I. Introduction

A. Scope of Report

La Capra Associates (LCA) has prepared this Technical Appendix to address elements of our Needs for and Alternatives To (NFAT) Scope of Work (LCA SOW) that pertain to the economic analysis issues and support other elements of the LCA SOW that rely on the materials in this report. The specific focus of this Technical Appendix is to assess the reasonableness of Manitoba Hydro's (MH) economic modeling of the alternative development cases and to address the additional issues related to that analysis included in the LCA SOW.

The specific LCA SOW elements addressed by the material presented in this Appendix include:

Power Resource Planning and Economic Evaluation

11. *For all scenarios addressed, define the lower quartile, median and upper quartile impacts of natural gas supply pricing, coal pricing and wind pricing.*

Business Case and Risk Assessment

2. *Assess whether the high-level summaries filed by MH of net present value and internal rates of return reflect sound assumptions and calculations.*
4. *Address estimate uncertainties involving large complex hydro projects.*
5. *Examine and evaluate the treatment of risk in MH's development of Power Resource Plans and resource scenario models. Include expert opinions on flood and drought risks and optimal strategy.*
13. *Test each scenario look for potential risks, including:*
    a) *Lower export market prices;*
    b) *Higher interest rates;*
    c) *Lower or higher domestic load growth;*
    d) *Droughts;*
    e) *Competing technologies;*
    f) *Fuel price changes;*
    g) *Carbon pricing;*
    h) *Government and regulatory policy change;*

La Capra Associates, Inc.
One Washington Mall, 9th Floor
Boston, Massachusetts 02108

lacapra.com

i) Construction cost escalator;
j) Economic conditions;
k) Infrastructure failure; and
l) Any other major risks identified.

This Technical Appendix is being prepared in two parts. This initial part Technical Appendix 9A covers the Business Case and Risk Assessment Elements 2, 4 and 5 described above. Part II of this filing, Technical Appendix 9B, will cover the other items in the SOW listed above.

This Technical Appendix also relies on information contained in LCA Technical Appendices:

- 1: Resource Planning,
- 2: Generation Alternatives,
- 3: Alternative Resource Plans,
- 5: Hydrological Risk (to be filed at a later date),
- 6: Export Markets,
- 7: Export Contracts, and
- 8: Transmission.

In addition, some inputs and information rely on work of other Independent Expert Consultants (IECs) retained by the PUB.

Moreover, PUB staff and advisors issued Information Requests to MH requesting data or analysis on specific issues related to the economic analysis. LCA agreed to address several of these issues, which are listed below and described as Expanded Scope of Work (ESOW) items. All but ESOW 1 will be addressed in Part II of the filing.

ESOW 1 – Economic Analysis sensitivity to alternative Discount Rates

ESOW 2 – Economic Analysis sensitivity to changes in Export Revenue

ESOW 3 – Economic Analysis sensitivity to CO_2 Regulation

ESOW 4 – Economic Analysis sensitivity to Alternative Drought Scenarios

ESOW 5 – Economic Analysis sensitivity to changes in Export Pricing

ESOW 6 – Economic Analysis of Combined Cycle Resource Plans

B. La Capra Associates Approach to Reviewing the NFAT Economic Analysis

LCA reviewed MH's economic analysis to answer the following questions:

1. Did MH use reasonable assumptions for the cost and characteristics of the resource options?
2. Did MH evaluate the benefits and costs of alternative development plans under reasonable external market and economic conditions?
3. Did MH evaluate the uncertainties and risks associated with the future resource technology improvements?
4. Are the models, programs, spreadsheets, and other analytical tools used in alternative development plan evaluations for the MH system appropriate?
5. Did MH execute the models, programs, spreadsheets, and other analytical tools with proper inputs?
6. Did MH utilize the results of its modeling and analysis accurately in the NFAT Submission in its presentation of information, observations and conclusions?
7. Did MH accurately calculate its chosen metrics, and were these metrics appropriate for the conclusions and decisions MH presented in the NFAT Submission?
8. Are there additional analyses, metrics, resource options, or resource development plans that MH should have included in its NFAT economic analysis?

In the course of its evaluation, LCA staff reviewed the NFAT Submission along with material from associated prior regulatory proceedings, including outside consulting reports. LCA filed several Information Requests and met in person with MH analytical and modeling team members in September and again in December to obtain a better understanding of MH's modeling and Analytical tools (namely SPLASH,[1] Economic

[1] The Simulation Program for Long-Term Analysis of System Hydraulics or "SPLASH" model is MH's internal and proprietary software program used to simulate the dispatch of MH's generation to serve domestic load and optimize energy available for export. This program determines generation costs, including water rental fees, fuel costs, variable O&M costs, purchase power costs and volumes, import costs and volumes, and energy export costs and volumes for 99 different historical hydraulic flow years.

Model, Financial Model, Load Forecasting, Demand-Side Management (DSM) Analysis, Capital Cost estimation processes, Risk Analysis). Moreover, LCA initiated several conference calls / webinars with MH staff to review analysis and data. In addition, LCA had numerous discussions with other IECs to assimilate their findings and thinking into our review.

MH did not produce working copies of the SPLASH or Economic Models for our use in this review. In lieu of direct access to the models, LCA used the following approach:

1. SPLASH - LCA performed a detailed review of SPLASH model outputs to test the reasonableness of the generation system operation, especially with respect to exports, imports, hydropower optimization, and thermal unit operation. Much of the information necessary for this review was not available to our team until late December. LCA was not able to conduct audit-level inspection of the SPLASH modeling to determine the detailed algorithms used or to verify that the intended algorithms were functioning correctly.

2. Economic Model - MH provided detailed PDFs and spreadsheets with Economic Model output in lieu of working versions of the Economic Model. The LCA team created its own working economic model output spreadsheet, which enabled it to analyze additional metrics and perform additional comparisons entirely utilizing MH data, and in most instances MH's actual modeling results. In addition, as will be discussed later in this report, some sensitivity analyses were performed in order to test the robustness of MH's observations regarding the relative benefits of alternative development plans. A working version of this model is provided in the workpapers accompanying this report.[2]

[2] A list of workpapers is provided at the end of this Technical Appendix.

C. Structure of the Report

LCA's review of MH's economic analysis as presented in this Technical Appendix is organized into four parts.

First, in Section II, we review MH's economic analysis methodology. In that section, we consider only the reference scenario set of assumptions. Four of the fifteen alternative development plans—plans that are more prominent in the NFAT Submission—were selected to illustrate our assessment of the methodology and provide examples.

In Section III, we review MH's economic uncertainty analysis. In that section, we consider the 27 alternative sets of assumptions that MH used to evaluate the uncertainty in export energy prices, discount rates, and capital costs.

In Section IV, we provide a sensitivity analysis on several key parameters. In this section, we test the sensitivity of MH economic analysis results to assumptions regarding energy prices, discount rates, capital costs, and the alternative assumptions of the probabilities assigned to these variables.

In Section V, we review the MH economic analysis from the perspective of the Province of Manitoba, in contrast with the prior two sections, which focus on the perspective of Manitoba ratepayers.

In Section VI, we provide a summary of our finding and conclusions from this review.

This report will be supplemented at a later date with additional economic analysis of alternative development plans using LCA assumptions as well as assumptions provided by other IECs. In addition, modeling results of additional development plans prepared by MH in response to Information Requests in this proceeding have only recently been made available. LCA requires additional time to complete its assessment of these results. All of this analysis will be provided in Technical Appendix 9B as soon as the information can be evaluated.

II. Economic Analysis – Reference Scenario

A. Introduction

In this section of our report, we review MH's economic analysis comparing the net costs of 15 development plans under reference scenario assumptions.[3] MH also conducted economic uncertainty analysis, which we address in a later section of this report.

The following is a list of definitions of a few key terms used throughout this Technical Appendix, consistent with MH's use of these terms in its NFAT Submission:

> **Resource Option** – A particular generation plant type, transmission facility or load reduction program or set of programs (DSM) that MH could use to serve native load or to facilitate imports or exports.
>
> **Resource Plan or Development Plan** – A sequence of assumed energy resource additions, enhancements, or retirements to the MH system to meet system requirements over the planning period.
>
> **Scenario** – A combination of planning assumptions for parameters not associated with a specific resource plan or which represent sensitivity to resource option costs. For example, a change in natural gas prices would constitute a new scenario as would a change in resource capital costs.
>
> **Case** – A resource plan evaluated under assumptions of a specific scenario.

MH evaluated 15 development plans using SPLASH and spreadsheet economic models under reference scenario inputs and assumptions. MH compared the results of 14 of the plans with a plan it called the All Gas Plan, which only utilizes natural gas-fueled

[3] NFAT Submission, **Chapter 9: Economic Evaluations- Reference Scenario of the NFAT Application,** MH performed a detailed economic analysis of the 15 development plans discussed in **Chapter 8: Determination and Description of Development Plans,** which is summarized in Table 9.3 of the filing.

generation as potential new resource options. MH's economic analysis is, therefore, a comparative assessment of the development plans evaluated.

MH developed the reference scenario to model its view of the "most likely" future outcome for Manitoba. MH drew from *"2012 resource planning assumptions with the exception of adjustments, primarily downwards, to the electricity export prices."*[4]

MH conducted its analysis from the perspective of costs to domestic load. Payments to the province are treated as expenses, and costs and revenues of export energy sales are included. MH must recover the resulting net cost from its domestic customers.

This Section reviews MH's economic analysis methodology and metrics and provides LCA's suggestions and analysis of additional metrics that are commonly used in comparing utility resource plans.

B. Manitoba Hydro Economic Analysis Methodology and Metrics

MH describes its method of economic evaluation in Section 9.1 of the NFAT Submission and emphasizes that this piece of the filing is *"integral to resource decisions."*[5] MH calculated the incremental net costs of each development plan relative to another development plan in real or constant dollars. The analysis is essentially an unleveraged cash flow analysis in that it uses only the direct capital investments as cash requirements in each year such costs are incurred, thereby not incorporating any interest costs or depreciation per the typical accounting treatment of capitalized expenditures. MH compares the cash flows of each plan on a present value basis using a discount rate that MH estimates to be its weighted average cost of capital.

MH performed its economic analysis excluding sunk costs because *"these represent money already spent or commitments that cannot be changed relative to the decision point when choosing among plans."*[6] MH defines sunk costs to include costs *"prior to June*

[4] NFAT Submission, Chapter 9, p. 1.

[5] *Id.*, p. 2.

[6] *Id.*

2014...having been made to protect in-service dates for Keeyask and Conawapa generating stations as well as the option of a new US interconnection and new export sale agreements."[7]

MH's economic evaluations also disregard "*accounting for any aboriginal income-sharing,*" as MH considers it "*a relatively small portion of the benefits Manitoba Hydro provides directly to Manitobans.*" This is the one departure from the perspective of the costs to domestic ratepayers. To the extent there are aboriginal income-sharing payments in an alternative development plan, those payments are effectively an added cost to domestic ratepayers that is not accounted for in the MH economic analysis. MH does incorporate aboriginal income-sharing in the financial analysis.

MH used the All Gas Plan (Plan 1) under reference scenario assumptions as the reference case to which all other alternative development plans are compared. MH chose this plan to be the reference case because it was the least capital-intensive plan considered. MH did not use a "do nothing" alternative because the results of MH's resource needs assessment determined that new resources would be required to serve future load growth, and that a "do nothing" option was not a viable resource plan.[8]

Table 9.3 of the NFAT Submission summarizes MH's 15 development plans and is reproduced in Figure 9-1 below. The plans are listed in a numerical order designation ranging from Plan 1, All Gas, which is the least capital-intensive to Plan 15 which is the most capital-intensive.

Figure 9-1: Manitoba Hydro's List of 15 Development Plans[9]

The longer description of each development plan to the right clarifies the nomenclature used. In the short names "K" refers to Keeyask Generating Station (GS) and "C" refers to Conawapa GS. The two digits that accompany the K or C designation refer to their

[9] *Id.*, Table 9.3, p. 12.

planned in-service date (ISD); "C25," for example, refers to Conawapa in service in 2025. Similarly, the two digits that follow "Gas" indicate when the first gas unit is in service. "Gas" refers to natural gas-fueled generating capacity that can either be a simple cycle gas turbine "SCGT" or a combined cycle gas turbine "CCGT." "WPS Sale & Inv" refers to a 300 MW export contract between MH and Wisconsin Public Service (WPS), and the "Inv" designation means that WPS is investing in the US portion of the 750 MW interconnection facilities.[10]

The cumulative present value (CPV) of the capital investment in each of the 15 plans is summarized in a table in Figure 9-2. The table shows that the incremental investment for each of the development plans as compared to the All Gas Plan is higher at the end of 35 years than at the end of 78 years. This is due to the shorter lives of the natural gas and wind generating capacity. A study of this length must make assumptions regarding the replacement of some of the natural gas and wind generating capacity added in the first 35 years. MH assumed the natural gas and wind generation would be replaced with the same technology with the same cost and performance after year 35 as is available now. This result shows how large the investment is for the Keeyask and Conawapa facilities and that in three development plans MH is proposing to make those investments through the next 12 years and in three development plans through 17 years.

[10] *Id.*, p. 12.

Plans	Present Value of Total Capital over 35 years	Present Value of Total Capital over 78 years
1-All Gas	$1,363	$1,706
2-K22/Gas	$3,630	$3,878
3-Wind/Gas	$3,274	$4,214
4-K19/Gas24/250MW	$4,054	$4,338
5-K19/Gas25/750MW (WPS)	$4,164	$4,439
6-K19/Gas31/750MW	$4,250	$4,491
7-SCGT/C26	$4,407	$4,527
8-CCGT/C26	$4,604	$4,786
9-Wind/C26	$5,211	$5,444
10-K22/C29	$6,501	$6,610
11-K19/C31/250MW	$6,711	$6,877
12-K19/C31/750MW	$6,974	$7,121
13-K19/C25/250MW	$7,496	$7,611
14-K19/C25/750 (WPS)	$7,748	$7,885
15-K19/C25/750MW	$7,889	$8,026

Figure 9-2: Present Value of Total Capital Expenditures through 35 and 78 Years – Millions of 2014 Present Value Dollars

Evaluation Process

MH evaluates the development plans using the following process:

1. Develop plan specific inputs, such that the sequence of resources is defined to meet energy and capacity requirements of the MH system over the planning study period.
2. Develop scenario specific inputs (e.g., energy prices, discount rates)
3. Perform system simulation using SPLASH to determine production costs net of export revenue for the MH system, including existing resources and the plan specific resource changes.
4. Put the net costs/revenues and other outputs of the SPLASH simulation along with other plan-specific inputs, such as direct capital expenditures and fixed operation and maintenance (O&M) costs of the plan-specific resources, into the Economic Model to determine the present value of the costs associated with the

specific development plan. The Economic Model is a spreadsheet analysis performed on an unleveraged cash flow basis. Sources of plan-specific inputs are summarized in Figure 9-3 below.

Plan-Specific Inputs	Sources of Input for all Development Plans
Revenue:	
Contract revenue from proposed electricity export sales	Export sale contracts
Electricity export revenue from surplus power	Manitoba Hydro's consensus electricity export price forecast as used in the generation system model (SPLASH)
Cost:	
Capital investment	Manitoba Hydro capital cost estimates for each resource option including associated transmission for each development plan and transmission interconnection as applicable
Fuel	• Water rental rate from The Water Power Act • Consensus natural gas price forecasts from Manitoba Hydro's Energy Price Outlook as used in the generation system model (SPLASH)
Operating & Maintenance (O&M) including capital maintenance	Manitoba Hydro's O&M estimates for each facility in each development plan including capital maintenance items required over the life of the asset.
Imports	Manitoba Hydro's consensus electricity export price forecast as used in the generation system model (SPLASH)
Taxes	• Capital taxes based on The Corporation Capital Tax Act • Carbon tax on coal from the Climate Change and Emissions Reductions Act • Forecast of future carbon adder for Manitoba-based generation (federal/provincial)

Figure 9-3: Economic Evaluation- Summary of Revenue and Cost Inputs[11]

MH derives a majority of the inputs for its Economic Model from its generation system production-costing model, SPLASH. Inputs to the SPLASH model include *"Manitoba domestic load, demand side management, electricity export prices, natural gas prices, current*

[11] *Id.*, Table 9.1, p. 6.

and future carbon adders, and proposed export power sales."[12] Outputs include *"flow-related electricity export revenues and production costs such as fuel and variable O&M."*[13] The SPLASH model is explained in further detail the NFAT Submission in ***Appendix 9.2- Description of the SPLASH Model***.

Reference scenario inputs, as explained in the introduction to Section II of this Appendix, were based on *"2012 resource planning assumptions with the exception of adjustments, primarily downwards, to the electricity export price forecast described in* ***Appendix 9.3 – Economic Evaluation Documentation."***[14] The reference scenario is meant to model the *"most likely"* set of outcomes; key assumptions for the reference scenario can be seen in **Table 9.2** of the NFAT Submission.

Once the cash flows for each plan are determined, a discount rate is applied to calculate the NPV. MH states that because the discount rate *"is used to guide investment decisions based on uncertainty, a risk premium may be identified to arrive at a discount rate which makes the investor indifferent between cash amounts received at different points in time. In the case of Manitoba Hydro, the discount rate consists of the cost of financing, which includes a guarantee fee to the Province, and a return on equity as described in* ***Appendix 9.3 - Economic Evaluation Documentation."*** [15] As mentioned earlier the Economic Model uses real or constant dollars in its evaluation. Thus, MH utilizes a real discount rate, the interest rate for which the inflation escalation rate has been subtracted.

Study Period - 78 Years

The most notable characteristic of MH's economic analysis methodology is the 78 year study period of fiscal year beginning 2013 to 2090, inclusive. The 78 year study period is meant to reflect the fact that hydro assets typically have extremely long lives. MH concluded that the 78 year study period was needed to analyze the full economic life of both the Keeyask GS and Conawapa GS investments, given that the proposed

[12] *Id.*, p. 7.

[13] *Id.*, p. 8.

[14] *Id.*, p. 1.

[15] *Id.*, p. 9.

Conawapa ISD is 2025 or alternatively 2031. The 78 year study period encompasses the economic life of both proposed hydroelectric generating stations.

The MH economic modeling for the 78 year study period includes a 35-year detailed evaluation period. The SPLASH model simulates all 35 years of this period.

After 35 years, "*replacement capital costs are assumed for assets that reach the end of their economic lives before the end of the long-study period. In addition, a net production cost approximation is used beyond the 35-year study period extending fixed operating and maintenance costs throughout the economic life of all assets…and extending the average net revenues of the last three years in a development plan to capture the expected ongoing incremental revenues between development plans to the end of the study period.*"[16] For some plans, since Conawapa GS has a 2031 ISD, this means that the detailed modeling period captures only the first 16 years of operation of the Conawapa GS.

In determining the system net costs/revenues, SPLASH modeled the MH system for 99 different water flow years, representing the full history of water inflow data available at the time. The Economic Model incorporates SPLASH output that is the average of the output of the 99 years, and not the individual modeling of the water flow years.

As discussed in Technical Appendix 1: Resource Planning, MH adds enough resources to each development plan to meet dependable energy and capacity requirements through the first 35 years of the study period, 2013 through 2037. Over that period, MH has included forecasted growth in energy and peak load requirements, as well as allowed for expected generation retirement and the expiration of export contracts.

In Figure 9-1 above shows the initial resource options added to the system under each plan. Development plans that include the new hydroelectric facilities also include the addition of enough natural gas-fueled CCGTs and SCGTs to meet the dependable energy and capacity requirements of the MH system after the new hydroelectric facilities are in service.

[16] *Id.*, p. 9.

Within the detailed 35 year study period, the net production costs or revenues are determined through the use of the SPLASH model. The SPLASH model accounts for forecasted Manitoba domestic energy and peak loads, existing and potential future firm export contracts, forecasted export prices available from the Midcontinent Independent System Operator (MISO) market, MH facility fuel and emissions costs, MH purchase power costs from wind generation facilities, and water inflow assumptions from 99 possible water flow years.

After the initial 35 years, MH uses the following methodology to estimate the potential ongoing costs of each of the plans for use in comparisons to other plans.

1. No additional growth in energy or peak load requirements is estimated; therefore, there is no need to add additional resources beyond 2037.
2. O&M costs are extrapolated at the escalation rates assumed for generating and transmission plant placed in service as part of a specific development plan.
3. Replacement capital costs are added for any plant added prior to 2037 that has an estimated plant life such that the plant would 'retire' prior to the end of the 78 year study period.
4. Net production costs or revenues are held constant at their year 35 value on a real dollar basis.

MH uses these simplifying assumptions to capture costs and benefits of each of the alternative development plans over the last 43 years of the 78 year study period.

The 78 year Metric – Net Present Value

MH utilizes net present value (NPV) calculations as the primary economic metric for comparison of the alternative development plans. Present value analysis is a common approach for economic analysis of an investment in which annual costs and revenues are discounted to a common point in time for an equivalent comparative analysis.

The incremental costs of one plan versus another can be calculated on a year-by-year basis by subtracting the cash flows of one plan from another. One plan is usually chosen as the base case plan. MH selected the All Gas Plan (Plan 1) as the base case plan, since it requires the least capital investment.

MH's economic model derives the NPV (2014 is the present value year in the analysis) of the difference in costs over the 78 years between two plans.

This 78 year NPV is the metric which MH uses to determine which plan is lowest cost or most economic. As MH explains, the NPV is "*the amount of money, if invested today at a stated discount rate that would grow to an amount sufficient to finance and to provide a return on the investment over the life of the project. When comparing alternative development plans, the incremental NPV represents the incremental net benefits (or costs) associated with the increment of investment made of a higher cost investment option, e.g. the additional investment for the higher-cost option becomes the investment in the NPV calculation, the additional benefits (revenue) from a higher-cost option becomes the revenue in the NPV calculation.*"[17] Figure 9-2 shown earlier provided the present value of the capital costs in each of the development plans.

MH's economic analysis is an unleveraged cash flow analysis based on real dollars (constant dollars). The discount rate used with this analysis to produce the NPV is a real discount rate, excluding inflationary effects. The unleveraged cash flow method has several key characteristics:

1) There are no financing-related costs;
2) All annual costs during the development and construction of any capital project (in this case generation and transmission), are treated the same as if they were expensed cash requirements;
3) There is no corresponding capitalization to include elements such as interest during construction;
4) This approach does not translate capital expenditures into the series of annual revenue requirement dollars (depreciation, interest and return on equity as well as income tax effects which are not applicable for MH) that would be included in annual costs of service totals for ratemaking purposes.

The unleveraged cash flow approach is primarily a MH perspective, rather than a MH customers perspective. The unleveraged cash flow approach is commonly used, at least

[17] *Id.*, p. 2.

in preliminary economic analyses, when the analysis is focused on single investments (projects) that have short installation or construction periods. Generally anything more involved, such as development plan comparisons, would be better-served with financial analysis or at least, where a utility is involved, a revenue requirements analysis.

Over the life of an asset, the sum of present value of direct capital expenditure in each year of a project should be approximately equal to the CPV of the annual revenue requirements associated directly with the capital costs of the asset. This is provided that the correct discount rate, i.e. the weighted average cost of capital, is used to make the present value calculations. This means that at the end of the 78 year study period, the calculation of an NPV comparison between plans will be similar to the CPV revenue requirement comparison between plans. Nevertheless, it is only an approximation of a revenue requirements analysis comparison.

Reference Scenario Results

MH provides numerous tables in its filing comparing the incremental 78 year NPVs of each development plan.[18] One such comparison showing the NPV benefit for each plan relative to the All Gas development plan is included in Figure 9-4 below. The sequence of plans shown begins with the plan with the highest capital investment on top followed by development plans in order of decreasing level of capital investment.

[18] *Id.*, Tables 9.4, 9.5, 9.6, 9.7, 9.8, and 9.9.

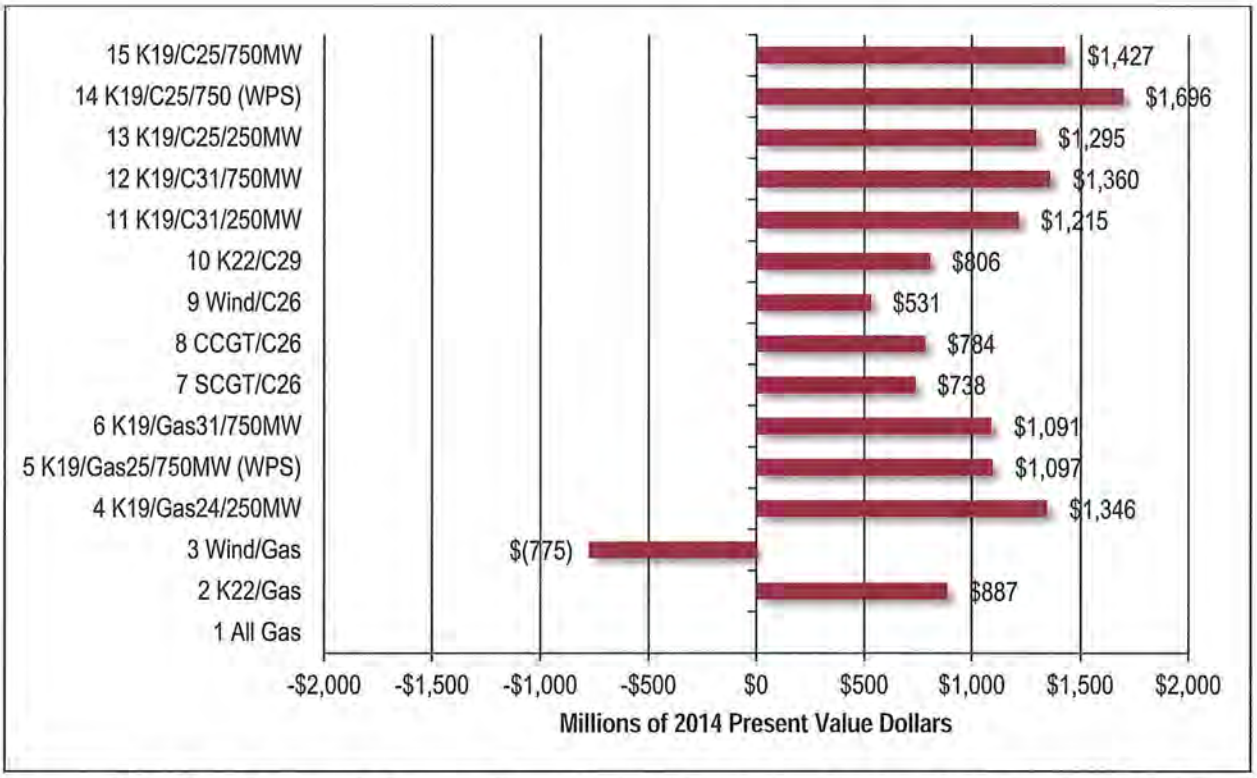

Figure 9-4: Development Plans – Benefits to Manitoba Hydro (Relative to All Gas) – Millions of 2014 Present Value Dollars.

MH observes that Plan 14, the Preferred Development Plan (PDP) with K19/C25/750 MW (WPS & Inv), is lower in cost than the Plan 1 All Gas base case by $1.696 billion of 2014 present value dollars at the end of the 78 year period. According to MH's results, the PDP is the lowest-cost of all the plans presented in the NFAT Submission.[19]

Next, MH compared the incremental NPV of four sets of selected plans in tabular form in order to estimate the benefits of a potential new interconnection. The four sets of plans include: (a) development plans with no new interconnection, (b) development plans with a 250 MW interconnection, (c) development plans with a 750 MW interconnection, and (d) development plans with either a 250 MW or 750 MW interconnection. LCA summarizes MH's observations and conclusions for each of the four comparisons in the following subsections.

[19] NFAT Submission, Chapter 14, p. 28:26-27.

(a) Development Plans with no new Interconnection,

First, MH compared the seven plans with no new transmission interconnection (Section 9.3.2.1 of the NFAT Submission). MH concluded that two plans, Plan 2 - K22/Gas and Plan 10 - K22/C29, provided significant benefits compared to the All Gas Plan, but that not much difference exists between these two plans. However, because Plan 10 K22/C29 requires a significantly greater capital investment, MH excluded it from further analysis.

MH used the Wind/Gas plan to provide a "*wind-based development plan which incorporates wind generation to meet energy requirements, combined with the most cost-effective natural gas-fired generation to provide capacity and to support the intermittent nature of the wind resource.*"[20] MH's analysis yielded a "*significantly negative*" NPV for the Wind/Gas plan in comparison to both the All Gas and the K22/Gas plans.[21] MH found all six of other development plans without a transmission interconnection preferable to the Wind/Gas plan.

The remaining three development plans (Plan 7 - SCGT/C26, Plan 8 - CCGT/C26 and Plan 9 - Wind/C26) were used to determine which of the "*non-hydro resources, when combined with the Conawapa [GS], will be selected for further revaluation*"[22] as each plan uses a different generating resource option to satisfy MH's resource needs prior to an in-service Conawapa. MH concluded that Plan 8 - CCGT/C26 could be ignored because the incremental 78 year NPV between Plan 7 - SCGT/C26 and Plan 8 - CCGT/C26 was very small; it was therefore not worthwhile to consider both plans. MH excluded Plan 8 - CCGT/C26 from further review.

Similarly, Plan 9 - Wind/C26 is the plan with the second-highest capital investment requirement among the plans analyzed in this group. Plan 7 - SGCT/C26 significantly outperforms Plan 9 - Wind/C26 leading MH to remove Plan 9 from further analysis under alternative scenarios.

---

[20] NFAT Submission, Chapter 9, p. 16.

[21] *Id.*, p. 17.

[22] *Id.*, p. 18.

Therefore, of these seven development plans without a new transmission interconnection, MH carried only three beyond the reference assumption economic analysis: Base Case Plan 1 - All Gas, Plan 2 - K22/Gas and Plan 7 - SGCT/C26. However, MH decided to use the Wind/Gas development plan in order to test a wind resource scenario.

(b) Development Plans with a 250 MW Interconnection

Second, MH considered plans with a new 250 MW interconnection (Section 9.3.2.2 of the NFAT Submission). Each of the three plans considered in this group yield an incremental NPV relative to the All Gas plan greater than $1.2 billion. MH's comparison of the three plans using the 78 year NPV metric shows they have very similar results. The net benefit of Plan 4-K19/Gas24/250MW in comparison to Plan 13-K19/C25/250MW is negligible and Plan 12-K19/C31/250MW is only marginally preferable to the two other plans. However, the substantial incremental investment associated with the addition of Conawapa distinguishes these three plans from the plans in the first set.

(c) Development Plans with a 750 MW Interconnection

Third, MH considered the five remaining plans (Section 9.3.2.3 of the NFAT Submission), which each include a new 750 MW interconnection. For the purposes of this report, LCA will focus on this set of plans in its review in ***Section II-C***. Based on MH's analysis and the 78 year NPV metric, the Preferred Development Plan, Plan 14 - K19/C25/750MW (WPS Sale & Inv) yielded the highest benefits despite its second-highest incremental capital investment. Plan 5 and Plan 14 (Preferred Development Plan) are very similar plans; Plan 5 uses natural gas-fired generation instead of Conawapa. The contrast between these two plans provides decision makers with two alternatives after Keeyask: the natural gas-fired generation and Conawapa. The other three plans propose scenarios where the 300MW WPS sale is not successful. Plan 15-K19/C25/750MW mimics Plan 14- K19/C25/750MW (WPS Sale & Inv) in this way.

(d) All Development Plans with either a 250 MW or 750 MW Interconnection

The final set of comparisons (Section 9.3.2.4 of the NFAT Submission) includes the development plans in sets two and three. This grouping shows that the Preferred Development Plan yields the highest net benefits of all the development plans. In the event that a 250 MW interconnection is built due to contracts or other external factors, MH concluded that the net benefits associated with a smaller line are larger than those plans with a 750 MW interconnection with natural-gas generation instead of Conawapa. In other words, MH found all plans with a 250 MW interconnection preferable to plans with a 750 MW interconnection with natural-gas fired generation instead of Conawapa. MH concluded that the 750 MW transmission interconnection was economically beneficial in the plans that include Keeyask and Conawapa.

C. La Capra Associates' Review and Concerns

LCA has a number of comments and concerns with MH's reference scenario analysis. Many of these concerns derive from the use of a 78 year study period. Specifically, the key issues we identified with the MH economic analysis approach are as follows:

1. The economic differentials at the end of 78 years between the alternative development plans is relatively small compared to the scale of the investments proposed in the Preferred Development Plan. The relative economic value of the plans considered can be materially affected by relatively small changes in assumptions.
2. A 78 year planning horizon analysis is particularly susceptible to forecast uncertainty.
3. MH's singular focus on the 78-year NPV metric as the basis for comparing alternative development plans is too limited in scope for a decision of this magnitude. MH does not offer any comparative metrics that capture important differences in the plans through the study period that bear on the timing of costs and benefits and the associated risks.
4. MH's use of an unleveraged cash flow analysis for its economic evaluation is a relatively simple approach for economic analysis of alternative plans with investments of the scale that are under consideration in this NFAT proceeding.

5. MH does not feature the annual differences in cash flow between the plans in its application, which is important foundational information for assessing relative ratepayer cost and risk implications between the alternative plans. LCA has prepared those comparisons.
6. MH does not provide a break even evaluation of the alternative plans. This analysis provides important information on the time required for proposed investments to provide benefits and on assessing implications of forecast risk. LCA has prepared comparisons of the plans using a cumulative NPV analysis.
7. MH does not provide conventional metrics comparing alternative plans over time. LCA has prepared comparisons of the alternative plans for 20 year, 35 year and 50 year NPV analysis and internal rate of return (IRR) analysis.
8. MH's economic analysis excludes sunk costs. In Part B of this Technical Appendix to be filed at a later date, LCA will provide a comparison of the total cost of the Preferred Development Plan to the All Gas Plan that considers the total cost of the resources to illustrate the impact that the sunk costs have on the comparative economics and ratepayers.

Each of these concerns is discussed further in this section below. The concerns discussed here are confined to the economic analysis methodology and the metrics used to evaluate the relative economic performance of the development plans. The 78 year planning horizon raises other concerns in resource planning that are addressed in LCA Technical Appendices on Resource Planning, Generation Alternatives, and Alternative Development Plans (Technical Appendices 1-3). For example, this Technical Appendix does not address concerns regarding the technology risk that exists over such an extended planning horizon.

The 78 year Economic Differentials Are Small

Figure 9-5 below puts in perspective MH's 78 year NPV values for each development plan. LCA has calculated the present value of the incremental capital costs for all the resource additions in each development plan relative to the All Gas Plan, which are shown in Figure 9-5 as the red bars. In comparison, the blue bars show the total incremental 78 year NPV values according to MH's results. The figure shows that the 78 year NPV of benefits are relatively small compared to the incremental investment

necessary to achieve them for the Preferred Development Plan and several of the more capital-intensive plans.

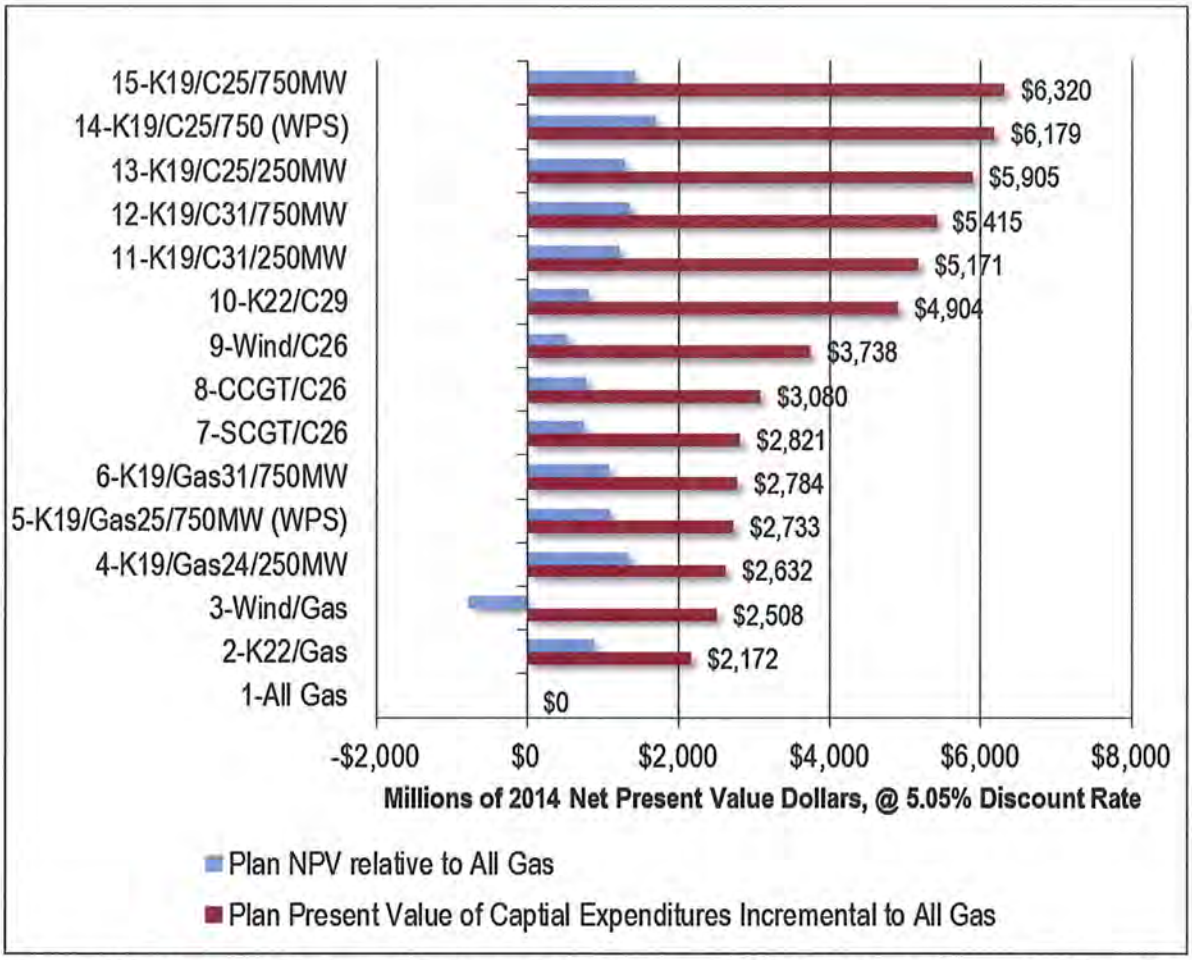

Figure 9-5: Present Value of Invested Capital and NPV of Costs for each Plan through 78 Years Relative to All Gas - Millions of 2014 Present Value Dollars

A 78 Year Planning Horizon Analysis Is Susceptible To Forecast Uncertainty

A 78 year study period is unusual in evaluating utility investments. While utility plant is used to serve customers reliably and economically over long lives, it is unusual for utilities to use economic analysis study periods that include the full plant life. All utility economic evaluations rely on forecasts of the economy, customer energy use, fuel prices, inflation, interest rates, operating costs, and more. There are risks inherent in forecasting over such a long period of time, and the estimates of benefits over that period of time are subject to much uncertainty.

- Forecast risk is inherently more uncertain when forecasts extend beyond 10 to 20 years. It is typical in the industry to conduct planning over 20 to 30 years, and even within these timeframes considerable uncertainty and scenario analysis is used to assess the inherent forecast risk. An analysis based upon forecasts of 78 years is even more susceptible to forecast error.
- It is common for decision makers to place much less weight on long-term forecasts of long-term benefits in conjunction with plans with high front-end costs. This means it is valuable to consider intertemporal issues, payback, IRR and other metrics that better articulate the temporal relationship between investments and the associated benefits expected from those investments.

Singular Focus On The 78-year Net Present Value Metric

The visuals depicting the reference scenario economic results in MH's filing and discussed in ***Section II-B*** only illustrate the economics of a single point in time (the 78-year NPV). The choice of such a long study period raises concerns over the uncertainty of outcome as risk increases over time.

It is a common practice in evaluating utility investments to look at the year-by-year effects of alternative resource options or resource plans. LCA proceeded to investigate the year-by-year impacts and estimated NPVs for different time periods using MH's reference scenario assumptions to understand certain questions like:

- How long it will take before a plan is more beneficial than the All Gas Plan?
- How much cost will accumulate due to high initial capital investment prior to a plan's ability to generate more revenues on an annual basis? and

- What sort of economic burden is MH taking on in the years leading up to its 78 year potential payoff.

MH's focus and reliance on the 78 year NPV metric for decision support fails to depict what occurs between year 0 and year 78, namely investment amounts and durations that affect risk. In this report, LCA provides annual differences between the unleveraged cash flows, break even years, CPV charts over time, and shorter time period incremental NPVs all for individual development plans relative to a base case. These additional metrics provide a more complete description of the temporal characteristics of the relative economics of the plans considered.

In addition, the NPV metric does not convey any information on the return on investment. Selecting the plan with the greatest benefits on an NPV basis does not necessarily provide the plan with the greatest return on investment. As can be seen in Figure 9-5, the plans with the largest NPV of benefits do not have the largest proportion of benefits to investment. IRR or other similar metrics would provide additional perspective on the results in considering the choice among alternative development plans.

Unleveraged Cash Flow Analysis

MH's 78 year NPV metric is just one way to look at comparative economics of alternative development plans. Considering the magnitude of the investments and the variability in the scenario and plan assumptions, there will always be additional perspectives regarding the likelihood of a particular scenario or regarding different scenario assumptions (characteristics). LCA believes it is more appropriate to look at how each plan's incremental costs translate into ratepayer impact in a revenue requirements analysis. However, much can be learned with the development of additional metrics, including looking at time periods much shorter than 78 years, using the unleveraged cash flow approach of the NFAT economic analyses.

In the following sections, we discuss the economic analysis results within the NPV methodology proposed by MH. In fact, most of the following discussion utilizes modeling results developed by MH. While we do not endorse MH's use of unleveraged cash flow analysis for an investment proposal of this magnitude, LCA believes that

reviewing the MH methodology without changing the modeling output results calculated by MH is a useful first step to demonstrate the additional viewpoints and metrics directly taken from MH analysis. In the latter part of this document we will focus on alternative assumptions and additional analyses that LCA suggests are important for the PUB Panel to see and understand in helping them formulate their opinion on the merits of the request by MH to endorse the Preferred Development Plan which would develop the Keeyask and Conawapa Generating Stations, and an additional transmission interconnection with the US.

Comparison of Annual Cash Flow Requirements of Plans

In this section, LCA provides examples of the comparison of the alternative development plans on a year by year incremental cash flow in real 2012 dollars[23] of each plan over the study period using all MH's reference scenario assumptions and model results. The year by year values shown here are MH's results, using the annual costs which were provided by MH from their economic analysis of the plans and used by MH to determine their 78 year NPV results. LCA's analysis here simply displays the annual detail from the MH analysis. The following figures provide additional, useful information for the decision maker, who can visualize and quantify the net costs and benefits of each plan over time.

For the purposes of illustrating year by year effects, we chose the All Gas Plan as the Base Case (as did MH) and four development plans: the Preferred Development Plan (Plan 14) and Plans 4, 5, and 6 which include Keeyask, add natural gas-fired generation capacity instead of Conawapa, and have variations in the amount of transmission included in their plans. As in MH's comparative analysis, LCA uses the All Gas plan as the base case for comparative analysis of these plans. It is important to keep in mind

[23] It is important to clarify that the MH economic analysis and modeling was indeed calculated utilizing annual cash flow implications that are expressed in 2012 real or constant dollars. Real or Constant dollar usage has removed inflation escalation. In the same analysis, MH utilizes present value techniques to capture the time value of money. These present value dollars have a reference year. MH has chosen 2014 as the present values year. Thus you will see in this report the use of the term 2014 Present Value Dollar basis.

that the PDP and Plan 5 add natural gas-fired generating capacity after the plan's hydroelectric development of either Keeyask and Conawapa or just Keeyask, is completed.

In this section we will start with the annual net costs of the five plans. The incremental costs involved were described earlier in the Plan Specific Inputs table. The annual costs developed by MH in their analysis of the All Gas Plan are presented in Figure 9-6 below. The costs depicted are the incremental investment and O&M costs required by the All Gas Plan and the production costs (net of export revenue) of the total generation system of MH which were developed utilizing the SPLASH model. The figure shows in years where the All Gas Plan where the value of net production costs is positive, which are years prior to capital investments when the system is showing a net revenue (i.e., export revenues exceed MH production costs and incremental capital investment). By 2027, the All Gas Plan has a net annual incremental cost (shown as negative) as the costs to add new resources, operate all new thermal resources and pay for all imports are greater than export revenues. The annual All Gas Plan incremental costs are negative (i.e., increase costs) for the remainder of the study period growing to over 600 million, 2012 dollars.

The Commercially Sensitive Information contained within this report has been redacted in accordance with the protective order.

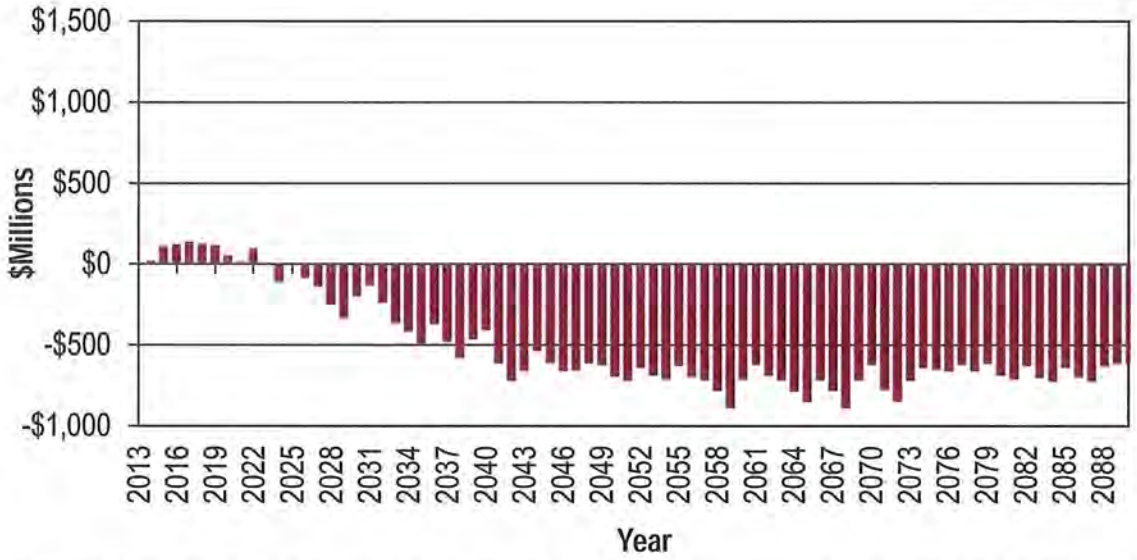

Figure 9-6: Plan 1- All Gas Annual Cash Flow Reference Scenario in Millions of Real 2012 Dollars

Figures 9-7 to 9-10 show the annual costs for the other four plans chosen for comparison, Plan 14 (Preferred Development Plan K19 C25 750MW WPS & Inv), Plan 4 (K19/Gas 24/250MW), Plan 5 (K19 Gas 24 750MW (WPS & Inv) and Plan 6 (K19/Gas31/750MW). Since each of these plans include the construction of the Keeyask GS, we can see in the first five or so years the cash flow is negative since there are substantial cash needs for the construction of Keeyask GS. The second period of years shows positive cash flow just after the Keeyask GS is placed into service.

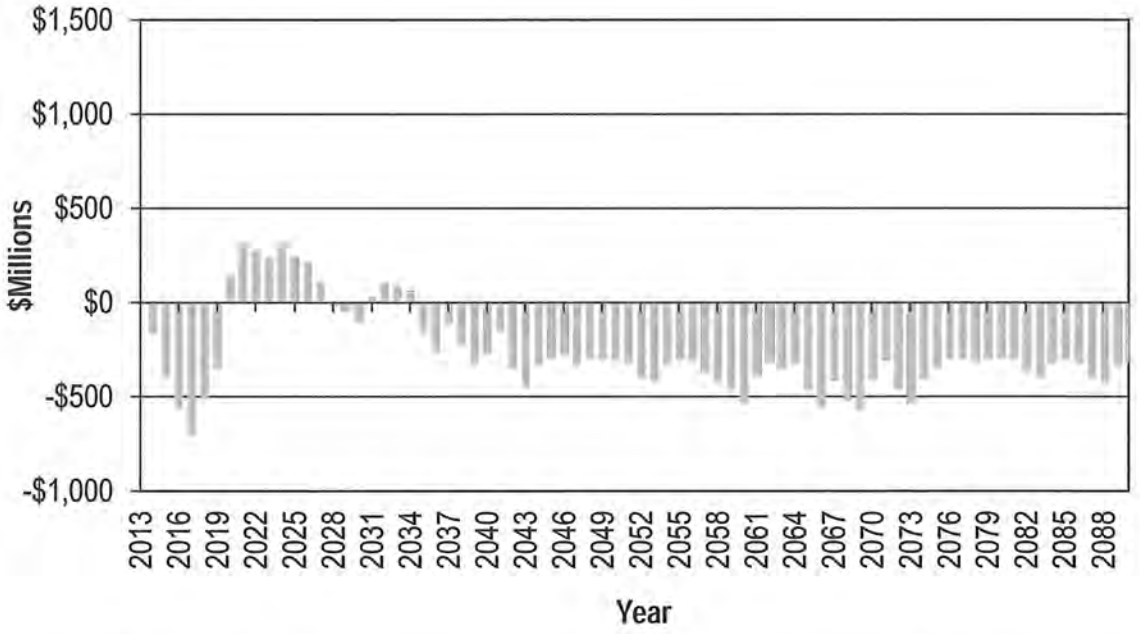

Figure 9-7: Plan 4 - K19/Gas24/250MW Annual Cash Flow Reference Scenario – Millions of 2012 Dollars

The Commercially Sensitive Information contained within this report has been redacted in accordance with the protective order.

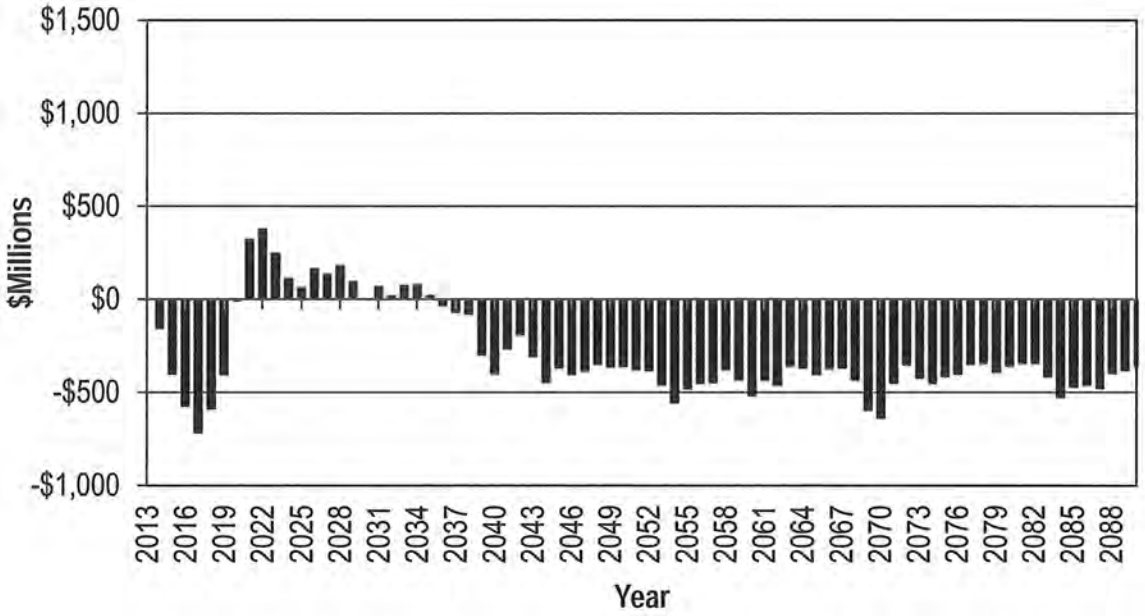

Figure 9-8: Plan 5 – K19, Gas 24, 750 MW (WPS & INV) Annual Cash Flow Reference Scenario in – Millions of Real 2012 Dollars

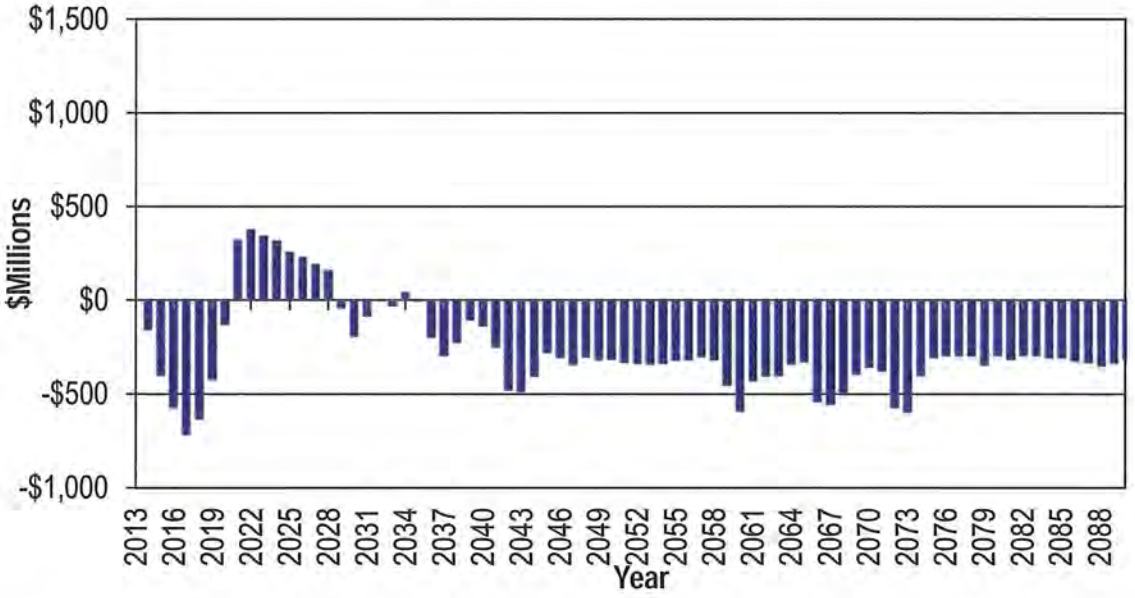

Figure 9-9: Plan 6- K19/Gas31/750MW Annual Cash Flow Reference Scenario – Millions of 2012 Dollars

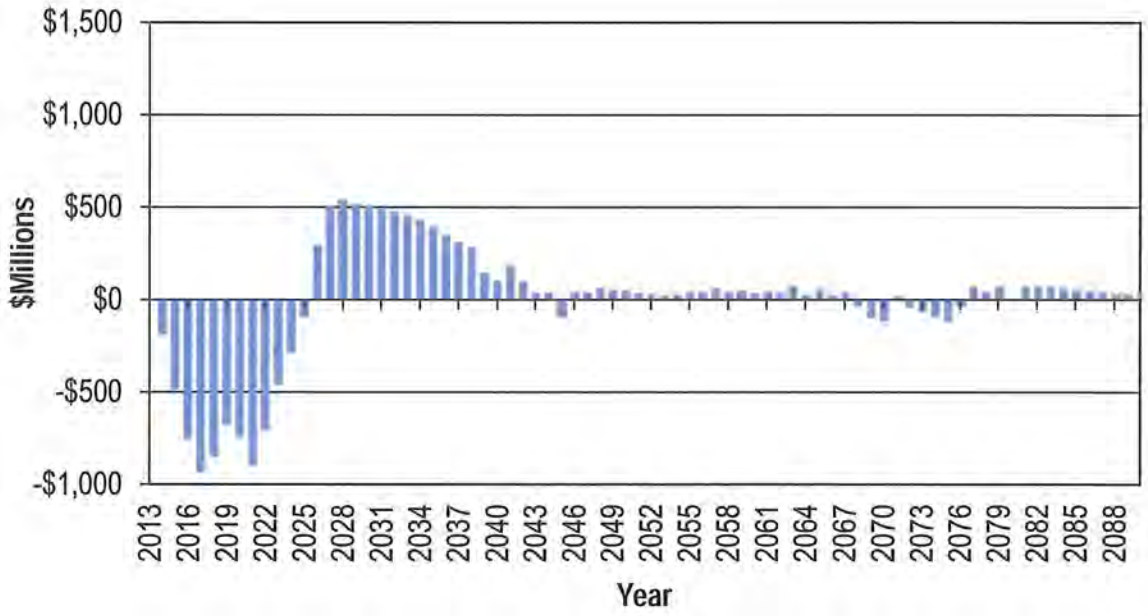

Figure 9-10: Plan 14 - Preferred Development Plan Annual Cash Flow (Real 2012 Dollars)

Figures 9-11–Figure 9-14 below, show the incremental cash flow or cash flow differences of Plan 5 and Plan 14 respectively compared to the Base Case All Gas Plan. A negative number indicates that the Plan being compared to the All Gas Plan has greater cash requirements than the All Gas Plan. Plan 14 has annual cash requirements greater than the All Gas Plan in the initial years. Plan 14 – the Preferred Development Plan in 2026 begins having substantially less cash requirements than the All Gas Plan, and throughout the study period MH analysis shows that Plan 14 is lower-cost than Plan 1 All Gas on a cash flow basis varying between $500 million and $900 million annually. Similarly Plan 5 in 2021 begins having substantially less cash requirements than the All Gas Plan, and throughout the study period MH analysis shows that Plan 14 is lower-cost than Plan 1 All Gas on a cash flow basis up to $500 million annually.

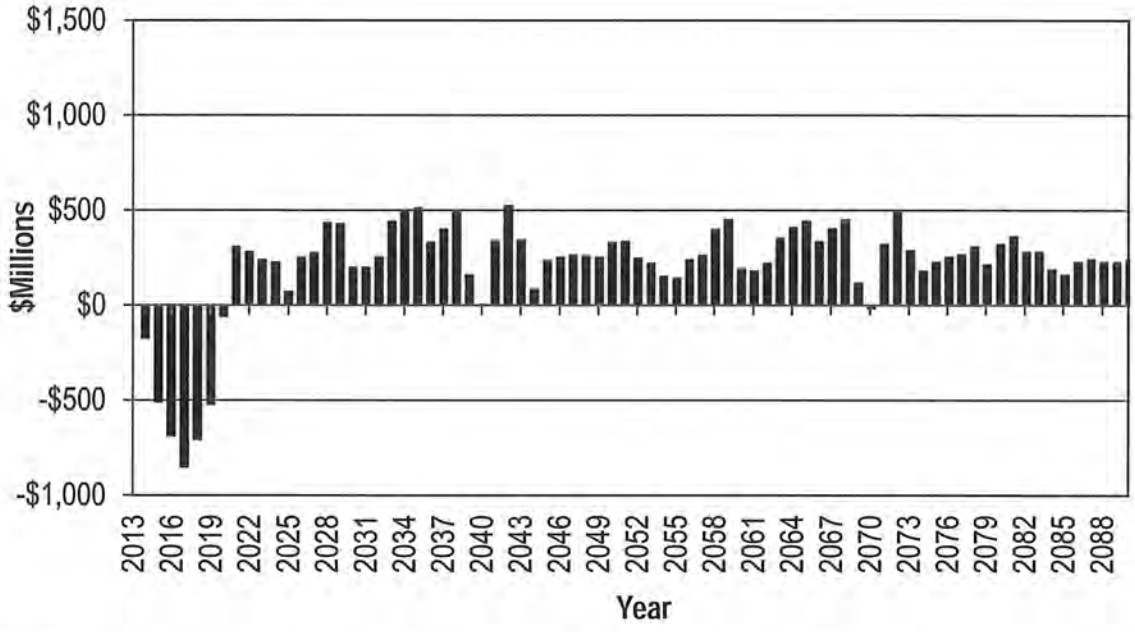

Figure 9-13: Incremental Cash Flow for the Plan 5 Cash Flow Compared to the All Gas Plan - Millions of 2012 Real Dollars

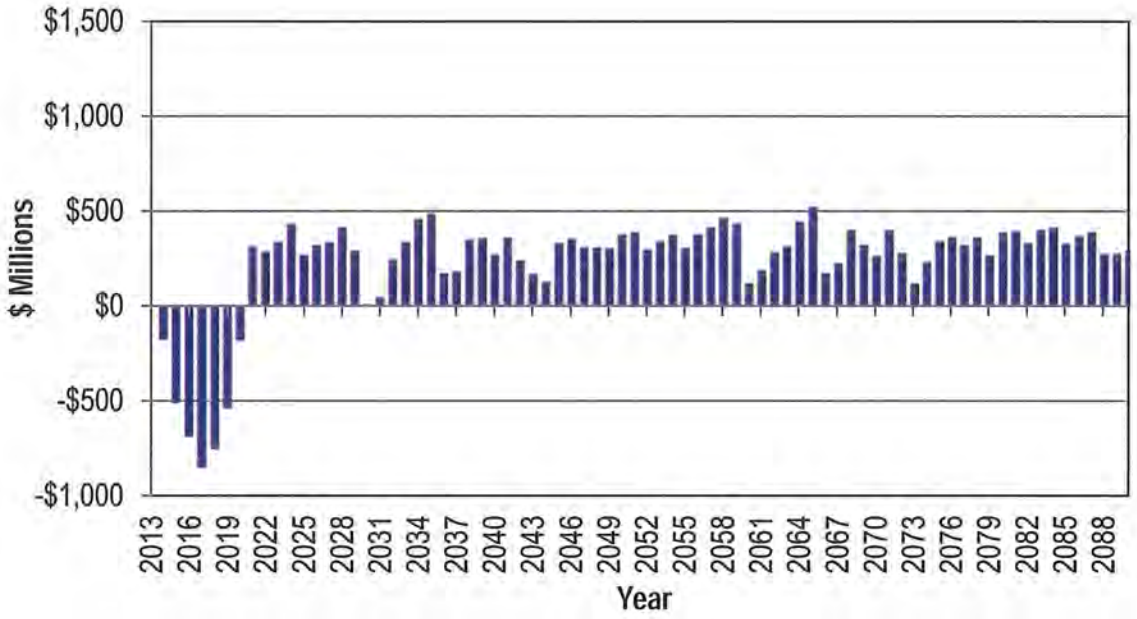

Figure 9-14: Plan 6- K19/Gas31/750MW Incremental Cash Flow Compared to the All Gas Plan (Real 2012 Dollars)

By inspection, we can see how much more upfront capital investment is required for Plan 14 in both amount and duration of payments. However, more costs are associated with the later years in Plans 4, 5 and 6. After 2026, when Conawapa is in service, Plan 14 accrues more revenues and thus has more positive cash flow.

While these annual 'plan' costs are useful in understanding the costs associated with a particular plan, the NPV is used to indicate the economics of an investment. As explained earlier, the "do nothing" plan is not an option in order to preserve the threshold of reliability utility customers require. Thus comparisons of plan economics are usually shown as the costs of the plan after subtracting the Costs of the Base Case, in this analysis the All Gas Plan.

Break Even Evaluation Of The Alternative Plans

Another potentially helpful graphic for decision makers is an incremental CPV chart of each plan over time relative to the All Gas Plan. The CPV is calculated by taking the

annual costs of each plan, as shown above, calculating the annual difference between the plan and the base case and discounting each to get an annual present value. The CPV we show below is the sum of the present value for each year's incremental cash flow from the beginning of the study period through that point in time.

CPV charts demonstrate how beneficial a plan is as compared to a base case from the start of the study to a given point in time; the CPV is essentially the NPV at a point in time. Thus the final year's CPV matches the 78 year NPV metric used by MH. These visuals lead more directly to an understanding of the path towards the final 78 year NPV value used in MH's filing and the year the development plan breaks even on a present value basis when compared to the base case (All Gas). They show how quickly the upfront investment pays off as it is discounted over time.

Plans 4, 5, 6 and Plan 14 as examples

Again, we used Plans 4, 5, 6 and 14 in Figure 9-15 to illustrate the value of these additional metrics. The CPV charts similarly use MH's assumptions associated with the reference scenario.

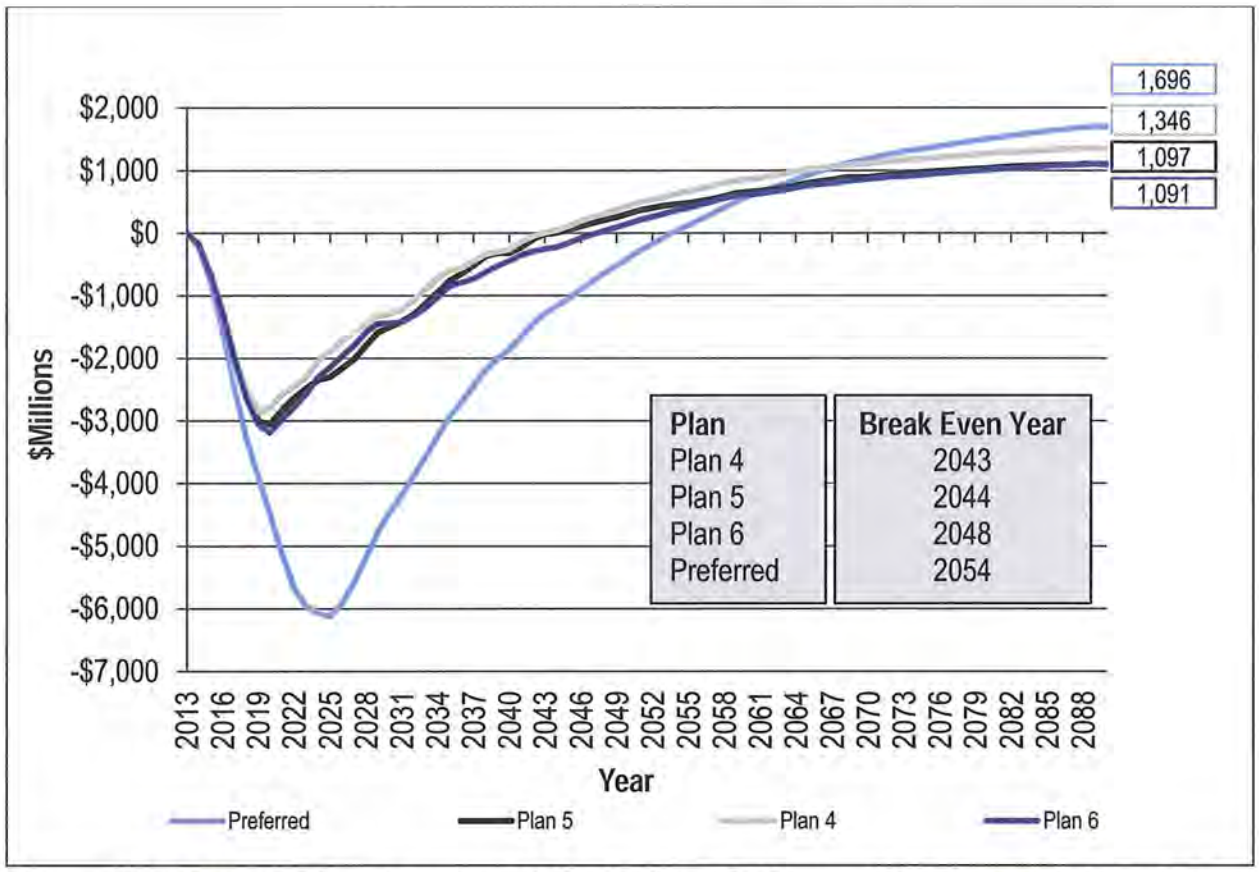

Figure 9-15: Cumulative Incremental Cash Flow Difference for Plans 4, 5, 6, and 14 as Compared to the All Gas Case – Millions of 2014 Present Value Dollars

As discussed above, the point at which each curve ends represents the 78 year incremental NPV value difference versus the All Gas Plan. However, there are many more aspects to this chart that could be beneficial to the decision maker beyond the point associated with year 2090.

The lowest point of the curve indicates when the annual net incremental costs of the specified plan begin to be lower than the Base Case (All Gas Plan). It is also significant to note how low the curve reaches; the lower the lowest point, the more cash outflow that has occurred for that plan on a present value basis as compared to the Base Case All Gas Plan. The Preferred Development Plan has a lowest point CPV of costs relative to the All Gas Plan of over $6 billion, double that of Plan 5. This is directly related to the significant capital investments required for Keeyask and Conawapa.

The point where the curve reaches zero (crosses the x-axis) is the point in time when the plan is at break even with the All Gas Plan. Prior to that point, the respective plan has a NPV cost more than the Base Case All Gas Plan. Plan 5 reaches the break-even point with the All Gas Plan in 2044. The Preferred Development Plan reaches a break-even CPV with the All Gas Plan later (2054) and experiences a much greater cash outflow as compared to the All Gas Plan in a single point in time. By the end of the 78 year study period, the Preferred Plan achieves a better 78 year NPV than Plan 5. It is also not surprising that there are only small differences among Plans 4, 5 and 6 in terms of the shape of these curves and Break Even year. Each of these plans has the primary characteristics of including Keeyask GS in 2019 and all generation thereafter is natural gas-fired.

While these figures have been selected as examples, they do show a specific comparison. The difference between the two plans is that Plan 14 (the Preferred Development Plan) includes Conawapa while Plan 5 uses natural gas generation instead of Conawapa. These charts also reveal the break even years for both plans as compared to the All Gas Plan (the point at which the curve crosses the x-axis). Plan 5 breaks even on a present value basis compared to All Gas at year 2044; the Preferred Development Plan doesn't break even on its costs relative to the All Gas Plan until 2054. In addition it is not until around year 50 of the study period, 2061, that Plan 14 becomes lower cost than Plan 5 on a CPV of cash flow basis. This is using MH-generated modeling results, unaltered by LCA.

Similar figures can be developed for any resource plan comparison for the plans studied by MH, based upon MH modeling results. LCA has prepared a working spreadsheet model that can select any comparison. This model is included in our filed workpapers. It does not contain any Commercially Sensitive Information.

LCA created figures similar to Figure 9-15 for each of the resource plans studied in the NFAT application. Below is a table (Figure 9-16) summarizing the break-even years for each development plan relative to the All Gas plan. In reference to the graphs displayed earlier in this section, it is the point at which each of these graphs would cross the x-axis in their incremental CPV chart relative to the All Gas case.

Plan	Break Even Year (All Gas) Base Case
2 - K22/Gas	2051
3 - Wind/Gas	N/A*
4 - K19/Gas24/250MW	2043
5 - K19/Gas25/750MW (WPS)	2044
6 - K19/Gas31/750MW	2048
7 - SCGT/C26	2059
8 - CCGT/C26	2059
9 - Wind/C26	2064
10 - K22/C29	2064
11 - K19/C31/250MW	2059
12 - K19/C31/750MW	2058
13 - K19/C25/250MW	2058
14 - K19/C25/750 (WPS)	2054
15 - K19/C25/750MW	2057

**note that N/A signifies that a Plan has higher CPV of costs than the All Gas Plan through 2090*

Figure 9-16: Break-Even Years for Development Plans Relative to All Gas on a CPV Basis

The break-even table shows that no single development plan breaks even for the first 30 years. Most cases don't break even until the 40 year mark. The table also shows that Plans 4, 5, and 6, which all have Keeyask GS and some additional new transmission interconnection before adding natural gas generation, have the shortest periods until they break-even and then become lower cost than the All Gas Plan. These plans break-even earlier than the Preferred Development Plan (Plan 14) by 6 and 11 years.

Alternative Economic Metrics Comparing Alternative Plans

While we recognize some value in viewing the potential impact of these development plans over a long time horizon given the long life of hydro assets, we believe that viewing the results through other, shorter time periods can provide additional and perhaps even more valuable information to decision makers. For the purpose of this analysis, we chose to calculate the CPVs for three additional time periods as follows:

a. 20 years - In our experience, this is frequently the longest period reviewed for rate making and other regulated purposes. Wholesale changes in the political, physical, and financial landscape can be expected over 20 years, making the modeling of even just those 20 years subject to considerable uncertainty. While these reasons may or may not apply equally in a proceeding such as the NFAT, we believe this is still a helpful lens through which to view the results. We recognize that this 20 year look is important to decision making for issues such as capital rationing, inter-generational equity, and the confidence in the assumptions made in an economic analysis. It is for this reason that few decisions are made based on benefits that take significantly longer than 20 years to accrue. However, we concede that this period would cover less than ten years of in-service time for the proposed Conawapa GS. Longer periods of time are also appropriate to analyze long-lived investments.

b. 35 years - This is the period over which actual production cost modeling output exists. As part of the LCA review, we investigated the basis for all economic analysis over the entire 78 year study period. MH was very forthcoming in discussing that its analysis is based upon detailed modeling for the first 35 years of the study period. The detailed modeling with SPLASH began with a forecast of MH customer energy usage and dependable energy requirements, peak system demand, impacts of current DSM programs, and commitments for firm export sales. The existing MH generation system and generation additions for each plan were then modeled to serve domestic customer needs and meet export sales commitments while optimizing market opportunities through the SPLASH model in order to determine net revenue/production costs for the first 35 years of the analysis beginning in 2014 for the various plans and uncertainty scenarios. This net revenues/production costs model was based on numerous assumptions including forecasts for market energy prices from outside experts. The annual net revenue/production costs were combined with export firm contract revenues, new generation construction annual cash flows, new generation annual O&M costs, water rental costs and capital tax charges to complete the economic analysis. Beyond 35 years the analysis was based solely upon the continuation of the annual costs of year 35 in real dollars except for replacement of generating assets assumed to have useful lives less than the study period. The analysis after year 35 is merely an extrapolation of the conditions at the end of this modeling period. Even though this extrapolation may be a valid consideration in any long-

term modeling, the economic implications of the results in this period are generally viewed as more suspect, given the uncertainty of any assumptions and in this case the simplistic estimation of annual effects after year 35. LCA maintains that understanding the relative results without any end effects would provide valuable insight.

c. 50 years – This is the period over which the financial model was run. This period extends through year 2062. This would capture at least 30 years of operation of the proposed Conawapa GS and over 40 years of the operation of the proposed Keeyask GS. This analysis period would even include 15 years beyond the end of the detailed modeling analysis.

By reviewing the results of these various time periods, decision makers can understand where the relative benefits and costs of various development plans occur. This can be especially useful in reviewing risk, since the risk profile of different development plans can vary greatly over time. Figure 9-17 below delineates the various study periods in the CPV analysis.

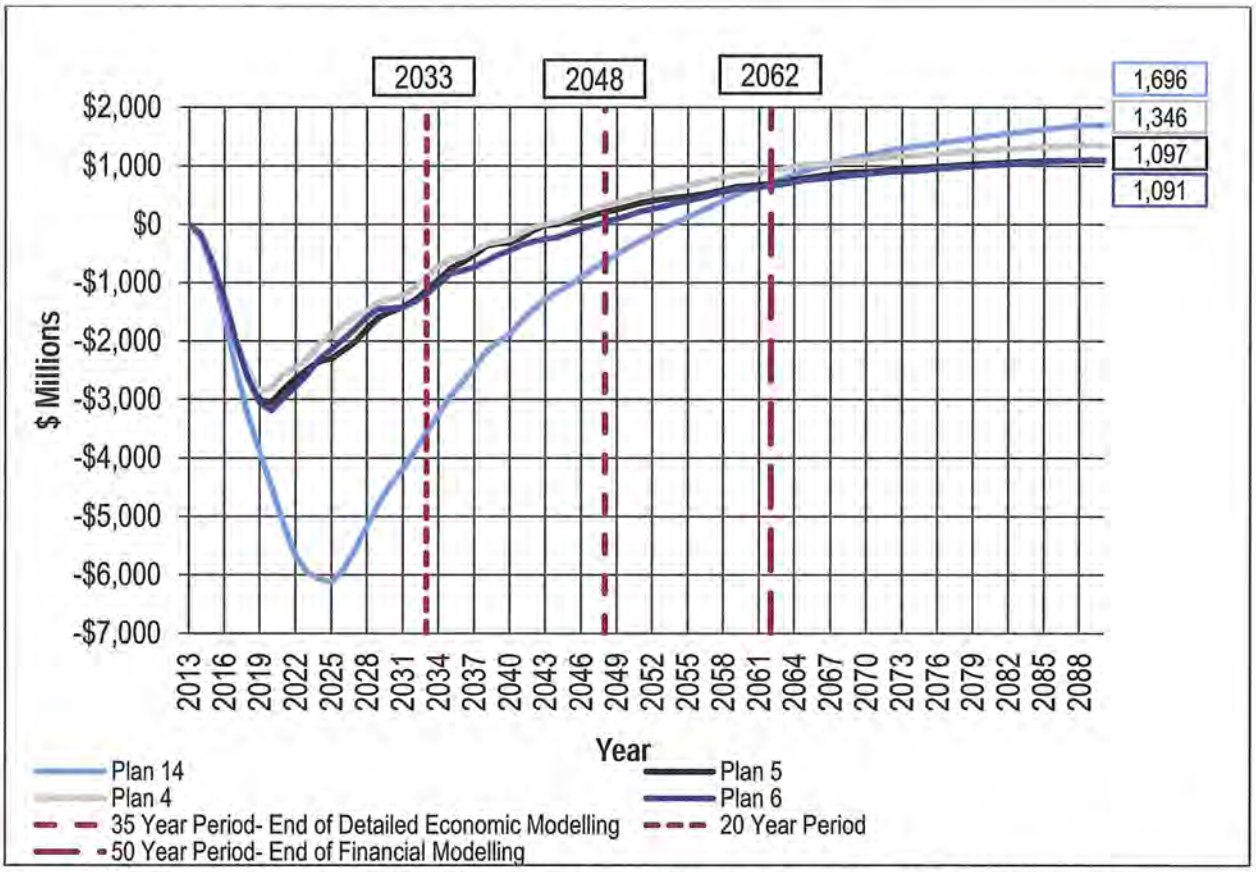

Figure 9-17: Incremental CPV Plan 4, 5, 6 and Plan 14 Relative to All Gas Case

The bar chart below (Figure 9-18) elaborates on the observations from the break-even table. Namely, every case is significantly worse than the All Gas plan in a 20 year period. As one might expect, since the more capital-intensive plans accumulate savings versus All Gas over time, all of the plans with higher investment in generating resources have higher cash flow requirements for a first 20 years of the study period. For example, in plans where Keeyask is added in 2019, the earliest that a generation station is added, Keeyask would only be in operation for 14 years at the end of year 2032. However this does show the magnitude of extra costs that are incurred during the first 20 years relative to the All Gas Plan. We see plans including both hydro facilities have costs approximately $4 billion higher than Plan 1 - All Gas. Plans with just Conawapa added in 2026 have over $2.5 billion higher costs than the All Gas Plan. Other plans have less than $1.4 billion higher costs than the All Gas Plan.

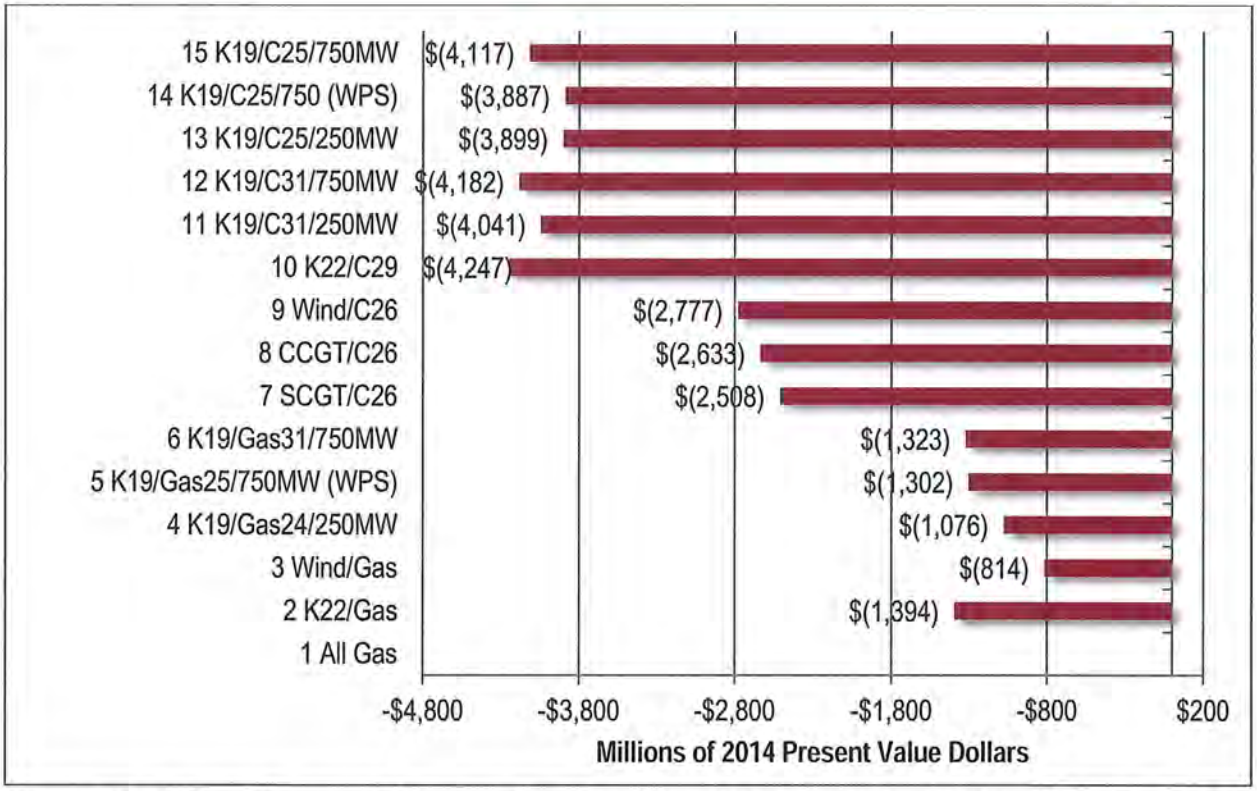

Figure 9-18: Development Plans – Benefits (Costs) to Manitoba Hydro (Relative to All Gas) after 20 years – Millions of 2014 Present Value Dollars.

The break-even Figure 9-16 in the prior section above showed that only two plans have reached the point where they are providing lower costs on a present value basis prior to 2047, the 35th year of the study period. Plans 4 and 5 are similar in that they are characterized by Keeyask in-service in 2019, do not include Conawapa, include new natural gas-fired generation first added in 2024 or 2025, and both have a new transmission interconnection. Utilizing MH assumptions and modeling results of year by year costs that are the basis for the analysis in the NFAT Submission, Plan 5 and Plan 4 would have lower costs than the base case at the end of 35 years of the study period on a CPV basis of $161 million and $254 million respectively. Conversely, even though MH observes that the Preferred Development Plan (Plan 14) has the lowest cost on an NPV basis at the end of year 78, it has a more negative CPV than the Base Case All Gas Plan by $766 million through the first 35 years. One would also observe that there are

only 6 out of the 14 other plans that have higher costs than the Preferred Development Plan through 2047, the first 35 years as seen in Figure 9-19 below.

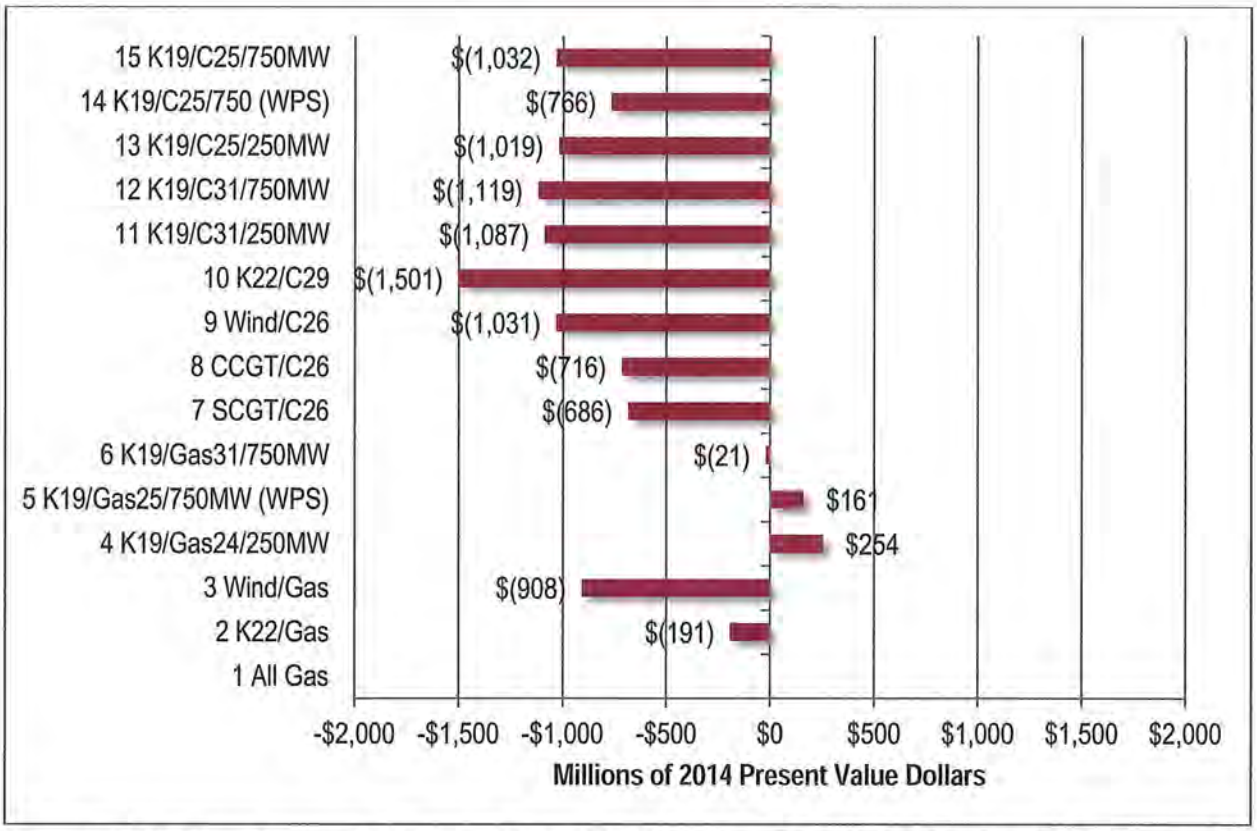

Figure 9-19: Development Plans – Benefits (Costs) to Manitoba Hydro (Relative to All Gas) after 35 years – Millions of 2014 Present Value Dollars.

As we look at how the plans compare by the end of 2062 in Figure 9-20, the 50 year study, we see that utilizing the exact year by year results MH used in its filing, only three plans, Conawapa plans (Plan 7 & 8) and Plan 3 Wind Gas, have higher costs than the All Gas Plan on a CPV basis. This is consistent with their break even years on our earlier table showing years after 2062. The bar graph below (Figure 9-20) demonstrates that even by 2062 years, Conawapa plans (11-15) have still higher costs than their natural-gas fired alternatives (Plans 4-6). The Preferred Development Plan has a 50 year CPV similar to Plans 4 and 5. The best plan on a 50 year CPV basis shows to be Plan 4 K19 Gas24 250MW. Only the 78 year incremental NPV chart relative to the All Gas case

shown as in Figure 9-4 earlier and in MH's filing presents the Preferred Development Plan as the lowest cost.

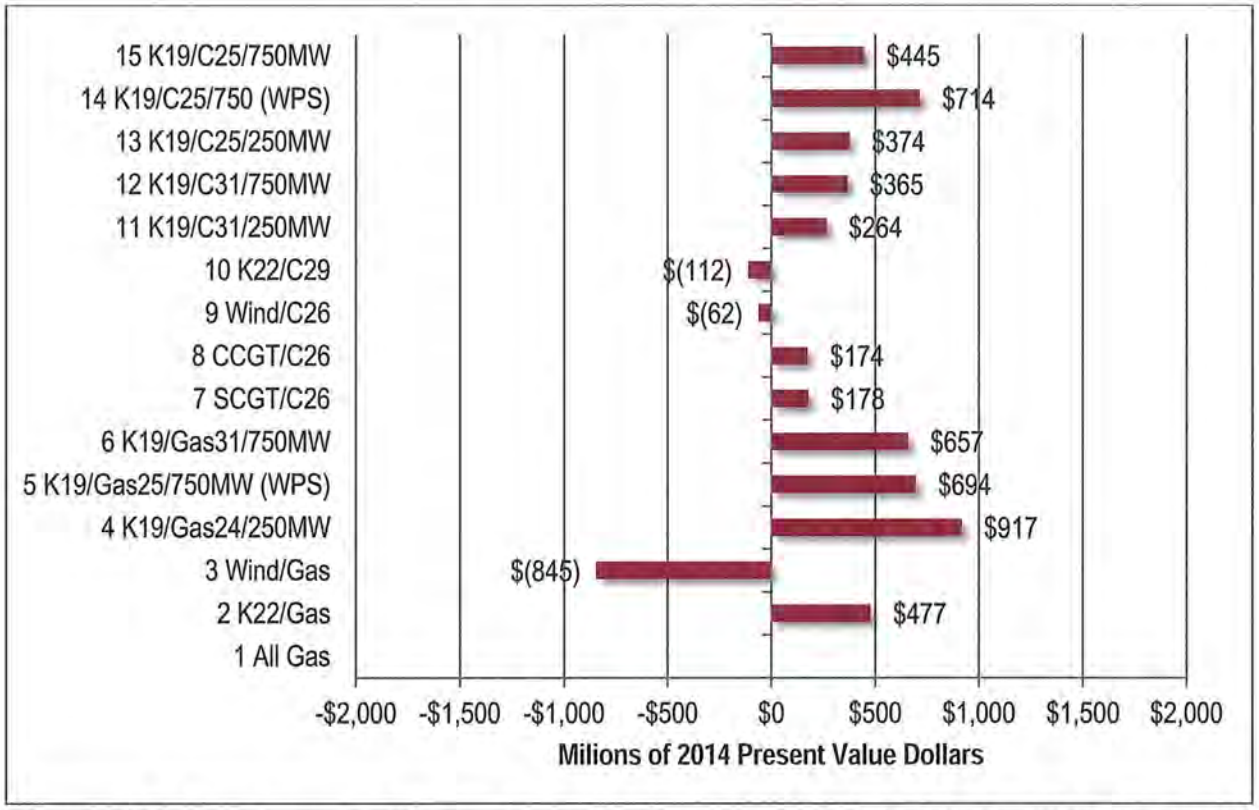

Figure 9-20: Development Plans – Benefits (Costs) to Manitoba Hydro (Relative to All Gas) after 50 years – Millions of 2014 Present Value Dollars.

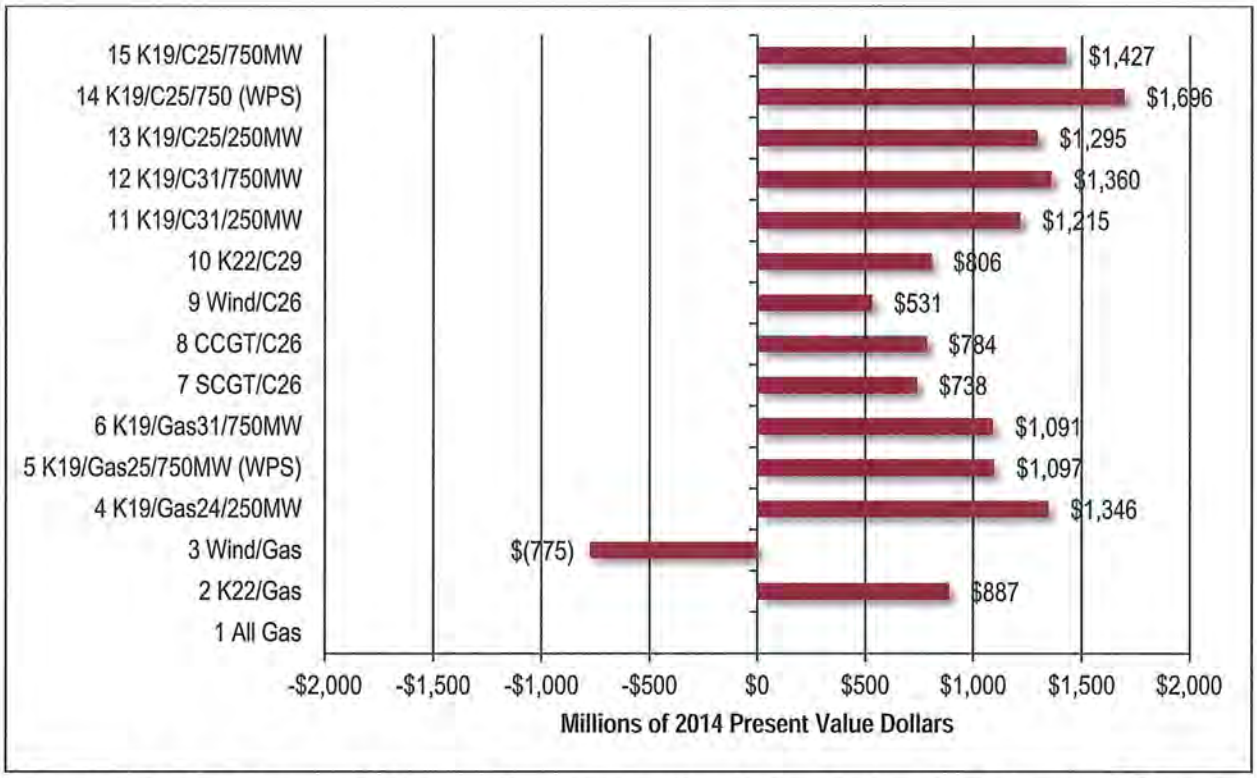

Figure 9-4: Development Plans – Benefits to Manitoba Hydro (Relative to All Gas) – Millions of 2014 Present Value Dollars.

The Internal Rate of Return Metric for Comparing Resource Plans

In addition to present value metrics that we have been discussing, some decision makers find it helpful to understand the benefits of making higher investments in generation and transmission resources in terms of a percent return. In the past, MH had generated IRR metrics for proposed hydroelectric generation projects. MH did not file IRRs in the NFAT application. LCA developed the IRRs for the 14 resource plans by using the annual cash flows incremental to the All Gas Plan. The annual cash flows are the annual values that resulted from MH modeling results. The IRRs were developed by determining what rate of return, if used as a discount rate, would make each individual plan have a 78 year NPV difference versus All Gas equal to zero. If a plan has a positive incremental NPV compared to All Gas than the IRR will be greater than the 5.05% real discount rate used by MH in the economic analysis.

Resource Plan Comparative Results using the Additional Metrics

Below, we have rendered a summary table (Figure 9-21) that synthesizes highlights from the CPV figures and the IRR analysis. This table repeats the values provided earlier in the break-even table. The column of 78 Year NPV represents the results published by MH in the NFAT Submission and discussed earlier. The 20, 35, and 50 year CPV columns are the values shown on the bar charts discussed earlier in this section.

We see that the while over 78 years the IRR values are indeed greater than the discount rate of 5.05%, the highest IRR realized after 78 years utilizing all of MH results is 7.1% attributed to Plan 4 K19/Gas/250 MW. Plan 14, the Preferred Development Plan K19/C25/750 MW, has an IRR of 6.15%. We can also observe from the table that since all 20 year CPV metrics are negative, that the lowest-cost plan through the next 20 years is the All Gas Plan. As observed earlier from the bar charts, only two plans are lower cost than the All Gas Plan on a cash flow basis over the next 35 years, Plan 4 and Plan 5. Each of these plans has the Keeyask GS followed by natural gas generation and a transmission interconnection expansion. Over the next 50 Years, most alternative plans are lower cost than the All Gas Plan, with the lowest cost plan over the next 50 years being Plan 4.

Plan	78 Year PV of Total Capital	Incremental to All Gas					
		78 NPV	50 CPV	35 CPV	20 CPV	78 Year IRR	Break Even Year
2-K22/Gas	$2,172	$887	$477	($191)	($1,394)	6.63%	2051
3-Wind/Gas	$2,508	($775)	($845)	($908)	($814)	N/A	N/A
4-K19/Gas24/250MW	$2,632	$1,346	$917	$254	($1,076)	7.10%	2043
5-K19/Gas25/750MW (WPS)	$2,733	$1,097	$694	$161	($1,302)	6.69%	2044
6-K19/Gas31/750MW	$2,784	$1,091	$657	($21)	($1,323)	6.62%	2048
7-SCGT/C26	$2,821	$738	$178	($686)	($2,508)	5.99%	2059
8-CCGT/C26	$3,080	$784	$174	($716)	($2,633)	5.99%	2059
9-Wind/C26	$3,738	$531	($62)	($1,031)	($2,777)	5.67%	2064
10-K22/C29	$4,904	$806	($112)	($1,501)	($4,247)	5.71%	2064
1-1-K19/C31/250MW	$5,171	$1,215	$264	($1,087)	($4,041)	6.04%	2059
12-K19/C31/750MW	$5,415	$1,360	$365	($1,119)	($4,182)	6.62%	2058
13-K19/C25/250MW	$5,905	$1,295	$374	($1,019)	($3,899)	5.94%	2058
14-K19/C25/750 (WPS)	$6,179	$1,696	$714	($766)	($3,887)	6.15%	2054
15-K19/C25/750MW	$6,320	$1,427	$445	($1,032)	($4,117)	5.96%	2057

Figure 9-21: Summary- CPVs as Compared to All Gas Plan at the End of Various Periods, Break-Even Year, and 78 Year IRR - Millions of 2014 Present Value Dollars

The NPVs listed above can be seen in Figures 9-18, 9-19, 9-20, and 9-4 earlier. They are calculated relative to the All Gas Plan base case using the modeling results provided by MH for MH's reference scenario.

When a 78 year study period is chosen, the magnitude of the NPV can appear very large. This NPV at the end of 78 years as shown in Figure 9-21 presents Plan 14, the Preferred Development Plan as having $1.696 billion lower costs than the All Gas Plan, the base case. This NPV is only $350 million dollars lower cost than Plan 4, which is shown to have the lowest cost at the end of 35 years and 50 years. Thus, this means that the benefits of the Preferred Development Plan as compared to Plan 4 have all accumulated after year 2062, or after 50 years. It is also important to understand these differences relative to the differences in capital investment made in these development plans.

Also, Figure 9-21 above shows that the net gain on NPV after 78 years is a small percentage of the incremental investment costs of the plans. For example, according to

MH results, Plan 14, the Preferred Development Plan has the largest NPV after 78 years of $1.696 billion. In order to implement Plan 14 the incremental investment on a present value basis is over $6 billion. A simple average of the NPV over the 78 years would be approximately $30 million annually net after paying for the investment. This is not a large number considering the amount of required investment.

LCA is filing electronic worksheets which have incorporated the MH modeling results and can be used to calculate NPV, Break-even Year and IRR metrics.

Consideration of Sunk Costs

MH's economic analysis focuses on the "*incremental costs and benefits associated with one plan relative to another*," which neglects costs and benefits common to all plans and all sunk costs, costs prior to June 2014.[24] In Part B of this Technical Appendix LCA will be providing information to help understand the effects of the sunk costs to date in the Keeyask and Conawapa projects and the implications of continued expenditures that may turn into future sunk costs of otherwise uneconomic projects.

D. Synopsis

There are several important aspects that should be summarized for convenience resulting from LCA's review of the MH Economic Analysis contained in this section of the report.

1. The MH Economic Analysis relies solely on the results at the end of a 78 year study period, 2013-2090.
2. The cash flow analysis used by MH for the 78 year study period has detailed modeling, including SPLASH, of generation operations and economics through the first 35 years only. The remaining 43 years of the economic analysis use extrapolation of costs and benefits at inflation, held constant on a real dollar basis, in order to estimate longer-term resource plan economics. The extrapolation process maintains the amount of export hydro power from Keeyask and Conawapa in 2045-2047 for the next 43 years.

[24] NFAT Submission, Chapter 9, p. 2.

3. Even in the first 35 years of detailed modeling, the cost and revenue results of the variations in water flow years is lost in the averaging, not allowing for the value of risk management to enter the economic analysis of the alternative development plans.
4. It takes at least 30 years, until 2043, before any development plan studied is lower-cost than the All Gas Plan, with the Preferred Development Plan requiring 41 years to break even versus the All Gas Plan
5. When interim period economic analysis results are used to develop metrics for 20, 35, and 50 year study periods, the Preferred Development Plan does not appear to be the lowest-cost resource plan alternative.
6. The IRR of the development plans compared to All Gas Plan are only slightly higher than the discount rate. The Plan with the highest 78 year IRR is Plan 4 and not the Preferred Development Plan
7. A closer look at the relative magnitude of the NPV after 78 years reveals that the differentials are small relative to the incremental investments required.

III. Economic Uncertainty Analysis

A. Introduction

As discussed in ***Section II-B***, MH performed a detailed Economic Analysis, which it presented in Chapter 9 of its filing and was reviewed by LCA. The key metric to this analysis was the NPV for each development plan using assumptions associated with the reference scenario. As a supplement to that analysis, MH produced a study of certain key uncertainties by performing both a probabilistic analysis and some sensitivity analyses. As MH stated in Section 10.0 of the NFAT Submission, *"(f)or decision making, including resource planning decisions, potential outcomes can directly and indirectly affect the impact of the alternatives considered and the choices made."*[25] This section discusses MH's probabilistic analysis and some alternative analytic methodologies that build off of it. The focus of this section is decision support: providing the best analytic metrics in order to *"recognize uncertainty and identify the way forward that has the best balance of value and risk given that uncertainty."*[26]

LCA agrees with MH that the primary objective of uncertainty analysis should be decision support. MH has done a reasonable job of identifying a basic methodology and set of uncertainty parameters to study. However, there are changes required that enhance this analysis's value to decision makers. One is a correction to the way MH provides comparisons with the uncertainty results, while the other provides additions to MH's base methodology that are useful for decision makers. Certain assumption ranges should be modified and certain additional development plans should be considered when identifying potential strategies for mitigating risk. This section covers the MH methodology, our evaluation of that methodology, and some recommended modifications and additions to that methodology for the purpose of more fully supporting a decision regarding integrated resource planning for MH.

[26] *Id.*

B. Manitoba Hydro Methodology

The probabilistic analysis uses all the same modeling and analytical processes described in Section II. The probability analysis models the development plans under differing scenario assumptions. MH's probabilistic analysis of each plan under each scenario utilizes the Economic Model and the SPLASH model in exactly the same manner described throughout Section II of this report. MH's probabilistic analysis also relies solely on the NPV metric after the 78 year study period. The probabilistic analysis methodology that MH chose is described in more detail within Section 10.1 of the NFAT Submission. MH's goal of this analysis was to consider "*the range of uncertainty defined by reference, high and low values on key factors.*"

The first step in the process was to determine the key variables for treatment using uncertainty analysis. As MH states, "*probabilistic analysis will grow exponentially with each added factor*".[27] In order to limit analytical complexity while still providing meaningful risk analysis, MH chose to focus on three variables, each of which was viewed as a "*proxy*" for multiple underlying variables. These variables "*represent 1) the electricity market 2) investment costs and 3) the economy and, when combined, result in 27 individual scenarios for each development plan analyzed.*"[28]

With the three categories of uncertainty identified, MH next determined which variables would present the highest risk and therefore be most important to model. MH looked at ten individual variables. The impact of each variable was measured by comparing the two development plans with the most significant difference in characteristics – the All Gas development plan and the Preferred Development Plan (K19/C25/750MW (WPS Sale & Inv)).[29] A tornado diagram was then created to visually indicate the ranking of all variables from the largest impact (widest range on the diagram) to the smallest.[30] From this the variables were grouped into three sets: Energy Prices, Capital Costs, and Economic Indicators.[31] Each of these sets then received a high, reference, and low value as well as an assigned probability to create 27

discrete scenarios with individual probabilities for use in the actual risk analysis. This analysis was then applied to evaluate the 12 development plans identified in Table 10.1.[32]

MH analytically derived several uncertainty variables that could be linked together to all the uncertainty analysis work with a more manageable amount of scenarios. Essentially MH created three uncertainty groupings.

MH's first uncertainty group, Energy Prices, actually includes Export Market prices, Natural Gas prices, and Carbon Emissions prices. MH moves these variables in the same direction within one set of reference, low and high probabilities.

The second uncertainty grouping, Discount Rate, includes Nominal Interest Rates, Inflation and Exchange Rate. Since the Economic Modeling is conducted in real (constant) dollars, the Nominal Interest rates and Inflation produce the real discount rate used in the economic modeling for present value purposes.

The third uncertainty grouping, Capital Cost, includes several parameters that may or may not be correlated. "*There are six variables included in the category Capital Costs:*

- *Hydro- Electric Generation Current Dollar Capital Costs*
- *Natural Gas-Fired Generation Current Dollar Capital Costs*
- *Wind Generation Current Dollar Capital Costs*
- *Transmission Line and Station Current Dollar Capital Costs*
- *Hydro- Electric Generation Capital Cost Escalation*
- *Natural Gas-Fired Generation Capital Cost Escalation*"[33]

Several other areas of the uncertainty analysis need to be introduced for a full understanding of the analytical framework used by MH. The first of these is the actual values used to represent the high, reference and low conditions for the three key variable sets discussed above. The other key input is the probabilities themselves. The probabilities are reported in Figure 10.6, reproduced below in Figure 9-22:

---

[32] *Id.*, Table 10.1, p. 10.

[33] NFAT Submission, Appendix 9.3, p. 57.

Figure 9-22: Probabilities for MH's Highest Impact Uncertainty Groups

MH obtains the probabilities used in this analysis from a process that captures the perceptions of those probabilities by MH personnel and experts that provide some of the inputs to this process (e.g., the experts retained to provide MISO market price projections). It is important to understand when working with these probability distributions that the input into the mathematical process are the probabilities estimated by experts and MH personnel, not data derived from forecasts or statistical analysis.

When the three uncertainty groupings, each with three stated sets of assumptions, or branches, are combined these produce 27 scenarios that were then modeled for each of the 12 Plans for which MH elected to perform uncertainty analysis.

MH next conducted an economic analysis of each case (i.e. each plan/scenario combination). This process, described in Section 10.1.3, involved multiple SPLASH runs (to reflect those variables that could impact dispatch) as well as economic modeling, both of which were also extrapolated beyond years with SPLASH data as described in Section II. Each case was analyzed to derive the relative NPV[34] of that combination. This led to 324 separate cases with NPV calculations, which were presented in a "quilt" in Table 10.4, replicated here in Figure 9-23:

[34] As will be discussed further below, MH used one methodology for calculating Relative NPV, but there are other methods that can be considered and which may provide a more useful decision support function.

The Commercially Sensitive Information contained within this report has been redacted in accordance with the protective order.

Figure 9-23: MH Probabilistic Analysis Quilt[35]

[35] NFAT Submission, Chapter 10, Table 10.4, p. 14.

The Probabilistic Analysis Quilt (PAQ) provides a lot of information, much of it clearly designed to provide strong decision support. In the development of the PAQ shown in Table 10.4, MH individually calculated the NPV of the net costs of each plan under each of the 27 scenarios of the uncertainty branches. As with most analyses of resource planning, a base case is chosen. MH, consistent with the economic analysis under the reference scenario discussed in Section II of this report, chose to use Plan 1, All Gas, as the base case. In the quilt above, the Reference-Reference-Reference All Gas case cell is 0, indicating that all values in the quilt are relative to that value. **LCA does not believe this is the appropriate comparison to make in utilizing the array of results of these 12 plans across 27 scenarios for future conditions. We will discuss this further later in this Section.**

As discussed by MH, one of the chief benefits of the quilt is that decision makers can scan the various development plans, identifying which have more relative downside risk (have more red color) and which have more relative upside opportunity (more green color).

Additionally, each development plan is plotted individually as an S-Curve, which illustrates the uncertainty of that specific plan as measured against the chosen base case. An example of this was presented as Figure 10.9 in the filing and is reproduced below as Figure 9-24:

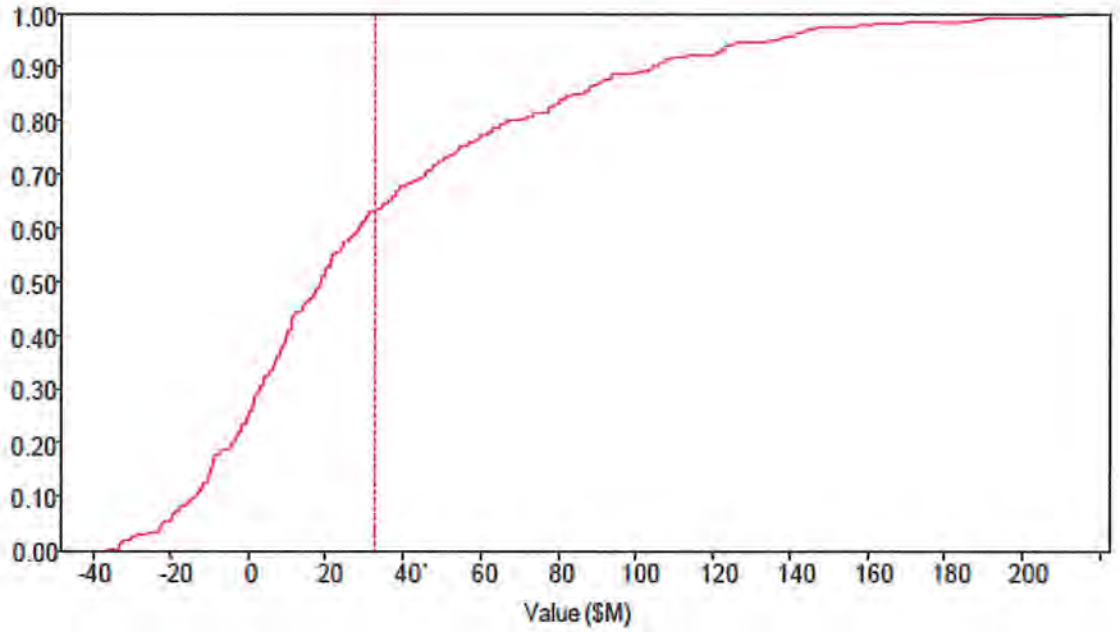

Figure 9-24: Sample S-Curve from MH Filing

An S Curve as MH has used it in their methodology shows, in a snap shot, a significant volume of information related to the risk profile of a given solution. The curve represents a comparison of a series of outcomes (the 27 scenario outcomes for a given plan) against a point from a selected base case. This means that the further to the right on the x-axis, the more beneficial a development plan's value is relative to the base case (All Gas with Reference Scenario inputs for all variables). The zero-point on the x-axis represents the point at which both the studied development plan and the base case have an equal NPV value. The further to the right along the x-axis, the more the development plan NPV exceeded the base case.

In the example above, as MH states, "*The risk profile clearly shows the range of possible outcomes, from a loss of more than $30 million to a gain of more than $200 million. It also shows that there is roughly a 25% chance that the value is less than 0; that is, that the base case is lower cost. There is roughly a 90% chance that the value is less than $100 million, meaning that there is a 10% chance that the value is more than $100 million; indicating that the investment has a 10% probability of being highly successful. Consequently, it can be determined that there is a*

65% (90% less 25%) chance that the value lies between $0 million and $100 million, a modest success."[36]

In addition to the quilt and S Curve tools used, MH also presents some scatter plots and "box and whisker" graphs. While these tools also illustrate finer points regarding the risk profiles of the various plans, the key tools are the quilt and S Curve graphs as they provide the majority of the decision support utility needed to identify the key risk characteristics.

One example of how MH utilized the S Curves is Figure 10.14 (Figure 9-25) from the filing, which compared the two plans that both included the 750 MW tie expansion between MH and the US and the 300 MW WPS sale.

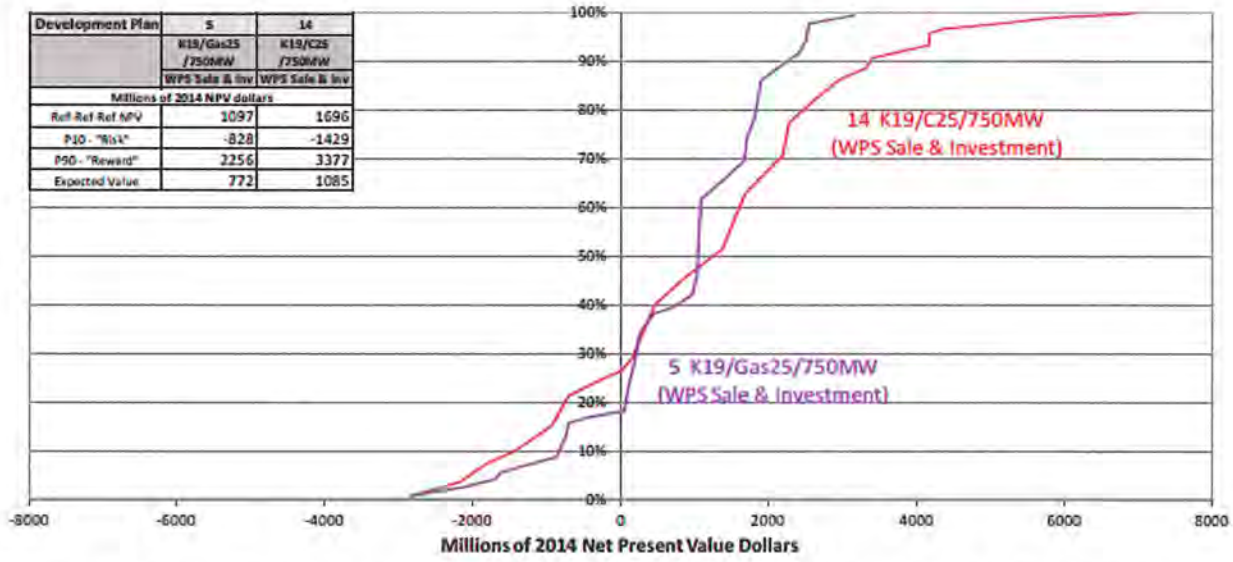

Figure 9-25: MH Sample Comparison S-Curve Figure 10.4 from NFAT Submission

MH, in reviewing this result, focused on two aspects: the similarity of the curves below the 50 percentile and the higher NPV results of the Preferred Plan above 50%. *"Below the 50th percentile, the risk profile is similar for the two plans but is driven by different factors. The downside risk of Plan 5 is due to a greater proportion of operating costs being related to*

[36] *Id.*, pp. 20-21.

thermal generation, particularly under low discount rate scenarios. As the Preferred Development Plan, which has Conawapa in 2025/26, has a large volume of surplus power, it is more sensitive to lower energy prices particularly when combined with higher discount rates and higher capital costs. Above the 50th percentile, the Preferred Development Plan lies to the right of Plan 5, reflecting significantly greater value primarily due to the availability of surplus power from the Conawapa GS at reference or higher energy prices."[37]

There are two aspects of the MH methodology and variable choices and the implications of those choices that are also important to note about the MH methodology.

1. MH's Base Comparison Case

The first step in reviewing MH's methodology is to review their choice of base case for comparison of NPVs. As discussed above, the quilt and S Curves use "Relative NPV" to compare the development plans. The calculation of relative NPV is simply [NPV of Plan (27 points)] – [NPV of Base Case (Ref/Ref/Ref point)]. This calculation is then used for all development plans (including the All Gas Plan which also serves as the Base Plan). Because this calculation is used for all cells in the quilt (all points along all S Curves) it is possible to compare the S Curves (or parts of the quilt) and derive information useful for decision makers. However, as will be discussed later, the choice of a single future as the reference point for all comparisons introduces a dynamic that may make it less useful than it could be.

MH's choice of Plan 1, All Gas, as the base case is appropriate given that among the plans investigated by MH in the analysis filed in the application, it represents the least capital-intensive strategy. This allows the decision makers to see the benefits of making additional investments.

2. MH's 78 Year Study Life – NPV Metric

As was discussed in Section II, the entire MH reference scenario economic analysis was done on the basis of a single metric, the 78 year NPV. This is true of all NPVs used in the uncertainty analysis, as well. The choice of 78 years was meant to reflect the fact that hydro assets typically have extremely long lives. However, decision makers

[37] *Id.*, p. 26.

frequently have to consider impacts that span shorter time frames than full resource life in order to completely understand the ramifications of potential options. Additionally, the various modeling tools used by MH do not all have the same time horizon, leading to a lengthy extrapolation period used to estimate economics over the last 43 years of the 78 year study period. ***Section II-C*** discusses several additional NPV calculations based on differing time horizons, including the various time horizons suggested by MH modeling tools that may be useful to decision makers.

C. La Capra Associates Critique of the MH Methodology

LCA has a number of comments and concerns specifically with MH's use of the probabilistic economic analysis. In ***Section II-C*** we discussed LCA's concerns regarding the MH reference scenario economic analysis and modeling. Since MH's probabilistic uncertainty analysis relies upon MH's economic analysis methodology and modeling, all those concerns directly apply to the uncertainty analysis. The following concerns and comments are in addition to those described in ***Section II-C***.

- The comparison of all cases (plan & scenario) to a single case (Plan 1 All Gas reference scenario assumptions)
- The sole focus on a study period of 78 years even within an 'uncertainty' analysis
- The probability assessments rely on judgments that may be dated

Each of these concerns is discussed in more detail below.

1. Development Plan Comparisons to a Single Base Case

LCA finds that the methodology by which MH develops the incremental NPV of a development plan's 27 scenarios is easily misinterpreted. MH subtracts the NPV of each case from the All Gas Plan NPV in order to determine the comparative risk of each plan. This manner of taking differences needs to be expressed in words to understand the potential for confusion.

In the MH PAQ, in the last column the 9th row down is the scenario of Low Energy Prices, Low Discount Rates and Lows Capital Costs. The value of the cell is -$2,155 or

approximately $2.2 billion of an NPV penalty. This -$2,155 value in words is that the Preferred Development Plan under the future scenario of Low/Low/Low outcomes is $2.155 billion higher in costs than the All Gas Plan under the Reference/Reference/Reference scenario. This does not tell us whether MH would be better off under Low/Low/Low scenario conditions with the All Gas Plan or the Preferred Development Plan.

LCA, when utilizing similar analysis techniques of probabilities and S-curve representations, compares case results of each plan to the base case (All Gas) under the same scenario. The NPV differences that result can be interpreted in this manner, a negative number means the All Gas Plan under that scenario has lower costs than the specific plan being examined under the same set of assumptions of the uncertain variables. When the comparative NPV metric is positive, the alternative plan is lower-cost on this NPV basis at the end of 78 years.

By comparing a given plan's result to a base case, the quilt and S Curves are providing a view of "the risk of regret." In other words, would the decision maker look back and regret the choice made if events prove to be different than the reference case assumptions and the investment does not provide the value expected? However, when doing this type of analysis, it is important to ensure that the comparisons being made are, in fact, useful to the decision maker in question. We believe that MH's methodology of comparing all 27 scenarios of a development plan's potential outcomes to a single (reference) point in the base case does not indicate the most important element, which plan is economic for a given scenario.

2. Utilization of Metrics determined at the end of the Study Period of 78 Years

The second area of critique of the MH methodology is that the uncertainty analysis does not consider shorter time periods than 78 years. If there is one thing to learn from considerations of uncertainty it is that forecast uncertainty increases over time, given the increasing number of variables that may make forecasts inaccurate. To perform an elaborate, time-consuming, and informative 78 year uncertainty analysis and not show NPVs using different time periods misses the opportunity to inform decision makers as to how development plans differ under uncertainty over time. As discussed in the reference scenario analysis in Section II, LCA's experience is that most decision makers do not look at economic analysis for study periods that are this long. The concern about

the validity of assumptions, the uncertainties in technology development and the inter-generational equity concerns are just a few reasons why shorter study period metrics are significant factors affecting utility resource plan selections.

3. Probability Assignments may be dated

The assessment of probabilities that MH used to develop its probabilities for the uncertainty scenarios begins with opinions of experts at a given point in time as the key inputs. This makes the probabilities as a very important input that can be changed to reflect updated information or differences of opinions. LCA is concerned that the perspective of the experts captured in the probabilistic analysis has likely changed in the two years since the analysis was conducted. One can adjust the probabilities to reflect the current wisdom of the range of potential assumptions, whether they be from the original experts providing inputs or some other party.

We should also note that these probabilities are the opinions of those experts at that time. Decision makers or other experts may have a different perspective on those probability assignments. For example, Potomac Economics has reviewed the probability assignments provided by MH market price consultants and offers its own view of those probabilities.

D. La Capra Associates Changes to MH Methodology

LCA made changes to the MH S Curve and Quilt analysis to make the comparison of development plans using an NPV difference that indicates which development plan has lower cost for a given scenario. LCA then compares S Curve probability distributions to learn the probability one development plan is better than the All Gas Plan. This allows expected value metrics to be calculated, which have meaningful indications of comparative economics of development plans. In this analysis, all of MH assumptions, NPV results, and probability assignments are used. The only change is the method of comparing alternative development plans with the same scenario inputs. In Section IV we will discuss analysis where LCA in sensitivity analyses does alter assumptions and probabilities.

Comparison of Resource Plan Economics over Multiple Scenarios

If, after making a decision to implement one of the development plans, the future yields a non-reference draw (such as High Energy Prices, Reference Discount Rate, Reference Capital Costs) then MH and the other decision makers will only be able to review their decision to implement that development plan under that actual future draw (High/Ref/Ref). What this means for decision support is that each point on the quilt of any development plan is more informative when compared to the same scenario outcome on the quilt of the base development plan. In terms of how the calculation should work, instead of:

[NPV of Plan (each of the 27 points)] – [NPV of Base Case (Ref/Ref/Ref point)]

as MH calculated, the formula should be:

[NPV of Plan (27 each of the points)] – [NPV of Base Case (each of the 27 points)]

We will be referring to the latter calculation as the LCA Methodology for convenience in the rest of this document. In our experience, this LCA Methodology is the common way comparisons are conducted this S-Curve Uncertainty Analysis.

While this means that the S Curve analysis cannot provide any meaningful view of the risk of the base case (in this case the All Gas development plan) there are other tools that can be used for such analysis.

The key concept is that all 27 future scenarios of the results must be utilized because MH has no control over the future with respect to these outcomes.

The 78 Year PAQ using LCA Methodology is shown in Figure 9-26.

Figure 9-26: Probabilistic Analysis Quilt 78 Year with LCA Methodology for Determining Comparisons to All Gas Plan

LCA believes that a useful metric that results from a probabilistic analysis is the expected value. In Section II we developed considerable discussion of the results of economic comparisons between development plans at reference scenario assumptions, as had MH in the NFAT Submission in Chapter 9. Figure 9-27 compares the Expected Value 78 year NPV which shows whether a development plan has lower costs (+) than the All Gas Plan.

There is a significant difference in the expected value results which probabilistically weight all the scenario outcomes in the Quilt and the reference scenario results. The reference scenario benefit that each of the alternative developments has when compared to the All Gas Plan is much lower based on the expected value. This indicates that the MH reference scenario assumptions are not a reasonable proxy for the value obtained with all of its scenarios considered.

The effect of the shift to the expected value metric is not uniform or proportional among the development plans. For example:

1. Plan 14 remains the plan with the highest benefit; however its advantage over the second highest plan is reduced.
2. The Plans including both Keeyask and Conawapa see the largest reduction in benefits
3. Plan 4 (K19/Gas24/250) becomes the second highest NPV plan (formerly Plan 15)
4. The difference between Plan 14 and Plan 4 was $350 million under reference case assumptions and is $144 million based on expected value.

Summary Table - NPV after 78 years as compared to All Gas			
Plan	Description	Reference Scenario	Expected Value
Plan 1	All Gas	-	-
Plan 2	K22/Gas	$887	$634
Plan 3	Wind/Gas	($775)	($1,014)
Plan 4	K19/Gas24/250MW	$1,346	$1,041
Plan 5	K19/Gas25/750MW (WPS)	$1,097	$842
Plan 6	K19/Gas31/750MW	$1,091	$776
Plan 7	SCGT/C26	$738	$525
Plan 8	CCGT/C26	$784	$529
Plan 9	Wind/C26	$531	$217
Plan 10	K22/C29	$806	$418
Plan 11	K19/C31/250MW	$1,215	$806
Plan 12	K19/C31/750MW	$1,360	$891
Plan 13	K19/C25/250MW	$1,295	$782
Plan 14	K19/C25/750 (WPS)	$1,696	$1,155
Plan 15	K19/C25/750MW	$1,427	$830

Figure 9-27: Summary Table of Expected Economic Value – Millions of 2014 Present Value Dollars

Figure 9-28 compares the S Curve of the Preferred Development Plan as calculated by MH with the same S Curve calculated by LCA. Note in the LCA Methodology the implied profile of the All Gas Plan is vertically zero for all scenario outcomes. The MH methodology would produce a risk profile for the All Gas Plan itself. The S-Curves are derived by plotting the entire range from the worst outcomes to the best outcomes.

The Commercially Sensitive Information contained within this report has been redacted in accordance with the protective order.

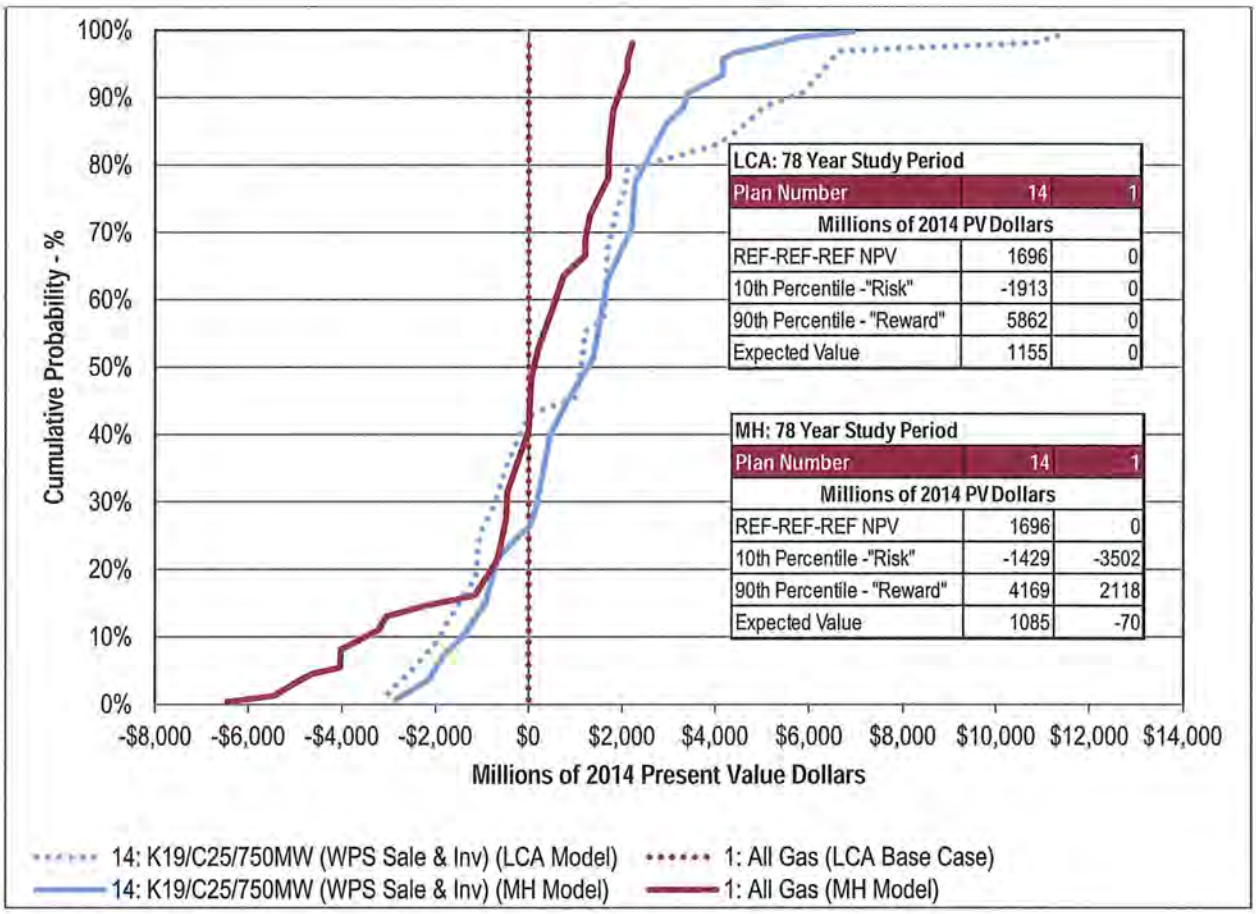

Figure 9-28: Plan 14 Preferred Development Plan S Curves, comparing MH & LCA Methodologies, NPV after 78 year

For the MH curve, the results show that there is a roughly 25% chance that the results of the Preferred Development Plan will be worse than the reference results of the Base Plan. For comparison, the LCA Methodology-derived S-Curve shows that there is a roughly 42% chance that in the future the Preferred Development Plan will end up with higher costs than the Base Plan.

The tail end of the upside of the curve is larger for the LCA curve which demonstrates that in this particular comparison, there is at least one future where the Preferred Development Plan provides a greater 78 year NPV cost savings as compared with the All Gas Plan than one could see in the MH Methodology S-Curves. While this

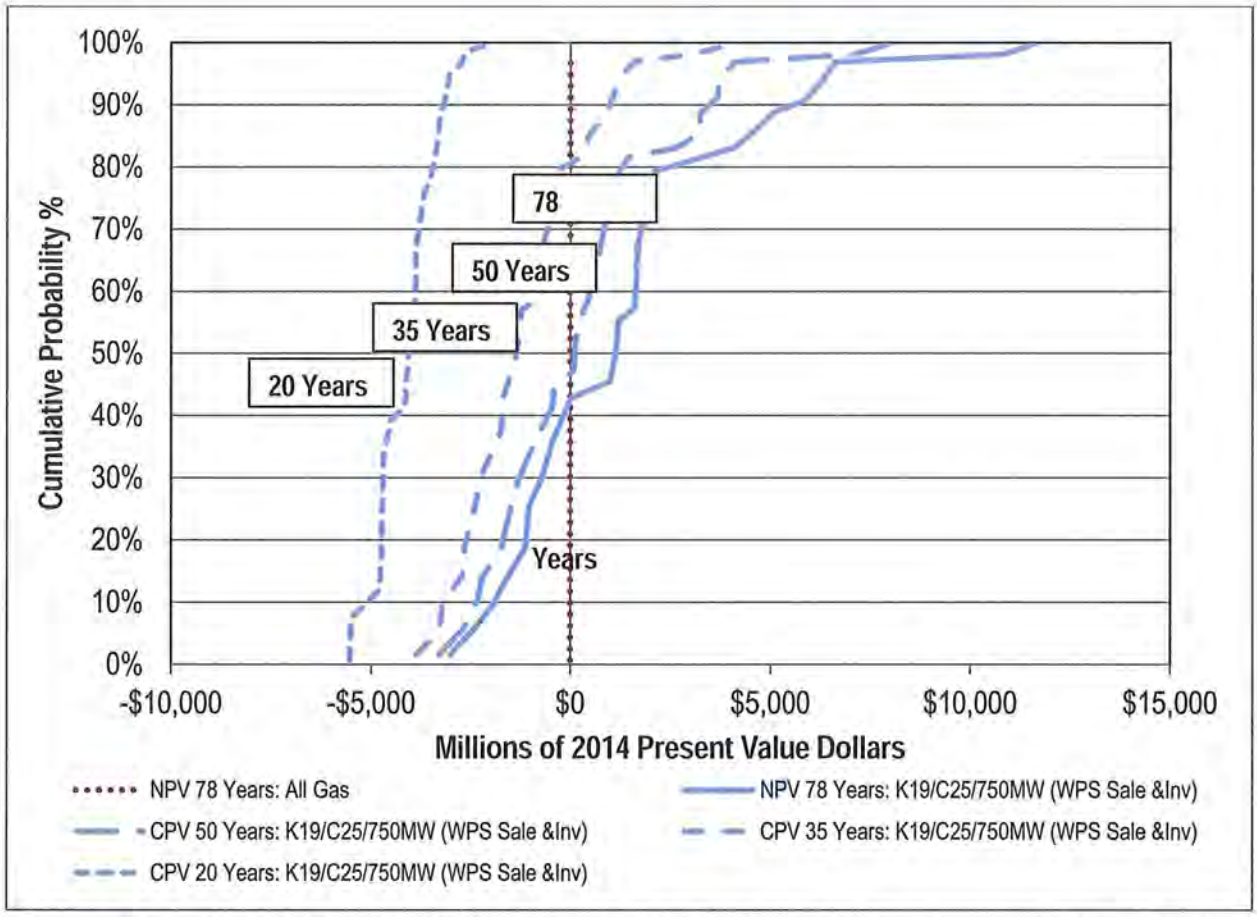
represents an extreme case and is unlikely to strongly determine any decision making, it is still a more accurate depiction of the range of uncertainty between these two plans.

Additional Economic Analysis Study Periods – CPV Metrics

While we recognize the value in viewing the potential impact of these development plans over a long time horizon given the long life of hydro assets, we believe that viewing the results through other, shorter life spans can provide additional and valuable information to decision makers. For the purpose of this analysis, we chose to calculate the NPVs for three additional time periods as follows. The detailed explanation as to why LCA proposes utilization of three additional time periods: 20 Years, 35 Years, 50 Years, is provided in ***Section II-C*** in the subsection titled Alternative Economic Metrics Comparing Alternative Plans.

By reviewing the results of these various time periods, decision makers can understand where the relative benefits and costs of various development plans reside. This can be especially useful in reviewing risk, since the risk profile of different development plans can vary greatly over time.

Figure 9-29 presents four S Curves for the Preferred Development Plan as compared to the All Gas Plan using the four time periods discussed above. All CPV/NPV calculations were made using the LCA Methodology, so this graph represents a "look back" based on four different vantage points.



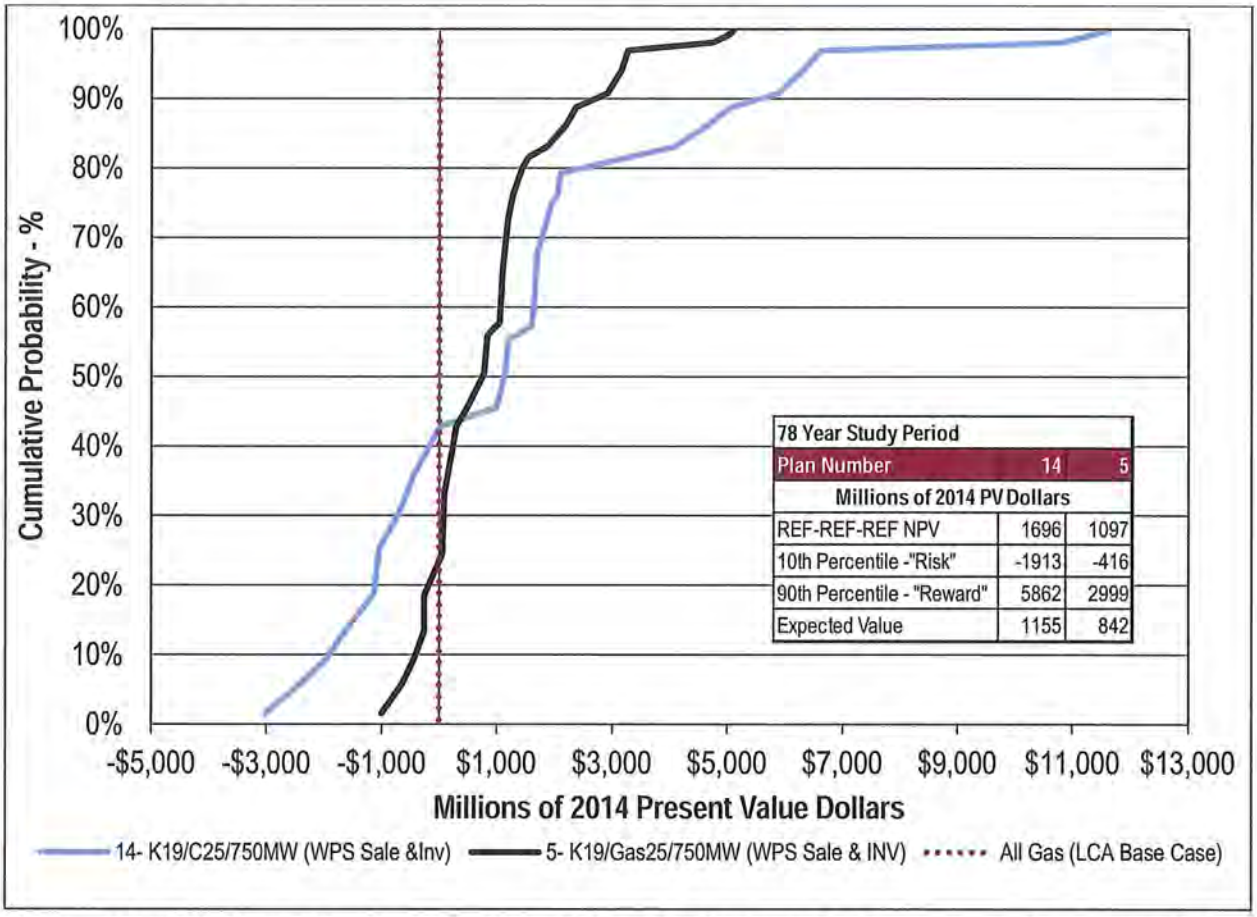


Figure 9-29: Probability Distributions of the Preferred Development Plan having Higher Costs than the All Gas Plan – Millions of 2014 Present Value Dollars

These graphs provide additional information. Over a 20 year horizon, within the scenarios used in the NFAT study, the Preferred Development Plan does not produce a higher economic value (CPV) than the All Gas Plan. While this may not be surprising given the investment needed up front to support the development of large hydro, it is instructive to see as a starting point. A more interesting comparison might be that at the 35 year mark, which is the end of the actual detailed economic modeling, the Preferred Development Plan is still only producing a CPV which is positive (thus lower costs than the All Gas Plan) roughly 20% of the time. The majority of the benefits that MH attributes to the Preferred Development Plan come from years 36 and on. These are also the years with the greatest uncertainty and the greatest risk that MH has not

captured the full range of potential outcomes in its risk analysis. Essentially, longer study periods carry an additional risk, which can be viewed as the chance that the uncertainty analysis may not capture a sufficiently wide range of potential outcomes. That risk exists in all modeling efforts, but becomes more material the further into the future the model extends.

Another way to use different time horizons in uncertainty analysis is to compare development plans over different time horizons. For the purposes of this illustration we chose two similar plans: The Preferred Development Plan and Plan 5, which is identical to the Preferred Development Plan except that it adds natural gas fired plants instead of Conawapa. This is the comparison that we illustrated with the inclusion of Figure 10.14 from the MH report in ***Section III-B*** above.

The first comparison is that when leaving the time horizon at 78 years but comparing all points along the S Curve as discussed above (the LCA Methodology) the shape of the curves change from the MH curves. This is illustrated in the figure below.

78 Year Study Period		
Plan Number	14	5
Millions of 2014 PV Dollars		
REF-REF-REF NPV	1696	1097
10th Percentile -"Risk"	-1913	-416
90th Percentile - "Reward"	5862	2999
Expected Value	1155	842

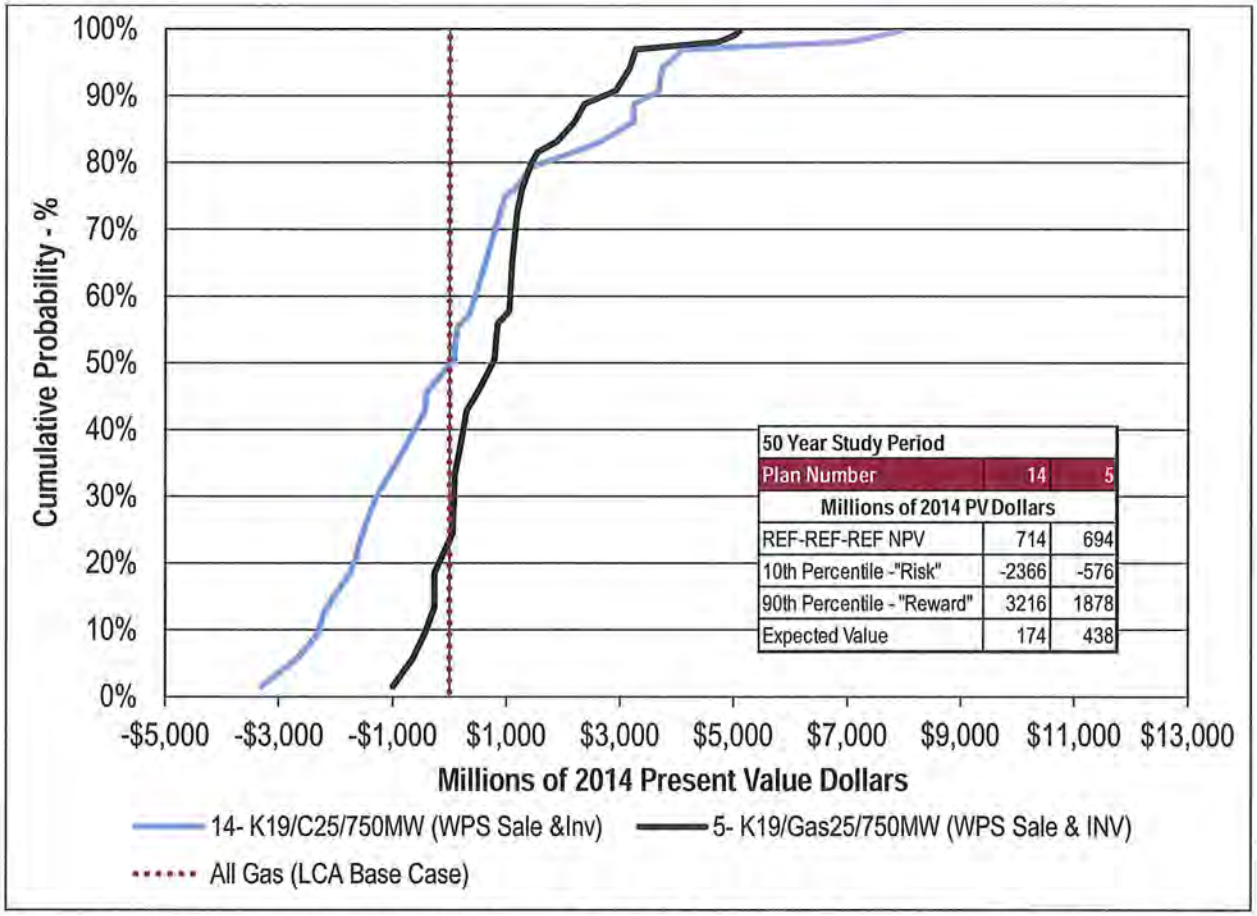

Figure 9-30: Probability Distribution of Plan 14 Preferred Development Plan and Plan 5 K19/Gas25/750MW/ WPS & Inv having higher costs than the All Gas Plan after 78 Years using the LCA Methodology – Millions of 2014 Present Value Dollars

While the potential for additional value in the top half of the curve remains as MH described it, the downside risk of all hydro is better illustrated in this graph. However, this is only one lens through which to view this comparison. As discussed above, these projects can be looked at for other time horizons in order to understand the magnitude of shorter term risks.

This figure also contains a table providing NPV comparison metrics on four different bases; NPV that results from the Reference Scenario evaluations, the expected value of the NPV that results from combining the results of all 27 scenarios, the 10% Percentile

value showing the lower NPV value that has a 10% chance of being that number or less, and similarly the 90% value of the NPV.

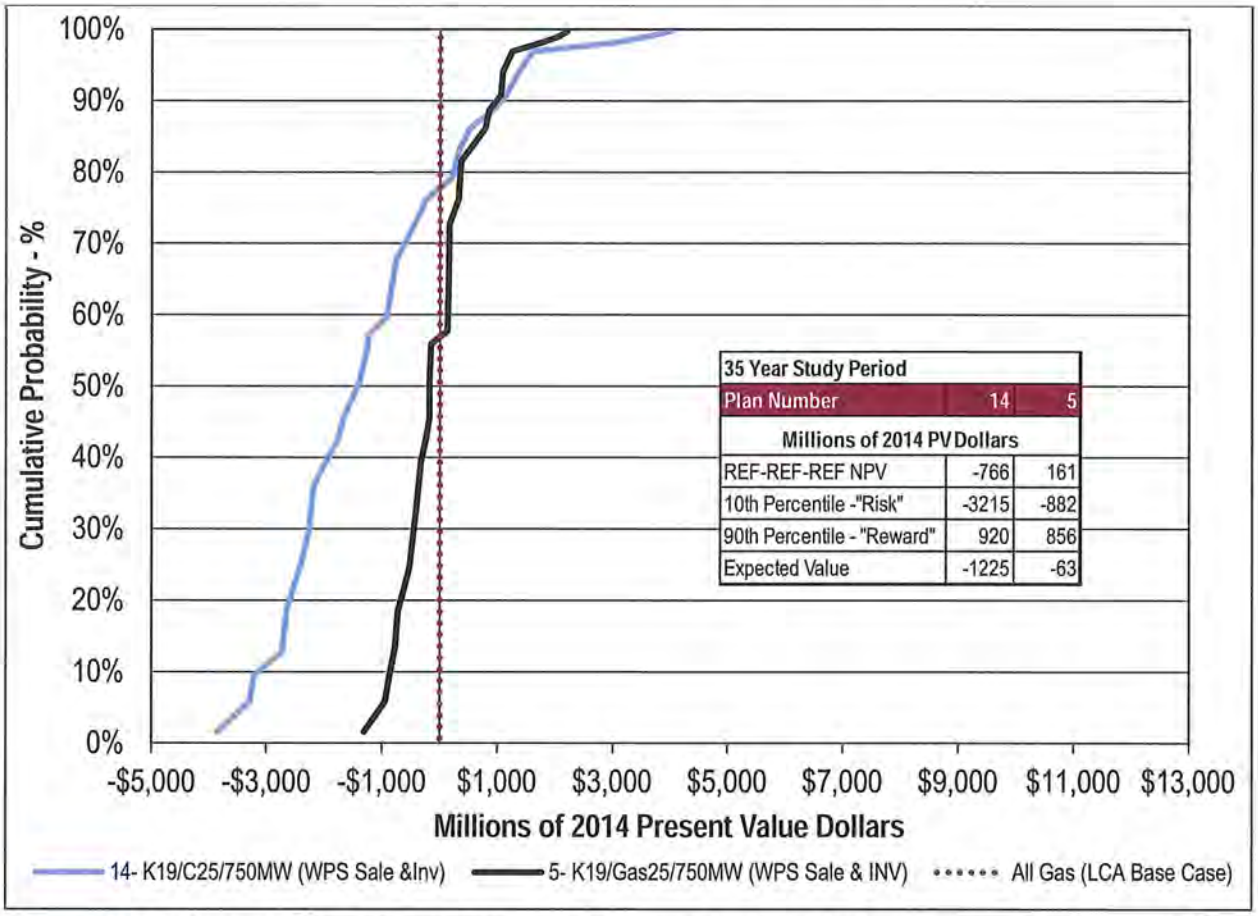

Figure 9-31 below provides the same comparison over the 50 year time horizon that MH used for its financial analysis. The most obvious difference is that the upside value that MH identified in its filing has, for the most part, yet to materialize. Most of the potential value that comes from the Conawapa investment in certain futures is not realized until more than 50 years from now, even if the futures and the results of those futures are exactly as MH predicts.

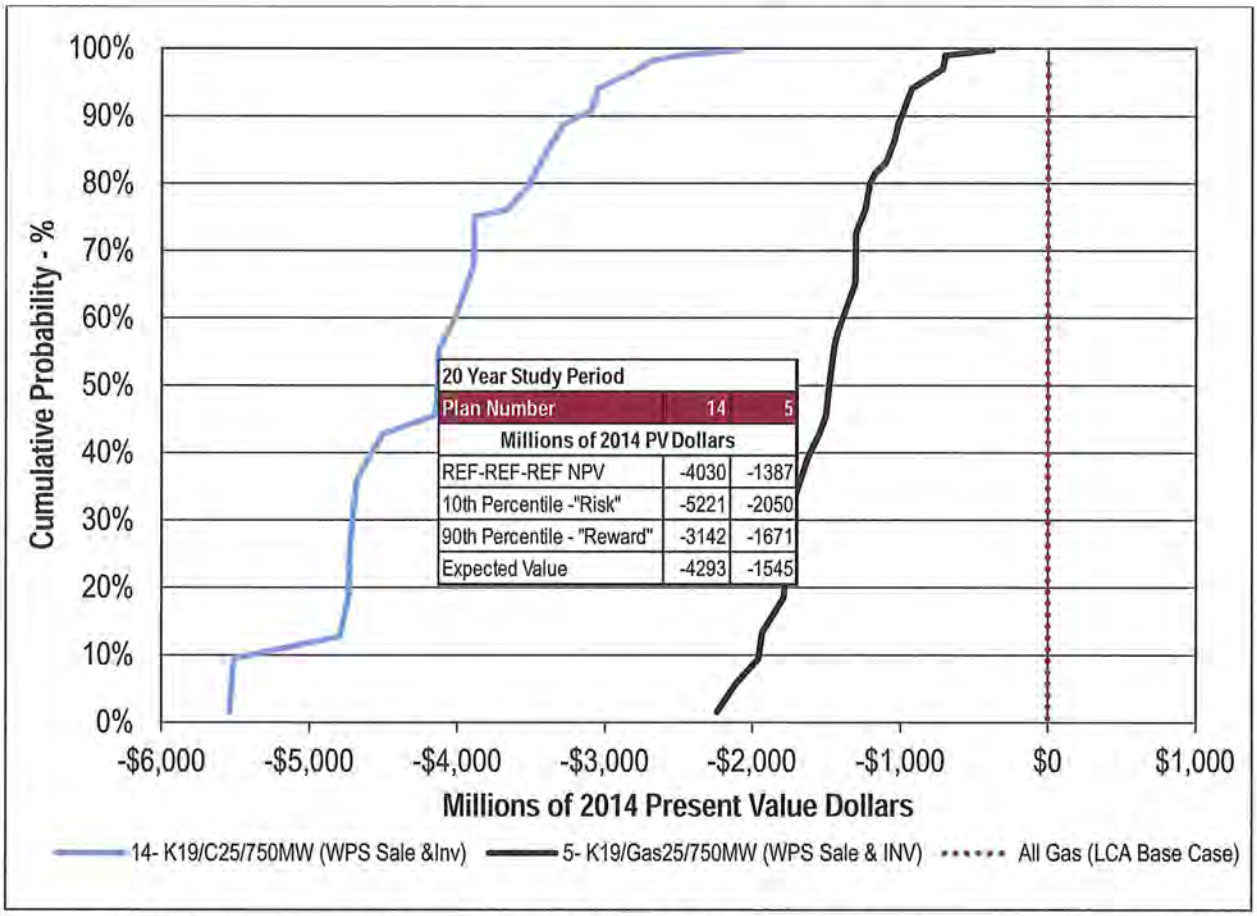
50 Year Study Period		
Plan Number	14	5
Millions of 2014 PV Dollars		
REF-REF-REF NPV	714	694
10th Percentile -"Risk"	-2366	-576
90th Percentile - "Reward"	3216	1878
Expected Value	174	438

Figure 9-31: Probability Distribution of Plan 14 Preferred Development Plan and Plan 5 K19/Gas25/750MW/ WPS & Inv having higher costs than the All Gas Plan after 50 Years using the LCA Methodology – Millions of 2014 Present Value Dollars



Another time horizon discussed above is the 35 years of detailed economic modeling. This is the time horizon over which actual economic analysis modeling occurred, and once again the comparison between these plans shifts when viewed in this light. Figure 9-32 below illustrates this. Over this time horizon, Plan 5 is almost always producing a higher relative NPV compared to Plan 14. So the modeled years tell a different story than the end effect years. While this doesn't mean that only a 35 year viewpoint is appropriate, it suggests that viewing these two plans solely through the lens of a 78 year NPV may not provide as much useful information for decision makers as viewing the plans from multiple perspectives. Solely relying upon the 78 year metrics will not provide insights into when there are higher costs between plans, and when there are lower costs between plans. This 35 year S-Curve shows that at the end of 35 years there is a 75% probability that the Preferred Development Plan is measurably more costly than the Base Case All Gas Plan on a CPV basis. In contrast at the end of the 35 year study period Plan 5 has only a 40% probability of measurably higher costs than All Gas and a 20% probability of measurably lower costs than All Gas. We can also observe that the magnitude of the regret in the Preferred Development Plan at the end of 35 years of the study is often four times the amount of Plan 5.

35 Year Study Period		
Plan Number	14	5
Millions of 2014 PV Dollars		
REF-REF-REF NPV	-766	161
10th Percentile -"Risk"	-3215	-882
90th Percentile - "Reward"	920	856
Expected Value	-1225	-63

Figure 9-32: Probability Distribution of Plan 14 Preferred Development Plan and Plan 5 K19/Gas25/750MW/ WPS & Inv having higher costs than the All Gas Plan after 35 Years using the LCA Methodology – Millions of 2014 Present Value Dollars

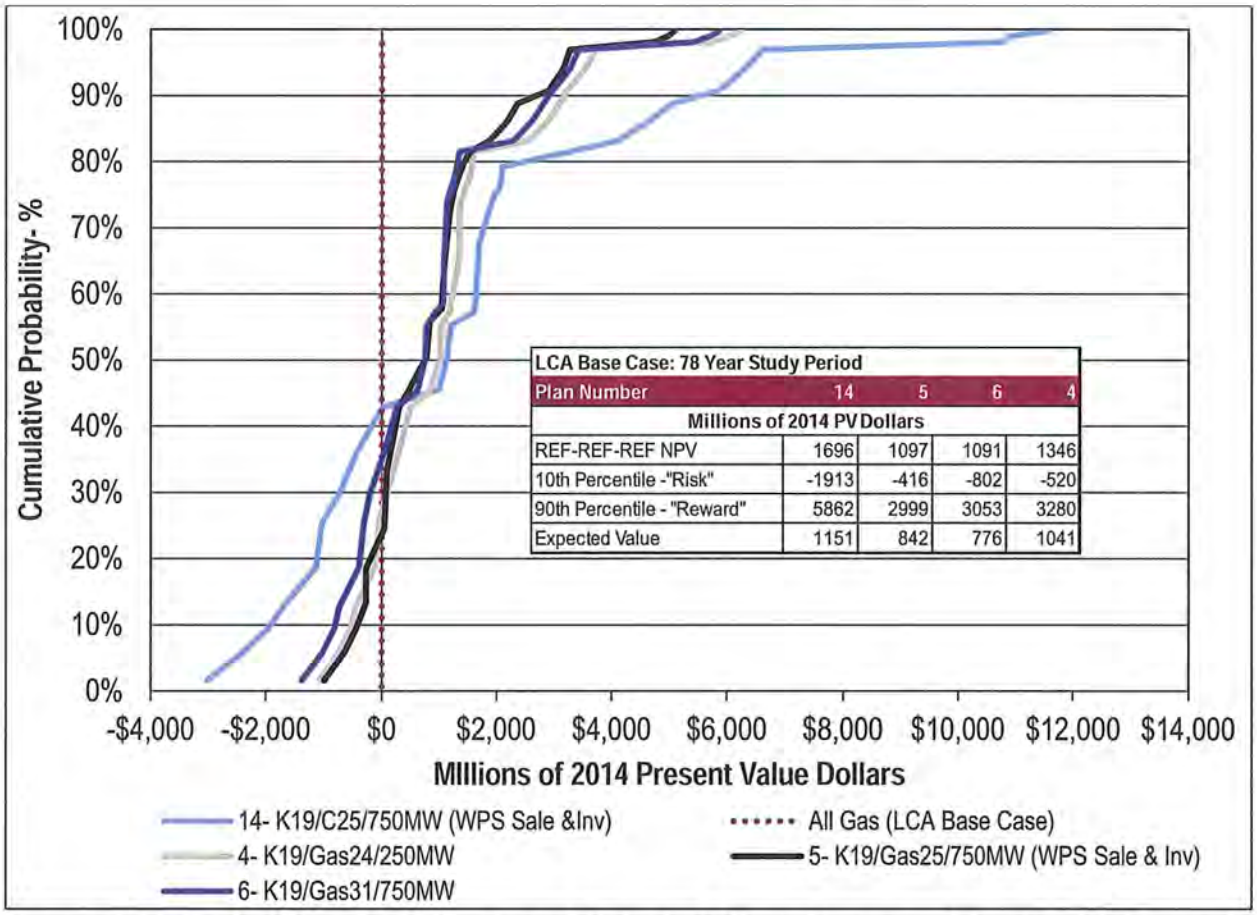
Finally, LCA modeled the S Curves for two plans from the perspective of a 20 year time horizon. Figure 9-33 below shows that over the first 20 years Plan 5 always has a higher NPV than Plan 14.

20 Year Study Period		
Plan Number	14	5
Millions of 2014 PV Dollars		
REF-REF-REF NPV	-4030	-1387
10th Percentile -"Risk"	-5221	-2050
90th Percentile - "Reward"	-3142	-1671
Expected Value	-4293	-1545

Figure 9-33: Probability Distribution of Plan 14 Preferred Development Plan and Plan 5 K19/Gas25/750MW/ WPS & Inv having higher costs than the All Gas Plan after 20 Years using the LCA Methodology – Millions of 2014 Present Value Dollars

Each of these metrics provides some insight into the temporal aspect of the comparative value of these plans. In long-term resource planning it is important to understand the useful life of various projects and to model appropriate time horizons to reflect that life. But it is also important to understand the relative impacts over other, shorter time horizons, especially when the proposed resources' useful lives can extend out over most of this century. Using the tool this way for all plans provides significantly more understanding of some of the potential tradeoffs and risks of all development plans.

The Commercially Sensitive Information contained within this report has been redacted in accordance with the protective order.



Comparison of Multiple Resource Plan Economics across All Scenarios

Figures 9-34, Figure 9-35, and Figure 9-36 each show a comparison of four plans using the 78 year, 50 year, and 35 year NPV metrics, respectively. Plan 14, the Preferred Development Plan includes the Keeyask GS and the Conawapa GS, and Plans 4, 5, and 6 include the Keeyask GS and uses natural gas generation instead of the Conawapa GS. Plans 4, 5 and 6 vary in the transmission interconnect size added as part of the plan.

Observations that can be made regarding the comparisons of these plans in these figures include:

- The reference case results are not a good proxy for the expected value results. The expected value result for each of the plans in each metric is lower than the corresponding value of the plans based on the reference scenario assumptions (see the first and fourth rows in the table insets in each figure). For example, in the 78 year analysis, the Preferred Development Plan shows a probability of benefits at or above the reference scenario results of about 30%. Use of the reference case results as a metric overstates the value of each these plans relative to the All Gas plan based on MH's analysis and probability assignments.
- Using the 78 year NPV metric, the Preferred Development Plan can be seen to offer slightly higher expected value, but also significantly more exposure to extreme outcomes at both tails of the distribution.
- Using the 50 and 35 year metrics, the Preferred Development Plan has lower expected value results than Plans 4, 5, and 6.
- Using the 35 year metric, the expected value of the All Gas Plan is higher than all of the other plans.
- Using the 78 and 50 year NPV metrics, the Preferred Development Plan has approximately a 45% probability of being the worst of the plans.

E. Synopsis

There are several important aspects of this uncertainty analysis resulting from LCA's review of the MH Probabilistic Uncertainty Economic Analysis:

1. The expected benefits from the PDP, relative to the alternative plans, are largely derived from upside opportunities after the first 50 years of the study period. Based on MH's economic analysis and probability assessments, the PDP recommendation requires a long-term view of benefits.
2. The LCA Methodology provides a comparative analysis across plans using consistent assumptions of uncertain parameters. Using this method with MH's economic analysis results and probability assessments, the comparative assessments of the plans are quite different than depicted in the MH S-Curve analysis.
3. When interim period economic analysis results are used to develop metrics for 20, 35, and 50 year study periods, the Preferred Development Plan does not appear to be the lowest-cost resource plan alternative even when a probabilistic scenario analysis covering 27 scenarios is included.
4. Plans with Keeyask GS but without Conawapa GS have more favorable economic uncertainty profiles than the Preferred Development Plan.

IV. Economic Analysis – Sensitivity Example

A. Introduction

This section of the report measures the impact of altering variables used as inputs to the economic analysis. Whereas LCA previously in this report utilized all modeling results generated by MH, we now investigate future scenarios not included in MH's filing by making small changes to the modeling results to calculate plan metrics.

These future scenarios include different values for high, low and reference discount rates, alternative probabilities for high, low and reference scenarios for energy prices and capital costs, and changes to capital costs used in high, low and reference scenarios for hydro, thermal, and wind generating stations. In each case, we used the LCA methodology discussed in Section III D.

The objective of these sensitivities is to provide an understanding as to how the metric values vary when changes to certain development plan or scenario assumptions are made. In economic analysis studies where the comparative metrics do not vary significantly with changing assumptions, decision makers can draw comfort that the choice they are making is robust in terms of the choice being beneficial. In economic studies where the results are very sensitive to assumptions, then the plans may be harder to distinguish in terms of economics.

B. Sensitivity to Discount Rate Assumptions

In the prior sections of this economic analysis we discussed that the metrics used for comparing the economics of the resource plans are often determined through a present value analysis. In any present value analysis an important input assumption is the discount rate that we apply to take the present value of future cash flows. In analysis of very capital intensive investments where the benefits take a long period of time to accrue, the value of the discount rate can have a large effect on the relative economics of alternatives. Higher discount rates would improve the economics of plans with lower costs in the early part of the study period. Conversely, lower discount rates would

enhance the value of the plans where the latter years of the study have lower costs than other plans.

In this sensitivity section we have two different ways of modeling the concern that the discount rates used in the MH's economic uncertainty analysis are lower than others might expect. One method of analyzing higher discount rates is to change the discount rates and recalculate the NPV metrics. The other way would be to shift some portion of the probability assigned to the low discount rate scenarios to reference and/or high scenarios. We have analyzed the results of the NPV metrics utilizing each of these methods independently in this section

Figure 9-37 below shows the reference case and expected value results using MH's discount rates as compared to the other two higher discount rate sensitivity analyses. Descriptions of the exact modeling of these discount rate sensitivities and more results in the form of S Curves are shown in Sections 1 and 2 below.

The economic results of these changes to discount rates are very dramatic. While all development plans lose some or all of their economic value (NPV) as compared to the All Gas Plan, the plans with Conawapa lose the greatest amount of their economic value. This is not that surprising when we realize that the time period metrics we looked at in Section III showed us that the benefits of Conawapa occur after year 50 of the study. Higher discount rates would affect these plans the most as a result.

The Commercially Sensitive Information contained within this report has been redacted in accordance with the protective order.

Discount Rates Sensitivity Case Summary Table - NPV after 78 years as compared to ALL Gas							
		Reference assumptions		Higher Discount Rates		Probability of Low Discount Rates = "0"	
Plan	Description	Reference Scenario	Expected Value	Reference Scenario	Expected Value	Reference Scenario	Expected Value
Plan 1	All Gas	-	-	-	-	-	-
Plan 2	K22/Gas	$887	$634	$568	$166	$887	$251
Plan 3	Wind/Gas	($775)	($1,014)	($738)	($909)	($775)	($970)
Plan 4	K19/Gas24/250MW	$1,346	$1,041	$958	$464	$1,346	$582
Plan 5	K19/Gas25/750MW (WPS)	$1,097	$842	$728	$286	$1,097	$400
Plan 6	K19/Gas31/750MW	$1,091	$776	$706	$202	$1,091	$318
Plan 7	SCGT/C26	$738	$525	$335	($77)	$806	$26
Plan 8	CCGT/C26	$784	$529	$358	($102)	$784	$2
Plan 9	Wind/C26	$531	$217	$121	($379)	$531	($289)
Plan 10	K22/C29	$806	$418	$220	($444)	$806	($315)
Plan 11	K19/C31/250MW	$1,215	$806	$594	($115)	$1,215	$32
Plan 12	K19/C31/750MW	$1,360	$891	$694	($92)	$1,360	$65
Plan 13	K19/C25/250MW	$1,295	$782	$565	($302)	$1,295	($104)
Plan 14	K19/C25/750 (WPS)	$1,696	$1,155	$906	($21)	$1,696	$196
Plan 15	K19/C25/750MW	$1,427	$830	$649	($320)	$1,427	($112)

Figure 9-37: Discount Rates Sensitivity Table – Millions of 2014 Present Value Dollars

1. Sensitivity - Utilizing Estimates of Higher Discount Rates

This analysis utilizes low, reference and high real discount rates of 4.5%, 5.5% and 7.5% respectively. These rates are consistent with the opinion being offered by Morrison Park Associates in their review of the NFAT application. The real discount rates used in the NFAT analysis by MH are 3.35%, 5.05% and 6.50% respectively. As it turns out the reference case discount rate of 5.5% is the same value used by MH in its 2013 update of some of the reference scenario assumptions.

We selected this sampling of cases[38] to illustrate the impacts that the change in discount rates has on the comparative economics of different development plans. This will also illustrate the impact such change has at different time intervals.

With the probability distributions, one simple metric that can be used to indicate the sensitivity of the results to the change in discount rates is the expected value, the probability-weighted average of the 27 cases for each plan. The following table provides the expected value results using the Alternate and MH discount rates in the analysis.

Discount Rates Sensitivity Case Summary Table - NPV after 78 years as compared to ALL Gas					
		Reference Assumptions		Higher Discount Rates	
Plan	Description	Reference Scenario	Expected Value	Reference Scenario	Expected Value
Plan 1	All Gas	-	-	-	-
Plan 4	K19/Gas24/250MW	$1,346	$1,041	$958	$464
Plan 5	K19/Gas25/750MW (WPS)	$1,097	$842	$728	$286
Plan 6	K19/Gas31/750MW	$1,091	$776	$706	$202
Plan 14	K19/C25/750 (WPS)	$1,696	$1,155	$906	($21)

Figure 9-38: Discount Rate Sensitivity Summary Selected Plans – Millions of 2014 Present Value Dollars

These results show that the change in discount rates has a material effect on the NPV results and the ranking of the alternative development plans. Using the Alternate Discount Rates, the Preferred Development Plan (Plan 14) is not the highest ranking plan on either a reference case assumptions basis (2nd) or on an expected value basis (5th) when considering the full 78 year NPV analysis. Plan 4 (K19/Gas 24/250 MW) becomes the highest ranking plan on both reference case assumptions and on expected value. These results make clear that the ranking of alternative development plans is sensitive to the discount rate assumptions used in the analysis. It is notable that the

[38] Our workpapers include the data and templates to allow the comparison of any combinations of cases that are of interest.

Preferred Development Plan loses all of its advantage over the All Gas Plan when the Alternate Discount Rates are used (expected value basis).

In this sensitivity analysis on discount rates, we develop a new set of NPV calculations for all of the uncertainty analysis cases considered by MH. The results for all cases are presented in Figure 9-37 for the 78 year period.

With these results, we develop several S-Curve charts to illustrate how the change in discount rates affect the relative economics of selected alternative development plans, including the All Gas Plan as the reference, the Preferred Development Plan, and Plans 4, 5, and 6. The results that are featured in the S-Curve charts are as follows:

Figure 9-39: Preferred Development Plan - 20, 35, 50, and 78 Year NPV – Alternate Discount Rates

Figure 9-40: Plan 5 (K19, gas 24, 750MW (WPS & Inv)) - 20, 35, 50, and 78 Year NPV – Alternate Discount Rates

Figure 9-41: Preferred Development Plan – 78 Year NPV – Comparison of Results with MH and Alternate Discount Rates

Figure 9-42: Preferred Development Plan compared to Plans 4, 5, and 6 – 78 Year NPV – Alternate Discount Rates

Figure 9-43: Preferred Development Plan compared to Plans 4, 5, and 6 – 50 Year NPV – Alternate Discount Rates

Figure 9-44: Preferred Development Plan compared to Plans 4, 5, and 6 – 35 Year NPV – Alternate Discount Rates

Figure 9-39 provides the Preferred Development Plan results using the Alternate Discount Rates for 20, 35, 50 and 78 year NPV metrics in an S curve format. In the 78 year study period, there is approximately a 50% chance that the Preferred Development Plan will produce a higher economic value (NPV) than the All Gas plan. The shorter time periods follow this trend of the Preferred Development Plan yielding a lower relative CPV using the changed discount rates. At the end of 50 years of the study there is about a 65% probability that the All Gas Plan will have lower costs. At the end of 35 years this probability is 90% meaning there is a one in ten chance that at the end of 35

years the decision maker will be find the Preferred Development Plan to be lower cost than the All Gas Plan.

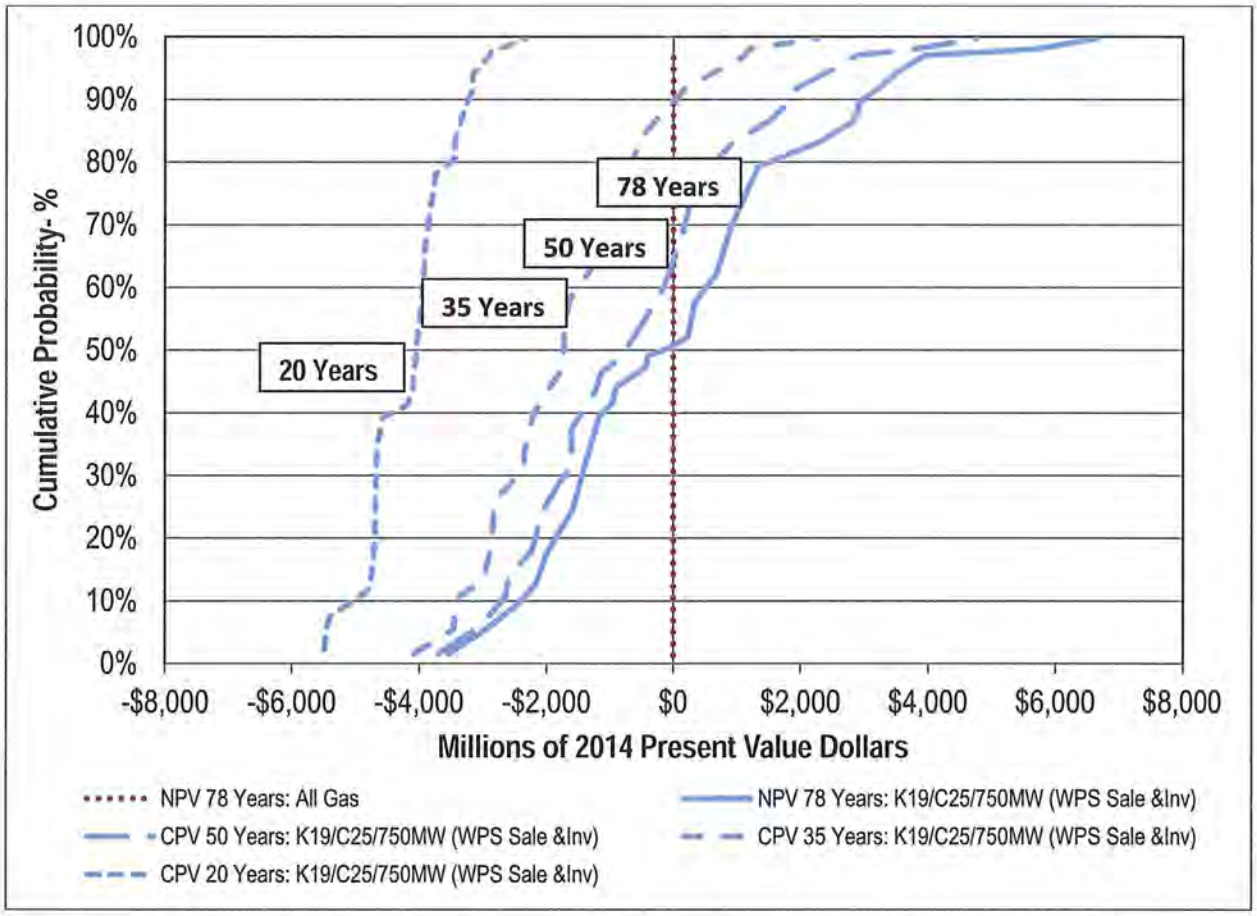

Figure 9-39: Probability Distributions of the Plan 14 Preferred Development Plan having Higher Costs than the All Gas Plan using LCA Sensitivity Discount Rates – Millions of 2014 Present Value Dollars

Also, it is informative to look at how this sensitivity affects Plan 5 (K19/Gas25/750 (WPS Sale & Inv)). Plan 5 is similar to the Preferred Development Plan except that it adds natural gas fired generation instead of the Conawapa GS Like the Preferred Development Plan, there is about a 50% chance the plan will produce a higher economic value (NPV) than the All Gas plan. In the case where gas replaces Conawapa and with

higher discount rates, Plan 5 is approximately 55% more likely to result in a higher 78 year NPV compared to the All Gas Plan. The 50 year time horizon yields an NPV that is still more than 50% likely to be higher than the All Gas base case.

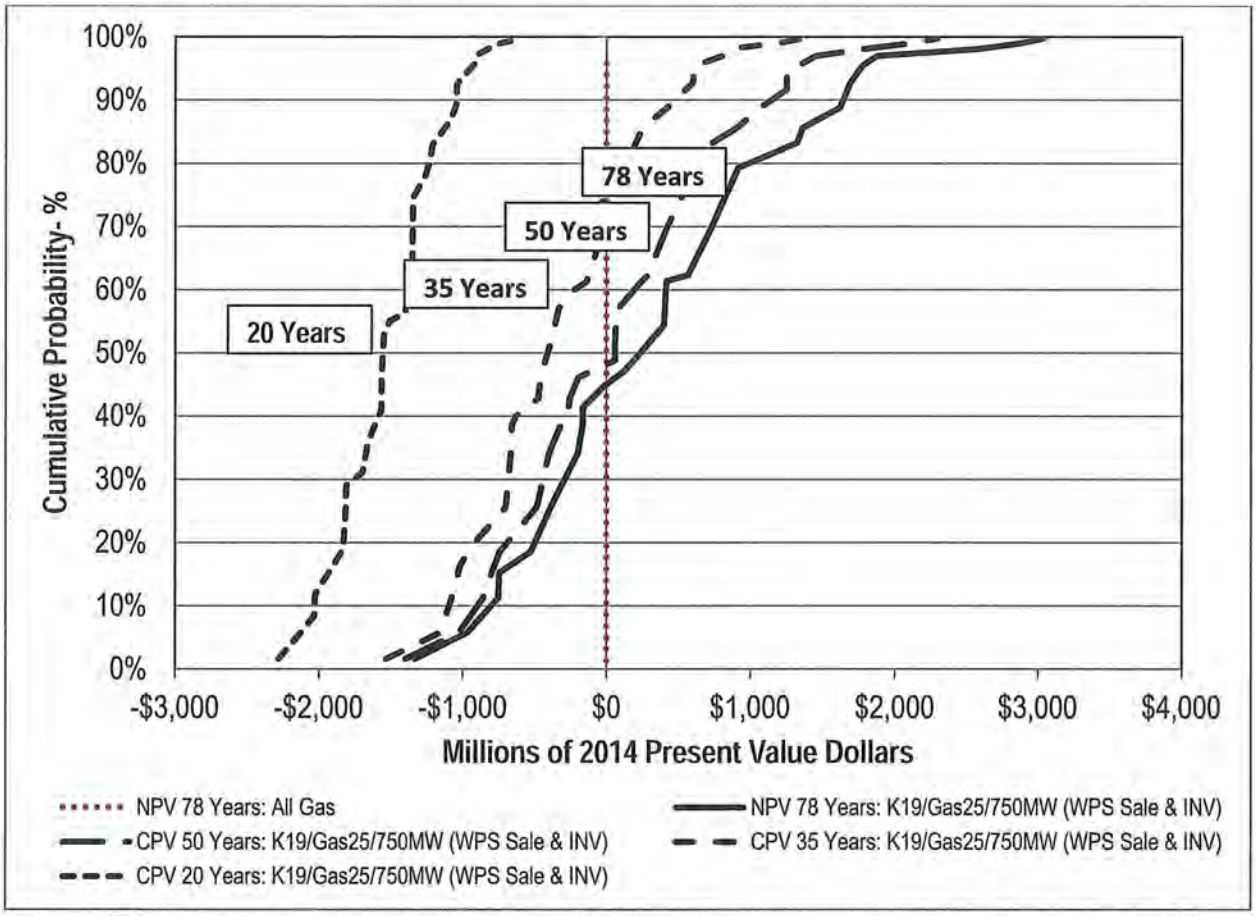

Figure 9-40: Probability Distributions of the Plan 5 K19/Gas25/750MW (WPS & Inv) having Higher Costs than the All Gas Plan using LCA Sensitivity Discount Rates – Millions of 2014 Present Value Dollars

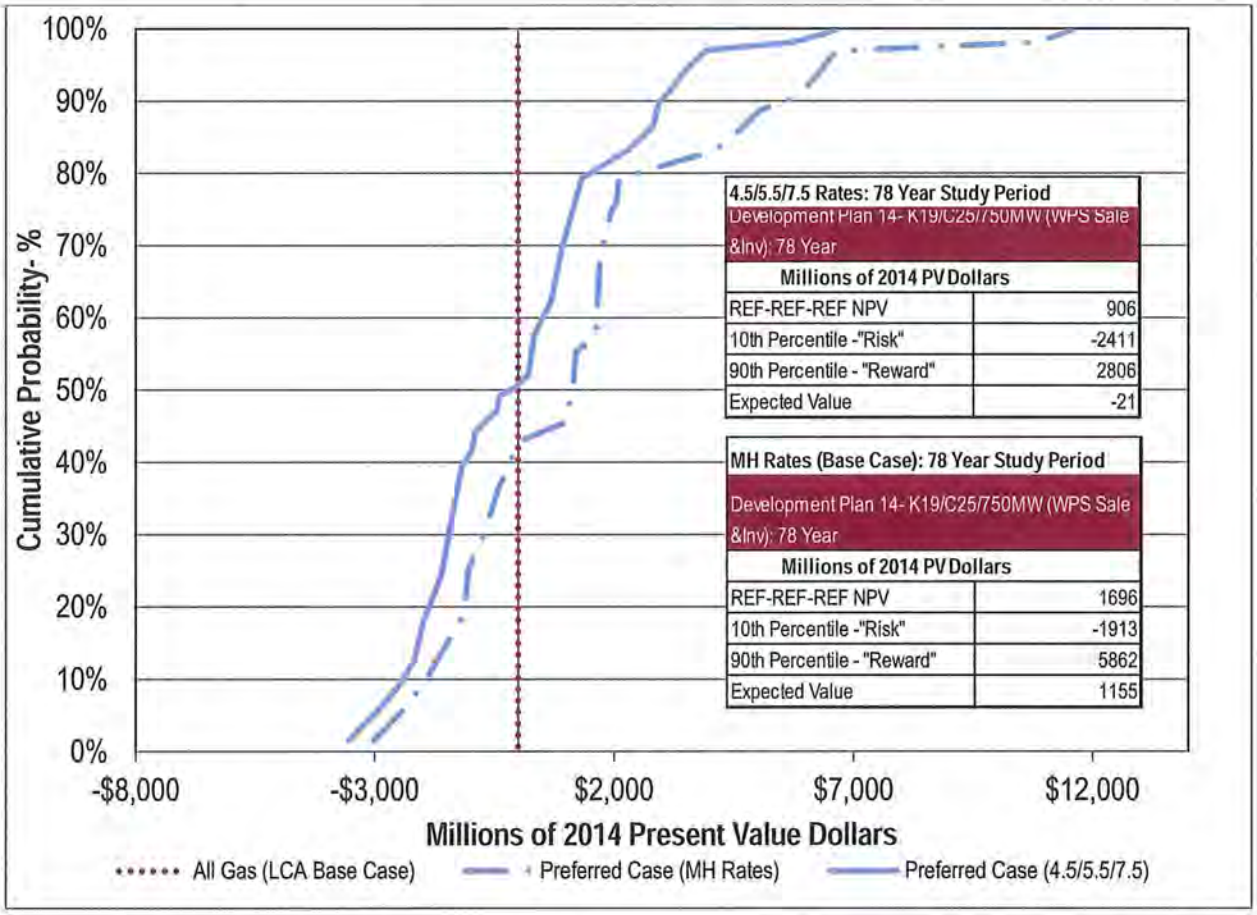
The Figure 9-41 below illustrates the impact that the change in discount rates can have by showing how the 78-year NPV for the Preferred Development Plan changes when compared to the All Gas Plan. The probability that the All Gas Plan would have lower costs than the Preferred Development Plan increases to 50% with the Alternative Discount Rates.



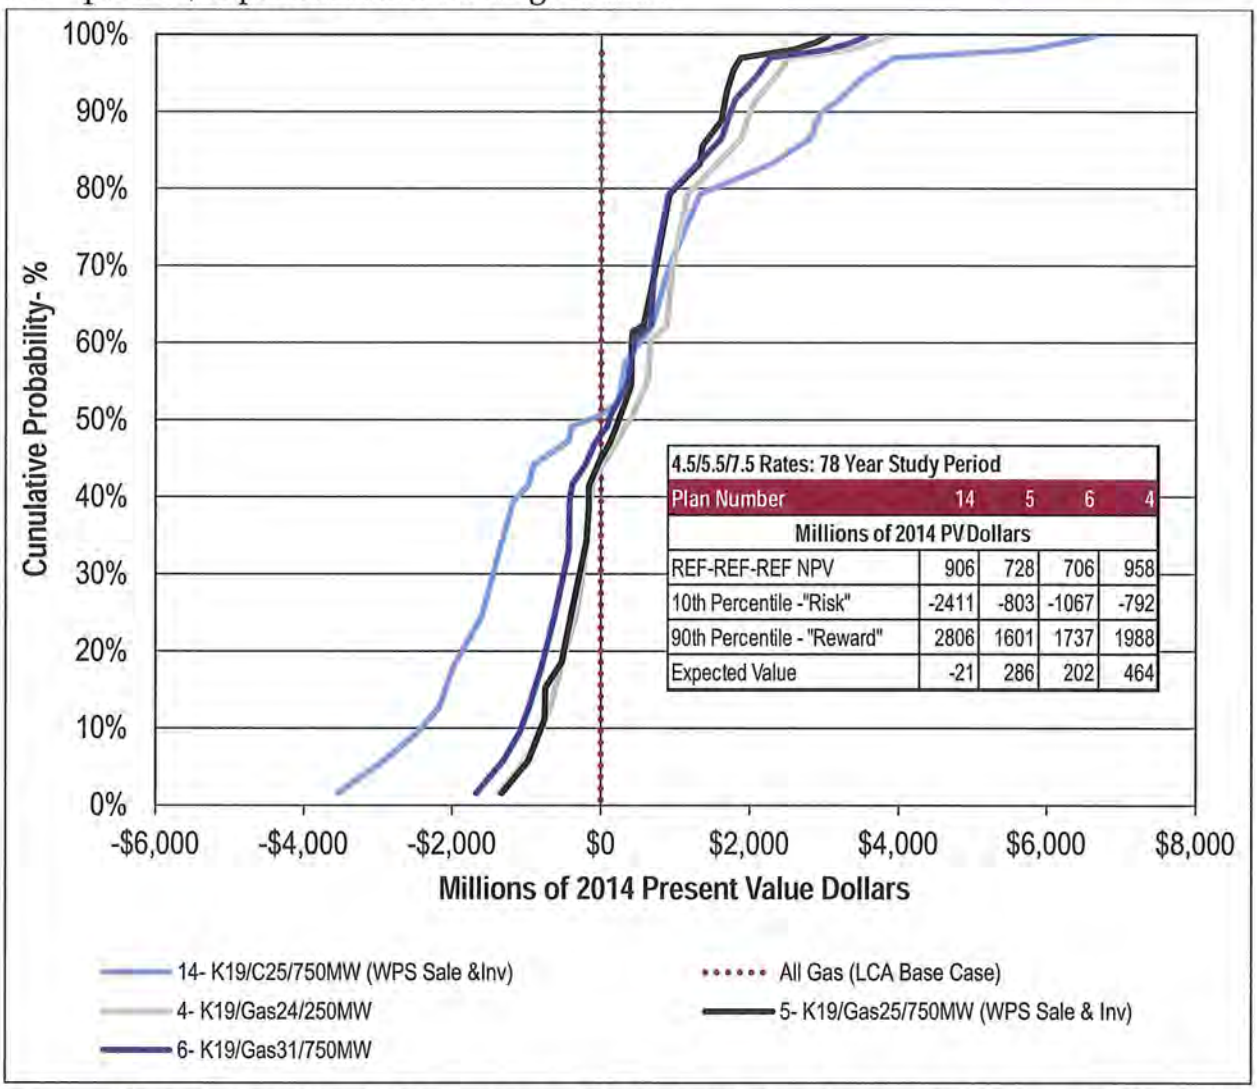


Figure 9-41: Probability Distribution of Plan 14 Preferred Development Plan and Plan 5 K19/Gas25/750MW/ WPS & Inv having higher costs than the All Gas Plan after 78 Years using the LCA Methodology and LCA Sensitivity Discount Rates – Millions of 2014 Present Value Dollars

Next, we have selected four development plans for comparison the Alternative Discount Rates. The following figures illustrate this economic comparison for the four study periods.

In Figure 9-42 the Preferred Development Plan is shown to have a greater range of possible economic outcomes than the three other development plans This indicates that the PDP has more potential risk and higher potential reward.. Also we see the risk with the Preferred Development Plan outweighs the reward since the PDP's expected value is negative $21 Million. The other plans shown on this figure have lower costs than the

All Gas. The shorter study period results in Figure 9-42, Figure 9-43 and Figure 9-44 show that for shorter study periods that the Preferred Development Plan has poorer NPV profiles, expected values and higher risks.

4.5/5.5/7.5 Rates: 78 Year Study Period				
Plan Number	14	5	6	4
Millions of 2014 PV Dollars				
REF-REF-REF NPV	906	728	706	958

2. Sensitivity – Elimination of the Low Discount Rate Scenarios

This analysis reflects the opinion being offered by Morrison Park Associates in their review of the NFAT application that the low discount rate scenario postulated by MH is not feasible over a 78-year period. In this sensitivity analysis, we assign a zero probability to the MH low discount rate scenario and 50% probability for each of the reference and high discount rate scenarios.

With these results, we develop several S-Curve charts to illustrate how the elimination the low discount rate scenarios affect the relative economics of selected alternative development plans, including the All Gas Plan as the reference, the Preferred Development Plan, and Plans 4, 5, and 6. The results that are featured in the S-Curve charts are as follows:

Figure 9-45: Preferred Development Plan - 20, 35, 50, and 78 Year NPV – Elimination of Low Discount Rate Scenario

Figure 9-46: Preferred Development Plan – 78 Year NPV – Comparison of Results with MH Discount Rates and the Elimination of the Low Discount Rate Scenarios

The multiple time period CPV chart Figure 9-45 for the Preferred Development Plan as compared to the All Gas Plan shows similar results and trends to the previous sensitivity analysis using the Alternate Discount Rates. However, even in a 78 year study period, the Preferred Development Plan has a less than 50% probability that it will have lower costs than the All Gas Plan.

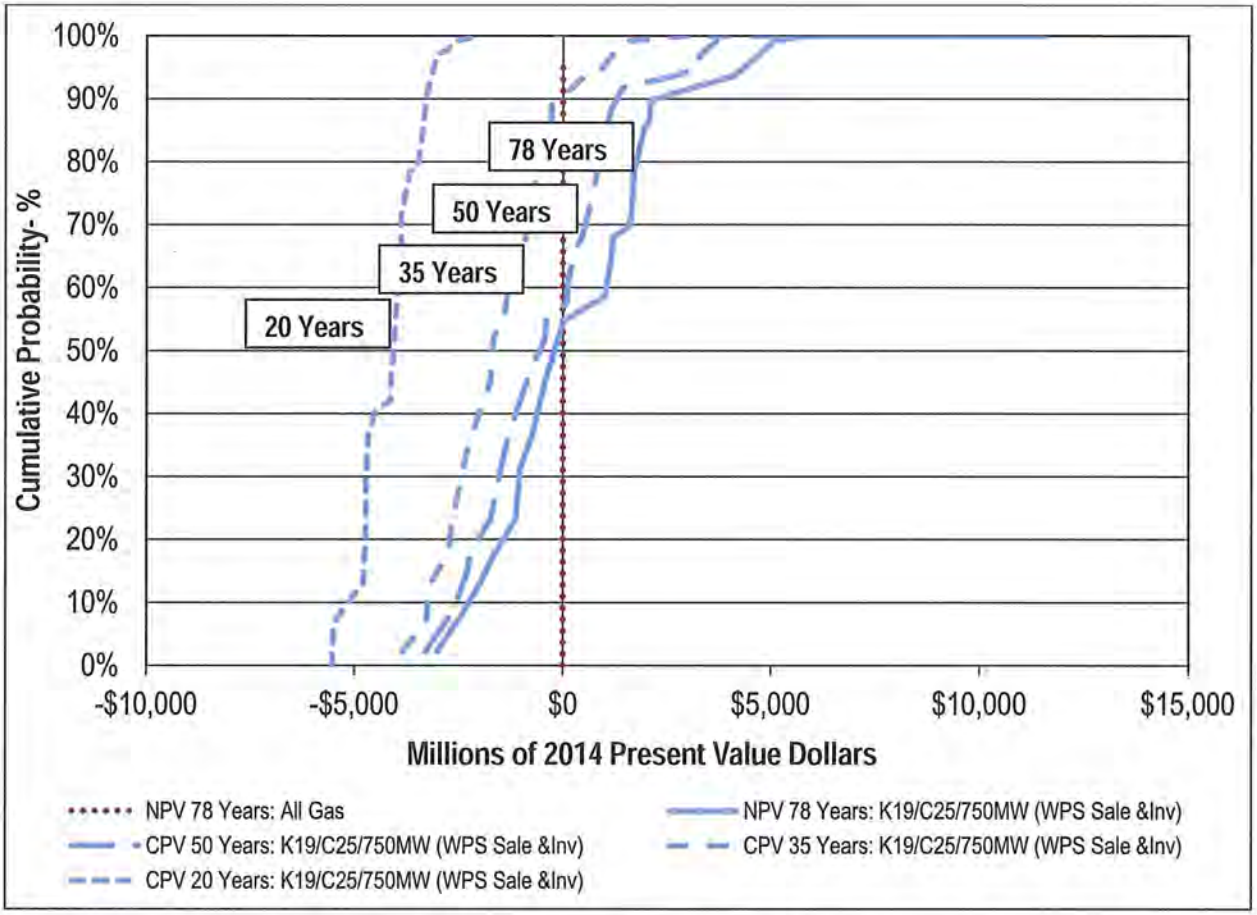

Figure 9-45: Probability Distributions of the Plan 14 Preferred Development Plan having Higher Costs than the All Gas Plan after 78 years when eliminating Low Discount Rate Scenarios – Millions of 2014 Present Value Dollars

As seen in the Figure 9-46 comparison, the Preferred Development Plan without low discount rates is approximately 10% less likely to yield a better economic value (CPV) than the All Gas plan in 78 years. Even though both scenarios exhibit the about the

same range of potential outcomestheir expected values vary widely. This simple change in opinion, i.e., the elimination of considering the low discount rate scenario, can eliminate nearly all the benefits of the Preferred Development Plan under the expected value metric.

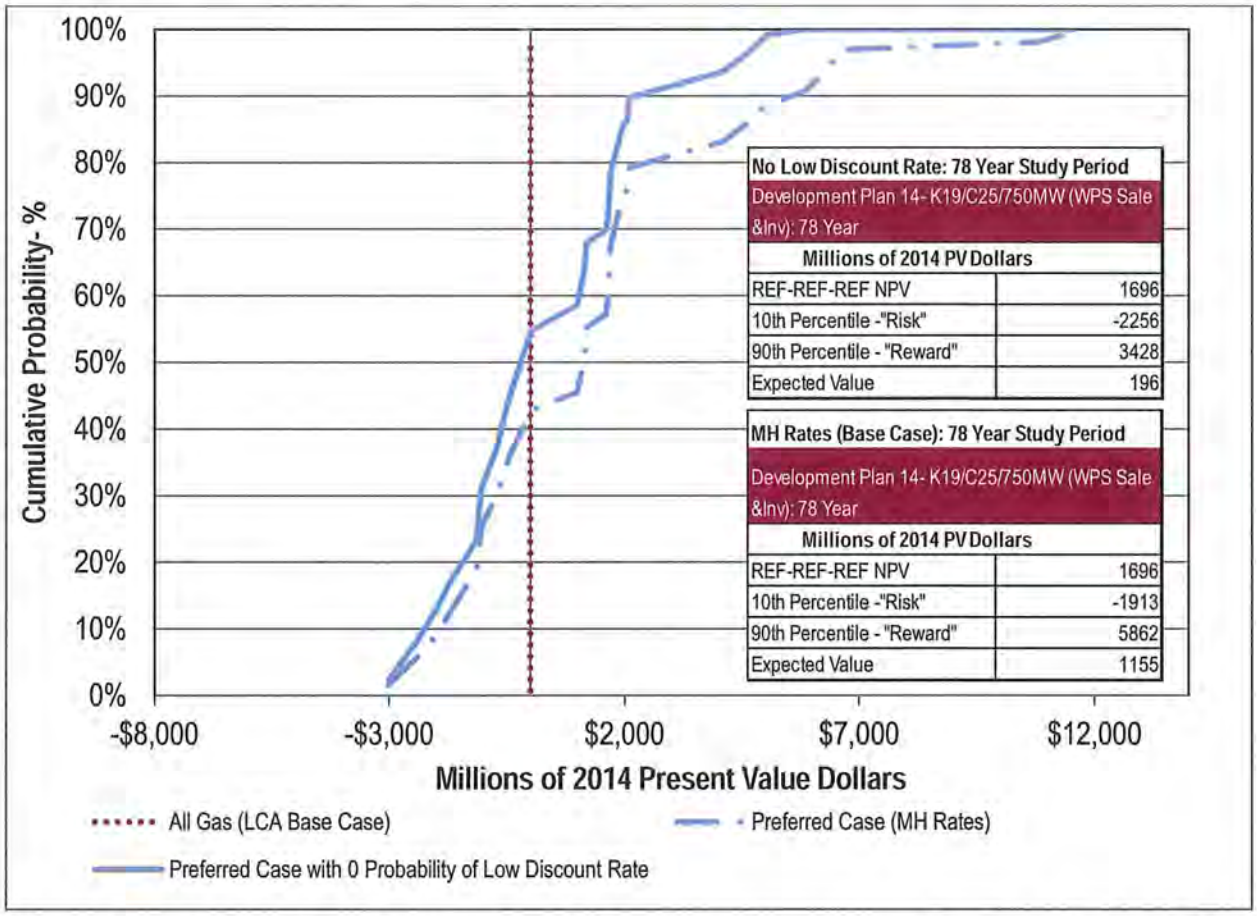

Figure 9-46: Probability Distribution of Plan 14 Preferred Development Plan and Plan 5 K19/Gas25/750MW/ WPS & Inv having higher costs than the All Gas Plan after 78 Years using the LCA Methodology and Eliminating the Low Discount Rate Scenarios – Millions of 2014 Present Value Dollars

C. Sensitivity to Alternative Probability Assumptions for Uncertainty Analysis

In the prior sections, we demonstrated two ways to test the sensitivity of the results to the uncertainty in discount rates. The first uses alternative probabilities on capital costs. In the second we change the probabilities assigned to energy prices.

Alternative probability assignment is a way to test the impact of different perspectives regarding the uncertainty associated with key assumptions. Perspectives, in this context, simply refers to the notion that another expert or decision maker may believe that energy market prices are more likely to be lower (or higher) than MH has assumed. That perspective can be reflected in the form of alternative probabilities to MH's low, reference and high energy price assumptions. Similarly, different perspectives on capital cost uncertainty can be reflective by changes in probabilities without having to do additional modeling.

MH had previously assigned the following probabilities to its three metrics as seen on each aforementioned quilt:

	Energy Prices	Discount Rates	Capital Costs
High	15%	35%	30%
Reference	55%	50%	50%
Low	30%	15%	20%

Figure 9-47: Manitoba Hydro Assigned Probabilities

In this sensitivity we have developed analyses centered around two views of the future; the first reflects an expectation that the probability of the High Capital Cost scenarios is more likely than estimated by MH and the second view is that Energy Prices are lower than MH expected.

Figure 9-48 below shows the reference case and expected value results using MH's view of probabilities as compared to sensitivity analyses that are described above. Descriptions of the exact modeling of these probability based sensitivities and more results in the form of S Curves are shown in Sections 1 and 2 below.

The economic results of these changes to probabilities vary in their impact. While all development plans lose some or all of their economic value (NPV) as compared to the All Gas Plan, when probabilities of the energy prices are shifted toward low the plans with Conawapa lose the greatest amount of their economic value. This is not that surprising when we realize that Conawapa in a development plan that is dependent on export energy prices to offset some of its costs. The small change we modeled in probabilities for the Capital Cost uncertainties has a minimal effect.

Probabilities Sensitivity Case Summary Table - NPV after 78 years as compared to ALL Gas							
		Reference assumptions		Capital Cost Probabilities		Energy Price Probabilities	
Plan	Description	Reference Scenario	Expected Value	Reference Scenario	Expected Value	Reference Scenario	Expected Value
Plan 1	All Gas	-	-	-	-	-	-
Plan 2	K22/Gas	$887	$634	$887	$593	$887	$424
Plan 3	Wind/Gas	($775)	($1,014)	($775)	($1,164)	($775)	($1,158)

Figure 9-48: Probability Sensitivity Results NPV after 78 years – Millions of 2014 Present Value Dollars

1. Capital Cost Sensitivities by adjusting Probabilities

This analysis starts with a change in perspective regarding capital costs. In this example, we increase the likelihood of the high cost by 10% and reduce the probability of the low cost by 10%, substituting MH's weighting of 20%/50%/30% with 10%/50%/40%. This reflects a perspective that considers higher costs to be a more likely outcome than MH has assumed.

With these results, we develop several S-Curve charts to illustrate how the increase the likelihood of the high cost by 10% and the reduced the probability of the low cost by 10% affect the relative economics of selected alternative development plans, including the All Gas Plan as the reference, the Preferred Development Plan, and Plans 4, 5, and 6.

The results that are featured in the S-Curve charts are as follows:

Figure 9-49: Preferred Development Plan - 20, 35, 50, and 78 Year NPV – With an increase in the likelihood of the high capital cost by 10% and reduces the probability of the low capital cost by 10%

Figure 9-50: Preferred Development Plan – 78 Year NPV – Comparison of Results with MH Capital Cost Probabilities and LCA Alternate Capital Cost Probabilities

Figure 9-51: Preferred Development Plan compared to Plans 4, 5, and 6 – 78 Year NPV – With an increase in the likelihood of the high capital cost by 10% and reduces the probability of the low capital cost by 10%

Figure 9-52: Preferred Development Plan compared to Plans 4, 5, and 6 – 50 Year NPV – With an increase in the likelihood of the high capital cost by 10% and reduces the probability of the low capital cost by 10%

Figure 9-53: Preferred Development Plan compared to Plans 4, 5, and 6 – 35 Year NPV – With an increase in the likelihood of the high capital cost by 10% and reduces the probability of the low capital cost by 10%

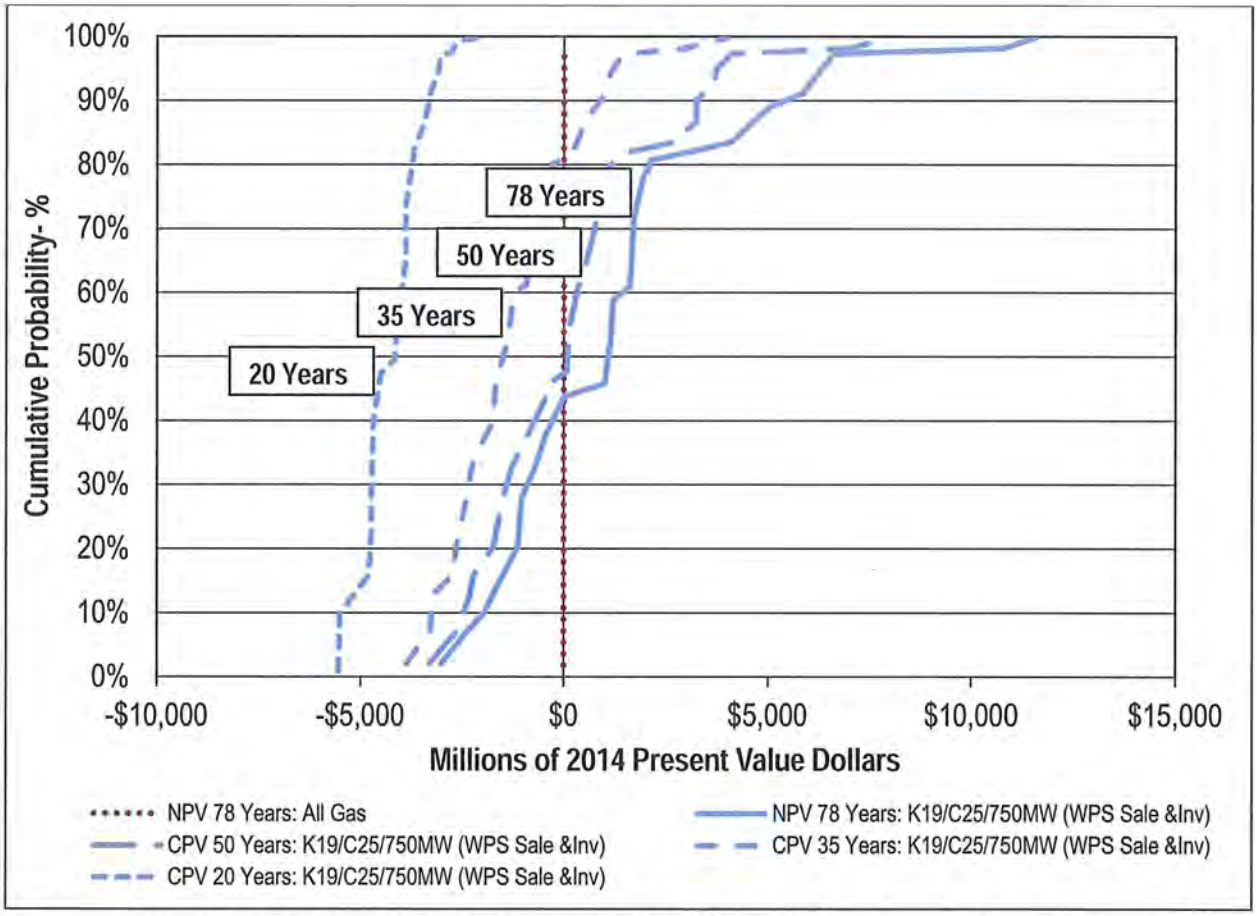

Figure 9-49: Probability Distributions of the Plan 14 Preferred Development Plan having Higher Costs than the All Gas Plan With Higher Probabilities of Higher Capital Costs after 78 years – Millions of 2014 Present Value Dollars

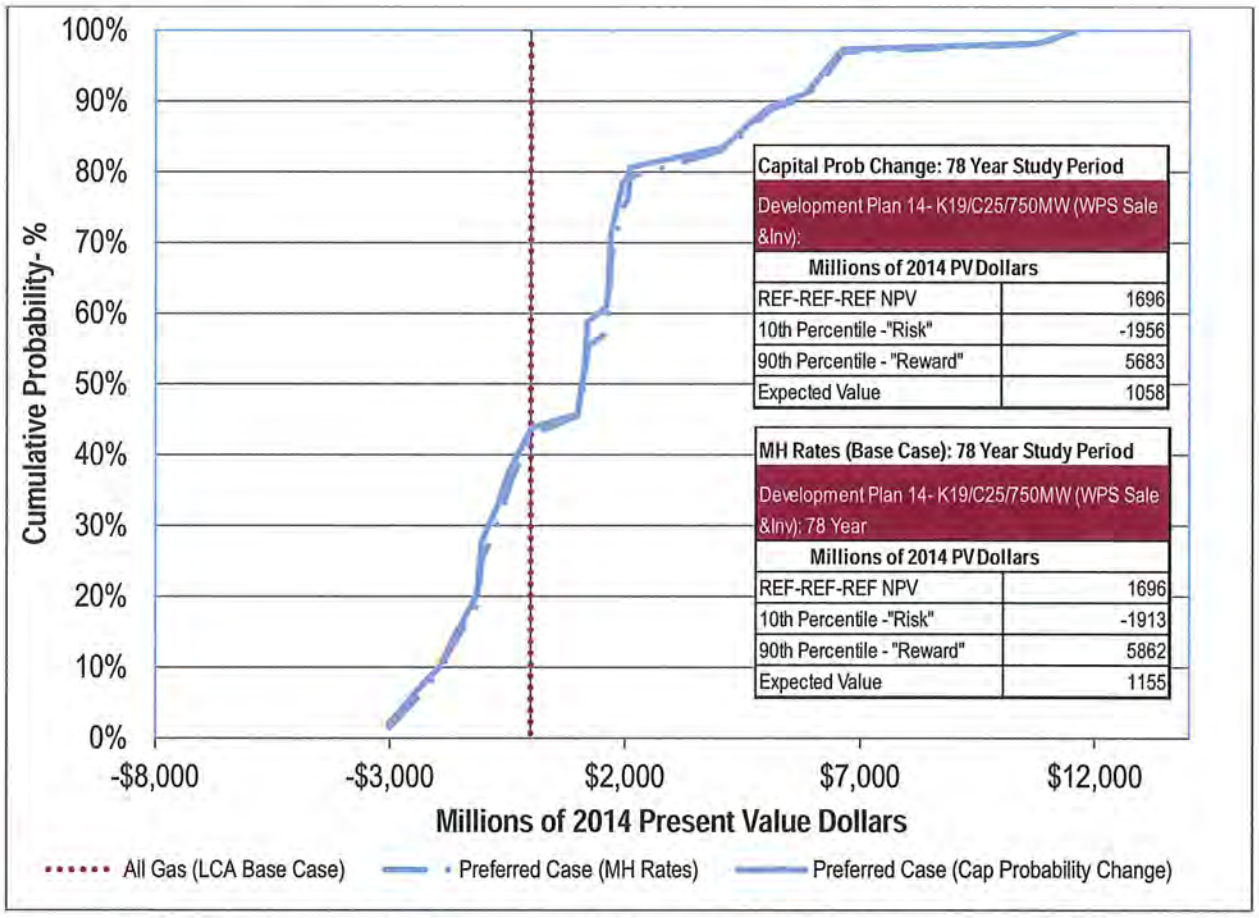

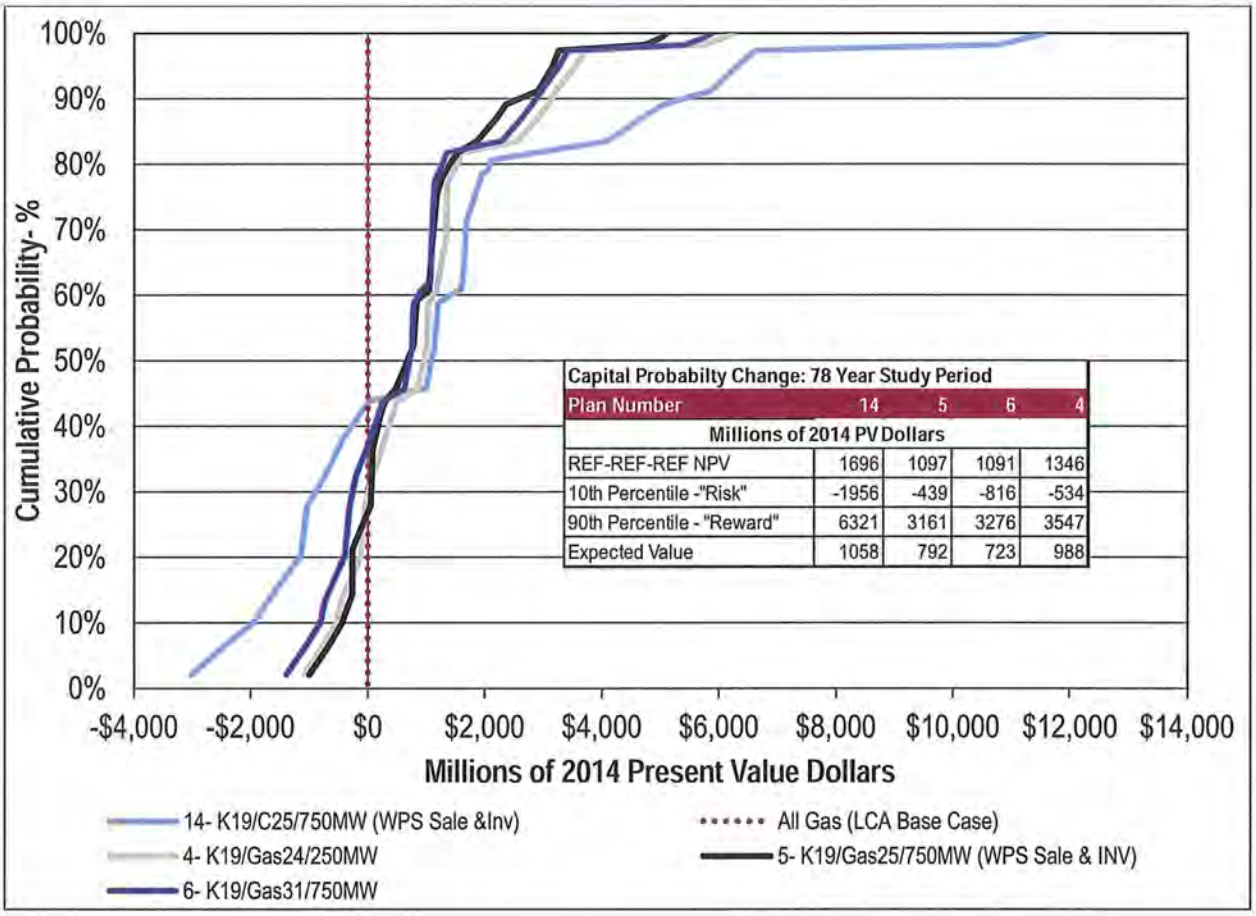

Figure 9-50: The Impact of the assumed change in Capital Cost Probabilities on the Probability Distributions of the Plan 14 Preferred Development Plan having Higher Costs than the All Gas Plan after 78 years – Millions of 2014 Present Value Dollars

As demonstrated in the above figure, our assumed change in the capital cost probability assignment does not significantly change the economic outcome. A much more substantial change in expectations about capital costs would be required to have a material effect on the economic analysis results.

2. Energy Price Probabilities

Similar to the discussion above on Capital Cost, this sensitivity was done to capture a different perspective from that of MH regarding energy prices. In our preliminary discussions with Potomac Economics, it indicated an energy price perspective that [redacted] in its analysis.

This analysis changes the probabilities assigned to the low, reference and high energy price scenarios from 30%/ 55%/15% to 40%/ 50%/10% for Low, Reference and High

Energy Price Scenarios, respectively. This technique incorporates an opinion that the energy price estimates are now lower than MH has assumed.

The results that are featured in the S-Curve charts are as follows:

Figure 9-54: Preferred Development Plan - 20, 35, 50, and 78 Year NPV – Increasing the Probability of Low Energy Prices

Figure 9-55: Preferred Development Plan – 78 Year NPV – Comparison of Results with the MH Probabilities and with those where we have Increased the Probability of Low Energy Prices

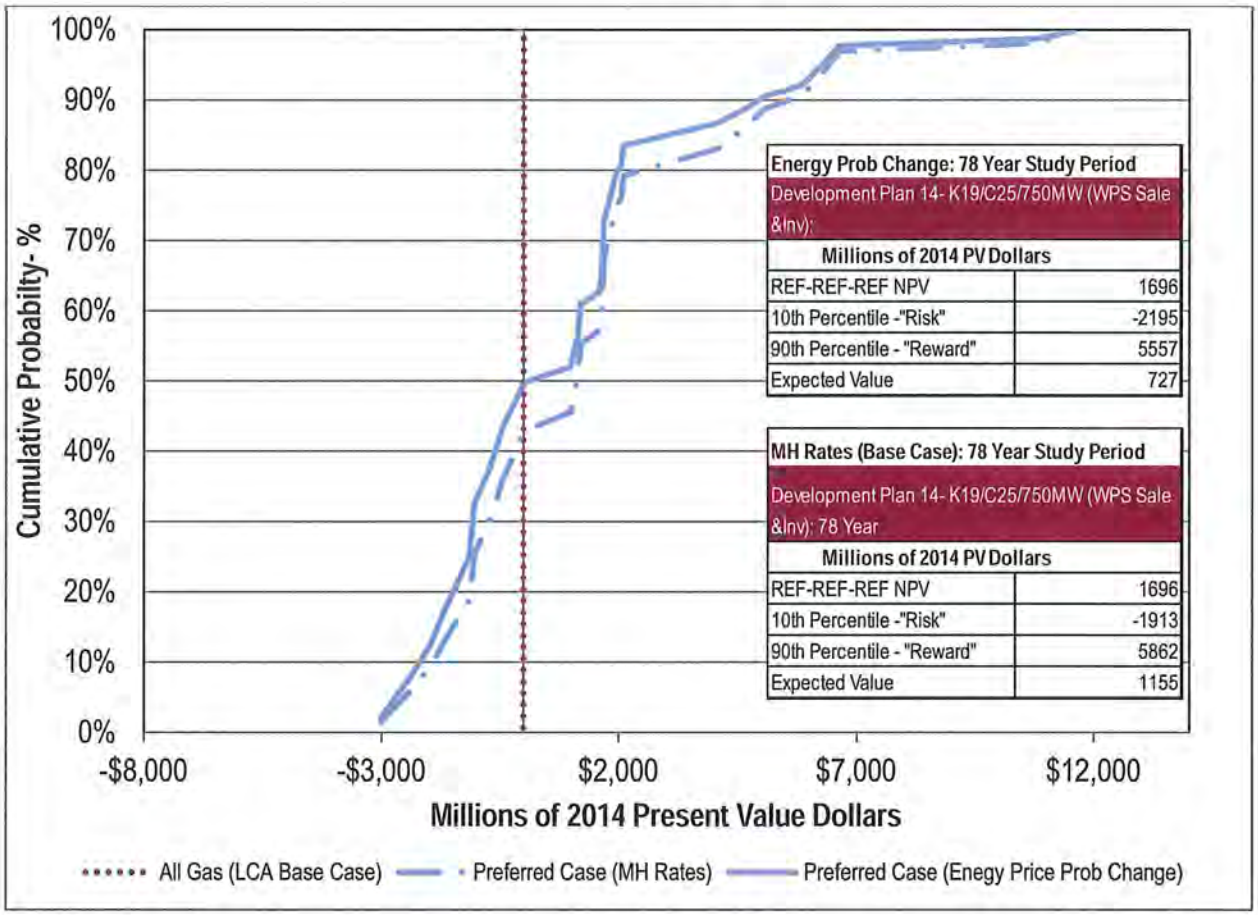

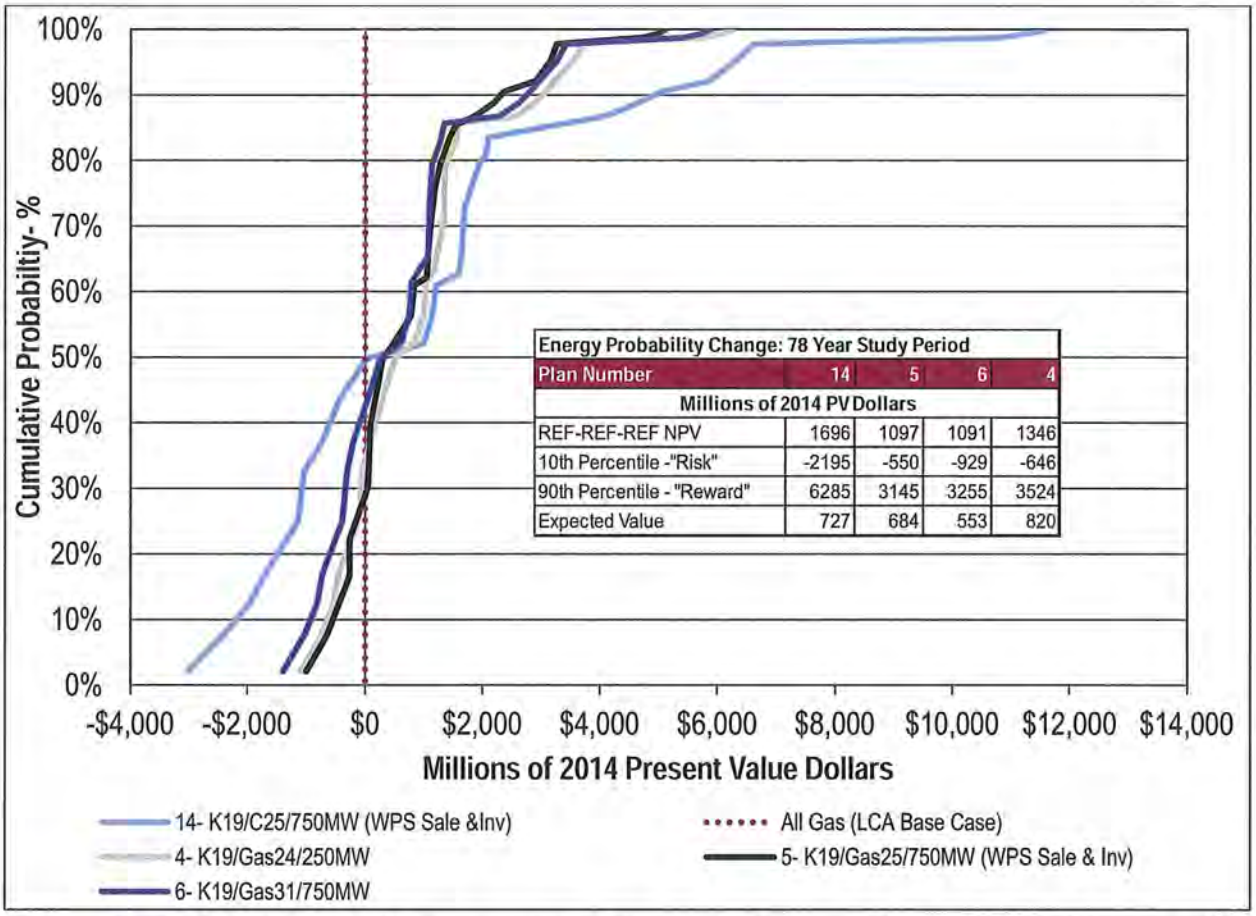

Figure 9-55: The Impact of the assumed change in Energy Price Probabilities on the Probability Distributions of the Plan 14 Preferred Development Plan having Higher Costs than the All Gas Plan after 78 years – Millions of 2014 Present Value Dollars.

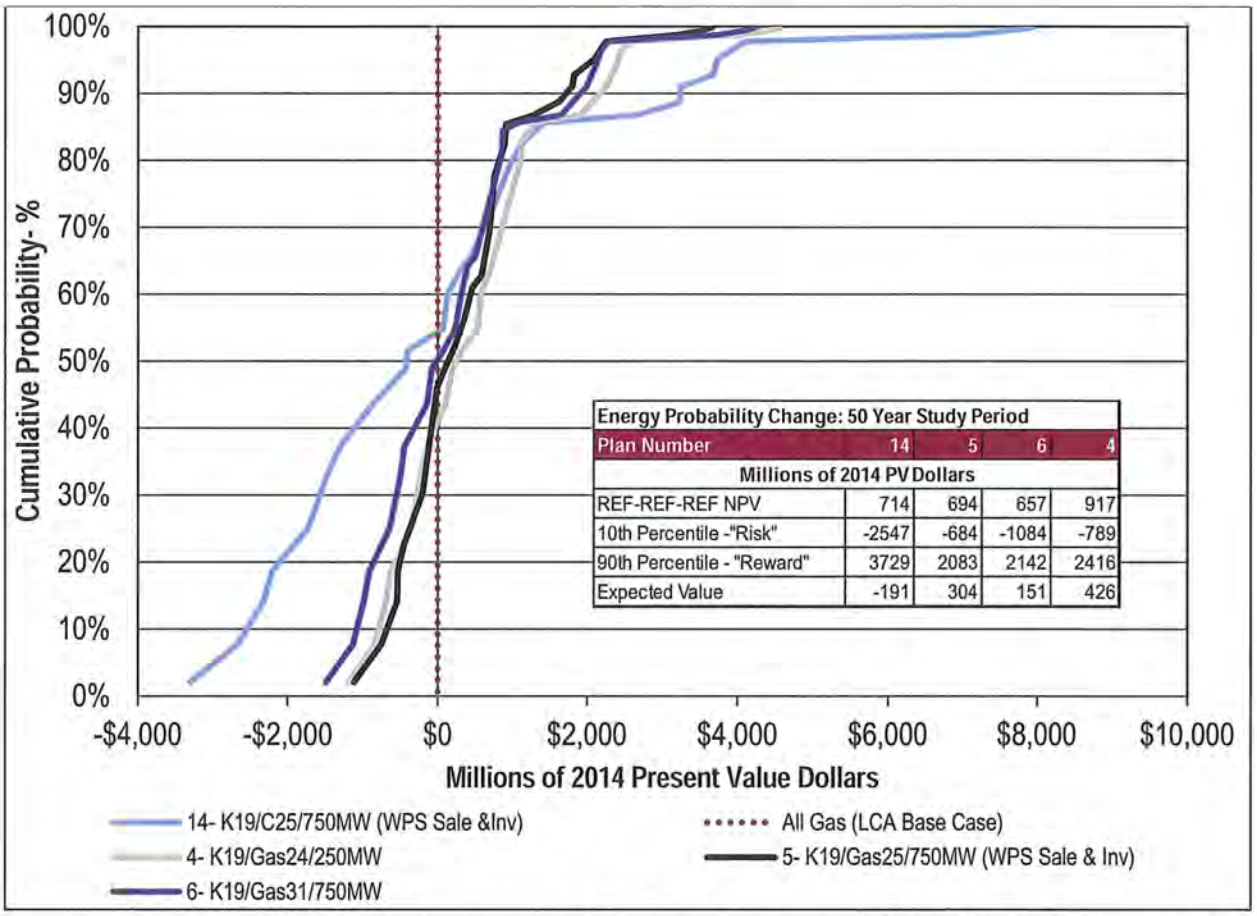
The above chart Figure 9-55, coupled with Figure 48, signifies that a change in energy price probabilities does have a significant effect on the range of NPVs, even changing the rank order of the plans on the NPV metric. Also, the change in probabilities does somewhat change the probability that the Preferred Development Plan will break even with the All Gas base case. With a higher probability that energy prices will be low, the Preferred Development Plan now has approximately a 50% probability of breaking even with the All Gas plan compared to more than 55% in the MH probabilities. It also reduces the expected value benefits of the Preferred Development Plan by just over $400M.



This change in energy price probabilities does produce a change in the ranking of the alternative development plans included in this example. With this move to somewhat lower energy price expectations, Plan 4 has the highest expected value of NPV benefits.

D. Sensitivity to Capital Costs of Keeyask and Conawapa

This analysis examines the impact of two potential scenarios that test the robustness of observations and results to a concern that there should be higher capital costs evaluated for Keeyask and Conawapa. In MH's analysis it estimated the range of uncertainty around the capital costs on Keeyask, Conawapa, SCGT, CCGT, and Wind. The following table was provided by MH in the NFAT filing[39].

[39] NFAT Submission, Appendix 9.3, Table 2.5, p. 37.

Resource	Low	Reference	High
Keeyask (2019)	-8.5%	-	+13.2%
Conawapa (2026)	-8.8%	-	+11.8%
SCGT (2022)	-30.5%	-	+38.2%
CCGT (2022)	-31.6%	-	+40.0
Wind	-26.2%	-	+34%

Figure 9-59: MH Percentage Difference of Low and High capital Costs relative to Reference[40]

In this sensitivity section we have two different ways of modeling the concern that capital costs for Keeyask and Conawapa may be higher than the high cost estimates developed by MH and used in MH's economic uncertainty analysis. One situation would be a modest increase in the high cost scenario's capital costs. The other would represent a very pessimistic view on the realities of the MH estimates. This was modeled by LCA assigning the MH estimate for reference capital cost for Keeyask and Conawapa to the low scenario. The reference and high scenario estimates for capital cost were each increased by 20%. We have analyzed the results of the NPV metrics utilizing each of these methods independently in this section

Figure 9-60 below shows the reference case and expected value results comparing results based upon MH's assumptions and these alternative values of capital costs. Descriptions of the exact modeling of these discount rate sensitivities and more results in the form of S Curves are shown in Sections 1 and 2 below.

The economic results of increasing the capital costs across all three scenarios are very dramatic. Only Plans 2, 4, 5, and 6 now show to be lower cost than the All Gas Case even after 78 years. The other sensitivity with only a modest increase in the high scenario capital cost estimates has a minimal effect on the NPV results.

Figure 9-60: Impact of Capital Cost Sensitivity – Millions of 2014 Present Value Dollars

1. The Increase of 10% in high scenario of capital costs for Conawapa and Keeyask generating stations

The first sensitivity increases by 10% the capital cost of Keeyask and Conawapa in the high capital cost scenario. This is targeted to see how the results change even if we are comfortable with the reference capital cost estimation process and we believe that the lower capital cost estimate is also possible. As one would expect this has only a small effect on the probability distributions of the economics of the Preferred Development Plan.

The results that are featured in the S-Curve charts are as follows:

Figure 9-61: Preferred Development Plan - 20, 35, 50, and 78 Year NPV – With an increase of 10% in high scenario of capital costs for Conawapa and Keeyask generating stations

Figure 9-62: Preferred Development Plan – 78 Year NPV – Comparison of Results of MH Capital Cost values for the scenarios and one with an increase of 10% in high scenario of capital costs for Conawapa and Keeyask generating stations

Figure 9-63: Preferred Development Plan compared to Plans 4, 5, and 6 – 78 Year NPV – With an increase of 10% in high scenario of capital costs for Conawapa and Keeyask generating stations

Figure 9-64: Preferred Development Plan compared to Plans 4, 5, and 6 – 50 Year NPV – With an increase of 10% in high scenario of capital costs for Conawapa and Keeyask generating stations

Figure 9-65: Preferred Development Plan compared to Plans 4, 5, and 6 – 35 Year NPV – With an increase of 10% in high scenario of capital costs for Conawapa and Keeyask generating stations

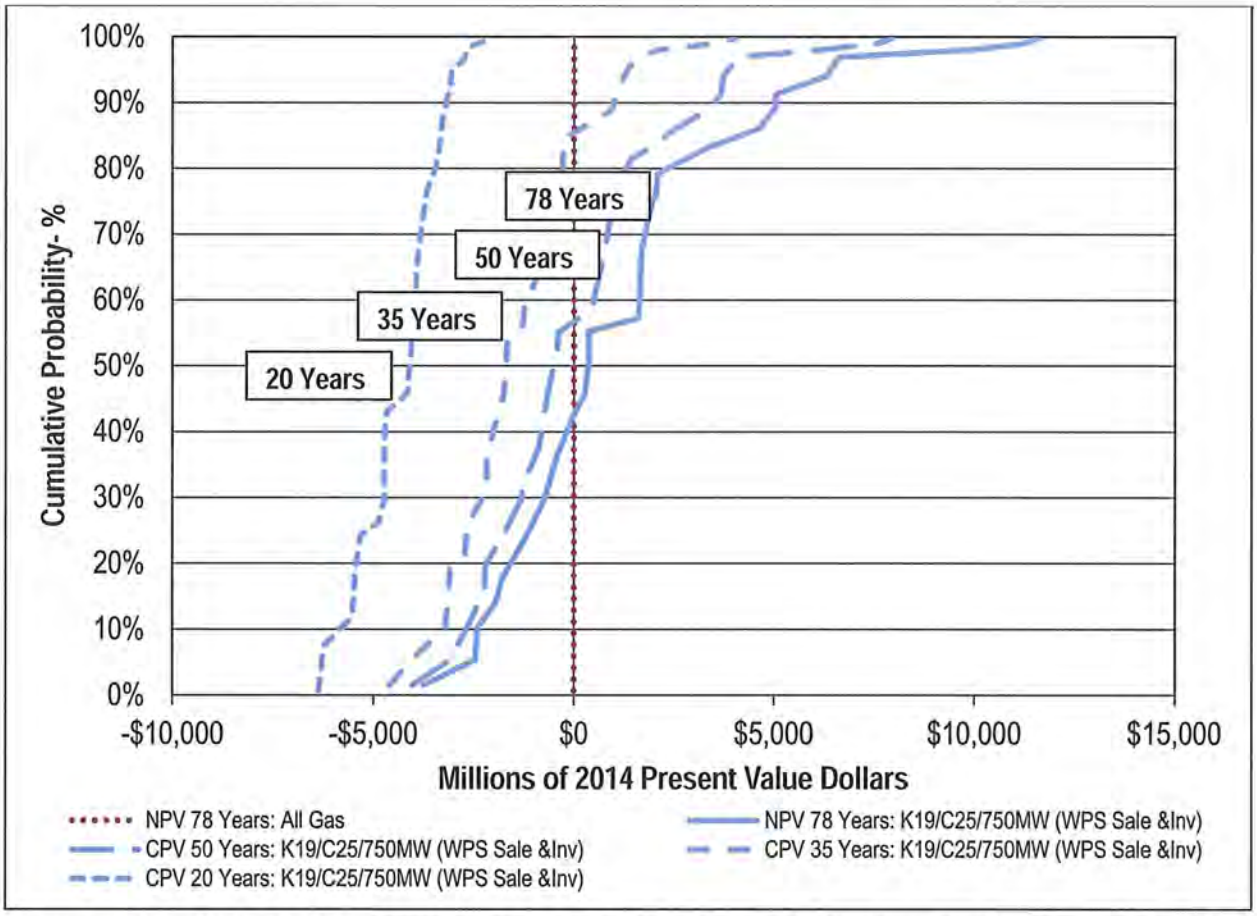

Figure 9-61: Probability Distributions of the Plan 14 Preferred Development Plan having Higher Costs than the All Gas Plan with 10% Higher Capital Costs for the Keeyask G. S. and Conawapa G. S. in the High Capital Cost Scenarios after 78 years – Millions of 2014 Present Value Dollars

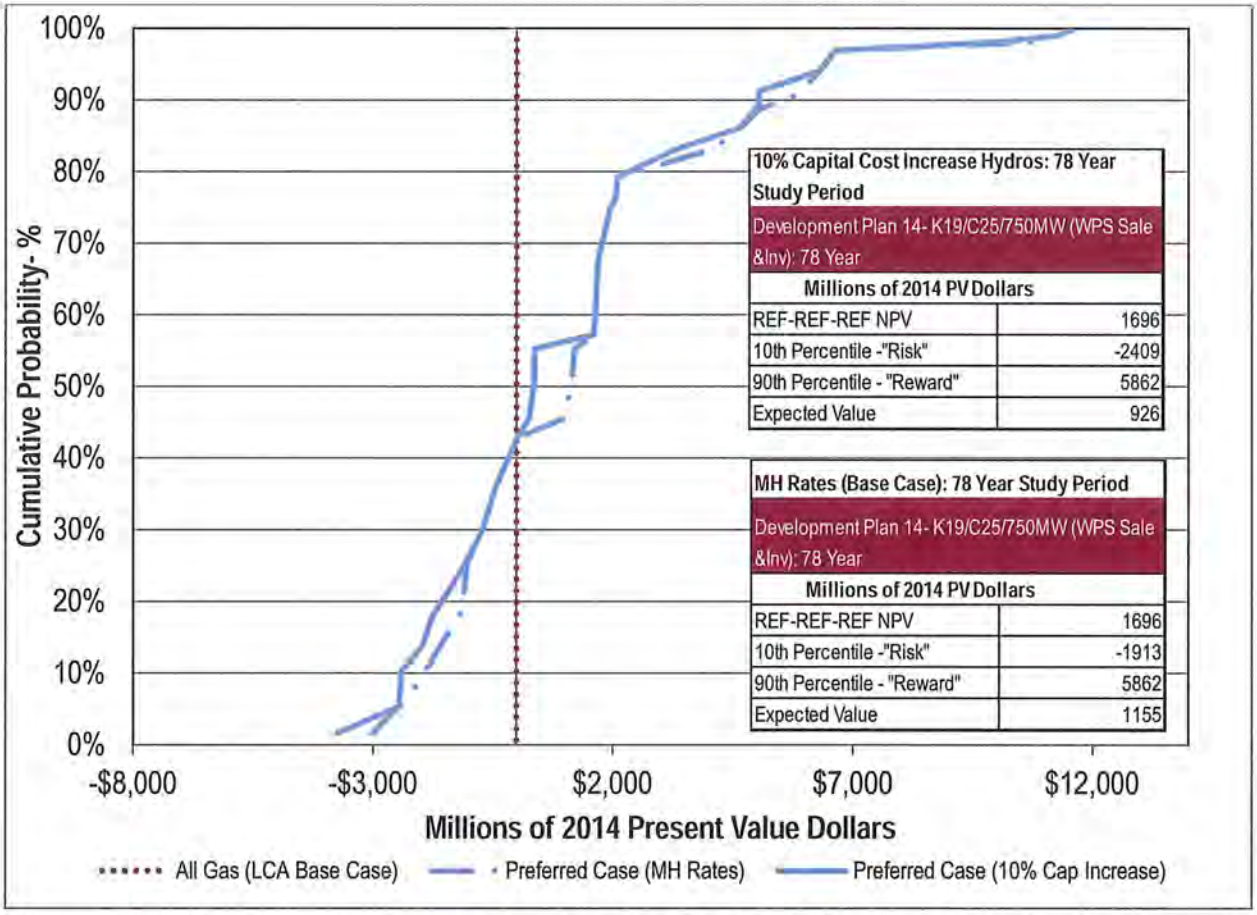

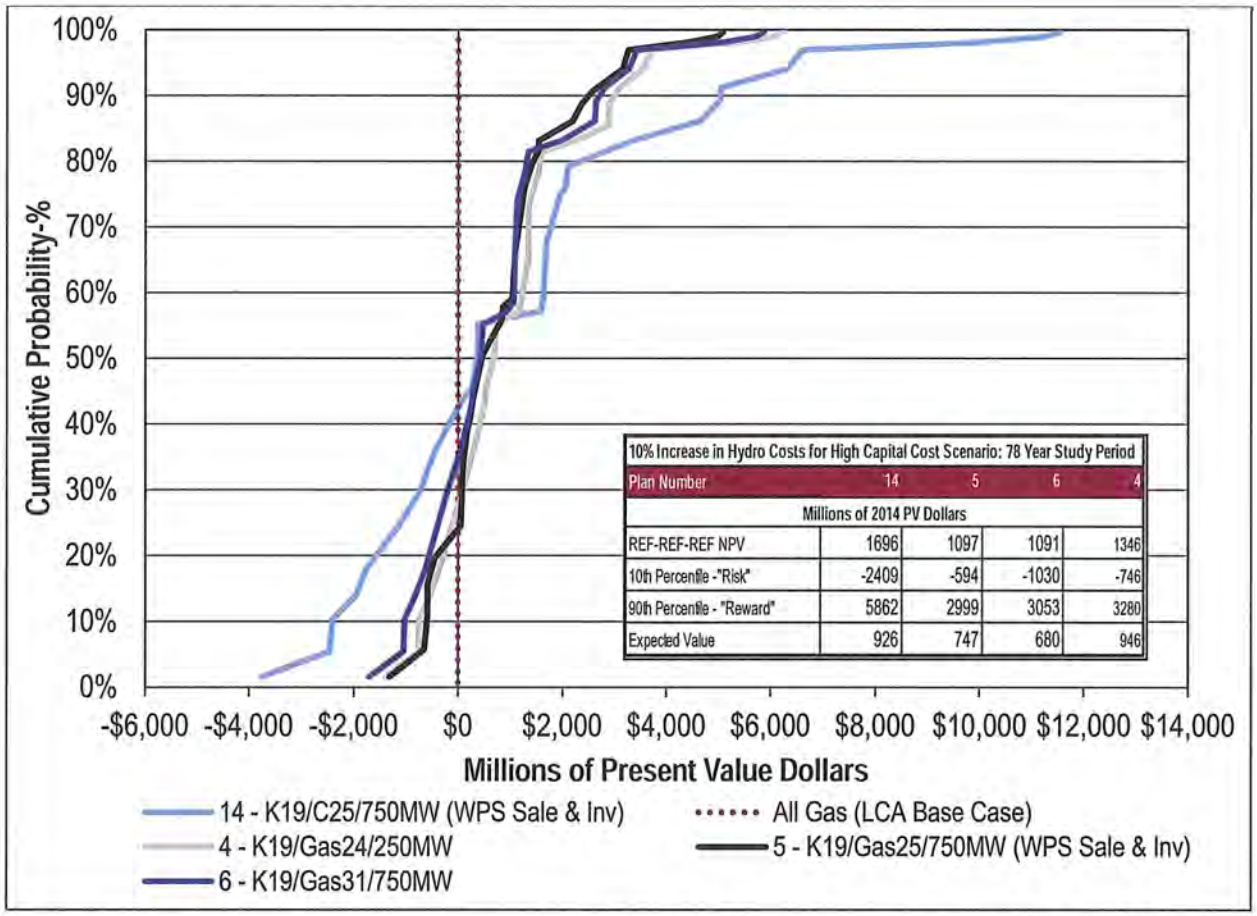

Figure 9-62: The Impact of increasing by 10% the High Capital Costs for the Keeyask G. S. and Conawapa G. S. in the High Capital Cost Scenarios on the Probability Distributions of the Plan 14 Preferred Development Plan having Higher Costs than the All Gas Plan after 78 years– Millions of 2014 Present Value Dollars

When we look at the four plan comparisons on the Figure 9-63 we see that the Preferred Development Plan now has an expected value for the 78 year NPV that is lower than Plan 4. The largest difference in these plans is that Plan 4 does not include the Conawapa G. S. This relatively small change has eliminated the economic advantage of the Preferred Development Plan. A similar observation from Figure 9-64 is that at the end of 50 years of the study the expected value of the Preferred Development Plan is now negative while the other three plans in the comparison are positive. This meaning not only are the other three plans in this comparison lower cost to the All Gas Plan and the Preferred Development Plan, the All Gas Plan through 50 years is lower cost than the Preferred Development Plan through 50 years.

Figure 9-65: The Impact of increasing by 10% the High Capital Costs for the Keeyask G. S. and Conawapa G. S. in the High Capital Cost Scenarios on the Probability Distributions of the Selected Plans having Higher Costs than the All Gas Plan after 35 years– Millions of 2014 Present Value Dollars

2. Higher Keeyask and Conawapa Capital Costs

The second sensitivity that we analyzed regarding the capital cost estimates for the Keeyask and Conawapa facilities is intended to capture a perspective that the low, reference and high capital cost estimates are all too low. While there have been prior hydro projects that have shown 40% or more final capital costs compared to the estimated capital cost we did not want to jump to such a pessimistic outcome. However based upon discussions with Knight Piesold we believe we settled on a

range that is feasible to have for someone skeptical of MH estimates. In the Low cost scenario. LCA used capital costs for Conawapa and Keeyask MH used with the Reference.

The Figures 9-66 through Figure 9-70 demonstrate that the impact of these increases in capital costs for Keeyask and Conawapa will, as expected, generate more costs than revenues for the Preferred Development Plan than the All Gas base case. Using the 78 year NPV metric there is less than a 50% chance that the Preferred Development Plan would be lower cost than the All Gas Plan. In the MH analysis (i.e., their capital cost estimates), the expected value of the Preferred Development Plan was to have a 78 year NPV that was nearly $1.2 Billion better than the All Gas Plan. This change in capital cost perspective for the proposed hydroelectric stations eliminates that advantage for the PDP entirely and results in Plan 4 having the lowest cost at the end of 78 years.

The results that are featured in the S-Curve charts are as follows:

Figure 9-66: Preferred Development Plan - 20, 35, 50, and 78 Year NPV – Increased Capital Cost Of Keeyask and Conawapa in all Scenarios

In figures comparing four plans, the Preferred Development Plan arises as even more of an outlier as compared to the All Gas Plan base case from the three other plans. The larger range in values suggests more potential risk and reward of the PDP. The comparison of the expected value at 78 years identifies the Preferred Development Plan as the only plan not to break even with the All Gas plan in this study period.

E. Sensitivity to Thermal and Wind Capital Cost

In this pair of sensitivities LCA sought to test whether the metrics were sensitive to assumptions around the capital costs of natural gas generation and wind turbine generation. It was apparent that the methodology adopted by MH that assigns wider capital costs uncertainties to projects that are in the earliest planning stages. This leads to an unusual view around capital cost uncertainty ranges that there is much greater uncertainty in the capital costs for Thermal and Wind Capacity than there is on the Keeyask and Conawapa projects, even though the hydro projects are much more

complex. Thermal and Wind Generation projects can even be completed under turn-key contracting approaches, which can minimalize the uncertainty in project related cost uncertainties. For these reasons LCA sought to test the impact of different ranges for uncertainty in capital costs of thermal and wind generation projects.

1. Reduced Uncertainty Band for Thermal and Wind Capital Costs –

LCA wanted to understand what would happen to the S Curve and expected values if the generation capital costs other than Keeyask and Conawapa had been the result of a more detailed study. To model this we have reduced the High Capital Costs Reduced by 20%, Low Capital Costs Increased by 15%. Figure 9-71 and Figure 9-72 which follow show that there is minimal impact.

The results that are featured in the S-Curve charts are as follows:

Figure 9-71: Preferred Development Plan - 20, 35, 50, and 78 Year NPV – Reduced Uncertainty Band for Thermal and Wind Capital Costs

1. Testing for No Uncertainty in Thermal and Wind Capital Costs –

In addition, LCA wanted to disconnect the joined capital cost uncertainty of the hydroelectric and non-hydroelectric projects. To model this effect we have made the capital costs of thermal and wind projects equal to reference in the high and low capital cost scenarios. In the high and low scenarios the hydroelectric projects still have uncertain capital costs. Figures 9-73 and 9-74 below show that this effect is minimal.

The results that are featured in the S-Curve charts are as follows:

Figure 9-73: Preferred Development Plan - 20, 35, 50, and 78 Year NPV – No Uncertainty in Thermal and Wind Capital Costs

F. Synopsis

LCA performed various sensitivity tests to understand how robust the observations and conclusions are that were made by MH, given that there can be differing opinions on certain core assumptions. LCA developed a working Economic Modeling spreadsheet that would us to vary the probability distributions of key uncertainties, the capital cost of generation additions, and the discount rates. Earlier in this report we showed by comparing the NPV differences to capital costs of development plans that there is actually only a small relative NPV compared to the large increase in investment required for the Preferred Development Plan. We also showed that the IRR of the Preferred Development Plan was only 6.15% compared to a discount rate of 5.05%, both

on a real dollar basis. It also showed that other development plans have IRR higher than the Preferred Development Plan when compared to the All Gas Plan. Lastly our analysis in Sections II and III showed that for time periods as lengthy as 50 years there are development plans with lower costs and lower risks than the Preferred Development Plan. All these metrics indicated a very small margin of savings being created even with all MH assumptions and analyses and even going out the full 78 years.

The last step in testing the robustness of MH conclusion that MH prefers Plan 14 is to review the sensitivities performed in this section. The sensitivities chosen by LCA are not intended to be extremes, but are intended to be reflective of more current information, the opinions of IECs in this proceeding, or to reflect a risk factor. The key observation we draw from the sensitivity analyses are the following:

1. A modest increase in discount rates or the elimination from consideration the low discount rate scenarios postulated by MH would make the Preferred Development Plan have the same present values of costs over 78 years as the All Gas Plan on an Expected Value basis.
2. Several Plans are have lower costs than the Preferred Development Plan, even over 78 years, when higher discount rates are assumed.
3. Modest increases in Capital cost assumptions for the Keeyask and Conawapa projects would also result in other Development Plans having lower costs than the Preferred Development Plan, even over 78 years.
4. A slightly lower view of export market prices substantially erodes the MH expected economic benefits of the Preferred Development Plan.
5. The economics used by MH to arrive at their preference for the Preferred Development Plan is not robust and, depending upon the perspective of the decision maker, could actually conclude that other development plans are preferred.

V. Economic Analysis Provincial Perspective

A. Introduction

All the prior economic analysis in this Technical Appendix was conducted as a cash flow perspective of MH and its ratepayers. In this prior analysis, this means that any cost incurred by MH is included, whether it be a hard expenditure or payments made to the province of Manitoba. In order to make this a change to the Province of Manitoba Perspective, one would look at which costs were included in the MH perspective analysis which are made to the Province that do not have a cost to the Province (i.e., essentially a tax payment of sort). MH has identified three candidate costs which can be labeled as Provincial Transfer Payments: Water Rental Fees, Capital Tax and the 1% Provincial Guarantee Fee on Borrowing made on behalf of MH.

In this section, we will show how the economics of plans with investments in one or more of the proposed hydroelectric facilities—Keeyask or Conawapa—are improved by removing those costs. As will be discussed, LCA, after consultation with Morrison Park Associates, differs in opinion as to whether all three of the cost types that MH assumes to be Provincial Transfers should be considered Provincial Transfers.

B. Manitoba Hydro Analysis

In MH's Section 9.3.3 they provide NPVs in a 78 year study period using reference scenario assumptions for "*additional assumed cash transfers to the Province of Manitoba,*"[41] which includes water rentals, capital taxes, and provincial guarantee fees. MH defines the water rentals as "*based on the operation of Manitoba Hydro's hydro-electric generation and are calculated and paid to the Province of Manitoba in accordance with the Water Power Act.*" Capital taxes are defined as "*provincial tax(es) assessed under The Corporation Capital Tax Act of Manitoba. In general terms, the tax is applied at a rate of 0.5% to the capital invested by Manitoba Hydro in the province, where "capital" can be generally defined as the "total debt and retained earnings of the corporation."*

MH defined the provincial guarantee fee as "*an annual fee payable to the Province of Manitoba in return for guarantee of corporation's debt (with exception of some MHEB bonds) and is calculated using a rate of 1% multiplied the gross outstanding debt at March 31 of the*

[41] NFAT Submission, Chapter 9, p. 23.

previous fiscal year."[42] The fee is 1%of the total capital invested for each development plan. The percentages for each of these fees are assumed to remain constant for economic analysis purposes.

MH includes a review of these cash transfers in their economic analysis because the fees benefit the provincial government and, indirectly, the Manitoban taxpayers. Because these fees are classified and used as costs in the economic analysis, MH believed specific attention and analysis would provide a more holistic understanding of these cash flows. MH concludes that the *"greatest cash transfers to the Province result from those development plans that include both Keeyask and Conawapa generating stations; these cash transfers are significantly greater than those development plans that include only one or no hydro-electric generating station."*[43]

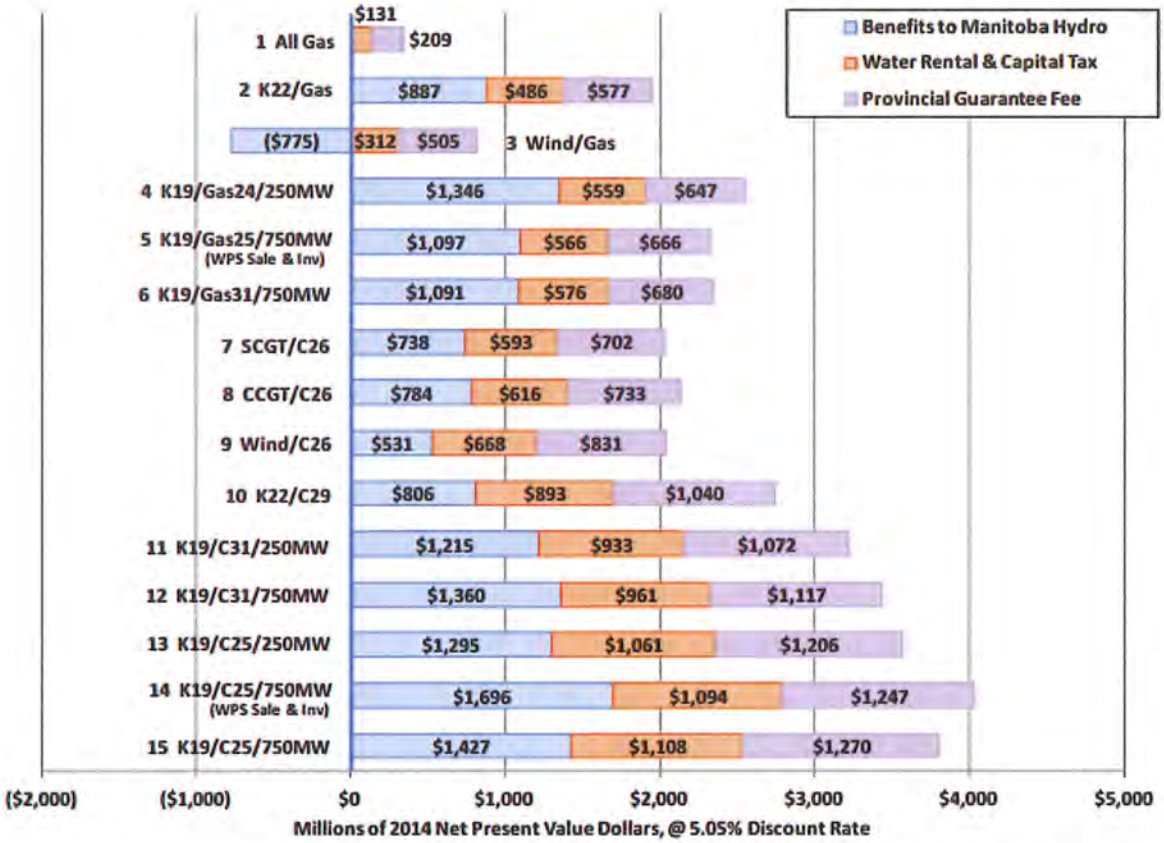

Figure 9-75: Resource Plan Economic Benefits after 78 year to the Province of Manitoba as filed in the NFAT application by Manitoba Hydro – Millions of 2014 Present Value Dollars

C. La Capra Associates' Critique of Manitoba Hydro Analysis

As mentioned in the introduction, LCA, after consultation with Morrison Park Associates, does not agree that the 1% Provincial Loan Guarantee Fee that the province charges MH is a Provincial Transfer. The rationale for our opinion is that this Fee, unlike the Water Rental Fee, is merely compensation to the Province for the risks the Province has assumed by providing the Guarantee. By taking on the risks, the Province has some probability that this will have a cost to the Province if the Guarantee is called upon.

In addition, as with the MH perspective economic analysis discussed earlier in this report, LCA views the MH sole reliance on the 78 year study time period metric of NPV for decision making lacks the important visibility as to what are the impacts during shorter time periods.

Lastly, LCA believes there are some additional insights that can be gained by analyzing the IRR metric which captures the time period impacts more acutely than a present value analysis alone.

D. La Capra Associates' Analysis—Economics of Resource Plans from the Provincial Perspective-Reference Scenario

As mentioned in the introduction, LCA, after consultation with Morrison Park Associates, does not agree that the 1% Provincial Loan Guarantee Fee that the province charges MH is merely a transfer payment. The analysis in this section is LCA's view of the economic analysis from the perspective of the Province of Manitoba. This view removes the Water Rental Fees and Capital Tax as costs associated with the Keeyask GS and the Conawapa GS.

In order to properly illustrate the results, the following chart is shown differently than the MH version above. The blue bars represent the economics to MH that we discussed in all the prior chapters in this Technical Appendix. The red bars represent the present value of the Water rental and Capital Tax charges. By adding these two together to get the gray bar, we have the Total direct benefits to the Province of Manitoba associated with each specific resource development plan.

We see that the 78 year study period economics of the development plans, which include both hydroelectric generating stations, have over $2 Billion of benefits compared to the All Gas Plan (assuming the modeling results of MH). The development plans with only one of the hydroelectric generating stations have benefits of over $1 Billion to $1.7 Billion on a 78 year NPV basis.

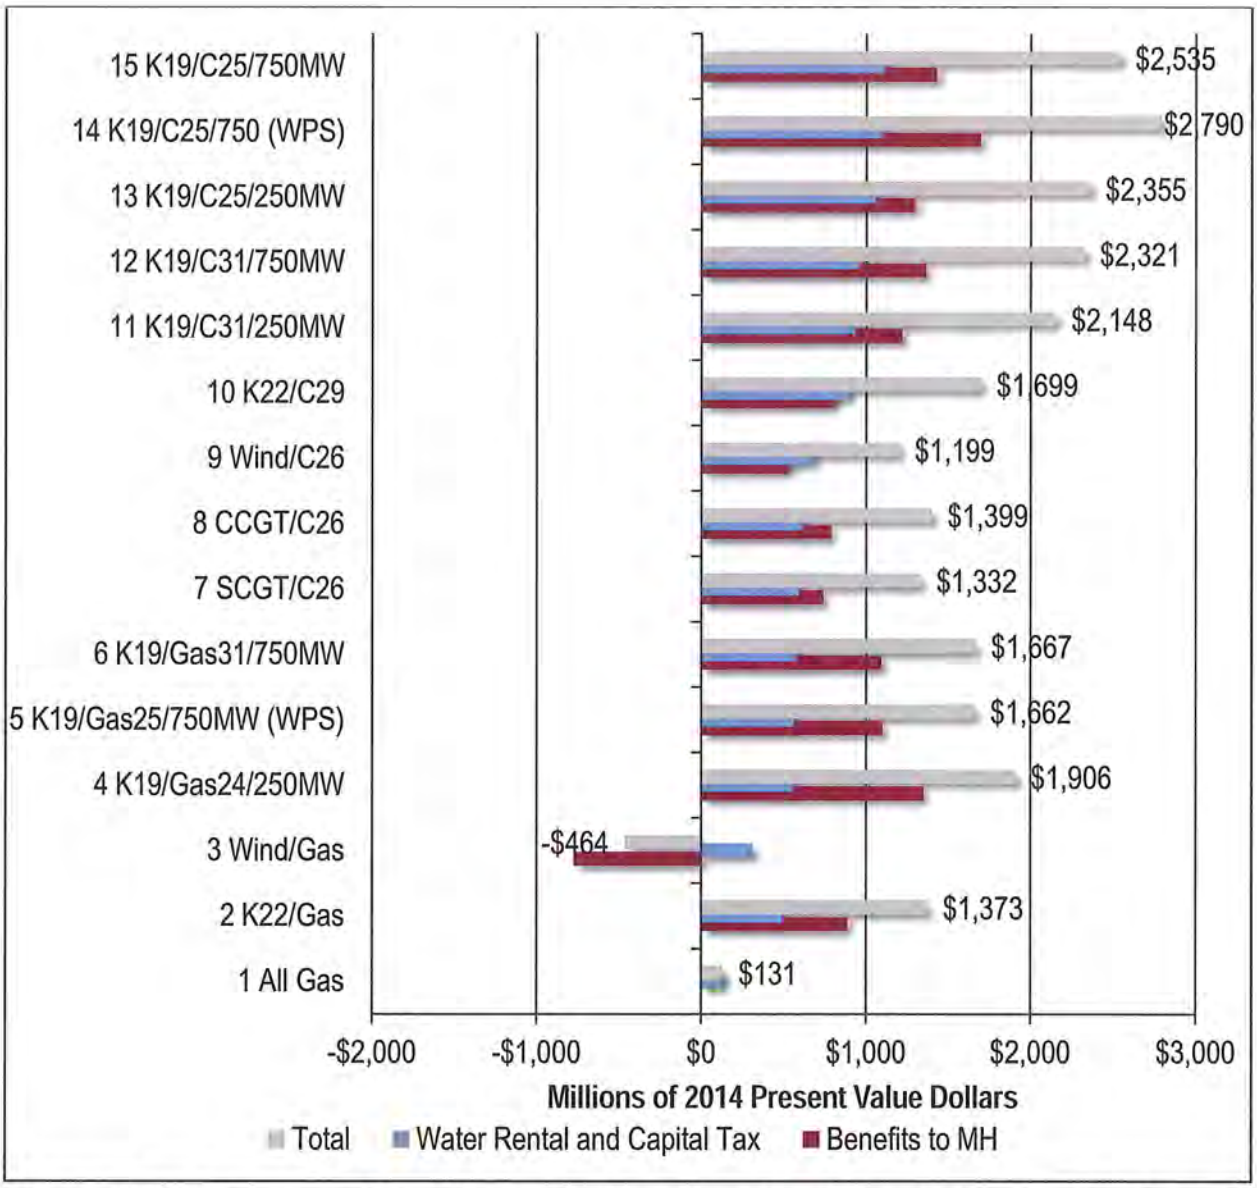

Figure 9-76: Resource Plan Economic Benefits after 78 year to the Province of Manitoba LCA Perspective – Millions of 2014 Present Value Dollars

The effects of looking at economics of the resource plans to the Province, when one looks at the shorter study periods of 50, 35 and 20 years, show reduced and even negative benefits of resource plans relative to the All Gas Plan. This is shown in Figure 9-77, Figure 9-78, and Figure 9-79 below.

Next, we should look at the 50 year CPV metric shown below in Figure 9-77. We see in this figure that from the MH perspective the plans have negative CPV, meaning they have higher costs to MH than the All Gas Plan. However the majority of the development plans' benefits from the proposed Keeyask GS And Conawapa GS are taken by the Province through the provincial 'tax' revenue, Capital tax and Water rental fees.

In the 35 year period, we can see in Figure 9-78 below that there are substantial Provincial Transfers made for Water Rental Fees and Capital tax charges made to MH and its ratepayers even though the resource plans have no net benefits when compared to the All Gas Plan. After 35 years, only three plans have lower costs than the all Gas Plan, even when the Provincial transfers have been taken away from the resource plan costs. After 35 years, the lowest cost resource plan is Plan 4, followed closely by Plan 5. These two plans include only the Keeyask GS and natural gas generation. Plan 4 assumes the smaller 250 MW of incremental transmission, while Plan 5 assumes the larger 750 MW transmission project.

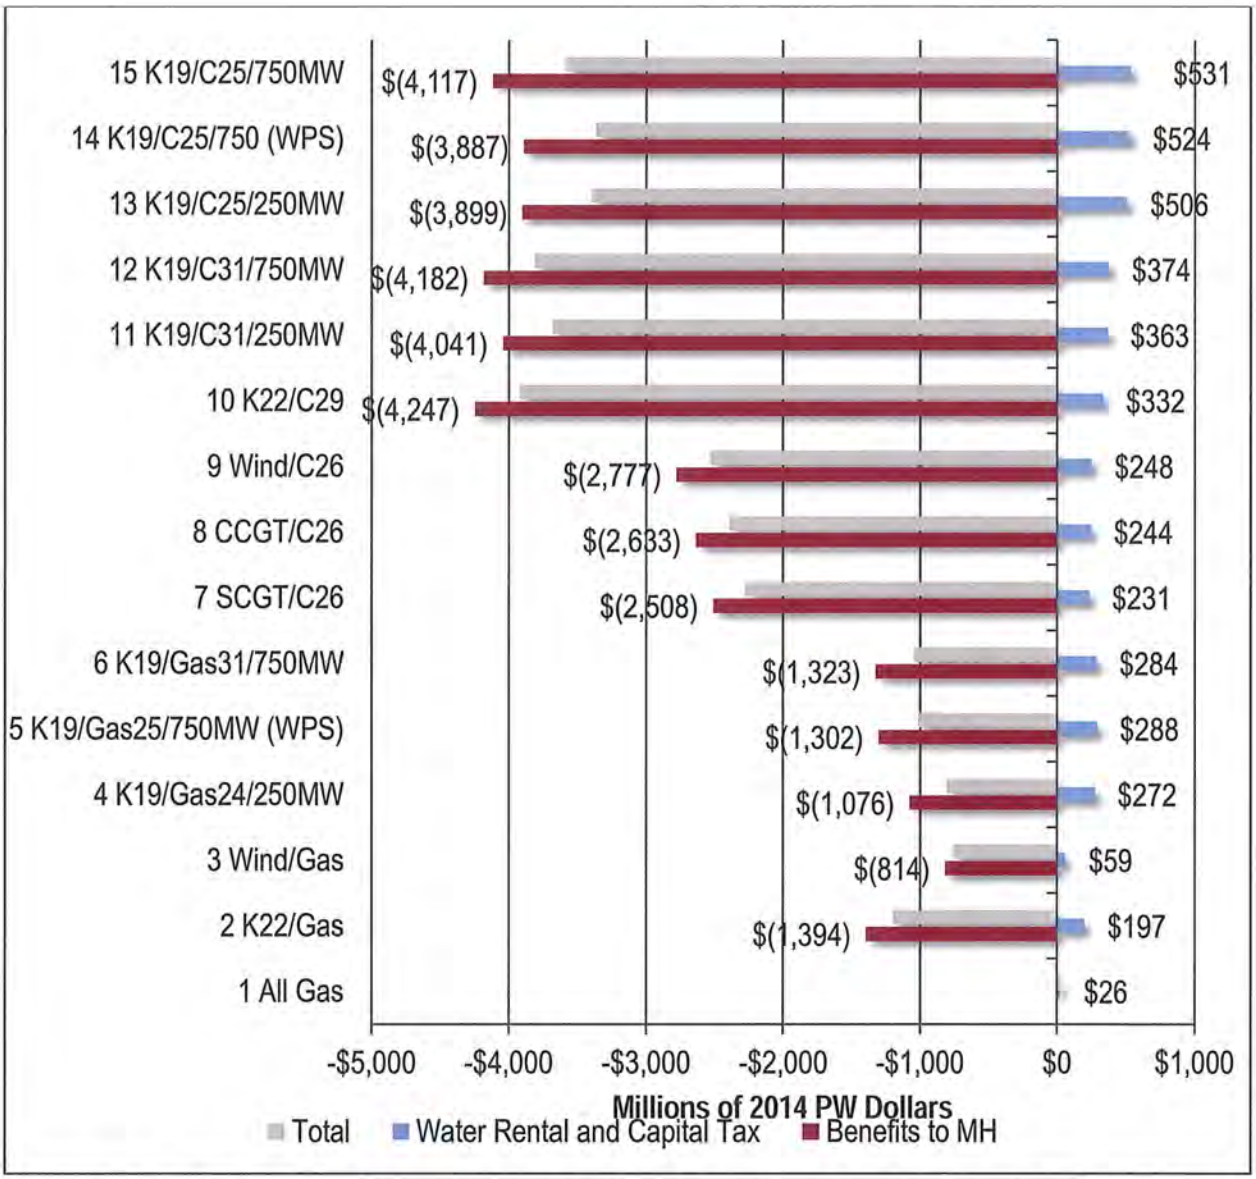

Figure 9-79: Resource Plan Economic Benefits after 35 year to the Province of Manitoba LCA Perspective – Millions of 2014 Present Value Dollars

E. La Capra Associates Analysis – Uncertainty

LCA also extended the analysis without Provincial Transfers, The Province of Manitoba Perspective, beyond the reference scenario analysis, bringing in the full uncertainty probabilistic analysis. In this section LCA applies its comparison methodology by determining the incremental NPV of a development plan under a given scenario to the All Gas Plan NPV under that same scenario. This is shown in Figure 9-80 to Figure 9-85 below.

Figure 9-88: Comparative Economic Value after 35 years - Provincial Perspective Millions of 2014 Present Value Dollars

F. Synopsis

LCA believes it is appropriate to study the economics of alternative development plans from the view of the Province of Manitoba, as well as the from the MH perspective. LCA believes that these views should be studied with equal scrutiny of metrics. LCA created additional metrics for different periods of time. In this section we also utilized the MH modeling results to study the Province of Manitoba Perspective of the economic analysis under probabilistic uncertainty analysis. The probabilistic uncertainty analysis from the Province of Manitoba Perspective above used the same LCA Methodology

discussed in Section III. Important observations that we make from the Province of Manitoba Perspective are as follows:

1. LCA, in consultation with Morrison Park Associates, does not agree with MH's assessment that the 1% interest rate guarantee fee that the Province of Manitoba adds to the borrowing costs is a Provincial Transfer Payment. This fee is believed to be compensation to the Province for it taking on potential costs should the loan guarantee be needed. LCA agrees with the MH assumption that water rental fees and the capital tax collected can be considered Provincial Transfers.
2. The removal of the Provincial Transfers as 'costs' of the Development Plans provides measurable improvement the present value metrics used in the economic analysis for the development plans with Keeyask and/or Conawapa The Provincial Perspective results shows that development of Keeyask and some new transmission to be a common element among the lowest cost plans of the 15 Development Plans studied in the NFAT application by MH.
3. The Provincial Perspective results would not favor developing Conawapa unless there is a willingness to give the 78 year NPV metrics more weight than the 50 year NPV metric.
4. The benefits of the Preferred Development Plan over other plans accrue after year 50 of the study, even from the Provincial Perspective.
5. The Preferred Development Plan is not lowest cost through the next 50 years even from the Provincial Perspective.
6. The Provincial Perspective Analysis shows that at least half of the positive benefits of development plans that develop *either* or *both* of the hydroelectric stations are captured by the Province and not MH electric ratepayers.
7. In the first 35 years of this study, the Province of Manitoba would collect tax benefits from the hydroelectric development, even when the development plan has yet to yield benefits to MH customers on a present value basis.

VI. Summary of Economic Analysis Review Part A

Our review of the NFAT Application's Economic Analysis included consideration of MH's economic and planning models and methods as they have been used in the Economic Model, its Economic Uncertainty analysis and MH's assessment of the Development Plan economics from the Province of Manitoba Perspective. While there are many observations as shown below, there are four high level observations that should be considered in the NFAT review.

1) ***Alternatives metrics such as IRR and Break-Even Year do not show the Preferred Development Plan to be the best development plan.***
2) ***The use of NPV metrics for different points in time, other than the end of 78 years, show that many other development plans, including the All Gas Plan, are lower cost than the Preferred Development Plan for at least the next 40 years.***
3) ***The conclusion that Plan 14, which includes Keeyask, Conawapa, a 750 MW Transmission Line, and the WPS Contract and Investment, should be the Preferred Development Plan based upon MH's analysis and observations is not robust to withstand simple sensitivities to changing assumptions, such as capital costs, discount rates and energy prices.***
4) ***While a Provincial Perspective in this study shows improved economics for all the development plans with either or both Keeyask and Conawapa, there are other plans with metrics superior to the Preferred Development Plan even when taking the Provincial Perspective***

A. Economic Analysis

MH's Economic Model is a spreadsheet model that is used to conduct the economic analysis of the alternative development plans. It is used to compile forecast of future operations costs and market revenues (SPLASH output) and capital spending into a forecast of future costs and market revenues. The model is used to derive the NPV of those costs and revenues over the planning period to compare the economics of alternative development plans.

In this report we have identified number of comments and concerns with MH's Economic Model and the features of the economic analysis structure. Specifically, the key issues we identified with the MH economic analysis approach are as follows:

1) The economic differentials at the end of 78 years between the alternative development plans is relatively small compared to the scale of the investments proposed in the Preferred Development Plan. The relative economic value of the plans considered can be materially affected by relatively small changes in assumptions.
2) A 78 year planning horizon analysis is particularly susceptible to forecast uncertainty.
3) MH's singular focus on the 78-year NPV metric as the basis for comparing alternative development plans is too limited in scope for a decision of this magnitude. MH does not offer any comparative metrics that capture important differences in the plans through the study period that bear on the timing of costs and benefits and the associated risks.
4) MH's use of an unleveraged cash flow analysis for its economic evaluation is a relatively simple approach for economic analysis of alternative plans with investments of the scale that are under consideration in this NFAT proceeding.
5) MH does not feature the annual differences in cash flow between the plans in its application, which is important foundational information for assessing relative ratepayer cost and risk implications between the alternative plans. LCA has prepared those comparisons.
6) MH does not provide a break-even evaluation of the alternative plans. This analysis provides important information on the time required for proposed investments to provide benefits and on assessing implications of forecast risk. LCA has prepared comparisons of the plans using a cumulative NPV analysis.
7) MH does not provide conventional metrics comparing alternative plans over time. LCA has prepared in Section II comparisons of the alternative plans for 20-year, 35-year and 50-year NPV analysis and IRR analysis.

The MH economic modeling for the 78-year study period includes a 35-year detailed evaluation of the alternative development plans with SPLASH. For the balance of the

study period, years 36 to 78, system operations, loads, and market interactions are being represented with much less detailed evaluation. Overall, there is both simplified modelling and the inherent reliance on very long-term projections to derive the 78-year NPV results that MH has presented.

B. Economic Uncertainty Analysis

MH conducted an uncertainty analysis as part of its economic analysis presentation in the NFAT Application. As discussed in Section II of this report, MH evaluated the alternative development plans in its Economic Model treating several variables collected into three groupings as uncertain: Discount Rate; Energy Prices; and Capital Costs. For each of these three groups, MH defined the uncertainty with three values (low, reference, and high) and assigned its assessment of the probability of those three values occurring. For each alternative development plan, MH used the Economic Model to evaluate the 27 combinations of inputs to develop a distribution of economic results for those plans.

As with the Economic Model, LCA created our own working uncertainty analysis model to conduct our review of MH's work and to conduct the analysis required of us in the LCA SOW. A working version of this model is provided in the workpapers accompanying LCA Technical Appendix 9A: Economic Analysis. Through the process of building this model, we have been able to replicate MH's results and confirm our understanding of the functionality of the MH Economic Model. We have also constructed an alternative formulation which we view as a better approach to considering the uncertainty cases MH has evaluated.

Our concerns with the MH uncertainty analysis methodology are several.

First, the uncertainty methodology relies on the Economic Model for all of its analysis. Thus, all of the issues discussed above regarding the Economic Model are resident in the uncertainty analysis.

Secondly, MH's method of comparing cases and presenting the results is unconventional and can be misleading, as a result. MH' method compares all cases to a single case, All Gas using reference case assumptions on discount rate, energy prices, and capital costs. This does not compare the performance of All Gas to the other plans with comparable sets of assumptions, which we view as more informative and is the more conventional approach to this method of analysis. LCA has developed a model that does the comparative analysis of MH's cases. The LCA Methodology provides a comparative analysis across plans on consistent assumptions of uncertain parameters. Using this method with MH's economic analysis results and probability assessments, the comparative assessments of the plans are quite different than depicted in the MH S-Curve analysis.

Thirdly, MH reports only one performance metric in their uncertainly analysis results, 78 year NPV. LCA has developed a broader set of metrics to display, which we believe provides a more complete perspective on the results of the analysis for decision makers.

Lastly, the assessment of probabilities that MH used to develop its probabilities for the uncertainty scenarios begins with opinions of experts at a given point in time as the key inputs. This makes the probabilities as a very important input that can be changed to reflect updated information or differences of opinions. LCA is concerned that the perspective of the experts that was captured in the probabilistic analysis has likely changed in the two years since the analysis was conducted.

There are several important aspects of this uncertainty analysis resulting from LCA's review of the MH Probabilistic Uncertainty Economic Analysis:

1. The expected benefits from the PDP relative to the alternative plans are largely derived from upside opportunities after the first 50 years of the study period. Based on MH's economic analysis and probability assessments, the PDP recommendation requires a long-term view of benefits.
2. The LCA Methodology provides a comparative analysis across plans on consistent assumptions of uncertain parameters. Using this method with MH's economic analysis results and probability assessments, the comparative assessments of the plans are quite different than depicted in the MH S-Curve analysis.

3. When interim period economic analysis results are used to develop metrics for 20-, 35- and 50-year study periods, the Preferred Development Plan does not appear to be the lowest cost resource plan alternative even when a probabilistic scenario analysis covering 27 scenarios is included.
4. Plans with Keeyask GS but without Conawapa GS have more favorable economic uncertainty profile of their economics than the Preferred Development Plan.

C. Sensitivity Analysis

LCA in this report performed various sensitivities to understand how robust the observations and conclusions are that were made by MH, given that there can be differing opinions on certain core assumptions. LCA developed a working Economic Modeling spreadsheet that would be used to vary the probability distributions of key uncertainties, the capital cost of generation additions, and the discount rates.

Earlier in this report we showed by comparing the NPV differences to capital costs of development plans that there is actually only a small relative NPV compared to the large increase in investment required for the Preferred Development Plan.

We also showed that the IRR of the Preferred Development Plan was only 6.15% compared to a discount rate of 5.05%, both on a real dollar basis. It also showed that other development plans have IRR higher than the Preferred Development Plan when compared to the All Gas Plan.

Lastly, our analysis in Sections II and III showed that for time periods as lengthy as 50 years there are other MH alternative development plans with lower costs and lower risks than the Preferred Development Plan.

All these metrics indicated a very small margin of savings being created even with all MH assumptions and analyses and even going out the full 78 years.

The last step in testing the robustness of MH conclusion that MH prefers Plan 14 is to review the sensitivities performed in those section. These sensitivities change costs and/or probabilities somewhat from the MH assumptions. The sensitivities chosen by LCA are not intended to be extremes, but are intended to reflective of more current

information, the opinions of IECs in this proceeding or to inject a risk preference. The key observation we draw from the sensitivity analyses are the following:

1. A modest increase in discount rates or the elimination from consideration the low discount rate scenarios postulated by MH would make the Preferred Development Plan have the same present values of costs over 78 years as does the All Gas Plan on an Expected Value basis
2. Several Plans have lower costs than the Preferred Development Plan, even over 78 years, when higher discount rates are assumed
3. Modest increases in Capital cost assumptions for the Keeyask and Conawapa projects would also result in other Development Plans having lower costs than the Preferred Development Plan, even over 78 years.
4. A slightly lower view of export market prices substantially erodes the MH expected economic benefits of the Preferred Development Plan.
5. The economics used by MH to arrive at their preference for the Preferred Development Plan is not robust and depending upon the perspective of the decision maker could actually conclude that other development plans are preferred.

D. Provincial Perspective

LCA believes it is appropriate to study the economics of alternative development plans from the view of the Province of Manitoba as well as the from MH perspective as was discussed in Sections II and III. LCA believes that these views should be studied with equal scrutiny of metrics. LCA created additional metrics for different periods of time. In this section we also utilized the MH modeling results to study the Province of Manitoba Perspective of the economic analysis under probabilistic uncertainty analysis. Important observations that we make from the Province of Manitoba Perspective are as follows:

1. LCA, in consultation with Morrison Park Associates, does not agree with MH's assessment that the 1% interest rate guarantee fee that the Province of Manitoba adds to the borrowing costs is a Provincial Transfer Payment. This fee is

believed to be compensation to the Province for it taking on potential costs should the loan guarantee be needed. LCA agrees with the MH assumption that water rental fees and the capital tax collected can be considered Provincial Transfers.

2. The removal of the Provincial Transfers as 'costs' of the Development Plans provides measurable improvement the present value metrics used in the economic analysis for the development plans with Keeyask and/or Conawapa. The Provincial Perspective results show that development of Keeyask and some new transmission to be a common element among the lowest cost plans of the 15 Development Plans studied in the NFAT application by MH.
3. The Provincial Perspective results would not favor developing Conawapa unless there is a willingness to give 78-year NPV metrics more weight than 50-year NPV.
4. The benefits of the Preferred Development Plan over other plans accrue after year 50 of the study, even from the Provincial Perspective
5. The Preferred Development Plan is not lowest cost through the next 50 years even from the Provincial Perspective.
6. The Provincial Perspective Analysis shows that at least half of the positive benefits of development plans that develop either or both of the hydroelectric stations are captured by the Province and not MH electric ratepayers.
7. In the first 35 years of this study the Province of Manitoba would collect tax benefits from the hydroelectric development, even when the development plan has yet to yield benefits to MH customers on a present value basis.

List of Workpapers and Models Electronically Provided by La Capra Associates

The Workpapers listed below include charts and tables seen in Technical Appendix 9A. The names all correspond to the electronic Excel spreadsheet workbooks that La Capra Associates is providing along with the filing of this report. The workpaper Excel spreadsheet workbooks are working files (formulas intact and readable) that contain the figures, chart or tables, in Technical Appendix 9A.

The Models listed below are the Economic Uncertainty Models developed by La Capra Associates and used for the sensitivity analysis included in Technical Appendix 9A. These models are interactive workpapers that are working models (formulas intact and readable) in Excel spreadsheet workbooks. These models differ from workpapers in that the user can select various input variables to produce different comparisons for different time periods. The models do produce charts and tables but are dynamic in nature. For example Model 16, below, is set up so that a user can input their assumptions for discount rates for the analysis. The models will have user instructions contained within the spreadsheet.

I. Introduction

La Capra Associates filed its main report for the NFAT review in two parts, Part A on January 24, 2014 and Part B on February 28, 2014. The La Capra Associates reports were supported by the filing of ten Technical Appendices, including Technical Appendix 9 – Review of Economic Analysis and Technical Appendix 10 – Review of Financial Analysis, which were also filed in two parts, A and B. In addition, as new information emerged on the capital cost estimates for the Keeyask and Conawapa Hydroelectric Stations, La Capra Associates filed an Addendum to TA 9A and TA9B to capture the higher capital costs impacts.

Manitoba Hydro simultaneously conducted an analysis of DSM program potential and economics during the NFAT review process. Manitoba Hydro has endorsed a substantial increase in its DSM Program spending and comprehensiveness. Manitoba Hydro refers to this new DSM initiative as DSM Level 2. The Manitoba Hydro economic analysis of DSM Level 2 concluded that it would be an economic benefit to add DSM Level 2 resources to all potential resource development plans. As a result, Manitoba Hydro provided significant information on several resource development plans in order to capture how these plans would change with DSM Level 2. In this modeling, Manitoba Hydro included the updated capital cost estimates for Keeyask and Conawapa for the reference scenario assumptions used in the 2013 Update section that was part of the NFAT Application filed in August, 2013. The Plans updated include 4, 5, 6, 12 and 14.

In response to these updates, the NFAT Review Panel has requested that La Capra Associates update specific figures from the figures shown in TA 9A and 10A. This Supplemental Filing Part A provides the updated figures.

La Capra Associates is also preparing a Part B which will summarize and observations and recommendations made in the La Capra Associates' main report Part A and Part B, discussed above. Part B is expected to be available during the week of May 26th.

II. Information Sources

In order to update the requested figures, La Capra Associates relied on Manitoba Hydro's detailed annual costs for Plans 4, 5, 6, 12, and 14 included in their economic analysis. Some of the financial TA 10 Figures below include original information from our reports as well as new information labeled "Main Submission", a designation used by Manitoba Hydro in their updated spreadsheets.

The figures below are derived from data and analysis provided in MH exhibits 104-4, 104-6, 104-4-3, 104-4-4, including Plan 4 and Plan 12 information filed on May 1, 2014. Our understanding is that these plans incorporate the following scenario:

- Reference Scenario Only - 2013 modeling assumptions for discount, energy prices, load forecast (prior to DSM adjustment) as used by MH in their 2013 Update Analysis within the August 16, 2013 NFAT Application.
- The Plans all include the cost and load reduction effects of DSM Level 2 as modeled by Manitoba Hydro.
- The Plans have the new March, 2014 vintage updated capital cost estimates for Keeyask and Conawapa.
- The timing of resource additions may have been changed by Manitoba Hydro in the some Plans due to lower Peak Load and Dependable Energy requirements from DSM Level 2.

III. Updated Figures from Technical Appendices 9A and 9B

The first figures shown below are updated versions of Figure 9-15 and Figure 9-21 from the original TA 9A, now labeled Figure 9-15S and Figure 9-21S respectively below. La Capra associates uses the letter designation "S" for all the figures in this supplemental report. The economic analysis is shown on a year by year basis from a cumulative present value perspective. Figure 9-21S shows in tabular form information that could be read off of Figure 9-15S. The updated analysis for these plans shows a significantly lower 78-year NPV, especially for Plan 14 MH's Preferred Development Plan.

The next two figures requested by the PUB NFAT Review Panel are Figure 9-98S and Figure 9-99S, which are also shown below. These figures were focused on showing the economics of adding each of the components of the Plan 14 (PDP) in a building block approach. The first item to point out is that not all the comparisons shown in the original Figures 9-98 and 9-99 were updated. These omitted comparisons would require additional information from Manitoba Hydro; Manitoba Hydro did not update all plans for Level 2 DSM and the new capital cost estimates for Keeyask and Conawapa.

The change in value of the PDP component blocks is quite substantial. The addition of Keeyask to the All Gas Plan is negative over the 78 year NPV period, meaning adding Keeyask would increase costs on a cumulative present value basis, where it had been a positive $634 million. The value of then adding the 250 MW transmission line and the MP250 sale of energy is $641 million. The steps of moving to the 750 MW transmission line and then Conawapa increase costs from MH's updated analysis to $218 million and $404 million respectively. Finally, the addition of the WPS contract and investment lowers costs by $63 million, resulting in a final 78-year NPV benefit of Plan 14 of $45 million as compared with the 2012 Reference Analysis of $1,696 million.

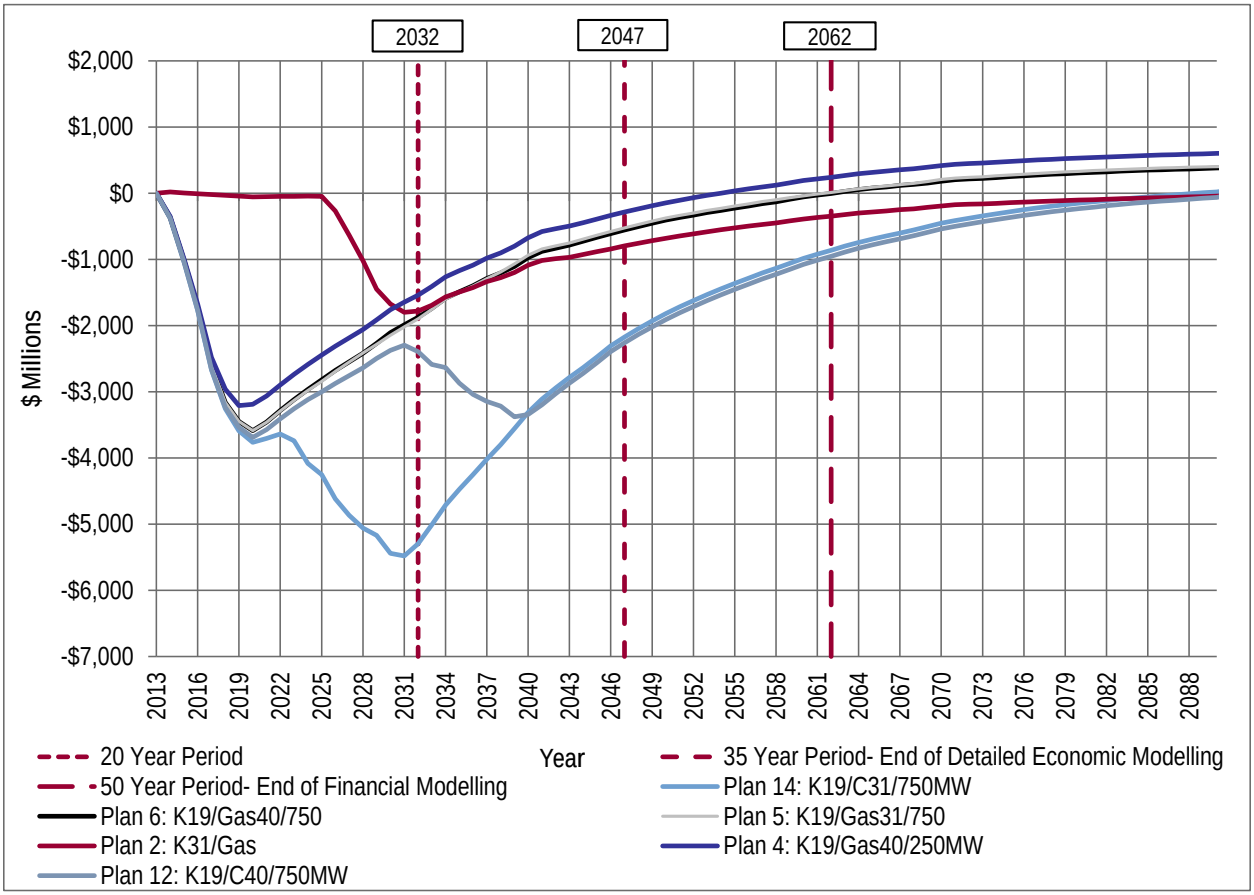

Figure 9-15S: Cumulative Incremental Cash Flow Difference for Plans 2, 4, 5, 6, 12 and 14 as Compared to the All Gas Case – Millions of 2014 Present Value Dollars

Plans	78 Year CPV of Total Capital	78 NPV	50 CPV	35 CPV	20 CPV	78 Year IRR	Break Even Year (All Gas) Base Case

Figure 9-98S: Summary of economic analysis results of components of the Preferred Development Plan

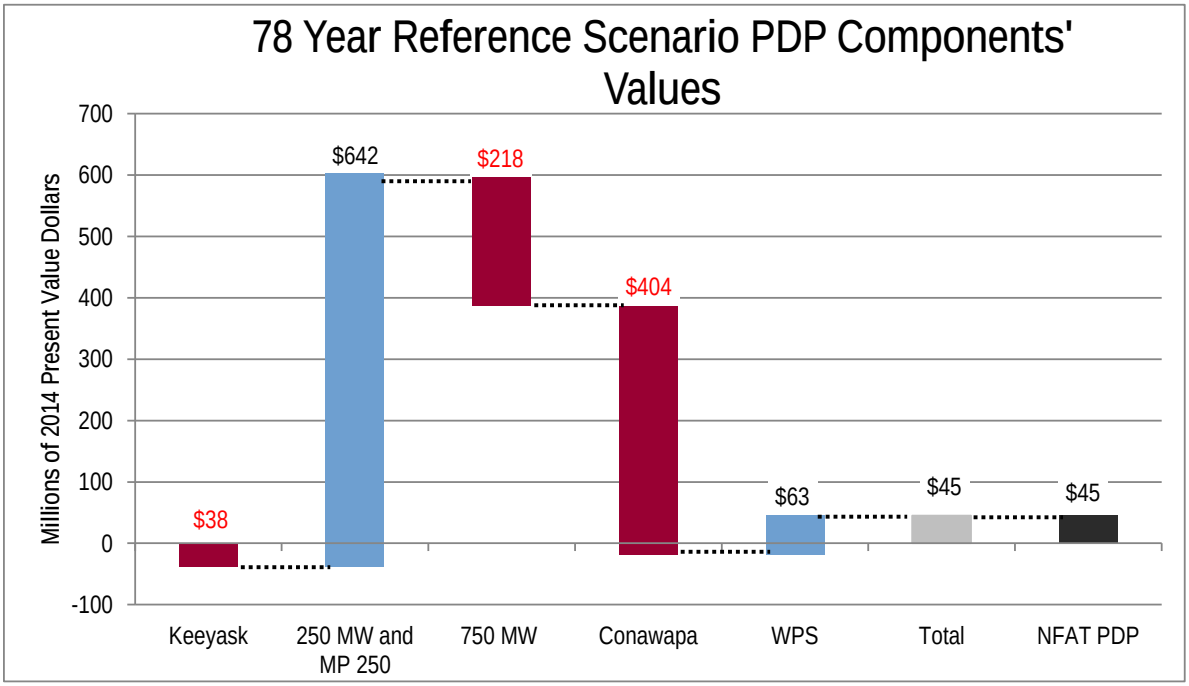

Figure 9-99S: Value of PDP Components – 78 Year NPV vs. All Gas

IV. Updated Figures from Technical Appendix 10A

The PUB NFAT Review Panel also requested that three figures be updated from the LCA TA 10A – Review of Financial Analysis. These figures are provided below showing the values from the original TA 10A figures as well as the updated cases available. The first figure, Figure 10-10S shows the NPV of the annual rate increases modeled by MH over four time periods. The biggest change occurred in Plan 1, the All Gas Plan. All plans have shown a lower level of NPV increases when DSM Level 2 is added and then that benefit is negated if higher capital cost estimates for Keeyask and Conawapa are included. This is shown in the Plan labeled High Capital (DSM 2) Main Submission.

The second figure, Figure 10-12S shows that the addition of DSM Level 2 provides strong reductions in typical monthly bills for residential customers consuming 750 kWh.

Similarly Figure 10-42S shows lower Even-Annual Rate Increases when DSM Level 2 is used in the resource development plans.

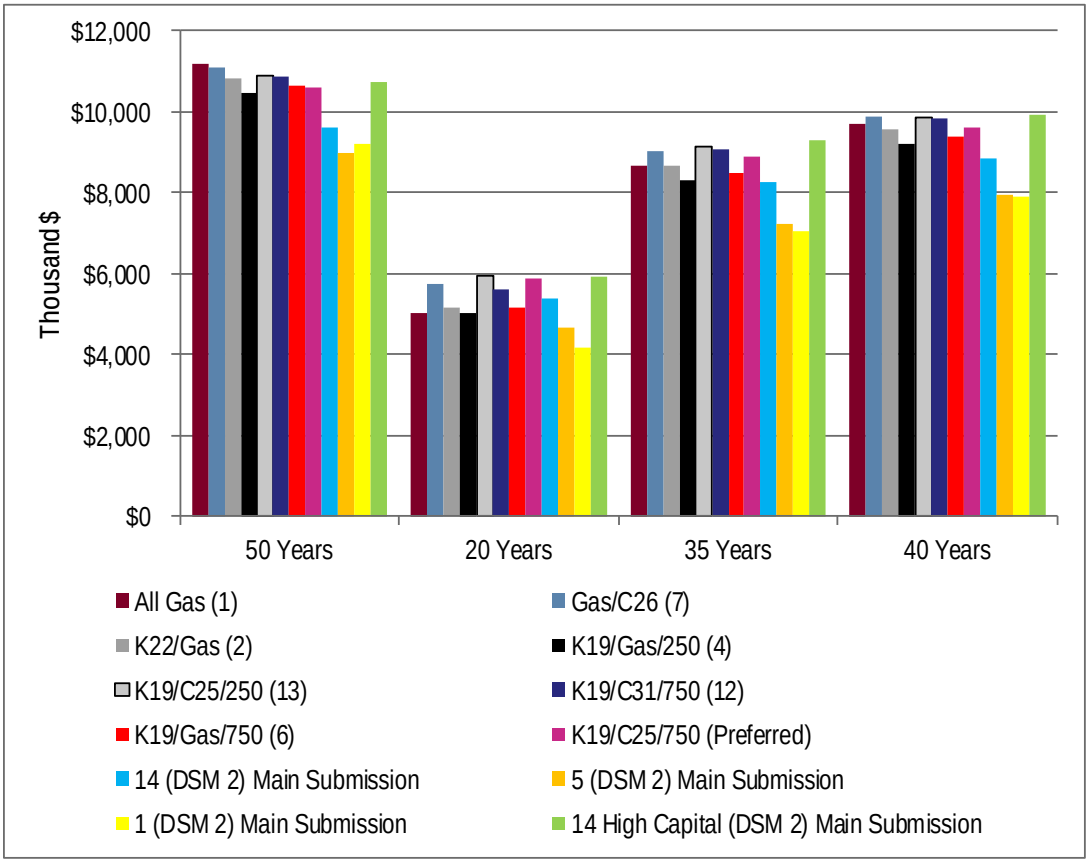

Figure 10-10S: NPV of Rate Increases by Development Plan

Development Plan	2013	2032	2042	2052	2062	NPV 2013-2062
All Gas (1)	$60.96	$115.72	$119.21	$143.32	$168.50	$1,218
Gas/C26 (7)	$60.96	$124.69	$109.96	$128.65	$142.89	$1,222
K22/Gas (2)	$60.96	$117.05	$115.46	$134.58	$146.44	$1,209
K19/Gas/250 (4)	$60.96	$115.58	$112.42	$131.55	$148.33	$1,196

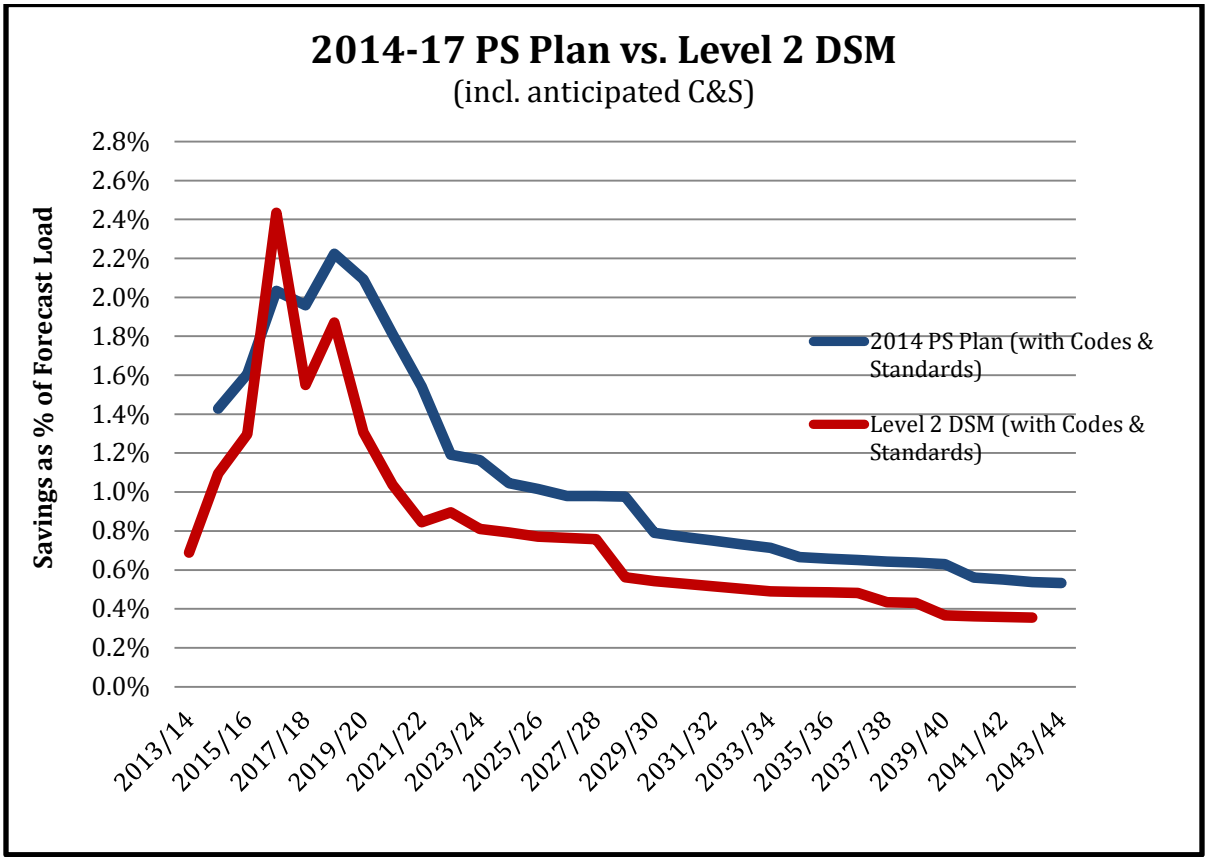
V. Observations

Overall, the updates provided by Manitoba Hydro provide significant information in time to be incorporated into La Capra Associates overall review of the NFAT filing. There are several observations that can be made.



1. The substantial increase of DSM program expenditures and activities will provide positive economic benefits to MHs customers.
2. The Preferred Development Plan (Plan 14) economics have eroded to essentially break-even with the All-Gas Plan, even over the 78 year study period.
3. Several resource development plans, Plans 4, 5 and 6) that do not include Conawapa have economic benefits over 78-year NPV basis of about $400 to $600 million as compared to the Preferred Development Plan.

136	Wesley Stevens to ask developer if the time estimate includes the time period for land acquisition	9814
137	Manitoba Hydro to provide information on the assumptions for DSM beyond 2028 and 2029	9863
138	Manitoba Hydro to provide the most recent progress report on DSM	9864

LIST OF UNDERTAKINGS (Con't)

NO.	DESCRIPTION	PAGE NO.
139	Manitoba Hydro to confirm when, if the diversity agreements were extended beyond 2024/'25, the earliest required in-service date for Keeyask would be, both from an energy and capacity perspective	9888
140	Manitoba Hydro to confirm if it has considered extending the diversity agreements, and whether doing so would be feasible; and if not, to provide some background information as to why not	9890
141	Manitoba Hydro to indicate if it's feasible to have the 750 megawatt line constructed before Keeyask is placed in service	9890
142	Manitoba Hydro to provide the section they are relying on in saying the contract will terminate	9935

--- Upon commencing at 9:01 a.m.

THE CHAIRPERSON: Good morning. I believe that we're in a position to begin today's proceedings. And Mr. Hombach, please.

MR. SVEN HOMBACH: Yes, good morning, Mr. Chairman, and good morning, members of the panel. Today is reserved for the evidence of Paul Chernick and Wesley Stevens. Both of them are expert witnesses for the Green Action Centre.

I'd also remind the parties in the room that following the evidence of Mr. Chernick and Mr. Stevens, Manitoba Hydro's DSM panel will be recalled later in the afternoon to address some additional questions.

I am not sure if Manitoba Hydro needs to speak to any undertakings this morning. If not, I suggest we turn it over to Mr. Gange to have his witnesses sworn and qualified.

THE CHAIRPERSON: Thank you, Mr. Hombach. Mr. Williams, please -- Mr. Gange, please, sorry. I apologize. Aren't you in some ways?

MR. WILLIAM GANGE: Thank you. I'm not sure who's going to take more offence at that, Mr. Chair. It's probably a 50/50 split. But, yes, thank

you. Today is the evidence of -- of the Green Action Centre. And we have the -- the Green Action Centre retained two (2) expert firms: Resource Insight Inc., which is represented this morning by Mr. Chernick; and Power Advisory, which is represented by Mr. Stevens.

As -- as the Board members may recall, there -- there also was a suggestion that we might bring Mr. Dalton in to -- to assist in the presentation of the evidence by Mr. Stevens, but the logistics of this worked out that he's someplace else on -- on May 1st rather than Winnipeg.

So I'm going to -- I -- I can advise that we have two (2) PowerPoint presentations for -- that -- that will be relied upon. And I would ask that Mr. Chernick's presentation be marked as GAC number 22.

--- EXHIBIT NO. GAC-22: Paul Chernick's PowerPoint presentation

MR. WILLIAM GANGE: And that Mr. Stevens's PowerPoint presentation be marked as GAC number 32.

--- EXHIBIT NO. GAC-23: Wesley Stevens's PowerPoint presentation

MR. WILLIAM GANGE: For people that -- well, I sent those out this morning. And apparently I attached the wrong document to GAC number 22, but we now have the correct one. And I will remedy that situation later in the day so that the -- the proper one has been sent out to all the parties. But I believe that Mr. Simonsen has the correct documents.

So, Mr. Simonsen, we may want to swear the witnesses.

GAC LOAD FORECASTING, FUEL SWITCHING, WIND PANEL:

PAUL CHERNICK, Affirmed (Qual.)

WESLEY STEVENS, Affirmed (Qual.)

QUALIFICATION OF WITNESSES:

MR. WILLIAM GANGE: Thank you. I'm going to start with Mr. Stevens in terms of the qualifications. Mr. Stevens, first of all, you're a native of Winnipeg.

Is that correct?

MR. WESLEY STEVENS: I am.

MR. WILLIAM GANGE: We like to get that on the record on this --

MR. WESLEY STEVENS: Okay.

MR. WILLIAM GANGE: -- this process.

And, sir, you are an economist by trade, is -- by training.

Is that correct?

MR. WESLEY STEVENS: I am.

MR. WILLIAM GANGE: Could you advise the Board of your educational background, sir?

MR. WESLEY STEVENS: I attended University of Winnipeg and Manitoba for a period, but I got my degree -- my bachelor's degree from Carleton College in -- in Minnesota. I then went to University of Toronto, where I got a master's degree in economics. And after that, I studied for and passed the chartered financial analyst exam with the Chartered Financial Analyst Institute.

MR. WILLIAM GANGE: And -- and can you advise the Board what a chartered financial analyst does?

MR. WESLEY STEVENS: You would most often find them as stock analysts, for example, or working for a pension fund, advising on -- on investments.

MR. WILLIAM GANGE: And in essence your job as a financial analyst -- analyst is crunching numbers.

Is that correct?

MR. WESLEY STEVENS: I am a number cruncher, and essentially what I'm doing here today is advising on investments.

MR. WILLIAM GANGE: Thank you. You have been involved with -- as an economist and financial analys -- analysts for Acres International Limited, is that correct, sir?

MR. WESLEY STEVENS: That's correct.

MR. WILLIAM GANGE: And you were also with Navigant Consulting LTD.

Where is that based?

MR. WESLEY STEVENS: The head office is in Chicago. It's spread across North America with offices in Europe and Asia. My office was in Toronto.

MR. WILLIAM GANGE: And your position with Navigant?

MR. WESLEY STEVENS: My last position was associate director.

MR. WILLIAM GANGE: Thank you. You also were the CFO of Solar Power Network.

Is that correct, sir?

MR. WESLEY STEVENS: Yes. That's a small company in Ontario that -- that builds solar plants.

MR. WILLIAM GANGE: You -- presently

you are the president of TeraTrends Consulting.

Is that correct?

MR. WESLEY STEVENS: Yes. I -- I am technically a subconsultant to Power Advisory. However, we have, you might call it, a very close relationship. I am a -- I'm -- I essentially work almost full time for Power Advisory.

MR. WILLIAM GANGE: And so with Power Advisory, your relationship -- that -- you -- you've done a number of projects with Power Advisory.

Is that correct, sir?

MR. WESLEY STEVENS: Yes. I work for them all -- as I said, almost full time.

MR. WILLIAM GANGE: Okay. And -- and I understand that you're about to change that so that you have -- actually have a formal position with Power Advisory?

MR. WESLEY STEVENS: I believe the press release went out this morning announcing their association with four (4) individuals. I am one of them. My title is, as of I guess this morning, manager of quantitative analysis.

MR. WILLIAM GANGE: And as the manager of quantitative analysis, can you advise the Board what you would be doing?

MR. WESLEY STEVENS: Financial analysis like -- like this, financial projections, electricity price forecasting, some demand forecasting, anything involving electricity that also involves number crunching.

MR. WILLIAM GANGE: Okay. Thank you. And with Power Advisory, I understand that you took part in hearings before the Nova Scotia Energy Board.

Is that correct?

MR. WESLEY STEVENS: Yes, the Utilities (sic) and Review Board. I was there with John Dalton. This was regarding the -- the Nova Scotia's participation in the Maritime Link. John and I wrote the report together. It was about 50/50, and I attended the Board with him. I did not -- I was not on the stand but consulted with him before and after.

MR. WILLIAM GANGE: You have undertaken the analysis of electrical projects, including nuclear, wind, and other renewable technologies.

Is that correct, sir?

MR. WESLEY STEVENS: That's correct.

MR. WILLIAM GANGE: And -- and again, that would be doing the number crunching?

MR. WESLEY STEVENS: Yes. I am not an engineer, but I -- I dig deeply into the engineering

analysis and then carry that through to financial analysis.

MR. WILLIAM GANGE: I understand, sir, that you reviewed the Ontario and New Brunswick electricity markets in support of a proposed new hydroelectric plant in Eastern Canada.

And that would have included an analysis of costs with respect to nuclear, wind, and other renewable technologies, correct, sir?

MR. WESLEY STEVENS: Yes. I reviewed the cost of all of those, and also looked at markets in Ontario and just south of the border.

MR. WILLIAM GANGE: I understand that you also have undertaken an estimation of the capital and operating costs of developing new generation capacity in Ontario based on a wide range of technologies, which would include gas, hydro, wind, combined heat and power, and solar -- and solar on behalf of the Ontario Power Authority?

MR. WESLEY STEVENS: That's correct. That was used as input to Ontario's Integrated Power System Plan.

MR. WILLIAM GANGE: And -- and this is your first appearance on your own in front of --

MR. WESLEY STEVENS: Yes.

MR. WILLIAM GANGE: -- a -- a board such as the Manitoba Public Utilities Board?

MR. WESLEY STEVENS: It is, yes.

MR. WILLIAM GANGE: With that, Mr. Chair, I'm going to ask that Mr. Stevens be qualified as an expert with respect to the analysis of the cost of electrical -- the construction of electrical projects, including wind.

I will then move to Mr. Chernick.

(BRIEF PAUSE)

MR. WILLIAM GANGE: Mr. Chernick, your slightly out of date CV is attached as part of Exhibit 14 that's been filed before the Board. And I say it's slightly out of date, because it ends in -- number 277 of your presentations as an expert witness before various boards took place in January 2013?

MR. PAUL CHERNICK: That's correct. I -- I haven't updated it since then.

MR. WILLIAM GANGE: Since January of 2013 you've been involved in -- in a number of other hearings, qualify -- been -- have been qualified as an expert in front of other boards.

Is that correct, sir?

MR. PAUL CHERNICK: Yes, I have.

MR. WILLIAM GANGE: And you have appeared with us on behalf of Green Action Centre, or -- or its predecessor, Resource Conservation Manitoba and Time to Respect Earth's Ecosystem, in hearings in February 2008, November 2008, and December 2010.

Is that correct, sir?

MR. PAUL CHERNICK: Yes.

MR. WILLIAM GANGE: You were qualified as an expert on each of those occasions and gave evidence on behalf of the Green Action Centre?

MR. PAUL CHERNICK: I was.

MR. WILLIAM GANGE: And your educational background, if you could go through that briefly, sir?

MR. PAUL CHERNICK: I hold a bachelor's Degree from the Civil Engineering Department of the Massachusetts Institute of Technology and a master's in Technology and Policy, also from MIT.

MR. WILLIAM GANGE: I'm going to try to shorten this process somewhat by -- sir, by advising the Board that I'm going to ask that you be qualified as an expert in a number of areas, and I'm going to go through them and review previous times when you've been qualified as an expert in each of those areas.

So we're going to ask that you be qualified as an expert with respect to load forecasting regarding power systems. And I understand, sir, that you've been qualified as an expert with respect to load forecasting in the Manitoba hearing -- Manitoba Hydro hearing before the Public Utilities Board in November 2012, and in front of the Massachusetts board in June 2011.

Is that correct, sir?

MR. PAUL CHERNICK: Yes, among other --

MR. WILLIAM GANGE: And -- and, Mr. Chair, just so that you know, I haven't gone through, and I don't intend to go through, all two hundred and seventy-seven (277) things that are on the CV. I'm just going to take the most recent for each of these topics, but there are other qualifications.

THE CHAIRPERSON: Could you give me the reference to the exhibit again, please?

MR. WILLIAM GANGE: It's Exhibit number 14 -- GAC-14.

THE CHAIRPERSON: Thank you.

MR. WILLIAM GANGE: Which has the combined -- and -- and thank you, Diana. You'll see that that's the ending, number 277. I'm also going to ask, Mr. Chair, that Mr. Chernick be -- be qualified as

an expert to give expert testimony with respect to fuel switching.

And, Mr. Chernick, again, you've given evidence before this Board previously in -- in hearings with respect to fuel switching. You've also given a report amongst others before the Arkansas board in March of 2010.

Is that correct, sir?

MR. PAUL CHERNICK: Yes.

MR. WILLIAM GANGE: You've also -- I'm going to ask that you be accepted as an expert with respect to DSM programming. You've given evidence before this Board with respect to DSM programming. You've given evidence, amongst others, before the Kansas board in December 2012, before the Oklahoma board November 2011, before the Nova Scotia board May 2009.

MR. PAUL CHERNICK: Yes, and many others.

MR. WILLIAM GANGE: You've -- I'm going to ask, Mr. Chair, that Mr. Chernick be qualified as an expert with respect to commentary on integrated resource planning.

And, Mr. Chernick, amongst others, you've testified and been acc -- accepted as an expert

in front of the Arkansas board in September 2012, the Kentu -- Kentucky board December 2011, the City of New Orleans December 2010, and Connecticut September 2008.

MR. PAUL CHERNICK: Yes.

MR. WILLIAM GANGE: And I'm also going to ask, Mr. Chair, that Mr. Chernick be accepted as an -- as an expert with respect to rate design.

And, Mr. Chernick, you've testified before this Board in December 2010 and November 2008 on rate design. You've also testified with respect to rate design in front of the Nova Scotia board August 2011, the Ontario Board August 2010, the Arkansas board March 2010, and the Maryland Board January 2009.

Is that correct, sir?

MR. PAUL CHERNICK: Yes.

MR. WILLIAM GANGE: So, Mr. Chair, those are the areas that I'm going to ask that Mr. Chernick be qualified to give commentary with respect to load forecasting, with respect to fuel switching, with respect to DSM programming, with respect to integrated resource planning, and with respect to rate design.

THE CHAIRPERSON: Thank you, Mr. Gange.

Me. Hacault, s'il vous plait.

MR. ANTOINE HACAULT: Bonjour, M.

President. MIPUG has no objection to the qualifications of these witnesses as experts in the fields outlined by Mr. Gange.

THE CHAIRPERSON: Merci, Me. Hacault. Ms. Saunders, please.

MS. JESSICA SAUNDERS: The MMF has no objections as well. Thank you.

THE CHAIRPERSON: Thank you, Ms. Saunders. Me. Monnin, s'il vous plait.

MR. CHRISTIAN MONNIN: Merci, M. President. We have no objections.

THE CHAIRPERSON: Merci, Me. Monnin. I'm sorry I -- I overlooked you, Ms. Menzies.

MS. MEGHAN MENZIES: No worries. Good morning. CAC (Manitoba) has no objections to the qualifications -- to these experts being qualified in the areas that were outlined by Mr. Gange.

THE CHAIRPERSON: Thank you, Ms. Menzies. And, Manitoba Hydro, please. Ms. Ramage, good morning.

MS. PATTI RAMAGE: Good morning. Manitoba Hydro just have a few questions of the clarification. I -- I would say by way of general comment with respect to Mr. Chernick, while I would

normally be cautious simply accepting that someone was qualified in another jurisdiction as proof of their expertise because we don't know what basis that was or whether it was subject to weight, as often happens here.

Mr. Chernick has appeared here a number of times and we've crossed swords before and I have no -- no questions for Mr. Chernick. And -- and we do accept his qualifications as identified because we've -- we've seen them here in prior hearings.

I have not, however, had the pleasure of meeting Mr. Stevens before, so I just had a few questions. You mentioned you have been doing work with Power Advisory.

What type of projects would that be? Is that primarily wind projects?

MR. WESLEY STEVENS: No -- no, it's a -- a range of projects. They include some wind. There was a pro -- a project recently in Ontario that looked at -- it was a detailed look at some of the contracts that the -- that wind projects there have, and in particular the -- the frequency of very low prices. So it was a co -- it was looking at wind, but also looking at price forecasting.

I've been involved in some -- some other

regulatory work. The -- the Nova Scotia work was -- was mentioned by -- by Mr. Gange. Currently involved in -- in some rate work in Alberta. If you give me a minute, I'll pull up another dozen or so projects that I've been...

MS. PATTI RAMAGE: I -- I can maybe shorten.

Have any of those projects dealt with the construction of large hydro?

MR. WESLEY STEVENS: No, they have not.

MS. PATTI RAMAGE: Okay. And I heard Mr. Gange mention --

MR. WESLEY STEVENS: Oh, sor -- sorry. The Nova Scotia project, the Maritime Link, the -- that did relate to Muskrat Falls. I certainly did not advise on the cost of Muskrat Falls. I did -- I did have -- have something to -- to say about the value of hydro power being exported.

MS. PATTI RAMAGE: And this is the point I - I'm trying to clarify. And I think it may be just being loose with language as opposed to an objection, but I -- my note says Mr. Gange requested you be qualified in the cost of construction of electrical projects.

And I just want to clarify that the

construction cost isn't the construction of the nature -- we had parties, like Knight Piesold, dealing with construction costs in terms of -- of the large hydro. That is not the intention?

MR. WILLIAM GANGE: That is not the intention, Ms. Ramage, no. Mr. Stevens's analysis is with respect to the -- to the financial analysis of construct -- of -- of doing wind power construction.

MS. PATTI RAMAGE: Okay. And with that clarification, we accept the -- the qualifications as -- as restated by Mr. Gange, but the part we were concerned with was the construction as it related to large hydro. So I think with that qualification, Manitoba Hydro does not have an objection.

THE CHAIRPERSON: Mr. Gange, that's not quite what you asked initially. My -- according to my notes, you had asked that he be qualified with respect to the analysis and construction of electrical projects, including wind. And now I think you revised that a little.

MR. WILLIAM GANGE: I've -- I've narrowed that, Mr. -- Mr. Chair, because the -- the report does deal with -- with the cost of wind, and that's what Mr. Stevens is here to talk about. So I -- I have narrowed it. And -- and I think that the

narrowing is satisfactory to Ms. Ramage. And it's certainly satisfactory to GAC.

THE CHAIRPERSON: So with that, Mr. Gange, Mr. Hombach, please.

MR. SVEN HOMBACH: If I could just ask a few follow-up questions to Mr. Stevens, as well. I understand from your resume that -- that you don't work as a construction estimator, per se?

MR. WESLEY STEVENS: I do not --

MR. SVEN HOMBACH: So when -- when you're analyzing the cost of wind, what sources do you base on to conduct those analyses?

MR. WESLEY STEVENS: I do what a financial analyst would do, which -- which is I look as deeply as I can into engineering reports. I -- I compare them to other sources. I exercise some judgment about balancing information from different sources.

MR. SVEN HOMBACH: So you look at different sources and you base your analysis based on the inputs that you gather from those other sources?

MR. WESLEY STEVENS: Exactly.

MR. SVEN HOMBACH: Okay. Thank you.

THE CHAIRPERSON: Thank you, Mr. Hombach. Just a second, please.

(BRIEF PAUSE)

THE CHAIRPERSON: Thank you. We've had the opportunity to caucus. And we will -- the panel has agreed that we'll accept both Mr. Stevens and Mr. Chernick as experts for the areas that have been outlined by Mr. Gange. So welcome to these proceedings.

EXAMINATION-IN-CHIEF BY MR. WILLIAM GANGE:

MR. WILLIAM GANGE: Thank you, Mr. Chair. Mr. Chernick, I'm going to start with you. And, Diana, if...

(BRIEF PAUSE)

MR. WILLIAM GANGE: If -- your evidence has been filed. And I can advise that it is part of number -- GAC number 13 was the combined evidence of Resource Insight Inc. and Power Advisory. And you have a presentation today that we've marked as GAC number 22, and it's now on the screen.

And so, Mr. Chernick, go ahead.

MR. PAUL CHERNICK: Thank you. The -- the subjects that I'll be discussing are the fuel

switching and -- and the DSM issues in our evidence. And just to give you an outline of -- of what I'll be talking about, the fuel choice, fuel switching issues that -- that I deal with are just the electric versus gas choices. There are, of course, other options available, such as biomass for space heating and so on, that I'm -- I don't look at here.

And while we often refer to this area as -- as fuel switching -- and by 'we', I mean myself and -- and Manitoba Hydro and other parties -- that it -- well, this is switching from gas uses to electric and from electric to gas that are worthy of consideration -- can be important, there's also the issue of choosing the fuel for new buildings, which is not really switching anything. It's just making a decision as you build the building.

And then I'll be talking appropriate DSM targets very briefly based on comparisons with other jurisdictions and the effect of DSM on the need for -- for new facilities for retail load.

So for end-use fuel choice, the -- the basic question is: Which is the preferable fuel in various situations? And I'll talk about Hydro's projections of future fuel switching, the drivers of -- of uneconomic fuel choices, and then how Manitoba Hydro

can respond to the market failures.

So first, which fuel is preferable? Basically, every analysis that's been done, including Hydro's own fuel switching study and my own analyses, indicate that gas reduces costs, it reduces emissions, it reduces -- excuse me, it improves the cashflow that, in terms of the efficiency at which gas -- gas is used, it's better to use gas at the burner tip in a home or business in Manitoba and free up the electricity to turn down a -- a gas-fired plant in -- in the US because the end-use efficiency of -- say, for heating is over 90 percent for -- for the gas used directly. And the gas generator that's turned down, including the line losses, is less than 50 percent efficient in delivering heat to the -- the homes in -- in Minnesota, for example, and perhaps, as little as 25 percent efficient.

So any way that anybody's looked at this, gas is preferable.

THE CHAIRPERSON: Mr. Chernick --

MR. PAUL CHERNICK: And I -- I summarize --

THE CHAIRPERSON: Can I interrupt you for a second. I just want to, you know, just make -- make sure we frame this one adequately because this is

very much a North American view, isn't it? I mean, for example, gas reduces emissions. That's appropriate to a -- a North America view of the world, as opposed to a Manitoba view of the world, where electricity is actually less pollute -- polluting then gas.

MR. PAUL CHERNICK: Yes. The -- the emission of concern here is carbon dioxide. And in terms of the effect on Manitoba, it doesn't matter whether the carbon dioxide is released from a -- a furnace flue in Manitoba, or a -- a stack for a combined cycle plant, or a peaker in -- in Minnesota or Wisconsin or Iowa or anywhere else.

If you -- if you posit some kind of -- of isolated greenhouse gas -- a cap or requirements that only affect Manitoba and gives no credit for or charges for -- for cross-border flows, then you might want to think just about Manitoba emissions, the ones that occur within the borders of Manitoba.

But that would be -- that would not represent any environmental benefit, in terms of -- of global warming. It simply would be a matter of Manitoba saying, Well, we're clean, but you're still going to be dealing with a climate change as a result of the gas and, for that matter, the coal plants operating south of the border.

CONTINUED BY MR. WILLIAM GANGE:

MR. WILLIAM GANGE: And, Mr. Chernick, you're now going to move to slide number 6, "Results from the Hydro Study"?

MR. PAUL CHERNICK: Right. I'm not going to go through these numbers. I just want to point out that in each case a positive number is a benefit for gas, a cost for moving to electricity. And you see only one (1) negative number, which would be a net benefit from the electric. And that's with a very high efficiency ground-source heat pump, and low equipment costs.

Every other measure -- global carbon emissions, the TRC, the customers' bills, the utility test -- they all come out to be better with -- with gas than with electricity for an electric furnace, for ground-source heat pumps, and for hot water.

And the -- the question has -- has been raised in a number of places about whether the current advantage of gas, economically and environmentally, could reverse over time. And the -- the things that people think about are, Well, could gas prices rise fast enough that what's now less expensive could become more expensive? And as I'll explain, that's not really

likely.

Could lower renewables costs have a dramatic effect on what's at the margin in the US and therefore the -- the value and benefit of exporting? And that's possible, and I'll talk about that in a moment also. And what happens if the US, or at least the -- the MISO portion of it, adopts some kind of CO2 pricing?

Well, first of all, on slide...

MR. WILLIAM GANGE: Slide 8.

MR. PAUL CHERNICK: Thank you. I'm not sure where it...

(BRIEF PAUSE)

MR. PAUL CHERNICK: The print is very small on my screen. On slide 8, the effect of higher gas prices, higher gas prices would raise the cost of gas heating, for example, but also is going to increase the prices in the electric energy markets, making exports more valuable.

So, yes, it costs more to run the -- the gas heater furnace in -- in Manitoba, but it also makes the electricity freed up more valuable. And because of the difference in efficiency, the higher gas prices

rise, the greater the -- the net benefit of being able to export and save 2 or 3 or 4 cubic metres of gas for every cubic metre you're using for the furnace.

Lower -- moving onto slide 9, lower renewables costs, and -- and this is something that's likely to happen because both wind and solar costs have -- have fallen substantially in the past and are likely to continue falling, while hydro's -- hydroelectric project costs have tended to rise over time.

More renewables could gradually push out the MISO coal and peakers, leaving mostly efficient gas plants at the margin, which will reduce the -- the global warming benefit and possibly the -- the economic benefit of exporting the electricity.

But it may also have the effect of pushing the coal up in the loading order, so coal is at the margin more often and the gas in the US is being used less often, which would mean that environmentally it was even a better deal to burn the gas at the end use in -- in Manitoba and trim down a coal plant more often in -- in the US.

And a very large price decline would be necessary in the renewables to make them so inexpensive that they would be -- it would be cheaper to serve ele -- electric load with renewables in the US than to

serve them with Manitoba energy freed up by using gas at the end use in Manitoba.

Moving on to slide 10, if CO2 is -- is priced in MISO, this is also a sort of ambiguous effect. It would increase the cost of burning coal. So the effect might be that some coal plants would shut down and be replaced by more gas plants. And so therefore the emissions that the -- the burning gas in -- in Manitoba is voiding in the US would conceivably decline, although there's still a big difference between even the best gas fired generation and the efficiency of a -- an end-use gas appliance.

But it could also have the effect, as -- as has actually occurred in some places in these periods of very low gas prices, where some of the efficient gas plants, the combined cycle plants, are dispatched before the coal plants.

So the coal plants are actually the marginal units much of the time. And therefore any electricity they free up by using gas for heating and water heating, for example, would be backing out those marginal coal plants, making them even less cost effective, making them more -- more likely to retire, and would have even larger global warming benefits.

And certainly, however the details of

dispatch in MISO work out and in terms of retirement of -- of plants, pricing of CO2 would raise the export prices that Manitoba Hydro would receive for the electricity that's freed up and therefore make conversion to gas or selection of gas more attractive economically.

Slide 11, since I filed my evidence, Hydro has filed a -- a study by the Brattle Group of CO2 displacement in the US as a result of -- of exports of hydro. And the -- they find that the -- in the early period mostly coal is avoided, because that's the dominant fuel on the -- on the system in -- in the US part of MISO, and that later, at some point about twenty (20) years out, the retirement of -- they -- they peg it to the retirement of -- of -- excuse me -- to nuclear plants results in more gas plants being built and gas being out on the margin more of the time. And that would bring down the avoided emission rates considerably, although still above the incremental emissions from the -- the use of gas in Manitoba directly.

So based on -- on their -- on the Brattle analysis, I asked the question: Well, at -- at what emission rate -- or for comparison with that, I'd asked: What emission rate would the various end uses

that Hydro looked at break even for global warming purposes?

So as -- as we saw in -- in an earlier slide, the efficient ground source heat pump has -- replacing efficient ground source heat pump has a -- reduces carbon emissions only a little bit currently. And if it falls very much, it's -- it's assuming emission rates of about point eight-five (.85).

Now, it would not have to fall very much before -- on an environmental basis; those high efficiency heat pumps would be producing less carbon than -- than the gas. But with a standard efficiency ground source heat pump, it would have to fall to -- to levels that Brattle is not expecting until after 2030, about 2035, and with a -- the water heater and the furnace it would have to fall much, much lower below the emission rates of a gas plant.

Oh, and my next slide ,I -- it says exactly what I just said, describing the -- the previous ones -- the previous slide.

On slide 14, I -- I look at the policy implications just with regard to greenhouse gasses and without looking at the other cost effectiveness tests for the moment. At this point, it makes sense to encourage gas for space and water heating and to keep

an eye on what's happening with MISO marginal emissions. And if the emission rate falls and -- it would be appropriate to assess whether a -- high efficiency heat pumps would not be preferable to gas and then to look at the cost of those high efficiency heat pumps and see whether it's a -- a cost of -- of reducing carbon emission makes sense and whether Manitoba wants to bear that cost for the -- the benefit of the -- of the global environment.

With larger declines in emission rates, standard ground source heat pumps should be reexamined. But for -- the -- the competing choice is an electric furnace. Baseboard heating or a -- a gas water heater, gas is -- is likely -- excuse me, gas versus an electric water heater, gas is likely to be preferable for many decades beyond the -- the Brattle analysis.

Interestingly, despite the fact that Hydro found that -- that gas is preferable to electricity in almost every situation and by any measure it could come up with, both the fuel switching report and the 2012 load forecast projected conversion to electricity to a very significant extent, with electricity dominating a new construction even where gas is available and with many buildings converting from gas to electricity.

The 2013 load forecast reduces that trend but still has hundreds of gig -- gigawatt hours a year of load growth due to the -- due to the fuel choice moving from gas to electric. And the 2013 forecast explained the change from 2012 in terms of a Manitoba Hydro initiative on -- on fuel choice.

And when asked about why the -- electricity was being used to replace gas in so many situations despite the advantages of gas, Hydro's explanation was basically that developers for new buildings choose a fuel source and they prefer to minimize their first costs. That they -- they think they can sell the -- the building for the same price regardless of whether it's electrically heated or gas heated, and they have to -- they put less investment into it. That contractors who are brought in to replace a gas water heater that's failing prefer the electric water heater because they don't have to check the status of chimney flue or whatever.

Customers, even when they're making their own decisions, may have a short time horizon. And they may be worried about their cashflow. They may be concerned that they won't be in the house long enough to get back the benefits that this whole -- this -- that gas would provide over many years, and so they

go with the -- the alternative that's cheaper up front.

And then there's a direct quote from -- from Hydro, that -- that,

> "Customers do not consider the total cost of ownership."

And another issue that -- that Manitoba Hydro at least alludes to in various places is that customers assume that electricity is environmentally benign.

On slide 17, I go into a little detail about the -- the choice of how developers choose their fuel source. Another point that I didn't mention previously was that Manitoba Hydro says that developers are reluctant to -- to use gas because they have to bring in yet another crew to do the gas piping and installation, and that's additional coordination.

Slide 18, the -- the chimney condition and getting involved with that causes contractors to say, Why don't we just put in an electric water heater and not -- not fool around with whether we can continue using gas in this house.

And then the -- slide 19 lists again the -- the reasons that customers may choose electricity over gas.

So that brings us to how one might

respond to these market failures in fuel choice. We can measure what the alternatives cost to customers. We can measure what they cost to the province. We can measure what they cost to the utility system. We can measure what they cost to the environment.

Electricity fails all those tests, and yet Manitoba Hydro sees a substantial amount of electricity being chosen over gas applications. And Manitoba Hydro has announced an initiative to discourage electric use where gas is an alternative. And there are more robust alternatives to what Manitoba Hydro has in place.

This Manitoba Hydro initiative, I'm not really clear on when the Company thinks it started the -- the initiative. It's on slide 21. One of their exhibits indicates that it started in about 2010, but the 2012 forecast apparently didn't incorporate it because that was the rationale for the big drop in -- in fuel switching; from the 2012 forecast to 2013 forecast was that the initiative was going to cut into that trend.

And I'm not entirely clear on what -- what this initiative consists of, but it seems to be mostly or entirely information based. And some of the -- the materials relating to the -- the information

program are -- are in the record. But there doesn't seem to be any -- anything else, any technical assistance or -- or incentives. And it's only in the transcript of the -- of the hearing that we learned that -- that Hydro is considering now going beyond the education approach, but is still thinking about it. And this is after many years of -- of fuel switching being on the agenda for Hydro to -- to deal with.

Now, on slide 22, I -- I list the -- the mechanisms that would be useful as an -- or useful as an addition to or in consort with the information program. And there's nothing wrong with information, and it helps prepare customers, get them interested in, make them more willing to go along with some of these other programs. But information by itself does not have a good track record, in terms of changing customer behaviour.

So one alternative is to provide cash incentives. If you've got an electric water heater and you put in a gas water heater, to act -- to give the -- the customer some money to help pay for the difference in -- between just replacing the electric with electric when it fails, and putting in a gas water heater.

Another alternative would be inclining block rates for -- for customers so that the electric

heat and hot water that they're choosing are more expensive, and they can -- they see even more clearly that gas is beneficial. And to give the signal that Manitoba Hydro and the Board believe that the high users in -- certainly in the winter, the heating users in areas where there are gas -- there's gas available, are imposing a cost on the system. And they should be looking at alternatives.

For large customers, inclining block rates are more difficult to design, but reducing demand charges and imposing higher time-of-use energy charges may help discourage gas use -- excuse -- discourage electric use and encourage gas use for -- for those customers.

And -- oops, I just lost control of my slides here.

And now I come to the problem of the developers, and -- and new housing in particular, and the fact that they tend to think about how much it's going to cost them to build the house and not how much it's going to cost to run the house. And that could be -- that problem could be diminished and the developers' interests could be brought to coincide more closely with the interests of their buyers or renters, and with the -- the province, and with the utility systems by

increasing the initial cost of putting in electric heat with higher hook-up charges and decreasing the initial cost for gas heat with lower extension and hook-up charges.

Moving on now to the DSM targets on page 23. Again I -- I just list the -- the three (3) topics that I'll be discussing. Page 24, I just point out that the -- Hydro's current DSM plans are very modest. They average, in terms of the program savings, about .3 percent a year over the next fifteen (15) years. And if you include some part of the fuel switching initiative, which may eventually include program components beyond the educational portions, then perhaps we're talking about 0.4 percent a year.

And other jurisdictions have achieved much greater savings than that. There are several states that have -- and -- and provinces, for that matter -- that have achieved over 1.3 percent of -- of energy saved per year, and some are planning for over 2 percent in coming years.

And on slide 25, I lay out what we had in the evidence, in terms of reasonable goals for ramping up from the rather modest levels of efficiency that the Company is pursuing now, in terms of the efficiency programs, to about 1 1/2 percent a year by

2018/'19, and then keeping it there.

Page 26, which is my last slide, I just briefly discuss the effect of a vigorous energy efficiency program on need for new facilities. With the 1 1/2 percent efficiency program, you'd have net load -- net retail load declining slightly over time, the existing resources would meet all of the retail load, all of the contracted exports, and the proposed exports through the Wisconsin Public Service 308 megawatt sale, another additional proposed sales in the works. But this is about far as you could go just with the existing resources.

And additional resources may well be justified by the benefit of exports, but they'd have to analyzed as export projects. And it may well be worth while, in terms of dollars and in terms of -- of environmental benefits, for Manitoba Hydro to continue developing Keeyask and beyond and wind to increase the -- their level exports.

And that concludes my summary.

MS. MARILYN KAPITANY: Mr. Chernick, could you go back to slide 25 for a minute, please?

MR. PAUL CHERNICK: Yes.

MS. MARILYN KAPITANY: You talk about ramping up DSM and then annually, post-2018/'19, you

say maintain it. And we've quite a bit about DSM and how there's only so many furnaces you can replace and so many insulation improvements that you can make.

What is it that you see as the possibilities for not only the ramping up, but for the maintaining DSM into the future?

MR. PAUL CHERNICK: Well, there -- there a number of -- of utilities and jurisdictions that have been pursuing energy efficiency fairly vigorously for decades now. And they still find that there are large opportunities. And some of that is because there are opportunities that we didn't have twenty (20) years ago. You could -- didn't have LED lighting, for example.

And the efficiency of equipment continues to rise, the cost falls. So that's one aspect that -- that allows you to keep going beyond the -- the narrow window of -- of what you could get if you ran out today and did everything immediately that you could.

The other thing is that over time, buildings are renovated. An office building, for example, will go through a -- a gut rehab or a major renovation. And you can do things that you couldn't do as a simple retrofit. You can go through and just take

out the -- out the fluorescent lights in -- in this room, for example, and put in more efficient ballasts, and you can put in occupancy sensors and a few other things.

But if you're talking about an office space where you could bring in more of the natural daylight into the interior of the -- the building, that usually would require ripping everything out, putting in appropriate kinds of louvres and -- and reflectors and so on to -- to bring the light in, rearranging the entire space. And you're not going to do that as an energy conservation measure.

But on the other hand, when it's time to clear out the 1970s vintage space and make it into more of whatever is useful for the next tenant coming into that building or the new use of the -- the owner wants to put to -- it to -- you have an opportunity to do things you haven't had before.

So that gives you something like twenty (20) years of sort of natural opportunities. And by the time you've gone through those twenty (20) years, you may have another set of options open when the -- the building that was renovated in 2015 is renovated again in 2035 that give you even more savings.

And, of course, you have your continuing

new construction. You have turnover in -- in appliances. Every -- every time your refrigerator dies, you can replace it with a more efficient one. And that's been true for the last thirty (30) some years and will probably continue to be true into the future.

So I don't think we're anywhere close to peak conservation, if you will, any -- any more than -- than it turned out we were close to peak oil because you keep finding new ways to do things and new places to -- to get savings. And, for example, now, you know, there is gradually a trend towards higher efficiency in devices that consumers have little control over, such as the transformers that -- that charge their -- their cell phones and -- and many other devices, the set-top boxes on their cable TVs and...

So programs that shift the efficiency of those devices upwards will also keep arising as the manufacturers and government and the utilities and other program administrators look harder at ways to -- to squeeze savings out.

(BRIEF PAUSE)

THE CHAIRPERSON: Could you explain to

me or tell me about fuel switching programs that apply in other jurisdictions specifically targeting shifting consumers from electricity to gas?

MR. PAUL CHERNICK: Well, interestingly, I've just started a program to -- to do that, gather those examples for another client. But it might be most efficient for me to -- to respond to that as an undertaking, rather than my trying to retrieve the -- the details from -- from memory. I mean, I could give you a couple, but then I start to get fuzzy about which -- which utility does what.

THE CHAIRPERSON: Well, I think that would be useful if you could frame it as an undertaking. And what I'm particularly looking for is, and I don't know if you can with a limited sample set, what works and what doesn't work in a fuel switching initiative. I think that would be useful for the panel to understand that.

MR. PAUL CHERNICK: I'll -- I'll do what I can in however much time I -- I have to -- to respond to this.

MR. WILLIAM GANGE: I think that the undertaking -- and, Mr. Chernick, if -- if you disagree with this -- but as I understand it Mr. Chernick will give examples of initiatives of fuel switching measures

that have been used in other jurisdictions and provide examples as best he can of initiatives that have worked well and initiatives that have worked less well.

Is that -- is that fair, Mr. Chair?

THE CHAIRPERSON: Yes, that's exactly what I think would be useful.

MS. PATTI RAMAGE: Mr. Chairman, if I could jump in, in a hope to make this -- to improve the undertaking. I think likely everyone in the room has been educated onto initiatives. It would be helpful if Mr. Chernick could provide programs where utilities have put together the various initiatives. That's what I'm hearing from Ms. Morrison that would be -- probably enhance the record.

MR. PAUL CHERNICK: I'll -- I'll provide whatever level of detail I can on -- on each of the programs

--- UNDERTAKING NO. 134: Paul Chernick to give examples of initiatives of fuel switching measures that have been used in other jurisdictions and provide examples as best he can of initiatives that

have worked well and initiatives that have worked less well

MR. RICHARD BEL: Mr. Chernick, the conclusion that net domestic load slightly declines is based on your assumption -- or your target of 1.5 percent a year --

MR. PAUL CHERNICK: Yes.

MR. RICHARD BEL: -- over the next twenty (20) years?

MR. PAUL CHERNICK: Yes.

MS. MARILYN KAPITANY: When you're looking at that, I'm looking at your slide 26 where you say, All Manitoba load and all contracted exports could be met with existing resources, what consideration...

(BRIEF PAUSE)

MS. MARILYN KAPITANY: When you're looking at slide 26 and you're looking at your assertion that all Manitoba load and all contracted exports can be met with existing resources, what consideration have you taken of potential increases? For example, pipeline growth or large industry coming

in, or we've got a huge small business industry in Manitoba. It's a real driver of our economy.

So that part of the economy increasing?

MR. PAUL CHERNICK: I -- I was referring here to the -- to Manitoba Hydro's current domestic load forecast. There would be room for some additional retail load, both in terms of energy and capacity, but I haven't looked at exactly how much that would be.

Actually you can determine that by looking at the tables at the end of our evidence, but I haven't tried to assess how large any of the factors you -- you've discussed might be or how much lead time Manitoba Hydro would have for adding wind, for example, to fill in small shortages of -- of energy.

DR. HUGH GRANT: I was just curious about this uneconomical fuel choice use. We had an expert witness from the Consumers' Association of Canada that came in the other day and said that all consumers were stupid and couldn't make rational choices if they tried, including the panel apparently but, so...

(BRIEF PAUSE)

MR. PAUL CHERNICK: You -- you may wonder about your -- the rationality of your choices as you sit there on this project.

DR. HUGH GRANT: Just between me and you, yeah. Anyway, about a couple months ago I carried home the Manitoba Hydro little brochure that says, You should be switching your hot water tank over. And I was thinking about this. And it's like, Well, wait a minute, you know, I -- I'm old enough now to live through the volatility of natural gas prices, and -- and I'm not sure that consumers are all that irrational in their -- in their switch between natural gas and electricity.

You live through a period of very low and stable electricity prices, and you see this high beta in what's going on with natural gas. And then if it comes to me making a large -- not a large, but a capital purchase that may last ten (10), fifteen (15), twenty (20) years, I'm not sure it is all that foolish, depending on how people formulate their expectations.

Now, is there -- are there programs then that essentially shift the risk, share the burdens? So in other words, if -- if the electricity supplier had different forecasts about relative prices in the future than I do that somehow they, you know, share the risk

with me, if you like.

Is there...

MR. PAUL CHERNICK: I'm not aware of any, but as you were describing that particular problem I -- I was thinking, Well, yes, your gas bill could go up if gas prices spiked again. But then so would export revenues. So taken as a whole the gas and electric customers of -- of Manitoba would be better off with you using gas.

But -- but you might be worse off because you'd be paying for expensive gas and the valuable electricity that you've freed up, which is now more valuable, that would -- the benefits of that would be spread out over all electric customers.

So if that is, in fact, a major deterrent in -- in this env -- environment, then I -- I certainly can see how between them, which is very convenient that they're owned by the same entity, Centra and -- and Manitoba Hydro could -- could, essentially, guarantee a gas price or -- or put a cap on the gas price and say, If our -- if the purchased gas cost goes above so much per cubic metre then we'll give you a rebate of this amount for every dollar per cubic metre it goes above that.

And that would then be funded out of the

additional economy purchases that the -- or sales that the -- that Hydro would be able to make at higher prices because, of course, the Americans would be paying for that higher gas for their generation.

So I think you could do that. I don't know of anybody else who has done it, but then I -- there aren't many jurisdictions that are in your situation of looking at that fuel choice and saying, It's good for us because if gas prices go up somebody else's prices are -- are going to go up even more and our -- we'd be able to get more for our electricity.

So I don't know that this issue has ever really arisen. And I -- I also don't know what percentage of customers would react the way that -- that you have. Some of them would probably just say, Well, it's such a nuisance. I have to find this contractor, I have to find somebody to in -- inspect the chimney and I'm going to have to -- to figure out whether the contractor's any good and can I trust him. And will -- and if the utility has a program that pre-screens the contractors and -- and gives you sort of one (1) stop shopping that might overcome a lot of people's issues.

But if there are a fair number who are saying, Well, I would do it. I have no problem with

gas, but I'm just concerned about what if it goes back up to the prices from 2007 and stays there for five (5) years or ten (10) years, then you could certainly institute that kind of a -- a guarantee.

DR. HUGH GRANT: I think, too, where there's a large initial capital outlay to switching -- and I know there's programs where the -- particularly targeting lower income groups where the capital cost can be spread out over the life of your -- your bill and such. But you'd feel pretty stupid, or I would feel -- well, as the consultant mentioned, you'd feel pretty stupid switching over and then a year later finding natural gas prices have spiked up and now you want to switch back. And so...

MR. PAUL CHERNICK: Well, again, if the -- if -- if that's a concern that's holding people back then the kind of -- of guarantee of hedge that you're talking about would -- could be appropriate. The other thing is that if you -- you have an on-bill financing sort of scheme you could say, And in any year where the -- the price of -- of ga -- of gas is more than this much above electricity, we'll -- we'll just write off your -- your payment.

And so there's a -- a specific dollar amount that you're not going to be paying for; that

might also help with -- with those concerns. So you could structure it various ways and I think this is the kind of thing where people use focus groups and -- and interviews with -- with consumers to get a better sense of what exactly would work in terms of program design.

The -- you know, I think we're still a couple steps away from that in that I don't get the feeling that Hydro has been pushing customers to do this and getting push-back like you've suggested, and they're scratching their heads about, well, what do we do about this issue.

And, you know, if -- first we have to get to the point where we have a commitment to a vigorous direct intervention kind of program, not just information. And I don't think consumers are stupid, but they have a bunch of issues that are not the same kinds of issues that -- that we're looking at here. They're the -- the nitty-gritty kinds of -- of concerns about how much time is this going to take me to figure out how to get it done.

And -- and if I do this and it doesn't work right, is my wife going to be yelling at me. And overcoming those barriers requires more than just telling people about the -- the advantages.

DR. HUGH GRANT: Have you heard of the

term 'paternalistic libertarianism'? Well, you want people to have choices and yet some -- perhaps you think they're not making the correct ones. I guess the example is you're in charge of cafeteria and you want people to eat healthy. You put the healthy food first and then the desserts later. So you're still letting them make the choice, but you're trying to guide their choice in it.

So I guess we wouldn't even portray Hydro's decision making at -- even at that stage yet, right? It's -- it's very passive as opposed to trying to do --

MR. PAUL CHERNICK: Yes, I -- I think it's -- it's more that there's a -- there's one (1) line that has the desserts right up front and there's another line that has the green beans up front. And they're saying, Well, let people choose whichever one (1) they want. And funny thing, people are going over to the cupcakes.

DR. HUGH GRANT: Okay. Thanks.

THE CHAIRPERSON: I have a few questions in relation to some of the things that we heard from Philippe Dunsky. And -- and I'll try to paraphrase what I understood he said.

And fundamentally he suggested to us -- he posited to us that with a -- with a sound DSM program extended over time, we could actually flatten the load forecast curve. Actually, even suggested you could actually turn into a negative slope on that curve.

Do you agree with that? I mean, do you -- do you agree --

MR. PAUL CHERNICK: Yes.

THE CHAIRPERSON: -- do you -- you are prepared to say that in -- in the Manitoba jurisdiction aggressive DSM would actually address all of the needs of Manitobans for the next generation?

MR. PAUL CHERNICK: I think that's very likely. Now, if you have some massive new industrial loads coming in then that -- you might need additional resources to meet those. But for sort of the normal growth and the -- and -- of the existing population and businesses and the kinds of things that -- that arise over time, yes, that should be possible.

We've seen -- I -- I don't think we've seen any -- any load growth in New England in -- in the last several years as a result of a couple of the States being very aggressive in their energy efficiency programs and all of them having at least middle of the

road programs, sort of, Manitoba Hydro kind of -- what -- what Power Smart has done historically. And that's held the New England load flat or declining for a decade or more, I believe.

THE CHAIRPERSON: You did preface your statement by saying that with the arrival of a large industrial load that throws that projection out of -- out of kilter, doesn't it?

I mean, if it's a brand new industry that comes to Manitoba and you didn't encompass that as part of your load forecast, you could be unable to supply the -- the electricity needs of that -- of that load?

MR. PAUL CHERNICK: Yes. If -- if somebody wants to move in or -- or a couple of things happen, a pipeline compressor loads and the -- an additional some kind of mining operations or something and it's going to increase your load 10 percent, then finding ways of -- of accommodating that would -- would be very challenging.

And, you know, fifteen (15), twenty (20) years from now you may have saved enough to -- to fit them in with your existing resources, but you're going to have some period where you can build load faster than you can conserve, and so you may need some

additional resources.

THE CHAIRPERSON: Thank you. Ms. Menzies, do you have any questions for these witnesses, please?

MR. WILLIAM GANGE: Mr. Chair, I'm just wondering, do you -- would you -- would you rather go and we'll -- we'll do Mr. Stevens's evid -- evidence, as well? And then both panel members could be cross-examined at -- at one time. That -- that was what I was expecting.

THE CHAIRPERSON: Okay, let me just check with my panel mates to see if they have any questions for Mr. Stevens immediately. Yeah, it was my view as well that we would expect the Intervenors to cross-examine both individuals at the same time.

MR. WILLIAM GANGE: Okay.

THE CHAIRPERSON: Now, I'm just wondering, looking at the clock, whether it would be best if we took a ten (10) minute break. I think it might be better if we took a ten (10) minute break. And -- and then we could start with you, Ms. Menzies, if you have any questions.

MR. WILLIAM GANGE: Mr. Chair, wouldn't we then come back and have Mr. Stevens give his presentation?

THE CHAIRPERSON: Oh, I'm sorry. Yes, you're right. I'm sorry. I apologize.

MR. WILLIAM GANGE: That's what I was thinking.

THE CHAIRPERSON: But I'm -- I apologize for that. Let's do that.

MR. WILLIAM GANGE: And I think your timing is right for a break. We could break now. And Mr. Stevens would -- would give his presentation after the break. Thank you, sir.

--- Upon recessing at 10:24 a.m.

--- Upon resuming at 10:44 a.m.

THE CHAIRPERSON: I believe that everyone's in position. So I'll turn the microphone over to you, Mr. Gange.

CONTINUED BY MR. WILLIAM GANGE:

MR. WILLIAM GANGE: Thank you, Mr. Chair. The second part of the Green Action Centre evidence is being presented by Wesley Stevens, of Power Advisory. And Mr. Stevens will make reference to his PowerPoint presentation, as well.

MR. WESLEY STEVENS: Okay, can you go

to the next slide, so slide 2. As you -- members of the panel, as you well know, Power Advisory's mandate in this was strictly limited to wind. Our findings in this respect, two (2) main ones, that Manitoba Hydro's application significantly overestimated the cost of wind generation in several ways.

And secondly, that the potential for wind generation was not adequately explored in the fifteen (15) development plans considered in the application.

Go to slide 3. First of all, we found that Manitoba Hydro has significantly overestimated the cost of wind in several ways. Their assumptions included an overnight capital cost of twenty-one hundred dollars ($2,100) per kilowatt. The schedule -- the construction schedule is pessimistic. Their assumptions about how wind prices will change over time is pessimistic. Their -- the project life is pessimistic and their wind integration cost is -- is pessimistic.

I should mention that all of these assumptions are taken from one (1) source. There was a spreadsheet which was in response to Round 1 IR from -- from La Capra, number 38 -- no, sorry, 308. Manihoba -- Manitoba Hydro provided a spreadsheet as an

attachment to their response to that IR. And that contains the best source I found of their -- the wind assumptions used.

There was some confusion at first in the application itself. There was a correction issued about capital costs. It turns out that the operating and maintenance cost listed in the application was not what was actually used in the analysis. So I have relied on this -- this spreadsheet as -- as a source. I call -- I refer to that as the LCOE spreadsheet, the levelized cost of energy spreadsheet.

Slide 4, please. So, first of all, the -- the capital cost of wind, Manitoba Hydro has used an assumption of twenty-one hundred dollars ($2,100) a kilowatt specifically excluding transmission costs, which they add in separately.

Various sources they've -- they've cited supported this, specifically in their rebuttal evidence, they cited two (2) -- two (2) reports: one (1) from the US Environmental Information Agency, one (1) from the National Renewable Energies Lab.

Digging into to these, both of these reports turn out to be overviews of many kinds of generation: one (1) covering twenty-two (22) kinds of generation ranging from coal to solar, another eighteen

(18) kinds of generation in which wind only accounts for a few pages each. The -- these are not in-depth studies for -- of wind. One of them is also dated -- is -- provides an estimate of 2009 costs, so we're talking about costs which are already four (4) year -- five (5) years out of date.

So digging into that, I did not consider those to be particularly reliable sources, whereas there is an excellent source on what a wind actually costs. It's issued by the -- the US Department of Energy. It's called, "The 2012 Wind Technologies Market Report." They survey most of the wind capacity completed in each year. In -- in this particular one, that covers something like 9,000 megawatts, 72 percent of the capac -- of the wind capacity completed in the United States. So it's not a sample survey. It's -- it -- it covers a large majority of projects act -- actually completed.

And they found that the cost -- the average cost of wind across all of these projects was not twenty-one hundred dollars ($2,100) a kilowatt; it was nineteen hundred and forty dollars ($1,940) per kilowatt, including transmission interconnection costs.

So to make that comparable to Manitoba Hydro -- Hydro's number, you either have to take

twenty-one hundred (2,100) and add fifty dollars ($50) or some number, or you take the nineteen forty (1,940) and subtract fifty dollars ($50) or some other numbers to make -- so you're talking -- talking apples and oranges.

I thought it was simpler to simply take the nineteen forty (1,940),, accept Manitoba Hydro's assumption of fifty dollars ($50) per kilowatt for connection costs and say -- and -- and come up with a plant cost eighteen ninety (1,890).

Now, if you've -- for those of you who bothered to read our report, this is -- this is a different number than we put in our report. There is evidence in the -- in this -- in the 2012 Wind Technologies Market Report that costs in the Midwest are significantly lower then are elsewhere in -- in the US.

And for our report we -- we used that number, the lower number for -- on reflection, I can't say that I know that -- I can't say with confidence that I understand why costs are lower in the Midwest. So we thought it was certainly more conservative to use the average for all of the US rather than the -- the average specifically for -- for the Midwest. I am considering doing some more digging on that and I'll --

we'll report back if I find -- find anything.

Slide 5, please. Manitoba Hydro also made some interesting assumptions about their construction schedule. They assumed a three (3) year construction schedule, which is reasonable. They assumed a small amount of costs in the first year for monitoring, permitting, you know, putting up a wind tower and mea -- measuring wind speed, you know, things like that, which is very reasonable.

However, they assumed that almost all of the work, the actual work of putting up the project -- the full costs of the turbines, the civil work, you know, site prep, roads, buildings, everything, even commissioning -- would happen in the second year, which is, you know, between twenty (20) -- twenty-four (24) and thirteen (13) months before commercial operation date. And then almost nothing would happen in the -- in the last twelve (12) months.

That seemed odd to me, so we, Power Advisory, we went back and talked to some of our -- our developer clients and asked them what do they actually do. And they said -- and this is an average of -- of across about three (3) responses -- that, yes, first year reasonable. They actually said a bit more spending in the first year, 5 -- 5 percent.

In the next year, the only major expense was turbine deposits, which came down to about 35 percent of the total. Maybe a bit of site, but in total 35 percent. And that the bulk of the cost, the remaining 60 percent, was in the last twelve (12) months before COD.

MR. WILLIAM GANGE: Mr. Stevens, before you go on, why is that important to you?

MR. WESLEY STEVENS: This is important because we are comparing costs on net present value basis. So when costs are incurred earlier, that increases the levelized cost of energy. That increases the net present value in the economic analysis. In this case, these costs increase the cost of wind by about 3 percent, which is not that much. But if you -- but if you're talking about a -- say a 10 percent difference between two (2) kinds of generation 3 precent is a third of the difference.

So can you go to slide 6, please? So what about -- and this is probably the biggest issue. What about project life? Manitoba Hydro has been -- has -- has assumed twenty (20) years, and they -- they have cited a number of studies in support of that: BC Hydro, three (3) different ones by National Renewable Energy Lab, something called Irena, and also Vestas.

They referred to the warranty period on one -- one of Vestas's wind turbines. Vestas is a wind turbine manufacturer.

Digging into these, again what I found is that with one (1) exception they simply give the statement of, We assume twenty (20) years, without justification. And that one (1) exception was one of the NREL studies where they said, There is actual evidence on this; we've looked -- there -- there -- we've accumulated evidence over -- over the years, and the evidence says the expected life of a turbine is twenty (20) to thirty (30) years. They went on to use twenty (20) years as project life but never explained why they chose the -- the lower number.

Manitoba Hydro also made an interesting statement in their rebuttal evidence that they are not aware of any wind turbines greater than 1 megawatt in nameplate capacity that have operated for more than twenty (20) years, seeming to imply that, you know, we just don't know how long they'll last.

There were no 1 megawatt turbines twenty (20) years ago. The first one was introduced a few -- few years after that, about seventeen (17), eighteen (18) years ago, and would have gone into service about seventeen (17) years ago. So we're looking at a

technology that is not that old. And you can -- and for a new technology, it's reasonable to be -- to be conservative about expected life. And it seems to me that that's what -- that's what -- what has happened.

Earlier on in -- when wind was first being put into service in the -- in large quantities, people didn't really know how long it would last. They assumed twenty (20) years. That went into studies, which were cited by other studies, which were cited by other studies, which -- which were cited by Manitoba -- Manitoba Hydro.

Now, after a few large wind turbines have been in service for fifteen (15), sixteen (16), seventeen (17) years, and many of them -- and quite a few for -- for somewhat shorter periods, we have some evidence. And what does that evidence actually say?

Well, the first piece of evidence is in Manitoba. There are two (2) -- two (2) wind farms in service. They have terms of twenty-five (25) and twenty-seven (27) years. Just one point of reference.

The second one, one of the -- I mentioned this already. One of the reports cited by Manitoba Hydro actually refers to research on wind projects and says, The wind turbines have a useful life of twenty (20) to thirty (30) years.

The third piece of evidence, while Manitoba Hydro was correct that Vestas, the wind turbine manufacture, that some of its wind turbines come with warranties of twenty (20) years, others, the newer -- some newer larger ones come with warranties of twenty-five (25) years.

Now, warranties is not the same thing as useful life. But it is indicative that the -- the turbine manufacturers, who are in a place to know and are in a place to, you know, they're putting their money where their mouth is, that they are becoming more confident that wind turbines are lasting for a longer time.

And finally, we went and asked some of the same developers that we asked earlier about construction schedule. We asked them: What do you use? And they said, without exceptions, We -- we do our financial analysis based on twenty-five (25) years.

We do it, the developers do it, the investors do it. Investors are not known to be particularly flighty when it comes to financial analysis. In fact some investors also look at thirty (30) years, though that's not the -- not -- that's not their primary focus. Their primary focus is on twenty-five (25) years. And none of them mentioned twenty

(20) years.

So our conclusion is that while twenty (20) years has been somewhat of a tradition, that the evidence actually points to a useful life of twenty-five (25) years.

So can you go to slide 7, please? Manitoba Hydro also assumed that there would be no -- no improvement in wind costs over time, either wind capital costs or in -- or in wind capacity factor. That makes them a distinct outlier among experts.

Another excellent study by NREL focussing entirely on wind looked at -- did a survey of eighteen (18) different scenarios by an -- by -- I'm not sure, thirteen (13) or so -- from thirteen (13) or so different sources and graphed them. That graph actually appears in Manitoba Hydro's application. It's -- it appears in one (1) of the -- one (1) of the appendices of the Brattle report, I believe. So Manitoba Hydro must have been aware of it in -- in developing their application.

The midpoint of expert opinions is a -- a decline of something like 25 percent by 2030. This is a combination, by the way. The improvements and costs are on a dollars per megawatt hour basis. A combination of lower costs, much of it linked to larger

tower sizes. So a lower -- lower unit. A larger tower costs more than a smaller tower, but on a unit cost basis it's less expensive.

As well, larger towers, if they're higher, and there's a move to go from the current 80 mega -- 80 metre standard to a hundred metres, larger towers have access to stronger and steadier winds. So that -- that improves the amount of wind -- that -- that improves the capacity factor and the capacity of the wind plants.

This can be modelled. I guess, perhaps ideally, you would have different projections of capital costs: capital costs going down over time and capacity factors going up over time. It's actually simpler to simply model this as a decline in capital cost, to take this -- this improvement in -- in wind cost per megawatt hour and simply model it as -- as an improvement in capital cost. But I want to acknowledge that it is in fact a combination of capital cost declines and capacity factor improvements.

Next slide, please. Now, we come to wind integration costs. And this, I've got to say, was a difficult one because there's such little information available in the application. Manitoba Hydro started with a study done -- done in 2005, so it's nine (9)

years ago, that said that wind integration will vary with electricity price and with how much wind is already on the system.

Those are reasonable statements, and they gave numbers -- the -- the report gave numbers: four dollars and twenty-two cents ($4.22) per megawatt hour for -- at the five hundred (500) -- if -- if you have 500 megawatts on your system and four-ninety-nine (4.99) if you have a thousand megawatts on your system.

Manitoba Hydro then made a number of assumptions about electricity prices and how much wind capacity would be ins -- installed. And one (1) of their assumptions is that this nine (9) year old study is the best and most current source of information on wind integration costs.

Manitoba Hydro applied these assumptions, did some kind -- some kind of calculation, and came out with a number. The number they came out with was eight (8) -- eight dollars and forty-five cents ($8.45) a megawatt hour, which is twice what the 2005 study came up with. I thought that was odd, because one (1) of the prime drivers of wind integration costs, according to this study, is electricity -- electricity prices. Electricity prices are lower now than they were in 2005. They are

significantly lower, and it will be many years before they will be higher.

But if there's anything that can be taken from the 2005 study it's that wind integration costs really cannot be brought down to a single number. If you're looking at adding a couple of hundred megawatts of wind in 2022, that is taking your total install capacity from two-sixty (260) not even -- but taking it up to the five hundred (500) level, that's different from talking about what's going to happen in 2040 if somehow you have -- already have 2,000 megawatts on -- on your system and you're going to add another -- add additional capacity on that. You can't really bring it down to one (1) number. But that's -- that's the approach taken.

Manitoba Hydro was asked, as an undertaking, to explain the difference between the wind integration costs shown in Appendix 9.3 -- that is, the four twenty-two (422) -- and the wind integration cost as taken from LCA/MH I-308. That is the eight forty-five (845). That was Undertaking number 40. The response, which is Exhibit 136, while it consisted almost entirely of information already available in the application, did not really provide much explanation.

It did -- did include one (1)

interesting phrase, that their wind integration costs are for a sign -- significant wind build-out. In other words, buried in this number appears to be the assumption that there's already a lot of wind on the system. How much? We don't know.

I would suggest that, particularly for a screening exercise, which is what the levelized cost of energy calculations are about, it's more appropriate to look at wind integration costs applicable to the next few projects -- what's going to be happening in 2022 when you go from two-sixty (260) to five hundred (500) or something like that -- than it is to be talking about what happens if you already have 2,000 megawatts on the system.

That's particularly relevant if you're talking about -- hold on. I lost my train of thought. It also matters whether we're talking about adding wind to the system as is or if we're talking about additional capa -- hydro capacity. Wind and hydro are a good match in many ways. One (1) of them is that the more hydro you have, the lower your wind integration costs.

Also, are we talking about a system with more transition -- transmission, interties with -- with neighbouring systems? Again, that's a factor which

tends to decrease wind integration costs. So are we talking about the system as is, adding wind to it without interties in hydro, or are we talking about a system with more hydro and more wind, or more transmission and more wind? All that makes a difference.

But the biggest problem that I have with the eight forty-five (8.45) number is we just don't know what Hydro did. It's a black box, and a black box that came out with what seems to be a very high number. We do know, however, because they say so in their report, that Manitoba Hydro's wind integration experience is generally consistent with the 2005 study results. I mean, what does that mean?

We're in a situation with very little wind. We're in a situation with low power costs. So 'consistent with the 2005 study' would imply that Manitoba Hydro has some experience with actual wind integrations costs and they're pretty low.

Ideally, I would have liked to have seen Manitoba Hydro provide information on actual costs, not a -- not a nine (9) year old study, but actual costs. In the absence of -- of that, I'd like to know how the numbers were derived, the assumption of the analysis behind them, and whether -- whether they're -- those

assumptions and analysis are -- are reasonable.

However, in the absence of that, I have to say that the only number we have, the only actual number we have is the four twenty-two (4.22) to four ninety-nine (4.99) number in the 2005 study. The four twenty-two (4.22) number is -- is at a 500 megawatt level. We're below that. We don't have 500 megawatts. We have something less than that. So it would have to be the -- the lower end. And I choose that regret -- regretfully but only because it's the only number we have.

The next slide, please. So where does that put us? If you do all these things, if you take a capital cost that's based on what it actually cost to -- - to build wind in 2012, if you apply to that reasonable assumptions about the expert consensus about how wind costs will change between now and, let's say, 2022, 2020, 2022, around there, if you go -- if you ask developers about how money will be spent during construction and if you put in the only number -- the only evidence-based number we have wind integration costs, where do you end up?

You end up at about sixty-five dollars ($65) a megawatt -- a megawatt hour, which is a lot lower than Manitoba Hydro's number from IR Response --

the -- the response to IR 308, which was eighty-four dollars ($84). And it actually makes it lower than the cost -- cost of energy from either Keeyask or Conawapa.

I don't want to make a big deal about the fact that it's lower. I want to make a big deal about the fact that it's in the ballpark. What that means is that it's too -- if it's too close to call, it deserves to be looked at in some detail.

The next slide, please. That will be slide 10. Looking -- in looking at the development plans, Wind was not technically screened out. It does appear in some of the plans. It appears in two (2). There's a Wind/Gas Plan and a Wind/Conawapa Plan.

However, even there, as La Capra noted, these plans were not optimized, so. And it's -- these are not my words. These are La Capra words, but they're -- they're worth repeating, so I'm going to read them.

> "Rather than abandoned wind as a resource option, it would have been reasonable for Manitoba Hydro to evaluate alternative plans with different sequencing and timing of the wind and gas generation, plans with alternative capacity resources,

such as CCGTs and in demand response measures and plans that varied the amount of wind developed."

So to -- if you're going to include, at least optimize the plan. Optimize it in combination with -- optimize the timing of wind. Optimize how it's combined with gas. That's for those two (2) plans.

There were no other plans that included wind. In particular, there are no plans that considered combining wind with new transmission interties or combining it with new export contracts or combining it with -- with -- well, they did consider combining with -- with Conawapa, but perhaps combining with Keeyask; smaller amounts, larger amounts. They just -- the -- the range of -- of plans they looked at was just very, very narrow.

The next slide, please. That's slide 11. One (1) of the things -- one (1) of the questions raised that -- that I raised is: Could wind, in fact, be paired with hydro to serve export markets? If export prices are so high and if the export potential is so great, what about wind plus hydro? What about either wind plus the existing system or wind plus a new system?

I'm not talking about using wind for

firming. Well, you could consider it a bit -- a bit of firming. I'm talking about looking at it on an -- really on a integrated basis where when -- when there is wind, when the wind is high, there is wind generation, you cut back on the hydro. The reservoirs stay higher. When -- when export prices are high you have that much more hydro to export.

So you're not so much generating -- you're not -- not so much exporting wind as you're using wind to enable the export of hydro. Is this feasible or not? We don't know. Manitoba Hydro was asked about this in Information Request from the Board, 26A. Their response was a list of reasons why they didn't want to consider it, and particularly because they seemed to be looking at wind in Manitoba as competing head to head with wind in -- in the US states, rather than looking at wind plus hydro together in Manitoba competing with wind in -- in the US.

Next slide, please, which is number 12. Actually, can you go back for just -- I seem to have -- can you go back one more? No, okay. I'm on track.

One other thing that should be considered with respect to wind relates to what Mr. -- Mr. Chernick just said, that -- that Manitoba Hydro -- that Manitoba's needs for electricity can be met

through -- through conservation. There are always errors in load forecasts. Conservation programs may be more or less effective. A new industry could come along. It could be argued that we need to build these large hydro plants just in case demand increases later.

You can look at wind as a form of risk management. Going back to the wind schedule, once you've invested the first 3 percent, 5 percent in project development, 95 percent of the costs don't happen until one (1) and two (2) years before the project is put in -- in service. So if -- if demand is tracking higher than expected, if there is a large mining development happening in Northern Manitoba and you know you will need more energy, you don't need eight (8) years' notice of that. You need two (2) years. You can put wind projects in.

If you need capacity, you can also put in gas projects on -- on the same sort of notice. So you can look at wind not -- not just from the long-term development plan perspective, but you can look at wind as a -- as a risk -- as a form of risk management. That's also something that -- I think that should be considered.

Now, the last slide, which is number 13. So my conclusion, just to summarize is, wind should be

considered more seriously in any long-term plan of Manitoba's electricity system. It is the lowest -- lowest cost type of generation on an energy basis; less expensive, as I calculate it, than Keeyask, Conawapa, gas, solar, geothermal, anything else. It is the lowest cost of energy.

As such, it should be conspired in a wide range of development plan -- plans, with the timing of -- of wind and other types of generation fully optimized. It may be possible to pair wind with either existing or new -- new hydro to serve -- to serve export markets. That should be explored. And it may be possible to use it as risk management, to hold it in reserve to deal with unexpected changes in demand with a -- with a two (2) year construction period rather than a six (6) to twelve (12) year construction period.

That concludes my -- my presentation. Thank you.

THE CHAIRPERSON: I have a few questions, I guess, in relation to the costs that you have proposed for the cost of wind. And I guess one of the concerns I have is around the blend of US costs/Canadian costs.

Could you talk about that, please?

Have you attempted to compensate for the fact that some of these costs are -- are based on US dollars and -- and we are in a Canadian jurisdiction?

MR. WESLEY STEVENS: I actually haven't done that. It's true that the -- the costs I -- I gave were in US dollars. I have not convert -- converted those Canadian dollars, either current prices or whatever the exchange rate is.

Bill, do you happen to remember the exchange rate assumed application?

So it -- it would -- it would actually be reasonable to -- to convert those numbers using whatever exchange rate -- what -- whatever long-term exchange rate --

THE CHAIRPERSON: Yeah, I mean --

MR. WESLEY STEVENS: -- not necessarily the point nine (.9) that -- you know, the ninety (90) cents on the dollar that it is now -- it is now.

THE CHAIRPERSON: So that would address the exchange rate, but it wouldn't address the issue of whe -- whether costs for constructing wind in the US is different than the cost in Manitoba. In other words, my intuition tells me that it probably would be more expensive in Manitoba than it is in the US, but I don't know that for a fact.

And I -- I -- can you comment?

MR. WESLEY STEVENS: I don't have any solid information on that. I have thought about that. And my thought was actually the -- the opposite, that you have -- in Manitoba, you would largely be -- be developing wind in the southern part on -- and you're not in the -- in the Canadian Shield, so -- so you -- so you're looking at fairly easy foundation construction compared to what you see in many places in the United States.

That may be one (1) reason why wind costs in -- in the Midwest were lower than they were elsewhere in the -- in the -- US, although there are other -- other reasons. There could be other reasons for that as well. It might be that you would have higher costs to deal with harsher winters, but winters get pretty harsh and snowy in -- in many parts of the US.

So I've looked at that. I don't have any -- any basis for saying that they would be higher in Manitoba. And that was part of -- actually part of my reason for going with the US national price rather than the Midwestern -- the US Midwestern price, is to kind of allow some -- some fudge factor in there.

THE CHAIRPERSON: I didn't understand

the suggestion you made that you create wind sites in reserve.

Could you explain that a little bit more? Are you suggestion you -- you pour a pad and...

MR. WESLEY STEVENS: No, no, no. You -- you choose a site, acquire the land, put up a wind -- a -- a wind -- like a monitoring tower to confirm that the wind is there. You can even go so far as permitting. And then you sit on it.

If -- if a big mining complex comes in that's going to need energy -- and something like that would typically need energy around the clock. It needs -- it needs more than capacity. Then, you know, call up the, you know, call up the wind turbine manufacturer. I need -- I need turbines. And two (2) years later, you can have a site commissioned.

But you have to do the prep work. Prep work costs -- essentially you have to do the year 1 work, the -- what -- what we estimate to be about 5 percent of the cost. And there would be some small costs of just sitting on the land rather than developing it. But it's pretty low cost risk management.

THE CHAIRPERSON: Now, part -- part of what Manitoba Hydro has suggested and -- and obviously

included in their plans is, you know, the fact they -- they would be importing US wind, storing water, and -- and shipping back the power at -- at an alternative time. So in effect, instead of having wind in Manitoba, you'd be using wind US and -- and enjoying the increased reliability that stems from two (2) different systems that are intertied and so on.

So you examined wind purely as a resource that might be available in Manitoba and didn't consider the broader gains that might be yielded by an intertied system.

MR. WESLEY STEVENS: I think that that is something that should be looked at. That would -- that would fall under the category of taking a much more serious look at wind, including importing wind from -- from the US. My -- this is a gut feel, I have to say.

My gut feel is it's -- it's likely to be more efficient to generate the wind in Manitoba and then -- then export it, rather than import it from the US and export again. It's -- it's more complicated. You have -- if -- if it's in with -- if it's in Manitoba, it's easier to -- to integrate more closely, integrate on a one (1) minute basis rather than scheduling -- schedule imports thirty (30) minutes or

an hour ahead.

So I -- I think there are benefits, but again that's something that I think should be worked -- looked at.

MS. MARILYN KAPITANY: My question is more mundane than the Chair's, but I've done some reading about wind. And one (1) of the things that I saw is that it doesn't do very well at really cold temperatures.

Is that information out of date, or could you comment on that at all?

MR. WESLEY STEVENS: That's -- that's getting into information -- I'm not an engineer. I -- but I have educated myself about this, because that's my responsibility. There are issues with icing, and that relates back to M. Gosselin's question about additional costs in Manitoba.

There -- for an additional cost -- I think it's small, but I'm -- I -- I don't know what it is -- you can get wind turbines at -- that are particularly good at dealing with icy conditions.

On the other hand, basic physics, cold air is more dense. So they're -- the colder it is, the more wind power you have.

MS. MARILYN KAPITANY: Even if it's a

dry cold?

MR. WESLEY STEVENS: That's actually an interesting question -- an interesting phy -- physics question: Does wet cold air weigh more than dry cold air? I don't know.

(BRIEF PAUSE)

THE CHAIRPERSON: I think that's all the questions the panel has for the time being. So, Ms. Menzies, please, on behalf of CAC.

CROSS-EXAMINATION BY MS. MEGHAN MENZIES:

MS. MEGHAN MENZIES: Good morning. Thank you. Good morning, Mr. Chernick and Mr. Stevens. I'm just back here. Mr. Chernick, I met you this morning at break, but I don't believe that I met you, Mr. Stevens. So by way of introduction, my name is Meghan Menzies, and I represent the Consumers' Association of Canada, Manitoba branch.

And I don't have many questions for today, but the ones that I do have are primarily targeted at Mr. -- at Mr. Chernick. But as I think we've always been aware, we're definitely open to responses from both of you where -- where appropriate.

Mr. Chernick, this morning you were qualified in a number of areas, and one (1) of those area was integrated resource planning.

Is that correct?

MR. PAUL CHERNICK: Yes.

MS. MEGHAN MENZIES: And I believe that Mr. Gange explained that you had previously been qualified as an expert in integrated resource planning in a number of jurisdictions. And my understanding was the jurisdictions that Mr. Gange spoke to were Arkansas, Kentucky, Contentic -- Connecticut, and the City of New Orleans.

Am I recalling that correctly?

MR. PAUL CHERNICK: Yes, and there are several others I've been appearing as a -- a witness on integrated resource planning since the 1980s.

MS. MEGHAN MENZIES: So before I was born. Maybe I shouldn't have said that. Moving on from that. Although, your presentation this morning was not largely focussed on integrated resource planning, because you've been qualified in the area and clearly have a lot of experience speaking to it, I would like to explore the topic with you a little bit this morning.

To begin with, could you provide the

Board and myself with some insight on what good integrated resource planning consists of?

MR. PAUL CHERNICK: Well, that -- that's a question sort of better suited for a -- a research paper or a primer on -- on integrated resource planning. And I -- I think some of those have been developed.

But basically the idea is to look at all of the tools at the disposal of the electric utilities system or the electric and gas utilities system, and to search for the best plans going forward, including, in the case of an electric utility, adding generation, retiring generation, switching fuels, purchases from other utilities -- non-utility generators, sales -- in this case of Manitoba, it would be exports -- energy efficiency, fuel choice issues, and -- and the whole range of potential solutions to your future supply problems or conditions that may arise, including both the -- the expected cost and the risk involved in the various alternatives.

MS. MEGHAN MENZIES: And to use some language of -- of Mr. Stevens this morning, my understanding would then be is that you -- you take all these different resources that you've looked at and -- and try to create an optimized plan? Is that -- sound

appropriate, or -- or am I --

MR. PAUL CHERNICK: Yes, that's your -- your objective, and -- and the -- the point is not so much to lay out a blueprint that you'll follow faithfully for the next twenty (20) years as to lay out what you're going to be doing in the foreseeable future and how that will -- relates to what you expect in the longer term.

In the -- so you -- there are things that you need to do now in order to bring resources online over the next three (3), four (4), five (5) years. But as you're making those decisions, you want to be thinking about a much longer time frame and what you expect to have happen, and how you will change your plans if your expectations change.

MS. MEGHAN MENZIES: Thank you. And -- and when you -- when I first posed this very general question to -- to you, you provided that -- that you look at a number of different resources. And something that we've been discussing here at the hearing within the last two (2) months has been portfolio analysis; so not just individual plans, but -- but also portfolio analysis within integrated resource planning.

Is -- is that something that's familiar to you or something that you can expand on?

MR. PAUL CHERNICK: Yes, I -- I think what you're alluding to is, while it's often helpful to focus on a particular resource, and how adding that would change the rest of your -- your plans and change the economics of the system, integrated resource planning doesn't just look at one (1) or two (2) decisions normally. It looks at your overall mix of -- of resources and -- and how that -- 'portfolio' is a good word for it -- how that set of resources and the policies that may be developed to complement your resources, how those perform under a variety of conditions.

Just as with a financial portfolio you look at balancing stocks and bonds and domestic and -- and foreign holdings, and so on, so that you aren't excessively vulnerable to any particular shift in the market.

(BRIEF PAUSE)

MS. MEGHAN MENZIES: And so something that was brought up this morning to some degree was energy efficiency. And -- and our understanding, or the understanding that I've been able to glean from the presentations thus far is that at the heart of

integrated resource planning is that optimized energy efficiency is just as important to consider as optimized generation.

Is -- is that -- is that statement correct, in your opinion?

MR. PAUL CHERNICK: Yes. One of the major resources available to both gas and electric utilities is energy efficiency for providing the energy services to their consumers at the lowest possible cost, and reducing the risk.

MS. MEGHAN MENZIES: Thank you. And I just have one (1) last question for you, and it's just -- because of the number of places that you've worked and that you've provided expert evidence on regarding integrated resource planning, it would be helpful if you could provide some direction or examples of jurisdictions that have undertaken what you would consider to be good integrated resource planning, if they're out there.

MR. PAUL CHERNICK: Oh, there -- there are, and there -- there may be -- if you're looking for models for Manitoba, you might take different pieces from -- from different jurisdictions.

And while -- say the treatment of -- of demand-side options, efficiency, in particular, for

that you might look to say Connecticut, which has a -- I think a fairly clear and straightforward development of -- of that side of the IRP. But Connecticut is a restructured state, so the utilities aren't making decisions about purchasing resources, for the most part. They -- they make some exceptions to resolve problems that the market's not taking care of, but for the most part for the supply side you'd have to look to another model.

I -- I think I'd prefer to respond to this in -- in detail in a -- in an undertaking, if that would work for you?

MS. MEGHAN MENZIES: I would be glad to -- to have an undertaking on that.

MR. PAUL CHERNICK: So this would be a few examples of integrated resource planning that I think work fairly well. And I'll get you the links to the specific documents that lay out the -- the plan and perhaps the Regulatory Board's order on the subject.

MS. MEGHAN MENZIES: That would be great. And for -- for the benefit of the court reporter, would you like me to repeat that undertaking?

(BRIEF PAUSE)

MS. MEGHAN MENZIES: So my understanding, and please interject if I'm restating this incorrectly, but Mr. Chernick will provide -- will provide an undertaking to provide the Board with a number -- or a number of good examples of jurisdictions that have done good integrated resource planning and will provide links to both those plans and the Board orders relating to those plans, if available.

Does that sound satisfactory to you, Mr. Chernick?

MR. PAUL CHERNICK: Yes.

MS. MEGHAN MENZIES: Thank you.

--- UNDERTAKING NO. 135: Paul Chernick to provide Board with a number of good examples of jurisdictions that have done good integrated resource planning; will provide links to both those plans and the Board orders relating to those plans if available

MS. MEGHAN MENZIES: And that concludes

my questioning for this morning.

THE CHAIRPERSON: Thank you, Ms. Menzies. I'm going to call upon Me. Hacault. Just to let you know, Me. Hacault, that our intention is to recess at approximately five (5) to 12:00. So I hope that helps you a bit.

MR. ANTOINE HACAULT: That should be okay. I expect that the questions I have will have been dealt with before that time.

CROSS-EXAMINATION BY MR. ANTOINE HACAULT:

MR. ANTOINE HACAULT: I'd like to cover one (1) area with Mr. Chernick and just provide a little bit of background before I get into the questioning. One (1) issue that has been raised in this hearing is when you build new generation for hydro you'll know the cost of that. And I want to explore how that -- your views on that and how that compares to DSM and whether in twenty (20) years we'll know the cost of the saving plans that you're talking about at the 1.5 percent. So that's the subject area.

Let's try and break that down a little bit. Sir, with respect to economic DSM, can you identify the most common cost components of those DSM programs? For example, labour might be one (1) of them

and physical components of different things might be others, but I'm just giving you that as an idea before you answer, sir?

MR. PAUL CHERNICK: Well, that varies a lot from one (1) program to another. Sometimes the program expenditures are almost entirely for technical assistance. For example, in new construction for large buildings, there's a tendency for there to be a market failure where the -- the owner doesn't ask the architect or the lighting engineer, or the -- the HVAC engineer for a -- a lowest total cost system. And the -- the charge is more to minimize first costs, because that's something that the owner can understand and -- and monitor more closely.

Even if the various professionals would like to do something more with efficiency, they have to do that work on their own time, and then explain to the owner why they should spend more, or, in some cases, why it saves them money because if you improve the lighting efficiency and the use of date lighting you can reduce the size of the cooling equipment, for example, in a high-rise building. But that means that the -- the architects and the -- the lighting engineers have to talk to the -- to the HVAC engineers across connections that are -- that -- that may not be made

normally.

So sometimes you're mostly paying to bring in an outside expert to work with the various parties and come up with a proposal for how to build a building that does what the owner wants to do and does it with a lot less energy use. And then there's a small cost perhaps for a plaque to put on the front of the building to let everybody know how amazingly efficient the building is when it's actually built as -- as designed. So --

MR. ANTOINE HACAULT: And I'll let you continue.

MR. PAUL CHERNICK: Yeah.

MR. ANTOINE HACAULT: But I just want to break -- break -- the first component that you've -- identify then is the nature of labour, either professional engineers, architects, or the people that are installing it.

And would it be fair to suggest that we could expect that people over the years, if we're projecting twenty (20) years, that cost will not stay fixed over a twenty (20) year time period; all things being normal, labour costs will increase in each year over the twenty (20) year time period?

Is that a fair assumption, sir?

MR. PAUL CHERNICK: Yes. You'd -- you'd expect it to rise roughly with inflation. Although as -- as you get some -- some buildings built and as the architects get familiar with the techniques, that they're able to research because you're either paying for their time or bringing in somebody else to -- to help them through the process, it may be much easier to do the -- the second one or the third on and the forth, one and so on. But there would some -- certainly be some escalation in fees.

And for both that kind of project and -- and ones where you're blowing in insulation or replacing windows, or that kind of thing, there would also be escalation in -- in labour costs. And there -- there would be escalation in -- in material's costs in general where you're replacing one (1) kind of equipment with -- either putting in new equipment early, for example, taking out a refrigerator that's still working but is using way too much energy and putting in a more efficient one.

On the other hand, the -- the premiums for an efficient refrigerator over the standard refrigerator may also decline over time as those efficient models become more commonly used. They're not special order anymore. They're now stocked

locally. They're easy to get a hold of. The manufacturers are producing more of them. They've spread their development costs out over more units. They're competing with one another to -- to capture this growing market.

So the incremental costs of some kinds of capital investments will go down. The incremental costs of others may go up with inflation, but you would expect some -- some upward trend in many of those activities. And in -- in terms of the costs of the measures, whether you're talking about costs that are being expended directly by the utility or being expe -- expended by customers, and then the utility provides a rebate, an incentive, or whatever, that, in general, costs will tend to rise with inflation. Although, there are other factors, as I've outlined, that would push back against that.

MR. ANTOINE HACAULT: Okay. And thank you for that answer, sir. I appreciate with respect to materials, which is kind of second area that you covered, that there can be a wide range as to whether or not there might be actual increases that match inflation, depending, as you say, on the competitive nature of the market and whether new things come out. But is it fair to say that, in general -- I think I

understood you to say that there probably would be some measure of increase for materials overall? For example, insulation -- is insulation -- probably you won't pay the same price for insulation in twenty (20) years from now as you do today.

(BRIEF PAUSE)

MR. PAUL CHERNICK: There are prob -- there are probably some specific materials that you use in -- in energy efficiency programs that you continue to use that would rise with the -- the cost of -- of other commodities. I -- I'm thinking about -- in the insulation case, at one (1) point the -- the cost of adding a layer of -- of foam insulation on the outside of the wood framing before you put on the siding, that was just an additional cost. Now, there are -- there's insulation integrated with the sheathing so that the -- the cost -- the incremental cost of doing that has gone down considerably.

So as the technology improves, as the foam insulation replaces blown in cellulose or -- or fibreglass, you may have lower costs to get the same efficiency levels. You may also be pushing for higher efficiency levels.

I guess my answer is it's complicated, but there certainly are areas in which -- in -- general inflation will tend to push up costs. And while you may get a little more efficient in how you -- you do the -- the blowing of the foam, you're going to have somebody there controlling the -- the equipment. And he's certainly going to hope that his -- his wages rise with inflation.

MR. ANTOINE HACAULT: And you had an exchange with Board member Kapitany on new technology, and you said while we can't necessarily predict what it will be. Does it follow that you also can't predict the price of that new technology with any measure of certainty?

Is -- like, in twenty (20) years from now, what is the technology that we're speculating about and what's going to be the cost of that technology to maintain that level of efficiency, or increased efficiency, of the one-point-five (1.5) that you have -- you have identified, sir?

MR. PAUL CHERNICK: Yes. And you may have new technologies that allow you to squeeze additional savings out at about the cost that you've -- we've been doing it in the past, or about that cost plus inflation, or at a lower price, or potentially at

a higher price. But in my conversation with the Chairman I was speaking about the technologies that would be cost effective. But they may be -- instead of costing two (2) cents a kilowatt hour, they may cost four (4) cents a kilowatt hour, or -- it's true that we -- we don't know exactly what will happen in the future with a lot of these things.

MR. ANTOINE HACAULT And, sir, I'm going to suggest to you that once you've built a major generating station and associated transmission such as Keeyask that once that construction is finished your costs are pretty well fixed except for ongoing maintenance and some support. And that's actually been a criticism that there's very little ongoing permanent jobs related to a generating station.

With respect to the statement I made, sir, that most of your costs will be fixed once that generating stations has been built, do you agree with that?

MR. PAUL CHERNICK: Yes. Although, there -- there are situations in which hydroelectric systems and major transmission systems require large investments. There's situations in which the dams are -- experience some kind of -- of problem, or you can have a generator fire which can knock out a big piece

of equipment for quite a while until you get it repaired, and it can be an expensive business.

So it's -- it's not necessarily the case that you don't have to spend any money on the facilities after you've built them, but there may be many years in which you're spending very little.

MR. ANTOINE HACAULT: And all things being equal, sir, I would suggest to you that if you spend say $6 billion in today's dollars, in twenty (20) years -- we don't know that the inflation will be, but in -- the dollars that'll be used to pay down that $6 billion, in twenty (20) years from now, if we use a time -- twenty (20) year metric, it'll be easier to pay that $6 billion because of the natural effect of inflation.

So you get an inflation hedge when you build a generating station, correct?

(BRIEF PAUSE)

MR. PAUL CHERNICK: I'm just making sure that I understand what -- what you're asking. If -- if you -- you borrow a certain amount of money this year and you pay it off with straight-line depreciation then you're going to be paying less in the future, and

people -- the bills will be getting paid in inflated dollars. And so it -- the repayment goes down in real terms, if --

MR. ANTOINE HACAULT: Yes --

MR. PAUL CHERNICK: -- I think that's the point you were trying --

MR. ANTOINE HACAULT: -- that's a point. For example, and I -- I don't want to show my age, but the first hearing I did before this Board was the Limestone Project, and a lot of people were complaining about the cost at that time. And when we consider the cost and -- and the amount of rates needed to pay -- and -- and out of my pocket in today's dollars, people are starting to think it's a pretty good deal. And they say, Well, it's a legacy that's been left to us by the people who had the foresight of doing that Limestone Generating Station.

So getting back to my question, sir, all things being equal a big generating station would have inherent in it some kind of an inflation hedge because a big part of the fixed costs are put there and don't change over time.

MR. PAUL CHERNICK: Yes. And -- and any capital investment that you make now has that -- that -- with a long life has that kind of advantage.

If you spend money on energy efficiency today, then -- and it saves energy in that building for forty (40) years, then, you know, thirty (30), forty (40) years from now you're getting those benefits. You probably aren't paying anything for it out of that end of the -- of the period, and -- but even if you borrowed money to do it with it's -- it's a very good deal.

So energy efficiency, hydro, wind, solar, all have very high -- or, you know, a high percentage of their costs are front-loaded, and therefore they look particularly good over time.

MR. ANTOINE HACAULT: Sir, I'd like to understand better your last statement, that energy efficiency has a lot of front-load costs. As I understood the evidence that you lead, in each year if we're going to get incremental savings of 1.5 percent in each year we need to spend money. And that money, we've talked about --

MR. PAUL CHERNICK: Right.

MR. ANTOINE HACAULT: -- will be increased labour costs, and -- and perhaps depending on the type of DSM --

MR. PAUL CHERNICK: M-hm.

MR. ANTOINE HACAULT: -- increase material costs. So I'm trying to understand why you're

saying that we spend a lot of up-front costs. Maybe in any given year, but that expense has to be repeated in each year to achieve those targets, correct?

MR. PAUL CHERNICK: Yes. To continue getting savings you have to continue spending money. It's sort of as if you could take Keeyask and split it into a thousand little pieces and -- and add just as many as you needed each year. As time went by, those additional little pieces of Keeyask would -- would be costing you more.

And the DSM, which you don't have to -- to spend your -- all of your money on today, you can -- you can put it in over time, it does inflate. But on the other hand, you don't pay anything until you actually start getting some benefits from it.

MR. ANTOINE HACAULT: And I'll finish with that. The difference is life -- we're talking about life of a generating station somewhere between sixty-five (65) and seventy-eight (78) years on average with the components, correct?

MR. PAUL CHERNICK: Yeah, the life of hydro electric facilities is -- can -- can be very long.

MR. ANTOINE HACAULT: Thank you. The next set of questions are to Mr. Stevens with respect

to the life of the wind towers.

Are you aware, sir, and you may not be, whether the assessment department in this province or other provinces, for purposes of valuation and then depreciation, as to what life they attribute to wind towers?

MR. WESLEY STEVENS: I don't know that.

MR. ANTOINE HACAULT: Okay. So if I suggested to you that in this province they use an eighty (80) year life, you wouldn't know whether in fact the valuation and depreciation is based on that length of time?

MR. WESLEY STEVENS: I wouldn't -- I wouldn't know that. That eighty (80) years would surprise me, but I -- I don't know anything about that.

MR. ANTOINE HACAULT: Well, sir, with respect to the life that you've attributed, you know, for example, the cement on which the pedestal is put. What's the life of -- of that component of the construction?

MR. WESLEY STEVENS: That's an engineering question which I'm certainly not qualified to answer. I -- I look at things more from a top down view.

MR. ANTOINE HACAULT: And the hundred

met -- metre tower on which the generating unit is put, do you know what the life of that component is, sir?

MR. WESLEY STEVENS: I don't know about the -- the difference between an 80 metre and a hundred metre tower. My understanding is that the -- that it's the turbine that's more likely to be the limiting factor than the -- than the tower itself. The tower is concrete and steel, which buildings are made out of.

MR. ANTOINE HACAULT: Okay.

MR. WESLEY STEVENS: But here again I'm -- I'm speaking from common knowledge, not from an engineering expertise.

MR. ANTOINE HACAULT: I was trying to understand the component issue because a generating station will have certain components that need to be replaced; like the turbines will have to be replaced, and it's shorter than the concrete structure itself.

MR. WESLEY STEVENS: Typically, after some point, twenty (20) -- twenty-five (25) years, thirty (30) years, something -- something like that, you would take down the -- take down the tower -- the towers and the turbines and replace them with new towers and turbines potentially of a different size, potentially a hundred or, who knows, perhaps, by that time, higher towers. But usually the -- my -- my

understanding is that the towers and the turbines go together. That if you're -- you wouldn't use the same towers to put new turbines on.

MR. ANTOINE HACAULT: Than you, sir. And the last question: Did you make any inquiries, sir, as to how much land has in fact been blocked off, so to speak, by Manitoba Hydro and investors in this province for wind farms?

MR. WESLEY STEVENS: I don't know anything about that.

MR. ANTOINE HACAULT: Okay. Thank you.

THE CHAIRPERSON: I do have a question in relation to what Me. Hacault was asking. It's in relation to, you know, once the life of the windmill is done, your levelized cost does not include taking down that windmill?

MR. WESLEY STEVENS: That's actually an interesting question. The -- in my -- my levelized cost calculations, and to explain, I took Manitoba Hydro's spreadsheet and I adjusted it for my calculations, including a longer life. One (1) of the changes I made was to -- to look at things -- look at a sixty-eight (68) year study period after COD. So that's time for -- to replace the wind plant, and then replace it again. It's also time to replace the -- the

transmission equipment.

So the question of what does it cost to replace a -- a wind plant does come up, and I have inquired about that. There's a cost of taking down the towers. There is a -- a salvage value to the metal and the turbines in the towers. And in talking with developers, those more or less balance out. They -- they're not concerned about having significant disposal costs at the end. The cost of replacement -- sorry?

THE CHAIRPERSON: Sorry, Mr. Stevens. Perhaps we can come back to this after -- after recess --

MR. WESLEY STEVENS: Sure.

THE CHAIRPERSON: -- if you don't mind. We have a commitment that we have to fulfill. So let's -- let's agree that we'll talk about this after -- after lunch.

So for the benefit of those are still here, you know, we would -- we would resume the proceedings at ten (10) after 1:00 this afternoon. Thank you.

MR. SVEN HOMBACH: And, Mr. Chairman, if I -- if I can remind the parties there's currently a plan to have a presentation by Mr. David Barber at 12:45 today. It may be possible to push him back, but

we're certainly at the panel's guidance.

THE CHAIRPERSON: We'll -- we'll think about that over lunch and -- and I'll let you know as quickly as possible.

(PANEL RETIRES)

--- Upon recessing at 11:57 a.m.

--- Upon resuming at 1:01 p.m.

THE CHAIRPERSON: Good afternoon. I believe that everyone is in position, so we can commence the proceedings. I'd like to welcome Professor Barber. And are you coming to address the panel on behalf of yourself or on behalf of the Centre for Earth Observation?

PRESENTATION BY DR. DAVID BARBER:

DR. DAVID BARBER: I'm a professor at the University of Manitoba, so my comments are as an academic at that institution. Okay.

So I've got a presentation that I wanted to present to the Public Utilities Board about the aspects of climate change, and how they're affecting Manitoba. To advance the slide I'll just go like this

maybe? There we go.

So as you know, the intergovernmental panel on climate change is one of the authoritative voices on the planet that looks at what's going on with climate change at a global scale. And the fourth assessment report just came out a few -- actually just a few weeks ago.

And four (4) of the main pieces of evidence for a changing global climate are indicated here on this slide in front of you. There's Northern Hemisphere snow cover. There's change in global average upper ocean heat content. There's global average sea level change. And there's change in the Arctic summer sea ice extent. I'm a specialist in sea ice. I've been working on sea ice for about thirty (30) years in the high Arctic. There was even a rumour going around that I was phoning in today from the Arctic, but I'm actually here in Manitoba.

And I wanted to present on what we're finding in the Arctic and how it connects to the climate here in Manitoba, and generally to the more tempered parts of the planet -- of our planet. I'll talk a lot about sea ice to begin my presentation. Then I'll move very quickly into what the impacts are to be expected in places like the Manitoba, the

prairies, that kind of thing.

So if we go to the next slide. This didn't come out right, but it's suppose to be animated. The reason the fifty dollar ($50) bill is there is it's over top of a whole bunch of people's names. The whole bunch of people's names are my lab at the University of Manitoba. There's about a hundred and fifteen (115) of us there that work on sea ice and climate change related aspects of the high Arctic.

And also teleconnections, or these are the connections between the Arctic climate and what's happening more temperately. A lot of our research work is quite high viability. That's the fifty dollar ($50) bill that was just announced about a year ago that has the Amundsen, which is our research icebreaker on the back of the fifty dollar ($50) bill.

Next slide. This is an indication as to what's going on with global temperatures on our planet. These are measured temperatures. So it starts in 1880 and goes through to 2012. And you can see the variability in the global temperatures over that period. And you'll see the temperature are normally in degrees 'C' indicated on the left side on the axis.

We basically come to a point in our global climate temperatures where we've increased the

global temperature by about .6 degrees Celsius. And this is increased from a period towards the end of the second World War quite significantly, and we're now in a stable situation, in the sense that we're not seeing a rapid increase or decrease over the last several years at a global level.

If I take a look at the one (1) circle that's there, that's 2005. I'll have a look -- I'll show you next -- in the next slide what the average temperature looks like across the planet that created that single box that's indicated by that round circle.

So next slide. This is the average conditions for 2005. And I put this slide up to illustrate a couple of things for you. One of them is you'll see the red temperatures towards the high latitudes of the planet in the Arctic where I work, this is called the Arctic amplification of climate change. So we basically see that a -- a signal of a warming global climate increases by about a factor of three (3) in the polar regions of the planet relative to the rest of the globe.

And what you see there also across the planet is variability. So you see some areas are cooling, some areas are warming; there's lots of variability across that system. I'm going to return to

these two (2) ideas later on in my presentation. To remind you, one of them is polar amplification, which means the Arctic is warmer than the rest of the planet, and increased variability in the temperature across the planet surface.

Next slide. As you all know, we use a lot of fossil fuels to drive our economies. In 1990, we were using about 20 billion tonnes; well, that's what we emitted in 1990. It's going up; we're about 32 billion tonnes in 2013. The important parts of this are the rate at which we're liberating greenhouse gases into the atmosphere through our reliance on fossil fuels.

The natural increase is about 0.0001 parts per million per year. Now we're somewhere around 2 1/2 parts per million per year, and we're increasing the rate at which we liberate carbon and increase greenhouse gases into the atmosphere towards a peak of around 5 parts per million somewhere by 2030, unless we get things under control.

Next slide. This idea of a warming planet is something that people pay a lot of attention to when they're sitting underneath one these cells, it's very warm. If you're sitting underneath a cell that's very cold you think: What's happened to global

warming? It's disappeared. It's now global cooling.

Well, in fact, it's all part of the same thing. And when you look at the record of our industrial activity on the planet, the simplest thing I think of is over the last thirty (30) years, each of those decades has been the warmest on record, and each of them has been warmer then the subsequent one. So we're moving forward into a warming climate with variability that's associated with that.

Next slide. When I look at the sea ice in the Arctic and what's been going on, when I started my career in the Arctic in the early '80s, there was not much variability in the minimum extent of sea ice. That went through the decade of the '80s, the decade of the '90s; we started to see quite an increase in things. Once we got into the decade of the 2000s and the 2010, we started to see a very precipitous drop off in the amount of sea ice that exists in the Northern Hemisphere.

That red line is the scientifically appropriate relationship in a decline like this. And it's basically caused by the fact you have an ice cover there, or used to have an ice cover there. You now have open ocean, and all the sunlight that enters into that system is now being absorbed by the ocean, instead

of reflected by the sea ice.

Next slide. These kind of changes are extremely significant in the Arctic to such an extent that we really talk now about the industrialization of a new ocean for our planet. We never used to think of how to develop the Arctic because it was inaccessible to us. It is no longer inaccessible to us.

In 2010 you could have taken an ice reinforced vessel right across the pole on that blue transit that you see there, which is across the pole. The Northeast Passage route has been open for the last seven (7) years or so. I've been personally through the Northwest Passage route seven (7) times myself, and one (1) of those times I could have went through in a rubber dinghy.

Of course, the Murmansk Manitoba Bridge is the red one (1), and that is of particular interest here in Manitoba with our desires and aspirations for the Port of Churchill and what may happen in the future with that.

Next slide. One (1) of the other things that's going on in the Arctic is this very pretty looking blue graphic. It represents the polar vortex. People that went through the cold of Manitoba here this

year will have heard the term a lot, the polar vortex and what's going on with the polar vortex.

The polar vortex is something we've known about for about thirty (30) years now scientifically. We've been studying it very intensively for the last ten (10) or fifteen (15) years. And what is happening is because the sea ice in the Northern Hemisphere is being reduced, we're getting a lot more heat from the ocean into the atmosphere. That is causing the gradient between the Arctic and the temperate parts of our planet to become more -- less steep.

If you go to the next slide. This has led to a hypothesis called a warm ocean/cold continent hypothesis. You can see on that graphic that is in front of you there a representation of the -- the Rossby waves that move around the Northern Hemisphere. Those Rossby waves are steeper now. They are more loopy, is how we call them, a very technical term for what the structure of them is.

But they move much more slowly around the planet. So there -- there's a tendency to get persistence in the climate now. And that persistence leads to persistence in precipitation. It leads to persistence in temperature, and the variability that

are associated with those.

The hypothesis we're working on right now, and it is a hypothesis; it's not a scientific fact yet, but there seems to be a lot of evidence for it -- is that a lot of our climate and the variability we're seeing in the climate system is driven by what's happening in the Arctic and the relationship between the Arctic and more temperate parts of the planet.

Next slide. Here's just a -- a graph that I pulled off of my computer at 7:32 in the morning on April 25th, which was when I was preparing the presentation for this Public Utilities Board hearing. And it shows you the surface temperature actually measured from the pole down over North America.

And I put this up just to illustrate what a lot of people don't appreciate on first instinct. And that is that the climate we have here in Canada is driven by what happens in the Arctic. You can see it in this graphic very clearly.

If you look over on the Russian side, the depth of the cold water over the Russian continent is not nearly as large it -- as it is over the North American continent, and that's largely because of Hudson Bay. Hudson Bay is frozen at this time of year, and it continues to propagate that cold weather and

cold air down from the Arctic, down over top of what happens with us here in North America.

Next slide. One (1) of the research staff in my lab has been looking at the cold winter we've had this past year, and the results are just about to be published in a paper that she's submitted to one (1) of our academic journals. And it shows that because of the reduction in the ice cover in the high Arctic, this caused a change in pressure patterns, which is very consistent with this warm ocean/cold continent hypothesis.

The breaking down of the polar vortex that occurred over the winter allowed this cold air to spill out over North America and kept the persistence of this cold air over North America for a very long period of time. Long enough for us to say we should get winter over with here in Manitoba. It's been too long; let's get on with spring and summer already.

If you're slightly to the west or slightly to the east of that, on the western seaboard of North America, they were outside of this Rossby wave that created this persistence over North America, and they had a very hot, and very dry summer in places in Southern California.

Next slide please. This variability in

the climate system has to do with two (2) things: both change and variability. That's why you'll hear scientists quite often talk about climate change versus climate variability.

The climate change is represented by the top graph. It's a shift in the mean. And if you just had a shift in the mean, you would expect more hot weather, more record hot weather, less cold weather, with changes in the temperature. So, for instance, that's the situation we have with .6 degrees Celsius.

But the problem is the variability in the climate system changes at the same time. So if you take that distribution and you squish it down, you increase the variability in that second graph. Therefore, you get more extremes at both ends of that situation: more extreme cold weather, more extreme warm weather. You could make the same arguments for precipitation as well.

The problem is the reality of our changing climate is really 'C' -- the 'C' graph, which is a change in variance and a change in mean. And this leads to increases in extreme weather, in particular an extreme variability in the climate system, which is something I'll return to later on in the presentation.

Next slide. Of course, Manitoba is not

immune to this. Manitoba sits right in the middle of it. We're right in the middle of the prairies in Canada. We're very much part of a continental climate system. Our climate system is driven by the Arctic, to a large extent, and to an even greater extent by Hudson Bay, and then the -- the westerlies that are associated with the Coriolis force across the interior of North America.

Manitoba can affect -- can expect a number of different impacts, from rising permafrost temperatures, thinning ice, forest fires, ecological change, extreme weather, less soil moisture, and, of course, flooding and drought.

The next slide. One (1) of the key things in Manitoba and one (1) of the key connections between climate change and what's going on here in Manitoba is represented by the water cycle. The hydrological cycle is increasing in variability. It's increasing in power. So as the temperature of the planet goes up, there's a nonlinear relationship to how much moisture the atmosphere can hold. And that leads to increases in extremes in precipitation and drought and aspects of the hydrological cycle.

Of course, we interface as a society with this as well, complicating how that water cycle

manifests itself with us and our societies and our economies.

The next slide. Just to give you one (1) example, here's a situation in Southern Manitoba where you can take a small increase in precipitation. But depending on when that precipitation occurs and where it occurs, it can translate into a very large change in runoff. So the runoff is a function of the landscape in which the precipitation is received, how that's been manipulated and managed, and what time of year that moisture makes itself available to that surface.

The next slide. Of course, Manitoba Hydro is directly involved with this because it is affected by aspects of a change in climate, both from the perspective of variability and change. One (1) of the key benefits of our hydroelectric system in Manitoba is the large watershed over which it derives its water so that you can average out some of the variability in space and in time.

But, of course, it's also susceptible to a number of other things that are associated with this; in particular, extreme weather events and the impacts it would have on built infrastructure that's associated with the hydroelectric infrastructure that we have here

in the Province.

The next slide. Of course, agriculture is also not immune to such a thing. You can imagine, given a number of presentations over the years to farmers and farm groups here in Southern Manitoba -- and they are a group of people that I find are actually quite tuned into climate because their livelihood relies on it. They pay attention to what goes on with the water cycle. They pay attention to what goes on with the temperature cycle.

And the idea that agriculture is going to be affected positively or negatively is very much up in the air scientifically. There's a number of potential impacts on the negative side, with increased insect infestations, crop damages, problems with reliable weather forecasts, soil erosion, weed growth, things like that.

There are also positive impacts. With more CO2 in the atmosphere, you're seeing a potential for increased productivity, longer growing seasons, the idea that warmer temperatures are going to be of assistance to that, and potentially decreased soil moisture stress depending on what kind of soils you talk about in our Manitoba landscape.

The next slide. Another key thing

that's happening with disasters, of course, is what's happening with the frequency of natural disasters and the cost of these natural disasters. There was just a conference recently held by the Centre for Catastrophic Loss Reduction and the University of Waterloo, where they were looking at the impacts of climate-induced disasters on our economy. And all signs are pointing to the same thing. We're getting an increase in the number of natural disasters worldwide, and we're getting an increase in the cost of those disasters.

So if you go to the next slide, that shows the accumulated cost of these natural disasters. Now, these natural disasters are associated with our inability to predict what's happening with the variability in the climate system and how that superimposes itself upon the built infrastructure that we live in and how that translates into economic costs for us as a society.

The next slide. So one (1) of the things that bothers me a little bit is that this is the fifth intergovernmental panel on climate change assessment report. There is now overwhelming evidence that our climate is warming. We're seeing increased variability. There are some organizations that are starting to pay attention to this and start to plan for

the future for it, and there are other organizations that are not. And by 'organizations', I mean everything from public companies to private companies to governments.

When you look at this graph that came of the IPCC assessment report, the different colours are interpreted this way. So if you look at the Arctic, that blue band that's there, that's what should be going on in the Arctic in terms of sea ice if there was no anthropogenic influence, if there was no influence by increased CO2 in the atmosphere.

The kind of orange-pinkish colour is one where it's been modelled with those effects in place. And then the red line is what we're actually seeing.

So if you go to the North American one to the left, this is a terrestrial response now. So if the terrestrial environment was not being impacted by human-induced CO2, that blue shaded area would be what we would expect to find. The sort of pink/orange shaded area is with CO2 accounted for. And then the actual observations of temperature change in black.

You just need to let your eyes wander over those for the entire planet and you'll see a very consistent story being told by those small, little graphs. Those small little graphs tell us that if we

don't account for human-induced CO2 in the atmosphere and we just have our environments move forward unaffected by our own human activities, we would expect those blue shaded areas.

All of our observations though show that all of these areas are changing and they're all changing by what we see with those black lines. Those black lines overlap with all of the pink areas, which are model projections of what should be happening to our climate system given a CO2 enhanced atmosphere.

So with that, I would take the last slide, which is basically just close this off. And I just wanted to come to reenforce the fact that I'm a scientist who's at the front edge of climate change. I'm at the front edge in the sense I'm in the Arctic working on sea ice and I see these impacts every day. The connections between what we're seeing in the Arctic and what we're seeing at the temperate parts of the planet are not an esoteric exercise. They're very real.

They are going to make, and they will continue to make, a change in how we unfold the society that we have in front of us and the economic decisions we have to make for the next ten (10) years, twenty (20) years, thirty (30) years, fifty (50) years.

My job is an easy one. I have to understand the physics of how the natural system works. Your job is the complex one. You've got to decide how we're going to move forward as a society when we make investments and how we're going to deal with these kind of things. So that was my purpose in coming here today. Thank you very much.

MR. RICHARD BEL: So the take away from the climate change with respect to the dams is --

DR. DAVID BARBER: Well, I think from my perspective the -- oh, not too close to the microphone she says. My perspective is that people talk a lot about the cost of energy to drive our societies. One (1) of the things we don't put a cost onto is how much greenhouse gasses we're putting into the atmosphere.

If you were to put a coal powered plant here in Manitoba instead of use hydroelectric power, you'd be making a very serious mistake. If you were to put a natural gas plant here instead of a hydroelectric plant, you'd be making a very serious mistake, because these have real costs into the future and what the contributions of these greenhouse gasses are to the atmosphere. We happen to have one (1) of the more green forms of energy in our province.

And from my perspective, this is an extremely important thing as we look about to move forward, because we're going to have to get ourselves off these fossil fuels. We cannot keep this rate going. We're going to be -- well, we're already starting to see the impacts, but those impacts are going to get larger, and larger, and larger. So what I'd like to see is a preservation and an expansion of our hydroelectric capabilities, because they're the least impactful of the different kinds of major systems that we can have to power our economies. That's the relationship, yeah.

DR. HUGH GRANT: Just curious to know if you've looked at the hydrology record at all, because one (1) of the interesting thing that -- thing that's come out is the -- I think the description was we've been fairly wet here in the last twenty (20) years or so.

Have you -- is there any pattern, have you seen?

DR. DAVID BARBER: Yeah, there is. There's -- there's -- the hydrological part of the climate change thing is the more complicated part. The temperature is the simpler part. Modelling and projecting the hydrological cycle is difficult. Now,

it's getting better. The models are getting better. We can use what we call paleoclimate records to look at, you know, wet cycles and dry cycles. We can look at teleconnections. And some of the models now are getting these teleconnections quite good.

You can actually see that, you know, an ENSO event is going to drive a certain climate pattern which includes the hydrological cycle over North America. And so the variability that's associated with this, the climate models we have now, the best ones we have all tell us the same thing.

As we increase the variability, we can expect an increase in variability of these hydrologic events. That means increased probability of droughts, increased probability of floods. But it really depends on how those interface with the landscape. Like our landscape is managed when it comes to water. We manage it, right. Manitoba Hydro manages it, essentially. And so that can be a positive things, or it can be a negative thing, depending on how the interpretation of that is done by the regulatory agencies and how you regulate that watershed system.

When you think about it from an agricultural perspective, if you happen to be sitting underneath, like that graph I showed you, or the

diagram of the planet where you have these little blobs of temperature change, you also have those little blobs of precipitation change. If you happen to sit under two (2) of them, you're under a drought if it's dry; you're under a flood if it's wet. And it depends where you're receiving it from. So it's very complicated to get people to understand the variability in the precipitation.

I also threw that other graph in there to kind of show you the difference between precipitation and runoff. Just because you're getting a lot of precipitation doesn't necessarily mean it translates into runoff. If you put it in right after you've had a dry spell and the soil is able to absorb a lot of it, a lot of it goes into the soil. If you put it in the fall when the ground just starts to freeze, you put it in on top and it all runs off into the watershed. So precipitation and runoff are very different things.

The uncertainty associated with those are high, but the reality of it is, a lot of our requirements as a society are driven by water and what we do with water and how we manage it.

THE CHAIRPERSON: I think -- thank you very much, Dr. -- Professor Barber. We have limited

time available. A very interesting topic. And I want to thank you for taking the time and trouble to prepare your presentation and come to talk to us. I thank you very much. Also for accommodating us in our schedule. I know you waited for us, so thank you very much. Appreciate that.

DR. DAVID BARBER: My pleasure.

THE CHAIRPERSON: Thanks much. Have a good balance of the day. With that, I think we will resume the regular proceedings.

MR. SVEN HOMBACH: Yes, Mr. Chairman. If we can stand down for two (2) minutes we can get the witnesses back into position.

--- Upon recessing at 1:24 p.m.

--- Upon resuming at 1:28 p.m.

THE CHAIRPERSON: Is it your intention to acknowledge some documents immediately, or...

(BRIEF PAUSE)

MS. PATTI RAMAGE: She's right. It's not on. In an attempt not to disrupt the proceedings I was going to suggest let Ms. Saunders go, and then I'll

come on the mic and do everything. Ms. -- Mr. Wojczynski can speak to the exhibits and then we'll begin our cross.

THE CHAIRPERSON: Thank you for that. So without further ado, Ms. Saunders, please, on behalf of the Manitoba Metis Federation.

GAC LOAD FORECASTING, FUEL SWITCHING, WIND PANEL, RESUMED:

PAUL CHERNICK, Resumed (Qual.)

WESLEY STEVENS, Resumed (Qual.)

CROSS-EXAMINATION BY MS. JESSICA SAUNDERS:

MS. JESSICA SAUNDERS: Thank you, Mr. Chair. So thank you for your presentations this morning, Mr. Stevens and Mr. Chernick. As the Chair said, I represent the Manitoba Metis Federation. And we filed evidence on the socioeconomic implications of additional wind resources. We have a few questions for Mr. Stevens on his presentation on wind.

Mr. Stevens, you're aware in the NFAT filing that Manitoba Hydro has indicated that other resources not specified as being included in the PDP may well be added, and Hydro provides customer self-generation, wind, biomass, solar, and additional

enhancement of existing Manitoba Hydro generation as examples.

Are you aware of that?

MR. WESLEY STEVENS: Yes.

MS. JESSICA SAUNDERS: And, so based on your review of Manitoba Hydro's assumptions on the cost of wind generation and Manitoba Hydro's consideration of the plans that include wind, what is your view of Manitoba Hydro's statement that they may well consider adding wind in the future?

MR. WESLEY STEVENS: It's my view that wind at least -- that wind at least should -- should receive more consideration in a long-term planning process. It should not just be something that might be added later. But in considering whether and when to make very large investments, very large long -- long-term investments such as Keeyask and Conawapa, that you should from the beginning take a very serious look at wind and how that could fit in, either instead of or in addition to either replacing or enhancing those investments.

MS. JESSICA SAUNDERS: Thank you. And in response to questions from the Chair on the cost of wind in Canada versus other jurisdictions, did I hear correct in that you said that research on the subject

would comprise a certain percentage of overall project costs?

And was it 5 percent, or so?

MR. WESLEY STEVENS: I'm not sure what you're referring to in regard to Canadian versus US costs. I -- I didn't really have a conclusion.

MS. JESSICA SAUNDERS: Okay.

MR. WESLEY STEVENS: I did say 5 percent, but that was in connection with the construction schedule.

MS. JESSICA SAUNDERS: Construction schedule.

MR. WESLEY STEVENS: In a three (3) year -- in a three (3) year construction schedule about 5 percent would be sent -- would be spent in the first year, three (3) years before commercial operation day.

MS. JESSICA SAUNDERS: Okay. Thank you for clarifying that. What I will ask you, I -- I just want to get a sense of timing and further study that may be involved in some of the matters you spoke to in your presentation.

So in slide 13 of your presentation, you indicate that it may be possible to pair wind with either existing or new hydro to serve export markets, and that this has not been adequately studied, correct?

MR. WESLEY STEVENS: That's what that -- yes.

MS. JESSICA SAUNDERS: I'm wondering if you could give us an estimate as to the timing and cost of the research that would be involved in order to adequately look into that?

MR. WESLEY STEVENS: That's something that Manitoba Hydro is in the best position to do.

MS. JESSICA SAUNDERS: M-hm.

MR. WESLEY STEVENS: They have -- they have models that -- that would do that. I -- it would be a fairly major undertaking.

MS. JESSICA SAUNDERS: M-hm.

MR. WESLEY STEVENS: I don't know how long it would take. At a guess, more than a month, less than a year.

MS. JESSICA SAUNDERS: And I guess why I was asking for some comments on you was just based on your view of the costs that have been provided in the current filing, just any comments that you may have based on the information that you've reviewed that's currently available for -- for wind costs and such and -- and what, if anything, you think would be required to give it more serious consideration.

That -- that was all I was asking for.

MR. WESLEY STEVENS: Are you asking now about the capital cost of installing wind or about the integration of wind -- of -- of wind and hydro?

MS. JESSICA SAUNDERS: The integration of wind and hydro and how seriously that's been considered and how -- how much, say, research and time would be needed in order to -- to look further into that?

MR. WESLEY STEVENS: I can't really give you a good estimate partly because that would be -- that's not something that I or my firm could do. We don't have the models. It's a study. It's not -- you're not building something, so it's -- it's not a huge amount of money. But it -- it would -- it would take some, you know, I would say months -- a few months to -- to look at seriously.

MS. JESSICA SAUNDERS: Okay. And that was -- that was all I was asking. Thank you very much. Those are all my questions.

THE CHAIRPERSON: Thank you, Ms. Saunders.

Me. Monnin, any questions on behalf of the independent consultants?

MR. CHRISTIAN MONNIN: Merci, M. President. We have no questions. Thank you.

THE CHAIRPERSON: Merci, Me. Monnin.

Ms. Ramage, please.

MR. SVEN HOMBACH: We seem to be waiting for Ms. Ramage, so.

(BRIEF PAUSE)

THE CHAIRPERSON: Sorry, I overlooked Mr. Orle. I didn't realize you were there, Mr. Orle. Do you have any questions for these witnesses?

MR. GEORGE ORLE: Thank you, Mr. Chair. No, I don't have any questions at all.

THE CHAIRPERSON: Thank you for that.

(BRIEF PAUSE)

MS. PATTI RAMAGE: I think it -- yes, it's on. Prior to Ms. Saunders, Manitoba Hydro handed out three (3) documents. The first one is its book of documents for its cross-examination of this panel. And that should be noted as Manitoba Hydro Exhibit 189.

--- EXHIBIT NO. MH-189: Book of documents

MS. PATTI RAMAGE: The second is

Manitoba Hydro's response -- well, the second and third, actually, are Manitoba Hydro's response to GAC's pre-asks of Manitoba Hydro. And the first of those, which is headed, "April 25th GAC Pre-ask of Manitoba Hydro Question 4b," that should be marked as Exhibit 190. It is a two (2) page document.

--- EXHIBIT NO. MH-190: Response to GAC Pre-ask 4b

MS. PATTI RAMAGE: And then the second Manitoba Hydro Exhibit, number 191, is an overview of climate change impacts and what it means to Manitoba.

--- EXHIBIT NO. MH-191: Overview of climate change impacts and what it means to Manitoba

MS. PATTI RAMAGE: And so those are the documents we filed. And I think Mr. Wojczynski was going to explain the documents before I commence the cross-examination.

MR. ED WOJCZYNSKI: Yes. First of all, Exhibit 190 is a second half of the response to the GAC pre-ask related to taking the externality value of CO2 and applying it to the plan evaluations. We had

provided an exhibit earlier. And they had asked us also to add it to the exhibit -- previous Exhibit 171.

So if you'd turn to page 3, that's what we did. Similarly to the other exhibit, where you have the market, the dark blue is the market evaluation. If you -- and then the light blue is the embedded ROE. And then we have the provincial transfers. That -- that would be the top set where we're looking at Plans 1, 2, 5, and 14.

And if you go to the next set of bars, that's exactly the same plans and evaluations, except what we've done is added in the cost of CO2 or -- or greenhouse gas emissions on the assumption that the province instituted or the federal government instituted some sort of -- of capital -- of CO2 tax or charge or something where any emissions emitted had to go into some sort of mitigation fund or some such arrangements. And this was the request from GAC.

And in effect what that becomes is part of the market evaluation. It's no longer an externality. What happens, you internalize the externality, and that's a little bit like BC. BC has a -- a carbon tax. Alberta has a -- has a partial carbon tax if you go above a certain limit. So there -- those kind of things are being instituted on a provincial

basis.

So as per GAC's request we took the values that have been used in Chapter 13 from the EPA as estimates of externality costs for greenhouse gas emissions and then applied them to emissions in Manitoba, not ones in the US. And if you see what it does then compared to the All Gas, it takes the market evaluation and in the case of Keeyask Gas increases its benefit on an NPV basis by around 200 million; and then Keeyask Gas around 400 million. And then the Preferred Plan, Keeyask/Conawapa, around 500 million. Those are very approximate numbers, but just to give an indication of how the significance of that compared to the other numbers we've been dealing with.

So that was Exhibit 190. The other Exhibit 191 is related to this, and that was that GAC had a pre-ask on us providing a compendium or collection of -- of scientific literature on the impacts of climate change on Manitoba. Not globally, but on Manitoba. This actually -- we timed this a little bit to -- to suit the presentation that you just heard. Obviously, they're strongly connected.

And I'm not going to go through this whole thing. I will start by saying the reference, the scientific references are all in this compendium that

Kristina Koenig had prepared with a whole bunch of others. If anybody -- if anybody wants to peruse it or a copy, we can make that. We didn't think we would suggest you read it over the weekend.

But what I -- if I could just very briefly highlight if you turn to page 1 of the summary, which is the exhibit we handed out. And I won't repeat -- go through it all. And it's got some more detail in there.

But I'll just highlight that if you go to the third bullet, we're talking about the health and well-being of Manitoba's freshwater ecosystems, and the fish communities, their population size range and diversity are being and will be affected. A -- a loss of habitat for cold water fish species, northward expansion of warm water species. These things are already happening and going to be more extreme.

The permafrost is melting. The winter roads in northern communities are being affected. Caribou are being affected by climate change and that will increase. Polar bears, everybody's heard about polar bears in the Arctic, so I can't not mention them. Migratory birds, including endangered species, are being affected.

Agriculture is positive and negative.

You've heard that. Forest fires; West Nile virus is spreading in Manitoba as well as elsewhere. And the First Nation people are already adapting to various forms of climate change, but that will increase.

And I'll just -- one (1) more reference out of here on page 4. There's the Lake Winnipeg Consort -- Foundation who are very concerned about Lake Winnipeg and what's happening there. And they have a -- a position statement that global climate warming is -- is impacting the Lake Winnipeg system. And if you turn the page over:

> "Increasing water temperatures are contributing to the proliferation of toxic blue-green algae and to invertebrate species changes which ultimately influence the Winnipeg -- Lake Winnipeg fish community, et cetera."

So these are climate changes, a Manitoba issue. And last night while I was reading The Globe, I can't but help not mention this. There was an article -- there was a series of articles on climate change being put out by The Globe. And they're quoting some scientific papers that say that:

> "Climate change is a health threat no

less consequential than cigarette smoking."

Which surprised me. And they're relating it to asthma, and allergies, and things. And the other -- last comment I'll make before getting off the mic is that Dr. Oliphant noted that:

"The most vulnerable Canadians, including families on low incomes and many Aboriginal people, those that are more likely to live closer to industrial areas, highways, or forest that could be swept by fire, are currently feeling the effects the most."

And that's from The Globe on -- actually, on Tuesday. Thank you.

THE CHAIRPERSON: Thank you for that information. I -- I'm having a tough time in my mind reconciling what I heard from the expert from Quebec regarding the consideration of hydrological change flowing from the perceived climate change. Remember that evidence? He indicated that it was too uncertain to be able to say that there would be definitive hydrological changes that need to be considered as part of the PDP.

I'm having trouble reconciling what that individual said to what I'm reading here. And so...

MR. ED WOJCZYNSKI: I could comment briefly, but perhaps we need to provide a more full explanation, but -- and we -- and we will do that. But I -- I -- let me give a preliminary answer, not being an -- an expert on this, but certainly as being an -- an area being in -- of much interest. And I -- I don't think I mentioned this before, but I have presented to United Nations meetings on climate change and -- and how to deal with GHG management, so this has been a particular topic of interest to me.

The -- in the modelling, there was some indication of the possibility of increased runoff, but there is not enough indication to definitively say, and I -- on -- on how much increase there might be and whether -- what degree of certainty we have on that. But the other part is will there be increased droughts or not compared to what we're looking at.

I think there's a general trend in the climate change science if they say there'll be greater variability, for example, in precipitation. But as Dr. Barber just said, precipitation and runoff aren't the same thing. They're -- the soil and the water system mitigates some of that.

So whether or not the droughts will be worse or the floods will be worse, it's distinctly a directional tendency, but right now, the models don't have enough certainty to say that is what will happen or not. It's not that the models are saying it won't happen.

It's saying that the -- the -- I'm now looking at Kristina to see if I'm -- okay, she's nodding, yes. It's that the models are not saying that won't happen. They're saying the models right now, to the degree they can model these things and a degree there's enough information, they can't definitely conclude that it will go in that direction.

THE CHAIRPERSON: Thank you for that. I guess we're ready to proceed with the cross from Manitoba Hydro.

CROSS-EXAMINATION BY MS. PATTI RAMAGE:

MS. PATTI RAMAGE: Thank you. I'm going to begin the cross at the end, Mr. Chernick. If I could have you turn to slide 25 of your presentation this morning. The savings referenced in slide 25 begin at .6 percent and ramp up to 1.5 percent annually.

Would I be correct that that would include, in order to achieve those savings, a

combination of program savings, fuel switching for electric heat and hot water, and the potential for non-program savings, as well as conservation rates?

Would that be the combined effect of those?

MR. PAUL CHERNICK: No. That -- that would just be program savings. And fuel switching might -- some of the fuel switching activities might be programs.

MS. PATTI RAMAGE: I'm sorry, could you repeat that -- those?

MR. PAUL CHERNICK: Some of the fuel switching might be included in the efficiency programs where you're providing incentives or other support that cause specific customers to switch or to choose gas over electric. This would not include codes and standards. It would not include rate design, encouraging customers to generate some of their own power.

(BRIEF PAUSE)

MS. PATTI RAMAGE: Are you aware that Manitoba Hydro has filed information on three (3) levels of enhanced DSM?

MR. PAUL CHERNICK: Yes, I am.

MS. PATTI RAMAGE: Okay. And if I could get you to turn to page 31 of Manitoba Hydro's rebuttal evidence, which we've provided at Tab 2, page 7, of the book of documents.

(BRIEF PAUSE)

MS. PATTI RAMAGE: Okay. The chart at the top of the page summarizes the savings projected under each of the three (3) levels of DSM. And we can see here that including the non-program savings, such as codes and standards, that the ten (10) year average savings as a percentage of sales is 1.3 percent for Level 2 and 1.5 percent for Level 3.

Do you see that?

MR. PAUL CHERNICK: Yes, that's what's shown at the top of the page.

MS. PATTI RAMAGE: And these Manitoba Hydro projected savings are quite different than the .3 percent referenced in slide 25 of your presentation, correct?

MR. PAUL CHERNICK: That's correct. These include codes and standards implemented by the province, not by Manitoba Hydro. They include load

reductions assumed to occur from rate designs yet to be developed and that other utilities do not include in part of the -- as part of their conservation savings, as their energy efficiency savings. And it includes non-utility generation, which is also not generally considered to be a -- an efficiency program.

MS. PATTI RAMAGE: They also include fuel switching, correct?

MR. PAUL CHERNICK: And it includes fuel switching. As -- as I said when I referenced the -- the point three (.3), that some of that fuel switching may be in the form of programs, but so far the Company is only talking about informational programs and has only implemented informational programs, and it's not clear exactly what the company has in mind for the future.

MS. PATTI RAMAGE: Now, you'd agree that DSM savings are generally built up year by year, correct?

MR. RICHARD BEL: Could I ask a point of clarification? You mentioned non-hydro generation?

MR. PAUL CHERNICK: Non-utility generation.

MR. RICHARD BEL: Non-utility. What did you mean by that?

MR. PAUL CHERNICK: The -- under load displacement, the -- the Company is including a -- a slice of -- of energy that they apparently believe they can get from encouraging customers to generate their own electricity to meet some of their own load; to not sell to Hydro -- to Manitoba Hydro, as I understand it, but to -- to displace loads, to -- to serve loads that otherwise would be served by Hydro.

MR. RICHARD BEL: Thank you.

(BRIEF PAUSE)

CONTINUED BY MS. PATTI RAMAGE:

MS. PATTI RAMAGE: Okay. So we've agreed that DSM savings are generally built up year by year.

Would you agree there is inevitably a degree of uncertainty as to whether those savings will be realized every year as projected?

MR. PAUL CHERNICK: Yes, programs under perform and over perform depending on a number of factors. The -- the skill of the utilities and its contractors in recruiting trade allies into a program, for example, getting the -- the developers, the builders, the plumbers to participate, that can go

faster or slower than you thought.

The -- the market size, a program for new construction, for example, will not have much in the way of savings in a -- a real estate downturn when there's not much new construction, and it may then boom a couple years later when building catches up again.

And then there are other factors such as weather. If you have a really nasty, snowy winter, then the insulation trucks may have a harder time getting around to -- to do their work. There are all kinds of factors that can cause you to -- to spend more or less and -- and save more or less then expected the year before.

MS. PATTI RAMAGE: So if I could have you turn to Tab 3, page 11 of the book of documents.

(BRIEF PAUSE)

MS. PATTI RAMAGE: Here we have provided an excerpt from Manitoba -- Manitoba's Clean Energy Strategy. And if you look at page 40, which is page 11 of the book of documents, and you look at the third paragraph down on the right-hand side of the page, there is a statement, and I quote:

"Nonetheless, for most Manitobans the

opportunity to move from conventional fossil fuel use to clean energy, and even on to fossil freedom, is increasingly a reality."

Do you see that?

MR. PAUL CHERNICK: Yes.

MS. PATTI RAMAGE: And then if we go back one (1) page in the Clean Energy Strategy to page 39, you'll see that this section -- which discusses freedom from fossil fuels. And on the -- if you look at the right hand side of the page, there it says:

"These Manitobans will achieve fossil fuel freedom through a simple three (3) step process. And one of the steps, steps number 2, is that heat will be provided for thousands of Manitobans through clean, renewable energy systems which eliminate the need for fossil fuels like natural gas."

Do you see that paragraph number 2?

MR. PAUL CHERNICK: I do.

MS. PATTI RAMAGE: And you're aware that the fifteen (15) year supplemental report to the 2014 to '17 Power Smart Plan, which is Manitoba Hydro

Exhibit 180, includes fuel switching in the fifteen (15) year plan?

MR. PAUL CHERNICK: I believe it's discussed in there. I haven't looked at it since yesterday, so I'm not quite sure.

MS. PATTI RAMAGE: You accept, subject to check?

MR. PAUL CHERNICK: I believe it is, yes.

MS. PATTI RAMAGE: And you'd acknowledge then there's a potential that some of the programs in that plan may ultimately not be approved or even cancelled at a later date?

MR. PAUL CHERNICK: Well, it's -- for a number of -- of the line items in the tables at the end of the -- or -- or on page 56 of the Exhibit 180, there are -- they represent programs or initiatives that either haven't been formulated or that the Company's talking about changing dramatically and would have to be approved by the Board. And therefore, they're all subject to uncertainty.

MS. PATTI RAMAGE: And I think -- I'll clarify for you -- it may help -- that pursuant to the Energy Savings Act, Manitoba Hydro must, in consultation with its minister, not the Board, prep --

prepare an energy efficiency plan. So the same party who has written the Clean Energy Strategy is a the party who -- who Manitoba Hydro consults with in preparing its -- its DSM plan.

And that was -- given that, do you see that there the is the potential that some of the programs might not ultimately go forward?

MR. PAUL CHERNICK: Well, I would certainly hope that Manitoba Hydro would be able to explain to the minister the -- the benefits of using the high-quality electricity to displace more gas in the US and to make Manitoba more money, rather than using it for a low value, low carbon offsetting purpose of -- of reducing gas heating in the province.

But if the -- if Manitoba Hydro cannot explain that and is precluded by law from implementing a program that is not approved by the minister, then that would be an obstacle to pursuing least-cost planning.

MS. PATTI RAMAGE: If we could move to page 12 in the book of documents, here we have Manitoba Hydro Exhibit 95, which was part of Manitoba Hydro's direct evidence. It's slide 129. And it deals with the economics of the various levels of DSM.

Have you had the opportunity to review

this slide before?

MR. PAUL CHERNICK: I -- I have gone through this -- this pack, so I guess I have looked at this.

MS. PATTI RAMAGE: We'll just walk through it quickly.

MR. PAUL CHERNICK: And I -- I do -- I understand how it's laid out.

MS. PATTI RAMAGE: You'd agree then when we move from base DSM to Level 1 DSM, incremental NPV increases for each of the three (3) plans shown? For example, in the All Gas Plan, the NPV increases by 535 million, it increases 497 million for the Keeyask/Gas/750 line, and by 285 million for the Preferred Development Plan? That's --

MR. PAUL CHERNICK: Yes, I --

MS. PATTI RAMAGE: Okay.

MR. PAUL CHERNICK: -- those are the numbers that Manitoba Hydro put in there.

MS. PATTI RAMAGE: Right. And similarly, when we move from Level 1 DSM to Level 2, you see a positive NPV effect for each of the plans, correct?

MR. PAUL CHERNICK: Yes.

MS. PATTI RAMAGE: And the analysis

then goes on to demonstrate when you move from Level 2 DSM to Level 3, it does not result in a positive NPV impact for any of the plans. It's negative 49 million for the All Gas Plan, negative 86 million for the Keeyask/Gas/750 line, and negative 102 million for the Preferred Development Plan?

You see that?

MR. PAUL CHERNICK: Yes. That's Manitoba Hydro's conclusions based on their assumptions about the -- the programs and the avoided costs.

MS. PATTI RAMAGE: And so based on Manitoba Hydro's conclusions, it -- one would -- if -- if one adopts those conclusions, it would indicate that DSM Level 2 provides the greatest benefit --

MR. PAUL CHERNICK: Well, given only these choices of -- of bundles and without relaxing Manitoba Hydro's constraints based on rate impacts and whatever other limitations have been put on DSM at the -- within Level 1, that would be the case.

MS. PATTI RAMAGE: What rate impacts are you referring to?

MR. PAUL CHERNICK: Basically, the -- the Company takes the position that it's appropriate to pursue all DSM that passes the RIM test, but anything that doesn't pass the RIM test is subject to an

undefined and undocumented truncation limitation reduction because of the fear of raising rates even though you're lowering bills.

(BRIEF PAUSE)

MS. PATTI RAMAGE: Mr. Chernick, I'm advised that there's no rate impacts considered in this analysis. So would that change --

MR. PAUL CHERNICK: Oh, not in this analysis.

MS. PATTI RAMAGE: -- your conclusion?

MR. PAUL CHERNICK: This -- there's -- it's not in this analysis because it's all done at earlier stages, when you decide what you'll put into the programs in Level 1. The Company's explanation is that they look at the -- the rate effects and other things which are very difficult to understand exactly what they are, and comes up with the portfolio.

And it's not intended to be everything that's cost effective under the TRC. It's everything that's cost effective under the RIM to the extent that the RIM is a cost-effectiveness test, and it's in some of the other things.

(BRIEF PAUSE)

MS. PATTI RAMAGE: Mr. Chernick, I'm advised that there was no RIM test applied to this information; that it -- that unlike, perhaps, past materials you've seen, this has been done based solely on TRC. So with -- I'm asking you to either accept that subject to teck -- check, or provide us with the analysis that supports the position you are making, or identify where in the record that that information -- you're deriving that information from.

MR. PAUL CHERNICK: Okay. If we're going to be taking an afternoon break at some point, perhaps I could go through the documents then rather than holding us up right now to find the Company's explanation of its use of the RIM test.

MS. PATTI RAMAGE: Okay. That'll be fine, and then we'll determine if we need to look at this any further. If I could have you to turn to page 13 in the book of documents. And that is Manitoba Hydro a hundred -- Exhibit 156. And this is where Manitoba Hydro assumed flat load beyond 2022/'23. I don't think the right -- this should be tab -- this should be page 13. Oh, it's there now? Okay.

We assume flat load. And we compared

the NPVs of a Keeyask with a 750 Line Plan with a No New Generation Plan.

And if you turn the page to page 14, would you accept that the analysis demonstrates the incremental NPV of the Keeyask/750 Line Plan is $402 million superior to the No New Generation case?

MR. PAUL CHERNICK: Yes.

MS. PATTI RAMAGE: And if you accept that evidence, you would agree that there is a sound case for proceeding with Keeyask, despite your concerns regarding alleged untapped potential of DSM.

Would you agree?

MR. PAUL CHERNICK: Well, actually, I -- I think in -- in my initial presentation I pointed out that adding additional resources, wind and/or Keeyask, might make sense based on the -- the potential for export revenues even without load growth.

This particular case does include load growth through 2022/'23, so it's only part of the way towards what I think we could achieve. But it certainly is possible that if -- even if you did that, that you would find that the export opportunities and the -- the benefits of the transmission interconnection would -- would justify their cost, even without any domestic need for the -- the generation.

(BRIEF PAUSE)

MS. PATTI RAMAGE: Mr. Chernick, this morning you spoke of some of the unique opportunities Manitoba Hydro has because of its ownership of Centra Gas. And I'm not sure if you are aware, but my co-counsel, Ms. Boyd, and I are the survivors of a number of PUB hearings over the last decade and a half where the primary topic was putting measures in place to prevent cross-subsidization as between gas and electric customers.

So would you accept that your recommendations to using electric benefits to create incentives for the gas side of the business would require a fundamental shift in the thinking with respect to the treatment of gas and electric costs in this province?

MR. PAUL CHERNICK: I don't believe so. The -- I'm sure the Board would not be happy if -- if Manitoba Hydro were paying some of the -- the overhead costs for a plumbing supply firm just because there was some kind of business connection between them. But if you're buying a service from that plumbing supply firm to -- for one (1) of your conservation programs, then that's a perfectly reasonable and -- and laudable

business expense.

In the same way, I -- I don't think it would be appropriate to increase total costs for electric customers to lower costs for gas customers. But as the Company's own analysis has found, moving electric loads over to gas or preventing new loads from winding up on electricity rather than gas would make the electric customers better off. It would make the individual consumer better off. It would make the gas consumers better off. It's a win/win/win.

So you want to make sure that you do it in some fair manner, something that would be reasonable if you didn't have a business link. Unfortunately, a lot of places where the electric and gas utilities are separately owned, and -- and even some places where they're jointly owned, there's a great deal of competition between them, which makes it hard for them to work together even where it's in both of their interests.

I would hope that Manitoba Hydro would be able to overcome any institutional barriers there and -- and work for the common benefit of the consumers of both electricity and gas.

(BRIEF PAUSE)

MS. PATTI RAMAGE: I'm now going to change topics and move to the topic of wind. Mr. Stevens, you'd agree that both capital costs and capacity factors are important to -- or capacity factor are important factors in deriving the overall cost of wind?

Is that correct?

MR. WESLEY STEVENS: Yes.

MS. PATTI RAMAGE: And if I could have you turn to Tab 2, page 8, of the book of documents.

(BRIEF PAUSE)

MS. PATTI RAMAGE: You see here there are seven (7) sites identified in the -- or I should start by saying that this is page 63 of Manitoba Hydro's rebuttal evidence.

Did you have a chance to review the rebuttal evidence?

MR. WESLEY STEVENS: Yes, I did.

MS. PATTI RAMAGE: And you see in Table 2 in the middle of the page it's headed, "Average wind speed and capacity factors." It's seven (7) sites. And it's St. Leon/Darlington -- Darlingford area.

Can you confirm, to the best of your

knowledge, this is Manitoba specific information?

MR. WESLEY STEVENS: This certainly looks like Manitoba specific information.

MS. PATTI RAMAGE: And there are seven (7) sites identified in the first column of that table, correct?

MR. WESLEY STEVENS: Yes.

MS. PATTI RAMAGE: And the second column of the table shows the average wind speed at 80 metres, measured in metres per second, correct?

MR. WESLEY STEVENS: As -- as reported in a study by Helimax, I believe, which was dated 2008, yes.

MS. PATTI RAMAGE: And the third column provides capacity factors for two (2) different sized 80 metre wind turbines installed at each site, correct?

MR. WESLEY STEVENS: Yes. Again, as based on a study by Helimax in 2008.

MS. PATTI RAMAGE: Site 1 has a capacity factor for the GE 1.5sle turbine of 37.4 percent and 36.1 percent for the MWT-95/2.4 turbine.

Do you see that?

MR. WESLEY STEVENS: I see that.

MS. PATTI RAMAGE: Site 6, by way of contrast, has corresponding factors of thirty point

seven (30.7) and twenty-nine point two (29.2) for the two (2) turbines?

MR. WESLEY STEVENS: I see that.

MS. PATTI RAMAGE: Okay. So is it fair to say that for a given size turbine, the capacity factor varies across sites?

MR. WESLEY STEVENS: Certainly the same turbine at different sites will -- will produce different amounts.

MS. PATTI RAMAGE: All right. So what we would expect to see is that as the better sites are developed, we would expect a drop in the capacity factors, for example, these 80 metre turbines?

MR. WESLEY STEVENS: Holding everything else constant, yes.

MS. PATTI RAMAGE: And if hub heights were to remain at 80 metres, Manitoba Hydro's assumption of a constant capacity factor into the future in its NFAT analysis would result in effectively assuming an increase in capacity factor as less productive wind sites are developed, correct?

MR. WESLEY STEVENS: As less productive wind sites are -- are developed, it depends on -- on what scale we're talking about. If we're talking about the second -- or the third thousand megawatts, that

would certainly be true. If we're just talking about the next few hundred megawatts, that's -- that might not be true. It also depends on whether you're looking at a small area or a very large area.

MS. PATTI RAMAGE: Now, at page 4-2 of your report you raise the concern that --

MR. WESLEY STEVENS: Is there -- is there -- do you have that in the -- in the documents?

(BRIEF PAUSE)

MS. PATTI RAMAGE: I don't. It's been brought up here. It's -- it's not critical, because I was just going to -- to provide you some context where I'm going.

You raised the concern that Manitoba Hydro did not analyze any development plans that included both new wind generation and new intertie capacity?

MR. WESLEY STEVENS: Yes.

MS. PATTI RAMAGE: And what I wanted you to do then is to turn to page 54 in the book of documents.

MR. WESLEY STEVENS: Okay.

(BRIEF PAUSE)

MS. PATTI RAMAGE: And this is Manitoba Hydro's response to a -- a PUB Information Request. It's PUB/Manitoba Hydro First Round 26a Revised.

And I guess first off, have you reviewed this --

MR. WESLEY STEVENS: I have, yes.

MS. PATTI RAMAGE: -- Information Request before?

MR. WESLEY STEVENS: Yes.

MS. PATTI RAMAGE: Okay. The part I'd like to look at is on page 2, part C. And here it says:

> "New wind generation development in Manitoba would not enable the construction of new transmission for Manitoba's benefit in the US. As indicated in the MISO Wind Synergy Study, only new hydro generation provides dispatchable capacity and storage services which are needed in the MISO market to accommodate US wind integration. New Manitoba wind generation for export would

exacerbate the issues associated with developing US wind resources and would result in increased integration costs rather than lower costs. To the extent US utilities invest in new transmission for wind, it will be to support the development of local wind resources that qualify for RPS recognition."

So first off, I always ask, did I read it correctly?

MR. WESLEY STEVENS: Yes, you read it correctly.

MS. PATTI RAMAGE: Now, in terms of wind resources, would you agree that the states of Minnesota and North Dakota both have good wind resources of their own?

MR. WESLEY STEVENS: Yes.

MS. PATTI RAMAGE: And are you aware that Minnesota has 68 megawatts of wind under construction with a 2014 in service date and North Dakota has 205 megawatts, also with an in service date of 2014?

MR. WESLEY STEVENS: I'm not aware of the -- of the specific numbers. However, that -- those

numbers would not surprise me.

MS. PATTI RAMAGE: Okay. Would you accept also -- then subject to check that a further 213 megawatts of wind is in the advanced stages of development in Minnesota and 460 megawatts are in the advanced stage of development in North Dakota?

MR. WESLEY STEVENS: For the sake of argument, I would accept that. Those -- those numbers would not surprise me.

MS. PATTI RAMAGE: And those numbers would be in addition to the recent completion of 266 megawatts of wind constructed in Minnesota and 211 in North Dakota since 2012.

Would you accept that subject to check?

MR. WESLEY STEVENS: With the same proviso, yes.

MS. PATTI RAMAGE: All right. And then finally, would you accept subject to check that with these recent and upcoming additions, Minnesota will have 2,901 megawatts of wind by 2015, and North Dakota 1,808 megawatts in that same time frame?

MR. WESLEY STEVENS: Again, I -- I can't confirm those specific numbers. It's certainly my understanding that a substantial amount -- amounts of wind exist and are under construction in those

states.

MS. PATTI RAMAGE: So given those substantial amounts of -- that substantial amount of wind and the fact that export customers in Minnesota and North Dakota have access to their own wind resources, do you accept that it's highly unlikely that they're going to be interested in purchasing a wind-based product from Manitoba Hydro?

MR. WESLEY STEVENS: If by 'wind-based product' you mean having a contract with a -- with a wind farm in Manitoba under which they accept whatever -- whatever the output of that wind farm is at the time that it is generated by that wind farm, I -- I would certainly agree with that.

MS. PATTI RAMAGE: You'd agree that they -- it -- it's also highly unlikely they would support an interconnection to facilitate Manitoba Hydro generated wind, a supply of that into their region?

MR. WESLEY STEVENS: Again, if you're talking about exports of -- of electricity from -- directly from a wind plant as generated, I -- I don't see much benefit to -- to Minnesota -- Minnesota, Wisconsin, US states, of taking wind from Manitoba at the time generated.

(BRIEF PAUSE)

MS. PATTI RAMAGE: Okay. Just to clarify, when you say, "the developer," what if the developer is Manitoba Hydro?

Does that change your answer?

MR. WESLEY STEVENS: No. I'm -- I'm talking about the -- the fact that wind -- wind exported on the variable basis. When -- when a megawatt hour of wind is generated in Manitoba, it's immediately exported. Whoever owns that, I don't see much benefit. It would -- it would only be if wind was working -- basically working to free up hydro generation in Manitoba.

MS. PATTI RAMAGE: So it would effectively have to be backed by hydro. Is that --

MR. WESLEY STEVENS: It would -- I would say it would effectively have to be integrated with hydro.

MS. PATTI RAMAGE: Okay.

(BRIEF PAUSE)

MS. PATTI RAMAGE: Now, on slide 6 of your presentation, which is not in the book of

documents, you challenge Manitoba Hydro's practice as well as the practice of BC Hydro, the National Renewable Energy Laboratory, the International Renewable Agency, and Vestas of using a twenty (20) year life for evaluating wind. And in your materials you raise the term of Manitoba Hydro's wind farm contracts as part of the evidence for a longer term.

Can you confirm -- you haven't reviewed the terms and conditions of the St. Leon or St. Joseph purchase agreements.

Is that right?

MR. WESLEY STEVENS: That's right, I have not seen those contracts. I would in -- just regarding your question, Vestas -- with regards to Vestas, that was a reference to a warranty offered. That was not a recommendation of a -- of a term for evaluating wind projects. But -- but the others -- the other, I think it's, five (5) studies did use twenty (20) years for evaluating wind projects.

MS. PATTI RAMAGE: Can you provide any real operational examples of a turbine greater than 1 megawatt exceeding a twenty (20) year life?

MR. WESLEY STEVENS: My understanding is that the first turbine -- wind turbine greater than -- of greater than 1 megawatt was offered in 1996 or

1997. So there has been no chance for a wind project to -- of greater than 1 megawatt -- with turbines of greater than 1 megawatt to last for more than twenty (20) years. There simply hasn't been enough time.

However, there has been ample time to -- to monitor their performance, notice how they -- notice their failure rates and the cost of -- of repairs, and to come -- come to some conclusions about how long they're likely to last. And I would refer you to Jiminez, one of -- one of the NREL studies which again refers to -- unfortunately without referencing it, it's very frustrating -- refers to a research on actual wind farm operations and says that wind turbines typically last for twenty (20) to thirty (30) years.

MS. PATTI RAMAGE: And was I -- did I hear correctly that you grew up in Winnipeg?

MR. WESLEY STEVENS: I did.

MS. PATTI RAMAGE: So you're prepared to accept that it gets cold here?

MR. WESLEY STEVENS: It -- it has. Although, I have to say I live in Toronto now, and I like Winnipeg winters a lot more than I like Toronto winters. Toronto winters are miserable. Winnipeg winters are sunny and beautiful.

MS. PATTI RAMAGE: I like your style.

But with respect to our cold weather and recognizing you're not an engineer, would you acce -- accept that the impact of cold weather on a wind farm is brittle component failure due to microfracturing, especially under extremely cold conditions?

MR. WESLEY STEVENS: That certainly sounds reasonable. I -- I -- I can't -- I can't really spea -- speak to that. I have heard -- actually, I -- I can't -- I cannot to those specific words.

MS. PATTI RAMAGE: M-hm.

MR. WESLEY STEVENS: But I have in my investigations run across reference to special cold-weather packages for wind turbines, implying that some special measures may be -- may be advisable for particularly cold weather.

MS. PATTI RAMAGE: But you'd accept that cold weather would be a consideration in --

MR. WESLEY STEVENS: Absolute consideration. It's also -- as -- as I mentioned, it's also a consideration in that cold weather is denser and, therefore, has more energy content. But that may well be -- already taken into consideration in the studies of the capacity factors.

MS. PATTI RAMAGE: Just to make sure, you filed any analysis detailing the basis for your

extending of the life to twenty-five (25) years. Your evidence is based on comments of wind --

MR. PAUL CHERNICK: Wind developers.

MS. PATTI RAMAGE: -- wind developers. Right.

MR. WESLEY STEVENS: It's -- it's based on a -- on -- on these four (4) factors that I list, one of which is -- and, I -- I have to say, the most convincing one of which to me is conversations with -- with wind developers where I -- where I -- we -- it wasn't actually me. It was one of our -- one of our staff who talked to them, asked them questions which I had written out.

MS. PATTI RAMAGE: Okay. Those are the same people though who profit from building the wind and selling the wind?

MR. WESLEY STEVENS: They would be. I -- I have no reason to think that they were actually lying about -- lying in their answers.

MS. PATTI RAMAGE: Well, I wouldn't suggest that, but they -- they are motivated to promote wind development, correct?

MR. WESLEY STEVENS: Certainly, but they were -- and they were also very definitive about what they do.

MS. PATTI RAMAGE: In your presentation this morning, you also -- oh, we're slide 6, so that's perfect. You raised the concern that Manitoba Hydro provided a cost of four dollars and twenty-two cents ($4.22) and four dollars and ninety-nine cents ($4.99) per megawatt hour for wind integration cost.

MR. WESLEY STEVENS: That would-- yes, and that's a different slide.

MS. PATTI RAMAGE: Sorry, I wrote down slide 6 --

MR. WESLEY STEVENS: Okay.

MS. PATTI RAMAGE: -- I'm sorry, it's slide 8. There we go; there it's up now. I was only bringing it up to get us to the topics, so if I could now -- Diana, could you bring up Manitoba Exhibit 136? It's not in the book of documents.

(BRIEF PAUSE)

MS. PATTI RAMAGE: This -- Manitoba Hydro Exhibit 136 is a response to an undertaking.

Have you had the opportunity to review this before?

MR. WESLEY STEVENS: I have gone over this in some detail.

MS. PATTI RAMAGE: Okay, good. Well, if -- we will now again. If we look to the paragraph under the two (2) bullets which says:

> "It should be noted that the above costs are in 2005 dollars. As explained in Appendix 9.3, Section .1, these values are used in the calculation of wind integration costs for varying levels of wind development and are impacted by changing export prices over the detailed study period."

And under -- I'll ask, did I read it correctly?

MR. WESLEY STEVENS: Yes.

MR. WILLIAM GANGE: No. Section 1.7.

MS. PATTI RAMAGE: Did I not say 1.7?

MR. WILLIAM GANGE: You just said -- you just said section 1 -- that -- that -- just a tiny little mistake, Ms. Ramage, but I don't want you to be too much of a roll here.

MS. PATTI RAMAGE: Yeah. Be careful, Mr. Gange, or I'll -- I'll read the whole thing over again. We'll accept your correction.

CONTINUED BY MS. PATTI RAMAGE:

MS. PATTI RAMAGE: But now rather than reading it, would you agree the next paragraph says that:

"The wind integration costs represents an average cost over the detailed study period."

MR. WESLEY STEVENS: I have not had an opportunity to look at Manitoba Hydro's calculations. I agree that that's what Manitoba Hydro has -- has said in this undertaking. And it was clear from IR response to -- the response to IR-308 that they were using one (1) single number for the entire period. I don't know how they -- how good they calculated that, and in -- in particular I don't know whether it was calculated correctly.

MS. PATTI RAMAGE: You can see by the materials that are here that the four dollar and twenty-two cents ($4.22) per megawatt hour for the 500 megawatts of wind generation was in 2005 dollars, as was the four dollars and ninety-nine cents ($4.99) per megawatt hours for the thousand megawatts, also in 2005 dollars?

MR. WESLEY STEVENS: Yes, and I was wondering about that. There's a mention of 2005 US

dollars three (3) times on this page, and then 2012 Canadian dollars once. As -- as I understand it, the four-twenty-two (4.22) and four-ninety-nine (4.99) are, according to the 2005 study, are to be escalated based on elec -- electricity export prices, not based on inflation.

So it really made me wonder why there was this emphasis on 2005 dollars and 2012 dollars. And again, I would have to review their calculation to make sure that there wasn't -- there wasn't an application of, say, both inflation and price escalation. I don't know. I haven't reviewed it.

MS. PATTI RAMAGE: I'm advised that it's -- it's based on both, the -- the price -- the export price escalation and the -- and the change in dollars.

MR. WESLEY STEVENS: If that's true, then that would constitute double counting and would -- would be -- and could explain how you got to such a high number. But I -- I don't know.

(BRIEF PAUSE)

MS. PATTI RAMAGE: But if you do the forecast every year and recalculate, it's in the --

it's in the year of the current dollars, and therefore it's in both. So if you redo your forecast and you're working from a 2005 forecast, then if we move up to a 2012 forecast --

MR. WESLEY STEVENS: Yes.

MS. PATTI RAMAGE: -- we're not going to be in 2005 dollars any more.

MR. WESLEY STEVENS: Yes.

MS. PATTI RAMAGE: Does that make sense then?

MR. WESLEY STEVENS: Yes, that -- it could well be that Manitoba Hydro did the calculation correctly. I don't know. I cannot tell from the -- the words you've used have not -- have not inspired confidence in me that it was done correctly, but I don't know.

(BRIEF PAUSE)

MS. PATTI RAMAGE: And -- and based on the fact that we -- it's using the export price forecast, would you accept then, subject to check, that Manitoba Hydro used, as wind in -- as wind integration cost, an average for the thirty-five (35) year period of the price forecast?

MR. WESLEY STEVENS: I -- I can see from IRs -- from the LCA spreadsheet as response to IR-308 that they used some kind of average price.

MS. PATTI RAMAGE: Wind integration values would also be affected by the amount of wind on the system.

Is that correct?

MR. WESLEY STEVENS: When you -- certainly when you get to large quantities of wind, that's been the experience in -- in other jurisdictions. It depends on a number of factors. It's the proportion of wind to the system as a whole. It's whether the system is entirely thermal based or hydro based with costs in hydro-based systems being much lower than in thermal-based systems. A question of how integrated the system is with -- with other nearby systems, especially if those systems themselves have hydro.

MS. PATTI RAMAGE: Thank you for that, Mr. Stevens.

Mr. Chernick, back to you. I was only going to do this if I was moving along, and I've moved along quickly enough that I think the Board can handle my next question because it's a time consuming one (1) I'll say, but an entertaining one (1) at the same time.

If you turn to page 3 of the book of documents.

(BRIEF PAUSE)

MS. PATTI RAMAGE: And at page 3 you critique Manitoba Hydro's corporate heating website page. And in particular, if you look at the footnote at the bottom of the page, you say that -- that the video on that site simply explains geothermal heating.

Do you recall that evidence?

MR. PAUL CHERNICK: Yes.

MS. PATTI RAMAGE: Okay.

MR. PAUL CHERNICK: I wrote that.

MS. PATTI RAMAGE: And I have to tell the Board, I struggled with this one because I couldn't come up with a way of putting this information to you other than actually watching that short video. And I can tell the Board it's only about four (4) minutes long, but I -- I think it's worth seeing what's on that website. And I talked to Mr. Simonsen to see if he could bring it up. And if he could go to www.hydro.mb.ca.

Oh, he's already there. He's two (2) steps ahead of me.

(VIDEO PLAYED)

MS. PATTI RAMAGE: This didn't happen at my house.

(BRIEF PAUSE)

MS. PATTI RAMAGE: I -- I think we're probably close enough. The...

(VIDEO PLAYED)

MS. PATTI RAMAGE: I think we're done. Yes. So, Mr. Chernick --

MR. PAUL CHERNICK: That's a very nice video.

MS. PATTI RAMAGE: Is this the video -- this is the video on the web page under heating cost comparisons. Is this the video that you suggest --

MR. PAUL CHERNICK: This is not the video that I -- that I saw.

MS. PATTI RAMAGE: -- concerning geothermal systems?

MR. PAUL CHERNICK: The -- no, the -- the one (1) that -- that I got to was actually the same

website, but -- and under 'your_home/geothermal_heat_pumps/index.shtml'. And my apologies, I see that you do have a very nice informational video on the -- the benefits of -- of gas water heating and...

(BRIEF PAUSE)

MS. PATTI RAMAGE: Thank you, Mr. Chernick, and I'm glad you liked the video. It hurt my feelings that you thought it was --

MR. PAUL CHERNICK: I understand.

MS. PATTI RAMAGE: -- all about geothermal.

MR. PAUL CHERNICK: I'm very sorry. I -- I think for somebody of my age I do a pretty good job of searching the web, but every once in a while I -- I don't find exactly what I'm looking for.

MR. RICHARD BEL: Mr. Chernick, I just have a -- a clarification. I'm not sure I understand. That was with -- the question was put to you about Manitoba Exhibit 156?

(BRIEF PAUSE)

MR. RICHARD BEL: It was page 13 in this last book of documents. Yeah, okay. I think that's it.

MR. PAUL CHERNICK: All right. Thank you.

MR. RICHARD BEL: So my question is: There's a reference here to flat load growth. And I'm not sure if this is the kind of flat load growth that you were discussing in your -- is that -- is that the import of your answer?

MR. PAUL CHERNICK: No, it -- it -- one (1) of those things that I -- I said in my answer was, well, this is -- this particular case was for load growth through 2022/'23 and then flat thereafter. And the conclusion was that it still made sense to build Keeyask and the transmission line.

And as I pointed out, I said in -- in my -- my initial presentation that the -- the fact that there's no domestic need for Keeyask doesn't mean that there isn't an export value to it. And the transmission line will certainly have some benefits in terms of improving reality and access to lower cost energy at -- in -- in drought conditions and so on.

So I -- I didn't -- I wasn't suggesting that even if you had flat load from, say, 2014 on, that

Keeyask would necessarily be inappropriate. But you have to look at it in the kind of context that they -- the Company did in this exhibit to see whether, as a purely export operation, Keeyask was -- was cost effective. And it's entirely possible that it would be.

MR. RICHARD BEL: What was the reference to exports and -- when you were discussing that? Can you --

MR. PAUL CHERNICK: Well, if there's -- if you're meeting all of your domestic load with existing resources and you're meeting all of your committed sales, then there's -- there's no reason to build Keeyask for domestic load.

But if you build Keeyask and can sell the power, and you also get the benefit of the intertie which allows you to sell more economy power when you have it, to buy power off peak, reduce your -- your usage at -- at those times, the -- the usage of the dams at those times, and then increase generation at high cost times and sell power down to the States in -- in greater quantity is basically using Manitoba's dams as a storage battery for MISO, and -- with Manitoba Hydro pocketing the difference between the cost of the electricity in the middle of the night and the value of

the electricity in the daytime, all of those things combined might very well make Keeyask and the transmission line a good investment even without the domestic load.

There -- Manitoba is not an island, and you have an unusually good opportunity here to do the right thing and reduce environmental damage and make money at the same time, and -- and help out your neighbours to the south, as well. And it's entirely possible that Keeyask and -- and the transmission line will be part of a long-term strategy to do that.

It's a different kind of analysis than that that the -- the Company presented in its original filing. Does that help?

MR. RICHARD BEL: Yes, thank you.

(BRIEF PAUSE)

MS. PATTI RAMAGE: Sorry, Mr. Chairman, I'm -- subject to anything that arises during Mr. Hombach's cross-examination and the materials that Mr. Chernick said he would look at at the break, I think I -- I've completed my cross. It was the highlight of a video. I haven't ever done that before.

MR. PAUL CHERNICK: I'm glad I gave you

the opportunity.

THE CHAIRPERSON: Thank you, Ms. Ramage.

Mr. Hombach, please...?

MR. SVEN HOMBACH: I anticipate that I'll be fifteen (15) to twenty (20) minutes, Mr. Chairman. Would you like me to finish before the break, or would you like to take the break before I start?

THE CHAIRPERSON: I think the preference would be to -- to have a break now, so we'll take ten (10) minutes, and we'll continue after the break.

MR. SVEN HOMBACH: Certainly.

--- Upon recessing at 2:46 p.m.

--- Upon resuming at 3:01 p.m.

THE CHAIRPERSON: I believe that we're ready to continue with the proceedings, so Mr. Hombach, please.

CROSS-EXAMINATION BY MR. SVEN HOMBACH:

MR. SVEN HOMBACH: Thank you. Good afternoon, Mr. Chernick and Mr. Stevens. The bad news

first, I won't have a video, but I'll try to be just as rivetting as the one that we just saw.

Mr. Chernick, if it's acceptable to you, we'll start with you. You were qualified as an expert in integrated resource planning, and I'd like to get a better understanding from you on what test for evaluating DSM you recommend as part of integrated resource planning?

MR. PAUL CHERNICK: I'm -- I'm sorry, what -- oh, what test?

MR. SVEN HOMBACH: What test.

MR. PAUL CHERNICK: Well, basically I would say that the total resource cost test, including all the costs and benefits that are identifiable is the -- the appropriate test, both in -- in resource planning and then in the detailed design and implementation of the programs.

MR. SVEN HOMBACH: And were you able to satisfy yourself during the break that Manitoba Hydro uses the total resource cost test?

MR. PAUL CHERNICK: Oh, I don't think there was any question that they use it to some extent, but I looked through the documents and found that what I was talking about is sort of embodied most clearly in the -- about -- what I was talking about with regard to

RIM is expressed most clearly in Exhibit MH-87, starting on page 67 where Mr. Kuczek says that Manitoba Hydro uses the RIM. It uses it to compare between programs as a measure of the value of a DSM opportunity, looks also at the levelized cost to the utility.

And then a few pages later, on page 71, looks at what happens when the -- under certain circumstances nonparticipant bills can go up even though the participants' bills are going down. And they pick an example in which the participants save seven dollars ($7) and the nonparticipants pay an extra seventy-three dollars ($73), indicating something like 99 percent of the customers are participants.

MR. SVEN HOMBACH: But when you hear references to economic DSM, what does that mean to you, and specifically what test does that mean to you?

MR. PAUL CHERNICK: That would be economic under the TRC.

MR. SVEN HOMBACH: Would you consider fuel switching to be a DSM measure that would be given the same status as other DSM measures in an integrated resource plan?

MR. PAUL CHERNICK: Yes.

MR. SVEN HOMBACH: And you recall My

Friend, Ms. Ramage, asking you about the spending of electric money to convince people to switch to gas?

MR. PAUL CHERNICK: Yes.

MR. SVEN HOMBACH: Would you consider that to be an electric DSM measure, as well?

MR. PAUL CHERNICK: Yes. If you spend electric money to convince people to switch from electric resistence heat to a heat pump, you reduce the amount of -- of electricity that you use. There are other costs incurred. If it's cost effective, it's a -- it should be included in the DSM program in the same way if you -- they're switching to a -- a gas furnace and reducing their -- the electric heating use down to, I guess, some fans, then their -- and that's -- that's -- that also can be a cost-effective DSM issue.

MR. SVEN HOMBACH: So to summarize that answer, as long as there is a benefit in the elect -- to the electric utility from a switch to DSM, you consider it to be appropriate for the electric utility to incur fuel switching costs?

MR. PAUL CHERNICK: I'm assuming that the measure is cost effective overall.

MR. SVEN HOMBACH: Let's go to slide 8 of your presentation from this morning.

(BRIEF PAUSE)

MR. SVEN HOMBACH: You spoke about how higher gas prices would improve gas end-use economics. Would that necessarily apply to residential customers?

MR. PAUL CHERNICK: No. What I meant there was that the cost to the residential customer would go up, but the benefit to Manitoba Hydro of having the extra electricity to sell into the United States would also go up.

MR. SVEN HOMBACH: But at the individual customer level, it may not necessarily be a benefit to that customer?

MR. PAUL CHERNICK: Yes. And as I discussed with the Board, it may be necessary if customers are very concerned about that; it may be necessary to offer them a -- a guarantee in which Hydro essentially says, Well, if the price of gas goes up beyond some point, then we'll share with you the windfall that we will get from our increased export sales that you, the fuel switching customer, has made possible. And that could be just a -- a guaranteed payment each year to the extent that the -- that the gas price goes over some benchmark. It could be structured a number of ways.

MR. SVEN HOMBACH: Are you aware of any such programs in other utilities you've worked with?

MR. PAUL CHERNICK: For that kind of -- of hedging for the -- for a customer who -- who converts?

MR. SVEN HOMBACH: Yes.

MR. PAUL CHERNICK: No, I'm not. And as I think I said to the Board, Manitoba's in a very unusual position where the electric utility stands to gain quite a bit if gas prices rise while customers who choose gas and help Manitoba Hydro make additional money could be put at -- at risk under high gas prices.

MR. SVEN HOMBACH: It's my understanding you've testified before the PUB previously?

MR. PAUL CHERNICK: Yes, three (3) times I believe.

MR. SVEN HOMBACH: Are you familiar with the Affordable Energy Fund?

MR. PAUL CHERNICK: I'm -- I'm aware that it exists. I'm not aware of the --

MR. SVEN HOMBACH: Yeah.

MR. PAUL CHERNICK: -- the details of its mechanism.

MR. SVEN HOMBACH: I was going to ask

you whether you consider that to be such a program, but I -- I don't need an undertaking to that if you're not familiar with it at -- at this time.

Let's go to slide 14 of the presentation. For a fuel switching customer how long do you expect a commitment to gas to be if somebody installs a new gas furnace or a new gas water tank?

MR. PAUL CHERNICK: Water tanks -- the water heaters tend to last on the order of twelve (12) to fifteen (15) years I believe. And furnaces, I think, are on the -- around twenty (20) years.

MR. SVEN HOMBACH: Is it fair to say, though, that there's some resistance to change? Meaning once somebody has a gas furnace they're unlikely to then switch back to an electric furnace the next time, or vice versa?

(BRIEF PAUSE)

MR. PAUL CHERNICK: Well, in a house that's -- that's go the -- the necessary supply, the -- the service line drop for the electricity, the breaker box being large enough to -- to cover the -- the load, I don't know how much resistance there would be. I -- I would think that a -- a customer who's been aware

that gas prices have risen above electric prices, if that's the case, would -- would look at that --- at the aging of his furnace as an opportunity to switch back to electricity if that seemed like a good idea.

MR. SVEN HOMBACH: If there was to be a larger percentage of solar energy or wind energy in MISO over the next fifteen (15), twenty (20), or even thirty (30) years, would that presumably change your conclusions about the greenhouse gas implications of people in Manitoba switching to gas?

MR. PAUL CHERNICK: Well, I -- I think those percentages will rise. The question is what does it do to the market prices and the -- the marginal emissions? And on slide 9 I discussed that, that wind and solar costs are likely to decline, and that more renewables in MISO might result primarily in the retirement of coal plants and the -- and less use of -- of the gas peakers which are less efficient.

But it could also result in the coal plants being more expensive to -- to run than the gas combined cycles and -- but staying on the system. And I'm sorry, that was the wrong example.

It could push the -- the coal up in the loading order. So at a given load level in MISO, more of the load is met with renewables and then coal, and

maybe you don't need any gas at all. So you're backing out coal at the margin and that would make the environmental benefits greater. It might make the economic benefits less, depending upon the relative pricing of coal and -- and gas.

I'm sorry I got that answer a little garbled in the middle. If you'd like me to run through it again I'll do my best.

MR. SVEN HOMBACH: No, I think that's okay. Thank you. Have you turned your mind to how large an impact on domestic electricity demand a concerted campaign to switch end-use heating to gas would have?

MR. PAUL CHERNICK: Well, I -- I think that Hydro has done that for us.

MR. SVEN HOMBACH: And if it helps, if we could go to Manitoba Hydro Exhibit 122. That, Mr. Chernick, is an answer that was provided in response to an undertaking calculating that the existing fuel switching initiative, if 100 percent successful, would reduce demand by approximately 903 gigawatt hours.

But first of all, it's my understanding, sir, that the fuel switching initiative is only in the south gas area and only applies to new construction and retrofits?

MR. PAUL CHERNICK: Well, the new -- new construction and retrofit's basically what the -- the market consists of.

MR. SVEN HOMBACH: So --

MR. PAUL CHERNICK: And -- and you -- you can't very well switch to gas in an area where you don't have gas. And just hang on it for a second.

The -- Exhibit 180, page 56, provides an -- an estimate of 286 gigawatt hours from the fuel choice program being contemplated by the Company at this point. So whether it's three hundred (300) or nine hundred (900), it's a substantial amount of -- of energy.

MR. SVEN HOMBACH: Are you suggesting that, aside from encouraging people to switch electric furnaces that have reached the end of their useful life, Manitoba Hydro should encourage people to switch otherwise still functional electric furnaces to gas?

MR. PAUL CHERNICK: Well, that's a cost effectiveness question. And let me take a quick look at the summary of the economics.

For a furnace -- this is on page 6 -- slide 6, of -- of my presentation this morning. Switching from an electric furnace to a gas furnace has an NPV, net -- net present value, under the TRC,

according to the Company, of about fifteen thousand dollars ($15,000).

So -- or I believe that's the choice between the two (2), assuming you'd have to either buy a furnace or -- either electric furnace or a gas furnace. And so even if you take out the -- the cost of the -- the electric furnace, or you -- you discount it, because if the electric furnace is only ten (10) years old and you think it'll last another fifteen (15) years, then some day you would have to replace it so you can -- you've delayed that -- you've -- you've avoided that replacement out there.

But even if you took the entire cost of the -- the electric furnace out of a couple thousand dollars, you'd still have a very large savings. So I suspect that it would be cost effective to -- to do early retirement and replacement for electric furnaces.

MR. SVEN HOMBACH: So that's a yes?

MR. PAUL CHERNICK: Oh, yes. I'm sorry. I was actually thinking it through while -- while I was answering your question, so.

MR. SVEN HOMBACH: If we could go to PUB Exhibit 58-2.

While we're waiting for that, do you recall the chart in the video that walked people

through the historic gas and electrical cost up to the present time?

MR. PAUL CHERNICK: Yes.

MR. SVEN HOMBACH: Vaguely?

MR. PAUL CHERNICK: Yes, vaguely.

MR. SVEN HOMBACH: If we could go to page 92 of Exhibit 58-2. Sir, this is a chart that was put to Manitoba Hydro's load forecast of DSM panel and projected into the future.

Have you had an opportunity to review this chart before?

MR. PAUL CHERNICK: I don't believe I've seen this specific chart, but I've seen similar comparisons.

MR. SVEN HOMBACH: If Manitoba Hydro agreed with the directionality of the chart, and they did advise that they did, in your view, would it be helpful to show customers the projected future prices of gas and electricity to encourage fuel switching?

MR. PAUL CHERNICK: That might be helpful, but as -- as I think I've indicated, that's -- it's not necess -- necessarily sufficient, but it certainly would help. And if Hydro were willing to provide the kind of guarantee that we were talking about, if gas prices actually get above electric prices

on an equivalent delivered basis, then some of that at windfall to -- to Hydro would be split with the -- the customers who have agreed to the fuel switching.

Then it -- it seems like that's a very low risk proposition for -- for Hydro to undertake. And I think that might be more of a comfort than looking at the -- the history and -- and the projected values.

MR. SVEN HOMBACH: Now, we also discussed the need for builder incentives. And I'm wondering if you could give the panel some example of what types of incentives for home builders you're thinking of?

MS. PATTI RAMAGE: Can I interject just for a second, Mr. Hombach? Just for the record, 'cause we're -- I'm trying to figure out here, the chart that's on the screen, can you give me the reference? I -- whose evidence that is, or --

MR. SVEN HOMBACH: That is the chart that was prepared by PUB advisors. It forms -- it is page 92 of PUB Exhibit 58-2. It was put to Manitoba Hydro's DSM panel and Manitoba Hydro was asked about whether or not the utility agreed with the directionality.

MS. PATTI RAMAGE: Okay. Thank you. I

was just trying to -- so I could follow along, for the record. Thank you.

CONTINUED BY MR. SVEN HOMBACH:

MR. SVEN HOMBACH: Mr. Chernick, I was asking you about your recommendations for builder incentives.

MR. PAUL CHERNICK: Oh, yes. Thank you. Well, with -- with builders there's opportunities for using both carrots and sticks. The carrots would be: If you put in a gas water heater and -- and furnace we will waive certain fees that we would otherwise charge you for the -- the hookup, or we'll contribute some hundreds of dollars towards the cost of doing that.

And we'll maybe give you a nice little medallion to put on the -- the front of your model home to let people know that this development is going to be economic and -- and environmentally efficient. And Centra (sic) can offer a discount on its usual extension to the builder.

Another alternative would be for -- for Hydro to say if you put in resistence heating, or you put in a -- a ground source heat pump below a certain efficiency, then the hookup charge will be larger

because you're going to force us to give up export revenues, or to procure additional resources. And, you know, we'll refund that to the customers over a period of time, but it'll show up as -- as something that the developer has to pay out of pocket and then get back through the sale price of the house. And that seems to be a strong motivator for the developers in general. So that kind of stick might chase them away from electricity towards gas.

If their customers really want electricity, of course they can do it and they'll get paid -- paid back. But for the vast majority of -- of customers who either would prefer gas 'cause they know it's cheaper or don't care, then you can overcome the -- - the developer's reluctance to spend his own money and, of course, be at risk of how long it's going to take to sell that house.

MR. SVEN HOMBACH: In your report, specifically on page 2-14, you also discuss rate design and inclining block residential rates. You're aware that Level 2 DSM, as proposed by Manitoba Hydro, actually includes such inclining rates?

MR. PAUL CHERNICK: Yes. I don't know the -- the detail of the conservation rates that the Company modelled for Level 2, but it sounds like, to

some extent, we're on the same wavelength in terms of believing that would be an appropriate way to go.

MR. SVEN HOMBACH: And when you're thinking about inclining block or inverted rates, are you envisioning that the block sizes would be the same for electric heat customers and gas heat customers in order to provide an increased incentive, or are you envisioning that electric heat customers be a -- provided with a larger initial load price block?

MR. PAUL CHERNICK: Well, that's a complicated question because there are a lot of considerations involved, and among them the statutory limitations on the extent to which Hydro and the Board can differentiate rates between groups of customers.

But ideally you would protect customers who have electric heat, and put it in -- in the past, and not by giving them some larger block in the winter. And either not do the same thing for new electric heating customers or give them a smaller block, except those who do not have access to gas. And exactly how you design the -- the rates is, as I said, somewhat complicated and something I haven't looked at for Manitoba in a few years now.

MR. SVEN HOMBACH: You critique the 2013 Power Smart Plan for not discouraging -- sorry,

for not encouraging fuel switching to gas.

Have you had an opportunity to review the 2014 Power Smart Plan?

MR. PAUL CHERNICK: I have looked through it, and there is a section on fuel choice, at least in the long-term plan. I don't really recall whether the short-term plan has fuel choice broken out.

MR. SVEN HOMBACH: If you can accept, subject to check, that the short-term plan does not address it?

MR. PAUL CHERNICK: I think that's correct.

MR. SVEN HOMBACH: Okay. In your view, does the long-term plan address your criticism?

MR. PAUL CHERNICK: Well, it's hard to tell exactly what -- what kind of a program, or portfolio of programs, is included in the long-term plan. The long-term plan is certainly a step in the right direction, and I'd be very interested in seeing how Manitoba Hydro intends to implement what's in the plan: the numbers that they project.

MR. SVEN HOMBACH: What you're saying is essentially the proof will be in the pudding?

(BRIEF PAUSE)

MR. SVEN HOMBACH: I didn't realize that would be such a controversial question.

MR. PAUL CHERNICK: Well, actually, it's not so -- so much whether the proof of the pudding will be in the eating, which implies that you have to wait until they've done it, but we haven't even seen the recipe yet. And so I would say the -- yes, the ultimate proof is -- is when we see the switching from electric to gas going up and gas to electric going down.

But the -- the initial -- 'proof' may be too strong a word, but the initial indication that they're on the right track would be when we see the recipe and they talk about what kinds of incentives they're planning on giving and to whom and how fast they -- they expect to be shifting over various usages.

MR. SVEN HOMBACH: Let's go to slide 24 of your presentation from this morning. You list on that slide that you have several examples of other utilities that are budgeting for 1.3 percent of DSM savings per year or more.

MR. PAUL CHERNICK: Yeah.

MR. SVEN HOMBACH: Just to be clear, those were incremental savings?

MR. PAUL CHERNICK: Those are

incremental savings and the one point three (1.3), those are reported actual savings after the fact.

MR. SVEN HOMBACH: Okay.

MR. PAUL CHERNICK: The -- the projections go over 2 percent.

MR. SVEN HOMBACH: And are those 2 percent projections in perpetuity, or is there a declining incremental DSM savings?

MR. PAUL CHERNICK: Well, I don't know of anybody who forecasts anything for the utilities in perpetuity.

MR. SVEN HOMBACH: Let me ask you this way.

Have -- have you reviewed the evidence of Mr. Dunsky?

MR. PAUL CHERNICK: I have.

MR. SVEN HOMBACH: And you're aware of the fact that Mr. Dunsky's recommending a gradual ramp up of DSM savings followed by a sustained annual incremental DSM savings of 1.5 percent per year?

MR. PAUL CHERNICK: Yes.

MR. SVEN HOMBACH: And you're aware that Manitoba Hydro projects significantly larger savings in the short term and then declining incremental savings over time?

MR. PAUL CHERNICK: Yes, and -- and I think Manitoba Hydro has projected that pattern for a number of years now, always with a -- a couple of years of relatively high savings and then having savings drop off.

MR. SVEN HOMBACH: Right. So -- so your recommendation -- is your recommendation to follow the Manitoba Hydro model of shoot high first and then have declining savings, or the Dunsky model?

MR. PAUL CHERNICK: I would -- I, and I think Mr. Dunsky would say --

MR. SVEN HOMBACH: Or your own model?

MR. PAUL CHERNICK: -- I -- I think Mr. Dunsky would agree with this -- start where Manitoba Hydro is for its plans for the next year or so and go up from there. And I don't know whether you can then maintain that level for, you know, fifteen (15) years or twenty (20) years. And we'll find out how technology changes and the markets change over time.

MR. SVEN HOMBACH: Thank you, Mr. Chernick.

Mr. Stevens, I have a few questions for you as well.

First of all, you'll recall My Friend, Ms. Ramage, asking you about wind exports and whether

or not there would be interest in buying Manitoba wind -- Hydro wind?

MR. WESLEY STEVENS: I do.

MR. SVEN HOMBACH: Now, when a US utility is purchasing energy they are not purchasing specific electrons, are they? They're purchasing either firm energy or opportunity energy?

MR. WESLEY STEVENS: Yes.

MR. SVEN HOMBACH: Okay. In your expertise, is there any way for a utility to distinguish what the source of that energy is if there is a supply mix consisting of more than one (1) source?

MR. WESLEY STEVENS: No. Well, hold on. Let me -- let me think about that. In some circumstances there -- there could be agreements about a generator injecting a certain -- injecting energy into the system from a certain source and then the utility extracting the same -- the same amount of energy or that energy without -- minus losses from the system at another point. So it is possible to relate exports to a specific type. And -- but -- but those are not the same type. They -- they are obviously not the same electrons.

MR. PAUL CHERNICK: And if Manitoba were exporting to New England, for example, and the

buyers wanted the energy to qualify for renewable energy credits, the energy would have to be tagged to generation from wind or small hydro, not Keeyask, or various other categories for renewables. And hour by hour the same amount would have to be delivered to the -- into the ISO for -- for that to be counted in that way. I mean, that's really a bookkeeping transaction. But the intent is to sort of, in some way, keep the suppliers honest and make sure that you really are getting more renewables into the system as you're paying for more of them.

And it sort of ignores the fact that with hydro you can -- you can store them. As a practical matter, even if you had to do that for -- to meet a state renewable portfolio standard and you wanted to have the wind tag on the power that was devel -- being delivered, you could always work out an arrangement where essentially you were -- the US utility was selling energy to Manitoba Hydro when it -- when there was excess and buying it back when it needed it to sort of firm up that -- that wind delivery.

MR. WESLEY STEVENS: Short answer: It's complicated.

MR. SVEN HOMBACH: And it would be a matter of contractual arrangements as to whether or not

somebody would want to specify that bookkeeping exercise, to use Mr. Chernick's words?

MR. WESLEY STEVENS: Yes.

MR. SVEN HOMBACH: Mr. Stevens, let's go to page 5 of your presentation for a moment. You referenced the time frames that several wind developers provided you with, and you included testing and you included permitting.

The three (3) year time frame that we see on the slide, does that include a land acquisition and approaching people to obtain various options to place turbines?

MR. WESLEY STEVENS: I don't know that. It -- it might. This -- this is a reference to significant spending. I don't think that time spent on -- on land acquisition and approaching people would involve significant spending, so I can't say from this whether or not that time is -- that activity is included in the three (3) years.

MR. SVEN HOMBACH: Are you able to undertake fairly easily to obtain an answer to that?

MR. WESLEY STEVENS: Yes.

MR. SVEN HOMBACH: Okay. Then I'd like an undertaking for you to approach the developer and ask whether that time estimate includes the time period

for land acquisition.

MR. WESLEY STEVENS: Okay.

--- UNDERTAKING NO. 136: Wesley Stevens to ask developer if the time estimate includes the time period for land acquisition

CONTINUED BY MR. SVEN HOMBACH:

MR. SVEN HOMBACH: Let's go to the next slide, page 6. There was some back and forth about the assumed lifespan of -- of wind farms.

And is it your understanding that, from a Crown utility perspective, that is really more of an issue of the contractual arrangements rather than the lifetime of the physical equipment?

MR. WESLEY STEVENS: It depends. When it comes to Crown utilities buying -- buying wind power, they usually set the term. Ontario has various contracts which are set to twenty (20) years. My understanding is that, in cases -- and this is from talking with developers -- that in cases where the utility has set a term of twenty (20) years, where the contract is for a term of twenty (20) years, the developers look at the value of the wind project

following for the next five (5) and, in some cases, ten (10) years, but -- but mostly five (5) years.

They assume that the proj -- that the wind project will in fact last for twenty-five (25) years, of which the first twenty (20) years will be covered by contract and that there will be some additional value to them in the last five (5) years. So there would be nothing to stop a utility from setting a term of -- of twenty-five (25) years for contractual purposes.

MR. SVEN HOMBACH: Have you seen any Crown utility similar to Manitoba Hydro develop wind power directly, or are these usually arrangements with independent power producers under a power purchase agreement?

MR. WESLEY STEVENS: I believe that Nova Scotia does a mix. It does -- it -- it's developing that -- the utility is developing some wind itself and it's -- it's contracting some out. I'm just running through the other utilities; for -- for the most part, they're contracting out, but certainly there's nothing stopping a utility from doing it itself.

MR. SVEN HOMBACH: Let's go to page 8 of your slides. The four dollars and twenty-two

cents ($4.22) per megawatt hour in 2012 dollars that you were recommending, what assumption is that making for the technology that's used to back up or firm up wind power?

Specifically, is that linked to building hydro power to firm up wind or to go with gas?

MR. WESLEY STEVENS: That is a number based on the 25 -- 2005 study, which looked at the -- at Manitoba Hydro's system which is primarily hydro. So that would -- that would be a number based on hydro.

If -- if you were talking about using gas to -- to firm up wind -- well, not to firm it up, but for wind integration costs, then a number on the order of eight forty-five (8.45) would not have surprised me. But for a system like Manitoba Hydro's, where you're using wind and it -- sorry, we're using hydro and existing hydro, eight forty-five (8.45) seems like a very high number and four twenty-two (4.22) seems like a more reasonable number.

MR. SVEN HOMBACH: So let me ask you a follow-up question.

Do you know whether this number would assume that no new hydro generation would have to be built and that existing generation is used, or does it include an assumption that some new hydro power would

have to built to firm up wind?

MR. WESLEY STEVENS: I don't know that because the 2005 study was considered confidential. I've not been able to review it.

MR. SVEN HOMBACH: In terms of the overall wind costs, it's fair to say that you essentially agree with La Capra's recommendations, or close to it?

MR. WESLEY STEVENS: Close to it. I -- I think the essential point about the wind costs is that on several fronts, Manitoba Hydro's assumptions have led to higher wind costs than -- than is reasonable.

And while La Capra and I may choose different specific assumptions, the point is that Manitoba Hydro's number is substantially too high. And if you put in more reasonable assumptions, then wind -- then wind -- wind is in the same ballpark as -- as new hydro.

MR. SVEN HOMBACH: Have you had an opportunity to review La Capra's wind economics?

MR. WESLEY STEVENS: I have reviewed their Appendix 3A and 'B', and I have -- I have looked at their report.

MR. SVEN HOMBACH: Do you agree with

the wind economics, or is that something outside your sphere of expertise?

MR. WESLEY STEVENS: We -- we have slightly different takes. For example, they -- they were recommending a capacity factor of 43 percent.

MR. SVEN HOMBACH: Right.

MR. WESLEY STEVENS: I recommended, for modelling purposes, taking the improvements in capacity factors that could reasonably come from new technology, specifically high -- higher towers, and for modelling purposes rolling that into the capital cost.

MR. SVEN HOMBACH: Okay.

MR. WESLEY STEVENS: There are minor differences, but I think we come -- come out to about the same place and we have the same concerns. I -- I looked at a number of -- I looked at a few factors that La Capra did not seem to look at, or at least they do not write about. For example, I looked in detail at wind integration, which is on slide 8, and I didn't see anything in La Capra's report -- I may have missed it, but I didn't see anything in La Capra's report about wind integration.

MR. SVEN HOMBACH: Let's have a quick look at La Capra's economics. It's Exhibit 45 -- La Capra Exhibit 45, slide 70.

And I appreciated it, sir, that those are the actual NPV numbers that La Capra came up with.

But are you able to address directionally on whether or not you agree with those numbers or whether, based on your points of disagreement with La Capra, you would expect those numbers to go up or down?

MR. WESLEY STEVENS: Okay. In my previous que -- in -- in my answer to your previous question, I was thinking more of La Capra's look at wind costs with var -- varying the capital costs, capacity factors, and so on. I wasn't thinking of the -- the next step, which is when they took that and translated into NPV -- NPV terms. Yes, I --

MR. SVEN HOMBACH: Is there something in --

MR. WESLEY STEVENS: -- I have looked at this --

MR. SVEN HOMBACH: Okay.

MR. WESLEY STEVENS: -- and while I have not tried to replicate it or -- or not get into it in detail, certainly directionally and in order of magnitude their numbers look very reasonable. Their -- their approach, their analysis, and their numbers look -- look very reasonable.

MR. SVEN HOMBACH: One (1) last question on the issue of wind integration, sir.

You're aware that over the recent past, water levels in the Lake Winnipeg basin have been quite high?

MR. WESLEY STEVENS: I actually didn't know that, but -- but, yes.

MR. SVEN HOMBACH: Would wind -- would the ability of wind to allow more water to be kept in the reservoir and be made available for hydroelectric generation be diminished in a situation where the water levels are already high?

MR. WESLEY STEVENS: It -- that's not a question I can really ask -- or I can -- I can answer. That would be the kind of question that I would highly recommend be looked at. If you're going to take -- if you're going -- going to -- wind -- wind, I believe, should receive more serious consideration, and it's exactly those kinds of questions that need to be asked --

MR. SVEN HOMBACH: And I was going to -- - I was going to ask you the same question with respect to drought.

I assume the answer would be the same?

MR. WESLEY STEVENS: Yes.

MR. SVEN HOMBACH: Okay. Thank you, sir. Those are all my questions.

(BRIEF PAUSE)

MR. RICHARD BEL: Mr. Chernick, I have one (1) question before you're released. And because we're going to have a DSM panel coming up, it's not really -- really related to your testimony tangentially. And that was the question of risk and DSM. And it's really a question about an opinion.

We've had two (2) experts on DSM: Elenchus and Dunsky. And there was a slight -- or a big difference in the way they viewed DSM, depending on your point of view. It's slide 51 of Dunsky.

(BRIEF PAUSE)

MR. RICHARD BEL: And I -- I guess I'm asking for your commont -- your comment on this issue. It -- it's Elenchus -- Elenchus saying that, in fact, DSM could be risky because you can't really predict how well those targets are estab -- you can't tell how well you can meet the targets in the future. And then Mr. Dunsky is saying that, in fact, DSM is the least risky

option.

So do you have a comment on that? Are you familiar with...

MR. PAUL CHERNICK: Yes, I -- I agree with Mr. Dunsky. The Elenchus discussion of DSM in general, and of risk in particular, I -- I didn't think really reflected much understanding of how DSM programs actually work.

One (1) of the important things about DSM is, unlike a major construction project, like a -- a major hydroelectric facility, you don't make the decision to go ahead and then find out five (5) or ten (10) years later how much it cost and when it came on. You find out year by year, and often month by month, how the -- the program is going and whether you need to correct something.

And so Elec -- Elenchus's concerns about risky DSM and -- and counting only part of what you think you found in the -- in the potential just struck me as being sort of off target. So I wouldn't put a lot of weight on the Elenchus's view of -- of risk of DSM.

DR. HUGH GRANT: Can I just ask you one (1) thing?

Are you aware of this literature that

says that utilities systematically overstate DSM savings and understate the cost?

MR. PAUL CHERNICK: Well, there are people who say that.

DR. HUGH GRANT: There are people that test it fairly robustly. I'm just worried -- I just wanted to know how widespread that literature was and--

MR. PAUL CHERNICK: Well, if you -- if you leave a utility on its own to run the programs without any real supervision, without independent monitoring and evaluation.

There will, of course, be a tendency to -- to want to look good, and to hence perhaps overstate the -- the benefits. And if you are giving the utility a reward, or you're going to penalize them if they don't meet their targets, and you trust them to self-report whether they met their targets, they'll meet their targets.

So you need to discount to some extent the claimed savings by some of the utilities in the mid to low part of the -- the pack, in -- in term -- across jurisdictions, some of whose regulators really don't pay much attention to -- to whether they're really producing what they say they are. In the high performing areas -- well, any of the New England

states, for example, the monitoring and evaluation programs are -- are quite -- quite rigorous, and I don't believe that the utilities are -- have much room to-- to pad their -- their reported values.

DR. HUGH GRANT: Just one (1) other thing. This concept of selection bias, is that commonly discussed, and does -- do people try to discount -- so the -- I guess the way I understand it is that you put in a DSM program to replace your refrigerator.

I was going to replace mine a year -- you know, a year from now anyway, so I decide I might as well take advantage of this opportunity. So that the actual DSM savings are smaller than -- right, so it's not like there's a -- the utility can go back and say, Oh look, we got rid of an efficient refrigerator for twenty (20), thirty (30) years. It was really only one (1) year of savings in that respect.

Does that -- you know, in -- if it's Dunsky or other people and they're throwing figures around, what kind of number are they using? I guess that's what I'm wondering, if there's selection bias arguments.

MR. PAUL CHERNICK: Well, again if there is adequate monitoring and evaluation for the

refrigerators, for example, then one (1) of the things that would be studied would be, How long do people keep refrigerators in at -- the absence of programs? And it's not that hard to -- to do that kind of study.

One (1) of the things that you can do is when -- for example, when my house was last audited by the -- the firm working for -- for our electric and gas utilities, they checked out the -- the refrigerator model, and looked up its efficiency and could tell us what size rebate we were -- we were eligible for. As they're doing those audits, they get a lot of data on how many refrigerators are left in 2012 of 1984 vintage, for example. And so they have -- and in 1980 vintage, and 1976 vintage, and so on, so that they can -- they can work out how -- how fast refrigerators seem to turn over naturally.

DR. HUGH GRANT: But do they actually do that in program monitoring?

MR. PAUL CHERNICK: Yes, I've --

DR. HUGH GRANT: Do you think --

MR. PAUL CHERNICK: -- I've seen -- I mean, I haven't tended to read the studies in -- in gruesome detail about how they gathered all the data and so on, but there are -- independent evaluators are often brought in to look at -- at data from before the

-- the program, from other jurisdictions that don't have such rigours programs, other kind of controls to try and figure out really what the remaining life is. And also to look at whether you're selectively replacing the refrigerators that have already begun to whine and knock and bang.

Now, I know that my refrigerator was working just fine. The food was cold. It was quiet. It was a wonderful machine. But it was wasting some hundreds of kilowatt hours a year, and we were offered a three hundred dollar ($300) rebate to -- to buy an energy efficient refrigerator, and basically send them the severed cord of -- from the old one. And -- and we did that.

And it was already a pretty old refrigerator. I don't know whether it had five (5) years or ten (10) years left statistically but, you know, it's sort of like working out life insurance premiums and guessing how much longer you're going to live. There's a -- a lot of statistical background that goes into taking the data that's available and projecting out what the -- what the remaining life is.

And it's not that those are perfect, but the important thing is that somebody uses the available data to come up with the best estimate. And -- and

that it's not the utility and you're not just trusting them to tell you what a wonderful job they're doing.

And I'm not a -- an expert specifically in evaluation, but I do see a fair amount of -- of the -- at least the titles of the evaluation reports that go back and forth, and good programs involve a lot of evaluation.

MR. WESLEY STEVENS: Can I just add something even though this is not technically within my area of expertise. I have done some work on DSM programs, a tiny fraction of Mr. Chernick has. That has include -- included looking at program savings and estimating program savings, only -- only a few such studies. And we specifically put into our calculations an adjustment factor for what would have happened anyway without the program. That was normal practice.

DR. HUGH GRANT: I'm just reading academic literature that did a pretty robust econometric study of US data for three hundred and forty (340) utilities using panel data with eleven (11) years included in it, and finds that the utilities reporting average costs of DSM at two (2) to three (3) cents. And when they control for every other factor they're getting an average cost between six (6) and twelve (12) cents, so.

But it's -- one (1) thing is the -- the data's probably about -- you know, it's stretching over a period that's -- it was five (5) years old at the time of the study. So there may have been improvements in the form of the monitoring, but it would be -- it's interesting.

MR. PAUL CHERNICK: Well, the other thing is, I don't think that that's -- I -- I believe I've seen that study and that basically it was trying to look just at the reported sales of a -- of each utility and their reported energy efficiency savings, and somehow tried to -- to project what their sales would have been if they had been just like all the other utilities in the country. And I think that was a very ambitious econometric exercise, and one (1) that probably didn't work very well.

DR. HUGH GRANT: Different study. That's not what they did.

MR. PAUL CHERNICK: Okay.

MR. SVEN HOMBACH: I'm not sure if Manitoba Hydro has any questions arising out of the examination?

RE-CROSS-EXAMINATION BY MS. PATTI RAMAGE:

MS. PATTI RAMAGE: For Mr. Stevens.

Now, Mr. Hombach got you to say that you agreed with La Capra's wind costs.

Do you recall that? Their assessment of wind costs?

MR. WESLEY STEVENS: We're talking -- there's -- okay. There are two (2) things in La Capra's report. One (1) is a levelized cost of energy calculation, a -- a questioning of when specific costs, and there's also a revision to the NPV calculation.

Which one are you referring to?

MS. PATTI RAMAGE: I was looking at the average cost of the project. Your report says nineteen hundred and forty dollars ($1,940) per kilowatt?

MR. WESLEY STEVENS: Yes. As I said, I think directionally La Capra and Power Advisory agree that the appropriate costs are lower than Manitoba Hydro's. We -- we have different opin -- somewhat different opinions about the exact number that should be used.

MS. PATTI RAMAGE: I -- I just want to clarify that because La Capra is two hundred dollars ($200) -- roughly two hundred dollars ($200) a kilowatt less than yours.

MR. WESLEY STEVENS: Yes. That's -- I believe their number came from the same study that I

used, the 2012 Department of Energy Study. They used, as I -- as I used in our report, they used a Midwest number. I've decided to back off from that a bit. I just didn't feel absolutely sure that that was the right number to use.

MS. PATTI RAMAGE: I'm going to correct you there. I -- I believe they used what was called the Interior number, and that would include states like Texas and Mex -- and New Mexico.

Do you recall that?

MR. WESLEY STEVENS: You are right. I believe that they called it -- I -- I've been call -- I've been saying -- using the word 'midwest'. And yes, I believe it is Interior and it stretches -- stretches all the way down to Texas.

MS. PATTI RAMAGE: Right. And your number uses the average of the states, which includes the west, California --

MR. WESLEY STEVENS: Yes.

MS. PATTI RAMAGE: -- the southeast, Florida, the Carolinas, the northeast, New York, Main, the Great Lakes?

MR. WESLEY STEVENS: Yes.

MS. PATTI RAMAGE: So it includes all of those?

MR. WESLEY STEVENS: Yes.

MS. PATTI RAMAGE: And each one of those regions would have differences -- would be distinct from Manitoba, correct? Each area has their own distinct attributes and --

MR. WESLEY STEVENS: Yes.

MR. PAUL CHERNICK: And in particular, in some of the areas that you've mentioned the wind resource is concentrated on mountains and ridges, places that are much more expensive to -- to work on and around than the plains of North Dakota, or the Texas Panhandle, or -- or Manitoba.

MR. WESLEY STEVENS: And I'd like to add that. What I would love to see or have seen is a reasonable cost -- a reasonable estimate for a North America wide cost, and then an adjustment factor for -- for Manitoba; why -- how is Manitoba different from the North America as a whole. That would have been a very reasonable approach.

MS. PATTI RAMAGE: So if I understand you correctly, your preferred approach would be one that's taken the North America-wide costs and adjusted for Manitoba, something that was specifically done?

MR. WESLEY STEVENS: Yes. Starting out with a reasonable number for the North America-wide

cost.

MS. PATTI RAMAGE: Okay. Thank you. We have another request. And this is just like the video. I've never done this before, but -- and I don't know if it's possible. But we were very interested in the study that Dr. Grant was referring to, and I'm not sure if he's able to provide us; that's not one we're familiar with.

We'd like to -- Dr. Grant to consider an undertaking to let us know what that study is.

MR. SVEN HOMBACH: I admire your procedural creativity, Ms. Ramage. And I'm certain that is something that -- the name of the study is something that can be provided.

DR. HUGH GRANT: Yeah, just in my literature review right now is the sum of two (2) papers, so -- but certainly I will. Hard copy.

MS. PATTI RAMAGE: Thank you.

THE CHAIRPERSON: I want to go back to the risk issue. This is back -- I wonder if Diana could bring up slide 51.

I'm a bit concerned about this one because it's one thing to be right about the cost of DSM, or wrong about the cost of DSM, relative to an alternative, but what we're doing here is we're, in

theory, supplanting regular generation for DSM.

Now, if you're wrong about the ability to achieve expected DSM savings, you haven't got generation. In other words, if you're saying on a portfolio level we're going to supplant generation by using DSM, so if you're right, then it turns out to be a good decision, but if you're wrong, you didn't achieve the savings you expected, you don't have generation. You have no alternative. You know, there isn't -- there isn't something you can look to to supplant the expected DSM savings.

So it seems to me that that's a far more significant risk than just a cost issue.

(BRIEF PAUSE)

THE CHAIRPERSON: And correct me if I'm wrong. I mean, because we are talking at the -- you know, we're kind of mixing decisions at the individual program level with portfolio decisions. And so being wrong at the portfolio level is one (1) thing. Being wrong at the generation level is quite another thing.

MR. PAUL CHERNICK: Well, the point I was making was, even if you thought that the DSM had some significant probability of not working for some

reason, you would find that out within the next year or two (2). So that might mean that if -- if you decided that DSM was sufficient to meet requirements and that Keeyask was not needed and not cost effective for exports, and then two (2) years later you found that for some reason these models of energy efficiency programs that have worked in other places can't be scaled up to work in Manitoba, and you're getting much lower savings, then you can go back to the generation alternative. And that may delay the beginning of the sale by a year or so.

Remember, you're going to get something out of the DSM. It's not like every measure is going to fail, every program is going to fail.

But let's suppose that you get 80 percent of what you expected. That's going to mean that after five (5) years you're one (1) year behind schedule on the energy efficiency. And if that's enough to make the difference about -- in sufficiency, then in the process you can decide to develop a wind farm to give you a little bit more energy; you can sign a purchase contract with somebody in MISO to give you energy and perhaps sell them back capacity; you can start Keeyask, if that's what you've deferred.

So DSM is not this kind of all or

nothing prospect that you have with a major power plant where you hope to be done in five (5) years but maybe it's seven (7) years, and you hope that it's going to cost 5 billion but it cost 7 billion. Or -- it's something that you can monitor year-by-year and decide whether conditions have changed and you need to do something different. And you'll -- you may have some -- some little gaps that you need to fill in, but it's -- it's not a disaster.

It's not like you're going to wake up in December of -- of 2019 and realize, Oh, my goodness, all that energy efficiency we thought we were going to get since 19 -- since 2014 hasn't materialized, and we're several percentage short on our energy supply. It's something that develops gradually and you can adapt to over time.

(BRIEF PAUSE)

MR. RICHARD BEL: Promise, last question. Those states -- there was a report introduced by Hydro yesterday -- I don't think we need it. Anyways, those states that have mandated incremental DSM programs, the report seems to suggest -- or suggests that they meet their targets very close

to their targets in most cases.

Is that your experience if you separate out utilities that have mandated programs, as opposed to ones that aren't mandated? Mandated and monitored, let's say.

MR. PAUL CHERNICK: M-hm. I think there have been -- been some situations where utilities have far exceeded the -- their targets. Often what happens is that there's a -- an interplay -- a collaboration of some sort between maybe the regulators or the equivalent of the -- of the energy ministry, environmentalists, consumer representatives, who look at the options and bring in the consultants to design a program and say, Yes, we think that you can get a hundred gigawatt hours of savings over this time period, and that becomes the target because they've put together the programs and they can see how they could do it.

And then the utility actually has to go out and hire the right contractors, and write good educational materials for the -- for the trade allies, and twist the right arms to get the -- more efficient equipment into the stores, and so on, but it's something that they've already seen a path to do. And if they're being pushed hard, they're not going to be

able to beat that by a whole lot. And if they're watching out for their shareholders, they're not going to agree to targets that are much more than they can -- they can achieve. So it wouldn't surprise me that for -- in many states, in particular, the -- the targets and the -- and the achieved values tend to be pretty close, because it's based on a -- a fairly detailed projection of what they can get.

There are other states that basically say, Give us .75 percent savings or else we'll get annoyed with you. And the utility says, Well, we don't want our regulator annoyed with us, so let's -- let's beat that by a little bit so we look good, but we did -- we really aren't committed to doing this and that's all we're going to do. So you have that kind of situation as well.

MR. RICHARD BEL: And you've seen that -- you've seen the -- the Dunsky diagram with the Manitoba Hydro DSM curve? It rises up to 3 percent and then it falls off in 2018, and then he counterposes his on, the incremental 1.5 percent -- or 1.3 percent a year. So the -- that's a troubling diagram, because it's -- it looks like two (2) different views of what DSM is.

So that pattern -- the Hydro pattern,

and I'm assuming it's achievable. I'm just saying, is that a -- a typical pattern of DSM implementation or...?

MR. PAUL CHERNICK: No. I -- it's -- it's very unusual. And I -- I can't really think of another example that -- that's quite so vivid in terms of a utility saying over and over again, We can do a lot in the next few years, but then there's nothing after that.

And it -- it looks like the Utility is -- is willing and interested in doing some energy efficiency in the near term, but is reluctant to interfere with long-term construction plans by committing to a long-term energy efficiency program, so the numbers always go down.

And there's never a real explanation of why the numbers go down, and there are always these illusions to -- to rate effects, or, Oh, you've run out of opportunities, but there's never any data, any real analysis to back that up in -- that I've seen anyway.

MR. RICHARD BEL: Okay. I'm -- I'm out. Thank you. Thank you.

THE CHAIRPERSON: I think that completes the questioning from the -- from the panel. So I think that we'll probably allow the witnesses to

stand down, so we can have the Manitoba Hydro panel move over. Before you -- before we -- before the departure of the -- of the witness, I'd like to thank you, Mr. Chernick and Mr. Stevens, as well, for your contribution to the proceedings of this panel and -- and the work you're likely to do in the future.

So thank you very much and have a safe trip home, both of you. Thank you.

(PANEL STANDS DOWN)

MR. SVEN HOMBACH: Before we disband for the day I was hoping to briefly address an administrative matter. I've had an opportunity to speak to Mr. Orle during the break who has advised that tomorrow there will not be any MKO presenters here. MKO presenters will be fielded in Thompson on the 14th during the presentations day in Thompson, which means we can start with Mr. Bowman immediately in the morning tomorrow.

That likely will mean that Saturday morning will not be necessary for that panel to sit. That is to be seen. There will also be a presenter at 8:45 in the morning.

THE CHAIRPERSON: One (1) presenter or

two (2), Mr. --

MR. SVEN HOMBACH: There's a presenter at 8:45 and another one at lunch tomorrow. And I see Mr. Hacault is in the back wanting to address Mr. Bowman, no doubt.

MR. ANTOINE HACAULT: Thank you very much. Mr. Bowman will be ready to present at nine o'clock. The point I wanted to address immediately is we had, in anticipation of his presentation, made a pre-ask of Manitoba Hydro with respect to the plans and pathways. And we're hoping that Manitoba Hydro can address that issue before tomorrow morning, so that -- that we can have that information before we start our presentation.

So, just to let you know, it was made last week and I think they're -- they may be able to do that, but I wanted to advise all present that we had made that pre-ask.

MS. PATTI RAMAGE: Perhaps Mr. Hacault can clarify because I believe Manitoba Hydro emailed that information. Are you just simply saying you want -- it was emailed this afternoon. They're -- are you suggesting you want paper copies distributed by Manitoba Hydro?

MR. ANTOINE HACAULT: Well, we can

distribute them, but it would be useful if there would be a short explanation with respect to the results of that pre-ask.

MS. PATTI RAMAGE: I'm sure we can accommodate that. We're just moving faster than I can keep up right now of throwing information and trying to satisfy people, so.

MR. SVEN HOMBACH: Ms. Ramage, why don't the lawyers talk to you in the break, and then we can regroup in a few minutes.

MS. PATTI RAMAGE: I think it's fairly straightforward. Mr. Wojczynski can go on the mic first thing in the morning to -- to file that as an exhibit.

THE CHAIRPERSON: I don't know if Mr. Hacault heard that. Did you hear that? Did you want to know...

(BRIEF PAUSE)

THE CHAIRPERSON: Is it possible for Mr. Wojczynski to address it right now?

MS. PATTI RAMAGE: Yeah, it's just a matter of copies. I -- I didn't realize Mr. Hacault needed it for before we could get started.

THE CHAIRPERSON: Why don't we take a break and -- and then we can have copies made -- so take ten (10) minutes.

--- Upon recessing at 4:14 p.m.

--- Upon resuming at 4:24 p.m.

THE CHAIRPERSON: I believe that everyone's in position, so we will resume the proceedings. I'd like to thank the -- the members of the Hydro DSM panel for coming back, and we had some questions that we wanted to -- to have addressed.

And so I'll turn the microphone over to -- to you, Mr. Hombach, or is it Mr. Williams?

MANITOBA HYDRO PANEL 3, RESUMED:

DALE FRIESEN, Previously Affirmed

LLOYD KUCZEK, Previously Sworn

LOIS MORRISON, Previously Sworn

ED WOJCZYNSKI, Previously Sworn

MR. BYRON WILLIAMS: I just have a humble request, and I'm not sure it's often that My Learned Friend, Ms. Ramage, and I think the same way, but we're certainly appreciative of getting the link to

the -- the article Board member Grant was referring to.

I know in past proceedings the Public Utilit -- like, the payday lending proceeding, for example, the Public Utilities Board shared a -- had a list of res -- research that it -- that it had been gathered independently by its staff and that it -- it had referred to -- or that it was reading.

And -- and I simply make a suggestion, if the Board was so inclined, it would be -- it would be helpful to parties if there is a -- a list of -- of kind of documents -- and I leave that for your deliberations, but we found it helpful to see what else the Board was referring to.

THE CHAIRPERSON: I think that's a fair request, and we'll certainly consider it.

And, Mr. Hombach, please.

MR. SVEN HOMBACH: Thank you, Mr. Chairman, and good afternoon to the members of Manitoba Hydro's load forecasting and DSM panel. I bet you thought you were done. I do apologize that you're not.

A lot of new evidence was filed since you were examined by all of the parties at the end of March, and the panel, in listening to the recent evidence and in reviewing the new evidence that has filed by Manitoba Hydro, had a number of follow-up

questions.

Procedurally, the -- the panel is in position to request that Manitoba Hydro panel would be called back. I've spoken to Ms. Boyd, and it appears you're still sworn as witnesses, so you won't have to re-swear an oath.

The panel has decided that questions will be asked primarily though Board counsel and then certainly afterwards if Intervenors have any follow-up questions, they'll will be given an opportunity to address them.

Before we get started, I do understand that Manitoba Hydro would like to speak to the pre-ask of MIPUG?

MS. MARLA BOYD: Thank you for picking up my little cue. I do have a number of things that have been circulated to be filed. So the -- there's only the last one that the Mr. Wojczynski will speak to very briefly, but just to keep the record up-to-date, you're aware our -- our staff has been working very hard to try and put together the information that we were looking for in your list of information. So there's a series of exhibits that I'd like to introduce. They are the product of long nights and short weekends. And Mr. Miles tells me he doesn't cry,

but I would have said, Blood, sweat, and tears.

So I suspect I'll be telling you something very similar again tomorrow when we plan to file some financial analysis. But what I have here is the economic analysis. The first one is Manitoba Hydro Exhibit 104-3-2, which is the supply and demand tables for Plan 4. That's Keeyask19/Gas40/250 megawatt line hypothetical with DSM Level 2.

--- EXHIBIT NO. MH-104-3-2:
Supply and demand tables for Plan 4

MS. MARLA BOYD: The second one is Manitoba Hydro Exhibit 104-3-3, the supply and demand tables for Plan 12, DSM analysis K19 -- Keeyask19/Conawapa40/750 megawatt line and DSM Level 2.

--- EXHIBIT NO. MH-104-3-3:
Supply and demand table for Plan 12

MS. MARLA BOYD: The third one is Manitoba Hydro Exhibit 104-4-3. This is the economic summary tables for Plan 4 and at the 5.4 and 4.65

percent discount rates.

--- EXHIBIT NO. MH-104-4-3:
Economic summary tables for Plan 4 at the 5.4 and 4.65 percent discount rates

MS. MARLA BOYD: Next is Manitoba Hydro Exhibit 104-4-4. That is the economic summary tables for Plan 12, again using the 5.4 and the 4.65 percent discount rates.

--- EXHIBIT NO. MH-104-4-4:
Economic summary tables for Plan 12 at the 5.4 and 4.65 percent discount rates

MS. MARLA BOYD: Next is Manitoba Hydro Exhibit 104-15, revision 3. This is an update to our Exhibit 104-15, page 2, for Plan 12.

--- EXHIBIT NO. MH-104-15-REVISION-3:
Update for Plan 12

MS. MARLA BOYD: Next is Manitoba Hydro

Exhibit 104-16, revision 3, again, an update to our Exhibit 104-16, page 2, for Plan 12.

--- EXHIBIT NO. MH-104-16-REVISION-3:
Update for Plan 12

MS. MARLA BOYD: Finally, we have revision 4 for Manitoba Hydro Exhibit number 171. This is an update to page 2 of Manitoba Hydro's Exhibit 171, again, for Plan 12, showing Level 2 DSM added to the chart.

--- EXHIBIT NO. MH-171-REVISION-4:
Update for Plan 12

MS. MARLA BOYD: And finally, is the diagram that is an update to Figure 14.2 from Manitoba Hydro's filing. I tell Mr. Wojczynski that this is my picture of how engineers think. I'd propose that it be marked as Manitoba Hydro Exhibit number 192.

--- EXHIBIT NO. MH-192: Update to Figure 14.2

MS. MARLA BOYD: It was requested by MIPUG. And I understand they're looking for a larger

version of this to be discussed tomorrow, so we will have larger versions of it produced tomorrow on a storyboard for the room. But in the meantime, if Mr. Wojczynski can perhaps walk you through how engineers think, it will help people understand the -- the diagram that's there. And I understand it will be used tomorrow.

MR. ED WOJCZYNSKI: Our wonderful court reporter doesn't think I can do this in two (2) minutes. Has someone got a stopwatch? This was the pre-ask from MIPUG. They ask that Figure 14.2, which showed all five (5) pathways, that, recognizing how things have evolved, they ask that we, if possible, update it, and also provide these storyboards that will facilitate Mr. Moore's presentation, direct evidence tomorrow.

What we have done here is -- first of all, it's based on Exhibit 104-1 loosely in terms of the capacity energy tables and the like, assuming DSM Level 2 in the pipeline load, 2013 load forecast. And recognizing the reality of where we are today, what we have done is combined pathways 1 and 2, recognizing that one (1) of the decisions possibilities or paths to go down is in the -- is at this point in time not to decide to advance Keeyask or to commit anything to

construction or any -- and to drop the export sales that we have signed, the -- the 250 MP and the 308 WPS, by not committing these and not proceeding with the projects.

Effectively, we lose all those options. And then down the road, we would have to make decisions on what would be needed for domestic load. Based on the particulars assumed in these capacity energy tables, we would need something in 2024. And that means in 2019, you would have to -- Manitoba Hydro would have to commit construction of Keeyask, which would mean backing things up; that roughly three (3) years from now we'd have to restart the NFAT process all over again for that.

There -- a choice that could be made in 2019 is we would commit Keeyask for that 2024 in-service date, or we could decide not to commit Keeyask and instead go with gas generation. And we recognize all kinds of other things will happen in that time: DSM, continued negotiation of export sales, load growth.

And the little blue sort of caterpillar that's at the bottom there is meant to reflect that every year we were doing our review of our load forecast, the latest DSM information, latest export

contracts, all those things, what this is depicting is the assumption that the load forecast doesn't change, the DSM level doesn't change, we don't get any new export contracts, et cetera.

It's a simplification of reality, because otherwise you have a thousand lines here. So this is assuming that we go ahead as per what is in Exhib -- Exhibit 104-1. Then in '24 you could build the gas turbine and then you'd have to make choices around then: Do we later on put in Conawapa as well, do we later on put in Keeyask, or do we not protect those options and commit those options and go with gas or something else for the later date?

So that -- those are pathways -- Pathway 1 and 2 which evolve into Pathway 1 or Pathway 2, as we described before. And these include Plans 7 and 8. They include Plan 1. They also include the Gas/Keeyask Plan that we have talked about in the hearing process and is in the IR process, LCA/Manitoba Hydro I-336.

Then we drop in the bottom here to Pathway 4 and 5, which at the front end has -- has now combined into one (1) pathway, because fundamentally, the choice is, do we adv -- if that pathway occurs -- if -- if a choice is made to advance Keeyask to 2019 and proceed with the 750 interconnection line. We

already have the MP sale signed. We have the WPS sale signed. And effectively, it will -- by the time the decisions are made, December, all those sales will -- not only would they have been signed, but all the approvals will be in place.

And what they are waiting for is the conditions precedent as to whether or not the generation gets built or not, because those are the conditions precedent, and the interconnection line. Assuming that we -- that this -- these choices are made, then the -- the 750 line is expected to receive approval by 2017, both in Canada and the United States. Then Keeyask comes into service in 2019, the tie-line a year later.

You see below that again we have that blue caterpillar. And that is every year we would review again all those same issues of DSM and load and everything else, whether the Great River Energy, SaskPower, NSP, or some other contracts we're negotiating, whether they come to fruition, what are the capital costs, what happens -- and all of those things would be reviewed.

And in this situation here what we're looking at now in 2022, we would have to make by then a decision if we want to get Conawapa in time for meeting

the WPS sale requirements. So -- and if you just stay on that line you carry on, Conawapa comes in, in 2030 and just in time to meet the WPS sale contract requirements.

In this one, the assumption is that in all those reviews earlier, in the blue caterpillar, there were no new export contracts and nothing that would cause Conawapa to come earlier. But this assumes we would have been protecting Conawapa for an earlier in-service date, but that nothing new gets negotiated successfully, and that's sufficiently attractive for proceeding and that we stick with just the -- the Preferred Plan, Plan 14, and we end up having Conawapa 2030 in that case.

In that 2022 time frame, we have a choice not to commit Conawapa. Remember, if you commit Conawapa, the WPS sale then goes ahead, because that was the pre-condition. If we do not commit Conawapa then or earlier and we follow the end, which is the 'no' out of that green decision, that -- then you get that purple thing that says, "Renegotiate WPS sale."

At that point, as Mr. Cormie, and myself, and Ms. Flynn has discussed, we would be in a position to discuss with any of the WPS whether we mutually agree to carry on with having gas generation

or whatever, meet the requirements of the energy and capacity that would be required for that sale.

And in that case you'd have a -- if we -- if it was successful on our side or their side, you get the 'Y', the 'yes', and we have the Keeyask/Gas Plan, which is Plan 5. Or if due to Manitoba Hydro not wanting to or WPS not wanting to, then you go with the 'N' on the top and you end up in Plan 6 or Plan 12, where you have Keeyask and -- and Gas eventually, but not on -- not on the time frame of this chart. And that's Plan 6 or Plan 12. That is our sort of depiction of the decisions we have and the flexibility in the future to change as we go along.

Obviously, there's a whole bunch of other in-service date possibilities. There's also a few started. Conawapa and a year later you wanted to cancel it or something, you could always do those things. But we're not trying to get into the thousand and one (1,001) possibilities there actually could be. We just -- these are just a general indication. Thank you.

THE CHAIRPERSON: Now, just -- just a question here in respect of looking at the very first pathway, Keeyask 2024.

That date was selected based on pipeline

load?

MR. ED WOJCZYNSKI: Yes, as per the -- some of the -- the analysis we've provided in -- in Exhibit 104. The assumption here with the 2013 load forecast, DSM Level 2, and the pipeline load. Recognizing that the load forecast could be higher or lower, DSM could be higher or lower, pipeline load could be higher or lower; I mean, there's all those possibilities.

But we have the capacity energy tables in Exhibit 104 for this one (1). We've provided economic analysis of some of this. So that's why we -- we chose to use that out of the many possibilities.

(BRIEF PAUSE)

CONTINUED CROSS-EXAMINATION BY MR. SVEN HOMBACH:

MR. SVEN HOMBACH: Ms. Ramage earlier made reference to the Energy Savings Act. And if I could ask Ms. Villegas to put Section 7 of that statute up on the screen for a moment. Since this panel has last been examined, Manitoba Hydro has filed its two (2) Power Smart plans. It's filed the three (3) year plan as Exhibit 153, and the fifteen (15) year supplement as Exhibit 180.

Were both of these prepared in consultation with the minister under the Energy Savings Act?

MR. LLOYD KUCZEK: Well, the thr -- the -- the overall plan was prepared in consultation. We -- we decided -- the first year we did it we presented the fifteen (15) year plan and it was -- as a draft. And it was decided that their preference was to have a three (3) year plan. So that -- that's how that one (1) evolved.

And then after we concluded what would be in the three (3) year plan, we suppl -- or -- consequently later we developed the fifteen (15) year plan, but it was more of a formal -- it was more of a formal process just to document what was in the fifteen (15) year plan previously with some adjustments. So -- and it was done later on.

This year we -- we consulted with them again to -- to see if they wanted a three (3) year plan and a fifteen (15) year plan as well. And it was concluded that we would proceed with the three (3) year plan, and so we developed that. And then subsequent to that we developed the fifteen (15) year plan.

MR. SVEN HOMBACH: So just to clarify, the province asked you to develop a three (3) year

plan. Manitoba Hydro then developed a supplementary fifteen (15) year plan?

MR. LLOYD KUCZEK: Well, the issue was what -- what period of time they wanted to focus on. And their preference was to focus on the three (3) year plan. And so that -- that was the -- the conclusion of our consultations to develop a plan in accordance with the Act. And -- and the fifteen (15) year plan we developed then and -- and provided it to government as well, because we needed it for integrated resource planning purposes.

MR. SVEN HOMBACH: Has Manitoba Hydro ever considered going with a longer range plan, such as some other jurisdictions are doing? For example, the Ontario Long-term Energy Plan?

MR. LLOYD KUCZEK: We've had some brief discussions, but generally we've had a -- I believe we had a twelve (12) year plan at one (1) time. We extended it to fifteen (15) years. It wasn't always fifteen (15) years. It was a ten (10) year plan, and -- and then we extended it to fifteen (15). And we've had some discussions, but we've -- we've concluded to -- it's best to stay with the fifteen (15) year for -- at this point.

MR. SVEN HOMBACH: You're no doubt

familiar with the slide from Mr. Dunsky's presentation that shows Manitoba Hydro's incremental DSM savings going up quite rapidly and then going down.

Is that an intended effect of the plan, or is that simply a side effect of the measures that you focussed on?

MR. LLOYD KUCZEK: Mr. Dunksy's diagrams were based on the information that he had available, and what -- what we -- I have here, and we'd like to provide you with, is a -- a graph that depicts what's actually in our 2014 Plan. So the information that Mr. Dunsky had -- was -- it was based on the Level 2 DSM numbers that were provided, but that wasn't our -- what ended up being within our approved plan. So the peak that you'll see in Mr. Dunsky's diagram will not be as peaky, for example.

If you -- if you had the information in the 2000 -- the approved plan, it would show that. The other thing that it would show is is that in the longer term period, it's -- doesn't drop off as much.

MR. SVEN HOMBACH: Did you say you have a chart available at this point? Could it be put on the screen?

(BRIEF PAUSE)

THE CHAIRPERSON: I'm sorry, Mr. Kuczek, the -- the data that Mr. Dunsky used for his graph was...? What time frame are we -- prior to the Plan? The...

MR. LLOYD KUCZEK: We -- we can't duplicate exactly what Mr. Dunsky developed, but we assumed that he used the -- the data that he had available from the Level 2 DSM, and then he added the codes and standards from our 2013 plan. So the codes -- energy savings that -- that are going to be achieved through Codes and Standards got adjusted considerably in our 2014 plan so that it -- that explains the difference in the longer term.

MS. MARLA BOYD: Sorry to --

MR. LLOYD KUCZEK: We --

MS. MARLA BOYD: -- sorry to interrupt. I'm just wondering if we should mark that as an exhibit before I forget. It would be Manitoba Hydro 180 -- 183 -- 193. Thank you.

--- EXHIBIT NO. MH-193: Manitoba Hydro's chart

CONTINUED BY MR. SVEN HOMBACH:

MR. SVEN HOMBACH: Thank you, Ms. Boyd. So if I'm reading this chart correct, then Hydro

projects that after 2022, there's going to be annual incremental savings in the approximately 1 percent range to 2028?

MR. LLOYD KUCZEK: Correct.

MR. SVEN HOMBACH: Has Manitoba Hydro given any thought as to what's going to happen beyond that date, whether that's going to be extended at a similar level?

MR. LLOYD KUCZEK: The component from the Codes and Standards should extend beyond that, and it depends on which of the -- which Codes and Standards that we're referring to. I'm -- I'll just give you an example which will help explain things.

So -- so when we work towards modifying the Codes and Standards of new construction in the -- in the commercial sector, for example, and once you've got that in place, what happens as you go forward into the future is every new building that gets built, you -- you capture the -- those incremental energy savings that result from that code going into the future, so every year you will capture that. So that's why you see the flatlining into the future a significant...

(BRIEF PAUSE)

MR. LLOYD KUCZEK: So a significant component of the savings at the back end is related to Codes and Standards.

MR. RICHARD BEL: Could I ask -- can I just jump in, because it's about --

MR. SVEN HOMBACH: Absolutely.

MR. RICHARD BEL: -- it's about the forecast. So when I was looking at this again last night, a question that jumped up at me was when you integrated the DSM Level 2 into all the net present value economic analysis plans, am I correct in assuming that after 2023, in that analysis, DSM drops to point five (.5) forever? So is it this one (1) hit in the DSM Level 2 economic adjustments, or -- or is it continuing along at 1 percent? I'm just curious.

(BRIEF PAUSE)

MR. LLOYD KUCZEK: You -- that's the graph that Mr. Dunsky developed that showed the point five (.5), I believe. So we couldn't recreate that -- that graph that Mr. Dunsky provided, but again, you know, in fairness, I mean, Mr. Dunsky didn't have -- we just filed our 2014 Plan, I believe, the day before.

MR. RICHARD BEL: Yeah, I was clear on

that. I was asking about when -- we're seeing the plans were updated in the economic analysis for DSM Level 2. What level of DSM was carried forward into the future? Was it point -- point zero-five (.05)? Because after 2018, the original DSM level dropped down, and is that what was carried forward, or did it drop to zero, or...?

CONTINUED BY MR. SVEN HOMBACH:

MR. SVEN HOMBACH: And -- and maybe if I can try to clarify. Manitoba Hydro provided economic analysis of various plans with DSM Level 2 over a seventy-eight (78) year timeframe, so presumably, for every single year a DSM assumption was made. We're not currently aware of what assumption you're making after the end of the fifteen (15) year Power Smart Plan going forward for purposes of that economic analysis.

So if that data could be provided either right now or by undertaking, it would be helpful.

MR. ED WOJCZYNSKI: We did provide the capacity energy tables for the DSM Level 2, and that provided the load and the DSM in it. Now, I don't have a handy graph for that, but that is part of the exhibits we have filed. Let me just see if I can -- even some of the ones we filed today.

THE CHAIRPERSON: It would be simpler, I think, Mr. Wojczynski, if we could have an undertaking from Manitoba Hydro to provide the information to address Mr. Bel's question. I think that'll be best for you and best for us so that we have a complete answer.

MR. ED WOJCZYNSKI: So the undertaking is -- or, Lloyd, do you want to say something? Do you have something there?

MR. LLOYD KUCZEK: Well, I just want to be -- we have to be a little careful, because you need to look at both the load forecast and the DSM numbers, because we -- we've provided you with a modified load forecast, and within that, we provided you with an adjustment due to the codes.

So that adjustment got transferred into the Power Smart Plan that we developed. So you got to look at both, and you kind of have to understand what's going on.

THE CHAIRPERSON: Okay --

MR. LLOYD KUCZEK: If --

THE CHAIRPERSON: -- and that's fair. I understand the difficulties involved. I just want to make sure that we have a complete answer. I mean, you're -- you're projecting -- this graph is suggesting

a 1 percent savings until 2028/'29.

And I -- I guess the question is what -- what's happening beyond that, assuming DSM Level 2, and so on? So I -- I think a, you know, an undertaking from your part would be satisfactory for us.

MR. LLOYD KUCZEK: We -- we'll provide a -- an undertaking to provide you with the information that the assumptions for DSM beyond '28/'29 that were used.

--- UNDERTAKING NO. 137: Manitoba Hydro to provide information on the assumptions for DSM beyond 2028 and 2029

CONTINUED BY MR. SVEN HOMBACH:

MR. SVEN HOMBACH: Has Manitoba Hydro prepared an annual report under Section 8 of the Energy Savings Act yet?

MR. LLOYD KUCZEK: Our first requirement under the Act will be March 31st, 2015 -- '15, yes, to do that.

MR. SVEN HOMBACH: So it hasn't been prepared yet, so that's going to be prepared closer to the deadline?

MR. LLOYD KUCZEK: It usually takes us close to a year to actually prepare that report, but having said that, we prepare -- without the legislation, we prepare that report every year anyways.

MR. SVEN HOMBACH: Are you prepared to file the most recent report on the record of the NFAT if that has not been filed yet?

MR. LLOYD KUCZEK: We'll do that.

MR. SVEN HOMBACH: Thank you. That's an undertaking to file the most recent progress report on DSM on the record.

(BRIEF PAUSE)

MR. LLOYD KUCZEK: We'll provide -- provide that.

--- UNDERTAKING NO. 138: Manitoba Hydro to provide the most recent progress report on DSM

CONTINUED BY MR. SVEN HOMBACH:

MR. SVEN HOMBACH: Has Manitoba Hydro ever considered having an independent auditor evaluate DSM progress, as opposed to Manitoba Hydro evaluating

it internally?

MR. LLOYD KUCZEK: Yes, we've had a number of discussions about doing that, and you can do that for individual programs and you could do that for your entire program, or portfolio. It's a fairly expensive venture to do and we're currently hiring Mr. Dunsky to do a review of just the process component at this point of our Lower Income Program.

We have talked to BC Hydro, because they -- they went down that road within their processes and there's advantages and disadvantages to undertaking -- or using external evaluations, but they're usually fairly expensive.

MR. SVEN HOMBACH: You spoke of disadvantages. Is -- is really the main disadvantage price, or are there other concerns that you have?

MR. LLOYD KUCZEK: Price and resource commitments, because, you know, even when you hire somebody to undertake a deman -- or a market potential study, a DSM market potential study, it takes up a lot of resources internally to do that.

It would be the same thing with undertaking an external review and the dat -- we have the data. It would just be a question of working with an external consultant to explain what the data is,

provide them with the -- the information, and they would do their analysis.

MR. SVEN HOMBACH: Manitoba Hydro filed a table that indicated that there would be a positive NPV of going to Level 2 DSM and a drop off going to Level 3.

Does that mean that Manitoba Hydro considers Level 2 DSM to be economic?

MR. LLOYD KUCZEK: Correct.

MR. SVEN HOMBACH: In your view, does the Utility currently have the necessary infrastructure to deliver economic DSM or to, for that matter, deliver Level 2 DSM and, if not, what resources would be needed?

MR. LLOYD KUCZEK: We -- we believe we need some additional resources. And we have plans in place to -- to get those resources. And we've already moved down that path.

MR. SVEN HOMBACH: When you discuss additional resources, does that mean additional personnel resources, or is it really a matter of having the -- the funding available?

MR. LLOYD KUCZEK: We have the funding approved and we need additional resources internally. And we're also open to using external resources where

it makes sense, such as using the AKI Energy Organization that we've been working with with First Nations.

MR. SVEN HOMBACH: Okay.

MR. LLOYD KUCZEK: That's very helpful.

MR. SVEN HOMBACH: During the last GRA there was discussion about two (2) community DSM delivery programs. I believe they were called 'build', where people go door to door, specifically with respect to low income programs.

Is Manitoba Hydro considering using additional third-party organizations to assist it in delivering DSM programs?

MS. LOIS MORRISON: One (1) of the initiative -- yes, we are. We are -- one (1) of the initiatives recently approved involves a greater outreach in electric heat communities to increase the number of people uptaking insulation upgrades. So essentially, yeah. We are definitely going to be going out to the community.

MR. LLOYD KUCZEK: But -- but just to add to that, we currently do outsource some -- some of our programs today, like the Refrigerator Buyback Program. We're using an external entity to help us there. The Water and Energy Savers Program, we're

using an external organization there. Build and Beep, we've been working with them. Those are two (2) community-based organizations, but there's also the AKI Energy organization that we referred to, so.

Manitoba Hydro is open to working with an external party for any of our programs where it makes sense.

MR. SVEN HOMBACH: What do you currently actually see as the main barriers then to achieving DSM?

MR. LLOYD KUCZEK: Each program has different barriers. So that -- that would be -- to an -- answer that question in -- in general is -- is difficult. But the opportunities are out there and it's really a question of -- in getting customers to participate in the programs. In a very simple -- to give you -- provide you with a simple answer, in terms of financial constraints we have financial services that we offer customers through loans and our PAYS Program.

So that -- that addresses that concern. But even though that addresses the financial concern, there's all sorts of other barriers, you know, that customers have and they're just not motivated to -- to incorporate those measures.

MR. SVEN HOMBACH: Okay. Getting back for a moment to the chart that was introduced as Manitoba Hydro Exhibit 193.

Do I understand you correctly that Manitoba Hydro does see it as its mandate to pursue all economic DSM, or at least it sees it as its strategy?

MR. LLOYD KUCZEK: I would view it as a strategy, close to a policy, but it's our overall strategy.

MR. SVEN HOMBACH: So are you assuming then that after 2023/'24 there will not be any economic DSM available to achieve incrementally more than 1 percent?

MR. LLOYD KUCZEK: There's a lot of uncertainty to what is going to be available in that time frame. What's included in our pro -- our plan today is our best estimate of what we're going to achieve. And we've had discussions about whether or not there potentially could be more in that time period beyond there. And we do believe there could be.

MR. SVEN HOMBACH: And if you've heard Mr. Dunsky's evidence on new technology becoming available, it just might not be here yet. He used the example of CFLs versus LEDs for example.

Is there any specific reason that

Manitoba Hydro is more cautious in its projections?

(BRIEF PAUSE)

MR. LLOYD KUCZEK: You -- you know when -- to forecast when a -- and Mr. Dunsky threw out the examples of shale gas and the fracking as an example of what can happen in the future. And he's correct there. But that -- that's a disruptive technology event. And those are very difficult to forecast. And I wouldn't -- I wouldn't want to count on those things happening.

What we do is we monitor emerging technologies as -- as there's developments that take place. And we incorporate those opportunities into our plan as -- as the risks become lower. And we were more conservative in the past than we likely will be in the future.

An example would be the LED technology for residential applications and road -- roadway lighting and -- and commercial as well. We were monitoring that market. We didn't think it was going to happen as quick as it did, but it did. But that doesn't mean all opportunities will unfold quicker than what some people are forecasting, so.

MR. SVEN HOMBACH: Now, there's been

quite a bit of discussion during the course of the hearing as to whether DSM should be considered at the load forecast level or at the integrated resource plan level.

Is there any specific reason why Manitoba Hydro did not use DSM as a resource as part of a plan? Let's say, for example, DSM plus gas, or DSM plus wind?

MR. ED WOJCZYNSKI: I'd like to answer that one.

MR. LLOYD KUCZEK: And I'll supplement that answer.

MR. ED WOJCZYNSKI: Could we turn to Exhibit 104-16, please, page 2? The one we just did -- it -- I believe that was just done this afternoon.

(BRIEF PAUSE)

MR. ED WOJCZYNSKI: This is an integrated resource planning analysis of DSM along with the different supply options that were available to us in terms of gas and hydro.

MR. SVEN HOMBACH: So you're saying essentially DSM is part of all of the resource plans? That's...

MR. ED WOJCZYNSKI: Well, let me explain.

MR. SVEN HOMBACH: Sure.

MR. ED WOJCZYNSKI: If you take a look at the -- and I did try and explain this once when we were doing a number of undertakings and we didn't dwell on it a lot. But I think there's been a lack of appreciation of what this involves. So I think it would be worthwhile if we spent two (2) minutes on this.

MR. SVEN HOMBACH: We won't time you, Mr. Wojczynski. Please go ahead.

MR. ED WOJCZYNSKI: Now, first of all this does not have solar. This does not have wind mixed in. And we acknowledge that with a full scale IRP you look at all the options. And we did other analyses earlier that effectively screened those out.

And so this -- this analysis is -- is an IRP, but it's an IRP that looks at gas, looks at hydro, looks at interconnections with its associated imports, exports, and everything and looks at DSM levels that are different. We have the three (3) levels of -- well, actually if you look here and I'll explain how we do that.

We have under the DSM levels --

effectively we have four (4) levels of DSM. And then we have the different plans. And -- and you know the plans. I don't have to go through them all. And these are all comparable against each other. You'll notice that we have in the All Gas Base DSM we have a zero there. But all the others we have an -- an NPV number which is relative to that point.

And this is using the TRC analysis, so this is the -- the TRC analysis. We've talked about benefits and costs previously. So all of these can be compared against each other.

One of the concerns that people have expressed, and it's a -- it's a justified issue that you have to address, is it could be with one plan -- one mixture of supply options that DSM would be more attractive than in another supply option mix, or portfolio, or plan. They're all the same thing. A plan is really a portfolio.

And, so you can do that here. You can compare DSM Level 2 let's say with Keeyask/Gas versus at-base DSM, and you can compare it against having Conawapa, as well, and you can compare the numbers against each other. So if you -- and you look at -- look at the All Gas.

One concern might be that DSM looks

better in an All Gas scenario. So maybe DSM Level 3 would not look good in the Preferred Plan but maybe it would look good in an All Gas Plan. And if you did not do a full-scale mix of all the possibilities, you wouldn't have that information. This tells you, when you look at it, that you have the direct analysis of an NPV, and you can compare directly All Gas with Level 3 DSM against the Preferred Plan, or one of the other plans.

So you have a direct comparison of different amounts of DSM with different supply resources. Now, have we got every single plan with every single level of DSM? No. But we think that this is a reasonably sufficient amount of information to tell us that we have that -- that optimized mix.

MR. SVEN HOMBACH: That was helpful, Mr. Wojczynski, thank you. If we could go to Hydro Exhibit 95, slide 4.

(BRIEF PAUSE)

MR. SVEN HOMBACH: That is the chart that sets out the need for new dependable energy, and the need for new capacity under the various DSM scenarios, and the with and without pipeline load

scenarios.

To clarify, these dates do not assume new export contracts, do they?

(BRIEF PAUSE)

MR. ED WOJCZYNSKI: This does not assume new exports, no.

MR. SVEN HOMBACH: If the Minnesota Power contract, as well as the Wisconsin Public Service contract were included, what would be the need for new generation under a DSM 2 scenario -- the earliest in-service dates?

Is that something we can glean from the demand and capacity tables, or the demand and energy tables?

MR. ED WOJCZYNSKI: Sorry, could you repeat that? I --

MR. SVEN HOMBACH: Yes.

MR. ED WOJCZYNSKI: -- I missed one of your components.

MR. SVEN HOMBACH: If we make the assumption that the Minnesota Power and Wisconsin Public Service contracts were included under a DSM 2 scenario, what would be the earliest required date for

new energy and for new capacity?

And if Manitoba Hydro would like to address that by way of undertaking, I'd be happy to accept an undertaking.

MR. ED WOJCZYNSKI: We have -- you can get those right from the tables we just looked at, even the exhibit we just looked at where it has the in-service dates. And, so I could just look at that for one second.

MR. SVEN HOMBACH: Yes.

MR. ED WOJCZYNSKI: If you look here at Level 2 DSM and Plan -- well, we could look at Plan 5. In that one, with Level 2 DSM and it doesn't -- without the pipeline load, you -- you would need -- after Keeyask, you would need a new resource in 2031.

MR. SVEN HOMBACH: And -- and just perhaps let me clarify, Mr. Wojczynski. Plan 5 in Exhibit 104-16 assumes that Keeyask is being advanced to 2019 --

MR. ED WOJCZYNSKI: Yes.

MR. SVEN HOMBACH: -- and then deals with subsequent gas. My question was actually: If you assumed that there was no advancement in Keeyask to 2019, when would the earliest date for new generation be, assuming that those two (2) contracts are

continued?

MR. ED WOJCZYNSKI: Okay. And I think what you're asking me is a very particular question that, based purely on the capacity energy tables and nothing else, when would we first show a deficit of -- of capacity or energy in that scenario. That, I don't --

MR. SVEN HOMBACH: Yes, with the contract.

MR. ED WOJCZYNSKI: That information, I don't have, but I will answer the question in a more general sense. If we don't have Keeyask at the front end, we will not have the MP sale, and we will not have the WPS sale, because the whole contractual package with MP is that we have to have Keeyask to get the line and the pack -- and the sale.

But we can provide you the answer of when we first hit a dependable energy deficit, but that's a different question than, When would we need Keeyask?

MR. SVEN HOMBACH: I'm mindful that we can't go into CSI, Mr. Wojczynski, so I will tread carefully, but are you in a position to state whether that is something that -- that is written in stone, or whether those contracts could be completed if Keeyask

wasn't built? And if you can't answer it on the public record --

MR. ED WOJCZYNSKI: I can state that the contracts cannot be -- I can state at this point that the contracts cannot be fulfilled as the packages they are with Keeyask not being part of the mix already. I can point to one (1) particular thing, but I -- we may want to have a broader discussion that includes Mr. Cormie and Ms. Flynn.

But -- but as a first piece of information, I can point to the certificate of need with the -- the transmission line specifically states Keeyask being part of the package, because part of the benefits that Minnesota Power looks for and -- and the whole regulatory system are the benefits associated, not with just having the interconnection, but having the additional generation that provides the kind of benefit to the region, including assisting with wind, for example.

I also point to the condition precedent in the contract, the MP contract, 250 contract that has Keeyask. Now that is a condition precedent favourable to Manitoba Hydro, but it was part of the context for Minnesota Power, and there's some other elements that would be CSI that I can't get into.

(BRIEF PAUSE)

MR. ED WOJCZYNSKI: And maybe this is a topic that -- on the day, I don't know what day has been chosen yet, but where the finance and economics panel are back up. That -- and I believe there's going to be a CSI portion to that, that that, perhaps, might be a time to address that more fully.

MR. SVEN HOMBACH: I -- I agree with that suggestion. I certainly have a few more questions, but we'll leave those for the CSI panel.

THE CHAIRPERSON: But I guess that, you know, just to -- to address that issue in a public forum without delving into the specifics of the contract, there are some people out there who believe that you have sufficient power to supply that Minnesota Power without new generation, for example. Yeah. I -- I could recognize that it's contingent upon Keeya -- Keeyask/Gas and a new US interconnection, but there are people out there who believe you can supply that contract with existing resources and no intertie.

And -- and you are suggesting that it's a contract term, admittedly, but you have the power to be able to supply that contract, don't you?

MR. ED WOJCZYNSKI: Yes, there are -- there are two (2) different questions. If you just look at the amount of capacity in the energy tables, the amount of surplus power we have, and you look at the amount of power required for the Minnesota Power sale, with enough DSM, for example, and if the load forecast doesn't go up, then there could be enough surplus power, I'm talking about dependable power here, to meet the requirements, say, just of the MP sale. Let's -- let's leave WPS or any other sale alone.

But when MP are entering into the arrangement, including with the interconnection, they are doing so with the express interests in the package that includes additional hydro on Manitoba Hydro's system to help fill the tie-line, and also provide more general benefits to them, so -- as part of an economic package, and -- and a whole economic package is not just the sale in isolation by itself. I don't know if that helps.

MR. SVEN HOMBACH: Are you in a position, Mr. Wojczynski, to address on the public record whether the construction of Keeyask is a condition precedent for Minnesota Power?

MR. ED WOJCZYNSKI: We're -- I -- I think we're getting into the CSI portion. Mr. Cormie

is here. If...

(BRIEF PAUSE)

MR. ED WOJCZYNSKI: We know that a portion -- at least a -- a good portion of this is CSI, so from that point of view, it's probably better to have that full discussion there, but I -- but I -- I --

THE CHAIRPERSON: Well, you know, I think -- I think, Mr. Wojczynski, let me just intervene here just to make sure that we understand where we're going here. Like, what you tell us, we don't expect you to reveal any CSI. You -- you -- we expect you to talk in general terms so that all the Intervenors can hear you, and the public can hear you, and so on.

If you confirm it by going to CSI, we can delve into the contracts to confirm what you're saying, but for the standpoint of talking in general terms, let's -- let's have a conversation so that everybody can hear it and we can confirm your -- the details in a CSI portion.

CONTINUED BY MR. SVEN HOMBACH:

MR. SVEN HOMBACH: And for the record, Mr. Wojczynski, I don't believe that the condition

precedent on the Minnesota Power Contract are actually CSI. I believe those are set out in the public version, but perhaps your lawyers can confirm that. I can move on in the meantime.

(BRIEF PAUSE)

MR. ED WOJCZYNSKI: Perhaps the other questioning on the DSM could proceed and we have a small caucus to see what we can say in -- in this very important topic. It's not that we have any doubts that Keeyask is a condition of the MP -- arrangement for MP, but how we can explain that better than I'd explained it without getting into the CSIs is the issue. So maybe a -- a few of us could caucus and at least do -- do that to -- in a short while, while the DSM questions continue.

THE CHAIRPERSON: Speaking of shareholders, which you are through the government of Manitoba, we don't -- we want to -- we don't want to harm Manitoba Hydro competitive positions, so let's all agree on that point.

I -- I don't want anything about, really, the CSI being revealed here, but I -- I do want to have a general discussion in public about the issues

that you face, and -- and I think that everybody need -- - everybody deserves to hear that discussion, I think.

MR. ED WOJCZYNSKI: And I think Manitoba Hydro shares that. Our preference that we be able to have as much transparent discussion of that and the ability for the -- the general public, as well as the stakeholders, because the more we can share publicly, the more people will understand and accept and minimize what's in CSI, and we fully share that with you, Mr. Chair.

MR. BYRON WILLIAMS: Mr. Chair, if I just might say before Mr. Wojczynski disappears for his caucus, we certainly would like to ask him some questions related to the material that was filed today, which relates to both DSM and his -- the calculations. So I hope he's not disappearing for -- for too long.

MS. MARLA BOYD: I don't think he's intending to disappear at all. We'll just, at some convenient point in the -- the proceeding, take a bit of a break and come back and discuss it after.

CONTINUED BY MR. SVEN HOMBACH:

MR. SVEN HOMBACH: I can move on in the meantime. You referred to the demand and capacity tables earlier, Mr. Wojczynski, and I'd actually like

you to take you to -- to one of them. If we could go to Manitoba Hydro Exhibit 104-3, page 57 of the document? If we could zoom to the core page level.

(BRIEF PAUSE)

MR. SVEN HOMBACH: That was my musical interlude for the day. This is the table for the K19 Gas 750 Plan, Mr. Wojczynski, and can you please confirm that under the contracted exports, this includes the Minnesota Power and the Wisconsin Public Service contracts?

MR. ED WOJCZYNSKI: Yes.

MR. SVEN HOMBACH: And if I'm reading the table correctly, if you look at the 2025/'26 year, about two-thirds (2/3s) on the right side of the page, the new energy for -- the new capacity from Keeyask in that year would be 630 gigawatt hours.

Do you see that?

MR. ED WOJCZYNSKI: Yeah.

MR. SVEN HOMBACH: Sorry, the 630 megawatts. We're dealing with capacity now, not energy?

MR. ED WOJCZYNSKI: Yes.

MR. SVEN HOMBACH: And on the bottom

there is an exportable surplus of 648 gigawatt hours, sorry megawatt.

So slightly more than that?

MR. ED WOJCZYNSKI: Yes.

MR. SVEN HOMBACH: If we move over one (1) year to 2026/'27, we see that the exportable surplus is less than the 630 megawatts provided by Keeyask?

MR. ED WOJCZYNSKI: Yes.

MR. SVEN HOMBACH: So that means that under this scenario the earliest required in-service date for Keeyask for capacity would be 2026/'27, including the Minnesota Power and Wisconsin Public Service contracts?

MR. ED WOJCZYNSKI: Yes.

MR. SVEN HOMBACH: Leaving aside the contractual issue that we just discussed?

MR. ED WOJCZYNSKI: From a capacity point of view, yes.

MR. SVEN HOMBACH: Right. If you look in the middle of the page on the left side you see the line about contracted imports? Under 'base supply power resources'?

MR. ED WOJCZYNSKI: Yes.

MR. SVEN HOMBACH: Those are the

diversity agreements, are they not?

MR. ED WOJCZYNSKI: Yes.

MR. SVEN HOMBACH: Has Manitoba Hydro considered extending the adversity agreements beyond 2024/'25? That -- that would push back the in-ser -- the required in-service date for Keeyask, would it not?

MR. ED WOJCZYNSKI: And that would require -- Mr. Cormie could answer better than me, but subject to check I know we certainly talked about it, but it's also something we'd have to have negotiation with MSP about.

And --and my -- my understanding subject to Mr. Cormie confirming it is that that's something we would have with them when they're in the -- the time frame of thinking about that far into the future. It's also the time frame they are starting to think about the diversity exchange in that time frame. They'd also be thinking about extending the MSP sale which also terminates ar -- in 2020 -- after 2025, so.

MR. SVEN HOMBACH: For a moment let's go two (2) pages down to the energy table for the same plan. Page 59. And if we could zoom to the page level again.

The way I'm reading that chart, Mr. Wojczynski, from an energy perspective under this plan

the earliest required in-service date would be 2029/2030, so three (3) years after the required need date for capacity?

MR. ED WOJCZYNSKI: You've got --

MR. SVEN HOMBACH: Specifically -- let -- let me take you through it. If --

MR. ED WOJCZYNSKI: You're -- you're taking -- you're having -- you're subtracting Keeyask energy out?

MR. SVEN HOMBACH: Correct. If we look at the top right of the chart we see that in 2029/'30, Keeyask adds 3,003 gigawatt hours of energy?

MR. ED WOJCZYNSKI: Yes.

MR. SVEN HOMBACH: And if we go to the very bottom of the 2029/2030 year we see exportable surplus of 2,699 gigawatt hours?

MR. ED WOJCZYNSKI: Yes.

MR. SVEN HOMBACH: So less than Keeyask? If you go to the left one (1) year to 2028/'29, we see that the exportable surplus is actually more than the energy provided by Keeyask?

MR. ED WOJCZYNSKI: Yes.

MR. SVEN HOMBACH: So based on that, the earliest required in-service date from an energy perspective would be '29/'30?

MR. ED WOJCZYNSKI: Yes, that's what I was saying. You -- you're subtracting Keeyask out and coming to that conclusion, yes.

MR. SVEN HOMBACH: Given your comments about the need to consult with Mr. Cormie, I would like to request two (2) undertakings from Manitoba Hydro. Firstly, to confirm when, if the diversity agreements were extended beyond 2024/'25, the earliest required in-service date for Keeyask would be, both from an energy and capacity perspective.

(BRIEF PAUSE)

MR. SVEN HOMBACH: That's acceptable?

MR. ED WOJCZYNSKI: Yes.

--- UNDERTAKING NO. 139: Manitoba Hydro to confirm when, if the diversity agreements were extended beyond 2024/'25, the earliest required in-service date for Keeyask would be, both from an energy and capacity perspective

CONTINUED BY MR. SVEN HOMBACH:

MR. SVEN HOMBACH: And secondly, to provide additional confirmation as to whether Manitoba Hydro has considered extending the diversity agreements, and whether doing so would be feasible. And if not to -- to provide some background information as to why not.

(BRIEF PAUSE)

MR. ED WOJCZYNSKI: Yes, so we got these two (2) undertakings that we will take on. But perhaps before I go off the mic, I should add that when you subtracted out the Keeyask energy from that, the calculation we just did, what was still left in there was the additional dependable energy our system obtains by having the -- the 750 megawatt tieline available with the exports.

So you -- if you're looking at a situation of not Keeyask and not the new tieline, then you're -- you can't count on all that dependable energy, because you'd have lost the depend -- the increased dependable energy that we could get with the tieline.

--- UNDERTAKING NO. 140: Manitoba Hydro to confirm if it has considered extending the diversity agreements, and whether doing so would be feasible; and if not, to provide some background information as to why not

MR. ED WOJCZYNSKI: It looked like you were going to ask me something on that.

CONTINUED BY MR. SVEN HOMBACH:

MR. SVEN HOMBACH: It is. Would it be feasible for Manitoba Hydro to have the 750 megawatt line constructed before Keeyask is placed in service? And if not, why not?

MR. ED WOJCZYNSKI: I think that's another undertaking.

MR. SVEN HOMBACH: I'd be happy to treat it as such.

--- UNDERTAKING NO. 141: Manitoba Hydro to indicate if it's feasible to have the 750 megawatt line

constructed before Keeyask is placed in service

MR. ED WOJCZYNSKI: Yeah, you know, perhaps rather than us go off and do a -- a caucus in which to give a -- a full discussion that we -- we probably require. Mr. Cormie could at least provide what he -- what he can just off the top of his head and why don't we see if that --

CONTINUED BY MR. SVEN HOMBACH:

MR. SVEN HOMBACH: Because I understand that Mr. --

MR. ED WOJCZYNSKI: -- is a faster response than having to do a caucus.

MR. SVEN HOMBACH: As I understand, Mr. Cormie's also still sworn, so that certainly would be acceptable. Welcome back, Mr. Cormie.

DAVID CORMIE, Previously Sworn

MR. DAVID CORMIE: Well, it's good to be back. I put on my tie for you.

MR. SVEN HOMBACH: What wisdom do you have to share with us?

MR. DAVID CORMIE: I -- I want to speak about the arrangement with Minnesota Power and -- and the conditions under which the new interconnection will be dealt.

It has been clear since we began negotiations with Minnesota Power back in 2007 that there needed to be a package, a package of new generation associated with new transmission. And that's what was necessary in order to have the interconnection built. Building an interconnection without new generation was never -- was never anticipated, was never part of the understanding of the Minnesota Regulator of Minnesota Power at -- at any time. It was always seen as a package.

We did negotiate in the agreement the possibility that Keeyask could be delayed for regul -- regulatory reasons, but it was always everyone's understanding that if Keeyask is not built, there will be no interconnection. Keeyask can be flayed and we negotiated the ability to delay that into the contracts, but there will be no interconenction if there is no associated construction of Keeyask in the 2020/'21/'22 time frame.

Minnesota Power is filing with -- with their Regulator. The discussions we've had with the

Minnesota Regulator, the -- the negotiations that we've had with Minnesota Power have alway -- always been premised on that there will be new hydro generation. We were able to negotiate a -- a contract with Min -- Minnesota Power that gave us the flexibility to -- with conditions prece -- precedented in Manitoba Hydro's favour that -- that -- which Manitoba Hydro could waive.

But if you read through the iss -- through the contract and you -- you look at the -- how the environmental attributes are handled and the subsequent negotiations that led to the upsizing of the 250 megawatt line to 750 megawatts, that whole package is based upon the construction of Keeyask and the delivery of not only the power and the energy, but in Minnesota Power's ability to invest in new transmission, the wind synergy benefits that they would achieve, the lower LNP prices that they would see as a result of the delivery of new hydro into the region.

And that was all part of the package that led them to cont -- and -- and leads them to continue to believe that this is a good deal for -- for their customers. For Manitoba Hydro to now say that we're not building new generation, we just want the new transmission line, it's a -- it's a non-starter. And -

- and we still have to go through the Minnesota regulatory process in order to get that line permitted. To go there now and say that we want the line but we don't want to build new generation, I think that that -- that would be -- that would be a surprise, and -- and it probably would put the project at extreme risk.

(BRIEF PAUSE)

MR. SVEN HOMBACH: I want to be clear, when you talk about not building new generation, we're -- my earlier question was about not advancing Keeyask to 2019 but advancing it to when it would be needed for energy and capacity, does your same answer hold true for that? Are you -- was your answer based on not building any new generation?

MR. DAVID CORMIE: Minnesota Power requires the new generation early in -- either in 2020. They can -- they can cope with a delay up to '22. The contract reflects that. Anything beyond that date does not work to meet their -- their load requirements, and -- and a delay to 2031 or -- or some later date, it's not -- it's not part of the -- of the contract.

And the -- the reason that we have negotiated the ability to delay was for regulatory

reasons, not because Manitoba Hydro was choosing an -- a later in-service date. Our objective was to have an in-service date of 2019, but to cover off the possibility that there were -- there were delays associated with -- in getting the environmental approvals, or going through regulatory approvals. It wasn't that Manitoba Hydro had the choice of choosing a later in-service date.

(BRIEF PAUSE)

MR. SVEN HOMBACH: Have you had an opportunity to caucus about my earlier question about the conditions precedent, or is that something that will have to be addressed later?

MR. DAVID CORMIE: I understand the conditions precedent, so if you have questions I'm prepared to answer those.

MR. SVEN HOMBACH: It's your understanding they're public?

MR. DAVID CORMIE: Yes.

MR. SVEN HOMBACH: Okay. Is it a condition precedent for the benefit of Minnesota Power that Keeyask go?

MR. DAVID CORMIE: No, it's a condition

precedent in favour of Manitoba Hydro.

MR. SVEN HOMBACH: Which means Manitoba Hydro could waive it?

MR. DAVID CORMIE: Yes.

MR. SVEN HOMBACH: Okay. So then based on that comment, on what are you basing the assumption that the transmission line may not get permitted if Keeyask is not advanced?

MR. DAVID CORMIE: If you read -- if you read Minnesota Power's Certificate of Need filing with the Minnesota regulator, the -- the premise of the entire project is that the line is needed to deliver new hydro, and the new hydro will be used to served mani -- Minnesota Power's new load requirements. And -- and to now say that we are not prepared to build new generation would be a distortion of the bargain that was struck between the companies.

MR. SVEN HOMBACH: Is it a condition precedent of constructing the transmission line that Keeyask gets built, or are you basing this purely on the proceeding before the regulator in Minnesota?

MR. DAVID CORMIE: The -- the line is necessary to deliver the new hydro from Manitoba. The Power Purchase Agreement and the investment in transmission are -- are linked contractually, and they

will not -- they can't be -- they can't be separated.

MR. SVEN HOMBACH: Okay. So let's be clear on this. You -- you indicated that building Keeyask is a condition precedent for the benefit of Manitoba Hydro that Manitoba Hydro could waive. You also indicated that the transmission line would be at risk if Keeyask is not built. That is why I asked you if it is a condition precedent of building the transmission line that Keeyask is actually constructed.

MR. DAVID CORMIE: The -- the Minnesota Power contract terminates if Manitoba Hydro does not commit to building Keeyask within the window that's provided in the contract.

(BRIEF PAUSE)

MR. DAVID CORMIE: Manitoba Hydro has the option of proceeding with the first rock in -- in the river in the summer of 2014. We can delay that by up to two (2) years, and that would delay the in-service date of Keeyask by two (2) years, and the contract allows for that. A delay in putting the first rock beyond two (2) years in -- in the river for Keeyask will result in the termination of the agreement.

(BRIEF PAUSE)

MR. SVEN HOMBACH: Let's move on for a -- a moment. The -- the 2014 load forecast, that's not going to be provided in time for the -- the NFAT concluding, is it?

MS. LOIS MORRISON: No, it will not be available.

MR. SVEN HOMBACH: Are you, at this point, in a position to advise whether it's generally consistent with the 2013 forecast or whether it's going to be revised upwards or downwards?

MS. LOIS MORRISON: At this point, the only information that we can provide is what we've already put on the record in terms of some of the adjustments that were mentioned in the presentation done by Mr. Kuczek. In terms of -- we are anticipating to make some adjustments related to reflect price elasticity. We will be making an adjustment to reflect increased activity or response to our fuel -- our fuel choice initiative, and also for codes and standards.

And we are, as Mr. Friesen has previously testified, in discussions with the top consumers to have a better understanding as to what their future load requirements are.

(BRIEF PAUSE)

MR. SVEN HOMBACH: Do the updated load for -- sorry, the updated population forecasts that were filed as Exhibit Manitoba Hydro 93 suggest that residential forecasts will also be lower as a result of lower than anticipated population growth?

(BRIEF PAUSE)

MS. LOIS MORRISON: At this point in our analysis, they are approximately the same.

MR. SVEN HOMBACH: Okay.

(BRIEF PAUSE)

MR. SVEN HOMBACH: The 2014 Power Smart Plan that's been filed, I looked for the words 'Level 1' or 'Level 2', and -- and they are not in there. It -- does it assume Level 2?

MR. LLOYD KUCZEK: No. Level 2 was developed for the purpose of the sensitivity analysis, so our 2014 Power Smart Plan is not equal to any of the levels. The only thing you could -- it -- I can say is

it's -- in terms of energy savings that we're planning to achieve, it's close to Level 2.

MR. SVEN HOMBACH: Can you be slightly more specific when you say, "close to Level 2," where between the two (2) it is?

MR. LLOYD KUCZEK: You know, it's so close, I -- I don't think it -- it would be -- there's much of a difference. It might be slightly lower in the further years, but it's -- it's fairly close. We made adjustments within the program to individual programs, so that's why, you know, I'm saying it's -- it's different, but it's similar, and it's -- it's close to Level 2.

MR. SVEN HOMBACH: Now, you did provide the costs that were assumed collectively in the economic analysis in Manitoba Hydro Exhibit 104-4. The fifteen (15) year Power Smart Plan does not provide the cost of individual measures beyond the fifteen (15) year date.

Has Manitoba Hydro conducted any analysis at this point as to what the cost on a measure-specific basis are going to be beyond the fifteen (15) years?

MS. LOIS MORRISON: Are you referring to by a program-by-program basis beyond the fifteen

(15) years?

MR. SVEN HOMBACH: Yes.

MS. LOIS MORRISON: That information is in the background spreadsheets or in the background Excel files as -- as to what we provide or what we will eventually provide to resource planning, so we do have that information.

(BRIEF PAUSE)

MR. SVEN HOMBACH: Now, Level 2 DSM, as I understand it, that includes Level 1 DSM plus fuel switching, conservation rates, and load displacement, and when you're discussion conservation rates, that means inclining rates?

MS. LOIS MORRISON: Yes, we are modelling a structure based upon an inclining rate -- inclining block rate structure.

MR. SVEN HOMBACH: And you've assumed that that's going to be phased in in 2019?

(BRIEF PAUSE)

MS. LOIS MORRISON: In terms of Level 2 DSM, ir are you looking at our '14 plan?

MR. SVEN HOMBACH: I'm looking at the -- the '14 year plan.

(BRIEF PAUSE)

MR. SVEN HOMBACH: Which is Exhibit Hydro-180. Will you accept it subject to check that you're assuming 2019?

MS. LOIS MORRISON: Yes, I will.

MR. SVEN HOMBACH: Okay.

MS. LOIS MORRISON: There's a number of dates floating around, so yes, I'll -- I'll accept that.

MR. LLOYD KUCZEK: Just add a comment, though, the -- the 2014 plan, when we're talking fuel switching and conservation rates, those programs are not improved -- approved internally. These programs and the energy savings that we have within the plan are placeholders at this point, and we have to do further analysis to -- and consultations with the government before a -- a decision is made to move forward with those initiatives.

MR. SVEN HOMBACH: And they would also have to approved externally by the PUB?

MR. LLOYD KUCZEK: The rates, yes.

MR. SVEN HOMBACH: Inclining rates would be a first in Manitoba, would it not?

MR. LLOYD KUCZEK: No, we actually had inclining rates, very insignificant inclining rates, for a short period of time.

MR. SVEN HOMBACH: It must have been before my time in the province.

Do you recall when that was?

MR. LLOYD KUCZEK: Five (5) years ago.

MR. SVEN HOMBACH: Are you making any specific assumptions on what the sizes of the blocks would be, or what the difference in pricing between the blocks would be in reaching your Level 2 projections?

MS. LOIS MORRISON: In preparing the estimates of the placeholder, as Mr. Kuczek referred to it, we modelled it after what BC Hydro has in place, and so essentially assumed similar -- if we were to apply a similar structure, what would be the corresponding energy savings that we might realize? We have not done, as Mr. Kuczek mentioned, a specific detailed analysis or rate design that would be reflected in the Manitoba market.

There's a lot of factors that we have to consider, specifically that were raised by this Board under the previous hearings when we did have the

previous inclining structure related to recognizing customers with elect -- electric heat and some -- a number of other issues. So what we put in, as -- as I mentioned, is a -- is a placeholder as to what we think the savings could be based on, a analysis -- of the BC Hydro initiative.

MR. SVEN HOMBACH: Let's actually maybe put the chart up for a moment. It's Manitoba Hydro Exhibit page 56.

(BRIEF PAUSE)

MR. SVEN HOMBACH: Mani -- Manitoba Hydro Exhibit 180, page 56.

(BRIEF PAUSE)

MR. SVEN HOMBACH: On the bottom, you see the conservation rates and you're seeing the assumptions.

If we look all the way on the right, you're assuming that conservation rates would account for approximately 14 percent of the savings?

MS. LOIS MORRISON: That is correct.

MR. SVEN HOMBACH: So if for any

reason, whether internally or externally, you could not get inclining rates approved, your savings would go down by approximately 14 percent?

MS. LOIS MORRISON: If all else stayed the same, yes.

MR. SVEN HOMBACH: Can you provide the panel with an explanation of what assumed changes to the fuel switching program are included in the new report?

(BRIEF PAUSE)

MS. LOIS MORRISON: The fuel choice initiative -- or sorry, the Fuel Choice Program that's presented here is a -- a broadly designed program based upon an incentive, where we pay the customer a substantial amount of money to support them changing to a natural gas furnace. I believe we used a value of about three thousand dollars ($3,000) in putting together the -- the projections for the savings and the program uptake.

(BRIEF PAUSE)

MS. LOIS MORRISON: And I should

mention, this is in addition to the savings that we are anticipating to -- or the reduction in load requirements that we're expecting to see from our fuel choice -- our heating costs -- heating education campaign, or the heating education initiatives, working with -- which -- where we, as previously mentioned, focussed primarily on new developments and encouraging people not to make a switch to electric, but to stay with gas.

MR. SVEN HOMBACH: Okay. And the -- the third component of Level 2 would be the load displacement, correct?

MS. LOIS MORRISON: That is correct.

MR. SVEN HOMBACH: Let's go to page 42 of the document for a moment. Sorry, actually, let's go to page 42 of Manitoba Hydro Exhibit 153.

(BRIEF PAUSE)

MR. SVEN HOMBACH: Page 42. The Customer-sided Load Displacement Program that's contained in the 2014 Power Smart Plan, is that the Load Displacement Program that's assumed under Level 2 DSM?

MR. DALE FRIESEN: It is a -- a more

refined version of what we proposed, yes.

MR. SVEN HOMBACH: And that is a new program, is it not? It wasn't in the 2013 plan?

MR. DALE FRIESEN: That is correct.

MR. SVEN HOMBACH: Okay. Let's scroll down to the bottom of the page. You're assuming a three (3) year energy savings of about 335 gigawatt hours?

MR. DALE FRIESEN: That is correct.

MR. SVEN HOMBACH: And the customers are listed on the top that you're signing up, the eleven (11) in 2014, fourteen (14) in 2015, and seven (7) in 2016/'17. Those are all incremental, are they not?

MR. DALE FRIESEN: That is correct.

MR. SVEN HOMBACH: Are you confident that you can actually achieve this target?

MR. DALE FRIESEN: The -- the targets that we've identified here are based on opportunities that we feel are relatively well established. They're customers that we currently have engagement with and are working with to evaluate and substantiate the business case, so we feel that the opportunity is there. There may be some year-to-year variations due to timing of construction, permitting, other issues,

but we feel that these savings are achievable, if not exactly within the three (3) year timeline that's given here, but they are -- they are achievable, yes.

MR. SVEN HOMBACH: Collectively, then, are you confident that you can actually achieve Level 2 DSM, provided that you can obtain conversation rates? Yeah, let me re-ask the question, Ms. Morrison.

Collectively, then, is Manitoba Hydro reasonably confident that it can actually achieve Level 2 DSM, provided that you can get conservation rates improved --

MR. LLOYD KUCZEK: We've had a number of discussions about our plan and -- with regards to our confidence, and at this point, we are confident that they're -- we're going to achieve the -- the energy projections within our plan.

MR. SVEN HOMBACH: And please remind us, Manitoba Hydro is not discounting DSM. It's assuming that 100 percent of DSM is going to be dependable and can be relied upon?

MR. LLOYD KUCZEK: Yes, and -- and it's -- our view is similar to what some of the other witnesses have testified. With the plan, we make adjustments every year. So as we move forward, each program is reviewed in terms of how well it's

performing, and -- and we may be off in terms of the year that we're going to get the savings, but we mig -- and we might have to make adjustments to the program designs. The adjustments could be -- could include increasing incentives. It could be changing where we're targeting incentives from the customer to, potentially, a supplier, but overall, we've been doing this for a number of years, and each year we review the plans, the individual programs, we make adjustments.

There'll be changes from one plan to another going forward, and generally, we believe this is our best estimate of what we're going to achieve going forward and it's similar to a load forecast. There will be changes as we -- as we move forward, and we'll make those changes accordingly each year.

MR. ED WOJCZYNSKI: I need to supplement that. From a decision on the future supply point of view, we are not going to discount the DSM, and what -- if you remember the definition of 'discount' that was provided by the consultant -- and now I can't remember which one it was, there have been so many good consultants. Where that is the definition of 'discount' in there is where you -- you reduce it by 10 percent or 20 percent or such -- such thing to account for uncertainty.

Manitoba Hydro is certainly not going to do that, and everything Mr. Kuczek said is accurate, but -- but also, just like load forecast has uncertainty, there's some uncertainty associated with it. There's also some uncertainty associated with DSM, and we've heard various DSM witnesses, including Mr. Dunsky, saying the same thing.

So when -- from a resource planning point of view, when we're looking into the future deciding what the in-service dates are and what are the risks, we consider -- particularly when it's in the longer term, not just a couple years out, we consider the uncertainty in load forecast.

We also will be considering the uncertainty in DSM, and particularly, when we're doing the middle of this ramping up of DSM and -- and there have been many agreed that this is a dramatic ramping up of DSM that we will be considering the fact that ten (10) years out, we don't even have all those programs fully designed yet, and the program will be updated as we go along.

So we're not going to discount it, but we will consider the fact there's some fundamental uncertainty, and it -- just like there is in the load forecast.

DR. HUGH GRANT: Sven, can I?

MR. SVEN HOMBACH: Yes.

DR. HUGH GRANT: I'm just -- while you've got this table up, I'm wondering, can I look at this and try to figure out what the utility cost per kilowatt hour saved is to the utility or to the customer, because this -- I take it the energy savings is cumulative, is it? So I've got, say, for 2014, that's the investment undertaken by the utility, but it's going to provide this stream of benefits?

MS. LOIS MORRISON: When we calculate the levelized costs per kilowatt hour of, say, the utilities investment or the resource cost investment, we look at the program as whole. We wouldn't look at just the three (3) years. So to -- to determine what the levelized utility cost is, it's best to go to the fifteen (15) year supplemental document, and it's all of those --

CONTINUED BY MR. SVEN HOMBACH:

MR. SVEN HOMBACH: That's Hydro Exhibit 180. MS. LOIS MORRISON: And Mr. Williams has very nicely told that it's on page 42, so he's apparently skipped ahead.

So on page 42 are the metrics that you're looking for in terms of the Utility's perspective metrics, and if you go back to page 38, you would see the integrated perspective metrics that we've talked to at quite a bit of length in this -- this hearing in terms of looking at the total resource costs, benefit analyses, looking at the levelized resource costs.

And then going to page 42, you would find for each program proposed, you would find the levelized utility costs also included. So if we go down just a little bit further please, you can find the load displacement and alternative energy. There, you can see that the levelized utility cost is one (1) cent a kilowatt hour.

DR. HUGH GRANT: Total resource cost?

MS. LOIS MORRISON: The total resource cost, you have to go back to page 38.

DR. HUGH GRANT: Just give me a ballpark, because I can't find -- I'm getting a headache trying to follow the scroll, there.

MS. LOIS MORRISON: It's five (5) cents.

DR. HUGH GRANT: I want to get a question in. Maybe this is just as good as time as

any. I'm still struggling to try to figure out this remarkable gap between apparently the cost in some US states of generating capacity and the apparent -- how cheap DSM apparently is. So we could all just go to Hawaii, where they're spending what, thirty-one (31) cents to generate a kilowatt hour of electricity.

We could go in and tell them that for three (3) cents a kilowatt hour, we could save them all this money, and I'm still trying to, you know, understand this large gap. And I understand -- I -- I get that there's a incentive problem in -- in some case.

But -- but could you enlighten me on this, why there -- there would be -- why you would have these utilities producing power at thirty (30) cent -- thirty-one (31) cents a kilowatt hour, extreme case obviously, when we could go and enlighten them and tell them we could, you know, save them that cost?

MR. DALE FRIESEN: Okay. If you don't mind, I'll address that question. The premise of the load displacement program, as we've indicated in our literature, is on a no-cost or low-cost fuel basis. So essentially, what we're dealing with here is the original or the originating energy source for load displacement is based on byproducts or waste products

that are coming from various industrial and agricultural processes.

So initially we have a very low fuel cost, so that in and of itself has a tremendous impact on the levelized resource cost. The actual technologies that we are using to convert these energy sources into electricity are priced in the range of thirty-five hundred (3,500) to five thousand dollars ($5,000) per kilowatt. These are not exotic technologies. These are proven technologies that are in the marketplace today and have well-established costs. So that's the basic premise.

Now, the difference between the levelized resource cost and the utility cost is premised on the fact that the customer has an immediate benefit, which is the marginal value of the energy that they're no longer required to purchase from the electric utility.

And when you compare those three (3) values, you look at a levelized cost in the range of five (5) cents, you look at a marginal return to the customer on energy not purchased being in the range of four (4) cents, you're left with about a cent. And that's where the levelized utility cost component comes from.

DR. HUGH GRANT: Okay. What I was struggling with is so presumably my concern here should be about the social costs and the social benefits. I don't care if it's, you know, from the point of view of who's going to actually pay for it. If it makes sense to undertake the investment from a social perspective, we should do it.

So if I were to use total resource cost as my metric, why in the world would we not -- you know, why shouldn't Hawaii shut down half of their generating stations and put DSM in? It seems like a lot -- you know, there's megawatt, megawatt comparison, whatever.

If I can save a kilowatt hour, you know, for five (5) cents total reserves cost instead of spending thirty-one (31) cents to produce it, why aren't we doing this?

MR. DALE FRIESEN: I'm struggling a little bit the -- the thirty-one (31) cent kilowatt -- cost per kilowatt hour in the context of Manitoba. And -- and --

DR. HUGH GRANT: I just picked an extreme case. I mean, I thought we could go -- you know, go consult in Hawaii and make a fortune doing this. It just seems it's such a gap --

MR. DALE FRIESEN: Like --

DR. HUGH GRANT: -- it's such an enormous gap, why isn't it --

MR. DALE FRIESEN: Yes. So if -- if you look at the -- again, if you return to the premise of our program, our program is -- is based on what is a mutually beneficial case for both Manitoba Hydro and our customers. They have waste streams. They have byproducts that may or may not have a cost to them to dispose of today. In some cases, there may not be a cost today but there may be a cost in the future.

So by using that energy in a productive way, or that waste energy in a productive way, we're providing a benefit to them that factors into this equation. So not every jurisdiction, not every customer in other jurisdictions has that same opportunity. And that opportunity is really derived from the type of industry that you have, and many other jurisdictions are pursuing load displacement, and their resource costs are very similar to ours.

DR. HUGH GRANT: I just don't understand why they're not doing it more. So in other words, we could sit here and talk about building a dam which, let's for the sake of argument say would -- is going to cost us ten (10) cents per kilowatt hour,

provided that -- just --

MR. DALE FRIESEN: The supply of waste product and -- or no-cost or low-cost energy to convert to electricity is not unlimited. It's dictated by the level of industrial activity and the type of industrial activity that you have available in your jurisdiction.

So I'll give you a representation. We have a customer that, for every kilowatt hour -- or for every 10 kilowatt hours of energy that they consume, they produce the equivalent of about 25 kilowatt hours of waste energy. It's a product that they dispose of today.

So I can't expand my capability to generate beyond that 25 kilowatt hours even if I had a hundred percent efficiency, which I can't achieve. So of that 25 kilowatt hours that I have available, if I have a conversion of efficiency of, let's say, 50 percent, I get 12 1/2 kilowatt hours. That's the absolute theoretical limit of what I can accomplish and what can -- what I can achieve.

So it's -- there is an upper limit as to what you can achieve based on the resource you have available to you. And that resource is dictated, like I said, by the type and quantity of energy supply you have available, which is related to the type of

industry you have.

DR. HUGH GRANT: It's not you. It's either the time of day or my cognitive limitations. Thanks for at least -- I'll get back to you on this.

MR. DALE FRIESEN: Okay.

DR. HUGH GRANT: Thanks.

THE CHAIRPERSON: I'd like to attack things from a slightly different perspective. And, you know, I want to frame it from the perspective of the householder or the small business owner out there who is faced with potentially rate increases of 4 percent over an extended period of time.

And it seems to me that we should be able to tell that small business owner or householder that, you know, despite these increases, there are opportunities for you to reduce your cost if you undertake certain things. And we've already described, you know, if I switch my furnace to a gas furnace I save six hundred dollars ($600) a year. If I change my water heater, I'll save eighty dollars ($80) a year.

So is there a way in which we can tell that householder or the small business owner that, you know, sure you'll get 40 percent rate increases or, you know, over and above what you're paying now, but you can save 20 percent, or you can save 16 percent, or...?

Is there in some way we could put it in those terms to the householder?

MS. LOIS MORRISON: Much of the advertising and the communication that we do to date, and we -- we do try to -- when we're -- when we're communicating to our customer we're trying to tell them what they can save on their bill, and that's a very strong message for when we talk to customers about improving the insulation on their home or making a change to -- you know, to their water heating equipment.

When we're messaging though we -- when we're out in the general public we -- in terms of advertising the Power Smart programs, we usually try not to say, Oh, by the way, we're going to hit you with a rate increase and this is what you can do to -- it -- it's how we message.

What we -- what we would expect to be doing as we go forward is having a stronger message out to the public about what they can do to reduce their energy bill and, therefore, see a reduction in -- in their overall -- the overall impact to their bill.

But we -- we don't normally try to mix those messages, because they're aren't usually well received. We -- we -- they -- they don't -- customers

won't focus on the message that would help them.

MR. LLOYD KUCZEK: But -- but, you know, overall, if you -- if you're involved in the DSM industry, whether it's the load displacement opportunities or residential or commercial, there's all sorts of people out there, and they're -- they're all different.

And so to achieve the -- the opportunities in the DSM industry we are with our plan over a number of years achieving significant numbers in terms of gigawatt hours. I think it'll work out to over 6,000 gigawatt hours over by the end of this fifteen (15) year period. That is -- that's not insignificant.

Part of that is through codes and standards. Changing codes and standards is a long-term process. We have people involved in that that work on it for a number of years. And then it takes a while before they're actually implemented. And as you see in our graph, it takes a number of years before you even reap the benefits from that.

But just individuals themselves, within my own family -- and I've used this as an example before, and I'll just put this on the table because there's many more types of people out there, but it

helps to understand what we're dealing with.

So I have a brother that's a millionaire. He does not care about energy efficiency. So no matter what we do and what the incentives are, not likely to get him ever, right. You -- you almost wait -- you have to wait till he sells his home, his cottage, the next person moves in might make -- make the changes. That's over decades.

My father, he's now in his 70s -- or 80s, actually but, you know, when I started in this he was in his 70s. When I talk to him about energy conservation he -- he comes back with: Lloyd, I don't know how long I'm going to be here. Why -- why do I care about pay backs of six (6), seven (7) years, right?

So -- so the -- the seniors think differently. My sister is on the low income side of the category, and she's got all sorts of other things she's focussing on. And so you -- you don't talk to her about energy efficiency unless you're going to give it to her, just like we're doing with our program. So -- and, you know, I have another brother that's a blue collar worker, and he's implementing some of the measures because he can afford to.

And -- and so each one of you would be

different and each one of us are different. Ms. Morrison didn't change her fridge and -- or furnace. I mentioned that earlier, right? You -- you know, and she understood the economics.

You know, so it -- it -- what -- what I'm really communicating -- the message is it's a -- it's a challenge, but there's an opportunity there. And as a utility we should pursue the opportunity because it's economic. And -- and so we've had a program in place and we're wrapping it up, more aggressive, captured more opportunities and we think it makes sense.

THE CHAIRPERSON: But you realize the dilemma you're -- I -- I -- you realize the dilemma you're -- you know, the -- the public -- what the public has in -- in their head is 3.95 percent increases over the next twenty (20) years. That's -- that's what's sticking in people's mind. And it seems to me we should be able to tell the typical householder can save 20 percent of their bill by adopting an available set of -- of energy measures.

I -- I think you're doing that, but you know, is there some way we can quantify what a typical householder can save by adopting the measures that are available from Manitoba Hydro?

MR. LLOYD KUCZEK: Well, not everybody has opportunities to save 20 percent, you know, right? So a lot of people, the opportunities are minimum. Like, you could change to CFLs or LEDs today, but if we told them how much they're saving per month they probably wouldn't even do it because it -- it's not a big savings.

Changing their fridge, if they've got a really old fridge makes sense. But if your -- if you've got a fridge that you bought even ten (10) years ago and you -- you know, even if it's consuming 650 kilowatt hours a year and you're going to buy something that's going to do five-fifty (550), do people really care? Do they want to go through that inconvenience?

So -- so the opportunities are there, but the bigger ones are with insulation. That's a big measure. And not everybody wants to do insulation. It depends on, again, you know, all those categories I talked about. You know, it depends where they are in life, what they're planning to do, whether they're going to stay, whether they're going to move.

Do you want to add to that?

MS. LOIS MORRISON: We -- I -- I believe we did file as an undertaking some examples of what the possible savings might be. And -- and we were

very challenged -- for a residential customer if they did -- if their house was this and if they did this and if they did this. And -- and our challenge in trying to respond to that undertaking is, as Mr. Kuczek mentioned, we don't -- there's the average house, but no one lives in that average house.

So when we do our -- our advertising for -- so -- so here's an example. We did a mailing to the Interlake area a little while ago. And in that communication to the customer we said, You could save this much on your home based on the fact that the majority of them -- some of the -- the houses we targeted were electrically heated. And they -- they could have installed a water and energy saver package and save a certain amount.

So what we did was we looked at the homes that might be more likely for that area, picked out what we think they might be best benefited from, and then we put together a communication as to what they could save. We don't talk about percentage, but what we said was you could save 'X' amount of money, dollars, on your -- your monthly energy bill by doing this.

So it's -- it's hard to say the average home because I said the -- the savings in the average

home don't really reflect what the -- what the Man -- the -- the ratepayers are going to see. So what we want to do is try to target it.

And -- and I do believe, as I said, we had the one (1) undertaking where we identified if the home is electrically heated and they upgrade their insulation from -- I think it was 'R' -- their attic insulation from R30 to R50, and if they add -- if they undertake the water and energy saver package, and if they do these components they could save this much on their average bill.

Like, we -- we tried to give you an idea as to what that might be. But to give you the one (1) number is difficult because we wouldn't do that. We would target it to the individual -- to those groups to more represent what they would realize because those people that are going to see the greater savings, as Mr. Kuczek mentioned, are the ones that need to upgrade their insulation. So we're going to target the older -- the home -- the areas that have older homes and have more opportunity.

MS. MARILYN KAPITANY: So, Ms. Morrison, I haven't been involved with PUB for very long, but we did talk about this as the gas rate hearing that -- that I was involved in. And I don't

see what's changed since then. And yet, you've expanded your -- the plans that you have for DSM and you've built it into NFAT. I'm not sure what the impetus for that was, but I'm happy to see it.

But I don't see what's changed that's going to allow you to reach your targets now when you haven't been in the past. And -- and I look at some of the jurisdictions that have had really good success and I expect that you probably have talked to those people in Washington, in Vermont, and asked them, like, what is it that they're doing that's not happening in Manitoba and what is it that's going to get us up that ramp and actually have us meet these targets?

We talk about it being dependable energy. How is that going to happen?

MR. LLOYD KUCZEK: Well, first of all, I'll let Ms. Morrison elaborate on that, but I'll just point out, with the new plan, first of all, we've identified some new opportunities, or we're pursuing some new opportunities that aren't necessarily new, like conservation rates. We've talked about that for a while.

So now what we've put on the table is an -- an aggressive rate structure that's going to actually achieve some results. The previous

conservation -- or inclined blocked rate structure that we had in place was -- an I even said that in our shop, you know, it's not going to do anything, right.

So we put a serious rate program in place to -- or we're proposing one. Fuel switching, we think there's opportunities there. We've talked about that at -- at these hearings for a number of years, so that's on the plate but again has to be discussed further.

Load displacement, we were pursuing load displacement with one (1) of our customers in 2005 for a period of time when the export market was very lucrative. We've since -- recently these other opportunities have surfaced. This is something that -- that I had in mind in -- in 2005, but they've surfaced and they were brought forward and we've put them in the plan.

If you look at the numbers associated with those three (3) components, they're fairly significant. That's going from, you know -- so it's -- it's not similar to the other programs that we have within our portfolio. So the other thing that we did do is we -- we didn't extend our programs beyond '17/'18. We had our plan that ended at that point. So our staff had programs that designed and -- and were

going to end at that time. So when we updated this plan, we said, Well, why are you stopping at '17/'18? Like there's probably still more opportunities.

So another significant component was added just by extending the programs further in time, because some of the people that I talked to will change homes and they will implement those measures. So you still capture those opportunities. It's just -- it takes time for -- for things to happen and things to change within a -- a home, or within people's lives.

And adding to that we modified some of our programs to be more aggressive. So and -- so we -- Ms. Morrison could talk to, you know, the discussions we've had with other utilities, but those programs that we're talking about, those typical programs, we're quite confident that we're going to achieve the results from those programs. I'm not too concerned about that.

Load displacement, Mr. Friesen and his staff are working on that. They're -- we've talked about the confidence level there. They're fairly confident. The two (2) that require further discussion are the conservation rates. We've talked to BC Hydro and -- and their staff about what they've achieved. They've implemented them for a number of years.

And so we feel our numbers that we're

estimating, if we implement the rate structure we're talking about, are reasonable. And then with fuel switching, you've seen the slide or the video, the opportunity there, the economics associated with that are so substantial, how could you not capture some opportunities there?

So in terms of confidence and -- and our ability to achieve these results, and I -- I think the witness testified this afternoon, you might not get 100 percent in all the programs. There's one (1) program, the Geothermal Community Initiative, I'm concerned on that one (1). But as a package, there'll be pluses and minuses.

MR. RICHARD BEL: Could I ask about -- I just want to carry on this for a bit. The -- the new package you put in here, 2014/2017, and could we look at slide 57 from Dunsky?

(BRIEF PAUSE)

MR. RICHARD BEL: So Mr. Dunsky's yellow lines are at one point three (1.3) and one point five (1.5) and he's going out to, what, 2025 there and you're at 1 percent. So what we're having is load forecasting in this range. Am I right? So you're sort

of Level 2 extended, and not exactly that because that was based on his calculation, but must be close to that.

Am I -- am I correct?

(BRIEF PAUSE)

MR. LLOYD KUCZEK: It's very difficult for me to -- to speak to the numbers that went into Mr. Dunsky's graphs here.

MR. RICHARD BEL: He's one point -- he's -- he's one point three (1.3) incremental, his -- his low case.

MR. LLOYD KUCZEK: I'm sorry, what's the question?

MR. RICHARD BEL: Well, the question is: So -- so we are flattening load based on the scenario here. Am I -- am I right? Because this is about flattening load. If we're carrying out -- that's what he's showing here.

(BRIEF PAUSE)

MR. LLOYD KUCZEK: We can't give a precise answer there. I know.

MR. RICHARD BEL: I get it. I get it. No, I -- I wasn't asking for an exact. I'm not -- I was just saying, but we're in that kind of -- if we're incrementally moving forward, we -- we must be in this region. But I'll leave that point. That's an observation, I think.

MR. LLOYD KUCZEK: You know, generally what I know is, with our updated Power Smart Plan, with the -- what we know -- expected at this point to happen with our load, we -- we are still expecting our load to grow at 0.9 percent, as -- as I recall it, so.

And I think Mr. Dunsky, if I'm looking at that, is suggesting it's going to be flat, and that's not what we're thinking with our numbers in our plan.

MR. RICHARD BEL: I think, to be fair, he said, "near flat." Anyways.

MR. LLOYD KUCZEK: We'll have to look. But I'm not thinking that we're there.

CONTINUED BY MR. SVEN HOMBACH:

MR. SVEN HOMBACH: Mr. Kuczek, to follow up on that point, one (1) of the issues that was raised is the risk of underestimating the load.

Based on that, if the load ever was

underestimated and new generation needed to be brought online quickly, what's the approximately lead time to bring a small gas plant into service? The panel has heard different years.

MR. ED WOJCZYNSKI: My apologies. I was trying to keep up with the other preparations.

MR. SVEN HOMBACH: I'd be happy to re-ask the question.

MR. ED WOJCZYNSKI: If you could, please.

MR. SVEN HOMBACH: Certainly. There's been some discussion about the risks of underestimating load with reliance on DSM. And the panel apprec -- certainly appreciates that hydroelectric developments have a long lead time.

What's the equivalent lead time for bringing a small gas plant into service, how many years?

MR. ED WOJCZYNSKI: Ones that would be practical for the kind of purpose we were talking about -- you can have smaller area derivatives that have very short lead times, of a year. But -- but for the industrial kind, we're talking about -- and not combined cycle -- simple cycle -- something in the order of three (3) years probably makes sense, assuming

you've done some pre-work for that and the transmission is available. So that -- that's assuming you've done some pre-work.

Of course, you've got now the issues of you're using that as your resource and -- and the cost associated. But in terms of lead time, it could be a bit longer. It could be a little bit shorter. Combined cycle would take a bit longer.

MR. SVEN HOMBACH: Is the 2014 forecast making any assumptions that would see advancements in off-grid technologies like solar, like small-scale residential wind turbines, or the likes?

(BRIEF PAUSE)

MR. DALE FRIESEN: Those types of measures would be addressed in our DSM Plan. They would not be addressed in our load forecast. So we would -- we would examine the impact of those measures within the context of our DSM plan.

MR. SVEN HOMBACH: Have you considered installing smart meters as part of the DSM Plan? And if not, why not?

MR. LLOYD KUCZEK: We're currently -- we have been for a number of years looking at smart

metres, and we're still looking at smart meters. The -- - the business case for smart meters is -- it's a challenge. At this point we think there is a business case, and at some point within the -- the next decade we would expect to have smart metres in place.

(BRIEF PAUSE)

MR. SVEN HOMBACH: I don't have additional questions to the DSM panel. I do have one for you though, Mr. Cormie. We discussed the Minnesota Power contract earlier, and you indicated that if Keeyask is not proceed with or if it's delayed beyond more than two (2) years, that the contract would terminate. And I believe you indicated that constructing Keeyask was a condition precedent for Hydro but not for Minnesota Power.

Can you point us to the section that you're relying on in saying the contract will terminate?

MR. DAVID CORMIE: Yes. We'll -- we'll take that as an undertaking, and --

MR. SVEN HOMBACH: Okay.

MR. DAVID CORMIE: -- provide that tomorrow, or shortly. Yeah.

MR. SVEN HOMBACH: Certainly. Thank you, Mr. Cormie.

--- UNDERTAKING NO. 142: Manitoba Hydro to provide the section they are relying on in saying the contract will terminate

MR. SVEN HOMBACH: Now, I am advised by Mr. Williams that he has about forty-five (45) minutes of questions, so given that the MKO will not be fielding presenters tomorrow morning, I'm seeking the panel's guidance as to whether the panel would like to break for the day and then continue briefly with the DSM panel in the morning or...

(BRIEF PAUSE)

MR. SVEN HOMBACH: Perhaps we could stand down for a -- for a minute.

--- Upon recessing at 6:22 p.m.

--- Upon resuming at 6:27 p.m.

CONTINUED CROSS-EXAMINATION BY MR. BYRON WILLIAMS:

MR. BYRON WILLIAMS: Mr. Chair, I'm a little afraid to speak unless the court reporter gives me permission, and I do apologize for that. And it -- just a bit of house -- housekeeping to start with.

In -- there was a discussion Mr. Hombach had with -- in terms of Manitoba Exhibit 153, page 40. Mr. Friesen, that's probably your part of the world. Okay. And if we scroll down to the bottom of that page -- and I'm just trying to reconcile some math here, sir. We see the -- in terms of load -- customer-sided load displacement we have incremental savings starting from a 2013/'14 base of 335.6 gigawatt hours.

Is that right?

MR. DALE FRIESEN: Did you say 2013/'14?

MR. BYRON WILLIAMS: Well, to back up, our baseline -- our base zero is presumably 2013/'14?

MR. DALE FRIESEN: Correct, yes.

MR. BYRON WILLIAMS: And if we move out what this is showing us is, as you discussed with Mr. Hombach, we've got 335.6 gigawatt hours cumulative as of 2016/'17 from that base?

MR. DALE FRIESEN: That is correct.

MR. BYRON WILLIAMS: And if we could just, Diana, please turn to Hydro Exhibit 180, Appendix

A2 and scroll down to the middle of the page. A2, Appendix A2. Scroll down a bit more, please.

And Mr. Friesen, if we see about on the -- on the -- the screen in front of us, about two-thirds (2/3) of the way down the page, you'll see the heading "Load Displacement and Alternative Energy"?

MR. DALE FRIESEN: Correct.

MR. BYRON WILLIAMS: And if we move out to the blue, being the 2016/'17 year, you'll see for customer-sided load displacement the figure of 305.1 gigawatt hours.

MR. DALE FRIESEN: Correct.

MR. BYRON WILLIAMS: And that would be the analogous figure to the -- to the page we saw previously in the three (3) year power plan, would it?

MR. DALE FRIESEN: That is correct.

MR. BYRON WILLIAMS: And is the difference, sir, between the two (2) figures generation versus meter, or -- or what is the difference, sir?

MR. DALE FRIESEN: It is the difference between generation and meter. That is correct.

MR. BYRON WILLIAMS: And if we can stay on this page and scroll to the left? And -- and look to the -- in the bottom right-hand corner, and this may go to Ms. Morrison, or -- or to Mr. Kuczek, but we'll

see the figure 2,739 gigawatt hours.

Do you see that, Ms. Morrison?

MS. LOIS MORRISON: Yes, I do. Thank you.

MR. BYRON WILLIAMS: And what I understand that to be is starting with the base year of 2013/''14, that is the forecast cumulative savings for the Power Smart '14 Plan, leaving aside codes and standards and regulations.

Is that right?

MS. LOIS MORRISON: Yes, that is correct. It would not include any savings that were projected to have been achieved in '13/''14. It would only include the savings expected to be achieved in '14/''15 going forward to '28/''29.

MR. BYRON WILLIAMS: Okay. Thank you. And if we could turn, Diana, to Hydro Exhibit 87, slide 80? Hopefully I've got that page right.

Ms. Morrison or Mr. Kuczek, you recognize this page being the projected energy savings for -- from different levels of DSM that was presented, I believe, way back in week 1 of this hearing?

MS. LOIS MORRISON: That is correct.

MR. BYRON WILLIAMS: And so if we look at the red line, we will see finishing in the 2028/''29

year a projection for Level 2 DSM, I'll suggest to you, of 2,961 gigawatt hours.

Would that be right?

MS. LOIS MORRISON: that is correct.

MR. BYRON WILLIAMS: So would that be an apples to apples comparison with the figure that we just discussed in terms of Power Smart '14 being 2,739 gigawatt hours?

(BRIEF PAUSE)

MS. LOIS MORRISON: Generally, for the purposes of comparison, it would be about the same, because this is fiscal year ending '27/'20 -- sorry, fiscal year ending '28. So this would be '13/'14 to '27/'28, so it's -- it's a -- still a fifteen (15) year time frame.

(BRIEF PAUSE)

MR. BYRON WILLIAMS: So just so I understand, the calculation of Level 2 DSM that's presented here runs from the 2013/'14 year to the 2027/'28 year and achieves 2,961 gigawatt hours as -- or at least, it forecasts that achievement?

MS. LOIS MORRISON: That is correct.

MR. BYRON WILLIAMS: And it is -- what you're telling me is it is not strictly analogous to the figure of 2,739 gigawatt hours I presented to you, because that figure -- that forecast starts a year later, being 2014/'15, and runs a year farther.

Would that be fair?

MS. LOIS MORRISON: That is correct, though there is an offset.

MR. BYRON WILLIAMS: Okay, and by 'offset', Ms. Morrison, you can help me out, what do you mean by that?

MS. LOIS MORRISON: Just that one (1) starts a year later than the other, and goes a year later than the other.

MR. BYRON WILLIAMS: Okay. Yeah. Fair enough. And sticking with Level 2 DSM for a moment, leaving aside codes and standards, is there incremental DSM savings forecast beyond the '27/'28 year for Level 2?

(BRIEF PAUSE)

MS. LOIS MORRISON: We have to find the exhibit number, however, we did provide an undertaking

where we identified specifically what was assumed after the '27/'28 year. It was under -- Manitoba Hydro Undertaking number 12.

MR. BYRON WILLIAMS: I can't even remember that far back, Ms. Morrison, but.

MS. LOIS MORRISON: Well, you -- you unfortunately have spent much more time here than I have, so I -- I can appreciate that.

MR. BYRON WILLIAMS: Well done, though.

(BRIEF PAUSE)

MR. BYRON WILLIAMS: So what -- so what you're suggesting here is that with the exception of the Refrigerator Retirement Program, you did not assume -- well, why don't you explain what you're saying here? I'm not brave enough, Ms. Morrison.

MS. LOIS MORRISON: I don't know if I am either. It -- like you said, it's been a while. What we were identifying here was the assumptions that were included in the analysis, and specifically, we identified that the Refrigerator Retirement Program savings ended. However, all the other savings continued on for measures, and we assumed reinvestment.

Then we identified where additional

incremental energy savings were being presented pra -- past the 2027/'28 fiscal year, and those initiatives are listed following as the Residential Geothermal Incentive Program, the Commercial Lighting Program, Commercial -- or the Power Program, Commercial Building Code, and the Conservation Rates Initiative all presented savings that had incremental savings passed either a year, or a few years past the '27/'28 date.

MR. BYRON WILLIAMS: And just so I understand, are you suggesting to me that the pace of incremental DSM savings post-'27/'28 under DSM Scenario 2 was roughly the same or somewhat lower than it was up to '27/'28?

(BRIEF PAUSE)

MS. LOIS MORRISON: You are correct that past the '27/'28 fiscal year, under the DSM Level 2, there were fewer incremental or new initiatives being brought in, or new savings, or new projects being undertaken under that -- in -- in that timeframe as compared to the timeframe leading up to that period.

MR. BYRON WILLIAMS: Could we go back to Exhibit 87, slide 80 for just a second?

(BRIEF PAUSE)

MR. BYRON WILLIAMS: So, Ms. Morrison, if I looked at the -- the red line as it ends at 2027/'28, what you're suggesting to me is that it flattens out somewhat past the 2027/'28 year. Is that what you're telling me?

MS. LOIS MORRISON: Its slope would be a little lower, yes.

(BRIEF PAUSE)

MR. BYRON WILLIAMS: So just to get a sense of the magnitude of difference between DSM plan -- excuse me, DSM Scenario 2 and Power Smart Plan 14. The two (2) figures that I -- I had given you previously being the twenty-nine sixty-one (2,961) for Level 2 ended at '27/'28. And the two thousand seven hundred and thirty-nine (2,739) for Power Smart 14 ended in '28/'29.

If I'm trying to get a sense of the magnitude of the difference of the plans, would I be for -- of course, for the first time in my life far too simplistic in -- in subtracting the two (2)?

MS. LOIS MORRISON: There would some --

looking at the program level strictly, you -- there -- there are some nuances because the fact that there is savings in the '13/'14 year versus the '27/'20 -- because of that offset there's some nuances. So there -- it is a little bit over simplified, but generally it's pretty close.

MR. BYRON WILLIAMS: So it would be about a 7 percent difference between the two (2) plans?

MS. LOIS MORRISON: I'm -- I'm hesitant to accept that without checking it and -- and doing a further detailed look. It -- it's -- yes, as Mr. Kuczek is whispering to me, it's close, because we tend to look at the overall package of codes and standards and such when we're -- we're looking at our analysis, but from just the program level, per se, yes.

(BRIEF PAUSE)

MR. BYRON WILLIAMS: So is Manitoba Hydro telling me, subject to check, I can rely upon an assumption of 7 percent difference?

MS. LOIS MORRISON: Yes.

MR. LLOYD KUCZEK: It depends what you're using it for, like I -- I think when I talked about this before when I was testifying that, you know,

I -- I don't like to get too detailed in terms of the specific numbers. There's -- there's a lot of -- this is an art, it's not a science so if you talk twenty-nine sixty-one (2,961) or twenty-nine hundred (2,900), you know. To talk twenty-nine sixty-one (2,961) is -- to me doesn't mean a lot. We're going to get roughly 2,900 gigawatt hours and -- and you know, or twenty-one sixty-one (2,161) as we say, that's what we're targeting but...

MR. BYRON WILLIAMS: Did -- did you misspeak?

MR. LLOYD KUCZEK: What -- what did I --

MR. BYRON WILLIAMS: You might've said twenty-one sixty-one (2,161), sir, but that -- that's probably a --

MR. LLOYD KUCZEK: I misspoke.

MR. BYRON WILLIAMS: Okay.

MR. LLOYD KUCZEK: I have progressives.

MR. BYRON WILLIAMS: Here's my challenge -- and Mr. Wojczynski, you can feel free to chip in, as well.

What I'm trying understand for my client is given that there appears to be some difference between Power Smart 2014 and DSM Scenario 2, can I -- can I rely upon that 7 percent difference in -- in

considering the implications for a net present value of the comparison between the plans?

(BRIEF PAUSE)

MR. ED WOJCZYNSKI: I heard your question. And maybe because it's 6:44, but I don't think I understand it. So if --

MR. BYRON WILLIAMS: Well, let -- let me ask it better --

MR. ED WOJCZYNSKI: Okay.

MR. BYRON WILLIAMS: -- if I could? Sir, in doing the net present value calculations, whether it's in Exhibit 104-15, or 104-16 Revised, you relied upon DSM Scenario 2, correct?

MR. ED WOJCZYNSKI: Yes. And the other levels, but for this discussion, yes.

MR. BYRON WILLIAMS: And I believe the evidence that I have from Manitoba Hydro in terms of the difference between DSM Level 2 and Power Smart 14 is, subject to check, in the range of 7 percent?

MR. ED WOJCZYNSKI: In terms of gigawatt hours.

MR. BYRON WILLIAMS: In terms of gigawatt hours.

MR. ED WOJCZYNSKI: Yeah, but then you talked about NPV, that's the part I was having trouble with.

MR. BYRON WILLIAMS: What I'm trying to understand is: Would we expect if we did a calculation of 104-15, for example, using Power Smart 14 gigawatt hour savings, all other things being equal, that the results would be different?

MR. ED WOJCZYNSKI: Sorry, that the results would be...? And you trailed off at the end.

MR. BYRON WILLIAMS: It is 6:45, I did trail off. I apologize.

MR. ED WOJCZYNSKI: Yeah.

MR. BYRON WILLIAMS: We would expect the results to be different?

MR. ED WOJCZYNSKI: They'll be different but -- but there wouldn't be 7 percent different. I mean, if you look at the level -- if you look at, for instance, Plan 5, going from base DSM to Level 1 DSM to Level 2 DSM, the numbers actually increased. Then Level 3 they go down slightly, but they're -- they're essentially bouncing around with that plus/minus called 40 million or something that I, at the beginning of this whole process, called noise.

So essentially, we're seeing for Plan 5

at least, 400 million -- or just under 400 million net present value benefit with the 2013 assumptions. You also saw on the flat load sensitivity we did that was related to Mr. Thomson's statement on day one, we got over 400 million for a flat load. So as earlier indicated, Plan 5 at least really, whether it's Level 2 DSM or 7 percent more, I don't expect we're going to see anything different than around 400 million for that scenario. It is true, the Preferred Plan is a different story.

And -- and that one we could simplistically right now assume that it would be part of the way between 45 million positive under Plan 14 and minus seven (7). So -- but it -- it's -- so somewhere between those for the Preferred Plan. So I -- I don't know if that helps you.

MR. BYRON WILLIAMS: It helps. And -- and the point you're making, sir, is that the impact of different levels of DSM does have an impact on the relative change in the plans?

MR. ED WOJCZYNSKI: It does for the Preferred Plan, but not for the Keeyask/750 Plan.

MR. BYRON WILLIAMS: And as compared to the Keeyask/Gas plans, more DSM would -- would tend to disadvantage the Preferred Plan?

MR. ED WOJCZYNSKI: Could you repeat that? I think you referred the Preferred Plan and the Keeyask/Gas Plan.

Were you comparing the Preferred Plan to the Keeyask/Gas Plan?

MR. BYRON WILLIAMS: Sir, all I was saying is -- is as compared to Keeyask/Gas plans, whether it's Plan 6 or Plan 5, am I correct in suggesting to you that they tend to perform somewhat better under more DSM as compared to Plan 14?

MR. ED WOJCZYNSKI: Yes.

MR. BYRON WILLIAMS: Now, just -- just a couple of small points for you, Mr. Wojczynski, and then I -- I think I will be done with you and be focussing on the lord -- load forecast.

But if we could pull up Hydro Exhibit 104-15, which I believe was filed earlier today. Or is that it right there, that was quick.

Mr Wojczynski, and -- and just so you know, I'm going to want to kind of reconcile this with Manitoba Hydro Exhibit 192.

So, sir, if I looked at Plan 6 under DSM Scenario 2, I've got a gas in 2040?

MR. ED WOJCZYNSKI: Yes.

MR. BYRON WILLIAMS: And -- and if I

were to go to Manitoba Hydro Exhibit 192 under pathway 4, we see that new resources are kind of -- or are anticipated around 2037, is that right?

MR. ED WOJCZYNSKI: Under which path was that, sorry?

MR. BYRON WILLIAMS: Pathway 4, sir. You see if you fol --

MR. ED WOJCZYNSKI: Yes.

MR. BYRON WILLIAMS: Okay. And is the difference between the timing of Plan 6 is portrayed on Manitoba Hydro Exhibit 104-15, and here being some three (3) years earlier - being Manitoba Hydro Exhibit 192 - is that the pipeline influence, sir?

MR. ED WOJCZYNSKI: Subject to check, yes. Let me just think about that for a sec. I sometimes answer too quickly and --

MR. BYRON WILLIAMS: That's the way we like it, Mr Wojczynski.

MR. ED WOJCZYNSKI: Yeah, yeah, I've learned that. Okay, so the question was with Plan 6 in DSM Level 2 in the -- we have it at -- gas coming in at 2040. And then on this pathway one, we have it coming in on 20 -- we say 2037 and that is Plan 6, as well, so I would say yes, subject to check, that -- that is right.

MR. BYRON WILLIAMS: And so subject to check, if I'm trying to reconcile the timing between, let's say, Exhibit 104-15 of some of the supplemental generation sources as compared to Manitoba Hydro Exhibit Number 192, I'm likely to understand that any timing differences are primarily related to a -- a difference in terms of including the pipeline load?

MR. ED WOJCZYNSKI: I -- I would say generally that's true, yes.

MR. BYRON WILLIAMS: And just one (1) second before we leave Manitoba Hydro Exhibit 192. Mr Wojczynski, you'll re -- recall earlier in the hearing we were talking about a decision point for Conawapa being on or about 2018.

Would that be fair, sir?

MR. ED WOJCZYNSKI: Yes, that was for '26 in-service date.

MR. BYRON WILLIAMS: Okay. And so when I look at Manitoba Hydro Exhibit 192 and go down to pathway -- just below pathway 5, we see a -- a different timing for Conawapa -- the decision point being 2022.

Is that right, sir?

MR. ED WOJCZYNSKI: Yeah, I can't this see this proper -- I need my glasses, I got --

MR. BYRON WILLIAMS: That's --

MR. ED WOJCZYNSKI: -- floaters so I need this thing, so.

MR. BYRON WILLIAMS: That's also how we like it.

MR. ED WOJCZYNSKI: So 2022, is what we have in there and that is to protect a 2030 in-service date, or to commit for a 2030 in-service date.

MR. BYRON WILLIAMS: And if we go up to pathway 1, we see a commit to Conawapa -- a construction under that as being the 2023 year?

MR. ED WOJCZYNSKI: Yes.

MR. BYRON WILLIAMS: And just so I understand, sir, and -- and to assist our clients, when we're thinking of the timing for the Conawapa decision point, are we now really thinking about 2022/'23?

MR. ED WOJCZYNSKI: Only in the scenario where we are not giving any consideration to other export sales than a WPS and NP. As when I introduced this earlier this afternoon, I discussed how at the bottom of Exhibit 192, I believe it was -- the one up here -- if you'd go at the very bottom, there's the blue caterpillar, and the blue caterpillar, the very first box says,

"Review Conawapa 2026 in-service date

and DSM level."

And then -- and then the idea was with the arrow that every year we -- we review our Power Resource Plan, the load forecast DSM, and then when you get to 2018 we'd explicitly say in that year, which -- pardon me, 2019. In 2019 we are considering whether we would want to commit Conawapa for 2027.

But -- but given that we're saying there's no other sales in this -- assumed right now, we let it slip. Then we let it slip another year. Then we let it slip another year. To protect the WPS sale, you need to be committing by 2030. If we had the MSP 500 sale. If we had something from Great River Energy, the 600 megawatts. If we had an -- if we had the SaskPower. If we had -- there's some other negotiations underway.

If any of those, or some of those happened then we would -- we would -- at those other blue boxes we would then commit Conawapa at that point, assuming that it was attractive to do so. We...

MR. BYRON WILLIAMS: That's helpful. And -- and thank you for going through that. And I apologize if I missed it the first time through.

MR. ED WOJCZYNSKI: There's a lot of material here.

MR. BYRON WILLIAMS: If we could go back to Manitoba Hydro Exhibit 180, and Appendix A-2, and Mr. Wojczynski you're always welcome to stay around but I think I'm on load forecasts, and --

MR. ED WOJCZYNSKI: I wouldn't want to leave this fun place.

MR. BYRON WILLIAMS: None of us really do, sir. If we -- if we focus on the energy efficiency subtotal, if we could scroll down a bit on the page, you'll see just under 'Industrial' the energy efficiency subtotal.

And does this go to you, Ms. Morrison?

MS. LOIS MORRISON: Depends on what the question is.

MR. BYRON WILLIAMS: Mr. Kuczek is -- is nodding his head, so. Just -- I want to work my way across this table with you. So we see the -- let's just take an example.

As we go across this table, these are cumulative figures; is -- is that right?

MS. LOIS MORRISON: Yes. They represent the cumulating energy savings year to year as new projects and new participants enter.

MR. BYRON WILLIAMS: So if I wanted to understand the incremental additional savings between

two (2) -- two (2) particular years, I would take the -- - the figure for the second year and sub -- and subtract from it the -- the savings from the first year. Would that be fair?

(BRIEF PAUSE)

MS. LOIS MORRISON: Generally, yes.

MR. BYRON WILLIAMS: And you can -- we're not going to go through every year, and you can either pull out a calculator or -- or accept my calculations subject to check, but if I were to look at the incremental difference between 2015 -- going from 2014 to 2015/''16, would you accept, subject to check, that it is about 114.2 gigawatt hours being the difference between two thirty-five point one (235.1) and one fifteen point nine (115.9)?

MS. LOIS MORRISON: Yes.

MR. BYRON WILLIAMS: And if I were to go out a few more years to the 2018/''19 year and seek to calculate the difference between the '18/''19 and the '17/''18 year, would you accept, subject to check, that that would be 103.3 gigawatt hours, being the difference between the '18/''19 cumulative figure and the 2017/''18 cumulative figure?

MS. LOIS MORRISON: Yes.

MR. BYRON WILLIAMS: And if I were to go out three (3) more years to 2021/'22, can we agree, subject to check, that the difference between the '21/'22 year and the '20/'21 year would be 77.6 gigawatt hours?

MS. LOIS MORRISON: That is correct.

MR. BYRON WILLIAMS: And let's go out three (3) more years to 2024/'25, and you would accept, subject to check, that the difference between the 2024/'25 year and the '23/'24 year would be about 51.5 gigawatt hours?

MS. LOIS MORRISON: That is correct.

MR. BYRON WILLIAMS: And, so just kind of -- what we're seeing in the early years are incremental growth in savings in excess of 100 gigawatt hours per year.

By the time we get out to the 2024/'25 year, we would have say incremental savings on a year-to-year basis of about half that?

MS. LOIS MORRISON: Looking at the efficiency programs alone, yes. And some of that would be reflected by the nature of the programs. The program that comes to mind is the roadway lighting conversion program where we know there are only so many

roadway lights out there, and we plan to convert them within that first period of time.

Once they're converted to LED, we will have to wait until something better comes along, and given that we waited fifteen (15) to twenty (20) years before something better came along last time, that's reasonable.

MR. BYRON WILLIAMS: Okay. And there you -- there you see the philosophical difference presumably between Mr. Chernick and Mr. Dunsky and -- and Hydro.

Would that be fair?

MS. LOIS MORRISON: To a certain extent, yes. There are diminishing savings -- in terms of the energy efficiency component of our plan, each time you go out to look at a new technology the slice gets thinner.

Again, going back to the roadway lighting program, in the early '90s, and I -- I hate to admit I -- I was around for that, we converted all of our roadway lighting from incandescent and mercury vapour -- we still had a few incandescents but primarily mercury vapour to high pressure sodium.

And when we did that program, we saved about 50 gigawatt hours, going back on memory here, by

converting all those lights. And those light -- we had fewer lights then. We have more lights now. This time around when we're going to do the conversion, we're anticipating going from HPS to LED to save about 35 gigawatt hours. So we have more lights in place, however, even with the substantial savings with LED that slice is smaller than when we went from incandescent mercury vapour to HPS.

So when you're looking at efficiency components of -- of equipment, you're -- you're -- every time you take a slice that slice gets smaller. When we talk about some of the other initiatives that are going in further down, such as what Mr. Friesen spoke to in terms of load displacement, that's more those newer technologies that are introduced here.

MR. BYRON WILLIAMS: And -- yeah, 'cause I was just -- we're going to come to load displacement --

MR. DALE FRIESEN: No, actually I'm talking on efficiency, and that phenomena that Ms. Morrison spoke to, about the slice getting smaller, affects Codes and Standards as well. So I'll give you an example.

If your refrigerator or other device went from 90 to 92 percent efficiency, the next time

you only have 8 percent losses. If you go from ninety-two (92) to ninety-five (95), next time you only have 5 percent losses. You can't take away more than your losses essentially. That's your limiting factor. It's the law of science.

'Cause I think we can all agree that we're not going to get greater than 100 percent efficiency. And as we approach that threshold, the challenge becomes progressively larger from both a cost perspective and a technical perspective.

So it's something we always have to keep in our minds, that we can't fundamentally ignore science here. We have to look at that in the efficiency spectrum, in particular, whether it's Codes and Standards or -- or whether it's programs, that we have some limitations there that we have to recognize.

MR. BYRON WILLIAMS: And we'll -- we'll come to that. Let -- let's go to load displacement for a moment, and let's look at Hydro Exhibit 153, page 40 again. And you had a bit of a conversation -- if we can scroll up on the page a little bit.

You had a bit of a conversation with My Learned Friend -- thank you -- Mr. Hombach about this program. And just without asking you to elaborate, in -- in the short-term under 'load displacement,' you're

looking at the conversion of waste streams and byproducts into useful energy.

Would that be fair?

MR. DALE FRIESEN: That is correct.

MR. BYRON WILLIAMS: And of course you're targeting some major customers segments including forestry, chemistry, chemicals, metals, et cetera.

Would that be fair?

MR. DALE FRIESEN: That is fair.

MR. BYRON WILLIAMS: As you look to the future, you note that other emerging sources, such as wind and solar, may have potential in certain in -- instances to offset purchase energy.

Would that be fair?

MR. DALE FRIESEN: There's been considerable discussion about solar at this hearing in many different parts of the hearing. And I think there's also been a lot of discussion about grid parity. So all of us recognize, I believe, that there is a future opportunity for solar, small wind, et cetera; it's a question of timing.

And in our current plan, the uncertainty is if you -- if you look at the evidence that's presented by various presenters, the uncertainty with

respect to when solar becomes cost competitive, it's a pretty big window.

And then there's the discussion of competition to solar, and that competition could be existing generation sources, and solar may not have a significant advantage over them.

So as Mr. Dunsky pointed out, and several others have pointed out, grid parity is one (1) discussion point, adoption rate is a completely second and almost separate discussion point and the rate at which these technologies get adopted.

Given all of these uncertainties, we have not included solar in our 2014 Plan.

MR. BYRON WILLIAMS: And just to follow that through, if I was looking for solar or a -- an alternative energy to show up, I would probably expect it to be in the customer's sited load displacement line.

Would that be fair, sir?

MR. DALE FRIESEN: That would be a logical place for it to -- to be, you know, depending on the -- the type of customer you're addressing it, we may create separate programs. So for instance it could be a residential program for rooftop PV, and there could be a commercial program but, essentially, you're

correct.

MR. BYRON WILLIAMS: If we could turn to Manitoba Hydro 180, Appendix A-2 again. And if we can scroll down to load displacement and alternative energy and, Diana, it's on the page, but if you could pull it up a little bit more -- oh, I think that's too far. That's lovely, thank you.

And, Mr. Friesen, if -- let's pick the year 2021 and go down to the customer's sited load displacement, you'll see cumulative savings of 580.6 gigawatt hours out to that point in time.

Would that be fair, sir?

MR. DALE FRIESEN: That is correct.

MR. BYRON WILLIAMS: And if I moved arou -- along that line each year out to 2028/'29, I would see that same figure of 580.6 gigawatt hours.

Would that be correct?

MR. DALE FRIESEN: That is correct.

MR. BYRON WILLIAMS: And what the constants of that figure suggests is past 2021 there are no incremental savings built into the 2014 DSM Plan related to customer sited load displacement.

Would that be fair?

MR. DALE FRIESEN: That is what the numbers say, yes.

(BRIEF PAUSE)

MR. BYRON WILLIAMS: And if I just went up one (1) line, sir, that is the Bio Energy Optimization Program, correct?

MR. DALE FRIESEN: That is correct.

MR. BYRON WILLIAMS: And if we turn to the 2019/'20 year, we see -- we -- just one (1) second, please. We see the cumulative savings to that point in time of 61.9 gigawatt hours. Is that correct?

MR. DALE FRIESEN: That is correct, as well.

MR. BYRON WILLIAMS: And if I move along that line out to 2028/'29, as well, that -- that number remains constant?

MR. DALE FRIESEN: That is also correct.

MR. BYRON WILLIAMS: And that suggests to me that past 2019/'20, there is no incremental savings related to this built into the forecast.

Would that be fair?

MR. DALE FRIESEN: That is what the numbers say, yes.

(BRIEF PAUSE)

MR. BYRON WILLIAMS: Mr. Cormie, you're here. And, Mr. Cormie, a big part of your business is monitoring what's hot, what's happening in -- in the American marketplace.

Would that be fair, sir?

MR. DAVE CORMIE: Those are your -- your words, not mine.

MR. BYRON WILLIAMS: But it -- it would be fair that in -- in your constant efforts to optimize export revenues for Manitoba Hydro, it would be important for you to keep your finger on the pulse of the American marketplace?

MR. DAVE CORMIE: My -- my priorities are with several of our major customers and that's where I focus.

MR. BYRON WILLIAMS: Okay. You would keep your mind, sir, on the -- what's going on in terms of generation in the American marketplace.

Would that be fair, in terms of new generation, what the sources of new generation are?

MR. DAVE CORMIE: I understand what our customers view their alternatives to be.

MR. BYRON WILLIAMS: Okay. And you're saying, sir, that you go no father than just your customers?

MR. DAVE CORMIE: Those are the ones that are important to me. Others I -- I can't sell to them and then so I -- I don't necessarily pay attention to them.

MR. BYRON WILLIAMS: So your evidence is that you have no reference to the office of energy projects, energy infrastructure updates in --

MR. DAVE CORMIE: I don't follow that, no.

MR. BYRON WILLIAMS: So just to confirm then, you're not in a position to comment on what is the number one new generation in -- in-service for the first three (3) months of 2114 (sic) among American generation sources?

MR. DAVE CORMIE: No, I can't comment on that.

MR. ED WOJCZYNSKI: But there are others who monitor that in Manitoba Hydro.

MR. BYRON WILLIAMS: Mr. Wojczynski, is that you?

MR. DAVID CORMIE: No, I think that would be Ms. Flynn's area that monitors what's happening in the MISO market in general.

JOANNE FLYNN, Previously Sworn

MR. BYRON WILLIAMS: Subject to check, would Manitoba Hydro agree that the number one source of new generation in-service in -- in the United States between January and March 2014 was solar?

MS. JOANNE FLYNN: Subject to check, yes.

MR. BYRON WILLIAMS: And accounting for roughly 51 percent of installed capacity in terms of megawatts in that time period?

MS. JOANNE FLYNN: Subject to check, yes.

(BRIEF PAUSE)

MR. BYRON WILLIAMS: And, Ms. Flynn, I -- I think I can just confirm your --- your check. So I'll just -- with your counsel's permission, show that to you.

(BRIEF PAUSE)

MR. BYRON WILLIAMS: I think I heard evidence from Manitoba Hydro that you can never get past 100 percent efficient.

Was -- was that Hydro's evidence?

MR. DALE FRIESEN: That was a statement that was attributed to me, yes.

MR. BYRON WILLIAMS: And would it be fair to say that in terms of heat -- heat pumps, one might expect somewhere between 200 and 400 percent efficiency?

MR. DALE FRIESEN: Generally, you wouldn't refer to that as an efficiency, that's a co-efficient of performance. It's a -- it's a different measure of explaining the relationship between electricity input and energy output. It doesn't -- the co-efficient of performance doesn't account for the energy that you utilize from the ground source or air source that you're using.

So if you would take all the energy that's drawn into the heat pump and measure that against the energy that's delivered by the heat pump, you would have an efficiency of less than 100 percent.

MR. BYRON WILLIAMS: Okay. Fair enough. Now, just a couple last questions, I think. I'm going to have a -- in a little bit a couple for you, Mr. Kuczek. You can't give Ms. Morrison all the hard work after making fun of her purchasing decisions.

But in Manitoba Hydro Exhibit 180, 42 -- page 42. This is actually for you probably, Ms.

Morrison. If we scroll down to -- towards the bottom of that page. And, Ms. Morrison, you'll recall that this is the levelized utility cost metric that you had some discussion with with Board Member Grant.

Do you recall that discussion?

MS. LOIS MORRISON: Yes.

MR. BYRON WILLIAMS: And if I looked at the overall portfolio metric for the 2014 Plan, would I be correct in suggesting that the LUC, or levelized utility cost, is one point eight (1.8) cents per kilowatt hour?

MS. LOIS MORRISON: That is correct.

MR. BYRON WILLIAMS: And I apologize for making you flip around a bit, Diana, but if you could go back to Appendix A-2.

To Mr. Kuczek, or -- or Ms. Morrison, if I look through the energy efficiency programs for Manitoba Hydro in the 2014 Power Smart Program, would I be correct in suggesting that there is no home energy report type project -- product, or O Power type product? Would that be fair?

MR. LLOYD KUCZEK: It's hidden.

MR. BYRON WILLIAMS: Is it, Mr. Kuczek?

MR. LLOYD KUCZEK: You -- well, you now found it, I guess, but... So we're unsure if we're

going to pursue that program, but what we did do is put some dollars aside to pursue the program. So the dollars are aside, and -- or set aside, and -- and we're evaluating whether or not we will pursue it, in time.

MR. BYRON WILLIAMS: I'm pretty happy to hear that, Mr. Kuczek. Now, in terms of the marketplace that that could potentially benefit, what are we talking, three hundred and seventy thousand (370,000) houses or so?

MS. LOIS MORRISON: Actually in all of our discussions to-date with 'O' Power, they have not encouraged us to pursue all three hundred and seventy (370) --

MR. BYRON WILLIAMS: Okay.

MS. LOIS MORRISON: What they've recommended is that we focus on the high energy users because we can identify those people, and specifically target them. And, so it's a much smaller group than the three hundred (300) and some --

MR. BYRON WILLIAMS: Fair --

MS. LOIS MORRISON: -- thousand customers.

MR. BYRON WILLIAMS: -- fair enough. If I look at 'O' Power actually being ruled out, would

I be fair to say that one of the markets across Canada that it's been ruled out would be in Nova Scotia?

MS. LOIS MORRISON: You may know this better based upon your discussions with your expert, Mr. Dunsky. Last discussions we had with Nova Scotia is they were -- they were in discussions and exploring the -- the idea of.

MR. BYRON WILLIAMS: We can do this one (1) of two (2) ways. Would you accept, subject to check, that it's currently available in Nova Scotia, or would -- or would you undertake --

MS. LOIS MORRISON: My counterpart behind me has indicated that, yes, they -- we are aware of it. I just didn't know yet.

MR. BYRON WILLIAMS: And I just found out today myself, Ms. Morrison.

And would it be fair to say that it -- it would be your expectation that there are many -- excuse me, a number of other jurisdictions in Canada that are about to launch 'O' Power?

MS. LOIS MORRISON: Yes. Based on our conversations with 'O' Power, they have indicated to us that they are very active in the marketplace, and seeking out additional clients.

MR. BYRON WILLIAMS: Subject to check,

would you agree that generally where 'O' Power is applied savings of 1 to 3 percent per year are reported?

MS. LOIS MORRISON: Those are the numbers that they have indicated to us. We have -- we're -- we're somewhat hesitant, given that those savings have to be re-earned every year and also given that we are looking at a number of other initiatives, including conservation rates and such.

Our concern was related to double counting and -- and what -- where -- where do you start assigning those savings into what programs and that. And I understand that 'O' Power is very good at doing the analytics and such, but in our discussions with them we were a little bit hesitant still just because of some of the initiatives we were looking at. And they weren't -- we didn't have definitive answers at that time from the -- from that supplier.

MR. BYRON WILLIAMS: And -- and just so I -- I understand your evidence and I -- and I -- I appreciate it, you -- you've confirmed that in -- 'O' Power has advised you that they're, on an annual basis, achieving savings of 1 percent to 3 percent. You're not quite at the stage where -- where you're accepting that as an expectation for Manitoba.

Is that fair?

MS. LOIS MORRISON: It's one (1) of the initiatives that we feel is subject to a little more investigation. And that investigation would have to be in consideration of the other initiatives that are being undertaken.

MR. BYRON WILLIAMS: Okay. And just so I understand your evidence, Mr. Kuczek, I believe you said there's some money in the budget for 'O' Power?

MR. LLOYD KUCZEK: Or another program, but there's -- there's a contingency line for -- in the doll -- dollars. And that was one (1) of the opportunities that we thought we should assess further. And we weren't comfortable including the energy savings associated with that initiative yet to include it in this plan.

MR. BYRON WILLIAMS: Sir, yeah, and I'm sorry I -- I lost attention just for a minute.

So the -- there's some money in the budget, but you -- as of yet you haven't put in the anticipated savings into the plan?

MR. LLOYD KUCZEK: Correct.

MR. BYRON WILLIAMS: Okay.

(BRIEF PAUSE)

MR. BYRON WILLIAMS: And, sir, in -- in conversation either with the Board -- I can't remember any more -- or My Learned Friend, Mr. -- Mr. Hombach, I believe you said earlier today, Smart meters, we think there is a business case.

Do you recall that statement, sir?

MR. LLOYD KUCZEK: Yes.

MR. BYRON WILLIAMS: Currently within Power Smart 2014 are anticipated savings from powers -- from smart meters built into the forecast?

(BRIEF PAUSE)

MR. LLOYD KUCZEK: We -- we don't -- we -- we don't have any dollars or energy estimated that could be saved through AMI within this plan at this point.

MR. BYRON WILLIAMS: Okay. Now, just so I understand the terminology that all you DSM brilliant experts thrown around, if I use -- if you use the term 'smart meters' and I use the term 'smart thermostats', i.e. Nest or Honeywell products, are using -- are we talking the same thing?

MS. LOIS MORRISON: No, we are not.

MR. BYRON WILLIAMS: Okay. Well, let's

go to smart thermostats, then.

If I were to look through your list of energy efficiency programs would I -- in the 2014 Power Smart program, would I see smart thermostats there?

MS. LOIS MORRISON: No, those were not one (1) of the initiatives included within the 2014 plan. But the home monitors and the smart thermostats and that were one (1) of the measures that were included in the DSM Potential Study.

MR. BYRON WILLIAMS: Okay. Am I right in suggesting to you that smart thermostats, as offered by -- by firms such as Nest and Honeywell, the early experience is suggesting savings between 5 and 15 percent?

(BRIEF PAUSE)

MS. LOIS MORRISON: Subject to check, that is their claim. But I would -- I would state that we would probably want to do further analysis before we were to accept their projection for savings in -- in our own marketplace.

MR. LLOYD KUCZEK: And just to add to that. Anytime we're dealing with salespeople trying to sell a program, whether it's 'O' Power or Nest, you're

generally -- you're likely getting a projection that's on the high side.

So it's the same thing with the geothermal industry. When we -- the industry's out selling the geothermal units we -- our feeling is, is they're suggesting the savings is greater than really what's been achieved in the marketplace. And that's what we've observed with geothermal, as well. So one has to be a little careful with those numbers.

MR. BYRON WILLIAMS: Okay. Mr. Kuczek, I -- I can show the reference if you would like.

But would it be fair to say that in the general rate application last year, Manitoba Hydro was suggesting that the DSM targets presented in the 2011 Power Smart Plan were declining but was suggesting that it was a reflection of Hydro's consistent long-term engagement in DSM and the diminishing availability of economic energy efficiency opportunities remaining in the Manitoba market?

MR. LLOYD KUCZEK: That was our statement.

MR. BYRON WILLIAMS: Okay.

(BRIEF PAUSE)

MR. BYRON WILLIAMS: This can go to either Mr. Kuczek or -- or Ms. Morrison. Leaving aside the Manitoba specifics, when we talk about -- when you see the term 'conservation rates', would it be fair to say that, as used generally, it might include inclining rate structures, it might include time of use, or -- and it also might include incentive programs?

MS. LOIS MORRISON: Traditionally, when we've referred to conservation rates, what we refer to are the inclining block structure, time of use rate, critical peak pricing. It's not traditionally, as far as we're aware, is referred to an incentive-based program for rates --

MR. BYRON WILLIAMS: And the answer was better --

MS. LOIS MORRISON: -- unless you...

MR. LLOYD KUCZEK: I do believe some utilities have offered incentives for customers to stay -- or to reduce their consumption by 10 percent over a period of time, so there are some of those programs out there.

MR. BYRON WILLIAMS: And -- and thank you. And -- and the -- the answers were better than the question. I apologize for the quality of the question.

But, Mr. Kuczek, what you're telling me is that in some jurisdictions you're aware of -- after normalizing for weather, there are incentives offered to consumers if they achieve savings beyond a certain threshold?

MR. LLOYD KUCZEK: I just recall Ontario Hydro offering a program like that for a period of time, and I'm not sure if it was over a long period or just a specific period. So in our case, we're looking for energy conservation -- or energy savings that would last over an extended period as opposed to just a temporary period.

MR. BYRON WILLIAMS: And in terms of conservation rates as contemplated in Manitoba, it's based upon an inclining rate -- rate structure.

Is that correct?

MR. LLOYD KUCZEK: Yes.

MR. BYRON WILLIAMS: And without getting into the specifics of Manitoba yet, just notionally one would pay a certain level for, let's say, the first certain number of kilowatt hours, and then a higher rate for the next level of kilowatt hours?

MR. LLOYD KUCZEK: That's correct.

MR. BYRON WILLIAMS: And is -- now

moving to Manitoba, are we anticipating that the inclining rate structure would be applied equally to homes that both light and heat their homes with electricity?

MR. LLOYD KUCZEK: That would not be the way I would approach it. And we've had discussions internally about that then, as well as I -- I believe at the hearings here. Our general rate in --

MR. BYRON WILLIAMS: That's probably my wife, Mr. Kuczek. And -- and if you have room on your couch for the next month. No?

MR. LLOYD KUCZEK: I do, but no.

MR. BYRON WILLIAMS: So, sir, you're saying that as currently contemplated in Manitoba, you wouldn't anticipate -- maybe you can give us some insight into what you're looking at.

MR. LLOYD KUCZEK: I'll -- I'll give you some background. So -- so what we did last time is we did offer it and there was no difference between customers that heated with electricity and natural gas. And I was a proponent in the company not to do that. So I -- I seen where there were issues, and we had some customers that came before the -- the Board here and explained those same issues and why we shouldn't be doing that.

But generally speaking, the threshold for natural gas customers, or people that heat with natural gas and electricity, are different. So you -- if you want to incent customers to conserve energy, you have to have different thresholds for it to be meaningful for those customers. So if you had too high of a level for electric heated customers, the natural gas customers aren't going to be incented because they're never going to get there, because they don't use a lot of electricity.

And the other issue that was evidence was -- is there's a fairness issue, in terms of who's going to pay for -- or where we're going to get our revenue. So we need to address -- sorry. Okay.

So -- so we realize that there's issues and -- and we need to address some of those issues as well as who's going to be impacted by whatever we propose. And we need to address that before we come forward with it. But we do believe it's important to address the -- the different types of customers and -- and at least in terms of the heating source.

MR. BYRON WILLIAMS: And -- and with Ms. Desorcy to my right and Dr. Miller at my back, you'll no doubt expect my next question which is: I'm presuming you intend to extend to consult extensively

with community organizations as you consider methods to roll out that plan?

MR. LLOYD KUCZEK: We think it's going to be important to consult with some individuals external to Manitoba Hydro. We haven't decided who those people would be yet, but it certainly would be yourselves and -- and your client and -- and Mr. Miller as well.

MR. BYRON WILLIAMS: If I was sleeping on the couch, Mr. Kuczek, it would be a lot easier to talk about these issues.

MR. LLOYD KUCZEK: Well, we think we have to get your client and Mr. Miller maybe to agree as well, so.

MR. BYRON WILLIAMS: Just a couple of last questions. Ms. Morrison, you will recall we had a discussion of savings with regard to 'O' Power.

And I was suggesting to you they were in the range of 1 to 3 percent annually?

MS. LOIS MORRISON: That's what 'O' Power puts on their literature, yes.

MR. BYRON WILLIAMS: Would you accept, subject to check, that these are independent evaluations -- these figures are based upon independent evaluations conducted for utilities and their

regulators?

(BRIEF PAUSE)

MS. LOIS MORRISON: Yes, subject to check. Recognizing that there may be differences in jurisdictions and differences in -- in the approaches.

MR. BYRON WILLIAMS: And similarly, in terms of smart thermostats, you'll recall we discussed savings between -- of between 5 and 15 percent?

MS. LOIS MORRISON: Yes.

MR. BYRON WILLIAMS: And rather than suggesting their manufacturers' claims, would you agree that they are the results of independent evaluations conducted for utilities and their regulators?

MS. LOIS MORRISON: Yes, I would. But I would also qualify that, that it really does depend on the market that it's being sold into. We previously had a Programmable Thermostat Program that we offered. And what we found is, and through our residential energy use surveys and through other surveys, found that there's a large number of people who already had them. And then there's a large number of people who manually set back their thermostats.

And so when we did our independent --

our own evaluations, sorry, of -- of that program we found that there were -- there -- the savings were limited because of this preexisting behaviour in our marketplace, being that we're quite climatically challenged.

MR. BYRON WILLIAMS: And just to finish, you mentioned -- you almost mentioned independent evaluations.

And, Mr. Kuczek, you'll recall in prior General Rate Applications you've had some conversations with me about independent evaluations, not just at the program level but at the portfolio level?

MR. LLOYD KUCZEK: Yes.

MR. BYRON WILLIAMS: And in discussion with My Learned Friend, Mr. Hombach, you -- you made the statement that they can be expensive.

Do you recall that?

MR. LLOYD KUCZEK: Yes.

MR. BYRON WILLIAMS: And, sir, just ballpark when you use the term 'expensive' to describe a portfolio independent evaluation, one would assume, first of all, that one wouldn't do one every year.

MR. LLOYD KUCZEK: My discussions were referring to just individual program evaluations. I never contemplated doing an overall portfolio

evaluation.

(BRIEF PAUSE)

MR. LLOYD KUCZEK: Maybe I should just add some clarification to that. We did hire Mr. Dunsky to -- to undertake an overall -- overall a review of our portfolio. You don't drill down into the evaluations. This was an evaluation of our -- our plans and so slightly different there than evaluating the results you achieve.

MR. BYRON WILLIAMS: Yeah. And the -- again the -- your answer is better than the question. Focussing on the evaluation of individual programs, can you give me -- actually, I'm going to scratch -- scrap that question, because I'm thinking we'll get in -- we might be getting into some commercial arrangements, so I'm going to scrap that question.

And I will thank the panel for the time this evening. It's much appreciated. And Manitoba Hydro, as well.

THE CHAIRPERSON: Okay. Dr. Miller, have you got any questions for this panel? No? Thank you.

Me. Hacault, any questions at all?

(BRIEF PAUSE)

THE CHAIRPERSON: Thank you for that. I just have one (1) very set -- set of questions I want to address, which is related to the testimony that we heard from Mr. Dunsky. Specifically we were talking, he and I, about what makes for success in energy efficiency programs and DSM programs, and so on.

And, you know, he mentioned having a suitable framework in place to -- to ensure success, and he mentioned independent evaluation programs we just talked about, and oversight mechanism which is not clear it exists in this -- in Manitoba. And he also talked about manded obli -- mandated obligations.

I combine that with a report that was tabled by Manitoba Hydro that was produced by the American's Council for an Energy Efficient Economy, and it referred to one of the major -- major reasons for success is for the utilities or the states to have an energy efficiency resource standard, a mandate or standard.

And I guess the question is, you know, from my perspective, and given that we're expected to give advice to the government, I'm asking the question whether or not the framework that's in place in

Manitoba is adequate to ensure success for DSM programs by Manitoba Hydro?

And I -- I put that question out there because obviously given the evidence that we've heard from Mr. Dunsky, and given the report that I've -- that all of us -- all the panel members have read, I think, it's pretty clear that -- that there has to be a suitable framework in place. And I -- that's the question that I think we need to address at some point, whether it's now or it's through closing arguments. But I -- we need to hear from Manitoba Hydro what its views are about the notion of a -- of a changed framework that would ensure success.

And I think the reason why we've spent so much time in DSM is, you know, in -- in addition to the issues around, you know, its importance to a portfolio and its importance to meeting future needs and so on, there's also the -- the harsh reality, which I've addressed already, which is the notion that people are facing significant rate increases. And -- and it seems to me we have to an array of tools available to them that will allow them to mitigate some of that exposure that they're having to deal with in the future -- exposure to increased rates.

And so I -- I think that I would like to

hear from Manitoba Hydro its views about what I've just proposed and what we've heard as a panel from -- from Mr. Dunsky and -- and what we've read, as well, so I -- I wonder if that you -- you can address it now, or we can address it later and give you an opportunity to think about that.

(BRIEF PAUSE)

MR. LLOYD KUCZEK: I'll -- I'll provide a few comments with regards to that, and so I'd been involved on the demand-side management side at Manitoba Hydro since about 2000, so. And I've talked to other utilities -- I monitor market sim -- similar to what Mr. Cormie does on the export market, and so I used to monitor it a lot closer when I had more concerns.

Generally speaking, I think it's important that Manitoba Hydro pursue all economic oppor -- DSM opportunities. I think that's very important, but in that context, we also have to consider some considerations associated with some of those opportunities, like a rate design. Is it really worth pursuing or having a -- a rate structure -- a conservation rate structures, because there's other issues that need to be considered?

So I don't think just looking at it from an -- being an economic opportunity alone, it makes sense. You have to look at that from a broader perspective.

Fuel switching, I think government policy comes into play with that particular opportunity. So that has to be looked at from a broader perspectives, as well.

So I think the framework in Manitoba with the legislation that they have in place deals with -- deals with the issues from the government's perspective at least, and the -- and the Utility's perspectives. The hearings allow for other parties to present their views, as well, and I think that is good.

In terms of the evaluations that Mr. Dunsky's suggestion -- suggesting that we do, I -- we have concluded a few times in the past that we should -- probably should do some third-party evaluations of programs. We did do the overall portfolio with Mr. Dunsky. We'd seen some value in doing that, so.

With the third-party evaluations, what's been a barrier in the past, and I don't mean this in a negative way, has actually been the regulatory hearings. We -- we seem to be here more than -- or just as often as we are in the office, but I had

instructed our evaluation team to actually undertake a third-party evaluation of at least one (1) program, and this has got to back two (2) or three (3) years ago.

And a year would go by and we would never get to it because of other interference with the regulatory hearings. And -- and again, I don't mean that in a bad way, but that's what's happened.

But even as I sat here and we talked about it, I did text the supervisor resp -- or the manger responsible for the program, and I said, We -- we really need to do this to provide people with some comfort. So I think that is probably necessary for everyone here.

THE CHAIRPERSON: I guess I'm -- I'm concerned about the disincent -- the disincentive facing Manitoba Hydro when it comes to DSM programs, because if you manage to -- if I save a few kilowatt hours, it's costing you seven (7) or eight (8) cents a kilowatt hour -- costing Manitoba Hydro. You take a -- you turn around and you take that kilowatt and sell it in the US for four (4), five (5), six (6) cents, perhaps.

I'm not talking about the -- the reliable energy. I'm talking about the energy that would be freed up short-term from DSM programs. I -- I

-- guess it's a built in disincentive for Manitoba Hydro to -- to sort of really take hold of this DSM program and really sell that to Manitoba -- 'sell' is probably the wrong word, but make sure that Manitobans are given ample opportunity to take advantage of that.

And -- and I guess -- could you comment on that issue?

MR. LLOYD KUCZEK: We -- we actually don't view it from the short-term perspective, so, you know, when I did my presentation I talked about the resource cost test that we used that filter.

So we're not looking at -- and -- and I also caution the Board about that proxy number for the marginal value, because the marginal value -- that proxy number is just one (1) number. The value's different in the winter, it's different in the summer, it's different into the future.

So what we do is we look at -- we have a -- a spreadsheet that -- that takes that into account, and when we're looking at the opportunity with DSM. We input the energy that we're projecting to be saved and you capture that, then you do your analysis.

So our perspective is not to look at it from that short-term perspective, but to look at it from a long-term perspective, to use the marginal

value, measure that against the resource cost. And if that resource cost is lower than the marginal value -- if the resource cost is lower than the marginal value we should be pursuing that.

Then the question is: How aggressive and what is the design in terms of how we do that? So that's our philosophy at Manitoba Hydro in terms of pursuing economic opportunities.

MR. ED WOJCZYNSKI: And then maybe just to support that, when we evaluated the different levels of DSM, we don't just use opportunity costs for the surplus energy, we do use the -- the firm prices as well.

THE CHAIRPERSON: Thank you. I think that completes the proceedings for today. So thank you all -- everyone for having stayed for such a long period of time, but it was with intended -- with the objective of making sure we didn't have to sit on Saturday, so.

So have a good evening everyone. We'll see each other again tomorrow morning at a quarter to 9:00, some of us at least.

--- Upon adjourning at 7:45 p.m.

Certified correct,

The Public Utilities Board

MANITOBA HYDRO NFAT REVIEW

DIRECT TESTIMONY OF PHILIPPE DUNSKY

April 28, 2014

dunsky
ENERGY CONSULTING

www.dunsky.ca 10212
(514) 504-9030 | info@dunsky.ca

DUNSKY OVERVIEW

CLIENTS (sample from among >100)

EXPERTISE

- Energy Efficiency and Demand-Side Management
- Renewable Energy and Emerging Technologies
- Greenhouse Gas Reductions

SERVICES

- Design and evaluation of programs, plans and policies
- Strategic, regulatory and analytical support
- New opportunities assessments

CLIENTELE

- Utilities
- Governments
- Solution Providers
- Large consumers
- Non-profits

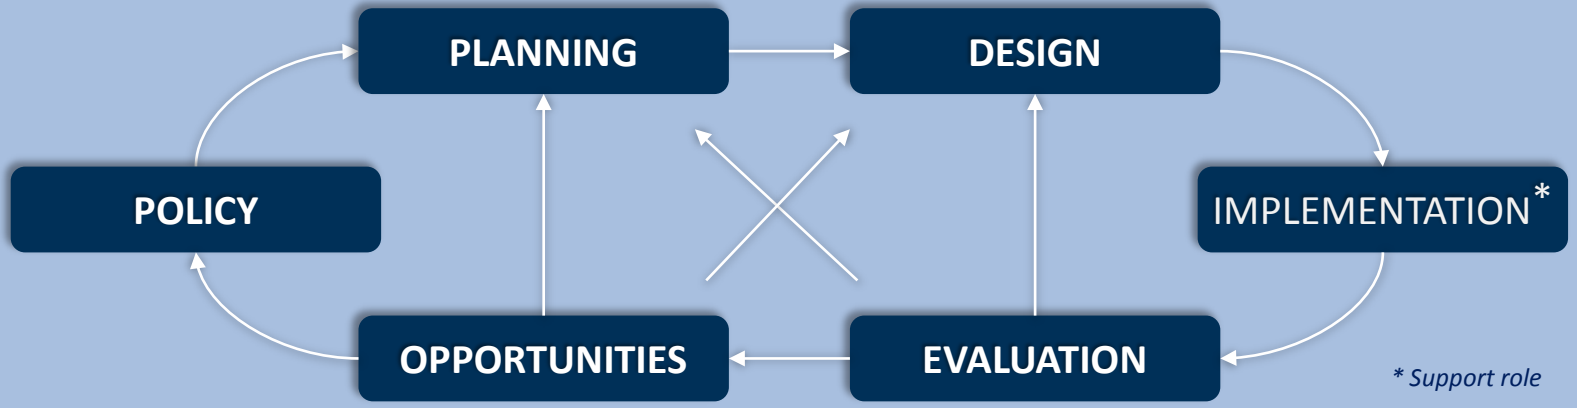
DUNSKY **EXPERTISE**

We assist our clients in the following areas:

RESIDENTIAL

- ✓ New Construction
- ✓ Retrofit (able-to-pay & low-income)
- ✓ Advanced HVAC (incl. controls)
- ✓ Lighting & Appliances
- ✓ Behavioural, Plug Load, Others

BUSINESS & GOVERNMENT



- ✓ Existing Buildings (custom, direct install, continuous optimization)
- ✓ New Construction (small and large)
- ✓ Equipment (Lighting, Controls, HVAC, Motors)
- ✓ Innovative Solutions

CROSS-SECTORAL

- ✓ Policies and Comprehensive Plans
- ✓ Regulatory Frameworks
- ✓ Innovative Financing
- ✓ Building Labelling & Benchmarking
- ✓ Rate Structures & Options
- ✓ Demand Response & Load Control
- ✓ Smart Meters / Grids
- ✓ Customer-sited Renewables
- ✓ Next-Generation Technologies
- ✓ Codes and Standards

DUNSKY **SERVICE AREAS**

PRIMARY AREAS

SUPPORT SERVICES

STRATEGIC & MARKET

- Comprehensive Plans
- Program Design
- Best Practice reviews
- Gap Analyses
- Business Plans
- Strategic Evaluations
- Process Evaluations
- Benchmarking
- Market Research
- Stakeholder Engagement
- Regulatory Frameworks
- Regulatory Support

TECHNICAL & ECONOMIC

- Potential Studies
- Technology Assessments
- Measure Characterization
- Savings Algorithms
- Modelling
- Impact Evaluations
- Cost-Effectiveness Screening
- Financial Analysis
- Energy System Modelling
- Carbon Markets

BUILDING SERVICES

- Building Assessments & Modelling
- Building Performance Optimization
- Building Certifications (LEED, BOMA, ESPM, etc.)
- Related services

My Qualifications

23 YEARS OF EXPERIENCE

- 10 leading my firm (advising N.A. govts, utilities, others)
- 8 as Executive Director of energy think tank
- 5 working with government and non-profits

PAST APPOINTMENTS

- GOVT: Canadian GMF ($650m); Quebec EE Agency, Quebec Energy Commission, NRTEE
- PRIVATE: Venture cap (FIDD), EIG investment fund, Enbridge DSM Audit Comm., others…
- Non-profit: FAQDD, PlanetAir, BC Green Landlords Project, Daphna Foundation, others…

CURRENT PROJECTS

- **Comprehensive Plans**
  - *MB (CAC/GAC): review NFAT filing*
  - *NB (NBP): design RASD plan (EE+DR)*
  - *VT: long-term energy planning / modelling*
- **Program Design and C&S**
  - *SK: solar finance design*
  - *ON (TAF): innovative finance model (C&I)*
  - *MB (MH): low-income program review*
  - *OEE: home retrofit strategies*
  - *OEE: new LVT standards*
- **Program Evaluation**
  - *CA (CPUC): impact evaluations (lead)*
  - *CA (IOUs): process evaluations*
- **Potentials and Opportunities**
  - *NB (NBP): potential studies*
  - *MA (CLC): potential study*
  - *MA (NU): smart thermostats*
  - *MA (NU): new gas savings opportunities*
- **Economic & Technical Analysis**
  - *AESP: Trainer – DSM Economics (Advanced)*
  - *GM: incorporation of non-energy benefits*
  - *CA: Methodologies for finance programs*
  - *ENSC: Frameworks for planning and IRP*
  - *NBP: Technical Resource Manual (TRM)*
  - *ON (OPA): advanced lighting TRM*

CURRENT OTHER CONTRIBUTIONS

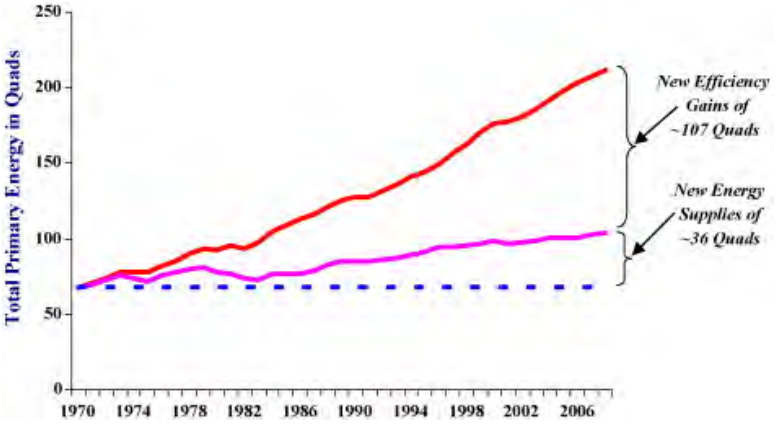
- NESP (cost-effectiveness): Advisor
- NEEP-AHP (Cold Climate): Member
- NEEP-AHP (Policy): Member
- Others (ACEEE, AESP, CEEA, AQME)

CONTENTS

1. Hydro's DSM Scenarios

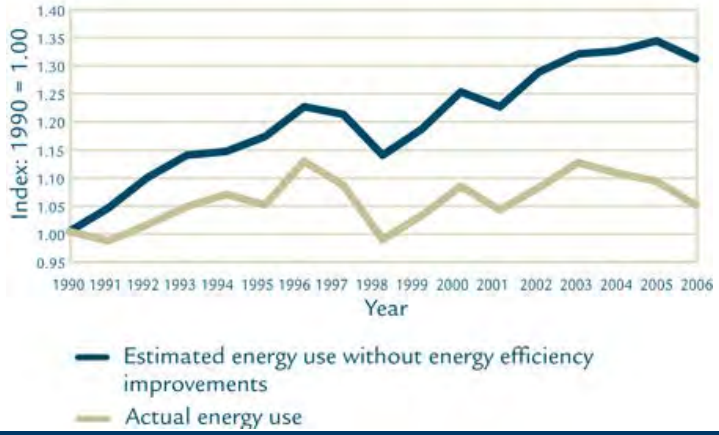
2. The Problem with a Static View of the Future

3. How Others Address the "Planner's Dilemma"?



4. Preferred DSM Assumptions & Implications for NFAT Review

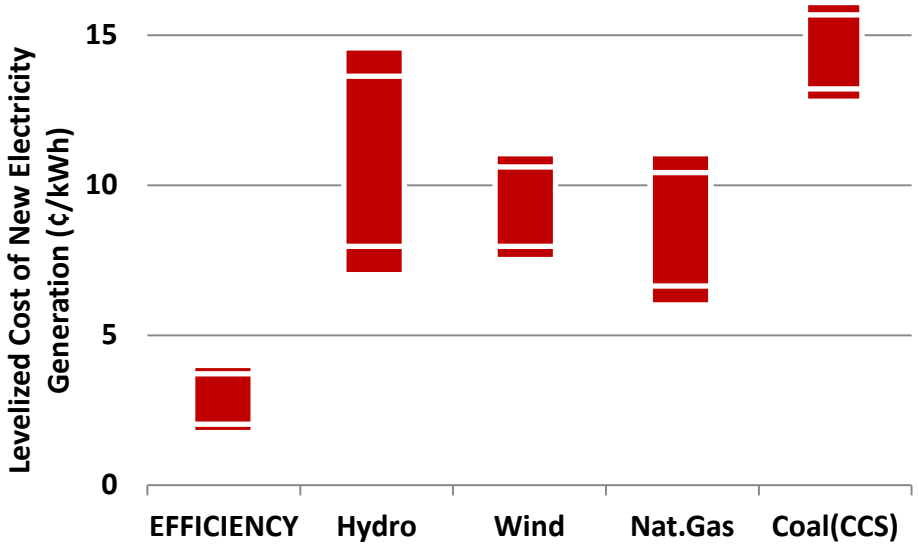
CONTENTS



1. Hydro's DSM Scenarios
2. The Problem with a Static View of the Future
3. How Others Address the "Planner's Dilemma"?
4. Preferred DSM Assumptions & Implications for NFAT Review

Demand-Side Management (DSM)

- **Two options to ensure sufficient supply**
  - Increase Supply
  - Increase Efficiency (reduce demand)
- In U.S., since 1970 energy efficiency has supplied 75% of growth in demand
  - Increased supply: 25%
  - **Increased efficiency: 75%**
- In Canada, from 1990 to 2006, energy efficiency (DSM) supplied majority of residential growth in demand for energy services
  - Increased supply: 15%
  - **Increased efficiency: 85%** or $6.6B



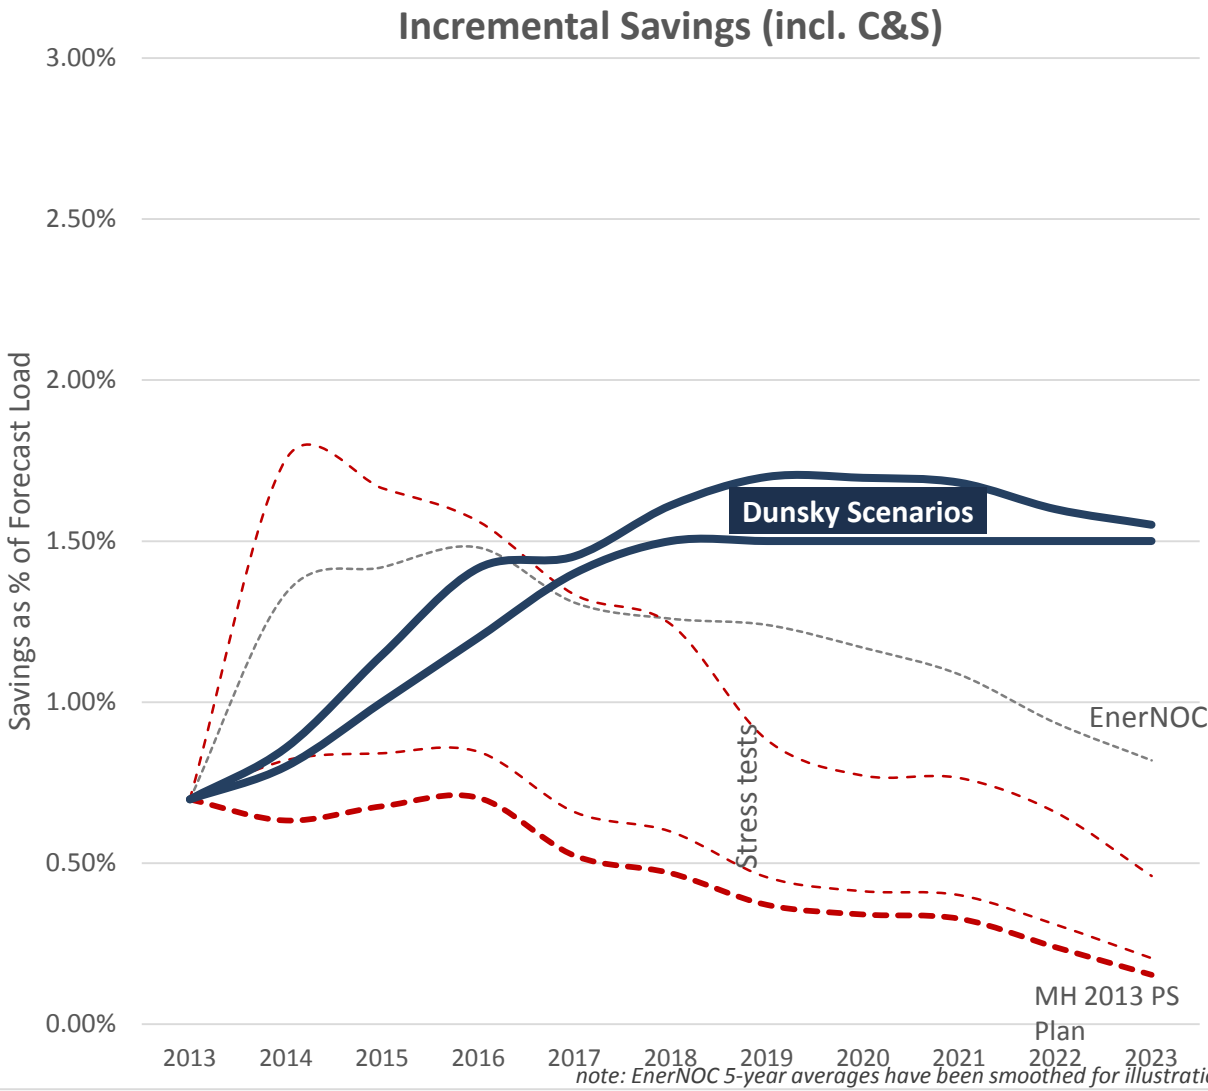
Residential Energy Use, Actual and Without Energy Efficiency Improvements, 1990 to 2006

EFFICIENCY'S BUSINESS CASE

- ✓ **CHEAP**
  - 2-8 times cheaper than new supply (power plants)
  - Also lower risk
- ✓ **JOBS**
  - ~2-10 times more jobs per million dollars invested
- ✓ **CLIMATE**
  - 1st priority in reducing CO2 emissions
- ✓ **ECONOMIC BENEFIT**
  - Increases household disposable income
  - Frees business capital for productive use
- ✓ **CUSTOMER SATISFACTION**
  - Opportunity to reduce bills and secure other benefits

MANITOBA HYDRO

- **Strong history with energy efficiency**
  - A+ ratings
  - Awards

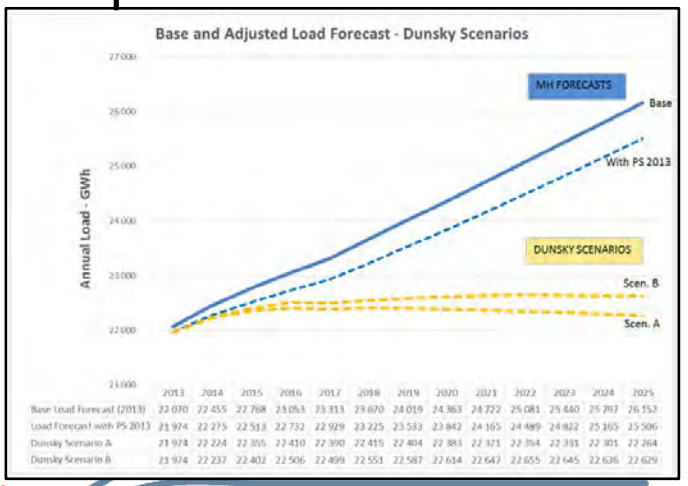


- **Unique strengths to deliver DSM**
  - ✓ Full territorial coverage
  - ✓ Electric-Gas Integration
  - ✓ History of DSM *incl. relationships with market channels, experienced/capable staff*
  - ✓ Billing integration
  - ✓ Data integration
  - ✓ Others

DSM & NFAT

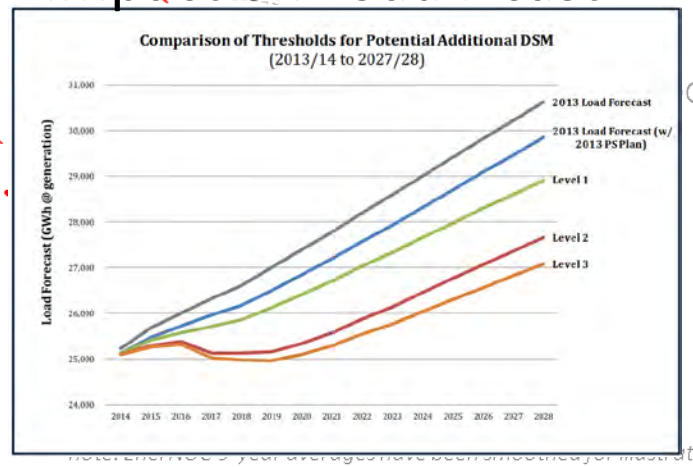
- INTRO
  - DSM critical resource for balancing supply & demand
  - Hydro: great strides in 6 months
  - Remaining steps to ensure long-range planning is as accurate as possible
- MY PRESENTATION
  - Seek to answer Q: **“What role should DSM be assumed to play for proper long-run planning?”**
  - Focus here on energy only; can speak to capacity – and demand response needs – upon request; other issues as well

Original Values (to 2023)



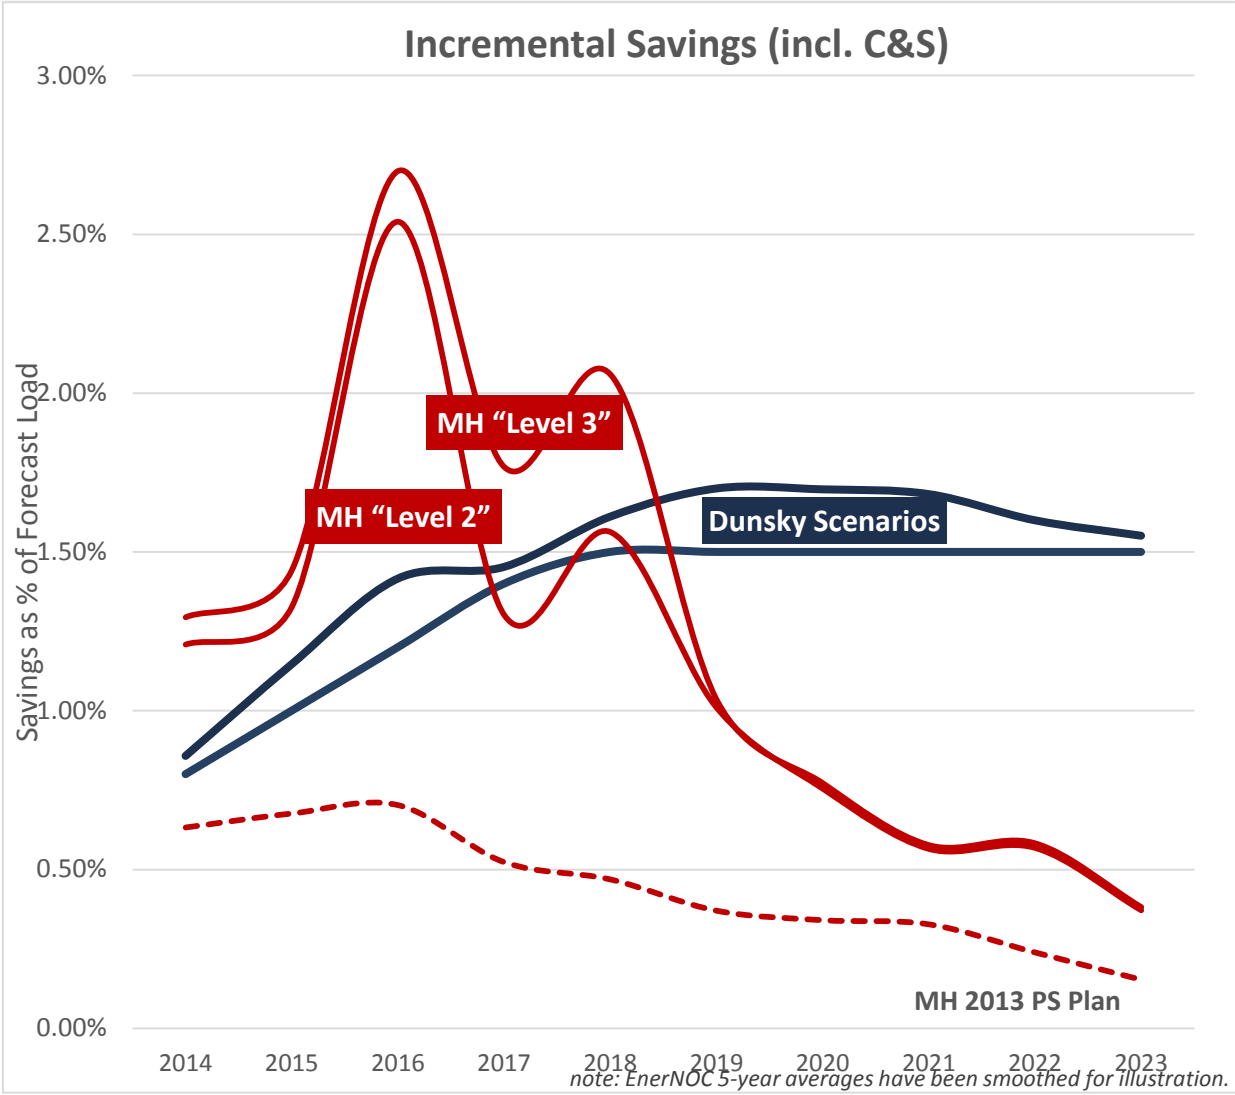
- MH 2013 Plan: ~0.4%/yr (avg)
- EnerNOC Mkt. Pot.: ~1.0%/yr (avg)
- Stress Tests (2013 x1.5 /x4.0)
- Dunsky scenarios: 1.3% and 1.1%

New MH "Levels" (to 2023)



DUNSKY DSM Scenarios → Impact on Load F'cast

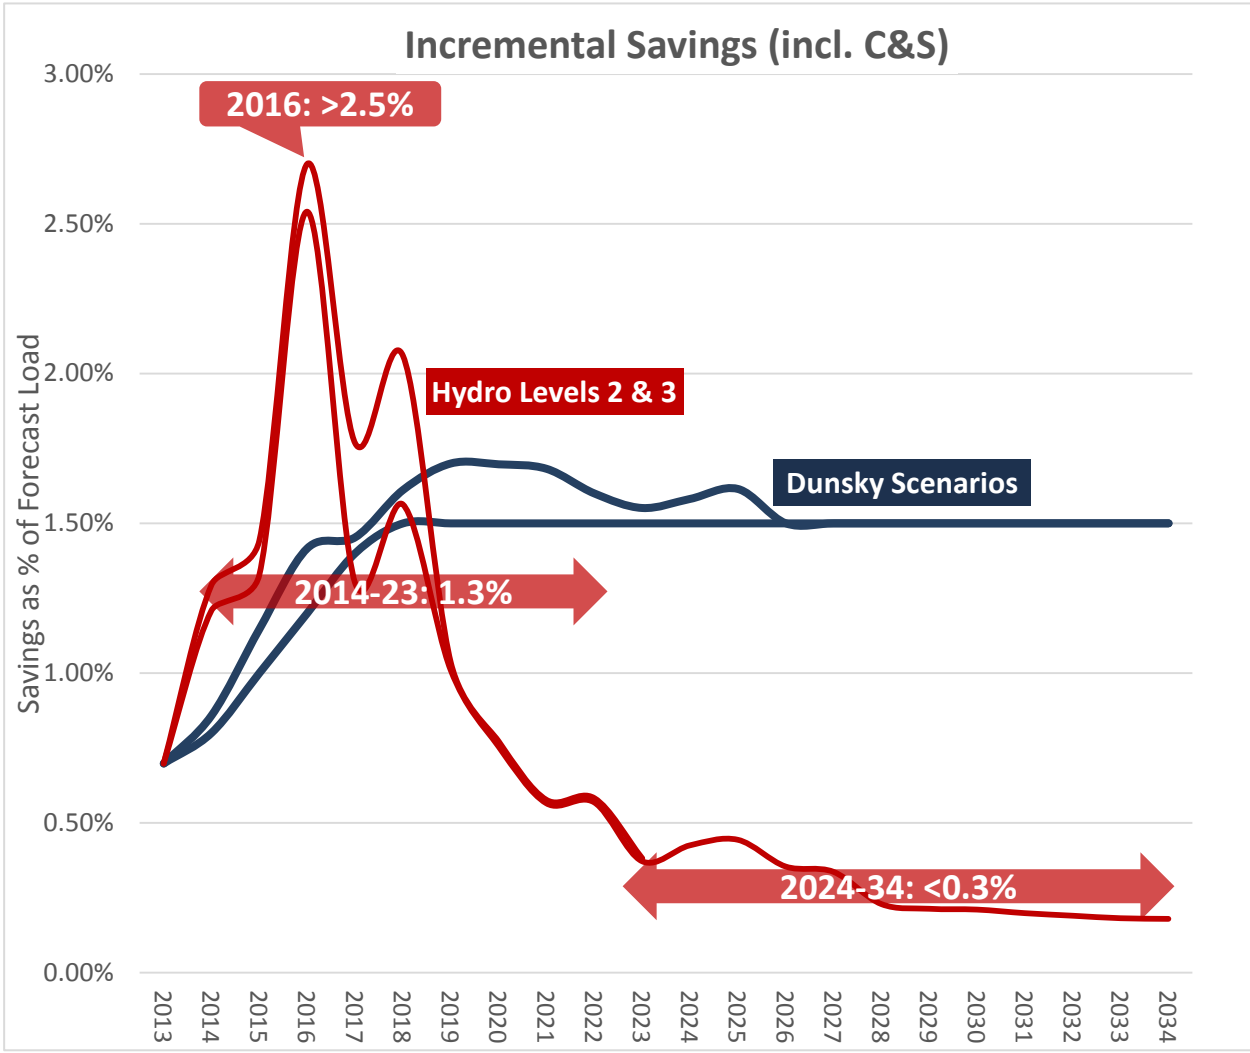
		2014	2015	2016	2017	2018	2019	2020 ++	10 YEAR AVG 2014-2023 (programs only)	10-yr Avg. 2014-2023 (prog's + C&S)
Scen. A (1.3%)	%/yr:	0.6%	0.8%	1.0%	1.2%	1.4%	1.5%	1.5%	1.3%	1.5%
	GWh/yr:	135	182	231	280	331	360	365	3,013 GWh/yr (cumulativ	3,534 GWh/yr (cumulative
Scen. B (1.1%)	%/yr:	0.5%	0.7%	0.8%	1.1%	1.3%	1.3%	1.3%	1.1%	1.3%
	GWh/yr:	122	149	181	267	305	312	317+	2,634 GWh/yr (cumulative)	3,220 GWh/yr (cumulative



MANITOBA HYDRO DSM Scenarios → Impact on Load F'cast

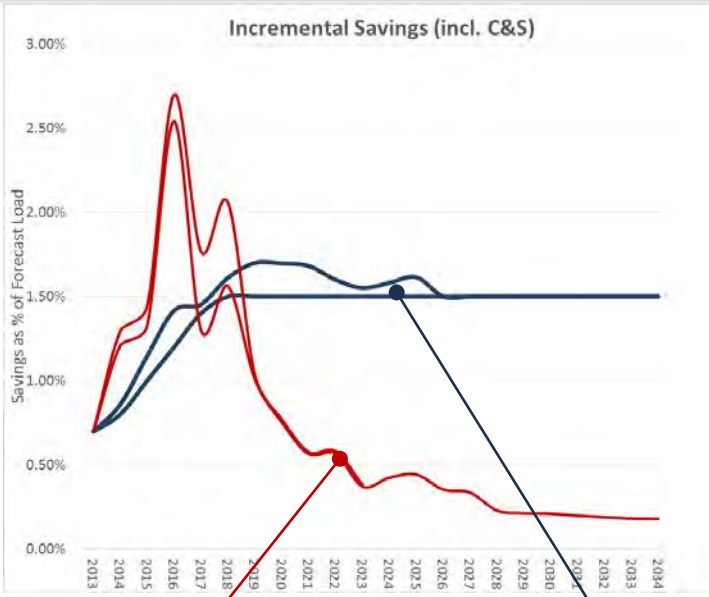
		2014	2015	2016	2017	2018	2019	10 YEAR AVG 2014-2023 (programs only)	10 -yr Avg. 2014-2023 (prog's + C&S)
Level 1 0.5%	%/yr:	0.4%	0.6%	0.7%	0.6%	0.5%	0.5%	0.5%	0.7%
	GWh/yr:	110	160	170	167	138	137	1,272 GW.h/yr (cumulative)	1,918 GW.h/yr (cumu
Level 2 1.1%	%/yr:	0.5%	1.0%	1.0%	2.1%	1.3%	1.6%	1.1%	1.3%
	GWh/yr:	138	244	255	559	352	445	2,459 GW.h/yr (cumulative)	3,104 GW.h/yr (cumulative)
Level 3 1.2%	%/yr:	0.6%	1.0%	1.1%	2.3%	1.5%	1.8%	1.2%	1.5%
	GWh/yr:	141	266	285	601	403	499	2,833 GW.h/yr (cumulative)	3,478 GW.h/yr (cumulative)

New MH "Levels" (to 2023)

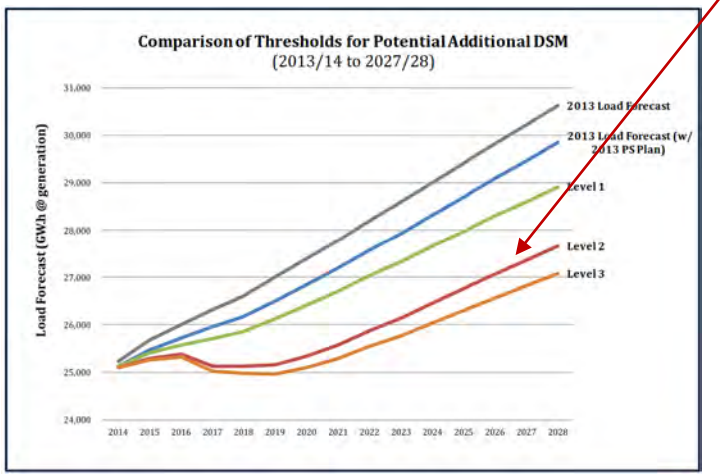


- Dramatic change in MH's DSM plan
- **2013-16:** Extremely aggressive ramp-up
- **> 2018: Rapid decline**

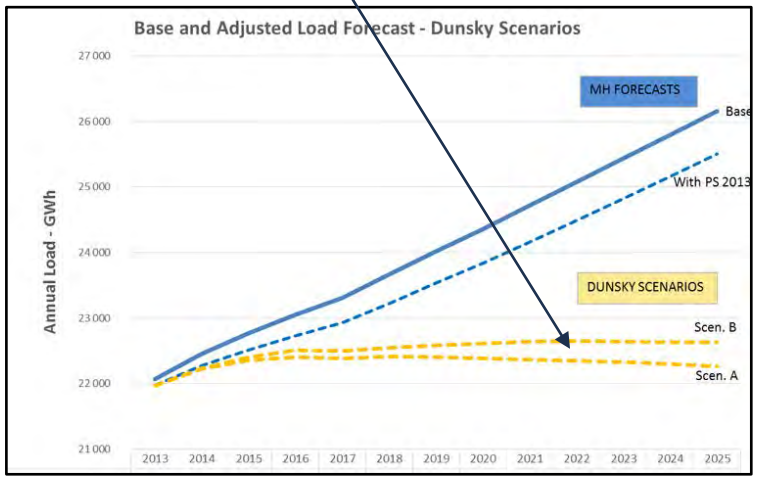
note: EnerNOC 5-year averages have been smoothed for illustration.



New MH "Levels" (to 2034)



- Dramatic change in MH's DSM plan
- **2013-16:** Extremely aggressive ramp-up
- **> 2018: Rapid decline**
- **≥ 2023: 0.28%/yr (avg) = 90% below Level 2 peak**



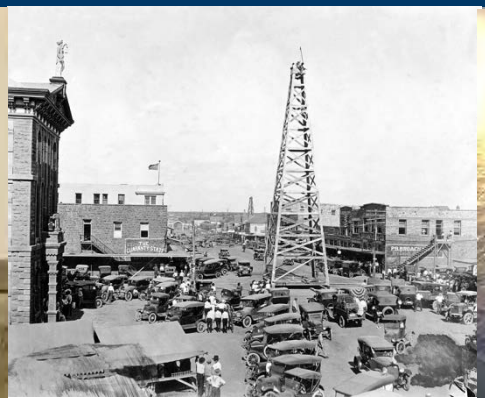
RECAP OF DIFFERENCES

- New MH Levels maintain "static" view of DSM
- = unrealistic assumption of few if any opportunities beyond what we now know

In the near-term, Hydro's Levels 2 and 3 represent a dramatic – and commendable – change in DSM planning and target-setting.

In the long-term, planning-level inputs quickly revert back to previous assumptions. These grossly understate DSM's future contributions – assuming Hydro maintains its "pursuit of all economic DSM" policy – and undermine the credibility of the domestic net load forecast.

CONTENTS



1. Hydro's DSM Scenarios

2. **The Problem with a Static View of the Future**

3. How Others Address the "Planner's Dilemma"?

4. Preferred DSM Assumptions & Implications for NFAT Review

DSM RESOURCE = INNOVATION

- Like mining, or oil & gas “drilling”, the more we want, the more we look, and the more we find
- Innovation does not stop; it strengthens over time
- Unprecedented capital flowing to energy innovations; will transform energy markets over coming 10-20 years

MANITOBA HYDRO'S RECOGNITION

"**Manitoba Hydro recognizes that the targets in this plan are conservative** as some programs and opportunities which could reasonably be expected to be achieved within the planning horizon were excluded (e.g. LED applications for Roadway lighting, residential and commercial applications; load displacement opportunities, fuel switching opportunities and energy conservation rates). **These and other programs are expected to be added in future Power Smart Plans"**

"To reflect DSM targets for resource planning purposes, the Corporation intends to forecast its expectation of DSM savings which will most likely be achieved, and therefore may include energy savings from emerging technologies or other initiatives such as load displacement, energy conservation rates and fuel switching."

(Rebuttal, page 28)

SAMPLE INNOVATIONS

Below are five sample areas where we *already know* that innovation will significantly impact demand for grid power in the coming years

i. **New efficiency standards**
   to secure savings from recent innovations

ii. **New: LED Lighting**

iii. **New: Heat Pumps**

iv. **New: Data-Driven Analytics**

v. **New: Solar PV**

i. Codes & Standards

Building Codes and "Appliance" Standards secure adoption of DSM innovations

- **CODES**
  - Specific to geography
  - Canada recently adopted far more stringent model codes
  - MB historically a leader
- **STANDARDS**
  - Typically Canada-wide; federal govt chose to follow U.S. lead
  - Obama admin.: unprecedented overhaul of EE standards
    - ***approx. 300 TWh/yr of savings expected by 2030***
    - *More to come (150 TWh more?)*
  - **= >10% of total U.S. electricity consumption**

New U.S. Standards Adopted Under Obama

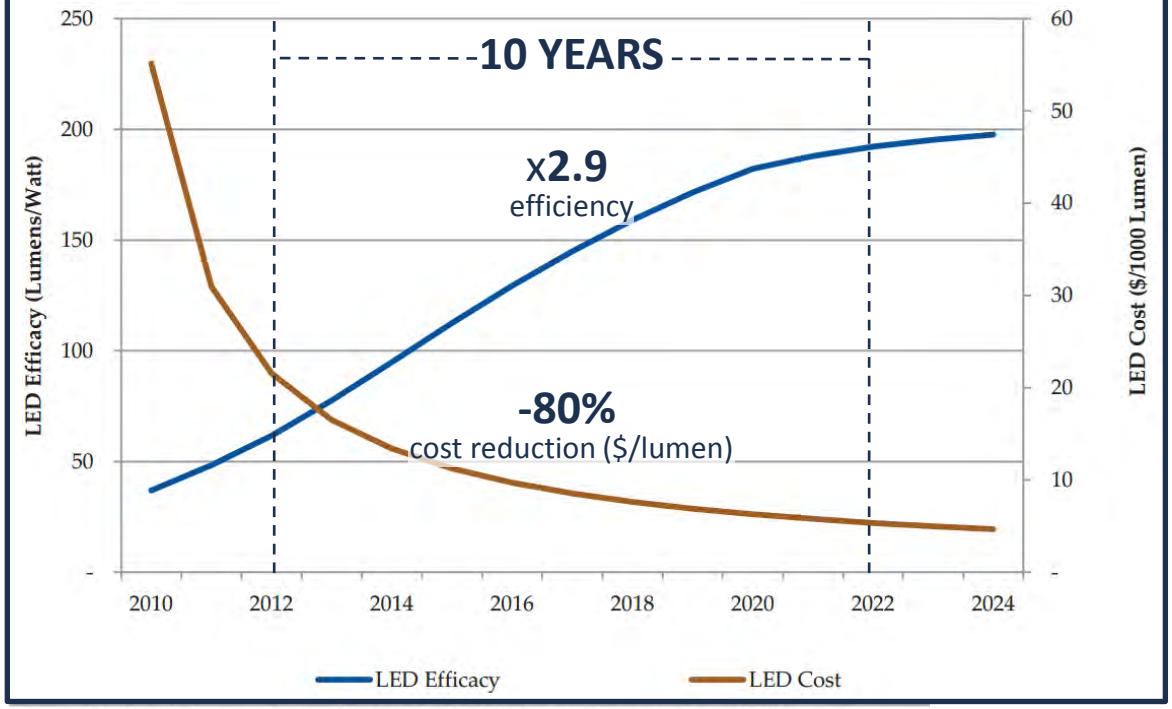
Product	Final Rule Date	Effective Date	Cumulative Electricity Savings Through 2030 (billion kWh)[iii]	Cumulative CO_2 Reductions Through 2030 (MMT)[iii]	Net Present Value of Savings (billion 2012$)[iv]
EISA[v] - General Service Lamps (GSLs)	March 2009	2012-2014	1,510.9	704.4	168.7
EISA (excluding GSLs)	March 2009	2008-2013[vi]	472.5	234.6	50.5
Ranges and Ovens	April 2009	2012	--	3.9	1.3
Commercial Boilers	July 2009	2012	--	6.1	1.5
General Service Fluorescent Lamps	July 2009	2012	414.6	193.2	17.6
Incandescent Reflector Lamps	July 2009	2012	98.3	46.1	6.7
Beverage Vending Machines	August 2009	2012	16.5	7.7	1.2
Commercial Clothes Washers	January 2010	2013	2.7	2.7	0.8
Small Motors	March 2010	2015	175.5	81.4	9.9
Water Heaters	April 2010	2015	118.1	74.8	6.3
Direct Heating Equipment	April 2010	2013	--	0.4	0.05
Pool Heaters	April 2010	2013	--	0.5	0.05
Clothes Dryers	April 2011	2015	21.9	10.6	2.7
Room Air Conditioners	April 2011	2014	40.2	18.7	3.1
Central A/C and Heat Pumps	June 2011	2015	112.6	52.2	8.8
Refrigerators and Freezers	September 2011	2014	248.7	115.4	15.7
Fluorescent Lamp Ballasts	November 2011	2014	318.1	147.6	30.9
Clothes Washers	May 2012	2015	115.5	59.3	29.9
Dishwashers	May 2012	2013	0.0	1.3	0.3
Distribution Transformers	April 2013	2016	58.6	27.2	8.7
Microwaves	June 2013	2016	26.1	12.1	3.0
Metal Halide Light Fixtures	February 2014	2017	13.0	6.8	1.3
External Power Supplies	February 2014	2016	28.3	23.6	1.2
Commercial Refrigeration Equipment	March 2014	2017	112.5	48	9.7
Total	--	--	**3,905**	**1,879**	**380**

Ref: http://www.appliance-standards.org/sites/default/files/Progress_toward_3_billion_CO2_reduction_0.pdf. *Feb. 18, 2014*

i. Codes & Standards

- Canada now playing catch-up
  - Strong push to harmonize with U.S.
  - **32 energy efficiency standards currently proposed for adoption**
  - Vast majority electric
- More to follow?

Canada 2014 Proposed Standards



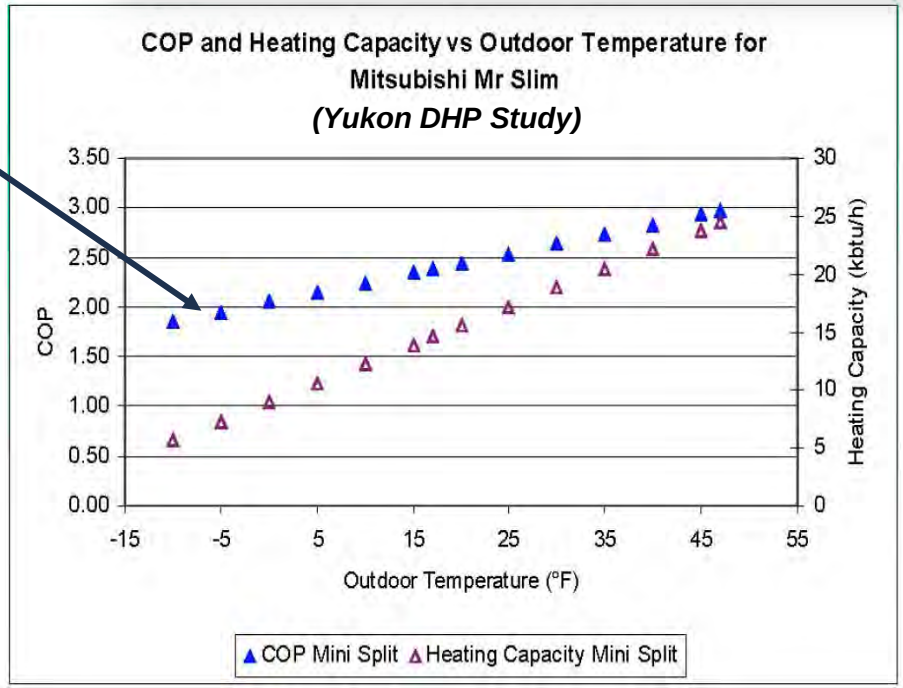
(to harmonize with new U.S. standards)

1. Chillers
2. Commercial self contained refrigeration products
3. Gas water heaters
4. General service incandescent reflector lamps
5. General service fluorescent lamps
6. Oil fired water heaters
7. Packaged terminal air-conditioners and heat pumps
8. Room air-conditioners
9. Residential refrigerators
10. Residential freezers
11. Residential dishwashers
12. Residential clothes washers
13. Residential clothes washer-dryers
14. Commercial clothes washers
15. Residential clothes dryers
16. Central air-conditioners and heat pumps
17. Vending machines
18. Oil furnaces
19. Fluorescent lamp ballasts
20. Dry-type transformers
21. Large air-conditioners and heat pumps
22. Metal halide ballasts
23. Commercial boilers
24. Line Voltage Thermostats
25. Pre-rinse spray valves
26. Tankless gas water heaters
27. Commercial water heaters
28. Commercial refrigeration with remote condensing unit
29. Small electric motors
30. Microwave ovens
31. Walk-in refrigerators
32. Pool heaters

ii. LED Lighting

- Rapid improvements on their way
  - 3x more efficient in 10 years
  - 80% cheaper for same light output
  - Anticipate dramatic savings across all sectors
- Note re. MH:
  - EnerNOC: LEDs not included until 2020 because too costly
  - MH: LEDs already promoted today

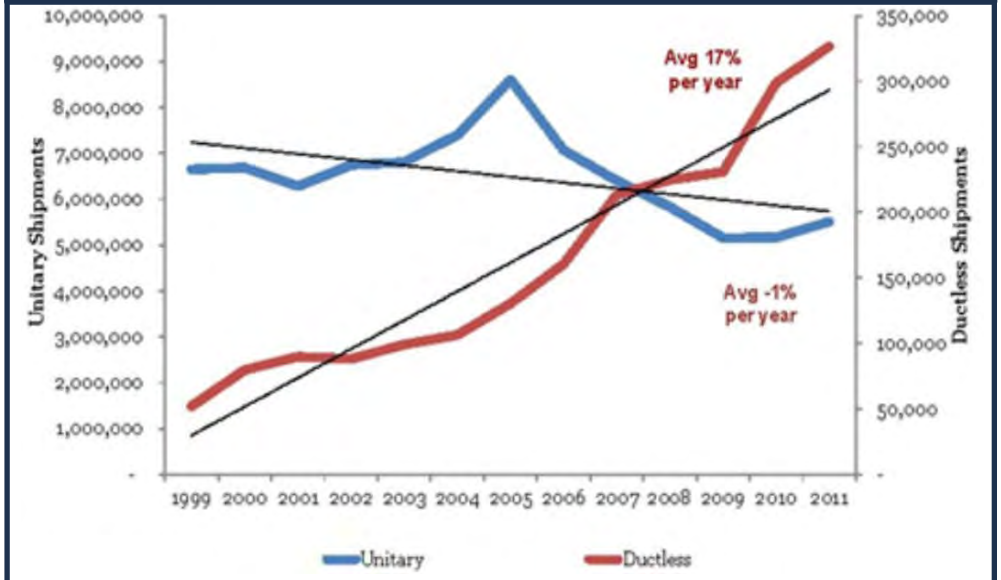
LED Lighting | Efficiency & Costs 2010-2024



Source: Navigant. Energy Savings Potential of Solid-State Lighting in General Illumination Applications. Prepared for the U.S. Department of Energy. January 2012.

iii. DHPs (Ductless Heat Pumps)

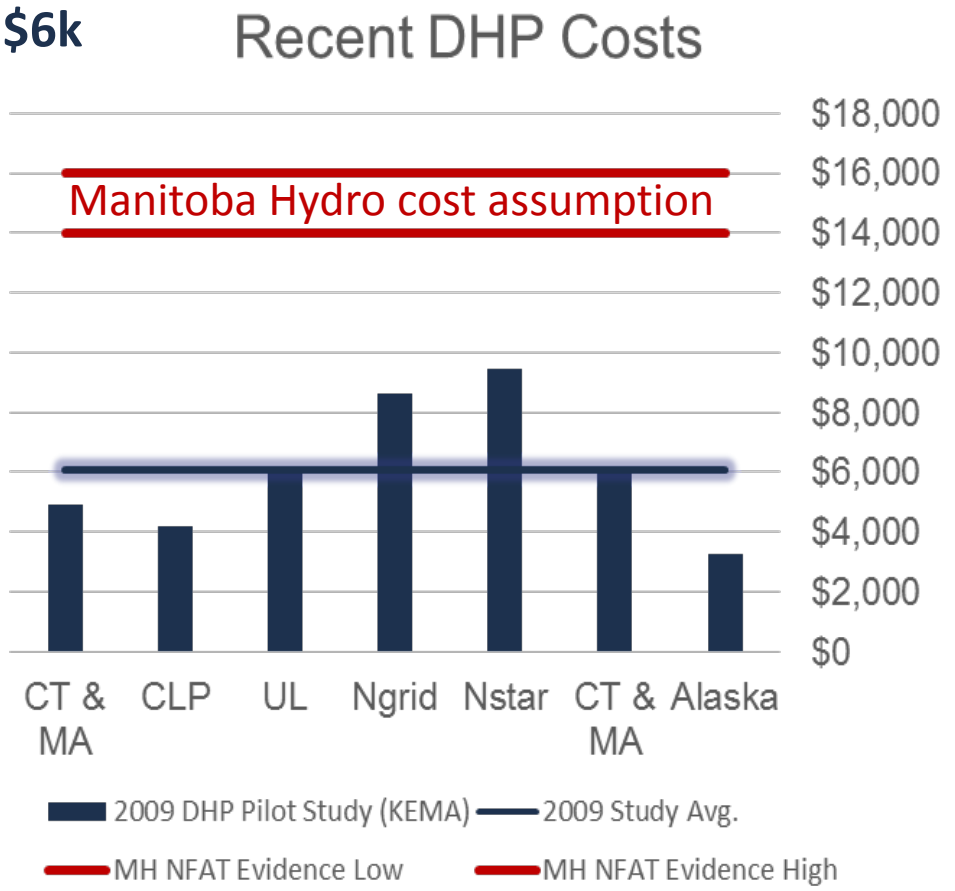
- **DHPs transforming heating options in colder climates**
  - **Excellent opp for baseboard heated homes** (no internal heat distribution system)
  - Inverter-driven models can achieve 200% efficiency at *minus 20^{o} C*
  - Can supply **30-60% of Manitoba home heating needs**
  - Improved customer value: air quality in winter; zonal control; AC in summer



iii. DHPs (Ductless Heat Pumps)

- DHPs posting strong growth across North America
  - U.S.: x2 every 4 yrs
  - Canada: anecdotal evidence suggests very strong growth

DHPs | U.S. Sales 1999-2011



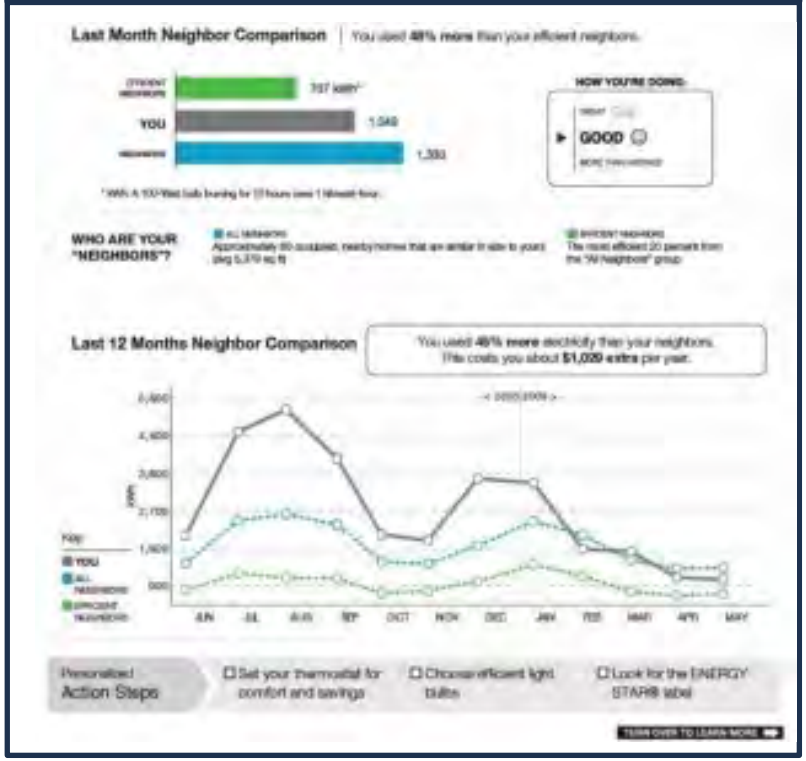
Source: AHRI, cited in NEEP, Mid-Atlantic Air Source Heat Pump Market Strategies Report, Jan. 2014.

DHPs (Ductless Heat Pumps)

- **High-efficiency DHPs now affordable**
  - Typical: $4k +$2k install = **$6k**
  - Less for smaller homes

- **MB notes:**
  - **MH assumes "$14-16k" cost** (rebuttal, p.37)
  - Excluded from EnerNOC study

iv. Data-Driven Analytics



- Combination of computing power and prevalence of wireless communications capabilities is driving unprecedented innovation in three areas:
  - **Residential "behaviour"**
  - **C&I facilities operations**
  - **Utility control of end uses**

iv. Data-Driven Analytics

CASE STUDY: **OPOWER**

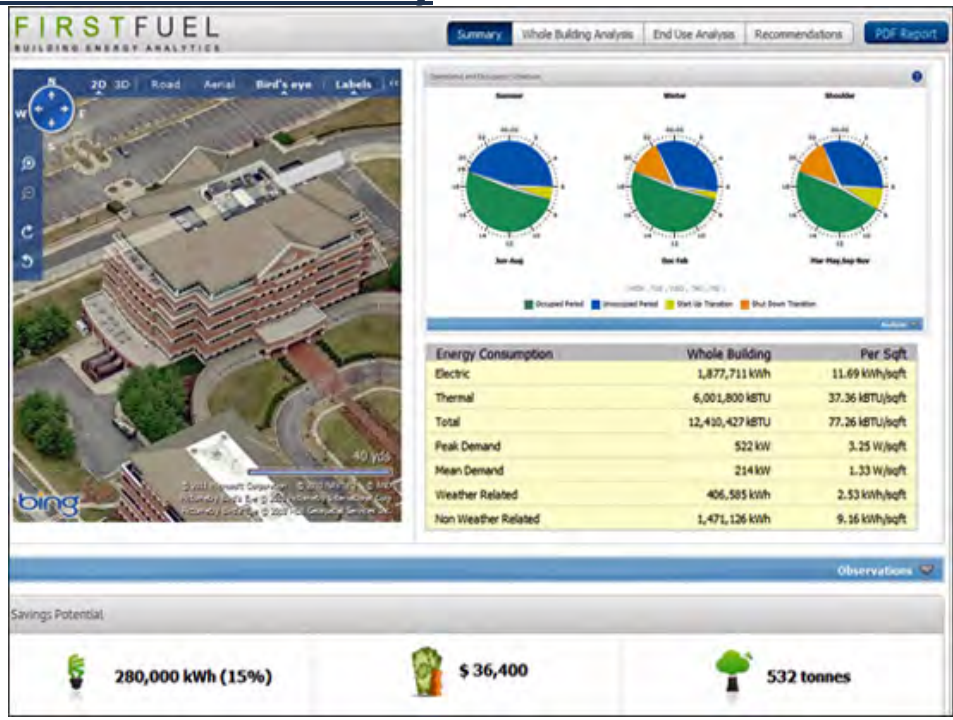
- Simple concept: Neighbour comparisons
- Driven by deep analytics and strong social science research
- Educates and motivates change
- 1-3% savings across multiple regions and timespans (independent evaluations)
- Very successful IPO last month

Home Energy Report | Sample

iv. Data-Driven Analytics

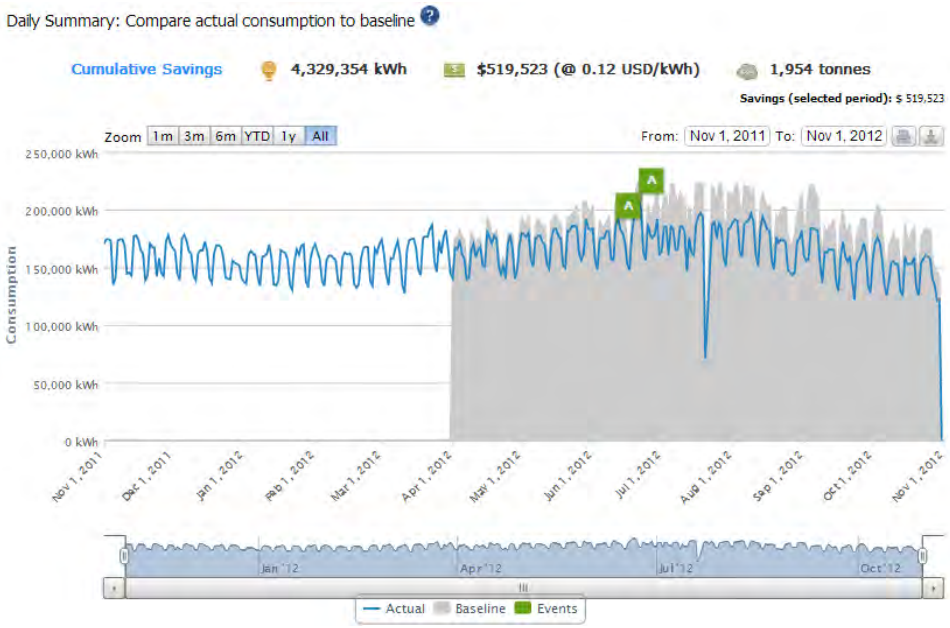
CASE STUDY: **SMART THERMOSTATS**

- Dozens of new entrants incl. Nest (Google), Honeywell, Ecobee…
- Wide array of functionalities including:
  - Assisted programming
  - Nudges and automated setting changes
  - Touchless home energy assessment and automated suggestions
  - Predictive start-to-temp set algorithms
  - Distance-based user controls
  - Distance-based *utility* controls (voluntary)
  - Furnace alerts, weather, photos, music, etc.
- Very large recorded savings to date (5-15%)

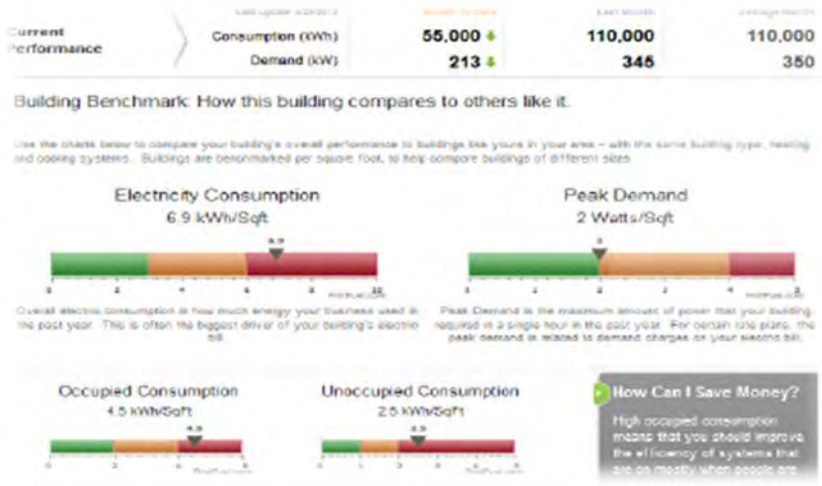


iv. Data-Driven Analytics

CASE STUDY: **FIRST FUEL (BLDG DIAGNOSTICS)**

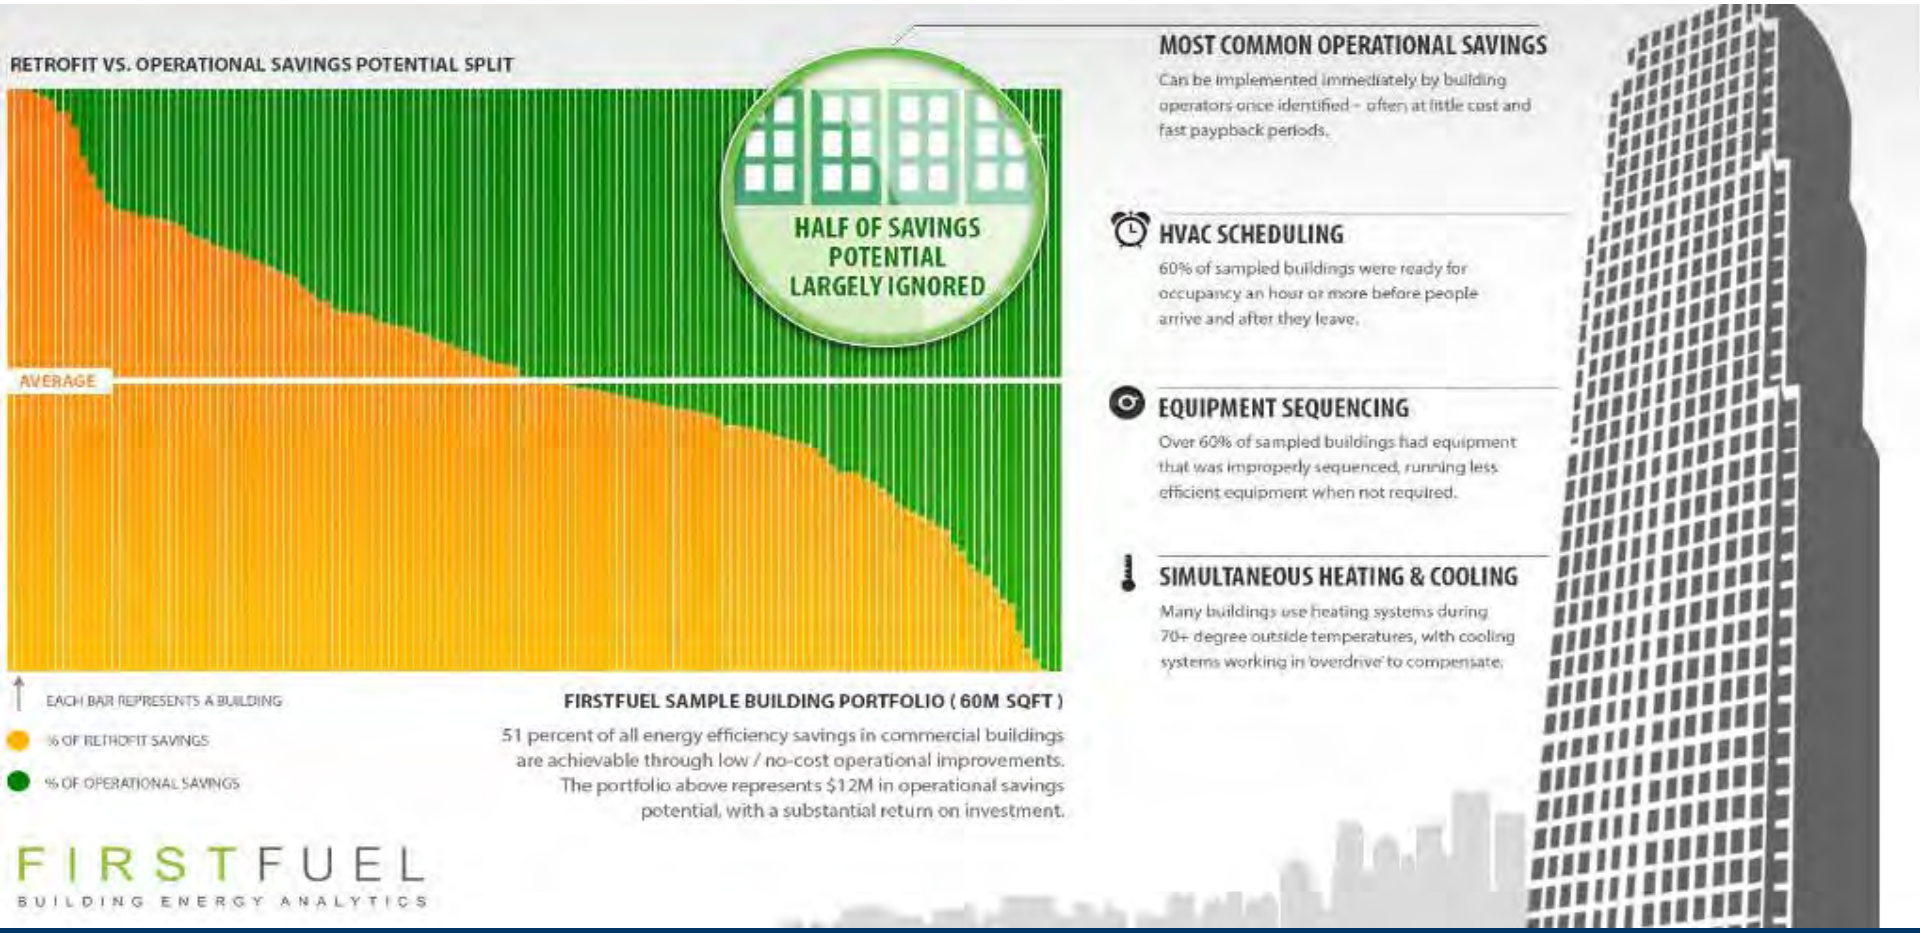


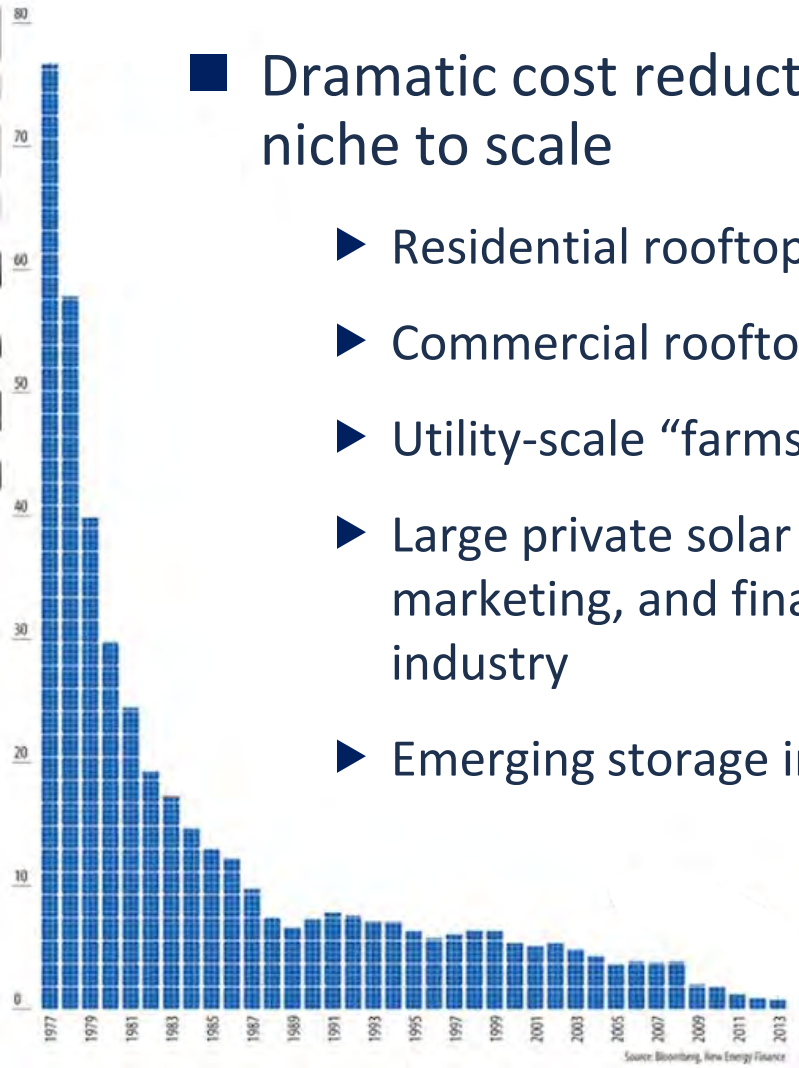
- Powerful use of new data streams to conduct "touchless audits"
  - Real-time meter data
  - Matched localized weather data
  - High-quality satellite imagery
  - Skilled back-office analysts
- Cost: 1/3 of traditional audits



- ASHRAE Level 2 quality + web platform facilitates continuous improvements
- **Scale: 100s and 1000s replace one-offs**

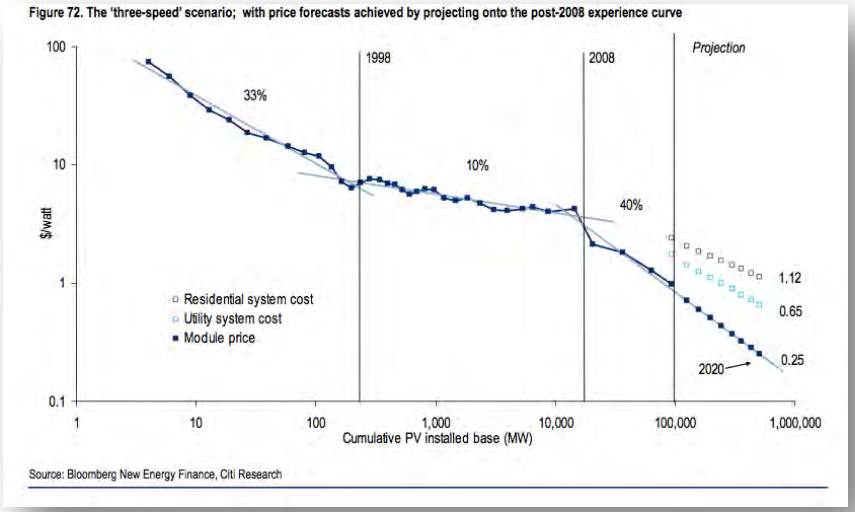
iv. Data-Driven Analytics





iv. Data-Driven Analytics

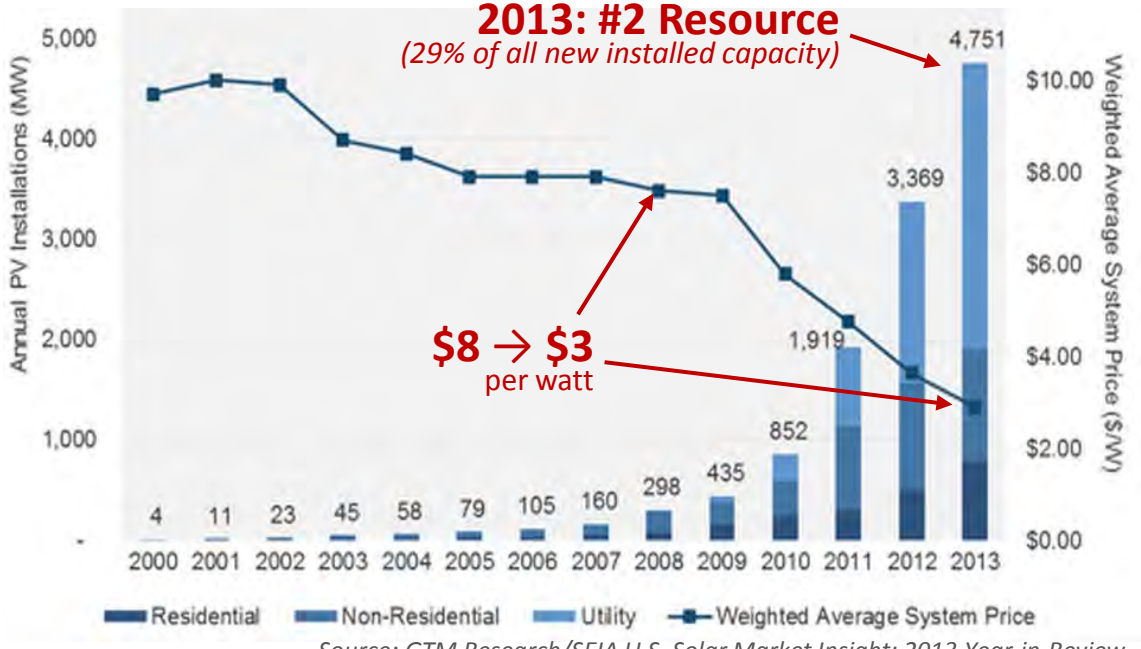
- Large savings from previously missed opportunities



v. Solar Photovoltaics (PV)

- Dramatic cost reductions have led solar to move from niche to scale
  - Residential rooftop
  - Commercial rooftop
  - Utility-scale "farms"
  - Large private solar install, marketing, and financing industry
  - Emerging storage industry (private and utility)

PV COST F'CAST FROM MB HYDRO'S FILING



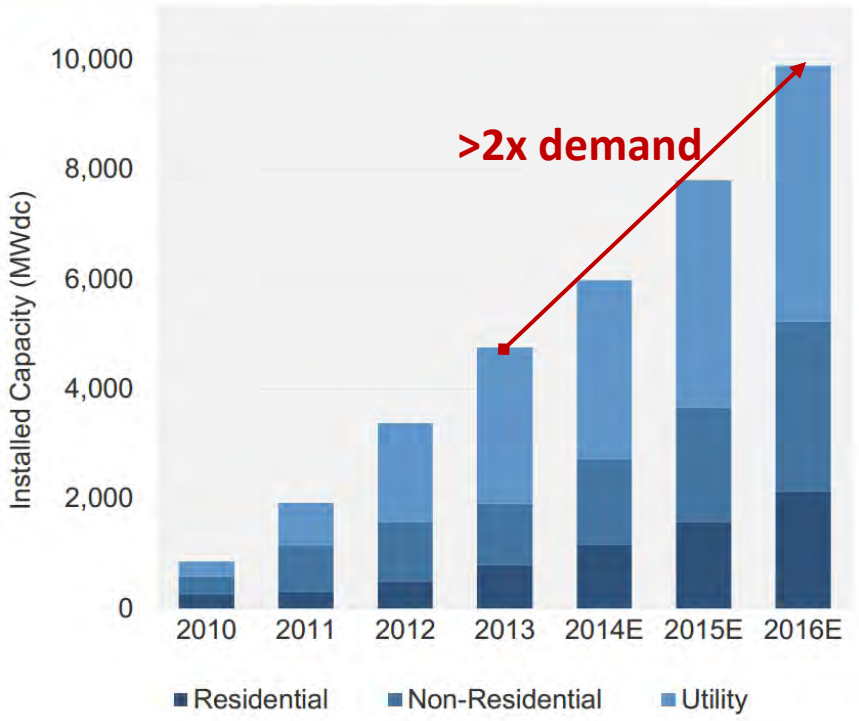
Module Cost | Installed System Cost`

v. Solar PV

- **Recent history (5yrs)**
  - PV module cost down ~80%
  - PV installed cost down ~60%
  - Annual installs up >15x (U.S.)
  - 30% U.S. market share in 2013 (#2 resource)

SOLAR PV | U.S. Installations & Prices 2000-2013

Source: GTM Research/SEIA U.S. Solar Market Insight: 2013 Year-in-Review

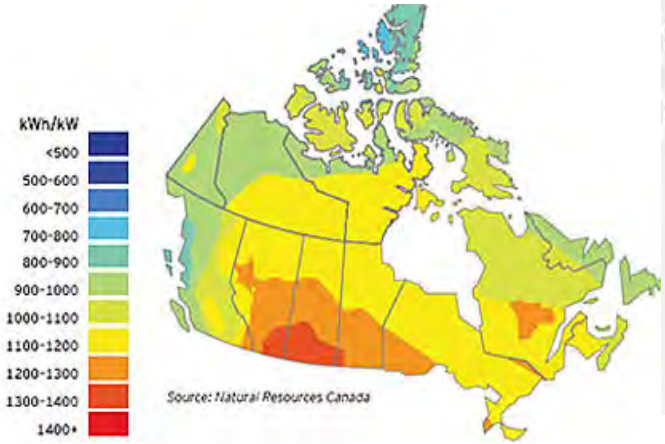


v. Solar PV

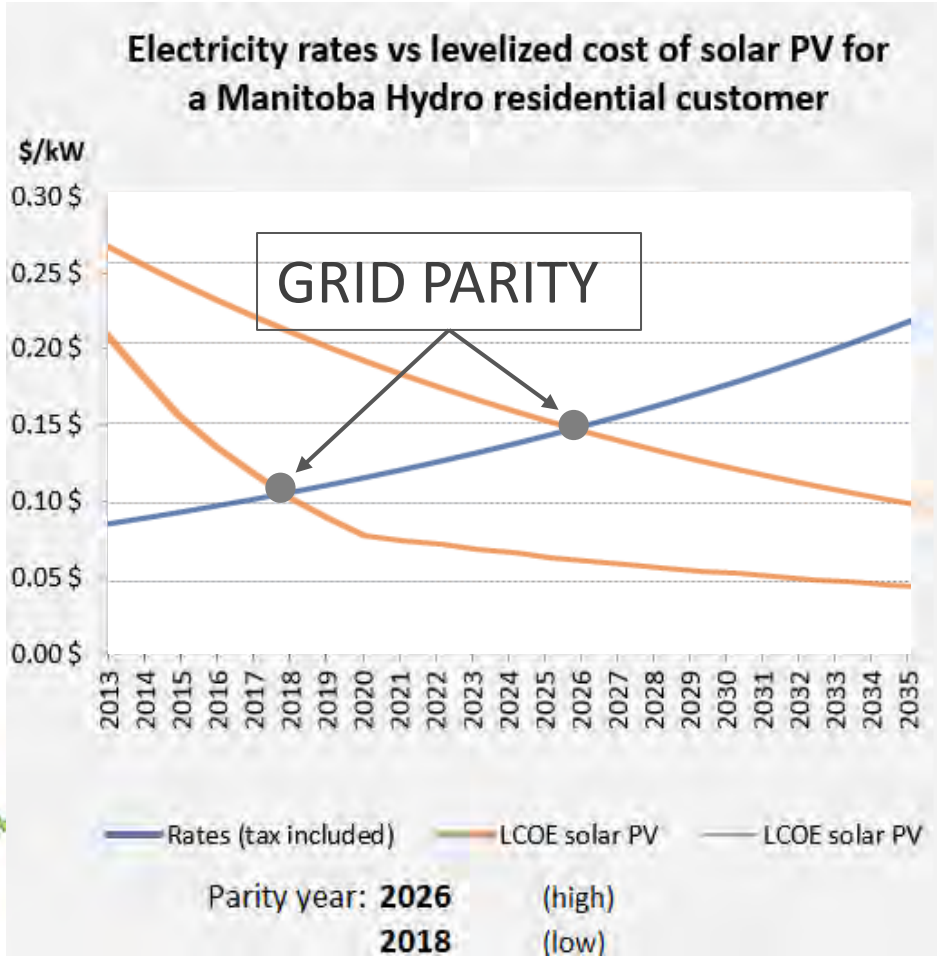
Near Future

- Continued cost declines
  - *Modules: -25% over 4yrs due to automation*
  - *Installation: savings from new plug-play designs*
  - *Financing: reductions with growth and strong track record (Solar City <1% defaults)*
- 3x manufacturing capacity anticipated over 5 yrs
- Continued demand growth (2x annual U.S. installs over coming 3 yrs)

Figure 2.14 U.S. PV Installation Forecast, 2010-2016



Source: GTM Research, PV Technology and Cost Outlook, 2013-2017



v. Solar PV

- **Implications for MB**
  1. Growing DSM opportunity
  2. Breakout demand suppression “threat” (locally or in export markets)?
  3. Low-cost Utility-scale power supply option/competitor

Germany

v. Solar PV

"Investors beware: Distributed generation could kill utilities as we know them today."

"Distributed Generation: The Death Spiral", February 2014. MORNINGSTAR®

Energy innovations are moving faster than at any time in recent history. New DSM opportunities abound – including several "game changers" that have already landed in market, with many more to come.

Not accounting for them exposes long-run investment plans to significant risk.

CONTENTS

1. Hydro's DSM Scenarios

2. The Problem with a Static View of the Future

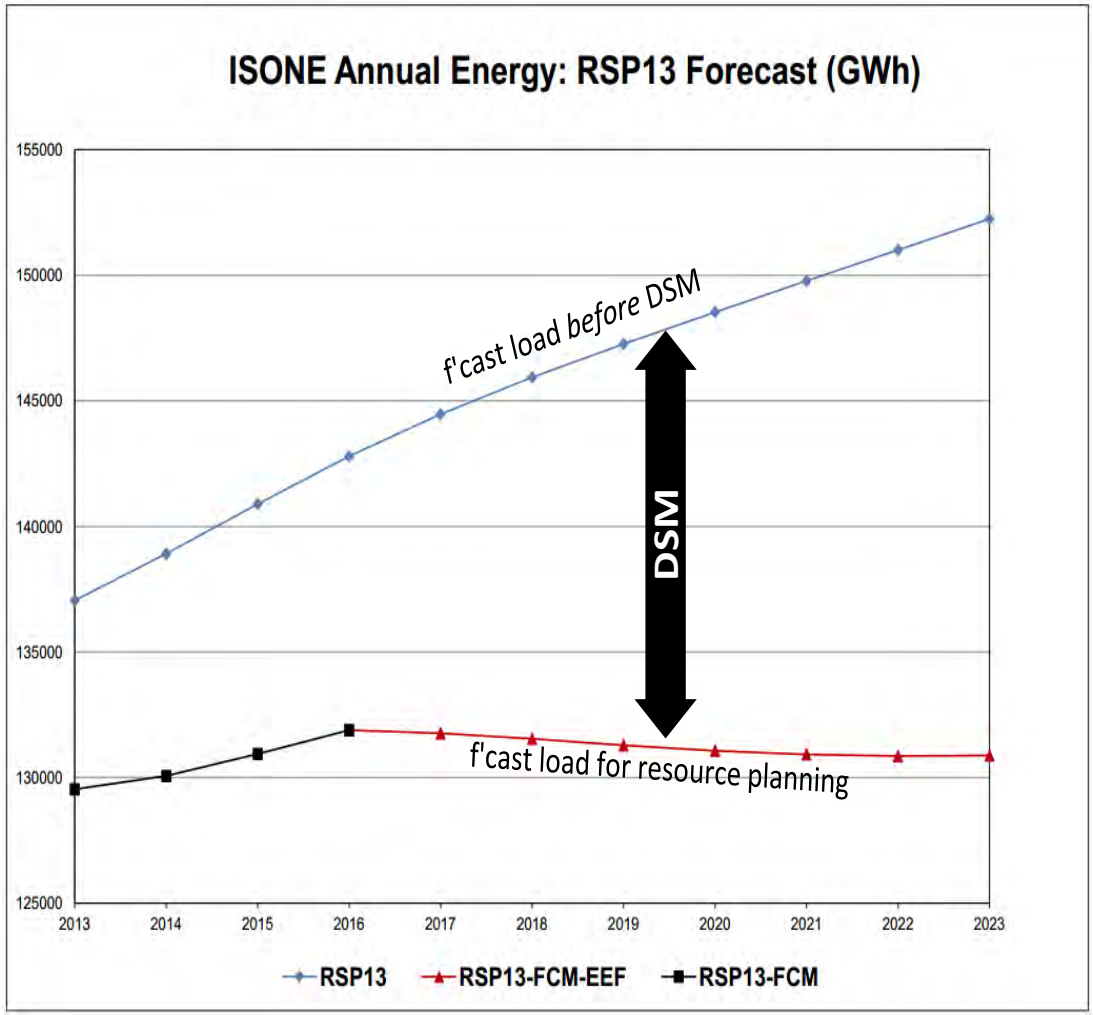
3. How Others Address the "Planner's Dilemma"?

4. Preferred DSM Assumptions & Implications for NFAT Review

Planner's Dilemma

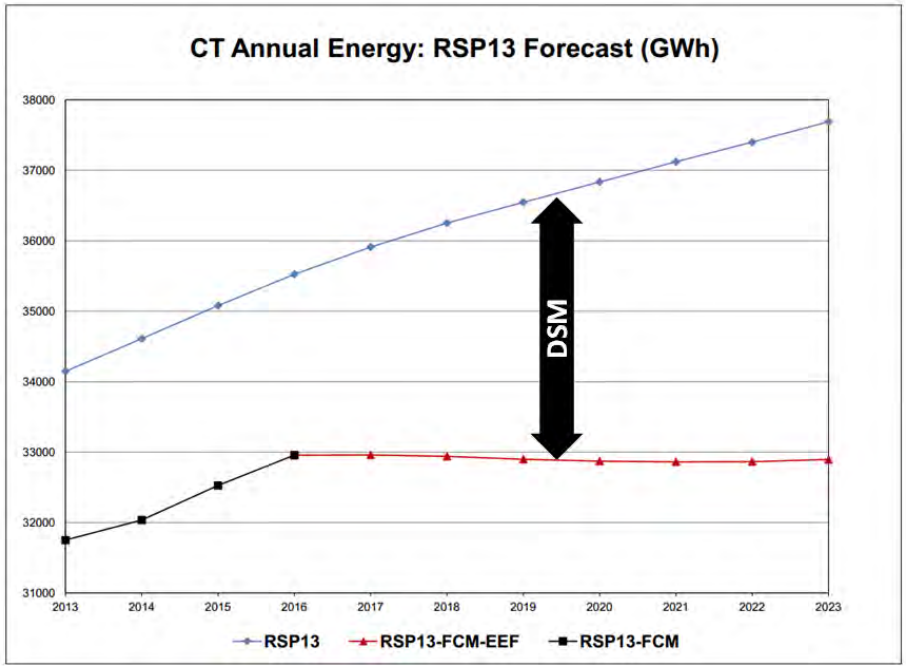
- Dilemma: How to account for the not-perfectly-known?
- How do Leaders Address This?
  - Past: truth is, many used to ignore future savings
  - Now: Then they took a closer look to improve planning precision and avoid over-committing to new supply
  - Three case studies:
    - ***New England ISO: EE Committee***
    - *California ISO: EE Committee*
    - *Nova Scotia Power*

ISO New England

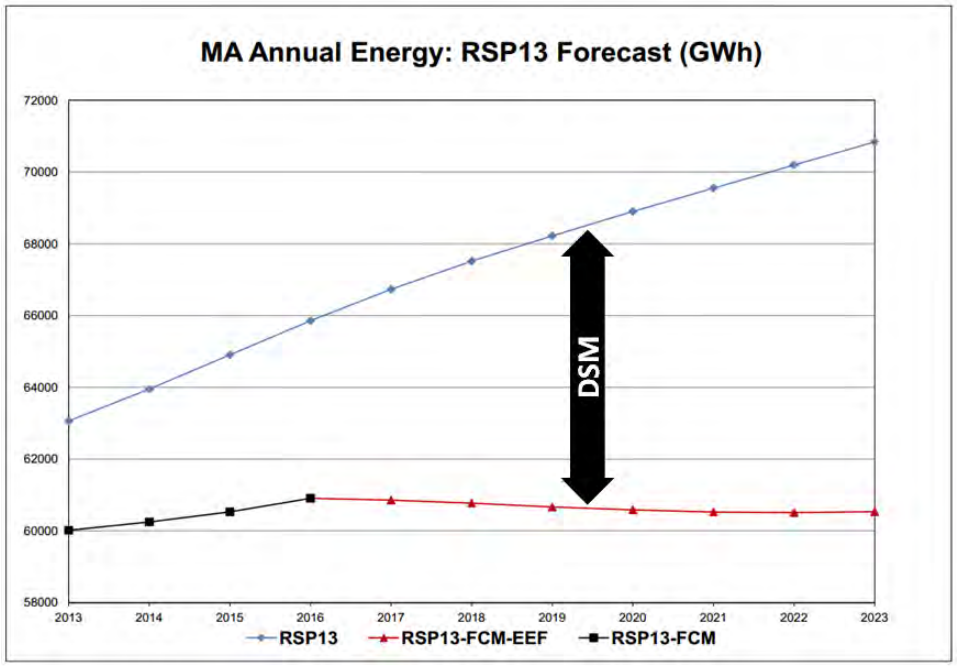


Mandate: ensure reliable supply of electricity across the six-state region

- Three basic tasks:
  - Day-to-day operation of bulk power system
  - Oversight and administration of regional wholesale market
  - **Management of comprehensive power planning process**
- Previous approach accounted only for approved EE plans
  - Committee struck to examine issue
  - Regional consultations of key market stakeholders
- New approach: long-term assumptions critical to planning

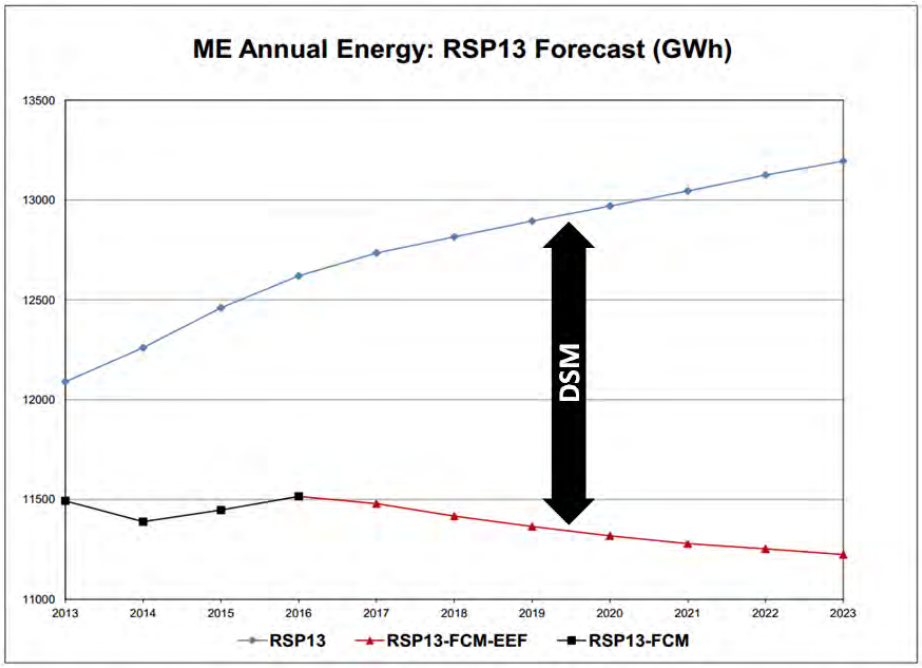


ISO-NE (New England)

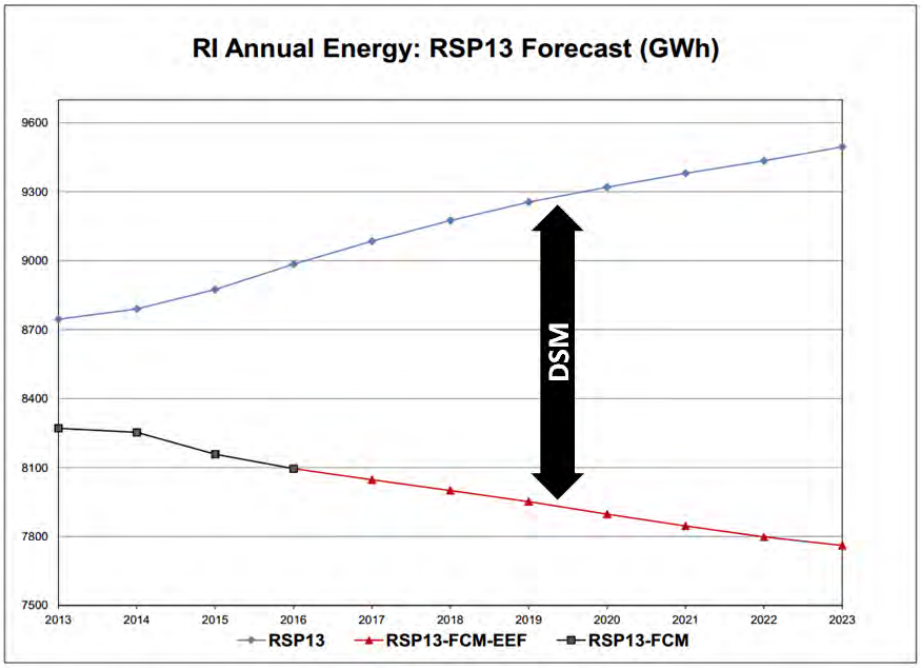


- Key Finding: sufficient evidence that DSM potential *replenishes itself* at roughly the same cost
- 100% of assumed DSM accounted for
- **Result: new plans anticipate zero net load growth** across the region

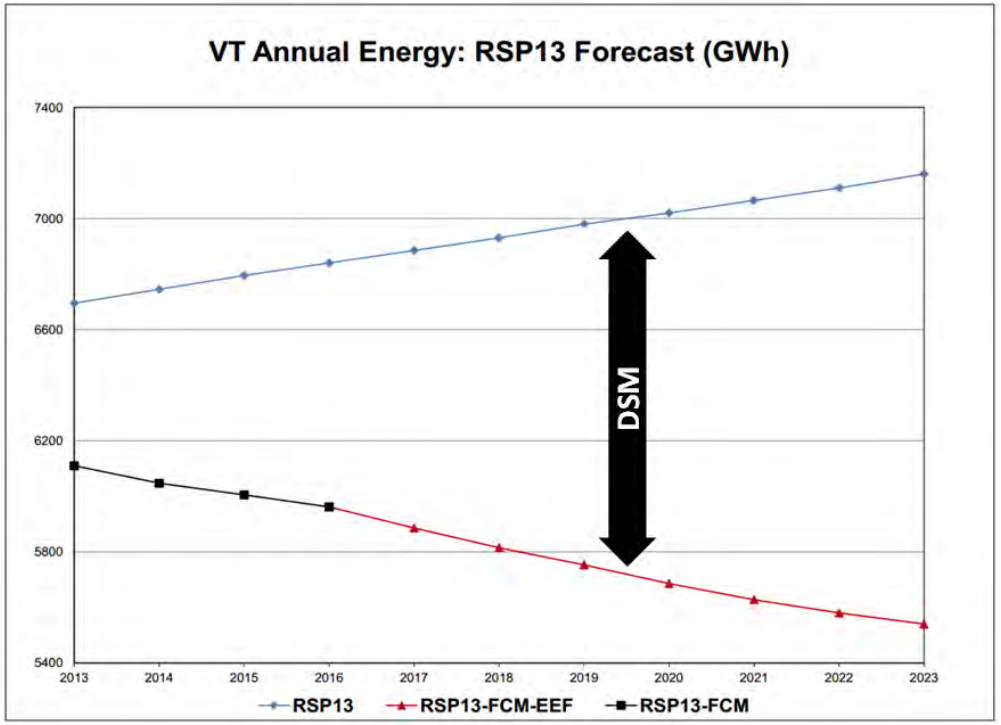
ISO-NE (New England)



- Connecticut and Massachusetts are among the continent's leaders in DSM



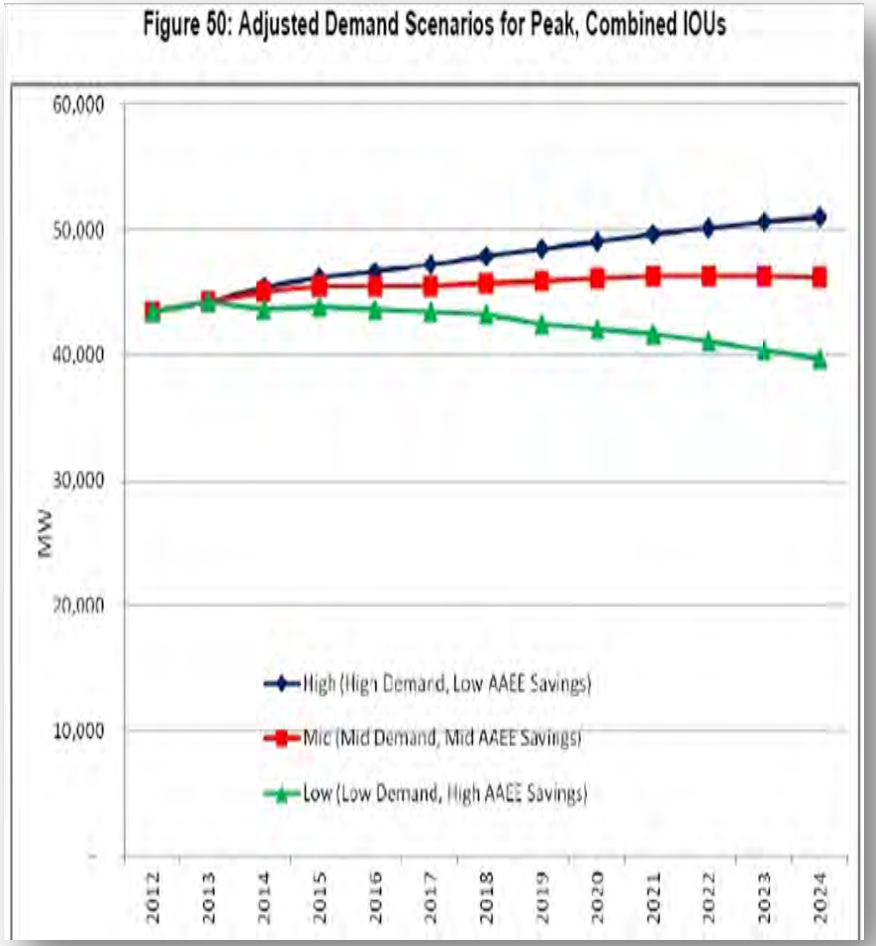
ISO-NE (New England)



- Maine and Rhode Island have recently emerged as very strong DSM players

ISO-NE (New England)

- Vermont is the historic leader in DSM.
- VT is currently considering increasing from ~2%/yr to an unprecedented 3%/yr (proposal of the independent DSM administrator)
- For the state's longer-term energy planning, 2%/yr is assumed to be the baseline… for the next 35 years



CalISO (California)

Mandate: ensure a reliable, efficient and affordable bulk power system while upholding the State's energy goals

- Includes planning function similar to ISO-New England
- Previous approach accounted only for approved EE plans
  - Multi-agency agreement to jointly examine issue: CEC / CPUC / CalISO
  - Statewide consultations of key market stakeholders
- New approach: long-term assumptions critical to planning

CalISO (California)

- Key Finding: sufficient evidence that DSM potential *replenishes itself* over the long-term
- Approach: adapt long-run DSM potential model to account for future savings opportunities
- Scenario analysis assumes actual savings may be higher or lower than anticipated
- 100% of DSM potential accounted for in mid scenario
- **Result: new plans anticipate near-zero net load growth** across the State

Others: Nova Scotia

- NSPI 2007 IRP examined long-run DSM potential study
- Incorporated 100% of study results
- Outcome: declining demand forecast
- *Note: N.S. went on to ramp up DSM from near-zero in 2009, to 1.5% savings/yr by 2012*

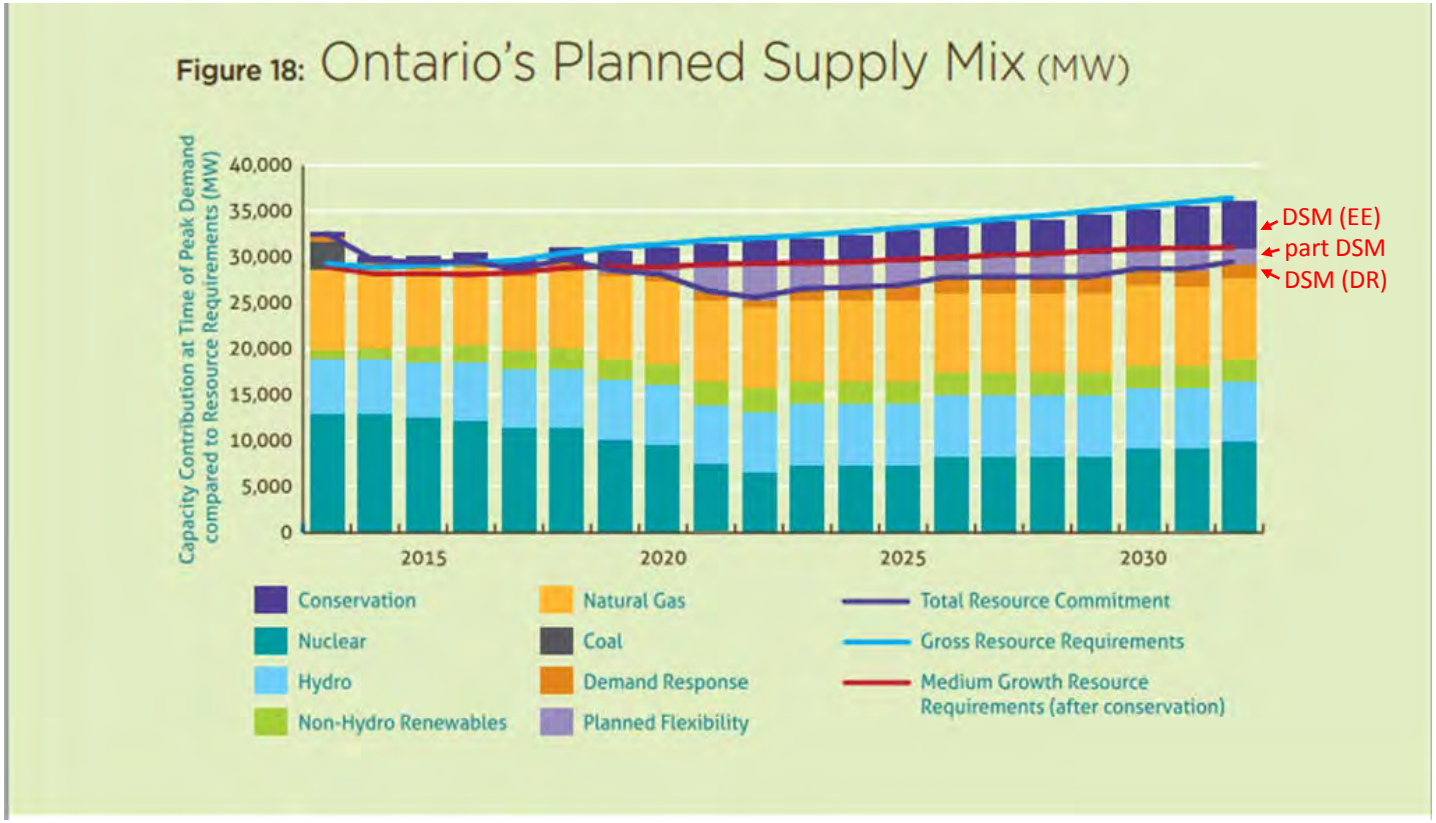


Table 1 – Total Energy Requirement with Future DSM Program Effects[2]

Year	Net System Requirement (GWh)	Annual Change (%)
2003	12,009.1	4.4
2004	12,387.7	3.2
2005	12,338.2	-0.4
2006	10,946.2	-11.3
2007	12,638.9	15.5
2008*	12,538.3	-0.8
2009*	12,073.1	-3.7
2010*	12,157.7	0.7
2011*	11,906.8	-2.1
2012*	10,475.4	-12.0
2013F	11,003.3	5.0
2014F	10,917.2	-0.8
2015F	10,919.9	0.0
2016F	10,853.2	-0.6
2017F	10,776.8	-0.7
2018F	10,707.4	-0.6
2019F	10,733.1	0.2
2020F**	10,710.1 [9,569.1]	-0.2 [-10.8]
2021F**	10,663.1 [9,522.1]	-0.4 [-0.5]
2022F**	10,595.8 [9,454.8]	-0.6 [-0.7]
2023F**	10,563.8 [9,422.8]	-0.3 [-0.3]

* Results for the years 2008 to 2012 contain the effects of past DSM programs

** Bracketed numbers represent the low load scenario without Port Hawkesbury Paper load.

Others: Ontario

Others

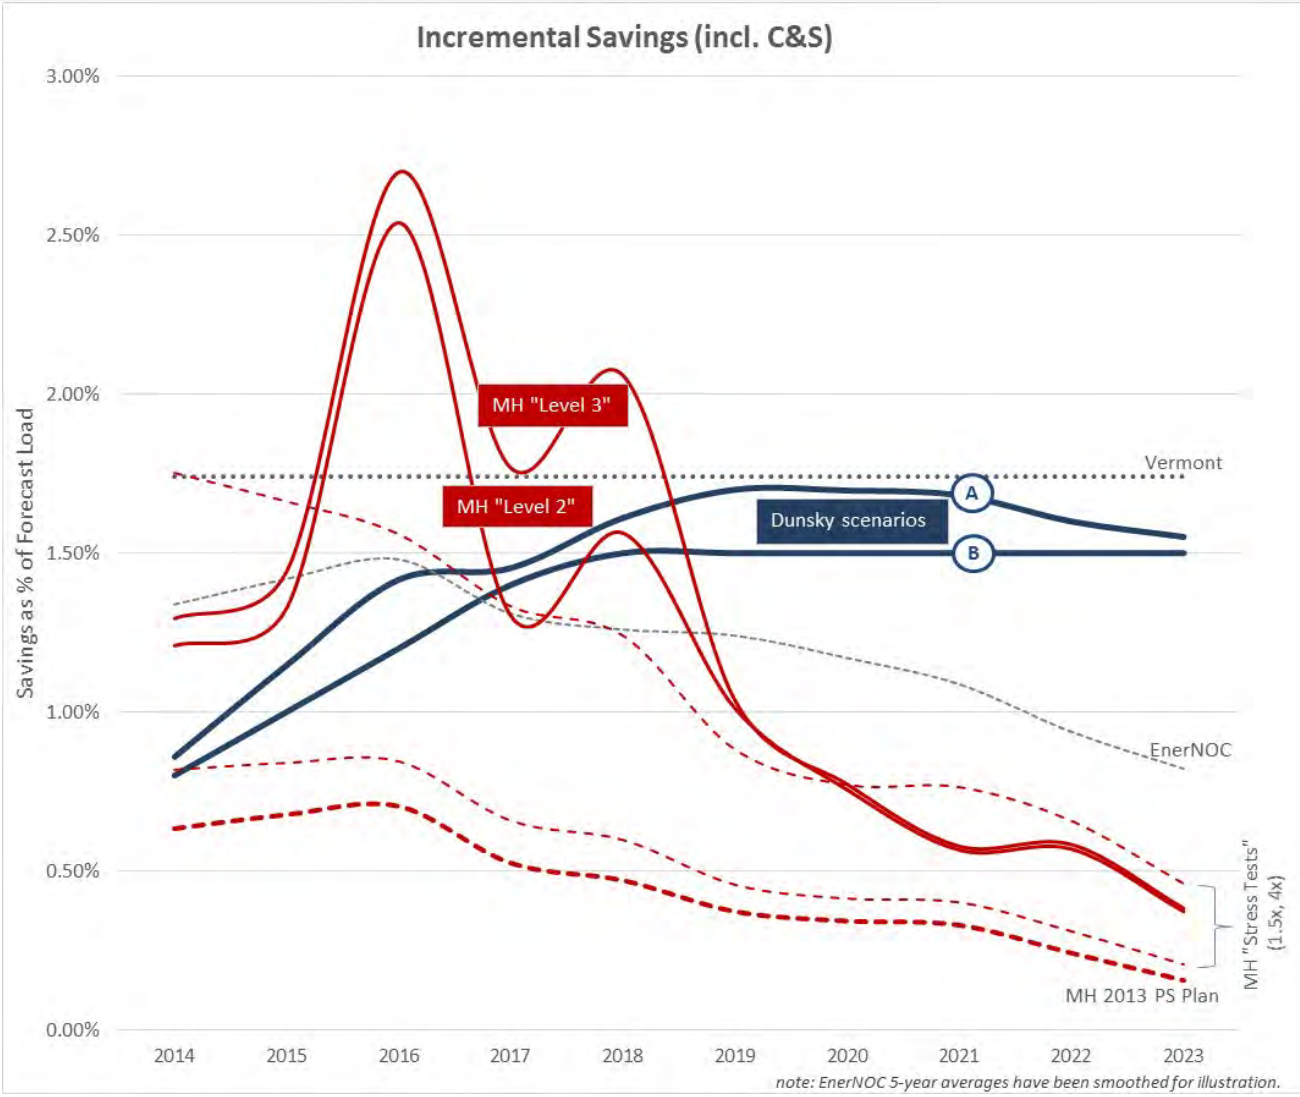
- Several regions have examined the issue of risk raised by Elenchus
- As noted by Elenchus, no state or province in North America has concluded the need to discount DSM savings projections
- Some have concluded the opposite
  - **Northwest U.S. applies 10% reduction to DSM costs** to account for net risk benefits when compared with supply resources
  - **Vermont and other states apply 10% risk premium to supply** options when compared with DSM
  - *Note: Vermont, the Northwest U.S., and California represent the three most experienced regions when it comes to DSM*

System planners who have been tasked with shining a light on DSM have concluded that, rather than seeing its potential depleted, it renews itself through innovation. They also conclude that it is a dependable, low-risk resource.

As a result, they have concluded that it would be **imprudent to *not* assume continued DSM improvements**, for planning purposes.

CONTENTS

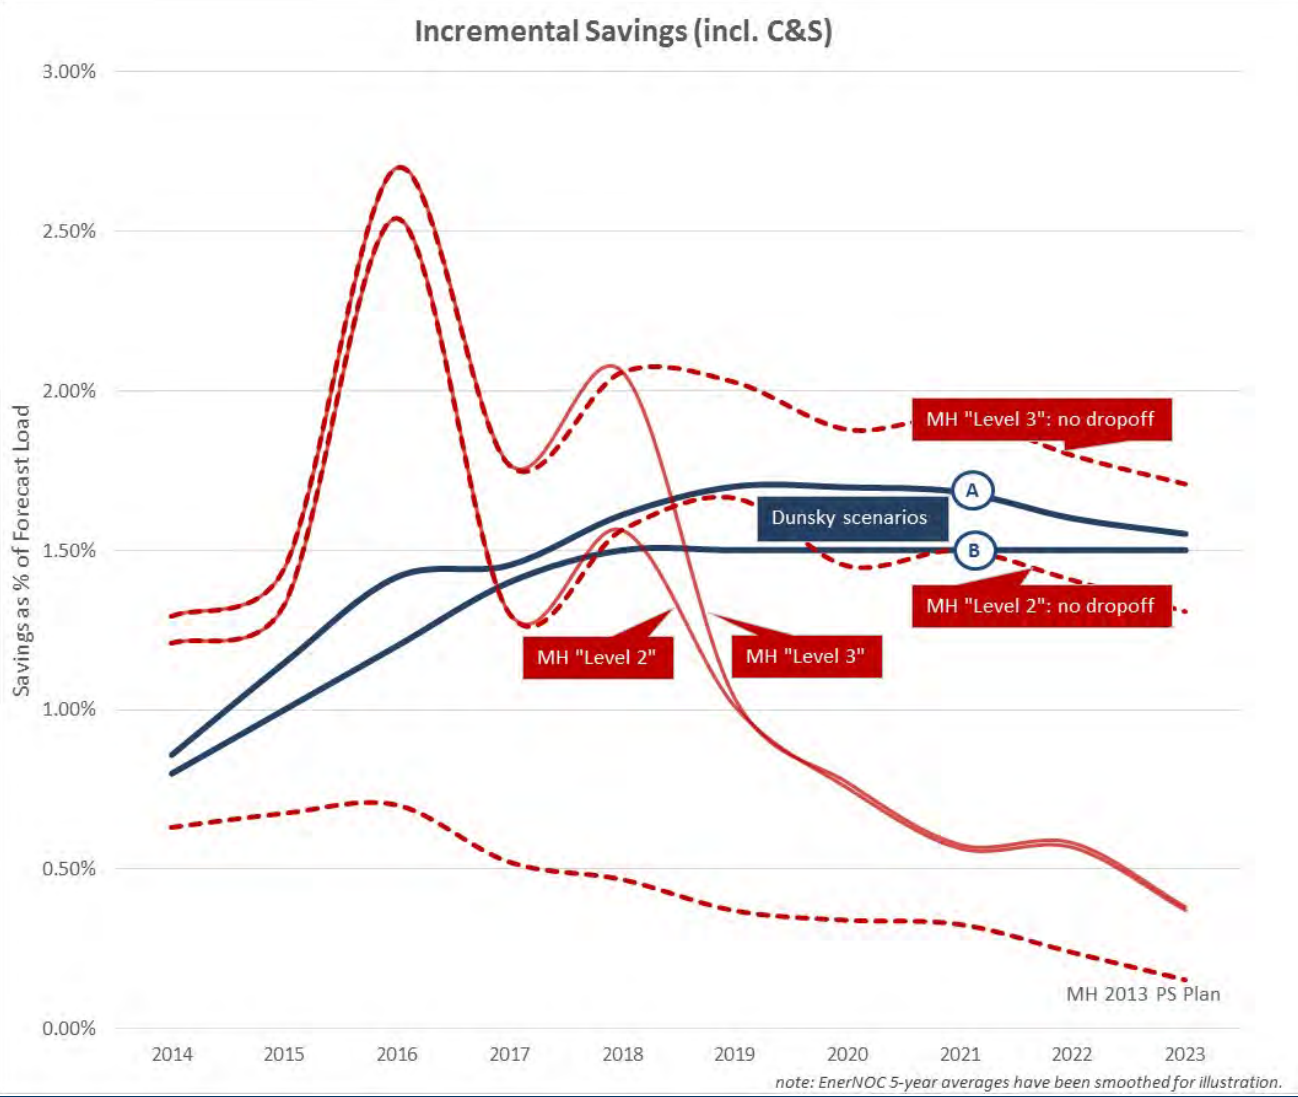
1. Hydro's DSM Scenarios



2. The Problem with a Static View of the Future

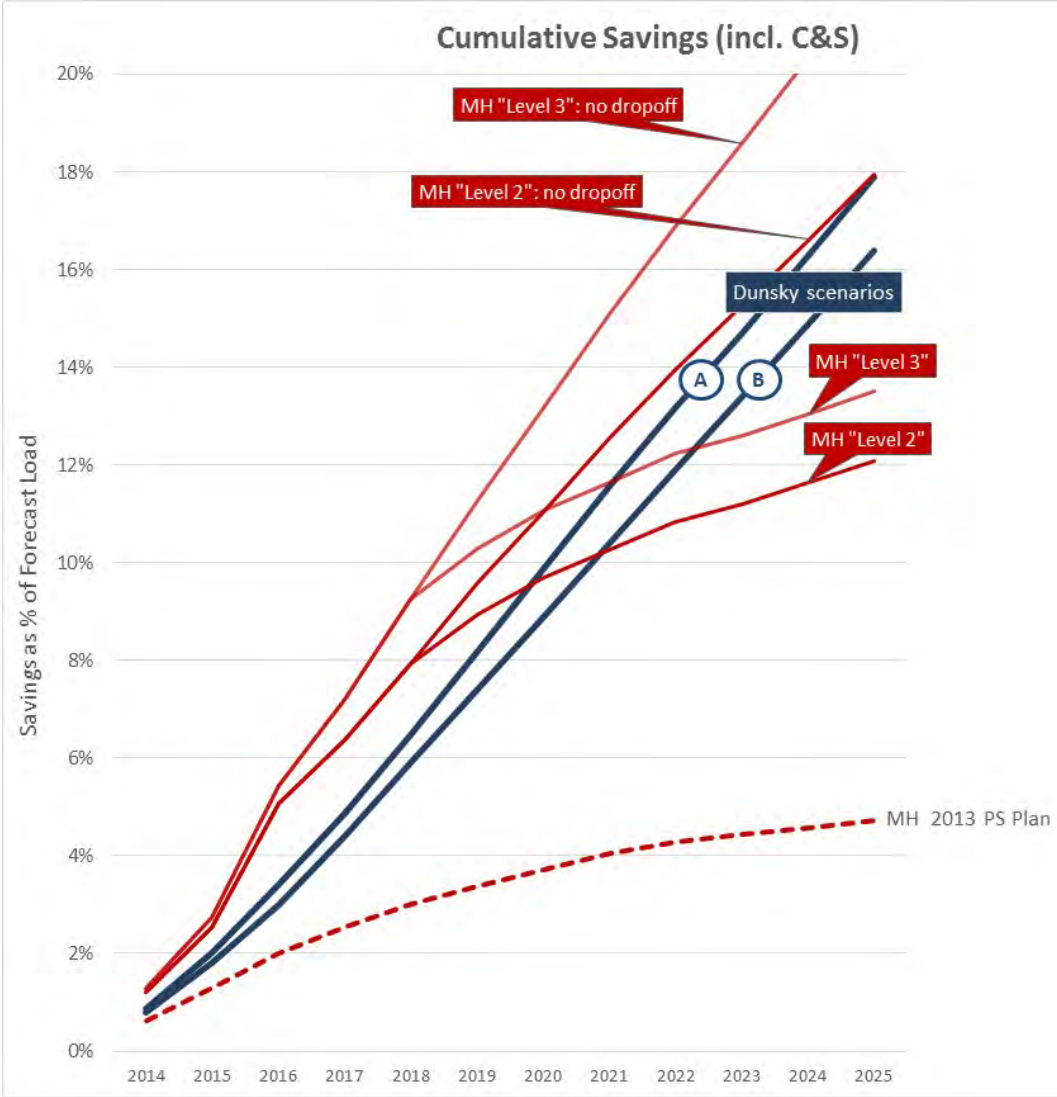
3. How Others Address the "Planner's Dilemma"?

4. **Preferred DSM Assumptions & Implications for NFAT Review**



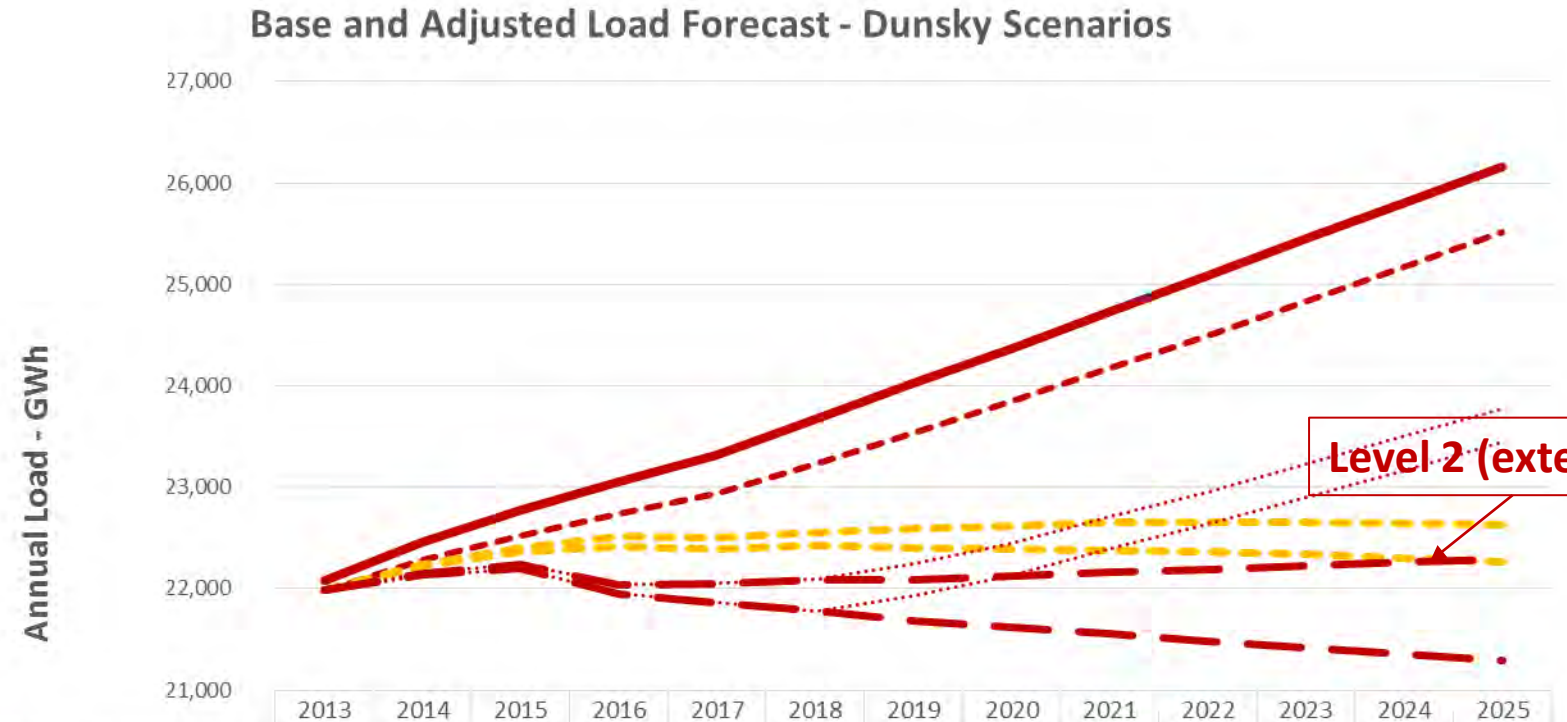
DSM Scenarios (from previous slide)

- Original written evidence included two long-run DSM scenarios
- Below: new effort to build from MH's "Levels 2 & 3"
  - Extend savings >2018
  - Rolling 3-year average



DSM Scenarios *incl. extended version*

- Extended versions of Levels 2 and 3 assume sudden no dropoff after 2018
- Results similar (both higher and lower) to our original Scenarios A and B



DSM Scenarios *incl. extended version*

- **Same results, but viewed in *cumulative annual* savings** *(as opposed to incremental annual)*

IMPLICATIONS

- **For planning purposes, a near-flat, long-run demand curve is the most prudent assumption for *domestic needs***
  - Note: not a *prediction*; rather a **likeliest scenario assuming MH pursues its stated policy of securing all economically achievable demand side management opportunities**
- Implies that Keeyask and other supply investments will **primarily or exclusively serve export opportunities**

= MERCHANT PLANT PERSPECTIVE

DISCUSSION: MERCHANT PLANTS

- **Preferred Plan *may* still be preferential**
  - ✓ Initial export contracts to secure part of investment
  - ✓ Additional export opportunities down the road
  - ✓ Added reliability benefits
- **But value is heavily dependent on key risk factors**
  - How will natural gas prices evolve?
  - How quickly will solar PV costs continue to drop?
  - Will U.S. adopt more aggressive CO_2 reduction requirements?
- **PUB decision would benefit from assessment rooted in this perspective**

For planning purposes, it may be more prudent to assume MH Level 2 *extended after 2018.*

This suggests a *nearly* flat domestic demand curve to 2034, which in turn suggests that Keeyask and other supply investments should be assessed primarily as merchant plants.

Manitoba PUB 1

NEEDS FOR AND ALTERNATIVES TO MANITOBA HYDRO'S PREFERRED DEVELOPMENT PLAN

INDEPENDENT REVIEW OF SOCIO-ECONOMIC BENEFITS

FINAL REPORT

Prepared for Manitoba Public Utilities Board

Prepared by TyPlan Planning & Management

January 2014

Lead Author: Russ Tyson, Project Director

Executive Summary

Introduction and Purpose

The Manitoba Public Utilities Board (PUB) regulates a number of Manitoba Public Utilities, inclusive of Manitoba Hydro (MH). The Ministry of Innovation, Energy and Mines, Government of Manitoba requested the PUB conduct the Needs for and Alternatives to (NFAT) for Manitoba Hydro's (MH) Preferred Development Plan (PDP), using an independent body.

The proposed expenditure of approximately $20 billion dollars on the PDP will have a significant economic impact on the Province of Manitoba, northern Manitoba communities, impacted First Nations as well as other jurisdictions in Canada. The NFAT review requires that the PUB Panel examine the socio-economic impacts. TyPlan Planning and Management (TyPlan) has been retained to review the findings presented in the NFAT Business Case prepared by MH, and comment on the reasonableness of the assumptions and findings. The scope of work (SOW) undertaken by TyPlan is provided in the main report.

The PDP consists of the Keeyask Generating Project (695MW), the Conawapa Generating Project (1,485MW), North-South transmission upgrade project with an in-service date to correspond with Conawapa, the Manitoba-Minnesota Transmission Project, and simple gas thermal units. MH has incorporated a number of lessons learned from both historic hydroelectric developments and recent construction projects (Wuskwatim Generating Station) that have influenced MH's approach to project delivery, and correspondingly, the resultant socio-economic benefits. Lessons learned include: establishment of partnerships with First Nations, early start of construction for supporting infrastructure (developed via first Nations partnership agreements), engineering costs and constructability inputs, and human resource attraction and retention strategies.

Key Observations

Economic Impact Assessment

Interpreting the Results of the Input Output Model for various alternative plans

The Manitoba Bureau of Statistics Input Output Model (IOM) was used to compare the expected economic impacts associated with the PDP and other alternatives such as a Simple Gas Turbine and a Combined Gas Turbine project. While varying detail was provided regarding construction costs for the gas options, we note that IOM's are linear and therefore scalable. Scaling the gas options to reflect the Keeyask Generating Project construction costs ($2.2 billion) enables a comparison of economic impacts. The Keeyask Generating Project (and the PDP) creates significantly greater economic benefits than that of the gas turbine projects.

Interpreting the Results of the Input Output Model for the PDP

Specific to evaluating the overall economic benefits of the PDP, our review commented on the key steps and related assumptions required to preparing the model, namely:

- the level detail related to construction costs;
- allocation of construction costs into input output categories;

- removal of expenditures with no provincial economic benefit and other leakages from the provincial economy; and
- treatment of labour.

MH provided detailed costs as inputs into the model, and has for the most part, allocated cost input data to the corresponding IO expenditure categories based on an understanding of the expenditures involved. MH has removed expenditures with no provincial economic benefit and identified leakages from the provincial economy. The results of which are also reflected in the treatment of labour.

It is observed however, that the treatment of many purchases as leakages may tend to understate the impact of the PDP in Manitoba, while overstating the impact in the rest of Canada. This is due to the fact that the margins embedded in the purchase cost of these goods and services (treated as leakages), may not have been attributed to Manitoba producers who may be providing services such as transportation or wholesaling.

The extent of the leakages can be explained by a number of factors such as the relatively small manufacturing base of Manitoba economy compared to the rest of the provinces in Canada (Ontario and British Columbia), as well as the extensive experience of MH regarding recently constructed projects that would verify the of out-of-province purchases.

The extent of the out of province expenditures may be reasonable, but MH should have explicitly commented on this as part of reporting.

The issue pertaining to whether the impacts to the rest of Canada are overstated, whereas the impacts to Manitoba are understated remains, and is discussed below.

Canadian vs. Provincial Benefits

A generally accepted principle of input output modelling is that the "direct" benefits of any project are incurred in the jurisdiction in which the project is located. The approach used in the Statistics Canada Interprovincial Input-Output Economic Impact Simulation model (catalogue no. 15F0009XDB) focused on the expenditures (purchase of goods and services) and the location where these expenditures took place. This approach ensures that the results generated from the model show the entire direct impact in Manitoba. It should be noted however that when the expenditure approach is used with the Statistics Canada model, the model estimates where the goods and services purchased are supplied from.

The key difference in the MH IOM approach was that MH made decisions, based on local experience and knowledge, on where the goods and services originated from. Although such an approach is reasonable, one must be careful in how to interpret the direct and indirect impacts, as the production (supply) of goods and services might generate a direct impact in the jurisdiction where the production took place, but in reality, this production should be interpreted as indirect impact, because these goods and services were produced to satisfy the demand associated with the project.

The results of both the MH IOM and the Statistics Canada Interprovincial model are presented for comparison purposes in the main body of the report for the Keeyask Generating Station.

The analysis suggests that the allocation of impacts between Manitoba and the rest of Canada in the MH study is significantly different from what the normal allocation, based on the structure and characteristics of Manitoba's economy would be, according to the Statistics Canada model.

Based on the results of the Statistics Canada model one would expect the economic impact in Manitoba to be higher than what was suggested in the MH study (employment, labour income and GDP), while the impact in the rest of Canada would be lower.

Regardless, the results confirm that the PDP creates the greatest economic impacts, and if the Statistics Canada Interprovincial model is considered, the benefits to Manitobans is greater than what was reported.

Determining gross provincial financial benefits by examining benefits over the life of the project

The economic lives of hydroelectric facilities are much greater than those of other resource options. Based on the timing and value of replacement costs and net production costs based on MH Splash modeling, the PDP creates the greatest value over the economic life of the asset. The longer-term life (past the economic life) of hydroelectric facilities represents a consideration worth noting in this review. Referred to by MH as bequest value, is difficult to ascertain how long such facilities can be maintained and operated. Literature suggests over the longer term (past the economic life) hydroelectric facilities continue to contribute to the provincial economy well past the economic life of the facility evaluated in the NFAT.

Northern and Aboriginal community based impacts in terms of employment opportunities, incomes, community tax base, skills development and community based opportunities

Our review identified ten (10) provincial utility criteria/measurers, specific to optimizing economic benefits for First Nations and northern communities. It is noted MH has met and exceeded such practices.

Community Access Improvements related to Health, Education and Culture

Community access improvements and their implications (environmental setting, effects assessment, mitigation, and residual effects) related to health, education and culture are discussed in the Environmental Impact Statement (EIS) for the Keeyask Generating Project. The assessment followed standard environmental impact assessment process and all identified issues were evaluated.

On-going monitoring throughout construction, operation and beyond will be critical to ensure success of the identified mitigation.

Economic Displacement Impacts and Effects on Consumer Spending

Global Canadian and Provincial Electricity Rates

Manitobans (as of 2013) have one of the lowest residential electricity rates in Canada, and correspondingly, Canada has one of the lowest residential rates in the world (2009). In the literature

reviewed, continued pressure to increase rates throughout Canada is evident and is expected to continue into the next decades.

Review of Increased Energy Costs on Consumers

Literature suggests that the displacement effects of rate increases predominantly affect the poor and those with low income or fixed incomes. The middle and upper class are not as affected as such costs are absorbed through greater disposable income.

Energy Efficiency and Reduction Initiatives

The literature also suggests that best means of mitigating such affects on those most affected will be to aggressively pursue energy efficiency and reduction initiatives. While MH is known for such programs, continued emphasis on such programs is suggested, along with on-going monitoring, in light of the proposed rate increases.

Optimizing demand side management (DSM) will be critical moving forward to manage impacts to ratepayers.

Socio-economic Impact of Key Alternative Scenarios

Evaluation of Alternative Plans

The use of Multiple Account Benefit Cost Analysis (MA-BCA) to ascertain socio-economic benefits focuses on the identification of net benefits from a broader social perspective. It also enables comparisons of the distributional advantages and disadvantages of various plans over the stated life cycle of the plan. MA-BCA is a methodology utilized to evaluate options and used to assist in program and policy decision-making.

The MA-BCA assesses the preferred and three alternative resource development plans, and include:

- the Preferred Development Plan;
- the Smaller Interconnection Plan (K19/Gas 24/250MW Interconnection);
- Keeyask with No Interconnection (K2/Gas); and
- Gas Thermal with on new Interconnection (all Gas).

The MA-BCA was based on the reference scenarios assuming a 78-year net present value metric. It is noted that while sensitivity analysis was undertaken for all of the alternatives, there still remains key assumptions within the economic, financial and sensitivity analysis (future load forecasting, the effect of demand side management, drought exposure, export sales and provincial revenues etc.), that would materially affect the outcome of this review.

Market Valuation

The key assumption effecting results is the discount rate utilized. The discount rate is a critical parameter in cost benefit analysis especially when costs and benefits differ in distribution over time. This is especially important when they occur over a long period of time. The 6% real discount rate chosen for the PDP, based on a social cost of capital, is reasonable based on literature reviewed.

The results are correspondingly reasonable.

Manitoba Hydro Customer Account

Pressure on rate increases is expected to continue globally and throughout Canada, and residential users should expect to pay for increasing rates. While the PDP has the greatest annual projected rate increases proposed in all plans, it will require residents of Manitoba to pay higher rates in the short term (until year 2031). The cumulative rate increases of all plans are not substantially different, with the benefits of the PDP incurring over the longer term as inflationary costs are reduced with the PDP limiting rate increases over the longer term. The key observation is pay now, benefit later regarding rates. Flexibility regarding MH objective to achieving the 20-year 75:25 debt/equity ratio is one means of dealing with rate issues.

Further discussion regarding the short to medium term rate increases associated with the MH plans should be clearly outlined and understood by the people of Manitoba as part of this process.

From a system reliability perspective, the PDP is preferred; however all of the development plans can handle load requirements under the majority of adverse conditions.

Manitoba Government Account

This account focuses on the net benefits to government over the term of the PDP. The results are based on identifying only direct incremental taxes and fees paid by Manitoba Hydro, net of incremental Government cost or risks. The key driver for revenues to the Provincial government in this account is represented by the capital taxes and water rentals. The account also assumes a "wash" for various taxes, such as coal tax and carbon charges taxes, discussed in the environmental review of the NFAT, and the debt guarantee fund, while substantial, is balanced between what MH owes and what the government of Manitoba secures. The approach the MA-CBA takes regarding the other total charges to government, such as the provincial debt guarantee is reasonable.

Manitoba Economy Account

The Manitoba account is specific to the employment and wages generated by the project in each plan, and estimates the potential incremental income that employment (wages) offers for Manitobans. The assumptions regarding proportioning the net economic rent (the additional wages earned net of) that would be derived, is based on project location and the employment/unemployment characteristics in that region. Northern regions with greater unemployment would result in greater net benefits, and the PDP is preferred. The assumptions made are reasonable.

Social Account

The societal benefit of hydroelectric projects outlined in the PDP should be considered in context to the $1 billion dollars in sunk costs incurred for the Keeyask Generating Project, and the $300 million in sunk costs for the Conawapa Generating Project, during project development. Such costs are not considered in the evaluation undertaken to justify the PDP. From a socio-economic perspective, while the investment of the $1 billion invested for KGP as sunk costs, is substantial, the corresponding socio-economic benefits derived from some of the sunk cost expenditures, such as the Joint Keeyask Development Agreement and related project benefits as well as Keeyask

Infrastructure Project support the optimization of socio-economic benefits for First Nations and northern communities.

The MA-BCA is a reasonable approach to ascertain socio-economic benefits, and based on the reference scenarios provides insight into the distributional benefits of the alternative plans studied. Considerable risk and uncertainty remains. To address such issues the concept of pathways is introduced.

The Significance of Pathways

To deal with risk and uncertainty over the period of the plan, the concept of pathways were identified in the PDP. The decision pathways enable MH the flexibility to modify the PDP to address risk and uncertainty and the ever-changing market characteristics over the longer term of the plan. From a socio-economic perspective the critical decision point within the pathways, if the PDP is pursued, is decision specific to the construction of Conawapa, which does not have to be made until 2018.

Between 2014-2018, the risk and uncertainty factors should be studied in detail and reported back to the PUB prior to the decision date, to enable the government of Manitoba to make an informed decision regarding its future energy policy decisions. The Government of Manitoba should provide the PUB direction enabling the PUB to work directly with MH as such risk and uncertainty is addressed.

High-level review of approaches to optimizing Provincial economic benefits of large-scale resource projects

The utilities benchmarked (Québec Hydro and Nalcor) have benefited from lessons learned from previous hydroelectric developments and incorporated initiatives to optimize local and regional benefits, specifically for northern and indigenous populations. Provincial and Canadian wide benefits are driven for the most part from construction benefits (employment) and a lesser extent operational employment jobs which are local. Such economic impacts are derived from IOM's. Provincial revenues are secured from export sales and on-going government tax revenues from water rentals etc.

Legal or quasi-legal agreements with First Nations have been secured in all jurisdictions. Cooperation with other Federal and local agencies involved in employment training and social services has also been pursued and resulted in successful economic optimization strategies. Equity ownership and management and administrative assistance also help in building capacity within the organization, as outlined in the MH example via the Joint Keeyask Development Agreement.

Manitoba Hydro's approach to optimizing provincial economic benefits reflects industry practices. On-going monitoring of the success of all of the related socio-economic optimization strategies should be pursued; lessons learned identified and implemented going forward.

Summary

From a socio-economic perspective, the approach assumptions and findings MH has presented are reasonable. Overall the PDP exhibits the greatest socio-economic benefits to the people of Manitoba, northern communities and First Nations compared to other plans based on the reference plans evaluated.

Use of the Statistics Canada Interprovincial IOM in this review suggests that, based on MH assumptions that the Manitoba related economic impact benefits may have been understated while the rest of Canada benefits overstated, making the PDP more attractive to Manitobans as greater benefits are derived. The Statistics Canada Interprovincial model confirms the overall benefits derived from the PDP are reasonable.

Planned investments are significant over the next decade (as outlined in the proposed PDP), placing increased pressure on the provincial debt and rates, in the short and medium term. The PDP is intended to contribute to the growth of the Manitoba economy, strengthen relationships with First Nations and create a lasting legacy for future generations. By doing so the PDP supports Manitoba Hydro's Corporate Strategic Plan (MCSP) 2012-13 and goals of the corporation, with two corporate goals in the MCSP being highlighted, supporting Aboriginal people and Provincial economic development.[1]

Throughout the short/medium term the Keeyask Generating Project would generate significant socio-economic benefits for the people of Manitoba, First Nations and northern communities and if not pursued such benefits would be forgone, inclusive of the sunk costs already allocated to the Keeyask Generating Project.

Over the longer term considerable uncertainty and risk remains and the introduction of pathways in the decision making process enables such risk and uncertainty to be studied prior to a decision being made on Conawapa.

Both Keeyask and Conawapa are capital intensive projects, creating significant employment throughout construction, and on-going operational benefits. Monitoring issues related to access, health, education and the cultural implications of project development, while identified, should be monitored aggressively, and lessons learned implemented on an annual basis to ensure sustainable capacity building within First Nations and northern communities.

Appendix B ..... What Economic Impact Models Measure
Appendix C Statistics Canada Interprovincial Input-Output Model 2009: Impact of Keeyask Generating Station

1 INTRODUCTION AND SCOPE OF WORK

1.1 Background

The Manitoba Public Utilities Boards (PUB) regulates a number of Manitoba Public Utilities, inclusive of Manitoba Hydro (MH). In January of 2011, the Government of Manitoba notified MH of its intention to carry out a public needs for and alternatives to (NFAT) review and assessment of MH's preferred development plan (PDP), consisting of both the Keeyask and Conawapa hydroelectric projects and Canada-USA Interconnection facilities. In November of 2012, the Ministry of Innovation, Energy and Mines announced that the government of Manitoba asked PUB to conduct the NFAT for the PDP, using an independent body.

The proposed expenditure of approximately $20 billion dollars on new hydro generation and transmission assets will have a significant economic impact on the Province of Manitoba, northern Manitoba communities, impacted First Nations as well as other jurisdictions in Canada and the USA. A component of the NFAT review requires that the PUB Panel examine what these specific socio-economic impacts are to the Northern and Aboriginal communities as well as the benefits to Manitoba as a whole.

TyPlan Planning and Management (TyPlan) was retained to comment upon the reasonableness of the assumptions and results of the NFAT Business Case prepared by Manitoba Hydro available at (http://www.hydro.mb.ca/projects/development_plan/nfat_business_case.shtml)

1.2 Scope of work[2]

The scope of work (SOW) undertaken by TyPlan, as defined by the PUB, includes the following:

1. Perform a critical analysis of the socio-economic impacts and benefits of Manitoba Hydro's PDP and alternative plans. This should include examination of potential effects to the people of Manitoba, especially Northern and Aboriginal communities, including employment, training and business opportunities, infrastructure and services, personnel family and community life and resource use, including:
   a) Economic impact assessment to determine sector economic impacts, impacts to provincial GDP, long term and short term indirect and induced employment opportunities;
   b) Determining gross provincial financial benefits by examining benefits over and costs over the life of the project;
   c) Determining Canadian benefits;
   d) Northern and aboriginal community-based impacts in terms of employment opportunities, incomes, community tax base, skills development and community business opportunities; and

[2] NFAT Scope of Work, (http://www.pub.gov.mb.ca/nfat/terms_reference.pdf)

e) Community access improvements and related health, education and cultural benefits.

2. Consider the economic displacement impacts and effects on consumer spending to the extent consumers will face due to increased electricity rates as a result of the PDP.
3. Identify and evaluate the socio-economic impact of key alternative scenarios, and provide a comparison table between the PDP and such scenarios.
4. Provide high level analysis on how other Canadian jurisdictions maximize provincial economic benefits from the development of large-scale resource projects, and assess if the PDP provides the highest level of socio-economic benefit to Manitobans.

1.3 Key Reports Referenced

Key reference material sourced from the NFAT Business Case submission and other MH reports are referenced in Appendix A.

MH provided Typlan with additional support information necessary to undertake the independent review of the economic impact analysis and the multiple account evaluation. Data containing Commercially Sensitive Information (CSI) is not referenced in our reporting.

1.4 Report Outline

The report is presented in the following sections:

Section 1: **Introduction and Scope of Work**; provides an introduction and scope of work outline, reference materials and a report outline.

Section 2: **Manitoba Hydro's Preferred Development Plan and Lessons Learned from other Hydroelectric Projects**; provides a description of the PDP, as defined in Manitoba's filing and lessons learned from recent hydroelectric developments (Wuskwatim) that have impacted how MH has dealt with project delivery and related socio-economic benefits.

Section 3: **Socio-economic Impact Review**; provides, based on Manitoba Hydro's economic impact assessment, verification and the reasonableness of, the identified economic sector impacts inclusive of provincial GDP, employment opportunities, gross provincial financial benefits, examining benefits over the costs over the life of the project, Canadian benefits, northern and aboriginal community based impacts (e.g., employment, incomes, community tax base, skills development, community business opportunities), community access improvement and related health, education and cultural benefits.

Section 4: **Economic Displacement Impacts and Effects on Consumer Spending**; provides an evaluation of current trends and comparisons in Global, Canadian, Provincial utility pricing, and considers the extent to which consumers will be faced increased electricity rates as a result of the PDP. The section concludes with a literature review of the key initiatives to reduce such displacement effects, namely energy reduction and efficiency measures.

Section 5: **Socio-economic Impact of Five Key Alternative Scenarios**; provides at a high level, based on the multiple account benefit cost assessment (MA-BCA) framework undertaken by Manitoba Hydro, a comparison of the PDP and alternative scenarios, and concludes with the importance of pathways in managing project risk.

Section 6: **High Level Review of Approaches to Optimizing Provincial Economic Benefits of Large Scale Resource Projects**; provides a comparison of other practices in Canadian jurisdictions, specific to Québec Hydro's Eastmain 1A Rupert River Project and Nalcor (Newfoundland and Labrador) Lower Churchill Project, both of which have similar project characteristics.

Section 7: **Observations**; provides a series of observations pertaining to the key issues identified in the statement of work for consideration by the Public Utilities Board.

2 MANITOBA HYDRO'S PREFERRED DEVELOPMENT PLAN (PDP), AND LESSONS LEARNED FROM OTHER HYDROELECTRIC PROJECTS

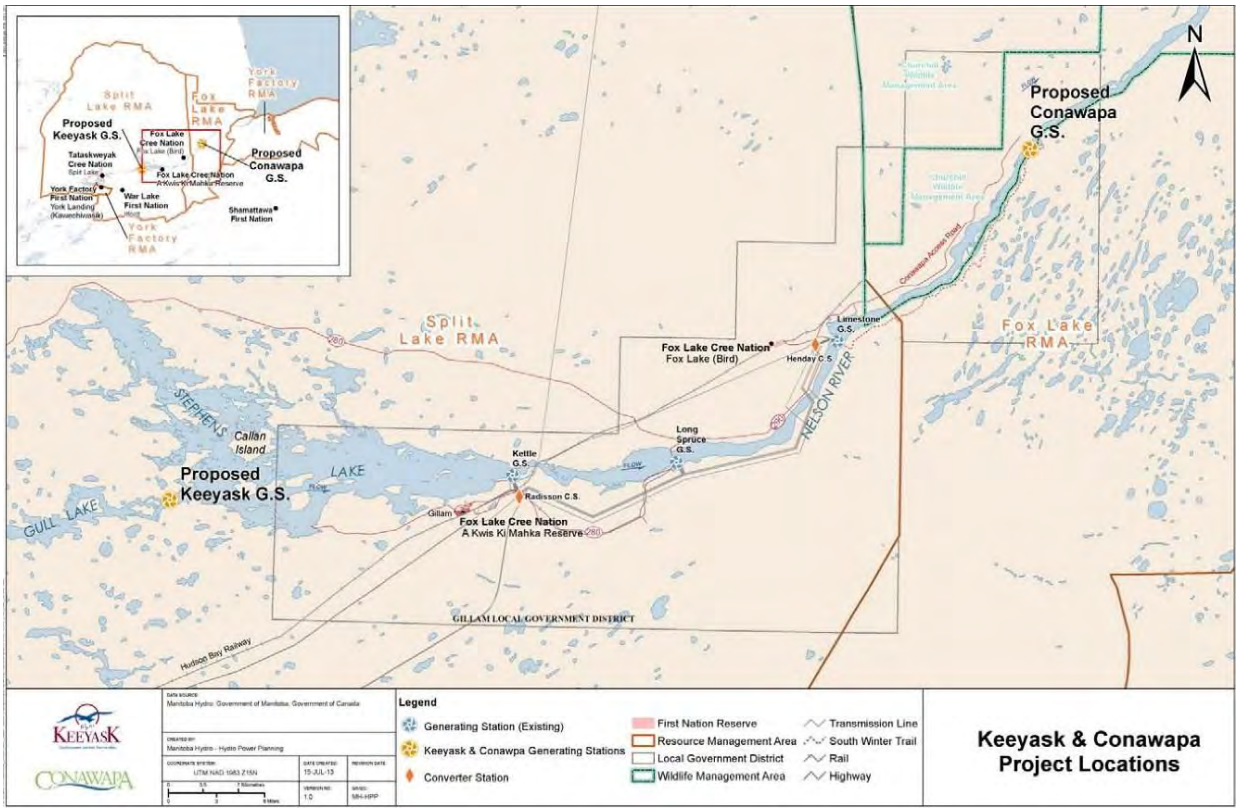
2.1 Preferred Development Plan

MH has identified a PDP intended to meet local supply requirements, as well as existing electricity sale commitments and future export possibilities. The PDP consists of the following.[3]

Table 1: Overview of Preferred Development Plan Components

Preferred Plan Infrastructure	Capacity (MW)	Proposed In Service Date (ISD)
Keeyask Project *	695	2019
Conawapa Project	1,485	2026
North-South Transmission Upgrade Project, with an ISD to correspond with Conawapa	185	2026
Manitoba-Minnesota Transmission Project	750	2020
Simple Gas Thermal Units[4]	Not determined nor defined in PDP	2041

Notes: The Keeyask Project consists of three components:



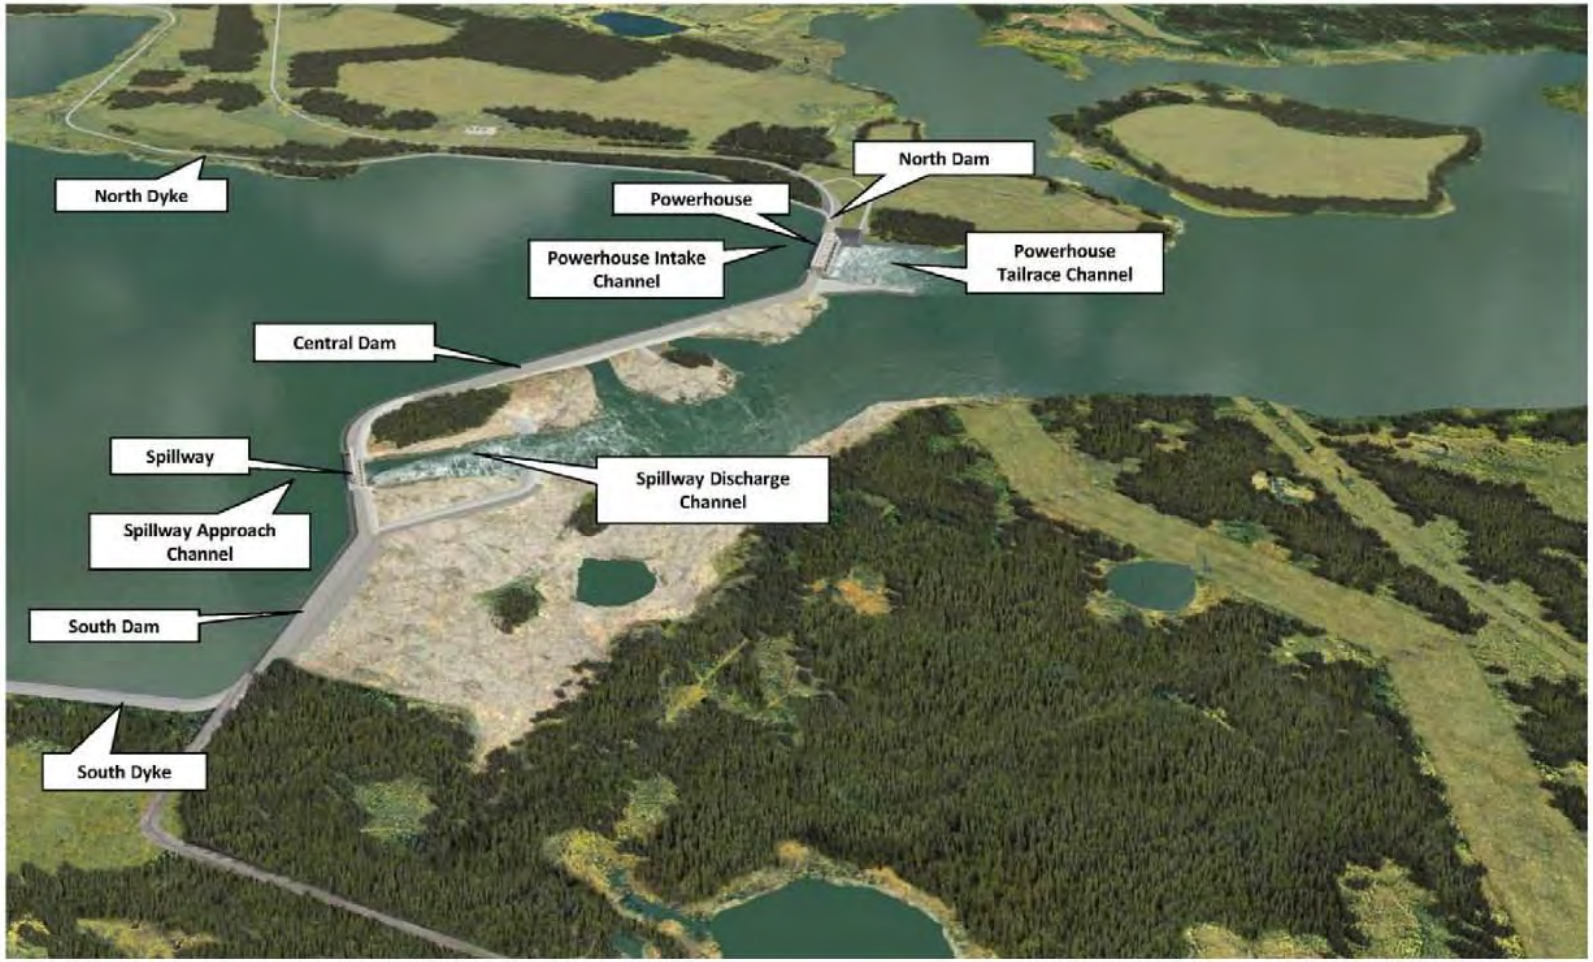
- 695 MW Keeyask Generation Project
- Keeyask Infrastructure Project
- Keeyask Transmission Project

Source: Needs for Alternatives to Chapter 2- Preferred Development Plan

Both the Keeyask Generating Project (KGP) and Conawapa Generating Projects (CGP) are sited on the Nelson River in Northern Manitoba. The Nelson River has historically been developed for hydroelectric development and has three (3) existing hydroelectric plants in operation, the Limestone Generating Stations (GS), Long Spruce GS and Kettle GS. The proposed Keeyask GS and Conawapa GS project locations are illustrated on Exhibit 1.

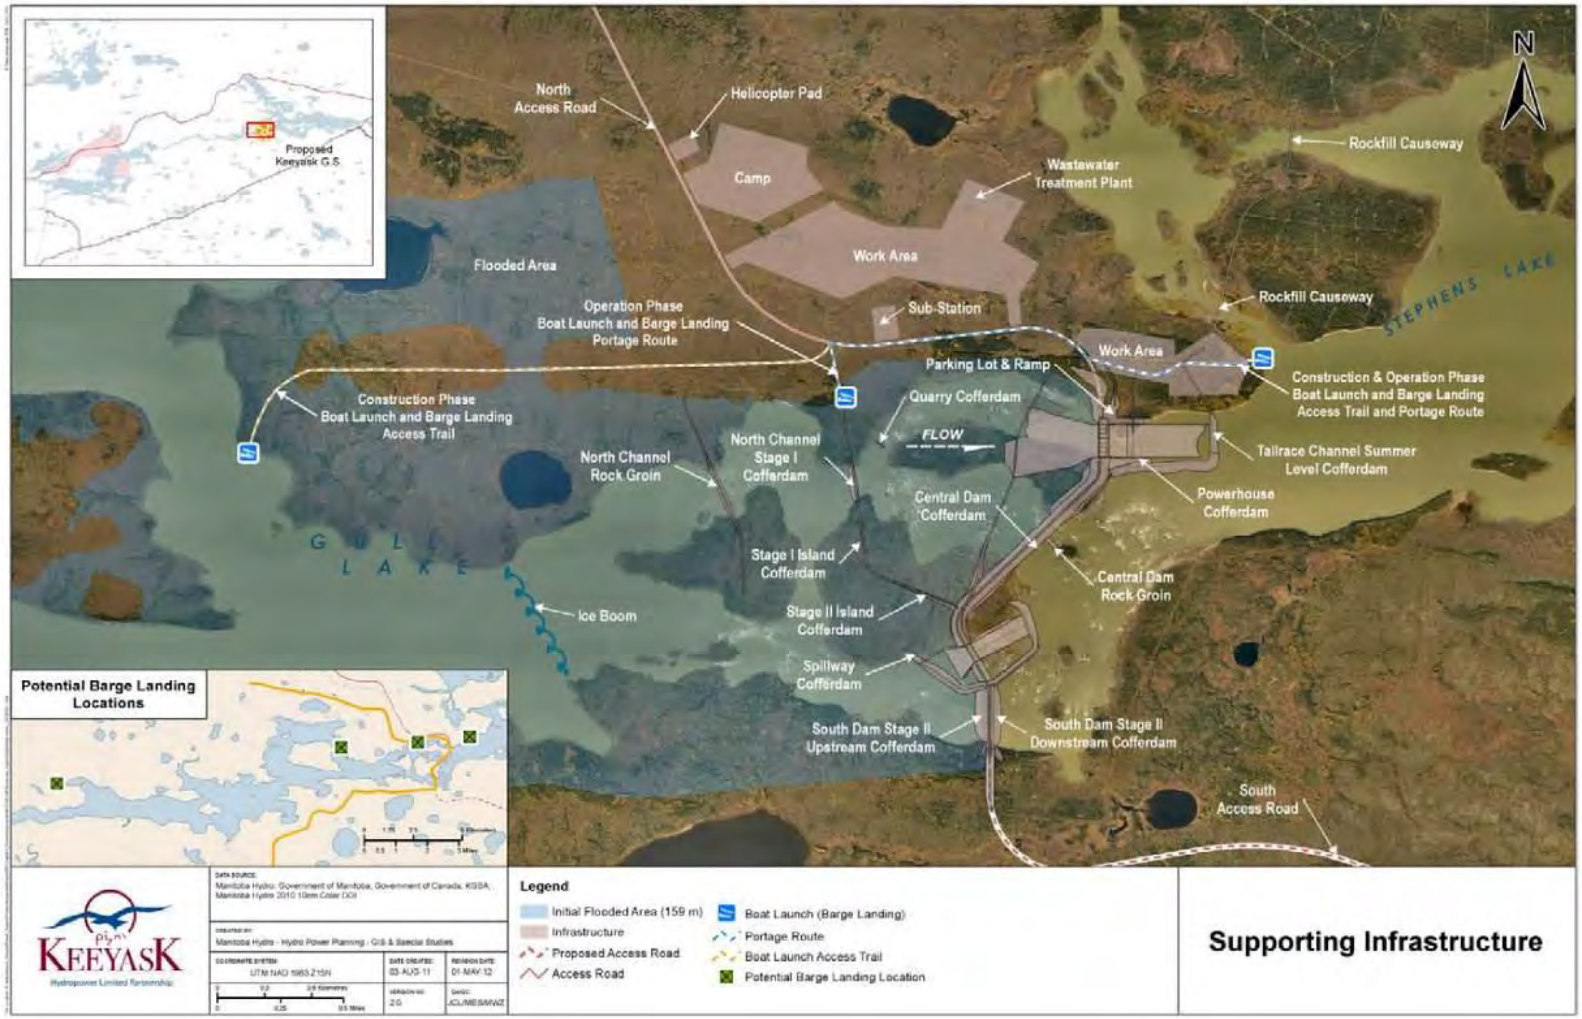
[3] Needs for and Alternatives to Chapter 2 - Preferred Development Plan Facilities (pg. 1-59)
[4] The simple-cycle gas thermal units towards the end of Manitoba's Hydro's Planning cycle (starting in 2041) to meet currently forecast domestic load growth. This assumption is used consistently in all plans to ensure the forecast load can be met through the end of the planning period without having to bring in additional types of supply. As such, this element of the Preferred Development Plan is not described further.

Exhibit 1: Keeyask and Conawapa Project Location



Source: Manitoba Hydro Needs for and alternatives to: Chapter 2 Preferred Development Plan Facilities

The typical works/infrastructure necessary to construct such facilities, inclusive of support infrastructure consists of the following, conceptually illustrated on Exhibits 2 and 3:



- Earth fill dam
- Spillway
- Powerhouse
- Powerhouse intake channel
- Powerhouse tailrace channel

It is those aforementioned components that represent the key capital-intensive construction activities and key project costs that generate economic benefits (via employment and supporting indirect and induced benefits from suppliers). Accordingly, construction of hydroelectric dams represents in general, the most capital-intensive resource options referenced in the NFAT review.

Exhibit 2: Keeyask Dam Site and Supporting Infrastructure

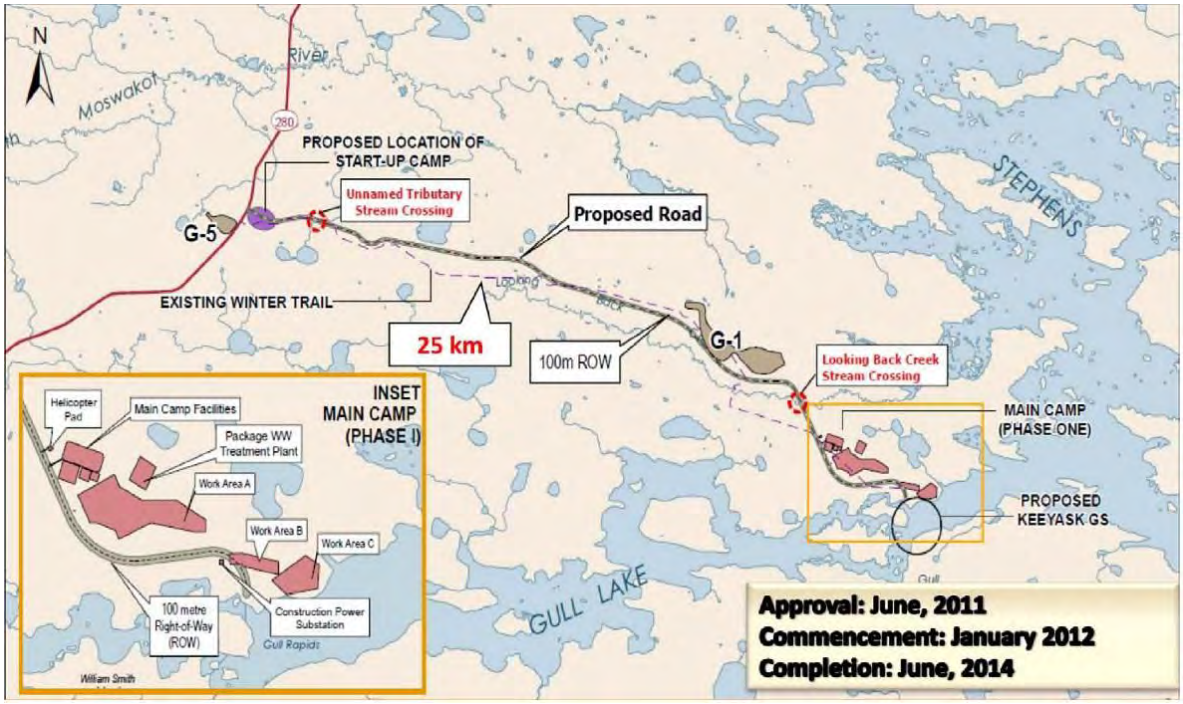
Exhibit 3: Conawapa Dam Site and Supporting Infrastructure

Source: Manitoba Hydro Needs for and alternatives to: Chapter 2 - Preferred Development Plan Facilities



Source: Source: Manitoba Hydro Needs for and alternatives to: Chapter 2 - Preferred Development Plan Facilities

2.2 Keeyask Infrastructure Project

The Keeyask Infrastructure Project (KIP) forms part of the Keeyask Generating Project (KGP), and is currently being constructed prior to approval of the PDP. KIP consists of supporting infrastructure for the KGP, inclusive of a 25 km north access road, 35 km south access road, transmission line spur, communication tower, placement for excavated materials, remnants of some cofferdams and rock groins, boat launches, portage, barge landings, and haul roads. The KIP is an example of one of the lessons learned from Wuskwatim. The project will facilitate schedule implementation and on site readiness for the larger dam site construction. Main camp, work areas, concrete batch plant, water and wastewater and treatment facilities etc. are also part of the plan, illustrated below:

Exhibit 4: Keeyask Infrastructure Project

Source: Needs for and Alternatives to Chapter 2- Preferred Development Plan Facilities

Unique to the PDP, and building upon the Wekwatim Power Limited Partnership (WPLP) agreement, the Joint Keeyask Development Agreement (JKDA), was signed in March 2009 by Manitoba Hydro and each of the four Keeyask Cree Nations (KCN's):

- Tataskweyak Cree Nation (TCN)
- War Lake Cree Nation (WLFN)
- York Factory first Nation (YFFN)
- Fox Lake Cree Nation

The JKDA was established to address pre-construction issues and proactively involve local aboriginal groups to support related socio-economic benefits potentially resulting from the PDP. The Partnership will own the generation project. The total cost of the KIP project is $229.9 m dollars.

2.3 Lessons Learned from Wuskwatim

While not a specific requirement of this socio-economic review, it was important to acknowledge "lessons learned" from recent MH projects, and how those lessons learned have, in turn, influenced the development of the PDP. A number of such lessons learned have influenced and resulted in a number of related socio-economic benefits that are analyzed in this review.

MH completed the Wuskwatim Generating Station (WGS) in 2012. As part of the on-going planning, lessons learned were incorporated to better manage the planning and development of the PDP.

WGS is located on the Burntwood River, in the Nelson House Resource Management Area, approximately 45 km south of Thompson and 35 km southeast of Nelson House. The WGS was developed and is owned by WPLP, a legal entity involving Nisichawayasihk Cree Nation (NCN) and Manitoba Hydro. Manitoba Hydro operates the WGS as part of the Manitoba power grid on behalf of WPLP. WGS represents the first time Manitoba Hydro has entered into a partnership with First Nations community on a generating station project, a lesson learned which has been transferred to the KGP.[5]

The WGS project resulted in significant cost overruns due to two key issues: labour (cost to attract/retain labour and labour productivity) and escalation costs. Manitoba Hydro has been proactive in evaluating the reasons such overruns occurred and has put in place measures to prevent similar issues arising in the proposed PDP. The New Generation Construction Division, Power Supply Group of MH, responsible for construction works, has developed a project execution plan for Keeyask and the Keeyask-Infrastructure and Generating Station[6]. The Project Execution Plan defines and expands on internally accepted project management techniques required for effective project delivery, a key lesson learned from Wuskwatim.

A summary of lessons learned, and what has been done to address such issues, which have implications from a socio-economic perspective, are presented below.

[5] Manitoba Hydro http://www.hydro.mb.ca/corporate/facilities/gs_wuskwatim.shtml
[6] Keeyask-Infrastructure and Generating Station Project Execution Plan (Project Execution Plan -20130314) CSI

Table 2 Lessons Learned Wuskwatim

Key lesson Learned	Manitoba Hydro Response	PDP Response
Establishment of partnerships with First Nations	The WGS was developed and is owned by the Wekwatim Power limited Partnership (WPLP), a legal entity involving Nisichawayasihk Cree Nation (NCN) and Manitoba Hydro. Manitoba Hydro operates the WGS as part of the Manitoba power grid on behalf of WPLP. WGS represents the first time Manitoba Hydro has entered into a partnership with First Nations community on a generating station project, a lesson learned which has been transferred to the KGP as well	The KGP project will be developed with full support of the local area First Nations as outlined in the Joint Keeyask Development Agreement (JKDA) signed by all First Nations
Early Start of construction for supporting Infrastructure	The Keeyask Infrastructure Project represents a $229.9 m investment by MH (identified under the terms of the (JKDA) intended to facilitate job learning and effective construction delivery of the KGS project via developing supporting infrastructure associated with road access and worker accommodation camps. This will facilitate effective and efficient readiness for dam site construction	Construction site readiness for the dam construction will be facilitated via the KIP project currently being constructed. While such costs are assumed "sunk costs" on the project, the KIP will create significant benefits to northern and aboriginal peoples
Engineering – early completion and earlier assessment of constructability inputs	The Keeyask and Conawapa capital cost estimates were developed based on the Association for Advancement of Cost Engineering International (AACEI) recommended practices for estimate development Detailed costing essential to manage potential cost overruns	Accurate costing and lessons learned from WGS provided New Generation Construction Division Power Supply the opportunity to review and clarify project costs in accordance with industry best practices and put in place strategies to deal with labour and cost escalation
Human Resources – attract and retain project staff and Labour	Driven by a proactive approach to skill development and training with First Nations. Employment and training for identified jobs associated with both the KIP and Keeyask Generating Project have been identified and provided for. The construction of a premier construction camp for workers represents a means of attracting skilled labour to the dam sites construction	Retention of skilled labour throughout project construction was identified as a critical issue both from a First Nations perspective and general labour perspective. The creation of a world class construction camp to attract workers and separate workers from local populations to reduce health and cultural conflicts has been established

Key lesson Learned	Manitoba Hydro Response	PDP Response
Project Management Practices[7]	Strong project management practices are required to manage such a multi-disciplinary approach to project delivery. MH has implemented such a program, inclusive of the key project management principles associated with the Project Management Institute (PMI) key knowledge areas, inclusive of the creation of: • Project Integration Plan • Scope Management Plan • Schedule Management Plan • Cost Management Plan • Quality Management Plan • Human Resource Management Plan • Communication Management Plan • Procurement Management Plan • Risk Management Plan • Construction and Commissioning Management Plan • Project Close Out Plan	Larger corporations from an organizational perspective may have difficulties in delivery methods for specific projects, as evident in a number cost overrun issues related to major hydroelectric developments in Québec and Ontario a well as Manitoba.

Source: Capital cost Estimates for Keeyask and Conawapa Generating Stations (Dave Brown, Manager Project Services, presented at the Intervener Presentations September 5/6 2013).

[7] Project Management Institute - A Guide to the Project Management Body of Knowledge

Observations:

MH has adapted lessons learned from the construction of WGS in the development of the PDP that have resulted in how the project delivered, and correspondingly influence the socio-economic benefits identified. A structured project management approach to project delivery has also been incorporated into the PDP.

3 SOCIO-ECONOMIC IMPACT REVIEW

3.1 Resource Options Overview and High Level Development Plan Comparison Table

The NFAT provides an overview of resource supply options and development plans evaluated by MH. The Range of Resource Options inventory consisted of a range of 17 different technologies suitable for utility scale generation.

Specific to Appendix 9.1 of the NFAT, 15 development plans were compared based on technical, environmental, socio-economic criteria. The socio-economic criteria included health and safety concerns, Manitoba business opportunities (% of capital spent in Manitoba), cumulative development plan employment (direct construction, construction at northern work sites, permanent operations and maintenance, permanent O&M at northern work sites), present value royalties (water rental, capital taxes, guarantee fees) and nearby population centers that would potentially benefit from such developments.

Observations:

As part of the NFAT review, Appendix 7.2 - Range of Resource Options identified 16 preferred resource options (that included 12 hydroelectric options, three thermal options and one wind resource option) for further study. Appendix 9.1 High Level Development Plan Comparison reviewed 15 specific development plans. A high level comparison confirms that overall, hydroelectric options that consider both Keeyask and Conawapa provide the greatest socio-economic benefit followed closely by other combination options with just Keeyask.

The resource planning process undertaken by MH regarding the selection of the hydroelectric development plans is reasonable.

3.2 Economic Impact Assessment

The economic impact analysis (presented in Appendix 2.3 of the NFAT) provides an indication of gross provincial benefits, inclusive employment in person years, labour income, and contributions to gross domestic product (GDP), federal, provincial and local taxes. Appendix A provides a description of what an IOM does and produces.

3.2.1 Manitoba Bureau of Statistics Input Output Analysis

The Manitoba Bureau of Statistics IOM was utilized to assess the economic impact of the PDP. The IOM was also utilized to determine the economic impact associated with a simple gas turbine project and a combined gas turbine project.

The IOM was utilized for the following components of the PDP:

1. The Keeyask project (695 MW hydroelectric generating station, three new transmission lines and a switching station).
2. The Conawapa project (1,485 MW hydroelectric generating station and new transmission lines).
3. North-South upgrades.
4. 750 MW interconnection.

MH also used the model to assess the impacts of other resource options including:

- A simple gas turbine project (construction, operation and maintenance);
- A combined gas turbine project (construction, operation and maintenance);
- A 230 KV transmission line (construction, operation and maintenance); and
- A switching station (construction).

Construction and operating costs were considered and resultant outputs (benefits) identified.

3.2.2 Interpreting the Results of the IOM Analysis between the PDP, the Simple Gas Turbine and Combined Gas Turbine

The Manitoba Bureau of Statistics IOM was used to compare the expected economic impacts associated with the PDP and other alternatives such as a Simple Gas Turbine and a Combined Gas Turbine project.

While the information used to calculate economic impacts was available at a detailed level for the PDP, the data used to calculate the economic impact of the gas turbine projects was only available in summary form. For example, construction costs for the simple gas turbine project were broken down into six categories: turbine, iron/steel structural materials, concrete, wages and salaries, electric or other engineering construction and other operating surplus. The expected construction cost was estimated at $157.8 million. Similar categories (turbine, electric power construction, concrete, wages and salaries, electric or other engineering construction and other operating surplus) were used in the economic impact analysis of the combined cycle gas turbine option, with an expected construction cost of $406.3 million. In contrast, the information that was used in the economic impacts associated with the PDP was provided at a much more detailed level. The input data used in the analysis of the KGP, expected to cost $2.2 billion, included expenditure data for 41 different input-output commodities, based on construction costs developed for the project (see Section 3.2.3.1).

Based on the data and results:

1. The gas turbine projects considered as alternatives are expected to represent a much smaller capital investment than the projects included in the PDP. As such, the expected economic impact associated with these projects is significantly lower than for the projects included in the PDP.
2. Since input-output models are linear, the results of impact analyses are scalable. If the simple gas turbine project (expected to cost $157.8 million) is scaled up to represent a level of capital investment similar to the KGP ($2.2 billion), the total expected employment impact (direct, indirect and induced, including Manitoba and Canada) would still be about half (10,750) the 21,144 jobs expected to be supported by the construction of KGP. In other words, even when the difference in the scale of the projects is taken into account, the expected impact of the construction of a hydroelectric dam would be significantly greater than the impact associated with spending the same amount of money building gas turbine facilities.
3. The analysis of the PDP is based on detailed costing estimates, while the analysis of the alternative options is based on high-level cost estimates. Therefore, the results of the economic impact analyses are not strictly comparable. The extent to which the conclusions would differ if more information about the options had been available is unknown.
4. For the gas turbine options, turbines imported into Canada represent more than a third of the total cost of the projects. Purchases of imported turbines do not provide a significant economic benefit to either Manitoba or Canada. In contrast, the imported generators used in the Keeyask and Conawapa projects is expected to account for a much smaller share (about 10%) of the total capital cost. In other words, the extent to which the project uses goods imported from other countries is significantly greater in the case of the gas turbine projects.

5. The PDP is expected to have greater economic impacts in Manitoba as well as Canada than the other options considered.

Observations:

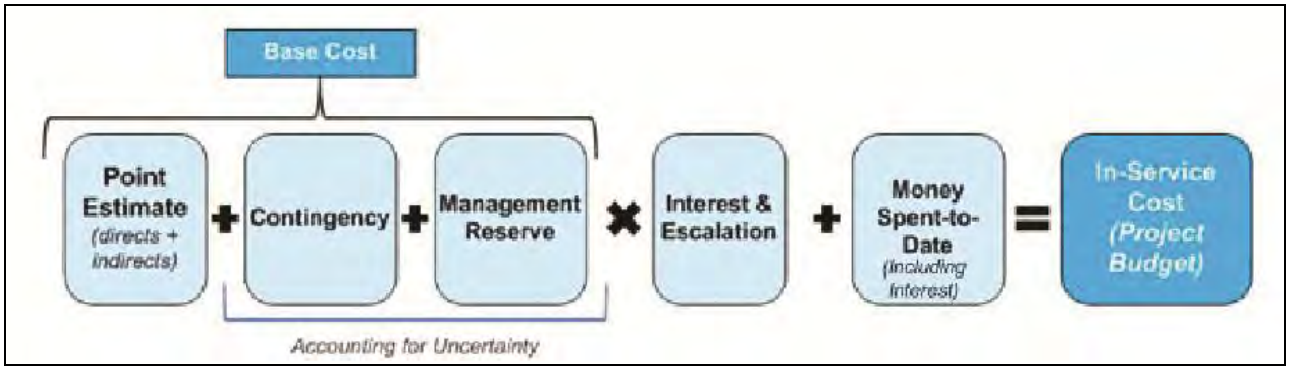
The Manitoba Bureau of Statistics IOM was used to compare the expected economic impacts associated with the PDP and other alternatives such as a Simple Gas Turbine and a Combined Gas Turbine project. While varying detail was provided regarding construction costs for the gas options, we note that the input-output models are linear and therefore scalable. The gas turbine projects are expected to create less economic benefits than that of the PDP. The PDP is expected to have a greater economic impact than the other options considered.

3.2.3 Interpreting the results of the IOM for the PDP

Modeling approaches can vary significantly, and results are dependent upon a number of assumptions and allocations made within IOM's (e.g., how construction inputs are allocated into the IO expenditure categories and the corresponding assumptions modelers utilize). This section comments on the reasonableness and assumptions that appear to have been made in preparing the estimated impacts of the PDP.[8] The following steps associated with preparing inputs into the IOM are commented upon in this review:

- Verification of construction cost estimates;
- Allocation of cost input data into IO categories;
- Removal of expenditures with no provincial economic benefit and other leakages and margins; and
- Treatment of Labour costs.

A brief discussion is outlined, followed by an analysis of what was undertaken as part of the PDP.



3.2.3.1 Verification of Construction Costs Estimates

The Keeyask and Conawapa capital cost estimates were developed based on the Association for Advancement of Cost Engineering International (AACEI) recommended practices for estimate development. The estimate development is a structured approach that builds estimates from the bottom up. Exhibit 5 illustrates the overall Manitoba Hydro Cost Development Process, inclusive of contingency and management reserve.[9]

[8] The comments provided in this review are limited, in that they are based on how the British Columbia IOM calculates economic impacts. It is not known if the Manitoba model uses the same process. However, it should be noted that input-output modeling methods are similar in nature and even though the application of modeling techniques may vary, the results of these exercises would normally be expected to fall within standard ranges.

[9] Needs for and Alternatives to Appendix 2.4 - Developing the Keeyask and Conawapa cost Estimates. Contingency and management reserves are excluded from the economic impact assessment model.

Exhibit 5: Manitoba Hydro's Cost Estimate Development Process

Source: Needs for and Alternatives to Appendix 2.4 - Developing Keeyask and Conawapa Cost Estimates

The first step in the process is the point estimate, representing a risk-free escalation based on initial set of assumptions and current costs within the marketplace. MH followed the AACEI recommended practice guideline 36R-08 to undertake this estimate.[10] Contractor indirect costs inclusive of mobilization supervising site facility costs; costs for major pieces of equipment (turbines generators and transformers etc.) are estimated from recent vendor quotations. In developing the point estimate information from other North American hydroelectric companies and market intelligence was utilized.

Keeyask

The last major re-estimate of the Keeyask project costs was undertaken in 2009/2010. The re-estimate involved detailed revision of estimate assumptions, incorporation of current market conditions and inclusion of additional lessons learned from Wuskwatim. The estimate can be considered to be between a Class 2 and Class 3 estimate, as (defined by AACEI), recommended practice 69R-12: Cost Estimate Classification system.[11]

Conawapa

The last major re-estimate of the Conawapa GS projects cost was undertaken in 2010/2011. The estimate was developed following the methodology outlined above and included incorporation of current market conditions and lessons learned from Wuskwatim and the 2009/2010 Keeyask re-estimate. This estimate can be considered a Class 3 estimate as defined by AACEI. Class 3 cost estimates are used for the purpose of budget authorization or control and based on semi detailed unit cost with assembly level line items. Class 2 cost estimates are used for bids and tenders, and include detailed unit cost with forced detailed take offs. Exhibit 6 illustrates the expected accuracy range of the various estimates derived from the AACEI methodology. The classes identified each represent a differing level of accuracy.

[10] The Point Estimate is based on the project definition report prepared by MH that provides a detailed and clear definition of project scope, compilation of all engineering design requirements, quantify definitions from current design and establishment of expected contract packages. Point estimates consist of both direct and indirect costs. Direct costs (costs directly attributable to the construction of the project) are identified, material cost databases, labour cost data bases and equipment cost data bases and productivity levels (human resources) are utilized as further inputs.

[11] The estimate is between these two classes because, despite a number of tender prices having been received, tender price for the General Civil contract (a major component of project expenditures) is still outstanding.

Exhibit 6: Cost Estimate Classification System

69R-12: Cost Estimate Classification System – As Applied in Engineering, Procurement, and Construction for the Hydropower Industry 3 of 14

January 25, 2013

COST ESTIMATE CLASSIFICATION MATRIX FOR THE HYDROPOWER INDUSTRY

	Primary Characteristic	*Secondary Characteristic*		
ESTIMATE CLASS	MATURITY LEVEL OF PROJECT DEFINITION DELIVERABLES Expressed as % of complete definition	END USAGE Typical purpose of estimate	METHODOLOGY Typical estimating method	EXPECTED ACCURACY RANGE Typical variation in low and high ranges [a]
Class 5	0% to 2%	Concept screening	Capacity factored, parametric models, judgment, or analogy	L: -20% to -50% H: +30% to +100%
Class 4	1% to 15%	Study or feasibility	Equipment factored or parametric models	L: -15% to -30% H: +20% to +50%
Class 3	10% to 40%	Budget authorization or control	Semi-detailed unit costs with assembly level line items	L: -10% to -20% H: +10% to +30%
Class 2	30% to 75%	Control or bid/tender	Detailed unit cost with forced detailed take-off	L: -5% to -15% H: +5% to +20%
Class 1	65% to 100%	Check estimate or bid/tender	Detailed unit cost with detailed take-off	L: -3% to -10% H: +3% to +15%

Notes: [a] The state of technology, availability of applicable reference cost data, and many other risks affect the range markedly. The +/- value represents typical percentage variation of actual costs from the cost estimate after application of contingency (typically at a 50% level of confidence) for given scope.

Table 1 – Cost Estimate Classification Matrix for the Hydropower Industry

Source: Manitoba Hydro Appendix 7.2 - Range of Resource Options: Appendix C AACE Cost Estimate Classification System

MH construction costs derived from this methodology were subsequently utilized to populate the commodity tables in the IOM.

Observations:

The construction costs defined by MH for the PDP are based on the Association for Advancement of Cost Engineering International (AACEI) practices and represent standard practice in industry. For the KGP they represent between a Class 2 and Class 3 estimate. The CGP is based on a Class 2 estimate. The construction cost estimates developed by MH for the purpose of economic impact are reasonable. The identification of operating and maintenance, and other costs related to both the Keeyask and Conawapa within the IOM fall within normal boundaries.

3.2.3.2 Allocation of cost input data into IO categories

The next step in impact modeling is to allocate project expenditures (above) to specific expenditure categories in the IOM. Proper categorization of expenditures to IO commodities can have a significant impact on the modeling results. The allocation of cost input data into the IO expenditure categories is dependent upon MH's and the modellers' understanding of how construction costs are allocated to the expenditure categories.

A review of the allocations indicates that a number of capital cost allocations may have been miscoded, and clarification from MH would be required.[12]

[12] Examples cited include (specific to Conawapa per dollar breakdowns as provided by MH): Sheet: CGOT – Construction, "Construction" coded to: "568 Gas & Oil facility construction" (given this is a dam, this does not appear to represent appropriate coding); "Anchors &

Observations:

The allocation of cost input data into IO categories by MH is based on their understanding of the expected cost breakdown. The allocation of cost data into the IOM categories, in a number of instances appears to be miscoded. MH should clarify.

The allocation of operating and maintenance, and other costs related to both the Keeyask and Conawapa within the IOM expenditure categories fall within normal boundaries.

3.2.3.3 Removal of expenditures with no Provincial benefits

Some types of construction expenditures do not result in a change to economic output as they are produced out of Province or in foreign countries, and are excluded from the analysis. These include goods that are purchased directly from suppliers outside of the province and the purchase of assets such as land and buildings.[13]

Based on the IOM expenditure categories those project expenditures that would not create an economic benefit were removed from the IOM. Turbines are such an example. In addition, based on MH experience with other recent projects other commodities were proportioned based on the percentage attributable to Manitoba and the rest of in Canada, essentially defining economic leakages from Manitoba.

The treatment of many purchases (identified in the IO expenditure categories) as leakages, as presented by MH, may result in understating the impact of the projects in Manitoba, while overstating the impact in Canada. This is due to the fact that margins embedded in the purchase cost of these goods and services may not have been attributed to Manitoba producers who may be providing services such as transport or wholesaling. Another example would be the treatment of cement, which is currently treated as a leakage from the economy. As of 1992 no cement plants operated in Manitoba, and cement is assumed to be 100% imported. If treated as a leakage, then the input-output model would fail to capture any margins or taxes associated with the use of the cement. For example, the cost of transporting the cement within Manitoba, mixing the cement in a batch plant (that would be required on site) represents provincial benefits that should be identified. Such benefits should be tracked through the model. It is not known how this has been accomplished in the model as presented.

The extent of such leakages may be explained, in part, by the fact that the majority of contracting opportunities (such as the General Civil Contractor) will be issued to out-of-province vendors. This review is limited as without a full understanding of either the Manitoba economy and how it functions, and an understanding of on-going contractual arrangements between MH and service providers, it is difficult to ascertain the extent of such leakages and how margins are treated.

To illustrate, from a theoretical perspective, standard economic multipliers produced by Statistics Canada, referencing their interprovincial input-output model (which takes into account the unique characteristics of each

---

Foundation" coded to "438 Lime"; "Alum. Phase Conductors" coded to: "431 Wire & cable, insulated, excl. aluminum"; "Steel Ground Conductors" coded to: "321 Food, beverage and other cans"; Potential inconsistency with "Insulators" coded to "441 Bricks & other clay building products".

[13] Goods that are purchased directly from a supplier outside the province. For example, there are no provincial economic impacts associated with the manufacture of a turbine overseas. However, if there are local services (or tax revenues) associated with such a purchase, they should be accounted for in the analysis, particularly if the purchase represents a significant percentage of total expenditures. For example, in the case of the turbine purchased from a foreign supplier, transportation and other services required to move, install and test the turbine could potentially be provided by local companies. There may also be associated tax revenue or other impacts that should be taken into consideration. If these represent significant expenditures, they should be explicitly accounted for in the analysis. In the case of transporting and installing turbines such might be the case but are not noted in the model. Purchases of existing assets such as land or buildings. Legal or real estate services associated with the transfer of the asset represent actual costs and should be included

provincial economy, and traces flows of goods and services across provincial borders), illustrates the number of jobs created by 1 million dollars of spending.

The following table shows the expected employment impact of electric power and other engineering construction projects in Manitoba, based on the Statistics Canada model and average industry expenditure patterns.

Table 3: Provincial Input Output Multipliers

Jobs per million dollars of output	Direct Employment Only	Direct, Indirect and Induced Employment by Area		
	Manitoba	Manitoba	Rest of Canada (ROC)	All Provinces
Provincial Input Output Multipliers , 2009 Statistics Canada				
Electric power engineering construction	5.5	8.3	2.7	11.0
Other engineering construction	6.3	9.6	3.9	13.5

Source: Statistics Canada; Interprovincial Model

The table shows that, for a typical "other engineering construction" project in Manitoba, there would be 9.6 direct, indirect and induced jobs for every $1 million spent on construction. The employment impact in the rest of Canada would be less than half that amount at 3.9 jobs.

These employment impacts are similar to those observed in other provinces, although provinces that have a larger manufacturing base rely less on imported goods and have fewer leakages, and therefore more of the jobs are in the province rather than in the rest of the country. In British Columbia, for example, the Statistics Canada data suggests that $1 million of engineering construction activity would generate an estimated 10.0 jobs in the province, and 2.2 jobs in other parts of Canada. Ontario, with its manufacturing base, would see 11.0 jobs in the province, with just 1.0 job generated in other parts of the country.

While it is true that Manitoba's economy is different and has a smaller manufacturing base, the expected leakages (based on industry averages) to the rest of the country from a major capital construction project may be less than those assumed in the MH analysis. While the allocation of expenditures for the MH projects may differ from the industry average based on MH experience, the reasons for these differences should be clearly explained as the results of this analysis fall outside the normal range.

Observations:

The treatment of many purchases as leakages and treatment of margins may tend to understate the impact of the project in Manitoba, while overstating the impact in the rest of Canada, since the margins embedded in the purchase cost of these goods and services may not have been attributed to Manitoba producers who would be providing services such as transportation or wholesaling.

Such extensive leakages to the rest of Canada may be reasonable and realistic if they accurately reflect MH's past experience and the Manitoba economy. The reasons for these differences should be clearly articulated in the reporting.

The allocation of operating and maintenance, and other benefits to both the Keeyask and Conawapa projects fall within normal boundaries.

3.2.3.4 Treatment of Labour Costs

It is assumed for both Keeyask and Conawapa that most of the Labour costs associated with construction of the generating station will be incurred outside the Province, which supports the observations provided in regard to the removal of expenditures with no provincial benefits (see Section 3.2.3.3). Labour costs should only include payments to workers directly employed on the project.

If it is expected that most of the people working on the project will come from outside of Manitoba, then the assumptions that most of the wages are paid outside the province is reasonable, and would help explain the higher than average impact on the rest of Canada. Regardless, if such is the case it should be explicitly stated.

Observations

If it is expected that most of the labour working on the project will come from outside Manitoba, then the assumptions that most of the wages are paid outside the province and wages being paid out of province is reasonable, and would partly explain the higher than average impact on the rest of Canada. A statement confirming that major contracts (i.e., such as the General Civil Contractor) will be issued to out-of-province companies should be clarified in the economic impact assessment.

3.2.4 Analysis of Results

In general, the results of the economic impact analysis appear to be consistent with the input data provided by Manitoba Hydro.

Table 4: Assessment of Manitoba Hydro's Approach to Economic Impact Assessment for the Preferred Development Plan

Steps Required for Input Output Modeling	Manitoba Hydro Approach	Observations	Implications On Model Results	Compliance to standard practice (Yes=☑ , No=N)
Step 1: Verification of construction cost estimates	The Keeyask and Conawapa capital cost estimates were developed based on the Association for Advancement of Cost Engineering International (AACEI) recommended practices for estimate development.	The Keeyask construction cost estimate can be considered to be between a Class 3 and Class 2 estimate, as (defined by AACE). The Conawapa cost estimate can be considered a Class 3 estimate as defined by AACE	The construction cost estimates provided to the Bureau of Statistics from Manitoba Hydro are detailed and accurate for purposes	☑
Step 2: Allocation of cost input data into IO commodity categories	Manitoba Hydro has allocated all cost inputs into commodity categories. In total over 40 commodity categories identified	MH has a comprehensive listing of commodity inputs that were generally appropriately allocated into the commodity expenditure categories within the IOM	The allocation of cost input data into the IO commodity categories was reasonable	☑
Step 3: Removal of expenditures with no Provincial benefit	Manitoba Hydro has removed all expenditures that are not produced in Canada and further proportioned Canada vs. Provincial expenditures	MH based on experience and knowledge of the provincial economy, has identified a number of expenditures representing leakages from the provincial economy	The treatment of many purchases as leakages may tend to understate the impact of the project in Manitoba, while overstating the impact in other provinces. the results might be in part from the fact that the margins embedded in the purchase cost of these goods and services may not have been attributed to Manitoba producers who may be providing services such as transportation or wholesaling	☑ The assumption here is that the extent of leakages is representative or the provincial economy. However construction of a major capital intensive hydroelectric project should by its nature contribute significantly to the provincial economy unless the majority of commodities are made and purchased out of province

Steps Required for Input Output Modeling	Manitoba Hydro Approach	Observations	Implications On Model Results	Compliance to standard practice (Yes=☑ , No=N)
Step 4: Treatment of Labour costs	It is assumed for both Keeyask and Conawapa that most of the Labour costs associated with construction of the generating station will be incurred outside of the Province, which supports the observations provided in regard to the removal of expenditures with no provincial benefits	If it is expected that most of the people working on the project will come from outside Manitoba, then the assumptions that most of the wages are paid outside of the province is reasonable, and would explain the higher than average impact on the rest of Canada	The current treatment of labour costs results in an potential overstatement of Canada wide benefits and an understatement of provincial benefits	☑ The assumption here is that the majority of labour originates out of Province. If that is the case results are reasonable

Source: BC Stats

Observations:

MH has provided detailed costs as inputs into the model; allocated cost input data to the IO expenditure categories based on their understanding of the expenditures involved; removed expenditures with no Provincial economic benefit and identified leakages from the provincial economy, the results of which are also reflected in the treatment of Labour. Manitoba Hydro has taken a reasonable approach to this review.

It is observed however, that the treatment of many purchases as leakages and the treatment of margins may tend to understate the impact of the PDP in Manitoba, while overstating the impact in the rest of Canada. The extent of the leakages can be explained by a number of factors such as the relatively small manufacturing base of Manitoba compared to the rest of Canada, and extensive experience of MH regarding recently constructed projects, that verifies that out-of-province service providers will be retained.

It is important to explain such assumptions regarding contracting opportunities, and if the majority of the contracts are to be secured by non-provincial firms, the results appear reasonable.

3.3 Canadian Benefits

In order to provide a theoretical comparison against which the impact estimates could be compared, the Canadian Interprovincial input-output model was used to assess the economic impact associated with expenditures on the goods and services expected to be purchased for the construction of the KGS. The Statistics Canada Interprovincial IOM is similar to the national model but consists of 12 regional economies (10 provincial and two territories) and has an interprovincial trade or regional commodity share matrix for each commodity.[14]

A generally accepted principle of input output modelling is that the "direct" benefits of any project are incurred in the jurisdiction in which the project is located. The approached used in the Statistics Canada Interprovincial Input-Output Economic Impact Simulation model (catalogue no. 15F0009XDB) focused on the expenditures (purchase of goods and services) and the location where these expenditures took place. This approach ensures that the results generated from the model show the entire direct impact in Manitoba. It should be noted however that when the expenditure approach is used with the Statistics Canada model, the model estimates where the goods and services purchased are supplied from.

The key difference in the MH IOM approach was that it considered the supply side, in which MH made decisions, based on local experience and knowledge, on where the goods and services originated from based on experience. Although such an approach is reasonable, one must be careful in how to interpret the direct and indirect impacts, as the production (supply) of goods and services might generate a direct impact in the jurisdiction where the production took place, but in reality, this production should be interpreted as indirect impact, because these goods and services were produced to satisfy the demand associated with the project.

Either approach is reasonable, however as noted earlier in this report, assumptions are critical regarding the results. The results of both the MH IOM and the Statistics Canada Interprovincial model are presented for comparison purposes. Refer to Appendix C for details.

[14] Canadian Journal of Regional Science XV111:2 Summer 1995): A Concise Description of Statistics Canada's Input Output Models: Erik Poole; Input Output Division Statistics Canada, and Department of Economics Simon Fraser University

Table 5: Comparison of Manitoba Hydro Results vs. Statistics Canada Closed Model Keeyask Generating Station

	Manitoba Hydro Results			Statistics Canada Closed Model		
IOM Results by Category	Manitoba	ROC	Total	Manitoba	ROC	Total
Employment						
Project direct (#)	2,014	2,463	4,477	12,792	0	12,792
Other direct (#)	1,887	2,644	4,531	4,345	3,826	8,171
Indirect and Induced (#)	3,089	9,047	12,136	8,360	7,023	15,383
Total employment (#)	6,990	14,153	21,144	21,152	7,023	28,175
Labour income	532,748	925,178	1,457,926	996,575	357,620	1,354,195
GDP ($ millions)*	706,393	1,285,069	1,991,462	1,456,863	703,309	2,160,172
Tax Revenues ($ millions)*	171,154	225,519	396,673	147,993	29,306	177,299
Provincial ($ millions)	34,745	59,340	94,085	107,375	18,090	125,465

Average Wage (calculated)($)	76,216	65,370	68,952	47,115	50,924	48,064
Total employment estimate using average wage assumed by MBS	6,990	14,153	21,144	13,076	5,471	19,640

* Statistics Canada tax revenues only include commodity taxes

ROC: Rest of Canada

Based on the information provided in table 5 the following comments are provided.

Overall, the Stats Canada model validates the total economic benefits derived by MH IOM results. There are however, important differences in the distributions between the benefits in Manitoba and the rest of Canada (ROC) between the two approaches used.

The Statistics Canada model estimated total employment to be about 28,175 jobs based on an average employment income of $48,064. The MH IOM model estimated total employment to be about 21,144 jobs based on an average employment income of $68,952. The average employment income generated from the Statistics Canada model is thought to be underestimated (and hence the number of jobs to overestimated) because the income estimate is based on the overall average employment income for the Electric power engineering construction industry as shown in the Input-Output Tables, whereas the average employment income generated by the MH IOM model is more reflective of the fact that the project takes place in a remote region of the province where one would expect the average employment income to be higher (thus generating a lower number of jobs). As such, it is assumed that the total number of jobs estimated by the MH IOM study is more accurate than the estimate generated by the Statistics Canada model.

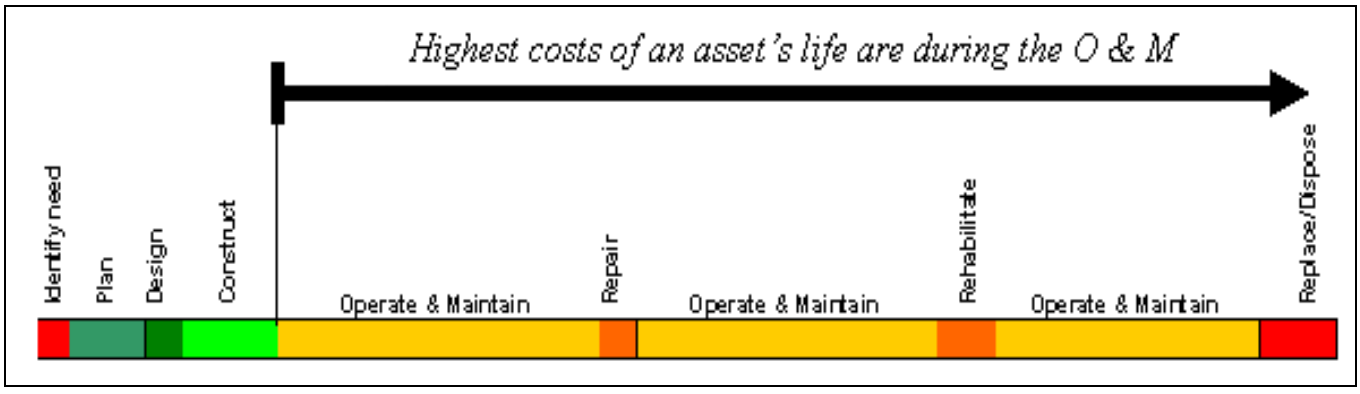
The Statistics Canada model estimated all the direct jobs as well as 75% of all jobs to be in Manitoba. The MH model estimated that 43% of direct jobs and 33% of all jobs to be in Manitoba. The MH distribution of jobs is not reasonable, given that all direct jobs should take place on Manitoba. As well, the overall percentage of jobs in Manitoba appears to be very low given the significant investment taking place in Manitoba. If one were to allocate all the direct jobs from the MH IOM study to Manitoba, the overall percentage of jobs in Manitoba would increase from 33% to 57%, which seems to be a more reasonable estimate.

The Statistics Canada and MH IOM models provide consistent estimates of GDP and labour income generated from this project, suggesting that these estimated values are reasonable. The two models, however, show very significant differences of these impacts in the province of Manitoba and the rest of Canada. The proportion of the

benefits estimated in the province of Manitoba by the MH IOM models appears low, for the same reasons explained in the allocation of jobs mentioned above. It would not be unreasonable to reallocate a portion of the GDP and labour income benefits from the rest of Canada to Manitoba to be consistent with the suggested reallocation of the employment.

The Statistics Canada model does not include estimates for income taxes and therefore no comparison is made.

Observations:



The Statistics Canada model suggests that the PDP will likely benefit the local economy more than was originally thought, while benefitting the rest of Canada less than was originally anticipated. These differences can be explained in part based on the approach taken by MH, which should be clearly articulated by MH as part of project assumptions. The results do not change the overall conclusions. The conclusion that the PDP provides greatest economic benefit is confirmed.

3.4 Determining Gross Provincial Financial Benefits by Examining Benefits over the Life of the Project

The determination of the gross provincial financial benefits is examined in this section by providing comment on the benefits of such assets over the life of the project. Provincial benefits of any major infrastructure project must consider all costs that would be incurred throughout the entire life of the project. Such costs include planning, design and construction as well as costs to operate and maintain, repair, rehabilitate and replace.

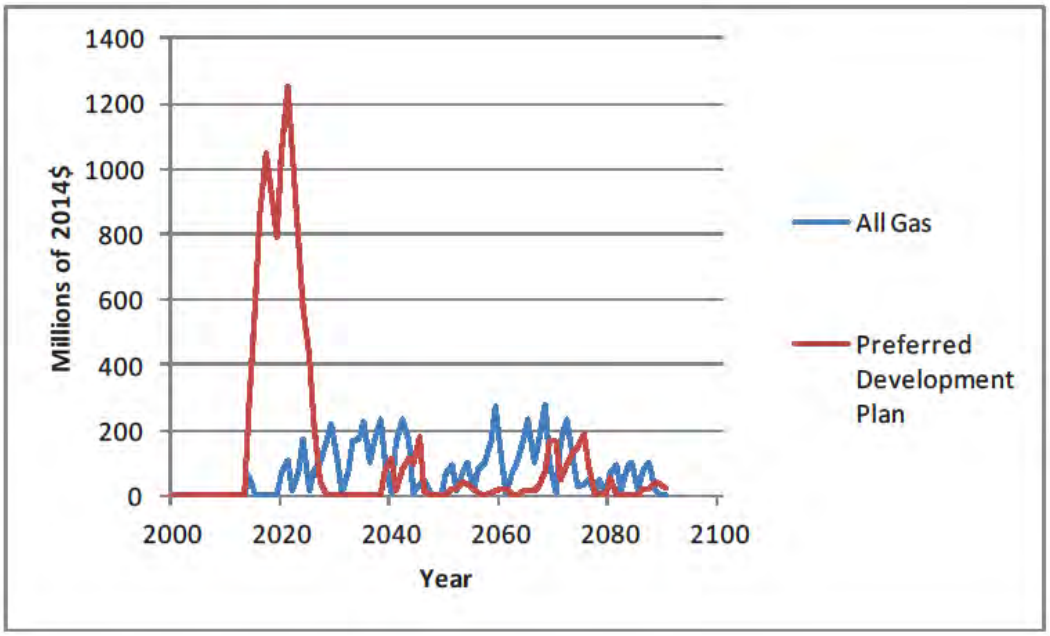
From a life cycle perspective significant costs are incurred throughout the operational and maintenance phases of a project. The following exhibit provides a representation of such costs. Different infrastructure projects have their own life cycle costs incurred throughout the entire life of the project. Hydroelectric facilities tend to have capital-intensive costs associated with planning, design and construction and extended economic lives, provided stringent maintenance repair and rehabilitation programs are followed.

Exhibit 7: Life of a Project: The range of planning, construction and operation and maintenance costs

Source: UMA Engineering

Appendix 9.3 Economic Evaluation Documentation considers the economic life of new generation resources used in economic evaluations.

Table 6: Economic Lives of New Generation Resources



New Generation Resource Options	Economic Life (years)
Hydro-Electric Generating Station	67
Wind Generating Stations	20
Simple Cycle Gas Turbines (SCGT)	30
Combined Cycle Gas turbine (CCGT)	30
Individual Turbines and generators for hydro-electric stations	25
Transmission Stations	35
Transmission Lines	50

Source Appendix 9.3 - Economic Evaluation Documentation, Table 1.1

The economic evaluations undertaken by MH for all alternative plans considered a total study life of 78-years. Total study life considers a 35 year detailed evaluation, and an extension to the end of the hydroelectric facilities service life. Beyond the 35 year study period, replacement capital costs are assumed for assets that reach the end of their economic lives, up to the 78 total study lives. This means that for those resource options with an economic life of 30 years (simple cycle gas turbines and combined cycle gas turbines) replacement costs would be considered.

Exhibit 8 shows the timing and value (in millions of 2014) of replacement capital costs of the PDP and the all gas plan over the total study life.

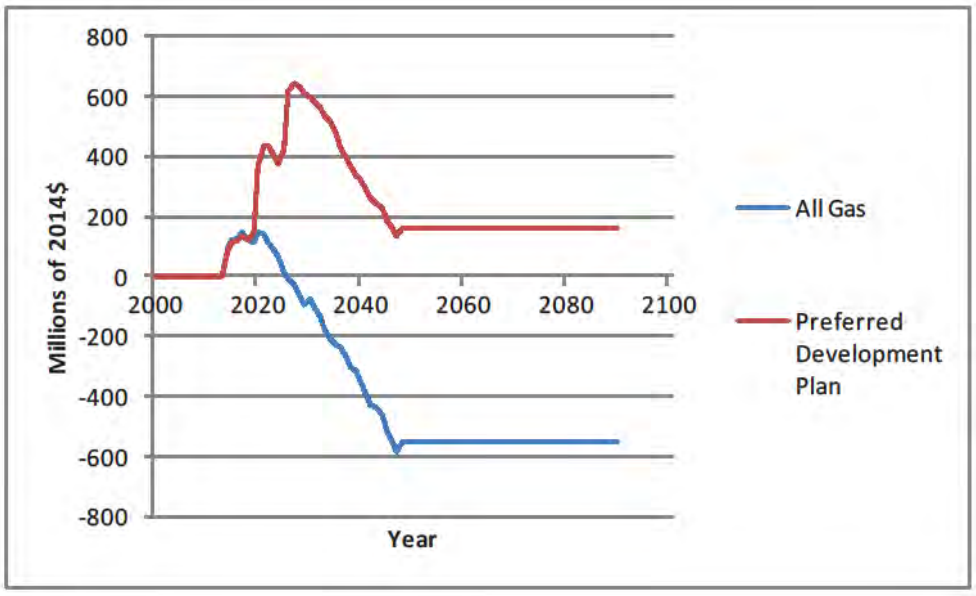


Exhibit 8: Timing and Value of Replacement Capital Costs: Total Capital

Source: Needs for and Alternatives to Appendix 9.3 - Economic Evaluation Documentation, Figure 1.1, Page 4

Exhibit 9 shows the timing and value of net production costs net revenues throughout the life of the total study life. The net average flow related revenue (production costs and revenues) are made of components using MH's System Simulation Computer Model (Splash). The exhibit highlights the benefits of the PDP over the study life.

Exhibit 9: Timing and Value of Net Production Costs: Net Revenue

Source: Needs for and Alternatives to Appendix 9.3 - Economic Evaluation Documentation, Figure 1.2, Page 4

While the benefits over the total study life of the project identify a preference for the PDP, the key consideration is the determination of the replacement timelines of the hydroelectric facilities past the total study life. The longer such a facility can be maintained the greater the extended societal benefits.

According to a research paper pertaining to the lifespan of a storage facility (hydroelectric facility) a dam can range from 80-150 years.[15] For example the average lifespan in years, for different components of a storage power station are presented below:

Table 7: Average lifespan in years of different parts of storage and run of river power stations (Frischnecht et al. 1996)

Parameter	Storage power station
Concrete	200
Reinforced steel	150
Steel (rest)	80
Cooper	150

Source: Life Cycle Inventories of Hydroelectric Power Generation ESU Fair Consulting in Sustainability (Karin Flury, Rolf Frischknecht).

The longer-term life (past the economic life) of hydroelectric facilities represents a consideration worth noting in this review. Referred to by MH as bequest value, is difficult to ascertain how long such facilities can be maintained and operated. Literature suggests over the longer term (past the economic life) hydroelectric facilities continue to contribute to the provincial economy.

[15] Life Cycle Inventories of Hydroelectric Power Generation ESU Fair Consulting in Sustainability (Karin Flury, Rolf Frischknecht)

Observations:

The economic lives of hydroelectric facilities are much greater than those of other resource options. Based on the timing and value of replacement costs and net production costs based on MH Splash modeling, the PDP creates the greatest value over the economic life of the asset. The longer-term life (past the economic life) of hydroelectric facilities represents a consideration worth noting in this review. Referred to by MH as bequest value, is difficult to ascertain how long such facilities can be maintained and operated. Literature suggests over the longer term (past the economic life) hydroelectric facilities continue to contribute to the provincial economy well past the economic life of the facility.

3.5 Northern and aboriginal community based impacts in terms of employment opportunities, incomes community tax base, skills development and community business opportunities

Northern and Aboriginal based community benefits represent a critical component of the PDP's rationale and a key corporate goal of MH. MH's ability to meet specific criteria/measures is examined. The criteria/measures utilized by large crown utilities approach to Aboriginal issues should include, in varying degrees of compliance, the following initiatives/practices:[16]

- Proactive (longer term) approach to engagement
- Establishment of benefit agreements
- Community ratification and support
- Provision of equity ownership opportunities
- Identifications of skill sets, training requirements, education and job opportunities
- Comprehensive education and training programs and supporting Federal and Provincial agency involvement in the delivery of programs
- Clear mandates and performance measures
- Pilot projects to assist in training
- Provision of administrative and management support
- Post project funding for other opportunities

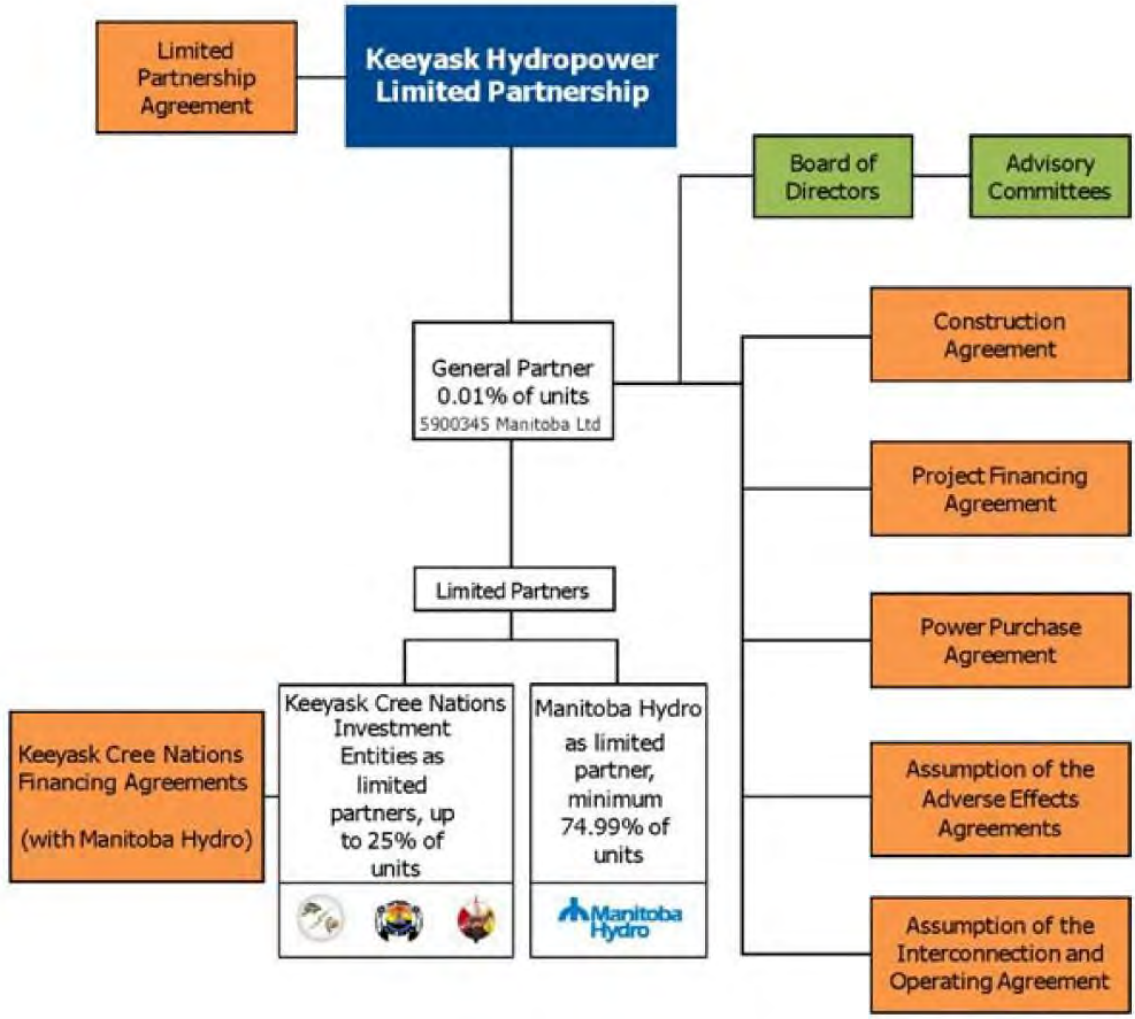
[16] Criteria/measures were also derived from the review of Quebec Hydro's approach to Eastmain and Rupert Diversion Project and Nalcor's Lower Churchill River Hydroelectric Project outlined in section 6 of this report, and further defined by TyPlan based on experience with First Nations involved in hydroelectric facility developments in British Columbia.

The historic development of MH hydroelectric facilities in northern Manitoba (the construction of the Limestone Generating Stations (LGS), Long Spruce (LSGS) and Kettle (KGS), provides insight into and context to, the establishment of the benefit agreements with First Nations that have been established for KGP. Historic agreements that have influenced MH approach to First Nations include:

- Northern Flood Agreement[17]
- Burntwood Nelson Agreement[18]
- Adverse Effects Agreements[19]

3.5.1 The Joint Keeyask Development Agreement

In June 2008, the Joint Keeyask Development Agreement (JKDA) was ratified by Tataskweyak Cree Nation, War Lake First Nation, Fox Lake Cree Nation, and York Factory First Nation. The Keeyask Cree Nations collectively have the right to own up to 25 percent of the partnership, with 75 percent remaining with Manitoba Hydro.



The JKDA lays out the terms of the partnership through which Manitoba Hydro and the four First Nations would become co-owners of and investors in the KGS. The JKDA sets out the rules for how the partners would invest and receive revenues. The JKDA also sets out provisions for training and employment business opportunities, the construction and operation of the project, and environmental monitoring. The business partnership created through the JKDA is the Keeyask Hydropower Limited Partnership (KHLP). The KHLP governance structure is illustrated below:

[17] Northern Flood Agreement Adverse effects to First Nations in the early 1970's by flooding arising from hydroelectric projects on the Nelson, Churchill Rivers and by the Lake Winnipeg Regulation Project were considered in the Northern Flood Agreement (NFA). To compensate First Nations for such adverse effects the Manitoba NFA and an accompanying Economic Development Agreement (EDA) was signed in 1977. Parties to the agreement included Canada, the Province of Manitoba, Manitoba Hydro and the Northern Flood Committee Inc. (NFC), an Aboriginal corporation acting on behalf of the five affected First Nations (Cross Lake First Nation, Nelson House - now Nisichawayasihk Cree Nation, Split Lake - now Tataskweyak Cree Nation, York Factory First Nation and Norway House Cree Nation).

[18] Established in 2005 the Burntwood Nelson Agreement (BNA) is a collective agreement between Hydro Projects Management Association (HPMA), representing contractors and the allied Hydro Workers of Manitoba, namely unions which sets out terms of employment for all workers including aboriginal peoples who work on northern construction projects. While many provisions exist in the BNA one important provision is the preference for, on all major northern hydro projects, will be offered to northern aboriginals who register with the job placement referral agency for the Keeyask project. The Job Referral Service is set up by the Provincial governments Entrepreneurship, Training and Trade (ETT) branch, and can be submitted at one of 17 of Employment Manitoba's 17 centers across the Province. A complete listing of jobs covered by the BNA is outlined on MH's web site.

[19] Individual adverse effects agreements with four first Nations have been signed. These agreements identify potential negative impacts of the Keeyask Project, and outline measures to prevent or reduce these effects. Where adverse effects cannot be avoided, offsetting measures are being pursued or compensation will be provided.

Exhibit 10: Keeyask Hydropower Limited Partnership Governance Structure

Source: Joint Keeyask Development Agreement Summary for members of York Factory First Nation

The general partner (Manitoba Hydro) is the entity that will have management and control over the Keeyask Project, awarding work contracts coordinating construction and ultimately operating the Keeyask Project. The general partner only owns 0.01% of the KHLP and is owned and controlled by Manitoba Hydro. Ownership is as follows:

- Manitoba Hydro 75% ownership;
- CNP 15% ownership;
- YFFN %% ownership; and
- FLCN 5% ownership.

The KCN's have the opportunity to negotiate up to $203.1 million of direct negotiated contracts (DNC) related to the Keeyask project.[20]

3.5.1.1 Keeyask Infrastructure Project

The Keeyask Infrastructure Project, which forms part of the JKDA commencing in early 2012, will consist of work on access road construction and camp development. This would enable a timely and efficient construction of the KGP based on the lessons learned from Wuskwatim (refer to Section 2).

The Keeyask Infrastructure Project is being undertaken to achieve the following objectives to:

- Provide early business opportunities for the Keeyask Cree Nations;
- Provide early and more employment opportunities for First Nation members, northern Aboriginal people and other northern and Manitoba workers;
- Provide more time for Cree Nation businesses to develop their management capabilities; and
- Accelerate investment to support the promotion of sustainable growth in the Province of Manitoba.

The Keeyask Infrastructure Project will provide an estimated 184 person years of employment over an estimate three-year period beginning the summer of 2011.

3.5.1.2 Training

The First Nations project partners are receiving pre-project training dollars through the Hydro Northern Training and Employment Initiative (HNTEI), established in 2004.Developed to support construction at Wuskwatim and Keeyask, Manitoba Hydro, Provincial and Federal Governments funded a $60 million dollar pre-training initiative.

During the period 2001 to 2010, the KCN's received $33.75 million of these funds to train their members.[21]

The results compiled by MH in the environmental impact statement suggested that[22]:

- 1402 trainees participated in 3272 training activities.
- 627 individuals completed project-related trades or occupational training.
- Of the 627, there are 13 carried journeypersons, 135 active apprentices and 97 pre-apprenticeship trainees.
- Aboriginal partners report 267 individuals employed in jobs related to training completed as well as other occupations.

3.5.1.3 Construction Jobs at Keeyask

A target of 630 person years of employment for members during construction has been identified within the JKDA.[23]

[20] Source: Joint Keeyask Development Agreement Summary for members of York Factory First Nation

[21] Needs for and alternatives to; Appendix 2.3 - Joint Keeyask Development Agreement - Benefits Summary

[22] Source Keeyask Environmental Impact Assessment Public consultation round 1 (http://www.hydro.mb.ca/projects/keeyask/panels_round_one.pdf)

[23] Needs for and alternatives to; Appendix 2.3 - Joint Keeyask Development Agreement - Benefits Summary

3.5.1.4 Monitoring

Under the JKDA two advisory committees have been negotiated designed specifically for the Keeyask project these include:

- Advisory Group on Employment (AGE)
- Construction Advisory Committee (CAC)

AGE has been negotiated under the BNA. Its aim is to increase the numbers of Keeyask Cree employed in the Keeyask Project. CAC was established o inform workers on issues and provide updates related to construction on Keeyask inclusive of upcoming contracts.

3.5.2 Manitoba Hydro's Ability to Support Northern and Aboriginal Community based Economic Development

MH's ability to satisfy meet the criteria/measures identified in Section 3.5 is summarized below.

Table 8: Northern and Aboriginal Community based Impacts

Criteria/measures	Manitoba Hydro Responses	Has Manitoba Hydro satisfied criteria/measure (Yes ☑ / No X)
Proactive approach to engagement	Aboriginal community engagement with Manitoba Hydro has been on-going for 40 years, from the Northern Flood Agreement, the Burntwood Agreement, Adverse Effects agreement and the Joint Keeyask Development Agreement (JKDA). The JKDA clearly defines the terms of the partnership through which Manitoba Hydro and the four first Nations would become co-owners of and investors in the Keeyask project. The JKDA sets out the rules for how the partners would invest and receive revenues. The JKDA also sets out provisions for training and employment business opportunities, the construction and operation of the project, and environmental monitoring.	☑
Establishment of benefit agreements	The JKDA as well as Adverse Effects Agreements have been signed with four First Nations affected by Keeyask Project. Each First Nation has signed the JKDA.	☑
Community ratification and support	Community ratification of the JDKA was achieved in 2009.	☑
Equity ownership	Equity ownership has been provided under the terms the JKDA.	☑
Identification of skill sets training, education and jobs	The JKDA sets out job opportunities. Targets for construction and operations are established.	☑
Comprehensive education and training programs with federal and provincial agency involvement	Jobs training and education has been coordinated with a variety of Federal and provincial agencies involved in the delivery of such programs. Hydro Northern Training and Employment Initiative (HNTEI) is one such example.	☑
Clear mandate and performance measures	JKDA sets out mandates and performance measures for the Keeyask Project.	☑
Pilot projects to assist in training workers	The Keeyask Infrastructure Project (KIP) represents such a pilot project enabling First Nations to gain employment, establish businesses related to various contracting and service opportunities.	☑
Provision of management and administrative services	Under the JKDA Manitoba Hydro is providing administrative and management support.	☑
Post project funding for other project opportunities	This represents a follow up activity related to overall approvals.	☑ (Monitoring of performance of the above should be emphasized).

Source: TyPlan

Observations:

The historic agreements between First Nations, MH, the Province and Federal government pertaining to past hydroelectric development projects has provided a context upon which MH has pursued and secured agreements with affected First Nations (e.g., JKDA). MH has been proactive at creating and securing relationships and legal agreements investing considerable time and effort in establishing such agreements. The identification of skill set requirements, job opportunities and the provision of training and education has been coordinated with other Federal and Provincial agencies to optimize opportunities. A pilot project in the form of Keeyask Infrastructure Project (KIP) enables First Nations to deliver on such benefits. The JKDA has clear mandates and performance measures related to jobs and training requirements. MH has also provided both administrative and management support to as part of the JKDA, to ensure project success. First Nations have also been provided ownership opportunities in the Keeyask Project.

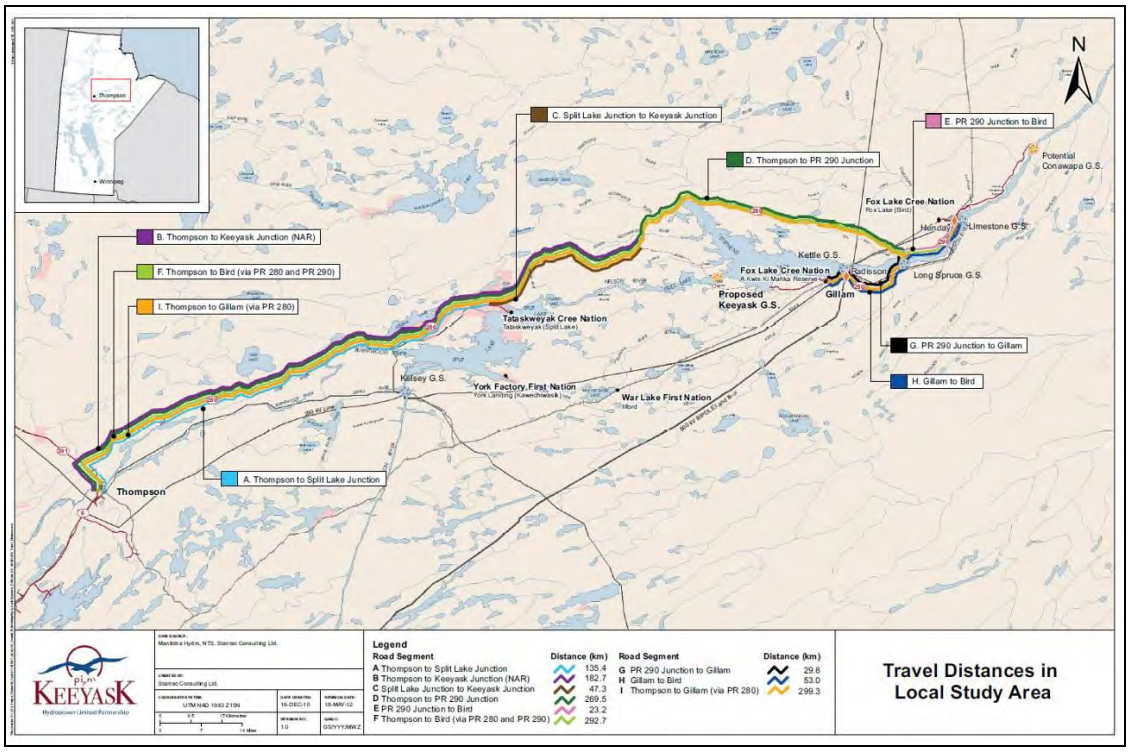
The above represent aspects of industry best practices that MH has not only met but exceeded. On-going and post project monitoring regarding the success of this approach should be undertaken to ensure lessons learned are incorporated into future projects.

3.6 Community Access Improvements Related to Health, Education and Culture

Community access improvements and their implications (environmental setting, effects assessment, mitigation, and residual effects) related to health, education and culture are discussed in the following sections of the Environmental Impact Statement (EIS) for the KGP:

- Socio-economic Environment Resource Use and Heritage Resources, Section 3: Economy.
- Socio-economic Environment Resource Use and Heritage Resources, Section 4: Population and Infrastructure.
- Socio-economic Environment Resource Use and Heritage Resources, Section 5: Personal Community and Family Life.

Each volume comments upon communities within the local study area (inclusive of Keeyask Cree Nations, Thompson and Gillian). The construction of the access road forming part of the KIP, designed as a two lane gravel road, will remain in perpetuity and establish improved access to Tataskweyak First Nation, the Keeyask Generating Station site and Gillam, as well as Fox Lake Cree Nation (immediately west of Gillam) and to York Factory First Nation, War Lake First Nation to the south of the Nelson River.



Correspondingly, improved access can create both positive and negative effects to aspects of health, education and culture. Education and training is discussed in Section 3.5.

3.6.1 Community Access

The main access route to the site would be via the North Road access road, which is being constructed under the KIP, in advance of the KGP. The north access road would be a two-lane all weather gravel road, meeting the Ministry of Infrastructure and Transportation (MIT) standards, starting at kilometer 174 on Provincial Road (PR) 280 approximately 185 km east-northeast from Thompson, and extending 25 km east to the north shore of Gull Rapids, the site of the KGP.

The potential effects of transportation infrastructure within the local study area would include increased use of rail, air, and road networks related to the transportation of people, equipment and materials to the Project site. No effect on transportation infrastructure is expected as a result of project construction. Post construction improved accessibility and reduced travel times to and from the local study area communities would result.

Exhibit 11: The Keeyask Infrastructure Project Access Road

Source: Socio-economic environment, Resource Use and Heritage Resources, Section 4, Figure 4.1

The proposed access improvements represent an overall benefit to the area communities providing a safer and more direct road transportation route to Gillian via Thompson and vice versa.

3.6.2 Community Health

The EIS Section 5: Personnel, Family and Community and Family Life, discusses MH approach to community health. The effects of which were discussed for both the construction and operation phases of the project in accordance with standard environmental assessment practices. The EIS provided an environmental setting (baseline); environmental effects assessment and mitigation; and summary of residual effects.

Specific to community health, the health of individuals, families and communities is shaped by a variety of factors or determinants of health, which include the social and economic environment, the physical environment and a person's individual characteristics and behaviors[24]. Community health in context to the environmental impact assessment prepared by MH goes beyond the absence of disease and considers a more holistic perspective. The EIS notes that from a Cree perspective, health has as much-to-do with social relations, land, and cultural as it does with individual physiology and disease. This is similar to the current day perspectives on population health research, with a focus on broad social and economic determinants, and the interaction with and impacts on health.

Community health issues directly associated with Project construction, as identified in the EIS, included water quality, community well being, and health services. Operational effects included mercury and human health, water quality, community well-being.

[24] World Health Organization (http://communityhealth.ku.edu/publications/publications.shtml)

The EIS provides a detailed and comprehensive assessment of the issues, potential effects and mitigation to address such issues. From a residual effects perspective increased demand for community health and social services was identified and mitigation inclusive of monitoring health and safety service levels; and the provision of health and safety services at the construction site were defined. MH has committed to working with other government agencies to manage this concern going forward.

Observations:

Manitoba Hydro has been proactive in identifying health issues based on the Cree perspective of community health and has identified appropriate mitigative measures, inclusive of on-going monitoring.

3.6.3 Cultural Benefits

Culture and spirituality according to Cree definition represents a composite of values, beliefs, perceptions, principles, traditions and worldviews that are based on individual and collective history experiences an interpretation. Cultural indicators include worldview, language, traditional knowledge, cultural practices, health and wellness, kinship, leisure, law and order and cultural products.

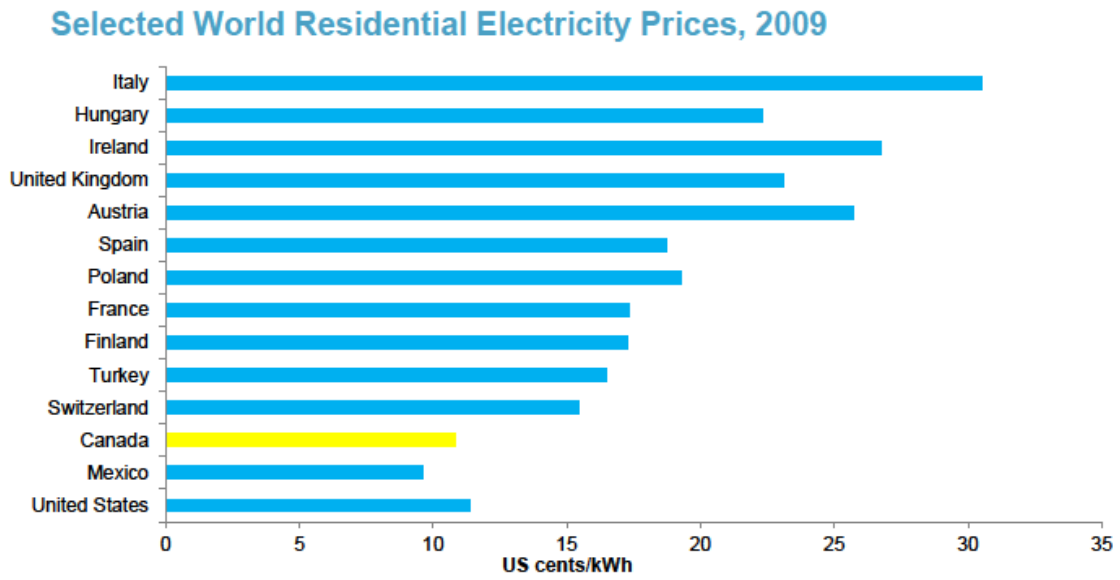
As part of the effects assessment reference is made to the JKDA, adverse effects agreements, employee retention and support services, highlighting the approach MH has taken to identify and understand Cree values and beliefs and engaging First Nations in the assessments.

The report considers the potential effects of in-migration to the communities, increased alcohol abuse, housing demand and potential pressures of local employees moving to work at the KGS. The creation of the construction camp in proximity to the KGS, at a distance from First Nation communities to the construction site, represents one mitigative measure to reduce potential interactions, as well as other mitigative measures that were identified limiting residual effects. Critical to the success of mitigation will be the on-going monitoring. Investment income generated as a result of the JKDA, equity partnership in the project also highlights MH attempts to address such issues (refer to Section 2 of this report).

It is further noted that the under the terms of the Burntwood Agreement, Adverse Effects Agreement and the JKDA proactive measures has be established to address concerns.

Observations:

Manitoba Hydro has been proactive in identifying cultural issues, appropriate mitigation and on-going monitoring.



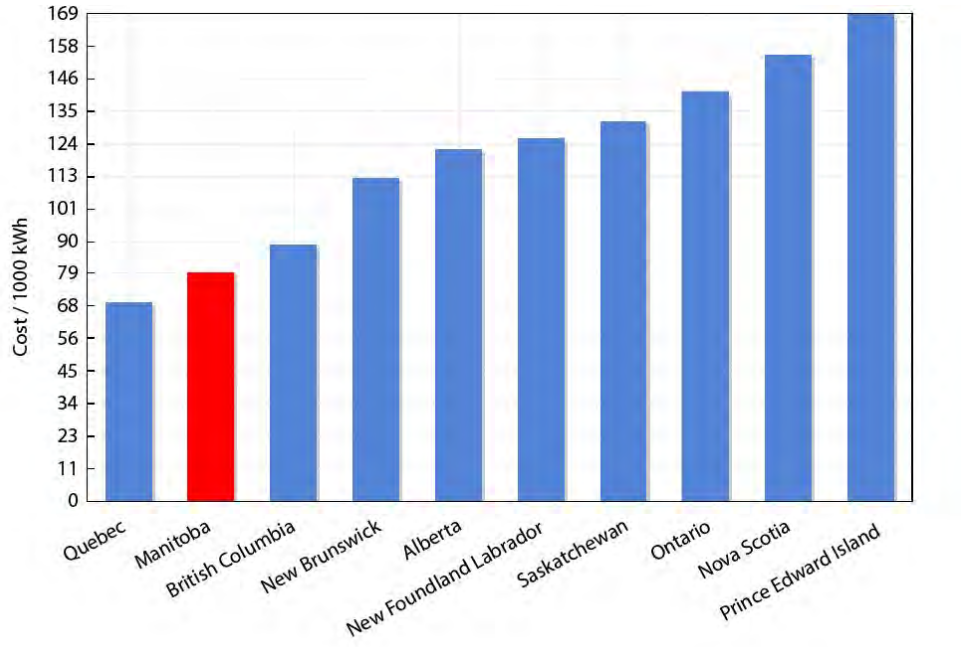
4 ECONOMIC DISPLACEMENT IMPACTS AND EFFECTS ON CONSUMER SPENDING

This section considers the economic displacement impacts and effects on consumer spending to the extent consumers will face increased electricity rates as a result of the PDP. Specifically, this section provides an overview of residential electricity prices in other countries relative to Canada, provincial utility rates relative to each other, and recent literature on proposed rate increases throughout Canada as context regarding current status and trends. The section concludes with a literature review of the effects of increasing utility prices (outlined in trends) on consumer spending, identifying those most affected (displaced) by such increases, and the key initiatives to reduce such effects, namely energy reduction and efficiency measures.

4.1 Review of Global, Canadian and Provincial Electricity Rates

4.1.1 World Electricity Rates

The Canadian Electrical Association (CEA) provides insight into Canadian electricity pricing. Based on selected world residential electricity prices in 2009, Canada benefits from some of the lowest rates, resultant from the historic capital investments associated with major hydroelectric projects in renewable energy. [25]



Source: Canadian Electricity Association: Electricity Pricing - An Introduction to Canadian Electricity Rates
Source for Canada: Hydro Québec, Comparison of Electricity prices in Major North American Cities 2009
Source for rest of the world: International Energy Agency Key World Energy Statistics 2009

[25] Canadian Electricity Association Power Point presentation: Energy Pricing An introduction to Canadian Electricity Rates

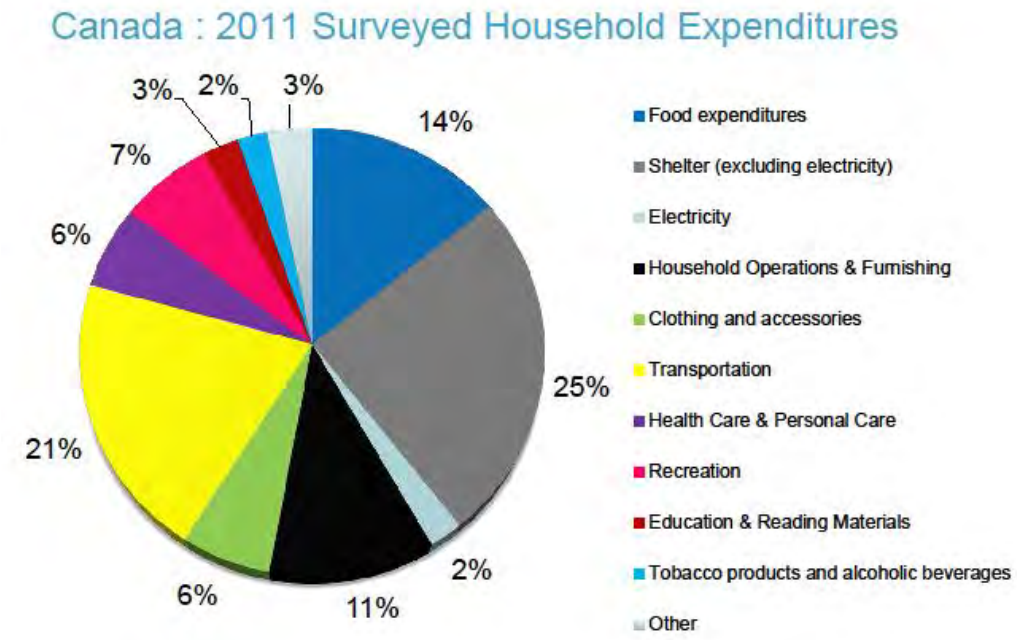
4.1.2 Provincial Utility Rates Overview

Correspondingly, provinces throughout Canada have low rates. The provinces associated with historic hydroelectric developments namely; Manitoba, Québec and British Columbia, exhibit the lowest rates. The chart below shows the average monthly electricity bill by province for 1,000 kWh of electricity consumption (which is typically about what most households use) as of May 1, 2013.

Exhibit 13: Domestic Electricity Rates across Canada based on 1,000 kWh Consumption per month as of May 2013

Source: Ontario Hydro http://www.ontario-hydro.com/index.php?page=electricity_rates_by_province

4.1.3 Current Rate Applications in Canada



Rates are overseen by each province's respective regulator authority (e.g., Provincial Energy Board or Public Utility Board), and in most provinces prices are set by the electricity regulator. Any changes in rates require the electric utility to submit applications and seek regulatory approvals. As a result, prices in these jurisdictions are adjusted periodically and are not immediately affected by market conditions. A number of the more common reasons for rate increase applications include:

- Replacement of aging infrastructure;
- Inflation;
- Higher cost of new contracted/constructed generation; and
- Upgrades and expansions to infrastructure.

The state of the economy also plays a part in electricity pricing as economic downturns can put downward pressure on pricing due to decreased demand. For example in Nova Scotia, in which reduced payments from the economically struggling pulp and paper industry (key industrial users whom generally consume significant energy) has recently been noted. In Manitoba, the net income fell on lower export revenues. As noted the economic deterioration reduced the need for power demand in the US and low natural gas prices contributed to lower US electricity rates, resulted in a decrease in the volume and price of Manitoba electricity.

The Canadian Broadcasting Corporation (CBC) undertook a study of provincial utilities' power-purchase agreements and financial statements that indicated that the average cost per kilowatt-hour countrywide will rise more than 50 % by 2020. The article indicated that BC Hydro has raised its rates 7.3 per cent last year and has announced it will seek an additional 30 per cent hike over the next three years. The Ontario government declared that the province's rates would rise 46 per cent by 2015.[26]

The potential effects of such proposed rate increases on households require an understanding of household spending expenditures. Based on 2011 Surveyed Household Expenditures, electricity accounts for 3% of total household expenditures.

Source: Statistics Canada, CANSIM 203-0021 Survey of household spending, retrieved April 10 2013

* total current consumption excluding income taxes, personnel insurance payments and pension contributions, gifts of money alimony and contributions to charity

Observations:

Canada has one of the lowest electricity rates in the world and Manitoba has one of the lowest utility costs in Canada. Literature suggests that such rates are resultant from the historical investment in major hydroelectric developments, notably those in Manitoba, Québec and British Columbia. Aging infrastructure, refurbishment, new construction, inflation and higher costs to produce electricity, are cited examples of increasing rate pressure. The majority of provincial electricity utilities throughout Canada are seeking rate increases. Continued upward pressure is expected on rates in both the short and medium term throughout Canada and the world.

[26] Electric shocker: Power prices set to rise sharply Zach Dubinsky, CBC News Posted: Mar 30, 2011 6:04 PM ET Last Updated: Mar 31, 2011 1:09 PM ET

4.2 Review of Increased Energy Costs on Consumers

A high level literature review was undertaken of selected documents pertaining to the impact of increased energy costs on consumers and their spending patterns. Much of the available literature in North America on-line focuses on the impact of rising gasoline or oil prices on consumer spending, rather than the impact of increased home energy (electricity) costs. Specific quantitative evidence regarding the effect of increasing household electricity bills is not evident; however the findings identify the socio-economic characteristics of those most affected households.

The impact of increased energy prices will vary significantly by household income, with high-income households being the least impacted and low-income households and those on fixed incomes such as low-income seniors, being the most impacted.

High-end retailers will be less impacted than low-end retailers as high-income households will still spend on discretionary items, as increased energy costs can be absorbed by households through higher disposable income and savings. Spending by middle income households may be decreased as a result of higher energy costs through less discretionary spending and substitution toward lower cost goods, particularly groceries, and curtailing the purchase of non-essential goods, dining out and entertainment. In case of studies on the impact of increased gasoline costs, it was estimated that a 25% increase in gas prices would cut the net cost of price paid by grocery item by 2-3% due to consumer substitution of usual grocery products toward promotional items.[27] Other retail categories most impacted for middle-income households are less essential goods such as sporting goods, clothing, and personal care items.

Spending by low income households will be the most impacted segment of consumer spending as their income is often inadequate to cover basic needs, which may result in the choice being made between spending on groceries, other essentials or heat.

The overall impact to the retail sector at a community level will depend on the income distribution in the community, energy costs, consumption, and needs (which will differ by climate), and programs available to offset the costs for low income households.

Aside from energy costs relative to income, other key variables in the level of impact are energy efficiency programs related to demand side management (e.g., Power Smart) as well as initiatives by households toward increasing energy efficiency of their homes and use of energy during off peak hours.

The table below provides a summary of the literature review, considering studies by major banks, US studies, Canadian energy poverty groups, and literature from jurisdictions with high-energy costs and an example from South Africa.

[27] CIBC Economics: Consumer Watch Canada' Sucking Energy Out of Households' April 2011 http://research.cibcwm.com/economic_public/download/cw-20110411.pdf

Table 9: Review of the Effects of Increased Energy Costs on Consumers

Report	Observations	Conclusions
CIBC Economics - Sucking Energy Out of Households'[28]	The conclusions of the report confirms that the impact will vary by income and are consistent with studies focusing on the impacts of rising home energy costs "Higher-income households are better able to absorb the increase in energy spending without much sacrifice to their non-energy spending." In other words, the extra cost is largely borne by their savings. But low and middle-income Canadian consumers are less likely to do so because energy represents a much larger share of their overall spending. For example, low income households spend more than twice as much of their income on energy as do high-income households. That suggests that high-end retailers will bode better in this environment compared to low-end retailers that service low to medium income households."	CIBC was contacted to determine if they had done any recent analysis on the impact of home energy prices (response was no, and "although power prices have risen in some jurisdictions, overall energy inflation has been much quieter of late".)
Scotiabank Group - Global Economic Research - report in 2011 "Energizing Household Energy Efficiency"[29]	The report notes that there is an on-going urgency to reduce household energy consumption because of the discernible upward trend in the price of energy. The report states: "Energy costs have, on average, outpaced the general rate of inflation since the 1980s, and increasingly so over the past decade. From the perspective of households, reducing energy consumption, or at least slowing its rise, could generate significant long-term cost savings. It would also reduce the sensitivity of household spending to future energy price shocks".	The report concludes that substantial progress has been made in improving household energy efficiency. However, more needs to be done, especially with energy usage and pricing on the upswing. Rising energy prices should help speed more efficiency gains in the future, generating long-term cost savings for households."
American Coalition for Clean Coal Energy report "Energy Cost Impacts on American Families, 2001-2012[30] [31]	The report noted that there is a disproportionate impact on low income households. "Lower-income families are more vulnerable to energy costs than higher-income families because energy represents a larger portion of their household budgets. Energy is consuming one-fifth or more of the household incomes of lower and middle-income families, reducing the amount of income that can be spent on food, housing, health care, and other necessities".	The report confirms that the key vulnerable segments are fixed income seniors and minorities due to their relatively low incomes
Canadian Energy Poverty Groups [36] Wellington and Guelph Task Force for Poverty Elimination[32]	Various academic and community groups have written about' energy poverty' – definitions vary by group but it is often defined as being when a household spends more than 10% of its after tax income on energy costs. In a recent report by the Wellington and Guelph Task Force for Poverty Elimination[33], several supporting studies are referenced. Key findings of the study are: "energy poverty affects about 1 million households in Canada, forcing many to choose between	The report concluded that Municipal, Provincial and Federal governments all have an integral role to play in eliminating energy poverty".

[31] American Coalition for Clean Coal Energy 'Energy Cost Impacts on American Families, 2001-2012, Feb. 2012 http://www.americaspower.org/sites/default/files/Energy_Cost_Impacts_2012_FINAL.pdf

Report	Observations	Conclusions
	heating their homes and buying groceries; energy poverty is expected to rise without intervention as the result of rising energy costs which are expected to increase 6.7 to 8 percent annually over the next five years; energy poverty directly and indirectly impacts resident's health and can result in disconnection and eviction leading to homelessness; energy poverty can be eradicated by increasing income, regulating energy pricing and improving energy efficiency of homes.	
Literature from Jurisdictions with High Energy Cost Increases	There are a lot of examples of reports and studies in jurisdictions hard hit by energy costs increases. Examples: Canadian Centre for Policy Alternatives: 'Energy Cost Politics and the Environment in Nova Scotia'; Ecology Action Centre Recommendations for Nova Scotia Energy Policy 'Energy Affordability vs. Rising Electricity Costs'; Environmental Law Centre, University of Victoria: 'Conserving the Planet without Hurting Low Income Households', etc.	
The Impact of Electricity Price Increase and Eskom's six-year Capital Investment Program on South African Economy[34]	Eskom is a South African electricity public utility established in 1923 as the Electricity Supply Commission (ESCOM) by the government of South Africa under the terms of the Electricity Act (1922). Eskom operates a number of notable power and nuclear stations. The company is divided into Generation, Transmission and Distribution divisions and together Eskom generates approximately 95% of electricity used in South Africa.[35] Generally speaking the report suggests that electricity price hikes have, by and large, a negative impact on the South African economy whereas extensive capital investment in hydroelectric developments leads to positive outcomes in both the short (employment) and long term from an economic development policy perspective. [36]	Eskom has put in place measures that will soften the burden on the poor, namely the Inclining Block Tariff (IBT).

[33] (www.gwpoverty.ca)

[34] Pan-African Investment and Research Services the Impact of Electricity Price Increase and Eskom's Six-Year Capital Investment Programme on the South African Economy (May 2011)

[35] Wikipedia http://en.wikipedia.org/wiki/Eskom

[36] In countries in which the energy sector remains an integral part of infrastructural development to support economic development (e.g. hydroelectric intensive industries like mining), sets the foundation for broad based sustainable long term economic growth and development.

It is apparent in South Africa's case that the current and future growth of the economy is also tied to sufficient and reliable energy availability and equitable access to it.

The report suggests a bi-directional causal relationship between GDP and energy production (GDP determines the level of energy produced and vice versa) and it is argued that the prosperity of the country is dependent on efficient and sustainable supply of and distributions energy. Simply stated, availability of energy is a pre-condition of growth. An increase in electricity pricing that is in general considered sudden and substantial increases (e.g., Manitoba Hydro's short term price increases) leads to disruptions for many businesses that had not anticipated sharp increases. Businesses that are at the margins of profitability cannot absorb substantial cost increases, be it electricity or otherwise. For such firms it is not the increase per se that matters, rather it is the quantum increases in the short term that leaves them with no degrees of freedom to absorb the production cost increases.

However increasing electricity rates based on capital investment does have distinct benefits, as increases establish the platform for sustainable and reliable power, helps set electricity prices at cost-reflective levels, creates economic stability over the longer term via sustainable use of resources and opens up other opportunities for alternative energy options.[36]

Observations:

The economic displacement effects of increasing rates identify that the lower income households, seniors with limited incomes will be most impacted, whereas the middle and upper class will adjust spending habits via savings or disposable income. The literature does not quantify the magnitude of potential effects, but confirms that federal, provincial and local programs (including utilities), designed to reduce the effects of increased energy prices on low-income households and the poor is the preferred solution. This solution is directed towards energy efficiency and reduction initiatives.

4.3 Energy Efficiency and Reduction Initiatives

The challenges of increasing energy costs are being faced by jurisdictions across Canada, the USA, Europe, and beyond. The focus of addressing this challenge is on initiatives to increase energy efficiency and reduce waste, which will have the effect of lowering the cost of energy for households, and on developing new methods to ensure energy affordability for those groups most impacted by rate increases. Both MH and British Columbia Hydro have a on-going programs designed to enable users to conserve and reduce energy demand. An overview of some of the strategic directions of other jurisdictions is provided in the table below.

Table 10: Literature Review of Energy Efficiency Programs and Reduction Initiatives

Province or Territory	Report / Program	Conclusions
Nova Scotia	Ecology Action Centre for Nova Scotia Energy Policy, as documented in the 2013 report 'Energy Affordability vs. Rising Electricity Prices'[37]	Key conclusion is that 'energy cost security will not be provided via lower prices, but by providing universal access to energy efficiency services and renewable energy generation opportunities… a new social bargain whereby government, citizens, and industry agree to respond to rising energy prices by developing new methods of ensuring energy affordability". "The best way to address energy security (i.e. affordability for low income households) is to implement a Universal Service Program that directly addresses energy cost security by making energy costs affordable to low income households. The target should be households whose total energy costs exceed 6% of income or whose electricity costs exceed 3% of income with an income cap." Recommendations pertaining to implementing an energy cost relief program for targeted low income households; developing a relief program to deal with arrears; fund crisis intervention assistance; and expansion of efficiency programs for low income households.
British Columbia	A report 'Conserving the Planet Without Hurting Low-Income Families: Options for Fair Energy-Efficiency Programs for Low-Income' by the University of Victoria. The report focuses on the importance of energy efficiency programs as a way to decrease energy costs[38]	Based on a review of various programs and related literature on low-income programs yields, the following best practices for low-income energy efficiency programs (LIEEPs) were identified in that paper for consideration in British Columbia: "A central energy-efficiency body should oversee, fund, and monitor household energy efficiency programs and low-income energy efficiency programs; LIEEPs should be comprehensive, addressing all savings opportunities, including household behaviours, and serving all fuel types; LIEEPs should also have mechanisms in place to provide basic health and safety upgrades where needed; all housing types, including rental and mixed-occupancy/mixed-use buildings, should be eligible for LIEEPs; LIEEP elements should be consistent with target populations, such as renters and minority groups; income criteria for participation in LIEEPs should be simple and consistent with other low income programs; and LIEEPs should be delivered by and in partnership with trusted non-profits and community organizations to improve outreach, participation, and delivery; develop partnerships with other governments and organizations to leverage funds and services, and where possible, pool resources and minimize delivery costs." Other recommendations are outlined in above noted report.
Ontario	The Low-Income Energy Assistance Program (LIEAP) was developed by the Ontario Energy Board (OEB) and has three	Households are eligible if they meet the Statistics Canada determination of low-income levels along with additional 15% thresholds.

[37] Ecology Action Centre Recommendations for Nova Scotia Energy Policy 'Solving Nova Scotia's Electricity Pricing Problem: Energy Affordability vs. Rising Electricity Prices, August 2013 http://www.ecologyaction.ca/energy_policy_reports,http://www.ecologyaction.ca/files/images/file/Energy/SolvingNSElectricityPricingProblem_LoRes.pdf

[38] Environmental Law Centre, University of Victoria, Conserving the Planet without Hurting Low-Income Families: Options for Fair Energy-Efficiency Programs for Low-Income Households, April 2010

Province or Territory	Report / Program	Conclusions
	components to assist low-income customers:[39] • emergency financial assistance fund; • targeted conservation programs; and • more flexible customer service rules.	These vary by community size to take into account the higher cost of living in large communities. For example, a 3-person household with a pre-tax family income of $28,651 in rural areas would qualify for the program. This increases to a pre-tax income of $41,622 in a community with a population of 500,000 or over. Information on the program is available at: http://www.hydroone.com
Manitoba	The practices of Manitoba are reviewed in a report to identify and quantify among the provincial programs that build on federal funding The report concludes Manitoba has been a leader through its collaborative, community-based LIEEPs. Successful pilot projects in Winnipeg and Brandon drew on provincial and federal funding, as well as support from Manitoba Hydro and non-profits". [40]	Manitoba Hydro has established a number of programs and loans geared towards reducing costs for qualified households inclusive of the home insulation program, refrigerator retirement program, water and energy saver program, Pays Financing, First Nations program, and the On-going residential loan and Affordable Energy Program. The affordable energy program is intended for homeowners and renters on limited incomes to save money via energy efficient upgrades. Programs are also available for commercial and industrial users.

[39] Ryerson University, Centre for Urban Energy: Roundtable Series 2012 – Electricity Prices: How Will Consumers Manage, June 2012: http://cue.ryerson.ca/publications/Roundtable_1_Electricity%20Prices.pdf

[40] http://www.hydro.mb.ca/savings_rebates_loans.shtml

Observations:

Energy efficiency and reduction initiatives have been identified and are supported by utilities throughout Canada, to reduce the burden on those socio-economic classes most affected by rates increases, low income households, citizens and elderly on fixed income. MH has established a number of programs and loans geared towards reducing costs for qualified households inclusive of the home insulation program, refrigerator retirement program, water and energy saver program, First Nations program, and the on-going residential loan and Affordable Energy Program. The affordable energy program is intended for homeowners and renters on limited incomes to save money via energy efficient upgrades.[41] *Programs are also available for commercial and industrial users.*

While such programs are prudent, continued effort and focus should be considered to ensure such programs, and related benefits are optimized in Manitoba in relation to the proposed rate increases outlined in the PDP, specifically referencing those most impacted, low income households and those on fixed incomes.

[41] http://www.hydro.mb.ca/savings_rebates_loans.shtml

5 SOCIO-ECONOMIC IMPACT OF KEY ALTERNATIVE SCENARIOS

This section evaluates the socio-economic impact of key alternative scenarios identified in Chapter 13 of the NFAT focusing on the reasonableness of the assumptions made (Section 5.2), and high-level comparison table between the PDP and alternatives (Section 5.3).

Manitoba Hydro undertook a Multiple Account Benefit Cost Analysis (MA-BCA) of Manitoba Hydro's PDP compared to a number of the alternative plans.

MA-BCA is different than Economic Impact Assessment (presented in Section 3).[42] Traditional cost-benefit analysis is a standard method economists use to assess the net benefits of alternative plans, projects or programs from a broad social perspective. Such analysis takes into account both the positive (advantages) and negative (disadvantages) of the alternatives, inclusive of social and environmental consequences[43]. The MA-BCA varies from traditional cost-benefit analysis, as it recognizes acknowledges non-monetized advantages/disadvantages to calculate the bottom line. A unique aspect of MA-BCA is that it also provides an assessment of the nature and distribution of those benefits and costs over time.[44]

Specific to MH's evaluation of the broader socio-economic benefits, the following accounts have been assessed:

- Market Valuation
- Manitoba Hydro Customer
- Manitoba Government
- Manitoba Economy
- Environment
- Social
- Risk

Each account, its purpose, the type of analysis undertaken, and indicators are provided below. It is noted that the environmental account is not included in this review as it is dealt with outside of this scope of work.

[42] Compared to economic impact analysis that focuses on gross impacts (benefits), the MA-BCA provides a **net** measure of the benefits inclusive of project expenditures. Economic impact analysis does not consider the opportunity cost of labour and capital in the project nor does it consider the revenue generated by the project.

[43] Multiple Account Cost Benefit Analysis: A Practical guide for the systematic Evaluation of Project and Policy alternatives, University of Toronto Press 2010 pp 3-15 Marvin Shaffer.

[44] As noted in Chapter 13 and referenced by Dr. Shaffer one of the first government agencies to adopt a multiple account approach to project assessment in North American was the U.S Water Resources Council, economic and Environmental Principles and Guidelines for Water and related Land resources Implementation Studies 1983.

Table 11: Multiple Account Benefit Cost Assessment Accounts

Account	Purpose	Analysis	Indicators
Market Valuation	Net benefit to Manitoba Hydro and project partners	Incremental revenues from surplus sales less incremental capital and O@M expenditures	Present value of net revenues or cost (market variation of investment)
Manitoba Customer	Consequences for customers (rate payers) in short to medium and long term and system reliability	Rate increases required to recover costs and meet MH financial targets System reliability	Average annual and cumulative rate increases over the planning period System reliability /Load carrying capability and cost of expected unnerved load
Manitoba Government	Net benefit to taxpayers	Incremental government net revenues	Present value of incremental revenues to government
Manitoba Economy	Consequences to the economy (net employment benefits)	Employment generated and incremental income earned	Present value of incremental income
Social	Consequences to aboriginal and non- aboriginal communities and Manitoba as a whole	Benefits to project partners Benefits/ Impacts on affected communities Benefits to the people of Manitoba	Nature and significance of partner benefits Nature and extent of residual community benefits /impacts Nature and benefits to Manitoba's (Potential bequest value of remaining assets)
Risk	Nature and significance of risk	Range of possible consequences Risk mitigation potential	Options to reduce risk

Source: Needs for and alternatives To Chapter 13 - Integrated comparisons of Development Plans - Multiple Account analysis, Table 13.1 Summary of Multiple Account Framework

Observations:

Multiple Account Benefit Cost Analysis focuses on the identification of net benefits from a broader social perspective. It enables comparisons of the distributional advantages and disadvantages of various plans over the stated life cycle of the plan. MA-BCA is a standard approach to evaluate policy options.

5.1 Evaluation of Alternative Development Plans

The MA-BCA assesses the preferred and three alternative resource development plans, two of which assume no US interconnection or firm export sales (one based on gas fired thermal generation and one specific to hydro development of Keeyask) (see Table 12 below). The concept of decision pathways are introduced here as they provide MH considerable flexibility in changing the development plan as new information becomes available. Pathways and their significance are discussed at the end of this section (See Section 5.3).

Table 12: Resource Development Plans Evaluated via the Multiple Account Cost Benefit Analysis

Resource Development Plan and objective	Description	Pathway (footnote 45)
Preferred Development Plan	Development of Keeyask and related transmission for 2019/2020; Conawapa and related transmission, and the North-South network upgrades for 2025/26, New 750 MW interconnections with US from 2020/2021 New export sales with Minnesota Power (250MW from 2020-2035) and Wisconsin Power (108 MW from 2014-2021, 100MW from 2021 to 2027, and 300MW from 2026-2036) Expansion of the Northern States Power Export sale (125MW from 2021-2025). Single cycle gas thermal units to be installed after 2041.	Commitment to develop Keeyask, the 750MW interconnection and new export sales. The pathway anticipates the development of Conawapa for 2025/26.The decision on that is not required at this time, and the precise in service date could be deferred if warranted by load growth or market conditions.
The Smaller Interconnection Plan (K19/Gas24/250MW)	Combines the development of hydro generation to meet growing domestic requirements with new export interconnection and export sales in the US (only 250 MW) Construction of Keeyask and related transmission for in-service date of 2019/20 Construction of new 250MW transmission interconnection with the US with an in service date of 2020/21 New export sale commitments of 250MW with Minnesota Power from 2020-2035, 100 MW with Wisconsin Power Service from 2021-2027, and 125MW with Northern States Power from 2021-2025	Commits to the development of Keeyask and a small interconnection. What transpires after the development of Keeyask could change. One variant would be the development of Conawapa instead of gas to accommodate domestic load.
Keeyask with No Interconnection (K22/Gas)	Construction of Keeyask and related transmission with an in service date of 2022/23 New export sale commitments of 100 MW with Wisconsin Power Service from 2023-2027 New SCGT starting 2029/30 and CCCTs starting 2034/35	Commits to the development of Keeyask and abandons the opportunity for and benefits of the current new interconnection opportunity. What happens after the construction of Keeyask can change such as the development of Conawapa instead of gas plants.
Gas Thermal with non-new interconnection (All Gas)	No new interconnection, any new firm export sales with the US and would only rely on gas - fired thermal generation to meet growing load Manitoba Hydro would developed SCCTs starting in 2022/23 and Act's starting 2031/32	Abandons the development of Keeyask for the foreseeable future and the current opportunity for and benefits of a new interconnections.

Source: Needs for and Alternatives to Chapter 14, Pages 17-20

[45] The concepts of pathways recognize that the long-term development plans may be modified in the future as new information becomes available. In this sense pathways defines what is set and what adjustments to the plan may be considered after initial decisions and commitments are made following the NFAT review.

5.2 Comparative Analysis

All of the accounts (except for the environmental account) identified in Table 12 are commented upon in terms of the reasonableness of the assumptions made.

5.2.1 Market Valuation

This account assesses the net benefit or cost of the preferred and alternative plans to Manitoba Hydro and its project partners. It quantifies the incremental revenues generated by the surplus electricity supply relative to the incremental capital and operating expenses incurred, based on a net present value, assuming a certain discount rate. The evaluation is based on the economic and financial appendices as provided by Manitoba Hydro in the NFAT submission.

The key assumption effecting results is the discount rate utilized. The discount rate is a critical parameter in cost benefit analysis especially when costs and benefits differ in distribution over time. This is especially important when they occur over a long period of time.

Two general approaches to discount rates are common, each providing a range of rates:[46]

- descriptive approach based on the opportunity cost of drawing funds from the private sector; and
- prescriptive approach that derives from ethical views about intergenerational equity.

As noted the net present value of any project with future costs and benefits crucially depends on the discount rate chosen especially when the costs are born in a different time frame than the benefits received. The size of the discount rate makes an even more significant difference when benefits occur in the distant future, such as many environmental policies/programs government initiate. Hydroelectric projects are one such example.

As part of the NFAT submission a detailed rationale for the selection of the discount rate is provided. A real rate of 6% has been used in the NFAT review that reflects the social cost of capital. The use of 6% is based on research on discounting in cost -benefit analysis outlined in supporting footnotes of the NFAT. Supporting references suggest that the social cost of capital can range from 5-7.3 % (as outlined in Chapter 13 Page 5 of 74), 6% is used as the mid-point between such variations. For comparative purposes the BC Hydro Site C clean energy project assumes a real discount rate from 5.5 to 6 per cent.[47]

The K19/G24/250MW appears to represent the best plan in this account.

Observations:

The discount rate utilized for the market evaluation account is the critical factor effecting results of this account review. The 6% real discount rate chosen for the PDP, based on a social cost of capital is reasonable.

5.2.2 Manitoba Hydro Customer

This account assesses the consequences of the alternative plans for Manitoba Hydro's customers relying on the financial analysis in Chapter 11 of the NFAT, that provides estimates of the rate increases in the short to medium

[46] Valuing the Future: the social discount rate in cost benefit analysis visiting Research Paper Australian government, Dr. Mark Harrison (April 2010)

[47] Site C Clean Energy Project Information sheet cost Estimate for Site C
http://www.bchydro.com/content/dam/BCHydro/customer-portal/documents/projects/site-c/cost-estimate-site-c.pdf

and long term that would be required to cover net system costs and meet 75:25 debt/equity ratio by the 20th year of the planning period. After year 20, the rates were adjusted each year to maintain an interest coverage ratio of 1:2.

This account also considers system reliability, defined as the ability to meet MH and industry standard reliability criteria.

Rate Impacts

Section 4 of this report provides a summary of Global, Canada wide and Provincial trends in electricity pricing and confirms continued upward pressure on rates. The rate impact undertaken under the Customer Account provides a discussion in short to medium term to longer-term impacts.

The results indicate the:[48]

- Projected cumulative rate increase by 2031/32 for the PDP would be 108% equating to a rate increase of 3.95% annually.
- Projected cumulative rate increase to the year 2031/32 for the all gas plan and small interconnection would be 90%, a 3.4% to 3.5% annual increase.
- Projected cumulative rate increase to the year 2031/32 for the Keeyask but no interconnection at 92 %, a 3.4% to 3.5 % annual increase.

The key difference between the plans is that higher rates would be needed in the short to medium term with the PDP as opposed to the long term to cover the 75:25 debt/equity ratios. After the debt ratio is achieved in year 20 there would be reduced inflationary pressure on costs. Conversely, lower rate increases would be required for the other options over the short term.

System Reliability

The different development plans are all designed to ensure MH has sufficient resources to be able to meet its peak and annual load, even under a wide range of forced outage and other contingencies. Manitoba's planning criteria for all alternatives provide for a very high degree of system reliability, and MH confirms there is a high probability of being able to meet system requirements under all contingencies.

Reliability assumes all plans are designed to meet Manitoba Hydro and industry standard reliability criteria. Loss of load expectation is the average number of days per year that the load could not be fully met. The common industry a standard is 0.1 days per year or an inability to meet system load one day every 10 years. Figure 13.2 of the NFAT review shows the estimated load carrying capability of the Manitoba Hydro system.[49]

Observations:

Manitoba currently has one of the lowest residential electricity rates in Canada. Pressure on rate increases is expected to continue throughout Canada and residential users should expect to pay for increasing rates. While the PDP has the greatest rate annual projected rate increases proposed in all plans evaluated, all plans will require rate increases (until year 20, the cumulative rate increases of all plans are not substantially different, with

[48] Chapter 13 - Integrated Comparison of Development Plans

[49] Appendix 13.1 - Reliability Evaluation confirms that Peak load carrying capability assessment shows there are some deficits in all alternatives to the Preferred Plan. In this case, the differences in the estimate of the loss of load probability and consequently load carrying capability are used to indicate the difference in the system reliability. This is measured by multiplying the expected unnerved energy by the cost of supply interruptions to calculate the differences in the expected costs of the bulk system failures. On average the Preferred Plan is able to carry approximately 10-15% more load than its alternatives.

the benefits incurring over the longer term as inflationary costs are reduced with the PDP). As the current PDP has greatest impacts on customers in the short term, one possible means of addressing this issue with rate payers would be to consider changing the 75:25 debt/equity ratio within 20 years. Rate impacts should not only be discussed, but also fully understood by Manitobans regardless of which plan is considered.

From system reliability perspective the PDP is preferred; however all of the development plans can handle load requirements under the majority of adverse conditions. The approach and assumptions are reasonable.

5.2.3 Manitoba Government

This account assesses the net benefit or cost (incremental net revenue) of the different plans to the Manitoba Government (ultimately the taxpayer). The key assumption under this account is to remove tax impacts that do not constitute incremental net revenues for government. The account identifies only direct incremental taxes and fees paid by Manitoba Hydro, net of incremental Government cost or risks. Issues pertaining to government cost or risk are dealt with under other aspects of the NFAT review.

The account provides a summary of the total payments made to government inclusive of capital tax, water rentals, debt guarantee fee, sinking fund administration fee, coal tax and potential carbon charges to derive total payments to the Manitoba government. Table 13.3 of Chapter 13 of the NFAT provides a summary of direct payments (which are substantial) for context, however such costs must be considered in relation to net benefits to government.

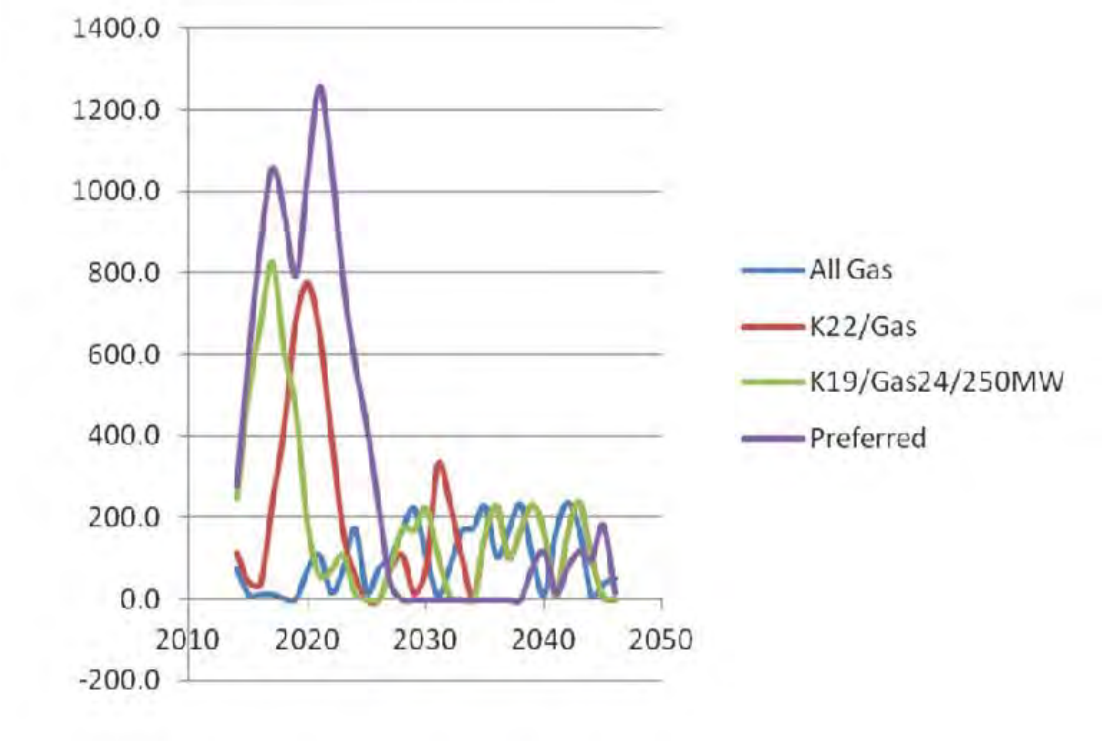
The key net benefits are the direct incremental taxes and fees paid by Manitoba Hydro net of incremental government costs or risks, essentially, water rentals and capital taxes, which are greater in the hydro, based plans.

This account also illustrates the net debt in context to the overall balance sheet. It is noted that debt is high with the PDP, in the early years due to construction; the debt is offset in later years due to overall higher fixed assets and retained earnings.

Observations:

The Manitoba Government account is specific to net benefits to government over the period of the Plan (78-years). PDP provides the greatest net benefit based on this accounts assumptions that are reasonable. The key generators of revenues to the Provincial Government are the capital taxes and water rentals.

5.2.4 Manitoba Economy



The Manitoba Economy account assesses the consequences of the different plans for the Manitoba economy and considers based on the NFAT reference scenario:

1. Annual capital expenditures with each plan over the alternatives life cycle.
2. Annual employment for project construction over the alternatives life cycle.
3. Annual employment for project operations and maintenance over the alternatives life cycle.
4. Comparison of gross wages for construction and operations and maintenance over the alternatives life cycle.
5. Comparison of the incremental income based on assumptions regarding the economic rent and jobs being filled based on regional employment differences.

The employment information utilized for this account was based on raw data provided by the construction and planning groups. The PDP is more capital and labour intensive than the alternative plans. It stands to reason that annual employment projected for construction would also be greater.

An important assumption made in the Manitoba Economy Account is that in well-functioning economies, the incremental income (defined as economic rent) is relatively small, as incentives are required to attract workers away from existing jobs (regions with relatively low unemployment), whereas in poorly performing economies (with high unemployment), in which new wages (jobs) are created and those unemployed can secure such jobs, the economic rent can be significant. As noted in the EIS (supported in Chapter 13) there is higher unemployment in northern Manitoba than in southern Manitoba. Consequently, the economic rent derived in northern Manitoba would be greater than that of southern Manitoba.[50]

The exhibit below depicts the total annual employment, directly required for the construction of all plans. The greatest amount of construction employment is generated by the PDP followed by the two plans, which include Keeyask. The gas plans generates the least amount of construction employment.

Source: Figure 13.5, Chapter 13, Multiple Account Analysis

[50] As noted in Chapter 13 Statistics Canada data indicated that at the 2001 unemployment rate for Keeyask Cree Nation was 40% and for the Northern Manitoba Aboriginal population (census divisions 19,2122, 23) was 28% compared to 6.1% to Manitoba as a whole.

The demand for Labour during operations is different. While all of the alternative plans generate increasing amount of annual O@M employment towards the end of the planning period, the three alternatives without Conawapa GS generate more annual employment than the preferred PDP, because of the need for more thermal plants to be constructed and maintained to meet growing load over the longer term.

Potential incremental income that employment (wages) offers for Manitobans is derived from assumptions made in regard the willingness to take jobs in the regions in which the alternative plans are located.[51] For the purpose of this account employment net benefits are measured by wages that are paid less the minimum amount of workers would have to be paid to take the jobs. This approach nets out the economic rent.[52]

Table 13.5 of Chapter 13 (Gross Wages for Construction and O&M) presents gross wages compared to the alternative plans. Again to derive the net benefits (which are measured not by the gross impact (Table 13.5) but by the incremental income) assumptions regarding northern and southern communities overall net benefit are identified:

- Construction: Northern communities the net benefit would 19.14%, southern communities 15% of the gross wages paid.
- Operations: Northern communities net benefit would be 30.75 % of the total gross wages paid, southern net benefits of wages paid would be 15%.

The results are presented In Table 13 below.

Table 13: Employment Net Benefits for Project Construction and O&M

	Preferred Development Plan	K19/G24/250MW	K22/Gas	All Gas
Construction Northern Manitoba	234.4	113.2	95.1	0.0
Construction Southern Manitoba	6.1	12.7	10.6	9.0
Total Construction	240.5	125.8	105.7	9.0
O&M Northern Manitoba	39.2	23.6	18.9	0.0
O&M Southern Manitoba	0.5	7.1	5.6	10.9
Total O& M	39.7	30.7	24.5	10.9
Gross Wages	280.20	156.5	130.3	19.8
Difference from the Preferred Development Plan	0	(123.7)	(150.0)	(260.3)

Source NFAT: Reference Scenario Assumptions (2014 Present Value in Millions).

[51] This account is different than the economic impact analysis that serves to estimate the direct, indirect and induced demand for labour generated by project expenditures. Economic impact measures gross effects not incremental employment or wages.

[52] Economic rent arises from conditions of exclusivity or scarcity. Economic rent can be used to demonstrate numerous pricing discrepancies in the real world. For example, a worker may be willing to work for $15 per hour, but because she belongs to a union, she receives $18 per hour for the same job. The difference of $3 is the worker's economic rent. As another example, the owner of a property in an exclusive shopping mall may be willing to rent it out for $10,000 per month, but a company that is keen to have a retail storefront in the mall may offer $12,000 as monthly rent for the property to secure it and forestall competition. The difference of $2,000, in this case, is the owner's economic rent.
(http://www.investopedia.com/terms/e/economicrent.asp) Essentially it is the difference between moving from one job to another for greater pay and the

Observations:

The Manitoba account is specific to the net employment and wages generated by the project in each plan, based on assumptions related to the net benefits based on location (southern vs. northern Manitoba). The approach and assumptions are reasonable.

5.2.5 Social

The social account addresses the consequences of the different plans for aboriginal and non- aboriginal communities as well as other social effects not addressed in the other accounts. Benefits to project partners, local and regional partners and Manitoban's as a whole are considered.

This account also considers the long-term sustainability attributes of the plans, namely the heritage/bequest value (or legacy value) of assets remaining at the end of the planning period (refer to Section 3.4). The bequest value is the acknowledgement that society is willing to pay or allocate resources today for the benefit of future generations.

Project Partners

The JKDA outlines the investment; employment and direct contract awarding that would benefit the four Cree Nations (refer to Section 3.5 of this report), inclusive of the current construction of the KIP project. As per the JKDA which guarantees that certain person years of construction employment be provided to the Partnership, as well as direct award contracts, such opportunities represent significant contributions to project partners and foster capacity building within these communities. Over the longer term (operations) there is a target under the JKDA of 182 KCN members in operating positions within Manitoba Hydro[53].

Equity ownership up to 25% is also provided to project partners that would generate significant returns, and while a similar approach has not been signed for Conawapa Generating Project (CGP) there is intent to do so.

MH has secured unique relationships with First Nations and northern communities that will generate significant socio-economic benefits, and satisfy MH corporate objectives related to economic development and fostering relationship with Aboriginal people.

Local and Regional Partners

Local and regional community impacts and mitigation are outlined in detail in the EIS Report:

- Socio-economic Environment Resource Use and Heritage Resources;
- Section 3: Economy;
- Section 4: Population Infrastructure and Services; and
- Section 5: Personnel Family and Community Life.

Overall the PDP generates significant employment benefits throughout the region both for First Nations and northern communities (the communities of Gilliam (MH company town) and to a lesser extent Thompson). While concerns regarding wage pressures, commercial trapping and drug and alcohol abuse are noted in the environmental impact statement as well as potential impacts on housing, the effects will be dealt with via on-going monitoring of the issues as commitments made in the EIS.

[53] Refer to Keeyask Hydro Power Limited Partnership EIS, Chapter 6

There will be significant benefits during the construction and to a lesser extent operations. MH has also made commitments in local communities. The improvements to the road access to the Keeyask will also represent a long-term benefit to northern Manitobans (refer to Section 3.6 of this report).

Manitobans as a Whole

The NFAT business case speaks to the perceived societal benefits of renewable energy vs. fossil fuels, and GHG gas emissions. One key noted benefit to Manitoban's is the bequest value (or legacy value) of the hydroelectric assets. The bequest value of the assets is defined as the benefits for future generations of Manitobans. Hydroelectric assets have long been recognized as having significant bequest value, and is suggested that this is evident in the low rates exhibited in provinces that have undertaken such investments, such as British Columbia, Québec and Manitoba (refer to section 4).

From an economic theory perspective the concept of the intergenerational consequences of investment and policy decisions remains an on-going point of contention. Lower discount rates utilized in the NFAT business case regarding the social cost of capital enhance the attractiveness of such investments compared to how the private market would discount the project. Economists suggest (as highlighted the NFAT Chapter 13, Pages 66 of 74), some government cost-benefit guidelines have in fact adopted declining real discount rates over time to give greater weight to intergenerational impacts.

Hydroelectric facilities do have a significant bequest value, which is a significant benefit to all Manitobans.

However, Appendix 9.3 - Economic Evaluation Documentation, Table 1.2, identifies sunk costs associated the Keeyask and Conawapa related to as stated in-service dates.

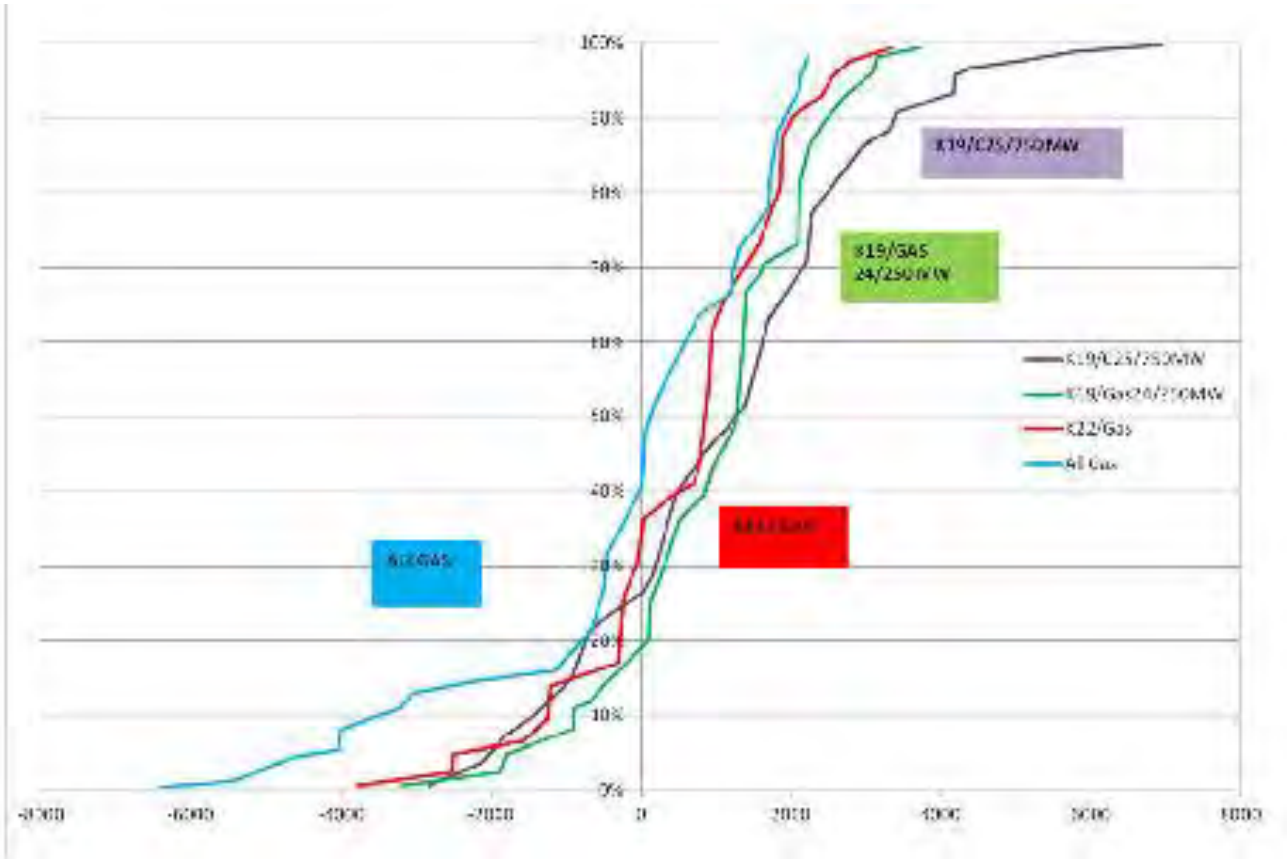
Table 14: Capital cost as Net of Sunk costs Used for Economic Evaluation Keeyask GS and Conawapa GS by In-service Date

	Keeyask 2019	Keeyask 2022	Conawapa 2025	Conawapa 2026	Conawapa 2029	Conawapa 2031
Base Cost	$4.3	$4.4	$6.0	$6.1	$6.2	$6.3
Sunk cost to June 2014	($1.0)	($1.0)	($0.3)	($0.3)	($0.3)	($0.3)
Evaluation Costs	$3.3	$3.4	$5.7	$5.8	$5.9	$6.0

Source: Appendix 9.3 - Economic Evaluation Documentation, Table 1.2

While bequest value is significant and not monetized in context to this review, one also has to consider the initial sunk costs that are not reflected in the evaluation.

Observations:



From a social perspective there are significant benefits to project partners, local and regional communities and Manitobans as a whole resultant from the PDP. The bequest value of such hydro facilities is also significant and is highlighted for the PUB board in its decision-making.

5.2.6 Risk and Uncertainty

How MH manages risk and uncertainty in relation to all alternatives is critical, and affects the results of this review. Longer-term assumptions past the 20-year forecast period are subject to considerable variation and ambiguity (load forecasts, construction costs, demand side management etc.).

Risk and uncertainty is addressed through the presentation "S"-curves illustrating the growth and variability of each alternative plan over time. Each reference plan (and the assumptions inherent in each) is presented as "S"-curve, illustrating the cumulative probability outcome values ($) over time, both positive and negative.[54]

Exhibit 16: Manitoba Hydro Net Revenue S-Curves

Source: Chapter 13 - Integrated Comparison of Development Plants - Multiple Account Analysis

Key aspects of risk and uncertainty are presented in context to the net present value variation associated with each plan. While a wide range of outcomes are presented, the PDP does offer the greatest upside potential, whereas the gas plans the most downside potential. The options with both hydro and gas small interconnection has less downside risk but not the upside of the PDP.

As Chapter 13 notes, what differentiates the plans is not the extent of downside risk but what is foregone by initial decisions to proceed, such as the revenues secured as part of export contracts.

Ultimately the ability of risk and uncertainty to be managed by each resource plan is dealt with and discussed in Chapter 14 - Conclusions. Chapter 14 presents a synthesis all of the technical information presented in the NFAT Business Case and introduces the concept of "pathways" in relation to critical time based decisions that enable

[54] An S curve is a type of curve that shows the growth of a variable in terms of another variable often expressed as unities of time (http://www.businessdictionary.com/definition/S-curve.html#ixzz2nZI1dTDD)

MH to verify the various components of the PDP, as presented, based on new information and changing market conditions. Chapter 14 is based on grouping the development plans into 5 pathways to assist the integration of results and assist in drawing conclusions on each commitment choice that must be made in 2014 and thereafter.

The pathways are established to enable MH modify the PDP based on continued input into those areas of uncertainty.

The ability to adapt to changing market conditions and change the ultimate plan represents a critical means of minimizing risk and uncertainty from a socio-economic perspective. The importance of which cannot be overstated.

Observations:

The Multiple Account Benefit Cost Approach (MA-BCA) was utilized to evaluate alternative plans identified by MH. The MA-BCA approach is a standard method in assessing the broader socio-economic benefits of an infrastructure investment, focused on the identification of net benefits. The MA-BCA consisted of the following accounts in the determination of the relative advantages and disadvantages and incremental benefits of each alternative plan: a market evaluation account, Manitoba Hydro customer account, Manitoba government account, Manitoba economy account, environment account, Social and Risk and uncertainty account. The assumptions utilized in the determination of MA-BCA results are reasonable.

The following table provides a summary of the MA-BCA as presented based on the reference scenarios. As noted the assumptions utilized in the analysis are commented upon above.

Table 15: Summary Comparison of Alternative Plans from a Socio-economic Perspective

Account	All Gas	K22/Gas	K19/G24/250MW	Preferred Development Plan
Market Valuation Account (1)	This option exhibits the highest net costs, significantly higher than the other options	This options net cost is $270.5 m higher than the PDP	This options net cost is the lowest	The PDP has 2nd lowest net costs. This plan entails much higher capital expenditures, which is offset by higher firm export sales and residual value of the assets
Manitoba Customer Account (2)	**Rate Impacts** The projected cumulative rate increase would be 90%, a 3.4 to 3.5% annual rate increase **System Reliability** This option has the least load carrying capacity	**Rate Impacts** The projected cumulative rate increase would be 92% a 3.4 to 3.5% annual rate increase **System Reliability** This option has the third greatest peak load carrying capacity. The interconnection and additional hydro resources contributes to reliability	**Rate Impacts** The projected cumulative rate increase would be 90% a 3.4 to 3.5% annual rate increase **System Reliability** This option has the second greatest load carrying capacity. The interconnection and additional hydro resources contributes to reliability	**Rate Impacts** The projected cumulative rate increase is 108%, a 3.95 % annually rate increase **System Reliability** The PDP has the greatest load carrying capability. The interconnection and additional hydro resources contributes to reliability
Manitoba Government (3)	The all gas plan generates the least net benefit to government	The K22/ Gas plan generates less than the PDP but more than the all gas plan due to capital taxes	The K19/ G24/250MW generates less than the PDP but more than the all gas plan due to capital taxes	The PDP generates the greatest net benefits to the Manitoba government, driven predominantly from water rentals and capital taxes
Manitoba Economy (4)	**Employment Net Benefits** The all gas plan generates the least net benefits during construction (9.0 m) **Operational Net Benefits** Total O@M benefits are $10.9m	**Employment Net Benefits** This plan generates $105.7m in construction net benefits **Operational Net Benefits** Total O@M benefits are $24.5m	**Employment Net Benefits** This plan generates $125.8m in construction net benefits **Operational Net Benefits** Total O@M benefits are $30.7m	**Employment Net Benefits** The PDP generates $240.5 m in construction net benefits **Operational Net Benefits** Total O@M benefits are $39.7

Account	All Gas	K22/Gas	K19/G24/250MW	Preferred Development Plan
Social Account (5)	**Project Partners** No plans to enhance local employment opportunities (no JKDA). **Local and Regional Partners** No plans to enhance local employment opportunities (no JKDA). **Manitoban's as a whole** Support in fossil fuel rather than a renewable energy solution - fossil fuels may not be supported socially. While jobs will be generated they will be located in areas that do not suffer high unemployment and therefore economic rent will be lower.	**Project Partners** Secures the benefits under the JKDA to project partners. **Local and Regional Partners** Significant employment benefits would occur throughout the region, inclusive of spin off benefits in Gillam and Thompson as a result of Keeyask construction. Potential adverse effects such as alcohol abuse and community conflicts with workers identified but appropriate mitigation identified in the EIS. **Manitoban's as a whole** Societal benefits of renewable energy solutions rather than fossil fuels and bequest value (the benefits of assets benefiting future generations).	**Project Partners** Secures the benefits under the JKDA to project partners. **Local and Regional Partners** Significant employment benefits would occur throughout the region, inclusive of spin off benefits in Gillam and Thompson as a result of Keeyask construction. Potential adverse effects such as alcohol abuse and community conflicts with workers identified but appropriate mitigation identified in the EIS. **Manitoban's as a whole** Societal benefits of renewable energy solutions rather than fossil fuels and bequest value (the benefits of assets benefiting future generations).	**Project Partners** The greatest benefit to Project partners is achieved under the PDP provided a similar agreement is established for Conawapa, which is envisioned **Local and Regional Partners** Significant employment benefits would occur throughout the region, inclusive of spin off benefits in Gillam and Thompson as a result of both Keeyask and Conawapa construction. Potential adverse effects such as alcohol abuse and community conflicts with workers identified but appropriate mitigation identified in the EIS. **Manitoban's as a whole** Societal benefits of renewable energy solutions rather than fossil fuels and bequest value (the benefits of assets benefiting future generations) are greatest in the options due to both Keeyask and Conawapa being constructed.
Uncertainty and Risk Account (6)	The downside (negative impacts) risk is greatest for the all gas plan, whereas the upside risk (positive impacts) is least for the all gas plan. The development of Pathways provides further opportunities to modify plans going forward.	The downside (negative impacts) risk are relatively even for the PDP and K19/Gas 24/250MW options, whereas the upside risk (positive impact) is greater than all gas but less than the PDP and the K19/Gas24/250MW. The development of Pathways provides further opportunities to modify plans going forward.	The downside (negative impacts) risk are relatively even with the K22/Gas and the PDP options whereas the upside risk (positive benefit) from partial export sales is greater than the all gas and K22/Gas options. The development of Pathways provides further opportunities to modify plans going forward.	The downside (negative impacts) risks are relatively even the K22/Gas and K19/Gas24/250mw options whereas the upside risk from export sales is the greatest. The development of Pathways provides further opportunities to modify plans going forward.

Notes

(1) Under the Market Valuation Account the discount rate represents the key factor affecting the outcome in this account. Projects with longer life cycles, such as hydroelectric projects, consider the social cost of capital in their economic evaluations , with the lower the discount rate the greater the net present value , the higher the discount rate the less the net present value .A discount of rate of 6% is utilized reflecting current literature and other utility benchmarks, as the social opportunity cost of capital. The present value are based on the estimated incremental capital and system operating expenditures and revenues over the 2014-2047 period.

(2) Under the Manitoba Customer Account the rate increases would be required to achieve a target 75:25 debt/equity ratio by year 20 (2031/32). The rates identified are expressed in nominal dollars that include the general rate of inflation. The real increase after adjusting for inflation would be approximately 1.9% per year less. Under the Manitoba

Customer Account the system reliability section confirms that all of the different plans are designed to ensure MH has sufficient resources to be able to meet its peak and annual load even under a wide range of forced outage and extreme weather conditions.

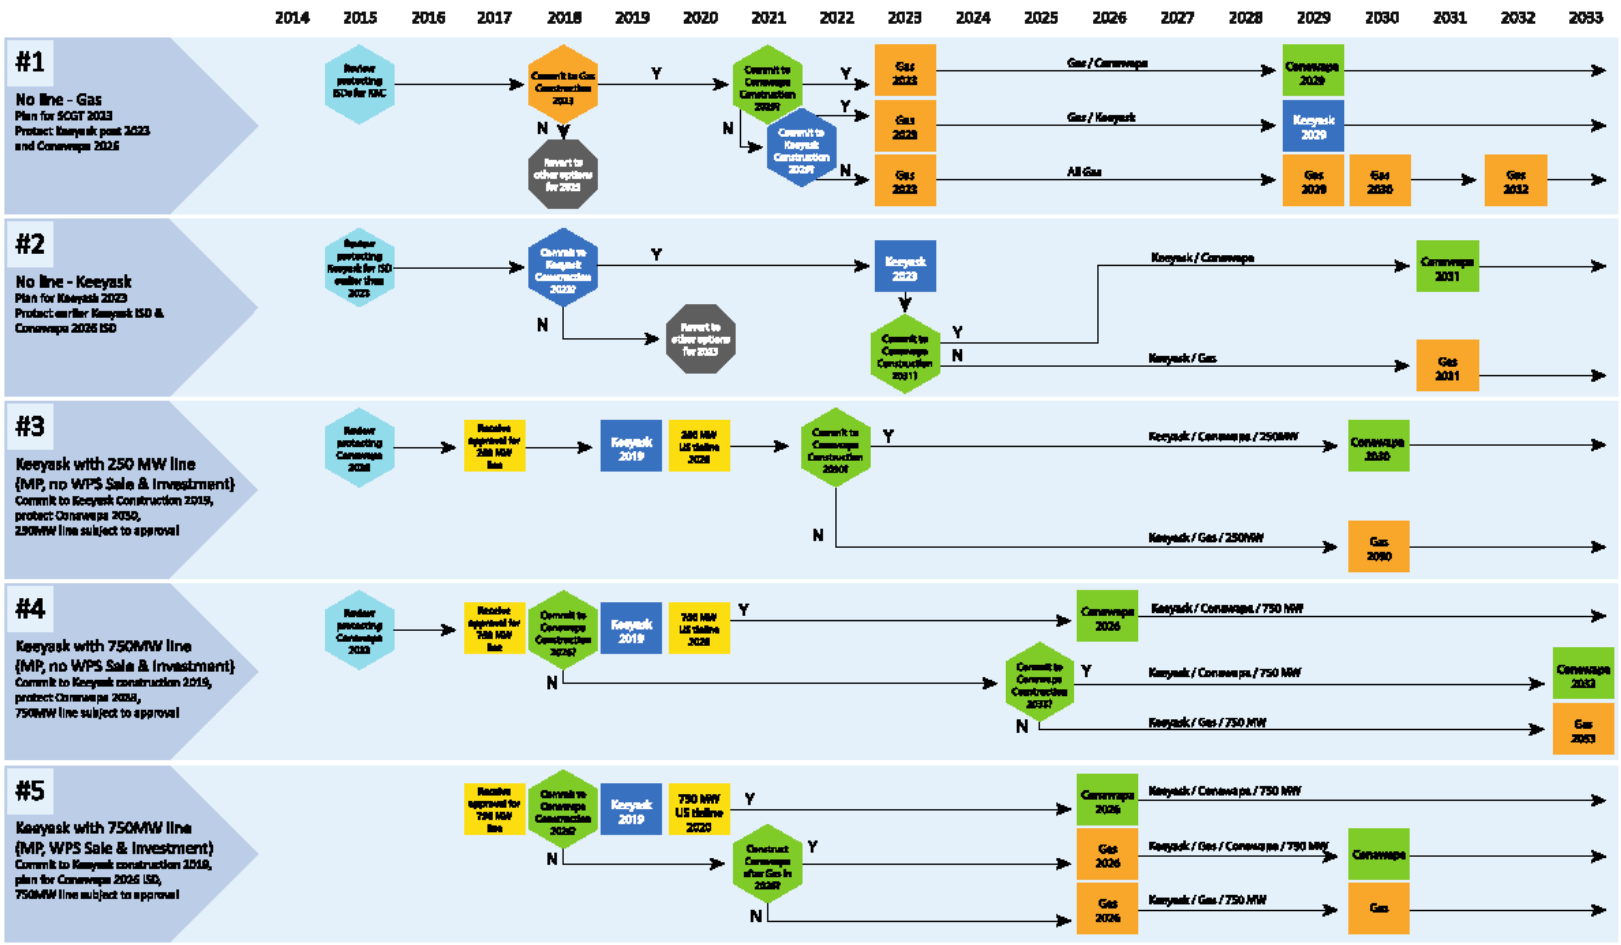
(3) Manitoba Government Account assesses the net benefit or cost of the different plans to the Manitoba government and analyses the incremental net revenues accruing to the government. Capital tax (a tax on a corporation's taxable capital, comprising capital stock, surpluses, indebtedness and reserves. Capital tax is applicable to capital owned by a company, not its spending. Capital taxes, in contrast to income taxes, are charged regardless of the profitability of the firm). Also known as "corporation capital tax", water rentals, debt guarantee fee, sinking fund administration fee, coal tax and potential carbon taxes are dealt with within this account.

(4) The Manitoba economy account is specific to the demand for Labour associated with construction and operations. The development plans that support the greatest potential for economic rent or net benefits associated with wages and salaries provides the greatest socio-economic benefit. The Manitoba economy account considers and incorporates the northern and southern employment /unemployment rates and a proportion of wages that would generate net benefits. Numbers are based on 2014 dollars.

(5) The social account provides a summary of the benefits to project partners local and regional partners and Manitobans' as a whole, which pertains to the use of renewable energy and bequest value of the reaming hydroelectric or gas assets upon completion of the assets life cycle.

(6) The uncertainty or risk account of the MA-CBA presents "S" curves illustrating the growth and variability of each alternative plan over time. Each reference plan (and the assumptions inherent in each) is presented as "S" curve, illustrating the cumulative probability outcome values ($) over time, both positive and negative. From a socio-economic perspective key aspects of risk and uncertainty are presented in context to the net present value variation associated with each plan, and whether to residents of Manitoba will be responsible for such risks.

5.3 The Significance of Pathways



Pathways are established to address future uncertainties inherent in the NFAT submission related to the plans for new generation. Load growth forecasts, on-going plans, new export contracts, natural gas price forecasts, export price forecasts capital cost estimates, retirement of existing gas generation and other parameters all impact on the recommendation associated with the PDP. Over time although such forecasts remain uncertain, the passage of time will provide additional information learning's available to reduce such uncertainty.

Accordingly, the ability of MH to adapt to changing conditions enables the province of Manitoba MH to make more informed decisions. The decision pathways enable MH the flexibility to modify the PDP. For example, the PDP can be supported currently although a decision specific to the construction of Conawapa does not have to be made until 2018.

Long term flexibility to respond to events or changing market conditions as they unfold is fundamental to managing risks and dealing with such fundamental uncertainties. Five pathways have been identified and are depicted below.

Thus, if circumstances warrant the selected development plan will and can be modified over time. The specific components in the preferred and alternative plans assessed in the MA-BCA are shown below.

Exhibit 17: Project Pathways for the preferred and Alternative Development Plans

Observations:

MH has considered potential pathways to limit the longer-term risk and uncertainty within the PDP. The decision pathways enable MH the flexibility to modify the PDP to address those longer term risk factors such as load growth, on-going (DSM), new export contracts (and prices), natural gas price changes, capital costs etc. From a socio-economic perspective the ability to adapt policy to evolving and ever changing social and market conditions is crucial. The most critical decision point within the pathways if the PDP is pursued (i.e., construction of Keeyask) is a decision specific to the construction of Conawapa, which does not have to be made until 2018. In the in-term if the PDP is pursued the above risk factors should be studied in relation to the Conawapa decision, and reported back to the PUB. The government of Manitoba should provide the PUB legislative authority to review such plans as such risks are addressed.

6 HIGH LEVEL REVIEW OF APPROACHES TO OPTIMIZING PROVINCIAL ECONOMIC BENEFITS OF LARGE SCALE RESOURCE PROJECTS

This section provides a high-level analysis of how other Canadian jurisdictions maximize provincial economic benefits from the development of large-scale resource projects and assesses if the PDP provides the highest level of socio-economic benefits to Manitobans.

6.1 Benchmark Review of Manitoba Hydro, Québec Hydro and Nalcor Energy

This section compares NALCOR's (Newfoundland and Labrador Hydro) Lower Churchill Project and Québec Hydro's Eastmain and Rupert Diversion Project with that of MH PDP. As both hydroelectric projects are sited in northern boreal forests and sparsely populated areas, they have similar geographical characteristics as with PDP. The power produced is intended to support future load requirements as well as export markets (provincial revenues), and the projects are sited on rivers that have historically been developed for hydroelectric power, the selection of such provides a defensible benchmark.

This high level review is based on available published information of the utilities website, inclusive of environmental impact statements and joint panel review hearing reports.

6.2 Manitoba Hydro: the Preferred Development Plan

Sections 1 and 3 of this report provide insight into the initiatives taken by Manitoba Hydro regarding optimization of provincial benefits via a review of the economic impact assessment results, and benefits to First Nations.

6.3 Nalcor Energy

6.3.1 The Lower Churchill Hydroelectric Project: Muskrat Falls and Gull Island Newfoundland and Labrador

The Muskrat Falls and Gull Island Hydroelectric Project have a combined capacity of more than 3,000 megawatts and are located on the lower Churchill River in Labrador. The Lower Churchill Project will be developed in two phases first, Muskrat Falls (824 megawatts) and then Gull Island (2,250 megawatts).[55]

6.3.1.1 Muskrat Falls

Phase one of the Lower Churchill Project is referred to as the Muskrat Falls Project. The project includes an 824-megawatt hydroelectric generating facility at Muskrat Falls, the Labrador-Island Link that will transmit power from Muskrat Falls to Soldiers Pond on the Avalon Peninsula, and the Maritime Link connecting Newfoundland and Nova Scotia. The Muskrat Falls project was sanctioned by the Government of Newfoundland and Labrador in December 2012, and construction is expected to take five years to complete.

[55] As noted in this review the MH Plan includes the 695MW Keeyask project followed by the 1485 MW Conawapa Hydroelectric project

6.3.1.2 Gull Island

Phase two of the Lower Churchill Project will consist of the development of the 2,250 MW Gull Island generation facility and associated transmission to markets. The proposed development of Gull Island would follow no earlier than three years after the sanction of Muskrat Falls, similar to what is proposed for Conawapa.

6.3.2 Determination of Economic Benefits

Provincial input output modeling was utilized in the determination of Canada wide and provincial benefits.

6.3.2.1 Canadian Wide Benefits

Canadian, Provincial and Regional (site specific) benefits are outlined on the Provincial website. It is noted that the development of Muskrat Falls and the transmission link to Nova Scotia is a national project (interprovincial interests), as reflected by the estimated Canada-wide benefits realized during construction and operations.[56]

6.3.2.2 Provincial Benefits: Newfoundland and Labrador

Newfoundland and Labrador Provincial Benefits will be optimized as per the Province's Benefits Strategy for the Lower Churchill Construction Project with Nalcor, which ensures opportunities for the people of the province. Total direct, indirect and induced employment in the province is estimated to be 18,400 person years. Peak direct employment in Newfoundland and Labrador will be approximately 2,700 people in 2013. After construction is complete, Newfoundland and Labrador employment will continue with an estimated 120 direct full-time jobs.[57]

6.3.2.3 Regional (Labrador)

The Provincial Government's regionally based benefits strategy for the project was developed to provide consideration to Labrador's Innu Nation and qualified residents of Labrador before those from other parts of the province. Studies suggest more than 7,500 person-years of direct, indirect and induced employment will take place in Labrador – an average of 1,150 people per year – throughout the development of Muskrat Falls. More than 75 percent of the direct Labour for the Muskrat Falls Generation Facility will be undertaken in Labrador. Approximately $450 million in income to business and labour will be earned by Labradoreans' and Labrador-based businesses.

Nalcor, to facilitate regional (local) benefits has committed to competitive terms and conditions of employment for workers. Workers receive an attractive compensation package inclusive of competitive wages, and high quality accommodations, transportation and accessible training. In 2012, Nalcor Energy launched (www.muskratfallsjobs.com), an online employment database where anyone interested in working on the project can be included in a database, with the objective that individuals can create an online resume, find information about contractors working with the project, and learn more about the many job opportunities that will be available throughout construction.

Registering with muskratfallsjobs.com represents the key means NALCOR pursued to ensure an individual's resume and information is accessible to contractors and unions seeking qualified workers with the project.

[56] Newfoundland and Labradorhttp://www.gov.nl.ca/lowerchurchillproject/backgrounder_4.htm

[57] Ibid

6.3.3 Provincial Economic Benefit Agreements

The Provincial Government and Nalcor committed to optimizing benefits with the business community via the following commitments made in:[58]

- Benefits Strategy with the Government of Newfoundland and Labrador
- Benefits Memorandum of Understanding between the Governments of Newfoundland and Labrador and Nova Scotia.

6.3.4 Economic Benefit Agreements with Innu Nations (November 11 2011)

Negotiations have been on-going between the Innu Nation and the Province of Newfoundland and Labrador in separate forums for many years. On September 26, 2008, Nalcor Energy, the Government of Newfoundland and Labrador and Innu Nation signed the Tshash Petapen (New Dawn) Agreement. Since that time, the parties have worked to complete three agreements:[59]

- A tripartite Innu Land claim and Self-government Agreement-in-Principle between Canada, Newfoundland and Labrador and Innu Nation (AIP)
- The Lower Churchill Project Innu Impacts and Benefits Agreement (IBA)
- The Upper Churchill Redress Agreement (UCRA)

These three agreements were ratified by the Innu in, 2011, and signed by the parties on November 18, 2011. The IBA and the UCRA come into effect immediately upon signing. The AIP will form the basis for on-going treaty negotiations between the Innu, Canada and Newfoundland and Labrador.

6.3.4.1 Land Claims and Self-Government Agreement-in-Principle with the Innu of Labrador (AIP)

The Labrador Innu asserts Aboriginal rights and title throughout a large area of central Labrador and Eastern Québec including the North Shore of the Gulf of St. Lawrence. No treaty has ever been signed with the Innu of Labrador. The Agreement-in-Principle (AIP) sets out jurisdictions, rights, benefits and limitations for the Labrador Innu in a variety of subject areas. These include the harvesting of forest resources and plants; fish; migratory birds; and wildlife. All rights and benefits are directly tied to specific geographically defined lands. Specific to the AIP four types of lands referenced, inclusive of the area of land under Innu control, the Labrador Innu settlement Area (LISA), and the rights to harvest within permit free hunting area and the economic and hydroelectric major development impacts and benefits areas, that would give the Innu the right to Impact and Benefit Agreements for Major Developments as defined in the AIP. While the AIP is not a legally binding document it does set the context for the related benefit agreements related to proposed hydroelectric developments.[60]

6.3.4.2 Lower Churchill Project Impacts and Benefits Agreement

The following benefits have been determined:

- Financial benefits:
  - Five per cent of net project revenue

[58] Backgrounder Execution of Agreements with the Innu Nations November 18, 2011

[59] Execution of Agreements with Innu Nations (November 11 2011 http://www.gov.nl.ca/lowerchurchillproject/backgrounder_9.htm

[60] Backgrounder: Highlights: Land claims and Self Government Agreement in Principle with the Innu of Labrador (www.aadnc-aandc.gc.ca/eng/1321571114945/1321571168634)

  - Five million dollars per year payable upon Lower Churchill Project sanction until commercial power
- Employment and training participation objectives in place for construction and operations.
- A target of $400 million in contracts for Innu businesses.
- Joint Nalcor-Innu Environmental Management Committee responsible for:
  - Environmental policies
  - Environmental Management System
  - Review and consideration of Innu knowledge
- Innu Nation will provide Nalcor with a comprehensive release and indemnity relating to any adverse effects associated with the development of the Lower Churchill Project.

6.3.4.3 Upper Churchill Redress Agreement

The Agreement provides compensation to the Labrador Innu for impacts associated with the Upper Churchill Falls development over the full project lifecycle.

- The compensation structure is an annual settlement payment of $2 million per year (indexed annually at 2.5 per cent) upon execution of the Final agreement until August 31, 2041, after which the Labrador Innu will be entitled to an annual dividend share of three per cent of Nalcor's revenue from the existing Churchill Falls development.
- Prior to September 1, 2041, the Innu Nation has the option to convert the annual settlement payments into an annual dividend share or percentage of revenue from the existing Churchill Falls development. This option is triggered if the revenue from the Power Contract between Churchill Falls (Labrador) Corporation and Québec Hydro changes.
- The Agreement provides the Province of Newfoundland and Labrador and Nalcor with a comprehensive release and indemnity against claims by the Labrador Innu relating to the Churchill Falls development.

6.3.5 Procurement Process

Throughout project construction, business opportunities will be made available via direct supply to Nalcor Energy or as a subcontractor or supplier to the project's primary contractors. Businesses interested in supplying works, goods and services to the project are encouraged to monitor the website for forecasted, active and awarded contract packages to identify potential opportunities matching expertise. All contractors, subcontractors and suppliers interested in supplying works, goods and services to the project are required to complete and return a Vendor/Contractor Registration Questionnaire to be added to the database of potential suppliers. The procurement process for primary contract opportunities with the project is managed by the following:

1. Upcoming contract packages and scopes of work are identified in the procurement forecast, available by selecting the Procurement Forecast link on Project website.
2. Expressions of Interest (EOI) and Bidder selection documents for contract packages are posted online in the Bidder Selection and RFP section of Project website.
3. Evaluation and selection of bidders.
4. Requests for Proposals (RFP) are issued to bidders selected through the Bidder Selection phase. The bidders list is then available online through the corresponding contract package.
5. Evaluation of proposals received through the RFP process.
6. Contact information for the successful contractor is available in the Awarded Contracts section of the Project website.

6.3.5.1 Subcontractor Opportunities

In addition to major contract awards, the project will generate significant subcontract opportunities for goods and services that will be required throughout construction. Subcontracted opportunities will be managed by primary contractors and suppliers with the project. Businesses can take advantage of subcontract opportunities by:

- Contacting bidders and primary contractors/suppliers directly. Contact information for approved bidders and primary contractors/suppliers with the project is available in both the Bidder Selection and Request for Proposals section and the Awarded Contracts section of the Project website.
- Regularly monitoring forecasted, active and awarded packages to identify areas for potential subcontract opportunities matching their area of expertise. All procurement information and scopes of work for contract packages are available by navigating the Project website.

While an Engineering, Procurement and Construction Management (EPCM) consultant for the development of the Muskrat Falls hydroelectric generating facility and the Labrador-Island Link has been selected, procurement opportunities with the project are managed by an integrated supply chain team with representatives from Nalcor and EPCM contractor to further ensure regional (local) content is supported.

Observations:

Nalcor, the Federal and Provincial Governments, and Innu peoples have worked to establish agreements to support economic development within the north. Long-term provincial economic benefits are derived by the sale of surplus power. In the short term, optimization of employment provincially and locally during construction has been identified via procurement strategies in which local businesses, service providers and individuals looking to obtain work are solicited and given preference too. While it is up to the contractors to assemble teams, procurement opportunities with the project are managed by an integrated supply chain team with representatives from Nalcor and contractor to further ensure regional (local) content is matched.

The Innu people's long term negotiations with the Province of Labrador and Newfoundland has resulted in the signing of the New Dawn agreement that articulates through AIP, IBA UCRA the benefits associated with undertaking the Muskrat Falls project for the regional populations.

6.4 Québec Hydro

6.4.1 The James Bay Hydro Electric Project: Québec Hydro; an Overview

In 2002, the Québec Government and the Grand Council of the Crees signed an agreement, "La Paix des Braves" ("The Peace of the Braves"), ensuring the completion of the last phase of the original James Bay Project: construction of the Eastmain-1 generating station, with a capacity of 480 MW, and the Eastmain Reservoir with a surface area of about 600 km^2. A subsequent agreement in April 2004 opened the way to a joint environmental assessment of the projected diversion of the Rupert River, to the south of the Eastmain River.[61] The project entails the diversion of about 50% of the total water flow of the Rupert River (and 70% of the flow at the diversion point)

[61] By 1986, the largest generating stations and reservoirs on the La Grande River were completed, including the Robert-Bourassa (originally named La Grande-2), La Grande-3 and La Grande-4 generating stations, with an installed capacity of 10,800 MW, and five reservoirs covering an area of 11,300 $km^{2.}$ Collectively these projects are known as the James Bay Hydro Electric Project. The Eastmain and Caniapiscau River diversions each added 800 m^3/s of water to the La Grande River. During the late 1980s and early 1990s, construction of the second phase of the James Bay Project centered on the construction of five secondary power plants on the La Grande River and its tributaries (La Grande-1, La Grande-2A, Laforge-1, Laforge-2 and Brisay), adding a further 5,200 MW of generating capacity by the end of 1996.

towards the Eastmain Reservoir and into the La Grande Complex, and the construction of two additional generating stations: Eastmain-1A and Sarcelle, with a combined capacity of 888 MW.[62]

6.4.2 Eastmain-1A and Rupert Diversion Hydropower Project

Specific to the Eastmain-1A and Rupert Hydro Project consists of:

The project estimated to cost $5 billion dollars consists of three main components:[63]

- Construction of a 768-MW powerhouse, Eastmain-1A, near the existing Eastmain-1 powerhouse.
- Construction of a 150-MW powerhouse, Sarcelle, at the outlet of Opinaca reservoir.
- Partial diversion of the Rupert River to these two generating stations and from there to Robert-Bourassa, La Grande 2A and La Grande-1 generating stations.

The Rupert diversion includes four dams, a spillway 74 dykes, two diversion bays and a 2.9 km long tunnel and a network of canals with a total length of about 12 km to facilitate flow in the various portions of the diversion bay. To bring the output from the new generating facilities onto the power grid, 315-kV lines were built.

6.4.2.1 Provincial Economic Benefits of the Eastmain-1A/Rupert Project

Construction of the Eastmain-1A and Rupert Diversion project will generate economic spinoffs of nearly $2.4 billion for all of Québec, including direct, indirect and induced spinoffs. As for the northern region of Québec (Nord-du-Québec administrative region), where the project will be carried out, it will benefit from 9% of the economic spinoffs.[64]

To optimize the potential economic benefits for northern Québec residents (predominantly Cree) a number of agreements were concluded to promote economic development in the region. A brief description of each is provided below:

6.4.2.2 Provincial Economic Benefits: Aboriginal Agreements

The James Bay and Northern Québec Agreement (JBNQA) – was signed on November 11th 1975. This agreement originally only covered claims made by Québec Cree Indians and Inuit, on 31 January, 1978; the Naskapi Indians of Québec signed a parallel agreement – the Northeastern Québec Agreement - and joined under the 1975 accord.[65]

---

[62] Wikipedia

[63] Quebec Hydro http://www.hydroquebec.com/rupert/en/projet_en_bref.html

[64] Government of Quebec (http://www.mddep.gouv.qc.ca/evaluations/eastmain-rupert/rapport-comexen/economic.htm)

[65] In the 1960s, Quebec began developing potential hydroelectric resources in the north, and in 1971 created the *James Bay Development Corporation (JBDC)* to pursue the development of mining, forestry and potential resources starting with the James Bay Hydroelectric Project (JBHP). This undertaking, which had been directed by the government of Quebec without consulting native people, was opposed by the majority of northern Quebec's Cree and Inuit.
The *Quebec Association of Indians* - an *ad hoc* representative body of native northern Quebecers - sued the government and, on 15 November 1973, won an injunction in the Quebec Superior Court blocking hydroelectric development until the province had negotiated an agreement with the natives. This judgment was overruled by the Quebec Court of Appeal seven days later, after the government's efforts to quickly negotiate an agreement failed. The legal requirement that Quebec negotiate a treaty covering the territory had not been overturned, even though construction continued.

The JBNQA agreement identifies a number of subjects and, as the first Canadian native treaty since the 1920s, has become the prototype of the many agreements made since then. It established a number of provisions, principally in the following areas:

- lands
- environmental and social protection
- economic and social protections
- economic development and financial compensation
- education
- local government
- heath and social services

In return for their signatures the governments of Québec and Canada and Québec Hydro agreed to provide northern Québec natives with extensive direct financial compensation to manage economic development through three native owned development corporations: The Cree Board of Compensation, the Makivik Corporation and the Naskapi Development Corporation.

A number of development agreements were subsequently established to compensate northern Québec Natives and include:[66]

- Nadoshtin Agreement
- Boumhounan Agreement
- Cree Employment Agreement
- Mercury agreement
- Decommissioning Agreement
- Waskaganish Transmission Line Agreement
- Whapmagoostui Transmission Line Agreement

The above agreements are summarized below.[67]

Over the course of the next year, the government of Quebec negotiated the required accord. On 15 November 1974 – exactly a year after the Superior Court decision – an *agreement-in-principle* was signed between the governments of Canada, Quebec, publicly owned Hydro-Québec, the Grand Council of the Crees, and the Northern Quebec Inuit Association.

[66] Agreements between Hydro Quebec the society d'energie de la Baie James and the Cree of Quebec summaries Quebec Hydro February 72002

[67] Summary of the complementary Agreement No.13 and Summary of the Agreement respecting Disputes and Dispute Resolutions committee are not presented.

Table 16: Québec Hydro and the Province of Québec: Provincial Benefit Agreements

Agreement	Objective of Agreement /Amounts ($)
Nadoshtin Agreement	The agreement allows Québec Hydro to build and operate the Eastmain 1 Project, as contemplated in the James Bay and Northern Québec Agreement (JBNQA). The agreement provides for the implementation of various environmental measures and allocated costs, including remedial and mitigating initiatives, with a view to reducing impacts of the project on concerned Cree. This includes the remedial measures fund ($1.8 m), archaeology and cultural heritage fund ($2.5m), Eenou Indohoun fund ($3.9 m), wildlife management fund (0.75 m), training fund ($1.5 m) and the EM-1 mercury fund ($3.0m)[68]
Boumhounan Agreement	The Crees consent to the construction and operation of the project in accordance with the terms set forth in the Boumhounan Agreement and subject to government authorizations, including those in conformity with the environmental and social protection regime prescribed in the JBNQA. The Crees will participate directly with Québec Hydro in studies and works rated to the project and will be involved throughout the feasibility phase, during which the necessary permits must be obtained. The agreement provides for the implementation of various environmental mitigating and remedial works, measure and programs aimed at reducing the impacts of the project. Contracts established by negotiation, subject to Québec Hydro's scheduling, cost, quality and guarantee requirements to be included consist of during the feasibility phase contracts totaling $5 m, construction phase, contracts totaling $240 m, and operations phase totaling $45 m.
Cree Employment Agreement	In total 150 Cree First Nations will be employed in permanent positions associated with the James Bay Project. To assist the Cree's in obtaining temporary jobs in the James Bay region, the agreement provides for the implementation of incentives and temporary employment programs designated to alleviate the negative impacts of the James Bay Project on traditional Cree activities and to improve the Cree's use of affected areas. The Apatisiiwin Corporation, a joint non-profit company, will be established under the agreement among others to facilitate and foster the employment of James Bay Cree, to reduce the barriers to employment, to recreate employment opportunities, to provide employment training and the create economic opportunities and jobs for the Crees, thereby creating a framework for improved relations between the James Bay Crees and Québec Hydro. A budget of $7 m has been established.
Mercury Agreement	This agreement was established to support human health authorities in the development and delivery of programs designed to manage the risks associated with human exposure to mercury. The Eye Names Corporation, a joint non-profit company, will be established to carry out studies monitoring etc. The corporation will be funded by $24 m as well as additional $3 m under the Nadoshitin Agreement and 3 m under the Boumhounan Agreement.
Decommissioning of work sites	This agreement is established to ensure the decommission of Québec Hydro's sites and installations that are no longer in service in the James Bay region and to agree upon a mechanism forth resolution of disputes with respect to decommission procedures.
Waskaganish Transmission Line Agreement	This agreement pertains to connect the community of Waskaganish to Québec hydro's main power grid by means of a transmission line.

Observations:

The Québec Government, the Federal and Provincial Governments, and Cree peoples worked to establish agreements to support economic development within the north. The Québec Government and the Grand Council of the Cree's signed the "The Peace of the Braves", ensuring the completion of the last phase of the original James Bay Project and identifying future opportunities. Provincial economic benefits were driven, in part by export sales and the revenues generated to the Province of Québec. From a regional perspective the economic benefits were focused on addressing economic disparity with the northern residents the majority of which were local aboriginals of Cree decent. A number of agreements were established inclusive of: The Nadoshtin Agreement, Boumhounan Agreement, Cree Employment Agreement, Mercury Agreement, Decommissioning Agreement, Waskaganish Transmission Line Agreement, and Whapmagoostui Transmission Line Agreement. All agreements

[68] Source: Agreements between Hydro-Québec, the Societies demerge de las Baie James and the Cree of Québec

provide insight into Québec Hydro's initiatives to optimize local benefits and address adverse effects of such projects. Agreements outline initiatives to train, educate and provide employment opportunities and address regional disparity felt in northern communities. The connection of communities of Waskaganish and Whapmagoostui within the Québec Hydro grid is one such example of capacity building. While such agreements evolved in part from addressing past issues resultant from historic hydroelectric development from aboriginal rights and title perspective, they have benefited from lessons learned from earlier hydro developments as outlined in the original The James Bay and Northern Québec Agreement (JBNQA).

Summary of Observations: NALCOR and Québec Hydro

Manitoba, Québec and Newfoundland and Labrador in cooperation with Federal and Provincial agencies have negotiated benefit agreements with local First Nations related to hydroelectric projects with the objectives of addressing outstanding issues pertaining to historic hydroelectric projects. In historic context, all of the utilities benchmarked have benefited from lessons learned from previous hydroelectric developments and incorporated initiatives to optimize local and regional benefits, specifically for northern and indigenous populations. Provincial and Canadian wide benefits are driven for the most part from construction benefits (employment) and a lesser extent operational employment jobs, and the on-going revenues secured as a result of export sales. Provincial input out models were utilized to determine benefits. First Nations benefit agreements have been tabled to address adverse effects and facilitate co-operation with other federal and local agencies involved in employment training and social services. Equity ownership and management and administrative assistance also help in building capacity within the organization. Manitoba Hydro's approach in this regard represents an industry best practice. On-going monitoring represents the key to ascertaining the success of the programs.

7 OBSERVATIONS

This section provides the PUB a series of observations derived from the NFAT review of the socio-economic considerations associated with the preferred development plan.

Economic Impact Assessment

Interpreting the Results of the Input Output Model for various alternative plans

The Manitoba Bureau of Statistics Input Output Model (IOM) was used to compare the expected economic impacts associated with the PDP and other alternatives such as a Simple Gas Turbine and a Combined Gas Turbine project. While varying detail was provided regarding construction costs for the gas options, we note that IOM's are linear and therefore scalable. Scaling the gas options to reflect the Keeyask Generating Project construction costs ($2.2 billion) enables a comparison of economic impacts. The Keeyask Generating Project (and the PDP) creates significantly greater economic benefits than that of the gas turbine projects.

Interpreting the Results of the Input Output Model for the PDP

Specific to evaluating the overall economic benefits of the PDP, our review commented on the key steps and related assumptions required to preparing the model, namely:

- the level detail related to construction costs;
- allocation of construction costs into input output categories;
- removal of expenditures with no provincial economic benefit and other leakages from the provincial economy; and,
- treatment of labour.

MH provided detailed costs as inputs into the model, and has for the most part, allocated cost input data to the corresponding IO expenditure categories based on an understanding of the expenditures involved. MH has removed expenditures with no provincial economic benefit and identified leakages from the provincial economy. The results of which are also reflected in the treatment of labour.

It is observed however, that the treatment of many purchases as leakages may tend to understate the impact of the PDP in Manitoba, while overstating the impact in the rest of Canada. This is due to the fact that the margins embedded in the purchase cost of these goods and services (treated as leakages), may not have been attributed to Manitoba producers who may be providing services such as transportation or wholesaling.

The extent of the leakages can be explained by a number of factors such as the relatively small manufacturing base of Manitoba economy compared to the rest of the provinces in Canada (Ontario and British Columbia), as well as the extensive experience of MH regarding recently constructed projects that would verify the of out-of-province purchases.

The extent of the out of province expenditures may be reasonable, but MH should have explicitly commented on this as part of reporting.

The issue pertaining to whether the impacts to the rest of Canada are overstated, whereas the impacts to Manitoba are understated remains, and is discussed below.

Canadian vs. Provincial Benefits

A generally accepted principle of input output modelling is that the "direct" benefits of any project are incurred in the jurisdiction in which the project is located. The approach used in the Statistics Canada Interprovincial Input-

Output Economic Impact Simulation model (catalogue no. 15F0009XDB) focused on the expenditures (purchase of goods and services) and the location where these expenditures took place. This approach ensures that the results generated from the model show the entire direct impact in Manitoba. It should be noted however that when the expenditure approach is used with the Statistics Canada model, the model estimates where the goods and services purchased are supplied from.

The key difference in the MH IOM approach was that MH made decisions, based on local experience and knowledge, on where the goods and services originated from. Although such an approach is reasonable, one must be careful in how to interpret the direct and indirect impacts, as the production (supply) of goods and services might generate a direct impact in the jurisdiction where the production took place, but in reality, this production should be interpreted as indirect impact, because these goods and services were produced to satisfy the demand associated with the project.

The results of both the MH IOM and the Statistics Canada Interprovincial model are presented for comparison purposes in the main body of the report for the Keeyask Generating Station.

The analysis suggests that the allocation of impacts between Manitoba and the rest of Canada in the MH study is significantly different from what the normal allocation, based on the structure and characteristics of Manitoba's economy would be, according to the Statistics Canada model.

Based on the results of the Statistics Canada model, one would expect the economic impact in Manitoba to be higher than what was suggested in the MH study (employment, labour income and GDP), while the impact in the rest of Canada would be lower.

Regardless, the results confirm that the PDP creates the greatest economic impacts, and if the Statistics Canada Interprovincial model is considered, the benefits to Manitobans is greater than what was reported.

Determining gross provincial financial benefits by examining benefits over the life of the project

The economic lives of hydroelectric facilities are much greater than those of other resource options. Based on the timing and value of replacement costs and net production costs based on MH Splash modeling, the PDP creates the greatest value over the economic life of the asset. The longer-term life (past the economic life) of hydroelectric facilities represents a consideration worth noting in this review. Referred to by MH as bequest value, is difficult to ascertain how long such facilities can be maintained and operated. Literature suggests over the longer term (past the economic life) hydroelectric facilities continue to contribute to the provincial economy well past the economic life of the facility evaluated in the NFAT.

Northern and Aboriginal community based impacts in terms of employment opportunities, incomes, community tax base, skills development and community based opportunities

Our review identified ten (10) provincial utility criteria/measurers, specific to optimizing economic benefits for First Nations and Northern communities. It is noted MH has met and exceeded such best practices.

Community Access Improvements related to Health, Education and Culture

Community access improvements and their implications (environmental setting, effects assessment, mitigation, and residual effects) related to health, education and culture are discussed in the Environmental Impact Statement (EIS) for the Keeyask Generating Project. The assessment followed standard environmental impact assessment process and all identified issues were evaluated.

On-going monitoring throughout construction, operation and beyond will be critical to ensure success of the identified mitigation.

Economic Displacement Impacts and Effects on Consumer Spending

Global Canadian and Provincial Electricity Rates

Manitobans (as of 2013) have one of the lowest residential electricity rates in Canada, and correspondingly, Canada has one of the lowest residential rates in the world (2009). In the literature reviewed, continued pressure to increase rates throughout Canada is evident and is expected to continue into the next decades.

Review of Increased Energy Costs on Consumers

Literature suggests that the displacement effects of rate increases predominantly affect the poor and those with low income or fixed incomes. The middle and upper class are not as affected as such costs are absorbed through greater disposable income.

Energy Efficiency and Reduction Initiatives

The literature also suggests that best means of mitigating such affects on those most affected will be to aggressively pursue energy efficiency and reduction initiatives. While MH is known for such programs, continued emphasis on such programs is suggested, along with on-going monitoring, in light of the proposed rate increases.

Optimizing demand side management (DSM) will be critical moving forward to manage impacts to ratepayers.

Socio-economic Impact of Key Alternative Scenarios

Evaluation of Alternative Plans

The use of Multiple Account Benefit Cost Analysis (MA-BCA) to ascertain socio-economic benefits focuses on the identification of net benefits from a broader social perspective. It also enables comparisons of the distributional advantages and disadvantages of various plans over the stated life cycle of the plan. MA-BCA is a methodology utilized to evaluate options and used to assist in program and policy decision-making.

The MA-BCA assesses the preferred and three alternative resource development plans, and include:

- the Preferred Development Plan;
- the Smaller Interconnection Plan (K19/Gas 24/250MW Interconnection);
- Keeyask with No Interconnection (K2/Gas); and
- Gas Thermal with on new Interconnection (all Gas).

The MA-BCA was based on the reference scenarios assuming a 78-year net present value metric. It is noted that while sensitivity analysis was undertaken for all of the alternatives, there still remains key assumptions within the economic, financial and sensitivity analysis (future load forecasting, the effect of demand side management, drought exposure, export sales and provincial revenues etc.), that would materially affect the outcome of this review.

Market Valuation

The key assumption effecting results is the discount rate utilized. The discount rate is a critical parameter in cost benefit analysis especially when costs and benefits differ in distribution over time. This is especially important when they occur over a long period of time. The 6% real discount rate chosen for the PDP, based on a social cost of capital, is reasonable based on literature reviewed.

The results are correspondingly reasonable.

Manitoba Hydro Customer Account

Pressure on rate increases is expected to continue globally and throughout Canada, and residential users should expect to pay for increasing rates. While the PDP has the greatest rate annual projected rate increases proposed in all plans, it will require residents of Manitoba to pay higher rates in the short term (until year 2031). The cumulative rate increases of all plans are not substantially different, with the benefits of the PDP incurring over the longer term as inflationary costs are reduced with the PDP limiting rate increases over the longer term. The key observation is pay now, benefit later regarding rates. Flexibility regarding MH objective to achieving the 20-year 75:25 debt/equity ratio is one means of dealing with rate issues.

Further discussion regarding the short to medium term rate increases associated with the MH plans should be clearly outlined and understood by the people of Manitoba as part of this process.

From a system reliability perspective, the PDP is preferred; however all of the development plans can handle load requirements under the majority of adverse conditions.

Manitoba Government Account

This account focuses on the net benefits to government over the term of the PDP. The results are based on identifying only direct incremental taxes and fees paid by Manitoba Hydro, net of incremental Government cost or risks. The key driver for revenues to the Provincial government in this account is represented by the capital taxes and water rentals. The account also assumes a "wash" for various taxes, such as coal tax and carbon charges taxes, discussed in the environmental review of the NFAT, and the debt guarantee fund, while substantial, is balanced between what MH owes and what the government of Manitoba secures. The approach the MA-CBA takes regarding the other total charges to government, such as the provincial debt guarantee is reasonable.

Manitoba Economy Account

The Manitoba account is specific to the employment and wages generated by the project in each plan, and estimates the potential incremental income that employment (wages) offers for Manitobans. The assumptions regarding proportioning the net economic rent (the additional wages earned net of) that would be derived, is based on project location and the employment/unemployment characteristics in that region. Northern regions with greater unemployment would result in greater net benefits, and the PDP is preferred. The assumptions made are reasonable.

Social Account

The societal benefit of hydroelectric projects outlined in the PDP should be considered in context to the $1 billion dollars in sunk costs incurred for the Keeyask Generating Project, and the $300 million in sunk costs for the Conawapa Generating Project, during project development. Such costs are not considered in the evaluation undertaken to justify the PDP. From a socio-economic perspective, while the investment of the $1 billion invested for KGP as sunk costs, is substantial, the corresponding socio-economic benefits derived from some of the sunk cost expenditures, such as the Joint Keeyask Development Agreement and related project benefits as well as Keeyask Infrastructure Project support the optimization of socio-economic benefits for First Nations and northern communities.

The MA-BCA is a reasonable approach to ascertain socio-economic benefits, and based on the reference scenarios provides insight into the distributional benefits of the alternative plans studied. Considerable risk and uncertainty remains. To address such issues the concept of pathways is introduced.

The Significance of Pathways

To deal with risk and uncertainty over the period of the plan, the concept of pathways were identified in the PDP. The decision pathways enable MH the flexibility to modify the PDP to address risk and uncertainty and the ever-changing market characteristics over the longer term of the plan. From a socio-economic perspective the critical decision point within the pathways, if the PDP is pursued, is decision specific to the construction of Conawapa, which does not have to be made until 2018.

Between 2014-2018, the risk and uncertainty factors should be studied in detail and reported back to the PUB prior to the decision date, to enable the government of Manitoba to make an informed decision regarding its future energy policy decisions. The Government of Manitoba should provide the PUB direction enabling the PUB to work directly with MH as such risk and uncertainty is addressed.

High-level review of approaches to optimizing Provincial economic benefits of large-scale resource projects

The utilities benchmarked (Québec Hydro and Nalcor) have benefited from lessons learned from previous hydroelectric developments and incorporated initiatives to optimize local and regional benefits, specifically for northern and indigenous populations. Provincial and Canadian wide benefits are driven for the most part from construction benefits (employment) and a lesser extent operational employment jobs which are local. Such economic impacts are derived from IOM's. Provincial revenues are secured from export sales and on-going government tax revenues from water rentals etc.

Legal or quasi-legal agreements with First Nations have been secured in all jurisdictions. Cooperation with other Federal and local agencies involved in employment training and social services has also been pursued and resulted in successful economic optimization strategies. Equity ownership and management and administrative assistance also help in building capacity within the organization, as outlined in the MH example via the Joint Keeyask Development Agreement.

Manitoba Hydro's approach to optimizing provincial economic benefits reflects industry practices. On-going monitoring of the success of all of the related socio-economic optimization strategies should be pursued; lessons learned identified and implemented going forward.

Summary

From a socio-economic perspective, the approach assumptions and findings MH has presented are reasonable. Overall the PDP exhibits the greatest socio-economic benefits to the people of Manitoba, northern communities and First Nations compared to other plans based on the reference plans evaluated.

Use of the Statistics Canada Interprovincial IOM utilized in this review suggests that, based on MH assumptions that the Manitoba related economic impact benefits may have been understated while the rest of Canada benefits overstated, making the PDP more attractive to Manitobans as greater benefits are derived. The Statistics Canada Interprovincial model confirms the overall benefits derived from the PDP are reasonable.

Planned investments are significant over the next decade (as outlined in the proposed PDP), placing increased pressure on the provincial debt and rates, in the short and medium term. The PDP is intended to contribute to the growth of the Manitoba economy, strengthen relationships with First Nations and create a lasting legacy for future generations. By doing so the PDP supports Manitoba Hydro's Corporate Strategic Plan (MCSP) 2012-13 and

goals of the corporation, with two corporate goals in the MCSP being highlighted, supporting Aboriginal people and Provincial economic development.[69]

Throughout the short/medium term the Keeyask Generating Project would generate significant socio-economic benefits for the people of Manitoba, First Nations and northern communities and if not pursued such benefits would be forgone, inclusive of the sunk costs already allocated to the Keeyask Generating Project.

Over the longer term considerable uncertainty and risk remains and the introduction of pathways in the decision making process enables such risk and uncertainty to be studied prior to a decision being made on Conawapa.

Both Keeyask and Conawapa are capital intensive projects, creating significant employment throughout construction, and operational benefits. Monitoring issues related to access, health, education and the cultural implications of project development, while identified, should be monitored aggressively, and lessons learned implemented on an annual basis to ensure sustainable capacity building within First Nations and northern communities.

APPENDIX B

What Economic Impact Models Measure

What Input Output Models Measure

An input output model (IOM) is a way of understanding and estimating how economic changes in one industry can affect other industries. For example, changes in lumber sales will have immediate (direct) effects on the sawmill industry, but also less immediate (indirect) effects on the logging industry, the transportation industry, and any other industries which provide inputs to the sawmill industry.[70] IOMs can be used to predict how an increase or a decrease in demand for the products of one industry will have an impact on other industries and therefore on the entire economy. An input-output analysis is based on:

- identifying a basket of goods and services used by a specific project and then; and
- tracking through all of the steps involved in producing those goods and services, to identify the total extent to which the provincial economy will be affected by project expenditures.

The results of IOM are presented based on three different types of impacts:

- The **direct supplier industry impact** measures the impact on provincial industries supplying goods and services directly used by the project;
- The **indirect supplier industry impact** measures the impact on provincial industries that are further back in the supply chain. The indirect impact is cumulative, and includes transactions going all the way back to the beginning of the supply chain; and
- The **induced impact** measures the effect that spending by workers (those employed by the project, or by direct and indirect supplier industries) has on the economy.

Output, GDP, employment, and tax revenues are the key measures used to assess the economic impacts associated with a project. In order to properly interpret the results of an analysis, some background information about what these measures represent and how they are calculated is presented.[71]

- Output is simply a measure of the total value of production associated with a project. In an industry-based analysis, output is equal to the value of goods and services produced by the provincial industry or industries that are affected by a specific project. In an expenditure-based analysis, it can be measured as the total dollar amount of all spending on goods and services produced in province. It should be noted that purchases of goods and services produced outside the province do not directly affect in- province businesses, so these expenditures are explicitly excluded from the analysis (allocation of expenditures to input output categories). This is usually the main reason why the direct impact on provincial industries is less than initial project expenditures.
- Gross Domestic Product (GDP) is a measure of the value added (the unduplicated total value of goods and services) to the provincial economy by current productive activities

[70] IOM's are derived from inter-provincial input-output tables developed by Statistics Canada. These tables provide a snapshot view of the economy in a given year, and include details on commodities, industries, and "Final demand" categories. The information in the tables is combined with a set of computer algorithms and used to estimate the economic impact associated with specific projects.

[71] BC Stats

attributable to the project. It includes household income (wages, salaries and benefits, as well as income earned by proprietors of unincorporated businesses) from current productive activities as well as profits and other income earned by corporations. Only activities that occur within the province are included in GDP.[72]

- Employment estimates generated by models are derived from estimated wage costs using information on average annual wages in an industry. They are not full-time equivalent (FTE) measures. Instead, they reflect the wages paid and hours spent on the job by a typical worker in an industry. For an industry where most employees work full time, the numbers will be very similar to FTE counts. However, in an industry where part-time work is more common, the job counts will be quite different from FTEs. Some models also provide FTE estimates.
- Government tax revenue estimates generated by input-output models include commodity taxes paid to federal, provincial and local governments. Some models also provide estimates of federal and provincial personal and corporate income taxes. Commodity taxes include PST, GST and other taxes such as gas taxes, liquor and lottery taxes and profits, air transportation taxes, duties and excise taxes.
- *Municipal tax revenues* include property taxes and other taxes such as accommodation taxes levied in some communities. Property tax revenues are included in the supplier industry impacts calculated by the model. Property taxes paid by the project are only reported if they have been explicitly included as an expenditure item in project expenditures.

[72] GDP is calculated by subtracting the cost of purchased goods, services and energy from the total value of an industry's output. As a result, the value of the work done by a producing industry is only counted once. In the case of a construction project, the direct GDP impact would only include the value of the work done by the construction firm. The indirect impact on the sawmill industry would only include the value of the work done to transform the logs into lumber, and the indirect impact on the logging industry would be a measure of the value of the work done by the loggers. There is no double counting in GDP measures.

It should be noted that the relationship between GDP and output is a useful analytical measure since it shows the extent to which industries rely on labour and capital as opposed to material and service inputs in production. The analysis of economic impacts relies on this relationship, since output is more easily and directly measured than GDP. In fact, the starting point for most input-output analyses is a measure of the direct output associated with a project. From this, known relationships between output and other indicators such as GDP and employment can be used to estimate the economic impact associated with a specific project (BC Stats).

1 INTRODUCTION

1.1 BACKGROUND

The *Manitoba Hydro Act* requires approval from the Lieutenant-Governor in Council for the development of new electricity generating stations, interconnections, and contracts for power exports and imports. In January 2011, the Government of Manitoba notified Manitoba Hydro (Hydro) of its intention to carry out a Needs For and Alternatives To (NFAT) review of Hydro's Preferred Development Plan ("PDP", or "Plan"). In November 2012, the Minister of Innovation, Energy and Mines announced that the Government of Manitoba had requested the Manitoba Public Utilities Board ("PUB" or "Board") to conduct the NFAT.

On August 16, 2013, Manitoba Hydro filed its NFAT documentation with the PUB for approval of its PDP. This Plan includes:

- Development of the Keeyask Project, a 695-megawatt (MW) hydroelectric generation project on the Nelson River with a proposed in-service date (ISD) of 2019;
- Development of the Conawapa Project, a 1,485-MW hydroelectric generation project on the Nelson River with an earliest ISD of 2026;
- Development of the North-South Transmission Project, a proposed 185-MW transmission line with an in-service date coinciding with the Conawapa Project;
- Development of the Manitoba-Minnesota Transmission Upgrade Project, a proposed 750-MW transmission intertie between Manitoba, Minnesota and Wisconsin with an in-service date of 2020;
- Development of natural gas generation facilities later in the planning period; and
- Six long-term export commitments, with Minnesota Power (MP), Wisconsin Public Service (WPS) and Northern States Power (NSP).

Manitoba Hydro notes that while the PDP includes the Conawapa Project, decisions on whether or not to construct Conawapa and its specific timing are not required now. However, activities (and spending) would continue to protect an in-service date for Conawapa as early as 2026, but conditions will be continually monitored to determine if such continued investments are worthwhile and, ultimately, to determine if Conawapa should be constructed and for what ISD.

The PUB is to submit a report to the Minister responsible for the administration of *The Public Utilities Board Act* by June 20, 2014. The report is to include recommendations to the Government of Manitoba on the need for the PDP and whether the Plan is in the best long-term interest of the Province compared to other options and alternatives.

1.2 QUALIFICATIONS

Rick Hendriks is Director of Camerado Energy Consulting, an Ontario-based consulting firm providing management consulting, strategic planning, research, and negotiation services to Aboriginal communities, community energy cooperatives, municipalities and non-governmental organizations with respect to energy planning, assessment, development and conservation. Mr. Hendriks' work with Aboriginal communities has focused on the environmental assessment of proposed hydroelectric, transmission and mining developments on or adjacent to some of the largest rivers in Canada, including the Mishta-shipu (Churchill) River in Nitassinan (Labrador), the Attawapiskat River in Treaty 9 (northern Ontario), the Slave River in Treaty 8 (Alberta and the Northwest Territories), and the Peace River in Treaty 8 (BC) in the traditional territory of the Dane-zaa.

Mr. Hendriks works closely and collaboratively with community and organizational leadership to envision, implement and achieve strategic objectives. Trained in engineering, science and social science, he brings an analytical, structured and comprehensive approach to understanding and explaining the opportunities and risks of development proposals.

Rick has provided testimony in several proceedings evaluating the environmental and socio-economic risks and benefits of hydroelectric development in Alberta, British Columbia, and Newfoundland and Labrador. At the recent environmental assessment hearings for BC Hydro's proposed Site C Clean Energy Project on the Peace River, he prepared written submissions and provided oral testimony concerning: the socio-economic benefits of wind resources; effectiveness of mitigation measures related to fish, fish habitat and fishing; and the development of site alternatives to the proposed Site C Project as a means to provide for potential reconciliation of the rights of the Crown with the rights of the affected First Nations.

Prior to founding Camerado Energy in 2009, Rick worked for six years with Chignecto Consulting Group, supporting natural resource negotiations between Aboriginal groups, government and industry with respect to mining and hydroelectric developments across Canada. Previous to that, Rick worked for the Innu Nation in Labrador as their environmental and engineering analyst for the proposed Lower Churchill Project.

Mr. Hendriks is a founding member of the Hamilton Association for Renewable Energy, and a member of the Ontario Waterpower Association, the Ontario Sustainable Energy Association and the Ontario Association for Impact Assessment.

1.3 MANDATE

The Terms of Reference for the NFAT Review of Manitoba Hydro's PDP require "an assessment as to whether the Plan is justified as superior to potential alternatives that could fulfill the need."[1] This assessment requires consideration of "the macro environmental impact of the Plan compared to alternatives", [2] which involves "a critical analysis of the macro environmental impacts and benefits of Manitoba Hydro's Preferred Development Plan (PDP) and alternative Plans." [3]

I was requested by the Manitoba Métis Federation (MMF) to review the available evidence concerning the macro environmental impact of the PDP and the alternative Plans, paying particular attention to the requirements of the definition of macro environmental impact provided by the PUB. Secondly, I was asked to comment on the determination of the macro environmental impact of the hydroelectric resources used in the various development plans, and to identify additional relevant information that would assist the Board in fulfilling its mandate.

[1] Terms of Reference – Needs For and Alternatives To (NFAT) Review, at p.2.
[2] Ibid., at p.3.
[3] Manitoba PUB, Order 92/13, at p. 13.

2 MACRO ENVIRONMENTAL IMPACT

2.1 REQUIREMENTS OF THE TERMS OF REFERENCE

The Terms of Reference for the NFAT Review detail the scope of the review to be undertaken by the PUB, and include:

> An assessment as to whether the Plan is justified as superior to potential alternatives that could fulfill the need. The assessment will take the following factors into consideration:
>
> i. The macro environmental impact of the Plan compared to alternatives; [4]

2.2 SCOPING THE DEFINITION OF MACRO ENVIRONMENTAL IMPACT

Prior to providing clarification with respect to interpretation of "macro environmental", the PUB, in Order 67-13, required Manitoba Hydro and any approved intervener intending to address this factor to submit a definition of this term. The PUB received several responses to its request, and I reviewed these responses in preparing this evidence in order to better understand the intentions and expectations of the Board when defining this factor, as well as the positions of other NFAT participants.

Manitoba Hydro

In its response to the PUB request, Manitoba Hydro provided a definition of macro environmental impact as follows:

> Macro environmental: high level summary of environmental impacts and benefits sufficient to compare resources (not detailed evaluations such as in EIS) [5]

Hydro's primary preoccupation in submitting this definition was to avoid any duplication of effort with the environmental assessment process being carried out by the Clean Environment Commission (CEC) in relation to the proposed Keeyask Project, one component of Hydro's PDP. Hydro noted that the recommendations and the final report of the CEC process would be available to the PUB prior to the PUB issuing its recommendations regarding the NFAT.

In my view, that duplication can be avoided by timely provision to the PUB of the recommendations of the CEC with respect to the Keeyask Project, including any findings with

[4] Terms of Reference – Needs For and Alternatives To (NFAT) Review, at pp.2-3.

[5] Letter of Manitoba Hydro to Mr. H. Singh (PUB) of June 28, 2013 re: Manitoba Hydro NFAT Terms of Reference Meaning of "Macro Environmental" and "Socio-economic", at p. 1.

respect to the significance of the environmental effects. The provision of this information, though necessary, is not sufficient for the PUB to make its determinations respecting the macro environmental impact of the Plan and the alternatives that include the proposed Keeyask Project, for reasons discussed further below.

In its response to the PUB request, Hydro also described the three-step process it used in its consideration of macro environmental impact:

1. Screening level analysis
    - Sixteen available resource technologies were screened against over fifteen technical, economic, environmental and socio-economic criteria

The screening process undertaken by Hydro is described in Chapter 7 of the NFAT. Detailed information is summarized in Table 7.1, and further information concerning emerging energy technologies is provided in Appendix 7-1. The relevant findings in the NFAT concerning the macro environmental impact of hydroelectric resources are discussed below in section 3 of this submission.

2. Preferred and alternative development plans
    - Specific resource plans were developed from the "screened in" technologies
    - A qualitative analysis of the potential environmental and socio-economic impacts of the specific resources in the preferred and alternative plans was undertaken
    - For the Keeyask, Conawapa and Manitoba-Minnesota Transmission Projects, Hydro drew on its existing understanding of these components of the PDP
    - For natural gas turbine and wind projects, Hydro drew from past environmental impact statements and licenses (underlining added)

The proposal to use a qualitative approach to analyzing the environmental impacts is generally appropriate. However, where quantitative information is available (e.g. in the case of greenhouse gas emissions), it should be used to support the understanding of the significance of the effects and the comparison between alternative plans and the PDP. A decision not to provide quantitative information that could be reasonably prepared is not a valid reason for resorting to a qualitative approach.

As indicated above, there are limitations to relying solely on the Keeyask environmental impact statement and existing preliminary understandings of the other PDP components, which have yet to be constructed. In my view, it is also important to consider available information concerning the known effects of similar projects developed on the same river or on rivers in similar environments, and some examples of this kind of information are discussed and

analyzed further in section 4 below. The Keeyask and Conawapa projects are not the first hydroelectric facilities constructed on the Nelson River, the Nelson River is not the only river to be developed with multiple hydroelectric facilities, and northern Manitoba is not the only region to be extensively developed for hydroelectric purposes.

Manitoba Hydro's suggested use of previous environmental impact statements, licenses and other related existing information for other similar projects is important and necessary in the case of wind and natural gas resources as well hydro resources, since no detailed environmental assessments have yet been undertaken for specific wind and gas resources that would be developed as part of any alternative plans to the PDP.

3. Multiple Account Cost-Benefit Analysis (MA-CBA)

- The MA-CBA is a disaggregated form of cost-benefit analysis that integrates project specific environmental and socio-economic considerations along with other factors. It was used to assess the full range of economic, environmental and social advantages and disadvantages of the different plans to Manitobans
- The overall socio-economic benefit of the preferred and alternative plans was assessed by examining the advantages and disadvantages in terms of seven accounts of which "environment" is one
- The environment account "assesses the consequences of the different plans for the environment. It analyzes impacts on GHG emissions in Manitoba and elsewhere, criteria air contaminant (CAC) emissions in Manitoba, and natural resource and other bio-physical effects associated with the construction and operation of the projects in the different plans, and assesses the externality (net social cost) they represent. For GHGs this is done quantitatively; for other impacts it is done qualitatively."[6]

The MA-CBA compared the PDP to three plans as follows:

- Plan 1 – Gas Thermal with No New Interconnection (All Gas)
- Plan 2 – Keeyask with No New Interconnection (K22/Gas)
- Plan 4 – The Smaller Interconnection Alternative (K19/Gas24/250MW)

Specific limitations to the MA-CBA respecting the consideration of hydroelectric resources are discussed below in section 3. I note also that the MA-CBA did not compare the PDP to any of

[6] Letter of Manitoba Hydro to Mr. H. Singh (PUB) of June 28, 2013, at p. 4.

the alternative plans containing wind resources. This issue is addressed more fully in my submission to the PUB pertaining to the macro environmental and socio-economic considerations of wind resources.

Consumers Association of Canada

In addition to Manitoba Hydro, the Consumers Association of Canada (CAC) also submitted its understanding of macro environmental impact to the PUB. The CAC made several observations that appear to have informed the PUB's determination of the definition of macro environmental impact, including a six-part definition of which the final three parts were as follows:

4. The macro level environmental effects findings presented to and discussed in the PUB process should be based on detailed existing analyses and the level of confidence about the conclusions ought to be clearly established. (p.2) (underlining added)

The request by the CAC for consideration of detailed existing analyses echoes the approach proposed by Hydro with respect to reliance on previous environmental impact statements and licenses.

5. The macro level environmental effects covered should include potential and likely effects, positive and adverse effects, individual and cumulative effects, and interactions among effects. (p.2-3) (underlining added)

This speaks to the need to address and consider a broad set of changes to environmental conditions.

6. The macro environmental effects discussion should consider not only the effects listed above but also the implications for the relative merits and the Plan components in light of the relative significance of the effects and the trade-offs involved in proceeding with the major Plan components and alternatives. (p.3) (underlining added)

The reference to "significance" is important given the task in front of the PUB. Not all changes are material for either the biophysical or socio-economic environments. Ecosystems have a degree of resiliency and human communities a degree of adaptability, and it is therefore important to focus on those effects that may threaten that resilience or capacity to adapt. Secondly, the "relative" significance is also material since the consequences of the changes to environmental conditions resulting from the PDP must be compared to the potential alternatives that could fulfill the need.

Manitoba Métis Federation

In its response to the PUB request, the MMF requested that I provide a definition of macro environmental impact, which was submitted to the PUB as follows:

> macro environmental impact means: the collective adverse changes to the air, land, water, flora and fauna, including the potential significance of these changes, their equitable distribution within and between present and future generations, and their implications for ecological processes, biodiversity and life support systems of the environment. [7]

In preparing this definition, I relied on the requirement of the NFAT Terms of Reference to assess the "alignment of the Plan and alternatives to … the Principles of Sustainable Development as outlined in the *Sustainable Development Act*", which involve:

- management for equitable benefit within and between generations (Principle 2 – Stewardship, and Principle 3 – Shared Responsibility and Understanding);
- significant adverse environmental effects (Principle 4 – Prevention), where significance typically refers to effects that are not only large in "scale, scope or capability" but that are also, for example, of long duration or irreversible; and
- the need to maintain ecological processes, biodiversity and life support systems of the environment (Principle 5 – Conservation and Enhancement), which suggests the need for consideration of the impact of the plan and its alternatives in the context in which they would occur, suggesting the need for consideration of cumulative environmental changes.

Finally, I cautioned against the use of a "summary", which implies a summation of the environmental changes. In general, this is not possible since the kinds of environmental changes will be different between the PDP and the alternatives and cannot simply be "summed" for the PDP and the alternatives and the end results readily compared. This was the basis for proposing the term "collective" in the definition, which was accepted by the PUB, and which implies a bringing together of the consequences of the environmental changes where their characteristics are maintained and distinguishable.

[7] Letter of MMF to PUB Order 67/13, dated July 2, 2013, at p.1 of attached memo "Meaning of Macro Environmental Impact".

2.3 APPLYING THE DEFINITION OF MACRO ENVIRONMENTAL IMPACT

In Order 92-13, the PUB provided the following definition of macro environmental impact for use by participants in the NFAT:

> macro-environmental impact: the collective macro-environmental consequences of changes to air, land, water, flora and fauna, including the potential significance of these changes, their equitable distribution within and between present and future generations.[8]

Based on the contributions of Manitoba Hydro and the CAC, the explanations provided previously on behalf of the MMF, and the definition itself, I understand the definition to imply the following with respect to these key terms:

- Collective: a bringing together of the consequences resulting from all components of the PDP or of the alternative plans that maintains their defining features
- Consequences: includes potential and likely, positive and adverse, direct and indirect, individual and cumulative, secondary and synergistic, where likelihood is determined by:
  - Probability of occurrence
  - Scientific uncertainty [9]
- Significance: consideration of the following criteria in relation to the "consequences of the changes":
  - Magnitude
  - Geographic extent
  - Duration and frequency
  - Degree to which the consequences of the changes are reversible or irreversible
  - Ecological context [10]

I am proposing use of the above understanding of significance provided by the Canadian Environmental Assessment Agency (formerly FEARO) since:

- It is in wide use across Canada, thereby supporting comparisons and use of findings across different jurisdictions; and

[8] Manitoba PUB, Order 92/13, at p. 14.

[9] Federal Environmental Assessment Review Office. November 1994. A Reference Guide for the Canadian Environmental Assessment Act: Determining Whether a Project is Likely to Cause Significant Adverse Environmental Effects, at p. 193

[10] Ibid., at p. 192.

- It has been in use for nearly two decades, allowing comparisons and use of findings over time.

Manitoba Hydro has indicated[11] that defining and determining "significance" is a task exclusively of the environmental reviews carried out by the CEC and to use the accepted understanding of this term leads to duplication. This is only the case to the extent that the PUB repeats the actions of the CEC. This is not what I am proposing, as the recommendations and conclusions of the CEC will serve as an input into the PUB process, not a replacement for that process.

The challenge facing the PUB is that it needs to be able to compare the macro environmental impact of the resources composing the PDP to those composing the alternative plans. Other than for Keeyask, we do not have access to environmental assessment findings for the resources being considered in the PDP and the alternative plans. Having multiple definitions and uses of the term "significance" does not allow for a consistent understanding, consideration and comparison of the "consequences of changes". The use of the accepted definition of significance does not preclude the use of professional judgment, particularly in highlighting the uncertainties in the findings of significance from the environmental assessment conducted for the Keeyask Project, and also in evaluating information from comparative situations where resources similar to those proposed have undergone environmental assessment or similar reviews elsewhere.

[11] See MH/MMF I-053a, and MH/MMF II-041.

3 REVIEW OF NFAT INFORMATION

3.1 MANITOBA HYDRO

3.1.1 Environmental Effects

Chapter 2 of the NFAT describes the PDP facilities. With respect to the potential environmental effects, a "high-level summary" of information with respect to proposed mitigation measures, residual effects, and potential cumulative effects is presented for each of the four components of the PDP.

In response to CAC/MH I-231a, Manitoba Hydro provided a more detailed high-level summary of effects to air, land, water, flora and fauna in relation to each of the components of the PDP as well as for natural gas and wind resources.

The materials in the NFAT and the responses to information requests though helpful to obtaining a preliminary understanding of the "consequences of changes to air, land, water, flora and fauna" are not sufficient to allow for "an assessment as to whether the Plan is justified as superior to potential alternatives that could fulfill the need." Other than a brief restatement of the conclusion to the Keeyask Project EIS given from the Proponent's perspective, there is limited information concerning the potential significance of the environmental changes, or how these environmental changes are equitably distributed within and between present and future generations.

Hydro also presents and considers the effects individually for each of the components, and not collectively. Some insignificant effects may indeed be significant when considering multiple impacts, multiple project components, or multiple developments interacting cumulatively or synergistically.[12] For example, the CEA Agency noted in its recently released operational policy statement on cumulative effects that a "cumulative environmental effects assessment should consider those VCs [valued components] for which residual environmental effects are predicted

[12] Hegmann, G., C. Cocklin, R. Creasey, S. Dupuis, A. Kennedy, L. Kingsley, W. Ross, H. Spaling, and D. Stalker. 1999. Cumulative effects assessment practitioners guide. Prepared by AXYS Environmental Consulting Ltd. and the CEA Working Group for the Canadian Environmental Assessment Agency. Hull, Quebec, at p.30.

after consideration of mitigation measures, regardless of whether those residual environmental effects are predicted to be significant".[13]

I anticipate that some of these shortcomings will be addressed with the submission of the report of the CEC in relation to the environmental assessment of the proposed Keeyask Project. However, the conclusions and recommendations to government provided by the CEC, though necessary to the NFAT, will apply only to a single component of the PDP and only to those plans in Table 9.3 of the NFAT that contain Keeyask as a plan component. The findings of the CEC will not apply at all to those alternative plans that do not contain Keeyask.

3.1.2 Multiple Account Analysis

The MA-CBA, discussed in Chapter 13 of the NFAT, presents the results of the PDP as compared to alternative plans with and without new U.S. interconnection capacity and new export sale commitments; and with and without new hydro generating capacity to meet domestic load growth. As noted by Hydro:

> [MA-CBA] uses a set of evaluation accounts to move from a Manitoba Hydro to a broader Manitoba social perspective. The objective is to provide a systematic, comprehensive assessment of all of the benefits and costs to Manitobans in a manner that can assist the NFAT panel address the question of overall socio-economic benefit. [14]

The MA-BCA assesses the preferred and alternative plans in terms of a series of evaluation accounts, of which "environment" is one. In describing this environment account, Hydro notes that:

> the focus of this account is not the impacts in themselves, but rather the externality they represent – the external net benefit or cost to Manitobans not reflected in the market valuation or other accounts.[15]

The challenge with this approach is that the impacts and their residual effects do matter. In fact, Manitoba Hydro acknowledges as much shortly thereafter:

[13] CEAA (Canadian Environmental Assessment Agency). 2013. Operational Policy Statement, Assessing Cumulative Environmental Effects under the Canadian Environmental Assessment Act, 2012. http://www.ceaa-acee.gc.ca/default.asp?lang=En&n=1DA9E048-1

[14] Manitoba Hydro. August 2013. Needs For and Alternatives To ("NFAT"), Chapter 13, at p.2

[15] NFAT, Chapter 13, at p.12

> With respect to biophysical effects, the issue is whether there are residual impacts despite the mitigation and compensation built into the projects' plans and costs. [16]

It matters whether or not these residual effects pose unacceptable economic or other risks, or that they pose threats to the environment or to human health, or that there are too many significant adverse effects or cumulative effects to justify imposing them on local communities, on future generations or on Manitobans more generally. The CEA Agency highlights one of the limitations to the approach used by Manitoba Hydro in the NFAT:

> Although cost-benefit analysis could be used to justify proceeding with a project that is likely to cause significant adverse environmental effects, this justification can take place only after the likelihood of the significant adverse environmental effects has been determined.[17] (underlining added).

In my opinion, this presents a problem for the PUB, as it suggests that the "consequences of the changes to air, land, water, flora and fauna, including the potential significance of these changes" of each component of the PDP and of the alternative plans would need to have undergone an environmental assessment prior to the completion of the NFAT.

That is not going to happen. Even once the CEC produces its report concerning the proposed Keeyask Project, we will only have information concerning the residual changes and their potential significance of, at most, this single component of the PDP, which is a component in only some of the alternative plans. As discussed below in section 4, other means to determine the likelihood of significant adverse environmental changes or effects as well as the "consequences of these changes" need to be used in the absence of information from additional environmental assessments of resources composing the PDP and the alternative plans.

3.2 MNP

As an independent expert consultant, MNP was retained to, among other things:

> Perform a critical analysis of the macro environmental impacts and benefits of Manitoba Hydro's Preferred Development Plan and alternative Plans, specifically, the collective macro-economic consequences of changes to air, water, flora and fauna, including the potential significance of these changes,

[16] NFAT, Chapter 13, at p.13

[17] CEAA 2012. Reference Guide: Determining Whether a Project in Likely to Cause Significant Adverse Environmental Effects. https://www.ceaa-acee.gc.ca/default.asp?lang=En&n=D213D286-1&offset=3&toc=show

> their equitable distribution within and between present and future generations.[18]

Much of MNP's report is dedicated to analysing the preferred and alternative development plans relative to the effects of climate change, GHGs and other air emissions. This information is necessary and the findings confirm the GHG benefits of the PDP versus many of the alternatives.

Sections 1.2 and 1.3 of the MNP report detail the approach taken to address water regime changes, and macro environmental impact, respectively. A small number of valued environmental components (i.e. water regime change, lake sturgeon, caribou and other at-risk fauna) were evaluated for representative purposes using a list of significance criteria as follows:

- Magnitude of the impact
- Risk of occurrence
- Importance of the predicted impact for further MPUB consideration in MNP's opinion.

Section 10 of the MNP report provides a useful summary of the "most significant impacts" of the preferred development plan in relation to the identified valued components. This summary partially addresses the concerns raised about the lack of information concerning the significance of the effects of other components of the PDP.

However, some issues are left outstanding.

First, the list of criteria used by MNP for its determination of significance does not include a criterion of particular relevance to assessing hydroelectric generation projects, namely reversibility. While some components of the PDP, such as the transmission lines, roads or quarries, may be readily decommissioned and the lands eventually returned to a more ecologically productive condition, other components, such as generating stations, dams and reservoirs and their associated effects are effectively permanent. This is evidenced by the fact that proponents typically do not file dam or reservoir decommissioning plans and do not consider decommissioning costs. This is not the case, for example, for wind or natural gas facilities, which can be readily decommissioned. This issue of reversibility also appears to be underappreciated in the analysis of the intergenerational equity of the macro environmental issues in section 9 of the MNP report. For example, once wildlife species habitat is lost to

[18] Scope of Work for MNP NFAT Review Last Updated: September 20, 2013

reservoir inundation, it is lost indefinitely, and species populations will be indefinitely displaced and lowered. There will be fewer animals for predator species and for hunters and trappers. This is an effect that extends to future generations and should be considered effectively irreversible.

Secondly, other than the analysis of greenhouse gas emissions, there is no comparative analysis in the MNP report of the macro environmental impacts and benefits of the PDP and alternative plans with respect to other changes (i.e. land, water, flora and fauna). The analysis determined that the PDP "minimizes the effect of inequitable distribution of macro environmental impacts on future generations as this plan has the lowest overall GHG emissions and air pollutants."[19] Without knowledge of the macro environmental impacts of the alternative plans with respect to the consequences of other (i.e. non-GHG) changes to the environment, it is not possible to determine whether an alternative plan performs better overall than the PDP.

The primary finding of the evidence presented by MNP illustrates this problem:

> the net environmental benefits of Manitoba Hydro's (MH) preferred plan are found to outweigh its overall environmental costs in a regional and global context.[20]

Regardless of ones views on whether the PDP has "net environmental benefits", an additionally important question, and the one that matters most to the Board, is whether or not these net environmental benefits exceed those that could be obtained through pursuing an alternative plan.

3.3 SUMMARY

In summary, my review of the existing information concerning macro environmental impact indicates the following key concerns:

- The conclusions and recommendations to government provided by the CEC, though necessary to the NFAT, will apply only to a single component of the PDP and to those plans in Table 9.3 of the NFAT that contain Keeyask as a plan component. The findings of the CEC will not apply at all to those alternative plans that do not contain Keeyask.

[19] MNP. January 2014. NFAT Review: A Review of Manitoba Hydro's Macro Environmental Considerations, at p.75.
[20] *Ibid*., at p.1.

- Other means to determine the likelihood of significant adverse environmental changes or effects as well as the “consequences of these changes” need to be used in the absence of information from additional environmental assessments of PDP and alternative plan resources.
- The consideration of the “consequences of changes to air, land, water, flora and fauna” must consider a criterion of particular relevance to assessing hydroelectric generation projects, namely reversibility.
- The “net environmental benefits” of the PDP, if there are net benefits, must be compared to the net environmental benefits of the alternative plans to determine whether these net environmental benefits exceed those that could be obtained through the development of any of the alternative plans.

4 INFORMATION TO ASSIST THE PUB

4.1 POTENTIALLY RELEVANT INFORMATION

In light of the summary of concerns identified above with respect to the existing information available to the Board to conduct "a critical analysis of the macro environmental impacts and benefits of Manitoba Hydro's Preferred Development Plan (PDP) and alternative Plans", I have considered additional relevant information for use by the Board.

1. Prior hydroelectric projects on the Nelson River.

The information provided during the environmental assessment of the Keeyask Project, in the NFAT, and in the analysis conducted by MNP is predictive information. That is, it is based on the collection of baseline data and information, analysis and professional judgment about potential changes in the future. Information respecting the actual environmental effects of the existing hydroelectric facilities on the Nelson River (i.e. Kelsey, Kettle, Limestone, Long Spruce and Wuskwatim) can also be very valuable to understanding the likely macro environmental effects of the PDP, which would be constructed in a similar landscape.

2. Similar hydroelectric complexes on other river systems.

The PDP is not the first example of a multi-facility hydroelectric complex on a boreal river system in Canada. Other jurisdictions have developed similar schemes and are also currently contemplating or recently contemplated the merits of additional hydroelectric facilities on these river systems. The considerations and findings in these other jurisdictions with respect to macro environmental issues are of potential value to the Board in its consideration of the macro environmental impact from the PDP and the alternative plans.

In addition to the above information pertaining to hydroelectric resources, I have identified potentially relevant information concerning the macro environmental impact of wind resources, as these resources have not been adequately considered by either Hydro or MNP in their respective comparative analyses. This information is discussed in my submission to the PUB pertaining to the macro environmental and socio-economic considerations of wind resources.

4.2 PRIOR HYDROELECTRIC PROJECTS ON THE NELSON RIVER SYSTEM

4.2.1 Historic Facilities

Probably the best place to begin to attempt to understand the "consequences of changes to the air, land, water, flora and fauna, including the potential significance of these changes" that would result from the PDP is with the existing hydroelectric facilities on the Nelson River, and the transmission infrastructure in the general region.

The relevance of these existing facilities stems from the fact that they are located in the same biophysical context as the proposed PDP. What has been learned about the existing facilities in terms of changes to environmental conditions is very relevant to trying to understand the macro environmental impact of the Keeyask and Conawapa facilities to be located directly upstream and downstream, respectively, of the existing facilities. (see Appendix A for a summary of these facilities and infrastructure).

4.2.2 Scope of Available Information

NFAT

In an attempt to identify information concerning the environmental changes of the existing hydroelectric facilities on the Nelson River, I searched for any information related to these facilities in the NFAT filings. While I was able to locate some information indicating that Manitoba Hydro is studying existing conditions within the reservoirs,[21] there was no specific information respecting the likely effects of the prior developments that could assist in understanding the potential macro environmental impact of additional hydroelectric development as part of the PDP or the alternative plans.

Environmental Impact Statement

Recognizing that this NFAT process is not intended to duplicate the environmental assessment of the Keeyask Project, I reviewed only the aquatic portion of the environmental impact

[21] E.g. in relation to lake sturgeon see NFAT, Appendix 2.1, at p.1.

statement[22] and the historical overview portions of the Cree Nation environmental evaluation reports dealing with hydroelectric developments. [23] [24] [25]

My review indicates that the EIS and environmental evaluations describe the adverse nature of the effects of the prior development in very general terms and provide overall perspectives on the implications of these effects for use of the affected lands and waters.

> Past project effects have substantially altered the existing environment from that known historically, as such the current heritage resources environment along the river within the open water hydraulic zone of influence may not represent that which was present prior to hydroelectric development. [26]

Some potential differences between the proposed Keeyask Project and the existing facilities in terms of environmental changes are also presented.[27] The behaviour of fish species within the existing reservoirs is also used to attempt to understand the behaviour of fish in the future Keeyask reservoir.[28] In other instances, the EIS acknowledges comparison to other components of the Nelson River system:

> The magnitude and the spatial and temporal extent of effects were determined through several methods, including: use of Stephens Lake, a reservoir environment similar to the Keeyask reservoir, as a proxy; comparison to empirical data from other reservoirs (e.g. Limestone and Long Spruce reservoirs in Manitoba, the Robert-Bourassa reservoir in Québec, and the lower Churchill River reservoir in Newfoundland and Labrador); and, where applicable, empirical models developed on the basis of observed relationships in the study area and elsewhere.[29]

While these types of information are useful to understanding the potential effects of the proposed Keeyask Project, they do not provide the kind of detail necessary to fully appreciating the nature and scope of the consequences of the changes that have resulted from the prior developments in a manner that would assist in characterizing the potential effects of potential future hydroelectric projects on the Nelson River.

[26] *Ibid*., at p.182.

[27] *Ibid*., at p.223.

[28] *Ibid*., at p.269.

[29] *Ibid*., at p.238.

Other Documents

It may be the case that Manitoba Hydro has characterized the residual effects of the prior developments in other documents. My review of materials on the company website confirmed the existence of some programs designed to monitor environmental quality in the existing reservoirs.[30] However, these programs do not seem to be designed with the overall intention of understanding the residual environmental effects of the existing facilities.

4.2.3 Summary

The apparent lack of comprehensive information concerning the residual environmental effects of the existing hydroelectric facilities is unfortunate. This kind of information would be very valuable in characterizing the potential consequences of changes to the environment resulting from future hydroelectric developments on the Nelson River, whether in relation to the PDP, to the alternative plans, or to some other future hydroelectric development in the Province.

Other utilities, including Hydro-Quebec[31] and BC Hydro, have made and continue to make efforts to characterize the residual effects of previous developments. BC Hydro's fish and wildlife program for the Columbia River[32] is particularly relevant as it considers cumulative environmental effects as an aggregate of multiple dam and reservoir footprints on the same river basin as an integrated ecological system.[33]

In summary, there does not appear to be sufficient information pertaining to the residual effects of the existing hydroelectric facilities on the Nelson River to provide meaningful insight into the potential effects of the hydroelectric components of the PDP or the alternative plans. This situation may change in the future, particularly as a result of the recommendations

provided by the CEC in relation to the environmental assessment of the Bipole III project, and that the Minister accepted,[34] in particularly recommendations 11.1 and 13.2:

> 11.1 Manitoba Hydro implement a cumulative effects assessment approach that goes beyond the minimal standard of the 1999 CEAA guidelines and is more in line with current "best practices." [35]
>
> 13.2 Manitoba Hydro, in cooperation with the Manitoba Government, conduct a Regional Cumulative Effects Assessment for all Manitoba Hydro projects and associated infrastructure in the Nelson River subwatershed; and that this be undertaken prior to the licensing of any additional projects in the Nelson River sub-watershed after the Bipole III Project. [36]

The information that could come out of a regional cumulative effects assessment could greatly assist the Board in understanding the residual effects of the existing facilities and using that information to predict the macro environmental impact of the PDP. This information will not be available for the current process. However, in the event that the PDP does not proceed or is delayed for several years, I recommend that the Board make use of the findings of this cumulative effects assessment program.

[36] Ibid., at p.130.

4.3 SIMILAR HYDROELECTRIC COMPLEXES ON OTHER RIVER SYSTEMS

4.3.1 Identification of comparable situations

There are several large rivers in Canada that have been developed with multiple generation, transmission and river diversion projects. In order to identify comparable hydroelectric complexes to the proposed PDP, I began by considering the historical hydroelectric development context on the Nelson River, summarized in Appendix A. To focus the analysis, I defined several criteria that: reflect the existing developments on the Nelson River; acknowledge that the development context has substantial implications for Aboriginal peoples; and recognize that new developments are currently being considered. I then used these criteria to screen potential hydroelectric complexes on several rivers in boreal regions across Canada, as indicated in the following table.

Table 4-2: Hydroelectric Complexes in Canada

River Systems	Churchill River (Labrador)	Romaine River (Qubec)	Manicouagan River (Quebec)	La Grande River (Quebec)	Lower Mattagami River (Ontario)	Peace River (BC)	Columbia River (BC)
Evaluation Criteria							
Multiple large generation facilities and/or river diversions built over several decades	Y	N	Y	Y	Y	Y	Y
High voltage transmission facilities	Y	Y	Y	Y	Y	Y	Y
New generation, diversion and/or transmission facilities assessed in the past decade	Y	Y	N	Y	Y	Y	N
Existing or proposed generation facilities on the main stem of the river system	Y	Y	Y	Y	Y	Y	Y
Substantial implications for Aboriginal groups	Y	Y	Y	Y	Y	Y	Y
Located in boreal ecosystems	Y	Y	Y	Y	Y	Y	Y
Reviewed by an independent panel	Y	Y	?	Y	N	Y	?
Meets all Criteria	**YES**			**YES**		**YES**	

The inclusion of the final criterion – “reviewed by an independent panel” – reflects my desire to seek out the highest levels of informed advice provided to governments in Canada. As is the

case with the Nelson River developments, there is a considerable volume of information available concerning these similar hydroelectric complexes. Considering the available time and resources, I focused my review on the observations, conclusions and recommendations of these independent regulatory proceedings. My preoccupation was not so much with the particularities or idiosyncrasies of the specific cases since these may be different as a result of project design or environmental context, but on the findings that would have more general application to consideration of the macro environmental impact of these other proposed developments in the context of the available alternatives – the same task before the PUB.

4.3.1 La Grande River (Quebec)

Historic Facilities

Begun in the early 1970s, the hydroelectric generating stations on the La Grande River in northern Quebec, collectively referred to as the James Bay Project or La Grande Complex, constitute the largest such development in Canada. According to the Société d'énergie de la Baie James, the agency responsible for the development of the Project, it consists of the following:

- eight hydroelectric generating stations with a total installed capacity of 15,240 MW, producing 78.3 TWh of electricity annually
- six 735-kV AC transmission lines and one ± 450-kV DC transmission line, for a total length of around 7,400 km
- partial diversion of the Caniapiscau and Eastmain Rivers into the La Grande River
- over three hundred retaining structures (dams and dykes)
- the development of thousands of kilometres of new roads, airports and other infrastructure [37] [38]

The implications of the La Grande Complex for the local Cree Nations were extensive, though the lack of a comprehensive environmental assessment at the time of the development of the Complex has prevented a full appreciation of the social effects for the Cree Nations.[39]

[37] http://www.hydroquebec.com/sebj/en/lagrande.html

[38] http://www.hydroquebec.com/hydloandfriends/publications/the-la-grande-hydroelectric-complex/index.html

[39] See http://www.gcc.ca/archive/article.php?id=38

Nonetheless, the effects generally parallel many of those experienced by the Aboriginal groups in Manitoba in relation to the Nelson River hydroelectric developments.[40]

The Eastmain-1 Powerhouse and Rupert Diversion

Project Description

In 2004, Hydro Quebec proposed additional hydroelectric facilities in Cree territory, as envisioned under the James Bay and Northern Quebec Agreement (JBNQA).[41] These new facilities, known as the "Eastmain-1 Powerhouse and Rupert Diversion" entailed the construction of Eastmain-1-A powerhouse and Sarcelle powerhouse, as well as the partial diversion of the Rupert River into Eastmain-1 reservoir, which had previously been diverted into the La Grande Complex. The proposed Project is in many ways similar to the diversion of the Churchill River into the Nelson River in Manitoba, in that it was intended to increase the production of electricity at existing facilities on a neighbouring river.[42] Hydro Quebec described the Project in the EIS as follows:

> The water diverted from the Rupert River will be channelled through the Rupert forebay and tailbay into Eastmain 1 reservoir, where it will power the turbines at Eastmain-1 and Eastmain-1-A powerhouses. The flow will then continue on to Opinaca reservoir, at the outlet of which, as per the option exercised by the Crees, a powerhouse will be constructed on the right bank near the existing Sarcelle control structure. Downstream of Opinaca reservoir, the diverted waters will flow through Lake Boyd and Sakami Lake, and then into Robert-Bourassa reservoir, to be turbined at Robert-Bourassa and La Grande-2-A. The flow will then be channelled into La Grande 1 reservoir and turbined once more at the La Grande-1 facility before emptying into James Bay via the Grande Rivière. It should be noted that the Rupert diversion will go into operation at least one year before Eastmain-1-A powerhouse. This will enable Hydro-Québec Production to increase its average annual output by some 8.5 TWh: 2.3 TWh from Eastmain-1-A, 0.9 TWh from Sarcelle powerhouse and 5.3 TWh from the increase in overall output from Robert-Bourassa, La Grande-2-A and La Grande-1. [43]

[43] Eastmain-1-A Powerhouse and Rupert Diversion – Environmental Impact Statement Volume 1: Chapters 1 to 9 – December 2004, at p.1-6.

Aboriginal Groups

The Project was developed pursuant to the *Agreement Concerning a New Relationship Between le Gouvernement du Québec and the Crees of Québec* (NRA). The *Boumhounan Agreement*, a sub-agreement of the NRA that pertains specifically to the Project, was signed between the Crees of Québec, Hydro-Québec and Société d'énergie de la Baie James. The main provisions of the *Boumhounan Agreement* are as follows:

- The Crees consent to the construction, operation and maintenance of the project, subject to the provisions of the *Boumhounan Agreement*.
- The Project is subject to the environmental and social protection regime stipulated in Section 22 of the JBNQA.
- Hydro-Québec undertakes to carry out remedial and mitigation measures, implement the specific guarantees, assurances and undertakings, and provide the economic and community benefits stipulated in the *Boumhounan Agreement*.[44]

Of note, once the Project was accepted by means of a special resolution of the Hydro-Québec Board of Directors and once the necessary permits and approvals were obtained, Hydro-Québec agreed that it would waive the possibility of building the Nottaway-Broadback-Rupert (NBR) project, which is provided for in the JBNQA. The following table from the EIS[45] compares the Project to the NBR.

Table 1-2: Comparison of project characteristics

Characteristics	Eastmain-1-A/Rupert	Nottaway-Broadback-Rupert[a]
Reservoirs	Creation of two diversion bays along the course of the Rupert diversion	Four major reservoirs in addition to the forebays of the powerhouses
Total area flooded	346 km^2	6,497 km^2
Number of dams	4	Approximately 20
Number of dikes	74	Over 130
Source :Complexe Nottaway-Broadback-Rupert, *Rapport préliminaire d'impact sur l'environnement et le milieu social*, Volume 4, December 1982		

a. Diversion variant: Variant III
Reservoirs on the Rupert: R-10 and R-11
Powerhouses: on the Rupert (R-10 and R-11), on the Broadback (B1, B2, B3, B4, B5, B6, B8), and Quénonisca and Evans generating stations

[44] Ibid, at p. 1-10.

[45] Ibid, at p. 1-11.

As noted by Hydro-Quebec in the EIS:

> Although the partial diversion of the Rupert will have impacts, the abandonment of the NBR project in favour of Eastmain-1-A/Rupert is a major plus for the Crees.[46]

The decision by Hydro-Québec and the Cree Nations to move forward with the negotiation of the *Boumhounan Agreement* suggests the following:

- Historic agreements, like the JBNQA, can be renegotiated as circumstances change;
- The framework for dealings between the Crown and Aboriginal peoples is part of an ongoing relationship and can change over time; and
- It is not uncommon for large hydroelectric utilities to reconsider their initial plans in light of changing circumstances.

Environmental Assessment

A Joint Review Panel assessment of the Eastmain-1 Rupert Diversion was carried out over several years leading to submission of a Panel Report in November 2006. The environmental assessment was conducted pursuant to the *Agreement Concerning the Environmental Assessments of the Eastmain-1-A and Rupert Diversion Project*, put in place to prevent duplication and overlap and to coordinate and align the assessment and review processes of different jurisdictions.

The five-member Panel was mandated to conduct a review of the environmental effects of the Project, including in the context of the need and alternatives to the Project, and to report to the federal Minister of the Environment. The review included preparation of directives (terms of reference) for the assessment, review of the EIS, and hearings in several Cree communities, as well as in Chibougamau and Montréal. The key relevant findings of the Panel are discussed below.

Alternatives to the Project

> The Panel concludes that, while wind power is a worthwhile complement to Quebec's core hydroelectric system, replacing viable hydroelectric projects with wind power cannot be justified under current conditions.[47] (underlining added)

[46] Ibid, at p. 1-10.

Those "current conditions" have changed considerably with respect to wind resources, as discussed in other submissions to the Board.[48] Interestingly, since the time of developing the Project, Hydro Quebec has constructed and contracted for nearly 3000 MW of wind resources.[49] As a result of developing both the Project, the Romaine Hydroelectric Complex and wind resources, coupled with the continued decline in load growth in domestic and export markets, Hydro Quebec will be running a large surplus for many years.[50]

This situation illustrates for the PUB the importance of considering future trends in the costs of the alternatives to the PDP, both in terms of creating unnecessary and expensive surpluses but also in avoiding unnecessary and permanent imposition of adverse environmental effects on the receiving environment and communities.

Project Justification

> The Panel concludes that, to date, there is no alternative or combination of alternatives that can guarantee the same operating and economic benefits as the proposed project. However, it considers that economic grounds alone are not sufficient to justify approval of the project since the project must also be considered environmentally and socially acceptable.[51] (underlining added)

The Panel reached a somewhat similar conclusion to that reached by Manitoba Hydro in its NFAT submission:

> Manitoba Hydro has compared the following development plan against alternative plans and has concluded that it is in the best long-term interests of Manitobans…[52]

However, the two caveats included in the justification statement above indicate that the Eastmain-1 Panel established macro environmental requirements that the proposed Project had to satisfy regardless of its operational and economic benefits.

[51] Eastmain-1 Panel Report, at p.iii.

[52] NFAT, Chapter 1, at p.2.

These macro environmental requirements speak to the "trade-off rules" noted by Dr. Gaudreau and Dr. Gibson in their Framework for Sustainability-based Assessment:

> Explicit and principled consideration of trade-offs is also an important component of sustainability assessment. The essential rules for trade-off considerations centre on open deliberations, emphasis on avoidance, and preclusion of trade-offs that displace significant adverse effects to future generations. But as with generic sustainability requirements and criteria, trade-off rules need to be specified for the context.[53] (underlining added)

One of those "trade-off rules" is "Avoiding Trade-offs":

> • treat potential trade-offs as a regrettable last resort while seeking mutually reinforcing and lasting cumulative contributions for the most positive overall result and avoiding significant adverse effects[54]

In assessing the PDP and the alternative plans with respect to macro environmental impact, it is my view that the experience of the Eastmain-1 Panel indicates that where significant environmental effects are anticipated, all reasonable steps must be taken to avoid trading off these environmental effects, including taking measures that could allow for the evolution of "an alternative or combination of alternatives" that would not require such trade-offs.

Cumulative Effects

> In terms of the quality of life of the Cree, the negative impacts of the project, combined with the effects of previous hydro-electrical projects, could exacerbate problems relating to opening and developing the land and harvesting traditional foods. The Panel believes that although the impact of the project appears marginal when looking at the big picture, the communities will still suffer consequences. [55] (underlining added)

This observation speaks to the tendency to view additional impacts in the context of larger impacts that occurred historically and in the context of a prior and different cultural understanding with respect to what is acceptable to impose on people and places, rather than

[53] K. Gaudreau and R.B. Gibson. 2014. Framework for Sustainability-based Assessment for the Public Utilities Board's Needs For and Alternatives To (NFAT) Assessment of Manitoba Hydro's Preferred Development Plan and Alternatives, at p.6

[54] Ibid., at p.30.

[55] Eastmain-1 Panel Report, p.xxi

viewing these impacts in the current context or even attempting to project forward to what future generations may consider justifiable.

> It feels that the cumulative impact is real, but difficult to quantify, making it impossible to specify the relative significance of the marginal cumulative impact and the causes of change attributable to the project. …. It therefore had to rely on its own judgment in this respect.[56]

This observation of the Panel is consistent with observations of many independent reviews of hydroelectric facilities, namely that information respecting cumulative effects is not sufficient to draw defensible conclusions about macro environmental consequences, whether adverse or beneficial. In my opinion, the PUB may also be relying in this instance on "its own judgement" in respect of the potential cumulative effects of the proposed PDP. The NFAT has not provided information relevant to consideration of the "collective environmental consequences" that may result from the PDP, relying instead on the future submission of the materials from the CEC review of the Keeyask Project, a single component of the PDP.[57]

> The Panel is of the opinion that the cumulative impacts of the La Grande Complex, coupled with the effects of the increased flow of the Rupert River, should be evaluated for the Chisasibi, Eastmain and Wemindji communities.
>
> …the Panel finds that the data that are currently available are insufficient to quantify the cumulative impacts on James Bay and Hudson's Bay or separate them from the major factors affecting these ecosystems, including inter-annual variability and climate change.
>
> … the Panel considers that a formal analysis of these impacts cannot be conducted without establishing a large-scale research and follow-up program, a measure which the Panel recommends.
>
> … The Panel believes that it would be important to initiate discussions on a more systemic approach to the analysis of cumulative impacts or on the possibility of making greater use of strategic environmental assessment in the evaluation of governmental policies and programs. [58]

[56] Eastmain-1 Panel Report, at p.xxi.

[57] See MMF/MH I-053a.

[58] Eastmain-1 Panel Report, p.xxi.

These recommendations are similar to those provided by the CEC in relation to the environmental assessment of the Bipole III project, and that the Minister accepted,[59] in particularly recommendations 11.1 and 13.2:

> 11.1 Manitoba Hydro implement a cumulative effects assessment approach that goes beyond the minimal standard of the 1999 CEAA guidelines and is more in line with current "best practices." [60]
>
> 13.2 Manitoba Hydro, in cooperation with the Manitoba Government, conduct a Regional Cumulative Effects Assessment for all Manitoba Hydro projects and associated infrastructure in the Nelson River subwatershed; and that this be undertaken prior to the licensing of any additional projects in the Nelson River sub-watershed after the Bipole III Project. [61]

The findings of the Eastmain-1 Panel support the concern that the cumulative environmental effects related to large-scale hydroelectric developments cannot be determined without a comprehensive research and follow-up program related to the existing facilities, which does not yet exist in relation to the Nelson River developments. In my opinion, without this knowledge of the existing conditions and the extent of change already imposed, the degree of certainty associated with the potential "collective consequences of changes" resulting from additional hydroelectric development on the Nelson River would be necessarily low.

Overall Finding

> …the Panel believes that the anticipated environmental and social impacts will be numerous and widespread, but the impacts are definable and can be mitigated in a satisfactory manner if all of the necessary conditions are put into effect. For these reasons, and considering the project's clear benefits, the Panel finds that the acceptance of these impacts is justifiable. [62] (underlining added)

The underlined conditions suggest that the bar was high for approving the Eastmain-1 Project. The impacts can be mitigated only if all the necessary conditions are put into effect, and justifiable only if there are clear benefits, presumably compared to the adverse effects but also compared to the alternatives available.

[59] Letter from Minister Gord Mackintosh to Shannon Johnson (Manitoba Hydro), dated August 14, 2013 re: Environmental Act Licence No. 3055.

[60] Manitoba Clean Environment Commission. June 2013. Report on Public Hearing: Bipole III Transmission Project, at p.129.

[61] Ibid., at p.130.

[62] Eastmain-1 Panel Report, at p.xxiv.

Dissenting Opinion

A member of the Panel did not agree with the majority decision in the case of the Eastmain-1 Project. I have also considered this Panel member's observations, conclusions and recommendations of relevance to macro environmental issues.

> • **Adaptive Management**. In order to limit the impact of the diversion of the Rupert River on fish habitats, an ecological instream flow regime is planned that would be synchronized around three periods of biological activity of the main fish species present in the river. The proponent has also agreed to respect the principle of adaptive management for this instream flow regime. The application of this principle would allow, if need be, for the revision of this regime if an impact is detected *a posteriori*, either during environmental monitoring by the proponent or as observed by users of the territory. However, such a measure does not allow one to determine, in advance of the project's approval, the potentially adverse effects if changes in the values of this regime aimed at protecting habitats or the sustainability of fish resources were to prove unrealistic in terms of the project's economic efficiency. … The project's economic profitability must be assessed on the basis of environmental requirements before permits are obtained, otherwise the project would be funded on "environmental credit," in which case it would be unacceptable for the project to go ahead. [63] (underlining added)

This raises an important consideration for the Board in evaluating the PDP. The onus is on Manitoba Hydro to demonstrate that the macroenviromental risks have been substantially addressed so as not to threaten either the economic viability of the PDP or threaten the economic advantage (if any) that the PDP may have over the alternative Plans (if any) that have lower macro environmental impacts.

> • **Sum of effects of the project**. Given the magnitude of the follow-up and monitoring required, some of which will serve to confirm the hypotheses on which the very design of the project is based, it will be several years before we will be able to determine the accuracy of these hypotheses and the success of the mitigation and compensation measures. Only then will we be able to fully judge whether the project's advantages outweigh its disadvantages. [64] (underlining added)

The issue being raised here in this dissenting opinion speaks to the nature of hydroelectric resources, namely that once they are developed they cannot readily be undeveloped or substantially altered. In assessing the macro environmental impact of the PDP and the

[63] *Ibid*., at p.381.

[64] *Ibid*., at p.383.

alternative plans, I recommend that the Board pay particular attention to the degree of uncertainty assigned to the predicted effects of the Keeyask by the CEC, and that effects that are considered moderately or likely to occur be assumed to occur.

> • **Loss of a natural and cultural heritage**. On a historical level, the Rupert River is part of one of the major arteries linking the St. Lawrence River and James Bay watersheds. It was one of the rivers most frequently travelled by explorers transporting commercial goods, including furs. The Crees have used it for centuries and it continues to play an essential role in their culture and way of life. Archaeological sites attest to its use as far back as the period of prehistoric human occupation. … Despite the mitigation measures proposed by the proponent, therefore, the partial diversion of the Rupert River represents a major negative cumulative effect on Quebec's natural and cultural heritage and raises questions about whether limits should be imposed on hydroelectric development, particularly on Eeyou Istchee territory. [65] (underlining added)

The notion of limits in the case of further hydroelectric development within the La Grande Complex is consistent with the CEC recommendation for a cumulative effects assessment, discussed above, prior to the licensing of any additional projects in the Nelson River sub-watershed.

The context surrounding what happened after the approval of the Eastmain-1 Rupert Project is of particular relevance for the PUB. In this instance, the Panel acknowledged that the "anticipated environmental and social impacts will be numerous and widespread", the Panel was aware that "under current conditions" alternatives could not yet be justified, but it proceeded to find these impacts justifiable without proposing a plan to avoid the trade-offs for a period of time to allow the situation to evolve.

As a result, those impacts are now imposed indefinitely without any lasting benefit to Quebeckers as a whole, since electricity from the Eastmain-1 Project is surplus to domestic requirements and sold on export markets at a cost considerably below production costs.

[65] *Ibid*., at p.388.

4.3.2 Churchill River (Labrador)

Historic Facilities

Owned and operated by the Churchill Falls (Labrador) Corporation, the Churchill Falls Project is one of the largest hydroelectric generating stations in the world, having a capacity of 5,428 MW and producing approximately 34 TWh of electricity annually. Constructed in the late 1960s, the Project resulted in profound changes on the landscape and ecology within the reservoir, downstream of the powerhouse in the Churchill River, as well as downstream in the rivers that were diverted into the reservoir above the generating station and control structures. In a community review of the effects of this Project,[66] the Innu of Labrador made similar observations to those noted by similarly affected Aboriginal groups in Manitoba.[67]

Commissioned in 1971, the Churchill Falls Project consists of the following components:

- A 5428 MW underground generating station
- A large reservoir totaling approximately 5750 km^2 in area
- Partial diversion of the Naskapi River
- Partial diversion of the Kanairiktok River
- Numerous dykes and controls structures
- Three 500 kV AC transmission lines from Churchill Falls generating station to Montreal
- The Town of Churchill Falls[68] [69]

The Lower Churchill Project

Project Description

In late 2006, Nalcor Energy registered the first of several components of Lower Churchill Project for environmental assessment. The Project consists of the following components:

- Lower Churchill Hydroelectric Generation Project

[66] The Innu Nation Community Consultation on the New Mishta-shipu Hydro Project. 2000. Power Struggle: An Innu Look at Hydro Developments in Nitassinan Final Report.

[67] See http://keeyask.com/wp/the-project/environmental-assessment-process/eis/keeyask-cree-nations-enviro-evaluation-reports

[68] http://www.nalcorenergy.com/chuchill-falls-at-a-glance.asp

[69] Hatch. 2010. Churchill Falls Dam Break Study, Volume 1 – Main Report

  - Gull Island Generation Project, a 2250 MW facility on the Churchill River downstream of the existing Churchill Falls Project, generating 11.9 TWh/year
  - Muskrat Falls Generation Project, a 824 MW facility on the Churchill River downstream of the proposed Gull Island Generation Project, generating 4.8 TWh/year
  - A 735 kV AC transmission line between Gull Island and Churchill Falls (203 km)
  - A 345 kV AC transmission ling between Gull Island and Churchill Falls (203 km)
  - Two 345 kV AC lines between Muskrat Falls and Gull Island (60 km)
- Labrador Island Transmission Link
  - An AC to DC converter station at Muskrat Falls
  - A ± 350 kV DC transmission line from Muskrat Falls to the Strait of Belle Isle (approximately 400 km)

The Labrador Island Transmission Link also continues onto the Island of Newfoundland, and electricity is eventually exported to Nova Scotia via the Maritime Link, which is also part of the Project. For the purposes of this review, I considered only those components within Labrador, and focused on the assessment of the Lower Churchill Hydroelectric Generation Project, since this was the only component considered by an independent review panel.

Aboriginal Groups

The Lower Churchill Hydroelectric Generation Project was developed pursuant to the Tshash Petapen (New Dawn) Agreement between the Province of Newfoundland and Labrador, the Province's Crown Corporation Nalcor Energy, and Innu Nation, the association representing the Innu of Labrador. The main components of the Tshash Petapen Agreement are as follows:

- A Land Claim Agreement in Principle
  - Land selection and rights of the Innu to quantities and categories of land
- Upper Churchill Redress Agreement
  - Payments to Innu Nation in relation to the Churchill Falls Project
  - A comprehensive release by Innu Nation for any and all past, present and future claims in relation to the Churchill Falls Project
- Lower Churchill Impacts and Benefits Agreement
  - Payments to Innu Nation in relation to the components of the Lower Churchill Project within Labrador
  - Other benefits to the Innu Nation (e.g. business opportunities)

- A comprehensive release by Innu Nation for any claims in relation to the Lower Churchill Project

Other Aboriginal Groups potentially affected by the Lower Churchill Project include the Labrador Inuit (Nunatsiavut Government), the southern Labrador Inuit (Nunatukavut) and Innu resident in Quebec who use lands in Labrador.

Environmental Assessment

A Joint Review Panel assessment of the Lower Churchill Project commenced in late 2007 and concluded in August 2011 with submission of the Panel Report to the Provincial and Federal Minsters of Environment. The environmental assessment was conducted pursuant to a harmonization agreement between the two levels of government.

The five-member Panel was mandated to conduct a review of the environmental impact statement in accordance with EIS Guidelines issued by the Ministers, determine the sufficiency of the EIS and hold public hearings. A total of 30 days of public hearings were held in Goose Bay and surrounding communities, in the Innu community of Sheshatshiu, in several Inuit communities, in Sept-Îles, Québec, as well as in St. John's. The key relevant findings of the Panel Report are discussed below.

Need, Purpose and Rationale

> the Panel concluded that Nalcor had not demonstrated the justification of the Project as a whole in energy and economic terms, and that there are outstanding questions related to both Muskrat Falls and Gull Island regarding their ability to deliver the projected longterm financial benefits to the Province, even if other sanctioning requirements were met. The Panel therefore recommended that the Government of Newfoundland and Labrador carry out separate formal financial reviews before sanctioning either Muskrat Falls or Gull Island to confirm whether the component being considered for sanction would in fact deliver the projected long-term financial benefits.[70]

These observations recognize the inherent challenges in determining the long-term financial benefits of hydroelectric projects as a result of long lead times and long financing periods, among other factors. They also demonstrate that during the reviews of hydroelectric projects,

[70] Report of the Joint Review Panel. August 2011. Lower Churchill Hydroelectric Generation Project, Nalcor Energy, Newfoundland and Labrador (Lower Churchill Panel Report), at p.xiii.

which are necessarily lengthy as a result of the complexity of issues involved, circumstances can change materially.

In the case of the Lower Churchill Project, during the review process, the initial preferred option to develop the larger Gull Island facility followed by the much smaller (and much more expensive in terms of unit energy cost) Muskrat Falls Project was reversed. Because the preferred option had been put forward as one of several possible options, the Panel proceeded to assess these variants since it was obligated to assess the Project "as proposed" by the Proponent.

In the current instance, such a reversal of the Keeyask and Conawapa generating stations is not contemplated as part of the PDP. However, some changes to the PDP as initially proposed have already occurred in relation to the Wisconsin Public Service (WPS) export and transmission investment. Further changes may yet occur prior to the conclusion of the process.

In the event the PUB recommends the proceeding with the PDP, I recommend that the PUB clearly indicate its understanding of the description of the PDP that is being recommended and, as appropriate, indicate any changes to the PDP that would be inconsistent with the findings of the PUB with respect to the associated macro environmental impact (e.g. changes that would make the PDP acceptable or unacceptable, based on macro environmental impact).

Alternatives to the Project

> …the Panel concluded that Nalcor's analysis, showing Muskrat Falls to be the best and least-cost way to meet domestic demand requirements, was inadequate and recommended a new, independent analysis based on economic, energy and environmental considerations. … The Panel also recommended consideration of Integrated Resource Planning as a better planning approach compared to the traditional approach of forecasting loads and then finding the lowest cost solution for meeting them. [71]

The "new, independent analysis" recommended by the Lower Churchill Panel is similar in some ways to the NFAT process currently underway in relation to the PDP. However, a submission [72] during the current NFAT proceeding has also noted that the review of the PDP also suffers from similar shortcomings to the approach used in the case of the Lower Churchill Project.

[71] Lower Churchill Panel Report, at p.xiii.

[72] Elenchus Research Associates Inc. January 2014. A Review of Manitoba Hydro's Demand Side Management Plan, at p.1.

The use of a proper integrated resource planning (IRP) process is not only material to ensuring that DSM is properly considered as a resource option, but it is also material to ensuring that the macro environmental impact of DSM is properly evaluated. The environmental effects of DSM are substantially lower than all of the supply side resources contemplated in the PDP and the various alternative plans. As such, the decision not to include DSM as a resource option is to implicitly accept greater macro environmental impact from the outset and greater macro environmental impact than is necessary. In my opinion, that is unacceptable. Not developing DSM resource options and evaluating them through an IRP process is a fundamental shortcoming of the NFAT process.

Greenhouse Gases

> The Panel notes that greenhouse gas emissions from the Project would be significant if considered in isolation. There is considerable uncertainty over the extent of displacement of higher greenhouse gas emitting sources of energy; however, there is every reason to expect that Project emissions would be more than offset through displacement of higher greenhouse gas sources of energy. [73]
>
> The Panel concludes that the opportunity to displace greenhouse gas intensive power is one of the great potential benefits of the proposed Project. How much of this potential is realized depends on the markets the power is sold into, whether it explicitly replaces coal-based power production, and whether the potential of utilizing the power from this Project to back up wind generation and other intermittent renewable power production is maximized. [74] (underlining added)

Two of the potential environmental benefits of large-scale hydroelectric development are described above: the potential to offset greenhouse gas emissions from other sources and the potential to integrate intermittent renewables into the electricity system. I recommend that the Board indicate in its report its conclusions respecting the long-term net greenhouse gas emissions of the PDP and alternative plans, noting any further emission reductions that could be realized for each of the plans through a more integrated approach to consideration of DSM or other demand-side measures.

[73] Lower Churchill Panel Report, at p.56.

[74] *Ibid*., at p.59.

Aquatic Environment

> The Panel concludes that … the Project would result in a potentially irreversible, significant adverse environmental effect to fish habitat and the final fish assemblage in both reservoirs. [75]
>
> The Panel concluded that effective monitoring would be challenging because of the need for good baseline data, enough resources to support the needed level of effort over many years, and setting appropriate thresholds to trigger further action. [76]
>
> the Panel questioned Nalcor's certainty that riparian and wetland habitat would re-establish and concluded that the residual adverse effect of the Project on these habitats, even with the proposed compensation strategy, would be significant. [77] (underlining added)

It is important to acknowledge that the reservoirs for the Lower Churchill Project are much larger in size, namely ~200 km^2 for Gull Island and ~100 km^2 for Muskrat Falls. However, the concerns raised about the irreversibility of effects on the aquatic environment, the challenges to effective monitoring, and the implications for riparian ecosystems resulting from inundation and changes to the flow regime apply to varying degrees to all hydroelectric reservoirs.

Terrestrial Environment

The Joint Review Panel for the Lower Churchill Project reached the following conclusions with respect to the terrestrial environment:

- the overall loss of terrestrial habitat is significant
- the lack of recovery strategies and identification of critical habitat for some of these listed species make a final significance determination premature
- the Project would cause a significant adverse environmental effect on the Red Wine Mountain caribou herd
- the Panel is not in a position to make a cumulative significance determination because a proper cumulative effects assessment for the George River herd was not carried out
- no final determination was possible with respect to listed bird species

[75] *Ibid*., p. 83.
[76] *Ibid*., p.xviii.
[77] *Ibid*., p.xix.

While many of the conclusions of the CEC regarding the Keeyask Project may differ as a result of the smaller reservoir size, the findings of the Joint Review Panel for the Lower Churchill Project illustrate that:

- large-scale hydroelectric projects can be associated with many significant environmental effects; and
- adequate information is often unavailable to make a confident determination with respect to the "consequences of changes to…land…flora, and fauna".

Cumulative Effects

> At the end of this process, it is the view of the Panel that Nalcor's approach to cumulative effects was less than comprehensive and that participants raised valid concerns that contributed to a broader understanding of the potential cumulative effects of the Project. …
>
> Participant input regarding the residual effects of the Churchill Falls development highlighted the limitations of Nalcor's approach of including the effects of past projects in baseline conditions, without clearly acknowledging these effects. Generally, Nalcor's approach illustrates the limitation of project-specific cumulative effects assessment, namely that the end result is the potential for incremental decline in the biophysical and socio-economic environments with each successive development. …
>
> The Panel recommends that, if the Project is approved, the provincial Department of Environment and Conservation, in collaboration with the provincial Department of Labrador and Aboriginal Affairs and other relevant departments, identify regional mechanisms to assess and mitigate the cumulative effects of current and future development in Labrador. [78] (our underlining)

The findings and recommendations of the Lower Churchill Panel are in many ways similar to those of the Eastmain-1 Rupert Panel, namely that cumulative effects of the interaction between existing and proposed hydroelectric projects are poorly understood and contribute to uncertainties regarding the "consequence of the changes" to the environment and the "potential significance of those changes."

[78] *Ibid*., at p.xix

Cultural Heritage

> The Panel concludes that the Project would cause a significant adverse effect to culture and heritage after mitigation particularly with respect to the "loss of the river" as a highly valued cultural and spiritual landscape. This effect … would be irreversible and would last for the duration of the Project.

I draw this conclusion to the attention of the Board because it was mentioned also in the dissenting opinion for the Eastmain-1 Rupert Panel and was a substantial issue in the review of the proposed Site C Clean Energy Project, discussed below.[79] In the case of the Rupert River, on which there has been no prior hydroelectric development, it is perhaps not surprising that diversion of a "pristine" river should raise concerns. However, in the case of the Churchill River in Labrador, the Churchill Falls Project already inundates about 50% of the Churchill River and the area is essentially unusable and culturally unrecognizable. Similarly, 60% of the Peace River in British Columbia is already inundated by the existing reservoirs with essentially no use by the affected First Nations. And yet, despite the extensive loss of the existing river valleys, inundation of the remaining portions was still considered highly significant. This reality speaks to the enduring and exceptional cultural value of large river valleys.

In reviewing the Terms of Reference for this proceeding, I noted that cultural and spiritual impacts are not captured by either the definition of macro environmental impact or by the definition of socio-economic impact in Order 92/13. Yet, in the case of the three large hydroelectric projects I considered in this review, these issues were considered to be of very high importance. As such, I recommend that the Panel be open to considering information in regards to potential cultural and spiritual impacts of the PDP or of the alternative plans that may come forward during the hearings phase of this process.

4.3.3 Peace River (British Columbia)

Historic Facilities

BC Hydro owns and operates two hydroelectric generation facilities on the Peace River in northeastern British Columbia. Developed beginning in the 1950s, pursuant to British Columbia's Two Rivers policy, the W.A.C. Bennett Dam was completed in 1968 and the Peace

[79] Treaty 8 First Nations (T8FNs) Community Assessment Team. 2012. Telling a Story of Change the Dane-zaa Way. (Site C EIS, Volume 3, Appendix b7), p.vi-xxii. CEAR #421 http://www.ceaa-acee.gc.ca/050/documents-eng.cfm?evaluation=63919

Canyon Dam in 1980. Similar to the La Grande River and Churchill River developments, the Peace River hydroelectric projects have had substantial implications for local Aboriginal groups.[80]

The Peace River hydroelectric developments include the following:

- The W.A.C. Bennett Dam, with a total installed capacity of 2,730 MW
- The Peace Canyon Dam, with a total installed capacity of 694 MW, located approximately 23 km downstream from the WAC Bennett Dam
- Williston Reservoir behind the WAC Bennett Dam, totaling 1761 km^2
- Dinosaur Reservoir behind the Peace Canyon Dam, totaling 8 km^2
- Three 500 kV AC transmission lines and several interconnecting lines at lower voltages, totaling over 1500 km

Site C Clean Energy Project

Project Description

In May 2011, BC Hydro filed a project description with Provincial and federal agencies to initiate an environmental assessment of its proposed Site C Clean Energy Project. The Project consists of the following components:

- The Site C generating station, a 1100-MW facility on the Peace River approximately 83 kilometres downstream from the existing Peace Canyon Dam, generating 5.1 TWh/year
- Two 500 kV AC transmission lines between Site C and Peace Canyon Dam (77 km)
- An 83 km^2 reservoir above the proposed dam, extending to the tailrace of the Peace Canyon Dam
- Realignment of several highways sections totaling approximately 30 km[81]

Aboriginal Groups

The Project has the potential to affect several Aboriginal groups, with 6-8 Treaty 8 First Nations being the primarily-affected Aboriginal groups.[82] Of these First Nations, most are opposed to

[80] *Ibid*., at p. 86-99.

[81] Site C Clean Energy Project Environmental Impact Statement Volume 1: Introduction, Project Planning, and Description Section 4: Project Description. CEAR #421 http://www.ceaa-acee.gc.ca/050/documents-eng.cfm?evaluation=63919

the proposed Project. BC Hydro has entered into preliminary discussions with a couple of First Nations and indicated its intended objectives for these discussions during the recent Joint Review Panel hearings, as follows:

- To provide cash payments, both lump sum and payments streams over time
- To support education, training, and community infrastructure
- To consider land compensation through Crown land transfers
- To implement land protection measures or special land management designations to compensate for lost lands[83]

Environmental Assessment

A joint review panel assessment of the proposed Site C Project was initiated in May 2011 and is continuing with submission of a Joint Review Panel report in April 2014. The environmental assessment was conducted pursuant to a Joint Review Panel Agreement between the Provincial and Federal governments.

The three-member Panel was appointed in August 2013 and mandated to conduct a review of the environmental effects of the Project, and to report to the federal Minister of the Environment. The review included a sufficiency review of the EIS, and hearings in several Dane-zaa and Cree communities, local municipalities, as well as Prince George and Peace River, Alberta.

Since the Panel has yet to issue its report, the materials below present the findings of the Proponent with respect to significant adverse environmental effects and some key relevant observations of the Panel and participants during the environmental assessment and hearings process respecting cumulative effects and perspectives on previous hydroelectric developments.

Significant Effects Identified by BC Hydro

BC Hydro identified a number of significant adverse environmental effects associated with the development of its proposed Site C project, as follows: [84]

[82] *Ibid*., Volume 5: Asserted or Established Aboriginal Rights and Treaty Rights, Aboriginal Interests and Information, Environmental Management Plans, and Federal Information Requirements Section34: Asserted or Established Aboriginal and Treaty Rights, Aboriginal Interests, and Information Requirements

[83] CEAR #2201, p.24, lines 5-21. http://www.ceaa-acee.gc.ca/050/documents-eng.cfm?evaluation=63919

- Fish and Fish Habitat
  - Potential for loss (i.e. extirpation) of several harvested fish species in portions of the reservoir and affected tributaries as a result of changes to fish habitat and the fish assemblage
- Wildlife resources
  - At risk population of migratory bird species and their habitat would be affected by the creation of the reservoir
  - Cumulative effects of the Project with the residual effects of other projects and activities on the loss and fragmentation of wildlife habitat, disturbance or displacement, and mortality for certain species
- Vegetation and Ecological Communities
  - Potential alteration and fragmentation of unique terrestrial ecosystems and loss of rare plant species
  - Cumulative effects of the Project with the residual effects of other projects and activities on future loss of rare plants and rare and sensitive ecosystems
- Current Use of Lands and Resources for Traditional Purposes
  - Loss of some important multi-use, cultural areas and valued landscapes for local First Nations
- Greenhouse Gas Emissions
  - Cumulative effects of the Project related GHG emissions, though relatively small, with the GHG emissions from the many source globally

In addition to a number other residual effects that were determined not to be significant, the Proponent also identified what it viewed as potential positive environmental benefits of the project (e.g. increased total fish biomass) but did not conclude that any of these were significant.

It is important to note that the above list reflects only the views of the Proponent, and that the Joint Review Panel may reach somewhat different conclusions. Similar to the Lower Churchill Project and the Eastmain-1 Rupert Diversion, proceeding with the development of large-scale

[84] Summarized from BC Hydro. January 2013. Site C Clean Energy Project: Environmental Impact Statement Executive Summary, at pp.34-35.

hydroelectric projects very often requires justification of many significant environmental effects.

Cumulative Effects

BC Hydro in conducting its cumulative environmental effects assessment determined that the effects of the existing hydroelectric facilities could be considered to be "reflected" in the description of current environmental conditions. The primary reason provided by BC Hydro for taking this approach was a lack adequate data concerning conditions prior to the development of the existing dams. The Panel questioned this approach:

> [PANEL MEMBER] BEAUDET: Some groups said, you know, that there was existing data and you disagreed. … Now, the Lower Churchill also did the same thing as you did. And they had lots of participant views that disagreed. I'd like to know more about the arguments that you've used and managed; they must be magical. And managed to convince the agency and environmental assessment office of the Province to go ahead and exclude the two dams. [85]
>
> MS. BEAUDET: Do I understand that the major argument was that you didn't have the data? I mean, the Peace Canyon Dam had the Environmental Impact Assessment done. The Bennett Dam -- when you build a dam, you have data. I mean, even if it's 1957, you would have data. [86]

The observations are in many ways similar to those of the Eastmain-1 Rupert Panel and the Lower Churchill Panel, namely that cumulative effects of the interaction between existing and proposed hydroelectric projects are very often not properly assessed and this contributes to uncertainties regarding the "consequence of the changes" to the environment and the "potential significance of those changes."

Perspectives on Previous Developments

> MS. SUSAN YURKOVICH [BC Hydro]: As a third dam on the Peace River, the project would make valuable use of the existing Williston reservoir to generate 35 percent of the output of the Bennett Dam with 5 percent of the reservoir footprint. [87]

[85] CEAR #2697, at p.194, l.22 to p.195, l.17. http://www.ceaa-acee.gc.ca/050/documents-eng.cfm?evaluation=63919
[86] CEAR #2697, at p.197, l.24 to p.198, l.13. http://www.ceaa-acee.gc.ca/050/documents-eng.cfm?evaluation=63919
[87] CEAR #2059, at p.53, l.23 to p.54, l.2. http://www.ceaa-acee.gc.ca/050/documents-eng.cfm?evaluation=63919

The above comments, made by the BC Hydro Vice President form one of the Proponent's key arguments in favour of the proposed Project, namely that the proposed Project is better than the ones that came before it.

During the hearings, Parks Canada representatives made the following comments in regards to the effects of the prior dams and reservoirs:

> MR STEVE OATES [Parks Canada]: Okay. I think our main concern is that the -- by incorporating the flow regulation and the impacts associated with that with the existing two dams into the baseline, it assumes or presupposes that the impacts of the existing dam operations are to a certain extent acceptable, and I think we would rather have seen a more robust assessment … specifically focused in on what is the actual impacts of operating the two existing dams in terms of how they actually flow manage… [88] (underlining added)

These comments from Parks Canada are consistent with those raised in their written submissions to the Panel:

> BC Hydro's approach to cumulative effects assessment for the Site C project is based on accepting the present state of the Peace River and the PAD as the baseline condition upon which to add the incremental impacts from construction and operation of the Site C dam. This approach doesn't fully consider the cumulative impact from all BC Hydro's flow management operations against an unregulated, undammed river. The point here is that the WAC Bennett dam was proposed, and constructed, in a time when no environmental assessment legislation or process was in place. If the Bennett dam project was [sic] proposed today it is very unlikely that such dramatic regulation of the flow regime on the Peace River would be found to be justifiable in the circumstances. The project would then either be modified to limit the scope of the impact to the hydrology of the Peace River, or the project would be cancelled.[89] (underlining added)

These observations by Parks Canada raise similar concerns to those raised for the Eastmain-1 Rupert Diversion Project, namely that viewing additional impacts in the context of larger impacts that occurred historically and that are or may no longer be acceptable is not appropriate.

[88] CEAR #2420, p.293, l.13 to p.294, l.3. http://www.ceaa-acee.gc.ca/050/documents-eng.cfm?evaluation=63919

[89] CEAR #922 http://www.ceaa-acee.gc.ca/050/documents-eng.cfm?evaluation=63919

Secondly, the views expressed suggest an evolving perspective about what is acceptable in terms of macro environmental and socioeconomic impacts from hydroelectric developments. This evolving perspective exists also in the utility industry itself, as proponents move towards project redesigns intended to reduce effects as in the case of Eastmain-1 and the Keeyask Project, smaller-scale renewables, and a greater emphasis on demand-side management. In my opinion, as costs of the alternatives continue to decline and as the means for addressing capacity requirements improve, the trend towards viewing the impacts of prior hydroelectric developments more negatively is likely to continue. How future generations view the choices we make today may be very different than the way we see them ourselves.

5 CONCLUSIONS

In reviewing the available evidence for this proceeding with respect to the determination of macro environmental impact, it is clear that the challenge facing the PUB is that it needs to be able to compare the macro environmental impact of the resources composing the PDP to those composing the alternative plans.

Much of the analysis in the PDP and evidence submitted respecting macro environmental impact focuses only on the "consequences of changes" for air. Regardless of ones views on whether the PDP has "net environmental benefits" in terms of greenhouse gas emissions, an additionally important question, and the one that matters most to the Board, is whether or not these net environmental benefits exceed those that could be obtained through pursuing an alternative plan.

The conclusions and recommendations to government provided by the CEC, though necessary to the NFAT, will apply only to a single component of the PDP and to those alternative plans that contain Keeyask as a plan component. The findings of the CEC will not apply at all to those alternative plans that do not contain Keeyask.

As a result, other means to determine the likelihood of significant adverse environmental changes or effects as well as the "consequences of these changes" need to be used in the absence of information from additional environmental assessments of PDP and alternative plan resources.

The apparent lack of comprehensive information concerning the residual environmental effects of the existing hydroelectric facilities on the Nelson River is unfortunate. This kind of information would be very valuable in characterizing the potential consequences of changes to the environment resulting from future hydroelectric developments on the Nelson River, whether in relation to the PDP, to the alternative plans, or to some other future hydroelectric development in the Province.

The PDP is the largest hydroelectric development that has been contemplated in the Province for several decades. It is my view that the observations of other independent tribunals who have considered similar developments and contemplated similar issues and trade-offs is valuable to the Board in the absence of detailed environmental assessment information for some components of the PDP and of the alternative plans. I encourage the board to consider the conclusions and recommendations of these other independent tribunals in carrying out its review.

APPENDIX A

Table A-1: Historic and proposed facilities on the Nelson River system[90]

Date[91]	Existing Component	Salient Data
1961	Kelsey Generating Station	▪ 250 MW ▪ Three 138-kV AC lines to Thompson ▪ One 138-kV AC line feeding Split Lake ▪ Two 138-kV AC lines to Gillam (which feed Gillam, Ilford, Churchill)
1974	Kettle Generating Station	▪ 1220 MW ▪ 138 kV AC to Radisson Converter Station ▪ ±450 kV DC to Winnipeg
1977	Churchill River Diversion	▪ A control dam at Missi Falls, the natural outlet of Southern Indian Lake, controls the outflow and also raises the lake level three metres. ▪ An excavated channel from South Bay of Southern Indian Lake to Issett Lake creates a new outlet to allow Churchill water to flow into the Rat River-Burntwood River-Nelson River system. ▪ A control dam at Notigi on the Rat River regulates the flow into the Burntwood-Nelson system.
1979	Jenpeg Generating Station	▪ 129 MW ▪ Transmission line 230-kV to Ponton
1979	Long Spruce Generating Station	▪ 230 kV AC to Radisson Converter Station ▪ 230 kV AC to Henday Converter Station ▪ ±450 kV DC to Dorsey Converter Station
1990	Limestone Generating Station	▪ 1340 MW ▪ 230-kV AC to the Henday Converter Station ▪ 500-kV DC to Winnipeg
2012	Wuskwatim Generating Station	▪ 200 MW ▪ One 230-kV line from Wuskwatim to Birchtree Station (Thompson); ▪ Two 230-kV lines from Wuskwatim to Herblet Lake Station
Date	**Approved Component**	**Salient Data**
2019	Bipole III	▪ ±450 kV DC from Keewatinoow Converter Station to Riel Converter Station ▪ 230 kV transmission line linking the Keewatinoow Converter Station

[90] https://www.hydro.mb.ca/corporate/facilities/generating_stations.shtml; https://www.hydro.mb.ca/corporate/water_regimes/churchill_river_diversion.shtml

[91] Indicates in-service date

		to Henday Converter Station and the Long Spruce Switching Station
Date	**Approved Component**	**Salient Data**
2020	Keeyask Generating Station	▪ 695 MW ▪ Keeyask Transmission Project
2026	Conawapa Generating Station	▪ 1485 MW ▪ Conawapa Transmission Outlet Project
2026	North-South Transmission Line	▪ Upgrades to existing 230 kV AC system and existing DC system ▪ New 230 kV to support additional 185 MW of north-south transmission
2020	Manitoba-Minnesota Transmission	▪ 500 kV AC transmission from Dorsey Station to US border

Tab 108

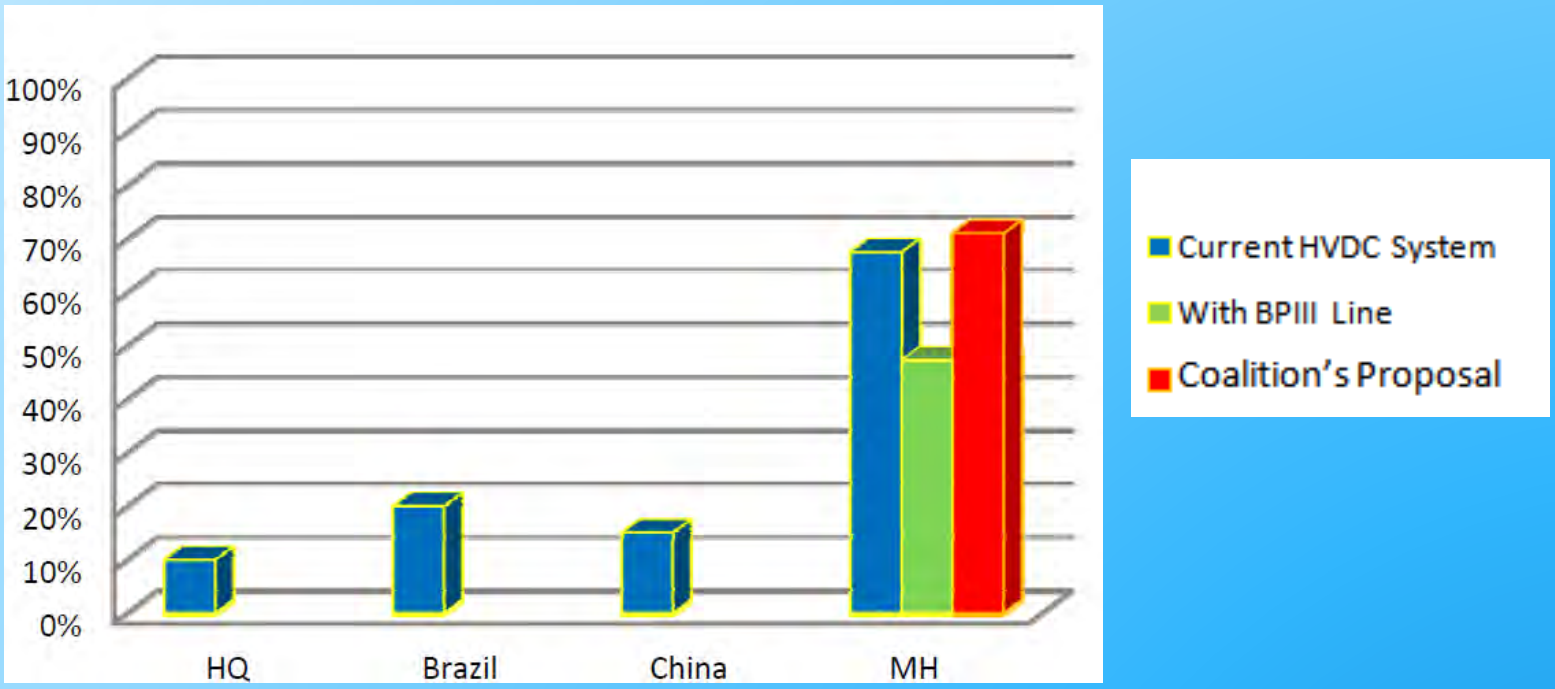
Why we need Bipole III

Dr. David R. Swatek, Manager, System Planning

Pei Wang, System Analysis /Controls & AC/DC Planning Engineer

Alastair Fogg, Manager, Bipole III Project Controls

The Existing Bipole I and II System



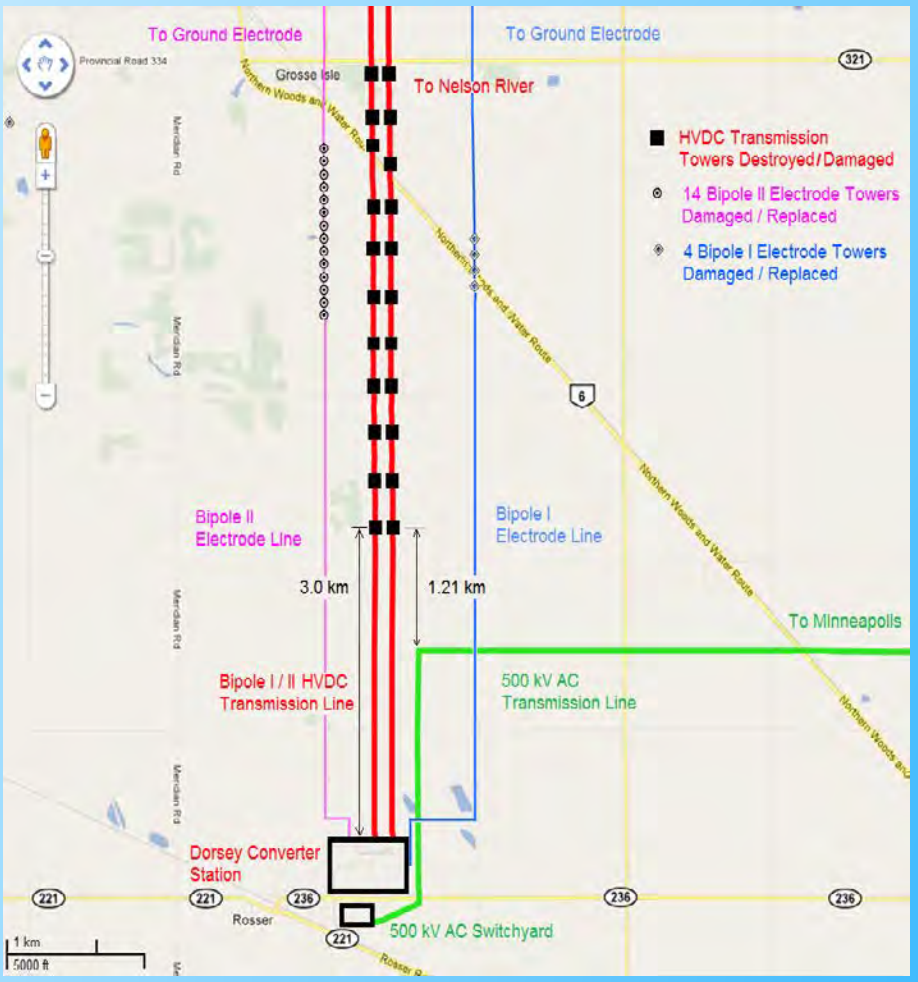
- Link to 70% of the Province's generating capacity
- Bipole I and II HVdc lines constructed on the same Right-of-way (same corridor)
- 900km overhead lines, difficult terrain and access in the north
- Terminated at a common station – Dorsey (inverter)

Manitoba Hydro

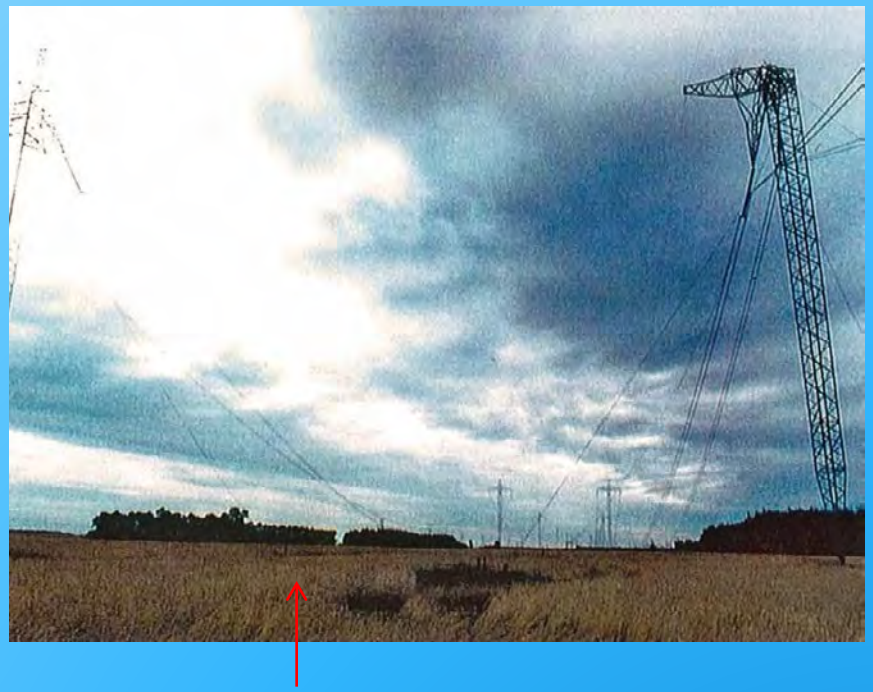
Maximum Percentage Power through a Single Facility

- Manitoba has highest percentage of power concentrated in a single facility for a major network in the world.
- "Too many eggs in one basket"

Manitoba Hydro



Why is Bipole III Required?



- Bipole III is required for reliability
  - Bipole I & II DC Transmission Line Failure
  - Only one southern converter station (Dorsey)
  - Long restoration times
- We've experienced loss of corridor before
  - *Real risk, not theoretical*
- Need to ensure reliable supply to Manitobans

Manitoba Hydro

Reliability Risk –1996 Wind Event

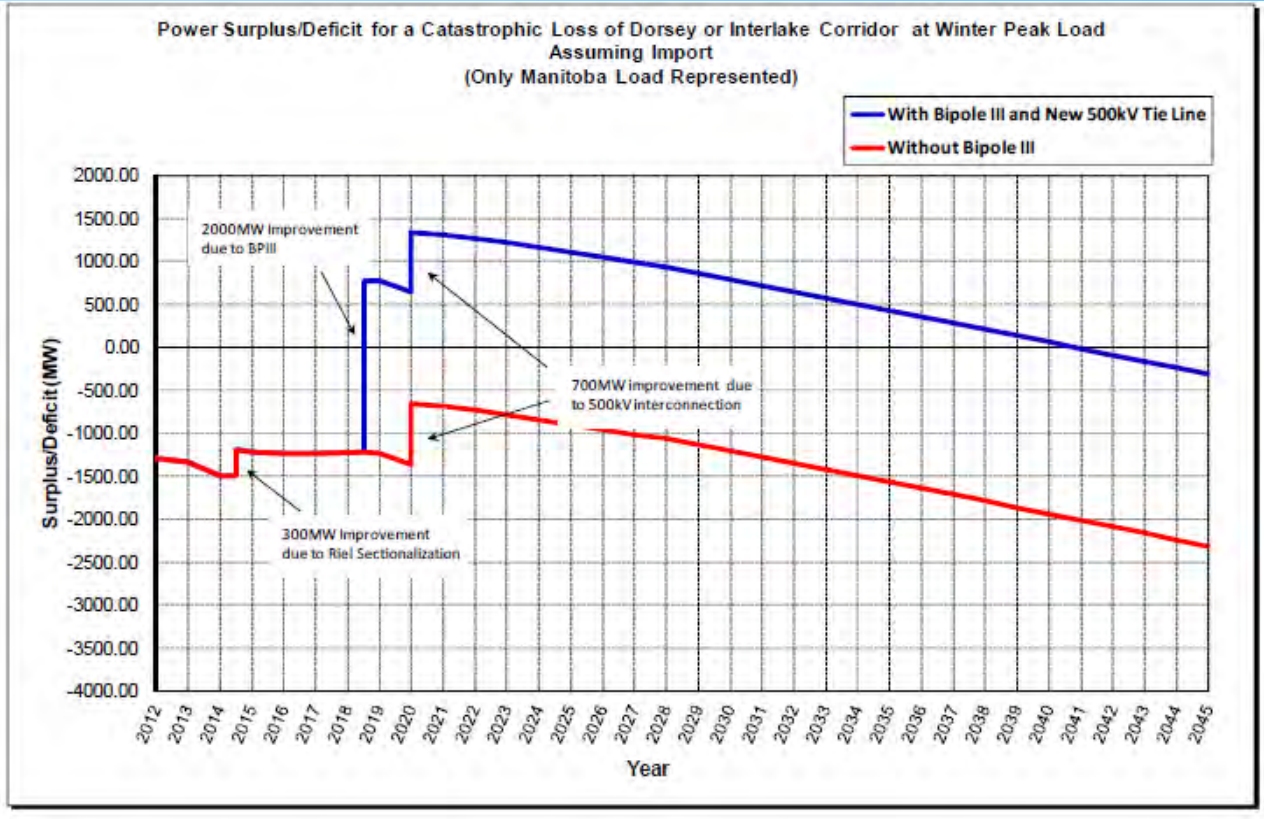
- 19 DC towers down
- Electrode line damaged

Manitoba Hydro

Reliability Risk – Dorsey Converter Station

- Dorsey is currently single terminus point for HVDC system
- Significant weather events (tornados, etc.) in the vicinity of Dorsey in the past
- A loss at Dorsey could mean loss of connection to northern generation for up to 3 years.

Reliability Risk – 2011 Ice Event



- With the tower bases locked in ice, torsional forces at the base bent members.
- Broken hardware, guy wire, and anchor rods.

- This structure was initially noted to be resting on the pin, about 3 inches off the plate.
- Eventually the structure was reset on a new helical pier foundation.

Governing Criteria

- Generation Planning Criteria: i.e. 12% reserves, low flow years.
- NERC Transmission Reliability Standards
  - TPL-001 (N), TPL-002 (N-1), TPL-003 (N-2)
- HVDC Adequacy Criteria
  - "spare pole over load" (1986 criteria),
  - to be replaced with "on-line spare valve group"
- Composite Reliability
  - Loss of Load Expectation (LOLE): 0.1 day/year guideline
    - Guideline since 1996 / explicit reporting requirement since 2012
- NERC TPL-004 – low probability, extreme events
  - Mandated to study consequences, but not necessarily to fix
  - LOLE does not replace TPL-004

TPL-004 Deterministic Analysis – Supply Deficit

- Supply deficit of approx. 700MW for Bipole I/II line loss in winter of 2020 vs. 1300MW surplus with Bipole III.
- Rotating blackouts for about 140,000 homes (5 kW per household), even with new 500kV import line

Manitoba Hydro

Probabilistic Analysis – Weather Hazards

- Manitoba Hydro has worked closely with field experts to evaluate weather hazards (Tornados, wide front wind, ice and etc) and other risks of losing the existing HVDC system after the 1996 event.

- Since 2001, three studies (Teshmont 2001, Teshmont 2006 and Teshmont 2012 reports) have been completed incorporating the advancement of study methodology and tools, and availability of extreme weather data -- filed as evidence in the CEC hearing

Probabilistic Analysis – Weather Hazards

- Teshmont 2012 Report

Events	Return Period of Failure (years)
Tornados	17 (Table 4-2)
Synoptic (wide front) Wind	90 (Table 5-1)
Combined Wind and Ice	20* (Table 5-1)

*MH used a more optimistic 50 year return period for LOLE studies

Probabilistic Analysis – LOLE

- A probabilistic adequacy analysis was performed to evaluate the impact of Bipole III. (2012)
- The existing system does not not meet the industry LOLE guideline of 0.1 day/per year without Bipole III. *(EMERGING NERC Requirement)*
- Bipole III significantly improved the system reliability with LOLE meeting the 0.1 day/per year guideline. (draft report, 2012)
- Together with new proposed 500kV tie line and Keeyask G.S, a reliable performance of Manitoba hydro system is ensured in the long term (probabilistic adequacy analysis was provided during 2014 NFAT)

Tab 109

2017/18 & 2018/19 ELECTRIC GENERAL RATE APPLICATION

Manitoba Hydro Undertaking #54

Manitoba Hydro will provide the presentation Dr. Swatek presented on the risks of reduction associated with the construction of Bipole III.

Response:

Please find attached the presentation on the need for Bipole III delivered by Dr. Swatek during the 2014/15 & 2015/16 General Rate Application oral hearings (Exhibit MH-57). The presentation was delivered on June 3, 2015 (Transcript pages 2108 – 2123).

Manitoba Hydro offered to re-file this presentation and is providing additional information below, to assist in understanding the system reliability that Bipole III brings to the Manitoba Hydro HVDC transmission system when it comes into operation. Statistically, introducing Bipole III substantially reduces the risk of significant weather events impacting the HVDC transmission system and disconnecting southern Manitoba from the northern load generation as follows:

Tornados:

- Pre Bipole III: 1:17 year return period
- Post Bipole III: 1:3700 year return period

Synoptic (wide front) Wind:

- Pre Bipole III: 1:90 year return period
- Post Bipole III: 1:560 year return period

Combined Wind and Ice:

- Pre Bipole III: 1:20 year return period
- Post Bipole III: greater than 1:200 year return period

Why we need Bipole III

Introduction and Caveats 1

The 78 Year Study Period is Too Long 3

Details on Export Revenue and Prices Are Unavailable or Inadequate and Subject to Risk 8

The Costs of Bipole III Should be Attributed Only to Those Alternatives Which Require the Extra Transmission Capacity It Provides 17

Recognizing the Cost of Bipole III and Other Sunk Costs Would Undermine the Preferred Development Plan 19

Description of Northern Hydro and HVDC System 22

The Preferred Development Plan is Inextricably Linked to, and Dependent Upon, Bipole III—There Is No Standalone Reliability Function of Bipole III 26

Conclusion 39

INTRODUCTION AND CAVEATS

Whitfield Russell Associates ("WRA") was retained to review and analyze Manitoba Hydro's Preferred Development Plan ("PDP" or "Plan") on behalf of the Manitoba Métis Federation ("MMF"). In particular, WRA has focused its examination on the Terms of Reference - Needs For and Alternatives To ("NFAT") Review number 2.g as identified by the Manitoba Public Utilities Board ("PUB") in Procedural Order 67/13. This term of reference is as follows:

> 2. An assessment as to whether the Plan is justified as superior to potential alternatives that could fulfill the need. The assessment will take the following factors into consideration:
>
> . . . .
>
> g. The financial and economic risks of the Plan and export contracts and export opportunity revenues in relation to alternative development strategies;

However, the MMF has been frustrated in its attempts to evaluate the financial and economic risks of the PDP and export contracts by its inability to gain access to the vast majority of information that Manitoba Hydro provided to the Independent Expert Consultants ("IECs"). Because of this lack of access, the MMF has encountered considerable difficulty analyzing the details of the various alternative plans, their underlying assumptions, the costs and benefits of each alternative, and how these relate to the concerns of the Manitoba Métis Community. Many questions asked by the IECs were similar to those that MMF would have asked. And many of the answers came as follows:

> "This Information Request has been withdrawn by the IEC as no longer required, having been satisfied through discussion with Manitoba Hydro."[1]

Many other data responses were considered to be commercially sensitive and were therefore not made available to the general public. See, for example, responses to MMF/MH II-015, II-016d and II-019h. The opaqueness is exacerbated by redactions in the IEC evidence.

[1] See, for example, LCA/MH 1-029 thru 032, among many others. Also troubling is the lack of transparency with regard to pricing of exports versus costs of the two proposed hydroelectric generation projects, Keeyask and Conawapa.

Most troubling to the MMF is that, as noted in the Terms of Reference at page 4, the scope of the NFAT does not include the Bipole III high voltage direct current ("HVDC") transmission line and converter station project. Of particular importance is Manitoba Hydro's stance that Bipole III is needed primarily for reliability purposes, and thus (somehow), no NFAT review was needed for this particular facility. One would think that a "Need for and Alternative To" review would have been required for a $3.3 billion facility traversing a large portion of the Province.[2] According to PUB Order 5/12, however, the PUB decided that a needs analysis was not required for Bipole III, and, accordingly, the Terms of Reference in this proceeding exclude Bipole III and its converter stations from the scope of the NFAT.

Manitoba Hydro's underlying assumption that each and every alternative should include Bipole III has the effect of understating the cost of the Preferred Development Plan and greatly overstating the cost and relative economics of certain alternatives—primarily those that do not include future hydro generation or that involve deferrals of Northern hydro development.

In short, the PDP of Manitoba Hydro consists of building two large hydro generating stations on the Nelson River (Keeyask Generating Station in 2019 and the Conawapa Generation Station in 2026), both of which will make use of the additional transmission capacity added by Bipole III. The PDP also includes North-South Transmission Upgrades which involve changes to the alternating current ("AC") collector system of the hydro plants on the Nelson River, as well as additional AC transmission lines. Finally, the PDP includes a transmission link with the United States—the Manitoba-Minnesota Transmission Project, which will enable Manitoba Hydro to export substantial additional bulk power to various utilities in the Midcontinent Independent System Operator, Inc. ("MISO"). As part of the NFAT, Manitoba Hydro analyzed 15 separate alternative plans that could provide the necessary energy and capacity for Manitoba's forecasted domestic loads, as well as planned exports to MISO utilities.

Manitoba Hydro described the need for Bipole III as follows in Chapter 5 of the NFAT (at 25:8 – 26:2).

[2] See PUB/MH I-053a Revised for the estimated cost of Bipole III.

> Approximately 70% of Manitoba's hydro-electric generating capacity is delivered to southern Manitoba via the Bipole I and Bipole II HVDC transmission lines. Bipoles I and II share the same transmission corridor through the Interlake region over much of their length from northern Manitoba to a common terminus at the Dorsey Converter Station. The existing transmission system is therefore vulnerable to the risk of catastrophic outages of either (or both) Bipoles I and II in the Interlake corridor and/or at Dorsey due to unpredictable events, particularly severe weather. This vulnerability, combined with the significant consequences of prolonged major outages, caused Manitoba Hydro to pursue a major initiative to reduce dependence on the Dorsey Converter Station and the existing HVDC Interlake transmission corridor.

However, as will be discussed in more detail below, Manitoba Hydro's reasoning in support of the reliability need for Bipole III is flawed. Indeed, Manitoba Hydro's PDP will put more eggs in the Northern hydro basket, fill the reserve transmission capacity to be provided initially by Bipole III and return Manitoba Hydro to its dependence on the HVDC Interlake transmission corridor.

THE 78-YEAR STUDY PERIOD IS TOO LONG

Manitoba Hydro's use of an extremely long study period (78 years) serves the purpose of tilting its economic analysis in favor of long-lived assets such as hydro projects that are projected to generate substantial off-system sales revenue. Initially, Manitoba Hydro noted that "The next step was to develop and evaluate potential alternative development plans using the short-listed resource options. The number and size of resource options were selected to cover Manitoba's energy and capacity needs for the next 35 years." See Executive Summary at 17:14-16. However, actual economic evaluations were based on the much longer 78-year time period, as described in Chapter 9 at 7:15-18:

> The total study life used in this analysis is 78-years. For the total study life, Manitoba Hydro combines two approaches – a 35-year detailed evaluation and a long-life asset evaluation which extends from the end of the 35-year study period to the end of the service life of hydro-electric generation assets, as representing the longest-lived assets.

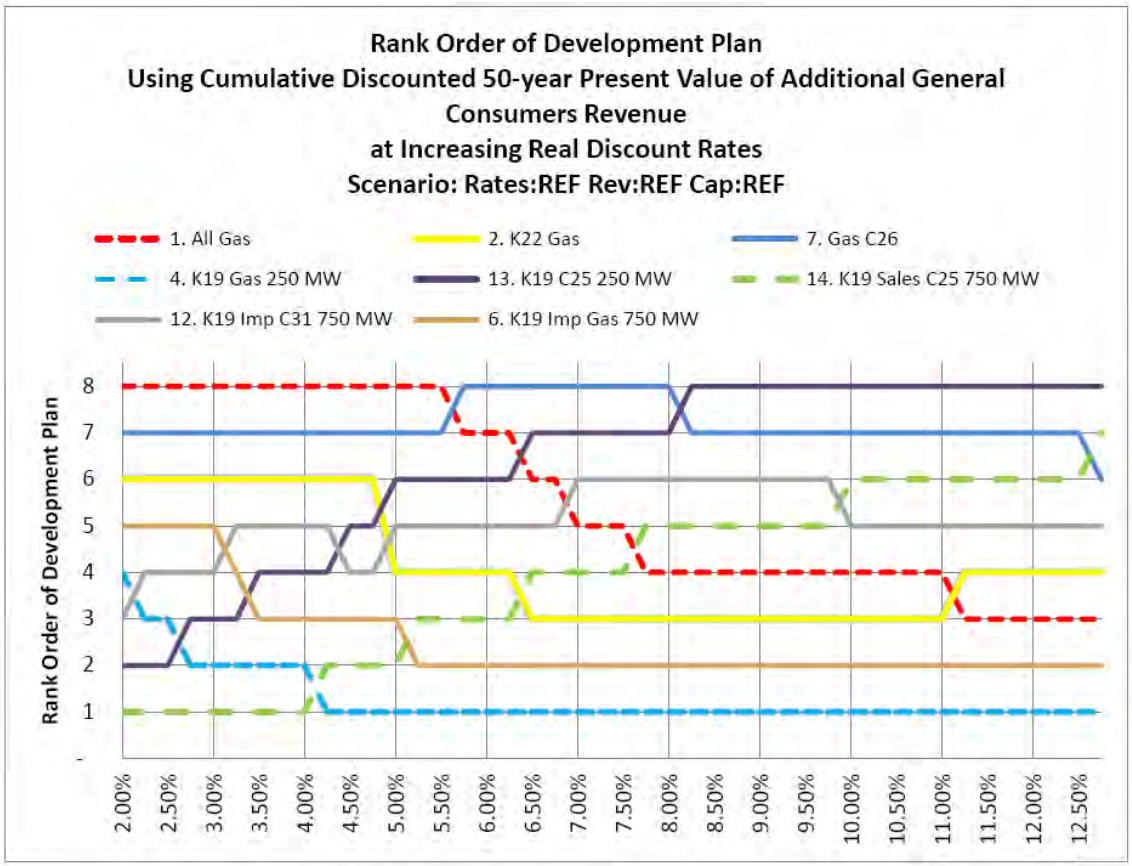
Manitoba Hydro's response to LCA/MH 1-189 notes that the 78-year study length was determined by using the weighted average life of the hydro plants (67) years, extending from the 2025, when the Conawapa Project was initially assumed to go into service. Attachment A of the

response to PUB/MH 1-020a indicates that other study periods of Manitoba Hydro tend to range from 10 to 35 years. Indeed, Manitoba Hydro's Integrated Financial Forecast ("IFF") uses a 20-year projection, while its Power Resource Plan looks forward 35 years.[3]

As a result, Manitoba Hydro's economic evaluations of its alternative plans mask the negative aspects of the financial burdens associated with capital-intensive hydro plans, and give unwarranted value to exports to the United States. Manitoba Hydro admits that these hydro-intensive plans cause a need for rate increases that, in the "medium" term (if 20 and 35 years are considered medium term), are projected to be higher than the rate increases necessary to support alternative resource plans with no hydro additions, or only one future hydro plant addition. For example, Manitoba Hydro states in Chapter 11 of the NFAT report:

> By 2035, following the in-service of both Keeyask and Conawapa, the cumulative rate increases for the Preferred Development Plan (green) begin to beneficially separate from the alternatives. By 2040, the cumulative rate increases for the Preferred Development Plan are lower than [those required in connection with] all other development plans as measured by the P10, P25, P50, P75 and P90 values.[4]

Therefore, nearly 26 years must elapse before the PDP lowers the cumulative rates paid by Manitoba consumers. Before 26 years, the cumulative rates required to support other alternative plans will be lower. And during these 26 years, many of the favorable conditions assumed to underlie these studies may not develop. Actual conditions could differ drastically from the favorable conditions assumed in Manitoba Hydro's studies. Furthermore, it is during this first quarter century initial period (e.g., until Manitoba loads increase and eat into its ability to export power) that revenues from exports are expected to be most significant in amount and value (as measured on a net present value basis). If assumed margins on export sales turn out to be overestimated, even greater rate increases will be required.



Manitoba Hydro's response to PUB/MH 1-149a REVISED shows the impact on customers of rates based on different alternative resource plans. It states:

[3] See NFAT Appendix B at 19.

[4] See Chapter 11 at 8:14-9:2.

> Figure 11.10 shows the impacts on customer rates (seen in Figure 11.1, 1 Chapter 11, page 8) on a present value basis and represents the projected cumulative present value of total general consumers' revenue for the 50 year study period. Figure 11.10 shows that:
>
> - In the near term, by 2020, the cumulative present values for the various alternatives are relatively similar.
> - By 2030, the cumulative present value of the capital-intensive plans that include both Keeyask and Conawapa are generally higher than [those associated with] the other alternatives.
> - Between 2030 and 2050, K19/Gas/250 (light blue) is projected to have the lowest cumulative present value at the P50 value.
> - From 2050 to the end of the study period, the preferred development plan (green) is projected to have the lowest cumulative present value at the P50 value.

This same data response indicates that Manitoba Hydro performed a sensitivity analysis of the discount rate on the various alternatives, and noted that "the Preferred Development Plan provides the lowest customer bill impacts on a present value basis up to a real discount rate of approximately 4.15%." What Manitoba Hydro did not say, however, was that another alternative, the K19 Gas 250 MW alternative was better at every single higher discount rate. See the table below, included in the data response as Figure 11.13:

One of the IECs, Elenchus, submitted a review of Manitoba Hydro's load forecast. In its report, Elenchus noted that (at i) "given the time frame of the NFAT analysis, it is our view that it is more reasonable to anticipate that there will be significant structural changes that could result in dramatically different domestic demand (and presumably export prices) in the coming decades." Elenchus also notes (at iii): "Forecasting over a 20-year time horizon has many associated risks." The fact that Manitoba Hydro has instead performed its economic evaluation of alternatives using a 78-year study period, including forecasting future energy prices and revenues, throws into doubt many, if not all, of its conclusions and plans. Elenchus mentions the possibilities inherent in increased demand side management and energy efficiency measures, as well as the real risk of distributed generation for lowering demand in the future.

The risks that Elenchus (and other IECs) describe are very real. For example, looking back to the decade of the 1990s, it is doubtful that forecasters predicted the recession period of 2008-2012, or the boom of shale gas production. Other recent changes include the rapidly decreasing

costs of wind power and solar power, as well as energy efficiency gains through the use of LED lights, which has led to lower load growth.

Manitoba Hydro admits itself that the excessive study period involves a lack of detailed inputs and assumptions, as stated in response to LCA/MH 1-218.

> The financial evaluation in Chapter 11 is a full revenue and cost analysis of Manitoba Hydro's entire electric operations, including the impacts of the current and proposed integrated hydro electric system, as compared to the incremental analysis, which includes the development plan specific inputs only, in the economic and uncertainty evaluations in Chapters 9 and 10. The 50-year period is an extension of the detailed 35-year evaluation period to be consistent with the long-term nature of hydro-electricity assets as well as provide a sufficient timeframe for which to analyze the benefits and costs for each development. Financial evaluation over a longer timeframe is limited due to the lack of availability of the detailed inputs and assumptions required by the financial model related to the entire integrated hydro-electric system both current and proposed rather than the availability of development plan specific inputs and assumptions.

If the economic study period is reduced to 35 years, the PDP is no longer the best plan, although Manitoba Hydro puts the best face on the PDP by stating that the "key conclusions from the probabilistic analysis provided in Chapter 10 do not change significantly whether assuming a total study life of 78 years, as provided in the NFAT submission, or a 35 year study period." See LCA/MH 1-397. This same response notes that "The Preferred Development Plan (Plan 14) and Plan 4 [K19/Gas24/250MW] have essentially the same incremental NPV under the reference scenario. Plan 4 has a higher expected value by $226 million." Emphasis added. Exactly how an amount that is $226 million higher is "essentially the same" as another amount remains unexplained.

La Capra Associates, Inc. ("LCA"), another IEC, has also discussed the risks relating to Manitoba Hydro's 78 year study period. Please see LCA's Technical Appendix 9A "Economic Analysis Part 1" at 9A-24f. In fact, LCA re-ran many studies using shorter study periods in order to better illustrate the impacts of the various alternative scenarios.

DETAILS ON EXPORT REVENUE AND PRICES ARE UNAVAILABLE OR INADEQUATE AND SUBJECT TO RISK

WRA has had a difficult time determining what portion of the net benefits of each alternative are related to the expected future sales to, and prices in, the MISO. Potomac Economics, one of the IECs, has found that Manitoba Hydro's forecast of future gas prices and export sales revenue are overstated, which has the effect of overstating the net benefit of the Preferred Development Plan. Potomac Economics stated at page 5 of its Expert Report on Export Prices and Revenues ("Report"):

> Our results generally forecast lower prices than Manitoba Hydro's consultants due to assumptions on key inputs. In particular, our models generally rely on lower natural gas price forecasts, lower growth rates of demand, and lower quantities of coal plant retirements.

Potomac Economics' Report also states later at page 11 that at least one consultant, the Brattle Group, used a much higher price for a combustion turbine to calculate the Cost of New Entry ("CONE") that was 70% higher than that used by Potomac Economics. Obviously, assuming a higher price for a gas-fired combustion turbine will favor the PDP and place gas-fired alternatives at a disadvantage. However, a prospective buyer of Manitoba Hydro's dependable power will not be misled. It will evaluate a purchase from Manitoba Hydro based on the real, lower cost of a gas-fired combustion turbine.

Importantly, Potomac Economics noted the following at page 45 of its Report:

> Manitoba Hydro's Consultants provide forecasts to 2034. However, Manitoba Hydro projects revenues until 2080. To calculate the forward revenues, Manitoba Hydro assumes a growth rate for the years 2035-2049 based on the compound average growth rate ("CAGR") for the years 2030-2034, but declining to a growth rate of zero by 2049. Basically, growth rates in prices are linearly interpolated between the value equal to the average CAGR for the years 2030-2034 and zero value for 2049. After 2049, growth rates in prices are assumed to be zero.
>
> With regard to capacity prices, we find no basis for assuming the real price will increase after 2034. For reasons stated above, such prices may even decline. For energy prices, we find it difficult to recommend an approach that would be reliable given the long-term nature of this assumption. We recommend that alternative post 2034 growth rates be

> examined in order to understand the sensitivity of the results to alternative growth assumptions. At least one such sensitivity should be a zero real growth rate, which would effectively assume that fuel prices and C02 prices escalate at the rate of inflation after 2034. [Emphasis added]

WRA was not allowed to view any detailed material on Manitoba Hydro's forecast energy and capacity prices. Although Manitoba Hydro's NFAT Appendix 9.3 provides documentation on each alternative (and on each sensitivity study) on an annual basis, the tables show only Net Average Flow Related Gross Revenue (in millions of 2014$). According to Appendix 9.3 at 87, this gross revenue includes only revenues from exports.

> Gross revenue incorporates the revenue from both firm export power sales and the sale of short-term opportunity export energy. Gross revenue does not include domestic revenue as it is common to all development plans. Expected export revenues are generated from the SPLASH model and are a function of the makeup of each development plan within the context of the whole Manitoba Hydro generation and transmission system and the interconnected markets.

Because the energy contract prices from the firm export sales have not been made available in usable form,[5] and because the Electricity Export Price Forecasts are deemed commercially sensitive (see response to PUB/MH 1-056a), WRA has not been able to delve into the details of the economic alternatives. However, material that has been provided makes clear that electric export prices over the past five years have fallen drastically, and that forecasts of export prices over time have demonstrated the same reductions. Although Manitoba Hydro concludes that its PDP, with its long study length and reliance on as-yet-unrevealed amounts of energy at as-yet-unrevealed prices to provide much of its value, is the best for the Province, that conclusion appears to be based upon a shaky foundation.

Recent sales to the United States have suffered the effects of the Great Recession. One table from the response to PUB/MH 1-008 REVISED illustrates how the past exports to the U.S. have fallen in price over the past six years, particularly the opportunity sales (which do not include prices under the firm export contracts). This table compares the revenues per megawatthour ("MWH") average price.

[5] PUB/MH 1-280 provides a summary table of the volumes, term and pricing assumptions used in the Integrated Financial Forecasts ("IFF") for 2009 and 2012 for the export term sheets/contracts.

NFAT PUB/MH I-008 Revised

TOTAL U.S. SALES

	U.S. Dependable Sales			U.S. Opportunity Sales			U.S. System Merchant Sales

2011/12	3,742	175	46.79	5,616	117	21.13	80	3	35.21
2012/13	3,636	177	48.69	4,690	113	23.62	63	2	29.92

Manitoba Hydro's responses to questions concerning forecast export revenues indicate that its estimates of projected revenues have continually been getting smaller. In almost every case, the prices have dropped, contributing to the drop in expected revenues. Note that these projections only go out 20 years, whereas the NFAT evaluations extend out over a 78-year study period. The response to PUB/MH I-058b illustrates how the prices have fallen over the last few IFFs.

Source: PUB/MH I-058b														

As noted above, these IFF estimates result from a succession of 20-year forecasts that only go out to 2031/32 (in the most recent cases). As can be seen in the table, expected prices have fallen from an amount estimated for 2019/20 at $105.60/MWH in IFF09 to $66.50/MWH in IFF12 and even further to $59.20/MWH in the NFAT. And, according to Potomac Economics, even these amounts of revenue are based upon unduly high forecasts for energy and capacity prices.

The PUB made the following notable comments about downward trends in export sales in its 2012-13 Annual Report (emphasis added):

> Manitoba Hydro's primary export market is the market operated by the Midwest Independent System Operator (MISO), which, over recent years, has seen reduced load-growth, an increase in subsidized wind power from U.S.-based wind farms, increased utilization of combined-cycle combustion turbine gas generation, imports into the Midwest Independent System Operator market from other U.S.-based utilities, and no increase in exports from Manitoba Hydro. **Since 2008/09, spot market export prices have decreased from about 8.0¢/kWh to an average of 3.2¢/kWh.**

The PUB's 2012-13 Annual Report goes on to state (at 10):

> Opportunity export sales prices have fallen significantly since the onset of the recession in 2008, driven in part by reduced growth in industrial demand, and also the advent of commercial production [of] natural gas from shale deposits.

That Annual Report also states (at 6-7):

> Wuskwatim Generation came on-line in 2012/13 with a Board-calculated (all-in) incremental in-service cost of $160/million/yr (10.5 ¢/kWh). This was estimated by the Board to be about three times the then current average export revenue rate.
>
> . . . .
>
> Because of low export prices, Manitoba Hydro is now forecasting losses for the first ten years of operations of Wuskwatim. At the time of the hearing, those losses were projected to total $341 million as Manitoba Hydro forecasts the project will not be profitable until 2023.

If Wuskwatim will not be profitable until 2023, what does this portend for the profitability of Keeyask in 2019/20, much less Conawapa? As noted by Elenchus, among others, the electric industry may be facing a paradigm shift with the increase in distributed generation, particularly behind-the-meter solar units, on the future loads of utilities themselves. Numerous articles have documented this new trend and its ramifications for electric utilities.[6]

Because of the confidentiality associated with Manitoba Hydro's use of its long-term generation system simulation model (called SPLASH) to simulate its system operations for 35 years[7] into the future, WRA does not have access to the input or output files, nor the actual input assumptions in any detail.[8] Manitoba Hydro describes its economic evaluation process in Appendix 9.3 at 29 as follows:

> Manitoba Hydro's SPLASH model utilizes an optimization technique to maximize net flow related revenue to the system by simulating the operation of reservoirs and hydroelectric generation plants utilizing a monthly time step. The expected price signals

[6] See, for example, http://www.forbes.com/sites/pikeresearch/2013/08/26/distributed-generation-poses-existential-threat-to-utilities/ and http://www.eei.org/ourissues/finance/Documents/disruptivechallenges.pdf

[7] See Appendix 9.2 at 2.

[8] For example, prices for export sales have been redacted from the versions of the export contracts provided.

> from the export market are provided to the model for on-peak and off-peak time periods for each month of the year. The capability of the interconnections to each market region is provided in order to limit the rate at which export energy can be transmitted. The SPLASH model determines the net production cost on a monthly basis for a series of years into the future. The net production cost is derived from the variable cost characteristics of the various generation sources and revenue is derived from export sales. A simulation of system operation is undertaken for each of the 99 flow conditions between the years 1912 and 2010 which are assumed to be representative of the range of flow conditions that may occur in the future.

Furthermore, the "components that make up net average flow related revenue are calculated using Manitoba Hydro's system simulation computer model known as SPLASH." See Appendix 9.3 at 87. The SPLASH model provides the detailed economic evaluation for the first 35 years of the study period. See Appendix 9.2 at 2 and Appendix 9.3 at 3, quoted below:

> The total study life used in this analysis is 78 years. For the total study life, Manitoba Hydro combines two approaches – a 35-year detailed evaluation and a long-life asset evaluation which extends from the end of the 35-year study period to the end of the service life of hydro-electric generation assets, as representing the longest-lived assets.
>
> . . . .
>
> Beyond the 35-year study period, replacement capital costs are assumed for assets that reach the end of their economic lives before the end of the long study period (78 years). In addition, a net production cost approximation (also referred to as net average flow related revenue) is used beyond the 35-year study period which includes:
>
> - extending fixed operating and maintenance costs throughout the economic life of all assets (including major capital O&M investments for large hydro-electric resources), and
>
> - extending the average net revenues of the last three years associated with the economics of a development plan to capture the expected ongoing incremental revenues between development plans to the end of the study period.

Therefore, the speculative nature of export prices forecast for the outermost years makes them even more suspect, as Manitoba Hydro just extends a trend line from the last 3 years of the 35-year study period to capture continuing differences between costs and revenues. And as made clear by LCA at Appendix 9A-15, Manitoba Hydro did not forecast its load increasing after the first 35 years of the study. Instead, Manitoba Hydro assumed that demand would remain steady, thereby removing any assumption that Manitoba's loads would increase over time and absorb the hydro power internally, thereby reducing revenues from exports.

Below is an illustration of the export revenues per MWH to U.S. as found in the Ref-Ref-Ref tables for three cases (All Gas, K19 Gas 250 MW, K19 Sales C25 750 MW) from Appendix 11.3. Also note that Manitoba Hydro's financial evaluations used a 50 year life, rather than the 78 year study period assumed in its economic evaluations.

Total Export Sales to USA Average Unit Revenue/Cost ($/MWH)			
	All Gas	K19 Gas 250 MW	K19 Sales C25 750 MW
Year	Plan 1	Plan 4	Plan 14

Nominal $, includes dependable sales, plus opportunity sales			

By relying primarily on surplus capacity additions of large, costly hydro plants based on its expectation of benefits arising from potentially unrealistic high export energy prices, Manitoba Hydro would forgo the flexibility it might otherwise have (i) to adjust to a situation in which loads turn out to be much smaller than those it currently forecasts, (ii) to locate plants where they would be more useful and valuable in reducing losses and the needs for transmission additions, and (iii) to reduce exposure to long transmission lines needed to deliver the output of remote hydro additions to Winnipeg and the US. Indeed, Manitoba Hydro's initial rationale for building Bipole III is that, because so much of its generation is located on the Nelson River, far from the major loads in Winnipeg, it needed a backup path to cover the simultaneous loss of Bipoles I and II. By building Keeyask and Conawapa in the same general area, Manitoba Hydro will fill up its backup transmission path and put even more of its eggs in one remote basket, creating the potential for trapping even more generating capacity in the North after an extreme combination of HVDC transmission outages and creating the need for even more backup transmission capacity on Manitoba Hydro's interconnections with the United States. A less risky approach would involve building gas plants in locations closer to the Winnipeg load center where power is needed and the transmission system is networked. Plus, gas plants could be distributed across its service area, reducing the concentration of large blocks of generation in a single transmission-constrained region. Indeed, by planning to build natural gas plants closer to Winnipeg, Manitoba Hydro would avoid any "need" to build Bipole III, which is driven by its high-risk plan to build excess hydro capacity and move even more hydro power to the U.S. market in the hope of making profitable sales.

If Manitoba Hydro insisted that it needed a backup for the simultaneous loss off Bipoles I and II, it could reinforce the capability of its interconnection with the U.S. instead of building Bipole III.

THE COSTS OF BIPOLE III SHOULD BE ATTRIBUTED ONLY TO THOSE ALTERNATIVES WHICH REQUIRE THE EXTRA TRANSMISSION CAPACITY IT PROVIDES

In its Environmental Impact Statement ("EIS") before the Clean Environment Commission ("CEC"), Manitoba Hydro attributed the need for, and the cost of, Bipole III primarily to system reliability. This reliability-based need for Bipole III will be discussed in a later section. But now the real purpose for Bipole III has become apparent. Based upon the economic evaluations of alternatives provided in the NFAT, it is clear that Bipole III is being built primarily to carry the output of Keeyask and Conawapa to both Manitoba loads and to loads in the United States, not to enhance reliability. The long period of negotiation over the export contracts indicates a longstanding intent to build additional hydro on the Nelson River.

Manitoba Hydro's decision to attribute the need for, and the cost of, Bipole III primarily to system reliability has had the effect - advantageous in Manitoba Hydro's eyes - of laying the groundwork for - and diverting attention from - its longstanding plans to build Keeyask and Conawapa. Those plans in fact depend upon Bipole III. Pre-building Bipole III supports the ostensible economic rationale for those plans by attributing a zero cost for Bipole III, and therefore much reduced transmission costs, in those plans. That attribution lowers the ostensible cost below that which Manitoba Hydro will actually incur under the PDP when building Keeyask, Conawapa and Bipole III together. The PDP is Alternative 14 of the NFAT, which calls, in part, for:

i. 2,180 MW (2,025 MW net) of new hydroelectric generation to be constructed at the northern end of the Nelson River (i.e., the 695 MW (net 630 MW) Keeyask Generating Station in 2019 followed by the 1485 MW (net 1395 MW) Conawapa Generating Station) in 2025 and

ii. the output of that new hydroelectric generation to be delivered to the Winnipeg load center by means of Bipole III and the existing HVDC system, as well as upgrades to the collector system and upgrades to the North-South AC transmission system. Much of that output will be redelivered to wholesale buyers in the United States through a new

interconnection with the United States (the 750 MW, 500 kV AC Manitoba-Minnesota Transmission Project).

Manitoba Hydro ignores the cost of Bipole III when assessing its preferred plan through a simple cost allocation sleight of hand: by assuming that the cost of Bipole III will represent a sunk cost under every alternative resource expansion plan. Through this sleight of hand, Manitoba Hydro has given its preferred plan, which must have Bipole III to work, the appearance of being more cost-effective than it really is by not including the costs for Bipole III and has added unwarranted costs to the plans that do not need Bipole III. The cost of Bipole III should instead be attributed only to those plans (including the PDP) that call for the Conawapa Project alone, or both the Keeyask and Conawapa Projects.

A prior 35-year analysis of the expected benefits of proposed northern hydro generation combined with construction of the Bipole III transmission line indicated that the All Gas scenario would be preferred at a 10% real discount rate (assuming that the in-service date ("ISD") of Bipole III was delayed to the 2024 ISD of new hydro generation (Conawapa or Gull), and that the costs of Bipole III were added to the costs of the new hydro generation).[9] See Attachment PUB/MH 1-024, Manitoba Hydro's 2004/05 Power Resource Plan ("PRP") at pages 10-11, attached as Appendix 1. While the hydro generation assumptions in that prior study are different from those in the NFAT (e.g., Conawapa or Gull versus Keeyask and/or Conawapa), the results of those analyses indicate that delaying Bipole III and adding the Bipole III costs to the hydro generation makes the hydro alternatives less desirable. The first part of the study (at 10), assumed Bipole III was built East of Lake Winnipeg. The second part of the study assumed Bipole III's costs were 46% higher with a Western route around Lake Winnipeg, and showed that the All Gas alternative was preferable. In addition, these studies were run using very different assumptions from those in the NFAT (e.g., lower cost estimates for Conawapa and Bipole III, as well as export prices presumably much higher than those used today).

[9] At a 6% discount rate, Conawapa (with 5 units or 10 units) or Gull (including SCGT1X-35, 39) were more favorable than an "all SCCT Sequence."

By adopting the analytical approach for the NFAT that Bipole III is a sunk cost, Manitoba Hydro has biased its analysis in favor of the PDP. Under the PDP, Bipole III will be built first (for commercial service by 2017/2018 and ostensibly for reliability reasons alone), but, in a happy coincidence for Manitoba Hydro, the capacity of Bipole III will be treated as if it is a "free good," available free of charge (although paid for by Manitoba Hydro customers) to accept the output of Keeyask in 2019 and of Conawapa in 2026.

However, the cost of Bipole III is not a "sunk cost." Bipole III has not yet been built but is instead presumably in the early stages of construction with an estimated in-service date of 2017/2018. Much could undoubtedly be saved by cancelling it or deferring its in-service date.[10]

It is not correct to assume that the cost of Bipole III is a neutral factor in assessing all resource plans because not all resource plans require construction of Bipole III in 2017/2018. Many resource plans will not require Bipole III until much later - or at any time. For example, an "all gas" alternative would not need Bipole III at all because that alternative involves adding thermal generation near the Winnipeg load center instead of adding new hydroelectric generation at locations remote from the Winnipeg load center along the Nelson River. Yet the cost of Bipole III is included in Manitoba Hydro's Plan 1, its "all gas" alternative. In a proper analysis, the cost of Bipole III would not be needed at all in the "all gas" alternative (and should not be attributed to that alternative). On the other hand, the cost of Bipole III should be explicitly added to the cost of the PDP because the transmission line is necessary for that alternative to work.

RECOGNIZING THE COST OF BIPOLE III AND OTHER SUNK COSTS WOULD UNDERMINE THE PREFERRED DEVELOPMENT PLAN

Bipole III is projected to cost $3.3 billion and enter service in 2017/2018. See the response to PUB/MH I-053a Revised. Moreover, about $1.0 billion of the projected total cost of Keeyask has also been ignored in Manitoba Hydro's analysis because those costs are also considered sunk

[10] A twelve (12) year delay of a $3.3 billion investment amortized over 30 years at 5% (assuming a 2% annual escalation in the investment cost) would save $970 million, about the cost of a new 500 kVAC Manitoba-U.S. interconnection.

costs.[11] The $3.3 billion in outlays for Bipole III are projected to be incurred early in Manitoba Hydro's study period (from the present through 2017/2018), and thus the NPV of those outlays will be roughly equal to their $3.3 billion cost.[12]

The $3.3 billion cost of Bipole III exceeds the incremental benefits which the Preferred Development Plan is said to produce under many scenarios as compared to the benefits of the "All Gas Plan." Accordingly, adding the $3.3 billion cost of Bipole III to the NPV of the PDP will make it less attractive than the all-gas plan in many scenarios. See the tabulation of relative benefits in Table 2 at page 23 of 42 of the NFAT Executive Summary. The PDP is Plan 14. In only a third of the scenarios studied does the PDP yield incremental benefits that are more than $3.3 billion greater than the benefits associated with the "All Gas Plan." Those scenarios are based on assumptions of low discount rates and/or high energy prices - both of which assumptions give greater value to off-system sales of power to the United States made possible by adding Keeyask and Conawapa. That is, use of the low discount rate will lend greater value to off-system sales projected to be made at high prices far into the future than would a high discount rate. If the study period were 35 years instead of 78 years, the Preferred Development Plan would produce fewer benefits than would Plan 4 (K19/Gas25/250 MW).[13]

Bipole III has a similar effect on the other resource plans. For example, the $3.3 billion cost of Bipole III exceeds the incremental benefits which the Preferred Development Plan will produce

---

[11] As noted in Chapter 11 at 5:20-27:

> As such, all costs (incurred or estimated) prior to June 2014 that were required to protect the in-service dates for Keeyask and Conawapa are considered as "sunk" in the economic evaluation. The financial evaluation, however, recognizes these costs need to be included in the revenue requirement at an appropriate point in time.

By expending $1.0 billion on Keeyask even before it was formally selected and approved as an element of the PDP, Manitoba Hydro has provided further support for the notion that development of Keeyask was pre-ordained. Manitoba Hydro's decision to ignore those potentially imprudent expenditures on Keeyask (because they are sunk costs) obviously favors any alternative that includes Keeyask. By not including expenditures on Keeyask to date in its analysis, Manitoba Hydro has further biased that analysis in favor of the PDP.

[12] NPV, or Net Present Value, is "the difference between the present value of the revenue and the present value of the cost. It is the amount of money, if invested today at a stated discount rate, that would grow to an amount sufficient to finance and to provide a return on the investment over the life of the project. When comparing alternatives, the incremental NPV represents the incremental net benefits (or net costs) associated with the increment of investment made for a higher cost investment option,…" See NFAT Chapter 9 at 3:17-22

[13] See LCA/MH 1-397.

under many scenarios as compared to the benefits of Plan 7 (SCGT/C26 - composed of simple cycle gas turbines plus Conawapa in 2026) and Plan 8 (CCGT/C26 - composed of more efficient gas-fired combined cycle generation plus Conawapa in 2026). Again, see the tabulation of relative benefits in Table 2 at page 23 of 42 of the Executive Summary. The incremental benefit of the PDP over the benefits produced by either the SCGT or the CCGT alternatives exceeds $3.3 billion for even fewer scenarios: only those based on assumptions of low discount rates AND high energy prices. Bipole III would be needed in these gas-fired scenarios but not until eight years later than now planned - in 2026 when Conawapa enters commercial service. Pursuing either of those combination Conawapa/gas-fired scenarios would enable Manitoba Hydro to:

1. Defer for eight years the in-service date of Bipole III (or longer depending upon demand growth and trends in export prices), potentially leading to a further deferral and/or cancellation of Bipole III and Conawapa and

2. Build lower-cost SCGTs ($770/kW - See NFAT Chapter 7 at 31 of 39) and/or CCGTs ($1,295/kW - See NFAT Chapter 7 at 31 of 39) instead of Keeyask ($9,048/kW- See the response to PUB/MH I-053a Revised) and share reserves with MISO over the existing 500 kV interconnection; and thereby

3. Reduce economic risk.

As noted previously, Manitoba Hydro's economic analysis does not include other sunk costs already expended for other projects (particularly Keeyask and Conawapa) in its economic evaluations of alternatives. See NFAT Chapter 9 at 2:4-6. Therefore, considerable amounts of money are ignored when comparing alternatives. For Keeyask, the effect of sunk costs is pronounced as its sunk costs total approximately $1 billion. See Appendix 9.3 at 5. Manitoba Hydro ignored sunk costs in its economic evaluation because it claims that Manitoba Hydro's customers will need to pay these costs no matter what plan is chosen, whether or not Keeyask or Conawapa come to fruition. It appears that the sunk costs of Keeyask were incurred as a result of Manitoba Hydro's decision to "to protect the in-service dates for Keeyask and Conawapa."

As noted in NFAT Chapter 11 at 5:20-27:

> As such, all costs (incurred or estimated) prior to June 2014 that were required to protect the in-service dates for Keeyask and Conawapa are considered as "sunk" in the economic evaluation. The financial evaluation, however, recognizes these costs need to be included in the revenue requirement at an appropriate point in time. For plans in which a decision is made to proceed with Keeyask or Conawapa, the sunk costs form part of the cost to acquire the asset and are amortized over the life of the asset. For plans in which Keeyask or Conawapa is deferred beyond the evaluation period, sunk costs are assumed to be amortized over an 18-year period to 2031-32.

If Manitoba Hydro is allowed to recover these sunk costs (projected to be more than $1 billion) from its customers, no matter whether it sought approval for incurring these costs or incurred them without review by the PUB, this allowance will encourage Manitoba Hydro to continue to make resource decisions prior to receiving input from the public and its regulators. WRA notes that LCA also made reference to concerns about the sunk costs, as provided in Technical Appendix 9A at 9A-49.

DESCRIPTION OF NORTHERN HYDRO AND HVDC SYSTEM

The basic facts on the existing Northern hydro generating capacity (both before and after addition of the net capacity of Keeyask and Conawapa) are set forth as follows in the NFAT Business Plan at NFAT Chapter 5:

Hydro Project	Rated Capacity MW
Kettle	1220
Long Spruce	1007
Limestone	1335
SUBTOTAL	3562
Net Keeyask	630
SUBTOTAL	4192
Net Conawapa	1395
TOTAL	5587

Source: NFAT Table 5.1 and Executive Summary p. 4

The capability of the HVDC system is contained in various interrogatory responses, such as MMF/MH II-018a:[14]

HVDC Transmission MW Capacity

Bipole I	1854
Bipole II	2000
SUBTOTAL	3854
Bipole III	2300
TOTAL	6154

Source: MMF/MH II-018a

The comparison of the existing and planned capability of the HVDC system is also addressed in many of Manitoba Hydro's Responses to data requests, including MMF/MH II-017a, -018a and -019a.

For example, the response to MMF/MH II-017a states:

> The existing HVdc system was designed with the reserve criteria of "a dc pole spare over load". Bipole I and II have a total rating of 3854MW, which can carry power of the existing generation [3562 MW, which Manitoba Hydro characterizes as "about 3600 MW"] under normal conditions [but not in a contingency condition involving outage of a d.c. pole].

Response to MMF/MH II-019a states (emphasis added):

> The existing Bipole I & II HVdc system is rated at 3854 MW and can accommodate the capability of Kettle, Long Spruce and Limestone [about 3600 MW] under normal operating conditions, but does not meet the spare valve over generation criterion. **The existing HVdc system cannot provide transmission capacity for Keeyask power.** Please also refer to the response to MMF/MH II-016e.

It is not precise for Manitoba Hydro to state that "The existing HVdc system cannot provide transmission capacity for Keeyask Power." It is more precise to state, as Manitoba Hydro did in

[14] These Bipole capacities are thermal capacities that do not take account of (i) the reconfigurations that Manitoba Hydro has developed in order to account for outages of valve groups or (ii) possible upgrades to the North-South AC Transmission System.

the response to MMF/MH II-007b (emphasis added) that "No **firm** capacity is available to transfer power from Keeyask or Conawapa over the existing HVdc system." Non-firm transmission capability is available.

According to Manitoba Hydro, Bipole III must be added before the existing HVDC will be able to meet reserve criteria. However, once Keeyask and Conawapa are added, the transmission capacity of the three-Bipole HVdc system will be nearly filled, and, once again, Manitoba Hydro will be unable to meet the reserve criteria of "a dc pole spare over load." Manitoba Hydro has introduced a different concept for assessing the reliability and firmness of the three-bipole system with Keeyask and Conawapa, the "spare valve over generation criterion."

The net effect upon reserve capacity of the three-Bipole system after the additions of Keeyask and Conawapa is as follows:[15]

Comparison of Northern Hydro and Capacity of Bipoles

Bipoles I and II	3854
Existing Generation	3562
Remaining Cap	292
Keeyask	630
Needed Cap	-338
Bipole III	2300
Excess Cap	1962
Conawapa	1395
Remaining Cap	567

Note that the rated capability of Bipoles I and II exceed the capability of the existing generation connected to those HVDC lines by 292 MW, whereas loss of a DC pole (rated 1000 to 1150 MW) would wipe out that 292 MW spare capacity. Accordingly, the existing system does not meet the reserve criteria of "a dc pole spare over load."

[15] The response to MMF/MH II-020c states:

> Bipole III will provide 2000 MW north-south capacity. Under normal operation, there will be approximately 1670 MW spare capacity on the three-bipole system with the addition of Keeyask. Keeyask will add 630 MW of new capacity to the system.

Approximately 300 MW of Kettle's generating capacity could be disconnected from the HVDC system and reconnected to the North-South AC system for transmission south to the Winnipeg load center. See NFAT Chapter 2 at 53-54, the response to PUB/MH 1-042f and the response to MMF/MH II-003. Thus, the existing system should be able to accommodate about 592 MW of the 630 MW of generation that is planned to be added at Keeyask without upgrading either Bipole I or II or adding Bipole III.[16]

In addition, the rated capability of both Bipoles I and II could be upgraded to carry the additional generating capacity that would be added at Keeyask. Note that the capacity of Bipole I is 1854 MW while operating at +/-465 kV whereas the ultimate capacity of Bipole III will be 2300 MW while operating at +/-500 kV. If there is sufficient ampacity in the Bipole I conductors, its capacity could conceivably be increased by 446 MW to 2300 MW by upgrading its terminal equipment (converters) to operate at higher voltages and to carry greater currents.[17] Such an upgrade of Bipole I plus the spare capacity in the existing system would provide 738 MW of capacity, more than the 695 MW needed for delivering Keeyask. Another 300 MW of transmission capacity could theoretically be obtained by upgrading the rating of Bipole II from 2000 MW to 2300 MW. HVDC transmission line capacity can be increased with installation of new valves, higher rated conductors, and other features.[18]

---

[16] According to several sources, such as NFAT Chapter 2 at 4, Keeyask's net generation will be 630 MW, rather than 695 MW.

[17] There is likely considerable ampacity available because the design was based on some level of losses. However, using that ampacity may mean excessive sag, and higher voltage may not be possible without first upgrading towers and insulators.

[18] In order to provide one with a sense of what Manitoba Hydro may be able to do with Bipoles I and II, it is worthwhile to examine what has been accomplished over the period since the early 1970s on the HVDC line of the Pacific Northwest-Pacific Southwest Intertie ("PDCI"). This HVDC line extends 846 miles from the Celilo Converter Station on the Columbia River in Oregon south through Nevada to Sylmar, near Los Angeles.

The PDCI was initially designed as +/-400 kV and 1800 amps, a transmission rating of 1440 MW at the sending end. The original mercury arc valves were up-rated to 2000 amps after a few years of operating experience.

The next step was to raise the operating voltage from +/-400 kV to +/-500 kV by adding a 4th valve at each end in order to achieve a 2000 MW transmission rating. Not much in the way of modification was required on the transmission line because it had originally been designed with plenty of insulation margin.

By 1989, the Bonneville Power Administration ("BPA") proposed adding parallel thyristor converters at both ends of the line to raise PDCI's rating to 3100 MW. See http://en.wikipedia.org/wiki/Pacific_DC_Intertie

Apparently, the firm transmission capability of the HVDC system is not critical to Manitoba Hydro's exports to the United States, as described in the response to CAC/MH II-075a (emphasis added).

> Manitoba Hydro's firm export contracts require Manitoba Hydro to provide firm transmission service on the AC network to facilitate energy and capacity transfers according to the system criteria associated with firm transmission service" [e.g., continued deliveries after loss of the single piece of equipment which most limits transfers - a loss referred to as the "most critical contingency"]. However, **Manitoba Hydro is not required to provide a similar level of firmness of transmission service on its HVDC system**.

THE PREFERRED DEVELOPMENT IS INEXTRICABLY LINKED TO, AND DEPENDENT UPON, BIPOLE III—THERE IS NO STANDALONE RELIABILITY FUNCTION OF BIPOLE III

The rationale given for building Bipole III was that Manitoba Hydro has too many eggs in one basket with 70% of its hydro-electric generating capacity being delivered to Southern Manitoba via the Bipole I and Bipole II HVDC transmission lines. Manitoba Hydro asserts that, because Bipoles I and II share the same corridor over much of their length, the existing transmission

---

On February 29, 2012, **Power** reported that

> The Bonneville Power Administration (BPA) last week proposed a $428 million upgrade to the Pacific Direct Current Intertie, an 846-mile overhead transmission line that delivers hydropower and wind power between the Northwest and California. The line is one of the world's longest and highest capacity transmission links.
>
> The BPA said the upgrades would modernize equipment that was "cutting edge when installed more than 40 years ago," but which has since become so outdated that the public service organization had to source parts to repair the line from online auction website Ebay.
>
> The upgrades would also increase the line's capacity from 3,100 MW to 3,220 MW and help it avoid outages and "strengthen it against weather and other threats," the BPA said. Over the past several years, it said, older equipment at Celilo Substation, the northern terminus of the DC Intertie in The Dalles, Ore., has failed with increasing frequency.

system is vulnerable to a common mode failure such as catastrophic outages of either or both of Bipoles I and II. See NFAT at Chapter 5 at 25 of 61.

Manitoba Hydro's concern goes further. It contends that an outage of both Bipoles I and II could be a long-term event necessitating reliance on its thermal generation, remaining hydro-electric generation and import capacity in amounts that are insufficient to meet its demand during many times of the year. In Chapter 2.2.1 of its EIS to the CEC, it portrayed the consequences in dire terms:

> The potential consequences of such an outage of the existing HVdc transmission system are exacerbated by the very long estimated repair times. Wide front windstorm, fire, or tornado damage at Dorsey Station could cause an outage that shuts down the HVdc system for up to three years because of the time required to repair or replace equipment of such complexity. The duration of a similar outage of the Bipoles I and II lines, although not as severe and dire as a failure at Dorsey Station, could still easily cause an outage of six to eight weeks.
>
> In the event of an extended HVdc outage, supply would be restricted to the generation connected to the ac system and the possible imports on the ac interconnections with the United States and neighbouring provinces. Such a restricted supply of power would be significantly inadequate to meet provincial demand, particularly in the winter, and could necessitate rotating blackouts for months. The potential shortfall has been growing steadily over the years, as increased demands for power from new and existing customers have increased the system load requirement.[19]

There are several major flaws in Manitoba Hydro's arguments for the reliability need for Bipole III. They are as follows:

A. Under industry reliability standards, utilities do not need to design their systems to withstand a catastrophic event, such as loss of four elements of a transmission system at the same time (such as a total loss of Bipoles I and II), which is considered an N-4 event under North American Electric Reliability Corporation standards.

B. If Manitoba Hydro's major concern is the length of outage of both existing Bipoles, then it could plan for outages by clearing brush and placing equipment (such as

[19] The Riel Station, scheduled to enter service in 2014, is designed in part to preserve Manitoba Hydro's system import capability if there is a major outage at Dorsey. See NFAT Chapter 5 at 24 of 61. This upgrade mitigates one of Manitoba Hydro's major reliability concerns with the present configuration of Bipoles I and II.

cranes, other construction equipment and replacement towers, wires, switchgear, transformers, valves, etc.) in areas along the length of the lines and at the converter stations, so that reconstruction could begin immediately. Switchgear, transformers and valves should be protected from physical damage at their present location. The cost of staging equipment and supplies for Bipoles I and II would be far less than the cost of building Bipole III.

C. If Manitoba Hydro first built a second 500 kV interconnection to the United States, it could import more power during outages of one or more of the Bipoles, which is cheaper than building Bipole III. [20] Furthermore, the cost of building a second 500 kV interconnection has been estimated at approximately the same cost as would be saved by deferring Bipole III for twelve years.

A. Transmission Planning Standards

The North American Electric Reliability Corporation ("NERC") is responsible for developing standards that ensure the reliability of the bulk power system in North America. For transmission planning, NERC has established various standards, including the ability of a transmission system to withstand the loss of a single element (N-1) so that none of the equipment exceeds its applicable ratings and the system does not inappropriately drop firm load. If there is a loss of two elements at the same time, or one right after the other (an N-2 or N-1-1 event), the bulk power system may reach emergency ratings for short periods of time, and load can be dropped in a planned or controlled manner.[21] An extreme event, such as a catastrophic failure of both Bipoles I and II would involve the simultaneous outage of all four single poles of Bipoles I and II (called an N-4 event), and utilities need only evaluate such scenarios for risks and consequences.

[20] In the Manitoba Hydro Bipole III EIS, December 2012, the cost of an additional 1500 MW interconnection to the United States was estimated at $1.5 billion. See Section 2.3.4 at 2-12. The cost of 500 MW of gas-fired generation was estimated to cost $750 million. Bipole III was then estimated to cost $3.28 billion. See Section 2.3.2 at 2-10.

[21] See Standard TPL-001.01 at http://www.nerc.com/pa/Stand/Reliability%20Standards%20Complete%20Set/RSCompleteSet.pdf

Loss of a single pole of a Bipole is considered an N-1 event which has a less-than-1% probability of occurring (i.e., less than 1 X 10^{-2}). See the response to CAC/MH II-013b.[22] Although industry reliability criteria require that Manitoba Hydro continue to serve all firm load obligations after the occurrence of any single contingency (an N-1 event), those criteria do not require that it continue serving all firm load after an N-2 event, let alone, after an N-4 event. Nevertheless, Manitoba Hydro contended before the CEC that the risk posed by the contingency loss of both poles of both Bipoles I and II was an unacceptable risk justifying the expenditure of $3.3 billion.

Manitoba Hydro's contention before the CEC was never tested because of the CEC's limited mandate and terms of reference in relation to Bipole III (which the Manitoba Minister for Conservation and Water Stewardship clarified did not include an NFAT review).[23] However, while the Bipole III hearings were ongoing, the Manitoba Government announced that it had "asked the Public Utilities Board to conduct a Needs For and Alternatives To (NFAT) review of upcoming Manitoba Hydro projects including the Keeyask and Conawapa generating stations and their associated transmission facilities."[24] Despite this public commitment, and the reality that Bipole III is clearly an associated transmission facility for Keeyask and Conawapa, Bipole III was subsequently scoped out of the NFAT process for the PDP which is currently before the PUB.

The MMF has repeatedly raised concerns about the need for Bipole III, its selected route down the west side of the province that dissects the Manitoba Métis Community's "breadbasket" as well as the project's non-mitigatable impacts on the Métis community's rights, culture, economy and way of life on the west side corridor of the province (which have not been addressed).[25] As

[22] An N-4 event involving four independent events would have a probability of 1 X 10^{-8} or one chance in 100,000,000. However, Manitoba Hydro proposed to build Bipole III to guard against a common mode failure such as tornados or severe ice storms affecting all four poles which its studies determined could be expected to occur once every 17 years. In a common mode failure case, loss of each pole is not considered an independent event.

[23] See letter from Manitoba to CEC Chair dated August 23, 2012 with respect to the conduct of a NFAT in relation to Bipole III. Letter available at: http://www.cecmanitoba.ca/resource/hearings/36/Motion%20Decision2%20-%20Coalitionandencl1.pdf.

[24] Manitoba Government http://news.gov.mb.ca/news/index.html?item=15563.

a result of the Manitoba Government's approach, Bipole III has been segmented from the PDP and other plans related to Keeyask and/or Conawapa and was not examined in an NFAT proceeding. This creates a significant gap. Moreover, Manitoba Hydro did not and has not engaged in meaningful discussions with the MMF about mitigation of the impact of, or Métis benefit from Keeyask and/or Conawapa despite their being inextricably linked to and dependent upon Bipole III. Consequently, the need for Bipole III as well as the social and economic cost of the PDP on the Manitoba Métis Community remains unknown and has not been addressed in any process.

Manitoba Hydro has confirmed that it generally designs its system to comply with standard industry reliability criteria but appears to have considered and accepted laxer criteria with respect to the HVDC system upon addition of Keeyask and Conawapa. For example, Response to MMF/MH II-016a states:

> Manitoba Hydro adopts the NERC reliability criteria and definitions which apply to both the ac and dc system. Loss of a DC pole is considered as a single contingency (N-1). Manitoba Hydro system is designed to meet the NERC reliability performance criteria.

As noted previously, Manitoba Hydro's existing transmission HVDC system does not meet this N-1 criterion. If Manitoba Hydro loses one of its DC poles, it can no longer transmit all of its existing hydro power from the Nelson River. Indeed, this is why it appears that some (if not all) of its export contracts allow the exports to be dropped under system emergencies. Response to MMF/MH II-016b admits that loss of just one Bipole is a multiple contingency event:

> Loss of a bipole is considered as a multiple contingency, or N-2 (category C) event. Loss of both bipoles is an extreme event (category D). Manitoba Hydro system is designed to meet the NERC reliability performance criteria. NERC does not specifiy [sic] performance criteria for extreme events but requires that such events be evaluated for risks and consequences.

[25] For documents outlining the MMF concerns on these issues, see MMF Closing Argument and Affidavit of David Chartrand in CEC hearing on Bipole III at http://www.cecmanitoba.ca/hearings/index.cfm?hearingid=36#3. Further, following the Minister of Conservation and Water Stewardship's issuance of a license to Manitoba Hydro for the construction of Bipole III, the MMF appealed the Minister's decision and the issuance of the license under section 28(1) of the *Environment Act*. This appeal remains pending.

Indeed, NERC criteria state that no firm load should be lost at transmission levels following a single contingency (N-1), while firm load can be dropped following an N-2 contingency (a multiple contingency). Scenarios involving N-4 events (such as loss of both Bipole I and Bipole II) are expected to be catastrophic. Manitoba Hydro is not required by industry standards to design its system to meet such catastrophic N-4 contingencies. However, Manitoba Hydro expressed a concern about living with months of rotating blackouts, which is more of a capacity reliability issue than a transmission reliability issue. Manitoba Hydro chose to address that concern by building new transmission within Manitoba Hydro rather than by building stronger transmission ties to its U.S. neighbors or gas-fired generation near its Winnipeg load center. In its planning, Manitoba Hydro should be seeking the ability to draw upon a more diverse set of generating resources (e.g., those in MISO), not just more reliable access to pre-existing on-system generation.

Other information illustrates how Manitoba Hydro has begun to change its criteria for its transmission system. For example, the response to MMF/MH II-016e states:

> Manitoba Hydro has historically adopted the "a dc pole reserve over load criteria" stated in the 1986 Transmission Planning Criteria (H&TPD 86-1), as quoted "The present Criteria is to maintain a dc pole reserve toward meeting the Manitoba Firm load demand in conjunction with existing southern system generation under median flows". This criteria was applied to the development of Limestone generation.
>
> The reserve criteria is under continuous review by Manitoba Hydro. The past operating experience (significant outages of HVdc valve groups) and increasing economic benefit received from power exports have led to the criterion of maintaining "on-line valve group spare over generation" to cover value group outages. This "spare valve" criterion is considered to provide optimum reliability and economic benefits. The reserve criteria is currently under further investigation for the split Northern Collector System associated with Conawapa.

Now that it has secured approval for construction of Bipole III, Manitoba Hydro has greatly relaxed its concerns with risks posed by a contingency outage of a single pole of a Bipole, an entire Bipole, or both Bipole I and II. It now contends that

> The loss of 900-1000MW pole is a low probability event (< 1%) as stated in Appendix 13 of the NFAT submission, therefore it is not considered to be an economically attractive

> option to cover for this loss with an additional spare HVdc capability when evaluating the firm transfer capability of the HVdc system.

See the response to CAC/MH II-013b.

Manitoba Hydro admits that the odds of such an event (simultaneous long-term loss of Bipoles I and II) are low. Ordinarily, utility systems are designed to meet load except for one day in every ten years, the 1-day-in-10 year loss-of-load-probability standard. The risk of losing both existing Bipoles is much lower. At Chapter 2.2.2 of its EIS submission to the CEC, Manitoba Hydro stated:

> Studies (Teshmont 2001) have shown that with respect to Dorsey Station, there is a 1 in 29 year probability of outage due to fire and a 1 in 200 year probability of outage due to wide front winds. While mitigation measures have been put in place, which partially address fire vulnerability at Dorsey, there is little that can reasonably be done to mitigate vulnerability to wind and other weather events. The same studies (Teshmont 2001) revealed that the probability of the loss of the Interlake corridor is 1 in 17 years from a tornado, 1 in 50 years from icing and 1 in 250 years from wide front winds.

In other words, Manitoba found it necessary to expend $3.3 billion on the spare HVDC capability of Bipole III in order to lessen the consequences of an N-4 contingency outage of four poles of Bipoles I and II, which has a probability of one occurrence in seventeen years[26] but has now determined that it is not "economically attractive…to cover . . . with an additional spare HVdc capability" the contingency outage of a single 900-1000 MW pole of any Bipole, an event which has a failure rate of 5.75/year with an outage duration of 1.21 hours (Bipole I), or 6.02 failures per year of 2.16 hours duration (Bipole II). See NFAT Appendix 13.1 at 11.

B. Length of Outage

As described above by Manitoba Hydro in the proceedings before the CEC, Manitoba Hydro's main concern centered on the length of a possible outage of both existing Bipoles. Manitoba Hydro contended that an outage of the Dorsey Substation could last as long as three years, while

[26] Please note that the one in 17 year expectancy is for a tornado, which would not be expected to occur during Manitoba's peak winter months when loads are highest.

outages of the corridors themselves could last from six to eight weeks. However, multiple actions could be taken to reduce the risk of lengthy outages of either the Dorsey Substation or the transmission corridor.

It is notable that the firm that provided the probabilities of losses associated with outages of Bipoles I and II, as well as the Dorsey Substation, has ties to Manitoba Hydro and the Bipole projects themselves. Teshmont Consultants acted as the Owner's Engineer on each of the Bipole projects on behalf of Manitoba Hydro, and has already been hired as Owner Engineer for Bipole III.[27] Therefore, Manitoba Hydro asked the consultant that actually designed the original Bipoles I and II to critique its performance in relation to catastrophic events, and then hired that same consultant to design and build the project that was ostensibly justified via that same consultant's report.

In any event, the probabilities of catastrophic contingencies described by Teshmont are all less than the industry's loss of load probability standard of one day in 10 years. The worst outage for the Dorsey Substation was listed as a 1 in 29 year event for fire, while the worst outage for the Bipoles I and II transmission corridor was a 1 in 17 year event for a tornado. The Interlake corridor was also estimated to be at risk for an icing event of 1 in 50 years.[28]

And for each of these catastrophic events, Manitoba Hydro could take steps to reduce risks for far less money than it would cost to build Bipole III. For example, fire risk could be handled by removing brush in and around the fence of the Dorsey Substation, as well as the transmission corridor. Furthermore, the substation could be reinforced to withstand tornado forces, and Manitoba Hydro could acquire long-lead-time replacement components that cannot be protected and keep these parts in reserve. Equipment necessary in case of icing or wind storms could be purchased in advance, and staged at areas along the transmission lines in order to hasten the recovery of the facilities. Each of these activities would be far less costly than building a third Bipole that will traverse land important to First Nations and Métis people.

[27] See http://www.teshmont.com/expertise/hvdc-systems

[28] Manitoba Hydro EIS on Bipole III to the CEC, Chapter 2.2.2.

Finally, adding Bipole III plus Keeyask and Conawapa would put even more eggs in the Northern Hydro basket which would be vulnerable to a single event taking out all three Bipoles of all Northern Hydro generation (i.e., a "common mode" failure such as tornados or ice build-up) or the loss of Bipoles I and II while Bipole III is out of service for maintenance. Today, the simultaneous or overlapping loss of Bipoles I and II would deprive Manitoba Hydro of 3562 MW of Northern hydro generation whereas loss of all three Bipoles would deprive it of 5587 MW of Northern Hydro generation once Keeyask and Conawapa are placed in service. Although constructing Bipole III on a right-of-way ("ROW") separate from that used by Bipoles I and II reduces the risk of a common mode failure of all three Bipoles, some of the common mode events could be widespread enough to take out all three Bipoles.

C. A Second 500 kV Line to the US Provides Reliability

The shortfall that would result from losing both Bipoles I and II was depicted at Chapter 2.2.3 (at 2-6 and 2-7) of Manitoba Hydro's EIS submission to the CEC as about 1500 MW in 2017, growing to 2000 MW in 2025, as illustrated by Manitoba Hydro in the graph below:[29]

[29] The 1500 MW deficit in 2017/18 would occur at the time of Manitoba Hydro's winter peak demand which would be unlikely to coincide with a tornado or a brush fire. The load duration curve for 2017/18 shows that Manitoba Hydro's demand can be met with both Bipoles I and II out of service in 68% of the hours of 2017/18. See the Manitoba Hydro EIS on Bipole III, Chapter 2.2.3, Figure 2.2-2.

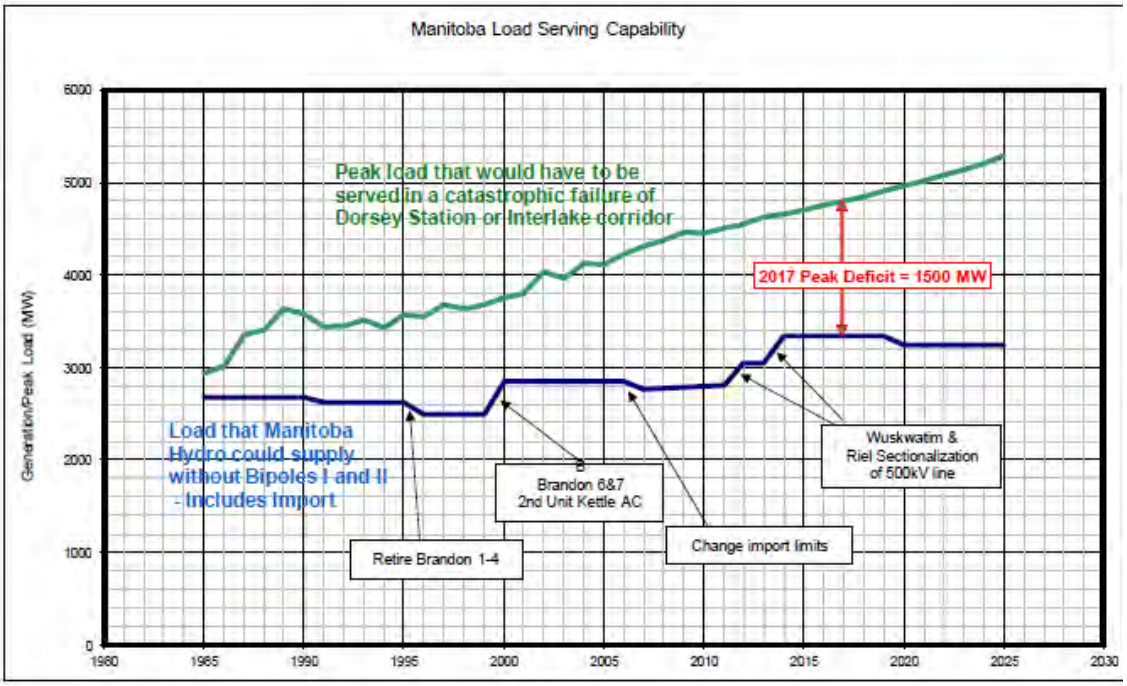

Figure 2.2-1: Load Serving Capability without Bipoles I & II

It appears from Figure 2.2-1 that Manitoba Hydro has been exposed to its alleged susceptibility to loss of Bipoles I and II since 1985 yet it will take more than 30 years to mitigate the impact of such a loss. Manitoba Hydro reports that, at the time of a September 1996 loss of both Bipoles (the only time such a catastrophic loss has occurred in over 35 years), it was able to arrange 985 MW of imports to cover the shortfall,[30] more than the 700 MW existing firm import limit from the United States and other Provinces. See NFAT Chapter 5 at 16 of 61.

Having identified the supposed need for addressing a low-probability event in its presentation to the CEC, Manitoba Hydro proposed two alternatives to building Bipole III (EIS submittal at Chapter 2.3 at 2-9):

2. The addition of up to 2000 MW of gas turbines in southern Manitoba.

3. The addition of up to 1500 MW of new import tie lines to the United States (USA) to provide access to US generation, which is assumed to be comprised mainly of natural gas-fired generation, plus the addition of another 500 MW of natural gas-fired generation in southern Manitoba.

[30] See Chapter 2.2.2 of the EIS for Bipole III at 2-4.

Both alternatives to Bipole III were rejected because of cost, but the rejection was not based on an apples-to-apples comparison. The addition of Bipole III brings with it no additional generating capacity, except for a reduction in losses of approximately 90 MW (see NFAT Chapter 4 at 44). That is, Bipole III only provides between 2000 MW and 2300 MW of backup transmission access to already-existing Northern hydro-electric generation in the low-probability event of simultaneous loss of Bipoles I and II. By comparison, each of the two alternatives would have provided 2000 MW of ADDITIONAL generating capacity. The alternatives were determined to be more expensive than Bipole III in large part because they included either (i) 2000 MW of additional firm gas-fired generation in Manitoba or (ii) 1500 MW of firm purchases from the United States plus 500 MW of additional gas-fired generation in Manitoba. Clearly, the two alternatives would have offered 2000 MW more long-term generating capacity value to Manitoba consumers than Bipole III will. In order to make the three alternatives comparable in terms of generating capacity, Manitoba Hydro should have added the costs of Keeyask and Conawapa to the cost of Bipole III, which likely would have made either alternative more attractive than Bipole III in combination with the additional hydro generation.

There were further flaws in Manitoba Hydro's analysis of the alternative that called for building an additional 500 kV AC transmission line to the United States. For example, there would be no need for Manitoba Hydro to line up 1500 MW of firm purchase commitments to cover a simultaneous outage of Bipoles I and II that was estimated to occur no more frequently than once in 17 years. Nevertheless, this alternative was rejected in large part because Manitoba Hydro contended that reliance on additional import capacity would require that, in addition to Manitoba Hydro's building the line to the United States, it would need to line up 1500 MW of costly long-term firm power purchase contracts tied to the cost of gas generation. The imported generation, combined with the 500 MW of gas-fired generation in Manitoba, was estimated to cost $2.99 billion. See the Bipole III EIS at Section 2.3.4 at 2-12.

In my experience, that contention is inconsistent with industry custom and practice. The right of Manitoba Hydro to rely upon interconnected utilities for support during contingencies – especially such extreme contingencies as outages of four poles of the Bipole HVDC system -- is

implicit in the interconnection process and is almost always made explicit in the bulk power contractual arrangements that accompany and govern such interconnections. There are numerous instances in which owners of large blocks of nuclear generation in North America experienced long-term outages or construction delays and obtained replacement power in bulk power markets. Manitoba Hydro could expect to pay a premium in some markets for such power but should obtain some protection from price gouging by MISO oversight of its markets and FERC regulation of interstate commerce in wholesale power.

In addition, any outage of both Bipoles I and II would require Manitoba Hydro to trip or back down the 3,562 MW of existing hydro-electric generation at Kettle, Long Spruce and Limestone, (NFAT Chapter 5 at 9 of 61), but this loss of generation represents a relatively small percentage of the 135,000 MW of generation in the MISO market and 167,000 MW of generation in the PJM market to which MISO is strongly interconnected.[31] Furthermore, apart from the position it took in its presentation to the CEC, Manitoba Hydro's position on the value and function of interconnections is consistent with the industry custom and practice I described. That is, Manitoba Hydro relies on its interconnections for just such events as loss of both existing Bipoles. As noted in the NFAT at 5.2.3 Reliability Benefits of Interconnections:

> Manitoba Hydro's interconnections provide significant reliability benefits in several ways:
> - sharing of generation contingency reserves
> - sharing of capacity resources due to load diversity
> - importation of energy during drought conditions or extreme supply loss in Manitoba
> - ability to supply cross-border load when this load is isolated from its system.

Moreover, NFAT Chapter 5 at 18 states:

---

[31] As noted at NFAT Chapter 5 at 40 of 61:

> MISO's July 2012 historic peak load for the market footprint was 98,576 MW; registered generation capacity in July 2012 was 131,581 MW. About 63,000 MW or 48% of the registered generation capacity is coal-fired generation.

Entergy has recently joined MISO and added 23,000 MW of generation. NFAT Chapter 5- at 39 of 61. MISO has strong interconnections with PJM which Wikipedia summarizes as

> More than 830 companies are members of PJM, which serves 60 million customers and has 167 gigawatts [167,000 MW] of generating capacity. With 1,325 generation sources, 59,750 miles (96,160 km) of transmission lines and 6,038 transmission substations, PJM delivered 682 terawatt-hours of electricity in 2009. [Footnote cites 2010 PJM Statistics]

> Imports may also be required for reliability purposes during major supply loss events such as the loss of the entire Interlake HVDC transmission corridor.

Furthermore, Manitoba Hydro has long-established relationships with the opposite parties from the United States in its interconnection agreements. Over the decades since Manitoba Hydro began development of its Nelson River hydro-electric plants, those opposite parties have benefited greatly from their purchases of low-cost power and are well aware of the risks posed by the configuration of Manitoba Hydro's bulk power system. Quite apart from their contractual obligations and industry custom and practice, it would be imprudent of those opposite parties to deny Manitoba Hydro access to reasonably-priced replacement power in the event of a simultaneous contingency outage of both Bipoles I and II. Manitoba Hydro would be in a position to deny those opposite parties' extensions of their present favorable bulk power supply arrangements.

Indeed, the benefits of interconnections provide a basis to include a second interconnection to the United States. And Manitoba Hydro examined the benefits arising from two possible sizes of transmission facilities to the United States. One interconnection upgrade would enable Manitoba Hydro to export an additional 250 MW, while the other would create "750 MW additional transmission interconnection import/export capacity between Manitoba and Minnesota and Wisconsin with an ISD of 2020." See the NFAT Overview at 2 of 13.

Clearly, the 750 MW planned addition to Manitoba Hydro's import limit associated with the second planned 500 kV line to the United States would enable it to cover half the 1500 MW shortfall it could experience in 2017 from loss of both Bipoles, leaving it exposed to a shortfall of capacity in only about 10% of the annual load cycle. It also seems likely that Manitoba Hydro could increase that 750 MW addition to its import capability by adding reactive support to its interconnections with the United States.[32] Nonetheless, Manitoba Hydro rejected that alternative.[33]

[32] The response to MMF-MH I-037 states that "Adding series capacitors to the Richer to Moranville 230 kV line might increase the import limit by 50 to 100 MW." That response also states that the present 700 MW import limit is based on preventing voltage collapse in the United States following loss of the existing 500 kV line between Dorsey and Forbes, suggesting that the 700 MW import limit could be increased by adding reactive support to both

These data suggest that Manitoba Hydro could have achieved the desired level of backup transmission capacity by building the 500 kV Manitoba-Minnesota Transmission Project (with voltage support suitable to avoid voltage collapse in connection with substantial import levels), instead of building Bipole III and - as discussed below - at a cost lower than the $3.3 billion cost of Bipole III. The total cost of the proposed 500 kV Manitoba-Minnesota line is projected to be $1.05 billion, of which some U.S. utilities would pay a share.[34] As noted, the Bipole III EIS estimated the cost of a 1500 MW increase in import capability to be $1.5 billion.

In referring to the Manitoba-Minnesota Transmission Project, the NFAT Executive Summary at 6-7 of 42 states:

> This project is still in the study and negotiation phase. Manitoba Hydro will be responsible for the Manitoba portion of the interconnection, which is estimated to cost $350 million. Manitoba Hydro will also be responsible for some portion of the capital and ongoing operating costs associated with the U.S. portion of the facilities. For the Preferred Development Plan, it is assumed that Manitoba Hydro will be responsible for 40% of the capital and ongoing operating costs associated with the U.S. portion of the 750 MW interconnection facilities, with the remainder of the transmission costs to be borne by MP and WPS. The total cost of the U.S. portion of the 750 MW interconnection is in the order of $700 M (2020 base dollars, not including interest).

CONCLUSION

Manitoba Hydro's Preferred Development Plan has not been supported by Manitoba Hydro's NFAT submission and, if approved and built, will impose unnecessary and excessive risks on ratepayers. Manitoba Hydro's pursuit of a gas-fired alternative and/or imported power

---

the existing and planned 500 kV interconnections with the United States. The cost of reactive support is typically far lower than the cost of a new 500 kV AC interconnection.

[33] "The [230 kV line to Rugby, North Dakota] project increased long-term import capability to 700 MW, and increased the export capability to the U.S. interface system operating limit of 2,175 MW, which is still in effect. It should be noted that 225 MW of the system operating limit is utilized for delivery of operating reserves and transmission reliability requirements and is not available for export purposes." NFAT Chapter 5 at 15 of 61.

[34] The N-2 loss of two 500 kV transmission lines would cause a blackout (or maybe not if an SPS is used and is successful) while the N-4 Bipole outage may or may not cause a blackout, but is primarily of concern because of the possibility of months of rotating blackouts (i.e., two very different kinds of impacts). A blackout is over in a few hours. Rotating blackouts for months are more severe.

(supported by enhanced import capacity on its interconnections with the United States) would be far lower in cost in the years through 2040, and lower in risk, than would pursuit of its PDP. The PDP would exacerbate the concentration of its generating resources along the Nelson River hundreds of kilometers north of its Manitoba Winnipeg load center and put more eggs in that basket.

In addition, Manitoba Hydro should cancel – or at least defer – construction of Bipole III. Manitoba Hydro could more cost-effectively guard against a simultaneous outage of Bipoles I and II by enhancing its import capacity through upgrades of its interconnections with the United States.

POWER PLANNING AND DEVELOPMENT DIVISION

Report on

THE 2004/05 POWER RESOURCE PLAN

Date: July 22, 2004

This report is intended **for internal use** by Manitoba Hydro only. External requests for information contained herein should be referred to Power Planning and Development Division.

3.Conawapa B axis versus DX axis:

The decision on which axis is to be developed for Conawapa would ultimately affect the capacity of the plant. Selection of the DX axis would likely provide 10% more capacity at Conawapa (1250 MW vs 1375 MW) allowing for greater hydro capability in the event the Gillam Island site is not developable. However, this would add additional investment risk to the Conawapa project. The recommendation of Conawapa for an in-service-date of 2024 allows sufficient time to re-evaluate the selection of the preferred axis prior to final commitment.

Other Risks:

Bipole III HVDC Line

Work is ongoing and the routing of the line is yet to be determined. Since the in-service-date of 2010 is not considered to be attainable and 2012 is more likely, the energy and capacity available from reduction in transmission losses resulting from construction and system operation of Bipole III line has been included for an in-service of 2012.

Recognizing that there is a risk of the Bipole III Line not being constructed in advance of new generation, a sensitivity was conducted in which the Bipole III Line is included with new northern generation developed to meet domestic load requirements. The costs and line benefits are now considered as part of the sequence economic analysis. For comparative purposes, all three northern hydro options (Conawapa, 5 unit Conawapa and Gull) have been included as these options would all depend on the Bipole III Line for transmission

Tables 3 below, tabulates the results of this scenario comparison. Under this sensitivity, SCCTs are most economic at the 10% discount rate but the Conawapa -2024 sequence is most economic at 6%.

Table 3
Expected Benefits Relative to all SCCT Sequence
(Bipole III Line costs and benefits included with northern hydro development ISD-2024)

Millions of 2004 PV Dollars, 2004 **EXPECTED** Export Prices

	Conawapa-24	Conawapa -24 (first 5 units of 10)	Gull-24 SCCT1X-35, 39
Incremental NPV @ **6% Discount Rate**	**589**	**416**	**310**
Incremental NPV @ **10% Discount Rate**	**1**	**-34**	**-40**
Incremental IRR	**10.0%**	**9.4%**	**9.1%**

This sensitivity assumes the Bipole III line being developed in 2024 would still be utilizing the East of Lake Winnipeg route. The loss reduction benefits are included but no monetary value is included for the reliability benefits.

Should the Bipole III line utilize the Interlake or West routes, the capital costs would be higher and the benefits resulting from loss reductions lower. A further sensitivity was conducted to estimate the impact on expected benefits of Conawapa, Conawapa 5 units and Gull should Bipole III Line be constructed on a West route. For this West route sensitivity, costs were estimated to be 46% higher and benefits from reduced losses were estimated to be 41% lower than if the line were construct east of Lake Winnipeg. Table 4 below, tabulates the results of this scenario comparison.

Table 4
Expected Benefits Relative to all SCCT Sequence
(Bipole III Line costs increase by 46% and benefits decrease by 41%, west routing, included with northern hydro development ISD-2024)
Millions of 2004 PV Dollars, 2004 **EXPECTED** Export Prices

	Conawapa-24	Conawapa -24 (first 5 units of 10)	Gull-24 SCCT1X-35, 39
Incremental NPV @ **6% Discount Rate**	**508**	**335**	**229**
Incremental NPV @ **10% Discount Rate**	**-38**	**-73**	**-79**
Incremental IRR	**9.4%**	**8.7%**	**8.2%**

Inclusion of at least some reliability benefits with the Interlake or West line would reduce or eliminate the cost impacts relative to the SCCT sequence. Thus, the additional costs for the Conawapa and Gull sequences would be larger but probably not sufficient to reverse the recommendation for Conawapa in 2024.

Higher Load Growth

The 2004 Medium High Load Growth scenario would result in deficits in the years 2008/09 and 2009/10, of 280 GWh and 410 GWh respectively. The addition of Wuskwatim in the year 2010/11 provides sufficient additional supply to maintain a net surplus of dependable energy until the year 2019/20. In the 2003/2004 IFF, under the High Load Growth scenario new resources were required (post Wuskwatim) one year earlier in the year 2018/19.

Lower Load Growth

If actual long-term domestic load growth turned out to be lower than the base load forecast, the requirement for new generation would be deferred from the current 2024 date under base load growth. For example, by applying the 2004 Medium Low Load Forecast, the need date for new generation would be 2048/49.

Needs For and Alternatives To

APPENDIX 9.3

Economic Evaluation Documentation

This page is intentionally left blank.

Economic Evaluation Documentation

This appendix documents the inputs and assumptions associated with the economic evaluations of the NFAT development plans. The appendix is organized into three sections which are 1) Reference Scenario Analysis, 2) Probabilistic Analysis with Scenarios, and 3) Economic Summary Tables.

Section 1 – Reference Scenario Analysis, includes the following planning assumption details:

- Economic Lives of New Generation Resources
- Total Study Life
- Sunk Costs
- Net Present Value Calculation – Manitoba Hydro's Real Weighted Average Cost of Capital (RWACC)
- Electricity Export Price, Natural Gas Price and Carbon Price Forecasting Methodology
- Summary of Export/Import Contracts
- Wind Integration Costs
- Description of Marginal Costs
- Cash Transfers to the Province

Section 2 – Probabilistic Analysis with Scenarios, includes details and explanations associated with the economic uncertainty analysis in Chapter 10.

Section 3 – Economic Summary Tables, includes the following cash flow details:

- Hydro Generation, Thermal Generation, Wind Generation, Transmission Capital Costs
- Capital Taxes
- Fixed Operating and Maintenance Costs
- Gross Export Revenue
- Water Rentals
- Variable Production Costs of Thermal Generation – Fuel Costs, Variable O&M, Carbon Adders
- Power Purchases
- Net Revenue

1. Reference Scenario Analysis

The reference scenario analysis considered inputs and assumptions that are associated with the "most likely" outcomes for the factors affecting Manitoba Hydro's future. The economic evaluations associated with ***Chapter 9 Economic Evaluations – Reference Scenario*** are based on 2012/13 reference scenario planning assumptions with the exception of adjustments, primarily downwards, to the electricity export price forecast as described in Section 1.6.4 of this appendix. The economic evaluations associated with ***Chapter 12 Economic Evaluations – 2013 Update on Selected Development Plans*** are based on reference scenario 2013/14 planning assumptions.

Following is a general description of each of the 2012/13 and 2013/14 key planning assumptions used for reference scenario economic evaluations.

1.1. ECONOMIC LIVES OF NEW GENERATION RESOURCES

Table 1.1 provides the economic lives of new generation resources used in economic evaluations.

Table 1.1: Economic Lives of New Generation Resource Options

Hydro-electric Generating Stations	67 Years
Wind Generating Stations	20 Years
Simple Cycle Gas Turbines (SCGT)	30 Years
Combined Cycle Gas Turbines (CCGT)	30 Years
Individual turbines and generators for hydro-electric stations	25 Years
Transmission Stations	35 Years
Transmission Lines	50 Years

1.2. TOTAL STUDY LIFE

The total study life used in this analysis is 78 years. For the total study life, Manitoba Hydro combines two approaches – a 35-year detailed evaluation and a long-life asset evaluation which extends from the end of the 35-year study period to the end of the service life of hydro-electric generation assets, as representing the longest-lived assets.

The economic lives of assets developed in the different development plans may extend well beyond the 35-year planning period. While natural gas-fired generation resources are estimated to have economic lives of 30 years, hydro-electric resources are estimated to have economic lives of 100 years or longer, with the "weighted average" life of the plants being around 67 years when considering the different service lives of the mechanical and electrical equipment and the service lives of the concrete and earthen structures. For the 35-year study period, detailed forecast information related to the Manitoba Hydro system, is used.

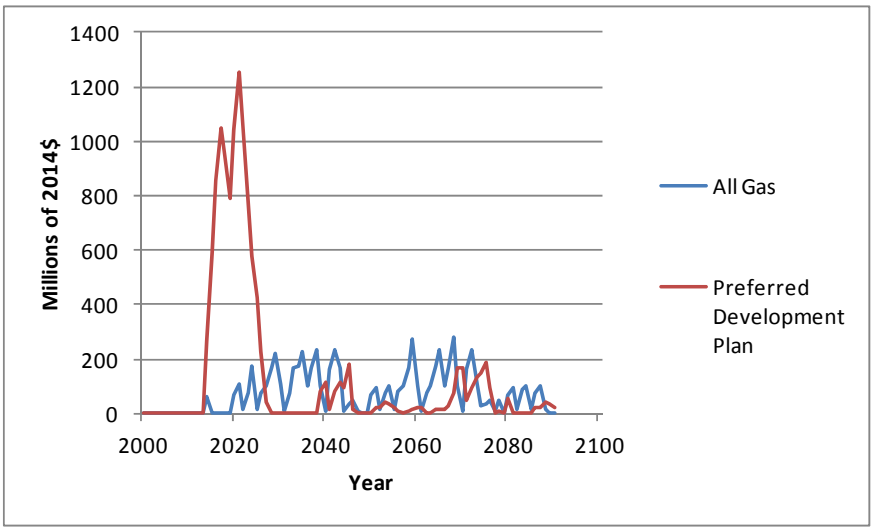
Beyond the 35-year study period, replacement capital costs are assumed for assets that reach the end of their economic lives before the end of the long study period (78 years). In addition, a net production cost approximation (also referred to as net average flow related revenue) is used beyond the 35-year study period which includes:

- extending fixed operating and maintenance costs throughout the economic life of all assets (including major capital O&M investments for large hydro-electric resources), and
- extending the average net revenues of the last three years associated with the economics of a development plan to capture the expected ongoing incremental revenues between development plans to the end of the study period.

As an example, Figure 1.1 graphically shows the timing and value (in millions of 2014$) of replacement capital costs for the reference scenario All Gas plan and the Preferred Development Plan (K19/C25/750MW (WPS Sale & Inv)) over the total study life. The cash flow component of "Total Capital" for each plan is the basis for the chart and is provided in the Economic Summary Tables 001 and 009 (Preferred Development Plan and All Gas plan,

respectively) in Section 3 of this appendix. Similarly, Figure 1.2 graphically shows the timing and value (in millions of 2014$) of net average flow related revenue (see Section 3.2 of this appendix for a description of net flow related revenue) for the reference scenario All Gas plan and the Preferred Development Plan (K19/C25/750MW (WPS Sale & Inv)) over the total study life. The cash flow component of "Net Revenue" for the each plan is the basis for the chart.

Figure 1.1: Timing and Value of Replacement Capital Costs: Total Capital



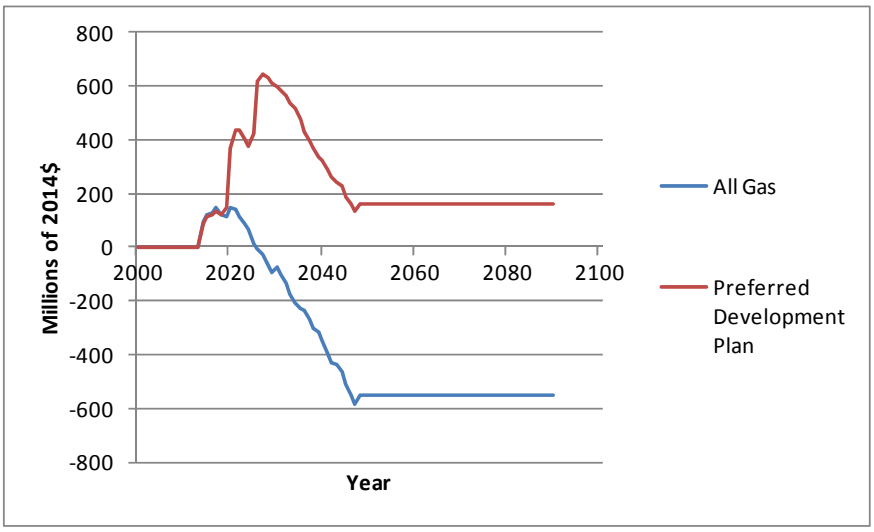


Figure 1.2: Timing and Value of Net Production Costs: Net Revenue

1.3. SUNK COSTS

When evaluating and choosing among alternative development plans, from an economic evaluation perspective, the appropriate measure is the incremental costs and benefits associated with one plan relative to another. This means that costs and benefits that are common to all development plans are not included in the analysis as these values are the same in each development plan. Likewise, sunk costs are not included in the economic evaluations as these represent money already spent or commitments that cannot be changed relative to the decision point when choosing among plans. While these costs could be included in the evaluations for all the development plans, the comparison of plans would yield the same result as not including the sunk costs in the evaluations. For the purpose of this submission, as appropriate for each development plan, all costs (incurred or estimated) prior to June 2014 will be considered as sunk and having been made to protect in-service dates for Keeyask and Conawapa generating stations. June 2014 was chosen because, according to the NFAT schedule, the NFAT panel report will have been made public and the Government of Manitoba will have made decisions on the development plans. Table 1.2 provides a summary of the capital costs, net of sunk costs, for Keeyask and Conawapa generating stations for the different in-service dates assumed in the NFAT evaluations.

Table 1.2: Capital Costs Net of Sunk Costs Used for Economic Evaluation Keeyask G.S. and Conawapa G.S. by In-Service Date (Billions of 2014 Base Dollars)

	Keeyask 2019	Keeyask 2022	Conawapa 2025	Conawapa 2026	Conawapa 2029	Conawapa 2031
Base Cost	$4.3	$4.4	$6.0	$6.1	$6.2	$6.3
Sunk Cost to June 2014	($1.0)	($1.0)	($0.3)	($0.3)	($0.3)	($0.3)
Evaluation Costs	$3.3	$3.4	$5.7	$5.8	$5.9	$6.0

1.4. NET PRESENT VALUE CALCULATION – MANITOBA HYDRO'S REAL WEIGHTED AVERAGE COST OF CAPITAL (RWACC)

The economic evaluation of development plans used standard economic analysis for project evaluation, known as net present value (NPV). Each development plan results in different streams of costs (cash outflows) and streams of revenues (cash inflows) occurring at different times. To compare development plans, all cash flows of costs and revenues are discounted to a present value which can then be compared on an equivalent basis. All cash flows of costs and revenues are discounted using a real discount rate which removes the effect of inflation common to all costs and revenues. Net Present Value (NPV) is the difference between the present value of the revenues and the present value of the costs. For the purpose of the NFAT economic evaluations, all present values are expressed in 2014 constant dollars.

The discount rate used in the NFAT economic evaluations is Manitoba Hydro's Real Weighted Average Cost of Capital (RWACC). Manitoba Hydro's RWACC is calculated using Manitoba Hydro's forecasted long-term interest rate (a 1% provincial guarantee fee is included in Manitoba Hydro's forecasted nominal long-term interest rate) associated with debt and the imputed interest rate associated with equity, which are then weighted by Manitoba Hydro's target capital structure of 75% debt and 25% equity. Table 1.3 demonstrates the derivation of Manitoba Hydro's weighted average cost of capital, both in nominal and real terms, for the rate used for the 2012 NFAT reference scenario economic evaluations. This results in a WACC of 7.05% in nominal terms and 5.05% in real terms. A long-term inflation rate of 1.9% is utilized to determine the WACC in real terms, i.e. without the effect of inflation.

Table 1.3: Derivation of Manitoba Hydro's Weighted Average Cost of Capital

Capital Source	Target Capital Structure	Nominal Rates		Real Rates	
	Weight	Rate	Weighted Rate	Rate	Weighted Rate
Long-Term Debt	75%	6.30%	4.73%	4.32%	3.24%
Equity	25%	9.30%	2.33%	7.26%	1.82%
Total	100%	_	7.05%	_	5.05%

Note – Total rates are rounded to the nearest 5 basis points.

The RWACC (discount rate) used throughout the NFAT submission for the 2012 reference scenario economic evaluations is 5.05%. The RWACC (discount rate) used in Chapter 12 for the 2013 update of the reference scenario economic evaluations is 5.40%, respectively.

To correspond to a June 2014 decision, all NPVs have subsequently been escalated to $2014 by the WACC (two years for the 2012 analysis, one year for the 2013).

1.5. ELECTRICITY EXPORT PRICE, NATURAL GAS PRICE AND CARBON PRICE FORECASTING METHODOLOGY

As part of its annual planning cycle, Manitoba Hydro prepares long-term forecasts of:

1) electricity export prices in order to determine the value of electricity exports from and imports into Manitoba,
2) natural gas prices used to estimate future operational costs associated with natural gas-fired generation in the Province of Manitoba, and
3) carbon prices used to estimate the cost premium associated with CO_2 emitting generation in the Province of Manitoba.

This section of Appendix 9.3 explains Manitoba Hydro's processes to forecast electricity export prices, natural gas prices, and carbon prices.

1.5.1. Electricity Export Price Forecast

Forecasting energy prices is complex as it not only requires specialized production costing and market simulation models but it also is dependent on anticipating public policy, technology and economic shifts. As it is impossible to foresee the future and because there are multiple perspectives on how public policy, technology and the economy will evolve, Manitoba Hydro has established a consensus based independent approach for electricity export price forecasting involving up to six industry expert consultants.

Each consultant uses a proprietary electricity price forecast model capable of simulating the expansion and operation of the power system over a period of time based upon forecasts of inputs and load demands. The power system modeled includes at least the Midcontinent Independent System Operator (MISO) market footprint. However some consultants choose to utilize a larger footprint in their work. Key inputs into these models include:

- Characteristics of the existing generation fleet, including generator size, fuel and fuel efficiencies (heat rate), and a transmission grid representation;
- Characteristics of the load, including the rate of load growth;
- Forecasts for thermal fuel costs (primarily coal and natural gas);
- Characteristics of new generation that could be built in the future, including capital costs, fuel types and efficiencies, and required rates of return on capital investment, as well as future transmission grid expansion;
- Forecasts for the value of emissions allowances for thermal generation, including SO_2 (sulfur dioxide), NO_X (nitrogen oxides) and CO_2;
- Other legislative requirements that may affect selection of the future generation sources - particularly renewable portfolio standard requirements (RPSs) which tend to have the effect of mandating some degree of wind development.

Manitoba Hydro requests that the consultants use their models to provide a long-term electricity price forecast at the Minnesota pricing hub (MINN Hub) which is an aggregation of generation and load pricing locations in the Minneapolis area. As Manitoba Hydro delivers and is paid for its surplus electricity at the Canada – U.S. border, a price adjustment from MINN Hub to the border is required. Manitoba Hydro modifies the MINN Hub price by an adjustment using historical transmission congestion and transmission line loss costs.

It should be noted that such long-term forecasts are attempting to forecast the average market price over the long term, and do not attempt to forecast any short-term volatility. That is, in the forecast period there will be years when prices will vary either higher or lower than the forecast associated with the economic cycle.

Electricity price forecast consultants normally forecast for a 20-year period. In recent years, Manitoba Hydro specifically requested and was provided a long-term 35 year forecast to match its 35 year detailed study life. While such a very long-term view may be necessary for making investment decisions related to hydro assets with a very long lifespan, there is great uncertainty in such long-term projections. Going forward starting with the 2013/14 forecast, due to this uncertainty, Manitoba Hydro has and will be requesting forecasts from the consultants for a 20 year period. Beyond 20 years, Manitoba Hydro has established a process to extrapolate the consensus forecast to the end of the 35 year detailed study timeframe as follows:

- The real annual compounded growth rate for the last five years of consultant forecast data was calculated.
- The compounded annual growth rate calculated was linearly regressed to 0%/year by the last year of the 35 year detailed study timeframe.

Each consultant is requested to provide a Reference, High, and Low electricity price forecast as follows:

- The "Reference" case should be the consultant's best (or most likely) estimate of future electricity prices;
- The "High" case should represent a plausible scenario reflecting the upper limit of prolonged pricing;
- The "Low" case should represent a plausible scenario reflecting the lower limit of prolonged pricing.

1.5.1.1. Electricity Export Price Forecast Products

Manitoba Hydro sells several products in the external markets. The two primary products are a) surplus energy and b) dependable energy and accredited capacity. Revenues from the sale of these products form the majority of Manitoba Hydro's export revenues. The Electricity Export Price Forecast indicates what unit price Manitoba Hydro can expect to receive for each of these products each year over the forecast period.

The pricing components of electricity include energy (the "Energy Component") and capacity (the "Capacity Component"). The price of energy reflects the average incremental operating and fuel costs of the marginal generator. In today's terms this price would be equivalent to the average MISO Day Ahead market price. The price for capacity reflects the forecast annual all-in cost of permitting, constructing and owning a generating facility.

Long-term price forecasts were prepared for three products:

1) On-Peak All-In Product,
2) On-Peak Long-Term Dependable Product, and
3) Off-Peak Energy Product.

Each product was forecast at the Manitoba - U.S. border (the MHEB pricing node). The on-peak period is defined using the 5x16 definition - that is energy supplied 5 days per week, 16 hours per day (which is Monday through Friday from 6:00 a.m. to 10:00 p.m. CST). The off-peak period represents all those hours not included in the definition of on-peak - which are the 5 days per week by 8 hours per day overnight hours during the week plus all weekend hours, including NERC holidays.

The On-Peak All-In Product includes energy based delivery for the 5x16 on-peak period and the necessary associated capacity. The On-Peak Long-Term Dependable Product represents a long-term sale which is sourced from Manitoba Hydro's dependable energy resources, including accredited capacity and must take 5x16, on-peak energy. The price for the On-Peak Long-Term Dependable Product includes a premium over the shorter term On-Peak All-In Product. The exact amount of the premium is confidential as it is commercially sensitive. However, it represents the additional value a purchaser is willing to pay for the specific price and product attributes associated with power purchased from Manitoba Hydro's dependable resources. The Off-Peak Energy Product is an energy only product whose value is based on delivery during the off-peak hours.

1.5.1.2. 2012/13 Electricity Export Price Forecast

For its 2012/13 forecast of electricity export prices, Manitoba Hydro obtained electricity price forecasts from five independent consultants. All five of the forecast consultants were also used for the 2011/12 price forecast and some of the consultants work has been used as far back as 2002/03. Equal weighting of each consultant's forecast was used to prepare the consensus forecast for 2012/13.

1.5.1.3. Adjusted 2012/13 Electricity Export Price Forecast

After the preparation of the 2012/13 Electricity Export Price Forecast, the outlook for long-term natural gas price deteriorated from that used in the forecast. Given that there is a strong

correlation between natural gas prices and electricity export prices, it was apparent by late 2012, that the long-term outlook for electricity prices could be lower than the electricity export price forecast that was developed in early 2012/13.

To address this issue of currency of information, preliminary indications were gathered at the end of December 2012 from available updates from the consultants presently used to develop the 2012 Electricity Export Price Forecast. Based on the advice received in December 2012, it was anticipated that the reference case 2013/14 forecasts for electricity export prices would be in the order of 8 percent lower than the consultants' respective 2012/13 outlooks for the reference case. However, the consultants generally confirmed that they did not anticipate any material changes to their outlooks of carbon policy/pricing.

Based on updated information available in December 2012, adjustments were made, on average, to the high, reference and low electricity export price forecasts for the On-Peak Energy Product from the 2012/13 Electricity Export Price Forecast as follows:

- High – increase by 3%,
- Reference – decrease by 8%, and
- Low – decrease by 32%.

The evaluations in the NFAT submission, with the exception of the 2013 update in Chapter 12, use the adjusted 2012/13 electricity export price forecast.

1.5.1.4. 2013/14 Electricity Export Price Forecast

Manitoba Hydro recognizes that the adjusted 2012/13 electricity export price forecast for the range of forecasts - high, reference and low (used in the NFAT analysis, with the exception of the 2013 update in Chapter 12) does not reflect the most current information.

The electricity export price forecasting process continues to use a consensus approach for 2013/14. In order to provide an independent perspective on future prices, for its 2013/14

forecast of electricity export prices, Manitoba Hydro obtained electricity price forecasts from six independent consultants. Of the six electricity export price consultants, four were used in both the 2011/12 and the 2012/13 price forecasts, with some of the consultants work used as far back as 2002/03.

The 2013/14 electricity export price forecast has resulted in, on average, approximate adjustments to the high, reference and low electricity export price forecasts for the On-peak Energy Product relative to the adjusted 2012/13 electricity export price forecast as follows:

- High – decrease by 7%,
- Reference – increase by 7%, and
- Low – increase by 41%.

1.5.2. Natural Gas Price Forecast Process

As with electricity price forecasts, Manitoba Hydro uses a consensus based approach for natural gas price forecasting in order to provide an independent perspective on future natural gas prices. This forecast is used to determine the price of natural gas used to fuel thermal generation in the Province of Manitoba.

For its 2012/13 forecast of natural gas prices, Manitoba Hydro obtained natural gas price forecasts from five independent consultants. These were the same consultants used for the 2011/12 price forecast. Some of the consultants work has been used as far back as 2002/03. Equal weighting of each consultant's forecast was used in the consensus forecast for 2012/13. The evaluations in the NFAT submission, with the exception of the 2013 update in Chapter 12, used the 2012/13 natural gas price forecast.

For its 2013/14 forecast of natural gas prices, Manitoba Hydro obtained natural gas forecasts from six independent consultants. Of the six natural gas price consultants, three were the same as in the 2012/13 natural gas price forecasts.

The 2013/14 natural gas price forecast has resulted in, on average, approximate adjustments to the high, reference and low natural gas price forecasts relative to the 2012/13 natural gas price forecast as follows:

- High – decrease by 5%,
- Reference – decrease by 6%, and
- Low – increase by 9%.

1.5.3. Carbon Price Forecast Process

Export Region

Manitoba Hydro's understanding of the timing and energy price implications of GHG emission pricing within its export region is largely based on the views of various independent electricity export price forecast consultants that contribute to Manitoba Hydro's electricity export price forecast. The outlook associated with the impacts of future GHG emission or climate change legislation/policies is embedded in the electricity price forecasts provided by each of the forecast consultants.

Domestic

Similarly, fossil-fuel resources within Manitoba are likely to face further GHG pricing constraints. The timing and level will depend on circumstances and policies specific to Canada or Manitoba such as further provincial emissions taxes, adoption of a broader carbon tax, or membership in a cap and trade program. The Manitoba outlook of carbon adders for thermal based electric generation considers GHG emission pricing from other regions within Canada and the U.S. as well as the perspectives of the electricity export price forecast consultants. Based on these considerations, a plausible range (high, reference, low) of future domestic GHG emission prices are produced.

1.6. SUMMARY OF EXPORT/IMPORT CONTRACTS

The following tables summarize the high level details associated with Manitoba Hydro's long-term export/import contracts that are "Common to All Development Plans" and "Contingent upon Development". Tables 1.4 through to 1.7 summarize the details for contracts assumed in the 2012 NFAT evaluations and Tables 1.8 through to 1.11 summarize the details for contracts assumed in the 2013 update evaluations.

1.7. WIND INTEGRATION COSTS

In 2009 the North American Electric Reliability Corporation issued a Special Report on accommodating intermittent or variable resources such as wind generation[1]. Intermittent resources differ from conventional and fossil-fired resources in a fundamental way: the fuel source (wind) cannot presently be controlled or stored. Unlike coal or natural gas, which can be extracted, transported and stored for use when needed, or water which can be stored behind a dam, intermittent fuels must be used when and where they are available.

As noted by NERC in the 2009 Special Report:

> "Fuel availability for variable resources often does not positively correlate with electricity demand, either in terms of time of use/availability or geographic location. …. Additionally, peak availability of wind power, the most abundant variable resource in terms of megawatt value today, can often occur during periods of relatively low customer demand for electricity.
>
> Further, the output of variable resources is characterized by steep "ramps" as opposed to the controlled, gradual "ramp" up or down generally experienced with electricity demand and the output of traditional generation. Managing these ramps can be challenging for system operators, particularly if "down" ramps occur as demand increases and vice versa. Insufficient ramping and dispatchable capability on the remainder of the bulk power system can exacerbate these challenges."

Accommodating the intermittency or variability of the wind resources creates some small but discernible costs, called wind integration costs, on the host power system. The study of wind integration into a power system and the resulting wind integration costs requires detailed system specific technical studies. As also noted by NERC in the 2009 Special Report:

[1] NERC Special Report: Accommodating High Levels of Variable Generation, North American Reliability Corporation, April 2009, available at www.nerc.com

> "Integration studies need to be conducted to assess the appropriate level of system ramping capabilities (intra-hour and load following), reserves, minimum demand levels, rapid start capability, scheduling intervals, additional transmission and system inertial response. The individual characteristics of each system (i.e. generation resource mix, ramping capability, amount of dispatchable resources, etc.) will affect these impacts. High-quality, high-resolution (typically sub-hourly) variable generation and load data is required to ensure the validity of the study results."

Manitoba Hydro contracted with external industry experts for two key studies as part of its work to better understand the implications of wind integration on its power system. The first study, by EPRI Solutions, looked at the sub hourly operational impacts of wind on Manitoba Hydro's system[2]. Outputs of this study included:

- Hourly wind generation time series for use in hourly resolution simulations to be used in further operations simulations.
- Sensitivity analysis of impacts of varying wind speed time series and generation synthesis algorithms on wind plant energy production and real power fluctuations.
- Processing of NREL 1-second wind plant real power output data as a proxy for conducting the high-frequency regulation impact analysis.
- Synthesis of Manitoba Hydro 1-minute resolution wind generation and system load time series data for the total regulating reserve impact analysis.
- Assessment of the impact of various wind generation capacity scenarios on the high-frequency regulating reserve requirements.
- Assessment of the impact of various wind generation capacity scenarios on the total regulating reserve requirement.
- Analysis of the impact on 10-minute changes in system net load.
- Assessment of the potential Transmission Reliability Margin impact to accommodate the fluctuations in net system load that might result in additional tie-line flows.

[2] EPRI Solutions, Manitoba Hydro Wind Integration Sub-Hourly Operational Impacts Assessment, March 1, 2005.

The second study, by Synexus Global, looked at the incremental cost of providing reserves and reshaping operations associated with the integration of a wind resource into the Manitoba Hydro generation mix[3]. The addition of 500 MW or 1000 MW of wind resources was analyzed over a one year period, for three flow cases ranging from, low (1989-90) to median (1993-94) and high (1996-97). The operations simulation includes an external electricity market model utilizing Manitoba Hydro's long-term export price forecast. The cost of wind integration was determined by comparing two operations simulations:

- An "equivalent energy base", (EEB) run, which involved operating the system using the average monthly on- and off- peak wind energy. This run essentially contained the same monthly average energy supply as the wind case (but without the variability and uncertainty) and formed the base case upon which the incremental operations and revenue impacts of wind variability/uncertainty and its reserve requirement could be evaluated.
- A wind run, which included updating the average energy (the equivalent energy case) with actual hourly wind records for each 24-hr period and re-optimization to determine the generation schedule for the week in response to changes in wind supply. Reserve for the wind case was increased accordingly to account for wind variability and uncertainty, based on the output of the EPRI Solutions work.

[3] Synexus Global, A Study to Evaluate the Short-Term Operational Impacts of Wind Integration into the Manitoba Hydro System, December 2005.

The incremental costs for the 500 MW wind capacity in relation to the EEB case are summarized in Table 5.3 and Table 5.4 of the Synexus Global report for the base case as well as the sensitivity to reserve case.

Synexus Global Table 5.3 500 MW - Incremental Costs, Millions of U.S. Dollars

Hydrology	Wind	Sensitivity[1]
Low	4.8	3.1
Median	5.6	3.6
High	6.7	1.8

1- Due only to variability as there is no additional reserves defined.

Synexus Global Table 5.4 1000 MW - Incremental Costs, Millions of U.S. Dollars

Hydrology	Wind	Sensitivity[1]
Low	9.1	4.5
Median	11.3	6.9
High	19.7	4.8

1- Due only to variability as there is no additional reserves defined.

The above wind integration costs were flow weighted and then the total divided by the average annual wind generation to produce the unit wind integration costs as follows:

- 500 MW of wind generation: $4.22/ MWh (2005 dollars)
- 1000 MW of wind generation: $4.99/ MWh (2005 dollars)

The unit wind integration costs are expressed on a marginal basis for each 100 MW increment of wind, and scaled to the current long-term export price forecast using the ratio of the current long-term price forecast divided by the 2005 price forecast.

1.8. DESCRIPTION OF MARGINAL COSTS

Introduction

Manitoba Hydro interprets marginal value to mean the cost or value to the system of deferring an increment of load growth. Since the supply of power to residential load requires generation supply, bulk transmission capability and distribution capability, a marginal value is determined for each of these three components. The marginal cost for generation consists of both an energy and capacity component while the transmission and distribution marginal costs have only a capacity component.

Transmission and Distribution Component of Marginal Costs

From the bulk transmission and distribution perspective, a customer that increases load requirement will incur a cost to the Manitoba Hydro system because even the smallest incremental increase in load, when considered in combination with other incremental increases, will eventually result in a requirement to upgrade transmission and distribution facilities. Manitoba Hydro uses the "one year deferral" methodology to determine the cost that an additional increment of load can be expected to incur from the transmission and distribution perspective It is noted that T&D marginal cost is derived primarily from the cost of infrastructure since there is virtually no incremental operation and maintenance cost associated with an increment of load.

Generation Component of Marginal Cost

The generation component of marginal cost differs from the T&D component in that it is influenced significantly by both the cost of operating the system and the cost of the infrastructure supplying the generation. The variable cost of system operation is called production cost and this includes the fuel cost of operating thermal resources, water rental costs of hydroelectric resources and the cost of purchased energy. For purposes of analyzing

marginal cost, the revenue associated with opportunity export sales is combined with production costs to obtain net production cost.

A new load from a domestic customer may incur two types of costs from the generation perspective that result in two components of marginal cost: a net production cost and a cost of infrastructure for generation resources.

1. The first component is the net production cost that results from altering the operation of a fixed system of resources under a defined load requirement. An increase in domestic load may result in an increase in the fuel cost for thermal generation, an increase in costs of purchased energy from imports and may result in a decrease in revenue from export sales. The production cost component is an ongoing cost on an hour by hour basis that is incurred over all the years that have an incremental increase in domestic load.
2. The second component of generation marginal cost is associated with the requirement to maintain firm resources to meet firm load requirements. A load increase may require that Manitoba Hydro advance the in-service date of new generation in order to meet firm commitments. Because Manitoba Hydro normally acquires generation in large blocks due to economies of scale, the need to advance generation resources may not occur for many years into the future. However, each small increment of load growth has the potential to incur a cost in that it contributes to the eventual requirement to advance the in-service date of new generation. This component of marginal cost is analogous to the deferral component associated with T&D marginal cost.

Prior to the year 2000, Manitoba Hydro utilized the “deferral” method for determining the cost avoided by an increment of new load in addition to consideration of production cost. However, it was necessary to change the methodology for determining marginal cost by not including a deferral component after about the year 2000 since the significant increase in the value of export power resulted in an economic opportunity to advance the in-service date of future generation plant. This change in methodology continues to be appropriate today since the

forecast of export prices currently is sufficiently high to make the advancement of hydroelectric development economic.

Current Marginal Cost Methodology

Currently, generation marginal value for the Manitoba Hydro system is determined by assuming that the load can be reduced by a small increment over the period of the planning horizon. Since the preferred development plan consists of hydroelectric resources installed in conjunction with new export contracts, a reduced load has the impact of increasing the quantity of firm energy and capacity that can be marketed as an incremental long-term export sale which generates additional incremental revenue for Manitoba Hydro. However, this incremental sale has some associated costs since it utilizes interconnection capability and thus affects other potential opportunity sales. This sale also affects the operation of the system and the quantity of import and thermal resources that may be required over the range of possible water flow conditions. These system operating impacts are called production costs and are determined by undertaking a simulation of system operation for 35 years into the future using Manitoba Hydro's long term generation system simulation called SPLASH.

Manitoba Hydro's SPLASH model utilizes an optimization technique to maximize net flow related revenue to the system by simulating the operation of reservoirs and hydroelectric generation plants utilizing a monthly time step. The expected price signals from the export market are provided to the model for on-peak and off-peak time periods for each month of the year. The capability of the interconnections to each market region is provided in order to limit the rate at which export energy can be transmitted. The SPLASH model determines the net production cost on a monthly basis for a series of years into the future. The net production cost is derived from the variable cost characteristics of the various generation sources and revenue is derived from export sales. A simulation of system operation is undertaken for each of the 99 flow conditions between the years 1912 and 2010 which are assumed to be representative of the range of flow conditions that may occur in the future.

In order to determine the marginal value of an increment of power, the production costs of two simulation runs of the SPLASH model must be compared. The first simulation run is a base case that corresponds to a specific development plan with new resources added over time as energy and capacity requirements increase as determined by net Manitoba load. In this model run firm (dependable) export sales are treated the same as domestic requirements in that they are both firm obligations that must be met. The output of a simulation consists of energy volumes, revenues and costs that vary with flow conditions such as thermal fuel costs, water rental costs and import energy costs. In order to determine marginal value, a second simulation is undertaken in which the load is reduced from the base case by a constant increment in each month for a total of 500 GWh over the year as an example.

It is assumed that the energy and capacity savings from this load reduction can be sold as a long-term firm sale on the export market. The characteristics of this sale are input into the second simulation run and the in-service dates of all resources remain identical to those of the base run. The output consists of production costs for each month over all the same flow conditions for the same components as the base run. The net difference in production costs between the two simulations for each year of the study period is divided by the energy associated with the incremental load change to derive the marginal generation value in dollars per megawatt hour. Transmission and distribution losses are also calculated and added to the generation component to account for the full quantity of generation that is required to serve the end use load.

For use within Manitoba Hydro, marginal costs are developed for two seasons (summer and winter) as well as a single annual marginal cost for each year over the 35-year planning horizon. In addition, these marginal costs contain an energy and a capacity component. Therefore, the marginal costs developed by Manitoba Hydro can be utilized for applications that have different impacts in summer and winter and that have different combinations of energy and capacity.

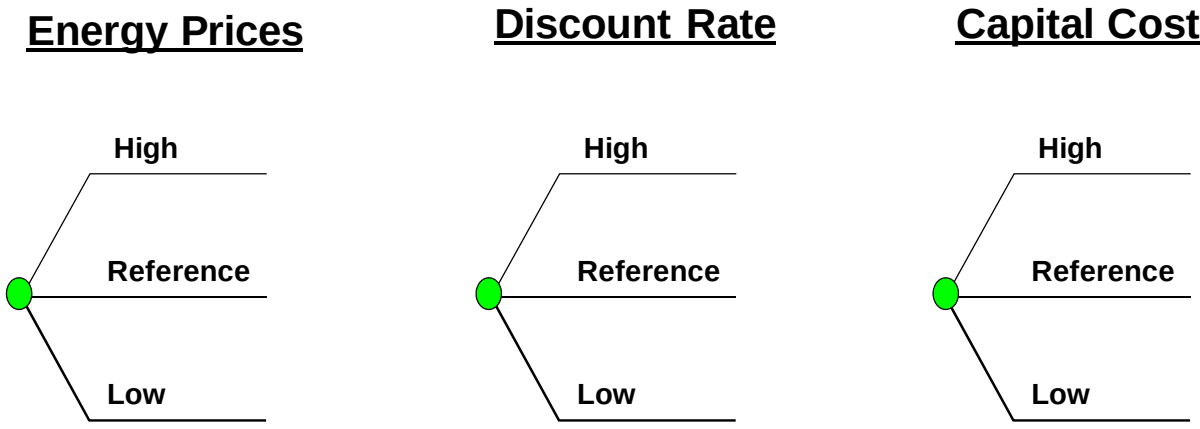
1.9. CASH TRANSFERS TO THE PROVINCE

The economic evaluations of development plans include capital taxes and water rentals as costs which are paid to the Province of Manitoba. As described in Section 1.4 of this appendix, included in the calculation of Manitoba Hydro's discount rate used for economic evaluations is the 1% provincial guarantee fee. Financial evaluations include capital taxes, water rentals and the provincial guarantee fee as costs which are paid to the Province of Manitoba.

While these transfers are considered as costs from the perspective of Manitoba Hydro, they benefit the provincial government and indirectly Manitobans.

Capital tax assumptions are described in Section 3.1.6 and water rental fee assumptions are described in Section 3.2.2 of this appendix.

Financial evaluations included the provincial guarantee fee as a 1% fee applied to the year-end corporate debt balance of the prior fiscal year. The fee is included in the financial analysis as a component of finance expense. An estimate of the provincial guarantee fee based on the incremental capital costs of each development plan has been calculated as part of the economic evaluation in order to illustrate the total provincial transfer associated with each development plan. The provincial guarantee fee is estimated based on the assumption that 80% of the total incremental investment for each plan will be financed through new long-term debt.



2. Probabilistic Analysis with Scenarios

The economic evaluations associated with ***Chapter 10 Economic Uncertainty Analysis – Probabilistic Analysis and Sensitivities*** are based on 2012/13 planning assumptions with the exception of adjustments, primarily downwards, to the electricity export price forecast as described in Section 1.6.4 of this appendix.

The reference scenario economic analysis considered inputs and assumptions that are associated with the "most likely" outcomes for the factors affecting Manitoba Hydro's future. The probabilistic economic analysis used reference, high and low values for the high impact factors that are grouped into three sets: Energy Prices, Economic Indicators and Capital Costs. For the economic probabilistic analysis the relevant Economic Indicator is the real weighted average cost of capital (discount rate).

Chapter 10 describes how the high impact factors were selected and what they include. The probabilistic economic analysis considered values and likelihoods for combinations of key factors. Figure 2.1 shows how, when combined, the three sets of highest impact factors with the high, reference and low assumptions result in 27 discrete scenarios (3X3X3).

Figure 2.1: Combination of Highest Impact Factors Resulting in 27 Scenarios

2.1. High, Reference and Low Assumptions for Highest Impact Factors

2.1.1. Energy Prices

Energy Price factors consist of natural gas, electricity and carbon prices. Electricity export prices are a key factor in evaluating Manitoba Hydro's development plans. The effect of natural gas prices on electricity export prices is embedded in Energy Prices as is the effect of carbon in the electricity markets. Carbon prices are reflected in Energy Prices from two perspectives. One is the impact of carbon policy on electricity export prices in the MISO market and the other is the impact of a potential carbon adder on Manitoba based fossil fuel-fired generation. As Manitoba Hydro recognizes electricity export, natural gas, and carbon prices are not perfectly correlated, an adjustment was made to the probabilities to accommodate the possibility of uncorrelated or negatively correlated results. This adjustment is outlined in Section 2.3.1 of this appendix. Section 1.5 of this appendix describes the methodology associated with the forecasts of high, reference and low electricity export, natural gas and carbon prices.

2.1.2. Discount Rate

The discount rate is representative of the cost of capital and is used to convert capital and revenue cash flows to a net present value. For a discussion on NPV, see Section 1.4 of this appendix. The reference case discount rate used in the 2012 NFAT evaluations is the fall 2012 Weighted Average Cost of Capital (WACC), which was derived using Manitoba Hydro's projected cost of debt plus an equity adder. The cost of debt was based on a consensus forecast methodology. Based on historical data, current Bank of Canada policy, and expert judgment, high and low discount rate cases were developed around the reference case using long-term expectations of interest and inflation that are higher and lower than expected under the consensus approach. Table 2.2 below summarizes the low, reference and high range of real discount rate used in the probabilistic evaluations.

Table 2.2: Range of Real Discount Rates used in Economic Probabilistic Analysis

Factor	Low	Reference	High
Discount Rate	3.35%	5.05%	6.50%

2.1.3. Capital Costs

Capital Cost factors include generation costs for all resource types, transmission costs and applicable real escalation.

Three sets of capital costs are produced based on internal analysis, or contingencies recommended by consultants on the basis of capital type. As discussed further in Section 2.3.3, it is assumed different types of capital costs are correlated. Therefore, in a 'high capital cost' world, natural gas-fired generation, wind generation, hydro-electric generation, and transmission capital costs are all at their high values, and in a 'low capital cost' world, they are all set to their low values.

The low and high base cost estimates for Keeyask G.S. and Conawapa G.S. differ from the reference case based on the amount included to address uncertainty (i.e. contingency and management reserve). As such, the point estimate is the same in each of the scenarios. The low estimate is based on a contingency amount at a P10 confidence level. This means there should be less than a 10% chance actual costs are less than the low amount. The high estimate is based on the inclusion of both the P50 contingency amount plus the labour reserve. The labour reserve represents the potential additional costs associated with labour productivity risk and associated cumulative impacts. The labour reserve was derived by applying outcomes of the Wuskwatim process reviews to the labour components of the Keeyask and Conawapa estimates. Based on the analysis, it is anticipated that this high amount has a low probability of being exceeded (less than 10%). The selection of low and high amounts is intended to provide a large range of potential costs in the analyses (versus selecting low and high amounts closer to the mean).

A contingency is applied to the point estimates for new wind and natural gas-fired generating stations and their associated transmission to account for uncertainty and potential risks that could be encountered during project implementation. Cost distributions for systemic risks were calculated by a 3rd party risk and contingency consultant so that, when applied to the point estimate, they would represent cost estimates at varying confidence levels. For the purposes of determining low and high cost estimates for these projects, P10 and P90 level project estimates were selected from these cost distributions. The contingency is consistent with and developed using AACE Recommended Practices.

Major new transmission projects, including new U.S. interconnections and north/south transmission associated with the development of both Keeyask and Conawapa, were developed with a cost estimate range of -10% and +50% of the P50 project costs. This range was applied to determine low and high project costs, respectively.

Capital costs estimates are classed by development stage, as defined by the Cost Estimate Classification Table outlined in AACE Recommended Practice 18r-97 as shown below in Table 2.3.

Table 2.3: AACE Cost Estimate Classification Table

	Primary Characteristic	*Secondary Characteristic*		
ESTIMATE CLASS	**MATURITY LEVEL OF PROJECT DEFINITION DELIVERABLES** Expressed as % of complete definition	**END USAGE** Typical purpose of estimate	**METHODOLOGY** Typical estimating method	**EXPECTED ACCURACY RANGE** Typical variation in low and high ranges [a]
Class 5	0% to 2%	Concept screening	Capacity factored, parametric models, judgment, or analogy	L: -20% to -50% H: +30% to +100%
Class 4	1% to 15%	Study or feasibility	Equipment factored or parametric models	L: -15% to -30% H: +20% to +50%
Class 3	10% to 40%	Budget authorization or control	Semi-detailed unit costs with assembly level line items	L: -10% to -20% H: +10% to +30%
Class 2	30% to 75%	Control or bid/tender	Detailed unit cost with forced detailed take-off	L: -5% to -15% H: +5% to +20%
Class 1	65% to 100%	Check estimate or bid/tender	Detailed unit cost with detailed take-off	L: -3% to -10% H: +3% to +15%

The Keeyask G.S. capital cost estimate can be considered to be between a Class 3 and Class 2 estimate. The estimate is considered to be between these two classes because, despite a number of tender prices already having been received, tender price for the General Civil contract is still required. Regarding Conawapa G.S., the capital cost estimate can be considered to be a Class 3 estimate.

Other capital cost estimates (Gas, Wind and Transmission), on the other hand, are at very early stages of development. Generally, these capital cost estimates could be considered to be between Class 5 or Class 4 estimates. To ensure consistency between the hydro, wind and thermal highs and lows relative to their reference capital cost estimate, Manitoba Hydro contracted with the same consultant to define the class estimates for different resource types.

A range of low, reference and high real escalation associated with hydro-electric generation resource options and natural gas-fired generation options is also applied to the base low, reference and high capital costs for generation. The range of real escalation is summarized below in Table 2.4.

Table 2.4: Range of Real Escalation Applied to Hydro-Electric and Natural Gas-Fired Generation Options

Generation Type	Low	Reference	High
Hydro-Electric Generation	0.3%/yr	0.6%/yr	0.8%/yr
Natural Gas-Fired Generation	0.1%/yr	0.5%/yr	0.7%/yr

In Table 2.5, the low and high capital cost estimates used in the probabilistic evaluations have been expressed as a percentage difference from the reference estimates. As real escalation is assumed throughout the planning horizon for natural gas-fired and hydro-electric resources, the year of installation matters. That is, plants built further in the future are assumed to cost more in $2014 than those built sooner.

Table 2.5: Percentage Difference of Low and High Capital Costs Relative to Reference Capital Costs

Resource	Low	Reference	High
Keeyask (2019)	-8.6%	-	+13.2%
Conawapa (2026)	-9.8%	-	+11.8%
SCGT (2022)	-30.2%	-	+38.1%
CCGT (2022)	-31.7%	-	+40.1%
Wind (2022)	-26.3%	-	+33.8%

2.2. Red-Green Quilts and Scatter Plots

Section 2.2 refers to Figures 2.7.1 through to 2.7.4 which are located in Section 2.7 of this appendix.

A Quilt table is a way to visualize the relative values of a large set of development plans across a large set of scenarios. Using such a table, one can quickly see which development plans have relatively good outcomes in particular scenarios or across a range of scenarios. Figure 2.7.1 shows a Quilt table of the 15 development plans. Each column represents one of 15 development plan alternatives while each row represents one of 27 scenarios. The number in each cell represents the incremental net present value of that development plan in that scenario relative to the All Gas Ref-Ref-Ref case. The All Gas Ref-Ref-Ref case, indicated by the "0" NPV, is used as a single point base for comparing all of the cases. Each cell is color-coded with increasing red for low NPVs and increasing green for high NPVs. For example, the development plan K19/C31/250MW is a dark red in the low energy price, low discount rate, and high capital cost scenario with a NPV of -$3,506. The same development plan is dark green in the high energy price, high discount rate, and low capital cost scenario with a NPV of $3,867. While most development plans have ranges of dark red to dark green, some are much redder (bad) or greener (good) than others. If a plan has a great deal of both dark red and dark green its outcome is more uncertain, while more uniform colouring indicates less uncertainty.

Figure 2.7.2 provides a Quilt table where the All Gas development plan is used as a fixed base for comparing each development plan in the context of each of the 27 scenarios and is indicated by the "0" NPV for each scenario under the All Gas development plan. In this type of analysis, NPVs for a development plan provide a measure of the relative performance between that development plan and the All Gas development plan within each of the 27 scenarios. When considering the incremental net present values in the Quilt from this perspective (the All Gas development plan is used as a fixed base), the colours must be interpreted slightly differently. For example, a plan that is entirely green may still have significant upside potential and downside risks. However, it will always be better than All Gas, regardless of the scenario.

Figure 2.7.3 provides a Quilt table that includes cash transfers to the Province which are calculated for each development plan as additional economic benefits. The cash transfers are water rentals, capital taxes and the provincial guarantee fee. Capital taxes and the provincial guarantee fee are assumed to be fixed rates on capital expenditures and therefore vary directly with capital costs. The water rentals are assumed to be constant with respect to the 27 scenarios.

Figure 2.7.4 shows a Scatter Plot of the 15 development plans which are displayed on the X-axis. Net present values are displayed on the Y-axis. For each development plan, the NPV in each of the 27 scenarios is represented with a symbol. The Scatter Plot provides the same incremental NPVs as provided in the Quilt in Figure 2.7.1 but graphically displays the range of incremental NPVs by development plan. It demonstrates that the rank of a particular scenario will not be the same in all development plans.

2.3. Derivation of Probability Weightings

As each of the combinations of the highest impact factors (Energy Prices, Discount Rate, Capital Costs) do not have the same likelihood of occurring, probabilities were developed for each of the sets of the key factors. This section describes how the probabilistic inputs were developed in each of these areas. While the details vary among areas, this process typically involves three steps:

1) Relationships among Variables - develop a formal understanding or model of the relationships among the individual variables in each area, typically in the form of an influence diagram.[4]
2) Probabilistic Assessment - obtain the best possible probabilistic assessment of the variables in the influence diagram. Generally, the philosophy underlying this assessment can be termed "Bayesian."[5] In this view, probabilities represent a "state of information" rather than a "state of nature." This state of information draws upon the best possible historical data, expert judgment or both.
3) Input Development - develop the specific probabilistic model inputs – probabilities and values – that best match the probabilistic assessment from Step 2 given constraints on the type of inputs used in the economic and financial models. In general, matching is based on the moments of the probabilistic assessment and model inputs.

The variables in this evaluation include both what are referred to as "market" and "private" risks. Market risks are those that can be easily hedged or priced in public financial markets. Good examples are oil prices and interest rates. Private risks are those that cannot be easily

[4] For more on influence diagrams, see R.A. Howard and J.E. Matheson, *Influence Diagrams,* Decision Analysis, Vol. 2, No. 3, September 2005, pp. 127-143.
[5] For a recently-published introductory discussion of Bayesian analysis, see James V. Stone, Bayes' Rule: A Tutorial Introduction to Bayesian Analysis, June 2013.

hedged or priced in public financial markets. Good examples are technology changes and environmental regulations[6].

It is generally accepted in economics, finance and management that it is appropriate to assign probabilities to private risks in order to understand and evaluate investments. For market risks, the situation is more complex. Under specific conditions - if the evaluation is based solely on diversified investor wealth maximization and the financial markets are complete – finance theory indicates that it is not appropriate to assign probabilities to these market risks. The reason is that the risks are already priced in the public financial market and can be valued at that price.[7] However, since Manitoba Hydro takes a much broader view in its resource development evaluation and must consider numerous stakeholder perspectives, public financial markets do not fully cover all the relevant risks over the entire investment time frame. Consequently, probabilities were assigned to all variables – "market" and "private."[8]

The time-frame of this evaluation extends over years, even decades. In general, the probabilistic inputs in this evaluation represent scenarios of values over this time-frame (vectors), not instantaneous or even annual values (scalars). Consequently, when terms such as "high and "low" are used, they refer to long-term sustained values over years not values in individual years.

[6] For more on market and private risks, see James E. Smith and Robert F. Nau, *Valuing Risky Projects: Option Pricing Theory and Decision Analysis*, Management Science, Vol. 41, No. 5, May, 1995, pp. 795-816.

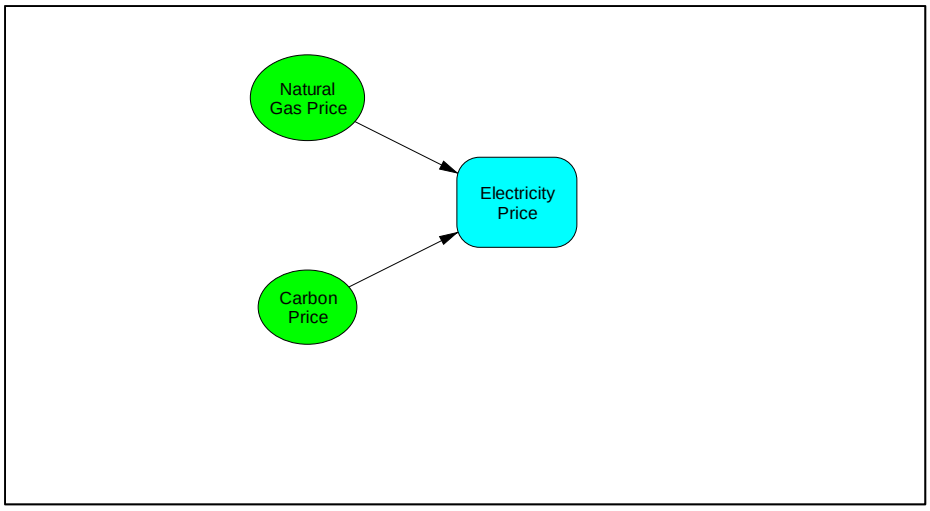
[8] For more detail on this point of view, see Kenneth J. Arrow et. al., *How Should Benefits and Costs be Discounted in an Intergenerational Context,* Resources for the Future, December 2012.



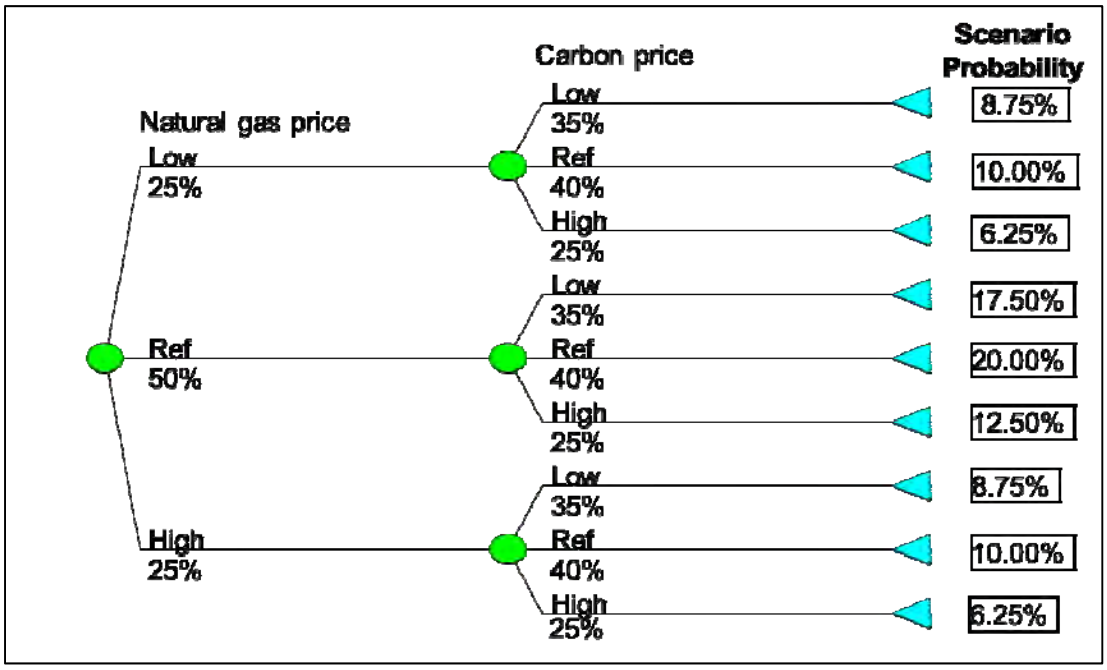
2.3.1. Energy Prices

Relationships Among Variables

There are three variables included in the category Energy Prices: Natural gas price, Carbon price and Electricity price.

The model used to describe the relationship among these three factors is illustrated in Figure 2.2. Natural gas price and carbon price are assumed to be independently uncertain. This assumption is a reasonable approximation since these two elements are driven largely by different factors – natural gas price primarily by economics and carbon price primarily by politics. Experts typically view them as only weakly linked. Electricity price is assumed to be deterministically dependent on the natural gas and carbon price. This assumption is a reasonable approximation since this linkage is supported both by logic and empirical data, as generation from natural gas is typically "on the margin." Experts generally view them as tightly linked.[9]

Figure 2.2: Energy Prices - Underlying Model



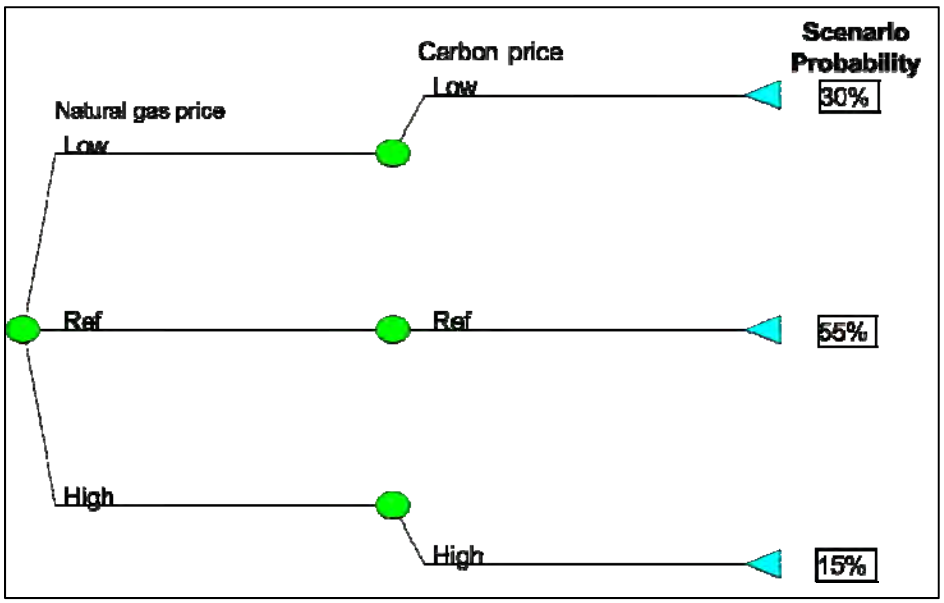
[9] See, for example, Rachel Wilson et. al., *2012 Carbon Dioxide Price Forecast*, Synapse Energy Economics, October 4, 2012.

Probability Assessment

Based on the model above, high, reference and low forecasts (with both values and probabilities) are developed separately using data, models and expert judgment for both natural gas prices and carbon prices. Electricity prices are calculated deterministically from the gas and carbon values in each scenario. These are combined into a nine-branch distribution as shown in Figure 2.3.

Figure 2.3: Natural Gas and Carbon Price Probability Assessment

Input Development



Once the nine-branch distribution above has been developed, the final task is to benchmark Manitoba Hydro's pre-existing gas, carbon and electricity price scenarios to this distribution. This matching is based on electricity prices. Section 1.6 of this appendix describes how Manitoba Hydro develops forecasts for electricity prices, natural gas prices and carbon prices.

Using the probability assessments in Figure 2.3, the mean and variance of the levelized electricity price are 22.3 and 45.6 respectively. The result of the benchmarking using Manitoba Hydro's scenarios is shown in Figure 2.4. Based on the mean and variance of electricity price, probabilities were assigned to three scenarios:

- Low gas, carbon, electricity
- Reference gas, carbon and electricity
- High gas, carbon and electricity

The distribution matches well with a mean and variance of 22.1 and 47.7 respectively.

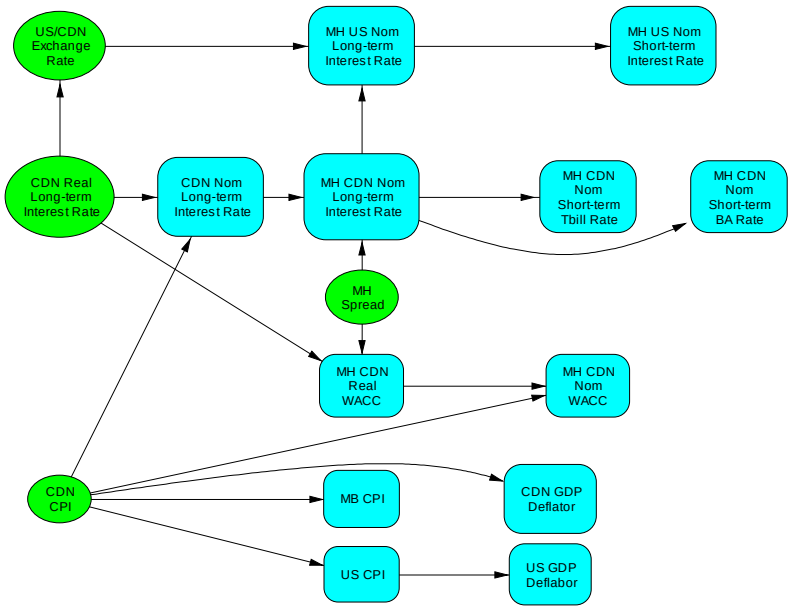
Figure 2.4: Manitoba Hydro Natural Gas Price and Carbon Price (and Electricity Price) Probabilistic Inputs

2.3.2. Economic Indicators (Discount Rate)

Relationships Among Variables

There are 10 variables included in the category Economic Indicators:

- MH Real WACC
- US-CDN Exchange Rate
- MH CDN Nominal Short-term T-Bill rate
- MH CDN Nominal Short-term BA rate
- MH US Nominal Short-term interest rate
- MH CDN Nominal Long-term interest rate
- MH US Nominal Long-term interest rate
- US GDP Implicit Price Deflator
- CDN CPI
- MB CPI



To properly assign probabilities to the Manitoba Hydro financial scenarios, it is necessary to evaluate the relationships between these and related variables. A model of these relationships among these is illustrated in Figure 2.5. This model is supported by a mix of data, logic and expert opinion. The key simplification in this model is that the different interest rate variables form an inter-correlated block while the different inflation/GDP variables form a separate inter-correlated block. The historic correlations within these two blocks are high enough that it is reasonable to assume that the values are deterministically linked.

While nominal interest rates and inflation rates are clearly linked by the definition of nominal interest rates, there is no evidence that real interest rates and inflation rates are correlated to the point that these blocks of parameters can be folded into a single value. Other variables in the analysis such as the US/CDN Exchange Rate and the MH Bond Spread (the difference

between MH's cost of borrowing and the risk free Government of Canada Rate) are considered separate from these blocks as there is no evidence that they are strongly correlated with either of the two partitions.

The rest of this section documents the evidence that a reasonable model of the economic indicator variables consists of four key drivers with the rest of the parameters assumed to be deterministically linked to one or more of these drivers. The underlying are the real Canadian long-term interest rate, Canadian inflation, the US/Canadian exchange rate, and the premium that Manitoba Hydro must pay to access the financial markets.

Figure 2.5: Underlying Economic Indicator Relationships

The first contention of this model is that it is reasonable to assume deterministic linkages between the interest rate parameters. Figure 2.6 shows average annual Canadian and US

nominal interest rates since 1983. The two parameters are highly correlated with a correlation coefficient of 0.98. Furthermore, since the Canadian and the US economies are so tightly linked, it is reasonable to assume that this strong correlation will continue into the future.

Figure 2.6: Canadian and US Long-Term Nominal Interest Rates[10][11]

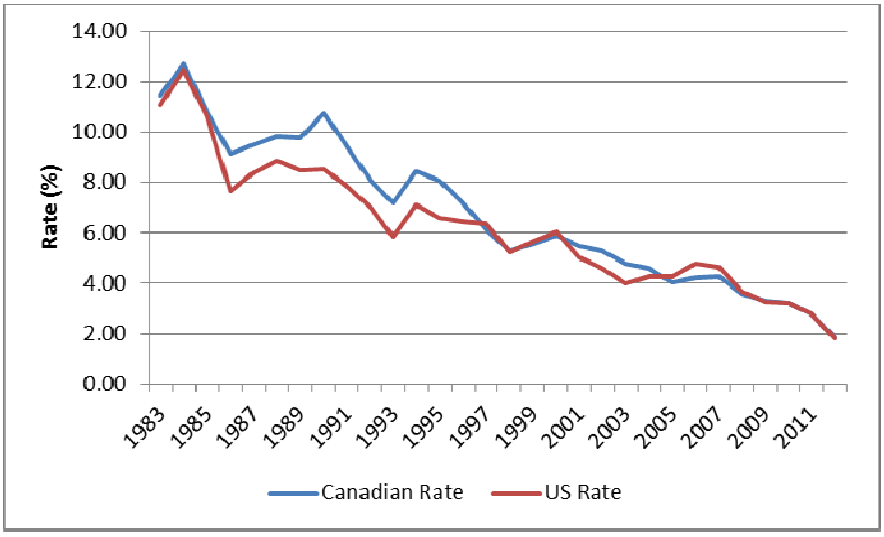


Table 2.6 shows the cross correlations of all the interest rate parameters used by Manitoba Hydro in their economic indicator analysis. All of the correlations are positive with the highest correlations as expected between similar types of interest rates. The lowest correlation is 0.49 but since the rest of the parameters are even more highly correlated, it is a reasonable simplification to assume a single interest rate value for the partition of interest rate parameters.

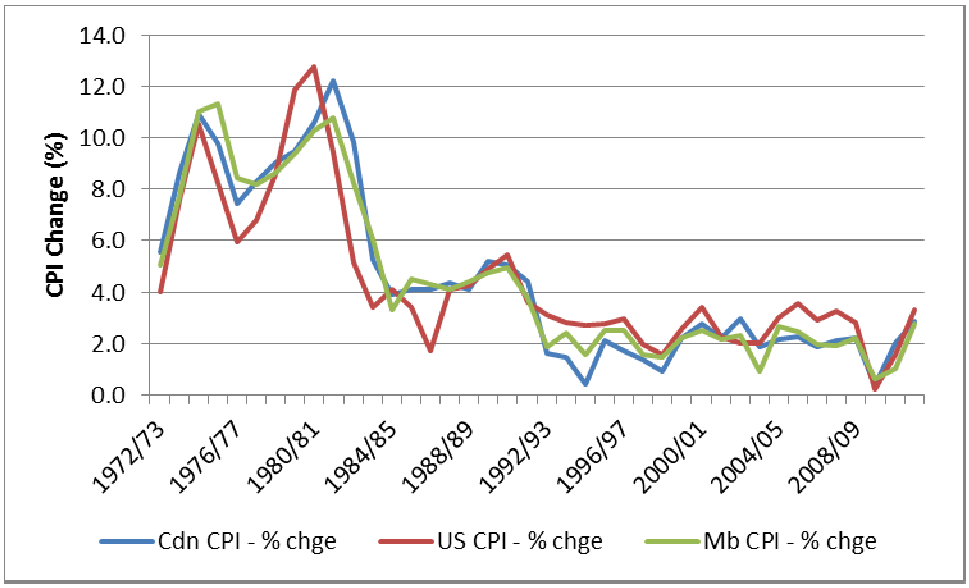


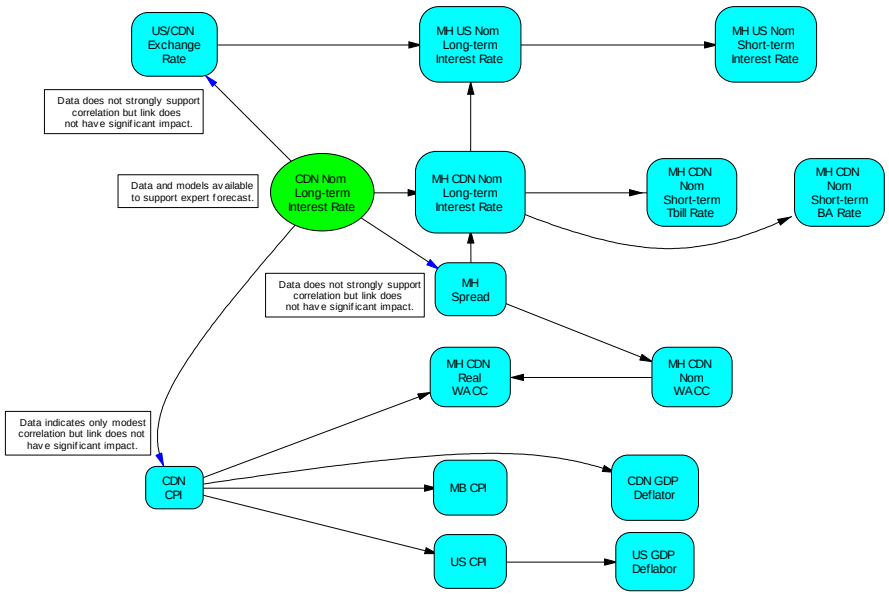
[10] Canadian Interest Rates from Bank of Canada, http://www.bankofcanada.ca/rates/interest-rates/selected-historical-interest-rates/
[11] US Interest Rates from Federal Reserve, http://research.stlouisfed.org/fred2/series/DGS10?cid=115

Table 2.6: Cross Correlations of Interest Rate Parameters[12]

	MH Cdn long-term nominal interest rate	*MH US long-term nominal interest rate*	*MH Cdn Short-Term nominal 3 mth T-Bill interest rate*	*MH Cdn Short-Term nominal 3 mth BA interest rate*	*MH US Short-Term nominal 6 mth LIBOR interest rate*
MH Cdn long-term nominal interest rate					
MH US long-term nominal interest rate	0.83				
MH Cdn Short-Term nominal 3 mth T-Bill interest rate	0.81	0.79			
MH Cdn Short-Term nominal 3 mth BA interest rate	0.76	0.70	0.98		
MH US Short-Term nominal 6 mth LIBOR interest rate	0.49	0.62	0.81	0.84	

The second contention of this model is that it is reasonable to assume deterministic linkages between the inflation parameters of the economic indicators. Figure 2.7 shows the evolution of Canadian, US, and Manitoba inflation since 1972. As expected for such tightly linked economies, the values move together with a correlation coefficient of 0.9 for Canada/US and 0.98 for Canada/Manitoba. This demonstrates that it is reasonable to assume a single inflation value per scenario for the partition of inflation parameters.

Figure 2.7: Canadian, US, and Manitoba Inflation[13]



[12] Data from Manitoba Hydro historic data provided for the project
[13] Data from Manitoba Hydro historic data provided for the project

Probability Assessment

The approximation of this model used for probability assessment is shown in Figure 2.8. This model matches more closely the readily-available data and judgment, particularly the availability of historical data and probabilistic forecasts. The sole underlying driver in this model is Canadian nominal long-term interest rates. A probability assessment of this driver was developed using a mixture of historical data on interest rates, expert opinion on the relationship between historical and future rates, and expert opinion on future inflation values. The other variables are linked deterministically to this driver.

Figure 2.8: Modeled Economic Indicator Relationships

In the case of the link between the US/CDN Exchange Rate and the CDN Nominal Long-Term Rate and the link between the MH Spread and the CDN Nominal Long-Term Rate, the data does not support strong correlation but there is little to no expert opinion on what the relationships should be. In both of these cases, a deterministic link versus a probabilistic link will not have a significant impact on the results of the overall analysis, meaning that it is reasonable to choose to assume a deterministic link.

There are reasonable expert probabilistic forecasts of both Canadian Long-Term Real Interest Rate and of US Inflation. Under the assumption that Canadian and US inflation are deterministically linked, the Canadian Long-Term Real Interest Rate and the inflation assumptions can be combined to create a probabilistic forecast of Long-Term Nominal Canadian Interest Rates. Under the simplified model shown in Figure 2.13, this probabilistic forecast can then be used to benchmark Manitoba Hydro's financial scenarios. The rest of this section explains how the probabilistic forecast of Long-Term Nominal Canadian Interest Rates was developed.

The Canadian Institute of Actuaries (CIA) provides an in-depth and authoritative method for developing probabilistic long-term interest rate forecasts, and an actual forecast of those rates[14]. This method is designed to be consistent with economic and financial principles, and to match key characteristics of historical interest rates such as reversion to a long-term mean and persistence of periods of high or low rates. The CIA model is "mechanism free"; that is, the forecast is benchmarked to history.

Despite the strengths of the CIA forecast, it was not used directly. Instead, the underlying concepts and understanding of the CIA work were applied to analyze historical interest rates. There are two major reasons for this indirect approach.

- The CIA provides only a limited number of spot or annual forecasts, and it is difficult to use these forecasts to forecast long-term sustained rates.
- The CIA forecasts are based on a historical view of inflation, although there is evidence that central banks now exercise more control over inflation than they have historically. It is difficult to isolate the impact of inflation in the CIA

[14] *Calibration of Stochastic Interest Rate Models*, Canadian Institute of Actuaries, 2009.

forecast, and determine the impact of changing underlying assumptions regarding inflation.

The approach used to develop a probability assessment is as follows:

1) Real Interest Rate: Use annual values of nominal interest rates and inflation to develop a forecast of 20-year levelized real interest rates
2) Inflation Rate: Develop a forecast of 20-year levelized inflation rates.
3) Convolution: Evaluate the correlation between 20-year levelized real interest rates and 20-year levelized inflation rates, and convolve the two distributions to develop a forecast of 20-year levelized nominal interest rates.

Each step is described in more detail below.

1) Real Interest Rate

The probabilistic forecast of real interest rates is based on historically observed values consistent with the CIA's methodology. Annual Canadian long-term nominal interest rates and inflation from 1940 are obtained from the Bank of Canada website. This is the same time period as is used in the CIA analysis. Annual real interest rates are calculated from nominal interest rates and inflation rates using the following formula.

$$r = \frac{1+i}{1+I} - 1$$

Then 20-year levelized values are calculated for real interest rates using the following formula for 20 year overlapping blocks.

$$\bar{r} = \exp\left(\frac{\sum_{n=1}^{20} \ln(r)}{20}\right) - 1$$

The result is a probability distribution of 20-year levelized real interest rates. Table 2.7 shows the percentiles of this distribution used in the rest of the analysis.

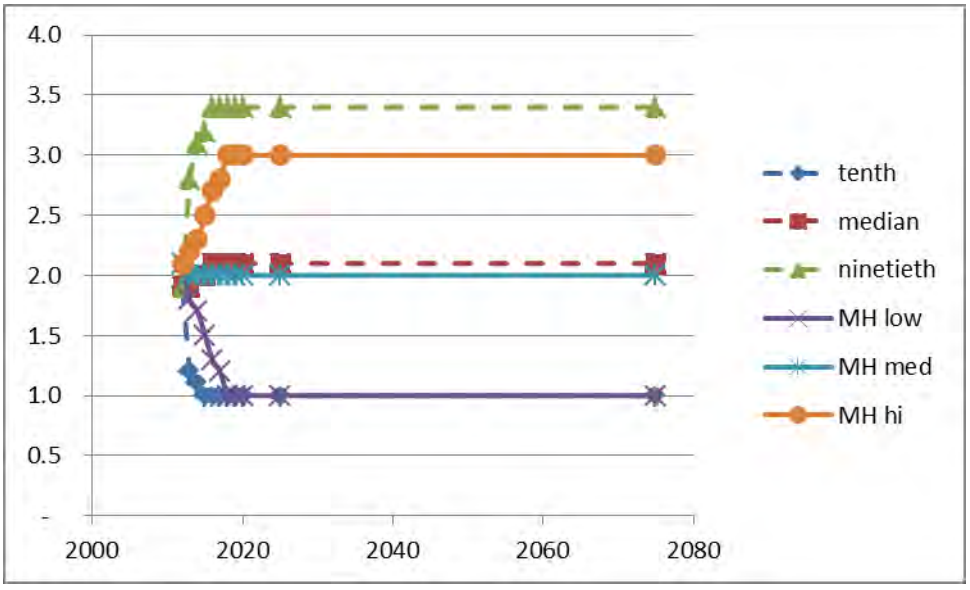


Table 2.7: Real Interest Rate Percentiles

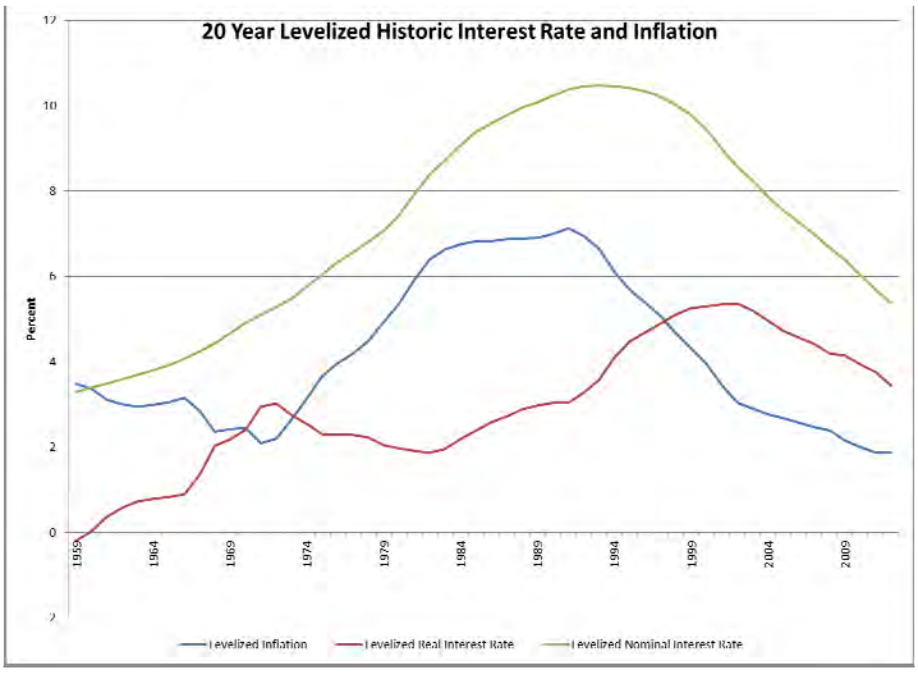
	10th Percentile	25th Percentile	50th Percentile	75th Percentile	90th Percentile
20-year Levelized Real Interest Rate	0.80	2.03	2.82	4.18	5.06

2) Inflation Rate

The U.S. Federal Reserve provides probabilistic inflation forecasts in their Green Book[15]. This is arguably the best source for such forecasts. Given the tight relationship between US and Canadian inflation, it represents an authoritative probabilistic forecast for Canadian inflation as well. Figure 2.9 shows both the Federal Reserve probabilistic forecast percentiles and Manitoba Hydro inflation scenarios. The two sets of scenarios are sufficiently close that it is reasonable to use the Manitoba Hydro inflation scenarios directly in the remainder of the analysis as representing 10th, 50th and 90th percentile values.

Figure 2.9: Federal Reserve and Manitoba Hydro Forecast Inflation Rate



[15] http://www.federalreserve.gov/monetarypolicy/fomc_historical.htm

The Green Book forecast required some processing to be useful to compare the Federal Reserve inflation probabilities to Manitoba Hydro's scenarios. The Green Book is only available 5 years after the relevant meetings occurred, so only documents from late 2007 and before can be used. Actual Inflation is 1.9% now versus 2.0% in 2007 so the base value for the Fed forecast was adjusted down. The Green Book forecast also only gives the results of scenarios out for 30 months meaning that the full forecast had to be extrapolated. Two aspects of this forecast were used to do the extrapolation. First, the range of the Federal Reserve probabilistic forecast was nearly constant month to month for all the Green Books that were available suggesting that it is reasonable to assume this same pattern would hold now. Second, the first derivative of the range of the forecast declined going out in time, suggesting that the range is converging to steady-state. To create Figure 4, the initial value was set to current inflation, the path of the Green Book forecast was matched for 30 months, and the convergence of the first derivative to 0 was extrapolated to create steady-state scenarios.

3) Convolution

The last step in developing a probability assessment of nominal interest rates is to combine or convolve the distributions on real interest rates and inflation rates. To do this, we first investigate the historic link between real interest rates and inflation rates. Figure 2.10 shows the historic relationships between levelized real interest rates and levelized inflation rates. The figure indicates a very modest amount of correlation between real interest rate and inflation with coefficient -0.02.

Figure 2.10. Historical Levelized Interest Rates and Inflation Rates

In order to develop the best forecast of nominal interest rates, the historic conditional probabilistic relationship between levelized real interest rates and levelized inflation rates is calculated. The conditional probabilities are calculated by determining the percentage of time that inflation was "Low", "Base", or "High" given that real interest rates were "Low", "Base", or "High" respectively. The definition of the bins for inflation and interest rates is given in Table 2.8: Bins for Convolution of Interest Rates and CPI.

Table 2.8: Bins for Convolution of Interest Rates and CPI

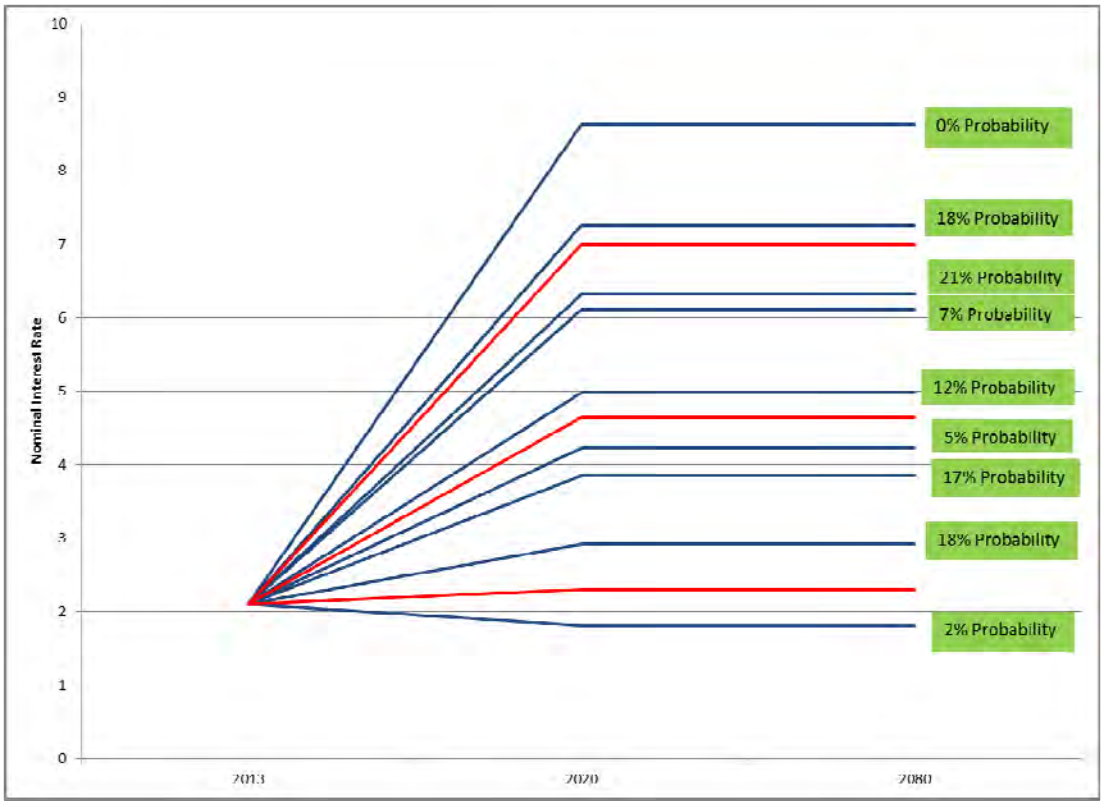
	25th Percentile	50th Percentile	75th Percentile
Levelized Real Interest Rate	2.03	2.82	4.18
Levelized CPI	2.71	3.45	5.85

An example of how the levelized values of interest rates and inflations are placed into bins is shown in Table 2.9. As can be seen in 2004, the CPI is 2.77 which is greater than its 25th percentile while the interest rate is 4.95 which is greater than its 75th percentile leading to the

CPI being placed in the "Average" bin while the interest rate is placed in the "High" bin. For comparison, in 2010 the CPI is 2.00 which is "Low", while the interest rate is 3.75 which is "Average".

Table 2.9: Example of Assigning Inflation and Interest Rates to Conditional Bins

	20 Yr Levelized CPI Change	20 Yr Levelized Real Interest Rate	Levelized CPI Scenario Bin	Levelized Real Interest Rate Scenario Bin
2003	2.894189	5.195664	Average	High
2004	2.771738	4.95066	Average	High
2005	2.683854	4.716231	Low	High
2006	2.576068	4.570574	Low	High
2007	2.465866	4.40903	Low	High
2008	2.385931	4.189312	Low	High
2009	2.147142	4.138725	Low	Average
2010	2.000075	3.939568	Low	Average
2011	1.86839	3.75425	Low	Average
2012	1.870999	3.435786	Low	Average



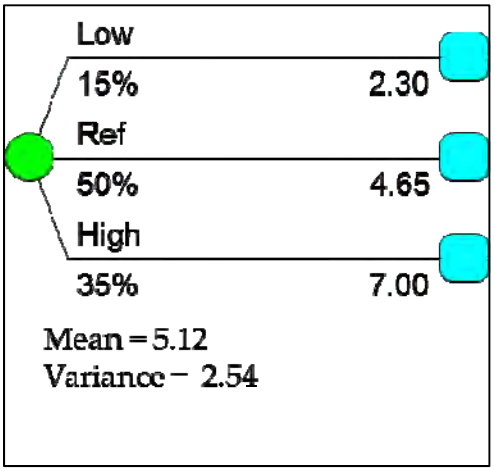
The computed conditional probabilities are shown in Table 2.10. Low values refer to those below the 25th percentile, high values to those above the 75th percentile and base values are the remainder. This table indicates some degree of dependence; for example, the extreme cases "low real interest, low inflation" and "high real interest, high inflation" are very rare.

Table 2.10: Conditional Relationship between Real Interest Rates and Inflation Rates

	Low CPI	Base CPI	High CPI
Low Interest Rate	7%	71%	21%
Base Interest Rate	35%	23%	42%
High Interest Rate	29%	71%	0%

The separate distributions on real interest rate and inflation rate, and the conditional relationships in Table 4 can be used to develop a combined nine-branch distribution of nominal interest rates using the formula given in the previous section. This is shown below in blue in Figure 2.11. For comparison, Manitoba Hydro's three nominal interest rate scenarios are shown in red.

Figure 2.11: Nominal Interest Rate Scenarios



Note that the extreme values in this chart both have low probability. The highest forecasted value that corresponds to high inflation and high real interest rate has 0% probability, while the lowest forecasted value that corresponds to low inflation and low real interest rate has 2% probability. This gives initial evidence that the Manitoba Hydro scenarios can be successfully assigned probabilities benchmarked to these 9 cases.

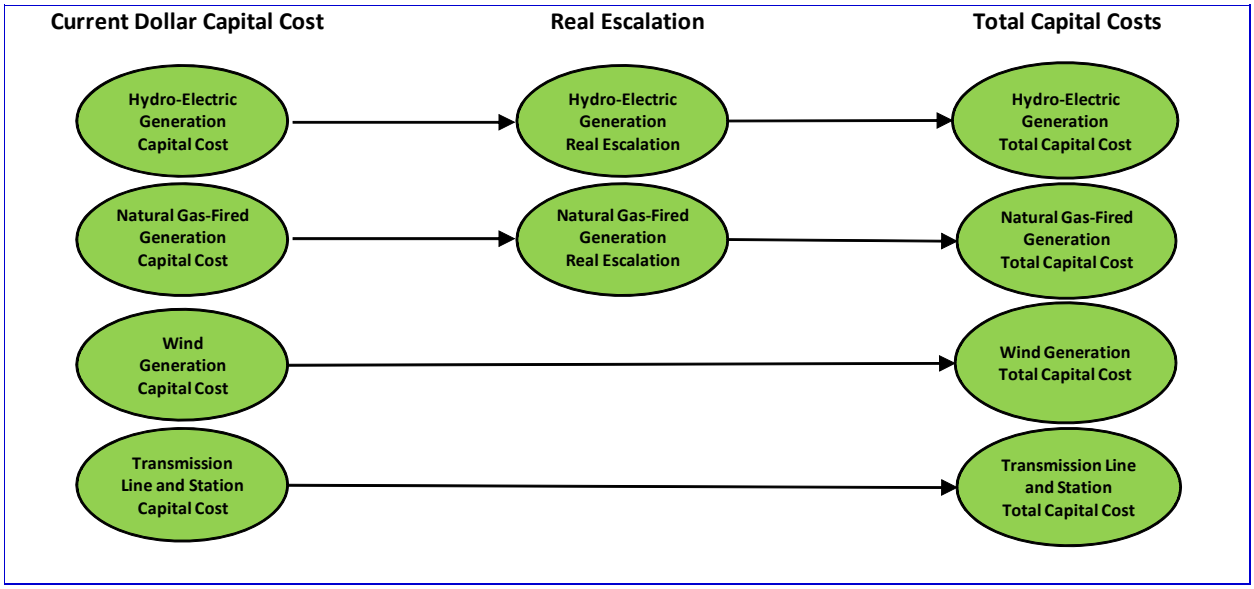
Input Development

Once the nine-branch nominal interest rate distribution has been developed, the final task is to benchmark the Manitoba Hydro nominal interest rate scenarios to this distribution. The mean and standard deviation of the nine-branch 20-year levelized nominal interest rate forecast are 5.09 and 2.58 respectively. The probabilities that should be assigned to Manitoba Hydro's three scenarios to best match this forecast are shown below. This three-branch distribution matches mean and variance well.

Figure 2.12: Manitoba Hydro Interest Rate (and Economic Indicators) Probabilistic Inputs

2.3.3. Capital Costs

Relationships among Variables



There are six variables included in the category Capital Costs:

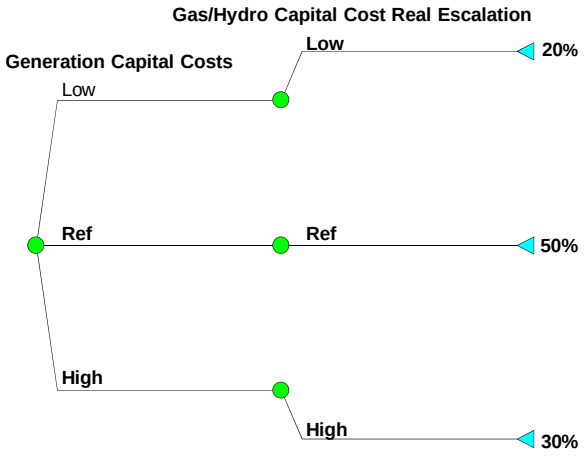
- Hydro-Electric Generation Current Dollar Capital Costs
- Natural Gas-Fired Generation Current Dollar Capital Costs
- Wind Generation Current Dollar Capital Costs
- Transmission Line and Station Current Dollar Capital Costs
- Hydro-Electric Generation Capital Cost Escalation
- Natural Gas-Fired Generation Capital Cost Escalation

The relationships among these individual factors can vary substantially based on the particular application and context. In general, it appears that current dollar capital (i.e., construction) costs and capital cost escalation rates are driven by different factors - capital costs by engineering issues and escalation rates by economic issues. Consequently, it is reasonable to assume that capital costs and capital cost escalation are independent. In addition, in our case, it appears that generation and transmission capital (construction) costs are affected by similar factors such as difficult site conditions and rising labour costs. This view of dependence among different generation and transmission assets is generally supported by empirical evidence and expert judgment. Data from the past ten years in EIA's Annual Energy Outlook shows a significant correlation between natural gas-fired generation and hydro-electric generation cost escalation.[16i] In addition, industry experts typically report combined capital cost escalation rates for non-nuclear generation technologies, such as the IHS CERA Power Capital Costs Index (PCCI)[17]. This indicates that these six factors can be combined into two as shown in Figure 2.13: generation/transmission capital costs and natural gas-fired/hydro-electric generation capital cost real escalation rates.

[16] See, for example, DOE/EIA, Annual Energy Outlook: 2013, April 2013.
[17] See, for example, IHS CERA, *Power Plant Construction Costs Falling for All Types of New Plants,* http://press.ihs.com/press-release/energy-power/ihs-cera-power-plant-construction-costs-falling-all-types-new-plants, June 23, 2009.

Figure 2.13: Capital Costs - Underlying Model

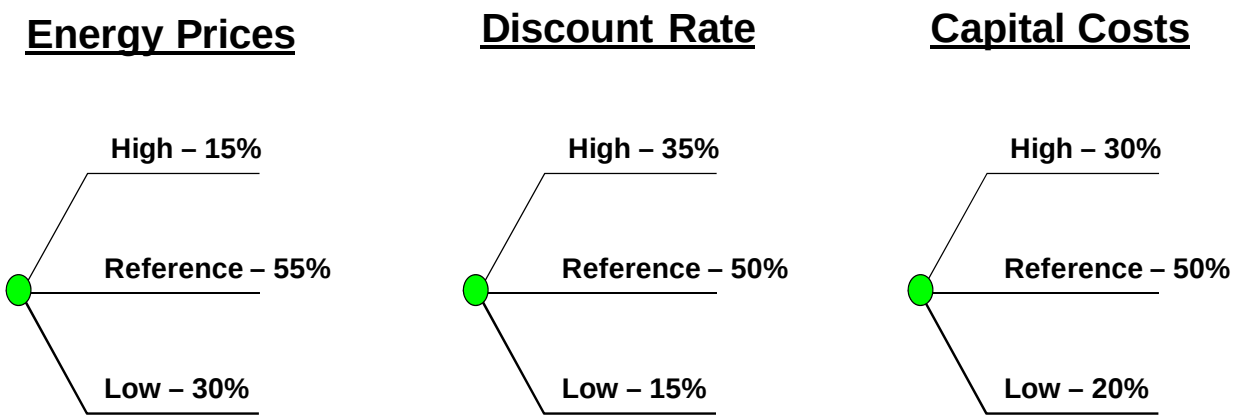
Probability Assessment & Input Development



Various techniques, including Monte Carlo analysis, were used in the initial development of the High and Low estimates at the P10 and P90 levels, which would correspond to probabilities of 25-50-25, excluding the impact of escalation. The probabilities were then refined for the following factors:

- Capital cost estimates for Keeyask G.S. and Conawapa G.S. are at an advanced stage; nevertheless, costs are more likely to increase than decrease, mainly due to labour costs.
- Capital cost estimates for the natural gas-fired and wind generation alternatives are at an earlier stage than those for Keeyask G.S. and Conawapa G.S. and likely do not capture all cost risks .
- There is a large amount of empirical data that supports the trend that costs are more likely to increase than decrease for any capital project.

- Similar labour issues associated with developing hydro generation are also associated with non-hydro generation.
- The assumption of dependence between capital costs and escalation rates makes our lower and upper bounds broader than if we treated them independently, countering the tendency for overconfidence in uncertainty estimation.



Based on this analysis, probabilities were assigned to three pre-existing capital cost scenarios as shown in Figure 2.14.

Figure 2.14: Manitoba Hydro Capital Cost Probabilistic Inputs

The graphic in Figure 2.15 provides the probabilities that were applied to each of the highest impact factors.

Figure 2.15: Probabilities for Highest Impact Factors

As shown in Table 2.11, these probabilities are multiplied in combination to produce a probability for each of the 27 scenarios under study as shown in the table below. For example, the Low Energy Price, Low Discount Rate and High Capital Cost (Low, Low, High) scenario results in a probability for the scenario as follows:

- 30% x 15% x 30% = 1.35%

Table 2.11: Probabilities for Each of the 27 Scenarios

Energy Prices	Discount Rates	Capital Costs	Probabilities
Low (30%)	Low (15%)	High (30%	1.35%
		Ref (50%)	2.25%
		Low (20%)	0.90%
	Ref (50%)	High (30%	4.50%
		Ref (50%)	7.50%
		Low (20%)	3.00%
	High (35%)	High (30%	3.15%
		Ref (50%)	5.25%
		Low (20%)	2.10%
Ref (55%)	Low (15%)	High (30%	2.48%
		Ref (50%)	4.13%
		Low (20%)	1.65%
	Ref (50%)	High (30%	8.25%
		Ref (50%)	13.75%
		Low (20%)	5.50%
	High (35%)	High (30%	5.78%
		Ref (50%)	9.63%
		Low (20%)	3.85%
High (15%)	Low (15%)	High (30%	0.68%
		Ref (50%)	1.13%
		Low (20%)	0.45%
	Ref (50%)	High (30%	2.25%
		Ref (50%)	3.75%
		Low (20%)	1.50%
	High (35%)	High (30%	1.58%
		Ref (50%)	2.63%
		Low (20%)	1.05%

2.4. Expected Value

The expected value for each development plan is determined by calculating the weighted average of the NPVs. The information in Table 2.11 is the basis for the determination of the expected value for each development plan when combined with the scenario weightings provided in Figure 2.15. Expected value is calculated for each development plan by:

Expected Value of a plan = the sum of (each scenario NPV x the probability of its occurrence).

The expected value (weighted average) incorporates asymmetries in the possibilities that may not be apparent from the single reference scenario and is a very meaningful measure in a probabilistic economic evaluation.

The following example illustrates how to calculate expected value, with three illustrative plans (Plan A, B, C) and three scenarios (low, reference and high). Table 2.12 provides the net present value of the three plans over the three scenarios. Table 2.13 provides the incremental NPV of all the cases relative to Plan A Reference Scenario.

Table 2.12: Net Present Value of Three Sample Plans

NPV $2014M	Plan A	Plan B	Plan C
Low Scenario	-3000	-2500	-1000
Reference Scenario	-2000	-1500	-1500
High Scenario	-1000	-500	-2000

Table 2.13: Incremental NPVs of Sample Plans: 'Absolute Reference' Perspective

NPV $2014M	Plan A	Plan B	Plan C
Low Scenario	-1000	-500	1000
Reference Scenario	0	500	500
High Scenario	1000	1500	0

In the above example, if the low, reference and high scenarios are assigned probabilities of 30%, 50% and 20%, Plan C would have an expected value of:

30% X $1000M + 50% X $500M + 20% X $0M = $550M

Similarly, Plan A would have an expected value of -$100M and Plan B would have an expected value of $400M. Note that in this example, the probabilities are not symmetric. Therefore, the expected value of Plan A is not $0M. In this case, it is -$100M. If desired, this can be shifted to 0, so Plan C would have an expected value *relative to Plan A* of $550M-(-$100M) = $650M.

2.5. Cumulative Probabilities: S-Curve Plots

To gain more insight beyond expected value, cumulative probabilities or "S" Curves are used. The first step is to order the scenario outcomes, which must be done for each plan individually. In this example, the All Gas plan is shown.

Table 2.14: Transforming Scenario Probabilities into Cumulative Probabilities

Probabilities	All Gas
1.35%	-4043
2.25%	-3049
0.90%	-2247
4.50%	-463
7.50%	208
3.00%	750
3.15%	1204
5.25%	1708
2.10%	2114
2.48%	-5014
4.13%	-4020
1.65%	-3217
8.25%	-671
13.75%	0
5.50%	542
5.78%	1308
9.63%	1812
3.85%	2218
0.68%	-6435
1.13%	-5441
0.45%	-4638
2.25%	-1158
3.75%	-487
1.50%	55
1.58%	1210
2.63%	1713
1.05%	2120

Probabilities	All Gas	Cumulative Probabilities
0.68%	-6435	0.3%
1.13%	-5441	1.2%
2.48%	-5014	3.0%
0.45%	-4638	4.5%
1.35%	-4043	5.4%
4.13%	-4020	8.1%
1.65%	-3217	11.0%
2.25%	-3049	13.0%
0.90%	-2247	14.6%
2.25%	-1158	16.1%
8.25%	-671	21.4%
3.75%	-487	27.4%
4.50%	-463	31.5%
13.75%	0	40.6%
1.50%	55	48.3%
7.50%	208	52.8%
5.50%	542	59.3%
3.00%	750	63.5%
3.15%	1204	66.6%
1.58%	1210	68.9%
5.78%	1308	72.6%
5.25%	1708	78.1%
2.63%	1713	82.1%
9.63%	1812	88.2%
2.10%	2114	94.1%
1.05%	2120	95.6%
3.85%	2218	98.1%
		100.0%

As shown in Table 2.14, after the NPVs are ordered from lowest to highest, cumulative probabilities can be calculated. For ease of calculation, the precise scenario outcome is defined as the midpoint of the range it is supposed to represent. For example, the high energy, low discount, high capital scenario (probability 0.68%) is the worst scenario for the All Gas plan. The NPV calculated (-$6435M) is representative of continuous scenarios that are similar to this scenario, and occupy the range from 0% to 0.68%, centred at 0.34%. The next-worst scenario (probability 1.13%) occupies the next part of the range, from 0.68% to 1.81%, centred at 1.24% (note numbers lose precision in rounding). Therefore, the value of $-5441 is set at this centred

value of 1.24%. This process continues until the entire range from 0 to 100% has been represented by a scenario.

These cumulative probabilities are plotted on the vertical axis with the values on the x-axis to create the 'S-Curve' figures used in Chapter 10. In that chapter, it is discussed that each point represents the probability that the value will be less than or equal to that value (for example, there is a 40.6% chance the NPV will be less than $0M in the All Gas case). However, given that 27 discrete scenarios have been used as the centre points of ranges to represent what is in reality a continuous distribution, there is some imprecision. The points were connected linearly to preserve the actual scenario values recognizing that the resulting lines are not smooth, but removing any subjectivity in how the points should be smoothed.

Figures 2.7.7, 2.7.8 and 2.7.9 show the S-curves for the three categories of development plans that have been evaluated -

- Development plans with no new U.S. interconnection designed to serve only Manitoba load and existing export commitments (Figure 2.7.7),
- Development plans with a 250-MW U.S. interconnection (Figure 2.7.8),
- Development plans with a 750-MW interconnection (Figure 2.7.9).

Figures 2.7.7 to 2.7.24 provide all of the S-curves that are provided in ***Chapter 10 Economic Uncertainty Analysis – Probabilistic Analysis and Sensitivities.***

2.6. Cumulative Probabilities: Box-Whisker Plots

A Box-Whisker plot is another method to visualize the range of NPVs for the different development plans being considered. The box-whisker plot in Figure 2.7.5 shows the P10 and P90 values as whiskers and the P25 and P75 as boxes for each of the 15 development plans. 'P' stands for percentile, so a P10 is at the 10th percentile, meaning only 10% of possible outcomes are lower than this value.

The value of a Box plot is that it not only shows the possible range of NPVs for each development plan, but the likelihood of those NPVs and the probability-weighted expected value. Box Plots provide a quick high-level picture of how the ranges of different plans compare, and if they have more significant upside or downside risk. For plans that are close in value from the Box plot perspective, a more detailed analysis is warranted. Box plots both with and without the provincial transfers are shown in Figures 2.7.5 and 2.7.6, respectively.

3. Economic Summary Tables

The Economic Summary Tables (Tables 001 through to 405 included at the end of this Appendix 9.3) provide the cash flows for components which make up the net present value of each of the 15 NFAT 2012 developments plans for each of the 27 scenarios (405 cases). For a description of the development plans refer to ***Chapter 8 – Determination and Description of Development Plans.***

A high level summary of the incremental present values (incremental to the All Gas development plan) of the cost and revenue totals derived from the Economic Summary Tables is also provided for each development plan for each of the 27 scenarios (Tables 406 through to 432 included at the end of this Appendix 9.3).

Economic Summary Tables are also provided for the development plans associated with the 2013 updated economic evaluations (Tables 433 through to 444 included at the end of this Appendix 9.3).

Following is a general description of each of the cash flow components used for the economic evaluations of development plans and provided in the Economic Summary tables.

3.1. Capital and Related Costs

Capital cost estimates and related costs for the resource options that make up the development plans are identified by resource type in this category. Incremental capital costs associated with each development plan are included in the cash flow components of this category. Capital costs common to all development plans are excluded. Capital costs are presented on the basis of remaining estimated capital costs going forward from June 2014. All costs incurred or estimated prior to June 2014 are considered as sunk.

3.1.1. Hydro G.S. - Hydro–electric Generation

Capital estimates for Conawapa G.S. and Keeyask G.S. are shown separately and include the capital estimate for the generating station principal and supporting infrastructure based on the in-service date of the development plan. The capital estimating process for these resources is described in ***Appendix 2.2 – Developing the Keeyask and Conawapa Capital Cost Estimates***. For economic analysis purposes, hydro-electric generating stations are assumed to have a life of 67 years which reflects a compromise between the different service lives of the mechanical and electrical equipment and the service lives of the concrete and earthen structures.

3.1.2. Thermal G.S. - Natural Gas-fired Generation

Capital cost estimates for natural gas-fired generation include the generating station as well as land acquisition and gas pipeline costs. The generating station estimate is the product of a consulting study commissioned in 2012. The consultant was hired to produce a study that recommends natural gas-fired generation options for use in evaluations based on Manitoba Hydro's unique system needs and long-term load and market forecasts. The scope of the study includes details of recommended generation including performance, lead time and price. The consultant used industry standard gas turbine plant estimating software. A number of input variable adjustments were required to tailor the estimate to a specific project in Manitoba. Climatic parameters, soil conditions, water quality and other factors were selected from a number of available options to match the expected site conditions. Adjustments were made to account for regional differences in labour rates and material pricing. For economic analysis purposes, natural gas-fired generation options are assumed to have a life of 30 years.

3.1.3. Wind G.S. - Wind Generation

For economic evaluation purposes, it is assumed that all additional wind developments would be owned and operated by Manitoba Hydro. Manitoba Hydro wind turbine capital cost estimates are based on annual industry reviews of average wind project costs. The land required is assumed to be secured through leases and those costs are included in the Fixed

Operating and Maintenance category. Wind turbines are assumed to have a life of 20 years which is the current industry practice for evaluation purposes. Most failure statistics available for megawatt size units have less than 15 years of operation.

3.1.4. Transmission

Transmission is separated into two categories: Generation Outlet Transmission (GOT) and US Transmission Line (US T/L). GOT includes the facilities required to transmit the power from a generating station. Where appropriate, GOT also includes the North-South Transmission Upgrade Project as described in Chapter 2. When available, detailed capital cost estimates for generation outlet transmission are used. For transmission projects which have not been studied in detail, more generic unit cost estimates for generation outlet transmission have been developed by Manitoba Hydro (e.g. on a cost per km basis). GOT includes the required transmission lines which are assumed to have a life of 50 years and transmission stations which are assumed to have a life of 35 years.

US T/L refers to the capital expenditure related to a new U.S. transmission interconnection and includes Manitoba Hydro's contribution to both the Canadian and U.S. portion of the transmission line. Depending on the development plan, either a 250 MW or 750 MW transmission interconnection is included. In either case, Manitoba Hydro is responsible for all costs of the Manitoba portion of the transmission facilities. In the case of the 750 MW interconnection, Manitoba Hydro will also be responsible for a portion of the capital costs of the U.S. interconnection, however as the business model and cost allocation for this project have not been finalized, assumptions have been made for purposes of the NFAT evaluations. US T/L includes the transmission interconnection lines and stations to the U.S. which are assumed to have a life of 50 years and 35 years, respectively.

3.1.5. Total Capital

Total Capital is the annual sum of the yearly cash flows for the generating stations and transmission facilities.

3.1.6. Capital Taxes

Capital taxes are a provincial tax assessed under "The Corporation Capital Tax Act" of Manitoba. In general terms, this tax is applied at a rate of 0.5% to the capital invested by Manitoba Hydro in the province, where "capital" can be generally defined as the total debt and retained earnings of the corporation. The capital tax included in the economic evaluation is the amount of incremental tax incurred based on the additional capital investment of each development plan.

3.1.7. Fixed O&M – Fixed Operating and Maintenance Costs

Fixed O&M are those costs that occur on an annual basis that are not dependent on the quantity of energy generated. These costs include labour, operating and overhead costs associated with operating, maintaining and administering the incremental generation, transmission and interconnection facilities contemplated by each development plan. Estimated costs of regular capital maintenance items required over the life of the facilities are also included. Fixed O&M for incremental wind generation also includes the estimated cost of land lease payments.

3.2. Net Average Flow Related Revenue (Production Costs and Revenues)

The components that make up net average flow related revenue are calculated using Manitoba Hydro's system simulation computer model known as SPLASH. The SPLASH model is described in more detail in ***Appendix 9.2 – Description of the SPLASH Model***.

3.2.1. Gross Revenue

Gross revenue incorporates the revenue from both firm export power sales and the sale of short-term opportunity export energy. Gross revenue does not include domestic revenue as it is common to all development plans. Expected export revenues are generated from the SPLASH model and are a function of the makeup of each development plan within the context of the whole Manitoba Hydro generation and transmission system and the interconnected markets.

Firm export power sales consist of existing long-term contract commitments and proposed contract commitments for firm sales in the future which are at a fixed contract price. In addition, any excess dependable hydro-electric energy not sold or anticipated to be sold is assumed to be marketed as a firm sale in the future. This uncommitted firm hydro-electric energy is valued at a premium price relative to short-term opportunity sales.

The value of market priced firm and opportunity exports is derived from the corporate electricity export price forecast. See Section 1.5 of this appendix for a description of the electricity export price forecast methodology.

All export revenues are forecast in U.S. dollars and then converted to Canadian dollars using Manitoba Hydro's forecast for the U.S. dollar to Canadian dollar foreign exchange rate.

3.2.2. Water Rentals

Water rentals are annual charges levied by the Provincial Government for the use of water for the production of electricity under the provision of the Manitoba Water Power Act and Regulation. Water rental charges for each hydro-electric generating station, on a calendar year basis, are the greater of:

a) a fixed rate multiplied by the installed capacity;
b) a fixed rate multiplied by the electric output for the year.

Water rental rates are set to be equivalent to 3.3426 mills per KWh. For planning purposes, it is assumed that this rate remains constant for the 35 year planning period.

3.2.3. **Thermal Burn** – Variable Production Costs of Thermal Generation

Manitoba Hydro thermal generation includes the existing natural gas-fired and coal-fired steam generation as well as future natural gas-fired generation contemplated by each development plan. For planning purposes it is assumed that Manitoba Hydro's last coal-fired steam turbine unit will be retired as of January 1, 2020.

The variable production costs of thermal generation are dependent upon the quantity of generation. As part of a predominately hydro-electric system, from a planning perspective, the need to dispatch thermal generation is dependent on water flows. The quantity of generation is determined by the SPLASH model and includes fuel costs, variable operation and maintenance (O&M) costs and carbon adders.

3.2.3.1. Fuel Costs

The methodology for determining both the coal and natural gas price forecasts is described below.

Coal

Price estimates for Powder River Basin (PRB) coal to 2019/20 are based on future projections of current contract provisions that exist with Manitoba Hydro's coal supplier and rail transporter. The above contracts expire in 2014. The coal price forecast includes both the cost of coal and transportation costs.

Natural Gas

The fuel cost for natural gas-fired generation is derived from the natural gas price forecast for the Province of Manitoba. See Section 1.5.2 of this appendix for a description of the natural gas price forecast methodology.

3.2.3.2. Variable O&M

Variable O&M for thermal generation represents the cost of the major maintenance and overhaul events that occur on either the basis of unit starts, operating hours or some combination of both as well as consumables such as chemicals and lubricants used during plant operation.

3.2.3.3. Carbon Adders

The provincial Emission Tax on Coal Act imposes a $17.37 tax per tonne on sub-bituminous coal purchased after January 1, 2012. This corresponds to an approximate tax rate of $9.40 per MWh generated for the remaining coal unit.

The expected costs associated with future carbon legislation/policies which would impact natural gas-fired generation are included and based on the quantity of natural gas-fired generation in each development plan. See Section 1.5 of this appendix for a description of the carbon price forecast methodology

3.2.4. Power Purchases

Power purchases include both imports from the MISO market and existing wind purchases.

Import quantities are generated from the SPLASH model and are a function of each development plan within the context of the whole Manitoba Hydro generation and transmission system and the interconnected markets. Imports are used to supply Manitoba Hydro's obligations and quantities vary depending on water flow conditions. In addition, when system conditions allow, Manitoba Hydro imports energy during lower import price periods, to facilitate sales opportunities during higher export price periods to maximize export revenue opportunities.

Wind purchase costs are based on the terms and conditions of the individual power purchase agreements in effect.

3.2.4.1. Wind Integration costs

Total wind integration costs are a deduction from the Gross Revenue and/or an addition to the Power Purchases. The allocation for each year is based on the volume of exports or imports divided by the market transaction volume (total import plus export volume) multiplied by the wind integration unit rate. A more detailed discussion of wind integration costs can be found in Section 1.5 of this appendix.

3.2.5. Net Revenue

Net Flow Related Revenue is calculated on an annual basis as gross flow related revenue less flow related expenses including water rentals, thermal burn costs and power purchases.
