forecasts"* (Transcript Page 3895)

Daymark identified the following key findings regarding Manitoba Hydro's base forecast for consideration:

- The Top Consumers projected long term growth was considered conservative in comparison to the method utilized in previous forecasts;
- The population forecast may be under-forecasting based on the historical evaluation of previous population forecasts;
- Electricity price elasticity values may be incorrectly estimated based on the evaluation of the econometric models currently in use by Manitoba Hydro;
- The possibility of fuel switching/substitution to an alternative fuel type or fuel source due to the increase in electricity prices in all sectors.

(Page 5 of Daymark Energy Advisors Report - Forecast Revised, Exhibit DEA-2-1)

Although Daymark Energy Advisors identified key findings and possible enhancements regarding several elements of the load forecast and indicated that the load forecast may directionally be conservative, Ms. Kelly acknowledged during her testimony that Manitoba Hydro regression equations of each sector is appropriate in total based on the statistics of the regressions evaluated (Transcript Pages 3993 to 3994).

Daymark also identified a number of enhancements for consideration by Manitoba Hydro in development and reporting of future Load Forecasts (Page 64 of Exhibit DEA-2-1):

- Consider scenario analyses by developing alternative load forecast to complement the base forecast and evaluate uncertainty utilizing stochastic risk assessments;

- Incorporate additional years of data in the development of the weather-normalization methodology;
- Move to a shorter period in the definition of defining the weather normal year from the existing 25 year period;
- Provide greater transparency in the review and testing of econometric models underlying the electric load forecast.

As noted in Manitoba Hydro's Written Rebuttal Evidence on Daymark, Exhibit MH-83, a number of these proposed enhancements have already been considered and some reviewed by the PUB, such as the use of 25 years for determining Weather Normal. (Page 13 of Exhibit MH-83).

8.2.3 Top Consumers and Potential Large Industrial Load ("PLIL")

As discussed at page 21 of PUB MFR 65 Attachment 1, Manitoba Hydro's Top Consumers segment is comprised of a limited number of customers spread across a broad grouping of differing industry sectors. The number of customers within each sector is relatively small with no one sector having an overwhelmingly larger concentration of customers than other sectors. Variables related to facility age and technologies employed within industrial facilities located in Manitoba reflect different levels of competitiveness within a global industrial landscape.

Daymark's Ms. Kelly acknowledged, as a former forecaster, that preparing a forecast of the Top Consumers sector is challenging:

> *"It's -- it's a very difficult job to predict, as pointed out earlier in some of the work that the Consumer Coalition was -- was showing us. They are very large consumers. They are very lumpy. They have their own business plans and they -- they are driven by their own business indices. It's very difficult to forecast."* (Transcript Page 4036)

Manitoba Hydro recently changed its approach in forecasting Top Consumers where the threshold to be considered a Top Consumers changed from a load of approximately 6 MW to 25 MW in the 2017 Load Forecast (Page 2 of Exhibit MH-83). The PLIL methodology change made in the 2017 Load Forecast was undertaken in response to recommendations and concerns expressed by the PUB following the Needs For and

Alternatives To ("NFAT") and 2015/16 & 2016/17 General Rate Application ("GRA") proceedings. For example, the PUB in Order 73/15 found that:

> *"There is evidence that Manitoba Hydro consistently over-estimates the Top Consumers load growth. The first year of each load forecast for the past five years over-estimated the Top Consumers load in the greater-than-100 kV sub-class. The PLIL does not recognize the last test years of near-zero load growth in the Top Consumers sector, or than using PLIL in addition to large pipeline load additions overlaps in some years and may be double-counting. The Board sees Manitoba Hydro's PLIL as an in appropriate upward adjustment that does not reflect the recent Top Consumers load growth history. The Board recommends that Manitoba Hydro take a more rigorous approach to forecasting the Top Consumers load."* (Page 78 of PUB Order 73/15)

Daymark's Scope of Work directed it to review Manitoba Hydro's 2017 Load Forecast and assess the changes with respect to the 2014 Load Forecast (DEA Exhibit-2-1, Appendix A, Item #8). Daymark noted that the more conservative PLIL method used in 2017 forecasted 523 GWh less load than using the 2014 method and 2017 data over the 20-year forecast period. This result is not unexpected and was implemented to address the concerns expressed by the PUB. The change in forecasting methodology for PLIL better represents the expected growth in this sector (Page 2 of Exhibit MH-83).

8.2.4 Population Forecast

In its initial report, Daymark identified a possible area for improvement with respect to Manitoba Hydro's treatment of population forecast within the Load Forecast. Recognizing that Manitoba Hydro utilizes external agencies for Manitoba's population forecast, Daymark's concern was driven by its evaluation of previous population forecasts, which on average were under-forecasting population trends.

Manitoba Hydro addressed the Population forecast accuracy regarding the impact of the Provincial Nominee Program when comparing to population forecasts prior to the announcement of the Provincial Nominee Program in 1999 (Exhibit MH-83). When evaluating recent forecasts since the inception of the Provincial Nominee Program, Daymark confirmed in response to Coalition/IEC Daymark Load 7(b) and further

confirmed in Undertaking 45, Exhibit DEA-12 that Manitoba Hydro's more recent population forecasts have not been under-forecast.

8.2.5 Price Elasticity well within Literature Review

Manitoba Hydro currently utilizes econometric models incorporating the impacts of electric price elasticity. Future forecasted price increases are included as part of the analysis to capture the reduction in electrical consumption by customers as a response to increasing electric prices.

Although Dr. Yatchew's review of Manitoba Hydro's electricity price elasticities initially suggested that Manitoba Hydro electric price elasticities are somewhat lower than those suggested by his research, he acknowledged that Manitoba Hydro's price elasticities are well within the range of price elasticities identified by the literature referenced within his expert testimony (MH/Yatchew I-1(b)).

While studies from other jurisdictions may be useful in providing certain insights, they should be used with caution as the production of price elasticities values are not necessarily applicable to Manitoba, and it is not prudent to simply adopt a price elasticity found in any specific study without understanding the conditions and drivers underpinning that value. Differences between Manitoba and other jurisdictions that should be taken into consideration include starting price, rate structure, and average versus marginal pricing and cross price effect with other fuels. All non-price effects must be accounted for in order to minimize the potential for double counting, such as double counting the effects of an economic downturn, codes and standards, conservation rate programs and DSM programming. Dr. Yatchew identifies that Manitoba Hydro electric prices are low by national standards and it is possible that the response to price increases could be attenuated until the price crosses a certain threshold (Page 32 of Dr. Adonis Yatchew Report, Exhibit AY-1). Although Dr. Yatchew acknowledges the difficulty in assessing the threshold in his response to MH/Yatchew I-5, it is certainly plausible for Manitoba to have slightly lower price response than jurisdictions with higher electricity prices.

8.2.6 Evidence presented during public presentations

Dr. Garland Laliberte's submitted both a paper and PowerPoint presentation presenting his view of Manitoba Hydro's Load Forecast and Load Forecasting in general. Manitoba

Hydro must address a few of the assertions and recommendations presented by Dr. Laliberte, which demonstrates that Dr. Laliberte misinterpreted the data, and thus made erroneous conclusions regarding Manitoba Hydro's Electric Load Forecast.

Dr. Laliberte discussed during the presentation that Manitoba Hydro's annual load growth of 1.2% is higher than projections in other areas within North America, which are forecasting load growth from about a .5% to 1% (Transcript Page 3567). While other jurisdictions are predicting on average less than 1 percent, those growth rates include the impacts of energy efficiency initiatives in other jurisdictions whereas the 1.2% load growth for Manitoba Hydro referenced by Dr. Laliberte does not include future program based DSM. In the 2017 Load Forecast (Page 58 of PUB MFR 65 – Attachment 1), Manitoba's expected annual load growth including the impacts of program-based DSM initiatives is forecast to be 0.7%, well within the range of annual growth rates currently forecast in other jurisdictions.

Dr. Laliberte also presented financial impacts on domestic revenue from calculations based on a simple 10-year linear extrapolation in comparison to Manitoba Hydro's electric load forecast. During cross examination by the Consumer Coalition, Dr. Laliberte admitted that a simple linear regression for the purpose of Load Forecasting is not what he is suggesting Manitoba Hydro undertake as a methodology enhancement. When asked about the technique utilized by Dr. Laliberte, Ms. Kelly of Daymark Energy Advisors stated:

> *"this…approach of… using just a simple trend line, …as Suman pointed out, misses a lot of underlying explanatory variables and relationships that -- that change the forecast from time to time. Back in the '50s and '60s, before I went into forecasting, there was the better opportunity to use this kind of approach, because they were building like crazy, everybody was growing. It was -- it was postwar make-up. For a lot of time, that wasn't happening. And I remember talking to my mentors and trainers who talked about the days when they just took a log-linear, a piece of paper, and drew a line, and that was forecast, and it was going to be right, which is not something that you can see today. And simp -- making this simple is crazy."* (Transcripts Page 4100, lines 1-15)

Manitoba Hydro submits that no weight should be placed on Dr. Laliberte's assessment of Manitoba Hydro's forecast, its methodologies or potential financial impacts resulting from his analysis.

8.2.7 Demand Side Management and Efficiency Manitoba

Manitoba Hydro's DSM plans have played a key role in meeting energy needs in a sustainable manner and assisting customers in reducing their energy bills. The most current 2017/18 DSM Plan was filed in response to PUB MFR 61.

There has been much discussion during this hearing about what level of DSM should be included in Manitoba Hydro's long term financial projections. Mr. Bowman testified that Manitoba Hydro's baseline IFF includes DSM activities that *"are benchmarked too high, given the facts facing us"*. (Transcript Page 6079)

The 2016/17 DSM Plan – 15 Year Supplemental Report, filed as Appendix 7.2 of the Application outlines the corporation's current DSM plan over the next 15 years, and includes the best projections available at this time. As Ms. Morrison has testified, it would be inappropriate for Manitoba Hydro to propose a different plan on behalf of Efficiency Manitoba. As Ms. Morrison testified:

> *"The reason we did not -- we did not include this table in the 2017/'18 one year DSM plan is that we did not undertake a 15 year analysis or plan for '17/'18. This is because we were aware that the Efficiency Manitoba legislation was being tabled and in our discussions with the provincial government, we were basically holding constant on the programs we had in place. And so we went and undertook in our consultations to develop a one year plan, as we have in the past, and that one year plan then became the new plan and we are simply carrying forward the -- what was developed under the 2016/'17 15 year plan until Efficiency Manitoba can come forward with a revised, updated long-term plan."* (Transcript Page 1569)

Ms. Morrison further clarified this position during cross examination by PUB Counsel, *"That mandate is moving over to Efficiency Manitoba. We are not making any changes until that has successfully transferred. That will then be the direction of Efficiency Manitoba."* (Transcript Page 2622)

The 2016/17 DSM Plan – 15 Year Supplemental Report projects average annual DSM savings of 1.2% of load which, although lower than the 1.5% targets identified in the Efficiency Manitoba Act, are at least in the range of the legislated targets and therefore appropriate for the review of this Application. These savings are certainly not greater than those mandated by the Efficiency Manitoba Act and as such cannot be said to be benchmarked too high as suggested by Mr. Bowman.

8.2.8 Forecast Conclusion

Manitoba Hydro respectfully submits that the evidence in this proceeding supports its position that the Load Forecast methodologies underpinning this application are reasonable and are a reliable estimate of future energy requirements.

8.3 Export Revenue Projections are Reasonable

8.3.1 Consensus Price Forecast Process is Reasonable

For the MH16 Update, Manitoba Hydro prepared a Reference Case long-term export price forecast in spring 2017, using the consensus of four external price forecast services. In simple terms, the *"consensus"* is a simple average of the price forecast consultant forecasts. In connection with the review of Manitoba Hydro's Export Price Forecast, Daymark was provided individual price forecaster data in electronic format in confidence for their review.

In its Export Pricing and Revenues Review report, Daymark confirmed this approach stating:

> *"MH received electronic information from each vendor, which represented the entirety of the information available for reviewing and characterizing the forecast received. For all four vendors that information was provided via one or more spreadsheets. All four vendors provided annual energy and capacity prices. Some provided monthly energy prices as well. MH used a consensus approach, taking the average of the annual energy and capacity prices to create a single forecast, which MH called their reference energy price forecast"* (Page 36 of Daymark Energy Advisors Report – Export, Exhibit DEA-1).

Manitoba Hydro's consensus approach to long term price forecasting has been externally reviewed a number of times, including during the NFAT and the 2010 Risk Review/ KPMG External Quality Review. It is the accepted approach.

On Slide 22 of Daymark Energy Advisors Export CSI Presentation, Exhibit DEA-9 CSI and Transcript Pages 4348 to 4350, Daymark makes comparisons to other forecasts, including information from the U.S. Energy Information Administration. Comparisons of the Reference Price forecast with other older price forecasts or other unidentified price, natural gas or carbon forecasts are not meaningful or useful. Manitoba Hydro incorporated the current price forecast information from its independent price forecast consultants regarding natural gas and carbon into its forecast at the time MH16 Update was prepared. The price forecast represented the best independent estimates available to Manitoba Hydro at that time.

Daymark provided in Exhibit DEA-9 CSI the identities of each individual consultant, the individual price forecast detail, and the consensus price forecast. Daymark did not raise any objections to the consensus price forecast process, finding that *"MH used the average of the four forecasts as its reference case"* (Page 50 of Exhibit DEA-1).

8.3.2 Other Export Revenue Projections are Reasonable

The export revenue projections in the MH16 Update also incorporate information including revenues sourced from contracted energy and capacity sales (Page 60 of Exhibit DEA-1) and the exportable energy and capacity volumes (Page 52 of Exhibit DEA-1).

Daymark noted that Manitoba Hydro's firm contract revenue forecast is a contract-by-contract analysis of the terms of each contract (Slide 34 of Daymark Energy Advisors Export Presentation, Exhibit DEA-7). With regard to the contracted energy and capacity sales (firm contracts revenues), Daymark found that

- *"Manitoba Hydro's revenues forecast from existing export contracts is reasonable"*
- *"The treatment of those contracts is consistent with the analysis of those contracts in NFAT"*
- *"The treatment of the new contracts is consistent and the resultant revenues forecast is reasonable"*

(Slide 35 of Exhibit DEA-7)

Daymark also reviewed the forecasting methodology used by Manitoba Hydro to determine the exportable energy and capacity volumes, considering the flow and inflow conditions, reservoir levels, as well as other hydrologic inputs that are applied to the computer modeling of the hydro system. Daymark found *"that the methodology used by MH for both the short-term and the long-term periods appeared to be reasonable."* (Page 52 of Exhibit DEA-1). With regard to the forecast surplus capacity and energy volumes, Daymark found that:

- *"MH's forecasting methods are consistent with past practices"*
- *"The forecast reasonably represents the average supply considering the range of hydrologic uncertainty."*

(Slide 38 of Exhibit DEA-7)

These findings are significant. The export revenue projections also depend on the surplus volume estimates and the firm contract revenue estimates, and Daymark found these key components to be reasonable and appropriate.

8.3.3 Manitoba Hydro Uses Multiple Sources in its Short-Term Export Price Forecast

Manitoba Hydro has used a total of four vendor forecasts along with Intercontinental Exchange ("ICE") forward power prices and recent historic prices experienced in the market in preparing the short term forecast of export revenues for IFF16 and IFF16 Update. Manitoba Hydro notes that Daymark's evidence (Transcript Page 4362) in this respect is incorrect, and that it appears that Daymark did not apprehend the multiple sources used in the development of the short-term export price forecast used in operations and in projecting export revenues in the early years of its Integrated Financial Forecast.

Manitoba Hydro's use of multiple forecast sources for the first two years of the IFF is a more thorough approach than what Daymark understood to be the process. Daymark concluded based on its review and understanding of the data and methodology that it was reasonable (Page 35 of Exhibit DEA-1). Manitoba Hydro submits that this conclusion remains valid, and, if anything, is strengthened by the use of additional forecast sources.

8.3.4 Review of SaskPower Sale and Transmission Construction Deemed Beneficial

Mr. Cormie provided an overview of the 100 MW SaskPower sale starting at Transcript Page 663 and Slide 30 of Exhibit MH-68. Daymark reviewed the economic justification for the sale and associated transmission project and found *"The transaction, including the transmission project, remains in the best interest of Manitoba Hydro and its ratepayers"* (Slide 18 of Daymark Energy Advisors - Saskpower Presentation, Exhibit DEA-10). The revenues and costs associated with this sale were included in Manitoba Hydro's financial forecast MH 16 with Update.

8.3.5 No Additional Capacity Resources Required in MISO Until 2023 Time Frame

Midcontinent Independent System Operator ("MISO")'s conclusion in its MISO Transmission Expansion Plan ("MTEP") 2017 regarding the need date for additional capacity resources in its market region was *"Beginning in 2023 MISO capacity is projected to fall below the PRMR [Planning Reserve Margin Requirement] and remain there for the rest of the assessment period (Table 6.2-1)"* (MH/DAYMARK (EXPORTS) I – 1). MISO's conclusion is significant, as if there is no demand for additional capacity, there can be no value for generation capacity and in turn no premium in Manitoba Hydro's revenue projections until 2023. At page 72 of Exhibit DEA-1, Daymark agreed with MISO's conclusion in stating *"that it is likely that MISO will be short capacity within the next ten years, possibly as soon as 2025"*. In their Direct Evidence Daymark changed their position somewhat, stating in various places that *"2022 MISO predicted need for new capacity"* with a reference MISO MTEP Table 6.2-1 (Slide 53 of Exhibit DEA-7), and a *"2023/2024 Year of Need"* (Slide 23 of Exhibit DEA-7) assuming new resources but not new, low certainty resources currently under development are completed.

Manitoba Hydro accepts MISO's projection of the summer of 2023 as the need date for additional capacity resources. MISO's finding is consistent with NERC which stated in its 2017 Long Term Reliability Assessment (Page 42 of the NERC - Long Term Reliability Assessment, Exhibit CC-39) that *"The Anticipated Reserve Margin remains above the Reference Margin Level of 15.8 percent through the summer of 2022"*. As noted on Page 30 of Exhibit MH-83, this need date is subject to uncertainty, and has been deferred over the last five MISO MTEP assessments.

8.3.6 Long Term Dependable Product Premium No Longer Exists

In Tab 3 of the Application at page 14, Manitoba Hydro states, *"… the premium that has historically been applied to the long-term dependable forecast prices has been removed as the achievability of this premium has reduced significantly in the MISO market"*. Historically, the Long Term Dependable Product Premium was applied by Manitoba Hydro based on its ability to leverage what was once an almost unique fixed price carbon free product in the MISO market.

As outlined on Page 25 of Exhibit MH-83, the premium was reviewed during the NFAT and Manitoba Hydro notes that both the PUB and Daymark were previously skeptical of the premium. Daymark (then LaCapra) stated, *"MH provides little justification for the amount of the premium"* (Page 6-61 of Appendix 6 in Manitoba Hydro's NFAT Submission). In their current report, Daymark now advocates for the inclusion of the premium stating, at Page 61 of Exhibit DAE-1, *"The elimination of the premium in the longer term is not consistent with the longer-term outlook for energy, capacity and clean energy requirements in the Northern MISO region"*. On page 115 in the June 2014 PUB NFAT report, the PUB itself expressed its skepticism of the premium stating, *"The Panel is concerned with the risk that future export contracts may not attract the premium pricing that Manitoba Hydro assumes"*.

Subsequent to the NFAT, Manitoba Hydro made the decision documented in the 2016 Energy Price Forecast, that the addition of the Long Term Dependable Product Premium was no longer appropriate as a result of five changes/ concerns in the export market. Details of the five concerns were included as CSI on Page 59 of Exhibit DEA-1, which was reviewed at Transcript Page 4359.

Manitoba Hydro agrees with Daymark's finding *"The elimination of the premium appears reasonable for the near term"* (Page 61 of Exhibit DEA-1). However, Manitoba Hydro does not see the return of the Long Term Dependable Product Premium in the longer term, in 2023 and beyond, when new capacity resources may be needed in MISO. As noted on page 27 of Exhibit MH-83, wind generation and more recently solar generation have increased significantly in the MISO market, with the four states in Manitoba Hydro's immediate market already generating from 17 to 36% of their own supply from wind generation in 2016. Accordingly, Manitoba Hydro is no longer the only renewable option for potential customers seeking a carbon free renewable product

at a fixed price. Competition from low cost renewables does not support a premium for long-term dependable products at this time, and Manitoba Hydro expects the situation is unlike to improve in the future as wind and solar costs are falling, even as subsidies for wind generation are being phased out.

8.3.7 Value of Generation Capacity in the Future is Uncertain

Potential capacity revenue is a significant uncertainty in the projections of future export revenue. In times of oversupply, the value of generation capacity can be very low. This uncertainty was recognized by the PUB in its NFAT report when it stated on page 108 *"However, it has not been conclusively demonstrated that all of this surplus dependable energy will achieve capacity revenues in addition to energy revenues".*

Given MISO and NERC findings that MISO's regional surpluses and potential resources are sufficient to meet requirements in the 2019 - 2022 timeframe, it follows that there is expected to be little or no demand for additional capacity resources in the MISO market through the end of 2022. In times of capacity surplus, as in the current situation, the capacity price is likely to be close to zero. For 2023 and beyond, if MISO load forecasts prove to be correct, there is the potential for a need for new capacity, and in turn a potential for some yet to be determined value for generation capacity at that time.

In determining the export revenue forecast, and in consideration of significant uncertainty associated with the value of generation capacity in the long term, a policy decision has been made by Manitoba Hydro to remove the potential capacity revenue associated with unsold capacity and dependable energy from the revenue forecast. This policy decision reflects the uncertainties and delay in the need for additional capacity resources in MISO (described as the Receding Horizon for the Capacity Need Date in MISO) (Page 30 of Exhibit MH-83). The continued delay in the need for additional capacity resources in MISO is a result of:

- Load growth, which for the US as a whole, and for MISO in particular, is low by historical standards, and has been trending even lower for 20 years. MISO's most recent projections of load growth are in the 0.3% (MH/DAYMARK (EXPORTS) I-1 Attachment 1) to 0.5% (Page 31 of Exhibit MH-83) range.
- Increasing wind and solar renewables, which MISO considers as providing some capacity to meeting regional peak load requirements in their supply and demand

analysis. In MTEP 17, MISO allocated wind generation a 15.6% capacity credit and solar generation a 50% capacity credit (MH/DAYMARK (EXPORTS) I-1 Attachment 1), as a portion of the installed or gross capacity rating, to meet peak load in their supply and demand analysis. This generation capacity from wind and solar reduces the need for generation capacity from other resource types.

- The deferral of emissions requirements in the US resulting from the Trump administration's rollback of environmental regulations, the lack of pending carbon legislation, and the pending plans to terminate the Clean Power Plan have (PUB MFR 79U) allowed existing thermal power plants, which may have been forced to close due to environmental regulations, to stay open, deferring the need for new capacity resources.
- Resource planners and generation developers within MISO already have under development significant generation with which to replace any expected generation retirements within MISO. As stated in MTEP 2017 *"MISO's West Region alone faces more than 22 GW of generation under study"* (MH/DAYMARK (EXPORTS) I-1 Attachment 1).

8.3.8 Export Prices are Continuing to Fall

Electricity prices in MISO have been on a general downward trend since 2008 driven in large part by falling natural gas prices. The August 2017 Staff Report to the Secretary on Electricity Markets and Reliability prepared by the US Department of Energy (DOE Staff Report) has an entire section titled *"Falling Natural Gas Prices"* (MH/DAYMARK (EXPORTS) I-1 Attachment 1). In discussing falling natural gas prices, the DOE Staff Report notes at page 36 that *"natural gas plants and gas prices have been the largest single driver of spot electricity prices"*. The DOE Staff report also states:

> *"Shale gas development has significantly expanded the availability of natural gas and lowered its cost across the United States and the world. Before the widespread use of horizontal drilling techniques in the past decade, U.S. natural gas prices averaged more than $7 per million British thermal unit (MMBtu) between 2003 and 2008, and approached $14/MMBtu in several short periods (including in 2005 after Hurricanes Katrina and Rita reduced production and delivery from Gulf of Mexico sources). Hydraulic fracturing practices spread and made previously inaccessible gas sources economic, causing natural gas prices to*

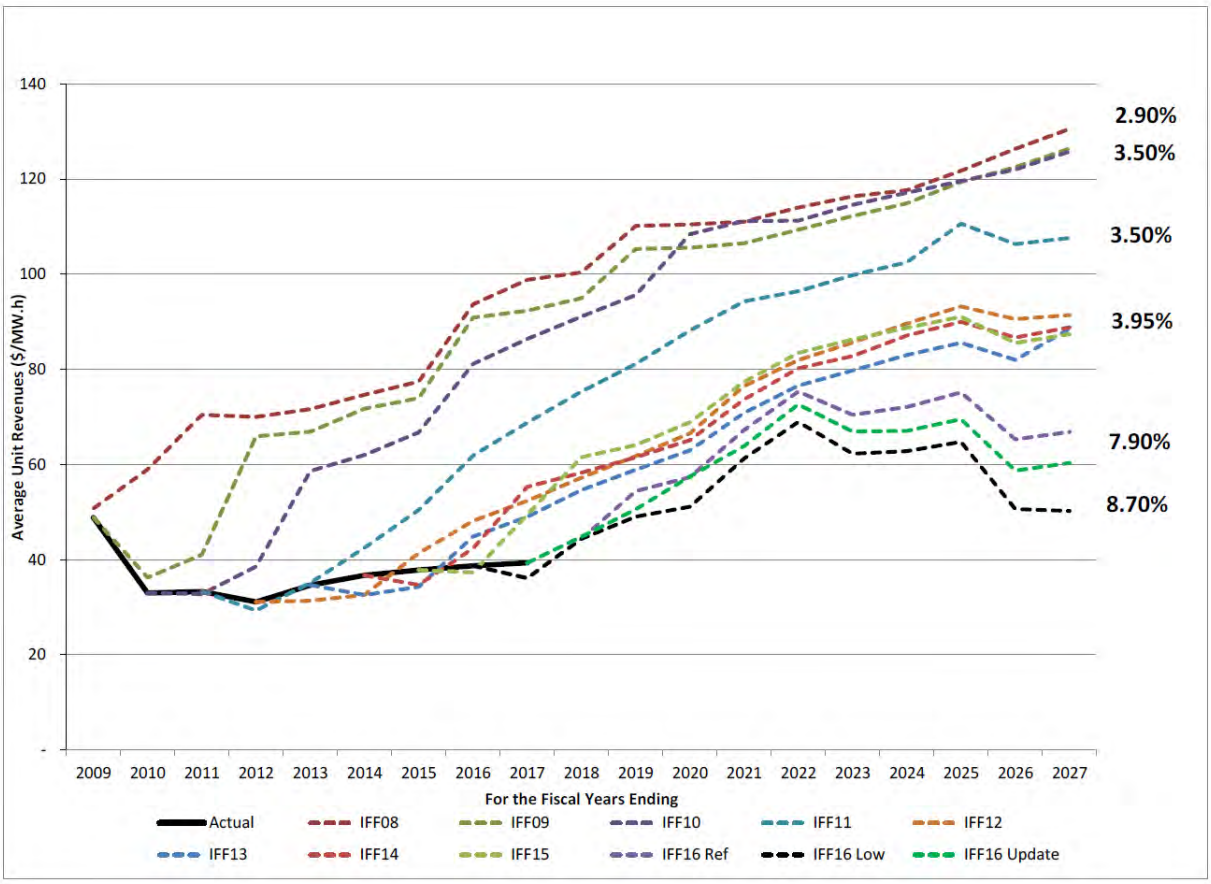
fall, averaging less than $3.20/MMBtu between 2012 and 2016" (MH/DAYMARK (EXPORTS) I-1 Attachment 1).

As indicated in the November 16, 2017 letter from Manitoba Hydro to the PUB which provided the Quarterly Report for the six months ended September 30, 2017,

> *"As of September 30, 2017, on peak opportunity prices were 22% below the target in MH16 Update with Interim while off peak prices were 6% below target. This represents a further deterioration compared to the quarter ended June 30, 2017 where on-peak prices and off peak prices were 16% and 4% below target."*

The current export market conditions are challenging and very competitive.

Dr. Yatchew summarized the market challenges very well:



> *"In any discussion of Canada's economic circumstances, consideration of the effects of the current U.S. administration cannot be ignored. The North American Free Trade Agreement is being re-negotiated at the initiative of the U.S. At a minimum, this injects considerable uncertainty into trade relations with our largest trading partner. The U.S. administration has also altered direction on its decarbonization policies, disengaging from the Paris Agreement and making efforts to revive the coal industry. Together, these factors are likely to have a dampening effect on investment, and weaken prospects for long-term power sales agreements that are premised on clean hydro-electric power"* (Page vii of Exhibit of AY-1).

8.3.9 Manitoba Hydro's Unit Export Revenue has Historically Been Overestimated

Manitoba Hydro's average unit export revenue is calculated as total export revenue divided by total export volume. Future projections of the export revenue reflect actual firm contract revenues, as well as revenue for expected future sales based on the electricity export price forecast. As export prices have fallen since 2008, so too has Manitoba Hydro's average unit export revenue. The history of Manitoba Hydro actual average unit export revenue compared to forecasts from previous IFFs was provided in response to PUB/MH I-153(b) and is reproduced below in Figure 8.3.

Figure 8.3 Progression of Average Export Unit Revenues Graph

Figure 3.7 Progression of Forecast Average Unit Revenues Compared to Actual Average Prices

Source: PUB/MH I-153(b)

When MH08 was prepared, the expectation for average unit export revenue for 2017 was in the order of $100/ MWh. In recent years, the actual average unit export revenue has been just under $40/ MWh. As near-term actual export prices have fallen, so too have the long term electricity price forecasts.

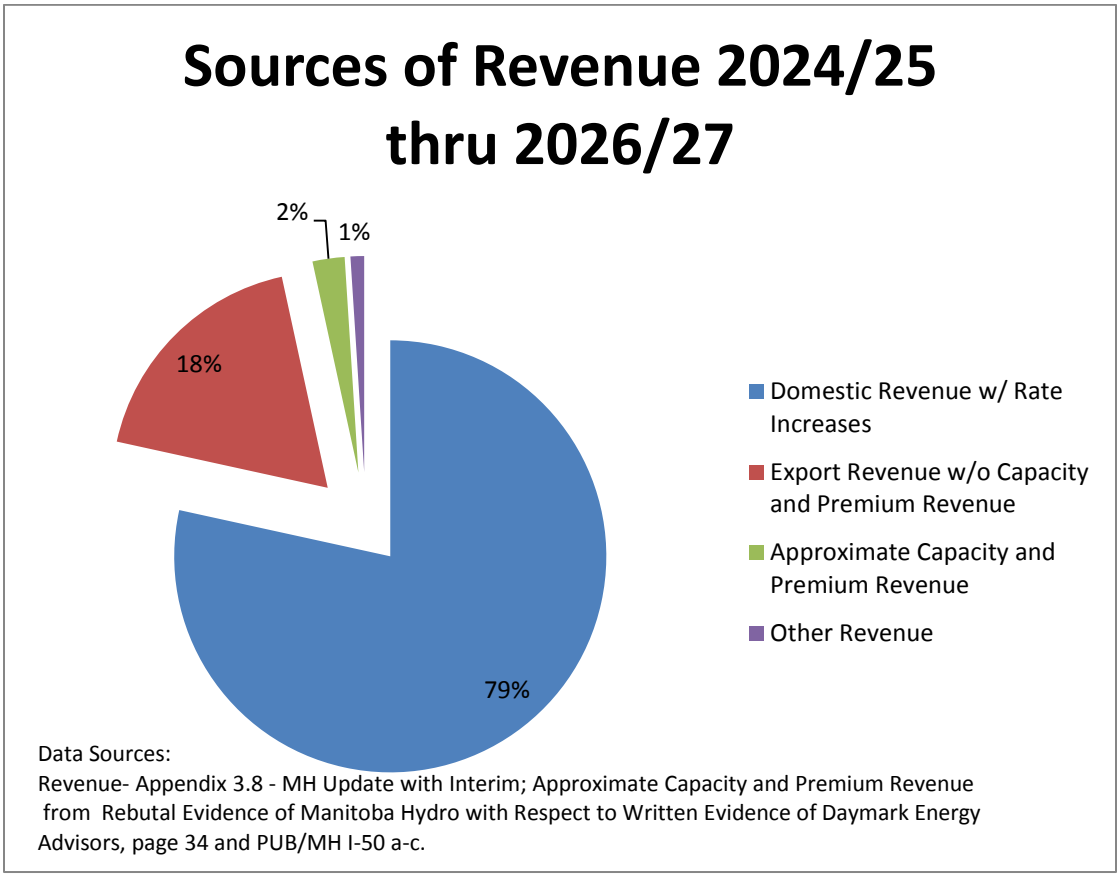
Average unit export revenues in MH16 Update over the forecast horizon have dropped nearly 50% from MH08 and over 20% compared to MH15. The decline in actual and projected average export unit revenues primarily reflects the previously noted steep declines in natural gas prices, with declines in carbon pricing outlook and increasing amounts of wind and solar generation also contributing. As can be seen in Progression

of Average Export Unit Revenues graph, each of the nine Integrated Financial Forecasts in the 2008 thru 2015 period have significantly overestimated the current actual average export unit revenue. This is not a result of any bias of Manitoba Hydro but rather reflects a decade long decline in natural gas and electricity market prices in the independent price forecasts Manitoba Hydro utilizes to form its consensus price forecast.

A review of the Progression of Average Export Unit Revenues graph shows that for the IFF16 Update, the average export unit revenue is projected to increase from around $40 today to around $70/ MWh in 2022. Given the history of underperformance of the unit export revenue projections over the last nine year due to declining price forecast, there is reason for concern as to whether the export revenue will increase to the degree anticipated. Daymark asserted that *"the reference case energy market price forecast and the resultant energy revenues are susceptible to be biased low"* (Page 1 of Exhibit DEA-1) suggesting that the forecast is too low and actual results will be higher. Actual experience over the last nine years has been the opposite.

There is much uncertainty as to what will happen five years in the future, in the 2023 time period, when MISO may need new capacity resources. As Mr. Shepherd noted,

> *"…one (1) of the key adjustments we've made is to reduce the expectation that we are going to be able to achieve premiums in export pricing associated with a firm or capacity demands and – and that's based upon a view that those are very uncertain at this stage that we will be able to actually achieve that level of pricing premium. So we've been more conservative in our export pricing forecast, and I think given our track record of it seems like regularly overestimating export pricing, being a little bit more conservative is the prudent thing to do"* (Transcript Page 296).



8.3.10 Impact of Potential Longer Term Premium and Generation Capacity Revenue Doesn't Change Current Rate Needs

Manitoba Hydro does not believe there is any realistic potential for the Long Term Dependable Product Premium to return for the MISO market, given competition from other renewables, on any time horizon. For 2023 and beyond, if MISO load forecasts prove to be correct, there is the potential for a need for new capacity, and in turn a

potential for some yet to be determined value for generation capacity at that time. Should additional capacity sales be contracted, the associated forecast revenues can be added into the IFF at the specific contract prices. There is likely to be two further General Rate Applications between now and 2023 to make this adjustment. However, for the purposes of the 2017/18 and 2018/19 test years, Manitoba Hydro's assumptions are reasonable and prudent in the circumstances.

As noted in Manitoba Hydro's Rebuttal Evidence, even if one were to include the Long Term Dependable Product Premium and the value of generation capacity after 2024/25 as suggested by Daymark, the impact on net export revenues for the period2024/25 to 2026/27 would be in the order of $200 to $300 million (PUB/MH I-50a-c CONFIDENTIAL). Manitoba Hydro's projected total revenue for this three year period, based on MH16 Update with Interim (Appendix 3.8 Revised) is in the order of $3.5 billion per year and about $10.4 billion for the three year period. Accordingly, the estimate of $200 to $300 million represents a very small portion of total revenue requirement some 7 to 10 years into the future, as shown in Figure 8.4 below.

Figure 8.4 Sources of Revenue 2024/25 – 2026/27

Data Sources:
Revenue- Appendix 3.8 - MH Update with Interim; Approximate Capacity and Premium Revenue from Rebutal Evidence of Manitoba Hydro with Respect to Written Evidence of Daymark Energy Advisors, page 34 and PUB/MH I-50 a-c.

The uncertainty of the potential premium and generation capacity revenue in the 2023 time period and beyond is well within the range of forecast uncertainty, and could be accounted for in future financial forecasts, should it materialize. The potential for such premium and capacity value in the 2023 and beyond timeframe does not have any impact on the current rate requests before the PUB.

8.3.11 Current Water Conditions Have Not Changed Significantly from IFF16 Forecast and Are Less Favourable Than IFF16 Update.

Mr. Cormie provided an update of water conditions in his direct testimony (Transcript Pages 657 to 659). With reference to slides 24 through 26 of Exhibit MH-68, he explained how inflow conditions declined from flood conditions in the early summer of 2017 (when MH16-Update was prepared) to close to average by late summer, and were close to average as of December 2017.

River flows and storage remain close to average and cumulative winter precipitation (November 1st through February 1st) is slightly below average. Carry forward storage into 2018/19 is similar to what was projected in MH16. Conditions continue to be such that Manitoba Hydro cannot confidently rule out the occurrence of flood or drought in 2018/19. The range of uncertainty in flow related revenues is approximately $500 million - between $100 million favourable and $400 million unfavourable (Slide 35 of Exhibit MH-64).

8.4 Interest Rate Outlook

Continuation/reliance on rates not seen since Depression era extremely risky strategy – reasons outlined in detail in next section

Interest rate risk is the risk that future cash flows will fluctuate due to changes in market interest rates. There are a number of forms of interest rate risk affecting the existing debt portfolio. Floating or variable rate debt is subject to interest rate reset risk during the life of the debt as the interest rate becomes adjusted at the periodic reset dates. Refinancing risk pertains to the interest rate exposure that exists upon refinancing a short or long term debt issue at its maturity. On a prospective basis, there is also interest rate risk on borrowings for new cash requirements.

Given the significant level of upcoming debt financings, the corporation's sensitivity to interest rate changes will be elevated during the next few years. Financial market conditions and the corporation's risk mitigation activities will be especially important during this timeframe.

Actual interest rates in the Canadian capital markets have generally been on a downward trajectory over the past two decades but since July 2017, the Bank of Canada has raised the overnight rate 75 basis points. The July 2017 interest rate hike was the first increase in this rate in seven years. Interest rates across the yield curve are projected to continue rising in the next few years.

Manitoba Hydro has been fortunate that the interest rate environment has remained low throughout the beginning of the intensive capital investment period. However, to continue to rely upon historically low interest rates as a means to buffering financial forecasts to reduce revenue requirement is an extremely risky strategy.

In PUB/MH I-31a (Revised) Manitoba Hydro updated the short and long-term rates based on September 2017 forecast information.

PUB/MH I-31(a) compared the short and long-term interest rates based on the September 2017 forecast and March 2017 forecast (used in MH16 Update with Interim). Manitoba Hydro's September forecast of Canadian long-term interest rates based on a 12 year WATM is 10 to 30 basis points higher than IFF16 Update with Interim until 2021 and then is lower thereafter by up to 25 basis points compared to the March forecast. For Manitoba Hydro's forecast Canadian short-term interest rates, the September forecast is up to 70 basis points higher to 2022 and then up to 20 basis points lower thereafter.

Over the forecast 2018 to 2027, the total impact to finance expense under the September 2017 forecast of interest rates is an increase of approximately $180 million net of a $13 million increase in capitalized interest related to Keeyask compared to the March interest rate forecast. Inclusive of modest increases in finance income on cash balances, the higher net finance expense resulting from the higher forecast near term interest rates results in net debt that is approximately $150 million higher and lower equity of approximately $150 million by 2026/27. This results in the target 25% equity ratio not being reached until during the 2027/28 fiscal year (PUB/MH I-31a).

Manitoba Hydro will amend its debt management strategy including the WATM of new debt issuance based on changing conditions. These amendments and associated interest impacts will be reflected in the forecast of the day.

9 SUSTAINING CAPITAL

9.1 All Business Operations Capital investments in the test year are required for the sustainable, safe and reliable operations to the benefit of Manitoba Hydro's customers.

Electricity is essential to public safety. The system is expected to function reliably 365 days a year, 7 days a week and 24 hours a day. Manitoba Hydro is responsible for managing that system and investing as required to assure the safe, reliable and sustainable operation of the electrical system, while achieving a balance of cost, performance and risk for the customer.

All of the capital investments planned for the test years in this Application are required for the sustainable, safe and reliable operation of the electrical system in Manitoba. This is supported by the extensive record of evidence on this subject matter in this proceeding.

Business Operations Capital investments are required to sustain electricity service through the replacement of aging or obsolete assets, capacity enhancements, and expansion due to load growth (Transcript Page 686). Growth and expansion investments are required to connect new customers and meet growing regional demand. In its Direct Evidence (Transcript Page 687), Mr. Wortley notes that Manitoba Hydro is required to be responsive to customer needs and therefore the timing of these investments is out of Manitoba Hydro's control.

System renewal accounts for the majority of the sustainment investment, either to replace failed assets or to proactively intervene to address asset deterioration ahead of failure (Transcript Page 688). This was the focus of METSCO's evidence (METSCO Report prepared on behalf of the Consumers Coalition, Page v, filed as Exhibit CC-19).

After reviewing all of the evidence on the record of this proceeding with respect to sustaining capital planned for the test years of the Application, it is clear that METSCO does not identify nor make a specific recommendation for even one program or project warranting reduction, deferral or any other form of modification. Instead, METSCO, without providing any specific facts or analysis, baldly asserted that there was insufficient justification for the sustainment renewal funding for the test years (Exhibit CC-19, page 45). This conclusion is specious.

All of the proactive interventions planned by Manitoba Hydro in the test years are justified by risk assessments performed by experienced operators and subject matter experts with professional expertise based on asset condition and criticality, with appropriate management oversight and approval. As observed by the UMS Group in their Asset Management Gap Assessment, *"Hydro is using risk to support its asset management decisions, mainly with regard to Capital Planning"* (Appendix 5.1 of the Application, page 16). As noted by Mr. Wortley at Transcript Page 689,

> *"We've got a high level of confidence that this is the right work at the right time… it is based on the actual condition of the asset or its performance. It's a risk assessment made by experienced operators and subject matter experts reviewed and approved by line management."*

Nothing in the evidence would suggest otherwise. These decisions are made by professionals with many years of collective technical experience and expertise with the sole purpose of achieving what is in the best interest of the customers of Manitoba Hydro. As Mr. Hjartarson, the CEO of METSCO confirmed in cross-examination *"I worked with many professionals from Manitoba Hydro, and -- and they are very knowledgeable in their field. So that's – we absolutely did not contest that."* (Transcript Page 7006).

System renewal investments in the test years benefit customers by improving safety and reliability and managing costs. For example:

- Streetlight replacements and grounding improvements to mitigate safety risks (Manitoba Hydro Rebuttal, page 41, lines 14-17, filed as Exhibit MH-52);
- Deteriorated pole and cable replacements serve to maintain customer service levels (Exhibit MH-52, Page 41, lines 17-20);
- Deteriorated apparatus replacements avoid damage to customer and Manitoba Hydro equipment (Exhibit MH-52, page 42, lines 7-15);
- Upgrades to the spacer-dampers on Bipole I and Bipole II to arrest conductor damage and avoid the costs of much larger future repairs (Exhibit MH-52, page 42, lines 17-27);
- Life extension works such as pole treatments and cable injection to delay future replacement costs (Exhibit MH-52, page 42, lines 1-2);

- Remediation of a deteriorated concrete dam to mitigate the risk of dam breach and generation reliability risk at a fraction of the cost of replacing the structure (Exhibit MH-52, page 42, line 29 to Page 43, line 2); and
- Upgrading obsolete generator control equipment to assure the reliability of Manitoba Hydro's largest generating station (Exhibit MH-52, page 43, lines 1-10).

Delaying sustainment investments in deteriorated assets will result in:

- Direct and collateral equipment damage due to in-service failure;
- Higher costs due to emergency replacement of failed assets being more costly than planned replacement;
- Jeopardizing employee and public safety;
- Harmful environmental impacts;
- Lost export revenue which increases costs to Manitobans; and
- Most significantly, customers service interruption.

Moreover, prolonged under-investment can result in a backlog of deteriorated assets which can threaten the sustainability of operations. METSCO stated in reference to sustainment funding during cross-examination (Transcript Page 7089) *"You cannot really just skip it for some time. Your assets do age and you'll have – you'll be in real problem."*

As noted by Mr. Wortley Transcript Pages 2187 to 2188,

> *"It's the customer, ultimately, who is subject to that balance of cost -- cost performance and risk, and essentially, the – the safe, reliable operation of the system is deemed to be what's best for the customer. And so these are the dollars are required to protect that safe and reliable operation and make sure that the customer -- we're there when the customer needs us."*

To conclude, all test year Business Operations Capital investments are required for sustainable, safe and reliable operations to the benefit of Manitoba Hydro's customers which Manitoba Hydro serves by striking a reasonable balance of cost, performance and risk.

9.2 Forecasts of future expenditures will be tested in future General Rate Applications

The Business Operations Capital targets beyond the test years are currently budgeted based on the extrapolation of past asset investment requirements, shaped by the best available information of future trends (see Exhibit MH-52, page 49 and Mr. Wortley's direct evidence at Transcript Page 689). Manitoba Hydro is working towards establishing a budget model for future operations capital in which these budgets will be more closely aligned with quantitative assessments of future risks based on forecasts of asset degradation. This is consistent with UMS' recommendations to close asset management gaps (Appendix 5.1, UMS Report, pages 34-36) and METSCO's recommendation for future work (see Transcript Page 7091, lines 11-19).

However, planned improvements to the budgeting process does not impact or change the fact that all of the capital investments planned for the test years in this Application are required for the sustainable, safe and reliable operation of the electrical system in Manitoba. The appropriate time for the Public Utilities Board of Manitoba ("PUB") to consider and review the merits of capital budgets beyond the test years in this Application is when the budget years in question are included as test years in future General Rate Applications as filed by Manitoba Hydro.

There are some indications of growing demand in sustainment investment levels, most significantly in the potential for coincident waves of similarly aged assets coming to end of life and exceeding historic replacement rates (Mr. Wortley's direct evidence at Transcript Page 690). The Boston Consulting Group also found *"Currently good reliability, but ageing assets a looming issue"* (PUB MFR 72 Attachment, Page 340) and *"System renewal capital investment insufficient to replace aging assets"* (PUB MFR 72 Attachment, page 342). Similar trends are being experienced in the industry as noted by METSCO *"…they're probably not spending enough on system renewal … Assets are aging at Manitoba Hydro as – as in other places. I – I would not be surprised if that was the story"* (Transcript Pages 7096 to 7098).

While these are indications of potential upward pressure on capital budgets, the demand for capital beyond the test years remains uncertain. This uncertainty is one of the drivers to implementing the tools and processes to enable the forecasting of investment requirements based on further and more refined predictions of asset

degradation. As noted in Tab 5 of the Application, three to five years are expected to be required to fully implement and mature these tools and processes.

9.3 Asset Management Practices are being Enhanced

Manitoba Hydro is committed to improving its asset management maturity and is proceeding purposely but cautiously to avoid costly missteps (see Transcript Page 693). Manitoba Hydro commissioned an asset management maturity gap assessment by UMS Group (see Appendix 5.1 of the Application). As anticipated, UMS identified gaps that would need to be closed in order for Manitoba Hydro to achieve best practice while also concluding that Manitoba Hydro's asset management maturity compared favourably to North American industry.

Plans to close these gaps are under development with significant progress anticipated in 2018. Advancing asset management maturity in a large organization like Manitoba Hydro is a complicated endeavour to be accomplished over several years. As described throughout these proceedings (e.g. in Tab 5 of the Application, during the Technical Conference on Asset Management conducted on June 20, 2017, a number of Information Requests, including PUB/MH I-71a-c, and several times in oral testimony including at Transcript Pages 693 and 1419), Manitoba Hydro has a number of initiatives underway to improve capital planning and portfolio management and is proceeding with its Corporate Asset Management Initiative. As Mr. Wortley testified in cross examination (Transcript Page 1421), Phase 2 – the development of asset management policies and strategies – will begin in early 2018 with a detailed roadmap for implementation to follow as Phase 3.

Also, as described in Section 9.3, Manitoba Hydro is undertaking a number of asset management process improvements in order to achieve its objectives of optimizing the timing of investments to maximize value and forecasting long-term capital requirements of the corporation, which are expected to take three to five years to come to full maturity. This timeline was confirmed to be reasonable by METSCO in their testimony at Transcript Page 6992,

> *"…we do acknowledge and commend Manitoba Hydro for the complex path of implementing and entrenching the new asset management tools and the experts*

that preceded us, the Manitoba Hydro's expert put the timeline at about three (3) to five (5) years of doing this work. To us, this timeline is not unreasonable."

METSCO also confirmed in cross examination that achieving a broader asset management maturity is a larger endeavour and *"it's really a never-ending journey"* (Transcript Page 7058).

In summary, Manitoba Hydro will continue to focus its efforts on closing the gaps identified by the UMS Group in the immediate and near term while in the midst of the corporate restructuring initiative.

9.4 METSCO's Recommendations for Additional Regulatory Oversight Must Be Reviewed According to the PUB's Regulatory Mandate and the Incremental Cost of Reporting

In Section 4.0 of their report (Exhibit CC-19), METSCO provided a list of potential accountability tools for consideration by the PUB in establishing additional regulatory oversight and incentive mechanisms for Manitoba Hydro.

METSCO does not appear to fully understand or appreciate how their suggested recommendations would be consistent with Manitoba Hydro's current regulatory construct. For example, METSCO mistakenly believed that the PUB was responsible for approving Manitoba Hydro's capital expenditures forecast (Transcript Page 7018). Such a misconception has now been recognized by METSCO.

Additionally, METSCO did not provide any evidence as to the ongoing costs of additional staffing to prepare reports and for the PUB to review and assess the information, both of which add to the cost of compliance ultimately born by the customer.

For example, at page 46 of its report (Exhibit CC-19), METSCO recommends *"…that the PUB establish a range of potential incentive mechanisms to ensure that the applicant progresses along its path of continuous improvement in asset management capabilities, while exercising increasing cost discipline".*

Regulatory incentive mechanisms are employed with investor-owned utilities to provide sufficient financial reward for shareholders to influence the utility to pursue a

given set of activities. However, Manitoba Hydro does not have a "shareholder" and therefore incentive based mechanisms are not necessarily appropriate in Manitoba. Manitoba's cost of service regulatory model sets customer rates according to the revenue required for sustainable operation of the utility for the customer. Moreover, incentives are not required as Manitoba Hydro is committed to continuing its asset management journey, as described in Section 9.3 above.

METSCO also recommended that the PUB consider an extensive array of new key performance, capital planning, portfolio management and project-specific reporting requirements to be provided to the PUB on a routine basis. A significant effort would be required to create these reports for the PUB with a costly ongoing effort to regularly refresh and publish them.

Furthermore, such reporting would require additional time and resources on behalf of the PUB and potential costs to engage external technical experts to review and assess the contents of such reports. It is also necessary to consider what the PUB would practically do with such technical information as it will not provide the PUB with information it can utilize in determining rates.

Manitoba Hydro reiterates that oversight and accountability for managing the Corporation, including implementation of the Corporation's asset management initiatives, properly rests with the Manitoba Hydro-Electric Board and the Executive and Management teams of Manitoba Hydro. Further, under the existing regulatory framework, there is opportunity for the PUB to review Manitoba Hydro's progress and results with respect to its asset management initiatives as part of the rate-setting process without the requirement for any additional reporting or monitoring as recommended by METSCO. Additional oversight and reporting will ultimately result in Management's efforts being diverted toward responding to these additional compliance requirements rather than working toward implementation of the improvement initiatives.

Manitoba Hydro submits that the current regulatory framework already provides opportunity for the PUB to review the Corporation's progress toward the implementation of its asset management framework. As part of this GRA, Manitoba Hydro has provided a status update with respect to the corporation's plans to

implement an overall asset management framework. In future GRA filings, Manitoba Hydro will provide updates on its progress with respect to the implementation of its asset management initiatives.

10 MAJOR CAPITAL PROJECTS

10.1 Overview

The Public Utilities Board of Manitoba ("PUB"), and the ratepayers of Manitoba, should be reassured by the detailed review of the construction and management of Manitoba Hydro's major capital projects that took place during the course of this General Rate Application.

By way of background, by virtue of Manitoba Order In Council 00092 / 2017 issued April 5, 2017, the PUB was assigned the duty of considering capital expenditures by Manitoba Hydro, in its next review, as a factor in reaching a decision regarding rates for services, in order to support setting rates for services in a manner that balances the interests of ratepayers and the financial health of the Manitoba Hydro.

In its Application filed on May 12, 2017, Manitoba Hydro provided a brief description of its Bipole III Reliability Project ("Bipole III"), its Keeyask Generating Station Project ("Keeyask"), and the U.S. Tie-Line Project made up of the Manitoba-Minnesota Transmission Project in Manitoba ("MMTP") and the Great Northern Transmission Line in Minnesota ("GNTL"). CEF16 also described the Manitoba-Saskatchewan Transmission Project. Included in those descriptions were the budget estimates in place as at that time, and the projected In-Service Dates for each as of May, 2017. The Application also made reference to the review of those projects by the Boston Consulting Group in 2016.

With respect to other review and regulation of the above projects, Bipole III underwent a 37 day hearing before the Manitoba Clean Environment Commission in the fall of 2012 and the spring of 2013. During that lengthy hearing, system risks and reliability, as well as the Corporation's requirement for this HVDC transmission line, were reviewed. Issues such as the proximity of transmission lines to each other, and weather risks such as tornadoes and wind events, were discussed. The Manitoba Clean Environment Commission then recommended this project to the Province of Manitoba and a licence was issued in 2013.

In 2014, the Needs For and Alternatives To ("NFAT") hearing was held before the PUB, and it included a review of both Keeyask and MMTP.

With respect to the Keeyask Project, starting at pages 122 of the PUB's decision dated June 20, 2014, there is a detailed description of the review done by Knight Piésold, an independent expert retained by PUB. It is stated:

> *"In its scope of work, Knight Piésold was asked to review the cost estimates, contracting practices, and the contract provisions. They undertook to determine the extent practices were appropriate, costs were reasonable, and measures were in effect to address changes or increases in construction costs. The Panel focused on Keeyask-related contracting given the immediate nature of decisions on whether to proceed with construction in July 2014, and the fact that Conawapa construction contracts had not yet been entered into.*
>
> *Knight Piésold assessed Manitoba Hydro's costs estimates and contracts. They discussed questions about documentation and procedures with Manitoba Hydro staff. They then used their experience and past work to assess these practices against industry best practices and similar hydropower construction projects. Knight Piésold reported to the Panel that many of Manitoba Hydro's practices and procedures were reasonable and appropriate, relative to industry best practice. Knight Piésold supported Manitoba Hydro using an Early Contractor Involvement process to obtain input from the chosen contractor in order to refine the design, construction techniques, schedule, and risk sharing. Knight Piésold told the Panel that Manitoba Hydro had made the appropriate choices in the various Keeyask Project contracting efforts. The contracting choices were designed to secure the most cost effective contracts."*

It is also clear that the PUB had the opportunity, at the NFAT hearing, to consider the appropriateness of the General Civil Contract in place with BBE. The following is an excerpt from page 123:

> *"The Keeyask general civil contract is a cost-reimbursable contract, not a fixed price contract. This leaves the contract vulnerable to cost escalations as a result of: quantity risk, especially in areas where quantities may have been underestimated; escalation to the contractor's cost factors due to labour productivity or labour costs; escalation in the cost of supply and equipment; and challenges related to adverse weather conditions."*

While there was much discussion about the GCC during the 2017/2018 GRA, virtually all of these issues have already been considered by a previous panel of the PUB and a decision made, based upon that analysis on the information available at that time, for the Keeyask Project to proceed. Having reviewed the nature of contract, as outlined above, the PUB concluded (page 34):

> *"There are good reasons to proceed with the Keeyask Project at this time in light of the need for new resources, construction expenditures undertaken to date, the socio-economic and environmental benefits of the project and the important commercial relations that Manitoba Hydro has established both with First Nations and through its export contracts. Moreover, there are associated reliability benefits with the 750 MW Transmission Interconnection Project." [MMTP]*

With respect to the new US Tie Line [MMTP], there is a detailed description of the review that was done by the PUB. It stated:

> *"With respect to Manitoba Hydro's construction cost estimates for transmission facilities, the Panel concludes that such estimates are reasonable and recommends that Manitoba Hydro be given approval to proceed with the construction of a 750 MW transmission interconnection to the United States for a 2020 in-service date. This interconnection provides increased firm transmission access extending into Minnesota, provides important, increased reliability, and supports import and export of electricity."*

The Province of Manitoba went on to accept the PUB's recommendations with respect to construction of both Keeyask and MMTP.

Keeyask and MMTP also underwent rigorous environmental review at hearings before the Manitoba Clean Environment Commission in 2013/14 and 2017 respectively. In both cases, the Commission recommended the projects to the Province of Manitoba. The Province issued a licence for Keeyask in 2014. The Province's decision with respect to MMTP is pending. MMTP will undergo further scrutiny at the upcoming hearing this spring before the National Energy Board.

The GNTL underwent regulatory review in the United States and received a Certificate of Need and A Route Permit from the Minnesota Public Utilities Commission, a Presidential Permit from the US Department of Energy and a Section 404 Wetlands Permit from the U.S. Army Corps of Engineers allowing its construction to proceed.

In addition to review through this current GRA process, the Manitoba-Saskatchewan Transmission Project is regulated under The Environment Act of Manitoba, though due to its size, a hearing will not be required. It is worthy to note that an independent review of this project was conducted by Daymark Energy Advisors for the PUB and it determined that it was in the best interests of Manitoba's ratepayers to proceed with the project. (Transcript Page 5979)

Although the Intervenors may wish to revisit many of the issues and considerations already reviewed at other regulatory proceedings, the PUB's task and focus is to now consider the Corporation's expenditures to date on these projects in its rate setting decision making process, as well as the budgets going forward.

Manitoba Hydro provided thousands upon thousands of documents, and responded to dozens of requests for information from MGF Project Services Inc. ("MGF"), an entity retained by the PUB to review Manitoba Hydro's capital expenditure program in relation to the above projects and to provide its opinion on Manitoba Hydro's updated costs for each. Although there are recommendations going forward, some of which may be implemented by Manitoba Hydro where feasible, practical and of value, it is notable that MGF made the following comments in its Report (Redacted MGF Report, Exhibit MGF–2R):

> "*Manitoba Hydro staff are competent and professional*". (Page 1)
>
> "*The Manitoba Hydro teams on all projects are very capable and dedicated*." (Page 2)
>
> "*In general Manitoba Hydro is very strong in capturing and reporting costs and has a very capable group*." (Page 35)

"*The team is comprised of a very knowledgeable and capable group*". (Page 99)

Further, Manitoba Hydro established a Major Projects Executive Committee that meets twice monthly to review the Corporation's major projects. (Transcript Page 5543) The Executive report regularly to the Board of Manitoba Hydro to keep it apprised of developments, and quarterly reports are provided to the PUB (Response to Directive 13 of PUB Order 73/15). Collectively, these steps should give the PUB and ratepayers comfort, going forward, that project execution is in good hands.

In terms of the impact on rates, with Bipole III coming into service this year, the finance expense, depreciation, and operating expense associated with it will be reflected on Manitoba Hydro's income statement and revenue requirement. The Keeyask Project and MMTP/GNTL are net income negative upon entering service and remain net income burdens for a 30 year period. Manitoba Hydro's financial position now must recognize the new reality of the carrying cost of these significant assets coming into service in the near future (Tab 2 of this Application on Page 48). Specifically with respect to GNTL, as it is not a Manitoba Hydro project, the construction cost contributions payable are not in Manitoba Hydro's capital expenditure forecast. However, they are included in the IFF. (Transcript Page 5067)

Below is Manitoba Hydro's position with respect to the issues discussed in relation to each of the major projects discussed at the hearing. The Manitoba-Saskatchewan Transmission Project is discussed in Section 10.4 below.

10.2 Keeyask Generating Station Project

As described on page 42 of Tab 2 of the Application, the Keeyask Generating Station is a 7 unit 695-megawatt hydroelectric generating station situated at Gull Rapids on the lower Nelson River in northern Manitoba and is owned by a partnership between Manitoba Hydro and four Manitoba First Nations, known as the Keeyask Hydropower Limited Partnership ("KHLP"). Manitoba Hydro has been tasked with the responsibility of managing the construction of the Keeyask Project and the operation of the facility when it enters into service on behalf of the KHLP. The Keeyask Transmission Project will transfer the power produced at Keeyask onto the Manitoba Hydro system when the generating station enters into service, currently projected to be in 2021. (Transcript Page 5562).

10.2.1 Complex project

The complexity of the Keeyask Project cannot be understated, as it is distinct from Manitoba Hydro's other major projects, and unique from many other projects across North America, as noted on Slide 24 of the Capital Panel presentation (Manitoba Hydro's Major Capital Panel Presentation, Exhibit MH-120). It takes many years to build and, unlike many other projects that are built near major centres, it is in a remote location requiring a camp that can accommodate a workforce of 2,400 people. Due to its northern location, there are seasonal constraints on construction. There will be limited warm weather construction time, and extreme cold may also hamper construction. There are numerous environmental and regulatory requirements necessary to protect and preserve the environment, as outlined in the Project's various licenses and permits. For example, the Project requires diverting a river over a kilometer wide and has extensive diking. Significant structures are required to protect the work area and the natural topography presents challenges as subsurface conditions underlying the river only become evident once cofferdams are constructed and the river bed is exposed. (Transcript Page 5547 and 5552 to 5553) Accordingly, forecasting of both the budget and schedule is challenging, particularly at the early stages of the Project.

10.2.2 Economics

In 2016, the Boston Consulting Group did an analysis and concluded that Keeyask should proceed as the Net Present Value was favorable when compared to the gas option. (PUB MFR 72) In 2017, Manitoba Hydro reviewed the economics once again and, though they have deteriorated to some degree since the 2014 NFAT, the corporation determined that it was still appropriate to continue construction to completion. (Transcript Page 451 and Tab 2 of the Application on Page 48) Cancellation would have increased aggregate revenue requirements in the billions through to 2026/27. (Transcript Page 451 and Tab 2 of the Application on Page 48) As such, its focus is to now deliver this Project on time at the new projected In Service Date ("ISD") and on budget consistent with the control budget of $8.7 billion. Manitoba Hydro has put forward a strong plan to do so and is working cooperatively with its General Civil Contractor ("GCC") to do just that.

When Keeyask comes online in 2021, the station will provide clean, renewable energy to Manitobans for generations. The energy generated by Keeyask will support export contracts until it is required to fulfill domestic load requirements.

10.2.3 Awarding of the General Civil Contract

Manitoba Hydro's decision to select BBE Hydro Constructors LP ("BBE") for the GCC was reviewed extensively again at this hearing. Hindsight being perfect, others may decide that the selection made several years ago was not the best one when considering the cost-reimbursable target price contract structure for the GCC. However, at the time, and with the full knowledge of the Manitoba Hydro-Electric Board, the selection was made. It is also important to note that the contract model is not determinative of success on a project. Both Muskrat Falls and Site C have contract models different from this GCC. However, both have experienced serious, if not more significant challenges in their projects, and both projects are behind schedule and over budget (Transcript Pages 7305 to 7312).

While it seems fruitless now to re-visit this decision, one that cannot be reversed, Manitoba Hydro will briefly summarize the history and the reasonableness of its past actions.

The GCC is the largest contract on the Keeyask Project and includes river management structures, rock excavation, concrete and earth structures, and electrical and mechanical work. (Transcript Page 5557) The form of contract entered into is a target price contract where the contractor is reimbursed for actual costs. The contractor is incentivized to perform and minimize cost and schedule as their profit and General Administration and Overhead ("GA&O") are at risk if they exceed their target price (Transcript Page 5560 and 5576).

The decision to proceed under the cost reimbursable target price contract model was made in 2012 and was part of a larger Project Delivery Strategy for the Keeyask Project. This decision was informed by a number of factors including lessons learned on the recently completed Wuskwatim Generating Station Project, completeness of the design, and allocation of risk and prevailing market conditions at the time (Page 5 of Manitoba Hydro's Written Rebuttal on the MGF Report, Exhibit 117).

In 2012, as Manitoba Hydro was evaluating various project delivery options, the North American major capital project market was extremely competitive. In this environment, megaproject contractors were not accepting hard money contracts, where risks such as labour availability and productivity would pass on to contractors without substantial and cost prohibitive premiums. This caused owners to proceed with alternative forms of contract, sharing risk where possible, and retaining risks that could not be cost effectively passed on to contractors. (Transcript Page 5558) As acknowledged by Mr. Campbell, contractors had many projects to choose from (Transcript Pages 7303 to 7305).

As described in the hearing, Manitoba Hydro experienced this reality on the Wuskwatim Project when it attempted to tender the GCC as a unit price contract. (Transcript Pages 5558 to 5559) A second lengthy procurement process was necessary which exposed the project to greater risk and required a much shorter ramp up schedule for the eventual GCC. These were factors in increasing the cost and lengthening the schedule for Wuskwatim.

In 2012, when Manitoba Hydro began to evaluate procurement options for the Keeyask GCC, the economic environment was similar to when the Wuskwatim GCC was procured. Having experienced the cost and schedule consequences of attempting to tender a contract model not reflective of the prevailing market conditions, Manitoba Hydro prudently undertook a three stage procurement process, beginning in 2012, that began with an appropriate market sounding exercise to better gauge the market conditions. The result of that sounding exercise was confirmation that it was best for Manitoba Hydro to proceed with a cost reimbursable target price model in order to secure the most competitive pricing considering the major project environment at the time. The process advanced on that basis and culminated in four prequalified proponents bidding on the work in a competitive environment. Manitoba Hydro prepared an internal engineering estimate and also engaged a third party to provide a reference proposal for comparison of the bids. The pricing proposed by the third party was generally in line with the Engineer's Estimate and was within the range of bids received from the four Proponents. (Page 10 of Exhibit MH-117) However, Manitoba Hydro still did an analysis to review BBE's bid, as it was lower, prior to awarding it in March of 2014, and carried a significant labour reserve to deal with potential productivity issues. Again, with the benefit of hindsight, the labour reserve should have

been higher to offset the issues experienced with the contractor (Transcript Pages 5677 to 5680).

The PUB and Knight Piésold ("KP"), the independent expert consultant retained by the PUB during the NFAT in 2014, were aware of the contracting methodology of the GCC, having received procurement and contract documents and summaries of the proponent's bids. On Executive Summary page II of IV of KP's report dated January 23, 2014, in reference to construction management, schedule and contracting plans (rebuttal page 4), KP stated that:

> *"The overall approach follows well documented internal standards developed by Hydro's NGCD [New Generation Construction Division]. The contracting method varies by project component but the principal civil works contracting strategy is an Early Contractor Involvement (ECI) Project Delivery Strategy. Overall the project delivery strategy has been to transfer risk away from Contractors and to Hydro in order to better understand and share the risks and obtain a better contract price as a result."* [Acronym explanation added]

10.2.4 2016 Issues and Recovery Plan

At the beginning of the 2016 construction season, the Project was generally on track and the project team was forecasting that the control budget of $6.5B and the schedule with a November 2019 unit 1 ISD would be achieved (Page 15 of Exhibit MH-117). Prior to the start of the concrete work in 2016, a senior off-site review team, comprised of former Manitoba Hydro and BBE senior staff not directly involved in the day-to day activities, was assembled to provide an objective review of the work falling under the GCC to ensure Manitoba Hydro and BBE were doing everything possible to be successful. Although this team identified areas of potential opportunity, the team did not predict the soon-to-be-realized underperformance (Transcript Pages 5569 to 5570).

In early June 2016, approximately 6 weeks into concrete activities, it was evident that BBE's actual volume of concrete completed to date was significantly less than planned. Manitoba Hydro immediately took action and took a number of steps that were both timely, and as KCB agreed, appropriate (Transcript Pages 7315 to 7320).

On June 19, 2016, Manitoba Hydro formally requested that BBE develop a recovery plan to increase its hiring rate to get more workers on site and to increase concrete production in order to bring production back in line with the 2016 plan. Manitoba Hydro staff continued to monitor the progress carefully during this time (Transcript Page 5570).

By July 2016, it was apparent that the initial recovery efforts by BBE were not going to be impactful enough to recover to the original plan. As well, both BBE and Manitoba Hydro were becoming aware that the work could not be built as it was originally planned, and re-sequencing efforts were undertaken (Transcript Page 5571).

By the end of the 2016 season, BBE had achieved only 41% of the concrete plan and 65% of the earthworks plan. Manitoba Hydro then implemented a formal Recovery Plan in September 2016 (Transcript Pages 5571 to 5572), which included:

- A call to action for BBE's project team, Executive Sponsors and CEOs;
- Developing a plan for the continuation of concrete through the severe winter months, which had not been planned previously;
- Identifying root causes that were impacting performance;
- Initiating activities to reforecast the cost and schedule for the Project;
- Undertaking analysis around contractor's claims; and
- Supplementing the commercial expertise of the team.

A separate task force was set up to understand the source of the underperformance and to understand the root causes. Multiple root causes were identified and mitigation measures began to be developed (Transcript Pages 5572 to 5573). More specifically, it was determined that the main contributing factors for this underperformance included:

- aggressive concrete production assumptions from BBE's bid that could not be achieved in the current marketplace;
- slower than planned progress during the ramp-up; and
- geotechnical and geological conditions, discoverable only upon the commencement of actual construction, which were more challenging than planned and impacted both concrete and earthworks.

In addition to these root causes, it was evident that the six month advancement opportunity that existed coming into the 2016 construction season had been lost and the Keeyask Project was facing a potential delay of two to three years or more (Transcript Pages 5572 to 5573). The large variance between actual and planned production also resulted in BBE having no opportunity to earn profit for the remainder of the Project under the existing contract structure. The erosion of profit potential created a risk of worsening performance for the remainder of the project if not addressed.

Between the Fall of 2016 and Spring of 2017, Manitoba Hydro's Keeyask team worked with BBE to implement the Recovery Plan to improve performance. There were meetings and negotiations between Manitoba Hydro and BBE resulting in a reworked schedule and cost forecast for the civil works and the entire Project. In addition, Manitoba Hydro reviewed its options on how to proceed for the balance of the Project. (Slide 7 of Manitoba Hydro's Major Capital Panel CSI Presentation, Exhibit MH–121) In consultation with legal and technical advisors, and with the approval of the Manitoba Hydro-Electric Board, the decision was made that the least cost option was to continue with BBE and to negotiate an amended contract (Slides 9 to 11 of Exhibit MH–121). Other options would have resulted in a substantial cost increase and significant time added to the schedule, as well as introduced significant risk to the delivery of the Project. (Transcript Page 5574, PUB/MH I-6a-b-CONFIDENTIAL Attachment 1, and CSI Transcript January 23, 2018, Page 23)

Further, Manitoba Hydro and BBE conducted a joint review of the schedule and saved the Project over one additional year in the schedule. (Transcript Page 5575) Such joint and collaborative efforts will continue throughout the life of the Project.

10.2.5 Amending Agreement #7 - Key aspects

Manitoba Hydro could not unilaterally change the terms of the agreement without being in breach of contract. The negotiation included *"gives and gets"* from both parties and, ultimately, an amended agreement was reached (CSI Transcript January 23, 2018, Page 27 and Slide 14 of Exhibit MH–121). The terms in Amending Agreement #7 lowered the overall costs and schedule risk for Manitoba Hydro and re-established a reasonable profit that BBE could earn back based on its future performance.

Foundational to the agreement was alignment of both parties' interest to deliver at the lowest cost and shortest schedule (Transcript Page 5575). The key features of the amendment are:

- Schedule and cost incentive pool provides incentive for BBE to earn profit and Manitoba Hydro to minimize Project cost and schedule;
- GA&O capped at 1.0x the target price; previously capped at 1.3x the target price;
- Contractor claims *"wiped clean"*, reducing Hydro's potential liability and overall cost;
- Narrowed ability for future claims so the contractor's focus would, instead, be on getting the work done;
- Liquidated damages for late delivery were established; the original contract had no damages for late delivery beyond the limitation of the profit pool; (Transcript Page 5576)
- Additional requirements such as a commitment to improve performance, focusing on efficiencies in indirect costs, more controls around cost and schedule, and training requirements were also part of the amended contract.

(CSI Transcripts Pages 26 to 36, Slide 63 of Exhibit MH-120, and Slides 17 to 19 of Exhibit MH–121)

10.2.6 2017 Outcomes

The revised control budget for Keeyask is $8.7B (at a P50 contingency level) with a first unit ISD of August 2021 (Slide 65 of Exhibit MH-120). The Project team considered the status of the Project, and the key risks remaining, and determined that this estimate balances the remaining risks and challenges the team to execute to that budget (Transcript Page 5577).

In the 2017 construction season, the first year of construction after the implementation of the Recovery Plan, significant improvements in both concrete and earthworks production were achieved. Despite the greater complexity of the concrete work in 2017 as a result of more curved formwork and work at higher elevations, there was a 12% increase in the concrete volume and a 90% increase in earthworks between 2016 and 2017. In 2017, three milestones were achieved which allowed the Project to protect an advanced schedule that could see the units come online earlier than the revised control schedule of August 2021. These milestones include completion of the spillway concrete, installation of the Powerhouse crane and enclosure of the Service Bay and Powerhouse unit 1.

Despite achieving these key milestones, concrete and earthworks production targets were not fully achieved. There was a deficit of approximately 20% of concrete and 25% earthworks (Transcript Pages 5557 to 5558).

Manitoba Hydro and BBE have worked to address this issue in 2018. BBE's updated forecast schedule from December 2017 recovers the delay to the GCC work as a result of last year's performance shortfall by extending the concreting season within the enclosure throughout the coldest winter months and adjusts monthly production targets to reflect actual quantities achieved in 2016 and 2017 by the Contractor. The GCC forecast schedule demonstrates that the Service Bay and Powerhouse Unit 1 enclosure was achieved on schedule in December 2017, and enclosure of units 2 and 3 were achieved in late January 2018 - on or ahead of schedule. The draft tube liner installation by the Turbine and Generator contractor began on schedule in late January 2018. The Project is also on track to achieve the diversion milestone where the South Channel of the river will be diverted through the Spillway in late August 2018. (Manitoba Hydro Undertaking 55, Exhibit MH–131 and Confidential Attachment)

To further improve production in the future and remove inefficiencies, Manitoba Hydro, working together with BBE has (Tab 2 of the Application on Page 46):

- Developed and deployed an issue management system;
- Developed refined processes, systems and tools based upon the root cause analysis;
- Implemented a change management program to enable a culture shift within the Project team; and
- Developed key performance indicators to report on all deliverables.

Manitoba Hydro has also taken a more active role in its management of BBE, embedding and integrating its team at the Project site (120 – 150 Hydro employees now working at site beginning in 2016) and introducing *"cold eyes"* reviews by experienced retired contractor employees (CSI Transcript January 23, 2018, Pages 47 to 49).

Most recently, discussions have just successfully concluded with the Allied Hydro Council and it is expected that the changes to the BNA will bring improvements to productivity and production (CSI Transcript, January 23, 2018, Pages 26 to 36).

10.2.7 Current Forecast at Completion

Manitoba Hydro is currently forecasting a final cost of Keeyask on or below the control budget of $8.7 B with all units completed ahead of the control schedule (Slide 74 of Exhibit MH-120). Meeting the control budget will require an achievable performance improvement of a further 10% by the GCC and no major risks to materialize (Transcript Page 5725). Manitoba Hydro is committed, despite the skepticism expressed by MGF, that with the improvements made in 2017, and the additional management and review tools and processes in place, we can achieve the necessary productivity increase in 2018. Manitoba Hydro and BBE's interventions are intended to create positive change, and efficiencies gained through completing repetitive work on the seven units.

With four years remaining, construction on Keeyask is approximately half complete. Significant risks remain that have the potential to jeopardize meeting the control budget and schedule, including:

- Execution/productivity rates of the GCC;
- Unexpected geotechnical/geological conditions at the South Dam/Dyke;
- Unseasonable weather (Slide 73 of Exhibit MH-120)
- Loss of site access/work stoppages;

However, as stated by the MGF team, there is still four years to run on the Project and still much opportunity to get the contractor to perform better in the future (Transcript Page 7191). Manitoba Hydro is continuously evaluating risks and developing mitigation plans to manage the risks when they materialize. The issues with respect to cost and schedule are also not unique.

Unlike Manitoba Hydro's rigorous budgeting process, and risk-based probability analysis done by John Hollmann of Validation Estimating, MGF provided a loosely estimated cost of $9.857B that cannot be relied upon. By its own admission, it was not precise, and was only an order of magnitude figure. It could go up, or it could go down (Transcript Page 7185). This value was also developed without a detailed probabilistic risk analysis, or any Monte Carlo analysis, to provide a more realistic range of outcomes and to verify its legitimacy (Transcript Page 7357). MGF also included a 10% contingency, or almost $900 million, on top of their forecasted cost increases due to BBE performance not meeting the plan. Further, it did not factor in any of the mitigation activities being

undertaken by both Manitoba Hydro and BBE (MGF Presentation (Keeyask -MGF Estimated Project Value), Exhibit MGF-4–1 and CSI Transcript, January 31, 2018, Pages 39 - 40).

10.2.8 2018 Plan and key upcoming activities

To improve outcomes in 2018 and beyond, Manitoba Hydro is working in close collaboration with BBE on execution planning, and is exerting greater oversight of BBE's construction management to improve BBE's performance. This initiative will continue to be a focus in 2018 and for the remainder of the civil contract. Manitoba Hydro has increased the pressure on the GCC to perform, and has collaborated wherever possible to stimulate greater productivity and production (Transcript Pages 5579 to 5582). Some of these areas include:

- Contractor's management of the trades;
- Travel logistics for the contractor's workforce;
- Site wide respectful workplace campaign;
- Contractor's revised organizational structure and increased supervision capacity and experience;
- The development of an effective monitoring and control system to provide daily feedback to contractor workforce;
- Combining and streamlining BBE's and Manitoba Hydro's quality control and assurance teams and processes;
- Establishment of single mission and team ethics for the Manitoba Hydro and BBE teams.

Manitoba Hydro has also been leading efforts to gain efficiencies, improve methods/processes and achieve cost and schedule savings. A few examples of key initiatives where Manitoba Hydro spearheaded efforts that led to significant cost and/or schedule benefits:

- The decision to procure a new draft tube formwork system to utilize on the remaining 5 units (Page 20 of Exhibit MH–117). This decision shortened the schedule to install the bottom portion of the water passage referred to as the draft tube and improved overall cost and schedule performance.

- The decision to utilize column extenders in the Powerhouse and Intake allowed for structural steel to be installed in the concrete structures at lower elevations. This installation provided an opportunity to enclose the Powerhouse and Service Bay earlier resulting in a schedule savings of over 1 year (Transcript Page 5656).
- Advancement of the south dyke in 2018 and supporting design changes (Page 20 of Exhibit MH–117). The advancement of the start of work on the south dyke will allow for additional quantities to be placed during the winter 2018 and reduce risk to the project schedule. (Pages 22 to 23 of Exhibit MH–117)

The 2018 plan, as noted on slide 72 of Exhibit MH-120, lists initiatives Manitoba Hydro and BBE are undertaking to drive further improvement. One example is strategic winter work being undertaken to allow for greater progress during the 2018 summer months including advancing the South Dyke, and winter concrete work for the Powerhouse now that it is enclosed (Exhibit MH-131 and Confidential Attachment).

10.2.9 Summary on the Keeyask Project

Manitoba Hydro is confident that the improvements from 2017 can continue and that further improvement will take place in 2018. Manitoba Hydro has engaged external experts to test Manitoba Hydro's and BBE's plans for 2018 to ensure everything is being done to deliver the project at lowest cost and the shortest schedule (Transcript Page 5580).

10.3 Bipole III Transmission Reliability Project

The Bipole III Transmission Reliability Project is critical to increasing the reliability of the HVDC system in Manitoba. Currently, approximately 70% of the Province's power is generated in northern Manitoba and is delivered to southern Manitoba by the Bipole I and Bipole II transmission lines which rest in the same right-of-way corridor and both terminate at the Dorsey Converter Station. Bipole III will provide a separate transmission corridor and termination point for the HVDC system

The Bipole III Transmission Reliability Project continues to be on schedule for a July 2018 in-service date and is on target to be completed within the $5.04 Billion control budget (Transcript Page 5595). As outlined by the PUB's Independent Expert Consultant MGF Project Services, the Bipole III HVDC Converter Stations are well managed by Manitoba

Hydro and the potential for cost over-runs is low (Page 1 of Exhibit MGF-2R and Slide 28 of MGF's Presentation, Exhibit MGF–4).

Similarly, the Bipole III Transmission Line is well organized and efficiently managed. The Project overall has used contracting strategies that were commercially astute and allocated risk appropriately (Page 2 of Exhibit MGF–2R).

With approximately 6 months remaining until the in-service date, the remaining risks on the Bipole III Transmission Reliability Project relate primarily to schedule. Performance issues with one of the Transmission Line contractors have presented risks to the on-time completion of the Transmission Line. However, Manitoba Hydro took *"immediate action"* to mitigate this risk by removing scope from the under-performing contractor and continues to closely monitor and manage schedule risks to ensure the July 2018 in-service date is achieved. This was the right course of action, as attested to by MGF (Transcript Pages 7202 to 7203).

10.4 Manitoba-Minnesota Transmission Project

The new 500 kV interconnection between Manitoba and Minnesota is a crucial part of Manitoba Hydro's development plan to meet the future electricity needs of the Province. The plan, at its core, includes the construction of the Keeyask Project, the new interconnection, and several long-term firm export sales to the US and Canadian utilities which will support the plan, and improve the economics, reliability and robustness (Transcript Page 5604).

The Manitoba portion of the new interconnection is currently on schedule for an In-Service Date of June 2020 and has a budget of $453 million (Transcript Pages 5611 and 5619, and Page 2 of Exhibit MGF–2R). MMTP has had the benefit of using recent costing and scheduling information from Bipole III and other smaller transmission line projects in its scheduling, forecasting and budgeting processes, allowing it to provide a current estimate at the P75 level (Transcript Page 5614).

Manitoba Hydro continues to manage the project appropriately and is committed to continuing efforts to secure the June 2020 ISD (Transcript Page 5809). Further, the Transmission Projects group is continually improving and adjusting how they perform (Transcript Page 5614).

Manitoba Hydro's use of Primavera P6 for its scheduling activities is appropriate and proven to be successful on several of its transmission line projects (Pages 52 to 54 of Exhibit MH–117). Further, Manitoba Hydro's approach to tower design is appropriate and cost effective (Pages 58 to 59 of Exhibit MH–117).

Manitoba Hydro's estimating methodology is consistent with industry standard (Page 2 of Exhibit MGF–2R). Manitoba Hydro will be updating the project estimate to include awarded contracted values instead of estimates when those contract values become available (Page 58 of Exhibit MH–117). While there are risks to both cost and schedule as the Project is still at the pre-construction stage awaiting licensing and regulatory conditions, the risks are being appropriately managed.

10.5 Great Northern Transmission Line Project

The U.S. portion of the new 500 kV interconnection between Manitoba and Minnesota is on schedule for in-service on June 1, 2020. To date, the project is on budget with approximately 10 percent of the funds spent. Manitoba has the expectation that the Project will be under budget given the conservative nature of the Minnesota Power's budgeting process (Transcript Page 5610).

The PUB's Independent Expert Consultant, MGF, reviewed the GNTL project. MGF concluded (Page 163 of Exhibit MGF–2R):

> *"The project is progressing, with Rights of Way being cleared, amongst other activities. The Construction Management Agreement is well considered commercially and serves to protect the interests of Manitoba Hydro. When benchmarked with other similar projects, its cost estimate is considered high and this should be reviewed in due course."*

Manitoba Hydro maintains that its estimates of costs included in the IFF associated with GNTL are appropriate. Specific terrain conditions and weather dependency do impact construction costs for the GNTL Project. As a large portion of the Right of Way is through very remote and wet terrain, the Project is dependent on favourable winter construction weather to minimize access costs. As a result, the Project has built an extra

year into the schedule to provide for the option of delaying work if a mild winter occurs (Transcript Pages 5609 to 5610).

Further, as Minnesota Power has yet to finalize some of its contract costs, once those contract costs are finalized, the budget will be updated to reflect market prices.

Given the challenging terrain conditions and the access related risk and associated dependency on favourable weather conditions for construction and finally the fact that construction is in its early stages with contracts remaining to be let, Manitoba Hydro argues that the GNTL related costs that are included in its IFF are appropriate. Consistent with MGF's recommendation, Manitoba Hydro will update the cost assumptions in due course and those assumptions will be updated in future IFFs.

11 12-YEAR VERSUS 20-YEAR DEBT TERMING STRATEGY

As outlined in Manitoba Hydro's Debt Management Strategy, filed as Appendix 3.5 to the Application:

> *Manitoba Hydro's fundamental debt management objective is to provide low cost, stable funding to meet the financial obligations and liquidity needs of the Corporation, while maintaining risk at prudent levels and reserving sufficient flexibility to adapt to changing circumstances.*

The potential cash flow stemming from cost reductions and the proposed rate increases assumed in MH16 Update with Interim (filed as Appendix 3.8) provided an opportunity for Manitoba Hydro to use the increase in forecasted cash flows to permanently retire debt in the early 2020s when cash flow from operations is projected to exceed cash required for investing activities. With the new forecast assumptions, there was an opportunity for Manitoba Hydro to consider shortening the term to maturity of new debt issuance, timing the maturity of new debt terms to coincide with periods in which Manitoba Hydro would have cash available for debt repayment.

Historically, Manitoba Hydro's interest rate forecast for Canadian borrowing has been the average of 10 and 30 year Manitoba cost of borrowing, which Manitoba Hydro called the 10 Yr+ rate. In the past, for forecasting purposes, Manitoba Hydro had assumed a 20 year term to maturity for new Canadian dollar borrowing.

MH16 Update with Interim modeled a reduction of the Weighted Average Term to Maturity ("WATM") for new borrowing from 20 to 12 years. Using this assumption, the forecast shifted approximately 30% of new debt issuance from the 30 year+ maturity bracket to the under 10 year maturity bracket. The increased weighting was predominantly in the 5 year term.

Matching expected surplus cash flows with maturing debt creates opportunity to avoid refinancing risk by permanently reducing debt. Manitoba Hydro can capture interest rate savings by borrowing more debt in the 5 year term as it is typically less costly than 30 year debt.

At the time of filing this General Rate Application ("GRA"), the new forecast modeled approximately $500 million interest savings in the decade out to 2027. Providing all forecast assumptions held, including forecast rate increases, the planned level of interest rate risk would be kept at a manageable level. This would have permitted Manitoba Hydro to reduce the net 10 year borrowings to 2027 by $4.2 billion. The following table (reproduced from Figure 1.9 of Manitoba Hydro's Rebuttal Evidence, Exhibit MH-52) shows the total planned borrowing for the next decade comparing the scenario of Manitoba Hydro's requested rate increases in MH16 Update with Interim with a 3.95% rate path.

Figure 11.1 MH16 Update with Interim under different rate increase scenarios

In Billions of Dollars

	IFF16U 7.9%	IFF16U 3.95%
2018-2022 Borrowing	$ 13.5	$ 14.1
2023-2027 Borrowing	$ 8.8	$ 9.7
2023-2027 Debt Retirement	$ (3.1)	$ (0.4)
Total 10 Year Borrowing	$ 19.2	$ 23.4

With higher rate increases, the MH16 Update with Interim generates more cash flow than under a 3.95% rate path. In the first five years of the forecast (2018-2022), this serves to modestly temper debt growth and borrowing needs as Manitoba Hydro borrows to complete Keeyask, Bipole III, GNTL and MMTP. In the second five years (2023 – 2027), the higher cash flows both limit new borrowing requirements and create surplus cash that can be used to pay down debt as it comes due instead of needing to refinance. Under the MH16 Update with Interim following the 7.9% rate path, Manitoba Hydro will borrow $8.8 billion in the 2023-2027 timeframe, and therefore face refinancing risk on those borrowings. However, the plan assumes $3.1 billion of cash flow that can be used to retire debt in that timeframe, leaving a net exposure of $5.7 billion. Should the $3.1 billion of cash flow not materialize as planned, the refinancing risk would increase. Even with the assumption of the 7.9% rate increases, a drought during this period could add $1.5 billion to refinancing risk. Rising interest rates, depressed export prices, and/or a decrease in domestic load could impact cash flow, thereby further increasing refinancing risk. Increased capital costs and delays in the in-service date of Keeyask could add new debt borrowings into this timeframe further increasing interest rate risk.

The rate increase and debt management strategy proposed by Mr. Bowman in his evidence would require the Corporation to borrow $14.1 billion between 2018 and 2023 followed by an additional $9.7 billion between 2023 and 2027. Prospective cash flow would offer almost no relief to the borrowing need in the 2023 to 2027 period.

Placing over $9 billion of refinancing risk into the 2023-2027 timeframe in the absence of any prospective cash flow is, in Manitoba Hydro's informed judgement, too risky. Even without adverse events or forecast error, it would increase the debt exposed to refinancing risk by over 60% ($5.7 billion vs. $9.3 billion) in the period immediately after Keeyask enters service, and results in effectively 100% of Manitoba Hydro's debt being exposed to interest rate risk in the next decade. This strategy is inconsistent with past debt strategies with the 3.95% rate path. Both NFAT scenario 5/6 and IFF15 had much lower levels of refinancing risk immediately following the in-service of Keeyask. If Manitoba Hydro has no reasonable prospect of cash flow and de-leveraging, prudence dictates that it must shift its debt strategy toward longer dated maturities in order to protect its ratepayers from unexpected interest rate movements for longer.

MH16 Update with Interim showed savings of approximately $500 million due to lowering the WATM of new debt issuance from 20 years to 12 years. However, this was predicated on an interest rate forecast which had an upward sloping yield curve with approximately 160 basis points between the all-in borrowing cost for a 5 year Province of Manitoba bond and a 30 year Province of Manitoba bond. However, as noted by Ms Stephen (Transcript Pages 1025 - 1026) Manitoba Hydro will adjust its debt management strategy based on changing market conditions. This is inclusive of the yield curve flattening as has been the case since the Bank of Canada began raising interest rates in July 2017. As at the beginning of December 2017, the yield curve had flattened such that there were approximately 90 basis points between the all-in borrowing cost for a 5 year Province of Manitoba bond and a 30 year Province of Manitoba bond. Based on that differential, the savings over the next 10 years under MH16 Update with Interim erode to under $250 million from adjusting the WATM for new debt issuance from 20 to 12 years.

Currently, the yield curve has flattened even further thus reducing the savings even further. This is a market risk similar to rising interest rates. Interest rates are still at historical lows, however, the Bank of Canada has raised interest rates three times since

July 2017 and will likely raise rates again in 2018. The current all-in borrowing cost for a 5 year Province of Manitoba bond is already exceeding the interest rate forecast used in MH16 Update with Interim. If interest rates increase 1% over Manitoba Hydro's forecast levels, the additional $4 billion of exposed debt under the 3.95% rate path (Transcript Page 703) would cost the Corporation an additional $40 million per year. There is potential over the 10 year period for the cost due to the rise in interest rates to exceed the savings from adjusting the terming from 20 to 12 years. Without the ability to generate sufficient cash to retire debt in the next 10 years, as would be the case under a 3.95% rate path, it would be imprudent to reduce the WATM to 12 years. Manitoba Hydro will monitor the spread between 5 and 30 year debt and the available cash to retire debt to determine and capitalize on any potential benefits available to ratepayers in adjusting the WATM of new debt issuance.

12 NO SAVINGS TO BE FOUND IN OPERATING AND MAINTENANCE EXPENSE

Manitoba Hydro has implemented effective cost reduction measures including an accelerated cost reduction plan to minimize growth in Operating & Administrative costs ("O&A"). These measures have resulted in a growth in O&A costs at or below inflation since 2009/10. As demonstrated on page 35 of Manitoba Hydro's Rebuttal Evidence (Exhibit MH-52), the corporation will achieve a 1.8% annual decrease in O&A over the 5 year period from 2014/15 to 2018/19, well below Manitoba CPI. To achieve this level of savings, Manitoba Hydro has eliminated over 400 operating positions between 2014/15 and 2016/17 and will be further streamlining its workforce by eliminating 900 staff of which approximately 700 are anticipated to be operational in nature. The 900 person staff reduction will be achieved primarily through the implementation of a Voluntary Departure Program ("VDP") which was launched in April 2017 in addition to a 30% reduction in Executive as well as a 40% reduction in senior management. The following table (**Figure 12.1**) summarizes the staffing reductions achieved since 2014/15 including the results of the VDP by each Corporate/Operating group.

Figure 12.1 Workforce Reduction Plan

	Workforce Reduction Plan		
	Achieved 2014/15 - 2016/17	**Current Committed Reductions**	**Total Reductions**
President & CEO	4	1	5
General Counsel & Corporate Secretary	2	5	7
Human Resources & Corporate Services	77	147	224

Generation & Wholesale	105	157	262
Transmission	115	198	313
Marketing & Customer Service	103	267	370
Total	429	817	1 246

Source: Page 35 of Exhibit MH-68

In addition to position reductions, Manitoba Hydro has committed to achieve procurement savings through supply chain management initiatives (as outlined in the response to Coalition/MH I-108b). As indicated in the response to Coalition/MH I-107b, to date Manitoba Hydro has achieved savings of approximately $8 million with estimated future annual cost savings between $20 and $50 million over the 5 year

period 2017/18 through 2021/22 (approximately 70% related to capital and the remaining 30% to operational savings).

Mr. Bowman's evidence (Exhibit MIPUG-13) on page 6-5 on lines 27 to 29 states "…*the utility has not even achieved a level of O&A that is as low as simple inflation since the 2011/12 year*." The O&A figures used as the basis for Figure 6-2 on page 6-4 of Mr. Bowman's evidence were provided in the response to MH-MIPUG (BOWMAN)-18, and do not take into consideration the impact of significant accounting changes that were implemented over the period 2009/10 to 2013/14 in support of the Corporation's transition to IFRS.

As shown in **Figure 12.2** below, Manitoba Hydro recognized approximately $37 million of accounting changes in 2011/12 which increased to $91 million by 2013/14. The majority of the changes were a result of aligning the corporation's capitalization polices with other Canadian utilities and are not indicative of a change in the costs to operate the corporation; rather they are a change in the accounting treatment of such costs and should be excluded from any analysis of year over year growth in O&A expenditures.

Figure 12.2 Summary of Accounting Changes Under CGAAP

Summary of Accounting Changes Under CGAAP
(in thousands of dollars)

	2009/10	2010/11	2011/12	2012/13	2013/14

Source: Page 36 of Exhibit MH-52

On page 52 of its evidence (Exhibit GSS/GSM-9), London Economics International ("LEI") recommends that Manitoba Hydro's request for a rate increase should be held in abeyance until several analysis is performed. Manitoba Hydro is concerned by such a recommendation given that in LEI's response to MH/LEI 1-11b, they confirm their analysis was only illustrative in nature and "*… that more detailed evidence on Manitoba Hydro relative productivity would be an important consideration in determining the appropriateness of Manitoba Hydro's operating costs*." This point is further confirmed in LEI's oral testimony (Transcript pages 6820 and 6821):

Ms. Patti Ramage: But—okay. The metrics you've provided in your report are not the type of metrics that would tell us whether Manitoba Hydro is achieving operating efficiencies, correct? We would have to do more than your report?

Mr. A. J. Goulding: I—I believe that we've acknowledged that in our report, that—that more would need to be done.

As stated on page 37 of Manitoba Hydro's Rebuttal Evidence (Exhibit MH-52):

Manitoba Hydro is also concerned with the key performance indicators ("KPI") used by LEI (page 45) in their comparison of the Corporation's operational efficiency with other utilities. Each of the KPIs measure the output per employee; however there is no information as to whether the utilities' employee bases are comparable in nature to Manitoba Hydro.

In addition, several of the metrics selected by LEI will improve instantaneously the moment Keeyask comes in-service (Transcript page 6819) which demonstrates the hazards of making conclusions based on arbitrarily selected metrics when dealing with a complex business such as that of Manitoba Hydro and the need to approach such analysis with caution. Manitoba Hydro notes that vertically integrated utilities are large complex organizations whose operations are influenced by a myriad of factors including political (provincial, federal and international) and regulatory influences, landscape, weather, provincial economics (employment levels, labour rates, inflation, etc.), financial markets, age of assets, type of supply (hydro vs. coal), location of supply, technology, etc. Because of the extensive number influences over the operations of a utility, comparisons (e.g. KPIs) amongst utilities are often limited to providing a surface analysis at best as the underlying reasons for differences are typically comprised of a number of different factors where the impact of any one factor is not specifically measurable. The complexity associated with comparing utilities to one another is discussed by Mr. Yatchew on Transcript pages 4475 and 4476 of his testimony as he states:

I mean for Manitoba Hydro to actually try to compare itself to other utilities, not on the outcomes, but really on the cost side, is a fairly-its-it's a-it's a fairly

challenging exercise because of its unique characteristics. That falls under the rubric of benchmarking, and benchmarking is a complicated process, and its always an evolving process.

The metrics presented by LEI in no way assist in assessing whether the Corporation is achieving operational efficiencies and does not provide any conclusive evidence to justify the abeyance of the requested rate increase. Further, the analysis does not provide justification that a more in-depth analysis/comparison of Manitoba Hydro's operations is required. Based on the actual and projected reductions to operating costs, Manitoba Hydro can demonstrate that the Corporation has taken aggressive cost reduction measures. The end stage of a Voluntary Departure Program involving the elimination of roughly 900 positions, where functions have been eliminated, jobs combined, departments dismantled and redistributed and operating costs have been reduced significantly is not the time to embark on a time consuming and costly benchmarking exercise. A more detailed review will only result in an increase in consulting costs to be borne by the ratepayer while providing limited value in terms of assessing the efficiency of Manitoba Hydro in comparison to other utilities.

13 IMPACT ON MANITOBA ECONOMY

13.1 Job Creation

Dr. Janice Compton and Dr. Wayne Simpson are correct in concluding that where the additional revenues received by Manitoba Hydro through a rate increase are all sent, in turn, by Manitoba Hydro to creditors outside Manitoba to pay interest and principal on debt, a consequence will likely be that fewer jobs will be created in Manitoba. There will be less money circulating in the Manitoba economy (Page 3 of Dr. Janice Compton and Dr. Wayne Simpson's Evidence filed on behalf of the Consumer's Coalition, Exhibit Consumer's Coalition CC-18). London Economics International ("LEI") gave the same conclusion, though its employees used a different model than did Drs. Compton and Simpson.

The precise impact on job creation, however, of a rate increase of 7.9% for one year commencing on April 1, 2018 is debateable. Drs. Compton and Simpson used a simple model to estimate the impact of the rate increase and acknowledged that their model did not take into account that as some firms choose not to hire, or to decrease their labour force, in response to a price increase in electricity, the supply of labour in the market place will increase (Transcript Pages 4650 to 4655). Other firms will react to an increase in the supply of labour, and the corresponding downward pressure on wages, to hire more labour. This, in turn, will modify the negative impact on job creation of an increase in the price of electricity where one assumes that the entire revenue raised from the price increase leaves the Province. Further, Drs. Compton and Simpson acknowledged that their model did not take into account that to the extent that there is an increase in the number of unemployed persons as some firms cut back their labour force, there is an increase in money coming into the Province in the form of Employment Income payments from the federal government. This increase in funds flowing into Manitoba will offset to an extent the flow of funds being sent out of Manitoba by Manitoba Hydro to pay its debt.

In their initial work, Drs. Compton and Simpson also ignored that some residential customers, as many as 70 per cent of Manitoba's residential customers, have the option of reducing the amount they save each year in order to pay for an increase in their electricity bills as opposed to cutting back their spending on other goods and services (Transcript Page 4795). Similarly, some businesses have the option of paying for an increase in their electricity bills by drawing on their tax deferral accounts, as opposed to passing on such increase in their prices, reducing their profits or reducing their purchases of other commodities used in their businesses. These facts will also modify the impact to Manitoba's economy of an

increase in electricity rates because they result in a more modest reduction to the overall amount of money circulating in the Province.

LEI's effort to "illustrate" the impact of an increase in the price of electricity on hog, dairy and potato farms, convenience stores and hotels was undermined by its misuse of Manitoba agricultural data that was itself imprecise and intended only as an "illustrative" guide to farmers for budgeting purposes and by a puzzling decision to rely upon American data for convenience stores and hotels in that country (Transcripts Pages 6828 to 6838 and 6856 to 6857). Dr. Adonis Yatchew, like Drs. Compton and Simpson, relied upon Canadian sources, primarily Statistics Canada, and Appendix 4 of Dr. Adonis Yatchew Report, filed on behalf of the Public Utilities Board of Manitoba, Exhibit AY-1, sets out over some three pages the proportion that electricity bears in the costs of the industries and business in Manitoba's economy. With the exception of six industries, electricity is less than five per cent, in many cases less than one percent, of the cost of doing business. An increase in the price of electricity of 7.9% on April 1, 2018 will have a far more modest impact on these businesses than an increase in price in a host of other commodities that they buy, a change in the exchange rate or, most significantly, an increase in interest rates. Indeed, Dr. Yatchew observed on slide 53 of Dr. Adonis Yatchew Presentation, Exhibit AY-2, "about 60% of Manitoba energy is from hydrocarbons". Although this compares very favourably with the rest of Canada, it nonetheless reveals that Manitoba's economy continues to be far more vulnerable to the impacts of an increase in the price of hydrocarbons that it is to the impact of an increase in the price of electricity.

One must also avoid confusing slower job creation following an increase in the price of electricity where, to repeat, one assumes that all of the revenue raised through the price increase leaves the Province, with a decline in the growth of Manitoba's economy. Since 2009, the price of electricity in Ontario has grown by 50 per cent (Slide 43 of Exhibit AY-2), well in excess of the proposed rate increase of 7.9% to commence April 1, 2018. Notwithstanding a much larger increase, Ontario's economy has continued to grow.

At worst, an increase in the price of electricity of 7.9% on April 1, 2018 might lead to something less than 80 fewer jobs than there otherwise might be (Undertaking 51, Exhibit CC-51)

The evidence presented on job creation is helpful in understanding the impact to Manitoba's economy that ultimately follows from the borrowing of many billions of dollars. Drs. Comptom and Simpson, to repeat, concluded as the basis of their analysis that money that leaves Manitoba to pay debt is taken out of circulation and this has a negative impact on the Province's economy, in particular on job creation (Transcript Pages 4650 to 4655). The more money that Manitoba Hydro is compelled to borrow to meet its day to day operating costs, estimated to be another one billion dollars in the absence of rate increases, will lead to more money leaving Manitoba in the future. If one wants to give priority to job creation, as is done by governments in the face of serious recessions, and accepts that it is necessary to borrow billions of dollars to facilitate job creation, such borrowing is best done by government. Government can best allocate such borrowing directly to businesses and jobs that will at least create infrastructure to improve the lives of the taxpayers who, in due course, will have to pay the cost of the borrowing. Leaving Manitoba Hydro in a position where it must borrow another billion dollars in order to operate, as distinct from creating new infrastructure, because it will avoid in the near term a negative influence on job creation is a clumsy and inappropriate use of a utility's ability to borrow. And, such borrowing effectively leaves the utility's rate payers, in the long term, with no discernable benefit, other than the knowledge that generally, with no rate increase, there was no negative impact on job creation that can be attributed to electricity rates. And leaving Manitoba Hydro in a position where it is compelled to borrow large sums just to operate is particularly ill-advised when such a course of action increases the risk of a down-grade in the credit rating of the Province of Manitoba (and of Manitoba Hydro). This immediately results in even more dollars being removed from circulation within Manitoba and being sent to creditors outside the Province with the same negative consequences to job creation and Manitoba's economy identified by Drs. Compton and Simpson and the employees of LEI.

Manitoba Hydro has created and is creating thousands of jobs through the borrowing it has and is doing to create new infrastructure, namely the Keeyask Project and Bipole Ill. Leaving it to borrow more in the near term so that jobs, in theory, may be created in other sectors of the economy, or not be lost, is ill- advised. Better to avoid such borrowing, pay back as quickly as feasible what has been borrowed and look at a future in which increases in electricity rate can match the rate of inflation and, in the long term less money will leave the Province through the payment of debt and remain to create jobs.

13.2 City of Winnipeg

The City of Winnipeg's Economist Tyler Markowsky attempted to quantify the increased direct and indirect electric utility cost to the City of Winnipeg over the next 20 years, assuming all rate increases in MH16 Update were approved. This evidence has demonstrated a series of unrealistic and oversimplified assumptions. Manitoba Hydro therefore submits that the PUB should give little weight to the conclusions advanced by the City of Winnipeg in this evidence.

Section 5 of Manitoba Hydro's Written Rebuttal Evidence, Exhibit MH-52, outlines several serious flaws in the financial analysis offered by the City of Winnipeg. Further, Mr. Markowsky admitted that the analysis includes not only the proposed rate increases which form the subject of this Application, but all indicative rate increases in MH16 Update (Transcript Page 6490); assumed no price elasticity (Transcript Page 6520); did not consider rate class, demand charges, or basic monthly charges (Transcript Page 6522); was not weather-adjusted (Transcript Page 6527); and that Mr. Markowsky had not made enquiries to ensure that the charges which formed the basis of his calculations did not include unrelated fees for licenses or miscellaneous billings (Transcript Pages 6525 to 6526).

Mr. Markowsky's decision to exclude the effects of price elasticity or the effects of energy conservation in extrapolating growth in consumption is an unrealistic assumption that results in a potentially significant overestimate of future costs to be borne by the City of Winnipeg. Manitoba Hydro has provided technical and financial assistance to the City of Winnipeg for in the order of 150 Power Smart projects, many of which are still in progress. Furthermore, Manitoba Hydro has embarked on a program to replace all streetlights with new high efficiency LED luminaires. Power Smart projects, the replacement and retrofitting of aging building stock and replacement of existing street lamps with high efficiency LED luminaires are factors which impact consumption and consumption patterns (Exhibit MH-52). It is therefore not reasonable to disregard the effects of energy conservation on electricity costs over the period of 2017 to 2037. Even by Mr. Markowsky's own admission, "it's not a – a perfectly precise analysis" (Transcript Page 6523).

In considering the impact of the Application presently before the PUB, Mr. Markowsky calculated the impact to the City of Winnipeg for 2019 to be $721,000. While this figure suffers from the imprecision noted above, it is worthy to note that this amount represents only 0.06% of the City of Winnipeg's projected budget expenditures for the same year

(Transcript Page 6535). Manitoba Hydro does not dispute that the City of Winnipeg's finances may be impacted by an increase in electricity rates, but submits that the City of Winnipeg is in a better position than most ratepayers recognizing that they receive Electricity Tax revenue calculated as a percentage of Winnipeg residents total electricity bills, and are able to recover net cost increases by increasing revenues through taxes, fees and other charges imposed by the City of Winnipeg. Given the significant flaws inherent in his analysis, Manitoba Hydro submits that the conclusions of Mr. Markowsky's analysis should be afforded very little, if any, weight in considering the impact of the requested rate increase on the City of Winnipeg.

14 MANITOBA HYDRO IS COMMITTED TO WORK WITH STAKEHOLDERS TO DEVELOP APPROPRIATE AND COST EFFECTIVE SOLUTIONS THAT WILL ADDRESS CHALLENGES OF LOW INCOME AND AFFORDABILITY

14.1 Income Sufficiency and Energy Poverty are Complex Issues

Manitoba Hydro is of the view that the issue of affordability of energy, like any other essential items such as food and housing, extends beyond considerations associated with electricity price increases.

Issues of poverty and distributional effects are complex and ought to be addressed through the setting of social policy which is within the purview of government. As such, Manitoba Hydro is of the view that of the provision of social assistance programs directed to low income customers is appropriately reserved for the Province of Manitoba.

As discussed in Tab 7 of the Application, Manitoba Hydro offers programs to assist customers in managing their energy consumption through the implementation of energy efficiency opportunities in their homes and businesses. Moreover, to assist low-income customers, Manitoba Hydro continues to provide targeted and enhanced support through its Affordable Energy Program, to improve the energy efficiency of their homes resulting in lower energy bills and increased comfort.

Manitoba Hydro actively participated in the Bill Affordability Stakeholder Engagement Process undertaken in 2016 to review existing initiatives and explore potential alternatives to further address bill affordability for Manitobans. Manitoba Hydro's existing suite of bill affordability initiatives includes the Affordable Energy Program, Neighbours Helping Neighbours Program and Bill Accommodation practices. These initiatives were reviewed by stakeholders in the collaborative process and enhancements were suggested to further increase assistance to lower income customers. Manitoba Hydro will enhance, where appropriate, its programs and processes to assist low-income customers.

The work of Bill Affordability Collaborative Group shed light on how difficult it can be at first instance to even define energy poverty and how complex it can be to administer an income based program.

Two of the key findings from the Bill Affordability Collaborative Process is that energy poverty is not a prime cause of arrears (Transcript Page 2326) which indicates those experiencing energy poverty may not necessarily struggle with their energy bills and the relationship between consumption and income is very low (Transcript Page 2328).

Manitoba Hydro's administration of the Affordable Energy Program, which is income based, is no stranger to the challenges of obtaining income information (Transcript Pages 2512 to 2513). As noted by Dr. Mason in his testimony, *"…there's a certain number of people who will not actually reveal their income…"* (Transcript Page 2325).

At Transcript Pages 2526 and 2527, Dr. Mason was asked about overcoming the issues identified with implementing a low income rate, and in his reply, he suggests that existing government social programs should be modified to address the issue:

> *"I think in my view, which is looking at how the – the resources that would be needed to do this, my view is that much closer cooperation with the provincial government and the existing programs, rent assist, social assistance or income assistance would be the smart way to go.*
>
> *I think if the Board were to kind of direct or sort of suggest that these programs be adjusted and accommodate energy increases in the same way they accommodate inflationary increases that would be, I think, the most direct way and cost efficient way to actually provide assistance."*

Dr. Mason raises another point for consideration in his discussion with Board Member Grant at Transcript Pages 2545 to 2550, regarding the complications in targeting recipients on the basis of low income, when they may not necessarily be low net worth individuals:

> *"We all talk about income, but we don't talk about wealth, and we have a lot of wealthy poor people in the country, and they're called seniors. They have assets, but they have low income, and that's very common.*
>
> *"So throughout our lifespan, our income and our wealth fluctuate upon which stage of our life cycle we're at. And so designing policies that apply to people at*

various stages of their income and wealth life cycle is very tricky. But you know, I think most Canadians would accept the fact that an income-tested program that referenced income tax data is probably still the best way to go, but we're going to always have to deal with these anomalies where we fund people under these programs who happen to be living in a household of relatively well-off people. So, I mean, targeting is always going to be a problem."

"And that's why I come back is that we have specialists in our society that do that. They're called income assistance people who work for the provincial government. Building a separate expertise in Manitoba Hydro is going to be quite complex, and you're just never going to get it right."

These findings and difficulties with the administration, implementation and on-going operation of a rate assistance program pose significant challenges in identifying which customers truly require assistance and point to the need for further exploration to ensure any assistance mechanism best addresses the intended need.

Dr. Mason summarizes this in his testimony at Transcript Page 2335 by stating,

"…running an income assistance program is extremely complicated and it's high cost and it requires a whole range of expertise that is typically not embedded within Hydro. It's typically embedded within the income assistance programs of the province, which have better access to information. So, the whole caution that I want to encourage, the Board needs to be careful in directing Manitoba Hydro to apply rate relief based upon an income test. The argument here is that Manitoba Hydro does not have nor is it likely to obtain critical information that will allows it to target rate support programs accurately. Manitoba Hydro is not currently equipped and is unlikely to run income tested program effectively."

Manitoba Hydro does not have the resources to administer a new income-based program nor does it have access to pertinent data, such as income of its customers, to successfully implement such a program. The Provincial Government of Manitoba already administers income based programs, has the resources and provides these programs through a variety of existing mechanisms noted in the report of the Bill Affordability Collaborative Process.

Manitoba Hydro's position has and continues to be any deviation from standard rate setting such as a special rate design for a specific customer rate class is a social policy issue to be funded by Government. Mr. Raphals agrees with this principal as noted on page 10 of his evidence on behalf of the Assemble of Manitoba Chiefs, Exhibit AMC-7-1,

> *"Since the affordability program should be designed to ensure energy security for those unable to cope with rising energy costs, however, funding from all taxpayers rather than simply higher income ratepayers or dedicated fees seems most appropriate, much as other income security programs such as Manitoba's Employment and Income Assistance are financed from general revenues."*

14.2 Manitoba Hydro's Role in Addressing Affordability Issues

Mr. Shepherd testified in his direct evidence presentation (Exhibit MH-64) on the perspectives of Manitoba Hydro on broader societal issues of energy poverty and economic competitiveness. At Transcript Pages 135 to 137, he states:

> *"Questions of income and energy poverty and economic competitiveness are certainly important and ones we have considered to the degree we can. But these are really issues of broad public policy and cannot easily be resolved through a rate-setting process. The responsibilities and tools for such matters do not rest with Manitoba Hydro or the Public Utilities Board.*
>
> *Manitoba Hydro has always worked and will continue to work with all stakeholders on these kinds of issues, and will seek to play a positive role in solutions that improve the economic conditions for all Manitobans. But income adequacy and economic development issues are mostly beyond Manitoba Hydro's mandate or control. We cannot and should need not use this rate-setting hearing to do the work of developing and implementing public social policies. We are not well-equipped to handle these issues and the potential consequence of trying to do so is compromising both the financial integrity of the utility and ultimately making decisions that result in the transfer of costs from some groups of customers to other customers.*

I believe these issues are best left to government, who are responsible for establishing the appropriate policy framework and directives for both Manitoba Hydro and this Board to follow."

14.3 Legal Issues to be Considered

Manitoba Hydro is aware that in Public Utilities Board of Manitoba ("PUB") Order 73/15, the PUB noted on page 28 that the PUB remained of the view, consistent with the findings in Order 116/08, that it had the jurisdiction to order the implementation of a bill affordability program. Manitoba Hydro's legal position on the issue has not changed since the last GRA. In our respectful view, there is a serious jurisdictional question, and concern that the PUB's conclusion in Order 73/15 cannot be reconciled with the current statutes in Manitoba. This jurisdictional issue remains untested in the court in Manitoba.

Manitoba Hydro submits that the PUB, ought to reconsider the issue and as such has set forth its legal position on the matter below. It is noteworthy that while the Nova Scotia Court of Appeal decision was raised in argument during the 2014/15 GRA, the PUB declined to provide reasons in Order 73/15 as to why this decision was not considered or applied. Furthermore, this issue has been considered in two additional Canadian jurisdictions, British Columbia and Alberta. Manitoba Hydro submits that the decisions of these two regulatory authorities are persuasive and ought to be considered.

As an administrative tribunal, the PUB is not bound by the concept of stare decisis - it is not obliged to follow its own previous decisions on similar issues. An administrative decision maker has the capacity to determine the scope of his or her own jurisdiction. The determination of an administrative tribunal's jurisdiction is a question of statutory interpretation.[8] The object of statutory interpretation is to *"seek the intent of Parliament by reading the words of the provision in their entire context and according to their grammatical and ordinary sense, harmoniously with the scheme and object of the Act and the intention of the legislature"*.[9] While the jurisprudence is clear that a broad, liberal and purposive approach should be taken to statutory interpretation, Canadian courts have repeatedly cautioned that *"a liberal and purposive interpretation cannot*

[8] *Canada (Canadian Human Rights Commission) v. Canada (Attorney General)*, 2011 SCC 53 at paragraph 33.
[9] *Canada (Canadian Human Rights Commission) v. Canada (Attorney General)*, 2011 SCC 53 at paragraph 33.

supplant a textual and contextual analysis simply in order to give effect to a policy decision different from the one made by Parliament."[10]

The PUB derives its jurisdiction to review Manitoba Hydro rates from section 25(1) of *The Crown Corporations Governance and Accountability Act* which provides as follows:

> 25(1) Despite any other Act or law, rates for services provided by Manitoba Hydro and the Manitoba Public Insurance Corporation shall be reviewed by The Public Utilities Board under The Public Utilities Board Act and no change in rates for services shall be made and no new rates for services shall be introduced without the approval of The Public Utilities Board.

Section 25(4) of *The Crown Corporations Governance and Accountability Act* contains a list of factors which the PUB may consider in a rate review application. None of those factors expressly permit the PUB to consider affordability or customers' ability to pay. It is worth noting that of the nine factors set out in section 25(4)(a), seven relate to Manitoba Hydro's fiscal needs. The remaining two factors permit the PUB to consider any *"compelling policy consideration"* or *"any other factor"* that the PUB may consider relevant to the rate for services application before it. When read in isolation paragraphs 25(4)(a)(viii) and (ix) are vague and expansive. However, the PUB does not have limitless discretion to consider any factor it chooses. The grant of discretion must be interpreted within the context of Part IV of *The Crown Corporations Governance and Accountability Act* and the entire statutory scheme rating to the price for supply of power, and the PUB's primarily role to set just and reasonable rates.[11]

Subsection 39 of *The Manitoba Hydro Act* is germane to the issue. The Act states:

> Price of power sold by corporation

[10] *Canada (Canadian Human Rights Commission) v. Canada (Attorney General)*, 2011 SCC 53 at paragraph 62; also see *Gould v. Yukon Order of Pioneers*, [1996] 1 S.C.R. 571 at paragraph 50 per Forest, J concurring; *Placer Dome Canada Ltd. v. Ontario (Minister of Finance)*, 2006 SCC 20 at paragraph 23.

[11] See *ATCO Gas & Pipelines Ltd. v. Alberta (Energy & Utilities Board)*, 2006 SCC 4 at paragraph 47 wherein the Supreme Court of Canada considered the jurisdiction of a utilities regulator to impose any condition in an order that was necessary for the public interest. The Court held "These provision on their own are vague and open-ended. It would be absurd to allow the Board an unfettered discretion to attach any condition it wishes to an order it makes. Furthermore, the concept of "public interest" found in s. 15(3) is very wide and elastic; the Board cannot be given total discretion over its limitations".

39(1) The prices payable for power supplied by the corporation shall be such as to return to it in full the cost to the corporation, of supplying the power, including

(a) the necessary operating expenses of the corporation, including the cost of generating, purchasing, distributing, and supplying power and of operating, maintaining, repairing, and insuring the property and works of the corporation, and its costs of administration;

(b) all interest and debt service charges payable by the corporation upon, or in respect of, money advanced to or borrowed by, and all obligations assumed by, or the responsibility for the performance or implementation of which is an obligation of the corporation and used in or for the construction, purchase, acquisition, or operation, of the property and works of the corporation, including its working capital, less however the amount of any interest that it may collect on moneys owing to it;

(c) the sum that, in the opinion of the board, should be provided in each year for the reserves or funds to be established and maintained pursuant to subsection 40(1).

Fixing of price by corporation

39(2) Subject to Part 4 of *The Crown Corporations Governance and Accountability Act* and to subsection (2.1), the corporation may fix the prices to be charged for power supplied by the corporation.

Equalization of rates

39(2.1) The rates charged for power supplied to a class of grid customers within the province shall be the same throughout the province.

Interpretation

39(2.2) For the purpose of subsection (2.1),

(a) grid customers are those who obtain power from the corporation's main interconnected system for transmitting and distributing power in Manitoba; and

(b) customers shall not be classified based solely on the region of the province in which they are located or on the population density of the area in which they are located.

Simply put, the price charged for power must allow the Corporation to recover its costs of supplying such power inclusive of certain specified business expenses. The rates charged for power supplied to a class of grid customers must be the same throughout the province, and customers must not be classified solely on their location or on the population density of the area in which they are located.

Subsections 39(2.1) and (2.2) were enacted by *The Manitoba Hydro Amendment Act*, SM 2001, c 23. The purpose of this amendment was to ensure Manitoba Hydro charged a consistent rate for all customers regardless of point of delivery. The amendment was characterized as one of *"fundamental fairness"* with the aim to make *"uniform electricity rates a reality in Manitoba and put everybody on an equal footing when it comes to the rates charged for basic services."*[12] The purpose of section 39(2.1) and (2.2) was to create a *"single rate for residential hydro users"*.[13]

It is expected that parties to this proceeding may ask the PUB to implement a low income program targeting First Nations living on reserves. Such a program would necessarily classify customers based upon their geographic location within the Province of Manitoba. Manitoba Hydro submits that a First Nations living on reserve class would violate the express prohibition contained within subsection 39(2.2) of *The Manitoba Hydro Act*.

The PUB's rate setting function must also be interpreted having regard to Manitoba Hydro's mandate. Section 2 of *The Manitoba Hydro Act* provides that the purpose and object of the Corporation is to provide for the supply of power adequate to meet the province's needs and to promote economy and efficiency in all matters related to the generation, transmission, distribution and use of power. Subsection 43(3) states the Corporation's funds shall not be employed for the purposes of the government or any government agency. Accordingly, the only appropriate use for Manitoba Hydro funds are the legitimate purposes set out in section 2.

[12] Legislative Assembly of Manitoba, Debates and Proceedings, 2nd Session 37th Legislature, May 30, 2001 at page 2505 (Hon. Greg Selinger). Found as **Appendix 14.1** to this Section.
[13] Legislative Assembly of Manitoba, Debates and Proceedings, 2nd Session 37th Legislature, May 30, 2001 at page 2505 (Hon. Greg Selinger).

Manitoba Hydro does not have a mandate, either express or implied, to engage in social programming. The bill affordability programs discussed by some Interveners during the evidentiary portion of the hearing aim to mitigate existing social inequities through rate setting. While such a goal is laudable, it falls outside Manitoba Hydro's stated mandate. Manitoba Hydro respectfully submits that absent express language to the contrary, the PUB cannot, through its rate setting function, expand the mandate and purpose of Manitoba Hydro.

The PUB's jurisdiction is expressly limited to the approval of rates which appropriately balance the interests of ratepayers and the financial health of the utility.[14] *The Public Utilities Board Act* applies to Manitoba Hydro only to the degree necessary to fulfill the function set out in Part IV of *The Crown Corporations Governance and Accountability Act*.

In Manitoba Hydro's respectful submission, the text, context and purpose of *The Crown Corporations Governance and Accountability Act*, *The Manitoba Hydro Act* and *The Public Utilities Board Act* clearly demonstrate that the PUB does not have the jurisdiction to order the implementation of low income rates or other bill affordability programs.

The Supreme Court of Canada held that only after a textual, contextual and purposive approach reveals a genuine ambiguity, should a court resort to any subsidiary principles of statutory interpretation, including consideration of constitutional values and other external aids.[15] Where there are two equally plausible interpretations, the interpretation that complies with constitutional values will generally be preferred. However, reliance upon the *Charter* as an interpretive aid cannot be used to defeat clear legislative intent.[16]

[14] *Manitoba Keewatinowi Okimakanak Inc. v. Manitoba Hydro-Electric Board*, 1992 CarswellMan 373 at paragraph 9 and *Consumers' Assn. of Canada (Manitoba) Inc. v. Manitoba Hydro Electric Board*, 2005 MBCA 55 at paragraphs 64-65.

[15] *Bell ExpressVu Limited Partnership v. Rex*, 2002 SCC 42 at paragraphs 28 and 55.

[16] Ruth Sullivan, *Sullivan and Driedger on the Construction of Statutes*, 4 ed (Markham: LexisNexis, 2002) at page 369.

While it may be appropriate for the PUB to consider relevant constitutional values in the exercise of its discretion,[17] reliance upon constitutional values in the determination of its jurisdiction is unnecessary absent a genuine ambiguity. The interpretation of the PUB's statutory grant of authority is not ambiguous when the modern principles of statutory interpretation are applied. As such, resort to constitutional principles is unnecessary, and could be considered improper.

Any efforts to rely upon constitutional values and *The Path to Reconciliation Act* is an attempt to broaden the purpose of the PUB's rate review function to achieve a policy objective not contemplated in the legislation. If permitted, this would result in an unreasonable expansion of the PUB's jurisdiction beyond what was contemplated by the Legislature.

While not binding upon the PUB in this matter, it is persuasive to consider parallel legislation in other Canadian jurisdictions.[18] Public utilities regulators in Ontario, Nova Scotia, New Brunswick, Alberta and British Columbia have considered whether their governing legislation grant jurisdiction to consider ability to pay in the exercise of its rate setting function.

The Ontario Energy Board, pursuant to section 36(3) of the *Ontario Energy Board Act, 1998*, SO 1998, c. 15, has the jurisdiction to adopt any method or technique that it considers appropriate in fixing just and reasonable rates.[19] This provision has been interpreted to allow the regulator to employ specific methods or techniques that it considers appropriate to further its statutory objectives of energy conservation and the protection of customer interests with respect to prices.[20] A majority of the Ontario Superior Court of Justice held that, while cost of service and cost causality are the root principles underlying the determination of rates by the Ontario Energy Board, subsection 36(3) of the *Ontario Energy Board Act* permits deviation from those principles and allows for the consideration of income level.[21]

---

[17] *Doré v Barreau du Québec*, 2012 SCC 12.
[18] *Canada (Canadian Human Rights Commission) v. Canada (Attorney General)*, 2011 SCC 53 at paragraphs 57 – 58.
[19] *Advocacy Centre for Tenants-Ontario v. Ontario Energy Board*, 2008 CanLII 23487 (Ont Sup Ct J). Found as **Appendix 14.2** to this Section.
[20] *Advocacy Centre for Tenants-Ontario v. Ontario Energy Board*, 2008 CanLII 23487 at paragraph 55 (Ont Sup Ct J).
[21] *Advocacy Centre for Tenants-Ontario v. Ontario Energy Board*, 2008 CanLII 23487 at paragraphs 52-53 (Ont Sup Ct J).

In Manitoba, there is no equivalent provision to subsection 36(3) of the *Ontario Energy Board Act*. The majority of the Ontario superior Court of Justice found subsection 36(3) to be the primary source of the Ontario Energy Board's jurisdiction to order low income rates. In the absence of similar statutory language in Manitoba, the Ontario jurisprudence is of limited assistance to the PUB. In addition, it is noteworthy that the dissenting opinion of the Ontario Superior Court of Justice commented *"Were the board to assume jurisdiction to order a rate affordability assistance program, it would be taking on a significant new role as a regulator of social policy. Given the dramatic change in the role that it has historically played, as well as a departure from common law principles, it would require express language from the Legislature to confer such jurisdiction."*[22]

The Nova Scotia Utility and Review Board does not have jurisdiction to implement a rate assistance program for low income customers. The Board's governing legislation, the *Public Utilities Act,* requires all uniform rates be charged to customers in substantially similar circumstances in respect of service of the same description:

> 67(1) All tolls, rates and charges shall always, under substantially similar circumstances and conditions in respect of service of the same description, be charged equally to all persons and at the same rate, and the Board may by regulation declare what shall constitute substantially similar circumstances and conditions. [23]

The Nova Scotia Court of Appeal upheld the utility board's finding that low income residential customers receive substantially the same level of service as all other residential customers and as such, subsection 67(1) of the *Public Utilities Act*, R.S.N.S. 1989, c. 380 prohibited differential rates based upon the customer's income.[24]

[22] *Advocacy Centre for Tenants-Ontario v. Ontario Energy Board*, 2008 CanLII 23487 at paragraph 106 (Ont Sup Ct J).
[23] *Public Utilities Act*, RSNS 1989, c. 380, subsection 67(1).
[24] *Dalhousie Legal Aid Service v. Nova Scotia Power Inc.*, 2006 NSCA 74 at paragraph 24, leave to appeal to SCC refused 31627 (January 18, 2007) . Found as **Appendix 14.3** to this Section.

The Court of Appeal went on to confirm that *"[t]he Board's regulatory power is a proxy for competition, not an instrument of social policy."*[25] Implementation of a rate assistance program was found to be a public policy initiative properly within the purview of the legislature, not the regulator.[26]

Finally, the Court of Appeal considered the appellant's argument the *Public Utilities Act* ought to be interpreted in a manner that is consistent with the *Charter*. The Appellant submitted that poverty is an analogous category under section 15 and as such the Court could direct the institution of an ameliorative program. The Court of Appeal declined to apply the *Charter* as an interpretative aid, on the grounds that there was no ambiguity in the statute and the statutory language could not accommodate the construction suggested by the Intervener.[27]

In Manitoba Hydro's respectful submission, section 67 of the Nova Scotia *Public Utilities Act* is similar to section 39(2.1) of *The Manitoba Hydro Act.* Both provisions require equal rates be charged to customers receiving substantially similar levels of service.[28]

The New Brunswick Board of Commissioner of Public Utilities also declined to order relief for low income customers, including the lowering or elimination of service charges, as such programming would necessarily result in some customers paying more for the same service.[29] The Board found that it has no legislative authority to establish rates that discriminate between similarly situated customers on the basis of income.

There are a number of parallels between the New Brunswick *Electricity Act*, S.N.B. 2013, c.7 and *The Crown Corporations Governance and Accountability Act*. Both statutes set out a number of factors for the regulator to consider in approving rates for services

[25] *Dalhousie Legal Aid Service v. Nova Scotia Power Inc.*, 2006 NSCA 74 at paragraph 33.
[26] *Nova Scotia Power Inc., Re*, 2005 NSUARB 27 (CanLII) at paragraph 256.
[27] *Dalhousie Legal Aid Service v. Nova Scotia Power Inc.*, 2006 NSCA 74 at paragraph 36-39.
[28] In PUB Order164/16, Order in Respect of a Review of Manitoba Hydro's Cost of Service Study Methodology, December 20, 2016 at page 5, the PUB stated "customers are grouped into customer classes according to their similar characteristics in terms of their electricity consumption and service requirements.
[29] *Review of New Brunswick Power Distribution and Customer Service Corporation's Customer Care Policies*, 29 January 2007 at pages 12-13.

which include *"any other factors that the Board considers relevant."*[30] Manitoba Hydro respectfully submits that the PUB can be guided by the New Brunswick jurisprudence.

The Alberta Energy and Utilities Board also held that it does not have the jurisdiction to order reduced rates for certain groups of individuals based upon the social principle of a customer's ability to pay[31], referred to as *"lifeline rates"*. That Board found that tariff applications were an unsuitable forum to address social issues such as lifeline rates. It further held that in the absence of express statutory authority, differential rates based upon a customer's ability to pay may contravene the statutory requirement that rates not be unduly preferential, arbitrary or unjustly discriminatory.[32]

Most recently, the British Columbia Utilities Commission found that it has the jurisdiction to approve a low-income rate if there is an economic or cost of service reason to do so.[33] The Commission concluded that a low-income rate in the absence of an economic or cost of service justification is necessarily unduly discriminatory because it differentiates between customers on the grounds of personal characteristics as opposed to energy consumption.[34] The Commission concluded that *"affordability is not a regulatory justification"* for the proposed low income rate.[35] Leave to appeal the Commission's decision was refused on the grounds that there was no reasonable prospect for success.[36]

Subsection 59(2) of the British Columbia *Utilities Commission Act,* R.S.B.C. 1996, c. 473 is akin to section 39(2.1) of *The Manitoba Hydro Act.* Subsection 59(2) provides:

> 59(2) A public utility must not

[30] *Electricity Act,* S.N.B. 2013, c.7, s.103(8)(e) and *The Crown Corporations Governance and Accountability Act,* C.C.S.M. c. C336, s 25(4)(a)(ix)

[36] *British Columbia Old Age Pensioners' Organization v. British Columbia Utilities Commission*, 2017 BCCA 400. Found in **Appendix 14.4** to this Section.

a) As to rate or service, subject any person or locality, or a particular description of traffic, to an undue prejudice or disadvantage, or
b) Extend to any person a form of agreement, a rule or a facility or privilege, unless the agreement, rule, facility, or privilege is regularly and uniformly extended to all persons under substantially similar circumstances and conditions for service of the same description.

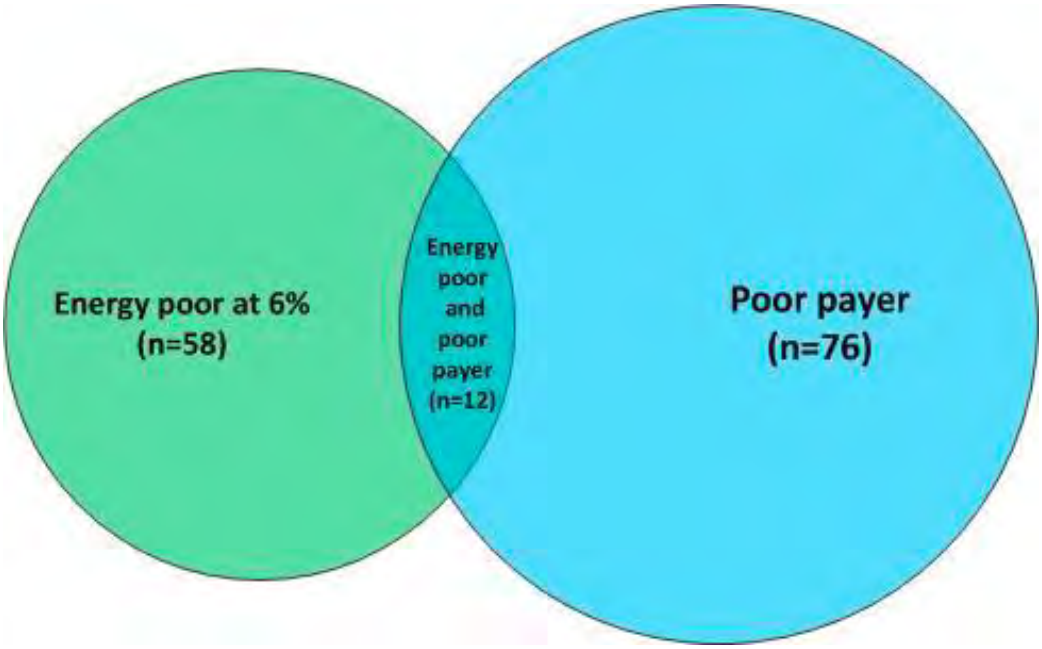
Regulators in most other Canadian jurisdictions recognize the departure from non-discriminatory rates is a significant matter, and one which ought not be undertaken without express statutory authority. While recognizing that these decisions are not binding on the PUB, the regulatory schemes in Nova Scotia, New Brunswick, Alberta and British Columbia are sufficiently similar to that in Manitoba, and the PUB may reasonably draw upon the principles set out in the above decisions.

The Appellate Court in Nova Scotia has upheld this determination, clearly articulating the distinction between social policy and rate-setting. The subsidization between customers on the basis of income is a policy decision that ought to be considered by the Legislature. To the extent that the decision of the Ontario Energy Board departs from this principal, Manitoba Hydro submits that its authority to do so is contemplated by the statutory framework in Ontario, and that neither *The Crown Corporations Governance and Accountability Act* nor *The Manitoba Hydro Act* grant the PUB similar discretion to implement *"any method or technique to set rates"*.

14.4 Bill Affordability Collaborative Process

As directed by the PUB in Order 73/15 Manitoba Hydro led a collaborative process in 2016 to examine bill affordability issues. The collective effort of the participants assisted in shaping the research questions and methods to be utilized to help discover and build knowledge of these issues within a Manitoba context.

The Working Group members collaborated to hire a third party facilitator and research firm to guide the process in the defined time period imposed by the Public Utilities Board of Manitoba ("PUB"). All decisions made through the Collaborative Process were done by consensus. A significant amount of work was undertaken by all actively engaged working group members, with over 30 meetings (working group and



subcommittee) plus additional work completed outside of these meetings, until the final report was filed in January 2017. The cost of the Collaborative Process was approximately half a million dollars. Working group members felt the process would have been further enhanced with the participation of the Assembly of Manitoba Chiefs and Indigenous and Northern Affairs Canada, who were both invited but declined to participate (Transcript Pages 2312 to 2314).

The Working Group undertook the first of its kind study of energy poverty in Manitoba with the assistance of Prairie Research Associates. The research work followed a defined research framework which the working group agreed to and included a literature review, definition of energy poverty, key interviews, a consumer telephone survey of Manitoba Hydro customers, analysis of Manitoba Hydro administrative data linked with survey responses, quantitative modelling of rate options and projections of potential rate increases with the associated impact to customer's energy burdens (Bill Affordability Working Group Report , Appendix 10.5 of the Application, page 45 of 242).

Some of the key findings were a surprise to the Working Group based on preconceived assumptions as few customers are poor payers and energy poor, energy poverty is not a prime cause of arrears and there was little correlation between electricity consumption and income (Manitoba Hydro Cost of Service, Rate Design and Bill Affordability Panel Presentation, Exhibit MH-88).

The consumer research revealed the link between arrears and energy poverty is relatively weak. The research showed that between 14% of customers who experienced arrears would be classified as energy poor using a 6% of income threshold, while just under 10% of the overall customer base would be classified as energy poor using the same threshold (Appendix 10.5 of the Application, page 18 or 242). While this demonstrates customers who are classified as energy poor are somewhat more likely to experience arrears, the vast majority of customers experiencing arrears cannot be considered energy poor.

Figure 14.1 Energy Poor and Poor Payer Households – General Sample

Source: Figure 3, PRA – Bill Affordability Research Services Final Report – January 9, 2017 (Appendix 10.5 of the Application, page 77 of 242)

This finding had significant implications for the research and the understanding of the issue. It also has significant implications for Manitoba Hydro in terms of how it can address these issues from a business perspective. The research showed that 86% of customers who experience arrears are not considered energy poor using a 6% energy burden threshold (Appendix 10.5 of the Application, page 77 of 242). This means that even a program that perfectly targeted customers classified as energy poor would be poorly targeted when the benchmark is Utility revenues and costs. On the other hand, an arrears forgiveness program would need to be extremely well targeted to benefit customers who are considered energy poor while not providing benefits to customers who fall outside that definition.

The working group also reviewed Manitoba Hydro's existing programs and initiatives which assist those struggling with energy bills. Ultimately, the working group did not include a recommendation to implement a subsidized rate design as the cost to Manitoba Hydro and therefore ratepayers was too significant to offset any reduction in Manitoba Hydro's collection costs.

Of the recommendations made by the working group, many were for Manitoba Hydro to continue its offerings and where practical, seek to further enhance them.

New program offerings are being implemented or piloted at Manitoba Hydro as a result of this collaborative work such as Energy Instalment Affordability Program and an arrears management initiative (Transcript Page 2289 and 2507 to 2508). Manitoba Hydro has also enhanced its Affordable Energy Program to increase the number of LED bulbs provided to 10 (Transcript Page 2489).

Manitoba Hydro has continued to work to address issues of energy poverty stemming from the collaborative process by undertaking an additional survey of Indigenous consumers with respect to Bill Affordability to gain further insight (AMC/MH I-4). Manitoba Hydro also convened its Bill Affordability Advisory Committee (formerly known as the Affordable Energy Advisory Committee) and invited all of the working group members on June 22, 2017. The meeting provided an update of Manitoba Hydro's efforts since January 2017 and sought feedback from those three members who attended (Transcript Page 2505). Moving forward, Manitoba Hydro believes all parties need to be fully engaged and participate in further exploring issues of energy poverty.

Manitoba Hydro is of the view that this stakeholder engagement was a valuable step forward in building understanding on the issue. Given that the outcomes of some of the research were contrary to assumptions held by many parties at the outset, the report of the Working Group forms a base of understanding for addressing these issues going forward.

14.5 Manitoba Hydro's Affordability Programs

Manitoba Hydro maintains a suite of initiatives aimed at enhancing the affordability of its service for customers with high energy usage, low incomes, or a combination of the two.

14.5.1 Bill Management Activities

As discussed in Appendix 10.8 of the Application, Slides 23 and 25 of Exhibit MH-88, and by Mr. Paul Chard at Transcript Pages 2286 to 2287, Manitoba Hydro undertakes a number of activities to assist customers in managing their electric and natural gas bills. Many of these activities have evolved over time to respond to changing conditions or

requirements. One of the longest standing and most popular programs in this area is the Equal Payment Plan which helps customers smooth their payments throughout the course of the year despite periods of high consumption (in winter months) and low consumption (in summer months) within the year. More than one-quarter of Manitoba Hydro's electric customers use this program. As discussed in the Transcript Page 2287, customers who require additional assistance in budgeting or managing their bill payments, are offered customized due dates and flexible payment arrangements from Manitoba Hydro. Payment arrangements allow for payment of bills in a series of smaller installments over time. When such payments plans are required for reasons of insufficient income, late payment charges are waived to ensure the customers financial concerns are not compounded. Manitoba Hydro also works with Income Assistance administrators in First Nation communities and with the provincial Employment and Income Assistance program to ensure that appropriate social assistance payments are applied to accounts. As noted by Mr. Chard on Transcript Page 2287, an enhancement to the Equal Payment Plan will be introduced in 2018 entitled the Energy Affordability Instalment Plan. This program came about as a result of the recommendations of the bill affordability collaborative process. The program will take a customer's arrears balance and spread it out over a longer period. Those repayment amounts will then be integrated with an equal payment plan amount into a single payment for the customer to manage.

14.5.2 Neighbours Helping Neighbours

As discussed during the course of the hearing and outlined at Transcript Page 2293, Manitoba Hydro offers the Neighbours Helping Neighbours program which provides a one-time financial grant to those facing a financial crisis. The program is offered in partnership with the Salvation Army, who administers the program, and since 2004, there have been approximately 8,000 financial grants offered to customers requiring assistance for a total of $2,665,337 (Slide 27 of Exhibit MH-88). In addition, the Salvation Army provides additional support services such as counselling, budget skills, job training and food assistance according to the unique needs of each customer and Manitoba Hydro provides access to a specialist in its credit recovery services department who works with customers and connects them with additional community support where they can obtain additional assistance.

As noted further in its oral direct testimony at Transcript Pages 2293 to 2294, Manitoba Hydro covers all of the Salvation Army's administration expenses along with matching customer donations dollar for dollar. In terms of the donations to the program, as can be seen on slide 27 of Exhibit MH-88, customers have donated $465,360. Not only has Manitoba Hydro matched donations dollar for dollar, Manitoba Hydro has also provided funds for the shortfall of donations that is required to meet the needs of the program. Manitoba Hydro's funding has been approximately $2.2 million, which translates to approximately 88% of all expenses for the Neighbours Helping Neighbours program being covered by Manitoba Hydro. With respect to the administrative expenses, Manitoba Hydro has covered over $1 million dollars related to the administrative expenses of the Salvation Army, which does not include administrative expenses related to Manitoba Hydro's efforts related to the program.

14.5.3 Affordable Energy Program ("AEP")

As explained in Manitoba Hydro's Annual Affordable Energy Program Report at Appendix 10.8 of the Application, page 2, Manitoba Hydro's Affordable Energy Program assists lower income customers with energy efficiency upgrades through a turnkey approach where customers receive a free in-home energy review, free basic energy saving measures, free insulation including installation and the provision for a low cost high efficient natural gas furnace when converting from a standard efficient natural gas furnace for only $9.50/month over five years interest free. As discussed in Transcript Pages 2489 to 2490 and 2511 to 2515, Manitoba Hydro has implemented improvements to its AEP, including increasing the offering of four LED bulbs to ten LED bulbs, and accepting alternative forms of income tax verification. An online application was also created in July 2015 to provide a more efficient option for an application system, and approximately 40% of AEP applications are now received through the online application form (as noted in response to PUB-MH-I-126 b-e).

Manitoba Hydro also continues to address barriers to participation in the AEP. As discussed in PUB/MH I-126 b-e, customers do not tend to experience a sense of urgency to acquire a new furnace or insulation except in the case of malfunction. Manitoba Hydro addresses this by forming strategic relationships with community groups (e.g. North End Community Renewal Corporation, Brandon Neighbourhood Renewal Corporation, Selkirk Community Renewal Corporation, Dakota Ojibway Tribal Council, and Manitoba Metis Federation) whereby Energy Advocates from these organizations

attend community events and canvass neighborhoods to directly explain the benefits and bill savings associated with the eligible energy efficiency upgrades. Continuous mass media and targeted marketing throughout the year along with internal promotion by Manitoba Hydro staff (Contact Center and Credit & Recovery Services departments) is also utilized to ensure that the AEP is top of mind whenever customers are looking to lower their energy bills, or upgrade their furnace and insulation. Targeted marketing efforts include autodialed calls to customers in arrears and direct mail letters and brochures to areas in Winnipeg and rural towns with higher incidences of low income populations. Promotional materials such as brochures, magnets and bookmarks are also distributed to local community centers and libraries across the province.

As further noted in response to PUB/MH I-126 b-e), Manitoba Hydro also specifically targets customers with higher than average energy consumption offering a free Home Energy Assessment (same offer as the in-home review provided under AEP) via mail and direct call campaigns. Customers are subsequently encouraged to apply to the AEP or any other Power Smart programs. Dedicated customer service portals such as a direct phone line, toll free phone number and email inbox also provide customers easy access to knowledgeable staff in order to complete the required eligibility and subsequent upgrade forms required to participate in the program. A video that will explain the steps of participation in the AEP is also currently in development. The first part of the video which gives an overview of the AEP is currently available on the Manitoba Hydro website (Transcript Page 2301). As discussed in Manitoba Hydro's Written Rebuttal Evidence, Exhibit MH-52, these continued efforts have attributed to the success of Manitoba Hydro providing over 20,000 lower income customers with energy efficient upgrades.

There have been some criticisms levied at Manitoba Hydro's Affordable Energy Program based on cursory reviews of the AEP. Dr. Simpson provides general comments regarding the AEP being a modest starting point, that significant barriers to participation exist, that better coordination is required between the AEP and other bill assistance programs. These comments understate the achievements of the program to date. While programs expand and evolve and there are always opportunities to improve programs, Manitoba Hydro aggressively markets its Affordable Energy Program to educate customers on the benefits of the program with mass media efforts as noted above, a video tailored to the target market and through customized outreach within the

community as discussed in Manitoba Hydro's Annual Affordable Energy Program Report at Appendix 10.8 of the Application, page 5 of 21.

The Bill Affordability Working Group identified key strengths of the Affordable Energy Program including, participation and savings with retrofits made to almost 18,000 homes, accessibility by addressing the unique barriers low income customer face by minimizing the financial burdens associated with upgrades; addressing eligibility by targeting gas and electric savings measures to low-income customers; a reflection of savings demonstrating estimated annual bill reductions per customer from anywhere between $37 (as a result of basic measures) and $556 (for insulation in electric heated homes); and outreach to customers by delivering and expanding awareness of the value and benefits of the AEP program (Appendix 10.5 of the Application, page 23). In addition, the conclusions of the Bill Affordability Working Group Report, at page 22, "Throughout the collaborative process, the AEP was shown to be well-managed and achieving solid results to date." and at page 24, *"Recent evaluations and studies conducted by other researchers generally reflect positively on the design of the AEP and the results it has achieved to date."* As further noted in the findings of an independent, external review of the Affordable Energy Program by Dunsky Energy Consulting , provided as an attachment to AMC/MH I-37, page 67, "Results in terms of participation rates, install rates and savings are strong".

With respect to the coordination of the AEP with other bill assistance programs, according to an independent review of The Affordable Energy Program by Dunsky Energy Consulting which also included a review of Customer Billing Assistance Initiatives , provided as an attachment to AMC/MH I-37, page 54, *"There is significant coordination between the Affordable Energy Program and Bill Assistance program…"* . Since the Dunsky review, as noted in Ms. Galbraith's direct testimony at Transcript Page 2296, Manitoba Hydro has further enhanced the coordination between programs. In March 2017, to ensure increased participation, a mandatory joint application form for both the Affordable Energy Program and Neighbours Helping Neighbours was created. In addition, at Transcript Page 2298, Ms. Galbraith discussed the new approach to landlord and tenant situations and how Manitoba Hydro is continually following up with landlords on behalf of their tenants to encourage the landlords to participate in the Affordable Energy Program for their revenue properties. As noted by Ms. Galbraith, Manitoba Hydro has noticed an increased number of customers participating in both the

Neighbors Helping Neighbors and the Affordable Energy Program; an increase from 14% to 28%.

Manitoba Hydro continually looks to increase participation for lower income customers who are struggling with payment of their energy bill such as increased awareness through various media, bill inserts, canvassing, energy advocates, community groups and centres, tradeshows, targeted calling of customers in arrears by the Affordable Energy Program and frontline staff in the Contact Centre and Credit department promoting the AEP.

14.5.4 Indigenous Power Smart Program

As shown in slides 34 to 36 of Exhibit MH-88 and as further discussed on Transcript Pages 2301 to 2306, Manitoba Hydro is taking a comprehensive approach with respect to Indigenous Demand Side Management. Manitoba Hydro's Indigenous Power Smart Program is customized to meet the unique needs of Indigenous communities. As indicated in PUB-MH-I-126 b-e, all homes located on First Nations reserves are eligible to participate regardless of income level. A dedicated Indigenous Energy Advisor works with each Indigenous community's Band Housing Manager (Transcript Pages 2301 to 2302) or housing designate (Transcript Page 3339) to identify qualifying homes and recommends energy efficient measures. While there has been some question with respect to Manitoba Hydro's use of one dedicated Indigenous Energy Advisor responsible for serving all 63 First Nations (Page 27 of Exhibit AMC-7-1), it is through this one point person that has led to the success of the program. The Indigenous Energy Advisor works directly with band housing managers to confirm with his feet on the ground as to what homes would still be eligible for installation upgrades (Transcript Page 2656) Ms. Galbraith explained at Transcript Page 2301 that this band housing manager has the intimate knowledge of the housing stock in communities and is the liaison with any federal government housing programs.

As noted at Transcript Page 2302, as part of the Indigenous Power Smart Program, Manitoba Hydro also provides the training and funding for the local residents to complete the installations of both the insulation and basic measures which create employment for members of the community. There is no cost to the indigenous community to participate. With over 5,000 homes having received retrofits through the

program, the equivalent of 22 full time jobs of Indigenous employment has been generated (PUB-MH I-126 b-e).

As further noted in PUB-MH-I-126 b-e, energy saving seminars are also available to provide community members with information and tips on what they can do to make their communities more energy efficient. In addition, a customized Heat Recovery Ventilation ("HRV") video explaining how to operate and maintain the unit was created to assist the Band Housing Managers. The video is currently available in three languages: English, Ojibway and Cree, and Dene (Transcript Page 2300). As further described in response to PUB/MH I-126 b-e, the video was distributed to all applicable First Nation Band Housing Managers and is also posted on the Manitoba Hydro's website. In addition, a customized Indigenous Energy Savings Tips publication was also created for use at events and it is distributed to each home as they participate through the direct install channel.

Upon reviewing the data provided by Manitoba Hydro in response to AMC/MH II-5 a-g that almost one-third of all First Nation on-reserve dwellings have participated in Indigenous Power Smart and 18.7% have received insulation retrofits, Mr. Raphals commented as follows, *"While there is clearly a long way to go, these results testify to a serious effort on the part of Manitoba Hydro to reach First Nations communities"*. (Page 27 of Exhibit AMC-7-1).

As noted at slide 35 of Exhibit MH-88, the total estimated Indigenous insulation target market is 3,778 homes. Manitoba Hydro has made significant achievements in terms of insulation efforts under the Indigenous Power Smart Program where 3,254 homes have received insulation upgrades as of October 31, 2017 which represents 86% of the estimated insulation market (Transcript Page 2303). In addition to these insulation upgrades, in approximately three years, over 5,000 homes have received basic measures which represents approximately one third of the overall Indigenous market (Transcript Page 2305). As shown in Exhibit MH-52, since its inception, the Indigenous Power Smart Program has achieved 1% to 16% participation annually. In its review of the Affordable Energy Program Report at page 21, Dunsky Energy Consulting noted that in his review of leading programs, the best programs achieve participation rates of 1% to 4% annually (AMC/MH I-37- Attachment 1).

In terms of the Manitoba Keewatinowi Okimakanak ("MKO") communities, as shown on slide 37 of Exhibit MH-88 and discussed at Transcript Pages 2305 to 2306, as of October 31, 2017 1,320 homes of an estimated 1,468 in the MKO communities have received insulation upgrades through the Indigenous Power Smart Program. This represents a 90% completion rate. Additionally, 1,790 homes of the estimated 7,375 have received the basic measures, representing approximately 24% of the market.

14.6 Demand Side Management Programming and Efficiency Manitoba

While the preceding section discussed programs that are specifically targeted at lower income customers, Demand Side Management programs have been and continue to be a key strategy for assisting all customers in managing their energy use, making energy more affordable. Manitoba Hydro currently offers a wide and comprehensive suite of programs as outlined in the 2017/18 Demand Side Management Plan (PUB MFR 61 - Attachment 1).

At Tab 7 of the Application, Manitoba Hydro has highlighted the DSM initiatives that have been implemented in the last couple of years since the last GRA. These include new DSM initiatives and enhancements to existing initiatives that have been introduced to assists all customers in managing energy bills. As shown on slide 38 of Exhibit MH-88, Manitoba Hydro has a variety of programs continuing to support all customer classes. New programs which have been introduced in the last couple of years include the Solar Energy Program, Power Smart Shops Program, Condensing Commercial Water Heater Program, Commercial HRV Program, Parking Lot Controller Program, New Homes Program, Residential Instant Rebates & Bill Credits Program, and Residential HRV Controls Program. In addition, a number of enhancements to existing Power Smart programs were introduced, such as increased incentives, new measures, and enhanced sales and technical support which are further outlined in Tab 7 of the Application.

In addition to the significant efforts achieved through the Indigenous Power Smart Program, First Nation Communities, benefit from other customized DSM initiatives. At Transcript Page 2310, Ms. Lois Morrison highlighted the Community Geothermal Program. Under the program, Manitoba Hydro worked with Aki Energy, a non-profit indigenous social enterprise funded by Manitoba Hydro, in order to install geothermal heat pump systems in residential homes. As of July 2017, Manitoba Hydro has had upgrades installed in 340 homes since the program began in April 2013. In addition to

this, Ms. Morrison discussed at Transcript Page 2311 that Manitoba Hydro provides technical guidance and financing through its PAYS Program to cover the up-front cost of the installations. For homes where the energy savings do not offset the financing costs of the geothermal systems, Manitoba Hydro will provide additional financial support. As further noted, the community invests in training local members to install the systems with 45 band members to date being trained and nine accredited as installers.

Ms. Morrison also highlighted the community energy profiles as another Manitoba Hydro offering. At the community's request, Manitoba Hydro will provide a report outlining the historical energy use trends by residential customers in their communities, and for the individual band-owned buildings in the community. (Transcript Page 2311) As noted by Ms. Morrison, we continue to be in discussions with communities and pursue these opportunities as they arise.

The 2016/17 DSM Plan – 15 Year Supplemental Report (Appendix 7.2 of the Application) projects average annual DSM savings of 1.2% of load which, although lower than the 1.5% targets identified in the Efficiency Manitoba Act. Mr. Bowman argues that Manitoba Hydro's forecasts for DSM spending are substantial and well beyond what can be justified on economic and cost effectiveness grounds. Mr. Bowman suggests that Manitoba Hydro should assume a substantially lower DSM investment and projected energy savings in its Application and determination of future revenue requirements when he states that *"it is appropriate to consider the likelihood that Efficiency Manitoba, its Minister, or the PUB will make a finding that continuing large-scale DSM is not cost effective for at least the next 5 – 7 or so years. Hydro should take this likelihood into account in its planning and budgeting"* (Patrick Bowman Pre-Filed Testimony, filed on behalf of the Manitoba Industrial Power Users Group, MIPUG-13, Page 6-25).

The Efficiency Manitoba Act received royal assent in June, 2017 and was proclaimed on January 24, 2017. There has been no evidence to suggest that the new entity or its planned activities will differ from those established in The Efficiency Manitoba Act or the 2016/17 DSM Plan. The Efficiency Manitoba Act requires a cumulative 22.5% energy savings over 15 years; it does not mandate specific year over year savings. To arbitrarily reduce forecasted DSM in the face of a legislative mandate that exceeds Manitoba Hydro's current plan, which outlines 17.3% energy savings over 15 years, is poor planning practice and there is absolutely no basis for considering such a suggestion.

In terms of next steps, as Ms. Morrison discussed at Transcript Page 646, , the responsibility for the planning, design and implementation of Demand Side Management programs will transition to the new Crown Corporation, Efficiency Manitoba. As Ms. Morrison testified:

> *"Now, the challenge that we are facing is, as I mentioned during my testimony at the revenue requirement panel, we're in a holding pattern on pursuing new opportunities or expanding our DSM offerings until we pass the torch effectively over to Man -- Efficiency Manitoba"* (Transcript page 2608).

In addition, The Efficiency Manitoba Act outlines a continuing key role for the PUB in the review of Demand Side Management activities in Manitoba as outlined under section 8.2.7.

15 COST OF SERVICE AND RATE DESIGN

15.1 Rate Setting Process

Manitoba Hydro provided the PUB panel with an overview of the rate setting process in its direct evidence presentation on December 19, 2017. As discussed on Transcript Pages 2258 to 2261, there are three sequential steps to the setting of electricity rates.

In the first step, the overall level of the revenue requirement is determined. After the total amount of the revenue requirement is finalized and confirmed, the Cost of Service Study is used to apportion the total revenue requirement to each customer class. The Cost of Service Study evaluates the allocated revenue requirement against the revenues expected to be generated by rates, and determines the Revenue to Cost Coverage ("RCC") ratio for each customer class.

Should the PUB determine that an adjustment to class revenues is needed to address any specific class RCC's that may lie outside of a zone of reasonableness, that decision must be explicit and determined prior to designing rates. Class revenues should be confirmed and then rates can be designed to recover the finalized level of revenues for each customer class, on a forecast (weather normal) basis.

In its direct evidence presentation, Manitoba Hydro noted its primary rate design objective, and how it related to one of Bonbright's *"Criteria of a Sound Rate Structure"*. Manitoba Hydro views its primary rate making objective as stated on page 2 of Tab 9 of this Application:

"Recovery of Revenue Requirement – Rates must provide the Corporation the opportunity to fully recover its allowed revenue requirement."

Similarly, Professor James Bonbright states that a sound rate structure should have:

"Effectiveness in yielding total revenue requirement under the fair-return standard without any socially undesirable expansion of the rate base or socially undesirable level of product quality and safety" (Page 30 of Manitoba Hydro's Book of Documents No. 2, Exhibit MH-116-2).

Both of these objectives reinforce the desirability of rates being designed to recover, to the fullest extent possible, the amount of revenue requirement identified as being the responsibility of each individual customer class.

Therefore, in the event that the PUB determines that revenues must be shifted between classes to achieve a change in RCC, that direction should be made prior to the calculation of rates for final approval. In that way, Manitoba Hydro will be able to design rates to accomplish the desired shift of RCC's while maintaining overall the ability to fully recover its allowed revenue requirement.

15.2 COST OF SERVICE

15.2.1 Intervenors Have Endorsed the PCOSS18 Implementation of the Directives from Order 164/16

Manitoba Hydro has provided a cost of service study in this Application that it views as essentially fully compliant with the methodology directed in Order 164/16. Intervenors who offered comments on the cost of service methodology appeared to share the view that changes made for Prospective Cost of Service Study 18 ("PCOSS18") were consistent with the Public Utilities Board of Manitoba ("PUB") direction in Order 164/16, and further that any outstanding matters were relatively minor.

Mr. Bowman provided his endorsement of the Corporation's implementation of the directives:

"Reviewing the filing, my conclusion was of the cost of service study as filed largely follows Order 164/16. It's refreshing to have a cost of service study that aligns with and an order and that needs at most some – some small outstanding directives dealt with" (Transcript Page 6101).

Mr. Harper echoed this view during his direct presentation:

"So if we're on slide 26, in terms of Manitoba Hydro's implementation of Order 164/16, their pers -- perspective cost of service study for 2018 generally follows the methodology set out in the Board's Order. There are a few areas of departure. However, in my view, these are based on either a lack of data, or simplifying assumptions" (Transcript Page 5229).

Finally, Mr. Chernick offered, on page 44 of his Direct Testimony, on behalf of the Green Action Centre, Exhibit GAC-11, that he had

"not identified any problems with the Company's revisions to its cost- of-service study methodology to reflect the Board's Order 164-16".

Manitoba Hydro acknowledges there are two outstanding directives in PUB Order 164-16 that remain to be addressed in the next cost of service study, specifically Directive 1(v) to update the weighted allocator for service drops, and Directive 1(gg) to study the allocation of common costs. Manitoba Hydro does not expect that the final outcome of these two remaining directives would materially impact the RCC outcomes of the next cost of service study, as discussed below.

The annual revenue requirement associated with Service Drops represents only one tenth of one percent of the total revenue requirement (Schedule 4.1 of Appendix 8.1 of this Application). Even with some unforeseen dramatic change in the class weighting factors or allocation method, the minimal dollars at stake simply cannot result in any significant changes to the level of allocated costs by class.

With regard to the treatment of common costs, while the quantum of common costs is greater, Manitoba Hydro does not anticipate any significant changes in the methodology used to functionalize these costs or in their ultimate allocation to customer classes. During the Hearing Mr. Barnlund shared the corporation's view that the current approach is reasonable and that parties should temper any expectations that there may still be large impacts to come from the upcoming review of common costs.

> *"And so while the Board had encouraged us to look to see if there's other methods which conceivably could be more cost causal, our current view is that the interim approach that we are us -- that we are using, and I would say this is the approach that we've been using for twenty (20) years. So, you know, it's not like this is something that we have -- have not used in the past. We have used this all the time.*

And -- and it's a reasonable way of allocating common costs. Your activities relate to a function, right. And so you can use that as being the driver to be able to drive common costs, and that's what we currently do.

Now, which isn't to say that we're not going to take a look at this from that perspective because the Board has asked us to look at it and we will do that. But, you know, I -- I don't want to leave this discussion with the impression that the way of allocating common costs is -- is lacking something. No, it's a valid allocator and it's an allocator that's been in use for over twenty (20) years here with Manitoba Hydro" (Transcript Page 2574).

Manitoba Hydro also notes that the examination of the treatment of common costs in the Cost of Service Methodology Review did not generate controversy. The PUB itself noted in Order 164/16 at the bottom of page 90, that:

"The issue of the allocation of common costs was not contentious in this proceeding and the interveners did not put positions forward."

15.2.2 Eliminating Non Cost Casual Factors from PCOSS Requires a Revision to the Zone of Reasonableness

In Order 164/16, the PUB provided clear direction on the methodology to be used in the preparation of future cost of service studies, as well as its view that cost causation should be the primary objective of a cost of service study and that other ratemaking principles should be considered at the rate setting stage after the cost of service results are known[37]. Manitoba Hydro has proposed in this Application that the PUB could consider expanding the zone of reasonableness from the current 95% to 105% band to a broader 90% to 110% range in response to this updated view on the role of cost of service in rate making.

[37] Order 164/16, page 27 – Board Findings "The Board finds that Manitoba Hydro's ratemaking principles and goals of rate stability and gradualism, fairness and equity, efficiency, simplicity, and competitiveness of rates should be considered in a General Rate Application ("GRA") and not in the cost of service methodology. While ratemaking principles are important in the overall process of setting rates, these concepts are issues for rate design and should therefore not be considered at the COSS stage. Likewise, consideration of RCC ratios is a rate design matter that should be addressed in the rate-setting phase of the GRA."

A broadening of the Zone of Reasonableness ("ZOR") is justified to accommodate the pre-existing fairness and equity matters that were considered at the time of the 2016 Cost of Service Methodology Review. For example, the elimination of the uniform rates adjustment from the study has reduced the revenues attributed to the Residential class by $21 million dollars (Coalition/MH II -85) in the 2018 study. If the use of the Uniform Rate Adjustment had been maintained, the RCC of the Residential class would have been approximately 1.6% higher at 96.4%, which would fall within the current ZOR (Transcript Page 3017).

The use of a widened zone of reasonableness also appears to be supported by practice in other Canadian jurisdictions. An informal survey conducted by Mr. Harper indicated that most two common ranges used in Canada are 95-105 and 90-110, and that even wider ranges are applied on a class by class basis by the OEB (Page 29 of William Harper, Econalysis Consulting Services Evidence filed on behalf of the Consumer's Coalition, Exhibit CC-20).

15.2.3 Revising the Method of Calculating RCC Would Require an Expansion to the Zone of Reasonableness

Manitoba Hydro traditionally calculates the RCC ratio by adding class revenues to the classes' share of Net Export Revenues, and then dividing those combined revenues by the allocated cost for the class. The existing RCC methodology has been utilized by Manitoba Hydro in each of its cost of service studies since 1979 (GSS-GSM/MH I-9). The calculation was used in this form when the ZOR was initially established; as we well as in 1996 when the zone was reviewed and reduced to the current 95-105% range as noted in PUB Order 51/96.

Mr. Bowman proposes modifying the long standing calculation to use export revenues as a reduction to cost in the denominator of the ratio, rather than as part of the calculation of total revenue in the numerator. He suggests this approach would provide results that are more relevant to customers (Transcript Page 6102), although he provides no evidence as to why a customer would prefer one methodology over another.

Manitoba Hydro has acknowledged this alternative approach is simply a re-ordering of the algebra in the equation, however, Manitoba Hydro cautions that this alternative

approach generates results with a much broader set of RCC outcomes (93.5 to 115.7) for PCOSS18 when compared to the current method (94.8 to 112.5) as shown in response to GSS-GSM/MH I-9. As further noted by Manitoba Hydro, the difference between the two methods will decrease as the revenue cost coverage ratios approach unity.

For classes outside the ZOR the differences can be significant. Using the traditional formula indicates that the GSL >100kV class is 3.6% above the 105% upper bound of the zone of reasonableness. Under the modified calculation proposed by Mr. Bowman, the variation from the upper bound doubles to 7.3% This alternate representation of the very same set of costs and revenues suggests a much more dramatic and immediate rate adjustment may be required than using the metrics as normally employed.

Changing the calculation of RCC should not be done in isolation, and must be accompanied with a reexamination of the appropriate ZOR.

Switching to the modified calculation of the RCC ratio should not be considered as this approach would represent a significant departure from the traditional RCC calculation that has been used to report PCOSS outcomes since the adoption of a ZOR. If the RCC formula is changed, it will not produce results that are directly comparable to those historically reported. Furthermore, a change in the RCC formula should then be accompanied by adopting a wider zone of reasonableness.

15.2.4 Outcomes of PCOSS18

Based on Manitoba Hydro's proposed expansion of the zone of reasonableness to 90% to 110%, all but one class would be captured within the revised zone of reasonableness.

Figure 15.1 PCOSS18 Results Compared to Zone of Reasonableness

Customer Class	PCOSS18 RCC[38]	Compared to 95-105% ZOR	Compared to 90-110% ZOR
Residential	94.8%	-0.2%	In ZOR
GSS Non Demand	112.5%	+7.5%	+2.5%
GSS Demand	101.0%	IN ZOR	IN ZOR
GSM	98.3%	IN ZOR	IN ZOR
GSL 0-30 kV	99.1%	IN ZOR	IN ZOR
GSL 30-100 kV	109.3%	+4.3%	IN ZOR
GSL >100 kV	108.6%	+3.6%	IN ZOR
Area & Roadway Lighting	100.3%	In ZOR	IN ZOR

While Manitoba Hydro is not proposing to shift revenues between customer classes to adjust RCC's, it recognizes that the PUB may determine to do so. If downward adjustment is made to one customer class, it should be recognized that the adjustment will require an upward adjustment to the other customer classes in order to maintain revenue neutrality and to afford Manitoba Hydro the opportunity to recover its full revenue requirement.

In the event that the PUB direct revenue changes by customer class, Manitoba Hydro requests that this matter be addressed explicitly and transparently in its rate Order for this GRA. Manitoba Hydro would request that the PUB provide clear direction as to how much revenue is to be shifted away from any given customer class and provide direction as to which customer classes would be responsible for those revenues, so as to keep Manitoba Hydro whole for its total approved revenue requirement.

15.2.5 RCC Evaluation Should Not Ignore Impact of Bipole III Coming in Service

BPIII is currently under construction and not yet in-service, and is therefore not reflected in the revenue requirement used for PCOSS18. However, the project will be part of the next cost of service study to be reviewed by this Board and it is appropriate

[38] Appendix 8.1, Schedule 1.1

to consider the results of PCOSS18 in conjunction with the directional changes expected in the next study.

The additional revenue requirement related to this massive Generation-functionalized asset will result in significant and predictable changes to class cost responsibility in future cost of service studies. In this application Manitoba Hydro has provided an alternate version of the cost of service study that includes an estimate of the revenue requirement for 2019/20 to illustrate the changes that are expected due to the addition of Bipole III.

The RCC for the smaller distribution level customers are expected to increase by up to two or three percentage points, with a more dramatic six or seven percent decrease expected to the RCC of the industrial classes.

Figure 15.2

Customer Class	PCOSS18 RCC[39]	Estimated 2020 RCC with BPIII In Service[40]	Estimated RCC Change
Residential	94.8%	96.7%	1.90%
GSS Non Demand	112.5%	115.3%	2.80%
GSS Demand	101.0%	101.3%	0.30%
GSM	98.3%	97.4%	-0.90%
GSL 0-30 kV	99.1%	96.5%	-2.60%
GSL 30-100 kV	109.3%	103.5%	-5.80%
GSL >100 kV	108.6%	101.5%	-7.10%
Area & Roadway Lighting	100.3%	118.2%	17.90%

These impacts by class are predictable based on each class' relative usage of the bulk power system, as well as the change in cost structure due to the significant, lumpy

[39] Appendix 8.1, Schedule 1.1
[40] MIPUG/MH I 23a-b

increase in the amount of Generation-related revenue requirement included in the study. The expected change in costs is sufficient to move the RCCs for both the Residential and Industrial customers to within the zone of reasonableness as soon as Bipole III comes into service without the need for any additional rate differentiation.

These results have been generally accepted by Mr. Bowman:

"I think Bipole III will likely have the type of effect people are showing. In other words, if you -- it will have a tendency to put a larger cost in percentage terms on people who make more use of the bulk power system. I think that's a given, the way it's classified. So in cents per kilowatt hour basis, it'll cost a little more for residentials than industrials. But overall, people will tend to pay the same cents per kilowatt hour for Bipole. And as a result, the RCC ratios will pull in somewhat, but I don't -- it won't address the greater than 10 percent that we're facing" (Transcript Pages 6103 to 6104).

Manitoba Hydro notes that Mr. Bowman cites a greater than 10 percent variance based on his alternative approach to calculating class RCC, while the traditional calculation results in an 8.6% variance for GSL > 100 kV and a 9.3% percent variance for the GSL 30 – 100 kV class. This alternate calculation has not been endorsed by this Board. It has not been used in PCOSS18 or any other study, and is not the standard measure used in reference to class RCCs. Manitoba Hydro has cautioned elsewhere in this argument that this revised measure of RCC cannot be used without reevaluation of the zone of reasonableness.

While acknowledging the reasonableness of Manitoba Hydro's evidence, Mr. Bowman remains unconvinced that Bipole III alone will move his clients sufficiently close to unity, suggesting in his direct testimony that previously the "same claims made about Wuskwatim and that did not occur". (Page 45 of Patrick Bowman Pre-filed Testimony on behalf of the Manitoba Industrial Power Users Group, Exhibit MIPUG-13).

Manitoba Hydro submits that there is no evidence on the record that isolates the impacts of Wuskwatim on class RCC that would confirm Mr. Bowman's assertion. Mr. Bowman is also neglecting to recognize the significant difference in the scale of Bipole III compared to the much smaller Wuskwatim project. The expected impact of a $5 billion asset (Tab 5 of the Application, Page 19) with no associated incremental revenue can

reasonably be assumed to be more consequential than that of a $ 1.4 billion (Tab 5 of the Application, Page 22) asset which is able to produce offsetting revenues.

Mr. William Harper also acknowledges and appears to accept the validity of the directional changes expected once Bipole III comes into service in his exchange at Transcript Page 5473.

The cross examination of Mr. Barnlund at Transcript Pages 2369 to 2370 identifies one further key consideration. The impact of Bipole is significant and immediate, but will be followed by directional consistent impacts in the longer term as Keeyask comes into service.

15.2.6 Cost of Service Treatment of Bipole III Reserve Account Revenues

As a percentage of revenue, all customer classes have contributed equally to establishing the Bipole III reserve account. With the upcoming in-service of Bipole III, these funds will be transferred out of the account and the additional revenues will be recognized in the next Cost of Service Study. It is Manitoba Hydro's intention to return the revenue to domestic classes on the same basis by which the revenues were accumulated in the fund - that is equally on an across-the-board basis. It is Manitoba Hydro's view that this approach most fairly apportions the reserve account to each class.

The alternative treatment of applying the revenues from the reserve account directly against the cost of the Bipole III asset will disproportionately benefit those classes that make relatively greater use of the Generation facilities, notwithstanding that each class has contributed equally to the reserve account.

Manitoba Hydro has demonstrated the impact of this disproportionate allocation, which would increase the revenue cost coverage ratio of the GSL>100 kV class by one percent (MIPUG/MH-I-23b and MIPUG/MH II-18a-b). For this reason, Manitoba Hydro does not view this as a reasonable alternative for purposes of Cost of Service.

Manitoba Hydro requests that the PUB provide direction confirming the proposed cost of service treatment of the amortization of the Bipole III Reserve Account in future studies.

15.3 Rate Design

15.3.1 Residential Rate Design

Manitoba Hydro has applied for rates in this General Rate Application based on its standard rate design. Manitoba Hydro's Residential rate design is a two-part rate, with a fixed basic charge per month and a single energy charge for all energy consumed in the billing period.

On September 12, 2017, Manitoba Hydro filed *"A Report on Rate Design for the Residential Class"* which included an illustrative residential rate design scenario. The rate design scenario was a residential electric heating rate which would shield electric heating customers from a portion of the proposed rate increase and would require non-heating customers to bear the additional revenue responsibility in order to be revenue neutral within the entire Residential Class. The rate design scenario in that report has not been approved by the Manitoba Hydro-Electric Board, and Manitoba Hydro is not seeking regulatory approval to implement that rate design.

<u>Rate Design Issues and Policy Considerations</u>

In Manitoba Hydro's view, any modification to the rate design needs to be examined to ensure it is undertaken with full regard and consideration for long standing rate making principles.

There was much discussion in this proceeding regarding inverted block rates (also referred to as *"inclining block rates"* or *"conservation rates"*). GAC's expert, Mr. Chernick, provided evidence as to potential inverted block rate designs to be considered for the Residential Class, which included tail block rates priced at approximately 9 cents per kWh.

However, setting electricity prices at this level for the run-off rate is considerably in excess of the levelized marginal value of electricity of 5.75 cents[41] and would send an inappropriate price signal to customers.

[41] On December 18th, Manitoba Hydro filed an update to PUB/MH II – 57 with the calculation of the levelized marginal values based upon the 2017 Load Forecast and the 2017 Energy Price Forecast and an updated value of generation marginal value. The 2017/18 levelized Marginal Value is approximately 28% lower than the 2015/16 Marginal Value, declining from 7.94 cents (in 2017$) to 5.75 cents.

Simply implementing inverted block rates or conservation rates needs to be assessed against the future conditions that may be experienced when Keeyask comes into service. The significant change in marginal value from 7.9 cents to 5.7 cents should be heeded.

Mr. Barnlund discussed this point with Mr. Gange at Transcript Pages 3063 and 3064:

> *"I think we need to look at the question of rate design and considering some of the issues we've got with electric heat customers, with low income customer with the potential photovoltaics coming out of the system, and I would add to that the information we talked about this morning where the marginal value of energy, if we – if we strictly look at which is being – being calculated, suggests that you would be looking to a declining block rate and not an inclining block rate."*
>
> *"So, I think that with all due respect, Mr. Gange, we find ourselves in far different circumstances today than we did in 2003, or 2008, 2009, and I think that we have to be alive to that change in circumstances, and we have to be intelligent terms of how we proceed with this."*
>
> *"We should be looking at the conditions of the present and the conditions of the future in terms of how we proceed."*

<u>Mr. Chernick's Rate Proposal Has Serious Shortcomings</u>

In Exhibit GAC-11, GAC's expert Mr. Chernick provided a rate design proposal which comprised four separate residential rate designs, including a LICO-125 electric heating rate, a LICO-125 non-heating rate, a non-LICO 125 conservation rate and non-LICO 125 electric heating rate. Each rate design had the size of the first block differentiated by four seasons (summer, fall, winter, spring). The LICO-125 rates also included the elimination of the monthly basic charge and the inclusion of a sharp price discount for the initial block of usage.

Manitoba Hydro requested that Mr. Chernick provide Proof of Revenue Statements for all of his proposed rate designs (MH/Chernick I – 10) in order for Manitoba Hydro to assess whether the proposed combination of basic charges, waivers of basic charges,

discounts to first block usage, seasonal block size variations and the recovery rate from non-LICO 125 customers would produce the required revenues as sought by Manitoba Hydro from the Residential Class in this Application. Unfortunately, Mr. Chernick did not conduct this analysis, as noted in his response to that Information Request. Furthermore, under cross examination from PUB Counsel at Transcript Oage 3836, Mr. Chernick stated:

"I don't believe that I – I've located the necessary data, and I wasn't able to provide the analysis."

Manitoba Hydro provides a Proof of Revenue Statement in each rate application to verify that the combination of rates and charges when applied to the test year load forecast, generates the expected level of revenue by customer class. As Mr. Chernick has not undertaken such an analysis, it is impossible to test his rate design proposal to ensure it produces the appropriate level of revenue, and therefore no weight can be given to his propose rate designs.

15.3.2 Rate Design for General Service Large Customer Classes

Time of Use Proposal

In his pre-filed evidence at pages 7-14 to 7-16, Mr. Patrick Bowman for MIPUG discusses the RCC outcomes for the GSL>100 class and proposes that Manitoba Hydro implement a time of use rate structure on an *"optional"* basis for that customer class.

His optional time of use rate design references the illustrative Time of Use ("TOU") rate scenarios previously prepared by Manitoba Hydro which were based upon revenues and billing determinants for August 1, 2016 rates. Under Mr. Bowman's proposal, both standard and TOU rates would be designed for the GSL>100 class and each of the 14 customers in the class would have the option to choose from either the standard rate design or the TOU rate design.

In his direct evidence testimony at Transcript Page 6106, Mr. Bowman states that time of use rates help make the rates within a class fairer, even if customers don't shift load. The *"fairness"* of a time of use rate design within a given customer class is an appropriate point to make when considering the reduction of cross subsidy between customers within any given class. For customers within the GSL > 100 kV class, the

degree of cross subsidy between customers depends upon their individual usage characteristics.

Based on each GSL > 100 kV customers actual usage characteristics, the annual bill impact to each of those customers was shown in the response to MIPUG/MH I-5c and on Page 71 of Manitoba Hydro's Written Rebuttal Evidence, Exhibit MH-52, which is provided below.

Figure 15.3

	Bill Impact of TOU vs Standard GSL > 100 Rate Design ($)	Customer under TOU rate design
Customer 1	900,200	Higher bill
Customer 2	438,500	Higher bill
Customer 3	140,300	Higher bill
Customer 4	114,700	Higher bill
Customer 5	39,500	Higher bill
Customer 6	36,800	Higher bill
Customer 7	400	Higher bill
Customer 8	(29,700)	Lower bill
Customer 9	(70,800)	Lower bill
Customer 10	(96,900)	Lower bill
Customer 11	(103,800)	Lower bill
Customer 12	(221,500)	Lower bill
Customer 13	(294,400)	Lower bill
Customer 14	(711,000)	Lower bill
7 customers	$ (1,528,100)	Lower revenues - TOU
7 customers	$ 1,670,400	Higher revenues - TOU

Mr. Bowman states that a time of use rate design has better fairness attributes than the existing rate design. The data in the above table compares annual bills under both a time of use and the standard rate design. This analysis demonstrates that customers 1 through 7 are not fully covering the cost to serve them under the standard GSL > 100 kV rate design, as they would be paying higher bills under the time of use rate design. Therefore, as Mr. Bowman observes, a time of use rate design would *"make the rates within a class fairer"*, indicating that Customers 1 through Customer 7 are currently being cross subsidized by Customers 8 through Customer 14 in the GSL > 100 kV class.

Manitoba Hydro's concerns with providing a standard rate design and an optional time of use rate centres on the issue of total revenue collection, in the event that only half of the customers opt for the time of use rate, leaving the higher cost customers on the standard rate design. This situation opens the door to self-selection by customers, based solely on their potential to benefit from one rate design or the other.

The result of the potential self-selection by GSL > 100 customers is that only customers whose bills could be lower under the time of use option would switch rates and therefore Manitoba Hydro would see a revenue shortfall of approximately $1.5 million for the GSL > 100 class as shown in the table above.

Mr. Bowman acknowledges the revenue losses of approximately $1.5 million on Page 7-15 of Exhibit MIPUG-13.

On page 7-16 of Exhibit MIPUG-13, Mr. Bowman suggests that the current RCCs of the GSL>100 kV class could drop with the implementation of optional TOU rates and no further recovery of the lost revenues.

The appropriate level of revenues should be explicitly dealt with by viewing the class by class RCC outcomes of PCOSS18 and determining whether there should be any deliberate shift in revenue responsibility between rate classes, prior to designing tariffs at the rate design stage.

In other words, if the likely outcome of an optional TOU rate offering is a net reduction of revenues of $1.5 million, that revenue must be made up either from other non-participating GSL>100 kV customers, by increasing the level of the standard rate, or it must be made up from customers in other rate classes.

In cross-examination by PUB Counsel on January 25, at Transcript Pages 6457 to 6459, Mr. Bowman discusses his recommendation on the matter of a Time-of-Use rate design. In his exchange, beginning on Transcript Page 6458, Mr. Bowman states:

"My – my suggestion to the Board is that it – t indicate to Hydro that – that work should be done on an – creating a new rate schedule available to at least the largest two (2) classes of customers. And that that rate schedule should be one (1) that customers can

opt into, but need not be required to move into. That rate schedule would not change the fact that they're in the overall class for the purposes of setting RCCs, so if there is less revenue it would affect the – it would affect the class in the cost of service study."

Mr. Bowman's recommendation suggests that Manitoba Hydro should not be compensated for any revenue loss caused by the self-selection of customers under an optional rate offering scheme. This recommendation violates Manitoba Hydro's rate making objective of full recovery of the revenue requirement, and furthermore violates Bonbright's criteria of *"effectiveness of yielding total revenue requirements"*.

15.3.3 The Relevance of Demand Charges in Rate Design

Mr. Chernick, at pages 39 to 42 of Exhibit GAC-11, advises the PUB to consider reducing or eliminating demand charges in the design of rates for general service customers.

Contrary to Mr. Chernick's opinion, demand charges provide a meaningful price signal to general service customers, in that electricity service consists of both the supply of energy and the provision of capacity to meet those customers' peak load requirements. Distribution feeders, substations, sub-transmission and transmission facilities are designed to accommodate the planned peak loads on the system, and the Corporation is contractually obligated to serve customers to the level of their required peak demand.

In addition, demand charges also provide the Corporation with a greater degree of revenue stability, which is also an important rate making consideration.

Demand charges give customers a price signal as to the cost of the capacity requirements that they impose on the system, the information to make better decisions around the management of peak demand, and an incentive to manage these peak demands. Without such an incentive, customers may place greater demand on the system than they would otherwise, which can result in increased capacity requirements on the system and increased costs to be borne by all customers.

On pages 42 and 43 of Exhibit GAC-13, Mr. Chernick expresses his view that Manitoba Hydro should eliminate demand ratchets or minimum billing demand provisions from its GSM and GSL tariffs.

The monthly billing demand for General Service Medium (over 200 kVA) and General Service Large customers is the greater of either (Appendix 9.3 (Updated) of the Application, Page 10-11):

1. measured demand; or
2. 25% of the contract demand; or
3. 25% of the highest measured demand in the previous 12 months.

Mr. Chernick has several criticisms of demand charges on page 43 of his evidence. He suggests that demand ratchets and contract demand provisions provide no incentive to reduce energy usage in low demand months (under 25% of the highest measured demand in the previous 12 months) and excessively penalize customers for marginal usage in the highest demand months, which in his view provides confusing and misleading price signals.

However, minimum billing demand and contract demand provisions reinforce the price signal to customers of the cost of demand that they impose on the Manitoba Hydro system. The cost of capacity and energy are shown separately on bills and customers can assess these costs in making their electricity usage decisions. In addition, contract demand provisions also encourage customers to more carefully assess their capacity requirements when adding load to the system. Without contract demand provisions, customers may contract for excess capacity on the possibility that it may be needed in the future. This capacity must then be constructed and reserved for that customer, and a contract demand provision provides for some level of ongoing revenue recovery for that additional capacity.

Lastly, Mr. Chernick suggests that demand bill impacts may arise for customers who unintentionally establish a new maximum contract demand. Manitoba Hydro notes that customers that inadvertently set a new maximum demand level may contact a customer representative to explain their specific circumstances and potentially have their billing demand level reviewed and adjusted, and therefore may not pose the bill impacts to customers as Mr. Chernick has suggested.

16 RATE SHOCK

16.1 Manitoba Hydro's Rate Request Does Not Represent Rate Shock

As noted by Mr. Barnlund on Transcript pages 2386 and 2387, Manitoba Hydro has, in fact, mitigated the level of rate increases that would otherwise be caused by the in-service of the Bipole III Reliability Project, the Keeyask Generating Station and the U.S. Interconnections comprised of the Manitoba-Minnesota Transmission Project and the Great Northern Transmission Line. In Order 73/15, the Public Utilities Board of Manitoba ("PUB") provided a table on page 7, reproduced below, which indicated the impact to revenue requirements of these new facilities entering service.

Figure 16.1. Revenue Requirement Impact (from Order 73/15)

The following table illustrates Manitoba Hydro's new revenue requirements attributable to new major projects, starting in 2019:

Revenue Requirement Impacts ($ Million)

Year Ending March 31	2019	2020	2021	2022
Bipole III Transmission Reliability Project	234	384	382	377
Keeyask Generating Station	28	80	316	462
Manitoba/Minnesota Transmission Project / Great Northern Transmission Line	1	5	85	115
Conawapa Sunk Costs	35	34	34	33
Additional Annual Revenue Required for New Projects	298	503	817	987
Cumulative Indicative-Only Annual Rate Increase Required to Pay New Costs	20%	34%	54%	65%

Sources: Application Appendix 11.15, Exhibit MH-118

Source: Page 7 of PUB Order 73/15

The increases in revenue requirement due to incremental depreciation, finance expense, capital tax and Operations & Maintenance associated with new major projects entering service would result in unmitigated rate increases of 20% in 2019, 34% in 2020, 54% in 2021 and 65% in 2022, if those costs were passed directly through to customers as that plant became used and useful. Unlike most other utilities that are regulated on a rate-base, rate-of-return basis, Manitoba Hydro is regulated under a cost of service approach that facilitates a more gradual smoothing into customer's rates of these lumpy increases in revenue requirement.

Given the extent of the unmitigated rate increases that would otherwise be necessary given the significant costs incurred with the in-service of these major projects, Manitoba Hydro's request of a 7.9% increase on April 1, 2018 demonstrates the significant rate impact mitigation that Manitoba Hydro is affording its customers through this time period.

The Consumer Coalition, MIPUG and the GSS/GSM-KAP representatives have characterized the rates requested in this General Rate Application as constituting "rate shock". Manitoba Hydro does not agree with this characterization, as discussed by Mr. Barnlund at Transcript Page 1469:

> *"MR. GREG BARNLUND: … We would not consider 7.9 percent rate increases to be -- meeting a threshold of rate shock.*
>
> *Typically utilities and utility boards consider a threshold of 10 percent. In 2004 this utilities board looked at Manitoba Hydro's application for August 1 rates and they considered a definition of rate shock or discussion of rate shock at that particular hearing. And they found that as long as the increases were no more than 8 or 9 percent that they would not be considering those as rate shock.*
> *…*
>
> *MR. GREG BARNLUND: While it's a difficult increase it's not rate shock because rate shock also infers a sudden surprise on customers and Manitoba Hydro has been very clear in terms of its communication of its financial situation, and indicating that there would be a need for continual rate increases of this order of magnitude."*

The reference to 2004 in the excerpt above is in respect of Manitoba Hydro's rate application filed on January 29, 2004. In that application, Manitoba Hydro applied for general rate increases of 3.0% to be effective April 1, 2004 and 2.5% to be effective on April 1, 2005.

The subject of rate shock was examined by the PUB in its review of that rate application which resulted in the PUB issuing Order 101/04 on July 28, 2004. The PUB granted

Manitoba Hydro a 5.0% increase (a full 2.0 % greater than requested by the corporation in its initial filing) for August 1, 2004 and a further 2.25% on a conditional basis for April 1, 2005 and 2.25% on a conditional basis for October 1, 2005.

In that Order, on page 27, the PUB noted:

> *In coming to a decision on the rate increases, firm and conditional, the Board considered the issue of rate shock, and opines that the rate increases for most customers will be within the thresholds put forth by the Intervenors (i.e. no more than 8-9% for any customers for the August 1, 2004 increase, and much less for most).*

Mr. Barnlund also raised the matter of the increases previously granted to Centra Gas Manitoba Inc. by the PUB in regards to natural gas rates. In Transcripts pages 2013 and 2014, in response to questions by Mr. Monnin on behalf of GSS/GSM-KAP, Mr. Barnlund testified:

> *I might, I guess, draw your attention though to some of the decisions that this Board has made with respect to the natural gas utility, Centra Gas Manitoba Inc., which of course deals with a much more volatile cost structure due to the fact that a great deal of the cost as passed on to customers is a cost of gas that's procured in the wholesale market.*
>
> *And there's been ten (10) at least – or ten (10) occasions where this Utilities Board has approved increases to natural gas customers in excess of 10 percent. And a situation in 1999 and 2000 when wholesale commodity prices really increased at a – at a very fast pace, the Utility Board passed through an increase of upwards of 25 percent on one (1) occasion.*

Mr. Barnlund further testified at Transcript pages 2014 and 2015, in response to questions from Mr. Monnin:

> *And – and you were asking me about the surprise to customers. And certainly some of the gas rate increases that have been approved by this*

Board were driven by some surprising changes in the wholesale market where there is relatively little notice that was provided to customers of those changes. And that was more of an issue of rate shock to be contended with than what we are certainly referring to here in this General Rate Application, sir

Regulators in Ontario and Alberta have identified a threshold of 10 percent as being an indication of rate shock or a level of rate increase that may require the utility to provide a rate mitigation plan to accompany its rate filing as discussed by Mr. Barnlund at lines 1 through 7 on Transcript page 2108.

Manitoba Hydro's proposed rate increase for 2018/19 of 7.9% is less than the 10% threshold identified in other jurisdictions, is less than the 8% - 9% threshold mentioned by the PUB in Order 101/04, and is far less than the unmitigated impact to revenue requirement that would otherwise be experienced as Major New Generation and Transmission projects come into service over the coming years.

17 REGULATORY DEFERRAL ACCOUNTS AND INTERIM APPROVALS

17.1 Regulatory Deferral Accounts

Under International Financial Reporting Standards ("IFRS"), financial statements must reflect the impacts of regulatory decisions with respect to timing differences for the recognition of revenue/expenses for rate setting purposes as compared to financial reporting purposes (e.g. $20 million of overhead expensed for financial reporting and deferred for rate setting). When performing the audit of Manitoba Hydro's financial statements, Manitoba Hydro's external auditor will review the content found in Public Utilities Board of Manitoba ("PUB") Orders to validate the accounting for regulatory deferrals as presented in the Corporation's financial statements.

Manitoba Hydro is seeking PUB endorsement of the following, pertaining to various deferral accounts:

- The proposed deferral and subsequent amortization for the costs incurred with respect to the Conawapa Generating Station as discussed in Tab 3 (page 18) of this Application;
- The proposed amortization period for the disposition of the regulatory deferral account established to capture the annual difference ($20 million) between overhead costs expensed for financial reporting purposes based on IFRS and overhead costs expensed for rate setting purposes reflecting Order PUB 73/15;
- The proposed amortization period for the disposition of the regulatory deferral account established to defer gains and losses on the disposition of assets; and
- The proposed time frame for the recognition into revenue of the Bipole III deferral account.

Manitoba Hydro's preference is to have a single basis of depreciation for both financial reporting and rate setting purposes thereby eliminating the need for a deferral account. This would address Manitoba Hydro's concerns with respect to the excessive growth in the deferral account balance, as well as reduce the ongoing administrative cost and effort to maintain the deferral indefinitely as the calculation of the deferral will become more complex over time.

However, Manitoba Hydro recognizes that for a single basis of depreciation to apply, the PUB's directives from Order 43/13 must be addressed. Given the specialized and technical nature of this subject matter, Manitoba Hydro is supportive of finding an

alternate process where the requirements of the depreciation directives can be discussed and resolution of this issue can be achieved. Manitoba Hydro is also supportive of finding an alternate process where the issue of the indefinite deferral of ineligible overhead can be discussed in more detail.

17.1.1 Conawapa Generating Station

Manitoba Hydro has incurred approximately $380 million in costs pertaining to the construction of the Conawapa Generating Station (Exhibit MH-127). A decision has been made to discontinue any further development of the station at this time. As a result, the Corporation is anticipating to write-down these costs to net income in 2017/18 as per Ms. Bauerlein's oral testimony on Transcript Page 765:

> *Things have changed. We will have to have discussions with our auditor this upcoming March 2018 to assess whether or not that this asset will be viewed as what we call a stranded asset, and would therefore have to be written off. Based on things that happened over the last several months, we believe that is a strong possibility.*

Manitoba Hydro is seeking the PUB's endorsement of its proposal to record the costs pertaining to the construction of the Conawapa Generating Station in a regulatory deferral account effective March 2018 and commence amortization of the costs to income on a straight line basis over a period of 30 years beginning April 1, 2018, in order to minimize the impact on customers.

At pages 49-50 of Mr. Harper's Evidence, filed as Consumers Coalition Exhibit CC-20, Mr. Harper provides endorsement of Manitoba Hydro's proposed accounting treatment with respect to Conawapa construction costs, stating that "*Since the decision dealt with the most appropriate way to meet Manitoba Hydro's energy needs over a long-term planning horizon, the write-off can be viewed as part of the overall cost of implementing the Board's decision. Overall, the 20 year period is reasonable.*"

It is noted that in oral testimony (Transcript Page 5186 and 5187), Mr. Harper corrected his written evidence referencing the 20 year amortization period to a 30 year amortization period consistent with Manitoba Hydro's proposal.

17.1.2 Depreciation Methodology

Manitoba Hydro adopted the Equal Life Group ("ELG") method of depreciation to be compliant with the financial reporting requirements of IFRS. This change resulted in an initial annual increase in depreciation expense of approximately $30 million compared to the CGAAP Average Service Life ("ASL") method of depreciation used by Manitoba Hydro prior to IFRS. Notably, over the service life of an asset, the total depreciation will be the same under either method.

In Order 43/13, the PUB directed Manitoba to perform the following:

> *8. That Manitoba Hydro file updated depreciation rates and schedules based on an International Financial Reporting Standards-compliant Average Service Life methodology with the next General Rate Application.*
>
> *9. That Manitoba Hydro file with the Board, with the next General Rate Application, a chart showing a comparison of the impact on its Integrated Financial Forecast (i.e. 'Budget') of asset depreciation pursuant to the Average Service Life methodology (without net salvage) and the Equal Life Group methodology (without net salvage), applying both methodologies to all planned major capital additions.*

In Directive 10 of Order 73/15, the PUB further directed Manitoba Hydro to continue to use the CGAAP-ASL method of depreciation for rate setting purposes until the PUB is satisfied that a change in depreciation methodology is warranted.

As indicated in Tab 10 of the GRA, Manitoba Hydro has addressed the requirements of Directive 10 of Order 73/15 by deferring the difference between depreciation expense calculated for financial reporting purposes (based on IFRS-compliant ELG depreciation rates) and depreciation expense calculated for rate-setting purposes (using CGAAP-compliant ASL depreciation rates) in a regulatory deferral account. As required by IFRS 14, Manitoba Hydro is also making a corresponding adjustment through the net movement in regulatory balances account such that for rate setting purposes, Manitoba Hydro's revenue requirement for the test years continues to reflect depreciation expense based on CGAAP-compliant ASL depreciation rates. Although a deferral account

has been established, Manitoba Hydro is not seeking approval of the amortization period for the differences in the depreciation methodology at this time.

Manitoba Hydro notes that a change in methodology was required in order to be compliant with IFRS and it is expected that an increase in depreciation expense would have occurred regardless of whether Manitoba Hydro used IFRS compliant ELG or ASL depreciation rates.

As an initial means to offset the impact of the change to the ELG method, Manitoba Hydro eliminated the recognition of negative salvage in depreciation rates which reduced depreciation expense by approximately $50 million per annum. This change more than offset the $30 million annual increase that resulted from the change to the ELG method.

Manitoba Hydro's preference is to have a single basis of depreciation for both rate setting and financial reporting purposes. A single basis of depreciation would have the benefit of eliminating the need for a deferral account and address Manitoba Hydro's concerns with respect to the excessive growth in deferral account balances ($1.9 billion by 2035), as evidenced in the response to PUB/MH I-1b. The corporation is concerned that such balances will need to be absorbed by future rate payers in addition to other risks (e.g. drought, reduced export prices) that may also arise. A single basis of depreciation will also reduce the ongoing administrative cost and effort to maintain the deferral indefinitely as the calculation of the deferral will become more complex over time as Manitoba Hydro continues to add and replace assets.

However, Manitoba Hydro recognizes that for a single basis of depreciation to apply, the PUB's directives from Order 43/13 must be addressed. Manitoba Hydro is supportive of finding an alternate process where the requirements outlined in the depreciation directives issued by the PUB can be discussed in more detail and a resolution of this issue can be achieved. Having an alternative process would allow Manitoba Hydro to provide the PUB with the information necessary to move forward with respect to the depreciation methodology issues. This is aligned with the recommendations of Mr. Harper's oral testimony at Transcript Pages 5219 to 5220 where he states:

The Board's directive also called for Manitoba Hydro to return with the necessary information to permit it to make a determination as to which depreciation -- while -- methodology should be used for rate -- rate setting. Assuming Manitoba Hydro intends to comply with the directive in a timely fashion, there is no need, in my view, to either, 1) amortize the current balance, or -- or establish a date after which the cost differences between the two (2) will no longer be deferred. These matters can better be addressed by the Board after it has determined what is the appropriate depreciation methodology for rate-setting purposes.

As noted above, Manitoba Hydro has established a deferral account to capture the difference between depreciation expense calculated based on IFRS-compliant ELG depreciation rates and CGAAP-ASL rates. While an assumption has been included in the current integrated financial forecast to amortize the deferral balance for rate setting purposes over a period of 20 years beginning in 2019/20, Manitoba Hydro believes that a more appropriate course of action would be to convene a process to review and consider the depreciation directives outside of a GRA process and before 2019/20.

17.1.3 Ineligible Overhead

Upon its transition to IFRS, Manitoba Hydro reduced the extent of overhead costs capitalized in property, plant and equipment to bring its capitalization policies in line with other Canadian utilities and to comply with the financial reporting requirements of IFRS. In the PUB findings on page 35 of Order 73/15, the PUB did not accept for rate setting purposes expensing an additional $20 million in annual overhead costs that were deemed ineligible for capitalization under IFRS and found instead that these additional overhead costs should continue to be capitalized, consistent with the practices used by Manitoba Hydro prior to its transition to IFRS.

As outlined in Tab 3 of the Application, Manitoba Hydro has established a regulatory deferral account to capture the $20 million in annual overhead costs that are ineligible for capitalization under IFRS. This deferral facilitates compliance with the PUB's direction in Order 73/15. As shown in MH16 Update with Interim, the balance in this deferral account grows to approximately $160 million by 2022/23.

Manitoba Hydro is seeking PUB endorsement of its proposal, as outlined in Tab 3, to amortize the balance in this deferral account over a 20 year period, beginning in 2017/18.

Intervenors to this application, specifically Mr. Bowman and Mr. Harper, have argued that the amortization period for the ineligible overhead costs should be extended to a 30 year period. As discussed by Manitoba Hydro on page 38 of Exhibit MH-52, while extending the amortization period for regulatory deferrals will result in a reduction to amortization expense and a subsequent increase to net income and retained earnings, such increases are based on a reduction to a non-cash related expense (i.e. amortization expense). The scenario provided by Manitoba Hydro in Appendix 3.1 of Exhibit MH-52 incorporates the recommendations of Mr. Bowman including: i) continuation of both the overhead and ELG/ASL deferrals through the forecast period; ii) extension to the amortization period of the overhead deferral to 30 years; and iii) no amortization of the ELG/ASL depreciation deferral.

The results of this analysis indicate that requested rate increases would marginally decrease by 0.26% from the 7.9% requested to 7.64% per year over the 6 year period from 2018/19 through to 2023/24. This marginal decrease is due to the fact that reductions to non-cash expenses have no impact on cash flows and as a result, do little to reduce debt levels. This fact is acknowledged by Mr. Bowman on page 6-10 (lines 17-18) in Exhibit MIPUG-13 as he states, "*The adjustment will not directly improve nor harm Hydro's cash flows, as deferral and amortization is a non-cash adjustment."* Consistent with Manitoba Hydro's responses to MIPUG MFR 5, PUB/MH I-1b and PUB/MH II-2a-c, the analysis demonstrates that 7.9% rate increases are required as a result of growing debt levels and a deterioration in cash flows and are not resolved through accounting changes related to the amortization periods of regulatory deferral accounts.

Manitoba Hydro notes that in Order 73/15, the PUB did not provide any direction with respect to how long Manitoba Hydro should continue to capitalize the additional overhead costs. Manitoba Hydro is concerned that an indefinite deferral is not appropriate given that there is no impact to net income by the end of the amortization period. As such, it is not clear what the benefit to the ratepayer would be in deferring such costs into perpetuity. Regardless of the amortization period used for the ineligible overhead, the annual amortization of the deferral account charged to net income will

equate to the annual deferral amount of $20 million by the end of the amortization period. For example, if a 20 year amortization period is used, by year 21, the annual deferral amount of $20 million will equate to the annual amortization of $20 million such that the net income impact will be zero. This impact on net income holds true regardless of the amortization period used.

Manitoba Hydro is also supportive of finding an alternate process where the issue of the indefinite deferral of ineligible overhead can be discussed in more detail. Mr. Harper is supportive of the need for further clarity on this issue as he states on page 46 of Exhibit CC-46:

> *Manitoba Hydro's comments suggest that the Board's decision to defer ineligible overheads (and ELG/ASL depreciation differences) was based on rate smoothing considerations. However, it is not clear that this was the case. In the case of ineligible overheads, the Board's Decision appears to reflect a view that the level of overheads identified in the proceeding prior to the 2015/16 and 2016/17 GRA were the appropriate level to capitalize for rate-setting purposes. However, at the end of the day, it remains for the Board to confirm what its objective was in deferring the $20 M of ineligible overheads. If the Board was/is of the view that the $20 M is more appropriately capitalized, then there is no basis for ceasing the deferral after 2022/23.*

17.1.4 Gains and Losses on the Disposition of Assets

As explained by Ms. Bauerlein in direct evidence starting on Transcript Page 678, Manitoba Hydro is proposing that asset retirement gains and losses be deferred in a regulatory account and amortized on a straight-line basis over a period of 20 years for rate setting purposes. The proposal is consistent with the PUB findings in Order 73/15 (page 45) where the PUB ordered Manitoba Hydro to continue to determine depreciation expense based on its existing CGAAP-compliant ASL methodology for rate setting purposes. Under the CGAAP ASL method, Manitoba Hydro deferred and amortized the recognition of gains and losses on the disposition of assets by recognizing them initially in accumulated depreciation and subsequently amortizing these amounts over the remaining lives of the respective assets via an adjustment to future depreciation rates. This CGAAP form of accounting is not consistent with IFRS which requires asset retirement gains and losses to be recognized immediately to net income

in the year incurred. As such, Manitoba Hydro requires a regulatory deferral account to record these amounts in order to continue to defer and amortize asset retirement gains and losses for rate setting purposes.

Consistent with other regulatory deferral accounts, Manitoba Hydro requires endorsement from the PUB as to the 20 year amortization period it is proposing in its Application. Manitoba Hydro notes that Mr. Harper agrees with the proposed accounting treatment of Manitoba Hydro as he states on page 41 of his written evidence, "*As noted earlier, in such situations the choice of amortization period is a matter of judgment. Since an amortization period of 20 years is likely to achieve a result similar to that experienced prior to the implementation of IFRS, the period appears reasonable.*"

17.1.5 Bipole III Revenue Deferral

The Bipole III reserve account was established by Manitoba Hydro, consistent with the direction provided by the PUB in Order 43/13 (directive #3, page 4) which stated that:

> *That a 3.5 % overall increase in billed rates for the basic monthly charge, the demand charge, and the energy charge for all rate categories to take effect May 1, 2013, with revenues from a 1.5% portion of the rate increase accruing in a deferral account to be utilized to mitigate the required rate increases when Bipole III is placed in-service,* ***BE AND IS HEREBY APPROVED****.*

The rational provided by the PUB for establishing the Bipole III deferral account is documented on page 10 of Order 43/13:

> *The capital deferral account is to assist in funding the planned Bipole III transmission line. The cost of this project will be capitalized during the construction phase, but significant annual depreciation, operation, maintenance & administration, and interest costs will have to be recovered from domestic ratepayers once the project is placed in-service. The deferral account allows Manitoba Hydro to collect funds as the Bipole III project is being built, which will help to mitigate rate increases required once the infrastructure is placed in-service.*

As shown in Appendix 3.8, MH16 Update with Interim, as at March 31, 2017, cumulative revenues accrued to the Bipole III deferral account are $196 million reflecting rate increases received by Manitoba Hydro since 2014 that were directed to the Bipole deferral. The Bipole III deferral account is projected to grow to approximately $400 million by the Bipole III planned in-service date of July 2018. The MH16 Update with Interim forecast assumes that the deferral account is recognized in domestic revenues over a five year period following the Bipole III project in-service date (effective August 2018) through to July 2023 to coincide with the final in-service date of the Keeyask generating station. A five year period over which to recognize the deferred revenue was chosen so as to help mitigate the initial expected increases in annual depreciation, interest and operating costs following the in-service of the Bipole III project. Subsequent to the 2023 period, additional export revenues from the Keeyask project will be available to help offset such charges and therefore, no further recognition of the deferral is required following that date.

Manitoba Hydro notes that the timing of the recognition of the revenue will not impact the future cash flows of the Corporation as the money has already been received via previous year's rate increases/revenue collected. As explained by Mr. McCallum in his oral testimony, at Transcript Page 751:

> *I think the really important thing to appreciate here is that this is a – this is accounting rules dictating the recognition of revenue. The cash has already been paid. It's in the bank or its been spent,…, There's no incremental cash benefit that comes from this $400 million balance which we amortize. This is a recognition item. It's an accounting policy item.*

In addition to the comments of Mr. McCallum, Manitoba Hydro further notes that the revenues collected by way of the Bipole III deferral account have been included in equity balances when determining actual and projected debt-equity ratios of the corporation. As such, the timing of when the revenue is recognized into net income will not change the cash/debt position or equity ratio of Manitoba Hydro going forward and will therefore have no impact on customer rates.

The following continuity schedule in **Figure 17.1** displays the annual contributions and proposed drawdowns of the Bipole III reserve account by fiscal year:

Given that the Bipole III project is expected to go into service in July 2018 of the upcoming test year, Manitoba Hydro is seeking direction from the PUB as part of its Order issued in response to Manitoba Hydro's GRA as to the amortization period over which to recognize the revenues deferred in the Bipole III account.

17.2 Interim Orders

Manitoba Hydro has attached, as Appendix 17.1, a complete list of interim and ex parte Orders that require final approval by the PUB.

and farmers to discuss the economic disaster that is currently going on in the oilseed and grain seed sector, one would have given some praise to the Prime Minister. Yet people and farmers, a group of farmers that asked for an audience with him were told that if they paid $350 per plate for a dinner they might get to say hi to him. I think, Mr. Speaker, it is clearly an indication of what kind of a disastrous situation we have in this province in response to the leadership in federal and provincial relations. I think that has deteriorated dramatically, and I think we need to address that at some point. I criticize the Prime Minister for not meeting.

Ms. Janice Y. Lederman

Mr. Doug Martindale (Burrows): Mr. Speaker, it is with pleasure that I rise today to pay tribute to Ms. Jan Lederman, the former chair of the United Way of Winnipeg's board of trustees. She was presented with the André Mailhot Award at the United Way of Canada/Centraide Canada's national conference in Québec City on March 24, 2001. It is given to one individual annually, and this year Ms. Lederman was honoured with being the recipient of this award.

She was involved for eight years with the United Way of Winnipeg and spearheaded a community involvement initiative called Journey Forward which engaged people to look at social issues most important to them and to Winnipeggers and to find ways to work together to address these issues, which I might point out involved some 3000 people. This culminated in the Willing Community Forum in November 2000 which was considered a model across Canada and the United States. Ms. Lederman is a very deserving recipient of this award. She is also bright, articulate and personable as an individual. On behalf of all members, I would like to thank her for her volunteerism and her leadership with the United Way of Winnipeg.

* (14:30)

Thomas Report

Hon. Jon Gerrard (River Heights): Mr. Speaker, last week Paul Thomas tabled the report of the Review and Implementation Committee for the report of the Manitoba Pediatric Cardiac Surgery Inquest. Yesterday the Minister of Health (Mr. Chomiak) suggested in his comments that the Thomas report dealt only with the period 1994 to 1995. A read of the report shows that Paul Thomas is dealing with the present situation when he says clearly: Where provincial leadership and involvement ends and the responsibility of the RHAs begins is not clear.

Again, Paul Thomas says: The exact nature of the working relationship between the two parties–he is referring to the minister and the regional health authorities–is not clear.

It is a real disappointment that the Minister of Health has not in 20 months been able to clarify the relationship between himself, as minister, and the regional health authorities. This relationship should have been made clear within the minister's first two months in office.

Ending the overlap and duplication is essential, as Paul Thomas indicates, in order to achieve cost savings and to clarify accountability. It is time for the Minister of Health to clarify the present overlap and blurred accountability. It is time for the Minister of Health to attend to what he should have attended to as one of his first tasks when he assumed office.

ORDERS OF THE DAY

House Business

Hon. Gord Mackintosh (Government House Leader): Mr. Speaker, before dealing with the routine for today, would you canvass the House and determine if there is consent to adjourn today at 5 p.m.?

Mr. Speaker: Is there agreement to adjourn at 5 p.m. today? *[Agreed]*

Mr. Mackintosh: Mr. Speaker, would you please call bills in the following order: First, second readings, Bills 27 and 30; second, debate on second readings, in this order, please, Bills 11, 19, 12, 14, 15 and 29; and then return to second readings, Bill 25, and we will take it from there.

SECOND READINGS

Bill 27–The Manitoba Hydro Amendment Act (2)

Hon. Greg Selinger (Minister charged with the administration of The Manitoba Hydro Act): Mr. Speaker, I move, seconded by the

Minister of Transportation and Government Services (Mr. Ashton), that Bill 27, The Manitoba Hydro Amendment Act (2); Loi no 2 modifiant la Loi sur l'Hydro-Manitoba, be now read a second time and referred to a committee of this House.

Motion presented.

Mr. Selinger: I am pleased to give second reading to this bill. As I mentioned in the first reading, this legislation will require Manitoba Hydro to charge customers connected to the provincial power grid the same rate for electricity service, regardless of where they live in Manitoba.

Mr. Speaker, on December 5, 2000, the Speech from the Throne promised this single rate for residential hydro users. The Lieutenant-Governor said at that time: A household in The Pas or in Lac du Bonnet will pay the same basic rate for hydro service as a household in Winnipeg. This bill delivers on that commitment.

Our Government sees this as an issue of fundamental fairness to all Manitobans with respect to an important service. Currently, Manitoba Hydro maintains three rate zones reflecting different cost structures associated with serving a large number of customers in a small area compared to serving a few customers spread across a large area. However, this difference in actual terms is less than 10 percent, so for example the average residential customer living in Zone 2 will save approximately $2.70 a month on their electricity bill. These current Zone 2 customers are typically those living in small towns and medium density areas. The average customers living in what is currently called Zone 3 are typically farm families, low density areas. They will save $10.11 per month.

Mr. Speaker, this legislation is long overdue. Many other provinces have uniform rates, including Québec, British Columbia and Nova Scotia. It is an issue of fundamental fairness. I am very pleased that we are able to work with our Crown utility to make uniform electricity rates a reality in Manitoba and put everybody on an equal footing when it comes to the rates charged for basic service.

Mr. Marcel Laurendeau (St. Norbert): I move, seconded by the honourable Member for Lakeside (Mr. Enns), that debate be adjourned.

Motion agreed to.

Bill 30–The Securities Amendment Act

Hon. Scott Smith (Minister of Consumer and Corporate Affairs): I move, seconded by the Minister of Transportation and Government Services (Mr. Ashton), that Bill 30, The Securities Amendment Act (Loi modifiant la Loi sur les valeurs mobilières), be now read a second time and referred to a committee of the House.

Motion presented.

* (14:40)

Mr. Smith: Mr. Speaker, the amendments to The Securities Act proposed in this bill fall into two broad categories. The first are amendments that will modernize and harmonize the securities legislation in the province.

You can break this into five generalizations, five categories: No. 1, making provisions to the Manitoba Securities Commission to participate in a national registration database which will allow registrants to operate in the securities industry to become registered in several jurisdictions from a single-entry point. This will present a benefit to both the registrants and investors, as the dealers will be able to service their clients with a minimum amount of paperwork and filing delays.

Number two, providing authority for the Securities Commission to officially recognize self-regulating organizations such as the Investment Dealers' Association and the mutual fund dealers' association, to which those registrants selling equities and mutual funds must belong. Recognition will give the Securities Commission both the ability to form a closer relationship with those groups but also a greater opportunity for scrutiny and oversight. This will be beneficial to not only investors but all Manitobans.

Number three, adopting the concept of the reporting issuer. As in other jurisdictions, this will result in additional financial reporting to the Manitoba Securities Commission by non-resident issuers currently not filing in the province. This in turn will provide greater disclosure to Manitoba investments.

Number four, harmonizing on a national basis to extend the notice period for takeover

ONTARIO
SUPERIOR COURT OF JUSTICE

DIVISIONAL COURT

KITELEY, CUMMING, AND SWINTON JJ.

B E T W E E N:	
ADVOCACY CENTRE FOR TENANTS-ONTARIO and INCOME SECURITY ADVOCACY CENTRE on behalf of LOW-INCOME ENERGY NETWORK Appellant	***Paul Manning*** and ***Mary Truemner***, for the Appellant
- and -	
ONTARIO ENERGY BOARD Respondent	***Michael Millar***, for Ontario Energy Board ***Fred Cass*** and ***David Stevens,*** for Enbridge Gas Distribution Inc. ***Robert Warren,*** for Consumers Council of Canada **HEARD at Toronto:** February 25, 2008

KITELEY and CUMMING JJ.

The Appeal

[1] The Respondent Ontario Energy Board (the "Board") is the provincial economic regulator for the natural gas and electricity sectors. The Board exercises its jurisdiction within the statutory authority established by the Legislature, being the *Ontario Energy Board Act, 1998*, S.O. 1998, c. 15, Schedule B (the "*Act*").

[2] By a majority (2:1) decision dated April 26, 2007, the Board determined that the *Act* does not explicitly grant to the Board jurisdiction to order the implementation of a low income affordability program: *Enbridge Gas Distribution Inc.* (April 26, 2007), EB-2006-0034 (Ont. Energy Bd.) (the "Board Decision"). The Board also found that the Board does not gain the requisite jurisdiction through the doctrine of necessary implication.

[3] Enbridge Gas Distribution Inc. ("EGD") sought approval by the Board of EGD's 2007 gas distribution rates based simply upon the Board's traditional, standard "cost of service" rate-making principles. The Appellant Low Income Energy Network ("LIEN") had intervened in the application before the Board. LIEN argues that without a rate affordability program, the interests of low-income consumers are not protected. LIEN proposed that the Board accept as an issue in the EGD proceeding the following matter:

> Should the residential rate schedules for EGD include a rate affordability assistance program for low-income consumers? If so, how should such a program be funded? How should eligibility criteria be determined? How should levels of assistance be determined?

[4] LIEN seeks from the Board the introduction of a rate affordability assistance program to make natural gas distribution rates affordable to poor people. The underlying premise of the proposal of LIEN is that low income consumers (estimated to be about 18% of households in Ontario) should pay less for gas distribution services than other consumers. LIEN emphasizes that the supply of natural gas (or other source of energy) serves to meet basic human needs such as warmth from heating and the generation of power. Those who cannot afford to use natural gas as a source of energy may be placed at a significant disadvantage. LIEN submits that the Board can consider ability to pay in setting rates if it is necessary to meet broad public policy concerns. Access to an essential service is arguably such a concern. The supply of natural gas can be considered a necessity that is available from a single source with prices set by the Board in the public interest.

[5] The majority of the Board held that the LIEN proposal amounted to an income redistribution scheme. The Board noted that such a scheme would require a consumer rate class based upon income characteristics and would implicitly require subsidization of this new class by other rate classes. It is undisputed that a common, if not universal, historical feature of rate-making for a natural monopoly is the application of the same charges to all consumers within a given consumer classification based upon cost of service, that is, cost causality.

[6] Section 33 of the *Act* provides for an appeal to this Court on a question of law or jurisdiction. LIEN seeks a declaration that the Board has the jurisdiction to order a "rate affordability assistance program" for low income consumers of the utility, EGD, within its franchise areas as the distributor of natural gas.

[7] The position of EGD, the Board and the intervenor, the Consumers Council of Canada, is that LIEN's quite understandable and commendable concern is an issue of public policy to be dealt with by the Legislature and falls outside the jurisdiction of the Board.

2008 CanLII 23487 (ON SCDC)

2008 CanLII 23487 (ON SCDC)

The Standard of Review

[8] The issue is whether the Board is correct in its determination that it does not have jurisdiction to implement a low income affordability program.

[9] There is common ground that the standard of review is correctness. That is, this Court will interpret the statutory grant of authority on the basis of its own opinion as to a statute's construction, rather than deferring to the Board's determination of the issue. A tribunal's determination that it has no jurisdiction will be set aside as a "wrongful declining of jurisdiction" if the Court is of the view that the tribunal's decision is wrong. Donald J.M. Brown and John M. Evans, *Judicial Review of Administrative Action in Canada*, looseleaf (Toronto: Canvasback Publishing, 1998) at 14-3 to 14-4.

Analysis of the Board's Jurisdiction

A. Applicable Principles

[10] The Court is to be guided by the principles of statutory interpretation as set forth in Ruth Sullivan, *Driedger on the Construction of Statutes*, 3rd ed., (Toronto: Butterworths, 1994) at 131:

> There is only one rule in modern interpretation, namely, courts are obliged to determine the meaning of legislation in its total context, having regard to the purpose of the legislation, the consequences of proposed interpretations, as well as admissible external aids. In other words, the courts must consider and take into account all relevant and admissible indicators of legislative meaning. After taking these into account, the court must then adopt an interpretation that is appropriate. An appropriate interpretation is one that can be justified in terms of (a) its plausibility, that is its compliance with the legislative text; (b) its efficacy, that is, its promotion of the legislative purpose; and (c) its acceptability, that is, the outcome is reasonable and just.

[11] The words of the *Act* are to be read in their entire context and in their grammatical and ordinary sense, harmoniously with the scheme and object of the legislation and the Legislature's intent. *ATCO Gas and Pipelines Ltd. v. Alberta (Energy and Utilities Board)*, [2006] 1 S.C.R. 140 at para. 37 [*Atco*].

[12] The statute shall be interpreted as being remedial and given such "fair, large and liberal interpretation as best ensures the attainment of its objects." *Legislation Act*, S.O. 2006, c. 21, Schedule F, s. 64 (1).

[13] A statutory administrative tribunal obtains its jurisdiction from two sources: explicit powers expressly granted by statute, and implicit powers by application of the common law doctrine of jurisdiction by necessary implication. *Atco*, *supra*, at para. 38.

[14] The Court must apply a "pragmatic or functional" analysis in determining the issue of jurisdiction, by considering the wording of the *Act* conferring jurisdiction upon the Board, the purpose of the *Act* creating the Board, the reason for the Board's existence, the area of expertise of its members and the nature of the problem before the Board. *Union des employés de Service, local 298 v. Bibeault,* [1988] 2 S.C.R. 1048 at 1088.

B. The Wording of the Act

[15] Section 36 of the *Act* confers the Board's jurisdiction:

> **36.** (1) No gas transmitter, gas distributor or storage company shall sell gas or charge for the transmission, distribution or storage of gas except in accordance with an order of the Board, which is not bound by the terms of any contract.
>
> ….
>
> (2) The Board may make orders approving or fixing just and reasonable rates for the sale of gas by gas transmitters, gas distributors and storage companies, and for the transmission, distribution and storage of gas.
>
> (3) In approving or fixing just and reasonable rates, the Board may adopt any method or technique that it considers appropriate.

[16] LIEN submits that the Board's authority to fix "just and reasonable rates" by adopting "any method or technique it considers appropriate", conferred by s. 36 (2) and (3) of the *Act* is very broad and the statutory language must be given its ordinary meaning.

[17] The Board argues that the word "rates" is in the plural form in s. 36 (2) to allow the Board to set different rates for different classes of consumers based upon the costs of serving those consumers. For example, large industrial users are typically considerably more expensive to serve than residential consumers. Separate rate classes are a necessity to ensure that consumers reimburse for the actual costs of the service they receive.

[18] The majority opinion in the Board Decision is of the view that the words "any method or technique" cannot reasonably be interpreted to mean "a fundamental replacement of the rate making process based on cost causality with one based on income level as a rate grouping determinant." (p.9)

[19] The phrase "approving or fixing just and reasonable rates" in the present s. 36 (2) was first introduced by s. 17 (1) of Bill 38, *An Act to Establish the Ontario Energy Board*, 1st Sess., 26th Leg., Ontario, 1960 by the then Minister of Energy Resources, the Hon. Robert Macaulay. He outlined for the Legislature the philosophy underlying rate setting (*Legislature of Ontario Debates*, 9 (8 February 1960) at 199 (Hon. Macaulay)):

2008 CanLII 23487 (ON SCDC)

> First, why are there rate controls? There are rate controls because, in effect, the distribution of natural gas is a monopoly, a public utility. Secondly…it is fair that whatever rate is charged should be one designated, not only in the interests of the consumer, but also in the interests of the distributor…[O]ne really should have in mind 3 basic objectives: First, the rate should be low enough to secure to the user a fair and just rate. Second, the rate should be adequate to pay for good service and replacement and retirement of the used portion of the assets. Third, it should be high enough to attract a sufficient return on capital….

[20] He went on to explain the purpose of the Government's policy (at 205):

> "[F]irst, to protect the consumer, and to see that he pays a fair and just rate, not more or less, and that is competitive with other fuels. Second, to make sure the rate is sufficient to provide adequate service, replacements and safety for the company providing the service. Third, it is that the company should be able to charge a rate which is sufficient to attract the necessary capital to expand.

[21] The present s.36 (3) replaced s.19 of the old *Ontario Energy Board Act*, R.S.O. 1980, c. 332, which required a traditional cost of service analysis in very prescriptive terms:

> 19 (2) In approving or fixing rates and other charges under subsection (1), the board shall determine a rate base for the transmitter, distributor or storage company, and shall determine whether the return on the rate base …is reasonable.
>
> The rate base …shall be the total of,
>
> (a) a reasonable allowance for the cost of the property that is used or useful in serving the public, less an amount considered adequate by the Board for depreciation, amortization and depletion;
>
> (b) a reasonable allowance for working capital; and
>
> (c) such other amounts as, in the opinion of the Board, ought to be included.

[22] The authority was granted in s. 36 (3) to use "any method or technique it considers appropriate" in approving "just and reasonable rates" i.e., employing methods other than simply on a traditional cost of service basis as proscribed in the repealed s. 19 to set rates for the gas sector. This aligned the approach for natural gas with the non-prescriptive authority seen governing Ontario Hydro as a Crown corporation in rate setting for electricity distributors.

[23] Thus, under the former *Act* the phrase "just and reasonable rates" was limited to the cost of service basis articulated in prescriptive detail in s. 19. The change in repealing s. 19 and allowing the Board to "adopt any method or technique it considers appropriate" provides greater flexibility to the Board to employ other methods of rate making in approving and fixing "just and

2008 CanLII 23487 (ON SCDC)

reasonable rates" rather than simply the traditional cost of service regulation seen in the former s. 19.

2008 CanLII 23487 (ON SCDC)

[24] Subsection 36 (3) allows the Board to adopt "any method or technique that it considers appropriate" in fixing "just and reasonable rates." The majority Board Decision view is that this provision, considered within the context of the *Act* as a whole, allows the Board to employ flexible techniques and methods for cost of service analyses in determining rates, for example, the incentive rate mechanisms currently used for the major gas utilities.

[25] In the same rate setting proceeding that is under review, EGD reportedly asked the Board to approve two fuel-switching programs to enable residential consumers to shift from electric-water heaters to gas-water heaters, given that the latter promote conservation inasmuch as there is greater energy efficiency. The programs are identical except that there is a subsidy offered for the low income group of $800 per participant but a subsidy of only $600 for other consumers. Vice Chair Kaiser in dissenting points out that none of the parties have objected to this proposal and no one has argued that the Board does not have jurisdiction to approve different subsidies based upon income levels.

[26] Indeed, the majority opinion in the Board Decision allows that the Board has ordered that specific funding be channeled aimed at low income consumers for "Demand Side Management Programs."

[27] As well, the Board on occasion has reduced a significant rate increase because of so-called "rate shock" by spreading the increase over a number of years. Although this does not in itself suggest an unequal approach as between residential consumers it does indicate that the Board considers it has jurisdiction to take "ability to pay" into account in rate setting.

[28] EGD, like other utilities, makes annual contributions to enable emergency financial relief through the so-called "Winter Warmth Program" which provides funds as a subsidy to some low income consumers, enabling them to be able to heat their homes in winter months. These subsidies are taken into account as costs of the utility in the approval and fixing of rates by the Board. Although the program is funded by all consumers, to some extent there is indirect cross-subsidization within the residential consumer class.

[29] The Board points out that this is a relatively small program in the nature of a charitable objective, involving the United Way, which is specific to individual consumers in a financial crisis situation. But the fact remains that its implementation means that some residential consumers are paying less for the distribution and purchase of natural gas than other residential consumers are paying. If the Board has jurisdiction to approve utilities paying subsidies to the benefit of low income consumers then it arguably has jurisdiction to order utilities to provide special rates on a low income basis.

[30] Section 79 of the *Act* explicitly authorizes the Board to provide rate protection for rural or remote consumers of an electricity distributor. The majority decision argues that it is a reasonable inference that the Legislature, by virtue of the explicit singling out of a single

2008 CanLII 23487 (ON SCDC)

category of consumers in s. 79, did not intend this benefit to apply to other categories of consumers. The Board argues that if s. 36 (2) and (3) are intended to allow for differential rate setting for subsets of residential consumers, then s. 79 is unnecessary. The majority decision considers the existence of s. 79 as indicating that the Legislature has been explicit on issues that it considers warrant special treatment through a subsidy. The majority decision argues that the existence of s. 79 implicitly excludes any intent to confer jurisdiction to depart from simply the cost of service approach employed to implement the mandate given to the Board by s. 36.

[31] Moreover, the majority decision points out that rural rate assistance through s. 79 does not consider income level as an eligibility determinant. Rather, eligibility is based upon location and the inherent higher costs of service related to density levels. The assistance from the program is conferred upon all consumers within a given geographical area irrespective of their income level. Hence, this program arguably serves simply to mitigate the effect of the cost differential related to geography and remains consistent with a rate making process based upon cost causality. Nevertheless, "rate protection" through s. 79 operates as a subsidy paid by some of Ontario's residential electricity consumers for the benefit of others and represents a departure from the principle of cost causality being applied on the same basis to all consumers within a given class (i.e., residential, commercial and industrial).

[32] As pointed out in the dissent by Board Vice Chair Gordon Kaiser, s. 79 was introduced in 1999 when the authority to regulate rates for *electricity* distributors was transferred to the Ontario Energy Board. Prior thereto, electricity distributors were regulated by Ontario Hydro, a Crown corporation which had established the policy of setting special rates in remote and rural areas through the now repealed s. 108 of the *Power Corporation Act,* R.S.O. 1990, c. P. 18. The inference can be made, as Vice Chair Kaiser asserts, that s. 79 was introduced into the *Act* to expressly indicate to the Board that this significant historical policy must continue.

C. The Purpose of the Act and the Reason for the Board's existence

[33] The objectives for the Board with respect to natural gas regulation are set forth in s. 2 of the *Act*:

> (2) The Board, in carrying out its responsibilities under this or any other Act in relation to gas, shall be guided by the following objectives:
>
> 1. To facilitate competition in the sale of gas to users.
> 2. To protect the interests of consumers with respect to prices and the reliability and quality of gas service.
> 3. To facilitate rational expansion of transmission and distribution systems.
> 4. To facilitate rational development and safe operation of gas storage.
> 5. To promote energy conservation and energy efficiency in a manner consistent with the policies of the Government of Ontario.

> 5.1To facilitate the maintenance of a financially viable gas industry for the transmission, distribution and storage of gas.
> 6. To promote communication within the gas industry and the education of consumers.

[34] The Board is charged under s. 2 of the *Act* with protecting "the interests of consumers with respect to prices …." The Board argues that this provision speaks to consumers as a single class, not to a particular subset of consumers. The majority decision of the Board says the Board's mandate is to balance the interests of consumers as a single group with the interests of the regulated utility in the setting of "just and reasonable rates."

[35] The Divisional Court has emphasized in the past that the Board's mandate to fix just and reasonable rates **"**is unconditioned by directed criteria and is broad; the board is expressly allowed to adopt any method it considers appropriate." *Natural Resource Gas Ltd. v Ontario Energy Board*, [2005] O.J. No. 1520 at para. 13 (Div. Ct.). The Divisional Court also stated in *Enbridge Gas Distribution Inc. v. Ontario Energy Board* (2005), 75 O.R. (3d) 72, [2005] O.J. No. 756 at para.24:

> …[T]he legislation involves economic regulation of energy resources, including setting prices for energy which are fair and reasonable to the distributors and the suppliers, while at the same time are a reasonable cost for the consumer to pay. This will frequently engage the balancing of competing interests, as well as consideration of broad public policy.

[36] Writing for the majority of the Supreme Court of Canada in *Atco, supra,* at para. 62 Bastarache J. stated that "[r]ate regulation serves several aims – sustainability, equity and efficiency – which underlie the reasoning as to how rates are fixed."

D. The Area of Expertise of its Members and the Nature of the Problem before the Board

[37] The Board was asked to consider the application of the utility to establish rates. In that context, an intervenor asked the Board to consider whether, as a factor in rate-setting, the Board could consider the interests of low-income consumers and establish a rate affordability program. That issue of rate-setting is squarely within the jurisdiction of the Board.

[38] The majority opinion in the Board Decision correctly states that the Board's mandate for economic regulation is "rooted in the achievement of economic efficiencies, the establishment of fair returns for natural monopolies and the development of appropriate costs allocation methodologies".. However, that does not answer the question as to the full scope of the Board's jurisdiction in approving or fixing "just and reasonable rates" and adopting "any method or technique that it considers appropriate" in so doing.

[39] The Board's regulatory power is designed to act as a proxy in the public interest for competition in view of a natural gas utility's geographical natural monopoly. Absent the intervention of the Board as a regulator in rate-setting, gas utilities (for the benefit of their

2008 CanLII 23487 (ON SCDC)

shareholders) would be in a position to extract monopolistic rents from consumers, in particular, given a relatively inelastic demand curve for their commodity. Clearly, a prime purpose of the *Act* and the Board is to balance the interests of consumers of natural gas with those of the natural gas suppliers. The Board's mandate through economic regulation is directed primarily at avoiding the potential problem of excessive prices resulting because of a monopoly distributor of an essential service.

[40] In performing this regulatory function, it is consistent for the Board to seek to protect the interests of *all* consumers vis-a-vis the reality of a monopoly. The Board must balance the respective interests of the utility and the collective interest of all consumers in rate setting. *Re Union Gas Ltd. and Ontario Energy Board et al.* (1983), 1 D.L.R. (4th) 698 (Div. Ct.), (1983) 43 O.R. (2d) 489 at 501. The Board's regulatory power is primarily a proxy for competition rather than an instrument of social policy. *Dalhousie Legal Aid Service v. Nova Scotia Power Inc.,* (2006), 268 D.L.R. (4th) 408 at para. 33 [*Dalhousie*].

[41] *Dalhousie* dealt with a request for a low income affordability program like that advanced by LIEN. However, it involved a consideration of rate setting under s. 67 (1) of the Nova Scotia *Public Utilities Act* ,R.S.N.S. 1989, c. 380, which is very different in wording with respect to jurisdiction to that seen in s. 36 of the *Act* at hand. The Nova Scotia provision expressly provides that "rates shall always, under substantially similar circumstances and conditions in respect of service of the same description, be charged equally to all persons and at the same rate …." Hence, the Nova Scotia Utility and Review Board found that it did not have jurisdiction to order low income affordability programs.

[42] Section 36 of the *Act* has broad language, empowering the Board to set "just and reasonable" rates for the distribution of natural gas. The supply of natural gas can be considered a necessity that is available from a single source with prices set by the Board in the public interest. The Board has traditionally set rates on a "cost of service" basis, that is, on the basis of cost causality and employing a complex cost allocation exercise. In brief, this approach first looks to the utility's capital investments and maintenance costs including a fair rate of return to determine revenues required. The revenue requirement is then divided amongst the utility's rate paying consumers on a rate class basis (i.e., residential, commercial, industrial, etc.).

[43] The rates have been traditionally designed with the principled objective of having each rate class pay for the actual costs that class imposes upon the utility. That is, the Board has sought to avoid inter-class and intra class subsidies. See RP-2003-0063 (2005) at 5. Consistent with this approach, the Board has refused the establishment of a special rate class to provide redress for aboriginal consumers. *Decision with Reasons* EBRO493 (1997) (O.E.B.). In that case, the Ontario Native Alliance ("ONA") requested the Board to order a utility to evaluate the establishment of a rate class for the purpose of providing a special rate class for aboriginal peoples. At 316-17, the Board stated:

> The Board is required by the legislation to "fix just and reasonable rates", and in doing so it attempts to ensure that no undue discrimination occurs between rate classes, and that

2008 CanLII 23487 (ON SCDC)

the principles of cost causality are followed in allocating the underlying rates. While the board recognizes ONA's concerns, the Board finds that the establishment of a special rate class to provide redress for aboriginal consumers of Centra does not meet the above criteria and it is not prepared to order the studies requested by ONA.

[44] This decision would be within the Board's jurisdiction and a like response to LIEN in the case at hand would arguably be consistent and reasonable. However, the Board in dealing with the ONA request did not decline on the basis of jurisdiction. Rather, it said that it should not exercise its jurisdiction as requested by ONA for the reasons given.

[45] A low income rate affordability program would necessarily lead to treating consumer groups on a differentiated basis with higher prices for a majority of residential consumers and subsidization of the low-income subset by the majority group and/or other classes of consumers.

[46] If the Board were to reduce the rates for one class of consumers based upon an income determinant, the Board would have to increase the rates for another class or classes of consumers. In effect, such a rate reduction would impose a regressive indirect tax upon those required to pick up the shortfall. Such an approach would arguably be a dramatic departure from the Board's regulatory function as implemented to date, which has been to protect the collective interest of consumers dealing with a monopoly supplier through a "cost of service" calculation and then to treat consumers equally through determining rates to pay for the "cost of service" on a cost causality basis for classes of consumers.

[47] The Board's mandate has not been directed to the public interest in social or distributive justice through a differentiation of rates on the basis of income. That need is seen to be met through other mechanisms and programs legislated by the provincial Legislature and/or Parliament, for example, by refundable tax credits and social assistance.

[48] Indeed, the provincial income tax legislation previously provided for public tax expenditures to assist low income consumers with rising electricity costs. This was done through an "Ontario home electricity payment" by reference to income levels. *Income Tax Act*, R.S.O. 1990, c.1.2, s. 8.6.1, as rep. by *Income Tax Amendment Act (Ontario Home Electricity Relief), 2006*, S.O. 2006, c. 18, s. 1. As well, Parliament has provided a one-time relief for energy costs to low income families and seniors in Canada through the *Energy Costs Assistance Measures Act*, S.C. 2005, c. 49.

[49] The Board is an economic regulator, rather than a formulator of social policy. While no doubt the Board must take into account broad policy considerations, rate-setting is at the core of the Board's jurisdiction. *Garland v. Consumers' Gas Company* (2000), 185 D.L.R. (4th) 536 at paras. 17, 45-46 (Ont. S.C.J.). Special rates for low income consumers would not be based upon economic principles of regulation but rather on the social principle of ability to pay. Any program to subsidize low income consumers would require a source of funding which is a matter of public policy. See generally *Re Rate Concessions to Poor Persons and Senior Citizens*, 14 Pub. Util. Rep. 4th 87 at 94 (Or. 1976).

2008 CanLII 23487 (ON SCDC)

[50] This view of the nature and limit of the regulatory function is generally accepted as the norm in other jurisdictions. See for example *Washington Gas light Co. v. Public Service Commission of the District of Columbia* (1982), 450 A.2d 1187 at para. 38 (D.C. Ct. App.); *State of Louisiana v. the Council of the City of New Orleans and New Orleans Public Service, Inc.* (1975), 309 So. 2nd 290 at 294 (La. Sup. Ct.).

[51] The historical common law approach for public utility regulation has been that consumers with similar cost profiles are to be treated equally so far as reasonably possible with respect to the rates paid for services. See, for example, *St. Lawrence Rendering Co. Ltd. v. The City of Cornwall,* [1951] O.R. 669-685 at 683; *Chastain et al. v. British Columbia Hydro and Power Authority* (1972), 32 D.L.R. (3d) 443 at 454 (B.C.S.C); *Canada (Attorney General)* v. *Toronto (City)* (1893), 23 S.C.R. 514 at 519-520.

Conclusions on the Board's Jurisdiction

[52] We agree that the traditional approach of "cost of service" is the root principle underlying the determination of rates by the Board because that is necessary to meet the fundamental, core objective of balancing the interests of all consumers and the natural monopoly utility in rate/price setting.

[53] However, the Board is authorized to employ "any method or technique that it considers appropriate" to fix "just and reasonable rates." Although "cost of service" is necessarily an underlying fundamental factor and starting point to determining rates, the Board must determine what are "just and reasonable rates" within the context of the objectives set forth in s. 2 of the *Act*. Objective #2 therein speaks to protecting "the interests of consumers with respect to prices."

[54] The "cost of service" determination will establish a benchmark global amount of revenues resulting from an estimated quantity of units of natural gas or electricity distributed. The Board could use this determination to fix rates on a cost causality basis. This has been the traditional approach.

[55] However, in our view, the Board need not stop there. Rather, the Board in the consideration of its statutory objectives might consider it appropriate to use a specific "method or technique" in the implementation of its basic "cost of service" calculation to arrive at a final fixing of rates that are considered "just and reasonable rates." This could mean, for example, to further the objective of "energy conservation", the use of incentive rates or differential pricing dependent upon the quantity of energy consumed. As well, to further the objective of protecting "the interests of consumers" this could mean taking into account income levels in pricing to achieve the delivery of affordable energy to low income consumers on the basis that this meets the objective of protecting "the interests of consumers with respect to prices."

[56] The Board is engaged in rate-setting within the context of the interpretation of its statute in a fair, large and liberal manner. It is not engaged in setting social policy.

2008 CanLII 23487 (ON SCDC)

[57] This is not, of course, to imply any preferred course of action in rate setting by the Board. The Board in its discretion may determine that "just and reasonable rates" are those that follow from the approach of "cost causality" once the "cost of service" amount is determined. That is, the principle of equality of rates for consumers within a given class (e.g., residential consumers) may be viewed as the most just and reasonable approach. A determination by the Board that all residential gas consumers (with relatively minor deviations through such programs as the "Winter Warmth Program") pay the same distribution rates is not in itself discriminatory on a prohibited ground. Indeed, it can be seen as a non-discriminatory policy in terms of prices paid.

[58] Nor is it to suggest that as a matter of public policy, objectives of distributive justice or conservation in respect of energy consumption are best achieved by rate setting as compared to, for instance, tax expenditures or social assistance devised and implemented by the Legislature through mechanisms independent of the operation of the *Act*. It is noted that the Minister is given the authority in s. 27 of the *Act* to issue policy statements as to matters that the Board must pursue; however, the Minister has not issued any policy statement directing the board to base rates on considerations of the ability to pay. Moreover, the power granted to a regulatory authority "must be exercised reasonably and according to the law, and cannot be exercised for a collateral object or an extraneous and irrelevant purpose, however commendable." *Re Multi Malls Inc. et al. and Minister of Transportation and Communications et al* (1977), 14 O.R. (2d) 49 at 55 (C.A.). As we have said, cost of service is the starting point building block in rate setting, to meet the fundamental concern of balancing the interests of all consumers with the interests of the natural monopoly utility.

[59] Nor does our conclusion presume as to what methods or techniques may be available in determining "just and reasonable rates." Efficiency and equity considerations must be made. Rather, this is to say only that so long as the global amount of return to the utility based upon a "cost of service" analysis is achievable, then the rates/prices (and the methods and techniques to determine those rates/prices) to generate that global amount is a matter for the Board's discretion in its ultimate goal and responsibility of approving and fixing "just and reasonable rates."

[60] The issue before the Court is that of jurisdiction, not how and the manner by which the Board should exercise the jurisdiction conferred upon it.

[61] In our view, and we so find, the Board has the jurisdiction to take into account the ability to pay in setting rates. We so find having taken into account the expansive wording of s. 36 (2) and (3) of the statute and giving that wording its ordinary meaning, having considered the purpose of the legislation within the context of the statutory objectives for the Board seen in s. 2, and being mindful of the history of rate setting to date in giving efficacy to the promotion of the legislative purpose.

[62] We also find that that interpretation is appropriate taking into account the criteria articulated in *Driedger,* above, namely it complies with the legislative text, it promotes the legislative purpose and the outcome is reasonable and just.

2008 CanLII 23487 (ON SCDC)

[63] As indicated above, a statutory administrative tribunal obtains its jurisdiction from explicit powers or implicit powers. Having found that the jurisdiction to consider ability to pay in rate setting is explicitly within the *Act,* we need not consider the doctrine of necessary implication or the related principle of implied exclusion.

The issue of the *Canadian Charter of Rights and Freedoms*

[64] Before concluding, it is appropriate to mention the submission made on behalf of LIEN in respect of s. 15 (1) of the *Canadian Charter of Rights and Freedoms*, Part 1 of the *Constitution Act, 1982*, being Schedule B to the *Canada Act, 1982* (U.K.), c. 11 (the "*Charter*").

[65] LIEN says it raises the *Charter* simply within the context of it being an interpretive tool in discerning the meaning of an asserted ambiguous s. 36 of the *Act*. LIEN says it does not raise any issue that the *Act* or the Board's actions or inactions are contrary to the *Charter*.

[66] LIEN argues that in the absence of clear statutory provisions, the requirement for "just and reasonable rates" must be interpreted to comply with s. 15. The *Charter* applies to provincial legislation and can be used as an interpretive tool. *R. v. Rogers*, [2006] 1 S.C.R. 554, [2006] S.C.J. No. 15 at para. 18. In our view, as stated above, the *Act* provides the Board with the requisite jurisdiction without having to look to the *Charter*.

[67] While we heard submissions from LIEN, we declined to hear from counsel for the respondents on this issue. We agree with our colleague Swinton J. that such an argument requires a full evidentiary record.

Disposition

[68] For the reasons given, the appeal is allowed and it is declared that the Board has the jurisdiction to establish a rate affordability assistance program for low income consumers purchasing the distribution of natural gas from the utility, EGD.

[69] All parties agree that there is not to be any award of costs in respect of this appeal.

KITELEY J.

CUMMING J.

2008 CanLII 23487 (ON SCDC)

Released: May , 2008

2008 CanLII 23487 (ON SCDC)

Swinton J. (dissenting):

[70] The sole issue in this appeal is whether the Ontario Energy Board (the "Board") erred in holding that it had no jurisdiction, when setting residential rates for gas distribution, to order a rate affordability program for low income consumers. In my view, the majority of the Board was correct in concluding that the Board lacked jurisdiction to make such an order.

[71] The majority of the Board predicated its decision on the understanding that the appellants' proposal contemplated the establishment of a rate group for low income residential consumers that would be funded by general rates. I, too, proceed on that assumption. While there were no details of a specific program put forth by the appellants during the hearing, it is inevitable that the Board, in setting lower rates for the economically disadvantaged, would have to impose higher rates on other consumers.

The Board's Practice in Setting Rates

[72] Pursuant to the *Ontario Energy Board Act, 1998,* S.O. 1998, c. 15, Schedule B (the "Act"), the Board has authority to set rates for both gas and electricity. It has traditionally set rates for gas through a "cost of service" assessment, in which it seeks to determine a utility's total cost of providing service to its customers over a one year period (the "test year"). According to the Board's factum, these costs include the rate base (which is essentially the net book value of the utility's total capital investments) and the utility's operational and maintenance costs for the test year, among other things. The utility's total costs for the test year (usually including a rate of return on the rate base portion) forms the revenue requirement. The revenue requirement is then divided amongst the utility's ratepayers on a rate class basis (that is, residential, small commercial, industrial, etc.).

[73] With respect to gas, it has always been the Board's practice to allocate the revenue requirement to the different rate classes on the basis of how much of that cost the rate class actually causes ("cost causality"). To the greatest extent possible, the Board has striven to avoid inter-class subsidies (see, for example, Decision with Reasons, RP-2003-0063 (2005), p. 5).

The Proper Approach to Statutory Interpretation

[74] To determine the issue in this appeal, it is necessary to consider the powers conferred on the Board by its constituent legislation, the *Ontario Energy Board Act*. That Act must be interpreted using the modern principles of statutory interpretation described by Professor Ruth Sullivan in *Driedger on the Construction of Statutes* (3rd ed.) (Toronto: Butterworths, 1994) as follows:

> There is only one rule in modern interpretation, namely, courts are obliged to determine the meaning of legislation in its total context, having regard to the purpose of the

2008 CanLII 23487 (ON SCDC)

> legislation, the consequences of proposed interpretations, the presumptions of special rules of interpretation, as well as admissible external aids. In other words, the courts must consider and take into account all relevant and admissible indicators of legislative meaning. After taking these into account, the court must then adopt an interpretation that is appropriate. An appropriate interpretation is one that can be justified in terms of (a) its plausibility, that is, its compliance with the legislative text; (b) its efficacy, that is, its promotion of the legislative purpose; and (c) its acceptability, that is, the outcome is reasonable and just. (at p. 131)

[75] The words of a statute are to be read in their entire context and in their grammatical and ordinary sense, harmoniously with the scheme of the Act, its objects, and the intent of the Legislature (*ATCO Gas and Pipelines Ltd. v. Alberta (Energy and Utilities Board)*, [2006] 1 S.C.R. 140 at para. 37).

The Words of the Provision in Issue

[76] Subsection 36(2) of the Act gives the Board the broad authority to approve or fix "just and reasonable" rates for the distribution of gas. On its face, those words might encompass the power to set rates according to income. However, the words do not explicitly confer the power to do so, and the Supreme Court of Canada commented in *ATCO, supra* that a discretionary grant of authority to a tribunal cannot be viewed as conferring unlimited discretion. A regulatory tribunal must interpret its powers "within the confines of the statutory regime and principles generally applicable to regulatory matters, for which the legislature is assumed to have had regard in passing that legislation" (at para. 50).

[77] The appellants also rely on s. 36(3), which states that in approving or fixing just and reasonable rates, the Board may adopt "any method or technique that it considers appropriate". These words were added to the Act in 1998. Examples of methods or techniques used by the Board for setting gas distribution rates are cost of service regulation and incentive regulation.

[78] On its face, the words of s. 36(3) do not confer the jurisdiction to provide special rates for low income customers. The subsection replaced an earlier provision of the Act which required a traditional cost of service analysis in setting rates. I agree with the conclusion of the Board majority as to the meaning of s. 36(3) (Reasons, p. 10):

> It gives the Board the flexibility to employ other methods of ratemaking in fixing just and reasonable rates, such as incentive ratemaking, rather than the traditional costs of service regulation specified in section 19 of the old Act. The change in the legislation was coincident with the addition of the regulation of the electricity sector to the Board's mandate. The granting of the authority to use methods other than cost of service to set rates for the gas sector was an alignment with the non-prescriptive authority to set rates for the electricity sector. The Board is of the view that if the intent of the legislature by the new language was to include ratemaking considering income level as a rate class determinant, the new Act would have made this provision explicit given the opportunity

2008 CanLII 23487 (ON SCDC)

at the time of the update of the Act and the resultant departure from the Board's past practice.

The Regulatory Context

[79] According to longstanding principles governing public utilities developed under the common law, a public utility like the respondent Enbridge Gas Distribution Inc. ("Enbridge") must treat all its customers equally with respect to the rates they pay for a particular service (*Attorney General of Canada v. The Corporation of the City of Toronto* (1892), 23 S.C.R. 514 at 519-20; St. *Lawrence Rendering Co. Ltd. v. Cornwall*, [1951] O.R. 669 (H.C.J.) at 683; *Chastain v. British Columbia Hydro and Power Authority* (1972), 32 D.L.R. (3d) 443 (B.C.S.C.) at 454).

[80] As noted in the Board's majority reasons, the Board is, at its core, an economic regulator (Reasons, p. 4). Rate setting is at the core of its jurisdiction (*Garland v. Consumer's Gas Company* (2000), 185 D.L.R. (4th) 536 (Ont. S.C.J.) at para. 45). I agree with the majority's description of economic regulation as being "rooted in the achievement of economic efficiencies, the establishment of fair returns for natural monopolies and the development of appropriate cost allocation methodologies" (Reasons, p. 4).

[81] Historically, in setting rates, the Board has engaged in a balancing of the interests of the regulated utility and consumers. The Board has not historically balanced the interests of different groups of consumers. As the Divisional Court stated in *Union Gas Ltd. v. Ontario (Energy Board)* (1983), 43 O.R. (2d) 489 at p. 11 (Quicklaw):

> … it is the function of the O.E.B. to balance the interest of the appellant in earning the highest possible return on the operation of its enterprise (a monopoly) with the conflicting interest of its customers to be served as cheaply as possible.

See, as well, *Northwestern Utilities v. The City of Edmonton*, [1929] 1 S.C.R. 186 at 192.

[82] In a similar vein, the Supreme Court in *ATCO, supra* spoke of a "regulatory compact" which ensures that all customers have access to a utility at a fair price. The Court went on to state (at para. 63):

> Under the regulatory compact, the regulated utilities are given exclusive rights to sell their services within a specified area at rates that will provide companies the opportunity to earn a fair rate of return for all their investors. In return for this right of exclusivity, utilities assume a duty to adequately and reliably serve all customers of their defined territories, and are required to have their rates and certain operations regulated…

The Court described the object of the Act "to protect both the customer *and* the investor" (at para. 64).

2008 CanLII 23487 (ON SCDC)

[83] The Legislature, in conferring power on the Board, must be taken to have had regard to the principles generally applicable to rate regulation (*ATCO, supra* at paras. 50 and 64). I agree with the submission of Enbridge that those principles are the following:

> (a) customers of a public utility must be treated equally insofar as the rate for a particular service or class of services is concerned; and
>
> (b) the Legislature will be presumed not to have intended to authorize discrimination among customers of a public utility unless it has used specific words to express this intention.

[84] Thus, the considerations of justice and reasonableness in the setting of rates have been and are those between the utility and consumers as a group, not among different groups of consumers based on their ability to pay.

Other Provisions of the Act

[85] In applying s. 36(2), the Board must be bound by the objectives set out in s. 2 of the Act, which includes

> 2. To protect the interests of consumers with respect to prices and the reliability and quality of gas service.

[86] The appellants submit that these words are broad enough to permit the Board to order a rate affordability assistance program. However, that is not obvious from the words used, which refer to "consumers" as a whole, and not to any particular subset of consumers. Indeed, it can be argued that any low income rate affordability program would run counter to the stated objective, given that such a program must almost certainly be funded through higher rates paid by other consumers. The result would be to provide benefits to one group of consumers at the expense of others.

[87] The reason for this conclusion lies in the Board's historical approach to rate setting, as described earlier in these reasons. The Board sets a revenue requirement for utilities before allocating those costs to the different rate classes. The only way the utility could recover its revenue requirement, given a rate class with lower rates for low income consumers, would be to increase the rates charged to other classes. Therefore, such higher prices can not be seen as protecting the interests of consumers with respect to prices, as set out in objective 2.

[88] Moreover, the Act contains an explicit provision in s. 79 that allows the Board to provide rate protection for rural and remote customers of electricity distributors. Subsection 79(1) provides:

> The Board, in approving just and reasonable rates for a distributor who delivers electricity to rural or remote consumers, shall provide rate protection for those consumers

2008 CanLII 23487 (ON SCDC)

> or prescribed classes of those consumers by reducing the rates that would otherwise apply in accordance with the prescribed rules.

Section 79 also provides grandfathering for those who had a subsidy prior to the change in the Act. As well, it explicitly allows the distributor to be compensated for the subsidized rates through contributions from other consumers, as provided by the regulations.

[89] This section was added to the Act in 1998, when the Board was given the authority over electricity rate regulation. Section 79 ensured the ongoing protection of rural rates put in place when electricity distribution was regulated by Ontario Hydro.

[90] One of the principles of statutory interpretation is "implied exclusion". As Professor Sullivan has stated, this principle operates "whenever there is reason to believe that if the legislature had meant to include a particular thing within its legislation, it would have referred to that thing expressly" (*supra,* p. 186). While the purpose of s. 79 of the Act was to protect a pre-existing policy to assist rural and remote residential consumers, nevertheless, it is telling that there is no similar explicit power to order special rates or rate subsidies for other groups elsewhere in the Act.

The Significance of Ordering Rate Affordability Programs

[91] An appropriate interpretation can be justified in terms of its promotion of the legislative purpose and the reasonableness of the outcome (see Sullivan, quoted above at para. 5).

[92] The ability to order a rate affordability program would significantly change the role that the Board has played – indeed, the majority of the Board stated a number of times that the proposal to base rates on income level would be a "fundamental" departure from its current practice. In the past, the Board has acted as an economic regulator, balancing the interests of the utility and its shareholders against the interests of consumers as a group. Were it to assume jurisdiction over rate affordability programs, it would carry out an entirely different function. It would enter into the realm of social policy, weighing the interests of low income consumers against those of other consumers. This is not a role that the Board has traditionally played. This is not where its expertise lies, nor is it well-suited to taking on such a role.

[93] An examination of the particular case before the Board illustrates this. The appellants seek a rate affordability assistance program for gas in response to Enbridge's application for a rate increase for gas distribution – that is, for the *delivery* of natural gas. Customers can make arrangements for the purchase of the commodity of natural gas with a variety of suppliers in the competitive market. Therefore, were the Board to assume jurisdiction to order a rate affordability assistance program here, it could address only one part of the problem that low income consumers face in meeting their heating costs – the cost of distribution of gas.

[94] In addition, the Board would have to consider eligibility criteria for a rate affordability assistance program that reasonably would take into account existing programs for assistance to

2008 CanLII 23487 (ON SCDC)

low income consumers. Obviously, this would include social assistance programs. As well, Enbridge, in its factum, has identified other programs which provide assistance for low income consumers. For example, the Ontario government has implemented a program to assist low income customers with rising electricity costs through amendments to income tax legislation (*Income Tax Act*, R.S.O. 1990, c. I.2, s. 8.6.1, as amended S.O. 2006, c.18, c.1). At the federal level, there was one-time relief for low income families and senior citizens provided by the *Energy Costs Assistance Measures Act*, S.C. 2005, c. 49.

[95] Moreover, in order to cover the lower costs, the Board would have to increase the rates of other customers in a manner that would inevitably be regressive in nature, as it is difficult to conceive how the Board would be able to determine, in a systematic way, the ability of these other customers to pay.

[96] Clearly, the determination of the need for a subsidy for low income consumers is better made by the Legislature. That body has the ability to consider the full range of existing programs, as well as a wide range of funding options, while the Board is necessarily limited to allocating the cost to other consumers. The relative advantages of a legislative body in establishing social programs of the kind proposed are well described in the following excerpt from a decision of the Oregon Public Utility Commissioner (*Re Rate Concessions to Poor Persons and Senior Citizens* (1976), 14 PUR 4th 87 at p. 94):

> Utility bills are not poor persons' only problems. They also cannot afford adequate shelter, transportation, clothing or food. The legislative assembly is the only agency which can provide comprehensive assistance, and can fund such assistance from the general tax funds. It has the information and responsibility to deal with such matters, and can do so from an overall perspective. It can determine the needs of various groups and compare those needs to existing social programs. If it determines a special program is needed to deal with energy costs, it can affect all energy sources rather than only those the commissioner regulates.
>
> With clear authority to establish social welfare policy, the legislative assembly also can monitor all state and federal welfare programs and the sources and extent of aid given to different groups. Without such overview, as independent agencies aid various segments of society, the total aid given each group is unknown, and unequal treatment of different groups becomes likely.

[97] Where the issue of rate affordability programs has arisen in other jurisdictions, courts and boards have ruled that a public utilities board does not have jurisdiction to set rates based on ability to pay (see, for example, *Washington Gas Light Co. v. Public Service Commission of the District of Columbia* (1982), 450 A. 2d 1187 (D.C. Ct. App.) at para. 38; *Dalhousie Legal Aid Service v. Nova Scotia Power Inc.* (2006), 268 D.L.R. (4th) 408 (N.S.C.A.) at 419; Alberta Energy and Utilities Board Decision 2004-066, Section 9.2.6 at 161, as well as the Oregon case, *supra*).

2008 CanLII 23487 (ON SCDC)

[98] The appellants distinguish the *Dalhousie Legal Aid* case because the Nova Scotia legislation is different from Ontario's. Specifically, s. 67(1) of the *Public Utilities Act*, R.S.N.S. 1989, c. 380 provides that "[a]ll tolls, rates and charges shall always, under substantially similar circumstances and conditions in respect of service of the same description, be charged equally to all persons and at the same rate".

[99] While the language of the two statutes does differ, nevertheless, the reasons of the Nova Scotia Court of Appeal make it clear that the Board's role is not to set social policy. At para. 33, Fichaud J.A, observed, "The Board's regulatory power is a proxy for competition, not an instrument of social policy."

[100] Moreover, the principle in s. 67(1) of the Nova Scotia Act requiring that rates be charged equally is a codification of the common law, set out earlier in these reasons. The Ontario Board has long operated according to the same principles.

[101] The appellants submit that the recent decision in *Allstream Corp. v. Bell Canada*, [2005] F.C.J. No. 1237 (C.A.) assists their case. There, the Federal Court of Appeal upheld a decision of the Canadian Radio-Television and Telecommunications Commission (the "CRTC") approving special facilities tariffs submitted by Bell for the provision of optical fibre services pursuant to certain customer-specific arrangements. All but one related to a Quebec government initiative aimed at supporting the construction of broadband networks for rural municipalities, school boards and other institutions. The Court determined that the Commission's decision approving the tariffs was not patently unreasonable, given the exceptional circumstances of the case that justified a deviation from the normal practice of rate determination. The Court noted that the Commission considered matters that were not purely economic, but noted that such considerations were part of the Commission's wide mandate under s. 7 of the *Telecommunications Act,* S.C. 1993, c. 38 (at paras. 34-35).

[102] Section 7 of that Act, unlike s. 2 of the *Ontario Energy Board Act,* expressly includes the power "to respond to the economic and social requirements of users of telecommunications services" (s. 7(h)), as well as to enrich and strengthen the social and economic fabric of Canada and its regions (s. 7(a)). Moreover, while s. 27(2)(b) of that Act forbids unjust discrimination in rates charged, s. 27(6) explicitly permits reduced rates, with the approval of the Commission, for any charitable organization or disadvantaged person.

[103] In contrast to the broad mandate given to the CRTC, the objectives of the Board are much more confined. When the Board's objectives go beyond the economic realm, specific reference has been made to other objectives, such as conservation and consumer education (s. 2 (5) and (6)). There is no reference to the consideration of economic and social requirements of consumers.

[104] The appellants have also pointed out that the Board has in the past authorized programs that transfer benefits to lower income customers. The Winter Warmth program is one in which individuals can apply for emergency financial relief with heating bills. It is triggered by an

2008 CanLII 23487 (ON SCDC)

application from a particular customer, and the program is funded by all customers. The fact that the Board has approved this charitable program does not lead to the conclusion that it has jurisdiction to set rates on the basis of income level.

[105] With respect to the Demand Side Management (DSM) programs, the majority of the Board explained that this is not equivalent to a rate class based on income level. At p. 11 of its Reasons, the majority stated,

> The Board is vigilant in ensuring that customer groups are afforded the opportunity to receive the benefits of the costs charged. In the case of Demand Side Management (DSM) programs, for example, the Board has ordered that specific funding be channeled for programs aimed at low income customers. It cannot be argued that this constitutes discriminatory pricing. Rather, the contrary. It is an attempt to avoid discrimination against low income customers who also pay for DSM programs but may not have equal opportunities to take advantage of these programs.

[106] Were the Board to assume jurisdiction to order a rate affordability assistance program, it would be taking on a significant new role as a regulator of social policy. Given the dramatic change in the role that it has historically played, as well as the departure from common law principles, it would require express language from the Legislature to confer such jurisdiction

Jurisdiction by Necessary Implication

[107] In order to impute jurisdiction to a regulatory body, there must be evidence that the exercise of the power in question is a practical necessity for the regulatory body to accomplish the goals prescribed by the Legislature (*ATCO, supra* at paras. 51, 77). In this case, there is no evidence that the power to implement a rate affordability assistance program is a practical necessity for the Board to meet its objectives as set out in s. 2.

The Role of the Charter

[108] The appellants submit that the values found in s. 15 of the *Canadian Charter of Rights and Freedoms* should be considered in the interpretation of the ratemaking provisions of the Act. However, the Charter has no relevance in interpretation unless there is genuine ambiguity in the statutory provision (*R. v. Rodgers*, [2006] 1 S.C.R. 554 at paras. 18-19). A genuine ambiguity is one in which there are "two or more plausible readings, each equally in accordance with the intentions of the statute" (at para. 18).

[109] In my view, there is no ambiguity in the interpretation of s. 36 of the Act, and therefore, there is no need to resort to the Charter.

[110] In any event, the appellants' argument is, in fact, that the failure of the Board to order a rate affordability program is discriminatory on the basis of sex, race, age, disability and social assistance, because of the adverse impact on these groups (Factum, para. 43, as well as para. 47).

2008 CanLII 23487 (ON SCDC)

Such an argument can not be made without a full evidentiary record, and the inclusion of statistical material in the Appeal Book is not a sufficient basis on which to address this equality argument.

2008 CanLII 23487 (ON SCDC)

Conclusion

[111] For these reasons, I am of the view that the majority decision of the Board was correct, and that the Board has no jurisdiction to order rate affordability assistance programs for low income consumers. Therefore, I would dismiss the appeal.

APPEAL by intervenor from board's decision to decline to consider proposal.

***Fichaud J.A.*:**

1 Nova Scotia Power applied to the Utility and Review Board for a rate increase. Dalhousie Legal Aid intervened and requested that the Board approve a program featuring power rate credits for low income customers. The Board declined. The Board was of the view that the legislation did not authorize the Board to reduce power rates based on the income level of the customer. Dalhousie Legal Aid appeals. The issue is whether the Board committed reviewable error by concluding that it had no statutory authority to adopt a rate assistance program for low income customers.

Background

2 Nova Scotia Power Incorporated ("NSP") produces and supplies electrical energy. As of December 31, 2003, NSP served approximately 460,000 customers throughout Nova Scotia. NSP is the successor to the Nova Scotia Power Corporation, a Crown corporation that was privatized in 1992. In January 1999, NSP became the principal subsidiary of what is now Emera Incorporated.

3 NSP is a public utility regulated under the *Public Utilities Act* RSNS 1989, c. 380, as amended. Section 64(1) reads:

 Copyright © Thomson Reuters Canada Limited or its licensors (excluding individual court documents). All rights reserved.

> 64 (1) No public utility shall charge, demand, collect or receive any compensation for any service performed by it until such public utility has first submitted for the approval of the Board a schedule of rates, tolls and charges and has obtained the approval of the Board thereof.

The "Board" is the Nova Scotia Utility and Review Board, created by the *Utility and Review Board Act* SNS 1992, c. 11, as amended ("*URB Act*").

4 In May 2004 NSP filed with the Board an application for approval of increased rates, followed by a revised application in June 2004. The application would have resulted in an average overall increase of 12.4% for all classes of customer.

5 The Board gave notice by advertisement as provided in s. 86 of the *Public Utilities Act*. Thirty-seven intervenors responded. One intervenor was the appellant Dalhouse Legal Aid Service ("DLA").

6 The Board conducted a public hearing over 16 days between November 16, 2004 and January 14, 2005. On March 31, 2005 the Board issued a decision (2005 NSUARB 27). The decision dealt with NSP's requested rate increase and related topics. Only one topic is relevant to this appeal. That is DLA's request that the Board approve a Rate Assistance Program for low income consumers of power.

7 The Board's decision summarized DLA's submission:

> **9.1 Rate Assistance Program (RAP)**
>
> [246] While DLAS has opposed the approval of a FAM [Fuel Adjustment Mechanism] and the SA [Settlement Agreement], and has detailed concerns regarding aspects of customer service provided by NSPI, its main focus at the hearing was the implementation of a proposed Rate Assistance Program ("RAP") to help low-income customers meet their electricity costs.
>
> [247] DLAS filed evidence from several individuals, including Dr. Richard Shillington, a principal of Tristat Resources and Roger Colton, a principal of Fisher, Sheehan & Colton, with respect to this issue. Dr. Shillington, in his direct evidence (Exhibit N-126), outlined the challenging costs of shelter and electricity for low-income Canadians. Mr. Colton's evidence focused on low-income energy assistance programs and his efforts, in a number of US states, in designing rate affordability programs. Mr. Colton's position is that NSPI should "... be directed toward allowing low-income consumers to obtain quality utility service at affordable prices within a reasonable budget constraint." Mr. Colton also submits that the costs of such a program, to be shared by customers, are offset, although perhaps not fully, by savings realized by the Utility resulting from the adoption of a 'universal service program'.

Mr. Colton's report summarized his fixed credit proposal:

> Although a variety of percentage-of-income based approaches exists, I recommend the delivery of rate affordability assistance using a fixed credit approach. The fixed credit approach begins as an income-based approach. In order to be eligible for the rate, a household must meet *both* eligibility criteria: (1) that the household income is at or below the Low-Income Cutoff (LICO) for Nova Scotia; and (2) that the household electric burden exceeds the burden deemed to be affordable.
>
> The fixed credit approach differs from a straight percentage of income approach in the calculation of the bill to the household. The fixed credit calculates what bill credit would need to be provided to the household in order to reduce the household's energy bill to a designated percent of income. To calculate the fixed credit involves three steps: (1) calculating a burden-based payment; (2) calculating an annual bill; and (3) calculating the fixed credit necessary to reduce the annual bill to the burden based payment. Each step is explained below.

 Copyright © Thomson Reuters Canada Limited or its licensors (excluding individual court documents). All rights reserved.

> 1. The first step in the fixed credit model is to calculate a burden-based payment. Assume that the household has an annual income of $8,000 and is required to pay three percent (3%) for its home energy bill. The required household payment is thus $240. This is simply $8,000 × 3% = $240.
>
> Distinctions are also made between heating and non-heating customers. A heating customer should be asked to pay six percent (6%) of the household's income toward her home heating bill, while a non-heating customer would be asked to pay three percent (3%) toward his or her electric bill.
>
> 2. The next step is to calculate a projected annual household energy bill. This calculation is to be made using whatever method NSPI *currently* uses to estimate annual bills for other purposes. NSPI, in other words, has an established procedure for estimating an annual bill for purposes of placing residential customers (low-income or not) on a levelized Budget Billing Plan (where bills are paid in equal installments over 12 months). Let me assume for purposes of illustration that this existing process results in an estimated annual bill of $960.
>
> 3. The final step is to calculate the necessary fixed credit to bring the annual bill down to the burden-based payment. Given an annual bill projection of $960 and a burden-based payment of $240, the annual fixed credit would need to be $720 ($960-$240 = $720). The household's *monthly* fixed credit would be $60 ($720 / 12 = $60).

8 The Board, in response to DLA's request, cited s. 67(1) of the *Public Utilities Act*:

> 67 (1) All tolls, rates and charges shall always, under substantially similar circumstances and conditions in respect of service of the same description, be charged equally to all persons and at the same rate, and the Board may by regulation declare what shall constitute substantially similar circumstances and conditions.

The Board accepted that "all customers, regardless of income, receive 'substantially similar' electrical service from NSP". The Board concluded that it had no power to consider DLA's proposed Rate Assistance Program:

> [256] After reviewing the submissions of DLAS, Board Counsel and the relevant provisions of the **Act**, the Board finds that it does not have the statutory authority to approve a RAP. The Board has the authority given to it by the Legislature to perform its duties in accordance with the provisions of the **Act**. The Board's role is to make decisions, based on fact and law, within the parameters of the statutory authority it has been given by the Legislature. The Board's duty is to follow public policy decisions made by the Legislature and expressed in statutes. The Board does not have jurisdiction to establish public policy. That is the role of elected officials who are accountable to the public for this function. It seems almost certain that the RAP, as described by Mr. Colton, would result in the electricity bills of certain customers, depending on their income, being subsidized by other customers. In the Board's view, this is a social and public policy question which falls within the purview of the Legislature rather than the Board. Should NSPI and DLAS wish to pursue this matter with Government, the Board would be pleased to offer assistance with respect to regulatory and ratemaking principles.

9 DLA appeals under s. 30(1) of the *URB Act*, permitting an appeal based on an error of law or jurisdiction.

Issue

10 The issue is whether the Board committed an appealable error by declining to consider the merits of DLA's proposed Rate Assistance Program for low income electricity customers.

Standard of Review

11 Under the pragmatic and functional approach, the court analyses the cumulative effect of four contextual factors: the presence, absence or wording of a privative clause or statutory appeal; the comparative expertise of the tribunal and the court on the appealed or reviewed issues; the purpose of the governing legislation; and the nature of the question, fact, law or mixed. The ultimate question is whether the legislature intended that the issue under review be left to

 Copyright © Thomson Reuters Canada Limited or its licensors (excluding individual court documents). All rights reserved.

the tribunal. From this analysis the court selects, for each issue, a standard of review of correctness, reasonableness or patent unreasonableness: *Pushpanathan v. Canada (Minister of Employment & Immigration)*, [1998] 1 S.C.R. 982 (S.C.C.), at ¶ 26; *Q. v. College of Physicians & Surgeons (British Columbia)*, [2003] 1 S.C.R. 226 (S.C.C.), at ¶ 26-35; *Ryan v. Law Society (New Brunswick)*, [2003] 1 S.C.R. 247 (S.C.C.), at ¶ 27; *Voice Construction Ltd. v. Construction & General Workers' Union, Local 92*, [2004] 1 S.C.R. 609 (S.C.C.) at ¶ 15-19; *Baker v. Canada (Minister of Citizenship & Immigration)*, [1999] 2 S.C.R. 817 (S.C.C.), at ¶ 55-62; *Granite Environmental Inc. v. Nova Scotia (Labour Relations Board)*, 2005 NSCA 141 (N.S. C.A.) , at ¶ 21; *N.S.T.U. v. Nova Scotia Community College*, 2006 NSCA 22 (N.S. C.A.) , at ¶ 11; *Capital District Health Authority v. N.S.G.E.U.*, 2006 NSCA 44 (N.S. C.A.) , at ¶ 36.

12 In *Johnson v. Nova Scotia*, 2005 NSCA 99 (N.S. C.A.) , at ¶ 33-46, Justice Oland applied the four contextual factors to the expropriation powers of the Utility and Review Board, and concluded:

> [46] After considering the four contextual factors of the functional and pragmatic approach, in my view the standard of review to be applied to questions of law, such as any entitlement for compensation for owner's time and for pension loss, the standard of review is correctness. For questions of mixed law and fact, such as matters related to compensation for market value and injurious affection, the standard is patent unreasonableness. For findings of fact, the standard is patent unreasonableness.

Though there is correspondence among the Board's different functions, the pragmatic and functional analysis for expropriation is not necessarily commutable to rate-making. So I will consider the four contextual factors from the perspective of utility rating.

13 Section 26 of the *URB Act* says that the Board's findings of fact are "binding and conclusive", while s. 30(1) prescribes an appeal to this court on questions of law or jurisdiction. The Legislature contemplated a serious judicial role in the review for legal error, particularly on threshold issues.

14 Section 44 of the *Public Utilities Act* entitles the Board to fix rates "as it deems just". Section 67(1) quoted earlier directs equal charges for "similar circumstances and conditions" of service and authorizes the Board to enact regulations that define "substantially similar circumstances and conditions". The Board has a standing membership, repeatedly has examined NSP rate applications and has developed a body of governing jurisprudence. Clearly, the Board has more expertise than the court in the architecture of rate-making.

15 In *Nova Scotia (Public Utilities Board) v. Nova Scotia Power Corp.* (1976), 18 N.S.R. (2d) 692 (N.S. C.A.), at ¶ 17, Chief Justice MacKeigan summarized the purposes of the *Public Utilities Act*:

> 17 The scheme of regulation established by the Act envisages and indeed compels control by the Board of all aspects of a utility's operation in providing a controlled service. Two great objects are enshrined — that all rates charged must be just, reasonable and sufficient and not discriminatory or preferential, and that the service must be adequately, efficiently and reasonably supplied to the public. Almost all provisions of the Act are directed toward securing these two objects — that a public utility give adequate service and charge only reasonable and just rates.

The legislation considered by Chief Justice MacKeigan included ss. 42 and 63(1), the equivalents to the current ss. 44 and 67(1) that are central to this appeal (see *NS (PUB)* at ¶ 15, 28).

16 DLA says its argument is "jurisdictional" and therefore the standard of review must be correctness. It may be that, after the court reviews the four contextual factors, true jurisdictional issues usually will attract the correctness standard. But I disagree that every labelled "jurisdictional" argument is tethered to correctness, and I reiterate this court's comment in *Capital District Health Authority v. N.S.G.E.U.* :

> [28] . . . The court no longer reviews for pigeonholed "jurisdictional errors." The phrase "goes to jurisdiction" describes a type of issue for which the proper standard of review is correctness, after the reviewing court has performed the pragmatic and functional analysis. But the "jurisdictional" inquiry is not a substitute for the pragmatic

 Copyright © Thomson Reuters Canada Limited or its licensors (excluding individual court documents). All rights reserved.

> and functional approach. [Citing *Pushpanathan* at ¶ 28; *Dr.* Q. at ¶ 20-25; *Voice* at ¶ 21; *Granite* at ¶ 41(b) and *ATCO Gas & Pipelines Ltd. v. Alberta (Energy & Utilities Board)*, 2006 SCC 4 (S.C.C.) at ¶ 21-32.]

17 A similar issue arose in *ATCO Gas & Pipelines Ltd. v. Alberta (Energy & Utilities Board)*, 2006 SCC 4 (S.C.C.) . A public utility applied to Alberta's Energy and Utilities Board for approval of a sale of assets and allocation of the sale proceeds. The Board allocated a portion of the proceeds of sale to the rate-paying customers. On appeal from the judicial review, the Supreme Court of Canada considered whether the Board had statutory authority to allocate any sale proceeds to the ratepayers. Despite the "jurisdictional" aspect of the issue, Justice Bastarache for the majority said that the pragmatic and functional analysis was necessary:

> 23 In the case at bar, one should avoid a hasty characterizing of the issue as "jurisdictional" and subsequently be tempted to skip the pragmatic and functional analysis. A complete examination of the factors is required.

In *ATCO*, a threshold issue of statutory interpretation determined whether the Board could exercise its core functions. Justice Bastarache selected a correctness standard, having reasoned as follows:

> 30 While at first blush the purposes of the relevant statutes and of the Board can be conceived as a delicate balancing between different constituencies, i.e., the utility and the customer, and therefore entail determinations which are polycentric (*Pushpanathan*, at para. 36), the interpretation of the enabling statutes and the particular provisions under review (s. 26(2)(d) GUA and s. 15(3)(d) AEUBA) is not a polycentric question, contrary to the conclusion of the Court of Appeal. It is an inquiry into whether a proper construction of the enabling statutes gives the Board jurisdiction to allocate the profits realized from the sale of an asset. The Board was not created with the main purpose of interpreting the AEUBA, the GUA or the PUBA in the abstract, where no policy consideration is at issue, but rather to ensure that utility rates are always just and reasonable (see *Atco Ltd.*, at p. 576). In the case at bar, this protective role does not come into play. Hence, this factor points to a less deferential standard of review.
>
> 31 Fourth, the nature of the problem underlying each issue is different. The parties are in essence asking the Court to answer two questions (as I have set out above), the first of which is to determine whether the power to dispose of the proceeds of sale falls within the Board's statutory mandate. The Board, in its decision, determined that it had the power to allocate a portion of the proceeds of a sale of utility assets to the ratepayers; it based its decision on its statutory powers, the equitable principles rooted in the "regulatory compact" (see para. 63 of these reasons) and previous practice. This question is undoubtedly one of law and jurisdiction. The Board would arguably have no greater expertise with regard to this issue than the courts. A court is called upon to interpret provisions that have no technical aspect, in contrast with the provision disputed in *Barrie Public Utilities v. Canadian Cable Television Assn.*, [2003] 1 S.C.R. 476, 2003 SCC 28, at para. 86. The interpretation of general concepts such as "public interest" and "conditions" (as found in s. 15(3)(d) of the AEUBA) is not foreign to courts and is not derived from an area where the tribunal has been held to have greater expertise than the courts. ...
>
> 32 In light of the four factors, I conclude that each question requires a distinct standard of review. To determine the Board's power to allocate proceeds from a sale of utility assets suggests a standard of review of correctness. As expressed by the Court of Appeal, the focus of this inquiry remains on the particular provisions being invoked and interpreted by the tribunal (s. 26(2)(d) of the GUA and s. 15(3)(d) of the AEUBA) and "goes to jurisdiction" (*Pushpanathan*, at para. 28). Moreover, keeping in mind all the factors discussed, the generality of the proposition will be an additional factor in favour of the imposition of a correctness standard, as I stated in *Pushpanathan*, at para. 38:
>
> > ... the broader the propositions asserted, and the further the implications of such decisions stray from the core expertise of the tribunal, the less likelihood that deference will be shown. Without an implied or express legislative intent to the contrary as manifested in the criteria above, legislatures should be assumed to have left highly generalized propositions of law to courts.

 Copyright © Thomson Reuters Canada Limited or its licensors (excluding individual court documents). All rights reserved.

18 The Board's rate-making power is a core function entitled to deference. But the issue here is whether the statute precludes the Board from exercising that power. After considering the four contextual factors, and given the statutory right of appeal and the comments in *ATCO*, in my view the Legislature intended no deference on that issue. The threshold legal question is governed by a correctness standard.

Did the Board Err in Law by Declining to Consider the Rate Assistance Program?

19 This is a question of statutory interpretation. The words of a statute are read in their entire context and in their grammatical and ordinary sense, harmoniously with the scheme of the *Act*, the object of the *Act* and the intention of the Legislature: *Parry Sound (District) Welfare Administration Board v. O.P.S.E.U., Local 324*, 2003 SCC 42 (S.C.C.) , at ¶ 41; *R. v. Sharpe*, [2001] 1 S.C.R. 45 (S.C.C.) at ¶ 33; *Nova Scotia (Minister of Health) v. G. (R.)*, 2005 NSCA 59 (N.S. C.A.) , at ¶ 24; *Doctors Nova Scotia v. Nova Scotia (Department of Health)*, 2006 NSCA 59 (N.S. C.A.) , at ¶ 25.

20 DLA focusses on the grammatical and ordinary meaning of the Board's general rate-making power in s. 44 of the *Public Utilities Act*:

> 44 The Board may make from time to time such orders as it deems just in respect to the tolls, rates and charges to be paid to any public utility for services rendered or facilities provided, and amend or rescind such orders or make new orders in substitution therefor.

DLA submits that the Board is mandated to consider whether a rate assistance program for low income customers is "just".

21 The court must also grapple with the basis of the Board's ruling, s. 67(1):

> 67 (1) All tolls, rates and charges shall always, under substantially similar circumstances and conditions in respect of service of the same description, be charged equally to all persons and at the same rate, and the Board may by regulation declare what shall constitute substantially similar circumstances and conditions.

DLA says that its Rate Assistance Program would provide a credit against the rate, but would not alter the rate itself. DLA says that s. 67(1) refers to pure "rates", not credits, and is irrelevant to DLA's Program.

22 In my respectful view, DLA's rate/credit distinction is artificial and analytically flawed. A gross rate subject to an automatic credit is just a net rate charged to the customer by NSP. The "charge" under s. 67(1) is the net amount. The Board's "rate" making power is not a blind stab at gross revenue. The rating involves a projection of NSP's expenses, net income and rate of return. The Board must consider the effect of a credit against rates just as it must consider NSP's expenses to generate power. DLA cites s. 44 of the *Public Utilities Act* as authority for its Rate Assistance Program, including the credit. Yet, s. 44, quoted earlier, empowers the Board to approve "tolls, rates and charges", saying nothing of "credits". Rate credits are integrated with "rates and charges" in s. 67(1) no less than rate credits pertain to the Board's "rating" power in s. 44, upon which DLA relies.

23 DLA's factum said that low income customers do not have "substantially similar circumstances" to higher income customers. So, different rates would not be barred by s. 67(1). At the appeal hearing DLA's counsel retreated somewhat from this submission.

24 With respect, the factum's submission misinterprets s. 67(1). The provision refers to "substantially similar circumstances and conditions *in respect of service of the same description*." To justify a rate difference, the relevant dissimilarity is not in customers' incomes. It is in the service from NSP. The Board accepted, and there is no basis to question, that NSP provides substantially similar electrical service whatever the domestic customer's income.

 Copyright © Thomson Reuters Canada Limited or its licensors (excluding individual court documents). All rights reserved.

25 Section 67(1) is mandatory. The rates and charges "shall always . . . be charged equally" to persons of similar circumstances and conditions in respect of service. The statute does not endow the Board with discretion to consider the social justice of reduced rates for low income customers. It is not for the Board or this court to read into s. 67(1) the words:

> . . . similar circumstances and conditions in respect of ***the income level of customers and*** service of the same description,

It is for the Legislature to decide whether to expand the Board's purview with the italicized words.

26 This point is illustrated by *Allstream Corp. v. Bell Canada*, 2005 FCA 247 (F.C.A.) , cited by DLA. The Federal Court of Appeal upheld the decision of the CRTC to provide low rates to schools and municipalities for fibre optic service. DLA's factum says:

> This case stands for the proposition that the jurisdiction to regulate utilities ***includes*** non cost-based rates and by analogy would include programs similar to a rate assistance program for low income consumers. [emphasis in original]

27 I disagree with DLA's measure of *Allstream*'s reach. The Federal Court of Appeal said:

> 34. ... It is apparent that the Commission was greatly concerned about the effect of a denial of services on the communities concerned and the dislocation of complex equipment and facility configurations at a significant cost and to the detriment of school boards and municipalities in the relevant areas and that such concerns outweighed, in its view, Bell's failure to seek prior approval of these rates. These are considerations that a specialized board can entertain and weigh relative to other considerations. It is true that these considerations are not purely economic in the sense referred to by the appellant such as costs, investment, allowance for necessary working capital, rate of return, etc. These considerations, however, are ***part of the Commission's wide mandate under section 7***, a mandate it alone possesses and are quite distinct from the grant of a rate under paragraph 27(6)(b) of the Act, a power the Commission did not invoke. [emphasis added]

Section 47(a) of the *Telecommunications Act*, S.C. 1993, c. 38 directed the CRTC to implement the telecommunications policy objectives from s. 7. Those included enriching the "social and economic fabric", rendering "affordable" and "accessible" service, and responding to "the economic and social requirements of users." [legislation quoted in ¶ 10 of *Allstream*]. Nova Scotia's Utility and Review Board has no such statutory mandate.

28 The grammatical and ordinary interpretation of s. 67(1), outlined above, is consistent with the statutory context, scheme and object of the *Act*, and intention of the Legislature.

29 The *Act* connects the Board's rate-making to NSP's "service". Section 2(f) of the *Public Utilities Act* defines "service" as including:

> (iii) the production, transmission, delivery or furnishing to or for the public by a public utility for compensation of electrical energy for purposes of heat, light and power,

Section 44 authorizes the Board to make rates "for services rendered or facilities provided". Section 52 requires the public utility to "furnish services and facilities that are adequate, just and reasonable". Section 64(1) prohibits the utility from charging compensation for any "service" until the Board has approved the rate for that service. Section 107, entitled "offence and penalty for unjust discrimination", prohibits the utility from charging "for any service" a rate that is higher or lower than charged to any other person "for a like and contemporaneous service".

30 Section 73 of the *Public Utilities Act* allows preferential rates for

> (3) . . . a senior citizens club, service club, volunteer fire department, a Royal Canadian Legion, community hall or recreational facility owned by a community and used for general community purposes, a charitable or religious organization or institution . . .

and authorizes the Lieutenant Governor-in-Council to extend this list by order-in-council.

31 The legislative context ties the Board's rate levels to the utility's services. The Legislature enacts, or assigns to order-in-council, non-compliant rates for specific classes of customer based on social criteria.

32 The Board sets rates for a utility that has a virtual monopoly on the supply of electric power. The Board's decision discusses this process: (2005 NSUARB 27)

> [17] . . . NSPI is not like an unregulated retailer. It is a virtual monopoly which operates its business on a cost-of-service basis. Providing electricity to all communities in the Province was not (and likely still is not) financially feasible for private, competitive companies. For that reason, the Province's electric service supplier is a cost-of-service monopoly. In return for undertaking and continuing the costs of electrification of the Province, the utility is permitted, under the *Act*, to recover the reasonable and prudent costs of providing the service. Because it is a monopoly, regulation operates as a surrogate for competition. One of the regulator's tasks is to balance the need for the Utility to recover its reasonable and prudent costs with the need to ensure that ratepayers are charged fair and reasonable rates.
>
> [18] It is in the interests of all Nova Scotians to ensure that NSPI continues to be a stable and financially sound company. This is a reality which the Board must consider when determining what, if any, rate increase is warranted.
>
> [19] In short, rates charged to customers are based on costs incurred by the Utility in providing service. If the Board finds certain costs to be imprudent or unreasonable, it can (and has) disallowed such expenditures and reduced proposed rate increases accordingly.

33 I agree with this portrayal of the background to the Board's rate-making function. The Board's regulatory power is a proxy for competition, not an instrument of social policy.

34 DLA points to the Board's approval of rates that prefer large industrial power customers. In *Nova Scotia Power Inc., Re*, [2000] N.S.U.R.B.D. No. 72 (N.S. Utility & Review Bd.), the Board approved NSP' s application for a load retention rate. This rate would be determined between the individual customer and NSP, then submitted to the Board for approval. Paragraph 5 of the Board's decision describes the features of NSP's proposed load retention rate:

> 5 NSPI states in its application that "the proposed rate is an appropriate approach to retaining existing customers who, in the absence of this rate, would reduce their purchases from the Company, to the detriment of all other customers". The rate would be available to customers "who are considering an alternate supply of at least 2000 KVA or 1800 KW". It would not be available for new load. The rate would only be available if the following conditions are satisfied:
>
> > 1. The customer's option to use a supply of power and energy (alternate supply) other than NSPI's is both technically and economically feasible.
> >
> > 2. Retaining the customer's load, at the price offered by this rate, is better for other electric customers than losing the customer load in question.
> >
> > 3. The price offered by this rate is not less than that necessary to make the customer in question indifferent with respect to alternate supply versus continuing to purchase the electric power and energy from NSPI.

 Copyright © Thomson Reuters Canada Limited or its licensors (excluding individual court documents). All rights reserved.

DLA says that, if the Board can approve a load retention rate for large industrial customers, then it can approve a rate assistance program for low income customers.

35 The Board's decision in [2000] N.S.U.R.B.D. No. 72 (N.S. Utility & Review Bd.) is not under appeal. Neither are its decisions on similar issues such as the extra large industrial interruptible rate: *Nova Scotia Power Inc., Re*, 2003 NSUARB 6 (N.S. Utility & Review Bd.) and *Nova Scotia Power Inc., Re*, 2003 NSUARB 91 (N.S. Utility & Review Bd.) . I make no comment on those rulings, except to say that they do not support DLA's submission here that the Board can implement social policy. The Board's approval of the load retention rate was premised on the finding that, otherwise, the large customer could leave NSP, obtain its energy from another source, and this would hike NSP's rates to its remaining customers. The Board's approach affirms the Board's role as a competition surrogate. The Board's load retention rate recognizes the microeconomic reality that NSP is not an absolute energy monopoly with a vertical customer demand curve, and is subject to elastic demand from high volume customers with other energy options. No such factors govern DLA's proposed Rate Assistance Program.

36 DLA says that legislation should be interpreted in a manner that is consistent with the *Charter of Rights and Freedoms*. DLA's counsel makes a forceful submission that the impoverished are a protected category under s. 15 and, following *Eldridge v. British Columbia (Attorney General)*, [1997] 3 S.C.R. 624 (S.C.C.), this court may direct the institution of a program to ameliorate their disadvantage. DLA's submission is interpretive and does not challenge the validity of the legislation.

37 I make no comment on s. 15. The statutory language does not accommodate the suggested construction.

38 The constructive principle applies only when the statute is ambiguous. In *R. v. Jackpine*, 2006 SCC 15 (S.C.C.) , at ¶ 18, Justice Charron for the majority said:

> It has long been accepted that courts should apply and develop common law rules in accordance with the values and principles enshrined in the *Charter*: *RWDSU v. Dolphin Delivery Ltd.*, [1986] 2 S.C.R. 573, at p. 603; *Cloutier v. Langlois*, [1990] 1 S.C.R. 158, at p. 184; *R. v. Salituro*, [1991] 3 S.C.R. 654, at p. 675; *R. v. Golden*, [2001] 3 S.C.R. 679, 2001 SCC 83, at para. 86; *R. v. Mann*, [2004] 3 S.C.R. 59, 2004 SCC 52, at paras.17-19. However, it is equally well settled that, in the interpretation of a statute, *Charter* values as an interpretative tool can only play a role where there is a genuine ambiguity in the legislation. In other words, where the legislation permits two different, yet equally plausible, interpretations, each of which is equally consistent with the apparent purpose of the statute, it is appropriate to prefer the interpretation that accords with *Charter* principles. However, where a statute is not ambiguous, the court must give effect to the clearly expressed legislative intent and not use the *Charter* to achieve a different result. In *Bell ExpressVu Ltd. Partnership v. Rex*, [2002] 2 S.C.R. 559, 2002 SCC 42, at para. 62, Iaccobuci J., writing for a unanimous court, firmly reiterated this rule:
>
> > ... to the extent this Court has recognized a "*Charter* values" interpretive principle, such principle can only receive application in circumstances of genuine ambiguity, i.e., where a statutory provision is subject to differing, but equally plausible, interpretations. [Emphasis in original.]

To the same effect: *Bell ExpressVu Ltd. Partnership v. Rex*, [2002] 2 S.C.R. 559 (S.C.C.) at ¶ 27-30, 60-66.

39 Section 67(1) is not ambiguous: "rates . . . shall always . . . be charged equally to all persons and at the same rate" in substantially similar "circumstances and conditions in respect of service of the same description". The Board cannot reduce the rate to a low income customer who receives the same service as a high income customer. There is no latitude for the interpretive presumption.

Conclusion

 Copyright © Thomson Reuters Canada Limited or its licensors (excluding individual court documents). All rights reserved.

40 The Board did not err in its conclusion that s. 67(1) precludes the Board from considering DLA's rate assistance program for low income customers. I would dismiss the appeal without costs.

Appeal dismissed.

2017 BCCA 400 (CanLII)

Summary:

BCOAPO and MoveUp apply for leave to appeal two orders of the BC Utilities Commission. The orders were made in the context of a Rate Design Application submitted by BC Hydro, which proposed utility rates for classes of customers. BCOAPO and MoveUp had intervened in the application process, requesting the implementation of strategies to assist low-income ratepayers. In the first order, the Commission denied most of the low-income proposals on the basis that it lacked jurisdiction under the Utilities Commission Act to set low-income rates without an economic or cost of service justification. The second order denied a request for reconsideration.

Held: Applications for leave to appeal dismissed. In the circumstances of this case the decision of whether or not to grant leave comes down to a consideration of the merits. Assessing whether there is some prospect the appeal will succeed on its merits must be done in light of the standard of review on which the merits of the appeal would be judged. In this case, the Commission interpreted and applied provisions of its home statute and thus its decision would be reviewed on a standard of reasonableness. Given the standard of review, this appeal has no prospect of success.

2017 BCCA 400 (CanLII)

Reasons for Judgment of the Honourable Mr. Justice Goepel:

INTRODUCTION

[1] The applicants, British Columbia Old Age Pensioners' Organization, Active Support Against Poverty, Council of Senior Citizens' Organizations of BC, Disability Alliance BC, Together Against Poverty Society, and the Tenant Resource and Advisory Centre (collectively, "BCOAPO") and the Movement Of United Professionals ("MoveUp") seek leave under s. 101 of the *Utilities Commission Act*, R.S.B.C. 1996, c. 473 [*UCA*] to appeal the following orders of the British Columbia Utilities Commission:

1. Order G-5-17, pronounced on January 20, 2017 (the "Original Decision"); and

2. Order G-87-17, pronounced on June 2, 2017 (the "Reconsideration Decision").

[2] The orders were made in the context of a Rate Design Application submitted by BC Hydro, which proposed utility rates for classes of customers. BCOAPO and MoveUp had intervened in the application process, requesting the implementation of strategies to assist low-income ratepayers. In the first order, the Commission denied most of the low-income proposals on the basis that it lacked jurisdiction under the *UCA* to set low-income rates without an economic or cost of service justification. The second order denied a request for reconsideration

[3] The application for leave is opposed by the respondents, British Columbia Hydro and Power Authority ("BC Hydro") and FortisBC Energy Inc. and FortisBC Inc. (collectively, "Fortis"). BC Hydro and Fortis both submit that if leave is granted, it should be limited to the Reconsideration Decision.

[4] The Commission takes no position on the application for leave to appeal from the Reconsideration Decision. It does submit, however, that it is improper to grant leave to appeal the Original Decision because that decision has been the subject of reconsideration by the Commission and only the Commission's final decision should be subject to appellate review.

[5] For the reasons that follow, I would dismiss the applications for leave to appeal.

BACKGROUND

A. Legislative Scheme

[6] BC Hydro is the publicly owned monopoly electricity provider to the vast majority of the province. The Commission is empowered to regulate BC Hydro to ensure its quality of service, infrastructure, operations and rates are in the public interest. Pursuant to sections 23, 38, 59 and 60 of the *UCA*, the Commission is charged with ensuring that utilities provide safe, adequate, efficient and secure service to their customers and that the rates are fair, just and reasonable, and not unduly discriminatory or preferential. Those sections read as follows:

2017 BCCA 400 (CanLII)

General supervision of public utilities

23 (1) The commission has general supervision of all public utilities and may make orders about

(a) equipment,

(b) appliances,

(c) safety devices,

(d) extension of works or systems,

(e) filing of rate schedules,

(f) reporting, and

(g) other matters it considers necessary or advisable for

(i) the safety, convenience or service of the public, or

(ii) the proper carrying out of this Act or of a contract, charter or franchise involving use of public property or rights.

(2) Subject to this Act, the commission may make regulations requiring a public utility to conduct its operations in a way that does not unnecessarily interfere with, or cause unnecessary damage or inconvenience to, the public.

Public utility must provide service

38 A public utility must

(a) provide, and

(b) maintain its property and equipment in a condition to enable it to provide,

a service to the public that the commission considers is in all respects adequate, safe, efficient, just and reasonable.

Discrimination in rates

59 (1) A public utility must not make, demand or receive

(a) an unjust, unreasonable, unduly discriminatory or unduly preferential rate for a service provided by it in British Columbia, or

(b) a rate that otherwise contravenes this Act, the regulations, orders of the commission or any other law.

(2) A public utility must not

(a) as to rate or service, subject any person or locality, or a particular description of traffic, to an undue prejudice or disadvantage, or

(b) extend to any person a form of agreement, a rule or a facility or privilege, unless the agreement, rule, facility or privilege is regularly and uniformly extended to all persons under substantially similar circumstances and conditions for service of the same description.

(3) The commission may, by regulation, declare the circumstances and conditions that are substantially similar for the purpose of subsection (2) (b).

(4) It is a question of fact, of which the commission is the sole judge,

2017 BCCA 400 (CanLII)

(a) whether a rate is unjust or unreasonable,

(b) whether, in any case, there is undue discrimination, preference, prejudice or disadvantage in respect of a rate or service, or

(c) whether a service is offered or provided under substantially similar circumstances and conditions.

(5) In this section, a rate is "unjust" or "unreasonable" if the rate is

(a) more than a fair and reasonable charge for service of the nature and quality provided by the utility,

(b) insufficient to yield a fair and reasonable compensation for the service provided by the utility, or a fair and reasonable return on the appraised value of its property, or

(c) unjust and unreasonable for any other reason.

Setting of rates

60 (1) In setting a rate under this Act

(a) the commission must consider all matters that it considers proper and relevant affecting the rate,

(b) the commission must have due regard to the setting of a rate that

(i) is not unjust or unreasonable within the meaning of section 59,

(ii) provides to the public utility for which the rate is set a fair and reasonable return on any expenditure made by it to reduce energy demands, and

(iii) encourages public utilities to increase efficiency, reduce costs and enhance performance,

(b.1) the commission may use any mechanism, formula or other method of setting the rate that it considers advisable, and may order that the rate derived from such a mechanism, formula or other method is to remain in effect for a specified period, and

(c) if the public utility provides more than one class of service, the commission must

(i) segregate the various kinds of service into distinct classes of service,

(ii) in setting a rate to be charged for the particular service provided, consider each distinct class of service as a self contained unit, and

(iii) set a rate for each unit that it considers to be just and reasonable for that unit, without regard to the rates set for any other unit.

(2) In setting a rate under this Act, the commission may take into account a distinct or special area served by a public utility with a view to ensuring, so far as the commission considers it advisable, that the rate applicable in each area is adequate to yield a fair and reasonable return on the appraised value

2017 BCCA 400 (CanLII)

> of the plant or system of the public utility used, or prudently and reasonably acquired, for the purpose of providing the service in that special area.
>
> (3) If the commission takes a special area into account under subsection (2), it must have regard to the special considerations applicable to an area that is sparsely settled or has other distinctive characteristics.
>
> (4) For this section, the commission must exclude from the appraised value of the property of the public utility any franchise, licence, permit or concession obtained or held by the utility from a municipal or other public authority beyond the money, if any, paid to the municipality or public authority as consideration for that franchise, licence, permit or concession, together with necessary and reasonable expenses in procuring the franchise, licence, permit or concession.

2017 BCCA 400 (CanLII)

[7] Pursuant to s. 79 of the *UCA*, determinations of the Commission on questions of fact within its jurisdiction are binding and conclusive on all persons and all courts.

[8] Section 99 gives the Commission the power to reconsider a decision.

[9] Pursuant to s. 105(1) of the *UCA*, the Commission has exclusive jurisdiction in all cases and for all matters in which jurisdiction is confirmed on the Commission by statute. Section 105(2) provides that unless otherwise provided in the *UCA*, any order or decision of the Commission must not be questioned, reviewed or restrained by or on application for judicial review or other process or proceeding in any court.

[10] Section 101 of the *UCA* provides that an appeal lies from of an order or decision of the Commission to the Court of Appeal with leave of a justice of that court. Appeals from the Commission are restricted to questions of law or jurisdiction: *Plateau Pipe Line Ltd. v. British Columbia Utilities Commission*, 2002 BCCA 246 at paras. 8–9.

B. Procedural History

[11] The orders which are the subject matter of these leave applications were made in the context of a Rate Design Application ("RDA"). In an RDA the Commission is tasked with determining utilities rates for various classes of customers. The Commission hears evidence and submissions from the applicant utility and intervenor groups regarding the costs to serve each rate group, and the

proper rate structure to recover those costs from each rate group. The Commission then makes a determination regarding the costs of service, rate structures, and terms and conditions of service for residential, business, industrial and all other customers.

2017 BCCA 400 (CanLII)

[12] On September 24, 2015, BC Hydro filed an application with the Commission, known as the 2015 RDA. It was the first comprehensive rate design application since 2007. BCOAPO, Move Up and Fortis were amongst the groups granted intervenor status in the 2015 RDA.

[13] BCOAPO asked the Commission to order BC Hydro to implement a strategy to assist low-income ratepayers. More specifically, BCOAPO asked that the Commission direct BC Hydro to:

(a) implement an "essential services usage block" ("ESUB") rate, which would allow low-income customers to receive the first 400 kWh of service each month at a discount; and

(b) amend the BC Hydro electric tariff to exempt low-income customers from late payment, minimum reconnection and account charges and security deposits (collectively, the "Low-Income Proposals").

[14] The Low-Income Proposals were opposed by BC Hydro as well as two intervenor groups, including Fortis.

THE ORIGINAL DECISION

[15] On January 20, 2017, the Commission issued the Original Decision and accompanying reasons. The Commission denied the majority of the Low-Income Proposals. It found that the *UCA* did not provide the Commission with the jurisdiction to approve a low-income rate in the absence of an economic or a cost of service justification. It found as a fact that it did not cost BC Hydro less to serve low-income customers than it did to serve other residential customers. It further found that low-income rates unsupported by an economic or cost of service justification would be

unjust, unreasonable and unduly discriminatory and therefore not in accordance with s. 59 of the *UCA* — and accordingly not within the Commission's jurisdiction to approve. Order G-5-17 contains the following paragraphs relevant to this appeal:

> 14. [BCOAPO's] request to establish an essential services usage block (ESUB) rate for qualified low-income ratepayers is denied.
>
> 16. BCOAPO's proposals to amend the Electric Tariff to exempt low-income customers from the minimum reconnection charge and account charge and to waive security deposits for low-income customers are denied.
>
> 17. BCOAPO's proposal to exempt low-income customers from late payment charges … [is] denied.

THE RECONSIDERATION DECISION

[16] On February 17, 2017, BCOAPO filed a request pursuant to s. 99 of the *UCA* that the Commission reconsider its decision. The grounds advanced were that the Commission erred in law in finding sections 23, 38, 59 and 60 of the *UCA* do not provide the Commission with jurisdiction to order or approve low-income rates.

[17] The Commission addresses reconsideration applications in two phases. The first phase is a preliminary examination: essentially a threshold test. In the case of a reconsideration application based on errors of law with respect to jurisdiction, the Commission examines the following two criteria to determine whether a reconsideration application should proceed to the second phase and be considered on its merits: (a) whether the claim of error is substantiated on a *prima facie* basis; and (b) whether the error has material implications.

[18] In the Original Decision, the Commission found no evidence of legislative intent to provide the Commission with jurisdiction to set low-income rates and no evidence the legislature intended the *UCA* to provide jurisdiction for low-income rates in the absence of economic or cost of service justification. It found as a fact

2017 BCCA 400 (CanLII)

that low-income rates unsupported by an economic or cost of service justification are unjust, unreasonable and unduly discriminatory, and are therefore not in accordance with s. 59 of the *UCA*.

[19] On June 2, 2017, by way of Order G-87-17 the Commission denied the reconsideration request finding the errors claimed had not been substantiated on a *prima facie* basis. In the result, the reconsideration application did not proceed to phase two and was not considered on its merits.

2017 BCCA 400 (CanLII)

TEST FOR LEAVE TO APPEAL

[20] Pursuant to s. 101 of the *UCA*, an appeal lies to this Court with leave of a justice. The judge who hears the leave application acts as a gatekeeper. The judge's task is to ensure judicial resources are not expended on matters that do not merit the attention of a division of the Court: *Teck Cominco Metals Ltd. v. British Columbia (Minister of Revenue)*, 2009 BCCA 3 (in Chambers) at para. 27.

[21] The factors to be considered in deciding whether leave to appeal from a statutory tribunal should be granted were summarized in *Queens Plate Development Ltd. v. Vancouver Assessor, Area 09* (1987), 16 B.C.L.R. (2d) 104 at 109–110:

> (a) whether the proposed appeal raises a question of general importance as to the extent of jurisdiction of the tribunal appealed from …;
>
> (b) whether the appeal is limited to questions of law involving:
>
> (i) the application of statutory provisions ...;
>
> (ii) a statutory interpretation that was particularly important to the litigant ...; or
>
> (iii) interpretation of standard wording which appears in many statutes …;
>
> (c) whether there was a marked difference of opinion in the decisions below and sufficient merit in the issue put forward ...;
>
> (d) whether there is some prospect of the appeal succeeding on its merits ... although there is no need for a justice before whom leave is argued to be convinced of the merits of the appeal, as long as there are substantial questions to be argued;
>
> (e) whether there is any clear benefit to be derived from the appeal ...; and

> (f) whether the issue on appeal has been considered by a number of appellate bodies ...
>
> [Case citations omitted.]

[22] Determining whether the issue raised by an application for leave to appeal has arguable merit must be done in light of the standard of review on which the merits of the appeal will be judged: *Sattva Capital Corp. v. Creston Moly Corp.*, 2014 SCC 53 at para. 75. While *Sattva* concerned leave to appeal a decision under the *Commercial Arbitration Act*, R.S.B.C. 1996, c. 55, the same principle applies to a leave application pursuant to s. 101 of the *UCA*: *Collins v. British Columbia Utilities Commission*, 2012 BCCA 455.

2017 BCCA 400 (CanLII)

POSITIONS ON APPLICATION

[23] The applicants submit they should be granted leave to appeal both the Original Decision and the Reconsideration Decision. They submit the proposed appeal raises an important question about the Commission's jurisdiction under the *UCA* to order or approve low-income rates. They submit the answer to this jurisdictional question will have significant implications for BC Hydro, other utilities and low-income ratepayers all over the province.

[24] The applicants submit that whether the Commission has jurisdiction under the *UCA* to approve low-income rates is a question of statutory interpretation which should be determined on the basis of correctness. They submit the Commission erred in law in finding that it had no jurisdiction under the *UCA* to set low-income rates. The applicants submit that the appeals would have the clear benefit of settling an important jurisdictional question and would clarify whether the Commission can, as part of its public interest function, make distinctions between customers based on income to ensure vulnerable ratepayers can access essential services. The applicants note that while the issue of a regulatory body's jurisdiction to order low-income rates has been considered by other appellate bodies, none have considered the specific legislation set out in the *UCA*.

[25] In response, BC Hydro and Fortis both submit that if there is an appeal, it would lie only from the Reconsideration Decision. They submit that the factors in the *Queens Plate* test have not been met and the application for leave to appeal should be dismissed. In that regard, they submit that the proposed appeal does not raise a true question of jurisdiction that would justify appellate review. Furthermore, they submit the appeal has no prospect of success given the high level of deference that would be shown to the Commission, which interpreted and applied provisions of its home statute. They submit the applicants have failed to show the appeal has some prospect of success or that there is a substantial question to be argued. They further submit the Commission did in fact consider the applicants' proposals and found as a fact the low-income rates would be unduly discriminatory and therefore not in accordance with s. 59 of the *UCA*. They submit this finding of fact cannot be challenged on appeal.

[26] The Commission takes no position as to whether or not leave to appeal should be granted. It does however submit that if leave is granted, it should be limited to the Reconsideration Decision.

DISCUSSION

A. Which Decision Can Be Appealed?

[27] The Commission, BC Hydro and Fortis all submit that if leave is to be granted, it should only be from the Reconsideration Decision. The applicants do not seriously argue otherwise.

[28] This Court in *Yellow Cab Company Ltd. v. Passenger Transportation Board*, 2014 BCCA 329, set out the framework governing the determination of whether leave to appeal should be from a tribunal's original or reconsideration decision. Where a party has taken advantage of a tribunal's reconsideration power, and the tribunal has undertaken the reconsideration, the reconsideration decision represents the final decision of the tribunal and it is the decision which should be reviewed: *Yellow Cab Company Ltd.* at para. 40.

2017 BCCA 400 (CanLII)

[29] The original decision of course gives rise to the reconsideration decision. It forms part of the appeal record and will inform the court's review of the reconsideration which is, in this case, an affirmation of the original order. This is the situation that arose in *Zellstoff Celgar Limited Partnership v. British Columbia Hydro and Power Authority et al.* (21 October 2014), Vancouver CA041888; CA042066 (B.C.C.A. in Chambers). In that case, as in this, the parties sought leave to appeal both the original and reconsideration decisions of the Commission. Madam Justice MacKenzie held that leave should only be granted in regard to the reconsideration decision. She noted that since the original decision forms part of the record and will inform the court's review on appeal, there was no prejudice in granting leave to appeal only the reconsideration decision. The same considerations apply in this case. If leave to appeal is to be granted, leave should only be granted with respect to the Reconsideration Decision.

2017 BCCA 400 (CanLII)

B. Should Leave Be Granted?

[30] I turn to the question of whether leave to appeal should be granted. This requires a consideration of the *Queens Plate* factors. The applicants place particular emphasis on factors (a), (b) and (d).

[31] In their submission, the applicants stress that the proposed appeal raises a question of general importance concerning the Commission's jurisdiction. They submit that the jurisdictional question is critically important, as it will determine whether the Commission is empowered to order BC Hydro to implement low-income rates. They submit the proposed appeal is limited to questions involving statutory interpretation and will focus on the Commission's finding that sections 23, 38, 59 and 60 of the *UCA* do not provide the Commission with the jurisdiction to order and approve low-income rates. They submit the Commission erred in law in finding that the *UCA* did not confer jurisdiction on the Commission to set low-income rates. They submit the appeal has some prospect of success and their submissions raise a substantial question to be tried.

[32] The applicants further submit pursuant to factor (e) that there is a clear public benefit to be derived from the appeal. In this regard, they submit that the impact of the decision on BC Hydro's low-income customers is severe. They submit the appeal can settle an important jurisdictional question and if successful, will enable the Commission to consider a substantive issue of important public interest.

[33] The applicants also point out that the issue of a regulatory body's jurisdiction to order low-income rates has been considered by other appellate bodies, albeit not with respect to the specific legislation that governs the Commission. In that regard, they point to the decisions in *Dalhousie Legal Aid Service v. Nova Scotia Power Inc.*, 2006 NSCA 74; *Advocacy Centre for Tenants-Ontario v. Ontario Energy Board*, 293 D.L.R. (4th) 684, 2008 CanLII 23487 (Ont. S.C.J.) and a recent Manitoba hydro general rate application: Manitoba Public Utilities Board Order No. 73/15, Final Order with respect to Manitoba Hydro's 2014/15 and 2015/16 General Rate Application.

[34] In my respectful opinion, the question of whether or not to grant leave on this application comes down to a consideration of the merits.

[35] The merits analysis plays a major role in the courts' gatekeeper function. In *Collins*, Mr. Justice Chiasson in discussing the merits test observed:

> [32] It is apparent to me that this Court equates "some prospect of success" with "a substantial question to be argued". I would not apply a test that limits the consideration to whether a proposed appeal is "not wholly devoid of merit". In my mind, that is not consistent with the gatekeeper function described by Frankel J.A. It also is not consistent with the development of the reasonableness standard in the law of judicial review and the deference owed by courts to tribunals where the issue does not concern true jurisdiction, and particularly, where the issue involves the construction of a tribunal's home statute or one closely related to its function.

[36] In this case, I find that the applicants' appeal is not one with some prospect of success. The foundation of the applicants' submission is that their appeal raises a jurisdictional issue which is to be determined on the question of correctness. The jurisprudence, however, suggests otherwise. This case involves the interpretation by the Commission of its home statute. A decision of an administrative tribunal

2017 BCCA 400 (CanLII)

interpreting or applying its home statute is to be reviewed on a reasonableness standard: *Alberta (Information and Privacy Commissioner) v. Alberta Teachers' Association*, 2011 SCC 61 at para. 39. The Supreme Court of Canada has recently reiterated this point in the context of a statutory right of appeal: *Edmonton (City) v. Edmonton East (Capilano) Shopping Centres Ltd.*, 2016 SCC 47.

2017 BCCA 400 (CanLII)

[37] This case turns on the Commission's interpretation of its jurisdiction to approve a low-income rate in the absence of economic or cost of service justification. The Commission interpreted and applied the provisions of its home statute governing rate making. This lies at the core of its expertise and competence. In reaching its decision the Commission undertook a textual, contextual and purposive analysis of the key provisions. It considered the Hansard evidence tendered by each party and concluded that this extrinsic evidence reinforced its interpretation. It also extended its review to decisions of courts and tribunals from other Canadian jurisdictions and examined with care whether the relevant statutory provisions in those jurisdictions were comparable.

[38] Ultimately the Commission rejected the appellants' submissions and held that the *UCA* did not provide the Commission with the jurisdiction to approve a low-income rate in the absence of an economic or cost of service justification. In their submissions the applicants do not suggest the Commission's findings are unreasonable. They have not put forward a credible argument or basis for this Court, given the deferential standard of review, to reverse the Commission's conclusion. Given the standard of review, I have reached the conclusion that there is no prospect that this appeal can succeed.

[39] I would also note that pursuant to s. 59(4) of the *UCA*, it is a finding of fact of which the Commission is the sole judge, whether a rate is unjust, unreasonable or unduly discriminatory. The Commission in its reasons found as a fact that the low-income rates proposed by the applicants were unjust, unreasonable and unduly discriminatory and therefore not in accordance with sections 59–60 of the *UCA*. Pursuant to s. 79 of the *UCA* that finding, which goes to the heart of the applicants'

rate submissions, cannot be challenged on appeal. In the result, even if the applicants could convince this Court that the Commission's interpretation of its home statute was unreasonable the appeal would have no practical utility.

[40] The applications for leave to appeal are dismissed.

"The Honourable Mr. Justice Goepel"

2017 BCCA 400 (CanLII)

1.0.0 EXECUTIVE SUMMARY

In this Order, the Public Utilities Board of Manitoba ("Board") approves a 3.5% increase in Manitoba Hydro consumers' billed rates effective May 1, 2013. However, of this increase, the revenues from a 1.5% rate increase are to mitigate rate increases when Bipole III comes into service.

Since a portion of the granted increase is dedicated to major capital, the Board expects Manitoba Hydro to realize internal cost savings to meet its net income projections. The key will be controlling Operation, Maintenance & Administration costs.

The major reasons for this rate increase are to address:

- Reduced revenues from export sales;
- Higher operating costs related to the Wuskwatim Generating Station;
- Higher Operation, Maintenance & Administration costs;
- Funding of capital expenditures undertaken to support the reliability of electrical service; and
- Manitoba Hydro's financial and credit rating integrity over the longer term.

Overall net export revenues projected, by Manitoba Hydro, over a 20-year forecast have declined by over $6 billion in the current forecast compared to the prior forecast presented at the last General Rate Application. Lower revenues mean increased borrowing to pay for capital expenditures.

The Wuskwatim Generation Station and transmission project came on-line in 2012/13 with a capital cost of $1.8 billion, which was almost double the initial cost estimate. The Board calculates that the project's incremental in-service cost is approximately $160 million/yr (excluding any internally generated funds). This amounts to an in-service unit cost of approximately 10.5¢/kWh, which is three times higher than the current average export revenue rate of 3.3¢/kWh. Wuskwatim energy sales may not be profitable for a sustained period.

The Board is concerned with the projected future deterioration of Manitoba Hydro's financial targets, in particular the debt-to-equity ratio that will fall from a current level of 75:25 to 90:10 by 2021, even with projected annual rate increases of approximately 4%, which is twice the projected level of inflation. This deterioration will put Manitoba Hydro in a weaker financial position given its planned capital spending over the next two decades.

Manitoba Hydro has identified over $33 billion in capital spending over the next twenty years. The planned major capital investments in the Keeyask Generating Station and Conawapa Generating Station will be the subject of a future Needs For and Alternatives To (NFAT) proceeding before the Board. However, part of the spending is also required to maintain aging infrastructure for reliability purposes.

Electricity rates are forecast, by Manitoba Hydro, to more than double from current levels over the next 20 years at approximately twice the forecast level of inflation. The Board therefore believes that Manitoba Hydro should increase its energy conservation and load management (Demand-Side Management) targets from its 2011 Power Smart Plan to assist consumers to reduce their energy consumption and the impact of projected rate increases. The rate increase granted by this Order contains specific funds designated to be used to implement energy-savings programs.

In this Order, the Board also finalizes several other interim orders with respect to Manitoba Hydro rendered by the Board since the last General Rate Application.

The specific details of Manitoba Hydro's Application are set out in Appendix A to this Order.

The Board was ably assisted in its extensive review by Interveners and their witnesses. The transcripts of evidence and Exhibits from the 21 days of oral hearings that have been considered by the Board in reaching its decisions in this Order can be found on the Board's website at www.pub.gov.on.ca. Likewise, Manitoba Hydro's complete Application, including Appendices, is posted on Manitoba Hydro's website at www.hydro.mb.ca.

2.0.0 IT IS ORDERED:

1. That the 1% rate deferral and associated revenues, which formed part of interim rates granted in Order 30/11 and 40/11 to be included in Manitoba Hydro's revenue and base rates effective April, 2012 **BE AND IS HEREBY APPROVED AS FINAL**.

2. That the interim rate increases of 2% granted April 1, 2012 and 2.4% granted September 1, 2012 **BE AND ARE HEREBY APPROVED AS FINAL**.

3. That a 3.5 % overall increase in billed rates for the basic monthly charge, the demand charge, and the energy charge for all rate categories to take effect May 1, 2013, with revenues from a 1.5% portion of the rate increase accruing in a deferral account to be utilized to mitigate the required rate increases when Bipole III is placed in-service, **BE AND IS HEREBY APPROVED**.

4. That Manitoba Hydro recalculate and refile, for Board approval, a schedule of rates reflecting a 3.5% increase to the basic monthly charge, demand charge and energy charge across all consumer classes, effective May 1, 2013, together with all supporting schedules including proof of revenue and customer impacts.

5. That Manitoba Hydro file with the Board, as part of any future interim application for rate increases, the following information on a monthly basis for the previous three months, and on an on-going basis until a rate Order in respect of the Application is issued:

    (a) Hydraulic generation monthly data (GWh) for the Winnipeg River System, Grand Rapids, Upper Nelson River Generating Station(s), Lower Nelson River Generating Station(s), and Wuskwatim Generating Station;

    (b) Monthly adjusted system energy-in-storage curves and Lake Winnipeg water levels;

    (c) Average monthly flow data for the Winnipeg River, Saskatchewan River, and Upper Nelson River (Kelsey Generating Station) and Lower Nelson River (Kettle Generating Station);

    (d) Monthly extra-provincial energy exchange data (volumes and prices) for National Energy Board-filed sales and purchases (by permit / license number), Midwest Independent System Operator day-ahead and real-time sales and purchases, and Canadian sales and purchases; and

    (e) Monthly updates to Manitoba Hydro's financial results relative to its forecast.

6. That Manitoba Hydro file with the Board an International Financial Reporting Standards status update report prior to the next General Rate Application that will provide the Board options available for rate-setting purposes.

7. That Manitoba Hydro complete and file with the Board an Asset Condition Assessment Study no later than the filing of the next updated depreciation study with the Board.

8. That Manitoba Hydro file updated depreciation rates and schedules based on an International Financial Reporting Standards-compliant Average Service Life methodology with the next General Rate Application.

9. That Manitoba Hydro file with the Board, with the next General Rate Application, a chart showing a comparison of the impact on its Integrated Financial Forecast (i.e. 'Budget') of asset depreciation pursuant to the Average Service Life methodology (without net salvage) and the Equal Life Group methodology (without net salvage), applying both methodologies to all planned major capital additions.

10. That Manitoba Hydro file, with its next General Rate Application, a detailed quantitative and probabilistic risk assessment and review of all of its operating and financial risks in order to allow the Board to assess the adequacy of the reserves. Commercially sensitive information in the report is to be redacted from the public version and filed in confidence with the Board.

11. That Manitoba Hydro file with the Board any negotiated agreements or changes with respect to the Wuskwatim Power Limited Partnership when finalized, and detail the impacts on Manitoba Hydro's operating results and rates.

12. That Manitoba Hydro's revenue requirements are determined based on the level of Demand-Side Management spending as set out in Manitoba Hydro's 2011 Power Smart report, i.e., $34 million for 2012/13 and $35 million for 2013/14, for a total of $69 million. To the extent Manitoba Hydro's spending on Demand-Side Management in the test years, including the Affordable Energy Fund and the Lower Income Energy Efficiency Program, falls below $69 million, Manitoba Hydro shall establish a deferral account for the discrepancy, the disposition of which the Board will consider at the next General Rate Application.

13. That Manitoba Hydro's proposed changes to the Curtailable Rate Program **BE AND ARE HEREBY APPROVED ON AN INTERIM BASIS**, to be reviewed by the Board at a General Rate Application to follow the Needs For And Alternatives To (NFAT) hearing with respect to Manitoba Hydro's Preferred Development Plan.

14. That all Curtailable Rate Program Orders from Order 52/12 up to and including all Curtailable Rate Program Orders issued prior to the date of this Order **BE AND ARE HEREBY APPROVED AS FINAL**.

15. That Manitoba Hydro's Option 1 Surplus Energy Program rate offering **BE AND IS HEREBY APPROVED ON AN INTERIM BASIS**, to be reviewed by the Board at a Cost of Service/Time of Use hearing.

16. That Options 2 and 3 of the Surplus Energy Program **BE AND ARE HEREBY APPROVED** as permanent rate offerings.

17. That Manitoba Hydro is permitted to file any future Surplus Energy Program applications based on the review and approval of a Division Manager in lieu of the current requirement for a Professional Engineer's Seal.

18. That all weekly Surplus Energy Program interim ex-parte rate Orders – from Order 6/12 up to and including all Surplus Energy Program Orders issued prior to the date of this Order – **BE AND ARE HEREBY APPROVED AS FINAL**.

Board decisions may be appealed in accordance with the provisions of Section 58 of *The Public Utilities Board Act*, or reviewed in accordance with section 36 of the Board's Rules of Practice and Procedure (Rules). The Board's Rules may be viewed on the Board's website at www.pub.gov.mb.ca.

3.0.0 IT IS RECOMMENDED:

1. That Manitoba Hydro control Operation, Maintenance & Administration costs to keep increases below inflation.

2. That Manitoba Hydro prepare a business case with a thorough analysis of the economic rationale for the rebuilding of Pointe du Bois (estimated to cost $2.4 billion), and that the Board be mandated, by the Province of Manitoba, to conduct a Needs For And Alternatives To (NFAT) review before proceeding further.

3. That Manitoba Hydro target higher levels of domestic customer energy savings and therefore spend, in its energy efficiency plan, at minimum, the budgeted amounts set out in the 2011 Power Smart Plan.

4. That Manitoba Hydro undertake an independent assessment of its Power Smart Plan with the goal of evaluating and improving the plan.

5. That Manitoba Hydro continue and increase its efforts with respect to the Lower Income Energy Efficiency Program, as low income individuals will find it more difficult to meet ever increasing energy rates contemplated in Manitoba Hydro's rate increase forecast.

4.0.0 THE RATE APPLICATION

4.1.0 Issues

4.1.1 Previous Rate Increases

In its final Order arising from Manitoba Hydro's last General Rate Application (Order 5/12), the Board awarded a 1.9% rate increase effective April 1, 2010 and a 2.0% rate increase effective April 1, 2011. Since the April 1, 2010 final rate increase was lower than the interim rates approved and collected by Manitoba Hydro, the Board directed the Corporation to create a deferral account. Manitoba Hydro sought to Review and Vary Order 5/12, indicating a deteriorating financial condition as a result of a mild winter, below-normal precipitation and lower export revenues due to the U.S. economic downtown. In Order 19/12, the Board denied the Review and Vary request but indicated that the matter would be dealt with as part of the current General Rate Application.

Total revenues accumulated in the deferral account total $36 million as of March 31, 2013, with another $14 million to accumulate by March 31, 2014.

On March 30, 2012, Manitoba Hydro filed an interim application seeking reinstatement of the 1% rollback accumulating in the deferral account balance, maintaining the base rates approved in Orders 30/10 and 40/11, and seeking an additional 3.5% rate increase effective April 1, 2012, all based on lower than forecast export revenues and a winter that was warmer than normal. In Order 32/12, the Board awarded a 2.0% inflation-based rate increase effective April 1, 2012 and denied a reinstatement of the 1.0% rollback.

Effective September 1, 2012, Manitoba Hydro requested a mid-year 2.5% rate increase based on lower-than projected domestic and export revenues and a projection that 2012/13 total hydraulic generation would be approximately 1,000 GWh below the post-Wuskwatim average, resulting in a net export revenue reduction of $30-40 million. In Order 117/12, the request for an interim 2.5% rate increase was granted, based on the lower projected revenues.

During the General Rate Application proceeding, it was determined that Manitoba Hydro's hydraulic generation and export projections presented as part of the Application for an interim September 1, 2012 rate increase (which were based exclusively on 1st-quarter (Q1) data) were much better than expected. The utility's Q1 projection was for 7,200 GWh of generation and 2,100 GWh of export in 2012/13. By the 2nd quarter (Q2) the projections had increased to 9,029 GWh of generation and 3,500 GWh of export. In July and August 2012, monthly exports were about 1,300 GWh. Energy-in-storage peaked substantially above historical averages in July 2012, suggesting above-average flow conditions. However, the Board was not advised that Manitoba Hydro's situation had improved until December 13, 2012.

4.1.2 April 1, 2013 Rate Increase

Manitoba Hydro's application for a 3.5% April 1, 2013 overall revenue increase is based on its expressed need to lessen the projected deterioration of its financial ratios in future years and maintain the financial and credit rating integrity of Manitoba Hydro. Manitoba Hydro also indicated that rate increases were needed to compensate for reduced non-firm export prices and address increased costs to maintain its aging infrastructure. Manitoba Hydro's financial forecast indicates annual increases of 3.95% will be required over the next twenty years, while annual inflation is forecast at 2% per annum.

The Consumers' Association of Canada (Manitoba) Inc. while recommending that the Board accept Manitoba Hydro's request for the 1.0% deferral account rollback for 2012/13 and finalize the April 1, 2012 2.0% and September 1, 2012 2.5% interim rate increases, requested that the Board require Manitoba Hydro to refund the amounts accrued in the 2010/11 and 2011/12 deferral accounts. The Consumers' Association of Canada (Manitoba) Inc. further opposed the request for an April 1, 2013 3.5% rate increase, stating that the economic slowdown, coupled with private and public-sector restraint, has brought some hardship to Manitobans, and a 4.5% rate increase (2.0% April 1, 2012 + 2.5% September 1, 2012) in 2012 compounded by a further 3.5% rate increase in 2013 would put substantial pressure on individuals with limited discretionary incomes, particularly those who rely on electric heat.

The Green Action Centre supported Manitoba Hydro's application for rate increases, stating that there was a need to invest in existing infrastructure for reliability purposes, and that Manitoba Hydro had demonstrated that it was negatively affected by a decline in export revenue.

The Manitoba Industrial Power Users Group recommended against Manitoba Hydro retaining any of the deferral account balance accrued prior to March 31, 2012, but recommended that the 2.0% increase in effect as of April 1, 2012 and the 2.5% interim rate increase in effect as of September 1, 2012 be made final. The Manitoba Industrial Power Users Group further requested that the Board implement rate adjustments of up to 0.2% to the appropriate customer classes to ensure that the rate increase is appropriately applied on an "across-the-board" basis when energy, demand and customer charges are taken into account, which issue will be addressed at a Cost of Service hearing. The Manitoba Industrial Power Users Group asked the Board to reject the request for a 3.5% rate increase as of April 1, 2013, stating that this was not needed to fund revenue requirements or set appropriate reserves.

4.2.0 Board Findings

The Board is called upon to balance the interests of consumers with those of the utility. While two of the interveners recommended that the rate increases sought by Manitoba Hydro be denied or rebated, the Board is concerned about the deteriorating financial

condition of Manitoba Hydro in the face of pending significant major capital expenditures.

Interveners recommended various accounting changes to lessen rate increases over the test years. The Board rejects this approach as it would have the effect of reducing Manitoba Hydro's revenues, weakening its financial situation, and increasing borrowing costs. It is important that Manitoba Hydro remain a financially strong and viable organization. The Board supports the staged approach to accounting changes planned by Manitoba Hydro.

The Board will allow Manitoba Hydro to include the 1% rollback in its revenues as final and confirm as final the 2% interim rate increase in effect as of April 1, 2012 approved in Order 32/12. The Board will also confirm as final the 2.5% interim rate increase in effect as of September 1, 2012 approved in Order 117/12. These decisions reflect an overall concern about the projected decline in Manitoba Hydro's financial targets in the upcoming years due to various factors, including the in-service costs of the Wuskwatim Generating Station, major capital expenditures, as well as continued low export revenues as a result of low export prices.

The Board will further permit a 3.5% increase to the basic monthly charge, demand charge and energy charge across all customer classes effective May 1, 2013 with a 2% portion of the increase included in general revenues and the balance to accrue to a deferral account. This reflects the Board's view that Manitoba Hydro must achieve a proper balance between cost containment and rate increases to meet its financial position. Manitoba Hydro is to establish a deferral account in which the revenues from the 1.5% increase accrues until further Order of the Board (2% to general revenues + 1.5% to deferral account = 3.5%) . The capital deferral account is to assist in funding the planned Bipole III transmission line. The cost of this project will be capitalized during the construction phase, but significant annual depreciation, operation, maintenance & administration, and interest costs will have to be recovered from domestic ratepayers once the project is placed in-service. The deferral account allows Manitoba Hydro to collect funds as the Bipole III project is being built, which will help to mitigate rate increases required once the infrastructure is placed in-service.

To address a problem the Board experienced with out-dated information in respect of Manitoba Hydro's request for a September 1, 2012 interim rate increase, the Board will direct Manitoba Hydro to file the following documentation as part of any future interim application for rate increases, for the three months immediately preceding the filing of such applications, and on an on-going basis until such time as a rate Order in respect of the Application is issued:

(a) Hydraulic generation monthly data (GWh) for the Winnipeg River System, Grand Rapids, Upper Nelson River Generating Station(s), Lower Nelson River Generating Station(s), and Wuskwatim Generating Station;

(b) Monthly adjusted system energy-in-storage curves and Lake Winnipeg water levels;

(c) Average monthly flow data for the Winnipeg River, Saskatchewan River, and Upper Nelson River (Kelsey Generating Station) and Lower Nelson River (Kettle Generating Station);

(d) Monthly extra-provincial energy exchange data (volumes and prices) for; NEB-filed sales and purchases (by permit / license number), Midwest Independent System Operator (Midwest Independent System Operator) day-ahead and real-time sales and purchases, and Canadian sales and purchases; and

(e) Monthly updates to Manitoba Hydro's financial results relative to its forecast.

5.0.0 OPERATION, MAINTENANCE & ADMINISTRATION EXPENSES

5.1.0 Issues

5.1.1 Overall Growth

From 2009/10 to 2013/14, Manitoba Hydro's total annual electric Operation, Maintenance & Administration cost has grown from $662 million to $802.4 million. When capitalized costs are factored out, Operation, Maintenance & Administration relating to electric operations has increased from $377.6 million in 2009/10 to a forecast $470.6 million in 2013/14. The increase is due to a growth in staffing levels and accounting policy changes.

5.1.2 Staffing Levels

Over 75% of Manitoba Hydro's Operation, Maintenance & Administration costs relate to labour costs, including employee benefits. Wages and salaries increased by an average of 4.5% per year, primarily as a result of contract settlements with bargaining units and an increase in total Equivalent Full-Time employees. The increase in Equivalent Full-Time employees has been attributed to growth in Manitoba Hydro's capital program, including new generation and transmission projects such as Bipole III, Keeyask Generating Station, Conawapa Generating Station, and Pointe du Bois Generating Station. To a lesser degree, Manitoba Hydro attributes the employee growth to operational support for various initiatives, including the commissioning of Wuskwatim Generating Station and the meter compliance program.

Both the Consumers' Association of Canada (Manitoba) Inc. and the Manitoba Industrial Power Users Group were critical of the growth in Operation, Maintenance & Administration costs. The Consumers' Association of Canada (Manitoba) Inc. took the position that Manitoba Hydro should be directed to develop a plan to have Operation, Maintenance & Administration expenses increase at less than inflation when accounting changes are removed from the equation. The Manitoba Industrial Power Users Group suggested that the level of staffing increases cannot be maintained, and that the utility's staffing should be thoroughly examined on employee-level basis. The Manitoba Industrial Power Users Group also took issue with the vacancy rate used in forecasting and suggested it be adjusted to be more consistent with recent experience of 8% rather than forecast 6.2%. Making this adjustment to the forecast would reduce the revenue requirement by $10 million. The Manitoba Industrial Power Users Group recommended that the Board ask the Minister to undertake an independent external review and evaluation of Manitoba Hydro's Operation, Maintenance & Administration spending, similar to the review undertaken for BC Hydro in British Columbia.

5.1.3 Capitalization of Operation, Maintenance & Administration

Manitoba Hydro capitalized $321.8 million (44%) of Operation, Maintenance & Administration cost in 2011/12 and forecasts to capitalize $324.4 million (42%) in 2012/13 and $331.8 million (41%) in 2013/14. The vast majority of cost capitalized is labour and benefits. Capitalized Equivalent Full-Time employees have grown from 2,369 Equivalent Full-Time employees in 2007/08 to a forecast of 2,825 Equivalent Full-Time employees for the two test years.

5.1.4 Accounting Changes

Since 2007/08, Manitoba Hydro has made changes to its capitalization practice to move away from "full cost" accounting and provide consistency with other Canadian utilities. Manitoba Hydro capitalizes overhead costs directly attributable to capital initiatives and has identified certain previously capitalized costs that would exist regardless of whether or not Manitoba Hydro incurred capital spending. Since 2009/10, Manitoba Hydro has removed approximately $29 million from capitalized overhead, with a further $27 million forecast for 2012/13, for a total of $56.5 million in 2012/13 and $57.6 million in 2013/14. The change in capitalization practice is consistent with Canadian Generally Accepted Accounting Principles and is directionally consistent with International Financial Reporting Standards.

Manitoba Hydro has also identified an additional $36 million in overhead costs that it plans on expensing when Manitoba Hydro adopts International Financial Reporting Standards in 2015/16. In total, over $93 million in overhead costs will be expensed when International Financial Reporting Standards are implemented. The new standards do not allow the capitalization of advertising and promotional activities, administrative and other general overhead expenditures, property and business taxes and interest on common assets.

International Financial Reporting Standards do not currently recognize "rate-regulated accounting". To comply with International Financial Reporting Standards, Manitoba Hydro may be required to write off the accumulated balance of its rate-regulated assets against retained earnings and expense, as incurred, expenditures previously deferred due to rate regulation. A major annual rate-regulated expense for Manitoba Hydro is Demand-Side Management. Under its existing rate-regulated accounting practices, Manitoba Hydro capitalizes Demand-Side Management expenses and depreciates them over a period of ten years. Manitoba Hydro's rate-regulated assets were $310 million as of March 31, 2012, of which $233 million relate to electric operations and $77 million to gas operations.

The Accounting Standards Board has granted deferrals for Canadian utilities with rate-regulated assets and liabilities, which will delay Manitoba Hydro's implementation of International Financial Reporting Standards until 2015/16. The International Accounting

Standards Board has indicated that it will be issuing an interim standard that may grandfather rate-regulated accounting practices. That interim standard is expected to be issued in 2013.

The Consumers' Association of Canada (Manitoba) Inc. did not support the $27 million in accounting changes in the test years related to information technology infrastructure and building depreciation in the revenue requirement. Furthermore, both the Consumers' Association of Canada (Manitoba) Inc. and the Manitoba Industrial Power Users Group recommended that Manitoba Hydro's approach to capitalization should be based on full-cost accounting. The Manitoba Industrial Power Users Group stated that accounting changes should not be the driver for rate increases as the economic reality of operations has not changed, and recommended that the Board should direct Manitoba Hydro to conduct a third-party review of its accounting policies.

5.1.5 Cost Containment Measures

Manitoba Hydro expects an annual productivity factor of 0.5-1.0% in setting Operation, Maintenance & Administration targets and states that it continues to implement several cost containment measures, including an external hiring freeze, overtime restrictions, restrictions on out-of-town travel, restrictions in community sponsorships and donations, and a leveraging of technology. However, Manitoba Hydro was unable to quantify the savings attributable to these measures, stating that they were internalized in the budgeting process.

5.2.0 Board Findings

Manitoba Hydro's Operation, Maintenance & Administration expenses have grown significantly, increasing by almost 25% over four years. While part of this increase is attributable to a change in accounting policies, the single biggest factor is an increase in staffing levels. Since 2003/04, staffing levels have grown by over 1,000 Equivalent Full-Time positions. Since the economic downturn in 2007/08, levels have increased by 771, with total payroll increasing by $197 million or 41% since that time.

Manitoba Hydro's cost containment measures appear to be modest at best, and despite a hiring freeze, the utility's current projections still reflect a growth in staffing of 243 Equivalent Full-Time positions from 2011/12 levels. The Board expects Manitoba Hydro to control Operation, Maintenance & Administration costs, the key to which will be capping or reducing staffing levels. The award of only a 2.0% portion of the 3.5% increase to accrue to general revenues reflects the utility's need to find internal savings, and to demonstrate those savings at the next General Rate Application.

The Board understands that Manitoba Hydro has been making changes to its accounting policies since 2007/08 to be more consistent with other electric utilities as well as to be consistent with International Financial Reporting Standards. The Board in

past orders had expressed concern with the level of capitalization and Manitoba Hydro has begun to address these concerns. In the Board's view, Manitoba Hydro's proposed accounting changes are appropriate for the test years. The Board will direct Manitoba Hydro to file an International Financial Reporting Standards status update at the next General Rate Application. Until such time, the Board expects Manitoba Hydro not to make any further accounting changes for rate-setting purposes.

6.0.0 DEPRECIATION AND AMORTIZATION

6.1.0 Issues

6.1.1 Asset Lives and New Asset Classes

Depreciation expense is recognized on a straight-line basis over the estimated remaining service lives of assets, which lives are determined pursuant to periodic depreciation studies. Manitoba Hydro filed a March 31, 2010 depreciation study prepared by Gannett Fleming. In this most recent study, Gannett Fleming recommended several extensions of assumed service lives and the creation of several new asset classes, most notably through the creation of a new "Dams, Dykes & Weirs" category with a 125-year service life, whereas previously all dams were depreciated over 100 years. The composite average service life of a generating station was thereby increased from 100 years to 104 years. Gannett Fleming also recommended an increase in the terminal life of most generating stations from 100 years to 140 years.

Overall, the new depreciation rates resulting from updated account groupings and changed service lives resulted in a reduction of depreciation expense by $40 million in 2012/13 and $44 million in 2013/14. This also means there currently is an accumulated depreciation surplus of $555 million, which will be refunded over the remaining service life of each asset account, consistent with Generally Accepted Accounting Principles.

The Consumers' Association of Canada (Manitoba) Inc. supported the changes to service lives and recommended that the estimates be revisited once an Asset Condition Assessment report has been obtained. However, the Consumers' Association of Canada (Manitoba) Inc. suggested that the accumulated depreciation surplus should be returned over a 20-year period rather than over the remaining service lives of the assets.

6.1.2 Equal Life Group vs. Average Service Life

Gannett Fleming testified on behalf of Manitoba Hydro and recommended a switch from Manitoba Hydro's current methodology of Average Service Life to Equal Life Group, a procedure whereby the investment of a group of assets is subdivided to specifically recognize the life expectancy of each subgroup. In Mr. Kennedy's view, Equal Life Group is superior as it reduces the need to recognize losses on interim retirements of assets within a category, thus providing for lower depreciation volatility.

Both Equal Life Group and Average Service Life are International Financial Reporting Standards-permissible methodologies and Manitoba Hydro indicated that the adoption of Equal Life Group was a policy decision. However, it would not be implemented until the utility adopts International Financial Reporting Standards. In 2015/16, the switch to Equal Life Group is expected to increase depreciation expense by $38 million.

Notably, Gannett Fleming used Average Service Life to determine depreciation rates for Wuskwatim Generating Station due to uncertainty about when the facility will come into service. By using Average Service Life compared to Equal Life Group for Wuskwatim, the calculated depreciation rate was approximately $3.0 million lower than it otherwise would have been. Similarly, Manitoba Hydro based the projected depreciation expenses for Keeyask Generating Station, Conawapa Generating Station, and Bipole III on Average Service Life proxy rates (without net salvage) until Gannett Fleming provides proposed Equal Life Group rates.

Neither the Consumers' Association of Canada (Manitoba) Inc. nor the Manitoba Industrial Power Users Group supported the switch to Equal Life Group, stating that many other utilities follow the Average Service Life approach. The Consumers' Association of Canada (Manitoba) Inc. raised issues of data reliability at a time of a rapidly increasing capital base. The Manitoba Industrial Power Users Group's witness testified that Equal Life Group leads to higher depreciation expenses in the early years of an individual asset's life. In a growing utility where newer and costlier assets are routinely added to plant in service, it can result in higher initial costs to ratepayers.

In the Manitoba Industrial Power Users Group's view, high depreciation in the early years does not match the economic benefit profile of utility assets, which provide the most benefit in later years. It further testified that Equal Life Group is very sensitive to the shape of the "Iowa Curve" chosen to calculate depreciation rates, and that Manitoba Hydro's asset retirement data is insufficient to support Equal Life Group, as data exists for only a small number of large assets.

6.1.3 Removal of Net Salvage

Manitoba Hydro's current depreciation rates include a provision for net salvage, representing the cost of decommissioning and disposal of an asset when taken out of service. The rationale for including net salvage in depreciation rates is to ensure that ratepayers benefitting from the use of the asset over time are shouldering the burden of paying for the eventual decommissioning costs.

Mr. Kennedy advised that International Financial Reporting Standards would no longer permit the inclusion of net salvage in depreciation rates. Manitoba Hydro plans to remove net salvage from depreciation rates at the same time as it switches to the Equal Life Group methodology in 2015/16. Manitoba Hydro indicated the impact of removing net salvage would lower depreciation expense by approximately $56 million in 2013/14, $63 million in 2014/15, and $66 million in 2015/16.

Both the Consumers' Association of Canada (Manitoba) Inc. and the Manitoba Industrial Power Users Group recommended that net salvage be removed from depreciation immediately rather than waiting for a possible implementation of Equal Life Group.

6.2.0 Board Findings

The Board accepts the depreciation rates applied April 1, 2011, which rates reflect the changes in service lives and the true-up of the accumulated depreciation surplus for the two test years. The Board also accepts Manitoba Hydro's position that net salvage should be removed from depreciation rates when International Financial Reporting Standards are implemented rather than during the test years.

The Board understands that Manitoba Hydro is enhancing its asset condition assessment tools and will direct Manitoba Hydro to complete an Asset Condition Assessment Study no later than the filing of an updated depreciation study with the Board.

With respect to the possible switch from an Average Service Life methodology to Equal Life Group, the Board notes that both are acceptable methodologies under International Financial Reporting Standards and that any proposed changes would take place in 2015/16, which is beyond the test years. The Board understands that the decision to move towards Equal Life Group is a policy decision very much interrelated with other International Financial Reporting Standards accounting policy considerations. Given continued uncertainty regarding the application of International Financial Reporting Standards on rate-regulated entities, the Board will expect Manitoba Hydro to file additional information, including an update on any accounting policy changes, that will impact depreciation rates at the next General Rate Application.

The Board also is concerned that not enough information has been provided to date to assess the true impact on ratepayers of a switch to Equal Life Group. As such, the Board will require Manitoba Hydro to file additional information, including a determination of depreciation rates and schedules based on the Average Service Life methodology, to provide a meaningful comparison between the two approaches. The Board further expects Manitoba Hydro to file, as part of its next General Rate Application, additional information to specify what, if any, increased componentization is required, and at what cost. The work undertaken by Manitoba Hydro and Gannett Fleming Inc. with respect to component groupings to date can serve as a foundation towards determining what additional component groupings and costs, if any, are required for an International Financial Reporting Standards-compliant Average Service Life methodology.

The Board will require Manitoba Hydro to provide a comparison, for the next General Rate Application, of the impact on the Integrated Financial Forecast of an Average Service Life methodology (without net salvage) and an Equal Life Group methodology (without net salvage), where each of the accounting methodologies are applied to planned major capital additions in the Integrated Financial Forecast. Given the forecast to increase net plant by over $21 billion over a 20 year period, it will be important to understand the implications on ratepayers of using each approach at the next General Rate Application.

The Board further expects Manitoba Hydro to file, as part of its next General Rate Application, additional information to support Manitoba Hydro's view that an Average Service Life methodology compliant with International Financial Reporting Standards requires increased componentization. As part of this information, the Board expects to see evidence as to what level of componentization would be required, and how such level of componentization would increase Manitoba Hydro's costs, if at all.

7.0.0 FINANCE EXPENSE

7.1.0 Issues

Finance expense to be recovered in electricity rates is forecast to be $452 million in 2012/13 and $444 million in 2013/14. Finance expense is forecast to be over $1.6 billion in 2028, an increase of almost $1.2 billion from 2013/14 levels.

Manitoba Hydro capitalizes (and does not recover in current consumer's rates) all interest on capital projects until the project is placed in service. Manitoba Hydro is forecasting to capitalize interest costs of $141.5 million (or 23%) in 2012/13 and $161.4 million (or 27%) in 2013/14. Overall, Manitoba Hydro is forecasting to capitalize over $5.3 billion in interest costs relating to capital projects by 2032.

Long-term interest rates in Integrated Financial Forecast IFF12 are projected to be 3.15% in 2013 and 3.3% in 2014 (excluding the 1% Provincial Debt Guarantee Fee). Manitoba Hydro is forecasting long-term interest rates to increase from 3.85% in 2015 to 4.55% by 2016, to peak at 5.3% in 2022 and remain at that level for the remainder of the forecast through 2032.

7.2.0 Board Findings

Manitoba Hydro's annual finance expense is set to grow substantially over the next two decades as Manitoba Hydro completes major capital projects. The Board notes that Manitoba Hydro's long-term debt is expected to grow from $9.4 billion in 2013 to $29 billion by 2027, which will lead to a finance expense exceeding $1.6 billion in 2028; three times the current level.

The Board sees a genuine risk that the capital cost for the major capital projects will escalate further and that interest rates will be higher than forecast. Manitoba Hydro's current risk analysis reflects that a 1.0% increase in the interest rate yield curve over the entire forecast will increase total interest costs by $700 million. It is expected that this risk will be reviewed by the Board at an upcoming Needs For And Alternatives To hearing with respect to Manitoba Hydro's Preferred Development Plan.

8.0.0 FINANCIAL TARGETS

8.1.0 Issues

Manitoba Hydro has three self-imposed financial targets:

1. A minimum debt-to-equity ratio of 75:25;

2. A gross interest coverage ratio of greater than 1.20; and

3. A capital coverage ratio of greater than 1.20, to facilitate funding all new base capital construction requirements, excluding major new generation and transmission facilities, from internal sources.

Manitoba Hydro acknowledges that the targets will not be attained during years of major investments in the generation and transmission system.

8.1.1 Debt-to-Equity Ratio

The debt-to-equity ratio measures the relationship of long-term and short-term debt to equity. This ratio is used to assess the overall financial risk to Manitoba Hydro.

Manitoba Hydro's capital structure is forecast to weaken to a debt-to-equity ratio of 90:10 in 2021 due to planned capital spending on major projects. Manitoba Hydro filed Integrated Financial Forecast IFF12, which indicates planned capital spending of $33.4 billion, of which $22.9 billion relate to major projects over the next 20 years. According to Manitoba Hydro's forecast, the debt-to-equity ratio target of 75:25 will not be reached until 2031/32.

At the last General Rate Application, Manitoba Hydro had forecast long-term debt to grow from $7.8 billion in 2010 to $23 billion in 2029. Based on Integrated Financial Forecast IFF12, long-term debt is now forecast to be over $29 billion by 2029, an increase of $6.0 billion (26%) from the level forecast at the previous General Rate Application. Higher debt servicing costs, coupled with lower forecast export revenues, have resulted in reductions in forecast and actual net income of $5.9 billion since Integrated Financial Forecast IFF09.

The Consumers' Association of Canada (Manitoba) Inc. expressed concern with the increase in capital costs and noted the promise made by Manitoba Hydro two years ago that a decade of investment was to be followed by a decade of returns. This appears to have been replaced by rate increases up to twice the level of inflation until 2030. In light of the significant planned capital expenditures, the Consumers' Association of Canada (Manitoba) Inc. further questioned the continued reliance on the debt-to-equity ratio to determine Manitoba Hydro's ability to withstand adverse events.

The Manitoba Industrial Power Users Group proposed adjusting the current method of calculating the debt-to-equity ratio to exclude Accumulated Other Comprehensive Income as well as the dedicated debt for the capital spending on the Keeyask Generating Station and Conawapa Generating Station, as the projects are currently not "used and useful" and not serving customers.

8.1.2 Interest Coverage Ratio

The Interest Coverage Ratio is calculated to measure the degree to which Manitoba Hydro can meet its interest payment obligations with the net income generated. An interest coverage ratio below 1.0 indicates that Manitoba Hydro must borrow to meet its interest obligations. Absent the requested rate increases for the two test years, Manitoba Hydro forecasts an interest coverage ratio of 0.95% in 2012/13 and 0.9% in 2013/14. In Integrated Financial Forecast IFF12-1, the 1.20 target is not achieved throughout the forecast period, with the ratio falling below 1.0 from fiscal 2019 to 2021.

8.1.3 Capital Coverage Ratio

The Capital Coverage Ratio measures Manitoba Hydro's ability to fund base capital expenditures out of current cash flow from operations. A capital coverage ratio less than 1.0 indicates that Manitoba Hydro must borrow to fund its annual sustaining (base) capital requirements. Absent the requested rate increases, Manitoba Hydro forecasts a capital coverage ratio of 0.90 in 2012/13 and 0.67 in 2013/14. Manitoba Hydro's target capital coverage ratio is set at >1.20. When the ratio exceeds 1.0, Manitoba Hydro internally generates funds from its operations that are used to fund major capital projects. This reduces the amount that must be borrowed to fund major capital projects.

8.1.4 Drought Reserves

Manitoba Hydro's existing Retained Earnings reserve to address a major drought is $2.4 billion. Historically, Manitoba Hydro has experienced drought situations in approximately 25 of the last 100 years. Manitoba Hydro's opening presentation at the General Rate Application suggested that a five-year drought would have a cost impact of at $1.6 billion. This suggests that Manitoba Hydro may have an adequate level of reserves.

Manitoba Hydro Exhibit #38 and Manitoba Hydro Exhibit #40 (Exhibits are available on the Board's website) have provided analyses of the impact of droughts, relative to Integrated Financial Forecast IFF11-2, as follows:

Impact of a 5-Year Drought ($millions)

	5-Year Starting 2014/15	7-Year Starting 2014/15	5-Year Starting 2021/22	7-Year Starting 2021/22
Net Revenue Impact*	**$1,341**	**$1,945**	**$2,473**	**$3,130**

*Excludes finance costs

In Integrated Financial Forecast IFF12, Manitoba Hydro's retained earnings were forecast to be at about $2.4 billion through 2022. Manitoba Hydro's drought history (1930's & 1940's) included a five-year drought followed two years later by a seven-year drought. A repeat of such a situation using the above net revenue impacts would nearly eliminate retained earnings in the absence of additional rate increases.

8.2.0 Board Findings

Manitoba Hydro currently has achieved its debt-to-equity target of 75:25. However, the Board is concerned about the contemplated deterioration in the utility's financial targets, particularly the fact that by 2021, the debt-to-equity ratio is projected to be 90:10. Any further escalations in the capital cost for Manitoba Hydro's major new capital projects will cause the financial structure to deteriorate further.

The rate increases contemplated by Manitoba Hydro in the test years and beyond are significantly lower than what would be required to keep the Corporation at its current level of financial strength in the medium to long term. Progress in meeting these financial targets will require further rate increases, but more importantly, a concerted effort at cost containment within Manitoba Hydro.

The Board is concerned that, by moving towards a 90:10 debt-to-equity ratio by the end of the decade, there will be an insufficient retained earnings reserve to deal with droughts and other risks such as infrastructure failure or rising interest rates. The Board sees a need to further examine and quantify the other risks that Manitoba Hydro faces at the next General Rate Application and determine whether these should be subject to separate reserve provisions. The Board will require Manitoba Hydro to provide an analysis of risks on a quantitative and probabilistic basis at the next General Rate Application.

The Board notes that Manitoba Hydro shares the benefit of the flow-through credit rating of the Province, which affords it preferential interest rates on its debt and access to funds to meet its major capital spending program. However, as its debt grows, there is a potential for Manitoba Hydro's financial condition to affect the credit rating of the Province. It is important that Manitoba Hydro remains a financially strong and viable organization.

The Board does not believe that establishing a debt-to-equity ratio that ignores real debt, as was proposed by the Manitoba Industrial Power Users Group, is a reasonable proposition when credit rating agencies focus on actual debt levels.

9.0.0 WUSKWATIM GENERATING STATION PROJECT

9.1.0 Issues

9.1.1 Cost Escalation

The Clean Environment Commission in 2003 conducted a hearing examining the Need For and Alternatives To the Wuskwatim project. The projected cost of the project at the Clean Environment Commission hearing was $901 million for the generating station and transmission facilities.

Since then, the capital cost estimate increased on an annual basis, almost doubling to $1,77 million.

9.1.2 Tendering Problems with Northern Generation

Manitoba Hydro experienced tendering difficulties with the primary contract(s) for building the generating station. This led to a retendering on a component basis. Productivity problems with respect to major civil, mechanical, and electrical components were also experienced.

9.1.3 The Wuskwatim Power Limited Partnership Agreement

The Wuskwatim Power Limited Partnership Agreement provided for a first-ever First Nations ownership stake in a Manitoba Hydro generating facility. Pursuant to the terms of the Agreement, the Nisichawayasihk Cree Nation was given the option of being a Limited Partner in the Wuskwatim Generating Station with an interest of up to 33%.

Revenues received by the Partnership from the sale of power to Manitoba Hydro were based on the actual output of Wuskwatim Generating Station and be priced in accordance with an agreed methodology which reflected Manitoba Hydro's actual selling prices for exports. The Partnership would pay Manitoba Hydro a percentage of gross revenues to contribute towards the marketing and transmission risks borne by Manitoba Hydro.

Wuskwatim's revenue related to energy generated during the on-peak (5x16) hours is determined based on the average price Manitoba Hydro realizes for long-term export sales and import transactions. Wuskwatim's revenue related to energy generated during the off-peak hours is determined from the average price Manitoba Hydro realizes for all on-peak and off-peak opportunity export and import transactions, excluding the on-peak long-term contract transactions. The total of gross revenue related to on-peak and off-peak energy is reduced by transmission and related market participation charges and Manitoba Hydro's 3% marketing risk fee. Domestic sales are not included in the determination of the revenue allocated to the Wuskwatim Power Limited Partnership.

Because of low export prices, Manitoba Hydro is now forecasting losses for the first ten years of operations of Wuskwatim. Those losses are projected to total $341 million as Manitoba Hydro forecasts the project will not be profitable until 2023. The current agreement also requires the partners to invest more money to cover operating losses.

The total cost of Wuskwatim as identified by Manitoba Hydro (in Exhibit #108) was $1.77 billion. Manitoba Hydro only applied $1.25 billion of project costs to the Wuskwatim Power Limited Partnership, as it subtracted $526 million of Manitoba Hydro's internally generated funds. On this basis, there is a net cost to the partnership of $43 million in 2012/13 and $75 million in 2013/14. This net cost results from the apportionment of both project costs and export revenues to the Partnership, with low export revenues contributing to a shortfall in both years.

If Manitoba Hydro's attribution of internally generated funds is removed from the calculation of partnership costs, the shortfalls would increase to $68 million and $114 million in 2012/13 and 2013/14, respectively. Because internally generated funds are the result of ratepayer contributions, they constitute a real cost to ratepayers that cannot be ignored when assessing the total impact of the project. In the absence of the Partnership covering the shortfalls, these costs flow through to domestic ratepayers.

During the hearing, Manitoba Hydro indicated its intention to re-negotiate the Agreement with the Wuskwatim Power Limited Partnership. Manitoba Hydro provided a calculation that attributed revenues based on the average of domestic and export revenues rather than just export revenue, upon which the Wuskwatim Power Limited Partnership Agreement is currently based. That potential change would still leave the Partnership with a shortfall in both test years, albeit a reduced amount. However, in the absence of a recovery in export prices, the net impact on ratepayers would actually increase, as a portion of domestic revenue would now be allocated to the Partnership.

Wuskwatim Generating Station in average flow years adds about 1,500 GWh/yr to the existing 29,500 GWh of energy, for a total Manitoba Hydro energy capability of 31,000 GWh. With average annual domestic load and firm export contract commitments less than 29,000 GWh until 2020, Wuskwatim energy is forecast to be sold at prices in the range of 3.0-3.5¢/kWh.

Wuskwatim Generation came on-line in 2012/13 with a Board-calculated (all-in) incremental in-service cost of $160 million/yr (10.5¢/kWh). This is about three times the current average export revenue rate (for both firm and spot market sales) of about 3.2¢/kWh.

The Consumers' Association of Canada (Manitoba) Inc. did not object to the renegotiation of the Wuskwatim Power Limited Partnership agreement. However, it expressed great concerns about the Wuskwatim project's cost growth. It further questioned whether the full impact of the Wuskwatim losses should be borne by current

ratepayers, as the extent of the losses were not contemplated when the project was initiated.

9.2.0 Board Findings

The Board has difficulty rationalizing the increase in the cost of the Wuskwatim project from the $900 million estimate presented to the Clean Environment Commission in 2003, to the most recent estimate of a $1.77 billion in-service cost. The increase in costs, in conjunction with a substantial decrease in export prices, means that the anticipated results have not been achieved and will not be achieved for many years.

The capital cost escalation of the Wuskwatim project is of serious concern to the Board. The reasons for the increased costs need to be more specifically broken down with respect to the various project components and construction activities. The utility's northern generation projects experienced competing demands for skilled labour from the Alberta market, resulting in the need to hire unskilled labour that had to be trained locally. This resulted in overall low productivity. These concerns should be more fully addressed and mitigated in future northern capital projects to the extent possible.

The Board understands that Manitoba Hydro is currently renegotiating its Wuskwatim Power Limited Partnership Agreement with its First Nations Partner as the economics of the project have changed substantially since the time the Agreement was first concluded. The revenues to be attributed to the Wuskwatim Power Limited Partnership were to be based on export revenues. The Wuskwatim Power Limited Partnership financial forecast now projects many years of losses. Absent adequate export revenues, the losses now have to be funded by domestic ratepayers. The Board expects to be notified when any changes to the current Agreement are finalized and apprised of the impact of such changes on Manitoba Hydro's operating results and domestic rates.

As for the cost consequences of Wuskwatim on Manitoba Hydro, the current rate increase requests are required to meet the operating losses from Wuskwatim. The Board finds that, as a rule-of-thumb, the average incremental annual operating cost of a capital project can be approximated at 9% of the capital cost minus the incremental export revenue gained. This makes for an additional revenue requirement of the Wuskwatim project viewed in isolation (without internally generated funds) equivalent to about $100 million in 2012/13 and $160 million in 2013/14. These costs are significantly greater than the $74 million and $117 million (respectively) set out in Information Request CAC/MH I-15(a) where Manitoba Hydro used financial costs that were net of internally generated funds:

	Partial Year 2012/13	**2013/14**
9% of $1.77B Capital Cost	$100M	$160M
Average Output/year	900 GWh	1520 GWh
Unit Output Cost	10.0 ¢/kWh	10.5 ¢/kWh
Incremental Revenues	$26M	$43M
Average Net Export Revenue Rate*	2.8 ¢/kWh	2.8 ¢/kWh
Net Cost Impact on Rate Payers**	**$74M**	**$117M**

*While MH calculates its total Export Sales (including long term firm export contract) average price of approximately 3.2 ¢/kWh [Exhibit MH-17], the output of Wuskwatim is not committed to a long term firm Export contract, so the average price of Wuskwatim output is only 2.8 ¢/kWh. [Exhibits MH-11 and MH-34]

**This assumes no new firm export contracts for Wuskwatim output.

The Board also understands that Manitoba Hydro intends to allocate only $1.25 billion of capital cost to the Wuskwatim Power Limited Partnership, employing $526 million of Manitoba Hydro's internally generated funds (accumulated since 2003). This would result in net costs to the Wuskwatim Power Limited Partnership of $43 million (2012/13) and $75 million (2013/14), assuming Manitoba Hydro ratepayers have already invested approximately $500 million that could have been utilized to reduce its overall level of borrowing.

10.0.0 CAPITAL EXPENDITURES

10.1.0 Issues

10.1.1 Base Capital Expenditures

Manitoba Hydro divides its annual capital expenditures into two broad categories, namely (i) “base capital”, meaning investments in maintaining existing infrastructure that will not create new generation and are generally funded entirely from internal revenue sources, and (ii) “major new generation & transmission”, which is financed out of a mix of internally generated funds and new debt.

Actual base capital expenditures have grown from $361 million in 2004/05 to $458 million in 2011/12. Base capital expenditures are forecast to be $433 million in 2012/13 and increase to $503 million in 2013/14. Until 2011/12 internally-generated funds were more than sufficient to cover the base capital costs.

10.1.2 Major New Generation and Transmission Expenditures

Manitoba Hydro’s most significant new generation and transmission investments consist of Wuskwatim Generating Station, which has since come into service, as well as Keeyask Generating Station, Conawapa Generating Station, and the Bipole III Transmission Line. Major new generation & transmission projects are financed out of a mix of internally generated funds and new debt. Major new generation and transmission annual expenditures have grown from $159 million (2004/05) to $656 million (2011/12). Future forecast annual expenditures on major new generation and transmission will total (in $ million):

2012/13	2013/14	2014/15	2015/16	2016/17	2017/18	2018/19	2019/20
909	1,352	1,435	1,536	1,781	1,797	1,437	1,299

10.1.3 Capital Cost Escalations

The following table illustrates the progression of major generation and transmission project costs since Capital Expenditure Forecast CEF06. When Manitoba Hydro defined the major new generation & transmission program (circa 2008) the projected project costs at the time were about 60% of what they are currently projected to be.

Capital Cost of Major Projects ($millions)

	CEF-6	CEF-07	CEF-08	CEF-09	CEF-10	CEF-11	CEF-12
Wuskwatim G.S	$1,094	$1,275	$1,275	$1,275	$1,275	$1,375	$1,449
Wuskwatim Transmission	257	320	316	316	291	298	323
Wuskwatim Total Project	**1,351**	**1,595**	**1,591**	**1,591**	**1,566**	**1,673**	**1,772**
Pointe du Bois Improvements and Upgrade	834	818	818	-	-	-	-
Pointe du Bois Spillway	-	-	-	318	398	398	560
Pointe du Bois Transmission	-	83	86	86	86	86	86
Pointe du Bois Rebuild	-	-	-	-	1,538	1,538	1,538
Pointe du Bois Safety & Rehabilitation	-	-	-	-	50	50	183
Point du Bois Total Project		**901**	**904**	**404**	**2,072**	**2,072**	**2,367**
Herblet Lake Transmission	54	95	93	93	75	75	77
Bipole III	1,880	2,248	2,248	2,248	3,280	3,280	3,280
Riel C.S	103	105	268	268	268	268	268
Kelsey G.S	166	184	190	190	302	302	302
Kettle G.S	61	61	76	76	166	166	166
Slave Falls G.S	179	192	198	198	223	230	-
Conawapa	4,978	4,978	4,978	6,325	7,771	7,771	10,192
Keeyask G.S	-	-	3,700	4,592	5,637	5,637	6,220
500 KV Dorsey US Border	-	-	205	205	205	205	205
Northern Generating Station Improvements	-	-	-	-	536	649	649
Gillam Redevelopment and Expansion Program	-	-	-	-	-	-	367
Firm Import Upgrades	-	-	5	5	-	20	20
Additional North South Transmission	-	-	-	-	-	318	396
Total	**$9,606**	**$10,359**	**$14,456**	**$16,195**	**$22,101**	**$22,666**	**$26,281**

Manitoba Hydro advised that it has now added a Management Reserve to its estimates for remote northern Manitoba projects (Keeyask and Conawapa) to cope with cost escalations. The Management Reserve has not specifically defined the components of remote major generation and transmission projects that need upward cost adjustments. Lower construction productivity has been cited, as well as a broader North American demand for heavy construction resources.

The Consumers' Association of Canada (Manitoba) Inc. argued that Manitoba Hydro's Capital Expenditure Forecast CEF09 grossly understated the expected capital costs of Conawapa, Keeyask and Bipole III. The Consumers' Association of Canada (Manitoba) Inc. also expressed great concern about the actual cost increases experienced on the Wuskwatim project. In light of the on-going escalations of Bipole III, Keeyask and Pointe du Bois, The Consumers' Association of Canada (Manitoba) Inc. questioned Manitoba Hydro's forecasting capability as well its ability to manage its capital program.

The Consumers' Association of Canada (Manitoba) Inc. and the Green Action Centre both spoke to the need for greater Demand-Side Management spending in light of the proposed capital spending and supported the evidence of Mr. Dunsky, which advocated greater Demand-Side Management investments to mitigate the need for additional power resources. Mr. Dunsky stated that Demand-Side Management is the lowest cost resource for balancing supply and demand. The cost of Demand-Side Management is 2¢/kWh to 4¢/kWh. He stated that much could be done by Manitoba Hydro to increase its savings by using Demand-Side Management measures. Mr. Dunsky further stated that Demand-Side Management can defer expensive capital investment in new dam construction.

10.1.4 Incremental Cost and Revenue Assumptions

Between Capital Expenditure Forecasts CEF08 and CEF12, Manitoba Hydro's cost and revenue forecasts with respect to major new generation and transmission have changed materially. With respect to Wuskwatim, the changes suggest that the incremental export electricity generated by Wuskwatim will be sold at less than 50% of the incremental cost of generation. Similarly, under current assumptions, the cost of Bipole III will no longer be covered by export electricity sales from Keeyask Generating Station and Conawapa Generating Station, as the capital cost of those projects has nearly doubled. The following table highlights the Board's understanding of the most recent cost and revenue impacts based on projections taken from Capital Expenditure Forecast CEF12 and Integrated Financial Forecast IFF12, which suggest that annual revenues generated by these projects will not be enough to cover their incremental costs at the start of their operation.

Project	**Wuskwatim G.S & T**	**Keeyask G.S.**	**Conawapa G.S.**	**Bipole III**
In service Date	2012/13	2019/20	2025/26	2025/26
Capital Cost ($B)	$1 .77	$6.22	$10.19	$3.28
Annual In-Service Cost ($M)	$160	$560	$900	$300
Average Year Output (GWh)	1,520	4,400	7,000	11,400 *
Unit Output Costs (¢/kWh)	10.5¢	12.7¢	12.9¢	*2.6¢
Export Revenue Rate (¢/kWh)	3.2¢	8.0¢	9.0¢	N/A
Net Export Loss (¢/kWh)	7.3¢	4.7¢	3.9¢	N/A

*Incremental transmission capacity for output from Keeyask and Conawapa

The cost and revenue data will be further reviewed by the Board at the upcoming Needs For And Alternatives To (NFAT) hearing with respect to Manitoba Hydro's Preferred Development Plan.

10.1.5 Pointe Du Bois Spillway

When Manitoba Hydro purchased Winnipeg Hydro (circa 2003) there was an expectation that the Pointe du Bois station output could be significantly increased above 600 GWh. Replacement of the spillway was not contemplated. However, by Capital Expenditure Forecast CEF09 Manitoba Hydro had moved away from consideration of facility improvements and upgrades to the concept of total station replacement by 2016/17, including a replacement of the spillway.

In the 2010/11 Power Resource Plan, Manitoba Hydro indicated that the decision to rebuild the Pointe du Bois powerhouse has been deferred to 2030/31; decommissioning of the powerhouse at that time had not been ruled out.

In PUB/MH Pre-Ask 16, it is stated that Manitoba Hydro extensively studied decommissioning Pointe du Bois but assumed a new spillway would be required to maintain the upstream water regime and safely manage river flow. The cost was, at that time, estimated at $400 million. In Capital Expenditure Forecast CEF12, Manitoba Hydro is budgeting over $2.4 billion in capital spending on Pointe du Bois.

Manitoba Hydro is currently proceeding with the new spillway and substantial improvements to the main dam, stating that a 2007 guideline published by the Canadian Dam Association requires the spillway to be capable of handling a flow of 5,040 m^3/s, while the existing capacity is only 2,840 m^3/s. Manitoba Hydro's view is that this requires a replacement of the spillway. However, when the capacity of the powerhouse is added

to that of the spillway, Pointe du Bois can currently handle a maximum flow of 3,250 m^3/s at full supply level (4,560 m^3/s at overtopping). The Board received submissions from Mr. Per Stokke, P. Eng., a retired Manitoba Hydro engineer, suggesting that this capacity was sufficient to allow the deferral of the spillway replacement until such time as the powerhouse is rebuilt. Mr. Stokke further questioned whether modifications to the river regime were seriously explored. His presentation is summarized in Section 15 of this Order.

10.2.0 Board Findings

The Board accepts that Bipole III is being constructed to improve domestic reliability and to permit exports into the United States. However, the Board is concerned that Bipole III may not achieve any incremental positive revenue from exports within the 20-year planning period. Accordingly, the Board will establish a deferral account to assist in funding Bipole III in-service costs. The deferral account will be established based on the revenues from a 1.5% portion of the 3.5% rate increase to be collected from customers commencing May 1, 2013.

In the Board's view, the introduction of a Management Reserve to define project cost escalation in future major capital projects, while justifiable, provides little or no assurance that the project costs will not increase further in light of the overlapping construction schedules of the many projects to be undertaken by Manitoba Hydro.

With respect to Manitoba Hydro's Power Resource Plan, the Board is of the view that the Plan does not clearly define Manitoba Hydro's firm contract obligations in terms of long-term/short-term/diversity sales and assured purchase opportunities. Manitoba Hydro's Recommended Plan and Alternatives identified in its recent Power Resource Plans is expected to be a subject of the Needs For And Alternatives To hearing process.

Regarding the planned Pointe du Bois spillway replacement, the Board understands that Manitoba Hydro's decision to replace the spillway to provide capacity of 5,000 m^3/s for a maximum probable flood was made prior to Sept 24, 2010 on the basis that a new powerhouse would be in service in 2030/31 and the existing spillway and main dam could not be economically rehabilitated, and operational safety issues precluded the longer term usage of the existing spillway.

The Board understands the cost implications of Pointe du Bois to be as follows:

2013/14 to 2015/16	**Total Capital Cost ($M)**	**In-Service Incremental Cost ($M)**	**Incremental Output Costs (¢/kWh)**	
Spillway Rebuild	560	50	8.2	(600 GWh)
Transmission Upgrade	86	8	1.3	(600 GWh)
Powerhouse Temporary Rehabilitation	183	18	3.0	(600 GWh)
Subtotal	829	76	12.5	(600 GWh)
2022/23 – 2031/32				
Powerhouse Rebuild	1,538	138	18.4	(750 GWh)
Overall Total (if station output increased to 750 GWh)	2,367	214	28.5	(750 GWh)

In the Board's view, based on the above analysis, the Pointe du Bois project, if developed, does not on the face of it appear to provide cost-effective energy to Manitoba Hydro customers. The decision to proceed with a Pointe du Bois rebuild should be subject to a more thorough review of the economics of the project before it proceeds. The Board recommends that it be mandated by the government of Manitoba to conduct a Needs for and Alternatives To (NFAT) process in order to review the economic rationale for the project.

11.0.0 LOAD FORECAST

11.1.0 Issues

Manitoba Hydro's domestic load growth history and forecast shows that the utility's actual gross firm domestic energy load peaked in 2008/09. The weather-adjusted gross firm load in that year was also near a historical peak, subsequently exceeded in 2011/12. Over the past 22 years, Manitoba Hydro's actual load grew by about 1.3%/year, while the weather-adjusted load grew by 1.5%/year.

In Integrated Financial Forecast IFF12 Manitoba Hydro anticipates a rebound in domestic load at generation from the ±24,000 GWh levels experienced in 2009/10, 2010/11 and 2011/12 to:

25,148 GWh (2012/13) including projected load losses of 3,400 GWh

25,597 GWh (2013/14) including projected load losses of 3,267 GWh

25,754 GWh (2014/15) including projected load losses of 3,197 GWh

26,006 GWh (2015/16) including projected load losses of 3,225 GWh

It appears that Manitoba Hydro's domestic load growth forecast is primarily predicated on a shift to electric heating as experienced prior to 2012. This assumption differs from Manitoba Hydro's Fuel Switching Report. It does not recognize the relatively lower natural gas cost since 2010 and the natural gas price outlook for the next decade.

Manitoba Hydro attributes almost all of the lower actual domestic loads to lower Top Consumer industrial energy consumption, partly as a result of the closure of a pulp and paper plant and the economic downturn. However, Manitoba Hydro continues to project a new industrial customer load of 100 GWh/yr being added in each and every year. Manitoba Hydro has also suggested that a new load, equivalent to Manitoba Hydro's largest customer, can be anticipated in the near future to offset the impact of pending northern Manitoba smelter closures.

Energy conservation (Demand-Side Management) apparently is not credited with any of the load reductions.

The Consumers' Association of Canada (Manitoba) Inc. has raised concerns about Manitoba Hydro's assumption that domestic load is non-responsive to on-going rate increases. This, in the Consumers' Association of Canada (Manitoba) Inc.'s experience, is inconsistent with most models, although perhaps it is reflective of limited price elasticity.

The Green Action Centre sees potential for Demand-Side Management-related load reductions in both the neart-term and long-term. The Green Action Centre is concerned about the information contained in the Fuel Switching Report filed by Manitoba Hydro

that suggests fuel switching will account for 11% of the increase in net firm energy requirements from 2011/12 to 2030/31.

The Fuel Switching Report cited two reasons for fuel switching. The first is that some existing customers replace their natural gas space and water heating equipment with electric equipment. The second is that developers choose the installation of electric heating equipment in new homes in areas that are serviced by natural gas. Manitoba Hydro's study concludes that switching to electricity for space and water heating has consistently adverse impacts from the perspective of the customer, the utility, and the global environment.

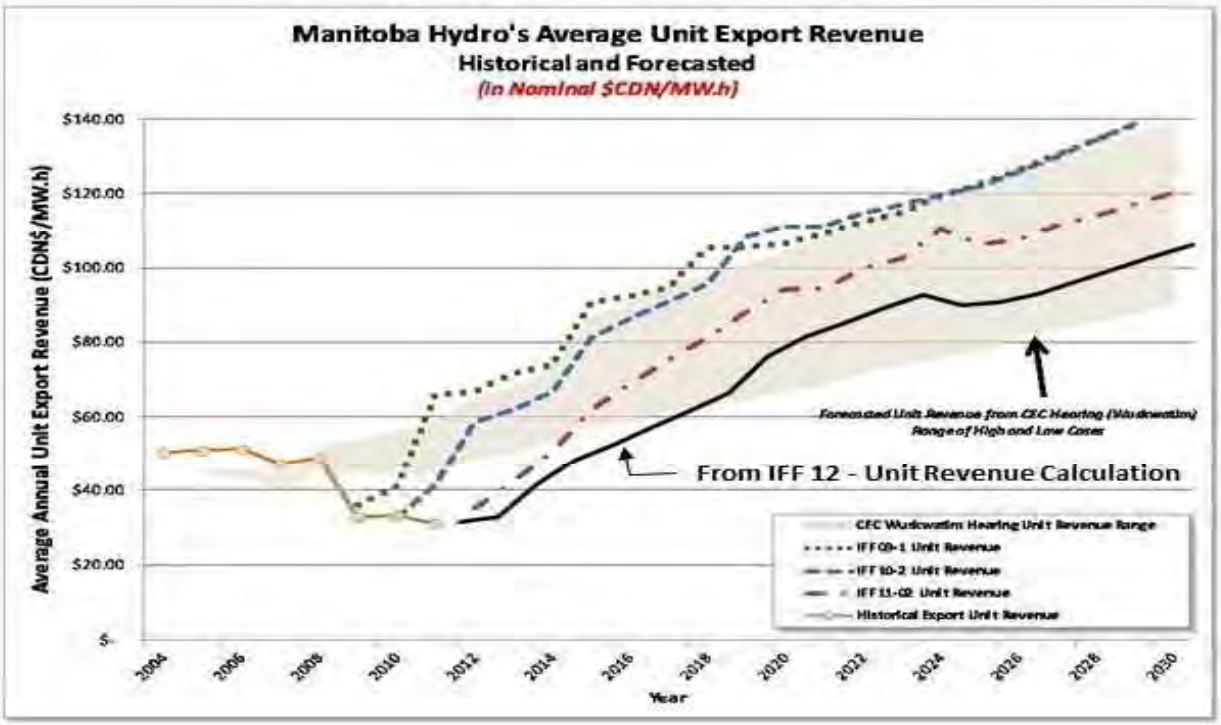
The Green Action Centre believes that proper measures ought to be introduced to ensure that better choices are made by customers in order to reduce the unwarranted electricity load growth. As recommended by the Green Action Centre's witness, Demand-Side Management programs that provide better information, rely upon trustworthy vendors with appropriate incentives, pay an adequate share of capital cost, and offer low-cost, on-bill financing transferable to future residents would assist customers in making choices that are environmentally more preferable. The Green Action Centre's witness also suggested that builders of electrically heated homes should pay connection fees that reflect the true cost of installation to the home buyers and the Province.

The Manitoba Industrial Power Users Group questioned Manitoba Hydro's industrial load growth assumptions considering that no new large industry has come to Manitoba since the late 1990's. Large customers use significant amounts of electricity. For example, Manitoba Hydro's largest industrial customer uses the equivalent of the entire output of the Wuskwatim Generating Station. If less expensive electricity options are available in other jurisdictions, such industrial customers could consider locating current, new and additional facilities in those other jurisdictions. This situation will likely be exacerbated by Manitoba Hydro's forecast of rate increases over the next two decades.

11.2.0 Board Findings

The Board is aware of several recent reports that predict lower electricity demand in the United States. Similarly, the Board is concerned that Manitoba Hydro's projected domestic load growth of 1,700 GWh over the next four years is overly optimistic. Manitoba Hydro's projections that 60% of new homeowners will opt for electric heat appears at odds with the utility's Fuel-Switching Report and the low natural gas prices available to homeowners. The utility's projected load growth of 1.5% per year also does not reflect the potential impacts of Demand-Side Management and rising electricity rates.

The Board is also concerned about Manitoba Hydro's weather adjustment calculation process, domestic loss assumptions and all-electric load growth assumptions. However,



the Board expects that these issues will be more fully canvassed at a Needs For And Alternatives To hearing into Manitoba Hydro's Preferred Development Plan.

12.0.0 EXPORT MARKETS

12.1.0 Issues

Manitoba Hydro's primary export market is the market operated by the Midwest Independent System Operator, which, over the past several years, has seen reduced load-growth, an increase in subsidized wind power from U.S.-based wind farms, increased utilization of combined-cycle combustion turbine gas generation, imports into the Midwest Independent System Operator market from other U.S.-based utilities, and no increase in exports from Manitoba Hydro. Since 2008/09, spot market export prices have decreased from about 8.0¢/kWh to an average of 3.2¢/kWh.

The chart filed by Manitoba Hydro in response to Information Request PUB/MH II-14 illustrates Manitoba Hydro's actual average export price experience and Manitoba Hydro's average price forecasts in successive Integrated Financial Forecasts IFF09-1, IFF10-2, IFF11-02 and IFF12, as well as Manitoba Hydro's Clean Environment Commission Wuskwatim Hearing "high" and "low" forecast in 2003.

From the chart, it is apparent that from Integrated Financial Forecasts IFF09-1 to IFF12, the average export price forecast has dropped by about 3.5¢/kWh for the entire period until 2030/31. This represents revenue decreases of more than $120 million/yr until 2019/20 compared to Integrated Financial Forecast IFF09-1. Beyond 2024/25, it

represents an export revenue loss of more than $200 million/yr. After 2024/25 the reduced export revenue would be about $300 million/yr.

As illustrated in Information Request PUB/MH I-18(a) and PUB/MH II-12(a) and (c), post-2008 to 2011, Manitoba Hydro sales into the Midwest Independent System Operator market have not increased, but have actually declined by about 600 GWh. Electricity suppliers from other regions have increased their supply into that market by about 14,000 GWh. Wind energy sales have increased by 25,000 GWh. Natural gas generation output has increased by about 10,000 GWh. Overall load growth of about 35,000 GWh was served despite lower coal and nuclear output.

Purported new or pending supply resources in the Midwest Independent System Operator market include 2,200 MW of new combined-cycle combustion turbine generation, 3,000 MW of additional wind generation (not including new Northern States Power ventures) and increasing imports as renewable energy surpluses resources grow.

The installed capacity of combined-cycle combustion turbine generation in the Midwest Independent System Operator region in 2008 was about 20,000 MW but was only being utilized 12% of the time. By 2011 this capacity had increased to about 21,000 MW but utilization had increased to 18%.

Manitoba Hydro's Northern States Power, Minnesota Power and Wisconsin Public Service existing and pending export contracts provide assured revenues for capacity and energy. Manitoba Hydro's firm contract fixed-price long-term export commitments are about 2,000 GWh per year (prior to 2015/16), about 1,200 GWh a year from 2015/16 to 2019/20, about 3,200 GWh a year from 2020/21 to 2024/25 and about 1,500 GWh a year until 2035. In average flow years, this means firm contract prices will apply to no more than approximately 50% of the energy sold to 2024/25 and less than 20% thereafter.

Both the Consumers' Association of Canada (Manitoba) Inc. and the Manitoba Industrial Power Users Group expressed concerns about the reliability of Manitoba Hydro's export forecasts, and noted that post-shale gas forecasts present a challenge. However, in the Manitoba Industrial Power Users Group's view, the decline in Midwest Independent System Operator energy prices is close to having reached its bottom, so the risk involved as a result of low export prices is less than previously anticipated.

12.2.0 Board Findings

The Board questions Manitoba Hydro's projection that average export market prices are set to increase to 4.1¢/kW in 2014/15 and 4.8¢/kWh in 2015/16, and believes that prices around 3.2¢/kWh are more realistic. In light of low shale gas prices and increasing availability, the Board is not confident that Manitoba Hydro will return to pre-2009/10 export revenue levels within the next decade.

The Board accepts that once Manitoba Hydro's new export contracts come into effect, the average export price realized by Manitoba Hydro will increase. However, with firm prices applying to only 25-50% of average export sales, revenues will still be primarily driven by the opportunity market and likely lower than forecast in Integrated Financial Forecast IFF12. The Board further notes that the Integrated Financial Forecast IFF12 first predicts export prices to rise above 10¢/kWh after 2028; this suggests that a project, such as Wuskwatim, would not be profitable based on export sales, until after 2028, and possibly even later, if market prices do not rebound as predicted by the Forecast.

13.0.0 DEMAND-SIDE MANAGEMENT

13.1.0 Issues

13.1.1 Manitoba Hydro's Power Smart Plan

Manitoba Hydro's Power Smart Plan consists of Demand-Side Management energy conservation and load management activities designed to lower the demand for both electricity and natural gas in Manitoba. Manitoba Hydro's 2011 Power Smart plan reflects spending of $34.4 million in 2012/13 and $34.7 million in 2013/14. However, in the course of the General Rate Application, Manitoba Hydro filed an update which lowered estimated spending to $28.5 million in 2012/13 and $28.0 million in 2013/14. The reductions were part of Manitoba Hydro's capital prioritization plan, reflecting a decreased availability of economically beneficial Demand-Side Management opportunities in the Manitoba marketplace. Manitoba Hydro amortizes its Demand-Side Management spending over a 10-year period.

The current 15-year Power Smart Plan targets 597 MW and 1,944 GWh of energy savings, representing 3.8% of the estimated electric load forecast for 2025/26. Cumulative energy and demand reduction achieved (including savings to date) is forecast to achieve 3,283 GWh/year of energy savings and 906 MW of winter demand by 2025/26. The cumulative savings are forecasted to reduce carbon dioxide (CO_2) equivalent emissions by 2.5 million tonnes.

Manitoba Hydro initially evaluates new Demand-Side Management programs based on a Marginal Resource Cost Screen, which compares the expected benefits to the incremental capital costs. If programs pass the initial screening, they are subjected to a more detailed analysis based on the Total Resource Cost and Rate Impact Measure tests.

Manitoba Hydro utilizes a marginal cost value of 8.5 ¢/kWh in its Demand-Side Management screening, which includes the expected value of electricity exports. However, consecutive Integrated Financial Forecasts since IFF09 have shown a material decline in the export revenues forecast. Manitoba Hydro has indicated that if incremental export revenues were to decline to a level where they no longer offered an offsetting value, the marginal benefits of Demand-Side Management would then shift from the export market value to a valuation of the benefit of deferring new generation facilities, recognizing that there is an economic benefit to achieving load savings in the Province.

Both the Consumers' Association of Canada (Manitoba) Inc. and the Green Action Centre expressed concern about Manitoba Hydro's reduction in Demand-Side Management programming, especially in light of increasing electricity prices. Philippe Dunsky, an expert retained jointly by the Consumers' Association of Canada (Manitoba)

Inc. and the Green Action Centre, indicated that Power Smart was costing the utility 1.8¢/kWh but could create 8.5¢/kWh in additional revenue, and that it could be in the public interest to have a slight increase in rates offset by a reduction in consumption, such that overall costs are lowered. Mr. Dunsky's benchmarking study indicated that comparable utilities are targeting 1.0-2.6% savings from Demand-Side Management, while Manitoba Hydro only targets 0.3%.

Considering Manitoba Hydro's significant proposed rate increases for the two test years, and with indicated rate increases of close to double the rate of inflation until 2030, the dramatic decline in Demand-Side Management savings is a matter of grave concern to the Consumers' Association of Canada (Manitoba) Inc. In their view, there are many opportunities for Manitoba Hydro to promote its existing products and Manitoba Hydro's failure to maintain and enhance its Demand-Side Management portfolio will result in considerable foregone opportunity in terms of cost reductions.

The Consumers' Association of Canada (Manitoba) Inc. argued that the $23 million amount related to the deferral account for the 2010/11 and 2011/12 years belonged to ratepayers, but that if there was a mechanism within the Board's jurisdiction to target the funds for Demand-Side Management, the Consumers' Association of Canada (Manitoba) Inc. would be open to dialogue. It argued that there would be a benefit to an independent review of Manitoba Hydro's Demand-Side Management measures.

The Green Action Centre's witness suggested that the marginal cost used by Manitoba Hydro to evaluate Demand-Side Management programs was too low and should be based on the cost of bringing new hydro generation for domestic consumption into service. He further recommended that the specific marginal cost for each customer class should be used for the test.

The Green Action Centre recommended that the Board require Manitoba Hydro to increase its Demand-Side Management programming to target energy savings of 1.0% by 2015 and sustain that ratio thereafter. The Green Action Centre further recommended that the Board build into the rate application an amount to supplement Demand-Side Management spending of $41 million per year, as suggested by Mr. Dunsky.

13.1.2 Lower Income Energy Efficiency Program

The objective of Manitoba Hydro's Lower Income Energy Efficiency Program is to ensure that the financial benefits associated with implementing Power Smart measures can be realized by low-income consumers. Targeted measures addressed by the program include low-cost or no-cost energy efficiency initiatives such as compact fluorescent light bulbs, low-flow water faucets, and subsidized measures such as increased basement and attic insulation and the installation of high-efficiency gas furnaces. The program is delivered through community-based organizations and the participation of individual households.

2011 Power Smart Plan target participation in the Lower Income Energy Efficiency Program has been set at 557 homes per year, down from 883 homes per year in the 2009 Power Smart Plan. The revised target is based on actual participation experience gathered from working with community based organizations and social agencies. With respect to the First Nations Power Smart Program, which focuses on 24 different communities, Manitoba Hydro has completed 597 homes by the end of August 2012. Manitoba Hydro is forecasting to complete 751 additional households by 2016/17.

The Consumers' Association of Canada (Manitoba) Inc. recognized that the Lower Income Energy Efficiency Program is making good progress with respect to government-owned social housing and First Nations, but expressed concern about the program not being able to effectively reach tenants.

The Manitoba Industrial Power Users Group focused its submissions on the accounting implications of the Demand-Side Management program, disagreeing with Manitoba Hydro's proposition that, as of the date of International Financial Reporting Standards implementation, Demand-Side Management expenditures be written off in the year in which they are incurred rather than treated as retained earnings. In the Manitoba Industrial Power Users Group's view, this does not fairly represent the economic profile of Demand-Side Management spending, and the Board should ensure that rates continue to be based on the existing practices.

13.1.3 The Affordable Energy Fund

The Provincial Government passed *The Winter Heating Cost Control Act* in 2006. The Act established the Affordable Energy Fund, requiring Manitoba Hydro to contribute 5.5% of its fiscal 2006/07 gross export revenues to the Affordable Energy Fund. This resulted in a fund of $37.4 million to be utilized for various energy efficiency initiatives, including assisting low-income electricity and natural gas customers. Manitoba Hydro has spent $17 million of the fund by the end of 2011/12 and forecasts depleting the fund by 2020/21.

Manitoba Hydro has $19 million reserved for low-income programs that would mostly benefit electricity and natural gas space-heated homes, and would provide for programs that would not otherwise be funded from Manitoba Hydro/Centra's rate-based Demand-Side Management programs.

Manitoba Hydro has forecast to spend approximately $2.5 million on the Lower Income Energy Efficiency Program during the two test years, including $1.8 million from the Affordable Energy Fund.

The Affordable Energy Fund is continued under *The Energy Savings Act,* passed in 2012, that leaves it up to the discretion of the board of Manitoba Hydro to allocate additional funds in the future. The new statute further requires Manitoba Hydro to

prepare an energy efficiency plan in consultation with the minister responsible for Manitoba Hydro by March 31, 2013.

13.2.0 Board Findings

The Board believes that it is fundamental that Manitoba Hydro enhances Demand-Side Management efforts from those reflected in the 2011 Power Smart Plan. Given an outlook where rates are forecast to more than double over the next twenty years, which is twice the expected level of inflation, the Board is of the view that Manitoba Hydro should be providing ratepayers with the tools to mitigate their exposure to rising electricity bills through Demand-Side Management.

The Board does not agree with Manitoba Hydro's decision to cut Demand-Side Management spending and targeted savings. For rate-setting purposes, Demand-Side Management spending and its related revenue requirement costs will be established at a minimum of $34 million for 2012/13 and $35 million in 2013/14, consistent with the 2011 Power Smart Plan. If monies are not spent on the Demand-Side Management programs to meet the minimum threshold, any underspend from the set levels will be accumulated in a deferral account.

DSM spending is beneficial to ratepayers and will be more prominent in the future as pressures from increasing rates continue in future years. The Board urges Manitoba Hydro to incorporate Demand-Side Management programs into its plan that target higher levels of energy efficiency, as was recommended by Mr. Dunsky and endorsed by the Consumers' Association of Canada (Manitoba) Inc. and the Green Action Centre. The Board further notes that Demand-Side Management may have a role in limiting future load growth and expects to evaluate Demand-Side Management options in the upcoming Needs For And Alternatives To hearing into Manitoba Hydro's Preferred Development Plan. The Board notes Mr. Dunsky's testimony that Keeyask could be delayed several years and Conawapa could be delayed indefinitely with an increased focus on Demand-Side Management.

In evaluating Demand-Side Management programs, the Rate Impact Measure test should not be a barrier to higher levels of Demand-Side Management savings and should be applied only at the portfolio level, not the individual program level. The Board recommends that Manitoba Hydro undertake an independent assessment of its Power Smart Plan with a goal of evaluating and improving the Plan. The Board further recommends that Manitoba Hydro should consider revising the marginal cost used to evaluate Demand-Side Management to include the cost of new generation. In light of low export rates, a marginal cost focus on generation deferral rather than export pricing may be preferable.

Manitoba Hydro has made modest progress in implementing the Lower Income Energy Efficiency Program, and the Board believes that the reduction in homes being targeted for the Lower Income Energy Efficiency Program is a reflection of the difficulty in reaching the target market. The Board urges Manitoba Hydro to continue or increase its

efforts in implementing the Lower Income Energy Efficiency Program, as increasing energy prices will place a significant burden on low-income individuals.

14.0.0 SPECIAL RATES

14.1.0 Curtailable Rate Program

Manitoba Hydro's Curtailable Rate Program allows the Utility to curtail a portion of a large industrial customer's peak load in exchange for reduced rates on that same portion of the load when not curtailed. The objective of the program is to be able to reduce electrical load at peak times when the system is near maximum capacity.

Manitoba Hydro is proposing to reduce the maximum amount of Curtailable Rate Program capacity that Manitoba Hydro will contract for with General Service Large customers, but expects to achieve this with minimal impact to existing customers. Presently the Curtailable Rate Program cost is about $6 million/yr or about 10% of Manitoba Hydro's annual demand billing to General Service Large >100 customers. The apparent value of short-term capacity in the Midwest Independent System Operator Capacity market has dropped substantially due to lower load growth in the area and also due to the greater availability of quick response natural gas generation. Additionally, when Manitoba Hydro brings Keeyask Generating Station on-line, there will be surplus capacity in Manitoba Hydro's system. That, coupled with lower Midwest Independent System Operator reserve requirements, removes much of the benefit to Manitoba Hydro of the Curtailable Rate Program.

The Consumers' Association of Canada (Manitoba) Inc. suggested that Demand-Side Management expansion in lieu of new generation could include more Curtailable Rate Program demand reduction initiatives. The Manitoba Industrial Power Users Group believes that the Curtailable Rate Program should continue at current or expanded levels of capacity available with the program. The Curtailable Rate Program is valuable to existing customers who are looking to expand operations. Manitoba Hydro should investigate additional rate options for industry such as Demand Response and Feed-in Self-Generation.

The Board accepts Manitoba Hydro's rationale for reducing the Curtailable Rate Program offering in response to the current capacity market decline. However, recognizing the potential Demand-Side Management resource expansion proposals that may be put forward during the pending Needs For And Alternatives To process, the Board will approve Manitoba Hydro's proposed Curtailable Rate Program cutback on an interim basis until a subsequent General Rate Application.

14.2.0 Surplus Energy Program

The Surplus Energy Program is a mechanism by which Manitoba Hydro prices electricity generated in excess of its immediate requirements and sells it based on pricing determined by a Board-approved methodology. Manitoba Hydro plans to make the Surplus Energy Program a permanent offering. This, along with some other

changes, is intended to broaden the appeal of Surplus Energy Program to the General Service Medium and General Service Large <100 customer sub-classes which currently have enrolled in the Option 2 Surplus Energy Program. Manitoba Hydro is also looking for a final approval of a revised Option 1 which currently has no customers. The change would also allow some General Service Medium and General Service Large customers to nominate different levels of Surplus Energy Program energy purchases in peak periods (5x8 weekdays – day time), off-peak periods (7x8 weekdays – night time), and shoulder periods (other weekday or weekend periods). These changes would allow customers to tailor their optional Option 1 purchases to minimize costs and/or maximize purchase effectiveness. Manitoba Hydro has not set any overall limits on the size of the Surplus Energy Program purchases, but only on individual customers' proportion of load.

Manitoba Hydro would also like to eliminate the need for a professional engineering seal on the weekly Surplus Energy Program pricing.

The Consumers' Association of Canada (Manitoba) Inc. and the Green Action Centre took no position with respect to the Surplus Energy Program. The Manitoba Industrial Power Users Group is supportive of the time-of-use amendment of Option 1 and making the Surplus Energy Program a permanent offer.

The Board agrees that making the Surplus Energy Program Options 2 and 3 permanent rate offerings has no obvious downside and will grant approval subject to the continuation of annual reports. It is the Board's view that allowing Option 1 to designate different reference levels based on time of use appears to have merit as an interim Surplus Energy Program amendment. However, permanent approval should await actual events with respect to load shifting.

The Board believes that the Surplus Energy Program involves the defining of surplus electricity and detailing of an acceptable pricing strategy for summer and winter sales and purchases. Surplus Energy Program price schedules are a weekly commitment by Manitoba Hydro to supply energy and not just a price schedule. As such, the Board would consider a division manager's signature as an adequate substitute for a professional engineer's seal.

14.3.0 Time-of-Use Rates

Time-of-Use Rates for industry will be addressed at a Cost of Service/Time of Use Hearing before the Board.

14.4.0 Diesel Communities

In Order 116/12 the Board approved a 6.5% interim rate increase on the full-cost portion of the rate applicable to General Service and government customers in the diesel zone. This increase is projected to provide $200,000 in 2012/13 and $300,000 in 2013/14. In

total, there are eight interim diesel orders identified in Manitoba Hydro's filing. Manitoba Hydro requested that if Manitoba Keewatinawi Okimakanak files the true copies of the settlement agreement prior to the issuance of the General Rate Application Order, the interim orders be approved as final. If the true copies are not filed, Manitoba Hydro requests the Board's final approval be granted conditional upon the filing of the true copies of the settlement agreement.

The Board is not prepared to finalize the interim orders until it has received true copies of the settlement agreement. Accordingly, the Board will address finalization when a true copy has been received.

15.0.0 PRESENTER SUBMISSIONS

15.1.0 Industry Presentations

The Manitoba Industrial Power Users Group

Mr. Bill Turner stated that the recent change in available lower-cost natural-gas-produced power in the U.S. is making it more difficult for some major Manitoba companies to be competitive in the export of finished goods. Given the relative importance of electricity to industry, both the actual price and the predictability of electrical costs are extremely important. The Manitoba Industrial Power Users Group asked the Board to help them retain their competitive position in Manitoba and in North America. In their view, dedication to providing reliable firm power at fair and reasonable rates, ensuring rates reflect cost of service, and developing innovative rate options that benefit both industry and Manitoba Hydro are important for the future growth of large industry in Manitoba.

Mr. Turner stated that the Manitoba Industrial Power Users Group questions if the timing is correct for Wuskwatim, Keeyask and Conawapa to go forward, and would like to understand the justifications for trying to complete as many of the expansions in a short order of time as proposed by Manitoba Hydro. Mr. Turner indicated that there are other opportunities to help alleviate some of the immediate concerns for increased power, such as the Curtailable Rate Program which was cut back by Manitoba Hydro. Mr. Turner also stated that if there were other options for curtailable rate programs that plants could be involved with, it would postpone some of that major development and spread it out until the U.S. economy changes, which would then promote higher export values. The Manitoba Industrial Power Users Group supports expansion and exports to other markets by Manitoba Hydro, but not at the sake of loss of domestic power loads.

Canexus

Mr. Dale Bossons stated that Canexus has made a lot of business decisions based on Manitoba's competitive power pricing. Canexus expanded its plant numerous times and continues to reinvest in the Brandon facility. However, it will not proceed with the expansion it was planning for economic reasons. As electrical pricing in Manitoba is forecast to increase, it makes it harder to justify capital expenditures into the facility. Mr. Bossons further stated that the Louisiana plant Canexus relocated to Brandon several years ago would now be more competitive in Louisiana, considering the current economic environment.

In that regard, Mr. Wayne Yan spoke of special programs available in Louisiana, in particular, a special rate program for electrochemical producers through Entergy, in which the demand cost is not charged. Mr. Yan suggested such a program could be beneficial to attract investments and to retain companies in Manitoba.

Mr. Bossons indicated that the proposed increase of 3.5 percent for this year is equivalent to electricity costs of $2 million for Canexus, and the planned increases over the next five years amount to $24 million for the plant in Brandon. These extremely significant amounts have major decision-making impacts on Canexus' future growth. Mr. Bossons mentioned that through the Curtailable Rate Program, Canexus has the ability to supply Manitoba Hydro with up to 168 megawatts of power on short notice to assist it in its times of need. Canexus is very interested in seeing this program continue into the future.

Gerdau Steel

Mr. Dave Forsyth indicated that with the current Application, by April 1st, 2013, Manitoba Hydro's rates will have increased by almost 35% for industrial customers since 2004, with a rate increase of over 9% for the 15 month period started in January 2012. This recent rate uncertainty has resulted in budget variances for the Gerdau Manitoba plant, preventing the plant from making investment decisions with confidence.

Mr. Forsyth stated that Manitoba Hydro developed the Demand Billing Concession Program, which helped Gerdau following the 2008 economic downturn. However, the previous Board ordered repayment of the concession long after the period had passed, creating another episode of uncertainty for the plant. Mr. Forsyth indicated that participating in the Curtailable Rate Program is the only option available for Gerdau to lower the limit of Option A megawatts.

Mr. Forsyth stated that Gerdau recommends this Board to advise Manitoba Hydro to explore other opportunities in demand response, such as economic demand response or price response and expanding interruptible contracts. In Gerdau's view, regulation should achieve firm, low cost, stable power rates that are necessary to maintain investment and jobs in the province. Rate stability is a key input when making long-term investment decisions. Mr. Forsyth requested that the Public Utilities Board reconsider the contemplated increases in this Application, and since the industrial class has been paying above the measured cost of service for a very long time, Gerdau requests that the rates reflect the cost of service for their customer class.

15.2.0 Individual Presenters

Doug Biggs

Mr. Biggs stated that Manitoba Hydro should cut back on its expenses rather than require the customers paying more at the whim of Manitoba Hydro's revenue shortfalls.

Carol Boitson

Carol Boitson presented her objection to the 4% rate increase being sought every year by Manitoba Hydro. In her opinion, Manitoba Hydro's executives should have lower salaries instead.

Allan Ciekiewicz

Mr. Ciekiewicz provided the Board with a written presentation together with his oral presentation. The presentation by Mr. Ciekiewicz covered a variety of topics from Manitoba Hydro's forecasts and projections, including an emphasis on rate increases.

Mr. Ciekiewicz also provided the Board with a series of recommendations that can be found starting at page 550 of the Transcript.

John Corden

Mr. Corden requested the Board to deny the increase being sought by Manitoba Hydro. Mr. Corden also questions Manitoba Hydro's plan to develop the infrastructure for exports while export revenues are currently decreasing due to the US using other forms of energy. Mr. Corden requested the Board to put a stop to Manitoba Hydro's mismanagement.

Brandy Fleury & Jennifer Pacaud

Ms. Fleury & Ms. Pacaud expressed concerns over Manitoba Hydro's requested rate increase. Since Manitoba Hydro sells Manitoba's power at a low premium price to the US, the maintenance of the power lines should be paid out of the revenue generated to supply those states with their power. Mrs. Fleury & Mrs. Pacaud believe the citizens of Manitoba should not have to pay to supply those in the US.

Sandra Giese

Ms. Giese provided the Board with her concerns and disapproval for the proposed rate increases for 2013. In Ms. Giese's view, Manitoba Hydro customers should not go through rate increases of 3-4% for each of the next 18 years to bail out Manitoba Hydro from losses due to poor management and planning. Ms. Giese questions Manitoba Hydro's expectations for exports from their future dam projects considering US energy attitude currently is to be self-reliant.

Ms. Giese stated that alternatives and new energy technologies should be investigated and encouraged. Ms. Giese also spoke of Manitoba taxpayers experiencing a wave of increases at every level, creating vulnerability for some segments of the population.

Justin Jaron Lewis

Mr. Lewis objected to the proposed rate increases being sought by Manitoba Hydro. As a Crown Corporation, Manitoba Hydro has a responsibility to serve the public interest, which does not require maximizing its profits or proceeding with new large-scale dam projects when the market for exported hydroelectricity is in steep decline. Mr. Lewis further stated that in light of U.S. plans for energy self-sufficiency, it is likely that Manitoba energy will not continue to be in demand in the United States, and that Manitoba Hydro will need to reframe its business model.

Gary Luby

Mr. Luby stated his outrage at Manitoba Hydro's proposed rate increases for the next 18 years. In Mr. Luby's opinion, the costs of building dams, and the proposed hydro line down the east side of Lake Winnipeg, should be incurred by the customers in the United States and the other Provinces, as they will be the ones supplied by those major projects. Mr. Luby further stated that it is unacceptable for Manitoba Hydro to sell inexpensive hydroelectricity to American customers. Mr. Luby indicated that Manitoba Hydro appears to be mismanaged, and that it should be run as a business or be privatized.

Douglas Macduff

Mr. Macduff provided comments on why the Public Utilities Board should refuse Manitoba Hydro's request for a 3.5% increase on April 1, 2013 and rates be rolled back instead. Mr. Macduff questions the necessity of building another series of dams, considering Manitoba Hydro is having problems selling the extra hydroelectricity. Mr. Manitoba Hydro should also not be supporting and/or sponsoring various organizations, and should end the Power Smart Program.

Allison Reid

Mrs. Reid presented her concerns over the new rate increase proposed by Manitoba Hydro. Mrs. Reid questioned why she was on the hook for an 8% increase for a single year. She is concerned the cost of living is going up but not the wages. In Mrs. Reid's opinion, Manitoba Hydro should cut back its expenses, or decrease its executive salaries and she urges the Board to not allow this increase.

Per Stokke

Mr. Stokke, a former Manitoba Hydro engineer previously involved in the planning of Pointe du Bois, provided the Board with a written presentation together with his oral presentation. Mr. Stokke questions Manitoba Hydro's decision to replace the spillway at

Pointe du Bois, and whether Manitoba Hydro had credible and defensible evidence that the spillway does not meet the Canadian Dam Safety Guidelines with respect to required capacity and that it therefore must be replaced. Mr. Stokke stated that Manitoba Hydro does not appear to have an open and transparent document with a detailed account of the decision-making process, as required by the Guidelines.

Mr. Stokke indicated that in 2002, a world-renowned engineering consultant and contractor suggested a repair of the existing spillway was possible at a cost of about 4 to $6 million, a pittance compared to the $400 million cost of the replacement spillway.

Mr. Stokke indicated that to determine if an existing dam is safe enough, Manitoba Hydro has neglected to use the necessary Guideline's risk-based approach and only used the standards approach. It is Mr. Stokke's opinion that Manitoba Hydro owes it to the ratepayers and owners to provide higher-level studies.

THE PUBLIC UTILITIES BOARD

"RÉGIS GOSSELIN, B.A., M.B.A., C.G.A."
Chair

"HOLLIS SINGH"
Secretary

Certified a true copy of Order No. 43/13
issued by The Public Utilities Board

Secretary

APPENDIX A – APPROVALS SOUGHT BY MANITOBA HYDRO

Manitoba Hydro requested the following:

(a) Approval, on an interim basis, of rate schedules incorporating an across the board 2.5% rate increase on currently billed rates, effective September 1, 2012, sufficient to generate additional revenues of $20 million in 2012/13;

(b) Approval of a further 3.5% increase in overall revenue effective April 1, 2013, sufficient to generate additional revenues of $48 million in 2013/14;

(c) Approval to maintain in base rates the rates approved by the Public Utilities Board in Orders 30/10 and 40/11, and include in current year revenues the revenues previously billed and collected, which have been accumulated in the deferral account pertaining to rates implemented April 1, 2010;

(d) Final approval of Orders 32/12 and 34/12 approving interim rates effective April 1, 2012, and final approval of any other interim rate Orders issued subsequent to the filing of the Application and prior to conclusion of this proceeding;

(e) Approval, on an interim basis, of rate schedules incorporating a 6.5% rate increase effective September 1, 2012 (consistent with previous and proposed rate increases for grid customers), for the full-cost portion of the rate applicable to general service and government customers in four remote communities served by diesel generation, sufficient to generate additional revenue of $0.2 million in 2012/13;

(f) Confirmation that the Board accepts the rate approval process given proposed modifications to the Terms and Conditions of the Surplus Energy Program, as will be discussed in Tab 12 of this Application;

(g) Confirmation that the Board accepts the rate approval process given proposed modifications to the Curtailable Rate Program ("Curtailable Rate Program");

(h) Final approval of all Surplus Energy Program interim *ex parte* rate orders as will be set forth in Tab 11 of this Application, as well as any additional Surplus Energy Program *ex parte* rate orders issued subsequent to the filing of this Application and prior to the Board's order in this matter;

(i) Final approval of Curtailable Rate Program *ex parte* Order 52/12 as well as any additional *ex parte* orders issued in respect of the Curtailable Rate Program issued subsequent to the filing of this Application and prior to the Public Utilities Board's order in this matter; and

(j) Final approval of diesel zone interim Orders (17/04, 46/04, 159/04, 176/06, 1/10, 134/10, 1/11 and 148/11), subject to confirmation that MKO has provided the parties to the agreement with the required affidavits from representatives of signatories to the agreement, as well as any additional diesel zone interim orders issued subsequent to the filing of this Application and prior to the Public Utilities Board's order in this matter.

APPENDIX B – APPEARANCES

R. Peters A. Southall	Counsel for The Manitoba Public Utilities Board (Board)
P. Ramage O. Fernandes	Counsel for the Manitoba Hydro Electric Board (Manitoba Hydro)
B. Williams	Counsel for Consumers' Association of Canada (Manitoba) Inc.
A. Hacault	Counsel for the Manitoba Industrial Power Users Group
W. Gange P. Miller	Counsel for the Green Action Center
D. Pambrun	Counsel for the City of Winnipeg
M. Anderson	Manitoba Keewatinowi Okimakanak

APPENDIX C – WITNESSES FOR MANITOBA HYDRO

S. Thomson	President and CEO
V. A. Warden	Senior Vice-President, Finance & Administration and Chief Financial Officer
R. Wiens	Division Manager, Rates & Regulatory Affairs
D. Cormie	Division Manager, Power Sales and Operations Division
D. Rainkie	Corporate Controller, Corporate Controller Division
M. Schulz	Corporate Treasurer
T. Miles	Manager of Resource Planning and Market Analysis
L. Morrison	Division Manager of Consumer Marketing and Sales
J. Hall	Division Manager of Distribution, Engineering, and Construction
W. Wittmeier	Division Manager, Apparatus Maintenance
M. Morin	Manager, Distribution Asset Maintenance
L. Kennedy	Vice President, Gannett Fleming Canada ULC.

APPENDIX D – INTERVENERS OF RECORD

Interveners of Record

Consumers' Association of Canada (Manitoba) Inc.

Green Action Centre

Manitoba Industrial Power Users Group

City of Winnipeg

Manitoba Keewatinowi Okimakanak

P. Chernick	President, Resource Insight Inc.

The Manitoba Industrial Power Users Group

P. Bowman	Consultant, InterGroup Consultants Ltd.

APPENDIX F – PRESENTERS

D. Biggs (written only)	Private Citizen
C. Boitson (written only)	Private Citizen
D. Bossons	Canexus, Brandon Plant Manager
A. Ciekiewicz	Private Citizen
J. Corden (written only)	Private Citizen
B. Fleury (written only)	Private Citizen
D. Forsyth	Gerdau Steel, Regional Energy Manager
S. Giese (written only)	Private Citizen
J. J. Lewis (written only)	Private Citizen
G. Luby (written only)	Private Citizen
D. MacDuff (written only)	Private Citizen
J. Pacaud (written only)	Private Citizen
A. Reid (written only)	Private Citizen
P. Stokke	Retired Manitoba Hydro engineer
G. Tobin	Gerdau Steel, Vice President, Plant Manager
B. Turner	The Manitoba Industrial Power Users Group, Interim Chair, retired Brandon Plant Manager, Canexus
W. Yan	Canexus, Manager Operational Services, Calgary

APPENDIX G - UNITS OF MEASUREMENT

Demand/Power represents the size of electricity load over a specific period of time.

expressed in:

- Watts (W)
- Kilo-watts (kW) - 1,000 watts
- Mega-watts (MW) - one million watts
- Giga-watts (GW) - one billion watts

Energy represents the amount of electricity provided to customers to do work or create heat, light, or sound. It is typically expressed as:

- Kilo-watt hours (kWh) - 1,000 watt hours
- Mega-watt hours (mWh) - 1,000 kilo-watt hours
- Giga-watt hours (GWh) - one million kilo-watt hours

Voltage represents the electric potential between two points expressed in**:**

- Volts
- Kilo-volts (kV) – 1,000 volts

Water Flow represents the rate at which water enters or leaves a system, expressed in:

- Cubic Meters per Second (m^3/s)

Tab 62

Before the Public Utilities Board of Manitoba

Manitoba Hydro

General Rate Application

2017/18 and 2018/19

Expert Testimony

of

Adonis Yatchew

November 15, 2017

Executive Summary

Background

1. **Projected Rate Increases** In May 2017, Manitoba Hydro filed a General Rate Application seeking rate increases of 7.9% for 2017/2018 and 2018/2019. Manitoba Hydro was granted an interim rate of increase of 3.36% effective August 1, 2017. In a subsequent letter, dated September 5, 2017, Manitoba Hydro advised the Board that it projects rate increases of 7.9% for each of the upcoming six fiscal years followed by an increase of 4.54% in the seventh year. The cumulative effect would be to increase electricity rates by close to 50% in real terms over the coming decade.

2. **Purpose of Testimony** In broad terms, the purpose of this testimony is to assess the likely impacts on, and responses of various customer groups to rate increases of this magnitude, as well as the implications for the Manitoba economy as a whole.

3. **Manitoba Resources and GDP** From a resource perspective, the Province of Manitoba has the good fortune of being endowed with vast hydroelectric resources, very productive agricultural lands as well as deposits of some metals and minerals. Manitoba has a diversified economy. Much like most advanced economies, the dominant share of GDP – 71% – is in the service sector. Manufacturing comprises about 10% of GDP, construction 9%, agriculture 4%, mining about 2%. There is considerable variation in energy intensity and electricity intensity across the various sectors and sub-sectors.

4. **Sources of Energy** The dominant source of Manitoba energy (approximately 37% in 2015) is hydroelectricity. About 60% of energy consumed in the residential sector is electricity, the industrial sector electricity share is 50%, and the commercial sector share is about 40%. These shares are considerably higher than the corresponding Canada-wide electricity shares which are 42% for the residential sector, 19% for the industrial sector and 35% for the commercial sector. Manitoba's reliance on electricity has been largely the result of low-priced electricity over many years. It is also suggestive of the potential for substitution to other energy sources, for example to natural gas where it is available, in the event of large and sustained electricity price increases.

Key Energy Trends Affecting Manitoba and Manitoba Hydro

5. **Natural Gas Prices** Natural gas prices are low and are likely to remain low for the foreseeable future. The extraction of natural gas from shale using hydraulic fracturing ('fracking') has revolutionized North American natural gas markets leading to excess supply.

    a. In the U.S., low natural gas prices have led to increased reliance on natural gas for generation of electricity; the cost is approximately 5 cents U.S. per kWh for high capacity combined-cycle generation. This in turn has a direct impact on the competitiveness of Manitoba Hydro in export markets.

b. In Canada, low natural gas prices influence energy choices made by all classes of customers. The potential for substitution towards natural gas in the face of major electricity price increases is a significant risk for Manitoba Hydro.

6. **Oil Prices** The shale revolution has triggered profound change in world oil markets, not only because it has led to new sources of supply, but more importantly, because it is *scalable*. Shale oil can be brought on in tiny increments, allowing rapid response to increases in price and thereby reducing OPEC market power. Oil market analysts consider a return to the high oil prices (which exceeded $100 USD/barrel prior to 2014) unlikely. Continued low oil prices have a strong influence on the prosperity of Alberta and on future development of the oil sands, which indirectly affect the Manitoba economy.

7. **Exchange Rates** Canada's exchange rate has historically been closely linked to world oil prices. Exchange rates have an important effect on Manitoba's economy as they influence demand for, and revenues from exports, including those in the electricity sector. Expectations about future oil prices inform forecasts of Canada/U.S. exchange rates.

8. **New Energy Technologies** The costs of new key energy technologies have been declining rapidly. Since 2008, costs of wind generation have dropped by 41%; photovoltaic costs have dropped more than 50%; battery costs by 73%; and LED bulbs by a stunning 94%. Continuation of these trends could have an important impact on Manitoba Hydro domestic and export markets.

9. **Decentralization of Electricity Systems** Electricity systems are facing powerful decentralizing forces, in part as a result of the scalability of new generation and storage technologies, and the enabling effects of information technologies. On the other hand, Manitoba Hydro, because of its vast hydroelectric resources, continues to operate with a highly centralized model, relying on massive investments in generation and transmission. These large investments have long life-times, and face financial risks in a world of rapid technological innovation.

Demand Modeling and Elasticities

10. **Types of Energy Models** There is a voluminous literature on the estimation of energy models of supply and demand. Many of the papers pertain to the electricity sector. Broadly speaking, three types of data can be used to infer the impacts of prices and of many other variables.

    a. **Time-Series Models** By observing patterns of demand over time within a specific geographic area, one can infer impacts of price changes on demand, and how energy users adjust to such price changes. There needs to be sufficient variation in prices for such models to produce useful results.

    b. **Cross-Section Models** By observing patterns of demand across various geographical areas at a single point in time, one can infer how different locations have adapted to varying price points, the kinds of industries that have been attracted, and the response of residential and commercial customers.

c. **Panel Data Models** Time-series and cross section data can be combined into more comprehensive specifications which permit estimation of impacts across locations and through time.

Each approach has advantages and disadvantages, and each can inform the present discussion of the potential impacts of large price changes on demand.

11. **Types of Demand Elasticities** Two classes of response measures, or 'elasticities' are particularly germane to the current discussion: the responsiveness of electricity demand to changes in the price of electricity (the 'own-price' elasticity, or usually just the price elasticity of demand); and, the responsiveness of electricity demand to changes in economic activity, which in this case is Provincial GDP (the GDP elasticity).

    a. The price elasticity can be further refined to be sector specific, i.e., separate values may be estimated for the residential, commercial and industrial sectors.

    b. There is also a distinction between short-term (say one-year) and long-term elasticities. Energy use is determined to a large degree by capital goods which take time to replace. Thus, short-run responses are usually much more attenuated than longer-term ones.

    c. A separate critical objective of energy modeling is the identification of trends which are evolving over time, in particular energy intensity and electricity intensity trends.

12. **Estimates of Demand Elasticities** The vast demand modeling literature produces a *very* broad range of electricity demand elasticities. So-called meta-analyses seek to aggregate and distill the results from many papers into single estimates. Defensible, empirically based values which are relevant for the present Manitoba environment are presented below:

    a. a short-term price elasticity of -0.1 across all sectors; that is, an electricity price increase of 10% leads to a 1% decline in electricity demand in the short-term;

    b. a long-term overall price elasticity of -0.4; that is, an electricity price increase of 10% leads to a 4% decline in electricity demand in the long-term;

    c. long-term price elasticities of -0.35 for the residential and commercial sectors, and -0.5 for the industrial sector;

    d. a GDP elasticity of 0.8; that is, an increase in GDP of 10% eventually leads to an increase in electricity consumption of 8%.

    Recent analyses suggest that long-term price elasticities are roughly three times short-term elasticities. Thus, impacts of price increases within the test period will not be fully realized for some time to come.

    While elasticities proposed by Manitoba Hydro are not unreasonable, especially given the degree of uncertainty associated with estimation of demand parameters, those recommended above are better supported by the literature.

13. **Stagnant Electricity Demand** These recommended elasticities suggest that basic load (unadjusted for certain demand management activities) is likely to be stagnant over the coming decade. Suppose that cumulative increases in electricity prices are about 50% and that the economy grows at 2% per year, so that GDP is 22% larger ten years hence. Then the price increase reduces electricity demand by about 20% (-0.4 x 50%) and GDP growth increases demand by about 18% (.8 x 22%).

14. **Business Cycle Risks** The current economic expansion is in its ninth year, so that a recession may not be far off. This will have an adverse effect on electricity demand.

15. **Declining Energy Intensity** Over the last 25 years, energy intensity, that is the amount of energy used per dollar of GDP, has been falling by more than 1% per year in Canada, a figure comparable to the average for OECD countries. Manitoba energy intensity has been dropping more rapidly, at a rate closer to 2% per year.

16. **Electricity Intensity** Patterns of electricity intensity in Manitoba have been mixed. In the service sector, which is by far the largest, intensity dropped by about 25% between 2005 and 2012, but by 2015 it had recovered to 2005 levels. Intensity in the manufacturing sector peaked in 2005, and has been displaying a fairly steady decline since that time. Agricultural sector intensity remained high until 2005, but subsequently dropped significantly.

17. **Energy Poverty** Manitoba has a relatively low rate of energy poverty in comparison to some other provinces: about 7% of households spend 10% or more of their income on energy. However, the incidence of energy poverty varies significantly across the Province and is particularly high in remote communities where prices of many goods, among them energy, are high. The projected growth in electricity prices will increase rates of energy poverty.

18. **First Nations** The impact on energy poverty, which is already high in remote and First Nations communities, is likely to be especially acute given the limited possibilities for energy substitution. In addition, low incomes will hamper substitution of capital goods, such as improved insulation, and efficient windows and doors. Commercial and industrial establishments will also be adversely affected, particularly in the absence of energy substitutes such as natural gas.

Macroeconomic Issues

19. **Energy Price Shocks** Market economies have experienced major energy price shocks. Past experiences are helpful in bounding the likely effects of significant electricity price increases in Manitoba. The dramatic oil price shocks of the 1970s which were largely unanticipated, led to economic contractions of half a per cent or less. The cumulative impact on U.S. GDP of the oil price shock in the late 1970s is estimated to be about 3%.

20. **Risks Associated With Exchange Rates and Commodity Prices** Certain sectors of the Manitoba economy are subject to large, difficult-to-predict variations in key variables. Exporters are subject to exchange rate variations: over the last decade, the Canadian dollar has varied from below 70 cents/USD to well above parity. Wheat prices, which reached a post-recession high of

$9 US/bushel in 2012, have since declined to $4 - $5 US/bushel in 2017. Nickel, copper, zinc and gold prices have also exhibited large swings.

21. **Vulnerable Economic Sectors** Electricity prices affect all households, firms, institutions and agencies. The extent of response depends on the electricity intensity and alternatives available.

    a. In the manufacturing sector, the most vulnerable industries appear to be 'basic chemicals' and 'pulp and paper' where electricity comprises high shares of costs. Iron and steel mills, foundries and non-ferrous metal production also have significant electricity cost shares.

    b. In the agricultural sector, 'greenhouses' and 'animal production' have significant electricity cost shares.

    c. In the mining sector, 'support activities for oil and gas production' and extraction of metals also have significant electricity cost shares.

    Where natural gas is available, some of these industries may engage in fuel substitution. Others are likely to carefully consider, or reconsider future investment plans.

22. **Macroeconomic Impacts of Large Electricity Price Increases** In the event that large electricity price increases are approved over the coming years, the Manitoba economy will adapt.[1]

    a. The *net* effect on GDP may eventually be modest, but in the interim, there are likely to be significant adjustment costs.

    b. In some locations, particularly those which are heavily dependent on an industry that is sensitive to electricity prices, there could be large local impacts on employment, incomes and output.

    c. The projected rate increases are not of the same magnitude as the energy price shocks of the 1970s. However, given that in the short-term, demand for electricity is highly price-inelastic, the steepness of the projected rate increases will impose a significant burden, particularly on households, businesses and institutions that do not have access to substitutes, such as natural gas.

Concluding Observations

23. **Regulatory Signaling** The regulatory decision made in this proceeding, which ostensibly deals with rate increases over a two-year test period, will have an important impact on decision making by industry because it will signal the likely future path of rate increases. Approval of

[1] Ontario has experienced electricity price increases in excess of 50% since 2009. Notwithstanding these increases, and the fluctuations in exchange rates, the Ontario economy continued to grow and the manufacturing share remained steady at about 13% of Provincial GDP.

increases that are close to the proposed 7.9% will suggest the acceptance of Manitoba Hydro arguments, and its focus on the time profile of future financial ratios.

24. **Excess Capacity** Large increases will induce a price response, which in a period of excess capacity may be sub-optimal as it will erode revenues at a time when marginal costs of production are low.

25. **Cost Reductions** Manitoba Hydro operates under a 'cost-of-service' regulatory regime. (Many other jurisdictions have moved to a mode of incentive regulation in order to improve incentives for cost minimization.) Manitoba Hydro is implementing a "Workforce Reduction Plan" which would eliminate 900 positions (15% of the workforce) over the course of two to three years.[2]

26. **Intergenerational Fairness** One might ask whether the projected rate increases are equitable from an intergenerational standpoint.

    a. Expansion of hydroelectric systems, such as that in Manitoba, involves lumpy investments in generation (to exploit scale economies) and transmission (as supply sources are distant from load). They do not enjoy the beneficial scalability features of solar, wind and natural gas generation.[3]

    b. This leads to long-term cyclical pressures on rates. Current customers have benefited from past investments, particularly those that have been largely depreciated, but remain functional. Future customers will need to pay for current projects. The calculus of intergenerational fairness is therefore, at a minimum, complex, and may not lead to unequivocal answers.

    c. Rate-smoothing is a useful tool for promoting inter-generational equity. The projected profile is more in the nature of a step function over six years, followed by a rapid decline to increases close to the rate of inflation. A ramped sequence of increases, perhaps linked to a clear demonstration of efficiencies achieved by Manitoba Hydro, may provide a useful framework for promoting internal efficiencies, allowing time to adjust to electricity rates, and distributing costs more equitably over each generation of consumers.

27. **Mitigation of Rate Increases** The effects of the large projected increases, should they be approved, could in theory, be mitigated.

    a. Special industrial rates could be offered to those firms with large electricity cost shares. But this would be viewed as inequitable by other customers.[4] Alternatively, the Government might implement incentives to retain major industrial customers.

---

[2] Manitoba Hydro, 2017/18 & 2018/19 General Rate Application, Integrated Financial Forecast, May 12, 2017, Tab 3, page 10 of 22.

[3] Or for that matter, shale oil extraction.

[4] Though rate design has inherent ambiguities. When there are significant common costs, there is no unique cost allocation based on the principle of cost causality.

b. There would be a substantial increase in the number of households facing energy poverty, however it is measured. To alleviate this effect will require funds either from other Manitoba Hydro customers, or from Government coffers.

28. **The Current U.S. Administration** In any discussion of Canada's economic circumstances, consideration of the effects of the current U.S. administration cannot be ignored. The North American Free Trade Agreement is being re-negotiated at the initiative of the U.S. At a minimum, this injects considerable uncertainty into trade relations with our largest trading partner. The U.S. administration has also altered direction on its decarbonization policies, disengaging from the Paris Agreement and making efforts to revive the coal industry. Together, these factors are likely to have a dampening effect on investment, and weaken prospects for long-term power sales agreements that are premised on clean hydro-electric power.

A. Introduction

1. In May 2017, Manitoba Hydro filed a General Rate Application seeking rate increases of 7.9% for 2017/2018 and 2018/2019. Manitoba Hydro was granted an interim rate increase of 3.36%, effective August 1, 2017.[5] In a subsequent letter, dated September 5, 2017, Manitoba Hydro advised the Board that it projects rate increases of 7.9% for each of the upcoming six fiscal years followed by an increase of 4.54% in the seventh year.[6] The cumulative effect would be to increase electricity rates by close to 50% in real terms over the coming decade.

2. In broad terms, the purpose of this testimony is to assess the impacts on various customer groups and their likely responses; and to provide an analysis of the likely macroeconomic consequences of electricity price increases. We begin by situating the discussion within the context of Manitoba's economy, its patterns of energy and electricity use, critical trends related to energy, and the regulatory environment. In order to assess customer responses, we draw upon the large literature of energy modeling and in particular the estimation of price and income elasticities. Consideration is given to the incidence of energy poverty and the impacts on remote and First Nations communities. Subsequent sections discuss the likely macroeconomic effects of the projected rate increases.

3. In the concluding section, comments are provided relating the projected price increase to Manitoba's decarbonization agenda.

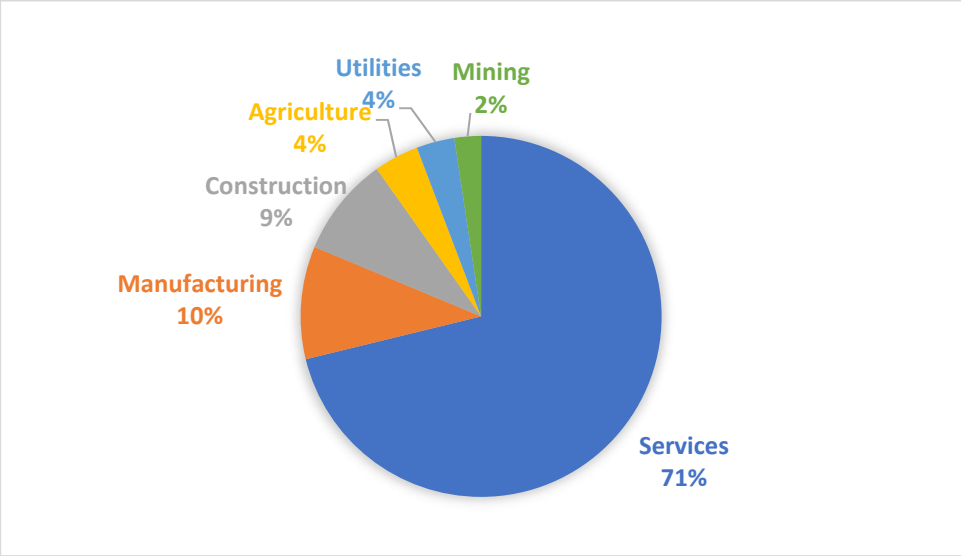
[6] Manitoba Hydro letter to the PUB, available at https://www.hydro.mb.ca/regulatory_affairs/pdf/electric/general_rate_application_2017/00.0000001_cover_letter_dated_september_5.pdf.



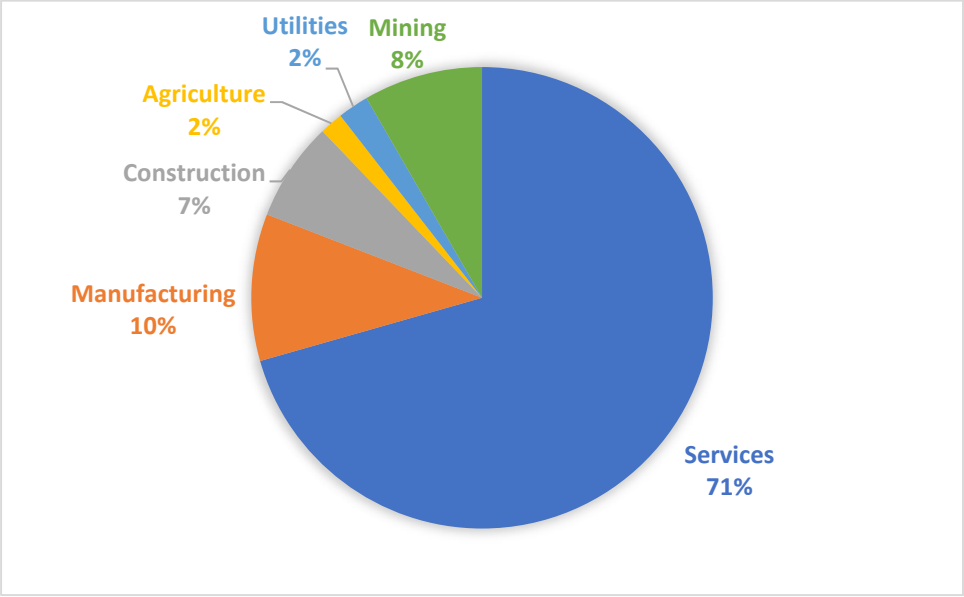
B. Background

B.1 Economic Setting[7]

4. Manitoba has a population of approximately 1.3 million. Its 2016 GDP was $67 billion with per capita output of $51,500. In part as a response to declines in commodity prices, Manitoba economic growth slowed during the 2014-2016 period, but is expected to have improved for the 2017 year. As a result of its industrial diversity, inter-provincial and international exports, high labour force participation and low per-capita debt, Manitoba's economic growth has been strong in comparison to a number of other provinces.

5. Manitoba is endowed with excellent fresh water and hydraulic resources, very productive agricultural lands, and a variety of deposits of metals and minerals. Its economy is well diversified. There is considerable variation in energy and electricity intensity across sub-sectors, making some firms more vulnerable to electricity price increases, while others more resilient to such price changes.

Figure 1: Manitoba GDP Shares 2016[8]



[7] See Manitoba Provincial Budget & Supporting Documents, available at http://www.manitoba.ca/budget2017/index.html and Manitoba Economic Highlights, https://www.gov.mb.ca/finance/pubs/highlights.pdf .

[8] Source: Statistics Canada, Table 379-0028 Gross domestic product (GDP) at basic prices.

6. Much like most advanced economies, the largest portion of Manitoba GDP -- 71% -- is in services. This sector comprises a virtually identical portion of Canada-wide GDP. (See Figures 1 and 2.) Major sub-sectors include real estate and rental and leasing (12%), wholesale and retail trade (11%), health care and social assistance (9%), public administration (8%), transportation and warehousing (6%), finance and insurance (6%), and educational services (5%).

Figure 2: Canada GDP Shares 2016[9]

7. Manufacturing comprises about 10% of Manitoba GDP. This sector consists of food processing, manufacture of transportation equipment (aerospace and motor vehicle), agricultural implements, chemicals (pharmaceutical and agricultural), metal and wood products and electrical equipment. Most manufactured goods are sold in other provinces or exported to the U.S. Export demand is sensitive to both exchange rates and economic activity in recipient countries.

[9] Source: Statistics Canada, Table 379-0031 Gross domestic product (GDP) at basic prices.

8. Exchange rates have an important effect on Manitoba's economy as they affect demand for, and revenues from exports, including those in the electricity sector. Canada's exchange rate has historically been closely linked to world oil prices, as we will discuss further below. Expectations about future oil prices inform forecast exchange rates.

9. In any discussion of Canada's economic circumstances, consideration of the effects of the current U.S. administration cannot be ignored. The North American Free Trade Agreement is being re-negotiated at the initiative of the U.S. At a minimum, this injects considerable uncertainty into trade relations with our largest trading partner. The U.S. administration has also altered direction on its decarbonization policies, disengaging from the Paris Agreement and making efforts to revive the coal industry.[10] Together, these factors are likely to dampen the Manitoba investment climate in the manufacturing sector, and weaken prospects for long-term power sales agreements that are premised on clean hydro-electric power.

B.2 The Manitoba Energy Sector

10. A particularly informative visual representation of energy sources and uses is provided by 'Energy Flow' diagrams, also known as Sankey diagrams. Figure 3 depicts this type of diagram for the Province of Manitoba. 'Pipe' diameters reflect the magnitudes of flows. [11]

[10] Notwithstanding these developments, the U.S. Government released a major report confirming the anthropogenic nature of climate change. See "Climate Science Special Report", Fall 2017, available at https://science2017.globalchange.gov/chapter/front-matter-about/.

[11] Such diagrams have been in existence since the 1800s. They are widely used to depict energy flows, for example Lawrence Livermore National Laboratories (LLNL) produce such diagrams for all U.S. states, see https://flowcharts.llnl.gov/. LLNL also produces U.S. national carbon flow diagrams. The International Energy Agency produces Sankey diagrams at national and continental levels http://www.iea.org/Sankey/index.html#?c=World&s=Balance.

Figure 3 was produced using *e!Sankey* software, https://www.ifu.com/e-sankey/ based on CANSIM data.

For further discussion of uses of Sankey diagrams, see *Economist*, "Data Visualisation, Sankey or Harness?" July 4th,2011; A. Yatchew, "Economics of Energy: Big Ideas for the Non-Economist", *Energy Research and Social Science*, 1(1), 2014, pages 74-78; "Using Sankey diagrams to map energy flow from primary fuel to end use", Veena Subramanyam, Deepak Paramshivan, Amit Kumar, Md. Alam Hossain Mondal, *Energy Conversion and Management*, 91, 2015, pages 342–352; and A. Yatchew 2016: "Rational vs 'Feel-Good' Carbon Policy", *Energy Regulation Quarterly*, Vol. 4, Issue 3,

11. At the top left is the total 'primary' energy of all types which in 2015, the latest year for which comprehensive data are available, was 334 peta joules (PJ). The total is obtained by summing the values of the five primary sources of energy on the left (wind, hydro, natural gas, coal and petroleum).

12. The left side of the diagram represents the supply side, while the pink boxes on the right represent the demand side.

13. The largest source of energy in Manitoba is hydraulic, which comprises about 125 PJ, or 37% of total energy. Almost all electricity produced in Manitoba comes from hydraulic sources. The second largest source of energy is petroleum at 116 PJ, or 35% of provincial energy, the vast majority of which is used in the transportation sector. The third largest energy source is natural gas at 88 PJ or 26% of total energy.

14. Next consider the demand side, which is comprised of residential, commercial, industrial and transportation sectors.[12] Manitoba's successful development of cheap and accessible hydraulic electricity is reflected in its share of total energy, and its shares within each end-use sector.

    a. About 60% (30 PJ of 50 PJ) of energy used in the residential sector is electricity.
    b. For the industrial sector the share is 50% (33 PJ of 66 PJ).
    c. For the commercial sector the share is 39% (19 PJ of 49 PJ).

In short, Manitoba is an electricity intensive province where hydraulic energy represents the largest energy source. This is a price phenomenon, thanks to abundant hydraulic sources.[13]

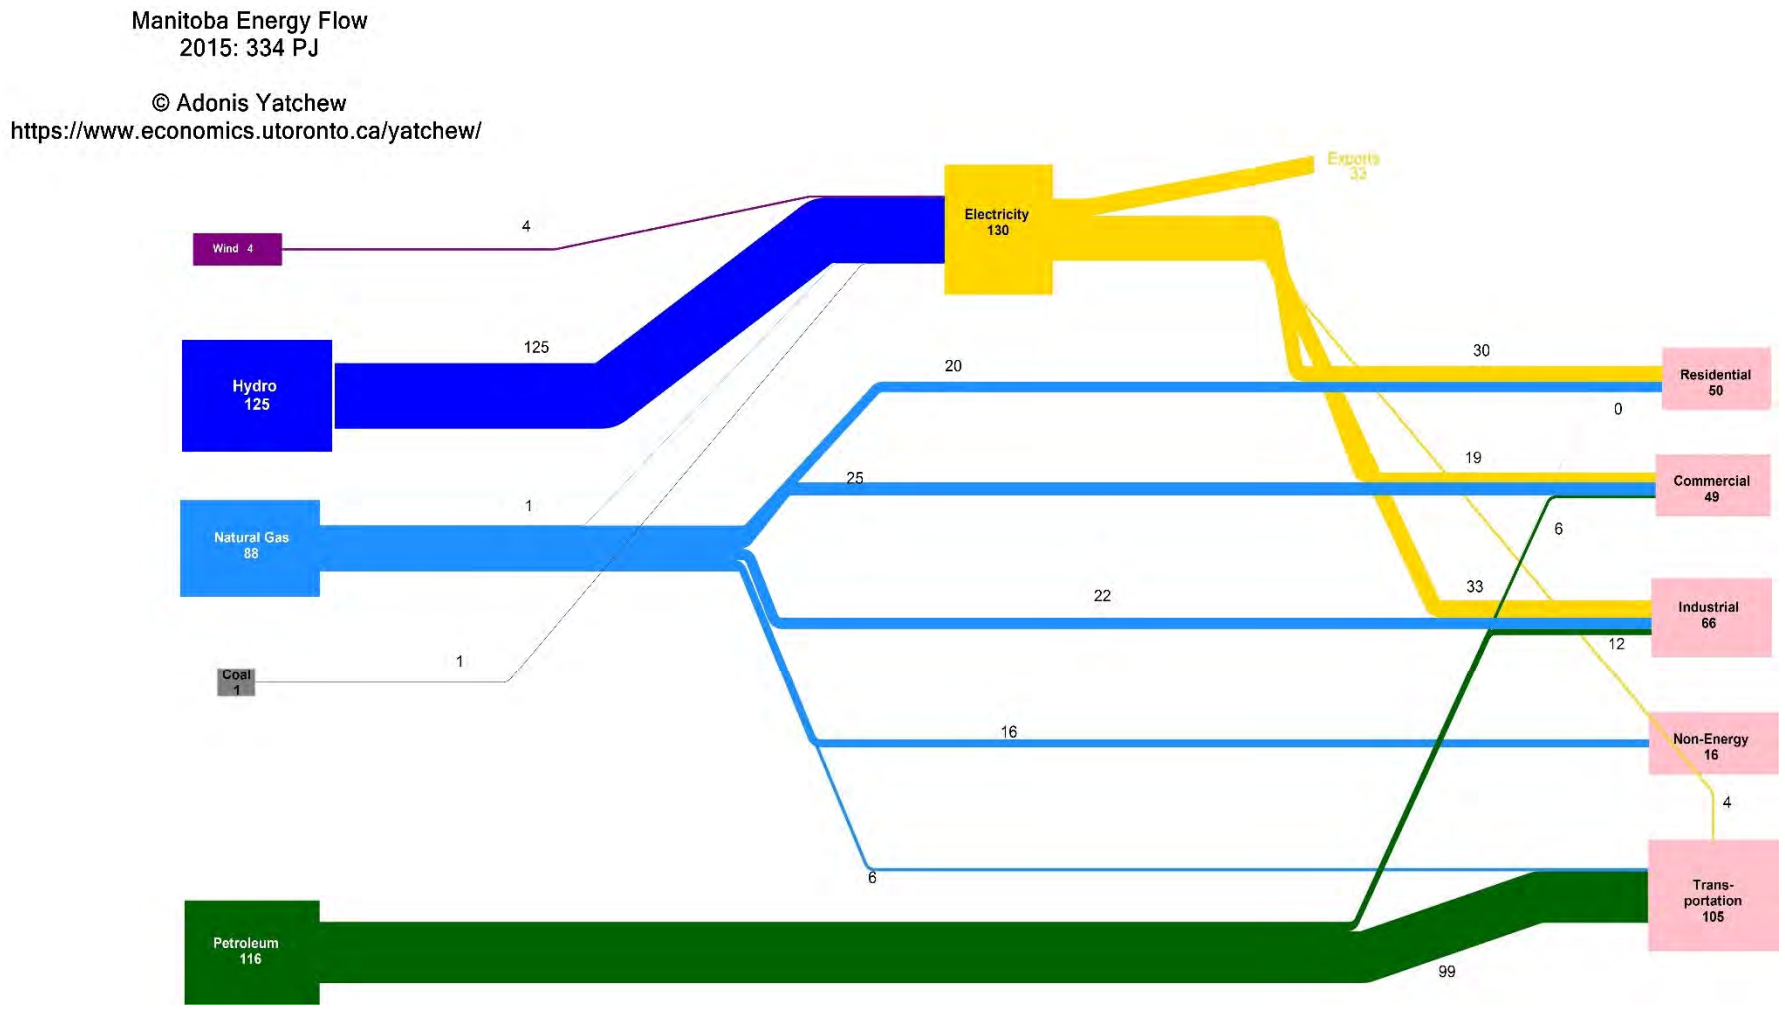
---

http://www.energyregulationquarterly.ca/articles/ rational-vs-feel-good-carbon-policy-transferability-subsidiarity-and-separation#sthash.GBtFuIOG.dpbs.

[12] There is also a non-energy sector which corresponds primarily to petrochemical feedstocks.

[13] A comparison with Canada-wide numbers illustrates the point. Natural gas is the dominant fuel in the residential, commercial and particularly the industrial sector where more than 50% of energy comes directly from this source (as well as a portion that comes indirectly through gas-fired electricity generation). See Canada-wide Sankey diagrams available at https://www.economics.utoronto.ca/yatchew/.

15. The Sankey diagram depicting energy flows in Manitoba (Figure 3) also provides a departure point for considering the impacts of changes in the price of electricity. Where natural gas is available, substantial increases in electricity prices could lead to substitution to gas in the residential, commercial and industrial sectors, particularly given the relatively low shares of natural gas there.



16. There is great potential for increased electricity consumption in the transportation sector, but a dramatic shift awaits further large drops in the costs and range of future generations of electric vehicles. In Manitoba, such a shift would contribute greatly to the decarbonization agenda as Manitoba has large supplies of clean hydraulic sources for the foreseeable future.

17. The energy in each sector either produces 'energy services' or is lost, usually in the form of heat. The least 'efficient' sector is transportation where 75%-80% of energy is 'rejected'. Depending on the source of energy and the types of uses, efficiency in the residential, commercial and industrial sectors ranges from 50% to 80%. While it might appear that we are very inefficient, 'wasting' well over half of the energy we produce, this is primarily a reflection of the state of technology and the second law of thermodynamics which states that whenever energy is transformed from one form to another, a portion is lost.[14]

18. The Sankey diagram is also useful for informing decarbonization discussions. Manitoba is very well positioned with such a large share of hydraulic source energy. Its use of coal is minimal and the remainder of non-transportation energy comes from natural gas, the hydrocarbon with the lowest carbon footprint (roughly half that of coal). The dominant share of energy-related carbon generated in Manitoba is in the transportation sector, which is the most difficult to decarbonize.

[14] Estimates produced by Lawrence Livermore National Laboratories suggest that roughly two-thirds of energy in the U.S. is 'rejected' and only one third produces energy services. See https://flowcharts.llnl.gov/content/assets/images/energy/us/Energy_US_2016.png.

Figure 3: Manitoba Energy Flow (Sankey Diagram)

B.3 Oil and Natural Gas Markets

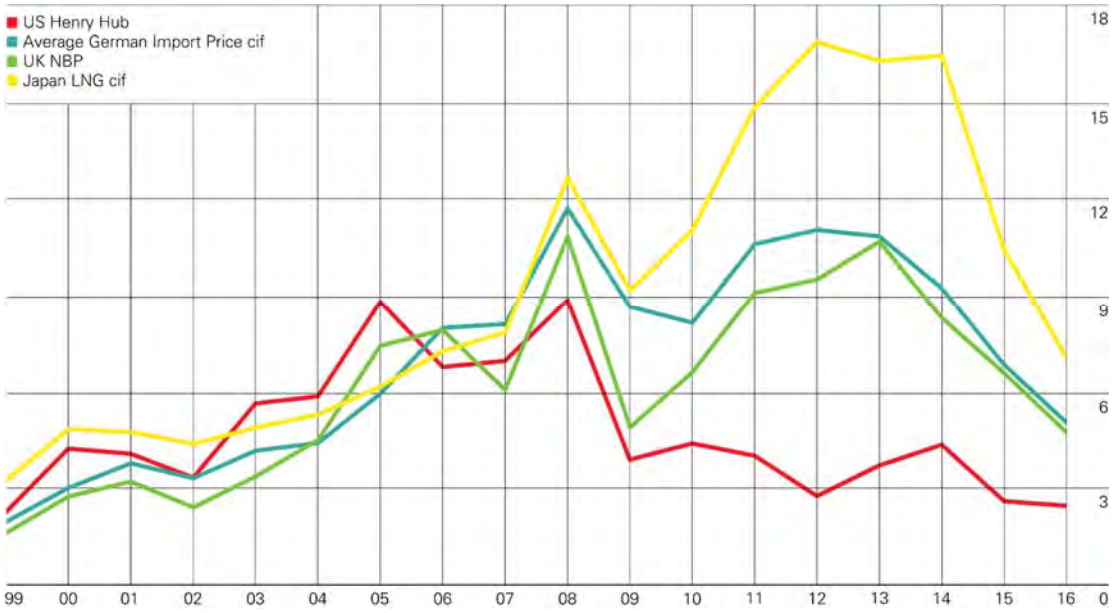
19. An understanding of oil and natural gas markets and scenarios of their future price paths is important to the current analysis in several ways.

    a. First, natural gas competes with electricity in certain industrial, commercial and residential applications, particularly if the end-use is space heating or process heat. A large increase in electricity prices could lead to loss of electricity load to natural gas.

    b. Second, low-priced natural gas is the 'go-to' fuel for electricity generation in many parts of North America, including states neighboring Manitoba, and the MISO transmission system to which Manitoba belongs.[15] This in turn affects Manitoba Hydro export markets.

    c. Third, oil prices have an important impact on Canadian export revenues and on exchange rates. The precipitous decline in oil prices which began in mid-2014 has had a dramatic impact on the economy of Alberta and to a lesser degree on Saskatchewan and Manitoba. Canada has vast reserves of oil, mainly in the form of bitumen. But these reserves are among the highest priced in the world.

20. What is the outlook for natural gas prices? A decade ago, it was widely believed that the U.S. would need to begin importing natural gas. Liquid natural gas (LNG) terminals were planned and some were built.[16] Then came the shale revolution. By efficiently combining



[15] Low natural gas prices have led to a significant shift away from coal-fired electricity generation in the U.S. towards natural gas generation. Roughly comparable amounts of electricity are generated from each of these two sources in the U.S.

[16] LNG shipping requires liquefaction terminals at the exporting site, and re-gasification at the importing site. Initially, the U.S. began to build re-gasification terminals. These sites have been largely converted to liquefaction. Qatar is the largest LNG exporter, followed by Australia. Floating storage and re-gasification carriers can serve as LNG importing terminals.

two technologies – horizontal drilling and hydraulic fracturing (fracking) – cost-effective North American gas reserves grew very rapidly.

Figure 4: Gas prices

USD/mmBtu

BP Statistical Review of World Energy 2017 © BP p.l.c. 2017

21. Natural gas prices worldwide dropped dramatically in 2009, as a result of the financial crisis. However, by 2012 they had recovered *except* in North America (Figure 4).[17] What we observed were the consequences of shale revolution. This in turn led to a reconfiguration of natural gas flows across North America as major natural gas supplies were developed, for example, in Texas and Pennsylvania, reducing the need for Canadian natural gas and leading to reduced use of the TransCanada Mainline.

22. In the past, natural gas markets have been continental (hence the separate benchmark prices in Figure 4). But recently, there has been a gradual globalization as LNG becomes

[17] LNG prices in Japan sky-rocketed in 2011 as a result of the Fukushima meltdown.

increasingly competitive in overseas markets. By 2015 about 40% of total natural gas trade moved by sea, and prices in distant markets began to converge.[18]

23. While globalization increases the demand for North American natural gas, there is little evidence to suggest that a dramatic price increase is likely; natural gas will continue to provide strong competition to electricity.

24. Though largely unanticipated, the revolution in natural gas would eventually lead to perhaps the most dramatic change in oil markets since the 1970s OPEC price increases.[19,20] One might think that the main effect of the fracking revolution on oil prices is through the increase in recoverable supplies. However, the peculiar features of the shale revolution have altered the nature of oil markets in another critical way. For the first time, additional oil can be brought online in tiny increments – the cost of a productive shale well is *three orders of magnitude* smaller than Arctic or deep-sea projects.

25. The ***scalability*** of shale has fundamentally altered the strategic behavior of OPEC. Whereas in the past OPEC might have coordinated a supply reduction to sustain prices, it is far more limited now in its ability to do so because shale producers (and others) can fill the gap. Shale has provided for a scalable response by many producers as market conditions change. This feature further limits unilateral or cartelized market power.

[18] "Long Promised, the Global Market for Natural Gas Has Finally Arrived", Russell Gold and Alison Sider, *Wall Street Journal*, June 6, 2017. See also MIT Energy Initiative, *The Future of Natural Gas*, Cambridge: June 2011.

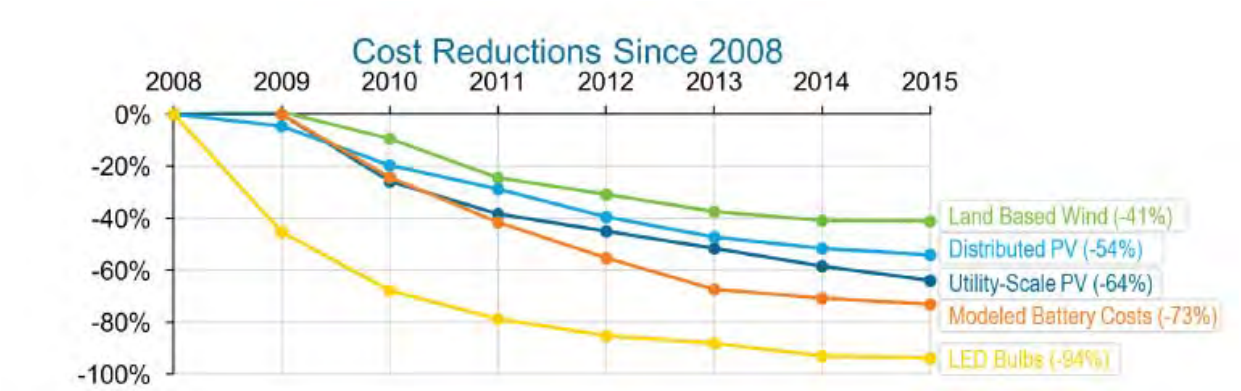
[19] Though in 2012, Berkeley physics Professor Richard Muller writes "Shale oil production could truly be a disruptive technology, with a large and positive impact on the US balance of trade, severe repercussions for the OPEC oil cartel, and a serious challenge to alternative-transportation technologies, particularly natural gas and synfuel. Shale oil could turn conventional oil into the new whale oil, replaced by a far more abundant source." Richard A. Muller, *Energy for Future Presidents: The Science Behind the Headlines*, 2012, (Kindle Locations 1679-1682). W. W. Norton & Company. Kindle Edition. In that same book, Muller sees $60 USD / barrel as a long-term limit price for oil. At the time of his writing, the world price of oil was well over $100 USD / barrel.

[20] The historic paths of oil and (North American) natural gas prices display a surprising degree of correlation. In fact, some have argued that the drop in world oil prices beginning in 2014 was signaled by the decline in North American natural gas prices which began in 2008. See, e.g., Dimitri Dimitropoulos, and Adonis Yatchew 2017, "Discerning Trends in Commodity Prices", *Macroeconomic Dynamics*, doi:10.1017/S1365100516000511.

Scalability of shale also reduces risks – wells do not last long, but capital requirements are low and lead-times short.

26. Not long ago, 'peak oil' meant that one day, in the not too distant future, we would reach peak production as supplies ran out. Now 'peak oil' refers to the day when demand levels off and begins to fall. Technological innovations to a post-carbon world are leading the way. Shale, bitumen and undersea resources are unlikely to run out, and the key question is what fraction of proven reserves will *not* be extracted. This in turn creates incentives for those with large cheap reserves (such as Saudi Arabia) to sell more today rather than saving reserves for an uncertain future.[21]

27. In the absence of innovation in electric vehicles which would lead to their wide spread adoption in growing economies such as China and India, demand for oil should continue to grow for a time. The question is when we will reach the tipping point in the sector that is the most difficult to decarbonize – transportation.



28. To summarize, low natural gas prices exert competitive pressures on Manitoba Hydro in domestic markets to the extent that they provide a viable alternative to electricity, and in export markets because they drive down electricity prices there. Low oil prices put downward pressure on the exchange rate, which enhances export competitiveness of Manitoba industries and improves Canadian dollar revenues of Manitoba Hydro electricity sales.

[21] See, for example, "Get Ready for Peak Oil Demand. There's a growing consensus that the end of ever-rising consumption is in sight. The big question that many oil companies are debating: When?", Lynn Cook and Elena Cherney, *Wall Street Journal*, May 26, 2017.

B.4 Costs of Key Technologies Have Been Dropping Dramatically

29. The costs of emerging technologies which are transforming electricity industries have been dropping at a rapid pace. Since 2008, costs of wind generation have dropped by 41%; photovoltaics have dropped more than 50%; battery costs by 73%; and LED bulbs by a stunning 94%. (See Figure 5 below.)

Figure 5 – Cost Reductions in Key Technologies[22]

30. Non-dispatchable generation such as on-shore wind is priced at about 5 U.S. cents/kWh for new installations at a capacity factor of 39%. Solar photo-voltaic is at 7 U.S. cents/kWh at a capacity factor of 26%. Combined cycle natural gas electricity generation for new installations costs about 5 U.S. cents/kWh if used at high capacity (87%), and conventional combustion turbine generation is at about 9 U.S. cents/kWh if used at low capacity (30%).[23]

[22] Source: "Revolution … Now, The Future Arrives for Five Clean Energy Technologies – 2016 Update", U.S. Department of Energy, September 2016. Available at https://www.energy.gov/eere/downloads/revolutionnow-2016-update. "Notes: Land based wind costs are derived from levelized cost of energy from representative wind sites… Distributed PV cost is average residential installed cost... Utility-Scale PV cost is the median installed cost… Modeled battery costs are at high-volume production of battery systems, derived from DOE/UIS Advanced Battery Consortium PHEV Battery development projects. LED bulb costs are cost per lumen for A-type bulbs..."

[23] These are Levelized Cost of Energy (LCOE) numbers which embed assumptions about depreciation lifetimes, cost of fuel and, as indicated, utilization capacity factors. U.S. Energy Information Administration April 2017 *Table A1a. Estimated LCOE (weighted average of regional values based on projected capacity additions) for new generation resources, for plants entering service in 2019* ", available at https://www.eia.gov/outlooks/aeo/pdf/electricity_generation.pdf. Combined heat and power systems, because of their high efficiency, have the potential for

B.5 Decentralization of Electricity Systems

31. Historically, the centralized structure of electricity industries has been driven by three critical features. First, non-storability of electricity meant that supply and demand needed to be balanced virtually instantaneously. Second, scale economies in generation led to electricity being produced at a relatively small number of locations. Third, the essentiality of electricity to every-day life underscored the need for a very high degree of reliability.

32. Scale economies in electricity generation increased into the 1970's, at which time they began to level off. Minimum efficient scale declined. Electricity networks, both transmission and distribution, which would transport and distribute electrons, were and continue to be natural monopolies, but at different spatial scales.[24]

33. In many jurisdictions, as a result of scale economies, (and some have argued due to vertical economies of scope), the electricity industry was vertically integrated, as is the case in Manitoba. In other jurisdictions, the distribution segment of the industry was serviced by a number of distributors.

34. By the late 20th century, the centripetal forces which centralized electricity industry structure began to weaken. The generation segment in many instances was no longer seen as a natural monopoly.[25] In various jurisdictions, the separation of natural monopoly components (i.e., transmission and distribution) from potentially competitive segments (i.e., generation and energy services) took place. This 'unbundling' was intended to lead

---

increasing market penetration. See *Combined Heat and Power Technical Potential in the United States,* U.S. Department of Energy, March 2016, available at https://www.energy.gov/sites/prod/files/2016/04/f30/CHP%20Technical%20Potential%20Study%203-31-2016%20Final.pdf; also *Many industries use combined heat and power to improve energy efficiency*, U.S. Energy Information Administration, July 27, 2016, available at https://www.eia.gov/todayinenergy/detail.php?id=27252.

[24] The power grid was named the greatest engineering achievement of the 20th century by the U.S. National Academy of Engineering. The main selection criterion was "how much an achievement improved people's quality of life". See "Great Achievements and Grand Challenges", *The Bridge*, September 1, 2000 Volume 30 Issue 3 and 4, pages 5-10.

[25] Previously, efficient scale for coal-fired and nuclear units was on the order of 1000 MW. The size of hydro-electric units depended critically on siting.

to increased competition, primarily in generation. In a few jurisdictions, industries were restructured and competitive forces were introduced, with varying degrees of success.

35. Still, the need for coordination, reliability and the natural monopoly characteristics of the grid, continued to be the fundamental centralizing drivers of the structure of the industry.

36. Transformation of electricity industries began gradually in the first decade of the 21st century. The information revolution had spawned new technologies, often called 'smart' technologies, which would improve responsiveness of the grid, facilitate more rapid identification and correction of faults, and eventually enable demand side response to grid or market conditions.

37. At the same time, the decarbonization agenda, which was being pursued most aggressively in Europe, began to drive innovation in renewables. Feed-in-tariffs and other stimuli were producing rapid cost declines and efficiency improvements in renewable technologies, particularly in solar and wind generation.[26] While one tends to associate successful implementation of solar technology with sun-lit locations and relatively little precipitation, grid parity is being achieved in some countries that are not endowed with either of these traits.[27]

38. Because solar and wind generation are non-dispatchable, i.e., intermittent, the value to the system is not fully reflected by the costs of production. Backup generation (usually natural gas) or electricity storage is required to ensure that sufficient electricity is available when needed.

[26] Between 2010 and 2016, average prices resulting from auctions have declined from about $90 USD/MWh to below $50 USD/MWh for wind generation. For solar, the decline for the same period has been from $250 USD/MWh to about $50 USD/MWh, a precipitous drop. See *Renewable Energy Auctions. Analysing 2016*, International Renewable Energy Agency, 2017, page 16, Figure 2.1, available at http://www.irena.org/DocumentDownloads/Publications/IRENA_Renewable_Energy_Auctions_2017.pdf.

[27] A 10 MW solar farm in the UK has recently been built without government subsidy. See "Solar Power Breakthrough as Subsidy Free Farm Open", by Nathalie Thomas, *Financial Times*, September 25, 2017, accessed at https://www.ft.com/content/8ea432e4-a1e9-11e7-9e4f-7f5e6a7c98a2. Note that this facility is two orders of magnitude smaller than conventional coal-fired stations of 1000 MW.

39. Storage technologies have also been experiencing major cost reductions, but have not yet reached a tipping point. Though, in some instances, solar-cum-battery installations have achieved unexpectedly low costs.[28]

40. Solar is extremely scalable (think solar powered calculators and parking meters) though larger facilities enjoy a significant cost advantage over small scale roof-top installations.

41. Scalability and storage, supported by innovative uses of information technologies, are combining to disrupt the conventional utility model. And that model is more susceptible to disruption if the price of electricity is relatively high. Residential and commercial customers are then more likely to invest in on-site solar to reduce their overall electricity costs.

42. Self-generation and 'net-metering' is posing a serious challenge to the conventional electricity utility model. In some jurisdictions this has led to a confrontation between utilities and their owners, and companies selling and installing distributed solar generation, and their customers.[29]

[28] In January 2017, a Hawaii electricity cooperative signed an agreement paying $110 USD / MWh for dispatchable electricity from a combined solar and battery storage system. See "Hawaii co-op signs deal for solar+storage project at 11¢/kWh", by Gavin Bade, *UtilityDive*, January 10 2017, accessed at http://www.utilitydive.com/news/hawaii-co-op-signs-deal-for-solarstorage-project-at-11kwh/433744/ . A few months later, Tucson Electric signed a similar deal but at a much lower price. See "Updated: Tucson Electric signs solar + storage PPA for 'less than 4.5¢/kWh'", by Gavin Bade, *UtilityDive*, May 23, 2017, accessed at http://www.utilitydive.com/news/updated-tucson-electric-signs-solar-storage-ppa-for-less-than-45kwh/443293/ .

[29] Perhaps the most prominent clash has been between Warren Buffet, whose Berkshire Hathaway owns NV Energy, a Nevada electricity utility, and Elon Musk, whose SolarCity company installs solar panels. See "In a clash of titans, Warren Buffett beat Elon Musk in Nevada", Nick Cunningham, *Business Insider*, December 30, 2015, http://www.businessinsider.com/warren-buffett-beat-elon-musk-on-solar-in-nevada-2015-12?pundits_only=0&get_all_comments=1&no_reply_filter=1; "Warren Buffett controls Nevada's legacy utility. Elon Musk is behind the solar company that's upending the market. Let the fun begin", Noah Buhayar, *Bloomberg Businessweek,* January 28, 2016, https://www.bloomberg.com/features/2016-solar-power-buffett-vs-musk/; "Solar Showdown In The Nevada Desert: Warren Buffett Vs. Elon Musk?", Michael Lynch, *Forbes*, February 23, 2016, https://www.forbes.com/sites/michaellynch/2016/02/23/solar-showdown-in-the-nevada-desert-buffett-vs-musk/#5b845aed1766; "Buffett vs. Musk: The clash of old and new energy titans", Daniel Rothberg, *Las Vegas Sun*, May 2, 2016, https://lasvegassun.com/news/2016/may/02/buffett-vs-musk-the-clash-of-old-and-new-energy-ti/.

43. In a landmark study entitled *Utility of the Future,* a group at MIT has conducted a wide-ranging analysis of how the electricity utility business is changing, and how companies, regulators and policy-makers need to adapt.[30] That study argues that fundamental changes are underway in the supply and consumption of electricity. Among the major factors driving the change are "emerging distributed technologies -- including flexible demand, distributed generation, energy storage, and advanced power electronics and control devices". Rapidly decreasing costs in information technologies are enabling synchronization of various energy supply, demand and storage resources.

44. The MIT study identifies a series of core findings ranging from the importance of accurate price signals (locational and temporal), the need to improve regulatory models, the potential for cost savings arising out of more efficient use of existing assets, and even privacy and cybersecurity issues as interconnectedness increases (for example, through 'smart appliances').

45. While at first it might appear that the *Utility of the Future* study may bear little relationship to the main objectives of this proceeding, particularly as Manitoba Hydro is in a position of excess capacity for some time to come, there are at least two reasons why an appreciation of industry evolution is relevant.

    a. First, an understanding of how other utilities are adapting to the proliferation of new technologies and uses of electricity, can inform Manitoba Hydro's planning and forecasting. In the presence of sufficiently high rate increases, there may be significant risk of loss of load in one or more market segments, in ways that cannot be directly extrapolated from price elasticities based on historical data, but may be heralded by experience elsewhere.

    b. Second, understanding how electricity and energy industries are evolving, particularly in neighbouring jurisdictions, can provide insights into Manitoba's electricity export markets.

[30] *Utility of the Future. An MIT Energy Initiative response to an industry in transition*, MIT Energy Initiative, December 2016, available at http://energy.mit.edu/publication/utility-future-report/.

46. While generation will likely be progressively decentralized, some have argued that electrification of energy systems (think transportation sector in the Sankey diagram at Figure 3) will require modernization and even expansion of electricity grids.[31]

47. Finally, in a world where infrastructure security (including cybersecurity) is becoming an increasingly important issue, decentralization of electricity system may provide an important measure of protection.

B.6 Regulatory Considerations

48. Manitoba Hydro operates in what is essentially a 'cost-of-service' regulatory regime. This form of regulation, and its sibling 'rate-of-return' regulation, have been in existence since the late 19th century. Under these regimes, the regulator reviews the 'revenue requirement', that is the amounts required to meet costs, in some cases disallowing or trimming certain ones, then sets rates to each customer class.

49. Cost-of-service regulation prevailed for much of the 20th century. Keeping in mind that increasing returns to scale and productivity growth were driving down unit costs in North America until the 1970s, the task of regulators was easier as the objective was to determine how to allocate these benefits to customers and producing firms.

50. During the 1970s, oil price shocks led to upward pressure on electricity prices, particularly in jurisdictions where the generation mix relied to a significant degree on hydrocarbons. A significant portion of electricity in the U.S. was generated using oil. What is less understood is the indirect effects of oil price increases on natural gas and coal prices. The

[31] See "Utility Touts Electrification to Meet California Climate Goals" Russell Gold, *Wall Street Journal*, October 31, 2017, available at https://www.wsj.com/articles/utility-touts-electrification-to-meet-california-climate-goals-1509457320.

flight from oil by generators to these other hydrocarbons put upward pressure on those prices as well, spreading the impact.[32]

51. Pressure began to accumulate on regulators and policy-makers to control electricity prices. In some instances, accounting devices were used to mitigate rate increases. For example, asset lifetimes were extended, thereby reducing annual depreciation expense. In other cases, rate increases were delayed (so-called regulatory lag) to put pressure on electricity companies to reduce costs.

52. Theorists had already identified limitations of the prevailing regulatory model. Costs of regulated monopolies were not being disciplined by market forces, leading to inefficiency and 'gold-plating'.[33] Developments in the economic theory of regulation suggested new directions. The crux of the regulatory problem was that regulators, no matter how skilled, experienced and well-supported, were greatly disadvantaged in trying to assess what 'reasonable costs' should be. The mountains of data that one would need to process and evaluate represented a Herculean task. (This became known as the 'asymmetry of information' problem.)

53. Rather than relying exclusively on a regulatory process to discover the achievable minimum costs, theorists suggested that instead, the regulatory mechanism should enhance the incentives for regulated firms to minimize costs, and to reveal the savings and productivity gains to the regulator, at least over some period of time.

[32] There is a surprising degree of co-movement of oil, natural gas and coal prices. See Dimitropoulos and Yatchew 2017, *op. cit.*

[33] For example, the so-called Averch-Johnson effect asserts that under rate-of-return regulation, firms expand capital expenditures in order to earn a higher volume of returns. This in turn leads to excess capital, and potentially inefficient input mix. Averch, Harvey; Johnson, Leland L. (1962) "Behavior of the Firm Under Regulatory Constraint", *American Economic Review*, 52 (5): 1052–1069.

54. These regulatory models fall under the general rubric of incentive regulation.[34] The most commonly applied version is price-cap regulation.[35] The emergence of incentive regulation coincided with the broad world-wide trends towards deregulation, privatization and an increased reliance on the market-place and individual choice.[36]

55. How are these regulatory considerations relevant to this proceeding?

a. First, Manitobans have been fortunate to have had the benefit of low electricity rates for many years. However, given current and future cost projections, there may be increasing pressure to shift towards a model which creates greater incentives for cost containment. This, at least, has been the pattern in other jurisdictions.

b. Second, the business community, particularly those segments for which electricity costs comprise an important share, are forming their expectations about future electricity prices in part based on whether the regulatory framework is well equipped to incentivize productivity growth and cost savings at Manitoba Hydro. Their decisions to expand or even situate themselves here are informed by these expectations.

c. Third, the financial community, which assesses debt worthiness, is carefully attuned to the regulatory model. The ability of Manitoba Hydro to service its debt and maintain healthy financial ratios, or at least to have them trending in the right direction, depends on Manitoba Hydro costs and rates, both of which are dependent on the regulatory

[34] Though the idea comes in many flavours, e.g., performance-based regulation, yardstick regulation, and so on.

[35] Price-cap regulation was first applied in the telecommunications industry in the U.K. It then spread to other network and energy industries. Steven Littlechild is often associated with its earliest implementation, though many economists contributed to the development of the ideas.

[36] An admittedly over-simplified narrative would describe the 'market failure' known as the Great Depression of the 1930s leading to decades of increased regulation and government intervention. The 1970s, a period of high inflation and unemployment, was seen by many as a 'government failure' which in turn brought a period of deregulation and privatization. It is during this period that incentive regulation had its intellectual and practical roots. See Yatchew, A. 2014 "Economics of Energy: Big Ideas for the Non-Economist", *Energy Research and Social Science*, 1(1), 74-82.

model, the decisions of the regulator and the direction set by the Government and policy makers.

56. Governments are perpetually under pressure to influence electricity prices, particularly in jurisdictions where the utility is publicly owned, such as is the case in Manitoba.[37] This in turn, can lead to delays in cost recovery and inter-generational redistributions.[38]

[37] The public complains when oil prices increase, but does not assign blame to the government. In fact, the variation in oil and gasoline prices has been far larger than the changes in electricity prices which are deliberately stabilized.

[38] The Ontario Government's financing of electricity rate reductions through debt flotation has come under heavy criticism from the Office of the Auditor General of Ontario, *The Fair Hydro Plan: Concerns About Fiscal Transparency, Accountability and Value For Money*, October 17, 2017, http://www.auditor.on.ca/en/content/specialreports/specialreports/FairHydroPlan_en.pdf

C. Demand Modeling

C.1 Energy Demand Modeling

57. In order to formulate a view on price elasticities of electricity demand, it is first helpful to understand how they are obtained. Elasticities are not estimated in isolation, but rather derived from more general models that try to incorporate various factors that influence the demand for electricity.

58. Numerous studies of energy demand have been conducted in many geographic locations. In the first instance, studies may be organized by the type and origin of data upon which they rely, such as
    a. geographical area
    b. individual data vs. aggregate data
    c. customer type -- residential, commercial, industrial
    d. time series, cross-section, or data that combine both time and spatial dimensions (i.e., panel data)
    e. sample period and frequency of data (e.g., monthly vs. annual)
    f. single equation vs multi-equation (e.g., electricity, natural gas and oil). [39]

59. Studies also differ by virtue of the econometric specification and their degree of sophistication. Distinguishing features include the flexibility that the model allows, for example, whether it captures potentially nonlinear responses to price changes; and whether key parameters evolve over time.

60. The work-horse of demand modeling is the log-linear model which in its very simplest form is given by $\log(y) = \alpha + \beta \log(x) = \varepsilon$ where x is price and y is demand. Such models are especially convenient because the coefficient β is the response elasticity. For

[39] There are also studies which focus on demand for energy services rather than energy types. Other models combine capital decisions with energy consumption. A classic, widely cited paper in this literature is "An Econometric Analysis of Residential Electric Appliance Holdings and Consumption" J. Dubin and D. McFadden, *Econometrica*, Vol. 52, No. 2, Mar., 1984, pp. 345-362.

example, if $\beta = -.1$ then a 10% increase in price leads to a 1% reduction in demand. Additional explanatory variables, such as prices of competing energy sources, GDP and characteristics of the purchasers can be readily added.[40]

61. Classical economic theory teaches us that prices adjust to 'clear the market', that is to bring supply and demand into balance. In most industries, this complicates modeling because the price variable cannot be treated as given (i.e., as being exogenous). This in turn requires either joint modeling of supply and demand, or the application of estimation techniques which correct for the problem. In much of the electricity demand estimation literature, this 'endogeneity' problem is moot because prices are set in advance and regulators ensure that there is sufficient supply to meet demand at expected prices.

62. A critical part of assessing the impacts of price trajectories requires distinguishing between short-term and long-term effects. For example, suppose there is the expectation that electricity prices will increase by 7% each year, roughly doubling in a decade. Next year, one might expect some response from residential, commercial and industrial customers, for example in the form of increased conservation. But adaptation takes time, mainly because processes and appliances that use electricity are costly to replace. Over time, more efficient appliances will be put in place, and there could be substitution to other sources of energy (such as natural gas). Thus, the short-run response is likely to be substantially smaller than the long-term response. Furthermore, the expectation of an increasing price trajectory may not only lead to efficiency improvements, migration to other fuels, and a more electricity efficient capital stock, but it may discourage future industrial investments, particularly in very electricity intensive industries.

63. At any given point in time, electricity prices vary widely across jurisdictions. Such 'cross-section' data are useful in identifying long-term effects of price changes (and therefore long-term elasticities). Locations with historically high prices are likely to have lower unit

[40] Richer but more complicated models which incorporate nonlinearities include *translog* and 'generalized Leontief' specifications. Semiparametric and nonparametric models allow the shape of price response to be fully data-driven rather than being imposed *ex ante*.

levels of electricity consumption, those with historically low prices are likely to have higher consumption levels, and a larger share of electricity intensive industries.

64. Time-series data are generally more useful in identifying short-term responses (and therefore short-term elasticities). Such models can be extended to try to capture long-term effects as well, though focusing on a single jurisdiction over time, usually limits the identification of larger and long-term price impacts. On the other hand, time series models enjoy the advantage of being able to capture smooth trends (e.g., resulting from efficiency improvements and technological innovation) as well as disruptive changes that eventually can result in a tipping point (such as we have seen in natural gas and oil markets).[41]

[41] Within the class of time-series models, there are two important and large sub-classes: stationary and non-stationary models.

a. Stationary models apply to data in which the main characteristics (means, variances, covariances and so-forth) do not change over time, hence this model property is referred to as 'stationarity'. In the simplest versions, co-movement of variables is modeled using correlations and regression models (the latter are in effect partial correlations). Within the class of stationary models, time dependencies of observed variables (e.g., the effect of previous price changes on current consumption) are often estimated using so-called distributed lag models. Unobserved components (i.e., residuals) are typically modeled using autoregressive (AR) or moving average (MA) structures. Stationary models can be static or dynamic. In static models, variables respond contemporaneously to drivers. Dynamic models allow one to model impacts which take time to be fully realized. For example, consumers and businesses do not respond to price changes instantaneously, but rather adapt over time. Partial adjustment models constitute one type of dynamic specification which incorporates responses over a period of time.

b. Non-stationary models allow for evolution over time, such as through trends which can be deterministic or stochastic (i.e., random). Trends play an important role in energy and electricity demand modeling (and more generally in the modeling of commodity prices). For example, the study of trends in energy intensity has experienced rapidly growing interest as governments and policy makers try to address the challenges of decarbonization. In nonstationary settings, co-movement is typically modeled using cointegration techniques. One of the most common specifications in this literature is the error correction model which posits a long-term equilibrium relationship between variables and an adjustment mechanism that moves the system towards that equilibrium.

c. Models of energy use may also incorporate cyclical components, such as diurnal and seasonal effects. Cyclicality is especially important in modeling electricity and natural gas consumption.

d. Time-series models may contain stationary, non-stationary and cyclical components.

65. Panel data models combine both time-series and cross-section data. For example, a data-set of this type might contain say ten years of monthly data on electricity consumption in each of the 13 sub-national jurisdictions of Canada, that is the Provinces and Territories, (yielding 1,560 data points).

66. Energy industries continue to evolve, and in some areas technological innovation is a critical driver. Prominent among the changes, as noted earlier, are rapidly dropping costs of solar and wind generation. Electric vehicle research, design and manufacturing is attracting a growing list of participants. Innovation in (chemical) battery technology and more generally energy storage technologies, is also proceeding rapidly. Statistical models provide useful tools for projecting future time-paths of technology adoption.[42]

67. Individual papers in the literature on energy typically focus on one or another technique, determined largely by the structure of the data-set, (time-series, cross-section, panel data). How does one inform one's judgement about price elasticities from such a massive collection of results and approaches? One might be inclined to construct an architectonic model which incorporates data from multiple sources. In a sense, that is what meta-analytic papers are comprised of: meta-analyses are a genre of (usually academic) undertakings which assemble the results obtained in many other papers, then use statistical techniques to weight the various results that have been obtained therein, and thereby to arrive at an overall summary view.[43]

[42] So-called 'convergence' models can be used to project adoption of LED lightbulbs and other energy saving devices, solar roof panels, and electric vehicles, to name a few.

[43] For example, suppose one has a dozen independent estimates of the price elasticity of electricity demand. One option would be to simply take the average of the estimates. A more sensible approach would be to give more accurate estimates (i.e., those that are estimated with greater precision as reflected by their lower standard errors) greater weight, and those that are estimated less precisely, less weight.

C.2 Price Elasticities

68. Given this very broad range of modeling techniques, data types, geographic locations and time spans, how does one organize one's thinking about the impacts of price changes on electricity demand in Manitoba and the trends in demand?

69. Our objective will be to inform the following questions:

    a. What are the short-term and long-term impacts of increases in the price of electricity on residential, commercial and industrial demand? To address these questions, we will focus on sectoral elasticities of electricity demand with respect to the price of electricity (known as own-price elasticities).[44]

    b. What is the relationship between economic growth and electricity demand? What electricity and energy industry trends can inform judgements about future electricity consumption? Here we will focus on the GDP elasticity of demand, and on energy intensity and electricity intensity trends.

    c. How can technological innovation be taken into account in constructing scenarios of future demand? Are there scenarios under which electricity demand could rise rapidly, or others under which it could fall?

70. Surveys of estimated demand elasticities reveal a very broad range of estimates.[45] It should be kept in mind that these ranges cover studies conducted over various time periods and in very different geographic locations. (Appendix 3 of this document contains a bibliography, focusing primarily on North American studies.)

[44] A related elasticity measures the degree to which substitution to natural gas is likely to take place in the residential, commercial and industrial sectors. This is a known as a cross-price elasticity.

[45] K. Gillingham, R. Newell and K Palmer, in "Energy Efficiency Economics and Policy" *Annual Review of Resource Economics,* 2009, 1:597–619 summarize the ranges of estimates at Table 1. Short term residential electricity demand elasticities lie in the range -0.14 and -0.44; their long-run counterparts are between -0.32 and -1.89. Commercial and industrial elasticities also lie in very broad ranges.

71. A recent 'meta-analysis', which as indicated earlier, is a methodology which weights the results of various studies, arrives at empirical results which are useful to the present proceeding.

    a. The first is that the short-term elasticity of demand for electricity is -0.126; that is a 10% increase in the price of electricity results in a 1.26% decline in demand.

    b. The second is that the long-term average elasticity is -0.365; thus a 10% increase in price will eventually lead to a 3.65% decline in demand.[46]

    c. A third useful finding is that long-term elasticities of demand for various energy types are roughly three times short-term elasticities.[47]

72. In contrast, a recent study which uses state-level American data finds a comparable short-term elasticity of -0.1 in all sectors, but much higher long-term elasticities of approximately -0.5 for the commercial sector, -1.1 for the residential sector and -1.4 for the industrial sector. These results are likely driven by the cross-sectional nature of the data. The authors attribute the large industry price elasticity to concentration of electricity intensive industries in low-price states.[48] While these elasticity estimates are certainly large when compared to those in other studies, they serve to bound the range of reasonable estimates: in short, a price elasticity of -1 in the long-term is within the limits of empirical evidence.

[46] Labandeira, X., Labeaga, J.M., López-Otero, X., 2017." A meta-analysis on the price elasticity of energy demand". *Energy Policy* 102, 549-568, Table 5.

[47] *Ibid.* p. 554 "Indeed, considering the papers that report both short (ST) and long-term (LT) price elasticities, the LT average elasticity slightly triples (3.08) the ST average elasticity. Moreover, all energy products are around that figure: electricity (3.04), natural gas (3.03), gasoline (3.05), diesel (3.20) and heating oil (3.73)."

[48] "The Price Elasticity of Electricity Demand in the United States: A Three-Dimensional Analysis", 2017, Paul J. Burke and Ashani Abayasekara, forthcoming, *The Energy Journal*.

73. A literature search for studies that estimated demand elasticities in a uniform fashion across the Provinces and Territories of Canada has turned up very little. [49]

74. **For present purposes, short-term sectoral elasticities of -0.1 and an overall long-term electricity price elasticity of -0.4 provide reasonable benchmarks. Long-term elasticities of -0.35 for the residential and commercial sectors, and -0.5 for the industrial sector would also provide reasonable reference points.**

75. These price elasticities are somewhat higher, in absolute terms, than those provided by Manitoba Hydro in its load forecast documents, as summarized in the table below. While elasticities proposed by Manitoba Hydro are not unreasonable, especially given the degree of uncertainty associated with estimation of demand parameters, those recommended above are better supported by the literature.

	2016 Electric Load Forecast[50]	2017 Electric Load Forecast[51]
Residential Basic	-0.29	-0.28
GS Mass Mkt Small/Medium	-0.18	-0.13
GS Mass Mkt Large	-0.47	-0.46
GS Top Consumers	-0.48	-0.37
Gross Firm energy	-0.32	-0.27

76. Manitoba Hydro is projecting rate increases of 7.9% through 2023/24 followed by 4.54% in 2024/25 for a cumulative nominal increase of about 65%. If realized, they will have a

[49] One report, however, summarizes the results of analyses conducted by researchers at the University of Alberta which was conducted on a Provincial basis. They find a short-term residential electricity demand elasticity of -0.57 for Manitoba; for the commercial sector, the elasticity is -0.44; and for the industrial sector, the estimated elasticity is effectively zero, signifying inelastic demand. See D. Ryan and N. Razek, 2012, "The Likely Effect of Carbon Pricing on Energy Consumption in Canada", Sustainable Prosperity Background Paper, available at http://institut.intelliprosperite.ca/sites/default/files/likely-effect-carbon-pricing-energy-consumption-canada.pdf. These estimates need to be interpreted with some caution, as they are obtained using historic Manitoba data. Electricity prices in Manitoba have displayed somewhat less variation than prices across many jurisdictions.

[50] Electric Load Forecast 2016, Manitoba Hydro 2017/18 & 2018/19 General Rate Application Appendix 7.1, page 57.

[51] Electric Load Forecast 2017, Manitoba Hydro, page 57.

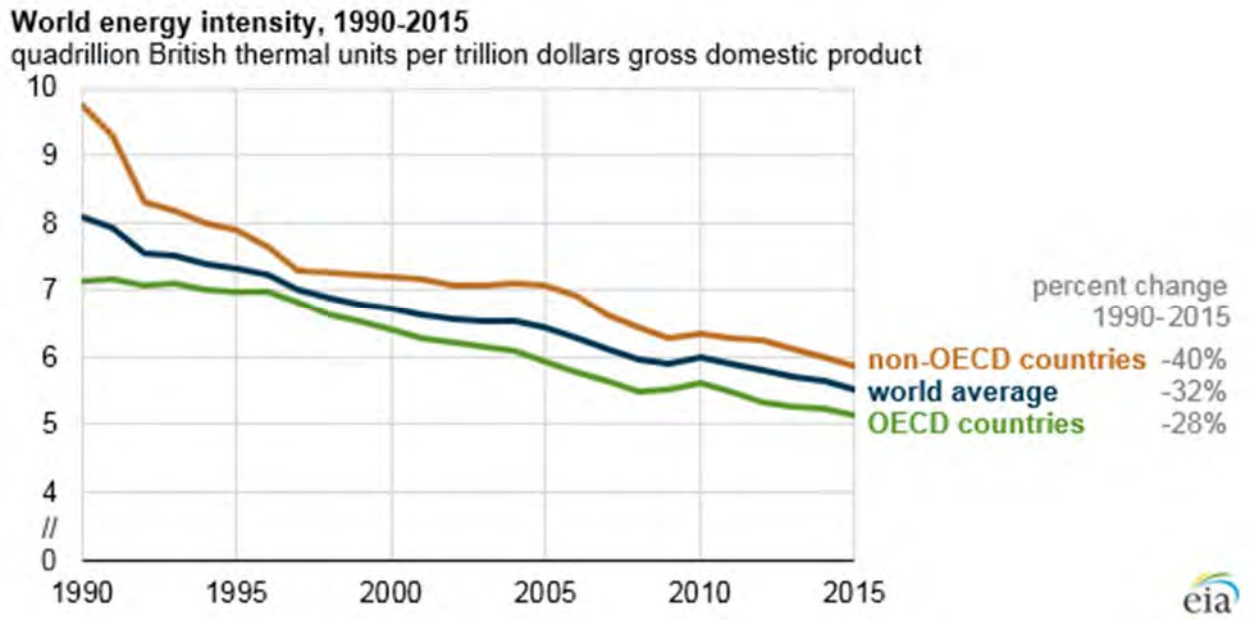
significant impact on electricity sales in all residential, commercial and industrial sectors. Indeed, the *anticipation* of a succession of rate increases will likely have an impact on business investment decisions in the near future.

C.3 GDP Elasticities, and Energy and Electricity Intensities.

77. Numerous studies have analyzed the relationship between GDP growth, and growth in demand for energy in general, and electricity in particular. For many decades, these variables moved very closely together. [52]

78. However, in recent years, this relationship has been weakening in advanced economies. In earlier stages of growth, energy demand grows rapidly in part because manufacturing industries are intensive energy users. As their share of GDP increases, energy demand rises rapidly. In the post-industrial phase, the GDP share of service industries increases. As these industries are less energy intensive, demand for energy and electricity slows. These effects are due to the *composition of GDP*.

79. Increases in GDP which lead to increases in per-capita incomes, in turn drive household energy and electricity consumption. As incomes rise, families increase the size of their living space, they purchase more appliances, computers and entertainment systems, they acquire additional vehicles and they are likely to drive more. These are *income effects*.



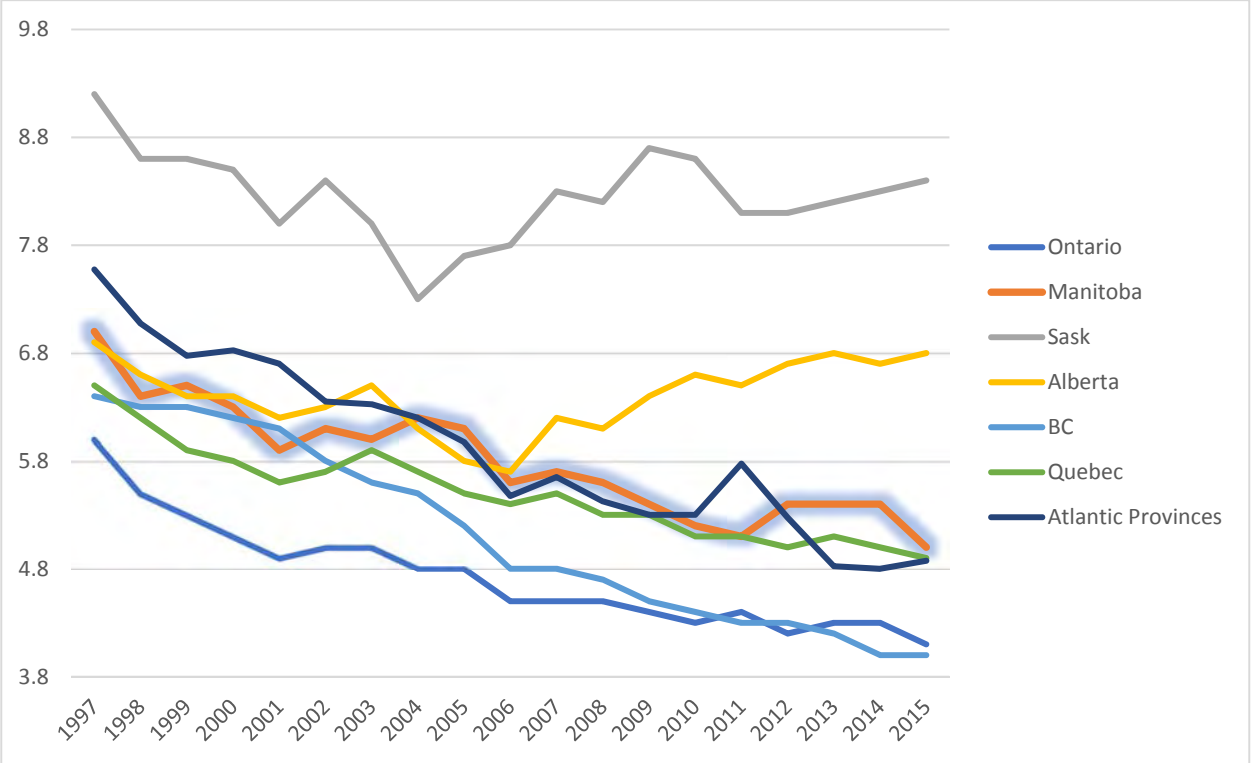
80. The decarbonization agenda also has impacts on energy demand. Energy efficiency programs reduce the energy or electricity required to produce a given level of service. Consider for example lighting where just a few years ago, incandescent light bulbs were the dominant source of light in homes; these used only about 3% of the energy input to produce light, the rest was lost as heat. Compact fluorescent light bulbs are four times as

[52] Standard models and tests assessed whether electricity demand and GDP were co-integrated. Causality testing was conducted to assess whether electricity demand led growth, or whether the reverse was a better representation of reality. The most convincing story is that causality runs both ways. See, e.g., "A survey of the electricity consumption-growth literature", J. Payne, 2010, *Applied Energy*, 87(3), 723-731.

efficient and LED efficiencies are six times higher and increasing.[53] Building envelopes are becoming progressively more efficient at conserving energy, and retro-fitting is common.

81. The net effect of these various forces is that energy intensity -- that is the quantity of energy used in producing say a dollar of GDP -- has been declining at over 1% per year for the last two decades in advanced economies.[54] See Figure 6 below. Over that same time period, energy intensity in Canada declined at a rate in excess of 1% per year, while per capita energy use remained flat.

Figure 6 – World Energy Intensity Trends[55]



[53] For example, a standard Philips LED bulb, which replaces a 60W incandescent bulb required 9.5W.

[54] For OECD countries, energy intensity, declined 32% between 1990 and 2015.

[55] Source: EIA, International Energy Outlook 2016, International Energy Statistics, and Oxford Economics
Note: OECD is the Organization for Economic Cooperation and Development. GDP calculated in purchasing power parity terms. Available at https://www.eia.gov/todayinenergy/detail.php?id=27032.

82. However, the decline has not been uniform across provinces. Over the period 1997-2015 Manitoba energy intensity declined by close to 2% per year, a number very similar to Ontario. Alberta energy intensity first declined, then increased in large part because of the oil sands, so that overall its energy intensity in 2015 was at approximately the same level as in 1997. British Columbia had the most rapid decline over this period of about 2.6% per year.[56]

Figure 7 – Provincial Energy Intensity Trends

83. Energy intensity varies considerably by sector. As noted earlier, the service sector has relatively low energy intensity. The manufacturing sector can have an energy intensity five to ten times higher than the service sector, depending on the specific type of goods being produced.

[56] There have been few careful empirical analyses of the drivers underlying energy intensity trends at sub-national levels in Canada. For a recent detailed study, see Moshiri, A. and Duah N. (2016), Changes in Energy Intensity in Canada, *The Energy Journal*, 37 (4), 315-342, and references therein.

84. In Manitoba, the service sector has exhibited a steady decline in energy intensity over the period 1997 to 2015. The agricultural sector has exhibited a downward trend, though the pattern has been irregular. The mining sector has experienced an increase in intensity in recent years. And the manufacturing sector intensity increased from 1997 to 2005, but has been steadily decreasing since that time.[57]

85. Turning now to electricity (as opposed to energy) intensity, the patterns in Manitoba have been mixed.

    a. In the service sector, which is by far the largest, intensity dropped by about 25% between 2005 and 2012, but by 2015 it had recovered to 2005 levels.
    b. Intensity in the manufacturing sector peaked in 2005, but has been displaying a fairly steady decline since that time.
    c. Agricultural sector intensity remained high until 2005, but subsequently dropped by more than 50%.

86. Electricity demand continues to be very closely linked the level of GDP. Given the declining electricity intensity, a GDP elasticity of about 0.8 is a reasonable reference number for present purposes.

[57] In the U.S., energy intensity in manufacturing has also been decreasing in recent years, but this has been largely attributed to a shift to less energy intensive industries within the manufacturing segment. "Intensity of U.S. energy use in manufacturing decreased as output outpaced fuel use", U.S. Energy Information Administration, October 18, 2017, available at https://www.eia.gov/pressroom/releases/press450.php.

D. Manitoba Hydro Electricity Prices

D.1 Rates, Costs and Intergenerational Equity

87. Manitoba electricity prices are low by national standards. Even the projected rate increases will not produce especially high rates compared to other provinces, with the exception of Quebec. It is possible that at low electricity prices, the response to an increase would be attenuated until the price crosses a certain threshold. The elasticities we are proposing should then be seen as an average response, keeping in mind that Manitoba Hydro projects a large cumulative increase in the coming years.

88. Consider the following simplified calculation. Assume an electricity price elasticity of -0.4 and a GDP elasticity of 0.8. Assume further that real electricity prices will increase by 50% over the next decade and that the economy grows at 2% per year, so that the economy is 22% larger ten years hence. Then the price increase will have a long-term effect of reducing electricity demand by about 20% (-.4 x 50%) and GDP growth will increase demand by about 18% (.8 x 22%). These calculations suggest Provincial electricity demand will be stagnant. While there will certainly be fluctuations in the short term, and economic growth may not be steady as a result of business cycles, the longer-term outlook for electricity demand growth is not favourable under the high price scenario.

89. This assessment is not unprecedented. In 2005, Ontario electricity demand exceeded 157 TWh. In subsequent years, prices increased by about 50%. Ontario demand declined to 137 TWh by 2016.[58]

90. Price induced impacts on electricity demand can come through many channels including:

    a. where natural gas is available, switching to natural gas in space heating and process heat applications, particularly as it is expected that natural gas prices are expected to remain low;

[58] Data available at http://www.ieso.ca/en/power-data/demand-overview/historical-demand.

b. improved energy efficiency of building envelopes: inexpensive measures include weather-stripping and caulking; more expensive measures include insulation and installation of efficient windows and doors to reduce heating costs in winter and cooling costs in summer;
c. purchase of energy efficient appliances;
d. accelerated migration from incandescent, to compact fluorescent and higher efficiency LED bulbs;
e. increased use of smart technologies such as programmable thermostats for heating and air conditioning, and motion-sensitive lighting;
f. increased use of low-flow shower-heads to reduce hot water use;
g. proliferation of solar panel installation by residential, commercial and even industrial customers.

91. There are significant risks to the forecast, for example, growth could be slower, or the price response could be stronger. But there are potentially upside risks as well.

a. In time, the current momentum towards decarbonization of transportation sectors will lead to accelerated adoption of electric vehicles. The price of electric vehicles, and particularly the cost of batteries has been declining.[59] This will increase demand for electricity. It is in this sector that electricity will play a "pivotal role".[60] However, the attractiveness of electric cars to Manitobans is unclear for at least two reasons. First, lower population density requires larger batteries to overcome range anxiety. Second, cold harsh winters have an adverse effect on battery output and electric vehicle range.

[59] Electric car batteries have dropped in cost by 80% in the last half dozen years. Tesla claims that its battery costs are around $190 US/kWh. Thus, a battery with say 80 kWh capacity would comprise about $15,000 US of vehicle costs. The Chevy Bolt now lists for $37,495 USD with a range of 380 kilometers, "Chevy Bolt: Meet the First Practical, Mass-Market Electric Vehicle", Dan Neil, *Wall Street Journal*, October 29, 2017.

[60] See "The technology path to deep greenhouse gas emissions cuts by 2050: the pivotal role of electricity", Williams, J.H., De Benedictis, A., Ghanadan, R., Mahone, A., Moore, J., Morrow, W.R., Price, S., Torn, M.S., 2012, *Science* 335, 53-59.

b. Increased emphasis on reducing carbon should stimulate demand for carbon-free electricity, such as hydro. The present U.S. administration however, is retreating on this issue, and instead promoting the use of hydrocarbons, including coal. Thus, increased U.S. demand as a result of decarbonization initiatives is unlikely to materialize in the near future.

c. Average residential rates in the U.S. in July 2017 were 13.12 cents U.S./kWh. For commercial customers they were 11.00 cents U.S. and for industrial they were 7.33 cents U.S. There is considerable variation across states. In neighbouring states and MISO members, electricity prices are much higher than in Manitoba, leaving room for potential growth in exports. [61]

92. As noted earlier, Manitoba Hydro operates under a 'cost-of-service' regulatory regime. (Many other jurisdictions have moved to a mode of incentive regulation in order to improve incentives for cost minimization.) Manitoba Hydro is implementing a "Workforce Reduction Plan" which would eliminate 900 positions (15% of the workforce) over the course of two to three years.

93. One might ask whether the projected rate increases are equitable from an intergenerational standpoint.

a. Expansion of hydroelectric systems, such as that in Manitoba, involves lumpy investments in generation (to exploit scale economies) and transmission (as supply sources are distant from load). They do not enjoy the positive scalability features of solar, wind and natural gas generation.

b. This leads to long-term cyclical pressures on rates. Current customers have benefited from past investments, particularly those that have been largely depreciated, but remain functional. Future customers will need to pay for

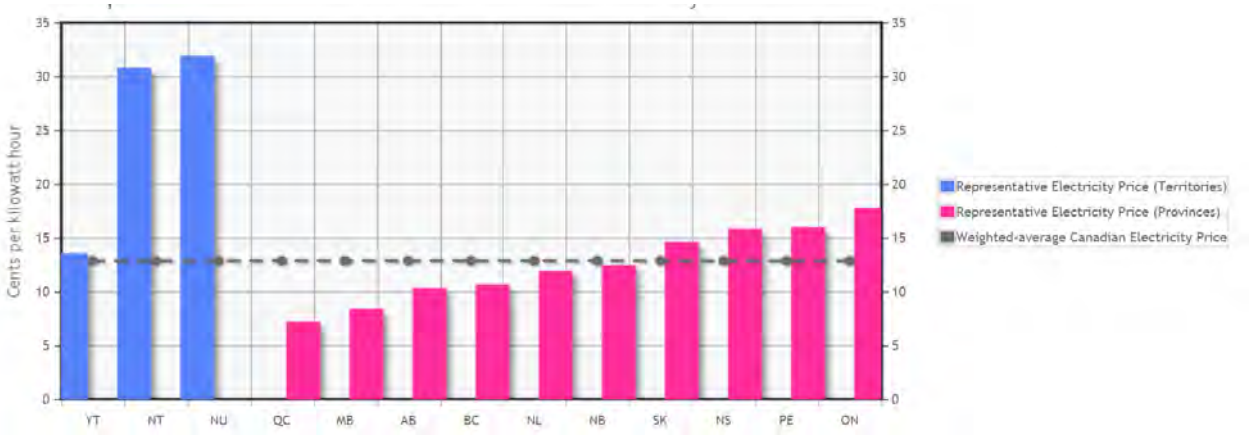
[61] U.S. Energy Information Administration, *Electric Power Monthly,* September 26, 2017, available at https://www.eia.gov/electricity/monthly/epm_table_grapher.php?t=epmt_5_6_a.

current projects. The calculus of intergenerational fairness is therefore, at a minimum, complex, and may not lead to unequivocal answers.

c. Rate-smoothing is a useful tool for promoting inter-generational equity. The projected profile is more in the nature of a step function over six years, followed by a rapid decline to increases close to the rate of inflation. A ramped sequence of increases, perhaps linked to a clear demonstration of efficiencies achieved by Manitoba Hydro, may be a useful framework for promoting internal efficiencies, allowing time to adjust to electricity rates, and distributing costs more equitably over each generation of consumers.

94. The effects of the large projected increases, should they be approved, could in theory, be mitigated.

a. Special industrial rates could be offered to those firms with large electricity cost shares. But this would be viewed as inequitable by other customers. Alternatively, the Government might implement incentives to retain major industrial customers.



b. There would be a substantial increase in the number of households facing energy poverty, however it is measured. To alleviate this effect will require funds either from other Manitoba Hydro customers, or from Government coffers.

D.2 Bill Affordability and Energy Poverty

95. Electricity prices vary widely across the Canadian Provinces and Territories. Quebec and Manitoba have the lowest prices, mainly due to their hydroelectric resources. British Columbia, which is also overwhelmingly hydraulic has somewhat higher prices. Of the provinces, Ontario has the highest prices, due to a variety of factors including the nuclear program and feed-in-tariffs. But even Ontario prices, at about 18 cents per kWh, are far

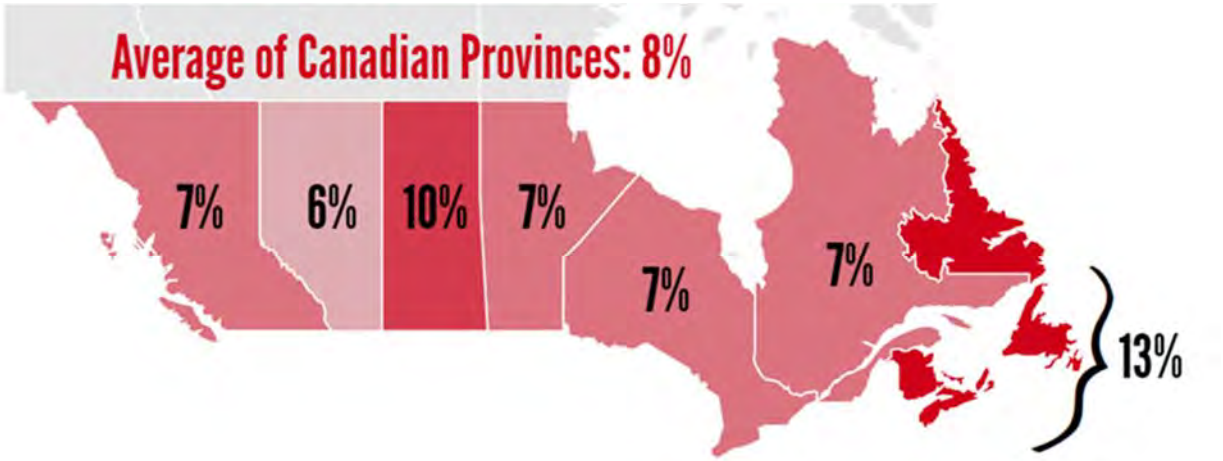
below those in the North-West Territories and Nunavut, which are heavily reliant on diesel and oil to generate electricity. (Yukon Territory prices are lower because of hydraulic resources.) See Figure 8.

Figure 8 – Representative Electricity Prices 2016[62]

96. On average, Canadians pay about 3% of income on household energy (excluding transportation fuels). These expenditures are almost entirely on electricity and natural gas, with a relatively small portion of households still relying on heating oil.[63] The National Energy Board defines households to experience energy poverty if they spend 10% or more of income on energy. (Some others set a lower threshold of 6%.)

97. Generally, the share of income spent on essentials such as energy and food (another form of energy) declines with the level of household income.[64]

98. There is an extensive literature on energy poverty, and various critiques have been put forth of simple income thresholds (such as the 10% indicated above). For example, a family may be spending less than 10% of income on energy because it has more urgent



[62] "Explaining the high cost of power in northern Canada", National Energy Board, February 16, 2017, available at https://www.neb-one.gc.ca/nrg/ntgrtd/mrkt/snpsht/2017/02-03hghcstpwr-eng.html.

[63] See Canada Energy Flow Diagram 2014, (residential sector) available at https://www.economics.utoronto.ca/yatchew/ .

[64] Such relationships are called Engel Curves after Ernst Engel a 19th century statistician and economist.

demands on its income, and as a result, household temperatures are too cold. More sophisticated measures attempt to quantify how much a household *should* be spending on energy, and compares this to total income to determine whether the theoretical amount represents too large a fraction. Alternatively, one can subtract the required expenditures from household income and then assess whether the residual income places the family below the poverty line.[65]

Figure 9: Household Fuel Poverty Rates in Canadian Provinces in 2015[66]

99. Nevertheless, a 10% threshold provides a common departure point for the discussion. By this measure, 7% of Manitoba households experience energy poverty, a level comparable to British Columbia, Ontario and Quebec. Saskatchewan and the Atlantic Provinces have much higher levels. See Figure 9.

100. Lower income households face the additional hurdle of inadequate access to moneys to invest in energy efficiency improvements. The empirical evidence put forth by the

[65] This is the methodology used in England, see https://www.gov.uk/government/collections/fuel-poverty-statistics. See also *Fuel Poverty, Methodology Handbook*, Department for Business, Energy and Industrial Strategy, UK Government, June 2017 Edition; and, "Special Section - Fuel Poverty Comes of Age: Commemorating 21 Years of Research and Policy", *Energy Policy*, Volume 49, October 2012.

[66] Source: "Market Snapshot: Fuel poverty across Canada – lower energy efficiency in lower income households", National Energy Board, https://www.neb-one.gc.ca/nrg/ntgrtd/mrkt/snpsht/2017/08-05flpvrt-eng.html.

National Energy Board suggests that higher income households have lower energy intensities, that is, they use less energy per square meter of dwelling size.[67] This may be partly due to implementation of more energy efficient measures.

101. Utilities across Canada are heavily involved in the development, administration and implementation of numerous energy efficiency programs ranging from informational initiatives, financial incentives and rebates, and energy management and monitoring. There are also programs available through various levels of government, municipal, Provincial, Territorial and Federal. Some specifically target low income households. A detailed listing is provided by the National Energy Board.[68]

102. Manitoba Hydro offers a wide range of energy efficiency and alternative energy programs targeting various segments of its customer base – residential, commercial and industrial. There are also programs specifically targeting First Nations and lower income households.[69]

103. The succession of proposed rate increases will have a particularly intense impact on low income households. In the short run, demand for electricity is highly inelastic. For low income households, facing constraints on cash flow and borrowing, expenditures on electricity saving alternatives may not be realistic. Households that heat with electricity, and therefore experience bills that are much higher than those that do not, are particularly vulnerable. Households in remote communities are especially vulnerable as there is little in the way of alternatives to electric heating. One of the likely consequences of rate shock will be greater 'uptake' of the various conservation programs that are available. However, investments that have multi-year payback periods, such as insulation,

[67] *Ibid.* Tables 3.5 and 3.7 provide data on electricity and natural gas intensity for households based on a Statistics Canada survey conducted in 2011.

[68] See "Directory of Energy Efficiency and Alternative Energy Programs in Canada", National Energy Board, available at http://oee.nrcan.gc.ca/corporate/statistics/neud/dpa/policy_e/programs.cfm.

[69] *Ibid.* "First Nations Program" and "Power Smart Affordable Energy Program".

thermal pane windows[70] and natural gas furnaces (where gas is available), may require greater incentives if they are to contribute to mitigating energy poverty.

104. The question arises as to where responsibility should lie for ensuring that high electricity prices do not drive low income households into poverty.

a. A valid case can be made that affordability of essential goods and services resides with governmental authorities. Supports should be designed to ensure sufficient income and to protect low income households from price increases of all essentials, electricity being one of them. Transfers come from the public purse, rather than from other ratepayers. Increases in electricity prices would be reflected in the escalation factors embedded in income supports, *if* these factors are properly calibrated.

b. A counter-argument can be put forth that in complex societies, multiple mechanisms are needed to protect the poor and disadvantaged. A social *safety net* which has multiple intersecting and reinforcing strands, is required to ensure that individuals and families do not 'fall through'.

105. Both arguments have validity. More recent sophisticated arguments based on behavioural economics suggest that individuals can be encouraged to make better decisions (for themselves and for society) if they are 'nudged' in the right direction. This year's Nobel Prize in economics was awarded to Richard Thaler, co-author with Cass Sunstein of the widely acclaimed 2008 book entitled *Nudge: Improving Decisions About Health, Wealth, and Happiness*. (At several points, the book discusses energy efficiency.) Arguably, many energy conservation programs may be seen as 'nudging' individuals, households and firms in a direction which serves both their individual interests as well as the public interest.[71]

[70] Low cost alternatives, such as reducing window heat loss using plastic, are poor substitutes.

[71] The 'nudge' approach may be interpreted as a mechanism which bridges the differences between social models focusing on individual responsibility, and those that argue for a larger role for government and its institutions.

106. Ultimately, which approach prevails, is a matter of public policy. The first approach is *transparent and simple administratively*. It does not reduce the price of electricity to households, and places expenditure decisions at the level of the household. The second targets an essential good that needs to be directly supported.[72]

107. In many markets, prices that diverge from marginal costs lead to economically inefficient consumption levels. This argument has less weight in electricity industries where prices do not reflect marginal costs to begin with, as rates are regulated so as to recover average costs.

108. On the other hand, in remote communities, where electricity is generated by diesel, high unit costs serve the purpose of sending a price signal that more correctly reflects the (marginal) cost of the electricity that is consumed.

109. The Manitoba Public Utilities Board recently directed Manitoba Hydro to lead a collaborative process to study 'bill affordability'. The report contains simulations of impacts on energy poverty under alternative future rate scenarios. Even with rate profiles somewhat lower than currently projected, energy poverty is forecast to increase by 10% over the next decade.[73]

110. That report also reiterates a previous finding contained in the Manitoba Hydro's 2014 Residential Energy Use Survey which "suggests that energy poverty is greater among customers who identify as Indigenous (i.e. of First Nations, Metis or Inuit ancestry), customers with older homes and/or homes that are electrically heated, and households with either a single member or five or more members."[74]

---

[72] Food stamp programs provide another example of support for a particular category of essential goods.

[73] "For example, if a rate increase scenario of approximately 8% for 4 years or 6% for 6 years and a 6% threshold is used, rates of energy poverty are projected to be approximately 24% higher in 2026. When the same rate scenario and a 10% energy poverty threshold is used, a 10% increase is observed. This underscores the degree to which potential rate increases could increase energy poverty in Manitoba." *Manitoba Hydro Bill Affordability Collaborative Process. Summary Report & Recommendations, January 2017*, page 26, available at http://billaffordabilitymb.ca/.

[74] *Ibid.* page 16.

111. The impact of large increases in electricity prices is likely to be especially acute in remote and First Nations communities, where the possibilities for energy substitution are limited and electricity is generated using diesel.[75] In addition, low incomes will hamper substitution of capital goods, such as improved insulation, and efficient windows and doors. While representative establishment level data do not appear to be available, commercial and industrial enterprises in these communities will also be adversely affected, particularly in the absence of energy substitutes such as natural gas.

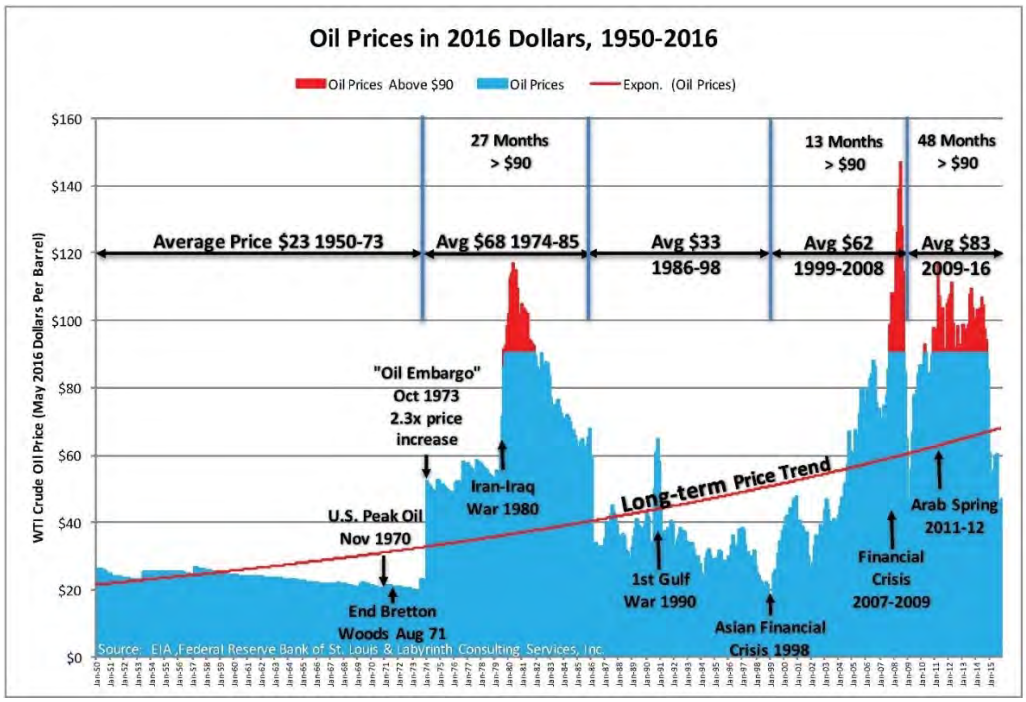
[75] The 2017 Federal Budget allocates funds, beginning in 2018-2019 for the implementation of "renewable energy projects in off-grid Indigenous and northern communities that rely on diesel and other fossil fuels to generate heat and power", see https://www.aadnc-aandc.gc.ca/eng/1481305379258/1481305405115.

E. Macroeconomic Impacts of Electricity Price Increases

E.1 Energy Price Shocks

112. In order to provide a broader perspective, it is useful to reflect upon the impacts of changes -- even sudden and unexpected changes -- in key energy variables on economic activity.

113. A great deal of attention has been devoted to the impacts of oil prices on the macroeconomy. Many economists attribute several of the past recessions to oil price shocks, particularly those resulting from OPEC increases in 1973, and the subsequent increases in 1979 at the time of the Iranian Revolution. Between 1973 and 1974, oil prices *tripled*, from $17.77 to $56.39 USD (2016 dollars) per barrel; between 1978 and 1979, they *doubled*, from $51.51 to $104.50 USD (2016 dollars), see Figure 10 below. Both of these occurred at a time when western economies were in a state of stagflation (high inflation *and* high unemployment), and both were unanticipated.



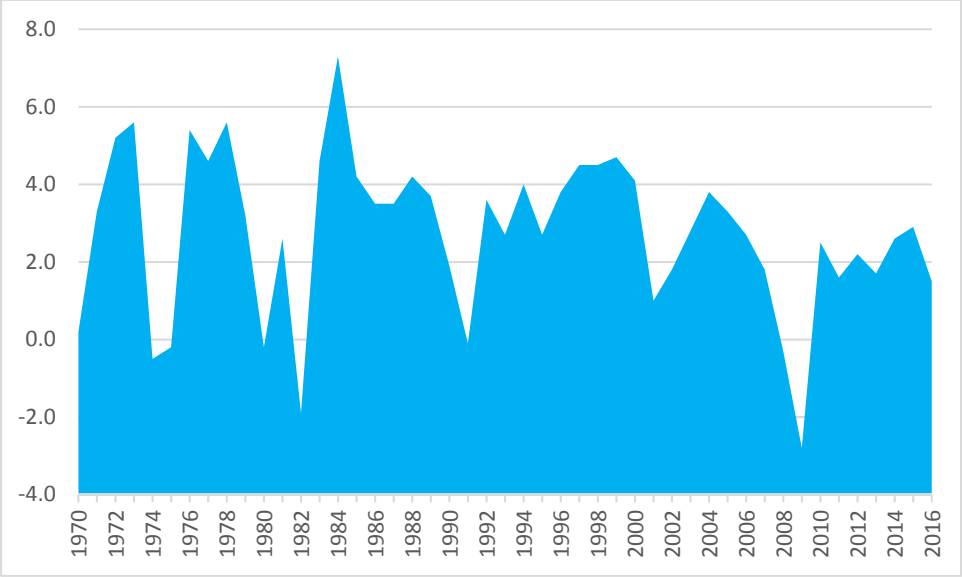
114. As may be seen from Figure 11, the two oil price shocks in the 1970s led to dramatic drops in GDP growth: from 5.6% in 1973 to -0.5% in 1974; and from 3.2% in 1979 to -0.2% in 1980. Kilian and Vigfusson estimate that US GDP is lower by 3% as a result of the doubling of oil prices in the late 1970s. [76]

115. Consider now oil prices in more recent years. Figure 10 reveals that oil prices increased from about $30 in 1998 to over $120 USD/barrel in 2008, a factor of four, which is much larger than the magnitude of the oil price shocks of the 1970s. During this period, U.S. real GDP growth averaged 3%, and the Great Recession which began in late 2008 was triggered by a financial crisis, not by the inexorable rise in oil prices. (In fact, many

[76] …"oil price shocks explain a 3% cumulative reduction in U.S. real GDP in the late 1970s and early 1980s and a 5% cumulative reduction during the financial crisis." See "The Role of Oil Price Shocks in Causing U.S. Recessions", by Lutz Kilian and Robert J. Vigfusson, The Federal Reserve Board, 2014 available at https://www.federalreserve.gov/pubs/ifdp/2014/1114/default.htm.

attribute the rise in oil prices to macroeconomic growth, particularly in China and the concomitant growth elsewhere.)

Figure 10: Oil Prices[77]



116. A key lesson from these contrasting macroeconomic responses to energy price increases is the critical difference between 'supply-push' and 'demand-pull' forces. The increases during the 1970s were supply shocks, resulting from decisions by major oil producing countries (OPEC). The increases in the 21st century were driven by increasing demand without sufficient opportunity or willingness on the part of suppliers to respond.

117. A second important lesson is that steady energy price increases, that are spread over a number of years, do not necessarily lead to disastrous adverse effects on aggregate economic activity. One of the reasons, of course, is that energy purchasers (consumers and producers) have some opportunity to adjust and to take the price effects into account

[77] Source: "Oil Prices Lower Forever? Hard Times In A Failing Global Economy" Art Berman, Forbes.com, July 25, 2016, http://www.artberman.com/wp-content/uploads/Oil-Prices-in-2016-Dollars-1950-2016-.jpg.

in their planning for the future. In contrast, large unexpected energy price changes can have a significant disruptive effect on the economy.

Figure 11: US GDP (% changes) [78]

118. Some who examine the data may also be surprised that, notwithstanding the *magnitudes* of the oil price increases in the 1970s, the contractions in both 1974 and 1980 were modest, half a per cent or less. In fact, the largest contraction over this period was 3% and it occurred as a result of the 2008 financial crisis.

119. Variations in oil prices have resulted in wide swings in gasoline prices. Between late 2008 and 2014, Manitoba pump prices increased from about 75 cents/liter to 128 cents/liter, an increase of about 70%.[79, 80]

[78] Source: Bureau of Economic Analysis, U.S. Department of Commerce, available at https://www.bea.gov/iTable/iTable.cfm?reqid=19&step=2#reqid=19&step=3&isuri=1&1910=x&0=-99&1921=survey&1903=1&1904=1970&1905=2017&1906=a&1911=0.

[79] Source: Gas Buddy, http://www.manitobagasprices.com/retail_price_chart.aspx.

[80] Natural gas prices have also experienced large changes since the turn of the century, driven in North America by the fracking revolution. The price declines have brought considerable benefits directly, to those households and businesses that have access to natural gas, and to a lesser degree to those that purchase goods for which natural gas is an input in the production process.

120. The implication for the electricity price increases, projected by Manitoba Hydro, is that they are not likely to have a disastrous impact on *aggregate* macroeconomic activity. This is further reinforced by the fact that over 70% of the Manitoba economy provides services, and electricity in this sector comprises a relatively small proportion of total costs.

121. However, that it not to say that certain industries will not be negatively impacted, possibly severely. As we discuss further below, some companies may choose to relocate or to scale back production. Some will consider very carefully whether to make major new capital investments in the Province. Indeed, the specter of increasing rates, in the near or more distant future, may have already discouraged investment. The risk of future price increases, that cumulate to 50% or more, must be part of the decision matrix for any electricity intensive firm in Manitoba.

122. Furthermore, there will be distributional effects that will be particularly felt by those in lower income brackets and those who do not have access to alternative sources of energy, in particular, natural gas.

123. In the past, electricity prices in Manitoba have increased steadily, but relatively smoothly over similar time-frames, largely due to regulatory decisions. The current proposal, for large increases over a sequence of years, is more in the nature of a rate shock.

E.2 Exchange Rates

124. The Manitoba economy is driven to a substantial degree by its exports markets, some of which involve sales to other Provinces and Territories (about 27% of Manitoba GDP), others involve international sales, primarily the United States (also about 27% of GDP).[81] Thus exchange rates have an important impact on the Manitoba economy.

[81] Budget Paper A, Economic Review and Outlook, page A14, Province of Manitoba, April 2017, available at http://www.manitoba.ca/budget2017/index.html.

125. Manitoba has a broad export base which includes grains and oilseed products (20.2%); transport equipment (12.7%); livestock and processed meats (10.7%); machinery and electrical equipment (9.5%); and chemical products (8.9%).[82]

126. The linkage between Canada's exchange rate and oil prices is illustrated in Figure 12 below; indeed the two series appear to be tethered to each other.[83]

Figure 12: Oil Prices[84] (blue) vs CAD/US Exchange Rate (orange)

127. In the early part of the 21st century, the exchange rate hovered around 80 US cents. As oil prices increased, the value of the Canadian dollar rose, achieving parity in 2007. The financial crisis of 2008 led to the 'Great Recession' through 2009, during which oil prices plummeted and the dollar returned to about the 80 cent level. As economies stabilized and recovered, oil prices rose once again. The Canadian dollar hovered around parity from

[82] *Ibid.* page A15.

[83] There is likely a co-integrated relationship between these series, as well as causality running from oil prices to the Canadian dollar value.

[84] West Texas Intermediate (WTI).

2010 to 2013. Then in 2014, oil prices collapsed and the Canadian dollar, which began its decline earlier, followed it down, at one point trading well below 70 cents US.

128. While oil prices have risen far above their lows of late 2015 when oil was trading below $30 USD/barrel, it is unlikely that they will return to $100 USD/barrel any time soon, if ever. As suggested earlier, the issue now is when worldwide demand (rather than supply) will reach its peak.

129. A stronger Canadian dollar has an adverse impact on the competitiveness of Canadian products on international markets. During the period of high oil prices, Western Canada benefited, while manufacturing industries in Ontario, and in other provinces, suffered the so-called 'Dutch Disease'.[85]

130. Presently, the dollar is near the 80 cent mark and Manitoba Hydro is projecting a gradual return to the 87 cent level over the course of the next few years.[86] Clearly much depends on the future price of oil.

131. But other factors may also have an important influence on the exchange rate. The NAFTA renegotiations are presently in limbo, and an adverse outcome for Canada will likely have a negative effect on Canadian and Manitoba exports to the U.S. and on the CAD/USD exchange rate.

132. To summarize, the exchange rate has important impacts on Manitoba and Manitoba Hydro.

a. International exports are affected: as the dollar appreciates, the competitiveness of Manitoba exporting industries (agriculture, manufacturing, chemicals) is adversely affected. Those that are electricity intensive are particularly sensitive to the kinds of electricity price increases that are being proposed.

[85] See, for example, "What Dutch disease is, and why it's bad", The Economist, November 5, 2014, available at https://www.economist.com/blogs/economist-explains/2014/11/economist-explains-2.

[86] Manitoba Hydro, GRA, Appendix 3.2 Revised, Economic Outlook, 2016-2037, Winter 2016, page 13.

b. Manitoba Hydro is also directly affected, in that its export sales to U.S. markets generate lower Canadian dollar revenues.

c. On the other hand, to the extent that some industries import inputs, particularly from the U.S., a stronger Canadian dollar is helpful.

E.3 Commodity Prices

133. Commodity prices are driven by a complexity of forces – depletion and discovery, innovation and obsolescence, competition and strategic behaviour, and of course, supply and demand. Each of these have played an important role in driving oil prices.

134. Metals markets are also driven by similar factors. The principal metals mined in Manitoba are nickel, copper, zinc and gold.[87] The first three exhibit both long term trends and cyclical behaviour. Gold prices are subject primarily to forces in financial markets, and are very much affected by market perceptions of risk and stability in geopolitical conditions.

135. The prices of each of these metals exhibit wide variations:

a. Nickel prices have dropped by a factor of two from $13 US/lb. in 2010 to less than $6 US/lb. in November 2017.

b. Copper prices also dropped by a factor of two between 2010 and 2016 (from $4 US/lb. to $2 US/lb.) but have since recovered to about $3 US/lb.[88]

[87] Budget Paper A, Economic Review and Outlook, page A11, Province of Manitoba, April 2017, available at http://www.manitoba.ca/budget2017/index.html.

[88] The long-term paths of nickel and copper prices exhibit similar patterns. See Dimitropoulos and Yatchew.

c. Zinc prices were at about $2400 US/metric ton in 2009, declined to $1600 in 2015 and have since increased to $3200.

d. Gold prices peaked at $1800 US/ounce in 2011, but have since dropped to about $1300 US/ounce in 2017.

The purpose of these examples is to illustrate the degree of price variation that mining companies experience in metals markets. By comparison, electricity prices have historically been a source of stability for Manitoba metal extractors.[89]

136. Agricultural products also exhibit large price variations and are affected by growth conditions (such as droughts) in various parts of the world. Wheat prices, which reached a post-recession high of $9 US/bushel in 2012, have since declined to $4 - $5 US/bushel in 2017.

E.4 Electricity Intensity Varies Widely Across Some Sectors of the Manitoba Economy

137. It is helpful to put into perspective the share of electricity costs in various segments of the Manitoba economy. The most electricity intensive sectors are manufacturing and agriculture with electricity comprising 1.23% and 1.21% of inputs respectively. Mining is not far behind with a share of 1.12% The service sector (aggregated over a broad range of services and comprising 71% of GDP) has an electricity input share of 0.75%.

138. Based on these figures, one might be inclined to conclude that even substantial increases in electricity prices (on the order of 50% over the coming years) would have a minimal impact on decisions made by firms in these sectors. However, this level of aggregation masks those instances where sub-sectors and firms may be particularly vulnerable to electricity price rises. A more refined look by specific sub-sectors is required.

[89] There is a large literature which attempts to model commodity prices in terms of trends and 'super cycles', however such modeling exercises have little predictive value as the length and amplitude of cycles varies over time.

In the following paragraphs we highlight certain electricity intensive sub-sectors. Detailed tables are available in Appendix 4: Manitoba Electricity Cost Shares by Sub-Sector.

Electricity Shares by Major GDP Sector[90]		
	GDP Shares	Electricity as Share of Inputs
Services	71.2	0.75%
Manufacturing	10.1	1.23%
Construction	8.9	0.05%
Agriculture	4.0	1.21%
Utilities	3.4	0.01%
Mining	2.4	1.12%

139. In the manufacturing sector, the most vulnerable industry would appear to be 'basic chemicals' which has an 18% share for electricity costs. This is followed by pulp and paper which has an electricity share of 7%. Iron and steel mills, foundries and non-ferrous metal production have shares of about 3%. Fertilizer and pesticide has a 2% share. Motor vehicle, engine and electric lighting equipment manufacturing have shares of about 2%.

140. In the agricultural sector, greenhouses, nurseries and floriculture establishments have a 3% electricity share of total inputs. Animal production has a 2% share.

141. In the mining sector, support activities for oil and gas extraction have a 6% share. Copper, nickel, zinc and gold extraction have electricity cost shares of 2%-3%.

142. These sub-sectors of the manufacturing, agricultural and mining industries face competitive pressures in export markets. Their locational decisions are determined by various factors, including proximity to certain resources and inputs, and past capital investments. Manitoba may continue to be a preferred location for operations. However, future production and investment decisions by existing entities, and the attractiveness of

[90] The electricity input shares are based on 2013 data, the most recently posted data in CANSIM Tables 381-0033.

Manitoba to potential new enterprises, will be affected if electricity prices are expected to increase substantially in coming years.[91]

F. Concluding Observations

143. The regulatory decisions made in this proceeding, which deals with rate increases over a two-year test period, will have an important impact on decision making by industry because they will signal the likely future path of rate increases. Approval of increases that are close to the proposed 7.9% will suggest the acceptance of Manitoba Hydro arguments and its focus on the time profile of future financial ratios.

144. Large increases will induce a price response. Our review of the extensive modeling literature suggests an overall price elasticity of -0.4. In a period of excess capacity, such increases may be sub-optimal as they will erode revenues at a time when marginal costs of production are low.

145. From the standpoint of carbon emissions, Manitoba's energy sector is very well placed: 37% of all energy (including the transportation sector) comes from hydraulic sources, and 1% comes from wind generation (recall the Sankey diagram in Figure 3). Natural gas provides 26% of total energy, coal a miniscule 0.3%, and the remaining 35% consists of transportation fuels.[92] Other jurisdictions are focusing on decarbonizing the electricity sector, but Manitoba has already accomplished this.

[91] There are also portions of the service sector that have high electricity cost shares. Social assistance and educational services have electricity shares in the 4% to 6% range. Dry cleaning and laundry services have an electricity share of 5%. Crude oil and other pipeline transportation have an electricity share of 2%. While these services will continue to be provided, large electricity cost increases will impact their bottom line.

[92] In total, about 60% of Manitoba energy is from hydrocarbons. Compare this to Canada-wide numbers where about 80% of domestic energy comes from hydrocarbons, see https://www.economics.utoronto.ca/yatchew/ . U.S. dependence on hydrocarbons is of a similar magnitude, see Lawrence Livermore National Labs Sankey diagrams at https://flowcharts.llnl.gov/content/assets/images/charts/Energy/Energy_2016_United-States.png.

146. Three decarbonization strategies suggest themselves.[93] The first involves reductions in energy intensity. While the energy intensity trends we have reviewed suggest that 2% annual reductions have been achievable in the past, this would just compensate for annual GDP growth rates of 2%. The second involves moving away from natural gas, which would be unappealing to residential, commercial and industrial consumers, especially when gas prices are expected to continue to remain low and electricity prices are increasing. The third involves decarbonization of transportation, which is by far the most difficult sector to decarbonize.

147. Increasing energy prices, whether in the electricity sector (for fiscal reasons) or in the natural gas sector (via a carbon tax), may be counter-productive for other reasons: if Manitoba's energy intensive industries decamp to other jurisdictions, the net effect on global emissions is likely to be negative. (To put it simply, how many industry-friendly jurisdictions are there with an energy mix as clean as that of Manitoba?) Reductions in carbon emissions may make Manitobans feel that they are doing 'their share' with respect to global warming, but it may not be rational unless the 'carbon leakage' problem is solved.[94]

148. The projected rate increases are likely to have a modest *net* effect on aggregate Manitoba output in the long-run, though there could very well be job losses and reduced output in the short-run. The immediate main effects will be distributional, impacting low income households and remote and First Nations communities more strongly. Such increases may also lead to structural changes in industry with the largest impacts on electricity intensive enterprises. Neither of these consequences constitute a basis for keeping rates inappropriately low for *all* purchasers, as there are superior mechanisms for handling distributional impacts in residential, commercial and industrial sectors.

[93] The recently released Manitoba Government discussion paper outlines strategies for decarbonization, including of the energy sector. See "A Made-in-Manitoba Climate and Green Plan Hearing from Manitobans" available at https://www.gov.mb.ca/asset_library/en/climatechange/climategreenplandiscussionpaper.pdf, released on October 27, 2017.

Appendices

Appendix 1: Scope of Work and Summary Responses

DR. ADONIS YATCHEW

(Summary responses in **bold**, report references in ***bold italics***)

For Microeconomic Issues:

1. Review, assess and comment on the reasonableness of the price elasticity information incorporated in Appendix 7.1 of Manitoba Hydro's General Rate Application.

The elasticities proposed by Manitoba Hydro are not unreasonable, given the degree of uncertainty associated with estimation of demand parameters. However, based on the extant literature, more negative price elasticities and a substantially larger income/GDP elasticity are recommended. See sections *"C.2 Price Elasticities"* and *"C.3 GDP Elasticities, and Energy and Electricity Intensities"*.

2. Provide a review of the relevant literature on the price elasticity of demand for electricity, drawing from the North American experience in particular. This should distinguish between how different customer classes ("Residential," Commercial" and "Industrial") and how different sectors of the economy (including industry, small business, agriculture, manufacturing, and any other relevant sectors) respond to price changes in light of their different substitution possibilities and geographical mobility. This literature review should include consideration of any impacts on First Nations consumers, including residential and commercial and/or industrial First Nations ratepayers.

The literature on demand modeling is voluminous and there are a variety of approaches, usually determined by the type of available data. These include time-series, cross-section, panel data, and meta-analyses. See section *"C.1 Energy Demand Modeling"*. The studies produce a very broad range of price elasticity estimates. Based on a review of the literature, the following elasticities are recommended:

   a. **a short-term price elasticity of -0.1 across all sectors; that is, an electricity price increase of 10% leads to a 1% decline in electricity demand in the short-term;**

b. a long-term overall price elasticity of -0.4; that is, an electricity price increase of 10% leads to a 4% decline in electricity demand in the long-term;

c. long-term price elasticities of -0.35 for the residential and commercial sectors, and -0.5 for the industrial sector;

d. a GDP elasticity of 0.8; that is, an increase in GDP of 10% eventually leads to an increase in electricity consumption of 8%.

The literature on estimation of sub-sectoral elasticities (such as manufacturing, agriculture) is limited. Some results are available on energy and electricity intensity trends at disaggregate levels. See sections *"C.2 Price Elasticities"* and *"C.3 GDP Elasticities, and Energy and Electricity Intensities"*.

Substitution possibilities are mainly in the form of natural gas, where it is available; capital investments, such as insulation, efficient windows and doors, LED lighting, and energy efficient appliances and equipment. Solar self-generation is progressively becoming a partial substitution option. Locational decisions for energy intensive industries are affected by energy prices. See sections *"B.2 The Manitoba Energy Sector", "B.3 Oil and Natural Gas Markets", "B.4 Costs of Key Technologies Have Been Dropping Rapidly", "C.2 Price Elasticities"* and *"C.3 GDP Elasticities, and Energy and Electricity Intensities"*.

Unavailability of natural gas limits substitution options for remote and First Nations communities in all sectors (residential, commercial and industrial). Low incomes also hamper capital substitutions that require large investments. See section *"D.2 Bill Affordability and Energy Poverty"*.

3. Review

- Tab 9 and Appendix 9.13 (Survey of Canadian Electricity Bills) in Manitoba Hydro's General Rate Application; Manitoba Public Utilities Board's Needs For and Alternatives To Report with respect to ratepayer impacts;

- Available information regarding consumption patterns of Manitoba industries, including PUB/MH 1-54 and PUB 11-58 from Manitoba Hydro's 2015/16 General Rate Application.

Provide analysis and comment on what, if any, inferences can be drawn from the general literature on the price elasticity of demand for electricity to the Manitoba context, specifically given:

a) The history of the levels of electricity prices in Manitoba; and

b) substitution possibilities due to technological improvements in renewable energy sources.

Manitoba has a history of low electricity prices, which has shaped the patterns of energy consumption: very high reliance on electricity, compared for example to Canada-wide averages. Substitution to natural gas, where it is available, is likely to occur if projected electricity prices are realized. The costs of renewable technologies, such as solar and wind energy, have been dropping dramatically, and may gain penetration, particularly in areas where gas is unavailable.

The response to price increases may be nonlinear, with limited initial changes in patterns of consumption, but the response is likely to strengthen if rates reach substantially higher levels. (Since 2009, electricity rates in Ontario have increased by more than 50% and demand has been stagnant.) See sections *"B.2 The Manitoba Energy Sector", "B.4 Costs of Key Technologies Have Been Dropping Rapidly"* and *"D.1 Rates, Costs and Intergenerational Equity"*.

4. In light of Manitoba Hydro's request for an annual increase in average electricity rates of 7.9%, including for the fiscal years of 2017/18 and 2018/19, as well as the proposed rate trajectory over the next 10 years, provide comment on how various domestic customer classes might be expected to respond to an increase of the proposed levels.

See responses to 2. and 3. above, and 9. below.

5. Review, assess and provide an explanation of any implications for the economy of the Province of Manitoba arising from the impact of the proposed or alternative rate increases, including rate increases proposed for the years beyond the test years.

See responses to 8. and 9. Below.

6. Provide comment on issues of rate shock, pacing of rate increases and the intergenerational impacts of rate increases in the Manitoba context, including with reference to the rate increases sought by Manitoba Hydro in its General Rate Application.

Expansion of hydroelectric systems, such as that in Manitoba, involves lumpy investments in generation (to exploit scale economies) and transmission (as supply sources are distant from load). They do not enjoy the scalability advantages of solar, wind and natural gas generation.

This leads to long-term cyclical pressures on rates. Current customers have benefited from past investments, particularly those that have been largely depreciated, but remain functional. Future customers will need to pay for current projects. The calculus of intergenerational fairness is therefore, at a minimum, complex, and may not lead to unequivocal answers.

Rate-smoothing is a useful tool for promoting inter-generational equity. Rates projected by Manitoba Hydro are more in the nature of a step function lasting six years, followed by a rapid decline to increases close to the rate of inflation. A ramped sequence of increases, perhaps linked to a clear demonstration of efficiencies achieved by Manitoba Hydro, may be a useful framework for promoting internal efficiencies, allowing time to adjust to electricity rates, and distributing costs more equitably over each generation of consumers.

See section *"D.1 Rates, Costs and Intergenerational Equity"*.

7. Review and assess Manitoba Hydro's General Rate Application Appendices 10.4, 10.5, 10.6 and 10.7 (B ill Affordability). Provide comment on the issue of "Energy Poverty", including as the issue applies to Indigenous and Northern communities, and an analysis of the experience in other Canadian jurisdictions as to measuring the extent of this problem and potential remedies that have been suggested. What lessons can be learned from other Canadian provinces as to measuring the extent of this problem and potential remedies that have been suggested.

Manitoba has a relatively low rate of energy poverty in comparison to other provinces: about 7% of households spend 10% or more of their income on energy. However, the incidence of energy poverty varies significantly across the Province and is particularly high in remote communities where prices of many goods, among them energy, are high. The projected growth in electricity prices will increase rates of energy poverty.

The impact on energy poverty, which is already high in remote First Nations communities, is likely to be especially acute given the limited possibilities for energy substitution. In addition, low incomes will hamper substitution of capital goods, such as improved insulation, and efficient windows and doors. Commercial and industrial establishments in such communities will also be adversely affected, particularly given the absence of energy substitutes such as natural gas.

Review of energy program initiatives across Canada indicates that Manitoba has been pro-active in seeking to understand the structure and causes of energy poverty, and in developing remedies.

See section "D.2 Bill Affordability and Energy Poverty".

For Macroeconomics Aspects:

8. Given your findings with respect to demand responses by various customer classes and sectors of the economy to electricity price increases, review, assess and provide analysis on the potential or probable implications for the Manitoba economy as a whole.

Market economies have experienced major energy price increases. The dramatic oil price shocks of the 1970s which were largely unanticipated, led to economic contractions of half a per cent or less. The cumulative impact on U.S. GDP of the oil price shock in the late 1970s is estimated to be about 3%. These past experiences are helpful in bounding the likely effects of significant electricity price increases in Manitoba. See section *"E.1 Energy Price Shocks".*

The projected electricity rate increases are not of the same magnitude as the oil price shocks of the 1970s. However, given that in the short-term, demand for electricity is highly price-inelastic, the steepness of the projected rate increases will impose a significant burden, particularly on households, businesses and institutions that do not have access to natural gas. In some locations, especially those which are heavily dependent on an industry that is sensitive to electricity prices, there could be large local impacts on employment, incomes and output. See sections *"C.2 Price Elasticities", "C.3 GDP Elasticities, and Energy and Electricity Intensities", "D.2 Bill Affordability and Energy Poverty"* and *"E.1 Energy Price Shocks".*

The Manitoba economy is significantly affected by wide and difficult-to-predict fluctuations in other key variables, such as exchange rates and commodity prices. Notwithstanding wide variations in these variables, the Manitoba economy has continued to thrive. See sections *"E.2 Exchange Rates"* and *"E.3 Commodity Prices"*

The net effect on GDP may eventually be modest, keeping in mind that the electricity cost shares for major sectors of the economy (e.g., the service sector which comprises 71% of GDP) are low. However, in the interim, there are likely to be significant adjustment costs. See sections *"B.1 Economic Setting" and "D.4 Electricity Intensity Varies Widely Across Some Sectors of the Manitoba Economy".*

9. In the context of the proposed Manitoba Hydro rate increases, with the benefit of the latest Statistics Canada input-output tables for Manitoba (and/or other relevant sources), identify

and provide comment on the "electricity intensive" sectors of the Manitoba economy, including the following:

a. Whether the province would be at risk of losing major electricity-consuming firms to other North American jurisdictions;
b. In light of the heavily export-oriented nature of key sectors of the Manitoba economy, what the implications would be for producers.
c. Place these issues in some quantitative perspective, both in terms of the aggregate provincial GDP and income distribution effects by key sectors and customer classes.

Certain industries will be significantly affected if the projected rate increases are realized. In the manufacturing sector, the most vulnerable industries appear to be 'basic chemicals' and 'pulp and paper' where electricity comprises high shares of costs. Iron and steel mills, foundries, non-ferrous metal production, fertilizer and pesticide, and various equipment manufacturing industries also have significant electricity cost shares.

In the agricultural sector, 'greenhouses' and 'animal production' have significant electricity cost shares. In the mining sector, 'support activities for oil and gas production' and extraction of metals also have significant electricity cost shares.

While the consequences of high electricity rates in some of these industries will be quite significant, they need to be understood from the perspective of overall price variation and uncertainty associated with other key variables which affect them, such as exchange rates and commodity prices.

See sections *"B.1 Economic Setting", "E.1 Energy Price Shocks", "E.2 Exchange Rates", "E.3 Commodity Prices", "E.4 Electricity Intensity Varies Widely Across Some Sectors of the Manitoba Economy"* and *"Appendix 5: Manitoba Electricity Cost Shares by Sub-Sector".*

10. Provide a report on the Microeconomic Aspects and Macroeconomic Aspects to be placed on the public record that provides your findings and supporting information.

Appendix 2: Curriculum Vitae – Adonis Yatchew

Professor of Economics, University of Toronto
Editor-in-Chief, The Energy Journal
Senior Consultant, Charles River Associates

Department of Economics, University of Toronto

150 St. George Street, Toronto, Canada M5S 3G7

(416) 978-7128

adonis.yatchew@utoronto.ca

Ph.D. Economics 1980
Harvard University

M.A. Economics 1975
University of Toronto

B.A. Mathematics and
Economics 1974
University of Toronto

Adonis Yatchew's research focuses on econometrics, energy and regulatory economics. Since completing his Ph.D. at Harvard University, he has taught at the University of Toronto. He has also held visiting appointments at Trinity College, Cambridge University and the University of Chicago, among others. He has written a graduate level text on semiparametric regression techniques published by Cambridge University Press. He has served in various editorial capacities at The Energy Journal since 1995 and is currently the Editor-in-Chief. He has advised public and private sector companies on energy, regulatory and other matters for over 25 years and has provided testimony in numerous regulatory and litigation procedures. Adonis Yatchew currently teaches undergraduate and graduate courses in energy economics, graduate courses in econometrics and 'Big Ideas' courses on energy and the environment with colleagues in physics and classics.

ACADEMIC EXPERIENCE

Current Position	Professor of Economics, University of Toronto
2008	Visiting academic, Department of Mathematics and Statistics, University of Melbourne
2008	Visiting academic, School of Economics and Finance, Queensland University of Technology
2008	Visitor, National Center for Econometric Research, Queensland University of Technology
2005	Visiting Fellow, ARC Center of Excellence for Mathematics and Statistics of Complex Systems, Mathematical Sciences Institute, Australian National University
2001	Visiting Fellow, School of Mathematical Sciences, Australian National University

1986 to 2004	Associate Professor, Economics, University of Toronto
1989, 1990, 1991	Visiting Research Associate, Harvard University
1986	Visiting Fellow Commoner, Trinity College, Cambridge U.K.
1980 to 1986	Assistant Professor, Economics, University of Toronto
1984	Visiting Research Associate, National Bureau of Economic Research, Cambridge, Massachusetts
1982 to 1984	Visiting Assistant Professor, University of Chicago
1976	Lecturer, University of Toronto, Scarborough College

EDITORIAL AND PROFESSIONAL ACTIVITIES

Current

Editor-in-Chief, The Energy Journal (2006-present)
Member, Board of Editors, Economics of Energy and Environmental Policy
Member, Editorial Board, Foundations and Trends in Econometrics
Member, Council, International Association for Energy Economics
Member, National Center for Econometric Research, Econometrics of Energy and the Environment, Australia

Past

Editor, The Energy Journal, (2006)
Joint Editor, The Energy Journal (1995-2005)
Associate Chair for Graduate Studies, University of Toronto, 2006-2009
Joint Editor 1997, Distributed Generation, special issue of the Energy Journal
Advisory Editor, Economics Letters (1985-1997)
Member, Advisory Board, *Eurasia Foundation*, 1995-2007

AWARDS AND DISTINCTIONS

USAEE Senior Fellow Award, June 2014

SELECTED PRESENTATIONS

May 2016, Montebello Quebec: presentation entitled “Rational Carbon Policy and Regulation”, Canadian Energy Law Forum.

March 2016, Paris: Keynote Address “Subsidiarity and Separation”, 4th International Symposium on Energy and Finance Issues.

November 2015, Panelist, “Outlook on Oil”, University of Toronto Energy Network, University of Toronto.

June 2015, Milan: “Discerning Trends in Commodity Prices”, Invited presentation, Fondazione Eni Enrico Mattei, International Workshop on Recent Evolutions of Oil and Commodity prices.
April 2015, Bank of Canada, Workshop on Commodity Super-Cycles, “Discerning Trends in Commodity Prices.

September 2014, Beijing: Keynote address entitled “The Economics of Energy, Big Ideas for the Non-Economist”, Chinese Academy of Sciences, International Association for Energy Economics 4th IAEE Asian Conference.

June 2014, Hong Kong: Invited presentation entitled “Renewable Energy”, Hong Kong’s Electricity Future: Balancing Reliability, Environment and Cost, Hong Kong Baptist University.

July 2012, Hong Kong: Invited Speaker on “Climate Change and Electricity Generation”, Hong Kong Baptist University.

December 2010, Hong Kong: Invited paper on renewable energy, Fourth Asian Energy Conference.

October 2010, Berlin: Invited paper on quantile regression, Workshop on Quantile Regression Methods, Humboldt University.

October 2008, Gold Coast, Queensland: Keynote speaker, Australian Conference of Economists. Title of presentation: “Economics, Econometrics and Regulation”.

August 2007, Lisbon: Keynote speaker, Cemapre Conference on Advances in Semiparametric Methods and Applications. Title of presentation: “Data on Derivatives, Nonparametric Regression and the Curse of Dimensionality”.

RECENT RESEARCH GRANTS

2011-2016 SSHRC grant "Nonparametric regression when data on derivatives are available".

2007-2011 SSHRC grant "Nonparametric and semiparametric estimation when data on derivatives are available".

2004-2007 SSHRC grant "Semiparametric demand modeling and testing".

CURRENT AND RECENT SUPERVISIONS

Ph.D.

Dhruv Sinha (2017): Essays in Energy

Dimitrios Dimitropoulos (2015): Three Essays in Energy Economics and Industrial Organization, Thesis Supervisor.

Adam Found (2014): Essays in Municipal Finance, Thesis Supervisor.

M.A.

Daniel Edgel (2017-2017): Fulbright Scholar, M.A. Economics

Nathan Warkentin (2015-2016): Masters of Science in Sustainability Management. “Integration of Renewable Wind Energy Sources in Ontario”

Sean Lemon (2013): M.Sc.Pl., Planning Program, Geography. An Evaluation of Ontario’s Global Adjustment Mechanism (GAM). Thesis Committee.

Undergraduate

Wei, Max (2016-2017) Engineering Science. Undergraduate thesis: “Wind Energy Intermittency, Diversity and Interconnections in Ontario”. Thesis Supervisor.

Shaker, Youssef (2016-2017) Engineering Science. Undergraduate thesis: “Analyzing the Effectiveness of Conservation Programs in Ontario”. Thesis Supervisor.

Wilbur Li, (2012) Engineering Science. Undergraduate thesis: “Ontario’s Feed-In-Tariff Program. Analysis of PV Solar Feed-In-Tariff Rates”. Thesis Supervisor.

OTHER PROFESSIONAL EXPERIENCE:

(2017) Prepared expert testimony on regulatory costing of railway transportation services, filed before the *Canadian Transportation Agency*.

(2017) Prepared analyses on the degree of integration of natural gas hub prices in a major North American acquisition of pipeline and storage facilities.

(2016) Prepared analyses on price determination in West Coast gasoline and diesel markets as part of an asset acquisition evaluation.

(2016) Prepared statistical analyses of market power in the acquisition of MTS by Bell Canada.

(2016) Testified before the *Ontario Energy Board* on behalf of EPCOR Utilities Inc. in a proceeding relating to natural gas expansion in Ontario, EB-2016-04.

(2016) Conducted ‘extent of the market’ and market power analyses for a major hydrocarbon company seeking to acquire additional refining capacity.

(2015) Conducted analyses of utility benchmarking for a large electricity distributor as part of a regulatory rate proceeding before the *Ontario Energy Board*.

(2015) Co-authored study of integration of renewables for the *Alberta Market Surveillance Administrator.*

(2014) Conducted econometrics analyses of spot and forward prices in Alberta electricity markets in a major electricity acquisition evaluation.

(2013) Testified before the *Ontario Energy Board* on behalf of the Electricity Distributors Association on electricity rates and incentive regulation.

(2012) Prepared expert damages testimony in *Oracle America Inc. v. Micron Technology, Inc., U.S. District Court, Northern District of California, Oakland Division*.

(2011) Coauthored study for the *Alberta Market Surveillance Administrator* on electricity market transparency and bidding.

(2011) Prepared Ontario electricity sector review for the Electricity Distributors Association.

(2011) Appointed sole representative of a major Canadian electrical utility in infrastructure pricing negotiations with an incumbent telecom carrier.

(2011) Prepared testimony on behalf of Toronto Hydro on the pricing of attachment space for wireless facilities on joint-use-poles, filed before the *Ontario Energy Board*.

(2010) Prepared testimony on behalf of Noranda Aluminum, Inc. Filed before the *Public Service Commission of the State of Missouri*.

(2009) Prepared study for major generating company on sufficient competition tests for boundary entities in the Ontario electricity market.

(2009) Prepared testimony on worldwide paraxylene markets *Interquisa Canada L.P. and Parachem Chemicals L.P.*, International Court of Arbitration of the International Chamber of Commerce.

(2008) Prepared analysis of incentive regulation of capital and operating c osts and productivity growth for electricity distributors. Filed before the *Ontario Energy Board*.

(2007) Prepared analysis of distributor benchmarking of capital and operating costs on behalf of the Electricity Distributors Association. Filed before the *Ontario Energy Board*.

(2007) Prepared evidence on market power in Ontario electricity markets.

(2005-2007) Prepared analyses of pricing of investor communications services.

(2007) Prepared testimony on behalf of the Electricity Distributors Association on utility benchmarking of capital and operating costs. Filed before the Ontario Energy Board.

(2004-2007) Prepared various analyses in a class action and settlement proceeding involving billing of natural gas. Participated in settlement proceedings.

(2004, 2005, 2006) Prepared odds of winning prizes in promotions by a leading U.S.-based international fast-food chain.

(2006) Prepared testimony on incentive regulation. Filed before the *Ontario Energy Board*.

(2006) Prepared testimony on cost-sharing of capital and operating costs of joint-use power poles. Filed before the *New Brunswick Board of Commissioners of Public Utilities.*
(2005) Prepared testimony on cost-sharing of power poles by cable companies on behalf of Thunder Bay Hydro.

(2004) Prepared testimony on cost-sharing of capital costs of power poles by cable companies. Filed before the *Ontario Energy Board*.

(2003) Prepared testimony on behalf of large Ontario electricity distributors on distributor service area amendments. Filed before the *Ontario Energy Board*.

(2003) Prepared testimony on behalf of J.D. Irving Ltd. on rates of return, performance based regulation and benchmarking. Filed before the *New Brunswick Board of Commissioners of Public Utilities*.

(1982-1994) Participated in numerous Ontario Hydro rate hearings before the *Ontario Energy Board* on behalf of Ontario electricity distributors.

(1989-1991) Filed testimony before the *Ontario Environmental Assessment Board* in connection with the Ontario Hydro long-term demand supply plan.

EXECUTIVE SUMMARY

Manitoba Hydro's (MH) 2017 Load Forecast Report summarizes its approach to developing a long-term forecast of energy and peak demand for its system, which it accomplishes by building up its forecast by sector based on historical econometric relationships. Daymark Energy Advisors (Daymark) was engaged by the Manitoba Public Utilities Board (PUB) to provide an independent review of MH's load forecast. This report details that review and presents our findings.

Daymark's scope of work is attached to this report – we were commissioned to gather sufficient information from available documents, meetings with MH staff, and research into and knowledge of current forecasting practices to evaluate the reasonableness of MH's load forecast methodologies. In addition, a comparison of the 2017 load forecast to the 2014 load forecast was included in our scope.

MH 2017 Load Forecasting Methodology

Overall, the methodologies employed by MH to develop its projections of future energy and demand are reflective of industry practice, but are not on the leading edge of forecasting approaches. MH's sector-level, regression-model-based load forecast is consistent with industry practices. Many Load Serving Entities (LSE) typically divide load forecast analyses into residential, commercial, and industrial sectors and then estimate the average electricity usage per customer and number of customers in each sector. The independent variables, or predictors, used in the regression models that MH developed are similar to the variables used in load forecasts in the industry. MH explicitly addresses weather impacts on load, savings from DSM and codes and standards, and load changes associated with electric vehicle adoption, but the company does not address potential fuel substitution during a time of anticipated large electricity price increases. MH relies on econometric approaches to a great extent; in this report we offer several areas of improvement and modification to enhance both the forecast and the documentation of the company's process and results.

A key shortcoming of the approach taken by MH is the reliance on a forecast that has a probability of being accurate 50% of the time – for a business with high capital costs and long project lead times, a forecast that is expected to address 90% of the potential futures is typically preferred. In addition, because of the uncertainty and change prevalent in the energy industry, MH should investigate a diversity of alternative futures in order to better understand the implications of a range of potential futures in their long-term planning process.

Key Findings

Table ES1 provides Daymark's assessment of key topics where improvement in the methodologies may improve the approach and have an impact on the load forecast used by MH. Moreover, this table also summarizes MH's methodology for addressing these key topics, along with Daymark's conclusions. We summarize those recommendations here and provide greater detail throughout this report.

The top consumers forecast relies on a conservative approach to forecasting – MH uses short-term knowledge of the MH account executives for particular accounts, which is useful for the near term, but the long-term sector projections should rely on all historical trends and not single out only those accounts with a consistent history of business and consumption in the province for the duration of the historical data period. In addition, the changes in methodology between the 2014 and 2017 forecasts for this sector result in significant forecast differences over the twenty-year period. The 2017 Potential Large Industrial Load (PLIL) method used a conservative approach by only considering the total load of top consumer companies that have been in the MH service territory since 1983/84, thus excluding the historical load of three companies that are currently in the top consumers sector. Daymark estimated that the conservative PLIL method used in 2017 forecasted 523 GWh less load than would have been forecasted using the 2014 methodology over the forecast period from 2017/18 to 2036/37.

The price elasticities of all three sectors (residential, general service mass market, and top consumers) reported by MH may be incorrectly estimated. The econometric model used for estimating residential price elasticity exhibits a multicollinearity issue. Similarly, the use of trend and dummy variables in the average usage models of both the residential and general service mass market sectors have suppressed the impact of electricity price elasticity. In our investigation of the modeling, the regression models used by MH produced higher price elasticity coefficients before the use of trend or dummy variables in the sector-level forecasts. Moreover, the price elasticity estimated for top consumers through the above-mentioned conservative PLIL method is lower than if it was estimated using the PLIL method used in the 2014 load forecast. Although this is an area of concern, based on the regression parameters, overall R-square and other statistics, the overall load forecast of each sector is appropriate in total, the key concern is in the interpretation of the elasticity coefficients.

The load forecast report provided by MH should include greater attention to the theoretical basis for their selection of the predictor variables as well as full disclosure

and discussion of the potential statistical concerns identified in the analysis so that one can review the total impact of their decisions as they move to the final forecast.

Price elasticity is included in the regressions used to forecast future energy, therefore response to price changes are embedded in the modeling. However, the magnitude of the electricity price increases anticipated are not of the level that have been seen during the historical period and MH may see greater elasticity impacts than presented in its 2017 load forecast report. Coupled with the multicollinearity issues observed with regard to the price variable coefficients and the trend and dummy variable impacts, the forecast could be lower than it is currently predicted by taking a higher price elasticity coefficient into account.

Finally, MH has historically under-forecasted population trends, a predictive variable that underlies the residential and general service mass market forecasts of customer count. The use of lower customer count forecasts will result in a lower residential load forecast and a lower general service mass market load forecast.

The possibility of switching to an alternative fuel type or fuel source, driven by increases in the price of electricity, is not explicitly considered in the MH load forecast analysis. It is important to consider the potential magnitude of energy source switching that the proposed MH rate hikes may induce, since electricity prices are requested to increase by 65% in the year 2025 as compared to 2018 rates.[1] Similarly, the recent trend of low natural gas prices and a projected decrease in solar costs may make these alternatives more economically attractive considering the proposed electricity price changes. It must also be recognized that a substitution effect will be offset by natural inertia, that is the consumer effort necessary to change fuels may delay or reduce the potential for substitution.

Based on our analysis, Daymark has developed the following recommendations for improving Manitoba Hydro's current load forecasting methodology:

- The load forecast analysis should consider scenario analysis by developing alternative load forecasts in addition to the base load forecast. These scenarios would help create alternative future settings that represent the different possible trends of several key input variables that are used in generating the base load forecast. Such scenarios could consider key uncertainties by

[1] "2017 GCR AT 2017 RATES" excel file provided by MH.

representing different assumptions for economic and population growth, electricity and fuel commodity prices, and CO_2 prices.

- MH should evaluate the inherent characteristics of fundamental variables using stochastic risk assessments. Currently, Manitoba Hydro's method of evaluating load uncertainty at p10 and p90 levels is based on considering the overall impact of key input variables on the load variation. Using a stochastic risk assessment method would allow for the estimating of potential outcomes by incorporating random variation in the key input variables. Probabilities are assigned to different values of key uncertain variables that have been identified as such through sensitivity analysis.

- MH may generate a better estimate of weather-dependent load by using more than two years of monthly energy and degree day data to estimate the weather-dependent relationship. Currently, the company uses two years of data to estimate the weather-dependent load relationship and 25 years of data to define the "normal" weather year. It is unclear at this stage whether this two-year-based coefficient is more extreme than that developed through a reliance on greater data points, nor is it clear whether the then-normalized loads are higher or lower than they should be – but these new normalized loads are the dependent variables on which the forecast econometric equations are based. MH should provide greater analysis and information in its next forecast, providing the rationale for the use of a two-year coefficient for normalization. Also, Manitoba Hydro could improve its weather normalization method by using a shorter period to calculate the "normal" year weather variables.

- MH should consider testing its econometric models for a variety of statistical concerns. For example, the average electricity usage regression models contain multicollinearity issues. Similarly, MH should consider the economic reasoning before introducing any new predictor variables into its regression models in addition to checking the statistical significance, and potential implications for its price elasticities.

Table ES1: Key Summary Findings of MH Load Forecast Analysis

TOPIC	MH METHOD	COMMENT/REMARKS	IMPACT ON LOAD FORECAST
Top Consumers PLIL model	The PLIL accounts for the long-term load growth of the top consumers sector by evaluating historical shifts in the energy usage of top consumers as a group rather than as individuals.	The 2017 PLIL method was conservative because it only considers the total load of top consumer companies that have been in the MH service territory since 1983/84, thus excluding the historical load of three companies that are currently in the top consumer sector.	The conservative PLIL method used in 2017 forecasted 523 GWh less load than using the 2014 method and 2017 data over the 20-year forecast period.
Electricity Price Elasticity	The load forecasting methodology uses price elasticity with the help of econometric regression models at the sector-level.	The price elasticities of all three sectors may be incorrectly estimated. The econometric model used for estimating residential price elasticity exhibits a multicollinearity issue. Similarly, the use of trend and dummy variables in the average usage models of both the residential and general service mass market sectors have suppressed the impact of electricity price elasticity. Moreover, the price elasticity estimated for top consumers through the conservative PLIL method discussed just above is lower than if it were estimated using the PLIL method used in 2014 load forecast.	The incorrectly estimated price elasticity will not provide the actual impact of proposed rate increases on each sector's electricity demand.
Population Forecast	MH uses population forecasts from an external institution in its load forecasting methodology.	The evaluation of historical population and residential values along with the forecast used by MH show that MH has under-forecasted the population and residential customer count.	Lower customer forecast will result in a lower residential load forecast and a lower general service mass market load forecast.
Scenarios and Sensitivity	MH evaluated the impact of changes in its key econometric analysis variables.	The load forecast analysis did not consider scenario analysis, which would help create alternative future settings that represent the different plausible trends of key input variables used in the base load forecast and provide broader information on potential system implications than the current approach.	Scenario analysis would have provided further insight of the impact of future alternative scenarios on MH's load forecast.
Risk and Uncertainty	MH evaluated load uncertainty at p10 and p90 levels on the base load forecast.	A more robust approach to consider uncertainty on load would be to evaluate the inherent characteristics of each fundamental variable with the help of probabilistic (i.e., stochastic) risk assessments.	
Fuel Switching Consideration in the Analysis	The possibility of switching to an alternative fuel type or fuel source due to the increase in electricity price is not explicitly considered in the MH load forecast analysis.	It is important to consider energy source switching, since electricity prices are requested to increase by 65% in 2025 as compared to 2018 rates. Similarly, the recent trend of low natural gas prices and a steady decrease in solar costs may make these alternatives more economically attractive considering the proposed electricity price changes.	Load forecast may change without considering potential alternative energy source substitution due to the proposed rate increase.

Load Forecast Methodology Comparison Between 2014 and 2017

Daymark also compared the 2014 and 2017 load forecast methodologies and assumptions for the various sectors defined by Manitoba Hydro. Overall, the 2017 methods generated a lower long-term forecast than the analysis conducted in 2014. Moreover, the annual average growth rate of gross firm energy forecasted in 2017 is lower than the annual average growth rate forecasted in 2014. The annual average growth rate of gross firm energy is estimated by using first and tenth year forecast from both 2014 and 2017 reports. Additionally, the annual growth rate using the ten-year gross firm energy forecast was higher in 2014 at 1.46% compared to 0.81% in the 2017 forecast. The key differences between the 2014 and 2017 load forecast methodologies are in the models used for forecasting general service mass market (GSMM) customer count, the PLIL method used for capturing long-term forecasts for the top consumers category, and economic and population assumptions used in the analysis.

In order to estimate the customer count for the GSMM sector, the 2017 forecast estimated customer count directly, while the 2014 forecast modeled the percentage change in the number of customer types. As noted earlier, the 2017 PLIL method used a conservative approach by only considering the total load of top consumers companies that have been in MH's service territory since 1983/84, the start year of MH's modeling period. In contrast, the 2014 PLIL methodology considered the load of all companies included in the top consumers sector.

I. INTRODUCTION

A. General Rate Application Process and Independent Expert Consultants

On May 5, 2017, Manitoba Hydro (MH) filed its 2017/18 & 2018/19 General Rate Application (GRA). The application has many facets that include interim rate relief and financial evidence to determine the requested rate increases. A key component in the financial information provided by Manitoba Hydro is its load forecast.

The Manitoba Public Utilities Board (PUB) retained Daymark Energy Advisors (Daymark) to review and provide an expert opinion on Manitoba Hydro's export price and revenue forecasts and electricity load forecasts. This report provides our expert opinion on electricity load forecasts; Daymark's expert opinion on export price and revenue forecasts is provided separately.

Beyond our two expert reports on the above-mentioned topics, the PUB has also engaged independent expert consultants to examine and provide opinions on:

1. Updated costs of Manitoba Hydro's major generation and transmission projects currently under development or construction;
2. The economic impacts to the Province of Manitoba of proposed electricity rate increases; and,
3. Capital Projects.

While our report comprehensively addresses the specific aspects of our scope of work, our review should be considered alongside the other studies and analyses commissioned by the PUB in connection with Manitoba Hydro's application.

B. Organization of this Report

This report is organized such that it aligns with our scope of work, which is available on the PUB's website[2] and is attached to this report as Appendix A, for ease of reference.

- Part II, ***Load Forecasting Methodology***, provides our assessment of Manitoba Hydro's load forecasting methods, including how they compare to industry practices;

[2] Access available at the following link. http://www.pubmanitoba.ca/v1/proceedings-decisions/appl-current/pubs/2017%20mh%20gra/daymark%20iecs%20scope%20of%20work.pdf

- Part III, ***Comparison of MH Methodologies with Industry Practices***, discusses Manitoba Hydro's load forecasting methodologies on key topics and compares with industry-practices;
- Part IV, ***Load Forecast Changes (2014 to 2017)***, provides our review of Manitoba Hydro's 2017 Load Forecast and our findings related to how the 2017 forecast compares to the 2014 forecast used in Manitoba Hydro's NFAT application; and,
- Part V, ***Summary and Conclusions***, bring everything together and describes our team's key findings and recommendations.

II. LOAD FORECASTING METHODOLOGY

A. General Overview

Manitoba Hydro developed sector-level forecasts to generate its total annual load forecasts. The key sectors that were modeled separately for generating the overall load forecast are residential, general service mass market, and general service top consumers; these sectors form the total consumer sales[3].

The total consumer sales, also referred to as general consumer sales, include the energy supplied to all of Manitoba Hydro's individually-billed customers. During the 2016/17 fiscal year,[4] MH averaged 570,712 general consumer sales customers, who consumed a total of 22,025 GWh[5] of energy. The common bus is the total load metered at all the substations in the province that supply MH's non-diesel customers. In addition to the total consumer sales, the common bus includes distribution losses and construction power. MH reported common bus load to be 23,115 GWh in 2016/17. The common bus is 1,090 GWh or 4.9% greater than the total consumer sales discussed above.[6]

MH adds transmission losses and station service load to the common bus load to calculate the gross firm energy – the total load that needs to be generated for domestic firm load requirements on the integrated system, excluding diesel customers. MH reported gross firm energy of 25,227 GWh for 2016/17. This is 3,202 GWh or 14.5% greater than the total consumer sales. Figure 1 graphically depicts MH's methodology for generating the forecast for gross firm energy.

Gross firm energy is then adjusted for DSM-related energy savings by subtracting forecasted annual program-based DSM savings. The DSM-adjusted annual load forecast becomes the basis for financial analysis to forecast revenue.

[3] "There are four remaining groups of customers. Seasonal customers are those billed twice a year rather than on a monthly basis. Diesel customers are from four remote communities not connected to the integrated grid system. Also included are Flat Rate Water Heating and Area and Roadway Lighting and over 50,000 of these services do not count as customers. The electricity use of these four groups totals 226 GWh or 1.0% of Total Sales." (Source: Page 2, 2017 Load Forecast Report)

[4] The MH fiscal year starts on April 1st of a typical year to March 31st of the following year. For example, 2016/17 represents the period from April 1, 2016 to March 31, 2017.

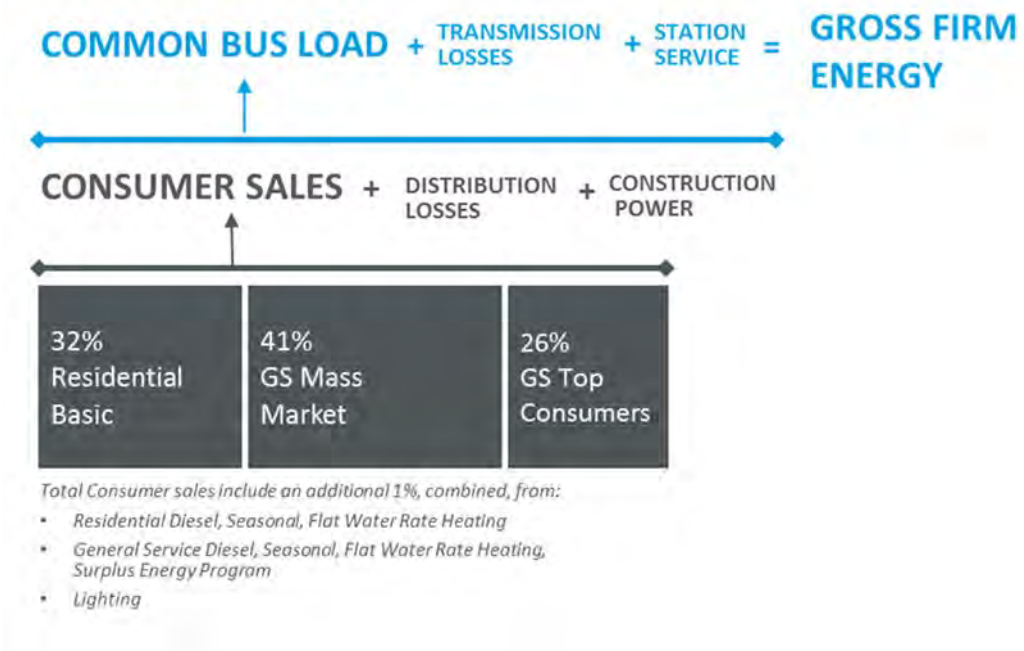

Figure 1. Components of Gross Firm Energy

B. Key Sectors

1. Residential Methodology

MH's residential sector includes a total of 480,365 customers that were responsible for 32.5% of total consumer sales in 2016/17. The residential sector is comprised mostly of residential structures that include single-family dwellings, multi-family dwellings, and individually-metered apartment units. MH uses a primary econometric approach to forecast load for this sector, which is then compared to a secondary approach to support the reasonableness of the primary approach. Each are described here.

MH's primary residential forecast methodology, first, estimates two key components: (1) number of residential customers or dwellings, and (2) the average usage per residential customer. The customer forecast relies on several third-party Manitoba population forecasts and a ratio of total population to total residential customers estimated by MH. The key assumptions used by the third-party population forecasts are summarized in the *Economic Assumptions* section of this report.

To forecast the average annual usage per residential customer, MH uses an econometric model with assumptions that include electricity prices[7], annual disposable income, and the annual ratio of the number of electric heat customers to total customers. The model also features a trend variable that, as MH indicates, captures increases in electric use and house size.[8] The average electricity usage, which is the dependent variable in the regression model, also included both program-based Codes and Standards DSM savings and weather adjustments to actual load. ~~**[CONFIDENTIAL BEGIN]**~~ Figure 2 shows the annual residential customer average usage and residential customer count for both historical and forecast periods. The average usage shown in the figure is adjusted for the change in usage due to weather variation. MH estimates that the average residential customer usage will decrease slightly for the next few years. The residential customer count is estimated to increase at a consistent rate during the forecast period.

[7] The electricity price variable was lagged by 2.5 years.

[8] Manitoba Hydro, "2016 Electric Load Forecast", Market Forecast June 2017, p.62

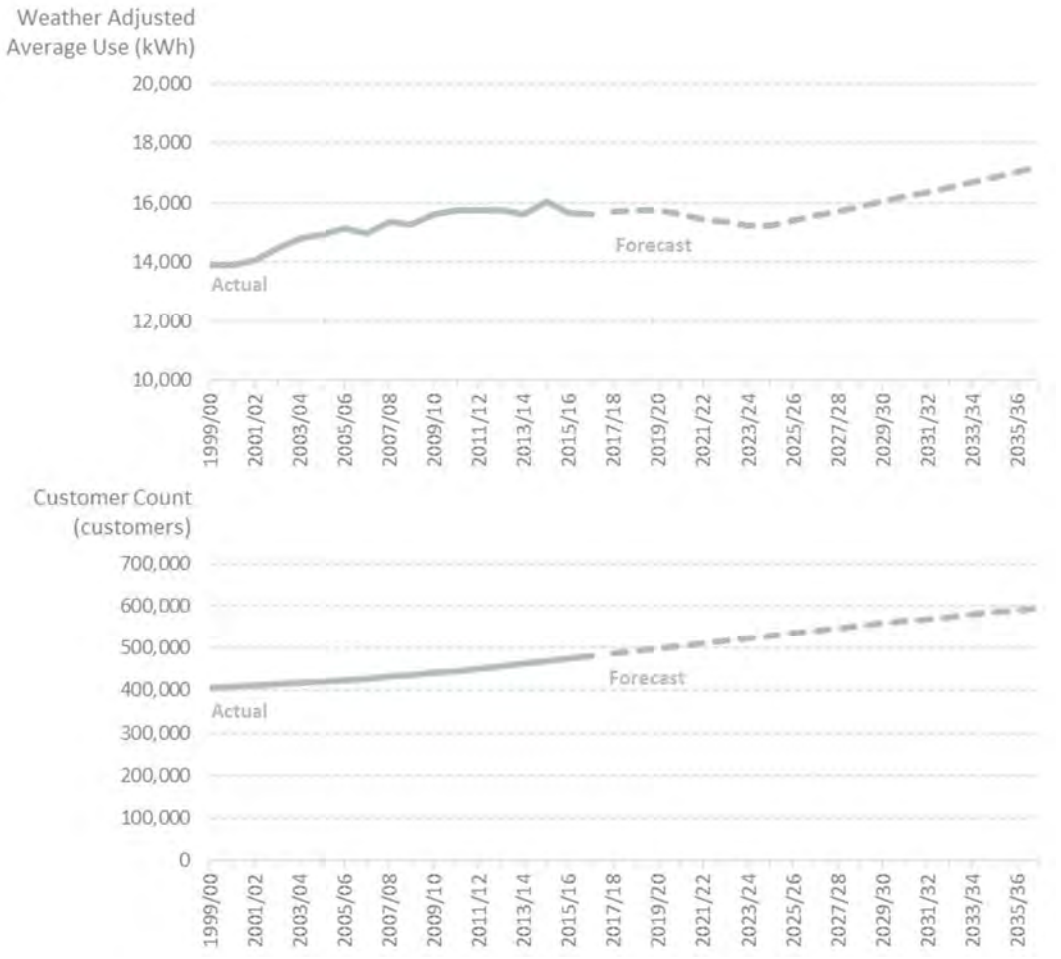

Figure 2: Annual Average Usage and Customer Count for the Residential Sector

~~[CONFIDENTIAL END]~~

To produce the residential energy forecast, the forecasted number of residential customers is multiplied by the forecasted overall average usage per customer. In addition, the projected energy savings associated with LED adoption is subtracted from the forecast and any increase in electricity usage due to future adoption of electric vehicles is added to the forecast. MH indicated that these phenomena are not adequately addressed in the baseline methodology. Similarly, the future energy savings associated with Codes and Standards, outlined in Manitoba Hydro's Power Smart Plan and DSM initiatives, are subtracted from the annual load forecast at this point in the analysis.

MH indicates that it also employed an end-use forecasting methodology as a secondary approach to its residential energy forecast. Most of the data to develop these end-use forecasts came from the 2017 Economic Outlook and 2014 MH Residential Energy Use Survey[9]. The end-use methodology developed different estimates of the number of both existing and new dwellings, and the saturation of space and water heating in these dwellings. The number of space heating systems were forecasted separately in existing and new dwellings. Specifically, the forecast of space heating systems in new buildings used econometric models to estimate the number of electric space heating systems in new single detached and multi-unit dwellings by region. Separate estimates for space heating in existing dwellings and water heating systems were developed to forecast the number of annual replacements using a Weibull distribution[10] based on the average age of the system. Regarding the forecast of water heating systems, MH estimated electric and natural gas water heater saturations and average age by considering annual replacements, fuel switching, and saving estimates from the Heating Fuel Choice initiative[11]. Moreover, the end-use forecasting methodology also included the forecast of electricity usage for other major appliances including central air conditioning, major appliances, televisions, and lighting by dwelling type.

The total load forecast estimated by this alternative end-use method, along with additional information from MH's 2014 Residential Survey, was balanced against the load estimated by the primary econometric modeling to ensure that the primary modeling was reasonable. During discussions with MH, staff indicated that the secondary modeling confirmed the primary approach and thus no modifications to the primary approach were needed. However, there was no specific documentation that described the "balancing" considerations in the load forecast report, nor did it explain what MH would have done if the load estimated by the primary regression method and the secondary end-use method were different. Based on its review, Daymark found that the secondary end-use forecasting results were limited in their use by MH, despite the effort that went into their development and maintenance. Besides balancing, the secondary end-use method is also relied upon to estimate the ratio of electric heat customers to total customers, which is one of the predictors in the primary residential average usage regression model. However, as discussed later in this report, the use of a

[9] MH develops both the Economic Outlook and the Residential End Use Survey and updates them periodically.

[10] Weibull distribution is a continuous probability function that is a versatile distribution that can take on the characteristics of other types of distributions, based on the value of the shape parameter.

[11] 2017 Load Forecasting Methodology, Page 61.

"saturation" variable in the primary average usage regression model causes a multicollinearity issue.

2. Mass Market

The general service mass market (GSMM) sector of MH's service territory is comprised of 67,676 customers and was responsible for 42% of total consumer sales in 2016/17. Of the total GSMM customers, 85% were commercial customers, and the remaining customers were industrial sector accounts. The 2017 GSMM forecasting methodology used two different models: one to forecast customer count and the second to forecast average annual usage, an approach that is similar to the residential modeling methodology. The GSMM customers were divided into two categories – grouping small and medium customers in one forecast group and then modeling the larger customers in a second group.

The method used to forecast GSMM customer counts leveraged econometric models with assumptions relative to Gross Domestic Product (GDP) and year-end residential customer counts. The small and medium customer model used year-end residential customer data and Manitoba real GDP from 1985/86 to 2016/17. Similarly, the model that forecasted large customers used the same year-end residential customer count and a blended GDP variable that MH created by combining Manitoba, Canada, and U.S. GDPs.[12]

The GSMM average use forecast followed a similar regression method for forecasting customer count. The average use forecast model for the small and medium customer category used an econometric model with assumptions related to electricity price, Manitoba GDP, and a dummy variable, to account for changes in the MH billing system in 2005/06. Similarly, the average use forecast model for the large customer category used an econometric model with assumptions related to electricity price, the Manitoba/Canada/U.S. blended GDP, and a dummy variable.[13] Both models used historical annual data from 1989/90 to 2016/17. The use of a lagging time frame with

[12] $Blended\ GDP\ = (Manitoba\ GDP\ in\ m\$)^a * (Canada\ GDP\ in\ B\$)^b * (US\ GDP\ in\ B\$)^c$ where a, b, and c are weights given to different GDP values and the sum of a, b, and c equals to 1. The weights vary by modeled sector. For example, in the regression models used to estimate customer number and average usage for the large GSMM sector, MH used the GDP weights of 30% (a), 35% (b), and 35% (c) for Manitoba, Canada, and US GDP, respectively.

[13] The dummy variable from 1999/00 to 2005/06 is included to reflect the average use of the 750V – 30 kV group being higher for during those years by 250,000 kWh. The average usage of large GSMM customers from 1999/00 to 2005/06 is 7,237,157 kWh. The dummy variable used to account for higher usage by 250,000 kWh is just 3.5% of the average usage during that period.

the electricity price is inconsistent between the two groups of GSMM categories. The large customer category relies on an electricity price variable that is lagged by 2 years, whereas the small and medium customer category regression selected did not lag the electricity price variable[14].

~~[CONFIDENTIAL BEGIN]~~ Figure 3 shows the annual average usage (kWh) and customer count for the small and medium customer category within the GSMM sector. The MH load forecast analysis projects both average usage and customer count to grow slightly during the forecast period.

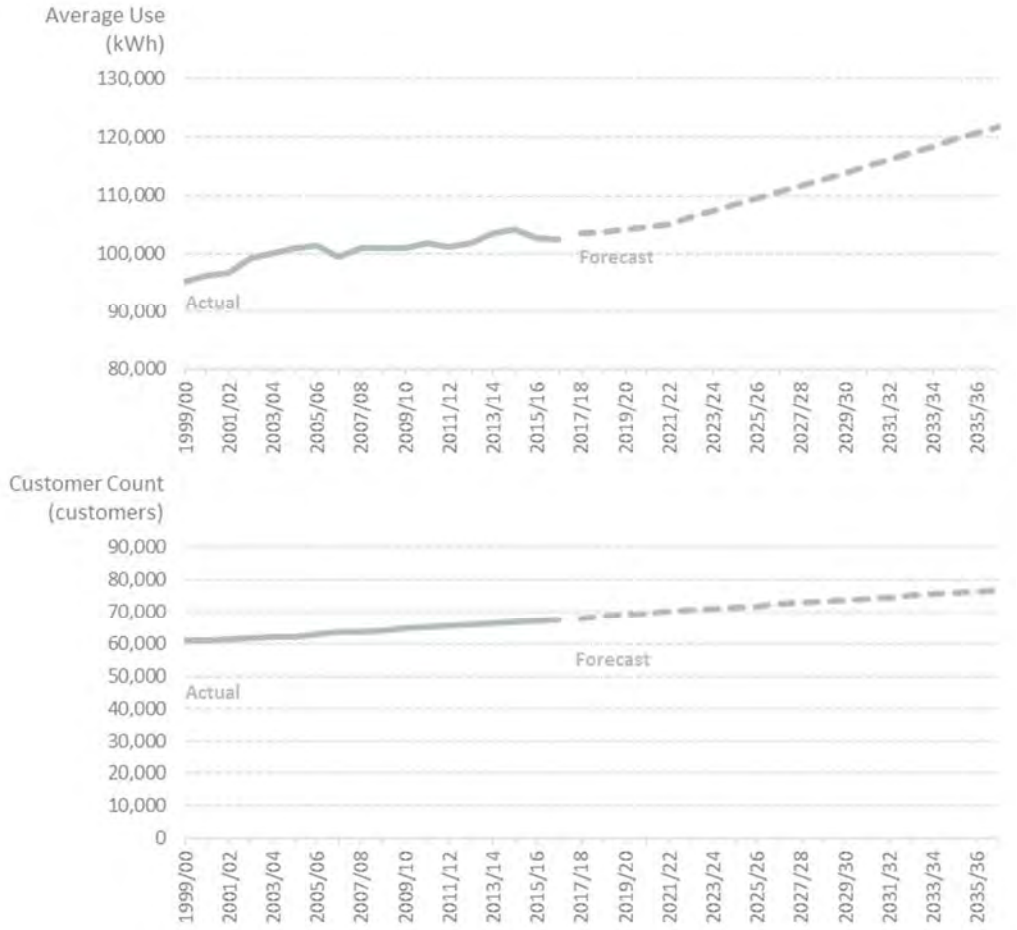

Figure 3: Annual Average Usage and Customer Count for the General Service Mass Market Sector, Small and Medium Customer Category

[14] The use of a lagged variable reduces the number of observations used in the regression model. In the load forecast analysis, MH used historical annual data from 1986/87 to 2016/17 resulting in 33 observations. The use of two-year lag in the large customer category excluded the first three observations resulting in the use of only 28 observations in the analysis.

Similarly, Figure 4 includes the annual average usage and customer count for the large customer category within the GSMM sector, for both historical and forecast periods. The average usage for the GSMM large customer category is projected to decrease within the 2017/18 to 2023/24 period. The decrease in average usage for large customers is mainly due to the proposed rate increase, and its impact on consumption. The number of customers in this category is estimated to increase consistently during the forecast period.

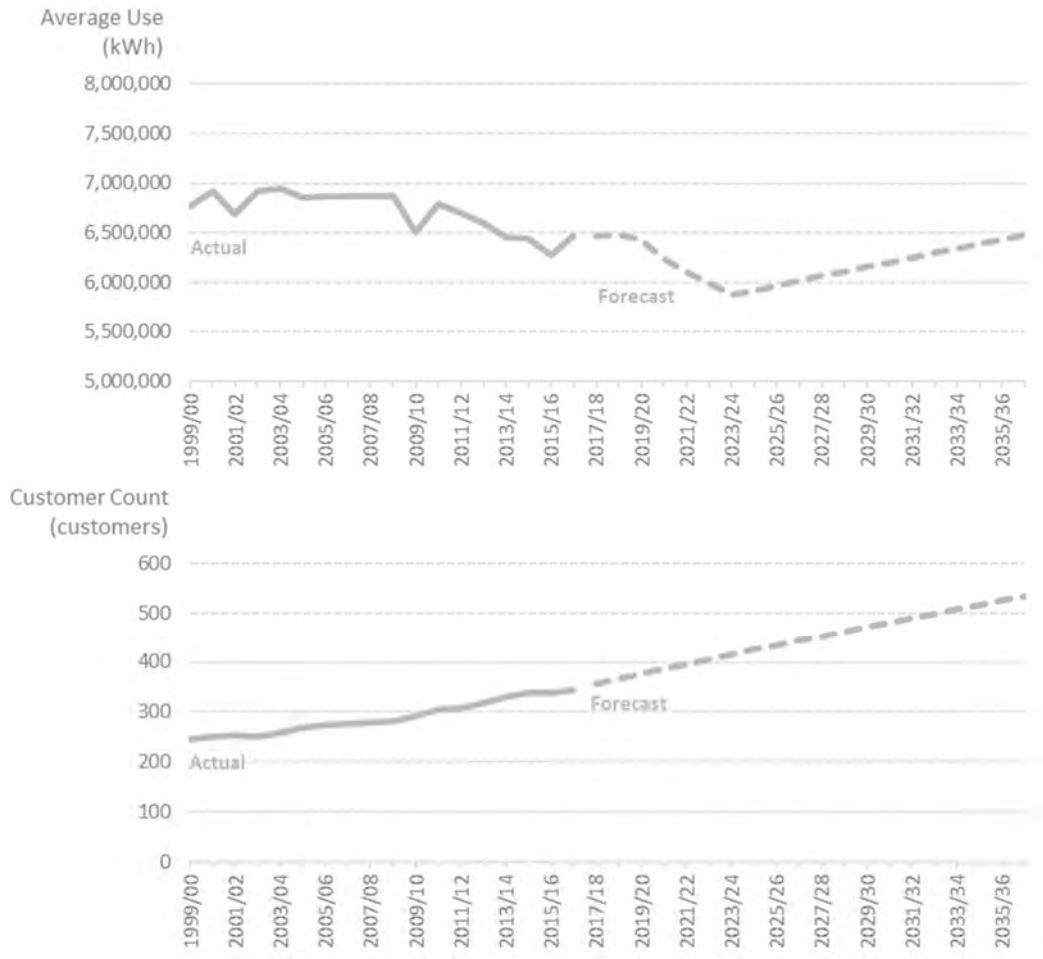

Figure 4: Annual Average Usage and Customer Count for General Service Mass Market Sector, Large Customer Category

~~[CONFIDENTIAL END]~~

The final step in forecasting the GSMM total load requires multiplying the forecasted number of customers in each rate class by the forecasted average use. Similar to the residential sector, the future use of electric vehicles in the general service mass market sector was added to this forecast and the energy savings from the codes and standards, as outlined in Manitoba Hydro's Power Smart Plan, were subtracted from the forecast.

3. Top Consumers

The General Service Top Consumers sector of MH's service territory includes 10 companies with 26 separate accounts that represent 26% of total consumer sales in 2016/2017. ~~[CONFIDENTIAL BEGIN]~~ The 10 companies belong to four industry sectors: primary metals, chemicals, petro/oil/natural gas, and pulp/paper. MH recently moved seven companies from its top consumers category to the GSMM category, citing that these companies have smaller annual usage and the usages are consistent over the future years. [redacted] [CONFIDENTIAL END] The load forecast methodology for the top consumers sector involved creating short-term forecasts for each customer and long-term forecasts for the sector as a whole.

The short-term forecasts were created for each individual customer using information about the individual companies' ~~[CONFIDENTIAL BEGINS]~~ operating plans, short-term expansion or contraction plans as shared in the news and in publications, company prospectuses, and through information gathered by MH's key account representatives. The company-level short-term forecasts generated the load forecast for the first five years. The individual company-level forecasts are then held constant beyond year 5 and a long-term forecast is considered to account for any changes in the load in the top consumer sector as a whole. MH defines this long-term forecast as Potential Large Industrial Loads (PLIL).

MH mentioned that the PLIL allows MH to account for the evaluation of historic shifts in the energy usage of top consumers as a group, rather than as individuals, thus accounting for unexpected load changes for the "current" companies included in the top consumers sector. The PLIL method uses an econometric model that fits a regression model of historical load of the ten top consumer companies with the annual electricity price and a blended Canadian and U.S.-based GDP assumption.

Figure 5 presents both short- and long-term load forecasts for the Top Consumers sector. As mentioned before, the short-term forecast covers the first five year of the forecast.

The industry-specific short-term, along with total short-term load, are presented from 2017/18 to 2022/23 in the following figure. Beyond 2022/23, in addition to the short-term forecast, the figure includes the additional load forecast generated using the PLIL method.

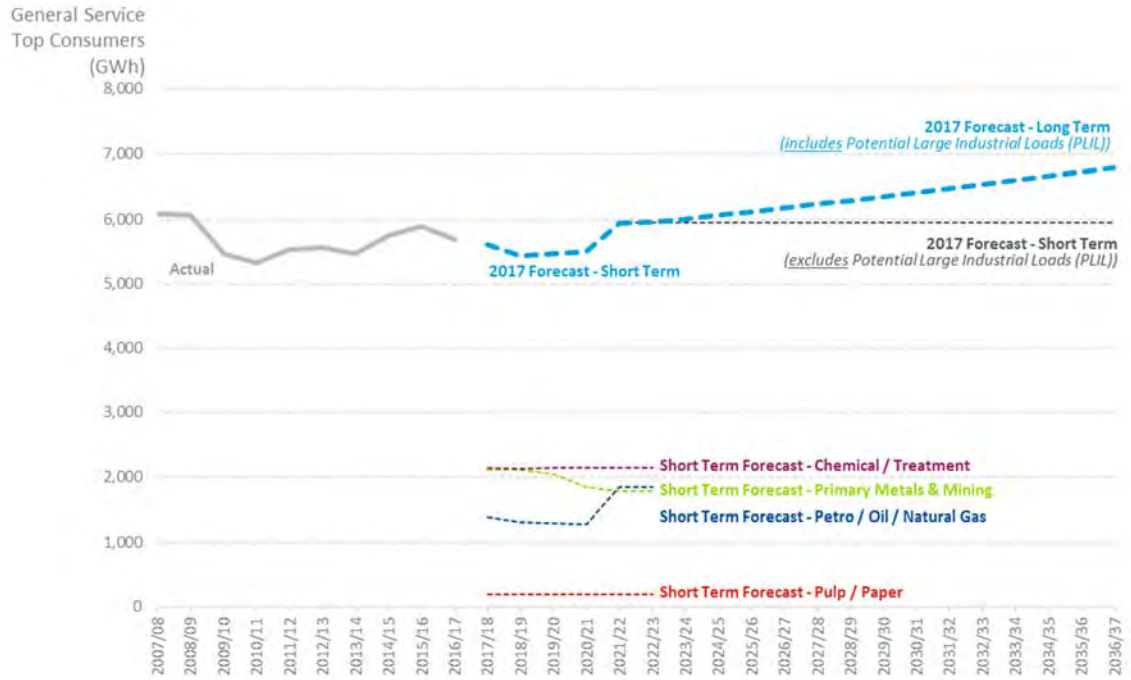

Figure 5: Short- and Long-Term Load Forecasts for the General Service Top Consumers Sector

The 2017 PLIL method used a conservative approach by only considering the total load of top consumers companies that have been in the MH service territory since 1983/84, the start year of MH's modeling period. The 2017 PLIL method excluded the historical load of three companies that are currently in the top consumers sector because they became part of the category after 1983/84. By excluding the historical load of these companies, the 2017 PLIL method did not consider the possibility of additional load from two sources: (1) future new customers that may be joining the MHs service area, nor (2) additional growth from the three companies that were not part of the group for the entire historical period. Unlike the 2017 method, the method used in 2014 for forecasting PLIL load considered the total historical load of the top consumers sector.

Daymark re-ran MH's 2017 PLIL model using the method used by MH in 2014, considering the historical annual load of all companies that are now part of the top

consumers sector.[15] The exclusion from the 2017 PLIL model of the load of three companies that became part of the top consumer sector after 1983/84 has at least two implications. The load forecast estimated for PLIL in 2017 is lower that it would have been if the method used was consistent with the method used in 2014. For example, the load forecast associated with PLIL using the 2017 method is 840 GWh in 2036/37 and the load at the same year using the 2014 methodology is 1,363 GWh. The conservative PLIL method used in 2017 forecasted 523 GWh less load than the method used in 2014 over the forecast period, a difference of 62%.

Moreover, the electricity price elasticity estimated using the more conservative 2017 methodology is lower by 41% than the price elasticity estimated by using the 2014 methodology[16]. MH reported the price elasticity impact of -0.37 in its 2017 Load Forecast report. Using MH's 2014 PLIL methodology, Daymark estimated that the price elasticity for the top consumers would be -0.53. ~~[CONFIDENTIAL END]~~

C. Transmission and Distribution Losses

MH calculated distribution losses by comparing the energy measured at the distribution centers and the energy measured at combined customers' meters.[17] The annual distribution losses for MH in the last twenty years has been between 3.5% to 5.5% of total consumer sales[18]. MH used distribution losses of 4.6% of total consumer sales in its load forecast analysis.[19]

In addition to distribution losses, MH incorporates transmission losses in its load forecast. MH defined transmission losses as the percentage of power (in terms of total consumer sales) lost during the transfer of power from generation stations to the distribution station, collectively known as common bus. The annual transmission losses for MH have been in the range of 8.8% to 10.5% of total consumer sales in the last 20

[15] Daymark's "*Average Use and PLIL stepwise regression summary*" spreadsheet.

[16] The price elasticity reported in the 2017 Load Forecast Report for Top Consumers is -0.3736. Whereas, Daymark estimated the price elasticity of -0.5280 when the 2014 methodology was used with 2017 data. The difference between the two price elasticities is 41.3% using the calculation:

$$\frac{\left(-0.3746-(-0.5280)\right)}{-0.3746}*100\%$$

[17] MH mentioned that besides technical power lost during transfer, other factors that contributed to losses include the offset tween billing cycle and calendar month, customer accounting adjustments, inaccuracies associated with estimated billing, metered but unbilled consumption of Manitoba Hydro offices, and energy theft (Page 31, 2017 Load Forecast Report).

[18] Table 22, Page 31, 2017 Load Forecast Report.

[19] Ibid.

years[20]. In its 2017 Load Forecast Report, MH attributed the transmission losses to the High Voltage Direct Current (HVDC) lines and the distance over which transmission of power generated must travel from northern-located generation to the southern distribution points. MH used an estimate of 9.1% of total consumer sales to account for the future transmission loss in its forecast analysis.[21] This is the average of the last five years' actual transmission losses in the MH territory.

MH's load forecast analysis then incorporates 13.7% of total consumer sales for its transmission and distribution (T&D) losses. The percentage of losses considered for T&D losses is higher than the national averages in Canada and in the U.S. Data from the World Bank suggests that the average transmission and distribution losses in Canada in the last ten years is around 8.5%.[22] Similarly, the U.S. Energy Information Administration reports that average transmission and distribution losses in the U.S. for 2015 were around 4.7%.[23]

D. Gross Firm Energy and Peak Demand

MH uses its sector-level load forecasts along with distribution losses to estimate the common bus load forecast. Specifically, the common bus forecast is the sum of total consumer sales, distribution losses, and construction power. MH adds annual transmission losses and station service load to the common bus energy to forecast the gross firm energy. Figure 6 presents the annual forecast of gross firm energy along with the sector-level load forecasts presented in the 2017 Load Forecast Report.

[20] 2017 Load Forecast Report, page 34, Table 25.

[21] Ibid.

[22] World Bank, accessed October 24, 2017, available at: https://data.worldbank.org/indicator/EG.ELC.LOSS.ZS?locations=CA

[23] US Energy Information Administration, accessed October 24, 2017, available at: https://www.eia.gov/tools/faqs/faq.php?id=105&t=3

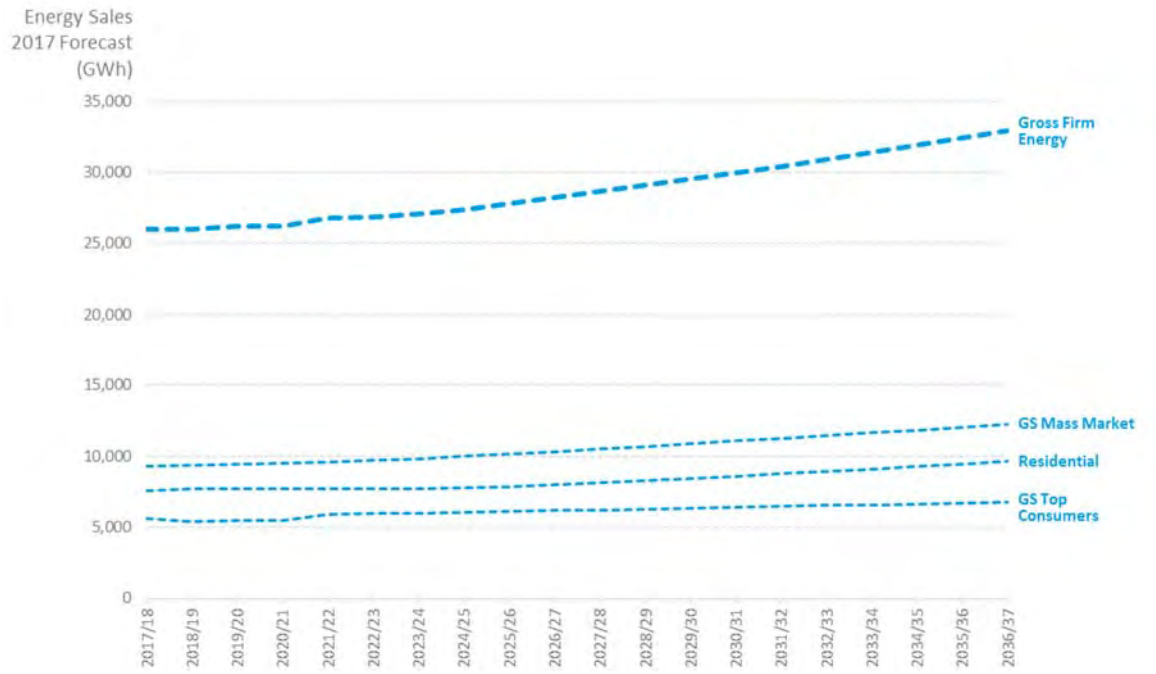

Figure 6: Gross Firm Energy and Sector-Level Load Forecasts

To forecast peak loads, MH breaks the annual energy forecasts into monthly energy forecasts and applies load factors. To forecast monthly gross firm energy, MH uses annual Common Bus load forecasts and the average of historical monthly Common Bus percentages as compared with the annual load. The monthly percentage estimated is based on the 5-year monthly percentage of Common Bus to annual Common Bus load. As shown earlier in Figure 1, the Common Bus is the sum of total consumer sales, distribution losses, and construction power. The monthly transmission losses and station service are added to monthly Common Bus to calculate the monthly gross firm energy.

MH then calculated the monthly total peak demand using the monthly gross firm energy and monthly load factor. Load factor is the ratio of average hourly energy usage to the peak hourly load. The load factors, and eventually the monthly peak load, are calculated separately for the Top Consumers sector since the average hourly usage for Top Consumers is higher relative to their peak value than in the residential of General Service Mass Market sectors. Top Consumers peak loads are calculated by applying a 92% load factor to that sector's monthly energy usage. Alternatively, for the residential and General Service Mass Market customers, a ten-year historical average load factor along with the monthly forecasted energy is used to forecast the monthly peak load.

Figure 7 shows the monthly peak demand (in MW) for the 2017/18 fiscal year. Please note that the 2017/18 fiscal year is from April 2017 to March 2018.

Figure 7: Monthly Peak Load (MW) for 2017/18 Fiscal Year

MH has a winter peaking system and, so it estimates the annual peak demand using the monthly peak demand of three winter months – December, January, and February. MH also applies a ratio using the January peak to estimate the annual peak demand.[24] Figure 8 shows the annual peak demand (MW) of the MH service territory for both historical and forecast periods.

[24] Page 69, 2017 Load Forecast Report.

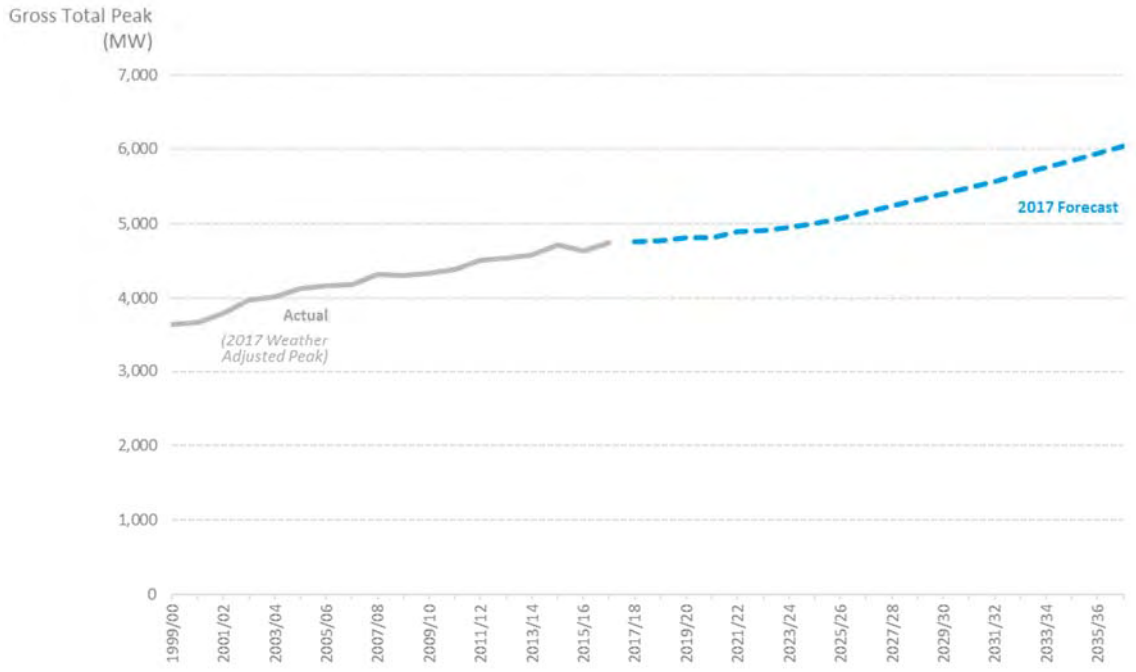

Figure 8: Annual Peak Demand for MH Service Territory

As discussed above, MH uses monthly gross firm energy and monthly load factors to forecast monthly peaks. While this concept is used by other utilities, it is less popular compared to other approaches used for forecasting peak load. According to a 2010 survey of utility companies' forecasting methods conducted by Itron, only 8% of utilities used this method. The same study found that 59% of surveyed companies were using econometric modeling and 26% used load shapes to develop the monthly peaks.[25]

[25] Itron "PGE Forecast Review Summary" (April 2015), p.26

III. COMPARISON OF MH METHODOLOGIES WITH INDUSTRY PRACTICE

A. Econometric and End-Use Forecasting

As discussed in the *Load Forecasting Methodology* section, MH performed forecasts at the sector-level by dividing its customers into three groups – Residential, General Service Mass Market, and Top Consumers. MH used econometric regression models to forecast Residential and GSMM sectors' average usage per customer and number of customers. For its Top Consumers category, MH used company-specific short-term forecasts along with an MH-developed, regression-based long-term forecast known as the PLIL method.

MH's sector-level, regression model based load forecast is consistent with industry practices. Load serving entities (LSE) typically divide the load forecast analysis into residential, commercial, and industrial groups to estimate the average usage and number of customers in each group. The independent variables or predictors used in MH's developed regression models are also similar to the variables used in other load forecasts in the industry.

One of the key predictor variables used in all the sector-level forecasts is electricity price, which allows the utility to account for the potential change in electricity usage with projected changes in electricity price. Besides electricity price, the regression models used by MH contained a variable to account for the change in electricity demand with the change in income or economic health. The Residential sector forecast included real disposable income per capita, whereas the GSMM sector included a GDP variable. However, MH did not include any variable to account for fuel substitution, such as natural gas prices. In light of the electricity price increases due to MH's proposed rate increases and the current low natural gas prices, this type of variable should have been considered.

MH used different approaches for forecasting customer counts for its residential and GSMM sectors. The customer count forecast for the residential sector is based on a third-party population forecast and the ratio of residential customers to population derived from historical data. Alternatively, the GSMM customer count forecast used regression models with residential customer count and GDP as predictor variables. As mentioned, the population and economic forecasts utilized by MH are based on external organization's forecasts. We discuss the key assumptions of the external third-party forecasts in the *Economic Assumptions* section of this report.

MH also relied on end-use forecasting in its residential sector load forecast. As discussed earlier, the use of the end-use forecasting results was limited, despite the effort used to develop and maintain the method. The average customer usage derived from the end-use method was used only to compare with the average usage estimated from MH's econometric method for "reasonableness." The end-use method also estimates "heating saturation", or the ratio of heating customers to total customers, which is used as one of the independent variables in the primary regression model that estimates average usage of residential customers.

Besides the econometric-based method, utilities have used other modeling approaches to forecast load, such as time-series analyses, engineering-based "bottom-up" forecasting approaches, and statistically-adjusted end-use modeling.[26] The time-series models typically use historical sales and weather variables to predict future electricity load. The econometric regression method, such as the one utilized by MH, can use many predictor variables including demographic variables, customer usage information, economy-related variables, monthly and seasonal-fixed effects, electricity and other fuel prices, and weather variables. The engineering-based "bottoms-up" approach is an end-use based model where the load forecast is estimated by disaggregating the usages of key end-uses such as space and water heating, refrigerator, and other appliances or equipment energy consumption. Statistically-adjusted end-use models are a hybrid structure combining components of the engineering end-use technology models with structural econometric equations. In practice, this type of approach mostly considers three different components: appliance ownership via a saturation component, energy usage intensity trends of the appliances or equipment, and consumer's usage behavior.[27]

B. Economic Assumptions

Economic and population variables are used extensively in the econometric modeling used to forecast both customer counts and average usage per customer. For example, the GDP variable is used as one of the predictors for estimating both the number of customers[28] and the average usage for the GSMM sector. Moreover, the PLIL method that is used to account for the long-term load forecast of the Top Consumers sector also

[26] Carvallo, Juan Pablo and *et. al.* Load Forecasting in Electric Utility Integrated Resource Planning. Ernest Orlando Lawrence Berkley National Laboratory, October 2016.

[27] Ibid.

[28] The other predictor used for estimating GSMM customer count is the Residential customer count. And the forecast of Residential customer count is based on the population forecast. Thus, the population forecast has an indirect effect on the GSMM customer count forecast as well.

relies on a combination of the Canada and US GDP as the predictor variable. Similarly, the load forecast for residential customers is based on the population forecast.

The GDP and population data used in the load forecast models are based on a survey of forecasts from various financial and consulting institutions. MH used GDP forecasts of Manitoba, Canada, and United States in its load forecasting methodology by calculating the simple averages of multiple third-party forecasts. MH has used multiple sources for its short-term forecast, but relied on only a few for its long-term GDP and population forecasts. There are many institutions forecasting near-term GDP, whereas there are only a few institutions that generate a long-term forecast.[29]

1. GDP Forecasts

~~**[CONFIDENTIAL BEGIN] [*Labeling this section as confidential as we relied on information provided by MH. To confirm with MH]***~~

The long-term GDP forecast used by MH is the average forecast of three organizations – Conference Board of Canada, IHS Economics, and the Centre for Spatial Economics. Daymark reviewed the method and assumptions used by these three organizations to generate the long-term GDP forecasts.

The Conference Board of Canada (CBC) provided projections of economic and population growth for both Canada and Manitoba. At the national level, the CBC expected the Canadian economy to grow 1.9% in 2017. However, this projected growth rate is much less than the average increase of 3.2% in the decade before the 2008-2009 recession. The CBC did not expect any acceleration in real GDP growth going into 2018 because of low business investment levels and slowing growth in the labor force tied to an aging population. Uncertainty pertaining to the rise of U.S. trade protectionism could also affect forecasted growth. In the long-term, economic growth in Canada is estimated to average 1.8% from 2019 to 2040. While continued anemic business investment levels will continue to hamper growth, the aging of Canada's population[30] will be the main reason behind slackening economic growth.[31]

[29] For example, in order to calculate the Manitoba GDP forecast for 2017 and 2018, MH used the average of Manitoba GDP forecast's estimated by CIBC, Desjardins, Laurentian, National Bank, BMO Nesbitt Burns, Royal Bank, Scotiabank, and TD Bank.

[30] Population aging in Canada will slow down growth in both the population and the labor force and significantly effect income and spending patterns. The rate of retirement for baby boomers is expected to increase over time, which will likely cause labor shortages that will compel companies to increase investment in equipment, machinery, technology, and efficient production methods and workforces.

[31] Confidential – Provincial Source Forecasts, pp. 78-79.

For the province of Manitoba, the CBC pointed out that the province has experienced the second-strongest growth of any province over the last 10 years. Manitoba experienced average annual real GDP growth of 2.5% over the past two decades. However, CBC argued that the lack of investment in important capital stock will lead to a decrease in growth in the future years. CBC believes that the province's capital stock will grow more slowly than most of the other provinces in Canada during the forecast period.[32] CBC expects Manitoba's real GDP growth to average 1.8% annually from 2016 to 2040.

IHS Economics provided a short-term look at the overall Canadian economy and a medium-term analysis of Manitoba's population and GDP. The short-term forecast for real GDP growth in Canada was 2.5% for 2017. However, like the CBC analysis, IHS sees the slowdown in the Canadian labor market and changing trade relations with the U.S. as potentially affecting economic growth.[33] In terms of the U.S. economy, IHS expects the U.S. economy to grow 2.2% in 2017.[34]

Regarding Manitoba, the economy of the province grew 2.4% in 2016. This growth was attributed to growth in goods-producing industries, as well as gains in construction, manufacturing, and agricultural industries. Growth in construction was greatly helped by Manitoba Hydro's construction projects such as the Keeyask power generation station and Bipole III transmission line. There has also been consistent growth of around 2% in the output in the service sector over the past several years. Because of the closing of the Thompson nickel mine in October 2017, the output of the goods-producing industry may experience some contractionary pressures. Therefore, output growth in this sector could decrease to 2.1%. In all, Manitoba is expected to experience around 2.2% growth this year and for the next four years.

The Centre for Spatial Economics (CSE) provides forecasts for economic and population growth in the U.S., Canada, and Manitoba. For the U.S., real GDP growth is expected to average 2.1% and 2.3% for the 2017-2021 and 2022-2028 periods, respectively.

[32] The rising debt levels of Manitoba Hydro will lessen the utility's investment for new projects once the current megaprojects are completed. While mining exploration endures, there have been few greenfield investments announced. Private investment in equipment and machinery will not be enough to support capital stock growth in the province.

[33] Canada's aging population and the growing transition from permanent full-time positions to part-time jobs is influencing the nature of job creation. The trade protectionist policies espoused by President Trump could have economic ramifications for Canada, especially with regard to the value of the Canadian dollar. The announcement of US duties on softwood lumber has led to the Canadian dollar dropping in value relative to the US dollar.

[34] Ibid., pp. 233-234.

However, the CSE acknowledged that there is much uncertainty regarding economic growth globally because of the change in the U.S. administration.[35]

The economic forecast for Canada has the country's real GDP growing on average 1.9% annually for 2017-2021 and 1.7% for 2022-2026. The CSE cited an expected slow recovery for most commodity prices as an important factor influencing growth since these prices impact all aspects of aggregate demand. Similar to the CBC's forecast, the CSE saw a slowing in business investment, especially in the long term when the investment cycle winds down and major projects are finished.[36] The investment and spending rates are expected to increase in the long term because of deficit elimination and the health and social service demands of an aging population. The labor force is estimated to grow by an average of 0.7% over the medium term. However, this rate will decrease to 0.6% during the long term as the participation rate declines and the country's labor force ages. Lastly, the country's population growth is expected to average 1.0% from 2017-2021 and 0.9% from 2022-2028.[37]

Manitoba is expected to see a strong rebound in its manufacturing industry, which will support its economic growth over the forecast period. The province will see an average growth in real GDP of 1.8% in the medium term, with continued investment and project completion in the utility industry helping to bolster this growth during this period.[38] On average, real GDP is estimated to grow 1.2% in the long term.

As discussed earlier, MH calculated the simple average of different third-party GDP forecasts for Manitoba, Canada, and U.S. regions. Figure 9 shows the annual GDP of the Manitoba region used in MH's load forecasting analysis for both historical and forecast

[35] It is expected that machinery and equipment investment will be strong over the medium term with an average of 5.6%. Residential expenditures are estimated to average 5.4% over the medium term and motor vehicle expenditures will average less than 0.5% over the entire forecast period. Ibid., p.362

[36] Residential investment is also expected to remain low because of the general decrease in housing. Consumer expenditure is estimated to be weakened in the middle of the forecast because of rising interest rates but rising to an average of 2.3% in the long term. Government investment is expected to grow by 1.1% while real current spending will grow by 1.3% in the medium term thanks to the federal's government's plan to invest $120 billion in infrastructure over the next ten years.

[37] Ibid., pp. 357-361.

[38] Residential investment is expected to grow by 3.7% annually in the medium-term due to increases in housing starts. Consumer expenditures will average 2.2% over the medium term while government investment will average 1.8% during that period. Employment growth will average a little over 1% in the medium term. Regarding the long term, residential investment will decline to an annual average of 1.3%, while consumer expenditures will also decline to an average of 2%. Government spending will be consistent in the long term at around 1% in the long term, with spending needs increasing due to population aging. The labor force will grow at 1% per year due to slower population growth and a weaker economy towards the end of the forecast time period. Manufacturing will increase in the later years while a reduction in major project investment is expected, which is similar to what the CBC anticipated.

periods. The Manitoba GDP, expressed in millions of 2007 dollars, is estimated to grow consistently during the entire load forecast period.

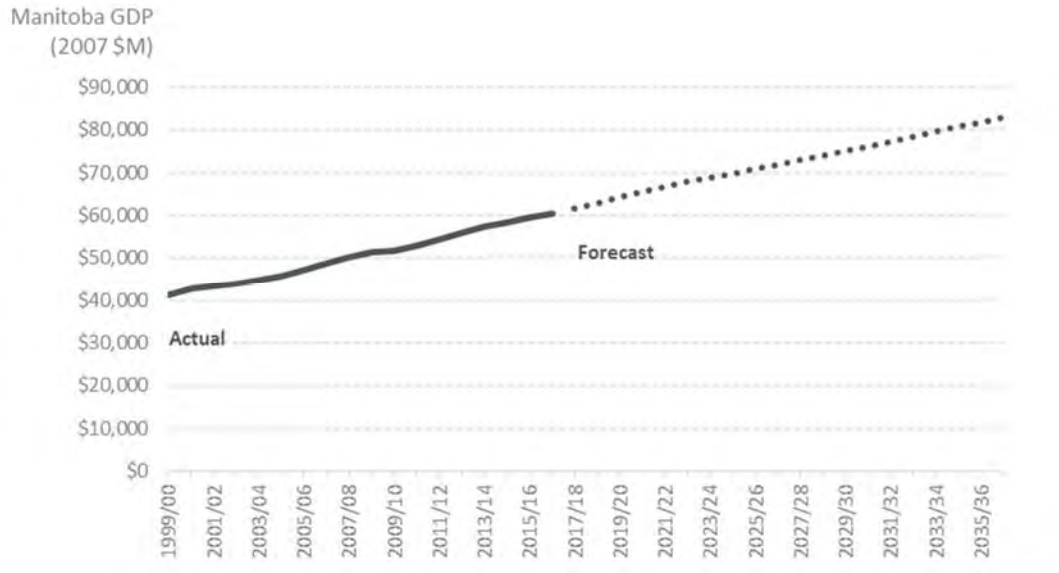

Figure 9: Annual Manitoba GDP (2007 $M) used in MH's Load Forecast

~~**[CONFIDENTIAL END]**~~

MH uses a single GDP variable, defined as a blended GDP, in its load forecast models created by geometrically combining Manitoba, Canada, and U.S. GDPs.[39] The weights assigned to each jurisdiction differ based on the sector modeled.[40] There are a couple of issues with the way the blended GDP is created and used in the analysis. First, the GDP units used for creating a combined GDP for the three sectors are not consistent. MH used Manitoba's GDP in millions of dollars ($), whereas Canada and U.S. GDP are considered in billions of ($). Even though the results (regression coefficients) would not have changed using the same units for three different GDP, the use of a blended GDP also has an interpretability issue, especially with the real GDP elasticity. For instance, the real GDP elasticity estimated for large customers within the GSMM sector is 0.29[41] and

[39] $Blended\ GDP\ = (Manitoba\ GDP\ in\ m\$)^a * (Canada\ GDP\ in\ B\$)^b * (US\ GDP\ in\ B\$)^c$ where a, b, and c are weights given to the different GDPs and the sum of a, b, and c equals to 1. The weights vary by modeled sector. For example, in the regression models used to estimate customer number and average usage for the Large GSMM sector, MH used the GDP weights of 30% (a), 35% (b), and 35% (c) for Manitoba, Canada, and US GDP, respectively.

[40] The Small, Medium category assigned 100% weight to Manitoba GDP. In the models used for the Large GSMM sector, MH used the GDP weights of 30% (a), 35% (b), and 35% (c) for Manitoba, Canada, and US GDP, respectively. Similarly, the PLIL model assigned equal weights of 50% for Canada and US GDPs.

[41] 2017 Load Forecast Report, Page 57.

interpreting this number is challenging until the geometric combination is used to track back to the individual GDP relationship.

2. Population Forecasts

~~[CONFIDENTIAL BEGIN] [*Labeling this section as confidential as we relied on information provided by MH. To confirm with MH]*~~

With regard to demographics, the load forecasting methodology used by MH relies on long-term population forecasts from CBC, Spatial Economics, and IHS. CBC concluded that Manitoba's population is expected to age over the next two decades but at a slower pace than most other Canadian provinces. A higher birth rate is expected for Manitoba, which will bolster natural population increases during the forecast period. Additionally, population growth will be supported by higher levels of international immigration into the province.

While growth in the labor force is expected to slow down over time in Manitoba, its forecasted 1% average annual compound growth will be larger than that of any other province.[42] The IHS report mentioned that Manitoba experienced a multi-decadal record increase in population in 2016 at 1.7%, which would boost domestic demand and labor force growth. Population growth is forecasted by IHS to generally hover around 1.2% for the next four years.[43] Similarly, the forecast created by Spatial Economics predicts that the population of the province will grow on average by 1.3% annually in the medium term while in the long term the growth rate will slow to around 1%. Spatial Economics expects the increase in net international migration of recent years will decline in the medium term, but will be offset somewhat by increases in net interprovincial migration.[44]

The population forecast forms the basis of both the residential and GSMM sector-level customer count forecasts. Historically, MH's evaluation of population and residential customer forecasts shows that MH has typically under-forecasted the population values. Figure 10 shows the average N-year ahead population and residential customer forecast errors. MH estimates the forecast errors using their population forecast and the actual historical numbers. For example, a 5-year ahead error forecast is the percentage difference between actual population and the forecast for population created 5 years in

[42] Ibid., pp. 96-97.
[43] Ibid., pp. 310, 313
[44] Ibid., pp. 376-377

advance. The figure shows that the average percentage error varies, on average, from 0.033% in 1-year ahead comparisons to 2.01% in 10-year ahead forecasts.[45] The positive error percentages denote that the actual population is higher than the forecasted population. Similarly, the average error percentage on forecasts for residential customer counts varies from 0.35% in 1-year ahead forecasts to 4.5% in the 10-year ahead forecasts.[46] Since the load forecast for the residential sector is the product of the customer count forecast and the average usage forecast, the use of a lower-than-actual customer count forecast will result in a lower residential load forecast. Moreover, since residential customer count is one of the predictor variables for forecasting the number of GSMM customers, the use of under-forecasted residential customer numbers results in lower-than-actual GSMM customer counts, which in turn produces a lower GSMM load forecast.

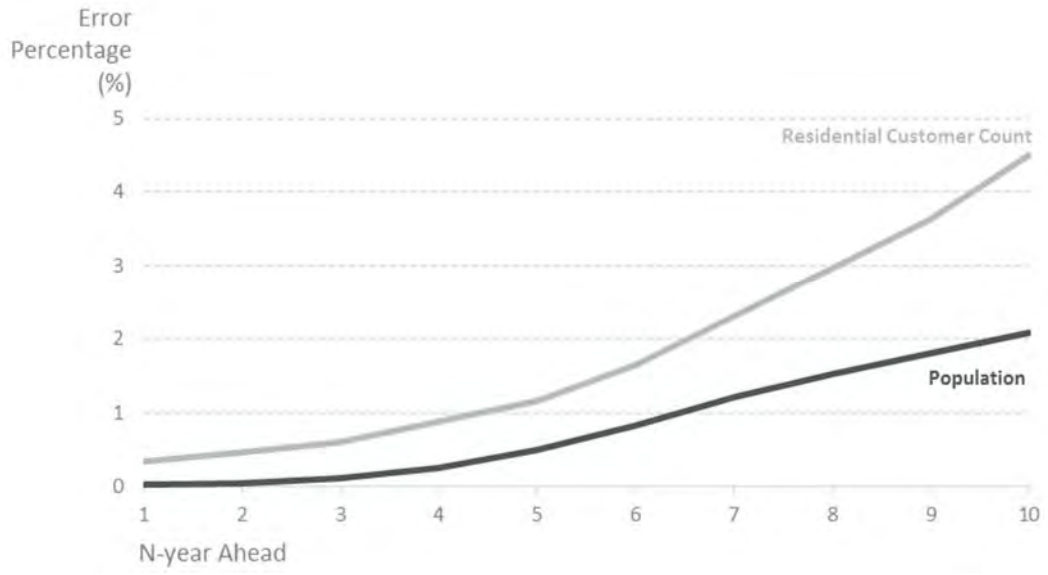

Figure 10: Average N-year Ahead Error Forecast, Population and Residential Customer Count

~~**[CONFIDENTIAL END]**~~

[45] Source: Row 68, "Population Fcst" tab in "Error Evaluation – Manitoba Population 2016" excel file

[46] The error percentage for residential customers only uses data after 2004 as MH reported a structural change in its Residential customer forecast in 2004.

C. Price Elasticity and Implication of Rate Increase

1. Price Elasticity

MH has estimated different elasticities by sector to measure and project the economic effects of electricity price, income, and GDP in the demand for electricity[47]. The price, income, and GDP elasticities were estimated from econometric modeling in the sector-level load forecasts. It is important to estimate the impact of electricity price on MH customers' electricity demand because the proposed rate increase is considerable. Figure 11 shows the real annual electricity price for residential customers.

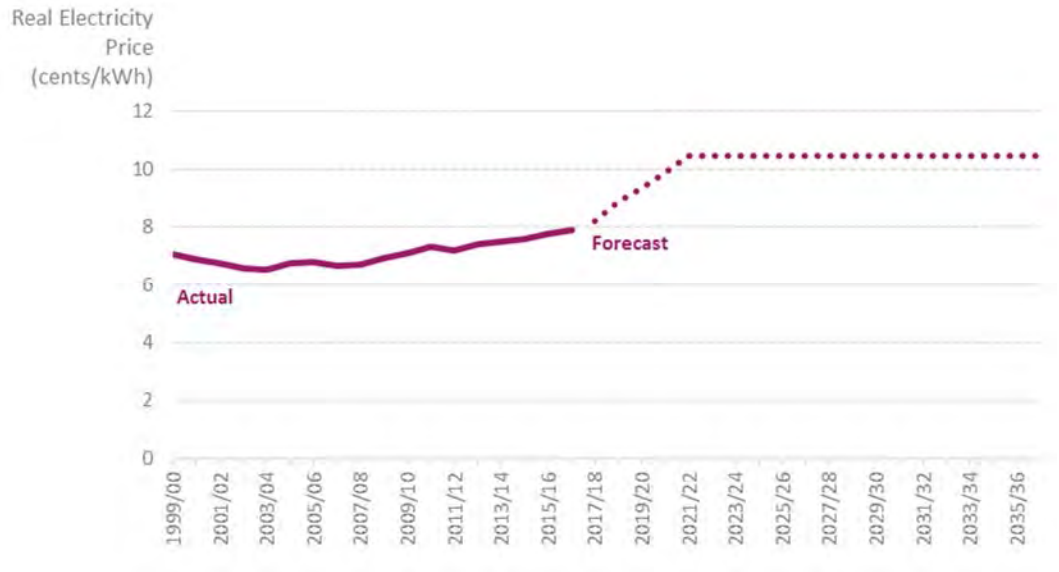

Figure 11: Annual Real Electricity Price, Residential Sector (2016/17 = 100)

Table 1 presents the elasticities estimated and reported by MH in its load forecast report. Using the price elasticity of gross firm energy from the table, MH estimated that a one percent increase in electricity price reduces the gross firm energy by 0.27%. The elasticities estimated are then used – along with the future electricity price, income, and GDP variables – to consider their impact on the load forecast.

[47] Price elasticity estimates the impact of a one percent change in electricity demand with a one percent change in electricity price.

Table 1: MH Estimated Price, Income, and GDP Elasticities [48]

	PRICE ELASTICITY	REAL INCOME ELASTICITY	REAL GDP ELASTICITY
Residential Basic	-0.28	0.30	
GS Mass Market Small/Medium	-0.13		0.55
GS Mass Market Large	-0.46		0.29
GS Top Consumers	-0.37		0.62
Gross Firm Energy	**-0.27**	**0.10**	**0.36**

Daymark found that some of the elasticities reported by MH may be incorrectly estimated for different reasons. The econometric model used for the energy forecast includes a variable that estimates the price elasticity of residential customers and that coefficient exhibits a multicollinearity issue. MH reported the price elasticity of -0.28 using the model with the multicollinearity issue. The regression model used for estimating average usage per customer has multicollinearity issues mainly due to the use of highly correlated independent variables - the log transformation income, saturation, and trend variables are highly correlated with each other. Daymark calculated the variance inflation factor (VIF) of the independent variables used in MH's residential regression model, which assesses how much the variance of an estimated regression coefficient increases if the predictors are correlated. A VIF value of 5 or greater indicates a reason to be concerned about multicollinearity[49]. As presented in Table 3, The VIF values of the independent variables of income, saturation, and trend variables are greater than 25 indicating that multicollinearity exists in the model.

Daymark estimated residential price elasticity to be -0.34 when the variables causing the multicollinearity were removed from the equation. Although multicollinearity doesn't affect the overall fit of the model, or result in bad forecasts of the dependent variable, it does produce unreliable coefficient estimates. As a result of the multicollinearity in MH's residential average usage model, the coefficients associated with electricity price and income, which are interpreted as price elasticity and income elasticity, may be incorrectly estimated[50].

Similarly, the price elasticity estimated for the top consumers sector, through the conservative PLIL method, is lower than it would be if it were estimated using the PLIL

[48] 2017 Load Forecast Report, Page 57.

[49] http://blog.minitab.com/blog/adventures-in-statistics-2/what-are-the-effects-of-multicollinearity-and-when-can-i-ignore-them

[50] Ibid.

method from the 2014 load forecast. MH reported the price elasticity of -0.37 for its top consumer sector in 2017. However, Daymark found that the price elasticity for top consumers would be -0.53 if MH had used the method used in the 2014 Load Forecast Report.

Moreover, the use of trend and dummy variables in the average usage models may have suppressed the impact of electricity price elasticity. MH used a trend variable in the average usage regression model featured in their residential forecast. MH mentioned in their load forecast methodology that the trend variable was intended to capture increases in both electric use and house size. A trend variable is typically added to a regression in order to control for a common trend among the variables[51]. In the case of the residential average usage model, a simple positive (1, 2, 3, 4, etc.) trend variable was added to control for the effects of increasing electric use and house size on the other regression variables over time. Even though including the trend variable in the average usage model of residential customer may be justifiable, we found that the residential price elasticity coefficient, decreases after adding the trend variable.

In order to understand the impacts on price elasticity of the trend and dummy variables MH used, Daymark performed stepwise regressions by adding independent variables incrementally to the average usage regressions of residential and GSMM sectors. Table 2 shows the results of the stepwise regression analysis of residential average usage. The values outside the parentheses are the estimated coefficients while the values inside the parentheses are the associated t-values.[52] The data in the last column (Model 4) present the results reported by MH in its 2017 Load Forecast Report[53]. The values of the coefficient for electricity price, or the price elasticity of electricity, across different models becomes smaller in magnitude after the trend variable is included in the regression equation. The price elasticity decreases from 0.46 (Model 3) to 0.28 (Model 4) once the trend variable is included.

[51] For example, regressing a stock price for one company on the stock price of another company may show that they are correlated simply because they were trending in the same direction. By adding a trend variable to the equation, the trend is accounted for and therefore the true nature of the relationship between the two variables is more clearly revealed.

[52] A t-value measures the extremeness of a statistical estimate. It is calculated by subtracting the hypothesized value from the statistical estimate and dividing the resulting value by the estimated standard error. The greater the absolute magnitude of the t-value from zero, the greater the evidence of statistical significance or difference.

[53] 2017 Load Forecast Report, Page 62.

Table 2: Estimates of Stepwise Regression Models of Residential Average Usage Model

RESIDENTIAL BASIC, AVERAGE USAGE MODEL				
	Model 1	Model 2	Model 3	Model 4
Electricity Price	-0.20 (-0.38)	-0.34 (-3.28)	-0.46 (-6.82)	-0.28 (-4.43)
Income	-	0.99 (24.26)	0.23 (1.79)	0.30 (3.19)
Saturation	-	-	3.42 (6.04)	1.31 (2.12)
Trend	-	-	-	0.01 (4.53)
Adjusted R-Squared	-0.03713	0.9609	0.985	0.9922

Table 3 presents the variance inflation factor (VIF), which assesses how much the variance of an estimated regression coefficient increases if the predictors are correlated. The VIF values associated with the income, saturation, and trend variables in MH's residential average usage model show that these three variables created the multicollinearity issue.

Table 3: Variance Inflation Factor (VIF) of Residential Average Usage Model

RESIDENTIAL BASIC, AVERAGE USAGE MODEL - VIF				
	Model 1	Model 2	Model 3	Model 4
Electricity Price	-	1	1.09	1.84
Income	-	1	25.93	26.63
Saturation	-	-	26.19	60.41
Trend	-	-	-	26.05

Moreover, our analysis shows that the inclusion of dummy variables in GSMM average usage regressions also reduces the price elasticity. MH included dummy variables in their forecast models for average usage of GSMM small non-demand, small demand, and medium, and large customers.

- The dummy variable in the GSMM small and medium customer average usage model represents a billing system change that resulted in a reclassification of customers in 2006/07.
- The dummy variable in the GSMM large customer average usage model reflects the average use of the 750V-30kV group being higher by about 250,000 kWh for the years from 1999/00 to 2005/06.

Dummy variables are often added to regressions in order to represent the measurement value of a variable that cannot be easily measured on a numeric ratio scale.[54] .

However, the coefficients for electricity price (also price elasticities of electricity) in the GSMM small, medium, and large customer average usage models decrease in magnitude once the dummy variables are added to each of the regressions. Table 4 presents the stepwise regression results developed by MH for small and medium customers within the GSMM sector.

Table 4: Estimates of Stepwise Regression of GS Small and Medium Average Usage Model

GSMM SMALL AND MEDIUM CLASS AVERAGE USAGE MODEL COEFFICIENTS			
	Model 1	Model 2	Model 3
Electricity Price	-0.85 (4.17)	-0.17 (4.13)	-0.13 (3.61)
Real GDP	-	0.46 (29.06)	0.55 (21.57)
Dummy	-	-	0.03 (3.79)
Adjusted R-Squared	**0.3779**	**0.9814**	**0.9879**

Similarly, Table 5 includes the stepwise regression results for large customers within the GSMM sector, which were produced by Daymark using the data provided by MH for the same time period. The decrease in price elasticity shows that including a trend or dummy variable in the regression equation reduced the forecasted impact of a price increase compared to when there were no trend or dummy variables used. While the inclusion of both the trend and dummy variables in MH's average usage models may be justified, our analysis shows that the price elasticities reported by MH are underestimated.

Table 5: Estimates of Stepwise Regression of GSMM Large Customers

GSMM LARGE CUSTOMER AVERAGE USAGE MODEL COEFFICIENTS			
	Model 1	Model 2	Model 3
Electricity Price	-1.07 (12.89)	-0.66 (5.86)	-0.46 (5.55)
Real GDP	-	0.22 (4.35)	0.28 (8.05)
Dummy	-	-	0.06 (5.63)
Adjusted R-Squared	**0.8595**	**0.9169**	**0.9627**

[54] Econometrics, Samuel Cameron, p. 173

2. Fuel Switching Not Considered

The load forecasting methodology developed by MH does not consider the effect of electricity price increase completely, particularly the potential substitution effect of electricity price increases. Increases in electricity price impacts customers in two different ways. With the increase in the price of electricity, the budget allocated for electricity can now only buy fewer units than the consumer could afford before. Similarly, the increase in electricity price makes the relative price of other substitute goods cheaper and can reduce the demand for the higher-priced product (electricity) as the consumer switches to a lower-cost substitute product.

The possibility of switching to an alternative fuel type or source due to the increase in electricity price is not explicitly considered in the MH load forecast analysis. For example, as the price of electricity increases and the price of natural gas decreases, or even remains constant, it can be expected that electric load will decrease due to consumers switching to natural gas as a rational response to the price changes. It is important to consider the potential magnitude of fuel or source switching that the proposed rate hike may induce, since electricity prices are requested to increase by 65% in 2025 as compared to 2018 rates.[55] Similarly, the recent trends of low natural gas prices and a steady decrease in solar costs may make these alternatives more economically attractive considering the proposed electricity price. It must also be recognized that a substitution effect will be offset by natural inertia, that is the effort to change fuels may delay or reduce the potential for substitution.

D. Alternative Load Forecast

The method for developing alternatives or ranges around the base load forecast is an important step in the forecast analysis because it considers a wider range of future conditions including alternative trends for the key input variables. A simple point forecast provides a single view of the future – investigating the potential differences that could occur using alternatives, or ranges, affords the utility the ability to plan more effectively by understanding the uncertainties involved.

Investigating alternative load forecast in addition to the base forecast helps to quantify the additional cost (or benefit) that might be realized if the future load pattern follows the path specified in the alternative load forecast rather than the base forecast. Thus, considering these alternative forecasts allows one to understand the magnitude of risk and uncertainty of different likely future load growth scenarios. The alternative load

[55] "2017 GCR AT 2017 RATES" excel file provided by MH.

forecasts are mainly developed using economic models based on scenarios or a statistical (percentile or distribution) approach based on a stochastic approach. Alternative load forecasts are also developed using percentiles or deviations from the base forecast as their alternatives. Besides developing alternative load forecast scenarios, utilities have also evaluated the impact on the base load forecast by varying key input variables individually which is known as sensitivity analysis.

1. Sensitivity and Scenario Analysis

MH's load forecast only considered sensitivity analysis by varying the key input variables of the load forecast analysis. Specifically, MH calculated the impact of a 0.1% annual change in population, income, GDP, and electricity price, on gross firm energy and peak demand over the 20-year forecast period. Table 6 presents these sensitivity results. For example, MH estimated that a 0.1% higher population growth than forecasted by MH in their base or reference forecast will increase the energy forecast in by 293 GWh and the peak load forecast by 54 MW over the next 20 years. The changes in the key input variables considered in the sensitivity analysis were not based on well-defined future economic or technology trends.

Table 6: Sensitivity of Load Forecast to an Assumption Change

CHANGE IN 20 YEAR AVERAGE ANNUAL GROWTH RATE	ENERGY (GWh)	PEAK (MW)
0.1% Increase/Decrease in Population	± 293	± 54
0.1% Increase/Decrease in Income	± 49	± 9
0.1% Increase/Decrease in GDP	± 178	± 33
0.1% Increase/Decrease in Electricity Price	∓ 134	∓ 25
Climate Change per Degree Celsius Warmer	+ 20	- 49

MH also evaluated the impact of a few extreme events on its future energy load. MH considered the effect of extreme events such as a 100 percent conversion of natural gas use to electricity, potential changes in load from a very large industrial customer, an increase in online shopping, high adoption of electric vehicles, and an illustrated effect of grid parity.[56] Table 7 presents the impact of extreme events on the base load forecast as estimated by MH.

[56] Grid parity is when a customer will have an economic option to provide some or all of their electricity need via an alternative energy source. The illustrated example of grid parity used by MH evaluated the load impact due to solar panel installation by 100,000 residential (2 kW system) and 10,000 commercial (50 kW system) customers. (Page 55, 2017 Load Forecast Report)

Table 7: Evaluation of Extreme Events

	ENERGY (GWh)	PEAK (MW)
All Natural Gas in Manitoba to Electricity	+ 16,000	+ 7,000
Increase/Decrease of One Very Large Industrial Customer	± 1,500	± 180
Maximum Potential Effect of Increased Online Shopping	– 775	– 143
Additional Load if 100% Electric Vehicle Saturation Rate	+ 12,015	+ 1,502
Illustrated Effect of Grid Parity (e.g., Solar Panels)	– 857	– 78

Even though MH evaluated the impact of changes in its key econometric analysis variables, its load forecast analysis did not consider scenario analysis by developing alternative load forecasts in addition to the base load forecast. Scenarios help create alternative future values for key variables that represent the different plausible trends that could occur. For example, scenarios may consider key uncertainties by representing different assumptions for economic and population growth, electricity and fuel commodity prices, and CO_2 prices. MH has the ability to develop comprehensive future forecast values that reflect the interactions of several different fundamental variables identified from its sensitivity analysis. Moreover, the different trends of key input variables considered in the scenarios account for the joint impact in the load forecast and, thus, can be an improved alternative to individual variable's impacts considered in the sensitivity analysis.

2. Risk and Uncertainty

MH's load forecast was created by developing various assumptions and different analysis methods to estimate Manitoba's future energy requirement. The underlying variations in the fundamental variables such as population and economic outlook, Top Consumer customers, and overall usage pattern gives rise to uncertainty inherent in MH's load forecast, as it does in any projection. MH created a P50 load forecast, meaning there is an expectation of a 50% chance that the actual growth will be higher than the forecast, and a 50% chance that the actual growth will be lower than the forecasted growth. In order to evaluate the potential load variation, MH then created two different load growth scenarios by considering a P10 and P90 of the base load forecast.[57] The P90 load forecast denotes the level of annual electricity load that is forecasted to be exceeded 90% of the year. The P10 and P90 load forecasts estimated by MH considered the variability due to long-term economic effects and did not include variability due to

[57] High (Low) Load = Base Forecast +/- 1.28*Standard Deviation

weather.[58] The load forecast variability estimated at p10 and p90 are not utilized further in the load forecast analysis.

MH's method of evaluating load uncertainty at p10 and p90 levels relied on considering the overall impact of key input variables such as population, economy, and other effects on the load variation. Utilities have also utilized a more robust approach by evaluating the inherent characteristics of each fundamental variable with the help of probabilistic (i.e., stochastic) risk assessments. This method provides a tool for estimating potential outcomes by allowing random variations in one or more key input variables. Probabilities are assigned to different values of the key uncertain variables, preferably identified through sensitivity analysis. The random variations can be based on fluctuations observed in historical data using standard time-series techniques.[59] Outcomes are then identified that are associated with different values of the key factors in combination. Since the probabilistic method involves generating multiple outcomes by varying key input variables, the final results often include the expected outcome and a probability distribution for these key factors.

E. Reliability of Load Forecast

Daymark compared MH's load forecast from previous years with the actual load to assess the reliability of the load forecast created by MH. Daymark also reviewed MH's method of calculating the accuracy of its load forecast by comparing actual weather adjusted load with the forecasts created five- and ten-years in advance.

1. Historical Performance of Load Forecasting Methods

Daymark gathered forecasts of gross firm energy and sector-level loads created in 2011, 2014, 2015, and 2016 with the goal of comparing these forecasts with the actual observed load.[60] Specifically, we compared the historical actual gross firm energy, residential load, GSMM load, and top consumer load to the corresponding forecasts conducted by Manitoba Hydro through the years. Additionally, weather adjusted values were compared to actual energy values; these are also shown in the coming figures.

[58] The 2017 Load Forecast Report mentioned that the standard deviation of weather variation has been found to be approximately 2% of both energy and peak. Annual weather variations tend to be independent of the economy, so the variance due to weather can be added to the economic variance to derive an overall combined variance. (Source: 2017 Load Forecast Report, Page 44).

[59] The random variations of the input variables are then used to generate a distribution of potential outcomes from a large number of simulations.

[60] "Electric Load Forecast 2011", "Electric Load Forecast 2014", "Electric Load Forecast 2015", "Electric Load Forecast 2016".

Figure 12 compares historical weather adjusted gross firm energy to different forecast vintages of gross firm energy. Comparing the 2011, 2014, and 2015 forecast values of the gross firm energy with the weather adjusted actual gross firm energy, this figure demonstrates that the forecasted load was greater than the actual load for all years. In particular, the 2011 forecast has the highest estimated deviations, followed by the 2015 and the 2014 forecasts. Only one historical data point exists for the 2016 forecast.

Figure 12: Comparison of Historical Weather Adjusted Gross Firm Energy (GWh) with Multiple Forecast Vintages of Gross Firm Energy

Figure 13 displays the estimated residential sales load values from the various forecasts conducted by MH. The 2011 forecast has consistently higher values than the actual historical adjusted values. The 2015 forecast also estimated higher values than those in 2017 in the later years shown in the figure. The figure shows that the Residential forecast created in 2014 estimated lower load than actual for the first two years of the forecast.

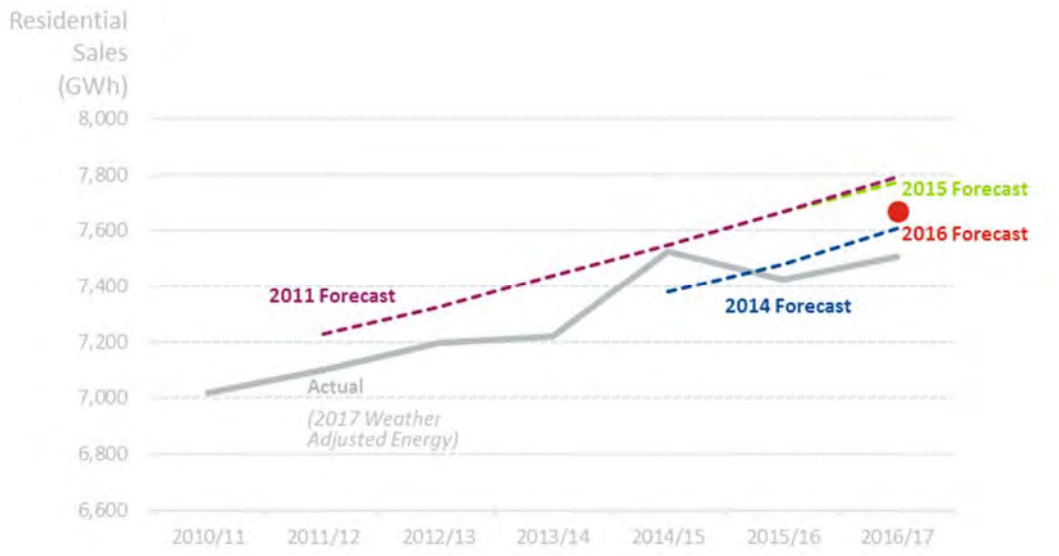

Figure 13: Comparison of Historical Weather Adjusted Residential Sales (GWh) with Multiple Forecast Vintages of Residential Sales

Figure 14 shows the estimated GSMM load values from the different forecast years. Overall, each forecast estimated load values that were higher than actual adjusted energy values. The only exception was the 2016/17 value from the 2015 forecast, which was slightly lower than the actual forecast.

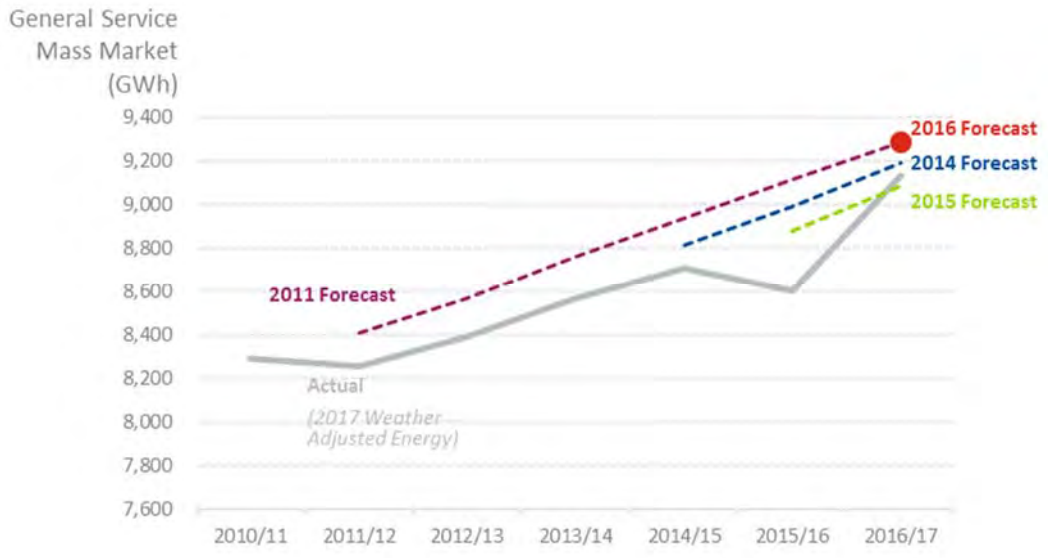

Figure 14: Comparison of Historical Weather Adjusted General Service Mass Market Sales (GWh) with Multiple Forecast Vintages of GSMM Sales

Figure 15 displays the estimated GS top consumer load from different MH forecasts. While all the previous forecasts have load values that were higher than actual historical consumption, there is significant variability in different years' forecasts from 2015/2016. While the 2015 forecast value is lower than both the 2011 and 2014 forecast value in 2015/16, it exceeds both the 2011 and 2014 values by 2016/17. The 2014 forecast value rises to more or less equal the 2011 forecast value in 2015/16 but falls below the 2014 forecast again by 2016/17.

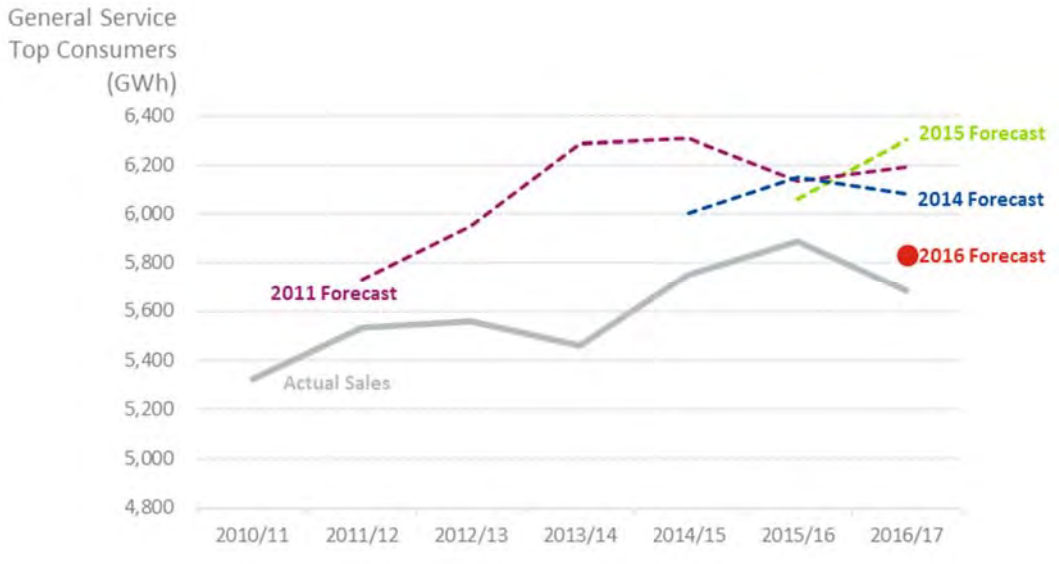

Figure 15: Comparison of Actual General Service Top Consumers Sales (GWh) with Multiple Forecast Vintages of Top Consumers Sales

2. Accuracy of the Load Forecast

MH calculates the accuracy[61] of its previous forecast by comparing the actual load with the forecasts created five- and ten-years in advance. Manitoba Hydro acknowledged that only a certain degree of accuracy is possible regarding the load forecasts due to load variation caused by both population and economic growth.[62] The Company estimates that there is only an 80% chance that a 5-year energy forecast will fall within 3.2% of the actual and an 80% chance that a 10-year forecast will be within 4.3% of the actual due to economic variability alone. The Company tracks historic forecast variation because of these forecast uncertainties[63].

The accuracy calculation method used by MH depends on weather normalization and on adjustments that are made to the forecast by subtracting program-based DSM savings. First, the actual, observed load is weather adjusted. Second, the forecasted program-based DSM savings are subtracted from the accuracy calculation. There is no analysis with regard to how forecasted program-based DSM savings compares with the actual savings. Thus, weather normalization and handling of program-based DSM affects the load forecast accuracy that MH is estimating.

MH can use additional methods to analyze its load forecast accuracies. For example, the sum of errors and annual average growth rate (AAGR) can be alternative metrics to compare forecasts with actual load.[64] The sum of errors is the ratio of the difference between forecasted and actual load to the actual load for any given year. The annual average growth rate[65] compares the load growth rate between two years of actual and forecasted load.

[61] Accuracy at five-year prior: $Accuracy_t = (Forecast_{t-5} - Actual_t)/Actual_t$ where $Actual_t$ is observed load ± weather adjustment – cumulative program-based DSM savings of five years.

F. Weather Normalization

MH assumes that its load forecast is adjusted to reflect what is considered to be normal weather. The historical annual loads are adjusted to account for weather variability within its load forecasting process. MH adjusts actual load for any weather-dependent usage due to actual differences in weather patterns in the current year as compared to a 'normal' weather pattern year. MH defined the 'normal' weather by using a 25-year rolling average monthly temperature. This process, commonly known as weather normalization, adjusts consumption for the weather-dependent load overserved in the actual load data. A common method in weather normalization, also used by MH, is to first quantify the electricity demand that is dependent on weather being colder or hotter than normal temperature days.[66]

MH's weather normalization regression models used the monthly energy usage, actual heating degree days (HDD), and cooling degree days (CDD) for the same month for the previous two years (24 data points). MH then used the resulting regression coefficients with 'normal' CDD and HDD data to calculate the weather-dependent energy usage for that year. The 'normal' degree days are based on the 25-year rolling temperature average of the Manitoba region.

Figure 16 compares the actual historical gross firm energy with weather adjusted gross firm energy along with the annual HDDs[67] during the same period. The weather adjusted annual gross firm energy is lower than actual gross firm energy since actual annual HDDs are lower than the normal HDD. Similarly, the weather adjusted load is greater than actual gross firm energy when the annual HDDs are higher than normal HDDs.

[66] The parameters used to measure weather-related electricity consumption are degree days. The degree days assume that consumers use more or less energy when the temperature is above or below a certain base temperature. MH has used a base temperature of 14˚C to calculate the heating degree days (HDD) and used the base temperature of 18˚C to calculate the cooling degree days (CDD).

[67] The annual HDDs were calculated using monthly Common Bus HDDs used by MH in its weather normalization. The HDDs are expressed in terms of fiscal year. For example, annual HDDs of 2016/17 includes total monthly HDDs from April 2016 to March 2017.

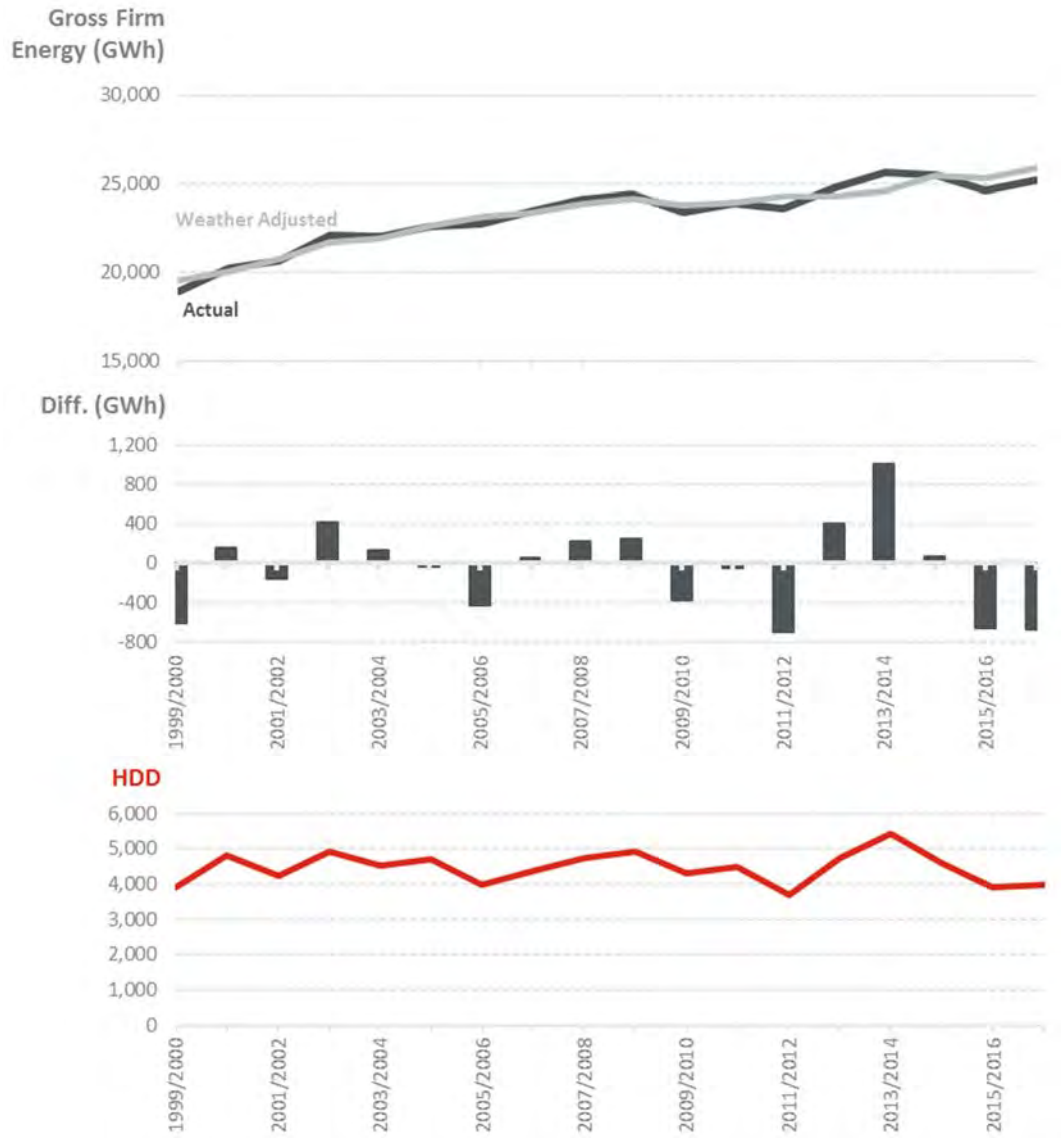

Figure 16: Comparing Actual and Weather Adjusted Gross Firm Energy with the Annual Heating Degree Days

MH may get better estimates of weather-dependent load by relying on more than two-years of monthly energy and degree days to estimate the weather-dependent relationship.[68] Regression models usually produce robust estimates when more data points are used. Since there is wide variation in recent weather patterns, the use of more monthly observation in the weather normalization model will help improve the

[68] Introduction to Regression Analysis, Nonlinear Regression and Curve Fitting: http://www.nlreg.com/intro.htm

robustness of weather dependent estimates. Daymark re-produced the regression results by using the previous ten years of monthly energy usage and weather data using the same weather normalization modeling parameters used by MH. The use of 10-year monthly usage and weather data for residential usage produced lower CDD and HDD coefficients than the coefficients estimated by MH's use of two years of data.[69]

MH could also improve its weather normalization by using a shorter-period to calculate the "normal" year weather variables. As mentioned earlier, MH used a 25-year rolling average to get normal year weather parameters for CDD and HDD. Many utilities are moving to the use of shorter time-periods to create normal weather temperature profiles. For example, BC Hydro uses a ten-year rolling average of monthly heating and cooling degree days.[70] With the climate change debate, it may make sense to use a shorter time-frame if in fact electricity use is becoming more weather-dependent. However, MH has not provided evidence to demonstrate why one approach is superior to the other.

G. Incorporation of DSM Savings in Load Forecast

MH considered two potential DSM-based savings programs in the load forecast analysis: savings based on the implementation of Codes and Standards (C&S) and utility program-based DSM savings. The annual historical average electricity usage also included both program-based and C&S-based energy savings. Essentially, MH added back historic DSM savings to the actual measured energy use prior to estimating its average use per customer for residential, GSMM, and top consumers[71] sectors.

The logic for including these DSM savings with actual measured MH load is that MH would have to serve this additional load if the DSM measures were not in place as part of C&S or utility-sponsored DSM programs. However, it is not clear why MH would add DSM savings related with C&S savings. The C&S DSM savings are based on set rules and these rules may have the same requirements going forward if they are not replaced by more stringent rules. Even though MH excludes the future C&S savings once the forecasts are created, the use of historical C&S DSM savings in the average usage regression model estimates different future average usage values than the average

[69] Using the same regression model used by MH with 10-year data. Data provided by MH in excel workbook: "WeatherNormalizationUpdated2-Daymark.xlsx"

[70] BC Hydro, Fiscal 2017 to Fiscal 2019 Revenue Requirements Application, Chapter 3-Load and Revenue Forecast, Page 3-6.

[71] The DSM savings are adjusted via PLIL model for Top Consumer category.

usage regression model used by MH by considering both C&S and program-based DSM savings.

Comparing MH's DSM forecasting method to those used by other utilities, a 2013 survey of utility forecasting methods found that 38% of utilities surveyed subtract DSM savings from their forecast.[72] Like the method used by Manitoba Hydro, this method assumes that current DSM program impacts are already accounted for in the forecast in the historical data and future DSM programs are not included and therefore are subtracted. Around 22% of utilities surveyed estimate a model with historical DSM and then subtract past and future DSM savings, while 11% of those surveyed capture DSM impacts through the SAE model specification.

IV. LOAD FORECAST CHANGES (2014 TO 2017)

Daymark carried out a comparison of the 2014 and 2017 load forecast methodologies and assumptions for the various customer groups defined by Manitoba Hydro. These customer group methodologies included the residential basic methodology, the general service mass market methodology, and the general service top consumer methodology. Similarly, we also compared the economic and population assumptions used in generating both the 2014 and 2017 load forecasts.

Overall, the methods used in 2017 produced lower long-term forecasts than the analyses performed in 2014. Figure 17 shows the gross firm energy forecasts created during 2014 and 2017. The 10-year historical growth rate of gross firm energy is 0.85%. The gross firm energy forecasted during 2017 is lower as compared with the gross firm energy forecasted during 2014. The annual growth rate using ten-year gross firm energy forecasted in 2014 is 1.46%. Whereas, the annual growth rate using the 10-year forecast from the 2017 methodology is 0.81.

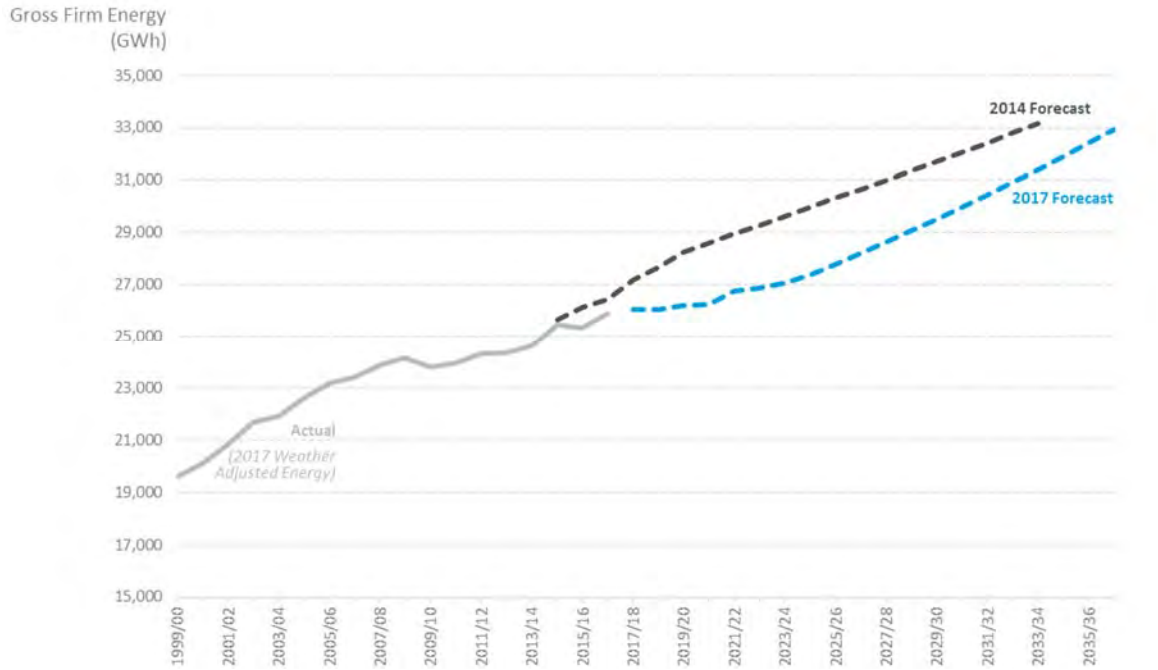

Figure 17: Annual Gross Firm Energy (GWh) Forecast Comparison

Similarly, Figure 18 shows the comparison of MH's 2014 and 2017 peak load forecasts. Consistent with the gross firm energy trend, the MH forecast of peak load in 2017 is lower than the peak load forecasted in 2014.

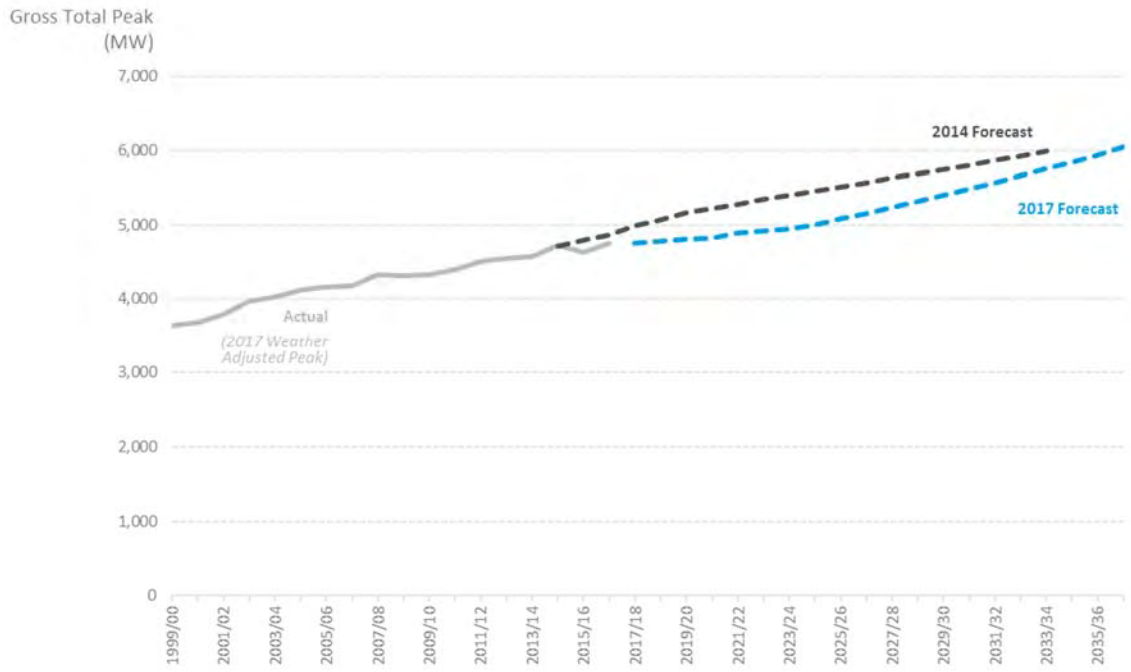

Figure 18: Annual Gross Total Peak (MW) Forecast Comparison

A. Residential Load Forecast Methodology

An econometric forecast of the average annual electricity use per customer of the residential basic sector was featured in both the 2014 and the 2017 methodologies. Although both the 2014 and 2017 forecasts used trend variables in their models, the trend variable used in the 2017 forecast was specifically defined as capturing increases in electric use and house size.[73] Lastly, the forecasted number of dwellings, multiplied by the overall average customer usage determined the GWh forecast in both 2014 and in 2017. However, the 2014 forecast mentions that annual savings estimates from the Heating Fuel Choice Initiative were subtracted whereas the 2017 forecast subtracted energy savings tied to the higher-adoption of LED lights.

Figure 19 shows the annual residential load forecasts estimated in 2014 and 2017. The residential load forecast is quite comparable between 2014 and 2017, although MH

[73] Manitoba Hydro, "2017 Electric Load Forecast", Market Forecast June 2016.p. 62.

estimated a slightly lower forecast for the residential sector customers in 2017 than in 2014, perhaps as a result of the elasticity response to anticipated electricity price increases among other factors.

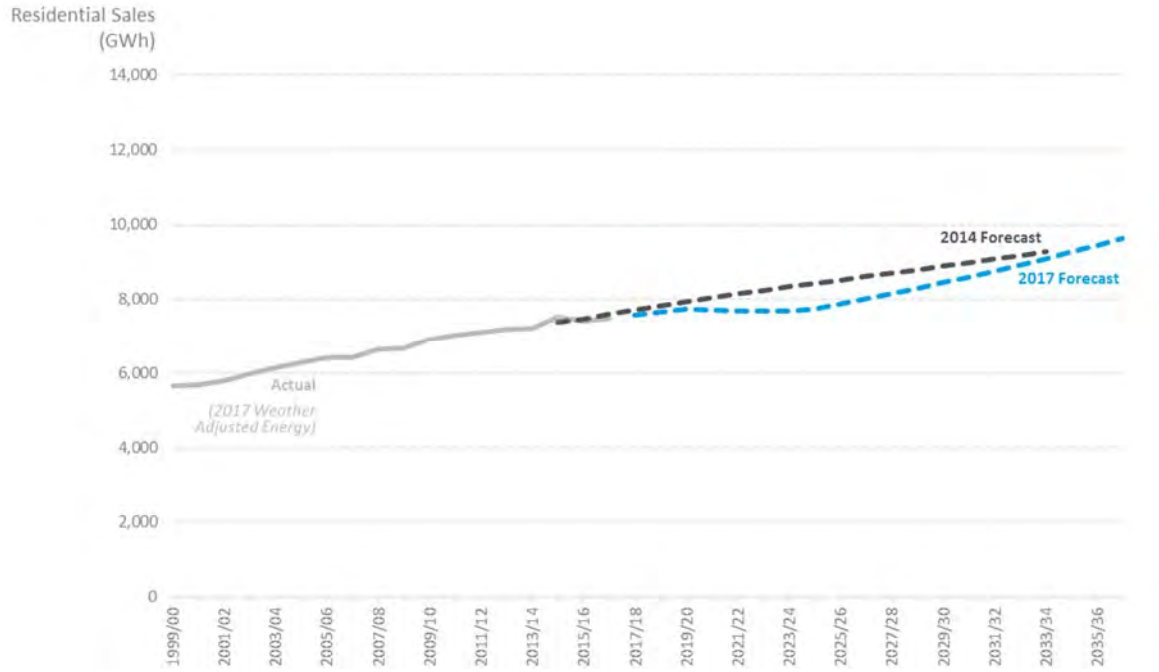

Figure 19: Residential Sales (GWh) Comparison between 2014 and 2017 Load Forecasts

In addition to the econometric model for average usage, the residential load forecast included end-use forecasting in both 2014 and 2017. However, it is not clear how end-use forecasting methodology is further used in both year's load forecasts, besides its use in estimating the ratio of electric heat customers to total customers, which is used in the average usage regression model.[74] The information used for the end-use forecasting model used information provided by the residential energy use survey. The 2014 methodology used the 2009 residential energy use survey while the 2017 methodology used the residential survey completed in 2014. The end-use forecasting methodologies used in 2014 and 2017 varied in forecasting the number of existing residential

[74] The ratio is expressed as a "Saturation" variable in the 2017 Load Forecast report. The 2017 report also mentioned the use of end-use forecasting results to check the reasonableness of total usage estimated from the average usage regression model. However, it is not clear how MH would adjust the average usage model if the results from the regression and end use models provided different results.

dwellings[75], space heating systems in the new dwellings[76], assumptions used for existing heating system in 2014, and heating choice method for 2017[77] .

B. General Service Mass Market Methodology

The general service mass market methodology in both 2014 and 2017 used two forecasts: a customer count forecast, and an average customer usage forecast. The customer count forecast model uses econometric regressions in both years. However, there are some differences between how this analysis was carried out in 2014 as compared to 2017. The percentage change in the number of customers was modeled in 2014 while the 2017 forecast estimated the customer count directly. Furthermore, the variable for Manitoba GDP is explained as being lagged[78] in the 2014 analysis but not in the 2017 analysis. Depending on the customer class, the GDP and customer variables used in the model equations for GSMM large customers differ between 2014 and 2017. The 2017 methodology uses a blended GDP variable created by blending Manitoba, Canada, U.S. real GDPs to forecast the year-end number of GSMM large customers. We discussed the implication of using a blended variable in detail in the *GDP Forecasts* section of this report.

The general service mass market average usage forecast calculated the historical average use per general service customer. The 2014 model does not lag electric price while the 2017 model lags electric price by two years. Unlike the 2014 model, the 2017 model incorporates dummy variables. The 2017 model also used a blended real GDP and holds the average use of each rate group constant. Finally, the 2017 model adjusted the number of customers in each group. The general service mass market sales forecast for 2014 and 2017 both project total GWh by multiplying the forecasted number of

[75] The forecast for existing dwellings differed between the 2014 and 2017 residential basic methodologies since the 2017 methodology specifically mentions that customer space heating fuel switches were taken into consideration for the forecast. The treatment of historical space heating systems by dwelling did not differ between the two methodologies, both involving the division of historical dwellings by type and region into nine space heating systems.

[76] The regions featured in the forecast were “Winnipeg” and “South Gas” in 2014 while the 2017 regions included “Winnipeg” and “Gas Available.” The regressions in the 2017 forecasts used a natural gas price trend variable, which was absent in the 2014 regressions. The weighted average and lag-years used in the regressions differ between 2014 and 2017. It seemed that choice of lag variables and assigned weighting is mainly driven with the goal of getting optimum statistical results rather than economic sense.

[77] The 2014 forecast methodology mentions that the former heating systems of dwellings were determined from billing system notes and inventory, while the 2017 forecast methodology makes no mention of this technique. The utilization of saving estimates from the Heating Fuel Choice initiative was also mentioned in the 2017 methodology for the forecast of water heating systems in new and existing dwellings but missing in the 2014 methodology.

[78] The lagged independent variable (Manitoba GDP) allows the regression to account for the impact of past value of the independent variable on the current dependent variable.

customers in each rate class by the forecasted average usage within those same rate classes. The future use of electric vehicles in the mass market sector was added to this forecast Figure 20 presents the general service mass market annual load forecast from 2014 and 2017. The 2017 load forecast is slightly lower than the 2014 load forecast; however, the annual load estimated in 2017 is projected to be higher than the load estimated in 2014 in the year 2027/28.

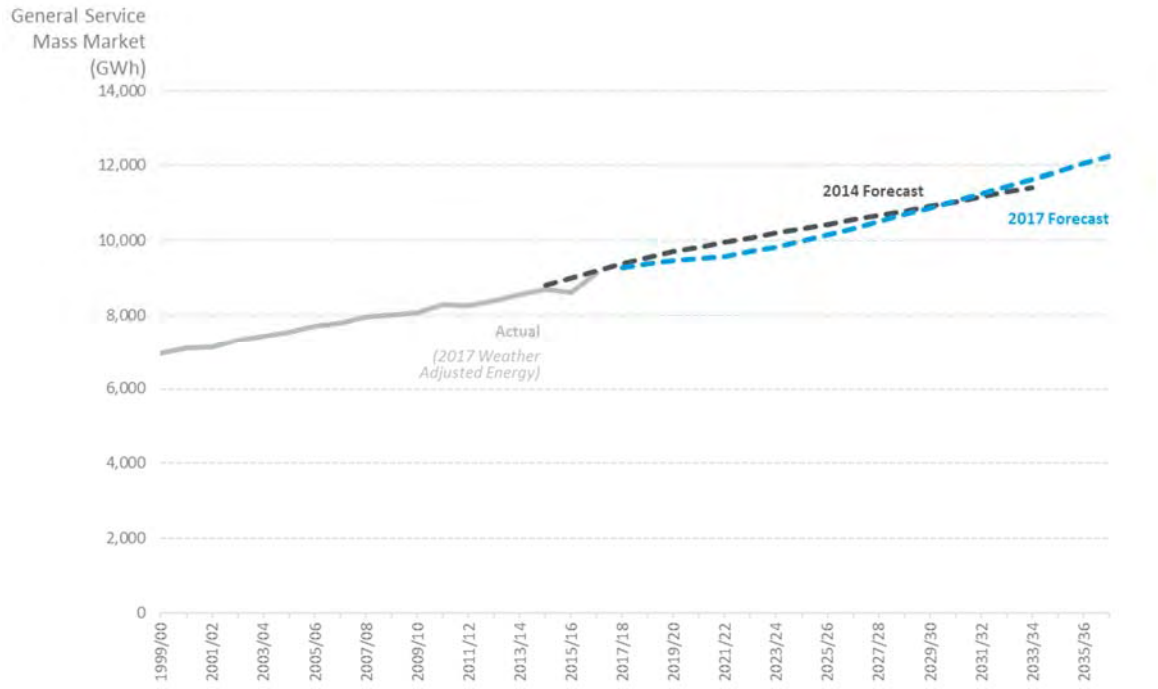

Figure 20: General Service Mass Market Sales (GWh) Comparison between 2014 and 2017 Load Forecasts

C. Top Consumers Load Forecast Methodology

The 2014 and 2017 general service top consumers methodologies both revolved around creating short-term and long-term growth forecasts among the company's top-consuming customers. Short-term forecasts are created for each individual customer using information on individual operating plans. The resulting calculations are five-year short-term forecasts for committed projects. To estimate long-term forecasts for the top consumers sector, the PLIL category, introduced earlier, was created. This allows for the evaluation of historic shifts in the energy consumption of top consumers as a group,

rather than simply as individuals. The differences between the 2014 and 2017 methods dealt with the number of companies included in the individual short-term forecasts. The 2014 method relied on 17 individual company forecasts while the 2017 method relies on just 10 individual company forecasts. This is because the 7 other companies moved to the general service mass market category. [CONFIDENTIAL BEGIN] [redacted] [CONFIDENTIAL END]

The long-term PLIL forecast used the same econometric model in both 2014 and 2017. However, the 2017 PLIL method used a conservative approach by only considering the total load of top consumer companies that have been in MH's service territory since 1983/84, the start year of MH's modeling period. The detailed discussion regarding the impact of PLIL method change in 2017 on MH load forecast is presented in the earlier *Top Consumers* section of this report. Figure 21 shows the load forecast comparison between 2014 and 2017 for the top consumers sector. Besides the short-term load forecast differences (number of companies included in top consumer category), the decrease in 2017 load forecast is also a result of the change in the PLIL long-term forecasting method in the 2017 load forecast.

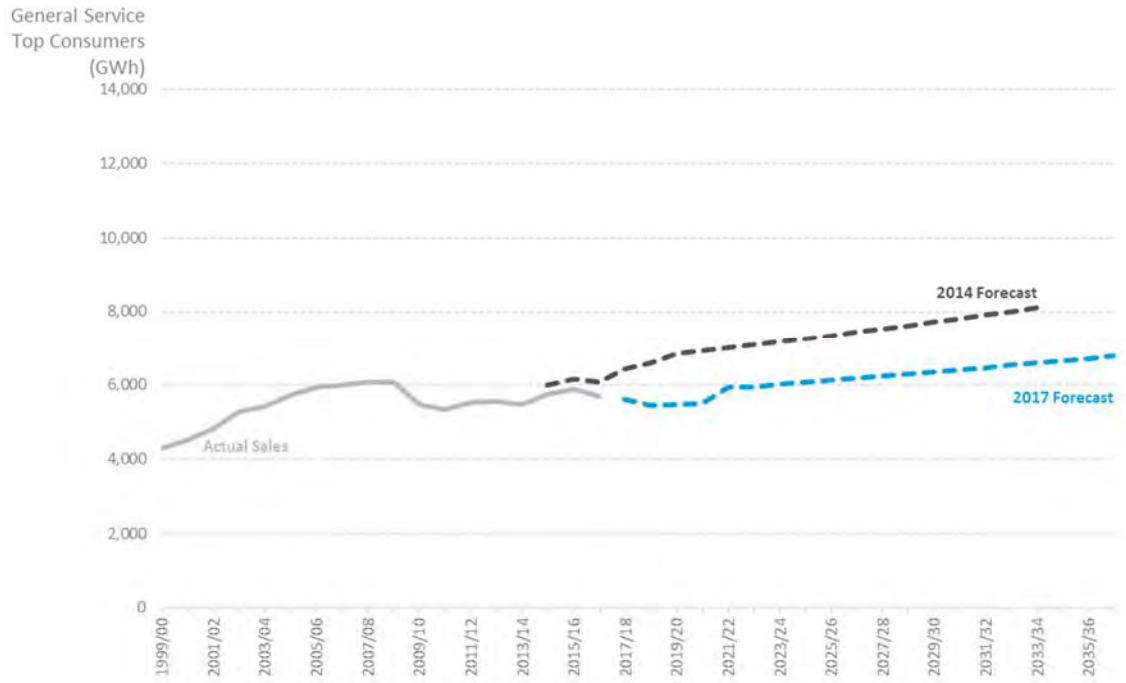

Figure 21: General Service Top Consumers Sales (GWh) Comparison between 2014 and 2017 Load Forecasts

D. Other Aspects of Load Forecast

The methodology for forecasting electric vehicles was the same in both 2014 and 2017. This forecast relied on historical automobile registrations per year in Manitoba to aid in estimating future trends.

The 2014 and 2017 methodologies for forecasting the individual communities that were supplied by diesel generation were also the same. In order to forecast monthly gross firm energy, the 2014 and 2017 methodologies averaged both the monthly percentages of customer growth through the year and the GWh for the month of the year for a specific time period. This time-period was three to five years in the 2014 methodology and five years in the 2017 methodology.

The calculation of monthly and annual gross firm energy and gross total peak in 2014 and 2017 were the same except for a few aspects. The 2014 method added top consumer peaks using a 95% load factor applied to the top consumer monthly energy while the 2017 method used a 92% load factor. While both the 2014 and 2017 methodologies used a three-month winter load factor for the winter months of

December, January, and February to calculate the annual gross total peak, the 2017 method applied a ratio from the January peak for use as the annual peak.

E. Assumptions

The economic assumptions that went into the 2014 and 2017 load forecast were taken from Manitoba Hydro's economic outlook and energy price outlook for those respective years. The number of residential basic customers in Manitoba was forecasted to increase by 1.3% (5,802 units) in 2014/2015 with averages of 1.0% per year throughout the forecast period. The historical average increase in 2014 was 1.0% per year over the last ten years. In 2017, the forecast of the number of residential basic customers estimated a 1.2 % increase in 2017/18 with an annual average of 1.1% per year during the forecast period. For 2017, the historical average increase in customers was 1.2% per year over the last ten years.

The electricity price forecast in both 2014 and 2017 is based on the Consumer Price Index and rate increase projections from the integrated financial forecast. In 2014, the real electricity price was forecasted to increase by 2.2% in 2014/15, increase between 1.9% and 2.1% from 2015/16 to 2018/19, and increase by 1.9% annually for the remainder of the forecast period[79]. In 2017, the price was forecasted to increase 3.36% in 2018, 7.9% annually from 2019 to 2024, and 4.54% in 2025.[80] In addition, MH also included a 2% price increase beyond 2025 to adjust for inflation.

In 2014, the real Manitoba disposable income annual growth was 1.2% for the previous 10 years and 0.8 % for the previous 20 years. The rate was forecasted to grow at 1.0% annually for the following 10 years and 1.2% annually for the next 20 years. These values changed in 2017, with the disposable income per residential customer growing on average by 1.4% during the past 20 years and 1.7% over the past 10 years. The disposable income is forecasted to grow 0.6% annually for the next 20 years and was used in the residential basic forecast in both 2014 and 2017.

Forecast information on the real economic growth (GDP) in Manitoba is used in the general service mass market and general service top consumers forecasts. The 2014 forecast expected estimated economic growth to be 2.2% in 2014/15, with 2.7% expected growth by 2016/17. Growth was then estimated to drop to 1.6% by 2020/21, staying level for the rest of the forecast period. In the 2017 methodology, the real economic growth expectations for Manitoba, Canada, and the U.S. that were used in the

[79] 2014 Load Forecast Report, Page 56

[80] MH-provided Excel workpaper. "2017 GCR AT 2017 Rates"

analysis were different than the numbers used in 2014. The real Manitoba GDP is expected to grow 2.0% in 2017/2018 and an average of 1.6% annually for the next 20 years. GDP in Canada is forecasted to grow 2.1% in 2017/18 and an average of 1.8% annually over the next 20 years. The GDP for the U.S. is estimated to grow 2.3% in 2017/18 and an average of 2.1% annually for the next 20 years.

The elasticities of price, real income, and real GDP were estimated using econometric modeling in the 2014 and 2017 forecasts. Price elasticities were determined for residential basic customers, general service mass market small and medium customers, general service mass market large customers, general service top consumers customers, and gross firm energy. Real income elasticities were calculated for residential basic and gross firm energy categories. Lastly, real GDP elasticities were estimated for all general service customer categories. Table 8 presents the price, income, and GDP elasticities estimated by MH in its 2014 and 2017 Load Forecast report. The elasticities estimated are very similar in both years.

Table 8: Comparison of MH Estimated Price, Income, and GDP Elasticities in 2014[81] and 2017[82]

2014 Load Forecast Methodology

	PRICE ELASTICITY	REAL INCOME ELASTICITY	REAL GDP ELASTICITY
Residential Basic	-0.26	0.27	
GS Mass Market Small/Medium	-0.12		0.55
GS Mass Market Large	-0.46		0.29
GS Top Consumers	-0.43		0.86
Gross Firm Energy	**-0.25**	**0.51**	
		(Income + GDP Combined)

	PRICE ELASTICITY	REAL INCOME ELASTICITY	REAL GDP ELASTICITY
Residential Basic	-0.28	0.3	
GS Mass Market Small/Medium	-0.13		0.55
GS Mass Market Large	-0.46		0.29
GS Top Consumers	-0.37		0.62
Gross Firm Energy	**-0.27**	**0.1**	**0.36**

[81] 2014 Load Forecast Report, Page 58.

Both the 2014 and 2017 forecasts reflected future DSM savings that were tied to existing provincial building codes and improved equipment efficiency standards (codes and standards). These DSM-associated savings from programs are included in the historical data used in the forecast. It is explained in the 2014 forecast that codes and standards were treated as a supply-side resource and are accounted for in Manitoba Hydro's power smart plan and not in the forecast. The 2017 forecast mentions that future DSM savings from future power smart offerings above the current level and incremental to the codes and standards were subtracted from the load forecast.

The normal weather assumptions for both 2014 and 2017 are based on degree days used to measure weather for the forecast. The temperatures used are from Winnipeg and are expressed in Heating Degree Days (HDD) and Cooling Degree Days (CDD), respectively. The HDD are the number of average degrees colder than 14 degrees C each day, whereas the CDD are the number of average degrees warmer than 18 degrees C each day. The forecast assumes normal weather, which is determined from a 25-year average of HDD and CDD in Winnipeg. This 25-year period was April 1989 to March 2014 for the 2014 forecast and April 1992 to March 2017 in the 2017 forecast.

V. SUMMARY AND CONCLUSIONS

Manitoba Hydro uses several different sector-level forecasts to estimate its total annual load. These sectors, which are modeled separately, include residential, general service mass market, and general service top consumers. In total, the load forecast of these sectors represents the total consumer sales.

The company's residential forecast methodology estimates the number of residential customers or dwellings and the average usage of residential customers. The customer forecast relies on different third-party Manitoba forecasts and a ratio of total population to total residential customers estimated by Manitoba Hydro. An econometric model is used to forecast the average annual usage per customer. This model regresses average electricity usage, which includes historical DSM savings, on electricity price, annual disposable income, and the annual ratio of the number of electric heat customers to total customers. The model also features a trend variable to capture increases in electric use and house size. Manitoba Hydro estimated a slight decrease in average residential customer usage over the next few years and an increase in residential customer count at a consistent rate during the forecast period.

The residential energy forecast is created by multiplying the forecasted number of residential customers by the forecasted overall average usage per customer. Projected energy savings tied to LED adoption and increases in energy usage connected to the future adoption of electric vehicles are also added to the forecast. Future energy savings linked to C&S outlined in MH's Power Smart Plan and DSM initiatives were excluded from the annual load forecast.

The general service mass market 2017 methodology forecasted customer count and average annual usage for both small and medium customers and large customers. The customer count forecasts used econometric models featuring GDP and year-end residential customer counts as predictor variables. The average usage forecast for large customers also used electricity price and a dummy variable, but used a blended GDP variable based on trajectories for Manitoba, Canada, and the U.S. Both the annual average usage and customer count projections are expected to grow slightly during the forecast period for the small and medium customer group. For the large customer group, the annual average usage is expected to decrease from 2017/18 to 2023/24, which is primarily due to the proposed rate increases. The number of customers in the large category is projected to increase consistently during the forecast period.

The load forecast methodology for the top consumers sector featured the development of short-term forecasts for each customer and a long-term forecast for the whole sector. This sector includes 10 companies and 26 separate accounts that represent 26% of total consumer sales in 2016/2017. The company-level short-term forecasts estimated the load forecast for the first five years, and then was held constant beyond year 5 where a long-term forecast is introduced to account for load changes for the entire top consumers sector. This long-term forecast, called the Potential Large Industrial Loads or PLIL, relies on an econometric model that fits a regression model of historical load of the ten top consumer companies with the annual energy price and a blended Canadian and U.S. GDP assumption. The PLIL method used in 2017 was conservative in that it only included the total load of top consumers companies that have been in the MH service territory since 1983/84. ~~[CONFIDENTIAL BEGINS]~~ This resulted in the exclusion of the historical load of three companies from the forecast. ~~[CONFIDENTIAL ENDS]~~ This methodology also resulted in the 2017 PLIL forecast estimating 523 GWh less load than would have been estimated using MH's 2014 forecast methodology, which considered the total historical load of the top consumers sector. Furthermore, the 2017 methodology estimated an electricity price elasticity that is 41% lower than the price elasticity estimated using the 2014 methodology.

After reviewing Manitoba Hydro's 2017 load forecast methodologies, Daymark identified several issues worthy of further discussion. Table 9 presents the key summary findings where improvement in methodology may enhance the approach and impact the load forecast. We discuss these below in more detail than in Table 9.

The price elasticities of all three sectors (residential, general service mass market, and top consumers) reported by MH may be incorrectly estimated. The econometric model used for estimating residential price elasticity exhibits a multicollinearity issue. Similarly, the use of trend and dummy variables in the average usage models of the residential and general service mass market sectors have suppressed the impact of electricity price elasticity. In our investigation of the modeling, the regression models used by MH produced higher price elasticity coefficients before the use of trend or dummy variables in the sector-level forecasts. Moreover, the price elasticity estimated for top consumers through the conservative PLIL method is lower than if it was estimated using the PLIL method used in the 2014 load forecast.

MH has historically under forecasted population trends, a predictive variable that underlies the residential and general service mass market forecasts of customer counts. The use of a lower customer forecast will result in a lower residential load forecast and a

lower general service mass market load forecast. Moreover, the company's use of a blended GDP variable presents several issues. The magnitude of the GDP monetary units used to create the blended GDP for the three sectors are not consistent across the Manitoba, Canada, and the U.S. While the regression coefficients would not have changed if the same units were used for the blended GDP variable for the three sectors, the use of a bended GDP has interpretability issues, particularly with regard to the real GDP elasticity.

Manitoba Hydro does not explicitly consider, in its load forecast analysis, the possibility of switching to an alternative energy source, which could reasonably occur as a result of increases in electricity prices. Since electricity prices are requested to increase by 65% in 2025 as compared to 2018 rates, it is important to recognize the amount of energy source switching that may occur. The recent trends in low natural gas prices as well as the consistent decrease in solar costs could make these alternatives more economically attractive based on the proposed electricity price. It is also important to recognize that a substitution effect will offset by the natural inertia, that is, the effort to change fuels may delay or reduce the potential for substitution.

Table 9: Key Summary Findings of MH Load Forecast Analysis

TOPIC	MH METHOD	COMMENT/REMARKS	IMPACT ON LOAD FORECAST
Top Consumers PLIL model	The PLIL accounts for the long-term load growth of the top consumers sector by evaluating historical shifts in the energy usage of top consumers as a group rather than as individuals.	The 2017 PLIL method was conservative because it only considers the total load of top consumer companies that have been in the MH service territory since 1983/84, thus excluding the historical load of three companies that are currently in the top consumer sector.	The conservative PLIL method used in 2017 forecasted 523 GWh less load than using the 2014 method and 2017 data over the 20-year forecast period.
Electricity Price Elasticity	The load forecasting methodology uses price elasticity with the help of econometric regression models at the sector-level.	The price elasticities of all three sectors may be incorrectly estimated. The econometric model used for estimating Residential price elasticity exhibits a multicollinearity issue. Similarly, the use of trend and dummy variables in the average usage models of both the residential and general service mass market sectors have suppressed the impact of electricity price elasticity. Moreover, the price elasticity estimated for top consumers through the conservative PLIL method discussed just above is lower than if it were estimated using the PLIL method used in 2014 load forecast.	The incorrectly estimated price elasticity will not provide the actual impact of proposed rate increases on each sector's electricity demand.
Population Forecast	MH uses population forecasts from an external institution in its load forecasting methodology.	The evaluation of historical population and residential values along with the forecast used by MH show that MH has under-forecasted the population and residential customer count.	Lower customer forecast will result in a lower residential load forecast and a lower general service mass market load forecast.
Scenarios and Sensitivity	MH evaluated the impact of changes in its key econometric analysis variables.	The load forecast analysis did not consider scenario analysis, which would help create alternative future settings that represent the different plausible trends of key input variables used in the base load forecast and provide broader information on potential system implications than the current approach.	Scenario analysis would have provided further insight of the impact of future alternative scenarios on MH's load forecast.
Risk and Uncertainty	MH evaluated load uncertainty at p10 and p90 levels on the base load forecast.	A more robust approach to consider uncertainty on load would be to evaluate the inherent characteristics of each fundamental variable with the help of probabilistic (i.e., stochastic) risk assessments.	
Fuel Switching Consideration in the Analysis	The possibility of switching to an alternative fuel type or fuel source due to the increase in electricity price is not explicitly considered in the MH load forecast analysis.	It is important to consider energy source switching, since electricity prices are requested to increase by 65% in 2025 as compared to 2018 rates. Similarly, the recent trend of low natural gas prices and a steady decrease in solar costs may make these alternatives more economically attractive considering the proposed electricity price changes.	Load forecast may change without considering potential alternative energy source substitution due to the proposed rate increase.

Based on our analysis, Daymark has developed the following recommendations for improving Manitoba Hydro's current load forecasting methodology:

- The load forecast analysis should consider scenario analysis by developing alternative load forecasts in addition to the base load forecast. These scenarios would help create alternative future settings that represent the different possible trends of several key input variables that are used in generating the base load forecast. Such scenarios could consider key uncertainties by representing different assumptions for economic and population growth, electricity and fuel commodity prices, and CO_2 prices.
- MH should evaluate the inherent characteristics of fundamental variables using stochastic risk assessments. Currently, Manitoba Hydro's method of evaluating load uncertainty at p10 and p90 levels is based on considering the overall impact of key input variables on the load variation. Using a stochastic risk assessment method would allow for the estimating of potential outcomes by allowing random variation in key input variables. Probabilities are assigned to different values of key uncertain variables which have optimally been identified through sensitivity analysis.
- MH may generate a better estimate of weather-dependent load by using more than two years of monthly energy and degree day data to estimate the weather-dependent relationship. Currently, the company uses two years of data to estimate the weather-dependent load relationship and 25 years of data to define the "normal" weather year. Also, Manitoba Hydro could improve its weather normalization method by using a shorter period to calculate the "normal" year weather variables.
- MH should consider testing its econometric models of different statistical issues. For example, the average usage regression models contain multicollinearity issues. Similarly, MH should consider the economic reasoning before introducing any new predictor variables in its regression models in addition to checking the statistical significance.

Daymark also compared the 2014 and 2017 load forecast methodologies and assumptions for the various customer groups defined by Manitoba Hydro. Overall, the 2017 methods generated a lower long-term forecast than the analysis conducted in 2014 with the 10-year historical growth rate of gross frim energy forecasted in 2017 being

lower than the 2014 forecasted gross firm energy. Additionally, the annual growth rate using ten-year gross firm energy forecast was higher in 2014 at 1.46% compared to 0.81% in the 2017 forecast. The key differences between 2014 and 2017 load forecast methodologies are in the models used for forecasting mass market customer (GSMM) count, PLIL method used for capturing long-term forecast for top consumer category, and economic and population assumptions used in the analysis.

In order to estimate the customer count for GSMM category, the 2017 forecast estimated customer count directly while the 2014 forecast modeled the percentage change in the number of customer types. The 2017 PLIL method used a conservative approach by only considering the total load of top consumer companies that have been in MH's service territory since 1983/84, the start year of MH's modeling period. Whereas, 2014 PLIL methodology considered load of all companies included in the top consumer category.

APPENDIX A

Daymark Energy Advisors

Scope of Work

DAYMARK ENERGY ADVISORS

Scope of Work

Export Pricing and Revenues Review

1. Review Manitoba Hydro's electricity export price forecast and third party consultant forecasts, including the low and high case forecasts, in the context of current MISO market conditions and factors influencing future MISO prices. The third party consultant forecasts are to be taken as a "given" and are to be assumed to be reasonable and accurate with respect to the other tasks in this Scope of Work. Notwithstanding that the third party consultant forecasts are to be accepted for the purposes of this review, if the IEC identifies significant issues or inconsistencies with the third party consultant forecasts in the course of its general review, those issues or inconsistencies are to be identified in the IEC's reports.

2. Review and assess Manitoba Hydro's forecast of exportable surplus energy and capacity by on-peak and off-peak period, taking into account expected inflow conditions, reservoir levels, and tie line capacities.

3. Review Manitoba Hydro's forecast for export revenues and fuel & power purchases for the next twenty years and assess whether the forecast of net extraprovincial revenue is reasonable. As an independent review of the extraprovincial revenues arising from contracted energy and capacity sales was undertaken at the 2014 NFAT (Exhibit LCA-5 in response to CSI Undertaking UT-34), a review of Manitoba Hydro's export contracts and estimation by the IEC of firm energy revenues and capacity revenues is not required for any contracts that were contemplated and assessed at the NFAT. Manitoba Hydro's updated export revenues, volumes, and unit prices by contract and by year will be provided as part of PUB MFR-84. The firm energy and capacity revenues in PUB MFR-84, for those contracts evaluated by the IEC at the NFAT, are to be taken as "given", so long as the firm energy and capacity revenues are aligned with the independent analysis from the NFAT after adjusting for changes in forecast exchange rates and escalation.

4. Assess the reasonableness of changes in Manitoba Hydro's forecasting methodology that eliminates the assumed premiums for surplus dependable energy and capacity sales.

5. Provide comments on the factors influencing the MISO market and trends that are affecting market prices, including but not limited to:

   (a) state and federal policies on electricity generation and emissions;

   (b) existing generation mix;

   (c) expected new generation to be installed in the next 20 years;

   (d) forecasted generation retirements in the next 20 years;

   (e) supply and demand balance in the northern MISO region; and

   (f) factors that may affect Manitoba Hydro's ability to export energy and capacity into the MISO market.

6. Provide a report to be placed on the public record that provides the Consultant's findings, opinions, and non-commercially sensitive supporting information.

7. Provide a non-public report to the PUB that provides commercially sensitive information and additional calculations supporting the findings.

Public and Commercially Sensitive Load Forecast Review

8. Review Manitoba Hydro's 2017 Load Forecast and assess the changes with respect to the 2014 Load Forecast.

9. Assess Manitoba Hydro's load forecasting methods for Residential, Mass Market, and Top Consumers segments and compare to industry best practices with respect to:

   (a) the econometric and end-use forecasting methodology;

   (b) the elasticity methodology used to evaluate how Manitoba Hydro evaluates the implications of rate increases and new technology on electricity demand.

   (c) Manitoba Hydro's economic assumptions including population growth, GDP growth, and price elasticity;

   (d) the reliability of the short and long-term domestic load forecast modelling;

(e) the extent to which Manitoba Hydro has used appropriate scenario planning to examine the potential impact of changes in the industry, the Manitoba and Canadian economies, available technology (generation and loads) and energy efficiency measures (costs and cost effectiveness);

(f) the appropriate use of probability analysis of projected load forecasts;

(g) the extent to which retrospective load analysis provides confidence in the load forecast;

(h) the reasonableness of peak demand and energy trends including seasonal variations in load forecasting; and

(i) impacts on load forecasts resulting from potential fuel switching, particularly in light of recent trends in the cost of natural gas and potential carbon taxes.

10. Assess other aspects of the load forecasting methodology including transmission and distribution losses.

11. Evaluate the historical performance of Manitoba Hydro's load forecasting methodologies for Residential, Mass Market, and Top Consumers segments.

12. Review the commercially sensitive load forecast for Top Consumers and assess the reasonableness of the forecasting methods and forecast.

13. Coordinate with other IECs who are reviewing price elasticity impacts on electricity demand in order to minimize duplication of analysis.

14. Provide a report to be placed on the public record that provides the Consultant's findings, opinions, and non-commercially sensitive supporting information.

15. Provide a non-public report to the PUB that provides commercially sensitive information and additional calculations supporting the findings.

APPENDIX B

Daymark Energy Advisors

Documents Relied Upon

Consistent with the agreement between Daymark Energy Advisors and the Manitoba Public Utilities Board, the following appendix provides a reference to the documents that were relied upon to develop this Independent Expert Consultant Report.

This appendix is organized into two sections. The first is a list of the documents relied upon that are already part of the record in this docket. The second is an annotated bibliography of additional documents relied upon that are not already part of the record in this docket.

EXECUTIVE SUMMARY

Overview

The Gross Firm Energy in Manitoba is forecast to grow from a weather adjusted value of 25,355 GWh in 2015/16 to 29,110 GWh in 2025/26. This average growth is 375 GWh or 1.4% per year for 10 years. By 2035/36, Gross Firm Energy is forecast to be 34,193 GWh, a twenty-year growth rate of 442 GWh or 1.5% per year.

Gross Total Peak is forecast to grow at about the same pace, from an adjusted value of 4,634 MW in 2015/16, growing 71 MW or 1.4% a year for the next 10 years, and 81 MW or 1.5% a year for the next 20 years. By 2035/36, the peak is forecast to be 6,250 MW.

Growth is expected in all sectors. The 20 year growth rates in the Residential Basic, General Service Mass Market and General Service Top Consumers sectors are forecast to be 1.2%, 2.1% and 1.1% respectively. During the last 10 years, Gross Firm Energy has grown 215 GWh or 0.9% per year. This ten year period includes the 2009 economic downturn that slowed growth and also reflects the influence of Manitoba Hydro's Demand Side Management activities.

The primary driver of growth in Manitoba is the population, with the secondary driver being the economy. The population of Manitoba has grown from 1,180,000 people in 2005/06 to 1,297,000 people in 2015/16, averaging 1.0% growth per year. Manitoba's population is forecast to grow to 1,562,000 by 2035/36, averaging 0.9% per year. Real Manitoba Gross Domestic Product (GDP) is expected to grow 2.1% in 2016/17 and average 1.8% annually for the next 20 years. Combined Canada and US GDP is forecast to grow 2.0% in 2016/17 and average 2.1% annually for the next 20 years.

Three main components represent the majority of Manitoba's electricity use:

1. **Residential Basic** customer growth is expected to mimic population growth, growing 0.9% per year over the next 20 years. An increase in average use per customer adds 0.3% to the growth and is primarily due to increased use of electric space and electric water heating in dwellings.

2. **General Service Mass Market** is forecast to grow at an average 2.1% per year, which is higher than the historic growth of 1.1% per year over the past ten years. The growth is

primarily due to expected continued growth in GDP and the transfer of seven Top Consumers into the Mass Market sector starting in 2016/17.

3. **General Service Top Consumers** is forecast to grow at 1.1% per year. This is higher than the 0.1% reduction per year during the past ten years which included the loss of a customer and an economic downturn. But it is less than the 4.0% growth per year during the prior ten years. The 20 year historical growth of the Top Consumers has been 1.8% per year.

Change Between the 2015 and 2016 Forecast

The Gross Firm Energy forecast starts 406 GWh (1.5%) lower in 2016/17 and by 2034/35 is 1,479 GWh (4.2%) lower than the 2015 forecast. This is a reduction of just over 3 years of load growth by 2034/35. (1 year = approximately 442 GWh). The difference in 2016/17 is mainly attributable to a lower starting point in the Residential and General Service Mass Market sector, along with changes in the Top Consumers short term plans. By 2034/35, the difference is primarily attributable to the Top Consumers sector (-1,065 GWh) and a lower population forecast lowering the Residential and General Service Mass Market sectors.

Consistent with the reduction in Gross Firm Energy, the Gross Total Peak is 210 MW lower in 2034/35 than presented under the 2015 Forecast, which is a reduction of 2½ years of load growth. (1 year = approximately 80 MW).

Forecast Variability

By 2035/36, the Load Forecast has an 80% probability of being accurate to within ±1,737 GWh or ±5.1%. Due to the inherent variability of the load, this is the best level of accuracy possible.

INTRODUCTION

This document is prepared annually as Manitoba Hydro's forecast of its future load requirements for its service area. The service area consists of all of Manitoba (99.85% of sales), as well as two resale customers that supply energy to Creighton, Sask. (0.12% of sales) and the Northwest Angle, Minn. (0.03% of sales). Exports of power to other utilities are not included.

This information is provided for several purposes. Short term forecasts of sales by billing month within rate groups are needed to forecast revenue for rate design and accounting. Short term forecasts of energy and peak is needed for system operations. Long term forecasts of energy and peak is required by power planning to determine long term supply requirements.

A "customer" in this document refers to a metered electrical service. Unmetered services, such as flat rate water heating and sentinel rentals do not count as customers, and street lights group a number of services as one customer. A customer is not the same as a building. One building can have multiple electric services and may count as more than one customer, or multiple buildings may have only one service and may count as only one customer. A customer in this document is also not the same as a customer on the billing system. The latter is a person or organization that Manitoba Hydro serves. One billing customer may pay the bill for multiple services and thus count as multiple customers in this document.

Electric consumption is read from a customer's meter in units of kilowatt-hours (kWh). A typical residential dwelling not using electricity for heating uses approximately 10,000 kWh per year. This document reports electric use in terms of gigawatt-hours (GWh). One GWh equals one million kWh, which is approximately the energy of 100 typical residential dwellings not using electricity for heating.

The highest load requirement for a time period is known as the peak load. It is given in terms of megawatts (MW). One MW equals one thousand kilowatts (kW). A typical residential dwelling not using electricity for heating would use a maximum of about 2.5 kW sometime during the year. However, dwellings will not all be at their maximum use at the same hour. The use of all dwellings at any specific hour is known as the coincident load. The coincident peak is the load at the hour of Manitoba's system peak. A typical dwelling not using electricity for heating would use about 1.6 kW at the coincident peak. Therefore 1 MW is approximately the coincident peak requirement of 600 typical dwellings not using electricity for heating.

Components of Manitoba's Electricity Use – 2015/16

General Consumers Sales (also referred to as Total Sales) includes the energy supplied to all of Manitoba Hydro's individually billed customers. During the 2015/16 fiscal year, Manitoba Hydro averaged 564,643 General Consumers Sales customers who consumed 21,654 GWh.

The major groups include

(1) Residential Basic, with 474,153 customers who used 7,074 GWh or 32.7% of Sales. These are mostly residential structures that include single-family dwellings, multi-family dwellings and individual apartment suites.
(2) General Service Mass Market, with 67,395 customers who used 8,442 GWh or 39.0% of Sales. These are small to large Commercial and Industrial customers.
(3) General Service Top Consumers, with 32 customers who used 5,886 GWh or 27.2% of sales. These are 17 high-usage companies (some count as multiple customers) that are forecast individually.

The remaining customers include Seasonal customers (billed twice a year rather than monthly), Diesel customers (four remote towns not connected to the integrated grid system), Flat Rate Water Heating and Area and Roadway Lighting. Their electricity use totals only 252 GWh or 1.2% of Total Sales. Over 50,000 of these services do not count as customers.

Manitoba Load at Common Bus is the total load metered at all the substations in the province that supplies Manitoba Hydro's non-Diesel customers and includes Distribution Losses and Construction Power. In 2015/16, Common Bus was 22,460 GWh or about 3.7% more than Total Sales.

Gross Firm Energy is the total load needed to be generated for domestic firm load requirements on the Integrated System (excludes diesel). It includes Transmission Losses and Station Service. Some customers are on non-firm contracts (Surplus Energy Program), and their load is not included as part of Manitoba Hydro's generation requirement. In 2015/16, Gross Firm Energy was 24,673 GWh or about 13.9% more than Total Sales.

FORECAST OVERVIEW

General Consumers Customer Forecast

In 2015/16, Manitoba Hydro had an average of 564,643 General Consumer Sales customers. These were made up of 474,153 Residential Basic customers, 67,395 General Service Mass Market customers, 32 General Service Top Consumers customers and 30 SEP (Surplus Energy Program, i.e. non-firm) customers, with the remaining being Diesel, Seasonal and Area and Roadway Lighting.

During the last 10 years, Residential Basic customers have grown at an average of 5,041 (1.1%) per year. Manitoba Hydro's 2016 Economic Outlook provides the forecast of Residential Basic customers, and this document uses that forecast. Residential Basic customers are forecast to grow 5,318 (1.1%) customers per year over the next ten years and 4,951 (1.0%) customers per year over the next 20 years.

General Service Mass Market customers have grown 590 (0.9%) per year over the last 10 years. The sector is forecast to grow 474 (0.7%) per year over the next ten years and 477 (0.7%) per year over the next 20 years. Starting in 2016/17, seven of the smallest Top Consumers were moved to General Service Mass Market for forecasting purposes and the 2015/16 customers are adjusted to reflect the change in both the General Service Mass Market and Top Consumers sectors.

Residential Seasonal customers, mainly cottages with lower usage, are growing at a slower rate than Residential Basic. Seasonal customer growth has averaged 3 (0.0%) customers per year over the last 10 years. The sector is forecast to decrease at 142 (0.7%) customers annually over the next 10 years and 131 (0.7%) customers annually over the next 20 years due to the continued transfer of higher usage seasonal customers to Residential Basic.

Area and Roadway Lighting customers were re-grouped in 2006 when Manitoba Hydro changed its billing system, resulting in a change in lighting customer counts. Area and Roadway Lighting is expected to grow at 5 (0.4%) customers annually over the next 10 years and 5 (0.4%) customers annually over the next 20 years.

General Consumers Sales Forecast

During 2015/16, Total General Consumer Sales was 21,654 GWh. The fiscal billing year (using weather from March 16, 2015 to March 15, 2016) was significantly warmer than normal giving a weather adjustment for the year of +532 GWh. The resulting weather adjusted Total Sales value was 22,186 GWh.

Over the last 10 years, Total Sales have grown at 188 GWh (0.9%) per year. The growth was 1.5% per year in Residential Basic, 1.1% per year in General Service Mass Market, and a reduction of 0.1% in General Service Top Consumers due to the economic downturn in 2009 and the loss of one Top Consumer customer. The historical growth includes the effect of past Demand Side Management (DSM) initiatives.

Sales are forecast to grow at 337 GWh (1.4%) per year over the next 10 years and 393 GWh (1.5%) per year over the next 20 years before accounting for future market-based DSM programs.

Most of the growth is forecast to occur in General Service Mass Market, at 200 GWh (1.9%) per year over the next 20 years, followed by Residential Basic at 98 GWh (1.2%) per year and Top Consumers at 95 GWh (1.5%) per year. Starting in 2016/17, seven of the smallest Top Consumers were moved to General Service Mass Market for forecasting purposes and the 2015/16 sales, totaling 404 GWh, are adjusted to reflect the change in both the General Service Mass Market and Top Consumers sectors.

Manitoba Energy Forecast

The weather adjusted actual Gross Firm Energy was 25,355 GWh in 2015/16. Gross Firm Energy has grown 215 GWh (0.9%) per year for the past 10 years. This historical growth reflects the effect of past Demand Side Management (DSM) initiatives. Gross Firm energy is forecast to grow to 34,193 GWh by 2035/36 at an average growth of 442 GWh or 1.5% per year. This is before accounting for future market-based DSM programs.

Distribution Losses, which is the difference between Manitoba Hydro's substations and the customers' meters, has a wide variance from year to year and has ranged between 3.5% and 5.5% of Total Sales. It is forecast to be between 4.4% and 4.5% of Sales for the entire forecast.

Transmission Losses which is the difference between the generators and the substations is forecast to be between 9.1% and 9.2% of Total Sales for the entire forecast period.

Distribution Losses and Transmission Losses, totaling almost 14%, need to be added to Total Sales to estimate Gross Firm Energy. The 14% value should generally be used to estimate load at generation when only load at the customer's meter is known. For example, to convert Power Smart program savings from the customer meter to generation. The exception is for large General Service customers who own their own transformation and incur minimal Distribution Losses. For these customers, a 10% value should be used.

Comparison of the 2015 Forecast to Actuals

Comparison of the 2015 Forecast to the 2015/16 Weather Adjusted Actuals

The weather adjusted General Consumer Sales for 2015/16 was 22,186 GWh which was 565 GWh lower than the 2015 Forecast of 22,681 GWh after removing the Demand Side Management (DSM) program savings achieved in 2015/16.

The weather adjusted Residential Basic sector was 210 GWh lower than the 2015 Forecast and the weather adjusted General Service Mass Market sector for was 142 GWh lower than forecast.

In 2015/16, the Top Consumers sector consumed 5,886 GWh which was 141 GWh lower than the 2015 Forecast of 6,021 GWh. The difference is primarily due to production and project deferral.

Distribution losses were 149 GWh lower than forecast and Transmission losses were 120 GWh greater than forecast.

Overall, the weather adjusted Gross Firm Energy for 2015/16 was 25,355 GWh which was 565 GWh lower than the 2015 Forecast of 25,920 GWh.

The normalized Gross Total Peak for 2015/16 was 4,634 MW which was 155 MW lower than the 2015 Forecast of 4,789 MW.

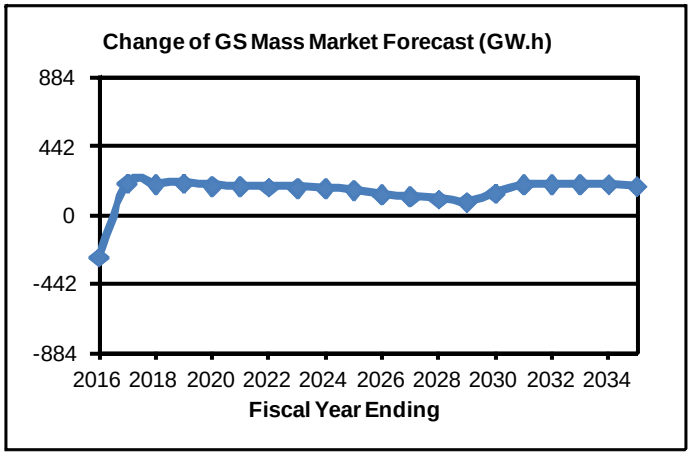
Change between the 2015 and 2016 Forecasts

Change Between the 2015 and 2016 Residential Basic Forecast

Figure 1 - Change of Res Basic Forecast

The 2016 Residential Basic forecast starts in 2016/17 101 GWh lower from the 2015 forecast primarily due to the 2015/16 weather adjusted actual energy use being lower than forecast. The difference lessens to 101 GWh in 2016/17 and grows to 359 GWh by the end of the forecast period. 359 GWh represents less than one year of Manitoba system load growth (1 year = approximately 442 GWh).

Major changes and their effect in 2034/35:



1. Decrease in the customer forecast by 17,752 customers (-220 GWh).
2. Changes in the average use forecast (-47 GWh), primarily due to:
   a. Increase in the forecast of real income: +116 GWh
   b. Changes to model and parameter estimates: -147 GWh
3. Change in the starting point (-230 GWh, which includes 39 GWh of achieved DSM)
4. Decrease in the forecast of Codes and Standards (+135 GWh)

Table 8 - Change of Res Basic Forecast

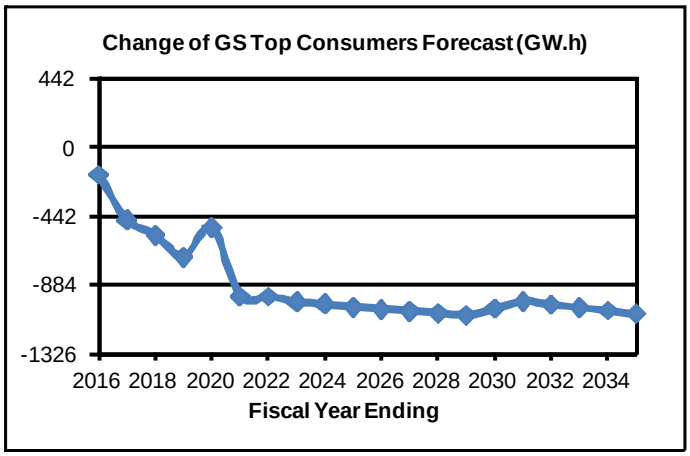
Change Between the 2015 and 2016 General Service Mass Market Forecast

Figure 2 - Change of GS Mass Market Forecast

The 2016 General Service Mass Market (GSMM) forecast starts in 2016/17 204 GWh higher from the 2015 forecast primarily due to the transfer of seven Top Consumers into the Mass Market sector starting in 2016/17. The difference remains steady throughout the forecast, and by 2034/35, the Mass Market forecast is up 187 GWh, representing about a half a year of load growth.

Major changes and their effect in 2034/35:



1. Seven Top Consumers transferred to the Mass Market as of 2016/17 (+449 GWh)
2. Change in the starting point (-269 GWh, which includes 128 GWh of achieved DSM)
3. Other model and economic differences (-210 GWh)
4. Decrease in the forecast of Codes & Standards (+217 GWh)

Table 9 - Change of GS Mass Market Forecast

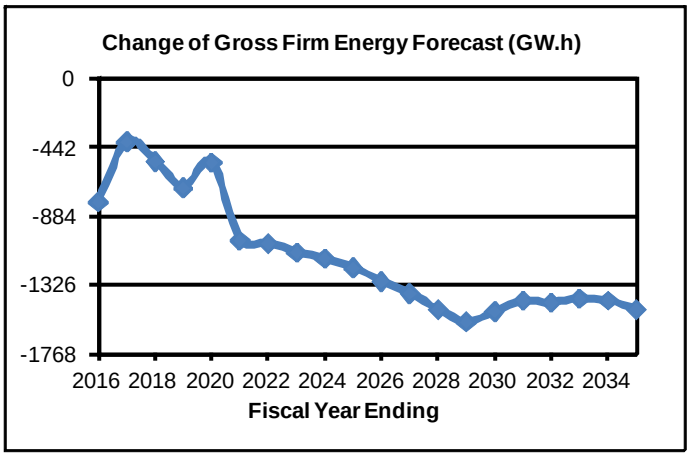
Change Between the 2015 and 2016 GS Top Consumers Forecast

Figure 3 - Change of GS Top Consumer Forecast

The General Service Top Consumers forecast is 1,065 GWh lower from the 2015 forecast. Seven customers were moved from Top Consumers to the GS Mass Market sector. The short term (3 year) individual customer forecasts were down from 2015, primarily due to the advancement of an expected customer reduction. All longer term growth is now considered to be included within the Potential Large Industrial Load forecast (PLIL), including expansions and contractions expected to arise from committed plans in the Petro/Oil/Natural Gas and Mining Sectors. The 1,065 GWh reduction represents 2½ years of load growth.

Major changes and their effect in 2034/35:



1. Seven Top Consumers moved to the Mass Market sector as of 2016/17 (-449 GWh)
2. Reassessment of short term customer planned projects. (-166 GWh)
3. Change in approach to longer term growth (PLIL) forecasts (-251 GWh)
4. The Potential Large Industrial Loads (PLIL) forecast begins in the fourth year of the forecast resulting in 16 years of PLIL in the 2016 forecast compared with 17 years of PLIL in the 2015 forecast. (-86 GWh)
5. Changes to PLIL forecast from updated model parameters and economic forecast (-113 GWh)

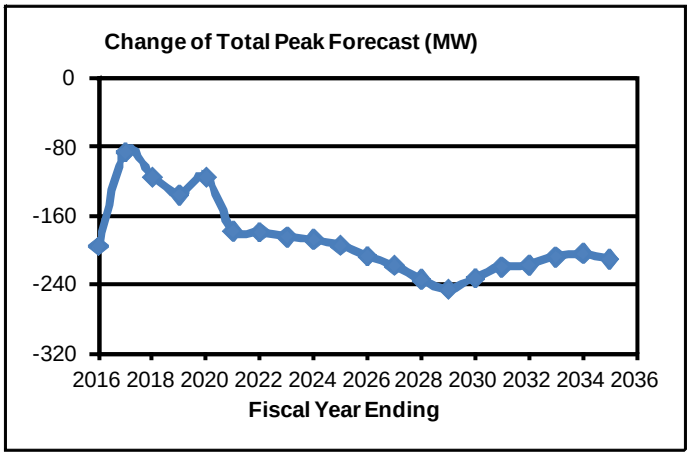
Change Between the 2015 and 2016 Gross Firm Energy Forecast

Figure 4 - Change of Energy Forecast

The Gross Firm Energy forecast starts 406 GWh (1.5%) lower in 2016/17 and by 2034/35 is down 1,479 GWh (4.2%) from the 2015 forecast. This is a reduction of just over 3 years of load growth. (1 year = approximately 442 GWh).

Summary of changes made in each sector and their effect in 2034/35:



1. Residential Basic forecast is lower primarily due to a reduced customer forecast and starting point (-359 GWh)
2. General Service Mass Market forecast is lower primarily due to a lower starting point. (+187 GWh)
3. General Service Top Consumers forecast is lower due to adjustments in customer short term plans and changes to the longer term growth forecast (PLIL). (-1,065 GWh)
4. Other Sales and Losses. (-242 GWh)

Change Between the 2015 and 2016 Gross Total Peak Forecast

Figure 5 - Change of Peak Forecast

The Gross Total Peak Forecast is down 210 MW (3.3%) by 2034/35 from the 2015 Forecast. The peak forecast very closely follows the energy forecast with the reasons for increase in peak being similar to those for energy.

Partially offsetting the energy reduction is a 0.5% decrease of the peak load factor forecast in 2034/35. The load factor is decreasing from 63.0% in the 2015 forecast to 62.5% in the 2016 forecast. The load factor decrease is due to the reduction of the energy forecast of the Top Consumers sector which has a high load factor of 91%.

The decrease in peak in 2034/35 amounts to 210 MW, which is a reduction of 2½ years of load growth. (1 year = approximately 80 MW).

FORECAST DETAILS

Residential Basic

Figure 6- Residential Basic Sales

In 2015/16, there were 474,153 Residential Basic customers. 78% are single detached, 9% multi attached, and 13% individually metered apartment suites. 54% are in Winnipeg where natural gas is available, 29% in natural gas available areas outside Winnipeg, and 17% do not have natural gas available.

Residential Basic has grown 107 GWh (1.7%) per year for the past 20 years and 101 GWh per year (1.5%) for the past 10 years which reflects the effect of past Demand Side Management (DSM) initiatives. It is forecast to grow 99 GWh (1.3%) per year for the next 10 years and 96 GWh (1.2%) per year for the next 20 years before program-based DSM initiatives.

The primary driver of Residential Basic growth is the population, which is forecast to grow 0.9% per year over the next 20 years.

Electric Heat Billed: Customers who have electric space heating included with their electric bill.
Non Electric Heat Billed: Customers who do not have electric space heating included with their electric bill.
% Electric Space Heat: The proportion of Total Basic customers who are Electric Heat Billed.
% Electric Water Heat: The proportion of Total Basic customers who have Electric Water Heaters.
2015/16: GWh and kWh/cust are not weather adjusted.

The average use (kWh/customer) for Electric Heat Billed customers is decreasing as individually metered apartment suites are making up a higher proportion of the growth. The average use for Non Electric Heat Billed customers is increasing mainly due to larger new homes, ventilation requirements in new dwellings and an increase in miscellaneous end uses.

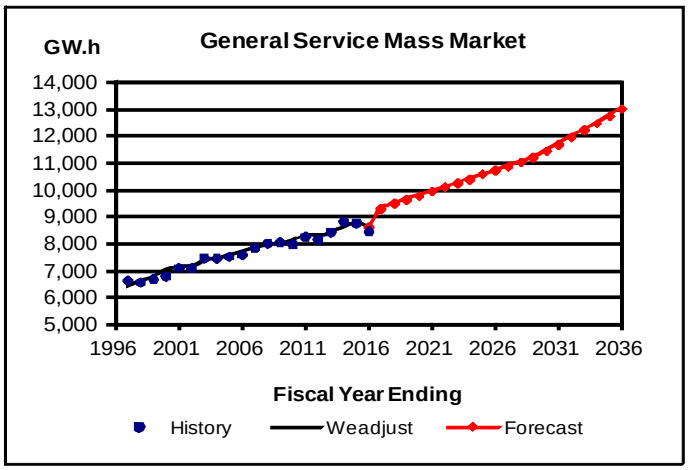
Residential Diesel, Seasonal, and Flat Rate Water Heating

Residential Diesel

There were 583 Residential Diesel customers that used 8 GWh in 2015/16 with an average annual use of 13,945 kWh per customer. They have 60 amp service that does not allow for electric space heating. Space heating in the four diesel communities is mainly provided by fuel oil. The number of customers is expected to grow to 728 and usage is expected to increase 1.7% a year to 11 GWh by 2035/36 under the assumption that the communities continue to be separate from the Integrated System.

Residential Seasonal

There were 20,176 Residential Seasonal customers that used 81 GWh in 2015/16 with an average annual use of 3,991 kWh per customer. The number of customers is expected decrease to 17,557 customers by 2035/36 due to transfers of higher usage seasonal customers to Residential Basic. Seasonal customers are billed only twice a year either due to low usage (being a seasonal residence or cottage) or because of a location that makes it difficult to access for more frequent meter readings. The usage of Residential Seasonal customers is expected to increase 0.4% a year to 87 GWh in 2035/36.



Residential Flat Rate Water Heating

Residential Water Heating is a flat rate unmetered service. This service has not been available to new customers since November 12, 1969. There were 3,454 remaining services in 2015/16. The number of services and usage is expected to decrease 5% per year throughout the forecast period. Usage was 18 GWh in 2015/16 and that will decrease to 6 GWh by 2035/36.

General Service Mass Market

General Service Mass Market includes all Commercial and Industrial customers, excluding the General Service Top Consumers. There were 67,395 General Service Mass Market customers in 2015/16. Approximately 15% are Industrial and the others are Commercial.

Figure 7 - General Service Mass Market

GS Mass Market has grown 114 GWh (1.5%) per year for the past 20 years and 91 GWh per year (1.1%) for the past 10 years. This historical growth reflects the effect of past Demand Side Management (DSM) initiatives. Starting 2016/17, seven Top Consumers totaling 404 GWh in 2015/16 were moved into the Mass Market sector for forecasting purposes which account for approximately 60% of the increase in 2016/17. The Mass Market Sector is forecast to grow 169 GWh (1.7%) per year for the next 10 years and 200 GWh (1.9%) per year for the next 20 years before program-based DSM initiatives.

The primary drivers for growth in the GS Mass Market are the population and the economy. Changes in residential customers and the Manitoba Gross Domestic Product (GDP) are reflected in the GS Mass Market's electricity use.

2015/16	8,442	167	8,608	2035/36	13,013

General Service Top Consumers

General Service Top Consumers represent the top energy consuming businesses in Manitoba and account for 27% of all General Consumers Sales. GS Top Consumers include 10 distinct companies that count as 23 customers in the Primary Metals, Chemicals, Petrol/Oil/Natural Gas and Pulp/Paper sectors.

Figure 8 - General Service Top Consumers

GS Top Consumers increased 90 GWh (1.8%) per year over the past 20 years but decreased 6 GWh per year (-0.1%) over the past 10 years. The decrease was due to the economic downturn experienced from 2008 to 2011 and the loss of one Top Consumer. Starting in 2016/17, seven of the smallest Top Consumers, totaling 404 GWh in 2015/16, were moved to the General Service Mass Market Sector for forecasting purposes. Restated Top Consumers sales for 2015/16 would become 5,482 GWh, with expected growth of 319 GWh in 2016/17.

The Top Consumers sector is now forecast to grow an average of 69 GWh (1.2%) per year for the next 10 years and an average of 95 GWh (1.5%) per year for the next 20 years. Short term increases are expected in the Petro/Oil/Natural Gas sector. These are offset by reductions in the Primary Metals sector. Long term growth is forecast to be steady based on an expectation of good economic growth into the future.

Table 16 - General Service Top Consumers

2014/15	5,750	2034/35	5,675	1,562	7,237
2015/16	5,886	2035/36	5,675	1,712	7,387

For the short term, General Service Top Consumers are forecast individually. Expected increases and decreases from customer's current and upcoming operating and expansion plans are compiled for the first three years of the forecast but exclude longer term plans that are uncommitted and subject to change.

For the long term, the growth of all Top Consumers is forecast together econometrically. The econometric long term Top Consumer forecast is referred to as Potential Large Industrial Loads (PLIL). PLIL is based on the historic growth of the ten companies that now comprise Top Consumers as well as one former Top Consumers customer that closed in 2009. These are large companies that both drive and define the national economy. The historical data used for modeling PLIL includes company expansions, cutbacks and shutdowns, new startups of companies that then were added to the Top Consumers classification, and the incremental growth of the individual Top Consumers. Therefore, the forecast implicitly includes the same expectations.

Historical growth of the Top Consumer sector is modeled using Gross Domestic Product (GDP) and electricity price as independent variables. The historic correlation between GDP, price and Top Consumer growth has been very strong and is expected to continue to be strong in the future. Future projections of GDP and price are used to forecast the future increase in Top Consumer growth starting from the fourth year of the forecast.

The sum of the individual company forecasts (less the seven Top Consumers moved to General Service Mass Market) is expected to grow from 5,482 GWh in 2015/16 to 5,675 GWh in 2018/19. After 2018/19, the individual forecasts for these customers are held constant. Longer term growth is considered to be included in PLIL, including growth and contractions expected to arise from committed plans in the Petro/Oil/Natural Gas and Mining sectors beyond year three.

PLIL is added starting in year four of the forecast. The econometric forecast for PLIL is based on an expected annual Canada/U.S. real GDP growth rate of 2.1%, leading to a forecast growth of 1.5% annually. When the historic real GDP growth rate over the past 20 years was 2.4%, the Top Consumers sector growth averaged 1.8% annually.

The Top Consumers sector is expected to grow 193 GWh in the first three years based on individual customer short term plans, and another 1,712 GWh in years 4 to 20 for PLIL.

General Service Diesel, Seasonal, and Flat Rate Water Heat

General Service Diesel

In 2015/16, there were 184 General Service Diesel Full Cost customers using 6 GWh. The General Service Diesel sector is forecast to use 7 GWh by 2035/36.

General Service Seasonal

In 2015/16, there were 882 General Service Seasonal customers using 5 GWh. The General Service Seasonal sector is expected to grow to 6 GWh by 2035/36.

General Service Flat Rate Water Heating

General Service Water Heating is a flat rate unmetered service that has not been available to new customers since November 12, 1969. There were 359 remaining services in 2015/16. The number of services is expected to decrease 5% per year throughout the forecast period. Consumption was 6 GWh in 2015/16 and that is forecast to decrease to 2 GWh by 2034/35.

General Service Surplus Energy Program

Participants in the Surplus Energy Program (SEP) used 27 GWh in 2015/16 and are expected to to use 25 GWh in 2016/17 and for the remainder of the forecast period. This energy is considered to be “interruptible” and thus “non-firm”. The energy used by these customers is included in Sales, but it is excluded from the Gross Firm Energy forecast.

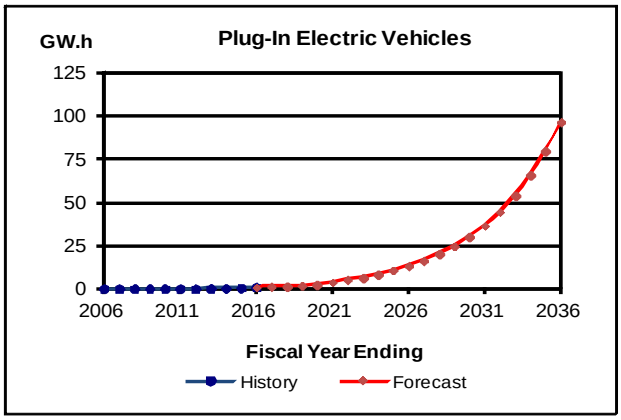
Plug-In Electric Vehicles

This forecast includes an estimate of the future adoption of Plug-In Electric Vehicles in the Manitoba Hydro service area. This is made up of two types:

(1) Plug-In Hybrid Electric Vehicles (PHEVs) run on an electric battery but use an internal combustion engine (ICE) or gasoline powered generator to extend the driving range when the battery charge runs low. An example is the Chevrolet Volt. As of March 1, 2016 there were 65 PHEVs registered in Manitoba.

(2) Plug-in Electric Vehicles (PEVs) run only on electric battery power. Pure electric plug-in vehicles include the Nissan Leaf, the Tesla, Mitsubishi MiEV, and New Flyer Xcelsior transit bus. As of March 1, 2016 there were 75 PEVs registered in Manitoba.

The forecast of electric vehicles does not include non-plug-in Hybrid Electric Vehicles (HEVs). These vehicles, such as the non-plug-in Toyota Prius, have an internal combustion engine as well as a battery and electric motor to drive the wheels. The HEV battery is charged with power from the ICE and through regenerative breaking. It is not charged by plugging in and therefore does not affect electricity consumption in Manitoba. As of March 1, 2016 and after 15 years in the market, there were only 4,650 HEVs registered in Manitoba, representing 0.5% of all registered road motor vehicles.



According to EV-Volumes, an EV sales database and consulting group, there were 540,000 plug-in vehicles sold worldwide in 2015, making up 0.6% of new vehicle sales in the last year. Total worldwide number of electric plug-in vehicles surpassed the one million mark in September of 2015. Out of the total global vehicle count of just over one billion, electric plug-in vehicles represent 0.1% of the total. The United States accounts for 406,000 of total electric plug-in vehicle sales to date or approximately 40% of all electric vehicles sales worldwide. In Canada, 18,451 plug-in electric vehicles were registered as of December 31, 2015 according to FleetCarma. Plug-in vehicles make up 0.08% of total road motor vehicle registrations in Canada. In Manitoba, as of fiscal year ending 2016, there were 140 plug-in vehicles out of a total of 870,589 making up 0.02% of total road motor vehicle registrations (Table 17).

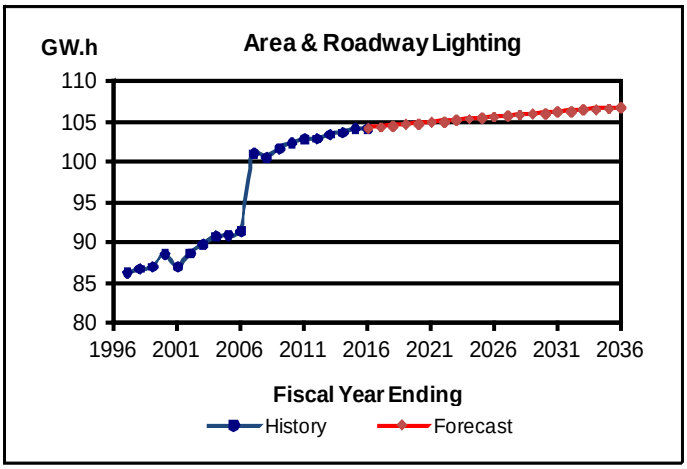
On March 31, 2016, Tesla Motors unveiled its most affordable EV, the Model 3 and opened it up for preorders. The Model 3 price starts at US $35,000. By May 19, 2016, 373,000 potential

customers reserved the Model 3 with a $1,000 down payment. Cancellations are allowed up until 2020. Delivery of the first Model 3's is anticipated for late 2017, early 2018. Deliveries will first go to California, and then to the American East Coast. Tesla Motors has sold almost 125,000 electric cars worldwide since delivery of its first Tesla Roadster in 2008. Based on the 20 Tesla vehicles registered in Manitoba, the number of Model 3s on preorder from Manitoba is estimated at 60. Model 3's will probably be arriving in Manitoba in 2019 or even 2020.

The Electric Vehicle Forecast

Figure 9 - Plug-In Electric Vehicles

As of March 1st, 2016, there were a total of 140 plug-in electric vehicles, including four electric buses, registered in Manitoba with the Manitoba Public Insurance Corporation. Last year's 2015 Load Forecast predicted a total of 137 plug-in vehicles to be registered in Manitoba at fiscal year ending 2016. The latest electric vehicle forecast is adjusted to incorporate the slightly higher actual registrations recorded in fiscal year ending 2016. The Table 17 details the Manitoba actual and forecasted number of new vehicles per year, the total number of vehicles each year, as well as the corresponding numbers for Plug-In Electric Vehicles. The forecast incorporates passenger as well as commercial category vehicles such as Sport Utility Vehicles (SUVs), light and heavy duty trucks, and transit buses. Pull-trailers, farm equipment, motor boats and motor cycles are not included in the count. A passenger PEV consumes approximately 3,500 kWh annually, the equivalent use of one residential, electric hot water tank. An electric transit bus consumes 87,500 kWh annually. That is the equivalent use of three electrically heated single detached dwellings. The number of new PEVs is expected to slowly increase until it reaches about 0.71% of new vehicle sales (481 units) in 2025/26 and 4.36% of new vehicle sales (3,399 units) in 2035/36. The total number of PEVs on the road is forecasted to be 0.21% of total vehicle registrations (2,345 units) in 2025/26 increasing to 1.37% of total vehicle registrations (18,742 units) by 2035/36.



Total energy use for PEVs in Manitoba is forecasted to be 13 GWh in 2025/26 and 96 GWh by 2035/36. Peak usage coincident to Manitoba Hydro's system peak is forecasted to be 1.6 MW in 2025/26 and 12.0 MW in 2035/36. Forecasted use decreased from 2015 forecast due an adjustment in the annual consumption of electric transit buses.

Area & Roadway Lighting

Figure 10 - Area & Roadway Lighting

The Area and Roadway Lighting sector represents 0.5% of all sales within Manitoba. This sector includes electricity sales for the Sentinel Lighting and Street Lighting rate groups. Sentinel Lighting is an outdoor lighting service where units are available either as rentals to an existing metered service or on an unmetered, flat rate basis. Street Lighting includes all public roadway lighting in Manitoba. In 2006, a readjustment of the rate classes moved some flat rate General Service meters into the Lighting sector. Only Street Lights count as customers.

The Area and Roadway Lighting sector is forecast to increase from 104 GWh in 2015/16 to 107 GWh by 2035/36 at an average annual growth rate of 0.1 GWh or 0.1% per year. This does not include the effect of future Demand Side Management (DSM) initiatives in this sector.

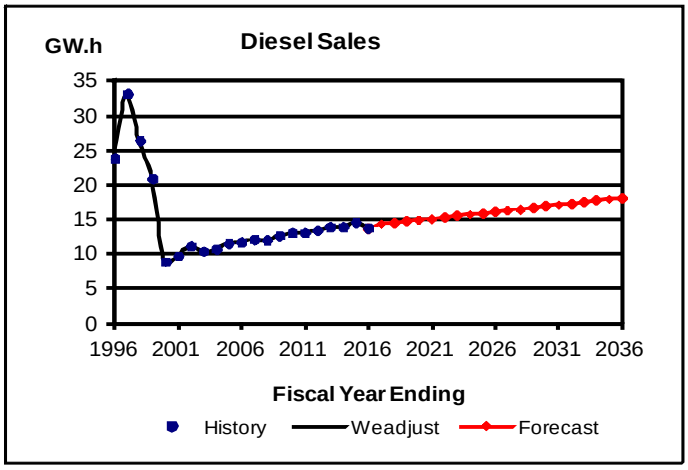
Total General Consumers Sales

Figure 11 - General Consumers Sales

General Consumers Sales includes sales to all of Manitoba Hydro's individually billed customers, but excludes export sales. This includes the total of all sales from the Residential, General Service and Lighting sectors. The General Service sector makes up about two-thirds, the Residential sector makes up about one-third and the Lighting group is only 0.5% of all sales.



Weather adjusted General Consumers Sales has grown 311 GWh (1.6%) per year for the past 20 years and 188 GWh (0.9%) per year over the past 10 years. This historical growth includes the effect of past Demand Side Management (DSM) initiatives. Sales are forecast to grow 337 GWh (1.4%) per year for the next 10 years and 393 GWh (1.5%) per year for the next 20 years before program-based DSM initiatives.

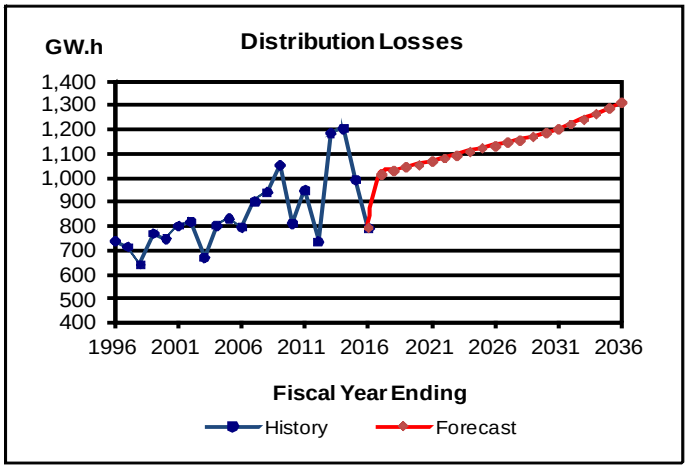
Diesel Sales

Figure 12 - Diesel Sales

There are four communities served by diesel generation in Manitoba: Brochet, Lac Brochet, Tadoule Lake and Shamattawa. Sales within these communities are included in General Consumers Sales, but are not part of the Integrated System, and are thus not part of Common Bus or Gross Firm Load.

Between 1997 and 1999, eleven communities previously served by diesel generation were connected to the Integrated System resulting in the drop in overall diesel sales. The four sites that were to remain diesel were converted from 15 amp service to 60 amp service between 1991 and 2001 causing the increase in those years.



Diesel customers do not have electric heat, which requires a minimum 200 amp service, therefore there is no weather effect.

Table 21 - Diesel Sales

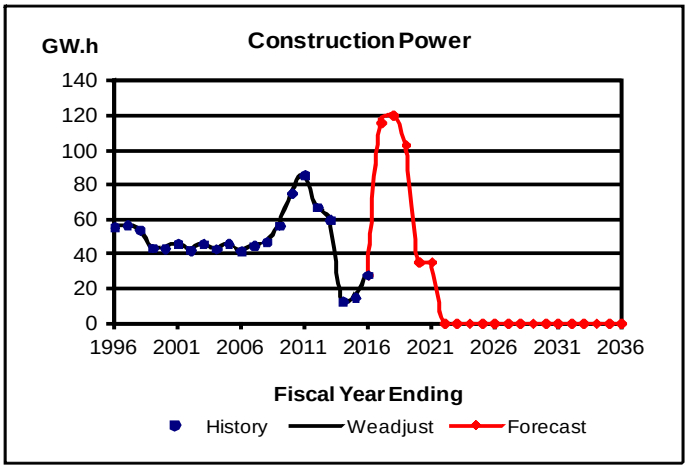
Distribution Losses

Figure 13 - Distribution Losses

Distribution Losses are made up of the power loss between the distribution substation (Manitoba Load at Common Bus less Construction) and the customer's meter (General Consumers Sales less Diesel), as well as all other differences between what was billed and what was metered. The other differences include:

1. The offset between cycle billing (General Consumers Sales) and actual calendar month usage (Common Bus).
2. Customer Accounting adjustments,
3. Inaccuracies associated with estimated billing (including flat rate estimates),
4. The metered but unbilled consumption of Manitoba Hydro offices, and
5. Energy lost due to theft.



Distribution Losses are forecast in 2016/17 to be 4.4% of the General Consumers Sales less Diesel and remain between 4.4% and 4.5% throughout the forecast.

Table 22 - Distribution Losses

DISTRIBUTION LOSSES (GWh) HISTORICAL / PERCENT OF SALES / FORECAST							
Fiscal Year	Losses	Sales less Diesel	% Losses	Fiscal Year	Forecast Losses	Sales less Diesel	% Losses

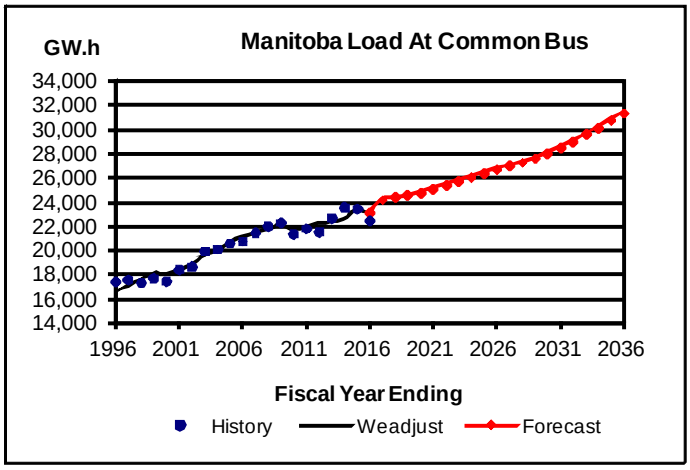
Construction Power

Figure 14 - Construction Power

Construction Power represents the energy used by Manitoba Hydro and its contractors in the construction of major capital works such as generating stations, converter stations and major transmission lines. Construction Power also includes Station Service until a plant is commissioned. Until 2013, about 48 GWh of heating load at the Gillam, Limestone and Kettle town sites was included in Construction Power. This energy is now included in Distribution Losses.



The Construction Power forecast includes: (1) the Keeyask Generating Station, (2) the Keewatinoow Converter Station, started in January 2012 with expected completion in the Fall of 2018 and (3) the Riel Converter Station with an expected completion date of 2019.

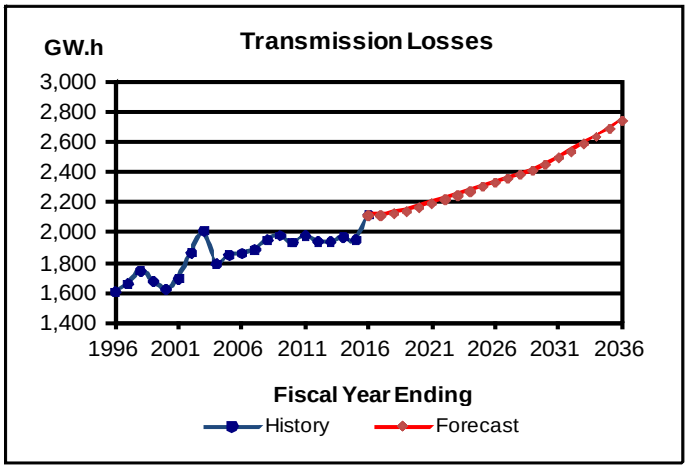
Manitoba Load at Common Bus

Figure 15 - Manitoba Load at Common Bus

Manitoba Load at Common Bus is the total load measured from all the distribution points (i.e. substations) within Manitoba. It includes all energy supplied to General Consumers Sales customers, Construction Power plus associated Distribution Losses, but excludes Diesel customers, Transmission Losses and Station Service.

Common Bus is metered and totaled to correspond exactly to each calendar month. Weather adjustment is done on a calendar month basis.



Weather adjusted Common Bus has grown 320 GWh (1.6%) per year for the past 20 years and 191 GWh (0.9%) per year during the past 10 years reflecting the recent economic downturn. This historical growth also includes the effect of past Demand Side Management (DSM) initiatives. Common Bus is forecast to grow 359 GWh (1.5%) per year for the next 10 years and 413 GWh (1.5%) per year for the next 20 years before program-based DSM initiatives.

Transmission Losses

Figure 16 - Transmission Losses

Transmission Losses are the amount of energy lost while delivering power from the generation stations to all of the distribution substations that make up Common Bus. Transmission Losses only contains losses associated with supplying Manitoba customers. Losses attributable to exports and the gains attributable to imports are excluded. Transmission Losses are mostly losses on the High Voltage Direct Current (HVDC) lines, and are substantial because of the distance of transmission from northern generation to southern distribution points, but are much less than what AC losses would be over that distance. Transmission Losses vary year to year depending on water conditions, system configuration, outages and the magnitude of the load. High losses experienced in 2002/03 were due to two HVDC transformer failures.

Transmission Losses are forecast to be 9.1% to 9.2% of the General Consumers Sales less Diesel Sales.

Station Service

Figure 17 - Station Service

Station Service is the energy used by power plants to generate power and service their own load. Manitoba energy or peak without Station Service is referred to as “Net”, and with Station Service as “Gross”.

Station Service energy is forecast to be 133 GWh and Station Service peak is forecast to be 23 MW from 2016/17 to 2035/36.

Station Service for Keeyask and for future non-committed plants is excluded from this forecast.

Gross Firm Energy

Figure 18 - Gross Firm Energy

Gross Firm Energy is the energy required to serve Manitoba Hydro's customers on the Integrated System. It excludes exports, interruptible (non-firm) loads, Diesel Sales and Station Service for Keeyask and non-committed plants.

Gross Firm Energy has grown steadily during the past twenty years, except during the economic slowdown in the 1990's and more recently in 2009.

Weather adjusted Gross Firm Energy has grown 352 GWh (1.6%) per year for the past 20 years and 215 GWh (0.9%) per year during the past 10 years reflecting the recent 2008 economic downturn. This historical growth includes the effect of past Demand Side Management (DSM) initiatives. Energy is forecast to grow 375 GWh (1.4%) per year for the next 10 years and 442 GWh (1.5%) per year for the next 20 years before program-based DSM initiatives.

Gross Total Peak

Figure 19 - Gross Total Peak

Gross Total Peak is the maximum integrated (i.e. average) hourly load required to serve Manitoba Hydro's customers on the Integrated System. It excludes exports and Diesel Sales. It includes Station Service and Curtailable Loads.

Typically, the peak occurs on a very cold winter weekday either in the morning (often from 8 a.m. to 9 a.m.) or in the afternoon (from 5 p.m. to 6 p.m.). Electric heating is a main contributor to the peak on one of the coldest days, whereas the operation or lack thereof of large industrials often makes the difference as to the specific day and peak hour.

The adjusted Gross Total Peak has grown from 3,486 MW in 1996/97 to 4,634 MW in 2015/16 at an average growth of 60 MW or 1.5% per year. It is forecast to grow to 6,250 MW at 81 MW (1.5%) per year by 2035/36.

Peak load is measured and recorded differently than energy data. The system load at every hour is calculated by System Operations as:

Hourly Gross Total Peak (t)
= Hourly Total Generation (t)
- Hourly Metered Exports (t) + Hourly Metered Imports (t)
- Losses Associated with Exports (t) + Gains Associated with Imports (t)
+ Curtailments (t)

Losses for exports and gains for imports are only known on a monthly energy basis. The hourly value is obtained by using the ratio of exports/imports for the hour to the total exports/imports for the month and applying that to the total metered loss/gain for the month. The remaining difference between the balance of the load and Common Bus is taken as the Transmission Losses associated with Manitoba load.

Curtailments for individual customers are calculated as the difference between what the customer would have used if not curtailed versus what they actually used.

Annual Peak

The forecast annual peak is higher than the maximum of the monthly peaks. This is because the peak can occur in any one of the winter months. The same characteristic is apparent in historical peaks. The average historical annual peak is higher than the maximum of the highest average monthly peaks. For studies requiring yearly data, the annual peak should be used.

16 Hour Peak

The peaks in this document are integrated hourly peaks. For some studies and analysis of avoided cost or DSM savings, an estimate of the average peak during onpeak hours (from 6 a.m. to 10 p.m.) may be desired. To convert hourly peak to 16 hour peak, multiply the hourly peak in the associated month by the following percentages:

Jan	Feb	Mar	Apr	May	Jun	Jul	Aug	Sep	Oct	Nov	Dec	Annual
94.4%	94.9%	95.8%	96.0%	96.3%	96.0%	96.6%	95.6%	95.8%	96.6%	95.6%	95.5%	94.8%

VARIABILITY AND ACCURACY

Weather Effect and Weather Adjustment

The weather effect is determined in any sector every year by regressing the previous two years of actual monthly energies against the actual HDD and CDD for the month. This results in a GWh per HDD effect and a GWh per CDD effect for that sector for that year.

Only sectors whose major variation is due to weather can have a weather effect estimated. Sectors that vary primarily due to industrial output levels or seasonal but non-weather reasons may yield false weather effects if estimated. Weather effects are not determined for the GS Top Consumers, Seasonal, Diesel, Water Heating and Lighting sectors.

For sectors where a weather effect is calculated, this document shows energy as the reported value and as a weather adjusted value. Forecasts are based on the weather adjusted values. The calculations are:

Weather Adjustment = HDD weather effect * (HDD actual - HDD normal)
+ CDD weather effect * (CDD actual - CDD normal)

Weather Adjusted Actual = Actual - Weather Adjustment

Following are the HDD and CDD weather effect factors by sector:

Residential Basic: 0.6 GWh / HDD, 1.0 GWh / CDD
GS Mass Market: 0.3 GWh / HDD, 0.8 GWh / CDD
General Consumers Sales: 0.9 GWh / HDD, 1.8 GWh / CDD
Gross Firm Energy: 1.2 GWh / HDD, 2.9 GWh / CDD
Gross Total Peak: 49 MW / degree (at -30 degrees Celsius),
119 MW / degree (at +30 degrees Celsius)

Effect of Extreme Weather

A record cold winter will increase load 4% and a record warm winter will decrease it 4%. An additional 2% load increase is possible due to a record hot summer and a 1% decrease due to a record cool summer.

The effect of extreme weather is larger on a monthly basis, and even larger on a daily basis.

		Effect of Weather due to Winter Extremes on Gross Firm Energy							
	GWh/DDH	Normal		Record Warm			Record Cold		
	1.2	DDH	GWh	DDH	GWh	Effect	DDH	GWh	Effect
Year:	2016/17	4,540	26,385	3,678	25,378	-4%	5,439	27,437	4%
Month:	Jan 2017	945	2,959	663	2,628	-11%	1,261	3,328	12%
Day:	Jan 2017	30	95	6	67	-30%	56	125	31%

		Effect of Weather due to Summer Extremes on Gross Firm Energy							
	GWh/DDC	Normal		Record Cool Summer			Record Hot Summer		
	2.9	DDC	GWh	DDC	GWh	Effect	DDC	GWh	Effect
Year:	2016/17	179	26,385	69	26,069	-1%	364	26,915	2%
Month:	July 2016	67	1,891	6	1,716	-9%	142	2,105	11%
Day:	July 2016	2	61	0	55	-10%	14	95	56%

The effect of a change in temperature on the load at the time of peak due to a 5 degree temperature difference is 18% in the summer and 5% in the winter.

Summer	Winter	Effect of Change in Temperature on Gross Total Peak							
MW/Deg	MW/Deg	Normal		Warm Winter, Cool Summer			Cold Winter, Hot Summer		
119	49	Temp	MW	Temp	MW	Effect	Temp	MW	Effect
Summer	2016/17	30	3,389	25	2,792	-18%	35	3,986	18%
Winter:	2016/17	-30	4,850	-25	4,607	-5%	-35	5,094	5%

Load Variability

Uncertainty is an inherent characteristic of forecasting. The load will vary both year to year and long term because of underlying changes in population growth, economic growth, changes in the operations of Top Consumers, and overall use patterns. An economic recession will slow energy growth and an economic boom will increase it. Cycles cannot be predicted in advance so some appropriate midpoint must be chosen as the forecast.

This forecast was created as Manitoba Hydro's best estimate of Manitoba's future energy requirement with an expectation of a 50% chance that actual growth will be higher than the forecast, and a 50% chance that actual growth will be lower than the forecast. This can also be called the P50 (50th Percentile) or Base Forecast.

To evaluate the potential for variation, historic load variability has been analyzed using a probabilistic-based approach. Doing this provides an estimate of the magnitude of the potential load variation from the forecast due to population, economy and other effects. 10% and 90% confidence bands (-/+ 1.28 standard deviations), also known as P10 and P90, were selected to be a proxy for the Low and High Load Forecast Scenarios for use in risk analysis studies. They are calculated as follows:

Load = Base Forecast -/+ 1.28 x Standard Deviation

For other probability points, substitute for the 1.28 the following numbers:

Prob	0.1%	2.5%	10%	20%	50%	80%	90%	97.5%	99.9%
Z(Prob)	-3.09	-1.96	-1.28	-0.84	0.00	0.84	1.28	1.96	3.09

This calculation gives the variability due to long term economic effects. It does not include variability due to weather which was removed through the use of weather adjusted load. The standard deviation of the weather variation has been found to be approximately 2% of both the energy and peak. Annual weather variations tend to be independent of the economy, so if a combined variance is desired, then the variance due to weather can be added to the variance without weather to derive an overall variance that includes weather.

The following four charts and tables summarize the variability for energy and peak. By 2035/36, the Load Forecast has an 80% probability of being accurate to within ±1,737 GWh or ±5.1%. Due to the inherent variability of the load, this is the best level of accuracy possible.

The overall economic standard deviation in 2035/36 is 1,355 GWh or 4.0% of the forecast energy. Analyzed individually, the economic standard deviation of the Top Consumers sector is 1,326 GWh (17.9%), Residential is 509 GWh (5.4%) and Mass Market is also 463 GWh (3.6%), showing that the Top Consumers sector is the majority of the variance.

5 and 10 Year Forecast Accuracy

Due just to the load variation caused by population growth and economic growth, there is only a certain level of accuracy possible. Using the load variability estimates of the previous section, due to economic variability alone, there is only an 80% chance that a 5 year energy forecast will be within 3.1% of the actual, and an 80% chance that a 10 year energy forecast will be within 4.2% of the actual.

Recognizing this inherent uncertainty of the forecast, historic forecast variation has been tracked. The following four figures and tables compare previous load forecasts to actual results 5 and 10 years later.

The energy savings achieved under Manitoba Hydro's market-based DSM programs between the year the forecast was prepared and the year being forecast was subtracted first from the forecast value. The remaining difference is taken as an estimate of the accuracy of the forecast.

The following figures and tables may suggest cycles in the forecast made up of alternating periods of over-forecasting and under-forecasting. These are not so much due to a bias in the forecast as they are due to unexpected periods of recession or economic growth. Once one of these unexpected periods occur, the accuracy of the previous five 5-year forecasts for 5 years, and the accuracy of the previous ten 10-year forecasts for ten years will be affected thus causing periods of over- or under-forecasting.

Compensation for these periods of over and under-forecasting cannot be applied until after the events occur and only then can they be identified and quantified. The forecast assumes average expected economic conditions. When economic conditions are abnormal, the forecast will be high or low.

The weather adjusted Gross Firm Energy is shown in two separate columns in the Energy Accuracy table (Table 35) and they vary in each year due to the difference in weather normals used in each of the respected forecasts. Weather normals differences are due to the use of a 25 year rolling average which relies on the previous 25 years of weather data while at the time the forecast is created.

LOAD SENSITIVITES AND EXTREME EVENTS

Manitoba Hydro examines the effect of possible events on the load. The information presented here provides planners with an understanding of what the potential scale of these individual events may have on the system load requirements.

The individual effects of each event can be included in scenario or sensitivity analysis if the need arises. Each change in assumption can be individually applied to the forecast as required to capture the annual energy and peak effect of the desired assumption in any given year. All values are listed at Generation and include transmission and distribution losses.

The sensitivities provide an estimate of what effect a change in assumption will have on the annual energy and peak over the 20 year forecast period.

Effects are summarized below, and the details of each effect follow.

Sensitivity of the Load to an Assumption Change	Energy (GWh)	Peak (MW)
0.1% Increase/Decrease in Population	± 297	± 54
0.1% Increase/Decrease in Income	± 47	± 9
0.1% Increase/Decrease in GDP	± 199	± 36
0.1% Increase/Decrease in Electricity Price	∓ 154	∓ 28
Climate Change per Degree Celsius Warmer	+ 50	- 49

Evaluation of Extreme Events	Energy (GWh)	Peak (MW)
All Natural Gas in Manitoba to Electricity	+ 16,000	+ 7,000
Increase/Decrease of One Very Large Industrial Customer	± 1,500	± 180
Maximum Potential Effect of Increased Online Shopping	- 775	- 143
Additional Load if 100% Electric Vehicle Saturation Rate	+ 8,792	+ 1,099
Illustrated Effect of Grid Parity (e.g. Solar Panels)	- 857	- 78

For context, one year of energy growth is 442 GWh and one year of peak growth is 80 MW.

Population / Economic / Price Changes

The population, economy and prices are the most significant drivers of the load in Manitoba. These effect of each driver based on the coefficients found in the models is summarized below.

Population: A one-time 1% increase in population (12,971 people) results in a 1% increase in the number of Residential Basic customers (4,742 customers representing 71 GWh) and a 0.33% change in the number of GS Mass Market customers (224 customers representing 61 GWh). The total effect on Manitoba Gross Firm Energy would be 148 GWh (0.59%) for any given year. Assuming a 0.1% change in the annual average population growth rate over the 20 year forecast period, the total effect would be a change of 297 GWh in the 20th year of the forecast.

Income: A one-time 1% increase in real income results in a 0.29% increase in Residential average use (43 kWh per customer and 21 GWh overall). On Manitoba Gross Firm Energy it is 23 GWh (0.09%). Assuming a 0.1% change in the annual average income growth rate over the 20 year forecast period, the total effect would be a change of 47 GWh in the 20th year of the forecast.

GDP: A one-time 1% increase in Manitoba GDP results in a 0.54% increase in GS Mass Market Small and Medium average use (555 kWh per customer totaling 37 GWh). A 1% increase in Canada/US GDP results in 0.30% increase in GS Large Customer average use (18,850 kWh per customer totaling 6 GWh) and a 0.84% increase in Top Consumers use (46 GWh). The total effect of a 1% increase in GDP on Manitoba Gross Firm Energy is 100 GWh (0.39%). Assuming a 0.1% change in the annual average GDP growth rate over the 20 year forecast period, the total effect would be a change of 199 GWh in the 20th year of the forecast.

Electricity Price: A one-time 1% increase in real electricity price results in a 0.29% decrease in Residential average use (-43 kWh per customer totaling -21 GWh). It will also result in a 0.18% decrease in GS Mass Market Small and Medium average use (-185 kWh per customer totaling -12 GWh), a 0.47% decrease in GS Mass Market Large average use (-29,532 kWh per customer totaling -10 GWh) and a 0.48% decrease in GS Top Consumers use (-26 GWh). The total effect of a 1% increase in real electricity price on Manitoba Gross Firm Energy is -77 GWh (-0.30%). Assuming a 0.1% change in the annual average GDP growth rate over the 20 year forecast period, the total effect would be a change of 154 GWh in the 20th year of the forecast.

Below is a summary of the 20 year impact to the forecast should a change of 0.1% to the annual growth rate for each of the economic assumption is assumed.

	Energy (GWh)	Peak (MW)
0.1% Increase/Decrease in Population	± 297	± 54
0.1% Increase/Decrease in Income	± 47	± 9
0.1% Increase/Decrease in GDP	± 199	± 36
0.1% Increase/Decrease in Electricity Price	∓ 154	∓ 28

Climate Change

The Intergovernmental Panel on Climate Change projects an increase in global temperature as a result of rising concentrations of greenhouse gases in the atmosphere. Changes to temperature and extreme events have the potential to influence future energy demands.

In the last 100 years, the city of Winnipeg's 25-year average temperature has resulted in Heating Degree Days (HDD) in the range of 4,500 to 5,000 each year. A 25 year moving average is used for the forecast to help minimize the effects of year to year variability and to represent the long term climatology. This section quantifies the general effect caused by a 1°C increase in average daily temperature throughout the year.

In Manitoba Hydro's case, if Winnipeg experienced a uniform 1°C warming throughout the year, winter months would be subject to less heating while summer months would be subject to more cooling. Over 200 winter days, every degree Celsius of temperature rise above average conditions will result in an approximate decrease of 200 Heating Degree Days (HDD) per year, and a corresponding approximate increase of 100 Cooling Degree Days (CDD) per year over 100 summer days.

Applying the Weather effect for Manitoba Hydro at Generation gives:

Decrease of 200 HDD ➔ -240 GWh and -49 MW in the winter

Increase of 100 CDD ➔ +290 GWh and +119 MW in the summer

The resulting total effect of every one degree increase in temperature would be:

An increase of 50 GWh to annual energy and a decrease of 49 MW to system peak.

	Energy (GWh)	Peak (MW)
Climate Change per Degree Celsius Warmer	+ 50	- 49

Conversion of all Natural Gas Use to Electricity

Currently, about 275,000 Residential and General Service customers use natural gas as a fuel for space heating, water heating, cooking, etc. Given possible future green initiatives that could implement carbon taxes on fossil fuels, a scenario to consider is the conversion of all natural gas used as a fuel to electricity.

Assumptions exclude industries using natural gas as an ingredient, not as a fuel, and use a fuel efficiency averaging 82% and a load factor of 26%.

	Energy (GWh)	Peak (MW)
All Natural Gas in Manitoba to Electricity	+ 16,000	+ 7,000

Potential Changes in Load from Very Large Industrial Customers

This forecast includes an expectation that there may be new large industrial users of electricity that may come to Manitoba. GS Top Consumers includes a Potential Large Industrial Loads category that adds 1,712 GWh to GS Top Consumers by 2035/36. This is expected to be made up of increases and decreases by current top consumers, additions of new top consumers and company closures. However, this forecast does not anticipate the scenario of one customer using up the entire PLIL projection as a single startup.

Manitoba Hydro's largest customer currently uses in excess of 1,500 GWh annually and has a coincident peak load of about 180 MW. It is feasible that one or more customers of this size could decide to start up in Manitoba in the next 20 years. A single large new customer could

use the entire amount of energy that has been forecast under the Potential Large Industrial Loads projection.

Similarly, it is possible that one or more very large customers may discontinue operations in Manitoba. This could also be the equivalent of losing Manitoba Hydro's largest customer.

	Energy (GWh)	Peak (MW)
Increase/Decrease of One Very Large Industrial Customer	± 1,500	± 180

Maximum Potential Load Effect of Increased Online Shopping

Online shopping is a growing service offering by many retailers. It is possible that this trend could lead to fewer retail establishments if online shopping becomes pervasive. The potential load reduction of such a scenario will be the electricity use of about 5,800 General Service customers in the Retail sector who currently use about 680 GWh. At generation, this represents a potential total of 775 GWh and 143 MW (using a 62% load factor). This assumes that the structures used for retail are torn down or are refurbished with other businesses that would otherwise have built a new structure.

	Energy (GWh)	Peak (MW)
Maximum Potential Load Effect of Increased Online Shopping	- 775	- 143

Potential Load from High Adoption of Electric Vehicle Technology

This forecast includes the expected impact due to adoption of electric vehicles within Manitoba over the next twenty years. The specifics have been detailed in the Electric Vehicle Forecast section of this document.

It is possible that the current technological challenges will be solved, price will match those of internal combustion vehicles, and range anxiety will be alleviated. If or when these issues are resolved, It is possible that electric vehicles may eventually grow to be the dominant vehicle.

The maximum load required, if 100% of all new passenger and commercial vehicles purchased every year within the forecast period are Plug-In Electric Vehicles (PEVs), would be 8,888 GWh of energy and 1,111 MW of load. Currently, the forecast for electric vehicles load by 2035/36 is 96 GWh and 12 MW. Therefore the maximum additional load required over the current forecast for 100% saturation is 8,792 GWh (20 years of load growth) and 1,099 MW (about 14 years of peak growth).

	Energy (GWh)	Peak (MW)
Additional Load if 100% Electric Vehicle Saturation Rate	+ 8,792	+ 1,099

Illustrated Effect of Grid Parity

Grid Parity is when a customer will have an economic option to provide some or all of the electricity needs their home or business requires with an alternative energy source. Grid parity requires the self-generated kWh cost to be competitive with utility power when considering operating, maintenance costs and a reasonable amortization period for capital costs.

Solar photovoltaic installations are frequently referenced in discussions related to grid parity as costs continue to decline. Initial adoption rates may be gradual and may take years to mature. For illustrative purposes, the effect at utility generation if 100,000 residential and 10,000 commercial customers added solar panels would be:

	Energy (GWh)	Peak (MW)
Illustrated Effect of Grid Parity (e.g. Solar Panels)	- 857	- 78

ASSUMPTIONS

Economic Assumptions

Economic forecast assumptions are taken from the economic variables that become part of Manitoba Hydro's 2015 Economic Outlook and the 2015 Energy Price Outlook.

Residential Customers - The number of Residential Basic customers in Manitoba is forecast to increase by 1.2% (5,809 units) in 2016/17 and averages 1.0% per year over the forecast period. This compares to a historical average increase of 1.1% per year over the last ten years. Residential customers are used in the Residential and GS Mass Market customer forecasts.

Electricity and Natural Gas Prices - The electricity price forecast is based on the Consumer Price Index (CPI) and rate increase projections contained in the Integrated Financial Forecast. The real electricity price is forecast to increase by 2.1% in 2016/17, annually increase between 1.9% and 2.2% from 2017/18 to 2027/28 and then reduce to a 0.2% annual increase for the remaining seven years of the forecast. Manitoba Hydro views the natural gas price forecast as commercially sensitive information. Consistent with the Clean Environment Commission and Electric General Rate Application, this information will not be publicly disclosed. The ratio of prices is used in the Residential Basic forecast.

Manitoba Disposable Income - Real Manitoba disposable income per Res Basic customer grew 1.4% for the past 20 years and 1.9% for the past 10 years. It is forecast to grow 0.9% annually for the next 20 years. Manitoba disposable income is used in the Res Basic forecast.

Gross Domestic Product (GDP) - Real economic growth in Manitoba averaged 2.5% annually for the past 20 years and 2.4% annually for the past 10 years. Real Manitoba GDP is expected to grow 2.1% in 2016/17 and average 1.8% annually for the next 20 years. Manitoba GDP is used in the GS Mass Market Small and Medium forecasts.

Gross Domestic Product (Canadian and US GDP) – Combined real economic growth in Canada and US averaged 2.4% annually for the past 20 years and 1.5% annually for the past 10 years. It is forecast to grow 2.0% in 2016/17 and average 2.1% annually for the next 20 years. This is used in the GS Mass Market Large and GS Top Consumer forecasts.

Price / Income / GDP Elasticity

The economic effects of price, income and GDP have been incorporated into the 2016 forecast. The elasticity of each has been estimated from econometric modeling. See the Methodology section for more details. A summary of the elasticities found is:

	Price Elasticity	Real Income Elasticity	Real GDP Elasticity
Residential Basic	-0.29	0.29	
GS Mass Mkt Small/Medium	-0.18		0.54
GS Mass Mkt Large	-0.47		0.30

Demand Side Management (DSM) in the Forecast

This forecast reflects future DSM savings associated with existing Provincial building codes and improved equipment efficiency standards and regulations (Codes and Standards). This is the only effect of DSM initiatives that is specifically accounted for in the forecast.

Savings due to DSM programs to date are embedded in the historical data that is the basis for this forecast. The current level of past achieved DSM savings is assumed to remain in place throughout the future. Future DSM savings arising from future Power Smart offerings and market engagement above the current level and incremental to the above mentioned Codes and Standards are not reflected in this forecast. They are accounted for separately in Manitoba Hydro's Power Smart Plan and Power Resource Plan.

As a result, historical growth rates in this document are not directly comparable to future growth rates because the history includes the effect of past program-based DSM initiatives, but the forecast does not.

For customers involved in Load Displacement and Alternative Energy initiatives, the forecast excludes the effect of the initiatives, and projects the load without the savings due to the initiatives.

Normal Weather Assumptions

Weather for forecast purposes is measured by degree days. Winnipeg temperatures are used, as Winnipeg is central to most of the weather-dependent load (Residential and General Service Mass Market) in Manitoba.

Cold weather is expressed in Heading Degree Days (HDD), which is the number of average degrees colder than 14 degrees Celsius each day. Hot weather is expressed in Cooling Degree Days (CDD), which is the number of average degrees warmer than 18 degrees Celsius each day. Daily temperature is the average of the high and low temperature for the day. The equations are:

HDD = sum (max(0, 14 - (Daily high + Daily low) / 2))

CDD = sum (max(0, (Daily high + Daily low) / 2) - 18)

The base temperature of 14 degrees for HDD is the temperature below which most buildings have their heating systems (furnaces) running.

The base temperature of 18 degrees for CDD is the temperature above which buildings start to run their space cooling systems (air-conditioning).

The forecast is prepared assuming normal weather. Normal weather for the 2016 forecast is determined from the 25 year average of Heating Degree Days and Cooling Degree Days in Winnipeg over the period April 1991 to March 2016.

The 25 year weather normals used for every year of this forecast are 4,539.7 HDD and 179.1 CDD. This is a decrease of 28.9 HDD from last year's normal of 4,568.6 HDD, and no change from last year's normal of 179.1 CDD.

The range of HDD from 1991 to 2016 was from a warm winter of 3,677.6 HDD in 2011/12 (862.1 HDD below normal) to a cold winter of 5,439.3 HDD in 1995/96 (899.6 HDD above normal).

The range of CDD from 1991 to 2016 was from a cool summer of 71.8 CDD in 2004/05 (107.3 CDD below normal) to a hot summer of 267.3 CDD in 1995/96 (88.2 CDD above normal).

METHODOLOGY

Residential Basic Methodology

Several different models and forecasts were used to determine the Residential Basic Model. These are the steps to produce the forecast:

1. **Forecast Residential Dwellings** - The forecast of Manitoba residential customers in Manitoba Hydro's 2016 Economic Outlook was used for the total number of Residential Basic customers for the 2016/17 to 2035/36 period. The customer forecast was based on the average of several Manitoba population forecasts from various external agencies multiplied by a forecast of the people per customer ratio. The customer forecast was reduced by about 0.5% to account for customers with multiple services to obtain the forecast of individual dwellings.

2. **Forecast Existing Dwellings** – Existing dwellings were broken down by dwelling type (single detached, multi attached, and Individually metered apartment suites) within each fuel region (Winnipeg, Gas Available outside Winnipeg and No Gas Available). The rate of change due to demolitions and type change (e.g. bulk apartments to individually metered) as well as customer switches of their space heating fuel were taken into account.

3. **Historical Space Heating Systems –** The number of historical dwellings by type and region were each divided into nine space heating systems: Electric Forced Air Furnace, Electric Baseboard, Electric Ground Source Heat Pump, Electric Boiler, Gas High-Efficiency Furnace, Gas Mid-Efficiency Furnace, Gas Standard-Efficiency Furnace, Gas Boiler, and Other heat that is not billed for gas or electric. Percentages of each heat type in existing dwellings were taken from the 2014 Residential Energy Use Survey.

4. **Forecast of Space Heating Systems in New Dwellings** – Econometric equations were developed to forecast the number of electric space heating systems in new single detached and multi attached dwellings in Winnipeg and South Gas regions as follows:

   Logit (Percentage of New Dwellings (t))

   = -5.45 + 2.20 * T + 2.07 * PGEFF (lag(t)) Single Detached, Winnipeg

   = -2.11 + 0.78 * T + 2.92 * PGEFF (lag(t)) Single Detached, South Gas

= -7.25 + 3.72 * T + 6.38 * PGEFF (lag(t))	Multi Attached, Winnipeg
= -3.26 + 0.39 * T + 5.82 * PGEFF (lag(t))	Multi Attached, South Gas

Logit	- A log transformation of percentages used for saturation analysis
T	- A trend variable capturing the effect of natural gas price changes
PGEFF	- Ratio of the gas to electricity price for high efficiency furnaces
lag(t)	- The weighted average (38%, 6%, 6%, 50%) of the 1, 3, 4 and 5 year lags

R-squared: 80.2%, 89.6%, 48.9%, 75.7%

T-stats:

Constant:	-10.14, -9.72, -3.34, -6.15
T:	7.53, 6.61, 3.16, 1.35
PGEFF:	2.49, 8.71, 1.90, 7.11

The 2014 Residential Energy Use Survey was used to break the forecast of new electric heat dwellings and new non-electric-heat dwellings within single detached, multi attached and individually metered apartment suites by Winnipeg, South Gas and No Gas areas into specific furnace types.

5. **Forecast of Space Heating Systems in Existing Dwellings** – The average age of heating systems in existing dwellings was determined from the 2014 Residential Energy Use Survey. The number of replacements was estimated using a Weibull distribution based on the average age of each furnace type from the survey. Switches of furnace types were estimated using survey respondents in older dwellings with newer heating systems and included saving estimates from the Heating Fuel Choice initiative. Their former heating system was verified using billing system information.

6. **Forecast of Water Heating Systems in New and Existing Dwellings –** Electric and natural gas water heater saturations and average age were estimated for dwellings with and without natural gas space heat using information from the 2014 Residential Energy Use Surveys. The number of replacements was forecast using a Weibull distribution based on the average age of water heaters and switches between fuels were taken into account when forecasting future numbers of water heaters. Saving estimates from the Heating Fuel Choice initiative were included.

7. **Other End Uses** – Other major uses of residential electricity were forecast by dwelling type, including central air conditioning, major appliances, televisions and lighting using the saturation data from the 2014 Residential Energy Use Survey.

8. **Determine Overall Average Use** – An econometric linear model was used to forecast the average annual electricity use per customer of the Residential Basic sector. The Average Use per customer without Demand Side Management (DSM) programs and Codes & Standards (C&S) savings was used as the dependent variable in the model. Historical data from 1992/93 to 2015/16 was modeled. The resulting model and parameters are:

   (Total Usage + DSM programs + C&S savings) / Customers
   = 3949 + 29645 x Saturation - 639 x Price + 0.0669 x Income + 67.2 x T(t)

   Saturation - Electric Heat Customer Count / Total Res Basic Customer Count
   Price - Manitoba Real Residential Electricity Price lagged 2.5 yrs
   Income - Manitoba Real Income per Res Basic Customer
   T - A trend variable capturing increases in electric use and house size

   R-squared: 99.4%
   T-stats:

Constant:	1.97
Saturation:	2.66
Price:	-4.40
Income:	2.80
T:	3.45

9. **Appliance Use and Balancing** – Conditional Demand Analysis using the Residential Survey data combined with customer annual use from billing data was used to derive average annual energy use by type of heating system and appliance for existing and new dwellings. These average uses were multiplied by the number of each type of system and appliance to get the total energy use. This was balanced against Step 8 results to ensure reasonableness.

10. **Determine Total GWh used** – The forecast number of dwellings multiplied by the overall average use determined the GWh forecast. The forecast of energy savings from Codes and Standards as outlined in Manitoba Hydro's Power Smart Plan were subtracted, and the

future use of Electric Vehicles in the Residential sector was added. The result was the forecast of Residential Basic customer total energy use. This excludes savings from future Demand Side Management initiatives.

General Service Mass Market Methodology

A) General Service Mass Market Customer Forecast

Econometric analysis of historical sales data was used to develop models to forecast the number of General Service Mass Market customers. Forecasts of Manitoba Gross Domestic Product (GDP) and Manitoba Hydro Residential Basic Customers were then input into the models to generate forecasts for the number of customers for each year of the forecast period.

The number of Small Non-Demand, Small Demand and Medium customers was modeled using yearend historical customer data from 1985/86 to 2015/16. The resulting model and parameters are as follows:

Number of Customers at yearend (t)

= 34087 + 0.191 x MGDP + 0.046 x RES

MGDP - Manitoba Real Gross Domestic Product
RES - Yearend number of Residential Basic Customers

R-squared: 99.6%
T-stats:

Constant:	18.16
MGDP:	7.46
RES:	6.48

General Service Mass Market customer growth was assigned to Small Non Demand, Small Demand and Medium classes by using their 3 year average growth by class and allocating the customers appropriately.

The number of General Service Large customers was modeled using yearend historical customer data from 1989/90 to 2015/16. The resulting model and parameters are as follows:

Number of GS Large Customers at yearend (t)

= -339 + 0.013 x CUGDP + 0.0013 x RES

CUGDP - Canada / U.S. Blended Real Gross Domestic Product
RES - Yearend number of Residential Basic Customers

R-squared: 98.8%
T-stats:

Constant:	-9.24
CUGDP:	2.98
RES:	10.20

B) General Service Mass Market Average Use Forecast

Historical Average Use per General Service customer was calculated after removing the effects of DSM and Codes & Standards. The average use of the combined Small Non-Demand (SND), Small Demand (SD) and Medium classes were forecast using an econometric linear regression model that included Electricity Price and Manitoba GDP. Historical data from 1989/90 to 2015/16 was used. The resulting model and parameters are as follows:

Average Use per SND, SD and Medium

= 63457 - 2740 x Elec Price + 1.24 x MGDP + 3572 x Dummy

Elec Price - SND, SD and Medium Average Real Electricity Price
MGDP - Manitoba Real Gross Domestic Product
Dummy - "1" up to 2005/06 due to a billing system change causing a reclassification of customers in 2006/07

R-squared: 99.1%
T-stats:

Constant:	11.33
Elec Price:	-5.48

MGDP:	22.12
Dummy:	4.33

The Average Use for Large Mass Market customers was modeled using historical data from 1989/90 to 2015/16. The resulting model and parameters are as follows:

Average Use per GS Large

= 7912265 - 631604 x Elec Price + 487 x CUGDP + 264846 x Dummy

Elec Price	- GS Large Average Real Electricity Price
CUGDP	- Canada / U.S. Blended Real Gross Domestic Product
Dummy	- Included from 1999/00 to 2005/06 to reflect the average use of the 750V-30kV group being higher for those years by about 250,000 kWh

R-squared: 97.7%

T-stats:

Constant:	12.77
Elec Price:	-7.08
CUGDP:	10.98
Dummy:	3.98

The GS Mass Market Small, Medium and Large groups are further subdivided into rate groups that are based on customer's usage. If usage by an individual customer increases (or decreases) sufficiently then they are re-assigned to the appropriate rate group. This action results in the average use of each group to remain relatively stable. For the forecast, the average use of each rate group is held constant. The number of customers in each group is adjusted so that both the total number of customers and overall average use forecast by these models is achieved.

C) General Service Mass Market Total Use Forecast

Total GWh for the General Service Mass Market sector was forecast by multiplying the forecast number of customers in each rate group by the forecast average use. The forecast of energy savings from Codes and Standards as outlined in Manitoba Hydro's Power Smart Plan were subtracted, and the future use of Electric Vehicles in the GS Mass Market sector was added.

General Service Top Consumers Methodology

Each company in the Top Consumers group was forecast individually. Information on individual company operating plans was collected from company specific prospectus and quarterly reports, industry news and reports, and from Manitoba Hydro's Key & Major Account advisors. This information is used in the preparation of company specific short term forecasts for committed projects. The short term plans are forecasted to occur in the first three years. In the long term, following the third year, the company specific energy forecast is held constant for the remainder of the forecast period.
